INDIA RUBBER WORLD

Published on the 1st of each Month by

THE INDIA RUBBER PUBLISHING CO.

No. 15 West 38th Street, New York.

CABLE ADDRESS: IRIWORLD, NEW YORK.

HENRY C. PEARSON, Editor

Vol. 47. OCTOBER 1, 1912. No. 1

SUBSCRIPTIONS: $3.00 per year, $1.75 for six months, postpaid, for the United States and dependencies and Mexico. To the Dominion of Canada and all other countries, $3.50 (or equivalent funds) per year, postpaid.

ADVERTISING: Rates will be made known on application.

REMITTANCES: Should always be made by bank or draft, Postoffice or Express money orders on New York, payable to THE INDIA RUBBER PUBLISHING COMPANY. Remittances for foreign subscriptions should be sent by International Postal Order, payable as above.

DISCONTINUANCES: Yearly orders for subscriptions and advertising are regarded as permanent, and after the first twelve months they will be discontinued only at the request of the subscriber or advertiser. Bills are rendered promptly at the beginning of each period, and thereby our patrons have due notice of continuance.

Entered at the New York postoffice as mail matter of the second class.

THE CONFERENCE AND ITS DELEGATES.

IT is probable that there are at present in New York more individuals directly interested in rubber than have ever before been gathered in any American city. In addition to the list of distinguished delegates to the International Rubber Exposition and to the Conference, there are members of the great Commerce Congress in which forty nations are represented, delegates to the International Chemical Congress and individual representatives of the whole rubber trade.

That the Rubber Exposition should call together so great and notable a gathering is in no way remarkable. The last half dozen years have shown unparalleled expansion in both crude and manufactured rubber, an expansion that is far from reaching its limit, and indeed is going steadily on. To the many present, therefore, facing a future full of promise and growth, whatever their interest in rubber, from whatever part of the world they come, we offer felicitation and welcome.

THE THIRD INTERNATIONAL RUBBER EXPOSITION.

AS this number of THE INDIA RUBBER WORLD comes from the press on the day of the opening of the Third International Rubber and Allied Trades Exposition, it is not possible to speak of that enterprise as one that is complete and finished; but, by reason of the breadth with which it has been planned and the thoroughness of the preparations that have been made for it—preparations that have been in progress for over a year—it is quite possible to prognosticate with more than a fair degree of certainty the outcome of this event.

We cannot, of course, from this initial viewpoint, make any definite statements as to the success of the exhibition from the standpoint of popular appreciation and attendance; but as a great educator and stimulator of the trade, and as a revelation of what the rubber industry in this country is to-day, it is perfectly possible to speak now, and to speak with all confidence. Looked at from this point of view, its success is already achieved, and is beyond all question. It merits success in every direction and will doubtless realize it. It is a worthy enterprise. The plans were well and wisely laid and they have been carried out carefully, conscientiously and intelligently.

The two great London rubber expositions were not only trade successes but made a wide appeal to popular appreciation. It may not, to be sure, be quite safe to argue from British experiences to American probabilities, for conditions are somewhat different. It cannot be questioned that American manufacturers, and business men take a less enthusiastic interest in exhibitions in general than their English contemporaries. There is a temperamental difference between the English and Americans. It might be described as saying that Americans are more keenly alert to the immediate substantial results of any enterprise on which they embark; or viewed from another angle, it might be expressed in this way,—that our friends across the water have more imagination, that their commercial outlook is broader, that they are concerned with the future as well as the present. However it may be described, the fact undoubtedly remains that the English as a class are more ready to participate in exhibition enterprises than we are. As a result of this American hesitancy to take part in shows, some of our large manufacturers are not actively participating in this great international rubber exploitation; but, on the other hand, many are—enough at any rate to make a creditable display of American rubber manufactures.

Foreigners have taken an unexpectedly active part in

this New York exhibition. They have contributed with a lavish hand. Take Brazil, for instance, which is represented by half a hundred commissioners, counting those from the national government and from various commercial bodies; while the material display takes the colossal form of nearly a hundred tons of the choicest rubber of that great rubber country. The plantation companies of the Far East—considering their remoteness from New York and the distance which it was necessary for them to cover in sending their exhibits—have not been far behind. This exhibition has not only brought together the most wonderful collection of crude rubber ever seen in this country, but it is doubtful if another such collection will be displayed again here for many years.

THE AWAKENING OF BRAZIL.

THE Ministry of Agriculture of Brazil has recently published in pamphlet form in English the decrees and regulations passed by the National Congress and approved by the President, looking to the encouragement of rubber production in that country. This action on the part of the great rubber republic is incomparably the most important step ever taken in that country to protect its leadership in rubber production.

Brazil is at last awake to the problem that confronts her, if she is to maintain her premiership in the world's rubber market. It would have been better if this awakening had come earlier, but the lost time can be made up by a vigorous prosecution of the campaign that has been marked out.

These decrees and regulations are carefully thought out and comprehensive, and should do much to stimulate a wide activity in rubber production in the Amazon country. A careful translation of the decrees was made, and presented in considerable detail in our June issue, but now that they have been further exploited by the Government for the benefit of English-speaking people, it may not be out of place briefly to review their general scope. They cover the following points:—The exemption from duties of all utensils and materials intended to be used in the culture of various rubber trees named in the decree, and in the harvesting and preparation of rubber extracted from those trees; the granting of liberal bonuses ranging from $280 to $800 to those who shall start new plantations and carry them to successful production; the establishment by the government of experiment and demonstration stations at convenient places in the different states lying within the rubber territory; the building of houses where immigrants brought into the rubber country may receive proper shelter and sanitary habitation, and the building of hospitals where they may be given, free of charge, any necessary medical treatment; the construction of narrow gauge and other railways in various sections of the rubber country, including a railway from some convenient place on the Madeira-Mamoré railway to the frontier of Peru; the execution of work that shall make navigable for the shallow rubber boats various rivers where it is impossible now for these boats to operate; the promotion of many centres of food production for the maintenance of the rubber gatherers; the holding of triennial rubber exhibitions at Rio de Janeiro, intended for the instruction and encouragement of rubber growers; and other measures tending to stimulate the production of rubber and materially assist in the opening up of the rubber country.

Brazil is at last aroused to the necessity of the proper development of her vast and wonderful natural resources. She is profoundly to be congratulated on this awakened spirit. If she shall carry out with determination and energy the wise measures which her legislators have enacted, great will be her reward.

TWO GREAT SYNTHESISTS IN OUR MIDST.

DURING the past few days we have had two great champions of the new synthetic rubber in our midst or—as the purists would prefer to have us say—in the midst of us: Professor William F. Perkin, spokesman of the English group of rubber makers, and Dr. Carl Duisberg, director general of the Farbenfabriken of Elberfeld, Germany, leader of the German producers of artificial rubber. Both delivered able and exceedingly instructive addresses before the Congress of Applied Chemistry that held its sessions in New York during the first half of September. Both had much to say of deep interest, not only to the science of chemistry, but to the rubber industry. Both courteously received a representative of The India Rubber World and further elucidated the views presented in their lectures.

On another page will be found highly interesting interviews with both of these distinguished scientists, as well as other matters of importance relating to the absorbing synthetic problem. It is a matter of regret that the great allotment of space necessarily devoted in this issue to the Rubber Exposition, together with pressure of other matters, makes it impossible in this number to report Dr. Duisberg and Professor Perkin in full.

OVERALLS ON TOP OF HARVARD.

WHEN young Roswell Colt, son of President S. P. Colt, of the United States Rubber Co., landed in New York recently on his uncompleted wedding tour, he, jointly with his distinguished father, was interviewed by representatives of the New York daily press; and in reply to the questions of one of his interviewers as to what his future plans were, he is reported to have replied: "We will travel about a while, and I'll show my bride my college—Harvard. Then we go to Montreal, where I'll buckle down to hard work, don overalls and become acquainted with every phase of the rubber business."

That reply of the young man that he would first visit his *Alma Mater* and then get into overalls, while intended only to throw light on his own personal plans, as a matter of fact flashed an illuminating shaft on a modern commercial situation of great significance, to wit: the efficacy of a liberal education—plus a pair of overalls.

A few years ago college men were looked upon with considerable suspicion in manufacturing circles. A college education was considered all well enough, as a preparation for the so-called liberal professions. University culture was thought to be quite the proper foundation for a career of theological argumentation, for the efficient, or at least for the harmless, administration of medicine, and for dealing in the shifty subtleties of the law; but when it came to commercial life—and particularly to the din and dust of the factory—four years spent amid the classic shades were currently believed to have a thoroughly incapacitating effect.

But now all this is changed. It has been discovered that a trained mind is preferable to an untrained mind, whether the work to be done is the inditing of sermons, the elucidating of an argument, or the running of a mixing machine; and companies that twenty years ago employed only "practical" men—those who had grown up in overalls—are now filling their important places with the possessors of sheepskins. As an illustration of that point, one of the large Akron factories recently applied to a Western college for a list of promising young graduates, and took five out of the last graduating class, to place in positions of prospective importance.

To be sure, not every college man is willing to don overalls. If he isn't, the factory is no place for him. But where is he willing to start at the very bottom, put on his working clothes with the other workmen, feed crude rubber biscuit into the washing machine, go from that into the mixing room, thence to the calender room, and thus work his way up, his progress obviously ought to be much more rapid than that of his factory comrade whose whole schooling has been that of the shop, and whose outlook in life has always been closed in by the four walls of the factory.

The college, where it has the right material to work on, gives breadth of view, and range of vision, and quickens the imagination; and when range of vision and quickened imagination put on overalls—there ought to be some excellent work done.

SYNTHETIC TIRES HAVE ARRIVED.

ON the evening of September 9, Americans took their first view of actual automobile tires made from genuine synthetic rubber. It was on the occasion of Dr. Duisberg's lecture before the chemists, and he illustrated the progress the Germans had made in the production of synthetic rubber by rolling out before the audience a set of tires constructed of rubber made in Germany—rubber which was innocent alike of plantation parentage and Amazonian ancestry. Moreover, these tires had not only been on actual wheels, but had carried an auto of weight and proportions 4,000 miles, and were still intact and unpunctured, and in fact apparently little worn, and full of promise for a few thousand miles more.

But the makers using the orthodox material that comes from Pará need not feel undue alarm, for there are only two sets of these synthetic tires in existence—the set the doctor exhibits and another set that were presented not long since to the Kaiser. Just what these two sets of tires cost, probably not even Dr. Duisberg himself could accurately state, but reflecting that the German chemists started out five years ago on this synthetic quest, and purposed to spend 1,000,000 marks a year on it, and further reflecting that these eight tires represent practically the only tangible and utilizable fruits of their efforts—apart of course from their great scientific value—it is obvious that they have come rather high. The Doctor does not expect to see synthetic tires on next year's output of autos. He is modest, and inclined to be patient. "Synthetic rubber," he says, "will surely not appear on the market in the immediate future; but I, for one, hope to live long enough to see art triumph over nature also in this industry."

THE EUROPEAN COTTON MARKET.

AMONG the leading European consumers of American cotton, are the spinners of Germany and Austria. Owing to their constant and intimate relations with cotton manufacturers, spinners are in a position to forecast trade prospects from the point of view of consumption, as well as to form a more or less accurate idea of the speculative influences likely to affect the market.

Hence special interest attaches to the recent statements of the managing director of the Bamberg (Bavaria) Spinning Mills, and of the president of the Austrian Cotton Spinners' Association, Vienna, two of the most representative European authorities on the subject named.

The Bavarian director asks whether the 16-million bale crop is really insufficient to cover the wants of spinners, and whether the growing cotton is in a condition which leads to the expectation of higher prices through insufficiency of supply. While he considers these questions justified, he calls attention to the fact that nearly all private reports state that the area sown in cotton this year in the American cotton states, is only to an unimportant extent smaller than that of last year. At the same time, he refers to the effect which the cold and damp weather of the spring may have exercised upon the final result. Seeing, however, that planting conditions have been statistically favorable, speculators have only the weather to consider as a basis of operations for a rise.

The nominal quantity of 16 million bales for the crop of 1911-1912, he considers, on account of its defective quality for manufacturing purposes, can only be regarded as the equivalent of 15 million bales. As this quantity has proved sufficient, he urges that even should the new crop turn out to be only 13½ million bales, it would meet the absolute requirements of the world's spinning industry. The hopes which had been entertained of the German cotton yarn business in 1912 do not seem to have been fulfilled, and the position of German spinners is much worse than it was a year ago.

In the Austrian cotton spinning industry, the overproduction of recent years has led to radical measures. Under the auspices of the spinners' association, 90 leading Austrian spinning mills have come to an agreement for the regulation of production. This agreement does not apply to production generally, but to the share of the various mills in the domestic consumption of yarn, and the production of the quantities thus allotted. Thus the export trade of Austrian spinners does not apparently come under the new agreement, which is intended to stop the losses which have arisen in the past from unrestrained competition in the home market.

As a leading German textile journal puts it, the further development of the cotton market is "a book with seven seals." Among the factors meriting consideration, besides the weather and the attitude of spinners, is the consumption of next year. The consumption of yarn in 1912 having exceeded that of 1911 by 10 per cent., it is urged that weavers' stocks have probably been replenished, so that a further increase in consumption is not anticipated for 1913.

TWO MONTHS FOR COUNTERFEITING A TRADE MARK.

AN interesting trade-mark case recently occurred in Russia, as reported in the Bulletin published by the United States Trade Mark Association. Five directors of a certain Russian rubber company have been adjudged guilty of counterfeiting the trade-mark of a German company, and each has been sentenced to a term of two months in jail.

The Russian trade-mark law provides that any dealer or manufacturer who makes unauthorized use upon his goods, wrappers, labels or in any of his advertising, of another's trade-mark, or who uses a trade-mark so closely resembling another's that it is likely to be mistaken for it, is liable to a maximum penalty of eight months' imprisonment.

We have been in the habit of considering ourselves much in advance of Russia in our standards of ethics, but here is a case where we may well learn a lesson from the subjects of the Czar. There has been far too much laxity in the way of copyright infringement. Many a manufacturer—and this is quite applicable to the rubber trade—has built up an enviable reputation through years of honorable achievement and given his trade-mark a great commercial value, only to have some not too scrupulous concern enter the field and deliberately adopt a trade-mark so similar as to make it inevitable that the trade, particularly the consuming trade, would confuse the two, the newcomer hoping in this way to reap what another has sown. A few months in jail for the directors of a company that seeks to embezzle the reputation of another company, would be a wholesome object lesson.

It may be added, however, that there has been a general improvement in regard to this matter in this country. Some years ago the manufacturer whose trade-mark rights were infringed could get very little redress in the courts. Judges are now disposed to treat these complaints more seriously, and in addition to this fact there is a constantly growing sense of business honor, that entirely apart from the legal aspects of the matter, tends to bring this form of dishonesty into increasing disrepute.

A Visit to the "Black Republic."

By the Editor of "The India Rubber World."

Haitian Rubber Trees—From Curacao to Jacmel—"The Second French Republic"—A Dangerous Roadstead—Ashore at Jacmel—The Post Office, Market and Jail—Upper Class Haitians—A Visit to Aux Cayes—A Wonderful Fire Department—Traveling Haitians—The Birthplace of Dumas.

TIME was when there were rubber trees in Haiti—*Castilloas* probably, although the early visitors, in 1492 and on, did not know the *Hevea* from the *Asclepias*. They simply mentioned the ball games of the native Indians, where were used very lively rubber balls of domestic manufacture.

The natives died off with the advent of the whites, and although coffee, cacao, and sugar cane were introduced, and grown at great profit, practically nothing was done in rubber. To be

JACMEL WATERFRONT.

sure a short time before the historic "rubber craze" a Belgian company took up land, and started rubber planting, but did only a little and that in an intermittent way.

So it was not in search of gum elastic that I visited Haiti. I was on my way home from Venezuela, and by going to Curaçao and taking a Dutch steamer I could visit Haiti, and see all that was worth while. The fact that American capital was back of some new railway construction, and that business houses in the United States were paying more attention to the trade of the Black Republic, and further that Secretary Knox of the State Department was even then on his way to Port au Prince for a

"THE GREAT RIVER," JACMEL.

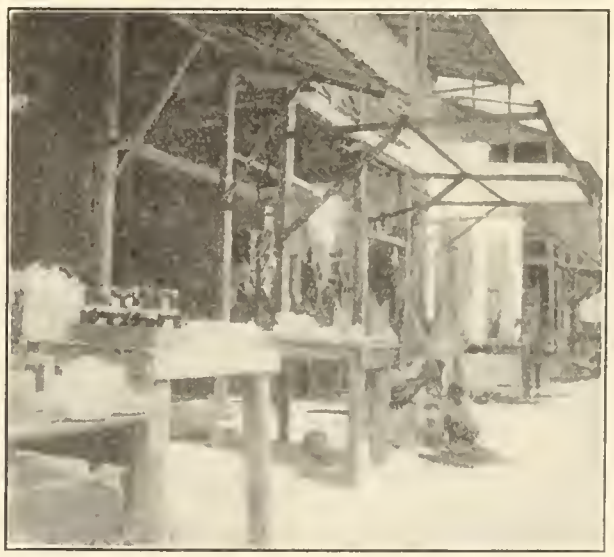
formal visit, led me to believe that this beautiful and fertile island was on the eve of an awakening. A visit would therefore be timely, for who could tell what the future might hold in store in the way of prosperous Haitian rubber plantations. The steamer was scheduled to stop at some seven ports, and would allow of visits ashore and even trips into the interior if one desired.

There was a Haitian aboard, who, as we neared his native land, waxed very voluble concerning his country's wealth and power. He spoke English well, although he claimed that he was

DANGEROUS HAITIAN COAST.

French. He was a large, raw-boned negro, black as night, and rather surly. When he did talk, however, his conversation was interesting, to say the least.

"I am a soldier," he said, "an officer—a general. You will not see our army, but we have thousands of the bravest. No country in the world can conquer us. Did not Spain, England and



MARKET, JACMEL.

France try it? We drove them into the sea. We are French. The second French Republic. We planned our constitution and laws after those of your country, which we far excel, as you will see."

It was thus he talked as we entered the dangerous roadstead off Jacmel, and puttered round for an hour or more to find safe anchorage. The harbor bottom is very treacherous, and steamers anchor fore and aft, and keep up steam ready to slip out and into deep water at the least sign of a blow. After we

were safely located the pilot came off and climbed aboard. He knew nothing about ships, shipping, or harbors, but was a thoroughly capable collector of harbor fees. He took the passenger list ashore, to be examined by the proper authorities, and after an interval returned with the information that "passengers

Primitive Sugar Mill.

would be permitted to land." Those who had visited the island before did not seem overjoyed; indeed, to a man they elected to stay on board. Some of us, however, chartered a row boat for a "Gourde" (30c.) each and started for the pier.

The little city, with its red roofed houses and its tropical setting, looked very pretty from the boat. So, too, the big flat-bottomed lighters, each propelled by three sturdy blacks standing side by side at the stern, sculling with twenty foot sweeps, were wonderfully picturesque. French were these boatmen, in their vivacity and wealth of gesticulation, but in appearance African. Some twenty of these lighters swept down upon our vessel, fighting for first place, crowding, casting off each other's moorings, jostling, swearing, threatening even to knife pulling, but never really coming to blows.

When we started the day was clear, but in a very few minutes heavy clouds appeared, and the mountain slopes were hidden by a brisk shower. We did not get it as the sea breeze, that blows all day long, sent it back to the land again, but that night, when the wind turned and the land breeze blew, everything was drenched with rain. As we neared the shore we passed close to the wrecks of several ships, that had been caught by a blow and driven in upon the rocky shore.

We landed at a tumble-down stone pier, littered with bales of goods, casks, old iron, rotting timber, and half-clad darkies.

The Roadstead, Jacmel.

A man in rainbow uniform escorted us to a shed, where a dozen officials with a copy of the passenger list checked off our names, and after warning us that the harbor was closed after six at night, allowed us to wander about the city. We first visited the post office—a great bare room furnished with a table where letters were stamped and sealed, and a desk for the postmaster. It was only a detail, but some one had stolen the weights from the scales and small stones had been substituted. An oil stove was used for heating the wax and a pewter spoon for a seal, and our attention was called to both several times by proud citizens who were acting as guides and avidly accepting cigars, or indeed anything we could be induced to part with. We bought some stamps, saw the mail for Aux Cayes deposited in a meal bag and thrown in a corner for delivery in the distant future and departed.

The market came next. Through swarms of beggars, goats, swine and filth that overflowed the gutters and covered the narrow roadway, we waded to see the place where the city got its food. It was a great rambling building, in which half-clad negroes sold corn, beans, rice, flour by the cup, queer confections, stripped tobacco leaves, and sulphur matches. These last mentioned seemed to be on sale everywhere.

Then one of the Port officers turned up and claimed he had not seen my passport. That meant a cigar or a tip, so I gave him a Haitian dollar so torn and black and dirty that it hardly held together. But he was afraid of it and declined it; so we compromised on a nickel and a long black cigar.

On the crest of a hill in the middle of the town is the city prison. Its huge barred gate was fastened by a rusty padlock,

Haitian Lighters.

the key to which was two feet long. The sentry, assisted by a muscular prisoner, unlocked the gate and admitted us for a consideration. The outer court was crowded with the most forlorn, tattered, yet cheerful wretches that I have ever seen. The inner prison, a big room with thick stone walls, was packed with men and women who crowded to the grated door and windows, begging, cursing and quarreling while the guards who kept no sort of order, jabbed at them with their antiquated muskets and cursed back constantly and vociferously. In a pit in one corner of the court yard were two crazy prisoners chained side by side. Everywhere was filth indescribable. It is hardly necessary to say that we did not tarry long in this bedlam.

Down the dirty, crowded streets with their high-sounding French names, we slipped and waded, and suddenly came upon the one wholesome spot in the city. It was a French Catholic school, run by the Sisters of Charity. Here the children were neat, clean, orderly and very bright. Here lies the hope of Haiti.

We were very glad to get back to the ship, bathe, fumigate and forget. And then we received another surprise. Off from the shore came a boat rowed smartly, and up the ladder came visitors for the captain—men dark, vivacious, elegant, and ladies

clad in Paris gowns. They were the upper-class Haitians, and would pass for wealthy and cultured French anywhere. But how they manage to exist in their filthy cities, even in suburban villas, and keep clean and well is a mystery.

We got away that night for Aux Cayes, and dropped anchor in the harbor the next morning. A crowd of port officials in a power boat run by kerosene, and adorned with a crooked stove pipe, from which poured clouds of black smoke, came alongside and boarded us. By advice of counsel we locked our cabins and kept them locked until the visitation was over. Thus we re-

Typical Haitians.

tained our extra shoes, bath-robes and toilet articles. When we had taken on some casks of honey, and were all ready to sail word came that passengers were expected, and in the long wait that ensued we explored the city.

It was different from Jacmel, and cleaner. More than one-half of it had burned down not long before, and that, in spite of

Haitian Washerwomen.

the fire department, was the clean part. Few Haitian cities have risen to the civilized heights of fire departments. But Aux Cayes had, and it was O. K. Those gold helmets of the firemen! —a bit battered, to be sure, but how they shone! And the sentinel at the door of the firehouse, what a proud handsome figure he was! The equipment for fire fighting? Well, there was a French hand-engine that properly manned, could throw several gallons of water a minute fully twenty feet, that is, if they had hose. But the gold helmets and the uniform! That was what the people were proud of! That was what they paid for, or at least owed for.

We met a traveled Haitian here, a man who had lived about nine years in France, and he showed us much that was interest-

Villa of Wealthy Haitian.

ing. A bank in a fine building all its own, and a big department store run by Germans that was a marvel in the completeness of its equipment.

Back to the boat late in the afternoon we came, and found it crowded with passengers for Port au Prince. The captain predicted stormy weather, and wanted to get away. But the health officer had not brought our papers. For two hours the big whistle roared at minute intervals, and then gave it up. Finally four hours late they came—and they had been ready all day! Had we sailed without the papers it would have meant five days' quarantine at the next port, and that was what the officials desired.

I forgot to say that it was here in the opulent olden time of the French occupation that Alexander Dumas, Sr., was born.

I hope that I am not giving the impression that there is nothing good in Haiti, that it is a country of filth, tatters and degeneracy only. That is very far from the fact. The coast cities are awful, and the people—that is the lower class—ignorant and shiftless. But the country itself, as soon as one gets a little way inland, is wonderfully beautiful and of exceeding fertility. It is also healthful. Indeed, the cities themselves do not breed the pestilences that one would expect. With an incomparable climate, a rainfall often of over 100 inches, and many excellent

Haitian Excursionists of the Better Class.

harbors, the time is sure to come when schools, churches and industries will have their effect, and the Black Republic under proper leadership will be sanatized, industrialized and saved.

(To be continued.)

INTERNATIONAL ASSOCIATION FOR TESTING MATERIALS.

FROM September 2nd to 7th, the sessions of the Sixth Congress of the International Association for Testing Materials, were held at the Engineering Societies building, New York. They were attended by nearly 800 chemists, engineers of tests, privy councilors, railway directors, collegiate teachers, and directors of official testing stations.

In order to facilitate the work of the Congress, it was conducted in the following sections:

(a) Metals and Metal Products.
(b) Concrete and Building Materials.
(c) Organic Materials.

Among the papers presented were five of particular interest to the rubber trade; two of them being of a general nature and three of a special character, as follows:

"Fundamental Principles for the Organization of the Public Testing of Materials," by Dr. A. Martens, director of Royal Testing Station, at Berlin, Gross-Lichterfelde.

"Some Apparatus for Tension Tests of Rubber," by P. L. Wormeley, physicist at the United States Bureau of Standards, Washington, D. C.

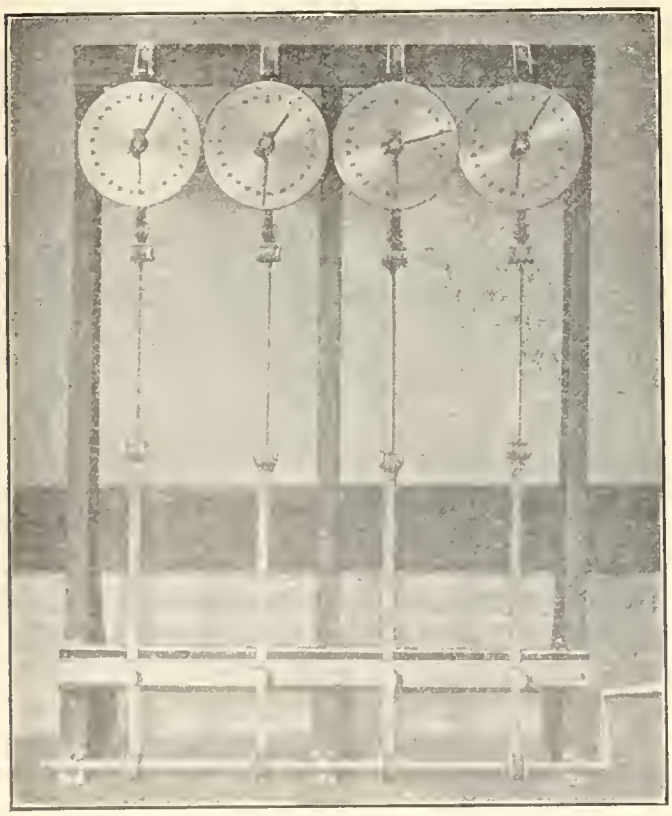
"Report on the Actual State of Rubber Analysis," by F. W. Hinrichsen, chemist at the Royal Testing Station at Berlin, Gross-Lichterfelde.

"The Present Status of the Mechanical Testing of India Rubber at the Royal Testing Station at Berlin, Gross-Lichterfelde," by Karl Memmler, engineer at the station.

"The Austrian Testing Station at Vienna," by Ernst Reitler, director of the bureau.

RUBBER TESTING IN GERMANY AND AMERICA.

AN opportunity has recently been afforded rubber experts in this country, to become fully acquainted with the latest developments in rubber testing. Several papers were read at the recent New York Congress of the International Association for Testing Materials, among which special interest attached to those of Professor Karl Memmler, of the Royal Testing Station, Berlin, Gross-Lichterfelde, and of Mr. P. L. Wormeley, of the United States Bureau of Standards, Washington, D. C.



Apparatus for Stretching Rubber.

Professor Memmler has long been engaged in the solution of the various problems affecting rubber testing, having in conjunction with Professor Schob, submitted a report to the Copenhagen Congress held 1909. Later, in collaboration with Professor Hinrichsen, he produced a work on "Rubber Testing," which brought the question up to the point it had reached in 1910.

While the subject aroused further interest, through the exhibition of apparatus at the laboratory's stand in the London Rubber Exhibition, the expected stimulus was not given to the mechanical testing of rubber. It was therefore, deemed advisable to lay the essence of the results newly obtained, before the present year's New York Congress of the association. These results were largely in connection with the ring test, and differed materially according as stationary or traveling rings were employed. The methods of manufacture likewise affected the results, while the influence of the dimensions was noticeable in the results of tensile strength tests.

Machine for Testing Tensile Strength of Rubber.

Although the field of experiment has been considerably widened since the Copenhagen Congress, it has not yet been found possible to bring forward definite and perfectly elaborated methods for the mechanical testing of soft rubber; owing to the peculiar physical and mechanical properties of this material, and its manifold technical uses. A committee of the German Association for Testing Materials is engaged on the points at issue.

The India Rubber World in the issues of October, 1911 (page 23); December, 1911 (page 107); January, 1912 (page 160), and May, 1912 (page 385-6), has reported upon the various features of the question, which has been advanced a stage by the results upon which Herr Memmler has reported, of the work of himself and his colleagues.

TESTING APPARATUS.

With a view to facilitating and expediting the work of rubber testing, a number of machines have been developed by the United States Bureau of Standards. In Mr. Wormeley's paper, to which reference has been made, he has described two kinds of apparatus for stretching rubber, and two for testing tensile strength. Effective illustrations are annexed to the paper, which also, like Professor Memmler's, deals with the influence of the form of test specimens on the results of tension tests.

News has been received of the death from yellow fever on July 28 of F. E. Mellinger, of the Ermila plantation, Mexico. Mr. Weis, of Huamqueller, Mexico, died of the same disease on August 18.

The accepted authority on South American rubber—"The Rubber Country of the Amazon," by Henry C. Pearson.

Eighth International Congress of Applied Chemistry.

THE Eighth International Congress of Applied Chemistry was held in New York from September 6 to 13th, under the presidency of William H. Nichols, Sc. D., LL. D. In the course of the proceedings, which took place in the Great Hall of the College of the City of New York, six lectures of general character were delivered by the following leaders of chemical thought from various countries:

England, Professor Perkin; Germany, Professor Bernthsen, Professor Duisberg; Italy, Professor Ciamician; France, Professor Bertrand; Norway, Professor Eyde.

The meetings of the 24 sections, into which the Congress was divided, were held at Columbia University. In the section devoted to rubber the following ten papers were read:

L. H. Baekeland, New York, "On Condensation Products of Phenols and Formaldehyde."

Paul Bary, Paris, "Application of Osmosis to the Deresination and the Reclaiming of Rubber."

C. Beadle and Henry P. Stevens, London, "Investigation into the Nature and Properties of *Hevea* Latex."

C. R. Boggs, Boston, "A Direct Determination of Rubber Applicable to Specifications on Vulcanized Rubber."

J. G. Fol. Delft, "On the Relationship Between the Amount of Resins and the Viscosity of Rubber Solutions."

Eduard Marckwald, Berlin, "Treatment of Rubber."

Clement and Riviere, Paris, "Researches on Cellulose Acetate."

B. Setlik and J. Zofka, Prague, "Analysis and Tests of Rubber-Coated Fabrics."

Lothar E. Weber, Boston, "The Action of Resins in the Vulcanizing of Rubber."

G. Stafford Whitby, "On Some Preliminary Observations Regarding the Causes of Natural Change in the Latex of *Hevea Brasiliensis*, and on the Depolymerization of Caoutchouc and its Conversion."

In the section for Coal-Tar Industry the following paper was presented:

W. H. Perkin, Manchester, "A Study of Syntheses in the Terpene Group."

THE SYNTHESIS OF RUBBER.

AN INTERVIEW WITH DR. DUISBERG, MANAGING DIRECTOR OF THE BAYER COLOR WORKS, ELBERFELD, GERMANY.

FOLLOWING the notable lecture delivered by the famous German chemist, Dr. Duisberg, at the Congress of Applied Chemistry, he courteously accorded an interview to a representative of THE INDIA RUBBER WORLD, in which he expressed himself further regarding the highly successful results achieved in the celebrated works at Elberfeld over which he presides, in the solution of synthetic rubber.

"In presenting the case relative to synthetic rubber, we should not overlook the fact that William Tilden was the true discoverer of the new product, for he observed its presence in a bottle in his laboratory in 1892. This you will note was about ten years after he had completed his experiments. Unfortunately he omitted to note the exact physical and chemical conditions under which the synthetic rubber was formed, and was therefore unable to duplicate his experiments. At all events his method was not a commercial one.

"The results published by Dr. Fritz Hofmann, of Elberfeld, state the exact conditions under which the new material may be prepared. He made observations as to the time and temperature required, and the concentration of the solutions needed for its proper preparation. Thus he was the first to describe a new and useful process for the preparation of synthetic rubber, and must therefore be regarded as the inventor of this process. In proof of his contention that his process is new and useful and technically possible, he has had rubber goods manufactured from the new material, and has applied tests to determine its commercial value.

"The production of synthetic rubber is one of the greatest successes, and yet it was one of the most difficult problems of the chemical industry. I am proud of the fact that its production was successfully accomplished in the works at Elberfeld, and that I was able to follow every stage of this important discovery. Perhaps you would be interested to hear how the whole thing happened, especially as much that is misleading has appeared in the press.

"Caoutchouc made from the milky sap of numerous species of trees and shrubs and the grotesquely formed lianas by various coagulation processes, on being suitably treated with sulphur or sulphur compounds, *i. e.*, by vulcanization, acquires its valuable and characteristic properties. The synthetic method took quite a different route. The very complex molecule which rubber doubtless possesses was broken up by heat, *i. e.*, by dry distillation, into a maze of all kinds of gases, oils and resins. A colorless fluid resembling benzine, to which the investigators gave the name "Isoprene," was also obtained. Bouchardat, in France, first expressed the belief that this isoprene, obtained in very small quantities, and in an impure form by the dry distillation of caoutchouc, might be closely and intimately related to caoutchouc itself. As far back as the eighties, the Englishman Tilden claimed to have prepared artificial rubber from isoprene by treatment with hydrochloric acid. Tilden, though he worked strenuously for years, did not succeed in repeating the experiments. Other investigators were likewise unable to confirm the results. Dr. Fritz Hofmann, of Elberfeld, in 1909 succeeded in polymerizing the isoprene molecules into the complex rubber molecule. Somewhat later Harries* discovered independently another method of arriving at the same result. Everyone is now in a position to repeat this exceedingly simple experiment himself, but in order to obtain Hofmann's results, it is necessary to employ *pure* isoprene.

"The practical value of this rubber, of which many samples have been made, has been tested by the highest authorities in this branch of the industry, whilst Harries, whose labors extending over many years, prepared the soil for Hofmann's synthesis, has carefully examined the chemical constitution of the substance.

"The matter appears very simple, intelligible and clear, but the difficulties which have been overcome were great indeed, and those which still remain to be surmounted, in order to produce a substance equal to Pará rubber in quality and capable of competing with cheap plantation rubber costing only 25 cents per lb., are still greater. The end in view is this: that artificial rubber may soon play as important a role in the markets of the world as does natural rubber.

"I have employed articles made of synthetic rubber, and for some time have used automobile tires made of this material. Yet, if you ask me to answer you honestly and truly when synthetic rubber will bring the millions which prophets see in its exploitation, I must reply that *I do not know*. Surely not in the immediate future, although synthetic rubber will certainly appear on the market in a very short time."

*See article on Synthetic Rubber in Germany, on page 11 of this issue.

DR. PERKIN ON THE SYNTHESIS OF RUBBER.

ONE of the noteworthy features of the Congress of Applied Chemistry, just held in New York City was a lecture by Dr. William H. Perkin, Professor of Chemistry at Victoria University, Manchester, on his researches in the field of rubber. It will, therefore, be of interest to note some comments which he made on this subject in the course of a subsequent conversation with Dr. Frederic Dannerth, secretary of the Rubber Conference. Dr Perkin's remarks are interesting, as they lack all flavor of resentment at the attacks of his critics.

"Dr Duisberg," he began, "has prepared at the factory in Elberfeld synthetic rubber on a considerable scale, and has supplied some very valuable information concerning its physical properties. It was shown in his lecture that automobile tires made up from synthetic rubber outlasted similar tires made with the best Up-River fine Pará. I heartily agree with Dr. Duisberg in this assertion, and fully appreciate the fact that an auto tire which has been run over 10,000 miles and shows so little wear as the tire exhibited by Dr. Duisberg is worthy of serious attention. I think many will agree with the doctor from Elberfeld that cheap synthetic rubber will be put on the market at a price which will enable it to compete with plantation rubber possessing the same properties.

"In the years 1883 and 1884 William Tilden, then professor at Mason College, Birmingham, England, prepared large quantities of isoprene from turpentine. Some of this he used for his experiments on isoprene at that time, and the remainder he either bottled up or sealed up in tubes which were set aside.

"On looking at these specimens in the year 1892 he found—to his great astonishment—that this isoprene had become polymerized to a rubber-like substance which we now know as 'synthetic' rubber. The specimens exhibited by me in my lecture were the original products prepared by Tilden, and those undoubtedly contained synthetic rubber. This is proved by the fact that by mixing the specimens with acetone true synthetic rubber is precipitated. We must not forget that Tilden worked under conditions far less favorable than those which face us at the present day. So that we should not wonder at the fact that some of his methods were less refined than those at present used in research work in this field.

"In answering your question as to a definition for synthetic rubber I would suggest: 'Isoprene, polymerized to a rubber-like substance.' Since Tilden, in 1892, had polymerized isoprene to a rubber-like substance, which he proved was capable of vulcanization, it is obvious that he had synthetic rubber in his hands in 1892. This you will note was seventeen years before Hofmann published the results which he obtained in the Elberfeld factory.

"An attempt has been made to underrate these observations made by Tilden on the basis of the difference between discovery and invention. In this connection it is interesting to note the attitude of Professor Bernthsen of the Badische Fabrik in Ludwigshafen, Germany. He says, 'If there is any difference between the invention and the discovery of synthetic rubber it is obviously a small one, and in discussing a matter of this importance Dr. Duisberg will no doubt wish to avoid any misinterpretation of his remarks. The factory in Ludwigshafen is not at this time desirous of publishing its results."

Continuing his comments, Dr. Perkin further said: "I viewed with considerable interest the wonderful specimens of manufactured rubber goods made from synthetic rubber. First, the tire which had been subjected to the practical road test of 10,000 miles, and a new tire recently vulcanized. In addition to these exhibits we certainly all admired the hemisphere of raw synthetic rubber of unusual density and translucency. This hemisphere was said to weigh about 60 pounds, and was made from isoprene by the sodium polymerization method. Isoprene, as most of us know, boils at 37 degrees Centigrade, so that it is rather difficult to transport it or keep specimens of this material in other than sealed containers.

"From all present indications a refinement of the present methods of working will make the ultimate price of synthetic rubber so low that it will compete with the plantation rubber having similar properties. We should be careful, however, not to be too sanguine and by our prophecies make possible a manipulation of the stock market in either direction. I note that previous remarks on the possibility of synthetic rubber have awakened in the fertile minds of stock market manipulators thoughts which no scientist ever had.

"There is one fundamental discovery connected with the Manchester method for the production of synthetic rubber. It is the observation by Professor Fernbach of the Pasteur Institute of Paris that it is possible to ferment starch—or even sawdust, in such a way as to obtain large yields of butyl alcohol and acetone at prices far below the present market on these materials. Of the three methods described for the synthesis of rubber which I described in my London lecture, there is one which appears to be of direct commercial importance. Briefly summarized it is as follows: (1) Take ethyl alcohol, which may be easily oxidized to acetaldehyde. (2) Condense this by means of potassium carbonate to aldol. (3) Convert the aldol (quantitatively) into butylene glycol. (4) Convert the butylene glycol into di-chloride. (5) Then pass this over soda lime and produce butadiene. (6) This when treated by the sodium method, yields a synthetic rubber equal—if not superior—to that obtained from isoprene. The work which has been accomplished at Manchester by me may be summed up by saying that a rapid and satisfactory method of polymerizing isoprene into normal rubber of five carbon atoms has been found. The problem of producing isoprene cheaply has not yet been solved."

A BRAZILIAN VIEW OF ARTIFICIAL RUBBER.

IN discussing the subject of artificial rubber in a recent issue, the "Folha del Norte" of Pará, remarks that the ideal pursued by modern chemistry, is to replace syntheses—derived from natural products, by laboratory syntheses, identical in quality with the original articles.

At various times, the journal remarks, it has been announced to the world that the synthesis of rubber was an accomplished fact. In all cases the result has been purely theoretical, or has led up to the question as to what would be the expense involved by carrying out the process on a large scale. Reference is made to the interest aroused in July, 1911, by the announcement that the firm of F. Bayer & Co., the well-known manufacturing chemists, expected to be successful in the work of producing synthetic rubber, to which it had long been devoted.

The importance of this statement was generally recognized; it being a well known fact that German chemical manufacturers regarded the production of the first pound of synthetic rubber as the point to be aimed at. The cost of making tons of it would have to be the subject of further investigation.

While recognizing the injury which the production of a perfect substitute for rubber would do to the natural article, it is urged that such a disaster would never extinguish the Brazilian rubber industry. Reference is made to the opinions expressed by chemists of eminence, to the effect that no artificial product can ever be substituted for Pará rubber; the former being lacking in the necessary qualities of resistance, elasticity, and homogeneous composition.

While this article was apparently written before the public announcement of the Perkin process, it is none the less interesting as showing how the question of synthetic rubber is regarded by the South American rubber industry.

Synthetic Rubber in Germany.

IN the early part of this summer, the question of synthetic rubber was dealt with at the Freiburg Congress of the Association of German Chemists, by two of the most noted authorities on the subject. Dr. Carl Harries, of Kiel, and Dr. Fritz Hofmann, of Elberfeld, respectively treated the matter from a scientific and a technical standpoint.

Dr. Harries, in amplification of his previous utterances on the subject at Dantzig, recalled the fact that the basic material for the production of synthetic rubber is isoprene, a relatively simple carbo-hydrate, belonging to the butadeine order, and which has been obtained from the dipentene in turpentine. He regarded the problem of the cheap production of isoprene as having now been solved, as well as that of butadeine or erythrene.

The influence of alkaline metals on butadeine was discovered by Dr Harries in the summer of 1910. According to his experiments, by enclosing butadeine in a tube with sodium wire, the butadeine after several hours completely disappeared; a substance resembling rubber adhering to the wire. He also found that isoprene was much more easily changed into rubber by sodium, than by mere heating. Regarding the substance thus obtained, Dr. Harries, however, remarked:

"These so-called 'sodium rubbers,' although physically acting quite like rubber (for instance, permitting of vulcanization) are not identical with other products, which correspond with natural rubbers."

WHAT IS MEANT BY ACTUAL RUBBER.

In dealing with this question, Dr. Harries takes the position that the isoprene product must, like natural rubber, have tough and elastic properties, must be soluble (neither too slowly nor too easily) in freshly prepared ether, benzole or chloroform; and must, when kept for a certain time, gradually become hard to dissolve. He adds that from the above comparison of natural rubber with synthetic rubber from isoprene, he has come to the conclusion that both are in a chemical sense identical; the products of the polymerization of the same basic carbo-hydrate (dimethylcyclooktadiene). Which exact isoprene formula corresponds most closely with natural rubber, is, he remarks, still an open question; but he leaves aside for the present the consideration of sodium rubbers, there being still uncertainty as to their composition, and their not being identical with other products, admittedly corresponding with the natural substance.

FUTURE OF SYNTHETIC RUBBER.

Dr. Harries remarks in conclusion:

"A wide field of chemical investigation is still offered here . . . which may in the future be developed in the same way as the chemistry of dye-stuffs. For every special purpose, its particular synthetic rubber will be manufactured. . . .

"While the country has been viewing with anxiety the gradual usurpation of German possessions by foreign nations, industrial chemists have been quietly carrying out developments, which will compensate our Fatherland, by rendering possible the domestic manufacture of one of our most important colonial raw materials."

TECHNICAL ASPECTS OF SYNTHETIC RUBBER.

The paper read by Dr. Fritz Hofmann dealt with the technical aspect of the question of synthetic rubber; his position as Director of the Laboratory of the "Farbenfabriken" of Elberfeld (which establishment has occupied a leading position in the recent investigations and experiments), naturally limiting his statements to facts of a more or less generally known character.

In the first place, he dealt with the powerful elements at work in developing the yield of Malayan rubber.

Against these powerful forces, there has been arrayed a small band of chemical experts. When the work of these pioneers commenced, there was but little prospect of a successful issue. While the possibility of transforming isoprene into rubber by polymerization, was referred to in technical literature, its advocates had grown discouraged. Even Tilden gave up working upon the subject, failing to see the prospect of a successful result. Individuals being thus unequal to the task, it had to be taken up by large chemical establishments, which besides abundant capital, had the necessary staff of expert chemists. As many as 300 are with the "Farbenfabriken" of Elberfeld, to the director general of which (Privy Councilor Duisberg) Dr. Hofmann paid a warm tribute of appreciation. Without the encouragement of his example, the apostles of synthetic rubber must long ago have had to give up the contest.

DR. HOFMANN'S RESEARCHES.

Dr. Hofmann's attention had been drawn to the subject about six years ago, through reading a paper by Professor Dunstan of London. As he discovered by the literature on the subject, that isoprene was a constitutent of synthetic rubber, he perceived that in order to make any progress it would be necessary to obtain isoprene itself by synthesis, rather than, following the method hitherto in vogue, to obtain it by the dry distillation of rubber. This latter form of producing isoprene had been experimentally employed nearly a quarter of a century ago by Kondakow, but the quantity was too small to be of service. Hence the necessity which Dr. Hofmann found of producing isoprene on a large scale, in the highest degree of purity. The fulfillment of this apparently simple requirement was, however, attended with much difficulty. After two years' experimenting the right path was found. As a basic material he had chosen coal, which in this respect did not disappoint the expectations to which it had given rise. Dr. Hofmann exhibited samples of the intermediate products between coal and rubber, with a table showing the sequence of the reactions of his process. Acting on the principles thus enumerated, Herr Coutelle, one of his colleagues, succeeded in March, 1909 in producing several quarts of pure synthetic isoprene. The "Farbenfabriken" thus had at its disposal the desired process; the technical practicability of which was no longer to be doubted. This process, Dr. Hofmann added, rested upon a strictly scientific foundation; he and his colleagues having been convinced from the start, that only such a basis for their work merited consideration.

ACTION OF HEAT UPON ISOPRENE.

Although isoprene had thus been produced, the troubles of the experts engaged in its production were not over. The first question was: Out of this liquid resembling benzine, to form a tough, elastic and "nervy" colloid, resisting all the influences to which it would normally be subjected. A trial of muriatic acid for this purpose only resulted in an oily chloride, but no trace of rubber. Another experiment was with light, in accordance with the statement of Wallach, that it would change isoprene into a substance resembling rubber. However, after patiently waiting eighteen months the only result was that the contents of the bottle had assumed the consistency of a thin solution of sugar. Under these circumstances all possible (and impossible) physical and chemical agents were let loose on the isoprene, but it would not thicken.

Finally, Dr. Hofmann found in heat the power necessary for producing the desired result. There was nothing new in heating isoprene, but the result was new. It was also found that the polymerizing effects of heat were promoted by certain chemical additions.

SYNTHETIC RUBBER PRODUCED.

The first rubber produced by polymerization was obtained in August, 1909, in the laboratory of the Elberfeld "Farbenfabriken."

under the direction of Dr. Hofmann. In September, 1909, Dr. Hofmann submitted the new material to Dr. Gerlach, director of the Continental Caoutchouc and Gutta Percha Company, of Hanover, who was the first to confirm the fact that the product was really rubber.

COMPETITION WITH PLANTATION RUBBER.

While further experiments were in progress, with a view to perfecting the successful method, the advance in rubber prices of the spring of 1910 took place. As Dr. Hofmann remarked, had the high prices of that time been maintained, the manufacture of synthetic rubber on an extensive and highly profitable commercial scale would have been ensured. He added that when the prospective increased supply from Malaya becomes an accomplished fact, prices will doubtless fall to one-half their present level. Thus, it is remarked, the producer of synthetic rubber must so lay his plans, that his product may compete in price and quality with natural rubber. While diligent efforts are being made with that end in view, progress is only at a snail's pace. Good things cannot be forced. The best reaction must be found; the determination of which is necessary before rational work is possible.

With reference to Malayan production Dr. Hofmann remarked:

"The bulk of the Eastern rubber plantations have not yet reached the productive stage. But in a few years this situation will have entirely changed. What is to be expected from Asiatic plantations, in what quantity and quality, is illustrated by samples of the rubber from that quarter, and still more, by the balance sheets of the few older companies, which already show the full utilization of their plantations."

SYNTHETIC RUBBER IN THE WORLD'S MARKETS.

Dr. Hofmann remarked, in conclusion:

"Give us the 36 years the plantations have been at work, and I think synthetic rubber will occupy an equal position with natural rubber in the world's markets. . . . The further development of serious work as to synthetic rubber should be as quiet as possible, without beating of drums, or alarming newspaper articles. The samples exhibited here show that we have progressed to a certain point, but we have really no cause for claiming anything remarkable."

FUSEL OIL AS BASIS OF SYNTHETIC RUBBER.

GERMAN CRITICISM OF PROFESSOR PERKIN'S SYNTHETIC PROCESS.

As was naturally to be expected, in view of the strenuous rivalry that has existed during the last three years between the English group of scientists and the German group of chemists, in their pursuit of a practicable and economical process of making synthetic rubber, the German chemists have not been slow to discover flaws in the English synthetic process, recently set forth by Professor Perkin, of Manchester, in his famous address of June 17.

Entirely apart from the lack of success which has so far attended the financial flotation of the English synthetic rubber enterprise, a number of German writers have found much to discuss in regard to the scientific aspects of this new English solution of the old synthetic problem.

The "Gummi-Zeitung" urges the necessity of devoting attention to the scientific and technical aspects of the question. Reference is made to a statement that in order to produce 10,000 tons of synthetic rubber by the fusel oil process, it would be necessary to plant 1,000,000 acres in potatoes to supply the necessary quantity of starch.

In discussing the subject a leading German authority on fermentation remarks that:

Professor Fernbach, of the Pasteur Institute, Paris, would seem to have discovered a micro-organism which yields large quantities of normal butyl-alcohol from starch or its derivates, such as grape-sugar. Such bacteria had already been discovered at an earlier date, for instance, by Pereire and Guignard in the Paris water supply. But, perhaps, it is suggested, the Fernbach microbe is in a position to produce a larger yield.

This *n*—butyl-alcohol is evidently the "fusel oil" of the prospectus, which is qualified as an unsuitable and unscientific designation. Real fusel oil contains isobutyl-alcohol in the proportion of 10-24 per cent., and *not* normal butyl-alcohol.

It is regarded as completely excluded from consideration that any amyl-alcohol can be produced from starch by bacteria, a supposition to that effect having been disproved by Ehrlich. Of course it would be of technical importance for the synthesis of rubber if a higher yield actually resulted from the Fernbach process. This point, it is remarked, is not clear from the prospectus, and is considered doubtful.

Fernbach claims that under certain circumstances over 42 per cent. of the starch used in the compound is changed into a high-grade alcohol. Of this proportion about two-thirds is butyl-alcohol.

On the above basis it is calculated that out of 100 per cent. starch there would be approximately only 30 per cent. of butyl-alcohol. This, it is added, would be a very small result; the question arising: What is to become of the rest of the starch? On this depends the technical utilization of the process.

WHAT IS HIGH-GRADE ALCOHOL?

This question arises in connection with the preceding estimate. In the opinion of the fermentation expert, whose views have been quoted, these terms seem to conceal the facts. To use his words:

"The chemical and general public are apparently to be made to think that the valuable higher homologues of alcohol are meant, and in the first place, amyl-alcohols! Such is, however, not the case. Were it so, the authors of the prospectus would certainly have underlined the word 'amyl-alcohol' a hundred times."

As amyl-alcohol is much more valuable than butyl-alcohol for the production of isoprene, surprise is expressed at the absence of mention of the former in the prospectus. From this fact the evident conclusion is that the so-called "high-grade alcohol" is nothing more than ordinary concentrated alcohol, probably the chief product of the starch germs or bacteria, while the butyl-alcohol is probably a kind of sub-product obtained in much smaller quantity. Butyl-alcohol further produces butyric acid.

Whether the quantity of ethyl-alcohol obtained in addition to the butyl-alcohol will make the process very lucrative is doubted.

PRODUCTION OF ACETONE.

On this subject it is remarked:

"This substance has hitherto not been found to result from any process of fermentation. Fernbach's work in this direction must be questioned, until exact scientific proof has been adduced. Acetic acid, it will be remembered, is a sub-product of the decomposition of starch. The authors of the prospectus may have thought to utilize this acid in the form of acetone, through transformation into lime salt and distillation."

In conclusion, doubts are expressed as to how any one could figure out a profit from the whole process.

Commenting upon the above statement, Dr. Frank, of Berlin, adds:

"These expert opinions coincide in all points with those of Dr. Marckwald and myself on the matter. The fundamental point is, and remains, that there are no real technical results nor products. Moreover, as far as can be seen, it is not amyl-alcohol (thus a basis for isoprene), but butyl-alcohol (the basis of butadiene), that is formed. The rubber from the latter has so far not proved satisfactory in anything.

"The only patents which present actual prospects are probably those based on the utilization of petroleum products, and of the gases resulting from coal-tar distillation."

India Rubber in the Navy.

THE manufacturers of rubber wares may take both a patriotic and a business interest in the battle line of our navy. While none of our war craft are arrayed in india-rubber armor, as has been seriously proposed in years past and, in a way tested, still there are plenty of ways in which this material fits into the workings of our fighting ships and makes them the better able to give and to take the blows of modern ordnance.

Our dreadnoughts and our super-dreadnoughts are virtually compact towns of substantially a thousand busy artisans and supervising officials. Apart from this, these vessels are mobile forts of high speed and exacting requirements, calling for continual expert care to keep them in the state of high efficiency now demanded by the present-day standards. Below and back of their rigid walls of gray-painted steel lie hundreds of mechanisms and auxiliaries of varying power, and this busy community of a thousand persons has plenty to do daily in making repairs and in keeping each of these fighters in trim to defend at brief notice the dignity of the Stars and Stripes. A modern battleship typifies the national state of pretty nearly every science and every contributive art. She is not only a fighting machine, with her burden of powder and shot and shell to make her fearful to the foe in the hour of strife, but she is the comfortable and the healthful home of her caretakers—the men who stand ready to make her guns do more than roar defiance and who are willing to lay down their lives in that service if the occasion requires. The keynote of all discipline and every act is EFFICIENCY, and in no community of a similar size ashore, or even in any factory, are the requirements of the personnel so exacting or generally so high.

One of Our Latest Dreadnoughts, the "North Dakota."

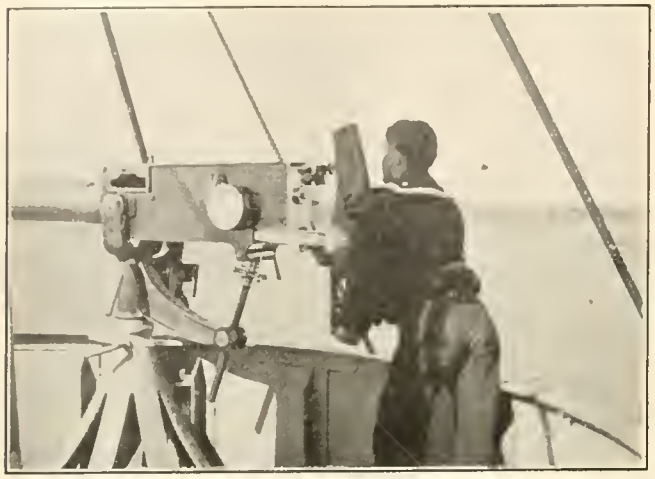
Let us see something of the part that india-rubber contributes toward the attainment of these splendid results. To begin with, the internal spacing below the armor belt is sub-divided into numerous water-tight compartments—some of them isolated and many of them intercommunicating. To make a passageway possible through the water-tight bulkheads, sliding and swinging doors are provided which, when closed, are also water-tight, and to make this certain the steel panels are jammed tight against rubber seatings which effectually prevent the water in one flooded compartment gaining admission to the flanking neighboring one. In addition to this, there are hatchways and manholes in some of these sub-divisions which must likewise be made secure against either the admission or the egress of water, and, again, india-rubber gaskets or collars make this end certain. Under some conditions, both the air and the sunshine are free to enter through skylights and airports, but there are days when either the weather or the state of the sea make it necessary to close these openings securely, and once more rubber seatings make this possibe. Water is not welcome inside of a fighting ship when it comes aboard through accidental openings, because while it may do no present damage, it may be the means of working insidious harm. Sturdy as steel is, still rust is its ever threatening foe, and moisture has a way of eating into the vitals of a plate and sapping its strength.

A man-of-war is subject to sudden and tremendous strains when her guns are fired, and no part of the supporting structure must be weakened by oxidation. Hence rubber plays an all-important part in keeping out water where it may otherwise find access to hidden places and do harm. There are many hundreds of pounds of sheet rubber employed for this purpose alone aboard each modern battleship, and the exigencies of this service call for fairly frequent renewals.

This, however, is not the only strictly structural direction in which rubber has a mission aboard our battle fleet. In the bath-rooms and the toilets of the officers, rubber tiling is laid; at the top and at the bottom of ladders and gangways there are non-slipping treads to give added steadiness to officers and men hurrying up and down between decks and over exposed places in bad weather and when the sea is running high. Rubber treads are also placed in the working places and on the floors of the turrets, so that the gun crews may have a firm footing in their exacting tasks.

But rubber has a still more refined and, we may say, important use in connection with the expert handling of the fighting ship's guns. The modern battle practice requires the gun pointers to keep the muzzle of the weapon continually bearing

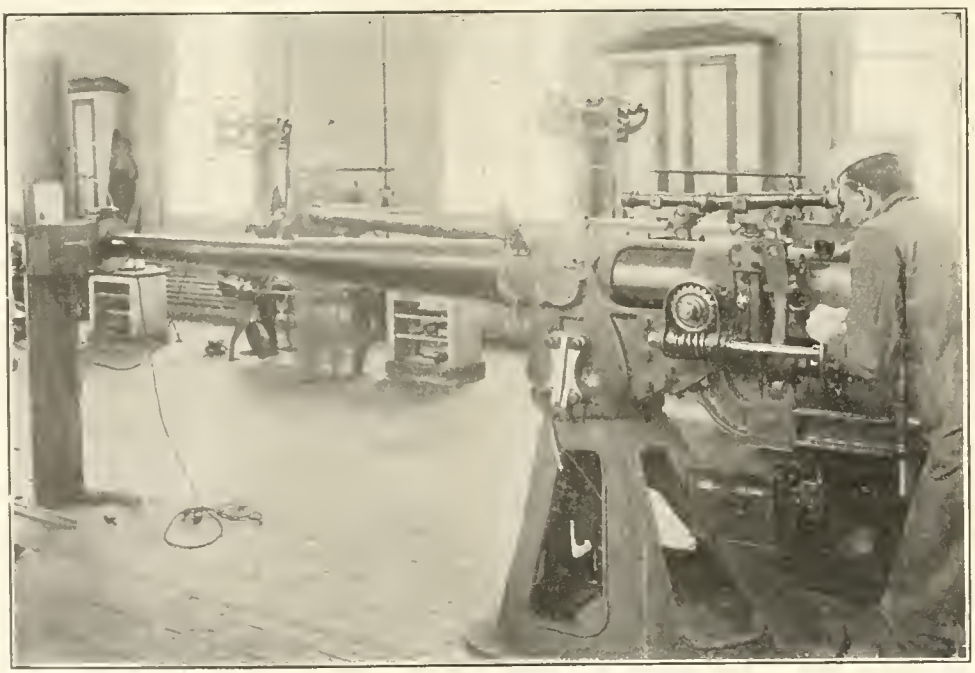
upon the target, and that they may do this they are provided with telescopic sights against which one eye of each pointer is pressed during the active working of the rifle. Despite the utmost effort to reduce shock and vibration, when firing, still these telescopes are forcibly jarred by each discharge and the attendant recoil.



Rapid-Fire Gun, Showing Rubber Cushion on Shoulder Piece.

To protect the gun pointer's eye from injury, a soft rubber cup is fitted to the telescope, and against this his brow and cheek bone rest in action. But for this cushioning it would be dangerous if not impossible for him to hold to his work for any length of time. On more than one occasion this rubber cup has become detached in the heat of rival target practice, and the gun pointers have stuck to their task even though the harsh eye piece of the telescope cut to the bone upon their brows and cheeks. It is easy to see how important is the role that rubber plays in the fighting perfection of our modern dreadnoughts and, in fact, all of our battle fleet.

The bulkhead doors in a battleship—even those above the water line—are of steel and are heavy, and in a rolling sea they are hard to control unless one be sure upon one's feet; therefore rubber treads are placed on the deck each side of the door to give the passer a better hold.



Rubber Eye Guard on Telescopic Sight.

Deep down in the bowels of the ship where the engines have their place safe from the reach of an enemy's shot and shell, and throughout the branching leads of the steam pipes from the boilers, india-rubber has many fields of usefulness. The layman must not forget that coal and fresh water on a fighting ship are at a higher premium than they are ashore, and every effort is made to conserve these factors, vital not only to the mobility, but to the very life of a man-of-war. In factories and commonly ashore, exhaust steam is freely vented into the surrounding air, and a leaking stuffing box or a dripping joint in a steampipe is of but little concern. For the factory both coal and water in plenty are generally near at hand and refinements of economy are not essential.

In the navy, however, on the other hand, things are quite to the contrary—escaping steam means energy wasted and a loss of so much coal and fresh water. To make up for this dissipated heat and moisture, coal must be burned in order to distil fresh water from the sea, and an actual monetary prize is now offered to the engineering force for all savings in the consumption of fresh water and coal. One very important means to this end is seeing that all sliding parts are steam-tight and that no leaky joints in either the feed or exhaust systems shall permit the escape either of precious water or still more precious steam with its charge of heat. Rubber packing finds, therefore, valuable employment in pistons, valve stems, stuffing-boxes and pipe joints in every direction, and only the best products of this description are acceptable for this service in the navy. Steam pipes are led everywhere throughout the organism of a modern battleship, and manifold auxiliaries with their moving parts demand the use of rubber packing in one form or another. Nothing else has yet been found capable of assuring the same degree of efficiency.

But steam is not the only source of power aboard ship, even though it is the fundamental fountain of energy. Compressed air is used for various purposes, such as supplying the motive force for the dreaded automobile torpedo, for blowing the smoke and the burning fragments of powder bags out of the big guns, and for refrigerating service in the various cold storage compartments. Compressed air has a very penetrative habit, and only good joints will keep it within proper confines. Here, again, india-rubber helps out.

But the type of energy which best indicates the remarkable up-to-dateness of the modern fighting ship is electricity in its wonderfully varied applications and uses in the fleet. There is no other single structure in the world—not even excepting the best-equipped technical institute that has electricity in daily employment in as many ways as one will find aboard our dreadnoughts, and even upon craft of lesser military might. Electric auxiliaries do quite 90 per cent. of the work that used to be done by the brawny sailorman of years ago, and do it far better; and in addition do many other things which are quite beyond either manual power or human agency. Electric wires spread from keel to truck and from end to end of a man-of-war like a veritable network of sentient nerves, carrying energy and speeding directive messages of many kinds. Powder and shot are trollied

from their storage places and carried up to the breeches of the waiting guns and rammed home in the bores by electric power. The turrets are turned and the guns elevated and depressed by electric motors. Electricity runs the great cranes that raise the boats from their resting places and lower them over the sides

A Submarine in Surface Trim.

The Three Circular Hatch Covers—Two Light and One Dark—Show Where Rubber Gaskets Are Absolutely Necessary to the Safety of the Boat Submerged.

into the water. Electric winches do a manifold service in helping to coal ship and load the stores aboard. Electricity provides the energy for the arc lights in the firerooms and engine-rooms, and the many hundreds of incandescent lamps both inside and outside of our men-of-war. Masthead lights, the running lights and the red and white Ardois signals that flash out their messages from ship to ship when darkness falls are all electric. So, too, are the powerfully inquisitive searchlights and the decorative strings of glow lamps with which the naval ship is dressed upon occasions of festivity.

But these are not the only ways in which electricity serves a valuable end in the fleet. There are dozens upon dozens of call-bells, buzzers, gongs, etc., which facilitate exchange of signals and which tell of the presence of hidden fire and unwelcome water, and announce just where these troublesome elements have appeared. Battle ranges are transmitted from the masthead stations to every fighting position below among the guns; orders and signals are exchanged between the fire and enginerooms and the bridge, as well as from the commanding officer's fighting station and every important division of the throbbing craft below him. There are electrical revolution indicators, indicators showing the angle of the rudder, the heel of the ship, the action of the turret hoists, and a log which registers the speed of the vessel—also electrically controlled. But these means of communication and information are not all—one of our big battleships has an installation of something like sixty telephones. Some of these are in positions which require that they shall be water-tight. In this widespread use of electricity and the many, many miles of connecting wires and cables, rubber is the prime insulating material, and rubber also serves the further end of insuring water-tightness in some of these fields of service.

Where hard rubber is used in connection either with construction or installations, the Government requires a very high insulating property, and the material must be capable of standing a five steam test for one hour without changing shape or form. We must recognize that insulation aboard a man-of-war is a far more serious problem in its relation to the life of the craft than upon a merchant vessel. Quite apart from the dangers of electrolysis, a grounded current may lead to a short circuit in the neighborhood of a magazine, and it requires no imagination to picture the dire consequences of such a misfortune. It is to guard against this, as well as the consequences of a bursting steampipe or the flames of battle, that the Government is so exacting in its specifications. Thus we see how india-rubber not only contributes to electrical efficiency, but how it also safeguards the fighting ship.

Down in the sick-bay of our dreadnoughts we have a miniature duplicate of a modern hospital and its associate clinic. Here we find rubber in the various forms which the surgeon and the physician demand in their day's work as well as for the uses to which the nurse also puts it in the treatment of his patients. It would merely mean the recital of a long list to cover rubber in its different forms as here employed. The dispensary of a battleship is virtually a drug store on a small scale, and we must leave to the imagination of the reader what this means so far as india-rubber is concerned.

There are two things on a fighting ship which no commanding officer can look upon with equanimity—these are fire and dirt. That the decks may be kept clean, there are hundreds of feet of hose, and at numerous places throughout the craft there are other coils hung ready to quench a conflagration. But these are not the only ways in which rubber hosing is employed on shipboard. Every fighting craft has one or more suits of rubber diving dress and its associate air lines. The work cut out for the divers calls for their service in examining the vessel's bottom, stopping leaks from without and examining the propellers and other under-water fittings as well as searching for lost

Navy Diver Preparing for Under-Water Work.

anchors and torpedoes. The Government will accept nothing but the best in the equipment of these rubber suits.

For the comfort of the sailor and the deck officers, there are rubber boots and rubber rain clothes; and when the weather is

summer-like and fair the officers wear canvas shoes with rubber soles. That the chairs and portable furniture may not slide threateningly when the ships roll in a heavy seaway, rubber castors are provided to help hold them in place. Rubber bumpers or stops either hold or check the force of a swinging door, and in dozens of other directions rubber in one form or another serves some useful purpose with which we have daily counterparts in our own domestic life ashore.

On board of a submarine, rubber has not the same manifold uses that it has upon a battleship, but where it is employed it is very much needed and must generally be of the best of its kind and form. Bad as the aftermath of a leak may be upon a surface ship of war, its menace is far more serious within a submarine. Not only must all valves be tight, but the hatches which form the passageways in and out of the submarine must certainly be secure against the admission of the sea when the boat is running submerged. Salt water in the storage batteries means the evolution of a poisonous gas—a gas which is capable of quickly overcoming and killing a submarine's crew. As boats of this sort are driven electrically when running under water, this part of their equipment is a large and important one. Rubber is employed as an insulator in the conduits and their connections, as well as in the storage batteries themselves. Short circuits are apt to be even more immediately dangerous in a submarine than in a battleship—hence the insulating rubber must not only be of the best, but more generously employed in these subaqueous craft.

There are many other directions in the navy where india-rubber in some form fills a useful office, but enough has been said to suggest how varied and how valuable are the parts this material already plays in the construction and the administration of our battle fleet.

RUBBER MANUFACTURES IN MARINE WARFARE.

LEAVING aside the various staple purposes for which rubber goods are used by the navies of the world, the "Gummi-Zeitung" calls attention to a number of rubber specialties, the uses of which in marine warfare are not generally recognized.

These objects are mostly defensive in character, including the blockade of harbors, the closing of mouths of rivers and other waters, the fortification of islands and other purposes. Blockading constitutes an extremely important feature of marine warfare, being effected by laying mines, by torpedoes, exploded from the land; by closing the waterways; and by other means.

In laying mines, cables are among the chief requirements. Insulation is effected by strips of rubberized cotton cloth, while rubber rings of various sizes are used in the insulation of the mines. The latter, coming more or less into contact with salt water, must be made of a good quality of rubber, with properties of resistance. The cables which connect the mines, or are necessary for their explosion, are of copper wire, likewise insulated with rubber. Ground cables are used on stony bottoms, placed in insulated hose, with an internal diameter of two-fifths of an inch. This hose is also protected by a thick rubbered covering wound round it, such as is used of late in compressed air hose. Cables were at one time protected by spiral wire or cords, but the danger of rusting, after various trials, led to the abandonment of this plan.

When high voltage currents are used in laying mines, those engaged in the work wear rubber gloves, while rubber garments serve to protect them against tempestuous weather.

Among the most recent improvements in mining, is the use of rubber hose, the interior of which is filled with explosive acids. This plan has been adopted as being preferable to tubing; this "mine-hose" having a diameter of about 2 inches. In its manufacture rubber substitute has been used for increasing the lightness.

This hose, which as a rule is about 100 feet long, costs the equivalent of $187.50. As the blockade of a waterway usually requires about 36 mines of this kind, an idea can be formed of their costly nature.

Another feature in naval warfare affecting the use of rubber, is the employment of torpedoes. In the torpedo itself, the rubber insulation is a point of extreme importance. The acids are conveyed to the gun-cotton through small rubber hose inside the torpedo. Hard rubber is likewise used for various purposes in different parts of the torpedo. Cables with rubber insulation are important adjuncts in torpedo warfare.

In the forts defending the entrances of harbors, rubber is used in various ways. Speaking-tubes convey the instructions for firing, while the gun-sights are fixed in rubber supports. For the prevention of concussions, rubber rollers and buffers are used. Hard rubber is used in various ways in guns, the wheels and other parts of the mechanism being rubber-covered. The mouths of the guns are now covered with rubber, instead of, as formerly, with leather; the use of leather having led to rusting. In very damp positions the use of rubber for covering the mouths of guns has been found of practical advantage, as it thoroughly excluded damp. These covers, or stoppers, are, moreover, expensive. For 8-inch guns they cost the equivalent of $20, and for 17-inch guns about $50.

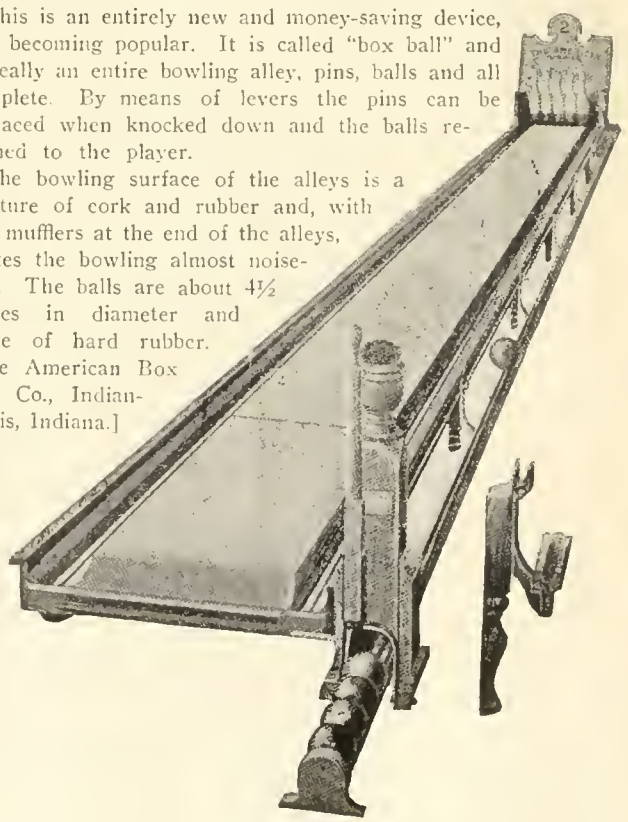
Besides forts and artillery depots, warships also carry mines for aggressive or defensive operations.

In conclusion, the anticipation is expressed that the use of rubber manufactures in marine warfare is destined to increase, to the benefit of that industry.

HARD RUBBER BALLS ON SOFT RUBBER ALLEYS.

This is an entirely new and money-saving device, and becoming popular. It is called "box ball" and is really an entire bowling alley, pins, balls and all complete. By means of levers the pins can be replaced when knocked down and the balls returned to the player.

The bowling surface of the alleys is a mixture of cork and rubber and, with ball mufflers at the end of the alleys, makes the bowling almost noiseless. The balls are about 4½ inches in diameter and made of hard rubber. [The American Box Ball Co., Indianapolis, Indiana.]



A RUBBER BOWLING ALLEY.

Mineral Rubbers.

AN ARTIFICIAL OR MINERAL RUBBER.

NEARLY six years ago the English manufacturers of rubber goods became deeply interested in a new substitute for the natural caoutchouc. An English inventor believed that he had hit upon a method of turning wheat into that commodity, so rapidly growing scarcer. This in spite of

Exposed Side of Elaterite Ledge.

the fact that over three hundred patents had, up to that time been taken out in the British Patent Office on substitutes for rubber. But somehow or other the new substitute failed to gain the place in the rubber world that was expected of it.

Now it seems a bit curious that men of an inventive turn should have thus been racking their brains when there lay to their hands a mineral substance, commonly known as "mineral rubber," which, even in its raw state had many of the characteristics of crude rubber. Elaterite is the scientific name for this substance. In color, elasticity, and other qualities it brings strongly to mind the distinctive characteristics of India-rubber. It was first discovered at Angers, in France. Later deposits were noted at Castleton, in Derbyshire, England, in the lead mines of Odin, at Alteland, South Australia, in Wasatch County, Utah, and elsewhere. The Wasatch deposits will be considered presently in another connection. In the Coorong district of South Australia a substance is found which, known as Coorongite, is believed by some to be practically the same as elaterite. Other chemists declare it is a vegetable product; the genuine elaterite being a mineral substance. This elaterite varies, according to the locality in which it is found, in quality and consistency. Sometimes it is as thick and unyielding as frozen tar. Commonly, however, it is fairly soft, and sticky. It is a hydro-carbon, generally dark-brown in color. Sometimes it goes under the name of elastic bitumen. Though so closely resembling rubber, practical chemists found no way of putting it to commercial use in that line, though other valuable uses had been found for it. All at once, however, this situation was changed with the finding of a new substance, now called tabbyite, in Wasatch County, also the home of elaterite. This peculiar name was given the substance in honor of old Chief Tabby, of the Unita Indians, who directed chemists to this important find.

Elaterite, it has been said, is a hydro-carbon. Tabbyite is also a carbon, belonging to the resinous group. A combination, or, rather, an amalgamation of the two appears to have formed an artificial rubber, difficult to distinguish from the genuine. A chemical analysis shows the following proportions of constituents: Carbon, 87.12 per cent; hydrogen, 12.88 per cent. The essential characteristics of rubber are also there, such as elasticity, texture, color, etc. If the compound be touched with fire the odor of burning rubber very promptly offends the nostrils.

In making this compound two parts of elaterite to one of tabbyite are used.

The finer grades of rubber, it is true, have not been produced. The chief material so far manufactured has been for matting, belts, insulation covering, etc.

SOME TYPES OF MINERAL RUBBER.

THE term "mineral rubber" as used has but little significance in determining the quality which it represents. The base of practically all known so-called mineral rubbers is asphaltic.

Mineral rubber should be classified in such a way that the chief characteristics could be easily distinguishable, so that a manufacturer could determine which one would be most suitable for the purpose for which he might want to use it. In making such a classification the essential qualities of each different grade, both physical and chemical, should be determined.

For a manufacturer to take one quality of mineral rubber and

An Elaterite Vein.

expect to use it in different grades of compound that he may wish to make, with equally satisfactory results, is as much folly as it would be to take one grade of any other ingredient that he wishes to incorporate in a compound and expect it to work as well in one compound as another.

The nature of mineral rubber being asphaltic means that they are all of them hydrocarbon compounds. It is a well known fact that any hydrocarbon will, when subjected to sufficient heat, throw off gaseous matters. If the temperature at which a compound will throw off these gaseous products is below that which is used in the vulcanization, it will be detrimental in such compound. As these gases must of necessity secrete themselves somewhere, and if the compound is one which is vulcanized in a mold or any air-tight compartment, it naturally follows that the gas will cause the compound to become porous.

Now taking the same class of compound and using a hydrocarbon therein that would not show any gaseous products at or below the temperature at which the compound was vulcanized, this result would not follow.

Again there are those so-called mineral rubbers which are produced by the treatment of asphalts segregated in the fractional distillation of petroleums. Subsequent to the segregation they are treated to a heating and drying process, by pumping in a current of air; sometimes accompanied by steam. This is pumped into the compound in the process of the so-called oxidization, or drying up of the compound. It is a well established fact that this class of hydrocarbons, exposed to atmospheric conditions do not have the wearing qualities that the asphalts have, which have not been thus treated; the theory, which is founded on practice, being that the life of an asphalt depends upon how long it will resist oxidization when exposed to atmospheric conditions. The treating of the asphalt for the purpose of oxidizing it, prior to use, simply shortens the life of the same proportionately to the amount of oxygen which it takes in and the amount of oxygen it takes to destroy it.

Transporting Tabbyite and Elaterite from the Wasatch County, Utah, Deposits.

It would follow that in the use of these qualities of hydrocarbons in rubber compounds, the same result would be obtained, *i. e.*, a rubber compound which contained a mineral rubber, produced by the oxidizing process, would have a shorter life than a rubber in which a mineral rubber was used which had not been previously treated by an oxidizing process. It would therefore seem reasonable for the rubber manufacturer to know and determine the quality of his hydro-carbon as definitely as he does the quality of his reclaimed rubber or other ingredients used in his compounds.

There are other grades of hydro-carbons which contain various quantities of paraffine and sulphur, such elements being contained in the natural asphalt which do not determine themselves until sufficient heat has been applied for decomposition to take place and free these elements.

It is of importance to know at what point such decomposition takes place, as, should it take place at a temperature less than that used in the vulcanization of a rubber compound, wherein such hydro-carbon was used, it would have a very detrimental effect upon the compound, and unless a manufacturer does know at what point this decomposition will take place, he cannot determine what this effect will be except through the channel of experimenting. If he knew, he would then be able to determine wherein he could use the hydro-carbon safely.

There is no doubt that this so-called mineral rubber can be used advantageously when properly applied, and there is no reason why a rubber manufacturer should not give to the producer of mineral rubbers the same closse attention which he does to the producers of the different grades of rubber, and insist that the producer of the hydro-carbon give him definite information relative to its constituents.

It is true that many of the rubber factories today have well equipped chemical laboratories, but it is doubtful if there are any of them that are equipped to properly test a hydro-carbon. Chemical analysis means but little in this class of materials, the important question being what this chemical process will do under conditions essential to use in the manufacturing of rubber compound.

Too many mineral rubbers are sold based solely upon the question of price, and too many rubber manufacturers have attempted to use them from this same standpoint, subsequently decrying them because they did not do all that was expected; whereas if they had known what the action would be when the mineral rubber received the treatment given it, they would have known as well that they could not secure satisfactory results.

There is probably no other place in the world where hydrocarbons are given the close study which they receive in the manufacture of the so-called rubber roofings. The surface of these roofings is composed of a compound purely asphaltic, and its life depends on the quality.

This class of manufacturers must of necessity know what the constituent elements of the compound are, and what are its actions when treated under the processes which they use. This means that practically every asphaltum that they use, is tested by a fractional distillation process either in their own laboratory, or by the firm which supplies them with the material being able to satisfy them that their reports relative to the products are correct.

If the rubber manufacturer will insist upon having a knowledge of his hydro-carbon along these same lines, he can without doubt use various grades of them advantageously in the different qualities of compounds which he manufactures; but for him to say

that he can secure the same results from a mineral rubber which will easily begin to decompose at approximately 200° Fahr., and which, owing to its soft and pliable nature will absorb a great amount of so-called dry fillers, that he can secure by using a mineral rubber that will not decompose at any temperature at which he vulcanizes, and which will not absorb a great amount of dry fillers, owing to its own density, would be as great folly as it is to say he can take a piece of acraflake rubber and produce an equally satisfactory result in all cases as he can with Up river Pará.

There is a place in rubber compounding for all grades of mineral rubbers. There is a wide difference in the qualities of the different mineral rubbers, and it is as important to know what these different qualities represent as to know any other branch of compounding.

Mineral rubbers have qualities that no other ingredients which rubber manufacturers use contain. They are impervious to moisture, more impervious to the action of acids and alkalis, and most of them have a very definite di-electric strength, and a longer life than any other ingredient excepting some of the dry fillers that enter into rubber compounds.

Rubber manufacturers can well afford to investigate these; they are a new article in commercial use for the present age, although history shows they were in use four thousand years ago, and they are in good condition at the present time.

Properly applied they will give life to a rubber compound and at the same time in almost every instance will give a reduced cost, on equal quality basis. Lowell F. Lindley.

NEW SUBSTITUTE FOR HARD RUBBER.

In fulfilment of its mission, the Philadelphia Commercial Museum has for some time been investigating the merits of a new substitute for hard rubber, discovered by a Philadelphian. The discoverer claims that he can take any waste fibrous substance, and convert it into a substitute equal, and in many cases superior, to hard rubber itself.

Although its properties have apparently only recently been noticed in the general press, it seems to have been undergoing, during the last two years, a series of detailed tests by well-known professors and engineers, both privately and at the Museum itself.

The earliest of these tests seems to have been that made at the Philadelphia Commercial Museum, October 19, 1910, with a view of showing the breaking down or puncturing voltage of the new fiber in comparison with other insulating materials. According to the report of Mr. G. R. Henderson, consulting engineer of the Baldwin Locomotive Works, who had attended the tests, they indicated that the puncturing voltage of the new fiber, with a thickness of .162 inch, was 45,000; as compared with records for hard rubber of 40,000 for .127 inch, and of 50,000 for .200 inch. The results with thinner samples were for the new fiber 20,000 with a thickness of .073 inch, as compared with 25,000 for hard rubber, with a thickness of .065. These tests are quoted as indicating that the new fiber is nearly, if not fully, equal to the best hard rubber. Tests of new material showed that it combines the mechanical properties of red fiber, with the electrical properties of hard rubber

In a report on special tests of samples of the new insulating material, Professor Worrall E. S. Temple of the University of Pennsylvania, stated on November 1, 1910, that it completely outdistanced fiber, as well as the ordinary grades of rubber. Technically it showed up superior in toughness to rubber; withstanding, moreover, acid and boiling tests far better than the fiber samples tested, and being comparatively simple to mold. Subsequent tests made later in the month confirmed the above estimate of the new material.

Mr. Ernest L. Rowe, a well-known electrical engineer of Philadelphia, reported on December 12, 1910, that from the exceptional insulating qualities of the new material, he considered it superior to either porcelain, ordinary fiber, or hard rubber; adding that, in his opinion, the demand for it would supersede the present demand for hard rubber and fiber.

The next step was the circulation in March, 1911, of a statement accompanied by the above-named reports, to several hundred corporations, inviting them to attend a public test in April, 1911. This invitation was officially issued by the Commercial Museum, in whose hands had been placed the presentation of the new substance. In addition to these public tests, there were in 1911 a number of the most severe acid tests for storage battery purposes, with the most gratifying results.

Finally, in December, 1911, a further test was made at the Philadelphia Commercial Museum, before a score of experts, including those already named. The test was surrounded by secrecy and did not reach the press for some months; the result being, however, arrived at, that the production of a successful imitation of hard rubber was possible.

While the new material was thus being tested experimentally, its commercial possibilities were also being studied by the Museum. A special despatch from Austin, Texas, to the Boston Transcript, in February, 1912, reported that the new substitute would be obtained from green cotton-bolls, which are now worthless, but would thus acquire a value of 3 to 4 cents per pound. It had been pointed out by Dr. W. P. Wilson, Director of the Philadelphia Museum, that it had long been known that these unripe bolls (representing about 15 per cent. of the total) contain a sticky substance, akin to rubber; generally supposed, however, to have no commercial value.

Little machinery is required to produce the new material. It is claimed that all that is needed to supply America, and, in fact, the world, with hard rubber products, is to establish a few central plants in the cotton fields of the South. Before a group of the most prominent electricians, the inventor is said to have made his product from old waste materials, within twenty minutes; with no other mechanical aid than a cheap hand-press.

It is understood that the new material, as yet unnamed, is not yet being manufactured for this market. Large concerns are said, however, to have tried it. The progress of the new discovery will be watched with interest by the rubber industry. The British Consul at Philadelphia has forwarded details of the tests to the Commercial Intelligence Branch of the English Board of Trade; the facts being thus disseminated through the British and Colonial press.

The India Rubber World has known for some time regarding this new rubber substitute, the claims made for it, and its endorsement by a number of expert engineers and chemists, but has refrained from making any mention of it, in the hope that further and larger samples might be forthcoming which might be put to some practical manufacturing test. Up to the present time, however, as far as can be ascertained, this new substitute has not been made in sufficient quantities to enable any manufacturer to put it to practical use. The information regarding it as detailed above, is given for the benefit of those who are interested in the general subject of rubber substitutes.

MALAYAN COMPANIES' RETURNS.

The returns of six leading Malayan companies for the eight months ended August 31, compare very favorably with those for the corresponding period of last year. Exact figures are:

Eight months to August 31	1911. pounds.	1912. pounds.
Anglo Malay	461,966	516,760
Pataling	196,230	281,118
London Asiatic	188,294	406,309
Golden Hope	162,488	85,760
Selaba	115,104	196,676
Bikam	54,906	97,630
Total	1,078,988	1,584,253

The First Rubber Exhibit Ever Made.

IT may seem a waste of energy to some people, when standing in the immediate presence of a great, live, spectacular exposition, like that now filling three floors in the Grand Central Palace, to hark back 61 years to the first rubber exhibit ever made; but a mention of that early exhibit is of value not only historically, but to people intimately associated with the rubber industry it will certainly not be devoid of interest.

Of course, it was Goodyear who made the exhibit. Not very much can be said about the rubber industry 61 years ago without mentioning Goodyear. The first general world's exhibition was held in the Crystal Palace, London, in 1851. Goodyear had taken out his patent for the vulcanization process only 7 years before, but he had made wonderful advances in rubber production, not only in the line of soft rubber goods—footwear, clothing and fabrics—but he had also made tremendous strides in the production of hard rubber, for which process his brother, Nelson, had taken out a patent in 1848.

Of course, Goodyear's name was known in England, and something was known regarding his exploits in rubber, but still in those days, as even at the present time, Englishmen were a little slow to accord recognition to American achievements. The thing had to be proved before they evinced any great interest in it; and Goodyear determined to prove to the English what he had been doing in the new rubber industry. Consequently he decided to make a memorable exhibit at the great Crystal Palace Show. Though he was in wretched health—which, as a matter of fact, was his chronic condition, for his brain was at least five times too active for his body—and although he had to hobble around on crutches, he entered into the preparation of the exhibit with even more than his accustomed energy and determination. He spent $30,000 on his Crystal Palace display; an unprecedented sum in those days, and a sizable sum for any entrant to spend at any exhibition, even at the present time. His exhibit was known as "Goodyear's Vulcanite Court" and it consisted of a suite of covered rooms, where everything was made of rubber—the walls, the roof, the ornamental cornices, the carpet on the floor and all the furniture. It was a wonderful display of rubber possibilities.

Goodyear's Exhibit at the Crystal Palace Show, London, 1851.

There were chairs of rubber; there were bureaus made of rubber; and boxes and shawl cases made entirely of rubber or rubber veneered. There was a fine display of rubber combs, something that Goodyear had just perfected, and in which he was trying hard to interest the public. There were buttons made of rubber—a distinct novelty at that time; and in addition there were many musical instruments made entirely of hard rubber. There were also rubber canes and cutlery with rubber handles. Rubber balloons of all sizes, inflated with hydrogen gas, were floating in the air. A rubber balloon is, of course, to us an old story; but at that time it was a distinct novelty and naturally appealed greatly to the populace.

The accompanying illustration reproduced from a wood cut made at the time, gives some little idea of the artistic and highly ornamental character of this famous rubber court.

This exhibit was esteemed of such importance that when the Crystal Palace was moved to Sydenham and made a permanent institution, the Goodyear Vulcanite Court was moved with it and made a regular feature of the museum.

It was only natural that the English people should flock to see the rubber exhibition. It was the most striking novelty in the entire show, and Goodyear's name was on everybody's lips. He was given the "Grand Council Medal," the greatest distinction that the exhibition authorities could bestow upon him.

It is not to be wondered at, in view of the tremendous success of Goodyear's London exhibit, that he should have determined three years later, when the *Exposition Universelle* was held in Paris (November, 1854), to repeat his display on that occasion; though the expense of the Paris exhibit was not as great as the earlier one, amounting only to $20,000—this smaller expense being attributable largely to the fact that he still had a considerable part of his London "Court" intact. His display, however, was considerably larger than on the earlier occasion. In fact, at the Paris show he had two distinct rubber courts. This increased area came about largely through Goodyear's intense patriotism. The Frenchmen had not allotted very much space originally to American exhibitors. The American committee applied for more space, which was conceded. They then discovered that they did not have exhibitors enough to fill this new territory, and they appealed to Goodyear. He determined that American reputation for enterprise should not be permitted to suffer if he could prevent it. Consequently he took double the amount of space he had intended, and erected a second court.

His exhibit there created a greater furore even than the earlier one in London. It stood in the very center of the exposition, and all Paris, to say nothing of the rest of the continent, flocked to see this wonderful rubber revelation.

In addition to the articles shown in the London show he had some elaborate rubber furniture very handsomely inlaid, which naturally attracted much attention. Besides the rubber carpets on the floor, he had in this exhibit many rubber pictures on the wall—landscapes and portraits artistically painted on hard rubber panels. The Emperor himself, Napoleon III, was greatly interested. An amusing incident connected with the Emperor's visit was given in some detail in the April number of The India

Rubber World, and need only be briefly alluded to now. The Emperor's visit to the exhibit was made early in the day during Goodyear's absence. There was a pile of large round rubber balls standing in one of the courts. The Emperor, whose mind was more or less contsantly on matters military, viewed this pile with great interest, and turning to a companion said: "I have always thought that rubber could be used in warfare as a means of defence, but it never occurred to me that it was suitable for projectiles; but there you see a pile of rubber cannon balls." The pile was really one of footballs, but nobody ventured to set the Emperor right.

The French were greatly impressed with the Goodyear exhibit. He was not only given the "Grand Medal of Honor," but that greatest of French distinctions, the "Cross of the Legion of Honor," was bestowed upon him.

Tremendous strides have been made since that day in the rubber industry. The entire value of the American rubber output in 1851 was less than $1,000,000; today it is over $220,000,000; but though it would not be impossible, it certainly would be quite difficult, to reproduce today the wonderful rubber exhibit that Goodyear presented to the English people at the Crystal Palace in 1851, and again with notable additions repeated three years later in Paris. Still there is much in the present rubber show that Goodyear would never have dreamed of.

Earlier Rubber Expositions.

WHILE, of course, the interest of the rubber trade now centers upon the great aggregation of rubber exhibits brought together in Grand Central Palace in New York, at the same time, it may not be out of place, as a matter of comparison if for no other reason, to glance very briefly at the three earlier rubber exhibitions; one—somewhat local in its character—held in Ceylon in 1906, and the other two of an international nature, held in London in 1908 and 1911.

THE CEYLON RUBBER EXHIBITION OF 1906.

ALTHOUGH exhibitions, international, local, and sectional, had long been held in connection with other branches of industry, it was reserved for Ceylon to start in 1906 the series of rubber exhibitions, the latest of which is now opening its doors in New York.

Leading officials took a prominent part. Sir Henry Blake, G. C. M. G., the governor of Ceylon, opened the exhibition,

Sir Henry Arthur Blake, G.C.M.G.

attended by a military escort; likewise acting as its president; thus anticipating the position he subsequently filled in London. Among other well-known names intimately associated with the exhibition, were those of Dr. J. C. Willis, director of the Botanic Gardens; Mr. M. Kelway Bamber, Government Chemist, and the Hon. Mr. E. Rosling.

Prizes were offered for the best samples of Pará in biscuit, sheet, crepe, worm and scrap; for *Castilloa* and Ceara in different forms; and for Rambong (*Ficus*). With a view to a more extensive scope than would have been afforded by Ceylon alone, the competitors were divided into two sections. One of these competitions was limited to Ceylon exhibitors, while the other also included competitors from other countries.

In commenting at the time upon the probable effects of the Ceylon Exhibition of 1906, The India Rubber World said:

"One result of the exhibition will be to promote interest among planters in scientific plantation methods, to the end that better returns and larger profits will be made. . . .

"Another result of the holding of the Ceylon exhibition will place a higher estimation in public opinion upon rubber planting, and lead to the more intelligent consideration of the subject by investors."

Who will deny that these predictions have been fulfilled and that the seed thus sown has germinated and fructified in the immense extension which has since marked the rubber industry?

It is of interest to note that Malayan planters participated in the competitions to which they were admitted and carried off honors in friendly rivalry with the Ceylon rubber growers.

THE LONDON EXHIBITION OF 1908.

WHILE the Ceylon Rubber exhibition of 1906 had been confined to the products of Southern Asia, its natural sequence was of the much broader scope displayed in London two years later. The "First International Rubber and Allied Trades Exhibition," held at Olympia, the largest exhibition building in London, took place during the two weeks ending Saturday, September 26. As an illustration of the attention given to the matter by the London press, it is of interest to recall the fact that the "Times" came out on the morning of the opening day with an advance notice of the show, resulting from the "press view" of the previous Saturday afternoon, occupying several columns. Not a single important feature was overlooked. Special interest was likewise displayed by the financial and scientific press, as well as by the leading metropolitan and provincial journals.

One reason for this attention was the growing interest taken in rubber by investors, many of whom had by that time made money in rubber, while others, whose holdings were of more recent date, were anxious to gain information as to the prospects of their being equally fortunate, when the younger plantations matured.

Another cause of the success of the exhibition was the intelligent maner in which it was brought to the notice of the public. Never, perhaps, was an exposition of such an international character, and on so large a scale, organized with so little direct government aid from any quarter.

CEYLON.

Following up its local exhibition of 1906, Ceylon had a comprehensive exhibit ready for display. It comprised the products of some 30 plantations, covering every kind of rubber produced in the colony. The Botanic Gardens sent two *Hevea* trees of two years' growth and one of three years'.

STRAITS SETTLEMENTS AND MALAYA.

The exhibits from the Straits Settlements and the Federated Malay States occupied a special section; having been contributed by the government, a number of leading estates, and by the botanic gardens at Singapore and Penang. A picturesque feature was an old Malay house from the Malayan Planters' Association. There were many specimens of rubber, mostly *Hevea*.

AFRICA.

Africa was principally represented by British East Africa, with exhibits illustrating cultivation as well as experimental work.

DUTCH INDIES.

The Dutch government had appointed a commission to secure adequate representation of Holland and her colonies. Samples and graphic illustrations of rubber at various stages were contributed by the official body referred to. These represented the products of a number of leading plantations in Java and Sumatra.

An interesting exhibit was that of the Haarlem Colonial Museum, including rubber and gutta percha from the Dutch Indies, as well as balata from Surinam.

BURMA.

Specimens of native rubber-yielding creepers were shown, in conjunction with samples of *Hevea* and other plantation rubber.

SOUTH INDIA.

South India was represented by an exhibit of the Penyar Rubber Co., of Travancore.

While the Eastern Hemisphere was thus well represented, the Western made an equally good showing, in accordance with its recognized position as a source of rubber.

BRAZIL.

The principal representation of Brazil was made by the Associação Commercial do Amazonas, of Manáos, with the support of the Amazonas State government. Seventeen lots represented the various grades of Brazilian rubber. In all the Brazilian rubber exhibit amounted to about 10 tons; the largest lot being one of 1½ ton of fine rubber from the river Acre.

In order to give the exhibit the appropriate "local coloring," complete outfits of the apparel worn by the *Seringueros* and full sets of tapping tools supplemented the rubber exhibit proper.

MEXICO.

A collection of important samples had not reached in time for the exhibition, so that the principal rubber exhibit was that of the Mexican Rubber Co., of London. Ed. Maurer, of New York, made an exhibit of guayule from some half dozen companies.

WEST INDIES.

Exhibits from Trinidad, Dominica, British Guiana and St. Lucia, had been arranged by the West Indian Committee, London, after having been prepared by the permanent exhibition committees of the various colonies.

Such were the principal features of the exhibition as regards rubber. The various accessory features of rubber plantation requisites, scientific apparatus, rubber works machinery, plantation machinery and appliances, and factory supplies were likewise fully represented.

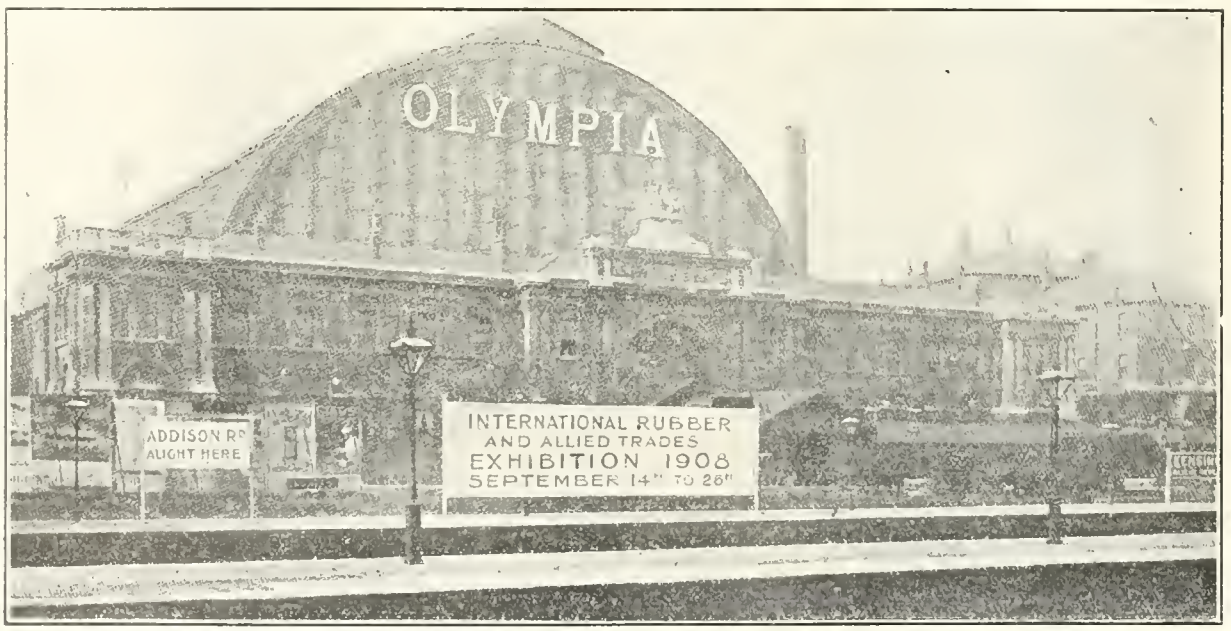
An important feature was the "rubber conference," in which a number of the leading rubber scientists from all countries took part.

SECOND INTERNATIONAL RUBBER AND ALLIED TRADES EXHIBITION.

NOTHING afforded more convincing proof of the success of the London Rubber Exhibition of 1908 than the fact of its repetition on an enlarged scale three years later in 1911. That triennial rubber exhibitions are destined to become a feature of the rubber trade is illustrated by that system forming part of the newly enacted Brazilian legislation.

Though on account of its recent occurrence, the consideration of the London Rubber Exhibition of 1911 belongs rather to present than past history, that occasion calls for a brief retrospect, as an introduction to that now opening in New York.

While the 1908 exhibition had been held at Olympia, situated in the residential West End quarter of Kensington, that of 1911 took place in the northeastern part of the city at the Royal Agricultural Hall, Islington, which was admirably adapted for the purpose. It was within a short distance of the busiest manufacturing and trading districts of the British metropolis, being thus convenient for the daily visits of business men interested in crude or manufactured rubber. "Mincing Lane" was within less than half an hour's drive.



FRONT VIEW OF THE BUILDING WHERE THE LONDON RUBBER EXHIBITION WAS HELD IN 1908.

Under the presidency of Sir Henry A. Blake, ex-Governor of Ceylon (who had presided over the 1906 Ceylon exhibition), and the management of Mr. A. Staines Manders, coupled with the

work of Miss D. Fulton as secretary, there was the organization necessary for the ultimate success which crowned the efforts made.

The general arrangement by countries was on practically the same lines as those of the 1908 exhibition.

CEYLON.

Twenty-four plantations contributed about 4,500 pounds of samples representing *Hevea* in all its various forms, as well as Ceara and Castilloa. Sections of rubber trees and tapping tools were shown by the Ceylon Research Committee and the Royal Botanic Gardens.

STRAITS SETTLEMENTS AND MALAY STATES.

From these possessions came 100 lots of rubber, weighing 2,000 pounds, comprising those varieties mentioned in regard to Ceylon, as well as others, such as *Ficus*.

SOUTHERN INDIA.

Eight estates from this quarter participated with samples and photographs.

BRITISH AFRICA.

The British East Africa Protectorate, the Uganda Protectorate and the Gold Coast Colony sent exhibits of their products.

WEST INDIES.

Trinidad furnished samples of *Castilloa* and *Hevea*, together with tapping tools and other requisites of rubber cultivation, Jamaica and Dominica being also represented. British Guiana sent samples of Balata and *Hevea*, with special publications.

BRAZIL.

A remarkable collection was furnished by the State of Pará, as well as by the Musee Goeldi, while the Commercial Association of Manáos exhibited 385 la rge pelles of fine and 91 balls of Caucho. Ceara rubber from Southern Brazil also constituted a feature of interest.

MEXICO.

An attractive exhibit was the miniature rubber factory exhibited by the Intercontinental Rubber Co.

DUTCH INDIES.

From 150 estates in Java, Borneo and Sumatra came a large number of rubber samples, including *Hevea*, *Ficus* and *Castilloa*.

GERMAN POSSESSIONS.

Some 350 lots from German East and West Africa and the German South Sea possessions, were mostly from sixty estates, but in part from Government institutions. These specimens had been assembled with Teutonic thoroughness, knowledge and enterprise.

BELGIUM.

Samples, maps and charts illustrated what the Belgian Congo is doing in rubber. Eighty classified rubber samples were contributed by the Antwerp Chamber of Commerce.

FRANCE.

Interesting samples of rubber and a number of photographs were sent in by the Governments of Madagascar, the French Congo and French Cochin-China.

PORTUGAL.

Samples of Ceara from the Portuguese colony of Angola formed an interesting exhibit.

ENGLISH CRUDE RUBBER EXHIBITS.

A graphic summary of the rubber resources of the British Empire was furnished by the Imperial Institute, and was illustrated by a variety of samples. Various exhibits were arranged by rubber share brokers, a crude washing company and the British Murac Syndicate, Limited.

RECLAIMED AND MINERAL RUBBER.

These features of the English and American rubber industry were appropriately represented.

RUBBER MILL AND PLANTATION MACHINERY.

There were twenty-five English exhibitors in this line, in which David Bridge had the most complete assemblage. Among American firms exhibiting were The Farrel Foundry & Machine Co. and The Birmingham Iron Foundry.

Prizes Offered at the 1911 Exhibition.

SUPPLIES FOR RUBBER MANUFACTURERS.

A full assortment of these was furnished by leading companies.

MANUFACTURED RUBBER GOODS.

Much interest attached to the exhibits of the North British Rubber Co. and the Premier Reforming Co.

THE RUBBER CONFERENCE.

This was one of the most valuable features of the exhibition and calculated to render its effects of permanent value to the industry, but the conference about to meet in New York bids fair to surpass its London predecessors.

The Third International Rubber and Allied Trades Exposition.

WHAT IS TO BE SEEN AT THE GREAT RUBBER SHOW.

QUITE a good deal has been heard during the last year by the people at large, and especially by the people in the rubber trade about the big Rubber Exposition, to be held at the Grand Central Palace, New York—Lexington avenue, between 46th and 47th streets—from September 23 to October 3. It is safe to say that practically every one in the rubber trade will attend this exposition, to say nothing of the thousands of people from the common walks of life. It will be an interesting question, therefore, with rubber people generally as to what there is to be seen there.

The Grand Central Palace is probably the best building for exposition purposes in the United States—certainly in New York. It has three floors that can be used for the display of exhibits—the main floor which occupies the entire width and depth of the building, and has an area of 200 by 275 feet, and two additional floors—the mezzanine and the balcony which have the same space, with the exception of the open court in the center which looks down on the main floor. Altogether the three floors comprise 160,000 feet of floor space, which is enough to give adequate display space for the largest expositions that are likely to occur for many years.

The Grand Central Palace, New York.

When entering the building by the main entrance, on the Lexington avenue side, one will discover at once that he is walking on rubber—everywhere the flooring is made of this easy, resilient material. There is rubber on the stairs, in the aisles and in the booths. It was intended originally to have the avenue in front of the building paved with rubber, but a number of difficulties arose and it was abandoned. They are still ahead of us in London in regard to this matter, for there is quite an area of rubber pavement in the great English metropolis—for instance, around the railway stations and in front of some of the finer hotels. When our friends succeed in producing synthetic rubber at 25 cents per pound, rubber pavements will be plentiful in American cities, but with Pará rubber still quoted at $1.25 the progress of rubber pavement laying is destined to be rather slow. But rubber flooring is coming more and more into vogue, as will be seen at the rubber show.

The exposition is divided into three parts, first, rubber manufacture and manufacturing machinery, which will occupy the main floor; second, the allied lines, including reclaimed rubber, chemicals and compounding mixtures on the mezzanine floor; and third, crude rubber, which will fill the third floor or balcony. The first exhibit that the visitor encounters on mounting the broad stairway to the main floor is that of the United States Rubber Co., which stands at the head of the stairs—a most commanding position; to which undoubtedly the company is entitled among American manufacturers, because of its commanding position in the trade—by reason of its huge capital, its large business, and its great number of factories, scattered through this country and Canada. There is nothing conspicuously commercial about this exhibit. The only rubber product which it exhibits is a number of automobile tires made by one of its constituent companies, the United States Tire Co.

The booth of the United States Rubber Co. will occupy 1,800 square feet, and will be divided into two reception rooms, equipped with elaborate mahogany furniture and supplied with a number of stenographers, telephones, etc., for the convenience of visitors.

The general woodwork comprising the exterior will be done in mahogany finish, and the pillars draped in flags, and on the counters set at angles affording the best display, will be pictures of the various factories of the company. The spaces in front of the booth will be covered with rubber tiling made by the New York Belting and Packing Co.

The companies taking part in this exhibit will be the United States Rubber Co., The General Rubber Co., The Rubber Goods Manufacturing Co. and The United States Tire Co.

THE ESSEX RUBBER CO., INC.

The Essex Rubber Co., Inc., of Trenton, New Jersey, displays

a very considerable variety of rubber products, comprising rubber soles and heels, sheet rubber soling, tap soles and heel cushions; also a variety of tire accessories like blow-out patches and tire inner liners. In addition there is a variety of rubber bumpers, "Pyramid" matting, "Radiator" hose, packing, both of rubber and asbestos, and pump valves. To those who are athletically inclined, there are sporting goods which will be of interest, including hockey pucks, rubber quoits, golf clubs with rubber handles, tennis rackets with handles of rubber, and rubber bicycle handle bar grips.

THE HOME RUBBER CO.

The Home Rubber Co., also of Trenton, New Jersey, has an interesting display of water hose, steam and suction hose, and various kinds of valves and gaskets, and a number of automobile tires.

THE INDIA RUBBER WORLD.

There is a superb display of rubber machinery, quite a little of it in motion, on this floor, but before you get lost in this mechanical labyrinth it will well repay you to turn towards the south wall of the building and visit the exhibit of The India Rubber World. It is not as large as some of the others—Brazil, for instance, which has 15,000 square feet, while The India Rubber World has only 20 x 35—but its exhibit differs from any other in that the others could be duplicated, but the exhibit made by this journal cannot be duplicated anywhere on the face of the earth. Of course, the intrinsic value of some of the other exhibits—particularly where expensive machinery is shown, or where there is a large quantity (often running into many tons) of crude rubber—is very large. But in all these instances the exhibits could be replaced if any untoward fate should overtake them. But in the case of these exhibits no replacement could be made; many of them are the only ones of their kind in existence. They are relics of Goodyear's days—some of them being products of his wonderful skill, and some of them reminiscent of the triumphs of his later years. They include the book, made entirely of india-rubber—leaves, covers and all—which Goodyear labored on so long, and of which there is no duplicate. Then there are two fine life-size portraits, one of Goodyear, and one of Daniel Webster, painted on hard rubber panels, by Walsh, a distinguished artist of those days. The propriety of Webster's picture on rubber will be recognized on reflecting that Webster conducted the famous seven years' suit for the protection of Goodyear's patents, and finally won it, receiving as his fee, $25,000, which at that time was the largest legal fee ever collected in this country—though a mere bagatelle to the average lawyer of today.

There are also specimens of hard rubber jewelry made by Goodyear, and the cross of the Legion of Honor conferred upon him by the French Government after his notable display of rubber products at the Parisian Exposition in 1854.

Grand Central Palace—View from Lobby of Grand Staircase.

Grand Central Palace—View of Exhibition Hall.

When Goodyear received his famous cross he was temporarily sojourning in prison for debt; for while a more honest man never lived, his constant pursuit of new rubber triumphs kept him in perennial financial straits. There are other priceless relics also at this exhibit, all of which were kindly put in the temporary possession of The India Rubber World by the Goodyear family.

In addition to these extremely interesting articles, there are several exhibits at this booth that could be duplicated elsewhere, but are not likely to be at this particular show. They were secured by the editor of the paper during his sojourn last winter in the rubber-growing countries of South America, and particularly in Venezuela. They consist of a number of unique designs made from rubber, as, for instance, a miniature rubber tree with a diminutive man tapping it, and various animals, insects and reptiles molded out of balata or gutta-percha. Taking it all-in-all this booth is likely to be voted a very interesting one—not only by rubber men, but by the casual visitor.

THE MANHATTAN RUBBER MANUFACTURING CO.

The Manhattan Rubber Manufacturing Co., manufacturers of mechanical rubber goods with factories, warehouses and executive offices at Passaic, N. J., show their product at the Rubber Exposition. The president of this company is Col. Arthur F. Townsend, and its vice-president, Elliot Henderson. Both of these gentlemen will devote more or less time to the company's exhibit.

The Manhattan Rubber Manufacturing Co. makes a good display of belting, emery wheels and all kinds of rubber hose; but what particularly attracts the visitor is the circular loom busy at work weaving hose.

FARREL FOUNDRY & MACHINE COMPANY.

The makers of rubber machinery are making a fine display of the products of their plants. Some of the machines are supplied with power and can be seen at work. Among the conspicuous displays of rubber machinery is that of the Farrel Foundry & Machine Co., which consists of an 8" x 16" motor-driven experimental outfit, mounted on a continuous bedplate, made up of a washer, mill and calender, as shown in the above cut.

The washer has corrugated rolls, with 6-V cuts to the inch. The washer and mill are equipped with automatic guides and with their patented coil clutch, type G, which gives an instantaneous release and picks up the load without shock. The calender and mill have bored rolls, and are fitted up with steam connections so that suitable temperature may be obtained: whereas the washer rolls are solid, the machine being piped for washing the rubber. Both the mill and the washer run at a speed of 30 r. p. m., and the calender at about 15 r. p. m.

Such an outfit as the above is extensively used in the laboratories for experimental work, and has been found to work very successfully for this purpose. These machines show on a small scale the standard milling equipment used in the manufacture of rubber goods, and are miniatures of the company's larger machines in every respect.

THE TURNER, VAUGHN & TAYLOR CO.

Turner, Vaughn & Taylor Co., Cuyahoga Falls, Ohio, are exhibiting an experimental outfit for vulcanizing rubber goods, which is complete and will be in operation at the exposition. They are represented by L. A. Vaughn and M. A. Pearson. The outfit includes three machines, a washer, a mixing mill and a calender. The washer is a 6 x 12 inch "Vaughn" with chilled iron rolls, one corrugated and one with an ordinary smooth tool finish. The mixing mill is also a 6 x 12 inch "Vaughn," with chilled iron rolls, having faces ground and polished. On this machine is demonstrated the quick-removable adjusting screw and nut—an exclusive feature on these mills. Both the washer and the mixing mill have automatic guides, gear guards and all brass journals. The calender is an 8 x 14 inch three-roll "Vaughn," with chilled iron rolls, having faces ground and polished.

In addition to the machines described above, the fact might be mentioned that the line shaft is driven by an electric motor through a pair of cut herringbone gears and a patented multiple band clutch.

THE ADAMSON MACHINE CO.

The exhibit of the Adamson Machine Co., of Akron, Ohio, embraces a comprehensive line of automobile tires, molds, cores, models, prints and photographs. The head of this company is Alexander Adamson, recognized as a rubber machinery expert, whose newly erected plant at Akron, Ohio, is regarded as one of the most completely equipped of its kind in the country. This is exhibit No. 16.

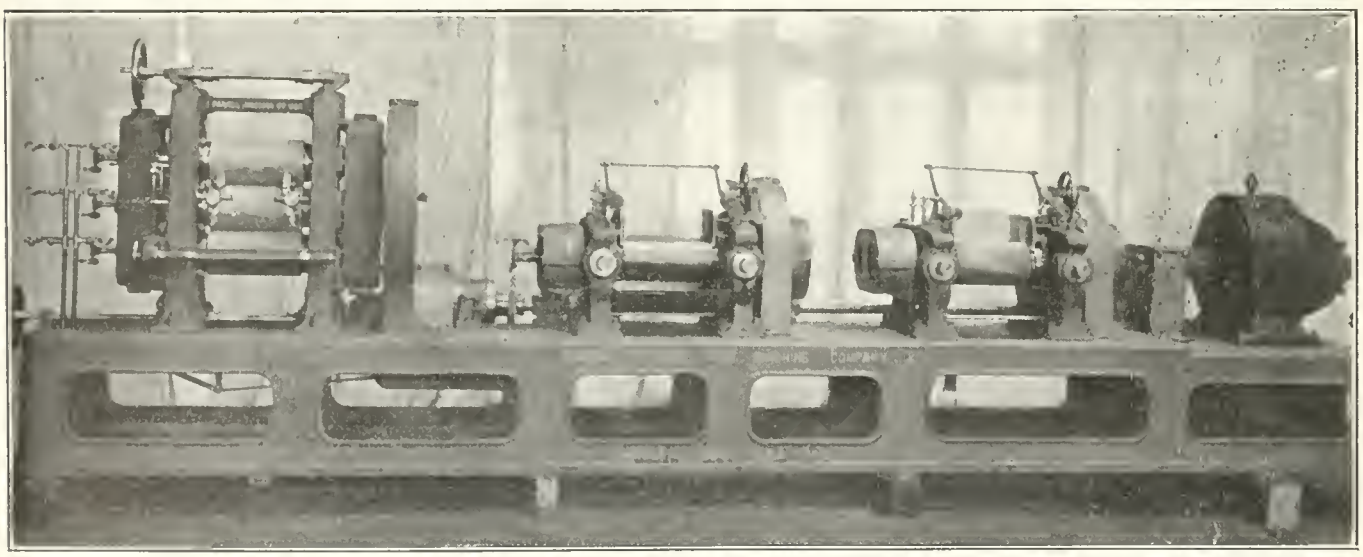


Exhibit of the Farrel Foundry & Machine Co.

THE UNITED SHOE MACHINERY CO.

Exhibit No. 19 is that of the United Shoe Machinery Co., which concern practically controls the shoe machinery interests of this country. They are making an exceedingly interesting exhibit of their various machines, some of which are adapted for certain classes of rubber manufacture.

The United Shoe Machinery Co., also has machinery in motion, which proves to be a drawing feature.

JOHN ROYLE & SONS.

One of the most important mechanical devices used in rubber manufacture is the tubing machine. Specialists in the production of these are Messrs. John Royle & Sons, Paterson, New Jersey. This concern, which is one of the oldest and best known among the producers of rubber machinery, has specialized in tubing machines for thirty years and has achieved notable success in their production. Official recognition has been given the Royle product by the granting of patents on tubing and insulating machines aggregating more than 100. This is exhibit No. 22

J. P. DEVINE CO.

Exhibit No. 25 is that of the J. P. Devine Co., of Buffalo, New York, who are showing their famous Vacuum Chamber Dryers for rubber, compounds and other materials used in the manufacture of rubber goods, Vacuum Rotary Dryers for whiting and other chemical compounds used in vulcanization; Deresinating and Solvent Recovering Apparatus. Mr. Devine is a recognized expert on matters pertaining to Vacuum Systems. The exhibit is in charge of Chas. Devine and F. Howard Mason.

THE HOGGSON & PETTIS MANUFACTURING CO.

The Hoggson & Pettis Manufacturing Co., New Haven, Connecticut, specialists in rubber tools and devices, are showing calender roll engraving, rolls of all descriptions, dies for cutting and dies for marking, and hand tools of various descriptions, such as rollers, stitchers, gauges, etc. Exhibit No. 113.

WERNER & PFLEIDERER CO.

The Werner & Pfleiderer Co., Saginaw, Michigan; Cannstatt, Berlin, Vienna, London, Milan and Moscow, are exhibiting their well-known Universal Rubber Washer and Universal Kneader. Both of these machines are extensively employed in rubber mills throughout the world. The manager of the American plant is Mr. Emil Staehele. Exhibit 27.

THE VICTOR BALATA AND TEXTILE CO.

The Victor Balata and Textile Belting Co., 51 Beekman street, New York City, are showing balata belting for power, elevating and conveying purposes; fasteners, joints, lace leather for all purposes, balata cement, gum, and a special car lighting belt for axle-driven generators. This is exhibit No. 28.

THE CURTIS & MARBLE MACHINE CO.

The Curtis & Marble Machine Co., Worcester, Massachusetts, are showing their well-known brushing machine, mill sewing machine, measuring rolls and dials, and winding bars for pasteboard tubes; also photographs and drawings of various other machines of interest to the rubber trade. Mr. Charles Marble is the president of this concern. Exhibit No. 29.

THE BUFFALO FOUNDRY AND MACHINE CO.

Exhibit No. 30 is that of the Buffalo Foundry & Machine Co., Buffalo, New York, which company will display their vacuum dryers, reclaiming apparatus, fabric impregnating apparatus, expansion tanks, vacuum pumps and laboratory devices, which will be among the very interesting exhibits of the show. The attendants in charge of the exhibit are E. G. Rippel, sales manager; H. E. Jacoby, New York City representative; E. G. Sleeper, New England representative; O. S. Sleeper, chief engineer, and H. D. Miles, president.

THE BUREAU OF STANDARDS.

The Bureau of Standards, Department of Commerce and Labor, Washington, District of Columbia, U. S. A., exhibits its official testing laboratories, which are equipped to investigate and test a wide range of materials, including mechanical rubber goods. New methods of testing are in process and new types of machines are being developed for the purpose of investigating the properties of crude and manufactured rubber. This is exhibit No. 31.

UNITED STATES RUBBER RECLAIMING WORKS.

The United States Rubber Reclaiming Works, factories at Buffalo and offices at 277 Broadway, show a complete line of the company's product in addition to a working exhibit, reflecting the operation of a reclaiming factory. This exhibit, which is No. 104, is in charge of Mr. Clarence Loewenthal.

E. H. CLAPP RUBBER CO.

The E. H. Clapp Rubber Co., with factories in New England and New Jersey, and offices at 49 Federal street, Boston, Massachusetts, show samples at exhibit No. 105 of standard grades of reclaimed rubber and a varied line of articles containing their product.

NEW JERSEY RUBBER CO.

The New Jersey Rubber Co., offices at 120 Franklin street, Boston, Massachusetts, have an interesting exhibit, No. 106, of insulated wire, hard rubber goods, mechanical rubber goods and products manufactured from reclaimed rubber

AMERICAN WAX CO.

The American Wax Co., works at Baltimore, offices at 105 Summer street, Boston, Massachusetts, show "Amax" mineral rubber and merchandise into which it has been incorporated. The exhibit, No. 100, will be in charge of Mr. William C. Coleman, the general manager of the office.

J. W. COULSTON & CO.

J. W. Coulston & Co., importers and manufacturers of dry paints and colors, 80 Maiden lane, New York City, are showing a comprehensive line of golden and crimson antimony, barytes, bone black, black hypo, green oxides, Indian reds, Tuscan reds, siennas, ultramarine blue, umbers, vermilion (English), chrome, tile and zinc yellows, zinc oxide, red green and white, and zinc sulphide (lithopone).

GEORGE A. ALDEN & CO.

George A. Alden & Co., 77 & 79 Summer street, Boston, Massachusetts, manufacturers of the famous mineral rubber known as "Emarex," are making a most interesting exhibit including a tread mill, the floor of which is made of "Emarex," and over which two sharply shod horses are plodding their weary way daily without making any perceptible effect on the flooring. Mr. George Watkinson, one of the best known rubber men in the trade is in charge of the Emarex exhibit, which is No. 100.

RUBBER REGENERATING CO.

The Rubber Regenerating Co., of Mishawaka, Indiana, show, at exhibit No. 101, reclaimed rubber by alkali, acid and mechanical processes. This company is said to employ 1,000 hands in addition to the laboratory force of 30 chemists.

MONATIQUOT RUBBER WORKS CO.

The merits of "Naturized" rubber are effectively displayed by the Monatiquot Rubber Works Co., of South Braintree, Massachusetts. It is claimed that the peculiar nature of the processes used in its manufacture constitute an advance in the art of reclaiming waste rubber. While a relatively young concern, the demand for its products has necessitated frequent addition to its productive capacity.

THE LOEWENTHAL CO.

The Loewenthal Co., of 481-483 Washington street, New York, is known as one of the largest scrap rubber dealers in the world. It has offices and warehouses in New York, Akron and Chicago, as well as representatives throughout the United States. It is estimated that the average yearly tonnage handled by this company represents about 35 million pounds of domestic and foreign scrap

PFALTZ & BAUER.

As agents for the well-known "List" Chemical Factory of E. de Haen, Seelze, near Hanover, Germany, Pfaltz & Bauer, of 300 Pearl street, New York, make a special exhibit of golden and crimson sulphuret of antimony and other compounding ingredients for the rubber industry.

LEHMANN & VOSS.

In harmony with its position as one of the largest German chemical factories, the firm of Lehmann & Voss, of Hamburg, makes a thoroughly representative exhibit of its various products, specially intended for the rubber industry. In addition to the various forms of magnesia and other salts, there is a full display of the numerous coloring and filling ingredients made by the firm; all being finely bolted and of uniform quality. One feature of particular interest is that stock is carried by the New York representative, Mr. R. Bardewyck, No. 5 State street.

THE AMERICAN ASPHALTUM & RUBBER CO.

The American Asphaltum & Rubber Co., of 600-619 Harvester Building, Chicago, makes a special exhibit of its "Pioneer" M. R. Hydro-Carbon, which has achieved an international reputation for its high percentage of purity. Another important feature is that the quality and melting point are always uniform.

The Canadian offices are: The Canadian Mineral Rubber Co., Limited, Winnipeg and Toronto; the London offices being the Canadian Mineral Rubber Co., Limited, 32 Victoria street, Westminster, S. W.

Meyer & Brown, successors to A. P. Morse & Co., are showing samples of crude rubber. Exhibit No. 215.

DUTCH GUIANA CULTURE CO.

Exhibit No. 217, of the Dutch Guiana Culture Co., with headquarters at the Harris Trust Co., Chicago, Illinois, is an interesting showing of *Hevea* trees at different ages, including the process of tapping, and samples of rubber grown in Dutch Guiana. The president of this company is L. C. Lawton, of Chicago, Illinois.

HENDERSON & KORN.

Henderson & Korn, 82 Beaver street, New York City, have an attractive booth of tropical design, decorated with Indian hunting equipment and basket work collected at the headquarters on the Rio Negro. The exhibit consists of samples of a few standard grades in which this concern deals.

The United Malaysian Rubber Co., are showing samples of Jelutong, and their booth, No. 221, has attracted the attention of a great many visitors. The agent of this company in New York is J. Warren Bird, 2 Rector street.

THE NEW YORK COMMERCIAL CO.

The New York Commercial Co., 605 Dun Building, New York City, one of the most important crude rubber organizations in the world, is showing samples of crude rubber from wild and planted trees, Jelutong, crude and deresinated; gutta percha, crude and reboiled. It is probable that no exhibit at the show is being more generally visited.

E. V. Wilcox.

Edward G. Salmon.

William Shakespeare.

This company issued a very artistic invitation to sundry members of the trade to visit its exhibit. This invitation is handsomely engraved and is sent out with a personal card of the sender folded in tissue paper, all enclosed in an inner envelope in addition to the addressed envelope, the whole thing being quite after the style of an invitation to a fashionable wedding or other high society function.

RUBBER TRADING CO.

The Rubber Trading Co., 38 Murray street, New York City, is one of the largest and the best known of the crude rubber importers of this country. Their exhibit is naturally of interest to buyers of crude rubber. The president of this company is William T. Baird, who looks after the office management, while the vice-president, Robert B. Baird is one of the best known and most popular crude rubber salesmen in the trade. Associated with the Rubber Trading Co. are Collier Baird, son of the president, and Robert L. Baird, son of the vice-president.

THE RAW PRODUCTS CO.

The Raw Products Co. are well known successful operators in crude rubber. This business being under the management of Mr. H. W. Pety. Their exhibit is No. 214, and is the center of much interest on the part of visitors.

ACUSHNET PROCESS CO.

The Acushnet Process Co., New Bedford, Massachusetts, are showing an interesting line of high-grade deresinated rubbers and high-grade resins. It is probable that Phillip Endicott Young, president of this organization, will take charge of the company's stand, which is No. 102.

NEW JERSEY ZINC CO.

New Jersey Zinc Co., stand No. 103, show a line of zinc oxides, calling special attention to their "White Seal," a new product, very white and velvety and of remarkable bulk, and certainly very pleasantly named. Lithopone is also included in the product of this company.

TYSON BROTHERS, INC.

Tyson Brothers, Inc., Carteret, New Jersey, show a full line of rubber substitutes and exhibit articles in which their product is used. They are also showing vegetable oils, whitings and a full line of rubber chemicals. Their exhibit is No. 118.

BURMA.

The Government of Burma, India, is represented by samples of plantation rubber from some half dozen leading estates. An illustrated booklet is also being distributed free with a full description of Burma.

THE HAWAIIAN ISLANDS.

An interesting exhibit is that of the Hawaiian Rubber Growers' Association of Honolulu. It includes photographs and literature

WHERE THE HAWAIIAN EXHIBIT WILL BE.

illustrative of rubber cultivation and preparation, as well as samples of rubber in bulk, as shipped to market. There is further shown an assortment of intercrops, which illustrate the fertility of the islands.

THE CEYLON SECTION.

THE CEYLON EXHIBIT.

The Hon. F. Crosbie Roles, editor of the "Times" of Ceylon, was appointed by the Governor of Ceylon to be commissioner for Ceylon at the Exhibition. Mr. Roles is well known in the United States, having been interested in the Ceylon exhibition at the Chicago World's Fair, and later occupied an official position at the St. Louis Exposition, 1904. He participated in the first World's Rubber Show at Peradeniya in 1906, and was a member of the local and London committees at the International Rubber Exhibition of 1911.

Ceylon's Rubber exhibit will be set in the center of a plantation crowded with spice trees. The commissioner has brought a score or more of picturesquely garbed Singhalese rubber workers to New York, for the show, and with them a few Tamils from Southern India, who work on the Ceylonese rubber farms as indentured laborers.

Ceylon has gone to great expense to show New York how its rubber industry is conducted. In the center of the Imperial Ceylonese rubber exhibit, stands an ancient Singhalese temple, such as the tourist sees at Kandy. All the details of growing, gathering and preparing rubber are shown. The Singhalese growers are rivals of the Malay rubber workers from the Straits Settlements, and the two exhibits, both under British royal patronage, are being made as attractive as possible

THE BRAZILIAN EXHIBIT.

Perhaps the most imposing exhibit in the International Exposition, now being held at the Grand Central Palace, is that of Brazil, which covers approximately 15,000 square feet. In the center of this exhibit is a pavilion of Portuguese architecture surrounded by a terrace, on the river side of which is a panorama over 200 feet long, showing the Amazon from Pará to its termination in the Jungle, illustrating the cultivation and handling of rubber—from the plantation to the market. At the south of the pavilion is a colossal figure, the conception, by the way, of Admiral Carvalho, who, in conjunction with Dr. Dahne has been mainly instrumental in promoting the success of the Brazilian exhibit. This gigantic figure symbolizes the wonderful rubber-growing capacity of Brazil.

This figure is a recumbent giant. It is about 35 feet long, and where the head is raised on the elbow the figure stands about seven feet high. The figure reclines very comfortably, looking over the valley of the Amazon, which lies stretched out green before it, showing the great river and its tributaries and the green rubber jungles. This figure, by the way, is covered with rubber, and is called "The Genius of the Amazon."

There is a deal of information to be obtained in this Brazilian section. It has been planned with much care and every evidence of thought. There are a number of charts hung in conspicuous places giving the visitor a great many interesting facts about Brazil. From one chart, for instance, it will be learned that the exports of Brazil in the last 20 years have increased 251 per cent., while the exports of the United States in the same time have increased only 141 per cent. Rubber stands second in point of importance among the Brazilian exports—coffee ranking first, with exports amounting in 1911 to over 12,000,000 sacks (132 pounds to the sack).

Another interesting export from Brazil—of which we know little in the United States—is *mate*, their native tea. In 1910 over 6,000 tons of this product were shipped out of Brazil, going chiefly to Germany, Chile and Argentine Republic. Another product of great value consists of hides—the exports for the last year to the United States alone, amounting to 31,000,000 kilos—or being interpreted, about 68,000,000 pounds.

There are five very life-like figures in this exhibit, illustrating five great industries of the republic. One shows the rubber gatherer; another, the coffee grower; a third, the cowboy; a fourth, the miner; and a fifth, the agriculturist.

Numberless photographs add a great deal to the interest of this exhibit. There are many handsome views, for instance, of the harbor of Rio de Janeiro, the finest harbor in the world, 40 x 60 miles in size, and large enough for the combined fleets of the world.

The north side of the pavilion is devoted to Manáos and its product, and is ornamented by a large painting showing rubber production and transportation. A pyramid of Pará rubber, weighing 30 tons, surmounted by a large sphere of the same material, over 1,400 pounds in weight, is a unique and interesting feature of the exhibit.

DR. PINTO'S CORNER.

Dr. Carlos de Cerqueira Pinto, who has a patented process

for coagulating latex, has a very interesting exhibit in the northwest corner on the crude rubber floor. He has speciments of Pará rubber coagulated in the old way, and a great many specimens of the same sort of rubber coagulated after his method, and he seems to make out a strong case for the superiority of rubber coagulated by the Pinto process. He has samples of rubber which he coagulated five years ago, which has lost none of its elasticity, strength or nerve.

AN ALL-RUBBER PAVILION.

One of the most interesting pavilions on the balcony floor is that of Ed. Maurer, which is composed—panels, pillars, roof, counters, everything that is observable—of rubber sheets. In order to give color contrast, the pillars and panels are covered with a pale yellow rubber, while the roof is covered with rubber of dark brown. It is a very striking exhibit, and incidently, quite valuable from a rubber standpoint.

A CLUB ROOM FOR RUBBER MEN.

In the northeast corner of the balcony floor there is a commodious room 30 x 75 feet, which is devoted to the use and comfort of the exhibitors and their friends. It is a pleasant retiring place where the exhibitor—after answering several thousand questions propounded by inquiring minds—can go and sit down in peace and quiet and get a few minutes' repose.

BRITISH GUIANA.

While British Guiana has not an independent exhibit, an effort has been made to secure representation for the colony, by including a number of rubber samples in the "British Guiana" display of the Imperial Institute.

These samples include a seven-pound sheet of balata from Messrs. Garnett & Co.; a similar exhibit from the Consolidated Rubber and Balata Estates, Limited, and seven pounds of plantation Para biscuits from Mr. William Hodgson, of Plantation Noitgedacht, a sugar estate on the Demerara River.

Biscuits of plantation Pará from Plantation Inschen, a sugar estate, have been sent by Messrs. Barker Brothers. McConnell & Co., Limited, while a similar exhibit has come from the Experimental Station of the Department of Science and Agriculture. Of Sapium rubber, biscuits have been sent from the Banasika Government Reserve and scrap cakes from the David Young Rubber Estate, Limited.

THIRTY TONS OF AMAZON RUBBER

DR. LOBATO, ADMIRAL CARVALHO, AND MR. MANDERS.

EXPOSITION NOTES.

The exhibit of the United States Rubber Co., which stands at the head of the front flight of stairs, will be beautiful by day and by night. It is to be hung with the flags of many nations. It will be lighted at night by the crystal reflection of three great

globes, a very attractive scene to meet the eye of the incoming visitor.

The booth of the Essex Rubber Co., Inc., a little to the left of the front stairway on the main floor, gives an illustration of what can be done in the way of decoration by the judicious utilization of the product of a rubber factory. Covering the top of the railing around the booth, and covering the pillars that support the roof and arranged in various designs on the front of the railing, is a fine display of the rubber tiling made by the company, both in red and white. This exhibit shows what an artistic sense is able to accomplish with material that does not seem particularly promising. In this exhibit there is a very interesting rubber tree standing about four feet high, all of red rubber, which is quite unlike anything that grows in the Amazon jungle, or in the famous 80,000 acre plantation in Sumatra. Its leaves all consist of red rubber soles neatly trimmed and ready to attach to the awaiting uppers.

A FINE HERBARIUM.

At the extreme left of the main floor, against the southern wall of the building, is the stand of THE INDIA RUBBER WORLD, noticeable for many things, but particularly so for several of its conspicuous features. For one, there is a big map, 15 x 20, showing

ENTRANCE TO BRAZILIAN SECTION.

the two hemispheres, so marked that they indicate what parts of the globe are reached by this publication. It will be seen at a glance what a very small part it does not reach.

Further impressing the visitor's mind with the circulation of this publication is a panel 9 x 11 feet, giving a list of the countries in which THE INDIA RUBBER WORLD is read. A panel giving a list where it does not circulate would only have to be one-twentieth part of this size, for barring the North Pole and the South Pole, and a few cannibal islands, it goes everywhere.

The two big portraits, six feet high, painted on hard rubber panels, one of Charles Goodyear, the other of his famous legal contemporary, Daniel Webster, are two other notable features of this exhibit, but perhaps the person in search of rubber information will be even more impressed by the extensive herbarium showing the various botanical specimens of rubber, and extending all around the three sides of the exhibit. There is an excellent light from the large south window, which makes it possible to study these specimens in detail. Seven or eight large photographs of *Castilloa* trees add also to the importance of this booth.

The J. P. Devine Co. displays at the back of its space, two large panels, one giving a list of the American users, and the other a list of the foreign users of the company's machinery.

The Manhattan Rubber Manufacturing Co., the Farrel Foundry & Machine Co., and the United Shoe Machinery Co. occupy the center of the main floor under the open court that reaches up to the balcony so that these three exhibits can be viewed not only from the side but from above.

THE MOVING PICTURE SHOW.

In the southeast corner of the main floor there is a room partitioned off, large enough to seat probably 200 people, where every hour or thereabouts a moving picture show is given of highly interesting scenes to the rubber world. These are colored views, and show the gathering of the latex in the Amazon country and its preparation. Fine pictures are shown of Pará, Pernambuco, Bahia, Rio Janeiro, and other cities. You are taken on a trip across Brazil, from Sao Paulo, to Matto Grosso. You see the new Madeira-Mamoré railway, which recently gave Bolivia its first exit to the outer world. Pictures of the falls in the Madeira river are shown, and many other exceedingly interesting jungle scenes.

THE IMPERIAL INSTITUTE.

On the third, or balcony floor, in the southeast corner, the Imperial Institute of London makes a fine display of a great variety of rubber produced in the British colonies. There is rubber in sheets, in biscuits, in crepe and in balls. There are Ceara rubber, *Landolphia*, vine rubber, and specimens of *Castilloa* from the West Indies. There is also quite an extensive Herbarium of rubber botany. This exhibit is characterized by the excellence in classification and description that one would naturally expect to find in anything pertaining to the Imperial Institute.

The British Malaya space is divided into sections, each section being allotted to a particular province, which is indicated by conspicuous signs, as, Perak, Pahang, Selangor, etc. Here are seen not only specimens of rubber, but many fine photographs illustrative of plantations in the Far East.

EXPOSITION NOTES.

The Philadelphia Rubber Works Co. have a large exhibit of reclaimed rubber, and are represented by their vice-president, J. S. Lohman and several other members of the company.

The Swinehart Tire and Rubber Co. are showing a full line of their solid and pneumatic tires, and also have on exhibition rubber goods made from the latex, which has been treated by a new process by the Brazilian Government, and which it is claimed is superior to the present method of treatment on account of the crude rubber being cleaner, purer and having more life. Their exhibit is No. 14.

Exhibit No. 15 is that of the "India Rubber Review," of Akron, Ohio, which is under the personal supervision of Mr. Theodore Eugene Smith.

Exhibit No. 117 is that of the American Rubber Reclaiming Co., of Germantown, Philadelphia, Pennsylvania, which is showing a varied line of reclaimed stock.

Gammeter-Brodbeck, of Akron, Ohio, operate a general agency for the distribution of rubber manufacturers' supplies—exhibit No. 120.

Muehlstein & Co. are among the prominent waste rubber firms of the country and their exhibit is attracting much attention—exhibit No. 121.

SILVER SHIELD FOR THE BEST WILD RUBBER.

THIS illustration gives some idea of the silver shield offered by Henry C. Pearson, editor of THE INDIA RUBBER WORLD, to the individual or company making the best exhibit of wild rubber at the Exposition. This cut was made from a pencil drawing, as the shield itself was not finished at the time the cut was made. It, therefore, hardly does the design justice, but it serves to convey a general idea of its appearance. The shield is made of sterling silver, stands 15 inches high and is an exceedingly artistic piece of work. It is on exhibition at the Palace.

THE INDIA RUBBER WORLD SHIELD.

CEYLON PRIZES FOR RUBBER IN 1906.

WITH reference to the pioneer rubber exhibition at Ceylon in 1906 (referred to in another column), it is of interest to recall the chief awards on that occasion.

COMPETITION FOR CEYLON ONLY.

Pará Rubber Biscuits; (40 competitors), gold medal, Duckwari Estate; silver medal, Katugastota.

Pará Biscuits, smoked; gold medal, Arapolakande.

Pará Rubber Sheet; (23 competitors), gold medal, Syston; silver medal, Kindesalle.

Pará Rubber, Crepe or Lace; (4 competitors), gold medal, Culloden; silver medal, Heatherley.

Pará Rubber, other forms; (7 competitors), gold medal, Gikiyanakande; silver medal, Culloden.

COMPETITION FOR CEYLON AND ABROAD.

Pará Rubber Biscuits; (8 competitors), gold medal, Duckwari; silver medal, Arapolakande.

Pará Rubber Sheet; (13 competitors), gold medal, Syston; silver medal, Kondesalle.

Pará Rubber Crepe or Lace; (10 competitors), gold medal, Culloden; silver medal, Pataling.*

Pará Rubber in other forms; gold medal, Lanadron,* (block); silver medal, Gikiyanakande.

Pará Ruber Scrap, (32 competitors), washed—silver medal, Vallambrosa.* Hand made—gold medal, Heatherley; silver medal, Kepitigalla.

*Denotes Malayan or Straits exhibitors.

THE HAWAIIAN COMMISSIONERS.

The Hawaiian Islands are comparatively newcomers in the rubber producing world. The Hon. William Williamson, and Wilbur A. Anderson are the official commissioners from the Islands to the Exposition.

F. CROSBIE-ROLES.

HON. WILLIAM WILLIAMSON.

WILBUR A. ANDERSON.

Who's Who at the Rubber Show.

WHILE of course the exhibits of what people are going to the Exposition to see—the manufactured goods, the machinery used in manufacturing these goods, the crude rubber that is the foundation of the whole industry, and various compounds without which the crude rubber would be of no avail—still the personnel of the Exposition is certainly not devoid of interest.

PRESIDENT WILLIAM H. TAFT, PATRON OF THE EXPOSITION.

The patron of the Exposition is William H. Taft, who for the last three and a half years has been president of the United States, and who, according to his campaign manager, Charles D. Hilles, will continue in that difficult but desirable posnion up to the 4th of March, 1917. Mr. Taft had hoped to be present at the opening exercises and to take part in that interesting event but, unfortunately, the President is often a victim to his duties, and he was compelled to remain in Washington just at this particular time. He expects, however, to pay the Exposition a visit during its ten days of duration. Just when this pleasing event will occur cannot be stated at this time, but will be properly announced.

President William H. Taft.

GOVERNOR JOHN A. DIX, PRESIDENT OF THE EXPOSITION.

The President of the Exposition is Governor John A. Dix, chief executive of the great state of New York. Aside from his political prominence, there is great propriety in having Governor Dix officiate in this capacity, because prior to his advent on the political stage he was known as a business man of large interests and conspicuous success. It is, therefore, quite fitting that he should have a prominent part in any notable commercial function in this state. Governor Dix, when he assumed the presidency of the Exposition, fully expected to be present on the opening day and deliver the inaugural address, but the exigencies of his official position rendered it impossible for him to be in New York City on the 23d, and Mayor Gaynor kindly accepted an invitation to make the opening address in the Governor's place.

Governor John A. Dix.

MAYOR WILLIAM J. GAYNOR, WHO OPENS THE EXPOSITION.

While Mr. Gaynor has only a local political position, being Mayor of the City of New York, his fame is national, it might properly be said international, the result not only of the importance of his position as the ruling spirit of the second largest city in the world, but even more the result of his unique and forcible personality. He is possibly the most picturesque citizen in a public position that we have produced in this country since Andrew Jackson, known in his day as "Old Hickory." The willingness of the Mayor to deliver the opening address is most fortunate, because he is at his best in his speechmaking—being full of wise saws and modern instances. But as the Mayor is much given to impromptu speaking it was impossible for this publication to secure his address in advance, but there is every assurance—from past experiences—that it will be well worth hearing

HENRY C. PEARSON, VICE-PRESIDENT OF THE EXPOSITION.

Henry C. Pearson, vice-president of the Exposition, and president of the Conference to be held jointly with the Exposition, hardly needs an introduction to the readers of this journal, which he founded twenty-four years ago, and of which he has been editor continuously ever since. It is safe to say that no one has done more to disseminate rubber information all over the world than the editor of this paper. He has traveled extensively in rubber countries—both in the wild rubber regions of South America and in the plantation districts of the Far East—and has written a number of books giving the result of his experiences and observations.

Mr. Pearson presided at the initial function of the Exposition—

the private view, with an incidental luncheon, given to the members of the press—and he will preside at the various meetings of the Rubber Conference.

A. STAINES MANDERS, THE ORGANIZING MANAGER OF THE EXPOSITION.

But after all is said and done, and after the enumeration of the important officials whose names have been mentionel above, the power behind the throne, the originator and creator of this

THE BRAZILIAN COMMISSION.

The Government of Brazil—to say nothing of the several provinces and various commercial organizations in that country—has sent a large number of distinguished delegates to the Exposition. The officers of the commission are as follows: Count Candido Mendes de Almeida, president; Admiral Jose Carlos de Carvalho, vice-president; Dr. Eugenio Dahne, general secretary.

A. Staines Manders.

Mayor William J. Gaynor.

Miss D. Fulton.

Exposition, is A. Staines Manders, organizing manager. His mind conceived it and his tireless industry has made it possible, and has filled the three great floors of the Grand Central Palace with rubber exhibits from the four quarters of the globe. Mr. Manders is an Australian by birth, an Englishman by citizenship, something of an American by reason of several visits to these shores, and a citizen of the world by reason of the breadth of his activities. He promoted and carried to a successful issue the first International Rubber and Allied Trades Exposition in London in 1908. This was voted so interesting, so instructive and so stimulating to the whole rubber industry that he was requested by rubber interests to repeat the exhibition three years later; and in July, 1911, he brought about the second international rubber show in London, four times as large and complete and successful as the first. And now he has afforded to this country and to the rubber interests of the Western Hemisphere an opportunity to enjoy their first experience of a large and comprehensive rubber Exposition conceived on broad lines, and built on the experience and knowledge acquired in the two London shows.

MISS D. FULTON, SECRETARY OF THE EXPOSITION.

As has been said above, Mr. Manders has been and is the driving force of the Exposition, but the one who holds the guiding reins is Miss Fulton, his secretary. She is a young Englishwoman, the niece of Mr. Manders, who acted as his secretary on the occasion of the two London shows held in 1908 and 1911. She knows, by correspondence at least, everybody in the rubber world—who he is, and what he is doing, and how much of it he does; whether he gathers rubber, grows rubber, or makes it up into the finished product. She has all the rubber people on the globe arranged, classified and systematized. Her knowledge of the rubber trade is encyclopediacal, and better than that, no matter how busy she may be with her multitudinous duties, she is always willing to contribute from her store of knowledge to the earnest inquirer after rubber information.

The commission includes the following members: Jayme de Argollo, commissioner for the State of Bahia; Dr. J. Cardwell-Quinn, commissioner for the State of Minas Geraes; George E. Pell, commissioner for the Commercial Association, Pará; A. W. Stedman, commissioner for the Commercial Association of the State of Matto Grosso; Dr. Manuel Lobato, commissioner for the State of Amazonas, the Federal Territory of Acre, and Matto Grosso; J. Levy, commissioner for the Commercial Association of Amazonas.

The following are among the distinguished visitors from Brazil: Raymundo C. Monteiro da Costa, Manáos; M. Pio Corrêa, Rio Janeiro; Dr. Jacques Huber, Pará; W. S. Gordon, Manáos; Dr. Carlos de Cerqueira Pinto, inventor of a smokeless process for curing rubber.

Dr. Dahne when interviewed by a representative of one of the daily papers, made the following interesting statement:

"Our government naturally takes the very greatest interest in the exhibition. Rubber is second in importance of our natural products, being surpassed only by our coffee. We expect to have about eighty tons of crude rubber in different stages of production and of different varieties. The government has sent up experts in the treatment of crude rubber to demonstrate improvements we have made and to confer with American manufacturers as to possible ways in which our product might be made more serviceable."

Count Candido Mendes de Almeida and Admiral Carvalho, after the expiration of the Exposition expect to make a tour of the manufacturing cities of the East, together with other members of the International Congress of Chambers of Commerce, recently held in Boston. Later Admiral Carvalho and Dr. Dahne will go to San Francisco to choose sites for the Brazilian buildings of the Panama Exposition. After that, the Admiral will proceed to the Canal Zone to look over the great engineering works at that point; for the opening of the Canal will be a matter of tremendous importance to Brazil. The

Admiral, by the way, has served more than 50 years' in the Brazilian Navy.

Count de Almeida is part owner of the "Jornal do Brazil," is a director of the Commercial Museum of Brazil, and occupies

Edward G. Salmon, commissioner for the Imperial Institute, London, England.

C. E. S. Baxendale, representing the Planters' Association of Federated Malay States.

Dr. Manuel Lobato.

Admiral Jose Carlos de Carvalho.

Dr. Eugenio Dahne.

one of the important chairs in the School of Law in the University of Brazil. He is accompanied by his wife and six children.

COMMISSIONERS TO THE RUBBER EXPOSITION.

Among the commissioners from foreign countries are the following:

BRAZIL'S BRIGHT RUBBER OUTLOOK.

The wonderful awakening of Brazil in regard to the development of her vast rubber resources, as indicated by the decrees and regulations recently passed by the National Congress, is commented on at some length on the editorial pages of this issue. The impressive exhibit made by Brazil at the Exposition is an-

George E. Pell.

Leonard Wray.

Pedro de Toledo.

Leonard Wray, I. S. O., commissioner for the governments of British Malaya and Straits Settlements.

F. Crosbie Roles, commissioner for the Government of Ceylon.

Dr. Walter Strong, commissioner for the Province of Moro, Philippine Islands.

The Hon. William Williamson, commissioner for the Hawaiian Islands.

other indication that the great southern republic does not intend to lose her dominance in the rubber world if energy and enterprise can prevent it.

There are more rubber men in New York this week than ever before gathered together in any American city. Some come to show, but more come to be shown.

The Brazilian Dinner.

THE beginning of the functions that always attend so great an exposition as that of the International Rubber, was the Brazilian dinner given on the evening of the 7th of September, the "Fourth of July" of the Republic of Brazil, to celebrate the 90th anniversary of the Declaration of Independence of Brazil from Portugal. The Roof Garden of the Hotel Astor was the place chosen for the banquet. The guests were the members of the Brazilian colony of New York, the officers of the International Rubber and Allied Trades Exposition, and the Brazilian delegates to the exposition.

The repast was such as would have been approved by the most critical epicure. Toasts and speeches were both in English and Portuguese. Dr. Eugenio Dahne, the Brazilian Commissioner, acted as toastmaster. The speakers were Count Candido Mendes de Almeida, Admiral Jose Carlos de Carvalho, Henry C. Pearson, A. Staines Manders, William H. Ukers, and many others.

The guests, some of them accompanied by their wives, were as follows:

Dr. Eugenio Dahne, Commissioner-General, representing the Minister of Agriculture, Industry and Commerce in the United States and Canada.

Count Candido Mendes de Almeida, Director of the Commercial Academy and Commercial Museum at Rio de Janeiro, President of the Brazilian Commission to the International Rubber Exposition, New York, and to the International Congress of Chambers of Commerce, Boston, Chief Editor of the "Jornal do Brazil" and "Revista da Semana," Rio de Janeiro.

Admiral Jose Carlos de Carvalho, Brazilian Navy, Member of Congress, Vice-president of the Brazilian Commission to the International Rubber Exposition, New York.

Dr. Manuel Jacintho Ferreira da Cunha, Consul General of Brazil, and the following members of the Brazilian Consulate: Dr. Garcia Leao, George W. Chester, Victor Ferreira da Cunha, James G. Mee, Adry Werneck and Aluisio Martins Torres.

Dr. Manuel Lobato, Special Delegate of the Governor of the State of Amazonas to the International Rubber Exposition; Dr. Carlos Cerqueira Pinto, Dillwynn M. Hazlett, Candido Mendes de Almeida, Baron de Suassuna, Member of Congress, Brazil; Jose Marcal, journalist, and Dr. Victor Resse de Gouvea.

The following American guests were present: A Staines Manders, Director-General International Rubber Exposition; Henry C. Pearson, Vice-president International Rubber Exposition, Editor INDIA RUBBER WORLD; E. G. Unitt, William H. Ukers, Editor "Tea and Coffee Trade Journal"; Dr Algot Lange; C. A. Green; E. W. Hiscox, and A. B. Lukens.

BANQUET OF THE BRAZILIAN COLONY OF NEW YORK, HOTEL ASTOR.

NOISELESS STREETS.

Efforts are being directed to make rubber pavements non-slipping, and this subject is receiving attention at the Exposition. Mr. Manders has expressed the conviction that with the aid of the American inventor, he will overcome this obstacle. At no distant date, it is expected, the streets of New York and other large cities will become silent and without becoming slippery.

As the "Morning Post," one of the leading London dailies, remarks: "There is a prospect that the day may come, when streets will be paved with rubber, so that the noise and vibration of traffic, which render life in a modern town so disagreeable, will be almost banished."

The Third International Rubber Conference.

PROGRAMME OF EVENTS.

THE Third International Rubber Conference will be held in the Grand Central Palace, on Lexington avenue between Forty-sixth and Forty-seventh streets, New York, from September 24 to September 30, 1912. The Executive Committee has made the following announcement, not only covering the object of the Conference and its general organization, but giving the schedule of the various meetings, together with the names of those who will take part and the subjects which they will discuss. Their announcement is as follows:

Purpose of the Conference.—This Conference has been called for the purpose of promoting knowledge of crude rubber and rubber products.

Membership.—Membership in the Conference may be obtained by registering with the secretary on or before September 24, 1912. Registration cards and numbers will be assigned in the Exhibition Hall at the New Grand Central Palace on and after September 23, 1912. All persons or corporations interested in the production of crude rubber, the manufacture of rubber goods, and the testing of these materials are eligible for membership. Delegates are asked to announce their connections when registering.

Meetings.—Meetings will be held in the mornings beginning at ten o'clock; in the afternoons beginning at two o'clock, and in the evenings at eight o'clock. The evening meetings will be held in those cases where the afternoon business has remained unfinished.

Technical Committees.—The work of the Conference will be done through committees who will be asked to present reports and recommendations at the final meeting.

SCHEDULE OF MEETINGS.

Tuesday, September 24, at 2 p. m.—An address of welcome by the president, Mr. Henry C. Pearson. The topic for discussion will be "Crude Rubber." Special papers:

"Rubber Contracts," by Mr. Arthur W. Stedman.

"The Plantation Industry," by Cyril E. S. Baxendale, Esq., of the Federated Malay States.

"Various *Manihots* Producing Rubber in the Central States of Brazil," by Dr. J. Santiago Cardwell-Quinn, Commissioner.

"Possible Rubber Producers in the Temperate Zone," by Mr. Charles P. Fox, Akron.

"Some Effects of Acclimatization Upon Guayule. *Parthenium Argentatum*," by Francis E. Lloyd, Montreal, Canada.

"The Smokeless Method for Coagulating of Rubber," by Dr. Cerqueira Pinto.

Wednesday, September 25, at 10 a. m.:

"Problems in Vacuum Drying," by Mr. J. P. Devine.

"Manufacture of Dipped Goods," by Mr. T. W. Miller.

"Physical Methods of Testing Rubber and Rubber Products," by Mr. P. L. Wormeley, Bureau of Standards, Washington.

"Factory Management and Organization Methods," by Mr. J. C. Jurgensen (President of the Institute of Operating Engineers), and Mr. Frederic Dannerth (consulting chemist).

DR. FREDERIC DANNERTH.

HENRY C. PEARSON.

CYRIL E. S. BAXENDALE.

Thursday, September 26, at 10 a. m.:

"A Brief History of Fire Hose Specifications," by E. A. Barrier.

Topical discussion on specifications (mechanical rubber goods for railroads, Federal and Municipal Governments), including as sub-topics: Air brake hose, railroad steam hose, fire hose, navy packings and steam packings.

"The Commercial Possibilities of Synthetic Rubber," by Mr. L. E. Weber, Boston, Mass.

Friday, September 27, at 10 a. m.—A report of the transactions of the Navy Conference at Washington, December, 1911, by Mr. E. S. Land, U. S. N. Topical discussion on specifications: (a) Materials for insulated wire; (b) Textile materials (sheeting, duck and yarns).

A preliminary report of activity by the "Railroad Committee" on "Standard Methods of Testing Rubber Products."

At this meeting the Rubber Section of the American Society for Testing Materials will be represented by Mr. E. B. Tilt, of Montreal, and the Rubber Section of the American Chemical Society will be represented by Mr. D. A. Cutler, of New York.

At 7 p. m.—Informal dinner for rubber chemists and engineers. (Place to be announced Friday morning.)

Saturday, September 28, 10 a. m.—Meeting for the presentation of resolutions and recommendation of official methods for physical testing and chemical analysis of crude gum and manufactured rubber goods.

A considerable number of topics for discussion have been forwarded to the secretary by manufacturers, as well as consumers of rubber goods. These will be presented on the appropriate days.

SOCIETIES REPRESENTED.

The following societies will be represented by official delegates:
American Chemical Society.
American Society for Testing Materials.
Society of Chemical Industry.
American Institute of Chemical Engineers.
German-American Technical Society.
Institute of Operating Engineers.

The following bureaus and Government departments will be represented by delegates:
U. S. Department of War.
U. S. Department of Commerce and Labor.
U. S. Department of the Interior.
U. S. Isthmian Canal Commission.

The Official Material Testing Bureaus of the principal foreign Governments.

The Factory Mutual Laboratories of Boston, Mass.

The following Governments will be represented by official delegates:
Federal Government of Brazil.
Federated Malay States and Straits Settlements.
Ceylon.
Hawaiian Islands.
Province of Moro, Philippine Islands.
Burma (India).
The State of Amazonas (Brazil).
The State of Matto Grosso (Brazil).
The State of Para (Brazil).
The State of Acre (Brazil).
The State of Minas Geraes (Brazil).
Bolivia.
Republic of Honduras.
State of Bahia (Brazil).

The president of the Conference is Henry C. Pearson, New York; and the honorary secretary, Frederic Dannerth, Ph. D.

The Executive Committee is as follows: E. S. Land, U. S. N., Washington, D. C.; D. A. Cutler, New York; Dr. Lothar Weber, Boston, Mass.; Dr. W. C. Geer, Akron, Ohio; D. S. P. Sharples, Boston, Mass.; Dr. Eugenio Dahne, Brazil; C. E. S. Baxendale, Esq., Federated Malay States; F. Crosbie-Roles, Ceylon; A. Staines Manders, London; Leonard Wray, Imperial Service Order, Federated Malay States.

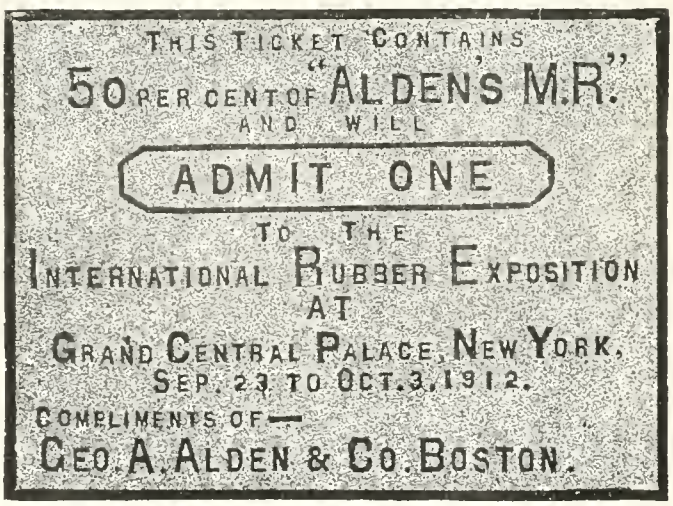
Dr. Cerqueira Pinto.

A. W. Stedman.

F. W. Miller.

RUBBER TICKETS FOR THE RUBBER SHOW.

Any ticket issued by the management and properly authorized will take the recipient into the Rubber Exposition; but George A. Alden & Co., of Boston, have issued a special ticket for the Exposition that is so distinctive that the man who receives one will certainly be loth to give it up at the gate, as it would serve as a fine permanent souvenir of that event. In issuing these to their friends Messrs. Alden & Co., remark: "This being a rubber exhibition, a rubber ticket seems more in keeping than one of mere cardboard; and as our "M R" improves and strengthens all grades of rubber, we have put in enough of it to demonstrate its remarkable properties as a compounding ingredient."



THE RUBBER TRADE IN AKRON.

By a Resident Correspondent.

THE Adamson Machine Co. is extending its present machine shop 240 feet, giving a total machine shop length of 480 feet, two stories high, equipped with modern machinery and machine shop conveniences. The company expects to occupy this plant completely by November 1. Mr. Adamson has recently been granted a patent on a hose mold, curing 500 feet or more at a single operation.

This company will be represented at the New York Rubber Exposition by its secretary and treasurer, R. B. Koontz. Mr. Adamson, the president, will be there part of the time. The present shop is crowded with work for rubber manufacturers—not only American, but English, Continental and other foreign concerns.

* * *

The Swinehart Tire and Rubber Co. has offered $150,000 worth of treasury stock to stockholders. Each stockholder will be allowed to take an amount equal to 23 per cent. of his present holdings. This offering is subject to the action of a meeting of the directors at their regular stockholders' meeting to be held September 25. The notice reads, "This action is made necessary by the company's inability to take care of the volume of business with its present capital." The quarterly dividend was reduced from 2 per cent. to 1½ per cent. in anticipation of the increased stock.

* * *

The Goodyear Tire and Rubber Co. plans to increase its auto tire output and working force 60 per cent. within the next year. It has under construction a new six-story factory building 80 x 400 feet, and an addition of two stories to another factory building. It is stated that the approximate cost of these improvements will be $300,000. It is expected that these buildings will be ready for occupancy by next spring. This will increase the working force two or three thousand, which means an increase in Akron's population of four to six thousand. F. A. Seiberling, president of this company plans to take care of the new employes by building houses on 300 acres, comprising several farms, which he has purchased just east of Blue Pond. It is expected that 100 houses will be built on the land at once as an experiment. The employes will be given the privilege of allowing the rent to apply on the purchase price of the home.

* * *

Mrs. Mary Perkins, widow of Simon Perkins, lately deceased, and one of the heaviest stockholders of the B. F. Goodrich Co., has given their old homestead located at the corner of Perkins and Prospect streets to the Association for the Aged, to be used as a temporary home until a permanent structure can be built by the association. C. B. Raymond will act as trustee of the property until it is turned over to the association. It is believed that the gift will place the organization on a permanent basis. Although it was founded several years ago, the trustees through lack of funds have never been able to start the construction of buildings on their property. A number of years ago, Mrs. Louisa Sumner died, leaving a farm of 80 acres located on high ground overlooking the city to the Board of Trustees to be used for a home for the aged. Mrs. Dr. Milligan, Mrs. Henry Robinson, F. A. Seiberling, Frank Adams and a few others have been very active, and by contributions and other means have preserved this excellent location for the purpose desired by the donor.

* * *

On account of the increased railroad traffic out of Akron, caused by the enormous enlargement of the various rubber companies, the Erie Railroad Co. this coming season expects to spend $400,000 to remodel the large yards south of Exchange street and the 40 acre property which it lately bought in Kenmore. Mr. Dunkel, general superintendent of this company said, "We fully realize that we have not kept pace with the growth of Akron. We also realize that Akron is one of the best cities in the State and has shown more growth during the past few years than any other city in the State." Vice-President Stewart of the Erie was in town last week and expressed surprise at the city's growth, and promised the above improvements. The Kenmore property will be developed into new yards. This will give the company a side track extending clear into the city, and will relieve the main track. It will also relieve the shippers by the building of side tracks leading to many of the larger factories.

* * *

The work on the Akron-Youngstown road is being pushed rapidly from Mogadore to the city of Akron. It is expected that this will be completed during the first half of 1913. This, when completed to Mogadore gives the manufacturers of East Akron another outlet and connects closely with the Wabash. It is believed by many that this new road will be controlled and operated by the Northern Ohio, one of the Lake Shore tributaries.

Last summer the Baltimore and Ohio Railroad Co. bought 40 acres of land along its line just north of Akron, which it expects to develop into new yards to facilitate its Akron trade.

The Cleveland, Akron & Columbus Railroad Co., one of the Pennsylvania lines, has, within the last few years, bought most of the land bounded by Mill, Prospect, East Market streets, and the Pennsylvania railroad lines, and has more than quadrupled its capacity for handling Akron freight. It contemplates within the next few years, building a large new office building for the head offices of the company.

* * *

The Akron division of the Philadelphia Rubber Works Co. is increasing its capacity by erecting additions to its present buildings.

* * *

A. H. Noah, former treasurer of the Diamond Rubber Co. has donated to the boys' camp of the Akron Young Men's Christian Association funds to help buy Cottage Grove, a summer resort located on the East Reservoir, six miles from Akron. The site consists of 11½ acres, with 1,156 feet of water front. The equipment to date consists of two tennis courts, a ball ground, three private cottages, bathing beach, large pavilion (the second floor of which is used for sleeping rooms, and the first floor for dining room and kitchen), one launch, steel boats and fishing boats. The camp will be used all the year round and cottages are being equipped with heating apparatus, so that the boys can take "hikes" there, in the winter and remain overnight. Mr. Noah says, "I think that the idea of boys having their recreation together is one of the best plans that can be arranged. There is nothing that will rub the rough spots off the boys more than to meet one another in play and endeavor. All of us have a dirty streak in us somewhere, and there is nothing better in the world to eradicate this streak than to associate with a bunch of clean-cut boys. I think that although any recreation is beneficial, outside recreation is the best, for it strengthens character and body, and these two are in as much need of development as is the mind.

"I am very well pleased with the uses to which the camp has been put, and am equally as well pleased with the bunch of boys who are using the camp. My hope is that when they grow older, they will see it as much their duty to aid the coming generations with either their physical, moral or financial support as we who are here now have done."

* * *

B. G. Work, who has been in Europe for some time, overseeing the building of The B. F. Goodrich plant at Colombes, France, has returned home.

* * *

Miss Irene Seiberling, daughter of F. A. Seiberling, president of the Goodyear Tire and Rubber Co., had a thrilling experience Saturday night, September 7, when a negro burglar, entered their home at 158 East Market street after the family had retired. Miss Seiberling awoke to see a man crawling on his hands

and knees within a few feet of her bed. She demanded what he was doing there. The negro made no response. She ordered him out of the house and with that, took after him. After chasing him out, she notified the other members of the family.

* * *

C. W. Seiberling, vice-president of The Goodyear Tire and Rubber Co., is having plans made for a new residence to cost $80,000. W. W. Sabin, Cleveland architect, has the plans in hand. It will be a two-story brick and stone structure in Colonial style.

* * *

O. C. Barber has just returned from an extended European trip.

* * *

F. A. Seiberling, president of the Goodyear Tire and Rubber Co., has returned from his vacation at the Cheneaux Islands. Mr. Seiberling has planned a magnificent home and a large estate at the northern end of Portage Path, the plans of which are being rapidly completed. To secure his ideal Mr. Seiberling has made an extensive trip through Europe and has carefully studied the various estates, manners and homes of Europe.

L. C. VanVever, of the same company, sailed for England on Sept. 3, to open an English branch and later to open a branch in France and each of the other countries of Europe, and as soon as these branches are fully completed, the foreign possessions of the various European countries will be exploited. It is the plan of the company besides establishing a branch in each one of the leading countries, to establish distributing systems radiating from the central branch of each country.

The new office building of the Goodyear company is completed and occupied. The main floor is used exclusively for executive offices, those of the president, vice-president, secretary and other executive officers being finished in solid mahogany. The remainder of the offices are finished in golden oak paneling. The entrance hall is elaborate and finished in oak. These afford spacious quarters for all departments.

* * *

In order to better cope with the rapid increase in business, the Goodrich company has built a factory at Colombes, near Paris, France. The company runs a touring bureau and furnishes reliable information concerning foreign tours free of charge.

* * *

It is estimated by Akron rubber men that the output of the Akron factories for the year of 1912 will exceed that of 1911 approximately 25 per cent.

THE NEW BRAZILIAN LEGISLATION.

It will be recalled that a decree was signed on January 5 last, by the President of the Republic of Brazil, by which various important measures were sanctioned for the benefit of the national rubber industry. A full extract of the decree appeared in The India Rubber World of June, 1912 (p. 427).

Since then the Brazilian Ministry of Agriculture has issued a series of regulations intended to put into effect the provisions of the decree. An English translation of both the decree and the regulations has been published by the Brazilian Government. It contains amongst other points, the regulations affecting the free entry of machinery, chemicals and other requirements of the rubber industry, of which the booklet contains a full list.

The regulations for experimental stations, rubber refinery and manufacturing establishments are likewise given at full length.

The Inter-Continental Rubber Co. on September 30 paid a quarterly dividend of 1¾ per cent. on its preferred stock, to holders of record September 20.

THE RUBBER TRADE IN CINCINNATI.

By a Resident Correspondent.

THE season of 1912 just closing will mark one of the greatest, if not the greatest, in point of business for local branch houses of the various rubber tire manufacturers in their history. For years this city has been looked upon by the tire manufacturers as an unprofitable city in which to open branch houses, as it was the general opinion that the automobile would not become a necessity, but would remain a luxury on account of the steep hills surrounding the city. These opinions were not well founded, and about the first to see the possibilities of this city as an automobile tire center were the Diamond and the Goodrich companies, which installed branch houses at a big expenditure. It did not take long for other manufacturers to follow these two companies and today the Commercial Club, and other civic organizations boosting trade for the Queen City never fail to call attention to the prominence of Cincinnati as an automobile tire center. Local agents for the various manufacturers are enthusiastic in their expressions of trade for next year and already many improvements are being considered to take care of the expansion of trade that is looked for in 1913.

* * *

The Ohio Retail Shoe Dealers' Association, which held its annual convention in Dayton, Ohio, early in September, has practically declared war upon the "fabric" footwear, especially on shoes made of cravenette cloth. Footwear of cloth and similar materials, it was said, "comes into being with the rising of the sun and ceases to be fashionable by night." Such styles were regarded as a source of trouble and expense. The association renewed its fight against the so-called trust manufacturing rubber footwear, and the committee having in charge the matter of financing a co-operative company to manufacture rubber footwear reported to the convention that plans were about perfected to launch a co-operative company in the near future. Fraudulent advertising, discounts and mail-order houses were assailed, and will be the objects of a relentless pursuit by the dealers from now on.

* * *

Coughlin & Davis, local agents for the Morgan & Wright Co., received an order the other day from a Southerner of pronounced political views. His letter containing the order follows:

"Nashville, Tenn., August 31, 1912.

"Coughlin & Davis, Cincinnati, Ohio.

"Gentlemen: Please send us the following tires:

"One 34 x 4 Nobby Tread, M. & W. Q. D.

"One 33 x 4 Nobby Tread, M. & W. Q. D.

"One 33 x 4 Round Tread, M. & W. Q. D.

"One 34 x 4 Inner Tube.

"Please see that we get Woodrow Wilson tires, as we don't care for the G. O. P. or Bull Moose. Very truly yours,

"Everett Philpot & Co."

* * *

The defeat of one of the Constitutional Amendments to the Constitution of Ohio, voted on by the people September 3, which provided for the issuance of a $50,000,000 bond issue for good roads in the State of Ohio, was keenly felt by local representatives of the tire manufacturers. While Ohio has been expending in the last few years sums in improving the various important highways of the State, yet good-roads experts say that at the rate of improvement it will be years before Ohio will have good roads in all sections of the State, and the proposed amendment was passed by the Constitutional Convention for the purpose of giving the Legislature authority to pass laws for a bond issue that would provide funds for improving the roads immediately. Local tire men say that the condition of many roads in Ohio is directly responsible for the major portion of complaints that come to them by automobile owners who complain of the life of tires.

THE RUBBER TRADE IN BOSTON.

By a Resident Correspondent.

BUSINESS in rubber, and its manufacture, is enjoying the same prosperity which seems to be vouchsafed to all other lines of industry. The consumption of automobile tires continues unabated, and the motor section of Boston, Boylston street, Massachusetts and Commonwealth avenues—is busy in spite of the general dilapidation and disorder of the former street, where traffic is terribly constricted, because of the construction of the new subway. Automobile dealers and supply houses report excellent business, even with these drawbacks.

The mechanical business has been and is good. Belting and kindred lines are in excellent demand, and even though the summer in New England has affected the domestic demand for hose, other lines—industrial and fire hose—have sold well; and even now orders are coming in most satisfactorily for 1913 delivery. The rubber clothing business is good. Salesmen now out are cautioned not to promise deliveries for six weeks or two months on orders taken now. Rubber footwear is now waiting for early fall storms, before many more orders are likely to be received, but the mills have orders enough on hand to advertise for makers right along in the "Help Wanted" columns.

* * *

The new Administration Building of the Hood Rubber Co., which has just been completed and occupied, is a model office business structure, and the move of the company in the placing of their business offices and the factory close together is one which is working out most advantageously. This building is a substantially built four-story edifice of reinforced concrete. In fact it is concrete from top to bottom, all the floors and roof, as well as the walls, being of this fire-resisting material.

A walk through the building is one which will give the visitor a good idea of its substantial character. The entrance opens into a roomy lobby furnished with oak tables and chairs. Hence the visitor is conducted to the desired department with the least loss of time.

On this floor are the main offices, all connected with a rubber carpeted corridor, each office enclosed with oak partitions and frosted glass. First is that of the Advertising Department, in charge of Mr. Kimball. Then come the three sales offices, that of Mr. Aldrich, the manager of sales, and those of Mr. Rice and Mr. Dailey, selling agents, the corner office being occupied by Mr. Mason, manager of footwear manufactures. A long aisle running from here to the back of the building separates the handsomely furnished sample room and the large Stenographic Department from the private offices of the Auditing Department, the tire salesroom, while Mr. F. C. Hood, general manager of the company, has his own private business office here. The other half of this floor is occupied by the extensive laboratory, and the basement under that is practically a miniature factory, where experiments are worked out before any novelty or change in manufacture is adopted. In the basement are the Paymaster's and Cashier's Departments, the offices of the Purchasing Department and Storekeeper, and the filing room.

Taking the elevator to the third floor the visitor is ushered to the Bookkeeping Department, where also are the offices of the Superintendent. The other portion of the third floor is devoted to the restaurant and welfare rooms, conducted by the company, for the benefit of the office force. The restaurant is a large and well-furnished room with tables and chairs in mission oak, and here also is the kitchen for furnishing the meals in the restaurant. There is also here a special dining-room for the officers and heads of departments.

On the top floor is the Order Department, where the various details of ticketing the orders for sending through the factory are made out. This floor also contains a large and well-equipped printing office with several jobbing presses, a power press, folders, binders, and addressing machines and other appliances for mailing out the literature printed in this office.

In the building adjoining the Administration Building are located the Cost Department, Sample Department, and a fully equipped hospital which serves without charge all the employes of the company.

* * *

The Walpole Rubber Co. is steadily increasing its business. During the first half of the present year it has done the largest business in its history, showing a gain of over thirty per cent. over the similar term in 1911. A large proportion of this increase is in the tire department, which has necessitated the securing of an additional manufacturing plant at Foxboro, an adjoining town.

* * *

The taking over of the Consumers' Rubber Co. by the Walpole Rubber Co. must redound to the great advantage of the footwear plant. Already a marked improvement is shown in the quality, finish and style of the product of this plant. Mr. Ryder, the new selling agent, is a thorough rubber shoe man. He was for years with the Boston Rubber Shoe Co., and later with the Apsley Rubber Co. He has opened an office and sample room at 508 Brown Building, 185 Summer street, on the same floor with the Walpole Rubber Co., and is showing there some fine samples of overs and tennis lines.

* * *

The Hubmark Rubber Co., which is a selling agency of the United States Rubber Co., constituted to push the sales in New England of footwear specialties bearing this trademark, is entering upon an extensive advertising campaign. Recently it sent out to a large number of retailers one-half of a storm slipper, the shoe being split lengthwise, enabling the recipient to examine the construction thereof. To push the sale of a certain brand of hip-boots it has contracted with over 50 local papers published on the New England seacoast, to issue a series of specially designed and very attractive advertisements, especially directed to fishermen and sailors.

* * *

Several of the manufacturers of rubber heels have made an arrangement whereby they will co-operate to exploit those heels which are provided with the "friction plug," a device of cotton fabric and rubber which, it is claimed, will overcome the tendency of rubber heels to slip on wet ice or pavements. Those interested in the combination include the Elastic Tip Co., Foster Rubber Co., F. W. Whitcher Co. of Boston, the B. & R. Rubber Co. of North Brookfield, Massachusetts, and the Revere Rubber Co. of Chelsea, Massachusetts. The heels thus advertised are the Safety Tread, Catspaw, Velvet, B. & R. and Spring Step.

* * *

R. L. Chipman of Geo. A. Alden & Co., crude rubber importers, is on a business trip to Canada.

* * *

Wallace G. Page, for several years sales manager of the Shawmut Tire Co., is now associated with George S. Van Voorhis in the American Marine Equipment Co., which has built up an extensive business in the sale of automobile tires and accessories.

* * *

The factory recently vacated by the Plymouth Rubber Co., at Stoughton, Massachusetts, has been purchased by the Elwell Rubber Manufacturing Co., of Trenton, New Jersey, who will remove its business to the new address, Stoughton, Massachusetts. The Plymouth Rubber Co. is very busy at its new factory at Canton Junction.

* * *

An increased popularity is noted in rubber-soled shoes. Some manufacturers, who experimented last year by showing one or

two samples, met with so great success that they are now showing, for next spring and summer wear, from half a dozen to a score of samples; while a number of other manufacturers have followed these pioneers. Most of their lines have the molded soles and half heels all in one piece; and these are furnished ready to attach by manufacturers who make a specialty of rubber soles and heels for shoe manufacturers.

* * *

The A. & A. Rubber Co. of South Framingham, manufacturers of rubberized fabrics, waterproof clothing and hospital supplies, will greatly enlarge their plant, not only adding to the original factory, but by erecting another structure. The present factory will be so enlarged as to give extra floorage, 150 by 40 feet, in the second story, and the present building will be paralleled by a one-story factory 150 by 60 feet. This second structure will have a false end, so that if further enlargement is necessary, a very considerable lengthening on the land of the company can be made. President Calvert B. Archer is quoted as authority for the statement that with their present facilities, even when working a day and night force, the company is unable to keep pace with its orders, and therefore the enlargement is found necessary.

THE RUBBER TRADE IN TRENTON.

By a Resident Correspondent.

THE Essex Rubber Co., Inc., has arranged for a creditable exhibit at the International Rubber Exposition, New York, scheduled for the week of September 23-30. The company has planned to have the heads of the various departments of the big local plant in attendance at the exposition during the entire show.

W. F. Bainbridge will be on hand to greet those men of the shoe trade who will find it possible to visit the exposition. R. H. Phillips and C. C. Tucker will go over from the local factory and in conjunction with S. Y. L'Hommedieu, the manager of the New York branch, will expound the virtues of the Essex automobile accessories and engineering specialties. T Wesley Wright, manager of the shoe findings department of the local plant, is to have charge of the booth which will exhibit "Soft Spot" heel cushions and the "Tred-Lite" rubber heel.

President C. H. Oakley, who is also the general manager of this concern, expects to spend considerable time in New York during the exposition and will be glad to meet personally interested visitors. The Essex Rubber Co. is one of the busiest concerns in this section, the orders which have been piling in necessitating the employment of the working force overtime. The company is not only doing a big business in America, but finds a ready market abroad for its specialties.

* * *

W. J. B. Stokes, head of the Home Rubber Co. and the Joseph Stokes Rubber Co., who recently returned from a European trip, declares that the outlook for a big export business was never brighter. He visited England, Belgium, France and other countries and spent considerable time with his English representatives.

* * *

The Crescent Belting plant is a busy place just now. The force is working day and night to keep up with the flood of orders sent in by the "Live Wires" on the road for this concern.

* * *

The new stock room of the Empire Rubber Manufacturing Co.'s plant is ready for occupancy. It was built at a cost of $24,000. The old stock room was partially destroyed by the explosion of two giant vulcanizers.

* * *

Although the Empire Rubber Manufacturing Co. and Empire Tire Co. and Crescent Belting and Packing Co. will not have an exhibit at the Rubber Exposition, General C. Edward Murray, treasurer, and A. Boyd Cornell, secretary of the concerns, will be in attendance at the show. General Murray plans to spend several days at the show as does Secretary Cornell.

Carl Claus, one of the ablest engineers in the rubber business, will attend the show as will also Superintendent Abden Lee and Assistant Superintendent Frederick Bechtel.

THE RUBBER TRADE IN RHODE ISLAND.

By a Resident Correspondent.

THE wire making department recently started at the plant of National India Rubber Co., Bristol, has been almost swamped with orders. The day after Labor Day the company began operations on a night and day schedule and added 150 men to the working force.

Frederick L. Dunbar has charge of the wire department under the supervision of Le Baron C. Colt, agent of the company, who designed it.

The wire making is done in a large room formerly used as a calender department in the mill on Wood street. The company has turned out insulated wire for a long time. Recently it decided to try wire drawing in its own plant on a small scale, and immediately found itself with a large amount of business on hand. The starting on a night as well as a day schedule is the result.

It is said that the working force is to be still further increased by at least 200, and that new buildings for this branch of the industry may be erected in the near future.

* * *

An idea of the value of the rubber industry to the city of Providence can be gained from the assessed valuations made public early in September for the year 1912. The assessed valuation of the property of the rubber companies is $2,111,020, divided as follows: Joseph Banigan Rubber Co., $161,100; Bourn Rubber Co., $147,000; Davol Rubber Co., $400,000; Goodyear Tire & Rubber Co., $50,000; Mechanical Fabric Co., $336,740; Revere Rubber Co., $1,016,180. A tax of $1.65 per hundred is levied upon this assessment by the city, and corporations capitalized over $50,000 also have to pay a tax to the state.

The assessment against the Joseph Banigan Rubber Co. shows a decrease of $149,000; that against the Davol Rubber Co. an increase of $225,000; that against the Mechanical Fabric Co. an increase of $75,000, and an increase of $926,380 against the Revere Rubber Co. Nothing could furnish a surer indication of the general prosperity of the business in the capital of this state.

The total assessment against Col. Samuel P. Colt in Providence is $210,100; against Augustus O. Bourn, $113,640, and against the Joseph Banigan Estate, $1,261,520.

* * *

In the city of Woonsocket, where the two plants of the Woonsocket Rubber Co. and one of the American Wringer Co. are located, rates on gas and electricity are to be reduced. The present rate for gas is $1.20 per thousand cubic feet, and for electricity 1¼ cents per kilowatt per hour. A City Council committee is working on the proposition. Hopes for success are based on a promise made by the Stone & Webster Corporation of Boston that these reductions would be made, if it could secure a charter to merge all its gas and electrical holdings in the Blackstone Valley. This charter was granted at the last session of the Rhode Island Legislature.

* * *

Col. Samuel P. Colt, who went to Europe last July, returned to his home in Bristol on Saturday, September 7. He reached New York on the steamship *Olympic* September 5. In a telegram to a Providence paper he explained that while his trip abroad was primarily for pleasure he had also mixed business in. He stated that one of his tasks was an effort to list $10,000,000 of

first preferred stock of the United States Rubber Co. on the parquet of the Paris Bourse. He expressed the opinion that negotiations were progressing satisfactorily, and that the task would be accomplished in a reasonable length of time.

The $10,000,000 would be the minimum amount, he stated, and would be increased from time to time as the original offering was absorbed.

Col. Colt attended the marriage of his son, Roswell C. Colt, to Miss Dorothy Chipman in London. He was accompanied on his arrival in New York by the newly married pair.

On his arrival in Bristol Col. Colt and his son and the latter's bride went to the colonel's home, Linden place. He entertained a party of friends at his home three days after his arrival.

* * *

An alarm from box 332 in Providence on August 27 started considerable excitement in this city that day. It is the private fire signal of the Revere Rubber Co. (the United States Tire Co.), where the worst fire in many years broke out a few months ago. The blaze was over a boiler in the fireroom and was quickly extinguished, but enough apparatus was rushed to the scene to end a conflagration.

* * *

The largest unit of tax to be paid in the town of Bristol, Rhode Island, this year will be by the National India Rubber Co. The assessment is $6,870.55 on a valuation of $501,500.

Other tax figures made public during the past few weeks are: Augustus O. Bourn, who is head of the Bourn Rubber Co., $26,000; Samuel P. Colt, $239,000; Terrence McCarty, General Manager of the Walpole Rubber Co.'s Bristol plant, $24,700.

* * *

Metal fittings began to disappear from the plant of the Revere Rubber Co. quite regularly late last month. Police inspectors who went to work on the case arrested Edward Abbott, 19, on August 26. Fifteen fittings were found in his possession. He was fined $25 and costs in the Sixth District Court, Providence.

* * *

Elmer J. Rishe, an assistant foreman at the plant of the Walpole Rubber Co., Bristol, formerly known as the Consumers' Rubber Co., was married early in September to Miss Mildred Louise Macauly. In addition to being a foreman in a rubber manufactory, Mr. Rishe is a well-known baseball player.

* * *

Gilbert McCarthy, who for many years was an arctic maker in the Alice Mill of the Woonsocket Rubber Co., died at his home in Woonsocket, September 6. He was 40 years old; was born in Wallingford, Conn., and had been employed in Woonsocket for 30 years.

THE RUBBER TRADE IN SAN FRANCISCO.

By a Resident Correspondent.

MERCHANTS report that there is a decided improvement in the rubber business, and all are agreed that if present prospects continue the present fall will be one of the most prosperous in the history of the business. A heavy and, considering the time of the year, very unusual rain fell for several days last week, reaching all through the northern portion of the State and down far into the San Joaquin Valley. This rain caused an immediate demand for supplies from the wholesale houses, because the dealers were unprepared for such an emergency, and for a few days there was a grand rush everywhere.

* * *

A new company has launched forth with the object of acting as selling agents on this coast for Eastern factories. The name is the Ralphs-Pugh Co., and offices and warerooms have been fitted up at 502 Mission street. This firm is composed of men well known in the rubber business, and has started out in a business-like way. Wm. J. Pugh, for the past thirteen years has been with the Goodyear Rubber Co. It seems that almost all of the men in this business started out and learned it under the guidance and able direction of the proprietors of the Goodyear Rubber Co. Mr. Pugh made a trip to the Eastern factories and returned with a number of good lines. Isaac Ralphs was formerly manager of one of the largest jobbing houses in San Francisco, and although he has never been identified with the rubber trade before, he has been in business here for the past twenty-five years, and is a man of high reputation. W. W. Woodd is also with the new firm, and will look after the selling end of the business. Mr. Woodd also had his training with the Goodyear Rubber Co., having been with that firm for over 18 years. Mr. Pugh has recently started out on his first trip, going to the southern part of the State, and then on his return will make the northwestern trip through Washington and Oregon.

* * *

The western territory over which Joseph V. Selby, during his lifetime, had charge for the Boston Woven Hose and Rubber Co., has since Mr. Selby's death been divided into three subdivisions. Mr. Ryker has been appointed to take care of the territory lying between Bakersfield and the northern State boundary line. Mr. Ring, who formerly represented the company at Denver, Colorado, has been selected to take charge of the Washington and Oregon territory. This district was for some time covered by Herbert Selby, son of Joseph V. Selby, but a few months ago Herbert Selby severed his connections with the company to take a position as sales manager for the Tubbs Cordage Co., of San Francisco. Mr. Lippincott, who formerly traveled for the Boston Woven Hose and Rubber Co., will now be the regular representative for Southern California and Arizona.

* * *

S. L. Plant, of the Plant Rubber and Supply Co., states that business is ahead of last year, and prospects are good for a fair business. This firm has just added a new branch to its factory for the purpose of making mold rubber work—valves, bumpers, etc.

* * *

The San Francisco Fire Commissioners have at last awarded contracts for fire hose for this city. Only four bids were submitted, two of them being eastern factories and two of them local, and the contracts were awarded to the local manufacturers. Most of the eastern factories wrote to the fire commissioners that they would gladly bid and would supply hose that would withstand the test, but they strenuously objected to the fire commissioners laying down the rules as to how they should manufacture their hose. The Bowers Rubber Works was allowed the contract for 20,000 feet of two-and-three-quarter hose. The American Rubber Co. got the contract for the three-and-a-half-inch hose, and those two concerns divided on the one-and-a-half-inch hose. Both of these are local manufacturers.

* * *

E. W. Balding, the general sales agent of the New York Belting and Packing Co., has just paid his annual visit to the Pacific Coast.

* * *

J. E. French, coast manager for the Pennsylvania Rubber Co., has returned from a trip to the Northwest, and while there opened up some important distributing points. He expects excellent business in the tire line this fall.

* * *

Mr. Norton, manager of the American Rubber Manufacturing Co., reports that the new addition to the factory at Emeryville

has been completed, and that a large new belt press has been installed. This factory is also working on a new ribbed-edged automobile tire which is considered very successful.

* * *

The California Rubber Co. has been incorporated in Los Angeles with a capital stock of $5,000. The directors are C. C. Booth, W. D. Walsh and W. C. Earhuff.

* * *

The Portland Rubber Mills Co. has been incorporated at Portland, Oregon. It has a capital stock of $25,000 and the incorporators are J. A. Spencer Smith, H. C. Huntington and G. C. Frisbie.

* * *

The Portland Belt and Manufacturing Co. has been incorporated at Portland by M. P. Klepper, with a capital stock of $25,000.

* * *

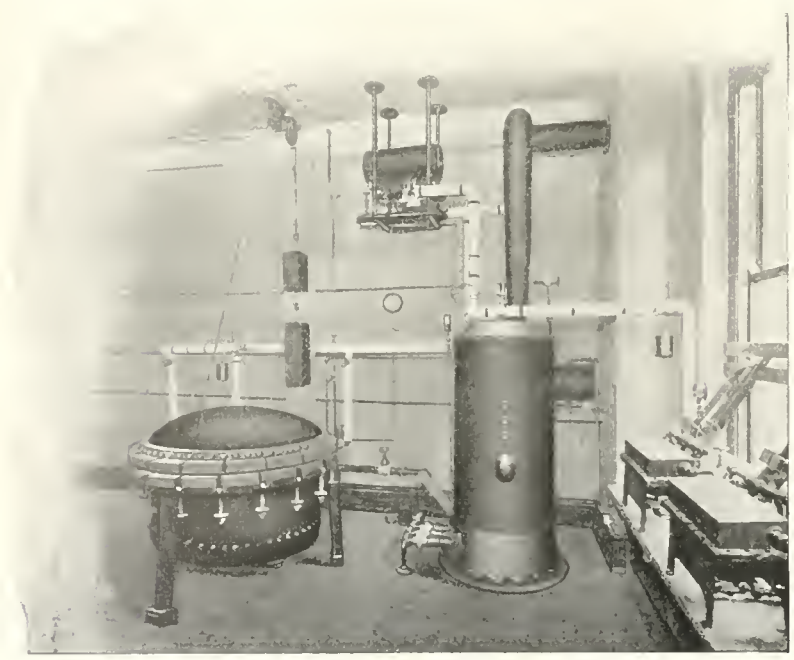
W. H. Halliwell, president of the Halliwell Co., has just returned from a trip to the factories in the East, and while there made a contract for the entire Pacific Coast on Knight tires. The Halliwell stores in Los Angeles, San Francisco, Seattle and Portland will receive the tires in carload lots, and after that by regular shipments, so that within a very short time the entire coast territory will be fully supplied.

* * *

The California League of Municipalities is now holding a public welfare exhibition at Berkeley, California, and many hose manufacturers are displaying their products at the show.

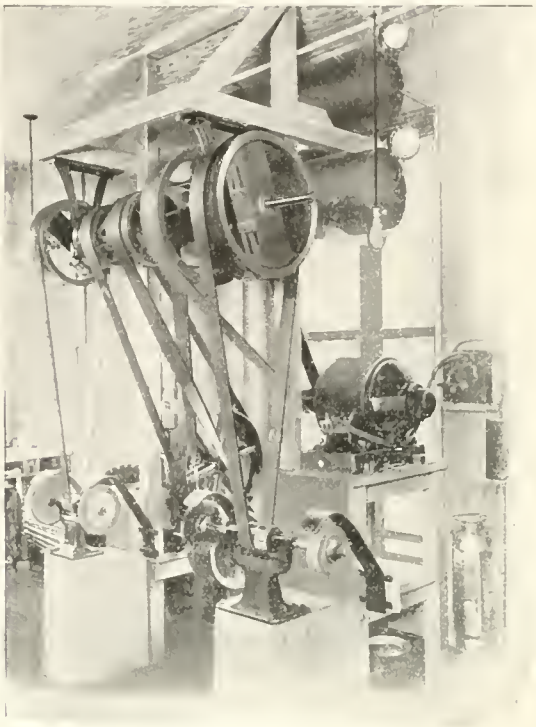
EQUIPMENT FOR REPAIR DEPARTMENT.

THE Fisk Rubber Co., Chicopee Falls, Massachusetts, not only make tires, but they make the wherewithal to keep the tires in repair. The two accompanying illustrations show some of their tire-repair equipment. The larger cut shows the pot heater for retreading tires, and the boiler; while the other cut shows the power bench.



THE FISK HEATER AND BOILER.

The heater is shown on the extreme left with weights attached for lifting the hinged cover. This heater is made of ¾-inch steel, with heavy bolts, and is equipped with traps and reducing valves, making a fine apparatus for curing treads and rebuilding tires.



THE FISK POWER BENCH.

The gas boiler, which appears in the centre of the picture, is a convenient arrangement for producing steam for a repair shop.

The cut also shows two vulcanizers on the extreme right. Pressure for curing tubes is obtained by placing weights on the end of the levers. This gives a positive pressure which is always the same, instead of an uncertain pressure obtained by screwed clamps.

The second cut gives a view of a power bench, which is designed to give maximum efficiency within minimum space. There is a single line of shafting connected with motor and with the various pieces of its equipment. The motor is of sufficient horsepower not only to operate the buffing brushes and wheels, but also to pump sufficient air for shop use and for inflating tires; the air is carried into the tow tanks at the top of the power bench. The retreading or the buffing drum, shown at the extreme left of cut, is rapidly becoming a necessity where retreading work is done. The buffing heads shown in the foreground contain two emery wheels, a wire buffing brush and a rotary rasp. The power bench also contains an air compressor. The cut shows the compact design of the equipment.

A British diplomatic report states that a contract has been signed between the Ministerio de Fomento and Senor A. Elozria, for the establishment of factories in Mexico for the manufacture of all kinds of rubber goods; including motor and carriage tires, waterproof cloth, insulated wire, etc. At least $125,000 must be spent upon the first factory. The materials and plant necessary for establishing the industry may be imported free of duty.

The India-Rubber Trade in Great Britain.

By Our Regular Correspondent.

CLIMATIC conditions have been the reverse of those which obtained in the long, dry summer of 1911, cold and wet having been most persistent. Last year there was a run on garden hose, and extreme slackness in the waterproof garment trade. This year it has been the other way about, and the mackintosh has been in almost daily use—a fact which, if not reflected in an immediate increase of sales, must certainly have shortened the life of those in use, and cause renewals to be sought at an earlier date than would have been the case as the result of a normal season.

THE LATE SUMMER.

Lawn tennis, which I may say is increasing in popularity, and calling for a larger supply of balls than ever, has suffered by the weather; but if the ordinary player has saved on his ball accounts, the wet weather prevailing during many of the tournaments, has led to the use of a greater number of new balls; so I do not suppose that the season's consumption will show much falling off compared with last year. The latest novelty in balls is a corrugated-surface, uncovered white ball, which can be easily washed. This has not been recognized by tournament committees, but private players have spoken highly of it, especially for use on wet lawns, near smoky towns, chiefly because the ball can be so readily washed.

One of the disadvantages of the mackintosh for pedestrians is that in heavy rain the drippings fall on the trousers. Of late this has been remedied by the introduction of loosely fitting trouser overalls. These, made of light double-texture waterproof cloth, are becoming very popular for pedestrians and general country wear, as they are very little weight to carry when not in use. The weather has given an impetus to the sale of top-boots for children to use in gardens. I have come across quite a number of these diminutive boots this summer, and as a patriot was pleased to find that they were made by the North British Rubber Co.

THE CELLULOID DANGER.

The lamentable conflagration in a celluloid workroom, in London, whereby several girls lost their lives, resulted in a good deal of correspondence in the press, and in questions being asked in Parliament. It has transpired that no special regulations were in force with regard to the storage and use of large amounts of this material in crowded localities; but in the future special rules regarding it are to be enforced. It was stated at the inquest that the material used was German, which was cheaper than British, although acknowledged to be more inflammable. One would have thought that here was a golden opportunity to advertise the merits of non-inflammable celluloid, but I did not see any correspondence on the point; though of course there may have been such, which escaped my notice.

Exactly what success has attended the manufacture and sale of non-inflammable celluloid, I do not know, though at least one factory for making it has been established in England. Mr. Worden, in his treatise of last year on the nitro-cellulose industry, refers to the methods for destroying the inflammability as having been attended with varying degrees of success, though he says that the rapid growth of the moving picture industry has invested the topic with increased importance. I believe that Mr. Worden is officially connected with the section in "Plastics," at the forthcoming Congress of Applied Chemistry in New York, and any information which he could announce to the world, by way of bringing the position up-to-date, would I am sure be appreciated generally. As to the cause of the London fire there was no mystery, flaming sealing-wax in the hands of a boy being responsible. Christmas cards were the principal goods manufactured, and the firm have decided not to use sealing-wax in the future in doing up parcels. Whenever there is a conflagration of celluloid goods, there is usually some agitation that the business should be suppressed, and this question was put to the jury, who, however, thought that such business might continue to be carried on in towns, if under proper registration and supervision. We must now await the action of the Home Office, in regard to this proviso.

THE PARAGON RUBBER MANUFACTURING CO., LIMITED.

This new company, which is situated at Sculcoats, Hull, has taken over the rubber manufacturing business of Messrs. Major & Co., Limited, a firm which has been long established in connection with tar distilling, in the Hull and Birmingham districts. The flotation of the Reinforced Rubber Co., Limited, in 1911, will be recalled by some of my readers. With this company Messrs. Major & Co. were connected, the factory being located on their premises. The Paragon Rubber Co. is an extension of the Reinforced Rubber Co., taking over the patents and goodwill of the latter under new management. Messrs. Major, Hanson and Pilling are the directors, and the general manager is E. L. Carbishley, so well known to the trade generally, owing to his past connection with Messrs. Capon, Heaton & Co., Limited, Birmingham, and the Gorton Rubber Co., Limited, Manchester.

Reinforced rubber differs from ordinary insertion, and in appearance is just like ordinary rubber, the fibres of cotton being completely incorporated in the rubber, in a tightly twisted state. The effect is to increase the stability of the rubber, while increasing its specific gravity; thus acting as a restraining influence over undue extension while in work. The works have been fitted with modern machinery for making many classes of mechanical goods, further extensions being contemplated. Rubber-covered rollers are a specialty, the firm having exceptional facilities for producing these accurately and quickly, up to 11 feet long and 30 inches in diameter. In a general way the establishment of a rubber works on the east coast is of interest, it being somewhat strange that rubber manufacturing proper has never had any location in the large Yorkshire towns. There must be a large demand for mechanical rubber goods in an important shipping centre like Hull. The manufacture most prominent in the district is that of oil seed crushing, Hull I believe ranking next to Marseilles as regards this business in Europe.

THE PUTOMAYO AFFAIR.

I do not propose to refer to this matter again at length, but feel constrained to mention one point in the interesting leading article in the August number of The India Rubber World. The credit for the exposure of that wretched business belongs solely to "Truth," which journal alone was bold enough to print copious extracts from Messrs. Hardenburg's and Perkins' MS. What appeared in other papers was given in a halting way on the authority of "Truth"—*palmam qui meruit ferat.* As indicating how public feeling has been stirred in this country by the disclosures, I may say that a town meeting to discuss the matter was called by the Lord Mayor of Manchester, on the request of many prominent business firms; and it is stated that the Blue Book has been sold out,—a fact which must have startled the purveyors of government literature. With regard to further action the position is that the government has promised to appoint a Departmental Committee to inquire into the affairs of the British Amazon Co., Limited, and the responsibility, or otherwise, of the directors thereof for what has taken place. It

is a pity that The India Rubber World has not a wider circulation among the British public, as the map given in the August number is a great improvement on what has been given in our daily and weekly press.

THE LITHERLAND DEVULCANIZER EXPLOSION.

The Board of Trade Report, embodying the result of the inquiry, held last December, into the explosion which occurred at the Northwestern Rubber Co. works in October, 1910, has now been issued. I have already given the Commissioner's findings at the inquiry, and the final report shows practically no alteration. Although no one at the works was found culpably negligent, reference is directed to insufficient engineering control. The cause of the explosion was hydrostatic pressure, due to over-filling of the devulcanizer; and an improvement has now been effected by the Boiler Insurance Co. whereby this cannot occur in the future. Referring to the future working of these devulcanizers, the commissioners say that they are satisfied from the evidence, that they cannot be said to be worked under safe conditions, without some safety appliance which must be automatic. Beyond that it must be automatic, they did not propose to make any definite recommendation as to what form the safety appliance should take. The matter is evidently to be left to the discretion of those who use high pressure devulcanizers, and it will be interesting to see how it develops. In an editorial in the March issue of The India Rubber World a plea is put forward for the utilization by rubber works of the services of the consulting engineer, and it certainly would seem, in the light of the four or five accidents in recent years due to plants using high pressure steam, that rubber factories, where no regular engineer is employed, should employ the consulting engineer to a greater extent than is now customary. The inspectors of the Boiler Insurance Companies in England do admirable work, of course, but it is outside their province to instruct or give advice; nor in most cases have they any detailed knowledge of the rationale of the operations involving the use of high pressure steam. I propose on a later occasion to say more on the particular question of automatic safety appliances, and shall conclude the present notice by mentioning that the Board of Trade Report refers to the boiler which exploded, as being the property of the London & North Western Rubber Co., Limited, U. S. A., of Canal Bank, Litherland. In another sentence the superfluous "London" is omitted; thus indicating some slackness in proofreading.

IMPROVED DOCK ACCOMMODATION FOR RUBBER IN LONDON.

Advices from London state that owing to the rubber business of the port having tripled within the last five years, improved dock accommodation is about to be furnished. This will be effected by the transfer of the warehousing of rubber from St. Katherine's Docks to London Docks.

A special warehouse is to be set aside wherein, under ideal conditions, rubber can be received, sampled and stored against delivery to consumers. The change will provide largely improved facilities compared with those available hitherto. This innovation is, needless to say, greatly appreciated by Mincing Lane.

THE CAB TIRE SHEATHING FOR ELECTRIC CABLES.

The St. Helens Cable and Rubber Co., Limited (London, England), have been making a cab tire for the last 9 or 10 years which has proved very serviceable, and they have recently begun the manufacture of a rubber sheathing for electric cables. As they are making this out of the same quality of rubber used in their cab tire they call it the "Cab Tire Sheathing"—which explains why they have selected this particular name for their new production.

STATISTICS OF RUBBER SUPPLIES AND CONSUMPTION.

THREE statistical tables, which have recently been issued, merit special attention and comparison: That of S. Figgis & Co., of London, for the calendar year 1911 (A); Hecht's returns (issued by Messrs. Hecht, Levis and Kahn of Liverpool) for the rubber year ending June 30, 1912 (B); and the recent estimate for 1913 of the Rubber Plantation Investment Trust (C).

In table A production is shown as 88,000 tons and consumption at a like amount; while in table B are summarized Hecht's figures, which for the year ending June 30, 1912, indicate production as 95,262 tons and consumption as 99,564 tons. Finally in table C the estimate for 1913 is 91,000 tons for production and 103,000 tons for consumption.

From a comparison of these tables, the estimate for 1913 (C) it will be remarked, shows the Brazilian quantity at the same figure as the report (A) for 1911—39,000 tons. Plantation rubber, which including Borneo and Rangoon may be taken as representing about 18,000 tons in table A, appears in the estimate of table C as 28,500 tons, this increased estimate being more or less in proportion to the increased supplies now coming forward. As table C does not include anything for Guayule, though figuring in table A, its estimate might therefore properly be regarded as representing about 100,000 tons for 1913, against 88,000 for 1911, and 95,262 by Hecht's figures for 1911-12. South American and plantation rubber as shown in table C constitute between them over two-thirds of the world's estimated rubber production for 1912.

The increase of consumption as shown by the three tables is more or less in harmony with the estimated increased supply being for 1911, 88,000 tons; for 1911-12, 99,564 tons; and for 1913 (estimate) 103,000 tons. American consumption, it is satisfactory to note, comes in for an increased estimate; the quantity of 42,000 tons shown for 1911 being 47,500 tons in the estimate for 1913. Thus the United States is expected to continue taking about one-half of the world's production of rubber. That this is now the case is shown by the official returns of imports for the fiscal year 1911-1912, which show a quantity of 55,000 tons, as compared with the latest estimate for 1913 of 47,500 tons. Hence this country is keeping ahead in the rubber procession, with more than three times the consumption of England, according to the English table appended (table A).

TABLE A—PRODUCTION AND CONSUMPTION FOR 1911.
(S. Figgis & Co., London.)

Production 1911, Actual.	Tons.	*Consumption* 1911, Actual.	Tons.
Brazil	39,000	America and Canada	42,000
W. Africa	15,000	England	12,000
E. Africa, Penang, Borneo and Rangoon	5,500	France	8,000
Assam, Madagascar, C. America and Mexico	2,500	Russia	8,500
Guayule	9,200	Italy	2,000
Plantation	14,000	Japan and Australia	1,500
Malaysian and extracted for Jelutong	2,800	Germany and Austria	14,000
Total	88,000	Total	88,000

TABLE B—HECHT'S WORLD'S FIGURES, 1911-12.
(Summarized.)

	Para Grades.	*Medium Grades*	*Totals.*
Arrivals (production)...*Tons*	40,953	54,309	95,262
Deliveries (consumption)	44,194	55,370	99,564

TABLE C—PRODUCTION AND CONSUMPTION FOR 1913.
(Estimate of Rubber Plantation Investment Trust.)

Production 1913 (Estimated)	Tons.	*Consumption* 1913 (Estimated)	Tons.
South America	39,000	America	47,500
Plantation	28,500	Great Britain	15,000
Africa	15,000	Germany	15,000
Central America	5,000	France	10,000
Assam, Rangoon, Borneo	2,500	Russia	7,000
All other sources	1,000	Belgium	1,500
		Various countries	7,000
Total	91,000	Total	103,000

COMMENTS UPON MESSRS. HECHT'S FIGURES.

In a circular summarized by the *Kölnische Zeitung*, it is maintained that the figures quoted in table B are inaccurate and should be as follows:

Production 91,135 tons instead of 95,262 tons.

Consumption 90,071 tons instead of 99,564 tons.

Hence it is argued that the heavy increase in the world's consumption has been surpassed by the world's production.

The point of greatest interest in the circular is the statement that Messrs. Hecht's estimate of present visible supply is insufficient, and instead of 10,181 tons should be 14,734 tons, to include rubber afloat for various destinations; to which, it is claimed, should be added about 2,000 tons undeclared Pará rubber stocks in Liverpool, and 1 to 2,000 tons in the export places of the East.

VISIBLE STOCKS.

In the estimates of visible stocks (June 30, 1912) the figures stand as follows:

	Hecht.	Suggested Correction.
Pará	6,817	6,970
Medium plantation	3,364	7,764
	10,181	14,734

The difference in Pará grades, it will be noticed, is slight, while in medium and plantation grades the figures stand thus:

Hecht's quantities are:

	Tons.
London	1,872
Liverpool	281
U. S. A.	402
Lisbon	350
Antwerp	343
Rotterdam	116
	3,364

To these figures, it is claimed, there should be added:

	Tons.
Hamburg	400
Bordeaux and Havre	250
Afloat for London	2,150
" " Liverpool	250
" " Lisbon	200
" " Rotterdam	100
" " U. S. A.	250
" " Hamburg	300
" " Bordeaux & Havre	200
" " Antwerp	300
	4,400
Stock as shown	3,364
Stock of medium and plantation, as suggested	7,764

FIVE YEARS OF GERMAN RUBBER GOODS EXPORTS.

STATISTICAL returns of the total exports of German rubber manufactures for the years 1907 to 1911 show the equivalents of the following totals:

TABLE A.
TOTAL GERMAN EXPORTS OF RUBBER MANUFACTURES.

	Weight.	*Value.*
1907	10,502 tons	$15,487,500
1908	10,638 "	13,326,750
1909	11,050 "	13,792,500
1910	13,251 "	16,652,500
1911	15,773 "	18,529,000

While the total value of German exports of rubber goods has thus increased within five years from 15½ millions to 18½ millions of dollars (or about 20 per cent.), that of the United States exports for the same period has advanced from 6¼ millions to 11 millions of dollars, or 80 per cent.

GERMANY'S LARGEST CUSTOMERS.

The four largest foreign customers of Germany in this branch are Great Britain, France, Italy and Austria, which countries took between them about 36 per cent. of the German exports in that line for 1907, and 42 per cent. for 1911.

The separate comparative details for the years 1907 and 1911 are shown in Table B:

TABLE B.
PRINCIPAL EXPORTS OF GERMAN RUBBER MANUFACTURES.

	1907.		1911.	
	Tons.	*Value.*	*Tons.*	*Value.*
Great Britain	2,214	$3,275,750	3,597	$4,254,000
France	432	946,625	897	1,437,000
Italy	249	442,000	815	1,106,250
Austria	496	889,250	709	1,025,750
Total	3,391	$5,553,625	6,018	$7,823,000

That the quantity has increased 85 per cent. while the value has only gained to the extent of 40 per cent. is probably attributable to the lower cost of crude rubber during the latter part of the five-year period.

UNITED STATES TRADE WITH GERMANY'S LARGEST CUSTOMERS.

Although only about half the size of the German rubber goods trade with the four largest foreign customers of that country, that of the United States has increased at double the rate during the five years named, as shown by Table C:

TABLE C.
UNITED STATES COMPARATIVE EXPORTS OF RUBBER GOODS.

Great Britain. 1907.		
Belting, hose and packing	$ 107,731	
Boots and shoes	320,595	
All other manufactures	1,216,490	$1,744,816
France.		
Belting, hose and packing	$ 18,968	
Boots and Shoes	53,676	
All other manufactures	40,093	$ 112,737
Italy.		
Belting, hose and packing	$ 598	
Boots and shoes	49,203	
All other manufactures	95,930	$ 145,731

Austria-Hungary.		
Belting, hose and packing	$ 1,975	
Boots and Shoes	23,499	
All other manufactures	13,093	$ 38,567
Total		$2,041,851
Great Britain. 1911.		
Belting, hose and packing	$ 186,839	
Boots and shoes	631,421	
Tires	1,231,894	
All other manufactures	1,115,092	$3,165,246
France.		
Belting, hose and packing	$ 3,319	
Boots and shoes	75,885	
Tires	194,008	
All other manufactures	118,775	$ 391,987
Italy.		
Belting, hose and packing	$ 2,181	
Boots and shoes	74,856	
Tires	18,369	
All other manufactures	43,792	$ 139,198
Austria-Hungary.		
Belting, hose and packing	$ 8,676	
Boots and shoes	19,376	
Tires	329	
All other manufactures	9,658	$ 38,039
Total		$3,734,470

Grouping the results the following position is shown:

TABLE D.

EXPORTS OF RUBBER GOODS TO FOUR LEADING MARKETS.

	1907.	1911.
Germany	$5,553,625	$7,823,000
United States	2,041,851	3,734,470

Thus, while Germany has gained at the rate of 40 per cent. the United States has progressed in more than double that proportion. American manufacturers should be thereby encouraged to persevere in their efforts to catch up with their German competitors in the export field.

UNITED STATES TRADE WITH GERMANY.

American imports of rubber manufactures from Germany, which in 1907 represented $1,028,746, afterwards dropped by degrees, amounting in 1911 to $438,302. United States exports to Germany of rubber manufactures meanwhile rose from $475,478 in 1907 to $711,831 in 1911.

NEW PATENT LEGISLATION IN HOLLAND.

Official announcement has been made of the going into effect on June 1, 1912, of the new Dutch law referring to patents. The patents issued under its provisions cover Holland, with its colonies and dependencies. It has a retroactive effect, extending back for a year.

In view of the increased cultivation of rubber in the Netherland Indies, inventors of planting machinery will doubtless see the advantages of availing themselves of the new Dutch law.

"SUPRA RUBBER."

During the quest after synthetic rubber, a product, named by the inventors "Supra Rubber," seems to have been obtained by the syndicate, which is said to promise a fair degree of success. This is a filling substance to be used in conjunction with high-grade natural rubber. Samples of a compound, reputed to have been composed of 50 parts supra rubber to 100 parts of fine Para, have been shown and have proved to be strong and resilient. As the estimated cost of "supra rubber" is six pence per pound, its possible use as a filling has a practical interest, apart from its association with the general question of synthetic rubber.

THE FRANZ CLOUTH COMPANY 50 YEARS OLD.

On the 11th of September last the firm of Franz Clouth, Coln-Nippes, Germany, attained a full half century, and commemorated that event with various exercises. On the evening of the 10th, the night before the company's birthday, a memorial service was held at the grave of the company's founder, Mr. Franz Clouth, who died two years ago. On the next day a celebration was held in the auditorium of the Civil Casino, which was attended by the members of the Clouth family, employes of the firm, a deputation of workmen and the local authorities, together with representatives of the manufacturing industry and of commerce. These exercises were followed by a luncheon, and in the evening a banquet was given at the Zoological Gardens, after which there was an informal gathering of those interested in the firm and their many friends.

ASBESTOS AND RUBBER COMPOUNDS.

THE question of asbestos and rubber compounds has recently been discussed in the "Gummi-Markt," with special reference to "Vulcan-Asbestos" and "Ite" compounds.

"VULCAN-ASBESTOS."

This insulating material is a gummed felt, composed of asbestos fibers, with coloring and filling substances. In consequence of the regular distribution of the asbestos fiber, a felted slab is obtained, which meets the highest electro-technical requirements. Subjoined is the method of producing these slabs:

The washed rubber, as shown in the annexed compound, is kneaded in a kneading mill, with 77 pounds of light benzine; while the other ingredients are added by degrees. The mass is kneaded until a uniform solution is produced, which process may last two hours. Only then is the asbestos fiber, ground to the fineness of flour, slowly added; the whole being then kneaded for an hour. As soon as the mass has become thoroughly mixed it is laid out in large frames, the benzine is evaporated in a vacuum cabinet and the slabs dried. The latter are then placed between plates of zinc under the hydraulic press, at a pressure of 284½ pounds per square inch. Finally, the pressed slabs pass through the glazing calender, and are ready to be used for the manufacture of magnet-spools, rollers, sounding boards, etc. The vulcanization compound follows; it being also possible to vulcanize the slabs in the press, under hydraulic pressure.

RECIPE FOR COMPOUND.

	Grams.	Pounds.
Massai	2,500	5.5115
Colombia	2,500	5.5115
Odorless rubber substitute	2,000	4.4092
Reclaimed rubbers	2,000	4.4092
Sulphur	2,500	5.5115
Golden sulphide of antimony	4,000	8.8184
Kaolin	4,500	9.9207
Sulphate of baryta	4,000	8.8184
Japan red	4,500	9.9207
Zinc white	4,500	9.9207
Linseed oil	1,000	2.2046
Calcined magnesia	500	1.1023
Asbestos fiber	16,000	35.2736
Burgundy pitch	1,000	2.2046

"ITE" COMPOUNDS.

It is remarked that the demand for ordinary rubber packing slabs has declined in proportion to the extent to which a tendency has been displayed for the use of superheated steam and higher steam pressures. At a pressure of 12 atmospheres (about 160

pounds to square inch) and a temperature of 180 to 185 degs. Cent. (356 degs. to 365 degs. Fahr.), ordinary rubber packing cannot be any longer used, as it will not stand the strain. To meet these requirements, new compounds were found necessary. These acquired the name of "Ite" compounds, on account of most of their designations terminating in "ite," as the special mark of certain firms; such as "Klingerite," "Moorite," "Metzelerite," "Cooperite," etc. Within a relatively short time, particularly in Germany, there has arisen a keen competition in these compounds; what was at one time a specialty having now become a staple, to the disadvantage alike of producers and distributors.

In principle these "Ite" compounds consist of a felted mass with a foundation of asbestos. Siberian asbestos bears high temperatures better than the Canadian material. Long fibers are necessary; asbestos waste not being suitable.

The special compounds for "Ite" slabs, generally contain mineral substances, such as kaolin, baryta, oxide of iron, etc. Rubber is employed in limited quantity, chiefly as a binder. Balata is also used. Such compounds produce a packing, tough and flexible in character and as tenacious as leather; unaffected by pressure or heat. The rubber employed is first dissolved in benzine; the fluid mass obtained being divided into two parts and mixed with the powdered substances to be added; a uniform pulp being thus obtained. The asbestos fiber is then added; the whole being kneaded long enough for the whole mass to become felted. The better the fiber is carded before being mixed, the more regular is the mixture.

After having been thus prepared, the mass can be brought into slabs in different ways; or it can be rolled advantageously in separate layers, with tempered cast iron calenders. The ends of the slabs can be placed together, so that sheets of 10 or 15 feet can be produced. In some factories, sheets of 15 feet can be made without the need of joining the separate slabs.

The pulp coming from the mixing machine is rolled between cold cylinders; being taken up on a cloth which carries it to the rolling mill, where the sheets are pressed. As soon as the desired thickness is attained, the slab is cut off and removed. The cylinders can be heated or used cold. Finally the sheets are pressed in order to obtain hard slabs.

INTERNATIONAL COMPARATIVE STATISTICS.

An interesting result is presented by a German statistical return, showing the comparative German, English and French imports and exports for 1910 and 1911. Converted into American equivalents, the figures stand:

GERMANY.

	1910.	1911.
Imports	$2,232,990,000	$2,386,195,000
Exports	1,868,665,000	2,025,452,500

ENGLAND.

	1910.	1911.
Imports	$3,460,042,500	$3,470,850,000
Exports	2,196,075,000	2,316,837,500

FRANCE.

	1910.	1911.
Imports	$1,793,332,500	$2,040,165,000
Exports	1,246,760,000	1,184,415,000

For comparison with the above figures the following returns for the United States for the calendar years 1910 and 1911 will be of interest:

UNITED STATES.

	1910.	1911.
Imports	$1,562,904,151	$1,533,067,130
Exports	1,829,022,929	2,058,413,224

RUBBER RESIN AND ITS USES.

In connection with the subject of its railway classification, Herr Badermann has summarized the chief features affecting the production and uses of rubber resins.

From the latex of the *Djera costulata*, found in quantity in Borneo and Sumatra, a raw material exudes which, according to its origin and port of shipment, is generally known as Jelutong. Its composition is about as follows:

Water	70 per cent.
Resin	20 " "
Foreign matter and albuminous substances	2 " "
Rubber	8 " "

After the extraction by pressure of the greater portion of the water, the mass is treated in closed boilers with a solvent, the composition of which is a trade secret. The resin and foreign matter are separated from the solid rubber by allowing the fluids to escape. The solution of resin is then conducted into an apparatus, by means of which first the water and then the resin solvent are removed by distillation, the residue left in the still consisting of resin and of the impurities separated.

The Chemical Testing Bureau at Berlin in its report upon rubber resin as compared with imported resin, states:

"We have not maintained that rubber resin equals American pine resin in all its possible uses, but have concluded that it competes with the ordinary rosins of commerce in the art and varnish industries."

One firm at Magdeburg, Germany, had asserted that the product of distillation of rubber resin had an unpleasant odor. Upon this point the report adds that all rosin oils obtained by distillation (unless intended for use in axle lubricants) have to be freed from their odor by chemical purification. The distillate of rubber thus treated is an extremely viscous product, with an agreeable odor, which fully competes with rosin oils of different origin.

With respect to the objections which have been urged as to the use of rubber resins in the varnish industry it is pointed out that after solution a small proportion is again precipitated; but not, as has been asserted, the largest part. This action is, however, more or less shown by all rosins used in the varnish industry. Every rosin needs to stand a long time for clarification before it is ready for use.

JAPANESE CRUDE RUBBER IMPORTS.

By Our Regular Correspondent.

OWING to the recent publication of fuller official details, the estimates already published of the comparative Japanese crude rubber imports for 1910 and 1911, are now available in more complete form, as shown below:

SOURCES OF JAPANESE CRUDE RUBBER IMPORTS.

	1910		1911	
	Pounds.	Value.	Pounds.	Value.
British India	54,175	$ 45,112	121,160	$ 118,355
Straits Settlements	892,928	617,012	1,223,071	691,651
Dutch India	119,593	70,317	132,173	80,703
Great Britain	311,559	474,727	426,013	467,696
Germany	13,845	20,621	4,588	3,563
United States	85,476	121,797	112,170	126,363
Other countries	103,342	156,397	35,689	41,678
Total	1,580,918	$1,505,983	2,054,864	$1,530,009

The increase thus shown for 1911 of about one-third in quantity, owing to the fall in prices, only resulted in about the same value as in 1910. Considerably increased attention was paid in Japan to the crude rubber trade, as a result of the advance witnessed in 1910 in the crude material.

Of the total quantity imported by Japan in 1911, the largest

proportion consisted of planted Pará rubber from Malaya, constituting over 60 per cent. of the whole. Receipts from Great Britain amounted to about 20 per cent. of the total; principally consisting of hard-cure Pará rubber produced in Brazil, with a small proportion of African grades. Imports from Germany and the United States were of the same general character as the British shipments.

It has been asked why Japan does not import direct from Brazil, and thus purchase more advantageously. Such an idea is, however, of a visionary character, as London and the other crude rubber points form a central market, whose operations influence prices throughout the world; thus establishing a universal standard of value.

Of the imports from Dutch India, the largest proportion consisted of Borneo rubber; Jelutong and gutta-percha being likewise represented. Some Borneo rubber was shipped via Manila, as well as through British India.

Prices of Pará rubber in Japan displayed less fluctuations in 1911 than had been the case in 1910, varying in the monthly average for 1911 per 100 pounds, as follows:

January	$118.18	July	$113.40
February	156.87	August	113.40
March	173.88	September	120.96
April	139.86	October	117.18
May	136.08	November	108.62
June	158.76	December	113.40

While Japanese imports of crude rubber amounted for 1910 to 2,054,864 pounds (or an average of about 170,000 pounds a month), the returns for this year show a falling off, the latest available figures for 1912 being:

	Pounds.
February	58,152
March	80,183
April	67,260
May	99,799

Distribution of Japanese Rubber Imports.

By the subjoined table the respective shares in rubber imports of the two principal Japanese trade ports are shown:

Distribution Between Japanese Ports.

	1910		1911	
	Pounds.	Value.	Pounds.	Value.
Yokohama	1,026,266	$1,062,016	1,044,199	$ 794,342
Kobe	554,652	443,967	1,008,240	732,933
Other ports	.....	.....	2,425	2,734
Total	1,580,918	$1,505,983	2,054,864	$1,530,009

The chief interest of the above figures lies in the fact that Kobe has almost doubled the quantity of its rubber imports, while those of Yokohama have remained stationary. Such a result is due to increased consumption of rubber by the European firms located at Kobe, including the Dunlop Rubber Co. (Far East), Limited, and the Ingram Rubber Manufacturing Co. of Japan. Many of the Japanese rubber manufacturers at Kobe, Osaka and Kyoto helped in using the augmented receipts at the port of Kobe.

European Rubber Companies in Japan.

Kobe is the seat of the chief European rubber manufacturing companies domiciled in Japan, to whose increased consumption is attributed the recent development of crude rubber imports at that port.

The Dunlop Rubber Co. (Far East), Limited, was established at Wakinohama, Kobe, in 1908, with a capital of $435,000. Its principal manufactures are automobile, cycle and jinrikisha tires, as well as mechanical rubber goods. The works cover an area of 2½ acres, the power equipment consisting of one engine and two boilers (each of 250 H. P.). Nine hundred hands, male and female, constitute the working staff.

Most of the officials are English, including the experts, the manager being Mr. B. V. Williams.

The Ingram Rubber Manufacturing Co., of Japan, was established at Shiriiki, Hyogo, in 1908, by Mr. Arthur Ingram, son of the president of the Ingram Manufacturing Co., London. During the following year it was converted into a stock company. Its manufactures include surgical and mechanical goods. The area of the works is three-fourths of an acre, 350 male and female hands being employed, while the mechanical equipment includes four engines and two boilers (each 70 H. P.). Mr. Tom Parker is works and shop manager. The plant is now being removed from Shiriiki to Wakinohama, Kobe, where the Dunlop Rubber Co. are situated. It is contemplated for the two companies to each get motive power from the same engines and boilers, with the result of effecting great economies.

A third European rubber company, established at Wakinohama, is the Premier Greer Cycle & Motor Manufacturing Co., of Japan, Limited, with a capital of $150,000. The manager is Mr. J. L. Newman.

German Rubber Imports.

According to the most recent German statistics, the total of crude material imported by the rubber industry during the year 1911 represented 31,042 tons, as compared with 34,061 tons for the year 1910. The separate classification of this total was as follows:

German Crude Material Imports.

	1910.	1191.
Rubber ..... *tons*	18,705	19,959
Gutta-percha	8,694	3,507
Balata	773	774
Scrap	5,143	5,937
Rubber substitutes	746	865
Total ..... *tons*	34,061	31,042

The shortage of 3,000 tons in crude material shown by 1911, as compared with 1910, is caused, it will be seen, by a falling off in gutta-percha, of 5,000 tons, partially offset by an increase of 1,200 tons in rubber and of 800 tons in scrap.

By another table are indicated the sources of supply, which throw light upon the development of the German crude rubber trade.

Sources of German Rubber Imports.

	1910.	1911.
Brazilian Rubber ..... *tons*	5,686	6,811
Other South American and Central Rubber..	939	1,340
African Rubber	7,323	6,455
Asiatic Rubber	2,859	2,717
Mexican Rubber	1,347	2,099
Indirect imports	551	537
Total ..... *tons*	18,705	19,959

Of the quantities credited to African rubber, the proportion from the German colonies is shown in the following table:

German Rubber Imports from German Colonies.

	1910.	1911.
German East Africa ..... *tons*	476	602
Kamerun	1,935	1,805
Togo	129	120
German South West Africa	258	....

Kamerun thus constitutes the principal source of German colonial rubber.

Some Rubber Planting Notes.

THE RUBBER PLANTATIONS INVESTMENT TRUST.

THE report of the above company for the year ending March 31, presented to the third meeting of shareholders, has various features of interest. With a capital of £1,000,000, of which £525,000 is paid up, profits for the year 1911-1912 amounted to £76,575, equalling about 15 per cent.

It would seem that these profits, out of which a dividend of 10 per cent. was paid, were derived from two sources: Investments of about £740,000 in 31 companies; and of about £200,000 in three properties in Sumatra and one in South Travencore. In the aggregate these four properties represented 54,324 acres, of which 10,521 acres are planted. In this way the principle of distributing risks is carried out to the fullest extent.

From a geographical standpoint, the investments in various companies are distributed as follows:

	Per Cent.
East Coast Sumatra	34
Java	27
Malay Peninsula	16¼
Southern India	12½
Ceylon	10¼
	100

The distribution among various crops is shown as follows:

	Per Cent.
Rubber (including coffee interplanted in rubber)	63
Tea	24
Tobacco and other products	13
	100

By the history of the properties owned by the company, the course of rubber prices is indicated. Of the 10,521 acres planted, 5,647 are in tea and 500 in coffee; the balance of 4,374 acres being in rubber, planted as follows:

	Acres.
1908	145
1909	296
1910	534½
1911	1,237½
1912	307
In course of planting	181
Sanctioned for 1912	1,673
Total	4,374

The large amount of planting in 1911 was a natural sequence of the boom of 1910, and it is of interest to note that an even larger amount has been sanctioned for this year.

In dealing with these figures, Mr. E. L. Killick, in the "Financier" of London, criticizes the large proportion allotted to Sumatra and Java. He remarks that the Ceylon companies have an unsurpassed record while it is scarcely conceivable that the profits earned by rubber estates in Malaya will ever be approached elsewhere.

RIVERSIDE (SELANGOR) RUBBER CO., LIMITED.

The yield for the 8 months ended August 31, 1912 was 101,854 pounds; as compared with 29,466 pounds for the corresponding months of 1911.

SCOTTISH MALAY RUBBER CO., LIMITED.

During the eight months ended August 31, the total yield was 101,733 pounds, as compared with 45,495 pounds for the corresponding months of 1911.

DIRECTOR LYNE ON TOUR.

With a view to investigating local conditions, R. N. Lyne, the newly appointed Ceylon Director of Agriculture, and C. Drieberg, Secretary of the Agricultural Society, recently completed a week's tour through the Northwest and north of the island, in course of which they visited Jaela, Negombo, Marawila, Chilaw, Puttalam, Anuradhapura, Jaffna and Vavuniya. From Jaffna a complete circuit of the Peninsula was made and a visit paid to Karativu Kayts Islands.

In the course of the tour the new director had the opportunity of meeting the revenue officers of the different provinces and districts visited, while in Jaffna a conference was held with the officials and others interested in agriculture.

MR. WICKHAM'S IMPROVED SMOKING APPARATUS.

Much interest has been displayed in Ceylon, as to the introduction of H. A. Wickham's "Mocha" smoking apparatus, intended to produce the equivalent of fine hard Pará by means of the "smoke cure." This apparatus is made by David Bridge & Co., whose agents, the Colombo Commercial Co., were, according to latest accounts, overhauling the apparatus just arrived with a view to a demonstration to be shortly held at their works.

It is of interest to note that a preliminary demonstration of the invention, with the small working model B, which has been several months on the island, was recently held at Peradeniya Gardens. This demonstration took place under the personal supervision of Mr. Wickham, in presence of Mr. Lyne, the recently appomted director, and the officials of the Gardens. The model worked very satisfactorily; it being anticipated that as soon as the machines are placed on the local market, they will become popular.

NEW TAPPING KNIFE.

During his stay in Ceylon, Mr. Wickham has also experimented with his now well-known tapping knife and found this likewise answered to expectations in every respect, except that possibly with older trees and hardened bark the spring of the knife would be more useful if it were of a stronger make. It appears that part of the essential working is that there should be a rapid withdrawal after the incision, and that the speed of the withdrawal will depend on the strength of the spring.

It is an encouragement for younger rubber experts to see the "Father of the Rubber Industry" thus at work, introducing his two latest inventions. Both the inventions are the outcome of half-a-century of experience, and unrivalled early acquaintance with the practices of the rubber-gatherers in the home *par excellence* of *Hevea* rubber, Brazil.

SUMATRA COMPANIES.

Figures of the United Serdang Rubber Plantations, Limited, for August show 61,511 pounds, as compared with 21,688 for the same month last year. During the financial year ended August 31 the total yield has been 532,360 pounds, as compared with 218,530 pounds for the preceding annual period.

In the yield of the Salang Rubber Estates, Limited, there has likewise been a considerable increase, the quantity for August having been 14,966 pounds, as against 4,898 pounds in August, 1911.

The Tandjong Rubber Co., whose holdings have just become productive, starts off with crops of 9,899 pounds in July and 11,828 pounds in August.

VALLAMBROSA RUBBER CO., LIMITED.

For the five months ending August 31, the yield of above company has represented a total of 202,000 pounds, as compared with 160,700 pounds for the corresponding period of 1911.

GERMAN VIEW OF MALAYAN RUBBER PRODUCTS.

THE general question of Malayan rubber production has recently been dealt with by the German Imperial Consulate General at Singapore. Attention is drawn to the yields of the last three years:

	Pounds.
1909	7,461,070
1910	14,569,307
1911	23,954,144

Between 1909 and 1910 there was thus an increase of about 100 per cent., while 1911 only showed an increase of 60 per cent. as compared with 1910, the rate of augmentation being slower, and the yield being 15 per cent. below the estimated quantity.

A further increase for 1912 is indicated by the fact that for the six months ending June 30, the exports from Malaya amounted to 18,980,798 pounds, or at the rate of about 38 million pounds for the present year, as compared with 7½, 14½ and 24 million for the three preceding years.

Leaving aside the consideration of the past and present, and carrying on the figures up to 1916, the United States consular estimates, as shown below, acquire special interest:

	Pounds.
1912	36,000,000
1913	48,000,000
1914	66,000,000
1915	90,000,000
1916	130,000,000

While plenty of rubber is thus in sight from Malaya up to 1916, the yield after that date will naturally be more or less affected by the policy now being followed as to new planting. In this connection certain passages in the German consular report are of interest.

The fact that after the product had doubled between 1909 and 1910, the rate of increase for 1911 as compared with 1910 should have descended to 60 per cent. would imply that special causes had been operative in retarding the development of yield.

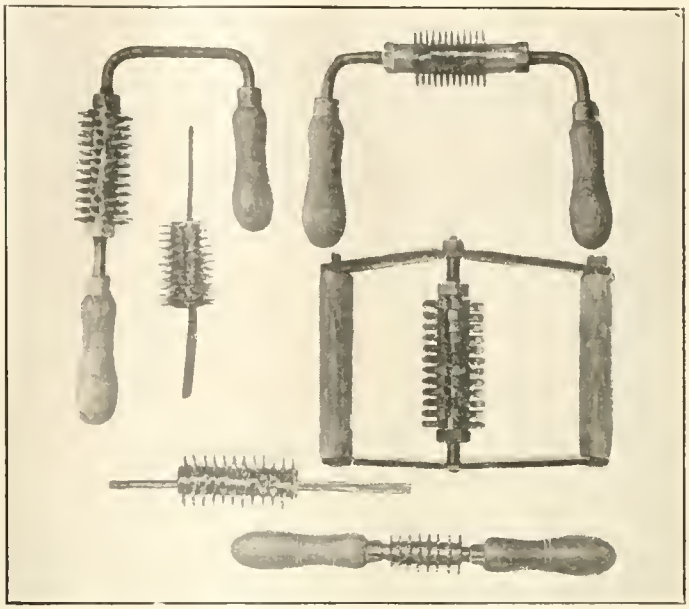
On this subject the German report states: "The plantations quickly recovered from the drought, but more than a year will be required for the rubber industry to overcome the hurtful influence of the 'boom' and to have established a permanently sound financial basis. The number of plantation companies founded during the 'boom,' which, owing to over capitalization, unsuitable soil conditions, unskilful planting, bad management, inaccessible location of the plantations, or labor difficulties, were to be regarded in advance as of deficient vitality, must be more than 100. But there are also a number of old companies, with respect to which a stoppage, or diminution of activity, has to be recorded, chiefly on account of over-tapping the trees, or lack of capital. From the last-named cause several plantation companies have been forced into liquidation.

"The planting of rubber in British Malaya has come to a standstill. There are only a few large companies prepared for further planting. With the others the necessary means are lacking. The total yield will of course quickly increase, as the young trees come into bearing. Well-managed companies will in any case be able to report a steady increase in their yields of rubber, if not of their dividends."

These German official views are calculated to support the ideas of those who consider the future Malayan production as over estimated, in the figures which have been published on the subject.

"PRICKER" TAPPERS FOR "CASTILLOA."

AN exceedingly interesting experiment in *Castilloa* tapping tools is shown in the accompanying illustration. The tool is of the "pricker" type, designed to make a series of incisions by being drawn down the tree, suitable pressure being exerted by the grasp upon the handles. Four types of tool will be noted, and much thought and labor was put upon the device. It was



Various Types of "Pricker" Tappers.

not wholly successful, partly because *Castilloa* Bark is so exceedingly tough, and partly because the rotary prickers made a drawing incision, rather than a direct puncture. The designs were made by the late J. B. Carruthers when he was in charge of the Botanical Gardens in Trinidad, and are a souvenir of last winter's visit to that island by the Editor of The India Rubber World.

DEATH OF A PIONEER MALAYAN RUBBER PLANTER.

Through the premature death at the age of 42 of F. E. Pears, of the Lanadron Estates, after an operation in London, Malaya has lost one of its pioneer rubber planters. After a few years passed in the family soap-making concern, he went to Malaya in 1899, where he obtained a tract of land. This tract was named Lanadron in remembrance of the Cornish village from which the Pears family had originated.

Commencing with the planting of 25 acres in 1899, the estate had by the end of 1909 increased to 11,281 acres, of which nearly half was under rubber. Mr. Pears developed the property from its virgin state into a rubber plantation that has served as a model for many later ventures. He pursued a policy of management which ran the estate ahead of most of its contemporaries and Lanadron rubber was recognized in the home markets as a first-grade product from the beginning. All the improved methods of sanitation and housing which the governments of the Straits and the F. M. S. now insist upon, were carried into effect by Mr. Pears on his own initiative years ago. Recognizing always the importance of an adequate and contented labor force, his coolies were his first care.

Mr. Pears' death is additionally to be deplored, occurring, as it did, a few months after that of his brother, Thomas, in the "Titanic" disaster.

EXPERIMENTAL RUBBER CULTIVATION AT PARA.

SEEING the importance now attached to the question of rubber planting in Brazil, it is of interest to note some facts recorded by Mr. Walter Fischer, the rubber consulting expert, formerly with the United States Department of Agriculture. These facts were gathered by him within the last few years, during his residence in Pará, as director of the Pará Agricultural Experiment Station.

While, generally speaking, rubber planting is backward in the Amazon valley, several companies have lately commenced to go into the work in a practical manner; Mr. Fischer having co-operated in the preliminary investigations and experiments on the subject.

Hevea Nursery, Para Agricultural Experiment Station

In Mr. Fischer's opinion, the safest and cheapest method in the long run is that of planting by stumps, although this plan means an extra year's growth being allowed in the nursery.

The first application of this stump-planting method in the State of Pará was at the Pará Agricultural Experiment Station, and is shown in Fig. 1, representing a model rubber plantation on the Station grounds. The tree where the man is standing, as also the row directly behind him, show a growth of 15 months (April, 1910, to July, 1911) from good-sized stumps; while the tree on the man's left is from a smaller stump and those beyond are seedlings of same age as stumps. The trees in the plot shown are planted 26 by 26 feet, and have been interplanted with mandioca (Cassava).

Fig. 2 shows a nursery of *Hevea* or Pará rubber trees in the above-named Station at Pará. This was the first and only real nursery of *Hevea* in the State of Pará. Modern and northern nursery methods were employed in growing these trees and with great success. In March, 1912, they were just one year old and for planting as "stumps," being thus a step forward.

Para Agricultural Experiment Station.

It is to be regretted that Mr. Fischer's valuable services to the cause of Brazilian rubber planting were interrupted by illness of both himself and wife, which necessitated their return to the States. He trusts, however, at a later date to resume his work in Brazil and to carry further his investigations and experiments.

IMPROVEMENTS AT PORTO VELHO.

One of the most interesting features of the revived "Porto Velho Marconigram," (just reappeared after a cessation of nine months), is a review of current progress at that point. This summary, bridging over the above-named interval, serves to connect the present with the past; thus affording a continuous record of the progress which has been made at this busy port.

Prominent among the works which have been carried out, is the removal of 1,000 feet of soil at the end of the hill on which are situated the engineers' quarters; as well as a good portion of one side of "Igarape Heights." The earth taken out has been used in bringing the Porto Velho Yard to grade; obliterating the marshy place in the southern end of the yard.

The appearance of the warehouse district has been completely altered by the erection of new storehouses for freight and materials along the river front. Notable among the latter is that of the mechanical department. Several new residential buildings have been completed on Boulevard Farquhar and on Wireless Hill.

But the most important event in connection with Porto Velho has been the Madeira-Mamoré railway. When the "Marconigram" suspended publication in September, 1911, about 137 miles were completed. Nine months later, at the date of its re-issue, the remaining 90 miles were closely approaching completion. This line opening up, as it does, extensive business prospects for Eastern Bolivia, has been justly qualified as the master-key to the entire section in which Porto Velho is situated. It is thus of interest to note that the anticipated opening of the line

has been marked by active building operations at that point, as well as by other phases of commercial development, notable among which is the resurrection of the "Porto Velho Marconigram," to which The India Rubber World extends fraternal congratulations and good wishes.

A BERMUDA RUBBER TREE.

The accompanying illustration shows one of the *Ficus elastica* trees which attain such large size in Bermuda. These trees grow to a height of about 70 feet, and are sometimes 15 feet in circumference; while some of the branches in their largest circumference measure from 2 to 2½ feet. Rubber culture has never been attempted in any serious way in Bermuda, but Mr. Arthur E. Friswell, an old rubber man, who was connected with

Ficus Elastica in Bermuda.

the Mechanical Fabric Co., of Providence, Rhode Island, for a number of years, and later with the Goodyear Tire & Rubber Co., Akron, Ohio, and who recently removed to Bermuda, intending to make it his permanent home, has tapped one of these trees 30 years old, and sent a sample of the rubber to this office. It is practically identical with what used to be known some years ago as *Java* rubber.

RUBBER IN ANGOLA.

According to the "Gummi-Zeitung," the first ton of crude *Manihot* rubber was exported from the Loanda district, Portuguese West Africa, in 1911. Two-year-old *Manihot Jequie* trees were tapped for the first time, giving an average yield of about 1¼ oz. Practical results were obtained with a new tapping knife from *Manihot Glaziovii*. The latex is diluted with an alkaline solution, so that its quick flowing is prevented. In consequence the rubber is obtained in transparent pieces, which command a good price. The Angola rubber planters are Europeans with a small capital. *Hevea* and *Manihot* are the trees most cultivated; the latter to a greater extent than formerly. An English syndicate has been formed for the cultivation of rubber in the interior of Benguela, which will also purchase rubber, to be cleaned by machinery.

CENTRAL AMERICAN RUBBER STATISTICS.

In commenting upon conditions and prospects of rubber production in Central America, the "Revista Economica," of Costa Rica, quotes the following statistics of exports for the years 1907 to 1909:

	1907.	1908.	1909.
Nicaragua .....*Tons*	296	284	205
Guatemala	180	146	172
Costa Rica.....	58	42	66
Honduras	45	35	58
Salvador	30	25	30
Total	609	532	531

The importance is urged, for the purpose of maintaining the Central American rubber production, of adopting scientific methods of working. It is added that this does not in all cases imply that methods, which might properly be described as rational in the Dutch Indies or the Far East, should on that account be introduced into Central America for native varieties.

It will be noticed that there was something of a falling off in rubber production in 1908 and 1909 from the figures of 1907. This, however, should not be taken to indicate that the sources of supply are being exhausted, for it is undoubtedly true that there are forests of rubber trees in the various Central American States that have not been touched, and from which considerable quantities of rubber could be taken if they were judiciously operated.

After referring to the difficulties attending the organization of competent agricultural and forest services, the writer in the Costa Rican publication reaches the conclusion that in order to form such organizations, capable of furnishing up-to-date information, it would be necessary to have a rubber bureau, amply endowed, and possessing in its various departments, men of science capable of bringing about a rapid advance in knowledge on the subject of rubber production.

MEXICO'S GUAYULE FACTORIES.

According to a recent consular report, fully 70 per cent. of Mexico's guayule rubber production is worked up in the large rubber plants of the Laguna district, chiefly in the cities of Torreon and Gomez Palacio. There are seven such factories in the Laguna district, which have a combined capacity of a little more than 200 tons of guayule shrub per day. The plant of the Continental Mexican Rubber Co., operated by the Rockefeller-Aldrich interests at Torreon, has a capacity more than equal to that of the other six plants operating in the Laguna combined. This immense plant operates 112 large pebble drums, each of which has a capacity for a little more than a metric ton of the shrub per day, or a combined capacity of about 120 tons. This factory gives employment to about 700 men, and is said to be the largest single plant for extraction of rubber in the world. The output of finished rubber from this one plant in 1911 amounted to between 6,000,000 and 7,000,000 pounds, almost all of which found a market in the United States.

DJASINGA (JAVA) RUBBER & PRODUCE CO., LIMITED.

For July and August there has been a total yield of 13,100 pounds, while the corresponding period of 1911 only represented 3,113 pounds, a more than four-fold increase being thus demonstrated.

LANGEN (JAVA) RUBBER ESTATES CO., LIMITED.

The yield of rubber for August has been 12,500 pounds, as compared with 2,700 pounds for August, 1911. For the 12 months ended with August, the total has been 145,577 pounds; as compared with 8,722 pounds for the preceding annual period.

NOTES FROM BRITISH GUIANA.

By Our Regular Correspondent.

BRITISH GUIANA AT THE RUBBER EXHIBITION.

READERS of these "notes" who visit the exhibition being held in New York will observe a small exhibit from this colony at the Imperial Institute's stand. After the authorities had succeeded in resisting the steady pressure brought to bear upon them, to induce them to secure a separate exhibit of the colony's rubber at the exhibition, it was resolved to make use of the permission accorded to the Imperial Institute, to exhibit in seven-pound samples, types of British grown rubber.

A more detailed description of the British Guiana exhibits at the New York show will be found in the special exposition section in this issue of THE INDIA RUBBER WORLD.

THE BALATA ASSOCIATION—DISSOLUTION.

At a meeting of the Balata Association held recently, it was resolved to disband. The chairman, Mr. George R. Garnett, pointed out that the Institute of Mines and Forests had recently been strengthened by the addition of various new members, many of them being connected with the balata industry. If the institute could be representative of the whole industry, it would be useless having two associations carrying on practically the same work. This view was endorsed by several members, who paid a tribute to the work performed by Mr. Henry Daley, the honorary secretary. This sudden dissolution is somewhat surprising. It was recently announced that the representatives of the local companies had joined the association and it was thought that it had a long career before it. It was Mr. Henry Daley who created the association and he is about to leave the colony, where he was the last manager of the Essequibo Rubber and Tobacco Estates Company. It is to be hoped that the Institute of Mines and Forests will prosecute the interests of the industry with the same energy as the association.

BALATA FROM VENEZUELA—SUGGESTED REMOVAL OF THE EMBARGO.

At the same meeting, the question of allowing Venezuelan balata to be shipped via British Guiana was discussed. Such transit trade was prohibited about five years ago, in consequence of the depredations of Venezuelans on the British Guiana side of the boundary. Improper bleeding of colony balata, which was shipped as Venezuelan, was rampant. It has since been thought, however, that complete prohibition was a somewhat too drastic remedy, and at this meeting the Balata Association endorsed that view. Some interesting information on the matter was supplied recently by General Federico R. Matthews, late governor of the Venezuelan territory on the British Guiana boundary, who was visiting Georgetown. He stated that there are large tracts of land, rich in balata in the territory, which have no outlet at present. The way over the inland rivers via Bolivia is too long to be profitable. The way via Morawhanna in British Guiana is prohibited. If that embargo were removed a company would be formed to exploit the balata resources of the territory. This embargo and the decline of the industrial enterprises in the northwest district of the colony have reduced the township of Morawhanna to a state of stagnation, and opinion in favor of the removal of the prohibition is growing.

RUBBER TAPPING IN THE NORTHWEST—CURIOUS PERFORMANCES OF *HEVEA CONFUSA*.

At a recent meeting of the Board of Agriculture Mr. Stackdale reported upon some tapping experiments in the northwest district, undertaken in June, July and August. Eighty-nine trees were taken, none under 16 inches in girth. Those less than 18 inches were given two basal cuts and those over 18 inches were tapped after the half herring-bone system. July's returns were better than June's, and August's better than July's. The results with *Sapium* were not very encouraging.

At the same meeting Professor Harrison reported that a sample of *Hevea confusa* rubber exhibited in London last year, had been sent to the Imperial Institute for analysis, which reads as follows: Loss on washing, 1.4 ounces; caoutchouc, 93.3; resin, 1.8; proteid, 4.9; ash, 1.0. The analysis was as good as if the sample was good rubber and worth 4*s* per pound. When first prepared, however, it had no elasticity and would break if pulled, but it had since got a feeble degree of strength. Nothing could be done with the tree, which was very old. The yield was small and the tree would soon run dry. The importance of the matter was that they should keep the tree out of cultivation, so as to prevent it making hybrids with good rubber.

IMPORTATIONS OF RUBBER SEEDS—INTERESTING STATISTICS.

A table has been published in the *Official Gazette* showing the number of Para rubber seed imported by the government between the years 1905 and 1911. Of 366,848 seeds received, 234,598 germinated; the cost of shipment amounting to $2,754.80. In 1905 a sample shipment of 50 seeds was received from Para, Brazil, but none germinated, and in 1906 of 25,062 seeds received from Ceylon, from the Botanic Gardens of Ceylon and Singapore, 2,000 seeds germinated. In 1907 63,850 were imported from the Botanic Gardens of Singapore and Ceylon, and 49,700 germinated. In 1908 of 50,000 seeds imported from Singapore, 43,150 germinated. In 1909 of 30,131 seeds, 21,609 germinated. In 1910 there were two shipments, the aggregate number of seeds being 85,155, of which 59,350 germinated. In 1911 89,679 seeds were obtained from Singapore and Ceylon, and 43,757 only germinated; of a further shipment of 19,921 seeds obtained from Mr. J. H. Richards, 15,024 germinated.

THE OLDEST "HEVEA" IN BRITISH GUIANA.

TIME was when Ceylon boasted only two or three mature *Hevea* trees. Those trees today are giants, are great producers of rubber, and often photographed and described. It is well therefore as a matter of record to show the oldest *Hevea* tree in British Guiana. This tree is already the parent of many others, and some day will probably be historic. Of the figures at the base of the tree, the one at the right is Professor Harrison, Director of Agriculture of British Guiana.

OLDEST *Hevea* TREE IN BRITISH GUIANA.

The Editor's Book Table.

ANNUAL REPORT OF THE UGANDA DEPARTMENT OF AGRICULTURE, for year ending March 31, 1912. Entebbe, 1912. (4to, 36 pages.)

THROUGH the courtesy of S. Simpson, Director of Agriculture, THE INDIA RUBBER WORLD has received a copy of the above-named annual report, dealing with rubber, cotton, coffee, cacao, and the other products of the Protectorate.

According to the details given the area planted with rubber is extending rapidly, the *Hevea* tree leading the way. The area planted in the various rubber trees are:

	Acres.
Hevea Brasiliensis	3,000
Manihot Glaziovii	750
Castilloa elastica	85
Funtumia elastica	24
Total	3,859

The total acreage of the European plantations in Uganda is about 6,000 acres, of which nearly 4,000 are thus in rubber; there being about 2,000 in coffee and 200 in cacao.

Rubber exports have been approximately as follows:

	WILD RUBBER. Pounds.	PLANTATION RUBBER. Pounds.
Year ending March 31, 1909	42,600	.....
Year ending March 31, 1910	94,500	.....
Year ending March 31, 1911	89,800	55,200
Year ending March 31, 1912	27,700	210,200

Plantation trees are thus evidently yielding increased quantities of rubber.

Ceara has found favor with various planters, but some of them are beginning to grow skeptical as to its merits. As shown by above table *Hevea* and *Manihot* are at present the only rubber producing trees of any importance in Uganda.

ANNUAL REPORT OF DEPARTMENT OF AGRICULTURE, TRINIDAD and Tobago, 1910-1911. (Special Bulletin.) Trinidad, 1911. (4to. 73 pp.)

According to this interesting report, the rubber industry has of late received a much larger amount of the department's attention than had been the case in previous years. Reference is likewise made to the experiments carried out with the centrifugal machine of H. Smith, of Tobago, who had visited Mexico and Central America. The *Castilloo* rubber industry has been materially stimulated by Mr. Smith's report on the subject.

A. E. Collens has devised a simple method of coagulating and smoking *Castilloa,* by which he has produced some fine specimens.

As a record of the work of Professor Carmody, the director and his associates, this report has a distinct interest, while its ample statistical material is thoroughly well handled.

COCO-NUTS: THE CONSOLS OF THE EAST. BY H. HAMEL SMITH and F. A. G. Pape, London. 1912. "Tropical Life" Publishing Department. [Cloth. 506 pp.]

To those who have not followed the progress which has marked the development of tropical agriculture, the above work will afford a mass of information upon the subject. A specially practical feature of the book consists of the suggestions made by the authors as to the management of large estates on which cocoanuts flourish. In fact, the work will be found indispensable by planters interested in that branch, being an exhaustive and complete study of the cocoanut palm. The questions of nurseries, manuring and diseases are treated in detail, as well as catch-crops.

Another important feature of the work is the discussion of the utilization of the products and by-products of cocoanuts, including coprah, fiber and oil, as well as the possibilities of paper making. How to deal with everything that can be made to pay is the point kept steadily in view by the authors, and brought out with perspicacity and clearness.

While rubber is dealt with more or less incidentally, the references to that subject have a distinct interest, particularly as to interplanting. Regarding Samoa and New Guinea, it is stated that interplanted cocoa and rubber have been tried with doubtful success, such a plan not being recommended. At the same time this combination would, it is remarked, restrict disease and distribute financial risks, if the soil and climatic conditions were suitable.

As to Papua, it is of interest to note that out of 7,740 acres under cultivation, 5,365 acres are in cocoanuts and 1,702 acres in rubber.

In North Borneo, large areas have been planted in rubber, and appear to be doing well. Moreover, land is still being planted up with rubber and other crops, so rapidly that additional labor is needed.

HANDBOOK FOR INDIA-RUBBER ENGINEERS, by Dr. Werner Esch, Editor of the "Gummi-Markt." Hamburg. 1912. [8vo, 135 pp., cloth.]

One of the chief requirements of a technical work is that the information contained should not only be accurate and reliable, but that it should be expressed in concise form. This has been accomplished by Dr. Werner Esch in the above-named handbook intended for the guidance of those whose occupations or interests call for more or less detailed knowledge of the production and preparation of rubber. As described in the subtitle it is "a practical manual for manufacturers, chemists, works managers, and commercial men in the rubber and allied trades."

Starting with the varieties of crude rubber, which are treated in detail, the physical and chemical properties of rubber are next discussed. Then follow the chapters dealing with the mechanical cleaning of crude rubber, including washing, deresination and drying.

The following section treats of the further working up of the dried rubber, conducting the reader through the processes of mixing, weighing and calendering. In natural sequence, the subject of vulcanization is then handled, with references to vulcanizing heaters and sulphur bath installations. Next in order come the vulcanization of proofed fabrics and the cold vulcanizing shop.

Finally, compounding ingredients for rubber compounds are dealt with, in connection with which subject a number of standard mixing formulae are given. The descriptions of machinery used in the rubber industry are supplemented by effective illustrations.

It is of material importance, considering the scope of the subjects treated, that Dr. Esch has written in English; the value of his work being thus considerably enhanced. The whole treatment of the subject reflects credit upon its author, and will add to his established reputation as a rubber chemist.

NEW TRADE PUBLICATIONS.

IN commemoration of the fiftieth anniversary of the Franz Clouth Rhemish Rubber Factory of Cologne, a festival souvenir volume has been isued, which is a notable example of typography and illustration. Various interesting statistical data are supplemented by a chart representing the movement of rubber prices from 1861 to the present time.

The personal features of the volume are represented by a full description of the works, embellished with a number of illustrations, representing the various portions of the installation and the chief manufacturing processes. The reader is conducted in imagination through the processes of washing, mixing and vulcanizing, as well as the manufacture of hose, belting and other products; including roller-coverings and diving appliances. Rubber tiling also constitutes a prominent feature of the firm's production; having been supplied for the smoking saloon of the "Prinz Wilhelm," which is effectively illustrated. The frontispiece is a portrait of the late Herr Franz Clouth, the founder of the firm, whose history is graphically told.

Under the title of "Merck's Analytical Methods for Testing Analytical Reagents," Merck & Co. have issued a handy booklet containing a full price list of their "Blue Label Reagents," indicating their analyses, and the tests to which they are intended to apply. The alphabetical order in which the various reagents are treated, facilitates reference and renders this little book a *vademecum* for the busy chemist and analyst. To those already using Merck's chemicals, it will recall familiar compounds, while to those contemplating the extension or improvement of laboratories, it will serve as a useful guide.

The B. F. Goodrich Co. has just issued a manual of tire repairing with complete descriptions and full illustrations sufficient to give professional repair men full information as to materials to be used and methods to be pursued in the repair of pneumatic tires. The information therein contained is based on the experience of the oldest and most complete repair departments in existence. The methods mentioned therein are applicable to ordinary shops.

The monthly publication of "The Goodrich" for September, their birthday number, contains an excellent article by Alexander P. Rogers, entitled, "In the Heart of South America—Part Second," which gives a vivid account of the country bordering the Madeira River and of the difficulties overcome in surveying and building a railroad around the rapids in that turbulent river. It also contains a map of Europe, giving the Goodrich service abroad. The September issue numbers 46,000.

NEW TENNIS LIST FOR 1912 AND 1913.

The United States Rubber Co. has issued its tennis lists for the year beginning September 1, 1912. These lists follow the usual form, being about 3½ inches x 6 inches, a convenient size for mailing in the ordinary envelope.

Three different lists are issued by the company, one entitled, "The United States Rubber Company's Tennis, Yachting, and Gymnasium Shoes"; the second entitled, "Tennis Glove Brand"; and the third, "Lycoming and Keystone Tennis and Gymnasium Shoes."

The first list describes and illustrates the company's Tennis, Yachting, "Champion" Gymnasium, Bathing, and Basket Ball shoes, most of these being made in Oxfords and bals.

The "Glove Brand" price list describes and illustrates the "Bon Ton," Outing, "Racquet," "Marblehead," and "Athlete" shoes, being similar in character to those shown in the list described above.

The Lycoming list includes yachting, gymnasium, and a general tennis shoe called "The Rival."

FIRE HAZARDS IN RUBBER MANUFACTURE.

IN an article on "Rubber Manufacture," with particular reference to the fire hazards attendant upon the making of mechanical rubber goods, written by L. Alexander Mack, for the *Weekly Underwriter*, of June last, the following paragraphs appear; which will be of interest to all rubber manufacturers:

THE FIRE HAZARDS.

"The greatest hazard in the manufacture of rubber products is not the rubber itself but its solvents. 'Rubber cement,' as it is commonly called, is composed of pure rubber, cut fine and softened in carbon dioxide, after which this mixture is dissolved in benzine, making a powerful adhesive. The dangers of volatile fumes of benzine are well known to every underwriter, and the danger from careless use of rubber cement cannot be too strongly emphasized. The inspector should devote particular attention to this material, first, as to its storage, and, secondly, as to its actual use. It is worth noting, however, that once the cement has been applied and becomes dry, the danger point appears to have been passed.

STORAGE OF RUBBER CEMENT.

"Manufacturers realize that with a costly product like rubber cement it is important that every gallon purchased should be used. This result cannot be obtained when the wooden barrel which has served for its transportation is afterward used for storage. Such a barrel is more or less porous, and so in the best plants the cement is at once transferred to metal tanks, buried underground at least thirty feet from any building. This is the only safe and approved method of storage of rubber cement. The inspector should satisfy himself that only a day's supply of cement is kept in the factory at one time, and this must be kept in self-closing metal cans. It seems almost needless to say that smoking should be prohibited within any portion of a plant where such material as rubber cement is used in almost every department.

STATIC ELECTRICITY.

"Next to the hazard of rubber cement is the danger from static electricity. Instances are of frequent occurrence, where in moving a sheet of rubber-lined cotton duck or belting across a table top enough static electricity is developed to generate a good sized spark. This is extremely dangerous if there is any rubber cement nearby. The best safeguard against this hazard is to have all tables in this department 'grounded'—a simple expedient within the reach of every manufacturer.

BUFFING.

"Some attention should be given to the department where buffing is carried on. The fine dust, here given off, though composed partly of rubber, has an admixture of lint from the buffing wheels themselves. This finely divided material if allowed to accumulate would make an excellent subject for spontaneous combustion, especially if left where any grease or oil could drop on it. Complete blower systems should be installed to carry the dust direct to the boiler room, where it should be destroyed as soon as practicable. There is very little danger of the friction of the buffers developing enough heat to set fire to any fumes of benzine in this department.

STORAGE AND WASHING.

"The storage of crude rubber under suitable conditions does not present any undesirable features from the underwriter's viewpoint. Nor does the process of washing, for, in spite of the frequent presence of foreign substances, water is so necessary an adjunct to this process as to make fire an impossibility at this stage of the work.

The rubber manufacturer thus need not fear the risk of fire through the storage of crude rubber, or the processes incidental to purification.

CHEMICAL ROOM.

"The chemical room should be carefully inspected to make sure that all chemicals are stored in standard self-closing bins of lock-jointed tin. The best mills store their chemicals in a separate building from which the boxes containing mixed chemicals and raw rubber stock are conveyed by a belt to the mixing machines. Lampblack is a decidedly dangerous substance, composed almost entirely of carbon. If it becomes damp it will heat up sufficiently to char its paper wrappings, or the paper linings of barrels in which it is shipped, and if left long enough will eventually set fire to the barrel itself. Barium sulphate is a rapidly oxidizing metallic substance which is a frequent source of trouble if allowed to become damp; carbon disulphide is a liquid similar to benzine in its volatile and explosive qualities. There is danger also from unslaked lime becoming slaked and setting fire to things about it. Sulphur is not bad, and there is no danger from whiting, paraffin or litharge.

MIXING AND CALENDERING.

"In the mixing process the underwriter will find little or no special hazard, as a high temperature would spoil the rubber. The temperature of the mixing rollers is maintained at about 176 degrees Fahr., and steam heat is now almost universally employed.

VULCANIZING.

"The fire hazard from the vulcanizers themselves cannot be said to amount to anything more than the usual steam pipe hazard, steam being the medium now employed in vulcanizing in practically all factories. With the boiler house properly isolated and the vulcanizers set on metal, and with all surrounding woodwork protected with metal sheathing, the hazards of the vulcanizer can be reduced to a minimum.

RECLAIMING HAZARDS.

"The hazards of the reclaiming house are chiefly those of the storage of chemicals. Sulphuric acid, nitric acid and caustic soda are the chemicals principally used. All are dangerous unless kept in approved receptacles, preferably in a detached building. The machinery and arrangement of the reclaiming plant present no more serious hazard than that the floors must of necessity be pierced in numerous places to facilitate the handling of the reclaimed material, thus making a total loss on this structure a high probability if fire once gets a start.

MISCELLANEOUS.

"As before indicated, the hazard of oily waste and lint is to be looked for in the department where jackets are woven for hose. Self-closing metal cans should be provided for waste in this department. Large plants frequently run their own printing establishments, the hazards of which have been pointed out in another article in this series. Benzine is the dangerous substance here, and should be kept in patent safety cans and only a day's allowance kept in the shop at one time.

OTHER RUBBER INDUSTRIES.

"While this article will not deal with the hazards to be found in factories making rubber clothing, boots and shoes, tires and druggists' sundries, it will be well to note that the hazard in the clothing industry is chiefly in the spreading of the daub, which is virtually a rubber cement mixture. Static electricity is the dangerous feature here. In the boot and shoe industry the lacquering room seems to be the source of most trouble. Here the lacquer, composed of highly inflammable materials, is 'slathered' over the boot or shoe by hand, and the article is at once put on a rack and taken into the drying room, where a high temperature prevails. Trouble may frequently develop here.

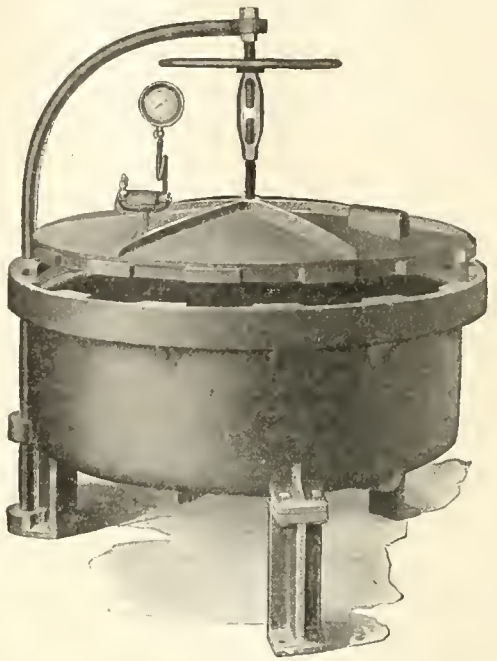
FIRE PROTECTION.

"A full equipment of fire pails, extinguishers, standpipe and hose, and, above all, a thorough sprinkler equipment will do much toward making rubber works profitable to the underwriters. Good housekeeping is, of course, an essential to every well organized factory, and should be insisted upon by the inspector at all times.

"In closing we desire to acknowledge the courtesies extended to us in the preparation of this article by the Manhattan Rubber Manufacturing Company, THE INDIA RUBBER WORLD, the Insurance Society of New York, the Biggs Boiler Works Company of Akron, Ohio, and the Birmingham Iron Foundry of Derby, Conn."

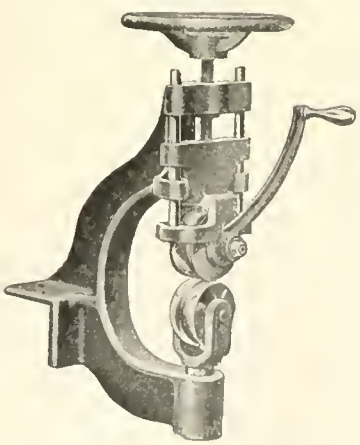
A TIRE KETTLE AND TREAD ROLLING MACHINE.

THE WILLIAMS FOUNDRY AND MACHINE CO., of Akron, Ohio, has recently put on the market a boltless, quick-opening tire kettle that has sufficient capacity for all except the very largest shops. It measures about 43½ inches inside



THE WILLIAMS TIRE KETTLE.

diameter in the clear, and the curing space is 16 inches high above the bottom grating, making capacity for about four tires 42 inches or smaller at a time. The kettle and lid are made of open hearth cast steel, tested with 200 pounds hydraulic pressure and 75 pounds steam pressure, making it safe for any condition of service. The crane head handling device and bottom grating which keeps the tires out of the water, and permits the steam to circulate all around the tires, overcome the common objections to vertical kettles. The boltless head saves so much time and labor that a retreaded tire can be cured with as little trouble as a sectional repair in a mold—a very obvious advantage.



TREAD ROLLING MACHINE.

This company is also placing on the market for the use of repair men who are retreading tires, a tread rolling machine that will enable the repairmen to roll the fabric much harder than it can be done by hand. The upper or concave roll is raised by means of a large hand wheel, and the tire inserted between the rolls. The desired pressure is applied by screwing down the hand wheel. The heavy oil tempered steel springs which roll the convex roller insure even pressure, and turning the crank causes the tire to turn between the rollers.

New Rubber Goods in the Market.

WATERPROOF COATS FOR THE NEW SEASON.

HERE are four new waterproof coats, taken from the offerings for 1912 and 1913 of the Greenhut-Siegel Cooper Co., of New York. They give a very good idea of the sort of rubberized garments that the women are expected to wear this winter.

Describing them from left to right they are briefly as follows:

No. 1 is made of serge or cravenette and guaranteed showerproof, but not being rubberized cannot be guaranteed as a sufficient protection against pelting rain. This is made in semi-fitted style with tailored seams and has a mannish collar and patch pockets which serve further to set it off. It comes in Oxford grey and tan.

Some 1912 Raincoats for Women.

No. 2 is a tourist raincoat made of imported rubberized diagonal tweed in the Raglan style. This garment can be worn in any weather and is suited for a general traveling coat or automobile wrap. This is made in grey, black, and black and brown diagonal.

No. 3 is made of rubberized cashmere, fashioned in the loose slip-on style, with high turnover collar and is made in olive green.

No. 4 is made of mercerized poplin rubberized and is cut in the English box style. All the seams are cemented with pure rubber, making them absolutely watertight. This garment is made in navy blue, grey and black.

Should be on every rubber man's desk—The Rubber Trade Directory of the World, 1912.

A COLLAPSIBLE PAIL FOR MOTORISTS.

This collapsible pail isn't in reality new, for it has been on the market for several years, but it probably is new to a good many people who tour around in motor cars; and all such will be glad to know about it. It is made of rubber cloth, well coated to avoid leaking. It is light, and when collapsed only stands 2½ inches high. When extended for use, it stands 11 inches high, and holds 2½ gallons of water. Any motorist who has found his radiator running dry, and not a house in sight, and has tried to convey water from a running brook in his hat, knows how much he would have given under those conditions for any sort of a pail. [The B. F. Goodrich Co., Akron, Ohio.]

A Collapsible Rubber Pail.

CUTTING PAVEMENTS WITH PNEUMATIC HAMMERS.

One of the most frequent sights in city streets, particularly in the streets of our older cities, is the taking up of hard pavement—asphalt or concrete—for the purpose of putting in new pipes or wires or rails, or repairing those that are already there.

Cutting Asphalt by Compressed Air.

It is no easy task to take up an asphalt pavement. It is almost as hard as iron, and the old regulation method of doing it by hand with a gang of men and picks is slow, expensive, and not very satisfactory in any way, particularly where it is desirable to follow a straight line and make a clean edge. To obviate the disadvantages of hand work in taking up these hard pavements, considerable experimenting of a very successful character has recently been

done with pneumatic hammers. A gas company in Brooklyn, New York, has found this method greatly preferable to the old way. They have a portable air compressor on a large flat-wheel truck; from this run rubber pipes conveying the power to the pneumatic hammers. The tools used are chisels with an edge somewhere from ¾ inch to 1½ inches in diameter. It has been found that a workman with a pneumatic hammer can accomplish as much as four or five workmen by the old method, and more than that, a straight chalk line can be drawn which the pneumatic hammer follows absolutely, making a clean-cut edge.

Pneumatic Hammers Cutting Concrete.

The experiment with the pneumatic hammer was thoroughly tried not long ago in the streets of Zurich, Switzerland, which were paved with a ten-inch thickness of concrete. It was found necessary to take up the rails of a street car track, and the pneumatic method was adopted with great success. A recent number of the "Compressed Air Magazine" has a more detailed account of both of these experiments illustrated with a number of cuts made from photographs, two of which, through the courtesy of that magazine, we here reproduce; the first cut showing a single workman chiseling out a line in an asphalt pavement, while the second cut shows a group of workmen taking up a concrete pavement in Zurich. Hard as asphalt is, this pneumatic chisel cuts into it and turns it over as if it were a piece of leather.

GOODRICH "LUMINA" AEROPLANE CLOTH.

The B. F. Goodrich Co. appears to have made very considerable headway with its new "Lumina" aeroplane cloth. It will be recalled by those who visited the recent New York Aero Show, that Wright and Curtiss both had aeroplanes there on exhibition in which this particular cloth was used. The Curtiss hydro-aeroplane recently purchased by the Russian Navy, and the Burgess biplane ordered by the United States Army, both are constructed with "Lumina" cloth.

"Lumina" is a handsome fabric, made from the finest long staple cotton, coated several times over with high-grade rubber solutions of various consistencies, and on one side again covered with aluminum. It becomes to all intents and purposes wind and weather proof.

The making of a suitable fabric for aeroplane purposes involves several novel conditions. The scantling of a plane is so slight that any warping or shrinking of the fabric will infallibly distort the frames, throwing them out of line and upsetting the true direction of flight. In "Lumina" these contingencies have been provided for, as it will neither shrink nor stretch. The rubber coating and aluminum covering are incorporated with the fabric, making it impervious to climatic influences; with the further advantages that it does not crack nor show dirt, while repairs may be readily executed with ordinary cement and without disfiguring the fabric.

"Lumina" cloth is made by the Goodrich company in its factory at Akron, Ohio, by special arrangement with the Continental Company of Hanover, Germany.

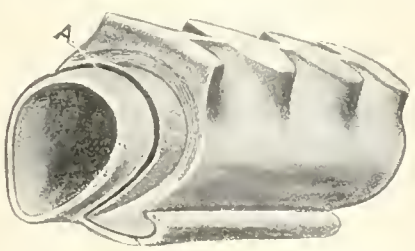
A RUBBER COAT FOR YOUR STRAW HAT.

There is nothing that fills a good man with more sorrow, or drives a wicked man to more profanity, than to pay $3.50 for a superior straw hat, and then immediately thereafter get caught in a pelting rain, and have the handsome, crisp, new headgear turned into a limp candidate for the dump-heap. And that really isn't at all necessary; for here is a rubber hat cover, which weighs next to nothing, and can be rolled up and tucked into a corner of a pocket; and yet, when occasion demands, can be taken out and in a second's time can be adjusted over the straw hat, so that it will go through the fiercest downpour without even getting moist. As some inventive genius has already made it possible to get a pair of rubber footholds so light that they can be conveniently carried in the pocket, if somebody else would only invent a spider-web rubber coat that could be carried in the same way, a man would only need three pockets to be able to carry adequate protection with him, wherever he went against the worst the elements might do. [National Rubber Hat Protector Co., Nashville, Tennessee.]

Straw Hat with Rubber Cover.

THE STEPNEY ROAD GRIP TIRE.

The annexed illustration displays in section the extremely heavy rubber tread of the "Stepney Road Grip Tire," the large flat projections in which form an excellent preventive against slipping, as they, to a certain extent, adhere to the surface of the road, while their rounded form casts on one side the stones and other objects which may come in the way. The thickness of the projecting portions tends to prevent nails and other sharp substances from penetrating the surface of the tire or the inner layers of linen, thus imparting a marked capacity of resistance.



Another specially made by the same concern is the "Stepney Tire Cover." This cover, it is claimed, permits the use of old, torn, or burst tires, instead of their being thrown away or sold as old rubber. It is shown in position A on annexed illustration, and is made of heavy linen impregnated with rubber, fitting the tire. With burst tires, it is recommended before putting on the cover to patch the hole with a linen rag and to vulcanize the surface or to apply rubber solution, so as to prevent water or dirt from getting in. [Stepney Auto-Reserve Wheel Tire Co., Limited, Berlin, 39.]

News of the American Rubber Trade.

COLONEL COLT BACK FROM EUROPE.

WHEN Colonel Samuel P. Colt, president of the United States Rubber Co., returned on the *Olympic* September 5, after a short visit to Europe, taken primarily to attend the wedding of his son, Roswell C. Colt, and incidentally devoted to the advancing of certain large enterprises in which his company is interested, he was met at the dock by various reporters of the New York dailies. In reply to their questions he gave his views on a number of subjects, predicting the re-election of President Taft, and stating that the Republican party of Rhode Island were united on his brother, Judge LeBaron C. Colt, to succeed Senator Wetmore in the United States Senate; but the paragraph of particular interest to the readers of this journal referred to certain important rubber matters. He is quoted by one of his interviewers as follows:

"While my trip has been primarily for pleasure," said Colonel Colt, "I have given time and attention to important matters in connection with the United States Rubber Co. One of these was an application to list $10,000,000 of our first preferred stock on the Parquet of the Paris Bourse. The negotiations are progressing satisfactorily and, I am confident, will be consummated within a reasonable time. This will be the minimum amount and it will be increased from time to time as the original offering is absorbed.

"I also gave attention to our crude rubber interests in the Far East. On one estate there we already have 25,000 acres planted. We are now putting out on an average 1,000 trees a day and we will continue at about this rate until we have 50,000 acres planted on that one estate. We shall begin to get rubber from our trees within the next two or three years."

ANNUAL MEETING OF THE FIRESTONE COMPANY.

Stockholders of the Firestone Tire and Rubber Co. held their annual meeting on September 4. The directors declared a 10 per cent. dividend on the common stock for the ensuing year, and a 7 per cent. dividend on the preferred.

After the dividends had been declared it was found there was nearly a million dollars in surplus. This will be used to expand the business, and to establish new branches. The year ending August 1 was the most successful in the history of the company, the gross receipts totaling $1,189,000.

The same officers and directors were elected at the meeting to serve for another year, namely: H. S. Firestone, president; Amos C. Miller, Chicago, vice-president; J. G. Robertson, treasurer, and S. G. Carkhuff, secretary. The capital stock of the company will remain the same, one million in preferred and three million in common.

THE RUBBER BALL PLAYERS TAKE THE CUP.

The Hub Athletic Association, composed chiefly of young men connected with the New York office of the United States Rubber Co., has during the last two or three years entered a baseball team against other members of the Shoe Baseball League. In the season of 1911 the Hub club was tied with the Morse and Rogers team, and the tie was to be played off during the past summer for the championship cup; but as the Morse and Rogers team was not able to get together with its original membership, the cup has been awarded to the Hub Athletic Association. The president of this association is Mr. Richard S. Harding, head of the mailing department of the United States Rubber Co., and the treasurer is the company's advertising manager, Mr. William H. Palmer.

TIRE COMPANY INCORPORATED IN MAINE.

The Hallett Vehicle Tire Co. has been incorporated under the laws of Maine to manufacture rubber tires for automobiles and other vehicles. The headquarters are at Augusta, Maine. The president is L. J. Coleman, and the treasurer G. E. Beane.

THE WILKIE COMPANY BECOME THE SAGAMORE.

It was voted at a special meeting of the stockholders of the Wilkie Rubber Manufacturing Co., Lynn, Massachusetts, held August 23, 1912, to change the name of the company to the Sagamore Rubber Manufacturing Co. All obligations due to and by the Wilkie Rubber Manufacturing Co. are payable to and by the Sagamore Rubber Manufacturing Co.

THE FISK SALESMEN HOLD A CONFERENCE.

The salesmen of the Fisk Rubber Co., Chicopee Falls, Massachusetts, had a three days' conference, from September 11 to 13 inclusive, at the head office of the company, for the purpose of discussing the policy for the coming season, and with the further object of getting acquainted with the company's plant and with one another.

WALLACE L. GOUGH RETIRES.

Wallace L. Gough Co., under date of September 14, has sent out the following letter announcing the retirement from that company of Wallace L. Gough. "We wish to inform you that our former treasurer, Mr. Wallace L. Gough, has sold his interest in the Wallace L. Gough Co., and that our former vice-president, Edward Weber, has been made the general manager of the concern.

The board of directors will consist of Edward Weber, president and treasurer; Cornelius Schroeter; Willy Kemmler, secretary.

All checks, notes, drafts or other obligations of the corporation will be signed by Edward Weber, as treasurer, or in his absence or disability by both C. Schroeter and W. Kemmler as directors.

RUBBER MEN AT THE CARRIAGE CONVENTION.

The Fortieth Annual Convention of the Carriage Builders' National Association was held on the famous Million Dollar Pier, Atlantic City, from September 23d to the 27th. In connection with this convention there was an exhibition in which the following manufacturers of rubber tires and other rubber articles took part: Diamond Rubber Co., Akron, Ohio; Fabrikoid Works, Wilmington, Delaware; Fairfield Rubber Co., Fairfield, Connecticut; Federal Rubber Manufacturing Co., Milwaukee, Wisconsin; Firestone Tire and Rubber Co., Akron, Ohio, and Goodyear Tire and Rubber Co., Akron, Ohio.

The Acushnet Process Co., New Bedford, Massachusetts, is adding a new building to its plant and otherwise making improvements in its factory.

OVER A THOUSAND TONS OF SCRAP RUBBER A WEEK.

The Loewenthal Co., New York, sold during the week ending September 14th over a thousand tons of scrap rubber—the actual weight being 2,118,000 pounds. On the hypothesis that the volume of scrap rubber sold is an excellent criterion of the rubber business being done in this country, these sales would indicate that the general trade is in very good condition.

TIRE MAN MAKES A GOOD SUGGESTION TO INNKEEPERS.

One of the officials of the United States Tire Co. passes along to the public generally and to keepers of way-side inns in particular a suggestion that comes to him from the owner of an automobile who is fond of touring around the country, as most automobile owners are, and naturally likes to stop from time to time at some proper house of refreshments. This man complains that the average automobile innkeeper acts as if he wanted all the money his guests could possibly raise, on the theory that this would be his last chance at him. Moderate and reasonable prices would certainly encourage tourists to patronize road houses much more than they do, and would therefore be ultimately for the benefit of innkeepers.

NEW INCORPORATIONS.

Amazon Rubber Smoking Machine Co., September 13, 1912; under the laws of New York; authorized capital, $5,000. Incorporators: Charles T. Green, 2 Rector street, New York; Edwin B. Griffin, 337 West Fourteenth street, New York, and Ernest M. Morrison, 206 Lincoln avenue, Brooklyn, New York. Location of principal office, New York.

Automobile Tire Filling Sales Co., August 24, 1912; under the laws of Delaware; authorized capital, $1,000,000. Incorporators: George G. and Oscar W. Stiegler, and William F. O'Keefe—all of Wilmington, Delaware. To buy, sell and generally deal in rubber goods of all kinds and to fill rubber tires and many other things.

The California Rubber Co., August 23, 1912; under the laws of California; authorized capital, $5,000. Incorporators: C. C. Booth, W. D. Walsh and William C. Earhuff—all of Los Angeles, California. To deal in manufactured rubber goods.

Empire Essenkay Co., September 13, 1912; under the laws of New York; authorized capital, $10,000. Incorporators: Herman C. Cowen, John W. Cumming and Howard C. Wilbur—all of Catskill, New York. Location of principal office, Albany, New York.

Englebert Tyre Co., September 13, 1912; under the laws of New York; authorized capital, $100,000. Incorporators: Samuel K. Kellock, 135 Kenmore place; Clarence B. Campbell, 16 Sydney place—both of Brooklyn, New York; and Edward W. Elverson, 82 Beaver street, New York. Location of principal office, New York. To deal in automobile and other tires.

Hallett Vehicle Tire Co., August 17, 1912; under the laws of Maine; authorized capital, $500,000. Incorporators: C. L. Andrews, L. J. Coleman and G. E. Beane—all of Augusta, Maine. To manufacture, buy, sell and deal in rubber, vegetable oils, substances for making artificial rubber and the like; to manufacture, buy, sell and deal in automobile tires, shoes, fillers, etc.

Hudson Raincoat and Duster Co., August 26, 1912; under the laws of New York; authorized capital, $6,000. Incorporators: Max Klein, 29 St. Marks place; Fischel Karp, 106 Avenue D, and Leon Wieselthier, 1341 Teller avenue—all of New York. Location of principal office, New York. To manufacture rubberized and other clothing.

Link Shoe Co., September 4, 1912; under the laws of New York; authorized capital, $10,000 Incorporators, Nathan Blyn, 27 East 124th street; Jacob Blyn, 22 Mount Morris Park, West, and Henry Blyn, 316 West 51st street—all of New York. Location of principal office, New York. To deal in leather and rubber goods.

The New England Rubber Reclaiming Co., August 26, 1912; under the laws of Massachusetts; authorized capital, $25,000. Incorporators: Paul Miller Broomfield, 121 Crawford street, Roxbury; Mary C. Cavanagh, 59 Olney street, and Harry Klein, 128 Chambers street, Boston—all of Massachusetts. To buy, sell and manufacture rubber, rubber waste, and rubber goods and merchandise.

Paragon Rubber Co., September 8, 1912; under the laws of New York; authorized capital, $5,000. Incorporators: Henry Horowitz, 124 West 117th street; Isadore Samisch, 133 West Twenty-first street, and Alexander Friedman, 220 Henry street, all of New York. Location of principal office, New York.

The Pharis Tire and Rubber Co., August 27, 1912; under the laws of Ohio; authorized capital, $25,000. Incorporators: Carl, Emma W. and Mabel A. Pharis. Location of principal office, Columbus, Ohio. To manufacture and deal in automobile, bicycle, motor-cycle, etc., tires and manufacture and sell appliances for same.

The Premier Waterproof and Rubber Co., September 4, 1912; under the laws of New York; authorized capital, $1,000. Incorporators: Ethel Cohan, 109 Ellery street, Brooklyn, New York; George A. Newman, Garden City, New York, and Albert A. Raphael, 23 Morningside avenue, New York. Location of principal office, New York.

Rondout Rubber Co., September 12, 1912; under the laws of New York; authorized capital, $1,000,000. Incorporators: Harry T. Clews, 115 East Thirty-ninth street; Frank C. Brannan, 327 West 124th street, and William J. Johnson, 1436 Crotona Park, East, Bronx, all of New York. Location of principal office, Kingston, New York.

The Sangha Rubber and Trading Co., August 16, 1912; under the laws of Connecticut; authorized capital, $50,000. Incorporators: Ewald G. Walker, Morristown, New Jersey; William D. and Laura I. Rorer, both of West Haven, Connecticut. To buy, sell, produce, import and export, manufacture and deal, as principal, in rubber, ivory and goods, wares and merchandise, etc.

United States Tire Sales Co., September 7, 1912; under the laws of New York; authorized capital, $500. Incorporators: A. G. Thaanum, 13-21 Park Row, New York; Joseph T. Weed, 150 Hicks street, Brooklyn, New York, and Max Greenberg, 32 West 112th street, New York.

FOUR FINE WAYS TO WEAR OUT TIRES.

Any motorist who has tire money that is burdensome to him and who would like to see the tire factories running with triple shifts, can find relief and promote a worthy cause by adhering to four very simple rules.

The first rule is of course, as everybody understands, to keep the tire only partially filled with air. This is so generally recognized as the best way of disposing of a tire that it needs no further consideration.

The second rule, which is important to observe, is to start the car into full speed and then apply the brakes. If the car can be made to grind along five or ten feet, particularly on a rough road, and this operation be repeated a few times, very noticeable sections of the tread can easily be removed.

Rule three is to stick to street car tracks, particularly attempting to cross them at a very slight angle so that the tire is pointed in one direction and the track constantly trying to pull it in another. Or if it is a country road where there are no car tracks, close adherence to ruts, the narrower and deeper the better, will bring about the same result. An auxiliary to this rule is on all possible occasions to run the car close to the curb, so that the side of the casings will rub as much as possible against the stone. This is a fine discourager of tire longevity.

Rule four is always to keep in mind that corners should be turned at a high rate of speed. This gives the whole tire an effective strain and helps materially to accelerate its pace to the junk heap.

Any motorist who will carefully observe the four rules enumerated above will find himself in a position to have fine new, handsome tires put on his wheels with great frequency.

A NEW TIRE PLANT FOR COLUMBUS.

The Pharis Bros. Rubber Co., Columbus, Ohio, has purchased the Newark Tire and Rubber Co., of Newark, Ohio, and expects to move the business to Columbus in the near future. New machinery will be added to the plant, so that its capacity for turning out tires will be materially increased. The output of the company will be called the "Pharis" tire, and will be made in two types, a wrapped-tread tire, good for 5,000 miles, and a molded tire with a 3,500 mile guarantee.

UNITED STATES RUBBER CO.'S ISSUES.

Transactions on the New York Stock Exchange for three weeks, ending September 14:

Common Stock, $25,000,000.

[The treasury of a subsidiary company holds $1,334,000.]
Last Dividend (special), July 8, 1912—20%.

Week Aug. 31	Sales 3,475 shares	High 51¾	Low 51
Week Sept. 7	Sales 3,400 shares	High 51½	Low 51
Week Sept. 14	Sales 2,500 shares	High 51⅜	Low 50½

For the year—High, 67⅞, May 21; Low, 45¼, February 1.
Last year—High, 48½; Low, 30½.

First Preferred Stock, $39,824,400.

Last Dividend, April 30, 1912—2%.

Week Aug. 31	Sales 430 shares	High 108⅞	Low 108½
Week Sept. 7	Sales 600 shares	High 108⅞	Low 108¾
Week Sept. 14	Sales 510 shares	High 108½	Low 108¼

For the year—High, 116, May 20; Low, 105⅝, July 25.
Last year—High, 115½; Low, 104.

Second Preferred Stock, $9,965,000.

Last Dividend, April 30, 1912—1½%.

Week Aug. 31	Sales 100 shares	High 79	Low 79
Week Sept. 7	Sales .... shares	High	Low ....
Week Sept. 14	Sales .... shares	High	Low ....

For the year—High, 85½, May 21; Low, 75, January 23.
Last year—High, 79; Low, 66.

Six Per Cent. Trust Gold Bonds, $18,000,000.

Outstanding of the 1908 issue of $20,000,000.

Week Aug. 31	Sales 38 bonds	High 104⅜	Low 104⅛
Week Sept. 7	Sales 7 bonds	High 104¼	Low 104⅛
Week Sept. 14	Sales 38 bonds	High 104¼	Low 103¾

For the year—High, 105, February 24; Low, 103¾, January 6.
Last year—High, 105; Low, 101¾.

THE GOODYEAR TIRE COMPANY MAKING COATS.

The Goodyear Tire and Rubber Co., Akron, Ohio, has recently embarked upon the manufacture of rubberized clothing and is now placing on the market a variety of rubber coats, one of which is shown in the accompanying illustration. The fabric, which is imported, is thoroughly impregnated with rubber, and this is done in such a way that the material does not stiffen, even after the coat has been long exposed to a pelting storm and is thoroughly wet.

Coat Made by Goodyear Tire and Rubber Co.

TO KEEP AUTO-BUSSES FROM SPLASHING.

In London they are experimenting with a splash-guard to keep the heavy auto-busses that run through their sometimes muddy streets from disfiguring pedestrians on adjacent sidewalks. These splash guards consist of a screen made of a steel mesh that is hung on the hub of the wheel and drops close to the ground. The mud that is thrown up by the wheel, instead of going off into space to hit any target, human or otherwise, that may be at hand, strikes against the screen and does no damage. Where mud-holes prevail in the roadways of a city, these or similar guards are certainly desirable, but the absence of mud-holes seems even a better and simpler solution of the problem.

AN ENGLISH MARKET FOR AMERICAN TIRES.

Mr. Alfred Halstead, American consul at Birmingham, England, made some interesting observations on England as a tire market for American manufactures, in a report which he recently sent to the State Department. In Mr. Halstead's opinion, there is an excellent market in the British Isles for American automobile tires, but it will take a crowbar of gold to pry it open. Here's what he says:

"The rapid growth of the automobile industry, the enormous development in the manufacture of motorcycles, and the continued British use of the ordinary bicycle have made the United Kingdom as good a market as there is for rubber tires of all kinds as well as for other articles made of rubber that are required in these industries. There are, naturally, great British firms that make rubber tires of all kinds, and they have also been very successfully introduced by prominent continental makers.

Despite the large sales of American automobiles here, American tires have not been introduced into the United Kingdom to the degree that might have been expected, especially as it is stated that there is more actual rubber in the American article than there is in the British or European product, in which, it is said, there is not more than 7 to 10 per cent. of rubber in the outer casing and 35 per cent. in the inner tube, rubber substitutes and filters being extensively used. If the trade in tires is to be successfully cultivated by United States manufacturers, heavy expenditure for advertising and other introductory measures will be necessary, but should be preceded by investigations as to the exact requirements of the market. American exporters may not understand how important a part in the introduction of tires and motor parts is played by hill-climbing and other tests and races. Every such success is regarded as the best possible advertisement, and it is quite customary for drivers of automobiles or riders of motorcycles to be in the employ of various firms and to be paid a bonus for each win they make.

"If tires are to be introduced by American firms, it will be absolutely necessary for a trained organization to be created in England, and the tactics pursued by British and other makers followed, with such modifications as American sales ingenuity may deem desirable. The thorough introduction of tires by any American company will cost an immense amount of money for advertising, racing expenses, etc., and for many months there would be no return; but if the American tires are as good as they are said to be, and prices right, success, when it comes, will be great, even though delayed by the strong hold of British and foreign tires on this market."

DETROIT'S 1913 PRODUCTION OF MOTOR CARS.

The Detroit makers of automobiles expect to add a third of a million motor vehicles in 1913 to the number already in existence. A conference was recently held between representatives of the various Detroit manufacturers and representatives of the railroads, with a view to ascertaining how large a freight-car equipment they would have to furnish. After hearing that the automobile makers expected to produce 330,000 automobiles the representatives of the railroads decided that the 1913 Detroit output would require over 100,000 freight cars.

A RECORD FOR TIRE ECONOMY.

According to the Nebraska papers, there is a certain owner of an automobile who lives in Norfolk in that state, who has driven a car for four years at a total tire expense, covering all repairs, of $2.70. Of this amount, $2.35 was caused by a puncture made by a nail. If it had not been for that nail, the four years' tire expense would have been 35 cents, or less than 9 cents a year; and yet so much is said about the high cost of living.

AN ANNOUNCEMENT EXTRAORDINARY.

There is an original genius in Bridgeport, Connecticut, who styles himself "Chemist Peck, Inventor," who is the inventor of a "Nu-Rubber Tire-Lining" which he describes as follows:

"Each Lining provides 1,000 instant, Self-Mending Plugs—Permanent, Unseen, Harmless, becoming a part of the tire; giving usually Double-Life and Value"—and so on, for several hundred more words to the same general effect.

But the "real cream" of his announcement is contained in the following paragraph:

"Eclesia, New Era, Federation of Nations, United States of the Globe. Initiated and Represented by the Corporation Eclesia, Stratford on the Ousatonic, Independence Day, July 4, C. D. 1908. Incorporated and Registered Copyright, State of Connecticut, U. S. A., 1908, Merit Certificate and Patent Award by Corporation Eclesia for Nu-Rubber Tire-Lining. Assigned for Protection and Promotion of Policies and Benefices Mutual and General."

If Nu-Rubber even remotely lives up to its literature, it must be marvelous stuff. Evidently Chemist Peck does not intend to hide his literary light under a bushel.

DAHL TIRE STOCK INCREASED TO $6,000,000.

At the annual meeting of the stockholders of the Dahl Tire Co., which was held at Minneapolis early in September, the capital stock was increased to $6,000,000 and the company reorganized. The new company will take over all the patent rights owned by the old company, and in addition to manufacturing Dahl tires, will also manufacture various tire accessories. The central office will be in New York city, with a branch office in Chicago.

A NEW RUBBER CEMENT COMPANY.

The Standard Rubber Cement Co., a New York corporation with a capital stock of $100,000, recently began business in a factory at 772 Humboldt street, Brooklyn, New York. The company expects to manufacture rubber cement of all kinds, but will make a specialty of rain coat and channel cement. An additional enterprise will be the washing and refining of crude rubber for the trade.

COMPRESSED AIR CUSHIONS FOR AUTOMOBILES.

Comparatively few people, who have heard Josef Hofmann operate on the piano, are aware of the fact that in addition to being a marvelous musician, he is very much of an inventor. He has recently invented an air-cushion automobile. It is being tested in Switzerland, and some are being constructed at the Saurer Machine Works in the district of St. Gall, Switzerland. It is described as follows:

"In place of the usual steel springs it has four brass cylinders for compressed air, resting on the axles under the four corners of the automobile body, and these, by means of pistons and soft leather diaphragms, greatly reduce the swaying and jolting.

"It is claimed for the new invention that it is adaptable to all kinds of roads, regardless of speed or weight of machine; that the air cushions work instantaneously with softness and ease of movement; that there is an entire absence of vibration, as no metal springs intervene between the axle and the car body; that there is almost perfect balance in rounding curves; and that there is as nearly perfect working safety as can be secured."

This Hofmann air-cushion auto has been put to severe tests during a number of months, and has run well towards 5,000 miles over rather trying roads, with results that are said to be very satisfactory. It has made a speed of 40 miles an hour over rough roads.

PERSONAL MENTION.

Ellsworth F. Norton, of E. F. Norton & Co., Chicago, Illinois, buyers and sellers of scrap rubber, was married on September 10 last to Miss Laura Steffan, of that city.

Miss Maie Elizabeth Spadone, of Brooklyn, New York, daughter of Walter W. Spadone, vice-president of the Gutta Percha and Rubber Manufacturing Co., New York City, was married on September 1 to Hamilton Disston Saxton, of New London, Connecticut.

Mr. Hartman, who had charge of the sheet packing department of the Manhattan Rubber Manufacturing Co., Passaic, New Jersey, died early in September after a short illness.

Albert Weber, of Weber & Schaer, of Hamburg, Germany, recently arrived here on the Olympic, the purpose of his visit being the renewal of many friendships in the trade in this country. Mr. Weber is the vice-president of the "Verein am Gummi Handel Betheiligten Firmen"; as well as a promoter and director of many important importing and growing associations. These include: The Gesellschaft Sued Kamerun; Deutsche Kamerun Gesellschaft; Mahesa Rubber Plantations, Limited, and the Anglo Bolivian Rubber Estates, Limited.

I. Henry Hirsch, of Adolph Hirsch & Co., crude rubber importers, sailed for Europe on September 3, by "Kaiser Wilhelm der Grosse."

Mr. William G. Brown, the well-known distributor of rubber manufacturers' supplies, of 701 Provident Bank building, Cincinnati, Ohio, is in New York with the two-fold purpose of placing his daughter, Miss Helen Brown, at Vassar, and attendance at the rubber show now in progress at the Grand Central Palace.

DR. EDUARD MARCKWALD IN AMERICA.

Dr. Eduard Marckwald, who for the last 12 years has been at the head of the Chemical Laboratory for Commerce and Industry, in Berlin, is now visiting the United States, and expects to remain in this country for the next three or four weeks. He is not only a well known German chemical authority but is especially prominent in the field of rubber chemistry.

TWO WALPOLE APPOINTMENTS.

The Walpole Rubber Co., of Walpole, Massachusetts, has recently made two new appointments to the selling staff of its New York headquarters at 80 Reade street. Charles O. Anthony, who for the past nine years has been connected with the New York Insulated Wire Co., has been added to the selling force of the New York office, as has also August R. J. Rode, who will be connected with the selling force of the druggists' sundries department.

THE SUPREME COURT UPHOLDS THE COMPLAINT.

In our last issue we referred to a decision in an action recently brought by a rubber manufacturing company against the National Board of Fire Underwriters. We have ascertained that the decision we there referred to merely called for the reframing of the complaint in the action; and that this was at once done by the plaintiff. The defendant then claimed by demurrer that no sufficient cause of action was shown in the complaint. This has since been argued before the Supreme Court, and a decision has been rendered holding the complaint to be good.

TO MAKE RUBBER GREASE-PROOF.

The Starkweather & Williams Co., manufacturers of textile specialties, Providence, Rhode Island, state that they have discovered a process by which they can put a coating, which is invisible and cannot be detected by touch, over a rubber surface so as to make it proof against grease. They have not only given this matter a thorough testing, but they have already begun to supply rubber manufacturers with this preparation. It is, of course, of obvious value for aprons, and in the making of clothing that is to be used where there is any grease, as, for instance, in a dairy. The name of this preparation is "Boline." The company is now increasing its facilities and expects to be ready before long to make this new product in considerable quantities.

COAL PRICES TO SOAR?

Advices from Cleveland speak of an impending car shortage, likely to be the greatest in the history of transportation, as being liable to occur within a month. As a result, it is anticipated that the prices of both hard and soft coal will advance. Local distributors of anthracite are said to be fifty per cent. behind in their receipts, due to the closing of the mines last spring and the failure of the railroads to move the output.

RUBBER FLOORS FOR STAGE DANCING.

According to European advices, the slippery floors on which stage dances have hitherto been executed at Parisian music halls, are being replaced by rubber matting. Two rubber mats about 17 feet long by 7 feet wide are placed side by side in the center of the stage. The mats are about ⅛-inch in thickness, a couple of them being said to cost about $50 or $60.

It has been suggested that sooner or later the whole stage will be covered with a rubber tiled flooring. That stage floors are at present too slippery is an admitted fact, the question arising: what is to be the consequence of prospective increased speed in terpsichorean evolutions?

FOUR-INCH TRUCK TIRES.

Foreigners, particularly the English, have been rather prone to criticize American truck tires on the ground that they were much too thin to give the best possible continuous service. American truck tires usually remain about 2¾ inches in thickness irrespective of the width of the tire, while in England and on the continent the thickness of a tire—or the sectional height—is in proportion to the width; for instance, a tire 3½ inches wide will be 2¾ inches thick, but a 6-inch tire will be 4-inch thickness. Undoubtedly this extra thickness gives greatly increased wear and also diminishes the jolting. On the other hand, of course, it takes much more rubber.

ASBESTOS IN THE UNITED STATES AND CANADA.

The total production in the United States for 1911, according to the United States geological survey, was valued at $119,935; the raw material imported from Canada was valued at more than 11 times that amount. Canada's production of asbestos in 1911 was worth nearly $3,000,000.

MR. TAFT TO HAVE SOME RUBBER BOOTS.

The Boston Rubber Shoe Co., at its factory in Malden, Massachusetts, is manufacturing a special pair of fishermen's hip boots, to be presented to President Taft when he visits that city during the carnival which is soon to be held in the Malden Anniversary Week. A great many of our statesmen have been said in the past to belong to the "gum-shoe brigade," but this is the first time that any man so distinguished in our political life has been openly decorated with a pair of rubber boots.

MOTOR TRUCK TIRES IMPROVING.

According to a prominent tire manufacturer, no period in the history of the motor truck industry has developed such marked improvements in solid tires as the past year. A proof of this statement may be found in the fact that within the year manufacturers have increased their mileage guarantees 2,000 and in some instances 4,000 miles. It now is possible for a truck owner to buy tires covered by a guarantee of 10,000 miles, irrespective of the city or locality in which they are to be used. Up to a short time ago manufacturers were compelled to discriminate against certain cities and localities because of local conditions, such as bad pavements, unimproved highways, the prevalence of hills and for other causes peculiar to a particular section. In such places guaranteed mileage was less than where better conditions prevailed.

Commenting on the solid tire situation at the present time, F. F. Phillips, of the United States Tire Co., says:

"Truck owners are not only receiving greater mileage guarantees today than ever before, but they are getting better all-around service. Our new demountable solid tire, which has been on the market about eight months, is sold under a flat guarantee of 10,000 miles, conditional only upon the service being had within one year's time. The locality where the tires are to run makes no difference in our case."

SOME HIGHLY VALUABLE SUGGESTIONS.

A correspondent in a recent number of "Motorcycling" contributes the following interesting economic suggestion. "If you have an old raincoat, mackintosh or like garment, split it down the back about the length of the regular vent, sew four or five buttons on strongly, and make button holes or clasps corresponding on each side of the front of the garment. When buttoned together, like illustration, it completely covers your good clothes." This suggestion is further elucidated by the accompanying cut, showing just how it is done.

But why stop with utilizing an old rubber garment in the method indicated? Why not complete the good work? An old football cover, with the lacing taken out and the slit extended possibly an inch or two, would make a clever motor cap, coming well down over the ears and fitting the head snugly. Two ten-inch sections cut out of an old automobile tire and turned up a little at the two ends would make a very fine pair of rubber shoes. Naturally the sides of these cut-open sections would clamp the foot and hold on like a pair of "Eversticks." Furthermore, if an old hot water bottle were cut in two across the middle, and gathering strings inserted around the edges you would have a fine pair of rubber mittens. These could readily be converted into gloves by simply cutting the necessary holes for the thumb and fingers to project through.

It will be seen at once from the above suggestions that anyone with a little thought and ingenuity, a few buttons, a string or two, and possibly a nail, can make almost anything he wants in the way of a rubber outfit from discarded rubber relics and thus materially cut down the present high cost of living.

THE UNITED STATES TIRE CO.'S ST. LOUIS OFFICE.

The United States Tire Co. expects soon to move into a new building at Locust street and Compton avenue, St. Louis, Missouri, of which it is said to have taken a ten years' lease.

Recent Patents Relating to Rubber.

UNITED STATES OF AMERICA.

ISSUED AUGUST 6, 1912.

No. 1,034,468. Tire for automobile wheels. H. Knoch, Aldershof, near Berlin, Germany.

1,034,475. Resilient vehicle wheel. M. Mathiesen, San Antonio, Texas.

1,034,497. Elastic suspension device for motor cars. F. Pagliano, Turin, Italy.

1,034,511. Automatic hose and tire connector. E. J. Rohrbacher, Portland, Ore.

1,034,524. Spring wheel. C. Sjogren, Wessington Springs, S. D.

1,034,720. Spring cushion tire. N. McQueen, Ludowici, Ga.

1,034,744. Shoe or boot. F. Tilt and J. E. Telling, Holland. Mich.

1,034,748. Pneumatic tire. E. Weil, New Orleans, La.

1,034,763. Cushion innersole for shoes. F. O. Brown, St. Louis, Mo.

1,034,779. Device for holding reins, leaches, and the like. H. Franzky, Liegnitz, and J. Wieczorek, Haynau, Germany.

1,034,847. Vehicle wheel. P. I. Viel, Paris, France.

1,034,942. Resilient metal tire for vehicle wheels. F. W. Wieber, Colorado Springs, Col.

1,034,966. Tire. H. A. Brandenburger, St. Louis, Mo.

1,034,975. Resilient wheel. Z. D. Butts, Cleveland, Ohio.

1,034,980. Spring wheel. J. F. Cocowitch, Dunnellon, Fla.

1,035,004. Vehicle wheel. T. A. Hargraves and E. J. McCord, Belfast, Ireland.

1,035,052. Spring tire. C. P. Rosier, Boulder, Col.

1,035,058. Spring wheel for automobiles and other vehicles. W. Stephens, New Bedford, Mass., and H. M. Gaston, Newport, R. I.

1,035,078. Resilient tire for vehicle wheels. W. W. Broga, Springfield, Mass.

1,035,107. Elastic material. W. J. Teufel, Stuttgart, Germany.

1,035,128. Cushion tire for wheels. N. McQueen, Ludowici, Ga.

Reissue.

13,454. Supporting and retaining device for spare tires. W. A. Allen, New York.

ISSUED AUGUST 13, 1912.

1,035,138. Vehicle tire. F. N. Ashley, New York.

1,035,207. J. K. Libby, Malden, Mass.

1,035,217. Face protector. O. H. McQuary, Jr., Lawrence, Kan.

1,035,283. Self-inflating and non-collapsible pneumatic tire. F. F. Wear, San Francisco, Cal.

1,035,367. Resilient wheel. A. Loock, Hayfield, Iowa.

1,035,371. Cushion heel. C. H. C. Martin, Forestville, N. Y.

1,035,473. Tire. A. C. Rovelli, Philadelphia, Pa.

1,035,487. Vehicle tire. G. E. Starn, assignor to Starn Tire Mfg. Co., Camden, N. J.

1,035,560. Method of refilling aerial vehicles during a flight. H. Erdmann, Charlottenburg, Germany.

1,035,586. Grip tread for elastic tires. C. L. Hoff, York, Pa.

1,035,749. Apparatus for making tires. J. N. Satterthwaite, assignor to Empire Tire Co.—both of Trenton, N. J.

1,035,788. Synthetic caoutchouc. A. Heinemann, South Kensington, London, England.

1,035,804. Air compressor. M. Mintz, Rock Island, Ill.

Trade Marks.

64,275. Parker, Stearns & Co., New York. The word *Boudoir*. For rubber bathing caps.

64,406. Hood Rubber Co., Boston, Mass. The word *Tuxedo*. For rubber boots, shoes, etc.

64,409. International Shoe Co., St. Louis, Mo. The words *Golden West*. For rubber boots and shoes.

ISSUED AUGUST 20, 1912.

1,035,851. Elastic tire for the wheels of vehicles. F. E. Blaisdell, Hammersmith, England.

1,035,859. Metallic packing. P. Conniff, Washington, D. C.

1,035,867. Wire winding machine. A. L. Eastham, Beaumont, Tex., assignor to J. A. Wiggs, Chattanooga, Tenn.

1,035,870. Vehicle tire. J. G. Funk, Swissvaleborough, Pa.

1,035,912. Wheel. M. C. Rose, Cleveland, Ohio.

1,036,016. Tire. E. Siegel and J. Ruppert, Jr., New York.

1,036,020. Tire holder. A. M. Sonnichsen, assignor to Auto Parts Mfg. Co.—both of Milwaukee, Wis.

1,036,065. Vehicle tire. C. W. Blaney, Philadelphia, Pa.

1,036,120. Hose supporting device. W. Humbaugh, Dayton. Ohio.

1,036,188. Resilient antifriction hub for vehicle wheels. C. G. Capwell, Roslindale, Mass.

1,036,251. Pneumatic rubber tire protector. J. F. Johnson, Jamestown, N. Y.

1,036,311. Wire cutting machine. F. H. Nullmeyer and C. A. Porath, Struthers, Ohio, assignors to The Youngstown Sheet & Tube Co., Youngstown, Ohio.

1,036,340. Cushioning device. A. F. Rockwell and C. F. Schmelz, assignors to The New Departure Mfg. Co.—both of Bristol, Conn.

1,036,349. Hose coupling. C. C. Schultz, Victor, Iowa.

1,036,428. Coated metal wire rubber fabric. R. M. Bissell, Valcour, N. Y.

1,036,448. Device for testing piston rings. D. J. Campbell, Muskegon, Mich.

1,036,455. Pneumatic tire. J. H. Clune, Springfield, Mass.

1,036,493. Pneumatic tire. B. B. Hill, London, England.

1,036,516. Rubber tire. J. J. Beitler, New York, assignor to H. C. Beitler, Chicago, Ill.

ISSUED AUGUST 27, 1912.

1,036,532. Shelter for dirigible balloons, airships and the like. R. A. Katz Berlin, Germany.

1,036,533. Vehicle wheel. W. C. Allen, Kansas City, Mo.

1,036,576. Attaching rubber to metals. L. Daft, Rutherford, N. J., assignor to Electro-Chemical Rubber & Mfg. Co. of New Jersey.

1,036,579. Resilient wheel. W. W. Darling, Delta, Col.

1,036,595. Suspender garter for stockings. H. Fenton, Glebe Point, near Sydney, New South Wales, Australia.

1,036,599. Vehicle wheel. A. H. Flournoy, Heraldsburg, Cal.

1,036,602. Signal for pneumatic tires. F. L. Fuller, Sacramento, Cal.

1,036,685. Vehicle wheel. R. D. Muro, Habana, Cuba.

1,036,748. Tire removing device. W. L. Tobey, Winthrop, Mass.

1,036,776. Tire armor. H. Auperl, New York.

1,036,829. Cushion tired wheel. N. Gratz, Boise, Idaho.

1,036,855. Pneumatic vehicle wheel. G. Kanter, Murtoa, Victoria, Australia.

1,036,856. Pneumatic shock absorber for vehicles. G. Kanter, Murtoa, Victoria, Australia.

1,036,955. Tire. G. V. Benninghoff, Meadville, Pa.

1,037,116. Tread for tires. J. A. Bowden, Los Angeles, Cal.

1,037,144. Vehicle wheel. T. J. Holland, Antigo, Wis.

1,037,158. Process of manufacturing substitutes for oils, caoutchouc, resins and the like. L. Lilienfeld, Vienna, Austria-Hungary.

Trade Mark.

52,874. Hood Rubber Co., Boston, Mass. The word *Winner*. For rubber boots, shoes, etc.

GREAT BRITAIN AND IRELAND.

PATENT SPECIFICATIONS PUBLISHED.

The number given is that assigned to the Patent at the filing of the application, which in the case of these listed below was in 1910.

**Denotes Patents for American Inventions.*

[Abstracted in the Illustrated Official Journal, August 8, 1912.]

9,264. Rubber substitutes. J. Stockhausen, 105 Fischelnerstrasse, Crefeld, Germany.

9,281. Tire attachments to rims. J. W. Hall, 70 Josephine avenue, Brixton Hill, and C. Baynes, 9 Kensington Court Mansions—both in London.

9,290. Wheel tires. T. H. B. Gayner, 113 Neville street, Middle Park, South Melbourne, Australia.

9,321. Moulding tires. Margetts International Sectional Tire Co., 56 Moorgate street, and A. J. M. Smith, Venner Villa, Venner Road, Sydenham—both in London.

9,364. Fluid pressure relays for amplifying sounds. Soc. des Etablissements, Gaumont, 57, Rue St. Roche, Paris.

9,427. Vehicle wheels. F. H. de Lostalot, 3 Avenue des Moulineaux, Billancourt, Seine, France.

9,434. Vehicle wheels. H. Farjas, 13 Rue Vignon, Paris.

9,497. Copying documents, etc. B. J. Hall, 41 Castelnau, Barnes, London.

9,523. Electric conductors. C. J. Beaver, Rangemoor Crescent Road, Hale, aid E. A. Claremont, Broom Cottage, High Leigh—both in Cheshire.

9,534. Sponge substitutes. B. W. Wittenberg, 31 Weidendamm, Riga, Russia.

9,535. Sphygmometers. A. A. Thornton, 38 Chancery Lane, London.

9,546. Wheel tires. C. Schmidt, Ichenhausen, Bavaria.

9,580. Vehicle wheels. Austin Motor Co., and H. Austin, Longbridge Works, Northfield, near Birmingham.

9,600. India rubber washing machines, etc. R. Bridge, Castleton Ironworks, Castleton, Lancashire.

9,635. Railway vehicles. A. Spencer, 77 Cannon street, London.

9,722. Diolefines; caoutchouc. W. H. Perkin and C. Weizmann, University Manchester, and F. E. Matthews and E. H. Strange, 7 Maple Inn, London.

9,734. Chair feet. H. Cohrs, 73 Steinstrasse, Dusseldorf, Germany.

[Abstracted in the Illustrated Official Journal, August 14, 1912.]

9,778. Discharging bottles, etc. R. G. Slee, Dowanhurst, Atkins Road, Clapham Park, London.

9,833. Boot machinery. F. H. and H. S. Pochin, of Standard Engineering Co., Evington Valley Road, Leicester.

9,855. Baths. A. C. Franklin, 24 Chatham Place, and G. W. Beall, 51 Gardner street—both in Brighton.

9,888. Signals. J. Buck and H. Them, Dinglingen, Baden, Germany.

9,923. Filling tires. R. Zimpel, 25 Verlangerte Wilhelmstrasse, Grosslichterfelde, Berlin.

9,962. Railway buffers. J. G. Robinson, Boothdale, Fairfield, near Manchester.

*10,023. Tire valves. F. B. Carlisle, 35 High street, Malden, Mass., U. S. A.

10,064. Rubber strips for carpets, floor rugs, mats, etc. C. E. Player, Birkenhead, Auckland, New Zealand.

10,126. Wheel tires. A. Boerner, 45 Rue Henri Maus, Brussels.

10,128. Electric conductors. Scandinavian Belting and T. E. Delmaine, 59 Southwark street, London.

10,155. Vehicle wheels. H. A. Pryor, 70 Chancery Lane, London.

10,216. Treating india rubber. Hiestrich (Nachfolger), W., 4, Jungfernstieg, Hamburg, Germany.

10,277. Boots, etc. O. Budt, 1 Burgstrasse, Werniegerode, Germany.

10,232. Rubber sheets in leather manufacture. A. G. Bloxam, Birkbeck Bank Chambers, London.

10,239. Date indicators. J. F. Coates, 52 King William street, and A. Emmett, 96 Nightingale Lane, Wandsworth Common—both in London.

10,257. Wheel tires. G. W. Mascord, 5 The Crescent, Barnes, London.

10,292. Rubber tapping knives. D. D. Wragg, 70 Charles street, Sheffield.

10,321. Billiard cues. E. and F. Rudolph, 12 Freiburgerstrasse, Waldenburg, Germany.

10,326. Wheel tires. A. Boerner, 45 Rue Henri Maus, Brussels.
[Abstracted in the Illustrated Official Journal, August 21, 1912.]

10,370. Lubricators. J. T. K. Maddrell, 5 De Beers Road, Kimberley, South Africa.

10,420. Rubber substitutes. R. Desouches, 20 Rue Alphonse de Neuville; A. Riasse, 46 Cité des Fleurs, and A. Duron, 63 Rue Dulong—all in Paris.

10,438. Wheel tires. E. Overy, 40 Haig Road, Plaistow, and W. F. Gould, 213 Neville Road, Forest Gate—both in London.

10,439. Heel protectors. B. Fuchs, 27 Akacfautca, Budapest.

10,451. Wheel tires. A. de Doncquers and J. de Koninck, Anderlecht, near Brussels.

10,452. Wheel tires. A. de Doncquers, Anderlecht, near Brussels.

10,473. Rubber cushions in axles of cycles. J. Roberts, 78 Granby street, Liverpool.

10,481. Moulding india rubber. W. H. Haydock, 2 Fitzwarren street, Pendleton, Manchester.

10,574. Weavers' shuttle threaders. A. MacLean, 49 Deansgate, Manchester.

10,612. Pressure gauges for tires. H. Edmunds, Parliament Mansions, Victoria street, Westminster.

10,619. Belts and bands. E. Lycett, Bromley street, Birmingham.

*10,622. Wheel tires, etc. E. G. Dreger and F. E. Püster, 19 Tehama street, San Francisco, Cal., U. S. A.

10,646. Bottle stoppers. Johnson & Sons, 23 Cross street, Finsbury, London, and E. A. Marr, 81 Stretton Road, East Croydon, Surrey.

*10,672. Vehicle wheels. M. Clark, 401 Steinway Hall, Chicago, Ill., U. S. A.

10,698. A box for bottles. G. Leigh, Warren street, Stockport, Cheshire.

10,720. Vehicle wheels. J. N. Mollett, 6 Eastcheap, and T. P. Thomson, 434 Strand—both in London.

10,722. Vehicle wheels. E. Sutcliffe, 19 Bradford Road, Brighouse, Yorkshire.

10,726. Vehicle wheels. C. R. Strange, Merilbah, Clan Alpine street, Mosman, New South Wales, Australia.

10,732. Vehicle wheels. H. W. Spence, 56 Millicent avenue, Toronto, Canada.

10,808. Vehicle wheels. H. W. Toengers, Marie House, Brockley View, Forest Hill, London.

10,816. Electric meters. Chamberlain & Hookman and S. James, Solar Works, New Bartholomew street, Birmingham.

10,826. Diolefines; caoutchouc. J. Y. Johnson, 47 Lincoln's Inn Fields, London.

*10,827. Electric coils. J. L. Milton, Hotel Moicher, Tiffin, Ohio, U. S. A.

10,896. Buoys. D. Pesci, 4 Piazza Mazzini, Pisa, Italy.

10,914. Caoutchouc substances. J. Y. Johnson, 47 Lincoln's Inn Fields, London.

[Abstracted in the Illustrated Official Journal, August 28, 1912.]

10,940. Compressing air, etc. G. Kubler, Brandon, Freta Road, Brexley Heath, and G. S. Woollatt, "Weathersfield," Brexley Road, Erith—both in Kent, and Frazer & Chalmers, 3 London Wall Buildings, London.

10,942. Extracting rubber, etc. A. J. Boult, 111 Hatton Garden, London.

11,060. Wheel tires. H. H. Cuthbert, 7 Belgrave Mansions, Grosvenor Gardens, and A. Tomlins, 130 Warwick street, Eccleston Square—both in London.

11,093. Pliers for manipulating elastic tires. J. Platt, Totley Rise, Bushey Wood, Dore, near Sheffield.

11,101. Smoking india rubber. A. Woosnam, 46 Lincoln's Inn Fields, London.

11,177. Medical syringe. F. J. Hering, Basel-Binningen, Switzerland.

*11,212. Artificial teeth. J. Petry, 2022 Lowrie street, Pittsburgh, Pa., U. S. A.

11,247. Skates. A. J. Mollinger, 42 van Nispenstaat, Nymegen, Holland.

11,301. Corsets. W. Pretty & Sons and L. E. Pretty, Tower Ramparts, Ipswich.

11,329. Cords. R. Latour and A. Cappelle, 157 Chaussee d' Ypres, Menin, Belgium.

11,449. Wheel tires. R. Withy, 103 Verney Road, North Camberwell, London.

11,432. Reclaimed rubber. H. L. Terry, 23 Hopwood avenue, Market Place, and G. Spencer, Dudley Bank, Withington Road—both in Manchester, and E. L. Curbishley, Woodlea, Albert Road, Cheadle Hulme, near Manchester.

THE FRENCH REPUBLIC.

PATENTS ISSUED (with Dates of Application).

439,519 (January 30, 1912). J. G. Peck. Elastic wheel.

439,564 (January 31). Pugniet & Co. Manufacture of rubber articles by stamping.

439,570 (January 31). R. Reinecke and E. Knoll. Process for production of a substitute for ebonite.

439,579 (January 31). G. G. Le Meneust. Vehicle wheel with elastic tire.

439,606 (January 29). Dupont & Ameripoque. Metallic elastic dismountable wheel, with special axle, applicable to all kinds of automobiles.

439,651 (April 13, 1911). H. Morin. Insulating product and process for its manufacture.

439,662 (February 2, 1912). P. Beer. Boiler press for the vulcanization of rubber.

439,715 (February 5). Bolat, Geiss & Richter. Elastic wheel tire, specially for automobiles.

439,766 (January 6). F. M. Henry. Combined sectional tire and wheel rim.

439,796 (February 2). A. Vertua. Pneumatic vehicle wheel.

439,797 (February 3). A. Mascart. Elastic vehicle tire.

439,805 (February 6). A. Bienassez. Anti-skid device for elastic tires.

439,841 (February 7). P. Rousset. Device for mounting and dismounting pneumatic tires.

439,956 (February 10). E. J. Andriess. Improvements in air chambers for automobiles and other vehicles.

440,018 (February 8). V. Bernard. Articulated protector for pneumatic tires.

440,045 (February 12). H. A. Pryer. Improvements in vehicle wheels.

440,046 (February 12). A. Olier & Co. Manufacture of metallic armatures for solid rubber tires.

440,052 (February 12). J. L. Didier, Paris. Elastic protective tire.

400,055 (February 12). A. Margette. Improvements in sectional covers for tires.

400,082 (February 1). A. von Brüning. System of durable and resisting tires for all kinds of wheels.

440,119 (February 13). F. Steigenberger. Improvements in anti-skid devices for automobiles.

440,169 (February 14). J. Borde. Pneumatic tire with rigid tread.

440,271 (February 17). O. T. Banks. Improvements in sectional pneumatic tires.

440,173 (February 14). Badische Anilin und Soda Fabrik. Production of substances resembling rubber.

THE GERMAN EMPIRE.

PATENTS ISSUED (with Dates of Validity).

250,181 (June 20, 1911). Impregnation of fabrics, etc. Th. Budde, Charlottenburg, Berlin.

259,282 (July 29, 1911). Air tight bottle stoppers. Josef Metz, Wien.

250,350 (November 27, 1910). Prevention of shrinking in elastic fabrics. W. J. Teufel, Stuttgart.

250,537 (June 25, 1911). Method of replacing damaged tires. Deutsche Dunlop Gummi-Kompagnie a. G. Hanau.

THE KINGDOM OF BELGIUM.

PATENTS PUBLISHED.

245,158 (1912). H. Villain, 20 Rue Coulincourt, Paris. Apparatus for softening gutta percha.

244,965 (1912). J. Ostromislensky. Manufacture of substances resembling rubber.

245,039 (1912). H. Graf, Brühl, near Cologne. Seamless assembling of rubber, without screws or other metallic appliances.

246,017 (1912). F. Pfleumer, Dresden. Hot vulcanization of rubber, gutta percha and balata.

246,245 (1912). S. Blok & Benina, Amsterdam. Filling substance for rubber and process of manufacture.

EXPORTS FROM THE UNITED STATES.

SHIPMENTS TO NON-CONTIGUOUS COUNTRIES.

For the Fiscal Year ended June 30, 1912:

Territories.	Belting, Packing and Hose.	Boots and Shoes.	Tires.*	All Other Rubber.	Total.
Alaska	$86,634	$181,505	$1,577	$21,890	$291,606

* Included in "All Other Rubber" prior to July 1, 1910.

Review of the Crude Rubber Market.

THE principal feature of the London market during September has been the loss of the advance established the previous month, in conjunction with a further drop in values. Comparing recent quotations of fine Pará, it will be found that the following prices have ruled: June 28, 4*s.* 7½*d.*; July 26, 4*s.* 11¾*d.*; August 31, 5*s.* 1¾*d.* From the last named point, the market has steadily fallen off; the price reaching: September 4, 5*s.*; September 10, 4*s.* 10*d.*; September 11, 4*s.* 9*d.*, and September 17 (at time o fwriting) 4*s.* 7½*d.* Thus the price is again where it was on June 28.

As to plantation rubber, the market has followed more or less the same course; pale crepe closing August 31 at 4*s.* 10¼*d.*; September 6, 4*s.* 9*d.*; September 10, 4*s.* 8*d.*; September 16, 4*s.* 7¼*d.*; and September 17 (at time of writing) 4*s.* 6½*d.*

The comparative movements of Pará and plantation rubber during August and September are of interest:

	Fine Pará.	Pale Crepe.
August 1	4*s.* 10½*d.*	4*s.* 10½*d.*
August 31	5*s.* 1¾*d.*	4*s.* 10¼*d.*
September 4	5*s.*	4*s.* 9½*d.*
September 10	4*s.* 10*d.*	4*s.* 8*d.*
September 11	4*s.* 9*d.*	4*s.* 7½*d.*
September 17	4*s.* 7½*d.*	4*s.* 6½*d.*

Thus plantation rubber has withstood the downward movement better than Pará has done, but it should be remembered that it did not share to the same extent as Pará in the upward course of the market during August.

Among the reasons to which the fall in quotations of plantation rubber is attributed, has been the anticipation that the quantities announced for auction would depress prices. Mail reports of the sale of August 27 of 875 tons indicate, however, that the opening was at practically unchanged prices maintained throughout the sale, which closed with steady values. Demand was remarkably well sustained; most of the buying interests having to go short.

The sale of September 10, for which nearly 1,000 tons had been expected passed off relatively well. At the opening demand was light and prices easy, though without material change. These rates were maintained throughout the sale, with moderate inquiry.

The New York market has partaken of the same general features as have characterized development in London.

At the Antwerp sales of August 28 a very satisfactory result was attained, due to a good demand from America and the Continent. Of the 360 tons Congo catalogued, 285 tons were cleared at an average advance representing 1⅜d. per pound over valuations. Out of 100 tons plantation, 90 tons were sold at a decline equalling 1⅜d. per pound.

Sales were fixed to take place at Rotterdam on Septembre 11 of 37 tons, and at Amsterdam on September 20 of 65 tons.

The Havre sale of August 28 resulted in 66 tons being sold out of the 100 tons Congo offered. Prices obtained were satisfactory, being about 2 per cent. above valuations.

According to latest advices, the London market has assumed a firmer aspect; fine Para having been quoted on 18th at 4*s.* 8*d.*, and on 19th, at 4*s.* 8½*d.* Pale crepe has recovered by 19th to 4*s.* 7*d.*

[Owing to this issue, though dated October 1, being published on September 23, in time for the Exposition, the various market reports are to a proportionately earlier date.]

NEW YORK QUOTATIONS.

New York.

In regard to the financial situation, Albert B. Beers (broker in crude rubber and commercial paper, No. 68 William street, New York) advises as follows: "A decided change has come over the money market since our report for August, rates having stiffened considerably and the demand for paper fallen off. New York banks have been mostly out of the market during September, but there has been a fair demand from out of town, the best rubber names ruling at 5¼@5¾ per cent., and those not so well known 6@6½ per cent.

Rubber Stock at Para.

Stock for January 31 showed an increase caused by heavier arrivals, while that of February 29 shows a slight decrease. The stock of March 31 displayed a further reduction, while that of April 30 was about the same as a month earlier. On May 31 the stock had again increased, but had receded by June 30; and had again fallen off on July 31. Large sales by the syndicate materially reduced the stock by the end of August.

Liverpool.

William Wright & Co., report [September 2]:

Fine Pará.—The market has continued firm; there has been a good demand for spot rubber, principally old condition; a good business done at higher prices, which advanced 3*d.* per lb. For forward delivery the near positions have been in good request at advancing rates; up to 4*s.* 10*d.* [$1.18] paid for October-November. Receipts for the new crop July-August are 800 tons in excess of last year, doubtless owing to increased transport facilities. Coupled with the active demand for Plantation, there seems little chance of any decided break in values for the present. Closing value—Upriver fine, spot, 5*s.* 1½*d.* [$1.27]; September, 5*s.* 1*d.* [$1.24]; September-October, 4*s.* 11½*d.* [$1.21]; Islands fine, 4*s.* 10½*d.* [$1.19].

INDIA RUBBER WORLD

CAOUTCHOUC — HEVEA BRASILIENSIS — FUNGIA ELASTICA — PACHYPOSIS GUTTA — GUTTA-PERCHA

FOUNDED 1889

Edited by HENRY C. PEARSON—Offices, No. 15 West 38th Street, NEW YORK.

Vol. XLVII. No. 2. NOVEMBER 1, 1912. 35 CENTS. $3.00 Per Year. $3.50 Abroad.

INDIA RUBBER WORLD

Published on the 1st of each Month by

THE INDIA RUBBER PUBLISHING CO.

No. 15 West 38th Street, New York.

CABLE ADDRESS: IRWORLD, NEW YORK.

HENRY C. PEARSON, Editor

Vol. 47. NOVEMBER 1, 1912. No. 2

SUBSCRIPTIONS: $3.00 per year, $1.75 for six months, postpaid, for the United States and dependencies and Mexico. To the Dominion of Canada and all other countries, $3.50 (or equivalent funds) per year, postpaid.

ADVERTISING: Rates will be made known on application.

REMITTANCES: Should always be made by bank or draft, Postoffice or Express money orders on New York, payable to THE INDIA RUBBER PUBLISHING COMPANY. Remittances for foreign subscriptions should be sent by International Postal Order, payable as above.

DISCONTINUANCES: Yearly orders for subscriptions and advertising are regarded as permanent, and after the first twelve months they will be discontinued only at the request of the subscriber or advertiser. Bills are rendered promptly at the beginning of each period, and thereby our patrons have due notice of continuance.

Entered at the New York postoffice as mail matter of the second class.

TABLE OF CONTENTS ON LAST PAGE OF READING.

LESSONS FROM THE RUBBER SHOW.

NOW that the Exposition has come and gone the natural question arises—"What has it taught us?" It certainly should have taught us something, as it is hardly credible that this first experience in rubber shows in this country should have passed by without leaving certain lessons more or less valuable with the trade. As a matter of fact, the expression was not infrequently overheard in conversations between exhibitors at the Exposition: "Yes, this is a very good show—but wait until you see the next."

Trade expositions may properly be divided into three kinds—those that are distinctly technical in their character, that are intended only for people directly interested in that particular trade, and without any purpose of attracting outside attention; second, those that are planned expressly to attract the general public, and which carefully avoid everything of a too technical character; and third, those that seek to combine these two functions, having enough of a technical character to appeal to all those associated with the particular trade, and enough of general interest to attract the public at large. The Rubber Exposition just held belonged to this third class, but undoubtedly it was much stronger on its technical side than it was in its general appeal to the public at large. Viewed as a rubber show intended for rubber men, it left little to be desired. The exhibits of crude rubber, reclaimed rubber, compounding ingredients and manufacturing machinery were full and varied, and covered the ground with satisfactory completeness. But in the department of manufactured goods the same cannot be said, for while certain manufacturers made admirable exhibits, there were important branches of the rubber manufacturing industry which were practically unrepresented.

The exhibitors of crude rubber cannot be complimented too highly on the intelligence, enthusiasm and thoroughness with which they did their work. Brazil exhibited with a lavish hand—nor was the Middle East far behind. Both wild rubber from the Amazon and plantation rubber from the Federated Malay States and Ceylon were forwarded to the exhibition in generous quantity and impressive variety. It was altogether the finest collection of crude rubber ever brought together in this country. A certain rubber mill superintendent, after going over these exhibits carefully, remarked: "I have learned more about crude rubber in the ten days of this show than I had ever learned before in any ten years in the factory." Of reclaimed rubber and of compounding ingredients there was also a comprehensive exhibit; while the foundry men, with their machinery set up and in motion, contributed a great deal to the importance and value of the enterprise. Undoubtedly, all these groups of exhibitors—crude rubber producers, planters and importers, manufacturers of compounding ingredients and makers of machinery, found their ten days at the Exposition time profitably spent. Many of them indeed expressed great satisfaction over the results of their participation.

But among the manufacturers of finished rubber goods who attended the show and who undoubtedly derived great benefit from what they observed, there must have been a number who regretted that they had not seized upon this opportunity to exploit their products in a large way. Some of them when approached before the exhibition took the stand that they could see no particular benefit for them in showing their goods to other rubber men—which undoubtedly was true. But in a city like New York, with its five million permanent population and with its half million floating population, more or less—it would have been possible at a show of this character, covering so large a floor space, to have secured an extremely large attendance of people outside of the rubber trade—

consumers of rubber goods; and to this class the rubber manufacturer might have appealed, with no little profit to himself. And that undoubtedly is the chief lesson learned from the first rubber show, the result of which will be shown at the second American Rubber Exposition, whenever that may be held. There is a great deal connected with many lines of rubber manufacture that could be made extremely interesting to the general public. There are many articles made almost exclusively by hand, which, had they been manufactured at this show would have proved great centers of attraction. Some of the footwear manufacturers have gone to considerable expense in sending demonstrators around the country—and even abroad—to explain and to illustrate, by the actual operation, the making of rubber footwear. It is thought worth while to give the demonstration even before small groups of people. At an exposition in such a place as New York it would be possible to have thousands of spectators during a single day. The public can always be relied on to attend any sort of exhibition, if it is properly encouraged.

Nor would the attendance of the general public in large numbers interfere with the success of the more technical side of an exhibition, especially in a place like the Grand Central Palace, where (as was the case in the recent show) the technical departments were grouped chiefly on the upper floors, the main floor being reserved for exhibits of a more general character.

One of the speakers at the concluding banquet held at the Plaza said that if he had had his way, the public school children of New York and the members of all the commercial organizations would have been brought in to see the wonderful rubber display. It might not be feasible to include all the public school children of New York at such an exhibition, as their number runs in the hundreds of thousands; but certainly it would be beneficial, not only to the students, but to all exhibitors whose display was of a general character, if the older classes of the public schools should attend. Quite irrespective, however, of any such special arrangement for any particular class of visitors, it is always possible in this great metropolis to secure a large attendance of desirable people at an interesting trade exhibition.

One feature of the recent show—which on another occasion would undoubtedly be much enlarged upon, because it was one of the most successful features of the Exposition—consisted of the moving pictures. There were two of these moving picture shows, one on the main floor under the auspices of the Brazilian exhibit, the other on the second floor under the auspices of the Federated Malay States. Both attracted a great deal of attention, and to many of the visitors proved the most interesting part of the exhibition. The plantation pictures were particularly to be commended, as they set forth in such orderly fashion the whole process of rubber culture in the East, showing the clearing of the forests, the preparing of the ground for the seed, the planting of the seed, the destruction of weeds and insects, the tapping of the trees, the gathering of the latex, its coagulation, the preparation of the rubber for the market and its final shipment to the rubber centers of Europe. This feature could be—and probably would be at another exhibition—made much more prominent, and with most gratifying results.

The management of the recent Exposition is certainly to be congratulated. It was a most creditable achievement, far beyond the expectations of many American rubber men. But by reason of the lessons taught by this first experience, the next exposition (whenever that may occur) will undoubtedly be more complete, more fully rounded out and symmetrical. It will not only be highly instructive from a technical standpoint to rubber men, but will be equally attractive to the public at large.

THE ECHO.

THERE seems to be one persistent echo in the air today which sounds like "specifications, physical tests and chemical analysis." Wherever we turn that echo greets us. The consumer of rubber products is testing his hose and belting and what not; the manufacturer of rubber goods is determining by chemical analysis the quality of his raw material; and the producer of these raw materials is, as a matter of course, compelled to gather accurate information about his goods before he sells them. It does not astonish us, therefore, when we hear that the producers of crude rubber in the Middle East are establishing rubber testing stations in Europe and at the plantations, for the purpose of gathering accurate information concerning the physical and chemical properties of their product.

Brazil, the mother country of the rubber industry, is not lagging in this respect, and if we are to believe current reports, the delegates who attended the recent International Rubber Conference in New York were on the lookout for a scientific adviser in this matter. So far as Brazil is concerned, it is most natural that she should seek to establish in New York a research

laboratory which would study the South American rubber problem in a most thorough manner.

One of the rubber experts made this suggestion at one of the sessions of the Conference: "Brazil stands today at the point of decision. It will be possible for her now to take out 'insurance' for her rubber forests; or, if she chooses, she may neglect the opportunity, and lose forever her hold on that commodity. If she wishes to protect it, she will receive from America the most friendly co-operation and advice. The best solution of the problem lies very probably in the establishment of a permanent testing laboratory here in the North, and possibly an additional one at Pará, under the direct management of the Federal Government of Brazil. The New York laboratory would then be in a position to test the rubber according to conditions which prevail in the United States. This station would also be available as an umpire in cases of dispute between manufacturers and brokers."

The suggestion provoked not a little discussion. Something may yet come of it.

THE APPARENT HAPHAZARDNESS OF GREAT DISCOVERIES.

SOME modern philosopher has observed that "it's generally the fellow who doesn't know any better who does the thing that can't be done. You see, the blamed fool doesn't know it can't be done, so he goes ahead and does it"—a sententious observation, which contains more truth than is usually the case with such aphorisms.

Many of the most revolutionary inventions and discoveries in the history of industrial development appear to have been reached in a thoroughly haphazard way—seem in fact to have been stumbled upon in the dark. There was Goodyear, for example—to come down at once to the realm of rubber. Everybody knows how he got the idea of vulcanization. Practically speaking, it flew up and hit him. He was the most surprised man in a dozen townships—he could scarcely believe his eyes.

Then there was Christopher Columbus, whose discovery of America our Italian citizens and a few others celebrate with much fervor with every recurring October 12. When the great American continent and its outlying islands popped up in front of him it was the surprise of the centuries.

But this haphazardness is apparent—rather than real. It is true enough that Columbus stumbled on a new continent, but that was because he was looking for a continent. He made a great discovery because he was bent on a great discovery. The thing he found was not the thing he was looking for, but he never would have located America if he had not been out looking for Asia.

Goodyear's case was very much the same. That accidental knock against the stove told him that heat and sulphur were the secret of rubber. That particular hit was pure accident, but he had been hitting around in all directions for a number of years, and that was the way he came to hit the stove.

Year after year he had been at work trying to find something that would make rubber work. First he mixed it with magnesia. That seemed to hold out promise; but it was a blind lead and he had to abandon it. Then he boiled his rubber and magnesia in quicklime and water, but that didn't yield up the secret he was after. Then he washed his rubber with nitric acid. He was going in the right direction, but still was far from the goal.

But it was only a question of time when his persistence—you might say his fanaticism—in this quest would compel success. Great discoveries seem to come by accident, but it is a noticeable fact that they come to those who are bent on making great discoveries. That quick transformation that took place in Goodyear's handful of rubber and sulphur when it struck the hot stove would not have meant anything to the ordinary man—he never would have given it a second thought. But to Goodyear's mind—as sensitive to rubber impressions as the delicate mechanism of wireless telegraphy is to its own peculiar electrical waves—it was a complete revelation. His years of search were over—the secret was his. So it may be stated, without much fear of contradiction, that great discoveries, so far, from being of incidental and haphazard origin, follow as definite a law of cause and effect as any that obtain in the ordering of the universe.

The aphorism quoted at the beginning of this humble disquisition may therefore properly be revised as follows: "The fellow who does the thing that can't be done is the fellow who knows that it can be done, if he can only find out the way to do it, and who keeps hunting around for the way to do it twenty-four hours a day—year in and year out—until all of a sudden he plumps straight into it."

The Third International Rubber Exposition.

A FINE DISPLAY OF CRUDE AND MANUFACTURED RUBBER.

THE October number of THE INDIA RUBBER WORLD was called a "Special Exposition Number," and it contained nearly twenty pages of matter referring to the Third International Rubber and Allied Trades Exposition, giving lists of the delegates and commissioners who had been appointed by various governments and commercial organizations, describing the exhibits that were to be seen, and containing many photographs of the commissioners, exhibitors and exhibits But inasmuch as that issue came from the press on the opening day of the exhibition, and as all the matter referring to that event had necessarily to be prepared somewhat in advance, it was not possible to cover the ground as fully as the importance of the event demanded. It has been found necessary, therefore, to devote almost equal space in the present issue to features of the Exposition that could not be described in advance. Accordingly a considerable part of the present number of this paper will be found to be devoted to the Rubber Exposition. No apology need be offered for this fact, because it will be admitted that it was an event of exceeding importance to the trade; and as another exposition is not likely to be held for some time—certainly not for two or three years—it seems quite the wiser course for a journal devoted to the rubber industry to let other matters wait until a later issue, and to surrender to the great Rubber Exposition recently held in New York the space to which its magnitude and the interest it has created seem to entitle it.

THE PRESS LUNCHEON.

THE PRESS LUNCHEON.

The day before the Exhibition was formally opened to the public it was opened privately for inspection by members of the press, and in connection with this press view there was a luncheon, attended by about 130 people. It was a very successful affair, and unique in several of its features. It was held in the large restaurant located on the ground floor of the Grand Central Palace. The menu cards were printed on mottled green rubber—the work of the Manhattan Rubber Co. The luncheon itself was voted substantial and satisfying. It consisted of blue points, consommé, salmon salad with lobster sauce, *filet mignon*, celery salad, with generous contributions of Mumm's Extra Dry, the beverage which cheers but does not inebriate—when used with discretion; with coffee, crackers and Camembert.

Mr. H. C. Pearson, vice-president of the Exposition, presided at the luncheon, and introduced with sundry happy commentaries the various speakers, who included Admiral Carvalho, of the Brazilian Navy; Dr. Eugenio Dahne, Commissioner General of Brazil; Mr. Cyril E. S. Baxendale, of the Federated Malay States; Mr. Wilbur A. Anderson, Commissioner for the Hawaiian Islands, and Prof. William Goodyear, of the Brooklyn Institute of Arts and Sciences, a son of Charles Goodyear.

THE FORMAL OPENING OF THE EXPOSITION.

The Exposition was formally opened to the public at 12 o'clock, Monday, September 23. A large space in the centre of the main floor had been left clear of exhibits and was filled with chairs facing a raised platform. At the time set for the opening ceremonies, all the chairs—accommodating about 300—had been filled and there were several hundred people crowded around the seats, back of them, and in the balconies looking down.

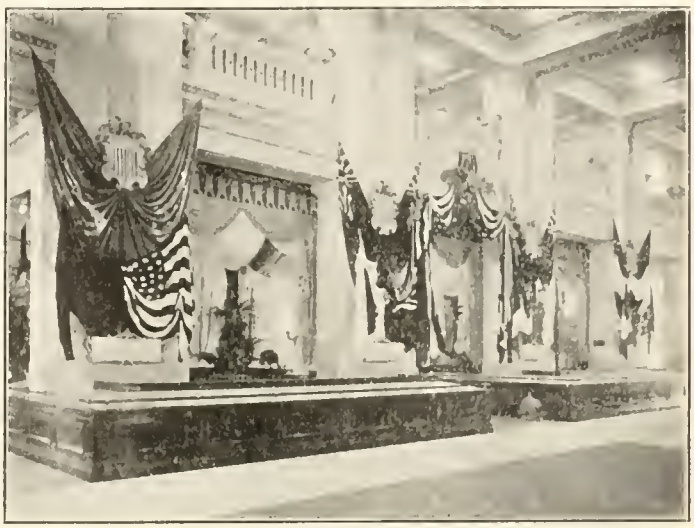
In the absence of Governor John A. Dix, president of the Exposition, who was unable to attend by reason of his official duties, the chair was occupied by Mr. Henry C. Pearson, vice-president of the Exposition. On the platform with him were Commissioner of Docks, Calvin Tomkins, representing the City of New York; A. Staines Manders, organizing manager of the Exposition; Miss D. Fulton, secretary of the Exposition; Mr. A. W. Stedman, Commissioner of the Commercial Association of Amazonas; Dr. Eugenio Dahne, Official Commissioner to the Exposition from Brazil; and Mr. Edward G Salmon,

Commissioner for the Imperial Institute of London. Promptly at the hour set, Acting-President Pearson arose and in a brief address which was very distinctly heard by all on the large floor—as well as by those looking down from the balconies—he stated the object of the Exposition, described the stupendous amount of work that had been done to accomplish it, and spoke of the beneficial results which were expected to accrue from it, in the increased acquaintance with one another of the different members of the great rubber industry, and in the wide interest that would be created in the industry among the people at large. He then introduced Commissoner Tomkins, who in the inability of Mayor Gaynor to be present—as had been his intention—spoke in behalf of the mayor and welcomed the commissioners and delegates to the city of New York. Commissioner Tomkins' address had been carefully prepared, and it contained a wonderful volume of rubber information—considering the speaker had never been intimately identified with the rubber trade. The Commissioner was listened to with deep interest; and he represented the great city of New York—which receives about half of the crude rubber of the world at its docks—most acceptably.

At the expiration of his address the Chairman pronounced the Exposition to be formally opened, and remarked that he would take Commissioner Tomkins on a tour of inspection, beginning with the crude rubber exhibits in the balcony, passing thence to the allied trades on the second floor, and coming down to the manufactured products and manufacturing machinery on the main floor. He suggested that this would be a profitable schedule for all those present to follow—either at that time or later—at their inclination. This concluded the opening exercises, and most of those present adopted the Chairman's suggestion and started for the wonderful exhibits of crude rubber in the Brazilian, Malaysian, Ceylon, and other departments on the balcony floor.

WHERE COMMERCIALISM YIELDED TO ART.

Taking it all in all the most noticeable exhibit on the main floor was that of the United States Rubber Co., which was conspicuous, both by reason of its position at the head of the grand stairway, and by reason of its character. It is quite safe to say, that there never was an exhibit in the Grand Central Palace more sumptuously conceived. The space was 1,800 feet, divided into two reception rooms of about 30 feet square; the two rooms being divided by the central aisle of the hall. These two reception rooms were closed in by a solid mahogany partition, handsomely panelled, running all the way around and having an aggregate length of about 240 feet. At the top of this mahogany partition, there was a sloping glass showcase containing pictures of the 36 different factories whose product is sold by this company.



The United States Rubber Co.

There were eight marble pillars included in these booths, which were draped with flags, with extremely fine effect, each having four—the two flags at the top representing rubber producing countries, and the two lower flags representing rubber manufacturing countries. As these flags were combined in a way that gave an exceedingly artistic color effect, it might be interesting to mention the various combinations.

The Opening Exercises.

The first pillar had at the top two Brazilian flags, and below them the flags of Canada and France. The second pillar had an arrangement of British Malay and Ceylon flags, with the flags of England and Holland beneath.

The other combination ran after this wise—the two flags mentioned first being always at the top.

British Malay and Ceylon—United States and Germany.

Two Peruvian flags—Australia and Russia.

Two Brazilian flags—Belgium and United States.

British Malay and Ceylon—Japan and England.

British Malay and Ceylon—Hungary and France.

Again, two Peruvian flags, and below, Germany and Italy.

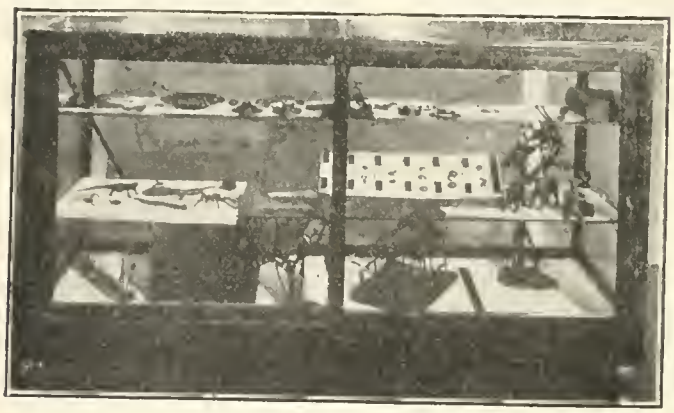
In addition to these flags, decorating the pillars, the entire two booths were covered with a silken canopy of silver-gray with side drapings of cadet-blue. Between the pillars were handsome signs of the United States Rubber Co., and of its two constituent companies—the "Rubber Goods Manufacturing Co." and the "General Rubber Co.," while inside the booths there was luxurious furniture of leather and mahogany, and palms in various corners.

The only suggestion of rubber was found in the interlocking tiling—made by one of the subsidiary companies—of which there were 1,300 square feet, surrounding the two booths and in the aisle between them.

Catalogues of the company's various footwear factories, and of its mechanical rubber goods factories, handsomely printed, were seen reposing unobtrusively on side tables; but the whole aspect of the place savored rather of art than of commercialism.

THE CHARLES GOODYEAR EXHIBIT.

Measured by its volume, there was no other feature in the entire Exhibition that attracted a fraction of the notice or ex-



SHOW CASE OF GOODYEAR RELICS.

cited a tithe of the interest that the exhibit of the Charles Goodyear relics in THE INDIA RUBBER WORLD booth received. It was the note of human interest that appealed to the visitors, for here were articles that belonged to the great Goodyear—the founder of the whole rubber industry—some of them presented to him in the days of his triumph, many of them made under his direction, and showing some unique applications to which he put his great discovery.

These Goodyear relics were on the upper shelf of the large showcase, as shown in the accompanying cut. They included the famous rubber book—Goodyear's Autobiography—printed in a volume of several hundred pages, every page of which is made of rubber thinner than parchment, the cover and everything about the book being rubber. This is the only volume of this sort in existence. Then there were many of the medals tendered Goodyear by various governments and scientific associations, including the large gold medal, of very considerable intrinsic value, aside from its association, given Goodyear by the Emperor of France at the time of his notable rubber exhibit at the Paris Exposition in 1854, and also the Cross of the Legion of Honor, bestowed on him on the same occasion. There were a number of wonderful pieces of jewelry made of hard rubber mounted in gold, showing the most delicate carving. There were bracelets and brooches and medallions and miniature statuary. The most noticeable piece of jewelry there was a replica of a remarkable chatelaine design which Good-

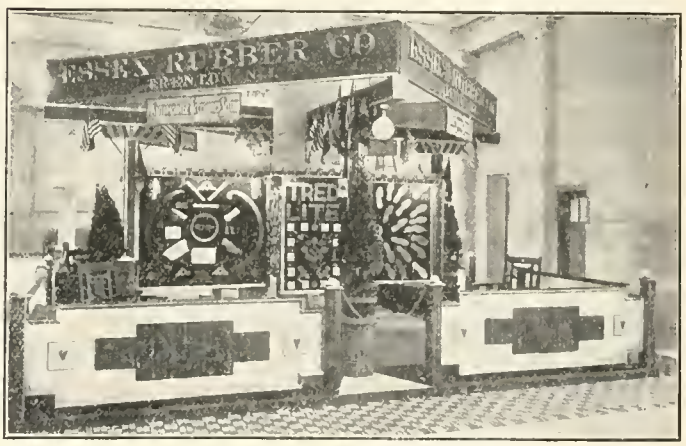
EXHIBIT OF THE INDIA RUBBER WORLD.

year presented to the Empress Eugenie, consisting of three short chains, the links of which were made of hard rubber of a dark brown color rimmed with gold, each chain terminating in an ornamental pendant, one being a seal, one a watch key, and the third having at its end a small watch in a hard rubber case edged with gold and elaborately set with jewels, including many small diamonds and several large rubies. This duplicate of Goodyear's gift to the Empress he made and presented to his wife, and it is one of the choice heirlooms of the Goodyear family. There were many other interesting items in this Goodyear collection, and it is not to be wondered at that every visitor to the Exhibition took a deep interest in these relics.

In the same case on lower shelves there was a variety of miniature creations—boats, trees, coagulating camps—made from balata by the natives of Venezuela. These too, being unique in their character, received much attention from the general visitor, while the extensive herbarium arranged around the booth naturally excited the interest of botanists and rubber experts.

THE ESSEX' BUSINESS-LIKE DISPLAY.

The exhibit of the Essex Rubber Co. was distinctly a com-



THE ESSEX RUBBER CO.'S DISPLAY.

mercial one. All the space was occupied by rubber products of various kinds—the floor being covered with matting made

at the Essex mill, and the aisles around the booth being laid with the Essex rubber rugs. In the booth a great variety of

THE HOME RUBBER CO.

these rugs was shown in several combinations of color—red and black, and blue and white. These rugs consist of small rubber blocks fastened together with slender rods passing through steel eyelets; consequently, their shape and size can be adjusted to any conditions. A large display of rubber heels and soles, automobile accessories, from goggles to bumpers, was also made by this company. There were some interesting sporting goods, including rubber covered bits for horses; recoil pads for guns, rubber bottles for veterinaries; while of mats large and small there were many kinds. The president of the company, C. H. Oakley, was present at the exhibition much of the time.

THE HOME RUBBER BOOTH.

This company's exhibit was also very business-like. There were four fine trees—not rubber, but near enough—in tubs in the four corners of the booth, but all the rest of the space was given up to rubber goods, including piles of hose of various sizes and for all manner of purposes. There was also a good display of tires, tubes, mats and matting.

THE MANHATTAN'S BUSY BOOTH.

Everybody likes to see a working exhibit—something in motion. Hence the crowd always standing around the Manhattan

MANHATTAN RUBBER MANUFACTURING CO.

Rubber Co.'s exhibit, for here were three distinct varieties of rubber activity. One of the company's large "Condor" conveying belts was at work carrying off a continuous stream of leather refuse—as would be shown in a shoe factory. Nearby there was another machine, knitting the "Economy" brand of underwriters' fire hose, made by the company, the same sort that the fire department of Chicago is using to the extent of some 85,000 feet. In another part of the booth a stalwart workman was grinding tools on an emery wheel, filling the air with scintillating sparks. There were various rolls of belting in this booth. One roll contained about 400 feet of 24-inch 10-ply belting, and stood about 5 feet high. In addition there was a variety of hydraulic packing on exhibition, and garden hose. One interesting article—something of a novelty—was the "Vacuum Mirror," which can be attached to any wall and adheres by the suction of a rubber vacuum cap; a very convenient device for a man to carry in traveling.

THE FARREL FOUNDRY EXPERIMENTAL OUTFIT.

The Farrel Foundry & Machine Co.'s exhibit consisted of an 8" x 16" motor-driven experimental outfit mounted on a continuous bed-plate, made up of a washer, mill and calender. The washer had corrugated rolls, six V cuts to the inch. This washer was equipped with a patented coil clutch, type G, which gives an instantaneous release and picks up the load without shock. The calender and mill had bored rolls and were fitted up

FARREL FOUNDRY AND MACHINE CO.

with steam connections so that the required temperature could be obtained; whereas the washer rolls were solid and the machine was piped for washing the rubber.

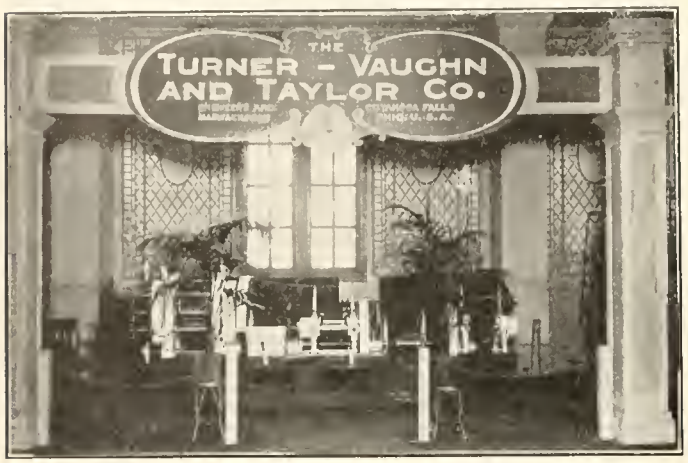
Both the mill and the washer run at a speed of 30 r. p. m., and the calender at about 15 r. p. m., and can deliver 10¼ yards per minute. Such an outfit as this is extensively used in laboratories for experimental work. It was a complete miniature of the company's larger machines.

THE TURNER, VAUGHN & TAYLOR MACHINES.

The Turner, Vaughn & Taylor Co., of Cuyahoga Falls, Ohio, also exhibited an experimental outfit, consisting of a 6" x 12" washer and mill, and an 8" x 14" 3-roll calender; the three machines being mounted on one bedplate and driven by an electric motor set inside the base, between the washer and the mill. The outfit was driven direct from the motor through a pair of double helical herringbone gears, the teeth being cut and staggered, and having a reduction ratio of 7.78 to 1. A patented multiple band clutch, equipped with an instantaneous release mechanism, controlled by a cord running over the washer mill and both sides of the calender, was attached to the gear on the main line.

The washer was fitted with chilled rolls, the back roll being cut 6 V threads per inch. The mill was equipped with chilled rolls,

both ground and polished, and connected up for steam. The frames were built with a quick movable adjusting screw and nut



TURNER-VAUGHN AND TAYLOR EXPERIMENTAL MILL.

(patents pending) to demonstrate an important feature on all large mills built by this company. The calender was equipped with 3 chilled iron rolls, ground and polished, with a two-speed control on the line shaft, and both friction and even connecting gears of cut steel, the latter being controlled by jaw clutches, which is a new feature. Further features on the calender were the disc friction let-off and wind-up, the latter being driven by small Diamond chain from the center roll.

The journal bearings throughout were all brass, and oiled by means of glass oilers. All line shaft bearings were ring oiling. All gearing was effectually protected by cast iron guards. The features which received much favorable comment—features found on "Vaughn" machinery only—were the method of changing connecting gears and the two speeds on the calender, the quick removable adjusting screw and nut on the mill, and the patented multiple band clutch on the line shaft.

The exhibit was in charge of Mr. Lee Vaughn, secretary of

BUFFALO FOUNDRY AND MACHINE CO.

the company, who was assisted by Messrs. M. A. Pearson and J. H. Ridgeway, the New York representative.

THE BUFFALO VACUUM DRYERS.

The exhibit of the Buffalo Foundry and Machine Co., though it was as far from the front entrance of the building as it could get, being against the Western wall—was still exceedingly conspicuous, because it faced the Grand Central aisle, and every visitor who mounted the marble stairway, on reaching its top was bound to see the illuminated sign and the large illuminated picture of the Buffalo factory at the head of the aisle, although they were all of 200 feet away. This exhibit was characterized by a great deal of illumination—a series of illuminated pictures of its various machines and machine parts forming a continuous railing around the booth.

But while the casual visitor was interested in these illuminated effects, the rubber manufacturer was most attracted to the working exhibits inside the booth—one of which was a large vacuum dryer with a capacity of 2½ tons of sheet rubber every twenty-four hours. These dryers are made of one piece, thus eliminating joints and the consequent leakage. They are also made

A DISTANT VIEW OF THE BUFFALO FOUNDRY EXHIBIT.

of very dense metal, preventing the seepage of air. The dryer is full of heating shelves, constructed either for steam or hot water circulation. One or two particular features may be mentioned regarding these dryers: First, that the steam manifolds are made of steel instead of cast iron, thus avoiding breakage; and secondly, that the shelves are connected to these steam manifolds by ground joints and in such a manner that no packing is used.

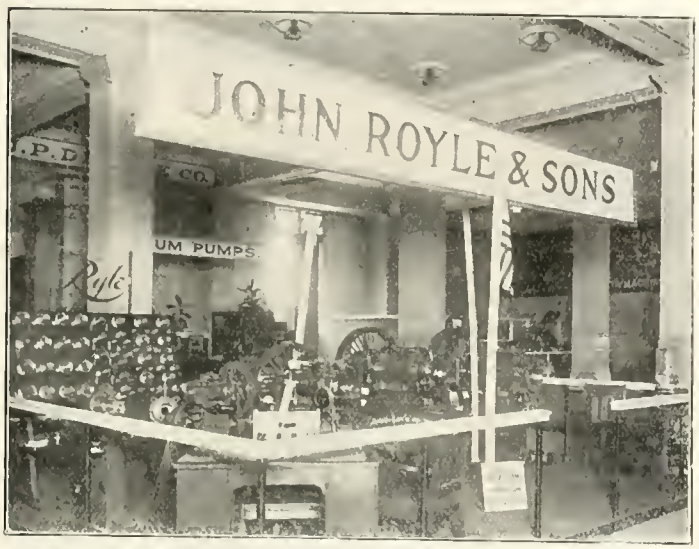
One interesting feature of the exhibit was a small laboratory vacuum shelf dryer where the centre of the stand formed the condenser—and the base a receiving chamber for condensed vapors. The vacuum in these dryers, by the way, comes within 1/10 inch of a perfect vacuum. The large dryer on exhibition was built for the Independent Tire Co., of Toronto, while the vacuum pump on exhibition was built for the General Electric Co. Mr. E. G. Rippel, sales manager, was in charge of the exhibit.

THE DEVINE VACUUM-DRYING APPARATUS.

The J. P. Devine Co., of Buffalo, New York, the pioneers and originators of vacuum drying apparatus in this country, had a working exhibit of a complete vacuum drying apparatus

for the drying of rubber and rubber compounding material, which consisted of a vacuum drying chamber made of cast iron, very strongly reinforced with bridged ribs on the outside to resist external pressure and prevent the chamber from collapsing when under very high vacuum. Inside of the dryer there is a series of welded heating shelves connected with expansion bands to steam headers for inlet and outlet of the steam. The chamber is connected to a condenser, the inside of which consisted of a number of copper tubes encased in a cast iron water jacket for condensing the vapors carried over from the vacuum drying chamber; the bottom of the condenser is a receiver, with two observation glasses, in front of which on the inside, is a copper drain pipe, permitting an ocular demonstration of the condensed vapor coming from condenser tubes to the receiver.

The condenser is connected to a dry vacuum pump, which obtains and maintains the vacuum on both condenser and dryer. The pump—an innovation in dry vacuum pump construction, as it has one rotary valve for both suction and discharge, attracted a great deal of interest at the exhibition, on account of its simplicity and effectiveness. A mercury column was attached to



The John Royle Tubing Machines.

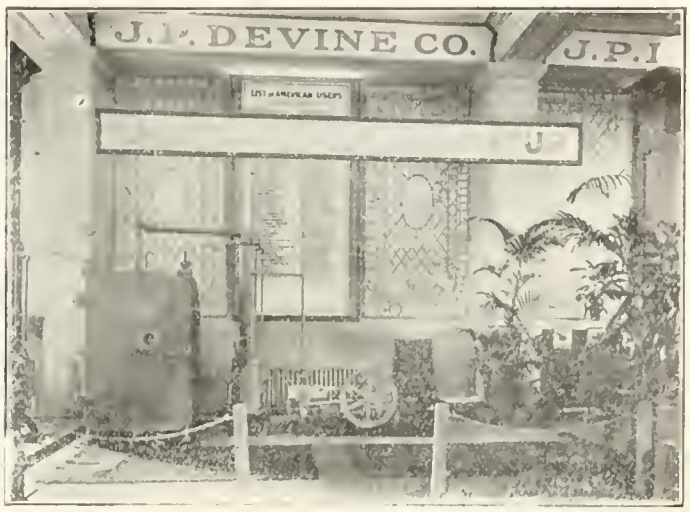
show the efficiency of the pump. This exhibit was in charge of Messrs. Chas. Devine and Howard Mason.

THE ROYLE TUBING MACHINES.

John Royle & Sons, of Paterson, New Jersey, exhibited five different tubing machines, making tubing of various sizes; the smallest machine making a tubing only 3/32 of an inch in diameter, used chiefly to hold artificial flowers on the feminine bonnet. The second-size tubing (machine made tubing) of a little larger size, but still of a small diameter, such as is used on children's toys—the jumping frogs, for instance, which one sees offered by venders on city sidewalks—to the great delight of the children, and to the equal distress of their elders who would like to get along about the more serious affairs of life. There were larger machines that made the rubber lining for garden hose. Where the hose is made particularly strong, as in some instances with three layers of rubber and two layers of fabric hose, it has to go through the machine three times—each layer representing a distinct operation. These machines make the famous garden hose that comes in 500 foot lengths. The largest machine displayed there turned out tubing of 2½ and 3 inches in diameter, for fire hose; and also for the making of jar rings.

INTERESTING WASHING AND COMPOUNDING MACHINES.

Werner & Pfleiderer, of Saginaw, Michigan, and four or five places on the continent, had a fine working exhibit of their washing, masticating and rubber solution machine. If any factory man went to the show and missed this exhibit, he was un-



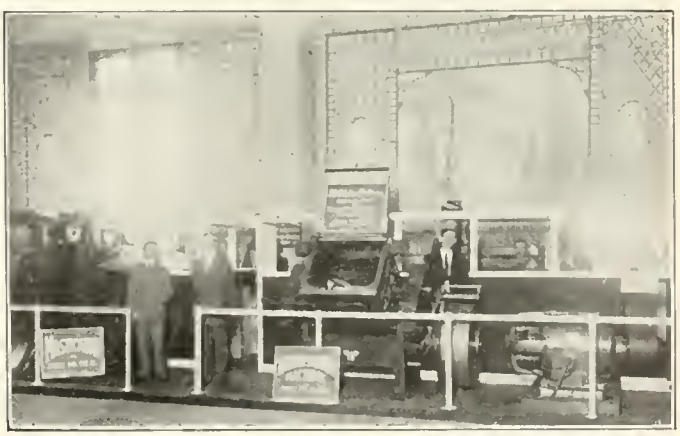
J. P. Devine Vacuum Dryers.

fortunate; because all of these machines were exceedingly interesting. The washing machine does its work rapidly and with wonderful thoroughness. The same can be said of the other two machines. Incidentally, the Michelin Rubber Co. has just ordered 30 more of these rubber solution machines for its works in France—in addition to the 60 that it is using now, which seems to indicate that this machine has at least the unqualified Michelin approval.

In fact their masticator and solution mixer have long been used by rubber mills throughout the world. The booth was in charge of C. Pletcher, W. J. Ennis and M. L. Johnson. During the Exposition the booth was visited by Mr. Emil Staehle, of Saginaw, manager of the company in this country.

THE CURTIS & MARBLE BRUSHING MACHINE.

The Curtis & Marble Machine Co., of Worcester, Massachusetts, made a convincing demonstration of their various machines, emphasizing particularly their brushing machine, which takes in a piece of fabric of any sort—from the thin fabrics used in dress shields to the heaviest tire fabrics and turns them



Werner & Pfleiderer Co.

out with smooth surfaces—all the lint and other undesirable matter being entirely removed, so that the fabric can receive a rubber coat to the best advantage. This brushing machine also takes fabric that has been coated with rubber and covers the

rubber coating with talcum, soap stone or starch to remove the stickiness and the rubber smell that it otherwise would have. In addition, they exhibited their sewing machine, which sews together widths of fabric so as to make a continuous surface.

CURTIS MARBLE MACHINE CO.

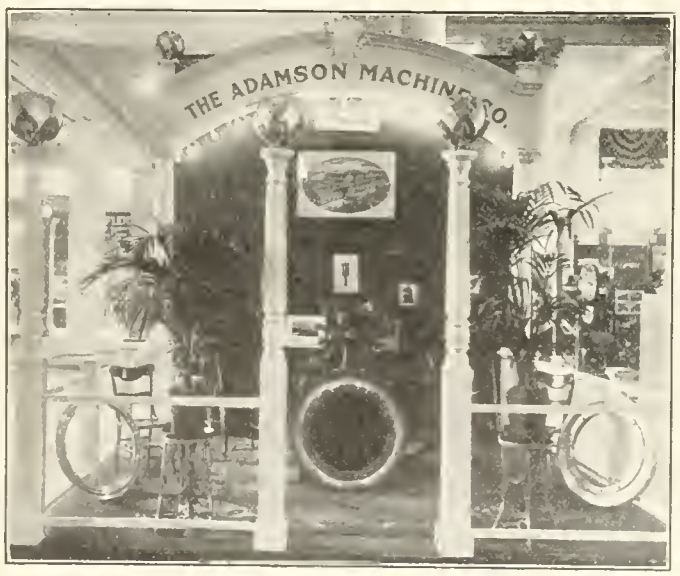
These machines, together with a measuring drum were in operation so as to give a complete demonstration of their work. Mr. E. H. Marble was present most of the time in this booth answering the questions of those who were interested in this machine.

THE ADAMSON MACHINE CO.

The Adamson Machine Co., of Akron, Ohio, did not make a display of its machinery, but exhibited a large photograph of the factory and smaller photographs of the machinery produced in the factory; in addition to distributing literature descriptive of the various machines.

THE GOVERNMENT TESTING APPLIANCES.

The exhibit of testing machines made by the Bureau of Standards of the United States Government attracted a great deal of



THE ADAMSON MACHINE CO.

attention naturally from rubber manufacturers, who were able by examining these machines to get some idea of the methods employed by the Government in testing the goods offered its various departments by American manufacturers.

E. H. CLAPP RUBBER CO.

The E. H. Clapp Rubber Co., and its subsidiary, the New Jersey Rubber Co., had an interesting exhibit of their combined product and merchandise. This stand was in charge of Messrs.

THE E. H. CLAPP RUBBER CO. AND NEW JERSEY RUBBER CO.

J. S. Clapp and Harold P. Fuller. During the show, Mr. E. H. Clapp and Mr. G. H. Clapp were among the visitors. In addition to a display of sheets and blocks of their reclaimed rubber there was quite an exhibit of tennis shoes—and other rubber footwear—tiling, cloth and tubing, manufactured from their material, including some belting that was impregnated with a rubber solution of their reclaimed rubber. Perhaps the most interesting product was a set of tires which had stood hard service without any appreciable effect, and which were composed of 20 per cent. of their reclaimed rubber.

THE LOEWENTHAL CO.

An exhibit of general interest to visiting manufacturers, was the showing of old rubber made by the Loewenthal Co., whose

THE LOEWENTHAL CO.

booth was the center of much interest, and was in charge of Messrs. Ralph and Paul Loewenthal and H. G. Armstrong. These gentlemen were among the busiest at the show, and did much during its progress to promote interest in their offerings.

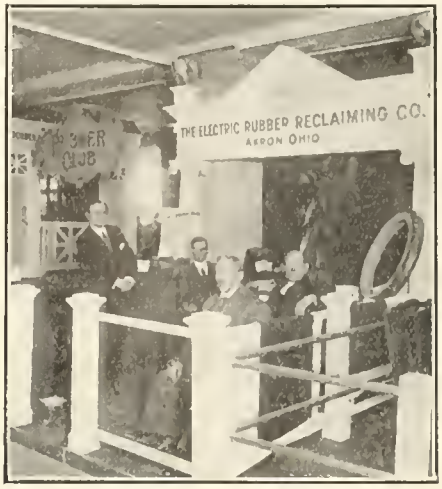
THE HOGGSON & PETTIS RUBBER TOOLS.

Those well known specialists in rubber manufacturing tools and devices, Hoggson & Pettis, exhibited a comprehensive and attractive line of their products, which display attracted much attention. The members of this company have been recognized experts for a great many years, in the production of mechanical devices adapted for rubber manufacture, and their output is to be found in practically all of the rubber mills of this country and Canada. The company was established in 1849.

Hoggson & Pettis Mfg. Co.

THE ELECTRIC RUBBER RECLAIMING CO.

The exhibit of the Electric Rubber Reclaiming Co., in charge of Messrs. Emil Gammeter, president of the company, W. A. Byrider and Shreve Clark, was among the attractive exhibits at the show, and these gentlemen were busily engaged in answering questions in reference to the company's product. The headquarters of the company are at Akron, Ohio, while the factory is at Barberton, in the same State. They claim a superior product, owing to their short time method, low temperature, and electrical process. While this is a new concern, it has already succeeded in stimulating considerable trade interest.



The Electric Rubber Reclaiming Co.

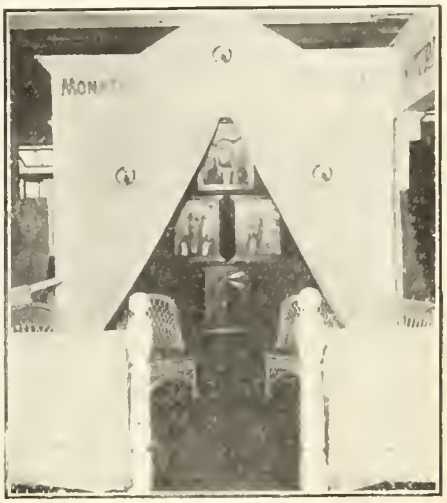
THE GAMMETER BRODBECK SALES CO.

The Gammeter Brodbeck Sales Co., whose headquarters are in Akron, are important distributors of rubber manufacturers' supplies and their exhibit attracted many users of this class of goods. Their booth was in charge of Messrs. Emil Gammeter and F. E. Ranney.

The Gammeter Brodbeck Sales Co.

MONATIQUOT RUBBER WORKS CO., SOUTH BRAINTREE, MASS.

The old proverb that the only good Indian is a dead one, does not hold good of the products of this company, whose "Four Good Indians" are very much alive. As the handsome booklet issued by it under this title tells us in attractive form, "Naturized" rubber is made under four brands, in a range of qualities, known as "Monatiquot," "Squanturn," "Massasoit" and "Samoset."



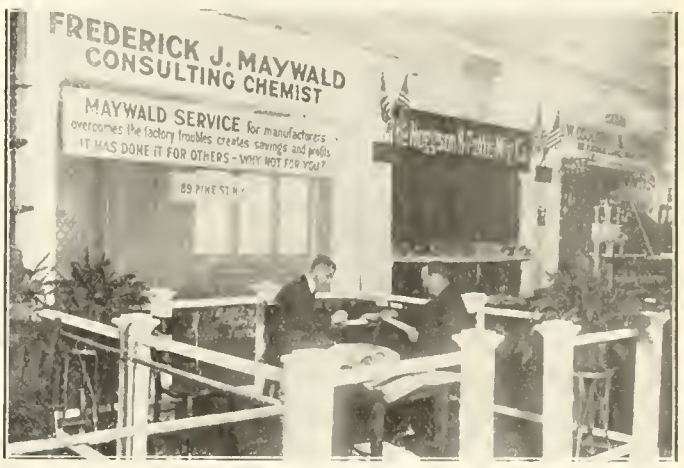
Monatiquot Rubber Works Co.

"Naturized" rubber was introduced some three years ago by the Monatiquot Rubber Co., and has proved a most available substitute for certain medium grade rubbers, and is said to be equally available for combination with the higher grades. It is adapted for a variety of purposes, especially for auto tires and mechanical rubber goods. The company's exhibit, in charge of Mr. Merton A. Turner, was most effective.

THE RUBBER CHEMIST IN EVIDENCE.

The chemist who specializes in rubber analysis has become an important factor in the trade, and Frederick J. Maywald, F. C. S., is a very well-known chemist specializing in rubber work. The Maywald booth attracted many rubber men, and Maywald methods were effectively shown.

The particular scope of these laboratories may be classified as the improvement and invention of processes, testing of new methods, experimental work, investigations, working out formulae, reduction of manufacturing cost, analyses and examination. The booth was in charge of Dr. Maywald and Mr. Clare Kennedy.



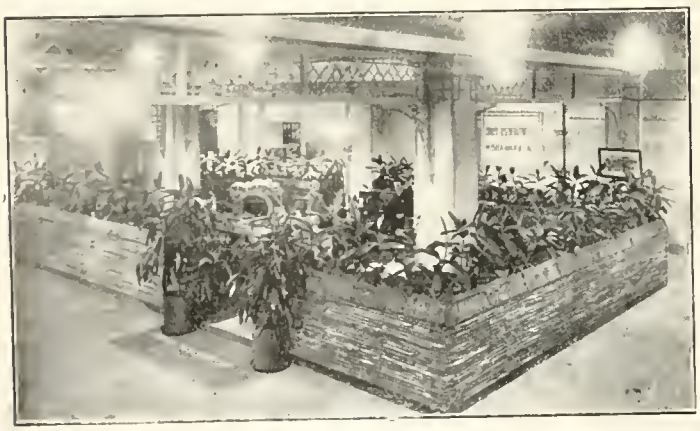
Dr. Maywald's Booth.

GEORGE A. ALDEN & CO.

"Emarex," the celebrated mineral rubber exploited by George A. Alden & Co., was the subject of attention and interest on the part of visiting manufacturers from the beginning of the

A FINE DISPLAY OF M. R. X.

show to its close. The exhibit consisted of a large number of drums attractively painted in red, containing the company's product, and in the center of the booth was a very heavy weight supported by a strip of rubber in which was incorporated a large percentage of "Emarex." Another particularly interesting feature of this exhibit was a treadmill, the flooring of which was of the Alden Mineral Rubber, operated alternately by two horses,



RUBBER REGENERATING CO.

during the progress of the exposition and showing on the closing day that "Emarex" is impervious even to the continuous hoof beats to which it was subjected for ten days. George A. Watkinson, who operates the mineral rubber department of George A. Alden & Co., was in charge of this exhibit, as he was of that in London last year, and his genial personality did much to promote the attractiveness of this exhibit and the popularity of this product.

WHERE ALL WAS RUBBER.

One of the most unique exhibits in the whole Exposition—combining art with business, was the booth of the Rubber Regenerating Co. This occupied a space of about 30 x 40 feet, and was walled in all the way around—a distance probably of 140 feet—with a solid wall about three feet high and a foot thick, built up of the regenerated rubber made by this company. On top of this wall, forming a continuous parapet, was a row of flourishing rubber trees—probably a hundred of them all told. This exhibit was in charge of Mr. W. A. Inwood, who received a great many congratulations on his conspicuously effective display.

A CHEMICAL EXHIBIT FROM HAMBURG.

Lehmann & Voss, of Hamburg, had an attractive showing of chemicals of interest to the rubber trade; in addition to which they distributed two publications of genuine value to the trade, namely:—"Handbook for India Rubber Engineers," and "Tables for India Rubber Engineers," publications which are very highly appreciated by all those fortunate enough to have acquired copies. The booth was in charge of Mr. R. Bardewyck, the company's manager in the United States.

J. W. COULSTON & CO.

This firm makes a specialty of imported red oxides of iron and of antimony in various forms, while in colors of American manufacture it carries greens and yellows for rubber compounding.

J. W. COULSTON & CO.

It likewise makes a particular feature of sulphide of zinc. Mr. Thomas Coulston, who had been in charge of the exhibit, expressed himself as much pleased with results obtained.

THE U. S. RUBBER RECLAIMING CO.

There was probably no more magnetic exhibit than that of the United States Rubber Reclaiming Co., which among other interesting features, operated a Birmingham mill, which demonstrated the process of grinding rubber in a reclaiming plant.

THE U. S. RUBBER RECLAIMING WORKS.

This booth was recognized as a center of hospitality and many good things, including "The Celebrated Loewenthal Cigar" and "Reclaimed Rubber Purses" were dispensed. Among the members of the company and its representatives present at different

times, were Messrs. Rudolph A. Loewenthal, Clarence Loewenthal, Theodore W. Bassett, L. J. Plum, D. McCallum and V. P. Schmidt.

TYSON BROTHERS.

Tyson Brothers, Inc., of Carteret, N. J., had one of the most attractive exhibits at the show.

In addition to a full line of substitutes they make a specialty of chlorinated oils, and have likewise a complete range of antimonies, whitings and fillers. In regard to substitutes, their facilities place them in a position to duplicate any quality at present on the market. Among their specialties is the "special brown adhesive," of which they are the originators and sole manufacturers. Their facilities of distribution are on a par with

TYSON BROS., INC.

the excellence of their manufactures. The capacity of their factory enables them to fill all orders promptly, while the special needs of Akron manufacturers are met from a full stock carried at that point.

The concern is managed and controlled by Messrs. R. E. and T. H. Tyson, who have brought it to its present importance.

PFALTZ & BAUER.

This firm showed a full line of the chemicals for india-rubber manufacture, made by E. de Haen, "List" Chemical Factory, Seelze, near Hanover, Germany. It included a range of colors in sulphuret of antimony, without free sulphur, which enables the manufacturer to cure rubber according to his own requirements. They also showed chrome yellows, arsenic sulphide and zinc chromates, with Japan red and iron oxides in various shades. Black hypo (with and without free sulphur), lithopone and other rubber chemicals were also shown.

An interesting feature of their display was the range of cured

AMERICAN ASPHALTUM AND RUBBER CO.

rubber samples made with their products free from sulphur. These samples were specially imported for the Rubber Exposition. The display was in charge of Mr. F. Bauer, and the firm's Philadelphia representative, Mr. J. Fred Lieberman.

AMERICAN ASPHALTUM CO.

American Asphaltum & Rubber Co., of Chicago, exhibited a number of attractively arranged drums of their well known "Pioneer" M. R., the booth being in charge of Mr. W. D. F McIntosh. The exhibit attracted many visiting manufacturers, who manifested great interest in this product.

HERMAN MUEHLSTEIN & CO.

Herman Muehlstein, a well known dealer in waste rubber, entertained a number of visiting buyers at his booth, to which he gave personal attention during the entire period of the Exposition.

DERESINATED RUBBER.

The Acushnet Process Co., of New Bedford, Massachusetts, had an attractive showing of high grade deresinated rubbers, in which visitors were much interested. The booth of this company was in charge of Messrs. F. R. Peabody, A. T. Weeks and Philip Endicott Young. Their selling agents are Geo. A. Alden & Co.

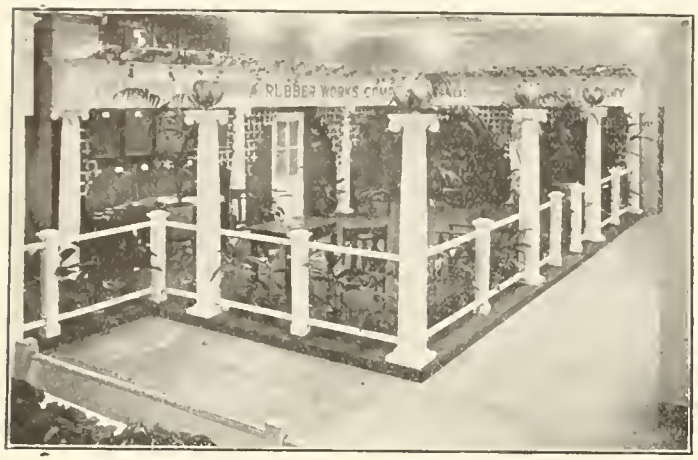
E. DE HAEN CHEMICAL WORKS.

ACUSHNET PROCESS CO.

H. MUEHLSTEIN & CO.

THE PHILADELPHIA RUBBER WORKS CO.

The exhibit of the Philadelphia Rubber Works Co., Akron, Ohio, was distinctly artistic. In the first place, it occupied generous space, so that there was no crowding. In the second

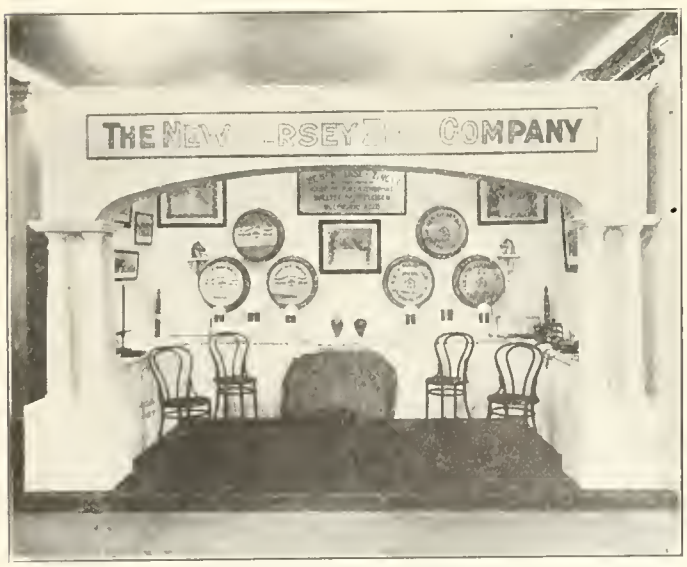


The Philadelphia Rubber Works Co.

place, it was a wonderfully fine color combination of pure white and dark green, the space being enclosed by a white rail with fluted pillars at short intervals, these pillars being topped by illuminated globes, while within the railing there was a row of rubber plants and ferns fringing the entire enclosure. Some simple furniture—not too much to clutter up the place—completed the general effect, while against the wall in the background—observable but not obtrusive—were samples of reclaimed rubber made by the company. The accompanying cut gives an idea in miniature of the general effect of this display.

DISPLAY OF NEW JERSEY ZINCS.

The exhibit of the New Jersey Zinc Co. was distinctly business-like. It consisted of tubs of oxide of zinc, taken from the company's mines at Franklin Furnace and Sterling Hill, New Jersey. There were also fine specimens of Franklinite and Willemite, concentrated forms of zinc ore. There were likewise



An Exhibit of Zinc Ores.

bottles of Lithopone, used in rubber compounding. The man from the street looking for general excitement probably did not linger very long before this booth, but the superintendent in the rubber factory found it exceedingly interesting.

COMMISSIONERS TO THE EXPOSITION.

THE following were the commissioners or delegates to the Exposition from various countries:

FEDERAL GOVERNMENT OF BRAZIL.

Dr. Candido Mendes de Almeida, president of the commission. Admiral José Carlos de Carvalho, vice-president. Dr. Eugenio Dahne, general secretary. Mr. Dillwynn M. Hazlett, assistant secretary. Mario Baptista Nunes, Dr. Oscar Sayao de Moraes, Adalberto de Sousa Aranha, Ivo Graca Campos, Dr. Carlos Cerqueira Pinto.

STATES OF BRAZIL.

Amazonas—Dr. Manuel Lobato. Mr. A. W. Stedman (New York), and Mr. J. Levy (Manáos), (Associacao Commercial do Amazonas).

Pará—Mr. George E. Pell (New York), (Associacao Commercial do Pará). Dr. Jacques Huber.

Federal Territory of Acre—Dr. Manuel Lobato, Mr. A. W. Stedman (New York).

Matto Grosso—Dr. Manuel Lobato, Mr. A. W. Stedman (New York).

Bahia—Dr. Jayme do Argollo.

Minas Geraes—Dr. J. Santiago Cardwell-Quinn.

OTHER COUNTRIES.

England—Mr. Edward G. Salmon (Imperial Institute), Mr. Noel Trotter (Rubber Growers' Association).

Federated Malay States and Straits Settlements—Mr. Leonard Wray, Mr. Cyril E. S. Baxendale.

Ceylon—Mr. F. Crosbie-Roles.

Hawaiian Islands—Hon. Wm. Williamson, Mr. Wilbur A. Anderson.

Province of Moro, Philippine Islands—Dr. James Walter Strong.

Republic of Honduras—Señor R. Camillo Diaz.

CRUDE RUBBER EXHIBITS.

WHILE Brazil at one time supplied the largest part of the world's consumption of rubber, that country has for some years had to experience the growing competition of southern Asia; notably of Malaya and Ceylon. At one time such an exposition as the recent one would have been needless. Every consumer knew what Brazilian rubber was, and the only question was, to what extent was the price to be affected by supply and demand. The possibility did not exist of an alternative variety.

Now, however, that Malayan and Ceylon rubber are daily assuming greater importance, it has become necessary for Brazil to assert her position by inviting comparison on a large and comprehensive scale.

This comparison could not be thoroughly effected in warehouses or brokers' offices, but called for a spacious building, such as those in which the first three international rubber exhibitions have been held—"Olympia," and the Agricultural Hall, London, and the Grand Central Palace, New York.

On each new occasion the arrangement of the sections has been improved, and that of the exposition just closed may be regarded as having achieved the best possible result in this respect. The close proximity of the three principal exhibits, from Brazil, British Malaya and Ceylon, was a great convenience to buyers and others interested in comparing the different varieties of rubber. It had another advantage—that of facilitating the comparison of notes between the planters of various countries, or their representatives.

Among the principal features of modern rubber cultivation is the recognition of the principle that the adoption of the processes of one country for the treatment of the *latices* produced in other countries, may lead to improved results. On this and other topics calling for the daily interchange of opinions between interested parties, the recent exposition probably did more than can now be realized, to unite and facilitate the exchange of views incidental to a successful gathering of such a nature.

BRAZIL.

The general character of the Brazilian exhibit was described in detail in the Special Exposition Number, so that many features of interest have been covered by the preliminary description. Suffice it to say that the harmonious and artistic setting was fully appreciated by the visitors.

From a comparison of the destinations (as shown by the statistical chart) to which the Brazilian rubber exports of 1911 were sent, the 36,547 tons were shipped as follows: United States, 16,146; Great Britain, 15,662; Germany, 1,058; France, 3,221; other countries, 460.

It was thus seen that about 90 per cent. of the total yield of Brazilian rubber went in about equal quantities to this country and to England.

As furnishing in about equal quantities 90 per cent. of the total Brazilian rubber shipments, the States of Pará and of Amazonas (including Acre and Matto Grosso) appropriately occupied the two principal divisions in the Brazilian section.

The Commercial Associations of Pará and Manáos had organized the exhibits from the States of Pará and Amazonas; the latter body having also undertaken the charge of the exhibits from Matto Grosso and the Federal Territory of Acre. The total weight of the samples exhibited in the Brazilian section amounted to about 70 tons, thus divided: State of Pará, 20; State of Amazonas, 30; Territory of Acre, 10; Matto Grosso and smaller States, 10.

PARA.

In the collection of samples from the State of Pará the following descriptions were included:

Low Xingu fine; High Xingu fine; High Xingu Caucho Bali; Islands coarse; Islands fine; Cameta coarse; Cavianna fine; Weak fine; Weak coarse; Cajary fine; Anapu; Tocantins; Tiras coarse; Tapajos fine strip and Itaikuba fine.

Mr. George E. Pell, of the General Rubber Co., was Commissioner for the Pará Commercial Association. Dr. Jacques Huber also represented Pará.

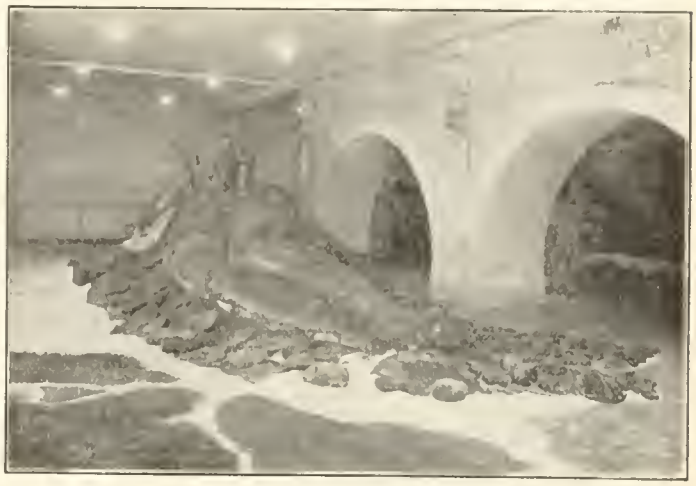
AMAZONAS.

The samples from Amazonas included: Up river fine from up the rivers Madeira, Jurua and Purus belonging to Amazonas,

30 TONS OF AMAZON RUBBER.

Matto Grosso and Acre. They also comprised *Hevea* Scrap (Sernamby) as well as Caucho ball. Smoked and smokeless sheets of *Hevea* rubber treated by the process of Mr. Monteiro da Costa were also shown. Dr. Carlos de Cerqueira Pinto also had specimens of Pará rubber treated by his patent process, which was further illustrated by the exhibits of various American manufacturers. Dr. Manuel Lobato was Commissioner and was in constant attendance.

The pyramid composed of 30 tons of Amazon rubber, illustrated in the last number of THE INDIA RUBBER WORLD, proved one of



THE GENIUS OF THE AMAZON.

the marked attractions. The Commercial Association of Amazonas was represented by Mr. A. W. Stedman and Mr. J. Levy.

MATTO GROSSO.

Matto Grosso sent the following up-river samples, which were in charge of the State of Amazonas:

Matto Grosso Samples.

Source.	Shown by
Valley of River Machado,	Avensi & Co.
River Mutumparaná,	Julio Müller & Co.
Valley of River Javary,	Aruda Bros.
Valley of River Guaporé,	Guaporé Rubber Co.
Valley of River Jacy—Paraná,	Fidel Bacca & Co.

The Commissioners for Matto Grosso were Dr. Lobato and Mr. A. W. Stedman.

BAHIA.

The Bahia samples, which only arrived on September 28, included Maniçoba, from Moraes & Co., J. C. da Costa Santos and S. Hess & Co.; Maniçoba Superior from M. Ullmann & Co.; Maniçoba Especial, from the Commercial Museum of the State of Bahia, and Maniçoba, from F. Stevenson & Co., Jequié.

Dr. Jayme do Argollo, the Commissioner of the State, gave full and courteous explanations regarding the samples.

MINAS GERAES.

The samples exhibited included types of Maniçoba from Clemence & Co., Resacca Estate and the Chamber of Commerce, of Minas; also of wild Maniçoba cleaned by Werner & Pfleiderer's machine.

Two comparative samples were of special interest: Wild Maniçoba sheeted on washer, and plantation Maniçoba, also sheeted on washer.

One very tranparent quality of sheet Maniçoba was exhibited by the British and Brazilian Rubber Plantation Co., Ltd., Lagoa Estate. Another sample came from Restinga Estate.

An interesting feature of the exhibit was the specimen of transparent sheet Maniçoba, through which could be read a card with the words "Rubber Window Panes from Minas, by Cardwell-Quinn's Coagulating Process." Dr. J. Santiago Cardwell-Quinn, the Commissioner from Minas Geraes, stated that 87 per cent. of the Maniçoba rubber produced there could be delivered in equally transparent condition.

OTHER STATES.

Samples from other States included small exhibits from Piauhy, Pernambuco, and Alagoas.

RECEPTION TO THE BRAZILIAN AMBASSADOR.

The greatest number of people gathered at any time during the Exposition attended on the afternoon of September 28, on the occasion of a reception tendered to the Brazilian Ambassa-

RECEPTION TO THE BRAZILIAN AMBASSADOR.

dor to Washington, Dr. Domicio da Gama. The reception committee consisted of Count Candido Mendes de Almeida, Admiral Jose Carlos de Carvalho and Dr. Eugenio Dahne. The reception proper was held on the spacious landing at the head of the grand marble staircase at the east end of the main floor as shown in the accompanying illustration. Immediately after the formal reception the entire company repaired to the balcony floor to visit the wonderful Brazilian exhibit, which, notwithstanding the large space devoted to it, was crowded in every nook and corner. After every one had had an opportunity to look at the samples of crude rubber displayed by the different organizations of Brazil, refreshments were served to the accompaniment of most excellent music. Brazil Day was a conspicuously successful feature of the Exhibition.

THE POPULAR MOVING PICTURE SHOWS.

One was always sure of finding a good crowd in the moving picture room, which was located on the main floor, in the southeast corner, and had seating accommodations for about 250 people, besides standing room, which was quite frequently utilized. These shows were given at two and four o'clock in the afternoon, and at 8 o'clock in the evening; and as new series of pictures were being constantly put on, one could attend a number of these picture displays without seeing any repetition. The pictures for the most part showed scenes along the Amazon, in the rubber exporting cities and in the rubber producing jungles. This feature was a valuable addition to the general exhibition.

One exceedingly interesting series of films showed the Madeira-Mamoré Railroad, which has recently been opened, after years of labor and millions of expense. One immediately sees as he travels over this road in these of moving pictures, why it should have taken so long to build and cost so much. The road is only 180 miles long, but it is a succession of bridges made of steel and cement, over streams and ravines, followed by deep cuts through solid stone—the whole road going through the densest imaginable jungle. As the road was built entirely by American engineers it reflects extreme credit upon our national engineering skill. This road starts at Porto Velho. Though this port is 1,800 miles up the river from the mouth of the Amazon, the largest steamers in the world can dock comfortably at its wharves.

ALGOT LANGE'S INTERESTING LECTURES.

Occasionally in place of the moving picture films Algot Lange, the well-known Amazon explorer, delivered a lecture, accompanied by stereopticon slides, on his twelve months' experience during 1910-1911 in the Amazon forests. It will be remembered that last spring his publishers issued his book, entitled "In the Amazon Jungle," an exceedingly interesting narrative, full of adventure and moving incidents. Mr. Lange's lectures traversed practically the same ground that was covered in his book, but to hear a story from an explorer's own lips is always more interesting than to read it in cold type, consequently his lectures always crowded the auditorium. He described the extraordinary features of the Amazon, which, he says, counting all its tributaries, has 100,000 miles of navigable waters. The river, hundreds of miles from its mouth, widens out in several places into a great inland lake, sometimes 24 or 25 miles in width.

He showed several pictures of a forlorn little hamlet, perched up on the banks of the river, called Remate de Males—being in English "The Culmination of Evils." This is at the point where the Javary River flows into the Amazon, a thousand miles from the Atlantic Ocean. The lecturer had spent several months in this forsaken spot, and he gave a graphic account of the place and its peculiar life. This is the resort of rubber gatherers during the rainy season, when their work is interrupted.

He also recounted his experiences up the Itecoahy River, where, among other interesting encounters, he fell in with a boa-constrictor, 54 feet and 8 inches long, which with the help of six trusted assistants was dispatched and duly skinned. Some American pessimists have doubted that 54 feet 8 inches —at least the 8 inches. But it seems that quite recently an English explorer alleged that he had an encounter with a boa-constrictor 65 feet long, which would appear to be ample endorsement of the accuracy of Mr. Lange's measurements. The lecturer's pictures of the animal life in the jungle proved of absorbing interest to his audiences.

Mr. Lange expects, in a few weeks, to start on another exploring expedition in the Amazon country, to cover the next three years, taken under the auspices of the University of Pennsylvania. He states that notwithstanding the fact that during his twelve months' residence in that country he had 17 distinct attacks of fever, with practically no respite between, he feels the most profound affection for the Amazon and cannot get away from the fascinating spell that it seems to cast over the natural explorer.

BRITISH MALAYA.

The bringing under British protection of the various

THE BRITISH MALAYAN DISPLAY.

native States in the Malayan Peninsula was the first step to the consolidation of their business interests. This combination has

rendered possible an exhibit in which all parts of the Peninsula would share, as was done in this case.

The growth of the Malayan rubber industry is a stimulus to renewed effort. From the interesting booklet distributed in this section, "The Story of the Rubber Industry in Malaya," its progress is clearly shown:

MALAYAN RUBBER EXPORTS.

	Pounds.
1906	1,035,601
1907	1,998,889
1908	3,186,099
1909	6,112,023
1910	12,245,864
1911	23,914,263
(Estimated) 1912	34,000,000

Such a development is probably without a parallel in the history of the world's commerce. Whether the increased yield will

FEDERATED MALAY STATES.

continue at the same rate depends on the number of trees reaching maturity. The acreage planted from 1906 to 1909 averaged about 50,000. That for 1910 was about 70,000, and that for 1911, 180,000. The direct result of the "boom" of 1910 was the heavy planting in 1911 and the prospectively heavy yield for 1916.

The samples shown were from about 80 estates and were distributed as follows among the various classes of rubber:

	Samples.	Pounds.
Crepe	58	6,949
Smoked sheet	33	5,406
Scrap	22	3,264
Sheet	6	628
Block, etc.	16	1,388
	135	17,635

One of the features of the Malayan exhibit was that companies which had in London exhibited independently now in almost all cases joined in the general British Malayan display.

Among the miscellaneous exhibits were specimens of good tapping and recovery of bark, as well as a model of the Kuala Lumpur Experimental Station. The tapping of gutta percha was shown by photographs. The samples were in most cases about 100 pounds each, but in the instance of the Sungei Kapar Rubber Co. were much larger; the exhibit including 1,548 pounds of smoked sheet rubber and 1,104 pounds of block rubber. The exhibit was in charge of Mr. Leonard Wray, I. S. O., assisted by Mr. W. J. Graham, who had come out from England for that purpose.

While the subject of Malayan rubber is probably today the most interesting to the industry, its products are to a large extent uniform in character.

Mr. Wray referred to the hearty co-operation he had met with from Mr. Cyril E. S. Baxendale, representing the Malayan Planters' Association, and Mr. Noel Trotter, acting for the Rubber Growers' Association of London. Malayan interests have undoubtedly gained by the exposition.

In the arrangement of the British Malayan exhibit the idea of unity of feeling among the various states and possessions on the Malay peninsula, has been very happily carried out. Mr. Wray had been appointed by the secretary for the colonies, as commissioner to the exposition from the Federated Malay States and the Straits Settlements. Although his official commissionership only extended to the above two governments, Johore and the other native states outside the Federation were likewise acting under Mr Wray's advice. The geographical—if not strictly political unity of all parts of the Malay peninsula was illustrated by the fact that the enclosure surrounding the space occupied by the British Malayan section bore the names of the various states on the peninsula.

HIGHLANDS & LOWLANDS PARA RUBBER CO.

The Highlands & Lowlands Pará Rubber Co. (Thomas Barlow & Brother, Ceylon House, London) exhibited the following samples:

a. Finest smoked sheet plantation Pará rubber.
b. Unsmoked sheet plantation Pará rubber.
c. Smoked crepe plantation Pará rubber.
d. Unsmoked crepe plantation Pará rubber.

This company received the first award and gold medal for smoked sheet; being likewise commended for unsmoked sheet. Its property, comprising 8,137 acres, is situated near Port Swettenham, Federated Malay States. The planted area is 3,760 acres, three-quarters of which had been planted before 1907, while the output of dry rubber has been as follows: 1907—193,505 pounds; 1908—222,287 pounds; 1909—346,259 pounds; 1910—511,724 pounds; 1911—637,449 pounds. Its dividend for 1910 was 50 per cent., while an interim dividend of 22½ per cent. was paid for 1911.

WATCHING THE RUBBER WORKERS.

One of the most interesting features of the whole Exposition —but one that possibly was missed by quite a number of visitors, because it was at the remote end of the mezzanine floor—was a display of moving pictures given every hour or so during the afternoon and evening, showing the work that goes on in the plantations of the Middle East. In a half hour's time the spectator could get a better idea of plantation operations than hours of reading could possibly give him.

The first films showed the virgin forests, and then the work of clearing. When the land was cleared off and burnt clean the planting began. Two coolies moved along over a bed of soft earth prepared for them—each at the end of a long board about one foot wide, with notches at even intervals along the edges. They put the board down on the ground, and at each notch pushed a seed into the earth. The board was then moved along its width and the process repeated. In this way, seeds were planted at perfectly regular intervals, and the whole work was done simply and rapidly without the necessity of any mathematical calculations.

Then the process of weeding and keeping the plantations clear of ants and other insects was shown. The scene was then transferred to a plantation of young trees about five years old and the tapping was shown. The natives were seen moving swiftly from tree to tree, making their incisions very deftly and attaching the little tin cups. Next came the gathering of the cups full of latex which was poured into pails and the pails in turn emptied into a large tank on wheels, drawn through the plantation to re-

ceive the rubber milk. The scene was then transferred to indoors where workmen were busy coagulating the latex and skimming the rubber off the top. The next step showed husky laborers kneading the rubber as a baker kneads dough. It was then put through rollers, coming out in long crepe sheets. After that came the shipping room, where the rubber was boxed up and made ready for the market. Then followed a dock scene with the boxes going on shipboard, and finally the ship was seen steaming down the harbor on its way to the London market.

It gave a very fine picture of all the plantation methods, and held the spectators in rapt attention. Many a rubber manufacturer who wants a good advertising medium might with advantage possess himself of a set of these films; they would make a marvelously interesting introduction to a brief story regarding his own product.

CEYLON.

The Ceylon exhibit, which was replete with interest, was in charge of Mr. F. Crosbie-Roles, whose previous experience at Chicago and St. Louis rendered him specially qualified for the office of Commissioner for Ceylon. He was assisted by Mr. E. B. Nathanielsz, a Sinhalese, who had come over with the exhibit. Rubber samples to the number of 64 were contributed by 32 estates, through 15 managing agents, distributed among the following classes: crepe, 2,192 pounds; scrap, 800 pounds; sheet, 150 pounds; smoked sheet, 104½ pounds; worm, etc., 129 pounds; total weight, 3,375½ pounds. The samples showed a judicious selection of the qualities in which Ceylon is at its best. They included one sample of block worm rubber from the Gikiyanakande estate of G. H. Golledge, Neboda, which had been shown at the 1906 Ceylon exhibition and which was still in unimpaired condition.

Another sample exhibited was one of 30 pounds from L. Bellerio specially prepared without acid by his new process. This sample was to be tried by a prominent American rubber company, after the close of the exposition.

In connection with the Ceylon exhibit there was distributed a "Ceylon Handbook," by R. H. Lock, M. A. Sc. D., Acting Director of the Botanic Gardens, Ceylon, and C. O. Macadam. An interesting series of tables shows the growth of rubber cultivation in Ceylon from 1,750 acres in 1900 to 230,000 in 1912.

The plantings show since 1909, a yearly increase of about 7 to 10 per cent. In Mr. Crosbie-Roles' opinion, it would be safe to reckon on an augmentation of 10 per cent. a year in plantings. The percentage of increase in yield depends, he added, not upon the recent plantings, but on those of five years before. Hence the increase in planting from 40,000 acres in 1905 to 100,000 in 1906 finds an echo in the advance of yield from 3,194 tons in 1911 to the estimate of 6,000 tons for 1912.

Exports increased from 19 tons in 1903 to 3,194 tons in 1911; having been for the last three years: 1910, 1,600 tons; 1911, 3,194 tons and 1912 (estimated, 6,000 tons).

Among the exhibits were 12 bottles of rubber latex from the director of the Royal Botanic Gardens, Peradenya, as well as five trunks of rubber trees from the same source. Desiccated cocoa nuts, plumbago, cocoanut oil, cardamoms, and other Ceylon products were likewise shown. Though not directly connected with rubber, they represent the produce of the island, on which was built up the present development of the rubber trade. Ceylon kept well in line at the exposition, which marks another step in its commercial progress.

Mr. Crosbie-Roles in conversation alluded to the advantage which American manufacturers had derived from being thus brought into touch with plantations, through the various Colombo managing agents, whose names appeared in conjunction with the plantation exhibits. The object of the exposition, in the dissemination of information about Ceylon had been fully attained.

One of the Ceylon samples (of the the Rosehaugh Estate) has been awarded the Silver Medal in the competition of the Rubber Growers' Association.

MORO PROVINCE, PHILIPPINE ISLANDS.

This exhibit was under charge of Dr. J. W. Strong, general manager of the Basilan Co., Commissioner of the Moro Provincial Government, as well as Mr. M. L. Stewart, Director for Commerce of the Philippine Islands, and Mr. J. R. Wilson, Assistant Director of the Government Bureau of Lands. Dr. Strong was obliged to return to the Philippines almost immediately after the opening of the exposition, so that his colleagues had charge during the greater part of the time.

In speaking with a representative of the INDIA RUBBER WORLD, Dr. Strong gave some interesting particulars of the present state of Philippine rubber planting. There are now, he stated, about 6,000 acres in the islands planted in rubber, chiefly *Hevea*, the larger portion having been planted since 1909. The Basilan Co., which has 660 acres planted, has been the first to enter the market with finished product from earlier plantings, having made shipments within the last few years to Hamburg and London. Arrangements have been made with Gravenhorst & Co., New York, to receive shipments of Basilan rubber, which was recently awarded a prize at the Philippine Exposition, Manila, and has been well received in Europe.

Among the samples exhibited were smoked and unsmoked Pará sheet; smoked Pará block; smoked Ceara sheet and block and Castilloa scrap.

The Moro Government exhibit also represented hemp, as well as the cabinet woods which abound in the Philippines.

HAWAIIAN RUBBER GROWERS' ASSOCIATION.

The commissioners for the Hawaiian Islands were the Hon. Wm. Williamson and Mr. Wilbur A. Anderson; but only the latter gentleman attended, the former having been unavoidably detained at San Francisco. Mr. Anderson occupies an important position, being general manager of the combination formed of the Nahiku Rubber Co., Hawaiian-American Rubber Co., and Koolau Rubber Co., as well as superintendent of the United States Experimental Station at Honolulu.

Special interest attaches to Hawaiian rubber from the fact that there are about 500,000 trees in the islands, mostly *Ceara*, chiefly planted before 1909 and thus now approaching the bearing stage. Further planting has been on a small scale from the desire to see the results of the earlier plantings now soon to reach maturity.

Tapping has just commenced of the trees planted in 1906, several thousand pounds having been shipped, larger and growing shipments being anticipated in the immediate future.

Analyses of the Hawaiian rubber which has reached New York have been extremely favorable. The samples exhibited were of pressed Ceara, the exhibit being in charge of Mr. C. A. Dann, representing Alexander and Baldwin (Ltd.), 82 Wall street, New York, agents of the combined companies referred to.

IMPERIAL INSTITUTE.

The interesting and valuable exhibit of the Imperial Institute, of London, was in charge of Mr. E. G. Salmon, the Commissioner. It was in two parts; the herbarium and the collection of rubber specimens; these covering, respectively, the botanical and the rubber growing features of the question. Upwards of 200 specimens of various kinds of rubber were displayed geographically arranged under their different sources. The inspection of these specimens was much facilitated by cards, with explanatory details as to the principal countries represented.

An interesting card attached to the exhibit of the Imperial Institute showed the distribution of the rubber production for 1910 among the British Crown Colonies and Protected States.

BRITISH GUIANA.

British Guiana was represented in the general collection of rubber samples exhibited by the Imperial Institute, as well as by samples of plantation Pará, *Sapium* rubber and balata shown by courtesy of the Institute in a separate glass case near its exhibit.

REPUBLIC OF HONDURAS.

Senor R. Camilo Diaz, Consul General at New York, looked after the interests of Honduras, which was represented by samples of crude rubber from the Republic.

FRENCH INDO CHINA.

This exhibit consisted of sheet rubber made in 1910. In connection, there was distributed a booklet by M. J. Lan on *Hevea Brasiliensis* in Cochin China, translated into English by M. G. Jason, of Sargon.

DUTCH GUIANA CULTURE CO.

Messrs. Ray C. Holbrook and J. E. Williams were in charge of the exhibit of this company, which included plantation Pará from trees 5-8 years old; wild Pará; *Castilloa elastica* ball and scrap.

Planting has been carried on for about 18 months at Plantation de Vrede, Dutch Guiana, where there are now 50,000 rubber trees which have been planted a year and a half. In addition there are 5,000 which have been planted 12 months, and 2,000 planted six months ago.

This company is specially interested in pushing Dutch Guiana products, and distributed a neat booklet descriptive of the Plantation de Vrede, as well as another of a more general character, entitled "Description of a Surinam Plantation." The trees now planted cover an area of about 300 acres interplanted with coffee trees. It is in contemplation to increase the plantings at an early date by a further area of 500 acres. The company's headquarters are at Chicago, Harris Trust Building.

THE BARTICA CO.

This company, which had an exhibit, reports that it has on its plantation in British Guiana, 250 acres in Sisal, interplanted with rubber, and 600 acres only in *Hevea*. It contemplates planting 600 to 1,000 acres a year in rubber.

ED. MAURER.

Mr. Ed Maurer and Mr. W. Greutert had charge of this exhibit, which included the following classes of rubber; Ceylon and Malay plantation; Brazil of all kinds; Africans (fifteen varieties), Borneo and Central American; as well as guayule and balata, which form a specialty of this firm's trading; and finally gutta percha. The exhibits were shown to advantage in a handsome pavilion made of Ceylon rubber.

Ed. Maurer's House of Rubber.

NEW YORK COMMERCIAL CO.

This exhibit attracted many visitors. It included: Upriver fine; Islands fine; wild rubber from Congo, Kamerun, Mexico and Panama; Guayule; Maniçoba, Sierra Leone niggers; plantation rubber from Dutch Guiana and Java. Mr. A. W. Stedman was in charge of the exhibit. The Boston-Bolivia Co. exhibited samples of fine Pará through the New York Commercial Co.

New York Commercial Co.

MEYER & BROWN.

This firm showed samples of *Hevea* in pale and smoked crepe, also block, smoked sheet and scrap, as well as Rambong crepe. In addition, they showed Congo Lobay, white Lopari, Congo Sangha, Central American Sausage; besides Massai, Java and Mozambique rubber.

HENDERSON & KORN.

The samples exhibited by this firm included pale, brown and dark crepe, also smoked sheet and ribbed smoked sheet; in addition to Java crepe and block. They were represented by Messrs. Ernst Korn, F. R. Henderson and Bancroft Henderson, of the New York office, and H. Henderson, of the Akron office. A comfortable inner room enhanced the attractiveness of the pavilion occupied by this firm.

THE UNITED MALAYSIAN CO.

The United Malaysian Co., of New York, London and Singapore, had an interesting exhibit in the balcony with the other crude rubber exhibits. Its booth was not elaborate, but was picturesque and inviting, being roofed over with palms, indicative of the Tropics, and having many sheets of crepe rubber hanging from the posts, and covering railings; besides many large photographs of the country in which this company operates, showing its plants, its coolies at work tapping trees in the jungle, and other interesting scenes.

Elsewhere in this issue there will be found an illustrated description of the work done by this company, with some facts relative to its particular product—Jelutong. This article will probably be of interest to all those who have given any attention to the various products of the Middle East.

A VARIETY OF RUBBERS.

Charles T. Wilson showed guayule grades: Mexican crude and refined Colorado; deresinated Colorado; *Hevea;* Maniçoba crepe from German East Africa; Mozambique crepe; *Castilloa.* Mr. Wilson and Mr. Henry Perlish were in charge of the exhibit.

RUBBER TRADING CO.

The samples exhibited by this company included a general line of Parás, plantations, African and Centrals, in which a satisfactory business had been done in the course of the exposition. Mr. Robert B. Baird was in charge of the exhibit.

OHIO GROWN RUBBER.

An excellently arranged show case was displayed by Mr. Charles P. Fox, of Akron, containing samples, representing Ohio-grown rubber in various forms. These had been respectively derived from *Apocynum* or Indian hemp and *Asclepias* or milkweed and represented the latex, as well as the resin, coagulum and rubber.

THE GENERAL RUBBER CO.

This company had an attractive pavilion, showing the names of its subsidiaries: General Rubber Co., of Brazil, Pará and Manáos; General Rubber Co., of Singapore; Wm. Symington & Co., Limited, London and Liverpool; Holland-American Plantations Co., Kisaran, Ashan, Sumatra; Netherlands Langkat Rubber Co., Tandjong Poera, Langkat, Sumatra.

A CENTRIFUGAL RUBBER COAGULATOR.

At the booth of the Empire Cream Separator Co., Bloomfield, New Jersey, Mr. G. M. Lescher, inventor of the process, was in charge and explained the advantages of the Empire Centrifugal Rubber Coagulator. This machine has met with much success in Mexico.

THE RAW PRODUCTS CO.

Mr. Samuel Kubie, president and treasurer, and Mr. F. H. Peaty, secretary and manager, represented this company. They received the visits of many friends during the exhibition.

OSTERRIETH & CO., ANTWERP.

This firm of prominent Antwerp importers showed a small but interesting exhibit of standard qualities of crepe plantation rubber. It included thin pale, grade I; thin, grades II and IV; thick pale, grade I; thick, grades II and IV.

THE FOREIGN PRESS.

The "Gummi-Zeitung" of Berlin, "Grenier's Rubber News" of Kuala Lumpur, and the "Rubber World" of London, were represented in the crude rubber section.

RUBBER FERTILIZERS.

The German Kali Works, 42 Broadway, New York, representing the Kalisyndikat of Berlin, distributed copies of literature descriptive of their fertilizing products, including a pamphlet on the "Manuring of Rubber," by Arthur Stephen, an English expert on the subject.

THE MANHATTAN COMPANY IN JAVA.

The Manhattan Rubber Manufacturing Co., Passaic, N. J., has found it desirable to add the cultivation of rubber to its manufacture, by means of its own plantation in Java. Increased importance is anticipated for this branch of its business.

SALE OF SAMPLES BY INSCRIPTION.

The large quantity of samples sent to the Exposition for display or competition (and which had not been sold privately, or otherwise cleared) was disposed of by "inscription," on the plan customary in various continental markets. Bids were received by the New York Commercial Co. until 4 p. m. on October 3, the last day of the exposition. Following are the prices obtained, which turned out to be exceptionally good, as the market has since been a declining one:

Brazil Rubber—

Amazon Fine Pará	$1.15 per lb.
DaCosta Process Hevea, smoked	1.64 per lb.
" " " unsmoked	1.64 per lb.

Rubber from Federated Malay States,
" " Ceylon, and
" " the Rubber Growers' Association—

Block Rubber	$1.19¼
Smoked Sheets	1.13—$1.18¾
Unsmoked Sheets	1.10
Crepe	1.11— 1.17½
First Latex Crepe	1.11— 1.12
Scrap Crepe	1.03½

In this distribution of the samples exhibited, throughout the American industry, the main object of the Exposition has been attained, through the more intimate knowledge consumers have thus gained of the rubber supplies at their disposal, both in wild and plantation varieties. The weights of the samples have ranged in most cases from 50 to 112 pounds. There was in all instances enough for a practical test.

AN INTERESTING CHECK.

Here is a rubber check of more than passing interest—not because of the size of the amount—for that is not so particularly large. The interest in the check shown below lies in the fact that this represents the first payment made for plantation rubber ever sold at a public sale in New York. This sale took place on the last day of the Third International Rubber Exposition, recently held at the Grand Central Palace.

CHECK PAID FOR FIRST PLANTATION RUBBER EVER SOLD AT PUBLIC SALE IN AMERICA.

THE EXPOSITION PRIZE COMPETITIONS.

TWO competitions marked the course of the Exposition. One was for the $1,000 silver trophy, which had been presented by Mr. Henry C. Pearson, editor of THE INDIA RUBBER WORLD, an illustration of which appeared in the special Exposition number. It was awarded on the merits of the samples exhibited, no special entry being required. It was won by the State of Amazonas. The presentation of the shield through the Brazilian Ambassador was one of the features of the closing banquet.

The other consisted of the gold, silver and bronze medals (each with diploma) of the Rubber Growers Association, London, awarded for the three samples of Plantation Rubber (irrespective of the method of preparation or country of origin), specially entered for this competition, which may be placed highest by the jury. The entries were 135 in number, of which 75 were from Malaya, 54 from Ceylon, 3 from Burma, 2 from Brazil and 1 from German East Africa. The list of awards follows:

Highlands and Lowlands Estate, Federated Malay States—First award, smoked sheet; gold medal.

Rosehaugh Estate, Ceylon—Silver medal.

West Country Estate, Federated Malay States—Bronze medal.

Klanang Estate, Federated Malay States—Smoked sheet; highly commended.

Bukit Rajah Estate, Federated Malay States—P. R. crepe; highly commended.

Maddagebera Estate, Ceylon—crepe; highly commended.

Cicely Estate, Federated Malay States—Pale thin crepe; commended.

Highlands and Lowlands Estate, Federated Malay States—Unsmoked sheet; commended.

Batu Caves Estate, Federated Malay States—Smoked sheet; commended.

The West Country Estate, Federated Malay States—Commended.

The medals were presented to the successful competitors at the Exposition banquet, through Messrs, Cyril E. S. Baxendale, F. Crosbie-Roles and Leonard Wray; the results of the two competitions illustrating the views expressed on that occasion that wild and plantation rubber can harmoniously co-operate for the benefit of the industry.

RUBBER STREET PAVING.

LOOKING ahead a few years when low priced rubber may make the article economically available for street pavement, the "Standard Asphalt & Rubber Co." of Chicago, through their selling agents, Geo. A. Alden & Co., of Boston,

made an exhibition of what "Sarco" and "M. R. X." will do for the purpose.

The exhibit consisted of rubber bricks 8 x 4 x 2½ inches, having grooves along the sides as shown in the accompanying cut.

The wearing surface on top, one inch thick, contains 50 per cent. of M. R. X., and 25 per cent. of rubber, etc., a mixture of

sufficient tenacity to resist the wear and tear of street travel and to remain unaffected by weather changes.

The base or underpart of these bricks is of "Sarco." They are to be laid an inch apart, the spaces all around being filled with melted "Sarco." This, flowing into the horizontal grooves, will form, when cooled, a dove-tailed anchorage to prevent the bricks being pried up in the night and carried off to the junk shop; and at the same time prevent the slipping of the horse and the skidding of the motor car.

A practical demonstration of the wearing quality of the top rubber and "M. R. X." surface of the bricks was given by means of an old fashioned tread mill, in which a relay of horses sharp-shod with heel and toe caulks, pounded along in an endless journey to nowhere, on lags or treads made of the "M. R. X." mixture, without in the least cutting or bruising them.

An amusing incident occurred in connection with this exhibit that affords a striking illustration of the eccentricities of the human mind. These horses, one white and the other black, were hired from the "Ben Hur" show, where they nightly appear in the great feature of the chariot race, running on movable platforms revolving against them.

The groom in attendance on these animals, a thoroughbred circus man, knowing horses from forelock to fetlock, after observing the pair go through their paces in the tread mill for several days, finally toward the close of the exhibition, circled curiously around the machine and said to Mr. Whitehouse, Alden's attendant: "Say! I don't see where the power is jined on that makes this thing go!"

NORTH BRITISH RAILWAY TESTS.

In the specifications for buffers, issued by the North British Railway Co., it is stipulated that after 48 hours' compression, the rubber should return to one-half its original size, and should likewise sustain without injury 40,000 strokes of a hammer.

This certainly is rather heroic treatment for rubber buffers, but buffers can be made to stand these tests if a sufficiently good quality of rubber is used. The question naturally arises whether this class of goods would warrant the use of such high grade rubber as this test would call for.

The Exposition Banquet.

ON the evening of October 2, the Grand Exposition Banquet was held in the ball room of the Hotel Plaza, New York. It was a signal success—both in the number and character of those present, and in the quality of the after-dinner speaking which was of an unusually high order. About 120 were present, including the officials of the Exposition, commissioners and delegates from foreign countries, and American exhibitors. Fifteen or twenty ladies, wives of officials and delegates, were also present as guests. The hour was set for 9 o'clock, and with unusual promptness all were at their places at the tables very soon after that hour. Mr. Henry C. Pearson presided, with the following gentlemen seated at his table: On the President's right, Dr. Domicio da Gama, Brazilian Ambassador to the United States; Leonard Wray, Commissioner from Malaya; A. Staines Manders, Organizing Manager of the Exposition; Dr. Candido Mendes de Almeida, President of the Brazilian Commission, and Admiral Jose Carlos de Carvalho. On the President's left: Hon. John Barrett, President of the Pan American Union; J. J. Broderick, Acting British Consul General in New York; F. Crosbie-Roles, Commissioner from Ceylon; Professor William Goodyear, Curator of the Brooklyn Institute of Arts and Sciences, and son of Charles Goodyear, and Professor Franklin W. Hooper, of the Brooklyn Institute of Arts and Sciences.

When all had found their places, the chairman arose and announced that in accordance with an excellent and time-honored custom which had come down to us from our fathers, the dinner would begin by saying Grace, and he called upon the Rev. Dr. S. Parks Cadman of Brooklyn.

The menu, to which nearly two hours were devoted, was unqualifiedly attractive, as will be seen below.

The PLAZA. Wednesday, October 2, 1912.

A little before 11 o'clock, the President arose and spoke briefly as follows: "These are times of much political interest in the United States, and there are, undoubtedly here present tonight adherents of the amiable Elephant, the docile Donkey, and the vociferous Bull Moose, but I think we can all join heartily in the toast which I am about to propose—a toast to the patron of this Exposition—the President of the United States." All arose to respond to this toast, which was drunk with enthusiasm.

The President then introduced the first speaker of the evening, as follows: "We have with us tonight a gentleman distinguished in diplomacy; he comes from a great country—great in rubber and great in other lines. It is difficult to propose a set toast to one who has been distinguished in so many different departments. He had served his country conspicuously at home—in Brazil—and in Peru and the Argentine Republic before he was sent to America. That he should come tonight from Washington especially to be with us on this occasion is a great compliment. I have the pleasure of presenting Dr. Domicio da Gama, Ambassador from Brazil to the United States."

Dr. da Gama: "I must ask your indulgence for the insufficiency of my English; and yet, perhaps, I should not be ashamed of my English, as with me it is a purely exotic product; but you see before you a truly embarrassed man, for while I have attended many banquets—some cheery and gay—some sad and gloomy—some given to me—and some which I had to give, I never before have attended a rubber banquet. You know a great deal more about rubber than I do, for I come from the south of Brazil, where rubber does not grow, and I confess that I never saw so much rubber before in my life as I saw today at your Exposition. But I esteem this a most important occasion, because it makes for international fraternity, through international trade. Those men down on the Amazon who are gathering the rubber may think that they are working only for their own interest, but in truth they are working for the interest and welfare of the whole world. We are the producers of rubber, and you the consumers, and I hope that the commercial relations between Brazil and the United States will grow better and stronger with the years, and that the United States will take an even more conspicuous position in the markets of Brazil."

THE PRESIDENT: "That was a happy thought in having the flags of Brazil and Great Britain draped together at the lower end of this room, for the exhibits that have been sent to us from Brazil and the Malay States have been wonderful; but the American flag which hangs back of this table should have been down there too, and the three hung side by side. Speaking of Great Britain, every American traveler has a most kindly feeling towards the British Consul, because—in years gone by, at least—whenever an American traveler in any part of the world needed help he invariably turned to the British Consul—and never in vain. I have the pleasure of introducing to you Mr. J. J. Broderick, Acting Consul General of Great Britain in New York."

MR. BRODERICK: "It might naturally be expected that I would address you on the subject of rubber, but I must confess a most Stygian ignorance of this subject, except that I know that the rubber industry—especially the rubber planting industry—has enjoyed a most extraordinary growth in the immediate past. It is my first duty to express the regrets of the British Ambassador at Washington, because of his inability to be with you tonight, and to express the regret that I know you must feel in not being able to listen to the Hon. James Bryce, whom

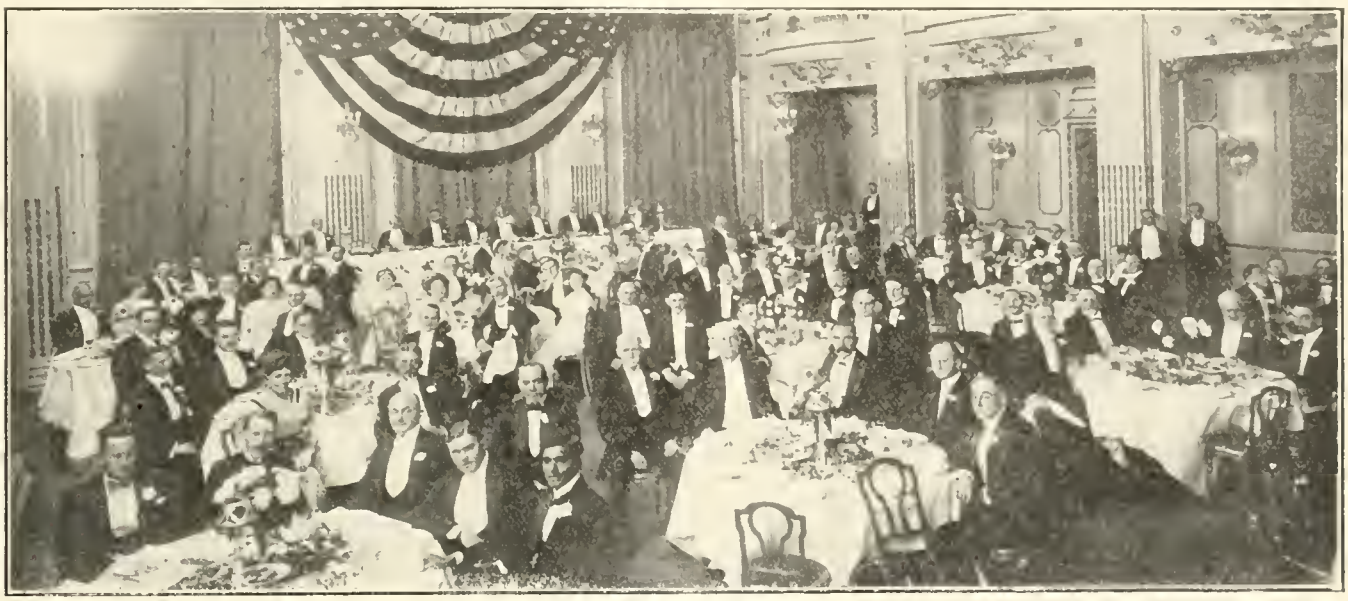
you have known from your school days; for his book on the American Commonwealth, has long been the *vade mecum* of American students. If he were here he would express to you in his admirable manner the importance that he attaches to this gathering of rubber men."

Mr. Broderick here introduced very cleverly one or two most amusing stories and then continued: "But your chairman has limited my time to 5 or 6 minutes, so I can only add that I esteem it an extreme honor to be asked to address you, and I speak not only for myself, but for all the representatives of Great Britain here, when I express my sincere appreciation of the great hospitality that we invariably receive from our cousins in the United States."

The President: "I think everybody on this round earth who knows either English, Spanish or Portuguese, knows of the Pan American Union, and of its live wire, the Hon. John Barrett."

Mr. Barrett: "In making a special effort to get to this banquet—leaving Washington last night on the midnight train, and returning thither on the midnight train tonight—I show the great importance that I attach to this occasion. I must congratulate you, however, on the fact that I am compelled to return on the midnight train—otherwise, I might not be so inclined to set a proper time limit on my remarks. Your chairman has spoken of our political emblems. In view of the unique character of the present campaign, I think a most fitting emblem would be a rubber ball. The Brazilian Ambassador has told you that among the banquets he has attended there have been some marked by gloom. I can hardly believe this; I do not think there is ever any gloom where the Ambassador is."

Mr. Barrett went on to describe a famous international banquet where the Brazilian Ambassador had spoken with unusual eloquence and had greatly impressed his hearers. He eulogized Dr. da Gama, and paid a fine tribute to his predecessor, Dr. Nabuco, whom he described as a man of gentle character, keen wit, and profound learning, and whom he called the greatest diplomat of his time. He spoke of the wonderful development of Brazil and the rapidity with which that country has taken her position among the great world powers. He sketched the awakening of the tropical countries because of the solving of the problem of tropical sanitation by Colonel Gorgas at the Panama Canal. He prophesied that by reason of this demonstration the tropics would be made perfectly sanitary, that the Amazon country, and other countries similarly situated would increase enormously in population and commercial activity. He spoke at some length regarding the natural advantages of the Amazon country, and of the rapidly growing cities of Brazil. He said that Brazil had spent more money and more energy in the last ten years in developing her resources than had been spent by the United States. He cited the building of railroads, the founding of agricultural schools and colleges, and other instances of the awakened spirit of modern progress. He outlined the work of the Pan American Union, of which he is the executive officer, which without any antagonism to the rest of the world, is seeking to bring all the countries of the American Continent together for their mutual good and permanent welfare. Referring again to the Rubber Exhibition he said: "If I had had my way, Dr. Leipziger would have brought all the boys and girls of the public schools of this city to this great exhibition so that they might realize something of the products of South America, and I would have had all the members of the commercial organizations of this city come to this great international show so that they might have some appreciation of what the countries to the south of us are doing. You have often heard cotton called 'king,' and you have often heard corn called 'king,' but I believe that rubber is now 'king.' I was walking along Fifth avenue this afternoon. I didn't see much cotton. The ladies promenading on the avenue were certainly not wearing cotton —nor did they look as if they were 'corn-fed.' But rubber was everywhere; the avenue was filled with automobiles, all moving swiftly and silently on their rubber shoes. It was time that we had in this country a great Rubber Exposition, and I heartily congratulate you on the pronounced success of this enterprise."



The Banquet at the Plaza.

The President: "It would be presumptuous to comment on this magnificent address. We are proud that Mr. Barrett is an American, and we are proud of his breadth of view, and we appreciate the truth of what he has said about the great Republic to the South."

At this point, several medals and diplomas were laid on the table before the chairman, and he was asked to hand them to those to whom they had been awarded by the various committees selected to pass upon exhibits.

A gold medal with diploma for the best plantation rubber was handed to Mr. Noel Trotter, who took it in behalf of the

Highlands and Lowlands Estate of the Federated Malay States. A silver medal with diploma for the second best sample of plantation rubber was handed to Mr. Crosbie-Roles in behalf of the Rosehaugh Estate of Ceylon. A bronze medal with diploma for the third best sample was given to Mr. Leonard Wray for the West Country Estate of the Federated Malay States. Mr. Pearson then took in his hand the large solid silver shield about 15 or 16 inches in height, very handsomely engraved, which had been offered for the best sample of wild rubber. He said that in presenting this he was obviously in an embarrassing position, because owing to the fact that this shield was offered by THE INDIA RUBBER WORLD he could hardly make the comments on it that he would have made if it had come from some other source; consequently, he handed it without comment to the Brazilian Ambassador in behalf of the state of Amazonas, to which it had been awarded.

After the awards of medals and diplomas the chairman continued: "The brave spirit that made such trophies possible, that made our presence here tonight possible—was Charles Goodyear. Many have forgotten his struggles and successes, but during the past ten years—what I might call the rubber conscience has been considerably disturbed, because nothing has been done in commemoration of this great man, and we have come to hear much about the propriety of erecting to him some suitable memorial. Professor Hooper, of the Brooklyn Institute of Arts and Sciences, will speak upon Charles Goodyear.

Professor Franklin W. Hooper, who responded to this toast, made an exceedingly eloquent address, and paid a fine tribute to the great genius and exalted character of Charles Goodyear. He spoke in part as follows:

"It is indeed true, as the chairman has said, that this exhibition would have been impossible—it is true the whole progress of the arts and sciences would have been held in check, had it not been for the discoveries and inventions of Charles Goodyear. We have had many famous inventors and discoverers in this country, but he was the greatest of them all. Beginning as the son of an inventor, his genius displayed itself before he was 27 years of age, and following out a God-implanted purpose and a destiny that he could not resist, he sought how he could serve humanity by making rubber, which up to that time had been a valueless product, serve some widely useful end. Between the ages of 34 and 44—for 10 long years—he wrought day and night, in season and out of season, and under all conditions, to make this product, not profitable to himself, but valuable to all mankind. When in 1844 he took out his first patent for Vulcanite, he laid the basis of the great industry which we are here tonight to celebrate."

Professor Hooper called attention to the fact that while other great discoverers and inventors like Morse with the telegraph, and Dr. Wells with the discovery of anesthesia, had the assistance and co-operation of collaborators, Goodyear worked alone through a long period of unrelieved hardship and self-sacrifice. "To show how thoroughly Goodyear did his work," Professor Hooper continued, "at the time of Goodyear's death rubber had been applied to 200 of the leading industries, and of these 200 different applications Charles Goodyear was the inventor of over 95 per cent. There has been no important new application of rubber since his death. The tire, of which we hear so much today, is but an amplification of the tubes he made in the 40's. But he was more than an inventor and discoverer. He was a wonderful character, and we are to be thankful not only for his industrial victories, but for the purity and simplicity of his heart and mind. He had the qualities of that other great American whom we all love and revere, Abraham Lincoln, and as on the banks of the Potomac there stands a fitting monument to the life and character of Abraham Lincoln, so in the national capital there should be some fitting memorial to Charles Goodyear. There should be a permanent exhibition of all the processes and discoveries in the rubber industry during the last three-quarters of a century, and in the midst of that great exhibition should stand a noble monument to that great inventor and American saint Charles Goodyear."

THE PRESIDENT: "The next toast is a very comprehensive one, 'The Rubber Industry,' but I will ask Dr. Huber to speak specifically on the rubber forests."

DR. JACQUES HUBER: "Having been summoned by our chairman to speak in the name of the forest or wild rubber industry, I am aware that I am not only representing the State of Pará (the typical locality of the typical rubber tree, as we botanists would say) and my Brazilian friends here present, but the whole community of the wild rubber producers of tropical America. But who are these wild rubber producers of tropical America? As a rule, you will not meet them in rubber conferences or expositions, nor even in rubber banquets. If we make exception of Guayule and some other rather exceptional concerns, there are no well organized companies with directors and advisers and staff of managers and visiting agents. Even the owners of rubber forests cannot be considered as the true producers, as they generally buy the rubber from the rubber gatherers, the hard-working and intrepid pioneers of the South American 'selvas.' These plain and often ignorant men are the true producers of the best kind of rubber. Their heroic struggle with the wilderness of the Amazonian forest is perhaps one of the most emotional chapters of human efforts to conquer the treasures of nature. Without the activity of these men, the streets of New York would probably present quite another aspect, as it can hardly be imagined that the motor car industry would have taken its actual development without 'Upriver fine.'

"The origins of the wild rubber industry are humble, but they are characteristic of the genius of the American race, and they can be considered as the starting point not only of the present flourishing wild rubber industry, but also of the whole manufacturing industry. The South American Indians, who made the gambling balls, the boots and the bottles of crude rubber, were not only crude rubber producers, but also manufacturers. The modern times, of course, require specialization, and the rubber boots we wear are no more made by Indians. Specialization is not possible without scientific work and scientific organization. In the planting industry, organization has already shown astonishing results. Science and scientific methods have now to be applied also to the wild rubber industry; increasing its vitality by giving it a proper organization.

"The plantation industry is like to a field, where, on the advice of men of science, wealthy England has sown broadcast the golden seed of its capital and initiative, harvesting already promising results. The forest rubber industry, on the other hand, is comparable to a large and venerable tree, whose birthday is unknown, but whose roots are well fixed in tropical America's early history and industrious population. The tree has grown up with a large trunk and wide-spreading crown, but although it has already produced a number of golden fruits, it has not yet given its full crop. Many branches must be cut out to give it light and air, but under the hands of skilful gardeners it will make a new start and grow and flourish to honor its American origin and the American genius."

THE PRESIDENT: "Mr. Cyril Baxendale will continue this subject, speaking from a planter's standpoint."

MR. BAXENDALE: "I feel very much like a certain character in one of Disraeli's novels. I have a feeling in my heart which may be indigestion, or it may be gratitude—I cannot tell which. I have a subject to which I would like to devote 6¾ hours, but I am limited to 6¾ minutes. By those who know my country, it is recognized that its representatives are famous for their

humility. We came here expecting to teach America, but we have found that there was much more for us to learn. We came to teach the American manufacturer to try our plantation rubber, and here discover that out of 10,000 tons shipped this year 6,500 tons came to New York. I find an idea in America that all plantation rubber is 'Highlands and Lowlands.' I assure you that while 'Highlands and Lowlands' rubber is of excellent quality, it is not quite so elastic as that. Our plantation rubber comes from 600 estates. It is very desirable for you to induce the growers to brand their rubber. The American manufacturer should insist on receiving rubber in the cases in which it is shipped. There are some dealers in London and Liverpool—or let us say of the Old World—who do not respect brands and do not forward rubber in the cases in which it is received. Americans should import their rubber direct from the East." Mr. Baxendale laid considerable emphasis on this point.

"In conclusion I would like to express the sense of the obligation felt by the whole industry to Mr. Manders, who has been so active in interesting the various powers in this exhibition, and for the very successful result he has achieved, with the assistance of his indefatigable and ever charming secretary, Miss Fulton, and finally I wish, in behalf of the rubber planters, to thank you for the great kindness which you have shown the 'stranger within your gates.'"

The President: "Mr. Baxendale anticipated me in what he said about Mr. Manders. I was and am going to call upon Mr. Manders to tell us something about this Exposition, and about the prospects of another."

Mr. Manders: "We have heard a good deal this evening about the hospitality of this country. I endorse it all—for yesterday it presented me with a first-class cold—as you will observe—rendering it impossible for me to make any detailed remarks. I wish simply to express my thanks and the thanks of Miss Fulton to all those friends here and abroad who helped us to bring this Exposition about—to the Governments that have sent their exhibits and their representatives here, that have sent to New York such fine specimens of rubber from every rubber producing country on the globe. I shall not speak of the tremendous amount of labor that has been involved in bringing this Exposition to pass—nor shall I undertake to speak regarding another Exposition here, but as you doubtless all know, there will be another in London in 1914, where I sincerely hope to meet my many friends from this and other lands. Because of this atrocious cold I will have to ask you to excuse me from further remarks."

Chairman: "We have with us tonight a friend from Dutch Guiana, who enjoys a wide reputation for his gift of oratory—Mr. O'Connor."

Mr. J. L. O'Connor: "After listening to all these words of eloquence I am more than ever impressed with the art of the after-dinner speaker. The first duty of the after-dinner speaker is to be surprised." Mr. O'Connor went on in an amusing vein to depict the science of after-dinner oratory, and the best methods of preparing an eloquent after-dinner effort. He cited an instance in his own career where he attended a Venezuelan dinner, and had made more or less elaborate preparation for the oration which he knew would be expected. To his great consternation, the speaker who immediately preceded him delivered his own address verbatim—having bethought himself of the same source of supply—the Encyclopedia Britannica. He told a story of a farmer in Ohio who had read some of Mr. Pearson's writings on the West Indies, and was quite impressed with the possibilities of those islands, but seemed to feel considerable apprehension regarding the hurricanes that are alleged to visit that section from time to time; so he wrote to one of the officials at Trinidad and asked if there was not some variety of rubber tree sufficiently elastic to be able to bend before the hurricanes without being injured. In conclusion he said, "We are all under obligations to Mr. Manders and Miss Fulton for the work they have done here and the difficulties which they have overcome, of which we have little conception. We are greatly indebted to them for bringing here to America—the country that uses over one-half of the rubber production of the world—this great Exhibition of crude rubber and of all the myriad articles that are manufactured out of it."

The President: "Now that the representatives of the New York press have withdrawn, I will call upon Mr. Salmon to speak for the press of Europe."

Mr. Edward G. Salmon spoke in part as follows: "We have just been told that over one-half of the crude rubber of the world comes into New York. I am disposed to think that quite a little of that goes into the offices of the New York newspapers—judging from the extreme elasticity of many of their statements. This Exposition has been a great object lesson in many ways—chiefly perhaps in the rivalry it has shown between the great rubber country of the South—Brazil, and the planters of the Middle East. Great credit is certainly due my countrymen in Ceylon and Malaya for the wonderful way in which they have developed this adopted tree. Their success has been a challenge to Brazil, and we have seen in this Exhibition the alert and aggressive manner in which Brazil has accepted this challenge. It is a rivalry on a stupendous scale—but entirely friendly. I wish there were present here to speak for the press of Europe, some representative of a great European paper, but as a humble representative of the European press I thank New York and America for the courtesy and hospitality that has been shown to us all, and simply express in addition the hope that we may all have an opportunity to accept your hospitality again."

The President: "Mr. Salmon has spoken to us about the wonderful development in the Middle East. I am going to ask Mr. Crosbie-Roles to tell us more about it."

Mr. A. Crosbie-Roles: "To the man who sits at his desk—to the stay-at-home—the Middle East seems far distant; but way beyond us—out in the Spice Islands—they have a daily paper. Colombo, by the way, has five daily papers, and it is the seventh harbor for tonnage in the world—an alert and enterprising town. We perhaps could hardly expect American capital to be attracted such a distance, but some of it has been attracted to the Middle East, as is shown by the enormous plantation of the United States Rubber Co., in Sumatra, where over 22,000 acres have already been planted, and well planted to rubber. Direct trading between the rubber growers of the Middle East and the American manufacturers is natural and logical, and will soon come about. Unfortunately, cable rates still stand at 2s. a word, notwithstanding the decrease in cable rates across the Atlantic. One great benefit from an Exposition—like this just closing in your city—lies in bringing together the different members of the same industry from the different quarters of the earth. These Expositions make for good will and friendship and for increased commerce."

The President: "In conclusion we will have a final word from Dr. Argollo, who will speak on the press of Brazil."

Dr. J. de Argollo: "Hard lines indeed for me to speak after the eloquent toast made by my clever colleague of the European press. I am not a wealthy citizen of the growing and powerful United States nor an Englishman, but only a Brazilian, a stranger. I feel alone, but morally obliged to say something, because in rubber questions and interests, Brazil cannot remain silent.

"Dr. Huber, the greatest scientist of Brazil on this subject has exhausted the most interesting side of the question of wild rubber as a product of the enormous Amazonian Valley, but most fortunately for me, he did not mention one of the sources of Brazil's progress, development and wealth; he did not refer to the press, as useful as dangerous, according to its display of power.

"In Brazil, the press is a political and instructive guide, but

in the present case we shall only mind about the latter and consider it as a school where the free citizens of the greatest Republic of South America try to learn what is going on throughout the world. There, they have followed the growing wealth of rubber plantation in the East. They have seen appearing on the stage of commercial struggle, a young competitor born from the seeds taken over, less than forty years ago, from the Amazonian Valley, by a clever and intrepid explorer, Mr. Wickham. In this growing child, in the *Hevea* of the East, they have not only seen a competitor in the near future, but also a teacher who has opened their eyes and showed them what they had to do to keep up their rubber wealth and avoid a crisis, in consequence of their indifference, in the East. Brazilians welcome healthy rivalry; they know the world is large enough, and will grow larger still in the using of rubber. Yearly the markets increase.

"There is no reason why the rubber of the Brazilian jungles and the fine product of the East should not live in peace. It is sometimes said that one of the rubbers will knock out the other. But why? Rubber is rubber, and very elastic, and you know it does not split. We Brazilians think that rubber of the jungles and rubber of the East are born to live and grow together as healthy friends. Brazil and the East will grow like brothers, for their respective common weal, and the necessities of humanity. Drink to the everlasting union of the two rubbers by the aid of the international press."

At the conclusion of Dr. Argollo's speech, Mr. Arthur W. Stedman arose and said: "I wish to propose a toast to a noted writer, the editor of a great paper, a strong character, frank and fair with all alike, beloved by his friends and admired by his enemies—Mr. Henry C. Pearson." This toast was drunk standing, and was immediately followed spontaneously by the song, "For He's a Jolly Good Fellow," in which every one joined.

MR. PEARSON: "I have been exceedingly touched by this toast so pleasantly expressed; I wish that I could say all that is in my heart; I wish that I could tell you how much I appreciate this expression of your kindly feeling; but you know it is now tomorrow, and if I should respond fittingly it would be day after tomorrow, so I will simply thank you all.

"In the refrain that you just now sang, I heard one exceedingly musical voice—I think it was Mr. Baxendale's. I am going to ask him to sing the solo of "Auld Lang Syne," with all the rest of us joining in the chorus, and with this we will bring this exceedingly happy occasion to a fitting close."

The Third International Rubber Conference.

FIRST SESSION, TUESDAY, SEPTEMBER 24, 1912.

THE Third International Rubber Conference opened in one of the spacious chambers of the Grand Central Palace, Tuesday afternoon, September 24, at 2 o'clock, with an attendance of about 150 delegates, including representatives of the plantation interests of the Far East, exporters of wild rubber from the Brazilian forests, manufacturers of rubber goods, as well as consumers of those products.

This is the first time in the history of the rubber industry in America that a successful attempt has been made to bring together such varied interests under one roof. The importance and interest of the gathering, and the discussions which were brought out, as the result of the papers offered, fully justified the large attendance, which was observed at all the meetings of the Conference.

After an address of welcome by the president, Mr. Henry C. Pearson, the session opened with a paper on "Rubber Contracts," by Mr. Arthur W. Stedman, a rubber importer of New York City.

This was followed by a most interesting paper on "The Plantation Industry" by Mr. Cyril E. S. Baxendale, Special Delegate from the Malay States Planters' Association. This paper was followed by a very animated discussion, in which both producers and consumers of plantation rubber took a lively interest. Among the speakers were: Mr. Frederic C. Hood, Mr. Crosbie-Roles, Mr. Geo. B. Hodgman and Dr. J. de Argollo of Bahia.

The paper on "Various *Manihots* Producing Rubber in the Central States of Brazil" by Dr. Cardwell-Quinn, was read by title only.

This was followed by a very interesting contribution by Mr. Charles P. Fox, of Akron, Ohio, on "Possible Rubber Producers in the Temperate Zone," in which the author showed that there were several plants at our disposal in this climate, which would be of commercial importance for the production of rubber, if the cost of production could be reduced sufficiently.

This paper was followed by an essay on "Some Effects of Acclimatization upon Guayule" by Mr. Francis E. Lloyd, Professor of Botany at McGill University, Montreal, Canada (read by title only).

Mr. Frederic C. Hood in discussing Mr. Stedman's paper called attention to the fact that we are at present comparatively ignorant of the exact definitions for most of the commercial varieties of crude rubber. Terms such as "Hard Para," "Up-River Fine," "Weak Fine" and the like are used in such a loose manner at the present day that the manufacturer is handicapped both in the purchase and in the use of these rubbers. On his motion, the question of "The Commercial Nomenclature of Crude Rubber Varieties" was referred to a committee of four, appointed by the president of the Conference.

At the suggestion of the president, it was agreed that the matter should be presented at the meeting of the Executive Committee of the Rubber Club of America, Tuesday night, September 24. As a result of this motion, the following members were appointed by the Rubber Conference:

Mr. Cyril Baxendale, Federated Malay States; Dr. Jacques Huber, State of Para, Brazil; Mr. Leonard Wray, Straits Settlements; Mr. F. Crosbie-Roles, Island of Ceylon; Mr. Noel Trotter, London and Federated Malay States.

The following members were appointed by the Rubber Club of America:

Mr. Albert Zeiss, Arnold & Zeiss, New York; Mr. Arthur W. Stedman, New York Commercial Co., New York; Mr. Wm. J. Bass, General Rubber Co., New York and Sumatra; Mr. Henry C. Pearson, THE INDIA RUBBER WORLD, New York.

These committees were appointed with instructions to present a preliminary report of their deliberations at the final meeting of the Conference, Saturday morning, September 28.

Note: The sessions of the "Nomenclature Committee" were continued daily during the week beginning Monday, September 30, 1912.

MORNING SESSION, WEDNESDAY, SEPTEMBER 25.

The first session of Wednesday opened at 10 A. M. with a paper on "The Present and Future of the Para Rubber Industry" by Dr. Jacques Huber, Director of the Goeldi Museum and Botanical Gardens at Para, Brazil. The paper called forth a very lively discussion from the manufacturers. Among the questions brought out were: "What is the cost per pound of gathering Up-River Fine Para and delivering it in the city of

Para?" and "What appears to be the difference between the acid coagulation and the smoking process?" Dr. Huber explained this point by stating that the smoke of the urucuri nuts probably contained certain chemical products which had a beneficial influence on the gum during the process of conversion. Any laboratory preparation used for coagulation should in his opinion be thoroughly tried out before it is finally adopted. Dr. Dannerth called attention to the fact that the smoke used in Para apparently contained volatile gases and liquids of low-boiling point. In that case a careful examination of the distillate would have to be carried out, in order to determine the constituents of the smoke.

The opening paper was followed by one on "Problems in Vacuum Drying" by Mr. J. P. Devine, which developed considerable discussion and brought out such questions as "Can rubber be taken direct from the dryer and put on the mixing rolls, for the purpose of increasing the efficiency of the plant?" and "Why is it that certain rubbers which have been dried in vacuum appear tacky after removal from the apparatus?"

The paper by Mr. T. W. Miller, manufacturer of dipped goods, was omitted, in the absence of the author.

Mr. P. L. Wormeley, of the Bureau of Standards, Washington, D. C., delivered a most enlightening address on "Physical Methods of Testing Rubber and Rubber Products." The paper showed that the National Bureau at Washington is at present exerting itself to a considerable degree in devising standard methods for physical and chemical testing of rubber products.

One of the questions brought out at this meeting was that by Dr. Dannerth—"What is the allowable variation in the tensile strength test on crude rubber?" In other words, "How close is it possible to make two results agree, provided the samples have been cured and cut from the same compound?"

EVENING SESSION, WEDNESDAY, SEPTEMBER 25.

On Wednesday evening, at 8 o'clock, a special meeting of the Conference was held to hear the papers on "Factory Management and Organization Methods" by Mr. J. C. Jurgensen and Dr. Frederic Dannerth, in which a plan was proposed for the systematization of laboratory work in rubber factories.

These papers were followed by one on "A Method of Determining the Density of Vulcanized Rubber Goods" by Mr. B. Denver Coppage, of Wilmington, Delaware, in which he demonstrated an instrument which was devised primarily for determining the plasticity of rubber-covered rolls for paper manufacturers. He has given this instrument the name of "Plastometer."

These papers started a very lively discussion by Messrs. Stone, Baxendale and Saunders. The meeting adjourned at 10 o'clock.

MORNING SESSION, THURSDAY, SEPTEMBER 26.

The Thursday morning session opened at ten o'clock with a paper by Mr. E. A. Barrier, of Boston, on "A Brief History of Fire Hose Specifications in the United States," in which he outlined the present status of the specifications issued by the two principal underwriters' laboratories. Mr. Pearson drew attention to the wisdom of the recent action of the Isthmian Canal Commission in eliminating from its specifications the phrase "Approved by the National Board of Fire Underwriters."

The second paper of the morning was by Dr. Lothar Weber, of Boston, Massachusetts, on "The Commercial Possibilities of Synthetic Rubber." In the discussion which followed, many interesting questions were asked by Messrs. Boggs, Driscoll, Crosbie-Roles, Smythe and Saunders, as well as by Dr. Huber and Mr. Fol of the Government Rubber Testing Station at Delft, Holland. Mr. Weber showed in the course of his remarks that the production of synthetic rubber at this time is handicapped by the fact that it is difficult to control the process of polymerization.

The statement made by one gentleman from London that automobile tires made of synthetic rubber would cost £1,000 or more was contradicted by Prof. Hinrichsen of the Royal Testing Station in Berlin, Germany. He drew attention to the fact that a certain large German chemical works is now producing synthetic rubber at a cost slightly above that of Hard Fine Para.

AFTERNOON SESSION, THURSDAY, SEPTEMBER 26.

Thursday afternoon, the Conference convened at two o'clock, with an attendance of about 110. This session was attended by a large number of railroad chemists and testing engineers. Fifteen of the principal railroads of the United States had sent delegates to the Conference, in order to hear the views of the manufacturers on such vital topics as "Air Brake Hose and Steam Hose." The discussion was led by Mr. C. D. Young of the Pennsylvania Railroad, presenting the case of air brake hose from the standpoint of the consumer in a concise manner. He called attention to the fact, in the course of a long paper presented by him, that the quality of air brake hose had deteriorated approximately seven years ago, and showed that train detentions on account of defective hose are more frequent in summer than in winter on railway lines in the United States. In continuing his remarks, he called the attention of the manufacturers to the fact that 82 per cent. of the air brake hose of the present day showed the defect of "porosity." His examination extended over 5,800 pieces of air brake hose. Other representatives brought out many facts, showing this decline in the quality of the product to be a matter frequently observed in various sections of the country. Chemists and engineers representing the manufacturing interests felt disinclined to discuss with the consumers this most important question. Mr. E. A. Barrier of the Factory Mutual Laboratories, Boston, called attention to the fact that after all it might be that the Master Car Builders' specifications were incomplete and not properly protecting the interests of the consumer.

Among the railroads represented were: The New York Central, Pennsylvania, Philadelphia & Reading, Illinois Central, Lake Shore & Michigan Central, Norfolk & Western, Lackawanna, Erie, Chicago & Northwestern, Atchison, Topeka & Santa Fe and Canadian Pacific; in addition to many other of the prominent trunk lines.

MORNING SESSION, FRIDAY, SEPTEMBER 27.

The Friday morning session opened at ten o'clock with a paper by Mr. E. S. Land, which was a report of the Navy Conference held in Washington in December, 1911. This conference was attended by 40 representatives of rubber manufacturers in the United States, and was called for the purpose of discussing the specifications at present in use by the Navy Department. The paper called forth considerable discussion on the part of Messrs. Boggs, Hinrichsen, Barrier, Cutler, Smith, Geer, Driscoll, Weber and Stone.

Mr. E. B. Tilt (Montreal) presented the report of the Rubber Committee of the American Society for Testing Materials and stated that the committee had been at work on a definite plan since February, 1912. The questions taken up will bear on the quality of manufactured rubber goods chiefly from an engineering standpoint.

This report was followed by official reports from the several rubber sections and committees now at work in the United States on standard specifications for rubber goods, and standard methods of rubber goods analysis.

Mr. W. A. Delmar (New York) presented a preliminary report of the activity of the Railroad Committee. This committee, composed of men representing railroads, United States Government departments and the manufacturers of insulated wire, has been at work since 1911 devising accurate methods of chemical analysis for rubber-covered wires.

Mr. D. A. Cutler, chairman of the Rubber Section of the American Chemical Society, presented to the Conference an outline of the work which is contemplated by that Section. He stated that steps had already been taken to determine the ac-

curacy of certain analytical methods used in the examination of rubber goods.

Attendance at this morning session reached 200 and the interest in the meeting was very keen, as was shown by the fact that most of those present remained to the close.

AFTERNOON SESSION, FRIDAY, SEPTEMBER 27.

The meeting was well attended. Mr. Loudenbeck presented the following motion: That the secretary be instructed to preserve the records of this Conference, publish the papers and minutes, and notify the members of this Conference when these are ready for distribution or sale.

The topic "Standard Methods for Testing Textile Materials Used in Rubber Manufacture" was then called up for discussion.

DR. FREDERIC DANNERTH.

HENRY C. PEARSON.

DR. JACQUES HUBER.

Little interest in this subject was manifested by those present so that the regular business was proceeded with.

The paper of the afternoon was by Mr. A. O. Bourn, of Providence, R. I., entitled "A New Theory of Vulcanization." Owing to the absence of the author of the paper, it was impossible for the members present to put directly the questions bearing on it.

MORNING SESSION, SATURDAY, SEPTEMBER 28.

The Saturday morning session opened at ten o'clock.

The chairman announced that the International Rubber Banquet was planned for the evening of Wednesday, October 2, at the Hotel Plaza. He also announced that the initial meeting of the Nomenclature Committee had been held in the main hall reception room on the afternoon of the previous Thursday. (This meeting was followed by a full meeting on Monday afternoon, September 30.) In this committee Mr. Baxendale had consented to develop a glossary of terms for the plantation rubbers, while Dr. Huber had been entrusted with a similar duty on the wild rubbers of Brazil.

The chairman stated that he had been requested by Dr. Weber to make an official denial of the statement, which a daily paper had attributed to him, to the effect that synthetic rubber cost a thousand dollars a pound. He went on to say that an American reporter is expected by his city editor to turn in interesting matter, and that he is for that reason constantly under the temptation of making his copy interesting rather than accurate. Dr. Weber added that he would communicate with the paper that attributed this statement to him and ask it to publish a contradiction. He went on to observe that it would be quite impossible to tell what synthetic rubber up to the present time had cost, but, inasmuch as a half ton of it had been made at the Elberfeld factory, it was fairly obvious that it could not have cost a thousand dollars a pound.

Dr. Weber, in presenting the subject of government specifications, said that the manufacturer is at present seriously handicapped when delivering goods to the government on specifications. It has been the policy, up to the present, to reject goods on the strength of certain analyses, and at the same time the government chemists who have made these analyses have omitted to publish their methods of testing. This, he thought, was a very undesirable state of affairs, and requires early attention and serious consideration. He presented this resolution: "It is the opinion of this Conference that all specifications should include complete descriptions of the methods of physical testing and chemical analysis, to which materials delivered on any particular specification will be subjected."

In explanation of his motion, Dr. Weber added that the Brooklyn Navy Yard had at various times rejected materials, as a result of analyses and analytical methods which are unknown to the general public.

Mr. Rodman advised Dr. Weber of the fact that the Railroad Committee on Standard Methods of Analysis would have its report ready in two or three months. He said that we should not confuse the Bureau of Standards with the Chemical Laboratory of the Navy Department, as the methods issued by the former are official, while those issued by the latter are the private methods of a consulting chemist who happens to be in the employ of the government.

Mr. Cottle stated that the American Chemical Society is now engaged on the preparation of standard methods, and that related work in the same field is being carried on by the Railroad Committee. He felt assured that these methods would be presented to the United States Government departments for their approval, and that the ability and standing of the men who have prepared these methods would insure for them serious consideration. It was inadvisable, in his opinion, at this time to publish methods of analysis, which would in any case have to be revised very shortly. This had been observed in the case of the methods published by the Bureau of Standards, which had to be revised shortly after they were published.

Prof. Hinrichsen said that the Royal Testing Station at Berlin at one time experienced difficulties similar to those recited by Dr. Weber. He stated, on this point, that the policy of the

German Government was to publish the methods which were used for analysis of specification material, at any particular date, in order to insure the co-operation of the manufacturer, and thus make possible a more rational examination of the goods than would otherwise be possible. He believed it to be a very simple matter to inform the manufacturer by mail, if need be, when a new and better method of analysis was discovered.

Mr. Earl presented a resolution, that The India Rubber World be designated as a means of intercommunication among the members of this Conference. This resolution was unanimously adopted.

Dr. Dannerth offered a resolution, that the present form of Conference Committee and Officers be continued as a means of intercommunication among the members of this Conference until the next Conference shall convene. This resolution was also unanimously adopted.

It was announced that The India Rubber World planned to publish in full the papers that had been read before the Conference.

Dr. Weber's suggestion that the U. S. Government be called upon to state its methods of analysis in all government specifications, was discussed by many members of the Conference; and while it was the consensus of opinion that the manufacturer was entitled to know to what tests his goods would be put, under government specifications, it was the general view that inasmuch as this was an international conference, it could not with propriety submit any request or memorial to the United States or any other government.

Mr. Pearson paid a tribute to the organizer of the Exposition, speaking as follows: "The exposition to which our friend Mr. Manders has invited us is most unique. He has brought to us commissioners and exhibits from the far-away countries of Brazil, the Island of Ceylon and the Federated Malay States. Mr. Manders and Miss Fulton have rendered us an inestimable service. It was they who originated the idea of a Rubber Conference, and an expression of appreciation is assuredly due them."

Mr. Wood of the New York Commercial Co. made the following motion: "Be it moved that a vote of thanks be extended the able organizer of this exposition and his niece, Miss Fulton, the secretary of the exposition, and that a copy of this resolution be engrossed and presented to Mr. Manders and Miss Fulton." The vote was carried unanimously.

Dr. Huber moved a vote of thanks to the chairman, Mr. Pearson, who, by reason of his thorough and intimate knowledge of the whole rubber world, and his conspicuous ability as a presiding officer, had directed the sessions of the Conference so smoothly and so successfully. This vote was also unanimously carried.

Mr. Van Derbeck referred to the fact that the producers, manufacturers and consumers of rubber goods had on no previous occasion been so successfully brought together. He moved a vote of thanks to Dr. Dannerth, the honorary secretary, for the efficiency with which he had served the Conference.

This vote was unanimously carried, whereupon the Conference adjourned *sine die*.

The following gentlemen were invited by the president to serve as honorary chairmen at the several sessions: Mr. G. Stone, Dr. Jacques Huber, Mr. C. R. Boggs, Mr. D. A. Cutler and Dr. Frederic Dannerth.

Cyril E. S. Baxendale.

Richard B. Earle.

Dr. Luthar E. Weber.

THE AFTER-EXHIBITION SUPPERS.

At the end of each day a supper was held in the Palace restaurant, attended by the exhibitors and their friends. These occasions were for the most part quite informal. At the opening supper on Monday night, September 23d, there were several speakers, among them, Mr. Salmon, Commissioner from the Imperial Institute of England, Dr. Dahne and Mr. Algot Lange, the explorer of the Amazon—a particularly delightful feature of the initial supper being the German student songs, contributed by Dr. Dahne. The suppers held later in the week were equally interesting and all well attended.

A COMMITTEE ON RUBBER NOMENCLATURE.

Early in the sessions of the Rubber Conference a committee was appointed from the members of the Conference to act in conjunction with the committee appointed by the Rubber Club of America to bring about the standardization of the nomenclature of crude rubber. The chairman of the committee was Henry C. Pearson and the three members from the rubber club were A. Zeiss, A. W. Stedman and W. F. Bass. The members appointed from the conference were, in addition to the chairman, C. E. S. Baxendale, from Federated Malay States; Leonard Wray, from British Malaya and Straits Settlements; F. Crosbie-Roles, from Ceylon; Noel Trotter, from London; Dr. Jacques Huber, from Pará; Dr. J. de Argollo, from Bahia; and W. A. Anderson, from the Hawaiian Islands.

NEW YORK ELECTRICAL EXPOSITION AND AUTOMOBILE SHOW.

THE increased application of electricity to all branches of industry is exemplified in the development of the annual Electrical Show. Started in the year 1907, it is now regarded as a yearly event of importance, bringing under one roof exhibits illustrating the varied applications of electricity to modern life and industry.

Lasting from October 9 to 19, the time of its duration, permitted all those interested to visit it and study its features, either from an industrial or a domestic point of view. Its removal from its original home at Madison Square Garden to the more commodious premises at the Grand Central Palace, has proved a marked success, both as to participation and attendance.

One of the features of the development which the change in location has permitted is the display of automobiles and motor trucks. To accommodate this section, a demonstration track had been arranged on the third floor, permitting manufacturers to make indoor demonstrations of the merits of electric vehicles and trucks. Among the former were the exhibits of the Anderson Motor Car Co., the S. R. Bailey Co., Buffalo Electric Vehicle Co. and the Studebaker Corporation.

Special prominence was given to commercial and industrial electric trucks, in which field electricity is making rapid strides, to the advantage of the rubber tire industry. Various sizes and models were displayed by the Studebaker Corporation, the Atlantic Vehicle Co., the Champion Electric Vehicle Co., the Lansden Co., the Ward Motor Vehicle Co., and the General Motors Truck Co. The facility of being able to demonstrate them indoors gives electric vehicles an advantage not enjoyed by those using gasoline.

In connection with automobile accessories, interest had been manifested in the announcement by the Westinghouse Electric and Manufacturing Co. of a tire vulcanizer, which would greatly simplify the problem of repairing tires. The model, however, had not arrived by the close of the exposition.

The government exhibits were varied and included those of the Department of Agriculture, the Department of Commerce and Labor, the Department of the Interior, the United States Navy and the War Department. The first-named department illustrated the stimulation of plant growth by electricity, while the application of electricity to cultivation on a more extensive scale was demonstrated by the produce of the electrified farm exhibited by Dr. Emilio Olson. These two exhibits were of special interest by reason of the possible application of electricity to the germination of seedlings and the cultivation of rubber trees.

Wireless outfits and signalling apparatus were displayed by the Navy Department, but particular interest attached, from a rubber point of view, to the model harbor built by the Government for the Alaska-Yukon-Pacific Exposition at a cost of $35,000 and operated by representatives of the United States Coast Defense. The harbor showed in miniature form the mines and batteries used for purposes of protection, in the manner explained in the October, 1912, issue of THE INDIA RUBBER WORLD, page 16. Miniatures of the cables used for transmitting the electric current were exhibited and explained by the attendants. They consisted of three copper wire strands covered with rubber, enclosed in rubber tubing, the whole constituting in miniature a section of a cable. From time to time electric current was sent through the cables, the ignition of a red light taking the place of an explosion.

Models of the Gatun Dam of the Panama Canal, and of one of the locks and the movable dam on the Mohawk River at Yosts formed interesting features.

The Habirshaw Wire Co. exhibited samples of their insulated wires and cables, showing their various qualities made in accordance with official requirements.

A distinctively rubber exhibit was that of the Canton Rubber Co., of Canton, Ohio, which appealed to most visitors. It consisted of seamless fine Pará rubber gloves and mittens, specially intended for electricians, to whom they are a vital necessity. They are of standard quality for 4,000 volts, and of heavy make for 10,000 volts. One pair was shown which had withstood as high as 23,000 volts. In addition to those for electricians, gloves for acid workers, tanners and similar operatives were also shown. Household gloves, finger cots, special rubber goods and druggists' sundries also formed part of the line.

The H. W. Johns-Manville Co. made a strong exhibit of asbestos roofing and waterproofing, making a special feature of their "Regal Roofing" of natural asphalt. Friction tapes and splicing compounds formed part of their full line of electrical supplies. Refrigerating machinery was a prominent feature of the exhibit, as well as "Transite" asbestos wood and other asbestos compounds.

One of the most interesting specialties was the "Acousticon," or electrical aid to hearing, which is largely composed of hard rubber. Besides facilitating ordinary conversation, it has an earpiece which, in conjunction with an "Acousticon" connection, enables deaf persons to hear and thus attend church or the theater with the same comfort as if their hearing were normal. It is made by the General Acoustic Co., of Jamaica, Long Island.

The prominent companies identified with electric light and power were fully represented, such as the General Electric Co., the Westinghouse Electric and Manufacturing Co., the New York Edison Co., the United Electric Light & Power Co., the Edison Electric Illuminating Co., of Brooklyn; the Electric Lamp Association, the Yonkers Electric Light & Power Co., the Wagner Electric Manufacturing Co., and others.

Office appliances and labor-saving household devices were largely represented, the object of most of the exhibits being practical utility, and that end having been fully accomplished.

Among other interesting exhibits was that of the Dodge & Zuill Manufacturing Co., of Syracuse—the "Easy" Motor Washer—with a wringer composed of rubber rolls. The combination of the two appliances economizes time and labor.

The exhibits of electric accessories were typical in character and marked various interesting stages in the progress of electrical science.

INDIA-RUBBER GOODS IN COMMERCE.

EXPORTS FROM THE UNITED STATES.

OFFICIAL statement of values of exports of manufactures of india-rubber and gutta-percha from the United States for the month of July, 1912, and for the first seven months of five calendar years:

MONTHS.	Belting, Packing and Hose.	Boots and Shoes.	All Other Rubber.	TOTAL.
July, 1912	$225,102	$141,583	$741,902	$1,108,587
January-June	1,156,546	512,881	3,850,713	5,520,140
Total, 1912	$1,381,648	$654,464	$4,592,615	$6,628,727
Total, 1911	1,290,415	927,644	4,162,495	6,380,554
Total, 1910	1,218,628	1,013,834	3,273,268	5,505,730
Total, 1909	996,859	637,090	2,393,563	4,027,512
Total, 1908	714,125	656,333	2,120,145	3,490,603

The above heading, "All Other Rubber," for the month of July, 1912, and the first seven months of the two calendar years, includes the following details relating to Tires:

MONTHS.		For Automobiles.	All Other.	TOTAL.
July, 1912	*values*	$297,340	$54,326	$351,666
January-June		1,537,705	292,178	1,829,883
Total, 1912		$1,835,045	$346,504	$2,181,549
Total, 1911		1,464,060	337,130	1,801,190

THE RUBBER TRADE IN AKRON.

By Our Regular Correspondent.

W. W. WUCHTER has resigned as general manager of the Swinehart Tire and Rubber Co. and John Walsh has been elected to fill that position. The new board of directors consists of Joseph Dangel, John Walsh, R. A. May, T. E. Borton, Oliver Tomey, William McWeldon, A. C. Hoff, A. Polsky, and Dr. E. L. Mather. The new board of directors authorized the sale of $150,000 worth of treasury stock at par. C. O. Baughman was re-elected secretary and R. A. May, treasurer. J. W. Cully, of the New York branch, was given charge of the Detroit branch. A. T. Carnahan has been appointed district manager in charge of Ohio, West Virginia, Kentucky, western New York, western Pennsylvania and eastern Michigan.

* * *

The Marathon Tire and Rubber Co., organized for the manufacture of tires and a general line of rubber goods, have secured land at Cuyahoga Falls, Ohio, just below the Glen Bridge, and are constructing their first building 65 x 300 feet. They expect to commence operations before the first of the year. The men interested in this company are experienced in rubber manufacturing. The board of directors consists of I. Walter Jenks, of Pittsburgh; John R. Scott, of Cleveland; C. W. Vaughn, a manufacturer of Cuyahoga Falls; W. F. Ridge, of Akron, and W. H. Jenks, of Akron. The officers of the company are John R. Scott, president; W. F. Ridge, vice-president and general manager; W. H. Jenks, secretary and treasurer. W. H. Jenks has been connected for five years with the engineering department of the Firestone Tire and Rubber Co., and W. F. Ridge has also had seven years' experience in the pneumatic department of the Firestone company. Franklin Kesser, formerly with the Hartford Rubber Works Co., and later with the Firestone, is manager of the sales department of the new company.

* * *

The B. F. Goodrich Co. have just completed a new route book covering the entire State of Michigan. This has been made from original data, the amount of which is voluminous. It develops the fact that many parts of the State are almost impassable, owing to the bad-road conditions.

F. H. Mason, first vice-president of The B. F. Goodrich Co., who has made the Akron boys and girls happy by donating parks and playgrounds, has come forward with another fine gift. He has given to the Akron Public Library $2,000, to be used in purchasing books for the school children. The library board will at once equip a room for that purpose. Certainly Akron should appreciate the generous spirit of its many rubber manufacturers.

* * *

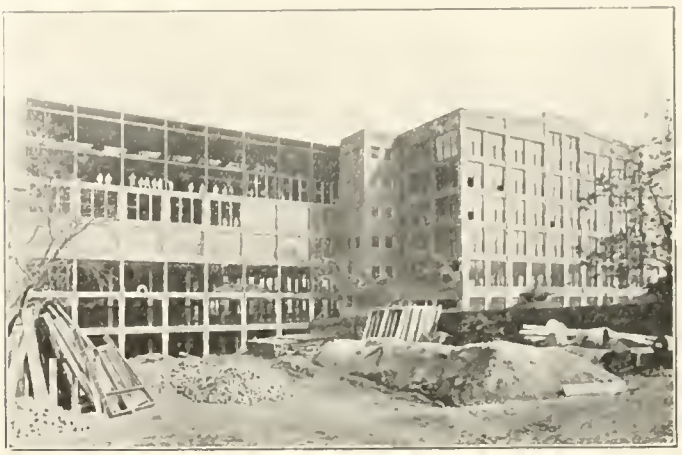
The Goodyear Tire and Rubber Co. has opened 16 new branches in the past 12 months. They are located at Albany, Rochester and Syracuse, New York; Dayton, Ohio; Kansas City, Missouri; Denver, Colorado; Newark, New Jersey; Oakland, California; Omaha, Nebraska; Portland, Maine; Rochester, New York; St. Paul, Minnesota; Spokane, Washington; Salt Lake City, Utah; Syracuse, New York; Worcester, Massachusetts, and Mexico City, Mexico. The company has erected several new buildings in the larger cities to accommodate the increased demand for their products. It is their plan to own all their branch buildings throughout the country. The new Goodyear buildings have been erected in Grand Rapids, New York, Buffalo, Columbus, Birmingham, Kansas City, Louisville, Minneapolis, Memphis, Newark and Philadelphia. The company has 11 branches in Canada, 55 in the United States, and with a new field being opened in foreign countries.

* * *

The Summit Rubber Co., which was destroyed by fire March 28, 1911, has been rebuilt and has commenced work. The force numbers about 100, including men and women. The company at present owns two acres of land and anticipates building another addition next summer. The plant is now located between Akron and Barberton, and has three railroad lines on one side and a street car line on the other. This is an independent company and manufactures rubber sundries. The officials claim that they have a large number of orders, which will insure their running for some time without any further orders.

* * *

Recent additions to the B. F. Goodrich Co.'s plant at Akron, Ohio, do not appear to indicate any anxiety on their part as to



NEW ADDITION TO THE B. F. GOODRICH FACTORY.

the future of the rubber industry. Although their present floor space is between sixty and seventy acres, this is at the present moment being augmented by the new building here illustrated. This structure of six stories and basement is 270 feet long by 157 feet wide. It is of the most modern fireproof construction, the materials used being solely steel, concrete and brick.

The office staff is growing with the growth of the factory, and a new six-story office building is also in course of construction. These illustrations show the buildings in process of erection, while it is stated that, owing to the rapid growth in the demand

NEW OFFICE BUILDING OF THE B. F. GOODRICH CO.

for Goodrich Wireless and other truck tires, the capacity of that portion of the factory will shortly be almost trebled. In the course of the past five or six years, practically the whole of the plant has been made over, the present buildings being uniform in design, and of modern fireproof construction, with exceptional facilities for lighting and ventilation.

* * *

The various Akron rubber companies are putting forth a

special effort to supply their help with the best of drinking water, and careful chemical and bacteriological tests are made from time to time to assure the companies that the drinking water is safe and healthful.

* * *

Mr. J. A. Ford, of the Cleveland Mechanical Rubber Co., has resigned his position to join the force of the Goodyear Co., of Akron, where he has accepted a position in the experimental department in connection with mechanical goods. Mr. Ford also had several years' experience with the Morgan & Wright Co.

* * *

The Swinehart Tire and Rubber Co., of Akron, are sending out an official denial of the report that they are going to build a factory at St. Louis. "I have heard that a new rubber company was going to build in St. Louis," says C. A. Swinehart, the sales manager, "but it has no connection whatever with this concern."

THE RUBBER TRADE IN BOSTON.

By a Resident Correspondent.

BUSINESS in the various lines continues much the same as was reported last month. The clothing manufacturers are rushed with orders, and although the salesmen are on the road, they are refusing to guarantee deliveries except subject to delay. The call for plain coated rubber coats is not so marked as for the finer mackintosh and cravenetted goods; and these are in many cases delayed because of the unusually heavy demand upon the textile mills for the cloth, the run on some patterns and colors being remarkable. Belting and packing lines are none too brisk at present, the tendency today being to allow the manufacturers to carry stock, rather than to purchase heavily and carry large quantities in the stock-rooms of the mills and factories. Hose is called for only to a limited extent, the municipal contracts being mainly let in the spring, while the garden hose demand, of course, is over, as far as consumers' trade is concerned, though dealers are already placing fairly large contracts for early 1913 delivery. Druggists' goods in soft and hard rubber are in normal call. Tire manufacturers are busy. The steady increase in the use of automobiles, and the lengthening of the season—if, indeed, there can be called a season today—makes the demand for tires strong, both for immediate delivery and on early spring contracts.

Footwear trade, as is to be expected, is not very brisk, though there is more doing than the manufacturers anticipated, after the heavy advance orders taken previous to July 1, in order to secure the extra discount. It appears that many retail shoe merchants preferred to hold back more or less of their regular orders in order to be certain of the trend of style of leather footwear, and this now being established, they are ordering suitable rubbers to fit these lines. The tennis shoe business is excellent, and already advance orders for next season's delivery are far ahead of a year ago. Taken altogether, the rubber industry is in fine condition in New England.

* * *

Last month the city of Malden was the scene of a trade carnival, when the local industries vied with each other in educating citizens and visitors as to the importance and extent of the manufactures of the city. Among those which made interesting exhibits were at least three, well known in the rubber trade.

The John H. Parker Co. exhibited the celebrated leather-soled rubber boots which have made the late Mr. Parker's name famous, and also Parker's Arctic Socks, which are sold by many dealers in rubber footwear. Mr. Charles Parker's little eight-year-old daughter, Elinor, had the proudest moment of her young life, when she presented to President Taft a pair of Arctic Socks, and was rewarded by one of that gentleman's most expansive smiles as he thanked her, and complimented her on her beautiful blue eyes.

The Converse Rubber Shoe Co. had a working exhibit, a rubber shoe maker being at work; and there was also shown the process of making the Converse Automobile Tires, a branch of manufacture recently added by this company.

By far the most interesting exhibit was that of the Boston Rubber Shoe Co., whose booth was a continuous centre of attraction throughout the entire week. A most ornamental structure was erected, in which were large, deep show cases, in which were displayed a full line of the many kinds of rubber footwear made by the company. Interspersed among the standard samples were shown pairs of shoes made of fancy colored rubber, many novel effects being produced. Perhaps the freakiest of these were rubbers made of mottled colors, so mixed as to resemble the "marbling" of bookbinders' lining papers. The rubber of various colors was so blended and mixed that though each was of a different composition from every other, the mixing in no way interfered with a perfect composition, or with the subsequent vulcanization, and the result was as interesting from the standpoint of the rubber chemist or manufacturer, as the shoes were to the general observer as a footwear novelty.

But that was by no means all that was interesting. At one corner a man made Boston boots, and at another a girl made "Hub-Mark" rubbers. In one case were three or four pairs of

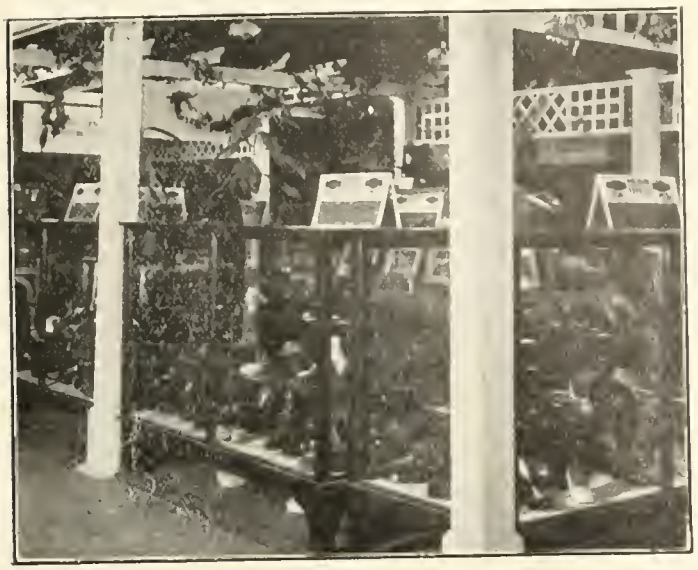
PRESIDENT'S BOOTS IN THE CENTER CASE.

hip boots. One of these pairs was a special one, made to measure for a gift to President Taft. This case, while shown in the illustration, was not sufficiently illuminated for THE INDIA RUBBER WORLD photographer to secure more than a faint outline of this pair of boots in the picture here presented.

Besides these, a table in the centre of the booth held a large number of curios collected by the company in its many years of purchasing crude rubber. There were specimens of gum, samples of Indian rubber working tools, including those for tapping and smoking. There were also a number of the crude rubber shoes made by the Amazonian natives, many covered with quaint barbaric ornamentation. Perhaps the greatest of all these curiosities was a human head, preserved after the fashion of the ancient Peruvian aborigines, who thus recorded their triumph over an enemy by showing his head as proof. The skull is removed, the eyes, nasal cavity and ears stopped up, the lips sewed together with coarse thread which is left with many long hanging ends. Then the head is immersed in and also filled with a strong tanning solution which not only turns it into a tough black leather, but, while retaining its shape, causes the head to contract until it is reduced to the size of a man's fist. In this condition it is as black as tar and as tough

and unyielding as bone. The specimen shown is supposed to be several hundred years old.

The company distributed several kinds of souvenirs to visi-



Boston Rubber Shoe Co. Exhibit at Malden Fair.

tors, among them being blotters and other advertising matter, miniature boots and rubbers, and pins bearing the trade mark of the company.

* * *

Francis H. Appleton, the popular head of the rubber reclaiming house bearing his name, has been signally honored by being elected president of the Perkins Institution and Massachusetts School for the Blind, at its meeting early last month. This institution is famous the world over for its wonderful success in its systematic education of the blind. It was founded in 1829 by Dr. Samuel G. Howe, beginning with six blind children who were taught in his father's house. It is named in honor of Colonel Thomas H. Perkins, one of the institution's most generous friends, who gave his mansion-house on Pearl street for its use. It was the first institution of its kind in the world, and has always served as a model for others of its class in America and Europe. The first books for the blind printed in this country were set up, electrotyped and printed here. For many years it occupied a commanding site in South Boston, but has now removed to a beautiful spot in Watertown, where a series of handsome buildings has been erected, and where for the first time the annual meeting was held, October 9, when Mr. Appleton was elected president, and Francis H. Appleton, Jr., an auditor.

* * *

Another philanthropic institution owes its establishment to one of the members of the rubber industry, Abraham Sydeman, president of the Plymouth Rubber Co., after learning of the difficulties encountered by able but impecunious men to secure even limited capital, and the reluctance of banks to assist such ambitious men, together with the greed and usurious practice of loan sharks, conceived the idea of forming a philanthropic credit union to aid small business men of limited financial means, by loaning money at very low interest, 1 or 2 per cent., instead of the 30 or 50 per cent. demanded by loan sharks.

Mr. Sydeman detailed his plan to several prominent business men, and the result was the incorporation in this city of the Boston Credit Union, which will probably have its plans perfected and be doing business by the time this journal is in the hands of its readers. The incorporators include: Edward A. Filene, whose magnificent new store, opened in September, is one of the show places of Boston; David A. Ellis, chairman of the Boston School Committee; Max Mitchell, vice-president of a leading trust company; importers, manufacturers and merchants; a Hebrew rabbi and a prominent attorney. They intend to raise a permanent fund of $100,000 to $200,000 from which loans will be made. It was Mr. Sydeman's idea that the institution might loan without interest, but as the stability of the capital was an important consideration, on legal advice it was decided to charge a small interest to cover costs of clerical force, rent and running expenses. When the union is solidly established, however, Mr. Sydeman hopes to reduce the interest rate to 1 per cent., thus doing far better for the small business man than any other credit union, most of which charge 10 and 12 per cent., and none less than 8 per cent. This union, founded strictly on a philanthropic basis by wealthy men, can, of course, greatly reduce these current rates.

* * *

The Walpole Rubber Co. has for years been a Maine corporation, its charter having been granted in that State under its corporation laws. Last month a new corporation was formed, under the laws of Massachusetts, entitled the Walpole Tire and Rubber Co., its purpose being to acquire the good will, rights, property and assets of the former company. The new company is capitalized at $4,500,000, of which $3,000,000 is 7 per cent. cumulative preferred stock, and $1,500,000 common stock. The preferred stock has no voting power, and is retirable at the option of the directors, at $120 per share and accrued dividends after five years from date of issue, in lots of $50,000 at a time.

The incorporators of the Walpole Tire and Rubber Co. are: E. W. Tinkham, Harrisville, Rhode Island; A. T. Baldwin, E. C. Green and J. C. Blanchard, Jr., Boston; F. J. Gleason, Walpole; E. W. Furbush and L. O. Duclos, Roxbury.

* * *

A. S. Foster, of Lamkin & Foster, an authority on rubber footwear styles, submitted to a severe operation early last month, and at present writing is convalescing in a most satisfactory manner at the Corey Hill Hospital.

* * *

It may interest our readers to learn that the heaviest individual tax paid in the city of Beverly is that of Mrs. R. D. Evans, widow of the late rubber magnate. Her property in that city is assessed at over $5,000,000, and her tax $76,319. Beverly now rivals Lenox as a summer residence for millionaires, and has grown rapidly in popularity since President Taft chose to make it his hot-season residence, and for some years he rented Mrs. Evans' "palace" there.

* * *

The B. & R. Rubber Company of North Brookfield is advertising in the Boston papers for a sales and department manager. The company is doing a steadily increasing business in its specialties.

* * *

The new plant of the Plymouth Rubber Co. at Canton, Mass., is already too small to accommodate the constantly increasing business of this wide-awake concern, and plans are being prepared for the erection of an additional building.

THE RUBBER TRADE IN CINCINNATI.

By a Resident Correspondent.

IN all branches of the rubber trade in this city there is heard the hum of prosperity. This briefly tells the condition of the trade locally despite the fact that this is presidential year, when usually the business outlook is discouraging, especially during the last stages of the campaign.

From the Cincinnati Rubber Co. comes the statement that business is very good and the outlook is bright.

W. G. Brown, of W. G. Brown & Co., crude rubber brokers in the Provident Savings Bank building, said: "The rubber business is flourishing, and the outlook is the best in years. There is a heavy demand for crude rubber at this time for hose, belt, packing, tires and other purposes."

* * *

To acquaint and interest Cincinnati capital in the possibilities of Mexico as a rubber growing country is one of the principal objects of the establishment in this city of a Mexican consulate. Enrique Ornelas has been sent to this city by the Mexican government to make a study of American industries, and at the same time interest Americans in the possibilities of his country. It is more than likely that within a short time there will be organized here a company that will operate an extensive rubber plantation in Mexico.

* * *

Setting out with the aim of answering satisfactorily the annoying "tire question," the Ideal Steel Wheel Co. has located a factory in this city under auspices most promising. Its chief product is to be the Ideal Steel Wheel, which they describe as "stronger than a wooden wheel, more easily cleaned, and with sufficient resiliency in itself to make possible the use of a puncture-proof cushion tire, at all speeds, with the same comfort attending a pneumatic tire on a wheel of wood." The officers of the new company are J. B. Fitch, president; J. E. Strietelmeier, vice-president and inventor of the patent; B. L. Mattox, secretary, and E. H. Maffey, treasurer. The capital stock of the company is $500,000.

* * *

The Diamond Rubber Co. filed petition in the Common Pleas Court in this city September 25 asking for the appointment of a receiver for the Ohio Motor Car Co., of this city, for the benefit of its creditors. The Diamond Rubber Co. claims to be a creditor of the defendant company on a note of $6,000, which was payable September 15. The Diamond Rubber Co. alleges in its petition that because of irreconcilable differences existing between the officers in active control of the business and some of the stockholders, unless harmony is restored the assets of the company will be wasted and reduced in value to the loss of its creditors. According to the statement of the officers of the company the assets amount to approximately $404,000, and its liabilities to $177,000. The Diamond Rubber Co., besides asking for the appointment of a receiver, asks for judgment on its claim of $6,000. The court appointed Edward G. Schults receiver.

* * *

"I believe I have absolutely the newest system of tire repairing," said F. B. Williams, local agent for the Jackson Motor Car. "One of my men was returning from a trip to the country the other day, and within 20 miles from town had a blow-out in one of his rear tires. He had an extra inner tube, but there was a hole in the casing that he could put his hand through. Unfortunately his tire repair outfit was left behind, and there was not an emergency patch to be had within 20 miles. After some figuring he went to the nearest farm house and secured an old grain sack and a couple of straps from a discarded harness. Pumping up the new inner tube just enough to bring it up to its shape, he tore the grain sack into strips, and wrapped several layers around the tube at the place where the casing was damaged. He then put the tube in the casing, put it on and pumped it up a little harder, wrapping the harness straps around the outside of the tire and between the spokes. The tire was then pumped up to its normal pressure and he went on his way rejoicing."

* * *

Articles of incorporation of the Federal Motor Supply Co. of this city have been filed with the Secretary of State. The capitalization is $250,000. While the company is authorized to manufacture and sell automobiles, motor vehicles, motor boats, motor-driven air vessels and the supplies and accessories for the same, one of the principal features of the new concern will be the handling of tires and other rubber accessories. The officers and directors of the new concern are: President, George W. Platt; vice-president, Fred H. Belohs; secretary, Jesse W. Wozencraft; treasurer, Emil G. Schmitt; directors, Edward H. Maffey, William C. Strachley, C. T. Woodrow, J. William Theobold and F. W. Stukenborg. The company's principal retail store and warehouse will be in this city, with branches in a number of other surrounding cities. Executive offices have been opened at No. 506 Fourth National Bank building.

* * *

That rubber clothing is coming to the front as one of the important mercantile lines in the larger cities is evident from the fact that very recently this line of business has grown from a mere side line in the various department stores in this city to a business all by itself. Perhaps no one forecast the possibilities of the rubber clothing business more accurately than did the Schaefer Rubber Co., which is now operating one of the largest retail rubber stores in the Middle West, and has a branch house in Detroit, Michigan. Then followed the Ohio Rubber Co., with a store on Race street, and then came the Goodyear Raincoat Co., of New York, which secured a store room at one of the busiest corners in the downtown district. Recently the London Raincoat Co. opened a branch store here.

* * *

There were few, if any, of the local representatives of the different rubber tire manufacturers who missed the opportunity of attending the first sales convention of automobile dealers and manufacturers which was held in Indianapolis October 8-9. This convention was the founding of what is to be known as the General Sales Convention Association. Perhaps the most important speaker representing the rubber industry at the convention was F. A. Seiberling, president of the Goodyear Tire and Rubber Co., of Akron. In his address to the convention Mr. Seiberling said in part: "I am in charge of the department of visions of my concern and am expected to see ahead, far and away. The total value of automobiles and accessories sold in the United States during the past year summed to the enormous total of $1,000,000,000, this as a result of a short ten years of activity and growth. But we are just under way and well going, and with better roads at our service and the sequeling possibility of connecting all cities, towns and villages through the agency of the motor truck I predict that in another ten years the income value of our automobile outputs will exceed that of all the railroads in operation everywhere. Before this can be accomplished, however, the motor car salesman must tone up and become more dignified, while the dealer must lay his mind more acutely on the matter of taking care of the machines he has sold. As to the 'Ocean to Ocean Highway' now being planned and appearing almost insurmountably stupendous, I say that it will be built and nothing on this earth can stop it. The need of a national highway from coast to coast has been so obvious that its possibility, in fact, its almost definite assurance, seems to be the most natural thing in the world. The plan proposed by C. J. Fisher of Indianapolis is the first practical plan to my knowledge that has yet been advanced. In pledging its *pro rata* of approximately $300,000 the Goodyear Tire and Rubber Co. feels that it has done nothing remarkable or unselfish. We look upon the pledge as a movement on which we will expect to realize dividends. The fact that the industry is supporting this move argues to my mind that the manufacturers look upon the project in the same light. In my opinion the move will succeed, it deserves to, and the men behind it are calculated to see that anything that they back gets its deserts. In other words, they are business men and it takes business men, not politicians, to do all of the really big things of today."

THE RUBBER TRADE IN RHODE ISLAND.

By a Resident Correspondent.

THE winter season approaches with the rubber industry in Rhode Island in as fine a condition as it has been in its history. Three concerns, the National India Rubber Co., Bristol; the Phillips Insulated Wire Works, Pawtucket, and the International Rubber Co., West Barrington, are increasing the size of their plants. One new company, in which Providence men are interested, has been chartered under Massachusetts laws. Practically all of the plants in the State are running to their full capacity.

The opening of a wire-making plant in connection with the insulating work at the plant of the National India Rubber Co. has proved one of the most successful ventures that concern has ever undertaken. It began with a large quantity of orders, and the business has developed so rapidly since the substitution of this work for several departments which were moved to Cleveland, Ohio, that the size of the building is being increased and new ones are being erected.

Night and day work did not relieve the congestion, so recently the company officials let a contract for the erection of a one-story building on the north side of the insulating plant, to be used as a shipping room. It is to be 68 feet x 63 feet. W. G. Murphy has the contract. The structure is to be of wood with a concrete foundation. The old scrap room in the yard was recently remodeled and put into use as a storehouse. Two thousand persons are employed at the plant—more than ever before.

On September 26 the plant was closed for stock-taking in accordance with the plan of the United States Rubber Co. to have semi-annual inventories in the factories under its control. Operations were resumed on October 2. Repairs to machinery were made during the short period of idleness.

* * *

The Washburn Wire Co., Phillipsdale, Rhode Island, declared a quarterly dividend of 1¾ per cent. late in September on its first preferred stock, which was payable to stockholders of record September 20 on October 1.

* * *

Eighty-five persons were entertained by the Mikado Club, an organization made up of employes of the Davol Rubber Co., at an outing and clambake at Emery Park, near this city, recently. One of the interesting features was a ball game between the married and single men, the former winning by a 10-4 score. The committee in charge of the arrangements included L. Page, R. Starritt, A. Cody, William Brennan and John Thornton.

* * *

Residents of Bristol were elated a few weeks ago when announcement was made that Col. Samuel P. Colt had completed an agreement with the New York, New Haven and Hartford Railroad Co. whereby he will stand half the expense of the elimination of a grade crossing on Asylum road.

This road leads from the mainland to Poppasquash, a neck of land which forms the western side of Bristol Harbor, and has a beautiful frontage on Narragansett Bay. By this arrangement a shore walk, corresponding to the famous right of way for the public across millionaires' estates in Newport, will be opened to the public in Bristol.

Col. Colt will build tar macadam roads as approaches to a bridge which the New Haven road is to erect across its tracks, and will keep the roadway in condition for five years. The estimated cost of the improvement is $20,000.

Shortly before this agreement was reached, Col. Colt also pleased his townspeople by offering a strip of land to the Government, so that it would be unnecessary to have a sharply sloping right of way across a sidewalk in the rear of the post-office.

During a campaign in Providence recently to raise $350,000 for a new Y. M. C. A. building, Col. Colt presented the committee in charge of the work a check for $10,000.

* * *

Augustus O. Bourn, head of the Bourn Rubber Co. and former governor of the State of Rhode Island, entertained friends at his home, "Sevenoaks," Hope street, Bristol, in honor of his birthday on October 1. Dinner was served early in the evening and an entertainment was provided from 9 until 11.

Owing to the illness of Mrs. Bourn, the usual reception was not held. Floral decorations were much in evidence, however, and the sons and daughters of Governor Bourn assisted him in entertaining.

* * *

William Sutcliffe, who was assistant foreman at the Cranston Worsted Mill, Bristol, recently became a member of the office staff of the National India Rubber Co., Bristol.

* * *

The vulcanizing room, one story high, construction on which was started for the International Rubber Co., West Barrington, about a month ago, is practically complete. It is 70 feet x 70 feet. The new room gives much-needed space in the main plant for the manufacture of sheetings.

* * *

Engineer Ernest W. Crawley, of the United States Engineering Department, New Haven, was present at an insulated wire test at the plant of the National India Rubber Co., Bristol, on October 10.

* * *

Mr. and Mrs. Roswell C. Colt, who were married in London last summer, left Linden Place, the home of Col. Samuel P. Colt, Bristol, for Montreal early in October. Mr. Colt is interested in the rubber business in the Canadian city.

Shortly before their departure Col. Colt entertained a large party of friends in their honor. The guests included the townspeople as well as many from Providence, and also a number of members of the Legislature and college friends of Roswell Colt. A clambake was served. Music at the reception was furnished by a large orchestra from Providence.

* * *

Stockholders of the United States Rubber Co. in this State, of whom there are many, were pleased to receive notices on October 3 that the big company had declared from the net profits for the quarter beginning July 1, a dividend of 2 per cent. on the first preferred stock, 1½ per cent. on the second preferred stock, and 1 per cent. on the common stock.

* * *

Tax lists just published in the city of Pawtucket show that the Collyer Insulated Wire Co. is taxed this year for $37,420 on its real property and $20,000 on its personal; that the United Wire and Supply Co. is taxed for $35,000 real and $10,000 personal; the Phillips Insulated Wire Co. for $186,320 real and $120,000 personal.

Herbert O. Phillips, head of the latter concern, is personally taxed for $44,180 real and $14,460 personal.

* * *

The National India Rubber Co., Bristol, has purchased two large motor trucks for hauling raw materials and finished products between its plant and the New York, New Haven and Hartford Railroad Co.'s freight yards in that town.

* * *

John J. Patterson, of this city, is president of a newly organized rubber concern, which is to be known as the Patterson Rubber Co. and is to erect a plant of five buildings in Lowell, Massachusetts. The capital stock is $500,000. It will manufacture automobile tires.

* * *

George F. S. Singleton, of Franklin, Massachusetts—a town

located just over the State line from Woonsocket, Rhode Island—is one of the directors, and it is understood that he has considerable capital invested. Work on the construction of the plant is to be started very soon.

* * *

The Consumers' Rubber Co., Bristol, is daily shipping large quantities of rubber footwear. As the season progresses the business increases to proportions that it rarely attained before the Walpole Rubber Co. took hold of the plant following its financial difficulties several months ago.

* * *

The Washburn Wire Co., which is located in the town of East Providence, is assessed this year on a valuation of $380,114. The assessed valuation of the Washburn Wire Co., located in the same section of the town, Phillipsdale, is $637,000, an increase over 1911 of $33,550. This was due largely to extensive improvements and additions to buildings.

* * *

About a year and one-half ago Dana McGovern, who for many years had been a worker in the National India Rubber Co.'s plant at Bristol, went to Maine on a hunting trip, and was not heard from thereafter. His body was discovered near Limerick in the latter part of September.

* * *

Theodore Duarte, who for many years was employed in the mixing department of the National India Rubber Co.'s plant, Bristol, died September 15. He was 67 years old.

* * *

Le Baron B. Colt, a brother of Col. Samuel P. Colt, and judge of the United States District Court, was given the unanimous indorsement of the Republican party of this State as a candidate for United States Senator at the State convention of the party held October 9 in Infantry Hall, Providence.

Judge Colt was practically the only party candidate for several months before the convention. Before his name was prominently mentioned it was expected in some quarters that Col. Colt himself would be a candidate again.

* * *

Many of the rubber concerns in this State have accepted the provisions of an Employers' Liability Act which was passed at the last session of the Rhode Island General Assembly. This law removes, when accepted, the common-law principles of assumed risk and fellow-servant negligence, and makes the employer liable for fixed charges or payments for various kinds of injuries, or a death.

THE RUBBER TRADE IN SAN FRANCISCO.

By a Resident Correspondent.

THE few rains which came early this season did not continue, and for a long time the weather has not been altogether to the liking of those whose interests are benefited by the sale of waterproof garments. On the whole, however, the merchants report that business has been very satisfactory, and much better than the same month last year. Without question this city has experienced much quiet business during the past three years, but the fact that there has been steady improvement has given assurance to business men that the future is bright, and that there is no longer any question that this city will maintain itself as the great metropolis of the coast.

The other day a parade made its way down the principal streets of the city, and it was significant as a forerunner of prosperous times. It was an impromptu parade, made up of the work teams of various contractors who are to supply the materials for the first building which will be erected on the grounds of the World's Panama Pacific Exposition. The old but decorated work wagons contained the materials actually to be used in the buildings—lumber, cement, paint, etc. It was a homely parade, but it aroused genuine interest and enthusiasm in every merchant and business man who witnessed it.

* * *

The Federal Rubber Manufacturing Co., of Milwaukee, has announced its intention of opening a branch store in San Francisco, which will be the headquarters for an extensive Pacific coast system of stores. They have selected E. L. Rettig to act as their Pacific coast manager, and he is as capable and efficient a man as they could have chosen. For over twelve years he has been the sales manager for one of the most prominent and aggressive tire companies on the coast. The Federal tire is very well known in northern California—at least it is well known to those who study tires—and will have no difficulty in taking a place among the leaders. Although the company manufactures a complete line of goods, it will make a specialty on this coast of a non-skid tire called the "Rugged Tread." Mr. Rettig has left for the company's factory, where he will take up the matter of determining upon a location and many other details. This work will occupy him for at least a month. H. A. Githens, the general sales manager of the Federal Rubber Manufacturing Co., promises that no money nor pains will be spared in making this one of the leading tire establishments on the coast. E. L. Rettig has been connected with the Diamond Rubber Co. in San Francisco for many years, and has lately been manager of the solid tire, motorcycle and bicycle tire departments, and has acted as chief assistant to General Manager C. E. Mathewson. Before coming to San Francisco he was for three years with the Diamond Rubber Co., in Boston, Massachusetts.

* * *

J. B. Brady and W. H. Gilbert, of the Gorham-Revere Rubber Co., are now visiting the factories in the East in the interests of the company, and will return within a week or two. W. H. Gorham, manager of the company, has returned from a trip to Denver, and states that business is good.

* * *

F. M. Steers, president of the Pacific Mill and Mine Supply Co., has returned from a trip East, and while away he secured a number of valuable agencies. This firm's branch store in Los Angeles, California, has just moved into larger quarters in a store located at 432 East 3rd street. This is one of the busiest districts of Los Angeles, and places them right in the midst of the rubber fraternity. * * *

Charles A. Gilbert, western district manager for the United States Tire Co., announces several important changes in the coast organization. H. A. Farr, who was in San Francisco a year ago, and since then has been manager of the Portland branch, has been placed in charge of the Seattle branch on the first of October. He will succeed H. A. Jones, who has resigned to accept a position as manager for Ballau & Wright, at Seattle, Washington. Mr. Jones will still be a United States Tire man, however, as the firm he is now with has the Seattle and Portland agency for the G. & J. tires, owned by the United States company. C. H. Mayer, who has been traveling—making San Francisco his headquarters—has been placed in Portland to act as manager there. Mr. Gilbert, the district manager, has been over the entire territory attending to the changes indicated above.

Mr. Gilbert is assuring all of his constituents that there will be plenty of tires for the coast trade this winter, as his company informs him that all of its factories will be run on the summer schedule—*i. e.*, night and day, three shifts of workmen being employed. * * *

The Gutta-Percha and Rubber Manufacturing Co. reports that business in the mechanical rubber line is very good.

* * *

Jas. F. Jiles, general manager of the American Hard Rubber Co., will soon arrive in San Francisco to pay a visit to his coast agents, the Goodyear Rubber Co.

The India-Rubber Trade in Great Britain.

By Our Regular Correspondent.

DITMAR and Thieben in "Zeitschrift für Kolloide," August, 1912, draw attention to the change which certain fillers undergo during the steam vulcanization process. Sulphur and various chemical fillers were mixed and submitted to vulcanization temperatures. It is somewhat surprising to read of the production of magnesium and calcium sulphides from the carbonates—of zinc sulphide from the oxide—and of barium sulphide from the sulphate. These changes, they say must influence vulcanization, but their special importance, they add, is in regard to analyses which cannot give an accurate clue to the composition of the mixing. This deduction goes without saying, and it cannot be too clearly understood that an analysis of rubber goods, however accurately carried out, does not necessarily indicate the composition as put in the mixing. I am of opinion, however, that an expert can deduce the original mixing pretty accurately from the results of his analysis. Such work, by the way, should not be attempted by those who have attended a course of sixpenny lectures at some technical school or other, in order (*vide* prospectus) to enable them to undertake rubber analysis if called upon. But to revert to my theme, whatever may be the chemical changes which occur during steam vulcanization, these are further considerably modified when the rubber is incinerated. Potts in his recent book devotes one or two lines to this important topic, but the subject is worthy of greater elaboration. The analyst who works rapidly and cheaply does not always recognize the considerable errors which may be involved in the determination of mineral matter, by the convenient method of direct incineration and where the result obtained is returned without correction, this should be stated. Cases have come under my notice with regard to important contracts for rubber goods, where discrepancies in analyses have arisen from the fact that, while one chemist has returned the figures obtained by direct incineration, as representing the original mixing, another has obtained different and more accurate figures, by making important corrections. Such corrections are usually arrived at by a combination of analyses and intimate knowledge of the manufacture, and I do not see any likelihood of factors being obtained, which could be utilized as necessary corrections.

DETERMINATION OF MINERAL FILLERS IN RUBBER.

OLD-ESTABLISHED rubber works doing a general business are complaining of the amount of competition which has arisen in recent years in the mechanical branch. Not that they fear any disaster to themselves, but from the fact that the lower quotations, sent out by new people who are compelled to get business somehow, have an unsettling effect upon customers. Newcomers in many cases have rapidly acquired what appeared to be a good business connection, only to lose it when the customers find that, while the goods are certainly cheaper, they are at the same time decidedly inferior. Various works established for the manufacture of goods by some special process, or for the exploitation of a particular patent, have, owing to difficulties arising, gone into the ordinary mechanical rubber trade, an instance of this being given in an adjoining paragraph. In many cases also, the various small works, established primarily for the rubber heel manufacture, have added certain mechanical goods to their list. As a rule, the rubber manufacture in Britain in the past has been carried out, not on lines of specialization, but with the idea of covering a variety of branches. It has been thought that this is the best way to avert any disaster in the case of exceptional slackness in a particular branch. This view is strongly held today, judging from what the manager of a large general works told me recently. "Look at so-and-so and so-and-so," he said, as a warning illustration as to the unwisdom of engaging in one particular branch only, in face of the competition to be faced from those who could afford to lose on a special branch, in order to retain customers, and yet have a successful year owing to good business in other branches. "The new competition in mechanicals," he said, "is viewed by us with complacency, as we feel sure that in many cases the interference with our trade can only be temporary." The managing director of another old-established firm, when spoken to on the subject, said he really could not understand how some of the cheap mechanical goods (including cycle tires) now on the market could be sold at a profit. They were not attempting, he said, to compete; if they had any demand for such goods they preferred to buy them from the people making them, rather than risk the scratching of good machinery by the working of mineral instead of rubber.

CUTTING PRICES IN THE MECHANICAL TRADE.

To refer shortly once again to the explosion which occurred at the North Western Rubber Co.'s works in October, 1910, the commissioners who conducted the Board of Trade inquiry in the following year, and whose report has been issued recently, recommended that an automatic safety appliance should be used in the future. The devulcanizer, they added, could not be said to be worked under safe conditions without some safety appliance, though they did not propose to make any definite recommendation as to what form this should take. Now this expression of opinion is entirely disagreed with by Mr. J. F. L. Crosland, the chief engineer to the Vulcan Boiler and General Insurance Co. of Manchester, with whom the devulcanizers were insured. In an interview I had with Mr. Crosland he was emphatic that not only would any such safety appliance be useless, but it would be a positive source of danger under the special conditions, as it would be sure to get clogged. All that was necessary, he said, was to have the manhole at the top of the side of the devulcanizer instead of at the surface. By this means the overfilling which led to the explosion of hydrostatic pressure could not occur, and any danger would be entirely obviated.

SAFETY VALVES FOR DEVULCANIZERS.

A CASE of some importance to British manufacturers of transparent druggists' rubber goods, such as teats and soothers, has just been decided. Some little time ago a French patentee instituted proceedings against Messrs. J. C. Ingram & Son of Hackney Wick, London, the well-known rubber manufacturers, for infringement with regard to transparent rubber. The action was defended by Messrs. Ingram with the support of other English manufacturers, notably the Leyland & Birmingham Rubber Co., Limited. Judgment has now been given in the French courts to the effect that the French patent has been declared void.

LEGAL DECISION.

AN interesting and important development in connection with this well-known motor tire firm has to be recorded. This is that the control has passed into the hands of Messrs. Chas. Macintosh & Co., Limited, whose works at Cambridge street, Manchester, are little more than half a mile distant from the works of the above tire company at Ardwick Green. The tire company owes its rise and progress to Mr. Challiner, the Earl of Shrewsbury and Talbot, though financially interested, not having taken any very active part in the business. Two years ago the factory was considerably enlarged. The main

SHREWSBURY & CHALLINER TIRE CO.

business is in connection with solid tires for vehicles, especially heavy twin tires for commercial motors. Under the new arrangements the whole of the ordinary share capital is held by Messrs. Macintosh, the holdings of the original shareholders being converted into preference shares carrying a fixed rate of interest. The management is entirely under the control of Messrs. Macintosh, the preference shareholders not having any voting power, except in the case of certain specified eventualities. This absorption by Messrs. Macintosh is not a new departure, as on former occasions I have referred to the taking over of other rubber businesses, including the Eccles Rubber Co. and the Liverpool Rubber Co.

TURNER BROS. LIMITED.

THIS well-known firm of asbestos manufacturers of Rochdale have just completed large branch works at Trafford Park, Manchester, not far from the ship canal. This extension, I may say, does not presage any new departure in the business or any cessation of the present Rochdale activities. It is merely an extension of the present business on a site which offers better business facilities, more especially in regard to freights, than does the Rochdale site, which, being served by one railway company only, is not so advantageously situated as Manchester, which has four or five competing lines. The new works are about 40 minutes motor run from Rochdale, where the business headquarters will remain. Although at present no new departure in manufacture is arranged, it is quite probable that the future will see developments on lines entirely new to Great Britain.

TRADE JOTTINGS.

I UNDERSTAND that the Crude Rubber Washing Co., Limited, whose reduction of capital has already been referred to, is relinquishing the rubber washing business altogether. A move has been made to Wembley, about ten miles from London, where the Aiperton works, started by Mr. Carpenter, of Charing Cross Bank fame, have been taken over. The business to be carried on will be the manufacture of mechanical rubber, tire-treads, etc., the machinery having been obtained at the sale of the Unity Rubber Works, Manchester. The Edmonton works, where the Murac and rubber washing business was carried on, are now in the possession of Mr. Dessau, late manager of the Crude Rubber Washing Co. Golf balls and other articles are being made there.

Mr. Ferguson, son of the late senior partner of the firm of Ferguson, Shiers & Co., waterproofers, of Newton Heath, Manchester, and who has been acting as works manager, has terminated his connection with the firm, and the business will be carried on by Mr. Shiers alone.

The Clyde Rubber Works, Limited, which are situated in a crowded quarter of Glasgow, are building more commodious works at Renfrew.

The recently issued report of the Rubber Tanned Leather Co., Limited, which has its factory at Ross, near Hereford, shows a debit balance of £3,059, and the question of raising further capital is under consideration. The result of the suit brought by the Société Franco-Belge de Tannage et de Cuir was adverse to the English company and the legal expenses amounting to £3,000 odd have been written off. Despite the somewhat unsatisfactory report, it is clear that rubber-tanned leather is making headway, especially for leather belting, repeat orders for which are coming in from various foreign centers as well as home markets. It is on this class of goods that the factory at Ross is mainly engaged at present, and a branch factory has also been opened in this connection in Canada.

INCREASED EXPORTS OF GERMAN RUBBER GOODS.

According to latest published statistics, the German exports of rubber goods increased for the seven months ending with July from 5,591 tons in 1911 to 10,990 tons in 1912, being an increase of nearly 100 per cent. in the aggregate. The proportions of soft and hard rubber were for the seven months:

	1911.	1912.
Soft	4,785 tons.	10,035 tons.
Hard	806 "	955 "
	5,591 tons.	10,990 tons.

It is of interest to note the relative preponderance of soft rubber, both in the actual quantity and in the rate of increase.

NEW GERMAN IMPREGNATION PROCESS.

A company styled "Terovin, G. m. b. H.," has recently been formed at Cologne for the utilization of a patent process for preserving the elasticity of rubber goods. The object is effected by a chemical emulsion, applied to the articles to be treated. This new product has proved specially adapted for the impregnation of pneumatic tires, considerably increasing their durability.

RUBBER BELTING CHEAPEST.

According to German reports, rubber belting is receiving increased attention in that country, consumers recognizing the fact that although higher in price, it is more economical in service than textile belting. Thus, a main driving belt was lately replaced, which had been sixteen years in constant service, and subject to considerable strain during that period.

AUSTRIAN CABLE FACTORY INCREASES CAPITAL.

The Kabelfabrik-und-Drahtindustrie-Aktien-Gesellschaft, of Vienna, has increased its capital from the equivalent of $1,200,000 to $1,520,000.

SWEDISH RUBBER SHOE MANUFACTURERS ADVANCE PRICES.

Owing to continued rain, Swedish rubber shoe manufacturers have been enabled to maintain their recently advanced retail prices.

RUBBER TRADE IN JAPAN.

By Our Regular Correspondent.

THE JAPANESE PACKING TRADE.

ACCORDING to a special report of the Japanese Custom House Bureau, the imports of rubber packing for 1911, showed, as compared with 1910, a decrease of about 10 per cent. in quantity, coupled with an increase of about 3 per cent. in value, as shown by annexed table. The reasons of this are threefold. First, the so-called rubber plate, lined with fabric, was being made by Japanese rubber manufacturers, its import being reduced to one-third of that of 1910. Secondly, the import of cheaper core-packing decreased. Third, the import of higher grade Amazon packing increased; its greater durability than that of core packing being recognized as making up for its higher cost. The imports of asbestos packing remained about the same as before.

The demand for this class of goods is being developed every year, but is being partly supplied by the two companies making rubber plate; Mitatouchi Rubber Manufacturing Co. (Tokio), and the Dunlop Rubber Co. (Far East), (Limited), Kobe.

Prices of goods in the countries of production, as well as in Japan, did not show any marked fluctuations. Market prices are now:

PRICES PER POUND.

	Yen.	Cents.
Rubber packing	.36	18
Core packing	.38	19
Amazon packing	1.30@1.75	65@88
Asbestos packing	.40	20

JAPANESE IMPORTS OF PACKING.

	1910.		1911.	
	Pounds.	Value.	Pounds	Value.
Great Britain	484,991	$91,033	397,156	$75,271
Germany	179,639	25,801	131,260	19,649
Italy	83,096	11,714	88,588	14,324
United States	84,385	41,723	130,043	64,762
Other countries	2,491	337	2,740	591
	834,602	$170,608	749,787	$174,597

INSULATED ELECTRIC WIRE IMPORTS.

The Japanese imports of submarine telegraphic or telephonic cables have diminished under the influence of domestic manufactures in that line. In three years they have represented from January to June—1910, $238,470; 1911, $165,759; 1912, $36,006.

All other classes of insulated wire represented during a similar period:

	Pounds.	Value.
1910	2,724,869	$340,777
1911	14,047,505	1,322,256
1912	7,952,928	666,735

The cause of the large increase shown for 1911 (apart from the impending new tariff) was the number of hydro-electric companies, electric car companies and electric light companies, projected or established in consequence of the development of electricity over the country. As a result of the imports having again fallen off in 1912, domestic manufacturers secured a large accession of business during the first six months of the current year. For instance, it is announced the Fujikura Electric Wire and Rubber Co., Limited, paid for that period a dividend at the rate of a little over 20 per cent. per annum.

Exports of insulated electric wire, January to June (chiefly to China and Japanese China) represented—1910, 336,801 pounds, $56,102; 1911, 164,936 pounds, $34,248; 1912, 134,668 pounds, $27,968.

Statistics of the electric installations in Japan on December 31, 1911, show that there were at that time 2,765,169 electric lamps, averaging about ten candle-power, and 10,419 electric motors, with a total actual horse power of 47,188.

JAPANESE TRADE IN JINRIKISHAS.

According to official reports, Japanese exports of jinrikishas, which had been relatively active in 1910, fell off in 1911. This was specially the case as to the Straits Settlements, which had taken in 1910, about 80 per cent. of the total exported from Japan. Owing to the dullness in Singapore, caused by many Chinese workers leaving for their native land, the demand fell off 22 per cent. in quantity, while the value was only diminished by 5 per cent., the adoption of higher grades being thus indicated. During the first six months of this year, business revived in the Straits market. In Annam, moreover, business was better than in Singapore. Rubber tires are there adorned with red paint, which gives them a characteristic aspect.

JAPANESE JINRIKISHA EXPORTS.

	1910.		1911.	
	Number.	Value.	Number.	Value.
China	1,286	$21,548	1,046	$20,781
British India	1,406	31,172	976	19,987
British Straits Settlements	11,027	148,128	8,616	149,109
Other countries, including Corea	478	8,329	188	4,209
Total	14,197	$209,177	10,826	$185,086

RUBBER PLANTING IN SIAM.

The Japanese Consul at Bangkok, the capital of Siam, has reported that rubber planting in that country is now in a tentative period; the most favorable districts being the two states of Champon and Segora, on the east coast of the Malay Peninsula, facing the Gulf of Siam. At the south of those two states is a state named Pato-ni, where there are already 300 acres planted with 58,000 Pará trees. In Chautaburi State (northeast of Bangkok), rubber planting has also been tried on a large scale.

This state resembles the Malay peninsula in climate and fertility, but owing to the droughts usual in spring, tapping is later by one or two years, than is the case there. Two of the plantations (aggregating 160 acres) are operated by individuals, and one by a stock company, styled Borisab Sowan, Chautaburi, with a capital equaling $22,500, which owns an area of 800 acres. Of this acreage 200 acres are planted with 16,000 Pará trees, the bulk of which were planted in July, 1911, and have now attained a diameter of an inch to an inch and a half; 600 trees having been planted two years ago. One of the representative men of this company is Mr. K. Tanje, a Japanese, who has become a naturalized Siamese.

The total area planted in rubber in Siam is estimated at about 3,000 acres, but the enterprise is of such recent date that it has not yet been possible to determine whether it is suited to the country.

The opinion is expressed in the official Japanese report, that if suitable locations are selected, Siam will in the future become a good rubber planting center, having much uncultivated land, with many of the characteristics of tropical countries. Siam, it will be recalled, is to the northeast of the Malay peninsula.

CYCLE, MOTOR-CAR AND JINRIKISHA SHOW.

This show was held during the early part of the summer of 1912 at the Shiba Exposition Hall, Tokyo, and included some 30 exhibitors. Among them were chiefly English-made cycles and automobiles, exhibited by Japanese traders. The exhibits included those of the Dunlop Rubber Co. (Far East), Limited, Kobe; the Meiji Rubber Works, Tokyo; the Leicester Rubber Co. of England, as well as various British and American makes.

Exhibits of other rubber manufactures included medical goods and carriage mats from the Meiji Rubber Works, Tokyo, as well as rubber gloves for electricians, hose and heavy rubber heels from the Ingram Rubber Manufacturing Co. of Japan, Limited, Kobe.

FURTHER JAPANESE RUBBER COMPANIES.

The Kawaji Rubber Works were established at Higuretori, Fukiai, Kobe, in October, 1907, with a capital of $5,000. The principal manufactures are toy balls, sporting and mechanical goods, jinrikisha tires, etc. Its equipment includes one 15 h. p. engine and one boiler of 20 h. p. Messrs. K. Kawaji and H. Suba are the proprietors.

The Kobe Rubber Manufacturing Co., Ltd., was established at Wakinohama, Kobe, in January, 1912, making tires, tubing, etc. Mr. W. H. Coast is the expert. All the members of the company are English, most of them having been connected with the Dunlop Rubber Co. (Far East), whose success encouraged them to branch out for themselves.

The Rubber Co. was established at Sumiyoshi-mura, in 1887, being the oldest factory in Osaka and Kobe. Its specialty is a water bottle, the annual output of which amounts to 20,000, principally sold to consumers in Tokyo. This bottle is made by a special and original process, which requires less machinery than the foreign method, but takes more hands. This factory has one fifteen h. p. engine. Many of the Osaka water-bottle manufacturing companies have emanated from this concern.

BRAZILIAN GOVERNMENT TENDERS.

On December 30, the Ministry of Agriculture at Rio de Janeiro, will receive tenders from persons who may propose to establish factories for the refining and manufacture of rubber, in accordance with the law of January 5, 1912 and the subsequent regulations. The provisions of the law were reported in THE INDIA RUBBER WORLD of June 1, 1912 (page 426).

Some Rubber Planting Notes.

RUBBER IN ABYSSINIA.

ACCORDING to the communication of Professor Henri Jumelle, of Marseilles, France, to the "Agriculture Tropicale," Abyssinia in 1910 exported 310,500 pounds of rubber. Rubber vines, principally *Landolphia,* are found in almost all the forests at altitudes of 8,000 to 10,000 feet; those which grow near the rivers being of inferior quality. The vines, which are being worked, have a length of 80 to 100 feet; the trunk, with a circumference up to 14 inches, being frequently divided 3 feet above the ground, into the large interlacing branches.

To obtain the latex, the natives draw down the trunks towards the ground, keeping them in a horizontal position by means of cords, attached to stakes fixed in the ground. They then make circular incisions at various points, beneath which the latex is received in curved *orki* leaves. When these are full, they are poured into a calabash. The native effects the coagulation the same evening in his cabin, using for this purpose the concave iron disc in which he usually makes his bread.

This metallic receptacle is placed on the fire, and the rubber thus prepared is delivered to the representatives of the employing company, who wash it and dry it for a month, sheltered from the sun's rays. They finally smoke it several times, burning small branches or leaves.

In Abyssinia there are numerous forests, the working of which has not been commenced, owing to the difficulty of communication. In consequence of the improvements anticipated for 1912, the hope is entertained of an important development of Abyssinian rubber exports.

DEVELOPMENT IN THE FEDERATED MALAY STATES.

In his recent summary of the progress of the British Colonies, the Colonial Secretary, Mr. Harcourt, said that if ever his name were to be honorably remembered as a colonial minister, he hoped it might be in connection with two things—railway building and tropical medicine. He was certainly able to show that both have made excellent progress in the last few years. Perhaps nowhere has the iron horse made greater strides than in the Federated Malay States, so that, as he pointed out, on the completion of the extensions in progress or projected, one may travel direct by rail between Penang or Singapore and the Siamese capital.

As regards the second point, he alluded to the special encouragement promised to the study of tropical medicine and the prevention of tropical disease. While much has already been accomplished, including the theoretical conquest of malaria and yellow fever, and the pending conquest of beri-beri, there is still a big task ahead in this direction.

Department reports arriving in England from Kuala Lumpur point to a continuance of the development of the trade and industries of the Malay Peninsula, which has been so marked during recent years.

AMAZONIAN ANTICIPATIONS OF THE EXPOSITION.

In discussing shortly before the opening of the exposition, its prospects as affecting Brazil and particularly the State of Amazonas, the "Revista da Associacao Commercial do Amazonas" of Manáos, comments upon Asiatic rubber being thus placed in direct opposition to the Brazilian article in leading markets for the consumption of the latter. Attention is also called to the fact that while on previous occasions only state assistance had been available, still a gold medal had been awarded to the Association for the best sample of rubber; referring to the special gold medal of the Rubber Growers' Association, obtained last year in London. With much difficulty the Federal Government was brought to see that it would never do to refuse this challenge on the part of its rivals to a trial of strength.

For the first time, it is added, a combination has been formed, with perfect harmony of purpose for the defense of the chief export product of the Basin of the Amazon; thus dispelling the idea of disunion or lack of confidence on the part of the Brazilian rubber states.

RIVERSIDE (SELANGOR) RUBBER CO., LIMITED, FEDERATED MALAY STATES.

A more than three-fold increase is reported by the Riverside Rubber Co. in the first nine months of 1912, as compared with the same period of 1911; the figures being, respectively, 120,056 and 37,319 pounds.

SCOTTISH MALAY RUBBER CO., LIMITED, FEDERATED MALAY STATES.

The total crop of the Scottish Malay Co. for nine months ended September 30, 1912, was 119,160 pounds, as compared with 53,534 pounds for the corresponding period of 1911. As the September yield was 17,427 pounds a large increase of last year's output of 102,017 is looked for by the end of the twelve months.

GOLDEN HOPE RUBBER ESTATE, LIMITED, FEDERATED MALAY STATES.

As compared with a total output for 1911 of 109,655 pounds, the yield for the first nine months of 1912, amounting to 98,384 pounds, indicates a good prospect for the year's result of the Golden Hope Rubber Estate, Limited. There have been 60,944 pounds sold at an average of 4s. 6.42d., while for 1913, 18 tons of No.1 are contracted for at an average of 4s. 7.33d. per pound.

FEDERATED MALAY STATES EXPORTS.

The returns to end of September show a marked increase over those for corresponding period of 1911 and 1910.

	pounds		
January	768,743	1,329,170	2,730,576
February	728,458	1,490,849	2,715,767

HARD FINE PARA IN CEYLON.

A recent issue of the "Times of Ceylon," contained an interesting paragraph regarding a demonstration given by Mr. H. A. Wickham, the father of plantation rubber, in which he produced hard fine Pará from Ceylon latex. The paper calls the product equal to the Brazilian article.

"To Hanwella estate belongs the distinction of being the first to turn out Ceylon hard fine Pará.

"Mr. Wickham, who contends that the difference between Brazilian hard fine Pará and plantation rubber is only a matter of treatment, has given a demonstration on the estate, and the results, which have turned out quite satisfactory, are to be seen in the premises of the Colombo Commercial Company in Slave Island. The rubber has been turned out in the shape of blocks, and is believed to be equal in every respect to fine hard Pará, consisting as Mr. Wickham says, not of a curd or coagulation latex, but of an amalgam of the whole of the latex with the preservative smoke.

"The opinions of the market on the rubber will be awaited with interest. Mr. Wickham says that he has found plantation latex if anything richer than that produced on the Amazon, and similarly treated ought to form superior not inferior rubber."

JELUTONG AND WHERE IT COMES FROM.

IN the pages devoted in this issue to the description of the various exhibits shown at the Rubber Exposition, there is a paragraph referring to the United Malaysian Co. as that is primarily an American company which has succeeded in building up a very considerable business in one of the lesser rubbers of the Middle East—jelutong—it may be interesting to many people to get a little more extended information regarding the company than could properly be given in a description of its display at the Exposition.

VIEW SHOWING PART OF KARIMON PLANT.

This company was formed in 1908 to gather, prepare and ship jelutong in the Middle East, and began the construction of its plants in the spring of 1909. It acquired large concessions in Borneo and planned and started the town of Goebilt on the northern coast of that island in the British Province of Sarawak. It also made arrangements for gathering jelutong in the Great Karimon Islands, Sumatra and in the Federated Malay States. It built two plants—one on the Karimon Islands, the other at Goebilt—getting them in operation in the fall of 1909. Its first shipment was received in this country in December of that year.

The jelutong tree grows in considerable profusion in the section covered by this company. The tree reaches a height of 150 feet—sometimes more—the branches being confined to the upper third of the trunk. Formerly, the natives tapped these trees in a very wasteful way, abusing them so much that in many instances they were killed. These abuses the company has made great efforts to stop, and the trees are now being tapped in such a way as not to injure them.

One-half the product of this company comes to the United States, the other half going to England and Germany.

This variety of rubber is often referred to as Pontianak, because of the port in Borneo from which it is shipped, but this is an improper name for it, and is not used anywhere except in the United States. Its scientific name is *Dyera Costulata*.

INTERIOR VIEW OF PLANT AT KARIMON.

Mr. J. Warren Bird, manager of the New York office, 2 Rector street, was in charge of the exhibit and he was kept busy answering the many questions that were prompted by the display of handsome sheets of jelutong crepe, and by the large photographs that every visitor stopped to look at. He distributed a small pamphlet, entitled, "Some Facts About Malaysian Rubber," in which is included a number of formulae for compounding this rubber in the manufacture of tires, packing, and other rubber goods.

The four illustrations here shown give a little idea of the work the company is doing. One shows a general view of the plant at Karimon Islands; the second, an interior view of the main factory built at that point. The third shows one of the bungalows occupied by the members of the staff; and the fourth shows a quantity of jelutong at Goebilt ready for shipment.

STAFF BUNGALOW.

CRUDE JELUTONG AT GOEBILT.

NOTES FROM BRITISH GUIANA.

From Our Regular Correspondent.

PROSPECTS OF THE BALATA INDUSTRY—A GLOOMY OUTLOOK.

THE position of the balata industry is not such as to give cause for general satisfaction. Ominous complaints have been received from the interior, where bleeding operations are in progress, that the trees are already refusing to yield. It is a fact that the dry weather, which is due in the ordinary course of events now, has already set in, but owing to the long duration of the drought it was thought possible that the rainy season might have extended beyond the usual period. Such has not been the case, and since I last wrote we have had scarcely any rain. I have it on good authority that most of the gangs are returning to the depots, alleging that it is only possible to get balata by spoiling the trees, which would constitute an offense, and that unless rains fall quickly the season will be a failure. These rains have not fallen and already one gang of men, sent up in May by Messrs. Bugle for six months, has returned, the men asserting that they remained as long as balata was there to bleed, but to remain longer was useless. This statement has been accepted, and the men have been discharged. It is said that unless matters improve very quickly—which they show no sign of doing—only one-third of the usual crop will be realized.

Up to September 26 the exports were only 165,552 pounds, against 524,541 pounds for the same period last year. It was hoped that as shipments came more rapidly to town towards the end of the season, some sensible impression would have been made upon the deficit, although it was not anticipated that it would have been entirely obliterated. It seems as though the influence of the drought is going to be as disastrous as the most pessimistic feared. If that is the case it cannot be doubted that the result will be disastrous both for the industry and the companies concerned. Already the events of 1911 have driven some companies from the field, but it was hoped that the experiences of that year would have been so instructive that 1912 would have been made more profitable. If matters do not mend, as is feared, very little margin of profit will remain to the companies. The advances to laborers have been more than usually heavy on account of the drought, and it is doubtful if they will make sufficient to clear themselves. Absconding has been fairly rife this season, and with an output a third of the normal, companies will not be in a favorable position to pay for expeditions, which have been more costly than usual. The outlook is by no means bright. Happily the industry has not the dead-weight expenditure of export duty on balata to meet this year.

THE REVENUE AND THE INDUSTRY—TOTAL AMOUNT OF ITS CONTRIBUTIONS.

Exactly how large the amount was, and how oppressive to the industry, is disclosed by the report for 1911-12 of the receiver general, R. Clifton Grannum, containing the financial statements of the colony. The colony's exchequer benefited from the export duty on balata to the extent of $22,102.96, an amount of $2,102.96 more than was estimated. It is interesting to record that the surplus of revenue over expenditure for the year was just $23,359.86, so that if this duty had not been imposed the Government would have been about $1,000 to the good as the result of the year's transactions. Other contributions to the revenue by the industry were $23,457.15 in royalties, and $16,400 in licenses. So that altogether in round figures the industry contributed $61,960.11 to the revenue. This does not include, of course, the indirect contributions made by the laborers in the industry to customs revenue. They were not inconsiderable.

MR. STOCKDALE PROMOTED—DIRECTOR OF AGRICULTURE IN MAURITIUS.

The news has been received here with some regret that Mr. F. A. Stockdale, Assistant Director of Science and Agriculture, has accepted the offer by the Secretary of State for the Colonies of the appointment as Director of Agriculture in Mauritius at £800 per annum. Mr. Stockdale just doubles his emoluments, and the promotion he has received is well deserved. Since he came to the colony in 1908 he has taken the greatest interest in the rubber and the balata industries, and has done some useful work at the Government's various experimental stations. He represented the colony most successfully at the Rubber Exhibition in London last year.

SOME TAPPING EXPERIMENTS—MR. STOCKDALE'S REPORT.

Mr. Stockdale has just issued his report on his visit to the experimental station at Issorora in the North Western District, where he commenced tapping experiments with the Pará rubber trees that have reached a tappable size. He says: "These experiments have for the present been laid out in two series, with two groups in each series. The trees are being tapped on alternate days on the half-herring bone system, and the latex is being coagulated with dilute (1 in 10) acetic acid. Notes made at the time the experiments were commenced show that the trees on the station may be divided into at least four groups according to the structure, thickness, etc., of their barks. Records are being kept of the different trees, and it will be possible later to compare the yields of rubber given by different types of plants. The latex in some trees was found to be of a yellowish hue at first, but eventually turned to a whitish color as tapping proceeded. In others the latex is a pure white from the commencement. The first latex obtained was of a thick consistency and coagulated readily in the cuts, but after a few tappings it became thinner and ran readily in the cups. The rubber is for the present being turned into biscuit form and is well washed in cold rain water. It appears to be of good quality, and is of good strength, elasticity and resiliency. A careful record is also being kept of the times that rains or showers fall at the station, in order that after a few years reliable information might be available for the district. The question of the time when rain falls in a district is of importance for rubber planters, and data on this point are required.

Tappings of young plantation *Sapium Jenmani* are also being commenced. The latex of these trees did not run freely. It coagulated readily, and consequently the rubber had to be collected as scrap. This rubber when carefully washed and dried appears to be of good quality. Several systems of tapping will be tried, and the relative yields of the different methods will be obtained. Extension work is being pushed along, and the planting of *Hevea Brasiliensis* is taking place as rapidly as possible. The planting of the third ten acres of the extension over the creek should be completed during this year, and further trials are being made on the hill slopes in conjunction with balata, letter-wood, and bastard letter-wood. Trials with various kinds of coffee are also being undertaken, and it is possible that planting of the creole variety on the hill slopes will be started. A visit was also made to the David Young Rubber Estates on the Aruka River, and the progress of the different kinds of rubber-producing trees was noted. The Pará rubber trees were bearing quite a fair crop of seed pods, and with suitable weather conditions a number of seeds should be obtained from this property this year.

BALATA AND RUBBER IN THE NORTH WESTERN DISTRICT—INTERESTING FIGURES.

That small progress is being made in the rubber and balata industries in the North Western District of the colony is revealed by the report of the commissioner, H. Thompson King. He records an increase in the quantity of balata and rubber shipped for the district during the year 1911-12, but says that the estimated returns have not been realized. He attributes this result to the exceptionally dry weather during the greater part of the year. There is not much hope that 1912-13 will produce an appreciably better result, if as good. The output of balata from the three sub-divisions was as follows: Barima, 5,498

pounds, agianst 116 pounds in 1910-11; Barama, none against 2,318 pounds in 1910-11; Waini, 5,559 pounds, against 5,042 pounds in 1910-11; total 11,057 pounds against 7,476 pounds. Rubber so far has come from Barima only; 1,837 ponds, against 102 pounds. The combined products have contributed $257.88 in royalty, against $157.56 in 1910-11. There has thus been an increase of 3,507 pounds of balata, 1,725 pounds of rubber, and of royalty $106.32. The rubber industry, however, is practically at a standstill in this part of the colony. Mr. King reports: "The Consolidated Rubber and Balata Estates, Limited, have done nothing on the tracts held by them under license from the Government, and with the exception of a little clearing nothing has been done on the estates of other companies owning properties in the district. I understand that this cessation of work on the properties other than those of the Consolidated Rubber and Balata Estates, Limited, has been caused by financial difficulties."

The experinemtal station at Issorora is being extended; the ten acres underbushed in 1910-11 being planted with Pará rubber. The remaining ten acres of the extension have been cleared and prepared for planting. An area of four acres has been cleared on the hill slopes for the purpose of conducting experiments in connection with balata growing.

PHILIPPINE RUBBER PRODUCTION.

IN considering this important question, one of the first points claiming attention is the present situation of Philippine exports of rubber and kindred products.

Philippine statistics, not being so detailed as those of this country, group under one head "Gums and Resins"; for which the latest published returns (those for the year ending June 30, 1910), show a total value of $107,271, thus classified:

Almaciga (mastic)	$71,117
Gutta percha (209,618 lbs.)	31,903
Rubber (1,113 lbs.)	749
All other gums and resins	3,502
Total	$107,271

The distribution of this amount is shown as follows:

PHILIPPINE EXPORTS OF GUMS AND RESINS—1910.

	Almaciga.	Gutta Percha.		Rubber.		All Other.
	Value.	Pounds.	Value.	Pounds.	Value.	Value.
Europe—						
Austria-Hungary	$50	...	...	...	...	...
Germany	195	...	...	143	$200	$2,772
Spain	5	...	...	...	...	...
United Kingdom	...	7,192	$842	750	520	730
America—

Totals ($107,271)	$71,117	209,618	$31,903	992	$749	$3,502

A dissection of the total amount for gums and resins amongst the various countries of distribution shows:

British East Indies	$69,658
United States	32,109
Germany	3,167
United Kingdom	2,092
Other countries	245
Total	$107,271

EARLIER STATISTICS OF RUBBER AND GUTTA PERCHA.

INDIA RUBBER.

While the figures quoted above for 1910 are of the most recent interest, those since 1904 (furnished through the courtesy of the Bureau of Insular Affairs) illustrate the course of the experimental cultivation of rubber during the last eight years. These results must necessarily form the basis of any future action.

PHILIPPINE EXPORTS OF RUBBER, CALENDAR YEARS 1904 TO 1911.

	United States.		British East Indies.		Germany.		England.		Other Countries.		Total.	
	Pounds	Value	Pounds	Value	Pounds	Value	Pounds	Value	Pounds	Value	Pounds	Value

GUTTA PERCHA.

While rubber has thus been passing through an experimental stage, gutta percha has been a more or less steady article of Philippine export, as shown by following statistics:

PHILIPPINE GUTTA PERCHA EXPORTS (CALENDAR YEARS 1904-1911).

Calendar Year.	United States.		British East Indies.		Other Countries.		Total.	
	Lbs.	$	Lbs.	$	Lbs.	$	Lbs.	$
1904...	...	...	6,255	535	...		6,255	535
1905...	...	...	50,899	4,782	...		50,899	4,782
1906...	...	...	228,604	30,905	...		228,604	30,905
1907...	...	...	295,367	26,895	8,543	650	303,910	27,545
1908...	...	...	84,993	6,381	...	...	84,993	6,381
1909...	...	...	155,491	22,470	198	45	155,689	22,515
1910...	...	...	217,182	38,409	7,221	847	224,403	39,256
1911...	750	66	113,704	18,783	22,419	1,260	136,873	20,109

In 1912 the total shipments for the fiscal year amounted to 91,645 pounds, valued at $8,551.

Philippine gutta percha, though already largely exported, was first shipped to the American market in 1911.

As the figures quoted for 1910 separately and as part of the general table, cover respectively fiscal and calendar years, they do not in all points correspond, but they are sufficiently close to illustrate past and present conditions, in their relation to the future of rubber and gutta percha cultivation in the Philippines.

BOOMING BRAZIL.

Everyone who attended the Rubber Exposition was struck by the generous scale on which the Brazilian exhibit was planned. Evidently the government of Brazil was determined to make an impressive showing. This was only one illustration of the fact that Brazil has entered on an aggressive campaign of commercial activity. A recent Consular report calls attention to the fact that "during 1911 about $150,000,000 of foreign capital was raised abroad for Brazilian loans and enterprises. The railway mileage of Brazil was increased by 469 miles; two new foreign banks and several branches of those already established were opened; three new steamship lines started in the South American trade, and the old lines added several large modern steamers of 12,000 tons to their fleets to meet the demands of the rapidly increasing passenger and freight traffic to Brazil from Europe; improved and additional port facilities at all the principal coast cities are being constructed; additional hydroelectric plants are being installed to meet the increasing demands for power and light; two of the most modern and comfortable hotels are in course of construction in Rio de Janeiro, and others are planned in the other cities; and houses, especially in Sao Paulo, are being erected as rapidly as material can be procured."

MAINTENANCE OF BRAZILIAN STANDARD.

Commenting upon the latest developments of artificial rubber, the "Revista do Associacao Commercial do Amazonas" of Manáos urges upon producers to provide a solid foundation to the Brazilian industry by maintaining a uniform type of fine rubber. This is the only type of rubber which, up to the present time, has not lost its ascendency, and successfully opposes foreign types, but Asiatic grades, inferior in quality, are preferred in some cases, on account of the method of their preparation, their transparency and their freedom from impurities.

New Rubber Goods in the Market.

THE APSLEY SUCTION HEEL.

MANUFACTURERS of rubber footwear for men have given a great deal of attention in the past to making a shoe that would go on easily, as the average man is far too impatient to take very much time in putting on a rubber; but one trouble with a shoe that goes on very easily is the fact that it is likely to come off very easily, and the sensations of the man who has crossed the street through the mud and finds when he gains the sidewalk that he has left one of his rubbers behind him in the road is not agreeable. The Apsley Rubber Co. has a new device called "The Apsley Suction Heel" for keeping the rubbers on. The cut gives an illustration of it. It is a piece of rubber with three perforations placed inside of the heel of a self-acting shoe. These perforations create enough suction to counteract the suction of the mud on the outside of the shoe, and thus tend to hold the rubber snugly on the heel. The device has been patented in the United States, Canada and several European countries. [The Apsley Rubber Co., Hudson, Massachusetts.]

RUBBER HEADED NAILS.

There are a thousand and one uses for rubber-headed nails. They are useful where there is any contact and a desire to escape the consequences of it. For instance, they are excellent articles to put in the bottom of chairs to keep them from marking hardwood floors; they do good service as bumpers where doors are likely to fly back and mar the wall. It is hardly necessary to enumerate the places where rubber-headed nails serve a worthy purpose. Here are five varieties put out by one of the German manufacturers.

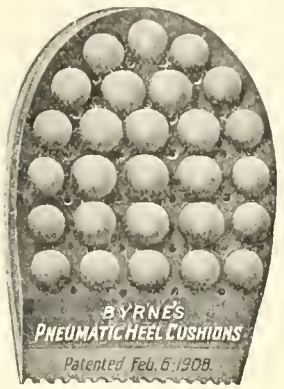
AN EMERGENCY GRIP FOR MOTOR TRUCKS.

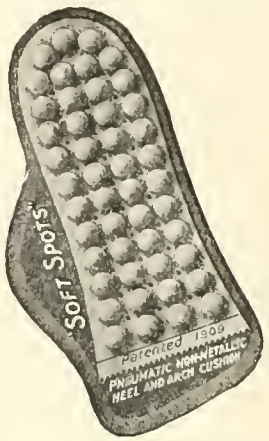
Here is an illustration of a chain grip for motor trucks recently put on the market by a Milwaukee manufacturing concern. It is made in ten different sizes and can be used on tires from 2-inch single up to 10-inch single—or 5-inch double. It will be noted that the chain simply covers the tread of the tire, the sides being protected by a solid piece. This greatly minimizes the wearing of the grip by rubbing against the curbing or car tracks. [The Garage Equipment Mfg. Co., Milwaukee, Wisconsin.]

THE GEMCO MOTOR TIRE GRIP.

STANDING AND WALKING ON AIR.

Everybody can always walk on "Easy Street" if he will always walk on air, and that is not so very difficult to do in these days of pneumatic footwear devices. Here are two illustrations of pneumatic appliances to go inside the shoe. One is called "Soft-Spots Arch Cushion" and the other "Soft-Spots Heel Cushion."

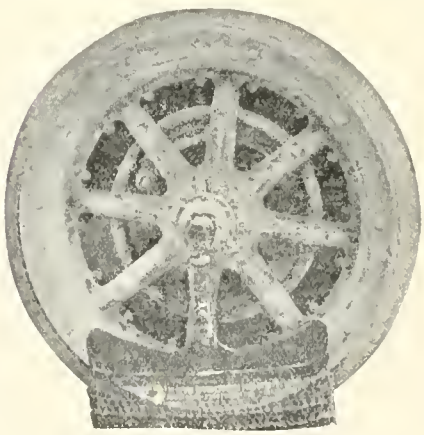




The arch cushion extends from the back of the heel well under the arch of the foot, while the heel cushion is intended simply for the heel. Both of these devices are finished with a leather surface on the top next to the foot, while the bottom surface consists of a group of rubber cushions full of air. Obviously these "Soft-Spots" appliances make the step resilient and walking easy, and they are quite inexpensive, especially the heel cushion, which retails at 25 cents a pair. (Essex Rubber Co., Trenton, N. J.)

SPLASH GUARDS IN PARIS.

The question of splash guards in most of our American cities is not a very urgent one, as our streets are as a rule in a condition where muddy pools are impossible; but evidently there are sections of London and Paris where splash guards are a *desideratum*, as both of those cities are more or less exercised over some device for preventing the vehicles in the street from throwing mud on the pedestrian on the sidewalk. The municipality of Paris, in conjunction with the Paris omnibus companies, has offered prizes for the best splash guards, the points to be taken into consideration being ease and simplicity of attachment, economy in construction and in use, weight and appearance. The test consists of an initial trial on a bus traveling twelve miles an hour, to be followed by a test of 100 consecutive hours, and a third trial to test the durability of the guard when brought in constant contact with the curbstones.



The accompanying cut shows one of the guards already in use in Paris. This cut cannot be commended as a work of art, but it was the best available, and it shows the splash guard and thus serves its purpose.

News of the American Rubber Trade.

FORTUNATE STOCKHOLDERS OF THE BOSTON WOVEN HOSE & RUBBER CO.

ON October 10, 1912, Henry B. Sprague, treasurer of the Boston Woven Hose & Rubber Co., sent out a circular to all the holders of common stock in that company, in which the following are the salient paragraphs, by which it will be noticed that the common stockholders are not only given the privilege of subscribing for an additional 25 per cent. of their present holdings at $100 a share (the last previous sale having been $231 per share), but are also given a cash dividend sufficient to cover this purchase.

"Pursuant to a vote lately passed by its Board of Directors, the Boston Woven Hose & Rubber Co. hereby offers to (1) those who shall be record holders of its common stock at the close of business October 21, 1912, other than the trustees of Boston Woven Hose Securities Co., and (2) those who shall then be record holders of certificates issued by said trustees representing common stock, two thousand (2,000) shares of additional common stock of Boston Woven Hose & Rubber Co. for subscription proportionately at one hundred dollars ($100) per share, payable in cash on or before November 1, 1912.

"Under this offering there will acrue to you at the close of business October 21, 1912, the right to subscribe for one-fourth (¼) as many additional shares of common capital stock of Boston Woven Hose & Rubber Co. as there shall then be shares of its already issued common stock or of common shares in Boston Woven Hose Securities Co. represented by trustees' certificates, as the case may be, standing in your name on the books of the company or of the trustees; but subscriptions in every case must be for whole shares.

"The privilege of subscribing will expire October 25, 1912. Subscriptions must be filed with the Beacon Trust Co., 20 Milk street, Boston, Massachusetts, not later than that day. They will be payable at the Beacon Trust Co.'s office in Boston, on or before November 1, 1912.

"The directors have also declared an extra dividend of twenty-five per cent. (25%) on the outstanding common stock, payable November 1, 1912, to stockholders of record at the close of business October 21, 1912. The amount of this dividend which may accrue to you as the record holder of common stock, or of trustees' certificates representing common stock, will be the same as the sum payable under your subscription, if you elect to take the stock to which you may be entitled; and the dividend may be used in payment of your subscription."

The treasurer is quoted as having made the following statement regarding the condition of the company: "The company has enjoyed the most profitable year in its history and the surplus, amounting to $1,310,000 on September 30, 1912, has reached the point where it is almost 50 per cent. larger than the common stock outstanding, and it was felt by the directors that some of the surplus should be distributed among the stockholders. Capital outstanding consists of $779,500 common and $750,000 preferred. The preferred does not participate in the stock dividend or right to subscribe to new common shares, as it receives a fixed dividend of 6 per cent. annually. The stock dividend will make a very valuable right to stockholders.

"It is probable that the regular quarterly dividend on the common stock at the next declaration, December 15, will be 3 per cent. instead of 2½ per cent., thereby increasing the rate to 12 per cent. annually."

THE COLORADO RUBBER CO., DENVER, COLORADO.

The Colorado Rubber Co., Denver, Colorado, has recently moved into its new building, situated at 1825-1831 Lawrence street, where its facilities for handling business and making shipments are much increased over its previous quarters.

THE FEDERAL COMPANY DOUBLES ITS CAPITAL.

The Federal Rubber Manufacturing Co., of Milwaukee, on October 12, filed in the office of the secretary of state amendments to its articles of association, increasing its capital stock from $1,000,000 to $2,000,000—the increase consisting of 7 per cent. preferred stock, redeemable at 120. The increased capitalization has been made necessary by the growth of the company's business in the past year, and to provide for future expansion. In May, 1911, the Federal Rubber Manufacturing Co. purchased the plant of the Federal Rubber Co., at Cudahy, since which time the present company has made extensive additions to the plant, practically trebling the floor space. A modern office building has been erected. The mechanical equipment for the manufacture of automobile, motorcycle and bicycle tires, carriage and truck tires, and a full line of mechanical rubber goods is very complete.

Additional buildings and other improvements are under way, including a new power plant aggregating 3,500 boiler h. p., and a further addition to the office building. The total expenditures for improvements will represent approximately $500,000, giving the company about 250,000 square feet of floor space, providing employment for a force of between 1,000 and 2,000 men and representing an approximate annual output capacity of $5,000,000.

AN INCREASE OF CAPITAL STOCK.

At the regular monthly meeting of the board of directors of the McGraw Tire & Rubber Co., held at East Palestine, Ohio, October 9, it was unanimously voted to increase the capital stock of this company from $100,000 to $250,000. Acting upon the very favorable report of the year's business made by President E. C. McGraw, the directors voted a stock dividend of 50 per cent. plus a cash dividend of 10 per cent. The McGraw Tire & Rubber Co. have made several important additions to their plant this year, including the building of a very fine laboratory.

This company has also catered to the long felt want of its Eastern patrons, and has opened a selling branch at 1706 Broadway, New York City. The popularity of the Imperial tires and tubes has already guaranteed the McGraw Tire & Rubber Co. several large contracts for the season of 1913.

DAY AND NIGHT FOR TIRE PLANTS.

The United States Tire Co.'s factories will be operated during the coming winter on full summer schedule, which means night and day, with three shifts of workmen. The decision to continue this plan, begun last year, was reached at a recent conference between General Manager J. M. Gilbert and the company's factory managers. Last winter was the first time in the history of the tire industry that it was considered necessary to maintain a full summer working schedule throughout the so-called off season. The plan worked so satisfactorily that its continuation was decided upon. The company's four factories produced more than 1,250,000 tires during the year, and their 1913 output will be in excess of this number, the equipment of all of the factories having been increased. Mr. Gilbert estimates that there will be somewhere near 750,000 automobiles in use in the United States by the middle of next summer, and adds that his company aims to keep its production up to a figure equal to one-fourth of the tire demands of the country.

THEY SOLD THEIR EXHIBIT.

Everybody who attended the Rubber Exposition will remember the experimental outfit shown by the Turner, Vaughn & Taylor Co. The entire outfit was sold to the Rubber Regenerating Co., of Mishawaka, Indiana.

FISK TIRES ON A RACING CAR.

Erwin Bergdoll, who finished second in the Elgin free-for-all with his Benz car, reports remarkable service from the Fisk bolted-on tires, with which the car was equipped. The original front tires were not changed during the entire distance of 300 miles. The Fisk equipment was purchased at regular prices, replacing another make of tire put on the car at a 50 per cent. discount. Since the Elgin meet other well-known drivers have approached the Fisk Rubber Co. for a racing arrangement on Fisk tires. The Fisk company, however, offer drivers no special racing inducement, believing the real test of tire equipment is on the road in every-day use.

THE GOODYEAR CO. OFFERS PRIZES.

The Goodyear Tire and Rubber Co., of Akron, Ohio, has hit upon an excellent idea and one that should bring it a great deal of valuable information at an inconsiderable expense. It has offered prizes to the dealers handling its tires for the best true short story regarding their advertising experiences. The best story will be awarded a prize of $10, and other contributions considered interesting and valuable will be awarded $5 each and these contributions will be printed by the Dealers' Service Bureau of the Goodyear company, for the general benefit of its customers. The best advertising ideas do not, as a rule, come from theorists, but from practical experience, and the Goodyear company ought to get very good returns for its offer.

A CANADIAN TIRE PLANT IN THE UNITED STATES.

According to very good authorities, the Canadian Rubber Co. contemplates erecting a large factory for the manufacture of tires on the American side of the river, with the intention of making a special line of automobile tires for the American trade. This factory will be in addition to its present factory in Montreal.

TO MAKE TIRES IN ST. LOUIS.

Articles of incorporation were filed on October 14, 1912, by the St. Louis Tire and Rubber Co., with a capital of $150,000, all paid. This company is composed of the following business men of St. Louis: Harry C. Barker, C. M. Skinner, Webster Groves, Alfred C. Einstein, William H. Glasgow, Roy F. Britton, C. C. Collins, and J. A. Swinehart, who has recently moved to that city from Akron, Ohio. They expect to use one of the buildings erected by the E. G. Lewis Publishing Co., in University City. The building is three stories high and covers a lot 177 x 40 feet, with a wing extension. It is the intention of the company to make a large addition to this building in the immediate future.

Mr. Swinehart, who has been for 15 years identified with the manufacture of tires, is active in the formation of the new company. He was associated with the Swinehart Tire Co., of Akron, and also the Firestone company.

He says that St. Louis is an ideal city for the location of a rubber tire manufacturing concern. "Its geographic situation could not be better," he told a St. Louis reporter, "for a plant of this nature. It is the gateway to the South and West. St. Louis has many advantages. Cheaper fuel and favorable shipping facilities make the city very attractive for a tire company. Labor, too, can be obtained readily in St. Louis. While at the start we probably will turn out but about 30 or 40 tires a day, within six months we expect to have a daily capacity of at least 300 tires."

Tires will be made for all classes of automobiles and trucks. Solid tires, block tires for trucks, and special tires for the electric coupé, operated largely by women, will be among those manufactured.

Mr. Morris Loeb, president of the Chemists' Club, died October 8, 1912, in his 50th year.

Mr. Wesley Wright, who for three years was Eastern sales manager of the International Specialty Co., is now acting in the capacity of sales manager of the shoe findings department of the Essex Rubber Co., Inc., of Trenton, with an office at 250 Broadway, New York. Among the articles he is pushing are "Soft-Spots" heel and arch cushions.

Mr. N. Lincoln Greene, known to the rubber clothing trade of the whole United States, was married on September 16, 1912, to Miss Adelaide Deming, daughter of Mrs. Edmund Orr Deming, of New York City.

Theodore W. Bassett, of the United States Rubber Reclaiming Co., ran part of his celebrated string of race horses at the Trenton fair on October 3, 4 and 5, and in the parlance of the turf, "cleaned up everything in sight."

MR. PAGE MAKES A CHANGE.

Wallace G. Page, who is well known in the rubber-tire industry, having had charge of the tire department of the Shawmut Tire Co., Boston, has recently associated himself with George P. Van Voorhis, in the American Motor Equipment Co., of 27 Haverhill street, Boston, jobbers and dealers in automobile tires and supplies. It will surprise none of his acquaintances to know that Mr. Page is doing very well in his new association, as he has always had the gift of making friends wherever he has been. He comes by his rubber proclivities naturally enough, as his father is a rubber man, having been connected for some time with the Chicago-Bolivian Rubber Co.

THE MARRIAGE OF C. G. ROEBLING'S DAUGHTER.

Miss Helen Roebling, daughter of Charles G. Roebling, of John A. Roebling Sons Co., Trenton, New Jersey, was married October 16 to Carroll Sargent Tyson, Jr., a well-known artist of Philadelphia. The ceremony was performed in the home of the bride, Trenton, by the Rev. Hamilton Schuyler, rector of Trinity Episcopal Church. Owing to the death of the bride's brother, Washington A. Roebling 2nd, on the ill-fated *Titanic*, the wedding guests were restricted to members of the two families.

THE MARRIAGE OF MR. FRED R. SAYEN.

Mr. Fred Richardson Sayen, secretary of the Mercer Rubber Company, of Hamilton Square, New Jersey, was married on September 25, 1912, to Miss Anne Jane Mellon, daughter of Mr. and Mrs. William A. Mellon, of Sea Girt, New Jersey, and Pine street, Philadelphia. The ceremony took place at St. Uriel's Episcopal Church, Sea Girt, New Jersey. Mr. and Mrs. Sayen visited the Rubber Exposition at New York on their honeymoon. They expect to reside at Hamilton Square, where Mr. Sayen has built a very handsome bungalow. Mr. Sayen is not only well known in rubber circles, but is a member of the Union League and the Art Club of Philadelphia, and the Merion Cricket Club of Haverford. He has traveled extensively and is widely known as a collector of pictures and objects of art.

REPRESENTS HIMSELF AS SON OF MR. PAUL.

The Davidson Rubber Co., of Boston, have sent out a warning to the trade against a young man who has been representing himself as the son of the company's president, Mr. Alexander M. Paul, and under the cloak of that representation has been trying to secure money from members of the trade. Mr. Paul has no son and this man is an impostor. He is described as about 30 years of age, 5 feet 8 inches tall, weighing about 150 pounds, with dark complexion, black hair, brown eyes; smooth shaven, dressed in dark clothes and wearing a black derby and black silk-lined overcoat, gray gloves and patent leather shoes.

THE FISK FOLK HAVE A CLAM-BAKE.

About the middle of September seventy-five or eighty of the branch managers and salesmen of the Fisk Rubber Co. of New York gathered at the factory in Chicopee Falls, Massachusetts, for a week's conference. For five days they attended strictly to the business of the company, laying their plans for the greatest output of tires in the history of the company; but on the sixth day they cast off all business burdens, relaxed their minds and proceeded to a nearby resort for a clam-bake. The accompanying illustration shows them with business burdens laid aside, with relaxed minds, and with no other thought except the impending onslaught on the appetizing and nutritious clam.

Clam Bake of Fisk Rubber Co.

Unfortunately, this small reproduction does not bring out very distinctly that look of supreme satisfaction that in the original photograph is so conspicuous on every face.

NEW INCORPORATIONS.

Atlas Tire Co., Inc., October 15, 1912; under the laws of New York; authorized capital, $10,000. Incorporators: Ralph W. Morrison, 181 West 73rd street; R. D. Placak, 318 West 52nd street, and F. F. Nichols, 135 Broadway—all of New York. Location of principal office, New York. To deal in automobile tires, etc.

Buffalo Resilio Co., September 16, 1912; under the laws of New York; authorized capital, $25,000. Incorporators: Stafford D. Noble, Alexander D. Falck and Philip E. Lonergan—all of Buffalo, New York. Location of principal office, Buffalo, New York. To manufacture and deal in tire fillers.

Co-operative Rubber Co., September 12, 1912; under the laws of Maine; authorized capital, $500,000. Incorporators: Horace Mitchell, H. A. Paul, M. G. Mitchell and Benjamin F. Bunker, all of Kittery, Maine. To manufacture, vend and deal in rubber boots, shoes and goods, and especially to buy, sell and deal in Dr. Edwards' "Cone Cushion Rubber Heels, soles, and half soles."

Cushionet Shoe Co., Inc., October 16, 1912; under the laws of New York; authorized capital, $1,200. Incorporators: Louis M. Emerick, Fulton, New York; William R. Johnson and Harry S. Lee, both of Syracuse, New York. Location of principal office, Syracuse, New York. To deal in boots, shoes, rubber, etc.

The Dutch Rubber Co., August 14, 1912; under the laws of Ohio; authorized capital, $1,250,000. Incorporators: E. L. Schnee, C. R. and I. A. Grant. Location of principal office, Akron, Ohio. To produce, reclaim, manufacture, etc., in rubber and rubber goods and other goods in which rubber may be a component part.

Economy Tire & Rubber Co., September 9, 1912; under the laws of Pennsylvania; authorized capital, $5,000. Incorporators: Edward L. Craft, Harrisburg, Pennsylvania; Edward M. and Benjamin F. Knupp—both of Penbrook, Pennsylvania. To manufacture and deal in rubber goods and products.

F. & M. Raincoat Co., August 24, 1912; under the laws of New York; authorized capital, $10,000. Incorporators: Julius, Charles and Rosie Fried—all of 1696 Madison avenue, New York. Location of principal office, New York. To manufacture rubber coats and other garments.

The Fearless Tire Co., Ltd., September 14, 1912; under the laws of Canada; authorized capital, $185,000. Incorporators: Jean Abel Michaud, Yvon Lamontagne, and Edmond Bouchard, all of Montreal, Canada. To manufacture tires.

Fibre Products Company, September 12, 1912; under the laws of Maine; authorized capital, $1,000,000. Incorporators: Everett B. Cook, Danvers, Massachusetts; Edwin C. Fisher, Winchester, Massachusetts; Stephen C. Perry, Portland, Maine; William A. Studley, Rockland, Massachusetts. To manufacture, buy, sell and deal in fiberized rubber and fiber and compounds thereof.

General Rim Company, September 30, 1912; under the laws of New York; authorized capital, $150,000. Incorporators: Robert W. Ashley and Frank Oberkirch—both of 47 West 34th street, New York, and William Kaul, St. Mary's, Elk County, Pennsylvania. Location of principal office, White Plains, New York. To manufacture auto parts, rims, tires, etc.

The Gerhart Spring Tire Co., September 13, 1912; under the laws of Ohio; authorized capital, $15,000. Incorporators: J. A. Gerhart, G. O. Balzman, and Casper Hopp. To manufacture vehicle wheel tires.

Hygrade Raincoat Company, September 16, 1912; under the laws of New York; authorized capital, $3,000. Incorporators: Herman Greenberg, 5 Willett street; Harry Futterman, 570 East 143d street, and Meyer Goldstein, 600 West 146th street—all of New York.

The Koblitz-Kohn Company, October 1, 1912; under the laws of Ohio; authorized capital, $50,000. Incorporators: Rudolph C. Koblitz, Adolph and Jacob B. Kohn. Location of principal office, Cleveland, Ohio. To buy and sell woolen rags, paper, rubber, etc.

Lavelle Rubber Co., August 27, 1912; under the laws of Illinois; authorized capital, $25,000. Incorporators: John E. and Clara M. Lavelle and Otto Scheible. To manufacture, buy and sell rubber wearing apparel, bands, belting, hose packing, auto tires, etc.

Never Skid Manufacturing Co., Inc., October 7, 1912; under the laws of New York; authorized capital, $50,000. Incorporators: Daniel E. Wing, George L. Lewis and Charles H. Stanton—all of 42 Broadway. Location of principal office, New York. To manufacture non-skid devices for automobile tires, etc.

Regal Raincoat Co., Inc., October 10, 1912; under the laws of New York; authorized capital, $10,000. Incorporators: Harry L. Goldbaum, 67 Fifth avenue; Herman Hertz, 115 East 96th street, and J. Goldbaum, 67 Fifth avenue—all of New York. Location of principal office, New York. To deal in rubber clothing, etc.

Strohbeck & Briggs, Inc., September 23, 1912; under the laws of New York; authorized capital, $100,000. Incorporators: Charles W. and Sophia Strohbeck, 234 Decatur street, and A. Lee Briggs, 655 East 18th street—all of Brooklyn, New York.

THE COMBINATION RUBBER MFG. CO.

The Combination Rubber Manufacturing Co., of Bloomfield, New Jersey, at its recent annual meeting of stockholders re-elected the same officers that served last year, with the exception of W. S. Hancock, who was made vice-president. F. L. Conover was made general manager. George B. Dickerson, formerly with the New Jersey Car Spring and Rubber Co., has charge of the company's offices in Bloomfield. The superintendent is W. A. Robbins, formerly with the Goodyear Tire and Rubber Co.

NEW AVERY CO. PREFERRED STOCK.

The Avery Co., of Peoria, Illinois, the oldest American manufacturer of agricultural implements, is offering $1,000,000 of 7 per cent. cumulative preferred stock at $100 per share and accrued dividend. The capitalization of the Avery Co., in addition to this issue of $1,000,000 preferred, is made up of $2,245,000 common stock and, according to a financial summary which accompanies the offer to the public, the total net assets of the Avery Co., above all debts, amount to $3,420,269.49; liquid net assets, above all debts, $1,816,956.31; average annual net earnings for four years, $171,820.27, and net earnings, January 1, 1912, to June 10, 1912, $256,860.47.

$10,000,000 OF FISK CO. STOCK.

The Fisk Rubber Co., of Chicopee, Massachusetts, which was incorporated under the laws of Delaware, has been reincorporated under the laws of Massachusetts with a capitalization of $10,000,000, consisting of 50,000 shares of preferred and 50,000 shares of common stock at a par value of $100. The preferred stock is 7 per cent. cumulative to be given $100 in case of liquidation and $115 is redeemed. The incorporators are Harry T. Dunn, Harry G. Fisk and John C. Cole.

NO INTERRUPTION OF THE LOEWENTHAL CO.'S BUSINESS.

The fire which occurred recently at the New York office and warehouse of the Loewenthal Co., 481 Washington street, though it did some damage to materials, caused no interruption whatever in the regular course of the company's business.

A GROUP OF FIRESTONE SALESMEN.

Here is a group of one hundred or more of the salesmen of the Firestone Tire and Rubber Co., Akron, Ohio. They were photographed during a three days' conference held at the factory from October 16 to 19. It was a busy conference for, while the report of the company showed recent business considerably in excess of anything in the past, these salesmen are determined that next year shall break the record of 1912.

Several important announcements were made, chief among them being the announcement of the perfection of a tire for electric cars, which it is asserted will reduce battery consumption by at least 12 per cent. This is done by a scientific adjustment of resiliency and bearing surface. This new tire will be interchangeable on pneumatic rims whether standard clincher or quick detachable clincher. It belongs to the dual tread type.

TRADE NOTES.

The Canadian Consolidated Rubber Co., Berlin, Ontario, will soon ask bids for machinery to be installed in its new factory now being erected. T. H. Rieder is manager.

The Koblitz-Kohn Co., of Cleveland, Ohio, are successors to Koblitz, Kohn & Co., dealers in rubber scrap and other materials.

The Gould Commercial Co. removed their offices and crude rubber sample rooms on October 9, 1912, from 227 Fulton street to 12 Bridge street, corner Whitehall street, New York City.

Messrs. G. C. Krelinger, of Antwerp, have taken over the business of the well-known firm of G. Schmid & Co.

Philo F. Barnum, cashier of the New York Rubber Co., died Thursday, October 24, of heart disease. He was seventy-one years old, and lived in New York. He was a nephew of the late P. T. Barnum, and had been associated with the rubber company for forty-seven years.

On October 7 the United States Rubber Co. declared the regular quarterly dividends of 2 per cent. on the first preferred stock (including all outstanding preferred stock), 1½ per cent. on the second preferred, and 1 per cent. on the common, payable October 31, to stock of record October 11.

Early in October the Thomas Motor Car Co. filed a voluntary petition in bankruptcy in the United States District Court, in Chicago, scheduling liabilities of more than $185,000. No statement of assets was filed beyond office fixtures. The principal creditor is the E. R. Thomas Motor Car Co., of Buffalo, N. Y., whose claim is nearly the amount of the entire indebtedness.

The Brazilian rubber crop for the gathering year just ended is officially stated at 28,206 tons, as against 27,064 tons last year and 30,064 tons in the year before.

A FIRE CAUSED BY NAPHTHA FUMES.

The fire which damaged materials and unfinished goods to the value of several thousand dollars at the factory of the Gordon Rubber Co., Canton, Ohio, is believed to have been started by a flash of lightning coming in over a wire and igniting naphtha fumes. The firemen were greatly hindered in their work by inhaling these fumes, but the damage to the building was not large, and the work of the company was in no way interfered with.

FIRESTONE TIRE SALESMEN.

THE INTERCONTINENTAL RUBBER CO.

THE annual report of the Intercontinental Rubber Co., issued under date of October 7, and covering the year ending July 31, 1912, shows the effect of the unsettled condition of affairs in Mexico—which is the chief field of this company's operation. There was a decrease of over one and a half million dollars—both in the gross and net profits of the company from the previous year, but owing to the smaller amount needed for dividends—no dividends on the common having been paid during the year covered by the report—the surplus account stands nearly $400,000 higher than a year ago. A comparison of the chief items in the report for the two years 1911 and 1912 is here given:

	1912.	1911.	Increase.
Gross profits	$1,190,095	2,714,255	*1,524,160
Expenses	81,136	73,737	7,399
Net profit	1,108,859	2,640,418	*1,531,559
Dividends	87,500	1,299,490	*1,211,990
Pr. and loss surplus	2,110,940	1,734,249	376,691

*Decrease.

The complete report of the company is as follows:

INTERCONTINENTAL RUBBER CO.

15 Exchange Place, Jersey City, New Jersey.

The directors submit herewith the balance sheet and statement of profits for the fiscal year ending July 31, 1912. These statements have been prepared and certified to by Messrs. Suffern & Son, certified public accountants of New York City. The year has been marked by a series of interruptions to operations caused by revolutionary disturbances, which conditions, we regret to state, still exist, offering serious difficulty to the free transaction of business in Mexico. The net operating profits for the year amounted to $1,108,959.34. Sundry accounts representing investments in certain subsidiary companies, as well as expenses of guayule culture and world-wide explorations to the amount of $644,768.51, have been charged off, as same are not considered of tangible value at the present time. Notwithstanding these charges and regular dividends on the preferred stock, the surplus account has been increased over the previous year by the amount of $376,690.83.

The competition for guayule shrub has been unusually active and prices have ruled correspondingly high. This has been due in part to revolutions, but to greater extent to the decreased supply. It has been definitely determined that this shrub reproduces itself naturally, but not as rapidly as it has been harvested since the inception of the guayule rubber industry. It will therefore be necessary to regulate the consumption to the rate of regrowth in order to maintain the business on a permanent basis. Experiments are being conducted looking toward the artificial cultivation of guayule, but these have not progressed far enough to warrant a definite prediction as to the ultimate outcome.

While the company's earnings show a considerable decrease over last year, they were still largely in excess of requirements for interest on the preferred stock. The directors feel, however, that consideration of dividends on the common stock should be deferred until the situation in Mexico and the future supply of raw material become more assured. Meanwhile the company remains in a strong financial condition, having cash and quick assets in excess of quick liabilities, of nearly double the amount of outstanding preferred stock.

BY ORDER OF THE BOARD OF DIRECTORS,

WALTER DUTTON, *Secretary.*

October 7, 1912.

BALANCE SHEET JULY 31, 1912.

ASSETS.

Investments in Stock of Merged and Subsidiary Companies:

PATENTS ISSUED (with Dates of Application).

440,305 (January 27, 1912). D. L. A. Grosclaude. System of compartments for pneumatic automobile tires.
441,410 (February 20). Weed Chain Tire Grip Co. Repairing of pneumatic tires.
440,418 (February 20). A. Sorsi. Elastic tire for automobiles, motorcycles, bicycles and other vehicles.
440,428 (February 21). L. Michel. Tires for vehicles.
440,480 (February 22). W. G. Skew. Improvements in anti-skid treads for pneumatic tires.
440,584 (February 26). A. Robertshaw. Improvements in covers for pneumatic tires.
440,704 (May 9, 1911). A. E. Thichault. Elastic tires.
440,717 (February 28, 1912). Bourne Rubber Co., Ltd. Process for treating rubber, vulcanite, or analogous substances and for making certain articles out of them.
440,833 (March 2). A. E. Wale. Improvements in manufacture of vehicle tires.
440,888 (February 28). A. Charvieux. Demountable tire for cycles and other vehicles.
440,940 (February 10). F. A. Nolan. Improvements in rubber heels.
440,941 (February 12). C. M. Metsch. Improvements in repair of pneumatic tires.
440,967 (February 24). L. G. Queval. Anti-skid appliance for pneumatic automobile and other tires.
441,013 (March 6). J. Savoie. Tire protectors.
441,075 (March 7). G. W. Bedam. Improvements in elastic tires.
441,122 (March 8). Dunlop Rubber Co., Ltd. Improvement in manufacture of pneumatic tires and covers.
441,134 (March 9). Maubon & Cané. Tire protecting appliance.
441,204 (March 11). Badische Anilin und Soda Fabrik. Production of substances resembling vulcanized rubber.

[NOTE.—Printed copies of specifications of French patents can be obtained from R. Robet, Ingénieur-Conseil, 16 avenue de Villiers, Paris, at 50 cents each, postpaid.]

THE GERMAN EMPIRE.

PATENTS ISSUED (with Dates of Validity).

251,216 (May 13, 1911). Process for production of isoprene. Badische Anilin-und Soda-Fabrik, Ludwigshafen.
251,217 (January 11, 1911). Process for production of erythrene. Farbenfabriken, vorm. Fried. Bayer & Co., Elberfeld.
250,690 (September 12, 1909). Process for production of artificial rubber, Farbenfabriken, vorm. Fried. Bayer & Co., Elberfeld.
250,920 (August 8, 1911). Process for manufacture of a product suitable as a substitute for rubber. Farbenfabriken, vorm. Fried. Bayer & Co., Elberfeld.
250,961 (June 7, 1910). Balloon material of woven fabric, paper and rubber. Julius Rund, Goethe Str. 10, and Max Samson, Westend Str. 3, Frankfurt-a. M.
251,260 (June 1, 1910). Centrifugal separator of rubber from fluids containing same. Empire Cream Separator Co., Bloomfield, New Jersey, U. S. A.
251,613 (October 25, 1911). Manufacture of marbled artificial rubber. Dr. Alexander & Posnansky, Kopenick, near Berlin.
251,728 (March 30, 1911). Process for smoking latex. Robert Derry, Singapore.
251,370 (March 3, 1911). Production of substances resembling rubber. Badische Anilin und Soda Fabrik, Ludwigshafen, Germany.
251,371 (August 7, 1910). Production of rubber substitutes. Chemische Fabrik Florsheim, Dr. H. Noerdlinger, Florsheim a. M.

THE KINGDOM OF BELGIUM.

PATENTS PUBLISHED.

246,696 (1912). F. Frank and E. Marckwald, Berlin. Extraction of rubber from latex.
246,826 (1912). Rauhgummi Verwertungs Gesellschaft m. b. H., Hamburg. Process for manufacturing wrinkled rubber.
247,139 (1912). A. Pinel, Le Houlme, France. Manufacture of gum or mucilage from seeds of carob tree.

UNITED STATES RUBBER CO.'S ISSUES.

TRANSACTIONS on the New York Stock Exchange for five weeks, ending October 26:

COMMON STOCK, $25,000,000.

[The treasury of a subsidiary company holds $1,334,000.]

Total	$1,379,387	$2,204,904	$3,838,146

Review of the Crude Rubber Market.

AFTER the fall in London price of Pará, in the first half of September, the level reached has since been more or less maintained. During the latter half of September the price fluctuated between 4*s.* 7*d.* and 4*s.* 8*d.* In the first half of October it varied between 4*s.* 6½*d.* and 4*s.* 7½*d.*; reaching on 26th (at time of writing) 4*s.* 6*d.*

While Pará rubber thus fell 1½*d.* in the last five weeks, plantation rubber showed a decline for pale crepe within the same period of 4*d.* per pound, from 4*s.* 6½*d.* to 4*s.* 2½*d.* On August 1 Pará and plantation had both stood at 4*s.* 10½*d.*, while at time of writing (October 26) they were respectively at 4*s.* 6*d.* and 4*s.* 2½*d.*

Since last report there have been three plantation auctions in London. The sale of September 24 to 26 comprised 920 tons. Prices in general showed a falling off to the extent of 2*d.* per pound, while smoked sheet commanded full rates. Nearly the entire quantity was sold. At the auctions of October 8 to 10 800 tons were offered and almost all sold at a further decline of 2*d.* A firmer tone prevailed towards the close.

The sale commencing October 22 (of which cable reports to hand), included 900 tons. While prices opened at a new reduction of 2*d.* per pound, a recovery to the extent of ½*d.* subsequently took place.

General opinion is to the effect that the fall in prices of plantation rubber has operated its own remedy by inducing buyers to act freely. Higher prices are being paid for later delivery than are current for spot rubber of the same grades.

At Antwerp on September 25 the offerings included 344 tons of Congo, of which 141 were sold at an average fall of 10 per cent., in addition to 158 tons plantation, of which 131 were placed at an average reduction of 8 per cent. On September 24, 95 tons (principally Congo) were offered at Havre, of which 20 tons were sold.

On September 30 at Amsterdam, out of 65 tons offered, 51 were sold at 5 to 7 per cent. reduction. For the sale of October 18, about 74 tons had been declared, chiefly *Hevea* and *Ficus*, three fourths of which changed hands at a fall of 5 to 6 per cent.

On October 11, 55 tons were offered at Rotterdam. The 12 tons of *Hevea* included were nearly all sold at an average of 5 per cent. below valuations, while a large proportion of the 37 tons of Congo was bought in.

NEW YORK QUOTATIONS.

Rubber Stock at Para.

On May 31 the stock had increased, but had receded by June 30; and had again fallen off on July 31. Large sales by the syndicate materially reduced the stock by the end of August, from which point it had slightly increased by September 30.

Garden hose	1⅝@ 1½
Fire and large hose	2 @ 2⅛
Matting	⅝@ ¾

Liverpool.

William Wright & Co. report [October 1]:

Fine Pará.—Prices have been gradually declining throughout the month. There is no doubt that the large plantation supplies are making themselves felt; in addition to which, we have in the near future heavy arrivals in prospect. With liberal supplies of plantation—which manufacturers can use as an alternatvie grade—we fail to see how prices of fine can command a premium, especially when the extra washing loss has to be taken into account. Receipts for the month are 2,620 tons, including 290 tons Caucho, against 1,900 tons last month, and 2,640 tons last year; totaling 6,460 tons, against 5,650 tons last year.

Antwerp.

Rotterdam.

HAVELAAR & DE VRIES report [October 11:]

In today's sales about 55 tons were offered, including 37 tons Congo and 12 tons *Hevea*. Competition was very good, but prices, owing to the lower state of the market, did not reach those of the valuations. Congos averaged 3 per cent. below valuations and plantation rubber 5 per cent. below. Congos were to a large extent bought in, while the plantation grades were nearly all sold.

Amsterdam.

JOOSTEN & JANSSEN, AMSTERDAM, September 20, 1912.

Notwithstanding the brisk demand at today's inscription sale, prices were in general a good deal below valuations. The downward movement was, however, not as marked as had been expected, in view of the fall which had occurred in London since valuations were made up. Out of the 65 tons offered, about 51 were sold at 5 to 7 per cent. below valuations. The results showed 5 per cent. reduction on *Hevea* and 7 per cent. on *Ficus* and *Castilloa*.

No. 15 West 38th Street, New York.

CABLE ADDRESS: IRWORLD, NEW YORK.

HENRY C. PEARSON, Editor

Vol. 47. DECEMBER 1, 1912. No. 3

SUBSCRIPTIONS: $3.00 per year, $1.75 for six months, postpaid, for the United States and dependencies and Mexico. To the Dominion of Canada and all other countries, $3.50 (or equivalent funds) per year, postpaid.

ADVERTISING: Rates will be made known on application.

REMITTANCES: Should always be made by bank or draft, Postoffice or Express money orders on New York, payable to THE INDIA RUBBER PUBLISHING COMPANY. Remittances for foreign subscriptions should be sent by International Postal Order, payable as above.

DISCONTINUANCES: Yearly orders for subscriptions and advertising are regarded as permanent, and after the first twelve months they will be discontinued only at the request of the subscriber or advertiser. Bills are rendered promptly at the beginning of each period, and thereby our patrons have due notice of continuance.

Entered at the New York postoffice as mail matter of the second class.

A BRIEF HISTORY OF FIRE HOSE SPECIFICATIONS.

IT is the opinion of many that if there is any monopoly or combination of capital now existing in restraint of trade it is the so-called fire insurance trust, as exemplified by its attitude towards the manufacturers of fire department hose.

That which more directly concerns our readers, however, is the attitude of the insurance laboratory theorists towards fire departments and manufacturers of fire department equipment. The manufacturers of fire hose, for instance, some thirty-two in number, have been protesting against the threatened complete domination of these insurance autocrats for the past three years. Their demands being unreasonable and their methods arbitrary, the great majority of the fire hose manufacturers declare that they will continue to stand out against the exactions of these self-appointed censors.

For the sake of argument let us admit that a few, say 10 per cent., of the fire departments of the United States have in the past, for economical reasons, purchased hose of a weight, quality or character not adequate or good enough for their needs, and let us also admit that the large interests of the insurance companies entitle them to respectful consideration. The agitation against poor hose was started by fire department officials in some of our largest cities, which, through false economy and in deference to public clamor, had bought cheap hose in the past. The insurance companies through their laboratories, without consulting reliable authorities on rubber compounding, plunged headlong into the controversy by formulating a set of specifications covering the construction of fire hose which they sent to leading fire chiefs, asking their opinion of them. Those familiar with the elementary principles of hose construction did not take these specifications seriously, others condemned them, but some were led to believe that these had been already established as standard. These specifications contained many incongruities and their circulation created a temporary condition of demoralization in the minds of the manufacturers and fire engineers alike.

A committee representing every fire hose manufacturer in the United States called upon the insurance interest, protesting and seeking some friendly co-operation. They yielded in a way by appointing a meeting with their hose committee. The manufacturers' committee sought to show the insurance committee that it would be impossible to draw specifications covering the construction of fire hose which would obtain for the fire service the best products of the American factories, as now represented by the highest quality brands of the various makers. But it was agreed that minimum specifications for laboratory guidance and standardizing, as a basis of agreement, were possible and desirable and the manufacturers would welcome an alliance with the insurance interest. It was soon manifest to the rubber manufacturers at the first meeting of this joint committee that the insurance members expected by virtue of the power behind them to ride down all opposition to their plan of domination. What appeared then as sane judgment, but later proved to be fox craft, prevailed, and the manufacturers' committee proposed to continue the conference with the distinct understanding that whatever specifications should be compiled would be for use in the laboratories only, and not published or circulated for advertising purposes. It was so agreed. (The laboratory specifications which were the outcome of this agreement were afterwards promulgated—notwithstanding the agreement—by the insurance laboratories.) The manufacturers' committee continued this conference with the insurance committee for the purpose of formulating minimum specifications for fire hose, not to be published but to be used only

as a laboratory standard. The so-called "National Standard Specifications" were the outcome of these conferences.

With this theoretically good fire hose quality established by these specifications, ways and means of preventing the manufacture and sale of hose inferior to the established minimum were next considered. The insurance committee demanded that their laboratory should furnish and attach to each section of hose a label at a cost of 25 cents per label to show that the hose was approved and in accordance with the specifications. The manufacturers argued that to do this they would bring down to one minimum level all brands of the better class of fire hose, as the label would not show that the hose to which it was attached was in any respect better than the specification requirements, and would eliminate all incentive to improve quality in the future. For these reasons, which must be apparent to any unprejudiced mind, the manufacturers could not agree to this proposition, and such was the unanimous opinion, and it was so unanimously voted.

The manufacturers in order to show their integrity of purpose submitted the following plan:

Each and every manufacturer of fire hose was to send to the Chicago laboratories of the insurance companies a section of each and every brand of fire hose manufactured by him or his company, guaranteed to be at least within the specifications proposed as a standard. The laboratory would upon testing, and finding said sections of hose to be at least within the specifications, at once register and approve each brand. By this means it was hoped to establish a long list of brands of fire hose, not one of which would be theoretically poor from the laboratory standpoint, and leaving the field open for competition in quality, which would otherwise be prevented by the use of one standard specification quality.

As part of the proposed plan of registering brands, the manufacturers even went so far as to agree to furnish the insurance laboratories with a list of their sales of fire department hose each month, with the understanding that they might send representatives to any city or town to which hose had been shipped, and there test it; and should any be found inferior to the specification standard, and not strictly in accordance with the sample on which the brand was approved and registered, that the approval should be withdrawn, the name of this particular brand and manufacturer stricken from the list, after a trial by a committee consisting of one expert chemist appointed by the manufacturers' association, one by the insurance laboratories, and the third by a joint selection.

All these overtures on the part of the manufacturers were finally turned down by the insurance companies, the specifications which were compiled by the manufacturers confiscated and promulgated; and they are now endeavoring to force their adoption by the manufacturers and fire departments as the one standard for fire department hose.

The manufacturers resent the accusation made by the insurance companies that their standard brands of fire hose had deteriorated in quality. They maintain, and stand ready to prove, that the quality of their best products has been improved from year to year, as experience and facilities for manufacturing have advanced.

The rubber manufacturers were the creators of the present type of fire hose. It took them years to supplant the cumbersome leather article. They have kept pace with fire needs wonderfully. That the last word has been said in fire hose improvement they deny. Nor do they propose to allow any interests to handicap them in further progress.

A LITTLE LIGHT ON TIRE ADVERTISING.

AN advertising agency, which has special facilities for informing itself regarding the advertising being done and being planned by the tire manufacturers, has furnished us with a list of ten of the leading tire makers, together with the amount of their advertising appropriation for the current year. These appropriations range from $20,000 to $450,000. One company is spending this large sum; one other appropriated for the year $350,000; two others $250,000 each, and two others $100,000 each. The aggregate advertising appropriations for these ten companies amount to $1,666,000—a very substantial sum certainly. And yet this represents the advertising outlay of only ten companies; and this list, while to be sure it includes most of the large companies, does not include them all. It would undoubtedly be safe to say that American tire manufacturers all together are spending this year at least $2,500,000 in advertising. This is about 2 per cent. of their gross receipts from tires, so that while the amount seems large, considered on the basis of percentage of the business done, it is not at all extravagant.

SHIPPING RUBBER DIRECT TO NEW YORK.

IN the exceedingly interesting addresses made by Mr. Crosbie-Roles and Mr. C. E. S. Baxendale, at the banquet held at the Hotel Plaza at the conclusion of

the recent rubber show—which were reported in our November issue—a good deal of stress was laid upon the desirability of having rubber shipments from the Middle East come direct to New York rather than having them go, as now, to London, Liverpool, or some continental point, to be re-shipped in new packages. This matter was given quite an extended mention in Mr. Baxendale's report to the Planters' Association of Malaya, written at the conclusion of the rubber show—an abstract of which appears in this issue.

Special emphasis was laid upon the two great disadvantages in the present system of shipment to Europe and re-shipment to New York; namely, that the identity of the rubber was largely lost, as it came to New York in mixed packages; and further that the repacking was often carelessly done, resulting in the receipt of the rubber at this port in very much poorer condition than would have been the case if it had been shipped direct. In Mr. Baxendale's report he speaks of a New York importer who showed him a small parcel of plantation rubber containing a most heterogeneous mixture of crêpe of every conceivable shade.

There is no sound reason whatever for this unnecessary handling of plantation rubber on its way to New York. It is attributable simply to the fact that until within the last three or four years plantation rubber had not assumed very considerable proportions, so that New York importers had not given it serious consideration. But that situation is now changed. In 1911 New York imported 6,590 tons of plantation rubber, and in the first eight months of the present year these imports had increased to over 8,000 tons; and with the very rapid increase in plantation production —which in 1912 will easily double the output of 1911—this question assumes a condition of such importance, that it is hardly credible that the present system will be much longer continued.

Considering the fact that America is using three and a half times as much rubber as England, three times as much as Germany, and five times as much as France, there hardly seems any reason why crude rubber should be shipped to any port in any of those countries to be re-shipped from that point to this great center of consumption. Moreover, the present outlook is that America's proportionate consumption of rubber will still further increase. The automobile manufacturers are planning a production of 600,000 cars for 1913, which, with the cars which will be in use from the product of earlier years, will make a total number certainly in excess of 1,000,000, and it is a conservative estimate to place the necessary tire production for 1913 at 5,000,000 tires. There seems to be no good reason, therefore, why the present indirect and wasteful shipment of plantation rubber to New York should be continued. Direct shipments mean expedition and economy, and they would enable American manufacturers to get what the plantation ships them, and not some indiscriminate mixture concocted in Europe.

ENGLISH MANUFACTURERS ALARMED.

NEWS comes across the water that the English manufacturers of automobiles are greatly alarmed over the large and constantly increasing number of low and medium-priced American cars which are being sold to the people living on that island. It is stated that at a recent conference, 15 or 20 of these manufacturers met and agreed to organize a company with a capital of $25,000,000, to manufacture inexpensive cars to meet this American competition.

It is quite likely that their fears are not groundless, because the low-priced car has proved exceedingly attractive in this country, and would naturally make the same appeal to people on the other side. The Ford company, whose product is of the less expensive sort, are said to be manufacturing at a rate that will bring their production for the present year up to 75,000 cars, and it is further stated that they are making plans to increase this voluminous output to something like 200,000 for the coming year. And other makers of low and medium-priced cars are rapidly increasing their production facilities; so that the number of cars of this class likely to invade England during the coming year will greatly exceed those of any previous invasion.

Two methods are suggested by the English for meeting these inroads on their trade—first, as stated above, the formation of a large corporation in which many of them are to be jointly interested for manufacturing cars of low cost; and, second, an appeal to the government to put a prohibitive tariff on American automobiles. Neither move is likely to be very effective. Obviously, if English manufacturers could compete in this department of automobile production profitably, they would naturally embark upon it without waiting for the organization of any combination; and if they cannot compete profitably by in-

dividual effort, they hardly will be able to by any concerted effort; as agreements of this character, entered into by competitors in any line of work, are never likely to be permanently satisfactory or efficient.

The second contingency—the levying of prohibitive duties on low-priced American cars is hardly likely to appeal to the Government, in a country like England, that has so long prided itself on its freedom of trade.

COMPELLING THE PRESS TO SHOW ITS HAND.

THERE seems to be some opposition to the Federal regulations that recently became operative, requiring publicity in regard to the ownership of newspapers and other periodicals. The act went into effect last August and specifies that a sworn statement shall be made twice a year, filed with the Post-Office Department, and also printed in the publication itself, giving the names and addresses of all the officers, the name or names of the owners, and—where the publishing company is a corporation—a list of all stockholders holding over one per cent. of the stock; together with the names of all those who hold mortgages or other liens upon the publication.

At a convention of the Illinois Daily Newspaper Association, held late in November, in Chicago, the following resolution was unanimously adopted:

"Resolved, That this association views with disapproval the growing tendency of the United States Government toward paternalism in matters pertaining to the press, and condemns the new law requiring publicity in matters in no wise concerning the general public."

But, is the association right about this matter? Is it a fact that the general public is in no wise concerned with the ownership and control of the daily press and other publications? The daily press in particular exerts an incalculable influence in this country. Is it not eminently proper that the public should know who is back of this influence? The press constitutes the greatest power existing in this country today. Is it not wise and salutary that the public should know who is exercising this power?

If a man owns an automobile he is compelled to register that ownership and mark the car in such a way that this ownership can be easily identified. That is because the automobile, while a very useful device, is recognized as possessing a certain capacity for doing harm. Should the press, which possesses a power for doing evil (it is conceded, of course, that this great power is usually exercised for good) which is immeasurably greater, be allowed to hide under the cloak of anonymity?

There should be no diminution of the power of the press. Its freedom of expression is one of the safeguards of a republic; but freedom of expression should not mean freedom from responsibility. Those who control the press and direct its activities should stand in the open. The Illinois Association is wrong when it says that these matters in no wise concern the general public. There is nothing that concerns the general public more.

RESTRICTING GENERAL EXPOSITIONS.

AT the Exposition Congress recently held in Berlin, an international agreement was signed restricting in future general expositions—usually referred to as "World's Fairs"—to intervals of three years, and establishing an interval of ten years between two general expositions in the same country.

These regulations seem sane and reasonable, for too great frequency in the holding of world's fairs must, almost inevitably, mean improper preparation for these events, with disappointing results; and even where the results are not disappointing, too many expositions are likely to pall upon public appreciation. The great world's fair to be held in San Francisco in celebration of the opening of the Panama Canal has substantial warrant. In the first place, more than ten years will have elapsed since the fair at St. Louis, and in addition to that fact this will be the first great international exposition ever held in the western half of the United States, and the occasion which it will celebrate is one of the epochal events in the world's history.

The strictures that properly are brought against frequent general expositions do not apply to trade expositions, where in some industries it is found, not only interesting, but highly profitable to have an exhibition every year; in fact, to hold several of them each season in different parts of the country, as in the automobile trade. In England it has been found conducive to the welfare of the trade to have rubber expositions once in three years. It is quite possible that such a plan would prove beneficial to the trade in this country also. In any event, not a few of the exhibitors who took part in the recent New York show expressed a desire to try it over again.

IT IS AN ANCIENT SAYING IN THE rubber footwear trade that "one early snow-storm is worth two late ones"; and experience has shown this to be quite true. When snow appears in noticeable volume in November, people say "We are in for a hard winter," and they start for the shoe store to get rubber boots and arctics. When snow holds off until February, these same people remark "Winter is about over, we will make our old rubbers do." Therefore the rubber footwear men were particularly fervent this year on Thanksgiving Day—with much of the country under a foot of snow.

India Rubber and Wireless Telegraphy.

A FEW years ago when the steamship "Republic" was run into and sunk off our coast, we got our first idea on a large scale of the usefulness of wireless telegraphy. Most of us can recall the manner in which Jack Binns stuck to his post on the sinking liner and sent his aerial calls for aid which fortunately brought succor in ample time. Then we realized something of the human benefits of Marconi's splendid work. That accident led to a broader adoption of wireless installations for sea-going passenger craft, and it also served to emphasize some of the limitations of the apparatus then in commercial service. It was well that such was the case, because there was another and still more disastrous accident yet to come, before the full significance and the need of the universal adoption of this means of communication at sea could be made plain. Even now, the mere mention of the ill-fated "Titanic" fills us with a sense of awe. But out of that dreadful catastrophe survives the story of Phillips' splendid heroism as he stuck to his wireless instrument until the moment of her final plunge—calling incessantly to his fellow operators far spread upon the darkened sea and asking that they hasten their captains with aid. But for those Hertzian waves that bore to the remote ships this message of need, the loss of life would probably have been still greater.

To the dealer in and the manufacturer of rubber it must be a source of interest, if not pride, that caoutchouc plays no inconspicuous part in the setting and the contributive equipment of the best of these wireless apparatus. Thanks to the courtesy of the Marconi company, we have been able to visit one of their local stations. Of course, we do not want to convey the idea that India rubber is an integral part of the dispatching or the receiving instruments so far as the wireless functions are concerned. India rubber merely serves to safeguard these operations, and in doing this to contribute to their efficiency. Insulation of the best is an absolute necessity in this department of electrical science: a necessity in carrying the dispatching impulses to the towering aerials without loss of energy through leakage, and still more necessary in preventing the

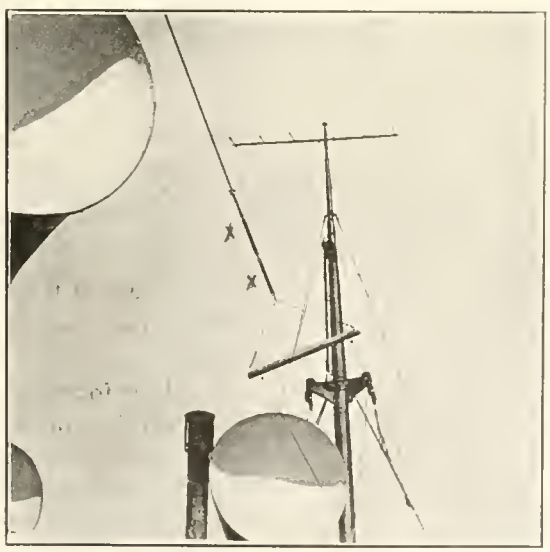

FIG. 1. SHOWING HARD RUBBER INSULATORS.

diminishing wave-force of a sending station far away from being further impaired as it travels down the waiting wires to the delicate receiver. Leakage in the first case means a restricted zone for the dispatched message; leakage in the second case might render a call for help futile.

Only the best of insulation will answer, and so far nothing

FIG. 2. SHOWING HARD RUBBER INSULATORS.

has been found equal to either hard or soft rubber for the various applications to which they are put. From the time the Hertzian waves reach the antennae 'way up in the air with their arriving message until they transmit their feeble impulses in faint ticks to the sensitive receiver, and thence to the operator by means of microphonic ear-pieces of a telephone, hard and soft rubber play a frequent part in the get-up of the apparatus and its installation. It would only confuse the average person to have these several parts designated by their technical names, and to the rubber man it will probably suffice to know that his commodity is so essential to this development of modern wizardry. What will also be a source of satisfaction to the trade and the manufacturer is that every advance in wireless and every broadening of its application, but serves to increase the demand for rubber.

Substantially every United States naval vessel, including most of the submarines, now carry wireless equipments, and this means of long-range communication has become an indispensable factor in the management of our fleets and squadrons upon the sea. It will undoubtedly prove of vital importance in the massing of our forces and the skilful interception of our enemies in the next great naval battle—if we have one. It was used by the Japanese and Russians during their recent struggle, but unfortunately for the Czar's fleet, the Japanese knew their enemy's code, and were able to intercept those confidential messages. Since then, however, the wireless expert has developed a system of "tuning"—really regulating the length of the Hertzian wave, and by this means the receiving instruments are made receptive only to the proper or prescribed impulses. This is getting somewhat into the technicalities of the science, but it only shows how one achievement leads to another.

Perhaps the most astonishing advances in wireless have been in the direction of securing greater range. Where it used to be a matter of less than fifty miles a few years ago, it is now possible to send Hertzian waves over a zone of several thousand miles in diameter, and to make these impulses so definite that the signals can be picked up and read distinctly at those

ranges. A splendid proof of this was given shortly after the loss of the "Titanic," when we sent to the mid-Atlantic two of our naval scout cruisers for the purpose of patroling the area near the steamship lanes upon which dangerous icebergs wandered south. These ships, the "Birmingham" and "Chester" alternated in this duty, and by means of their powerful apparatus, were able to send daily warnings to the far northern coast of this continent whence the news was relayed to our hydrographic office for distribution among our Atlantic ports. There is no telling how many lives and tons of shipping were thus saved from needless peril.

As an outcome of the "Titanic" catastrophe, Congress has recently passed a rigid law prescribing the more general installing of wireless equipments upon all sea-going passenger vessels. It will be necessary for every ship to carry at least two operators and to have an auxiliary apparatus which will be available for service in case of failure of the regular outfit. This will mean still more rubber. But Congress went further than this: while the foregoing provision went into effect upon the first of October of this year, another requirement of the same law is that even freight vessels, after the first of next July, shall also be provided with wireless. The reason for this is plain, quite apart from the immediate protection of the vessels concerned: freighters are quite able to render assistance and to be of material aid to a damaged ocean greyhound, and by substantially compelling all ocean-going craft to carry this means of communication, the chance of detecting danger and giving prompt warning to others is thus correspondingly bettered.

Figures 1 and 2 illustrate the application of hard rubber insulators (marked X in the cuts) in the aerials of wireless telegraphy. In order to keep these insulators in a more efficient condition, they have to be coated at least once a month with vaseline. This makes them shed water better and keeps the surface of the rubber from becoming coated with carbon from smoke. Either water or carbon would constitute electrical conductors and, to that extent, neutralize the insulation.

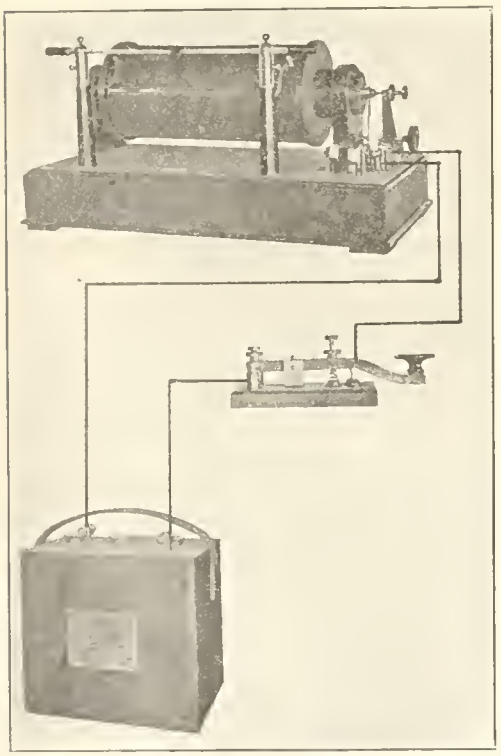

FIG. 3. THE AUXILIARY WIRELESS OUTFIT.

FIG. 4. WEATHER PROTECTED INSULATOR WITH RAIN CONE.

On the 23rd of July the President of the United States signed a bill making it mandatory that all vessels carrying fifty passengers and upward should be equipped with an auxiliary wireless outfit to do duty in case the prime installation should fail. Sixty days were allowed to accomplish this innovation, which involved the making of quite 250 auxiliary sets and their delivery to the various vessels. The Marconi Company accomplished this by working its manufacturing plant night and day and calling into service two other establishments. This involved an expenditure of substantially a quarter of a million of dollars, and many of the instruments were delivered by express rather than by freight in order that they could reach their destination and be ready for service inside of the time limit set by Congress. The law was for the better protection of the public in transit upon the sea, and the Marconi Company made every effort to facilitate subscribing to this law.

The auxiliary set, shown in Figure 3, draws generously upon the rubber trade for its get-up—the cylinder, the two prominent upright posts, and much of the apparatus on the right above the box being made of hard rubber. The storage battery is also held within a hard-rubber box.

Figure 4 shows a form of weather-protected insulator showing the hard-rubber tube passing from the rain cone through the top of the operating house or station.

A RUBBER PIPE MAKES DIVING EASY.

ANYONE who has a *penchant* for diving can now follow his inclination without cumbering himself with a helmet to go over his head and a heavy suit to cover the body, for an inventive genius connected with the French navy has recently given a demonstration of a simple diving device which he has invented. It consists of a mouth-piece kept in place by a teeth-grip and by a rubber band going around the head. This mouth-piece, which is not more than 10 or 12 inches long, and small in its other dimensions, is connected with a rubber pipe of any length that the diving operations may necessitate, at the other end of which is an air pump, such as is used to inflate auto tires. The sailor who gave the original demonstration walked into the Seine and disappeared into its depths; an operator kept the air pump in motion so as to supply the diver with the necessary amount of air, and air bubbles along the surface of the river showed what progress the subaqueous perambulator was making. This mouth-piece is so constructed that the diver's exhalations are not interfered with, while his inhalations are amply provided for by the pipe and the air pump.

A RUBBER LIFEBOAT.

SINCE the horrible *Titanic* disaster hundreds of inventive minds—we might say, with just as much accuracy, thousands of inventive minds—have been busy on the lifeboat question, which is natural enough, considering the impressive way in which the lesson of the need of life boats was taught—not only to the steamship companies, but to the traveling public. Among the results of all this inventive application there is one device invented by a Jerseyman which is particularly interesting to rubber men, as it is an all-rubber boat. The frame is made of hard rubber and over this frame, both outside and inside, are laid sheets of tough rubber cloth. The frame is fairly thick, leaving air chambers in the open places which are inflated. This gives the boat buoyancy and at the same time makes practically the whole boat a pneumatic buffer in case it comes in contact with any other object. The boat can be made of any size.

On first thought it would appear that a wooden frame would be quite as serviceable as the hard rubber frame. The efficacy of the boat lies in its double rubber covering with the intervening air chambers.

A MODEL CALENDER ROOM.

By Morris A. Pearson.

IN preparing this article on this important subject, the writer has dealt solely with the mechanical side of the question. During the past ten years, he has had an excellent opportunity to study the mechanical details of a great majority of the important installations in this country, and has incorporated in this article the most desirable features, as well as a few new ideas.

The general layout of the room, as shown, is practically the same as one recently installed by a large rubber factory in the Middle West, though it differs materially in many details. The various mechanical features, however, are applicable to almost any sized installation.

The room is 75 feet wide by 150 feet long, with a 1½-inch maple floor laid on concrete. On either side of the room is located a line of six mills with rolls 20-inch diameter by 60-inch face. Each line is driven by a 300 horsepower motor, with reducing gear, located midway between the mills, there being three on each side of the drive. Located between the mill lines, are twelve 3-roll calenders, with rolls 24-inch diameter by 66-inch face, and equipped with individual motor drives. A central passageway, 8 feet wide, extends the whole length of the room.

MILL LINE DETAILS.

The original drive for the mill line consisted of a motor, directly connected with the line shaft, running at about 100 r. p. m. The size of the motor, to give the power required at this slow motor speed, necessitated a pit in the floor about 17 feet by 14 feet by 3½ feet deep.

The drive shown here is one of recent design and has the motor located directly over the line shaft, where it is easily accessible. The power is transmitted from the motor to the line shaft by cut double helical gears enclosed in oil-tight casings. Automatic lubrication is provided by means of an oil pump, connected with the lower part of the casing, which delivers the oil to the gears directly at the point where needed. Gearing of the cut double helical type is far superior to spur gearing, in that it allows a more compact design and reduces vibration, wear and noise to a minimum. The only part of the drive to extend below the floor is the lower part of the gear casing.

The motor is connected with the reducing gear by a magnetic coupling, providing for a safety stop, which is absolutely instantaneous and which can be operated by hand or foot trips from any mill on the line. A magnetic brake, used in connection with this coupling, is automatically applied when the coupling is cut off. The power required for energizing a 300 horsepower magnetic coupling is only 2 amperes at 120 volts, and for the brake 1.75 amperes at 120 volts—both continuously. It will thus be seen that the operating cost is comparatively nothing.

All line shafting is 6⅛-inch diameter, providing for duplicate pinions and bearings throughout. It is located high enough to allow everything connected with the mill line to clear the floor.

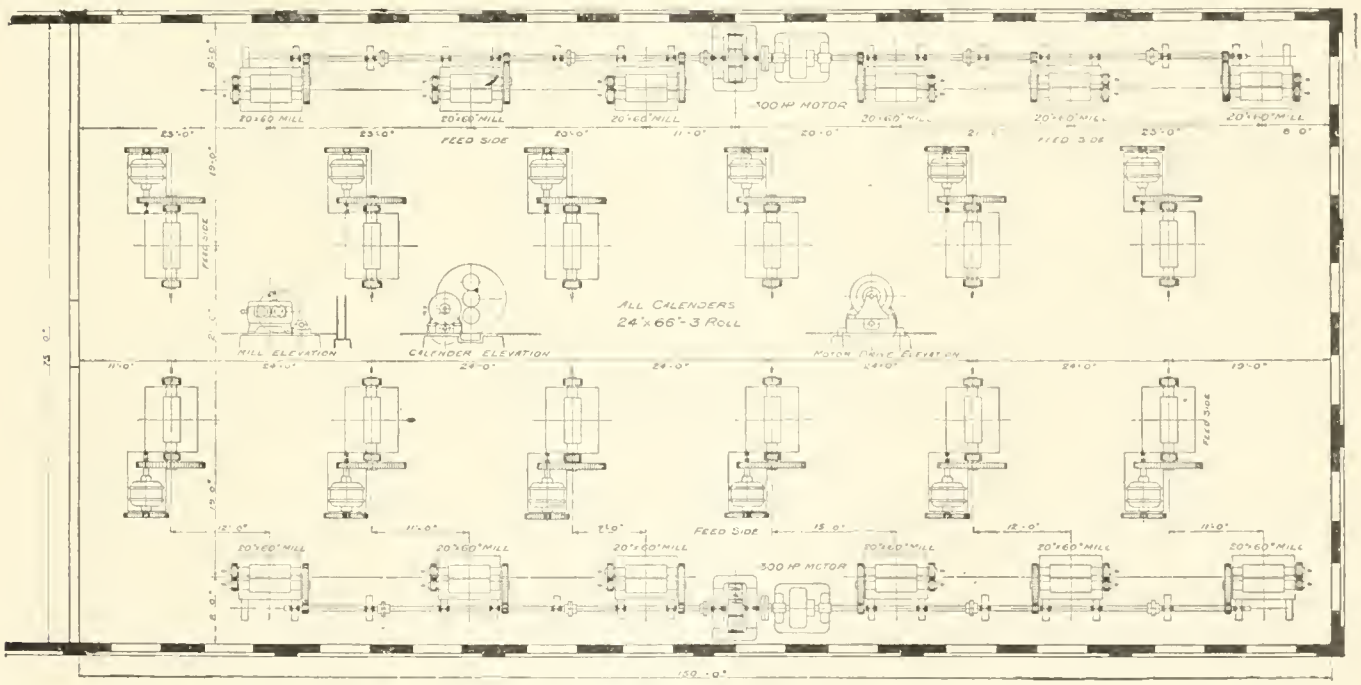
MILL DETAILS.

The mill housings are of cast iron, with caps of O. H. cast steel, giving the greatest strength possible to both frame and cap at the joint where they are fitted. This style of construction appears to be preferable mechanically to the present method, where the cap is made of cast iron and separate bars of steel are fitted between the frame and cap to secure the same results. The adjusting screw nut is so held in the housing that both the nut and screw can be removed from the frame at a moment's notice, without disturbing any other part of the mill. The rolls are of chilled iron, turned smooth and fitted with steam connections of the improved type, where the inlet pipe is located exactly on the center of the roll.

The roll bearings are full brass-lined and are interchangeable throughout. They are designed to carry automatic guides, which allow for the greatest possible working space on the rolls.

Special attention has been given to the gearing, the involute shape of tooth being used throughout. The drive pinion is split and flanged on the outer side only, so that it may be drawn out of mesh from the drive gear when it is desired to "cut a mill out." The connecting gears are of ample pitch, with no flanges, both being of O. H. cast steel. The large pitch and involute shape of tooth result in satisfactory service on a large range of centers, which fact will be found to be a distinct advantage as the rolls wear down. Both connecting and drive gears are fitted with slush-pans and gear-guards of convenient design.

The speed of the back roll is 24 r. p. m. and the front roll 16 r. p. m., giving a friction of 1½ to 1.



PLAN OF A MODEL CALENDER ROOM.

CALENDERS.

The calenders, which are 24 inches by 66 inches 3-roll machines, have individual drives, each machine being driven by a 75 horsepower variable speed direct current motor. The speed reducing gears have cut double helical teeth to reduce the vibration and wear to a minimum. The motor speed has a variation of 1 to 3 and permits a delivery on the calender of from 5⅓ to 16 yards per minute when running friction and from 8 to 24 yards per minute when running even. The motor controller is connected with a rod trip, located in front of the rolls, for emergency use.

Compact and easily operated clutches are used on the even and friction connecting gears, doing away with the antiquated method, requiring the operator to draw and drive keys in the gears when it was desired to change from even to friction, or *vice versa*. Both top and bottom rolls are adjustable from one handwheel, where are also located levers controlling the jaw clutches on the adjusting worm shafts. Change from quick to slow adjustment of the top roll may be made by shifting one clutch.

On either side of the calender are located the let-offs and wind-ups, the former having the hand type of brake and the latter driven by reversible gearing and adjustable by a stationary handwheel. An extended bracket placed on either side of the rolls provides for readily adjusted locations for tension rolls, knives, pressure rolls, etc.

The whole machine, with the exception of the adjusting mechanism of the lower, and a part of the speed gear, stands clear of the floor and all gearing is provided with guards and slush pans.

DEPARTMENT STORES GETTING THE RUBBER TRADE.

ONE of the best arranged displays of india-rubber wares for family trade is shown in a variety store in a small city within the metropolitan zone of New York. The space for the displays of staple and novel wares of rubber and gutta-percha goods is ample on shelves and counters, and the salespeople are well instructed by the salesmen of the makers of the wares, so as to make the buyers appreciate the merits of what is proffered to them. This small city is the home of more than one hundred manufacturers and distributors of rubber goods whose main offices are in New York. A number of these business men pass this particular variety store every day; they know the proprietor, and keep him informed about whatsoever is new in manufactures for household trade.

In an interview with a representative of THE INDIA RUBBER WORLD, the keeper of this variety store spoke as follows: "My frequent window displays and well advertised sales of rubber goods for family trade, are results from what might be called a campaign of education carried on for my benefit by friends in town who make or distribute such wares. I started out here to carry on a department store. But I found out that my ideas were, in that respect, years ahead of the times. I found that I must use my space for goods in a few fast selling lines. I gave no thought to rubber goods. I supposed that the local hardware and apothecary stores carried good lines in rubber products, such as families wanted. We have no factories hereabouts, so there is no market for belting or other rubber articles for industrial plants. On a venture, I laid in a small stock of rubber clothing and boots and shoes. There I stopped for a while. Then we began to have inquiries for rubber hot-water bottles, syringes and other wares of descriptions in which druggists specialize. I instructed my clerks to inform customers asking for goods that are commonly kept by drug stores, to go thereto to supply their wants. You see, in our city a great many families come every year from other places, and it takes them some time to find out where to go to buy for their household in a place like this, which is large in area but small in population.

"Sometimes the customers, whom we advised to go to the drug stores or the hardware stores for certain articles of rubber, would come back and say that those merchants did not have the goods in stock, or had none but inferior products that were unsuitable for well-to-do families. Then I decided to increase my lines of rubber goods, and as I had ample window and shelf-room for displaying such goods, I soon found out by my books that I was doing a profitable trade in rubber goods, which my friends in the local hardware and drug store trade told me were to them not worth keeping in stock. The reason those men gave me they believed to be correct. But I am satisfied that the explanation of their small sales was because they never made window, counter or shelf displays of such wares, and never advertised anything in the rubber line. They kept such goods where customers could not see them. Two drug stores in town used to keep fair lines of rubber goods for the household trade. But both stores now give almost one-sixth of their space to cold and hot beverages, and almost one-eighth to confectionery, ice cream, ices and light luncheon, and almost one-half the space is given to proprietary medicines and tobacco, cigars and cigarettes. In such stores, and the number thereof comes to above 40,000, taking the nation throughout, india-rubber wares, which years ago made quite a department in a retail drug store, are now what might be called sidetracked. That is to say, only a few articles are kept, as compared with the variety shown before most of the drug stores became confectionery, ice cream, luncheon and cigar shops.

"In our city, and in a number of adjacent cities, the hardware stores do not keep as large a variety of rubber goods as they did years ago. This is because in all cities, towns and villages in which a good deal of building, and the repairing and improvement of buildings by mechanics goes on for nine months in the year, the hardware stores have become mainly distributing agencies for building trades material, in heavy hardware and allied lines. In such stores to-day one sees little in rubber goods, except garden hose, and small stocks of packing and belting for farmers and small mechanical plants. Of course these druggists and hardware retailers, who keep but a few kinds of rubber goods are always ready to tell customers that they will order from the makers or distributors of rubber products, what is not in these retail shops. But the consumers want what they want in rubber, as in other wares, delivered on the spot."

This story, told by the proprietor of a department store in one of the suburban cities outside of New York, could be duplicated by many more, in similar positions, all over the country, and it is not only in the large cities and the suburbs that this marked change has taken place. It has occurred in practically all the smaller towns. The drug stores in the last ten years have devoted more and more of their space and attention to soda water, cigars, cigarettes and confectionery, and in some places to a light lunch as an adjunct to the soda-water fountain. The rubber department in the ordinary drug store, while not actually crowded out, has been much curtailed. But people must have rubber goods, so the enterprising department and general stores have not been slow to seize upon this line of trade.

CANADA USING OUR AUTOS.

A large number of the auto cars used in Canada are of American make. Exports to that country from the United States increased from 1,230 in 1909 to 4,687 in 1911, and this does not take into consideration the separate parts which were exported to that country and assembled on the other side of the line; nor does it take into consideration the cars made in Canada by the Canadian branches of American factories.

Mr. Baxendale's Report on the Rubber Show.

MR. CYRIL BAXENDALE, representative of the Planters' Association of Malaya, has written a report to that association covering the recent Rubber Exposition held in New York, which is exceedingly valuable as giving the viewpoint of the Eastern planter. This interesting paragraph is found at the very beginning of his report: "Owing to the extraordinary development in the manufacturing business (both in the U. S. A. and Canada) and the keen desire of Americans to learn more about plantation rubber, I am of the opinion that this exhibition will prove of greater value to our community than either of its predecessors, considerable as their value no doubt was."

He states that the exhibit of rubber made by the Federated

CYRIL E. S. BAXENDALE.

Malay States was visited by representatives of nearly all, if not quite all, of the rubber factories on the American continent, and he shows the appreciation in which they hold plantation rubber by citing the increase of plantation imports in the port of New York, the year 1911 showing imports of 6,590 tons, while the first eight months of 1912 show imports of 8,067 tons.

He lays a great deal of emphasis on two great disadvantages under which plantation rubber is now placed; one is the lack of uniformity in tensile strength, and the other, which is attributable in no way to the Eastern planter, is the very poor method in which this rubber is packed for the New York market, coming in rough wooden boxes with chips of wood mixed in with the rubber. This bad packing is due to the carelessness of the European shippers, who do not forward the rubber in the original packages, but repack it themselves in an exceedingly slovenly way. He speaks of an American importer who showed him a parcel of rubber about 5 pounds in weight which contained a mixture of about thirty scraps of Crepe of every conceivable shade. This parcel, according to the importer's statement, is a fair sample of the condition in which plantation rubber is received at this port. This importer strongly favored direct shipments from Malaya and also spoke of the need of stamping all plantation rubber with the name of the estate or with some other mark of identification.

Mr. Baxendale visited quite a number of the leading factories in the United States and Canada, and gives a great deal of information regarding American manufacturing processes that cannot but be of interest and value to the Eastern rubber growers.

One manufacturer recommended, in order to bring about a uniformity of importations, that a plant, or plants, be established on the estates for testing the rubber before it is shipped out; these plants to consist of the following apparatus: First, an acetone extracting apparatus to ascertain the percentage of resin; second, a machine for testing tensile strength; third, a mixing machine; fourth, a vulcanizing plant, and fifth, a miniature washing plant—the expense of such a testing laboratory, where it is too much for one estate, to be borne by a group of estates, all of them utilizing its facilities. This same manufacturer said that he was prepared to pay from 5 per cent. to 10 per cent. over the current prices if he were assured of the rubber's uniformity up to the following standard:

Tensile strength.....not less than 1,750 lbs. per square inch.
Stretch.....not less than 6½ times.
Resin.....not more than 2 per cent.

Mr. Baxendale quotes another large manufacturer as saying that he had placed his first order for plantation rubber since visiting the New York Exhibition, adding that no information that he had ever received before through correspondence or conversation had aroused anything like the interest in his mind in the product of the Middle East that had been inspired by his personal inspection of the fine exhibits in the Malaysian and Ceylon courts. Mr. Baxendale speaks of the great care that should be taken in the using of artificial coagulants and the necessity of keeping them at the lowest possible limit. He says the general opinion among manufacturers seems to be that acetic acid if used in very small quantities is harmless, but that no other coagulant should be used in the bulk until there is absolute proof that it can be used without injury.

He states his conviction that Mr. Manders and those associated with him in organizing the exhibition held in New York have done a very genuine service to the plantation industry, as it enabled the planters to bring their product before the personal attention of their best customers, and he concludes his report as follows: "I must express my appreciation of the kindness I received in the United States and Canada, from all the leading representatives of the trade. The freedom with which manufacturers discussed every detail of their business and accorded their permission to use any information they gave me for this report, is the best evidence that their experience with plantation rubber has been sufficiently satisfactory to encourage their desire to improve the acquaintance."

IMPROVED APPLIANCE FOR CUTTING RUBBER.

THE "Ceylon Observer" quotes the following description of a patent application which has been accepted by the Registrar of Patents:

"Improved appliances for cutting rubber whether in sheet or crepe or otherwise and other substances.

"The appliance consists: (1) Of a long knife hinged at one end to a table and capable of moving about that hinge in a vertical plane, being guided in that plane by providing large vertical surfaces of contact at the hinge as well as, when necessary, by providing a vertical spring guide or guard at the end of the knife farther away from the hinge and against which the knife bears in its descent; (2) of a blade fixed in a vertical plane to the table and against which the side of the movable knife bears and so provides the shearing action required.

PRINCIPLES OF PLANTATION RUBBER CULTIVATION.

THE history of plantation rubber is one of the most prominent features of modern commercial progress. Beginning with the despatch of Pará seedlings to Ceylon in 1876 by H. A. Wickham, the pioneer in this work, it has assumed enormous proportions and is still growing. As the German Colonies have been among the last to take up the question, interest attaches to a paper read by Dr. E. Marckwald at the recent Congress of Applied Chemistry, entitled "The Treatment of Rubber on Plantations, with Particular Reference to Personal Experiences."

Dr. Marckwald last year visited German East Africa and published his experiences in a booklet reviewed in THE INDIA RUBBER WORLD of March 1, 1912 (p. 269). This paper deals with the general question of plantation rubber, and thus brings out various new points, following up and supplementing his previous remarks.

SCIENTIFIC PLANTING.

It might have been expected that the mistakes committed in the German colonies, caused by insufficient experience, would have been avoided elsewhere, but such has not been the case. Even in the English colonies, it is remarked, scientific and practical tests have not been carried out to the anticipated extent. It is added that today the best wild rubber, Brazilian Pará Hard Cure, is so far superior to plantation rubber that the latter, notwithstanding its attractive appearance, cannot be used in articles of high quality.

HISTORY.

The history of plantation rubber is dealt with, its well-known features being brought out. Its first beginning is said to have been in 1861, when the Dutch forest authorities established *Ficus* plantations in Java, which by 1864 had attained a certain degree of importance. Being, however, neglected, they fell off, so that the despatch of seedlings to Ceylon by Mr. Wickham in 1876 was really the start of the industry, the aggregate production of which in 1911 was about 14,000 tons. This quantity, it has been estimated, will be doubled in 1913. The favorable regulations made by the government of the Malay States contributed to the growth of plantations in that quarter. Lands are there leased for the duration of one life, at the rate of one dollar per acre per year, until the trees are in bearing, when the rent is advanced to three or four dollars a year.

GERMAN POSSESSIONS.

The German plantation industry dates from the year 1892, when cuttings of *Hevea* were first sent from Ceylon to Kamerun. It would seem that the German authorities, in their justifiable attempt to remedy abuses, have shown themselves disposed to place obstacles in the way of planters acquiring concessions of lands.

PRINCIPLES OF RUBBER PLANTING.

In covering this subject, Dr. Marckwald touched on its detailed features:

SEEDS.—The selection of seeds is a point which, in his opinion, does not receive sufficient attention in any country. Sowing takes place without any discrimination, and to the planter's astonishment, trees planted on the same soil, with the same girth and tapped at the same time, give yields differing as much as tenfold. This fact indicated the mixed planting of high and inferior grades of seed.

PLANTING.—After dealing with the question of the best time for planting, Dr. Marckwald controverts the assumption that trees with a large number of branches give more profitable yields. On the contrary, the cost of tapping in such cases is 30 per cent. more than the normal rate, which reduces the profit.

DISTANCE.—Plantations being usually valued in accordance to the number of trees, efforts are made to plant as closely as possible. The Malaya plantations were some years ago planted on the scale of 12 x 12 feet, but the average scale is now 17 x 17 feet. Doubts were expressed whether the latter distance ensures the best results, while narrow intervals hinder the tree from developing its fullest dimensions. The yield of *Castilloa* per tree in German New Guinea was increased by widening the distance for planting, from 1 ounce to 9 ounces per tree within a few years. *Manihot* plantations in German East Africa, Dr. Marckwald found, planted 7 x 10 feet, 10 x 10 ft. or 10 x 17 feet, while he considered 17 x 17 would have been right.

TAPPING.—The various methods of tapping in different countries were discussed. With regard to tapping knives, of which new models are constantly appearing, it is recommended to have a different construction for the different varieties of tree. The fundamental conditions are that they should be cheap and simple, easily and quickly handled by the tapper, and that their use will not injure the tree.

COAGULATION.—Dr. Marckwald expressed the opinion that the proper methods of coagulation cannot be determined in a general way, but require to be decided according to local circumstances. After dealing with the various methods hitherto used, he referred to the success which had attended his efforts in conjunction with Dr. Fritz Frank, to introduce into the rubber in the process of coagulation certain salts from the soil which gave exceptional nerve. Another process of a German expert was intended to prevent the giving off of any injurious substances from the milk during the coagulation. The combination of these two processes seemed to him destined to operate a complete revolution in the matter of coagulation, and to allow of the production of rubbers, on the one hand superior in nerve to all those already known, and, moreover, possessing remarkable durability.

The question of the right choice and preparation of the ground for planting and that of manuring were likewise dealt with in this interesting paper.

In conclusion Dr. Marckwald remarked:

"The future belongs to plantation rubber, but only to the rubber of those plantations which are rationally planned and conducted; on which favorable labor conditions prevail; which have sufficient capital at their disposal and which send into the world's markets first-class standard qualities, as part of the production of their respective countries."

A FAMOUS SOUTH AMERICAN EXPLORER.

THERE are very few American explorers who have done as much genuine exploring and who have had as many moving experiences as Edgar Beecher Bronson, and still fewer who have written about their experiences in such an interesting way. Everybody who follows the literature of exploration and discovery will remember the absorbing book, "In Closed Territory," which appeared two years ago, which gave a description of Mr. Bronson's quest after big game and general information in British East Africa, where he covered much of the same territory traversed by Mr. Roosevelt a year or so later.

Mr. Bronson has recently returned from a two years' tour of discovery through the rubber countries of South America. He entered Colombia from the Pacific Coast in the spring of 1910, and in the course of his extensive travels traversed Ecuador, Peru, Bolivia and a considerable part of Brazil. In December of 1911 he started down the course of the Madre de Dios River, which ultimately finds its way into the Mamoré River. He then went over the length of the Madeira-Mamoré Railroad, just opened, and landed in Pará in May, 1912. He had with him a considerable body of men for field work, and devoted himself especially to a careful study of the sources of crude rubber supply in the great rubber basin of the upper Amazon. Just when Mr. Bronson will give the result of his two years' sojourn in the heart of the rubber country to the world is uncertain, but when he does it will be something worth reading.

The Philippine Rubber Planting Industry.

PHILIPPINE rubber has for some time been discussed, first as a possibility, then as a probability, and later as a certainty. It has, however, been reserved for the International Rubber Exposition to show the actual product.

Rubber planting has made its chief progress in two of the Philippine provinces—that of Moro, which includes the large

EIGHTEEN-MONTHS-OLD PARA RUBBER.
[BASILAN PLANTATION CO.]

island of Mindanao, in the southern portion of the group, and its tributary island of Basilan at the southwestern extremity, and the Province of Mindoro, comprising the island of that name, in the western part between the islands of Mindanao and Luzon (Manila). It has been estimated that the total area under rubber in the Philippines is about 6,000 acres, of which, roughly speaking, about 3,000 are in the province of Moro, 2,500 in Mindoro and 500 in other provinces.

In Moro province is situated the plantation of the Rio Grande Rubber Co. of Cottabato, of about 2,000 acres, planted in 1910, and that of the Basilan Rubber Co., with about 700 acres, as well as some other companies. The province of Mindoro has about 2,500 acres planted, of which approximately 1,000 are estimated to belong to the Baco Rubber Co., and about the same to the Sellner Rubber Co., while the remainder is represented by the plantings of smaller companies. The bulk of the Mindoro as well as the Moro planting has been done since 1909.

That company having been the first to place Philippine rubber on the market, it was appropriate for the government of Moro Province to appoint Dr. J. W. Strong, general manager of the Basilan Co., Island of Basilan, Province of Moro, to the post of Commissioner to the International Exposition. Interest therefore attaches to his estimate of the total Philippine plantings in various years.

Acreages planted in various years.

Year.	Approximate acreage.
1905	360
1906	360
1907	1,200
1908	1,200
1909-11	2,880
Total	6,000

Of these, 90 per cent. are in *Hevea* and 10 per cent in *Castilloa*. It is anticipated to increase the area planted next year, particularly if certain proposed arrangements are carried out by American capitalists.

The Basilan Co. has 660 acres planted in the following years:

	Acres.
1906	40
1907	10
1908	30
1909	..
1910	70
1911	250
1912	260
Total	660

These quantities are practically all in *Hevea*, and it is expected to add 500 acres more next year.

It is of interest to note that the bulk of the companies now cultivating rubber are understood to be working with American capital.

PLANTING PHILIPPINE RUBBER.

It took eight years from the time of the American occupation for the first planting of Basilan rubber of 40 acres to be ef-

FIVE-YEAR-OLD PARA RUBBER.
[BASILAN PLANTATION CO.]

fected, in 1906. It is the result of the early plantings which is now reaching maturity in the form of the rubber being shipped and exhibited, shown at the recent New York Exposition, by the Province of Moro, on behalf of the Basilan Plantation Co. This

company claims to have been so far the only one to show the finished product and to ship Philippine rubber. Although its rubber has up to the present only entered the American market on a very limited scale, it has within the last few years been favorably received in Europe, particularly in London and Hamburg. One of the first shipments made realized in May, 1910, at auction in London, the equivalent of $2.63 per pound, and has ever since commanded about the top price.

VARIETIES PLANTED.

Although at first *Hevea* Ceara, and *Castilloa* were tried, the first-named became the most important, it being estimated that 90 per cent. of the acreage at present planted is in that variety, the balance being distributed between the others. The various

SIX-YEAR-OLD PARA RUBBER.
[BASILAN PLANTATION CO.]

grades were represented among the samples exhibited at the recent exposition. The *Castilloa* virgin scrap exhibited is the first *Castilloa* tapped in the Philippines.

SHIPMENTS OF BASILAN RUBBER.

The first small shipment (of Ceara rubber) was made in 1909 to Hamburg, subsequent shipments being Pará. A quantity of 130 pounds was shipped to London in 1910, while 600 pounds were shipped to Hamburg in 1911. Arrangements have been made for shipments to Gravenhorst & Co., New York, thus following up the success achieved in Europe.

An official report confirms the statement of the Moro Province Government that the Basilan Co. is the only one at present actually producing rubber, out of some eight rubber companies established up to the present in the Archipelago.

PROSPECTS OF PHILIPPINE RUBBER.

By the extent of the plantings since 1909, it is evident that large interests are involved in Philippine rubber, which tend to assure its development. It may, therefore, be of interest to glance at the physical conditions under which it is being cultivated.

CLIMATIC CONDITIONS.

Large quantities of Government land can be secured on the easiest terms, and the Philippine soil, it is claimed, is not surpassed by that of any rubber-growing district in the world. The annual rainfall of 100 inches is evenly distributed throughout the year; while being out of the typhoon belt, there are no storms; the temperature rarely exceeding 92 degs. F. In fact, the Philippines have been described for centuries as essentially a "white man's country."

The location of Moro province is an ideal one, its most northern point reaching nine degrees north of the equator; the limit in which *Hevea* rubber does best, being within a zone ten degrees north or south of the line.

COST OF PRODUCTION.

The various elements of cost of production have been carefully analyzed by the Moro Province Government. According to its estimate, new land can be brought into cultivation for a price per acre of $50.94, as compared with $73.60 in Sumatra, $109.94 in Java, and $137.42 in the Straits Settlements.

The relative costs of upkeep per acre are quoted: Moro Province, $18; Sumatra, $20; Java, $23; Malay States, $29. It is claimed that an acre of Pará rubber can be brought into bearing (fifth year) for $100, covering all charges, including cost of land.

Rubber is usually planted from 100 to 150 trees per acre. As the yield increases year by year, the cost of production gradually diminishes. From carefully-kept statistics, five-year-old rubber trees have averaged three-quarters of a pound per tree, against estimates by world's experts of half a pound for trees of that age. This brings the cost per pound of dry rubber of finest quality, ready for shipment, to 33 cents per pound, which can be reduced as the yield increases with age. Abundant native labor is procurable at 20 to 30 cents per day, United States currency, of a character far excelling that of other rubber countries. There is, moreover, a very efficient contract labor law.

TAPPING AND PREPARATION.

The trees are tapped in the early morning, being finished by 10 a. m., when the tappers are available for other work. The latex is coagulated at the factory with acetic acid or other coagulant, the operation taking from one to two hours, and the surplus water expelled by wooden or metal rollers. The rubber is then placed on galvanized woven wire racks to dry. After drying, if so desired, it is smoked, when the sheets, crepe or biscuits are ready for packing.

ESTIMATE OF ACREAGE APPROACHING PRODUCTIVE STAGE.

While the Moro Government Commissioner's estimate of the total planted area in the Philippines is 6,000 acres, the official estimate of the Director of Agriculture places the acreage in promising rubber trees (approaching the bearing stage) as about 1,250 acres. The acreage on paper, it is added, might amount to 125,000 acres.

The official report attributes the failure of the hundreds of thousands of Pará seedlings within the last few years, to drought, unsuitable location, natural enemies, improper planting of seeds, transplanting of young trees and mistakes in management.

Only Pará rubber, it is stated, is now considered of value on the plantations, Ceara and *Castilloa* having in most cases been abandoned, owing to their inability to withstand droughts and strong winds and their variability in yield of latex.

It is understood that the Philippine government will shortly

endeavor to compile a detailed statement of the acreage of rubber in the Philippines, respecting which the data hitherto available are insufficient.

The climate being the finest in the Far East, the Moro Province Government believes it has the best rubber-growing country in existence and predicts a brilliant future for Philippine rubber. Moro Province, it will be recalled, is the most important center of Philippine rubber cultivation.

Rubber-Growing in the Philippines.

By Richard Arthur.

IN 1906 the value of plantation rubber exported from the Middle East was $1,250,000. Last year it was about $30,000,000. In the near future there is no doubt whatever that it will run up to $100,000,000.

"The romance of plantation rubber," says H. Kerr Rutherford, formerly Chairman of the London Rubber Growers' Association, "is the old, old story. A few resolute men working in Eastern jungles, having faith in the ultimate success of the work they had undertaken: hampered by want of capital, but undismayed by the carpings of the pessimists, they doggedly forged ahead to their goal. Some of the pioneers did not live to see the fruits of their labor, but many have been fortunate in bringing in their sheaves, and a host of outsiders, although never having seen a rubber tree, have, from the persevering efforts of these men, reaped a harvest where they had not sown."

The growing of rubber—"the exciting business of running a tree dairy," as someone has called it—is one of the greatest agricultural opportunities in the world today. The English have got a flying start in this venture. English agricultural science, English commercial activity and English capital are largely responsible for the creation of the vast rubber plantations which have come into being in the Malay States, Ceylon, Borneo and the Dutch East Indies. Lately considerable American capital has also been invested in rubber planting in these Eastern countries. But even now the United States is comparatively timid and backward in this respect. And yet this country has an enormous rubber field waiting to be planted—the Philippines. Here are millions of acres of public lands eminently suitable for rubber growing, that may be leased or purchased at a small figure. Labor is not difficult to find, and catch-crops can readily be grown on the same land while the owner is waiting for the rubber trees to mature.

A serious mistake was made, some years ago, in planting a large number of Ceara trees in the Philippines. Experience has shown that these are liable to damage by wind, and it is now an accepted fact that the best possible rubber tree for plantation purposes is the *Hevea Brasiliensis*. There is no hard and fast rubber belt as some experts claim, for the authorities concede that almost the whole extent of the Philippines has climatic and soil conditions favorable for rubber. Trees grow in the vicinity of Manila with the same luxuriance that they show in Mindanao and the islands of the Sulu Sea. In fact, rubber is being grown in Singalong, an experiment station in Manila, and across Manila Bay in Bataan province is the Abucay rubber plantation where two-year-old trees are now 20 feet high. In the island of Basilan are the Basilan Rubber Plantation Company, which has harvested rubber, and the San Rafael Rubber Company, whose trees are making a record for growth.

From Manila to Basilan is 600 miles in a direct line, and it is absolutely proven that all this area, at least, is rubber land, since rubber is growing healthily at its extremities.

Rubber growing in the Philippines is no longer an experiment; several of the existing companies are ready to tap, and one or two of them are already exporting rubber. Some of those whose trees are ready for tapping refuse to stop their work of planting, saying that the trees they are planting now are more of an asset than the small amount of revenue that present tapping would yield. They are working for a large output in the future rather than to make a present small profit.

In Mindanao, the Basilan Rubber Plantation Co. has produced and exported crude rubber for about three years. The San Rafael Rubber Plantation Co. have over 20,000 rubber trees, some of them large enough to tap, and they are planting out another 100,000 seeds and seedlings. Near Nueva Caceras in Ambos Camarines province, Mr. R. Richmond has a Pará rubber plantation of 10,000 trees, four years old, that are doing splendidly. The Abucay Rubber Plantation Co. near Abucay, Bataan province, have 40,000 Pará rubber trees two years old, and they have planted and are planting 100,000 more from the nursery. The Lapac Plantation Co. on one of the southern islands near Jolo, has a hopeful growth of rubber trees nearly ready to tap. Two companies, financed by Seattle capital, have been organized to plant rubber in Davao; and American and English residents of Manila have formed the Baco River Plantation Co., which this year planted 65,000 seeds in its nursery in Mindoro. This company has brought an expert from the Straits Settlements to manage its enterprise.

Wherever the trees in the Philippines are of an age suitable for tapping, the yield of rubber, says the government expert, is equal in quality to that obtained in the most favored localities in the East.

Besides having maintained for several years a conservative interest in the rubber industry in the Philippines, and having published numerous technical articles on the subject, the Bureau of Agriculture in the Philippines has arranged to distribute to the proper centers some 50,000 Pará seedlings; these young plants will be put out under the direction of the Bureau, and will be carefully watched until well established. It is believed that none of the dangerous fungus diseases which affect rubber in other countries have been introduced into the Philippines along with the seeds, which were obtained from Malaya. Nearly all districts of the Philippines, with the exception of Mindanao and some of the southern islands, are subject to a dry season, but the Bureau of Agriculture believes that in many otherwise unfavorable localities the soil about the roots of the young seedlings can be kept sufficiently cool by the new system of leguminous "blanket crops," thus preventing injurious packing and baking by the sun. Many of the failures that have been experienced with young Pará seedlings have been due to the neglect of the planters to furnish this necessary protection to the roots. Many of the planters have only recently learned in the expensive school of experience, that there is a tremendous difference in this connection between grass and plants of the legume family: grass roots excrete poisons which injure the roots of the rubber, whereas legume roots furnish a concentrated form of nourishment with no drawbacks or dangers whatever.

To all actual and prospective rubber planters in the Philippines, the Bureau of Agriculture extends the "glad hand," and stands ready to advise and to assist them as much as possible in the matters of site location, seed, plantings and general culture. With this valuable assistance and the experience of planters in other eastern countries to guide them, the planter of rubber in the Philippines has a first rate chance of obtaining a high degree of success.

Tapping Rubber Trees by Electricity.

SINCE Columbus' Day—and for nobody knows how many centuries before—rubber trees have been tapped in the same old way. An Indian with a machete or some other instrument has cut, hacked or gouged the tree, and placed a little clay cup—or in later years a tin substitute for the clay cup—under the cut for the latex to trickle into. Then he has gone laboriously around from one tree to another, emptying the latex into a gourd, emptying that in turn into a larger receptacle, and then dipped his paddle into the latex and held it over the palm-nut smoke until it coagulated. It has all been done by tedious, individual effort that finally secured the rubber, but very slowly and at great expense. It is not to be wondered at—considering these primitive methods—that rubber, ever since its usefulness became known to civilized man, has sold for $1, $2 and even $3 a pound.

But it looks as if all this might at last be changed, for here comes a scientist, Georg M. von Hassel, a German by nationality, but a Peruvian by many years' of residence, a civil engineer by profession, but an explorer by preference, and employed by the

ELECTRICAL TAPPING DEVICE ATTACHED TO A RUBBER TREE.

Peruvian Government for many years to explore the resources of its rubber territory, who has devised a method of extracting the rubber from the tree, which, if not instantaneous, is at least so rapid and efficacious in its operation that it is likely to supersede the ancient methods of the natives, if it works out in practice as it has given promise of doing in the various tests to which this process has been subjected. Mr. von Hassel's method is

SHOWING THE WIRE CARRYING THE ELECTRICAL CURRENT FROM TREE TO TREE.

nothing less than touching the button, and letting electricity do the rest.

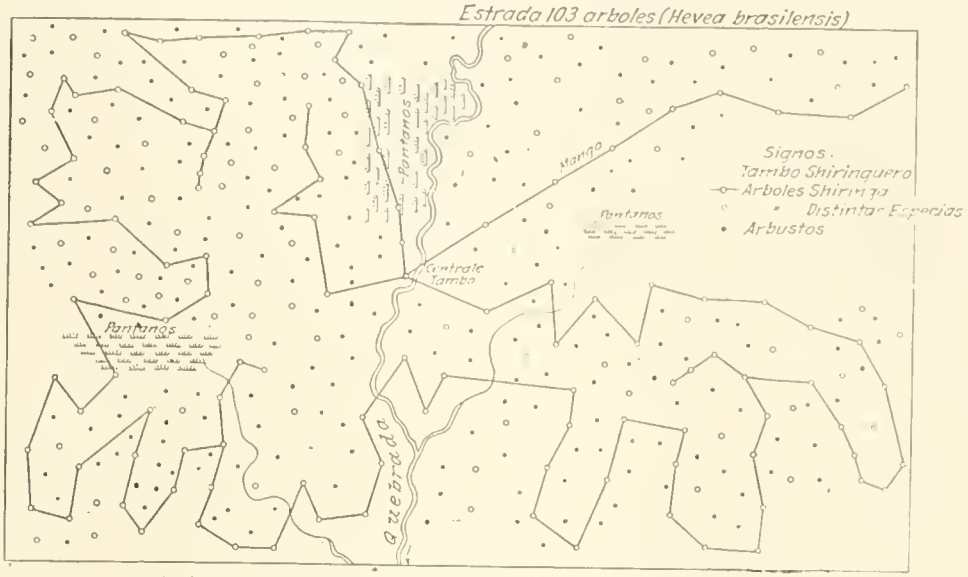
Here briefly is the apparatus that he has devised. He places upon the trunk of the rubber tree a piece of sheet-iron about 5 feet long, 5 inches wide, with the two sides folded back against the tree to a thickness of about 2 inches, constituting a hollow channel of sheet-iron. This hollow channel is divided into a series of fifteen to thirty sections; the number of sections depends upon the number of days the apparatus shall be worked. Each section has a mechanism for the extraction of the latex from the rubber tree and a receptacle for receiving the flour, which also contains a preparation for the coagulation of the latex. When working *Hancornia* and *Castilloa* trees, plates provided with longitudinal canals are used instead of the receptacles for gathering the latex, and the product thus obtained is known as "Sernamby." This product is gained in the form of threads without the aid of acids or other chemical substances.

The method of operating is as follows: This channel of sheet iron, with the above-described mechanism and receptacles, is fastened against the rubber trees. If it is a small tree there will be two of these devices; if it is a large tree there may be as many as nine circling the tree and about a hand-span apart. This apparatus is connected by an insulated wire with a central station which is equipped with electric power. A machine devised by the inventor makes it possible to send the electrical current so that it will set the first section in motion. The latex then oozes out and flows into the receptacle immediately beneath. In the receptacle there is an acid preparation that coagulates the latex, converting it into rubber. The next day—or preferably 48 hours later—the current is turned on again affecting the second section, which in turn pricks the tree, bringing forth the latex which drips into the second cup and is there similarly coagulated. After another interval of two days, the third section is set in motion, and so on for the fifteen to thirty sections which are operated from the central station, tapping the tree and filling the receptacles with rubber.

No one need approach the tree until the expiration of sixty days, when a handful of rubber will be found in each of the receptacles, and on a large tree where there are nine of these

devices—each with thirty cups—there will be 270 lumps of coagulated rubber waiting for the gatherer.

The same current that does the work on one tree can do the work on 5,000 trees by simply equipping that number of trees with these tapping devices, and connecting them by the insulated wire, so that the electrical current can be communicated. In actual tests, already made, between 50 and 60 trees have been tapped at one time from the central station.



A GROUP OF WILD RUBBER TREES CONNECTED BY THE WIRE WITH THE ELECTRICAL TAPPING APPARATUS.

The advantages of this system are obvious. Mr. von Hassel enumerates them as follows: First, the tremendous saving of labor, one man being able to do the work of 40 under the old system; second, the ability to tap trees in the swamps which cannot ordinarily be approached by the tapper; third, the fact that the trees can by this process be tapped very early in the morning before the sun is up, when the latex flows more freely; and fourth, the fact that by this process the trees can never be injured, the punctures made by the apparatus being so small as to heal very rapidly.

The accompanying illustrations give some idea of this method: The first photograph shows three of these sheet iron devices attached to a tree, together with the insulated wire that supplies electricity. The second photograph shows this apparatus on two different trees with a connecting wire. The third is a chart, illustrating the course followed by the wire running from the central station through a group of rubber trees.

The inventor is highly gratified with the success of the various tests his apparatus has been given, and expects to see it entirely supersede the present primitive methods of gathering rubber in the South American jungles.

The labor question has been the most difficult one to solve in the gathering of rubber in the Amazon country, but if Mr. von Hassel's electrical appliance is found, when tried out in a large way, to work satisfactorily, the Amazon labor question will have been solved; and if this apparatus proves practicable in the wild jungles of South America, it can certainly be operated even more efficaciously under the easier conditions of the plantations.

THE WEST COAST RUBBER COMPANY.

This company, which now has a capital of $250,000, expects soon to increase its capital to $500,000. The new issue will be devoted to increasing the plantings of rubber on the property in Guatemala. The property covers 22,000 acres and is located near the port of San José on the Pacific side. They now have 200,000 *Castilloa* trees planted, but expect to put out some *Hevea* next season. They have been shipping rubber each month for about four years except during the dryest months. This rubber was obtained from the wild trees on the property which are estimated to number about 300,000. A shipment is said to have brought within 3c. a pound of the price for Up River Para.

OUR DEBT TO THE TROPICS.

THE report sent out about the middle of November by the Department of Commerce and Labor of the Federal Government has to do with tropical imports into the United States, and contains a number of exceedingly interesting items. The value of the imports into this country from the tropics as shown last year is $750,000,000. One-half of this consists of foodstuffs, sugar leading with a value of $200,000,000, coffee coming next, with $100,000,000. In manufacturers' materials rubber leads by a considerable margin with a value of $100,000,000. The importation of rubber from the Tropics has increased from 58,500,000 pounds in 1900 to 125,500,000 pounds in 1912, the value having increased from $32,000,000 to $100,000,000. The largest contributor to the entire $750,000,000 worth of imports from the Tropics is Brazil, and, of course, Brazil is by far the largest contributor of our crude rubber. The United States takes over 36 per cent. of the exports from Brazil, but of the Brazilian imports less than 13 per cent. represents goods from the United States, showing that to keep up an equality of trade we ought to increase our exports to Brazil by 200 per cent.

ANTICIPATED SURPLUS IN CUSTOMS' RECEIPTS.

ACCORDING to the statement of Acting Secretary James Freeman Curtis, of the United States Treasury Department, the deficiency in customs receipts for the year ending June 30 last, (which he had estimated as compared with the previous year at $18,000,000), only turned out to be $4,000,000.

During the new fiscal year customs' receipts have exceeded by $10,000,000 those of the corresponding period of 1911. Should this improvement continue, he anticipates for the current financial year ending June 30, 1913, a surplus of $50,000,000. In Mr. Curtis' opinion the situation is all the more remarkable in view of the continued agitation for a revision of the tariff downward. There is no way, he adds, to explain the heavy customs receipts except on the theory that importers no longer stand in awe of politics or prospective tariff legislation.

THOUGHT IT PROPER TO TIP REPORTERS.

In the course of the inquiry now being held in the House of Commons as to the responsibility of the British directors of the Peruvian Amazon Co. for the Putamayo atrocities, a newspaper reporter gave evidence that when he was inspecting the charges against the company's directors one of the officials handed him an envelope containing a bank note and told him that this was in recognition of the trouble the reporter had taken, but that the company preferred not to have anything further printed about the charges. The reporter returned the money, and later the chairman of the directors stated, by way of explanation, that the tender was made by one of the foreign directors, who thought it was customary to tip reporters.

NEW TRADE PUBLICATIONS.

THE October number of "The Goodrich," which, by the way, is No. 2 of Volume 2, is, like its predecessors, full of interesting matter and attractive illustrations. The cover is an excellent example of art in commercialism; it shows a night view of Akron, with the big Goodrich mills ablaze with light, and this night landscape is framed in by a cross section of a Goodrich tire.

In the reading matter of this number the important place is given to an article "On the Dawson Trail With Goodrich Tires," by J. C. Manning, who describes the famous Dawson trail, and, incidentally, speaks of "the record of a set of Goodrich tires on a 1909 model Winton Six which, in less than two years, has covered 9,000 miles under the most primitive road conditions to be found on the North American continent. And the tires are still in good condition; they have not cost a penny for repairs or replacement up to date, and apparently have still left in them a few thousand more miles of useful life." This article is generously illustrated.

Easterners have an idea that in matters of art—printing, for instance—they are considerably in advance of their friends in the extreme West; but this is only another one of those superstitions that have come down from the fathers. Here is a catalog issued by the Boyd Rubber Co., of Seattle, coast agents for the Apsley Rubber Co., which shows that just as good commercial printing can be done along the Pacific seaboard as along the Atlantic.

This is a catalog of 72 pages and cover, 4 x 9 inches in size (just a convenient shape for the coat pocket), and contains a great deal of information in compendious shape regarding the rubber lines carried by this company.

A NOTABLE CATALOG.

Combining all the advantages of careful preparation and artistic execution, the new assembled general catalog of the Boston Woven Hose and Rubber Co. ranks among the highest of its class. It is seldom that, even in these progressive days, such completeness in design and execution is met with.

A prominent feature of the catalog is the practical form in which the company's production is classified. Rubber belting, rubber hose, garden hose, fire hose, matting, insulating tape, tubing and molded goods, jar rings and brass fittings, form the links in the chain of the company's products, and are conveniently indicated by marginal indexes, so that the reader can at any time refer to a particular branch.

The general advantages of rubber belts are concisely dealt with in the earlier pages of the catalog, followed by an illustrated description of the fifteen standard brands in which rubber belting is made. Canvas beltings are then taken up in their standard grades, while valuable details as to lacing and putting on belts lead up to a code of "Handy Belt Rules," intended to help users of belts to profit by them to the utmost extent.

Another equally interesting phase of the company's manufactures is the section devoted to hose, with its subdivisions of water, suction, steam, pneumatic, vacuum and railroad hose. These various uses of hose are appropriately illustrated by representations of their application, this forming one of the many attractive features of the catalog.

The domestic uses of the company's products are illustrated by the sections for garden hose, matting, tubing and jar rings, while the importance given to fire hose will be appreciated not only by fire fighters, but by property owners who desire to keep abreast of the latest improvements in that line. The molded goods section includes rubber heels, bath brushes and other specialties.

But apart from its other merits, this comprehensive catalog appeals to the buyer or purchasing agent by its practical features, being frequently interleaved with plain or ruled paper. Its size, about 7 x 8, gives it breadth of beam, allowing of the text and illustrations being effectively displayed. It is printed on a heavy coated paper and the typography is in harmony with its other high-class features.

While the varied extent of the company's products give importance to this catalog (of 300 pages), the manner in which they have been presented calls for special notice. While the numerous illustrations are usually on a white ground, the text is generally upon a delicate Nile ground, which brings up the type most effectively. Nearly every page either carries or faces an illustration; the high character of the artistic work meriting special commendation.

Two distinctive features enhance the usefulness of the catalog. It is on the loose leaf plan, so that any desired portion can be easily removed and replaced, while its flexible leather cover adds to the convenience of using it.

The whole catalog reflects the highest credit upon all concerned in its preparation.

A HANDSOME JUBILEE SOUVENIR.

GERMANY is admittedly the home of the factory jubilee, in which the work of several generations culminates in a festive celebration, shared in with like enthusiasm by the heads of the concern and by its youngest workers. More than usual interest has attended the festivities, marking the fiftieth anniversary of the Hannoversche Gummi-Kamm Co., A. G., now styled the "Hannoversche Gummiwerke 'Excelsior' A. G.," which took place a short time ago.

Through the courtesy of Mr. Julius Lehmann, vice-president of the Hanover Vulcanite Co., the American branch of the concern, THE INDIA RUBBER WORLD has received a copy of the elegant souvenir, lately issued in connection with the celebration. This "Jubiläums-Festschrift" records in the highest style of graphic and pictorial art the chief features of the occasion.

Turning to its various pages, the reader first meets a striking representation of the factory at its various stages—in 1862, 1870, 1880, 1892, 1899 and 1912, together with portraits of the general director, Herr Georg Heise, Royal Prussian Commercial Councillor; Director Wilhelm Siercke, Director Gustav Bartl, and Herr Hans Breul, chairman of board of inspection. Herr Heise entered the company's service in 1872, Herr Siercke in 1886, and Herr Bartl in 1873, these three gentlemen constituting the present management.

Next in order come scenes from the dramatic representations which marked the occasion, in which the staff took part. These included a "Rubber Ball Ballet."

The "History and Gathering of Crude Rubber" are illustrated by representations of tapping, gathering and smoking, with appropriate explanatory text. In another series of illustrations the various processes of manufacture are shown, commencing with the examination of the crude rubber and taking the reader through the various operations of washing, mixing, calendering and other processes. Next follow the pages dealing with the production of combs (the original specialty of the company, from which its earlier name was derived). The various stages of manufacture and packing are effectively illustrated. In following pages the manufacture of hard rubber is dealt with, leading up to that of pneumatic tires, which gives prominence to the "Excelsior" tire. Rubber toys, surgical and sanitary articles, rubber sponges, heels and other branches are next dealt with.

The work appropriately concludes with a series of views of Hanover and Hanoverian life, artistic specimens of color printing, supplemented by highly interesting descriptive text. The form in which the souvenir has been got up reflects the highest credit on all connected with its preparation.

The Editor's Book Table.

THE DETERMINATION OF TOTAL SULPHUR IN INDIA-RUBBER. By C. E. Waters, associate chemist, and J. B. Tuttle, assistant chemist, Bureau of Standards. Reprint 174. Washington, 1912. [Paper, 9 pp.]

IN this summary of the various tests for the determination of sulphur in rubber, the authors refer to that published by Henriques in 1899 as being still the usual method and too well known to need detailed description. Other methods have since been advocated, such as those of Alexander, with sodium peroxide; Esch, with Eschka's mixture; Wagner, with a slight modification of Henriques' method; Pontio, with manganese peroxide and a mixture of sodium and potassium carbonates; Hinrichsen, with nitric acid; and, finally, Hübener, with concentrated or fuming nitric acid and bromine, intended to exclude insoluble mineral sulphates.

Having frequent occasion to determine the total sulphur in rubber, one of the authors made a number of comparative tests of different variations of the Henriques method. These tests were made with two samples of rubber each of 0.50 gram. The proportion of sulphur, as shown by five series of tests, varied from 2.93 to 3.71 in the twenty separate tests.

In an attempt to obtain satisfactory results without fusion, and without a knowledge of Hübener's paper, determinations were made several months later. After Hübener's paper had been called to the attention of the authors, some further determinations were made on a sample of hard rubber containing no barium. These determinations (22 in number) were made with variations of the Hübener and Henriques methods, full particulars of which are recorded.

In their concluding remarks, the authors call attention to the fact that treatment of the rubber with nitric acid alone gives low results, this being probably largely due to loss of free sulphur; since nitric acid alone does not completely oxidize sulphur to sulphuric acid in the length of time usually taken for a determination. The fusion method gives results very close to those obtained by direct precipitation and by neutralization. The best results, in the authors' opinion, seem to be obtained by the use of the method, according to which the rubber is decomposed by means of nitric acid saturated with bromine; this being apparently a modification of the Henriques method.

The treatment of the subject indicates much laborious research and investigation on the part of the authors.

LEADING AMERICAN INVENTORS, BY GEORGE ILES. New York, 1912. Henry Holt & Co. [Cloth, 448 pages.]

Forming part of a series of "Biographies of Leading Americans," this compendium of the lives of a dozen leading American inventors of note contains a wealth of acceptable reading, particularly appealing to those interested in one or another of the branches of industry dealt with.

Seeing the diversified nature of American invention, Mr. Iles has had a difficult task in selecting representative names, but has been successful in his efforts.

John and Robert Livingston Stevens, those pioneers of marine and railroad engineering at the commencement of the last century; Robert Fulton, who developed the steamboat; Eli Whitney, the inventor of the cotton gin; Thomas Blanchard, who made the Blanchard lathe; and Samuel F. B. Morse, the commanding figure in American telegraphy, are successively treated.

Next to these comes Charles Goodyear. The forty pages of Goodyear's biography are replete with incident, following the course of his struggles and successes. He may be said to form the central figure in this brilliant group of inventors.

In continuation of the record of American invention, the lives of John Ericsson, the greatest engineer that Europe ever bestowed upon America; Cyrus H. McCormick, inventor of the reaping machine; Christopher Latham Sholes, to whom we owe the typewriter; Elias Howe, father of the sewing machine; and Benjamin C. Tilghman, who first introduced the sulphite pulp process and the sand blast, are dealt with. Finally the story of the latest in the group, Ottmar Mergenthaler, the inventor of the linotype, is told in detail, closing with his death in 1899.

This valuable record of American invention indicates a vast amount of careful research and forms an appropriate tribute to the American inventive genius which was such a prominent characteristic of the nineteenth century.

Fifteen artistically executed portraits give a marked personal tone to the volume, while the text is supplemented by a number of illustrations.

RUBBER FACTS AND FIGURES, NO. 8. FREDERICK C. MATHESON & Sons, London.

The latest issue of this *vade-mecum* of the rubber share investor records in tabulated form the most recent information about acreage, number of trees and output, as well as dividends. One important fact is shown prominently: the number of tappable trees as compared with the total planted. Now, when production is increasing by leaps and bounds, it is necessary to keep track of the total trees and what is equally important—of the year when they will be in bearing. This last information would acceptably supplement the many other valuable points of this booklet.

DER KAUTSCHUK, SEINE GEWINNUNG UND VERARBEITUNG. (Rubber, Its Production and Manufacture.) By K. W. Wolf-Czapek, Berlin, 1912. Union Deutsche Verlagsgesellschaft. [Cloth, 8vo, 128 pages, with 50 illustrations.]

In this handy little volume, 7 x 5, is condensed a quantity of information, treated in a clear and perspicuous manner, and so divided that those seeking light on a particular subject can readily find what they want.

The scope of the work includes the sources and production of rubber, and its chemistry; as well as the questions of filling substances and rubber solutions. Vulcanization and preparations for manufacture are dealt with in a lucid way; the special subjects of hard and soft rubber goods, rubbered fabrics, hose, tires and seamless rubber goods, being successively handled. Treating the matter from a commercial standpoint, the chapter on "Rubber in the World's Trade" deals with the various classes of rubber and with details affecting their distribution.

One feature of special interest consists of the illustrations showing the inspection of rubber samples by the dealers in a London warehouse; the office of a London rubber broker with samples laid out, and the public auction of rubber in London.

Illustrations of the principal machines used in rubber manufacturing are a valuable aid to the general non-technical reader, for whom the work is largely intended, and to whom its clear explanations appeal.

ACCORDING TO A CONSULAR REPORT ENCOURAGING advices come from the Kagi district of South Formosa concerning the new rubber plantations undertaken by private capital. The rubber seed was imported from Hawaii. Nearly 50,000 rubber trees were transplanted during the rainy season and few died. The Formosa Agricultural and Forestry Co. is engaged in the rubber industry, but private plantations are said to be more promising.

THE RUBBER TRADE IN AKRON.

By a Resident Correspondent.

THE sixth building to be either built or remodeled by the Goodyear Tire and Rubber Co., was started November 16. This will be 100 x 260 and seven stories high, the construction to be absolutely fireproof, of brick, steel and reinforced concrete; estimated cost, $100,000. They are constructing two new factory buildings, remodeling a factory building, an office building and an employment office. The total approximate cost will be $400,000.

* * *

The Goodyear Tire and Rubber Co., of South America, has been organized under the laws of Maine with a capital stock of $3,000,000. The object of the incorporation as given in the certificate is to operate rubber plantations in South America and to manufacture the raw product. Several years ago F. A. Seiberling, president of the Goodyear Co. made an extended trip through South America, where he studied the rubber supply thoroughly.

It is understood that the Goodyear company has representatives in Brazil who are thoroughly investigating this rubber field. The Brazilian government is offering certain exemptions from taxation and bonuses to rubber factories, which were described in detail in the June issue (page 427) and the October issue (page 2) of the INDIA RUBBER WORLD.

C. W. Seiberling, vice-president of the Goodyear Tire and Rubber Co., says: "Our sales for the fiscal year ending November 1 approximate $25,000,000. The contracts indicate that for the coming season we will supply to car makers 200,000 sets of tires. The demand for Goodyear tires has compelled us to add three new buildings. The company has acquired the entire property of the Akron branch of the Great Western Cereal Co., located on East Market street, just west of the company's present buildings. These buildings will be used for storage until such time as it is necessary to utilize the ground for manufacturing purposes. The three latest additions aggregate 335,300 square feet of floor space, which brings the total to date, 1,935,300 square feet, which equals a factory 60 feet wide, one story high and six miles long.

* * *

The Goodyear Tire and Rubber Co., Limited, of Bowmanville, Canada, has built two additional buildings, doubling its 1911 capacity. The company has purchased and remodeled a large hotel in Bowmanville to be used as a club house and has erected a new office building in Toronto. In March, 1912, the capital stock was increased to $250,000, and in October it was again doubled.

* * *

Four hundred members of Cleveland's Chamber of Commerce —all leading business men of that city—recently made a trip to Akron on a special train, for the purpose of visiting the B. F. Goodrich Co.'s factory. The entire trip occupied six hours, two hours of this time being devoted to the inspection of the great Goodrich plant. The visitors were received by C. B. Raymond, H. E. Raymond and other officers of the company, and were divided into twenty different parties, each party with its own guide, so that the tour of inspection might be intelligently made and all questions answered that naturally would arise.

* * *

"The Goodrich" for November is called the "Fire Chiefs' Number" and is given almost exclusively to fire department news.

The B. F. Goodrich Co. is making a more thorough development in its system of training salesmen. Donald Hotchkiss, who has had charge of the Richmond branch, will have charge of the training of salesmen under the direct supervision of the heads of the sales department.

B. G. Work, of The B. F. Goodrich Co., has bought a home on Fifth avenue, New York, and will divide his time between Akron and New York.

The B. F. Goodrich Co. has opened a new store in Los Angeles, California, located at 1175 B street, with Mr. Schoenraub in charge.

Mr. R. W. Hainer, of the Goodrich company, has been elected general manager of the Electric Rubber Reclaiming Co., Barberton, O. The machinery is in place and the company is putting out standard goods.

* * *

The American Tire and Rubber Co., at their directors' meeting on November 18, passed a resolution requesting the stockholders at the next meeting to increase the capitalization from $200,000 to $500,000 to supply the needs occasioned by the growth of their business. A new addition, 40 x 50, consisting of two stories and a basement north of the present plant, has been built for the manufacture of solid tires. Machinery for reclaiming rubber and for the manufacture of steam packing is being installed. The reclaiming is said to be a mechanical process and the company claims for its packing that its longitudinal fabric is compressed in such a manner that it has a marked tendency to retain its original form, thus giving it added expansion qualities.

* * *

The St. Louis Tire and Rubber Co., whose incorporation was mentioned in the November issue of the INDIA RUBBER WORLD will have the following officers: J. A. Swinehart, of Akron, Ohio, first vice-president and general manager, in full charge of the manufacturing end; H. C. Barker, of Carter, Collins, Jones and Barker, president and general counsel; William H. Glasgow, treasurer; and the following directors: C. C. Collins, vice-president of the Missouri Lincoln Trust Co.; Roy F. Brittain, assistant general counsel of the Cotton Belt R. R. Co.; Alfred E. Einstein, vice-president and general manager of the Union Electric Light & Power Co.; and C. N. Skinner, of Buxton & Skinner. In solids, the company expects to manufacture the "Krotz" tire, and a new pneumatic tire, every layer of the fabric of which bears an equal amount of strain. The company has bought fireproof buildings, already built, and will be in a position to place its goods on the market within a short time.

* * *

On November 12 a disastrous fire of unknown origin totally destroyed the palatial summer home of F. H. Mason, first vice-president of the B. F. Goodrich Co., at Turkeyfoot Lake. The loss is estimated at between $50,000 and $100,000. The fire is presumed to have started in the upper part of the house and was not discovered until it had gained a headway that could not be checked. The house was totally consumed within two hours. The blaze was discovered by one of the servants, and all escaped injury.

* * *

At a recent meeting of the stockholders and directors of the Miller Rubber Co., reports read by department heads showed an increase of this year's business over last year's of 60 per cent. In order to handle the immense volume of business and to be in a position to fill the many orders received for next year, the company is now erecting a new factory building 150 x 75 and three stories high. The land adjacent to and formerly belonging to the Franz Body Co., has been leased by the Miller Rubber Co.

* * *

A report of the Akron Chamber of Commerce shows that Akron has 144 industries employing 34,700 persons and has an aggregate capital of more than $142,000,000.

* * *

In view of the indisposition manifested by the local transportation company to provide the necessary accommodation for the growing needs of Akron, a proposal is being considered for the city to build the required extensions. According to the opinions of prominent citizens, by having a system of its own, the city of Akron will be in a position to take over the local company's lines in 1924, when its franchise expires.

THE RUBBER TRADE IN BOSTON.

By a Resident Correspondent.

BUSINESS continues about the same as last month's report, with the possible exception of the footwear industry. This is naturally the quiet time for that branch of the trade, as the winter stocks have been ordered and delivered, and until real winter sets in, the trade will be almost at a standstill. The call for heavy goods, however, has been disproportionately large, and the manufacturers are behind their orders on heavy Arctics and Lumbermen's. The tire business is exceptionally good, and new concerns are starting to get a share of the demand, while factories already established are enlarging their capacity. It is reported that one company, whose factory is as yet a hole in the ground, has had sales which will warrant a big output as soon as the plant is ready to begin manufacturing. The clothing business continues good, and the difficulty in securing fabrics has to some extent been overcome, and orders are now being filled in a more satisfactory manner. Taken altogether the trade is in good condition from one end to the other.

* * *

The event of the month in the rubber business has been the labor troubles at the Hood Rubber Co.'s factory at East Watertown, and the threatened extension of that trouble to the American Rubber Co. and the Boston Woven Hose and Rubber Co. in East Cambridge. Early in the month the Hood company posted a notice that the factory would shut down in all departments except the packing room, and the reason given was that there were changes to be made in the calender room, and some new boilers were to be installed. Immediately the agents of the Industrial Workers of the World, who had been recruiting members among the help, announced that the closing was a shut-out, done to intimidate the unionizing of the workers in this organization, and they immediately declared a strike, and proceeded to use forcible tactics to compel or induce those workers who were not laid off to join in the strike. As a consequence some violence and much excitement ensued, and, besides a siege of the works of the Hood company, the strikers formed processions and marched by the factories of the American Rubber Co. and the Boston Woven Hose Co., demanding that the employes of these companies join their ranks. This attempt was unsuccessful, even though the organization had already secured some members in these factories. The Hood factory was somewhat in a state of siege for a few days, and during the disturbances the mob was attacked by well-directed streams of water as well as by the police. Some arrests were made, and the matter culminated when one man was found dead with a bullet in him and another so badly wounded with a knife or other sharp instrument that he was removed to an hospital. The dead man and the wounded man had both, it is reported, stated their intention of going to work when the mill opened. Arrests have been made, but at present writing the authorities are not sure they have the murderers.

Meanwhile the repairs at the factory were continued and so far completed that the factory was opened in nearly all departments except the calender room, and little or no disturbance has resulted since the above-mentioned tragedy, which seems to have served as a deterrent on the part of the agitators and the strikers. Most of the help was taken back, though some, who had been active and aggressive, lost their jobs. The organizer of the society acknowledged the strike to be a failure, and has been endeavoring to secure for all strikers the positions they held previous to the shut-down.

* * *

"What is one man's loss is another's gain." The Boston newspapers had an advertisement in their "Want Columns" offering work to rubber shoe makers, and as a consequence about a hundred rubber workers secured jobs at the Beacon Falls Rubber Shoe Co., some 35 going one day and 65 the next. It is said that none of those applying were given employment unless they could speak the English language.

* * *

The Fisk Rubber Co., of Chicopee, whose re-incorporation was mentioned in the November issue of THE INDIA RUBBER WORLD, will sell $1,000,000 of the new preferred stock, and with the proceeds will add to its facilities for manufacturing pneumatic tires for automobiles and bicycles, and will add thereto the manufacture of solid tires for commercial vehicles. The mills are being enlarged and an entire new four-story steel and concrete building 200 by 90 feet will be ready for the increased force of workmen by the first of the year. The company now employs a force of about 1,200 workmen, but, with these additions, it is expected that the output will be increased between 50 and 60 per cent. Harry G. Fisk, who was secretary of the older corporation, is clerk and treasurer of the newly incorporated company.

* * *

The Apsley Rubber Co., of Hudson, has its own factory, its own box factory and case plant, and now it will have its own printing establishment. Perhaps this is not exactly true in the strict sense, but practically so. For years the Worcester Printing Co. has been a leading industry in Hudson, not only doing a fine business for home concerns, but a much larger outside business. Much of the printing of the Apsley Rubber Co. was turned out from the presses of this establishment. Last month Hon. L. D. Apsley became sole owner of this big printing establishment, when he immediately changed its name to the Hudson Printing Co., and moved the Boston office from the Old South building to one of the three office-rooms of the Apsley Rubber Co. in Haynes building, corner of Summer and High streets. Mr. Worcester remains as manager and will spend the greater portion of his time at the Boston office, and the relations between the rubber company and the printing company are likely to be closer than ever.

* * *

Mr. Apsley is a good loser. One of the greatest admirers of Theodore Roosevelt, he wanted to see him again sent to the White House. He rather expected this to be the result of the election, and he hired the opera house at Hudson for election night and invited the whole population to come and hear the returns and rejoice with him. They came—or enough of them to fill the hall—and, as returns came in slowly, he entertained them with stereopticon pictures of candidates and scenery, and lest they should grow hungry bushels of doughnuts, cans of coffee and baskets of fruit were provided. When the hopes of the Progressive Party were absolutely and unqualifiedly dashed, Mr. Apsley caused a message to be written to the effect that, though people present might differ on political questions, they were unanimous for Hudson and its prosperity, and the crowd amended this by declaring themselves unanimous for Hudson's leading citizen.

* * *

Pine Banks Park is a beautiful natural park situated in Malden and Medford. It was formerly the property of the late Deacon E. S. Converse, of the Boston Rubber Shoe Co., who presented it as a public park to the two cities. It is in care of three commissioners from each city, and to them last month were presented two handsome deer about a year old. These were born on the estate of Col. Harry E. Converse at Marion, and the Colonel deemed the park a fitting place for them. An addition to the zoo at the park is being prepared, and the animals are to be a permanent added attraction to this beautiful place.

* * *

The new factory to be built in Lowell for the Patterson Rubber Co. will be of brick, four stories high and of modern mill construction. The foundation is already laid, and the contract was awarded about the middle of last month. It will be 210 feet long and 68 feet wide. The company proposes to install machin-

cry as fast as the building progresses, the heavy machines being put in as soon as the first story is completed, and so on through the building. The office building has already been erected, as is also a storage shed, and a two-story boiler house 40 by 68 feet will be built near the main factory. It is hoped that the company can begin work early next year, but it is not expected that the entire plant can be in full operation for three or four months. The enterprise starts under the most auspicious conditions, under the immediate personal management of John S. Patterson, for many years in charge of important departments of the Revere Rubber Co., who has associated with him his son, James M. Patterson; the Appletons, Francis H. and Francis H., Jr., and other capitalists. I understand that the product for the first year is already sold.

* * *

The completion of the fine new two-story office building at the plant of the American Rubber Co. at East Cambridge has enabled that company to combine its business forces in one building, and those portions of the purchasing, bookkeeping and record departments which were housed in the Boston office of the company on Essex street have been moved to Cambridge, where they occupy the second floor of the new building. General Manager N. Lincoln Greene will have his office in Cambridge, but, of course, will continue his Boston office, and will divide his time between the two. The Boston headquarters have undergone several alterations, which will result in more and better facilities for the display of samples and the accommodation of customers.

* * *

So important has grown the tire department of the Converse Rubber Shoe Co. that the company will soon build a three-story addition 125 by 65, to accommodate this new branch of the business. When the company secured the location for its factory, a larger lot was purchased than was needed at the time, in anticipation of future needs. Now, in addition to making rubber footwear, the company makes two or more patented styles of rubber heels, and has been eminently successful in turning out automobile tires, which have been in such demand that this new addition seems amply justified.

* * *

The Atlantic Rubber Co., manufacturers of mechanical goods and rubberized fabrics, have sold their factory at Hyde Park, and will seek new and larger quarters where they can double their present force and capacity, being justified in this move by the rapid increase of their business. Whether they will purchase a factory near this city, or will build a concrete factory on land owned by the company, is a question not yet decided upon. Meanwhile they have taken a temporary lease of a factory at Hyde Park, where they will manufacture until the question of relocation is settled.

* * *

The Metropolitan Raincoat Co., which purchased the plant of the Atlantic Rubber Co., will continue manufacturing under the name of the Hyde Park Rubber Co. Besides the factory buildings, this concern acquired some of the heavy machinery already in place, which it will utilize in its own enlarged business.

* * *

The Interchangeable Rubber Heel Co., of Taunton, which has been fitting up a factory in what was known as the Field Shop No. 2, has installed nearly all its machinery and expects to be turning out goods by the time this is read.

A new rubber concern which will locate in Stoughton is the Panther Rubber Co., which was recently incorporated with a capital stock of $150,000. The incorporators are Frank Bernstein and William Bernstein, of Chelsea, Massachusetts, and Mark Marcus.

It is stated that the factory recently vacated by the Plymouth Rubber Co. at Stoughton may be taken by the Elwell Rubber Co. for the manufacture of rubber heels.

THE RUBBER TRADE IN CHICAGO.

By a Resident Correspondent.

CHICAGO has among its business houses, representatives of practically all the large American manufacturers of rubber goods of all kinds. The city's telephone directory contains the names of several hundred wholesalers, general dealers, brokers and others who handle the manufactures of establishments in other cities. Especially long is the list of those who represent the factories making automobile tires. And yet, in all the long array of names of men connected with some branch of the rubber business there are not to exceed six or seven who manufacture rubber goods, who actually make any of the articles in which they deal. In very few cities in the world are so many automobiles in use as in Chicago. The demand for rubber tires for the hundreds of thousands of wheels on the machines is enormous. That demand constitutes the basis of a tremendous trade by manufacturers' agents, by jobbers and by an immense number of small dealers.

The question very naturally suggests itself: Why is not Chicago making its own automobile tires? Why is the great metropolis which is a leader in so many lines of business willing to sit by and use the output of the factories of other cities, some of which are mere villages compared with itself? Why are the wide-awake men who fear not to grasp the wheels of direction in practically every other manufacturing line of business content to allow Akron, Detroit and other places to occupy the field in connection with this one line of trade?

Does the often-heard statement that labor is higher in Chicago than in Detroit and Akron answer these questions satisfactorily? Is labor higher here than in the cities named? Not so far as can be learned from any comparison based on results of inquiry. Again, is it a full explanation of the situation to assert that there is a material difference in the freight rates between ports of importation and points in Ohio and Michigan and the rates between those ports and Chicago? Is it not a fact that the ultimate freight charges on the manufactured articles from the places of manufacture to this city are more than an offset for any such differences?

In practically every line of business in Chicago trade is good. Factories of all kinds are running full time; many of them are in operation over-time. Manufacturers, jobbers, commission men and retailers are all busy. Collections are good. All reports concerning the early holiday trade agree in the statement that never before in the history of Chicago have the demands been so large for high-grade, high-priced goods as during the year just drawing to a close.

Nearly all lines of rubber goods trade in Chicago have shared in the general conditions. Here and there special reasons have operated to lessen the volume of trade and make demand slight compared with that for other manufactures of rubber. The trade in garden hose is a large factor in the rubber goods business throughout the Northwest and West. In those sections the calls for garden hose are comparatively light. Last season was a very rainy time all over that part of the country. The retailers had comparatively few calls for hose.

In all other lines of mechanical rubber goods, business is reported excellent. Favorable conditions have prevailed throughout the year. Improvement in the tone and the volume of demands has increased as the season has advanced. The cement factories all over the West and Northwest are doing a tremendous business. That, of course, means heavy calls for the output of the manufacturers of mechanical rubber goods. The paper mills are running at full blast. And there, again, is occasion for calls upon the dealers in the required rubber goods. With steel works adding their demands, the jobbers' and manufacturers' agents are busy.

Dealers in rubber boots and shoes report a year of most satis-

factory business, with no sign of discouragement for the future. The fine weather of the last few weeks has enabled the dealers to "straighten out," and business is moving now in the most satisfactory manner. The Chicago manager of the Standard Rubber Shoe Co., with headquarters at 311 West Monroe street, says the record of the year has been most pleasing to his company, and he looks for a continuance of good times in the rubber boot and shoe trade. The Chicago house of the Beaver Falls Rubber Shoe Co., 207 West Monroe street, reports business good and expects that 1913 "will be the best in history."

* * *

Chicago continues to be one of the world's largest patrons of the manufactories of rubber tires. Every local representative of the factories who could be reached by personal call or by telephone reported everything satisfactory in regard to the prospects for 1913.

In druggists' sundries and similar manufactures of rubber the same prosperous conditions are reported. The demand for fire hose increases just about in proportion with the increase in population. Additional purchases are made in some population centers because of discovery that hose on hand is of inferior quality and likely to prove practically useless in case of emergency. As a general rule, however, the calls on the hose manufacturers keep up with the requirements caused by growth in population. In all departments of the "hard rubber" trade in Chicago, business is reported excellent.

* * *

H. W. Fauver has come here from Indianapolis to take position as assistant manager in the Chicago headquarters of the Diamond Rubber Co., 1523 Michigan avenue.

THE RUBBER TRADE IN CINCINNATI.

By a Resident Correspondent.

WITH the election over and the political battles fought, rubber manufacturers and dealers are now down to hard work again to make the year just closing a banner one for their individual institutions. In the rubber clothing trade the weather this fall has been all that could be desired to encourage large orders in this line. Perhaps no other line has shared so well in the prosperity of the city as did the rubber tire industry, and from all local houses comes the same report—"Business is very good."

* * *

Perhaps there was no one person in the country who worked harder for the re-election of President Taft and felt the President's defeat more keenly than did Fred A. Geier, vice-president of the Cincinnati Rubber Co., who was the president of the "Prosperity League" that had its headquarters in this city and was a power in getting before the business men of the country arguments in favor of Mr. Taft's administration.

* * *

The Dayton Rubber Manufacturing Co., manufacturers of the Dayton Airless tire, and termed the "Air Free Care Free" tire, has opened a branch in this city at 803 Race street. B. H. Pfister has been appointed manager in charge for this territory.

* * *

Bumiller & Remlin, local agents for several leading makes of automobile, motorcycle and bicycle tires and dealers in automobile and bicycle accessories, have installed a unique feature in connection with their establishment. This concern, located at 412 Main street, is in the heart of the business district. They have installed at the curb in front of their establishment a reservoir for the purpose of supplying air to all automobile and bicycle owners, free of charge. The supply of air is furnished through the agency of an electrically-operated pump that fills and refills the reservoir automatically, and air is available every day and night throughout the year, the only requirement being a key, which the firm is distributing free to all automobile and bicycle owners on application. The firm has had 500 keys made, and most of them have already been distributed.

* * *

The rubber manufacturers and jobbers maintaining branch houses in this city, which are the distributing points for the central West and South, are unanimous in praising the results obtained by the Merchants' and Manufacturers' Association in the development of the package car system, which is proving a benefit to Cincinnati shippers. The main development is the issuance by the association of shipping guides by which shippers are enabled to judge before shipment what routing to give a package to insure its earliest delivery at its destination. Package cars leave Cincinnati direct for the following distributing points west and southwest and northwest: Chicago, Akron, Denison, East St. Louis, Houston, Kansas City, Little Rock, Memphis, St. Paul, Minneapolis, Peoria, St. Louis, Shreveport (Louisiana) and Vicksburg (Mississippi). At these points package cars start in various directions. A post card accompanies each invoice, giving the date of shipment. The consignee marks on it the time of receipt and puts on it any complaint as to delay. This enables the association to take up with the railroads any just complaints, and the railroads are co-operating to remedy any delays in delivery and appreciate highly the work the association does in locating the blame for delay. A sticker is put on every invoice and on every package. Local managers for the rubber houses who have a large number of shipments each week, and mostly shipments requiring prompt delivery, are enthusiastic over the results the association is obtaining in supplementing the work of the railroads.

* * *

Arthur Jack, for several years active as Cincinnati newspaper man and later engaged as city sales agent for the Diamond Rubber Co., at Minneapolis, has returned to this city to serve in a similar capacity for the Diamond Rubber Co.

* * *

Urged on by widely expanding trade, the United States Tire Co., which operates a branch house at 1121 Race street, has just added two new salesmen to its already large staff—W. C. Price and J. A. Moore.

* * *

I. Z. Stone, of the Diamond Rubber Co., spent several days in the city and while here took advantage of the opportunity of mixing with automobile owners and talking Diamond tires. In speaking of the several fallacies that it seems impossible to get out of the average automobile owner's mind, Mr. Stone said: "The belief that hot weather and road friction increase the air pressure in a tire to a dangerous point, cost the car owners of this country millions of dollars every year. Because of this fallacy thousands of car owners habitually travel on under inflated tires, the 'soft' tire becomes bruised and cut, and before long there is a blow-out. The internal friction in a tire caused by the bending of the material, especially the fabric, does heat the tire, but the softer the tire the greater the bending action and the more internal heat. The increase in air pressure due to heat is not nearly as great as the car owner thinks. To get maximum mileage, the car owner should inflate according to a very simple rule—the pressure per square inch as shown by the pressure gauge should be 18 times the tire's cross section in inches. For instance, a 3½-inch tire should always be inflated to 63 pounds, a 4-inch tire to 72 pounds, and so on, regardless of hot or cold weather."

* * *

The I. J. Cooper Rubber Co., located at 717 Main street, has increased its capital stock from $10,000 to $100,000. The company deals in rubber accessories for bicycles and automobiles. Although the company has been in business a little less than a

year, the business has almost doubled in that time and branches have been established in Columbus and Dayton.

* * *

Cecil F. Adamson, of East Palestine, Ohio, filed suit in the United States District Court here against J. Everett Inman and George Inman, proprietors of the Victor Inner Tire and Rubber Co., of Dayton, Ohio, for alleged infringement of a patent on improvements in tire vulcanizing repair apparatus. He asks damages in the sum of $5,000, an accounting and an injunction restraining the defendants from further infringement of his patent.

* * *

Creditors of the Ohio Motor Car Co., which was placed in the hands of a receiver last month on application of the Diamond Rubber Co., filed a petition of involuntary bankruptcy in the United States District Court. The petition alleges that a specific act of bankruptcy was committed by the company by settling the claim of certain creditors in preference to others.

* * *

F. J. Ramler, formerly with the United States Tire Co., has joined the selling force of the Racine Rubber Co. as general representative for this territory. The local distributor for the product of the company—the Kelly-Racine tires—is the I. J. Cooper Rubber Co.

* * *

The Ideal Steel Wheel Co., a new Cincinnati corporation, has purchased the former plant of the Seufferle Cooperage Co. at Winton Place, paying, it is reported, $41,000 cash for the property. The corporation expects to revolutionize the automobile tire industry by the introduction of a solid tire, made possible through the manner in which the wheel is constructed. President J. B. Fitch of the company stated that the property would be greatly enlarged at an early date. The general dimensions of the main building are 200 x 226 feet, together with several minor structures. Since the latter have strong foundations it is the company's intention to utilize these and connect the whole in the very near future with an immense addition.

* * *

The Ajax-Grieb Rubber Co. is represented in this city by Hanke & Rothe, who have opened warerooms at 803 Race street and are handling the product of this company exclusively.

* * *

The Motz Tire & Rubber Co. of Akron has started active competition for business in this city and territory. An agency has been established with the Selden Auto Agency at 109 East Liberty street.

* * *

The Federal Motor Supply Co., which was recently incorporated in this city, has leased the buildings at 919 and 921 Race street and, after remodeling is finished, will open for business in about 15 days. The company will operate as wholesale and retail dealers in rubber accessories, parts and supplies for automobiles, truck, motor boats, air vessels and bicycles.

* * *

The scrap rubber trade is fast developing into one of Cincinnati's leading commercial lines. Until the advent of the automobile, dealers in rags and papers bought scrap rubber as a side line. Now there are two concerns in the city which are making a specialty of scrap rubber. These two concerns are M. Rider & Co., who operate a big plant at 113 and 115 Sycamore street, and Klein & Cohn, who have a large establishment recently fitted up and equipped for handling scrap rubber at 731 Reading Road.

THE RUBBER TRADE IN RHODE ISLAND.

By a Resident Correspondent.

CONSTANT increases in output were made during November by the manufacturers of rubber shoes, arctics and boots. The unusual mildness of the season did not seem to affect business in Rhode Island, and in many instances factories ran well into the evening in efforts to keep up with their orders. One concern, the National India Rubber Co., of Bristol, sent shipments as far west as California. These latter were confined to insulated wire, which is being made in immense quantities in the new department which this concern opened, following the transfer of the manufacturing of sundries to Cleveland, Ohio.

* * *

The United Wire and Supply Co. has declared a quarterly dividend of 1¾ per cent. on the preferred stock and one per cent. on its common stock.

* * *

The International Rubber Co. at West Barrington, is increasing its output regularly. It now operates until 9 o'clock each evening.

* * *

A suit for $10,000 was filed in the Superior Court at Providence on Thursday, November 21, by Michael Mountain, of East Providence, against the Uniform Seamless Wire Co., of Providence. The plaintiff alleged that the fingers of his right hand were crushed as the result of a defect in the machinery at which he was working on February 20.

* * *

Owing to a misunderstanding the International Rubber Co., of West Barrington, started to erect a vulcanizing room at its plant in West Barrington recently without obtaining a building permit from the Barrington Town Council. When the attention of officials of the concern was called to the matter an effort to legalize the work was made. The company sent blue prints and a lengthy explanation to the town officials, and the Council voted that it would grant the belated permit.

The officials of this company are endeavoring to locate a place for a new manufactory to be started in New York, but thus far no plans have been decided upon, and the nature of the business has not been announced. At the present time this firm manufactures rubber textiles.

* * *

Although Providence dealers have been experiencing difficulty in securing sufficient coal to satisfy the terms of their contracts for several months, the National India Rubber Co., at Britol, has had large orders filled by the New York operators, and has been storing immense quantities for use during the winter.

* * *

John Anderson, foreman of the shipping department of the wire department of the National India Rubber Co., and Miss Cora F. Shaw, of Fall River, Mass., were married at the home of the bride's parents on November 11.

* * *

The stores of the Diamond Rubber Co. and the B. F. Goodrich Co., of Providence, have been combined at 260 Weybosset street. Although the companies combined last spring, separate stores have been maintained in this and other cities. The separate lines, made by these companies which have been manufactured since the consolidation, will still be carried at the new store. George Coleman has been appointed business manager. Originally the Diamond company store was at 200 Washington street, and the Goodrich company at 392 Weybosset street.

* * *

Col. Samuel P. Colt has started the work of beautifying that part of Bristol which lies near his estate. A steam shovel has

arrived and big embankments are being raised where he will transform a neglected lane into a wide avenue which will pass over the tracks of the New York, New Haven and Hartford Railroad. A bridge 700 feet long will be a part of the improvement. This is another of a long list of improvements which Col. Colt has given to the town, where one of the largest plants of the United States Rubber Co. is located.

* * *

The Bourn Rubber Co., of Providence, which recently began the manufacture of automobile tires in addition to making overshoes, is widely advertising its new product as the Bourn-Goodyear tire. They claim for it that it costs from 10 to 15 per cent. more than other high grade tires to manufacture, but that the retail price is the same. The company is also emphasizing the fact that it has no connection, directly or indirectly, with any other tire manufacturer. The concern was established in 1840.

* * *

Rebuilding tires is now one of the industries of Providence. The Invincible Puncture Proof Tire Co., of which Charles H. Graves is president, is taking old tires at its plant, 53 Sabin street, and making them over and guaranteeing 3,000 or more miles.

* * *

Rhode Island manufacturers are congratulating themselves that they are not having trouble with the "Industrial Workers of the World," like that which some of the other rubber companies have encountered. Organizers of this body have made repeated attempts to gain a foothold here, but their demonstrations have been dealt with vigorously by the police, and public sentiment is so strong against the militant tactics of the "workers," that they have practically no representative in the state at present.

THE RUBBER TRADE IN SAN FRANCISCO.

By a Resident Correspondent.

E. C. TILSLEY, with offices in the Call building is now promoting a company for the purpose of manufacturing and selling a new substitute for rubber. A man by the name of J. H. Schwartz, now of this city, is the inventor of the process, and he claims that it has attained the desired degree of perfection to successfully compete with the genuine product. He has been working on the basic mineral called Gilsonite, for seventeen years, making it up in different combinations until he at last arrived at a result which appealed to him as thoroughly satisfactory. Gilsonite is a black mineral found in large quantities in Colorado, Utah and Nevada. It is a light substance and feels something like a piece of hard tar, or hard metallic rubber. Mixed by Schwartz's chemical process it becomes a crude mass with much resemblance to crude rubber, although more gritty and brittle. After being subjected to a vulcanizing process, however, all sorts of rubber products are produced, which the inventor claims are in every way equal to those made from genuine rubber.

* * *

The Pennsylvania Rubber Co. has opened a fine large branch at Seattle, Washington, and J. E. French, the Pacific Coast manager for the company, who has his headquarters in San Francisco, has returned from that city where he attended to the details of installing the new store. G. J. Brooks, who was the chief clerk in San Francisco has been placed in charge of the Seattle branch. The store is located in the Armory building, and it is the finest store which the company has on the Pacific Coast. It is fitted up in most excellent style, and has every modern convenience, and having 9,000 square feet of floor space, there is plenty of room to carry a large stock. This gives the company a firm hold on the business of the Northwest, as besides the new Seattle store they have a distributing agency with the Yakima Hardware Co., of North Yakima, Washington, and another with the Morrow Drew Co., of Walla Walla. In Oakland, California, the company has made a find in the person of Robert Martland, a pioneer tire man of that city who has a store on Broadway. Mr. Martland is one of the live wires in the tire business, and he has taken hold of the company's Vacuum Cup tires in such a whirlwind campaign that the company is unable to supply him with enough goods. Mr. Martland has imparted his enthusiasm to all kinds of prominent people and even had a Superior Court judge doing some non-skid stunts out on a slippery road for the sake of demonstrating his firm belief in the tires.

* * *

The Superior Vulcanizing Co. has been incorporated at Bakersfield, California, with a capital stock of $20,000, practically all paid up. A. W. Albrecht holds the control, and A. Albrecht and Geo. A. Baer are also owners in the business.

* * *

The Firestone Tire & Rubber Co. has already started work on the foundations of an elegant new building which the company will occupy as soon as completed. It is located on Van Ness avenue between Bush and Pine streets. The building will be completed early in the spring. When the Firestone company established a branch in San Francisco two years ago it erected a three-story building on Van Ness avenue and Fulton streets. Recently the city has been purchasing property in order to establish a great civic center, and this property is included in the civic center and has been taken by the city. The new building will be a two-story structure and will be large enough to accommodate an immense stock. Mr. W. H. Bell, local manager of the company, has just returned from a visit to the factory in the east.

* * *

C. E. Mathewson, Pacific Coast manager of the Diamond Rubber Co., says that the popular belief that hot weather causes the tire pressure to increase and injure the tire, is not only a fallacy, but costs automobile owners millions of dollars every year. "In hot weather," he said, "they are afraid to pump their tires full, and the result is that the half filled tires wear out in half the time."

* * *

The W. D. Newerf Rubber Co. has opened a retail service shop and store at Van Ness and Golden Gate avenues. The company's warerooms are on Mission street.

* * *

J. M. Gilbert, of New York, general manager of the United States Tire Co., is expected in San Francisco in a few days. He will be met by C. A. Gilbert, the Pacific Coast manager in Seattle, and from there they will make a complete tour of inspection of all of the Pacific Coast branches.

* * *

Henry Byrne is no longer connected with the Quaker City Rubber Co., having recently accepted a position with the Plant Rubber & Supply Co.

* * *

Mr. Gibson, who was formerly with the Sterling Rubber Co., has quit the rubber business to take up the agency for a new electric heating device attached to faucets for heating water.

* * *

Mr. Oliver, who was formerly superintendent of the factory of the American Rubber Co., at Emeryville, California, has gone into business for himself, having opened a shop on Broadway, in Oakland, where he makes automobile tubes, and patches only.

* * *

Elliott Mahan, a rubber planter of Colombo, Ceylon, has been a recent visitor in this city. He is on his way to Edinburgh, Scotland, for an extended visit.

* * *

The Acme Rubber Co. has been incorporated in San Francisco with a capital stock of $100,000, the shares being of the value of $1 each. The organizers are L. Seidenberg, G. M. Davis, W. S. Baker, J. C. Montgomery and P. Kenrick.

THE RUBBER TRADE IN TRENTON.

By a Resident Correspondent.

THE Roberts Manufacturing Co., of Trenton and New York, which was incorporated November 22, for $1,000,000 under the laws of Delaware, plans to manufacture sectional inner tubes for automobile tires on an extensive scale, at the plant which the company proposes to erect in this city. Frederick T. Roberts, of this city, the promoter of the new company, was one of the incorporators, along with Frederick L. Guggenheim and Edward Howitz, both of New York City, and Walter L. Watson, of Weehawken, New Jersey.

The company is organized to manufacture and sell rubber goods of all kinds, but Mr. Roberts declares that the main business of the corporation will be the manufacture of the patent inner tube automobile tires. These sectional inner tubes are of the pneumatic order, but constructed along entirely new lines. There are ten sections of a tube to each tire. Each section has thirty-two cells running the length of each section, and each cell is filled with compressed air, and then the ends are vulcanized to prevent the escape of the air.

When the inner tubes are placed in an outer tube or shoe they make a complete circle with close fitting joints. The advantage is that when a puncture occurs only a single section is destroyed, if it is destroyed at all, instead of the entire inner tube. By reason of the fact that there are thirty-two longitudinal cells, it is claimed that in an ordinary puncture the air would be let out of a small number of the cells and that the progress of the machine would not be seriously interfered with. By the use of these sectional tubes it is claimed that autoists will not be obliged to carry extra tires on the machine. Only one or two additional sections will be required. The sections are about ten inches in length.

The patent inner tubes are now being manufactured at the plant of the United and Globe Rubber Co. in this city. The placing of compressed air in the cells, and the vulcanizing of the ends of the sections is being done at the plant of the Roberts Co. on Pike street, this city. Mr. Roberts believes the patent sectional inner tube is perfect, and says he has been working on the sectional inner tube for the past two years, and that tests have demonstrated the superiority claimed by the company. The tubes are so constructed that they will fit any rim or shoe on the market.

FROM THE SAYINGS OF SQUANTUM.

Reno—a name suggestive to the ordinary lay mind of divorce and alimony—not to mention subsequent matrimony—has according to so eminent an authority as Squantum, a good Indian chieftain, famous in song and story another meaning, to wit: "lack of attention," which; after all, has no doubt been the forerunner of the conditions first suggested. The late Mr. Squantum, who in addition to being an authority on definition, is a sort of reclaimed sponsor for the Monatiquot Rubber Co., South Braintree, Massachusetts, pledges his aboriginal credit that Monatiquot stocks are not RENO-VATED, but are reclaimed in most—if not all—of their original virtue.

NO EXHIBITION RUBBER IN THE MARKET.

As some manufacturers have reported that they have been approached with the offer to sell them some of the crude rubber that was on exhibition at the recent New York rubber show, it may be well to state that there is none of this exhibition rubber on the market, as all of it was sold on the last day of the exhibition direct to manufacturers.

ANOTHER INCREASE IN CAPITAL.

THE Knight Tire & Rubber Co., of Canton, Ohio, has increased its capital stock to $1,500,000. The increase in the capital stock is to provide a larger working capital and for future improvements and additions to the plant

OBITUARY RECORD.

DEATH OF FRANK W. GREENE.

FRANK W. GREENE, crude rubber broker, of 150 Nassau street, New York, died October 31 of pleurisy at his apartments in the Standish Arms, Brooklyn. He was 73 years of age.

Mr. Greene first became connected with the rubber business in 1870, when he was a member of the firm of Randall H. Greene & Sons, of which his father was the head. In 1883 he opened a rubber brokerage office of his own and was continuously in this business until the time of his death, acting strictly as a broker, and for the greater part of that time as a general broker, though for ten years—from 1888 to 1898—he acted as a special broker for John Kenyon of London.

Mr. Greene was born in New England and was a fine exemplar of the characteristic New England virtues—by which he came quite naturally, as his ancestors settled in that part of the country about 250 years ago. He was a man of quiet tastes, and divided his time between his office and his home, but he had many stanch friends among the rubber men of his generation, among them such well-known and substantial characters as John B. Forsythe, Amadee Spadone, John H. Cheever and William H. Acken. He was deeply interested in everything that pertained to the rubber industry and, incidentally, he had been a subscriber and reader of this publication almost from its initial issue.

He is survived by his widow, one son, Irving W. Greene, and a grand-daughter, Mildred, to whom he was much attached. His son was formerly associated with his father as a rubber broker, but is at present connected with F. W. Devoe and C. T. Reynolds, the paint manufacturers.

THE DEATH OF A RUBBER FOREMAN.

William Folsom, for many years a foreman in the works of the Revere Rubber Co., Chelsea, Massachusetts, died on November 8, in that city, at the age of 68. Mr. Folsom was a veteran of the Civil War and belonged to the Theodore Winthrop Post.

INDIA-RUBBER GOODS IN COMMERCE.

EXPORTS FROM THE UNITED STATES.

OFFICIAL statement of values of exports of manufacturers of india-rubber and gutta-percha from the United States for the months of August and September, 1912, and for the first nine months of five calendar years:

MONTHS.	Belting, Packing and Hose.	Boots and Shoes.	All Other Rubber.	TOTAL.
August, 1912.....	$269,239	$196,415	$763,659	$1,229,313
September, 1912....	237,546	163,809	660,097	1,061,452
January-July	1,381,648	654,464	4,592,615	6,628,727
Total, 1912.....	$1,888,433	$1,014,688	$6,016,371	$8,919,492
Total, 1911.....	1,701,441	1,349,380	5,402,984	8,453,805
Total, 1910.....	1,592,594	1,664,215	4,258,968	7,515,777
Total, 1909.....	1,301,497	1,127,806	3,059,146	5,488,449
Total, 1908.....	926,566	1,043,528	2,629,927	4,600,021

The above heading, "All Other Rubber," for the months of August and September, 1912, and the first nine months of the two calendar years, includes the following details relating to tires:

Months.	For Automobiles.	All Other.	Total.
August, 1912.....	405,781	46,937	452,718
September, 1912.....	292,809	50,002	342,811
January-July	1,835,045	346,504	2,181,549
Total, 1912.....	2,533,635	443,443	2,977,078
Total, 1911.....	1,941,773	437,201	2,378,974

The India-Rubber Trade in Great Britain.

By Our Regular Correspondent.

EXCEPT for the general reason that it is the main topic of the moment, there is no particular reason why I should refer to this subject. I believe I am correct in saying that in none of the five States at war is there a rubber works in the regular sense of the term; but, of course, a considerable business is done in imported rubber goods. This business will naturally be hampered in the same way, though to a less important extent, as has occurred with—for instance—cotton goods, the export of which from Lancashire has for the time entirely ceased. This will not affect the staple Lancashire trade to any great extent, because business generally is very brisk and the merchants have other and more important markets to absorb their attention. In certain cases, however, I hear of mills running on short time, or even closing down, owing to the stoppage of business in the Near East. With regard to imported rubber goods, Turkey is the most important Balkan State. Goloshes come mainly from America and Russia, the latter country having largely increased its trade in South Eastern Europe in late years, a fact due, no doubt, to a large extent, to the common basis of the Slav languages. For many rubber goods, such as mackintoshes, there is very little demand. Probably the rubber imports which have shown the greatest expansion in quite recent years, are motor tires. Since I was in Montenegro the mail car has been converted from a low-wheeled horse vehicle to a motor car, which appears to tackle the 4,000 feet rise from Cattaro to Cettinge without difficulty. The road, I may say, although a monotonous zig-zag, is otherwise a very good one and far superior to any to be found in northern Albania, these being mainly rough tracks freely strewn with boulders. Metalled roads in Montenegro are, however, by no means universal, a fact which does not disconcert the natives, who tackle rocks, as their goats do. The ordinary footwear is an untanned laced calfskin sandal, as leather boots have a very short life on the rocks. Needless to say that Montenegro offers no inducements to the establishment of a golosh store. A largely increased (though it is to be hoped ephemeral) demand is for hospital bandages, etc., as part of the equipment of the various Red Cross League parties that are being dispatched to the theatre of war by Great Britain, Russia and other countries.

THE BALKAN WAR.

WHETHER it is due to inconsiderate usage or to decline in quality I am not in a position to say, but one hears general complaints with regard to these goods. Since a certain legal case of a few years ago, when an action for damages was brought against a chemist, as seller of a bottle that burst when in use, shop keepers have been somewhat chary in giving guarantees. Nowadays some sellers will not give guarantees, while others will give a twelve-month guarantee on the understanding that only hot, but not boiling, water is to be put in them. A good many people, I understand, have given up the use of the more convenient rubber bottles in favor of the glazed stone-ware article, owing to fear of the former bursting at an inopportune time. With the stone bottle the water can be put in at the boiling temperature, the heat being retained for a longer time than in the rubber bottle. I heard recently of a nursing institution, formerly a large user of rubber bottles, which has now entirely given them up. It would, therefore, seem clear that this article, like elastic thread, should be made of one quality only—the best—and that price cutting should be sternly discountenanced by all manufacturers. Exactly how this end is to be attained, I will leave to others to decide.

HOT WATER BOTTLES.

THE number of different advertisements relating to mineral rubber or natural asphalt as obtained in America is a pronounced feature of our trade literature, and those on this side to whom the subject is of interest confess that they are somewhat bewildered. They are wondering whether so much as is claimed really depends upon the special trade mark of the package, or whether there is a certain amount of bluff, owing to close trade competition. Far be it from me to attempt shedding light upon such a dark mystery, but I may perhaps make a few general observations. These asphaltic bodies certainly seem to have substantiated their claims to utility in a variety of rubber mixings, and there can be little doubt that the demand will increase. I have been asked if there is any difference between these natural products and coal tar pitch, which is so largely produced in Great Britain for home use and export. I certainly find a distinct difference not only in chemical constitution—a matter not of great moment—but also in physical properties, particularly in flexibility. The ordinary coal tar pitch is much more brittle at any rate than the particular American products I have had under test. The instrument known as a penetrometer, used in America for differentiating qualities of solid mineral hydrocarbons, does not appear to be much known in England. The manager of one of our largest pitch works tells me that he has heard of its use in America, but knows nothing about it himself. Perhaps our editor could do something to dispel the cloud of ignorance on this side by giving a sketch and brief description of the instrument in use in America. The article on "Mineral Rubbers" in THE INDIA RUBBER WORLD for October is very interesting, though one regrets that the geological illustrations are not explained in the text. For instance, what is the nature of the country rock through which the elaterite vein courses. I am familiar with the limestone district in Derbyshire, where the mineral rubber has long been known. Here it usually occurs in the lead veins at the top of the limestone, where this latter is covered by the black Yoredale shales. Small quantities of mineral oil have in past days been tapped by the lead miners, and it is on record that men have been killed by explosion of petroleum vapor. Owing to its intermittent occurrence in the veins, elaterite has never been commercially worked in England, though quite recently asphalt works have been established at places where the limestone is strongly bituminous.

MINERAL RUBBER.

THIS subject is being investigated by Mr. S. T. Peachey at the Manchester School of Technology, and a preliminary paper giving his results to date was given by him at a meeting of the Manchester Section of the Society of Chemical Industry, on November 1. Special reference was made by the author to the work done recently by Herbst, who passed oxygen through a solution of rubber in benzine and obtained 86.4 per cent. of a body $C_{10}H_{16}O$ in solution, and 1.7 per cent. of an insoluble yellow body $C_{10}H_{16}O_3$. The author's experiments were carried out in a different manner, a thin film of rubber being deposited from solution inside a glass flask, and this being acted upon by a measured volume of oxygen at a temperature of 85 degs. C., until no further oxygen was absorbed, as registered by a gas burette. The rubber used at first was plantation crêpe, freed from resin by acetone. This was found to undergo complete oxidation in 35½ hours. Further experiments were made with the same rubber, which had not had its resins removed, and it was found that the time for complete oxidation was much prolonged, ninety-nine hours being required. The amount of resin

THE ACTION OF GASEOUS OXYGEN ON INDIA RUBBER.

in the rubber was 3.00 per cent. Analysis of the product showed that each $C_{10}H_{16}$ reacted with four atoms of oxygen, the results therefore not being in agreement with those obtained by Herbst. In the discussion which followed the reading of the paper, Mr. H. L. Terry referred to the figures published by Burghardt in 1883 relating to the oxidation of vulcanized elastic thread, and supported Burghardt's statement that the percentage of water found in decayed rubber formed a good index of the amount of deterioration which had taken place. He (Mr. Terry) had observed that where the rubber had oxidized to the degree at which it could be powdered in a mortar, the amount of water was always greater than in the earlier stages of oxidation, and further that the harder the rubber was the greater was the amount of free acid present. He thought that Mr. Peachey's experiments were of great interest, but would prove of more practical importance if applied to vulcanized rubber. The rate of oxidation of rubber was very largely a matter of tenuity, and conclusions must not be drawn too hastily with regard to rubber goods generally, on the basis of the extremely thin films used by the author. Professor Perkin inquired whether the oxygen used was dry or moist, as he would expect a different result in each case, and was any volatile body produced? The answer was that the oxygen used was saturated with moisture, and that some drops of an oily liquid were volatilized. Mr. S. Frankenburg suggested that if the author had used Brazilian Pará instead of plantation rubber, he would have found that a much longer time was required for oxidation. In the course of discussion when the meeting was over, some visitors from rubber works expressed surprise at the resinous rubber giving better results than the resin free—this not being in accord with their practical experience.

SELECT COMMITTEE.

A COMMITTEE, consisting largely of members of Parliament, belonging to both political parties, has been appointed by the government to inquire into the Putomayo atrocities, and, in particular, to decide whether or no the Englishmen on the board of the Peruvian Amazon Company are to be censured for what has taken place. An application made to the courts for the removal of Senor Arana from the position of liquidator in the present voluntary liquidation, has been adjourned until the above committee gets to work.

Another committee has been appointed to inquire into the matter of the celluloid goods manufacture in Great Britain. This is the outcome of a fatal fire which occurred in London a few months ago. These committees, though of a lower status than a royal commission, have much the same powers. Witnesses may be examined on oath, and persons whose actions come into question may be represented by counsel. The proceedings are always open to the reporters of the press.

FIRE HAZARDS IN RUBBER MANUFACTURE.

THE article on this topic in the "Weekly Underwriter," and reproduced in THE INDIA RUBBER WORLD of October 1, is of interest, though all manufacturers will not agree with it throughout. We read that in making rubber cement the rubber is softened in carbon dioxide; presumably carbon disulphide is meant, though it is not customary in this country to use any special softener before dissolving in naphtha. The dangers attached to this branch of the manufacture have often been exaggerated, and what trouble has arisen has usually occurred after it has left the manufacturer's hands. It seems to be going rather too far to expect the manufacturer who knows his business and its associated risks, to restrict himself closely to the amount of cement he has on hand at any particular time. With regard to danger of firing from static electricity, I suppose a case does occur every two or three years. This will be when the atmosphere happens to be very dry. The suggested precaution of "grounding" the machines has been followed to some extent in this country, but a good system of ventilation where naphtha vapors are heavy, will obviate any danger. I have no experience of the danger alleged to exist in the buffing department, and pass on to the chemical room. It is entirely news to me that "barium sulphate" is a rapidly oxidizing metallic substance which is a frequent source of trouble if allowed to become damp. The writer seems entirely off the track here, and I am sure there is no truth whatever in the statement. With regard to unslaked lime becoming slaked and setting fire to things about it, this is quite possible, though the probability is quite remote, at any rate in this country, as all the lime sold for rubber purposes, though nominally the oxide of calcium, is always partially hydrated before sale. The reference to lamp-black is important—too important to be adequately treated in a couple of sentences. There are plenty of instances where blacks have suffered spontaneous ignition in rubber works, but a great deal depends upon the nature and origin of the black. In my experience calcined lamp-black is quite safe—it is certain qualities of vegetable black that always have danger associated with them, and these should be stored in a suitable place apart from anything of a combustible nature.

THE GORTON RUBBER CO., LIMITED.

The annual meeting of the Gorton Rubber Co., Ltd., Manchester, England, was held November 9. There was a large attendance, including all the directors; George H. Cartland (chairman) presided. F. Walmsley and W. H. Veno were re-elected directors. This was immediately followed by an extraordinary general meeting, at which it was resolved unanimously to increase the capital of the company by 30,000 pre-preference shares, 20,833 of which will be issued to the present shareholders at the rate of one new share for every three shares now held. This was agreed to by a separate meeting of the preference and ordinary shareholders. It was stated that the orders on the books at the present moment are double the number at this time last year.

NEW LONDON RUBBER FIRM.

A new firm, under the style of Ritter & Hankin, has been formed in London, as importers of and dealers in india rubber, gutta percha and balata, at 27 Mincing Lane. The partners are Alfred Westendarp, M. A. Ritter and George Hankin, all of whom have long been engaged in the india rubber, gutta percha and balata trades, both as importers and dealers.

MISTOVSKI BECOMES MINTON.

Louis Mistovski, a merchant dealing in raw rubber in the Trevelyan Buildings, Manchester, England, announces that he has changed his name to Louis Minton, and that hereafter he will transact all business under that name.

THE PERCENTAGE OF RUBBER IN ENGLISH CASINGS.

One of the American consuls in Great Britain has been looking into the possible tire market in that kingdom for American tires. According to his opinion, it ought to be possible to sell American tires there because of their better quality. He writes as follows:

"Despite the large sales of American automobiles here, American tires have not been introduced into the United Kingdom to the degree that might have been expected, especially as it is stated that there is more actual rubber in the American article than there is in the British or European product, in which, it is said, there is not more than 7 to 10 per cent. of rubber in the outer casing and 35 per cent. in the inner tube, substitutes and fillers being extensively used."

The Empire Rubber Co. (Messrs. E. Hodgson & H. Waterhouse), of the Leeds Old Rubber Works, pioneers of the scrap rubber trade in Yorkshire, England, have recently purchased the business of the Union Rubber Co., of Leeds, and have again added to their premises by leasing extensive ground adjoining, including the wholesale premises so long occupied by the late John Robshaw in St. Columbia street, Leeds.

THE SETTLEMENT AND TAXATION OF AMERICAN FIRMS IN GERMANY.*

IN dealing with the above subject in the Bulletin of the American Association of Commerce and Trade, Berlin, Dr. Paul Marcuse of that city points out that foreign persons over a year resident in Germany, or engaged in doing business there are subject to the same taxes as German subjects. These taxes come under four heads—income tax; tax on personal property and capital; real estate tax; and tax levied on all persons personally engaged in business (Gewerbe Steuer).

The chief point at issue being that of "doing business," it is of interest to note that, in Dr. Marcuse's opinion, if an American firm sells to or buys in Germany; orders being taken by mail, wire, traveling salesman and canvassers, it is not thereby "doing business" in the sense of the law. Apparently the running by the American firm of a place in Germany, where any business forming part of the home trade is done, brings it within the law.

At the same time, the appointment of an agent or representation by a commission merchant, does not necessarily constitute doing business.

Two typical cases are referred to. In the one a big importing house, which represents many foreign firms, in various trades is an independent business. In the other, the salaried representative of a single firm is to be considered as an employe who runs the foreign firm's establishment. While these two cases are in themselves perfectly clear, it will often be rather doubtful whether the office is that of a German commission merchant or of a foreign firm; for the reason that, as a rule, business men choose the most convenient form of representation, without worrying about the legal side of the question. So it is often very hard to decide whether the foreign firm or its representative is doing business.

The keeping of a large sample room does not constitute doing business. On the other hand a firm was considered as doing business in Germany, which sold its goods through traveling salesmen, which were forwarded from stock held in Berlin.

In conclusion, Dr. Marcuse remarks that there is one way of evading all the above difficulties, by forming an independent corporation, either a stock company or an association with limited liability; the latter form being more appropriate for the representation of foreign firms. Such association can be formed by two persons with a capital of $5,000, and may have for its object the representation of a certain foreign firm. The income tax on such associations is higher than that levied on individuals, but as it will never have to show a profit, it will be consequently practically exempt from that tax, with which the business tax is small in comparison.

The authorities have attempted to claim that such associations should be disregarded, as being in bad faith. The courts have, however, decided that a corporation, duly organized under German laws, cannot be simply overruled by tax officers, for the reason that they were formed to evade taxes.

MR. YAMADA GOES TO THE "GOMU SEKAI."

OUR enterprising correspondent in Japan, Mr. S. Yamada, who has been associated for some time with the Japanese rubber paper called the "Gomu Shimpo Sha," has left that publication to take the position of editor and manager of the Tokyo and foreign office of the "Gomu Sekai," a monthly publication printed in Osaka, which is an organ of the rubber and celluloid trades. Mr. Yamada is a very painstaking and reliable newspaper man and is widely familiar with the rubber trade of Japan, as well as with the trade generally all over the world. He goes to his new position with a fine equipment for his work.

RUBBER TRADE IN JAPAN.

By Our Regular Correspondent.

JAPANESE RUBBER PLANTING IN MALAY PENINSULA.

ACCORDING to the details which appeared in the April, 1912, issue, Japanese investors to the number of 77 had, up to the previous August, acquired in Malaya about 83,750 acres, of which the area of 15,800 acres had been planted. More detailed particulars, since available, show the distribution to be as follows:

STATES.	Number of plantations.	Acreage rented.	Acreage cultivated
Johore	44	77,730	12,785
Negri Sembilan	15	2,845	1,768
Selangor	21	1,420	880
Perak	6	1,055	480
Kedah	1	450	220
(Singapore)	2	250	120
Revised particulars to end of 1911..	89	83,750	16,453

The State of Johore thus contains 50 per cent. of the number of Japanese plantations in the Malay Peninsula, as well as 93 per cent. of their total acreage and 75 per cent. of the cultivated area of its plantations. Eighty per cent. of the whole Johore acreage and 60 per cent. of the cultivated portion belongs to eight plantations. Johore is consequently the most important Malay State for Japanese rubber cultivation.

LATEST EXTENSIONS.

In October, 1912, Mr. Chujun Osada, who had owned 500 acres along the river Johore (not cultivated), established the Malay Planting Co. with $150,000 capital for cultivating 1,000 acres.

The Okura Rubber Co. has been lately established with $50,000 capital to cultivate 1,300 acres along the Central Railway of Johore, in part of which the late Mr. Okura had been interested.

RUBBER PLANTING COMPANIES IN CHINA.

During the rubber boom of 1909-1910 no less than thirty-nine companies were started in China for the purpose of acquiring rights to rubber lands selling them, rather than with the idea of planting trees. When the reaction came these companies were seriously affected, some of them only retaining their name, without any assets.

Six of the companies, however, paid a dividend to the stockholders for a time. These were: (1) Alma Estates; capital, $350,000; paid 3 per cent. in 1910, when they made $18,000, but lost $19,000 in 1911. (2) Chaupedack Rubber and Gambier Co.; capital, $190,000; paid 10 per cent. in 1910, when they made $12,000. In 1911 they made only $5,500 and paid no dividend. (3) Anglo-Java Estate; capital, $1,250,000; paid 7½ per cent. in 1910, when they made $8,500; paying 4 per cent. when profits were reduced in the year 1911. (4) Denkaranturian; capital, $150,000; profits in 1911, $2,000, and $24,000 in 1912, when 12 per cent. was paid. (5) Padang Rubber; capital, $150,000; made $10,000 in 1911, but paid no dividend; made $23,000 in 1912, when paid 6 per cent. (6) Senaivan Rubber Estates; capital, $250,000. In 1911 paid 38 per cent., when they made $75,000.

Most of the investors are Englishmen and the rules of the companies are in accordance with British law.

BRITISH CAPITAL IN SUMATRA.

According to a British Consular Report on the trade of Sumatra, the cultivation of rubber is one of the most important industries of that island, representing about $40,000,000, five-eighths of which is estimated to be British capital, divided among 50 companies. Some 30 companies are said to be producing, but the majority only on a small scale. Returns are quoted which showed that at the end of 1911 there were 130,000 acres planted in *Hevea Brasiliensis*.

Some Rubber Planting Notes.

FEDERATED MALAY STATES RUBBER CO., LIMITED.

ACCORDING to the annual report prepared for presentation to the shareholders at the annual meeting of October 30, at Antwerp, the planted area increased during the year from May 31, 1911, to May 31, 1912, from 3,824 acres to 4,594½ acres, total area having increased in the same time from 7,264 acres to 8,217½ acres.

The total yield of rubber for the year was 720,853 pounds, slightly over the estimate of 711,000 pounds, the average yield per tree having increased from 2 pounds to 2.49 pounds, and per acre from 211 pounds to 227 pounds. The cost of production, including general expenses, equaled 1*s.* 9½*d.* per pound, against 2*s.* 6½*d.* for the previous year, the increased number of trees tapped and the higher yield per tapped tree causing this reduction. For the year 1912-1913 the estimate is 1,000,000 pounds of dry rubber.

SAPUMALKANDE RUBBER COMPANY, LIMITED.

THE total harvested for the first three quarters of 1912 was 149,916 pounds (against about 90,000 for corresponding period of 1911), of which 76,600 pounds were sold at an average gross price of 4*s.* 8*d.*, forward contracts for 13,440 pounds No. 1 having been made at an average gross price of 4*s.* 8½*d.* Forward contracts for 1913 represent 36,000 pounds at a gross average of 4*s.* 8.33*d.*

SEAPORT (SELANGOR) RUBBER ESTATE, FEDERATED MALAY STATES.

Having produced in the year ended June 30, 1911, a yield of 17,717 pounds, the figures for the year ended June 30, 1912, of 130,291 pounds show more than a seven-fold increase in the production of the Seaport Rubber Estate.

The cost of production was 2s. 0.38d. per pound, or, including all London charges, 2s. 6.54d. per pound.

MALAYAN GOVERNMENT WARNING INVESTORS.

The government of the Federated Malay States has issued a warning against participation in certain speculative companies. During the boom of 1910 they started acquiring rubber estates, but are now devoting their energies to cocoa nuts and copra. In the cable which transmitted this warning it was likewise stated that several retired English officials were mixed up with these companies, the financial status of which is not thereby strengthened.

MALAYAN COMPANIES' RETURNS.

The returns of six leading Malayan companies for the eight months ended August 31 compare very favorably with those for the corresponding period of last year. Exact figures are:

	Eight months to August 31	
	1911	1912
	pounds	pounds
Anglo Malay	461,966	516,760
Pataling	196,230	281,118
London Asiatic	188,294	406,309
Golden Hope	62,488	85,760
Selaba	115,104	196,676
Bikam	54,906	97,630
Total	1,078,988	1,584,253

MR. WICKHAM'S IMPROVED SMOKING APPARATUS.

In the October issue attention was called to the fact that the new smoking apparatus designed by Mr. H. A. Wickham and made by David Bridge & Co. was to be shortly demonstrated at the works of the Colombo Commercial Co. According to the "Colombo Observer," the demonstration has now taken place, with the result that a block has been produced resembling fine hard Pará in appearance, but on being cut was seen to be finely laminated, each flake of rubber having been well smoked. The block produced was about nine inches or a foot square, and at the time of writing was not quite hard.

This condition would be attained in about a fortnight, and then its appearance would closely approximate that of hard Pará.

The process is interesting. Latex is poured into a revolving drum, smoked and pressed. In the Amazon the smoking is done with fuel obtained from the palms. The palms, however, are different from those growing in Ceylon, but Mr. Wickham thinks that the local palm tree will be quite suitable for his process. The machine at present is foot powered, but it is adaptable for belt drive. There is a possibility of a further demonstration in Colombo. Those who have seen both the rubber and the process are convinced that it is a good thing, and may have an important bearing on the plantation industry.

PROSPECTS OF SOUTHERN INDIA.

The report of Harrisons & Crosfield (Limited), London, in speaking of the acquisition of the business of Cameron & Co., of Quilon, Southern India, adds:

"We decided to extend the interests the company had in Southern India, which country, we feel, has a great future before it in connection with the tea and rubber industries, having many natural and economic advantages for the production of both."

As this company acts as secretary for various large rubber companies, it is in touch with the situation generally.

FEDERATED MALAY STATES RUBBER EXPORTS.

	1910. lbs.	1911. lbs.	1912. lbs.
January	768,743	1,329,170	2,730,576
February	728,458	1,490,849	2,715,767
March	899,383	1,916,219	3,089,583
April	1,123,097	1,235,917	2,285,390
May	877,435	1,147,488	2,255,034
June	879,675	1,229,754	2,305,915
July	971,469	1,581,993	2,695,861
August	981,022	1,651,845	3,655,535
September	1,110,476	1,677,062	2,968,121
October	1,484,847	2,182,857	3,210,831
Total	9,824,605	15,443,154	27,912,613

By the above returns it will be seen that this year's rubber exports from the Federated Malay States are so far nearly double those for the corresponding period of last year, and almost three times those for the first ten months of 1910.

RUBBER EXPORTS FROM PANAMA.

According to the report of the German commercial expert for the West Coast of South America, the rubber exports of Panama are still inconsiderable; planting being only as yet in its commencement. Good prospects, however, exist for the future. *Castilloa elastica* is found in nearly all parts of the interior, and a little rubber has been exported for many years. In former years the Indians used to cut down the trees for the sake of the latex; but more recently they have been re-planting. The plantations are, however, still too young to produce a yield. The rubber exported as "Panama Rubber" is quoted in Germany at the same price as Peru rubber.

BRAZILIAN VIEW OF NEW YORK PRIZE AWARD.

The "Revista" of the Amazonas Commercial Association of Manáos, in commenting upon the cable advice of the award to the State of Amazonas of The India Rubber World trophy, remarks:

"It is beyond doubt that our rubber forms a distinct type, superior in resistance and elasticity to the rubbers obtained by the chemical coagulation of the latex, seeing that in competition with the latter it has obtained the special prize in three expositions."

A CHANCE TO START RUBBER IN BURMA.

A letter has been received in the office of The India Rubber World from an Englishman resident in Burma, who believes that there is a very fine prospect for the profitable planting of rubber in that country. He writes as follows: "I am very much interested in rubber, being a practical planter of seven years' experience in Sumatra, Malay States and Burma, and from what I have seen this country compares very favorably with the others, and I am certain there is a great future for rubber-growing in Burma. The principal reasons in support of the above statements are as follows:

"1. Large tracts of suitable rubber-growing land.

"2. Soil and climatic conditions excellent.

"3. Plenty of labor, and cheaper labor than in other countries, daily labor varying from 16 to 25 American cents per day, principally the former.

"4. Estates are very free from disease.

"5. Easy communications by road, rail or sea.

"6. Land is rent-free for eight years.

"And lastly, estates can be opened up, burnt, cleared and stumped, planted and brought into bearing easily for $150 American money, which compares very favorably with other countries."

He goes on to say that he believes there is a fine opportunity for American capitalists to invest money in a rubber plantation in Burma, and he would like very much to undertake the management of such a plantation, and refers to a number of people in the Middle East and in London who will vouch for his personal reliability.

PLANTATION AND WILD RUBBER—AS VIEWED BY A BELGIAN EXPERT.

In a review of the above question in the columns of the "Gummi-Zeitung," M. G. van den Kerckhove, of Brussels, refers to the opinion often heard that wild rubber is destined to be superseded by plantation rubber, but takes exception to that view of the case. Here is his opinion of the matter:

"Wild rubber will always retain its market, particularly the fine Pará of the Amazon, which will always remain the standard of elasticity for all the rubber manufacturers in the world. Fine Pará will not allow itself to be dethroned, and will always take the lead for elasticity, although many Ceylon and Malay descriptions may surpass it as to purity and dryness."

From the above it is deduced that the efforts of the planting companies should be directed towards a product as far as possible equal to fine Pará.

Attention is called to the fact that there is in plantation rubber a great diversity of quality, though from the same source (*Hevea*) and cultivated on the same soil. At a recent London auction, according to this writer, there were 11 or 12 well marked qualities of crepe ranging in price from 3s. 8d. to 4s. 8d., and five qualities of biscuits and sheets from 4s. 4½d. to 4s. 7¼d. Only block was fairly uniform in price and quality.

He continues:

"Is there any way of counteracting this diversity in quality, which affects the good reputation of this rubber? I must answer this in the affirmative. In my opinion, binding agreements should be made at one of the next rubber congresses, between the planting companies as to a uniformity in the form of their product, and about uniform coagulation of the latex."

In conclusion, it is added, that while such an arrangement would be extremely difficult, yet if a majority of the rubber producing companies were in favor of the measure, the others must necessarily follow. The consequent uniformity would lead to greater confidence on the part of manufacturers and to a higher valuation of the product; to the advantage of plantation industry; particularly in the Malay States, Ceylon and the Dutch Indies.

SUMATRA'S RUBBER OUTLOOK.

Since the United States Rubber Co. invested in an 80,000-acre plantation in Sumatra and has started to plant this to rubber—having, as a matter of fact, nearly one-third of this great acreage already set out in rubber trees—a great deal of attention has been turned on the part of rubber planters everywhere to this particular island. Baron Autenried, the manager of one of the large English plantations in Sumatra, who recently passed through New York on a trip around the world, was very enthusiastic over the Sumatra rubber outlook. He expressed himself as follows:

"Of course, everybody out there seems to be going in more or less for rubber. The first trees were planted in 1899, and then in 1903 the great estates, many of which had been devoted to coffee raising, began to plant rubber. A little later came the rubber boom, when a great deal of English capital came in, and much new land was opened. Up to 1911 there were 126,000 acres on the east coast in rubber. Now about $25,000,000 of English capital, $3,500,000 Dutch, $2,000,000 of French, $400,000 of German, and $4,000,000 of American money are invested in the industry.

"Experiments have shown that the eastern district of Sumatra is more favorably adapted to rubber cultivation than Ceylon, and is equally as good for that purpose as the Federated Malay States. Besides, labor conditions are much better than in most other countries. We import coolies from Java, which is overpopulated, and the workmen are very satisfactory. It takes a rubber tree four years to bear in Sumatra. We have better weather and a more equable temperature than they have in Singapore.

"As a rubber producing country, Sumatra is only beginning. So far only some twenty estates are actually producing, for most of the planting was done during the boom. The exportation of rubber in 1911 was 1,400,000 pounds. In 1914 this will be doubled."

AN ENGLISH OPINION OF UNITED STATES RUBBER CO.'S PLANTATION.

In reviewing the above subject the "Financier" of London remarks that it will be about two or three years before the United States Rubber Co. can reasonably expect to get any quantity of rubber from its 80,000-acre plantation in Sumatra. But, it is added, after the trees come into bearing they should rapidly increase their production, until a yearly total of 15,000,000 to 20,000,000 pounds of rubber should be available.

Whether production will ever reach a point where the company is not obliged to buy any rubber in the open market, it is considered too early to predict, but it is remarked that in the best opinion this idea will be very closely realized.

Until the trees come into bearing the capital which will have been poured into this Sumatra investment, will, it is calculated, have reached $6,000,000, this money in the meantime earning nothing. As to prospective value of the property, the journal says in conclusion:

"This rubber plantation is a valuable equity with fascinating possibilities. Its income-producing ability has not begun to be discounted in the price of the shares. As time goes on, it must inevitably receive an increasing degree of speculative attention.

AMERICAN SYNTHETIC RUBBER PATENTS.

IN view of the attention now being paid to the question of synthetic rubber, interest attaches to a series of four American patents recently issued to Lucas Petron Kyriakides and Richard Blair Earle, of Boston, Massachusetts. The applications had been made on November 11, 1911, and the patents were granted on July 23, 1912.

The claims of the four patents are as follows:

PROCESS OF PRODUCING PIPERYLENE.

1. The process for producing piperylene, which consists in passing the vapors of amylene oxid over heated dehydrating catalytics at temperatures from 400°-500° C., *in vacuo*, at pressures less than 60 millimeters of mercury.

2. The process for producing piperylene which consists in passing the vapors of amylene oxid over heated aluminum silicate at temperatures from 400°-500° C., *in vacuo*, at pressures less than 60 millimeters of mercury.

PROCESS OF PRODUCING ISOPRENE.

1. The process for producing isoprene, which consists in passing the vapors of the valeraldehyde over dehydrating catalytics at temperatures from 400° to 600° C., *in vacuo*, at pressures less than 60 millimeters of mercury.

2. The process for producing isoprene, which consists in passing the vapors of the valeraldehyde over aluminum silicate at temperatures from 400° to 600° C., *in vacuo*, at pressures less than 60 millimeters of mercury.

PROCESS OF PRODUCING ERYTHRENE.

1. The process for producing erythrene, which consists in passing the vapors of normal butyraldehyde over heated dehydrating catalytics at temperatures ranging from 500°-600° C., *in vacuo*, at pressures less than 60 millimeters of mercury.

2. The process for producing erythrene, which consists in passing the vapors of normal butyraldehyde over heated aluminum silicate at temperatures from 500°-600° C., *in vacuo*, at pressures less than 60 millimeters of mercury.

PROCESS FOR PRODUCING β γ DIMETHYLBUTADIENE.

1. The process for producing β γ dimethylbutadiene, which consists in passing the vapors of the hexylene oxid over heated dehydrating catalytics at temperatures from 400°-500° C., *in vacuo*, at pressures less than 60 millimeters of mercury.

2. The process for producing β γ dimethylbutadiene, which consists in passing the vapors of the hexylene oxid over heated aluminum silicate at temperatures from 400°-500° C., *in vacuo*, at pressures less than 60 millimeters of mercury.

SYNTHETIC RUBBER FIGURES.

IN the "Ceylon Observer," D. U. Weigel, of Kollupitiya, questions the figures of yield put forward in the prospectus of the synthetic rubber promoters. These yields, it is recalled, were stated as follows:

1. Starch from potatoes .....60 per cent.
2. Fusel oil from starch.....43 per cent.
3. Isoprene and rubber from fusel oil..50 per cent.

The first figure he characterizes as "utter nonsense" the maximum yield being 24 per cent., and the average 17 per cent.; adding that there had apparently been some confusion with the 55 per cent. yield from maize.

As to the alleged 43 per cent. of fusel oil from starch, Mr. Weigel remarks that the bacteria which influence butylic fermentation are known, but he has never found any authority to attribute to any of them the power of activity up to a 43 per cent. yield.

This discussion of the question of yield from a scientific point of view, at such an important point as Ceylon, indicates the widespread interest which the subject of synthetic rubber has aroused throughout the world.

FAREWELL DINNER TO MR. MANDERS.

AMONG the many farewell luncheons and dinners tendered A. Staines Manders prior to his departure to Europe, one of the most notable was the dinner at the Lotos Club on the evening of November 12. There were present only men identified with the rubber trade. Informal speeches were made by Arthur W. Stedman, J. O. Stokes and George B. Hodgman. In behalf of friends of Mr. Manders in the rubber trade, H. C. Pearson presented a beautiful loving cup. Mr. Manders, in accepting it, paid a high tribute to American enterprise as evidenced by the prosperous rubber industry.

The cut below shows the cup on an ebony standard. The cup alone stood about 12 inches high and was etched on its face with a decorative design of rubber leaves framing the following inscription:

Presented to
A. STAINES MANDERS
Organizing Manager
and
MISS D. FULTON
Secretary
Of the
Third International Rubber
And Allied Trades Exposition
New York, 1912
By Their Friends
Of the
American Rubber Trade.

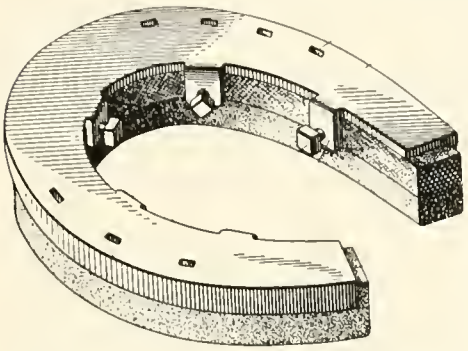
Mr. Manders was greatly pleased with this token of regard from his American friends, and though he received a number

of other souvenirs of his six months' stay in the United States, he probably received none that he will treasure more highly.

New Rubber Goods in the Market.

A NEW RUBBER HORSESHOE.

EVERYBODY ought to be glad when things come the horse's way. Here is a new horseshoe that should do a great deal to relieve the horse's burden. It really puts him on a quick-detachable tire footing. The accompanying cut will give some idea of this new shoe. It consists of an iron shoe that is nailed on the horse's hoof like any other shoe. Around the outer edge of this shoe there is a flange and on the inner edge five lugs, each with a threaded bolt with a square head. This flange and these lugs form a channel, into which is fitted a solid rubber tread, the lower half of it, which touches the ground, being resilient rubber, the upper half, which fits into the iron shoe, consisting of rubber and canvas. A layer of stout fabric covers this upper half of the tread, reaching down to the lower or rubber half. This canvas cover makes it possible to screw the bolts in so as to hold the tread securely without damaging that part of the tread that comes in contact with the bolts.



This shoe gives the horse an all-rubber tread, and at the same time leaves the frog of the foot entirely open. When the tread is worn out another can be inserted in a couple of minutes by simply loosening and then tightening the bolts, and the iron part of the shoe gets no wear whatever and consequently stays permanently on the horse's foot without the necessity of replacing. This new horseshoe was invented and has been patented by G. E. McKinnon, Little Falls, New Jersey.

THE TWIN NURSING BOTTLE.

The youngster who has not yet arrived at the stage of life where he is interested in table d'hotes, and must still subsist solely on milk, has had a good many devices prepared for his convenience and health. Here is one of the very latest. It is a nursing bottle, very simple in construction, consisting of one tube and two rubber caps—one at each end.

When the cap, or "the breast," as the manufacturers call it, at one end of the tube is turned inward, it forms a base for the nursing bottle. This base may contain a puncture in the nipple, or not, as preferred. When the nipple is perforated, air is admitted to the bottle by way of the base, which makes nursing easier for the child. This device is easy to clean. [Hygeia Nursing Bottle Co., Buffalo, New York.]

THE LIBBY ANTI-BURSTING DEVICE FOR TIRES.

AN objectionable feature of pneumatic tires on automobile wheels has been that they would frequently burst or blow out, on account of excess pressure within the tire, caused by the expansion of air confined therein, resulting from friction or changes in temperature, or from sudden contact of the tire with obstacles in the road. This trouble is of comparatively frequent occurrence and has not only proved a source of expense, but has led to many serious and fatal accidents. Moreover, the constant variations of pressure shorten the life of the tire.

An invention of John K. Libby, of Malden, Massachusetts, for which a United States patent (No. 1,035,207) has been issued, consists of a vehicle wheel having a pneumatic tire, whose interior communicates with an elastic relief chamber. When the pressure of the air in the tire increases, it is exhausted into the relief chamber, thereby preventing an excessive or injurious pressure in the tire. When the pressure in the tire falls, air will be exhausted from the relief chamber into the tire, thus preventing an excessive reduction of pressure in the latter. A normal safe working pressure, according to the inventor, will thus be maintained, notwithstanding variations of temperature within the tire, however caused.

The device is a mechanical one, composed of metal and rubber and mounted on the hub of the wheel. It is already patented in the United States, and patents have been applied for in Great Britain, France, Germany, Italy and Canada.

THE RUBBER CUSHION HAIR BRUSH.

Rubber-cushion hair brushes are not so particularly new; the Pearson hair brush, for instance, first appeared on the London market about twenty-eight years ago. But it is an interesting article, in which rubber plays a considerable part, and it has proved extremely popular. As the accompanying cut shows, the bristles are imbedded in a cushion of rubber. This enables the brush to combine the durability of stiff bristles, together with the yielding effect of the rubber cushion, which, in reality, is an air-cushion; accordingly the brush has a certain pneumatic resiliency. These Pearson rubber-cushion brushes are now made in a great variety. They are made in three sizes: in black and white, cherry, rose, satin and ebony woods. The American agents are Alfred H. Smith Co., 35 West Thirty-third street, New York City.

PEARSON'S RUBBER-CUSHION "IDEAL" HAIR BRUSH.

A LIGHT SANITARY, INEXPENSIVE FOOT ARCH.

An Albany physician—or to be more explicit—Dr. John J. Collins, 69 Ten Broeck street, Albany, New York, has invented a new sort of foot arch, made from reinforced hard rubber. It is thoroughly ventilated, which makes it sanitary and cool. It is impervious to moisture and is extremely light. Moreover, it can be made flexible by the application of a certain degree of heat, which makes it possible to adjust it to any normal or abnormal condition of the foot. Another point in its favor is that it can be manufactured very inexpensively, so that it can be put on the market at an attractive price. The doctor, who has other affairs to attend to, has never put this arch on the market or advertised it, and he is willing to dispose of the patent (which has 14 years to run) and the molds at quite a reasonable figure. This arch has been examined by other physicians and highly commended by them. Here appears to be a chance for somebody to acquire a good foot arch on favorable terms.

THE BRAENDER AUTO TIRES.

The illustration below shows a tire made by the Braender Co., which has a somewhat peculiar tread. These tires are said to be made of exceedingly fine fabric and rubber, with particular

THE BRAENDER TREAD.

attention given to the tread, so that it is unusually durable. These tires range in size from 30 x 3 inches to 37 x 5½ inches. [The Braender Rubber & Tire Co., Rutherford, New Jersey.]

A FINE USE FOR OLD AIR-BRAKE HOSE.

To find a good use for a useless thing is to confer a benefaction on all mankind. That is practically what one of the Eastern railroads has done in converting worn-out air-brake hose into rubber mats on which to drop trunks. To be sure, old air-brake hose is not absolutely useless, for the rubber can be extracted from it, but if it can be converted into a satisfactory mat its value is much enhanced. The mats used by this particular railroad consist of about 24 pieces of old hose, cut a little less than 2 feet in length. These pieces are put side by side close together and fastened to four strips of wood that form a base and serve to keep the strips in place. This makes a mat nearly 2 feet wide by about 4½ feet long, and when trunks are pulled out of the cars or dumped off of trucks, instead of being smashed on stone or concrete flooring, they land on these resilient mats with very little harm. Probably some other sort of base made of rope or fibre would be even better than the wooden base, but the essential feature, of course, is the layer of rubber tubes that form the mat.

RUBBER COMPANIES AT THE AUTO. SHOWS.

THE automobile manufacturers will hold their annual shows in New York, Chicago and Boston as follows: In New York there will be two shows, one in the Madison Square Garden and the other in the Grand Central Palace. Both will continue two weeks, from January 11 to January 25. The Chicago show will continue two weeks, from February 1 to 15, and the Boston show will be held for one week, from March 5 to March 12.

The following tire and accessory manufacturers will take part in the two weeks' show at the Madison Square Garden:

Ajax-Grieb Rubber Co., New York; S. F. Bowser & Co., Fort Wayne, Indiana; Consolidated Rubber Tire Co., New York; Continental Caoutchouc Co., New York; The Diamond Rubber Co., Akron, Ohio; Joseph Dixon Crucible Co., Jersey City, New Jersey; Empire Tire Co., Trenton, New Jersey; Firestone Tire & Rubber Co., Akron, Ohio; The Fisk Rubber Co., Chicopee Falls, Massachusetts; G. & J. Tire Co., Indianapolis, Indiana; The B. F. Goodrich Co., Akron, Ohio; The Goodyear Tire and Rubber Co., Akron, Ohio; The Hartford Rubber Works Co., Hartford, Connecticut; Link-Belt Co., Philadelphia, Pennsylvania; Michelin Tire Co., Milltown, New Jersey; Morgan & Wright, Detroit, Michigan; The Motz Tire and Rubber Co., Akron, Ohio; Pennsylvania Rubber Co., Jeannette, Pennsylvania; The Republic Rubber Co., Youngstown, Ohio; A. Schrader's Son, Inc., New York; Swinehart Tire and Rubber Co., Akron, Ohio; The United Rim Co., Akron, Ohio.

The following tire manufacturers will exhibit in Madison Square Garden only for the first week:

The Batavia Rubber Co., Batavia, New York; Endurance Tire and Rubber Co., New York; New Jersey Car Spring and Rubber Co., Jersey City, New Jersey; The Pantasote Co., New York; The Seamless Rubber Co., New Haven, Connecticut; Voorhees Rubber Manufacturing Co., Jersey City; Walpole Rubber Co., Boston; Marathon Tire and Rubber Co., Cuyahoga Falls, Ohio.

A. Schrader's Son, Inc., New York, will exhibit at the Grand Central Palace for two weeks. The Continental Rubber Works Co., Erie, Pennsylvania, will exhibit at the Grand Central Palace for the first week only.

The following tire manufacturers will exhibit at the Chicago show for the entire two weeks:

Ajax-Grieb Rubber Co., New York; S. F. Bowser & Co., Fort Wayne, Indiana; Consolidated Rubber Tire Co., New York; Continental Caoutchouc Co., New York; The Diamond Rubber Co., Akron, Ohio; Joseph Dixon Crucible Co., Jersey City, New Jersey; Empire Tire Co., Trenton, New Jersey; Firestone Tire and Rubber Co., Akron, Ohio; The Fisk Rubber Co., Chicopee Falls, Massachusetts; G. & J. Tire Co., Indianapolis, Indiana; The B. F. Goodrich Co., Akron, Ohio; The Goodyear Tire and Rubber Co., Akron, Ohio; The Hartford Rubber Works Co., Hartford, Connecticut; Link-Belt Co., Philadelphia, Pennsylvania; Morgan & Wright, Detroit, Michigan; The Motz Tire and Rubber Co., Akron, Ohio; Pennsylvania Rubber Co., Jeannette, Pennsylvania; The Republic Rubber Co., Youngstown, Ohio; Swinehart Tire and Rubber Co., Akron, Ohio; The United Rim Co., Akron, Ohio.

The following manufacturers will exhibit at the Chicago show for one week only:

The Batavia Rubber Co., Batavia, New York; Double Fabric Tire Co., Auburn, New York; Endurance Tire and Rubber Co., New York; Federal Rubber Manufacturing Co., Cudahy, Wisconsin; Leather Tire Goods Co., Niagara Falls, New York; Lee Tire and Rubber Co., Conshohocken, Pennsylvania; Michelin Tire Co., Milltown, New Jersey; New Jersey Car Spring and Rubber Co., Jersey City; The Pantasote Co., New York; Racine Rubber Co., Racine, Wisconsin; The Seamless Rubber Co., New Haven, Connecticut; C. A. Shaler Co., Waupun, Wisconsin; Universal Tire Protector Co., Angola, Indiana; Voorhees Rubber Manufacturing Co., Jersey City.

The following tire manufacturers will exhibit at the Boston show: Ajax-Grieb Rubber Co., New York; S. F. Bowser & Co., Fort Wayne, Indiana; Consolidated Rubber Tire Co., New York; Continental Caoutchouc Co., New York; The Diamond Rubber Co., Akron, Ohio; Firestone Tire and Rubber Co., Akron, Ohio; The Fisk Rubber Co., Chicopee Falls, Massachusetts; G. & J. Tire Co., Indianapolis, Indiana; The B. F. Goodrich Co., Akron, Ohio; Goodyear Tire and Rubber Co., Akron; Hartford Rubber Works Co., Hartford, Connecticut; Morgan & Wright, Detroit, Michigan; The Motz Tire and Rubber Co., Akron; Pennsylvania Rubber Co., Jeannette, Pennsylvania; Swinehart Tire and Rubber Co., Akron; The United Rim Co., Akron; Voorhees Rubber Manufacturing Co., Jersey City; The Batavia Rubber Co., Batavia, New York; Double Fabric Tire Co., Auburn, Indiana; Endurance Tire and Rubber Co., New York; Empire Tire Co., Trenton, New Jersey; Federal Rubber Manufacturing Co., Cudahy, Wisconsin; Leather Tire Goods Co., Niagara Falls, New York; Lee Tire and Rubber Co., Conshohocken, Pennsylvania; Michelin Tire Co., Milltown, New Jersey; The Pantasote Co., New York; The Republic Rubber Co., Youngstown, Ohio; The Seamless Rubber Co., New Haven, Connecticut; C. A. Shaler Co., Waupun, Wisconsin.

News of the American Rubber Trade.

PENNSYLVANIA RUBBER COMPANY.

THE annual stockholders' meeting of the Pennsylvania Rubber Co. was held at the main office of the company at Jeannette, Pennsylvania, on November 8. The office of chairman of the board of directors was created, to which Mr. Herbert DuPuy was elected, having retired from the presidency in favor of H. Wilfred DuPuy, who was elected to that office in addition to that of treasurer. The other officers and directors were re-elected as follows: Charles M. DuPuy, vice-president; George W. Shiveley, secretary; Seneca G. Lewis, general manager; Charles G. Morrill, assistant treasurer. Mr. Lewis announced that business had increased 75 per cent. over the previous year, and that contracts on hand would tax the utmost capacity of the plant during 1913.

THE HARTFORD'S OUTPUT OF BICYCLE TIRES.

A GREAT many people have the idea that the bicycle has lapsed into innocuous desuetude—to use a term quite popular twenty years ago. To be sure, one doesn't bump into a bicycle every time he goes out now, as he did some years ago, but evidently the bicycle is still affected by a very considerable part of the population—judging from the number of tires made for this comparatively inexpensive but convenient vehicle. Take, for instance, the output of one factory alone. The Hartford Rubber Works' factory manager says that two years ago they manufactured 230,000 bicycle tires; last year the number increased to 450,000; for the year 1912 he estimates 650,000, and for 1913 100,000 more, which would seem to indicate that bicycles were not only holding their own, but really growing in popularity.

THE AKRON MOLD AND MACHINE CO.

One of the best equipped foundries in Akron is that of the Akron Mold and Machine Co. This company specializes in rubber mill works and has recently moved into its present quarters, built especially for the purpose to which it is devoted, and which was made necessary by the remarkable increase in the company's business during the past three years. A unique feature of the new building is a well appointed toilet and locker room for the use of the 60 men employed. In addition to its regular line the company is making the famous Y. and S. core. Stanley Harris, the president, is one of the most capable machinists in the trade, and to him belongs the credit of the development of the Akron Mold and Machine Co. to its present enviable position.

The Gordon Rubber Co., Canton, Ohio, has become an important factor in drug sundry and automobile tire lines. The Gordon product is of recognized standard, and the company has expanded continuously since the inception of the present management. The superintendent, Neil Crawford, formerly of the Hewitt Rubber Co., is producing excellent results in his present position.

The Indiana Rubber and Insulated Wire Co., Jonesboro, Indiana, estimates that its present automobile tire production will be multiplied by three in 1913.

A surgeon's glove with a patent knuckle, which is claimed to obviate tension at finger ends is a recent production of the Hadfield Rubber Co., Akron, Ohio. It is said to be favorably received by surgeons.

A map of Akron, "the city of opportunity," surrounded by cuts of several of the prominent rubber mills, has recently been issued by a local printing concern.

A hard rubber corset stay with re-enforced ends is a recent patent of the Summit Rubber Co., Barberton, Ohio.—Another new Summit offering is a dipped narrow-necked water bottle.

NET EARNINGS OF NEARLY 14 PER CENT.

The annual report of the Ajax-Grieb Rubber Co. for the year ending August 31 last has recently been published, and shows a net business of $2,936,923.19, with net earnings of $408,434.53, or almost 14 per cent. The company's statement is as follows:

ASSETS.

Cash in banks and offices		$110,307.48
Bills receivable		137,389.42
Accounts receivable		291,313.65
Merchandise and materials		432,672.81
Mortgages, etc. (owned)		12,912.61
Real estate, buildings, machinery and equipments	$322,296.72	
Less depreciation charges	57,844.01	
		264,452.71
Patents		10,000.00
Total assets		$1,259,048.68
Net earnings for year	$408,434.53	
Fire insurance carried	890,000.00	

LIABILITIES.

Notes payable		None
Accounts payable (not due)		$155,161.77
Capital stock:		
Preferred 7 per cent	$285,000.00	
Common	450,000.00	
		735,000.00
Surplus August 31, 1912		368,886.91
Total liabilities		$1,259,048.68

MESSRS. PATTERSON & APPLETON START A TIRE COMPANY.

John S. Patterson, who has been factory superintendent of the Revere Rubber Co. for the past 10 years, and Capt. Francis H. Appleton, of F. H. Appleton & Son, Inc., the well-known rubber reclaimers of Boston, have organized a stock company, under the laws of Massachusetts, under the name of the Patterson Rubber Co., with a capital stock of $500,000, for the manufacture of automobile tires. Mr. Patterson will be president of the company and have general charge. His son, who has also been with the Revere company for some years, will be manager of the new factory, and have as his assistants a number of men who have been his former associates, among them Walter F. McDonald, who will be assistant factory manager; Frank Chamberlain, who will be factory superintendent, and Charles H. O'Neil, who will be mechanical engineer.

The work of building the factory has already begun. It will be located in Lowell, Massachusetts.

A NEW TIRE CO. IN EAST PALESTINE.

A new tire company has just been started in East Palestine, Ohio, under the name of the East Palestine Rubber Co., incorporated under the laws of Ohio. The president is the well-known rubber chemist, Wilmer Dunbar; the vice-president is A. S. Mauk, and the secretary and treasurer, Abram Hartley. The company is capitalized at $50,000. It has started on its factory, and is putting up a two-story building 50 x 110 feet, with a power house 35 x 50 feet. It expects to be manufacturing tires by the 1st of January.

The land was given the company free of tax by the town, and the townspeople have also subscribed a considerable bonus.

THE UNITED STATES RUBBER CO.

The rapid rise in the price of the common stock of the United States Rubber Co. during the latter part of November, which in a week's time carried it up some 10 points, gave rise to a great deal of conjecture as to its cause. Quite a good many of the financial writers said that this stock was to be placed on a 5 per cent. dividend basis, which accounted for its activity in the market. Inquiry at the office of the United States Rubber Co., however, brings the information that at the present time no such dividend increase is being considered. The report that the company's gross business shows an increase for the 10 months ending October 31 of 30 per cent. over the same period for last year, is confirmed at the company's office. This is a very substantial increase, and in itself would be sufficient to explain a marked rise in the price of the common stock.

NEW INCORPORATIONS.

American Kushion Kore Tire Co., Inc., November 12, 1912; under the laws of New York; authorized capital, $10,000. Incorporators: Charles H. Taylor, Christopher M. Baldy and K. E. Wilhelm—all of 558 Ellicott square, Buffalo, New York. Location of principal office, Buffalo, New York.

American-Mexican Rubber and Coffee Corporation, November 12, 1912; under the laws of New York; authorized capital, $2,000,000. Incorporators: William C. Douglas, 409 Eddy street; Arthur N. Gibb, 106 Cayuga Heights road, and Isaac K. Bernstein, 433 North Geneva street—all of Ithaca, New York. Location of principal office, Ithaca, New York.

Auto Tire Repair and Supply Co., November 4, 1912; under the laws of New Jersey; authorized capital, $100,000. Incorporators: Joseph Michel, 236 Salem street, Gloucester City, New Jersey; Thomas F. Golden, 2729 North Twentieth street, and Thomas J. Manning, 2229 North Fifteenth street—both of Philadelphia, Pennsylvania. To manufacture and deal in automobiles, cars, carriages, wagons, trucks and vehicles of all kinds.

The Carbone Co., Inc., October 28, 1912; under the laws of New York; authorized capital, $200,000. Incorporators: W. E. Greene, 100 Reade street, New York; G. C. Leonard, 472 Broadway, and W. G. Van Loon, 100 State street—both of Albany, New York. Location of principal office, Albany, New York. To deal in all kinds of rubber tires, etc.

The Goodyear Tire and Rubber Co., of South America, October 14, 1912; under the laws of Maine; authorized capital, $3,000,000. Incorporators: Joseph Williamson, Augusta; E. M. Leavitt, Winthrop, and E. M. Hussy, Augusta—all of Maine. To manufacture articles from rubber and refine crude rubber and to do all things incidental thereto.

Ithaca Boot Shop, September 17, 1912; under the laws of New Jersey; authorized capital, $25,000. Incorporators: James B. Banister, John W. and George M. Denny—all of Newark, New Jersey. Location of principal office, Ithaca, New York. To deal in boots, shoes, etc.

M. R. L. Resilient Tire Co., October 15, 1912; under the laws of Illinois; authorized capital, $25,000. Incorporators: Mitchell R. Labbee, Martin O. Lundholm and B. Wilson Moore. To manufacture and sell resilient non-puncturable tires, and deal in motor vehicles, and their parts and accessories.

Macandaruba Tire Filler Co., November 9, 1912; under the laws of Delaware; authorized capital, $1,500,000. Incorporators: H. Ralph Ewart, Clarence J. Jacobs, and Harry W. Davis—all of Wilmington, Delaware. To sell and place on the market a composition used as a filler for rubber tires known as the Macandaruba Elastic Filler.

The Owen Rubber Co., October 29, 1912; under the laws of Ohio; authorized capital, $10,000. Incorporators: Thomas J. Owen, F. E. Henry and Frank A. Owen. Location of principal office, Ashtabula, Ohio. To manufacture and deal in rubber goods, druggists' sundries, novelties, and merchandise.

St. Louis Tire & Rubber Co., November 15, 1912; under the laws of Missouri; authorized capital, $150,000. Incorporators: J. A. Swinehart, St. Louis, Missouri; Harry C. Barker, Webster Groves, Montana, and Alfred C. Einstein, St. Louis, Missouri. Location of principal office, University City, St. Louis County, Missouri. To manufacture, sell, import, and export and deal in vehicle and automobile tires, and to buy and sell as owners or on consignment, merchandise, etc., of which rubber is wholly or in part a component.

Triangle Tire Co., October 7, 1912; under the laws of Illinois; authorized capital, $5,000. Incorporators: Lawrence A. Cohen, Charles Aaron, and Floyd M. Stahl. Location of principal office, 59 East Garfield Boulevard, Chicago. To manufacture and repair automobile tires, accessories, automobiles, motorcycles, and operate a garage.

Tuxedo Tire Co., Inc., November 9, 1912; under the laws of New York; authorized capital, $8,000. Incorporators: Augusta Hormann, 429 East 157th street; Emilie and Adolph Walterberg—both of 558 Mott avenue, New York. Location of principal office, Bronx, New York.

Wetnot Manufacturing Co., Inc., November 18, 1912; under the laws of New York; authorized capital, $10,000. Incorporators: Charles Pechner, Henry L. and Samuel Speiling—all of 302 Broadway, New York. Location of principal office, New York. To deal in rubber goods.

TO SELL U. S. MOTOR CO. AT AUCTION.

A decree was signed on November 17 ordering the sale of the assets of the United States Motor Company and five subcompanies—the Alden Sampson Manufacturing Co., Brush Runabout Co., Columbia Motor Car Co., Dayton Motor Car Co. and the Maxwell Briscoe Motor Co.—on January 8 next, in Room 47, New York Postoffice Building, at 11 A. M. W. E. S. Strong and Roberts Walker may receive sealed bids at their office, Sixty-first street and Broadway, New York, up to 10 A. M. of January 8, which bids will be opened in the presence of Judge Hough in Room 47, Postoffice Building, at 11 A. M.

The property will be offered for sale in six parcels, in the order named above. The entire properties, as a whole, will also be offered in a single lot. After the sale of the properties bids will be received for shares of stock in various companies held by the United States Motor Company.

THE ATLANTIC RUBBER COMPANY.

Owing to the large increase in their business during the past year or two, The Atlantic Rubber Co. found their present factory inadequate, and have therefore sold it, and expect to build a new fireproof one next year. They have moved to another factory in Hyde Park, on River street, where they will remain until their new factory is fully equipped. In addition to selling their buildings and real estate, they sold a few of their heavy machines, which were expensive to move.

THE NORTH BRITISH PICTURES.

Mention was made in our November issue of the very interesting moving picture display contributed to the Rubber Exposition by the Malayan planters, but through an oversight no mention was made of the equally fine moving pictures, showing the process of manufacturing rubber, contributed by the North British Rubber Co. These pictures followed immediately after the plantation pictures and completed the story—the two series together giving the entire history of rubber from the time the seed is planted to the packing of the goods for the consumers' use. These pictures constituted one of the most valuable features of the exposition.

A PUNCH BOWL FOR MR. RODENBACH.

THE Rubber Reclaimers' Club held its annual meeting on November 7, at the Hotel Belmont, New York. All but three of the members were present. The officers of the preceding year were re-elected for the coming year; they are as follows:

President—F. H. Appleton.
Treasurer—R. W. Seabury.
Secretary—J. A. Norman.

The annual meetings of this club are always highly enjoyable occasions; this was particularly so by reason of the presentation of a Paul Revere punch bowl to Mr. W. T. Rodenbach, general manager of the United States Rubber Co.'s reclaiming plant, at Naugatuck, Conn. The presentation speech was made by President Appleton in the happy manner which is his habit. The following paragraph shows its general tenor: "It is surely a part of your nature," he said to Mr. Rodenbach, "to aid and

W. T. RODENBACH.

uplift mankind, apparently without distinction, and as far as I have been able to see, I have found you ready to help even a competitor whenever the opportunity has presented itself to you. You have ever been, and are, the father of this club, for without your aid, in my opinion the club would not have existed, but with your wise council all members have been benefited, so that today the club is in a flourishing condition, with a kindly feeling existing among all its members."

Mr. Rodenbach, like Mr. Woodrow Wilson—who was a professor before he undertook the reclaiming of politics—was a professor before he reclaimed rubber, and enjoys an exceptional facility in the expression of his ideas. Accordingly, while taken totally by surprise, he acquitted himself most creditably.

After the lunch had been adequately analyzed, the club proceeded to the discussion of the question of old tires, which, with not a few of the reclaimers, have now become the chief source of their old rubber supply.

BOSTON RECEIVES BIG RUBBER SHIPMENT.

ON the 11th of November a British freight steamer from the Far East arrived at Boston with a general cargo valued at more than $2,000,000, which is said to be the most valuable cargo of merchandise brought into that port in recent years. Among the interesting items that constituted the cargo was a consignment of 3,000 large cases of rubber.

PERSONAL MENTIONS.

According to an interview which a reporter secured with the American Consul at Para, Mr. George H. Pickerell, Commodore E. C. Benedict, one of the directors of the United States Rubber Co., has secured a rubber plantation not far from the city of Pará and has already planted 50,000 trees.

Mr. Lester Leland, vice-president of the United States Rubber Co., has been made a director of the Second National Bank of Boston.

Mr. Frank M. Hale, who has been in the service of the Woonsocket Rubber Co., as chemist, for the past three years, has given up that position to accept a similar one with the Whitall-Tatum Co., of New York. He will be located at their factory at Keyport, New Jersey.

Mr. W. T. Walker, formerly with the Oldsmobile and Matheson companies and other automobile concerns, has been appointed New England branch manager of the Kelly-Springfield Tire Co., with headquarters in Boston.

A. E. Williams, formerly manager of the advertising department of the Swinehart Tire and Rubber Co., Akron, Ohio, recently resigned to accept a position as district sales manager of the Stevens Motor Car Company of Chicago, Illinois.

Among the many visitors to Akron rubber mills during November was R. J. Caldwell, of R. J. Caldwell Co., of 374 Broadway, New York. Mr. Caldwell is among the well known and successful operators in tire fabrics. The Caldwell Co. control the output of several large mills.

T. F. O'Brien, formerly identified with a prominent rubber culture company is now a partner in a well known Canton, Ohio drug house, as well as being a successful operator in oil lands.

Mr. Guy W. Parsons, assistant treasurer of the United States Rubber Co., was recently called to Kansas City, Mo., by the illness of his mother. Her death occurred in that city on Monday, November 18.

Mr. A. Bambęrger, manager of the New York office of Meyer Cohn, of Hanover, Germany, expects to sail for Europe in a few days in the interest of his constantly increasing American trade.

MR. GOUGH CHANGES HIS OFFICE.

Mr. Wallace L. Gough announces a change in location of his office from 108 Water street, to 2 and 4 Stone street, New York City. The new telephone number is 1480 Broad. Cable address "Wallagough."

MR. MANDERS THANKS HIS AMERICAN FRIENDS.

Mr. A. Staines Manders, the organizing manager of the International Rubber Exposition recently held in New York, and Miss D. Fulton, the secretary of that Exposition, sailed from New York for England on the steamship *Caronia*, November 16. They arrived in New York early in April last, and the intervening months were devoted exclusively to the big rubber show. Mr. Manders had also made several preliminary visits to this country in connection with this enterprise. Many friends were at the dock to see them off and to wish them a pleasant voyage. Mr. Manders expressed himself as very much gratified, not only with the success of the enterprise to which he has devoted so much time and work, but with the way in which he had been received by the American rubber trade; and he said that he wished to thank the hundreds of friends he had made in this country, both for their assistance in making the Rubber Show so successful, and for the many agreeable recollections that he carries away of his six months in America.

AN EXPERT ON THE RUBBER SHOW.

Mr. W. P. Wilson, the managing director of the Commercial Museum of Philadelphia, is an expert on exhibitions, as he has had charge of a continuous industrial and commercial exhibition in Philadelphia for some years. His opinion of exhibitions in general, therefore, is one of more than ordinary value, and Mr. Manders may well feel complimented in receiving the communication given below from Mr. Wilson. This is only one of many complimentary letters received by Mr. Manders, but this is particularly worth quoting because of its authoritative source

THE COMMERCIAL MUSEUM,
Thirty-fourth Street, Below Spruce Street.
PHILADELPHIA, October 28, 1912.

MR. A. STAINES MANDERS, Manager Third International Rubber & Allied Trades Exhibition, New Grand Central Palace, New York, N. Y.:

MY DEAR MR. MANDERS,—I came home the other day after visiting the Rubber & Allied Trades Exposition in New York, with a new mass of knowledge relating to rubber and its production over all quarters of the globe. Although I had been over the building before the exhibit was opened and had seen something of the magnitude of the display, I really had no adequate conception of what this exhibition was to be. Its magnitude was beyond anything that I had in mind.

The whole arrangement and organization of the exposition seemed to me to be well done and followed out on excellently-laid lines. The only regret I had on leaving it was that I could not return and spend ten days in studying the great diversity of products, rubber and allied, which you had brought together.

A graphic exhibit of this kind does more than anything else to impress one with the great value and extensive use of this absolutely necessary product. The Exposition, a great success in every way, I hope repaid you for your painstaking and hard work which I know full well an exposition of this kind requires.

Yours very truly, W. P. WILSON, Director.

A MANUFACTURER'S VIEW OF THE EXPOSITION.

Editor, INDIA RUBBER WORLD: Dear Sir.—

Now that the crude rubber exhibition is a thing of the past, one wonders how much good has come of it.

It was my privilege to spend a whole week at the Grand Central Palace, taking in all the lectures and discussions during the conferences. After returning home and digesting the many things I learned there, I could not help but feel that we fail to make the most of our opportunities.

We on this continent seem to be imbued with the idea that if we open up a little in a discussion we are surely going to expose our knowledge to others, and in that are giving something away. But, coming down to hard facts, what have we got to give away? Is there anything we know that the average intelligent rubber company does not already know? I think not. It is foolish to think otherwise; if anyone has a machine more advanced than others it is quite within reason to keep it secret as long as possible, but to think we are ahead of others in the technical understanding of the rubber business is at once erratic and foolish.

I heard some men say that the Exhibition and conferences were of no particular use to them. In such cases it was surely their own fault. Any man with a modicum of common sense, who was looking for and wanted information, surely found it there. I have been twenty-one years in the business and have spent much time in the technical part of it, and I must say I learned much. There were learned men from different parts of the world whom we may never have the opportunity of meeting again. To engage in conversation with these men was to realize quickly how willing they were to open up and to give one a tremendous amount of the most valuable information—information that cannot be bought; and I for one feel that this exhibition afforded one of those opportunities rarely obtained in our business. Yours truly, MANUFACTURER.

A WORD OF WARNING.

Editor, THE INDIA RUBBER WORLD:

In reference to the Rubber Show recently held in New York, it has suggested itself to me that, whilst all manufacturers received much benefit from being in attendance, some may become so over-enthusiastic as to be led to the excessive uses of some of the grades, without sufficient tests, both as to percentages to be used and the proper working of the rubber, as well as the time to cure, and under what pressure.

It would seem to me to be well to caution those, not yet well informed, to the end that they should commence with, say, one to two per cent., and make *their own experiments,* as they finally must stand or fall by their own acts.

Time, only, gives the final test to rubber, and I earnestly recommend everyone to not follow too closely advice not proved by actual personal knowledge.

The whole rubber trade is now in a most critical position—we are at the apex in the use of Parás, African and Central rubbers, and at the base in the use of Ceylon, Strait Settlements and kindred plantation grades, and there are such radical differences in coagulation, locality and climate that special expert knowledge must be had if the uses of plantation rubber in substitution of other, proved, grades be successful.

As in a crossing, I can only advise, "STOP! LOOK! LISTEN!

Respectfully submitted,

New York, November 21, 1912. ROBT. B. BAIRD.

AS SEEN BY A FRIENDLY VISITOR.

THE INDIA RUBBER WORLD tried to acquit itself creditably at the Rubber Exposition recently held in New York City, and it hopes that it succeeded in that worthy purpose. The following paragraph would seem to indicate that it did. It is taken from a column and a half description of the Exposition which appeared in a recent number of the *Daily Chronicle* of Georgetown, British Guiana, written by the paper's special correspondent:

"Of course, our first attention was given to the space devoted to THE INDIA RUBBER WORLD, which was decorated with a map bearing the names of all the countries where it is circulated. A wonderful portrait painted on hard rubber of Mr. Goodyear, of Vulcanite fame, one of Mrs. Goodyear and Mr. Webster, on the same rubber, hung on the walls. These portraits are very valuable and were heavily insured. Specimens of all rubber-bearing trees, collected, arranged and named by Miss Pearson, were shown, and all sorts of rubber literature, including Mr. Pearson's latest on his visit to the tropics—in which British Guiana is not included. Mr. Pearson, however, assured me that the next book should be all about British Guiana, which is promising. In stoppered bottles, Hevea and all other seeds were shown, personally collected, as were the rubber snakes, centipedes, lizards, spiders and other familiar objects. Wonderfully lifelike these were, very much admired."

RETROSPECT OF THE NEW YORK RUBBER EXPOSITION.

In discussing the features of the recent exposition in the columns of the "Gummi-Zeitung," Mr. E. G. Salmon, who represented various European interests, expresses the opinion that both Germany and England missed a valuable opportunity of showing their capacity as makers of rubber machinery. He adds that while the exposition was a very good display of crude rubber, manufacture and machinery were much less efficiently represented.

The importance is recognized of the direct relations established between Eastern planters and the American market, which, it is added, will lead to the former dealing with New York directly, instead of through London. This would possibly lead to a reduction of rubber prices. American manufacturers, it is remarked, are all looking for cheaper rubber and would welcome any methods tending in that direction.

It was noticed at the Exposition that American manufacturers much appreciated the opportunity of seeing rubber, if not actually in cultivation, at least in the stages least removed therefrom. Whatever the final mode of purchase might be, it was doubtless to the advantage of both seller and buyer to know each other's peculiar needs, in a manner possible only through personal association. One prominent importer was heard to remark that he would at all times prefer to do business with a buyer acquainted with the goods he was bargaining for, rather than with one devoid of that knowledge. This personal coming together of producer and purchaser was inevitably to the advantage of both.

THE PENNSYLVANIA RUBBER CO. OPENS A PARK.

The days have gone by when manufacturers looked upon their employes as simply so many machines from which the maximum amount of work was to be extracted. Employers now realize that sound bodies and contented minds are desirable for their employes, not only from the standpoint of humanitarianism, but from the standpoint of efficiency; and manufacturers of the more advanced sort are taking steps for the physical and moral welfare of those depending upon them. As an illustration of this tendency, the Pennsylvania Rubber Co., of Jeannette, Pennsylvania, may be cited, which has recently opened a fine park in that city for the benefit of its employes. It is called Paruco Park. The significance of the word "Paruco" will be fairly obvious to the analytical mind, being a composite of the name Pennsylvania Rubber Co.

Paruco Park is a sixty-acre tract of wood and meadow land on a large knoll back of the company's works, and is admirably adapted for a recreation ground. The park was opened with appropriate exercises which were attended by a thousand of the company's employes and their friends. Refreshments in bountiful quantities were furnished for all who attended, and 500 children were given park membership badges, which entitled them to admission to the park any time during the next year. The enclosure contains an ample baseball field, besides equipment for various other sports. The entire expense of fitting out and maintaining this magnificent playground is borne by the company.

THE PARK OPENED BY THE PENNSYLVANIA RUBBER CO., AT JEANNETTE, PA.

NO CAUSE FOR ALARM.

A NUMBER of magazine writers have done excellent work during the last two or three years, in calling attention to "occupational diseases," that is, the troubles that workmen are especially liable to in various branches of manufacture. In a recent contribution of this sort there was a short paragraph devoted to rubber factories which reads as follows:

"Workers in the india rubber industry suffer frequently from the fumes of carbon disulphide. It brings on a dull headache, confused sight, vertigo, unrestrained inclination to talk, which in turn is followed by moodiness, irritability, insomnia and insensibility to pain in many parts of the body."

There is no great cause for alarm, however, in this particular charge against the rubber industry, because carbon disulphide is used in a very small department of rubber manufacture, being employed only in the making of a few specialties. The number of rubber workers, therefore, who suffer from carbon disulphide fumes is a small percentage, and where these fumes do exist special care is taken with the ventilation.

A NEW RUBBER HOUSE IN SYRACUSE.

THERE is a new rubber jobbing house dealing in druggists' sundries and rubber goods in Syracuse, New York. It is called The Wm. G. Yeckel Co., and is composed of William G. Yeckel and William H. Kemp. Mr. Yeckel was connected for fifteen years with the Syracuse Rubber Co., during the last five years of that time acting as the company's buyer of druggists' sundries. Mr. Kemp was for many years connected with the Goodyear Rubber Co.'s office in Buffalo, and was later a member of the firms of Hall & Kemp, and the Kemp Rubber Co. Both men are widely known through central New York.

AMERICAN TIRES ABROAD.

THAT American-made tires are pushing ahead in foreign countries in competition with the European product is indicated in a contract made by Backdahl & Co., of Stockholm, for 750 sets of the United States Co. tires for taxicab service in Norway, Sweden, Denmark and Finland. As the price asked for American tires in Europe is considerably in advance of that charged for the native product, competition must be founded on a basis of quality and mileage service.

Commenting on the general trend of the tire industry in foreign countries, John B. Tower, export manager of the United States Tire Co., remarks that in this country tires must necessarily be constructed to meet a wide variety of road conditions, many of them extremely bad, which explains why our tires show up so well in comparison when they are tested out on European highways, which, generally, are far superior to American roads. The United States Tire Co. now has agents in Japan, the Philippines, Australia, Chile, Uruguay, Brazil, Venezuela, Panama, Costa Rica, Cuba, Porto Rico, Mexico, Finland, Norway, Denmark and Sweden, and, of course, in Canada, and it sells a great many tires in Germany, France, Egypt and South Africa.

FIRE IN A RAINCOAT FACTORY.

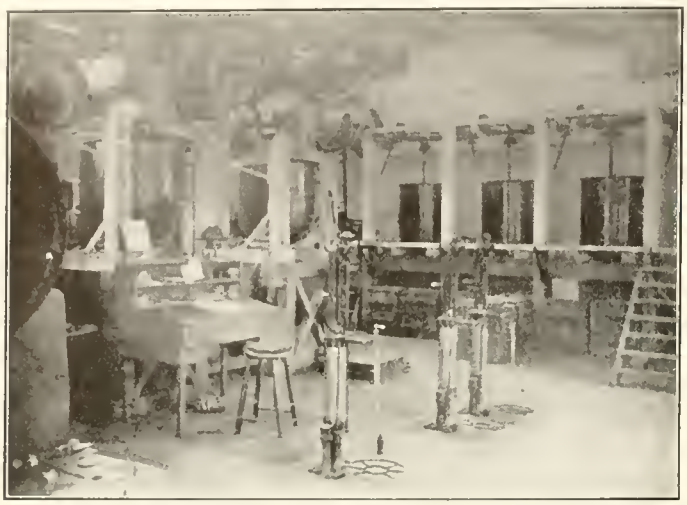
THE building occupied as a factory by the Standard Raincoat Co. of Milford, Massachusetts, was destroyed by fire on October 30 last. It was a 4½ story wooden structure, and the fire was too far advanced before the arrival of the firemen to be checked. The entire loss on the building and stock was placed at $40,000.

A JERSEY RUBBER PLANT BURNS DOWN.

THE plant of the Harmer Rubber Works in East Millstone, New Jersey, was destroyed by fire, October 29, entailing a loss of $100,000. A locomotive, rushed from New Brunswick, aided in extinguishing the flames by pumping water from the Raritan canal.

A CANADIAN CEMENT HOUSE.

PROBABLY few rubber factories make the same quantity and variety of cement as The Canadian Consolidated Rubber Co. of Montreal, Limited. The company being a manufacturer of shoes, waterproof clothing and general mechanical goods, uses an immense quantity of cement. In addition to these lines,

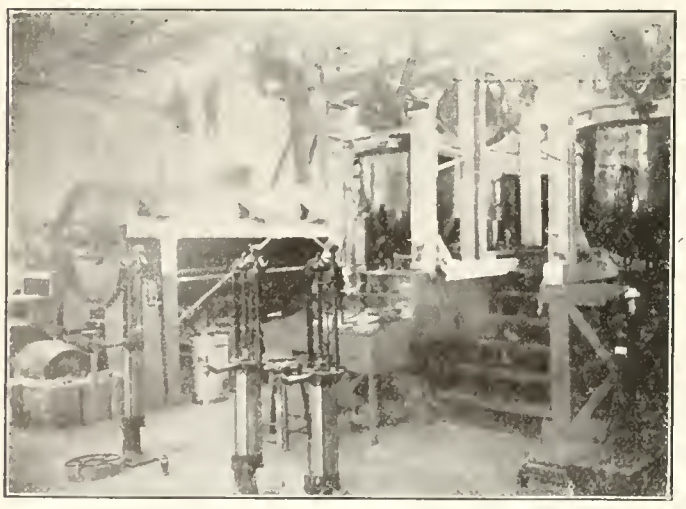


AN INTERIOR VIEW OF THE CANADIAN CEMENT HOUSE.

the company supplies large quantities to the leather boot and shoe factories, of which Montreal is the centre for Canada.

The Cement House is probably not excelled in America. It contains 52 churns of various sizes, the largest having a capacity of 5,200 pounds. The method of supplying naphtha is by pumps. The tanks are buried in the yard. Bowser pumps are placed in the Cement House, and an exact amount taken as required. Great care is taken to insure the correct quality of naphtha. On arrival of a tank, a telephone message brings an assistant from the laboratory, who immediately makes the usual hydrometer tests. Afterwards evaporation tests are carried on in the laboratory. This applies to every tank.

The building is constructed on a principle particularly suited



ANOTHER VIEW OF THE CANADIAN CEMENT HOUSE.

for a business of this character. Should an explosion take place, it would take the roof off the supporting walls, leaving the walls intact, but owing to the use of the Bowser Pump no clear naphtha is ever lying around, which of course reduces the chance of an explosion to a minimum. Perfect cleanliness is the order of the day, and instead of being the usual dirty, untidy corner, the cement department of the Canadian Consolidated Rubber Co. is one of the cleanest, and is a pleasure to the eye of any rubber man.

THE RUBBER TRADE IN CANADA.

CANADIAN imports of manufactures of india-rubber and gutta-percha for the fiscal year ended March 31, 1912, by countries, are officially stated to have been in value as follows:

	United States.	Great Britain.	Other Countries.	Total Value.	Duties Collected.
Boots and shoes...	$40,614	$53	...	$40,667	$10,166.75
Belting	46,578	185	$578	47,341	13,018.91
Clothing and waterproof cloth	30,564	4,495	367	35,426	12,399.10
Hose	100,495	....	51	100,546	38,191.10
Packing and mats..	70,206	606	465	71,277	24,946.95
Vehicle tires	651,316	70,849	16,212	738,377	258,431.95
All other	644,983	12,290	51,371	708,644	194,879.78
Total, 1911-12...	$1,584,756	$88,478	$69,044	$1,742,278	$552,034.54

There may also be noted the following imports, not classified by the customs as "rubber goods," but having a relation to the industry:

	United States.	Great Britain.	Other Countries.	Total Value.	Duties Collected.
Webbing, elastic and non-elastic	$265,794	$8,244	$24,801	$298,839	$59,767.80
Stockinettes for rubber footwear.	47,727	1,760	.....	49,487	7,423.05
Duck for rubber belting and hose.	106,960	6,776	151	113,887	free
Rubber thread..	21,853	.....	.....	21,853	free

EXPORTS OF CANADIAN RUBBER GOODS.

Belting	$60,613	All other	$80,666
Hose	6,517		
Footwear	122,613	Total	$270,500
Clothing	91		

DISTRIBUTION OF RUBBER GOODS EXPORTS.

To	Value.	To	Value.
Great Britain	$38,743	Chili	$215
Bermuda	450	Denmark	1,311
Australia	48,277	France	7,195
British Guiana	277	French Africa	2,116
B. South Africa	14,143	Germany	10,556
B. India	38	Italy	520
B. West Indies	43	Japan	82

Other British Possessions	513	Mexico	884
Newfoundland	63,431	Norway	164
Alaska	4	Spain	4,281
Argentina	545	Sweden	1,493
Belgium	8,790	United States	31,556
			$270,500

IMPORTS OF RAW MATERIALS.

	Pounds	Value
India-rubber and gutta-percha	4,431,335	$4,250,269
Rubber recovered; rubber substitute; hard rubber in sheets	4,870,394	792,444
Rubber, powdered, and rubber waste..	2,452,944	289,814
Rubber thread not covered	11,289	21,853
Total, 1911-12.....	11,765,962	$5,354,380

ITHACANS TO PLANT RUBBER IN MEXICO.

THE American-Mexican Rubber and Coffee Corporation, with principal office at Ithaca, was incorporated in New York State November 12 with a capital of $2,000,000, to cultivate rubber and coffee lands in Mexico. The directors are: William C. Douglas, Isaac K. Bernstein, Fred H. Smith, Arthur N. Gibbs, Benjamin Johnson, Robert A. Heggie, E. D. Button, Edwin S. Banks, Alfonso R. Swayer, Ithaca; Joseph Bondy, Syracuse, and Frank E. Pino, Tapachula, Chiapas, Mexico.

Recent Patents Relating to Rubber.

UNITED STATES OF AMERICA.

ISSUED OCTOBER 1, 1912.

No. 1,039,697. Machine for coating hose. H. Z. Cobb, Chelsea, Mass.

1,039,731. Coupling for train pipes. W. A. Greenlaw, Melrose Highlands, Mass., assignor to The Greenlaw Manufacturing Co., Boston, Mass.

1,039,760. Vehicle tire and rim. E. H. Koken, Akron, Ohio.

1,039,805. Resilient tire. E. Rimailho, Neuilly-sur-Seine, France.

1,039,838. Motorcycle stand. S. Y. Steinberger, Peoria, Ill.

1,039,843. Combination non-refillable bottle and drinking cup. F. Fortunatus, Syracuse, N. Y.

1,039,857. Spring-wheel. U. Grant Weidman, Knightstown, Ind.

1,039,877. Combination syringe case and supporter. J. W. Allan, Omaha, Neb.

1,039,897. Resilient tire for vehicles. H. A. Carmichael, West Lorne, Ontario, Canada.

1,039,898. Convertible-tread wheel. H. W. Clapp, Berkeley, and B. C. Edgar, San Francisco—both of California.

1,039,943. Motorcycle. E. O. Himes, Albion, Ind.

1,039,946. Roll for cotton-gins and machines for burring wool. G. E. U. Huckaby, Houston, Tex.

1,040,074. Cushion tire for vehicle wheels. M. M. Weiss, Detroit, Mich.

1,040,114. Pneumatic cushioned wheel. I. H. Babcock, De Ruyter, N. Y.

1,040,134. Method of rolling tubing. R. E. Brock, Monessen, Pa., assignor to Pittsburgh Steel Products Co.

1,040,139. Hose-supporting clasp. D. H. Buell, Bridgeport, Conn.

1,040,157. Wheel for vehicles. W. Dalton, Schenectady, N. Y.

1,040,173. Resilient wheel. G. Dorffel, Oakland, Cal.

1,040,246. Tire protector. R. A. Willett, Warren, Ohio, assignor of one-half to E. J. Maxwell and one-half to G. M. Hughson, Los Angeles, Cal.

Trade Mark.

64,229. The Manhattan Rubber Mfg. Co., New York. The word *Condor*. For belting.

ISSUED OCTOBER 8, 1912.

1,040,275. Demountable rim. J. C. Cole, assignor to Fisk Rubber Co.—both of Chicopee Falls, Mass.

1,040,276. Force and suction pump. A. J. Coleman, Pittsburgh, Pa.

1,040,285. Manufacture of chewing gum. J. D. Darling, Philadelphia, Pa.

1,040,311. Air-supply device for firemen. J. D. Halloran, New York.

1,040,334. Rubber valve for pumps and the like. T. Howland, Mackay, Queensland, Australia.

1,040,426. Spring wheel. L. Sanders, Cravens, La.

1,040,431. Cushion tire. Paul Schneider, Webster Groves, Mo.

1,040,436. Resilient wheel. A. Seibert, Harvey, Ill.

1,040,471. Vehicle wheel tire. C. Van Smith, Kansas City, Mo.

1,040,511. Automobile wheel. H. B. Coats, Veedersburg, Ind.

1,040,512. Spring wheel. H. B. Coats, Veedersburg, Ind.

1,040,569. Method of making seamless tubes. J. W. Offutt, Ellwood City, Pa., assignor to The Shelby Steel Tube Co., Pittsburgh, Pa.

1,040,581. Tire for automobiles, vehicles or the like. A. W. Rowe, Philadelphia, Pa.

1,040,599. Resilient hub for wheels. C. A. White and F. McLaughlin, London, Ontario, Canada.

1,040,647. Pneumatic tire. M. A. Dees, Pascagoula, assignor to American Tire Co., St. Louis, Mo.

1,040,737. Apparatus for producing rubber bulbs for atomizers, syringes, etc. J. A. Murray, assignor of one-half to J. L. Mahoney—both of New Haven, Conn.

1,040,865. Non-skidding tire. J. G. Boss, Denver, Col.

1,040,877. Tire-repairing case. C. Byrne, Pompton Lakes, N. J., assignor of one-half to G. W. Drew, Florida, N. Y.

1,040,920. Tire. H. G. Fiske, New York, assignor to The Columbia Motor Car Co., Hartford, Conn.

1,040,926. Hose-band. H. Gibbs, assignor to W. D. Allen Mfg. Co.—both of Chicago, Ill.

Design.

43,105. Garter. R. J. Freeman, Overbrook, Pa., assignor to Pioneer Suspender Co., of Pennsylvania.

Trade Marks.

60,330. The Star Rubber Co., Akron, Ohio. The word *Saturn*. For household rubber gloves and bath caps.

60,333. The Star Rubber Co., Akron, Ohio. The word *Jupiter*. For household rubber gloves and bath caps.

65,059. The L. Candee & Co., New Haven, Conn. The word *Es-ki-mo*. For rubber boots and shoes.

65,060. The L. Candee & Co., New Haven, Conn. A picture of an eskimo. For rubber boots and shoes.

ISSUED OCTOBER 15, 1912.

1,041,012. Bathing suit. J. F. Burke, Philadelphia, Pa.

1,041,026. Tire-tightener. T. F. Chrane, Cravette, Ark.

1,041,062. Temporary locking-piece for transversely-split vehicle-wheel rims. R. W. Funk, Weehawken, N. J.

1,041,074. Roll for leather-working machines. R. H. Harris, Boston, Mass., assignor to the Turner Tanning Machine Co., Peabody, Mass.

1,041,097. Combined vehicle-hub and shock-absorber. C. L. Kennedy, Winnipeg, Canada.

1,041,104. Garment support. F. E. Krauch, Indianapolis, Ind.

1,041,139. Anti-skid device for block tires. S. S. Miller, Akron, Ohio, assignor to Consolidated Rubber Tire Co., New York.

1,041,172. Wiper for windows and the like. W. A. Roth and F. O. Moldenhauer, Chicago, Ill.

1,041,182. Cushion-tired wheel. W. D. Simpson, Columbia, S. C.

1,041,216. Automatic elastic check-valve for pneumatic tires. P. P. Wood, Hot Springs, Ark.

1,041,244. Resilient wheel. C. J. Craig, Lathrop, Mo.

1,041,336. Pneumatic-pressure gage. O. Olsen, Oakland, Cal., assignor of one-half to H. T. Carvin, Alameda, Cal.

1,041,350. Pneumatic tire for vehicle wheels. E. R. Riedinger, assignor of one-half to A. Fraser—both of London, England.

1,041,391. Air-brake coupling. O. P. Wilhelm, Michigan City, Ind.

1,041,408. Supporter for articles of apparel. A. B. Beck, Cranford, N. J., assignor to M. W. Schloss, New York.

1,041,460. Spring attachment for vehicles. G. Graybill, York, Pa.

1,041,519. Motor wheel for cycles. A. C. Seibak, San Francisco, Cal.

1,041,526. Core-filling compound for pneumatic tires and process of making the same. H. M. Suss, Fall River, Mass.

1,041,544. Apparatus for manufacturing rubber tires, etc. Emrys T. Williams, Akron, Ohio.

1,041,567. Detachable and divisible rim for motor cars and other vehicles.

1,041,632. Tire lock. T. J. Kelly, Denver, Col.

1,041,660. Tire tool. A. A. Nelson, Washington, D. C.

1,041,702. Shock-absorbing hub for vehicle wheels. J. W. Tilton, assignor of one-half to G. Hoefer, J. C. Adams and N. W. Young—all of Atlantic City, N. J.

Trade Marks.

62,741. The Continental Supply Co., St. Louis, Mo. The initials C. S. Co. intertwined. For rubber machinery belts, etc.

ISSUED OCTOBER 22, 1912.

1,041,739. Tire. W. G. Chipley, New Orleans, La.

1,041,774. Bottle-stopper. J. D. Geraghty and J. E. Hager, New York.

1,041,907. Coupling gasket. J. M. Towne, East Orange, N. J., assignor to Safety Car Heating & Lighting Co., of New Jersey.

1,041,958. Golf ball mold. E. W. Buckau, New York.

1,042,016. Tire traction device. R. Livingston, Los Angeles, Cal.

1,042,026. Tire casing. E. B. Nathan, New York.

1,042,035. Resilient vehicle wheel. A. D. Ray, Cleveland, Ohio.

1,042,065. Automobile tire. W. J. Woodcock, Brooklyn, N. Y.

1,042,157. Tire protector. C. J. Shumaker, Tupelo, Miss.

1,042,178. Tire. A. G. Walker, Pacific Junction, Ia.

1,042,209. Closure for vessels. J. C. Eichhorn, assignor to The Victor Jar Co.—both of Detroit, Mich.

1,042,214. Vehicle wheel. H. S. Grace, San Francisco, Cal.

1,042,237. Bottle for jar closure. W. Koufman, Paterson, N. J.

1,042,327. Life-saving garment for aviators. J. J. Costanzo, Alexandria, Egypt.

Trade Mark.

63,649. General Electric Co., Schenectady, N. Y. The word *Acme*. For electrical insulating tape.

ISSUED OCTOBER 29, 1912.

1,042,377. Tire lock for automobiles. B. A. Alperin, New York.

1,042,392. Automobile tire. C. L. Butler, Chicago, Ill., assignor to American Steel Tire Co., Milwaukee, Wis.

1,042,426. Tire. W. F. Gaul, Jersey City, N. J., assignor of one-half to E. H. Fahey, Philadelphia, Pa.

64,053. The American Mills Co., New York. The word *Reclastic*. Elastic webbing.

65,297. Revere Rubber Co., Providence, R. I. The word *Shower*. For rubber hose.

65,631. The Imperial Merchandise Co., Perry, Ohio. The word *Daylight*. For fruit-jar rings.

[NOTE.—Printed copies of specifications of United States patents may be obtained from THE INDIA RUBBER WORLD office at 10 cents each, postpaid.]

GREAT BRITAIN AND IRELAND.

PATENT SPECIFICATIONS PUBLISHED.

The number given is that assigned to the Patent at the filing of the application, which in the case of these listed below was in 1911.

**Denotes Patents for American Inventions.*

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, OCTOBER 2, 1912.]

13,867. Air tubes. Marquis G. Fossi, 6 Piazza Peruzzi, Florence, Italy.

13,881. Vehicle wheels. A. H. Roberts, "Rockbank," Victoria street, West Brunswick, Melbourne, Australia.

13,897. Horseshoes. F. Gundlach, 4b, Vorwerksgasse, Celle, Germany.

13,951. Horseshoes, etc. G. A. Bennett, 14 Blythswood road, Goodmayes, Essex.

*13,973. Vehicle wheels. J. A. Anglada, 225 West Fifty-seventh street, New York, U. S. A.

*13,974. Vehicle wheels. J. A. Anglada, 225 West Fifty-seventh street, New York, U. S. A.

14,015. Boots, etc. J. J. Hartopp, Rutland street, Leicester.

14,078. Vehicle wheels. C. G. Kleinschmidt, 19 Siepenstrasse, Herne, Westphalia, Germany.

14,087. Wheel tires. Albion Motor Car Co., and T. B. Murray, South street, Scotstoun, Renfrewshire.

14,119. Collapsible boats, etc. W. J. Simpson, 28 Clerkenwell road, London.

*14,145. Hot water bottles, syringes. L. F. Gilletie, 11 Wall street, Concord, New Hampshire, U. S. A.

*14,206. Firemen's dress. F. W. Vinton, 48 Fulton street, Weehawken, N. J., U. S. A.

14,250. Vehicle wheels. G. P. Milnes, Whitehall, Stroud, Gloucestershire.

14,304. Treads for tires, boots, etc. G. C. Taylor, "Ravencar," Helsby, Cheshire.

14,411. Vehicle wheels. A. C. Frost, Hazelmere, Lichfield road, Four Oaks, Warwickshire.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, OCTOBER 9, 1912.

14,495. Toys, games. A. Jud, 83 Stalden, Solothurn, Switzerland.

14,524. Fire valves. W. de C. Prideaux, 12 Frederick place, Weymouth, Dorcetshire.

14,584. Floor mats. P. M. Justice, 55 Chancery lane, London.

14,693. Covers for food vessels, etc. B. J. Letherland, 562 Woodborough road, Nottingham.

14,696. Stair treads. Safety Tread Syndicate, 15 Barbican and E. S. Higgins, 21 Cornford Grove, Balham.

14,761. Door stops. C. W. Wood, 372 Euston road, London.

*14,858. Erasers. A. Tregoning, 841 North Bunker Hill avenue, Los Angeles, Cal., U. S. A.

14,892. Vehicle wheels. Vicomte M. A. M. J. de Grassin, Chateau de Louvieres, Bayeux, Ca'vados, France.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, OCTOBER 16, 1912.]

14,910. Heel pads, etc. H. Thorne, 241 Collins street, Melbourne, Australia.

14,930. Balls. P. A. Martin, Granville street, and J. Stanley, 137 Ivor road, Sparkhill both in Birmingham.

14,939. Stuffing boxes. J. Walker & Co., and J. Walker, Lion Works, Garford street, Poplar, London.

14,940. Stuffing boxes, etc. J. Walker & Co., and J. Walker, Lion Works, Garford street, Poplar, London.

14,943. Artificial leather. E. D. Delahaye, 40 Boulevard de l'Est, C. Vesinet, France.

15,045. Heel protecters, etc. F. Knipp, 51 Bessungerstrasse, Darmstadt, Germany.

15,164. Testing golf balls. R. Ramsbottom, Scarrwheel, The Cliff, Higher Broughton, Manchester.

15,288. Tapping rubber trees. G. S. Brown, 46 Hammerfield avenue, Aberdeen.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, OCTOBER 23, 1912.]

15,353. Wheel tires. A. R. Harris, 84 Mount Pleasant, Cross street, Sale, Manchester, England.

15,363. Vehicle wheels. J. Windibank, 123 Ribblesdale road, Streatham, London.

*15,415. Wheel tires, etc. J. W. Driscoll, P. O. Box 143, Central City, Colorado, U. S. A.

15,417. Wheel tires. D. Maggiora, 153 Warwick street, Belgravia, London.

*15,450. Block tires. C. B. Morris, 5821 Chester avenue, Philadelphia, Pa., U. S. A.

15,496. Vehicle wheels. C. H. Sims, 18 Sir Thomas White road, Coventry.

15,557. Mud guards for wheels. F. Stenning, 29 Cambridge road, and W. Bailey, 12 Cambridge road—both in Sidcup, Kent.

15,566. Stocking-suspenders, etc. J. D. Gillespie, 481 Grimsby road, Cleethorpes, Lincolnshire.

15,588. Sole and heel protectors. J. G. West, 8 Fairfield road, Kingston, Surrey.

15,713. Wheel tires. W. Edgell, Westfield House, and A. T. Edgell, Redfield road both in Midsomer Norton, Somerset.

15,761. Artificial leather. E. Reidel, 3 Rupprecht Strasse, Mannheim, Germany.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, OCTOBER 30, 1912.]

15,835. Closing tire punctures. F. H. Hall, Gannaway Gate, Norton, Lindsey, Warwickshire.

15,938. Vehicle wheels. T. H. Rushton, 158 Grimsby road, New Cleethorpes, Lincoln.

15,945. Substitutes for gutta-percha, etc. E. C. R. Marks, 57 Lincoln's Inn Fields, London.

15,973. Boots. F. Knipp, 51 Bessungerstrasse, Darmstadt, Germany.

16,108. Removing tires. J. Hornby, 97 Kensington road, T. Sawyer, 45 St. John's road, Firkdale, and T. Rimmer, Linaker street—all in Southport, Lancashire.

16,139. Inflating pumps. H. Lea, 38 Bennett's Hill, Birmingham.

16,149. Tire attachments to rims. R. Brown, 2 Eddington street, Tollington Park, and C. Pallash, 14 Boundary road, Wood Green—both in London.

16,157. Head-washing appliances. J. S. Withers, 323 High Holborn, London.

16,164. Pressure gauges. Erste Suddeutsche Manometerbau-Anstalt und Federtriebwerkfabrik, J. C. Eckhardt, 72 Pragstrasse, Cannstatt, Germany.

16,189. Apparatus for making tire covers. F. H. Hall, Gannaway Gate, Norton Lindsey, Warwickshire.

16,212. Manufacture of packing. J. C. Cuthbertson, 113 Fenchurch street, London.

16,226. Head-washing appliances. J. S. Withers, 323 High Holborn, London.

16,260. Horseshoes. A. W. Knight, 4 Upper street, St. Martin's lane, London.

16,276. Tapping rubber trees. H. F. Browell, Fairfield, Longdown, Guildford, Surrey.

16,326. Tire attachments to rims. A. Buckland, 41 Westfield road, Hornsey, London.

THE FRENCH REPUBLIC.

PATENTS ISSUED (with Dates of Application).

441,273 (March 12, 1912). L. Prochazka. Elastic tire for automobiles and other vehicles.

441,324 (March 13). J. H. Messenger. Improvements in tires.

441,400 (March 16). J. B. Rozet. Elastic tire for bicycles, automobiles and other vehicles.

441,461 (March 18). P. Fontenelle. Improvements in pneumatic tires.

441,477. (March 18). "Farbenfabriken," formerly F. Bayer & Co. Process for preventing the glutination and resinification of substances resembling rubber.

441,404 (March 16). G. Evans. Improvements in removable heels.

441,514 (March 19). C. H. Myers. Anti-skid device for pneumatic tires.

441,534 (March 21). W. H. Bitnam. Anti-skid device for automobiles.

444,554 (March 4). A. M. P. Huchon. Elastic tire.

441,569 (March 20). T. Christopherson. Improvements in automobile and other tires.

441,568 (March 20). C. Beyer. Process for preserving the elasticity of rubber objects.

441,635 (March 22). P. G. Seward. Improvements in elsatic tires.

441,771 (March 26). Continental Caoutchouc and Gutta Percha Co. Improved air chamber for automobile wheels.

441,773 (March 26). M. A. Kennedy. Improvements in elastic tires.

441,655 (March 22). "Farbenfabriken," formerly F. Bayer & Co. Process for producing substance analogous to rubber.

441,840 (March 27). J. R. Salmon & E. W. Roy. Improvements in pneumatic tires.

441,881 (March 28). J. Bermudez de la Puenti. Improvements in air chambers of pneumatic tires.

442,056 (February 14). H. Bagieu. New method of fixing rubber to vehicle wheels by rims.

441,802 (February 19). "Farbenfabriken," formerly F. Bayer & Co. Process for production of rubber, its homologues and analogues.

442,107 (April 2). Arnold & Johnston. Improvements in pneumatic tires.

442,179 (April 4). G. Gray. Elastic automobile tire.

442,250 (April 21). P. Bourcet. Protection for pneumatic tires.

442,260 (April 6). B. W. Dinne. Tire for vehicle wheels.

442,231 (April 9). C. Beyer. Process for preserving the elasticity of rubber objects.

442,492 (April 12). A Steinhauser. Improvements in pneumatic tires.

442,521 (April 13). H. Döhne. Attachment to air cushions.

442,525 (April 13). G. L. Pauer. Apparatus for vulcanization and repair of pieces of rubber.

442,665 (April 18). K. Rechberg. Manufacture of covers for pneumatic tires.

[NOTE. Printed copies of specifications of French patents can be obtained from R. Bobet, Ingénieur-Conseil, 16 avenue de Villiers, Paris, at 50 cents each, postpaid.]

THE GERMAN EMPIRE.

PATENTS ISSUED (with Dates of Validity).

252,104 (September 30, 1911). Process for recovery of rubber from rubber waste. The Moore Architectural and Engineering Co., Akron, U. S. A.

252,109 (December 5, 1911). Process for hot vulcanization of tire cover. Etablissements Bergougnan, Clermont-Ferrand, France.

252,111 (June 29, 1911). Rubber tires for motor trucks, etc., with inserted twisted wire. Heinrich Rentz, Goldberg, Silesia.

252,789 (February 8, 1912). Rubber or other elastic packing for steam doors. Haniel & Lueg, Dusseldorf-Grafenberg.

252,705 (July 6, 1910). Manufacture of products resembling rubber. Chemiche Fabrik Florsheim. Dr. H. Nordlinger, Florsheim, a. M.

253,400 (July 27, 1911). Press with extensible core for vulcanizing tires. Lucien Morane, Paris.

253,269 (January 31, 1912). Adjustable rubber sole for shoes. Eugene Fuller and Joseph Rosenblatt, Providence, R. I., U. S. A.

THE KINGDOM OF BELGIUM.

PATENTS PUBLISHED.

248,432 (1912). "Farbenfabriken," formerly F. Bayer & Co., Elberfeld. Production of substance resembling rubber.

248,417 (1912). The Diamond Rubber Co., Akron, U. S. A. Process for improving inferior qualities of rubber.

247,981 (1912). "Farbenfabriken," formerly F. Bayer & Co., Elberfeld. Manufacture of product resembling vulcanized rubber.

248,080 (1912). M. Kochnitzky and A. Fried, Brussels. Process of extraction of resin from crude rubber.

247,627 (1912). Gesellschaft fur Teerverwertung, G. m. b. H., Duisburg-Meiderich, Germany. Process of manufacturing a substance analogous to rubber.

247,518 (1912). G. Millienne, rue Richer 10, Paris. Appliance for gathering latex of rubber and gum trees.

247,901 (1912). C. E. Anquetil, place St. Michel, Marseilles. Process of making synthetic rubber.

247,493 (1912). H. Auzies, Toulouse, France. Process for making plastic substances resembling gutta percha.

UNITED STATES RUBBER CO.'S ISSUES.

TRANSACTIONS on the New York Stock Exchange for four weeks, ending November 23:

COMMON STOCK, $25,000,000.

[The treasury of a subsidiary company holds $1,334,000.]

Last Dividend, October 31, 1912—1%.

Week November 2	Sales	3,715 shares	High	51⅝	Low 50¾
Week November 9	Sales	4,500 shares	High	53	Low 51
Week November 16	Sales	23,490 shares	High	56¼	Low 51⅜
Week November 23	Sales	52,450 shares	High	60⅝	Low 55½

For the year—High, 67⅞, May 21; Low, 45¼, February 1.
Last year—High, 48½; Low, 30½.

FIRST PREFERRED STOCK, $39,824,400.

Last Dividend, October 31, 1912—2%.

Week November 2	Sales	1,150 shares	High	107⅞	Low 106¾
Week November 9	Sales	1,400 shares	High	108⅜	Low 107
Week November 16	Sales	3,650 shares	High	109	Low 107⅛
Week November 23	Sales	1,066 shares	High	109⅜	Low 108¼

For the year—High, 116, May 20; Low, 105⅝, July 25.
Last year—High, 115½; Low, 104.

SECOND PREFERRED STOCK, $9,965,000.

Last Dividend, October 31, 1912—1½%.

Week November 2	Sales	... shares	High	....	Low ....
Week November 9	Sales	... shares	High	....	Low ....
Week November 16	Sales	310 shares	High	80¼	Low 80
Week November 23	Sales	800 shares	High	80¼	Low 80

For the year—High, 85½, May 21; Low, 75, January 23.
Last year—High, 79; Low, 66.

SIX PER CENT. TRUST GOLD BONDS, $18,000,000.

Outstanding of the 1908 issue of $20,000,000.

Week November 2	Sales	17 bonds	High	103⅜	Low 103⅛
Week November 9	Sales	3 bonds	High	103⅜	Low 103
Week November 16	Sales	22 bonds	High	103⅛	Low 103
Week November 23	Sales	21 bonds	High	103⅛	Low 103¼

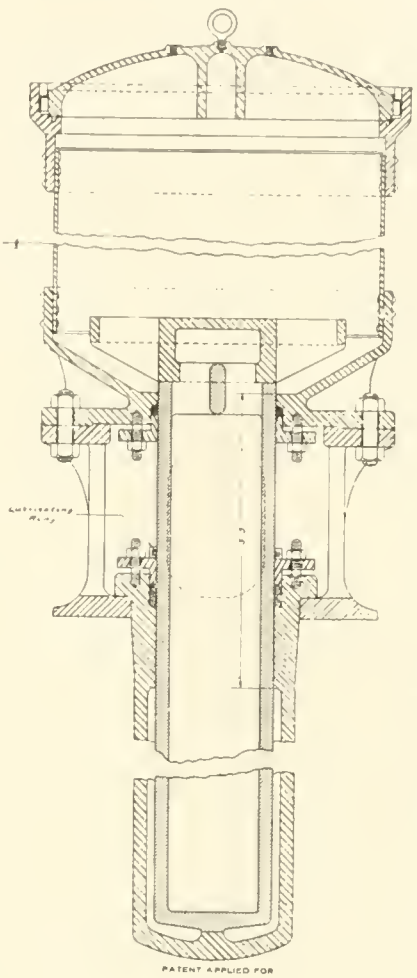
For the year—High, 105, February 24; Low, 103, October 19.
Last year—High, 105; Low, 101¾.

GENERAL BAKELITE CO. STARTS INFRINGEMENT SUITS.

The General Bakelite Co. has brought suits for infringements of its Bakelite patents against the Condensite Co. of America and several users of "Condensite," among them the Dickinson Manufacturing Co., of Springfield, Massachusetts; The Duranoid Mfg. Co., of Newark, and Hardman & Wright, of Belleville, New Jersey.

A NEW TIRE-HEATING PRESS.

THE revised design of the Akron-Williams Tire Vulcanizing Press, which is proving very popular for the curing of automobile tires at the present time, has a number of valuable improvements. As the expert will discover by the examination of the cross-section diagram which is here shown, the unusually long ram-bearings noticeable in this diagram insure its exerting pressure at right angles to the press lid, between which and the ram cap the molds are squeezed during the process. Even a slight amount of play in these bearings will permit the ram to slant considerably when fully extended and may leave the molds open a little on one side or the other. The design obviates this trouble.



In the ordinary construction the packing gland for the hydraulic ram is placed in the bottom of the vulcanizing chamber. It is difficult to re-pack this gland on account of its position. The condition of the packing cannot be determined while a cure is in process. A slight leakage through the hydraulic packing will permit cold water to enter the vulcanizing chamber, reducing the efficiency and uniformity of the cure.

The new design effectually overcomes this difficulty.

STATEMENT OF THE INDIA RUBBER WORLD.

Statement of the ownership, management, circulation, etc., of THE INDIA RUBBER WORLD, published monthly at New York, required by the Act of August 24, 1912.

Editor, Henry C. Pearson, Tompkins Corners, Putnam Co., N. Y.; managing editor, John P. Lyons, 150 West 91st St., New York City; business manager, Edward F. Pfaff, 94 Hawthorne St., Brooklyn, N. Y.; publisher, The India Rubber Publishing Co., 15 West 38th St., New York City.

Owners: (If a corporation, give names and addresses of stockholders holding 1 per cent. or more of total amount of stock.) Henry C. Pearson, Tompkins Corners, Putnam Co., N. Y.

Known bondholders, mortgagees and other security holders, holding 1 per cent. or more of total amount of bonds, mortgages, or other securities: None.

(Signed) HENRY C. PEARSON, Editor.

BOSTON WOVEN HOSE AND RUBBER CO.

The directors of the Boston Woven Hose and Rubber Co. have declared a semi-annual dividend of $3 per share on the preferred stock, and a quarterly dividend of $3 per share on the common stock, both payable December 16, 1912, to stockholders of record December 5

Review of the Crude Rubber Market.

THE fall in value of fine Pará in London, which had marked the latter part of October, bringing the price to 4*s.* 6*d.* on October 26, made further progress during the closing days of that month and the opening days of November. By the 6th it had reached 4*s.* 3¾*d.*, when the tide turned, the price of 4*s.* 5*d.* being established on the 7th.

During the succeeding portion of the month it ranged from 4*s.* 4¾*d.* to 4*s.* 6*d.*, thus keeping within a narrow margin and reaching 4*s.* 5*d.* on November 25, at time of writing.

While Pará thus recovered only part of the fall which had taken place, plantation rubber advanced in the four weeks from 4*s.* 2½*d.* to 4*s.* 3¾*d.*, having in the interim touched 4*s.* 5*d.* A month ago fine Pará stood at 4*s.* 6*d.*, while pale crêpe was at 4*s.* 2½*d.* At time of writing the prices are respectively 4*s.* 5*d.* and 4*s.* 3¾*d.*, a closer approximation being thus indicated.

In contrast with the two preceding fortnightly London auctions which averaged about 900 tons, that of November 5 only included 720 tons. The tone was firmer, the decline having been partially arrested, and prices being only 1*d.* below those of last auction. At the decline a good demand was created, which checked the downward tendency.

The second London November auction took place on the 19th, when 750 tons were offered. Although demand was not active, the improvement established in the outside market led to an advance at the opening of 2½*d.* per pound on the prices of the previous sale. A slight reaction took place on the second day.

While the recent political complications and the stringency of money affected the tone of the Antwerp sale of October 22, it was generally satisfactory in character. Of the 503 tons offered, 406 were sold; the average fall being about 3¾ per cent. Congo descriptions formed 75 per cent., and plantation 20 per cent., the balance being composed of various grades. At the sales of November 14, 315 tons Congo and 114 tons plantation were offered. Sales made were at an advance on valuations of about ⅝*d.* per pound.

The Havre sale of October 20 was marked by reduced demand, but 27 tons Congo were sold with an average fall of about 5 per cent. Owing to the reserve of sellers only about one-half of the 33 tons offered at Rotterdam, November 12, was sold, averaging slightly under valuations.

At the Amsterdam sale of November 15, about 40 tons were sold, chiefly *Hevea;* mostly at steady prices.

Messrs. Hecht, Levis & Kahn's statistics for end of October show visible supply as follows:

	1911. Tons.	1912. Tons.
Pará grades	6,862	5,225
Medium grades	2,439	3,976
	9,301	9,201

New York.

In regard to the financial situation, Albert B. Beers (broker in crude rubber and commercial paper, No. 68 William street, New York) advises as follows: "During November the market has continued about the same as in October, the demand for paper being light, and almost entirely from out-of-town banks, rates ruling at 6@6¼ per cent. for the best rubber names and 6½@7 per cent. for others."

Liverpool.

William Wright & Co. report [November 1]:

Fine Pará.—There has been a shortage of spot rubber, so that prices ruling have not been a fair indication of the market. For delivery, prices have steadily declined, showing a total drop of 4*d.* per pound. Supplies of Brazilian and plantation continue ample, and at present there is every indication of a further decline in values of Pará, which we still maintain will have to assimilate itself to the level of plantation. Closing value: Hard fine spot, 4*s.* 5*d.* [$1.07]; Island, 4*s.* [97 cents].

Receipts for the month, 3,920 tons, including 400 tons Caucho, against 2,620 tons last month and 2,990 tons last year, totalling 10,380 tons, against 8,640 tons last season.

Rubber Stock at Para.

On May 31 the stock had increased, but had receded by June 30; and had again fallen off on July 31. Large sales by the syndicate materially reduced the stock by the end of August, from which point it had slightly increased by September 30. A further increase was shown on October 31.

Vol. 47. JANUARY 1, 1913. No. 4

SUBSCRIPTIONS: $3.00 per year, $1.75 for six months, postpaid, for the United States and dependencies and Mexico. To the Dominion of Canada and all other countries, $3.50 (or equivalent funds) per year, postpaid.

ADVERTISING: Rates will be made known on application.

REMITTANCES: Should always be made by bank or draft, Postoffice or Express money orders on New York, payable to THE INDIA RUBBER PUBLISHING COMPANY. Remittances for foreign subscriptions should be sent by International Postal Order, payable as above.

DISCONTINUANCES: Yearly orders for subscriptions and advertising are regarded as permanent, and after the first twelve months they will be discontinued only at the request of the subscriber or advertiser. Bills are rendered promptly at the beginning of each period, and thereby our patrons have due notice of continuance.

Entered at the New York postoffice as mail matter of the second class.

TABLE OF CONTENTS ON LAST PAGE OF READING.

SETTLING DISPUTES BY ARBITRATION.

THE administration of the law in this country has been for a long time something to make the patriot grieve. When President Taft stated (a remark that he has repeated in one form or another a number of times)—that "the law's delay amounts in many cases to a denial of justice," he described the situation with true Presidential moderation. The eternal evasion of punishment by the rich criminal, and the interminable avoidance of settlement in civil suits by those who have the price of a new appeal, have long since become a national disgrace.

For some years there has been a feeling among honest business men that some new method ought to be devised—some direct and satisfactory method by which the disputes that must inevitably arise in the course of business—even among those who are in the main well intentioned—could be settled. The New York Chamber of Commerce has taken cognizance of this demand, and in January, 1911, established a method of commercial arbitration under its auspices, and appointed a committee under whose direction such ordinary business controversies or disputes could be settled without litigation.

This action of the Chamber of Commerce has so much significance for all those interested in any branch of our commercial life, that it seems well worth while to reproduce a brief description of the plan, which appeared in a recent issue of the "Independent"—which will be found on another page.

The advantage of submitting to arbitration commercial disputes which might otherwise lead to expensive litigation, was illustrated in a case which was recently settled through reference to this committee on arbitration, and which is of interest to both buyers and sellers of crude rubber.

The case above referred to was submitted in consequence of a dispute as to the quality of a portion of a shipment of Plantation rubber on a delivery made by a rubber importer to his customer, and the question at issue was whether the rubber was of "fair average quality," as described in the contract. As the contract had this provision, "Disputes, if any, to be settled by arbitration by the New York Chamber of Commerce," each of the disputants selected an arbitrator to act for him, and the third arbitrator (who was required to be a member of the Chamber of Commerce) was an officer of one of the well-known rubber manufacturing companies in New York. The result of the arbitration, by unanimous vote of the arbitrators, was the approval of the rejection of the lot of rubber in question by the purchaser.

It is of interest to business men to know that there now exists a method by which commercial disputes of any nature may be adjusted, and which is available to any merchant, whether he be a member of the Chamber of Commerce or not.

Disputes are bound to arise in the rubber trade, as they do in every branch of commercial activity, and the rubber men will certainly find it greatly to their advantage to avail themselves of this method of settlement, which is so direct, expeditious, inexpensive, and so free from suspicion. At the last meeting of the Executive Committee of the Rubber Club of America, held early in December, a resolution was passed "that the Executive Committee approve of the plan of commercial arbitration as adopted by the New York Chamber of Commerce." This resolution of approval of the act of another body was a most unusual step for the Rubber Club to take, but it certainly is fully justified by the great importance of this subject to the rubber trade.

THE RIO DE JANEIRO 1913 EXPOSITION.

RIO DE JANEIRO, a community of a million and a quarter inhabitants, the finest city on the South American continent—and by some travelers called the most beautiful city in the world—is to have a great International Exposition next May. It will be held under the authority of the General Government and will be under Federal auspices and control. It will be held in substantial buildings erected for permanent use in the handsome park that surrounded the palace of the Emperor Dom Pedro, the palace itself being converted into a museum. This Rio de Janeiro enterprise will be (in the words of the act creating it) "an Exposition of large plantation products and the industry of vegetable extraction, viz., sugar, rubber and fibres." While it is primarily a Brazilian exhibition, exhibitors from the outside world will be warmly welcomed and their exhibits will be entered duty-free—duty of course to be paid on them if they are sold in that country after the conclusion of the show.

This will be the best opportunity that the American manufacturer ever had to show his wares in the great Republic of the South. The balance of trade between Brazil and the United States is all awry. According to the latest available statistics the value of the imports into the United States from Brazil amounts to $124,000,000 a year, which is over ⅓—or to be exact—36.2 per cent. of the total amount of Brazilian exports. But the proportion of Brazilian imports entering from the United States only amounts to 12.8 per cent., and as the total Brazilian imports are in the neighborhood of $200,000,000 that leaves the value of American goods sold to Brazilians at about $25,000,000 a year—or one-fifth of the amount of Brazilian goods sold to Americans. Obviously this is not as it should be, and the coming Exposition ought to offer a good chance to make a beginning, at least, toward evening up this marked inequality.

With the great industrial awakening now taking place in Brazil there should be an excellent market for mechanical rubber goods; and there is no reason why Brazilians should not use as many druggists' sundries, in proportion to population, as the people of the United States. The automobile, too, has made its way into all the Brazilian cities, and that should mean a constantly increasing number of American tires. The market for footwear is, of course, not so active in any of the tropical countries as in regions of plentiful snow, but even footwear in its lighter varieties ought to find a much larger sale in the great Empire of Brazil with its many thriving cities than is now the case. In any event, this would seem like a fine opportunity for the American manufacturer of rubber goods to show the South Americans what he has to offer.

DIGESTS OF THE RUBBER CONFERENCE PAPERS.

AT the Third International Rubber Conference held, in conjunction with the Rubber Exposition, in New York in September and October last, 18 papers were read on a great variety of topics—but all related to the rubber industry—by men of acknowledged authority in their particular field. We hope to publish these papers in full in future numbers of this journal, beginning with the February issue; but in a preliminary way, and as giving a sort of bird's-eye view of the whole subject matter of the Conference papers and discussions, we publish in this issue digests of these different papers.

These digests follow as closely as possible the thought of the author, but, of course, in the process of condensation—attempting to reproduce in 500 words a paper that in the original required 3,000—it is quite possible that full justice has not always been done the subject or the author. Whatever inadequacy, however, may be noted in these digests, will be atoned for, we trust, by the full publication of these papers in later issues.

PLANTATIONS IN BRAZIL.

AMONG the many interesting papers read at the Conference held in conjunction with the recent Rubber Exposition in New York—a digest of which appears in this issue—there was a particularly valuable paper on "The Present and Future of the Native *Hevea* Rubber Industry in Brazil," by Dr. Jaçques Huber, director of the government museum at Pará. He described in detail the present situation of the rubber industry in Brazil. He spoke of the great awakening that has recently taken place in that country as to the necessity of immediate activity, if the Brazilian superiority in the crude rubber market is to be preserved; and he reviewed the obstacles that the Brazilians must overcome if they are to retain their supremacy.

It is obvious from Dr. Huber's paper that rubber plantations in South America to be successful must be oper-

ated in a large way. It will hardly be possible under the conditions prevailing there, for men with small capital, whose operations must necessarily be confined to narrow limits, to hope for much success. As the chief problem of the Brazilian planter is the labor supply, any plantation venture in that part of the world necessitates sufficient capital to include a broad scheme of colonization; which means that labor must not only be provided with conditions of life that are sanitary, but with conditions that are agreeable and attractive. In other words, it must be made possible for the laborer to keep his health and also to preserve his contentment of mind. This requires scientific sanitation, medical supervision, a sufficient supply of good and wholesome food, and the establishment of such an environment that the laborer will be satisfied to stay and become permanently identified with the undertaking. These requirements call not only for skilful management, but obviously for an abundance of capital.

But with the present attitude of Brazil, with its willingness and eagerness to encourage foreign capital to embark on the opening up of plantations, with the government extending such a warm hand of welcome, it would certainly seem as if American capital would be attracted to Amazon plantations. According to the American Consul at Pará, some American capital has already been invested in plantations near that city. It is likely to be followed by more. Certainly the field holds out many substantial promises, and the risk is no greater than usually attends the entrance of capital into a new field.

CHARLES GOODYEAR'S SON.

IN the department in this publication entitled "The Editor's Book Table," where current books are reviewed from month to month, there will be found in this issue a short description of a book on ancient Greek architecture, called "Greek Refinements," written by Professor William Henry Goodyear, Curator of Fine Arts in the Brooklyn Institute Museum. Many people in the rubber trade are familiar with Professor Goodyear—at least by reputation—and know that he has written a number of notable books on ancient architecture and other topics of a kindred nature; but probably very few rubber men are aware that he is the son of Charles Goodyear. Such, however, is the case. But as Charles Goodyear devoted his life to that experimentation in the utilization of a practically useless product that laid the foundation for the great modern rubber industry, his son has devoted his life largely to architecture, and rather to the history and literature of architecture than to its practical application. The father's life was an intensely practical one, while the son's career has been devoted (to borrow a word from the title of his latest book) to the refinements of life—to its intellectual rather than to its industrial activities.

At first glance it might seem that it is a far cry from the elder Goodyear eternally hovering over the kitchen stove with his pan-full of compounded rubber to the younger Goodyear minutely examining the curvatures of ancient Greek temples and mediaeval churches. But, as a matter of fact, the son comes logically enough by his peculiar mental bias. The elder Goodyear was a many-sided man. He was not only an indomitable—almost fanatical—experimenter, but he was a religious enthusiast, an idealist, and full of the artistic temperament; and this temperament inherited by the son has had full opportunity for expression. While the father devoted his energies to benefiting the millions of humanity yet to come, the son has devoted his energies to interpreting the thought of those who dwelt upon the earth centuries ago. It entirely satisfies one's sense of the proprieties to have a distinguished father followed by a distinguished son; it is not necessary, or desirable, that the one should follow directly in the footsteps of the other. As long as the son of a father who has achieved worthily fills his own life with worthy achievements, it is enough.

THE LATEST RUBBER STATISTICS.

THE statistics given by Mr. Arthur Lampard, quoted elsewhere, show an estimated rubber production for 1912 of 104,700 tons and a consumption of 108,250 tons; the reduction in the visible supply confirming those figures.

His remarks on future production and consumption are equally interesting. He does not anticipate that at current prices there will be any notable increase in the production of wild rubber in 1913, while he expects plantation rubber will go up from 28,500 tons to 40,000 tons. Judging from American expectations and from the large increase in American consumption which has taken place this year, he expresses the conviction that the whole of the increase in sight could easily be absorbed by America alone, even if all the other countries of the world are going to hold aloof, which, of course, he observes, is inconceivable. He adds that

the figures quoted prove that the statistical position of rubber has never been stronger than today.

Coming a little ahead of the usual annual statistics and based on actual results as far as the end of October (with careful estimates for November and December), Mr. Lampard's statistics are of marked interest as indicating the prospects of the rubber market, and in particular his recognition of the importance of the American outlet.

SIMPLIFYING RUBBER NOMENCLATURE.

ONE of the most important problems before the rubber trade today is the simplification and standardization of the nomenclature of crude rubber varieties. Twenty years ago this problem did not exist, as the crude rubber that arrived at our ports came practically all from one source, and while there was some variety, to be sure, there was not enough to be especially confusing.

But all that is now changed. With the exploitation of many forest trees—hitherto untouched—for an additional wild rubber supply, and with the great development of rubber plantations in all parts of the tropical world, the variety of crude rubber now coming to our ports is very large and constantly increasing, and necessarily occasions much confusion.

This matter was the subject of no little discussion at the Rubber Conference held in New York last September, and a committee was appointed of eleven members—three of them appointed by the Rubber Club of America, and eight of them by the Conference—to see what measures could be taken to simplify and systematize the crude rubber names now in vogue. This committee represented in its membership American importers, the plantations of the Middle East, and of the Pacific, and the wild rubber interests of the Amazon. A number of meetings were held and tentative lists of names for the more important varieties of crude rubber were submitted.

With the ending of the Exposition and the conclusion of the Conference, the members of the committee—many of whom were from foreign countries—became widely scattered, but the American members, together with the representatives of the Rubber Club, have been going over these lists with most painstaking care, and THE INDIA RUBBER WORLD hopes very soon to be able to publish the result of these deliberations.

There will be no suggestion of finality about these lists, but they will no doubt constitute an excellent beginning in the solution of one of the most pressing problems in the rubber industry today.

THE BLOOMING OF SHOES.

IF there is anything that fills the rubber footwear manufacturer with keen regret that he did not embark upon some other calling, it is a "blooming" shoe, or even more, a boot that "blooms," because the boot is worse, inasmuch as there is more of it. Any light on the wherefore of blooming is welcome to anyone whose duties include the successful vulcanization of rubber goods. A superintendent relates in another column of this issue some of his experiences with footwear that bloomed. It will be found interesting to those who have had like experiences.

He found that in the same lot of footwear made from the same rubber, with the same compounds, and subjected to the same degree and duration of heat, some shoes were entirely free from bloom, others bloomed a little, and still others a great deal. But when he examined his crude rubber he found that while it had been taken from the same lot, there was in reality a marked lack of uniformity in the different sheets, and in some instances in different parts of the same sheet; the rubber as a whole being hard, but having certain soft spots. He then made a trial mixture, vulcanizing three batches at the same time, all being similar except that one contained nothing but hard crude rubber, while the second contained a combination of hard and soft, and the third was made up entirely of soft rubber. The result was perfect vulcanization where the hard rubber was used, a noticeable bloom where some soft rubber was used, and a pronounced blooming where the rubber was taken entirely from soft spots, which shows the necessity of examining lots of crude rubber carefully, and—where there is any lack of uniformity—of separating the lots according to their quality, so that the different qualities may be subjected to different vulcanizing conditions.

FREQUENT MENTION HAS BEEN MADE IN THESE columns of late of the great industrial awakening that is taking place in Brazil. In connection with this situation it will be of interest to the readers of THE INDIA RUBBER WORLD to learn that the editor, Mr. Henry C. Pearson, is now on his way to that country, having sailed on December 16. He will make a brief stay in Barbados, and will proceed thence to the great South American Republic, where he will be able to observe at close range the New Brazil. The result of his observations will appear from month to month in these columns.

Hoolihan on the "Case of Caasey."

"CAASEY," said Hoolihan, "is tha wan av ahl uthers that gives me a paain!"

"What has he done?" I inquired.

"Listen, me bye, av iver a mon was thrained an' given ivery chance thot mon was Caasey."

"You mean the hose inspector of that name?"

"LISTEN ME BYE."

"Av thot naame, an' maany uthers as well. But it wuz as Caasey yez knew him. Phwat the assoshiated Boord av Overwriters' done fer him couldn't be missured be words. To staart at the beginnin' we sint him down to the nagur rubber gathurers in Brazzil."

"What?"

"Shure thing, we pit an insphector on the ground so thot Paraa rubber shud be Paraa rubber an' not be mixed wid cowchew or Ballatha or anny av thim infarior gooms. We had a laabel to pit an ivery caake, an' charged thim tin cints a laabel, glory be!"

"Glory be indeed!" I gasped.

"Not only thot, we laabeled the barls of soolpfur, av whitening, an' the kigs av litharge, an' we pit insphectors in ivery mill thot made thim vaarious stuffs," said Hoolihan with huge satisfaction.

"It must have cost your association a pretty penny."

"Divil a cint. The wans inspicted paay the cost, an' paay for laabels too. We give our consint to ahl av thim to do business an' they paay us fur it. We saay Nicholos Suarez the Rubber King av the *Madeira* makes rale Paraa rubber, see our label an his biscuits, yez kin buy av him av yu plaze (tin cints a biscuit, an' $500 insphectors' expinse, ahl fer us).

"But, but what does your inspector on a rubber estate do?"

"Do, is ut? He shows thim nagurs how to do. He watches thim pit the cups an the threes. Thin he seals up the cans av milk an' allows thim to be oapened only in his prisince. He annylizes the palm nuts to see av they have the requisut propoartions av sillicate av oxigin, bicarbonate av elasticum, an' Lithium av Wangaroo. He tists the hate av the smoak wid a thermomater. He taakes an observaation av the direction av the wind, an' the amount av preciptous moisture in the air. Thin the nagur does the rist. Thin, and oanly thin we affix our laabel."

"Wonderful: what does the label say?"

"Just this!" was the prideful answer.

> Fine Para Rubber
> Prepared under Supervision of
> Overwriters' Laboratories, Inc.
> No. 13,333.

"What does that Inc. mean?" was my query.

"Incloosive to be sure. Includes inspiction for paay, laabel for paay, an' unlimited taxation an' misriprisintation."

"It certainly seems very thorough," said I hesitatingly.

"Not half as thorough as we plan," was the enthusiastic reply; "we were oanly laabelling 20,000,000 articles in connixion av fire risks an' we naded more scoape."

"But—"

"Niver mind the but, it's about Caasey I am talking. He wint through ahl av the schools av inspiction, wild rubber in Brazil, ahl av the compounds in th' vaarious mills, an' thin he inspicted the makin' av laabeled fire hoase in th' rubber facthries."

"Yes?"

"And phwat do yez think he done?"

"Give it up."

"After larnin' ahl he cud av compounds an' processes he trew up his job an' staarted a facthery av his own an' is makin' fire hoase."

"HE SHOWS THIM NAGURS HOW TO DO."

"And now he will have to be inspected and labelled himself," I laughed.

Hoolihan shook his head sadly.

"Thot's the divil av it," he said; "he won't lave one of us

"WE HAD A LAABEL TO PIT AN IVERY CAKE."

over th' treshoald av his mill. He says he intinds to run his oan business widout bein' bossed be self-elicted intherferers."

"What shall you do?"

"PARAA RUBBER SHUD BE PARAA RUBBER."

"Oah we are ahl roight; there's plenty av others that hav' no thrace ov Caasey's foightin' timpermint. We will go afthir thim.

The Kingston Rubber Brush Co., of Kingston, New York, has increased its capital stock by $150,000 to $300,000.

STATISTICS OF RUBBER EXPORTS.

While statistics of American rubber goods exports of earlier periods are of interest for purposes of comparison, the most recent figures are the most valuable as a guide to future prospects.

American exports of belting, hose and packing for the twelve months ending June, represented for 1910, $1,960,825; for 1911, $2,163,416; and for 1912, $2,315,424. That this increase is more than being maintained is shown by the figures for August, which show in 1912, $269,239, as compared with $191,637 for the previous year.

Rubber boots and shoes for the three fiscal years ending June 30, represented: 1910, $1,984,739; 1911, $2,219,430; 1912, $1,502,890. The returns for August alone show: 1911, $247,953; 1912, $196,415.

Automobile tires, which in the fiscal year 1911 represented $2,085,107, increased in 1912 to $2,657,809. That a still further increase is in prospect is shown by the figures of August, 1911 and 1912, respectively, $251,262 and $405,781.

"All other" tires show a falling off, but for the fiscal year 1912, and for the month of August separately, the respective figures being $546,833 in 1912 against $592,470 in 1911. The August returns are for 1912, $46,937 against $58,615 in 1911.

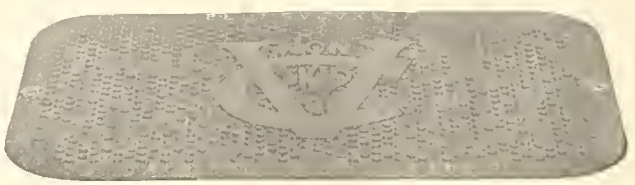
"All other" manufactures of rubber, being a general head, its results are subject to various influences. The figures for the last three fiscal years are for 1910, $5,115,331; 1911, $3,886,825 and 1912, $4,144,273. August alone shows a slight retrogression from the figures of 1911, the amounts being respectively, $310,941 and $343,336.

Thus the more important articles of export, mechanical goods and automobile tires, are in a sound statistical position. That there should have been a falling off in rubber shoes is largely due to the extent to which they are now being made in other countries.

In export trade there is an unlimited field if rightly taken in hand, with a due appreciation of its difficulties and of how to overcome them.

A NOVEL MAT.

The Pennsylvania Rubber Co., Jeannette, is making a mat of unique design for dealers and jobbers selling Vacuum Cup tires. The surface of the mat is composed of a multitude of



cup-shaped knobs, similar to those on the tire-tread, and in the center is the V. C. trade mark. This mat is made of high quality white rubber and is in great demand among the company's agents.

A NON-SKID IN MOVING PICTURES.

THE advertising department of The Diamond Rubber Co. has hit upon a very clever device for showing the superiority of the "Diamond Safety Tread" tire over the ordinary smooth tire. This is done by a set of moving-pictures which show a smooth pavement recently wet by the sprinkling wagon; an automobile equipped with smooth tread tires comes down the street and turns a corner at a considerable rate of speed. The result is that the car skids around like a healthy young couple on a well-waxed dancing floor. Then comes another car equipped with the "Diamond Safety" and turns the same corner at the same rate of speed—but without any skidding, which is a fine way to tell a long story in two or three seconds of time.

Digests of the Papers Read at the Rubber Conference Held in New York.

SEPTEMBER 23 TO OCTOBER 3, 1912.

DIGESTS of the 18 papers read at the recent Rubber Conference held in New York, in September and October, in connection with the Rubber Show, are given below and on succeeding pages. The work has been carefully done, but a digest is never quite adequate or satisfying. The papers will be published in full in subsequent issues of THE INDIA RUBBER WORLD, beginning with February.

THE PRESENT AND FUTURE OF THE NATIVE HEVEA RUBBER INDUSTRY. (*Abstract.*)

By Jacques Huber, Museu Goeldi, Pará.

THERE is an opinion common among people interested in plantation companies that Brazilian rubber will be entirely supplanted by the product of the Eastern plantations within the next ten years. But it is a case where the wish is father to the thought. There seems to be no necessity for the disappearance or the reduction of the Brazilian crop. On the contrary, there will be increased need for the Amazon crop of rubber—and especially for the hard-cure Pará. The advent of plantation rubber has helped the industry as a whole, assuring the manufacturer that there will be no shortage in the supply, and tending to the general lowering of prices.

Brazilian producing centers appreciate the competition of the plantation and are preparing themselves to improve their position by lowering the cost of production. On the other hand, the plantations doubtless appreciate that Brazilian rubber will be able to hold its position because of its superior qualities, particularly the superior qualities of the hard-cure smoked Pará, whose resistance to exterior influence—light and temperature—is so much greater than that of plantation rubber. As an illustration, the stock held by the Pará Syndicate, after being kept two years in more or less overheated stores has improved in quality, and it is probably true that where crude rubber has these resisting qualities the vulcanized product will also have them.

One argument often adduced in the attempt to prove that the native *Hevea* rubber will disappear, is the difficulty of gathering rubber from the scattered forest trees; but this condition has its advantages also. These forest trees, though scattered, are much older and larger than the plantation trees, so that the worker can collect and coagulate as much as 10 kilograms (22 pounds) of rubber in a day, where the plantation tapper gets only 2 kilograms. Moreover, the fact that the native trees are widely scattered protects them from the spread of fungus and other diseases. Another reason cited to prove the disappearance of *Hevea* rubber, is the exhaustion of native rubber districts. This is true in some districts in reference to *Castilloa*, but not true of *Hevea*. The shortage of labor has not made it possible to exhaust the *Hevea* trees.

A third proof cited that *Hevea* will disappear is the scarcity of labor. It is true that labor in Brazilian forests is six times as expensive as coolie labor on the Eastern plantations, and that is the principal problem that South Americans have to solve. It is cited as a proof of the impending ruin of the Amazon rubber industry that the output has been practically stationary for the last few years. This is owing chiefly to the deficient organization of the entire industry and a lack of the proper amount of capital for its development. Unfortunately, the profits of the industry have not in sufficient measure gone back into the improvement of the general conditions, but during the last few years the Government and leading citizens have awakened to the necessity of instituting reforms and introducing improvements on a very large scale. Some of these reforms briefly are as follows: First, an improvement in the means of communication, making the rivers more navigable and building railroads on the banks of rivers made unnavigable by rapids; second, better food supply—cheaper in price and more accessible. With this in view the Federal Government has planned cattle breeding on an extensive plan in the upper *Rio Branco* region. And third, sanitation and other measures protective of the laborers' health.

In addition there must be special protection for young *Hevea* trees and interplanting among the old trees of the forest. There are seldom more than 10 trees per hectare (about 2½ acres). This number could very easily be doubled. Tapping methods may also be improved, although it may not be possible to adopt those of the Eastern plantation. First, because the trees are already defaced by the native methods, and second, because it would be difficult to train the natives to adopt a new system. The method of preparing the rubber may likewise also be improved, although no change should be made until its superiority over the present effective smoking process should be fully proved.

Is it possible to operate a plantation successfully on the Amazon? is a question constantly asked. There are a few old plantations in the State of Pará, but these as a rule have not been very successful. There are some private plantations but their records are not accessible. The new plantations started under the State protective laws are still too young to serve as a criterion. After the enactment of State laws offering many advantages and encouragements to rubber growers there was a rush to obtain these subsidies, and the registration in the Agricultural Department in two years' time has reached the number of 8,000,000 *Hevea* trees to be planted within the next four years. Of these, about 350,000 had been planted at the end of 1911. Rubber plantations planned and operated on a large scale, by companies with sufficient capital, hold out considerable promise in the Amazon region, though plantations here cannot be operated exactly as in the Middle East, because the conditions—and particularly labor conditions are so different. In a general way, rubber planting on the Amazon must either be carried on by the actual occupants of the land or by companies abundantly financed, which can operate an efficient scheme of colonization together with the planting; and what is most needed to insure success is efficient management. This has been lacking to a considerable extent in earlier plantation experiments as it has been difficult to secure men who have had just the right experience. The evolution of the plantation on the Amazon will doubtless differ from the plantation development in the Middle East. It will probably be of slower growth, but the plantation on the Amazon will undoubtedly come as a necessary complement of the forest rubber extraction, and the whole industry will be placed on a more scientific, more economical and more stable foundation.

THE PLANTATION RUBBER INDUSTRY. (*Abstract.*)

By Cyril S. Baxendale.

IT is a remarkable fact that the profitable cultivation of rubber should have been so long open to doubt. It was in 1876—36 years ago—that H. A. Wickham smuggled 70,000 *Hevea* seeds out of Brazil to London. 2,800 plants were raised at Kew

Gardens, and in the same year shipped to Perideniya Gardens, Ceylon. In 1877 a case of 22 plants reached Singapore and were planted in the newly founded botanic gardens there. In the same year the first *Hevea* trees arrived in the Malay States. It may seem strange that these trees reached maturity many years before it was realized that they were capable of yielding a sufficient quantity to make regular tapping profitable. The explanation lies in the very poor methods of tapping pursued by the Malayan aboriginals. In 1888 H. N. Ridley was appointed director of the Singapore Botanic Gardens and immediately began experimental tapping. In 1891 the first sample of plantation Pará was sent to London and favorably reported upon. The first actual sale of Malayan rubber was in 1899, realizing 3*s*. 10*d*. a pound; the rubber was taken from trees 22 years old. The first rubber planting on a commercial scale began in 1895. The slow development of rubber plantations at the beginning was attributable to lack of interest on the part of capitalists. Finally European financiers became interested and by 1905—38,000 acres in Malaya had been planted to *Hevea*, and from that time on the average increase has been 70,000 acres per annum—the total acreage at the end of 1911 being 542,877.

Then came the boom of 1909 with much indiscriminate speculation, comparable only in English history with the South Sea Bubble of Queen Anne's time. But the legitimate rubber men kept their heads and while the bubble was much deflated it did not burst.

The great advantage of the Malay Peninsula for rubber-growing is its regular rainfall. The Peninsula does not exceed 170 miles in width and it is the meeting place of the Northeast monsoon of the China Sea and the Southwest monsoon of the Indian Ocean—both contributing liberally and regularly to the precipitation. But while there is an abundance of rainfall there are very few days in the year when it is too wet to work, and this, of course, gives the planters in the East a great advantage in a matter of collecting rubber over wild rubber gatherers on the Amazon, where for several months of the year tapping has to be altogether suspended.

Another advantage of the Peninsula lies in its superior healthfulness. This is attributable to the scientific investigations by famous medical experts looking to the discovery and removal of the causes of disease. The richness of the soil is an additional attraction, and to this might be added that the success of the industry is due—not a little—to the confidence inspired by an absolutely honest and conscientious public service. The Planters' Association of Malaya comprises 600 plantations with an invested capital of £50,000,000, and an actual value of several times that figure.

In the early days of rubber cultivation the prevailing method was that of interplanting *Hevea* trees through the old fields of coffee. Then new jungle tracts were cleared and rubber and cocoanuts were planted in alternate lines, but this necessitated the destruction of the cocoanut trees in a few years' time to give the rubber trees sufficient room. At the outset the *Hevea* seeds were obtained from original stock and were quite expensive. Now they are obtained from trees of all ages and the expense is much less. In the hilly districts ordinary surface drainage is required, but near the coast land must be selected that can be effectively drained and this often involves considerable expense. In clearing an area for rubber the drains are laid out, the jungle is cut down, and branches lopped to a level of about 4 feet. A few weeks later the area is burned; afterwards the unburned branches and small trees are piled up and a second fire started. This leaves some stumps and big trunks, but in three or four years' time these have rotted and can easily be removed. Planting is done from seed or from stumps taken from the nursery from 6 months to 2 years old. There has been much controversy as to whether it is desirable to let the grass grow or to cultivate some cover stock, but in the author's experience, clean weeding followed by digging and plowing is preferable to any cover crop.

The cost of production is an ever-interesting phase of rubber planting, and planters are twitted over the difference between recent actual costs and early estimated costs; but there are reasons for this. The boom of 1909 materially increased the cost of rubber production, as the ad valorem export duties naturally were higher; while managers and assistant managers and even the coolies all demanded a part of the great prosperity that had come upon the planter. Moreover, many of the trees tapped were young, which made the collection expensive. With the return to normal conditions and the maturing of the trees, rubber production has declined in cost, and will still further decline.

The question of close or wide planting has been much discussed. One rubber botanist maintains that the trees should be 40 feet apart, which would be only 27 trees to the acre. The author's experience is against any such wide planting. Insect and fungus diseases are easily kept under control. On the author's plantations the loss does not average 2 per cent. from these causes.

In regard to the labor problem, which is likely perhaps to present more difficulties in the future than it has in the past, there is one obvious phase, namely that the Indian laborers are more anxious for healthful conditions than for extremely large pay, and that they will avoid plantations reputed to be unhealthful, notwithstanding tempting wage rates. But the Chinese and Japanese laborers on the contrary, are willing to risk ill-health for better pay.

Some consideration has recently been given to the question of fertilizers in Ceylon, though little has been done in this direction in Malaya except where the soil is particularly rich in humus, where lime has been supplied to correct the acidity. The author believes that for some years to come, at least, systematic cultivation of the soil will prove more valuable than any sort of fertilizer.

Another question that is always uppermost is that of future supplies of rubber. The author has seen fields that produced from 800 to 900 pounds of rubber per acre, but this yield is abnormally high. In his opinion a first-class plantation may be expected to yield an average of 500 to 600 pounds per acre. His estimate of the total acreage now under cultivation (including the 500,000 acres in Malaya) is 1,000,000 acres. His estimate of the production of plantations for the year ending 1912 is from 25,000 to 30,000 tons. The annual increase will be fairly steady, and in about 1918 the annual production of plantation rubber should be 100,000 tons—or equal to the entire consumption of the world at present. The present outlook is that consumption will fully keep pace with production, so that there is no imminent struggle between plantation and wild rubber.

The future of the planter depends entirely upon the activity of the manufacturer, and it is reasonable to expect that there will be a constant demand for rubber in lines of manufacture already open, and that in addition many new uses will come into vogue. A well-managed, favorably-situated and mature plantation can at the present time, produce rubber with a handsome profit at 60 cents a pound. Planters can guarantee an enormously increased supply of rubber and will in future years be content with a much lower price than now prevails. What interests the planters is to know whether with a larger increase in their output there will come a glut in the market in a scramble to sell, or whether the manufacturers will be able to take care of this constantly increasing supply.

THE COMMERCIAL POSSIBILITIES OF SYNTHETIC RUBBER. (*Abstract.*)

By Lothar E. Weber.

THE possibility of converting isoprene into a rubber-like substance has been known for twenty years, but little progress has been made in developing this knowledge until quite recently, owing to the vast proportions of this problem. The synthesis of rubber, however, received a new im-

petus about three years ago when two German chemists, Hofmann and Harries, working independently, simultaneously discovered products that gave the chemical reaction of rubber and possessed certain physical resemblances to the natural product. The recent forming of stock companies to place synthetic rubber on the market has attracted much attention to the subject on the part of the press and the public generally. While the author greatly admires the fine work of the chemists in accomplishing the results attained, he deplores the attempt to make the public think that synthetic rubber is an immediate commercial probability.

He cites the comparison synthetic enthusiasts make between the success in synthetic indigo and the probable success in synthetic rubber. In his opinion, the two problems have little in common, as indigo is an article of absolutely definite characteristics and properties, and moreover, the investigator can tell in a few moments whether the product he has obtained is indigo or not, a condition totally differing from the conditions under which synthetic rubber is made. Synthetic rubber is obtained by the polymerization of isoprene. This the author defines as a process whereby a large number of small units combine to make a single large unit. It is essentially a process of agglomeration. The molecules of isoprene—at least a hundred of them—unite and polymerize into one single molecule of rubber, but the difficulty is that it is impossible to determine how many isoprene molecules are necessary to make one molecule of rubber, and equally impossible to obtain any uniformity of polymerization. The chemist cannot control the process. He says: "With the chemical methods available to-day, it would be absolutely impossible to make a product with an assured uniform degree of polymerization," and without this uniformity commercial synthetic rubber is an impossibility.

Synthetic enthusiasts also ignore a very important fact, that by 1916 the plantations will be producing at least 100,000 tons of rubber, and that in consequence the price of rubber will be much lower than at present. Plantation rubber is even now—according to report—being produced at 25 cents per pound. At any rate, the large dividends of many plantations show that much plantation rubber is now being produced at a comparatively low figure, so that even if synthetic rubber could now be marketed in large quantities at 50 cents a pound, it would soon come in competition with plantation rubber that could be produced even cheaper. Moreover, it will be quite possible for the plant physiologist to still further increase the production of rubber plantations just as he has increased the beet-sugar yield.

Synthetic indigo was able easily to overcome competition with the natural article, because natural indigo was produced under the crudest and most unintelligent methods. In rubber plantations the case is entirely different as the rubber planters are keenly alive to all the possibilities of scientific methods of cultivation, production and preparation. Briefly, the author's position is this: That with our present chemical methods it is impossible to assure a uniform synthetic product, and that within the next few years plantation rubber will be in a position to make a stubborn fight against any synthetic rubber product. He does not take the ground that synthetic rubber will never be a commercial possibility, but doubts whether anyone now in the rubber industry will live to see synthetic rubber in successful competition with the natural product.

THE TAPPING OF RUBBER TREES. (*Abstract.*)

By R. Fyffe.

THE operation called tapping is one of extreme importance and the present methods are susceptible of marked improvement. This subject did not receive the consideration in the London Conference of 1911 that its importance warrants.

After the close of that exposition the author toured through Ceylon, the Federated Malay States and Java, studying the preparation of rubber and methods of tapping. Subsequently, he made many tapping experiments and reached the conclusion that the best method was a combination of excision and incision.

Excision alone he believes detrimental to the tree, as the coolies in their endeavor to get the maximum latex almost inevitably cut too deep, thus injuring the lactiferous tubes close to the cambium. These deep wounds heal slowly, retard the growth of the tree and give access to fungus. He does not consider incision alone practical, but advocates a shallow excision combined with incision made by a fine push pricker. Where the points of the pricker are fine they may penetrate the cambium without injury. He does not advocate broad blunt teeth. He got satisfactory results from a push pricker with gramophone needles filed flat on two sides and fitted ⅛ inch apart into a small block of wood. He followed the half herring-bone system on about one-third of the tree's circumference.

NOTES ON THE ACCLIMATIZATION AND CULTIVATION OF THE GUAYULE (PARTHENIUM ARGENTATUM—GRAY). (*Abstract.*)

By Francis E. Lloyd,

MacDonald Professor of Botany, McGill University, Montreal.

IN connection with the general conditions affecting guayule cultivation, the results available to the author have been from plants grown at Cedros, Zacatecas, Mexico; Tucson, Arizona; Stockton and Austin, Texas; and Auburn, Alabama. These situations included the semi-arid Chihuahuan and Sonoran deserts, within the former of which the guayule has its natural habitat; the moister climates of Eastern Alabama (with a rainfall of 45 to 55 inches), and Eastern Texas.

Guayule is by no means uniform in structure within its natural area; the variations arising being due to differences in available moisture, this being in turn attributable to greater rainfall or to the character of the soil. These structural differences are those of relative thickness of the bark (or *cortex*), which is thinner in proportion to the greater amount of water available. Correlated differences are to be noted in the length of the annual accretions of stem.

In the easternmost region of the distribution area (the state of Nuevo Leon) the practical extraction of crude rubber is reduced, roughly speaking, to about 4 to 5 per cent. of the wild weight. This does not necessarily mean that the amount of rubber, in proportion to the volume of rubber-bearing tissues, is less than elsewhere, but that the volume of woody tissues is greater. Nevertheless such may be the case, and in view of what we know about the relation of water supply to the amount of rubber secreted, it is not considered improbable that the actual intracellular secretion in these Nuevo Leon plants is somewhat less than in dryer regions.

The well-known habitual differences between "Macho" and "Embra" guayule have been attributed to racial differences, but whether this is so or not, the practical distinction in Mexico is marked, the former being regarded as decidedly better in rubber content. The inferiority of the latter is due to the greater relative volume of the woody cylinder and the relatively greater number of smaller branches.

One of the principal differences in minor details is that the greater the water supply, up to the limit thus far observed, the greater is the volume and hardness of fibrous or woody tissues barren in rubber, the greater the irregularity of growth, and the larger the number of smaller twigs and leaves.

As to the tenure of life, a combination of conditions may prove fatal to plants when moved to another habitat, while they might successfully resist the influence of any one factor. Thus guayule can withstand cold better under arid, than moist, condi-

tions. The tenure of life in a new habitat depends, moreover, upon the ability of a plant to resist new enemies. Thus in Alabama, thrips and nematodes have been seen to affect guayule badly. In the semi-arid desert, on the contrary, no case of death has been noted during three years, save as the result of insufficient irrigation. It is deduced from this behavior that the resistance of an irrigated plant to drought is much less effective than that of one grown under usual conditions.

With respect to rate of growth it is estimated that the average dry weight of a plant would be 1 pound, and assuming 10,000 plants to the acre, a 2 per cent. rubber content would yield 200 pounds of rubber in two growth seasons, followed by six months of suppressed irrigation. At 60 cents per pound this gives a return of $120 per acre for two years, or $60 per acre per year, subject to the charging of the usual costs. Were the yield of rubber even 6 to 7 per cent., it would not compete with onions in irrigated land. It is assumed that it would not pay to grow the plants longer than two years.

The rate of growth in the moister climate of Auburn, Alabama, is less rapid than in the desert under irrigation. In the first season a height of 8 to 10 inches is attained, but the additional growth in the second is meagre. Thus only the rubber secretion of the first season has to be considered. This, it is added, is practically nil, the possibility of growing guayule in this region being excluded.

After dealing with the method and character of rubber secretion, the author draws the conclusion as inevitable that the determining factor in the cultivation of guayule is control of the water supply. In the presence of an abundance of water applied irregularly and at too frequent intervals, it will take more than three years for the maximum cell amount of rubber to be attained. A quantum approaching the maximum is attained, on the other hand, if plants which have been well irrigated for two seasons are then subjected to drought conditions for six to eight months.

LABORATORY ORGANIZATION IN THE RUBBER INDUSTRY. (*Abstract.*)

By Frederic Dannerth.

IN view of the necessity of arriving at positive data, successful corporations have arrangements with the managing director to purchase at the lowest possible market price the best raw materials for a given purpose; to criticize the manner in which the factory manager is making up these raw materials and help him to attain perfection; to help the salesmen when competitors are offering better quality for same or less money; and to deliver to the factory manager, heat, light and power at the lowest possible cost.

In factory management, as now carried out, all chemical problems are first presented to the supervising chemist of the works, who occupies a position parallel to that of the factory manager and the operating engineer; being wholly or partially employed by the particular corporation.

The duties of this department are: (1) To investigate all new processes; (2) to constantly improve existing ones; (3) to correct and explain irregularities of current operations; (4) to invent new and useful processes; (5) to determine the value and exact composition of all raw materials; (6) to determine the value and composition of competitors' products; (7) to advise correctly on "specification goods"; (8) to control different stages of many processes.

Co-operation with the laboratory by every department is thus necessary for the full use of the constructive forces at work.

The supervising chemist, whose value is in proportion to his far-seeing capacity, has five first assistants: the engineering, buyer's, factory, sales and research chemists. In the laboratory organization are included the abstracting of foreign and domestic technical literature and of patents; as well as a library of catalogs. Superintendents should present monthly to the supervising chemist reports of their own or their assistants' ideas, warranting investigation.

The engineering chemist's most important field of activity is the examination of materials used by the power plant; co-operating with the buyer's chemist, who is essentially an analyst; and whose duty it is to devise rational specifications on standard material. The factory chemist investigates problems arising in the factory, and looks after the writing of recipes to meet certain specifications. The sales chemist makes analyses of commercial rubber products offered by competing firms, and conducts the final tests on specification goods. The research chemist's duties include dealing with the periodical and patent literature of all countries, as well as the investigation of the latest advances in machinery for chemical processes, and the utilization of wastes. He should embody the varied talent and knowledge required in a wide field, and should have a properly equipped research laboratory with miniature rubber machinery. Together with the supervising chemist and the factory manager he forms the research committee, which meets regularly to consider all important investigations.

The supervising chemist has the supervision of the work of his five first assistants, and calls a weekly meeting of the chief chemists to discuss standard analytical methods and patents of interest to the rubber industry. A digest of this meeting should be forwarded to all the chemists of the company for comment and filing; while the supervising chairman has in his office a card index with condensed abstracts of relevant articles from chemical journals. The efficiency of the chemical department may be increased by periodic visits of the supervising chemist to the different laboratories of the company and to those of other industries, in order to incorporate in his organization the favorable developments made by them. Laboratory buildings should be roomy, well lighted and ventilated, likewise equipped with all the apparatus required for accurate and rapid work.

The central laboratory and office should have a file of chemical and engineering periodicals and standard works. All the laboratories should be in the same building, to facilitate library references and consultations by the individual chemists.

Another point of importance is the holding of periodical general meetings of the chemists to promote cordial co-operation and to discuss specific subjects; as well as the periodical exchange of chemists between the different laboratories, to broaden the experience of the individual chemist. Monthly reports should be made by each laboratory to the supervising chemist, explaining all difficulties encounted in the course of investigations and making suggestions for improvements in existing methods.

When a corporation has plants in different cities, the central laboratory should be connected with one of the large plants, so that mechanics may be available for construction work in the laboratory. Such an arrangement, moreover, allows of chemists asking advice of foremen and superintendents.

The rules to be posted in the laboratories should provide: For the verification of the accuracy of weighing and measuring apparatus; for standard solutions being checked by the head or one of the chief chemists; for all important investigations to be in duplicate and all clerical work and calculations to be checked; for the employment, even in the simplest determinations, of systems of weighing and manipulation, devised to prevent errors.

The form of organization of which the leading features have been described, must never take the semblance of dull routine; while the interest in the work can be decidedly promoted by having the chemist come into personal touch with the department for which he is doing work.

Scientific management resolves itself into buying the best material of a given grade at the lowest possible price and selling the finished product of a given quality at the lowest possible price. To accomplish this our manufacturers have drawn to their aid the services of men exercising the above functions.

FACTORY MANAGEMENT METHODS. (*Abstract.*)

By J. C. Jurgensen.

THE interest manifested lately in "scientific management" for factories has produced a large number of efficiency engineers, whose efforts are looked on with some skepticism by many manufacturers. Where they have failed, however, it has usually been owing to their method rather than to the principles involved. It is extremely difficult to lay down hard and fast rules for the efficient management of a factory. Even when the plant is thoroughly analyzed and investigated, the system must be fitted to each case. Whether the factory manager can himself apply it, depends upon his talent for investigation and administration. The human factor is the most serious problem he is called on to solve. Each employe, whatever his position, should have his duties thoroughly defined, and must be chosen with careful reference to them.

All orders for work emanating from the manager's office should be carefully planned and explicitly worded. Clearness should be insured by a system of checking before the final issue of the order. The indefinite order is the father of every bad habit in foremen and workmen, and leads to disorganization of plant and factory.

It is an important function of factory management to encourage general industrial education and vocational training, many experienced men being found willing to act as teachers of the young men in the service of the company.

Organization is a matter of fundamental importance, and the successful factory manager has some simple method or system for determining the responsibilities and authorities of all his subordinates. On his solution of these daily problems depends the success or failure of his management. The factory manager must know what he wants to accomplish and, having decided on the method to be used, must stick to it. Changes of plan and spasmodic efforts never lead to results. Repeated changes in methods create misunderstandings, insubordination and intrigues, while organization, although it cannot entirely prevent such conditions, will greatly minimize them.

The organization in which each department head is selected to perform the duties for which he is best fitted, has the elements of a perfectly co-ordinated factory, but to insure practical co-operation between the various heads, a supreme authority must be provided, in the form of the owner, a firm management committee, or the factory manager. The absence of such an authority leads to indecision and general disorder; divided authority always causing shirking of responsibility. A thoroughly competent assistant is recognized as the acting work manager when his superior is absent.

After an expert organizer has had an opportunity to analyze the nature of the business and to classify the work, a series of organization charts should be drawn up by him, showing graphically the departmental relationship, as well as the extent of departmental responsibility.

The cost system is another essential in factory management; showing plainly the well operated and improving departments and those badly run. It creates a more determined and careful management, but does not stop at executive organization; gauging the value and efficiency of every operative, every machine, and every operation. With proper use it can become not only historical, but prophetic. When this can be done the cost system is established. Its proper employment by an energetic factory manager enables him to analyze any part of the plant; at the same time setting standards of mill expenses and unit costs.

While the sales price of the product cannot be controlled by the factory, the cost of production can; the latter being the one vital element in the industrial world to-day. Even if incomplete, a cost system will be of use to the management. As every penny spent in the mill is part of the cost of the product, it is the function of the cost system to determine daily where each individual expenditure shall be charged.

A practicable system is best established by finding departmental totals for material, labor and mill expenses; then going after details. To begin with details and go up to totals is wrong. When the totals have been proven with the accountant's books, the factory manager can divide them as required; each cost item being checked with the total. Thus the modern factory manager, in his fight for better managment and methods, must install a practical expense control system.

PROBLEMS IN VACUUM DRYING. (*Abstract.*)

By J. P. Devine.

THE author's connection with the rubber industry dates from ten years back, when he sought to interest manufacturers in this country in a new method of drying rubber. He found that they were satisfied with the then existing method, and did not hesitate to express their opinion that any shortening of the drying process would sacrifice the quality of the rubber and jeopardize standards established during the course of years.

At the outset of his investigations, the author found that little, if any, advancement or improvement had been made up to that time. His opinion was thus confirmed of the value of the Passburg Vacuum Drying Process (originated and designed by Emil Passburg and William Strohn of Berlin), for economically and thoroughly removing moisture, particularly for the removal of the final traces, as is necessary with rubber and rubber compounding materials.

This new process was introduced in Germany by Messrs. Passburg and Strohn and in this country by the author, and has proved of great benefit to the rubber industry.

For years rubber was dried by any convenient method, not involving capital expenditure, such as a boiler room. Subsequent improvements included the adoption of drying lofts, where the sheeted rubber was hung on racks, the heat being distributed by coils, or hot air circulated by fans or blowers. Little regard was paid to the temperature or duration of the drying process. The fallacy of the claims sometimes made in favor of these old systems is proved by the use of the vacuum apparatus, and by the superior quality of the rubber dried by that system.

The improvements introduced from time to time only served to reduce the effects of high temperatures, with a consequent prolongation of the drying period. Heat and oxygen, however, are the two insidious enemies of rubber, always present in hot air drying. They are eliminated by the vacuum apparatus.

Another objection to the hot air system of drying is the contraction of the rubber and the hardening of the surface, which prevents the elimination of the last moisture within the rubber, except by a prolongation of the drying period. The vacuum process and apparatus alone afford the proper conditions for the rapid, uniform and thorough drying of rubber at a low temperature and without oxidation, independently of climatic conditions.

While under atmospheric conditions, rapid boiling can only take place at 100° C. or 212° F., and the drying time is extended as the temperature decreases—under vacuum, the boiling point is greatly decreased as the barometric reading is approached. Thus at a vacuum of 29″, water boils at 25° C. or 77° F. Rubber dried in the vacuum chamber, while the first free water is being removed, need not be heated practically above the boiling point of water at that particular vacuum. The supply of the heating medium—steam or hot water—is regulated and is entirely shut off before the final drying. The last traces of moisture are therefore drawn off by the latent heat in the dryer, accelerated by the high vacuum. In a properly constructed vacuum chamber, with the condenser and pump properly balanced, the application of well known physical laws absolutely prevents any over-heating if reasonable care be taken in its operation.

By reason of the absence of oxygen, oxidation cannot take place. The rubber not being overheated, nor impaired by oxida-

tion, has greater elasticity and tensile strength, enabling the manufacturer to obtain the greatest yield when being made into the final product.

As different grades of rubber must be subjected to varying temperatures, the temperature of the heating medium is easily regulated without overheating or materially affecting the time of drying, so that the vacuum process offers many advantages over the old method of drying rubber, whether it be fine Pará or Pontianak.

Owing to the drying period only taking a few hours, varying according to grade of rubber, the crude rubber can be washed, dried and pressed in a fraction of a day. Consequently, there is no deterioration between drying and using.

With an average establishment of today, with a consumption of two tons, if the old hot air method is used and six weeks consumed in drying the washed and sheeted rubber, there would be 72 tons of rubber hanging in the drying lofts, representing an idle investment of $144,000 on raw material, besides insurance, factory space, etc. The same quantity of rubber could be more thoroughly and permanently dried by one or two vacuum chambers in a day of ten hours, thus working up the requirements of each day's output, with an initial cost of installationn less than that of the old-fashioned drying rooms for the same quantity. Besides paying for itself the vacuum chamber gives an otherwise unattainable flexibility to the factory for its daily production. A vacuum drying chamber having a capacity of two tons of dry sheeted rubber every ten hours, occupies a space 8½ ft. high, 15 ft. wide x 9 ft. long, its auxiliaries, the condenser and pump, being conveniently located in any place in the factory near the dryer.

While not more than one-third of the heat units are utilized by any hot air system—by the vacuum process practically every heat unit is transmitted to and comes in direct contact with the material being dried. The apparatus itself is practically indestructible and only requires one operator. There is a considerable saving of fuel and the time of drying is shortened from weeks to hours, combined with higher efficiency. The condenser connected with the vacuum chamber (as well as the vacuum pump) should be of the proper capacity for condensing the vapors given out during drying; while the necessary heating surface must be balanced in order to transmit a certain temperature, and if the condenser is burdened with a much larger quantity of vapor than it is calculated to cool, the result is detrimental, both to the product and the working of the pump.

Basing his view on the foregoing and other facts quoted, the author submits the opinion that it is wrong to subject apparatus to work for which it is not intended, and attribute the unsatisfactory results to the principles of drying under vacuum, viz.: rapidly and thoroughly at a low temperature.

While the use of the vacuum drying process was first adopted by manufacturers to dry washed rubber, much thought has of recent years been given to the preparation of crude rubber on the plantation. This fact is especially noticeable in the quality of the rubber reaching the market from the Malaysian, Straits Settlements and Congo Plantations, where this process has been installed and found of great value. This is somewhat reflected in the moisture content of plantation rubber, which reaches the market with a low percentage of moisture, as compared with 15 per cent. or more in Upriver Pará. Planters will understand in the future that the price is based on actual rubber, and that they will serve their purpose by adopting the very latest method for the treatment of the raw material, so as to free it from impurities and let it contain a minimum percentage of moisture.

This improvement in quality of the raw material will not cause the discontinuance of the process of drying at the factory, but will restrict its use to the removal of the final percentage of moisture only, thus simplifying factory operation.

The results of scientific and research work in the laboratory have materially contributed to the advancement of the industry, and its further progress can and will be accomplished by a closer and more intimate relationship between the manufacturer or producer and the appliance manufacturer. The author asks in conclusion why users and makers of machinery should not recognize their mutual obligations to co-operate, so that a maximum productiveness by newer and better methods may be secured.

LITHOPONE AND OXIDE OF ZINC IN THE RUBBER INDUSTRY. (*Abstract.*)

By G. C. Stone and Gilbert Rigg.

THE zinc oxide of commerce is a white amorphous powder, the purity of which depends on the character of the ore from which it is produced. With the exception of those from Franklin Furnace, New Jersey, zinc ores contain considerable lead and usually cadmium. Their presence, when the object is to make a white product, is inadmissible, while their absence insures regularity in the composition of oxide of good color. For example, the oxide made by the New Jersey Zinc Co. contains upwards of 99 per cent. zinc oxide.

Zinc oxide is made by two processes, the direct or American, and the indirect or French. The first drives off the zinc from the ore by the action of carbon at a high temperature, the zinc vapor being burned direct to oxide. In the second, metallic zinc or spelter is first produced by smelting, this metal being then burned to oxide. The latter is the more costly and the products of the two differ in certain material points.

Purity is the first essential of a zinc oxide for rubber purposes, while uniformity of composition is likewise very desirable for arriving at a good result. The authors believe that users of oxide should confine their analytical work to testing for adulteration and suitability for a particular purpose by a practical laboratory compounding test, rather than spend much time and effort in attempting to determine the zinc contents of the oxide.

Commercial zinc oxide consists of extremely minute particles, forming more or less coherent aggregates resembling a slightly elastic sponge entangling considerable air.

It is necessary to distinguish clearly between the coherence of an oxide and the true specific gravity, these two properties being sometimes confounded under the term "density." The determination of the actual specific gravity requires considerable care, as the oxide tends to retain its entangled air, a good vacuum pump being used to insure that the air has been completely expelled.

While screening is often useful for breaking up aggregates, this method is, according to the view of the authors, useless for sizing oxide of zinc, owing to its extreme fineness. This can best be done in a bolting machine. Revolving screens without heaters tend to form balls, while shaking screens have a like tendency.

Oxide of zinc, the use of which is rapidly increasing, is one of the most important ingredients of manufactured rubber. It is remarkably constant in chemical composition and physical properties, and is also rarely adulterated.

LITHOPONE.

Lithopone is an amorphous white pigment obtained by mixing solutions of barium sulphide and zinc sulphate, which causes a transfer of the acids and produces an intimate mixture of zinc sulphide and barium sulphate. In properly made lithopone every particle of the barium sulphate appears coated with zinc sulphide; the opacity being much higher than that of a mixture of the dry salts in the same proportion. It is largely used in the manufacture of rubber goods, but in the opinion of the authors, oxide of zinc is preferable for giving strength and resilience in the product.

The authors add that a good sample of lithopone should contain not less than 28 per cent. of zinc sulphide. It should be a good white, be smooth and free from coarse particles and have good binding power.

A NEW RULE OF VULCANIZATION. (*Abstract.*)

By A. O. Bourn, Providence, R. I.

THE rate at which the combination of rubber and sulphur increases or decreases with each increase or decrease of temperature, is a point naturally calling for investigation, a knowledge of which would be of great value to manufacturers, and would seem to be the foundation of a careful study of the subject of vulcanization.

To ascertain this ratio of increase or decrease, a large number of experiments were made previous to 1903, with the same compound and samples uniform in thickness in most well known processes of vulcanizing.

The experiments referred to were first made with a compound of 12 pounds dry fine Pará rubber, 6 pounds litharge, 6 pounds whiting and 6 ounces of sulphur, giving a proportion of about 3 per cent. of the latter. When these samples were submitted to the ordinary dry heat air process, physical vulcanizing effects were obtained approximately as follows:

15 seconds	at 337° F.	13 minutes	at 260° F.
23 "	" 326° "	26½ "	" 249° "
35 "	" 315° "	53 "	" 238° "
1 minute	" 304° "	105 "	" 227° "
2 "	" 293° "	210 "	" 216° "
3½ "	" 282° "	420 "	" 205° "
7 "	" 271° "	840 "	" 194° "

These results seem to establish the rule *that for each increase in temperature of about* 11° *F. during the vulcanizing operation, the velocity of vulcanization is doubled, and that with each decrease in temperature of about* 11° *F. the time required for vulcanization is doubled.*

Above 304° the rate of increase is different, there being a marked change in the physical constitution of sulphur; while below 194° the *air process* does not produce good results in vulcanization. In other processes down to 161°, there was no difficulty in effecting vulcanization.

The temperature above 304° showed following results: 325° F, 26 seconds; 350° F, 13 seconds; 375° F, 6 seconds; 400° F, 3 seconds. These and other experiments led to the view that a properly compounded rubber not only vulcanizes at all temperatures, but that vulcanization commences immediately upon the compounding.

In 1904, experiments were made with a view of testing the truth of the proposition that vulcanization proceeds at all temperatures. Accordingly samples of Pará rubber compounded with from five to seven per cent. of sulphur and fifty per cent. of litharge, were subjected to treatment at temperatures varying from 161° F. to 194° F. in a bath of metal, which fuses at about 150° F. The results confirmed the general rule obtained in the preceding experiments, with the exception that the time required for doubling the velocity of combination was somewhat greater for an increase of 11° F. in the temperature.

The results of embedding samples of the same compound in a ball of metal, and others in a jar of flowers of sulphur, showed that in seven months the former were thoroughly vulcanized, while in four months the latter were not fully so, but on being exposed to the air became strong and elastic. Samples of both are still available in a state of perfect preservation. The samples had been placed in a room with the average temperature of 110° to 115° F.

In February, 1912, another series of experiments was commenced on a line with those of 1904. Similar samples of a similar rubber compound and samples of four different grades of rubber shoe compounds, were placed in a ball of fusible metal, in a well-corked jar of sulphur, and in two tight jars; one containing a mixture of one part by weight of sulphur with five parts of litharge, and the other containing a mixture of equal parts by weight of sulphur, litharge and "Green Seal" French zinc. Samples of pure, fine Pará rubber, free from compounds or mastication, were placed in each jar.

Of the samples enclosed in fusible metal only one compound was properly vulcanized. All the others were vulcanized very perceptibly less than those embedded in sulphur, sulphur and litharge, or in sulphur, litharge and zinc. The action of litharge and sulphur, as compared with the action of sulphur alone, was very marked; the vulcanization of all the samples being carried much further than in the case of either of the other experiments.

An important deduction to be made from the new law of vulcanization and the experiments made in accordance with it, is, that the melting of sulphur has not the slightest effect in changing the rate of vulcanization. Whatever may be the time required to vulcanize a rubber compound at 227° F. it will vulcanize in one-half that time at 238° F, and in one-quarter the time at 249° F.

Moreover, vulcanization of rubber properly compounded proceeds at all temperatures, whether high or low. At high temperatures, the compound may be vulcanized in one second or less, and at low temperatures the vulcanization may proceed so slowly as to escape attention. Samples of these experiments can be examined at the Bourn factory laboratory, at Providence, by any one wishing to do so.

A BRIEF HISTORY OF FIRE HOSE SPECIFICATIONS IN THE UNITED STATES. (*Abstract.*)

By E. A. Barrier, of the Factory Mutual Laboratories.

AMONG the more important events which led to the development of the present Underwriters' Specifications for hose was the fact that previous to 1890 it was a matter of common occurrence for length after length to burst at pressures well under 100 pounds.

Steps in the direction of the needed improvement were first undertaken by Mr. John R. Freeman, then connected with the Inspection Department of the Factory Mutual Fire Insurance Companies, and now one of the foremost hydraulic engineers in the country, as well as president of several of the individual mutual companies. In experiments conducted in 1888, Mr. Freeman had found that with poor hose a pressure of 95 pounds would be required at the hydrant to produce a good fire stream, while the pressure needed with good hose would be about 73 pounds; 200 feet of hose being used in a line.

After a large number of tests and conferences the first set of Underwriters' Hose Specifications was published in July, 1896.

The clause requiring 40 per cent. of pure Pará gave rise to more discussion than any other in these specifications, but at the time and for several years after "Pure Pará" was understood to mean "Fine Pará." The whole idea was to obtain a list of manufacturers whose product could be recommended to mills insured in the Factory Mutual Companies. Any manufacturer desirous of being upon the approved list could send in samples for testing, and if they were found to conform with the specifications, his name was placed on the list without charge.

No changes were made until 1900, and they were then of no great importance. Meanwhile the National Fire Protection Association had been founded and the Underwriters' Laboratories established. In 1899, the National Fire Protection Association had adopted a set of specifications for hose, which were sufficiently different from the Factory Mutual Specifications of 1896 to cause some confusion among manufacturers. Seeing the de-

sirability of uniform specifications, a "National Standard" was adopted in May, 1902, in which only two important changes were made from the old specifications. One item, regarding the stretch of the rubber lining to five times its original length (which had appeared in the N. F. P. A. specifications) was omitted, and another item requiring a test of 200 pounds on each 50 ft. length, not originally in the Mutual specifications, was added. Since that time, the specifications of both organizations have been essentially the same, although their ideas regarding method of enforcement have differed widely.

The years up to 1911 were occupied with continual tests, during the progress of which, the paper states, evidence was accumulated that most manufacturers of hose were not turning out a product made in accordance with the specifications. The number and character of the analyses and tests gradually changed.

In 1906 the system of "Label Service" was developed by the Underwriters' Laboratories of Chicago, according to which an inspector would be stationed at the factory, and inspect every length of hose sent out; a label stating that the hose had been manufactured under the supervision of the laboratory, to which samples could at any time be sent for more detailed tests. Owing to several objectionable features which it was found impossible to have removed, in spite of a number of conferences, the "Label Service" has never been adopted by the Mutual companies.

Owing to the opposition of manufacturers, and their objections to using the labels, all those on the "Approved List" of the Chicago laboratories were dropped during 1909 and 1910. In the early part of 1911, however, two of them submitted samples to the Underwriters' Laboratories, which were approved, and adopted the "Label Service." Later in the year another manufacturer followed. At the present time, it is added, these three are the only ones using the labels. According to the system as developed, the rubber from the beginning of the manufacturing operations, until the hose is completed, is either in the inspector's presence, or under lock; the key being in his possession.

After a long series of conferences between the National Fire Protection Association and the manufacturers, a set of specifications was drawn up, which at the time was mutually satisfactory, and allowed a much lower grade of rubber than the present specifications. Owing to a misunderstanding as to their application these specifications were subsequently cancelled, when a much more stringent set was proposed at the annual meeting of the National Fire Protection Association in May, 1911 and formally adopted in May, 1912.

Meanwhile, the accumulated experience of the Factory Mutual Laboratories during the last five years, has shown, it is remarked, that much more stringent and definite requirements regarding rubber lining would have to be included in the specifications. A new set was drawn up in the fall of 1910, at the same time that the more definite specifications, already mentioned, were being prepared by the Underwriters' Laboratories for the annual meeting of the National Fire Protection Association of May, 1911. Owing to there being some differences between the two, a specification was finally drawn up satisfactory to both associations. This was formally adopted by the Factory Mutual Companies in December, 1911, and by the National Fire Protection Association in May, 1912.

Owing to various delays the Mutual companies have not yet put these new specifications into effect, but in the near future the manufacturers of Underwriters' hose will be notified that after a certain date, hose must be made in accordance with the new specifications; with which some manufacturers have voluntarily expressed their hearty concurrence.

The most important change made by the new specifications is a definite call for 40 per cent. "Fine Pará" instead of "Pure Pará." Tests are specified which the compound must meet, including acetone extract, free and total sulphurs, alcoholic potash extract, tensile strength, elongation and the so-called "permanent set."

Including this description of the work of the Factory Mutual Companies, which has apparently led to a settlement of the questions at issue, it is remarked that their only object is to make it possible for their members to obtain good hose. The work of testing and inspection is done without charge to the manufacturers and it has always been the intention to treat them fairly and to co-operate with them as far as they would allow.

NOTES ON TENSION TESTS OF RUBBER.

(Abstract.)

By P. L. Wormley, U. S. Bureau of Standards.

THAT the time is now ripe for co-operation between manufacturers and consumers, with a view to uniformity in tests and specifications for goods intended for the same purpose, is shown by the wonderful development of the rubber industry. In the same way uniformity of method is likewise essential for comparing the work of different laboratories; the standardization of specifications and testing methods being of substantial benefit to manufacturers, consumers and the public at large.

In each case, the refinement of the methods used should be determined by the nature of the material tested. In this respect rubber constitutes a most interesting field, uniformity in methods being more desirable than extreme accuracy in measurements; while the adoption of uniform testing methods would serve to prevent misunderstandings between manufacturers and consumers, arising from specifications being indefinite.

Opinions differ as to the relative merits of ring and straight test-pieces, the former involving several lengthy operations for their preparations, while the latter are instantly cut out by a single stroke of the die. The ring lends itself to the automatic measurement of elongation, having advantages over straight specimens. When, however, the strength of the rubber varies the ring gives a smaller ultimate elongation than a straight testing-piece. This difference is not always found, but the author's tests on twenty different compounds show a general tendency towards higher values for straight specimens.

With a view to the encouragement of the testing of rubber goods, the Bureau of Standards has constructed machines combining the greatest simplicity with a reasonable degree of accuracy. For determining tensile strength and elongation, they use an ordinary twin spring dynamometer, attached to the upper end of a metal column, a device being used for preventing recoil by holding the springs under the maximum tension. Two years of continuous service have proved the accuracy of these dynamometers.

As already mentioned, the measurement of elongation at rupture is less simple in the case of a straight test piece than with a ring, but a little practice obviates this difficulty.

Owing to the author's experience of the time consumed in testing the recovery after extension, he constructed an apparatus for testing six specimens at once.

Of the tensile machines seen in operation by the author, or studied from illustrations, some appear better adapted to experimental or research work than to routine testing, this being partly due to their delicate or expensive construction, and their slower operation.

It would be difficult to obtain by autographic means tension or hysteresis curves for straight test pieces, but another slow, yet otherwise satisfactory method exists of securing curves, that is, by means of a narrow flexible scale of paper or tracing cloth, attached to the test piece by a small spring wire clip. From this scale, one operator reads the elongation at convenient intervals. With a little practice this process becomes exceedingly simple, the curves given clearly showing the characteristics of different rubbers.

The tension test, which is the most widely applicable for soft rubber products, is used to determine strength, ultimate elongation, and elasticity or recovery. The results of tests are influenced by:

1. Shape and size of test pieces.
2. Method of preparing and measuring same.
3. Design of grip.
4. Direction in which test pieces cut (in straight specimens).
5. Temperature.
6. Previous stretching.
7. Time allowed after extension and release before measuring set.
8. Speed at which rubber is stretched.

Other important considerations affecting test pieces are: Preparation and measurement; design of grip; direction of cutting; temperature; influence of previous stretching on strength and elongation; increase of ultimate elongation and strength.

An objection to the practice of attempting measuring and remarking specimens immediately after release, is the influence thus exercised on the second set by the few seconds interval which necessarily takes place.

The author's aim has been to deal with uniform methods of testing, no attempt having been made to treat the general subject of physical testing in an exhaustive manner.

TESTING OF AIR BRAKE HOSE AND ACTUAL SERVICE. (*Abstract.*)

By G. E. Bishop.

THE above subject is treated by the author in two sections—air brake hose and steam heat hose. In the former two sizes are considered—1⅛ in. x 22 in. and 1⅜ in. x 22 in. The first of these is for use in passenger service and the second on freight cars only, the hose being specified to stand a bursting pressure of 500 pounds per square inch for 10 minutes. At 200 pounds pressure it must not expand in diameter more than one-quarter inch, or change more than one-quarter inch in length. It has also to stand a friction test of such a nature that with a weight of 25 pounds suspended from the end, the separation would be uniform and regular; the average speed not exceeding 6 inches in ten minutes; as well as a stretch test, between marks two inches long on a piece half an inch wide. This is quickly stretched until the marks are 10 inches apart and released; then re-marked as at first and again stretched to 10 inches; remaining ten minutes without breaking. After release the distance between the marks must not show a permanent set of more than one-quarter inch.

Several interesting tables are appended to the paper, showing in the first place the performance of 1⅛ in. air hose during the year from November, 1911, to November, 1912. The table includes the number of hose removed for all causes, classified under the general causes for removal and the life of the hose. The total number of hose purchased of each of the eight makes used during a period of three years is also shown as an indication of the proportion of the different makes of hose in service. This point is illustrated by the numbers of each make inspected and rejected.

A large portion of the hose was removed on account of being damaged in service; this being largely attributed to the automatic connector, which increased the chafing and cutting of the hose. The results given by the eight makes are criticized in detail.

Another table deals with similar particulars as to the 1⅜ in. air hose, the two tables constituting a detailed history of the performances of the two sizes of air-hose during the twelve months ending November, 1912.

In the second part of the subject, steam heat hose 1⅜ in. x 24 in. is dealt with, used on passenger cars, locomotives and tenders, with an automatic connector, as referred to under the discussion of air hose. The tests include the elongation and ultimate tensile strength of a piece of the inner tube. A friction test provides for the pull at which the duck will start to unwind, while the sample is likewise subjected to saturated steam at a pressure of 45 pounds per square inch for a period of forty-eight hours. After cooling, the tests are repeated, when the stretch test must not show a deterioration of more than 30 per cent. and the tensile friction not more than 20 per cent. Inspection of the hose after removal from the digester must not disclose swelling, blisters or loosening of inner tube.

A performance table records the results on the same principle as those shown for air hose.

In conclusion, the fact is referred to that purchasing under proper specifications has decreased consumption of hose per car per year from 4.3 pieces to 2.5 pieces.

It is thought that better steam hose can be procured by increasing the friction and stretch test. A specification is now being tried with the requirements, after the digester test, increased to what they were before that test.

RAILROAD AIR BRAKE HOSE. (*Abstract.*)

By J. S. Sheafe.

WHILE the requirements prescribed by the Master Car Builders' Association are intended to insure uniformity of standard in railroad equipment, the air brake hose now being manufactured does not comply with those requirements in other than the physical tests.

The M. C. B. specifications prohibit the use of rubber substitutes. Neither pure rubber nor a fair grade of rubber can be used at the price paid.

Air brake hose to-day are poorer than formerly, for which both the railroads and manufacturers may be blamed; the former for continually hammering down the price asked for an honest article, and the latter for consenting to attempt the manufacture of an article at a price below that which they know can be fairly met. The quality of air hose must be improved by the co-operation of manufacturer and consumers.

Air hose is sold as low as 30 cents a foot and as high as 50 cents, there being thus a difference of 66 per cent. How much can be expected of a quality costing the minimum? The cost of replacing poor hose would make up for the extra price of a good quality.

The largest number of failures has resulted from outside injury, not attributable to inherent weakness of the hose.

There can be no doubt of the deterioration of the average air hose within six months of manufacture. The making of hose to wear well, is the most important part of the manufacturers' problem. Rubber manufacturers could make a lasting hose by compounding a tube and cover with just as much or little flexibility as would be necessary for long life. If the manufacturers will produce a hose with an inner tube and cover able to withstand the action of time and weather for 36 months at a commensurate price, the whole situation will be greatly improved.

CONTRACTS. (*Abstract.*)

By Arthur W. Stedman.

COMMON law presupposes that, in making a contract, both parties have agreed upon the same thing. A contract should be so drawn as to be enforcible by law, and should embody a consideration, whether in the form of some actual object or service, or under the guise of "one dollar and other good and valuable consideration."

The chief points to be defined are: First, an agreement as to what is being purchased; second, an expressed or understood standard of quality, and third, delivery at a certain time and

place. The point at which the seller's responsibility ends and that of the buyer commences, should also be defined, as well as the mode of settlement.

Since all contracts are not carried out, it is a wise precaution to stipulate the course to be pursued, in the event of violation by one or other of the parties.

Rubber purchases include two forms: "spot" and import transactions. In the former the chief risk is a difference between the samples and the bulk of actual rubber, at New York, London, Liverpool, Antwerp or other central points. Forward rubber contracts, on the other hand, are based on standard classifications, in accordance with which the importers agree to make certain deliveries, in New York or at the mills. Such business whether for early or deferred delivery needs the safeguard of a contract, protecting alike buyer and seller.

The principal features of the Standard Rubber Contracts for forward orders, adopted by Liverpool and London, include detailed provisions as to the three points of Tendering, Inspection and Arbitration. In addition to these, the question of the shrinkage is a serious one for manufacturers. It has a parallel in the case of wool, where in some cases the importers guarantee a maximum rate of loss. The silk trade affords an instance of the moisture being adjusted. The importance of this question to the rubber industry is indicated by the quicker time in which rubber now reaches New York, and the larger percentage of moisture it now contains, than was formerly the case.

Attention has been paid in Europe to the question of standard grades of plantation rubber, to which planters would conform. Forward orders extending over 1913 have largely been for well-known grades of plantation rubber; the more general adoption of this system having been suggested. The Silk Association of America, among others, has given attention to the question of forward contracts.

The chief points to be covered in arrangements regarding standard rubber contracts would be as follows:

1. The seller draws up, signs and sends a contract to the buyer, stating conditions of sale. Formerly, silence on the part of the buyer was taken to mean acceptance of the contract, but it was found that misunderstanding resulted, and now it is the uniform custom for the seller to send to the buyer two signed contracts, one of which he keeps and one of which he returns with his acceptance written thereon.

2. Any objection to the terms expressed in this contract must be made immediately upon receipt, and any changes must be in writing, signed by both parties.

3. Provisions should be made for delays in transportation. If the rubber is shipped by a steamer due to arrive at port of destination within the contract period, buyer must accept delayed delivery upon receipt of proof of sailing and cause for delay.

4. If any part of the rubber is lost at sea, contract to be voided for that portion.

5. The rubber becomes the purchaser's property as soon as it leaves the seller's hands, the buyer paying the freight and cartage.

6. Seller's responsibility for goods in transit ceases when they pass into the hands of the transporting company. Stealage or other loss while en route is at the buyer's risk.

7. If shipment is questioned as to quality, and if bought by sample, this is compared, and in case of dispute (to be decided by arbitration), the losing party to pay the costs of arbitration.

8. The buyer is not allowed to select the good and reject the bad from any lot; he must take all or none.

9. If the seller fails to make delivery on or before the last week-day of the month specified, and no proof is offered that the delay was from causes beyond seller's legal control, the buyer can enter the open market and purchase, charging any loss to the seller.

The fair-minded seller means to deliver what he has bargained to supply, and the honest buyer means to accept and pay for what he agrees upon. It only remains therefore, to find and agree upon fair and equitable terms and conditions which will prevail and become known the world over, as the usual basis upon which rubber is bought and sold.

FARMING BY DYNAMITE. (*Abstract.*)

By Harold Hamel Smith, Editor of "Tropical Life."

WHILE the author had long suspected the possibilities of explosives in connection with agriculture, it is only within the last year that he has been able to demonstrate how very useful dynamite (and the other "ites") can prove for that purpose, when used with discretion, by natives or Europeans. Any race, sufficiently intelligent to tap rubber trees, could, in his opinion, be trained to handle these explosives, under the same class of white direction as with rubber tapping.

For twenty or thirty years past, farmers in the western states of America have regularly blasted their ground, and thereby obtained bumper crops, while leading journals have opened their columns to a discussion of the matter.

Dynamite, or another explosive if more suitable, can be advantageously used in agricultural industries for the following purposes:

1. To break up hard or virgin soil, particularly the under crust, which no ordinary plough could penetrate.

2. To blast out boulders, rocks and tree stumps, leaving the ground in a state to be easily and properly ploughed.

3. To clean the soil of pests, and destroy ants' nests or rabbit warrens, and to regenerate and aerate hard or worn out soils generally, such as West Indian soil which is not ploughed, but only hoed; the hard-pan sub-soil being left till it becomes waterlogged and dangerous.

4. For throwing up soil for drains, especially deep gullies, to be removed by hand plough.

5. For making holes for tree planting, and loosening the soil for fence post holes.

6. For well-boring, or well torpedoing, the latter being for the purpose of increasing the flow from an artesian well.

Doubtless other uses will be found for explosives in connection with estates, the author referring to their use for removing masses of rock or soil for making estate roads. The latter, it is added, is too big and dangerous a work for the average planter, and should not be carried out without consulting an expert. The use of explosives in connection with mining is referred to as a separate branch of the subject.

While explosives advantageously supplement ploughing, they do not obviate the necessity of the latter. As the "Queensland Agricultural Journal" remarks, the plough must be used just as ever; the only difference being that dynamite expends its disintegrating force in the sub-soil, which is never touched by the plough, so that one is not merely planting the crops in the same soil year after year. By the use of dynamite the crops are enabled to draw up their nutriment from below, the clay strata being broken up and the accumulated and stagnant water being allowed to pass through. At the same time myriads of harmful lives are destroyed.

Another point of importance is the need of a regular adequate supply of water at all times, if good crops are looked for, in order to enable the plant food to nourish the trees or plants. This point is one of the advantages of farming by dynamite. This last named principle, as the "World's Work," of London, lately wrote, "has gripped the United States and is speeding through Canada like a prairie fire."

The Queensland "Agricultural Journal" has recently published various practical details as to the system. The "Times of Ceylon" has also dealt with the matter, with special reference to the trial of the plan by a Kelani Valley rubber planter. The editor of "Grenier's Rubber News," of Kuala Lumpur, lately wrote that the consensus of opinion, at least among planters of the Federated Malay States, is that clean clearing, which means the removal of

all stumps of timber, is of paramount importance, for the expeditious and economical accomplishment of which work there is in dynamite an adequate material. According to the "Home and Colonial Mail" experiments are becoming quite popular in South Africa of ploughing by dynamite.

All the leading papers in the rubber producing world, as well as those devoted to planting interests elsewhere, recommend attention to the use of dynamite for estate work. Its employment especially appeals to the author, in connection with Latin America where the transport of even the lightest make of ploughs is difficult, costly and often impossible. In fighting locusts and various other pests, organized explosions tend to their reduction at all stages, whether in the soil or as grubs flying over it.

The author quotes a letter to the "Times of Ceylon" from Kalkudah in the Eastern Province of the island, referring to the advantages of using dynamite for breaking through the slabs of coral which run from the coast to one and a half miles inland. This coral runs from 2 to 9 feet below the surface, and measures in some places from 18 to 24 inches in thickness.

In conclusion the author remarks that there is no doubt explosives have not only come to stay as a necessary auxiliary to modern agricultural science, but that their use will extend on all sides until they occupy a prominent position in rubber planting and other branches.

POSSIBLE RUBBER PRODUCERS IN THE TEMPERATE ZONE. (*Abstract.*)

By Charles P. Fox.

WHILE the production of rubber in the temperate zone has been regarded as possible, its probabilities are remote and dependent on many conditions. Some of these are: Demand; cost of production; grade of product; influence of supplies of natural and plantation rubber; and the ever recurring spectre of synthetic rubber.

From his investigations extending over fifteen years, the author has found several rubber producing plants suitable for the various sections of the temperate zone. Among foreign plants were *Atractylis and Eucommia*, the most interesting specimen being the *Eucommia ulmoides*, or "Chinese Rubber Tree," said to be hardy in New England. This source of rubber was found only suitable for ornamental forestry. Of native plants, those of possible value as rubber producers are members of the *Asclepiadaceae, Apocynaceae* and *Compositae* families.

Of the true milkweeds, only one is of any importance, *Asclepias Cornuti*, which is very abundant and contains a quantity of milky juice producing 3 per cent. of fair grade rubber. The cost of collecting the latex is, however, prohibitory. The common Indian hemp, *Apocynum Cannabium* is less abundant than milkweed and produces less latex, but the quality of the rubber is better. The third native group named, that of the *Compositae*, include *Souchus* or Sow-thistle, producing an excellent grade of rubber, which is the subject of a German patent of 1885. It grows on a dry barren soil.

Two species of wild lettuce, *Lactuca Canadensis* and *Lactuca virosa*, both produce a thick latex containing rubber. Another promising plant of the arid region is "Strockle's Rubber Bush," a robust member of the *Compositae* family.

As to the arid section of the Temperate Zone, it is amply provided with guayule (*Parthenium Argentatum*) pingue, greasewood and *Candelillia*. It is stated that since the first of these can be successfully grown in Mexico, it should thrive equally well in the Southwest of the United States. Pingue (*Actinella Richardsonii*), with less rubber than guayule, has superior advantages in other respects.

Nevada greasewood contains rubber, as shown by Ellis and Warner's patents of 1902. A large amount of this plant is reported to be available.

In North Mexico and the Big Bend country of Texas there is an immense growth of *Candelillia*, producing rubber and wax, the latter being used in making hard rubber.

Some 15 years ago rubber growing was attempted with *Ficus elastica* in Key West, Florida, but proved a failure, the conditions being too dry and the soil shallow.

The same tree has grown to a large size in the deep, fertile and moist soil near Miami. Rubber as good as the Mexican "Amate" rubber has been grown on a small scale at Palm Beach, Florida, with its large available area of soil suitable in character, seems to offer specially good prospects for rubber cultivation.

While the other plants named are of interest from a botanical point of view, the author considers that only two, guayule and pingue, contain enough rubber to insure profitable working. It is for experimental stations to continue the work of developing the others.

THE PLASTOMETER, A RUBBER TESTING INSTRUMENT (*Abstract*).

By B. Denver Coppage (Wilmington, Del.)

THIS instrument, designed for the use of its manufacturers, the Pussy and Jones Co. of Wilmington, Delaware, is intended to define the plasticity or density of the rubber covered rolls used in paper manufacture. These rolls have to be selected suitable to the paper to be made.

Since the adoption of this instrument there is no uncertainty as to the conformity in plasticity of the rolls with the samples chosen. Plasticity also indirectly indicates elasticity, softness and hardness, density, resilience, etc.

In the plastometer a weight is supported upon a sphere, the penetration of which into the material at the expiration of one minute can be determined. For instance, most grades of commercial rubber may be tested with a hardened steel ball ¼ inch in diameter and a weight of one kilogram. The penetration or indentation of such a ball is indicated to 1/100 of a millimeter. The softer materials would require a larger ball or less weights, or both. The harder materials would require a smaller ball or more weight, or both. Certain very hard materials would possibly require a longer application of the weight than one minute, while certain very soft materials would require less than a minute to obtain satisfactory indications.

The possibility is discussed of utilizing the plastometer for establishing a standard scale of qualities for rubber and for the determination of raw rubber values. The plastometer is used by many leading rubber manufacturers in this country, and by users of paper making machinery at home and abroad. It has so far been developed by a buyer of rubber, while its further development for the benefit of that trade will undoubtedly depend upon the engineers and chemists directly connected therewith.

THE VARIOUS MANIHOTS PRODUCING RUBBER IN THE CENTRAL STATES OF BRAZIL (*Abstract*).

By Dr. J. Santiago Cardwell-Quinn.

DR. CARDWELL-QUINN has contributed an interesting and exhaustive treatise on this subject, but he was not able to submit it in time to be read at the conference; and in fact it was not received by the secretary of the conference until a few days ago, and too late to make it possible to present an adequate abstract of it at this time. It will be reproduced in full in a later issue, and will prove a valuable contribution of the literature of the *Manihots*.

Gutta Percha in Kaiser Wilhelm Land.

NEW GUINEA, the vast island immediately to the north of Australia, is like ancient Gaul, divided into three parts. The western part belongs to Holland, the southern portion to England, and the northeast to Germany (Kaiser Wilhelm Land).

Special attention was directed to the latter by the expedition in 1907-9, organized by the "Kolonial Wirthschaftliches Komitee" (Colonial Economic Committee), the report of which has appeared, after having been for a long time in preparation. It has been compiled by Dr. R. Schlechter, the botanist, who was in charge of the expedition.

The following were the objects of the expedition:

1. Determination of the quantities of gutta percha and rubber worth gathering.
2. Gathering of these crude materials.
3. Instruction of natives as to their gathering.
4. Preparation for and development of gutta percha and rubber cultivation.

The necessary funds were provided by the German Colonial Company, the Colonial Administration, and by the German rubber manufacturing industry.

The expedition reached Kaiser Wilhelm Land on March 12, 1907. From that time until February, 1909, the party remained in the central part of Kaiser Wilhelm Land. They then passed several months in the Waria valley; later on visiting the west-

MAKING CHANNELS ON TRUNK OF A GUTTA PERCHA TREE WITH HOLLOW CHISEL.

ern part of the protectorate and leaving New Guinea late in the year. The results of the expedition are classified into the following heads: gutta percha, rubber, other useful plants; botanical and geographical points.

GUTTA PERCHA.

As far as positively known, there are in the Protectorate of New Guinea, two principal varieties of *Palaquium*, which produce a marketable gutta percha. The first of these, which may

COLLECTING GUTTA PERCHA MILK.

be designated red gutta percha, has been designated by Dr. Schlechter as *Palaquium Supfianum*. The second, as yet undescribed, differs from the first by the baldness of its leaves. This description it is proposed to call *Palaquium Warburgianum*.

Palaquium Supfianum is a tree which attains the height of 100 to 130 feet. The diameter of the trunk approaches 6 feet. The *Palaquium Warburgianum* is very similar to the first-named variety, but grows more quickly and has a greater diameter. Regarding the habitat of the *Palaquium Supfianum*, the expedition found it in almost every region visited, chiefly at an altitude from 300 to 2,500 feet above sea level. It apparently prefers hilly locations, but is also sometimes found in low situations. It favors well drained land, and seems to avoid all places where there is stagnant ground water.

TAPPING.

With a view to defining the best method of tapping, Dr. Schlechter made trials of all the known methods. These were made of horizontal cuts, oblique and vertical cuts, and long and short incisions of various lengths, partly upon trees standing in the forest and partly on those already felled. From these various trials it was seen that the quantity of gutta percha gathered did not pay for the amount of work involved. The extent of these trials led Dr. Schlechter to the conclusion that under the circumstances, the ring methods employed in the Dutch Indies, particularly Sumatra and Borneo, were the only profitable ones, much greater quantity of gutta percha being obtained than by any others.

As soon as a gutta percha tree is found which appears worth tapping, and before the tree is felled, it is estimated in what direction it will probably fall. The forest is partially cleared on the side in question, short trunks of trees being laid crosswise, in order to prevent the tree from falling directly on the ground. The short trunks placed crosswise allow of the more convenient use of the cups placed beneath for collecting the milk, and allow of the rings being brought around the whole

of the trunk, a larger quantity of milk being thus obtained. As soon as the tree has been felled, the rings are cut at distances of about 12 inches apart, around the whole of the trunk.

For the making of these grooved rings, a gutta percha knife

COAGULATING GUTTA PERCHA MILK BY BOILING.

was used by the expedition, such as was already in use by Malay tappers in Borneo and Sumatra. These knives had in general the form of a hollow chisel.

The grooves cut out had at the upper edge a width of about an inch, and were cut deep enough to reach the cambium layers. Otherwise a limited yield of milk would result.

GATHERING.

While some of the workers were engaged in making the rings on the trees, others were placing under each ring one or two receptacles into which the gutta percha dropped, so far as it had not begun to coagulate in the grooves. For convenience and economy, these receptacles were made on the spot from palm leaves, or other leaves of leathery texture. As soon as the milk ceased to fall, which usually took place in 15 to 20 minutes, the contents of the receptacles were emptied into large vessels, to be boiled, coagulated and pressed into gutta percha. When water was available it was found desirable to add some to the milk, as the latter was thereby to some extent washed,

KNEADING AND PRESSING GUTTA PERCHA CAKES.

and the particles of resin could thus be removed in the watery residue. The milk coagulated in boiling in about ten minutes.

COAGULATION.

After trying various methods of coagulation, Dr. Schlechter was obliged to revert to the plan of boiling already in general use in Borneo and Sumatra, as being the only system adapted for forest purposes.

TIME OF TAPPING.

The time of tapping was investigated on various occasions. Trees tapped on the day of felling did not show any noticeable difference as compared with those tapped immediately after being cut down. Even after three days the milk flowed well, but it had begun to thicken and coagulation had evidently commenced. A week after felling, the yield was very small, as the bulk of the milk had coagulated. Trees tapped in the morning gave better results than those tapped in the afternoon.

The observation of a number of trees extending over several months, indicated that after heavy rainfall, gutta percha milk flowed much more thinly than after the lapse of several warm days without rain.

AGES OF GUTTA PERCHA TREES.

Owing to the fact that trees exposed to light and air often form more than one ring a year, while those in dark locations form less than that average, Dr. Schlechter remarks that rings do not indicate with certainty the age of gutta percha trees. He adds that it is unadvisable to tap young trees. He has usu-

RUBBER READY FOR SHIPMENT (ABOUT 4 LBS. DAY'S WORK FOR 6 NATIVES).

ally tapped only such trees as have at a height of 40 inches a diameter of at least 12 inches. In many cases, however, the yield was small.

PROGRESS OF GUTTA PERCHA GATHERING.

The gathering of New Guinea gutta percha has been considerably developed, owing to the energy of the German government, and is being carried on by natives, under the guidance of Malay experts, brought for that purpose from Sumatra. Being forced to earn so as to pay their "cottage tax," these natives have overcome their natural indolence. Gathering gutta percha being an occupation which brings them in money, they have every inducement to follow it. The government buys all the gutta percha the natives bring in at a price equaling about 11 cents per pound.

ADVISABILITY OF GOVERNMENT PLANTATIONS.

From the results of the expedition, Dr. Schlechter advises the German Colonial Government, following the example of England, Holland and France, to establish gutta percha plantations in New Guinea, the climate of which is more suitable for the purpose than that of the other German colonies. These plantations, when found to be profitable, might serve as a plant-

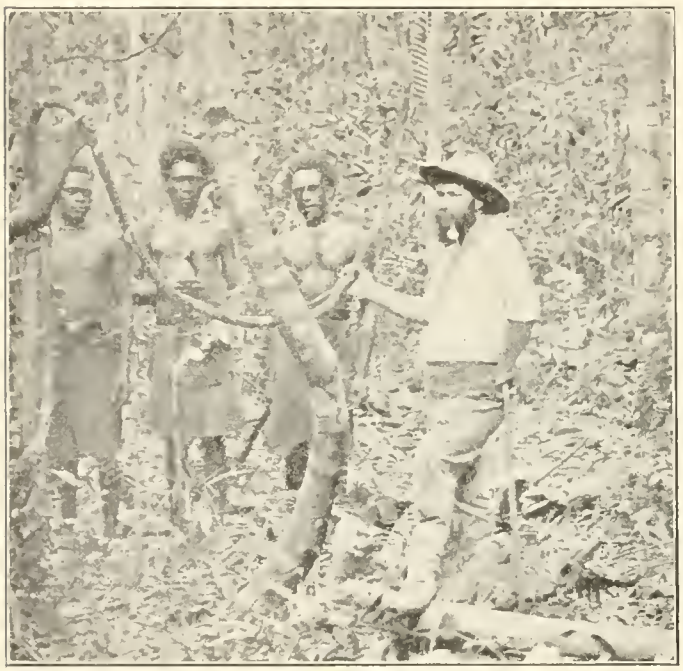
ing school for private undertakings, being thus in a position to always supply the requisite quantity of seeds at the right time.

STORAGE AND SHIPMENT.

On the coast there had been erected a special storage warehouse with a cemented basin large enough to hold about 4 tons of gutta percha. After being prepared in the forest, it was brought to the coast in bags by the first opportunity, being kept cool and shaded from the sun's rays. On reaching the coast it was stored in the above-mentioned basin and kept under water up to the time of shipment, the basin being boarded over in order to be kept in darkness. Ample ventilation was, however, provided.

NEW GUINEA'S RUBBER VINES.

Dr. Schlechter discovered six rubber vines, of which only four have been technically described, belonging to the *Apocynaceae*. The most important of these is the *Parameria Wariana*, of the Waria territory, which is very long and often as thick as a man's arm. It often climbs into the tops of the highest trees, from which it spreads over several others. The branches are very



PRIMEVAL FOREST ON THE UPPER MOROBE RIVER, IN WHICH THE *Parameria Wariana* VINE IS FOUND.

slim and have a large quantity of leaves. Besides these four *Apocynaceae* there are two *Ficus* vines in Kaiser Wilhelm Land: *Ficus Hypaphaca*, and *Ficus Supfiana*. In the annexed illustration is shown a forest on the upper Morobe river, in which the *Parameria Wariana* rubber vine is found.

The report is supplemented by some effective illustrations, a few of which are herewith reproduced, showing the various stages in the gathering and preparation of gutta percha in Kaiser Wilhelm Land.

RUBBER PROSPECTS IN PORTUGUESE EAST AFRICA.

THERE is every reason to believe that rubber will soon become an exceedingly important industry in Portuguese East Africa. The rubber forests are extensive, and the *Landolphia* vines from which the rubber is extracted are profuse. With organization and working capital there is no reason why the export of rubber should not jump within two years to over 500 tons annually. While the percentage of rubber to waste in the vines is small as compared, for instance, with the output of latex from a young Ceara tree, the abundance of the vine and its remarkable powers of recuperation are factors which more than make up for the low percentage of rubber to waste.

THE WORLD'S PRODUCTION AND CONSUMPTION OF RUBBER.

In July last, it will be recalled, Mr. Arthur Lampard, chairman of the Rubber Plantations Investment Trust, estimated the current year's production as about 91,000 tons and the consumption as about 103,000 tons. Closer data now available enabled him at the December meeting of the United Serdang Rubber Plantations to revise his estimates, which now stand respectively at 104,700 and 108,250 tons.

Details of the estimates are as follows:

PRODUCTION, 1912.	July Estimate. Tons.	December Estimate. Tons.
South America (East Coast)	39,000	40,700
South America (West Coast)	.....	2,000
Central America and Mexico	5,000	5,000
Africa	15,000	15,000
Assam, Rangoon and Borneo	2,500	2,500
Guayule and Jelutong rubber	.....	10,000
Plantation	28,500	28,500
All other sources	1,000	1,000
Total tons	91,000	104,700

CONSUMPTION, 1912.	July Estimate. Tons.	December Estimate. Tons.
America	47,500	48,000
Great Britain	15,000	17,250
Germany	15,000	16,000
France	10,000	10,000
Russia	7,000	7,000
Belgium	1,500	2,000
Other countries	7,000	8,000
Total tons	103,000	108,250

The increase in figure of production is in great part only apparent, chiefly arising from guayule, and jelutong rubber having been omitted in the July estimate. With that rectification the quantities would stand thus:

	July Estimate. Tons.	December Estimate. Tons.
Production	101,000	104,700
Consumption	103,000	108,250
Excess of consumption over production	2,000	3,550

Increased consumption is thus shown; the excess of consumption naturally finding its level in the position of the visible supply, which illustrates Mr. Lampard's figures. On November 1, 1911 it stood at 11,104 tons and on November 1, 1912, at 8,818 tons; the reduction having been 2,286 tons in the twelve months. By December 1 it had been further reduced to 7,832 tons, the falling off being 3,272 tons; this figure practically corresponding with the estimate of an excess of consumption in 1912 over production of 3,550 tons.

These figures bear out Mr. Lampard's contention, that consumption is going ahead quicker than production.

DIVIDENDS PAID BY THE HIGHLANDS AND LOWLANDS CO.

The Highlands and Lowlands Para Rubber Co., Ltd., whose plantation is in the Federated Malay States paid a dividend of 50 per cent. during 1910, and interim dividends of 22½ per cent.; with a final dividend of 15 per cent., making 37½ per cent. in 1911. It also paid two interim dividends in July and October of 1912—aggregating 15 per cent.

The Rubber Industry in Hawaii.

SEEING the favorable results of recent analyses of Hawaii rubber at New York, interest attaches to a special detailed report on the subject of the Hawaiian rubber industry, by Mr. E. V. Wilcox, Special Agent in Charge at the Hawaii Agricultural Experiment Station, Honolulu. The report covers the ground very thoroughly, dealing with cultivation, methods of tapping, the questions of rainfall and altitude, the most effective measures for combatting the ravages of pests and a comparison of *Hevea* and Ceará as desirable trees for the Hawaiian Islands. It begins with a description of the area now under cultivation.

AREA NOW UNDER CULTIVATION.

There are at present about 1,500 acres under rubber, and as further plantings are contemplated, there is a possibility of this

FOUR YEAR OLD CEARA TREES.

acreage being considerably enlarged. At the present there are in all about 1,200 acres planted in Ceara, and 300 in *Hevea*. Organized planting dates from the year 1905, though rubber trees as old as 20 years are to be found in the territory.

Five companies operate the principal part of the industry, with the following planted holdings:

	Established.	Capital.	Rubber acreage planted (approximately).
Nahiku Rubber Co.....	1905	$150,000	480
Hawaii American Co.....	1905	50,000	245
Koolan Rubber Co.....	1906	30,000	275
Nahiku Sugar Co.....	1906	.....	250
Pacific Development Co..	1907	80,000	250
Total	....	.....	1,500

The Pacific Development Co. contemplate ultimately increasing their planted acreage to 600 acres.

In addition to these large companies there are about a dozen small plantings, aggregating about 50 acres, so that the total area specifically devoted to rubber is about 1,550 acres

The rubber companies of Hawaii have so far been operating with local capital, and have been trying to demonstrate the rubber possibilities of the territory. At present there are too few trees of tapping age to allow of a definite statement of cost or profit. The results of the tappings at the experimental station, and of those made as trials by the managers of the different plantations, agree to such an extent, that as long as the market price is from 75c. to $1 per pound, satisfactory results may be anticipated from plantings of Ceara rubber in Hawaii.

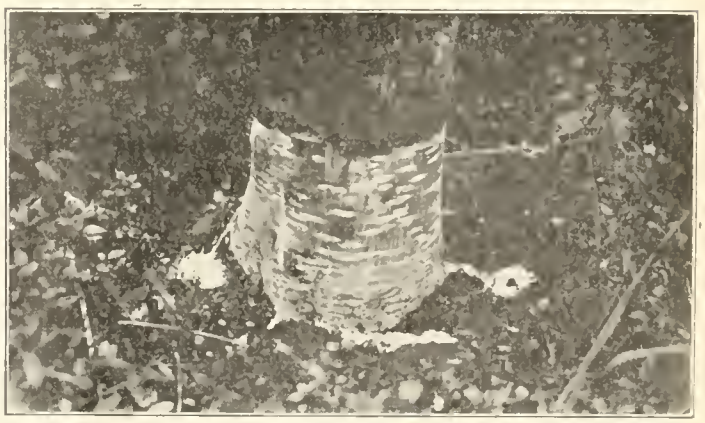
BENEFITS OF CULTIVATION.

It was at first thought that rubber trees would grow sufficiently well without cultivation, but it was soon found that the cost of cultivation was made up for by the more rapid growth of the trees. Cultivated trees at two or three years of age are, on an average, larger than uncultivated trees at five or six years of age. By the adoption of a suitable method of cultivation, at least two years could be cut off the period of waiting for trees to come to maturity. Cultivating the trees seems a necessity under Hawaiian conditions. The unusually rough nature of the land, and the tangle of shrubby undergrowth rendered horse cultivation out of the question, while the cost of hand-cultivation promised to be extremely high. Recourse was had to chemical spraying for destroying the weeds. Sulphate of iron was fairly satisfactory, but arsenite of soda gave much better results and has been generally applied. The cost of spraying is from $1.25 to $2 per acre. As soon as the woody growth is killed, the soil can be readily tilled; the tillage and the action of the sun bringing about the oxidation of the soil, thus greatly improving its physical and chemical properties.

TAPPING.

Tapping experiments were begun on trees at two years of age and have been continued. During the present season about 50,000 trees are being tapped, and from these a considerable amount of rubber will be extracted. Of the various methods used, the half herring-bone system is perhaps the most promising. On account of the Ceara dropping its leaves annually, it seems desirable in Hawaii to allow the trees complete rest from February to May.

Of the various receptacles for catching the latex, the ordinary Japanese tea cup has given the most satisfaction. The flow of latex is best from daylight to ten o'clock, the cost of tapping depending largely upon the experience of the worker. After a few weeks' experience, a man can readily tap twice as many trees as at first. The oldest trees experimented upon are about five years old. From such trees it is possible to obtain a pound of dry rubber for each 100 trees at a single tapping, and at present price of labor, a pound of rubber seems obtainable at a cost of 50 cents. This can probably be reduced as the men acquire greater experience.



TAPPING METHOD.

RAINFALL.

In the regions where rubber is chiefly grown in Hawaii (the Nahiku district of Maui and the Puna district of Hawaii), the rainfall is rather high (100 to 200 inches a year). Most of the land is exceedingly porous, particularly in Puna, where the

soil is underlaid with a peculiar broken lava. Thus even the heaviest falls do not produce running streams of water.

ALTITUDE.

The Hawaiian rubber plantations are situated from near sea level to the height of about 1,400 feet. Rubber plantations are mostly on the windward side of the islands, where the rainfall is much higher than on the leeward side. Ceara rubber appears to thrive well at the highest level at which it has been planted, but *Hevea* seems to be more susceptible to the lower temperatures of the higher altitudes.

INTERPLANTING.

On the Maunawili ranch, the cultivated area, of which is largely devoted to coffee, several thousand Ceara trees have been planted at regular intervals among the coffee.

PESTS.

No serious pests have been encountered in Hawaii. Seedlings are sometimes attacked by cut-worms, but these pests can be controlled by the use of poisoned bait or by sections of bamboo stems being placed around each young plant. The ravages of tree rats have been controlled, as a result of the thorough cleaning up accomplished by spraying. There is a tendency for a shot-hole fungus to become troublesome on *Hevea* leaves.

CEARA VS. *HEVEA*.

The first plantings of rubber were almost exclusively Ceara, this species having given satisfaction in Ceylon as to growth. With the increased planting of *Hevea* in the Orient, a livelier interest was manifested in Hawaii regarding that variety, and all the plantations put out experimental plantings of that kind. It was thought that its large yield would make up for its slowness of growth. *Hevea* has, however, grown so slowly that the tendency is at present again in favor of Ceara. In addition to the ordinary Ceara (*Manihot Glaziovii*) experimental plantings have been made of *M. Dichotoma* and other species of this genus.

CEARA RUBBER.

Rubber experts who have examined the samples submitted of Ceara rubber from young Hawaiian trees, have never made the value more than 10 cents below that of the finest plantation Pará from Ceylon. The fact that Ceara has come largely from wild trees and has been collected by careless methods, has placed it in a position below its real value, on account of the unfavorable impression created by its appearance. Practical tests show it is slightly inferior in tensile strength to the best plantation Pará, and that it is a little high in resin contents. These defects may be partially due to the Hawaiian trees being young, which would render them likely to contain more resin than should be found in the latex of older trees. Even prepared without special care, Ceara rubber keeps in good condition for two years or more, without losing its tensile strength or developing especially disagreeable odors.

For some time past it has been felt that a combination of all the rubber interests in the island of Maui would be a decided advantage, and a strenuous effort is being made to bring about such a combination. Three of the largest companies have combined to the extent of employing the same manager for the three concerns. Whether or not a combination is made, it is certain that there will be one factory, and that the Hawaiian rubber which comes on the market in the future, will be of uniform quality and standard. The methods thus far used in preparing the rubber do not involve the use of any chemical, either in tapping, coagulating or washing. It has been found possible, by observing care, and by washing in water and passing through simple rollers, to obtain a clear rubber of firm consistency and good light color.

The manager referred to as being in charge of three companies is Mr. Wilbur A. Anderson, general manager of the Nahiku Rubber Co., Limited; Hawaiian-American Rubber Co., Limited, and Koolan Rubber Co., Limited. He is also superintendent of the Rubber Sub-station, United States Experimental Station, Honolulu, and was commissioner to the recent exposition. To his courtesy THE INDIA RUBBER WORLD is indebted for Mr. Wilcox's report, the leading points of which have been reproduced above.

THE WAY IT IS COLLECTED FROM BASE OF TREE.

AFTER GOING THROUGH WASHING MACHINE.

READY FOR SHIPMENT TO NEW YORK.

The New York analysis of Ceara rubber grown in Hawaii, referred to above was as follows:

Loss in Washing and Drying.	Tensile Strength.	Stretch.	Resin.
1⅝%	1710	15¼"	3.98%
⅔%	1660	15"	4.00%
1%	1660	15"	2.12%

Messrs. Alexander & Baldwin, Limited, of 82 Wall street, are the New York agents of the three companies under the management of Mr. Anderson.

RUBBER VS. LUXURIES.

THE value of crude rubber imported into the United States during the year 1912 is estimated at $100,000,000—a very large sum, but only slightly in excess of the value of the importations of two classes of goods that are most distinctly luxuries. The Bureau of Commerce and Labor estimates that for the year just passed the importation of diamonds and other precious stones will equal between $40,000,000 and $50,000,000, while the value of the importation of laces and embroideries will equal the same amount; the two together will be close to $90,000,000, and possibly $100,000,000, showing that crude rubber, which has long since become one of the necessaries of life, holds a position of about equal importance, in American consumption, with earrings, brooches and millinery.

STATE OF PARA STATISTICS.

THE annual "Relatorio" submitted to the Governor of Pará by Dr. José Antonio Picanço Diniz, contains a large number of interesting statistical returns, embracing results for the world, for various countries, for the Valley of the Amazon and for the State of Pará.

In a table (reproduced as Table A) of the world's production for seventeen years, there is shown an increase of annual quantity from 34,277 tons in 1893 to 88,000 in 1911, or a gain of about 160 per cent. The rate of increase in Amazonian rubber was from 20,700 tons in the former year to 42,820 in the latter, being at the rate of about 110 per cent.

TABLE A. WORLD'S PRODUCTION OF RUBBER (IN TONS). (PARA GOVERNMENT ESTIMATE.)

YEAR.	Amazonia.	Africa, Central America and Malaysia.	India Plantation).	
1895	20,700	13,577	.....	34,277
1896	21,550	16,175	.....	37,725
1897	22,650	17,240	.....	39,890
1898	21,900	23,359	1	45,260
1899	25,100	24,686	4	49,790
1900	26,750	27,177	4	53,931
1901	30,300	21,547	5	51,852
1902	28,700	23,638	8	52,306
1903	31,100	24,827	21	55,948
1904	30,000	32,080	43	62,123
1905	33,900	35,428	179	69,507
1906	35,250	32,022	646	67,918
1907	37,300	30,171	1,175	68,646
1908	38,850	26,061	2,120	67,031
1909	39,150	26,522	3,700	69,372
1910	38,150	23,747	8,103	70,000
1911	42,820	32,980	12,200	88,000

Consumption is shown in another table to have increased in the aggregate in about the same proportion as production—from 33,952 tons in 1895 to 88,000 in 1911. The latter amount is shown separately for 1911 at 46,000 tons for Europe and 42,000 for America, compared with 16,908 tons and 17,044 tons, respectively, for 1895.

Special interest attaches to the analysis of the 42,820 tons shown as the production for 1911 of Amazonian rubber. This figure is dissected as follows:

TABLE B. PRODUCTION FOR CALENDAR YEAR 1911.

	Tons.
Federal Territory	10,580
State of Amazonas	10,420
State of Pará	10,300
Republic of Bolivia	2,950
Republic of Peru	2,490
State of Matto Grosso	2,100
Republic of Venezuela	50
Republic of Colombia	30
*States of Ceara Bahia Maranhao	3,900
Total	42,820

*Also including Maniçoba, Mangabeira and Soria.

Another table dealing with the year ending June 30, 1912, gives a dissection of the total shipments from different ports to the various destinations. Summarized, it shows following results:

TABLE C. EXPORTS FOR YEAR ENDING JUNE 30.

Shipments from—	1910-11. Tons.	1911-12. Tons.	Shipped to—	1910-11. Tons.	1911-12. Tons.
Pará	14,972	21,577	New York	13,596	20,613
Manaos	16,142	16,664	Liverpool	16,522	15,529
Iquitos	2,372	2,498	Hamburg	777	690
Itaquatiara	108	166	Havre	2,615	3,914
			Antwerp	84	155
Total	33,594	40,905	Vigo	.....	4
			Total	33,594	40,905

This last table, dissecting the shipments to June 30 last, shows that America took 20,613 tons of Amazonian rubber, as compared with 13,596 tons for the last fiscal year. The above figures are those of the Pará authorities. Those of the American Department of Commerce and Labor for the last six years show:

RUBBER IMPORTS FROM BRAZIL (FISCAL YEARS).

	Pounds.
1907	40,286,751
1908	32,645,173
1909	43,993,670
1910	39,510,920
1911	31,020,764
1912	46,762,744

While naturally dealing with the various questions from the point of view of the state of Pará, the important position of that state as a source of supply adds importance to the statistical information given.

AMERICAN RUBBER GOODS IN BRAZIL.

As many people in the rubber trade know, there is to be a notable exposition in Rio de Janeiro next May and June. This exposition will be open—not only to Brazilian exhibitors—but to foreigners as well, and in order to encourage foreign entries the Government will allow all exhibits to enter free of import duty—duties to be paid only where foreign exhibitors sell their products after the exhibition is over.

Probably some American manufacturers will avail themselves of this opportunity to show their product in this progressive part of the world, and those who do not feel like going to the expense of making such exhibits can arrange to have their factory and its products shown to the Brazilians through the medium of moving pictures. Those who visited the recent Rubber Show at the Grand Central Palace, New York, will recall how popular the moving pictures of South American scenes proved to be. They were given four times a day and the auditorium was almost always crowded. Those moving pictures were under the direction of Mr. D. M. Hazlett. He is going to have a moving picture exhibit in connection with the Rio de Janeiro show and intends to devote a considerable part of it to the products of American mills. Any manufacturer who is interested in having his wares displayed in this way can get all the particulars from Mr. Hazlett. His address is 3680 Folsom avenue, St. Louis, Mo.

REDUCTION OF BRAZILIAN EXPORT DUTY ON RUBBER.

As indicated by the summary of the new Brazilian legislation in the June issue (page 427) of THE INDIA RUBBER WORLD, the Federal Government was authorized to negotiate with the states of Pará, Amazonas and Matto Grosso for the gradual reduction of the present duties, until a maximum diminution of 50 per cent. had been effected. It is reported that from January 1, 1913, there will be a reduction of 5 per cent. in the duty on shipments from Pará and Amazonas, in accordance with a recent arrangement between the central government and the two last named states.

RUBBER GOODS EXPORTS TO BRAZIL.

By the courtesy of the Department of Commerce and Labor, advance figures have been received of the rubber goods exports to Brazil for the year ended June 30, 1912.

Comparing the figures with those of 1909 and 1911, the following results are shown:

	1909.	1911.	1912.
Belting, hose and packing	$25,310	$34,442	$40,777
Boots and shoes	23,746	35,548	41,036
Automobile tires	.....	10,112	24,952
All other tires	.....	7,767	11,273
All other manufactures	35,406	62,596	81,203
	$84,462	$150,465	$199,241

An increase of almost 150% within three year is decidedly encouraging.

The Editor's Book Table.

THE TESTING OF MECHANICAL RUBBER GOODS. CIRCULAR No. 38 of the Bureau of Standards. Washington, 1912. [Paper, 38 pages.]

THIS valuable pamphlet combines a number of known facts with interesting details of the system of rubber testing in use at the Bureau of Standards. It is divided into four parts: Introductory (embracing crude rubber, rubber substitutes and reclaimed rubber); manufacture of mechanical rubber goods; physical testing of rubber; and the chemistry of rubber.

Chief interest, from the point of view of the subject treated, attaches to the third section, dealing with the tension, friction, hydraulic pressure and steaming tests most commonly employed. The descriptions are copiously supplemented by illustrations and diagrams.

In dealing with the fourth section, it is remarked that it is only recently that we have known very much of the chemical nature of rubber. The synthesis of rubber, acetone extraction, vulcanization and the determination of the amount of rubber in a vulcanized compound are successively dealt with.

In conclusion, it is stated that the methods of analysis in use at the Bureau of Standards are now in course of thorough testing and revision. It is hoped within a comparatively short time to publish the results of the work.

Reference is made to various standard works and publications dealing with the subject, including the INDIA RUBBER WORLD and the volume on "Crude Rubber and Compounding Ingredients," by H. C. Pearson.

GREEK REFINEMENTS. BY WILLIAM HENRY GOODYEAR, M.A. Yale University Press, New Haven, Connecticut. [Quarto, 227 pp., board covers.]

It is safe to say that all rubber men—at least those in the Eastern section of our country—whose outlook is not bounded by the four walls of their factory or storehouse, who keep abreast with the intellectual life of the age, know—by reputation at least—Professor William Henry Goodyear, the scholarly curator of Fine Arts, at the Brooklyn Institute of Arts and Sciences. But probably there are many rubber men who are

THE THESEUM AT ATHENS.

not aware that Professor Goodyear is the son of Charles Goodyear. The beginnings of the rubber industry in Charles Goodyear's day—though of tremendous prospective importance, were so small in actual commercial production as compared with the vast proportions of the industry today—that Charles Goodyear, in the minds of most rubber men seems like a figure in the distant past; but, as a matter of fact, his death occurred only a half century ago, and his son is not only still living among us, but is adding distinction to the great name he inherited.

Charles Goodyear, though his life was devoted to scientific achievements, was a man of genuinely artistic temperament. That was shown in many of the devices he invented, and the famous exhibitions that he gave abroad, and also to a considerable extent by the excellent drawings that he made of his own inventions. His son has held a distinguished position for over 40 years, in the world of art—particularly in that department of art devoted to architecture. His accomplishments in his chosen

THE MAISON CARREE AT NIMES.

field have been recognized by the leading architectural societies of Europe, and he has been made an honorary member of the Architectural Associations of Rome, Venice, Milan, and Edinburgh, and of the British Society of Architects. He is also the author of many accepted works on the history of architectural art, among them, "Roman and Mediaeval Art," and "Renaissance and Modern Art." The latest contribution from his pen—which is just from the press—is a beautiful volume entitled, "Greek Refinements." It is a book of 227 pages containing a large number of illustrations of ancient Greek temples—some of the illustrations being full page size. Both cuts and text are printed on a heavy paper of fine quality, and the book is bound in buckram covers lettered in gold.

Professor Goodyear first became interested in the Greek refinements (which is another name for various curvatures— perpendicular and horizontal—and other departures from the strictly normal in architecture) over 40 years ago, when in the years 1869 and 1870 he made an exhaustive study of the monuments, the cathedral and other notable architectural objects in Pisa. He wrote an article on this subject entitled "The Lost Art," for "Scribner's Monthly," in the early 70's, but owing to other demands upon his time he made no further literary contributions on this topic for over 20 years—until 1895. Since that time he has devoted a great deal of attention to these peculiarities in the ancient Greek temples, and also in cathedrals and other specimens of mediaeval architecture, and the first result of these years of study and observation of this fascinating phase of early architecture is the book just published which will be followed later, undoubtedly, by a book on the refinements of mediaeval architecture.

This book will be found interesting—not only by professional architects, but by all those to whom art in any of its phases makes an appeal, and also by those who are interested in history —the most absorbing chapters of which were written by the ancient Greeks with their wonderful literature and their unsurpassed and enduring architecture.

THE RUBBER TRADE IN BOSTON.

By a Resident Correspondent.

BUSINESS generally is about the same as was reported last month. The close of the year naturally tends to slow down certain lines, but this is more than made up by increased activity in others. The mechanical branches suffer most at this season, because of the nearly universal custom of purchasing agents to defer buying as far as possible until after the opening of the New Year. Toys, druggists' goods and similar lines are still going with their accustomed regularity, and clothing seems to be as much called-for as ever. Notwithstanding the weather, or perhaps because of it, the tire business flourishes. The one branch which is suffering most is the rubber footwear trade, which is quiet because of absence of snow.

* * *

The Monatiquot Rubber Works Co. is installing a third engine at its plant in South Braintree, Massachusetts—this one of 450 horse power. It is also erecting another brick building, which will accommodate a double line of shafting to work a dozen new mills which will be installed. This company owns a tract of about 112 acres between the Monatiquot River and a branch of the N. Y., N. H. & H. R. R. and also about 25 acres on the gentle slope of a hill the other side of the river. Under the planning of landscape architects this latter tract is to be laid out in streets, all of which will bear appropriate Indian names, Squantum, Samoset, Massassoit, etc. Small lots will be offered at such terms that employes can be enabled to build, and thus form a little community under the finest auspices of health, comfort and rural beauty.

As is the custom of this company at Thanksgiving, turkeys were given to all the married employes both at the factory and at the office. The single men received cigars and the girls boxes of candy. The good feeling between employer and employe at this establishment is noticeable in the *esprit de corps* manifest in all departments.

* * *

The Boston Continuation School has as its pupils a fine lot of young shoe clerks, who are learning much about their business. Last month a practical lesson was given them of how a rubber overshoe was made. Miss Elizabeth A. King, one of the star rubber makers at the Converse Rubber Shoe Co.'s factory at Malden, brought to the school the various parts which go to make a storm overshoe. The manufacture of the sheeting and the cutting and coating of the various pieces was explained, and a rubber shoe made slowly, to show every detail. Then Miss King made another while the students held watches to time the work. The process of vulcanizing and varnishing completed the lesson.

* * *

The Maynard Shoe Co., Claremont, New Hampshire, which has manufactured McKay sewed rubber-soled shoes for some ten or fifteen years, and cemented tennis shoes for a shorter period, has sold all its rubber machinery to the W. C. Coleman Co., of this city, which will probably dismantle the factory where these goods are made. The factory has been sold to the Sullivan Machinery Co., which will utilize it in extending their business. It is reported that the tennis goods end of the Maynard Shoe Co. will be transferred to the Beacon Falls (Connecticut) Rubber Shoe Co., and that the rubber heel business will be discontinued. The Maynard Shoe Co. will, however, continue to manufacture leather shoes for the jobbing trade.

* * *

Work is proceeding right along on the new power plant of the Boston Woven Hose and Rubber Co. at Cambridge. Two units were put in commission on Saturday, December 21, and were found ready for the task set out for them. The whole plant will not be ready before the first of March. The new brass finishing department is now in full running order. Other important improvements are under way, all of which is a proof of the prosperity of the company, and the continued demand for its many branches of product.

* * *

The two buildings on Atlantic Avenue adjoining that in which the Elastic Tip Co. has its office were badly damaged—in fact almost entirely destroyed—by fire early last month, and at one time it seemed certain that the flames would spread to No. 370, but by arduous work this was prevented. Nevertheless the company sustained considerable damage by water, which, however, did not materially interfere with their business.

* * *

The Enterprise Rubber Co. has a prominent store on Federal street in this city, which is passed by thousands every hour of the business day. There are two very large windows of plate glass, and these are not only attractively arranged, but they are filled with most seasonable displays. During the football season the gridiron is reproduced and rubber toy animals are used to personate the players. In the hunting season camp scenes are arranged to advertise clothing, hunting footwear, etc. If the day be rainy the windows, or at least one of them, is sure to contain a display of waterproof coats, etc., while a fall of snow is a practically automatic order for the window dresser to arrange a display of Candee footwear. Undoubtedly this timeliness brings in a large amount of retail trade. At present writing the windows present a true Christmas appearance, and toys of red rubber are prominently displayed in a holly-decorated setting.

* * *

Speaking of window displays reminds me that recently there was on exhibition in the window of the Goodyear Rubber House on Boylston street, a splendid portrait in oil of Charles Goodyear which was painted by Miss Frances Chamberlin, a portrait painter of more than local celebrity. Miss Chamberlin is the niece of Mr. Robert Josselyn, the proprietor of the Goodyear Rubber House which was established thirty-two years ago, and which occupied one store on School street for three decades, moving to Boylston street only about a year ago, owing to the southward march of Boston's retail centre.

* * *

The Eastern Rubber Co., wholesale dealers in rubber clothing and footwear having outgrown their recent quarters, have moved to 72 High street where they now occupy two large floors for stock shipping and offices. They have been working at a disadvantage owing to the increase of their business, as they could not secure additional room at the Purchase street building where their store was, and had to use a floor on Congress street for their surplus stock. The new location enables them to carry on all the details of their business under one roof.

* * *

Richmond L. Chipman's usually pleasant and smiling face is more so than ever just now, as he informs his friends that Richmond L. Chipman, Jr., joined the family December 14, 1912 and is already making a noise in the world. Chipman *père* says that he is going to teach the young scion to chew rubber, so that by the time he is five years old he will be an expert in all varieties of crude gum, and by the time he graduates from college he will be a full-fledged crude rubber man.

While this is the first boy in the Chipman household, he is not the first child. Mr. Chipman has two charming daughters, and he is a most artistic and expert amateur photographer. Recently the kodak people asked for specimens of amateur photographic work. About 18,000 samples were sent and only 1,200 of these

were chosen, and among these was one of Mr. Chipman's photos of his younger daughter. This picture occupies a place of honor in the Kodak exhibition now being shown in the large cities of the United States. Mr. Chipman's picture of his elder daughter was similarly honored in the previous Kodak exhibition.

* * *

The Boston Belting Co. state that their business at Chicago has so outgrown the quarters occupied in that city as to necessitate a removal, and that the new location is at 172 West Randolph street, where with more room and increased facilities the company is much better enabled to serve its customers.

* * *

The well known rubber footwear firm of William F. Mayo & Co., of this city, has changed over into a corporation, named the William F. Mayo Co. This was recently incorporated under the laws of Massachusetts, with a capital stock of $150,000. This in no wise changes the personnel of the concern, the three partners owning all the stock and continuing as before. William F. Mayo is president, and his sons, Geo. H. Mayo and William H. Mayo are respectively secretary and treasurer.

THE RUBBER TRADE IN AKRON.

By a Resident Correspondent.

THE Goodyear Tire and Rubber Co. has invented a rim gauge through L. A. Falor, of the motorcycle tire department, and is supplying the trade on application. With this gauge the dealer can tell in a moment the most suitable-sized tire for any given rim. One simply inserts into the rim the correct gauge length and reads on the proper section of the gauge the exact size to be used. The tire size is printed boldly on the section fitting the rim.

The new offices of the Goodyear Tire and Rubber Co. were formally opened by a banquet December 7. Fully 700 persons attended the banquet and dance in the new office dining room. F. A. Seiberling, president of the company, was toastmaster. After the banquet, a dance followed until midnight. In a short address, Mr. Seiberling thanked his employes for their loyalty in helping to build up the great industry. He called attention to the fact that the office force of the Goodyear company in 1899 consisted of but seven people, while at present it consists of 700.

The company has made it possible for the employes from now on to secure meals at the restaurant of the plant. A souvenir program of the occasion consisting of a booklet, well illustrated, giving an interesting account of the remarkable growth of the Goodyear company was given to each person attending. Mr. Seiberling attributes the success of the company to a great extent to the loyalty and industry of the many, who, in subordinate offices have done their part.

In the combined offices of the new and old plants there are 57,000 feet of floor space. Although at the time the new office building was planned, it was believed to be ample for years to come, yet at present nearly every nook and cranny has been occupied.

The gross amount of business done for the fiscal year now ending was $25,232,207.03. The first year's gross business of the company, summarized under date of September 1, 1899, was $527,080.66.

The first Goodyear office force, back in 1898, upon the organization of the company, consisted of two persons. They were Miss Clara Bingham, still with the Goodyear in a position of trust and responsibility, and Miss Cleveland, now the wife of Dr. Henninger, this city. They came as stenographers. In January, 1899, came W. E. Palmer, now assistant treasurer of the company. Mr. Palmer's duties included those of bookkeeper, timekeeper and bill clerk. Walter Sheill, who later left the company's employ, was collector. C. W. Seiberling, now vice-president, was purchasing agent and sales manager. F. A. Seiberling, now president, was general manager of the company. C. W. Seiberling, and J. A. Burrows, now of Denver, were the sales force. Thus in the first year the entire managerial, office and sales force totaled seven persons. In the factory less than 100 persons were employed at first. There were but two classes of products, bicycle tires and solid carriage tires.

At the recent annual meeting the old board of directors were re-elected, as follows: F. A. Seiberling, Chas. W. Seiberling, H. B. Manton, J. P. Loomis, P. W. Litchfield, G. M. Stadelman and F. H. Adams. Officers were elected as follows: F. A. Seiberling, president; C. W. Seiberling, vice-president; F. H. Adams, treasurer; W. E. Palmer, assistant treasurer; G. M. Stadelman, secretary, and P. W. Litchfield, factory manager.

Frank Seiberling, president of the Goodyear Tire and Rubber Co., has given a contract to construct houses on land which he has purchased in the vicinity of the company's plant. It is the plan at the present time to start the foundations as soon as the weather will permit and have a large number ready for occupancy early in the summer. In the entire lot there will be 500 new homes. These will be sold to employes of the company at cost. It is not the plan of the company to make anything on the proposition but to bring within reach of all its employes homes at reasonable prices. The houses will be modern in all respects, and will add greatly to the appearance of fast growing East Akron.

Count de Almeida of Rio Janeiro, Brazil, representing the Federation of Brazilian Chambers of Commerce, with his son, paid the Akron rubber factories a visit during the first part of December. He was a guest of the Akron Chamber of Commerce and entertained at the Portage Hotel. He says, "Akron is a prosperous city, with big factories and beautiful homes. We often hear of Akron in Brazil, and I was much interested in your great rubber plants." He visited each of the rubber factories and had a conference with each of them relative to Brazilian rubber. He believes that the automobile industry is yet in its infancy and that Brazil will furnish the world with rubber. Count de Almeida is about 50 years old, is a most genial gentleman and is a heavy land owner in Brazil. He speaks several languages, and outside his own language is most at home in French and Spanish. His main purpose in coming to the United States was to study our commercial conditions and to bring closer together the commercial relations between the States and Brazil.

* * *

Clifford B. Myers, former manager of the Diamond Rubber Company's branch at Cleveland, Ohio, has been appointed general manager of the Swinehart Tire & Rubber Co. Mr. Myers was born in Akron and has had quite a number of years' experience in the rubber business.

* * *

Following the general decline of the stocks throughout the country, the stock of the various rubber plants in this city showed a decline of a few points, but within a few days most of them revived to almost their original quotations.

The Marathon Tire and Rubber Co. expects to start its plant and manufacture tires the first of the year.

The B. F. Goodrich Co. has remodeled the immense electric sign which was over the Diamond Rubber Co. buildings and it now reads "The B. F. Goodrich Company, Everything in Rubber."

The Stein Double Clincher Tire and Rubber Co. is being reorganized, details of which are not at present ready for publication.

The Rubber City Machine Co. has increased its capital stock from $10,000 to $30,000. The board of directors is as follows: E. W. Romwebber, Geo. Porter, T. E. Welton, Chas. Henninger, Richard Haag, Chas. Bertsch, and J. H. Romwebber. The officers of the company are as follows: E. W. Romwebber, president; Geo. Porter, vice-president and superintendent; T. E.

Welton, general manager and secretary; and J. H. Romwebber, treasurer.

The Adamson Machine Co. will occupy its new addition shortly after the first of the year.

The Miller Rubber Co. at its annual meeting the latter part of November re-elected the same officers, viz.: Jacob Pfeiffer, president; C. T. Grant, vice-president; F. B. Theiss, treasurer and William Pfeiffer, secretary and assistant treasurer. The board of directors at their meeting December 18, declared the regular quarterly dividend of 2½ per cent. to be paid January 20 on stock of record of January 1, 1913.

THE RUBBER TRADE IN CHICAGO.

(By a Resident Correspondent.)

CHICAGO veterans in all lines of the rubber goods trade learned, long ago, to discount most of the rumors concerning big alleged movements in the way of combinations, new factories, reorganizations, etc. Still, rumors, and rumors of rumors portentious in proportions, continue to be originated and to spread. In fact, in no other lines of business in Chicago do stories of alleged great movements of one kind and another attach to the trade and form the basis of gossip and discussion as they do in the various departments of rubber manufacture and dealings. The prompt denial by President B. G. Work, of the B. F. Goodrich Co., that his concern was about to combine with the United States Rubber, puts a quick end to one of the most interesting rumors of the month.

However, no statement from anybody has caused the rumor that the United States Rubber Co. is to build a new one million dollar plant somewhere in the west to cease to be circulated. It continues to spread among the Chicago rubber men. It is not unlikely that the condition of affairs in connection with this particular movement, is the result largely of the fact that Chicago has no large rubber manufacturing works, and of the hope that, if the story be true, the new million dollar concern will be located here. Against such a supposition, however, the fact is urged that possibilities of labor troubles always exist in greater or less degree in Chicago; and as a result it would be likely that any enterprise of the proportions suggested might seek a location elsewhere.

At the same time it is not an occasion for satisfaction to local rubber dealers or to the people of Chicago generally that the city must draw on places of much smaller size for supplies of mechanical rubber goods. While Chicago is credited with using more automobiles in proportion to population than any other place in the world, the auto makers and owners, must secure their tires from the factories of smaller towns. These conditions have had their influence in increasing the interest in the rumor of the possibility of the erection here of an immense rubber manufacturing plant.

* * *

The month has seen no special changes in the tone of various branches of the rubber business in Chicago. Demands have continued strong and prices are being maintained. General business is showing satisfactory improvement. The hesitancy occasioned by the National political campaign has become a matter of the past. The prospects for 1913 become more and more a certainty. This condition applies to the entire territory covered by the business of the Chicago rubber men. George F. Switzer, who has just returned from a very extensive trip to the Pacific Coast States and the Vancouver section, reports that business in all quarters is in a most satisfactory condition. He calls attention to the prospects based on the arrangements for opening the Panama Canal, and the increased business likely to develop as the result of the San Francisco Exposition. People in the East, he says, do not realize the extent to which the entire country is to be benefited by the Canal opening and the Exposition.

An interesting illustration of the manner and degree in which various large branches of business are correlated, is shown in the late reports of the Allis-Chalmers Company, which turns out so immense an amount of machinery for crushing stones, etc. The stone crushing business, of course, depends to a large degree on certain articles of mechanical rubber for successful working processes. The immense quantity of the stone crushing machinery now being manufactured in response to demands, results in great increase in the business of the Chicago rubber men whose wares are required in connection with such machinery.

Reports of increased business in the lead and zinc mining country and in some portions of the copper mining sections are followed by increased demand for mechanical rubber goods required for mining operations. Great paper mills continue to be running full time and with full crews, and their calls for rubber goods have an influence in increasing the volume of Chicago trade.

* * *

The increased cost of the crude materials used in the manufacture of practically all kinds of rubber goods, particularly cotton duck, is regarded by Chicago experts as sufficient justification for putting up rates on the finished product. It is understood that the officers of the large manufacturing corporations are consultory with their leading representatives in Chicago, with a view to obtaining their opinions concerning the proposed movement. It appears to be expected generally in the trade that arrangements for increased prices will be made early in the coming year.

* * *

Several of the more important Chicago headquarters are arranging for increased facilities for future business, both in the way of enlarged quarters and extension of territory. M. S. Curwen, Chicago manager for the Boston Belting Co., is busy arranging to move into new headquarters, at 172 West Randolph street. Mr. Curwen's present quarters are very extensive, but those into which he will go, as soon as arrangements can be completed, are much larger and will be one of the most attractive places of business in the city. His company has decided, also to take advantage of the increased business on the Pacific Coast, and has secured much larger quarters in San Francisco than those at present occupied.

* * *

While the so-called hard rubber goods in the preparation of which no rubber whatever is used, continue in increasing demand for certain mechanical purposes, the real hard rubber business does not seem to be affected thereby. Local representatives of the leading hard rubber manufactories continue to report excellent business. Probably no other line of rubber goods is affected to so great degree by the demands of the holiday season as those sold by druggists. In this line, the volume of trade is exceptionally large.

* * *

C. W. Lynde, formerly connected with W. D. Allen, Chicago, and later with Pacific Coast Rubber Co. and the Gorham-Revere Rubber Co., has entered the service of the Boston Belting Co., and will have charge of the company's business in Portland, Ore. Mr. Lynde has a remarkably wide acquaintance among the men interested in the rubber goods trade, East and West. His connection with the Pacific Coast Rubber Co. gave him an intimate acquaintance with the conditions of the trade in the section where he is to assume the duties of his new and responsible position.

* * *

When arrangements were made for building the magnificent new station of the Northwestern Railroad Co., on West Madison street, the McIlroy Belting & Hose Co. was one of the concerns forced to move away from that section. The company's works were established in Harvey, with a Chicago office located

at 138 North La Salle street. R. T. Whelply, the Chicago representative of the McIlroy concern, reports that business has increased very largely since the change in location and that the prospects for the coming year are excellent.

* * *

A few years ago, the eelskin seamless, solid woven, cotton belting now so much in demand in this country could be obtained only from England. With the high rate of duties on such material, this sort of belting was very expensive. Now the Boston Belting Co., through its Chicago agency, is furnishing the Middle West, the Northwest and the West with a full line of the materials. Experiments and tests of most severe nature have resulted in agreement on the part of experts that the product of the Boston concern is fully equal to the imported article. This belting is the first of the kind made in the United States.

* * *

An indication of increasing activity on the part of some of the railroad companies is seen in the fact that they are buying more freely in the line of rubber goods than heretofore for some time. The fact that it is necessary to equip many cars idle heretofore, in connection with the movement of the crops, is an explanation of the increasing demand for the output of the mechanical rubber factories for use on cars.

THE RUBBER TRADE IN CINCINNATI.

By a Resident Correspondent.

THE ideal weather that has predominated over the Central States during the past thirty days has been beneficial to the rubber trade in this section. The tire manufacturers report business booming, and indications that there will be no let up in activity, while in the other lines, such as the rubber clothing, golf balls and rubber toys the season has been more active than anticipated.

* * *

Local dealers of adjustable calks and rubber hoof-pads and horseshoes are much interested in the civil anti-trust suit filed by the government in Detroit, December 12, against the Master Horseshoers' National Protective Association and a number of other large manufacturers of horseshoes and calks. Hulbert Marshall, of this city, secretary of the International Union of Journeymen Horseshoers, commented on the action of the government as follows: "The men of our union, numbering 15,000, are employed by the master horseshoers. Why the Association of Master Horseshoers and the manufacturers should be charged with being a horseshoers' trust, I can not understand, for it always seemed to me that they were within the law. I know that the horseshoers did try through agreements with the manufacturers to confine the sale of calks, or toes, and horseshoe pads to horseshoers, but the plan never worked out, and I or anyone else could buy all of these things we wanted. The manufacturers sent out agents who would sell to anybody. A man would buy shoe toes or pads, take them to a shop, and then want his horse shod for fifty cents. Naturally the horseshoers objected and wanted to handle these things themselves, but they never succeeded in confining the sale only to horseshoers."

* * *

To many a poor family Christmas would be of only passing moment, while many poor little tots in Cincinnati would not know the joys of a visit from Santa Claus, if it were not for the activities of W. G. Brown, head of the firm of W. G. Brown & Co., rubber brokers. Mr. Brown has been connected with the Citizens' Santa Claus Committee since its inception, and each year it falls to his lot to be the executive head of that committee. This year a determined effort was made by Mr. Brown and his committee to bring Santa Claus into the lives of 10,000 children. Arrangements were made to distribute Christmas baskets containing dolls, toys, candy, nuts and fruits.

* * *

The Victor Rubber Co., of Springfield, Ohio, filed with the Secretary of State notice of an increase in its capital stock from $60,000 to $150,000.

* * *

The Schaeffer Rubber Co., retail dealers in rubber clothing and rubber sundries, have entered into a lease for a term of eight years, for the storeroom now occupied by them at 116 East Fourth avenue. The lease calls for close to $50,000 as rental for the term.

* * *

J. S. Sackett has placed on the market here a new device, invented by himself, for clamping patches applied to inner tubes. Simplicity is its feature, together with the element of convenience, for the reason that there is no further need of using the foot as a means of pressure while patches are in process of drying. The clamp can easily be packed in any tool chest.

* * *

Not to be outdone by its competitors in this territory, The United States Tire Co. has just completed and is now occupying its own building in Cincinnati. The building is located at 1121 and 1123 Race street, is of re-inforced concrete and terra cotta, three stories in height, and is one of the ornamental structures in the automobile and tire district of the city. The two

NEW U. S. TIRE CO.'S STORE AT CINCINNATI.

upper floors are used as stock rooms, while the first floor is occupied by offices, and is equipped with every modern office environment. From the Cincinnati branch the company covers part of Ohio, Kentucky and Tennessee, having branches under the supervision of the Cincinnati branch in Louisville, Ky., and Dayton, Ohio. R. P. Motte, who for a number of years was connected with Morgan & Wright—before the consolidation—has been selected to head the Cincinnati branch.

* * *

Fred A. Geier, vice-president of the Cincinnati Rubber Mfg. Co., was one of the principal speakers at the banquet following the annual meeting of the Society for the Promotion of Industrial Education, which was held in Philadelphia early in December. Mr. Geier's subject was "What the Manufacturer Can Do to Get Team Play Between the Schoolmaster and the Layman."

* * *

Coughlin & Davis, dealers in auto supplies and rubber accessories, are about to engage in extensive exportations to the nearer points in South America. The firm has been feeling its way to trade relations for some time, and is the first concern in the city, handling such a line, which is going after foreign business.

* * *

The local branch of the Goodyear Tire and Rubber Co. made the best of a record made by one of the Goodyear Non Skid tires, owned by R. Parker Smith, of Fort Wayne. Mr. Smith stated that he has obtained 17,000 miles out of a Goodyear tire and expected to get 20,000.

* * *

The plant and assets of the Ohio Motor Car Company, which was placed in the hands of a receiver on petition of the Diamond Rubber Company several months ago, have been sold to the Northway Motor Co., which has just been incorporated with a capital stock of $600,000 for the purpose of taking over the plant of the former company.

* * *

Local retail dealers in rubber sundries and rubber toys are heralding the movement toward a "safe and sane" Christmas, which has been endorsed by local civic organizations. The movement started is opposed to costly gifts for Christmas, and as presents for children it is urged that toys of an indestructible nature be given as well as harmless. This is a boom for dealers of rubber toys, who for several years have been conducting an advertising campaign to promote the sale of these toys, especially for the smaller children, and it now looks as though their efforts will be rewarded, for dealers report a surprisingly large increase in sales of rubber toys this year over previous years.

THE RUBBER TRADE IN SAN FRANCISCO.

By a Resident Correspondent.

THE status of the rubber industry has not experienced any appreciable change during the past month. All engaged in the business report that the year has been somewhat ahead of the previous one. Indeed the western coast market has grown very considerably and if there were no more houses here than there were ten or twelve years ago, each house would report a substantial increase in business. But the business is now divided between some twenty houses instead of eight or ten. With the increase of business there has been an even greater increase in the number of establishments to take care of it, and this has gradually worked a change in the methods. Even big houses find that they have to look closely to the matter of expenses in order to show a satisfactory profit, and the expense end of the business is more closely attended to now than ever before.

Rents are high in San Francisco and the merchants are insisting that in many cases they are too high. A local rubber merchant found that in Chicago rents in fine sections of the city are no higher than in this city and yet the field there is far greater than here. Outside of the tire industry, which is very active on this coast, the field is limited in comparison with the eastern markets. Of course, owing to the distance between commercial centers, traveling expenses are bound to be higher here and these cannot be very materially reduced, but the feeling is so strong against high rentals that many removals to new locations have resulted, and this is bringing the property owners to realize the fact that it is inadvisable to ask exorbitant prices. As the city has grown following the 1906 fire new buildings have been continually erected, and gradually the rentals in some localities are getting down to a reasonable basis.

* * *

The death of "Tom" Rollins last month comes as a sad bit of news to his many friends in the rubber trade. He has been for several years manager of the branch of the Fisk Rubber Co. located on Golden Gate avenue and was a man held in high esteem and respect by the entire trade.

* * *

W. D. Rigdon, coast manager of the Gorham Revere Rubber Co., with offices on Fremont street; H. S. Sachs, president of the Artgravers Co. of New York; E. H. Farrish, formerly vice-president of the Gorham Rubber Co., and E. S. Vandinwagen and F. C. Cooley, both with the rubber company, have purchased 140 acres of the Fairoaks region, near Sacramento, and each of them will immediately start to improve and develop his portion for country residence purposes. The deal involved $20,000. The Trainor-Desmond Co., which negotiated the sale, has contracted to plant the property to 3,500 trees, leaving space on each tract for bungalows. The varieties of trees to be planted are oranges, lemons, almonds, olives and French prunes. Most of the purchasers intend to build immediately.

* * *

The Goodyear Rubber Co. is rushing work on its new factory on Second and Natoma streets, so that they will be able to move from the temporary quarters which have been found inadequate to the growing demands of the company's business. The new building is of reinforced concrete, two stories in height with basement, and will have a frontage on Natoma street of 145 feet. It is being equipped with every modern facility and within a few weeks the shop will be able to take up its new quarters in one of the finest factories of its kind in the West.

* * *

Arthur Hamlin, who represents the Gorham-Revere Rubber Co. in the Northwest, is now in San Francisco on a flying visit. He looks after the firm's branch stores in Portland, Seattle, Tacoma and Spokane and says that the stores under his supervision are ahead of the business done last year.

* * *

A. H. Gregory, manager of the coast branch of the New York Belting & Packing Co., has returned to this city after visiting the head offices and branches in the East. He finds that his people are very well satisfied with the results for the year and he also notes that most merchants with whom he talked do not apprehend any trouble from the change in political control.

* * *

A. W. Warren, secretary and general manager of the Hodgman Rubber Co. of New York, has been visiting in San Francisco for a few days and will return to New York by way of Portland and Seattle.

Henry D. McCoy, manager of the Chanslor & Lyons Co. of this city, states that his company has secured the agency for the Lee automobile tires made by J. Elwood Lee, and will distribute them through the firm's stores in this city, Los Angeles, Portland, Seattle, Spokane and Fresno. This is the first time that these tires have been represented on the coast.

E. L. Rettig, Pacific Coast manager for the Federal Tire Co., has opened a branch store and shop on Golden Gate avenue.

J. M. Gilbert, general sales manager of the United States Tire Co., accompanied by J. D. Anderson of the corporation, both of New York, have been recent visitors in San Francisco on their tour of inspection of the coast. They report themselves as favorably impressed with conditions here and have decided to increase working facilities and to open new branches.

D. W. McElligott, San Francisco manager for the Halliwell Co., an automobile supply house, has recently taken on a new line, the Jackson-Eno rubber tire specialties

W. D. Newerf, Pacific Coast agent for the Miller tires, has returned from his recent visit to the factory at Akron.

The Panama Rubber Co. has been incorporated at Los Angeles with a capital stock of $1,000,000 by W. H. Newerf, W. E. McCune, A. S. Heilbron, and J. G. Seymour.

The Alcorn Rubber Co. has been incorporated at Los Angeles with capital stock of $20,000. J. A. Alcorn, C. F. Wickland and G. Baker are among the stockholders.

THE RUBBER TRADE IN TRENTON.

By a Resident Correspondent.

AN appalling accident occurred about the middle of December in one of the rubber factories of this city. The details are altogether too shocking to be given, but it might serve a good purpose to give simply the essential facts, to show all rubber manufacturers (together, of course, with other manufacturers) the necessity of guarding elevator shafts so completely that accidents of this sort would be impossible. In this particular mill the company had put a safety gate across the opening in the elevator shaft to keep employes from falling down, but this gate was only about shoulder high, so it was possible for an employe to put his head over and look down the shaft. This is precisely what a 15-year-old boy did at just the moment that the elevator was descending above him. He was struck and beheaded as if by a guillotine.

Fire did damage to the plant of the Empire Rubber Manufacturing Co. last week to the amount of $10,000, fully covered by insurance. The blaze started in the enamel and storage department and the firemen had a hard battle for some hours.

The cause of the fire is unknown, but the opinion was advanced by several employes of the plant that the blaze was due to electricity from the friction of machinery. The fire occurred in the afternoon and the employes fought the blaze pending the arrival of the city fire department apparatus.

The officers of the plant stated that the fire would not in any way hinder the operation of the plant, which is running day and night, as it has been all season.

According to an amended certificate filed in the office of the Secretary of State of New Jersey the General Rubber Co. of Newark has increased its capital stock from five to ten million dollars.

REVISION OF PLANTATION SALARIES.

With lower prices for rubber, the question of the salaries paid by plantation companies for white supervision has been attracting attention. The expenditure of plantation companies may be divided into labor, white supervision and home administration. In dealing with this subject, the "Financial Times" of London lately remarked that the high prices at one time ruling for rubber allowed the payment by producing companies, of high salaries to men with limited tropical experience, and none whatever of rubber cultivation. It is suggested that the plantation companies will find compensation for lower prices not only by increasing outputs, but by a reduction of the current expenses for supervision.

OBITUARY RECORD.

SUDDEN DEATH OF JOSEPH N. SMITH.

MR. JOSEPH N. SMITH, president of the Boston Woven Hose & Rubber Co., died very suddenly at his Beacon street home in Boston, about 11:30 on the evening of December 18. Throughout the day Mr. Smith had been at his office attending to business with nothing to show that he was not in his usual good health except a slight indisposition ascribed by himself and his family to a temporary attack of indigestion. In the evening he attended the opera but complained of feeling worse, and for that reason left before the performance was finished. On returning to his home he retired immediately, dropping into an entirely natural slumber almost at once. About 11:30 Mrs. Smith was awakened by an unusual noise only to find that Mr. Smith had already passed away.

Mr. Smith was born January 12, 1840, in what is now Peabody, but was at that time a part of the town of Danvers. In early business life he was a successful shoe manufacturer, later becoming identified with other large interests, and upon the reorganization of the Boston Woven Hose & Rubber Co., in 1899, was elected a director and president of the corporation. These offices he had held continuously from that time up to his death.

The offices and all departments of the factory were closed Saturday, December 21, as a mark of respect.

THE DEATH OF JOHN H. GREACEN.

John Henry Greacen, at one time an officer of the International Rubber Co., and son of the late John Greacen, died on November 29, on board his private yacht, "The London," at Savannah, Georgia, in his 56th year. The body was forwarded to Glen Ridge, New Jersey, for interment.

UNITED STATES RUBBER CO.'S ISSUES.

TRANSACTIONS on the New York Stock Exchange for four weeks, ending November 23:

COMMON STOCK, $25,000,000.

[The treasury of a subsidiary company holds $1,334,000.]

Last Dividend, October 31, 1912—1%.

Week November 30	Sales	43,705 shares	High	66	Low	57⅜
Week December 7	Sales	39,200 shares	High	67⅞	Low	61¾
Week December 14	Sales	17,050 shares	High	63¾	Low	60¾
Week December 21	Sales	16,450 shares	High	67½	Low	61¾
Week December 28	Sales	8,690 shares	High	65½	Low	61⅜

For the year—High, 67⅞, May 21; Low, 45¼, February 1.
Last year—High, 48½; Low, 30½.

FIRST PREFERRED STOCK, $39,824,400.

Last Dividend, October 31, 1912—2%.

Week November 30	Sales	1,013 shares	High	109¼	Low	108½
Week December 7	Sales	1,245 shares	High	108⅞	Low	106½
Week December 14	Sales	3,400 shares	High	107½	Low	106
Week December 21	Sales	1,850 shares	High	108¼	Low	107
Week December 28	Sales	700 shares	High	107	Low	107

For the year—High, 116, May 20; Low, 105⅝, July 25.
Last year—High, 115½; Low, 104.

SECOND PREFERRED STOCK, $9,965,000.

Last Dividend, October 31, 1912—1½%.

Week November 30	Sales	900 shares	High	80½	Low	80
Week December 7	Sales	300 shares	High	75	Low	75
Week December 14	Sales	600 shares	High	79⅝	Low	78
Week December 21	Sales	2,100 shares	High	80¼	Low	79¼
Week December 28	Sales	300 shares	High	79	Low	79

For the year—High, 85½, May 21; Low, 75, January 23.
Last year—High, 79; Low, 66.

SIX PER CENT. TRUST GOLD BONDS, $18,000,000.

Outstanding of the 1908 issue of $20,000,000.

Week November 30	Sales	7 bonds	High	103⅜	Low	103¼
Week December 7	Sales	25 bonds	High	103⅝	Low	103
Week December 14	Sales	21 bonds	High	103	Low	102½
Week December 21	Sales	26 bonds	High	103	Low	102⅝
Week December 28	Sales	14 bonds	High	103	Low	102½

For the year High, 105, February 24; Low, 102½, December 28.
Last year—High, 105; Low, 101¾.

The India-Rubber Trade in Great Britain.

By Our Regular Correspondent.

IN the June issue, 1912, of THE INDIA RUBBER WORLD, we reported the action of the North British Rubber Co. v. Willows; this being for the value of dirigible balloon fabric supplied. The fabric proved faulty and useless for its purpose after a few months, and the defendant counterclaimed for damages. At the trial Mr. Justice Scrutton gave judgment in favor of the North British Co., and the defendant appealed. The appeal came on for hearing on November 25, before the Master of the Rolls, and Lord Justices Farwell and Hamilton. The appeal was dismissed; the Master of the Rolls in delivering judgment, laid stress on the scientific evidence and said that Mr. Justice Scrutton was clearly entitled to the view that the duration of life of such an envelope was a matter of speculation and uncertainty.

IN THE COURTS.

Mr. O'Gorman (for the defendant) had given it as his opinion that the life of such fabric was two years, but he had declined to say that it was unfit for use when it left the North British works in October, 1910. It had been suggested that the judge had put the expert evidence on one side, and had relied only on the report of the Advisory Committee on Aeronautics. Mr. O'Gorman, however, had said that they were at a speculative stage on this matter of duration of life, and the judge was not bound to accept the opinion of an expert when such opinion was purely speculative, and not based on the experimental proof which an expert witness should give, if his opinion was to be regarded as final.

With this judgment in existence there is hardly likely to be a similar action, until the experiments which are now in hand both in England and Germany on balloon and aeroplane fabrics, have produced evidence which can be quoted as authoritative. It is important also for expert witnesses to note, that they are expected to back their opinions by experimental evidence.

The case in which Mr. E. E. Buckleton sued Messrs. Heilbut, Symons & Co., for the return of money invested in a rubber plantation was won by Mr. Buckleton at the Liverpool assizes, and also in the Court of Appeal. The defendants, however, took it to the House of Lords; the final result being that they have won and Mr. Buckleton has been deprived of the satisfaction he had previously experienced, and at the same time of course is more out of pocket.

There does not seem any falling off in the demand for reclaimed rubber; the various producing works reporting themselves as fully employed. The largest works (the North Western Co. of Liverpool) has decided, I hear, upon practically doubling their plant in the near future. It is clear from this, that the certain prospect of cheaper raw rubber from the increased plantation output in forthcoming years, does not cause any apprehension as to a serious curtailment of the reclaimers' business. On the contrary, the view appears to be held, that cheaper rubber will result in increased use, and therefore larger stocks of waste to come upon the market.

RUBBER SCRAP NOTES.

The Rubber Regenerating Co., of Trafford Park, Manchester, are again making additions to their works, and have recently purchased further land. The average grade of the reclaimed rubber now produced in England, is higher than was the case ten or twenty years ago, though a demand still continues for 4d. per pound qualities. Indeed there is a market for stuff at 3d. per pound; this lowest quality coming from abroad. The Mersey Reclaiming Co., of Stockport, one of the newer concerns, reports a gratifying increase in their sales and may now be considered firmly established.

The firm of T. Hallas & Co. have removed from their Todmorden works to new premises at Woodley, near Stockport. The factory, which was formerly a wool washing mill, is conveniently situated for carrying on the business; which includes substitute making and heel pads. Mr. Harris, who was formerly with Messrs. G. H. Scott & Co., of New Mills, was the manager at the Todmorden works, but has now left the company.

Scrap rubber collectors complain that the market values of old rubber are now so widely known through the increased circulation of rubber technical literature, that it is a difficult matter to pick up a bargain. In regard to published quotations, sellers of old rubber are too apt to ignore the fact that quotations refer to goods delivered at specified places. When a man has had to travel to a country town on hearing that old rubber is for sale, and finds only four or five tires, he is naturally disinclined to pay the full price quoted for tires delivered in London. The present price for motor tire covers is 38s. per hundredweight, which is about 4s. per hundredweight less than a year ago. Red inner tubes fetch 9d. per pound.

This substance (formerly called Parkesione, after the name of its inventor) will come up for discussion before the Departmental Committee, appointed by the government to enquire into the conditions of manufacture, use and storage of celluloid. Some discussion will probably arise as to the difference, if any, which exists between the various bodies, including celluloid and xylonite, which are all camphor-containing cellulose nitrate plastics. Under the circumstances, a few facts concerning xylonite may be appropriate.

XYLONITE.

At the time in 1868, when Parkes, owing to want of capital, had suspended his manufacture of Parkesine, Daniel Spill, who had been associated with him, effected an improvement, or at any rate an alteration, in the process of manufacture, and patented his cotton xyloidin or xylonite. Further patents were taken out in 1875, after the manufacture had been commenced by Daniel Spill & Co. In 1877 this firm was taken over by a new company, called the British Xylonite Co., of which more anon.

The Spill patents in America were exploited by a Mr. Brown, and a company called the American Xylonite Co. was started in 1881 at Adams, Mass. Litigation, however, arose with the owners of other plastic patents, and in 1890 the company was absorbed by the Celluloid Co., ceasing its separate existence. The works of the British Xylonite Co. are situated at Hale End, near Epping Forest, on the outskirts of London, and also on the Essex coast; the operations being for reasons of safety carried on at the two localities. The buildings at the works are laid out in separate blocks and are of an artistic character; separated by beds of flowers. They are under Government regulation and inspection as if the business formed a branch of the explosives manufacture. The nitrating process, which is the more dangerous part of the manufacture, is carried out at the coast works, the material being made up into combs, tooth brushes, knife handles, etc., etc., at the Hale End Works. From statistics which are immediately available, it appears that Great Britain exported in 1910 celluloid and xylonite goods to the value of £167,000. The imports of celluloid for the same year are given as of the value of £450,000, no mention being made of xylonite.

JOTTINGS.

The Lancashire Motor Transport Co., Ltd., whose prospectus appeared some months ago, and which was destined to revolutionize goods traffic between large Lancashire towns, has come to an untimely end, and is being wound up in bankruptcy. Its career has been unsuccessful.

Mr. Brown, late manager of the Droylsden factory of the Gorton Rubber Co., Ltd., resigned that position in order to take up the management of a new motor tire factory in Australia.

The Werneth Rubber Co., of Gee Cross, Hyde, near Manchester, is making good progress under the management of Mr. Saunders, a former manager of the Gorton Rubber Co. As reported in these notes some time back, these works were put up to auction, as Mr. Salmon, the proprietor, wished to retire from business. As the reserve was not reached, the property was withdrawn, but was subsequently sold privately. The head office is at Burton-on-Trent. Recent developments in the business include railway buffers and small motor tires.

The Synthetic Products Co., Ltd., are at present engaged in negotiating for a site for their works, in which the manufacture of acetone will be carried on. As was stated in the prospectus, the synthetic rubber manufacture will remain a matter for future development. In connection with this I may mention that Professor Perkin is billed to read a paper on synthetic rubber before the Royal Society London, shortly.

GERMAN EXPORTS OF ASBESTOS MANUFACTURES.

ACCORDING to official statistics, the total value of German exports of asbestos manufactures equalled in 1910 $1,060,250, and in 1911, $1,231,500. The latter figure included the following items:

Asbestos paint and colors, etc.	$ 3,250
Asbestos paper and board	453,000
Asbestos yarns and cords	107,500
Asbestos fabrics, etc	174,500
Asbestos and rubber fabrics	280,500
Insulating materials	212,750
Total	$1,231,500

American exports of asbestos manufactures, which appeared in separate form for the first time, in the annual return to June 30 last, represented $520,894 for the fiscal year 1911-12.

GERMAN RUBBER COMPANIES' DIVIDENDS 1910-1911.

The dividends paid by 18 leading German rubber companies for the business year of 1910-1911 were as follows:

	Per Cent.		Per Cent.
2 companies, between	3 and 4	2 companies, between	9 and 10
2 " "	4 and 5	1 " "	10 and 12
2 " "	5 and 7	1 " "	12 and 15
5 " "	7 and 8	1 " "	20 and 25
1 " "	8 and 9	1 " "	25 and 30

Eight companies worked at a loss. The results obtained by the rubber industry, separately from those of the leather branch, have this year formed a special feature of the returns.

THE EUROPEAN RUBBER INDUSTRY AND THE BALKAN WAR.

While European business in general with the Balkan states has suffered from the consequences of the hostilities, the rubber industry has apparently gained by the complications. Several firms are reputed to have had large orders from the Greek medical authorities. The orders of the Turkish government have included large quantities of hospital supplies and surgical appliances, in which rubber has a prominent part.

"It's an ill wind that blows nobody good."

SILVER JUBILEE OF DIRECTOR HERBST.

Herr Edgar Herbst, of the Austrian-American Rubber Manufacturing Co., Vienna, recently celebrated the twenty-fifth anniversary of his becoming director, with a seat at the board. Born in 1855, he took up laboratory work in 1876 at Carlsruhe, under Professor Engler. He then went to the Von Oehler Chemical Factory at Offenbach. Through the publication by him of a work on the "Chemistry of Rubber," he was invited to Vienna to assume the post which he has now filled during twenty-five years. He is a well-known authority on both the theory and practice of rubber manufacture, having given special attention to the synthesis of rubber. In addition he is known as the editor of the "Rubber Industry Calendar and Annual."

TIRE NOTES FROM FOREIGN LANDS.

Portugal's imports of bicycles increased from $500,000 in 1910 to $650,000 in 1911. During the latter year 208 motorcycles, valued at $24,000, were likewise imported.

A contract for 750 sets of taxi tires has been recently closed by Backdahl & Co., Stockholm, with the United States Tire Co. Experiments had led to the adoption in the Scandinavian countries of American tires, notwithstanding their cost being higher than that of the domestic product.

Herr Wilhelm H. Bartels has resigned the management of the firm of Alfred Teves, Frankfurt, to take up, among other matters, the exclusive sale of the "Garuda" propeller for aerial navigation, motor cars and steam vessels.

Among notable English exhibits at the recent London show were those of the Connolly and Avon tires. The former concern was associated from the start with the development of the rubber tire, to which their experience as wheel manufacturers also contributed, particularly in devising the most durable and non-skidding patterns.

The Avon India Rubber Co., Ltd., has brought out a special tire with an extra thickness of rubber on the surface of the tread.

Among the features of the recent London show, were the pneumatic and solid tires of the Midland Rubber Co., Ltd., of Birmingham. They made a special display of their "Ajax" pneumatic tire, which carries with it a 3,000 mile minimum guarantee. Solid rubber tires of this company's make carrying a 10,000 mile guarantee have been supplied to the London General Omnibus Co. and the National Steam Car Co., besides other public motor enterprises.

NEW RUBBER WORKS IN IRELAND AND SCOTLAND.

According to English reports, a company is being formed called the "Irish Rubber Co." to manufacture tires and other rubber goods in Ireland. The influence of local directors is being exercised to bring the factory to Dublin, but Wexford has also been under consideration. The promoters are said to have obtained the support of 500 cycle agents in Ireland.

It is reported that a large Scottish rubber manufacturing firm is about to establish at Newburgh, Scotland, a factory for ladies' waterproof garments.

CALMON AUSTRIAN WORKS INCORPORATED.

The Calmon Asbestos and Rubber Works of Hirschstetten, Austria, have been converted into a limited company; the business managers being Imperial Councillor Hugo Goldschmidt and Herr Marcel Herczeg, of Vienna. It is announced that the capital of the company is the equivalent of $422,046.

NOTHING NEW AT PARIS AERONAUTIC SHOW.

At the recent Aeronautic Salon held in Paris there appeared to to be nothing particularly new in the line of rubber manufacture. There was a good display of pneumatic tires, shock absorbers and rubberized fabrics, but practically nothing that was not shown at the exhibition a year ago.

JAPANESE RUBBER PLANTATIONS IN MALAY PENINSULA AND SUMATRA.

By Our Regular Correspondent.

REFERRING to particulars lately sent of Japanese rubber growing in the Malay Peninsula (published in the INDIA RUBBER WORLD of December, p. 155), the total acreages rented and cultivated by 87 plantations have since increased respectively, to 85,069 and 16,455 acres.

STATE OF JOHORE.

Out of the above-named 85,069 acres, Johore has 79,010; divided as follows:

Along the River Johore in eastern part of state	45,860
West coast	30,870
Along railway	1,300
Other locations	980
Total	79,010

As previous report showed, Johore has in number one-half of the Japanese plantations on the peninsula and is encouraging

MALAYAN WORKERS CLEARING WEEDS UNDER DIRECTION OF JAPANESE MANAGER.

rubber planting. The government is facilitating planting operations by allowing planters time for payment of ground rent and survey fees. The ground rent, moreover, is lower than in other Malay states. Leases are for ever, while in other states they run for 99 years and in Dutch India for 75 years. Owing to the competition for riverside plantations, many of the Japanese plantations are inland. Most of the latter are still in the preparatory stages of wood-cutting and weeding, but some have been cultivating Pará trees for several years, and are in a few cases tapping.

STATE OF NEGRI SEMBILAN.

The total acreage rented in this state by Japanese rubber plantations is now 3,010, as compared with 2,845 by last report. Near Seremban, the capital, many of them are being gradually developed. One plantation of 160 acres, with 8 and 9-year-old Pará trees, has been acquired for $300,000 by an English firm which intends cultivating it in conjunction with Japanese planters. On four-fifths of the acreage wood-cutting and the removal of weeds are being carried on.

STATE OF SELANGOR.

Latest particulars show the area of Japanese plantations as 1292 acres, mostly cultivated and reaching maturity; thus showing a reduction on the average of 1420 previously reported. Owing to the competition of British investors, Japanese capitalists are at a disadvantage; so they are seeking locations along the railways to the south; thus avoiding Kuala Lumpur, the center of the British plantations.

KEDAH, PERAK AND SINGAPORE.

A Japanese residing at Penang has a plantation of 450 acres in Kedah. Many Japanese investigated, but did not start operations.

Three plantations in the State of Perak have 1,055 acres in all, while three Singapore planters have 250 acres between them.

ANTICIPATED YIELD FROM JAPANESE PLANTATIONS.

The total Japanese acreage is 85,069, which is estimated as about 9 per cent. of the total Malayan acreage. When these plantations come to tap Pará rubber later, their yield will be an appreciable factor in the market. At the rate of 130 trees to the acre, the 85,069 acres, on the basis of 1½ pounds per tree per year, would represent a yield of 16,588,455 pounds.

Two-thirds of these planters are small investors, to whom planting is an additional occupation, and who cannot get along without making profits for several years. They hope to get funds from the "Mujinko," a lottery association (described by the INDIA RUBBER WORLD, April, 1912, page 339). If they cannot cultivate their own plantations, these small investors will sell out to other planters or amalgamate with them.

SUMATRA.

In 1911, the total investment in Japanese rubber plantations in Sumatra was estimated at about $400,000 and the plantation area 140,000 acres. Among these plantations is one of two acres planted with rubber trees and cocoanut palms, owned by a German who had married a rich Japanese woman. The latter had engaged about 60 Japanese workers, 16 of whom are still employed, and who superintend the labor of Malayan and Japanese hands.

Owing to their unfitness for tropical life, and their inability to stand heat, Japanese usually fall ill soon after their arrival in Sumatra. Though not fitted to act as workers, there is ample room for their services in directing Malayan and Javanese laborers, or in tapping, gathering, and coagulating.

JAPANESE RUBBER PLANTERS' ASSOCIATION.

This association was established on August 15, 1912, at the Sekidenkwan Hotel, Singapore. It has 38 members, mostly large Japanese planters located along the River Johore; their purpose being mutual protection and development.

It is proposed to issue a monthly bulletin and to hold organized consultations with members as to rubber plantations.

Following is the list of the officials: President, Sinzo Suzuki; vice-president, Masaji Inoue; committee, O. Watanabe; S. Kawakami; M. Yoshida; K. Yamakawa; Y. Goto, and M. Sasaki.

Headquarters of the company are at the above-named hotel, the name of which means "Japanese Hotel."

JAPANESE LABORERS FOR MALAYA.

The efforts made by private enterprise to employ Japanese labor in rubber plantations at the south of the Malay Peninsula are being followed up by organized steps in other directions. According to the "Japan Mail," the "Toyo Imin Kaisha" (Oriental Emigration Company) recently obtained permission to send Japanese laborers to Malaya, and a party of 150 men was shortly to leave Japan.

In view of the hygienic situation in Johore being unsatisfactory, attention has been given to the question of better conditions in other parts of the Peninsula. These have been found to exist in the northern portion of Perak, and a contract has been made with an English plantation owner for the despatch of a small number of Japanese on probation to that district.

Under the conditions of employment, the Japanese undertake nine hours' daily labor for the equivalent of 40 to 45 cents gold.

Getting Balata by Destroying the Trees.

IN a recent issue of THE INDIA RUBBER WORLD our British Guiana correspondent stated that a proposal recently ventilated, that instead of balata trees being partially bled and kept alive for future bleedings, they should be cut down entirely and every ounce of balata extracted, occasioned much surprise in the colony. He went on to say that on calmer consideration, however, many people were beginning to think that there was a good deal in the suggestion and he quotes a prominent member of the British Guiana Balata Association as follows:

"It is understood that the balata tree on being cut down yields 30 lbs. to 40 lbs. of milk, whereas under the present system the quantity obtained by a good bleeder is only some 5 lbs. By periodical bleeding, therefore, it would take 30 years to get a result obtainable immediately by cutting down the tree, and I venture to say that there is hardly anyone in the colony who will contradict the statement that at the end of 30 years the trees will be dead. The cost of periodical bleedings must necessarily be very much greater than the cost of cutting down trees, and, the question comes to be whether is it better to bleed entirely a tree at once or allow it to remain till it dies within a period of 30 years?"

TAPPING BALATA, BRITISH GUIANA.

As a matter of fact, this proposal is not of recent origin. The process of extracting the latex from the balata tree by the destruction of the tree and the removal of all the bark was given a thorough test some 15 years ago and the results, according to those who made the experiment, were very highly satisfactory. Three Americans went into this enterprise in Venezuela in 1896. They put up a plant at a cost of about $25,000, with an average production of over 500 pounds of gum per day. They reported that the average balata tree in Venezuela furnished 1230 pounds of bark, that it required 30 trees to produce one ton of gum, the average extraction being about 66 pounds of gum for each tree. This, however, was from trees which had been previously tapped and from which 10 to 16 pounds of gum had already been taken, their estimate being that from trees that never had been tapped, from 80 to 120 pounds of gum could be secured, while by the tapping method not more than 8 to 16 pounds of gum could be secured. (It is quite likely that these figures are more than tinged with a promoter's natural optimism.)

They claimed a number of distinct advantages for this process. The first was the large amount of gum that could be secured at one time, as compared with periodical bleeding. Another advantage was the fact that the work could go on regardless of the season, which would not be true under the ordinary process of bleeding. The third

was that the gum was much more pure and free from sand and dust and bark. They reported that it cost them to produce the gum less than 8 cents a pound.

Through some dissension in the management the enterprise seems to have been abandoned and not since resumed, but the success, or at least the reputed success, of this early undertaking would at least seem to afford considerable encouragement for further experimentation in this direction.

NOTES FROM BRITISH GUIANA.

From our Regular Correspondent.

THE report on the forests of the easily accessible portions of the colony, by C. Wilgress Anderson, Forestry Officer, is now being published. The general report and Series 1 have been issued, and others are to follow in due course. It cannot be said that the general report offers quite that amount of assistance upon matters connected with the balata industry, that have long been calling for settlement, that was expected. Mr. Anderson opens that section of his report dealing with the balata resources of the colony, by pointing out that "the collecting of balata has within the last four years been most extensively carried on, so much so as to have now become the foremost forest industry, but judged by the value of the exports, the third most important one of the colony."

Mr. Anderson does not appear to have any original information to give us respecting the yield of the tree, but points out the well known fact that the flow of latex is best in the dry seasons, and that "in very dry seasons many of the trees do not flow at all." He proceeds to quote Jenman, to whom we owe the great amount of our existing knowledge of the bullet tree, and whose advice, if followed, would have enabled us to have a promising rubber industry at the present time, instead of the one of meagre proportions we now boast of. Mr. John Ogilvie's estimates for the Rupununi District are also quoted, and Mr. Anderson says that these estimates "are in close accord with respect to the average yield, which works out at four lbs. of balata per tree on the first occasion of tapping. This I consider may be accepted as a reliable estimate, for apart from being based on data obtained by highly observant and experienced individuals, I am well aware that collectors are generally quite content if they get as much as a gallon of milk for an average good-sized tree, tapped in the usual way for the first time. On subsequent tappings the yields are said to be less." This is not an important contribution to the available knowledge on the subject.

Mr. Anderson discusses also the question of felling the trees, which was alluded to in a recent letter, but here again he adds nothing new that will lead to a settlement of the question. For the most part his figures are quoted from previous authorities, which have already been referred to by those taking part in the controversy. Jenman said, and his remarks are quoted by Mr. Anderson, that "a young tree, a foot in diameter, felled, will give a gallon. A gallon of balata milk weighs over 10 lbs., collectors say 10½ lbs. Two samples I collected weighed 10.033 lbs. During the rainy season collectors estimate the yield per gallon at from 4 to 5 lbs. of pure balata and in the closing parts of the year 5 to 6 lbs. Average balata milk loses less than half its weight in drying."

Mr. Anderson points out that in Venezuela the felling method of collecting the milk is invariably practised, but that "this method, although at first used in British Guiana, is now against the law, as it also is in Dutch Guiana." He tells us that the felling method involves a comparatively small extra amount of labor, "and that the returns immediately obtained are far in excess of those obtained by the method of tapping the trees while standing," but he does not tell us how much they are in excess. He tells us, however, that "the felling method is undoubtedly a most wasteful one, as the forests are denuded of valuable trees," but again he gives us no figures, going on to say: "Unfortunately there are no reliable data available as to the yields obtained on the successive tappings made after the tree has first been bled, the class of men employed as bleeders and the conditions under which the work is being carried on being such as to render it difficult, if not impracticable to obtain such data. Yet the indisputable fact remains that the tracts of Crown lands on which the balata trees were first tapped a quarter of a century ago are still being worked and continue to yield supplies of balata. That this is the case I can testify from personal experience, for balata is still being obtained from certain tracts on Canje creek surveyed by me in February, 1889, on which most of the trees had at that date been already tapped." These remarks cannot be said to help on the controversy one way or the other as to the desirability of allowing licensees to fell trees.

The report is equally lacking in original information in respect to the age and growth of the trees, which bear an intimate relationship to the felling problem. Mr. Anderson informs us that the bullet tree is considered to be of very slow growth, but so far little is known with regard to the time it takes for a tree to grow sufficiently large to be fit for tapping, much less how long it takes to reach maturity. He informs us, however, that a balata tree planted in the Botanical Gardens in Georgetown, in 1880, has a trunk 48 inches in girth and branching 8 feet from the ground, being over all about 50 feet in height. He proceeds: "It has been reported by an officer of this department that on certain properties on the Canje creek, bullet trees of not more than ten inches in girth are to be found growing on beds originally laid out and cultivated by the Dutch, which probably have been abandoned for at least 80 years and are now recovered with forest growth. The trees in this case are said to be growing tall and straight. Further investigation on these lands may help to throw some more light on this subject."

Inasmuch as Mr. Anderson has been engaged since 1908 getting data for this report, and the Acting Governor has told us that it will be the standard authority upon Colony timbers for 25 years, it may be regarded as disappointing to be told that further investigation is needed to throw further light upon the subject of the balata resources of the colony when it is most needed. In fairness to Mr. Anderson, however, it has to be admitted that he is engaged in a herculean task. It is quite impossible for one Forestry Officer to investigate the resources of a forest area of 83,000 acres and supply us with any important data. What is needed is a thoroughly well equipped Forestry Department, and the creation of such a branch of government activity would appear to be well justified by the growth of the balata and other forestry resources. It will be recollected that the government's proposal to tax forest industries by means of the export duty was justified on the ground of its growing demands upon the revenue, and that this view was confuted by the Balata Committee, which pointed out that the industry's contributions to the revenue were greatly in excess of the amount spent upon it. The creation of a Forestry Department, it would appear, ought to be one of the first acts of the constructive Administration that is just opening.

Mr. Anderson enters into considerable detail concerning tapping regulations and tapping methods, but they are probably familiar to readers of the INDIA RUBBER WORLD. The balata wood is described in the report "as a well-known marketable one of considerable value. It is a very hard, heavy, dense wood of a moderately fine grain, and varying in color from a reddish tinge to a dark red. Because of its color it was a few years ago put on the English market under the name of 'beefwood.' The weight per cubic foot is 55 to 68 lbs.; the largest logs being 80 feet long, and squaring over 40 inches." The restriction as to the felling of the trees, however, prohibits its exportation as timber. Mr. Anderson points out that there are many large logs lying waste, particularly in the forests of the North Western District,

where many trees were illegally felled as recently as a few years ago, but the difficulties of transportation prohibit its exportation. It will be remembered that one of the claims of those who wish to have the restriction as to felling removed, is that after the balata has been extracted a marketable wood remains. Mr. Anderson's information appears to throw some doubt upon this claim. It will not be sustained until means of transportation are improved.

Mr. Anderson's report is more informative when he comes to discuss the distribution of trees. He says that they are to be found growing in most parts of the colony, being widely dispersed throughout the forests of the savannah lands, but on the slightly elevated lands and hilly country they usually occur in communities, varying in number from a few to thirty or more trees, which are irregularly distributed within definite forest areas, or in belts of varying extent, known locally as "bullet tree reefs," in which these communities occur more or less concentrated. "Hence the trees are more plentiful in the depths of the forests than near the rivers. During my inspections, and on the many previous occasions on which I have traversed the balata forests, I have never found any land which the bullet trees occupy to the entire exclusion of all others, but I have come on particular forest areas or zones in which this tree was among the most prevailing species of forest trees." The distribution, says Mr. Anderson, is "not a question of soil, but may be due to situation with regard to access of light; but evidence so far collected is not sufficiently convincing on this point of the problem." He proceeds to the local distribution of balata trees in the easily accessible forests. In subsequent reports doubtless the result of his researches will be more fully amplified.

Mr. Anderson also supplies some interesting information concerning the *Sapium* rubber tree, for details of which he refers us to the Imperial Institute's "Bulletin" and the Department of Science and Agriculture's "Rubber and Balata in British Guiana." He says these trees are to be found scattered about the forests of the colony generally, but more particularly in those bordering the banks of the rivers or streams of the North West District, the Pomeroon, and the lower Essequibo rivers. "Estimates made in certain localities in the upper Amakura-Barima District, where these trees are reported to grow most plentifully, indicate that in certain localities they only number about 30 to the square mile." Mr. Anderson reports that the tree reaches at maturity an average girth of 60 inches and a height of about 60 feet, but that they occasionally attain much greater dimensions. The trees occur mostly in the western part of the colony, on the upper Amakura River, Barima River from Morawhanna upwards and its tributaries, the Barama and the Waini rivers, the upper Pomeroon and the lower Essequibo River, but that in the forests on the Demerara, Berbice, Canje, and Corentyne rivers they are either very scarce or not found at all.

Mr. Anderson says that there is reason to believe that at present the name *Sapium Jenmani* is applied generally to rubber-producing *Sapiums* and other *Sapiums*, such as *Sapium Hemsleyanum, Huber,* growing on the coast lands or in the forests and also known by the name of "Mabua," yielding a latex of a more or less sticky nature, and of no value. The Hya-hya, two species, also yield a copious flow of latex, which when dry forms a hard substance. Mr. Anderson says that the milk of this tree has been stated to be drinkable, but he does not recommend it. The latex of these trees, also the balata (bully) tree, *Sapotacae ficus*, is of no commercial value.

It will be remembered that among the proposals of the Balata Committee was the improvement of means of communication by means of wireless telegraphy. The Chamber of Commerce has now received proposals from the Anglo-French Wireless Company, Limited, which it has sent on to the Government, offering to erect and install seven stations at Georgetown, Zisingaatugalso Pass (on the Brazilian Boundary), Morawhanna, Bartica, Wismar, Omai (for the Potaro District), and Arnida Post (for the Rupununi District), at a cost between $10,000 and $15,000 erected. This estimate coincides with the estimate made a year ago by John Alsing, assistant government electrician. The Council of the Chamber of Commerce hopes that the scheme may have the favorable consideration of the Government.

Mr. Edward Edwards, local attorney for Ed. Maurer & Co., New York has been appointed to act as attorney of the Amsterdam Balata Co.

The exports of Balata to November 7, were 460,648 lbs., as compared with 833,022 lbs. to November 7, 1911.

THE AMERICAN-MEXICAN RUBBER AND COFFEE CO.

We published the notice in our December number of the incorporation in New York State of the American-Mexican Rubber & Coffee Corporation with its principal office at Ithaca. A request sent the secretary of the company for some information regarding its operations elicits the following interesting paragraphs:

"The corporation owns about 17,000 acres of valuable land about 30 miles north of Tapachula, State of Chiapas, Mexico, and near the Huixtla Station. We have about 2,800 acres of land in coffee consisting of 1,000,000 trees, ages from one to fourteen years—about 1,400 acres in bearing from which was sold last year over 1,100,000 lbs. of coffee. We also have about 2,500 acres in rubber containing over 950,000 trees, averaging from one to seven years. We expect to begin tapping next year, although a few of the trees are old enough to tap this fall.

"We own our own electric light plant which furnishes light and power for the plantation; also our own telephone system with over thirty miles of telephone wire connecting the different sections. The Pan-American Railway crosses the property affording prompt shipments. The majority of the directors and stockholders of this corporation are also interested in the Mexican Coffee Co., which is incorporated under the laws of New York State, for $100,000 owning 3,000 acres adjoining the property of our new corporation, and which has paid 10 per cent. dividends since its incorporation."

ENGLISH AUTOMOBILE IMPORTS AND EXPORTS.

For the nine months ending September 30, 1912, English imports of motor cars and parts equaled $27,263,425, against $22,825,965 for the corresponding period of 1911. Exports for the same periods represented $12,662,685, as compared with $10,633,010 in 1911. Development is thus shown in both directions; England importing to double the extent of the automobile exports.

These figures referring to automobiles in general, and thus including the high priced French machines, it is of interest to note the statement in the "Carriage Monthly," that the English imports of American automobiles during the first half of last year, represented 3,327 cars of the average value of about $1,000. It is added that:

"The low-priced American car has made the automobile a possibility for a large number of Englishmen, who could not have afforded to pay the price of the higher priced English cars, and has taught the British public to appreciate a vehicle that is reliable and economical in operation, even though some of the refinements to which they had become accustomed may be wanting."

British makers having specialized in cars at $2,000 and upwards, there is said to be at present apparently little prospect of American cars of that type obtaining a substantial footing in the English market.

THE NEW SUPERINTENDENT OF SINGAPORE BOTANIC GARDENS.

It is announced that Mr. J. H. Buckill, hitherto attached to the Indian Botanical Service, has been appointed by the British Colonial Secretary to replace Mr. H. M. Ridley as superintendent of the Singapore Botanic Gardens.

Some Rubber Planting Notes.

STATISTICS OF LEADING PLANTATION COMPANIES.

FIGURES of leading plantation companies for the entire year 1911 as compared with the first nine months of 1912 show following results:

	Year 1911. lbs.	9 months, 1912. lbs.
Highlands & Lowlands Pará Rubber Co..	633,024	618,180
Anglo-Malay Rubber Co.....	780,972	608,090
Linggi Plantations 1,064,500		776,000
London Asiatic Rubber & Produce Co..	352,688	472,400
Grand Central (Ceylon).....	406,061	389,960
Damansara (Selangor) Rubber Co.....	383,745	385,340
Lanadron Rubber Estates.....	375,846	392,990
Kapar Pará Rubber Co.....	330,861	369,360
Seafield Rubber Co.....	308,461	332,650
Sungei-Kapar Rubber Co.....	338,480	325,200
Gula Kalumping Rubber Estates.....	243,040	315,900
Pataling Rubber Estates Syndicate....	333,044	315,480
Consolidated Malay Rubber Estates...	401,897	314,810
Seremban Rubber Estate.....	363,344	305,810
Batu Caves Rubber Co.....	261,605	261,200
Total for year 1911.....6,577,568		
Total for 9 months, 1912.....		6,183,370

Thus the output of 15 leading companies reported for the first nine months of 1912 was nearly as large as it had been for the entire year 1911.

LATEST CROP REPORTS.

The cabled reports of the larger companies to November 30 show a continued increase as compared with last year. Thus the Anglo-Malay reports 813,649 pounds as compared with 692,786; while the London Asiatic does still better with 624,581 pounds against 301,039. Selaba records 288,928 pounds as compared with 176,043. The gain in the output of the smaller companies is in some cases in even a higher proportion.

TANDJONG RUBBER CO., SUMATRA.

The crop for the year ending June 30, 1912, of the Tandjong Rubber Co. was 34,864 pounds, exceeding the estimate by 4,864 pounds; the average yield being 108 pounds per acre. The net average price realized was 4s. 4.46d. per pound, against f. o. b. cost of 3s. 2.18d. per pound. The relatively high cost is owing to the recruiting of additional coolies, and the expenditures caused by inaugurating tapping. By the fact that the estimate for 1912-13 is 180,000 pounds, and the estimated cost reduced to 2s. 3d. per pound, the prospect of a large number of trees being about to come into bearing is indicated.

LANGEN (JAVA) RUBBER ESTATES.

According to the report presented to the annual general meeting of December 3, the original estimate for the year ending September 30 was 42,000 pounds; afterwards raised to 92,500 pounds. The amount actually harvested during that period was 145,633 pounds, the cost being 2*s.* 3.86*d.* per pound and the average net price realized 3*s.* 11½*d.* The estimate for the current year is 250,000 pounds; a reduction in cost being anticipated.

UNITED MALAYSIAN RUBBER COMPANY, LIMITED.

Prominence is given by the "Malay Mail" to a statement made to the shareholders by the secretary of the United Malaysian Rubber Co., to the effect that good progress is being made, reports of which would be published in due time.

UNITED SERDANG (SUMATRA) RUBBER PLANTATIONS.

In the report presented to the shareholders at the annual meeting of December 1, of the above company, the crop secured up to the date of the accounts was shown as 534,979 pounds, against a quantity of 218,000 in the previous year. The estimate for the year (ending August 31) had been 433,000 pounds. For the current year the estimate is 921,000 pounds.

A satisfactory feature recorded, was that the growth of the rubber is excellent, as well as the renewal of the bark, these conditions being attributed to the system of wide planting carried on throughout the estate. This system has promoted the renewal of the bark, which, it is added, is the capital of the rubber tree.

TANGKAH RUBBER ESTATE (JOHORE).

According to the report for the year ended September 30, 1912, presented to the shareholders' meeting of December 16, the crop of rubber amounted to 54,000 pounds against an estimate of 40,000 pounds, and a quantity for 1911 of 17,413 pounds. The estimate for the year ending September, 1913, is 100,000 pounds.

In order to develop the estate, the installation for an up to date factory has been shipped; while orders have been placed for a suction gas engine and the necessary washing mills. The cultivated area is 1,600 acres.

BOTANICAL GARDEN FOR SUMATRA.

According to the Batavia "Niewsblad," the local Director of Agriculture has gone to Medan, Sumatra, with the object of finding a suitable location for a Botanical Garden. Many of the larger planting companies are said to be interested in the project and have offered their land to the government to help the work. The general opinion in Sumatra is that such an institution would materially help experimental planting work and would afford much information as to the most suitable methods of cultivation.

KAMERUN AND CONGO RUBBER.

From the results of a botanical investigation undertaken by Herr C. Ledermann by order of the German Geographical Commission, it would seem that Kamerun is much behind the Congo in the preparation of rubber by the natives. In the latter territory every factory has a drying house, while Mr. Ledermann could not discover a single one in Kamerun.

He considers the higher value of Congo rubber, particularly Kassai, as being due to its judicious treatment by the Belgian buyers, who cut it, remove impurities as far as possible by beating and kneading, and reject every piece of crude rubber found to be adulterated.

It is added that if similar care were exercised in Kamerun, rubber from that quarter would command a higher price. Kamerun trees yield a good product, and the natives are not unskilled as rubber collectors. They must, however, be trained to deliver only rubber of good quality.

RUBBER IN FRENCH WEST AFRICA.

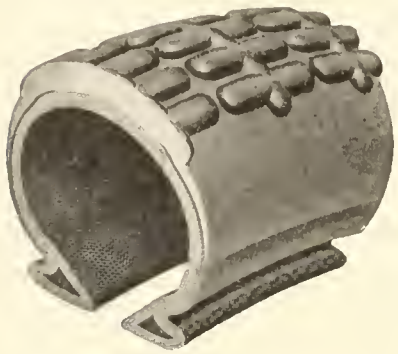
President Falliéres has recently approved an ordinance for the regulation of crude rubber gathering in the French West African territories. The Governor-General of West Africa had urged upon the government the need of such a measure, in order to prevent the depreciation of the article on the European markets.

According to this ordinance, the preparation and sale of crude rubber is forbidden in other form than in slabs or cakes of the maximum thickness of one centimeter (two-fifths of an inch); in crepe, or in very thin strips. Gathering from rubber plants is prohibited every year during a period not exceeding three months, to be fixed by the Lieutenant-Governor of each Colony. During this time, business in rubber can only be carried on in French West Africa with a certificate that the rubber was gathered before the commencement of the close season.

New Rubber Goods in the Market.

NEW GOODRICH SAFETY TREAD TIRE.

RAISED tread formation in any style does not of itself constitute a non-skid tire. It is the arrangement of it which offers resistance to any slipping or skidding movement. In the case of the traction engine, the cross-bars or strips attached to the rim of the wheel bite into the road, giving the necessary hold against slipping, thus allowing the bulky engine to be propelled up and down hill, and over all kinds of roadway.

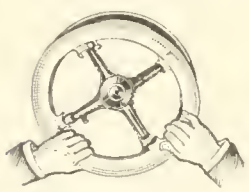


The application of this principle to the tread of an automobile tire has been engaging the attention of the B. F. Goodrich Co., and the apparent difficulty in the matter has been overcome by means of a series of longitudinal bars, broken into cross sections and strengthened by the cross-bars. In this way there is in reality a double series of raised projections, with the cross-bars holding against forward slipping and the longitudinal bars gripping the pavement and lessening the possibility of side slipping.

The double set of bars is distributed so as to prevent any punching in at any point on the fabric construction. In this way the cross-bar principle of traction wheels is adapted to automobile tire tread construction, being modified to meet rubber tire conditions. [B. F. Goodrich Co., Akron, Ohio.]

"STEEREASE."

For the prevention of slipping through the hands, it has been customary to wrap motor steering wheels with twine, rope, tap etc. Apart from the fact that such a wrapping is apt to chafe the hands, its efficacy for the purpose intended has been questioned.



With the object of meeting this difficulty a new device, "Steerease," has been introduced. This is manufactured from a fine quality of rubber, specially molded, and constructed to fit the steering wheel of the various motor cars and trucks. Being slightly corrugated, it prevents any slipping of the hands in wet weather, while there is no bunching, caused by the slipping of the cover upon the wheel.

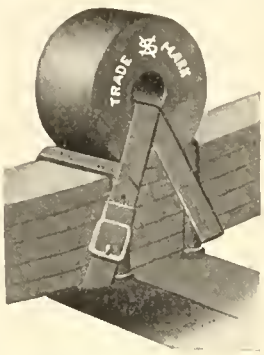
"Steerease" is easily applied. After thorough cleaning and the consequent removal of all moisture and grease, it is stretched over the wheel, the edges being made to fit closely together. These are turned back and the cement applied; being allowed to spread as much as possible. The wheel is firmly wrapped with tape and allowed to stand overnight, being then unwrapped. [Goodyear Rubber Hose and Packing Co., Philadelphia.]

RUBBER GLOVES FOR SURGEONS.

At a recent German medical congress, Dr. Krömer, of Greifswald, gave particulars, illustrating that specially prepared rubber gloves afforded greater antiseptic protection than any other description. The importance of these preventives in cases where the coating of the stomach of the patient had been injured was particularly dealt with.

THE ESSEX BUMPERS.

Among the prominent features of the Essex Rubber Co.'s line of automobile accessories are their very elastic and pliable rubber spring bumpers. These are made from high-grade stock, and retain their elasticity without becoming hard from old age. With the object of conforming to different kinds of springs, they are made in various shapes and sizes; the oblong being in three sizes, from 6½ to 8¼ inches in length, 1⅜ to 1¾ in. width, and 3 to 4 in height. The round bumpers (illustrated herewith) are likewise made in three sizes from 1½ to 2 inches in width, and from 3¼ to 3¾ in. diameter. One special advantage of the Essex Bumpers is that they will at certain times prevent the springs from breaking, when subjected to a sudden jolt.



Seeing the important functions of the spring buffer, the value of its reliability is self evident. This consideration is specially met by the Essex Rubber Co's products of this class, which are the results of close study of existing requirements.

The "Essex Outside Hook-on Boot" is also proving very popular among many users of automobiles. It is made of fine duck and high grade rubber. [Essex Rubber Co., Inc., Trenton, New Jersey.]

ANDERSON NEVERSLIP CUSHION HEEL.

The Anderson Patent Neverslip double cushion heel is said to be a triumph in rubber heel manufacture. Among its other features, claim is made that it is self-leveling and arch-supporting. It is further claimed that it is unusually resilient and will absolutely prevent slipping. The patentee, William G. Anderson, of the Sudbury Building, Boston, is offering this heel to rubber manufacturers on royalty.

MR. EGGERS INVENTS A NEW MOLD.

A new type of mold adapted for the manufacture of both hard and soft rubber specialties, which produces excellent results and costs less than the old kind, is now being made under his own patents by William Eggers, the well-known rubber machinist of Brooklyn, New York. The weight of the new molds is much less, consequently they are more easily handled; and because of the thinner material, they are more susceptible to heat and more uniform in vulcanization. The molds are so constructed that they cannot warp and are said not to be adversely affected by heat. The metal of which they are made, while less expensive than the material formerly used, takes a very high polish, giving the rubber product a fine finish. These molds are being used by prominent manufacturers, who state that they have used them with much success.

Commercial Arbitration: A Hopeful Outlook.

By Charles L. Bernheimer in the "Independent."

WHEN the New York Chamber of Commerce turned its attention to commercial arbitration, the fundamental and controlling purpose was to find a remedy for the law's delays, which President Taft, before his inauguration and many times since, declared "Amount in many cases to a denial of justice." In the final analyses one could hardly be charged with overstatement in saying that the law's delays are at the bottom of many of our present civic, political and economic disorders.

During the one hundred and forty years of its existence, the Chamber of Commerce has attempted to provide commercial arbitration in three distinct ways: The first failed because no method to enforce the award was provided; the other two because they attempted too much, for the promoters had in mind a Court of Commerce for merchants exclusively, fashioned after the Old World Handelsgerichte and Tribunaux de Commerce. Differences in laws, customs and viewpoints made such a scheme impracticable in our country.

A more modest attempt seemed in order, and quite within the realm of practicability. The controlling features of the plan now in operation under the ægis of the Chamber of Commerce, are the following:

First: Strict adherence to the provisions of the Code of Civil Procedure as found, and acceptance of their opportunities and obligations.

Second: Formal submission of the dispute, strictly in accordance with the formalities and safeguards prescribed by the existing law.

Third: Provision for a list of official arbitrators.

Fourth: Waiver of the revocation provision in the law; we are, of course, aware that there is still some question as to whether this right to revoke can be waived, but dependence has been placed upon the honor of those submitting to a tribunal instituted by and composed of fair-minded, public-spirited fellow merchants. Nothing in our experience has yet occurred to lessen this faith.

These are some of the things the New York Chamber's system actually accomplishes:

It saves money, time and trouble to the merchant, law office and State. It supplies "technical" skill for judicial decisions because, with the large membership of the Chamber (covering practically every phase of business and commercial life) the disputants can select arbitrators specially familiar with the technical and industrial data of the specific business involved.

It affords a medium for conciliation: The antagonism present in a lawsuit is lacking. Instead there is in the attempt at arbitration itself—a recognition of and respect by each side for the other's contention. In the atmosphere of openmindedness thus created, an amicable adjustment is frequently reached without actual arbitration.

It assures an absolutely impartial award—one that commands the respect of the disputants, the courts and the legal profession.

It establishes commercial equity: It applies the rule of reason to the actual facts, and it renders an award that is final and binding, one that *has the force and effect of a Supreme Court decision.* It admits of the disposal of a dispute within a short time, sometimes within twenty-four hours after it arises.

It offers the disputants the opportunity to select their own court, judge and jury; to designate the time of trial and hearing. They may, before the arbitrators selected by them, subpoena witnesses and compel the production of books and papers as they could in a court of law.

The number of cases that can be handled simultaneously by the Chamber is limited only by the number of arbitrators on the "official list," and this may be extended to include as many as fifteen hundred names.

The procedure is exceedingly informal. Usually the parties communicate with the Chamber for information; then they are referred to the chairman of the arbitration committee and supplied with a handbook of arbitration. The chairman arranges a meeting—with both parties, where possible—and, after hearing an explanation of the matter, endeavors to bring about a settlement "out of court," if he can. In other words, he attempts by conciliation to avoid both arbitration and litigation—as would a conscientious lawyer. And in a large number of the cases considered, such informal hearings have brought a satisfactory adjustment.

If arbitration is finally determined upon, the parties decide through which of the three methods available the arbitration is to proceed. A formal submission signed by both parties is placed before the committee on arbitration, which first judges whether or not the case is one that they can handle. The rules permit them to decline a case for any reason that appears to them good and sufficient.

The date of the hearing is set for a time that will suit all concerned—arbitrators and disputants. It takes place in one of the rooms of the Chamber of Commerce; the hearings and results are private, and are inaccessible even to the members of the Chamber expect by order of the arbitration committee.

In proceeding the arbitrator is sworn in before a notary or justice of the court; the arbitrator in turn places the witnesses under oath. The arbitrator then asks either of the parties to acknowledge the genuineness of the submission and to explain the situation in his own way, just as he views it, and also to present any documentary evidence he desires, and, if he has witnesses, to produce them. After the witnesses have been duly sworn, their testimony is taken. The same general method is followed in hearing the opposition. An informal cross-examination, or any other form of investigation best suited, follows, of course with the assent of both parties, under the control of the arbitrator. The proceedings are taken down by a court stenographer, and the award, including disposition of the expense item, is carefully worded and forwarded to both parties. When the submission is handed in a deposit of $60 is required from each party. This serves to defray incidental expenses, such as stenographer's fees and $10 per day—the compensation of each arbitrator. The arbitrator decides in his written award how this shall be paid and by whom. Any balance is returned to the parties.

This ends the work of the Chamber.

The law provides that the prevailing party may file the award with the Supreme Court any time within a year, and obtain judgment thereon. The court must confirm the award unless it is not in accord with the submission, or was obtained by fraud or undue influence, or shows partiality; or in case adjournments were warranted and were refused. Should the award of the arbitrator contain errors that do not affect the merits of the decision upon the matters submitted, the court must modify or correct them. Ordinarily (invariably, so far in our experience) the award has been complied with without an application to the court.

Arbitration by the Chamber is not limited to its members, nor even to citizens of this country. It serves impartially every business man bringing to it his honest differences with

another—whether he be a resident of this country or a foreigner.

The Committee on Arbitration has been frequently asked concerning its attitude toward the legal profession. The citing of a case submitted to the Chamber of Commerce about a month ago will answer:

The disagreement concerned lawyer's fees a law firm could not collect from its client. Both the lawyer and the client submitted the case to the committee and were represented by attorneys who argued the case for them. It was determined in two hearings and both parties write that they cannot speak too highly of the patience, ability and fairness displayed by the arbitrators.

The National Association of Credit Men are sympathetic in this arbitration work, keenly realizing, as they do, that a business man's assets are quickly vitiated by unsettled or pending lawsuits tying up his capital.

If the national, state and municipal governments will encourage arbitration in some form similar to that instituted by the New York Chamber of Commerce, by providing for arbitration of the disputes or differences arising between it and those furnishing supplies and labor, the number of bidders will be vastly increased and the prices and terms necessarily become more favorable to the Government. From 10 to 20 per cent. can undoubtedly be saved in its operation in this manner. At present the number of bidders on contracts is reduced because the average competent merchant, through business prudence, refuses to bid lest a dispute arise and leave him very little redress except through a lawsuit.

International commercial arbitration on its broadest basis seems a fair possibility: a system whereby the award rendered by a Chamber of Commerce of one country will be accepted and enforced by that of any other signatory to this agreement—as court decisions in one country are respected by the courts of any other country with which it is at peace.

In its very simplicity of procedure lies a great part of the strength of our plan; for the legal technicalities that, to the layman's mind so often obscure the real issue in litigation, are entirely lacking.

A FINE CATALOG OF HYDRAULIC MACHINERY.

R. D. Wood & Co., Phila., Pa., have recently issued their catalog No. 7 descriptive of hydraulic machinery for rubber mills. This is a handsome booklet of 36 large pages 8 x 11 inches in size, with effective cover of heavy paper. The company illustrates only one of its foundries—that situated in Camden; but practically all the entire 36 pages contain fine illustrations of the different hydraulic tools and machinery manufactured by this company for use in rubber mills. Among these machines so illustrated are the following: Hydraulic Operating Valves, two-pressure type; High-pressure Stop Valves, balanced type; High-pressure Check and Stop Valves, unbalanced type; Pressure Relief Valves; Closing Press; Heater Press, standard type; Heater Press, Goodrich Patent; Tire Bead Press, eight-column type; Tire Bead Press, goose-neck type; Tire Bead Press, two-opening type; Tire Bead Press, twin type; 700 Ton Rubber Press; Steam Platen Press, single-opening type; Steam Platen Press, special type; Steam Platen Press, two-opening type; Steam Platen Press, multiple-opening type; Die Chilling Press; Laboratory Press, 100-ton capacity; Tire Forcing Press, hand operated; Tire Forcing Press, power driven; Horizontal Two-plunger Pump, cross-head pattern; and Hydraulic Accumulators, inverted type.

The illustrations are to be commended not only for the artistic way in which the engraver and printer have done their work, but for the exceedingly fine detail which enables the prospective purchaser to get almost as good an idea as he would if examining the machine itself.

ONE REASON WHY SHOES BLOOM.

IF there is anything a rubber shoe manufacturer dreads more than another it is "BLOOM." It is certainly the worst fate that can befall him. It is a continuous nightmare to know that even one shoe taken out of stock shows signs of bloom.

A frequent and most generally understood reason for this trouble is that the shoes are under-cured, but there are instances when it is quite certain that the cure is complete and correct, and that shoes placed side by side in the same heater, and at unquestionably the same temperature, show that something is wrong, inasmuch as some show bloom, while on others there is none.

It usually takes a long investigation in a matter like this. Probably the very next heat will fail to show any trouble whatever.

It is my purpose to show *one* of the causes. The temperatures in the chamber were found to be correct, the varnish was right, the compounds were chemically correct; and so I finally landed where we frequently do land viz.: crude rubber. I found the trouble. We were using Centrals,—"Esmeralda" in particular. Examination of the rubber hanging up showed that about 10 per cent. of it was soft and mucky. A sheet would show some usually hard, and some soft; another sheet was all hard; while again some was falling on the floor. I mixed three batches of shoe upper stock, using three selections of the rubber, the hard, the soft, and a combination of the two. The three sheets were cured together, wrapped on a mandrel. The results were sufficient to convince anyone.

The *hard* rubber was what it should be—fully cured and elastic. The combination of *hard and soft* was under-cured quite a little in comparison, and bloomed in three days. The *soft* rubber sample bloomed in two hours; the elasticity was almost nil.

Further work in the laboratory showed the sulphur in combination varied greatly; the good sample contained practically no free sulphur, while the soft rubber had taken up such a small amount that 78 per cent. of the amount used was still in a free state, and, of course, commenced to work its way out and show in the form of bloom.

Other rubbers than "Esmeralda" act this way. Ceylons in particular need watching, while the sweated Congos are dangerous, but not so much so as the Centrals and Ceylons.

SUPERINTENDENT.

INDIA-RUBBER GOODS IN COMMERCE.

EXPORTS FROM THE UNITED STATES.

OFFICIAL statement of the values of exports of manufactures of india-rubber and gutta-percha for the month of October, 1912, and for the first ten months of five calendar years:

MONTHS.	Belting, Packing and Hose.	Boots and Shoes.	All Other Rubber.	TOTAL.
October, 1912.....	$236,900	$134,028	$606,963	$977,891
January-September .	1,888,433	1,014,688	6,016,371	8,919,492
Total, 1912.....	$2,125,333	$1,148,716	$6,623,334	$9,897,383
Total, 1911.....	1,909,150	1,487,563	5,935,113	9,331,830
Total, 1910.....	1,759,590	1,906,961	4,687,399	8,353,950
Total, 1909.....	1,469,272	1,288,705	3,478,438	6,236,415
Total, 1908.....	1,049,641	1,157,136	2,940,309	5,147,086

THE above heading, "All Other Rubber," for the month of October, 1912, and for the first nine months of two years, include the following details relating to tires:

MONTHS.	For Automobile.	All Other.	TOTAL.
October, 1912 .....*values*	$225,704	$42,465	$268,169
January-September	2,533,635	443,443	2,977,078
Total, 1912.....	$2,759,339	$485,908	$3,245,247
Total, 1911.....	2,080,517	480,915	2,561,432

News of the American Rubber Trade.

A VERY FINE PORTRAIT OF GOODYEAR.

EVERYBODY familiar with Boston remembers the Goodyear Rubber House on School street. It was there for many years and was one of the landmarks of the older city. The proprietor of that rubber house was Robert Josselyn, and he had among his most prized possessions an old photograph of Charles Goodyear, bearing his signature. A niece of Mr. Josselyn, Miss Frances Chamberlin, is a portrait painter of distinction, and she has reproduced a large portrait in oils from this old photograph. The illustration below is a small reproduction of this oil painting. While this cut, of course, gives but an inadequate idea of the painting, at the same time it conveys at least a suggestion of the excellence with which the work has been done. Not only is the face full of character, but it is unquestionably one of the best likenesses extant of the famous old rubber pioneer.

A NEW PORTRAIT OF GOODYEAR.

RUBBER IN CONGRESS.

An appeal was recently introduced in Congress by Representative Raker of California, providing for the appropriation of $5,000 for the investigation and study of the methods of growing and testing sage-brush and grease-wood for the production of rubber, alcohol and acetic acid. $5,000 will not cover the normal expenses of a large number of inspectors over a protracted period of time, but still, if the bill is passed, it would be an official recognition of the possibility of producing rubber from plants indigenous to the United States.

UNITED STATES RUBBER CO.'S FOOTWEAR PRICES, 1913.

The United States Rubber Co. has issued its new gross price list on Rubber Footwear, which goes into effect on January 1, 1913. The discounts are the same as those announced on February 1, 1912, which include a premium of 5 per cent. for early orders.

Where certain styles are packed both in bulk and in cartons, a common gross price has been made, which is the carton gross price. This change was made at the request of the wholesale and retail trade of this country.

TIRE EXPORTS INCREASING.

Tire exports from the United States show a substantial increase for the year just passed over the preceding year. The value of the exports for the first nine months of 1912 amounted to $3,025,736 as against $2,375,268 for the same period in the preceding year—being an increase of over 30 per cent.

THE GUTTA PERCHA & RUBBER MFG. CO., OF TORONTO, LTD., TO BE REORGANIZED.

There is to be a reorganization of The Gutta Percha & Rubber Manufacturing Co. of Toronto, Limited, whose factories are located in Toronto (Parkdale). The reorganization will take effect as of January 1, 1913. The company has carried on an extensive business throughout Canada, and by export to various parts of the world for over a quarter of a century, having been incorporated as a purely Canadian industry under the Ontario Joint Stock Companies' Act in 1887.

As the business of the company grew, it became necessary to open branches in many places. At some points these branches were operated under the name of "The Gutta Percha & Rubber Mfg. Co. of Toronto, Ltd.," but in the Prairie Provinces the business has been conducted at Winnipeg and Calgary through a subsidiary company, The Winnipeg Rubber Co., Ltd., and in British Columbia through another subsidiary company, the Vancouver Rubber Co., Ltd. The directors and shareholders of the company have now decided to operate in all its branches under one name and at the same time adequately care for and develop its very large and constantly increasing business. To this end, application has been made for a Dominion charter under the name "Gutta Percha & Rubber, Limited," with an authorized capital of $6,000,000. The new company will be controlled by the same interests and be under the same management as the old. It will acquire all the trade-marks, patents, properties and good-will of the old company and, as heretofore, will be an entirely independent concern without connection or affiliation with any other company in or out of Canada.

CALENDARS, CARDS AND BOOKS RECEIVED.

The handsome calendar is a souvenir of which the trade never tires—as a calendar of some sort is obviously a necessity, and quite as obviously, a handsome calendar is preferable to one that cannot be so described. A number of desirable calendars have been received at this office.

The Lebanon Mill Co., Pawtucket, Rhode Island, which manufactures knitted fabrics, has favored its customers with a very dainty calendar, the full size of which is about 9 x 20 inches. It consists of a reproduction in water color effects of a handsome young woman set off with a sizeable corsage bouquet of violets and pansies. A unique feature of this calendar is its multiplied mounting—the picture being mounted on a drab board, which in turn is mounted on grey, and that again mounted on a piece of drab—the whole being tied at the top with a pearl grey ribbon. Its delicacy would suggest that as a rule this calendar would be carried home rather than being left in the office.

The Derby Rubber Co., Derby, Connecticut, engaged in the manufacture of reclaimed rubber, has a calendar somewhat similar in its general appearance to the one described above, but different in its dimensions. This is about 14 inches square. It has a water-color face on a panel at one side, and is tied with a silk cord at the top. This panel also has a double mounting—first on a heavy cream cardboard, and that in turn upon a board of green. This calendar, like the one mentioned above, is suited for home consumption.

The Apsley Rubber Co., Hudson, Massachusetts, has supplied its customers with one of those exceedingly convenient desk memorandum calendars with a week on each page and enough space opposite each day to make any important memoranda that it may be necessary to make. The calendar is 5½ by 8½ inches in size and has a cover and a mount of mottled green printed in gold, which gives it a rich and artistic effect.

The New Jersey Rubber Co., Lambertville, New Jersey, manufacturing reclaimed rubber, is distributing a number of "The Handy Memorandum Desk Calendars" which have a page for every day in the year, the front of the page giving the day of the month and underneath that in small type three whole months, while on the back there is ample space for any memoranda. The leaves are 3 by 4 inches in size, which gives abundant writing space. These leaves are intended to be placed on the little metal frames that are familiar to users of this sort of calendar. A good many business men wouldn't feel that they could start their day's work until they had turned over a page in one of these familiar desk conveniences.

The American Asphaltum and Rubber Co., of Chicago, Illinois, has favored its customers with a very convenient little leather pocket-book, having a pocket at one side containing a celluloid calendar for 1913, and on the other side a memorandum pad supplied with a number of small memorandum slips about 2½ by 4 inches in size. This is a souvenir that anybody might be pleased to get.

The Dunlop Tire and Rubber Co., Toronto, Canada, has distributed a little Christmas booklet of 16 pages and cover printed in red and green and black, giving in a humorous vein the story of its 20 years of successful operation.

White & Reid, rubberizers of textile fabrics, Hoboken, New Jersey, have mailed to many members of the rubber trade an engraved folder ornamented with a spring of holly, extending the compliments of the season, and wishing their customers and all their employees a happy and prosperous New Year.

The Derby Rubber Co., Derby, Connecticut, has favored some of its friends with a particularly convenient pocket memorandum book 3½ x 5½ inches in size, having a flexible leather cover in which is inserted a pad of about 100 leaves provided with a sheet of carbon paper, so that one may not only make a memorandum, but also keep a copy of the same. The leaves are perforated at the top so as to be easily detached. An additional pad goes to complete the equipment—a very great convenience—particularly for the traveling man who wants to send a memorandum to the home office and still keep a copy himself.

The Selby Shoe Co., Portsmouth, Illinois, mailed at Christmas time to its customers, a seasonable card ornamented with gilt bells and holly sprigs, carrying the company's good wishes for a happy Christmas and a prosperous New Year.

LECTURING ON RUBBER.

Mr. C. H. Guild, Jr., connected with the general manager's office of the United States Rubber Co., and son of C. H. Guild, treasurer of the Woonsocket Rubber Co., gave a lecture recently in Brooklyn (to which the "Brooklyn Eagle" devoted nearly half a column) on "The Biography of a Rubber Shoe from the Tree to the Foot," in which he described the processes through which rubber goes from the time it leaves the tree as cream-like latex to the time that it goes on the foot as a rubber shoe—and beyond that through its post-mortem and revivification as reclaimed rubber. Mr. Guild illustrated his lecture by samples of crude rubber, and by making a shoe where all the spectators could watch the operation.

There is so much interest in rubber these days because of the extremely important position it occupies among the industries of the world that a good lecturer on the subject can always command an attentive audience.

PRINTERS WHO PRINT ON RUBBER.

Printing establishments are innumerable in this country, as the output of literature of one sort or another is voluminous and unceasing; but printers who print on rubber are scarce. The

ROGER-WILLIAMS PRINTING CO.

Roger-Williams Printing Co., of Providence, Rhode Island, print on all kinds of rubberized fabrics. They print a great many handsome designs in many colors, as was shown in THE INDIA RUBBER WORLD for last March. Their work has been very successful, and they have been compelled recently to add considerably to their quarters. This added space is shown in the cut of the building given below. They print in fast colors that have been thoroughly tested and are guaranteed not to injure rubber in any way.

SCHRADER TAKES THE TWITCHELL PATENT.

A. Schrader's Son, Inc., of New York, has acquired the entire right, title and interest in the Twitchell tire gauge patent. This acquisition, together with the Schrader patents already owned by the company, places the entire tire pencil-gauge business in the hands of this company.

THE UNITED STATES RUBBER CO.

THE daily press of late has been devoting an unusual amount of attention to the affairs of the United States Rubber Co. Some Western papers—particularly Chicago and Cleveland papers—have felt quite positive that there was to be some sort of a merger between the United States Rubber Co. and the B. F. Goodrich Co.—either that the United States would absorb the Goodrich or that the Goodrich would absorb the United States—or that they would mutually combine—each half absorbing the other, and forming a company representing in capitalization and bond issues a quarter of a billion dollars.

RUMORS OF CONSOLIDATION DENIED.

But all these rumors are industriously denied by the officers of the United States Rubber Co., on one hand, and the officers of the B. F. Goodrich Co., on the other. Notwithstanding these denials, some of the Western papers have exploited the topic at a considerable length, stating that the competition between the two great corporations was being felt keenly by both—and particularly in the tire department—and that a consolidation would be greatly to the interest of both. It seems hardly likely, however, in the present—and prospective—attitude of the people at Washington, that any such merger will be attempted.

6 PER CENT. COMMON DIVIDEND?

Another theme to which certain members of the daily press have devoted some attention is the possibility of an increase of dividend on the common stock of the United States Rubber Co. The "Christian Science Monitor" of Boston, in a recent issue, contained this interesting paragraph:

"In connection with the recent advance in the common stock of United States Rubber it is rumored that the dividend would be increased from 4 to 5 per cent. There is, however, excellent authority that the new rate will be 6 per cent. Action may be taken next month and it may not be taken for three months, it is said."

The "New Haven Register," a publication that from time to time prints quite a little information about the big rubber company, discourses as follows:

"It is understood that including undivided profits of its various subsidiaries the company is earning so far this fiscal year at the rate of 20 per cent. on its former $25,000,000 common stock. This is at the rate of 16 per cent. on the present outstanding common. From a neglected issue, Rubber common has become a considerable center of speculative activity, largely on buying of interests closely identified with the directorate.

"While it is too early as yet to talk definitely regarding a further increase in the common dividend rate, there are bankers close to the company who expect to see 6 per cent. within the next eighteen months."

But, as stated in our December issue, inquiry at the head office of the company in New York brings the answer that increase of dividends on the common stock is a subject that has received no consideration by the directors of the company.

The directors of United States Rubber Co. at their meeting December 5, voted to authorize the officers of the company to carry out the action of the stockholders last spring providing for the retirement of the Second Preferred Stock of the company by the purchase of the same and the issue of three shares of First Preferred Stock for each four of Second Preferred Stock. They also voted to offer to the outside holders of the Rubber Goods Manufacturing Co. Preferred Stock—amounting to $2,413,900—the privilege of exchanging their stock for the First Preferred Stock of the United States Rubber Co.

At a meeting of the directors of the General Rubber Co., held on the same date, action was taken for the increase of the capital stock of the company from $5,000,000 to $10,000,000 to provide additional funds for the investments of that company in the Far East. All matters pertaining to the Crude Rubber interests of the United States Rubber Co. are handled through the General Rubber Co.

THE UNITED STATES TIRE ANNOUNCEMENT.

The publicity department of the United States Tire Co.—one of the constituents of the United States Rubber Co.—makes the following announcement regarding the company's tire plans for the coming year:

"The greatest daily output ever considered possible in tire manufacture is provided for in next year's plans of the United States Tire Co. This concern, which operates four great plants, plans an expenditure of over $3,000,000 in factory improvements and extensions. First of all, the Morgan & Wright plant, which is located in Detroit, is to be doubled in both area and production. An idea of the extent to which this factory will be increased may be gained from the fact that whereas its employes now number 2,500, 6,000 workmen will be required when all the improvements are finished. The output of the factory will be in excess of 5,000 tires daily.

It is planned to erect sixteen new factory buildings, ranging in size from 2,000 square feet to 131,000 square feet. Among these will be a finely appointed laboratory, where the scientific experimental work incident to the manufacture of automobile tires can be carried on; several vast warehouses, and at least half a dozen great manufacturing buildings—the largest of these to be 230 x 60 feet and six stories high. A big new power plant also will be installed, doubling the boiler capacity of the factory. When all of this work is finished, the Morgan & Wright plant will have a floor space of more than 1,000,000 square feet, twice its size at the present time.

"In addition to its big Detroit factory, the United States Tire Co. operates extensive rubber works in Indianapolis, Hartford and Providence, and it is the intention to increase the facilities of all these plants. At Indianapolis a building 80 x 170 feet and six stories high is being erected. At Providence another structure, 75 x 300 feet and three stories high, will be added, while at Hartford a fine new power house and power plant have been installed at a cost of more than $175,000."

THE DOMINION RUBBER CO.

The Dominion Rubber Co., of Toronto has just been organized by a number of prominent Toronto men, with a capital of one million dollars, to engage in the manufacture of all kinds of automobile, truck, bicycle, motorcycle and carriage tires, and a full line of belting, hose, packing, etc. The plant will be built in Toronto, and will be of considerable size. Mr. John J. Main, former vice-president and general manager of the Polson Iron Works of Toronto, director of the Dominion Radiator Co., and president of the Policyholders Life Insurance Co. of Toronto, is the managing director; Mr. W. R. Blowers, who resigned from the Independent Tire Co. of Toronto, some time ago, is general factory manager, and W. Deane Tyrer is the general manager of sales.

A NEW TIRE COMPANY FOR BRIDGEPORT.

The Polack Tire & Rubber Co., is not exactly a new company. The original Polack Company began business in 1863 in Waltershausen, Germany, making fire hose and other rubber goods. When the auto industry came into being the Polack company took up the manufacture of tires on a very large scale. It employs 2,000 hands at its big German plant, and has in addition thriving plants in Paris; Shepherd's Bush, England, and Sydney, Australia. In all of its factories it makes a high grade solid truck tire, and also a line of pneumatic tires. It has been looking for some time for a location in the United States, and has decided upon Bridgeport, Connecticut, where it has secured a small factory building, formerly occupied by a copper company. It is installing machinery and intends to start in the manufacture of tires in a small way immediately. It hopes later to build its own factory in Bridgeport with equipment for a very large output. This plant is in charge of Herman W. Polack, the company's vice-president.

PERSONAL MENTION.

Mr. William Keyes, formerly with Prescott Bros., Boston, is now traveling in the South for the Chicago Rubber Clothing Co., of Racine, Wisconsin, and has booked some very large orders for "at once" and future delivery.

E. T. Carnahan has resigned from the sales force of the Swinehart Clincher Tire & Rubber Co., and will travel in the East for the Firestone Tire Co., with headquarters at Buffalo.

T. B. Goodlee has been made manager of the United States Tire Co., Atlanta branch. He was formerly manager of the company's branch at Richmond, where he has been succeeded by J. G. Given from the Philadelphia organization. The United States Tire Co.'s branch in Dallas, Texas, is now under the management of W. F. Gordon, formerly with the United Motor Co., Dallas. This branch covers the States of Texas, Louisiana, Mississippi and part of Alabama.

MR. MINITER WITH RAYFIELD.

N. H. Miniter, who for several years has been sales manager of the Stromberg Motor Devices Co., has resigned his position with that concern and is now associated with the Findeisen & Kropf Manufacturing Co., of Chicago, as factory sales manager. He will in future represent the Rayfield Carbureter throughout the country.

F. C. HOOD, GENERAL MANAGER.

On December 1, 1912, Mr. F. C. Hood retired as treasurer of the Hood Rubber Co., and will hereafter act as general manager, with his office at the Factory Administration Building in Watertown, where the company has consolidated all its business offices including the purchasing department, foot-wear sales department, tire sales department, and accounting department. Mr. A. N. Hood will succeed Mr. F. C. Hood as treasurer, and Mr. J. E. Stone will become assistant treasurer, with offices as heretofore at 103 Bedford street, Boston.

A DIAMOND PIN FOR MR. CROCKER.

Mr. Isaac Crocker, treasurer of the Hope Rubber Co., of Providence, the company that operates a chain of rubber stores through New England and the Middle States, sailed for Florida and the Panama zone a few days ago, and just before sailing he was decoyed by his employes into one of the Providence hotels, given a Christmas dinner, and presented with a handsome diamond stick-pin. Mr. Crocker was taken quite by surprise, but responded appropriately to the complimentary speech of presentation.

AN ALDEN CHRISTMAS CAROL.

Geo. A. Alden & Co., of Boston, are famous for the individual character of their advertising. They are now sending out to the trade a little booklet of 4 pages and ornamental cover, entitled "Wishing You A Me Rry Xmas," etc., in which it will be noticed that certain letters in "Merry Christmas" represent the famous M. R. X rubber substitute manufactured by the company. The opening stanza of the carol is as follows:

"'Twas the night before Christmas,
When all through the mill,
M. R. X. made by Alden
Was used with good will."

And the rest of the carol maintains this same poetic level.

VALIDITY OF THE ADAMS TIRE TREAD PATENT.

In July, 1911, Judge Platt, in the United States District Court, Hartford, Connecticut, declared against the application of the Calvin T. Adams patent, No. 609,320, to heavy automobile tires, in the suit of the Metallic Rubber Tire Co., against the Hartford Rubber Works Co. On the dismissal of the suit, the plaintiffs appealed, with the result that Judge Platt's decision has been reversed in the Court of Appeals by Judge Noyes.

The patent is for preventing the yielding tires of bicycles and other wheeled vehicles, from slipping in the roadway, as they are particularly apt to do when the roadway is smooth and wet.

THE CHICAGO RUBBER CLOTHING CO.'S NEW FACTORY.

The Chicago Rubber Clothing Co., of Racine, Wisconsin, will have completed by January 15 a new three-story and basement brick factory, mill construction, 62 feet wide by 117 feet long, the upper floor of which will be devoted to the manufacture of men's and women's "Slip Ons," both single and double texture. They have installed a number of new and up-to-date machines and this new factory—combined with a 50-foot addition to their spreading department—will enable them to double their output. The year just closed has been the most successful the company ever had in its 28 years.

THE PORTAGE CO. DOUBLES ITS OUTPUT.

The Portage Rubber Co., incorporated in the state of Ohio, and capitalized at $1,000,000, is putting up a new building to add to its plant in Barberton, Ohio. When this building is completed the company expects to double the output of its auto tires and tubes.

ANOTHER HOPE STORE.

The Hope Rubber Co., which already had nine rubber stores that do both a wholesale and retail trade, has now added a tenth store, situated at Portland, Maine. Its chain of stores covers most of the New England States and one or two of the Middle States. They are operated by Mr. Isaac Crocker, treasurer of the company, who is located at the Providence, Rhode Island, store.

TWO BIG FINES.

Suit has been brought by the United States government against the American Stepney Spare Wheel Co., and the Neumastic Tire Co. A fine of $10,000 is claimed from each company, for failure to make returns under the corporation laws.

THE UNDERWRITERS' LABORATORIES AND THE INSULATED WIRE INDUSTRY.

Editor, INDIA RUBBER WORLD:

In a recent number of the "Journal of Industrial and Engineering Chemistry" (November, 1912, page 856) Mr. G. H. Savage, a rubber specialist well known in the chemical fraternity, calls attention to the Cottle Extraction Apparatus designed by G. T. Cottle of the New York Insulated Wire Co.

It appears from the article that the Underwriters' Laboratories have borrowed—to use a euphemism—the design of the apparatus and the "Methods of Analysis." The author states that the "Methods" are actually the joint work of several chemists of the insulated wire industry, who completed the work without the smallest assistance from the Underwriters' Laboratories. After several unessential changes these instructions were actually published as the "Underwriters Laboratories Methods for Chemical Tests of Rubber Compounds, etc." This attitude of the Official Laboratory of the National Fire Protection Association is interesting in view of the Editorial which appeared in THE INDIA RUBBER WORLD for December, 1912. CHEMIST.

UNITED STATES TIRE CO. ENLARGING BRANCH SYSTEM.

In addition to the changes in staff of agents noted elsewhere the United States Tire Co. is opening new sub-branches at Washington, D. C.; Newark, New Jersey; Birmingham, Alabama; Rochester, New York; and Milwaukee. It is also in contemplation to open sub-branches at Providence; Worcester, Massachusetts; Baltimore; Syracuse, New York; as well as Columbus and Toledo, Ohio.

PROPOSED AUTO ROAD ACROSS CONTINENT.

AT a banquet attended by some 300 Indiana automobile manufacturers and dealers, the amount of $800,000 was subscribed towards the construction of a macadam roadway from New York to San Francisco. The length of the road would be 3,349 miles, and the total estimated cost $25,000,000.

THE CHEMIST AND THE ENGINEER IN THE RUBBER INDUSTRY.

In a recent circular letter to the rubber industry, Messrs. Frederic Dannerth and Hubert E. Collins announce the opening of their new office in New York City. The announcement incidentally points out to the rubber manufacturer, several lines along which the consulting chemist and the consulting engineer can be of service to the several departments in the rubber works. It is probably well known to many of the leading manufacturers, that Messrs. Dannerth and Collins have rendered such services for a considerable period, but the announcement states the character of the work concisely and clearly. Those who have not yet received copies of the announcement can secure one by sending a post card request to their offices at 110 West 34th street, New York. Mr. Collins has been practising as a consulting engineer since 1902, and has in that time acquired a reputation as an expert in power plant efficiency. His professional work has taken him from coast to coast and as far south as the city of Belem-Pará, the hub of the wild rubber industry. Mr. Frederic Dannerth has back of him an extended experience as a consulting industrial chemist, and has devoted a large part of his time to problems peculiar to the rubber industry. His activity as advisory chemist to rubber manufacturers has never been given publicity, chiefly because such services are, as a rule, confidential and "not for publication." This attitude toward his clients has won for Mr. Dannerth an enviable reputation.

THE EMPIRE TIRE AND RUBBER CO.

The Empire Tire and Rubber Co., Trenton, New Jersey, has been incorporated with a capital of $1,000,000—$500,000 common stock and $500,000 preferred stock—to take over the business of the Empire Rubber Manufacturing Co. and the Empire Tire Co. The officers of the new company are Charles H. Baker, president; C. Edward Murray, treasurer, and A. Boyd Cornell, secretary.

NEW OFFICERS FOR REPUBLIC RUBBER CO.

At the directors' meeting of the Republic Rubber Co. on November 27 the following elections were made: L. T. Petersen was chosen first vice-president, succeeding L. J. Lomasney, deceased. John H. Kelly was chosen second vice-president and director, succeeding L. T. Petersen as second vice-president. A. H. Harris was chosen a director of the company, filling the remaining vacancy on the board.

THE MYSTIC CO. REORGANIZES.

The Mystic Rubber Co., located in West Medford, Massachusetts, for the past three years, manufacturing dress shields, rubber sheeting and rubber specialties, has reorganized under the same name with the following officers: Herman T. Dean, president; William B. Marshall, vice-president; Herbert A. Derry, general manager. Edmond N. Warner will continue in charge of the factory, acting as superintendent. They are negotiating for new machinery and expect to branch out in several lines. This plant has a most advantageous location.

A NEWARK TIRE CO.

The "Best Tire Co.," of Newark, completed its permanent organization on December 7. The president is S. L. Henry, of Newark, the secretary and treasurer is Edward Spillane, and the board of directors are S. L. Henry, Edward Spillane and Martin Walker. The office of the company is at the above address, which is also to be the sales office. The capital stock is $125,000 divided into 125,000 shares, all common. The company has purchased the right to manufacture and sell an automobile tire that is constructed on a new model and which is a radical departure, both in design and principle, from any of the tires so far proposed or placed on the market.

TRADE NEWS NOTES.

THE Atlas Tire Co., incorporated in New York, with salesroom at 1771 Broadway, New York, is engaged in the wholesale and retail jobbing of tires and tubes of all standard makes and is now arranging for factory facilities for the manufacture of special brands of casings.

The general tendency of tires seems to be in the direction of the larger sizes, but the American Tire & Rubber Co. of Akron has just sent out some tires that show a distinct movement in the other direction. These tires are half an inch thick and only 2¼ inches in diameter. They evidently are not intended to go on any wheels now in existence, but rather are intended to go on the desk or table—probably as paper weights—though in reality they would serve an excellent purpose as mats, under a stein, for instance.

The John W. Wood Elastic Web Co., of Brockton, Massachusetts, intends to build an addition to its factory, 60 x 80 feet, with fireproof material. This will about double the factory's manufacturing facilities.

The Lyon Rubber Co., of Akron, Ohio, has awarded a contract for a two-story and basement factory.

The Connecticut Mills Co., Danielson, Connecticut, is installing a 50 per cent. increase in its equipment, which is expected to be ready for operation early in February.

The De Leon Tire and Rubber Co., Trenton, New Jersey, incorporated a few weeks ago, with a capitalization of $500,000, is getting bids through the architects for a two-story factory, 245 x 60 feet.

The Chicago Rubber Clothing Co., Chicago, Illinois, expects soon to build a two-story factory, 126 x 60 feet.

It is reported that George M. Anderson and J. S. McClurg, of Akron, Ohio, and N. F. Sanford, of Pittsburg, are looking for a site in Pittsburg for a rubber reclaiming mill.

The Independent Tire Co., of Guelph, Ontario, expects very soon to have its plant in operation.

The American Hard Rubber Co., College Point, New York, expects to make a three-story addition to its present plant.

The Seamless Rubber Co., New Haven, contemplates an addition to its plant, 60 x 100 feet and two stories high.

Plans have been filed for the erection of a four-story brick factory to cost $225,000 for the Goodyear Improvement Co., of Akron, Ohio, at Long Island City, New York.

The Canadian Consolidated Rubber Co., Ltd., has declared regular quarterly dividends of 1¾ per cent. on its preferred and 1 per cent. on its common stocks, payable Jan. 1, to holders of record Dec. 21.

The Walpole Rubber Co. has declared the regular quarterly dividend of 1¾ per cent. on preferred stock and 1 per cent. on common, payable Jan. 15 to stock of record Jan. 1.

The Continental Rubber Works, of Erie, Pennsylvania, have been for a number of years producing an extensive line of bicycle tires, the distinguishing mark of which was and is a knurling—or indentation. The Continental Works have recently served notice on tire manufacturers who have been using this registered trade-mark, which, as already stated, is characterized by a zig-zag corrugation, that they will take action against concerns—either making or selling—tires bearing this mark. It is especially used by the Continental Rubber works for the purpose of individualizing their single tube bicycle tires.

The Wellington Rubber Co., with headquarters at 79 Milk street, Boston, and a factory located at Medford, Massachusetts, are doing spreader work and making carriage automobile goods, as well as cloth for surface clothing. It is a Massachusetts corporation with a capital of $25,000. The president is F. F. Silliman, and the treasurer E. B. Silliman.

TRADE NEWS NOTES.

The Motz Tire and Rubber Co., of Akron, Ohio, which has hitherto been represented in New England by an agency, has now established a branch factory in Boston.

The Bourne Rubber Co., of Providence, Rhode Island, has commenced the manufacture of automobile tires, its product being designated as the "Bourne-Goodyear" tire. It has, however, no connection with any other tire company.

The Tire Core Co., of America, New York, the Eastern distributor of the Dahl tire filler, has filed schedules in bankruptcy.

Contracts have been awarded for the erection of a factory building at Clermont and Atlantic avenues, Brooklyn, by A. Schrader's Sons, Inc., makers of the well known Schrader valves and tire gages.

The Etablissements Bergougnan, of Clermont-Ferrand, France, the large tire makers, are preparing to open a branch selling office in New York City, for the purpose of introducing their tires in the American trade. They are said to contemplate subsequently establishing a factory in America.

The Seamless Rubber Co. have removed from 2007 Broadway, to 250 West Fifty-fourth street, New York, from which address the entire United States sales are now handled; the offices of the company being also located there.

The Atlas Tire Co., New York, has been registered to deal in motor car tires.

The Dayton Airless Tire Co., of Dayton, Ohio, has recently opened a branch at 803 Race street, Cincinnati.

The McNaull Automobile Tire Co., of Toledo, Ohio, has increased its capital from $50,000 to $75,000.

The Detroit Puncturine Company, recently incorporated, is making a compound intended to heal punctures in tires, and cure in the envelope.

A meeting of the stockholders of the McGraw Tire Co., of Pittsburgh, is called for January 27, to consider a change in the by-laws.

The Dayton Airless Tire Sales Co., of Cleveland, Ohio, has been incorporated to deal in automobile tires and supplies.

For the cultivation of south western business, the Cutting Motor Car Co., of Jackson, Michigan, is about to establish a factory at Kansas City; from which point the trade of Missouri, Texas, Oklahoma, Kansas and New Mexico will be handled.

The L. & M. Co-operative Tire Association, Chicago, has been registered under Illinois laws, to deal in motor car tires.

Various changes are reported in the western staff of the Diamond Rubber Co. H. M. Fauvre has been promoted from the management of the Indianapolis branch to that of the Chicago branch, being succeeded at the former point by O. C. Reavell, from the Kansas City office.

The Universal Wheel Co., Fort Wayne, Indiana, making punctureless auto wheels, has let the contract for the erection of its $150,000 plant.

The Heilbron Rubber Co. has opened up premises at East Union street, Pasadena, California, where "Gibraltar" tires will be kept in stock.

Ballon & Wright, the well-known Portland (Oregon) jobbers, are about to open a branch store in Seattle, Washington, under the management of A. J. Jones, former manager of the United States Tire Co.'s branch at the latter point.

The Mosher Rubber Co., of Los Angeles, has been purchased by Franz O. Nelson, former branch manager of the Diamond Rubber Co., and Frank T. Price, a Diamond tire adjuster. They will deal in tires and perform vulcanizing work.

RUBBER IMPORTS NOW AND TEN YEARS AGO.

The value of manufacturers' materials imported into this country during the year 1912 exceeded $900,000,000—or double what it was ten years ago. Of this great importation about $100,000,000 will represent the importation of crude rubber. The figures for the entire year are not now at hand, but for the ten months ending with October 31, the crude rubber imports amounted to 97,000,000 pounds valued at $82,000,000 which would bring the total for the year about 120,000,000 pounds with a valuation close to the $100,000,000 mark. The figures for the same ten months of 1902 were 41,000,000 pounds with a value of $20,000,000.

RUBBER LEADS IN RAW MATERIAL IMPORTS.

According to advance sheets of the statistics for the fiscal year 1912, the imports of the principal raw materials for that year were:

India rubber, gutta percha and substitutes	$105,034,556
Hides and skins	102,371,585
Silk	69,796,848
Chemicals, etc.	58,167,903
Tin	46,227,460
Copper	45,045,222
Wool	14,454,234

Rubber thus takes the lead among industrial raw materials imported; being with the exception of coffee, the largest article of import.

IMPORTS OF CRUDE RUBBER.

The total is given below of the imports of crude rubber into the United States for the 12 months ending June 30, during the last three years, and for the 10 months ending October 31, for the same period. It will be noticed that the imports for 1911 were materially below those for 1910, but that the increase for 1912 carried the figure considerably beyond that for 1910.

FOR FISCAL YEARS ENDING JUNE 30.

	Pounds.
1910	101,044,681
1911	72,046,260
1912	110,210,173

FOR TEN MONTHS ENDING OCTOBER 31.

	Pounds.
1910	77,691,446
1911	66,334,189
1912	97,308,544

THE REPORT FROM PUTAMAYO.

Consul Stuart Fuller, who was sent by the American government to investigate the atrocities in the Putamayo district in Peru, and particularly to discover if—as has been stated by the Peruvian government—these atrocities have been entirely stopped, has returned to the United States with his report. He reached Washington on December 23, and immediately conferred with the officials of the State Department. The contents of his report have not been made public, but there is ground for the surmise that cruelty is still being practised upon the defenceless natives in that unhappy country; and it is believed that the report presents a very delicate problem for the State Department to handle; especially as many of the rubber gathering interests in that country are in the hands of British citizens.

THE JANUARY AUTO SHOWS.

As noted in THE INDIA RUBBER WORLD of December, the automobile manufacturers will hold their annual shows from January 11 to January 25. The two shows will take place concurrently in Madison Square Garden and at the Grand Central Palace; the second week, beginning January 20, being specially devoted to motor trucks, delivery wagons and accessories. The Chicago show follows from February 1 to 8.

RUBBER TRADING CO. ELECTS NEW OFFICERS.

At a recent meeting of the stockholders of the Rubber Trading Co., Collier W. Baird and Robert L. Baird were elected directors, and later at a directors' meeting, Collier W. Baird was elected assistant treasurer, and Robert L. Baird was elected assistant secretary.

WILLIAM T. BAIRD,
President and Treasurer.

This company—one of the most important in the crude rubber field—had its inception in March, 1902, and since that period has developed to its present important growth.

The Rubber Trading Co. today enjoys the confidence and patronage of a very large number of the rubber manufacturers of this country and Canada, and has through effective methods and honest management established a most lucrative and extensive business. Its European connections are of a very desirable character and its buying facilities excellent.

The home offices are located at 38 Murray street, New York, with connections in principal rubber centers. The company handles practically every variety of crude rubber, and its offerings are invariably regarded as dependable.

The gentlemen comprising the executive staff of the Rubber Trading Co., at this time are Mr. William T. Baird, president and treasurer; Robert B. Baird, vice-president and secretary; Collier W. Baird, assistant treasurer and Robert L. Baird, assistant secretary. Mr. William T. Baird who from 1892 until 1902 was prominently identified with The New York Belting and Packing Co., of which he was—during the latter period of his connection—the secretary. Later he was identified with the Mechanical Rubber Co., as secretary and treasurer; so that when he came to the Rubber Trading Co., he brought a wide experience which has contributed in no little degree to the success of that organization, and he is today recognized as one of the most effective credit men in the rubber trade.

ROBERT L. BAIRD,
Assistant Secretary.

The vice-president and secretary of the company is Robert B. Baird, who from 1892 until 1899 was connected with The New York Commercial Co., and George A. Alden & Co., and from 1899 until the start of the Rubber Trading Co., operated under his own name. Mr. Baird conducts the selling end of his concern and it is a safe assumption that there is no more successful, popular, or competent crude rubber salesman in the trade today, and the volume of business which has resulted from his efforts may no doubt be ascribed in a large measure to his unusual energy, honest representation, and to "the smile that won't come off."

ROBERT B. BAIRD,
Vice-President and Secretary.

Mr. Baird spends a large proportion of his time in traveling through the various rubber centers of the country, where he is very well known, and where his presence is always welcome. He is naturally of a very cheerful and helpful disposition, and he has always had the confidence and respect—not only of his customers but of competing rubber men as well. In 1911 Mr. Baird went to London as the commissioner of the Rubber Club of America to the Second International Rubber and Allied Trades Exhibition, and incidentally toured Europe with his family. During his visit he called on various members of the trade in Great Britain and on the Continent, cementing many old friendships and establishing a number of new and profitable connections.

COLLIER W. BAIRD,
Assistant Treasurer.

Robert L. Baird, son of Mr. Robert B. Baird, and the present assistant secretary of the Rubber Trading Co., became identified with the company in 1907, and at the present time he is well and favorably known to the rubber manufacturing trade.

Collier W. Baird, who is now assistant treasurer of the company, is the son of Mr. William T. Baird, and is a graduate of the Sheffield Scientific School of Yale. His connection with the company commenced September 16, 1910, and he has already shown remarkable aptitude in his department.

Recent Patents Relating to Rubber.

UNITED STATES OF AMERICA.

ISSUED NOVEMBER, 1912.

NO. 1,043,961. Quick demountable block-tire. P. B. Bosworth, assignor to the Firestone Tire & Rubber Co.—both of Akron, Ohio.

1,043,062. Tire-grip. R. A. Breul, Bridgeport, Conn.

1,043,075. Resilient wheel. F. E. Day, Everett, Mass.

1,043,143. Tire fabric. H. K. Raymond, assignor to The B. F. Goodrich Co.—both of Akron, Ohio.

1,043,149. Life-saving device. J. Schwab, Winnipeg, Manitoba, Canada.

1,043,208. Means for mounting punctureless tires on wheel-rims. B. Dahl, Minneapolis, Minn.

1,043,373 Tread for tires, etc. G. C. Taylor, Helsby, England.

1,043,407. Pneumatic tire. A. A. Dennis, Grand Rapids, Mich.

1,043,424. Tire-removing tool. H. Hevey, Biddeford, Me.

1,043,525. Elastic-webbing. W. Kops, assignor to Kops Bros., New York.

1,043,571. Resilient wheel. D. L. Crosbie, Sacramento, Cal.

1,043,620. Bottle-closure. J. Marian, Pressburg, Austria-Hungary.

1,043,642. Resilient-tire. H. A. Stoneham and C. T. Schwarze, South Orange, N. J.

1,043,647. Hose-Reel. C. Wagner, Grantwood, N. J.

1,043,658. Tire-rim. J. D. Anderson, Kansas City, Mo.

1,043,677. Pneumatic cushion for vehicles. J. O. Davis, Pawnee, Okla.

1,043,752. Tire-supporting case. E. R. Bolz, Somerville, Mass.

Designs.

42,214. Vulcanizer. A. M. Baugh, Omaha, Neb.

Trade Marks.

57,833. La Crosse Rubber Mills Co., La Crosse, Wis. Indian-head in a circle. For rubber boots and shoes.

59,300. The Miller Rubber Co., Akron, Ohio. The letter *M* in a circle. For adhesive rubber-cement and rubber-tire dough for repairing rubber articles.

59,904. Imperial Rubber Co., New York. The word *Premier*. For rubber belting, etc.

60,721. Edward James, Cleveland, Ohio. The word *Gyroheel*. For rubber heels.

61,248. Charles A. Daniel, Philadelphia, Pa. The letters *aniel* inside a large *D*. For rubber and fabric packing.

63,853. The Diamond Rubber Co., Akron, Ohio. The letters *XX*. For bicycle and all kinds of vehicle tires.

63,854. The Diamond Rubber Co., Akron, Ohio. The number 400 and word *Tandem*. For bicycle and all kinds of vehicle tires.

63,855. The Diamond Rubber Co., Akron, Ohio. The number 1930. For bicycle and all kinds of vehicle tires.

63,856. The Diamond Rubber Co., Akron, Ohio. The word *Ixion*. For bicycle and all kinds of vehicle tires.

63,891. The Diamond Rubber Co., Akron, Ohio. The word *Python*. For rubber belting, valves, etc.

63,892. The Diamond Rubber Co., Akron, Ohio. The word *Unicorn*. For bicycle and all kinds of vehicle tires.

63,893. The Diamond Rubber Co., Akron, Ohio. The word *Clipper*. For rubber belting, valves, etc.

63,894. The Diamond Rubber Co., Akron, Ohio. The word *Defiance*. For rubber belting, valves, etc.

ISSUED NOVEMBER 12, 1912.

1,043,828. Vehicle-wheel. J. B. Hayden, San Angelo, Tex.

1,044,013. Hose-protector. R. W. Burnett, Montreal, Quebec, Canada.

1,044,015. Pneumatic insole and arch support. M. Byrne, San Francisco, Cal.

1,044,222. Rubber-heel. J. Mladezki and P. Wenk, Chicago, Ill.

1,044,260. Waterproof flower-stem protector. E. Schloss, New York.

1,044,294. Resilient top piece for the heels of boots and shoes. H. Thorne, Melbourne, Australia.

1,044,324. Adjustable elastic automobile-wheel. P. Wilkes, Cleveland, Ohio.

1,044,328. Detachable rim for vehicles. M. Wolff, Chelsea, England, assignor to Messrs. Michelin & Cie, Clermont-Ferrand, France.

1,044,352. Vehicle-tire. W. C. Cleghorn, Bloomington, Ill.

1,044,355. Shoe-dauber. J. R. Cygon, Annapolis, Md.

Trade Marks.

65,559. Near-Air Tire Co., St. Louis, Mo. The words *Near Air*. A compound filler for non-metallic tires.

66,208. Vulcanized Rubber Co., New York. The word *Senorita*. For rubber combs.

66,263. The Republic Rubber Co., Youngstown, Ohio. The letter *R* over an eagle and wreath design.

ISSUED NOVEMBER 19, 1912.

1,044,174. Vulcanizer. B. R. Barder, Akron, Ohio.

1,044,495. Hose-coupling. T. Clegg and G. Gee, Calgary, Alberta, Canada.

1,044,512. Cushion-tire. H. A. Fry and G. J. Bruce, Spring Lake, Wis.

1,044,522. Resilient wheel. A. Frederick, Hawksley, Fairhaven, England.

1,044,540. Rubber heel. F. W. Kremer, Carlstadt, N. J.

1,044,619. Resilient hub for vehicle-wheels. E. Yoder, Tulsa, Okla.

1,044,652. Buoyant wearing-apparel, cloth, and other article. K. Hartwig, assignor to Hartwig-Gesellschaft, m. b. H. Berlin, Germany.

1,044,703. Tire-protector. S. Stern, Albuquerque, N. Mexico.

1,044,737. Nipple. F. H. Bowly, New York.

1,044,779. Tire-signal. G. T. Hackley, Los Angeles, Cal.

1,044,888. Wheel-tire. F. Householder, Guthrie, Okla.

1,044,890. Elastic fabric. W. Kops, assignor to Kops Bros., New York.

1,044,947. Corset. E. Temple, London, England.

1,044,951. Resilient wheel. T. E. Van Der Werken, Green Island, New York.

1,044,977. Protective covering for hats and the like. H. Berlin and M. J. Fogarty, New York.

1,045,018. Demountable rim. E. L. Gold and J. H. Messinger, Nazareth, Pa.

1,045,042. Garment clasp. M. Krischer, New York.

1,045,053. Method of producing a rubber-containing product. A. E. Merritt, Gainesville, Ga.

Trade Mark.

65,693. Hood Rubber Co., Boston, Mass. The words *Country Club*. Rubber boots and shoes.

ISSUED NOVEMBER 26, 1912.

1,045,214. Sectional tire. B. C. Swinehart, Youngstown, Ohio.

1,045,346. Tire-making machine. T. J. Whalen, New Brunswick, N. J.

1,045,402. Pulsator for pneumatic milking. C. V. Henrichsen, Copenhagen, Denmark.

1,045,456. Nursing nipple. A. H. Tatum, assignor to Whitall Tatum Co., New York.

1,045,495. Tire-inflating pump. H. K. Austin, Reading, Mass.

1,045,543. Elastic tire for wheels. C. H. Genth, Philadelphia, Pa.

1,045,544. Wheel-tire. C. H. Genth, Philadelphia, Pa.

1,045,574. Rupture-truss. A. Loewy, Berlin, Germany.

1,045,601. Toy bottle. W. C. Parsells, Ellenville, N. Y.

1,045,661. Spring-wheel. J. Baird, Detroit, Mich.

1,045,760. Tire-inflator. W. A. Vinson, Heraldsburg, Cal.

1,045,762. Rubber mats. E. P. White, Chicago, Ill.

[NOTE.—Printed copies of specifications of United States patents may be obtained from THE INDIA RUBBER WORLD office at 10 cents each, postpaid.]

GREAT BRITAIN AND IRELAND.

PATENT SPECIFICATIONS PUBLISHED.

The number given is that assigned to the Patent at the filing of the application, which in the case of these listed below was in 1911.

**Denotes Patents for American Inventions.*

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, NOVEMBER 6, 1912.]

16,490. Inflating rubber articles by diffusion. A. Staehler, 1 Hessische strasse, Berlin.

16,560. Molding tire covers. J. S. Stocks, Chapeltown, Leeds, and G. W. Bell Fulstone, Mile End Lane, Stockport.

16,570. Washing or wringing machines, etc. E. Bentley, 149 Beeches avenue, Bradford Road, Keighley, Yorkshire.

16,604. Wrapping fabrics round pneumatic tyres. Soc. A. Olier et Cie., Usines St. Remy, Clermont-Ferrand, Puy de Dome, France.

16,606. Working crude rubber. Soc. A. Olier et Cie., Usines St. Remy, Clermont-Ferrand, Puy de Dome, France.

16,803. Pneumatic tire-cover. A. J. Boult, 111 Hatton Garden, London.

16,812. Pneumatic cushion for tires. E. R. Riedinger, 84 Upper Kennington Lane, and A. Fraser, 6 Atherstone Terrace, Kensington—both in London, England.

16,855. Use of layers of india-rubber in boots. A. G. Knight, Wickham, Hampshire.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, NOVEMBER 13, 1912.]

16,949. Supports for rubber tires. O. H. Hinds, Le Mars, Iowa.

17,124. Extracting resin from rubber. W. Hiestrich (Nachfolger), 4 Jungfernstieg, Hamburg, Germany.

17,125. India-rubber. W. Hiestrich (Nachfolger), 4 Jungfernstieg, Hamburg, Germany.

17,182. Flexible tires. J. Souden, 10 Oswald Road, Edinburgh, Scotland.

17,261. Pneumatic cushion in tires. W. Woodland, 34a Melville Road, Walthamstow, London.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, NOVEMBER 20, 1912.]

*17,406. Caps for fountain pens. J. Blair, 6 John street, New York, U. S. A.

17,578. Tire attachments to rims. T. D. Staples, 1 Coronation Cottages, Exning Road, and C. Peck, Sefton Lodge—both in Newmarket.

17,582. Feeding-bottles. B. E. D. Kilburn, Chancery Lane Station Chambers, London.

17,624. Block tires. H. P. Haas, 112 Boulevard de la Senne, Brussels.

17,643. Tongue-cleaning appliances. M. Balaban, Barlow Moor Road, West Didsbury, Manchester.

17,689. Locating punctures in tires. B. G. Burchell, 10 Dalkeith Place, Kettering.

17,700. Wheel tires. D. Maggiora, 1 Albany street, Regent's Park, London.

17,726. Purifying india-rubber. M. Kochnitzky, 204 avenue Brugmann, and A. Friedl, 81 avenue du Midi—both in Brussels.

17,789. Moulding-process. L. Penkala, 7 Rue Condorcet, Courbevoie, Seine, France.

17,808. Wheel and mud guards. E. Newman, 1 Leonard street, City Road, London.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, NOVEMBER 27, 1912.]

17,888. Rubber seed shells in fuel composition. Williamsons, Ltd., Savage Gardens, and W. S. Curtis, 19 Lancaster Road, Ealing—both in London.

*17,956. Rubber casing in rectal appliances. T. Weaver and D. M. Ennis, 1529 Prospect avenue, and I. O. Crittenden, 8920 Wade Park avenue—both in Cleveland, Ohio., U. S. A.

17,992. Rubber hand stamps. A. H. Rogers, 22 Temple street, Springfield, Mass., U. S. A.

17,998. Winding wire, etc., on cores. W. Furstenberg, 54 rue Scheutveld, Anderlecht, near Brussels.

18,045. Springs for fastenings, straps, etc. M. Alberiz, 28 Muhlenbach, Cologne, Germany.

*18,079. Couch rolls in paper machinery. W. H. Millspaugh, Sandusky, Ohio, U. S. A.

18,075. Rubber cements. C. Jearsain, 5 bis, rue Sebastien Gyrphe, Lyons, France.

18,146. Pneumatic cushions for tires. T. H. Holroyd, 34 Morley Road, East Twickenham, Middlesex.

18,234. Vulcanizing solid tires to metal bands. J. Reuse and C. Reuse, Quai au Charbon, Hal, Belgium.

18,258. Rubber gymnasium shoes. North British Rubber Co., Castle Mills, Fountainbridge, and E. C. Clark, 156 Craiglea Drive—both in Edinburgh.

THE FRENCH REPUBLIC.

PATENTS ISSUED (with Dates of Application).

442,704 (March 23, 1912). A. Thevenin. Leather protector against wear and bursting of pneumatic tires.

442,800 (April 23). G. Gerli. Tanned and parchmented leather cover for pneumatic tires.

442,862 (April 23). M. Giraud. Elastic vehicle tire.

442,878 (June 29, 1911). C. Morel. Elastic vehicle tire.

442,893 (April 29, 1912). W. W. Byam. Improvements in elastic tires and wheel rims.

442,974 (March 11). J. Gand. Demountable pneumatic tire in 3 parts, with non-wearing and non-bursting band.

442,980 (March 21). Ostromislensky and Bogatyr Rubber Manufacturing Co. Process for obtaining isoprene by means of dipentenes, their isomers and analogues.

442,981 (March 21). Ostromislensky and Bogatyr Rubber Manufacturing Co. Process for obtaining rubber by means of chloride and bromide of vinyl.

442,982 (March 21). Ostromislensky and Bogatyr Rubber Manufacturing Co. Process for obtaining rubber by means of isoprene and analogous bodies.

443,156 (April 30). J. M. Thevenet. Elastic vehicle tire.

443,180 (April 30). Ober & Co. Apparatus for vulcanizing covers of pneumatic tires.

443,222 (May 1). W. Mascord. Improvement in elastic tires.

442,991 (March 30). Ostromislensky and Bogatyr Rubber Manufacturing Co. Manufacture of rubber or analogous substances by means of halogene compositions and organic substances.

443,322 (May 2). Heinemann and Boehm. Manufacture of tires.

443,333 (April 26). "Tenax" Tire Co. Tires for heavy automobiles.

443,275 (July 10, 1911). A. Pinel. Manufacture of gum or mucilage from carob seeds.

443,338 (April 27, 1912). J. Giraud. Fixed double faced rubber heel.

443,511 (May 8). G. Chapelet. Protected pneumatic automobile tire.

443,546 (March 5). De Laski & Thropp Circular Woven Tire Co. Machine for manufacture of pneumatic tires.

[NOTE.—Printed copies of specifications of French patents can be obtained from R. Bobet, Ingenieur-Conseil, 16 avenue de Villiers, Paris, at 50 cents each, postpaid.]

THE GERMAN EMPIRE.

PATENTS ISSUED (with Dates of Validity).

254,371 (September 1, 1911). Farbenfabriken, vorm. F. Bayer & Co., Elberfeld. Process for production of substance resembling rubber.

253,517 (August 7, 1910). Process for manufacture of products resembling rubber. Dr. H. Noerdlinger, Flörsheim, Germany.

253,518 (August 7, 1910). Process for manufacture of elastic masses. Dr. H. Noerdlinger, Flörsheim, Germany.

253,519 (August 7, 1910). Process for manufacture of products resembling rubber. Dr. H. Noerdlinger, Flörsheim, Germany.

253,854 (November 13, 1910). Machine for washing crude rubber, etc. Crude Rubber Washing Co., London.

254,196 (January 12, 1911). Process for preservation and improvement of latex. Dr. G. Eichelbaum, Augsburger Strasse 8, Berlin.

THE KINGDOM OF BELGIUM.

PATENTS PUBLISHED.

249,236 (1912). Wenjacit G. m. b. H., Hamburg. Preparation of an elastic and plastic substance.

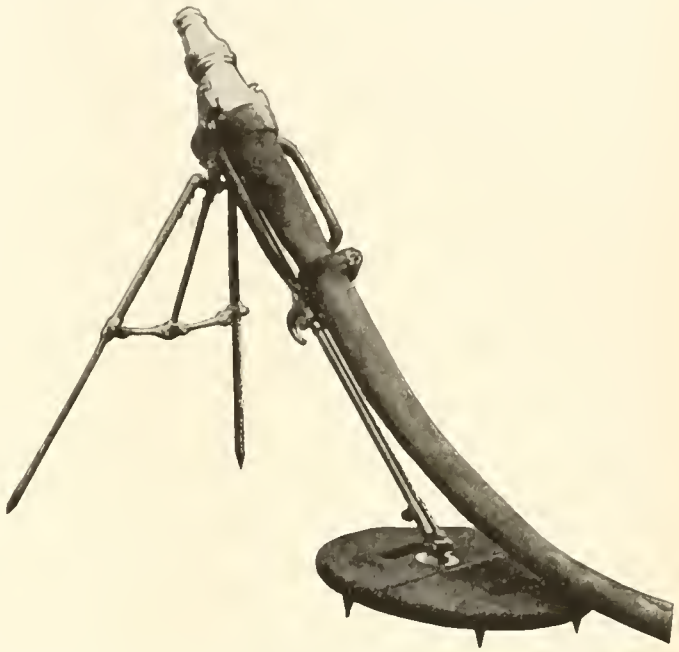
A PLATFORM FOR HIGH-PRESSURE STREAMS.

It is often a very hazardous matter to hold the nozzle of a fire hose on an icy pavement, a slippery street, or a slanting roof. The illustration shows a small and conveniently handled device that makes it perfectly possible for a single person to manipulate the nozzle of a hose pipe no matter how uncertain the footing or how high the pressure. It is a small oblong platform which can be folded up, and when folded is only about 20 inches long and 10 inches high; it weighs only 20 pounds. This can be opened and put down on a slanting roof or an icy



THE EASTMAN PLATFORM FOR HIGH-PRESSURE STREAMS.

pavement, and nothing can budge it, because there are several sharp prongs on the lower side that take hold and keep hold. The upper surface of this platform is covered with rubber to protect the firemen from electric shocks from streams that strike highly charged wires. Near the center of the platform there is a socket which holds the extension rod of the "Perfection" holders, also made by the Eastman Company. The accompanying cut shows the Eastman platform in conjunction with one of the Eastman Perfection holders. By the use of this combined platform and holder, the stream can be directed at any angle and under all possible pressures. A great many city fire departments are equipped with these Eastman outfits, the Baltimore Fire Department having recently adopted this system for its million-dollar high-pressure service. (The Samuel Eastman Co., Concord, N. H.)

FINE IF IT ONLY WORKS.

From time to time the general consumer is cheered by a paragraph—that turns up once in so often in the columns of the newspapers—telling him how rubber articles that have lost their elasticity can be brought back to their original estate. The advice usually reads something like this paragraph, taken from a recent number of a western paper:

"People using articles made of rubber that frequently lose their elasticity through oxidation may restore the material to its original condition by a simple process. Soak the article in a mixture of one part of ammonia to two parts water. This is particularly well adapted to the restoring of rubber bands, rings and small tubing which are ready to become dry and brittle."

Soaking rubber goods in a mixture of ammonia and water is simple and easy, but, unfortunately, there is one drawback—it doesn't work. The only way to remedy a rubber band that has turned hard and brittle is to get a new band.

Review of the Crude Rubber Market.

ON November 25, at date of last report, the price of fine Pará in London was 4s. 5d. During the later days of the month it improved, reaching 4s. 6¼d. on November 30. A further improvement brought it by December 10, to 4s. 8¼d., the highest price reached during the month, from which point it fell during the ensuing week to 4s. 6d. Another rise commencing on the 18th brought the price by the 24th, just before the holiday, to 4s. 7¾d. The month's fluctuations, therefore, resulted in an advance of 2¾d.; restoring figure to about where it had stood three months earlier.

In plantation rubber there was during the month a closer approximation of value to that of fine Pará. On November 25, they stood respectively at 4s. 5d. and 4s. 3¾d., since which time the difference thus shown was in some cases increased by the course of plantation rubber. The latest quotations, of December 24, are: Pará, 4s. 7¾d.; plantation, 4s. 7¼d. (only ½d. difference). Compared with the position on October 26, of 4s. 6d. and 4s. 2½d., the interval of two months has resulted in an advance of 1¾d. in the former, and of 4¾d. in the latter.

The relative quietness of demand in the London market throughout the month, was accompanied by absence of any pressure by sellers. Consumers have not been desirous of anticipating their wants. In some quarters it is thought that there is a considerable short account in existence, but this consideration has not exercised much influence upon the action of buyers. Meanwhile the increased American consumption has strengthened the market. Anticipations have been expressed of consumers entering the market more freely after the turn of the year, in order to replenish their stocks.

Auctions took place in London on December 3 and 17; the former comprising about 800 tons. The quantity would have been larger but for the withholding of crêpe descriptions, arrived in execution of contracts. The anticipations of firmness proved correct, the rates averaging one penny above the previous fortnightly sale; thus reflecting the course of the open market. One of the features of the auction was the attaining of the price of 5s. per pound for Highland smoked sheets. Cable reports of the sale of December 17 indicate a slight decline on the rates of the previous auction of December 3. Offerings were 922 tons.

At the Antwerp sale of December 13, out of 392 tons Congo, 359 were sold at an advance of about 6 per cent. on valuations. Of 118 tons plantation, practically the whole was sold at a similar increase.

The Rotterdam sale of December 10, included 60 tons Congo and 6 tons *Hevea*. An advance representing on an average 5 per cent. over valuations was obtained.

At Amsterdam, on December 11, there were offered 56 tons, chiefly *Hevea* and *Ficus*, of which about 40 tons were sold at 4 per cent. above valuations.

New York.

IN REGARD to the financial situation, Albert B. Beers (broker in crude rubber and commercial paper, No. 68 William street, New York) advises as follows: "The demand for paper during December has been very light, city banks buying almost nothing and out-of-town ones but little. Rates have ruled at 6@6½ per cent. for the best rubber names, and 6½@7 per cent. for others. We look for an improvement in demand and lower rates in January."

Liverpool.

WILLIAM WRIGHT & Co. report December 2, 1912:

Fine Pará.—In the early part of the month there was a sharp decline of *2d.* to *3d.* per pound. Since then prices advanced to the former level. The market closes with a distinctly steady undertone. Closing values: hard fine, *4s. 6d.* [$1.10]; soft fine, *4s. 1½d.* [$1]. Trade demand on the whole continues good, which, we think, is evidenced by stock returns, which, in spite of an increase in supplies, are 263 tons, against 929 tons in November, 1911, and 1,337 tons in 1910. America still continues buying a fair proportion on this market, in addition to direct purchases in Brazil; further parcels are now in course of shipment, which do not appear in this month's statistics. The outlook at present is for steady prices, with moderate fluctuations. Receipts for the month are 3,760 tons, including 500 tons Caucho, against 3,920 tons last month, and 3,540 tons last year, totaling 14,140 tons against 12,180 tons last season.

Rubber Stock at Para.

On May 31 the stock had increased, but had receded by June 30; and had again fallen off on July 31. Large sales by the syndicate materially reduced the stock by the end of August, from which point it had slightly increased by September 30. A further increase was shown on October 31. The stock had dropped by November 30 to the lowest point reached in 1911 or 1912.

CAOUTCHOUC — HEVEA BRASILIENSIS — FOUNDED 1889 — ICHORSS GUTTA — GUTTA-PERCHA

Edited by HENRY C. PEARSON—Offices, No. 15 West 38th Street, NEW YORK.

Vol. XLVII. No. 5. FEBRUARY 1, 1913. 35 CENTS. $3.00 Per Year. $3.50 Abroad.

INDIA RUBBER WORLD

CAOUTCHOUC GUTTA-PERCHA

Published on the 1st of each Month by

THE INDIA RUBBER PUBLISHING CO.

No. 15 West 38th Street, New York.

CABLE ADDRESS: IRWORLD, NEW YORK.

HENRY C. PEARSON, Editor

Vol. 47. FEBRUARY 1, 1913. No. 5

SUBSCRIPTIONS: $3.00 per year, $1.75 for six months, postpaid, for the United States and dependencies and Mexico. To the Dominion of Canada and all other countries, $3.50 (or equivalent funds) per year, postpaid.

ADVERTISING: Rates will be made known on application.

REMITTANCES: Should always be made by bank or draft, Postoffice or Express money orders on New York, payable to THE INDIA RUBBER PUBLISHING COMPANY. Remittances for foreign subscriptions should be sent by International Postal Order, payable as above.

DISCONTINUANCES: Yearly orders for subscriptions and advertising are regarded as permanent, and after the first twelve months they will be discontinued only at the request of the subscriber or advertiser. Bills are rendered promptly at the beginning of each period, and thereby our patrons have due notice of continuance.

Entered at the New York postoffice as mail matter of the second class.

TABLE OF CONTENTS ON LAST PAGE OF READING.

THE RUBBER CLUB OF AMERICA.

THE annual dinner of the Rubber Club of America, recently held in New York, and described in some detail elsewhere in this issue, was such a successful function—in the large attendance, general atmosphere of good fellowship and in the excellence of the addresses—that it may with propriety serve as a text for a brief dissertation on the general idea and purposes of the club.

This club was organized (under the name of the "New England Rubber Club") fourteen years ago, for the purpose of promoting acquaintance and a feeling of fellowship among the members of the rubber trade. As the American rubber industry had at that time completed almost two-thirds of a century, obviously the time was ripe for such an organization. Its original purpose was solely a social one, and it has remained distinctively a social organization practically up to the present time—its meetings consisting of two annual events—a mid-winter dinner and a mid-summer outing. Both of these functions have always been marked, not only by a large attendance, but by the heartiness and zest with which the members have responded to the opportunities of social enjoyment which they afforded. In July, 1909, the name of the club was changed to the "Rubber Club of America," in order to make it national rather than local in its character, and to permit the admission of many members of the trade outside of New England who wished to join. Its strictly social character, however, was not changed.

But great developments have taken place in the American rubber industry in the last fourteen years. The annual product of manufactured rubber goods has during that time increased over 100 per cent. in value. In 1900 it was $100,000,000; in 1912, $220,000,000. And many of the leading members of the club have felt that this organization was fitted to do more than simply bring its members together twice a year in friendly fashion to share an inviting menu; they have felt that this organization could undertake and successfully accomplish serious work that would be of great and permanent benefit—not only to its members—but to the trade at large; and with this idea in mind at the last annual meeting, in April, 1912, the constitution and by-laws were revised, and an entirely new class of membership called "Firm Membership" was added to the club. The Firm Members were to retain all the social privileges previously enjoyed, but in addition, on the payment of slightly increased dues, were to share in benefits of a strictly commercial and industrial nature; the excess dues—over those paid by other members—to be used exclusively to meet the expenses of any work of a commercial character which, in the opinion of the Executive Committee, might advantageously be undertaken for the general benefit of the Firm members.

Space does not permit to enumerate here the various projects which this inner organization might profitably undertake, but two illustrations will be sufficient to show how wide is its field, and how pressing the problems to which it may apply itself. All the members of the rubber trade—and especially dealers in crude rubber and manufacturers—are interested in the simplification of crude rubber nomenclature. Again, practically all the members of the rubber trade—and especially manufacturers and distributors—are interested in maintaining such a level of duties as will protect the American rubber industry against competition from foreign countries, where labor receives materially lower wages, and where the conditions of living are much below those of the American workman. It will be obvious without further enumeration, that there are many enterprises that could be forwarded easily—and with slight expense to any one man or company—where 100 or 200 men were associated in an organization like the Firm Membership of the Rubber Club, while these same undertakings would be exceedingly expensive—if not impracticable—for any individual.

The Firm Membership class of the Rubber Club has enjoyed a substantial growth during the past year, and is

undoubtedly destined to reach large proportions, for self-interest and trade loyalty must both suggest to men identified in any important way with the rubber industry, that they can profitably co-operate with their fellow rubber men in such an organization, to the substantial advantage of each, and to the greatly increased good of all.

WHAT PARA THINKS OF THE EAST.

DR. JACQUES HUBER, director of the Botanical Museum at Pará, and generally recognized as the foremost South American authority on rubber, paid a visit a year ago to the plantations of the Middle East and devoted several months to the careful inspection of the rubber producing territory in Ceylon, the Federated Malay States and in Java and Sumatra. He was received everywhere with the utmost courtesy, as befitted his standing in the rubber world, and as comports with the reputation for hospitality which the Eastern planters enjoy. They treated him, not as a rival, but as a friend and a fellow-worker in the great field of rubber production.

After his return to Pará he wrote in Portuguese a detailed and comprehensive report of his visit, which has just come from the press, making a book of over 130 pages. This interesting story has been summarized in English, and will be found on another page of this issue.

He concedes that the *Hevea Brasiliensis* has become thoroughly acclimated in the East, and appears to be perfectly at home there, even though the topographical conditions are often quite different from those on its native Amazon. He also finds that the plantation industry has become established on such a sound foundation that nothing is likely seriously to menace its continued success. He concedes that the Eastern planters enjoy two great advantages over their Amazon competitors: first, the vast supply of cheap labor, and second, the large number of trained agricultural experts available for the management of rubber plantations. He finds that the cost of labor in the Middle East is only one-tenth the labor cost in the Amazon basin. When one reflects that Java alone has a population of 30,000,000, the vastness of this labor supply is immediately evident.

Dr. Huber mentioned, in his speech at the banquet which concluded the Rubber Exposition, recently held in New York, the almost absolute lack in South America of trained and experienced plantation superintendents. He dwells on this matter again in his report.

On the other hand, there is one advantage enjoyed by the South American planter, namely, unlimited land. Comparing the free land and very dear labor of South America with the dearer land and cheaper labor of the Middle East, Dr. Huber thinks that the only course for the South American planter to pursue is to place his trees far apart, giving them all the room they need, so that each tree may produce to the utmost. In that way, while the yield per acre would be considerably less than that of the East, the yield per laborer might compare favorably with results obtained in Ceylon and the Federated Malay States. He intimates that the Eastern planter—laboring under the necessity of producing dividends on invested capital—has pushed his trees unduly, and that in consequence these plantations may later be found to require considerable periods of rest. He admits that in the early stages South American plantations could not be expected to yield the large returns of those in the East, but might do so after reaching full maturity.

A HOSE MANUFACTURER STATES HIS VIEWS.

IN a letter which will be found an another page in this issue, a manufacturer of fire hose states his views on the contention of the underwriters that they be allowed to inspect all the ingredients and processes employed in the making of hose. He observes sententiously: "A tube made up of a certain percentage of pure new rubber, mixed with brains and experience will be much more durable than a specification tube composed of laboratory theory and inexperience. To obtain the best hose put the manufacturers on their mettle, and create among them the spirit of competition in quality." His conception is that the best way to get serviceable hose is to let each manufacturer make the best he can in the light of his ten, twenty or fifty years' experience, and then submit the finished result to the officials of the fire department, who from their own experience know what service they should get from hose. If, after testing his offering they reject it, the manufacturer will be content; and if after a thorough test they accept it, then let the manufacturer be held responsible for any defects in material or construction that may develop within the first three years of service.

To state the case briefly, the writer of this letter

believes that fire hose should be judged—not by the various stages through which it may pass in course of construction—but by the actual service it gives when put to use. This seems fair, business-like, and adequately to cover the requirements. Where the results are satisfactory the methods of attaining them are immaterial: and conversely the best theoretical methods in the world are of little value if they do not produce the results. When a man gets into litigation all he wants of his lawyer is to win his case. Whether his brief is written on an Underwood typewriter or a Remington: or whether in addressing the jury he gesticulates with his right hand or with his left, would not to the normal mind appear to be matters of vital concern.

A BOSTON CHEMIST ON SYNTHETIC RUBBER.

LIKE most discussions that arise over the advance of science along the border-land which divides the known from the unknown, where the battle of progress continually rages, the discussion of the problem of synthetic rubber has its flood and its ebb, sometimes engrossing the attention of the scientific world, and sometimes lapsing into a condition of profound quiet. This has been the situation ever since Sir William Tilden, over thirty years ago, made the discovery that rubber could be made out of isoprene.

The synthetic discussion was renewed with great vigor last year by the disclosures made by Professor Perkin, of Manchester, England, in an address given before a body of scientists, showing what marked progress had been made in the solution of this problem by a group of English chemists on one hand, and another group of German chemists, both working independently and both arriving simultaneously at practically the same conclusion.

Dr. Lothar E. Weber, a Boston chemist of recognized authority in rubber circles, contributed a very interesting paper on this subject to the discussions held at the Third International Rubber Conference which took place in New York last September. This paper is produced in full in this issue. Dr. Weber views the situation judicially and dispassionately. He is not disposed to join the chorus of chemists who proclaim that natural rubber—whether from the wilds of the Amazon or from the cultivated plantations of the East—will soon be given its *quietus* by the worker in the laboratory. He recognizes the great triumph of the chemical researchers, in being able to produce rubber as good as comes from the South American forests, but he does not believe that they will be able—for years to come at least—to produce it on a scale that will seriously compete with natural rubber. He combats the theory of those who argue from the success of synthetic indigo to the success of synthetic rubber, showing that the two problems are totally different; stating that, while the producers of synthetic indigo had a perfectly definite task set before them, the composition of indigo being uniform and recognized, producers of synthetic rubber are compelled to work more or less in the dark, because the process of polymerization has not yet been brought under chemical control and is seriously lacking in uniformity; and he contends that synthetic rubber in commercial quantities will not be possible until the polymerization of isoprene is much more clearly understood than it is at present. While he thinks commercial synthetic rubber a possibility of the future, he does not believe that anyone now engaged in the rubber industry will see synthetic rubber in open competition with the natural product.

Of course, the exact time when synthetic rubber will arrive at a commercial basis is only a matter of conjecture, but many competent observers will be greatly surprised if it does not do so within the lifetime of those now engaged in rubber activities. With the tremendous advances made in the solution of this problem during the last three or four years, it does not seem possible that its final success can be many years away.

THE WORLD'S OUTPUT OF MOTOR CARS—WHICH RUBBER HAS MADE POSSIBLE.

IN point of attendance—volume and value of exhibits and artistic setting, the Automobile Show held during the latter half of January in New York, was a triumph. Nearly half a million people attended it. This is not to be wondered at when one considers the tremendous hold that the automobile has taken upon our American life. There are at present nearly 900,000 motor cars in use in this country—practically one car for every 100 people; and there will very soon be over a million cars. The year 1912 added 250,000 cars to those already in use, and the aggregate of the estimates made by the manufacturers for the present year reaches 600,000. Deducting one-third of that as rep-

resenting possible undue enthusiasm, we have 400,000 which probably will come close to the number of new cars that will make their initial appearance on our roadways during the present year. It is quite safe to predict that the million mark will be reached within the next few months.

What a tremendous boon the automobile has been to the world! What an addition to the efficiency and fulness of our modern life! In the first place its contribution to the pleasure and satisfaction of living is incalculable. While some people succumb to the speed-mania—certainly destructive of the nervous forces—viewing the auto, by and large, it has been a great help to the health of the community. What more wholesome for the tired business man, or the woman jaded with her household cares, or social exactions, than to jump in a car for an hour's spin over smooth roads by green pastures and through fragrant woods!

The motor car has not only made it possible for the city dweller to get into the country, but it has made it equally possible for the country dweller to get into the city. It has brought almost the first joy into the farmer's life. In the old days a trip to town, five miles away, behind the faithful but sluggish farm horses was an all-day enterprise—now it is but an incident in the day's activities. Moreover, it has not only permitted the town dweller to make swift excursions into the country, but it has enabled him to live in the country six months of the year. The rocky farm ten miles from town, which twenty years ago was not worth the cost of a new front gate, and was abandoned because it was impossible to extract a living from it, now makes a most wholesome and delightful family home from May till November.

In addition to the great number of pleasure cars already mentioned, one must also consider the commercial vehicle, of which there are now some 36,000, and which are bound to grow in number with tremendous rapidity. These are a boon not only because of their commercial efficiency, but as a humanizing agency. They have done more to relieve the burden of the over-worked draft horse than even the lamented Henry Bergh, who devoted his whole life—his time, energy and fortune—to that worthy cause. It is probably a very safe conjecture that in two decades draft animals will disappear from the streets of our large cities—greatly to the advantage of the animals as well as of the streets.

There is no space here to consider the vast addition that the motor car has made, in one way or another, to our national wealth, or the great army of people who find profitable employment in its construction and distribution.

But all the blessings, many as they are, which have come to the human family from the motor vehicle have all been made possible by the rubber tire. Remove that and those million pleasure cars would rust in the garage, and the motor trucks would soon jolt themselves into the junk heap.

CONCERNING CALENDARS.

WITH the coming of every glad New Year comes the annual crop of calendars. Large and small; plain and ornate; with pictures of fair faces embowered in roses, and severe factory fronts with dense smoke (indicative of extreme activity) rolling up into the sky; with figures large enough to stare one in the face across the street, and so small as to require microscopic research to decipher them—calendars of infinite variety; but all welcome, for they serve a purpose and fulfill a mission.

Occasionally some profound person rises to remark: "Why does anybody get out a calendar? People have been getting calendars for 50 years and they are tired and sick of them." Which is fully as wise as it would be to say: "Why does anyone start a restaurant? People have been eating for 6,000 years and they are bored to death with it." Anything that supplies a constantly recurring want will continue popular as long as the want recurs. The great public will still be asking for calendars in the year 19013, provided those hot internal flames (which the geologists assure us are at work in the bowels of the earth) have not by that time broken through the thin crust, and consumed the printing presses.

Many rubber companies issue calendars every year, others issue them from time to time; but they can all rest assured that, if their calendars are attractive and the figures thereon comfortably legible, none of them will go to waste. To be sure, all the calendar offerings sent to a company may not find a conspicuous place immediately over the president's desk; but, unless they are hopelessly devoid of grace or utility, they will all find lodgment somewhere, on wall or table, where they will continue industriously at their job—Sundays and holidays included—for at least 365 days.

Commercial Possibilities of Synthetic Rubber.

By Lothar E. Weber, Ph.D.

A PAPER READ AT THE THIRD INTERNATIONAL RUBBER CONFERENCE, HELD AT GRAND CENTRAL PALACE, NEW YORK, SEPT. 24 TO 30, 1912.

IT is rather peculiar that although the conversion of isoprene into a rubber-like substance has been known for upwards of twenty years, further progress in this direction has been practically stagnant until recent date. This is not altogether due to lack of effort, but rather to the enormity of the problem. The synthesis of rubber, however, received a new impetus about three years ago when two German chemists, Hofmann and Harries, working independently, succeeded in obtaining almost simultaneously products which gave the chemical reactions of rubber and had certain physical resemblances to the natural

DR. LOTHAR E. WEBER.

product. Since then, considerable progress has been made in this direction and, more recently, stock companies have been formed and capital subscribed with a view to actually placing synthetic rubber on the market. The daily press both in this country and especially in Europe, gave this latest development of synthetic rubber wide publicity, sharing the optimism of the promoters and inventors of the new process, and as a result, the general public and, to a very large extent, rubber manufacturers themselves, have been led to believe that synthetic rubber can in the near future be manufactured in competition with the natural product.

I do not want to give the impression of holding in light regard the magnificent work which has been accomplished by European chemists in their efforts to synthesize rubber. I almost think that a certain amount of chemical training is necessary to appreciate the innumerable difficulties and pitfalls which face the investigator in these fields. These men deserve the profoundest admiration for their painstaking and laborious efforts, but it is greatly to be deplored that the public was given to understand that synthetic rubber is today a commercial possibility, since, if the promise is not fulfilled, the attitude of the public will scarcely be one of admiration.

Synthetic rubber enthusiasts have been very fond of comparing the synthesis of rubber with the synthesis of indigo, asserting that the same fate awaits natural rubber that befell natural indigo. These two problems, however, have very little in common and differ from each other in such striking respects that the two syntheses are not capable of comparison. I should like to take up this comparison in more detail because I think in this way the difficulties which will prevent commercial synthetic rubber becoming a realization during the next few decades can be more clearly shown. Before doing so, however, I would ask your indulgence in attempting to make clear to those of you who are not chemists, the meaning of a rather formidable looking word which is always in evidence whenever there is any mention of synthetic rubber. I refer to the word "polymerization."

We are being continually informed that isoprene polymerizes to rubber and that the process of converting isoprene into rubber is one of polymerization. The process of polymerization briefly stated, is one whereby a large number of small units combine to make a single large unit. It is essentially a process of agglomeration. This process of agglomeration takes place between the molecules, the latter, as you know, being regarded as the smallest amount of substance that is capable of existence. The molecules of isoprene, at least 100 of them, unite and polymerize into one single molecule of rubber. Unfortunately, we have not the least idea exactly how many isoprene molecules go to make one molecule of rubber, and it is probably certain that the natural rubbers themselves vary very widely in the respect of their degree of polymerization. It does, however, seem probable that the higher the degree of polymerization; that is to say, the more the number of isoprene molecules that unite to form one rubber molecule, the better are the physical properties of the rubber. In other words, two rubbers of exactly the same chemical composition, with different physical properties, owe this latter difference to their different degrees of polymerization. It follows then, that a uniform degree of polymerization would be the first requirement for a synthetic rubber.

Unfortunately, the chemist of today is absolutely powerless in determining this degree of polymerization experimentally and, to a certain extent, of controlling it. For instance, it is not possible to go into a laboratory with a quantity of isoprene and polymerize the latter to any desired extent. In fact, we have no means of feeling sure that we can on two different occasions bring about the same degree of polymerization. With the chemical methods available today it would be absolutely impossible to make a product with an assured uniform degree of polymerization, and until this is possible, I fail to see how there can be any possibility of commercial synthetic rubber. The first requirement of such a product is uniformity of polymerization, but as we have no means of determining this uniformity, or lack of it, variations would be bound to occur which would make the employment of such synthetic rubber by the manufacturer altogether too precarious. We all know to what disagreeable results variations in the uniformity of the natural product lead and in the latter case the possibilities for uniformity are infinitely more favorable than in the case of the synthetic product.

Now let us briefly consider the case of indigo. Here the problem was to manufacture an article of absolutely definite characteristics and properties. It undoubtedly required a vast amount of chemical skill before the composition of indigo was determined, but once this important feat having been accomplished, the chemist had a definite conception of the substance to be synthesized. Furthermore, there could never be the least doubt as to whether the investigator had actually succeeded or not in obtaining indigo. It is the work of only a few moments to be able to definitely decide whether a product is indigo or not.

In the case of rubber the state of affairs, as we have seen it, is totally different. In the first place, the methods of polymerization are still in their infancy; we have no means of controlling its magnitude, or of assuring its uniformity. The chemical methods of today are wholly insufficient for the solving of this problem.

Synthetic rubber enthusiasts have either overlooked or ignored with supreme indifference the very important fact, that in the year 1916 the price of raw rubber must of necessity drop very considerably. It is estimated (and from all accounts the estimate is a conservative one) that by the year 1916 the Eastern plantations alone will be able to produce 100,000 tons per year, although there are two factors which have not been taken into account in making the estimate, which might have a very serious effect on the future of the plantations. These two factors are: first, diseases of the trees, and secondly, the labor problem.

The chances of the trees becoming infected either with a disease or insect pest is probably very small, as the bulk of the plantations are under very careful supervision, and special precautions are being taken to prevent such an occurrence. The labor question seems to be of more serious consequence, as the Malay coolie is of a rather independent nature. Nevertheless, it is highly probable that the estimate is not exaggerated. Even today one repeatedly hears statements being made that the plantations that are producing rubber could, if necessary, put their product on the London market at 25 cents per pound. This is possibly slightly exaggerated, but not very much so. One has only to look at the dividends now being paid by some of the Eastern plantations to realize that there is a certain amount of truth in this statement. As things stand today, supposing it were possible to market synthetic rubber at 50 cents a pound in great quantities, the competition with plantation rubbers would not be very noticeable, as their output is relatively small; but in 1916 the case will be quite different. Even supposing that the demand for rubber keeps on increasing, the plantations will still be in a position to supply at least half of the demand. There are, furthermore, enormous opportunities for the plant physiologist in the cultivation and production of rubber. So far very little has been done in this direction, as the plantation industry is still in its infancy; but it seems more than probable that careful experimentation will enable means to be devised whereby the yield of rubber per tree can be materially increased.

In the case of the sugar beet this increase in the yield has been accomplished with surprising success. It has been possible by careful methods of cultivation and selection of the most advantageous conditions of soil, to raise the yield of sugar in the beet from 3 to 18 per cent. Undoubtedly, in the case of rubber, the problem is more complex than in the case of the sugar beet, but this field of investigation is still waiting for the pioneer, and I cannot help feeling that the possibilities are indeed large.

It must be seen, even on the supposition that synthetic rubber were today a commercial possibility, and that an article could be produced equal to the plantation product, that the struggle for commercial supremacy would necessarily be a fierce one, with the advantage very much in favor of the plantation product.

In the case of indigo, the synthetic product had practically no competition to meet whatsoever. The production of natural indigo had been carried out under the crudest possible fashion, and the methods of obtaining the dye from the plant were even more crude. For some extraordinary reason, although the production of this dye stuff was of such extreme value to the textile industry, it always remained in the hands of the ignorant natives. Had the same amount of energy and skill been applied to the indigo plant that is now being applied to plantation rubber, the victory of synthetic indigo would probably still be in doubt. It must be granted that the commercial synthesis of indigo was the crowning technical achievement of the nineteenth century, but it must also be acknowledged that its fight for supremacy over the natural product was materially aided by the shortsightedness of indigo planters. Rubber planters, on the other hand, have been keenly alive to the large possibilities which are to be derived from scientific methods of cultivation and production, and they have got such an infinite lead over the efforts of the synthetic chemist, as to be in little danger of being vanquished for many decades to come.

I hope I have not been altogether unsuccessful in making plain some of the difficulties that confront commercial synthetic rubber. With our present-day chemical methods it would be well nigh impossible to assure a uniform synthetic product. Within the next few years the Eastern plantations will be in a position to supply half the demand for rubber, and accordingly would be in a position to wage a very stubborn fight against any synthetic product. Finally, it seems more than probable that scientific investigations will enable the planter to increase the yield of rubber per tree, and thus put him in a still better position to combat the synthetic article.

I do not want to make such a rash statement as to assert that synthetic rubber will never be a commercial possibility, but I should be greatly surprised if there is anybody engaged in the rubber industry today who will have the opportunity of seeing synthetic rubber in open competition with the natural product.

GERMAN ANALYTICAL RUBBER PROGRESS.

Several interesting booklets have been received from the Henriques Laboratory, Berlin, dealing with subjects which have been recently dealt with by that institution.

One of these, reprinted from the "Gummi-Zeitung," describes a process for defining the nitrogenous sub-components and impurities in crude rubber.

In a reprint from the "Tropenpflanzer," Dr. Frank's views on synthetic rubber are reproduced. These had been dealt with in THE INDIA RUBBER WORLD of September, 1912, page 580.

Another reprint from the "Tropenpflanzer" contains a paper by Dr. F. Wohltmann, Director of the Agricultural Institute of the University of Halle, upon "South American and East African Rubber Soils." This interesting paper reproduces the analyses of clays from the left and right banks of the River Acre; as well as from Tanga and Longusa, Ngambo, Magunga, Morogoro, and other East African points.

THE WORLD'S EFFORTS TO RAISE COTTON.

It is very natural with a staple like cotton, which is so necessary to the welfare of mankind, that every considerable government should seek, if possible, to raise its own supply. The various European governments have long tried to devise methods of being independent—to some extent at least—of the American product. One-third of the world's supply of cotton comes from Egypt and India; but notwithstanding this fact, England has made constant efforts to develop a profitable production of cotton in various other territories under English control, and Russia has expended a great deal of effort in the attempt to produce cotton profitably in Central Asia. These various attempts have been successful as far as producing cotton is concerned, but they have not been altogether successful in producing it at a figure that can compete with the cost of its production in the United States; and when the price of cotton in our Southern States has been low these rival efforts in other countries have been attended with much discouragement.

In the last 25 years the average export price of cotton from the Southern States has been 9.3 cents—the lowest price was 5.5c. in 1899, and the highest price during the last 25 years was in 1910, when the export price rose to 19.7 cents.

Replete with information for rubber manufacturers—Mr. Pearson's "Crude and Compounding Ingredients."

FOURTEENTH ANNUAL BANQUET OF THE RUBBER CLUB OF AMERICA

AT THE WALDORF-ASTORIA, NEW YORK, JANUARY 23, 1913.

The Fourteenth Annual Dinner of The Rubber Club of America.

THE dinner of the Rubber Club of America, held at the Waldorf-Astoria, New York, on the evening of January 23d—which, by the way, was the fourteenth annual gathering of this kind in the history of the club—was a thoroughly successful function, highly creditable to the officers and to the members of the committee which had the event in charge, and altogether enjoyable to all who attended.

In the first place the attendance was large—190—which, considering the scattered nature of the club's membership—some from New England, some from the Middle States and many from distant points in the West—is a very satisfactory number out of a total membership of 320.

Another feature that contributed to the enjoyability of the occasion was the fact that so many members availed themselves of the social opportunities afforded by the preliminary reception. The large reception room was well filled a half hour before the dinner by members who utilized the occasion to exchange greetings with old friends, and to make new acquaintances—often with men whom they had long known by reputation but never before personally met. Incidentally, this preliminary reception afforded the out-of-town members a chance to acquaint themselves with the fact that the word "Bronx" does not stand for a geographical location, but rather, in a preparatory way, for a state of mind.

At the appointed hour—or within a reasonably few minutes thereafter—the diners filed into the big Astor gallery and took their seats. The menu, which is given below, was exceptionally well chosen, and showed the handiwork of connoisseurs, and it stopped just at that golden line between just enough and not too much. The dinner was accompanied by a wealth of music. There was an excellent orchestra, and in addition a singing leader with a robust voice. But these were only incidents; there is probably not another club in the country that can boast of so many fine baritones, exceptional tenors, and powerful basses. As a consequence there was a full hour of voluminous harmony, which seemed to make even the waiters temporarily forget their chronic grievances.

MENU.

Huîtres Smith Island

Tortue verte claire

Radis Olives Céleri Amandes salées

Médaillon de bass, sauce Margery
Tomates et concombres

Champignons frais à l'Eugenie

Mignon de filet de boeuf, sauce Colbert
Petits pois à la Paysanne

Poitrine de pintade à la Hongroise
Salade romaine à la Francaise

Pommes de terre farcies, sauce de vanille
Petits fours Fromages assortis
Café

Sauterne

The Waldorf-Astoria le 23 janvier, 1913

The after-dinner addresses covered a variety of themes, and covered them in an interesting and informing fashion. The speaking moved very briskly under the influence of President Hood, whose introductions were models of what introductions should be—brief, direct, and just enough to present the speaker properly to the audience. The president's own address was exceedingly practical and business-like, being largely concerned with the marked developments in the work of the club during the past year. It was listened to with deep interest by all the members of the club and made a specially favorable impression on those who are most interested in the club's expansion and growing usefulness.

After everybody—but the most hardened laggards—had finished his coffee, the president arose and when quiet prevailed, proposed the following toast: "Let us all stand and drink a toast to the President of the United States." His request was carried out with a heartiness and unanimity that indicated that the asperities of the recent election had been entirely forgotten. When the diners were comfortably settled in their seats again Mr. Hood began his address.

THE ADDRESS OF PRESIDENT HOOD.

Fellow members and guests.—At the dinner held in this room a year ago I mentioned my belief that a club, to be permanent, must be useful. My talk this evening is intended to give you a short resumé of the past and some suggestions for usefulness in the future.

In February and March last year there was a very serious agitation in Washington to place an import duty on crude rubber, because additional income was needed, and one line of argument in support of this agitation was that crude rubber was used in automobile tires; automobiles are a luxury, and luxuries should be taxed.

A proper acknowledgment should be made and deep appreciation should be shown the New York members of this club, several of whom gave a large part of many days in preparing statistics and *data* to refute the insidious arguments of certain Congressmen, and many more days were cheerfully given to the preparation of a brief for the Ways and Means Committee. This brief convincingly showed that crude rubber is a necessity and not a luxury.

For this unselfish work, done by a few, but benefitting every user of crude rubber and manufactured rubber, they have our grateful and hearty thanks.

At last winter's dinner I urged a revision of our constitution and by-laws, in order that your directors might have the power to be useful in case an opportunity arose for possible usefulness. The old constitution provided only for sociability. And at the annual meeting of the club, held last April, the new constitution was unanimously adopted. The directors approved a vote delegating to a small executive committee of five the authority of the directors during the interim between directors' meetings, and at last there was a responsible body small enough and so geographically located that they could meet and consider the many problems and the many opportunities for usefulness.

And, fellow members, after attending many executive meetings—of which the president is a member only *ex-officio*—I fell that this club has arrived at another mile-stone in its career where it should desire to do much more.

The unselfish work of your Executive Committee, and especially its chairman, and the hours and days of work given by your secretary and assistant secretary, are deeply appreciated by us all.

But it is too great a favor to ask of these men, to do our

work for us without giving them the tools to properly work with.

Last year the club had a membership of 254 members, including active and honorary. This year there is a total membership of 321, of which 36 are firm members, 228 active members, and 57 associate and honorary members. It has been estimated that there are over 400 firms eligible for firm membership, and your Executive Committee have many assurances of more firm members as well as active members. New firm membership does not begin until the beginning of the next fiscal year, April 1 next.

GEORGE B. HODGMAN, VICE-PRESIDENT.

FREDERIC C. HOOD, PRESIDENT.

HAROLD P. FULLER, SECRETARY.

The opportunities for usefulness of the club that are purely *pro bono publico* are so many and so varied in kinds that I can mention here only a few.

How many of us understand the magnificent work of the *tire group* of the Motor & Accessories Manufacturing Association—an extremely husky and financially strong association—and the Druggists' Sundries Association, the Reclaimers' Association and the Mechanical Association? The mainspring of each of these groups is crude rubber, and our club, the *pater familias* of the crude rubber industry associations, should co-operate with and cordially supplement the work of all of these rubber associations.

Isn't this recital sufficient to show clearly the needs of the club for more support, both numerically and financially, on the part of all firms dealing in rubber? And is it strange that your president strongly urges the employment of a paid secretary, and strengthening of the power of the next president and next executive committee by giving them the facilities for executing the work considered advisable or expedient by them, instead of forcing them to do their own work at great sacrifice of energy and time? And because your Executive Committee is composed of men representative of the best of us, and consequently carrying great responsibilities, sometime the work itself is sacrificed simply because of exhaustion of physical energy and lack of unemployed hours.

The adage, "If you want a thing done get a man who has all he can do," applies to this club. But such men must have tools to do with.

Just a few words on another association—the National Boot & Shoe Jobbers' Association—which has a rubber section. Some of us know that the simple meeting in open conference has tended to stop the secret misrepresentations of quality which are usually the twin sister of price-cutting and other unbusinesslike and wasteful methods. But their traffic departments and credit departments alone justify the existence of the association

Louisiana has lately passed a pure-leather-shoe law which goes into effect next July, and requires that all leather shoes sold in Louisianna shall be made of nothing but pure leather. This is not quite so ridiculous as if a State passed a pure rubber shoe law, a pure rubber tire law, a pure rubber belting, hose, water bottle and clothing law. But who knows, now that four States here have passed or are considering passing laws requiring the date placed on certain kinds of rubber goods sold in those States, but that some States will pass a pure rubber law and imagine they are doing good similar to a pure food law? We must have some organization to meet these issues, and there are enough real issues now to keep us all busy without suggesting imaginary issues.

Now another viewpoint:

The sales of rubber goods manufactured per annum, variously estimated, figured at prices received by the manufacturer, are $225,000,000 to $250,000,000. Of this amount in 1912 the pneumatic tire business was over $100,000,000—a development for the most part of the last ten years.

The United States and Canada consume over one-half of the world's production of crude rubber, and estimates give the consumption in crude rubber for 1909 at, say 33,000 tons; while in 1912 the consumption in this country and Canada is estimated rising 50,000 tons. Of course this increased consumption has come principally from the manufacture of tires, but rubber footwear has increased also from about forty millions in 1902 to fifty millions in 1912.

How fortunate for us all that rubber plantations have increased the supply of crude rubber! Estimates of Pará plantations production also help us to view our opportunities for usefulness. In 1910 the plantations produced about 9,000 tons; in 1911 they produced over 18,000 tons, and in 1912 they produced over 28,000 tons. The estimates for 1913 vary with different people from 38,000 to 40,000 tons, while most people agree that in 1915 the production will exceed 65,000 tons, far exceeding the production of wild rubber from Brazil, especially when it is remembered that statistics for Brazil are figured on green weight, and, for comparison with the Plantation group, must be cut down an average of 20 per cent. for the wild rubber shrinkage.

And, fellow members, think of upwards of 50,000 tons of rubber being bought by manufacturers in this country, valued at somewhere about $125,000,000, and the various kinds of rubber not being even named or having a definite description. This nomenclature of crude rubber has been a difficult problem and

has been the subject of discussion in many an executive committee meeting, and of many patient hours' conference on the part of a sub-committee appointed by your president. It is gratifying to report that we are all in harmony and agreements have been reached on three points.

1. A uniform contract for the sale of crude rubber.

2. An arbitration clause in the contract. But this will be a subject for further talk this evening.

3. A definite nomenclature; that is, a definite name shall be given which shall have a definite meaning.

The first difficulty arises over preparing the name and definite description of the kind which the name shall mean. From a certain river in the Amazon come several kinds of *Hevea* rubber which must be named and described. For example "Up-river Fine," "Up-river Weak Fine," "Up-river Medium," "Up-river Seconds Medium," "Up-river Coarse," "Up-river Nuggets," etc., etc.

The dealers in New York trade constantly with each other and they understand, as between themselves, what they will accept as a delivery on a contract under a name, notwithstanding there are often two names for the same thing, as, for example, "Seconds Medium" and "Mixed Pará"; and there are often two different sortings of rubber under the same name, as, for example, "Up-river Coarse"—some take out the nuggets and others leave the nuggets in.

It all seems so extraordinary that such a condition can exist that the mere recital of such customs, especially when we remember that rejected lots often give an opportunity for unscrupulous dealings, should awaken us all to the necessity of a correct nomenclature of kinds.

And then think of the numerous kinds of Plantation rubber masquerading under the names of "First Latex Crepe," "Smoked Sheet," etc.

The Rubber Club of America can be and should be able to accomplish this nomenclaturing of crude rubber and bring about an integrity of quality which works for a standardization of the principal item in the goods we manufacture. And, gentlemen, what helps the whole helps each part, and this is true of the goods we manufacture and of the members of this club.

We were fortunate in having a Crude Rubber Exposition last fall. The Brazilians were particularly patriotic in sending the best collection of representative kinds of rubber ever exhibited and ever gathered together. It is a pity that representative kinds could not be filed in a museum for reference and study. Each kind was named, but, unfortunately, not all the poorer qualities of each kind were exhibited.

Beautiful exhibits of plantation rubbers were shown, and the public spirit of the exhibitors was always in evidence.

Two things interested me the most. First, the conferences. Many carefully prepared and intelligent papers were read, and much attention was paid to the solution of the nomenclature problem and to the adoption of a standardized method of coagulation. The conferences will all work for the integrity of the industry.

The second thing was the exhibition of old, used rubber scrap. I think there were 168 different kinds exhibited, all properly named and described. This nomenclature of rubber scrap was accomplished by the Reclaimers' Association, simply by the adoption by them of a circular describing the kinds of scraps and the conditions of packing and sorting. Can anyone say that their action in adopting the nomenclature has not worked for the integrity of their business, for economical manufacture and for the benefit of the whole industry? And especially for the protection of the honest dealer as against the "piker"?

Thus, a crude rubber nomenclature will work for the benefit of the industry, and will benefit each person engaged in the rubber business, as a dealer, manufacturer or user. The values of an exact nomenclature will seek their proper levels; and what pleases me most is that all the large dealers in crude rubber in New York City agree that there should be a proper nomenclature and seem more keen for an adoption of it than even the manufacturers, whom it will benefit most.

But, as I have mentioned before, the only reason it is not accomplished is because of the lack of tools to properly do the work.

London does its business in crude rubber better in some ways than New York. As this country uses more than half the world's production, why should not New York have more than half the "say"? If any action can increase the integrity of the industry right here in New York, it is the firm belief of your president that it will tend to build up the importance of New York as a center of the crude rubber industry, just as New York is *the* city of the world today in so many lines of industry, and just as we all fervently hope the United States of America will be in *all* lines of industry.

J. FRANK DUNBAR, TREASURER.

WM. E. BARKER, DINNER COMMITTEE.

CHAS. A. COE, CHAIRMAN DINNER COM.

After the applause that greeted President Hood's address had

died away, he presented the first invited speaker of the evening as follows:

"There is no name more familiar to the rubber trade than 'Goodyear.' Charles Goodyear left us a heritage, not only his name, but his patents and his accomplishments. Contemporaries seldom do true justice, for historians have a clearer perspective, and it is not strange that the movement for a memorial to Charles Goodyear is fast becoming a reality.

"I have the honor to introduce Professor Franklin W. Hooper, the director of the Brooklyn Institute of Arts and Sciences."

PROFESSOR HOOPER'S TRIBUTE TO CHARLES GOODYEAR.

I speak with great hesitation, realizing as I do, not only the importance of my theme, but the fact that I am speaking to representatives of the great rubber industry of the world. You represent an industry, the raw material of which amounts to $250,000,000 a year; while its manufactured product exceeds half a billion a year in value. It is an industry, moreover, whose applications to our modern life have increased with tremendous rapidity during the last two or three years. And yet, if it were not for one man this great industry would not exist, and neither you nor I would be here tonight. Therefore, we must contemplate, not only with a profound personal interest, but with most thankful hearts, the life of this great American.

Charles Goodyear is at once the greatest American discoverer, the greatest American inventor, and a man whose character and career place him in the foremost rank of men in all time. His father before him had shown the genius of the inventor as a hardware merchant in New Haven where he made and sold for the first time in this country farming tools made of steel. Charles Goodyear's education was very largely received in his father's store. Shortly after he reached his majority he established for himself a hardware store in Philadelphia where he sold for the first time goods manufactured only by American industry. In a few years he built up a large and successful business, a business which he sold to others and which was the foundation of the present large hardware business of Philadelphia. But Charles Goodyear, like Louis Agassiz, was not content simply to make money. He had within him an unquenchable desire, an all impelling purpose to be of some great service to humanity. He would have been glad to be able to acquire an education and to enter the ministry, but failing that he sought some material means of benefiting his fellowmen.

He had observed a good deal of crude rubber, in the use of a poor kind of shoe, made in the tropics, worn by very poor people. He conceived the idea that this material, existing in enormous quantities, might be made of the greatest possible service, not only in the manufacture of shoes and of wearing apparel, but of boats, sails and of life-saving apparatus. He studied its qualities, its solubility, and he sought to make out of the crude rubber a material that would resist ordinary heat. He made machinery with which layers of crude rubber of varying thicknesses could be produced. He applied nitrous fumes to the surfaces of the films so that they were less easily melted by heat. He mixed magnesia, lime, oxide of lead, and many substances with the rubber in most intimate ways, and was able to manufacture fabrics very beautiful in appearance, but nevertheless fabrics which softened and decayed in warm weather. For ten long years, 1834 to 1844, he experimented, giving his entire time and energies in his search for some means of converting rubber into a permanently usable and useful article.

But it was not until 1844 that Charles Goodyear discovered, during the course of his researches, that by heating crude rubber, mixed with sulphur, to a high temperature it was converted into vulcanite—the rubber of modern commerce. This discovery was the triumph of long years of the most painstaking and most manifold experiment during which he had suffered in health, had experienced extreme poverty and privation, and through the failure of others to meet their obligations had been involved in debt, and according to the custom of the time had with unbroken spirit endured the hardships of the debtors' prison in Philadelphia.

The discovery once made, Goodyear gave the remainder of his life, 1844 to 1860, to the invention of ways in which the vulcanite could be used. At the time of his decease it had been applied to some two hundred different and distinct uses, and of these over ninety per cent. were the direct product of his inventive genius. In fact, there has been since his decease no important invention for the use of rubber that was not known to Goodyear. The rubber tire which now consumes so large a part of our annual production is but a modification of the rubber tube which Goodyear made. Throughout his entire career he entered into no manufacturing business with the ulterior motive of making money. He invented the machinery with which more than two hundred vulcanite products were manufactured and used the income from his patents and from his sales of manufactured goods in further invention and in making further machinery for manufacturing.

In 1851 he exhibited at the Crystal Palace, at Sydenham, many products of his skill and invention, and in 1854, at the International Exposition in Paris, he was not only awarded the Gold Medal of the Exposition, but he also received the decoration from Napoleon III. of the Legion of Honor—the highest combined compliments that have ever been paid to any American at an International Exposition in Europe.

But in Europe, as in America, Goodyear was unfortunate in making collections due to him, was unable to meet his notes, and the honors conferred by the Exposition and the Emperor were delivered to him in the debtor's prison in Paris.

Charles Goodyear, I have said, was the greatest of American discoverers and inventors. But great as was the work of Goodyear as discoverer and inventor, the character and career of the man are even more remarkable and exceptional. He was simple, earnest, patient, long-suffering, heroic, magnanimous, and he gave himself as fully for his fellow-men as any patriot or martyr in any time. And it is especially because of the quality of the man, added to his pre-eminent discovery and inventions, and to his great and lasting services that a suitable memorial to Charles Goodyear should be erected for the instruction and the uplifting of all the generations of men that follow.

A few years after the decease of Charles Darwin, I visited for the first time the great Natural History Museum at South Kensington. The buildings were new and stretched several hundred feet on either side of the main entrance. I had been a student of Charles Darwin for twenty years and had come to feel the power of his simple life—the far-reaching value of the theory of evolution as a mode by which the Creator had brought the universe to its present condition. I felt then as I feel now that Charles Darwin was the greatest genius and benefactor of the nineteenth century. With this feeling I entered the vast vestibule of this Museum and there unexpectedly found resting on the first landing of the main stairway, in the place of honor in the entire Museum, the statue of Charles Darwin. England and the entire world had ridiculed this student of nature, and yet within a third of a century of the date of his great work on the "The Origin of Species," the whole world had recognized the character of the man, the value of his great contribution to the sum of human knowledge, and had honored him by giving to his statue a place of supreme worth.

Our country is soon to erect on the banks of the Potomac a beautiful temple, inspired by the genius of Greek art, in memory of Abraham Lincoln, and in that temple will stand alone, in enduring bronze, the strong figure of the savior of his country and of her institutions.

So likewise in the City of Washington, as one of the group of buildings destined to become our great National Museum,

most comprehensive in scope, most useful in purpose, most commanding in plan, will stand a museum in memory of Charles Goodyear; a museum in which may be placed, not only the history of the discovery and of the manifold inventions of Charles Goodyear, but in which may be exhibited all of the inventions, examples of manufactured products, illustrations of the many and great uses to which vulcanite has been put in these latter days. And in the grand vestibule of this Museum shall stand a statue of Charles Goodyear, the greatest American discoverer and inventor, a man whose character places him with Socrates, with Savonarola and with Abraham Lincoln.

Professor Hooper's eloquent tribute to Goodyear called forth a hearty demonstration of approval. President Hood then introduced the next speaker:

"THE INDIA RUBBER WORLD had a most excellent article on commercial arbitration in its January number, and the article suggested two thoughts to me: First, the wisdom of having our assistant secretary attend our executive committee meetings; and

H. F. J. PORTER.

PROFESSOR FRANKLIN W. HOOPER.

SERENO S. PRATT.

"Second, the realization of the sincere effort and purpose of so many representative men to use peaceful and progressive methods of settling differences by turning on the bright light of open publicity and broad good fellowship.

"We are very fortunate in having with us tonight the secretary of the New York Chamber of Commerce, to talk to us on Commercial Arbitration. I have the pleasure of introducing Mr. Sereno S. Pratt."

MR. PRATT ON COMMERCIAL ARBITRATION.

Arbitration has seven distinctive, important advantages for business men in the settlement of their commercial disputes. These advantages are:

Speed, Economy, Efficiency, Privacy, Simplicity, Adaptability and Good Will.

1. SPEED. Nothing is more destructive to justice and, therefore, dangerous to civilization, than the law's delays.

In saying this, do not interpret my language as an attack on the courts and the legal profession. In spite of all criticism, reasonable and unreasonable, to which they have been subjected during the past hundred years, it is impossible to measure the length and breadth, the height and the depth of the services they have so splendidly performed for the maintenance of law and order in this country. But justice is inherently slow. Even the mills of the gods grind slowly, though they grind exceeding fine.

Commercial arbitration as proposed by the Chamber of Commerce does not undertake to abolish courts, and it is no attack upon the legal profession. Its practicability is demonstrated by the fact that it seeks the co-operation of lawyers, and it has the commendation of the judges. The best practice of the law today is directed to the avoidance of litigation rather than to the trial of actual cases of litigation; and a lawyer may well advise his client to submit his dispute to arbitration in any case that is especially adapted to trial by arbitration. One of the proofs of the practicability of this system is that lawyers themselves have submitted disputes to it; and we have on file a letter from a leading firm of lawyers thanking our Arbitration Committee for its offices of conciliation in bringing about the settlement of an important dispute without trial.

This arbitration system does not undertake to settle cases which ought to go to a court of law; for instance, cases which involve intricate points of law. The cases which it is willing to take are questions of fact having some real relation to the conduct of business.

Court proceedings are necessarily subject to many inevitable delays, and in addition, the normal course of justice is often defeated by various legal expedients by which litigation can be protracted.

In commercial arbitration there is no opportunity for such causes of delay. Quick action is the rule from which there is no exception. There is no succession of postponements, adjournments or appeals. The procedure is so simple that a decision is speedily reached. In one case tried in the Chamber of Commerce the issue was joined, the submission made, the arbitrator appointed, the trial held, the decision rendered and the judgment paid, all in one week, and both the successful and the defeated party to the case thanked the arbitrator for his courtesy and good judgment.

2. ECONOMY. The time saved by arbitration means, of course, expense avoided. Controversies are to business what friction is in a machine, or waste is in the application of power. By reducing the amount of friction and waste involved in commercial disputes, arbitration increases the efficiency and, therefore, the economy of business. In addition to this indirect gain, the direct costs of arbitration are very small.

In the Chamber of Commerce each party to the dispute is obliged to deposit $60 with the clerk of the committee, and this $120 commonly covers all expenses of the litigation. It is possible that for less than $100 a dispute involving tens of thousands of dollars may be settled in a week's time and without ill feeling—a dispute that if carried into the courts would cost thousands of dollars, a year or more of litigation and, it may be, a lifetime of hatred.

3. EFFICIENCY. Commercial disputes necessarily involve questions of commercial usage, the quality of goods contracted for, the interpretation of trade agreements, etc. Equitable settlements of these disputes call for a knowledge of trade terms and customs. Imagine what a reputable merchant risks when he submits an issue of this kind to a jury made up of men who it may be do not know the difference between a bill of lading and a *billet doux*.

Under the Chamber of Commerce plan one can choose an arbitrator, or arbitrators, from a list of 200 to 300 of the best-known business men of the city—men who have achieved success in their lines of trade, and who know the rules, the customs and the language which prevail in the markets of the world. This makes for high class efficiency.

4. PRIVACY. Publicity is absolutely necessary to the administration of justice in a court of law. There can be no star chamber proceedings in the operation of justice in these modern days.

But, publicity, which is a necessary safeguard in the courts, is not necessary in the conduct of a case voluntarily submitted by disputants to arbitration. In an arbitration committee, a business man may secure the guarantee of justice, with the additional and great advantage of privacy.

Every business man, and certainly every credit man, understands what losses may be sustained through the publicity given to litigations. This is one of the reasons why the National Association of Credit Men are establishing arbitration tribunals in their organization. So greatly does litigation often impair credit that the time may come when one of the questions which the commercial borrower may have to answer before obtaining loans will be: "Do you make a practice of submitting your differences to arbitration?"

A striking illustration of the value of privacy is afforded by a recent case tried in the Chamber of Commerce between a business man who disputed the charge made by his attorney for professional services. The lawyer desired the privacy of arbitration because his professional ability was attacked. The merchant desired the privacy of arbitration because the credit of his concern was involved in the proceedings.

5. SIMPLICITY. No elaborate machinery is necessary for the conduct of arbitration, and this is one of its great merits, for it would inevitably break down if arbitration simply substituted a private court for a public court; and undoubtedly this was one of the reasons why the former Court of Arbitration failed of entire success. That court was established because the earlier arbitration method of the Chamber had in the course of time become inadequate to the changing requirements of business, and yet that early method which was established by the Chamber at its first meeting in 1768, and which lasted for nearly a century, was infinitely better than the Court of Arbitration which followed it, because it worked on a simple rough-and-ready plan, and hundreds and probably thousands of cases were decided by it. I recently discovered in the New York Public Library the minutes of the Arbitration Committees of the Chamber from 1779 to 1792, and they make a large manuscript volume.

6. ADAPTABILITY. The present method of arbitration of the New York Chamber has the merit of adaptability to varying conditions and classes of cases. For instance, it makes it possible for the two parties to have one arbitrator, or three arbitrators, or, in certain important disputes, to have the entire Committee on Arbitration sit as arbitrators.

The system is adapted not only to disputes between members of the Chamber, but also to persons not members; and it can settle controversies between citizens of different countries. It will interest you to know that the first case tried under the present rules was between a manufacturer in England and a contractor in New York; and the impartiality of the proceedings is demonstrated by the fact that the American arbitrator decided in favor of the English manufacturer. Moreover, as the system works, it serves not only to decide definitely submitted disputes, but it also serves to bring about settlements by conciliation without any trial whatever. This is even better than arbitration. Scores of disputes have already been brought to an amicable settlement through the conciliatory offices of the Chamber's Committee on Arbitration which, without that method of mediation, would inevitably have gone to litigation. In one case between two of the most noted merchants in the city, the dispute involved the sale of a large amount of merchandise. At first they determined to submit this case to litigation in court. Then they agreed to submit it to the Arbitration Committee of the Chamber, and an arbitrator was appointed. A day was set for the trial, when, by the good offices of the committee, the two merchants were brought together and they settled their dispute privately and without arbitration.

7. GOOD WILL. The conduct of a trial in a court of justice necessarily involves much irritation and bad feeling. It can hardly fail to do this. Even innocent parties to the dispute, as for instance, witnesses who have no interest whatsoever in the controversy, may be irritated by the trial and leave with a feeling of dislike for the administration of justice. Any one who has undergone the ordeal of cross-examination will understand something of what I mean.

Now, in an arbitration proceeding, while bad feeling may not be entirely eliminated, there is nothing in the conduct of the case which involves any breach of courtesy, any violent attack upon the opposing party, any irritating cross-examination of witnesses, any exhibitions of bad temper. This is a very great advantage of arbitration proceedings. In one case at the Chamber of Commerce, the two parties to the dispute, after the decision had been rendered, left the building practically arm in arm, both entirely satisfied that they had obtained justice.

In conclusion let us not claim too much for arbitration, whether applied to international disputes, labor disputes or commercial disputes. Arbitration will not always settle. But because arbitration is not applicable in every case, that is no reason for not establishing arbitration tribunals. There is an international court at The Hague, yet there have been two big wars in Europe during the past year. But shall we therefore abolish international arbitration, when we know that there has been an average of one important dispute between nations settled by arbitration every year in the last half century? Shall we abandon arbitration in labor disputes because in some cases the contending parties prefer the arbitrament of industrial war?

Commercial arbitration is not always the wisest course of action in business disputes; but in ordinary questions of fact arising out of mercantile transactions it is the best, speediest, most economical and simple method of effecting settlements.

The man who consciously or unconsciously feels that he is in the wrong will go to litigation every time, preferring to take his chances before a jury. Arbitration establishes the honest intent of both parties to a dispute; and I believe the time will come when business public opinion will put upon the merchant who refuses to arbitrate his dispute the burden of giving a clear and convincing reason to justify his action.

As many members of the Rubber Club have taken a deep interest in the system of arbitration established by the Chamber of Commerce, Mr. Pratt's clear and concise statement of the scope and advantages of that system was listened to with close attention. At its conclusion President Hood arose and stated

that a friend noting his fondness for limericks, and also his continued persistence for a rubber nomenclature, had sent him the following limerick:

THE OPTIMIST.

Said a cheerful old bear at the Zoo:
"I never have time to feel blue.
If it bores me, you know,
To walk to and fro,
I reverse it and walk fro and to."

"But this limerick," he continued, "also suggests a subject for the next speaker, namely, The Elasticity of Rubber. I have the honor to introduce Mr. Lawrence Sharkey."

MR. SHARKEY ON RUBBER—AND OTHER MATTERS.

Mr. Sharkey proved to be a humorist. He admitted that his only knowledge of rubber was attained through a recent visit to an old friend of his—one named John. He stated that he had called at his friend's place of business and was hardly seated when his friend was called to the 'phone, and he heard him give an order for a certain number of tons of pickles—nuggets—crepe—sheets and blankets. When the receiver was hung up Mr. Sharkey exclaimed: "In Heaven's name, John, what business are you in?" and his friend replied, "The rubber business." Subsequently, John took him over his mill and showed him the processes of converting crude rubber into manufactured product; but the chief impression made on the speaker's mind was of the extreme—not to say excessive—fragrance of the crude material, which he averred "had limburger backed into the corner and begging for mercy." But while Mr. Sharkey's knowledge of the rubber industry was not very profound, it served for a string on which to hang a great many diverting anecdotes, which were not only good, but, better than that, were new; as a consequence of which, when the speaker sat down, he did so amid much applause.

PRESIDENT HOOD.—"Most arguments arise from misunderstanding of the meaning of words used. The meanings of the words 'parsimony' and 'economy' are often confused, but a true definition of 'efficiency' once established clearly will make us all want to 'get together for efficiency.'

"And this is the subject of the talk by our next speaker, who is the Secretary of the Efficiency Society of this city, a society composed of live wires with high voltage. I have the pleasure of introducing Mr. H. F. J. Porter."

MR. PORTER ON GETTING TOGETHER FOR EFFICIENCY.

We do not always realize how natural the processes are through which we are passing when we do certain things. For instance, we do not realize that the natural tendency which is innate in all human beings to segregate in groups is what occurs when a meeting such as this takes place.

Man is a social animal. By that I mean that he has an innate tendency to associate himself with others who have the same common purpose, and this purpose may be either for self preservation or for aggression, or for some common characteristic.

This was the force which operated in early days to form the tribe, and later to bring the tribes together to form a nation, and we see the same force operating in the formation of groups for business and social purposes. Now when these groups form, another action takes place which we do not always recognize as perfectly natural and automatic, and that is the development out of the group of some special personage who is best qualified to lead the movement in hand. Thus, in olden times we had the patriarch or the chief selected for his wisdom or his prowess, and later we had the shrewd or capable business man, or other person best suited to act as leader. This man having been so selected receives the guarantee of the group that they will support him.

After a while another natural process occurs when the group gets so large that the leader cannot keep in close touch with all its members. He appoints others to direct smaller groups into which the larger one is divided, and here the psychology of the situation changes, for these men so appointed are not the selection of the groups over which they are placed, but on the contrary are the selection of an outsider, to whom they are responsible and whose interest they are subserving, and in order that they may get these people to carry out his wishes, they may have to use force instead of depending upon their voluntary service. Now force always develops resistance, and all groups, whether in the past or in the present, as they grow from small to large, pass through this stage and the man once a leader of the smaller group becomes the dictator to the larger. In this way came monarchy, and in this way when the monarch's dictation became too arbitrary the resentment of his people overthrew him.

In this country, up to the middle of the 18th century, our national and state groups were too widely settled to feel the oppression of the ruler who was located in a distant land, but finally the time came when through the importunities of his emissaries they felt the pressure of his rule and they simply threw it off, and came back to the old group association and selected their leader; and this time in order not to make the mistake which their experience had taught them, they limited the leader's term of service, and so we got democracy. At this time we were an agricultural nation and our national, state, county and municipal groups did not require much administrative machinery to carry out their purposes. But about the beginning of the 19th century, there came machinery and the steam engine, and the man whose home was his castle built an adjunct to it, installed machinery and an engine, invited in his neighbors to help him manufacture this or that product, and thus established the industrial group. As long as this group remained small enough for the master workman to keep in touch with all his people, just so long did they all work together in harmony, but when it grew larger and the master workman appointed superintendent and foreman, then came about the psychological change before referred to, and the subordinate officials having no knowledge of the principles of organization and management, applied their self-devised methods, and when the latter did not work, applied force to accomplish their purposes.

So in the growth of industrial groups we have developed small monarchies with dictators in control. This force they applied aroused resistance, and we have allowed the antagonism between employer and employe to grow to such proportions as to constitute open warfare.

It is by knowledge of the psychology of situations such as this that the manager is able, by tact and the application of principles of efficient management which are now becoming known, to hold himself in the relation of leader rather than that of dictator or driver, and maintain such amicable relations between his employes and himself as to keep administrative mechanism operating smoothly.

By efficient management I mean accomplishment with the least amount of effort, for effort causes friction and friction means cost, and when a manager can succeed in his accomplishment of operating his business with the least amount of friction he is operating efficiently. The principles which are now recognized as those which conduce to efficiency are those which take advantage of innate human tendencies. The manager lays out his organization in departments so as to develop a team where each individual is so harnessed as to pull his part of the administrative mechanism in parallel with that of his fellow in the next department, and the harness must be so adjusted to all of the participants in the service that the latter do not overlap each other's traces and so interfere with each other's movements.

In our industrial field we must endeavor to search for the principles of efficient organization and management, for manage-

ment means simply the operation of the organization when properly developed.

When we have a grouping of employer and employe in any industrial enterprise so as to permit the operation of efficient organization and management, we have an approach to democracy in industry, and the nearer we can approach to the principles which we have found to be successful in political democracy the less the friction will be and the higher the efficiency.

In order that the manager may obtain the best results along modern lines of efficient operation, he should get the most advanced members of his group to co-operate with him in organized team work, each specialist taking charge of his own department and studying its features so as to secure the highest refinement in the direction of the special business. Too often do personal animosities and selfish business interests interfere in this efficient development, but the principles of efficiency are becoming more and more generally applied, and when they become thoroughly established we shall obtain a better relationship between the members of the groups and a better condition of affairs in industry and business.

At the conclusion of the speaking, one of the members arose and proposed a vote of thanks to the president and to the members of the Dinner Committee for the unqualified success of the dinner and the great pleasure that had been afforded the members and their guests. Vice-President, George B. Hodgman put the vote, which was carried unanimously.

A new feature was then introduced, namely, a rubber moving picture show, in two parts. The first part showed the growing of rubber in the Middle East plantations, depicting the whole process from the clearing of the jungle to the placing of the cases of rubber on the ocean liners bound for European ports; while the second part of the show covered the gathering, preparation and shipping of wild rubber in the Amazon Basin. The pictures descriptive of the Eastern Plantations were secured especially for this entertainment through the courtesy of Mr. A. Staines Manders, of London, the manager of the Rubber Exposition, recently held in New York.

When, at the highly conservative hour of 11:30 all the diners arose and sang "America" as the concluding chapter of the evening, and then made their way toward the coat room—guarded by the usual number of young but remorseless financiers—it was universally agreed that in no one's experience had any evening been spent more pleasurably or to better profit.

THE MEMBERS AND GUESTS PRESENT.

At the Speaker's Table.

Dr. Jacques Huber's Visit to the East.

CLOSELY following his able paper read at the late Rubber Conference, there has appeared an interesting report by Dr. Jacques Huber, the well-known Pará authority, dealing with his visit early last year to the Middle East. In his journey of investigation he was accompanied by Messrs. H. Akers, Alfredo Ufenasi, and Franciso Lugones, the last-named gentlemen representing various Pará shipping interests.

Sailing from Marseilles on December 13, 1911, they reached Colombo on December 31. Their first visits in Ceylon were to the Botanic Gardens of Heneratgoda and Peradeniya, where they saw the parent rubber trees from the *Hevea* seeds introduced in 1876. Dr. Huber acknowledges the courtesies received from various officials, including Messrs. Lock, Kelway-Bamber, and Petch, at Peradeniya, as well as Mr. Alexander Wardrop (since deceased), secretary of the Ceylon Planters' Association.

In the course of his investigation, he then visited the plantations of North Matale, Tapton Wood, New Peradeniya, and Pallekally. Returning to Colombo, he and his colleagues spent a day at the Culloden estate; subsequently visiting, amongst others, those of Devituraí and Gikayanakanda.

After spending nearly three weeks in the Island of Ceylon, which constituted the first stage of their journey, the party embarked on January 19 for Singapore, which became their center of action on the Malay Peninsula, where they passed five weeks. On arriving at Singapore, Dr. Huber's first step was to try to get into communication with Mr. H. M. Ridley, Director of the Botanic Gardens of that city, whom he qualifies as the man to whom, above all, the Malayan planting industry owes its development and prosperity. Mr. Ridley having retired into private life, some days before Dr. Huber's arrival, he was courteously received by Mr. Derry, one of the veteran promoters of the cultivation of *Hevea* in the East, under whose guidance he visited the Gardens.

Having decided to visit, in the first place, the plantations of the Federated Malay States, where rubber cultivation is the most highly developed, the party embarked on January 27 for Port Swettenham, on their way to Kuala Lumpur, the capital of the Federated States. In the course of the short railway journey from the port referred to they had an opportunity of seeing the noted Klang district, which has been transformed into a vast forest of rubber trees. The following days were devoted to automobile excursions, in the vicinity of the capital and in the district of Klang. Among the estates visited were: Batu Caves, Kent, Wardieburn, Damansara, Bukit Rajah, Vallambrosa, and West Country.

The Malacca Territory occupied their attention from February 3 to 6; during which time they visited the Cumendore plantations, belonging to the Malacca Rubber Plantations, Limited, as well as Ayer Panas, Pegoh Estate, Linggi Plantations, Marjorie, Linsum and Labu Estates. On their return to Kuala Lumpur they paid a visit to the Kuala Lumpur Experimental Station, headquarters of Mr. Lewton-Brain, Director of Agriculture of the Federated Malay States. Dr. Huber refers with appreciation to his cordial reception by Mr. Brain and his scientific staff.

On February 10 they left Kuala Lumpur for Teluk Anson, in the State of Perak, from which point they visited the Cicely Estate, as well as the Nova Scotia, Rubana and Bernam Perak Plantations. On subsequent days the party visited the Kamuning, Changkat Salat and Lauerdale Estates; finally inspecting the Museum of Taiping, capital of the State of Perak. From the last-named point they took the train, on February 15, for Penang, which became their headquarters for the balance of the month. The chief points visited were the Malakoff and Sempuh Estates, where valuable information was gathered as to the cultivation of rubber, mandioca and cocoanuts. Owing to the Chinese New Year's, business was more or less generally suspended during the latter part of February.

On March 1 they embarked for Sumatra, where they spent almost three weeks at the capital, Medan, making excursions in various directions, and visiting, among others, the plantations of Bangoen Poerba, Gallia, Bandar Maria and Cilinda. On succeeding days they took in other plantations, including that of Dolok Baros, situated about 3,000 feet above the level of the sea, being thus the highest point at which *Hevea* grows in the Island of Sumatra. Among other plantations visited were the Dolok Estates, Sunger Mangkei, Batoe Rata and Simahé.

Returning for a few days to Singapore, Dr. Huber and his colleagues took steamer from there to Batavia, Java, where they arrived on March 26, visiting on the following day the Botanical Garden of Buitenzorg, where they received much valuable information from Dr. Tromp de Haas and other scientists of that institution.

Among the Java plantations visited were the Dramaga, Tjukados, Pasir Oetjing and Sengon Estates. The testing station at Malang and the Garden of Acclimatization at Vonger contributed valuable information. The party returned from Batavia to Singapore on April 18.

Before returning from Singapore to Europe, they inspected the plantations on that island belonging to the Hollandsch Americansche Plantage Maatschappij (Holland American Plantation Co.).

GENERAL CONDITIONS OF COUNTRIES OF RUBBER PRODUCTION.

This itinerary is followed by a discussion of the general conditions affecting the subject. Dr. Huber expresses the opinion, that while rubber cultivation has been developed in the Malayan Peninsula, as well as in Ceylon, Sumatra, Java and Borneo, the other Eastern countries in which it has been introduced, such as Southern India, Burma, Cochin-China, the Philippines, New Guinea and Samoa, will probably never exercise a preponderating influence upon the world's rubber production.

As to climate, it is added that the above countries are relatively uniform in temperature, while the amount of rainfall varies considerably, according to the districts. Regarding topography, the Eastern rubber producing countries are distinguished by their character being more varied than that of the Amazon region. Ceylon is relatively mountainous in the center and southern half of the island, culminating in Adam's Peak, 7,379 feet in height. The cultivation of *Hevea* extends to a portion of the mountainous region, in some cases attaining a height approaching 3,000 feet above sea level. In the Malayan Peninsula a mountain chain extends from northwest to southeast, with an undulating plain extending along the west coast. In Sumatra there is likewise a mountain chain from northwest to southeast; while in Java plains alternate with mountains of a massive character, some of which are volcanic, with rich soil, and others of tertiary calcareous formation, poorer in quality. Borneo is also to a great extent mountainous, with large rivers, the alluvial plains of which are covered with virgin forests, partly marshy in character, thus more or less resembling Amazonian conditions. Burma, Siam and Cochin China are marked by extensive plains, varied by low hills.

With respect to population, Dr. Huber is of opinion that the Eastern rubber producing countries are in a favored situation as compared with Amazonia. The former countries have a relatively large native population, essentially agricultural in its

character, which has served to carry out European enterprise. The Singhalese of Ceylon, the Malays of the Peninsula and the Sunda Islands, as well as the Javanese, are easily accessible to European civilization.

The population of the five principal Eastern rubber producing countries is estimated as follows: Ceylon, 4,000,000; Java, 30,000,000; Federated Malay States, 1,000,000; Sumatra, 3,200,000; Borneo, 1,700,000. Of the four million population of Ceylon, about two-thirds belong to the Singhalese race, while the coolies on the plantations are almost all Tamils from Southern India. On the Malayan Peninsula the number of coolies employed in 1910 was 179,030, composed of: Tamils, 98,988; Chinese, 45,663; Javanese, 17,760; Malayans, 14,258; others, 2,361. In Malaya the Tamil coolies are generally found on the older estates, having a prejudice against new estates. Tamil coolies, in addition to being cheaper, are more obedient than Chinese and Javanese coolies.

Regarding hygienic conditions, they are in general satisfactory in Ceylon, except in times of epidemic, while in Malaya and Sumatra they leave a good deal to be desired, particularly in new plantations.

HISTORY OF HEVEA CULTIVATION IN THE EAST.

In a section devoted to the above branch of the subject Dr. Huber recalls the well-known facts which have led to the present development. The total area planted in the Middle East is estimated at 1,125,000 acres in 1911, divided as follows:

	Acres.
Malayan Peninsula	550,000
Ceylon	215,000
Sumatra	150,000
Java	125,000
Other Sunda islands	40,000
Southern India and Burma	30,000
Cochin China	15,000
Total	1,125,000

PRODUCTION OF EASTERN PLANTATIONS.

The figures of 1911 exports from the two principal sources in the Middle East are quoted as: Ceylon, 3,194 tons; Malaya, 10,700 tons; total, 13,894 tons. With respect to Malayan production for the five years 1912 to 1916, Dr. Huber makes the following estimate: 1912, 20,000 tons; 1913, 32,000 tons; 1914, 45,000 tons; 1915, 60,000 tons; 1916, 70,000 tons. That these figures are not exaggerated is confirmed by the independent estimate for 1916, of 65,000 tons from 360,000 acres, by the Director of Agriculture of the Federated Malay States.

PLANTATION ORGANIZATION.

This subject is comprehensively dealt with, from the acquisition of the ground to the packing of the rubber for shipment. The question of the cost of production is then taken up and finally the cost of establishing a *Hevea* plantation.

FUTURE OF ASIATIC PLANTATIONS.

The portions of Dr. Huber's report referred to, chiefly deal with the past and the present of Eastern rubber cultivation. In the last two sections he discusses the future of Asiatic and Amazonian plantations. He remarks as to the former, that an industry so highly developed and so richly capitalized will not allow itself to be easily overcome by unfavorable circumstances, and to a certain extent guarantees its own success. At the present price of rubber, a well-managed plantation in full bearing is, he remarks, in a position to yield fabulous profits, if the capitalization is not too high. He asks whether these conditions may not be altered by external or internal causes, the former including the question of labor and its price.

The chief danger confronting the Asiatic plantation industry, however, arises from its organization, and depends upon financial considerations. The careful observer will remark in this rapid evolution, symptoms of precipitation and errors inherent to an industry still at an early stage.

After discussing the cultivation of *Hevea* in comparison with that of cereals, tobacco and cotton, Dr. Huber adds, that in accordance with the nature of the plant, its cultivation should be slow but steady, while under the exacting requirements of capital, it has to give a maximum yield. Probably the time will come when planters will recognize the necessity of letting the trees rest at regular intervals.

Dealing with the question of the number of large trees to an acre, he refers to the opinions expressed in favor of planting 50 or 40, giving his own view that under the most favorable circumstances not more than 20 should be allowed. For 400 pounds to the acre each tree would then have to give 20 pounds.

As to the general question, Dr. Huber remarks that there is no longer any doubt of the acclimatization of *Hevea* in the East, public opinion in Amazonia having, moreover, begun to be enlightened on that point.

EASTERN AND AMAZONIAN PLANTATIONS.

In the final passages of his report, Dr. Huber remarks that one of the principal factors in the rapid development of Asiatic plantations has been the abundance and cheapness of labor in contrast with its high cost in Amazonia. "But," he adds, "we are in need above all of a *directing staff* of skilled agriculturists, with sufficient experience to organize an important agricultural enterprise with satisfactory results. In the East such men are never lacking, particularly those trained in Ceylon and Java as administrators of plantations."

The opinion is expressed that the complete abolition of duty on plantation rubber exported (even for a certain number of years) would be the most efficacious means of stimulating Brazilian plantations, especially those heavily capitalized.

As has been already pointed out. The cost of establishing in Brazil a plantation upon the Eastern model would be higher, on account of the dearer labor, which costs in Amazonia, it is estimated, ten times what it does in the East. But, apart from the question of establishment, is that of operation, in which Dr. Huber sees no chance of competing with Asiatic plantations, at least during the earlier years of existence, when the yield of latex is small. The whole problem depends on the yield obtained by the individual laborer. If he is paid ten times as much as in the East but gathers ten times as much rubber, he can compete.

In conclusion Dr. Huber thus sums up the case of the East vs. Amazonia: "In the East, where labor is relatively cheap, and where a tax is paid on the land, the return for a given area is of great importance. On the other hand, here (in Amazonia) where land is relatively abundant and cheap, but labor very dear, this factor is of subordinate importance to the yield per laborer. Consequently we ought to strive in our plantations to prevent the trees planted from being exhausted before their time, by premature and unprofitable tapping, so that at least a good part of them may attain large dimensions; this being the only means of insuring profitable working, notwithstanding the high cost of labor."

Such are a few of the most salient points in Dr. Huber's valuable and interesting report (in Portuguese), which in pamphlet form occupies 116 pages. While principally intended for the Brazilian planter, it contains much matter of general value to the industry. Told in Dr. Huber's lucid and comprehensive style, the story of his Eastern journey is a distinct acquisition to rubber literature.

M. J. Kabayashi has been appointed editor-in-chief of the Japanese rubber paper, "The Gomu Shimpo Sha," published at Tokyo, Japan.

MR. H. A. WICKHAM AND ONE OF HIS TREES.

PROBABLY everybody in the rubber industry is more or less familiar with the story of Mr. H. A. Wickham and the cargo of *Hevea* seeds which he gathered along the Amazon in 1876 and carried to Kew Gardens in London. Charles Goodyear

MR. WICKHAM AND ONE OF HIS ORIGINAL SEEDLINGS.

may properly be called the father of the rubber industry, but Mr. Wickham is certainly the father of the rubber plantations. It was 50 years ago—when he was a considerably younger man than he is at present—when he first conceived the idea of planting *Hevea* trees on soil under English control. He was exploring the Amazon Basin, not particularly well known in those days, when he saw the great forests of *Hevea* trees, and it occurred to him that these trees could be made to grow under the very similar conditions that obtained in India.

He went back to England and tried to interest his friends, but they thought his scheme much too visionary. However, finally he interested the India office and returned to the Amazon in

1875 with a commission to get the seeds in any way he could. It was not so difficult to get the seeds—but it was extremely difficult to get them out of the country, as obviously the Brazilian authorities would not view with composure this attempt to rob them of their monopoly. But by great good luck in the following year he was able to charter an English steamer that appeared on the Amazon, and by the assistance of a small army of natives he soon collected over 70,000 seeds, and was off down the Amazon and out on the ocean headed for England. The seeds were planted immediately on his arrival, and two weeks later thousands of little rubber plants were to be seen in Kew Gardens. These were later sent to Ceylon, and there started the great plantation industry. The above picture shows Mr. Wickham (who is still hale and hearty and interested in rubber growing) leaning against one of his seedlings sent out to Ceylon thirty-seven years ago. This tree produced 240 pounds of dry rubber in the two years 1909 to 1911.

CEYLON HARD FINE PARA.

According to latest advices, Mr. H. A. Wickham, the father of the Eastern plantation industry, expects to remain until July next in Ceylon, where he has been more than six months developing his process for producing plantation rubber on the lines of Hard Cure Pará. His previous work on these lines was referred to in THE INDIA RUBBER WORLD of November, 1912, on page 112.

From reports quoted in the local Ceylon press, it would seem that the samples of rubber treated by Mr. Wickham's process have been pronounced in New York and London to be the nearest approach to Fine Hard Brazilian Pará as yet sent from Eastern plantations.

In order still further to test the matter, it is proposed to ship half a ton of this smoke-cured rubber at an early date. Manufacturers are prepared, it is said, to pay a premium of 4*d*. per pound for this rubber treated by Mr. Wickham's process.

A FRENCH VIEW OF AMAZONIAN ECONOMIC DEVELOPMENT.

IN an interesting article in the "Bulletin of the French Society of Commercial Geography" M. V. Cayla (Agricultural Engineer) deals with the general question of the economical development of the Amazon territory. While much of the matter contained in the article is already familiar to our readers, it seems well worth while to review it briefly, in order to show the conclusions reached by a trained European observer, who has carried on his investigations in that territory in a thorough and painstaking manner.

He recalls the fact that the Amazon, while doubling its production of rubber within 20 years, now only furnishes about 49 per cent. of the world's supply, instead of 61 per cent. a score of years ago. The increased Malayan production will doubtless, it is added, lead to a continuance of the present comparatively low prices of rubber. These conditions are only to be met by a reduced cost of Brazilian production, to which end the recent Federal legislative measures have been directed.

The problem of Brazilian rubber includes two varieties, *Hevea* and *Castilloa* (caucho), the former being of chief interest. It is obtained by the Brazilian method, which under present conditions is preferable to that used on the plantations of the Middle East. The Amazonian production has, in fact, marked advantages over the Malayan plantations. Virgin forests, rich in rubber trees, cover extensive surfaces along the Amazon and its affluents. *Heveas* are there found in the condition best adapted to their development. By the fact that the *seringueiro*, when making up his "estrada," only takes in sufficiently mature trees, in itself constitutes a selection. These undoubted advantages, which have rendered Amazonian rubber the standard of the market, are outweighed by the high prices of labor and provisions; particularly in the districts furthest from the seacoast. On the Rio Xingu, moreover, the situation is complicated by the irregularities of the bed of the river, which impede navigation. As a result of this situation, the cost of rubber transport from Iriri to the port of Pará represents about 22½ cents per pound.

Among the causes of dear labor is the insalubrity of the climate, which prevents the workers, almost all from the State of Ceara, from bringing their families to Amazonas.

The export and other duties imposed by the States of Amazonas and Pará reach a total of 25.93 per cent. on the value. In addition there is a municipal tax levied on rubber at the point of production, so that it is estimated that including the various duties and freight, the cost of bringing rubber to Pará represents about 53 per cent. of the selling price at that point. It is added that the freight from Pará to Europe and to the United States is too high and might be materially reduced.

In view of the inexhaustible wealth of the Amazon basin in rubber and other products, the improvement of the methods for developing Brazilian industry acquires preponderating importance. Reference is specially made to cacao, rice and tobacco as of possible interest in this connection.

In addition to facilitating the wild rubber industry, the importance is urged of developing the planting of *Hevea* in Brazil, its natural home; following out the successes which have marked its introduction from Brazilian seed in the Middle East. This principle has been understood by the Federal Government; the legislative measures adopted, while favoring the wild rubber extraction by reductions in export duties, affording much greater advantages to the plantation industry, ranging from premiums for planters, to total exemption from export duty, and from duty on the necessary working installation. Owing to the legislation only dating from January, 1912, plantations are as yet few in number, being principally situated along the lower Amazon and in the large island of Marajó.

Nor is the economic development of the Amazon in danger from difficulty in the shipment of its products. The important port of Pará has recently completed improvements which will permit of its accommodating at its quays steamers of 7,000 tons.

These facts are brought out by M. Cayla in the paper he has prepared in anticipation of his proposed visit to the Brazilian *Hevea* plantations. In his concluding words he thus expresses the French view of the situation:

"The production of the Amazon is therefore not in the desperate situation which might be inferred from certain pessimist opinions. Doubtless, it finds conditions not so easy as formerly, competition having intervened for its chief product—rubber.

"It becomes necessary to modify the processes used, . . . and to turn from the period of exploitation to that of colonization. This is the program which Brazil has traced for her Northern states, for which competition is the best stimulant."

THE BYRNE SMOKING MACHINE.

The "Times of Ceylon" quotes a cable report from London to the effect that the Byrne smoking machine has been thoroughly tested, with the result that the curing produces a distinct improvement in the quality of the rubber. Figures obtained are said to show that the resiliency is better than that of Bukit Lintang crepe, while the resistance and recovery are higher.

RUBBER SHIPMENTS TO THE UNITED STATES FROM SOUTHAMPTON.

An official report from Consul Albert W. Swain shows that the shipments of crude rubber from Southampton to the United States represented in 1910, $8,230,125, and in 1911, $7,436,690. In contrast with these large exports of crude rubber are the relatively small amounts of $60,040 and $60,200 for manufactured rubber goods shipped from that port to this country.

SPECIFICATIONS THAT HINDER PROGRESS.

EDITOR OF THE INDIA RUBBER WORLD—SIR: Fire departments of this great and wealthy country must necessarily continue to be equipped, as they now are, with the best products of the American factories; with particular reference to hose it is the earnest desire of the manufacturers to obtain recognition for their best output. They are, however, practically unanimous in the belief that this opportunity cannot be offered through the medium of specifications. This is due to the fact that specifications covering any product of which rubber is a constituent part, cannot be drawn in detail so as to assure obtaining the best quality. Manufacturers of hose having a varying experience of from ten to fifty years have acquired a knowledge of compounding rubber, warranting their belief that by their particular process they have obtained the best present compound of rubber for a fire hose tube. This is not necessarily of delicate refined texture, but must possess strength, resiliency and durability.

Each manufacturer thinks that after experimenting practically all his life, he is making a rubber tube a little better than the others, and each is striving to place in the fire departments the very best result of his experience and factory facilities. As these processes vary it is not natural to expect any established manufacturer to divulge the ingredients of his rubber compound. In fact in most cases it would be impossible to formulate specifications providing for a chemical test that will be in even a moderate degree accurate in showing the value of the tube. The ability of the chemist to determine by his art the rubber component part of a vulcanized compound is not a lost art, but one which has never yet been discovered. Hence the inconsistencies in all specifications.

It is a mistaken policy for any city to adopt or dictate theoretical specifications to which no manufacturer of experience and integrity of purpose can commit himself. It is perhaps, hardly within the province of propriety for the seller to attempt to dictate to the buyer, but the manufacturers may venture to offer the suggestion that if fire engineers and municipal officials continue to make conclusions based upon experience they will make no mistakes.

We say again, the best rubber products today are not susceptible of accurate chemical analysis. A tube made up of a certain percentage of pure new rubber, mixed with brains and experience, will be much more durable than a specification tube composed of laboratory theory and inexperience. To obtain the best hose put the manufacturers on their mettle, and create among them the spirit of competition in quality, not competition in price alone.

If the combination of insurance interests wishes fire departments to buy apparatus and hose of its own makes, why does it not maintain fire departments from its own profits. The large revenue even at present rates of insurance would warrant this and leave ample funds for fat dividends.

What is the actual cost of fire insurance, as compared with the insurance trust charges?

The average cost per annum for real actual fire insurance as shown by six years' results in the mutual or co-operative companies, doing business where they are not restrained, was just eight and six-tenths cents per annum on each one hundred dollars. If the so-called straight line companies succeed in obtaining control over the tax-payers' fire department property, will the reduced rate be anything like eight and six-tenths cents per one hundred dollars? If not, why not?

Large fires and the consequent large losses are seldom the results of imperfect hose and apparatus, or inefficient fire department service, but are most frequently due to causes beyond the control of human or mechanical effort, or within the scope or ordinary fire department organizations to meet; and labels on hose or apparatus attesting its popularity with the Underwriters Laboratories would not save the property.

A large fire in any community is seized upon by the insurance interests and used as a club to pound the fire department. As for instance in the case of the City of New York, having the best equipment obtainable and the best organized fire department in the world. Is it supposable that a school of theorists should be competent to reform that great modern fire department? It is said that large fires periodically are productive of great profit to the insurance companies, as they furnish the means of throwing a scare into the people for another juggle with rates—to send them up or keep them where they are, when they dare not put them higher.

The best method of selecting hose for fire department purposes is to allow the manufacturers to offer prices and samples of their very best products, the departments to reserve the right to reject any or all bids, and the samples thus submitted under the supervision of the chief executives of the fire department, would show to the people of the cities that their fire department is self-contained, and well able to select the best tools for protecting property. A city should rely upon the records of its own fire department for the quality of brands of fire hose it has used in the past. It should also try new brands of the very best quality in material and manufacture that may be offered. This course will create a rivalry among the manufacturers on the test of quality alone. Furthermore, it should hold the manufacturer responsible for any defects in material or manufacture that may develop in three years.

By distributing their business, buying only the best, the fire departments will soon obtain the absolute confidence of the public, and prove that there can be no better criterion to go by than the judgment and experience of the trusted officials of the fire department and their record of past performances.

The insurance interests claim that they wish to elevate the efficiency of fire departments. Whence comes their knowledge of fire fighting ability, and standards of quality justifying their sweeping condemnation of methods now in vogue? Theory and practice have always been at variance. The insurance laboratory has the theory. Our fire departments have the experience. Which should command the greater respect?

Municipalities should, and will, protest against the arbitrary inspection and dictation of self-appointed and self-interested censors. City government under our American system is not a failure, and men selected to serve on its boards as fire commissioners or chief engineers, are capable of making their own judgment, and of following legitimate business methods.

MANUFACTURER.

EDITOR OF THE INDIA RUBBER WORLD, Sir.—Coaltar Pitch has recently been offered to us as a compounding ingredient to be used in place of the expensive Earth Pitches. Now the price is very attractive at twenty dollars per ton. What I would like to know is this: Have any of your readers any experience with this material in the mixing of compounds for mechanical rubber goods? Do these compounds "bloom" or "dry out"? Thanking you for any information which you can give me, I am.—WALTER FERGUSON.

The English Society of Dyers and Colorists are offering a prize equal to $100 for an investigation of the maximum amount of copper in dyed cloths for rubber proofing. Papers have to be sent in before June 30, 1913. Another prize of same amount is being offered for a printing machine cylinder obviating the necessity of using blankets or lapping. The use of rubber-covered rollers has been suggested and tried, but results have not been decisive.

The Thirteenth Annual Automobile Show.

THE Thirteenth Annual Automobile Show, held in New York from January 11 to 25, might with great propriety be called a multitudinous success, for it was crowded beyond precedent. This Show has outgrown any one building in New York, and consequently this year it was held in the two largest show buildings in the city—the venerable and capacious Madison Square Garden and the spacious new Grand Central Palace. It not only was held in two buildings, but was divided into two parts; part one consisting of pleasure vehicles and occupying the first of the two weeks of the Show—from January 11 to 18—and part two being devoted to commercial vehicles and covering the second week—from January 20 to 25. The management had hoped for an attendance of 300,000 during the first week and 100,000 during the second week. Both of these hopes were more than realized, and probably half a million people attended during the two weeks.

About 500 exhibitors took part during the two weeks and 1,000 distinct exhibits were shown—the value of which has been estimated at close to $6,000,000. This is certainly a wonderful growth from the little initial show of 13 years ago, when there were practically only 20 exhibits, and when such visitors as attended were prompted rather by curiosity as to what these "buzz wagons" might be, than by a lively sense of personal interest—which was the actuating motive that took most of the several hundred thousand visitors to the recent exhibition.

Too much praise cannot be given to the scenic experts who prepared the Garden and the Palace for the 1913 exposition. In the Garden the roof of the edifice—not in itself a very sightly spectacle—had been covered by thousands of yards of sky-blue draperies dotted with thousands (to be more exact something over 7,000) electric bulbs, which, flashing out of the dull background, gave a wonderfully fine starry effect. In addition to all this individual illumination there were three large crystal chandeliers hung in a line through the center of the big building, around which there was an oval of twenty smaller crystal lights, the whole giving a particularly brilliant effect. The rest of the Garden was decorated in white and green, while the names of the exhibitors—all in a uniform character of display—appeared in red or white. Everything was done to make the general appearance harmonious and to eliminate any suggestion of incongruity.

The Palace naturally lent itself to fine decorative effects, and here the scheme of ornamentation ran to mural paintings and trellises covered with running roses.

The tire exhibitors, of whom there were 40, had their display at both places, on the upper floors. In the Garden they occupied a very considerable part of the first and second galleries, while in the Palace they had much of the space on the third floor. Practically all the leading manufacturers were represented, and represented very adequately, occupying generous space, in which, avoiding all appearance of crowding, they showed only their leading lines. One feature that could not help impressing any visitor was the liberal volume of literature provided by the tire makers for the general education of the public. For instance, the B. F. Goodrich Co., on a stand at the front of its exhibit had twenty different booklets, pamphlets and folders, varying in size and volume of contents, but all attractive in appearance, and some of them obviously representing considerable expense. The Diamond Co., the United States Tire Co., the Firestone Co., and the rest were not far behind. Anyone who made a judicious collection of this literature—free to all—and took it home and digested it carefully and intelligently, ought to know more about the tire industry than has ever yet gone into any encyclopedia.

There were not many absolutely new tire offerings exhibited at the show; and logically one could hardly expect that there would be, as the tire industry has long since reached a conservative basis where distinct innovations are not to be expected in rapid succession.

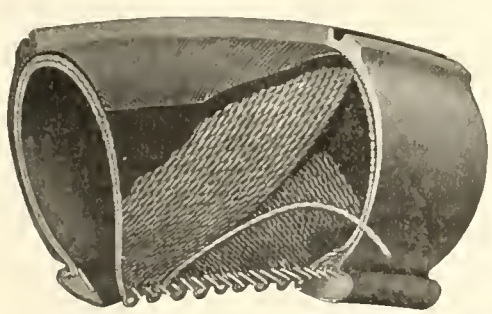
One tire was shown, however, that is new to this country—

MAIN FLOOR AT MADISON SQUARE GARDEN.

although it has been familiar to the Englishman for several seasons—the tire made by the Silvertown Cord Construction. The Diamond Rubber Co. rented a spacious corner just across the avenue from the Garden, at the corner of Twenty-seventh street, and there, where its operation could be commanded through two large windows from the sidewalk, a machine was in motion constructing this "Silvertown Cord" tire. There was always a crowd of spectators on the walk and another crowd of spectators inside watching this machine at its evolutions. Briefly the tire is made as follows: An inner lining of rubber is laid over a wooden form; the form is then placed in the machine. A long arm seizes an endless cord (flat, about ⅛ inch wide, made of many strands of the best cotton and impregnated with rubber) and swings it over the tire form, when two steel hands clutch the cord, bringing it in a double loop down diagonally over the form, fastening each loop to a steel peg on the inner side of the form and releasing it just as two sets of steel fingers reach around the cord and press it tightly into place. In watching this operation one is lost in admiration at the ingenuity of this machine; it is uncanny in its intelligence. As one observer said: "It can do everything but talk." As the long arm swings back to get another double fold of cord, the form moves slightly forward, and is ready for the next double loop.

After the form has completed a revolution, and the rubber lining been entirely covered with the cord, another thickness of rubber is put over it and the process repeated—except that the cord now runs diagonally the other way. When this layer is completed the tire is ready for its tread. These tires are extremely resilient, rebounding several times when dropped on the floor, and will stand ten times the air pressure to which a tire is normally subjected. They cost a little more than tires constructed of layers of fabric, but are said to give a materially longer service.

Main Floor at Grand Central Palace.



"Silvertown Cord Construction" Tire.

Here is a somewhat detailed description of the exhibits made by the tire manufacturers. Some of these exhibits were new; some were shown a year ago; but all are interesting as showing the trend of tire development in this country.

The Fisk Rubber Co., of Chicopee Falls, Mass., had on exhibition a line of heavy-car type tires, including a clincher "Q-D," Fisk-Dunlop and bolted-on types, the Fisk Removable-Rim and Pure Pará inner tubes. The Fisk "Town-car Tread Tire" is the latest production. The knobs on this tire are in addition to the regular thickness and are arranged in three rows running around the tire, the largest row of studs being in the centre. This shoe also has a ring on either side to take care of the slipping in turning sharp corners.

The Ajax-Grieb Rubber Co. showed both their smooth tread and their anti-skid, which consists of cross-cuts in the rubber, and is noted for its thick treads and great road-gripping power.

The Pennsylvania Rubber Co., originators of the "Vacuum-Cup" tread, had a line of their new oil-proof tires, which they claim are not injured by oily roads.

The New Jersey Car Spring & Rubber Co. tires are made by the one-cure wrapped tread process. The "Clingtite" tread is a depression instead of a projection construction. The depressions are cup-shaped with protruding centres at the middle of the tread, while at the sides they are semi-circular. The cups with raised bottoms are designed to form a vacuum as the rubber is pressed against the road-bed, and the claim is that, as the pressure is released; the convex bottom automatically breaks the vacuum.

The Thermoid Rubber Co. showed a full line of brake lining, bumpers and hose, red inner tubes bearing the trade name "Merit." Their "Thermoid *de Luxe*" tire is the company's leader. They also manufacture the "Nassau" tire.

The Miller Rubber Co. has developed a new tread. It consists of angle-shaped depressions arranged in two rows, one on each side of the centre of the tread. They are manufactured by the one-cure wrapped tread process.

The United States Tire Co. showed the "G. & J.," Morgan & Wright, Continental, and Hartford tires. The tread with two chains running around the tire was on the stand, and the "Nobby" tread was seen on an extra large tire designed for truck use—38 x 8—easily the largest tire there. This company also showed a new red inner tube.

The Republic Rubber Co. makes the "Staggard Tread," which has a series of finger-like projections running around the tire. There are six rows of these so set that the space between two of these come opposite centres of the adjoining row.

The Empire Rubber & Tire Co. showed a new line of red tires in smooth and non-skid treads. They claim that this wears better and heats less than grey tires.

The Diamond Rubber Co. exhibited the "Squee-Gee" tread as their safety; and the "Diamond Silvertown Cord" tires, the making of which is described in the first part of this article. The "Squee-Gee" tread consists of a series of five finger-like projections joined together through their centers by a strip of rubber running across the tread. This design repeats itself around the tire. These tires are made of vitalized rubber.

The Goodyear Tire & Rubber Co. showed tires with straight sides, and also oversized tires. The "No-rim cut" features mark this line. The anti-skid tread is made up of triangular shaped studs. These tires are made by the double-cure process.

The B. F. Goodrich Co. displayed a large line of tires, among which were the "Goodrich Safety Tread" and "Goodrich Cord Tires" for electrics. In the latter cord replaces fabric. These are both new developments of this company. They also showed a new plug for mending punctures, resembling a collar button in appearance and method of insertion. This instantly closes a puncture. They also had a self-vulcanizing patch.

The Seamless Rubber Co. had a straight-side or clincher tire. They are made plain or safety tread. They have a series of cuts at each side of the centre of the tread, resembling a scaling ladder. The seamless tubes are of red and of grey rubber and are built without a seam.

The Firestone Tire & Rubber Co. had a new red inner tube. Their line of tires is marked "Non-Skid" diagonally across the tread. The abrupt angles and hollows of the letters grip the road and prevent slipping. Firestone cushion tires for electric pleasure cars have double tread and internal cavities.

The Portage Rubber Co. makes a heavy pneumatic tire of four and five-inch sizes, having from eight to ten plies of fabric. Durability and not speed is claimed of this style. Its non-skid tread has many edges and angles which grip the road in all directions. This is known as the "Daisy Tread."

The "Brown Scientific Non-deflating" tube, made by the Voorhees Rubber Manufacturing Co., is made in some respects similar to a casing. It is made upon a mandrel, the outer, or tread, half being of double thickness. On the inner side is placed a strip of extremely high-grade non-elastic fiber. It is then vulcanized, blown off the mandrel and turned inside out, thus placing the rubber inside, causing the rubber to compress sufficiently to effectually close any puncture.

The Double-Fabric Tire Co. makes the "Interlock" inner tire, which is made to be placed between the inner tube and the shoe. It consists of a substantial casing-like structure, which has a thicker portion where the interlock comes in contact with the shoe, and at the beads has two wide over-lapping flaps which serve to lock the device when the tube is inflated.

The Walpole Rubber Co. guarantees its tire against stone bruises and defects in manufacture. The construction, which is the basis for the stone bruise guarantee, consists of placing a gum breaker strip between the fabric and the tread one-eighth of an inch thick, tapering it down at the bead.

The Federal Rubber Manufacturing Co. makes the "Rugged-Tread." This has three rows of strong studs set equidistant upon the body of the tire.

The Continental Rubber Works, makers of the "Continental-Erie," "Liberty" and "Tribune" brand of tires, had an exhibit of these tires in plain and anti-skid treads, fitted for the Q. D. Clincher, and straight-side rims. Their tires are noted for their wearing capacity.

The Essex Rubber Co. showed a line of automobile and tire sundries such as blowout patches, inner sleeves, hook-on and lace outer boots, "Perfection" rubber goggles, red rubber tubing, radiator hose, gas-engine packing, brake lining and rubber spring bumpers.

The L. J. Mutty Co. had a line of "Numotor" fabrics in single texture for automobile seat covers, and also double texture with Pará rubber interlining for tops. These fabrics are made of cotton yarn, dyed in the fiber with a special dye, "Indanthrene" which will not fade. The single cloth comes 54 inches wide, and the double 60 inches wide, so as to eliminate the center seam in tops. It comes in all colors and is guaranteed absolutely waterproof.

The Standard Woven Fabric Co. showed the "Multibestos" Brake lining. This comes in all sizes and is interwoven with copper wire. Oils do not injure it, and it will not burn.

A. Schrader's Son, Inc., had their Universal tire gauge on exhibition, also the pencil type, which is very small, only 2½ inches long. Both of the gauges remain fixed so that they can be removed from the valve stem for easy reading.

The Overman Tire Co. exhibited a cushion tire of generous proportion and of new design. It is based on the flow of rubber. Such a tire requires a special rim to which the tire is bolted in the center near the base. There is a triangular cavity extending around the tire. This permits a flow of rubber inward. The tread is cut with alternating wedge-shaped indentations around the edge, which prevents skidding and allows the rubber to give under pressure.

The Racine Rubber Co. makes a "Trusty Tread," composed of three rows of elongated studs; those in the centre being set straight on the tread, the outer ones arranged irregularly; so that the breaks between studs do not come opposite each other.

The Swinehart Tire & Rubber Co. makes the "Keaton Depression" tread. These are kite-shaped depressions grooved in centre, and act like a sharp skate on the ice, making it impossible to slide sidewise. They also make the "Electrical Cellular" tire, which consists of a series of deep holes in a solid tire, forming a suction upon the road bed.

The entire Marathon line was new, for the Marathon Tire and Rubber Co. is a late entry into the tire field. The "Angle" tread is its most marked feature, and designed for non-skidding purposes; plain treads are also furnished. The company's inner tube is of red rubber, for which much is claimed by the tire-makers as an inner tube material.

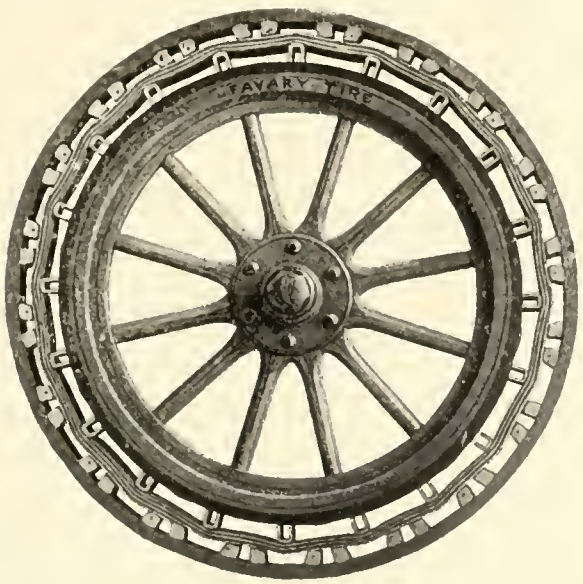
A puncture-proof tire made by the Lee Tire and Rubber Co. was mounted on a bed of spikes, weighted with over half a ton upon the wheel. This tire has several layers of small round metal disks imbedded in the tread and interlapping each other with a thickness of rubber between. This is to prevent sharp objects from entering the tire. They also make the "Zig-Zag" tread, which grips the road with all the tenacity of chains. When the middle wears down the sides prevent the car from skidding.

The American Tire and Rubber Co.'s patented tube is reinforced on the side which comes next to the rim; the rubber being considerably thicker at that point, which affords protection against possible injury from pinching or friction with the rim. Their tubes are of red and grey rubber. They showed a line of blow-out patches, tire protectors, reliners, and their five-minute cure vulcanizing cement, which they claim will cure in that time, nor over-cure if left much longer. There was a large pneumatic tire without an inner tube. A new type of solid tire is about to be added to the line.

The Kelly-Springfield Tire Co. makes a "Kant-Slip" tread which is a new design, consisting of a bead running around the tire's greatest circumference, with small, raised crosses at each side and at close intervals. They have a full line of truck tires all of which are solid.

The Dayton Airless Tire construction consists of a tier of rubber blocks spaced apart within the casing, and supporting the tire. Freedom from puncture and blowout is claimed without loss of resiliency.

The Motz Tire and Rubber Co. displayed solid and cushion tires; the latter made with slant-wise bridges and undercut sides and used for electrics.



FAVARY CUSHION TIRE.

The Favary Tire and Cushion Co. had new cushion tires for pleasure cars and trucks. The former is made up of several layers of water-proof fabric supported by rests at frequent intervals around the rim. This in turn supports a double set of rocker blocks, which are mounted midway between the others to form a cushion. The solid tire, either smooth or non-skid, is fastened to this. The truck tires are made up of chains in place of fabric.

The Englebert Tire Co. makes the flat chevron non-skid, and leather steel studded tread. This is a part of the tire itself. This tire presents a flat surface to the road. These tires are made in Belgium.

The United and Globe Rubber Manufacturing Co. makes the "Globe Interlock" tires. These are made with the double bias in the construction of the carcass and are said to be exceedingly strong. They also make the "Globe Red" inner tube, which is guaranteed against oxidation.

The Russian Tyre Sales Co. exhibited the "Provodnik" tires in flat steel-studded or "Columb Tough Tread." This is composed of a section of tough black rubber at the wearing point of the tire.

The Braender Rubber & Tire Co. was distinguished by its "Bull-Dog Tread" tire, which is of a peculiar design built up on the regular tread, across which it forms an angled groove. This when pressed down to the road is said to form a vacuum and on wet or oily roads the raised bars secure a firm grip.

The Tyer Rubber Co. are makers of the "Hold-Tite" anti-skid. This tire is made up of two rows of T-shaped depressions, the heads of the T's abutting on an uncut section which extends circumferentially about the casing, and forms a great gripping power.

THE ANNUAL AUTO. IMPORTERS' SHOW.

THE Ninth Annual Exhibition of the Importers of foreign-made automobiles was held from January 2 to January 11, in the handsome and spacious ball room of the Hotel Astor. Some twelve exhibitors took part and about 35 cars were displayed. These exhibits, together with the crowd of visitors that daily frequented the show, filled the room, large at it is.

The wire wheels seemed to be generally used on these foreign cars. All of these wheels were of the clincher-rim type. Detachable wheels instead of detachable rims predominated. Both Rudge-Whitworth and Dunlop wire wheels appear to be in favor with the European makers. In addition to these wire wheels of foreign make the McCue wire wheel, made in this country, was also noticeable.

There was one wheel that was particularly worthy of attention—the Italian Isotta car with a metal wheel, entirely new to this country, stamped out of sheet metal in halves, welded together by electricity, forming a very strong wheel; lighter and more durable than wood, and practically indestructible. This is a detachable wheel with a clincher rim. The Renault car has a new wood wheel which detaches at the hub—a great improvement over the old demountable rim.

There was a variety of tires on those foreign cars, three of them of foreign make, the Michelin, with the straight sides; the Faure "Never-Skid" tire, reinforced with anti-skid plugs and intervening cross bars; and a red Russian tire, the Provodnik, with a novel tread of herring-bone effect.

At least half of the cars, however, were equipped with American-made tires, among them Firestone, with both smooth and "Non-Skid" treads; Goodyear, smooth and anti-skid; Morgan & Wright clincher, with chain pattern running around the tire; Hartford, smooth; United States quick-demountable rims, with "Nobby" tread; Republic, with "Staggard" tread, and Diamond, with smooth tread. Tire sizes ran from 36 x 5 inches to 30 x 3½ inches—or in metric measure, from 935 x 135 to 760 x 90.

MORE RUBBER IN AMERICAN THAN EUROPEAN TIRES.

According to United States Consul Albert Halstead, the sales in England of American tires have been less important than might have been expected from the fact, that there is more other rubber in the American article than in the British or European product. In the latter there is only 7 to 10 per cent. of rubber in the outer casing, and 35 per cent. in the inner tube; rubber substitutes and fillers being extensively used.

Mr. Halstead recommends preliminary investigations as to the exact requirements of the English market, followed up by extensive advertising and other introductory measures. Results of hill climbing and other tests form valuable material for such campaigns.

Trained organization in England, following the tactics of British and other European makers, is absolutely necessary for American firms wishing to introduce their tires in England. Success, though possibly delayed by the hold of British and Continental tires on the market, will, it is urged, eventually be attained, if American tires are as good as has been claimed.

THE RUBBER TRADE IN BOSTON.

By a Resident Correspondent.

BUSINESS generally has started on the new year with a confidence in the future which belies the prophecies of the pessimist, who is superstitious of the number thirteen, as well as the dejected individual who augurs calamity because of the coming change in the political control of the government. The outlook in all lines of rubber manufactures seems excellent, with only the footwear industry feeling an uncertainty. As a rule, the purchases of rubber boots and shoes last spring and summer were very large and highly satisfactory, and stocks held by jobbers and retailers were full. The mild winter that has prevailed in New England has been far from satisfactory, and while stocks have been moved to some extent, it will take several good storms to reduce these stocks to a satisfactory basis.

But if the shoe men have not been favored, the waterproof clothing manufacturers have certainly profited by the state of the weather, and practically every factory is rushed with orders, and salesmen now out are refusing orders unless a longer time than usual is allowed to fill them. Mechanical lines are going better than last month, perhaps because the mill industries, after inventory, found need of new material. Druggists' lines of rubber goods are in excellent demand; in fact, some of the larger syndicate drug stores are competing with each other in a specially lively manner, and running large advertisements, almost exclusively of rubber goods, offering these at cut prices. Certainly all lines with the above mentioned exception, are in excellent shape for a good business this year.

* * *

W. H. Palmer, of the United States Rubber Co., after years of service in Malden and Boston, was transferred to a higher position in New York late in 1911. Mr. Palmer had taken a very active interest in Mount Vernon Lodge, F. A. M., of Malden, and was "in line" for the chair of Worshipful Master. The lodge elected him to this office, and during 1912 Mr. Palmer made monthly flying trips to Malden to preside at the regular communications of the lodge. When his term expired, and he was succeeded in office by another, the Lodge, in recognition of his unusual exertions in fulfilling his duties, voted him a life member and presented to him a beautiful jeweled Past Master's badge, of which he is deservedly proud.

* * *

Captain Francis H. Appleton, president of the Rubber Reclaimers' Club, in a recent interview tells of the success of that organization:

"At the mettings general business has been discussed, and each member has become so well acquainted with his competitors that the result has been most advantageous to the trade at large.

"The discussions have resulted in formulating ideas which have been of advantage to the entire rubber business, so that today there is an understanding between the seller of rubber scrap and the buyer, so that the old troubles which formerly existed in regard to poor packing, have been almost entirely eliminated. For instance, today a live dealer understands that a 'no-name' or 'unguaranteed' tire will not be accepted as a good delivery; therefore, I have to say, as I have said on many occasions, that these trade organizations are decidedly beneficial in every way.

"The year 1912 has been a phenomenal one, not alone for the Reclaimers of Rubber, but for the rubber trade in general. The volume of business has been great, but the percentage of profit, owing to the high prices which have prevailed in the scrap market, has been smaller than in previous years; but in the aggregate, I think I can say in all truthfulness, that never has there been so much business done, and never were the manufacturers in a more healthy condition."

* * *

James H. Stedman, treasurer of the Monatiquot Rubber Works Co. was the donor recently of a fine pipe organ to the Congregational Church at New Sharon, Maine, as a memorial to his mother. It was dedicated with impressive exercises, the Rev. Dr. Beach, president of the Bangor Theological Seminary, officiating. The church was built by ancestors of Mr. Stedman and is located in the town, the home of his people for many generations.

* * *

Boston is having an epidemic of small burglaries and sneak-thieving. One of the breaks was at 60 Pearl street, where the Manhattan Rubber Co. has its office and stores. Thieves forced the door with a jimmy, broke the glass in the door leading to the inner office, pried open six or eight desks, searched the entire office, even going through the pockets in the office coats left there, yet there seemed to be nothing carried away of any importance.

* * *

The many friends of Arthur W. Stedman, of this city, will sympathize with him in the lost of his wife, Mary P. Stedman, who died on Saturday, the 18th of January, after an operation. She was the daughter of the late S. Prescott Shepard, a well-known dry goods dealer of Boston, and Lucy P. (Innes) Shepard. She was married to Mr. Stedman in 1883, and for several years lived in Brookline, but later the family removed to the celebrated "Weld Farm" in West Roxbury. She leaves, besides her husband, one son, Arthur W. Stedman, Jr., who is now at school, preparatory to entering Harvard College.

* * *

Another well-known rubber man was similarly afflicted last month. Mrs. Emily J. Pike, wife of Chester J. Pike, died at her home in Medford on January 17, after a long illness. For several years she was afflicted with Bright's disease, and last September was so stricken that she only occasionally rallied, and only for short periods. The interment was at Oak Grove Cemetery on Sunday, the 19th. Mr. Pike has a host of friends in the trade who will condole with him in his affliction.

* * *

Will G. Snow, the bright advertising manager of the International Silverware Co., prints every month a paper containing extracts and reprints from the daily and weekly newspapers of the year 1847. It is an interesting little sheet, and contains many facts which might otherwise be lost to memory. One item Mr. Snow unearthed from a Connecticut local reads:

"The editor of the New London 'Star' has been shown a one dollar bill, of the New Haven County Bank—genuine—the paper of which was of India rubber, manufactured in Lisbon. It was slightly elastic, but little thicker than the ordinary paper, and perfectly impervious to water. Indeed, to so great perfection had it been brought, both in the filling up, and in the ink used for the signatures, that it seems to have defied the common, and even some uncommon methods of obliteration. It had been soaked and boiled in strong potash lye, with scarcely any perceptible effect."

We all know about that famous book of Goodyear's, printed on leaves of soft rubber, but how many of us ever heard of a rubber bank note?

* * *

Richmond L. Chipman, for nearly 15 years with George A. Alden & Co., Boston, has been transferred to the New York office of the concern, where he will occupy a still more important position than that which he has hitherto filled. Mr. Chipman is a bright, active young man with a pleasing personality, who will doubtless make for himself as large a circle of friends in the big Metropolis as he leaves in the Hub. He has not yet moved his family to New York, but is

already "at home" at the New York headquarters of this well-known crude rubber house.

* * *

W. H. Reilly, for sixteen years with the Boston Rubber Shoe Co. at its Boston office, was transferred to the office of the Hubmark Rubber Co. on January 1. On leaving his old position, his associates in the Essex Street office presented to him a handsome gold Waltham watch, suitably engraved, and a fine gold chain. Mr. Reilly is, naturally, proud of the gift, but more so of the letter from Selling Agent Charles A. Coe, which accompanied it.

* * *

I notice that the Davidson Rubber Co. is advertising for a "progressive man as technical superintendent, who must be experienced in rubber analysis of all kinds and practical factory control," and also desires "a cost expert with first-class experience in manufacturing costs."

* * *

Interest is increasing each week in the work of the Rubber Tire Bowling League, which is nearing the end of its season. Ten teams, representing twelve tire concerns, have been bowling each week since the first of November, and the tournament will end March 6, the eighteenth week, each team rolling off two matches with each of the others. Some wonderful records have been made. Of course, it is too early to name the winners. The prizes are $25 for the highest team; $15 for individual high average, and $10 each for individual three string and individual single string. A banquet will be given the entire membership at the end of the season.

* * *

The Patterson Rubber Co. factory at Lowell is up four stories at present writing, and President John S. Patterson predicts that the factory will be making tires by the middle of this month. It will be a good deal of a hustle to fulfil this prophecy, but the men of this company know what it is to hustle. The factory nearing completion will be 250 by 63 feet, and plans are ready for a similar building to be erected next fall. The company owns ten acres of ground, and will have plenty of chance to expand as business warrants.

* * *

The Walpole Rubber Co.'s factories are all running at full capacity. The company has declared a regular quarterly dividend of 1¾ per cent. on preferred stock and 1 per cent. on common stock, payable January 15.

* * *

The B. & R. Rubber Co., of East Brookfield, is making important improvements in its factory at North Brookfield, Massachusetts, installing elevators, and removing the shipping room to a more convenient location, thus facilitating both the manufacture and shipment of goods.

THE RUBBER TRADE IN AKRON.

By a Resident Correspondent.

THE Miller Rubber Co. has placed on the market a new inner tube to meet the present demand for a very high grade article. They are also placing on the market a new non-skid tread, which consists of a series of projections on the outer side of the tire, with a construction in the middle of the tire which gives it the wearing service of an ordinary flat tread tire; thus giving an increased amount of mileage and at the same time retaining an excellent non-skid feature based on the interlocking action of a cog wheel.

This company has opened a new sales agency in New York under the name of the Miller Tire Sales Co., Inc. It is in charge of H. C. Mills, who for ten years was New York sales manager for the Diamond Rubber Co., and H. C. Miller, who was formerly connected with the Diamond Sales Agency in New York, and for two years had charge of the Diamond Sales Agency at St. Louis.

* * *

The Portage Rubber Co. of Barberton held its annual stockholders' meeting Jan. 20, electing the following directors: James Christy, Wm. Leary, W. W. Wildman, A. S. Mottinger, D. A. Doyle, M. S. Long, J. W. Miller, J. D. Raw, Fred H. Snyder, Edward Langenbach, John Kerch, Dr. O. S. Weldy. The following officers were elected: Jas. Christy, president; J. W. Miller, vice-president; A. S. Mottinger, secretary; W. W. Wildman, treasurer and general manager.

The yearly report of the General Manager showed the business of the past year to be good and the outlook was of the best for a record-breaking year. The company has firmly established its tire trade, and its orders more than fill its limited capacity. The new building which was recently completed will be occupied in a few days, and it is believed by the directors that it is only a matter of a few months, before business will compel the erection of more buildings.

* * *

A. H. Marks, of the B. F. Goodrich Co., who has been in Johns Hopkins Hospital, Baltimore, Md., with acute nervous trouble and heart complications, was announced to be in a "fairly satisfactory condition" on January 21.

* * *

The Electric Reclaiming Co., of Barberton, recently held its annual stockholders' meeting. The following were elected directors: E. M. Gammeter, F. A. Brodbeck, Fred W. Albrecht, Chas. Fastnight, Jos. Dangel, Wm. Byrider, F. R. Moore, Geo. W. Blackburn, E. R. Albrecht, J. M. Sumner, E. E. Crook. The following officers were elected: Emil Gammeter, president; Francis A. Brodbeck, vice-president; Fred W. Albrecht, secretary and treasurer; C. E. McLain, assistant treasurer; and R. W. Haines, general manager. E. R. Albrecht of Massillon, and J. M. Sumner of Akron were elected to fill vacancies on the board caused by resignation of Shreve Clark and H. A. Backderf.

* * *

The Mohawk Tire and Rubber Co. has been organized and has bought the Stein Double Cushion Tire and Rubber Co. plant and machinery, patents and good-will. The new company is organized with a capitalization of $350,000; $250,000 common stock and $100,000 7 per cent. cumulative preferred stock, redeemable at 110 with accrued interest after January 1, 1916. The Stein plant is located in East Akron, near the factory of The Goodyear Tire and Rubber Co. It consists of a 2½ acre tract of land, a brick factory in good condition, with switching facilities, and water; having a present capacity of between 75 and 100 tires per day. The company is to be organized without any water in the stock.

The president of the new company will be R. M. Pillmore, who for a number of years was general manager of The Akron Grocery Co., and is at present Director of Public Service of the City of Akron. The superintendent of the plant will be S. S. Miller, for many years connected with the manufacturing end of The Kelly-Springfield Tire Co., known in Akron as The Buckeye Rubber Co. Among the directors of the new company are C. K. Sunshine, president of the Sunshine Suit & Cloak Co., Cleveland, Ohio; C. D. Paxton, Cleveland, Ohio, State Agent for the Jackson Auto Co.; R. M. Pillmore and J. K. Williams of the J. K. Williams Foundry and Machine Co., Akron, Ohio., noted rubber machinery manufacturers; S. S. Miller and F. J. Mishler, vice president of the Citizens Savings & Loan Co. The company expects to be able to place tires on the market to take care of the spring trade.

* * *

J. W. Mowe has resigned as manager of the Detroit branch of The Firestone Tire & Rubber Co., where he has become well acquainted with the tire trade, and has become associated with

the sales force of the Goodyear Tire & Rubber Co. He is quiet and unassuming and has been very successful.

H. A. Coffin, a man of experience in the automobile business, has been given charge of the Detroit branch of the Firestone company. The company has opened new branches in the following cities: Columbus, Ohio, Geo. Richards, manager, formerly with the Chicago branch; Houston, Texas, H. W. McFadden, manager; Milwaukee, Wisconsin, John E. McGinnis, manager; Cincinnati, Ohio, E. F. Firestone, manager; Memphis, Tennessee, W. C. Ward, manager; Salt Lake City, Utah, M. L. Turbush, manager. The needs of the trade demanded larger quarters in Philadelphia, Buffalo and Chicago. The new offices of the company in Philadelphia are located at 304 North Broad Street; in Buffalo, on Main street, in the automobile section; and in Chicago at the corner of Nineteenth street and Michigan Ave.

* * *

The Y. M. C. A. of Akron is offering several special courses for rubber workers. The courses are designed to give the rubber worker an opportunity to obtain a fundamental knowledge of the appliances and materials with which he works. These lectures are being conducted by some of the most noted manufacturers of the city; among whom are J. H. Vance and W. R. Miller, of the B. F. Goodrich Co., and L. M. Bourne, Dr. Millard and E. R. Hall, of the Goodyear Tire & Rubber Co.

The following is an outline of one of the main rubber courses:

PART I.—INSTRUCTION IN POWER AND APPLIANCES USED IN MANUFACTURING IN GENERAL.

I. Power Elements.—Instruction in methods of producing, and characteristics of
- a. Steam.
- b. Electricity.
- c. Air.
- d. Hydraulic pressure.

II. Transforming power elements into usable horsepower power plant:
- a. Boilers.
- b. Steam engine.
- c. Dynamo-generator to motor.
- d. Air compressor.
- e. Pumps, accumulator.

III. Transmitting horsepower to factory machines:
- a. Mechanical drive.
- b. Electric drive, switchboard.

IV. Miscellaneous appliances:
- a. Elevators, conveyors, trucks.
- b. Blocks and tackle, chain blocks, air and electric hoists, cranes.
- c. Safety devices, fire extinguishers.
- d. Lighting, heating, ventilating.

PART II.—INSTRUCTION IN RUBBER AND COMPOUNDING PIGMENTS.

I. Rubber:
- a. Description of various grades.
- b. Where and how grown.
- c. Value and importance of careful handling of scrap, etc.
- d. Scrap rubber, reclaiming, etc.

II. Compounding pigments:
- a. Description of various materials.
- b. Their action in connection with rubber.

PART III.—INSTRUCTION IN THE THEORY, USE AND CONSTRUCTION OF THE VARIOUS SPECIAL APPLIANCES USED IN THE RUBBER INDUSTRY.

I. Washing and drying.

II. Compounding, and mixing, or milling.

III. Calendering, cementing and impregnating.

IV. Preparing stock and vulcanizing the various rubber products:
- a. Tires and automobile accessories.
- b. Molded goods, rubber belting, etc.
- c. Insulated wire, hose, etc.
- d. Boots and shoes, druggists' sundries.
- e. Hard rubber, balata and gutta percha products.

PART IV.—CONCLUDING LECTURES.

I. Factory hygiene with special reference to rubber factory conditions.

II. Review of the course.

III. Lecture on the present status and future outlook of the rubber industry.

The Cleveland Automobile Show, held the week of January 4-11, 1913, on the lower floor of the new Wigmore Building, was the most successful and best patronized auto show ever held in Cleveland. The value of the cars and equipment on display was placed at over $2,000,000, and the various salesmen representing the automobile factories report large sales. The various Akron rubber companies were well represented. The success of this show depended to a large extent on the general manager, Fred Caley, and on Fred Wood, both of whom were formerly Akron men, who have had years of experience in the automobile business.

THE RUBBER TRADE IN CINCINNATI.

By a Resident Correspondent.

AFTER a brisk trade covering the fall months and the holidays the rubber business locally has put on the brakes and slowed down, though not more than is usual at this time of the year. Local houses, despite the temporary lull in trade, are taking advantage of the slack season and making preparations for the opening of trade in the spring. Indications point to a banner year for the rubber industry, and naturally efforts are being put forth to meet the unexampled trade which is promised. Many of the managers of the branch houses of the big rubber companies are of the opinion that the opening of spring trade will find the consumption overtopping the production.

* * *

C. J. Butler, vice-president of the United States Tire Co., was a visitor to the city the past month, stopping over for an examination of local conditions and prospects and inspecting the new branch house of the company which was recently opened. Mr. Butler expressed himself as pleased with local conditions and after a brief stay left for the South for a period of recuperation with his family.

* * *

It is reported in local financial circles that the Grasselli Chemical Co., which had its origin in Cincinnati, but which now operates more than 15 plants throughout the country for the manufacture of heavy chemicals and zinc products used by the rubber industry, will soon call a meeting of its stockholders to authorize an increase in its capital stock, which is now $7,500,000. The company recently gratified its stockholders by handing out a melon consisting of its unissued common stock.

* * *

A recently formed establishment, which is new in its line in this city, is that of the Automobile Tire & Tube Hospital. The hospital is located in the rubber tire and automobile sales district, being located at 907 Race street—head physician, W. M. Galt; chief interne, H. V. Hague. Both men are practical rubber men, having had wide experience in the manufacture of rubber tires.

* * *

The Republic Tire & Rubber Co. has moved its local sales rooms from 915 Race street to 907 Race street, occupying part of the rooms which have been leased by the Automobile Tire & Tube Hospital.

* * *

Much interest is being manifested by local rubber tire men in the automobile show to be held by the Automobile Dealers' Association of Cincinnati. While the tire manufacturers will not have individual exhibits at the show, they will, however, be represented by the local supply and auto accessories dealers

* * *

To meet the heavy demand for rubber clothing and rubber footwear brought on by the flood of the Ohio River January 12, the Schaefer Rubber Co., which operates one of the largest retail rubber stores in the Middle West, kept its salesrooms open Sunday and every night in the week during the high water,

in order to supply the needs of those who were affected by the flood. This enterprise on the part of this company merited high praise from those who were obliged to equip themselves with necessary clothing to combat the flood to save their property.

* * *

The L. & M. Rubber Co., of Carrollton, Ohio, filed notice with the Secretary of State that it had increased its capital stock from $120,000 to $500,000.

* * *

R. J. Firestone, general manager of the Firestone Tire and Rubber Co., recently spent several days in this city looking over the new branch opened by the company in this city. M. E. Palmer, traveling auditor of the Firestone Tire and Rubber Co., is spending several weeks here assisting in the arrangement of the office of the new branch of the company which was opened the first of the year.

This company has selected generous quarters for a direct factory branch in this city. The new branch is located at Ninth and Sycamore streets. It will look after the business of the company in Southern Ohio, Southern Indiana, Kentucky, West Virginia and Tennessee and is in charge of E. S. Firestone. The company in its new branch has a floor space of 5,000 square feet. A section of this space is given over to a modern-equipped office, while another section is devoted to a fully equipped shop. The balance of the space is used in carrying stock, which is said to be the largest stock of rubber tires and rubber accessories carried by any local branch house. The operation of a shop in connection with the branch is a distinct feature in this city and bids to be a popular move on the part of the company, as it is arranged so that automobiles can be run into the shop and tires and rims attached without the necessity of owners taking them to repair shops.

"The outlook for the automobile industry was never so bright as it is right now," said Mr. E. S. Firestone. "Cincinnati is one of the best cities in the country for a branch and we intend carrying a $150,000 stock of tires with other accessories."

THE RUBBER TRADE IN RHODE ISLAND.

(By a Resident Correspondent.)

A NOTICEABLE slacking up in some branches of the rubber trade in Rhode Island developed during the early part of this month. The all-night force in the wire department of the National India Rubber Co.'s plant was discontinued, and the Consumers Rubber Co.'s plant was closed recently for a week to permit the making of repairs anl numerous improvements.

Manager Le Baron C. Colt, of the former plant, stated that as soon as inventory-taking was finished work would be rushed in the wire plant. He said he expected increased demands for the product. "The fact that there are no wire working forces in the open during the winter weather in the northern states cuts off much of the business," he said. "Later the lack of orders from northern business men will be counterbalanced by the extension of wires in tropical countries."

Although 300 men were let go from the night shift, the day force was kept busy.

* * *

Col. Samuel P. Colt was reelected chairman of the board of directors of the Industrial Trust Co., one of the largest banking institutions in Rhode Island, at the annual meeting of stockholders, held January 21. The meeting was the second anniversary of the fight which he had in 1911, in trying to regain control of the institution.

* * *

United States Circuit Court Judge LeBaron B. Colt was elected United States Senator by the Rhode Island Legislature on January 21. His selection was a foregone conclusion several weeks before. The vote in the Senate was 32—5 in his favor, and in the House 56—37—7. In the Senate he had one opponent, and in the House two. His term will begin March 4. He succeeds George Peabody Wetmore. Judge Colt is a brother of Samuel P. Colt. He was born in Dedham, Massachusetts, June 25, 1846, and has been a Federal judge for more than 30 years.

* * *

Agent LeBaron C. Colt, of the National India Rubber Co., was the recipient of a handsome Davenport couch Christmas. It was a present from the heads of the selling departments. James W. Franklin, superintendent of the shoe and arctic departments, was given a book case by his foremen and clerks.

* * *

The Consumers' Rubber Co., at Bristol, has resumed the work of manufacturing insulated wire. In November the work of getting the old departments at the factory on Wood street ready for use was begun. This was formerly an important part of the product of this concern, and it is expected that it will be made so again by the people who are now in control. This company has also started to make its own cardboard packing boxes, instead of letting contracts for the work. The industry is being operated on a small scale at present, but plans are under way for its enlargement.

* * *

After exhaustive examinations, conducted by experts, because of complaints from people in West Barrington, the International Rubber Co. in that town is making a vigorous effort to prevent unpleasant odors from issuing from its plant. A filtration plant for the dyeing waters is to be installed, and a drain pipe is to be laid across Park avenue to connect with another drain pipe which leads to the shores of Narragansett bay a quarter of a mile to the westward. Other improvements are being installed by this concern. A 350-horse power steam engine is being put in as a substitute for a 75 horse power machine which has been furnishing power for a part of the plant.

* * *

Arthur L. Kelley, president of the Mechanical Fabric Co., who is also head of the Narragansett Electric Lighting Co., is making a strong fight to retain the exclusive right of that company to furnish power and light in Providence. A hydro-electric concern is seeking a franchise in the city. Recently the following rubber companies petitioned the City Council to accept an offer of lower rates made by the Narragansett Co.: Mechanical Fabric Co., Revere Rubber Co., Improved Seamless Wire Co., and Glendale Elastic Fabrics Co.

* * *

Because of the rapid increase in its business the Davol Rubber Co., has started the construction of a big addition to its plant at the corner of Point and Eddy streets, Providence. The new structure, which is to be 281 ft. x 50 ft., is to be of brick and steel. It will cost $60,000, and will be located on the Eddy street side of the plant, where a long row of cottages was razed several months ago to make room for street-widening. The building will be three stories high. Work has been started, and, because of the open weather, much progress has been made in putting in the concrete foundations. The building will probably be completed during the late spring.

Charles J. Davol, president and treasurer of the Davol Rubber Co., was elected to the directorate of the Homeopathic Hospital at the annual meeting, held January 15.

* * *

The Revere Rubber Co. closed the year 1912 doing a tremendous business. In addition to a variety of lines this concern is the Providence branch of the United States Tire Co. For a long time it has been operating 24 hours a day and has been increasing the number of employes as fast as capable men could be obtained. Many additions and changes have been made to the property, and at present the power plant is being improved. A new boiler room is being put up. It is on the Valley street side of the plant.

J. Murray Percival, who was for many years assistant foreman of the cutters at the Alice Mill of the Woonsocket Rubber Co., left that position early this month. A watch and fob were presented to him by his fellow employes.

* * *

Mrs. Isabella E. Norris, daughter of the late Francis M. Dimond, Governor of Rhode Island in 1853, and mother of Samuel Norris, of New York City, secretary of the United States Rubber Co., died at her home in Bristol, R. I., on November 26. She was in her 86th year. Her last illness was short, death being due principally to old age.

Mrs. Norris was born in Providence. She went to Bristol to live when a girl. She was long active in work of St. Michael's Episcopal Church in that town.

* * *

Clifton A. Hall, 87 years old, died at his home, 380 Benefit street, Providence, January 12. He was one of the oldest architects in New England, and was the originator of modern well-lighted manufacturing establishments. One of his early productions was the plant of the National India Rubber Co., Bristol.

* * *

T. O. Doyle, overseer of dyeing at the British Hosiery Co.'s plant, has accepted a position with the International Rubber Co. at West Barrington.

THE RUBBER TRADE IN CHICAGO.

By a Resident Correspondent.

IN all but two lines of the rubber industry in Chicago, manufacturers, jobbers and dealers report good business for the month of January. Despite the fact that the weather has been decidedly inclement since the middle of the month, which is due to a heavy snowstorm and subsequent rains, footwear has been moving sluggishly and this condition of affairs has caused keen disappointment in all quarters. It was the general belief that the footwear market would show a degree of activity after the advent of the heaviest snowstorm of the season, but jobbers and dealers report that there has been but a slight improvement over December, and they do not look for much activity until the advent of spring.

Rubber hoof-pads is the other line that has failed to show any evidence of activity, and dealers do not hesitate to say that the sales are not near so good as for the same period last year. However, they do not overlook the fact that severe cold weather was the programme in Chicago for a period of six weeks last year, while during January of this year the temperature at no time reached a low mark. But the dealers in hoof-pads say that the market has shown a gradual improvement since the middle of January, and if the weather would change to colder and remain that way for a week or more, there would undoubtedly be an activity that would to a degree make up for the sluggish condition of the market since the beginning of winter.

Incidentally it may be stated that the Society for the Prevention of Cruelty to Animals and two prominent Chicago newspapers have been active of late in urging upon drivers the necessity of providing hoof-pads for their horses. The newspapers have pointed out that the horses lose at least 60 per cent. of their energy in trying to maintain their feet on the slippery cobblestones and asphalt, and that consequently drivers are alone to blame because of the fact that so many of them neglect to provide foot pads. Hoof-pad dealers feel that if the teamsters can be made to realize the truth of the assertions made by the newspaper, the market should show an unusual activity during the remainder of the winter.

But the real feeling of cheer appears to be monopolized by the mechanical rubber goods manufacturers, jobbers and dealers, who report that they could not be better satisfied with the sales that they have made of almost every item since the first of the year. Furthermore, they state that the mechanical rubber goods market is showing constant improvement and they anticipate a heavy spring business. Reports from all of the steel mills in the vicinity of Chicago are that orders are coming in much faster than anticipated for this season. Another pleasing feature is that none of the mills has been laying off men, but on the contrary are working full time. This state of affairs is very encouraging to mechanical rubber goods men, and they assert that they are receiving larger orders from the steel mills at the present time than at the same period last year. There is also much activity in western mines, which is largely responsible for the present prosperity of Chicago mechanical rubber goods manufacturers.

"So far as our house is concerned, the demand for the various items of mechanical rubber goods is about the same as for this period of last year," said a representative of the Quaker City Rubber Co. "Orders for tires have been coming in stronger than we had anticipated, and this is due to the more general use of automobiles in Chicago during the winter season. Mining business is good in certain sections, and a most gratifying feature is that the large steel mills at Gary, Ind., South Chicago and other points contiguous to Chicago are working full force."

* * *

The fact that automobiles are in such general use in Chicago during the present winter has caused much rejoicing among those who make a specialty of repairing tires. It is said that the number of automobiles in daily use in Chicago since the advent of the present winter far exceeds that of last year, and as a result repairers have about all the work that they can handle conveniently. One prominent repairman has found it necessary to increase his working force, and he asserts that his business is about twice as large as last winter. In the past it had been the belief of automobile owners that the machines were merely a dry-weather convenience, and that it would be the height of absurdity to drive them through the slush and snow of winter. But investigation at most garages reveals that few owners of machines have abandoned them for the winter, and that the number in storage is much smaller than last year. Garage men point out that an automobile can be used in the worst winter weather when it would be a crime to use a horse.

* * *

The recent seasonable weather has caused unusual activity in clothing and druggists' sundries. Business in these two items is reported as much better than for the same period last year. The prospects for heavy trade in clothing were not particularly bright at the beginning of the new year. Most dealers were well stocked and manufacturers and jobbers did not look for large orders until the middle of February at the earliest.

* * *

The scrap rubber market held its own during the month of January, and from no quarter is complaint heard that the outlook for a heavy spring business is not good. The scrap rubber industry has been developing rapidly in Chicago during the last twelve months, and most of the concerns have found it necessary to employ additional help.

THE RUBBER TRADE IN SAN FRANCISCO.

By a Resident Correspondent.

NOTHING could have been more cheering than the rains which have been falling during the past two weeks. This has brought the rainfall for the season well up to the average throughout the state, and its timely coming has assured good crops for the farmers, to say nothing of the increased demand for rubber shoes and clothing. The rains were so late in coming this year that merchants in the interior had scarcely drawn at all on their stocks of rubber clothing and shoes. But during

the past few weeks they have been making up for lost time. They are also coming in with some payments which in some cases have been long past due. They always prefer to do business on the jobbers' capital if possible. Consequently the jobbers feel that conditions are much better than they were a few weeks ago, and that the outlook is favorable.

* * *

The Gorham-Revere Rubber Co. held a big gathering of Pacific Coast salesmen at San Francisco on the 20th and 21st of last month. There were 65 men in attendance and it was the largest gathering of its kind ever attempted on the Pacific Coast. There were salesmen from the company's branch stores at Spokane, Seattle, Tacoma, Los Angeles, Portland and other points; including one salesman each from Australia and Alaska. C. C. Case, vice-president of the Revere Rubber Co., attended the meeting and addressed the men.

* * *

The Cradley Rubber Supply Co. has moved from the store at the foot of California street to a new and better location at 315 Market street. Here the firm is looking more to the retail trade than before, owing to the prominence of the location, and many lines of handy retail articles have been added to the stock, including rubber boots and shoes.

* * *

W. E. Griffiths, the secretary of the American Rubber Manufacturing Co., died on Saturday, the 11th of January, very suddenly and unexpectedly. He was a very popular man in the trade and his death is greatly regretted by all who knew him.

* * *

Mr. R. H. Pease, senior, president of the Goodyear Rubber Co., and Mr. Watson, the treasurer of the company, started last week for Portland to make their regular winter tour of inspection. Mr. R. H. Pease, Jr., reports that the present rains will make a big difference in the boot and shoe business for this year.

* * *

W. T. Powell, Pacific Coast district manager for the Goodyear Tire and Rubber Co., has returned to San Francisco from his business trip through the Northwest territory. He reports that the branches located in Portland, Seattle and Spokane are enjoying a flourishing business. His company has four branch houses in California. "We expect to soon open branches in Fresno and Sacramento also," he said, "and this will give us a larger number of agencies in active operation than any other tire company on the coast."

* * *

The Chanselor & Lyons Co., a well known automobile supply house, has recently incorporated with a capital stock of $200,000.00. The incorporators are W. G. Chanselor, W. A. Avery, P. H. Lyons and H. D. McCoy.

* * *

Henry Auger of the Chanselor & Lyons Co., has left with his wife for a trip to the manufacturing centers of the east. Mr. Auger was recently made the head of the purchasing department of this company, and the fact that the company has incorporated for the purpose of centralizing its business management in San Francisco for all of the branch stores, makes this position all the more important.

* * *

The Fire Commissioners of San Francisco have accepted the bid of the Bowers Rubber Works of this city for 20,000 feet of 2¾ inch hose, the total cost being about $17,000.00.

* * *

The Diamond Rubber Co. is making an important advertising feature of the immense new electric sign which the company has recently erected on the top of the Hughes Building on Market street. Th advertisement shows a great revolving wheel, and advertises the non-skid qualities of the Diamond tire. Then in the Sunday papers the company has taken full pages showing a photograph of the electric sign standing high in the air. To further draw attention to the tires an offer of $100.00 cash is made to the person who can guess the number of electric lights actually used in the display.

* * *

The statement was made in this column in the December issue that Mr. Henry Byrne was no longer connected with the Quaker City Rubber Co., having recently accepted a position with the Plant Rubber and Supply Co. Mr. Byrne writes from Los Angeles that the only change that has been made in the Squire & Byrne Rubber Co. is this: that Mr. Squire has taken charge of the San Francisco office, while Mr. Byrne has taken the management of the Los Angeles branch. The firm still represent the Quaker City Rubber Co., in California.

THE RUBBER TRADE IN TRENTON.

By a Resident Correspondent.

PRESIDENT-ELECT WILSON'S statement anent "Big Business" at a recent dinner in Chicago, and his later utterances against Wall street, have not had any material effect on the rubber industry according to the declarations of local manufacturers who, now that the anxiety attendant upon a Presidential election has subsided, have settled down to business in earnest. The opinion prevails that the year will be fully as prosperous for the local rubber industries as was 1912, and many of the factories are reaching out for trade in new and untried foreign territory. Practically all of the local plants are running full-handed and many are working day and night shifts of operatives. The Thermoid Rubber, United and Globe Rubber, Woven Hose Co., Empire Rubber and Tire Co., Essex Rubber Co., Home Rubber Co. and Joseph Stokes Rubber Co. are working day and night to keep abreast of the volume of orders.

* * *

Representatives of the Department of Labor at Washington who made inspection of the local manufacturing plants recently, declared through the newspapers that the factory laws as regards sanitation, blowers and employment of boys and girls were obeyed more closely in this city than in most manufacturing centers.

In practically all of the local plants much attention is given to sanitation and safety of the operatives. The Employers' Liability Law, which has been in force in this State the past year, has caused many concerns to exercise great care in the safeguarding of the employees. The majority of the plants have installed lunch rooms for the operatives and provided other accommodations which are appreciated by the employees.

* * *

The Empire Rubber and Tire Co. has marketed a new tire which bids fair to be a tremendous seller. The factory managers have been working to perfect this new tire for the past six months, and hard road tests have convinced the designers that the tire is a success in every particular. Much favorable comment on it was heard at the recent Garden Show.

The large number of orders booked for this new make of auto tire will engage the running capacity of the local plant for some months to come, and with the orders for other makes of tires and accessories means a solid year's work ahead for the operatives, it being necessary to work day and night shifts in some of the departments to get out the orders for early delivery.

In the manufacture of the new "Red Tire" the Empire company adopted the same compound that made the "Imperial Empire Tire" famous in the auto world. While the new tire commands something like 15 per cent. above the price asked for ordinary tires, the demand for the "Red Tire" gives the company the impression that the trade is perfectly willing to pay the additional cost; realizing that the durability of the tire warrants the additional outlay.

The life of the compound used in the new tire is regarded as phenomenal. Tubes six years old made by the Empire company are still in good condition and giving satisfaction. Auto dealers and others interested in the industry are firm in the belief that the Empire company has a "winner" in the new tire.

* * *

The Hamilton Rubber Co. is working full-handed in the effort to keep pace with orders. The three-story new addition to the plant is being used to its full capacity.

* * *

One of the busiest of the local manufacturing rubber plants is that of the Essex Rubber Co., which concern employs close to 200 operatives. The plant is being operated day and night, with orders enough to insure the operation of the factory with day and night shifts for the next six months.

The Essex Rubber Co. makes a specialty among other lines of automobile accessories, and at the recent automobile show in Madison Square Garden, New York, booked a large number of orders. The display of the Essex Co. at the Garden auto show attracted considerable attention. The company also exhibited at the recent rubber show, being one of the few rubber concerns of this section to make an exhibit.

The Essex company the past year made a successful bid for foreign trade, particularly in the Latin countries of South America. Large shipments to Cuba, Porto Rico, Panama, Brazil and Equador attest the success of the company in this territory. Rubber shoe heels and soles are some of the many specialties manufactured by this concern. Shipments are made to all sections of the world. Molded specialties are also included in the list of articles made by the Essex Co. In the past year the company has materially improved its plant.

* * *

Though working day and night shifts the firm of John E. Thropp's Sons is unable to keep pace with the many orders which are coming in for the new patent automobile tire-making machines. The patents on the machines are held by the De Laski & Thropp Circular Woven Wire Tire Co. of this city, the machines being invented by J. K. De Laski. These machines for the making of automobile tires have been on the market only a short time, but judging from the demand for them, are a success in every particular. One of these machines will turn out more tires in a single day than it is possible for four men to make in the same space of time.

Advices received at the local plant of the Thropp concern are to the effect that one of the machines in use in the plant of the Dunlop Tire and Auto Goods Company, Toronto, Canada, turned out seventy tires in ten hours with one man operating the machine. The Dunlop concern declared that the services of five men would have been required to make the same number of tires in ten hours. Seven of the patent machines are in use in the plant of J. Ellwood Lee, Philadelphia. In addition to the tire-making machine, the Thropp company is making a machine for the wrapping of tires and one for manufacturing tire molds.

* * *

The Thermoid Rubber Co. is making large shipments to France of automobile tire brake linings, used on the rear wheels of the machines. For the Paris market alone it is said the local concern has orders for close to 20,000 feet of brake lining. The tire department of the Thermoid plant is a particularly busy place these days. The company has arranged for a big display at the Chicago automobile show. The concern exhibited at the recent Garden show.

O. K. Patton, office manager of the Thermoid Rubber Co., has been promoted to the post of assistant manager of the Chicago branch, handling mechanical rubber goods. Frederick Wilson is in charge of the Chicago office. E. B. Knowles, of the Ray 'Bestos brake lining concern, Bridgeport, Connecticut, succeeds Mr. Patton as office manager of the local plant.

General C. Edward Murray, the guiding spirit of the Empire Rubber and Tire Co., tendered a dinner to the managers of the branch stores. The dinner was given in the Hotel Astor, Monday evening, January 20. Those present were Ray Paddock, of the Buffalo branch; W. H. Chadwick, of Boston; L. V. Richardson, of Philadelphia; J. B. Frisbie, of Cleveland; Charles Wyland, of Indianapolis; Howard Zelley, of Newark; E. B. McKay, of Chicago; W. M. Perrett, of Detroit branch.

The representatives attended the Garden auto show and made an inspection of the Empire plant during their visit to this section of the country, reporting the outlook for a big season's business as most promising.

British Crude Rubber Imports.

OFFICIAL statistics for calendar years, stated in pounds:

YEAR.	Imports.	Exports.	Net Imports.
1898	54,833,072	33,023,536	21,809,536
1899	50,360,912	34,284,320	16,076,592
1900	57,593,312	32,864,832	24,728,480

INDIA-RUBBER GOODS IN COMMERCE.

EXPORTS FROM THE UNITED STATES.

OFFICIAL statement of the values of exports of manufactures of india-rubber and gutta-percha for the month of November, 1912, and for the first eleven months of five calendar years:

MONTHS.	Belting Packing and Hose.	Boots and Shoes.	All Other Rubber.	TOTAL.
November, 1912....	$217,405	$96,439	$681,900	$995,744
January-October ...	2,125,333	1,148,716	6,623,334	9,897,383
Total, 1912.....	$2,342,738	$1,245,155	$7,305,234	$10,893,127
Total, 1911.....	2,085,613	1,565,146	6,528,022	10,178,781
Total, 1910.....	1,918,611	2,094,016	5,193,806	9,206,433
Total, 1909.....	1,637,018	1,474,559	3,978,186	7,089,763
Total, 1908.....	1,131,272	1,224,799	3,255,507	5,611,578

The above heading "All Other Rubber," for the month of November, 1912, and for the first eleven months of two calendar years, include the following details relating to tires:

		For Automobile.	All Other.	TOTAL.
November, 1912....	*Values*	$275,360	$58,569	$333,929
January-October		2,759,339	485,908	3,245,247
Total, 1912.....		$3,034,699	$544,477	$3,579,176
Total, 1911.....		2,257,727	526,653	2,784,380

OBITUARY RECORD

THE DEATH OF EDWARD R. RICE.

A GREAT shock came to the whole rubber trade—and especially to those more intimately associated with the footwear branch of the industry—when on the evening of Wednesday last, January 29, a telegram was received at the New York office of the United States Rubber Co., announcing the death of Edward R. Rice, at Portland, Oregon. Nothing so unexpected and startling has occurred in rubber circles for a long time.

Mr. Rice left New York on January 17, in the same excellent health that he had always enjoyed, except that for some days he had been troubled with a painful tooth; but this was extracted shortly before his departure. It was his intention to be gone about a month, in which time he expected to visit the various interests of the company on the Pacific Coast. On reaching Chicago he suffered so much pain that he kept to his room in the hotel for a day, and wrote the home office that he felt much more like going back than like going on, but that he thought it best to continue his journey.

He reached Portland, Oregon, on the 22nd, and still complained of considerable distress where the tooth had been extracted. He telegraphed on the morning of the 29th, that he expected to go into one of the Portland hospitals and undergo a slight operation in the hope of getting relief. The next telegram was received at nine o'clock the same evening from the hospital authorities, saying that while under the anaesthetic his respiration ceased, and that all the efforts of the staff to resuscitate him had proved unavailing.

Edward R. Rice.

While Mr. Rice was only in his 57th year, he was one of the veterans of the rubber trade, having been connected with it for forty years. He was born June 21, 1856, and while still a young boy he became connected with the wholesale house of L. P. Ross, Rochester, N. Y., soon developing into a successful salesman. In 1887 he became the selling agent at Buffalo of the Woonsocket Rubber Co., under the firm name of Edward R. Rice. When the Woonsocket Rubber Co. became part of the United States Rubber Co., in 1893, Mr. Rice's Buffalo agency became one of the branch stores of the big corporation. When in 1896 the Joseph Banigan Rubber Co. was formed, Mr. Rice was made its manager of sales, remaining in that position until that company also became a part of the United States Rubber Co., in 1901, when he was put in charge of the United States company's system of branch stores. He remained in this important position until July, 1906, when he was put in complete charge of the sales of the United States Rubber Co., being appointed manager of sales, to succeed the late E. H. Paine, who had been placed at the head of the company's export department, with headquarters in London. Mr. Rice's appointment to this position—carrying with it the general charge of the sales of over one-half of the rubber footwear manufactured in this country—was a signal recognition of his ability on the part of the directors of the United States Rubber Co. He remained in the position of manager of sales to the time of his death, and had also been on the board of directors since May, 1909.

Mr. Rice applied himself to the duties of his important office with characteristic energy and unflagging industry, familiarizing himself with all the details in all the various departments that go to constitute the selling system of this great corporation. But he did not permit the exactions of his position—great as they were—entirely to absorb his time and interest. He was an active member in various social and philanthropic organizations. He was a member of the Buffalo Club and the Saturn Club of Buffalo, being at one time its president. He was also president of the Elmwood School, a private educational institution of that city. He was a member of the Union League, the Lotos, and the Economic clubs of New York, and was a director for some years (receiving his appointment from the Governor) of the State Tubercular Hospital at Raybrook, New York.

He is survived by his widow, a daughter recently graduated from Vassar College, and a young son, now in a preparatory school at Buffalo. While the greater part of his time for many years had been passed in New York, he still retained his home in Buffalo, where the funeral services will be held.

He was a man of exceptional intelligence, with great power of application. He succeeded because he possessed, to a marked degree, the qualities that make for success. He was a man of unusually fine appearance, and was not only one of the most widely known personalities in the entire rubber trade, but he had a circle of most devoted friends.

WILLIAM HAGUE.

It is a great distinction in these days, and a record to be proud of, to have been actively associated with an important enterprise continuously for 52 years, and to have discharged one's duties faithfully and capably during that time. This distinction belonged to William Hague, who died in Tuckahoe, New York, January 15.

He was born in the North of Ireland in 1845. He came to this country at the age of 15, and secured employment in the factory of the Hodgman Rubber Co., at Tuckahoe. He remained a trusted and esteemed employee of that company up to a year ago, when, after 52 years of service, he was pensioned by the company. He lived during all that time at Tuckahoe, and took a useful part in the civic and religious life of the town, being at one time a trustee of the village, and actively identified for many years with the Asbury Centenary Methodist Church.

Another interesting incident connected with his career was the fact that he had a brother, Robert, also working for the Hodgman Rubber Co., but connected with their New York store, who, two years ago, rounded out 50 years of service in that position and was also pensioned by the company. It is refreshing in these days of industrial unrest to find instances where commercial relations between employer and employed have continued for half a century to the entire satisfaction of both.

News of the American Rubber Trade.

THE GUTTA PERCHA AND RUBBER, LTD.

THE January issue of this publication contained an announcement of the fact that the Gutta Percha and Rubber Manufacturing Co., of Toronto, Limited, was to be reorganized so as to include its three subsidiary companies with itself under one general name, viz.: The Gutta Percha and Rubber, Limited. The general facts of that reorganization were given in that announcement, but it did not include the names of the officers and directors, who are as follows:

Board of directors: S. T. Warren, chairman; A. W. Anglin, K.C., C. N. Candee, W. H. Galt, R. H. Greene, J. H. S. Kerr, C. B. Street, Trumbull Warren. Officers: Trumbull Warren, president and treasurer; C. N. Candee, vice-president and managing director; R. H. Greene, secretary and manager shoe department; J. H. S. Kerr, manager mechanical department; C. B. Street, general superintendent; W. H. Galt, general sales manager; L. L. McMurray, assistant treasurer; E. M. Lake, assistant secretary.

THE BOSTON BELTING CO.

A condensed summary of the last balance sheet of the Boston Belting Co., under date of September 30, 1912, shows the following:

LIABILITIES.

Capital stock	$1,000,000.00
Reserve fund	800,000.00
Profit and loss	201,666.52
Notes payable	439,000.00
Unsettled bills	7,500.00

ASSETS.

Real Estate (land and buildings)..	$328,711.85	
Machinery	275,757.32	
Tools, furniture and fixtures.....	99,111.15	
Cash	66,598.10	
Bonds receivable; notes receivable; investment acct; accts receivable.	808,688.10	
Merchandise	869,150.00	
Trade marks	100.00	
Sundries	50.00	
	$2,448,166.52	$2,448,166.52

THE HODGMAN RUBBER CO.

At the annual meeting of the stockholders of the Hodgman Rubber Co. held January 16, 1913, the following were elected directors for the year 1913: G. B. Hodgman, S. T. Hodgman, F. A. Hodgman, N. E. Stout and A. W. Warren. And at a subsequent meeting of the Board of Directors the following officers were re-elected: G. B. Hodgman, president; F. A. Hodgman, vice-president; S. T. Hodgman, treasurer; and A. W. Warren, secretary.

THE MASSACHUSETTS AUTOMOBILE CLUB OFFICERS.

At the annual meeting of the members of the Massachusetts Automobile Club, held at the club house in Boston January 9 last, the following officers were elected for the present year: President, William H. Ames; first vice-president, W. S. Shrigley; second vice president, William A. Rolfe; treasurer, Frank W. Remick, and secretary, Arthur H. Brooks. Executive Committee for three years—Frank E. Peabody, Henry S. Rowe and George R. Alley. Election Committee for three years—Joseph C. Stedman, George Tyson and Harry K. White.

THREE UNITED STATES RUBBER CO. DIVIDENDS.

On January 2 the United States Rubber Co. declared regular quarterly dividends of 1 per cent. on the common and 2 per cent. on the first preferred and 1½ per cent. on the second preferred stock, all payable January 31 to stockholders of record January 13.

ANNUAL MEETING OF THE MOTOR AND ACCESSORY ASSOCIATION.

The tenth annual meeting of the Motor and Accessory Manufacturers was held January 15, at the Waldorf-Astoria, New York, with an excellent attendance of members. The reports of the retiring president, treasurer and of the chairmen of the various committees were read. The following members of the Board of Directors were elected to serve three years: C. E. Thompson, of the Electric Welding Products Co.; Alfred P. Sloan, Jr., of the Hyatt Roller Bearing Co.; F. Hallett Lovell, Jr., of the Lovell-McConnell Mfg. Co., and C. E. Whitney, of the Whitney Manufacturing Co.

At the meeting of the Board of Directors, held in the headquarters at 17 West Forty-second street, New York City, January 16, the following officers were elected to serve for the ensuing year: President, J. H. Foster, of the Hydraulic Pressed Steel Co.; first vice-president, F. Hallett Lovell, Jr., of the Lovell-McConnell Mfg. Co.; second vice-president, C. E. Whitney, of the Whitney Mfg. Co.; third vice-president, F. C. Billings, of the Billings & Spencer Co.; treasurer, L. M. Wainwright, of the Diamond Chain & Mfg. Co.; secretary and assistant treasurer, Alfred P. Sloan, Jr., of the Hyatt Roller Bearing Co. William M. Sweet continues as manager.

The fifth annual banquet of the association was held on the evening of the 15th. Beside the members there were the following guests: Samuel A. Miles, Merle L. Downs, A. G. Batchelder, H. A. Bonnell, James S. Marvin, Sidney S. Meyers and T. E. A. Barthel. The speakers at the dinner were Wilbur D. Nesbit, Hon. George McAneny, T. O. McGill, W. J. Burns and Col. George Pope.

THE REPUBLIC COMPANY'S ST. LOUIS BRANCH.

The Republic Rubber Co., of Youngstown, Ohio, has leased the building at 2018-20 Locust street, St. Louis, to be used as a branch for the Republic tires. The company will occupy the first two floors and basement, handling all sizes and styles of Republic tires. George M. Hoffman will be manager of the branch.

THE FIRESTONE'S NEW YORK BUILDING.

The Firestone Tire and Rubber Co. has leased for a term of 21 years a vacant plot 150 x 100 feet, on the corner of Sixty-third street and West End avenue, New York, on which it will build a modern four-story fireproof service building, to be used exclusively for the motor truck end of its tire business. It will maintain a night service as well as a day service, which will undoubtedly appeal to a good many users of motor trucks. The aggregate rent for the term of the lease is said to be about $250,000.

THE INTER-CONTINENTAL RUBBER CO.

Very few American enterprises located in Mexico have been immune from the unhappy results of the civil strife, that has been going on in that republic during the last few years. The Inter-Continental Rubber Co. has suffered together with other American undertakings, but still its condition might be worse, as will be seen from the following remarks recently made by the president of the company, Mr. W. M. Porter: "We are now operating our Torreon plant," he says, "at from 75 per cent. to 80 per cent. of capacity, and have plenty of business on hand to continue operating at this rate for a long time. There is no special condition existing now, so far as the company's operations go, that would be regarded as a really depressing feature."

DUTCH GUIANA RUBBER CULTURE CO.

The Dutch Guiana Culture Co., controlling substantial rubber and coffee properties in Dutch Guiana, attracted a great deal of favorable interest at the recently held Rubber Show, and the accompanying sketch shows the company's booth at the exhibition. The president and treasurer of the company, Mr. L. C. Lawton, a prominent Chicago rubber man, is giving the company his personal attention, which is a sufficient guarantee of successful management. The offices of the company are at the Title & Trust building, 63 Washington street, Chicago.

THE DUTCH GUIANA CO. AT THE RUBBER SHOW.

UNITED STATES RUBBER CO.'S ISSUES.

TRANSACTIONS on the New York Stock Exchange for four weeks, ending January 25.

COMMON STOCK, $25,000,000.

[The treasury of a subsidiary company holds $1,334,000.]
Last Dividend, October 31, 1912—1%.

Week	January 4	Sales	8,500	Shares	High 65¼	Low	62
Week	January 11	Sales	33,800	Shares	High 68⅜	Low	62¾
Week	January 18	Sales	22,300	Shares	High 66½	Low	63
Week	January 25	Sales	19,400	Shares	High 67½	Low	64½

For the year—High, 68⅜, January 10; Low, 62, January 3.
Last year—High, 67⅞; Low, 45¼.

FIRST PREFERRED STOCK, $39,824,400.

Last Dividend, October 31, 1912—2%.

Week	January 4	Sales	925	Shares	High 107⅜	Low	107
Week	January 11	Sales	1,900	Shares	High 109	Low	107½
Week	January 18	Sales	1,312	Shares	High 106	Low	105½
Week	January 25	Sales	2,285	Shares	High 107½	Low	105⅝

For the year—High, 109, January 8; Low, 105½, January 15.
Last year—High, 116; Low, 105⅝.

SECOND PREFERRED STOCK, $9,965,000.

Last Dividend, October 31, 1912—1¼%.

Week	January 4	Sales	900	Shares	High 79⅜	Low	79⅛
Week	January 11	Sales	2,300	Shares	High 81½	Low	79½
Week	January 18	Sales	200	Shares	High 79¼	Low	79
Week	January 25	Sales	200	Shares	High 79	Low	79

For the year—High, 81½, January 9; Low, 79, January 16.
Last year—High, 85½; Low, 75.

SIX PER CENT. TRUST GOLD BONDS, $18,000,000.

Outstanding of the 1908 issue of $20,000,000.

Week	January 4	Sales	53	Bonds	High 103	Low	102⅞
Week	January 11	Sales	83	Bonds	High 103	Low	102¾

Week	January 25	Sales	34	Bonds	High 103⅛	Low	102⅞

For the year—High, 103⅛, January 25; Low, 102¾, January 18.
Last year—High, 105; Low, 102½.

U. S. RUBBER RECLAIMING CO. IN 42d ST. BUILDING.

The United States Rubber Reclaiming Works has recently reorganized; changing the company name to that of the United States Rubber Reclaiming Co., Inc. The stock of the company has been increased to $2,400,000, divided into $1,200,000 preferred and $1,200,000 common. There has been no change in the administration or personnel of the company. About the 1st of March the administrative department will move its offices from the present location at 277 Broadway to the Forty-second street building, where it will occupy commodious and handsomely appointed offices.

NEW QUARTERS OF A CRUDE RUBBER HOUSE.

Wallace L. Gough, the well-known crude rubber operator, has taken a suite of offices on the fourth floor of the Maritime building, No. 8 and 10 Bridge street, and is certainly very happily located. Mr. Gough has extensively developed connections along the lines of both selling and buying. On the first of the year, Edward R. Williams, a young rubber man of experience—both in this vicinity and in Western rubber sections—became identified with the Gough concern, and brings to it what will very probably prove a profitable connection.

REMOVAL OF A TIRE FABRIC CONCERN.

The Connecticut Mills, Danielson, Connecticut, has recently added a 250-foot building to its extensive plant, augmenting production 50 per cent. and incidentally increasing its capital to $550,000. R. J. Caldwell, the selling agent of the company, has changed his New York address to 488 Broadway. He recently distributed a very large and effective water-color reproduction, showing the water-front of lower Manhattan. This souvenir is something that is not only sure of a substantial place in the appreciation of recipients, but of a conspicuous one on the walls of their offices as well.

INCREASED FACILITIES OF A RUBBER TOOL CONCERN.

The Hoggson & Pettis Manufacturing Co., makers of a complete and standard line of rubber-cutting tools and devices, and specializing in "The Sweetland Lathe Chuck," are now so situated as to handle orders with increased efficiency. This company has always been recognized as being standard in its line.

TRADE NEWS NOTES.

According to the newspapers of Trenton, there is quite an agitation in that city over a possible industrial exposition to be held under the direction of the Chamber of Commerce. If such an exposition is held, it will give a number of rubber manufacturers quite an opportunity to display their products.

The Duck Brand Co., of Chicago, are now located in their new store at 22-26 South Market street, that city.

It is reported that the East Palestine Rubber Co., are now turning out tires.

The McGraw Tire & Rubber Co., East Palestine, Ohio, are adding new buildings to their already extensive factory, and are now in a position to turn out their product in increased volume. The New York branch of that company, which is at 1706 Broadway, is now under the management of Russell F. Hobron, who was for many years connected with the Voorhees Rubber Co. Mr. Hobron enters upon his new position finely equipped to give good service to the metropolitan trade.

The annual banquet of the Goodyear Rubber Co., of Milwaukee, for salesmen and heads of departments, was held in the red room of the Hotel Pfister in that city, January 18. Mr. Olin A. Richards, of the United States Rubber Co., New York, was a guest.

R. L. Chipman, identified for many years with the Boston house of George A. Alden & Co., is now identified with the New York Commercial Co., 290 Broadway.

NEW INCORPORATIONS.

Alcorn Rubber Co., Inc., November 15, 1912; under the laws of California; authorized capital, $20,000. Incorporators: James A. Alcorn, C. F. Wickland, and Gay Baker, all of Los Angeles, California. Location of principal office, Los Angeles, California. To deal in rubber, imitation rubber goods, rubber products, imitation rubber products, etc.

Bedford Auto Renting and Repair Co., Inc., December 20, 1912; under the laws of New York; authorized capital, $10,000. Incorporators: George J. Murphy, 429 Willoughby avenue, Brooklyn, New York; Joseph H. Bernstein, 167 St. Ann's avenue, New York, and August E. Fuchs, 80 Heyward street, Brooklyn, New York. Location of principal office, Brooklyn, New York.

Best Tire and Rubber Co., December 5, 1912; under the laws of New Jersey; authorized capital, $125,000. Incorporators: S. L. Henry, 237 Jelliff avenue; Martin Walker and Edward Spillane, 54 Warren street—all of Newark, New Jersey. To manufacture and sell automobiles, and all kinds of vehicle tires, etc. Location of principal office, 237 Jelliff avenue, Newark, New Jersey.

Brooklyn Auto Livery Co., Inc., December 20, 1912; under the laws of New York; authorized capital, $20,000. Incorporators: Lewis W. Boynton, Ulster Park, New York, Dodge B. Hicks, 188 Lincoln avenue, and Charles M. Fuller, 527 Quincy street—both of Brooklyn, New York. Location of principal office, Brooklyn, New York.

The C. & K. Raincoat Co., Inc., December 6, 1912; under the laws of New York; authorized capital, $1,500. Incorporators: Barnett Cohen, 721 Stone avenue; Wolf Karsh, 353 Chester street, and Nathan Rosenbaum, 661 Rockaway avenue —all of Brooklyn, New York. Location of principal office Brooklyn, New York.

Climax Garter Co., Inc., December 23, 1912; under the laws of New York; authorized capital, $5,000. Incorporators: Aaron Gotlieb, 195 Penn street, Brooklyn, New York; Moses J. and Joseph Berger—both of Bedford avenue, Brooklyn, New York. Location of principal office, New York. To deal in garters, elastic goods, etc.

Durable Tread and Automobile Sales Co., Inc., December 13, 1912; under the laws of New York; authorized capital, $10,000. Incorporators: Rose H. Jacobs, 605 West 112th street; Samuel M. Winkler, 524 West 34th street, and Henry A. Deimel, 540 West 143rd street—all of New York. Location of principal office, New York. To deal in tires, tire treads, automobiles and accessories.

Favary Tire Co., December 21, 1912; under the laws of New York; authorized capital, $300,000. Incorporators: Ethelbert Favary, 111 Broadway, New York; William P. Richardson, Goshen, New York; and M. W. Brashears, 327 Central Park West, New York. Location of principal office, New York.

Flex-O-Fill Core Co., Inc., November 26, 1912; under the laws of New York; authorized capital, $10,000. Incorporators: Guy Osborn, 1493 Broadway, New York; L. McCready, 50 Church street, New York, and F. H. Crooks, Newark, New Jersey. To manufacture compounds for filling vehicle tires.

H. Goldman & Co., Inc., December 26, 1912; under the laws of New York; authorized capital, $25,000. Incorporators: Harry and Sarah Goldman—both of 598 West 152nd street, New York, and Blanche Denosky, 610 West 150th street, New York. Location of principal office, New York. To manufacture and deal in ladies raincoats, etc.

Illinois Tire Filler Co., December 14, 1912; under the laws of Illinois; authorized capital, $10,000. Incorporators: Albert Jacobs, Anton Pecival and Charles B. Stafford. Location of principal office, Room 1016, 29 South La Salle street, Chicago, Illinois. To manufacture and sell vehicles, wheels, tires and rims.

Improved Rubber Products Co., Inc., January 20, 1913; under the laws of New York; authorized capital, $100,000. Incorporators: Carrie M. Berger, Arthur C. Mandel and Samuel A. Berger—all of 772 Humboldt street, Brooklyn. Location of principal office, Brooklyn, New York.

The Miller Tire Sales Co., Inc., January 7, 1913; under the laws of New York; authorized capital, $5,000. Incorporators: Harry C. Miller, 608 Warburton avenue; Harrison C. Mills, 193 Woodworth avenue—both of Yonkers, New York, and Warren A. Schenck, 473 West 158th street, New York. Location of principal office, New York.

National Comb Works, Inc., January 7, 1913; under the laws of New York; authorized capital, $5,000. Incorporators: William L. Wray, Rockville Center, Long Island; Morris Friedman and Max Rothman—both of 96 East Fourth street, New York. Location of principal office, Brooklyn, New York. To manufacture combs and other articles of celluloid, rubber, etc.

New York Macandaruba Tire Filler Co., December 20, 1912; under the laws of New York; authorized capital, $25,000. Incorporators: Moses Haas, Nathaniel Levy and George A. Weingetz—all of 366 Broadway, New York. Location of principal office, New York. To deal in a composition used for filling tires.

Para Products Co., Inc., January 10, 1913; under the laws of New York; authorized capital, $5,000. Incorporators: Jacob Schreiber, 149 Broadway; Alfred Epstein, 1777 Broadway, and Frank Brown—all of New York.

Peninsular Tire and Rubber Co., November 25, 1912; under the laws of Michigan; authorized capital, $1,000. Incorporators: William O. Hugart, Jr., George T. Kendal and Herbert B. Gillette—all of Grand Rapids, Michigan. Location of principal office, Grand Rapids, Kent County, Michigan. To sell and manufacture and deal in rubber goods, automobiles, automobile tires, etc.

Peruvian-Chamayro Rubber Co., December 19, 1912; under the laws of Delaware; authorized capital, $700,000. Incorporators: Tonko L. Milic, 60 Wall street; George R. Allison, 64 Riverside Drive—both of New York, and Andrew E. Sanborn, Wilmington, Delaware.

Pneumatic Hub Wheel Co., Inc., January 15, 1913; under the laws of New York; authorized capital, $10,000. Incorporators: Kasiel Blau, 120 Delancey street, New York, George Derfman, 220 Hopkins street, Walter Primoff, 993 St. Marks avenue—both of Brooklyn, New York. Location of principal office, New York. To manufacture pneumatic rubber cushion hub wheels, etc.

Pneumatic Stamp Co., Inc., January 7, 1913; under the laws of New York; authorized capital, $15,000. Incorporators: Arthur H. and Mary Saunders—both of 115 Leroy street, and J. Addison Brown, 4 Ayres street—all of Binghamton, New York. Location of principal office, Binghamton, New York. To manufacture rubber stamps, type, etc.

Rochester Macandaruba Tire Filler Co., Inc., December 5, 1912; under the laws of New York; authorized capital, $10,000. Incorporators: Charles S. Morris, Nunda, New York, and John S. Crosier and Albert C. Olp—both of Rochester, New York. To deal in tire fillers, tires, etc.

Sidney Rubber Roofing Co., Ltd., October 23, 1912; under the laws of British Columbia; authorized capital, $150,000. Incorporators: Victor A. Elliot, Charles M. Lamb and Harold Despard Twiggall, of Victoria, British Columbia. Location of principal office, 607 Sayward Building, Victoria, British Columbia. To manufacture roofing felt and roofing paper, etc.

Standard Motor Co., December 31, 1912; under the laws of Delaware; authorized capital, $31,000,000. Incorporators: Donald C. Muhleman, New York, William J. Maloney and Herbert E. Latter—both of Wilmington, Delaware. To manufacture and deal in automobile tires, etc.

Star Raincoat Co., Inc., December 4, 1912; under the laws of New York; authorized capital, $10,000. Incorporators: Abram Harris, 527 West 110th street, Bernard Friedman, 1039 East 165th street, and Jacob Friedman, 906 Simpson street, Bronx, New York. Location of principal office, New York. To manufacture rubberized clothing, etc.

The Storm Shield Manufacturing Co., December 3, 1912; under the laws of Illinois; authorized capital, $100,000. Incorporators: L. E. and Norman A. Street and R. E. Wighton. To manufacture and deal in automobile accessories and parts.

Syneru Manufacturing Co., Inc., January 7, 1913; under the laws of New York; authorized capital, $100,000. Incorporators: Charles D. Gwyer, 303 Putnam avenue, Brooklyn, New York, Maxwell Greenberger, 2 Rector street, and Samuel R. Upham, 8 Gold street—both of New York. Location of principal office, New York. To manufacture rubber goods, etc.

United Rubberine Supply Co., Inc., December 6, 1912; under the laws of New York; authorized capital, $200,000. Incorporators: Herman Mayer, 331 West 83rd street, New York; Thomas H. Royce, Borough Park, Brooklyn, New York, and Charles L. Bookheim, Riverview Manor, Hastings-on-Hudson, New York. Location of principal office, New York. To deal in tire fillings, rubberine, etc.

United States Rubber Reclaiming Co., Inc., December 30, 1912; under the laws of New York; authorized capital, $2,400,000. Incorporators: Theodore W. Bassett and Rudolph A. Loewenthal—both of 277 Broadway, New York, and Cornelia Beebe, Ellenville, New York. Location of principal office, Buffalo, New York. To manufacture and deal in rubber goods, tires, etc.

Wholesale Auto Tire Co., Inc., December 26, 1912; under the laws of New York. Authorized capital, $1,000. Incorporators: William P. Cole, 83 Chambers street, David Morris, 26 Oliver street, and Abraham Levy, 277 Broadway. All of New York. Location of principal office, New York.

Winston-Hueter Co., Inc., December 5, 1912; under the laws of New York; authorized capital, $5,000. Incorporators: Charles C. Winston, John S. Sumner—both of Freeport, New York, and Gustav A. Hueter, 1252 58th street, Brooklyn, New York. Location of principal office, New York. To deal in leather and rubber belting, mill supplies, etc.

A NEW RUBBER COMPANY IN OHIO.

The I. J. Cooper Rubber Co., recently incorporated, is operating stores in various Ohio cities, including Cincinnati, Dayton and Columbus. These stores distribute the "Racine" automobile tires and the Cooper Rubber Company's own brand of solid carriage and bicycle tires.

RUBBER CITY MACHINE CO.

The Rubber City Machine Co., Akron, Ohio, which commenced business some four years ago, manufacturing a general line of machine work, is now specializing in rubber-making machinery, and is putting a mixing apron for mills, a ringless and boltless core, and a hydraulic tire-vulcanizer-press on the market. The special feature in the construction of this press is that it obviates the necessity of dropping the ram below the floor line. The cover is operated by hydraulic power. P. E. Welton, a well-known engineer, is putting in a line of machinery for The Rubber City company, which is said to have a thoroughly up-to-date plant.

PERSONAL MENTION.

Mr. George G. Bryant, secretary and general manager of the Chicago Rubber Clothing Co., of Racine, Wisconsin, was the guest of Mr. F. H. Peaty, of the Raw Products Co., at the annual dinner of the Rubber Club of America, held January 23, at the Waldorf-Astoria Hotel.

RETIRES AFTER 54 YEARS OF RUBBER-MAKING.

The only surviving incorporator of the Tyer Rubber Co., which was incorporated in 1876, is Mr. John H. Flint. He has acted as treasurer of that company for 30 years, and all-told has been in the rubber business for 54 years. He has just retired from active service in the company to enjoy a little leisure, which assuredly has been well earned. He will remain, however, as a director in the company. His position as treasurer has been taken by Mr. Frederick H. Jones.

W. W. WUCHTER.

The subject of the accompanying sketch is William W. Wuchter, who has recently become connected with the Gibney Tire & Rubber Co., of Philadelphia. Mr. Wuchter received his initial training in the rubber business with the B. F. Goodrich Co., with which concern he was identified for nine years. Subsequently he was prominently connected with the Firestone Tire & Rubber Co., with which he remained seven years. On September 1, 1909, Mr. Wuchter took the management of the Swinehart Tire & Rubber Co., of Akron, Ohio, and in this capacity developed the business from a relatively insignificant volume to a very important output.

W. W. WUCHTER.

Mr. Wuchter is recognized as a truck-tire expert and a generally competent rubber man, and one who has a host of friends in the trade. He is a man of genial personality and sterling integrity and will, no doubt, achieve substantial success in his present connection.

TWO POPULAR FOREMEN.

It is, of course, an economic fact that a foreman who is popular with his subordinates can run his department much more smoothly and efficiently than a foreman who is disliked or feared by his subordinates. The Stoughton Rubber Co., Stoughton, Massachusetts, evidently has some popular foremen, judging from the following paragraph cut from a local paper during the holidays: "Max J. Zinner, a foreman at the Stoughton Rubber Co., was presented a sideboard and a bouquet by those working for him, Wednesday afternoon. At about the same time Charles A. Kartstein, the foreman in the coat room, was responding to the presentation speech when a chest of silver was given to him by the employees."

TRADE NEWS NOTES.

The Loewenthal Co. has removed its warehouse and office in New York from 481 Washington street to 136 Watts street.

The Empire Rubber and Tire Co., Trenton, New Jersey, was incorporated with a capitalization of $1,000,000 on January 2, 1913, and took over the assets and liabilities of the Empire Rubber Mfg. Co. and the Empire Tire Co., both of the same place.

The Mayflower Rubber Works, of South Braintree, Massachusetts, is a new company of which William Killion is president, and S. R. Nichols is treasurer. They make a general line of molded specialties, which are marketed through the F. W. Wicher Co., Albany Building, Boston.

A branch has been opened in Atlanta, Georgia, by the Mansfield Tire and Rubber Co., Mansfield, Ohio, with Robert E. Warwich in charge as manager.

A new concern has recently been formed in New York—to begin business the present month—called the Wholesale Auto Tire Co., which will deal in unguaranteed tires. W. P. Cole is the manager, and Wilfred E. Willis, the assistant manager.

The object of this company is to deal in surplus and factory seconds, and also in first-grade tires where they can be bought at a low figure. The company will do only a wholesale business and will sell no goods at retail.

The Firestone Tire & Rubber Co., on January 15, paid a quarterly dividend of 2½ per cent. on its common stock and 1¾ per cent. on its preferred stock.

The Standard Raincoat Co., whose factory at Milford, Massachusetts, was recently destroyed by fire, has decided to move to Everett, in the same State, and will occupy a factory formerly used in the making of shoes.

The Victor Rubber Co., of Springfield, Ohio, has increased its capital from $69,000 to $100,000.

At a meeting of the board of directors of the Chicago Rubber Clothing Co., of Racine, Wisconsin, held January 15, a dividend of 12 per cent. on the outstanding stock was declared.

THE HIBERNATION OF TIRES.

The Service Bureau of the United States Tire Co. gives some seasonable advice an the proper way to winter tires.

"In laying up a car the tires should be removed from the rims and washed thoroughly with soap and water. They should then be carefully wrapped in strips of paper or cloth and stored in a dark place which is kept as nearly as possible at a temperature of 50 degrees.

"If the tires are to remain on the wheels for a considerable length of time while the car is out of service, the wheels should be jacked up and only about five pounds of air left in each tire. This keeps the tubes in shape and also preserves their softness and pliability. When the wheels are not jacked up and the car is allowed to stand for any length of time, the tires should be kept well inflated and the car moved occasionally, so that the tires do not flatten from standing too long on one spot."

THE ELWELL RUBBER CO. MOVES.

The Elwell Rubber Co. has recently removed from Trenton, New Jersey, to Stoughton, Massachusetts, having purchased the plant formerly occupied in that town by the Plymouth Rubber Co. It manufactures rubber heels and employs about 150 hands.

TO FILL TIRES WITH "DIXITE."

A new company has just been incorporated in Louisville, Kentucky, called the Dixie Rubber Co., for the purpose of manufacturing "Dixite," a substance for filling rubber tires. The capital stock of the company is $5,000, issued in shares of $10 each.

THE UNITED STATES RUBBER CO. BUYS THE RUBBER REGENERATING CO.

THE United States Rubber Co. recently made application to the New York Stock Exchange to list $6,000,000 additional common stock to be used for the purchase of the Rubber Regenerating Co., of Mishawaka, Indiana—a corporation with $1,500,000 common stock and a certain amount of preferred stock outstanding.

As there was considerable criticism in the columns of the daily press over the company's report for the six months ending September 30, 1912, which accompanied this application, President Samuel P. Colt, of the United States Rubber Co., has made the following statement:

"Judging from newspaper articles to which my attention has been called, several matters in the recent application of the United States Rubber Co. to list additional common and first preferred stock were misunderstood. As stated in the application, which has been duly granted by the authorities of the Stock Exchange, $6,000,000 additional common stock is to be given in exchange for the entire common stock of the Rubber Regenerating Co.

"It is only fair that our stockholders should know at this early date that the entire earnings of the United States Rubber Co. for this fiscal year promise to be largely in excess of dividend requirements. The earnings of the Rubber Regenerating Co. are now double the dividends on the amount of the United States Rubber Co. common stock issued in exchange for the corresponding issue of that company. Furthermore, the United States Rubber Co. will undoubtedly, aside from earnings, be indirectly benefited to a large extent by the acquisition of the Rubber Regenerating Co.

"There seems to have been some misapprehension as to the amount of surplus shown in the statement of the United States Rubber Co. to the Stock Exchange for the six months ended September 30, in comparison with the surplus shown as of March 31 last, in the annual report. Apparently it has been overlooked that in the meantime the company has declared and paid a stock dividend of $5,000,000 to its common shareholders. Obviously the surplus was reduced by that amount.

"In making the application to the Stock Exchange to list the additional common and first preferred stock, as complete financial statements as possible for the various companies involved were made. The application was filed some time before the close of the fiscal year of the United States Rubber Co., and its subsidiaries; consequently it was impossible to render complete statements, as could have been done if the application had been filed some little time after the close of the fiscal period.

"To my mind the important point in this whole matter is that which I have already referred to, namely, that the earnings of the United States Rubber Co. promise to be largely in excess of all dividend requirements."

OFFICERS OF THE MANSFIELD TIRE & RUBBER CO.

At the annual meeting of the stockholders of the Mansfield Tire & Rubber Co., of Piqua, Ohio, the following officers and directors were elected: C. R. Grant, president; G. W. Henne, vice-president and general manager; Jesse E. LaDow, secretary; W. F. Henne, treasurer. These with Dimon Herring, William Isaly, Charles Hoffman and John Schauer, comprise the board of directors.

A RUBBER PLANT IN OREGON.

It is stated that some citizens of Portland, Oregon, including Dr. E. G. Watts and Ray Pritchard, are engaged in promoting an enterprise for the manufacture of druggists' sundries in the town of Stanfield—not far from Portland. The town has contributed a site containing two acres for the factory, which is 50 x 100 feet in size. It is hoped that manufacturing operations will begin (on a small scale) in the immediate future.

OVER 11,000 FEET OF AIR-BRAKE HOSE A DAY.

The Air Brake Department of The Republic Rubber Co. made a record January 7, in turning out short-length hose, which, the company believes, will surpass that of any other establishment in the country. On that day 11,500 feet of air-brake hose were produced by the hundred men employed in this section of the works. C. B. Frase is manager of the department, and not a little credit for the feat is due to his executive skill.

THE DAVOL COMPANY'S NEW PLANS.

Just before the recent holidays, the sales force of the Davol Rubber Company, Providence, Rhode Island, gathered together after their usual custom, for the semi-annual meeting and conference. At the conclusion of the conference, which lasted two days, the president of the company, Mr. Charles J. Davol, gave the members of the force a banquet—and an exceptionally generous and attractive banquet it was, if one may judge by the menu. There were 14 in attendance on that occasion—the sales manager, superintendent, secretary and acting treasurer attending, together with the salesmen. The feature of the evening, however, was not the menu, abundant and choice as that was, but the speech of President Davol, in which he thanked his assistants for having made 1912 the largest year in the company's history, and in which he went on to describe the company's plans for the coming year—not forgetting the large new factory now under course of erection on ground adjoining the present plant. The new mill will be four stories in height and will cover an area of 300 feet by 60 feet, thus adding approximately 80,000 square feet to the present large plant. With the new addition the Davol Rubber Co. will have the largest factory in the world devoted exclusively to the manufacture of druggists' sundries.

A new selling feature, from which much is expected, is being added to the output of the company in the shape of a patented household dish-washing device that will be marketed under the style of the "Yankee Girl Dish Washer." This device, made of rubber and metal, represents the most practical advance in the washing of household dishes since dishes have been used. It enables either mistress or maid to do all the dish washing in a practical and sanitary manner, without so much as wetting the hands. It divorces the dish pan from the kitchen and makes the work of washing dishes a pleasure, instead of a distasteful task. The Davol people expect to make this a greater success than even their famous "Anti-Colic Nipple."

HIGHEST FOR UNITED STATES RUBBER COMMON.

On January 10, last, the common stock of the United States Rubber Co. sold at 68⅜, which was the highest point at which this stock has ever sold.

THE WALPOLE'S FINE YEAR.

The Walpole Tire & Rubber Co., Walpole, Mass., had a very successful year in 1912. The gross sales exceeded $2,500,000—over 60 per cent. increase over the previous year. The net earnings for the year are estimated at $335,000.

LOUISVILLE TO MAKE TIRES.

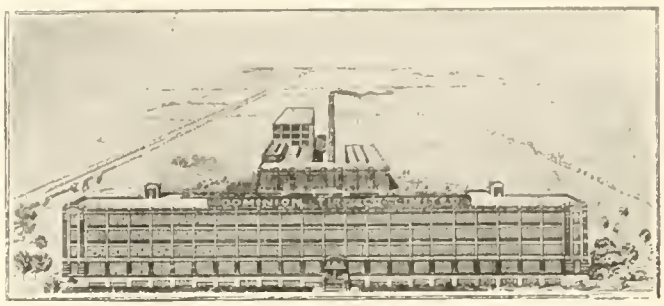
The manufacture of tires having in the past been practically confined to the territory north of the Ohio river, interest attaches to the incorporation at Louisville of the Speedway Tire Co., with a paid-up capital of $250,000. Sixty-five per cent. of the stock is held in the city named.

At first the new company will be located in a leased factory, with option of purchase. Later on, when its wants are known, a modern eight-story structure of concrete, steel and glass will be erected. It is expected to make about 100 motor vehicle tires a day, in three standard types. The chief product will consist of pneumatic and solid automobile tires, but mechanical rubber goods and druggists' supplies will also be manufactured. About 300 men will be employed, the plant being in charge of G. W. Greene, a Massachusetts tire expert. Harry L. Lewman is president; the other officials being likewise prominent local men.

THE NEW DOMINION TIRES.

The Dominion Tire Co., Ltd., recently started with a capital of $1,000,000, bids fair to make itself very well known in a short space of time. It is building an exceptionally fine factory in Berlin, Ontario. Berlin, by the way, has a marvelous record for growth and enterprise. Less than sixty years ago it had only 400 inhabitants; but they came from good stock; they were mostly Pennsylvania German farmers. Now the town has a population of 25,000 and is celebrated for its high-class factories. The workmen, too, are of a superior class; over 70 per cent. of the people of Berlin owning their own houses.

This new tire company has secured 40 acres of land, so that it will have room to grow. The main building, which is rapidly



DOMINION TIRE CO., LIMITED.

nearing completion, is 432 x 90 feet, five stories and basement, and is flooded with light from every side. It will be equipped with the very best machinery to be obtained anywhere on the continent, and both the Canadian Pacific and Grand Trunk Railways have extended their sidings to the factory, insuring prompt delivery of materials and equally prompt shipment of goods.

The company does not intend to get out a cheap tire, as it believes that cheap tires bring only disaster to manufacturer, dealer and consumer. Its purpose is to make the very best tire that the finest equipment and the best available labor can produce. The Canadian Consolidated Rubber Co., Ltd., will be the sole agent and distributor of the "Dominion" tires.

FAVARY TIRE CO. ACQUIRES PLANT.

Since its incorporation three years ago, the Favary Tire Co., of New York City, has been perfecting its special cushion tire. It recently acquired a plant at Middletown, New York, where it was expecting to produce tires during January. The company is composed of Ethelbert Favary, the inventor; H. C. Cryder, and M. W. Brashears.

The special feature of this tire is a concentric series of endless bands of specially woven fabric and rubber, supported by closely spaced aluminum blocks.

A NEW MICHELIN FACTORY.

A direct factory branch is being established in Wisconsin by the Michelin Tire Co., of New Jersey. In its application, the company states its capital as $3,000,000, and the Wisconsin interest as $25,000. The new branch, it is understood, will be located at Milwaukee.

PROHIBITION OF BULB HORNS.

A police ordinance in Los Angeles, California, prohibits the use of bulb horns as signal devices on automobiles. The new ordinance requires a signal producing an abrupt warning note, to be only used in the event of impending danger.

COMPLETION OF MARATHON RUBBER FACTORY.

Satisfactory progress is reported in the mechanical installation of the factory, lately erected by the Marathon Tire and Rubber Co., of Cuyahoga Falls, Ohio. It is anticipated that the company will be working at its full capacity by early in February.

CALENDARS RECEIVED.

A BEAUTIFUL HAND-COLORED PANEL.

The Adamson Machine Co., manufacturers of rubber-working machinery, of Akron, Ohio, have favored their customers with a particularly artistic calendar for 1913. The full size is 14 x 18 inches. The effective feature consists of a panel 6 x 12 inches, showing a restful landscape at sun down, hand-colored in the most delicate fashion. "That's good enough to frame" is the general expression on seeing this handsome picture. The panel is mounted on a cream-colored card and that in turn is mounted on a delicate shade of green. The calendar pad proper is printed in a very soft green and tied to the mounts with white ribbon. This calendar is rather for the private office or the library at home than for the factory walls.

"THE RUDE BRIDGE THAT ARCHED THE FLOOD."

The J. H. Stedman Co., scrap rubber merchants, Boston, Massachusetts, turned with great propriety to New England history for a calendar subject for the new year. Their calendar requires a sizeable space on the wall, as it is printed on heavy white cardboard 15 x 18 inches. One-half of this space is taken up by a photogravure of the old North bridge at Concord, Massachusetts, which Emerson referred to as "the rude bridge that arched the flood," where "the embattled farmers stood." The calendar pad is 5 x 9 inches, which gives plenty of space for legible figures. This makes a convenient and artistic office calendar.

TWO FINE HAND-TINTED SKETCHES.

The American Rubber Manufacturing Co., San Francisco, California, manufacturers of rubber belting, hose, matting and other mechanical rubber goods, have made a handsome contribution to the 1913 calendar output. It consists of a panel picture—the three-quarter length figure of a winsome young woman holding an American beauty rose. The title is "An American Beauty." Whether the title refers to the rose or to the young person holding it, would depend upon whether the decision rested with a woman or with a man. The average man would ignore the rose and say the title fitted the girl. This panel is mounted on a primrose-colored card, which in turn is mounted on a card of dark brown, the whole, which is 7½ inches wide by 16 inches long, being finished with brown silk ribbons and a ring for hanging.

Mr. Elmer E. Bast, manager of the Hamilton Rubber Manufacturing Co., and the American Belting Co., of Chicago, displays much taste in the handsome panel with which he has favored his friends. This is also a delicate water-tinted creation, showing a young woman—or at least the head and shoulders of one—enjoying the fragrance of a bunch of yellow roses, the title of the panel being "When Roses Bloom." This panel has a double mount, first on a cream and then on a delicate green background, the two mounts being fastened together with a heavy green silk ribbon.

CALENDARS BY THE MILLIONS.

Speaking of calendars, it is an interesting fact that an American company, the American Lithograph Co., of New York, prints more calendars than any other concern in the world, and has enjoyed this distinction for many years. The American Lithograph Co. has printed as high as 20,000,000 calendars in a year, which is almost enough to put one of its calendars in every home in the United States. Some of its single orders—generally from life insurance companies—amount to editions of 5,000,000. It has printed more calendars—and it is safe to say handsomer calendars—for rubber companies than any other concern. For a number of years the United States Rubber Co. distributed very large editions of handsome calendars intended for the general consumer. The B. F. Goodrich Co. for a number of years issued a series of beautiful lithographed heads. All this work was done by the American Lithograph Co.

Its principal customers—outside of the big rubber companies—have been packing houses, publishing concerns, the large soap manufacturers, life insurance companies and the fire arms companies. Of course these large companies that give orders for calendars running from 100,000 to 4,000,000 or 5,000,000 always have special designs made for them by the leading American artists—the original design often costing several thousand dollars.

SOME SMALLER CALENDARS.

The Electric Hose and Rubber Co., Wilmington, Delaware, prefers the useful to the ornamental in its calendar offering, and has supplied its customers with a desk calendar 5½ x 9 inches in size, which has a memorandum page for every week. At the bottom of each page there is a striking cut of a section of the company's hose; and printed in a light skeleton effect on each memorandum page one will find a variety of brief arguments in favor of using this brand of hose.

The Derby Rubber Co., Derby, Connecticut, manufacturers of reclaimed rubber, sent out a little panel calendar, 3¼ x 6½ inches, with a small picture in colors, of the American aborigine, the Red Man, with his bow and arrow, in pursuit of game.

The West India Committee Circular, published in London, has distributed a modest calendar 5 x 8½ inches in size, giving the calendar for the entire year—naturally in rather small figures—and above this showing a photographic panel of a familiar West Indian scene, to wit: a group of husky negresses going to market with a basket of yams and other delicacies on their heads, accompanied by a meek and lowly burro, whose circumference is considerably increased by bundles of sugar cane.

The Hazard Manufacturing Co., Wilkes-Barre, Pa., with offices in New York, Chicago and Pittsburgh, has distributed a large wall calendar about 30 x 18 inches in size, having a conspicuous half-tone picture printed in black and buff, showing a tug coming down the North River pulling the gigantic *Olympic* in its wake, a coil of insulated cable serving as an appropriate frame. The pad itself has large and conspicuous figures which will make it serviceable in office or storehouse.

The Revere Rubber Co.'s calendar is ornamented appropriately with a picture of a high-stepper trotting through a park. The calendar card, which is about 15 x 20 inches in size, also displays half-tone reproductions of 18 of the company's popular horseshoe pads. The card also bears some information relative to the use of pads.

The La Favorite Rubber Manufacturing Co., has made an attractive calendar by printing in a sepia tint, a large half-tone reproduction of a photograph of the exhibit the company made at the International Rubber Exhibition held in the Grand Central Palace last Fall. The half-tone is mounted on a brown board and has a brown calendar pad at the bottom of the mount.

White & Reid, "Rubberizers," Hoboken, New Jersey, have favored their customers with a particularly serviceable office calendar, consisting of a heavy cardboard back 8 x 12 inches, on which is mounted a calendar pad about 6½ inches square, having a page for each day of the year. This makes naturally a heavy pad, which is secured to the back by a couple of steel screws with caps that can easily be removed to change the date from day to day.

TO MAKE SYRINGES IN MEMPHIS.

The Sanitary Reversible Syringe Co., of Memphis, Tennessee, was granted a charter in November last, to manufacture reversible syringes and other druggists' supplies. The company expects to have its own factory in Memphis. The stock is $25,000, divided into shares of a par value of $25.

The Editor's Book Table.

INDIA-RUBBER JOURNAL DIARY AND YEAR BOOK, 1913. Maclaren & Sons, Limited, London, England. [Cloth, 4to, 96 pages, besides 122 pages of diary.]

THIS diary, which is in the usual convenient size of 11½ x 8½ inches, has once more appeared, and is fully up to the mark of its predecessors. Its statistical and other information in the introductory portion is as complete as usual, and shows much careful preparation.

HENDRICK'S COMMERCIAL REGISTER OF THE UNITED STATES. Twenty-first Annual Edition, 1912. Samuel E. Hendricks Co., New York. [Cloth, 1,575 pages, price $10.]

That this standard work has reached its twenty-first annual edition is the best proof of the valuable character of its contents. To the export buyer it is particularly valuable, as in the entire work there are 13,333 headings, each representing one article, with the names of the makers in each instance.

Those who know the "Register" will appreciate the completeness of this new edition, while those who have not hitherto used it, will probably find it just what they have been wanting.

FACTORY MUTUAL INSURANCE. The achievements of seventy-five years. Compiled to observe the fiftieth anniversary of the Arkwright Mutual Fire Insurance Co., Boston. [Pasteboard. 8vo. 123 pp. Privately printed.]

The Arkwright Mutual Fire Insurance Co., Boston, is one of the Associated Factory Mutual Insurance Companies, generally called "The New England Mutuals." It is an association of manufacturers for the prevention of fire loss and for the securing of insurance at cost. The company was founded in 1860, and this book is a souvenir of its half century of successful existence; and it very properly takes the form of a history of the whole mutual fire insurance development since its beginning in 1835. In that year a New England manufacturer conceived the idea that by getting other manufacturers to associate themselves with him, and by agreeing to share fire losses in their plants they could all secure insurance on much better terms. The idea was a good one. It was put into practice and has grown to such an extent that at the present time, in this country and in Canada, there are about 20 of these manufacturers' mutual insurance associations, with a valuation of their combined manufacturing properties aggregating over $2,000,000,000. Among this number might be mentioned the Rubber Manufacturers' Mutual Insurance Co., founded in 1884, and having an amount of risk of about $60,000,000.

The work of these mutual associations has been very successful in the great decrease of disastrous fires. As an illustration, during the 15 years from 1880 to 1895 there were among the plants insured by these companies 31 large fires, with an aggregate loss of $7,500,000; in the last 15 years from 1895 to 1910, notwithstanding the fact that the average amount of risk covered by these companies had increased from $550,000,000 to $1,200,000,000, the number of large fires dropped to 8, and the total loss to $1,400,000.

Naturally as all losses are borne by all members of the associated companies, all are mutually interested to have the best protection for their own property and for that of all other members. As a consequence great care is exercised in the original construction of plants and in their proper protection thereafter.

The above paragraphs give but a faint idea of the amount of interesting information in this little book. It contains a number of tables and charts and a great many cuts made from photographs; and altogether contains a mass of insurance information of great value to manufacturers, builders, architects and mill engineers. The book is not for sale, but can be secured, by people whose occupation makes them interested in the subject, from the Arkwright Mutual Fire Insurance Co., Boston.

CHEMICAL ANALYSIS OF LEAD AND ITS COMPOUNDS, by John A. Schaeffer, A. M., Ph. D., and Bernard S. White. Joplin, Missouri, 1912. Picher Lead Co. [8vo, cloth, 63 pages.]

It is a standing requirement of modern technical practice that the laboratory must control every process from the raw material to the various finished products. The Picher Lead Co., the well-known makers of lead compounds, in response to numerous and constant requests, have grouped the leading features of standard and new analyses of lead ores, pig lead, sublimed white and blue lead, red lead, litharge and other preparations of the mineral, in this concise and well prepared booklet.

The analyses are followed by accurate calculations, which facilitate their application.

An interesting section of the work deals with the idiometric determination of antimony and arsenic in lead-antimony alloys, while a comprehensive index assists in prompt reference to the various branches of lead analysis.

By means of the blank pages of ruled writing paper bound in at the back of the booklet, notes of study or experiments can be preserved. To users of lead in its various forms this little work will prove invaluable.

MY TOWN, OR COMMUNITY PATRIOTISM. BY GEORGE BLACKstone Irving. Rogerson Press, Chicago, Illinois. [8vo. 136 pp. Paper covers. Price 50c.]

This book has nothing in the world to do with rubber, as it is primarily an attempt to create and increase local patriotism. Indirectly, it has this much to do with the rubber industry, viz., that many of the most conspicuous rubber manufacturers have been, and are illustrious examples of local patriotism—not only looking after the welfare of their own employes, but contributing handsomely toward everything that promotes the welfare of the community in which their enterprise is situated. The author of this book, Mr. Irving, has lectured for years on this subject, traveling all through the country. His particular forte is to visit a town that needs "boosting," and to show the citizens in what way they can coöperate for the best interest of the community, and consequently for the best interest of each of its citizens.

When our synthetic friends succeed in producing rubber, as they hope to, at 8 cents a pound, so that it can be used liberally for pavement purposes, the promotion of local welfare and the rubber industry will be closely associated, for naturally the first suggestion that any wise community improver will then make, will be the taking up of noisy cobbles and the putting down of streets of noiseless rubber.

GRENIER'S RUBBER ANNUAL FOR 1912.

This is a quarto publication of 44 pages, printed on a very fine quality of coated paper, which not only brings out the text sharply but shows the most excellent halftones, of which there is a generous number, to extreme advantage.

More and more attractive with each recurrent year, this annual has become a standard feature of rubber trade journalism. Its literary contents include articles on "The Rubber Position," by S. M. Gluckstein; "Brazilian Rubber Reforms," by Arthur Shepard; "Rubber Costs and Commissions," by J. F. Ashly, "Rubber and Ten Per Cent.," by Sidney Pearson, and "Factors Affecting the Valuation of Rubber Shares," by W. A. Tinnock.

The illustrations, 86 in number, represent scenes on as many estates, and add greatly to the interest and value of the publication.

NEW TRADE PUBLICATIONS.

THE printing department of the B. F. Goodrich Co., produces exceedingly effective work. Another illustration of this fact is to be found in a lot of a dozen folders recently sent out from that department, descriptive of various products of the Goodrich mill. One large folder entitled "Comfort and a Few Facts," describes the hot water bottles made by the company's drug supply department. About thirty varieties of bottles are illustrated in the folder. Another folder, with eight detached leaflets included in it, has to do with the automobile and its appurtenances. The detached leaflets are each devoted to some particular tire trouble, which is described with a cut of a tire showing the effect of this particular trouble, after which the remedy is given. These leaflets are entitled: "Skidding," "Anti-Skid Devices," "Over-Speeding," "Wheel Out of Alignment," "Bad Roads," "Running in Car Tracks," and "Over-Loading."

The Goodrich Company, in addition, has recently distributed three little folding leaflets calling attention to three of its lines of production, namely, surgeons' rubber aprons, dental dam, and infant bulb syringes. The circulars are each printed in two colors and adequately illustrate the articles described. Regarding surgeons' aprons, the company calls attention to the fact that aseptic reliability and facility of sterilization can only be successfully realized by the use of high grade material. The company's dental dam is prepared from fine pure gum and will retain its elasticity under all conditions. Furthermore, it is translucent and does not get sticky. These three folders will be of interest to dealers in these various lines.

Three other folders pertain to the hose department, one describing and illustrating steam hose, another the Goodrich Sand Blast Hose, and the third, hose used in drilling. It is an effective lot of commercial literature.

With the object of making their "Analyzed Chemicals" more generally known, and at the same time keeping in touch with their old friends, the J. T. Baker Chemical Co., of Phillipsburg, New Jersey, issue a monthly booklet entitled the "Chemist Analyst"; containing papers by practical experts on subjects connected with laboratory practice.

In the latest number received, "Electric Combustion Furnaces," "Air in the Electrolytic Determination of Copper," and other subjects are treated, while Mr. J. T. Baker, the president, gives his views on "Manufacturing Incompatibilities." As appealing to the chemist and analyst, the title is fully justified by the contents.

The sprightly little publication issued by the Beacon Falls Rubber Shoe Co., Beacon Falls, Connecticut, contains in its January issue the usual amount of entertaining and instructive reading. It is a 16mo., consisting of 16 pages and cover and full of moralizing and humor, with facts interspersed with fables. Incidentally, it leaves the impression on the mind of the careful reader that Beacon Falls footwear is eminently desirable. It has one excellent feature that publications of this sort sometimes lack—there is just enough of it. Enclosed in this little booklet is a new price list for 1913.

The Katzenbach & Bullock Co., of 100 William street, New York, importers and dealers in chemicals, have just issued a 24-page catalogue 3½ x 6½ inches, giving a list of the chemicals in which they deal. These chemicals are first given in alphabetical order, and then the various trades supplied by the firm are alphabetically arranged, while under each trade is a further classified list of the chemicals that are of particular interest to that trade. This makes the book exceedingly easy for purposes of reference.

The Eureka Fire Hose Manufacturing Co., manufacturers of the Eureka "Paragon Red Cross" brand of fire hose, have issued a large wall calendar, on which there are a number of photographic illustrations showing the fireman at his hazardous occupation.

SOUVENIR OF CANADIAN TOUR OF BRITISH MANUFACTURERS.

In connection with the British manufacturers' Canadian tour of last year, under the auspices of the Dominion Government, the "Financial News" of London has issued a handsome souvenir number of 72 pages, richly illustrated. It closely follows the itinerary of the party; one of its special features being the reproduction of the groups photographed at various points. Views of picturesque Canadian scenery and of street scenes at the different cities visited, enhance the attractiveness of this artistic issue; while the narrative text is concise and full of information.

TWO RECENT BOOKS WHICH REFER TO RUBBER.

As Viewed by Our English Correspondent.

RUBBER LITERATURE.

In the present paragraph I am not referring to any new book on rubber, but to the chapters on rubber in a new book. This book is entitled "Industrial and Manufacturing Chemistry" (Organic), by Geoffrey Martin, assisted by numerous specialists familiar with British and American practice. Section IX, Part I, dealing with the rubber industry, is by A. J. Carrier, B. Sc., of whose nationality I must confess my ignorance. As the space given to the subject only covers twelve pages, and a good part of this is occupied by illustrations of David Bridge & Co.'s machinery, it will be seen that condensation has had to be severely employed.

It is doubtful whether the rubber industry of today can be satisfactorily dealt with in so short a space, and a few paragraphs on the general topic of the manufacture of rubber goods can convey but little of utility to seekers of information. We read that inner air tubes for cycles and motors are made of high-class rubber; while cruder rubber articles such as dolls, toys, goloshes, etc., contain a very large amount of mineral fillers or rubber substitutes. I don't know that a high-class golosh is really a cruder article than an inner tube, and I have my doubts about the large amount of substitute present. Raw caoutchouc is said to melt under ordinary pressures at about 190 degs. F. to a gummy mass (presumably Centigrade is intended). In the paragraph dealing with Devulcanization and Re-manufacture of Rubber it is stated that it has not been found possible up to the present to free vulcanized rubber from its sulphur, and thus transform it into a product akin to raw rubber. This, of course, is quite correct, but why head the paragraph "Devulcanization"? This part concludes with some useful trade statistics. Part II is by Mr. Martin himself and deals efficiently with the topic of synthetic rubber, and is probably the most up-to-date detailed account of the chemistry of this somewhat abstruse and complicated business.

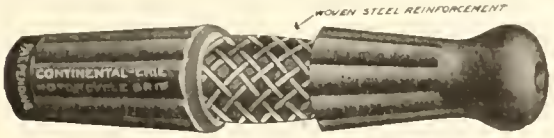
Another new and imposing volume, in which rubber finds mention, is "Industrial Chemistry," edited by Allen Rogers and Alfred B. Aubert and various collaborators. This is an entirely American production. The information on rubber and its manufacture covers only 2½ pages in the chapter on resins and gums. The general statement that raw rubber is very impure, with water, sand, wood, etc., will doubtless be objected to by planters in the Far East. It is hardly correct to say that litharge is only added as a filler in inferior grades of goods. Under "Reclaimed Rubber" we read that the most widely employed method is Goodyear's, which consists in reducing the waste to a finely divided state, mixing with normal rubber and sulphur and beating for several hours under heavy pressure.

Another statement is that hydrofluoric acid is kept in hard rubber containers. In England, at any rate, it is kept in gutta-percha containers. Altogether, the rubber information strikes me as decidedly weak, compared with the treatment of other materials and manufactures in the volume.

New Rubber Goods in the Market.

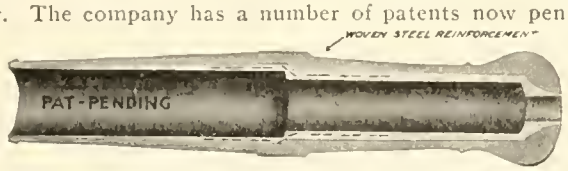
MOTORCYCLE GRIPS REINFORCED WITH STEEL.

THE Continental Rubber Works are offering manufacturers of motorcycles a new grip which they call "The Woven Steel Reinforced Grip." The two cuts here shown will give a good idea of what these grips are. It will be



A "Continental Erie" Grip.

seen that these grips have a woven steel reinforcement in the center or relief part of grip, which strengthens the grip at its weakest point. This woven steel reinforcement is pliable and does not take away from the grip any of its resiliency. The company has a number of patents now pending,

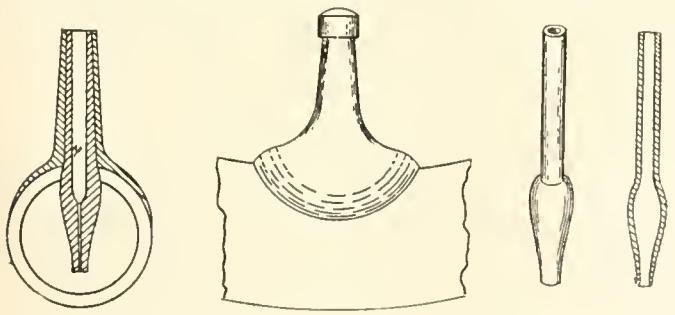


Cross Section Showing Steel Reinforcement.

covering this construction and also covering reinforcements of other materials to be used in the grip. It proposes to make these grips for the manufacturers, but it does not propose to issue any licenses for others to make them. The Continental Rubber Works, Erie, Pennsylvania.

ALL RUBBER AIR VALVES.

A certain inventive genius in Hot Springs, Arkansas, has devised an all-rubber valve for rubber air receptacles, like tires for the auto, bicycle and motorcycle, and also for air-cushions and footballs. This valve does away with all metal parts, and one claim for its superiority is that it cannot be injured by the creeping of the tire. Here are four illustrations which may possibly make the working of the valve a little plainer. No. 3 shows the valve by itself; No. 4, a cross-section of it; No. 1, a cross-section of the valve fitted into a tire; and No. 2, a side view of the valve when fitted and firmly attached to the tire. The theory is this: that the lower



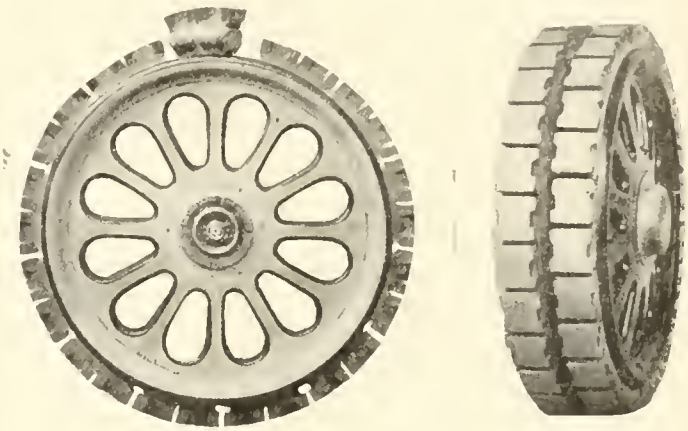
1. 2. 3. 4.

end of the valve which projects into the tire, or other air-chamber, is of such soft collapsible rubber that when the tire or other chamber is filled with air the pressure causes the valve to come together, entirely closing the air passage. A rubber cap is fastened on the outer end of the tube, as shown in Fig. 2, serving still further to make the tube air tight. Theoretically, this is an interesting valve; as to just how far it has been tested in practice, information is lacking. The inventor and patentee is Mr. P. P. Wood, Hot Springs, Arkansas.

THE ENGLISH RESILIENT WHEEL AND TIRE.

Excellent reports come across the water regarding the Lynton Resilient Wheel and Tire, which seems to be a happy combination where the wheel and tire work together, each increasing the resiliency of the other, and the two together giving practically a pneumatic effect to a solid tire. The tire (as will be seen by the accompanying illustrations) is a solid tire in blocks. This sectional character of course greatly increases the economy of the tire, as it is not necessary to discard an entire tire when one part of it becomes injured or worn.

It is the peculiar construction of the wheel, however, that gives the Lynton combination its distinctive character. This wheel is formed of two steel discs. One disc is rigidly attached to the hub, while the other disc, by means of a form of ball-joint, which allows it to rock in any direction upon the hub, has a pronounced element of "give" to it; which greatly in-



The Lynton Wheel and Tire.

creases the resiliency of the tire. These two discs are so correlated that the tire—which is fitted into a seat formed by the curving and spreading of the two discs at their outer circumference—flattens out when any obstruction is encountered and causes the two sides of the rim to spread. This spreading is possible through the arrangement of the loose disc. But while the rim at the point of contact is spreading, the part of the rim diametrically opposite, that is, at the top, correspondingly contracts; so that not only is that part of the tire which touches the ground operating to overcome the obstruction, but the corresponding section of the tire farthest removed is also operating for the same purpose—the lower section flattening out, while the upper section is being compressed.

This interplay of tire and wheel gives the "Lynton" a peculiar resiliency. These wheels are made with a single tire for pleasure cars, and also with double tires for commercial vehicles. The accompanying cuts show both the single and the double wheels. [The Lynton Wheel and Tire Syndicate, Ltd., Longford Bridge, Warrington, England.]

DEEP CUT RIVETS TO GRIP THE ROAD.

The Leather Tire Goods Co., of Niagara Falls, New York, is out with a new chrome leather tire cover differing from its earlier products in having at intervals of 2 inches very deep cup rivets, intended to take a strong grip of icy and snowy roads. It is the hope of the manufacturers that this cover will do the work which is now generally accomplished by the inconvenient chain—which is not only inconvenient but hard on tire and road-bed alike.

Some Rubber Interests in Europe.

GOOD RECORD OF DERMATINE VALVES.

IN June, 1911, a large sugar refinery in Whitechapel, London, installed an air pump manufactured by W. H. Bailey & Co., Ltd., of Manchester, England. This pump was supplied with the valves made by the Dermatine Co., Ltd., of London. Recently the pump has undergone an inspection, the valves being taken out. They have been re-measured, and it is found that although the pumps have been maintaining a vacuum of over 29 inches night and day for 11 months, the valves have worn on one side less than 3/64 of an inch. The good result attained has been to a large degree due to the fact that the valves were fitted with the Patent Anchor Bush which eliminates any tendency to enlargement in the central hole. It thus maintains a high vacuum and avoids the expense of early stoppage of the machinery, and the possibility of spoiling the material in process of manufacture.

NEW COMPOUNDING INGREDIENT.

According to the claims made for the new compounding ingredient "Corub," recently introduced on the English market, it is specially adapted for mixing with rubber compounds where a large quantity of waste or reclaimed rubber is used, imparting greater elasticity and resilience to the finished product. At the same time it tends to preserve the rubber. It is supplied in various colors.

MR. CASPER KRAAY IN LONDON.

Mr. Casper Kraay, who is well known in rubber and financial circles on both sides of the water, has established himself as a rubber dealer at Dunster House, Mincing Lane, London, E. C., under the style of Casper Kraay & Co. Doubtless we are interpreting the sentiments of his American friends in wishing him good luck and a prosperous new year.

A VALUABLE COMBINATION DIARY.

Typke & King, Ltd., 16 Mincing Lane, London, india-rubber chemists and chemical manufacturers, have favored their customers with an extremely convenient desk diary. It is a combination diary and writing pad. When folded up it is 11 x 13 inches in size; the top, finished in crimson leatherette, opens in the middle, disclosing a blotter pad with leatherette corners and quite large enough for ordinary desk purposes; while the left leaf when folded back proves to be a diary about 10½ x 6 inches in size, one week being covered by each page. It is not a particularly inexpensive form of diary—but that will not seriously militate against its welcome by the trade. At the front of the diary there is a calendar for the years 1913 and 1914, together with discount and interest tables, tables of money equivalents in various countries, Post-Office regulations, and other information such as a business man needs for ready reference.

THE JOSEPH FYNNEY DIARY.

Joseph Fynney & Co., india-rubber merchants and importers of Liverpool, have issued to their particular branch of the trade, a valuable little diary, of a size to go easily in the pocket, and yet containing pages enough for a memorandum for every day of the year, and besides that, a great volume of information of particular value to the rubber man. For instance, there is a table occupying 21 pages showing, for the benefit of raw rubber buyers, the loss in washing rubber—that is, the shrinkage in washing being known, the table gives the money equivalent. Then there is a table occupying a number of pages giving the equivalents of English money per pound, in cents per pound, and in francs and marks per kilo. Another valuable table gives the equivalent in kilograms of English weights. Then a number of pages are devoted to the Pará receipts and values for the last seven years. Another table shows vulcanizing pressure and temperature. These are but a few instances of the volume of valuable information this little book contains.

THE FOURTH INTERNATIONAL RUBBER EXHIBITION.

Mr. A. Staines Manders, the organizing manager of the two rubber expositions held in London in 1908 and 1911 and of the Rubber Exposition recently held in New York, announces the Fourth International Rubber and Allied Trades' Exhibition, to take place in London during June, 1914. It will be under the patronage of His Majesty, King George V; the president will be Sir Henry Blake, G. C. M. G., and the vice-president will be The Right Honorable Lord Elphinstone. In conjunction with this rubber exhibition, occurring at the same time but in another building, will be held the First International Cotton, Fibre, Tropical Products and Allied Trades Exhibition, of which Mr. Manders will also be organizing manager.

JOSEPH FYNNEY & CO.'S LONDON OFFICE.

Joseph Fynney & Co., rubber merchants and importers, have recently opened a London office at 155 Fenchurch street, which will deal more particularly with plantation rubbers.

THE MANUFACTURE OF ELECTRICAL INSTRUMENTS IN EUROPE.

The Bureau of Foreign and Domestic Commerce is about to issue a monograph dealing with the manufacture of electrical instruments and meters in Europe. The report is by H. B. Brooks, commercial agent of the Department of Commerce and Labor, who recently inspected 31 of the most important electrical works of England, France, Germany, and Italy. The products of each concern are treated in detail and descriptions are given of the buildings, equipment, labor conditions, kinds of material used, and the markets in which the products are sold.

PROGRESS OF DANISH TIRE COMPANY.

The Danish United Rubber and Tire Co. has paid for the last business year a dividend of 12 per cent. as compared with 10 per cent. for the preceding annual period. Its capital has recently been increased from the equivalent of $84,000 to $140,000.

CHANGE IN GERMAN TIRE COMPANY.

The International Rubber Tire Co., Limited, of Wittenberg, Germany, has removed its headquarters to Hamburg; at the same time changing its name to the International Rubber Industry Co., Limited.

NEW GERMAN AUTOMOBILE FACTORY.

According to Frankfurt advices a new automobile factory, to be styled the "Taunus" works, is contemplated in the neighborhood of that city. The capital will equal $1,500,000. and will be taken up by Count Posadowsky-Wehner, in conjunction with Herr von Brandenstein.

TRADE NEWS NOTES.

Some 1,500 skilled workmen and a large number of native laborers are employed in the Cape Province and the Transvaal in the manufacture of carriages and automobiles, but there are no builders of chassis in South Africa. Hence the tariff commissions of the various states have recommended their admission at a normal rate of duty, with the object of encouraging the building of motor bodies in the country. Motor vehicles are gradually superseding in South Africa those drawn by horses.

The trade mark "Rambler" has been registered in Germany for automobiles by the Thomas B. Jeffery Co., of Kenosha, Wisconsin.

Contrasted with a loss for the preceding annual period equaling $92,000, the last business year of the Harburg-Vienna Rubber Factories showed a profit of about $280,000. This result is attributed to absence of the fluctuations in the rubber market which had marked the preceding annual period. A dividend of 6 per cent. has been declared.

RUBBER PLANTING IN FORMOSA.

By Our Regular Correspondent.

THE Japanese government does not facilitate the acquisition of land in Formosa for rubber plantations, though the boom of 1909 and 1910 directed attention to the island and its possibilities as a source of rubber.

Five planters have, however, started plantations after careful preparation, and with the permission of the government. The total area of these plantations represents 6,124 ko (about 15,310 acres); the principal holders being:

	Ko.	Acres.
Mr. Fujii	460	1,150
Mr. Mukono	830	2,075
Mr. Murai	3,134	7,835
Toyo Rubber Co., Ltd.	1,000	2,500
Fujikura Electric Wire and Rubber Co., Ltd.	700	1,750
Total	6,124	15,310

Mr. Kunishige Watanabe and the Formosan Agricultural and Forestry Co. are applying for permission to plant 1,200 ko (3,000 acres).

Rubber planting commenced in Formosa in 1908, at which time experiments were made at the Kagi government rubber planting beds with all kinds of rubber seeds. These included *Hevea* from South America, *Manihot* from Hawaii, *Castilloa* from Central America, *Ficus* from Borneo and the South Seas, as well as *Funtumia* and *Landolphia* from Africa.

Some years before, the existence had been discovered of the *Gomu Katsura*, or rubber vine, which was recognized as a source of wild rubber, a full botanical report on which was issued by the government and was reproduced in the Japanese papers, with the result that several leading Japanese rubber manufacturers visited Formosa to investigate the vine. Among them were Messrs. Isaburo Yamada and Tomekichi Matsumoto of the Fujikura Electric Wire and Rubber Co. The American and British governments, through the United States Department of Agriculture and the British Imperial Laboratory, discovered the excellence of the vine. It grows thickly in groups of twenty or thirty, at a height of 1,200 feet or thereabout above sea level.

With a view of testing the merits of this vine, the Japanese government distributed 100 pounds of the latex among various factories, for the production of different kinds of manufactures. At the same time they tried to plant it by a method of grafting, but on account of its slow growth it was finally decided to plant rubber trees from various parts of the world, which have produced the following results:

Hevea (planted in April, 1907).—In April, 1911, the trees varied from 5 feet 7 inches to 11 feet 3 inches in height.

Manihot (planted in March, 1908).—At the end of May, 1910, the largest tree was 29 feet high and 12 inches in circumference at the base.

Castilloa, in the same period as recorded for *Manihot*, had attained a height of 6 feet 4 inches with 7 inches circumference of the trunk.

The following details illustrate the climatic conditions in the various provinces of Formosa:

	Average Temperature. Fahr.	Annual Rainfall. Inches.	Days of Frost in a Year.
Taihoku	70.7	83.42	1.6
Taichu	71.6	74.38	.9
Tainan	73.4	66.14	.1
Koshun	75.9	85.63	.0

Taihoku is at the northern end of the island and Koshun at its southern extremity. The climate is thus well fitted for rubber cultivation, particularly in the southeastern part, where it has grown twice as well as in the official rubber planting beds at Kagi, towards the west of the island.

In October, 1910, Mr. Bradford, an American expert from Hawaii, in conjunction with Mr. Masaichi Mukono (already mentioned), applied to the government for a lease of 830 ko, or about 2,075 acres. In Mr. Bradford's opinion *Manihot* grows better in Formosa than in Hawaii; other kinds also growing satisfactorily and Pará twice as well in the latter island.

The government, however, does not encourage plantations, preferring to see the results of a few years before expressing a definite view. One ground of apprehension is the fear of damage to *Manihot* from the hurricanes to which Formosa is exposed.

EXISTING PLANTATIONS.

With regard to the plantations already referred to, covering an area of 15,310 acres, Mr. Fujii, who has 1,150 acres in Hozan, is the oldest planter and has planted *Manihot*, while Mr. Mukono's previous experience of Pará and *Manihot* planting has not been favorable. Both he and Mr. Fujii depend more on the proceeds of cotton than of rubber.

Mr. Kichibei Murai, a wealthy resident of Tokyo, is the largest owner, with 7,835 acres. He has only *Manihot* and planted 2,000 acres with 50,000 trees in the rainy season of 1912 along with 200,000 camphor trees. The latter were specially for the purpose of forestation. Camphor, it will be recalled, is the chief product of Formosa.

The Toyo Rubber Co., of Tokyo, has acquired 2,500 acres, which will probably be planted during the ensuing spring.

Some authorities think Formosan rubber growing has passed through the experimental stage and has good prospects. All depends on the results of the first tappings, some five or six years after planting.

[Formosa, an island to the east of China, was ceded to Japan by the former country in 1895. Its length is 235 miles and its area 41,402 square miles. The population is 3,039,751.]

DETERMINATION OF WET RUBBER IN LATEX.

An instrument for the determination of the amount of wet rubber in latex has been invented by Mr. Thomas Cockerill, Chief Instructor of the Technical Schools, Colombo. The results of five years of experiments have convinced him of the infallibility of the "Latexometer," for at once estimating, within a fraction, the quantity of wet rubber contained in the latex brought in from the collecting area.

The "Latexometer" is similar to a hydrometer, only the body is brass plated with tin and the recording figures are placed on a metal tape. The set of instruments consists of five, each recording a certain range of yield; the five groups extending from 9 ounces to 117 ounces of wet rubber per gallon. In Mr. Cockerill's opinion, the range thus indicated would cover all practical requirements. If so desired, the scale can be marked to show the weight of dry rubber.

Experiments have been made at the Heneratgoda Gardens (through the courtesy of the officials), and at various plantations, including those of Gikiyanakande, Horana, and Talangama. The last-named experiments were conducted in presence of a representative of the "Times of Ceylon," which journal speaks favorably of Mr. Cockerill's invention, for which a patent specification has been accepted.

RUBBER SEED HUSKS AS FUEL.

The "Ceylon Observer" describes a new gas-producing plant in use at the Lauka Iron Works. This plant, instead of requiring charcoal, coal, anthracite, or liquid fuel, consumes rubber seed husks, which have hitherto been regarded as useless. They can be put straight into the generator from the estate. The power required is thus obtained at a minimum cost.

Some Rubber Planting Notes.

GOLD COAST ANNUAL REPORT.

THE report of the Agricultural Department of the Government of the Gold Coast for the year 1911 has recently been submitted by Mr. W. S. D. Tudhope, Director of Agriculture. An interesting table shows the following quantities (in pounds) of rubber shipped from the colony during the years 1902-1911 inclusive:

1902—1,599,974; 1903—2,258,981;
1904—4,013,837; 1905—3,633,106;
1906—3,649,668; 1907—3,549,548;
1908—1,773,248; 1909—2,764,190;
1910—3,223,265; 1911—2,668,667.

Five agricultural stations were controlled by the department; one in each province of the colony, one in Ashanti, and one in the Northern Territories. During the year there were distributed the following quantities of plants and seeds:

	Plants.	Seeds.
Pará rubber	43,455	94,115
Funtumia rubber	8,898	3,930,000 (262 lbs.)

Supplies of *Hevea Brasiliensis* seeds were far short of the demand.

Several European plantation companies are now actively operating in the colony and Ashanti. The African Rubber Co. has 55,075 Pará rubber trees, while the Avreboo Rubber Co. has 45,000 Pará and 37,000 *Funtumia*. The West African Rubber Plantations, Limited, have 300 acres planted with Pará rubber, and 150 acres with *Funtumia*.

Plantations in Ashanti include the Offin Rubber Plantations, Limited, with 50,000 *Funtumia* trees 8 months old, and 5,000 Pará trees 6 months old; as well as the Ashanti Rivers and Concessions, Limited, with 2,500 Pará rubber trees and 38,000 *Funtumia*.

The above particulars indicate the progress being made by European plantations; while the rates of growth show that rubber may be successfully grown in the Colony.

RUBBER EXPORTS OF FEDERATED MALAY STATES.

Official statistics received from the Malay States Information Agency, London, show the following rubber exports for the last three years:

	1910.	1911.	1912.
January	768,743	1,329,170	2,730,576
February	728,458	1,490,849	2,715,767
March	899,383	1,916,219	3,089,583
April	1,123,097	1,235,917	2,285,390
May	877,435	1,147,488	2,255,034
June	879,675	1,229,754	2,305,915
July	971,469	1,581,993	2,695,861
August	981,022	1,651,845	3,655,535
September	1,110,476	1,677,062	2,968,121
October	1,484,847	2,182,857	3,210,831
November	1,153,137	2,104,317	3,111,473
December	1,234,669	2,147,859	3,693,929
	12,212,411	19,695,330	34,718,015

These statistics refer to the Federated Malay States only, and do not include exports from the Straits Settlements or the Non-Federated Malay States. The output for 1912 constitutes a record for the first-named section of the Middle East.

SCOTTISH MALAY RUBBER CO., LTD.

The crop for the eleven months ended November 30, 1912 amounted to 156,736 pounds dry rubber, as compared with 88,411 pounds for the corresponding period of 1911.

RIVERSIDE (SELANGOR) RUBBER CO., LTD.

Returns for the eleven months ended November 30, 1912, show a total yield of 153,217 pounds, against 52,645 pounds for the same period of 1911; the quantity being almost threefold.

MR. BAXENDALE CORRECTS AN ERROR.

Some of the Ceylon papers had it that Mr. Cyril E. S. Baxendale, when in this country on the occasion of the recent Rubber Exposition, had stated that Malaya could produce rubber at 15 cents a pound. He has hastened to correct this error, saying that he never gave an opinion as to the lowest cost of production. He then continues:

"I told the American manufacturers that a well-managed, favorably situated, mature plantation can produce, with a handsome profit, at 2s. 6d. (60 cents) per pound. I might have put the figure lower, but I desired to ascertain whether they anticipated a sufficient development of their business, if rubber should fall to this price, to absorb the output of six years hence. I may say that their replies to this question were encouraging. Perhaps the most encouraging form of reply received was when every manufacturer I visited showed me the extensions to his factory, built, usually, out of the profits won last year, when the price of rubber averaged 5s. 2d., or just over twice the value I suggested."

ATTACHMENT TO TAPPING KNIVES.

A specification reported in the "Colombo Observer" has been lodged by Mr. George A. Craib. It is based on the fact that the bark, when cut in the process of tapping, has been let fall on the ground; thus taking up a certain quantity of extraneous matter, which affects the manufacture of the rubber. To prevent this, a receptacle is attached to the knife, which collects the bark cut from the tree in the process of tapping.

IMPROVEMENTS IN LATEX COLLECTION.

Mr. Oswald Dufaur-Clark, of Sungei Limau Estate, Perak, has been granted by the Government of the Federated Malay States, exclusive privileges for fourteen years, in respect to an improvement in the method of attaching latex-collecting cups to rubber trees. Similar privileges have been granted Messrs. J. G. Barclay and H. W. Weigall, of Kemendore Estate, Jasin, Malacca, for a latex cup holder.

PROPOSED GERMAN INVESTIGATIONS IN VENEZUELA AND GUIANA.

With the financial support of the heads of three leading German rubber manufacturing companies, an expedition is being organized which will visit the territory of the Orinoco and its affluents, for the investigation of rubber and balata conditions. Two years will be devoted to the work, which will be under the direction of Dr. Siegfried Benig, of Berlin, who lately returned from a visit to Venezuela. Satisfaction is being expressed at the prospect of the countries referred to being thus opened up to German enterprise, instead of being left in English and American hands.

BRAZILIAN AGRICULTURE.

According to cable advices from Rio de Janeiro, the estimates for the Ministry of Agriculture included about 36,000 contos of reis (about $12,000), for improvements in public services and the promotion of agriculture; including the advancement of the rubber industry in Amazonas and the other rubber producing States, in accordance with the plan elaborated by Dr. Pedro de Toledo, Minister of Agriculture. Among the features of this plan, it will be recalled, were the perfecting of the methods of production and extraction of rubber, as well as the reduction of cost of labor.

The Federal Senate at first proposed to cut out several of the items included in the estimates, but on hearing the explanations of Dr. de Toledo gave way and adopted the proposed legislation, which had already passed the Chamber of Deputies by a substantial majority.

NOTES FROM BRITISH GUIANA.

(From Our Regular Correspondent.)

FAILURE OF ANOTHER BALATA COMPANY, LABOR AND CAPITAL.

THAT 1912 has been a bad year for the balata industry is becoming only too evident by the official returns. We are now coming very close to the end of the year, and the export returns make lamentable reading. From January 1 to December 5, 1912, the amount exported has been 554,453 pounds, against 987,287 pounds during the same period last year. The difficulties of the season appear to have been too much for the Amsterdam Balata Co., which has gone into liquidation, with an indebtedness to laborers of $18,000, it is reported. The situation thus precipitated is an exceedingly unfortunate one; a number of laborers, about 300 it is said, have been dispatched to the interior, where they have been working for some months. It is known that two of the expeditions of this company have been involved in river accidents, caused, it is presumed, by undue recklessness in negotiating falls, which have had disastrous results, and there has been a certain amount of sickness in camp, in some cases with fatal results. The survivors of these expeditions return to town, find that their employers' business is in the hands of the Public Trustee, and that they can only get a small percentage of their earnings. This has precipitated a situation which was anticipated at the time the Balata Committee was investigating the conditions of the industry. No recommendation, however, was made to the committee. The Institute of Mines and Forests has now applied to the Government to remedy the situation by applying to the industry the following regulation that has been enforced for the past seven years in the gold industry: "No company or co-partnership, whether duly registered in this colony or not, shall be allowed to register laborers to work in any capacity in any mining district, otherwise than in the name of an individual resident in the colony, who must be the duly authorized attorney or representative of the said company or co-partnership, and who shall be held personally and individually liable for all the liabilities imposed by these regulations upon an employer of labor." Mr. James Winter, secretary of the Institute of Mines and Forests, has advanced the following reasons for taking this step on behalf of the Council of the Institute, in his letter to the Government: "Along with other witnesses that gave evidence before the Balata Commission, I urged the need of Mining Regulation No. 102 being made applicable to balata collecting. There is, however, no reference to this point in the report of the commissioners. Just at this juncture there have arisen circumstances in connection with the Amsterdam Balata Co., which very aptly illustrate the need of the regulation referred to. Many of the laborers of that Company now in town cannot get the wages due them, and the same will be the plight of some 300 who have not yet come to town. These men are without resources, and depend entirely upon the wages they earn in the interior, and after performing their duty it is extremely hard on arrival in Georgetown to find there is no money nor an attorney of the company they have worked for during months, to whom they may look for payment for services rendered. My Council are strongly of the opinion that this matter should not be overlooked, but dealt with when the matters connected with balata collecting are being considered, as foreshadowed in His Excellency the Governor's reference to that industry in his speech to the Combined Court."

ATTORNEYS AND LABORERS: QUESTION OF LIABILITY.

Mr. W. Maynard Payne, legal adviser to the Institute, in an interview, has given the following reasons in support of such legislation: "I always have been of the opinion that a clause similar in effect to that prevailing as regards the gold industry should be inserted in the balata regulations. If the employer receives a due and proper report on his concessions or grants, he should be able to cut his coat to his cloth, and there is no excuse for any employer who cannot give that remuneration, to which his laborers are entitled for their labor, the fruits of which he has himself disposed of. Such provisions I consider would be most advantageous where the balata industry is concerned, in fact I ventured to urge the necessity for them before the recent Balata Commission. I consider when work is paid for it should carry with it a certain proportion of responsibility. In the absence of any such enactment in the balata regulations, as I referred to, what is the position? The moment any trouble arises, the attorney of the foreign companies, can any day when it no longer suits his book, relieve himself of the responsibility, chuck up the power of attorney, throw everything on the broad back of the official receiver, and look on while the band plays. It is a case under certain implied conditions, namely that a certain amount of balata is to be obtained from a certain spot; when it is obtained it will be paid for at certain prices, and the laborers undertake to do a certain duty. If they do not do so they go to gaol, and what is sauce for the goose ought emphatically to be sauce for the gander, too. Introduce this section and a stop would soon be put to the indiscriminate acceptance of powers of attorney, without making due inquiry, or still more without being secured against possible eventualities as regards the financial status of the principals of the companies."

The "Daily Chronicle," commenting editorially on the proposal, says: "To what extent will a remedy be found by making the attorneys liable, it will be asked. Why should an attorney be held responsible for the failure of his principals? There is no reason, however, why attorneys should ever be called upon to discharge the liability they have incurred. The regulation proposed does not seek to be punitive, it seeks to be precautionary. . . . The object of such a regulation is to make the attorneys more careful in despatching expeditions. With such a regulation in force, attorneys would require their principals to give adequate security for their laborers' wages, before despatching expeditions to the balata forests; the absence of any such conditions does not remove the position far from Mr. Maynard Payne's definition—a gamble with other people's labor." Opposition to such a proposal appears unnecessary to say the least of it. If the regulation was deemed to be good for the gold industry, why should the Government deem it to be bad for the balata industry? That it has been good for the gold industry there can be no doubt. It has inspired caution in men who might otherwise have sent laborers to do work that is attended by some hazard and some risk."

THE GOVERNOR AND A HINTERLAND RAILWAY.

The chief need of the balata industry at the present time, as the Balata Committee emphasized in its report, is improved means of communication. As I have indicated in previous letters public opinion is rising in favor of a through line to Manaos, on the Amazon, which line could easily be made to take three-fourths of the balata output. It was anticipated that the new Governor, who was sent out here with a reputation as an administrator of constructive ability, would have favored this project. He has somewhat dampened the ardor of the enthusiasts by announcing in the course of a lengthy speech in the Legislature: "While guaranteeing the construction of a line to the far interior seems to me beyond the means of this colony, I wish to acquire personal knowledge of the country and there can be little doubt that a direct line from Georgetown to Manaos would be a great benefit to British Guiana, and that this Government should not put any obstacle in the way of capitalists who might be willing to undertake its construction." He also stated that "for the past year a specially engaged railway surveyor (Mr. J. Tew) has been employed in the surveying of a route for a railway from near Rockstone, the terminus on the Essequibo of the short line joining the Demerara and Essequibo Rivers, to the Potaro and the Goldfields of the Konawarook. His report has only just been

delivered, but will shortly be available. I fear that the estimated cost of construction is very high and that there is no doubt that this route is not suitable for adoption as a section of the main line to the interior of Brazil." His Excellency has pleaded for an extension of the Coast Railway as far as the Dutch frontier, but he is shortly to pay a visit to the Rupununi savannahs, which possess possibilities for rubber cultivation, and it is not to be understood that he has arrived at any dogmatic opinion. It is significant that in a memorandum which he submitted to the Legislature on the coast-railway extension he advocated the metre gauge for this and all future railways that may be built in this colony, because the metre gauge is in use in Brazil. There is presumptive evidence that His Excellency has a Brazilian frontier railway in view. It is by no means beyond the bounds of possibility that such a railway should take the form of an extension of the existing coast railway.

PROPOSED REMOVAL OF EMBARGO ON VENEZUELAN BALATA.

In the same speech His Excellency said that the "question of withdrawing the prohibition of importation of balata from Venezuela has long been under discussion. It is proposed to allow such importation, but subject to an import or transit-duty equivalent to the royalty on indigenous balata." His Excellency has thus speedily reversed the policy of his predecessor, who adopted a desperate remedy, which has done much harm to the Venezuelan balata industry and to the British Guiana township of Morawhanna. The removal of the embargo will be advantageous to the Georgetown merchants, whose representative, the Chamber of Commerce, has long advocated the admission of Venezuelan balata.

THE OUTLOOK FOR THE BALATA INDUSTRY; BETTER PROSPECTS FOR 1913.

At the present time there is severe industrial depression in the colony as a result of the long drought, and nowhere is this more apparent than in the balata industry. The sugar and rice crops are going to be short, and the figures relating to the balata output I have already quoted. There is likely to be a serious shrinkage in the spending capacity of the large amount of labor employed in the industry, which will be rendered worse by the unfortunate failure of the Amsterdam Balata Co. There can be no doubt that the balata industry is passing through a critical period. Three companies have dropped out, and those who have survived previous storms will have done well to have escaped heavy losses on the season that is now closing. The calamity of a long drought, following upon the labor difficulties of 1911, has been a crushing blow. Nevertheless, the position for the companies remaining is by no means hopeless, providing prudent and careful action is taken. The outlook at any rate is still being regarded optimistically. Mr. James Winter says that the prospections for next year have been very successful, and there is promise of a good season next year, providing weather conditions are favorable. The failure of some companies he attributes to bad management and unnecessary expense. To this, of course, has been added the important consideration that most of the grants within easy distance of Georgetown have been worked out, and the cost of despatching expeditions to the upper reaches of the river has proportionately risen.

The real remedy, of course, is an improvement in transit facilities, but even under the most favorable circumstances, that cannot be accomplished for years. Provided, however, that the labor difficulties are adjusted and the prospections are more honest than has always been the case in the past, 1913 should offer concessionaires some opportunity of retrieving the losses of the past two seasons. Employers and laborers are settling down, and the evil that arose from the necessity of sending all sorts of incompetent and inexperienced men to the balata concessions, after the first rush for labor, should show some signs of abatement. Managers have acquired more experience, and the men themselves are better equipped for performing their duties. The failure of some companies has shaken confidence to some extent, but prudent management next year should relieve the situation.

The failure that has marred the operations of the past two seasons has not entirely been the fault of the industry, if at all. Adverse circumstances have been supplemented by imprudent flotations. A gentleman well informed as to the circumstances of the industry has said: "I attribute the failure of these companies chiefly to their being over-capitalized, and to the fact that they paid very much more for their grants than they were actually worth. In a great many cases they acquired lands, which, after being prospected at great expense, proved valueless, and the consequence was the available working capital was exhausted. The Amsterdam Balata Co. suffered a great deal through the grants being such a long distance from Georgetown, and the journey the men had to take to get to the grants took roughly three months, while in addition they had immense difficulties to overcome. In their case their working capital has also been exhausted. The grants may or may not be valuable, but at the present time there is no information on the subject. This company had some grants within easy reach of the city, which, after prospection, proved valueless, after the spending of a great deal of money for that purpose.

If the balata business was worked more carefully, and a limited number of men sent up to prove grants that are known to be valuable, there is yet a great deal of money to be made. The balata industry has been an important factor in the colony's welfare for over 20 years and there are still grants at work now, which were working 20 years ago. This proves that if the trees are bled properly, the balata industry will continue for years. In a large number of cases the trees have been killed by bad bleeding; of course, where that takes place, the balata industry must die out. It is, therefore, much to the interest of the balata licensees to conserve the forests and it is also the duty of the government to do what they can, not only in that direction but also to increase them. That seems to be a point the government has missed up to the present. No doubt this year's losses are due to the drought, but the effect will be felt a great deal more in the first half of 1913 than it has up to the present. At least $120,000 ought to go into circulation in Water Street at the end of 1912, but will not, owing to the shortage in balata. The advances to balata bleeders in 1913 will necessarily be very much less than they were in 1912. Economy will have to be practised."

RUBBER IN TRINIDAD AND TOBAGO.

In an interesting special report, Mr. A. E. Collens, F. C. S., assistant analyst, Government laboratory, has dealt with the subject of rubber planting in Trinidad and Tobago. He traces the progress made since the introduction in 1876 of *Hevea*. At present about 150,000 *Hevea* are under cultivation, mostly in Trinidad, only a small number having been planted in Tobago. The cultivation of *Castilloa* has been taken up in various parts of Trinidad, where there are 500,000 trees; while in Tobago 120,000 have been planted. Of *Funtumina*, about 25,000 to 30,000 trees are being cultivated in the colony. *Landolphia* and *Ficus* have only been planted to a limited extent.

Many interesting particulars are given of official and other results as to tapping and yields.

BRITISH EXPERT'S VIEW OF BRAZILIAN SITUATION.

According to a recent cable from London, an expert has lately visited the East to study the question of rubber cultivation, on behalf of an important financial group. He also visited Pará and his report states that it is absolutely imperative for the Brazilian rubber planters to make three reforms. One of these is the adoption of the mode of incision employed in the East, while the others are the importation of Chinese labor and the reduction of the export duties on rubber.

1,046,272. Emergency traction device. F. B. Comins, Sharon, Mass.

Designs.

43,310. Tire tread. A. P. Lohmann, assignor to The B. F. Goodrich Co.—both of Akron, Ohio.
43,311. Tire tread. A. P. Lohmann, assignor to The B. F. Goodrich Co.—both of Akron, Ohio.
43,330. Wheel. W. C. Teasdale, Jr., assignor to The Motor Car Mfg. Co.—both of Indianapolis, Ind.
43,332. Tire tread. B. G. Work, assignor to The B. F. Goodrich Co.—both of Akron, Ohio.

Trade Marks.

63,825. The Essenkay Co., Chicago, Ill. The word *Essenkay*. A compound for filling automobile tires in place of air.
65,509. Sealo Tire Co., Chicago, Ill. The word *Sealo* inside of tire. A composition for preventing leakage of air through punctures in pneumatic tires.

ISSUED DECEMBER 10, 1912.

1,046,424. Life-saving device. T. E. Aud, Herndon, Va.
1,046,451. Tire mail. J. B. Duhring, Chestnut Hill, Pa.
1,046,501. Socket member for water bags. M. C. Schweinert, West Hoboken, N. J., and H. P. Kraft, New York.
1,046,584. Syringe. M. A. Grafflin and R. J. Gregg, Los Angeles, Cal.
1,046,629. Fastening device for tires. W. R. Morrison, Chicago, Ill.
1,046,686. Rubber tire protector. J. A. Utter, Crawfordsville, Ind., assignor of one-half to J. F. Utter, San Francisco, Cal.
1,046,712. Resilient wheel. B. Anderson and C. L. Miles, Boston, Mass.
1,046,760. Resilient wheel for vehicles. R. E. Fivey, Newark, N. J.
1,046,839. Vehicle washer. E. Muller, Weehawken, N. J.
1,046,855. Tire clencher ring lock. P. Recconi, San Francisco, Cal.
1,046,901. Hose connection. J. P. Tierney and L. Csernai, Youngstown, Ohio.
1,046,909. Hose reel. C. Wagner, Grantwood, N. J.
1,046,954. Anti-skidding device for motor vehicle tires. F. E. Bond, Walton, N. Y.
1,047,063. Hose coupling. J. H. Irving and M. Pedersen, Kenosha, Wis.

Design.

43,335. Tire tread. W. R. Blowers, Toronto, Ont., Canada.

Trade Marks.

24,146. Massachusetts Chemical Co., Walpole, Mass. The word *Dryfoot*. Waterproof textile fabric.
59,000. I. B. Kleinert Rubber Co., New York. The word *Brassiere*. Dress shields.
59,773. Kabus Rubber Co., New York. The word *Victor*. Rubber erasers and rubber bands.

ISSUED DECEMBER 17, 1912.

1,047,166. Repair or reinforcement of pneumatic tires. T. E. Cann, Leicester, England.
1,047,190. Resilient wheel. W. C. Fickes, Shirland, Ill.
1,047,204. Inner tube guard for pneumatic tires. S. Goodman, Bayonne, N. J.
1,047,268. Cushion wheel. J. Millar, assignor of one-half to D. Campbell—both of Arlington, N. J.
1,047,278. Traction wheel attachment. O. Olson, Brager, Minn.
1,047,297. Resilient wheel. L. S. Robbins and J. R. Davis, Vine Grove, Ky.
1,047,303. Spare tire cover. H. A. Sallop, New York.
1,047,268. Cushion wheel. J. Millar, assignor of one-half to D. Campbell—both of Arlington, N. J.
1,047,297. Resilient wheel. L. S. Robbins and J. R. Davis, Vine Grove, Ky.
1,047,352. Automatic air hose coupling. W. A. Weil, Findlay, Ohio, assignor of one-half to J. W. Grant, Uniontown, Ohio.
1,047,354. Ball. L. Wermeling, Covington, Ky., assignor to P. Goldsmith's Sons, Cincinnati, Ohio.
1,047,407. Resilient tire for vehicles. H. D. Hart, San Diego, Cal.
1,047,409. Pneumatic tire pump coupling. R. F. Hersey, Beverly, Mass.
1,047,485. Combination spring cushion tire wheel. R. F. Balding and H. P. Garland, Los Angeles, Cal.
1,047,495. Pneumatic wheel. A. Burfoot and J. Burfoot, Auckland, New Zealand.
1,047,504. Rubber shoe. J. T. Vrowley, assignor to The Beacon Falls Rubber Shoe Co.—both of Beacon Falls, Conn.
1,047,538. Spring tire for automobiles or other vehicles. G. A. and W. M. Krautter, Marion, Ohio.
1,047,544. Wringer. C. J. Marth, assignor to Wayne Mfg. Co.—both of St. Louis, Mo.
1,047,594. Expansible core for repairing tires. E. H. Trump, assignor of one-half to J. K. Williams—both of Akron, Ohio.
1,047,620. Pneumatic wheel. J. A. and R. R. Dennis, Cambridge City, Ind., assignors to International Pneumatic Wheel Co. of Indiana.
1,047,621. Pneumatic wheel. J. M. and R. R. Dennis, Cambridge City, Indiana.
1,047,642. Vehicle wheel. A. Jaeger, Jackson, Mo.
1,047,658. Jeweler's tool. A. J. Krueger, North Branch, Minn.
1,047,663. Turbine compressor or pump for elastic fluids. F. Lawaczeck, Aerzen, near Hameln, Germany.
1,047,750. Manufacture of rubber footwear. M. C. Clark, Providence, R. I.
1,047,790. Tire patch. R. E. Gregg, assignor to General Specialty Co.—both of Indianapolis, Ind.
1,047,803. Inner tube for automobile wheels. D. W. Harris, Platte City, Missouri.
1,047,888. Resilient vehicle wheel. J. Gaynor, assignor to Standard Resilient Wheel Co., Inc.—both of New York.

Design.

43,348. Tire tread. E. C. Shaw, assignor to The B. F. Goodrich Co.—both of Akron, Ohio.

Trade Marks.

64,714. W. S. Daniels, Boston, Mass. The words *New Era* written above the words *"Simply Honest."* Pneumatic tires.
64,869. Sté. Ame. Pour Le Commerce & l'Industrie du Caoutchouc, Brussels, Belgium. The word *Royal* under picture of tiger's head in circle. For automobile horn bulbs.
66,333. The Ringwalt Linoleum Works, New Brunswick, N. J. The word *Rubberoleum* fancily written. A waterproof floor covering similar to linoleum.

ISSUED DECEMBER 24, 1912.

1,047,918. Elastic fluid turbine. G. B. Collier, Kinderhook, N. Y.
1,047,962. Hose clamp. C. Marion, Petaluma, Cal.
1,048,054. Resilient wheel rim. J. Adman, assignor to A. M. Hovland—both of Minneapolis, Minn.
1,048,069. Syringe. E. E. Hall, Wausau, Wis., assignor to Layula W. Hall, Chicago, Ill.
1,048,120. Automatic air coupling. J. C. Wright, Kansas City, Mo.
1,048,138. Method of vulcanizing vulcanizable articles. W. W. Duncan, Boston, and N. E. Tousley, Watertown, assignors to Hood Rubber Co.—all of Massachusetts.
1,048,183. Cover for vehicle wheels. K. J. Lageson, Benson, Minn.
1,048,208. Device for repairing pneumatic tires.
1,048,215. Wringer. S. E. Schroeder, Minier, Ill.
1,048,238. Spring tire. P. Tysseling, Pelia, Iowa.
1,048,326. Manufacture of composite tubes. W. Love, London, England.
1,048,367. Rubber heel. L. J. Soderlund, Two Harbors, Minn.
1,048,371. Pneumatic cushion spring for wheeled vehicles. J. W. Sutton, assignor to Mary Sutton—both of Brisbane, Queensland, Australia.
1,048,376. Anti-skidding device. R. J. Thiesen, and C. T. King, Jr., Atlanta, Ga.
1,048,385. Puncture repairer. W. R. Barstow, Oakland, Cal.
1,048,423. Puncture proof tire. W. McKay, New York.

ISSUED DECEMBER 31, 1912.

1,048,564. Elastic fluid turbine. J. F. Metten, Philadelphia, Pa., assignor to the Wm. Cramp & Sons Ship & Engine Building Co. of Pennsylvania.
1,048,813. Resilient wheel. W. F. Doll, Liberty, N. Y.
1,048,863. Hose reel. R. L. Notman, assignor to McKinnon Dash Co.—both of Buffalo, N. Y.
1,048,904. Elastic wheel for automobiles and other vehicles. A. Sordi, Lugano, Switzerland.
1,049,039. Rubber composition. W. F. Beasley, Plymouth, N. C.
1,049,046. Spring cushioned wheel. S. W. Buercklin, Prague, Okla.
1,049,067. Resilient tire for vehicle wheels. O. Erickson, and O. G. Sunden, Chicago, Ill.
1,049,071. Spring tire for vehicles. P. C. Fox, assignor to Fox Spring Tire Co.—both of Spokane, Wash.
1,049,090. Device for repairing pneumatic tire tubes. A. R. Hoeft, Chicago, Ill.
1,049,129. Resilient wheel. H. C. Moore, Cleburne, Texas.
1,049,142. Tire alarm. J. B. Polo, Clear Lake, S. D.
1,049,157. Tire. P. C. Seward, Petersburg, Va.
1,049,164. Shoe heel. W. E. Stedman, Zanesville, Ohio.
1,049,287. Clencher tire retaining device. S. Barnett, Tipton, assignor to Joseph Darlus Griffin, London—both of England.
1,049,300. Vehicle wheel. S. C. Harfield, Baltimore, Md.
1,049,313. Protective shoe for tires. J. A. Murphy, Holyoke, and R. J. Harrison, Chicopee Falls—both of Massachusetts.

Design.

43,412. Tire tread. E. C. Shaw, assignor to The B. F. Goodrich Co.—both of Akron, Ohio.

Trade Marks.

58,272. Louis Judell, New York. The words *Regime Shoe*. Boots, shoes, etc.
65,055. Federal Rubber Mfg. Co., Milwaukee, and Cudahy, Wis. The word *Rugged*. Rubber vehicle tires.

GREAT BRITAIN AND IRELAND.

PATENT SPECIFICATIONS PUBLISHED.

The number given is that assigned to the Patent at the filing of the application, which in the case of these listed below was in 1911.

**Denotes Patents for American Inventions.*

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, DECEMBER 4, 1912.]

18,356 (1911). Isoprene; intermediate products. J. Y. Johnson, 47 Lincoln's Inn Fields, London.
18,391 (1911). Elastic bulbs for motor horns, etc. A. Cleret, 6 avenue Gambetta, Paris.
18,408 (1911). Balata plies in belts. R. Slack, Market Place, Chapel-en-le-Frith, Derbyshire.
18,430 (1911). Supplementary air tubes for tires. T. and J. Nuttall, 536 Romford Road, and R. Nuttall, Goodmayes avenue—both in Goodmayes.
18,431 (1911). Isoprene and similar hydrocarbons; caoutchouc. K. Gottlob, Prague-Vysocan, Austria.
18,452 (1911). Tread bands for tires. W. H. J. Willson, 40 Chapel street, St. Kilda, and S. Moody, Plenty Road, Preston—both in Victoria, Australia.
18,469 (1911). Tread bands with metal plates. T. H. Rushton, 158 Grimsby Road, New Cleethorpes, Lincolnshire.
18,470 (1911). Improvement in tread bands. G. A. Mortier, "Elsinore," Garstang Road, Fulwood, Preston, Lancashire.
18,540 (1911). Rubber covers for golf tees. W. H. H. Booth, 4 Woodlands Terrace, Blackhill, and W. H. Francis, Bays Hill, Ffynone Terrace both in Swansea.
18,556 (1911). Spring wheels with pneumatic cushions. E. Jones, "The Poplars," Greenfield, near Holywell, North Wales, and W. S. Williams, 28 Bowring Road, Ramsey, Isle of Man.

18,562 (1911). Continuous elastic tire. C. A. Besaw, and A. C. Tyre Co., Union street, Sunderland.
[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, DECEMBER 11, 1912.]
18,807 (1911). Elastic bands in spring wheels. O. Deprez, 44 rue Africaine, and A. Richir, 18 rue de Danemark—both in St. Gilles-lez-Brussels, Belgium.
*18,839 (1911). Spring wheels with pneumatic cushions. C. D. Galvin, 1820 Wallace street, Philadelphia, Pa., U. S. A.
18,863 (1911). Compositions for sealing punctures in tires. G. H. Price, Queenstown, Cape Colony.
18,876 (1911). Spring wheels with pneumatic cushions. C. E. de Boos, Temona, New South Wales, Australia.
18,967 (1911. Stocking-suspenders. H Bunte, 22 Grabenstrasse, Dusseldorf, Germany.
19,027 (1911). Raising sunken vessels. F. L. Blonkinsop, Lansdowne Lodge, Lansdowne Crescent, Great Malvern, Worcestershire.
*19,038 (1911). Ear-protectors. J. A. R. Elliott, 7404 Third avenue, Brooklyn, New York, U. S. A.
19,080 (1911). Rubber tip in heel protectors. W. G. Rudolph, 84 Luisenstrasse, Offenbach-on-Main, Germany.
19,117 (1911). Rubber covering for printing rolls. E. Ludin, Dornach, Elsass, Germany.
[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, DECEMBER 18, 1912.]
19,216 (1911). Spring wheels with rubber blocks. H. G. Hugon, 22 rue de Vic, Calais, France.
*19,218 (1911). Rubber tire with transverse holes. E. W. Morrow, 116 Broad street, New York, U. S. A.
19,245 (1911). Improvement in fitting of rubber gloves. H. F. Finlay, 75 York street, Sydney, Australia.
18,286 (1911). Spring wheels with pneumatic cushions. E. C. R. Marks, 57 Lincoln's Inn Fields, London.
19,293 (1911). Pneumatic cushions for springs. M. Sutton, "Stonehenge," Bowen Terrace, New Farm, Brisbane, Australia.
19,424 (1911). Composition for repairing tires. F. W. Farr, Cogenhoe, near Northampton.
19,504 (1911). Teeth-cleaning appliances. R. F. Gunther, 8 Clemenstrasse, Bonn, Germany.
19,522 (1911). Spring-wheel with pneumatic cushion. C. A. C. Rispaud, rue Etienne Jodelle, Paris.
19,562 (1911). Tread bands for tires. H. Agha, Eagle Lodge, Hale, Cheshire.
19,568 (1911). Repairing pneumatic tires, hose-pipes, etc. R. Jennings, P. O. Box 1809, Johannesburg, Transvaal.
[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, DECEMBER 27, 1912.]
19,702 (1911). Vulcanizing presses. Soc. A. Olier et Cie, Clermont-Ferrand, Puy-de-Dome, France.
19,711 (1911). Rubber rings for use in planting bulbs. W. Dick, 28 Glebe street, Townhead, Glasgow.
19,770 (1911). Hot-water bottles, etc. T. Machin, 93 The Crescent, and T. H. Joy, 5 Great North Road—both in Woodlands, and D. W. Freeman, Finningley—both near Doncaster.
19,784 (1911). Coagulating latex. Freudweiler, 64 Feldeggstrasse, Zurich, Switzerland.
19,788 (1911). Coagulating latex. H. H. Markley and F. E. Mellinger, Lumija, Chiapas, Mexico.
19,881 (1911). Portable vulcanizer. R de C. de Peruzzis, Roosendael, Holland.
19,889 (1911). Rubber rings for billiard rollers. W. Westmoreland, 84 York Road, West Hartlepool.
19,901 (1911). Rubber surface for bowls. E. V. Row, Know Hill, Nutbank road, Norwich.
19,919 (1911). Erythrene, isoprene and intermediate products. P. A. Newton, 6 Breams buildings, Chancery lane, London.
19,950 (1911). Lace tags. W. and H. and W. Stommel, Barmen, Germany.
[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, DECEMBER 31, 1912.]
*20,116 (1911). Improvements in tire covers. F. Power, 3950 Wyandotte street, Kansas City, Mo., U. S. A.
20,129 (1911). Compositions of rubber flint. Rauh-Gummi-Verwertungs-Ges., 48 Werderstrausse, Hamburg, Germany.
20,240 (1911). Apparatus for detecting punctures. H. T. Stephens, 4 Quay street, Garmarthen.
20,297 (1911). Waterproof fabrics for tires. J. Hoyle, Acre Mills, Hebden Bridge, Yorkshire, and A. J. Smith, Milne, 210 Venner road, Sydenham, London.
20,315 (1911). Football bladders, etc. J. W. Albers, 1 Bremergasse. Hamburg-on-Elbe, Germany.
20,438 (1911). Spring wheels with pneumatic cushions. A Lucia, 102 Corso Vittorio Emanuele, Rome.
20,463 (1911). Machinery belting. H. Panzetta, Carrara, Redhill, Surrey, and Panzetta Tire Syndicate, St. Michael's House, Cornhill, London.
20,481 (1911). Elastic tires and cores. M. D. Rucker, "Heimath," Foxley lane, Purley, Surrey.

THE FRENCH REPUBLIC.

PATENTS ISSUED (with Dates of Application).

443,642 (May 9, 1912). J. A. Redfern. Rubber sole for footwear, etc.
443,700 (May 11). B. W. Wittenberg. Anti skid system for pneumatic tires.
443,767 (May 13). E. C. Lena. Elastic tire.
443,926 (May 15). J. Hobel. Anti-skid system for automobiles.
443,973 (May 18). L. Liais. Improvements in rubberized fabrics for use as pneumatic tire covers.
444,059 (May 21). M. Gratz. Wheel with elastic tire.
444,026 (July 28, 1911). Chemische Fabrik Florsheim, Dr. H. Nördlinger. Process of making products similar to rubber.
444,031 (July 27). Auquetil. Process of preparing rubber by synthesis.
444,062 (May 21, 1912). S. Block and S. Benima. Filling material for rubber and its process of manufacture.
444,244 (May 24). H. Zeuner. Elastic tire for wheels.
444,305 (May 28). M. A. Dees and McLeod. Mold for vulcanizing tires.
444,315 (August 4, 1911). J. Fiena. Elastic vehicle tire.
444,369 (May 23, 1912). S. M. Luguet. Soft wheel for automobiles and carriages.
444,423 (May 15). Dujardin. Rubber soles and heels for footwear.
444,467 (May 31). P. Seydel and N. Klemenz. Portable vulcanizing apparatus for repairing *en route* automobile tubes and tires, etc.
444,483 (May 31). W. Ure. Improvements in covers for pneumatic tires.
444,528 (June 1). N. Rosenblatt. Compound tire for automobiles, etc.
444,641 (August 12, 1911). H. Farjas. Shock absorbing vehicle tire.
444,628 June 5, 1912). McGraw Tire and Rubber Co., Process and apparatus for vulcanization.
444,646 (June 5). G. Molu and A. Wohlcken. Protector for vehicle tires.
444,804 (June 10). E. R. Riedinger and A. Fraser. Improvements in pneumatic tires.
445,025 (June 15). Weed Chain Tire Grip Co. Improvements in arrangements for repair of tires.
444,872 (June 12). C. D. Williams. Pneumatic vehicle wheel.
445,058 (August 23, 1911). Mendes de Almeida. Pneumatic vehicle tire.
445,107 (June 17, 1912). A. Von Linde. Pneumatic tire.
445,139 (June 18). E. H. Jones. Improvements in manufacture of pneumatic tires.

[NOTE.—Printed copies of specifications of French patents can be obtained from R. Bobet, Ingenieur-Conseil, 16 avenue de Villiers, Paris, at 50 cents each, postpaid.]

THE GERMAN EMPIRE.

PATENTS ISSUED (with Dates of Validity).

254,548 (December 13, 1910). Production of rubber, its analogues and homologues. Farbenfabriken, vorm. Fried Bayer & Co., Elberfeld.
254,569 (May 27, 1909). Rubber protective covering for walls and floors of rooms containing electrical accumulators. Felten & Guilleaume, Mülheim-on-Rhine.
254,672 (January 26, 1912). Process for production of artificial rubber. Farbenfabriken, vorm. Fried Bayer & Co., Leverkusen and Elberfeld.
254,703 (September 30, 1909). Extraction of pure rubber from resinous crude material. Schon & Co., Harburg-on-Elbe.
254,868 (March 15, 1912). Production of rubber substitute. Farbenfabriken, vorm. Fried Bayer & Co., Leverkusen and Elberfeld.
254,847 (May 28, 1911). Elastic tire, in which the enclosed air is compressed by the pressure of the tire. F. T. Roberts, New York.
255,129 (March 13, 1912). Process for manufacture of Butadiene rubber, its homologues and analogues. Farbenfabriken, vorm. Fried Bayer & Co., Leverkusen and Elberfeld.
255,417 (December 14, 1911). Protective and anti-skid armor for pneumatic and solid tires. Rudolph Müller, Kiew, Russia.
255,679 (August 8, 1911). Process for manufacture of artificial rubber. Farbenfabriken, vorm. Fried Bayer & Co., Leverkusen.
255,680 (August 8, 1911). Manufacture of a product coming near to vulcanized rubber. Farbenfabriken, vorm. Fried Bayer & Co., Leverkusen.
255,703 (April 4, 1911). Production of a rubber substitute from oils and chloride of sulphur, in conjunction with suitable resins and neutralizing agents. Rubber Substitute, Limited (1910), London.
255,786 (January 27, 1912). Manufacture of products resembling rubber. Badische Anilin & Soda Fabrik, Ludwigshafen.
255,795 (February 28, 1911). Repair appliance for pneumatic tires. Gustav Joseph Martel, Chicago.
255,796 (March 17, 1912). Elastic vehicle tire. John Henry Messenger, London.
255,801 (June 23, 1912). Appliance for fastening pieces of rubber on heels. Alfred Weichelt, Dresden.

THE KINGDOM OF BELGIUM.

PATENTS PUBLISHED.

250,126 (1912). Gross (C. K. F. L.), Sporveisgade 31, Christiana, Norway. Process for manufacture of mass, acting as calazyator in the production of isoprene from oil, turpentine and other materials.
250,128 (1912). Gross (C. K. F. L.), Sporveisgade 31, Christiana, Norway. Process for manufacture of rubber from synthetic isoprene.
250,125 (1912). Gross (C. K. F. L.), Sporveisgade 31, Christiana, Norway. Process for the manufacture of synthetic isoprene.

STATEMENT OF THE INDIA RUBBER WORLD.

Statement of the ownership, management, circulation, etc., of THE INDIA RUBBER WORLD, published monthly at New York, required by the Act of August 24, 1912.

Editor, Henry C. Pearson, Tompkins Corners, Putnam Co., New York.

Managing editor, John P. Lyons, 150 West Ninety-first street, New York City.

Business manager, Edward F. Pfaff, 94 Hawthorne street, Brooklyn, New York.

Publisher, The India Rubber Publishing Co., 15 West Thirty-eighth street, New York.

Owner, Henry C. Pearson, Tompkins Corners, Putnam Co., New York.

Known bondholders, mortgagees, and other security holders, holding 1 per cent. or more of total amount of bonds, mortgages, or other securities: None.

(Signed) HENRY C. PEARSON, *Editor.*

Sworn to and subscribed before me this 30th day of September, 1912.

(Signed) HELEN HEROLD, Notary Public,
(Seal) Kings County, No. 162.

Certificate filed in New York County. Term expires March 30, 1913.

Kings County Registers Certificate No. 882. New York County Registers Certificate No. 3082. (Commission continuous.)

Report of the Crude Rubber Market.

SINCE December 24, date of last report, the course of the London market for fine Pará has tended downwards, though the result has only been a falling off to the extent of 2*d.* per pound. Practically, the advance established during December has been lost; the figure at time of writing (January 25) being 4*s.* 5¼*d.*, as compared with 4*s.* 7¾*d.* on December 24, and 4*s.* 5*d.* on November 25. This position has been attributed to the relative abstention of buyers.

During the past four weeks plantation rubber has fallen 3*d.* per pound, likewise reverting to about the position it occupied at the end of November, the gain in December having been offset by subsequent reductions. The course of London prices for pale crepe, basis first latex, was: December 24, 4*s.* 7¼*d.*; December 31, 4*s* 7¾*d.*; January 6, 4*s.* 7*d.*; Jaunary 18, 4*s.* 6¼*d.*; January 23, 4*s.* 5¼*d.*; January 24 and 25, 4*s.* 4¼*d.* On the two last-named days Pará stood at 4*s.* 5¼*d.*

That the London plantation rubber auctions are getting a large part of the increased production is proved by the table in another column, which shows that the total offered in 1912, including the sale of December 31, was 18,069 tons, as compared with 9,945 tons for the year 1911.

Owing to the non-arrival of rubber afloat, the final sale of the year, on December 31, only included 350 tons, as compared with 930 tons in that of December 17. This fact led to keen competition, resulting in an advance of 2*d.* to 3*d.* over the prices of the preceding sale.

By the date of the next sale, January 14, large arrivals brought up the amount offered to 1,130 tons, this auction thus creating a record for quantity. The whole was sold at an average of 1*d* per pound under the rates of a fortnight earlier, thus making a good start for the new year.

On this basis English consumers operated extensively, apparently covering their wants for the immediate future.

At the Rotterdam sale of January 10, there were offered 33 tons Congo, 7 tons *Hevea*, and 5 tons *Ficus*, three-fourths of which sold on an average about 2 per cent. below valuations. The next sales at Rotterdam are fixed for February 18.

The Amsterdam sale of January 16 included 26 tons *Hevea* and 13 tons *Ficus*. In the former, valuations were about obtained, while an advance of 2 per cent. was realized for the latter.

On January 21 there was a sale at Havre including about 70 tons Congo rubber.

New York.

In regard to the financial situation, Albert B. Beers (broker in crude rubber and commercial paper, No. 68 William street, New York) advises as follows: "During January a decided change has come over the money market as expected, rates easing very much and the demand improving from both city and out-of-town banks, with the best rubber paper selling at 5@5¼ per cent., and names not so well known 5½@6 per cent."

Rubber Stock at Para.

On May 31, 1912, the stock had increased, but receded by June 30; and had again fallen off on July 31. Large sales by the syndicate materially reduced the stock by the end of August, from which point it had slightly increased by September 30. A further increase was shown on October 31. The stock had dropped by November 30 to the lowest point reached in 1911 or 1912, very slightly increasing by the close of 1912.

Edited by HENRY C. PEARSON—Offices, No. 15 West 38th Street, NEW YORK.

Vol. XLVII. No. 6. MARCH 1, 1913. 35 CENTS. $3.00 Per Year. $3.50 Abroad.

INDIA RUBBER WORLD
CAOUTCHOUC GUTTA-PERCHA

Published on the 1st of each Month by

THE INDIA RUBBER PUBLISHING CO.

No. 15 West 38th Street, New York.

CABLE ADDRESS: IRWORLD, NEW YORK.

HENRY C. PEARSON, Editor

Vol. 47. MARCH 1, 1913. No. 6

SUBSCRIPTIONS: $3.00 per year, $1.75 for six months, postpaid, for the United States and dependencies and Mexico. To the Dominion of Canada and all other countries, $3.50 (or equivalent funds) per year, postpaid.

ADVERTISING: Rates will be made known on application.

REMITTANCES: Should always be made by bank or draft, Postoffice or Express money orders on New York, payable to THE INDIA RUBBER PUBLISHING COMPANY. Remittances for foreign subscriptions should be sent by International Postal Order, payable as above.

DISCONTINUANCES: Yearly orders for subscriptions and advertising are regarded as permanent, and after the first twelve months they will be discontinued only at the request of the subscriber or advertiser. Bills are rendered promptly at the beginning of each period, and thereby our patrons have due notice of continuance.

Entered at the New York postoffice as mail matter of the second class.

DR. HUBER ON THE RUBBER OUTLOOK IN BRAZIL.

IN the January issue of this publication there appeared a digest of the paper read by Dr. Jacques Huber, director of the government museum at Pará, on "The Present and Future of the Native Hevea Rubber Industry." In the same number there was an editorial referring to the importance and value of this contribution to the literature of an exceedingly interesting subject.

In this issue this paper will be found in full, and will undoubtedly be read attentively by everyone interested in the rubber industry. At the present rate of increase in the production of wild rubber in the Amazon basin, and in the output of the Eastern plantations, it is highly probable that the present year will see the plantation product overtake the volume of rubber shipped from Pará.

While there has been a material increase in the exports of rubber from Pará in the last fifteen years—an increase amounting very nearly to 100 per cent.—the increase during the last five years has been slight, while the increase in the plantation output has been constant and large. To go a little more into detail, the total shipments of rubber from Pará fifteen years ago were a little less than 22,000 tons. The volume rose steadily for four years until in 1901 it was 30,000 tons. It remained practically at this figure for four years, when in 1905 it began slowly to increase and grow steadily larger each year until it reached 39,000 tons in 1909. It then fell back in 1911 to less than 36,000 tons, or less than the output four years earlier. In 1912 it reached its highest point—43,000 tons.

But in the meantime Eastern plantation rubber has increased by leaps and bounds. In 1906 the Eastern plantation output amounted to 510 tons; the next year it nearly doubled, being 1,010 tons. In the following year it nearly doubled again, reaching the figure of 1,800 tons. The next year, 1909, it increased considerably over 100 per cent., amounting to 3,850 tons. In 1910 it showed another increase of over 100 per cent., reaching the substantial figure of 8,230 tons. In 1911 it was over 14,000 tons; and for 1912 the plantation output will doubtless prove to be over 28,000 tons. Careful estimates for the next few years, made by competent observers, place the product of the Eastern plantations at 40,000 tons for the present year, 55,000 tons for next year, and 70,000 tons for 1915.

The slow and by no means uniform increase in the Pará output during the last five years would seem to substantiate the contention made in many quarters that the production of South American wild rubber had about reached its maximum, while no one would care to hazard a conjecture as to when the output of plantation rubber will reach its limit. If the Amazon basin, therefore, is to compete in volume with the plantations of the East, it must do so from plantations of its own. Obviously it has the soil and the climate, as it is the native home of the *Hevea*. What it needs is capital, management and labor, chiefly the last. But if the Eastern planters have succeeded by carrying the trees to the place where there was labor in abundance, the South American planters will have to succeed by carrying labor to the place where nature has placed the trees.

THE LATEST REPORT FROM PUTUMAYO.

IN July and August of last year the whole English-speaking world was shocked by the astounding disclosures of the cruelties practised in the Putumayo district in the gathering of rubber in the concessions owned by the Peruvian-Amazon Co. For several weeks the press of England and America was full of the story of these atrocities. A summary of the situ-

ation was given in the editorial pages of our August issue, and may be remembered by some of our readers.

The first intimation of the situation in the Putumayo district (the Putumayo being one of the tributaries of the Upper Amazon, flowing through a section which at different times has been claimed by Colombia, Ecuador, Brazil and Peru, but of late years generally conceded as being under Peruvian sovereignty) came from two American engineers, who, after spending many months in that territory, went to London in 1909 with a story of what they had seen, that was so appalling that no publisher would accept it, and no daily paper print it—except in part. But what was printed aroused so much indignation in England that the British Consul at Rio de Janeiro, Sir Roger Casement, was despatched to the Putumayo territory to make an official investigation. The result of his investigation, extending over many months, was the substantial corroboration of all the allegations made by the two Americans, and it was the publication of Sir Roger Casement's report last Spring that inflamed the public—not only of England, but of America.

As a consequence of the popular indignation felt in this country that such conditions could exist in a government concerning which—under the theory of the Monroe Doctrine—we must necessarily feel some moral responsibility, our government felt called upon to take some action, and appointed Stuart J. Fuller consul at Iquitos, for the express purpose of having him visit the rubber country along the Putumayo and report his findings to the State Department.

Consul Fuller left Iquitos on the 7th of August, for his trip into the rubber jungle. He remained there a little over two months, and then sailed for home to submit his report. He reached New York on the 21st of December and immediately laid the results of his investigations before the State Department. On February 7, President Taft submitted the essential facts of this report, accompanied by a message of his own, to Congress; and on the same date the Peruvian Minister at Washington, Señor Pezet, handed to the State Department a communication from his government, giving many assurances that immediate reforms would be instituted, and that the atrocities that had given the name Putumayo the same evil prominence that was attached to the word Congo a few years ago, should immediately cease.

It cannot be said that Consul Fuller's report is altogether satisfactory, for he states that his work was carried on under extreme difficulties, as his movements were continually watched, and the result of his investigations, as far as possible, negatived by the agents of the Peruvian-Amazon Company, who constantly dogged his steps, making it difficult for him to get access to witnesses, and rendering it dangerous for the witnesses, even when secured, to give him the truth of the deplorable situation. But notwithstanding the fact that his movements were closely watched and constantly hampered, he learned enough to be able to corroborate practically all the statements made by Sir Roger Casement. Though conditions had apparently been somewhat ameliorated from what they were when at their worst, he found that the unoffending natives were still being flogged and otherwise maltreated and tortured in order to exact from them the maximum amount of effort. He found a system of peonage—under which the natives became the absolute slaves of the agents, being bought and sold as chattels—extremely prevalent.

The Peruvian minister in his communication declares the deep determination of his government to stop these barbarities, and cites as one reason "not alone because these events have occurred in our territory, but on account of the harm which they have done to Peru by giving us an undeserved notoriety for deep-rooted cruelty which is not a trait of our national character." Everyone will agree that it is most unfortunate that Peru should have gained "a notoriety for deep-rooted cruelty"; and it is quite likely that this is not a trait of their national character, but the fact remains that these frightful atrocities have been going on in Peru for over 15 years, and that no effort worthy of the name was ever made to stop these horrors, and to bring their perpetrators to justice, until, through American and English channels the dark secrets of the Putumayo had been told to the whole world, and could no longer be hidden.

The cries of the tortured natives fell on deaf ears at Lima. It was not until the voice of Christendom was raised in indignation and angry denunciation, that the home government began to show a genuine interest in the appalling crimes perpetrated within its borders.

A new administration has recently come into power in Peru, and its declaration of a determined purpose to wipe out the horrors of the Putumayo forests should be taken at their face value; but at the same time, in view of earlier protestations of a like sort that were never fulfilled, it behooves England and America—and especially America—not to relax their vigilant interest. Moreover, if any new investigators are sent into that

country, they should go unheralded and do their work without the constant escort and assistance of the criminals whose deeds are under inquiry. They should do their work unattended, unobserved and unhampered. Then the true conditions will be disclosed.

A MEMORIAL TO CHARLES GOODYEAR.

THOSE who were fortunate enough to be present at the banquet given at the Plaza, New York, last October, which concluded the International Rubber Exposition, as well as the members of the Rubber Club of America who attended the annual dinner held in January, will recall the eloquent addresses made on both of these occasions by Professor Franklin W. Hooper, of the Brooklyn Institute of Arts and Sciences, on the character and achievements of Charles Goodyear. In both of these admirable tributes the speaker urged the propriety of some adequate and suitable memorial to the man, whose life of heroic self-sacrifice had laid the foundations for the great rubber industry of today.

In his address before the Rubber Club, quoted in the February number of THE INDIA RUBBER WORLD, he said:

"In the City of Washington, as one of the group of buildings destined to become our great National Museum, most comprehensive in scope, most useful in purpose, most commanding in plan, will stand a museum in memory of Charles Goodyear; a museum in which may be placed, not only the history of the discovery and of the manifold inventions of Charles Goodyear, but in which may be exhibited all of the inventions, examples of manufactured products, illustrations of the many and great uses to which vulcanite has been put in these latter days. And in the grand vestibule of this Museum shall stand a statue of Charles Goodyear, the greatest American discoverer and inventor."

It is earnestly to be hoped that this vision may come true. Undoubtedly it will—in time. It can hardly be questioned that some day the Government will establish in connection with the Smithsonian Institution or otherwise, a great permanent national museum that shall adequately represent our national development in all the mechanical arts, and that the rubber industry will be allotted space in that great exposition commensurate with its importance. And such an exhibit of the rubber industry without a proper memorial to Charles Goodyear would be inconceivable. But in the meanwhile, and quite aside from what the Government in its own time may undertake, why should not the rubber men, through the club to which so large and representative a number of them belong, or through some other suitable agency, inaugurate a movement for some fitting and permanent memorial to the illustrious founder of this great industry.

The only public memorials to Goodyear in this country are two life-size bronze busts—one in the railroad station at Naugatuck, the scene of many of Goodyear's early struggles and of his first triumphs, and the other in the executive offices of the United States Rubber Co., the president of that company, Colonel Samuel P. Colt, being the donor of both of these memorials.

THOSE EUROPEAN MUD-GUARDS.

THERE appeared in the November issue of THE INDIA RUBBER WORLD an illustrated description of a mud-guard—or splash-guard—in use on some of the heavy automobile busses in the streets of Paris. In an account of the automobile show recently held in that city, from our special Paris correspondent, which appears on another page in this issue, quite a good deal of space is devoted to the rubber mud-guard. Our correspondent states that in some of the side streets of Paris it is not an infrequent occurrence for a pedestrian to be spattered with mud by one of the heavy motor-vehicles passing through the street, though he may be eighteen or twenty feet distant, and that the stores along these streets are frequently disfigured by the splashing of the mud. He believes that the mud-guard is so necessary that its use will soon be compulsory, and he predicts that the development of this new line of rubber manufacture will become quite important. Accounts appear quite frequently in European journals of competitive trials to test the merits of various mud-guards; the points chiefly taken into consideration being their efficiency, economy of construction and maintenance, and convenience in use and lightness.

All this indicates a condition in European cities with which we in this country, fortunately, are unfamiliar. We have heard a good deal about the superior roads in England and on the Continent, but the streets of their cities evidently still leave much to be desired. A mud-guard would be quite a curiosity to an American auto owner, and if the streets in our cities were so deep in mud that store-fronts and inoffensive pedestrians twenty feet away were be-spattered by passing vehicles, it would occur to us—not to put guards over the wheels—but to practise the recall on the street commissioner and get a new one.

In most lines of rubber manufacture we believe that we are fully abreast—if not a little ahead—of our friends

across the water, but in the development of mud-guards Europe is quite likely to retain the pre-eminence.

THE RIO EXPOSITION POSTPONED UNTIL SEPTEMBER.

THE January number of The India Rubber World contained a fairly extended editorial comment on the International Exposition to be held in Rio de Janeiro next May. The attention of the manufacturer was called to this opportunity—rendered particularly attractive by exemption from duties—to show the South Americans the product of his skill and enterprise. But great expositions to be successful, require much time for preparation, and the Rio management has concluded most wisely to postpone the opening from May until the early part of September. This is most fortunate for Americans who wish to be properly represented there, as it gives them ample time to prepare a creditable exhibit.

As already pointed out in these columns, the imports from Brazil into the United States amount to $124,000,000 a year in value, being one-third of all the Brazilian exports, while the Brazilian imports from the United States amount to only $25,000,000 a year, or one-eighth of the foreign goods bought by Brazilians. There certainly seems to be no good reason why when we buy over a third of their exports, they should buy seven-eighths of their imports from other markets. There certainly is a market for rubber goods in South America. The demand for tires in the large urban centers is already considerable, and undoubtedly a market for other lines of rubber goods could be secured if sufficient effort were put forth. Some English companies and at least one American manufacturing concern are seriously contemplating the erection of rubber factories in or near Rio de Janeiro. Such a move would be a distinct departure, and the result would be awaited with interest. But to make an attractive display at the Rio exposition would involve comparatively little expense and no risk, and is certainly worth the American manufacturers' most earnest consideration.

RUBBER TIPS TO SAVE THE EYES.

SOME of our progressive state legislatures have passed sundry enactments against the long, sharp and perilous hatpin, with which the feminine members of our body politic are accustomed to attach their headgear to the abundant locks with which they have been endowed by nature—or otherwise.

Any man who has occasion to use the subway, the elevated, or even the plain trolley during the going-to-work or going-home hours, appreciates the awful menace of this keen steel point projecting at random into space, and sweeping through the air with every movement of the owner's head. There was a time when in a crowded car, a man gave consideration to his watch and his pocketbook, but now if he is wise he watches only his eye.

In Sweden they have handled this world-wide evil with much acumen. They sometime since passed a law in that advanced country, making it a misdemeanor to wear hatpins with exposed points; and early last month a new law, corollary to the first, went into effect, providing that street car conductors throughout Sweden should be supplied by the Government with rubber tips which they should furnish, at one cent each, to women passengers with unprotected hatpin points.

Now here is a vital issue for the new administration. If Mr. Wilson in his impending inaugural, will forego all references to sacred honor, plighted faith and high resolve, and simply announce that the first work of the new Congress will be to pass a law compelling the use of rubber tips on all hatpins, he will achieve what the historical writers love to refer to as a *coup d'etat,* and will instantly take his place in masculine regard by the side of Washington—if not a little in front.

But let us view this matter not with reference to its political effect, but rather as to its bearing on the great world of rubber manufacture. What a fine new industry it would open up. Just consider the statistics for a moment: There are 45,000,000 female persons in the United States, 40,000,000 of them being of the hatpin age, viz., between 8 and 80. It is safe to say that each bonnet contains five hatpins. (There are men who aver the number is fifty, but this is undoubtedly an exaggeration.) Each bonnet wearer would doubtless consume—counting the lost, loaned and those given to the baby to play with—three full sets, or fifteen rubber tips a year. That would make an annual consumption of 600,000,000 rubber tips. Assuming that these rubber tips retail here as in Sweden, at one cent each, making annual gross sales of $6,000,000, and that the manufacturer modestly contents himself with 50 per cent. of the gross—that would amount to $3,000,000, quite a snug, little business. Now who will see that the Swedish law is adopted in the United States, and who will be the first to equip his factory for the output of 600,000,000 point-covering, eye-saving rubber tips?

COMPARATIVE IMPORTS AND PRICES OF RUBBER.

STATISTICS to end of November (the latest published at time of writing) give the following details of rubber imports for first eleven months of the last three years:

Year.	Pounds.	Value.	Average Per Pound.
1910.....	83,888,801	$91,038,750	$1.08
1911.....	74,013,921	67,179,799	0.91
1912.....	107,078,574	90,436,489	0.85

As these returns are based on the imports of various descriptions of rubber, their value is only of general character. However, they establish the broad fact, that an increase of nearly 50 per cent. in the quantity imported in 1912 as compared with 1911, only led to an average fall in price of less than 7 per cent.

The Present and Future of the Native "Hevea" Rubber Industry.

By Jacques Huber, Ph. D., Director of the Museu Goeldi, Pará.

PAPER READ AT THE THIRD INTERNATIONAL RUBBER CONFERENCE, HELD IN NEW YORK, 1912.

THE opinion is common among persons interested in plantation companies, that native Brazilian rubber will be entirely knocked out by the product of the eastern plantations within the next ten years, when the output of these will be over 100,000 tons.

Regarding those opinions, it is evident that "the wish is father of the thought." Most of these prophets hope that the disappearing of the Brazilian crop from the market will relieve the plantations from the danger of over-production. Others perhaps are instinctive enemies of Brazilian rubber because of the manner in which Brazil has protected its coffee output.

If we consider the problem from a higher and more objective point of view than that of the plantation shareholder, if for instance, we consider the views of the manufacturing industry, we find that there is no necessity for the disappearance or reduction of the Brazilian crop; on the contrary, there will be an increased need for the Amazonian grade, and especially for the Hard-Cure Pará rubber.

Dr. Jacques Huber.

Of course, the wonderful development of the whole rubber industry would have been seriously checked had it not been for that very necessary asset. The plantations and their rapidly increasing production will enable the manufacturing industry to develop without fear of shortage. The opportunities for the manufacturing industry are increased by the low cost of the plantation rubber, which can be sold at much lower prices than those prevailing for Pará. There is, further, no doubt that in their downward movement, the prices of plantation rubber are bound to affect, to a greater or less extent, even the quotations for the highest grade of rubber—the upper Amazonian Hard-Cure, the prices of which (without the prodigious development of the plantations and the improvement of their product) would, of course, have steadily and considerably increased.

The Brazilian producing centres appreciate the changed position of the rubber market, and instead of trying in vain to force the prices to a higher level, they are now preparing themselves to improve the position of the article by lowering the cost of production. This, of course, involves some sacrifice, but as the life of a whole country depends on it, the sacrifice will be made without muttering.

It is now generally conceded in Brazil, that that country cannot monopolize the rubber production of the world, and that we have to reckon with the fact that within a few years the Eastern plantations may produce more good quality low-priced *Hevea* rubber than Brazil.

At the same time the people interested in rubber plantations will probably realize the fact that the Amazonian rubber, although at the present time more expensive to produce than the plantation grades, will hold its position, thanks to its superior qualities and thanks to the efforts which are being made to improve the conditions of the industry.

Perhaps the following statements will help to give an idea of the true position of wild rubber in comparison with its younger brother, the plantation rubber, and may contribute to strengthen the conviction above expressed, which, I believe, is shared by all who understand this very complicated problem.

SUPERIOR QUALITY OF AMAZONIAN RUBBER.

In spite of all the drawbacks of the native rubber industry on the Amazon, there is, fortunately, one great advantage—the *superior quality of the Amazonian product.* This remark has reference only to smoked rubber, and more especially hard-cure smoked Pará, the superior elasticity and strength of which (over the other grades, and principally over the plantation rubber) has been proved by the daily experience of the manufacturers, and by many scientific experiments.

It is hoped that we will before long have a complete comparison of the Pará Hard-Cure with plantation *Hevea,* as carried out according to the program of the Rubber Testing Committee.

For the moment I think that it is not yet possible to give definite figures, but I wish to call your attention to some points which seem to me to be even of more importance than the usual figures about tensile strength. I refer to the behavior with regard to the exterior influences—light and temperature—which together determine more or less the "keeping quality." The stock of rubber held by the Pará Syndicate is one very instructive example of the good keeping qualities of the smoked Pará rubber. After two years of keeping in more or less overheated stores, this rubber has only improved in quality. There are other more striking cases of the resistance of smoked rubber, which have always astonished me, when I heard on the other side, of the precautions which are necessary to preserve the plantation rubber from being injured by light or heat. Smoked rubber balls can be left for months in the sun without being spoiled, and this happens for instance in Bolivian *seringaes.*

Perhaps the keeping qualities of the raw rubber are not as important as those of vulcanized rubber, but it is probable that the raw rubber which better resists the action of sunlight and high temperatures, will continue to resist these influences when vulcanized. That is only a suggestion which I desire to bring to the attention of this conference.

One of the principal arguments of those who predict the disappearance of native *Hevea* rubber from the market, is the difficulty of exploiting scattered forest trees in comparison with the very easy exploitation of modern plantations. There is in fact a big difference in favor of the plantations, but it is compensated to a certain extent by the size and age of the native trees. It is worth considering that, in the Amazonian rubber forests a worker not only collects, but prepares by the tiresome smoking process from three to five or even ten kilograms of rubber, instead of the one or two kilograms furnished by one

tapper in the planting districts of the East. (One kilogram = 2.2 pounds.) The principal cause of this difference is of course the age of the trees. There is no doubt that full grown trees can be more economically tapped than young trees.

Of course the eastern planters have succeeded in making the best of their young trees and in obtaining from 4 to 6-year-old trees, crops never thought of in former years; but if they continue in the same way, many of them probably will never have old trees in full bearing.

Even the scattered location of the native trees has some advantages, as it guarantees a longer existence and protection against the spread of fungus diseases. It may, however, in many cases, be advantageous to augment the actual number of wild trees by interplanting.

Another argument of those who oppose native *Hevea* rubber is the exhaustion of some rubber districts on the Amazon. For *Castilloa,* this argument has of course some weight, as the trees are cut down for the extraction of latex. Even in this case, it must be remembered that only the biggest trees (more than 15 inches in diameter) are exploited, and after a number of years there are other full grown trees to take their place.

For the *Hevea* trees extinction cannot be thought of, as even the most roughly treated specimens resist rough treatment for many years, and there is always a free supply of young trees. It is true that in some districts, where the exploitation has continued since the middle of the last century—as for instance in the Cametá district—the full-grown trees are badly injured, so that their yield has been considerably reduced. As a rule the trees are allowed to rest if they show any sign of exhaustion. Owing to this precaution and to the scarcity of labor, perhaps only half of the known *estradas* are actually exploited.

LABOR.

This scarcity of labor has always been one of the drawbacks in the development of the Amazon region. Native free labor is available in agricultural districts about Belem (Pará) and along Bragança railroad, and on the lower Amazon (Santareus and Obidos); but it is not abundant, and is at least six times as expensive as the average coolie labor on the Eastern plantation. The labor force in the *seringaes* consists mainly of native inhabitants of the northern provinces of Brazil. They are not working for a fixed wage, and the special arrangements they have with the owner of the *seringal* give them apparently a much more considerable share of the profit on the rubber than they would realize as simple agricultural workmen. That is the reason why the *seringaes* have such a fascination for even the settled agricultural population, which is periodically drained of young men, when there is any rise in the price of rubber.

But the financial superiority of a rubber gatherer over an agricultural worker is often illusory, as the "patrão" takes back in exaggerated prices (for the articles of first necessity) the money he has paid the laborer. In all cases, however, the labor is expensive on the Amazon, and though it is much more efficient than the coolie labor, as regards the amount and value of rubber produced, this compensation is generally not sufficient to bring the cost of production to the same figure as in the Eastern plantations. Where communication is easy and the freight charges are low, the trees are generally more or less spoiled, and give less than the average; and in the districts where the trees give good yields, the freight is far higher.

Sometimes irregularity of supply is charged against native rubber. This of course is not so much the fault of the wicked *seringueiros,* who are sometimes accused of retaining their product for speculative purposes. It is rather attributable to the conditions of navigation on the remotest affluents of the Amazon. Speculating is of course always done to a certain extent by *seringueiros, aviadores* and export firms; and we have seen some attempts of this kind in late years, but the meteorologic and hydrographic conditions of the country are chiefly responsible for the irregularity of the supply.

It is not probable that the distribution of the working periods can be altered, as these depend entirely upon the weather conditions. For the regulation of the transportation of the rubber from the remotest districts, the Brazilian Federal Government has taken important steps, so that it is hoped that in the future the supplies can be better distributed over the whole year.

Those who predict the ruin of the Amazonian rubber industry point to the fact that in the last years the output of rubber from that region has been almost stationary, in spite of the generally favorable conditions of the market and the "corner" in 1910. This is generally attributed to the exhaustion of the yielding power of the rubber trees in the more accessible districts and to the difficulty of working the more remote districts. This of course is right to a certain extent, but there are many other reasons for the arrested development of the rubber industry on the Amazon.

In the first line, there is the deficient organization of the whole industry, especially its financial side, which is so bad as to make the careless distribution of money frequently possible.

Unfortunately only a small part of the money earned in rubber production has been applied in improvements in the *seringal,* and in the general conditions of the rubber districts. Had there been a sound policy in this respect, the Amazon would have made very much greater progress.

It is only in recent years that the Government and the leading men in the trade have awakened to the fact that without the introduction of a rational scheme of improvements and reforms in the rubber districts; and without a thorough reform of the whole organization of the industry, it will be impossible for the Amazonian trade to meet the competition of the Eastern plantations.

Considering the immense extent of the territory, the scarcity of population and the complexity of problems, the task of such a reorganization is a gigantic one, and it is certainly excusable, if in the proposed plans there are some points open to discussion.

Within the scope of this address it is not possible, of course, to cover the whole scheme of reforms planned by the Federal and the State Governments, but I shall ask your permission to present here some points, which seem to me of particular interest.

PROPOSED REFORMS.

As to the improvement of the means of communication there would be much to say. The first thing to do is to improve and cheapen river navigation, by which most of the actual producing centers are reached. Railroads are indispensable along the course of the rivers which are obstructed by rapids. How much an improvement in the means of communications is needed, is shown by the fact that the *seringueiros* of certain remote districts are sometimes exposed to actual starvation, because of the holding up of the steamers by bad conditions of navigability.

Better food supply will come with cheaper and quicker communication. There are always several agricultural centers, especially in the State of Pará, from which the food could be sent to the rubber producing centers.

In the scheme of reforms planned by the Federal Government the upper Rio Branco region, with its extensive *campos* for cattle breeding, is considered as the principal food-supply center for the rubber districts of the Upper Amazon. Food production within the limits of these districts will always be small, because of the attractions which the free life of the *seringueiros* always has for the other working classes.

Sanitation is of course closely connected with good food supply. *It is perhaps the most important problem in the Amazonian region.* The successful extinction of yellow fever in the State of Pará is a very important step in that direction, especially as it proves that the Brazilian Government has at its command good men to carry out the much more difficult problems of sanitation in the interior.

Of course, all these measures will augment the output of rubber, as the proportion of the sick will be reduced, and the work-

ing power of the healthy strengthened. Then again, the rubber districts will be more attractive to immigrants and will encourage the settlement of a permanent population. For the producing capacity of the country, these improvements are probably of more importance than any other, as they bear on a factor keenly appreciated in Amazonia—the human element.

That does not mean that there will not be other reforms regarding the conditions of work in the rubber forests.

First of all, I have always advocated the special protection of young *Hevea* trees in the rubber forests, and even interplanting in cases where this is possible. More than 10 trees per hectare (1 hectare = 2½ acres) are seldom met with in the natural rubber forests, and even if we do not intend to have a pure rubber plantation, it should be possible to obtain in favorable situations at least 20 trees per hectare by protecting the young trees and replacing only occasionally some of the other forest trees by *Hevea* trees.

I am sure that the methods of tapping used in the East could be applied to the old forest trees, thus increasing their yield, and the whole output of the rubber forest would be much larger, perhaps double the present amount.

There are, however, two principal reasons which have until now, prevented the introduction of these methods in native *seringaes*. First: most of the trees are already deformed by the old systems of tapping with the *machadinha*, so that it would be impossible to work them with the tapping knives without giving them first a rest of several years. Second: it would be difficult to train the *seringueiros* for systematic tapping according to the methods used in the East.

There are other reasons, for example, the moisture content of the bark in these forests, which would probably prevent the latex from flowing straight down to the cup. In spite of these circumstances, I thought it advisable to encourage some experiments of tapping forest trees, according to the best methods used in the East.

As is now generally admitted, the superiority of the Amazonian *Hevea* rubber is due principally to the smoking process. It would not therefore be prudent to introduce any other method of preparing the rubber, without having positive proofs of its superiority over the smoking process. In Europe it is known that a considerable part of the Amazonian *Hevea* rubber is produced in the form of scrap, and "Sernamby de Cameta!" Of course it would be better to produce this part also in high-grade quality, but that would not be possible even with the greatest care, as part of the latex always coagulates on the bark of the trees and on, or in, the collecting tins. The idea of turning out only one standard grade of Amazonian *Hevea* rubber, is therefore not feasible. It is, of course, possible to work the scrap into crepe, as is usual in the Eastern plantations, but then we should always have two grades. If the Cerqueira Pinto process—proving superior to the smoking process—should be carried out more commonly, it would allow us to reduce the scrap considerably; and as it permits the coagulation of watery latex, it would avoid the loss of considerable quantities of latex, which in rainy weather are actually not worked out either in form of smoked rubber or in form of scrap; but simply thrown away.

PLANTATIONS ON THE AMAZON?

Is it possible to start plantations successfully on the Amazon? This is a very important question, not only for the inhabitants of that region, but also, I think, for the whole rubber industry. As I have always advocated plantations on the Amazon, I have naturally followed with great interest the planting movement in Brazil, which some years ago—owing to the news of the splendid success of the eastern plantations, and thanks to official protection—has set in with renewed energy.

Of older plantations there are only a few, at least in the State of Pará, and these have as a rule not been very successful. Some private plantations may have given better results, but we have no records as to their production. On the other hand the new plantations, started under the protective State Laws, are now too young to permit a prophecy as to their future.

After the enactment of the State laws providing many advantages to the rubber growers, there was a rush in obtaining these advantages, especially the premium in cash. The registration at the Agricultural Department has reached in two years over eight million *Hevea* trees, to be planted in the next four years. Of these, 340,000 were reported as planted at the end of 1911. Most of the registrants are private planters, but the bulk of the proposed planting will be done by companies, one of which, on the river *Mojn*, is operating with American capital.

Comparing our conditions with those prevailing in the East, our chief advantage is that of cheap land, against which must be entered the very serious disadvantages of expensive labor and high export duties. It is true that the new laws reduce the duty to a considerable extent for rubber produced on plantations. There are other advantages, which have more bearing on lowering the cost of the first establishment of the plantations than of their production later.

Taken as a whole, planting on a large scale, by companies with foreign capital, is not at all out of the question in the Amazon region. Since I visited the Eastern plantations, I am, however, inclined to think that to operate our plantations in exactly the same way, as, for instance, in Malaya, is neither possible nor would it be advisable. This is impossible with the Brazilian worker, who is at least three times more expensive, even taking into consideration his higher working power. He is much more independent than the Indian coolie and imported coolies are undesirable in most cases.

I think that by introducing contract work to a great extent, some big plantations could be established in places where frequent supervision as well as free supply of labor and food can be assured. The neighborhood of Belem or the lower course of the Amazon offers these conditions. Of course, there will be some danger of frequent changes in the labor force, but the best elements, if well treated and reasonably paid, will stay and form a nucleus of skilled workmen able to introduce the new comers into the work.

In a general way, however, I am of the opinion that the rubber planting on the Amazon has to be carried out either by the actual occupants of the country or by companies with very large funds, which can combine the planting with an efficient scheme of colonization.

In any case—and this can not be sufficiently insisted upon—the first work of every planting company should always be the sanitation of the place and the creation of an attractive *milieu* for the workmen, either by giving them the opportunity of settling under favorable conditions, with their wives and children, or offering them good housing and good fresh food at a reasonable price, if they are to be employed only for a limited time.

I have always had a strong belief in the necessity and usefulness of rubber planting done by the native and settled population. If every owner of a small *seringal* would only plant a thousand rubber trees, there would be in ten years a very sensible increase of the output. It is true that planting in this line is now generally done in a very deficient manner, and it will require a serious campaign of agricultural education to improve the condition of these small plantations. Above all, these plantations should be operated upon good principles of selection. Then they should afford an opportunity for experiment and demonstration of the best tapping methods applicable to the proper *seringaes*. Finally, they should show the way to the best method of improving rubber forests by interplanting.

There is no doubt that the big plantations will have some influence upon the methods used in the native rubber forests, and the reverse is likewise true. It would seem strange that in the Amazon region, the very home of the *Hevea Brasiliensis*, its cultivation has not made more progress, in spite of the many efforts in that direction. The cause is not only in the general

conditions of the country, and in the scarcity of labor, but perhaps principally in a factor which unfortunately has too often been overlooked—that of management. In the East the rubber plantations were nearly all started by men of experience in the management of tea, coffee or other big estates. In Amazonia there are practically no plantations on a large scale and trained plantation managers are seldom to be found there. They have, therefore, to be contracted for, from Southern Brazil or from the Eastern plantations. They should be familiar not only with rubber planting, but should be able to adapt themselves to changed conditions of life and work.

In conclusion, we must admit that the evolution of rubber planting on the Amazon will probably be something quite different from what was witnessed in the Eastern plantations. There is no doubt, that during the immediate future the East will continue to lead in planting enterprises. On the Amazon the plantations will be established more slowly, but they will be of great importance as the necessary complement of the native rubber extraction.

The old method will be helped and develop from a crude empirical process to a scientifically established and more economically operated industry.

ENGLISH VIEWS ON RUBBER SITUATION.

DIFFERING to some extent in details, the annual reports of the leading English rubber authorities show an increase in the past and estimate a still further augmentation in the production for 1913.

One of the most complete presentations of the statistical position is that published by Messrs. J. A. Henderson & Co., Ltd., of London, including figures of actual production for 1911 and 1912, together with estimates for 1913. The table is subjoined:—

RUBBER SUPPLY AND CONSUMPTION ESTIMATES.

ESTIMATED WORLD'S SUPPLY (TONS).

	1911.	1912.	1913.
Amazonas and Brazils	39,000	40,500	40,000
West African	15,000	13,800	13,800
East African, etc.	5,300	4,000	4,000
Central American, etc.	2,500	2,500	2,500
Plantation	14,200	28,500	38,000
	76,000	89,300	98,300
Guayule	9,200	7,000	7,000
Malaysian, etc.	2,800	2,700	2,700
Totals	88,000	99,000	108,000

ESTIMATED CONSUMPTION (TONS).

	1911.	1912.	1913.
England	12,000	14,500	17,520
Germany, Austria, etc.	14,000	16,000	18,286
France	8,000	9,500	11,281
Russia	8,500	9,000	9,529
Italy, etc.	2,000	1,500	1,125
Japan and Australia	1,500	1,000	667
America and Canada	42,000	47,500	53,720
Totals	88,000	99,000	112,128

These figures indicate an augmentation of the supply by 9,000 tons for the present year. Leaving out of consideration the minor variations in receipts from other quarters, this result practically represents the increase in the estimated supply of plantation rubber from 28,500 to 38,000 tons. Mr. Lampard (prominent as a director of various planting companies), had named 40,000 tons as a probability. An estimate of an average of 3,000 tons a month of plantation rubber for 1913 seems generally accepted.

In their annual review, Messrs. S. Figgis & Co. comment on the freedom with which Brazil continues to supply the markets of the world, quoting the following shipments for the last four years: 1909, 42,000 tons; 1910, 40,500 tons; 1911, 39,500 tons; 1912, 40,500 tons. The improvement which has taken place in the preparation of rubber by Eastern planters, has proved of mutual benefit; having stimulated the forward order business. Further progress is urged in this direction, in conjunction with a renewal of the previous suggestions to standardize qualities into: No. 1 Latex pale; No. 2, clean light brown and grey, and No. 3 (from bark), dark and brown.

Messrs. Figgis estimate 950,000 acres as being the area under rubber cultivation in the East, and place the number of trees at probably 110 millions, of which only a moderate proportion have been tapped.

Messrs. Gow, Wilson & Stanton in their report for the year 1912 point out an interesting fact. Six years ago the production of rubber from the whole of the East was about one thousand tons; the price then realized averaging 4/9⅝ per pound. In 1912 the total product has exceeded 28,000 tons, while the price obtained at the London auctions averaged 4/7½, being only a slight reduction on the figure realized for the smaller quantity at an earlier date. The consuming power of the industry is thus clearly demonstrated. At the same time the development of the trade has shown that the physical properties of the best prepared samples of plantation rubber are fully equal to those of any other description. A large proportion of the whole crop is shipped in the form of crepe. The premium lately ruling on smoked sheet will probably stimulate its production, with the possible ultimate result of the premium not being maintained.

AS TO DIRECT SHIPMENTS FROM THE EAST.

IN the December issue of THE INDIA RUBBER WORLD there was an editorial advocating the shipment of rubber direct from the Eastern plantations to New York, instead of having it shipped, as at present, from the East to some Continental or English port, to be re-shipped to New York later. This article has elicited the following letter from the well-known firm of John Lang, Ltd., of London.

To the Editor, INDIA RUBBER WORLD—

Dear Sir: Referring to your very interesting article on the "Shipping of Rubber Direct to New York," we should like to state that, although this would be very desirable from a manufacturer's point of view, we fear that it will never assume large proportions, as it is, of course, common knowledge that the bulk of the plantation rubber sold either privately or in the auction here is graded by the buyers, each of whom have their own standard types by which they sell to the trade, and consequently the original parcels are sorted and divided into these various standards before they are sent to the manufacturers.

There is, of course, a certain reason, and sometimes a necessity, to deal with certain packages in this way, but the necessity is not unavoidable.

We have for years acted as buyers for manufacturers here and on the Continent, and always forward the original packages with the original marks as received from the East, so that the identity of the rubber is never lost or tampered with. We find it necessary only to see that the packages are put in good repair for shipment, and our experience always has been that the manufacturers appreciate the original packages, and we have never had any complaints either as to the quality of the rubber or the condition of the packages on arrival at their destination.

We should be pleased to hear from any firms desirous of buying on this market with the understanding that they buy and receive only first hand rubber in the original packages.

Yours faithfully,

JOHN LANG, LTD.

J. R. BRIGGS, Director.

Laboratory Organization in the Rubber Industry.

By Frederic Dannerth, Ph. D., Consulting Industrial Chemist.

PAPER READ AT THE INTERNATIONAL RUBBER CONFERENCE, HELD AT GRAND CENTRAL PALACE, NEW YORK, SEPTEMBER 23 TO OCTOBER 3, 1912.

THERE are certain persons to whom a manufacturer should tell the whole miserable truth of his failures—his lawyer, his chemist and himself. Above all, he should be absolutely frank with himself. After he has congratulated himself upon the perfect manner in which his goods are being bought and his factory is being managed, he should stop for a moment for a close scrutiny of his plant.

The Consulting Chemist would very often like to question

Dr. Frederic Dannerth.

the manufacturer on this point, but he is prevented from doing so for obvious reasons.

Successful corporations of today have either a written or verbal arrangement with the managing directors, which is in effect:

1. To purchase the best raw materials for a given purpose at the lowest possible market price.

2. To criticize the manner in which the factory manager is making up these raw materials into saleable goods, and help him to attain perfection.

3. To help the salesman, when it is found that competitors are offering better quality for the same or for less money.

4. To deliver to the factory manager, heat, light and power at the lowest possible cost.

One corporation president who had risen to a realization of the importance of chemical consultation, recently opened a conversation thus:

"Our competitors have us skinned to death on water-tank packing; we have been put out of the race with our air-brake hose; our railroad steam-hose has rotted away in actual use. Do not waste any time on theoretical considerations and research work, but go right ahead and give us these three things. What we want is results, and you will have to earn your fee every day, for we cannot afford to gamble away one hundred dollars without getting the results we want."

As a matter of record it might be added that that particular man is still wanting those results. He has failed to realize that the science of Applied Chemistry was not created in an off hour, but is the product of many years of arduous labor and thought. From the day when "the compound man" was the chief chemist of the works, we have come to a point in the development of factory management where all chemical problems should first be presented to the Supervising Chemist, an official who occupies a position parallel with the Factory Manager and the Operating Engineer. In some cases he is permanently employed by the organization, while in other cases he devotes only a portion of his time to his duties at one particular factory.

The constant growth in efficiency of the rubber industry is largely the result of organization that insures the orderly use of every talent required. Occupying a very important place in such organization is the fullest use of a laboratory staff with trained chemists. It is the duty of this department to:

1. Investigate all new processes.
2. Constantly improve existing ones.
3. Correct and explain irregularities of current operations.
4. Invent new and useful processes.
5. Determine the value and exact composition of all raw materials.
6. Determine the value and composition of competitors' products.
7. Advise correctly on "specification goods."
8. Control different stages of many processes.

Hence if these constructive forces are to be used to the fullest, it must be through the creation of an organization that will cause every department in that organization to cooperate with the laboratory. To accomplish this I present for your consideration methods which are the result of careful study for many years in some of the largest manufacturing plants in America.

The Supervising Chemist is valuable to the firm in proportion to his perspective, his ability to see from afar the possibilities of some new proposition, whether it be a problem in purchasing, manufacturing or selling. Directly under him he has a corps of five first assistants who are in some cases designated as chief chemists. They are: The Engineering chemist, the Buyers' chemist, the Factory chemist, the Sales chemist, and the Research chemist.

The organization of the Laboratory Department includes:

1. Systematic abstracting of the important foreign and domestic journals and of the patents of the principal countries.

2. Forwarding copies of these abstracts weekly to all who can use them, with instructions to study them carefully and advise the Laboratory immediately of those which might be of value.

3. Thorough abstracting of the literature, in the case of new work, thus presenting all that has been published relating to the subject. Repetition of the work of others is thus saved, valuable suggestions are received and new lines of thought are opened.

4. A pamphlet library containing catalogs of machinery, structural material, scientific apparatus, etc., is kept up to date by correspondence with the manufacturers of these materials. This collection can be made far more valuable than regularly published books upon identical subjects.

5. All translating, abstracting and indexing should be in charge of one competent man, with assistants, if needed.

6. Superintendents should present to the supervising chemist, monthly reports embodying all ideas of their own, or their assistants, that might in any way warrant investigation. Through such a system thoroughly carried out, valuable suggestions can be obtained that might otherwise be lost. This plan will also stimulate closer thought and observation concerning all the details of manufacturing.

7. There should be (through proper connections) systematic prompt advices of all improvements in European practice that would be of value to the corporation.

8. The Laboratory should place at the disposal of the sales department, whenever this is necessary to demonstrate the value or quality of the company's products—a competent testing engineer, who can instruct the customer in the standard methods of conducting physical tests of manufactured rubber goods.

The Engineering Chemist receives instructions from the Operating Engineer (through the supervising chemist). His first and most important field of activity is the examination of materials used by the power plant. This includes:

1. Periodic analysis of the coal supply.
2. The control of combustion by flue-gas analysis.
3. The examination of lubricants.
4. The examination of the water used for boilers.
5. The examination of boiler deposits and boiler compounds.
6. Practical tests on the quality of paints and varnishes used in the works.

As a result of his contact with the power plant, the engineering chemist is in a position to provide the factory chemist with exact data on the wearing qualities of rubber goods used in the power plant. Such materials include steam-packing, transmission-belting, water-hose, conveyor-belting and washers of all sorts. He also keeps his eye on the various structural materials, metals and lumber brought into the factory, in which case he co-operates with the buyer's chemist.

The Buyer's Chemist receives instructions from the purchasing agent (through the supervising chemist). He is essentially an analyst, for he must determine the purity and the comparative commercial value of mineral drugs, organic fillers, reclaimed rubber, crude gum, textiles (sheeting, duck and yarn), and the various metals—which have been offered to the purchasing department. He must control all work relating to sampling and analysis, because so much depends upon prompt and accurate results. He must be able to devise special methods, and should endeavor to make his methods conform to those of the vendor so far as this is consistent with good work. He must record all physical tests made on rubber and textiles, and enter these with the chemical tests in a special folio kept for this purpose.

He devises for the purchasing departments, rational specifications, so that it will be possible for the buyer to procure bids on a standard material which the vendors will be able to supply, without an abnormal rise in price for the commodity.

The Factory Chemist receives instructions from the factory manager (through the supervising chemist). He investigates problems which arise in the factory and endeavors, by simplifying operations, to reduce the cost of production. This may be attained by increasing the speed of machinery; by omitting unnecessary operations; or by eliminating waste. Before arriving at final conclusions regarding recipes for new compounds, he will, of course, have to make such examinations as "friction tests" on belting and hose; pressure tests on fire-hose; steaming tests on steam-hose and so forth.

Other problems which he must face from time to time are: the reclaiming of waste rubber; the correction of defective cures on molded goods and steam-cured articles; defective frictions on cotton-jacketed hose.

In addition to the actual manufacturing operations, he must follow up for the factory manager, the preparatory processes of washing and drying the crude gum; compounding, mixing and calendering the stock. In his record book he enters all improvements made in any of these departments and devotes a separate page to each department. By thus entering the date on which the improvement or new method was installed, he will be in a position to give the factory manager complete data on the advantages gained by the step. He also makes such analyses as are necessary in the intermediate steps of some processes in order to insure proper control and a uniform product.

The "premature hardening" of steam-packing; the "bootlegging" of belts; the "blooming" of hose; the "loose sleeve" effect on rubber covered rolls; the "dead-friction" effect on cotton-jacketed hose; the "uncurable" stamp gum; the abnormal "swelling" of extract-tank packing—these are but a few of the innumerable defects which must from time to time be investigated by the factory chemist.

Another field of activity is the writing of recipes to meet certain specifications. The various government departments, municipalities and railroad companies have at present sharply defined specifications for the delivery of manufactured rubber goods, so that it has become necessary for contractors to exercise considerable caution in the making up of these goods. In such matters the factory chemist as a rule works in conjunction with the foreman of the compounding room.

The Sales Chemist receives instructions from the sales manager (through the supervising chemist). To him are brought commercial rubber products put on the market by competing firms. His duty is to pick apart these products and determine the manner in which they were constructed, so that the desirable features of the sample can be duplicated if need be. He makes chemical analyses of these samples and carries out physical tests to determine in the laboratory their approximate value compared with similar products turned out by his employers. Thus he determines as far as possible the character of the textiles used and the particular fiber employed (whether it be cotton, flax, hemp, or ramie). He determines the "friction" value on belting and hose; the strength and stretch value of the rubber lining in articles like fire-hose; he also determines the tensile strength and other physical properties of such products as steam packings.

If the competitor's article is of inferior quality and is sold at a lower figure than the article made by his firm, he must give the sales manager information which will enable him to present these facts to the customer. The sales manager occasionally has turned back to him specimens of conveyor belting or transmission belting which have not stood the test of time. In such cases it is for the sales chemist to ascertain the exact conditions under which the belt has operated, so that he can determine whether or not the usage has been unexpectedly rough.

The Sales Chemist conducts the final physical and chemical tests on specification goods and places his "O. K." on all such orders before they are shipped.

The Research Chemist receives instructions direct from the supervising chemist. The raw material for his researches is obtained to a considerable extent from his colleagues in addition to the problems which are mapped out for him by his superior. He should have at his disposal a well arranged and adequately equipped index to periodical literature and the patent literature of all countries. It is from these sources that many valuable suggestions are obtained, and it should not be forgotten that many very important suggestions for development work are obtained from sources entirely outside

the rubber industry. Thus it sometimes happens that a chemical process which has been used in the leather industry, in the varnish industry, or even in some inorganic industry, has called forth in the mind of the chemist possibilities which would not appear at first thought. As the special chemist in charge of development work, he should be informed as to the latest advances in the way of machinery for all operations which involve chemical processes. Materials of construction for vulcanizing and relaiming apparatus should also be given due attention by him. His duties comprise:

1. Investigation of cheaper raw materials.
2. Creation of new uses for products manufactured.
3. Examination of new products to determine their present and future value.
4. Promotion of increased efficiency.
5. Improvement of the quality of products manufactured.
6. Utilization of wastes.
7. Procuring more efficient structural material for apparatus.

Great care should be exercised in the selection of the Research Chemist as he should embody all the varied talent and knowledge required in a wide field; and it is important here that only the very fit be retained, as the achievements of this department will very largely depend on two factors: (1) a highly efficient college-trained staff; (2) an organization that will, from every other department, invite periodic presentation of all questions worthy of research.

The collective talent of the research chemists should embrace:

1. Thorough scientific education in the principles of physics and chemistry.
2. The power to imagine new processes.
3. The power to discern the causes of various irregularities in manufacture.
4. The ability to submit these ideas to the test of experimental proof.
5. The habit of accurate observation.
6. The skill to deduce from such observation the correct conclusion.
7. The quality of discerning the one vital thing that counts amidst the maze of unessential generalities.
8. A knowledge of manufacturing that will make all conform to practical conditions.

"All these qualities, diligently applied," says Mr. William Ferguson in a recent communication, "are essential to the success of modern research."

The Research Chemist should have at his disposal, a properly equipped research laboratory, with miniature mixing-mills, calenders, presses and vulcanizers, where work can be carried on in a test tube or on a manufacturing scale as occasion requires, in order to determine practical difficulties and costs. Together with the supervising chemist and the factory manager he forms the Research Committee which meets regularly to consider and advise upon all important investigations.

Questions presented to this department are settled: (1) by carrying out the experimental work upon a small scale; (2) abstracting the journal and patent literature bearing upon it; (3) increasing in size the experiments, as occasion warrants. Each investigation should be made by a man particularly fitted for the job, and this man made responsible, but he should constantly consult with other members of the staff whose knowledge or skill would be helpful. The progress made and the difficulties encountered should be presented to the Research Committee at its regular meetings so that it can advise when necessary. At the conclusion of each investigation: (1) a detailed report is made to the supervising chemist; (2) an exact estimate of the cost is made for each investigation. This will show the profit or loss in each particular case and will demonstrate the value of the research work as a whole.

THE SUPERVISING CHEMIST.

If a corporation has more than one laboratory, uniform methods of sampling, of chemical analysis and physical tests must be used throughout. The selection of standard methods and the complete written description of each should be under the immediate charge of the supervising chemist. Their accuracy should be first proved by analyzing mixtures of known composition. The various precautions to be observed should be prominently outlined at the end of each method, together with the experimental data, and where possible, equations showing the accuracy of the method. These methods should be issued to the different laboratories, and all chemists of the corporation required to strictly adhere to them. Without this, uniform methods and uniform results are impossible.

He assigns to his first assistants all analytical work which will aid the departments for Purchase, Manufacture, Sales and Engineering. He carefully investigates new methods of analysis and considers complaints presented by the sales department. He should call a weekly meeting of the chief chemists to discuss:

1. The company's standard methods of analysis.
2. Abstracts of promising analytical methods; and physical tests.
3. Patents of interest to the rubber industry.

A digest of this meeting should be forwarded to all the chemists of the company for comment and for filing. He has in his office a card index which contains condensed abstracts of all relevant articles from the chemical journals. One file is devoted to "Rubber-chemical" articles while another contains indices to "Related Industries." Such an equipment facilitates considerably the investigation of any problem which is presented for his consideration. He should request of his chief chemists carefully worded reports of all work done and these should contain all results, whether favorable or otherwise. New methods (physical and chemical) suggested through the literature or through other chemists of the company, should be tried out, and if found to be an improvement they are incorporated in the Standard Methods of the company.

The policy of the supervising chemist should be to give his chief chemists a broad acquaintance with all the work of his department through the weekly meetings. All work should be systematically and independently checked by more exact or by different methods than those in daily use. Each man is held strictly responsible for the work entrusted to him, and he should be encouraged to become thoroughly familiar, through study and inquiry, with the theory and practical application of his work.

Foremen should, so far as possible, make simple tests to control processes under their charge, as they can often make a test in less time than it takes to send the sample to the Central Laboratory. Such work must, of course, be periodically checked by the laboratory. In order to estimate each man's capacity and to charge up the chemical work correctly a Laboratory Order Blank is used. These are numbered consecutively and a different color is used for each section (Factory, Buyer, Sales, etc.) One order accompanies each sample or request for laboratory investigation. It has a place to record:

Date on which the sample or request was received at Laboratory.

Actual number of hours spent on the investigation.

Date on which the results were handed in.

Results obtained; recommendations.

Signature of the chemist, the supervising chemist and the department for which the investigation was made.

The "History of the Case" can be conveniently typewritten on the back of the order. The completed order is filed in the laboratory, separate cases being used for each section. In order to prevent delay, due to loss of an "original" order, a carbon copy is made and this is filed in a case in its proper numerical order. No chemist undertakes any work without a Laboratory Order Blank of which a carbon copy has been filed. The "History of the Case" should be entered at least on the carbon copy. The laboratories of the several plants should be strictly subordinate to the supervising chemist. All standard methods of sampling and analysis must be standard methods of the company, so that superintendent and chemists should cooperate for their strict enforcement.

Salaries of the chemists should be standardized as far as possible and promotion made according to the kind of talent which the individual possesses. Thus it is found that some men are far better adapted for superintending factory work, while others are peculiarly fitted for research. The efficiency of the chemical department may be increased by:

1. Periodic visits to the different laboratories of the company by the supervising chemist, in order to see that the standard methods are being properly followed, and to enable him to compare the general efficiency of the plants.
2. Occasional visits of the supervising chemist to laboratories of other industries, in order to incorporate in his organization the favorable developments made by others.
3. Periodic general meetings of the chemists to promote cordial cooperation and to discuss specific subjects.
4. Periodic exchange of chemists between the different laboratories, to broaden the experience of the individual chemist.
5. Monthly reports by each laboratory of the company to the supervising chemist explaining all difficulties encountered in investigations, and making suggestions for improvements in existing methods.

Laboratory buildings should be roomy, adequately lighted, well ventilated, and equipped with all apparatus required for accurate, rapid work. Unhealthful, dismal surroundings and crowded quarters interfere considerably with efficiency and progress in chemical work. Slovenly arrangement of notes and samples should not be tolerated by the head of the laboratory.

The Central Laboratory and office should have all important chemical and engineering periodicals in an easily accessible file, and should possess a permanent library of the best books on these subjects. All the laboratories should be in the same building, so that the library may be easily reached and the individual chemists may have consultations. In the case of a corporation with plants in different cities, the Central Laboratory should be connected with one of the large plants, so that mechanics will be available for construction work in the laboratory. Such a location makes it possible for the chemists to ask advice of the foremen and superintendents. Certain rules, such as those given below, might well be posted in the laboratories:

1. The accuracy of balances, weights and measuring apparatus, thermometers, and hydrometers, must not be taken for granted. They must be checked for accuracy by comparison with standards of known accuracy as often as required.
2. All standard solutions must be checked by the head of this laboratory or one of the chief chemists.
3. All important determinations must be made in duplicate.
4. All clerical work and calculations must be checked.
5. Systems of weighing and manipulation, devised to prevent errors, should be employed, and adhered to even in the simplest determinations.

The form of organization, just described, must never take the semblance of dull routine. The personnel must be of the highest type and all necessary plans must be carried out with enthusiasm and thoroughness. The interest in the work can be decidedly sharpened by having the chemist come into personal touch with the department for which his work is being carried out.

The laboratory department should lead the way so strikingly, that its methods are never justly censured. It should, by precept and example, be an exponent of the profession of chemistry.

The plan just outlined provides for a chemical department with one supervising chemist and five first assistants, but it will readily be seen that the functions of these chemists must in certain cases be embodied in a smaller number of men. This should, however, not interfere with the sub-division of work, and great care should be exercised, in keeping records as to the time spent on any investigation and the results arrived at. For this purpose an adequate system of Laboratory Order Blanks should be installed in the manner indicated. (See "Supervising Chemist.") The supervising chemist must interview his assistants at least once each week and obtain from them written reports of progress.

In one case which was brought to the speaker's notice, the corporation professed that such a corps of men could not be maintained, as the cost would be prohibitive, yet that same factory was operated in such a manner that every three workmen were doing work which could, without any undue training, be performed by two men. That corporation was keeping down its production by employing unproductive men in quantity, at a minimum wage of $10 per week. A large part of the success of chemical supervision will, of course, depend on the use made of the laboratory by the factory manager, the buyer and the sales manager. Parkhurst has called attention to the need for showing clearly the line of authority and the responsibility of each individual. The duties of each person must be determined and the positions should be filled by men who have had an adequate training in chemistry. The factory manager should be so sure of his ground that he will not have to fear anything from an inspection of the factory by the supervising chemist; on the contrary, he should draw the chemist into his confidence and call his attention to "weak spots" in the chemical processes, so that he may benefit by his suggestions. This point is fully covered by that basic principle of factory management: "Each and every employe shall be supplied with written instructions describing fully his duties and responsibilities.' Important details of a process are sometimes forgotten, because an employe who was at one time given oral directions, has died or has been transferred to another department.

In the laboratory, as in all other departments, remarks such as "RUSH," etc., should be omitted from an order. In their place should be put a definite date on which a report is desired. This makes it impossible for any work to be postponed as a matter of convenience or on some other weak plea. If a new material is offered to the purchasing department, it is important to know at an early date whether it is desirable or not, and the same remark holds good for material which is tested previous to shipping, by the sales chemist.

Thus it is seen that scientific management includes not only the factory, but the purchasing and selling departments as well. It resolves itself into—buying the best material of a given grade at the lowest possible price and the sale of a finished product of a given quality at the lowest possible price. To accomplish this end, our most progressive manufacturers have drawn to their aid the services of one or more men exercising the above functions.

Note: For collateral reading see W. C. Ferguson on "Organized Research and Analytical Chemistry," read at VIII International Congress Applied Chemistry, 1912.

Some Observations on the Testing of Steam and Air-Brake Hose Used on Railway Locomotives and Cars.

By G. C. Bishop.

(Superintendent Motive Power of the Long Island Railrood Co.)

PREPARED FOR THE THIRD INTERNATIONAL RUBBER CONFERENCE, HELD IN NEW YORK IN 1912.

WE will first consider air-brake hose of 1⅛ inch x 22 inches and 1⅜ inch x 22 inches. We will pass over sizes and badge plates, which are not important as far as the observations in this paper are concerned. On a certain sample of hose the specification called for (1) a bursting pressure of 500 pounds per square inch exerted for 10 minutes; (2) at a pressure of about 200 pounds per square inch, the hose must not expand in diameter more than one-quarter inch or change in length more than one-quarter inch; (3) a friction test; with a weight of 25 pounds suspended from the end the separation must be uniform and regular and the average speed must not exceed six inches in 10 minutes; (4) a stretch test: between marks two inches apart on a piece one-half inch wide, stretched quickly until the marks are 10 inches apart, released, then re-marked as at first and again stretched to 10 inches, the specimen must remain 10 minutes without breaking; and (5), after release the distance between the marks must not show a permanent set of more than one-quarter inch.

The 1⅛ inch x 22-inch air hose is used with an automatic connector of the general appearance shown below:

Data sheet "A" shows the number of hose lengths removed for all causes during the year from November, 1911, to November, 1912, this being classified under (1) the general causes for removal, and (2) the life. The total number of hose purchased of each make for a period of three years is also shown as an indication of the proportion of the different makes of hose in service. The different makes of hose are designated by the letters "A" to "H" inclusive.

It will be noticed that a large proportion of the hose is removed because of being damaged in service. This is largely due to the automatic connector, which increased the chafing and cutting of hose.

Little can be learned from makes "B" and "H," as they represent purchases made three years ago, and only the oldest hose was removed in the period covered by our data. It is interesting, however, to note that the removals of "B" hose represent a comparatively high percentage of the amount purchased, and the high *average life* checks with the high *average characteristics* shown by the tests.

"F" hose, it will be noted, shows a large percentage of rejections and from our inspection of the results of the tests the reason is apparent. The friction is below the average, and the stretch just passes. Although the bursting tests are not shown, the rejections are numerous and the lots accepted were just within the requirements. This hose was all purchased in the year 1912.

"A" shows a fair life, and the results of the tests closely approach the general average.

"C" represents one purchase only, but the test results were uniform and very good; the explanation of the low life is that the hose was soft and a considerable quantity failed shortly after application due to inability to properly clamp the hose around the nipples.

"D" shows a good life, even though the percentage of damaged

Inner tube stretch	.216″	.142″	.142″	.163″	.225″	.227″	.225″	.125″	.1955

hose is high the removals are small, and the test results are better than the general average.

"G" has a good average life probably due partly to the small percentage of hose damaged in service. The average result of the test is good, with the exception that the stretch of the outer tube is above the average.

1⅜ x 22-inch air hose is used on freight cars only, and is not subject to the peculiarities of the auto hose connector as is the case with the 1⅛ x 22 inches.

Data sheet "B" shows number of this hose removed for all causes during the year from November, 1911, to November, 1912, this being classified in the same manner as the 1⅛ inch x 22-inch air hose.

Makes "E" and "H" represent small purchases made about three years ago, and may be eliminated from a study of the data as our records cover only the hose having probably the longest life.

The same criticism which applied to make "F" of the 1⅛ inch x 22-inch air hose applies in every particular to the 1⅜ inch x 22-inch air hose.

"G" may also be eliminated as none was purchased during the three-year period and only five failures are recorded.

"A" and "B" represent a considerable number of lengths with sufficient failures to afford proper comparison. The results of tests indicate that "B" is the better hose and this is confirmed by increased life.

"C" hose has a friction inferior to the average and the life is low.

"D" has the highest average life and the tests show a good inner tube and the best friction.

DATA SHEET "B."

From a study of the relation of the service of air hose to results obtained from tests of sample pieces, we draw the following conclusions:

1st—To prolong the life of hose from a possible bursting failure a good friction is necessary.

2d—The quality of the inner tube as determined by the stretch test gives an indication of the probable life of the hose before it fails due to deterioration.

3d—That the outer tube merely serves as a protective coating and the chief requirement is that it remain intact.

STEAM-HEAT HOSE.

The steam hose from which the following data are compiled was of one size, 1⅜ inch x 24 inches, used on passenger cars, locomotives and tenders. All this is used with an automatic connector illustrated under the discussion of air hose. The construction and shape of this hose are shown annexed.

The essential points of the specification under which this hose is purchased are that the sample piece is to be tested as follows: A piece of the inner tube one-half inch wide cut circumferentially with the grip ends one inch wide, must show an elongation to not less than six inches before breaking (between two marks that have been placed two inches apart). The ultimate tensile strength of this piece must be not less than 600 lbs. per square inch. The friction of a section one inch wide must be such that the duck will not start to unwind with a pull of less than 20 lbs. The remainder of the sample is then placed in a closed vessel, known as a digester, and subjected to dry saturated steam at a pressure of 45 lbs. per square inch for a period of 48 hours. The hose is removed from the digester and sufficient time allowed for it to cool naturally. The tests are then repeated and the stretch test must not show a deterioration of more than 20 per cent. while the tensile strength and friction test must not show a deterioration of more than 30 per cent.

Further, an inspection of the hose after its removal from the digester must not disclose any swelling in diameter or increase in thickness of the various parts and there must be no indication of blisters or loosening of the inner tube.

Data sheet "C" shows number of this hose removed during the year from November, 1911, to November, 1912. The data show: (1) the general causes for removal and (2) average life of hose. The total number of hose of each make purchased is shown as an indication of the proportion of the different makes in serv-

Non-specification hose used per car year 4.3

†This hose considered only as to total consumption in last two years. No records as to tests.

ice. Further, a comparison is made between service life of hose purchased from November 1, 1910, to November 1, 1912, under the specification described and hose purchased the previous two years without specifications.

Make "A" represents hose purchased about November 1, 1910, under specification, but there is no record of tests; so this hose is not considered except in the comparison with the non-specification hose.

"C" has a high life, and the tests show results well within the requirements.

"E" hose has a fairly low life, and the tests show the quality of the hose to be the poorest of the makes considered.

"G" hose shows an average life of only ten months, but it will be interesting to note that the most of this hose was placed in service in November, 1911, and the record of failures covers only three pieces. This is but ¾ of 1 per cent. of the hose purchased of this make. The indications are that a high average life may be expected from this hose when a sufficient number of lengths have been removed to give accurate data. The quality of the hose as shown by the tests would confirm this belief.

A study of the information collected shows:

1st—The desirability of purchasing hose under proper specification as the consumption has dropped from 4.3 pieces of non-specification hose per car per year to 2.5 pieces of specification hose.

2d—That the service life of steam hose is largely dependent on the quality of the friction between the layers of duck, as indicated by tests made after removal of test hose from the digester.

3d—Tests made of this hose before being subjected to steam pressure do not give much information as to the suitability of the hose for the required service. This indicates that a satisfactory specification need not include this steam test. It is thought, however, that better steam hose can be procured by raising the friction test and stretch test. A specification now being tried requires that the properties before and after the digester test be the same.

PRIVATE ENTERPRISE IN THE BELGIAN CONGO.

According to a statement of Grisar & Co., Antwerp, in their annual review, the cession to private enterprise of the gathering of vegetable products in the domains of the Belgian Congo, has been of general application, since July 1, 1912. The Governor-General has given instructions to his staff to promote in every way the establishment of business houses and the success of their operations.

While it is possible that the lactiferous stores of some forests may have been in some degree exhausted by several years of uninterrupted tapping, it is not less true that a good many districts are immensely rich in plants yielding latex, some of which have never been exploited. The hope is expressed that companies and individuals will now devote their efforts to deriving the utmost possible advantages from the resources of the colony in rubber and gum copal.

It is to be regretted that since immense zones of territory came into the control of individuals, the blacks, stimulated by competition, abandoned their previous rational methods of cultivation, and are now delivering rubber of an inferior grade, lots of good quality forming the exception. Hence, it is hoped that conservative measures will be adopted, to preserve to the colony its principal article of export. This end would be attained by refusing permission to export rubber badly coagulated, imperfectly dried or defectively packed. Rubber containing an excess of impurities, indicating a fraudulent intention, should also be stopped. Such regulations have been, it is added, adopted in certain French West African colonies, to the general benefit.

But, it is urged, these measures can only be regarded as palliatives. The idea must be more and more developed, that the future belongs to the planters, whose trees, under rational treatment, will supply the industry with a product of high quality, at prices with which the forest industries cannot compete.

With the object of promoting the creation of agricultural or planting enterprises, the Government accords the right of occupation for five years, of open domain lands, with the privilege, at the expiration of that time, of purchasing or leasing them.

Facilities are granted to parties desirous of establishing and operating factories, for the acquisition of suitable locations on lease or by purchase.

UNIFORMITY IN PLANTATION RUBBER.

In commenting editorially upon this subject, the "Times of Ceylon" remarks that when there is a type of rubber produced in fairly large quantities, of uniform and known quality, it is naturally much sought for, being set apart for the manufacture of particular articles, for which it has been found suitable. If such a quality is not available when required, considerable inconvenience results.

Attention is called to the fact that the usual forms of plantation rubber are subject to varied treatment on different estates, and even, sometimes, on the same estate. They are coagulated with such varied percentages of acetic acid (sometimes with different acids), that the buyer never knows what he is to expect at the different auctions. As a result, Brazilian rubber, such as fine hard Pará, which can always be depended upon, has a material advantage over its competitor.

The concluding words of the article thus emphasize its salient points:

"Whether or not it turns out that Eastern producers have been proceeding on erroneous lines, and will have ultimately to fall back on the old Brazilian methods of treatment, it is certain that either collectively or individually they will sooner or later have to standardize their factory work. It is, of course, open to sufficiently large producers to settle the matter for themselves; for by producing rubber of uniform qualities they can secure a steady market for their own marks. This is practically what has been done by the estates which realize such excellent prices for their smoked sheet."

This opinion on the part of the "Times of Ceylon" is founded upon the results of the personal investigations made by its editor at the late rubber exposition. It will therefore doubtless be appreciated by planters, as illustrating the practical side of the question from the standpoint of an acknowledged expert.

THE RUBBER CURING PATENTS SYNDICATE.

According to the "Malay Mail," an English company has been registered with a capital of £45,000 ($225,000) for the general purpose of acquiring inventions relating to the drying, smoking, curing and coagulating of rubber latex. The objects of the company include the adoption of an agreement with the Rubber Chemical Co., Limited. The process specially in view consists of a portable and simple smoking apparatus, the working of which is said by those who have seen it, to be effective and at the same time cheap.

NEW PLANTATION PROCESSES.

Exclusive patent rights in the Straits Settlements have been granted Mr. Noel Fisher, of the Harpenden Estate, Selangor, for a spout to be used in tapping rubber trees. Similar rights have been granted Mr. D. W. Weigel, Colombo, for a process of coagulating and defecating latex; as well as to Mr. Walter Jackson, of Singapore, for a compound intended to produce smoke for curing rubber.

TRADE MARKS FOR PLANTATION RUBBER.

In line with the idea of standard qualities of plantation rubber, is the registration of trade marks by rubber plantations. English advices report that the Highlands and Lowlands Pará Rubber Co. has taken out a trade mark. This consists of its established shipping mark—a crescent and star, with the word "Highlands."

Imitation Horn and Whalebone.

AN interesting article on this subject has recently been published in Germany by Hood, and it is here given in free translation.

Whalebone is used in great quantities for different industrial purposes, for instance, as inlays for ladies' hats and corsets, for walking-sticks, umbrellas and whips, for certain kinds of artificial flowers, buttons, boxes, etc.

Its advantages lie in its great elasticity; for this reason it has been so largely used in corset manufacture. In order to work it up for buttons, boxes and similar articles, it must first be softened by steam or hot sand; it may then be pressed in molds and afterwards polished.

The consumption of this rather expensive material is so great that the various industries could not do without imitations thereof. It is imitated in several ways and in great quantities. A good imitation should, however, possess as far as possible, and to as high a degree as possible, all the good qualities of the natural whalebone; for this reason, it is well to discuss these latter qualities.

The so-called black whalebone comes from the mouth of the bearded whale; the sickle-shaped bent horn-like plates, which are in the mouth on each side of the upper jaw, to the number of 250 to 300, with the wide sides lying together, take the place of the teeth of the ordinary whale. These so-called "beards" are fringed at their outer edges, and hang in strands from the jaws, forming the so-called "beard." They not infrequently reach a length of 12 to 16 feet, and are from 12 to 14 inches wide, and about 2½ inches thick. A single whale will yield about 1,600 to 3,500 pounds of whalebone. When the "beards" are removed from the mouth of the dead whale, they must be cleaned and split into sheets—this latter process being very readily accomplished; then dried and cut into as long pieces as possible and boiled soft in water. The plates are then separated, according to the use which is to be made of them, into rods, which are then shaved and wet polished. For the latter operation pumice-stone and felt are used; these rods are then rubbed with air-slaked lime.

The principal advantage of the natural whalebone lies, as before said, in its great elasticity. But the material possesses also great tensile strength and toughness, with no low degree of hardness; and is readily split. It is exactly this facility of splitting, making it possible to cut thin strips without any trouble, that makes the material especially valuable for corsets and the like. The shops in which the whalebone is freed from the fringes are called whalebone tearing shops; there are such in Berlin, Hamburg, Bremen, Vienna, Amsterdam and Copenhagen, which cities are the principal centers of the whalebone industry. The fibers which result as waste from the manufacture of whalebone for umbrella-makers, tailors and whip-makers, are used for upholstery. They are very similar to horse hair and are used for the same purpose.

Another material of quite different character is the so-called "white fishbone" coming from the cuttle-fish, which has a yellowish white limy shell which shines like mother-of-pearl, and is used almost exclusively for polishing fine wood, meerschaum, ivory, etc.; also for tooth powder. It has nothing in common with whalebone.

As regards the cheaper imitation whalebones, there are some which are not to be compared with those of india-rubber. For instance, there is the process covered by Munk's German patent No. 72923, which treats hides with lime and a solution of sulphite of soda, and then with a heavy solution of chromate of lime; then dries the material and subjects it to heavy pressure. The material thus obtained possesses the essential properties of corset whalebone, but is readily damaged by moisture; it must therefore be impregnated with varnish or a solution of india-rubber to make it weather- and sweat-proof.

A very remarkable substitute for whalebone is an elastic material patented by Tharin & Petit in Germany (No. 77218).

Paper is cut into thin strips and about 20 of these are laid together and drawn through a bath of concentrated sulphuric acid. If these strips are then passed between rollers, they are united into a firm parchment-like elastic piece, which may be cut into strips or rods that may be employed for corset making and the like.

According to the German patent of Pirazzi & Co. (No. 72551), a substitute for whalebone may be made by bleaching certain intestines after thoroughly cleaning with strong lye, and then treating them with a thin adhesive material. The product thus obtained is made water-tight by dipping in tannic acid, next dried and then varnished.

These are only some of the substitutes for real whalebone. There are numerous other recipes, and the substances made thereby are most varied in quality.

But the imitations made by the employment of india-rubber—for instance "balenite" and "plastite"—not only are good substitutes for whalebone, but serve to replace horn in the manufacture of articles for which whalebone would not be suitable.

"Hard" or "horn" rubber (also called ebonite) may be made into a good substitute for horn and whalebone. According as it is compounded, the resulting mass has a greater or less degree of elasticity, color, hardness, resistance to pressure, etc. Sometimes the substances are added only to cheapen the product; sometimes to perfect it. This is true in the case of balenite and plastite, which may be called imitation whalebone. We must not lose sight of the fact that horn has very much the same qualities as whalebone.

Natural horn is yielded by ordinary cattle, goats, giraffes and the "rhino." The so-called "horns" of deer are not made up of horn at all, but of bone; being only an excrescence of the skull; and may be considered the same as a tusk.

The composition of balenite varies according to the articles which are to be made therefrom. Elasticity is the main consideration. The mixture is usually about 100 parts by weight of india-rubber, 20 each of shellac, calcined magnesia, sulphur and flowers of sulphur. The hard ingredients are pulverized, well mixed and then kneaded with the india-rubber. From this plastic mass there are made plates which are cut into strips. Then comes the vulcanizing, which according as an elastic or a hard tough material is desired, is done under a comparatively low or a high temperature. But no balenite is as hard and brittle as hard rubber. The product is used for cane-handles, sheaths of sabres, cigar cases, knife and tool handles, etc.; but more especially as a substitute for whalebone. It may be polished just like ebonite.

An equally useful product is plastite, which has a deep rich black color and may be planed, turned and polished. This material also is suitable for use in place of whalebone. By proper handling it may be given a very high degree of hardness and is often used to make articles which would otherwise be made of stone or metal; also to take the place of horn. In making the plastite mass, many different materials may be used as "fillers"; especially magnesia, by reason of its light weight. A common recipe is 100 parts of india-rubber, 40 to 50 each of magnesia and flowers of sulphur, 20 of sulphur, and 50 of coal-tar. Laboratory tests are always necessary to determine for what purpose the mass is best adapted. In order to make the mixture more plastic, it is first worked, next pressed in molds, and then vulcan-

ized. A great advantage of the mass is that it contains but a very small proportion of india-rubber; but for all that has about the same properties as the pure material. The price depends entirely upon the greater or less proportion of india-rubber; the efforts of the manufacturers being always in the direction of obtaining perfection in the product with as low a proportion of india-rubber as possible.

"FELRUBITE" AND "MASCOLITE."

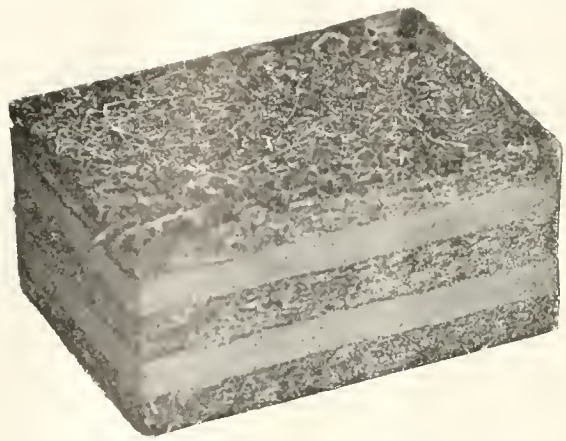
A COMPARATIVELY new material has come upon the market for use in covering floors and walls where it is especially desirable to avoid vibration and sound. It is called "Felrubite" and consists of a layer of felt covered with a layer of rubber. These two layers are joined together so effectively that they produce practically a solid uniform material which does not come apart under any conditions of use. The specially prepared felt backing acts as a cushion and gives resiliency that materially decreases the wear on the rubber surface, and thus increases its serviceability. This material is made in various thickness from 1/16 to 1/4 inch and even thicker. The accompanying illustration is made from a photograph of a section nearly 1/2 inch thick.

The advantages of this material in places where it is desirable to deaden noise and stop vibration are obvious. It is particularly serviceable in railway cars, motors and boats, and for all vehicles where there is more or less jar from machinery. It is well adapted, too, for passage ways and corridors which are not particularly well heated, as it is proof against cold as well as against sound. As a wall covering it can be fixed to any surface

A Car Platform with "Felrubite" Flooring.

and is not shaken loose even where there is considerable vibration. As all the joints are made with a special pliable waterproof cement, preventing the penetration of water below the rubber surface, it makes a water-proof and moisture-proof covering. It is less expensive than solid rubber covering, and is made in all the ornamental designs, marbles, mosaics, etc.—in which rubber tiling is usually made, and in whatever colors the design may call for. It can be used to advantage in lavatories and other places where rubber flooring is particularly desirable. It makes a specially good flooring in a billiard room.

Another material similar in principle and made by the same English manufacturers who have put "Felrubite" on the market, is "Mascolite," which has been in use on the Continent for quite a number of years. "Mascolite" is made in several different ways.



Insulated "Mascolite" of Felt and Rubber.

One form is simply a layer of felt made of a special mixture of fibers selected after long tests as the best sound and vibration absorbers, and then treated so that it is damp and insect-proof, and will stand any climate changes without alteration. A little more advanced form consists of interposing between layers of this prepared felt layers of cork; and a still different form which is used for insulating purposes, consists of five layers of material, the two outside and the middle layer being of felt, and the two alternating layers being made of vulcanized rubber. In its various forms this "Mascolite" is used as a bedding for machinery where there is a great deal of jar, or in the roadbeds of railroads for the purpose of absorbing the vibration. Its usefulness under machinery is obvious, especially where machines are installed in buildings with steel frames, as is often the case in this country. Here, if the engine or machine—particularly if it it is a grinding machine—rests upon the floor or even is placed upon a bed of cement, the vibration is communicated to the steel structure of the building; and the effect—particularly where there are many machines, as in buildings occupied by printers—is to impart to the entire building a continual quiver which is not only uncomfortable, but which greatly increases the wear and tear of the machinery. The layer of "Mascolite"—particularly of the thicker varieties—absorbs practically all of this jar, and many machines can be in operation simultaneously in the same building with little effect, either upon the building or upon one another.

It is also a useful material in the roadbed of railroads, and especially in underground railroads where the noise, unless means are taken to deaden it, is almost deafening. This material has been used in certain Russian railways for the last seven years, and the result in decreasing the wear on the rails and on the rolling stock has been very perceptible. It is used in railway tracks to best advantage by putting a layer under the chair or plate that holds the rail to the sleeper. Where the railway is an elevated structure, "Mascolite" can be used to advantage at the foot, or at the top, of the column, or in both places, and also between the rail and the sleeper. This material is so thoroughly water-proof that it is not affected by exposure to the weather, and, it remains resilient, while at the same time it will stand the greatest weight without being pressed out of its original shape, or taking what builders call a "permanent set."

THE RUBBER TRADE IN AKRON.

By a Resident Correspondent.

AT the time of writing this, a strike among the rubber workers in Akron has been under way for ten days, and has assumed a serious aspect. The leaders of the I. W. W. and of the American Federation of Labor have been exceedingly active in getting the rubber workers to join their organizations. A great many of the employes are standing loyally by their employers, but it cannot be denied that the work of the rubber factories at the present time in this city is badly crippled. The origin of the strike came about through a dispute between the management of the Firestone Tire & Rubber Co., and the employees, over a new schedule for tire finishers; the management contending that under this new schedule finishers could make $3.50 a day, while the employes contended that this could be done only by exceptional men under exceptional conditions.

This new schedule was proposed February 11 or about that date. Mr. H. S. Firestone made the following statement regarding it: "This new schedule, which will give the average tire finisher $3.50 per day, was occasioned by the use of more machinery in the production of the tire. By this new machine method one man builds the carcass and the other finishes the tire. That makes two processes where formerly there was but one. The tire finisher was therefore a new feature for us to deal with. We desire to fix a rate that will give the finisher $3.50, believing that to be a just and reasonable wage. While experimenting with the machine we made a rough allowance to the tire finisher of one-third the price formerly given the man who made the whole tire by hand. This allowance was to last only until a reasonable just rate could be arrived at by practice. The temporary rate given tire finishers lasted only a few weeks. It is true that finishers made unusually large wages during that time, but it was understood that it was merely a provisional arrangement. This led to the differences that appeared when our $3.50 scale was reached.

"The rate first decided upon, it was felt, would bring this result. The men in the tire finishing department agreed that under this scale they could on some days earn $3.50, but they felt that they could not maintain this rate week in and week out. After another careful consideration of the whole subject, we decided upon the scale now in force. It enables beyond question any experienced tire finisher who is an average worker to make $3.50 a day.

"The installation of machines for the making of tires makes the labor of building tires lighter, and while the output of tires would be increased, and the rate paid the tire maker less for each tire, the tire makers are able to earn the same average of $3.50 a day with lighter work.

"The new scale affected less than sixty men, but later would have affected more. I am sure that now our men in their own hearts have no grievances and are perfectly satisfied."

Mr. Firestone further said, "There has been nothing in the present situation that we could not or would not have adjusted to the satisfaction of the company and its employes, and all the present trouble in the rubber industry is caused directly by the agitation of men who do not live in Akron, who have no real interest in Akron or its people, and who would, when peace has been restored here, pass on to the next place where trouble will be started."

The workmen refused to accept the schedule and walked out, and have been endeavoring to create a sympathetic strike by inducing the other rubber workers to come out and by threatening to have the strike extend through all the rubber factories in the United States, and by trying to induce the allied trades and the railroad and street car men to walk out. The local and national organizers of the I. W. W. have been in Akron and have tried to arouse discontent among the rubber workers, and to prevail upon them to join the I. W. W. Many without knowing the purpose of this organization have joined it. Several of the smaller factories have felt the effects of the strike more than the larger factories.

Work in the rubber plants is to a great extent dependent upon the different departments working together, and the loss of a few men in one department may tie up a whole plant, so that it is hard to state how many are actually striking, and how many are home on account of some other person striking upon whose work their work depends. At present the State Board of Arbitration is endeavoring to bring about an adjustment. The strikers are peaceful and most of them claim no cause of discontent with their present employment and wages. The conditions of Akron rubber workers have been good and cannot be compared with Lawrence, and with rare exceptions the Akron rubber employe is well dressed, well fed and well housed, which is evidenced by the large number of workingmen's homes which are owned and paid for, or being paid for, by the rubber employes of Akron.

It is believed that all differences will be speedily remedied and efforts to this end are being put forth by the Akron Chamber of Commerce, State Board of Arbitration of Ohio, and by men influential with employers and employes of Akron industries.

A STATEMENT BY THE AKRON CHAMBER OF COMMERCE.

On February 19, the Board of Directors of the Akron Chamber of Commerce issued, and published in the local papers, the following statement, under the caption:

A PLAIN STATEMENT OF FACTS IN BEHALF OF AKRON:

In view of the many misleading and exaggerated reports sent out regarding the rubber strike and rubber strike conditions in Akron, it is only fair to those who have the best interests of Akron at heart and earnestly desire a speedy and fair minded settlement of any difficulties which have arisen, to recount something about where Akron stands in relation to its rubber industry, and reversely, where the Akron rubber industry stands in relation to the welfare of the community at large.

Whatever plea is contained in this article is directed towards but one end—the keeping with us of that prosperity which has made Akron conspicuous—not only as a great manufacturing center, but beyond all, as a good town to work in—a good town to live in.

Wages In General. The 1912 report of the Ohio State Bureau of Labor Statistics is compiled from figures covering the year 1911. The general average of wages paid in Akron rubber factories is considerably higher at the present time than in the year 1911, yet the Bureau's figures show that for 1911 the average annual income of Akron rubber workers, not including superintendents, salesmen, and office help, was $655.08 each, for an average of 278 days at work—the average daily earning for workers (both men and women), being $2.36. The average work day was 10 hours.

Comparing the general average of wage conditions in Akron with other cities, from figures contained in the same report, it is seen that Akron factories paid to wage earners in 1911 a total of $14,259,262.30, as against a total of $13,984,129.09 so paid in Dayton and $13,561,048.95 so paid in Toledo, each of these cities being much larger in point of population than is Akron.

Akron Pays All Workers Well. The tremendous growth of the rubber industry in Akron and the consequent ever-growing demand for workers, has established in this city a wage standard above the average in every other field of industry. Manufacturers in other lines than rubber have been obliged to keep steadily recruiting the ranks of employes because their men were attracted away from them by the rubber industry.

Merchants have experienced the same difficulty. Laundrymen in Akron are paying higher wages for women workers than in any other city in Ohio, for the same reason.

The wages on farms adjacent to Akron average above those of most other sections, for the same reason.

Akron Is a City of Homes and Home Owners. There is practically no building in Akron that could in any sense be styled a tenement house. The very great majority of Akron people in every walk of life live in detached dwellings. Figures compiled the past year by the Akron Real Estate Board, *show 68 per cent. of the heads of families in Akron to be home owners*, a figure high above the average, if, indeed, it is equalled anywhere. More than two of every three married men you see in Akron, then, are living in homes of their own.

The Oppression of Labor is so uncommon as to be almost unknown in Akron. Conditions are not all ideal, but as to sanitation, light, ventilation, and proper working surroundings, Akron factories are nearly all modern, and in the rubber factories particularly is this true, as most of the buildings have been erected in recent years, and fire-proofing and sanitary conditions have received large attention.

The Employment of Minors, whether boys or girls, is a subject of the strictest attention in the Akron rubber factories, and the laws governing these matters, both as to age limitations and limits upon hours of work, are almost universally observed to the utmost in letter and spirit.

There Is Little Poverty In Akron. In shops, in offices, and in stores, Akron is a hive of workers. There is no idle class and there are no vagrants. It may well be a matter of pride, indeed, to every one interested in Akron, that the very ranks of those now on strike in this city, show rarely any but well dressed, and never any but well fed men and women.

Unanimously adopted by the Board of Directors of the Akron Chamber of Commerce, Wednesday, February 19, 1913.

J. Edward Good, President.
Vincent Stevens, Secretary.

* * *

On Saturday, February 15, the Swinehart Tire & Rubber Co. announced that they had let a contract for a new building 102 x 70 and three stories high, absolutely fireproof, being constructed of reinforced concrete. This new addition will be erected on ground just west of the present building at the corner of North Howard and North streets. The rumor that the Swinehart company might remove from its present location to some site where there is more room to expand was confirmed by Mr. Walsh, president of the company. "It is true we are expecting to move to a new site where we will have more room. At present we are looking for a site to build. On account of this new building which we will put up, it will be at least two years before any removal will take place. This building we are forced to build at once as all our output for the coming year has been contracted for, and with our present limited means we will be unable to meet our contracts."

The present number of men employed at the plant is about 300 and the erection of the new building will give employment to many more. The new building will be equipped with an entire new steam plant, new boilers and new engines. The entire three floors will be given over to the manufacture of pneumatic and solid tires.

Other rumors that have been afloat concerning the consolidation of the Swinehart Tire and Rubber Co. were characterized by Mr. Walsh as false. "There is absolutely no truth in these statements. We are an independent company doing business under our own charter."

* * *

F. A. Seiberling, president of the Goodyear Tire and Rubber Co. says: "Goodyear sales for the year 1912 approximated $25,000,000 which came near to doubling the sales of 1911. For several years past, each year has shown a doubled output. It is fair to suppose that this is going to continue. We have twice as many users as two years ago. Contracts from makers are larger than ever before and this means two million tires next year, enough to equip 500,000 cars.

* * *

L. M. Latta, formerly of the Diamond branch of the B. F. Goodrich Co., has resigned his position and is now Office Manager of the tire department of the Swinehart Tire and Rubber Co.

* * *

The B. F. Goodrich Co. expects to break ground as soon as the frost is out of the ground, for a plant at St. Catharines, Canada, to take care of their Canadian trade. This plant will start with approximately 1,000 men and will be increased as business demands.

* * *

On February 18, James C Baldwin was appointed receiver for the Ohio holdings of the New York Commercial Co., by Judge Doyle. The appointment of a receiver followed a suit filed by A. H. Alden & Co., an English corporation. The Ohio holdings of the New York company are said to aggregate $40,000.

* * *

H. W. French, who for the last several years has successfully represented in Akron the New York Commercial Co. and The Geo: A. Alden & Co., has severed his connection with these companies and is at present with Ed. Maurer. He has opened offices at 513 First-Second National Building, Akron. His many friends wish him continued success. J. C. Baldwin now represents the New York Commercial Co. and the Geo. A. Alden & Co. in this city.

* * *

Among those convicted at Indianapolis for dynamiting were Messrs. Smith and Anderson, of Cleveland, Ohio, who on July 5, 1910, dynamited structural iron in the yards of The Burger Iron Co., at Akron, Ohio, which was being prepared for The Diamond Rubber Co.

* * *

The B. F. Goodrich Co. has just issued its route book covering the territory from St Louis to Denver. The Goodrich Tough Tread tire is the selection of The Studebaker Automobile factory as the standard equipment for 1913.

THE RUBBER TRADE IN BOSTON.

By a Resident Correspondent.

BUSINESS in the various lines of the rubber industry is unequally affected by what many consider an unusual winter. The tire men are all as busy as can be, and probably every factory devoted to this line is beating last year's record. The boot and shoe factories are far from busy, the present season so far having been unpropitious for this business. The rubber clothing men and also those making other lines of raincoats have had a good season, and the demand continues brisk. Druggists' hard and soft rubber goods are seasonably active and, in fact, should naturally be so with two leading syndicate drug concerns competing with each other and extensively advertising these goods at cut prices.

The makers of fire hose are laying plans for town appropriations next month, and garden hose is being ordered for early spring shipment. Belting and packing lines are moderately active, though manufacturers note the tendency on the part of consumers to let the mill supply houses and manufacturers carry the bulk of the stock by buying in smaller quantities and only as needed. The crude rubber people seem to be satisfied with present conditions and reclaimers are active, so much so that they have boosted the prices of scrap rubber way above normal at this season of the year.

* * *

The vicinity of Congress street and Atlantic avenue has become still further a rubber district, so by the removal thereto of one well-known concern and by the opening of an entirely new distributing agency for rubber clothing and footwear. Both stores are large, high-studded, with broad plate-glass windows in both front and rear with excellent light, splendid shipping facilities and right in the heart of downtown business.

The store numbered 524 Atlantic avenue is to be formally dedicated and opened the day this journal is dated, March 1, by J. D. Stiles, manager of the Boston house of Jenkins Bros., whose pump valves, packing and discs are sold in almost every civilized country. This store and basement will enable Mr Stiles to carry all his stock in one place instead of having a large portion of it in a separate storehouse. The offices are fitted up according to the most up-to-date requirements and the store and basement so arranged that the entire stock is available for immediate shipment. The shelving on the side wall, for instance, contains, sorted out into sizes and styles, over 25 tons of brass

valves. The celebrated black and "Jenarco" rubber packing and the valve discs are also sorted out for instant filling of orders. Mr. Stiles has been with this house 25 years, and manager of the Boston store 16 years, being for most of this time a director in the Jenkins Bros. corporation and the Jenkins Rubber Co., of Elizabeth, New Jersey.

* * *

Next door, at 520, the Arco Rubber Co. has opened a jobbing house for the distribution in New England of the clothing and footwear manufactured by the Apsley Rubber Co., of Hudson, Massachusetts. This store is a commodious one, well lighted both in front and rear. It is fitted up in oak, conveniently arranged with offices and sample rooms at the front, while the main part of the floor and basement is arranged to carry, sorted out, all the lines represented in the catalogs of the company. The store is in charge of Mr. H. G. Cressinger, who has been connected with the Apsley interests for some years. This jobbing house will cover New England by means of a corps of salesmen, who will undoubtedly still further extend the sale of the well known lines of rubber clothing and the various brands of rubber boots and shoes made by the Apsley company.

* * *

The New England Leather and Shoe Finders' Association held its annual business meeting and banquet at the American House on the 13th ultimo. Among those who participated in the meeting or attended the banquet which followed were quite a number of gentlemen connected with the rubber heel business, which is becoming quite an industry. The Foster Rubber Co., with its usual enterprise, furnished the cigars for the banquet and these were distributed in envelopes emblazoned with the cat trade mark of the house. The White Rock Water and the champagne were furnished with the compliments of Mr. F. W. Whitcher, of the company bearing his name, manufacturers of the Velvet rubber heel. The O'Sullivan Rubber Co. distributed to each guest a neat silver key chain with a number tag to be registered so that if the keys are lost they can be returned.

* * *

The new reinforced concrete building of the United States Tire Co., at the corner of Massachusetts avenue and Beacon street, is nearly completed and already the sign of the company is emblazoned on both fronts. The building is somewhat wedge-shaped and not very wide at the junction of the two avenues; and with the large plate-glass windows will be one of the best lighted establishments of the kind in the city. It is also one of the best situated at the very beginning or entrance to that section which is fast becoming the recognized automobile centre of the city.

* * *

The Fisk Rubber Co., of Chicopee Falls, in this State, which late last fall gave up its Delaware charter as a $5,000,000 corporation, and reincorporated under Massachusetts laws with an authorized capital of $10,000,000, is now having constructed a new storage house, 240 by 90 feet, three stories and basement, of steel, brick and concrete, to be completed by June or July. This building, which is to cost $400,000, will be parallel to the tracks of the Boston and Maine Railroad and a new siding will be built, giving facilities for loading ten or twelve cars at one time. Their mill No. 7 is being enlarged by the addition of two more stories, thus enabling the company to materially increase its manufacturing facilities—a necessary measure with the present steadily increasing demand.

* * *

Hon. L. D. Apsley, president of the Apsley Rubber Co., was tendered a banquet recently by the Progressive Committee of the town of Hudson and the Progressive Glee Club, which did active duty during the last political campaign. Mr. Apsley, during his term in Congress and ever since has been a close personal friend of ex-President Roosevelt and he was a strong advocate for the principles of the Progressive party; but he is reported to have positively declined to allow his name to be used in connection with any political office, preferring to remain a private citizen and confine his activities to his own steadily growing manufacturing and mercantile business.

* * *

The Boston Chamber of Commerce has planned a most important and interesting trip to and across South America, starting from Boston April 25 and lasting until July 30, during which eighteen important cities will be visited in six South American countries. It will give the tourists an opportunity to study at close range the possibilities of increased trade between the United States and these countries. Prominent in the committee in charge is William H. Gleason, of the Revere Rubber Co., who is doing his full share of the work of securing recognition for those who will take the tour, among the representative business organizations in the various cities visited. Letters have been received from the officials of the various South American governments promising most hospitable welcome.

* * *

The strike of the garment workers last month in this city has hit the rubber trade. The raincoat makers' union of the I. W. W. announced a strike and a number of concerns had the experience of seeing their workmen and workwomen walk out. Up to the present time but few of the large producers have had any very serious trouble with their help.

* * *

The Monatiquot Rubber Works Co. is to build a two-story store house near its factory at South Braintree, Massachusetts. In digging for the cellar a fine quality of granite was discovered and this incipient quarry has been drawn upon for stone for the foundation of the building. The structure will be 70 feet wide and extend 140 feet along the railroad siding, thus facilitating the shipment of goods.

* * *

The Boston Retail Shoe Merchants' Association at its regular monthly meeting on February 13 held a rubber shoe night, when the members were addressed by Geo. H. Mayo, of the Hubmark Rubber Co.; A. S. Foster, formerly of Lamkin & Foster, now in charge of the rubber department of Winch Brothers Co.; George Hutchinson, of Clark-Hutchinson Co., and Fred F. Schaffer, superintendent of the Goodyear India Rubber Glove Co.'s factory at Naugatuck, who told the retail shoe dealers a heap of facts about rubber boots and shoes, which were of interest. The question of multiplicity of styles, the necessity of fit, and the methods of manufacture were the main topics considered.

* * *

The steady and continued increase of business in the clothing department of the Enterprise Rubber Co., of this city, has compelled the enlargement of their sample room devoted to this line of goods. This has been accomplished by moving their sample lines of druggists' hard rubber goods to another location and throwing the space thus secured into the garment sample room, which is now double its former size. This allows for a much better display of the lines and adds greatly to the convenience of their customers.

* * *

Some foreigners are thrifty. A man named Hagop Hadjulian, who works in the Hood Rubber Co.'s factory, charged a fellow-countryman ten dollars for getting him a job in that factory. Later Judge Luce charged Hagop twenty-five dollars for the affair, and Hagop wept.

* * *

The Republic Rubber Co., of Youngstown, Ohio, manufacturers of Republic automobile tires, are making arrangements for opening more adequate quarters for stockrooms, salesrooms and general offices in this city. W. S. Carleton, who has been in charge of the New York office of the company for several years will be in charge.

THE RUBBER TRADE IN CHICAGO.

By a Resident Correspondent.

WHILE the strike in Akron, Ohio, has affected the Chicago rubber market to some degree, the general tone of business may be described as good, and the majority of the trade are predicting that a settlement of the difficulties will soon take place. There is absolutely no feature of the rubber market (aside from the labor difficulties) to worry the local trade, and investigation of the most representative houses in Chicago reveals that they have about all they can do to get orders out on time, and that many large demands for immediate delivery are in hand. The absence of snow during February and the many days of rain-threatening weather had a tendency to cause activity in clothing. The rubber houses that feature their clothing departments had been very much disappointed over business conditions for December and January, and the early part of February gave little promise of better conditions, but since the middle of the month there has been a decided change in conditions and some of the larger houses have employed additional help.

About the only complaint heard is from the scrap rubber men who had been enjoying marked prosperity during December and January. The Akron strike appears to have affected this element to such a degree that there is a manifest feeling of dissatisfaction over general market conditions.

"I may say that there is nothing to be enthused about so far as the scrap rubber market is concerned," said a representative of H. Muehlstein. "The strike at Akron, Ohio, has been of incalculable detriment to the Chicago rubber market, and we are hoping that the trouble may be terminated without unnecessary delay. The present strike is a good example of just how serious labor troubles may affect the rubber market. Perhaps in no other line of the rubber industry in Chicago has there been more general satisfaction among jobbers and dealers than in 'scraps,' because the market has been going along better than normal throughout the winter. Just when we were feeling our best the Akron strike dawned and now we are simply at sea."

Mechanical rubber goods, which have been taking their normal course during the last three months, are now in much greater demand than at any time since the fore part of December and the trade in general reports that they have not the least complaint to find. Drug sundries, which were running ahead of other lines at last report, continue to maintain their excellent showing, and dealers are buying with the confidence that business will continue to be brisk for an indefinite period.

The hoof pad market has not been as encouraging during the last three months as could be wished, and now that spring is near there is a feeling of general dissatisfaction over conditions. The reason for the slack business is that the winter has been marked by so little snow and sleet that at no time has there been active buying. Despite the fact that certain reform organizations have been exerting themselves to the utmost to have the city council make provision for the better shoeing of horses their efforts have been unavailing. Concerns that last winter reported the largest business in their history, due to the extreme cold that prevailed for so long a period, are now complaining of the quiet trade conditions.

* * *

According to the Goodyear Rubber Co. there has been a slight improvement in footwear during the month of February. The present winter has not been a particularly active one so far as footwear is concerned, most jobbers reporting that their volume of sales has been less than in former years. "Now that spring is near there is no question that the footwear market is deserving of a degree of activity," said the representative of the Goodyear Rubber Co. "We are sorry to report that the present winter has not been up to expectations so far as footwear is concerned, but this situation was due to the comparatively mild weather and virtual absence of snow. Whenever such situation obtained in past years the spring trade that followed has always been brisk, and history will undoubtedly repeat itself."

* * *

The Raven Mining Co., which maintains a large office in the Marquette building, has placed several large orders for mechanical rubber goods during the present month. This concern feels that the boom in mining which has prevailed throughout the winter will become permanent and that many of the larger mines will be heavy buyers of mechanical goods during the spring.

* * *

Former Senator Albert J. Beveridge of Indiana is to erect a six-story and basement building at the southeast corner of Michigan avenue and Sixteenth street to cost approximately $125,000, and has contracted to lease the same to the Goodyear Tire and Rubber Co. The building will occupy a lot fronting 50 feet with a depth of 165 feet, and the lease provides for an annual rent of 5 per cent. on a valuation of $125,000 for the first ten years and 5 per cent. on $150,000 for the second ten years. The lessee is to pay the usual rate on the cost of the building and in addition the taxes and insurance. The Goodyear Tire and Rubber Co. has also purchased the Ford-Johnson warehouse at Indiana avenue and the Illinois Central tracks for $95,000. This concern's Chicago business in the future will be centralized in this locality.

* * *

Dealers who carry a large line of garden hose are now preparing for the opening of the spring trade. To date a number of the larger houses have orders that have reached them much earlier than anticipated, and this situation is taken as an indication that the spring trade will open earlier than last year and will also be much heavier.

* * *

Two meetings of particular interest to the rubber industry were held in Chicago recently. The Friction Plug Heel Association held a meeting that was attended by a number of men from various parts of the country who are well known to the rubber trade. Among those who were here were Mr. Pitcher of the Pitcher Rubber Co., Boston, and Mr. Platt of the Foster Rubber Co., Boston. The second meeting was that of the Finders' Association, which is composed of the shoe jobbing interests of Chicago. This meeting was held at the La Salle Hotel and was one of the most largely attended in the history of the organization. Many from out of town attended this meeting. Various matters of vital importance to the association were discussed.

THE RUBBER TRADE IN CINCINNATI.

By a Resident Correspondent.

THERE has been a healthy volume of business transacted by the local tire houses during the first two months of this year, and orders from traveling salesmen and mail orders have made the rubber trade quite active locally. There has been no falling off in the demand for rubber footwear, despite the fact that in this section there has been an open winter with weather conditions unfavorable to creating a demand for rubber clothing and footwear.

* * *

W. G. Brown, the executive head of the W. G. Brown & Co., rubber brokers of this city, was tendered a complimentary dinner at the Business Men's Club in recognition of his past services as chairman of the Santa Clause committee. For several years past Mr. Brown has been one of the stanchest supporters of the movement, and its success was largely due to his untiring efforts.

* * *

The Ideal Steel Wheel Co. has secured title to a valuable man-

ufacturing site, which was practically purchased last November, mention being made in this column at the time. The company will be in full operation as soon as special machinery which is being built is installed. The product to be manufactured by the company is a patented steel wheel which makes possible the use of a puncture-proof cushion tire at all speeds.

* * *

While the agreement entered into by the rubber tire manufacturers of the country prohibits exhibits of their products at the automobile shows given outside of the cities of New York, Chicago and Boston, several of the managers of the big companies maintaining branches in this city arranged to run side shows of their own at their respective branches during the Cincinnati Automobile Show, which opened February 24 and continues to March 5. Manager B. M. Lovell, of the B. F. Goodrich Co., has a display at the spacious quarters of that company on Race street in the form of a rear automobile system equipped with safety treads. A similar exhibit has been held in other parts of the country and always with marked interest to the public. The Firestone Tire and Rubber Co., The Diamond, The Fisk and The United States Tire companies are also making a special point to interest visitors to the show in their products.

* * *

The Seamless Rubber Co., represented locally by Bumiller & Remelin, dealers in automobile and bicycle accessories, golf balls and sporting goods, has a large display of its products at the Automobile Show. The display is unique for this city, as it shows the process of manufacture of rubber goods in their various forms, from crude rubber to the finished product.

* * *

The I. J. Cooper Rubber Co., at 717 Main street, has taken over the agency of the Motz Tire and Rubber Co., which was formerly held by the Selden Motor Co. The Cooper company also handles Racine tires.

* * *

Dr. C. L. Bonifield, president of the Cincinnati Automobile Club, and Gustav Drach, an architect, are the president and secretary of the National Cement and Rubber Co., which has its principal offices in Toledo, Ohio. The specialty of this company is a patented clamp by which any make of casing or inner tube may be cured of blow outs and punctures in five minutes.

* * *

The Fisk Rubber Co. has become a prominent factor in the local rubber field. It has recently opened a branch in this city at 816 Main street and placed M. J. Kirby in charge. The local branch will cover the Central states from this city.

* * *

Edward Barrett, who was formerly connected with the Federal Tire Co.'s branch at Columbus, Ohio, as assistant manager, has resigned and has taken a position with the Fisk Rubber Co. here.

* * *

John Barrett, the director-general of the Pan-American Union, and former United States Minister to Panama and other South American countries, in an address at the annual dinner of the Chamber of Commerce, urged Cincinnati business men to be awake to the trade possibilities which the Panama canal will develop. He advised them to make preparations to study the buying and selling field of all of the South American countries and canvass the trade conditions, in order that this city may not be outstripped in the race for commerce there. Declaring that he recognized the strategic position which this city occupies in the commerce of the United States and especially in the great Ohio and Mississippi valleys, the speaker said he wanted to see it awaking to the importance of the Panama canal and of Pan-American commerce. He laid particular stress upon the rubber-producing countries of South America and the importance of Cincinnati becoming one of the leading points of distribution of that product, in view of the fact that it has as its immediate neighbors some of the most important rubber manufacturing cities in the world. Mr. Barrett in speaking of the rubber trade possibilities in the South American countries said: "I urge upon the Cincinnati Chamber of Commerce, manufacturers, the business men, the exporters and importers to take a direct interest in what the Panama Canal actually means not only to Cincinnati, but to the entire country, and to study intimately the twenty sister republics of the Western hemisphere lying south of the United States. Nothing better could happen to Cincinnati than that you should start here what might be called a Panama Canal and Pan-American movement which would not only benefit this city, but expand all over the Ohio Valley and the Central West. 'Get ready for the Panama Canal, and go after Pan-American trade' should be the slogan of your Chamber of Commerce."

* * *

Local representatives of the manufacturers of anti-skid and non-skid tires are lending every possible encouragement to the movement started by city officials to follow New York in tabooing the use of tire chains on asphalt streets. With the increase in use of motor vehicles in this city it has been found that many of the more travelled thoroughfares, paved with asphalt, are rapidly becoming destroyed, it being claimed that the constant wear and friction of the steel edges of the chains cut into the asphalt. The agitation, however, is meeting with a storm of protest on the part of accessories dealers and auto owners who have invested in chains.

* * *

Recently the Schaefer Rubber Co. entered into a lease for its present quarters on East Fourth street for a term of years. After the lease was executed the owner decided to improve the premises by building a skyscraper, and it was necessary for this company to seek other quarters. As a result, and in order to accommodate the owner, it will be necessary for the Schaefer company to move twice before it will be permanently located again. The company will occupy temporary quarters at 418 Vine street until April, 1914, at which time it will again be located on East Fourth street.

THE RUBBER TRADE IN RHODE ISLAND.

By a Resident Correspondent.

WORKMEN have just finished their labors on the new storehouse for the Revere Rubber Co. in Providence, and the contractors are ready to turn the structure over to the company. The building is of modern construction and is connected with the main building of the plant by a bridge 150 feet long. It was erected as a result of the increasing business of the company. It is the second storehouse that the concern has erected during the past year. It is of reinforced concrete of flat slab construction, no beams or girders being used to support the floors. The size is 75 feet by 300 feet. The five floors give a floor area of more than 100,000 square feet. The floors are designed for a live load of 250 pounds per square foot. Brick curtain walls enclose the building, while each floor is divided into three rooms by terra-cotta fire walls provided with automatic fire doors. All the concrete is reinforced with Havemeyer deformed steel bars, and steel sash and wire glass are used in all the windows. The roof is of concrete slab, with tar and gravel roofing. This building was erected for the storage of raw materials and manufactured goods. As soon as the building is occupied the space now used for storage will be available for manufacturing purposes, and this, together with other extensions and improvements, will provide for about 50 per cent. increase in the production of tires.

* * *

Judge LeBaron B. Colt, who on January 21 was elected United States Senator from Rhode Island by the General Assembly, mailed to President Taft on February 3 his resignation as United States Circuit Judge from the First Judicial Circuit. The resig-

nation took effect Saturday, February 8. Judge Colt has served in the United States courts since March, 1881, when he was appointed District Judge for Rhode Island by President Garfield. His term of service in the Federal courts was for a period of more than 30 years.

On the day that Judge Colt sent in his resignation, February 3, Col. Samuel Pomeroy Colt, head of the National India Rubber Co. of Bristol, and president of the United States Rubber Co., gave a dinner at the Squantum Club, Squantum, to the members of the General Assembly, State officials and prominent citizens of Rhode Island in honor of his brother, Judge Colt. About 100 guests were present. Following the dinner addresses were made by Col. Colt, Governor Aram J. Pothier, Lieutenant Governor Roswell B. Burchard, Albert B. West, Democratic leader of the House of Representatives, and Judge Colt.

* * *

Forty-seven years in the employ of the National India Rubber Co., Bristol, is the record of James H. Hoar, foreman of the Vulcanizing department of the factory, who recently celebrated his 66th birthday. Mr. Hoar is the oldest employe of the company in point of service. In all the 47 years of his service in the company, as laborer, assistant foreman and foreman, Mr. Hoar has not missed a day because of illness. He has held the position of foreman for 26 years.

James H. Hoar.

When a young man Mr. Hoar was associated as a gardener with his father. In the autumn of 1866 when the factory of the National India Rubber Co., then the National Rubber Co., had been in operation but a year, Mr. Hoar gave up his position with his father and entered the employ of Bristol's new industry. For several years he worked at varnishing and curing of rubber goods, until he had acquired a thorough knowledge of his trade. It was while Stephen Bourn, a former well-known rubber man, was foreman of the department that Mr. Hoar was made assistant foreman. This was in 1877. In 1887 Mr. Bourn retired and Mr. Hoar succeeded him.

Mr. Hoar has 40 men under him today in the vulcanizing department. This department is one of the most important of the many in the big Bristol factory. The product of the mill—boots, shoes, arctics, carriage cloth and many other articles of every-day use—have to pass through "the heats" before being ready for the market. It is here that Mr. Hoar's long training stands him in good stead, for it requires skill and knowledge of the rubber business to determine when the goods are vulcanized to the proper degree.

Mr. Hoar tells many interesting stories of the work in the rubber mill in the early days of the industry. "I used to work many hours overtime," said Mr. Hoar. "It was customary in those days when there was a rush to begin the day's work at 5 o'clock in the morning and keep it up without stopping, with the exception of when we went to our meals, until 11 or 12 o'clock at night. They don't do that nowadays," he added with a smile. He explains his ability to keep up this high tension by his habit of taking rest when he could, and by living a moderate life. "I never had a vacation," said Mr. Hoar, one day recently, "being content to enjoy freedom from work when the factory was closed for repairs or other causes." Although his work keeps him on his feet, Mr. Hoar says he feels no ill effects.

* * *

The factories of the National India Rubber Co. and the Consumers' Rubber Co., of Bristol, resumed operation February 3, the former after a shutdown of two days for repairs to a cylinder and the latter after about two weeks' cessation of work for repairs and improvement to the machinery.

* * *

Manager LeBaron C. Colt of the factory of the National India Rubber Co., of Bristol, left February 5 for Denver, Colorado, where he will spend some time resting. Mr. Colt has had a busy season and will remain in Colorado for two months or longer. He was accompanied by his family.

* * *

A new steam boiler was installed at the factory of the International Rubber Co. at West Barrington February 3. A new 350-horse-power engine will soon be set up in that mill. Because of the rush of business night work has been started at this plant.

* * *

The Woonsocket Rubber Co. had a booth at the Arts and Crafts exhibit at the Baptist Church, Woonsocket, on the evenings of February 4 and 5. The booth was one of the most interesting in the whole exhibit. A rubber "ham" from South America was on exhibition and was examined with great interest by those present. Other articles displayed at the booth were other samples of crude rubber, and the finished rubber boots and shoes. This was the first exhibit of its kind ever held in Woonsocket. The manufacturers of the city plan another large one soon in some local hall, so that residents in Woonsocket may learn of the various articles manufactured in the city.

* * *

The annual meeting of the American Wringer Co. was held January 31 at 75 Westminster street, Providence. The following were elected directors: W. S. Granger, Lyman A. Mills, W. S. Ballou, A. G. Beardsley, Jr., J. F. Hemenway, Dr. James E. Sullivan, and Latimer W. Ballou. At a meeting of the directors held immediately after the adjournment of the stockholders' meeting, W. S. Ballou was elected president, and A. G. Beardsley, Jr., was elected treasurer.

* * *

Marcus L. Carder has filed suit for $10,000 against the American Electrical Works of Phillipsdale, manufacturers of wire insulating, alleging that a stroke of paralysis that he suffered on May 20 of last year was due to the poisonous fumes arising from the burning of arsenic, in which the defendant company forced him to work.

* * *

Frank Salisbury, for a number of years employed at the factory of the National India Rubber Co., died February 7 at his home in Bristol, after an illness of several months. He had been a sufferer from tuberculosis. He was a native of Bristol, and was 27 years old.

* * *

Arthur L. Kelley, president of the Mechanical Fabric Co., makers of rubber goods, and president of the Narragansett Elec-

tric Lighting Co. of Providence, was recently operated upon for appendicitis in a Boston hospital. Mr. Kelley has been in poor health for some time, although he has shown considerable improvement since the operation.

* * *

Francis Munro, a veteran of the Civil War and for years an employe of the National India Rubber Co., of Bristol, died at his home in Bristol February 11, after a few days' illness, of heart trouble. He was 73 years old. After serving in the War of the Rebellion Mr. Munro returned to Bristol, where he obtained a position with the National India Rubber Co. He was a machinery belt maker in that plant for about 30 years, until he retired several years ago, owing to ill health.

* * *

Considerable interest has been awakened among the employes of the Consumers' Rubber Co. in Bristol this winter over the work of the basketball team, which is composed of men from the plant. On February 8 the team defeated the second team of the Bristol Naval Reserves by a score of 16 to 8. The officers of the company are also taking an interest in the sport, and are encouraging the employes in their loyalty to the team.

THE RUBBER TRADE IN TRENTON.

By a Resident Correspondent.

LOCAL manufacturers of mechanical rubber goods, hard rubber, automobile tires and sundries are much concerned regarding the attitude of labor in this city, and to judge from the activity of labor organizers of the American Federation of Labor a general strike of workmen in the local plants is a possibility of the near future. For weeks the labor organizers have been working quietly among the more skilled men of the rubber industry, and their efforts to form a union and have the operatives affiliate with the A. F. L. appear to be bearing fruit.

The labor leaders have already organized the operatives employed in the manufacture of hard rubber, and the employees of several other rubber companies in this city and in Morrisville, across the river from this city, have formed a union and applied to the Federation for a charter. Delegates have been named to the Central Labor Union, a county organization affecting practically all skilled labor in this section of the State. About 400 men are employed in the hard rubber branch of the rubber industry in this section.

The labor organizers are holding meetings every Sunday for the organizing of the rubber workers, a state of affairs which naturally is not viewed with any great favor by the manufacturers.

The memory of the strike of the rubber workers of this city in the winter of 1904 is still fresh in the minds of the manufacturers, the majority of whom are not anxious to go again through such an experience. In this strike, conditions become so bad that the strikers were indicted by the county grand jury and some sent to prison for assaults on men who replaced the strikers in the plant of the United and Globe Rubber Co., Home Rubber and one or two other places. It was a long, drawn-out battle, marked by fierce fighting on the part of the strikers, but at the finish they were glad to go back to work. The strike leaders were unable to secure employment in any of the plants.

* * *

The Industrial Workers of the World members are taking an active part in the rubber strike, and also in the strike of artisans and operatives in other industries in the city. There are now six different strikes on in the city, and business has become affected to such an extent that the merchants and tradespeople in general have appealed to the Chamber of Commerce to settle the strikes. In the John A. Roebling's Son's mills several thousand employes are on strike with no immediate chances of a compromise.

General C. Edward Murray, treasurer of the Crescent Belting and Packing Co., in discussing the strike situation said: "After my experience in the general rubber workers' strike in 1904, which it will be remembered ended with a tremendous loss for both sides, I feel that everything should be done to arrive at some definite conclusion without the necessity of either side losing anything. I find, submitted by a committee of employes, a statement containing a list of advances desired, and it is such as would indicate that the committee has given very little thought or possessed little knowledge of the earnings of the different employes; for example, we have 43 girls employed on our braider machines and spoolers. With an idea of making it possible for them to earn more money without additional labor, two or three weeks ago we increased the speed of our machines, and also made some changes to our take-offs which increased the daily capacity of the machines while in operation, with the result that 26 of the 43 girls averaged 49 hours and received 12.7 cents per hour, which would equal for a week of 55 hours $6.98, while the amount asked for by the committee is 12½ cents per hour, or $6.88 for the week.

"The management of the Crescent Belting and Packing Co. hasn't any objection to organized labor, or to treating with any committee representing their employes, but they feel that any difference should at least be discussed before strike action is taken, as was done in this case. It has been our policy to pay the maximum amount of wage paid by our competitors, which is all anyone can possibly do and compete successfully."

George R. Cook, of the Acme Rubber Co., and J. L. Lambert, also an officer of the concern, declare that the strike of the men in that plant has not seriously hampered business.

* * *

President and General Manager of the Essex Rubber Co., C. H. Oakley, announced in the week of February 17 a 10 per cent. increase in the wages of all the employees of this rubber concern, a piece of news which was enthusiastically received by the 200 or more operatives. If a strike is declared it is hardly probable that this progressive concern will be affected, as the best of feeling exists between employers and men.

* * *

The Delion Tire and Rubber Co., Inc., of this city and New York, has contracted with Burton & Burton, builders of this city, for the erection of a three-story fireproof building on East State street, just outside the city boundary line. The building is to be modern in every particular and will be of steel construction, with reinforced concrete floors and other material calculated to make it fireproof. The work of construction was started February 19, and the contract calls for the completion of the building by May 1, when the manufacture of high-grade automobile tires will commence. The company is to make a tire which it will guarantee for 5,000 miles' service. The building is to cost in the neighborhood of $60,000. Freeman & Halstead, of New York City, are the architects. R. S. Peale, of 111 Broadway, New York, is president of the corporation, and he has interested local capital in the enterprise. Some of the Trenton stockholders include: R. C. Manning, automobile dealer; I. Harper Clayton, contractor; Newton A. K. Bugbee, civil engineer and contractor, and Burton & Burton, contractors. Contracts for the new building have been filed in the office of the county clerk.

* * *

Thomas B. Holmes, Jr., who covered the States of Pennsylvania, Ohio and West Virginia for the Empire Rubber Co., has quit the rubber business and is traveling for a linoleum concern, the Turford Co., of this city.

* * *

The M. & M. Tire Co., with offices at 214 East State street, was incorporated in this county a fortnight ago with a capitalization of $150,000. Seventy-five thousand shares of common stock are placed at $1 a share, and 7,500 shares of preferred

shares are held at $10 a share. The incorporators named are: William McGinnis, of this city; William Morgan, of Ewing, and A. Trapp, of Trenton. Mr. McGinnis is named as the president of the concern.

THE RUBBER TRADE IN SAN FRANCISCO.

(By a Resident Correspondent.)

CALIFORNIA has suffered considerable loss as a result of the material damage to the orange crops in the southern part of the State. Such a loss is felt by nearly every industry. The rubber industry has felt it through certain lumber mills and box factories which supply the lumber and boxes for the oranges. A sufficient number of orders have been cancelled for boxes to affect such mills and factories to such an extent that they will not order rubber belting this year. In other respects the State has shown great growth and increase of commercial activity, and the improvements which are being made in and about San Francisco, in preparation for the 1915 fair, certify to the big increase which business of this city is to receive.

* * *

Mr. Nat. Dodge, of the Western Belting & Hose Co., on Mission street, has taken an interest in the American Rubber Manufacturing Co. The death of Mr. Griffiths, whose guiding hand had done much to bring the business of the concern to a high state of success, made it necessary to secure some one who would assist in maintaining the high standard which Mr. Griffiths had set. The business of the company, which has many important eastern connections, will continue as before.

* * *

The Panama Rubber Co. has been organized for the purpose of making automobile and motor tires in a factory to be erected in or near San Francisco. The new company, when the incorporation is fully perfected will have a capital stock of $1,000,000, and the men connected with the enterprise are prominently associated with big automobile and extensive financial enterprises on this coast. W. D. Newerf, one of the best known rubber tire merchants in the West, has been the prime mover in the new plan, and will have an important connection with the company. Mr. Newerf is at present coast distributor for the Miller tires. The exact location of the big factory has not been determined upon, but it will be either in San Francisco or in one of the cities close by on the bay, and as soon as the site is selected the work of erecting one of the most thoroughly equipped tire plants of the country will be rushed to completion. This western territory has been a wonderful field for the sale of tires, and a big factory located here can hardly fail to succeed.

* * *

A new concern known as the Acme Rubber Co. has opened an establishment on Golden Gate avenue, near Van Ness. Considerable machinery has been installed. The rubber used, however, is artificial, being a substance derived by a patented process of a local inventor. Mr. Schwartz, who was formerly with the Plant Rubber & Supply Co., has become associated with the new company.

* * *

Some big houses are wondering why it should be necessary to have automobile shops and tire shops out on Golden Gate avenue, strictly in the residence district. This of course was natural after the fire of 1906, when business of all kinds located there, but now all business has moved down to the regular business quarters except the automobile shops and tire shops. The big dealers have moved down, but they still maintain branch stores there, which doubles their expense. Setting a suitable example, the Gorham-Revere Rubber Co. has closed its Van Ness avenue and its Oakland tire branch, and has moved everything down to the factory on Freemont street.

W. L. Eaton, with the New York Belting & Rubber Co., has returned from a recent trip to Honolulu in the interests of the firm.

* * *

N. Lincoln Green, of the United States Rubber Co., has been a recent visitor in San Francisco.

* * *

E. J. Day & Co., of Oakland, an old established automobile supply firm have just completed arrangements with the Federal Rubber Manufacturing Co. to distribute Federal tires in Alameda and Contra Costa counties. Day & Co. are making extensive alterations in their present store in order to accommodate a large stock of Federal tires, and in connection with the tires a service department will be maintained, so that automobilists will get the same service for repairs as from a direct factory branch. H. V. Overington, who has been with the Diamond Rubber Co., as manager of their Oakland branch, has accepted a position with Day & Co., to take charge of their new tire department.

* * *

Frank E. Carroll, manager of the San Francisco branch of the Goodyear Tire & Rubber Co., held in February the first of a series of monthly conferences with the employes selected from all of the branch stores.

* * *

The Plant Rubber & Supply Co., of this city, has recently bought out the stock and business of the Magnesia Asbestos Co., a concern of this city.

* * *

Mr. Oliver, formerly superintendent of the American Rubber Manufacturing Co., and now proprietor of a factory of his own on Telegraph avenue in Oakland, is enjoying a big business on his specialty of inner tubes for automobile tires.

NO OFF AUTO SEASON THIS YEAR.

Unfortunately all rubber manufacturers cannot be equally happy at the same time. When the ground is covered two feet deep with snow the footwear makers are in a most contented state of mind, while the tire makers begrudge every day that the snow remains on the ground. This past winter the makers of boots and shoes have had considerable ground for complaint—one might say, bare ground for complaint—while the tire makers have looked upon it as their lucky year. Owing to the open character of the winter and the meager fall of snow thousands of autos have remained in commission which ordinarily would have remained in the garage.

This naturally has made an appreciable difference in the demand for tires. Sales manager J. D. Anderson, of the United States Tire Co., recently made the following statement: "From a sales standpoint this is proving by all odds the best winter I have ever known in the industry. And the logical explanation for this fact is that owners owing to good weather, have deferred laying up their cars until it commences to look as though they would keep them in operation straight through the winter months. Our factories all have been running night and day, still we haven't been able to keep so very far ahead of our orders. This winter has proved conclusively that the motor car is now distinctly a year round utility."

A RUBBER PLANT AT LOS ANGELES.

Los Angeles, California, is to have a rubber factory for the manufacture of tires, belting, hose and other kinds of rubber goods. The company back of this enterprise is the W. C. Hendrie Rubber Co., of Denver, Colorado. Its operations have hitherto been confined to Denver, where it has been simply a distributing concern, handling the various articles manufactured by the Republic Rubber Co., of Youngstown, Ohio. It purposes now to go into the manufacturing line, and will erect a $100,000 factory in Torrance, in the suburbs of Los Angeles.

News of the American Rubber Trade.

THE APSLEY RUBBER CO. INCREASES ITS CAPITAL.

THE Apsley Rubber Co. increased its capital in February from $750,000 to $1,000,000 by adding $50,000 to its common stock and $200,000 to its preferred stock, bringing each of these stocks to a full issue of $500,000.

Both are 7 per cent. stocks which have never failed to earn and pay their dividend. The stock has been selling in the open market at $114 whenever it appeared upon the market, which has been very seldom. The present stockholders have been given the right to subscribe to this new issue of stock at par, and we learn that the rights, where anyone wished to dispose of them, are selling at $5.00 and $6.00 premium. The date of subscription and the date of payment both expired February 25.

The Apsley Rubber Co. did the largest business last year they have ever done; and notwithstanding the open winter, they are now ahead of last year at the same date. They are putting in some new heavy machinery, which they have bought of the Farrel Foundry & Machine Co., which is now being installed, for the purpose of making heavy rubber clothing.

THE FISK CO. INCREASES ITS CAPITAL STOCK.

The Fisk Rubber Co., of Chicopee Falls, Massachusetts, has issued $3,000,000 additional in 7 per cent. first preferred stock. The new authorized capital is $15,000,000, of which $5,000,000 is first preferred, $2,000,000 second preferred, convertible and common, and $8,000,000 common. The directors of the enlarged company will include H. T. Dunn, H. G. Fisk, J. C. Cole, R. B. McGraw and G. A. Luddington. The officers will be as follows: President, Mr. Dunn; treasurer, Mr. Fisk; vice-president, Mr. Cole, secretary, Mr. McGraw.

The Fisk company is in need of increased factory facilities, although the capacity of the plant has been increased 40 per cent. during the past year and the factory has been in operation day and night. Since 1908 the output of automobile casings or shoes has increased from 57,695 to 221,826; of inner tubes from 40,960 to 198,925, and of bicycle tires from 84,387 to 240,623. The company is now manufacturing 1,300 automobile tires a day, and expects through the use of the new buildings now under construction to increase this to 1,800 a day.

AMERICAN TIRE COMPANY INCREASES CAPITAL.

At the recent annual meeting of the American Tire and Rubber Company of Akron, Ohio, the following new directorate was elected: Adam Duncan, Charles F. Fosnight, F. L. Kryder, Gus Sieberling, C. M. Wertz, G. C. Waltz, F. M. Lapp, Frank Pfeiffer and James Shaw.

In the subsequent election of officials, Adam Duncan was chosen as president and treasurer, but from the pressure of business, declined to serve in the latter capacity, Frank Pfeiffer being thereupon elected treasurer. G. C. Waltz was chosen vice-president and F. E. Rowe, secretary and assistant treasurer.

The first business undertaken by the new board of directors was the increase of the capital of the company from $200,000 to $500,000. It is not, however, intended to issue at the present time more than $50,000 of the new stock. A new solid tire is being perfected by the company, which will soon be placed on the market. Patents for the new tire will shortly be issued.

FIRESTONE GETS BIG TIRE ORDER.

An order for 200,000 tires is said to have been booked by the Firestone Tire and Rubber Co., Akron, from the Ford Motor Co. of Detroit. The order represents over $2,000,000.

The Seamless Rubber Co. of New Haven has filed a certificate of issue of five thousand additional shares of capital stock, making the outstanding stock $500,000 of common stock and $500,000 of preferred stock.

THE CINCINNATI RUBBER MANUFACTURING CO.

The annual meeting of the stock holders of this company was held February 11. The old board of directors consisting of Casper H. Rowe, J. A. Green, S. E. Hilles, George McG. Morris and J. M. Crawford was re-elected, and the following officers were chosen for 1913: S. D. Baldwin, president; Fred A. Geier, vice-president; F. D. Scherl, secretary and treasurer, and A. D. Rogers, sales manager. The results of the company's operations for 1912 were very satisfactory, and during the present year substantial improvements and additions will be made to the company's plant.

CHICAGO RUBBER CLOTHING CO.

At the recent annual meeting of the stockholders of the Chicago Rubber Clothing Co., Racine, Wisconsin, the same board of directors was re-elected, and the following officers were also re-elected: Honorable Charles H. Lee, president; E. V. Laughton, treasurer, and George G. Bryant, secretary and general manager.

THE M'GRAW OFFICERS AND DIRECTORS.

The McGraw Tire & Rubber Co., East Palestine, Ohio, at the meeting recently held, elected the following officers and directors:

Officers—E. C. McGraw, president; R. W. McGraw, vice-president; R. B. Taggart, treasurer, and L. M. Kyes, secretary.

The following were elected directors—E. C. McGraw, Mrs. E. C. McGraw, R. W. McGraw, John Morgan, L. M. Kyes, R. F. Taggart, R. B. Taggart, J. C. Chamberlin, C. L. Merwin, H. C. Fraser, Geo. Flaccus, J. C. Chaplin, J. S. Wilson, F. H. Rea and C. H. Bolton.

The report of the company shows that $1,160,000 worth of automobile tires were manufactured and sold by the company in the year 1912. The company hopes to double its output during 1913.

RECOVERING UNCURED FRICTION SCRAP.

The Acushnet Process Co. has been trying some experiments in the recovering of uncured friction scrap, in which they have been very successful. Their process differs radically from those commonly used, and is more costly to operate, but the rubber obtained is said to be entirely free from any effects of vulcanization, which allows it to be put to more uses.

The Acushnet Co. has recently produced a rubber which it claims possesses the characteristics of guayule, and which is said to be already in active request. The Acushnet Co. has devoted a great deal of time and thought to the development of this new product, which seems likely to prove very popular. The new rubber is soft and capable of absorbing a large amount of compound, cures quickly and is sold washed and dried. The company is prepared to furnish samples, crude and vulcanized, and to quote attractive prices, and also to guarantee deliveries as per specifications.

TRUE—AS FAR AS IT WENT.

The February issue of THE INDIA RUBBER WORLD had a paragraph to the effect that the Air-Brake Department of the Republic Rubber Co., made a record on January 7, in producing short length hose—turning out on that day 11,500 feet. This was quite true as far as it went, but it was too modest a statement. The paragraph should have read 11,500 pieces instead of feet; and as each piece was 22 inches long, the record for the factory on that particular day was 21,083 feet of air-brake hose—very nearly four miles. The company believes that this is the record for one day, and as far as there is any information available at the present time, the company appears to be right in its belief.

AN ORDER FOR 20,000 FEET OF FIRE HOSE.

The city of Montreal, Canada, invited tenders early in February for supply of 20,000 feet of 2½-inch cotton, rubber-lined fire hose, for use by the Fire Department in that city.

Bids were offered by various Canadian companies. After considerable investigation and delay the city finally placed the order with the Canadian Consolidated Rubber Co., Ltd., Montreal, for 20,000 feet of 2½-inch wax and gum-treated "Keystone" fire hose at $1.10 per foot coupled. The company was represented in this transaction by Mr. J. M. S. Carroll, district manager.

When this large order has been delivered the city of Montreal will have in use over 90,000 feet of "Keystone" brand fire hose.

A PATENT FOR A PROCESS FOR PRESERVING EXTRACTED RUBBER.

Mr. H. O. Chute, of New York, has been granted patent No. 1,051,987, dated February 4, 1913, for a process of preserving extracted rubber by washing with pyroligneous products or the liquid of wood distillation. It is claimed that while it is well known that Pará rubber is treated with smoke from palm nuts, it is new to treat a deresinated rubber with the liquid products of wood distillation, and that this process preserves the rubber and prevents it from softening and running. The claims cover the process of extracting the resins, and then treating the rubber with the liquid, the product consisting of extracted rubber having incorporated the products of wood distillation. Specifically, deresinated Pontianak rubber impregnated with pyroligneous acid is claimed as a new product.

DIVIDENDS PAID BY RUBBER COMPANIES.

The B. F. Goodrich Co. paid on February 15 a quarterly dividend of 1 per cent. on its common stock to stockholders of record on February 5.

The B. F. Goodrich Co. reported February 24 for the nine months ending on December 31, 1912, net profits from operations of $3,719,334. Other income amounted to $571,844. The surplus after paying preferred and common dividends amounted to $806,235.

The Hood Rubber Co. paid on February 11 a quarterly dividend of 1¾ per cent. on its preferred stock to stockholders of record on January 31.

The Manufactured Rubber Co. pays on March 1 a quarterly dividend of 1¾ per cent. on its preferred stock to stockholders of record on February 24.

SAVINGS BANK LIFE INSURANCE IN RUBBER COMPANIES.

Massachusetts Savings Bank Life Insurance now has more than 7,000 policyholders with insurance in force to the amount of $2,700,000. Two hundred agencies have been established by manufacturers and at these agencies premiums are collected from the pay envelopes of the employees, and once a month transmitted to the insurance departments of the banks. The Tyer Rubber Co., Andover; Hood Rubber Co., Watertown; American Rubber Co., Cambridge; and the Boston Woven Hose & Rubber Co., Cambridge, have agencies and many policies are in force among their employees. An agency has recently been established at the Revere Rubber Co., Chelsea. Massachusetts Savings Bank Life Insurance affords an opportunity for the employer to give his employees the advantages of insurance at a low cost.

THE TUXEDO TIRE CO., INC.

The Tuxedo Tire Co., Inc., the incorporation of which was recently announced, has taken over the business of the Tuxedo Tire Exchange, Bronx, New York. It states that it is open to consider good selling propositions from makers of automobile accessories. Mr. Hugo Liedtke has recently visited the South, on the lookout for new selling ideas.

A BOSTON OFFICE FOR THE LOEWENTHAL CO.

The Loewenthal Co., of New York, announced on February 20 the opening of a Boston office in order to insure better service for the company's New England customers. This office will be in charge of Mr. George Friedman.

A STATEMENT FROM THE N. Y. COMMERCIAL CO.

Referring to the announcement made February 17—received everywhere in the trade with much regret—of the appointment of a receiver for the New York Commercial Co., the company issued the following statement:

"We deeply regret to announce to you that we have felt it in the interest of all our creditors to consent to a receivership, not on the ground of insolvency, but for the purpose of preserving our assets for the equal benefit of our creditors and, after them, of our stockholders.

"This immediate step was necessary on account of large payments falling due next week which we could not, and in all fairness ought not, to pay, in view of certain banking facilities which we had heretofore enjoyed having been suddenly withdrawn.

"Immediately that the receiver is able to make up a statement of the company we propose to call a meeting of all the creditors for the purpose of showing them that our assets exceed our liabilities, and of determining what further action they may require."

Judge Seabury of the Supreme Court appointed John Z. Low, Jr., receiver for the company's property in New York, Pennsylvania and Virginia, on the application of James N. Taylor, attorney for A. H. Alden & Co., Ltd., of London. A receiver was appointed at Norfolk, Virginia, February 13, as it is a Virginia corporation.

This receivership in New York made it necessary for the firm of Geo. A. Alden & Co., of Boston, to consider what action it should take to protect the interest of its creditors, and after considering various possible courses, it decided that the most satisfactory action to take in the interest of all concerned would be to make an assignment which was done on February 17.

The assignees are: Mr. Archibald Blanchard, of the firm of W. O. Gay & Co.; Arthur H. Brooks, of the law firm of Myers & Brooks, both of Boston, and William L. Wadleigh, a commission merchant of Boston who is familiar with the rubber business. A public accountant has already been placed upon the books and a report of the firm's financial condition will be made at an early meeting of the creditors. Efforts are being made to accomplish a reorganization in order that the business in which the firm has been so long engaged may be continued.

Arrangement have been made by the Standard Asphalt and Rubber Co., 137 La Salle street, Chicago, to carry stocks of the material widely known as Alden's "M. R. X." These stocks will be carried in Chicago, Boston and Trenton, as well as in Liverpool, Hamburg and Paris, and rubber manufacturers may be supplied by sending to any of these addresses, or by writing to Mr. Geo. Watkinson, who has temporary quarters in the Alden offices at 77 Summer street, Boston.

AN AMERICAN FACTORY IN RIO DE JANEIRO.

In the December issue of The India Rubber World there was a paragraph referring to the fact that the Goodyear Tire and Rubber Co., of South America, had just been incorporated under the laws of Maine, with a capital stock of $3,000,000, for the purpose of operating rubber plantations and manufacturing rubber in South America. It was stated at that time that representatives of the company were in Brazil investigating the field.

Reports received within the last few days from Rio de Janeiro state that the representatives of the Goodyear company have met with much encouragement in their plans for a rubber factory in that city, and that the establishment of such a factory there is one of the probabilities of the near future.

A FINE RUBBER WINDOW ON BROADWAY.

The Rubber Exposition which was held in New York last Fall naturally excited a great deal of interest in the rubber industry, not only among those who visited the exhibition, but among the hundreds of thousands who read more or less about it in the daily print. One large manufacturing concern, at least, seized upon this general awakening of interest to give the public some further information regarding the industry. The Hodgman Rubber Co., at its large New York store on Broadway just North of Eleventh street, devoted one of its spacious display windows for several weeks preceding and during the holidays to an educational rubber display. As the window is 20 feet wide and 12 or 15 feet high, it gave ample opportunity for a creditable exhibit.

In the center of the window there were two large balls of Pará rubber which had previously been displayed at the exhibition, while at either side there was an exhibit of plantation rubber. These exhibits were described on large placards hanging immediately over them, which told what sort of rubber they were, and where they came from. In the background, and filling the rest of the window, were a great many manufactured articles made by the company, including their famous hot-water bottles and numerous rubber cushions, rings and bags—many of them covered with silk in attractive patterns. The window told at a glance the story of rubber from the crude product of the tree to the most finished product of the factory; and as the display was in the very heart of the downtown shopping district, it is safe to say that 100,000 people, probably more, stopped to look in this window and went away with a much more intelligent idea of what rubber is, and the uses to which it can be put, than they ever had before.

THE HODGMAN EDUCATIONAL RUBBER DISPLAY.

INDICTMENTS QUASHED.

Judge Dodge in the United States District Court in Boston, on February 6, quashed the indictment against Warren B. Wheeler, Stillman B. Shaw and G. Alden Wittemore, who were connected with Wheeler & Shaw, Inc., charging them with using the mails in a scheme to defraud in connection with the sale of stock of the North American Rubber Company.

The court held that the averments in the indictment, while they set up a scheme to deceive, do not show a scheme to defraud, and as it is only the latter that is prohibited by statute, no criminal offense was charged.

It is stated, however, that the government will seek a re-indictment.

THE FISK CO.'S NEW STOREHOUSE.

The Fisk Rubber Co., of Chicopee Falls, Mass., recently awarded the contract for the erection of a storehouse 240 feet long by 90 feet wide. The building will cost about $400,000 and will, when completed, add approximately 385,000 square feet to the present floor area of the concern, or nearly double the present area. The building will be located parallel to the tracks of the Boston & Maine Railroad and will be three stories high.

This company has just opened at Winnipeg a completely equipped branch house where it will carry a full line of Fisk tires.

THE HARMER RUBBER RECLAIMING WORKS RESUME.

The Harmer Rubber Reclaiming Works, of East Millstone, New Jersey, will resume operation on or before March 10.

On October 28, 1912, a fire, which started in the drying room destroyed practically their entire plant. The plant that was destroyed has been replaced by a number of fine fireproof buildings, the three largest being 105 by 140 feet, 60 by 140 and 30 by 76. In addition there are a number of smaller buildings.

The company will have an 800-horsepower plant equipped with new engines, and with the latest type rubber machinery, thus enabling them to double their former capacity. Their shipping facilities by both water and rail are good, as they have the Delaware and Raritan canal and the Pennsylvania Railroad siding.

Business will be resumed with orders booked ahead, and it is expected that a night shift will have to be added in order to make quick deliveries to their customers, who have patiently waited during the course of reconstruction. Recently, Mr. Marcus called on the Eastern trade and found all their customers pleased to see him again ready for business. At a recent meeting of the company, Mr. Laurie, president, and Mr. Marcus, secretary and treasurer, were re-elected for the ensuing year.

This company makes a special brand for supplying the insulating wire trade. It also has installed a separate department for the making of White Shoddy exclusively.

I. W. W. AFTER RUBBER RECRUITS.

The organization known as The Industrial Workers of the World, and generally referred to simply as "The I. W. W.," has been extremely active during the last month among the rubber and waterproof garment makers in Massachusetts, seeking to enroll them among its membership.

PERSONAL MENTION.

Mr. James H. Stedman, treasurer of the Monatiquot Rubber Works Co., accompanied by Mrs. Stedman, is enjoying a four weeks' sojourn at Hampton Terrace, Augusta, Georgia.

Mr. John M. Miller, Jr., the popular manager of the Goodyear Rubber Co., St. Louis, has recently returned from his annual visit to New York, and reports business for the past year very good and prospects for 1913 promising.

Alexander Adamson, of the Adamson Machine Co., Akron, Ohio, is spending a well-earned vacation in Florida.

L. M. Franklin, formerly with the Knight Tire and Rubber Co., Akron, Ohio, is now one of the Goodyear Tire and Rubber Co.'s Boston sales force.

Mr. P. W. Koebig, dealer in packing and rubber goods, moved his office on February 10, from 150 Nassau street to 116 Broad street, New York.

MR. I. R. BAILEY GOES TO THE GOODYEAR CO.

After an association of ten years with the Diamond Rubber Co., Mr. I. R. Bailey has joined the Goodyear Tire & Rubber Co., and will act as sales manager of the mechanical goods department. The company intends, beginning about the first of April next, to manufacture a complete line of mechanical goods, including belting, hose and packing.

The manufacturing department will be under the direction of William M. Metzler, who was for many years assistant general superintendent of the Diamond Rubber Co., and superintendent of the mechanical goods department.

WILL REPRESENT EASTERN PLANTERS IN NEW YORK.

A number of the Eastern planters have secured New York representation, and undoubtedly more desire it. A rubber man of excellent character and standing, still young, although he has had ten years' experience in inspecting and passing on crude rubber imports, wants to act as representative in New York for an Eastern planting company. This would appear to be a good opportunity for planters who want to do so to get in direct communication with the American market.

MESSRS. FROST ON A FLYING TRIP

We Americans rather pride ourselves on the rapidity with which we go through life. But evidently there are some Englishmen who are not so particularly dilatory. Messrs. Harvey and William Frost, of Harvey Frost & Co., Ltd., London, have recently paid the United States a flying trip. They landed from the Mauretania on Saturday, February 8, and embarked on the Baltic on Thursday, February 20. Taking out Sundays and Lincoln's Birthday they had eight working days. During that time they covered New York, Philadelphia, Washington, Buffalo and various points west of Buffalo.

Harvey Frost & Co. are known the world over for their repair equipments—particularly tire vulcanizers and repairers. They make all kinds, from large equipments for factory use, down to little $15 outfits with which the car owner can do his own repairing. It is stated that they own more patents on vulcanizing apparatus than any other concern in the world. They came to this country to look over the ground and learn what they could about the needs of the American trade. They met a great many people—particularly among tire manufacturers and dealers—absorbing much information and reciprocally imparted much.

If the Messrs. Frost were Americans we should call them hustlers, but being Englishmen we can only say that they are exceedingly energetic and enterprising men, and it is not at all surprising that their business, though established only nine years ago, has reached its present large proportions.

DATES ON TIRES.

According to reports, automobile tire manufacturers and others are scheduled to have another fight on their hands in New York, in connection with a proposed law requiring the placing of the date of manufacture on each tire produced.

TRADE NEWS NOTES.

The Century Rubber Manufacturing Co., of Plainfield, New Jersey, is making a fabric cord tire, for which there is an active request. This company has a completely equipped plant, including a well appointed laboratory, which might naturally be expected as the president, Dr. Harold Von der Linde, and the factory manager, Maurice L. Allard, are chemists of recognized efficiency.

The Baumann Rubber Co., of New Haven, Connecticut, has added to an already extensive product a line of high grade ice caps.

The Bay State Insulated Wire Co., of Hyde Park, Massachusetts, has recently completed its new laboratory, which is now one of the best in its particular line in that section. The company is preparing to make a fibre heel and sole which will be marketed under the name of Springwell Gum Fibre.

Terkelsen & Wennberg, 90 High street, Boston, are said to produce an excellent line of molds for rubber work. They are also making molds for composition or hard rubber substitute devices.

The Hoyt Rubber Co., of 58 Reed block, Boston, is making a line of footwear specialties, which are interesting the shoe manufacturing and retail trade.

C. J. Bailey & Co., of 22 Boylston street, Boston, are about to issue a new one-hundred-page catalogue, showing cuts and descriptive matter of the very extensive Bailey line, which will be sent to any address on application.

Ernest Jacoby, of 79 Milk street, Boston, is manufacturing a black and white substitute which has earned considerable reputation. The Jacoby factory is located in South Boston.

E. W. Furbush, manager of the Walpole Rubber Co., 185 Summer street, is one of Boston's busy rubber men. This company, in itself an important concern, controls several subsidiaries, all of which are working full capacity.

E. W. Graves, of Graves & Graves, of 95 Milk street, Boston, is the inventor of a complete line of rubber plantation tools and devices. Among the Graves' inventions are tapping knives, a latex cup and a unique type of ladder, all of which are highly esteemed by rubber growers.

The extensive plant of The Monatiquot Rubber Co., South Braintree, Massachusetts, is producing large quantities of the various brands of Indian-named rubbers made by this concern. The company's Boston manager is Merton A. Turner and its offices are located at 565 Atlantic avenue.

The Wellington Rubber Co., with factory located at Wellington (Medford), Massachusetts, and offices at 79 Milk street, Boston, are proofing for the trade.

The Hyde Park Rubber Co., proofers, now occupy the premises in Clarendon Hills, formerly occupied by The Atlantic Rubber Manufacturing Co., which is now operating in a new factory in Hyde Park proper.

The Dove Machine Co. is now occupying its new factory on Broadway, South Lawrence, Massachusetts. This concern, which specializes in various types of rubber machinery and devices, has a complete and up-to-date equipment, with ample facilities for extension, which is already among its early plans for the future. In addition to its rubber machinery business it has acquired the Ford automobile agency and in a very short time proposes to commence the manufacture of business trucks.

The Derby Rubber Co., Derby, Connecticut, now under the management of P. B. Price, a successful reclaimer, is producing what is known as "The Derby," a floating reclaimed rubber, which is giving remarkable results in the manufacture of hard rubber without the addition of any crude material to the compound. The Derby Co. is also making a high grade tire and tube stock as well as a wire-covering rubber, which is proving very satisfactory.

A FEW MORE CALENDARS.

Several calendars really worthy of mention were received too late in January to be included in the column devoted to such publications in our February issue.

Among those later calendars is a large and handsome one issued by The Republic Rubber Co., Youngstown, Ohio. The entire calendar is nearly 3 feet wide x 30 inches deep, and the essential feature of it, a handsome lithograph in ten or a dozen colors, is 30 inches wide x 20 inches deep. This shows an old farmer with his horse at the watering-trough. The two are gazing with much interest on a red touring car that has just whizzed by, leaving in the road the familiar tracks made by the Republic "Staggard" tread. The title of the picture is "It begins to look like we're back numbers, Billy." The picture is worth framing, and probably many of them will be.

De Lagotellerie, crude rubber importer, 24 Stone street, New York, has issued a wall calendar in bright colors, giving a half dozen half-tone pictures of rubber-shipping scenes in Brazil, and scenes on the New York docks where the rubber is received. The most useful feature of the calendar, however, is a map of the world, about 12 or 14 inches in width, which is a very convenient thing to have on the wall for reference.

The Eugene C. Lewis Co., bookbinders, 214 William street, New York, have distributed a very artistic little wall calendar, with a block pad devoting a leaf to each day of the year. This is mounted on a heavy card printed in gold and several shades of brown, the whole enclosed in a suitable cardboard box.

The Omo Mfg. Co., Middletown, Conn., makers of dress-shields, are also represented by a very tasteful calendar. It is intended for the wall, being about 16 inches long. It is printed in gold, black and gray on heavy cream-colored paper, which is mounted on gray cardboard and finished with a pearl-gray ribbon for hanging purposes.

H. F. Taintor Mfg. Co., makers of whiting, Paris white, chalk and China clay, have distributed a small desk calendar, each sheet showing the current month in figures of good size, while the preceding and succeeding months are shown in smaller figures at the sides.

A FINE LITTLE POCKET DIARY.

John Royle & Sons, Paterson, N. J., manufacturers of tubing machines, insulating machines and circular looms for the rubber trade, have distributed to their customers a very attractive little pocket diary, gilt-edged and leather covered. They explain the somewhat delayed appearance of this diary by the statement that an earlier edition was just about to be shipped when the publishing plant took fire and their whole edition was destroyed, making it necessary to print another. In the front and back of the diary there are several pages devoted to an interesting recital of what the company has done and is prepared to do. The following paragraph is taken from the story:

"Go over your equipment carefully. Find out what it costs to run each machine and what it gives you in return. Then look into Royle machines and see what an investment in better tools would pay in the way of annual returns. Financiers consider six per cent. a splendid return on an investment. We have built machines that paid the user nearly one thousand per cent. on the investment; and while we may not be able to do quite so well every time, we can do something for you well worth your while."

A DESK CALENDAR AND PAD COMBINED

A convenient combination of calendar and writing pad has been received by the customers of Stanley Doggett, 11 Cliff street, New York, dealer in chemical colors and compounding ingredients for the rubber trade. The writing pad, which is of excellent paper, is attached to a heavy mount about 3½ by 8 inches in size. Over the pad there is a calendar having a card for each month, the cards being inserted in a leatherette case. While the calendar is attached to the same mount as the pad, by reason of a double fold, it can be pushed up to the head of the pad and kept in an upright position where it stands, at a convenient optical angle, and leaves the pad uncovered for use.

THE THEODORE HOFELLER PLAYING CARDS.

Theodore Hofeller & Co., of Buffalo, New York, dealers in old rubber, have favored their friends with a very attractive set of playing cards, the face of the cards being, of course, like those in general use, except that the joker shows a half-tone print of the large Hofeller factory. On the back the cards are printed in crimson and gold and display this text artistically arranged: Theodore Hofeller & Co., Buffalo, New York; largest Dealers in Old Rubber in the World. It is a souvenir that is bound to receive a cordial welcome.

TRADE NEWS NOTES.

The Rubber Tire Repair Co., located at 915 East 15th street, Kansas City Missouri, is acting as a distributing center for the Shawmut brand of tires and other rubber goods for the territory around Kansas City.

About 85 per cent. of the second preferred stock of United States Rubber Co. has been deposited for exchange into first preferred on the basis of three shares of first preferred for four of second preferred. This represents approximately 85,000 shares.

The Alling Rubber Co., having a chain of stores in a number of cities in New England, New Jersey and New York, will open a store in Binghamton, New York, about April 1, at 157 Washington street.

The directors of the Boston Woven Hose and Rubber Co., have declared a quarterly dividend of $3 per share on the common stock, payable March 15, 1913, to stockholders of record March 5, 1913.

The International Auto and Tire League of Buffalo has reorganized, and its present name is the Northland Rubber Co., Inc. It is capitalized for $2,000,000 and has just completed a factory costing $350,000 with a daily capacity of 1,000 tires. The company has approximately 8,000 stockholders to whom they supply tires at cost. The secretary and general manager of the company, Mr. W. J. Hayes, is well known in New York banking circles.

The Keystone Rubber Manufacturing Co., of Erie, Pennsylvania, manufactures the "Keystone No-Cement Patch" for use on inner tubes made of Pará rubber, requiring neither cement nor acid to apply. This patch, now being extensively used, is a distinct innovation which will doubtless appeal to automobilists. In addition to the patch "Keystone Imperial Reliners" and a general line of automobile accessories are among the varied output of this company, which is now making everything in rubber goods with the exception of heavy mechanicals. The Keystone Co. has made remarkable progress since its inception, and its present factory is commodious, well-stocked and thoroughly equipped.

The Vulcan Rubber Co., Erie, has recently commenced the manufacture of mechanical goods.

The Allen Machine Co., Erie, is a recently organized corporation, now making rubber machinery.

The Speedway Tire Co. is a new rubber manufacturing concern at Louisville. H. S. Luman, the president of the company, is also president of the Falls City Construction Co. The secretary is Dr. Fred. L. Kauntze, a prominent Louisville physician. The practical department will be under the charge of H. W. Green, formerly of the Shawmut Tire Co.

The mill and washer equipment for the Speedway Tire Co., Louisville, was supplied by the Turner, Vaughn & Taylor Co., Cuyahoga Falls, which has recently added much up-to-date equipment to its plant.

A new rubber manufacturing company is in early prospect at Alliance, Ohio. No name has as yet been selected.

NEW INCORPORATIONS.

Albion Raincoat Co., Inc., February 17, 1913; under the laws of New York; authorized capital, $5,000. Incorporators: Henry E. Sanson, 149 Vermilyea avenue, New York, Edward B. and David C. Helwitz—both of 303 Marlborough Road, Brooklyn, New York. Location of principal office, New York.

Amper Electric Co., Inc., February 21, 1913; under the laws of New York; authorized capital, $25,000. Incorporators: Theodore D. Robinson, 453 Willow street, Lockport, New York, Ernest W. Jones, 61 Highland avenue, Buffalo, New York, and Charles L. Nichols, 45 Main street, Lockport, New York. Location of principal office, Lockport, New York. To deal in automobiles, automobile locks and switches.

Brooklyn Rubber and Metal Co., Inc., February 21, 1913; under the laws of New York; authorized capital, $9,000. Incorporators: Allan A. Deutsch, 405 Graham avenue, Brooklyn, New York, Morris Reicken, 86 Jefferson street, Hoboken, New Jersey, and Julius Pepperman, 368 Hicks street, Brooklyn, New York. Location of principal office, Brooklyn, New York.

Define Raincoat Co., Inc., February 1, 1913; under the laws of New York; authorized capital, $10,000. Incorporators: Rubin Fine, 54 East 11th street, Isaac Merlub, 106 Hester street, and Joseph Eisenberg, 52 East 117th street—all of New York. Location of principal office, New York. To deal in raincoats and rubber apparel.

Empire Rubber and Tire Co., January 2, 1913; under the laws of New Jersey; authorized capital, $1,000,000. Incorporators: Charles H. Baker, C. Edward Murray, and J. Cornell Murray, all of Trenton, N. J. To manufacture and sell rubber hose, tires for automobiles, etc., and to manufacture and sell rubber goods of every kind.

Goodyear Apparel Co., Inc., February 19, 1913; under the laws of New York; authorized capital, $10,000. Incorporators: Samuel Rosenstein, 308 East 72nd street, Henry Pearlman, 1001 Faile street, Bronx, and Carmie A. Panaro, 70 East 106th street, all of New York. Location of principal office, New York. To deal in waterproof and other apparel.

Kenneth Kernan Co., Inc., January 30, 1913; under the laws of New York; authorized capital, $10,000. Incorporators: Kenneth and Henrietta Kernan, and Elizabeth Graf—both of 428 59th street, Brooklyn, New York. Location of principal office, New York: To manufacture and deal in artificial limbs, elastic bandages, etc.

Motor Cycle Tire Co., Inc., January 27, 1913; under the laws of New York; authorized capital, $10,000. Incorporators: Henry W. Torney, 65 Park avenue, New York; Earl E. Beyer, 454 Riverside Drive, New York, and J. E. Beyer, Rochester, Indiana. Location of principal office, New York.

No Shock Wheel Co., Inc., February 21, 1913; under the laws of New York; authorized capital, $400,000. Incorporators: J. W. Ebbs, Englewood Cliffs, New Jersey, R. H. Waddell, 220 Broadway, New York, and A. A. Kelley, Montclair, New Jersey. Location of principal office, New York. To deal in autos, tires, auto parts, etc.

Panama Rubber Co., December 9, 1912; under the laws of California; authorized capital, $1,000,000. Incorporators: W. H. Newerf, W. E. McClune and John F. Roe—all of Los Angeles, California. Location of principal office, Los Angeles, California To manufacture automobile tires and all kinds of rubber goods.

Puncture Cure Sales Co., February 11, 1913; under the laws of New Jersey; authorized capital, $50,000. Incorporators: Frances B. Stewart, Howard F. Kirk and Charles H. Stewart—all of Newark, New Jersey. To acquire or purchase patents covering the manufacture of any device, substance or material to be used in the repair of automobile tires, etc.

Rex Tailored Raincoat Co., February 15, 1913; under the laws of New York; authorized capital, $900. Incorporators: Jacob Singer, 272 New York avenue, Brooklyn, New York, Moses Satz, 945 Fox street, Bronx and Isidor H. Brown, 1182 West Farms Road—both of Bronx, New York. Location of principal office, New York. To manufacture raincoats, etc.

The S. & M. Tire & Rubber Co., January 13, 1913; under the laws of Ohio; authorized capital, $20,000. Incorporators: Aleis Michler, Ervin S. Kintz and Charles M. Smith. To manufacture and deal in rubber and metallic tires and accessories for vehicles and other rubber products.

Savoie Tire Co., February 7, 1913; under the laws of Rhode Island; authorized capital, $100,000. Incorporators: Joseph Savoie, Central Falls, Rhode Island, Edward C. Glines, 33 Eddy street, and Harry D. Reed, 177 Westminster street, both of Providence, Rhode Island. To promote, develop and manufacture tires and protectors for automobiles and other vehicles, etc.

The United States Tire Filler Co., January 17, 1913; under the laws of New Jersey; authorized capital, $125,000. Incorporators: Robert B. and Harry E. Patton, 709 Linden street, Camden, New Jersey, and John R. Gorman, 219 South Fourteenth street, Philadelphia, Pennsylvania. To manufacture, buy, sell, trade, deal in and with patented and all other fillers of all manner and kind for automobile tires, etc.

UNITED STATES RUBBER CO.'S ISSUES.

Transactions on the New York Stock Exchange for four weeks, ending February 22.

Last year—High, 105; Low, 102½.

"THE INDIA RUBBER WORLD'S" NEW MEMBER.

The force of The India Rubber World was increased on February 26, by the arrival of Henry Pearson Norton, nephew of Mr. Henry C. Pearson, the Editor, and son of Mr. A. B. Norton, of the editorial staff. The young man has not yet fully decided what department he will assume, but as at present writing he is not quite a day old, there is still time to decide this important question.

A VERY PLEASANT COMPLIMENT FROM THE PAN-AMERICAN BULLETIN.

THE Bulletin of the Pan American Union gave an exceedingly comprehensive and interesting account of the Rubber Exhibition held in New York last fall, in the issue immediately succeeding that exhibition; and in the description there appeared this extremely gracious paragraph regarding the exhibit of THE INDIA RUBBER WORLD:

"One exhibit which was of absorbing interest to all visitors, whether personally interested in the industry or not, was the booth of THE INDIA RUBBER WORLD, the greatest industrial magazine not only in this country, but probably in the world, devoted solely to the india-rubber industry. This exhibit, while confined to a space of 20 x 35 feet, was unique and could not have been duplicated anywhere on earth, should it have been destroyed, for many of the interesting articles shown were the only ones in existence. Among these were relics of the days of Goodyear, some being products of his personal skill, other souvenirs of the triumphs of his later years. They included the book, made entirely of india rubber—leaves, covers, and all—which Goodyear labored on so long, and of which there is no duplicate. There were also the two fine life-size portraits, one of Goodyear and one of Daniel Webster, painted on hard-rubber panels, by Walsh, a distinguished artist of those days. There were also speciments of hard-rubber jewelry made by Goodyear and the Cross of the Legion of Honor conferred upon him by the French Government in 1854. Other interesting exhibits in this booth were articles and curios gathered by Mr. Henry C. Pearson, editor of THE INDIA RUBBER WORLD, during his sojourn in the rubber-growing countries of South America. Among these were unique designs made from rubber, such as a miniature rubber tree with a tiny *seringueiro* tapping it; snakes, insects, etc., molded out of balata or gutta-percha; and many other articles of interest to the casual visitor. The most instructive feature, however, of this exhibit was the extensive herbarium, showing the various botanical speciments of rubber, which was arranged around three sides of the booth. Large photographs of *Castilloa* trees and other plants decorated the walls and added to the attractiveness of the exhibit."

THE AMERICAN RUBBER MANUFACTURING CO.

The American Rubber Manufacturing Co., of Emeryville, Cal., has recently elected the following officers: President, A. Borland, of the firm of Bates, Borland & Ayer, general contractors; treasurer, H. C. Norton, formerly manager of the Pacific Coast Rubber Co.; secretary and factory manager, H. A. MacKusick; superintendent, F. I. Young. Mr. N. C. Dodge, formerly manager of the Western Belting & Hose Co., of San Francisco, has been appointed general sales manager.

The company is now building in its own machine shop a 25-foot by 50-inch belt press, and also another circular loom to take care of its increased fire hose business. They have also taken up on an extensive scale the recovering of paper mill rolls, and recently received one of the largest single orders ever given a rubber company for this class of work, consisting of ten 20-inch diameter by 120-inch face rolls. They have just been awarded 8,000 feet of 2¾-inch fire hose for the city of Oakland, 3,000 feet for the Isthmian Canal Commission, 2½-inch size, besides 7,200 feet 2½-inch for Manila.

THE U. OF P.'S AMAZON EXPEDITION.

The expedition which the University of Pennsylvania has been organizing during the last year for the purpose of exploring the Amazon, and particularly the tributaries of the Upper Amazon, will be ready to sail from this country within the next few days. The leader of the expedition is Dr. William Curtis Farabee, the Commander of the yacht is Captain J. H. Rowen, U. S. N., retired, and the physician is Dr. Franklin H. Church.

MID-WESTERN FLOODS AND THE RUBBER BOOT TRADE.

IT is truly an extremely ill wind that blows nobody good, and even at the heart of the gale some one is sure to benefit. Just for example, while most of the unfortunates who live close enough to the margin of the mid-western rivers to be reached by the usual spring inundations, yearly bewail their lot, the dealer in rubbers—and particularly in rubber boots—looks upon the situation with a great deal of complacency, not to say positive satisfaction. The recent floods that visited this section were the highest ever recorded, but as usual, people in the "bottoms" all knew that the flood could not come so high as to reach *them*. Government flood-warnings? They knew better! Over-night the rivers would surely go down. So they delayed and waited, and took things calmly.

And then it happened! The muddy, relentless water crept up and up. It filled the cellar. It came into the first story. It rose

A CINCINNATI STREET IN THE RECENT FLOOD.

to the ceiling, and still higher. Skiffs came to the second-floor windows to bring the prisoners supplies. In other places, skiffs rowed in and out the parlor windows.

Then came the demand for rubber boots. One needed these, and high ones, too, to wade about in the water, rescuing one's possessions. They couldn't be had quick enough; nor did it seem as if one could buy enough of them to supply the family, and willing rescuers. Rubber boots went up to a premium and, even when the river began descending, they were still above par,—for the work of clearing cellars, and of floundering through the mud left behind.

The picture, taken in Cincinnati, gives a good idea of the indispensability of rubber boots at flood-time.

A NEW RUBBER COMPANY IN ST. LOUIS.

A new rubber company, the British American Rubber Co., has taken a long lease of property on the corner of Tenth and St. Charles street, St. Louis, Mo., for the manufacture of rubberized cloth, raincoats and other waterproof garments, and will soon install machinery. Among those interested in the company are Gerard B. Allen, John H. Gundlach, H. Lueddinghaus, Jr., and W. H. Geisse.

A CHANGE OF NAME.

The name of the Simplex Electrical Co., with offices in Boston, Chicago and San Francisco, was changed on February 1 to Simplex Wire & Cable Co. This does not, however, involve any change in the management or interest.

Official India-Rubber Statistics for the United States.

Fiscal Year Ended June 30, 1912.

OBITUARY RECORD.

W. W. WALLIS

SUDDENLY and without a note of warning came the death of Walter W. Wallis, for 28 years the manager of the Goodyear Rubber Co.'s Milwaukee branch. Apparently in his usual good health, he arose at 6 o'clock Sunday morning, February 9, to bid goodby to a guest who had been visiting him for several days and who was obliged to take an early train. When his absence from the house was first noticed, it was thought he had accompanied his friend to the station, but when it became evident that he had not left the house a search was instituted and he was found in the basement, whither presumably he had gone to look after the furnace; but when discovered life had been for some time extinct.

Mr. Wallis was born in Milwaukee, November 18, 1852, and lived there all his life. After graduating from the public school he became connected with the Milwaukee branch, then just established, of the Goodyear Rubber Co. and in 1885 was made its manager, a position he occupied with marked success until the day of his death. He was a man of exceptional energy and conscientiousness; his house enjoyed a fine reputation in the trade, and for the year just closed showed the largest volume of sales, if not the greatest amount of profits, in its career.

Notwithstanding the time and thought and hard work that he devoted to his business, he did not let that engross his entire attention. He was an active member of the Merchants' and Manufacturers' Association of Milwaukee, and was conspicuously active in the philanthropic and religious life of the city. He was for many years a trustee of the Y. M. C. A. and was especially energetic in advancing its prosperity. He was also for many years a trustee of the Park Place Methodist Church and superintendent of its Sunday School. The esteem in which he was held by those who knew him best is shown by a statement made by one of his life-long friends, which appeared in one of the local papers the day after his death, which contained the following tribute:

"I knew Walter W. Wallis for nearly fifty years. We have worked for many of the same causes. I knew him as a friend and a companion, and the shock of his untimely death comes as a benumbing blow.

"He was one of God's true noblemen, a loving husband and father, a loyal friend, a great-hearted, Christian gentleman, whose hand was ever ready to help the fallen, whose every heart throb was given for the betterment of life and living, whose purse was ever open to every good cause, whose time was considered as a gift from God, to be used for the benefit of his family, his friends and the city of his birth."

Mr. Wallis is survived by his wife, four children—Mrs. F. H. Bennett, Baltimore, Mrs. Harold Detienne, Milwaukee; Winifred Wallis, at home, and John L. Wallis, a student at the University of Wisconsin; also by two sisters—Mrs. H. C. Graham, Milwaukee, and Mrs. G. L. Richards, Chicago—and two brothers, John and Irving, St. Paul.

The funeral was held at his home, February 11; the pastor of the church to which he had been so long attached officiated.

WALTER F. JONES.

Walter F. Jones, assistant general manager of the Revere Rubber Co., died at his home in Chelsea, Massachusetts, Tuesday, February 11, after a somewhat prolonged sickness of typhoid fever. Mr. Jones was a successful business man. Born in Chelsea 37 years ago and educated in the public schools. He entered the employ of the Revere Rubber Co. as clerk when 15 years of age. Quick to learn, active and efficient, promotions came rapidly and he was made chief clerk of the business office in Boston, then traveling salesman, afterwards factory manager and later assistant general manager.

The burial services were held at his late residence and were attended by many men prominent in business and finance, including also many of his associates in the Revere Rubber Co. and representatives of the several Masonic bodies with which he was affiliated. The officiating clergyman was the Rev. H. W. Slebbins, who performed the ceremony at the wedding of Mr. and Mrs. Jones about ten years ago. The pall-bearers, all associates of the Revere Rubber Co., were: A. R. Taft, E. H. Scribner, H. Z. Cobb, J. H. Learned, A. A. Learned, G. P. Whitmore, A. Y. Tucker and H. L. Williamson.

FRANCISCO I. MADERO, JR.

Francisco I. Madero, Jr., who recently, under compulsion, resigned the presidency of the Republic of Mexico, was assassinated in the city of Mexico a short time before midnight on February 22. Up to three years ago the late president was known only as a member of one of Mexico's oldest and most influential families—a family which had amassed great wealth through real estate holdings, and particularly through the fact that it owned vast sections of land covered with the *guayule* shrub. Not a

Francisco I. Madero, Jr.

little of the family's wealth came from this source and from the several *guayule* factories owned by the Maderos in different parts of Mexico. When Madero's grandfather, Don Evaristo Madero, died in Los Angeles in the spring of 1911 it was estimated that his wealth equaled $20,000,000—an extraordinary figure for Mexico.

But the fame of Francisco I. Madero, Jr., as a figure in the rubber world has been entirely eclipsed during the last three years by reason of his political activities. While nature endowed him with almost none of the qualities for the leadership of a turbulent people, his revolt against the Diaz domination, which occurred in March of 1910, came at the psychological moment, and many Mexicans flocked to Madero's banner simply because they sympathized with him in his opposition to Diaz. From that time, three years ago, to the time of his death, his life was crowded with moving incidents. In June, 1910, he was thrown into prison by Diaz, but a few months later escaped, recruited troops, and in February, 1911, fought against the administration forces. In the following May Diaz was compelled to resign, and Madero

became provisional president, and a few days later, in June, entered the capital city acclaimed by the populace as "the savior of Mexico." In October, 1911, he was elected president, practically unanimously; but was not fitted for the herculean task before him. He lacked the dominating personality required to rule an unruly people. His administration was rendered ineffective by constant and widespread opposition.

But the grave crimes that are already laid at the door of his successor could not be charged against him. He was singularly lenient with his enemies, abhorred blood-shed, and did not seek revenge. He was, in fact, an idealist, and entirely wanting in the iron qualities needed for the administration of Federal affairs in our neighboring republic. Madero was in his 48th year.

H. L. HOAG.

Harry L. Hoag, manager of the Alling Rubber Co.'s store at Pittsfield, Massachusetts, died February 12 of pneumonia at a private sanitarium in Hartford, Connecticut, after an illness of three weeks. Mr. Hoag was born in Danbury, Connecticut, thirty-five years ago. He was formerly employed in the Hartford store of the Alling company, being transferred to Pittsfield as manager six years ago. He was a member of the Park Club and of the South Congregational Church of Pittsfield.

NEW TRADE PUBLICATIONS.

A TIRE LESSON WITH A MORAL.

In an attractive booklet with above title, the Ajax-Grieb Rubber Co. has dealt with the consequences of inattention on the part of the driver, at the same time giving some valuable advice regarding the means by which the life of a tire may be prolonged. The various forms of injury by chains, fabric rupture, blow-outs, sand-blisters, neglected cuts, rut wearing, under-inflation, faulty alignment and other causes, are successively treated.

"How to attain a greater mileage" is the subject of detailed recommendations. Finally, a scale of the proper inflation indicates the gradations applicable to various sizes.

Two other attractive booklets with the titles, "Figures that Don't Lie," and "A Word to the Wise," discuss various aspects of the tire problem, as solved by the "Ajax." The former contains a table showing cost of "Ajax" in comparison with other guaranteed makes.

In the latter, reasons are adduced in proof of the advantage of the 5,000-mile guarantee, carried by the Ajax tire. Attention is likewise called to the fact that this guarantee is a written one, signed by the president of the company. These booklets show that the Ajax-Grieb Co. is well to the front in the matter of attractive publicity.

CATALOG OF RUBBER GOODS AND BELTING.

Apart from the staple articles of rubber manufacture, there are a large number of rubber mechanical accessories, indispensable to industrial and manufacturing operations. These form a special branch of the rubber industry, the extent of which is shown by the general catalog of W. H. Salisbury & Co., Inc., of Chicago, containing in its 257 pages a vast quantity of matter interesting to the prospective buyer. It comprises two main divisions; one of them (180 pages) subdivided into belting and belting supplies, hose and hose supplies, and engine room and plumbers' supplies. The other division (77 pages) includes: mats, matting and tiling, clothing and sundries, and miscellaneous goods.

One of the most useful features of this catalog is the abundance of its illustrations, brought out with remarkable clearness. To the distributor of any of the lines indicated this booklet will be extremely interesting and useful.

THE GORDON NEWS.

That brevity is consistent with attractiveness is shown by "The Gordon News," the bright house-organ of the Gordon Rubber Co., Canton, O. Within its four pages is grouped a quantity of literary material of interest, naturally leading up to the subject of the "Household Rubber Glove." A portrait of Mr. C. W. Keplinger, the president, gives a personal feature to this little publication, carried further by the list of "The Men Behind the Goods," including its administrative and distributing staff.

THE UNITED STATES TIRE CO.'S MONTHLY.

The publication issued by the United States Tire Co., entitled "U. S. for Us," has changed its form from a small pocket size to a shape more uniform with the popular magazines, being now 7 x 10 inches in size. The January issue is devoted quite largely to the New York Automobile Show, and contains a fine gallery of half-tone prints of the various cars displayed at that time.

A HANDSOME TENNIS BOOKLET.

The United States Rubber Co. has just issued its net price list of tennis, sporting and outing shoes for 1912-13. Hitherto these price lists have been very modest in their appearance, simply illustrating the various shoes with a few lines of description and the prices. But this year the tennis list appears as a 16-page booklet printed in colors on a fine quality of paper, with a very artistic scene of some sporting event occupying the upper third of every page. These scenes are admirably drawn and are reproduced in delicate water-color effects. They show a golf field; a yachting race, with the winner just passing the home buoy; an exciting tennis match; a base-ball game; a gymnasium scene, with young athletes doing some wonderful work on parallel bars; a bathing scene, and a hot basket-ball fight between a couple of college teams. The booklet gives all the information that the former lists contained, but in such an artistic setting that anyone receiving one of these lists is sure to preserve it.

LATEST GOODRICH LITERATURE.

The latest batch of Goodrich literature is fully up to that company's standard. One of its most attractive features is a neat folder showing in four cuts the gathering and manufacture of the cotton which forms the "backbone of the tire," as it is pertinently called. The Goodrich fabric is made only of the finest selected long staple Sea Island cotton, of which upon selection not ten per cent. is approved. Braided Fabric Hose is also illustrated by an attractive card. In another tasty folder the merits of the "Meteor" Golf Ball are told.

Prominent among the more extensive features of this effective group of advertising matter is an illustrated catalogue of the "Goodrich Pneumatic Truck Tires," as well as a circular of the "Goodrich Wireless Motor Truck Tires," it being recorded that 570 motor truck tires of other makes were recently changed in one month to "Goodrich Wireless." A group of testimonials from various classes of tire users, in a neat booklet, serves to hold the smaller items of this attractive collection of Goodrich lore. The booklet is entitled "Kismet," the "reason why" being told by its introduction.

A BANIGAN CATALOG.

The Banigan Rubber Co., of Baltimore, has issued a highly creditable catalog describing and illustrating the great variety of rubber footwear carried by this company. The catalog contains a mass of information, given in compendious form, and shows, by means of large-sized half-tones, what the varieties of footwear described look like. In the back of the book there is a photographic picture of the Banigan company's factory at Woonsocket, Rhode Island.

The Editor's Book Table.

A MANUAL OF SHOEMAKING AND LEATHER AND RUBBER Products. By William H. Dooley, Principal of the Lowell Industrial School. With 41 illustrations. Little, Brown & Co., Boston, Mass. [8vo. 280 pp. Cloth. $1.50 net.]

WHEN the Lynn Commission on Industrial Education desired a text book on shoe manufacture, to be used in the proposed shoe school in that great shoe city, it was found that there was no such text book in existence in the English language, and the principal of the Lowell Industrial School, Mr. William H. Dooley, was invited by the Commission to prepare such a work. He accepted the invitation and devoted a great deal of time in collecting material for a book of shoe making He visited the factories of Europe, as well as those of America; and the result of his labors is a compendious book of 280 large-print pages, with many illustrations, giving in concise, clear and intelligible form all the essential information relating to the manufacture of leather and rubber boots and shoes.

The greater part of the book is devoted, naturally, to leather footwear. He describes hides and their treatment, methods of tanning, how shoe styles are made, and the departments of a shoe factory. He tells the difference between the old-time making of shoes, where each cobbler supplied the footwear for his immediate neighborhood, and the present perfected methods which pour out vast quantities of finished shoes every day from the great factories of New England and the West.

The last chapter in the book, devoted to the history of footwear will be, for the general reader, one of the most interesting; but the chapter that is most important from the standpoint of the rubber industry is that devoted to "Rubber Shoe Manufacture and Terms." Here the author begins with the collecting of the latex in the Brazilian forests and on the plantations, and follows the coagulated rubber from the shipping docks at Pará and in the East to the American factory, where it is duly cleaned, dried, compounded, calendered and cut up into the component parts of boots and shoes. Then he describes the method of constructing the boot and the shoe from these various parts, and follows by describing the processes of varnishing, vulcanizing, packing and shipping. It is an interesting story, and while it will afford no additional light, naturally, to people experienced in the practical work of the factory, it gives to the uninitiated—the student in the industrial school, the beginner in the factory, and especially to the general reader—all the essential information regarding, at least, the rudiments of rubber footwear making, and gives it in a clear, concise and readable form.

WEST INDIAN TALES OF OLD. BY ALGERNON E. ASPINALL, author of "The Pocket Guide to The West Indies" and "The British West Indies—Their History, Resources and Progress." Illustrated. Duckworth & Co., London. 1912. [8vo. 260 pp. Board covers.]

Readers of this publication will doubtless remember earlier reviews of books by Mr. Aspinall. His book on the British West Indies was reviewed at some length in the June, 1912, issue of THE INDIA RUBBER WORLD. That book contained one chapter on the rubber potentialities of the British West Indies, which, though not long, was full of interesting information.

Mr. Aspinall's latest book, "West Indian Tales of Old," contains nothing about rubber, but having to do with a part of the world in which rubber production is a matter of constantly increasing importance, it ought to appeal to people interested in rubber countries. This book contains eleven different stories, largely historical, somewhat legendary, and all good reading. The opening story, "Benbow, the Brave," describes some of the chivalrous deeds of the redoubtable English Admiral, who, a little over two centuries ago, drove the pirates away from the British possessions in the West Indies, and later, single-handed—deserted by the cowardly captains of his fleet—engaged the French, and against great odds gave an exhibition of English pluck and naval prowess, which has been a treasured incident in English history ever since. By way of introduction to the brave Benbow, there is a graphic description of the destruction of Port Royal at Jamaica Bay by an earthquake in 1692.

One story in the book that will appeal to the lovers of the mystic is "A Barbados Mystery," which relates the extraordinary occurrences that took place about 100 years ago in a certain tomb in the church-yard of Christ Church, situated on the south coast of Barbados. The moving events recorded in the story must have occurred, as they were vouched for at the time by all the local dignitaries of State and Church, but no explanation has ever been given of these gruesome phenomena.

Another extremely interesting story is "The Legend of Rose Hall," which tells of the cruel fate that overtook an exceedingly cruel woman, who, nearly a century ago, was mistress of this famous mansion, which still stands (in a dilapidated condition) near Montego Bay on the North Coast of Jamaica.

For tourists intending to embark for a cruise through the West Indies, Mr. Aspinall's book can be most highly recommended. It will greatly increase their interest in the scenes and places that make the West Indies so attractive to visitors.

THE OPERATION, CARE AND REPAIR OF AUTOMOBILES. Edited by Albert L. Clough. Revised Edition. New York, 1912. The Horseless Age Company. [Cloth. 300 pages.]

In the above comprehensive and detailed work Mr. A. L. Clough, of the editorial staff of the "Horseless Age," has grouped together a number of facts and suggestions of material value to those seeking light upon the operation of the automobile, as well as upon the best remedies for the various troubles connected therewith.

While it contains a number of sections dealing with various sub-divisions of the contents, the work has nine main divisions. In the first the subject of "Ignition" is treated in 96 pages, with full descriptions of the jump spark and torch spark ignition systems. While the latter unites electrical simplicity with a notable degree of mechanical complication the contrary is the case with the former, which is electrically more complex but simpler mechanically. Hence it has apparently been very generally adopted.

"Carburation" deals in 27 pages with the properties and treatment of gasoline, including its filtration and storage, as well as with carburetor troubles and their remedies. It finally discusses fuel consumption as a criterion of a car's condition.

Proceeding from the mechanical to the accessory features of the subject, the next point dealt with is "Lubrication," to which 18 pages are devoted. One of the most interesting chapters is that upon how to locate abnormal friction in the moving parts.

Specially interesting to the rubber man who may be also owner of an automobile is the section of 28 pages treating of tires, the scope of which is indicated by the headings of the principal chapters: "Wear due to Faults in Tire," "Some cases of Abnormal Wear," and "Hints on Tire Maintenance." Repairs, demountable rims and other kindred subjects also receive attention.

Other divisions of the work are: "Inspection, Care and Use of Motor Cars" (49 pages); "Garages, Washing and Shipping Cars" (21 pages); "Repair Suggestions" (50 pages), and "Winter Use of Automobiles" (17 pages). A well arranged index facilitates reference.

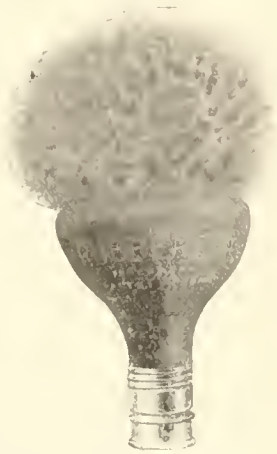
The total of 300 pages therefore covers all branches of the subject, while at every step the reader is aided by one of the 180 illustrations, which, in conjunction with several graphic charts form one of the most valuable features of the work.

Combining as it does a large amount of personal knowledge with valuable journalistic experience, Mr. Clough's work may be regarded as a distinct acquisition to automobile literature.

New Rubber Goods in the Market

A RUBBER-SET WAGON WASHER.

AN inventive genius associated formerly with one of the oldest rubber manufacturers in the country has invented a rubber-set washer for vehicles. It consists of a rubber cup-shaped bulb provided with a coupling at one end so that it may be attached to a hose, while the other end is open and clear, with inturned rubber teeth. A sponge is inserted in this open end, and the water turned on, the pressure of which bends the rubber teeth outward so that they take a tight grip on the sponge.



This washer has various obvious advantages. In the first place, the sponge can retain no grit to scratch the varnish, because the force of the water passing through it necessarily cleans away all grit. It has no metal parts to come in contact with the varnish, and there is no waste of water, as all the water used must pass through the sponge, and be applied at the spot that is being cleaned. Moreover, there is no splashing, as is usually the case where a sponge is used in the hand. The mechanism is simple in construction, the sponge being easy to insert and to remove when the pressure of the water is relaxed. [Rubberset Co., Newark, N. J.]

RUBBER GARMENTS TO REDUCE SUPERFLUOUS FLESH.

THE world can be divided into two classes—the thin who want to get fat, and the fat who want to get thin. For the first class there is little hope; but for the second class there are sundry avenues of escape. One recently opened is a medicated rubber garment, or more properly, a series of such garments of various styles and sizes, intended to cover the male or female anatomy—in whole or in part—invented by a New York woman doctor. The accompanying cuts show some of these garments. The statement is made that if these garments are worn by people with undue flesh—particularly if they walk or take other exercise while wearing them—the superfluous avoirdupois will gradually melt away. The further statement is made that these garments can be worn with perfect safety, and that they are endorsed by leading physicians. [Dr. Jeanne Walter, 45 West 34th street, New York.]

A PNEUMATIC TIRE IN SECTIONS.

One great trouble with the pneumatic tire is the fact that all the air is in one tube and when anything goes wrong with that tube, even a little puncture the size of a tack point, out goes the air and away goes the tube. Now some inventive people in Trenton, New Jersey, have devised a pneumatic tire that is composed of distinct sections—6 to 10 sections making a complete inner tube—and each of these sections will have 30 cells running its length, so that the complete tube is composed of from 180 to 300 small tubes; anyone of which can be punctured and blown-out without affecting the others. It is called "the Roberts Sectional Pneumatic Tube" and it embodies the old proposition of dividing a large space into several smaller spaces like the tubular boiler and water-tight compartments in a ship.

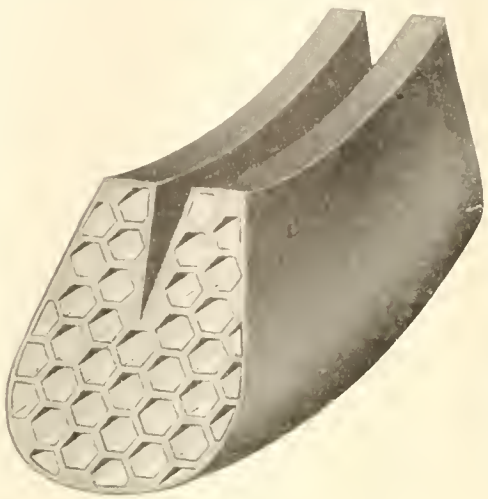


FIG. 1

Each section—molded with one end closed and the other open, as is shown in Fig. 1—is put in a patented machine filled with compressed air, and at the same time the open end is sealed, by a cap of rubber and fabric being vulcanized over it. When taken from this machine it appears as in Fig. 2. The V-shaped cut has spread apart, thus allowing for the expansion of the rubber.

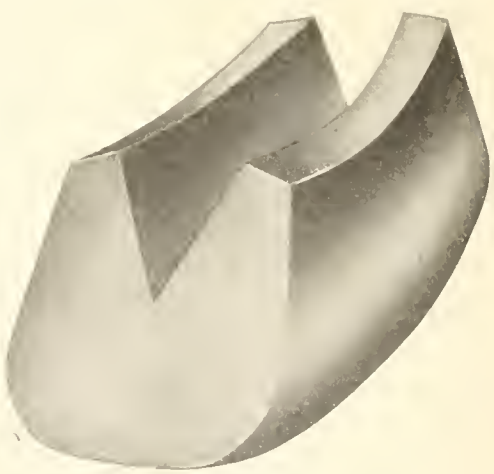

FIG. 2.

The necessary number of these sections are now cemented together, forming a ring the exact size of the inside of the shoe. To put on a wheel take the ring of sections, place in a shoe, then with an ordinary tire-iron or C-clamp draw the points of the V together and push the beading of the shoe under the rim. The pressure of the V is sufficient to hold the shoe on the rim.

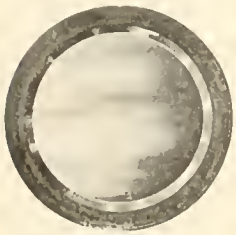
It can be seen at a glance that blowouts are impossible. A nail would not penetrate more than three or four of these cells, and, as these cells are not connected, the air would

escape only from those actually punctured, the rest remaining intact.

The company expects to have these sectional tires on the market in the early spring. Roberts Rubber Manufacturing Co., Trenton, New Jersey.

SHAVING BY PNEUMATIC AID.

Thousands of fortunate people are now able to ride to their morning labors on pneumatic tires. These same people and thousands of others can start the day by shaving (if they so elect) with pneumatic assistance. Some inventive genius in Connecticut (the whole rubber industry is based on the invention of a Connecticut genius) has devised a mirror called the Aero Safety Mirror, with a rubber edge and rubber back. This rubber back, being slightly concave in form, can be pressed against a window-pane—the raised rim being slightly moistened—and will remain there when the hand is removed, because a slight vacuum is created, and the mirror is held by the pressure of the air. In other words it is a suction mirror. This mirror is of use not only to shavers, but to others, as it can be used in any place where there is a smooth surface to press it against. For instance, ladies, after a 60-mile jaunt in an auto can put the mirror up in front of them to see how much is left of their complexions, and how much awry their bonnets are. The rubber back and raised rubber edge also prevent the glass from breaking should it happen to fall. [Aero Sales Co., Hartford, Connecticut.]



The Aero Safety Mirror.

SUCTION PUMP FOR CLEANING PIPES.

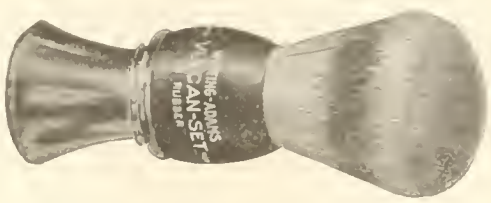
Life contains few more aggravating experiences than the stopping-up of a drainage pipe with the resulting overflow of bath-tub or wash-bowl. The cut shown herewith illustrates a new pump—the Noppel Force and Suction Pump—which is used for removing any obstruction that gets into the plumbing. The particularly effective feature of the pump is a double lip vacuum cup. [George W. Heiland, 99 Beekman street, New York.]

A NEW TIRE VALVE.

This tire valve is made by The Burke Valve Co., Cleveland, Ohio. It differs from the regular valves in many ways. First, the valve stem is made in two parts, so that if it becomes bruised at any time on the end the end stud can be changed for a new one instead of changing the whole valve. This has a lead gasket to insure a tight joint. Second, the plunger has no spring, being a balanced valve; the pressure in the tube equaling that of the pump, so the valve closes automatically. Third, this valve has three ports for air to pass through, so that when pumping up a tire it can be done in very much less time. Those who pump up their tires by hand will be surprised at the ease and rapidity with which the tire is inflated. It has another good point—the reversible valve seat, of rubber, which rests in a metal recess in the valve seat.

"VULCAN-SET IN RUBBER" SHAVING BRUSH.

From its general adoption the safety razor has evidently come to stay. One of the results is that the individual shaving brush has in many cases become an indispensable toilet adjunct for the sterner sex. This widely extended use has encouraged manufacturers to meet the demand for better brushes and this has been effected by the "Vulcan-set in Rubber" shaving brush. The bristles and hair are first imbedded in rubber of best quality in a plastic condition, which is then vulcanized as hard as granite, by which means it becomes impossible for the former to be loosened. The brushes are made by new machinery especially constructed for the purpose, and every bristle is firmly locked in its place, being, moreover, not liable to injury by heat.



This brush has been adopted as the standard by the United States Navy, having been re-ordered in January, 1912, after experience of its use during the voyage round the world of the White Squadron. The makers claim to be the largest brush manufacturers in the world. [John L. Whiting-J. J. Adams Co., Boston, Massachusetts.]

THE "SIOUX CHIEF" BOW AND RUBBER-TIPPED ARROW.

Old as history, archery has still a living interest as an outdoor sport. While its main features differ only in detail from those known in ancient times, these details in themselves constitute appreciable improvements. Archery has at all times been a favorite sport of young people, and it is largely for their benefit that much enterprise has been shown by manufacturers in this line.

In this connection the "Sioux Chief Bow" claims to represent the latest developments. It is a steel bow with a hardwood arrow. The bow and handpiece are of polished nickeled steel 26 inches long, while the arrow is of polished hardwood 15 inches long, with soft rubber tip and weighing only eight ounces.

With the above advantages and its low retail price of 25 cents, it is considered likely to do much to revive the former taste for archery contests. [Markham Air Rifle Co., Plymouth, Michigan.]

NEW RUBBER WATERPROOFING LIQUID FOR LEATHER.

The waterproofing of leather by means of oils as hitherto practiced by tanners, has had the disadvantage that the oils quickly wear off, leaving the leather in a hard and unsatisfactory condition. "Leakanot" is the result of many years of painstaking efforts to obtain rubber in such form that it will penetrate and be absorbed by leather. It wears off very slowly, leaving the leather perfectly soft and pliable, ready for another coating after many weeks of wear.

Another distinctive advantage of "Leakanot" is that it does not discolor tan leather; thus appealing particularly to ladies wearing light colored shoes and to men of particular taste in their footwear.

For retail trade it is put up in large 50-cent containers, sufficient to waterproof several pairs of shoes, thus being calculated to last the individual customer at least one year. [National Rubber Co., St. Louis, Missouri.]

The India-Rubber Trade in Great Britain.

By Our Regular Correspondent.

A SERIOUS fire broke out early in the morning of January 17 at the works of the Leyland and Birmingham Rubber Co., Limited, at Leyland, the resulting loss being somewhere near $40,000, which, however, is covered by insurance. It is a very long time since a British rubber works has experienced such a conflagration, and it has been an arduous time for the directors, all of whom remained at hand for a week. With regard to the business, I am officially advised that comparatively little interruption has occurred, the boilers and engines being untouched. Moreover there was duplicate machinery at hand. A feature of these works is the area of ground covered with low buildings instead of the small space occupied by six or seven story buildings to be found in other important works. The building in which the fire broke out was one of the highest, being of three stories, this being the only part remaining of the original works. It was used mainly for the manufacture of surgical goods, and naturally contained much inflammable material, though no light at all has so far been thrown upon the origin of the fire. The rebuilding of the burnt portion is now being actively proceeded with on the most modern lines; and as this has long been contemplated the fire, though not perhaps to be considered a blessing in disguise, has not proved an absolute catastrophe.

FIRE AT LEYLAND WORKS.

It is announced that Mr. W. H. Veno has retired from the board of this company, and that the directors have elected Mr. G. W. Panter, a large shareholder, in his place. Mr. Veno was one of the new directors elected in the autumn of 1911, at the time of the first adverse balance sheet. A more surprising announcement is that Mr. George Spencer, the managing director, has resigned all connection with the company. Mr. Gray is succeeded as works manager by Mr. G. W. Price, late of the St. Helens Rubber & Cable Co., Ltd. The sales department remains in the hands of Mr. W. Downs, while Mr. M. M. McGregor, lately with the Calico Printers' Association, Ltd., has been appointed commercial manager. Mr. G. H. Cartland, for so long the chairman of the company, remains at his post, while there is no announcement of a new managing director.

CHANGES AT THE GORTON RUBBER CO.

The report of the company for its last financial year was referred to in The India Rubber World for December last, and it does not need much reading between the lines to see that the late managing director must have had an arduous time in his efforts to put the company again on a dividend paying basis after the relapse in 1911. The company reports that it is full of orders and expects a busy year in connection with the cycle tire trade. This is its most important branch, though playing balls, heel pads and various mechanical goods are made at the Gorton works.

It is announced in the papers that the certificate of the British Fire Prevention Committee has been awarded to Cellit non-flaming cinematograph films, this being the only celluloid substitute thus far to receive it. It can hardly be said that the committee has acted precipitately as the discovery of cellit was announced in 1901 at the works of the well-known Bayer Co. in Germany, though it certainly was not brought to perfection until many years afterwards. The main thing about its composition is that it is a cellulose-acetate camphor, instead of a cellulose-nitrate camphor body.

NON-FLAM CELLULOID.

The main drawback, if such a term is applicable where danger to life is concerned, is that cellit cannot at present compete with celluloid in the matter of price, owing to the high price af acetic acid compared with nitric acid. This may affect its sale for general technical use, but if it really is quite satisfactory for film making there is great probability that its use will be made compulsory, higher price or no. It is reported that the important Paris firm of Pathe Frères tried this substance for films two years ago, and found it satisfactory. This is important in view of the reiterated statements that the "non-flam" celluloid substitutes have all proved failures. Cellit is not incombustible, but it only ignites with difficulty, and then smoulders; while celluloid, as is known, shoots into flames under conditions which leave cellit unaffected. No doubt some definite evidence will be given before the Commons Committee which is now investigating the subject of celluloid and its storage.

I have no wish to go into controversial political matters, but may be allowed to state that rubber manufacturers, among many other classes, have lifted up their voices to declaim against the Insurance Act of 1912. Some of those, however, who previously complained are now in a more tractable mood. These are the surgical goods manufacturers who are inundated with orders for bandages, etc. In the past a retail chemist stocked whatever goods pleased his fancy; now, however, those who are on what are called the insurance panels are bound to stock a certain quantity of specified goods, among which elastic bandages are prominent. The demand for these goods is consequently heavy at the moment, and coming as it has on the top of the demands from the Red Cross societies operating in the Balkans, it has caused stocks to be cleared. With regard to one form of bandage—the plain, cured, cut sheet—there are only four or five British makers; though competition from the Continent has to be met in this as well as in the elastic fabric and spread rubber varieties.

IT'S AN ILL WIND, ETC.

The amusing skit "Hoolihan on the case of Caasey" in The India Rubber World for January, based presumably on facts, reveals a state of affairs in a branch of American rubber manufacturing which is without parallel in this country. An approach to it is in the case of government contracts, where a clause empowers the right of inspection of the rubber works as desired by an official of the particular government department concerned. These officials do not pretend to have any expert knowledge of the manufacture, and as a rule the inspections do not take place while the contract is in hand, the samples for analysis being taken from deliveries. Perhaps a nearer approximation to the procedure of the Underwriters' Laboratories is to be found in the case of the engineering firms in Westminster, which act for various Indian colonial and foreign railways. These firms have inspecting engineers in their pay to make periodical visits to the works with which they are contracting. These inspectors are invariably engineers who are more at home in the steel works than in the rubber factory, in the latter case usually contenting themselves with cutting off a sample of the vulcanized rubber and sending it to headquarters for analysis. So far, except in the case of the Cable Makers' Union, which is not really comparable, there is no tendency on the part of British rubber manufacturers to certify that goods intended for general use conform to standards fixed by any association or committee. They prefer to do things their own way without dictation. This, of course, does not apply to specific contracts, where the rubber has to be made to a formula supplied. With regard to formulas I see that the new specifications for underwriters' fire hose call for 40 per cent. "Fine Pará" instead of "Pure Pará." For many years it was customary for the British Admiralty and various railway com-

HOOLIHAN ON CAASEY.

panies to specify that Fine Pará rubber only was to be used. A few years ago, however, the word Pará was deleted, and what is known as the Admiralty 8 A specification now reads, "to be made of fine rubber, with no added ingredients other than sulphur and white oxide of zinc. The sulphur is not to exceed 3 per cent. and the white oxide of zinc 40 per cent. To endure a dry heat test of 320° F., without impairing its quality; the material to be non-porous, of uniform quality and free from defects."

MOISTURE IN RAW RUBBER.

In the paper on Raw Rubber Contracts read by Mr. Stedman at the late Rubber Conference in New York, reference was made to the moisture question, which is understood to have received attention from the National Bureau of Standards at Washington. From the absence of any other information, and from other remarks in the paper, I gather that the condition of affairs in America is the same as in England; that is, there is no guarantee that the rubber when delivered in bulk will have the same moisture content as in the original post sample, on which it was purchased. I don't say that the case is parallel with that of silk, which has long since been put on a satisfactory basis, or with cotton, on which discussions are now taking place, with regard to the moisture in American cotton delivered in Europe. That the present state of affairs is not considered altogether satisfactory is, however, a fact. Quite recently a manufacturer was complaining to me that while the moisture in a sample of rubber sent him was 8 per cent., the bulk delivery, which the sample sent was supposed to represent, showed 14 per cent. moisture. For this discrepancy the seller said he could take no responsibility, and the buyer considered himself rather hardly treated. Doubtless this is not an isolated case and the the matter certainly seems one which is worthy of attention.

LEARNING FROM COMPETITORS.

The Advisory Committee of the English Board of Trade has arranged with the Trade Commissioners in various British Colonies, to collect and send home samples of foreign made articles which are competing with the sale of English goods in the respective markets. The branches first taken up include hardware, cutlery, etc., the samples having been placed in the hands of the Birmingham and Sheffield Chambers of Commerce for the benefit of manufacturers in those districts.

Efforts are being constantly made by the hard-worked United States consular staff in foreign countries, to obtain and forward such samples, but their work requires for its complete utilization, an organization in this country of a nature analogous to that which exists in England.

INCREASED ACCOMMODATION FOR LONDON RUBBER STORAGE.

With a view of meeting the storage requirements, necessitated by the largely increased receipts of rubber at the port of London, the St. Katharine's Docks warehouses, where the article has hitherto been stored, have been replaced for that purpose by the more commodious London Dock Warehouses. As the two docks are near each other, this change has not caused any inconvenience to the trade.

Three large single-story sheds, with ample overhead light, have been placed at the disposal of the trade for the preliminary operations connected with the examination of rubber, gutta-percha and balata. Two of these sheds are more than 250 feet in length. For subsequent storage, a cool vault of between two and three acres has been set aside.

In order to ensure a sufficient degree of moisture for the rubber in the vault, the cases are placed upon scantling, resting on mold. Being under the wool warehouses, the vault presents a minimum variation of temperature.

The first thing done when rubber arrives is to weigh, sort, and sample it; the tare of the package being also taken, and the gross weight ascertained before it is sent to the vaults for storage.

Rubber reaches London in packages of various kinds, often in old tea chests; this form of packing being no doubt the most convenient for estates interested in both tea and rubber. Balata is generally shipped in canvas coverings, and occasionally in barrels. This article was formerly stored at the Crutchedfriars (city) warehouse belonging to the port authorities, but since the recent change, it has been transferred with other rubber to the London Docks.

Satisfaction has been expressed with the new arrangements for the convenience of the London trade, as being calculated to enhance the importance of that market as a point for the distribution of rubber.

The quantity of rubber passing through the London auctions during 1912 was 18,069 tons, as compared with 9,945 tons in 1911; so the need of increased warehouse accommodations was evident.

NEW GERMAN WASTE CONCERN.
