# NEW ENGLAND FARMER,

## AND HORTICULTURAL REGISTER.

PUBLISHED BY JOSEPH BRECK & CO., NO. 52 NORTH MARKET STREET, (AGRICULTURAL WAREHOUSE.)

VOL. XIX.]

BOSTON, WEDNESDAY EVENING, JULY 8, 1840.

[NO. 1.

### N. E. FARMER.

#### ESSEX AGRICULTURAL SOCIETY'S ANNUAL CATTLE SHOW, &c.

AT GEORGETOWN, WEDNESDAY, SEPT. 30TH, 1840.

*Premiums offered by the Essex Agricultural Society and the Massachusetts Society for Promoting Agriculture.*

#### I. MANAGEMENT OF FARMS.

For the best cultivated farm, of not less than fifty acres exclusive of woodland, regard being had to particular improvements within a few years past, the quantity of produce, the manure and expense of cultivation, with a statement in writing of all facts in relation to the same—

1st premium	\$30
2d premium	15

Notice of intention to claim these premiums must be given to the Secretary on or before the 1st of July, the present year. Such farms as are entered will be examined by a committee in July and September. It is hoped that there may be many competitors in this county, for the liberal premiums offered by the State Society on farms, and that the same gentlemen will report their farms in their own county. The farmer who undertakes to place his farm in a condition worthy to be examined, is sure of obtaining *one premium*, if not more; in the increased quantity of his produce and the general appearance of all around him.

#### II. DAIRY.

1. For the best butter produced on any farm within the county, from the 1st of June to the 9th of July, inclusive, in the present year, a sample of which, not less than twentyfive pounds, to be exhibited, with a particular statement of the method of making and preserving the same,

For the best	\$8
For the second best,	6
“ third best,	4

2. For the best produce of butter, on any farm within the county, in the four months next following the 20th of May, the present year—a sample of not less than twentyfive pounds of this butter to be exhibited at the anniversary of the Society—*quality* as well as *quantity* to be taken into view, with a satisfactory account of the manner in which the cows have been fed, and the general management of the milk and butter,

For the best,	\$10
For the second best,	8

3. For the best produce of new milk cheese, in proportion to the number of cows producing it, on any farm within the county, in the months of July, August and September, in the present year, a sample of which, not less than fifty pounds, to be exhibited,

For the best	\$10
For the second best	8

#### III. TURNING IN OF GREEN CROPS AS A MANURE.

For the most satisfactory experiment of turning

in green crops as a manure, on not less than one acre of land, a detailed account of the whole process to be given in writing,

For the best	\$20
For the second best,	10

#### IV. FOREST TREES.

1. For the best plantation of either of the following species of forest trees, viz: white oak, yellow oak, locust, larch, white ash, maple or walnut, in the third year of their growth, and not less than one thousand trees,

	\$30
2. For the best do. do. do. not less than six hundred trees,	15
3. For the best do. do. do. not less than four hundred trees,	10

#### Remarks.

To encourage the cultivation of forest trees, and to induce our farmers, if possible, to make experiments therein, it is allowed that the trees may be raised from the seed, or transplanted from the forest, and that they may be set on one or more parcels of land on the farms of the claimants, or in ornamental rows about the farms. The number of trees and the thrift and vigor of growth will be regarded more than their position; always understanding them to be placed where it is designed they shall continue to grow. If raised from the seed, the third year of their growth will be the time for examination. If taken from the forest, the third year after being transplanted will be the time for examination. If any person now has trees growing that will answer this description, they may be subject of premium, as well as those which may hereafter be cultivated for this purpose.

Notice of intention to claim any of these premiums must be given to the Secretary of the Society on or before the fifteenth of June in the year in which the claim is made.

#### V. CULTIVATION OF MULBERRY TREES, SILK, &c.

1. For the best plantation of mulberry trees, for which no premium has been awarded, at least one hundred trees, of three years growth or more, the same being in a thriving condition,

	\$15
For the second best,	10

2. For the best nursery of mulberry trees, at least five hundred trees, not exceeding two years growth,

	\$10
For the second best,	5

3. For the best specimen of silk produced within the county of Essex, not less than one pound,

	\$7
For the second best,	5

4. For the best conducted experiment in the production of silk, the result to be shown in the exhibition of the article, the same to be exhibited either in cocoons, reeled, or manufactured, with a statement in writing of the facts relating thereto,

	\$10
For the second best,	5

#### Remarks.

If any person shall have commenced experiments in reference to the premiums heretofore offered, their claims may be presented. The results of every experiment on these subjects although not par-

ticularly within the description for which premiums are offered, would be acceptable, and if found worthy, rewarded with a suitable gratuity.

#### VI. IRRIGATION.

For the most satisfactory experiment for increasing the crops, upon not less than one acre of land, by irrigation, with a detailed account of the manner, expense, and benefits produced,

	\$12
For the second best,	8

#### VII. IMPROVING WET MEADOW OR SWAMP LANDS.

For the best conducted experiments in reclaiming wet meadow or swamp lands, on not less than one acre, for which no premium has heretofore been awarded, the course of management, and the produce, &c. for a period of two years, at least, to be detailed with a statement of all incidental expenses,

	\$20
For the second best,	10

As numerous premiums have been awarded on these subjects, more minuteness of detail will be required than has heretofore been exacted.

#### VIII. PLOUGHING.

1. *Double Teams.*—For the best performance in ploughing,

	\$12
the second,	10
the third,	8
the fourth,	6

2. *Single Teams.*—For the best performance in ploughing,

	\$10
the second,	8
the third,	6
the fourth,	4

3. *Horse Teams.*—For the best performance in ploughing,

	\$8
the second,	6

#### Remarks.

Double teams will be required to plough not less than one sixth of an acre, and single teams not less than one eighth of an acre. Double teams not less than *seven* inches deep; single teams not less than *five* inches deep. The plough must be of the best construction, the furrows truly cut and well turned; the whole must be done in a workmanlike manner. So many premiums have already been awarded for ploughing, and so great have been the improvements in the construction of ploughs, that nothing less than the best work will be satisfactory. Those who intend to be competitors in the ploughing match must give notice to the secretary on or before the Monday previous to the exhibition. Persons residing more than ten miles from the place of exhibition, can have their teams intended to be used in the field, fed at the expense of the Society, the night previous.

The competitors for these premiums must be the owners of the teams, and the same must be entered in the name of the owner. No person will be entitled to receive more than one premium, although he may enter more than one team.

#### IX. IMPROVEMENT OF AGRICULTURAL IMPLEMENTS.

To the person who shall exhibit at the show any

new or improved agricultural implement, the invention being his own, which shall in the opinion of the trustees merit a reward, a premium shall be given, not exceeding ten dollars.

In all cases, proof must be given of the work done by the implement before it is exhibited, and of its having been used and approved by some practical farmer.

#### X. Comparative value of Crops as Food for Cattle.

For the most satisfactory experiment upon a stock of cattle, not less than four in number, in ascertaining the relative value of the different kinds of fodder used for the cattle, as compared with English hay, with a detailed account of the fodder used, and the expense of raising the same; the experiment to be made in the three winter months,

	\$20
For the second best,	15
For the third best,	10

These premiums are offered, to be paid whenever a meritorious claim is presented to the Trustees, and will be continued for three years.

#### XI. Experiments on Manures.

For any well conducted and decisive experiment in the use of marl, peat, lime, gypsum, ashes of wood, peat, or coal, as a manure, in the improvement of land, with full accounts of its management and results,

	\$20
For the next best experiment,	10

#### XII. Fattening Cattle and Swine.

For the most satisfactory experiment in feeding cattle or swine, with a statement in detail of the process and the results,

	\$15
For the second,	10

#### XIII. Cultivation of Wheat, Rye, Oats, Barley, Buckwheat and Indian Corn.

1. For the best conducted experiment of *Wheat*, on not less than one acre of land, \$10
2. For the best conducted experiment of *Rye*, on not less than one acre of land, \$10
3. For the best conducted experiment of *Oats*, on not less than one acre of land, \$10
4. For the best conducted experiment of *Barley*, on not less than one acre of land, \$10
5. For the best conducted experiment of *Buck Wheat*, on not less than one acre of land, \$10
6. For the best conducted experiment of *Indian Corn*, on not less than one acre of land, \$10

A statement of the produce, the manner of preparing the ground, the seed, harvesting, &c., including all the details in relation to the crops, &c. will be required to be handed to the Committee.

(Concluded next week.)

#### CANKER WORMS.

To the Editor of the New England Farmer:

I notice in a late number of your valuable paper some account of the canker worm, signed by Elijah Vose of Dorchester, in which he remarks that the grubs ascend in October. I will here state for the information of your readers, (and I wish it were in my power to tell it to all people who are troubled with canker worms,) that the grubs ascend in the ninth month, (September) and that they continue to ascend whenever the weather is favorable, and the ground is not frozen so as to confine them in it, until the first or middle of the fifth month (May) following. I believe that the want of success on the part of those that attempt to destroy the canker worm, is owing to their not applying their remedies early enough in the fall, and that

they do not continue them late enough in the spring.

In conversation with Mr Asa Freeborn, a highly respectable farmer of Portsmouth, R. I., I inquired what success he had in destroying the canker worms with the leaden trough and roof. He said "it prevented any from ascending where it was applied, and that he ascended the trees and used his best endeavors to find some worms upon the trees, but he could not find one; but where he used tar, or any other apparatus except the leaden troughs, they ate his trees badly." He had heretofore been in the practice of tarring his trees, but says he, "I will never tar another tree." He informed me that he intended to have the balance of his trees furnished with the troughs this season. He assured me that he caught some ascending in September. I find very few people are willing to believe that the grubs ascend in the fall. I have heard some say that they had seen accounts of their ascending in the fall, but did not believe them. If any person who is troubled with canker worms will put some apparatus on the tree in the fall that will catch them, they will be so perfectly convinced, that any argument beside would be superfluous. Respectfully, your friend,

J. DENNIS, JR.

Portsmouth, R. I., 7mo. 1st, 1840.

The undersigned having used J. Dennis, Jr.'s patent trough and roof for preventing canker worms or other insects from ascending trees, for the two years past, are satisfied that is the cheapest, and most effectual, and more durable than any other method we have any knowledge of, and requires less care and attention; and we take pleasure in recommending it to the public.

George J. Bailey,	} Middletown, R. I.
David Buffum,	
James E. Bailey,	
William Bailey,	} Portsmouth, R. I.
Thomas B. Buffum,	
Henry Hedly,	
Asa Sherman,	} Bristol, R. I.
Solomon Hedly,	
Charles S. Henishoff,	

Having an orchard of rising 100 apple trees that had been badly eaten by the canker worms, for a number of years, I did, in the fall of 1838, have one half guarded with the leaden roof and trough invented by Jonathan Dennis, Jr., of Portsmouth, R. I., and am satisfied that if properly done, and timely care and attention paid to keep the troughs well supplied with oil, both fall and spring, in the season of the grubs ascension of the trees, it will prove a thorough remedy. At any rate, I was so far pleased with the result of the trial on the first half of my orchard, that I had the residue of my trees furnished with lead in the fall of 1839. The part that was supplied the first, produced about 75 bushels of apples; whereas the other part produced scarcely any, having been eaten up very much by the worms, while the part secured by the troughs was scarcely eaten at all.

DAVID BUFFUM.

Middletown, R. I., 2mo. 11th, 1840.

It is estimated that 100,000,000 lbs. of Beet Root Sugar has been manufactured in France the last year, and in Prussia and Germany 30,000,000 lbs. The Troy Whig states that in Michigan, 240,000 lbs. were manufactured the past season.

#### Massachusetts Horticultural Society.

EXHIBITION OF FRUITS, FLOWERS, AND VEGETABLES.

Saturday, July 4th, 1840.

*Vegetables.*—Potatoes from Josiah Lovett 2d, Esq., of Beverly. Mr Lovett states that they are of excellent quality for winter, as well as summer use, and are always in eating by the 4th of July; they appear ripe, and are fine specimens for the season.

*Fruits.*—Gooseberries, (fine) from John G. Thurston, Esq., of Lancaster; Grapes, White Chasselas, from the garden of J. S. C. Green, Esq., of Waltham; Black Hamburg, (very fine) from the garden of Mr. C. Golderman of Chelsea; Cherries, by A. D. Williams, Esq.

*Dahlia's.*—By Messrs A. Bowditch and Parker Barnes.

*Roses and Picotees,* from Samuel R. Johnson, Esq., of Charlestown.

*Bouquets,* from John Hovey and S. Walker.

*Pinks and Violas* from S. Walker.

*Native Flowers,* by Dr E. Dwight of Dedham.

S. WALKER,

Chairman Com. on Flowers.

From the New Genesee Farmer.

#### PLUGGING FRUIT TREES.

MESSRS EDITORS—Some seven or eight years ago, you doubtless recollect there was considerable said about plugging fruit trees with sulphur and other substances to protect them from disease and insects. I had thought however that this was all a humbug, which had lived its day and received its doom; till a few days since a respectable looking man told me he had practiced a similar method with the most perfect success, on many trees in Livingston Co., for several years past, and that he had discovered a compound, which on being inserted into the body of the tree, would in a few hours expel all borers, caterpillars, curculios, slugs, &c., and would effectually prevent all injury to the tree or fruit from these depredators for many months after the application. I asked him if so powerful an agent would not injure the tree or render the fruit unwholesome. He replied it would not, as the ingredients were all used by men as medicine, and the quantity absorbed by the fruit was so very small, that nothing but an insect could discover it. He evidently did not belong to the Thomsonian school of medicine, however, for he informed me that Calomel and raw quicksilver were among the substances employed. How they were to be dissolved and made to circulate in the sap of the tree, is a mystery which he did not explain to me.

May 27, 1840.

MONROE.

*Canada Thistles* should be mowed, to prevent seeding. This formidable weed is most easily disposed of by utter extirpation. Never allow them to show their heads above ground, and they will die. The leaves are the lungs of the plants, and if they are not permitted to breathe, they cannot live. A good way to destroy a patch, is to let it grow till about the time of flowering, then the roots may become somewhat exhausted, then turn the whole under by deep ploughing, subsequently harrowing, and never allow the thistles again to peep above ground. This will be effectual the second, if not the first year.—*lb.*

For the New England Farmer.

BOOK FARMERS, &c.—HAYMAKING.

Boston, July 1st, 1840.

MR COLMAN—There are in the cities, I am informed, gentlemen who are called (perhaps in derision) *book farmers*; who own farms, but have little practical knowledge of husbandry. If they be judicious men, however, I should be far from thinking meanly of the utility of their labors. They have the means and the time to collate and examine the various practical facts presented by working farmers, and the various theories offered by speculators. And then, opinions based upon so much valuable data cannot fail to be respectable. The voluntary and gratuitous labors of such members of the agricultural societies, to say nothing of their money contributions, ought to be encouraged. Indeed it may be hoped that the time will come (so much desired by Franklin) when these men of leisure and fortune will transplant some of their sons and daughters into the happy abode first made for man, instead of overloading the learned professions with supernumerary members and breaking down the real merchant by a crowd of pretenders—depriving agriculture of her natural arms, and then increasing its labor by charging it with the maintenance of a host of bankrupts.

On the continent of Europe it is absolutely a title of nobility to possess and improve a good farm; and those who have this good fortune, call themselves the lords of the land, and their title is not disputed. A little estate which I held, till lately, in France, with one other *small* circumstance, entitled me to be a baron of the empire, under Napoleon, if such a title could have been acceptable to a republican.

If the agents of the census had been instructed to inquire what number of young men had left the fields for commercial pursuits, and those who had adhered to the plough, and the results of their respective labors at the end of fifteen years could have been known, few will doubt that the balance would be in favor of the farmers: especially when it is known that more than three quarters of the traders in our great cities fail.

It is to the practical farmers, however, that we must look for the facts still wanting to fill the measure of agricultural science. And no one should think so humbly of himself as to suppose, that he cannot contribute something towards the filling that measure. The most trivial circumstance, if it appear new, and out of the common order of events, should be noticed and communicated, so that it may find its way into print. By itself it may be of little value or quite insignificant: but in the hands of a master workman in his study, it may prove to be the lost *pleiad*, the very essential star that was wanting to complete some new and brilliant galaxy in vegetable physiology. The workingman furnishes the facts without which the synthetic philosopher can build up no sound and philosophical theory. Let then every intelligent farmer take note of every variety of product, and every anomaly in nature's *seeming* freaks, but wise though unknown purpose, and in due time man will be able to read her works perhaps more understandingly, and probably with more fruit than he now reads the bible.

I claim not to be a practical farmer—(I wish I could)—nor yet a cabinet farmer, for I do not possess one book on agriculture; nor do I remember to have read one. In my youth I was destined *myself*

for a farmer, and engaged land for a settlement before I was twentyone; but I was opposed by my parents, and have thus been nothing. But my first love comes back to me in my old age, and I would discourse about it as much as I dare to, without exposing too much my ignorance. Where my notions or suggestions may appear unsound to those who have some real knowledge, I hope to be pardoned for my presumption. Perhaps my blunders may prove to be fruitful hints to them. I will now venture on one of them.

HAY.

The hay I made and saw made in France, was done very much as it is here. But their scythes were inferior to ours. Their hay is kept in barns and mows, like ours, and is subject to the like accidents.

My intention now is to propose a means of preserving it better, which has been suggested to me by a practice common in Switzerland for preserving what is called Swiss tea, or certain aromatic herbs found in the mountains. These herbs are compressed, after drying, into a very small compass, so as to exclude perfectly the air, and thus to preserve their aroma. The Shakers, I believe, preserve medicinal herbs in the same way; so that they may be kept for years, and are taken for the longest voyages.

Here then is the source from which I propose to borrow some useful knowledge, for this or some other place—for this or some other time.

The principle is with me, I am sure; however circumstances may be unfavorable to practice. The aroma of the Quaker herbs, as the aroma of the hay, constitute essential parts of their value. To judge of hay the first act is to smell it; not to learn if it be musty only, but to know if it be sweet smelling. This sweet smelling indicates a more important quality than may at first appear. It is not to gratify the cattle with a luxury like a pinch of snuff; but it is something more substantial. It announces the presence of those essential oils which may be evaporated by exposure to the air, as the essential oils of the aromatic plants of the Quakers would be, without the pressing. These oils are essentially nourishing. Their presence informs us that there is in the hay, well cured and well kept, certain farinaceous and saccharine matter in a state of slow fermentation, from whence emanates a fragrant spirit—the *alcohol* of the plant, if I may be allowed to use the term. This saccharine principle, however, is not wanted in the shape of alcohol for our cattle, no more than it is wanted from grain or molasses for man. But it is the grand nutritive principle, without which the hay would be no better than chaff. Now our object is to preserve this important substance, and not let it escape and be wasted in the air.

The time for cutting hay should be, I presume, that in which the juices of the grass are sufficiently elaborated to produce the seeds very soon, but not to have *completed* that object. The saccharine matter is then in the grass. If it were in the seed and they were ripe, the seeds would be apt to fall and be lost.

The grass now cut, and at the proper time, requires vigilance, judgment and good weather. Too much drying would take away much of the qualities mentioned above; too little would expose it to the putrid fermentation. It must, then, be well dried, and immediately housed or stacked. When I was a boy, I remember to have seen the barns quite open-work; seemingly with the intention of

letting in the air. Now, if the hay wanted drying, it ought not to be housed. If it were well dried, then it could not be kept too close.

You see, sir, that I am coming to the pressing of hay, in imitation of the Shakers' process on herbs. Yes, that is the object of this letter; and I offer the suggestion humbly, to those who know more about the matter than I do.

If hay coming from Maine, or other distant places by water, exposed to the rain, and perhaps put up wet, often slow to disadvantage, these untoward circumstances should be taken into account before taking such hay for a sample of the system.

If any simple contrivance can be devised for pressing hay, as I doubt not there may, the saving of room alone, it would seem, would compensate for the trouble. Our barns need not be half so large, and no hay need be exposed to the weather. And if it were convenient or necessary to stack it in the fields, it might then be much better protected from the air and the rain.

Now all this, it will be said, is theory,—*Boston notions*. However boldly I may theorise, it is my practice to give *some* reasons for what I offer; and to adduce, when I can, the experience of others, and the common sayings (which often contain the short-hand popular philosophy of the time) in support of my theory. I this view, I will remind you of what you have often heard, probably.

Hay cut from the mow will feed more cattle than that from the barn. Now I believe that hay in mows is closer packed and more protected from the air than that in our common barns, although it undergoes nothing like mechanical pressing. It is moreover said, that hay two years old will go farther than new hay. Hay two years old, to be eatable at all, must have been well preserved; therefore its superior nutritive quality must proceed from a certain degree of that conservative care which it is my present object to make general, more easy and systematic. If I have been correct in principle, I have no fear that the seeds I attempt to sow will fall on a barren soil: the American farmer's mind is a very fruitful soil.

Yours,

WM. FOSTER.

From the Genesee Farmer.

CULTURE OF THE GRAPE.

MESSRS EDITORS—A correspondent in the fourth number of the Farmer wishes to know the best method of raising the grape. My way is to trim those vines that have been growing some years, in the winter, so as to prevent the sap from running in the spring, which is apt to retard their growth. When the buds begin to start, I rub all from the old part, leaving those on the last year's growth only which will produce grapes. After they have grown to the size of shot, I clip the ends of the vines and free them from branches, leaving a few of the thickest, which I keep free from branches, so that in the fall I have a number to raise a crop from the next season. By the middle of August I take the leaves from the vines that have grapes on, and by this means get them ripe before frost. If the buds have not been taken off when they first started, the surplus branches of the present year's growth may be clipped off in the forepart of June. By pursuing this course my grapes ripen without being frozen. C.

Port Gibson, N. Y.

For the N. E. Farmer.

—  
THE CULTURE OF SILK, &c.

MR EDITOR—I send you some remarks in relation to the subject of silk—a subject which at this time deeply engages the attention of a considerable portion of the American people. They contain some facts which I consider highly important for them to know at this particular period and season. I have endeavored to recall their attention to a very remarkable race of men: I mean the anglo-Saxons, to which also the American people belong, as a people pre-eminently calculated to succeed in every enterprise which they once undertake. To this I shall also subjoin a valuable article from the National Intelligencer, which was sent to me through the politeness of the Hon. Wm. S. Hastings, member of Congress for this district. It contains some account of the New System of France, or the system of M. Beauvais; also of the system pursued with such extraordinary success by the Misses Reina, the daughters of Count Reina, at his several establishments on his estates at Come, in Lombardy. This system also, is eminently deserving of trial in our climate.

Very respectfully, yours,

WILLIAM KENRICK.

Nonantum Hill, Newton, June 17, 1840.

The race of the anglo-Saxons, to which we all belong by direct descent, includes a people undoubtedly one of the most extraordinary known on the records of time. This race seems destined to overspread many vast countries and to cover territories nearly four times as extensive as the whole of Europe. In this calculation I include New Holland and numerous other isles of the four oceans, and also a very large proportion of North America; all destined to hold communion at some not very distant day, in but one common language:—a race peculiarly distinguished for intelligence, for industry and untiring perseverance—for energy and enterprise, and for their wonderful knowledge and progress in agriculture and every useful art. In all these circumstances combined, few have ever equalled and none have ever surpassed them. All this is true of the anglo-Saxon race, but only in their own element or suitable climate: that climate is comprehended only in that portion of the earth which is situated between the equinoctial regions and the polar circles.

In those delightful islands and tropical countries where but a very little amount of clothing is required—where the earth produces its fruits without cultivation, and where even the bread is the spontaneous production of trees—where the labor of but a few days is sufficient to provide for the subsistence of a whole year—where want and even the fear of want can never come, few or none will voluntarily toil for great riches or for a great and needless future store: none it is believed will thus toil except by compulsion; none indeed but slaves. In such a country and climate, the anglo-Saxon, like an exotic plant, has usually been found to degenerate in the second or third generation, during which he loses, in a great degree, his native energy both of body and of mind: his fields of cotton, of indigo, of cocuo, of coffee, and of sugar, if cultivated at all, must be cultivated by labors not his own; “the fields of the rich man” being literally “fertilised and refreshed by the toil and sweat of the poor man,” whom he has been enabled by his

superior power to circumvent and to make his slave. Thus the opium of India, which yields to the government of Britain an annual revenue of many millions sterling, is by Britons extorted from the poor Hindoo, who is compelled throughout whole and extensive districts of India to cultivate a certain proportion of all his lands in opium; to sweat and toil for no adequate compensation, and for the sole benefit of his cruel taskmaster; to cultivate the intoxicating drug for the infamous purpose of being smuggled into China. The infernal poison with which the British government seems determined to pollute and destroy a whole nation, and to sap the foundations of an ancient and mighty empire, is not produced by the labors of the anglo-Saxons, but extorted by them from a people whom they have brought into subjection by the sword.

Yet in England they cannot raise silk; their hostile climate forbids: the prevailing winds, blowing as they do from the west or north, and directly from the ocean, they carry from thence a cold and humid atmosphere, loaded with aqueous vapors, which for a considerable portion of the year obscure the sun. Indian corn will not ripen in that climate, neither will the leaf of the peach elaborate its juices sufficiently to mature its fruit; nor will the leaf of the mulberry mature its juices sufficiently to become the healthful food of the silkworm, from this same cause. Thus in the systematic and careful experiments of Mr Felton at Birmingham, in 1839, none of the silkworms began to spin till the end of eight weeks from the time of hatching, and a great portion not until after the end of eleven weeks: of the former, 35 to 50 per cent. died; and of the latter, or of those which lingered thus long, 87 per cent. also died; and the cocoons produced were small.

We have many accounts of the unsuccessful attempts to raise silkworms in England. In the fifteenth volume of the Popular Encyclopædia, which volume was published in that country so lately as 1839, and at page 127, we have the following remarkable passage under the article *Morus alba*, which I here quote: “In this country (England) the white mulberry in all its varieties, suffers a good deal from our winters, but not so much as to prevent its cultivation. Some years ago an attempt was made to introduce it, and the rearing of silkworms into Great Britain, but the attempt failed, owing partly to unskillful management, but more to the soft, juicy condition of the leaves in this damp climate, which rendered them unfit for the food of the silkworm.”

In all the north and west of France, from the points where Indian corn ceases to be a certain crop, we are assured that they usually in ordinary culture lose from 40 to 60 per cent. of the silkworms and without doubt from these same and no other causes. Not so in our own climate and country, and for reasons which I shall now attempt to explain. Our serene skies and days of genial heat and of sunshine are not only highly favorable to the health of the silkworm, but they serve also sufficiently and completely to mature the juices of the leaf of the mulberry in all its varieties, and to convert them into the most healthy as well as nutritious food, so that losses from disease from this cause can never come. Our prevailing winds for about three fourths of the year are also from the westward, but, coming as they do over a vast extent of territory, they are dry and salubrious, they always bring fair weather, they repel the cold and foggy atmosphere and moisture of the ocean. These

prevailing winds of the middle latitudes it is well known, carry ships across the ocean and to the coasts of Europe in a far less period of time than they can ever return, either by the same or by any other route. These winds of the middle latitudes are the counter-currents of those same winds called *trade winds*, which, following in the direct course of a vertical sun, blow unceasingly in the contrary direction and in all seasons within the tropics.

In “Graham’s India” we are informed that the high table lands of the Deccan, situated beyond the extensive barrier of hills called the western Ghauts, offer advantages very far superior to those of the low sultry plains of Bengal, or of almost any other country, for the cultivation of the white mulberry and the rearing of the silkworms. In Italy it is deemed unsafe to strip the leaves from the trees more than once for the worms, which are slow in progress in that climate, so that they can have only one crop of silk in the year. In the Deccan the mulberry trees thrive with the most surprising luxuriance, and being in perpetual verdure may be deprived of their leaves six times in the year, and this without injury to them, provided a few leaves are allowed to remain at the top of the branches. So rapid is the progress of vegetation in that country, that fresh leaves soon burst forth to supply the place of those which have been removed. The silkworm is so rapid in its operations, that six crops of silk in the year can with ease be obtained. The labor of the Hindus is also much lower than in Europe. In Italy they are obliged to have recourse to stoves and to warm currents of air, both for the purposes of hatching the eggs and of rearing the worms in their natural temperature. From sudden changes of atmosphere also, the insect is in Italy liable to disease. In the Deccan the insect in this respect requires no artificial aid. The silkworm in all its varieties, from the copious transpiration of the watery part of the leaf through the pores of its body, requires a dry, warm, and equable temperature to carry off the insensible perspiration, and particularly when vast numbers are congregated in the same apartment. The climate of the Deccan, from its great elevation, from the mildness of its rains, from its temperature, dryness and equability, is the most congenial to the silkworm of any in the world; yet notwithstanding these decided advantages for the cultivation of silk in the Deccan, it has been hitherto neglected; while in Italy, with all its natural disadvantages, silk has long been cultivated, and is become the grand source of the national wealth.

Thus it is, that in those countries where nature seems to have done every thing, neither the anglo-Saxon or any other people will voluntarily labor beyond the needful wants of today. Nor can the arts and manufactures and the agriculture of our own country or of Britain, so unrivalled, the cutlery, the cotton or the wool, be transplanted to those countries with even any hope of success. In our own country and in some of the States, we have also extensive establishments, not only of cutlery but of jewelry, and vast printing establishments of standard works, which require a great amount of manual labor, yet neither can these nor those other manufactures be transplanted from our own climate to those intertropical countries where from the despotic character of their governments and the insecurity of all property, or from the density of their population and the scarcity or monopoly of their lands, or from the enervating nature of their climate and the inefficiency of the people, labor is nominally so

cheap and men perform the labors of horses and oxen. From the natural temperature of our own climate, from the energy and efficiency of our people, from the fertility of our soil, and the abundance and cheapness of our lands and pasture, are we enabled cheaply to maintain the vast animal power which we employ in all our agricultural operations. We have, in fact, little or nothing to fear from the people of any of those countries as rivals, even in silk or in any other agricultural production which we can in our own climate raise as well as they, by the superior energies of our people, by the cheapness and fertility of our lands, and the very great proportion of animal labor which we employ.

[Here follows the article from the National Intelligencer, alluded to in the foregoing, the great length of which compels us to defer its insertion until next week.]

## WANDERINGS IN THE WEST IN 1839.

### No. VII.

(Continued from vol. 18, page 436.)

The southern half of Wisconsin is quite similar to Illinois, but the face of the country is more rolling and there is a larger proportion of timber. There is a fine district of country in the vicinity of Rock river, about 20 to 40 miles north of Illinois line, and another between the Sugar river and the Pekatonica: the latter is the best farming district that I have seen west of Ohio: it is well watered by the finest springs: there is an abundance of timber and stone enough for all useful purposes may be obtained by digging a few feet below the surface in most of the hills. The northern portion of Wisconsin is a forest country, producing the different varieties of pine as well as hard wood. The northern part of Michigan is a forest country also.

The climate of the country west of the Alleghany mountains is undoubtedly milder than in the same parallels east of the mountains. Some writers have undertaken to show that there are more fair days there than at the east: how that may be I know not: but the principal advantage of the climate I apprehend is, that the spring is more favorable: when winter breaks up it does not "linger in the lap of spring" so long as in the east, but warm weather advances more regularly and vegetation is not so frequently checked by cold easterly storms.

In the prairie country where the rays of the sun are not obstructed, the evaporation is very great and rapid in the summer and the dews are very heavy, so that one can scarcely go out in the morning without being wet to the knees as thoroughly as though he had waded in the creek.

As soon as the sun is down the air becomes damp and chilly, and it is not prudent to go out in the evening without warm clothing even in midsummer. It is probable that the fever and ague is brought on by exposure to the night air, as often as from any other cause.

The quality of the water is an evil in the western country, though this is denied by some. Mr Jones in his book "Illinois and the West," says that he never drank a drop of unpleasant water in Illinois, and compares it to the pure sparkling water of the Green mountain springs; but if Mr Jones could detect no difference, his taste must be much less delicate than mine; but I presume he drank none but river water until he came to Tremont, because no other is used on board the steamboats, and his travels by land, according to his own account, were limited to a ride from Tremont to Rock

river and back, and from Peru to Chicago, so that he found no water of very bad quality; but the water about Tremont and Peoria is certainly not good, except comparatively. The truth is, that all the water in the western country is strongly impregnated with lime, and where clay abounds the water contains various salts and earthy substances which render it disagreeable and unhealthy, and in many places it is nauseous. Where gravel takes the place of clay the water contains very little of any of these substances except lime, and it is clear and sparkling and not very unpleasant to the taste, and I presume is not unhealthy, though it acts medicinally upon strangers: such is the water in Wisconsin and the northern part of Illinois: the greatest inconvenience arises in the use of it for washing; the lime makes the water hard.

Many opinions are expressed with regard to the healthiness of the western States: some insist that the whole country is unhealthy; others assert that it is as healthy as the eastern States. That every part of the country has been at times unhealthy, will not be denied; and this has been the case in all countries when first settled, except those in high latitudes, and it may be attributed in a great measure to the greater exposure of the settlers, the change of climate, of diet, ignorance of the character of the prevalent diseases, the want of proper remedies and medical advice. But without doubt there are many places which are decidedly unhealthy from permanent local causes. The low level districts in Indiana, Illinois, Michigan and Iowa, and the vicinity of large rivers, generally have a sickly season as regularly as summer and winter. The common diseases are of a bilious character and are said to yield readily to medicine in most cases, if attended to seasonably. Pulmonary diseases are not common. The high rolling districts I believe to be as healthy after the first summer's residence, as any districts in the east in the same parallels.

Agriculture is not pursued with economy or neatness in the west. Farmers give their attention chiefly to the cultivation of grain. Corn is the greatest product. They raise besides corn, a large amount of oats and wheat: rye and barley are seldom raised. In the forest country they clear their land by deadening the trees, which they do by girdling, which method they prefer to cutting, because they sooner get rid of the stumps; the dead trees in a few years fall down and pull out a part of the roots: they then burn them on the ground. As soon as the clearing will permit, they put in corn or wheat, and the same field is cultivated for one kind of grain many years in succession.

On the prairies they usually plough in June or July, and let the sward lie until the next spring,—though it is often ploughed in May and planted to corn by cutting holes with an axe in every third or fourth furrow: this is called *sod corn*, and it receives no further attention after planting. Sod corn often yields nothing but fodder, but usually it yields from ten to fifteen bushels to the acre. I have seen it stated that sod corn yields ordinarily 35 or 40 bushels, but I venture to say that such a crop was never known upon prairie sod; I never heard any experienced man rate it higher than 15. After the first season the land is light and friable, and a single horse answers very well to plough it, though two horses are generally used. The common practice is to plant corn in hills, and when it is three or four inches high they begin to plough

it and continue the operation until the corn begins to set for ears; it is then "laid by": very few have their corn at all: sometimes after the last ploughing the larger weeds are chopped down, and corn thus tended in the southern counties yields on an average 50 bushels to an acre: in the northern counties 35 to 40 bushels. The kind raised in the south is the flat corn; there are several varieties; that which is esteemed the best is the yellow dent. In the north the hard flint corn is raised, the southern corn being liable to be cut off by frost. With the use of manure and careful cultivation the crop may be very much increased, and more than a hundred bushels have been raised upon an acre; but the average, without manure, is not higher than above stated.

An average crop of winter wheat is about 25 bushels and spring wheat about 18. Oats average from 40 to 50 bushels. I have seen 40 bushels of wheat to the acre and from 70 to 80 of oats; but these were extra crops.

Roots are very little cultivated. A few potatoes, beets, English turnips and onions are raised, but no large crops of either. Many farmers who raise 500 bushels of corn will have not more than 20 bushels of potatoes. In the far west no one thinks of raising roots for cattle, so far as I am acquainted. The soil appears to be admirably adapted to roots. On Fox river the cultivation of beets for the manufacture of sugar is beginning to excite attention, and some experiments have been made, with what success I did not learn. Beet sugar may become a great staple in the west.

Gardening is very little attended to. Most farmers raise a few vegetables, but a regular garden is hardly to be found in the west.

Fruit trees flourish remarkably well throughout the whole western country, and in the older settlements there are fine orchards of apple and peach trees. The only fruits which are indigenous in the west are crab apples, wild plums, pawpaw, raspberries and strawberries. The pawpaw is not found in the north. Plums are very plentiful in almost every grove.

The horse is a favorite animal in all the western states, and the farmers generally take pains to rear horses of good blood. The horses generally are lighter than in Pennsylvania, but more active.

Very little attention is paid to the breed of cattle. Milk and butter are of little value and cheese is hardly known; hence the quality of cows is a matter of very little concern. I have seen, however, some of the finest cattle in Illinois that I ever saw in my life, but in general a more ill-looking, black, ring-streaked and speckled race of cattle have never been known since the days of the patriarch Jacob.

Hogs are very plenty, and the farmers in Ohio, Indiana and Illinois rely upon them principally as the means of obtaining money. They are generally of a miserable breed, long-nosed, long-legged animals, apparently better fitted for running than for any other purpose. They go at large upon the commons and in the woods, living upon grass, mast, &c. till autumn, when they are fed a little while with corn, and when ready for market the average weight does not exceed 150 lbs. The farmers seldom slaughter their hogs but sell them to be driven to Cincinnati, Alton, Chicago and other markets, where the slaughtering and packing of pork is made a very extensive business. The usual price that is obtained is from three to four dollars a hundred weight.

(Concluded in our next.)

## NEW ENGLAND FARMER,

AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, JULY 8, 1840.

## COMMENCEMENT OF VOLUME XIX.

Time, ever on its wing, has brought us to the close of another volume, and the commencement of a new one.

In looking over the last volume, we feel assured that none of its predecessors have been conducted with greater ability, nor have their pages been enriched with so much original, useful and interesting matter as that of the last year. It has been our endeavor to meet the wants and wishes of the intelligent *agricultural community*, and as far as we can learn, believe our efforts have not been in vain. We have certainly exerted ourselves to do the best we could. The able assistance from the Agricultural Commissioner, we are confident, has been duly appreciated by the public, as well as that which we have received from our numerous correspondents, who have so generously contributed from their knowledge and experience for the advancement of agriculture. We take this opportunity to express to them our grateful acknowledgments and also to solicit a continuance of their favors.

We have endeavored at all times to steer clear of politics, sectarianism and every subject in fact aside from agriculture, upon which the public mind is divided and agitated. We have our own political and religious views, which we hold most dear—to which we shall rigidly adhere, and at proper times and in suitable places defend; but our paper is not the place for any allusions whatever which have a tendency to wound the feelings of any party or sect. This will account to some of our correspondents why their communications have been curtailed or not inserted; and we beg of them to remember that there are papers where opinions of every kind, political, religious and miscellaneous, may be advanced without offence to their readers.

In conducting the present volume we shall continue to exert ourselves to the utmost, hoping thereby to keep up with the improvement of the age, and present to our readers all that is interesting and instructive relative to agriculture, which transpires either in this or foreign countries, by which our farmers may be benefited.

Having been absent for the last two weeks, we are not able now to send out the Index for vol. 18th, but hope to have it in readiness the next week.

We remember with gratitude those who have promptly paid for their paper; but regret to add that an unusual number of our subscribers are still behind. We trust that a hint is all that is necessary, and that the amount due will be speedily remitted. J. B.

## PROGRESS OF VEGETATION DURING THE MONTH OF JUNE, 1840.

(Communicated for the N. E. Farmer.)

June 6. Saturday. The much-wished-for and long delayed rain has come at last, relieving us effectually from the drought, to which our light lands have been subject for the last week. The face of nature is already changed to a beautiful verdant green; the locusts and the ash trees have robbed themselves with their tardy foliage, and the waving grain reminds us of our entrance upon the confines of summer. There was a slight frost on Tuesday morning, the effects of which were not visible upon the most tender plants. The vines have grown most vigorously during the week, and the Isabellas on the back of the vinery, which commenced blossoming on the 28th May, are now beginning to set their berries.

The locust trees are blossoming, as also the pink borders around the circular plats of flowers. Squashes, melons and pumpkins planted the 20th May, and mangold wurtzel planted the 22d May, are all up finely. The prospect for fruit is not so promising as in the early part of the season, owing, as is generally thought, to the great heat of Monday the 18th May, when the trees were just setting their fruit: not only the pears, but also in many instances plums and peaches have apparently dried or withered and fallen from the trees. Cherries, in most of our gardens, have remained on better, and apples in our orchards and fields never promised more abundantly.

June 13th. Another week of fine summer weather. It showered abundantly during the morning service on Sunday, sprinkled generously during the afternoon and evening, and the sky being overcast on Monday, we availed ourselves of the opportunity to transplant the dahlias to the flower borders. From some cause or other, either from an unsuitable exposure or an uncongenial soil, my success with dahlias has been very discouraging, and I did not obtain last season one perfect flower. The vines upon the rafters commenced blossoming on the 9th, and today several bunches are setting their fruit. The berries upon the Isabellas have grown finely, and are, generally speaking, about the size of early peas. They do not, however, set their fruit well under glass, the blossoms requiring more air than it is practicable to admit into a vinery; but when thoroughly ripened, which they never are with us in an outdoor exposure, they are a far richer and more highly flavored grape than the Sweetwater. Strawberries are ripening very fast, and we have gathered freely from our vines both yesterday and today. Cherries are coloring upon the trees, and there have been some few offered in the market, but they need a few hot suns to sweeten them. Roses have commenced blooming finely, especially the Scotch, the Boursalt and the Moss roses. The fly which disfigured the foliage the last season has again made its appearance, and no effectual remedy has been discovered for dispelling them. Sulphur, dry ashes and snuff have each been recommended and used, but they can neither of them be applied at this stage of the growth without injury to the buds and flowers. The weather has been showery again today, and we have completed the filling up of the flower borders with annuals, and have transplanted to the field a quantity of cabbage plants sowed 13th May. The locust trees have been in perfect blossom during the week and also the double pheasant-eyed pink borders around the circular flower beds upon the lawn, which combined with the clover blossoms, have completely perfumed the air with fragrance.

June 20th. A brilliant flash of lightning succeeded instantaneously by a tremendous clap of thunder at 2 o'clock yesterday morning, introduced one of the finest rains of the season, which continued to fall in pouring showers until mid-day. The weather has been clear and comparatively cool since Saturday last, such as farmers term at this season of the year, fine hoeing weather. Green peas, cherries and strawberries are now very abundant, but our crop of cherries is generally imperfectly ripened, owing perhaps, in some measure to the difficulty of preserving the ripened fruit from the depredations of the feathered tribe, who not content with a fair proportion of the spoils, peck at each rosy cheek, and leave it to decay upon the tree. The vines in the grapery have all set their berries fully and strongly, and the vines themselves have grown with great vigor. Garden vegetables of all kinds are looking remarkably well, with the exception of carrots, the seed of which in many instances failed to vegetate, in consequence of the con-

tinued dry weather immediately after the sowing. This seed vegetates at best but very slowly, and like the beet seeds of every kind, should invariably be soaked at least three days before planting. I last year sowed on the 30th May, half an acre with carrot seed, which had been soaking in spring water 4 days, and we were enabled to weed and thin them on the 15th June, almost before a weed had made its appearance upon the field. The show of roses and of pinks have been perfectly beautiful during the week, but the latter were much injured by the rain of yesterday; for the last fortnight they have been blossoming superbly, attracting the admiration of hundreds who have visited Ellington for the purpose of viewing them, and now that they are trimmed off, and the earth drawn up around them, they will still continue until autumn, a green and ornamental border.

June 27th—Saturday. It commenced showering this afternoon at 2 o'clock, and we have now every prospect of another refreshing rain. Since Saturday last the weather has been clear and very hot, and the surface of the ground has become quite dry again under the influence of the scorching sun. The month of June has been hot and summer-like throughout, forming a striking contrast to the June of last year, when we had scarcely a warm summer day, and not one solitary warm night during its continuance. Crops of all kinds are now promising remarkably well. Indian corn has generally been hoed the second time and is just ready to spindle, and early planted potatoes are fully in blossom. I would recommend to cultivators to test the experiment of plucking off the flower blossoms for the purpose of increasing the produce of potatoes. I experimented last season upon six rows of Dillinghams. The three rows from which I plucked the blossoms yielded five bushels; while the three rows upon which the balls ripened produced only four bushels. The first crop of peas are about gone, and their place will soon be supplied with string beans, which are just podding. Melons and squashes have recovered from the effects of the fly, and early planted canteloupes are already setting their fruit. Strawberries and cherries are very abundant. The grapes in the vinery are growing vigorously and are a week or ten days in advance of the last season. On the 29th June last year, they were barely of the size of very small peas: today they are larger than the largest marrowfats. During the week we have sowed several rows of Bloodgoods, ruta бага, (a reddish variety, far superior to the white or green,) for transplanting the latter part of July and August; have planted into the trenches the celery plants which were pricked out from the hot-bed into the cold frame on the 27th May; and have hoed and thinned out the mangold wurtzel planted on the 22d May. The success of this most valuable crop depends much upon the proper thinning of the plants in the early stage of their growth.

The soil for Mangold Wurtzel should be rich and deep, and if practicable, be trench ploughed, which is merely ploughing two furrows deep, by following with a second plough in the track of the first. The seed, having been previously soaked in spring water, should be planted about the 20th May, at the rate of 4 lbs to the acre, upon drills two feet apart. Each seed produces two or more plants, all but one of which should be drawn out at the first hoeing, and the plants thinned to 12 inches. Upon drills two feet asunder, with plants standing one foot apart from each other upon the row, there will be 46,560 plants upon an acre. Allowing them to average 2 lbs. each, which is certainly a low estimate, (I last year raised several Mangold Wurtzels and Ruta Bagas, weighing 8 and 10 lbs. each,) we shall have 91,120 lbs., or more than 45 tons of the most nutritious food for stock. Mangold Wurtzels cannot be transplanted to advantage, but

any vacancies which may occur upon the rows should be filled up with Ruta Bagas, sowed for this purpose, as mentioned above. We have also trimmed the Buckthorn hedges, of which we have upwards of one thousand feet at Ellington. Some persons have objected to the use of hedges to any great extent, on account of the difficulty of pruning them into a proper shape. With the garden shears, which is the implement generally used for this purpose, this is a long and tedious process; but the operation is performed with great neatness and despatch with the hedge knife, with which an experienced hand will easily trim fifty rods of hedge in a day. Grass upon the uplands is ripening rapidly, and farmers in general are intending to commence haying in good earnest on Monday.

**BRIGHTON MARKET.—MONDAY, July 6, 1840.**

Reported for the New England Farmer

At Market 285 Beef Cattle, 18 Cows and Calves, 1325 Sheep and 125 Swine 40 Beef Cattle unsold.

PRICES.—Beef Cattle.—We quote to correspond with last week. First quality, \$6 25. Second quality, \$5 75 a \$6 00. Third quality, \$5 00 a \$5 75.

Cows and Calves.—Sales \$22, \$25, \$28, \$30, \$32, and \$40.

Sheep.—Dull. Lots were sold at \$1 50, \$1 75, \$2 00, \$2 25, \$2 37, and \$2 62.

Swine.—No lots to peddle were sold. A few were retailed at 4 1-2 a 7

**THERMOMETRICAL.**

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass., in a shaded Northernly exposure, weeks ending July 5.

July, 1840.	7 A.M.	12, M.	5, P.M.	Wind.	
Monday,	29	65	80	77	S
Tuesday,	30	71	93	75	S. W.
Wednesday,	1	69	82	72	S.

Saturday,	4	58	75	64	S. E.
Sunday,	5	59	82	73	E.

**SUPERIOR SILK WORMS' EGGS.**

200 ounces White and Yellow Peanut, White Piedmontese, Milan, and Lyons Silk Worms' Eggs, for sale at \$5 per ounce. They can be sent per mail. The first crop of worms in the cocoonery of the subscribers have produced the most beautiful snow white Cocoons and of remarkable size and compactness. No worms have perished, and such has been the general success attendant every where in the State of New York and the adjoining States on this new branch of business, that there is already found a great insufficiency of foliage and \$1 per 100 lbs. is now offered for leaves.

WILLIAM PRINCE & SON.

Flushing, Long Island, July 8. 2t\*

**SCYTHES, RAKES, &c.**

The subscribers offer for sale a very extensive and complete assortment of Scythes, Rakes, &c. consisting in part of

300 dozen Phillips, Messer and Colby's superior Scythes.	
50 " Metcal's do. do.	
50 " Taft's cast steel do. do.	
25 " English do. do.	Grass do.
10 " do. do. do.	Cradle do.
10 " do. do. do.	Border do.
100 " Hall's Rakes, superior.	
100 " Wilder & Eddy's do. do.	
200 " Common do. do.	
100 " Clapp's patent Scythe Snaths.	
50 " Baker's do. do. do.	
100 " Common do. do. do.	
2500 " Austin's superior Rifles.	
2000 " Common do."	
1000 " Scythe Stones.	
100 " Grain Cradles superior.	

They would respectfully call the attention of Dealers and Agriculturists to the above assortment, which consists of many of the best kinds now in use, and which they are prepared to sell at the very lowest prices.

JOSEPH BRECK & CO.

New England Agricultural Warehouse and Seed Store, 51 & 52 North Market Street.

May 20.

**NOTICE.**

The Rhode Island Society for the encouragement of Domestic Industry, have procured copies of Dr Jackson's Geological and Agricultural Report of Rhode Island, and will deliver the members each a copy gratis, by calling on B. Cranston & Co. at their Bookstore in Providence.

WILLIAM RHODES, Treasurer.

Rhode Island, June 24.

**REVOLVING HORSE RAKE.**

The Revolving Rake, which has been in general use in most parts of Pennsylvania and New Jersey, is found to be one of the most useful and labor saving machines now in use. One man and horse, with a boy to lead, will rake on an average from 25 to 30 acres per day, with ease, and do the work well. They are coming into very general use in all parts of the country, and will, no doubt, in a few years, supersede the use of the common hand rake. There is a great advantage in this rake over all others, as the person using it does not have to stop the horse to unload the rake.

**GRAIN CRADLES.**

The Grain Cradle is an article which is coming into very general use in the New England States, where they were till of late but little known, although they have been in very general use in the southern and western States, for many years, and which is found to be decidedly the best mode of harvesting grain, as it is supposed one man will cradle five acres in a day when he cannot reap more than one. The difference in gathering a crop is so much in favor of cradling, that we must suppose that it will be the only mode adopted hereafter, and the grain cradle will become of as much use, as an implement of husbandry, as the plough now is.

There has been a very great improvement in the manufacturing of this article, they are now made on the most improved plan; the scythe is well secured and finished in a superior manner and made of the best cast steel.

**OSTRICH FOWLS.**

For sale, a few pairs of this largest breed of domestic poultry. The hens are good layers and the eggs of the largest size. The male, of which these are the produce weighs more than eight pounds in common condition, and he is not quite a year old. This breed, as well as the Dorking, makes good capons. Price \$5 per pair. Apply to

JOSEPH BRECK & CO.

June 24.

**PURE BLOOD BERKSHIRE PIGS.**

The Society of Shakers at Harvard, Mass., have for sale the Pure Blood Berkshire Pigs. Also, a lot of Berkshire crossed with other Breeds, on reasonable terms at their Village

Persons wishing to be sure of the clear Berkshire breed may rely on those they offer for sale, as they are the progeny of some of the latest imported from England.

June 24.

**DORKING FOWLS.**

For sale, a few pairs of pure Dorking Fowls. The stock, of which these are the produce, were procured in Dorking, County of Surrey, England. Few breeds have a title to boast of so high and long continued a reputation as the Dorking. Upwards of fiftyfive years have passed, since, while resident in Surrey, I sent to Dorking for my first regular breeding-stock: they were then the ancient and superior five-clawed breed of Surrey.—Mowbray on Poultry, 7th Edition.

This breed attains to a large size, and the hens are the best of layers. Price \$3 per pair. Apply to

## MISCELLANEOUS.

## THE BIBLE.

We do not know where there is so good a description of the Bible, in so small a compass, as is to be found in the article below from the Hartford Courier:—

A nation must be truly blessed, if it were governed by no other laws than those of this blessed book: it is so complete a system that nothing can be added to or taken from it; it contains every thing needful to be known or done; it affords a copy for a king and a rule for a subject; it gives instruction and council to a senate, authority and direction to a magistrate; it cautions a witness, requires an impartial verdict of a jury, and furnishes a judge with his sentence; it sets the husband as lord of the household, and the wife as mistress of the table; tells him how to rule and her how to manage. It entails honor to parents and enjoins obedience upon children; it prescribes and limits the sway of sovereigns, the rule of the ruler and authority of the master; commands the subjects to honor and the servants to obey; and promises the protection of its author to all who walk by its rules. It gives directions for weddings and for burials; it promises food and raiment, and limits the use of both; it points out a faithful and eternal guardian to the departing husband and father; tells him with whom to leave his fatherless children and in whom his widow is to trust, and promises a father to the former and a husband to the latter. It teaches a man how he ought to set his house in order, and how to make his will; it appoints a dowry for the wife, and entails a right of the first-born; and shows how the younger branches shall be left. It defends the right of all and reveals vengeance to the defrauder, over-reacher and oppressor. It is the first book and the oldest book in the world. It contains the choicest matter, gives the best instruction, and affords the greatest pleasure and satisfaction that ever were revealed. It contains the best laws and profoundest mysteries that ever were penned. It brings the best tidings, and affords the best of comforts to the inquiring and disconsolate. It exhibits life and immortality, and shows the way to everlasting glory. It is a brief recital of all that is to come. It settles all matters in debate, resolves all doubt, and eases the mind and conscience of all their scruples. It reveals the only living and true God, and shows the way to him; and sets aside all other gods, and describes the vanity of them, and of all that put their trust on them.

*Astronomy.*—In the Report of John Quincy Adams on the Smithsonian Bequest, occurs the following eloquent passage, describing the beauty and sublimity of the science of astronomy:

"The express object of an observatory is the increase of knowledge by new discovery. The physical relations between the firmament of heaven and the globe allotted by the Creator of all to be the abode of man, are discoverable only by the organ of the eye. Many of these relations are indispensable to the existence of human life, and, perhaps, of the earth itself. Who can conceive the idea of a world without a sun, but must connect it with the extinction of light and heat, of all vegetation and production, leaving the lifeless eld of matter to return to its primitive state of chaos, or to be consumed by elemental fire? The influence of the moon—of the planets, our next door neighbors of

the solar system—of the fixed stars, scattered over the blue expanse in multitudes exceeding the power of human computation, and at distances of which imagination herself can form no distinct conception—the influence of all these on the globe which we inhabit, and upon the condition of man, its dying and deathless inhabitant, is great and mysterious; and in the search for final causes, in a great degree inscrutable to his finite and limited faculties. The extent to which they are discoverable is, and must remain unknown; but, to the vigilance of a sleepless eye, to the toil of a tireless hand, and to the meditations of a thinking, combining and analysing mind, secrets are successively revealed, not only of the deepest import to the welfare of man in his earthly career, but which seem to lift him from the earth to the threshold of his eternal abode—to lead him blindfold up to the council-chamber of Omnipotence, and there, stripping the bandage from his eyes, bid him look undazzled at the throne of God."

*The Three Friends.*—Trust no friend wherein thou hast not proved him. At the banqueting-table how many more are found than at the door of the prison!

A man had three friends: two of them he dearly loved—the third to him was indifferent, although he was the most true hearted of the three. On a certain occasion he was summoned before a judge, and was, although innocent, cruelly accused. 'Who among you,' said he, 'will go with me and be a witness in my behalf? for I have been cruelly accused and the king is angry.'

The first of his friends immediately excused himself, saying he could not go with him on account of other business.

The second accompanied him to the door of the judgment hall, then turned away and went back, fearing the anger of the judge.

The third, upon whom he had reckoned the least, went in, spoke for him, and so joyfully bore testimony to his innocence, that the judge released him and sent him away. \* \* \* \*

Three friends has man in this world, and how do they bear themselves toward him in the hour of death, when God summons him before his judgment seat? *Wealth*, his most cherished friend, first forsakes him and goes not with him. His *relatives and friends* accompany him to the portals of the grave, and turn back again to their dwellings. The third, that which in life was most frequently forgotten, is his *good works*. They alone accompany him to the throne of the judge: they go before, speak in his behalf, and find mercy.

*The Arab's Hospitality.*—One of the missionaries to Syria, in a speech at the late anniversary of the American Board in Philadelphia, gave a graphic sketch of the Arab's virtues, from which we take the following:

"There is one trait possessed by the Arab, which is most valuable—it is a nice sense of honor. There are still good and bad among them, but they all have a high sense of honorable obligation. Another feature is their universal hospitality. This has come down from old to them. In their lofty poetry, which is more exalted in its character than that of any other nation, they laud and extol that Arab who consumes his substance to entertain strangers; and the Arab has no greater boast than that the fire of his hearth never goes out, but is always burning,

to cook food for the stranger, his guests. Dismount from your horse in the desert, and enter the Arab's tent, and he will entertain you as Abraham did of old—if not with the calf, yet with milk and butter, and the best he has, and wait on you till you are refreshed: for to be economical, is with the Arabs, the height of meanness."

**POUDRETTE.**—1. Poudrette is a perfect substitute for common dung, whether with respect to price or quality. 2. Its favorable effects essentially depend on the moisture of the season. 3. In dry years it is less efficacious upon sandy soils than upon very greasy or medium clays. 4. It is particularly suitable to very greasy clays. 5. By virtue of the lime and ammonia which it contains, it quickens and develops the inert humus, and the humic acid which often accumulates in the soil. 6. The Poudrette combined with organic matter, or in the state it is actually made, is a powerful means of rendering clay land friable.—*Le Cultivateur for August, 1838.*

Watering must not be neglected in dry weather. If well water is used, it should stand all day in a tub or barrel, exposed to the sun. Evening is the best time for watering.—*Gen. Fur.*

**BONE MANURE.**

The subscriber informs his friends and the public, that after ten years experience, he is fully convinced that ground bones form the most powerful stimulant that can be applied to the earth as a manure.

Orders for Bone Manure or Oyster Shell Lime, left at the Bone Mill, near Tremont road, in Roxbury, at the New England Agricultural Warehouse and Seed Store, No. 52 North Market Street, or through the Post Office will meet with prompt attention.

## PREMIUM LIST OF THE ESSEX AGRICULTURAL SOCIETY.

(Concluded.)

### XIV. ANIMALS TO BE PRODUCED AT THE EXHIBITION AT GEORGETOWN, ON WEDNESDAY, SEPTEMBER 30, A. D. 1840.

By the favor of the Trustees of the Massachusetts Society for Promoting Agriculture, we have it in our power to say, that in addition to the other premiums offered, the following will be awarded for stock from any county in the commonwealth, by a special committee for this purpose.

“For the best full blooded bull, of an imported breed, not less than one year old, on satisfactory assurance being given that he shall be kept for use in some county of the State, at least nine months from the day of exhibition, \$15

For the second best, 6

For the best milch cow, full blood, of an imported breed, not less than three, nor more than ten years old, with satisfactory evidence as to the quantity and quality of her milk, and the manner in which she has been fed, \$15

For the second best, 6

For the best full blooded heifer, of imported breed, that has been milked not less than three months, with satisfactory evidence of the quantity and quality of her milk, \$10

For the best yearling full blooded heifer, of imported breed, \$5

For the best pair of working oxen, taking into view their size, power and training, \$12

For the second best, 6

For the best pair of three year old steers, taking into view their size, power, &c. \$10

For the best milch cow, of native breed, not less than three nor more than ten years old, with satisfactory evidence of the quantity and quality of her milk and mode of feeding, \$15

They also propose the following premiums to be awarded to competitors from any county in this Commonwealth, on stock exhibited at Concord, in the county of Middlesex, at the Cattle Show of the Middlesex County Agricultural Society, on Wednesday, the 7th day of October next, viz:

For the best bull, \$50

For the next best, 25

For the best milch cow, 30

For the next best, 20

For the best heifer under 3 years old, 15

For the next best, 10

For the best boar, 15

For the next best, 10

For the best breeding sow, 15

For the next best, 10

The distribution of the amount of the foregoing premiums having been apportioned in conformity with the suggestions of the respective agricultural societies of Essex and Middlesex, competitors will be required to comply with the rules and regulations of said societies respectively, and also to give

notice in writing of their intention to offer animals for the foregoing premiums, to Benjamin Guild, Esq. Boston, Recording Secretary of the Massachusetts Society for Promoting Agriculture, on or before the Monday preceding the aforesaid days of exhibition respectively.”

For the best ox fattened within the county, regard being had to the manner of feeding and the expense thereof, \$15

For the second best, 10

For the best fattened cow or heifer, 10

For the second best, 7

For the best bull, not less than one year old, on satisfactory assurance being given that he shall be kept for use in the county at least nine months from the day of exhibition, \$8

For the second best, 6

For the best milch cow, not less than three nor more than ten years old, with satisfactory evidence as to the quantity and quality of her milk, and the manner in which she has been fed, \$8

For the second best, 6

For the third do 4

For the best heifer, that has been in milk three months or more, with satisfactory evidence as to the quantity and quality of her milk, \$6

For the second do 4

For the best yearling heifer, 3

For the second do 2

For the best pair of working oxen, not to exceed eight years old, taking into view their size, power, and the manner in which they have been trained, \$10

For the second do 7

For the third do 5

For the best pair three year old steers, taking into view their size, power, &c. \$7

For the second do 5

For the best pair of two year old steers, taking into view their size, power, &c. \$6

For the second do 4

For the best pair of yearling steers, taking into view their size, power, &c. \$4

For the second do 2

For the best boar, 5

For the second do 2

For the best breeding sow, 5

For the second do 3

For the best litter of weaned pigs, not less than four, from two to six months old, \$6

For the second do 3

### XV. TEAMS OF WORKING OXEN.

For the best team of working oxen, not less than forty pair, belonging to one town, that shall be exhibited between 12 and 2 o'clock, \$20

If these teams should come more than six miles, the expense of their feed will be paid in addition to the premium.

### XVI. DOMESTIC MANUFACTURES.

For the best piece of carpeting, a yard wide, and not less than twenty yards to be exhibited, \$5

The second best do do 3

For the best piece of stair carpeting, not less than twenty yards to be exhibited, \$3

For the best straw or grass bonnet, 5

The second best do 3

For the best wrought hearth rug, having regard both to the quality of the work and the expense of the material, \$3

The second best do 2

For the best piece of woolen cloth, 7-8ths of a yard wide, and twenty yards in quantity, \$5

The second best do 3

For the best piece of flannel, a yard wide and twenty yards in quantity, \$4

The second best do 2

For the best wrought woolen hose, not less than four pair, 2

The second best do 1

For the best men's half hose, not less than four pair, \$1

For the best silk hose, not less than three pair, 2

For the best piece of linen cloth, not less than twenty yards, \$4

The second best do 2

For the best piece of linen diaper, not less than twenty yards, \$3

The second best do 2

For the best wrought counterpane, having regard to the quality and expense of the materials, \$4

The second best do 2

For the best specimen of wrought lace, 3

The second best, 2

For the best specimen of work performed by a child under twelve years of age, exhibiting industry and ingenuity, \$3

The second best do 2

The Trustees being disposed to encourage domestic industry, solicit an exhibition of all articles manifesting this—and will reward them as liberally as in their power—the amount of these awards not to exceed one hundred dollars.

### XVII. FRUITS AND FLOWERS.

A convenient room will be provided for the exhibition of fruits and flowers—whoever presents the same is requested to give a description of the article presented. A committee will examine and report on these articles, and particular care will be taken that no disposition will be made of them other than such as the owner may direct. The friends of horticulture are solicited to contribute their mite for the honor of the county.

### XVIII. LIVE FENCES.

The trustees, with a view to encourage the cultivation of hedges, or live fences, as in many cases most important, and when in good condition always useful, economical and ornamental, have determined to offer premiums as follows:

For the best cultivated hedge or live fence of any kind, of not less than five years growth from the seed, and at least twenty rods in length, well trimmed and filled, a premium of \$20

For the next best, under the same conditions, a premium of \$10

*General Remarks.*

All claims for premiums to be awarded on the day of exhibition, must be entered with the Secretary of the Society or his agent, on or before 9 o'clock, A. M. of that day.

All other claims for premiums must be handed or forwarded to the secretary in writing.

All premiums awarded, the payment of which is not demanded of the treasurer within one year from the day of exhibition, will be considered as given to increase the funds of the Society.

No animal, for which a premium has heretofore been awarded by this Society, will be entitled to another premium, unless it be of a higher order, and for qualities different from those for which the former premiums were awarded.

No person will be entitled to receive a premium unless he complies with the conditions on which the premiums are offered, and gives notice as required, of his intention to claim the same.

In regard to all subjects for which premiums are offered, it is to be distinctly understood, that the trustees reserve to themselves the right of judging of the quality of the animal or article offered; and that no premiums will be awarded, unless the objects of them are of decidedly superior quality.

By order of the Trustees,  
J. W. PROCTOR, *Sec'y.*

From the Journal of the English Agricultural Society.

## EXPERIMENTS

*On the Improvement of poor lands by Subsoil ploughing, both with and without Underdraining.* By the Rev. W. L. RHAM, Vicar of Winkfield.

*To the Secretary of the English Agricultural Society:*

Sir,—As it is of more importance to the progress of agriculture to have well-authenticated facts and accurate details of different modes of cultivation, than mere theoretical speculations, I venture to lay before the English Agricultural Society the result of two experiments, made with considerable attention to every circumstance which might influence the result.

1. The first which I shall mention may be found interesting at this moment in consequence of its throwing some light on the use of the subsoil plough, which, although by no means a new invention, has lately been strongly recommended on particular soils, not without some discussions as to its merits, and doubts of its general usefulness.

The field which was the subject of the experiment was once a portion of the open common in the forest of Windsor, and brought into cultivation soon after the inclosure of the forest in 1813. Its soil consisted of a very moderate loam, inclined to yellow clay, only a few inches in depth; the subsoil chiefly a stiff clay, but with occasional portions of a very gravelly loam, nearly impervious to water. The surface is slightly undulated, and sufficiently inclined to let off the surface-water by means of open drains. It was first brought into cultivation by paring and burning the surface; and no very regular rotation of crops was followed. The first crop was turnips, broadcast; a very good crop, in consequence of the ashes. After this had been sold off by sheep, came oats; a good crop. It was then chalked, at the rate of about 15 tumbril loads to the acre, and manured with good dung, 6 tumbrils per acre. After this, part of the field was planted with potatoes, part with beans, and part with peas, as experiments; the crops were moderate. The next crops were half wheat and half oats; fair

crops—about 2 1-2 quarters of wheat and between 5 and 6 quarters of oats per acre. A similar course was pursued, with variations, till within a few years when rye-grass and clover were sown with the last crop. The grasses were mown twice for hay the next year. The two next years the field was pastured, chiefly with sheep.

This I consider to have completed the preparatory cultivation; and the field, when broken up, showed a manifest improvement in the depth, color, and texture of the soil. After that it bore beans and wheat. It was then fallowed, in order to clear it of the coarse natural grasses which, in spite of all this cultivation, had not been entirely eradicated, and also of a considerable portion of couch grass (*Panicum repens*.) which had increased in the soil. Six acres of the field were subsoil-ploughed, early in 1838, to the depth of 14 or 15 inches, by means of the Rackheath-plough, made by Messrs Ransome & Co., at Ipswich. A common swing-plough (the only plough I ever use,) with two horses abreast, first made a furrow of about 6 inches deep. Not having a large team, I had several such furrows opened, and then the two horses, and two more who had been carting manure while the other pair was ploughing, were yoked to the Rackheath plough, which stirred the subsoil 9 or 10 inches deep. The common plough after that filled up the furrows. Thus somewhat less than half an acre a day was subsoil-ploughed with 4 horses, the weather being very favorable. The land was now manured with 10 cartloads of yard dung to the acre: one acre was planted with potatoes; in another acre, mangold-wurtzel seed was drilled in rows 18 inches apart; two acres were sown with Swedish turnips, and two acres with red tankard turnips.—The mangold-wurtzel was either taken off early by the fly, or failed; and turnip seed was drilled over it. The Swedes were also sown a second time. Before Christmas there was a very good appearance of Swedes and turnips, which had been properly hoed two or three times and were clean. I congratulated myself on the result of the experiment, and began to feed off the turnips with sheep, drawing a portion for the cows at home. The winter was wet, and I was soon obliged to remove the sheep. The ground became too hollow to bear the cart wheels and the tread of the horses; and I began to regret having loosened the subsoil, which now held wet like a sponge. I had never thought that the field required underdraining. The water always ran off by the open drains before it was subsoil ploughed; I might, therefore, very naturally have concluded that the subsoil plough had now ruined my land. The turnips were now eaten off or carted home till late in spring; and perhaps I should have lost the use of them altogether, or spoiled my land by cutting it up, if I had not determined on an effectual remedy.

I immediately ordered 18,000 draining tiles, which fortunately I procured from different kilns in the neighborhood: they were the footed tiles. The common size cost 2 guineas a thousand, besides carriage; they were 13 inches long; those for the main drains cost 3 guineas a thousand, 6 inches in diameter, but only 12 inches long. I laid out the drains 30 feet apart; the common drains 26 inches deep, the main drains 30 inches. An immense volume of water ran out of the drains before the tiles were put in; and in a short time after they were filled up, my sheep returned to the fold, and my cart took the daily supply of turnips for the cows. The whole field was underdrained at a cost of 50l.,

besides the carriage of the tiles, that is only 5l. per acre. Of the 6 acres which had been subsoil ploughed, 2 were drilled with Chevalier barley; and 4 with Tartarian oats. Red and white clover, rye grass, and other grass seeds, were sown after the land had been harrowed, and the surface was rolled. The season being moist, the clover grew very rapidly, and the barley suffered in consequence. The crop, notwithstanding, was fair, reckoned at about 4 1-2 quarters to the acre; which is more than is usually grown in the neighborhood. Had there been no clover, 6 quarters might have been fairly expected from the length of the straw and ears. The Tartarian oats kept down the clover. The straw rose above a man's head, and the crop was very heavy. It is not threshed out, but we estimate it at 9 quarters to the acre. From the yield of a small portion threshed, I have reason to think it will exceed this. The field is now (Dec. 21st) after all the rain which has fallen in autumn, as dry and sound as any pasture I have. My cows and horses have been occasionally turned into the field without making any impression; and the old water furrows, which were dug out by my men, from habit, are quite dry, with fine clover in the bottom of them.

The conclusion to be drawn from this experiment is important, as it shows that, wherever the subsoil is retentive of moisture, complete underdraining is essential; and that the subsoil plough should never be used until the water can run off below. It also shows what an improvement is made on moderate land by the union of draining and subsoil ploughing. The cost is nothing when compared to the result. The 50l. I laid out on this field, I consider as the most profitable investment I ever made. The 4 acres which were not subsoil-ploughed are in artificial grass: as soon as the field is again broken up, which will be in two or three years, this portion shall also have the benefit of the subsoil plough.

[The other experiment will be given in our next.]

For the New England Farmer.

## BUTTER AGAIN.

MR COLMAN—In my first letter on butter, I omitted to state that much of that celebrated butter of Holland is made from new milk; and that the buttermilk remaining is a very good food—much better than that proceeding from cream churning. I know not whether any of our farmers adopt this process; or if they do, what improvements they have made on the practice of the Dutch; and I should not be astonished to learn that they had really "beaten the Dutch."

The superior quality of Dutch butter is attributed by some persons to the salt which they use—they make a secret of the preparation of their salt. It is certain that their butter has very little of the taste of salt in the sense that ours has. Their secret consists, probably, in diminishing that acrid taste which proceeds from the muriate and sulphate of magnesia.

For the want of positive knowledge, I will now indulge in my own speculations, which may go for what they are worth.

I can easily imagine that the rich strippings from the cows may be churned with more ease than common milk. Now let us suppose that some of our experimental farmers, with some knowledge of chemistry, could find the means of stripping the

common new milk of its superfluous watery particles, by a short and simple process; we should then have it all like the best strippings, or perhaps better and more butterous. I will suggest such notions on this subject as now occur to me, which may lead to better ones, and encourage experiments which I have not the means of making in the city.

I have shown in a former letter, that the separation of liquor from its sediment, which is commonly a slow process, may be accelerated, and made almost instantaneous. Co'oring matter, of various kinds, may be taken out of liquors as well as from stuffs, by chemical application; and various compound substances may be reduced to their diverse elements by mechanical as well as chemical means. Churning itself is a mechanical means of separating the butterous from the caseous and watery particles of the milk. I make these preliminary remarks, by way of encouraging myself in the search of something analogous for the desired process on milk.

It is true that the filtration of liquors is for the extraction of heavy particles from the liquid, and the separation now sought for, is the extraction of light particles, or butter, and that upwards. The desired result is, to precipitate quickly the heavier particles from the milk. If I were about to try experiments, I should begin by trying cold and heat, in their various degrees, from congelation to boiling. I would next try these two means combined with salt, or alum, saltpetre, &c.: with cold water even, if I did not care about the buttermilk. If I were right in the hypothesis in my first letter, viz: that salt had no affinity for butter or any pure fatty substance, there would be no danger of salting the butter by this process; and if the salt have an affinity for watery particles, it would seem that salt might be made an efficient agent in the separation now required. If by any one process now suggested or any one which may occur to persons better qualified to invent them, a speedy mode of separation be found of the thick, butterous, lighter parts of the milk from the others, which I here suppose to be heavier, I would then propose a plan for drawing the latter off, so as not to disturb the former; which idea I borrow from the refiners of Champagne wine. They first cork the bottles hand-tight, and place them in a bottle-rack, with the cork down. The sediment gets all into the neck of the bottle: they then go from bottle to bottle, without displacing them, and take out the corks quickly, let the sediment drop out, and replace the cork, with a very small loss of liquor.

Now let the vessel in which the prepared milk is placed, have a plug in the bottom, to let off the buttermilk without disturbing the upper surface. I will here suggest another practice, which may be used in this process, or in some other, perhaps, to good purpose. Water may be separated from wine or cider, by various simple means. First, put the watered liquor into an earthen vessel so porous that it will not contain water: the water will then run out first, and the wine or cider will remain last.—Second—put a small solution of alum in the vessel, stop it with a sponge rubbed with sweet oil, then incline the vessel gently, and the water will run out through the sponge, leaving the wine behind. I am inclined to believe that a cotton rag immersed in a tumbler, with a longer part of it hanging out, would by capillary attraction and a little of the syphon principle, extract the water, or some part of it.

You see, Mr Editor, that I am desirous to make up for my want of positive knowledge and experi-

ence, by throwing out hints for others to work upon. In so doing I trust that I can do no harm.—You are aware that the visionary alchemists, in their vain labors to make gold, did more to advance chemical science than kings could have done with all their power. In fact, it was in opposition to kings, priests, and popes, that the black and forbidden art cast a blaze of true light on the important science of chemistry.

WM. FOSTER.

#### SALTPETRE IN MEAT.

It is a matter of regret that while so much salt meat is made and used, we have not yet acquired the proper knowledge of the best mode to prepare and preserve it; nor is it known how noxious salt meat may become by an improper use of saltpetre in the pickle or brine usually employed.

There are various modes of preserving salt meat and fish, by drying, salting, pickling, oiling, smoking, &c.; but I merely mean at present to notice some of the defects and noxious properties of our actual meat, either beef or pork.

One of the main defects appears to consist in the useless addition of saltpetre to the pickle whereby the meat often becomes sour or spoiled, and always acid and pernicious. I never could understand why this substance was added to common salt, except that it is said to make it look better. But it ought to be known that saltpetre absorbed by the meat is *nitric acid* or *aqua fortis*—a deadly poison, whereby our salt meat becomes unpalatable and pernicious. A slight excess of this acid renders the meat sour, or spoils it, as we say. It has been suggested to correct this by potash, which re-absorbs this excess; but this only hides the defect without neutralizing the whole poison.

Is it not surprising that we should feed and deal, as a staple of our country, with an article containing a portion of such active poison as *nitric acid*? In fact, our salt meats are *no longer meat*: they are a new pernicious substance produced by a chemical action of salt upon the flesh of animals. This flesh when fresh, consists chiefly of *gelatine* and *fibrine*. Gelatine or jelly, is the substance soluble in warm water, forming a broth by boiling, or becoming a jelly by concentration; while fibrine is the fibrous, tough part of the meat, which cannot be dissolved, and is therefore unfit for food, while gelatine is the real nutritious part of the meat.

But it is well known that salt meat and even corned beef can no longer afford a broth, and therefore the gelatine must have been changed into another substance no longer soluble, nor so nutritious, by the chemical action of salt and saltpetre. To this new substance chemists have not yet given a name; but it is as different from meat as leather is from the hide before it is tanned by the tan-bark or *tannin*.

To this chemical change in meat are to be ascribed all noxious qualities of salt meat, and the diseases to which those who feed chiefly on it become liable; sea-scurvey, land-scurvey, sore gums, rotten teeth, bilis, ulcers, &c., which we entail on ourselves by using a kind of poisoned bad meat, which we call salt.

This important and doleful fact ought to be well known generally to all those who raise cattle, cure meat, or consume it, in order that they may correct this sad defect.

The first thing to be done is to abandon altogether the use of saltpetre in curing meat. This is

indispensable, and no one who is told that *aqua fortis* is the produce of it, ought any longer to use this poison in pickles or brines.

The best substitute for it is *sugar*. A small quantity makes the meat healthier, sweeter, nicer, and quite as durable. Let this be known to all our farmers and sailors.

How to make brine for meat perfectly innocuous, is yet a desideratum. Gelatine ought to be preserved in salt meat pure and soluble, as it is in broth cakes, before any meat can be perfectly healthy and equal to fresh meat. But at any rate, by withholding the saltpetre, we divest it of a deadly poisonous substance.

#### MASS. HORTICULTURAL SOCIETY.

EXHIBITION OF FRUITS AND VEGETABLES.

*Saturday, June 27, 1840.*

The exhibition of fruits at the rooms this morning reflected great credit upon the various contributors: every specimen could with truth be called excellent. They were as follows:

By Hon. E. Vose, Dorchester—Black Tartarian and White Bigareau Cherries; very superior specimens.

By B. Guild, Esq.—Very fine specimens of B<sup>l</sup>k Tartarian Cherry.

By Wm. Kenrick, Esq., Newton—Beautiful specimens of Napoleon Bigareau Cherry. The lovers of this fruit should not fail to order from Mr Kenrick trees that will yield such superb fruit.

Jno. A. Kenrick, Esq., Newton, exhibited Black Tartarian and one other kind of cherry not named; the first a beautiful specimen and worthy extensive cultivation.

John M. Ives, Esq., Salem, presented two specimens of seedling cherries: one called Mottled Bigareau and raised from seed of Manning's White Bigareau, and the other not named, raised from the seed of an English Bigareau—both very fine specimens.

R. Manning, Esq., of Salem, exhibited the following cherries: large White Bigareau, China Bigareau and common White Bigareau, Black Tartarian, Black Heart and Black Eagle, American Amber and American Heart, Elton cherry, and a seedling from the White Bigareau: these were all fine and some very excellent.

Mr Hawks, of Lynn, exhibited fine specimens of Downton, Southboro' and Methven Strawberries.

There was one specimen of fruit exhibited this morning, which though mentioned last, it would be impossible to forget—a Peach tree grown in a pot, of fine form and healthy, bearing beautiful specimens of the "Early Ann Peach"? This species attracted much attention, and the universal opinion was, "Beautiful! beautiful!" It reflected much credit upon the contributor, Capt. George Lee, of West Cambridge.

Sam'l Walker, Esq., Roxbury, exhibited specimens of Rhubarb, (Pie Plant.) These specimens were very large, and equal if not superior to any that have been exhibited at the rooms for a long time.

Spring Potatoes, so called, said to be full grown, though small; raised by J. Toulmin Smith, Esq., of Roxbury

For the Committee,

JAS. L. L. WARREN.

## WANDERINGS IN THE WEST IN 1839.

No. VIII.

(Concluded.)

In the thick timber bottoms along the Illinois river and in the swamps of Indiana, there are great numbers of wild hogs, which are occasionally hunted, and many are taken, but they are hardly worth the killing.

Sheep are not very common, on account of the wolves, but in some parts of Ohio there are considerable flocks, and there are a few in Illinois.—The high rolling prairies make excellent sheep pastures, and they thrive exceedingly well there.

There is no finer mutton to be found in the world perhaps, than in Illinois. Sheep husbandry might be made very profitable there.

The wild animals most common are deer, wolves of two kinds, the grey wolf and the prairie wolf, foxes, badgers, rabbits, otters and squirrels: bears are seldom seen.

Of birds there are wild turkeys, in the forest country, partridges, which are generally called pheasants, quails, called also partridges; grouse, or prairie hens, cranes, snipes, larks, parroquets—very beautiful birds with white bellies, black wings, and head and neck a bright scarlet; and a few other small birds, besides water fowl, which are plenty at particular seasons.

The lakes and streams are well stocked with fish of various kinds, and many of large size.

From these lists it will be seen that sportsmen have fine opportunities for the exercise of skill in their various arts.

The people of the western States suffer great inconvenience from the want of ready markets for their produce. Notwithstanding the noble lakes and rivers, the numerous canals and railroads which have been, and are being constructed, intersecting the country in all directions, still a great portion of the country does and always will suffer in this respect. The west is destined to be an agricultural and not a manufacturing country. Almost all branches of manufactures are carried on by means of water power or are greatly facilitated by its aid, and the west has but a small share of water power, not more than sufficient to drive the saw mills and flour mills necessary for the country; hence no large communities of consumers of agricultural produce can grow up in the country, except in the cities, and these can never be so numerous as to consume a large amount compared to what will be produced; therefore the great staples only can be carried to market, and these to a great distance, to be exchanged for the various manufactures of other countries and the produce of other climates, and must seek a market chiefly at the Atlantic cities and New Orleans. Improve the internal communications as much as they may, a canal or a railroad cannot be made to every man's door, nor through every town nor every county, and the largest part of the produce must be transported a considerable distance to any of these improvements, and thence a long and expensive route to the ultimate market, and when we consider the vast extent of fertile country to be cultivated, and the enormous amount of produce, we readily see that prices must be low, and deducting the cost of transportation, the farmer's profits must be small, and the prices of manufactured and foreign goods must be high, exactly in proportion to the low prices of his own produce, and from the same causes—the cost of transportation and the commissions of the many

hands through whom they must pass; and it is only the great staples that can be sold at all, for the various little things that are profitable to raise for a handy market, will not pay for the transportation to a distant one:—thus, to use a familiar phrase, "any way you can fix it" the west must suffer a great inconvenience from the want of a market, which goes far to balance the greater fertility of her soil.

The population of the western States is of a mixed and heterogeneous character: the immigrants are from all the States and of almost every nation, and there is little union among them. The southern portion is chiefly settled by people from the more southern States, and are generally denominated "Hoosiers"—a nick-name, which particularly appertains to the inhabitants of Indiana; the northern portion has a majority of New England and New York people, who are styled "Yankees." The manners and customs of the two classes are different, and there is mutual jealousy between them. Besides these two classes there are many foreigners, especially Irish and Germans—the latter generally settled in little communities by themselves or in connection with the descendants of Germans from the middle States; and although these different races live peaceably with each other, there is little of that harmony and kindly feeling which exists among the people of New England; and a long period must elapse before the whole population will become assimilated and melted down into one homogeneous mass. Good society may be found in the west, even in the newest settlements, but it must be selected.

The laws and institutions of the western States, excepting Missouri, are copied in a great measure from those of New York and New England. Ohio is especially a Yankee State. The more western States differ more from us. Towns and parishes are scarcely recognised in law. The corporations which are denominated towns, have powers and privileges unlike the towns with us. Almost all municipal affairs are managed by the county officers, the most important of whom are the county commissioners and sheriff, who are periodically elected by the people.

Public schools are provided for with some degree of liberality. The government has appropriated one section in each surveyed township, that is one thirtysixth part of all the public lands, for the use of schools, and the States have established other funds for the same purpose; but the people are generally unable to contribute much individually, and a great many do not properly estimate the importance of educating their children.—teachers who are competent are with difficulty obtained, and consequently the facilities for education are indifferent. There are a few persons who are interested in the cause and who tell us that in a few years they will have good schools, and that the means of education will be abundantly sufficient to satisfy the wants of the community, and in Ohio a great deal has been done; but in general these advantages exist mainly in the future prospect; and in the mean time the present rising generation will grow up in comparative ignorance.

The means of obtaining general information are limited; the public journals are nearly all of them ill-conducted concerns, containing little which is calculated to improve the tastes or the morals of their readers;—libraries and literary societies are rare, and the conversation of the people of the west is almost wholly upon tangible subjects connected

with the all-absorbing object of accumulating property.

These things will undoubtedly be changed in time, and the western country will improve much faster than the Atlantic country has done;—but at best a long period will be required before the moral, intellectual and social advantages of the west will be equal to what they are in the east.

The common buildings in the west are log cabins, which are built by locking logs together and filling the crevices with splinters and clay. On the inside the logs are usually hewn off: the chimney projects the whole size from one end of the house, and the fire-place is built of stones, if they can be procured: if not, of timber lined with a thick coat of clay: single floors of boards or rough planks complete the finishing of the dwelling. These cabins are comfortably warm but rather inconvenient habitations. A good cabin costs about one hundred dollars. After a time these cabins are exchanged for framed or brick houses, the cost of which is greater than the cost of similar houses in many parts of New England.

One of the greatest inconveniences of houses in Indiana and Illinois is, the want of good cellars; as there are very few localities high and dry enough to have a dry cellar, and it is very difficult to drain them; hence there are very few houses there which have any cellar at all.

What great advantages are to be realised by emigrating to the west?

The emigrant who has a capital may obtain good land at a very cheap rate, and the rise of property will eventually make him rich; in the mean time if he is industrious, he may have an abundance of substantial food, indeed most of the necessaries of life; and he may have them too for one half the labor that would be necessary to obtain them at the east; but the luxuries, comprising many things which he has been accustomed to all his life, and which most people esteem as almost necessary to the comfort of life, are not easily obtained.

Except the opportunity which is afforded to the man who has a capital to become rich by speculation, I know of no important advantage to be gained by emigrating to the west. Mechanics and laborers have no better opportunities there than at the east. Merchants and professional men, if they are talented and active, will almost always obtain wealth and honors in the west, and such men will succeed any where; and men who are wanting in talent and activity, will always be losers by going away from their connections and friends. It is almost a proverb in the west, that one who has not the "go ahead" in him will never succeed.

I do not conclude that it would be better for all to remain where they are. A young man who has a little money but not enough to give him a start in life, and who has in addition, strong hands and a light heart, will do well to emigrate, if he will avoid whiskey and gambling, and attend to his own business.

A man who has a family of boys to provide for and who may have been unfortunate, but can yet save something from the wreck of his property, will find it advantageous to emigrate to the new settlements in the west, where he can begin anew with a prospect of success. But a young man, whether a farmer, a tradesman, a merchant or a professional man, who can enter life with a tolerable prospect of acquiring a competence, and of supporting a family in his own neighborhood, and the man who is settled in life and in comfortable cir-

circumstances, and also the man who is entirely destitute of means, had better remain where they are; and if they acquire less property they will be likely to enjoy life better than they would to emigrate; the middle-aged man especially, who has been settled in comfortable circumstances, and removes, whatever may be his success, will always regret having left his home.

J. GOULD.

For the New England Farmer.

### "FANCY FARMERS."

Jamaica Plain, 19th June, 1840.

MR COLMAN—Dear Sir—A neighbor sent me, a day or two since, the Boston "Cultivator" of the 13th inst., thinking I might like to see a notice on "Fancy Farmers," without knowing I should feel any interest in that piece. That paper I have never seen three numbers of since its first publication, having always been well satisfied with the N. E. Farmer, which I have taken from its commencement.

The article on *large premiums on ploughs*, was brought to the notice of the Trustees of the Massachusetts Agricultural Society by me. I was one of the trustees of that society for twenty years, and retired from it six or seven years ago. I still feel a great interest in it, and am a firm believer in its having done and is still continuing to do, much good to the farming interest. They were the first in America to recommend ploughing matches, which was the means of such improvements in ploughs, that although at their first match in 1817, only one with iron mould board was in the match, (and which I imported from London,) at their last match in which twentytwo ploughs were tested, *every one was of cast iron*. This result was brought about by the means, as the editor of the Cultivator styles them, of "*fancy farmers*."

Now as to the mode of ploughing, whether the furrow slice should be laid flat or on the edge, I have always thought for our New England farming, the flat mode was preferable. But I also know from *book reading*, that in England where much wheat is raised, that they very generally use machines for sowing in rows, and afterwards machines drawn by a horse and guided by a man, to hoe and weed between the rows; and they also lay the furrow slice *on edge* and sow broadcast, by which means the grain slides to the bottom of the furrow, and the harrow drawn lengthways, levels the earth and leaves the seed in rows; by which means the air draws more freely through it; and it is also by many farmers hand-hoed and weeded, and not allowed to grow, weeds and all, as is much the case in other countries, smothering the crop and producing more weeds than grain.

In our ploughing matches at Brighton, *one* of the chairmen of those committees usually directed the ploughman to lay the furrow slice on edge.

You will perceive, sir, notwithstanding the sneering of the aforementioned editor, I am not to be laughed out of my ploughing notions, which are not of yesterday.

This is not a great *grain* growing State, but our premiums for ploughs extend to every State in the Union, and they are for the use of any other State where much grain is cultivated.

Now as to the reason for the premiums at all.—I was invited three years ago to act on the premium committee on agricultural implements at the mechanics' show in Faneuil hall. Ploughs by sev-

eral of our best makers were there. I stated that I could not give an opinion which was the *best*, without seeing them tested in the earth; last autumn I again declined acting on that committee for the same reason: [that Society are not prepared to make such trials.] Several of these plough-makers came to me on the subject, to see how this could be brought about, and the premiums now offered by the Massachusetts Agricultural Society, are in consequence of my request to the Trustees.

I am sorry to see an editor of an agricultural paper still using the term "fancy farmers" or "book farmers"—by whom many experiments have been made that would not probably otherwise have been attempted—many of which may have been found too expensive, but many also have resulted in much good—and those have been copied and continued. What also are editors of papers doing, but disseminating their weekly papers, the chief contents of which are but copies from books or other papers.

I am, dear sir,

Yours, very truly,

JOHN PRINCE.

From the Albany Cultivator.

### TIMBER: PROPER TIME FOR CUTTING, &c.

Timber includes all kinds of felled and seasoned woods. Of all the different kinds known, oak is considered the best for building, and even when it lies exposed to air and water, there is none equal to it. The goodness of timber not only depends on the soil and situation in which it stands, but likewise on the season in which it is felled. People disagree very much in this: some are for having it felled as soon as the fruit is ripe; others, in the spring, and many in the autumn. As the sap and moisture of timber is certainly the cause that it perishes much sooner than it otherwise would do, it seems evident that timber should be felled when there is least sap in it, or when the sap is most fusible or in a liquid state.

The ancients chiefly regarded the age of the moon in felling timber: their rule was to fell it in the wane, or four days after the new. An Amherst, Massachusetts, cooper states that he formerly furnished three oil mills in that vicinity with casks made from oak felled in June; because, he says, timber felled in winter being more porous, would not contain oil: and that oak and walnut cut in June, would not powder-post.

That the moon has an influence on the sap, no one who has paid attention will have occasion to doubt: the liber or inner bark is less adhesive at this stage of the moon, the ligneous or woody matter being in a more fluid state. It has been ascertained by various experiments, that the woody part of oak in full vegetation, is only four tenths of the whole: air constitutes one fourth of it, and the rest consists in sap. Light woods have still a much less quantity of solid matter; but the season of the year and age of the tree occasion considerable variation.

Timber should be cut when of a proper age, for when it is either too young or too old, it will not be so durable. They should be cut in their prime, when almost fully grown, and before they begin to decay; and this will depend upon the dryness and moistness of the soil where the timber grows. The time of its commencement to decay, or when it is going past its prime, is when the concentric circles are less and less, as may be seen in the oak,

beech, walnut, &c. These circles yearly enlarge the trunk by the formation of a new alburnum or soft wood, which the next succeeding year becomes the lignum or hard wood.

The wood of the north side of all trees which grow in this climate is the weakest, and that of the south side is the strongest. The heart of a tree is never in its centre, but always near to the north side, and the concentric circles or annual coats of wood are thinner on that side. In conformity with this, it is the general opinion of carpenters, that timber is stronger whose annual plates are thickest; the air vessels makes the visible separation between the annual plates. Therefore, when these plates are thickest they contain a greater proportion of the woody fibre.

Timber after being felled and sawed, must be seasoned; not by standing upright, but lie one piece upon another, only kept apart by short blocks interposed to prevent a certain mouldiness which they will contract in sweating on one another. Some advise the planks or other timber to lay in water a few days, in order to extract the sap, and afterwards to dry in the air: by this means they will be prevented from cracking or chopping. Some scorch and season them in the fire, such as piles, posts, &c. which are to stand in water or earth. They are charred and seasoned by burning them round in a strong violent flame, until a black, coaly crust is formed; the internal part of the wood is thereby so hardened that neither earth nor water can damage it for a long time afterwards. An excellent preservation of wood by charcoal, especially applied to eve troughs and water spouts is, first to lay on a coat of drying oil, then immediately dust it over with a thick layer of charcoal finely powdered, and contained in a muslin bag. After two or three days, when the oil is thoroughly dried, brush off the loose particles of charcoal, and cover that which adheres with a coat of paint, and in a few days after a second; the whole will become a fine solid crust, and is said to preserve the wood sound many years.

Some advise to season the timber before it is cut down, by taking off the bark a year before it is cut: the sap is expelled and the alburnum is converted into wood in the course of the year. Sills and sleepers for out buildings should have a free circulation of air to save them from decay.

S. W. JEWETT.

*Peaches*.—A correspondent of the Journal of Commerce speaking of peach trees and their liability to be destroyed by hard winters, states that Judge Judson, of the U. S. District Court of Connecticut, who resides at Canterbury, caught the idea that it might be the too early springs which created the difficulty. He therefore in January, after the ground had become thoroughly frozen, covered the roots a foot deep with hay or straw, which had the effect to keep the frost in the ground and so prevent the sap from starting until the spring was fairly opened. He succeeded completely; for the last spring the trees all around, and of his neighbors in the adjoining yard, were all destroyed, but his were fresh and blooming. The fact seems to be, that not the cold weather, but warm weather, does the mischief. The trees are killed by frost after the sap starts.—*Bost. Times*.

Eggs, it is said, may be preserved good for a year, if kept in lime water salted.

## NEW ENGLAND FARMER,

AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, JULY 15, 1840.

## DENNIS'S "PATENT" TROUGHS.

To the Editor of the New England Farmer:

I notice in your list a communication from J. Dennis, jr., of Portsmouth, R. I., which induces me to ask that gentleman if he really considers himself entitled to a patent for the invention of surrounding a tree with a trough or gutter, filled with some liquid, which arrests the progress of the parent of the canker worm? If he does, I would ask him whether it be not a duty to appoint numerous and faithful agents to make and apply the patent article?

A year ago, one of his agents in this vicinity was applied to and engaged to make and put on leaden troughs for a considerable number of large and valuable trees, in proper season. The fall arrived and he had forgotten it. He promised anew. The winter passed and he had neglected it. The writer was then obliged to resort to the troublesome and uncertain remedy of tarring in the spring. This induced him to look into the question of the patent right, which he is convinced is not founded on original invention on the part of Mr Dennis, unless he can go back many years. One thing is certain—that a long time ago troughs of tin were used; and it can hardly be imagined that Mr Dennis intends to rest his patent on the suggestion of lead instead of tin. Will he favor the public with a copy and the date of his original specification?

H.

## REPLY TO THE ABOVE.

Through the politeness of the editor of the N. E. Farmer, I am permitted to reply to the communication of H. in the same paper, for which favor the editor will please to receive my thanks.

In reply to the gentleman who signs himself H., I will state for his information that I consider myself entitled to a patent right for the circular metallic trough and roof for preventing insects from ascending fruit or ornamental trees. I would also inform him that I know of no law that requires the patentee, if a citizen of the United States, (and I claim to be such,) to appoint agents or take any other measures to supply the demand there may be for the thing patented, or that forbids his making such use of his invention as his inclination may dictate. Notwithstanding, I consider it is my interest and perhaps my duty to take the most efficient measures to supply the public to their satisfaction. I am extremely sorry that the gentleman should have been so grievously disappointed by any of my agents, for I used my best endeavors to appoint the most efficient men, and such as were recommended to me by those who wanted their trees protected; and if there was any neglect on my part, I hope the gentleman will be kind enough to consider that it was not intentional, and pardon me accordingly. If the gentleman had taken the trouble to have written to me, (for he could have readily obtained my address,) I should have been very happy to have used my utmost efforts to have had his trees supplied to his satisfaction; and I will consider it a particular favor if any person who has or may suffer from the neglect of any of my agents, if they will please to inform me accordingly, and prompt attention and efficient action shall be exercised for their relief;—and it would give me pleasure to have any gentleman or a number of gentlemen who may want their trees protected, to inform me accordingly, and recommend some suitable person in

their neighborhood, (it is not necessary that he should be a mechanic, but any industrious young farmer can learn in one day to make the troughs and put them on the trees,) whom I might appoint as agent and teach to make the troughs; and where there may be agents appointed that do not serve them to their satisfaction, I shall take pleasure in appointing such as they recommend. Or if it would be more agreeable to them, I should prefer to sell them a right for such portions of the country as they may wish to purchase for. And I may further state that I am very desirous to sell rights or appoint agents wherever there are any canker worms to be destroyed.

Having replied to the first part of H.'s communication, I now hope to give him such information as will satisfy him of the originality of the invention in question. I am very well aware that tin troughs were used ten years ago and perhaps more; but they were made square, and proved very troublesome on account of the space in the corners of the squares between the trough and the tree, which were so much larger than at the sides, that it made it very difficult to keep them properly packed; whereas the leaden trough is made to stand at an equal distance from the tree all around. The space between the trough and the tree when properly packed with seaweed, and a little tar put upon the top of the seaweed to stick the ends together, it will remain in good order for years, or until the tree shall grow so as to burst open the troughs, which has happened in several instances where the troughs have been upon the trees for a number of years. If seaweed cannot be readily obtained, hay or straw will answer; but cotton waste holds the oil that may get on it against the tree, and will injure the bark if it does not kill it. It also requires more oil for the square than for the circular troughs, on account of their being so much longer. And when the tree had grown so that the square troughs were too small, it was very expensive making them larger, as it required four pieces of tin to be soldered into each trough and four more into the roof, whereas the circular troughs only require one small piece of lead to be soldered in, which may be done at a very small expense and leave the trough as good as when it was new. When the tin troughs are taken off they are worthless; but the lead troughs are worth two thirds of the original cost of the lead per pound.

If my recollection is correct, I made the first circular metallic troughs in the summer or fall of 1836, which was previous to any similar ones being made by others. I have no objection to the whole copy of my patent being printed; but as it will make less work for the printer, I will extract the claim, which will perhaps answer H.'s purpose; but if it should not, I shall be happy to supply the whole. "What I claim as my invention and desire to secure by letters patent is, a circular metallic trough and roof, made of one piece of metal and bent to conform to the shape of the tree, using for that purpose any metal that can be wrought into the proper shape." As many persons infringe upon patent rights unconsciously, I will here give the 14th section of the law of 1836, and inform such that the patentee is at liberty to bring his action against the maker, vender, or the person who uses or has used and laid aside the thing patented.

"Section 14. And be it further enacted, That whenever, in any action for damages for making, using, or selling the thing whereof the exclusive right is secured by any patent heretofore granted, or by any patent that may hereafter be granted, a verdict shall be rendered for the plaintiff in such action, it shall be in the power of the court to render judgment in any sum above the amount found by such verdict as the actual damages sustained by the plaintiff, not exceeding three times the amount thereof, according to the circumstances of the

case, with costs; and such damages may be recovered by action on the case, in any court of competent jurisdiction, to be brought in the name or names of the person or persons interested, whether as patentee, assignee, or as grantees of the exclusive right within and throughout a specified portion of the United States."

J. DENNIS, JR.

Boston, 7th mo., 13th, 1840.

N. B. Persons addressing me will please to direct their letters to Portsmouth, Newport Co., R. I. J. D.

## EARLY POTATOES.

We have received a "good mess" of early potatoes from Mr Josiah Lovett, 2d, of Beverly, which we pronounce to be first rate. They are without a name. He had them from the master of a coasting vessel, and does not know where they originated from. We think probably from Nova Scotia, as we saw at St. Johns two years since in August, a large quantity of the same variety apparently, on board a vessel from Annapolis. We have not seen or tasted a better early potato this year, and from the statement of Mr Lovett, believe there is none cultivated in this region that will go before them. The potatoes are white marbled with pale red, roundish and rather flat, and the flavor resembling the Chenango.

We have engaged what Mr L. has to spare, and shall offer them for sale at the proper season. J. B.

## NEW AGRICULTURAL WAREHOUSE AT THE SOUTH.

We would call the attention of our southern subscribers and others, to the advertisement of John D. Legare, in this day's paper, who is about opening an agricultural warehouse in Charleston, S. C. Mr Legare is editor and proprietor of the Southern Cabinet of Agriculture, Horticulture, &c., printed in the pamphlet form, which we would recommend as being suited to the meridian of South Carolina. We wish him success in this enterprise, and trust it will prove a benefit to the agricultural interests of the south, and we hope profitable to himself. J. B.

## Massachusetts Horticultural Society.

## EXHIBITION OF FRUITS.

Saturday, June 20th, 1840.

Strawberries; by Messrs Winship—Methven Castle, Keen's Seedling, Chili and another variety.

By Hovey & Co.; their Seedling, uncommonly large and very fine.

By J. L. L. F. Warren; his seedling Methven; fine specimen.

The seedling strawberries exhibited by Messrs Hovey and Warren, were represented as being very prolific and highly deserving of cultivation.

Cherries; by John A. Kenrick;—Black Tartarian—fair specimens.

For the Committee,

E. M. RICHARDS.

## CARNATION EXHIBITION.

The exhibition of Carnations for premiums, will take place on Saturday, the 18th inst., at the Horticultural Rooms. For the Committee,

Boston, July 11th, 1840. JOSEPH BRECK.

The editor of the Genesee Farmer prepares his lettuce for eating as follows:—"We cut the lettuce fine and sprinkle it sufficiently with powdered sugar; cream is then poured on, and vinegar, just enough to impart a zest. To our palate this is delicious. Please to try it."

**BRIGHTON MARKET.—MONDAY, July 13, 1840.**

Reported for the New England Farmer.

At Market 225 Beef Cattle, 15 Cows and Calves, 1450 Sheep and 330 Swine.

**Prices.—Beef Cattle.**—We quote to correspond with last week. First quality, \$6 25. Second quality, \$5 75 a \$6 00. Third quality, \$5 00 a \$5 75.

**Cows and Calves.**—\$24, \$28, \$35, \$50.

**Sheep.**—Lots were sold at \$1 50, \$1 88, \$2 00, \$2 17, \$2 33, and \$2 75.

**Swine**—A lot of small pigs to peddle at 5; a lot of large sows 4, 4 1-4, and 4 1-2; large barrows 5. At retail from 4 1-2 to 7.

**THERMOMETRICAL.**

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northern exposure, weeks ending July 12.

**To Manufacturers of Agricultural and Horticultural Implements.**

The undersigned, (editor and proprietor of the Southern Cabinet of Agriculture, Horticulture, &c.) proposes establishing in Charleston, South Carolina, by the first of August next, a repository for the exhibition and sale of all articles connected with either agriculture, horticulture, or domestic and rural economy, and he invites manufacturers, to forward to him two or three of each article, (unless bulky or costly) to serve as specimens, and to be deposited for exhibition and sale in his rooms. He will act as general agent for such, and where truly meritorious, will endeavor to present them to the notice of the community. All not disposed of, will be subject to the order of the manufacturerers at all times. For further information address the undersigned (post paid) at Charleston, South Carolina. **JOHN D. LEGARE.**

References, Messrs. J. Breck & Co., Mr Daniel Kimball, and Messrs. Ellis & Bosson, Boston. July 15.

**TIE UP CHAINS.**

Just received at the New England Agricultural Warehouse, a good supply of those celebrated Chains for tying up cattle. These chains, introduced by E. H. Derby, Esq. of Salem, and Col. Jacques, of Charlestown, for the purpose of securing cattle to the stall, are found to be the safest and most convenient mode of fastening cows and oxen to the stall. They consist of a chain which passes round the animal's neck, and by a ring attached to the stall, plays freely up and down, and leaves the animal at liberty to lie down or rise at pleasure, and keeps him perfectly secure. July 15. **JOSEPH BRECK & CO.**

**BUDDING FRUIT TREES.**

Cuttings of fruit trees for budding, comprising nearly all the choice sorts of Apples, Pears, Plums, and Cherries, known and cultivated in this country or in Europe, all from bearing trees, can be packed in such a manner as to be sent with perfect safety to any part of this country or Europe. Apply by mail to the subscriber, at the Pomological Garden, Salem, Mass. **ROBERT MANNING.** Salem, July 15.

**FENCE CHAINS.**

Just received from England, at the New England Agricultural Warehouse, 6 casks chains, suitable for making the chain fence, &c. **JOSEPH BRECK & CO.** July 15.

**TRACE CHAINS.**

Just received, direct from the English manufacturer, 8 casks of Trace Chains, from 6 to 11 feet long, suitable for ploughing or draft chains. **JOSEPH BRECK & CO.** July 15.

**CASES OF TOOLS.**

Just received from England, a few cases of superior horticultural tools, for gentlemen or ladies use, a splendid article in mahogany cases. **JOSEPH BRECK & CO.** July 15.

**REVOLVING HORSE RAKE.**

The Revolving Rake, which has been in general use in most parts of Pennsylvania and New Jersey, is found to be one of the most useful and labor saving machines now in use. One man and horse, with a boy to lead, will rake on an average from 25 to 30 acres per day, with ease, and do the work well. They are coming into very general use in all parts of the country, and will, no doubt, in a few years, supersede the use of the common hand rake. There is a great advantage in this rake over all others, as the person using it does not have to stop the horse to unload the rake.

**GRAIN CRADLES.**

The Grain Cradle is an article which is coming into very general use in the New England States, where they were till of late but little known, although they have been in very general use in the southern and western States, for many years, and which is found to be decidedly the best mode of harvesting grain, as it is supposed one man will cradle five acres in a day when he cannot reap more than one. The difference in gathering a crop is so much in favor of cradling, that we must suppose that it will be the only mode adopted hereafter, and the grain cradle will become of as much use, as an implement of husbandry, as the plough now is.

There has been a very great improvement in the manufacturing of this article, they are now made on the most improved plan; the scythe is well secured and finished in a superior manner and made of the best cast steel.

**SUPERB ROCKET LARKSPUR SEED.**

The subscribers offer for sale a quantity of Superb Double Rocket Larkspur Seed, of their own raising, saved from double flowering plants only, embracing all the different colors. For fine, strong and early plants, the seed should be sown in August. **JOSEPH BRECK & CO.** June 17.

**PURE BLOOD BERKSHIRE PIGS.**

The Society of Shakers at Harvard, Mass., have for sale the Pure Blood Berkshire Pigs. Also, a lot of Berkshire crossed with other Breeds, on reasonable terms at their Village.

Persons wishing to be sure of the clear Berkshire breed may rely on those they offer for sale, as they are the progeny of some of the latest imported from England. **JOSEPH BRECK & CO.** June 24.

**HORTICULTURAL TOOL CHESTS.**

Containing a complete set of Garden tools of superior finish and style, recently received from Liverpool and for sale at the New England Agricultural Warehouse and Seed Store. **JOSEPH BRECK & CO.** May 6.

**PATENT SPRING BALANCE.**

A few of those very convenient spring balances, for family use, a very simple contrivance for weighing small articles. **JOSEPH BRECK & CO.** No. 51 and 52 North Market Street, Boston. July 15.

**WHOLESALE PRICES CURRENT.**

## MISCELLANEOUS.

To the Editor of the New England Farmer :

Would not the following little story, founded on fact, be interesting and useful to your readers?—It is from the Temperance Almanac. B.

## THE GARDEN.

"Money! money! money! O there is nothing which money will not do," said Mr Jaques to himself, as he stood one June morning in 1828, looking into the garden of Mr Lane, cultivated somewhat better than was common in the place, though certainly not at any very great expense. While Mr Jaques was talking thus to himself, Mr Johnson, a neighbor, came up, to whom he addressed himself with much interest, saying, "Only see what a garden this is! How early and flourishing! Radishes fully grown, lettuce with large heads, cabbages almost fit for boiling, peas and beans full of blossoms and pods. Just look at the melon and cucumber vines; could you believe they could have grown so large? There are the currant, gooseberry, raspberry bushes, peaches, apples, and pears, and multitudes of beautiful flowers, and I know not what; and it is only a few years since this lot was nothing but a common field, and not regarded as a very good soil neither. But there is nothing that money cannot do. I should like amazingly well to have such things, but we poor people must be content without them; God has not given me riches, and I do not know, finally, if he had, that I should think it right to lay out so much just to please the eye and gratify the taste. How much good all the money spent here to gratify pride and suit the appetite, might have done, if given to some poor family to purchase food and clothing. But the appetites of the rich must be pampered, let the real wants of the poor be what they may. There will be strange overturning when God shall judge the world."

"Do you then really think, neighbor Jaques," replied Mr Johnson, "that Mr Lane is a rich man? Only reflect; you know that he commenced life here, as we speak, only about ten years since, with little or nothing to depend on but his earnings.—His wife, also, who was the daughter of farmer Peasley, could not have brought much property with her, and though they have been industrious and prudent, yet they certainly have not been in the way of making any great sum of money; and they have had a young family to provide for, like the rest of us."

"There must have been money somewhere, I am certain," said Mr Jaques, "for I know that I have worked as hard as Mr Lane ever did, and I know that instead of being able to get such a multitude of things, I have had more than I could do to provide the common necessaries for my family; this garden and all these fine things never come without money, and a good deal, too."

"You mistake, entirely," said Mr Johnson, "and if you will hear me, I will tell you all about it, as I heard it from Mr Lane himself, and his statement was confirmed by looking at his books, where he has recorded every tree, vine, plant, &c. which he has purchased, and the price given for them. The circumstances are these: Mr Lane became early convinced that the use of ardent spirits as a beverage was of no service to a man, and thus left the use, if indeed he ever had fairly got into the habit of drinking it. And when he bought here he de-

termined to devote a certain sum every year less in amount than was usually expended by the most temperate men as they were then called, who were in the habit of drinking a little every day. This sum, if I remember right, was not more than eight or ten dollars, which he has constantly devoted to the purchase of trees, plants or seeds for the garden.—These he has cultivated almost entirely himself, by taking advantage of those intervals of business which most men spend to little or no profit. The result is what you see, and it is very certain, should he continue in this way, a very few years will exhibit still greater results. And you and I, and in fact most of the neighbors, might have done the same thing, just as well as he. You speak of gratifying the appetite: do you not think you have spent more for that purpose than Mr Lane has, even if this simple gratification were the only advantage gained from all the fruits and flowers the garden yields. If you will reckon, you will find you have paid more than ten dollars yearly, for ten years past, for ardent spirits, just to gratify your taste; and so have I, and so have most of the neighbors. And I have just been thinking how unwise we have been; and have finally come to the conclusion that I had better adopt a different course, and therefore yesterday signed the temperance pledge; and, though my advice is not asked for, I will venture to suggest that it might be well for you to do the same thing. Your lot and mine, which we have owned as long as Mr Lane has this, have a much better soil than his, and lie more favorably to the sun, and can be cultivated much easier, while his now is worth a half dozen of ours. We have lost much by delay, but better begin late than never; and I have determined to begin. It will be much better than to talk about what money can do, and complain of those who cultivate and improve their garden with money which we spend for rum. But as I am in haste I must leave you, so good morning."

Saying this, Mr Johnson passed on, and went about the business of the day. The conversation produced a deep impression upon the mind of Mr Jaques, who after many struggles between the understanding and appetite, finally concluded to yield to the dictates of the first, resolved upon a change, and signed the pledge. His means of support soon increased, and his whole temporal circumstances became greatly improved. His barren field was turned to a fruitful garden: and he with his neighbor Johnson has long since found, from delightful experience, that a beautiful enclosure is a more pleasant resort than the shop of the retailer, filled with the dreadful fumes of alcohol and tobacco; a basket of fresh and delicious fruit more grateful to the taste than the intoxicating draught; and bouquets of beautiful flowers than the wine when it giveth its color in the cup; and the smiles of the peaceful family circle than the noise and ribaldry of a company of drunkards.

If a man begins to save ten cents a day when he is 21 years old, and continues to do so until he is 70, he will then be worth \$10,957 37. A great many boys and young men spend nearly as much as this for unnecessary and injurious eating, drinking and smoking.

The census of Boston recently taken, gives a population of 83,707. In 1835 it was 78,504. In 1830 it was 61,381.

## SCYTHES, RAKES, &amp;c.

The subscribers offer for sale a very extensive and complete assortment of Scythes, Rakes, &c. consisting in part of 300 dozen Phillips, Messer and Colby's superior Scythes.

50 "	Metcalf's	do	do.
50 "	Tait's cast steel	do.	do.
25 "	English do. do.	Grass	do.

2500 "	Anstin's superior Rifles.		
200 "	Common do.		
1000 "	Scythe Stones,		
100 "	Gram Cradles superior.		

They would respectfully call the attention of Dealers and Agriculturists to the above assortment, which consists of many of the best kin is now in use, and which they are prepared to sell at the very lowest prices.

JOSEPH BRECK & CO.

New England Agricultural Warehouse and Seed Store,  
51 & 52 North Market Street.

May 20.

## SUPERIOR SILK WORMS' EGGS.

200 ounces White and Yellow Peant, White Piedmontese, Milan, and Lyons Silk Worms' Eggs, for sale at \$5 per ounce. They can be sent per mail. The first crop of worms in the cocoonery of the subscribers have produced the most beautiful snow white Cocoons and of remarkable size and compactness. No worms have perished and such has been the general success attendant every where in the State of New York and the adjoining States on this new branch of business, that there is already found a great insufficiency of foliage and \$1 per 100 lbs. is now offered for leaves.

WILLIAM PRINCE & SON.

Flushing, Long Island, July 8.

21\*

## BONE MANURE.

The subscriber informs his friends and the public, that after ten years experience, he is fully convinced that ground bones form the most powerful stimulant that can be applied to the earth as a manure.

Orders for Bone Manure or Oyster Shell Lime, left at the Bone Mill, near Tremont road, in Roxbury, at the New England Agricultural Warehouse and Seed Store, No. 52 North Market Street, or through the Post Office will meet with prompt attention.

March 4, 1840

NAHUM WARD.

## DISHLEY SHEEP.

For sale, twenty full blood Dishley or New Leicester Ewes, and one Ram. Price \$10 each. Apply at the Farmer Office.

June 24.

\*

## DORKING FOWLS.

For sale, a few pairs of pure Dorking Fowls. The stock, of which these are the produce, were procured in Dorking, County of Surrey, England. "Few breeds have a title to boast of so high and long continued a reputation as the Dorking. Upwards of fifty five years have passed, since, while resident in Surrey, I sent to Dorking for my first regular breeding-stock: they were then the ancient and superior five-clawed breed of Surrey."—*Moorbray on Poultry, 7th Edition.*

This breed attains to a large size, and the hens are the best of layers. Price \$3 per pair. Apply to

JOSEPH BRECK & CO.

June 24.

†

## GARDENERS' KNIVES.

JOSEPH BRECK & CO. have this season imported and now offer for sale a few very superior Garden Knives, for pruning, &c. manufactured expressly for Gardeners, and warranted superior to any article of the kind before imported.

Also—a large assortment of Budding Knives, Grape Scissors, &c. &c.

April 22

## NOTICE.

The Rhode Island Society for the encouragement of Domestic Industry, have procured copies of Dr Jackson's Geological and Agricultural Report of Rhode Island, and will deliver the members each a copy gratis, by calling on B. Cranston & Co. at their Bookstore in Providence.

WILLIAM RHODES, Treasurer.

Rhode Island, June 24

## THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at \$3 per annum payable at the end of the year—but those who pay within sixty days from the time of subscribing are entitled to a deduction of 50 cents.

TUTTLE, DENNETT AND CHISHOLM, PRINTERS,  
17 SCHOOL STREET, BOSTON.

N. E. FARMER.

### EXPERIMENTS

*On the Improvement of poor lands by Subsoil ploughing, both with and without Underdraining.* By the Rev. W. L. RHAM, Vicar of Winkfield.

(Concluded.)

2. The other experiment which I would mention was made on a field of 5 acres, of a cold wet clay. When I first took this field the soil was poor and heavy. About 5 or 6 inches of soil only had ever been stirred. All the land around is in permanent grass, being supposed too heavy and wet for profitable cultivation with the plough. The tenants are tied down, under heavy penalties, not to break it up. The mode in which my field had been cultivated before, was the old one of two corn crops, after a complete fallow. To attempt to have turnips there would have been considered as absolute folly. The first thing I did was to trench-plough it very partially, only bringing up about an inch of the yellow clay; and this was too much. It was then well chalked all over; a practice extensively followed here, where there is no calcareous earth in the natural soil. The chalk is carted seven miles, and is reckoned to cost 1*l.* per wagon load when laid on the land. From 5 to 10 wagon-loads per acre are usually put on the land every 8 or 10 years, at the time it is fallowed.

I followed the old course of tillage, with the variation of wheat, beans, oats, and tares; manuring well, and fallowing every 4 or 5 years. But every course was attended with loss, as my accounts proved, although I had fair crops, paid a very low rent, (for it is not my own,) and it was tithe-free. This did not suit my purpose; but as I had a lease of it, and could not give it up, I laid it down to grass with a crop of oats, sowing clover and a mixture of good grass-seeds. The feed of it would more than cover the rent and outgoings; and I could lay out my money to better advantage on improving my own land.

It remained in grass five years, in which time it was mown twice for hay and fed three years. After the first two years the grass began to deteriorate, and at last the coarse grasses, especially *Alopecurus arvensis*, and the different varieties of *Agrostis* prevailed, and left bare spaces between them. I therefore determined to break it up. Preparatory to this I had all the old furrows ploughed out between the ridges which still remained. The sward which the plough raised was taken up and carted into heaps at the corners of the field, which was then ploughed and left for 6 weeks. On the 1st of January, 1835, the weather being very mild, beans were dibbled on it, in rows 15 inches distant, beans being put in 4 inches asunder. They came up well, and were very carefully hoed three times, and the weeds pulled up by hand. The crop was abundant—the bean-stalks were high and well furnished with pods through their whole length. The produce was 30 quarters of excellent horse-

beans, (6 quarters per acre.) The bean-stubble was cleared and the land cleaned with the scarifier, harrows, and rake, and then ploughed. Red wheat was drilled upon it immediately, and produced next autumn 25 quarters of plump corn. I need not add that the wheat was hoed and weeded about the time it began to tiller. The wheat stubble was ploughed soon after harvest, after a moderate coat of compost had been applied, and the field was sown with winter tares. This compost was made by mixing farm yard dung with the earth which had been ploughed out of the furrows on breaking up the grass, and which had been turned over twice with the spade, so that it had the appearance of fine garden mould. Great attention was paid to have water-furrows sufficient to carry off all superfluous water. The tares produced a good crop in 1837, which was partly made into hay; a small portion was cut up green for the horses, and a part, left for seed, was reaped in the end of August. Where the tares had been left for seed some manure was applied. The field being again ploughed was sown with wheat, and produced 20 quarters—1 quarter per acre. It was now apparent that the weeds were increasing, and that a cleaning became necessary: the wheat stubble was therefore scarified, and the surface raked; the weeds were burnt or carried off. The whole was ploughed as deep as possible before Christmas, and left rough to the influence of the frost. This was in 1838. As soon as the business of the farm permitted in the spring of 1839, the field was ploughed level by reversing the furrows; the heavy harrow, called here the drag, was drawn over in all directions, and all the roots and weeds were collected. It was next ploughed at right angles to the first direction, and after a little time harrowed repeatedly, and all root weeds carefully forked out. In April, after spreading about 18 cubic yards of fresh stable dung on 1  $\frac{1}{2}$  acre, potatoes were put 12 inches apart into every third furrow, after the plough, the manure being raked over the sets, and covered by the returning plough. On the remainder of the field, the rest of the manure, consisting of about 40 cart-loads of good yard dung, which had been carted on to the headland from the yard, and there turned over once, was spread evenly. It was now ploughed into very small ridges, 32 inches wide, each consisting of 2 furrows up and 2 down, or 2 *bouts*, as they are called. On the top of these ridges, after a light harrow had gone over, one row of Swedish turnips or of the red globe turnips was drilled. Plenty of seed was used to secure a plant. After this, the turnips, which came up well, were cultivated after the Northumberland manner; the intervals were ploughed, first laying the earth from the turnips, and then to them again. The double mould-board plough, which reached down to the yellow clay, deepened the middle furrow, and gave a free course to the water.

The Swedes and red rounds are as good a crop as I could desire. The distance of the ridges will allow the wheels of my carts to take two ridges between them, the horse walking in the interval between them. Thus I shall draw the turnips with-

out injury to the land, even in wet weather; but I mean to avail myself of a few dry days to take them off and set them in a sheltered situation, as close as possible, with the tops on, where they will continue to vegetate slowly, and no frost will injure them, as I know by experience.

This minute detail of my operations may appear tedious, but it tends to establish an important fact, that cold wet clays may be improved so as to bear good crops of turnips, even without under-draining. I do not pretend to say that under-draining would not greatly improve this field: but it has not suited my purpose or convenience to do so hitherto, and I have made it profitable without draining. I would not on any account use the subsoil plough here, unless I first drained it thoroughly.

The subsoil plough does wonders in lands which have a porous subsoil, even when employed by itself; but unless its application on stiff wet lands be accompanied with draining, it makes them worse, keeping in the water which would otherwise run off the surface.

### ON FOREST TREES.

The Committee on Forest Trees, report: That although liberal premiums for the cultivation of forest trees have been offered by the society from its organization to the present time, no claim for those premiums has, within the knowledge of the committee, been presented until the present year. Perhaps the subject has not engaged the attention of the farmer, or the benefits have seemed too remote, or the experiments made have not been so extensive as required by the rules of the society; but whatever cause may have hitherto prevented attempts to cultivate forest trees, your committee think that at no very distant day, the increased price of fuel and the diminished stock of timber, will awaken attention to supply the deficiency of both. Already the planting of trees by the roadsides, for ornament and shade, is becoming more frequent, and thousands might yet be planted, which would beautify our county, and in a few years add greatly to the stock of fuel.

This article is one of the heavy items of expense to every family, and every addition to the sources of supply tends to keep down its price. How many tracts of land there are throughout the county, of little value for other purposes, which might be profitably devoted to the cultivation of trees:—how many beautiful hills, long since divested of their primitive forest growth, and from which more recently the high price of ship timber stripped the few remaining oaks, until they now stand bleak and bare, exhibiting the aspect of sterility however good the soil, without shade or shelter for the cattle under our summer suns:—and how obviously would rows of trees by the fences and clumps scattered over these hills, heighten the beauty of the landscape, afford a grateful shade to animals and augment the value of the land. The value of the trees

which might now be planted in the county would, thirty years hence, without materially diminishing the income of the land, be almost invaluable.

Mr Nathan Webster, of Haverhill, is the first and only claimant for this premium. He commenced planting the seed of the locust in October, 1835, and not discouraged by the failure of most of the seed to germinate, or the destruction of the young plants by the winter of 1836 '7, has continued to plant extensively the seeds of the locust, ash, elm, also walnuts and chesnuts, to the present time, until the larger part of about nine acres of land has been planted, generally in furrows ten feet apart. But few of the walnuts came up, and of a bushel of acorns planted in the fall of 1837, not one germinated, owing, as he supposes, to having been injured by frost before planting. Mr Webster has found it necessary to soak locust seed from twelve to twenty hours in hot water before planting, to insure their germinating. He also showed the committee a promising nursery of ash trees, sown in his garden the last fall, and another of elms from 12 to 18 inches high, which were planted in June from seed the growth of the present year. The committee visited his plantation on the 20th September instant. The soil is dry and gravelly, and the land in 1835 was mostly covered with white birch and some white oak and maple trees. Previously to planting trees, only one acre of the field had been ploughed. The seed was dropped in furrows made with the plough in the sward, at ten feet distance, and covered with the hoe. Mr W. exhibited to the committee a considerable number of ash and buttonwood trees in a thrifty state, which he had transplanted; some of the latter were growing thrifty from slips set in the wettest part of the land. But the attention of your committee was particularly directed to the locust trees, of which Mr Webster estimated that from five to six thousand were in the fourth year, and from three to four thousand in the third year of their growth. The seed having been dropped without manure in furrows from which the soil was removed by the plough, the trees could not be expected to have had a rapid growth, and were almost universally injured by the borer, which is so peculiarly destructive to the locust tree. They were slightly hoed the first year, but had received no cultivation since, and the white birch and other trees were beginning to assert their claims to the soil. Cattle are entirely excluded from the field by a very substantial wall. Your committee think Mr Webster entitled to commendation for his extensive and spirited experiments in planting trees; and although they wish his cultivation had been more exact and thorough, and the present appearance of the plantation cleaner and more promising, yet considering the variety and extent of his experiments, and the importance of the subject, they recommend that he receive the first premium of thirty dollars.

In behalf of the Committee,

J. H. DUNCAN.

September, 1839.

*Nathan Webster's Statement.*

To the Committee of the Essex Agricultural Society on Forest Trees:

GENTLEMEN—The lot of locust trees which I have offered for the premium of the Essex Agricultural Society, is planted in Haverhill, about one mile east of the village. The land, between nine and ten acres, was in 1835 mostly covered with white birches, with some white oak and maple trees.

The land is light gravelly loam; the bushes and trees I had cut, and about one acre of the land ploughed and planted with potatoes, and in October, 1835, I sowed one pound of locust seed, but very few came up. In May, 1836, I had one acre of land furrowed in furrows ten feet apart, and in these furrows sowed two pounds of locust seed, and think that more than ten thousand trees came up. These were hoed once the first year, but in the following winter more than three fourths were killed. In the spring of 1837, sowed one pound of locust seed on two acres of land, in rows about ten feet apart; the seed came up well—the plants were slightly hoed the first year;—the first winter killed more than half of them. In the fall of 1837, I planted between one and two bushels of white oak acorns in rows ten feet apart, made by ploughing a furrow, but from these acorns not a single tree came up. I presume the early frost of that year killed the acorns before they were ripe. In 1838, sowed one pound of locust seed which came up well. I pour hot water on the locust seed, and let it remain twelve or twenty hours in the same water; but few locust seeds will germinate if not soaked in hot water. I presume there are now on the nine or ten acres of land, in the fourth year of their growth, from five to six thousand trees, and in the third year from three to four thousand trees. Where they were too thick, I transplanted them, and they now cover eight or nine acres. They have been very extensively attacked by the borer, which has very much injured their appearance and growth. There has not been any labor bestowed on them since the first year.

Yours, very respectfully,

NATHAN WEBSTER.

For the New England Farmer.

THE MORAL & PHYSICAL IMPORTANCE OF AGRICULTURE.

Boston, 14th July, 1840.

MR COLMAN—The voluntary contributors to your paper are very properly permitted to choose their own subjects, (saving politics and religious sectarianism,) and it is well that they are; because all men, in matters of mind, as well as all women in matters toilet, are *daily*:—they have their pretty and their ugly days; their precise, logical moods, and their desultory moods. I sat down with the intention of being very mathematical, and headed a paper with *Rural Mechanics*. But I soon found that I was not in a mood for figures, and tore up the paper. However, as I have devoted a little leisure which I have on hand, to your valuable paper, I will let my pen take its own course.

The moral as well as the physical importance of agriculture, has doubtless been the theme of many learned dissertations and poetical essays, from the time of Virgil to this day. But as I have not read them all, I may now flounder heavily through some of its pleasant paths, which have been rendered by others still more fascinating by the flowers with which they were strewed. But also, this ignorance of the past, may cause me to blunder into some new path, less smooth and florid, though leading, possibly, to fruitful results.

We must look back, I believe, to agriculture, for the true basis of civilization, if fixed property be considered as its principal agent. The property of the wild hunter was hardly deserving that name,

for it could be maintained only by physical strength, or by that cunning which we hold in common with the fox, who hides his half knawed bone in the ground. The wandering, pastoral life of the ancient Nomades was not much better, or their property much more secure. Their flocks and herds were the lawful spoils of the stronger tribe; there where no other law was known than that of the strongest.

A little sophistry would enable me to make a tolerably good plea in favor of this system of plunder, and a little refinement might enable one so disposed, to draw arguments in favor of it from our own system of majorities, considered in the abstract. But, really, *might* cannot make *right*, independently of other circumstances; although right without might is a very impotent affair.

It is to agriculture, then, that we owe the progress we have already made in civilization. Is there any thing else to which we may owe our future progress? Shall we now kick away the ladder by which we have mounted so high, and vainly say that society may now soar to the empyreal regions, astride on a single *idea*, independent of the terrestrial base, on which the foot of our ladder stood, and far beyond its top, through the giddy regions of imagination? No—let us rather, like Anteus, never forget our kind mother earth; always maintain our foothold there, and be ever ready to call on her in time of need. She will never desert those who depend upon her and themselves jointly. But let us beware of the wily serpent, who has too often assumed the tempting office of distributor of earth's best gifts, without ever putting his own hand to the plough. He always has been partial; he is now partial, and always will be partial. If he were not partial, he would be obliged to do his share of the work; but being partial he shares in the Esau lots which he assigns to his favorites. This partial distributor is the maker of partial and unjust laws, which throw unequal burdens on labor, with the *semblance* of protecting it.

Well might the ancients bestow the honors of apotheosis on the supposed author of agriculture, in the person of Ceres, of whom they made an object of adoration. Many other objects less worthy have fascinated the minds of man; but none on earth is more worthy of his love and gratitude. If it had not been for the wily serpent who followed Ceres in her fruitful furrows, to gather where he had never sown, Ceres had been a goddess indeed, to this day, and worshipped by all, with that homage alone which can be acceptable to her, viz: the labor necessary, and the fruition consequent to her wise precepts.

When agriculture first appeared to bless this world, then did man make the most important step in the path of morals. Property became fixed, and permanent. The respect due and rendered to the property of others was the surest, nay the only guaranty of rights. Peace then looked down from heaven, and smiled on the future prospect of peace on earth. And in spite of the old French proverb, (which says, '*Qui terre a guerre a*': He who has land has war,) peace *will* bless this earth, and every man will sit down under his vine and fig tree, and no one shall make him afraid. If possession bring war, necessarily, it can be so only where unjust monopoly deprives many, very many of *all* property. I say very many, because it requires great numbers to hazard a war on property: and

the petty war between neighbors, to which the French proverb particularly refers, proceeds from the same source—some latent injustice or imperfection in the law. Can it be our will and pleasure that this last imperfection in law continue forever to verify the French proverb? If a hundred land owners were asked whether they had rather hold their possessions free from every chance of litigation, or take the chance of getting some small portion of their neighbor's land by force of law, with all the trouble, heart-burning and costs, how many would vote for litigation?

If agriculture, where a few potent, luxurious, idle, profligate landlords were owners of all the land, and its cultivators were slaves or semi-slaves, have been the means of civilizing the world to the degree we now find it, what may be expected in a country where almost every cultivator is also a proprietor of the soil? If the increased products of agriculture afforded the leisure and the means of making progress in all the other arts and sciences, including its own, through the experiments and mental labor of a few wise and philanthropic men, not obliged to exhaust themselves by hard work, and not willing to waste their strength in dissipation, what may be hoped from multitudes now similarly situated? Indeed the great majority of our intelligent and independent farmers are well qualified to labor in this intellectual field, and do now labor in it most efficiently. In proof of this round assertion, which would astonish Europeans, we have but to turn to our patent office, to our manufactories, to the arts generally, including the fine arts; to the learned professions, to commerce, and to our legislative halls, for all these are almost exclusively peopled by the sons of agricultural labor, who have found money and leisure enough to qualify themselves to take the lead in them all. Where in old countries one man could afford to suspend his daily toil for the improvement of his mind, for a few short days in the year, hundreds here have six long winter months for the same purpose, and their children have every day of the year.

Is it then so extravagant to indulge in the flattering hopes of a moral millenium? Either the abundance furnished by agriculture has *not* been the means through which our present progress has been made, or increased abundance with more numerous laborers in the field of science, must accelerate that progress. I do not see how to get rid of this conclusion; I will therefore hope on, and refer to posterity for the verification of my prophecies.

Now that I have established my general premises, to my own satisfaction at least, and concluded that we have the means and the disposition to improve our talent, and are even now improving it, I will hazard a few remarks on the importance of maintaining *entire* the sacred means bequeathed to us by our noble sires, for the completion of the great moral work began by them. Those means are, physical and moral independence:—independence in property and independence in mind; for they must go together or they both fall. A slave, be he white or black, is not a whole man. He is, in fact, but the shell of a man. A man in debt is a slave; and a poor man is a semi-slave. Such men can make no progress. The day when independence in property shall begin to diminish in this happy country, will be a gloomy day for our children. That day, if it could be ascertained, and fixed in our almanacs, would be celebrated in sackcloth and ashes, by our miserable posterity.

We seek not to level property by any other

means than those afforded by the present just and equal distribution of it among all our children, without favor or partiality. Nor can we wish to see it heaped up in excessive masses, by any other means than by honest industry;—and such excess is not to be feared where the laws are just and equal. The difference between one man and another is not so great, nor is life long enough to accumulate excessive wealth, by sheer labor and economy. If our laws be wise and republican, our condition will never become aristocratic by excessive wealth; and every other kind of aristocracy has become impossible in the present state of the world.

But how shall we ascertain whether independence of property diminish or not, among the great mass of our citizens? Be it remembered that this is no idle question of a statistic-monger. It is one of the deepest significance. It is the infallible monitor, who would tell us *truly*, if his voice could be heard, whether we were really rising or falling in the scale of morality and civilization. Need I add, in religion also? No,—for what is religion without morals?

Cannot some of our oldest farmers answer my first question, after looking about and numbering the independent land-holders of the present day, compared with those of former times, according to the ratio of population? By independent farmers I mean to distinguish all those who held then or hold now a house and ever so little land, from the mere day-laborers and tenants.

If some philanthropist of forecast, had thought of the importance of this question, and had had a voice in Congress, he might have added this to numerous queries which the commissioners of the census are now making of every house-holder in the nation. But before the next census, which will be ten years, this hint will have been forgotten, I fear.

The general idea of high civilization, such as nations have heretofore aimed at, is, I am aware, at variance with my present thesis. That idea leads us to look to cities and great accumulation of wealth as the sources of civilization. This very word, from *civis*, as well as urbanity, another word derived from the Latin for city, lead to the idea that cities alone are the schools for civilization. I must here admit that if any civilization worthy of Americans could exist *without morality*, then indeed would the cities have superior advantages to the country. The very vices of the city are, in a manner palliated by the illusions of fashion and the lustre of wealth. True civilization must then look to its own mother earth, for the completion of her great and glorious work.

In connexion with this subject, I will quote a very significant remark, which I have heard in this city, from a fashionable quarter. I have heard it said that "the city had deteriorated in good manners and high polish, by the introduction of so many emigrants from the country; and that the manners of the country have gained by the more frequent intercourse with the city, and by intermarriages between them."

No one will deny the beneficial tendency of the frequent intercourse which an active commerce brings about. But may we not have some doubts on the supposed decline of civilization in the cities? I would not dwell invidiously on this subject; but I am old enough to remember in the highest circles in this city, gambling to the loss of whole estates, and invariable drunkenness at every fashiona-

ble festival. In these two particulars we have, then, evidently improved in the city, notwithstanding the great influx of *rustic vulgarity*. I wish I could add, that we had also improved in the moral sense of *right and wrong*, commercially and legally speaking. I leave it to the happy inhabitants of the fields to inquire how much *their* sense of right and wrong has been improved by our example.

I cannot terminate this long letter more appropriately than by a quotation from Jefferson to Dr Priestley:

"There is an overcharge in the class of competitors for the learned occupations, and great distress among the supernumerary candidates; and the more so, as their habits of life have disqualified them for retiring into the laborious class. The evil cannot be suddenly, nor perhaps ever entirely cured. Nor should I presume to say by what means it may be cured. Doubtless there are many engines which the nation might bring to bear on this object. Public opinion and public encouragement are among these. The class principally defective is that of agriculture. It is the first in utility and ought to be the first in respect. The same artificial means which have been used to produce a competition in learning, may be equally successful in restoring agriculture to its primary dignity in the eyes of men. It is a science of the first order. It counts among its handmaids the most respectable sciences, such as chemistry, natural philosophy, mechanics, mathematics generally, natural history, and botany. In every college and university there might be professorships of agriculture, and that class of students might be honored as the first.—Young men closing their academical education with this, as the crown of all other sciences, fascinated with its solid charms, and at a time when they are to choose an occupation, instead of crowding the other classes, would return to the farms of their fathers, or their own, and replenish and invigorate a calling now languishing under contempt and oppression. The charitable schools, instead of storing their pupils with a lore that the present state of society does not call for, converted into schools of agriculture, might restore them to that branch, qualified to enrich and honor themselves, and to increase the productions of the nation instead of consuming them. A gradual abolition of the useless offices, so much accumulated in all governments, might close this drain also from the labors of the field, and lessen the burthens imposed on them. By these and better means which will occur to others, the surcharges of the learned might in time be drawn off to recruit the laboring class of citizens, the sum of industry be increased, and that of misery diminished."

I hope, sir, that the sound and philosophic views of an old farmer as well as a profound statesman, will atone for the length of this letter.

Your ob't serv't,

WM. FOSTER.

The Baltimore Sun mentions an instance of a hen that lived twentyeight days without either food or drink, having been accidentally fastened in a pile of wood. The hen is still living and likely to recover. In case of a famine, it would be quite an advantage to be an old hen.

The ship Henry sailed from Philadelphia last week for London, with a cargo of 33,750 bushels of oats!

From the Third Report on the Agriculture of Massachusetts.

### SILK CULTURE—MANAGEMENT OF JOSEPH FIELD.

The Commissioner has the pleasure of subjoining the account given by the Rev. Mr. Field, of Charlemont, Franklin county, Mass., of his silk culture. His intelligence and excellence of character entitle his statements to entire respect.

#### Letter I.

Ma COLMAN—Sir—I will, by your suggestion, submit a few hints, as the result of six or seven years experience in the production of silk, in the town of Charlemont, Franklin county, Mass. One who has tested the art of managing the silk worm only by experimenting upon a thousand or two at a time, has no high claim to be looked to for instruction, where large establishments are in operation. In small parcels none of the principal difficulties present themselves which are to be encountered by the cultivator who, in one season, rears his hundreds of thousands in a single laboratory. My experience has been within the range of from 10,000 to 50,000 per annum. To carry on the business to a much larger extent, with equal success, proportional caution and care will be required. In this communication I will consider the evils and hazards to be guarded against, and the process by which the desired end may be insured.

Well made, perfect cocoons are as essential to profit in this branch of industry, as full plump grain in wheat and other bread stuffs, instead of that which is blighted and shrivelled. To accomplish this, nothing is wanted but a vigorous and healthy worm. The art to be mastered and studied, is such a treatment of the worm, commencing at its earliest existence and continuing to the end, as is found to be the surest preservative from feebleness and disease. The difference of skill or assiduity, (making allowance for the difference of temperature in the seasons,) with which this husbandry is managed, will be apparent from the proportion of worms that fail, either wholly or in part, of yielding a perfect and sound product. It can never be safely calculated that a whole brood will go through without loss, under the best regimen that prudence can adopt. But when (there being nothing peculiarly adverse in the season) the labor bestowed ends, as sometimes, in the entire loss of one quarter or more, dying when they ought to be spinning their cocoons, or the scarcely less revolting spectacle of cocoons scarcely begun and then left for want of power to do more, others half finished, and the rest, though somewhat nearer to perfection, barely worth reeling; it may be presumed that the undertaker of the enterprise began without being sufficiently aware of the nature of his task. The rearing of silk worms differs from many other employments which, in the last result, do not materially suffer by occasional errors or neglects, they being susceptible of remedy in some after stages of the process. The worms that suffer by bad treatment or unfortunate circumstances, at any period of their existence before their work is done, are liable, more or less, to disappoint the hopes of a satisfactory return; and among other considerations not to be overlooked, there is that which relates to atmospheric temperature. Although considerable changes may be endured without proving fatal, yet the loss of time which is unavoidable so long as the mercury stands much below 70°, is not the worst effect produced by such an occurrence.

By some, the necessity, or even usefulness of an apartment impervious to cold air, as a place for feeding the worms, is disregarded. Experience, however, during the late cold summers, has made it certain to my mind, that he is not prepared to prosecute this business under the most promising auspices, who has not a dwelling place for these tender objects of his charge, in which he can raise the temperature of the air to the necessary point, when it has fallen below; and thus keep the wheels in motion, or restore at once to vivacity the torpid animals whose faculties are benumbed and labors suspended by cold. Stove heat is perfectly adequate to this want.

Being prepared with a proper receptacle for the young caterpillar, when it shall break its shell and vegetation having advanced far enough to furnish the needed nutriment, the little embryos are to be called forth by exposure to the influence of a summer atmosphere. The process of hatching in the warmth of early June, out of the sun's direct rays, is ordinarily effected within from five to ten days. Then commences the business which may not be intrusted with impunity to truant or slack hands; but for the encouragement of promptness, industry, and attention, will find its reward at the end of twenty, thirty or forty days. Tender leaves should be laid for the worms as soon as they appear, and that will be in the morning, for two or three successive days. The product of each day should be kept by itself, if convenient, that there be no unnecessary assemblage of those of different ages.—The expenditure of feed is very small during the first days of the worm; but care must be taken to serve them with fresh leaves as often as they need, and to see that none of them lose their chance of thriving by being buried in rubbish, or retarded in growth by being crowded out of their right through the greater strength and activity of their fellows. Chopping the leaves puts them in a good condition for the worm, until its powers and voracity give it an easy mastery of any thing that contains the material of silk fibre.

Through the successive ages of the worm, an eye is constantly to be had to the convenient arrangement of hurdles or shelves on which the worms are placed; the seasonable and judicious distribution of feed; their preservation from unwholesome effluvia, and from suffocation in their own litter; and other useful matters essential to their cleanliness, and such purity of air as health requires, whether in men, beasts or reptiles. As to the kind of platform upon which a discreet cultivator should deposit his little passive animals, to receive their daily sustenance, and go through their successive ages, to the production and maturity of the golden apple, every man's ingenuity will decide. Fresh, pure air, circulating freely about the bed on which the worm reposes, and which he never leaves at his own choice, is always important; and provision should be made accordingly, for ventilation, especially where the atmosphere becomes hot and sultry.

In their food, consisting of clean mulberry leaves, not too much withered and shrivelled by drying, two cautions are to be observed, relating to time and quantity. Some contend that they should be served by weight, according to a prescribed rule, varying the quantity from time to time. My practice has been to do by them as I myself like to be done by; that is, to measure out a portion suited to the demands of appetite, studiously avoiding irregularity and unseasonableness in the ministrations.

They should be fed early and late, not unnecessarily subjecting them to long intervals of fasting. Five meals a day, at least when they are in a mood promptly to dispatch what is set before them, or laid upon them, are not too much. They are not to be urged to gluttony beyond their inclination, and thus obliging them to leave a residuum to be wallowed upon rather than devoured. There are whole days when they do not eat at all, at the periods of moulting, or casting the skin, when they should not be disturbed until they have disencumbered themselves, and their appetite returns. Much depends, unquestionably, on preserving the silk worm in all its stages, from the deadly influence of sickly, unwholesome air, arising, it may be, from a variety of causes, one of which is likely to be the accumulation of litter on the shelves, if care be not taken to remove it before moisture and decomposition render it pestiferous. Another evil, from permitting litter to grow into a pile, is often the loss of worms buried in their own rubbish, which, if extricated, can never be restored to vigor sufficient to finish their task and produce a crop. Sickness and death may come in consequence of a culpable inattention to cleanliness. The sick should be removed to some sequestered spot, where they may be restored by sweet air and tender nursing, and the dead thrown away. In removing worms to give them a clean bed, unnecessary handling of them should be avoided. While their size will admit of it, they may be removed by branches laid down, on which they readily fasten.

After nearly attaining their size, it will be found necessary to use the fingers, which should be done with gentleness. Rough handling does not comport with their soft texture. Peculiar care to keep them from falling to the floor from the hurdle is important. When they manifest a disposition to spin their cocoons, which some ordinarily do in about thirty days, no time should be lost in freeing them from all the filth and rubbish remaining under them. This being done, preparation must be made for their accommodation, with a convenient and eligible cabin, in which they may accomplish their last labor and house themselves in their silken tissue, until a mysterious metamorphosis shall enable them to emerge into the light of day, prepared for procreation; and to leave behind them at their death not many days afterwards, the foundation of a progeny, to be the subject and hope of another year's culture.

Various articles are used for a refuge to the worm where it may build its cell. Oak branches answer well; but rye straw set up at convenient distances among them, in small handfuls tied, is as good and on some accounts better than any other arrangements. Cocoons being perfectly formed and ripe, which is effected in three or four days, are to be gathered and stripped of their floss or loose silk, preparatory to reeling. If there be occasion to delay this operation more than eight or ten days, the chrysalis within the cocoon must be stifled with heat, by being baked in a moderately heated oven, or by the action of steam; and the cocoons spread out in a safe place to dry until wanted for reeling or sale.

The cultivator may now wish to order things the most wisely for the ensuing season. To keep on the ground of experience, I state my own mode of doing the business. The best cocoons for seed, all scientific and practical men will say, is a rational maxim. Shall we therefore take the best part of our crop, cocoons yielding the most to the reeler,

and set them apart for seed? Instead of this, we reserve for reeling such as are best for that operation, which will yield their silk the most readily; but those which we call dupions or double cocoons, and which are incapable for the most part of being reeled, we devote to propagation, and find no perceivable inferiority in the product. The silk, after the escape of the butterfly, is used to good profit by being cleansed of its gum by boiling in soap and water, and then spun like flax on the little spinning wheel, yielding an article for hosiery of excellent quality. The eggs deposited on cloth or paper, are preserved during winter from too much frost and the depredations of mice, and will be ready in spring to be put to their proper use.

Whether the above sketch can be applied to any useful purpose in aiding the silk culture, I leave entirely to you, confiding in your judgment as to the best means of diffusing knowledge among those who look to you for instruction in what pertains to agricultural pursuits.

With high esteem, your servant,

JOSEPH FIELD.

Boston, Jan. 24, 1839.

#### Letter II.

Charlemont, April, 1840.

REV. MR. COLMAN—My Dear Sir—My last letter enclosed samples of four varieties of mulberry leaves, White, Multicaulis, Canton and Broussa—all produced last season on the same patch of ground—by inspecting which I think one would come to the conclusion, that the more modern fashionable leaves, after all, have little or no pre-eminence to the white, being little larger in size, and as to compactness and firmness of texture, manifestly inferior. I have formed no judgment, from my own experience, whether there would be economy in substituting other kinds for the Italian white mulberry; for I have not had sufficient opportunity for a test. There is one consideration not to be overlooked. According to the proposed modern plan of silk production, viz: by taking up the trees in the autumn and housing them, and resetting them in the spring, their foliage will be later, and require that the latter rather than the former part of summer be the season for rearing the worm. Now experience has established us in the opinion that the earlier months are incomparably preferable to the later for rearing healthy worms, and, consequently, for producing good cocoons. Trees which will not endure the winter, must be waited on for their harvest, until those of a more hardy race have matured their crop and given it into the hand of the gatherer. If the importance of early feeding be not a prejudice, every one must see that trees which stand the winter must, other things being equal, be entitled to the preference. When *acclimation* shall remove the objection which lies against the larger leafed species, they may command respect, and even pre-eminence; but to continue their triumph by *acclimation*, is not to be expected. If the leaves I forwarded to you are minutely examined, it will be judged, I believe, that the cultivators of the mulberry tree have good encouragement, even if their preferences cling to the Multicaulis, still to regard the white with favor, so much as to allow it generous fare; not to be turned off with a seat at the second or third table; or still worse, to be denied every indulgence and kindness. A rich soil is alone able to clothe the mulberry with a rich foliage, and, for a liberal allowance of sustenance, even the com-

mon sort, so degraded and scorned of late, will yield a noble and satisfactory return.

Most sincerely yours,

JOSEPH FIELD.

#### INJURIOUS EFFECTS OF WEEDS.

The question has been asked, how it was possible for China and Japan, with the ordinary products of agriculture, to furnish bread for a population, equaling, according to the latest census, about 300 persons to a square mile. The answer is to be found in the care with which every foot of ground is cultivated; in the fact that few animals are kept either for labor or food; and more perhaps than any thing else, in the entire freedom of the crops from every thing that can reduce their quantity or quality. Not a weed of any kind is to be found in the fields, and the most positive enactments and most assiduous attentions are directed to keeping the country free from them.

Few are aware how much weeds, or grasses, growing in a grain crop, detract from its value, by lessening the product. A vigorous root of charlock or thistle will draw from the earth the nutriment that would have given fullness to half a dozen ears of wheat; and where these, or any other foreign substance is permitted in a growing crop, that is sure to suffer in proportion to the quantity of the foul material present. Weeds injure a crop in two ways—by the room they occupy, to the exclusion of the valuable plants, and by the nutriment of which they rob the growing crop. We have seen fields in which the wheat maintained a dubious struggle with the red root, charlock or thistle; and where the stem and the ear both showed how much they needed to be relieved from such crowding and unwelcome neighbors. On the best cultivated farms of England or Belgium, not a plant or weed of any description can be found in a growing crop; and in some years the Earl of Leicester has offered a reward, but without success, for the smallest or any weed that could be found in hundreds of acres of his turnips or his wheat.

In this country, but few experiments have been made to show the difference of product between clean and foul fields, but several are recorded in Sinclair's Code of Agriculture, some of which we shall give, to call the attention of farmers to this point, and show that the labor expended in clearing fields or crops from weeds, is far from being lost, as many would seem, from their negligence in the matter, to suppose.

"1. *Wheat*. Seven acres of light gravelly land were fallowed and sown broad cast; one acre was measured off, and not a weed was pulled out of it; the other six were carefully weeded. The unweeded acre produced 18 bushels; the six weeded acres 136 bushels, or 22 1-2 bushels per acre; which is 4 1-2 bushels, or one-fourth of the whole, in favor of weeding.

"2. *Barley*. A six acre field was sown with barley, in fine tilth, and well manured. The weeding, owing to a great abundance of charlock, cost 12s. per acre. The produce of an unweeded acre, was only 13 bushels; of the weeded, 28. Difference in favor of the weeding, 15 bushels per acre, besides the land being so much cleaner for succeeding crops.

"3. *Oats*. Six acres were sown with oats; one acre ploughed but once and unmanured, produced only 17 bushels. Another six acres ploughed three times, manured, and weeded, produced 37 bushels

per acre. This experiment proves that oats require good management, and will pay for it, as well as other crops. Ten bushels of the increased produce may be fairly attributed to the weeding, and the other ten to the manure."

It is admitted that the labor and expense of weeding a crop is considerable; but if the difference be such as is here stated, and there is no reason to doubt it, as it is abundantly corroborated by other experiments, then it should be more generally and promptly attended to than it is. If our farmers could raise 4 1-2 bushels of wheat, 15 of barley, or 10 of oats, additional to their usual crop per acre, the effect would at once be felt in every department of labor in our country. No one can travel through our country before harvest time, without being convinced that millions of acres might have their products increased in as great a ratio as the above, by entire freedom from weeds. Farmers would be gratified could they have their lands tax free; but experience shows that to have them *weed free*, would be of far greater importance to them.—*Albany Cultivator*.

*Massachusetts Premiums*.—The Agricultural Society of the Old Bay State does not grow weary in well doing, as its list of premiums for the year 1840 fully shows. They are certainly magnificent, and should induce extensive competition among the farmers of that State. We are pleased to learn that the condition of the society is prosperous: that its funds are ample, the list of premiums demonstrate.

We learn from the N. E. Farmer with some surprise, that censure in some quarters has been cast on this noble society for having not done more for the promotion of agriculture. The censure is clearly undeserved; for if all that could be wished has not been accomplished, all that could reasonably be expected from the well directed efforts of such a body, has been performed. Massachusetts has been peculiarly fortunate in the individuals selected to manage her agricultural affairs; and under their enlightened guidance and supervision, the most cheering results for the future may be safely anticipated.—*Ibid*.

*The Borer*.—This worm makes less show of business than the canker worm or the caterpillar, but he does his business effectually where he undertakes. Deacon Leland, of Sherburne, says he finds the borer in his nursery, in those places only where he has neglected to destroy the sward. Mr. Oliver Barret, of Bolton, tells us that he found no borers in his quince trees until he had placed chip-dung about their roots; and ascribes their introduction to this cause. We think this probable. For many years we have avoided putting chip-dung about the roots of our trees. It is often full of worms, and should be thrown into the hog-pen before it is put in to any field.—*Farmer's Companion*.

*Grape Jelly*.—We have examined a specimen of this exquisite article. It is made from the Isabella ripe grape, raised at Croton vineyards: the object has been to preserve the flavor and virtues of the ripe fruit. In this the preparation has met with the most perfect success. We recommend the jelly as delicious to the taste, and an excellent beverage to the sick.—*N. Y. Express*.

Plant a vine, and in a few years the fruit thereof will cause thee to bless the day when thou didst it.

## NEW ENGLAND FARMER,

AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, JULY 22, 1840.

## AGRICULTURE IN MASSACHUSETTS.

Severe sickness has prevented the continuance of some suggestions on this subject, which we commenced a few papers since. The remarks we then made, we apprehend, must have indicated the extreme debility which preceded the crisis; and we shall ask the indulgence and kind judgment of our readers, if our present essay show that in mind as well as in physical strength we are not yet half a man.

The greatest of all difficulties connected with farming in Massachusetts is labor. It is difficult to be obtained. The prices of labor are enormous. The morals of labor, as we shall presently explain, both on the part of the employers and the employed, are exceedingly loose; and the management of it involves innumerable difficulties. We are the warm friend of the laborer. We wish to see him not only well but liberally paid. We would spare no pains that his situation should have all reasonable comforts, and would do every thing to inspire a pride of character, to increase his self-respect; and to remove from his mind, when he performs his part honestly and well, any painful sense of inferiority. We consider high wages of labor, where there is a sound currency, among the best evidences of the prosperity of a community. Heaven forbid that labor among us should ever be reduced to the miserable and degraded condition of Europe, even of improved England, where men and women perform constantly the most laborious and servile offices for the most miserable pittance and the meanest food.

But on the other hand, the price of labor should bear a just proportion to the value of agricultural produce, or the farmer cannot pay it. It has often happened within the last fifteen years, that a day laborer on a farm in seasons of haying and harvest, has by a day's work been able to buy one and a half bushel of wheat, three bushels of corn, or eight bushels of potatoes. Now no farmer can afford for any length of time to pry prices like these; and the consequence is a most serious discouragement to the farmer, for the whole of the produce is consumed in the payment of the labor. As Scott says in describing in one of his novels the result of some one's farming, it is in this case—"the carls and the cart-eavers make it all, and the carls and the cart-eavers eat it all." It is said that some years since a very extensive and successful farmer in Essex county, in showing a friend through his crowded barns and his granaries, almost bursting with their fulness, was asked what he was going to do with all this produce; "O," said he, "my cattle will eat it." "Well, what are you going to do with your cattle?" "O," said he, "my men will eat them." But this can hardly be called an encouraging agriculture; and men must have long purses who can sustain it.

The great variety of mechanical employments existing among us, the amount of hands occupied at high prices in our manufacturing establishments, the emigration of young men into the new States, the great numbers who go into the learned professions, the unnumbered herds that crowd into cities as house-servants, or shop-keepers, or tradesmen, or merchants, or almost any other employment which will enable them to cock a beaver on one side of their empty heads, and to sport a clean dickey, a pair of kid gloves, and a black walnut

stickee at public places—all these circumstances sweep the country almost clean of young men, and render it next to impossible to procure the labor necessary to manage a farm. The same remarks apply to female labor. It is not to be had. The amount of dairy produce among us is greatly diminished. Many farms within our knowledge in the State, which formerly kept their ten, twenty, and thirty cows, and found a rich source of income in the product of their dairies, now scarcely make their own butter and cheese; and it would be less difficult in most towns in the State, to find even in our farmers' houses, a young lady who can execute quite passably one of Mozart's best airs upon the piano, or lead off with grace in one of the latest German waltzes, than to find one who can milk a cow or make a cheese.

Now we know no remedy for this serious discouragement to agriculture, than by the more general employment of foreign labor. Our own people pretend to bluster and swear a great deal about the introduction of the Irish into the country; but if our own people will not work, we must have recourse to those who will.—The country is largely indebted to the Irish. They have made all our railroads, dug all our canals, filled up all our wharves, and wherever human life was to be used up without concern, there we have sent them, because their necessities and their recklessness compelled or made them willing to go. The Irish have many noble traits of character. Many whom we have had in our employ have been among the most laborious and faithful laborers we have ever found. We have treated them with the grossest abuse and injustice. We have insulted their religion, to which no people on earth was ever more attached. We have used them with constant contumely and contempt. We have even stoned those who were born among us, when in obedience to the civil authority of the State, they have appeared on our public parade ground, prepared to defend not their adopted but their native country. We have suffered the devil to go among them unrestrained;—we have sent him in the form of rum and whiskey,—and then expect them to do well.

If the Irish can but be induced to go forward in the great moral reformation which is going on in their own green isle—if we can but induce them to break up their clannish spirit by offering them the honest hand of friendship—if we can persuade them to send their children to our common schools and induce them to lay up their earnings in our savings bank, they will rise at once in the scale of humanity, and prove a great blessing to the country; for as yet they are willing to labor and consider labor as their destiny. Never on the earth were a people so crushed and abused as they have been in their own country. Philanthropy and humanity bid us therefore welcome them to a country of boundless extent, and which ten centuries cannot fill up, and let them feel that they have the rights and the responsibilities of men.

There is one other remedy for the difficulties of labor, which is of a moral character, and the effect of which may be something. Indeed we think in some cases we begin to perceive its influence. The opinions of young men and women are becoming more sound on the subject of labor. They are beginning to feel that it is not degrading but honorable; and the caprices and distressing changes in business and public affairs, are with effect admonishing many that a moderate and reasonable competence, the product of honest labor, is far better than to take the perils and uncertainties of trade and speculation.

On other topics connected with labor, we must postpone our remarks. H. C.

## EARLY RISING.

It is hopeless to persuade any one to get up early whose habits of late indulgence are fixed; and sometimes we think that the man in health who would close his shutters that the morning sun might not enter, would shut his door in the face of his best friend. But we can say in sober truth, that the most delicious of all pleasures of this kind is in the morning of summer, that of witnessing the first streak of light as it darts upwards above the horizon, breathing the balmy freshness of the morning, after leaving your own confined chamber, watching the gradual advancement of the light, until the sun presents himself in his robes of glory, and the whole creation rises as it were from the dead. H. C.

## ENQUIRY.

To the Editor of the Farmer:

I notice that in the N. E. Farmer of July 8, it is stated in the communication recording the progress of vegetation during the month of June, that a buckthorn hedge was trimmed at Ellington on the 27th ult. Will you or your correspondent have the goodness to communicate the reasons for performing this operation at this season? I have thought heretofore that early in spring, before vegetation commences, is a better season, giving the new shoots time to harden and ripen before the winter, which they cannot so well do if they commence putting forth in July. C.

## WEEDS.

MR EDITOR—Will you have the goodness to give the public a chapter on weeds? I well know that you have often done so; but we require "line upon line and precept upon precept."

Would it not be well for towns to impose the duty upon their surveyors of highways, to cause all weeds on the roadsides like the Canada thistle and the *Cicuta maculata* or American hemlock, to be mowed down at certain seasons. The latter is increasing rapidly and is well known to be highly poisonous. Its root is perennial and its seeds very numerous. Hardly a season passes without a case of death arising from eating it. C.

[Our correspondent will find an article from the Albany Cultivator on the subject of weeds, on another page of this day's paper.]

## THE YOUNG GARDENER'S ASSISTANT.

We have before us a copy of the 8th edition of "The Young Gardener's Assistant," by Thomas Bridgman, of New York. In looking over its pages we are well pleased with its systematic arrangement and with its plain and easy manner of communicating instruction to the young gardener. We are acquainted with the author, and know that he has the reputation of being one of the first in the line of gardening in his neighborhood. He fully understands the subject on which he has written. We can safely commend this work to the public, with the assurance that it will not lead them astray. J. B.

## WOODLAND.

A friend at Harvard, Mass., requests us to insert the following inquiry:

"Which is the most profitable management on clearing ground, where it is intended to allow the wood to grow again—to burn it over and take off one crop of rye, or to allow the immediate growth?"

Will some of our correspondents have the goodness to reply?

**Massachusetts Horticultural Society.**  
EXHIBITION OF FLOWERS.

Saturday, July 18th, 1840.

Carnations—by Messrs Walker, Jno. Hovey, Carter and Johnson.  
Dahlias—by Parker Barnes, A. Bowditch, and S. Walker.  
Native and other pretty flowers from Thomas Lee, Esq.—Native flowers by F. L. Call and F. Parker.  
Bouquets—by S. Walker, Jno. Hovey, Hovey & Co. and A. Bowditch.  
We noticed among Mr Carter's specimens, some seedling phloxes, and *Delphinium grandiflorum*—the latter of great beauty, and well worthy of cultivation.  
For the Committee.

S. WALKER, *Chairman.*

The Committee appointed to award premiums for Carnations, adjudge them as follows:

To Wm Meller, for the best display, the 1st premium.  
To John Hovey, for the second best display, the 2d premium.

The committee would remark that the exhibition was not such as they were in hope to have seen, from the liberal premiums offered by the Society; and they trust that another year the exhibition of Carnations may be more worthy of the Society's premiums.

C. M. HOVEY, } *Committee.*  
S. WALKER, }

We recommend to our readers the letter from our valuable correspondent, Wm. Foster, Esq. It will lead to a train of thought perhaps new to them, and this seems to be the principal aim of the writer, to elicit thought in others rather than to obtrude his own ideas.

**BRIGHTON MARKET.—MONDAY, July 20, 1840.**

Reported for the New England Farmer.

At Market 200 Beef Cattle, 30 Cows and Calves, 2000 Sheep and 170 Swine. 120 Swine were reported last week.

Prices.—*Beef Cattle.*—The prices obtained last week were sustained and we quote the same First quality, \$6 25. Second quality, \$5 75 a \$6 00. Third quality, \$4 75 a \$5 75.

*Cows and Calves.*—\$20, \$23, \$26, \$28, \$32, \$35, \$40, and \$42.

*Sheep.*—Dull. Lots were sold. \$1 25, \$1 33, \$1 62, \$1 71, \$1 88, \$2 00, \$2 17, \$2 25, \$2 50, and \$3 00.

*Swine.*—Dull. No lots were sold to peddle and no purchasers were at market. A few were retailed at former prices, from 4 1-2 to 7.

**THERMOMETRICAL.**

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northernly exposure, weeks ending July 19.

July, 1840. | 7 A.M. | 12, M. | 5 P.M. | Wind.

Monday,	13	64	84	73	S.
Tuesday,	14	73	93	73	S. W.
Wednesday,	15	68	94	80	S.
Thursday,	16	70	95	80	S.
Friday,	17	76	94	79	S. E.
Saturday,	18	72	92	73	S.
Sunday,	19	78	90	69	S.

On Wednesday at 2 o'clock, P. M., it was at 99½ On Thursday, at the same hour, 98. There has been hot very little rain for several weeks, and the earth has been very dry indeed. Sunday afternoon we had a refreshing shower accompanied with thunder and lightning.

**WANTED.**

A situation as gardener, by a young man who is acquainted with its various branches. The best references can be given. Apply at this office.  
July 22.

**TIE UP CHAINS.**

Just received at the New England Agricultural Warehouse, a good supply of those celebrated Chains for tying up cattle. These chains, introduced by E. H. Derby, Esq. of Salem, and Col. Jacques, of Charlestown, for the purpose of securing cattle to the stall, are found to be the safest and most convenient mode of fastening cows and oxen to the stanchion. They consist of a chain which passes round the animal's neck, and by a ring attached to the stall, plays freely up and down, and leaves the animal at liberty to lie down or rise at pleasure, and keeps him perfectly secure.  
July 15. JOSEPH BRECK & CO.

**REVOLVING HORSE RAKE.**

The Revolving Rake, which has been in general use in most parts of Pennsylvania and New Jersey, is found to be one of the most useful and labor saving machines now in use. One man and horse, with a boy to lead, will rake on an average from 25 to 30 acres per day, with ease, and do the work well. They are coming into very general use in all parts of the country, and will, no doubt, in a few years, supersede the use of the common hand rake. There is a great advantage in this rake over all others, as the person using it does not have to stop the horse to unload the rake.

**GRAIN CRADLES.**

The Grain Cradle is an article which is coming into very general use in the New England States, where they were till of late but little known, although they have been in very general use in the southern and western States, for many years, and which is found to be decidedly the best mode of harvesting grain, as it is supposed one man will cradle five acres in a day when he cannot reap more than one. The difference in gathering a crop is so much in favor of cradling, that we must suppose that it will be the only mode adopted hereafter, and the grain cradle will become of as much use, as an implement of husbandry, as the plough now is.

There has been a very great improvement in the manufacturing of this article, they are now made on the most improved plan; the scythe is well secured and finished in a superior manner and made of the best cast steel.

**BUDDING FRUIT TREES.**

Cuttings of fruit trees for budding, comprising nearly all the choice sorts of Apples, Pears, Plums, and Cherries, known and cultivated in this country or in Europe, all from bearing trees, can be packed in such a manner as to be sent with perfect safety to any part of this country or Europe. Apply by mail to the subscriber, at the Pomological Garden, Salem, Mass.  
ROBERT MANNING.  
Salem, July 15.

**FENCE CHAINS.**

Just received from England, at the New England Agricultural Warehouse, 6 casks chains, suitable for making the chain fence, &c.  
JOSEPH BRECK & CO.  
July 15.

**TRACE CHAINS.**

Just received, direct from the English manufacturers, 8 casks of Trace Chains, from 6 to 11 feet long, suitable for ploughing or draft chains.  
JOSEPH BRECK & CO.  
July 15.

**SUPERB ROCKET LARKSPUR SEED.**

The subscribers offer for sale a quantity of Superb Double Rocket Larkspur Seed, of their own raising, saved from double flowering plants only, embracing all the different colors. For fine, strong and early plants, the seed should be sown in August.  
JOSEPH BRECK & CO.  
June 17.

**PURE BLOOD BERKSHIRE PIGS.**

The Society of Shakers at Harvard, Mass., have for sale the Pure Blood Berkshire Pigs. Also, a lot of Berkshire crossed with other Breeds, on reasonable terms at their Village.  
Persons wishing to be sure of the clear Berkshire breed may rely on those they offer for sale, as they are the progeny of some of the latest imported from England.  
June 24.

**HORTICULTURAL TOOL CHESTS.**

Containing a complete set of Garden tools of superior finish and style, recently received from Liverpool and for sale at the New England Agricultural Warehouse and Seed Store.  
May 6. JOSEPH BRECK & CO.

**PATENT SPRING BALANCE.**

A few of those very convenient spring balances, for family use, a very simple contrivance for weighing small articles.  
JOSEPH BRECK & CO. No. 51 and 52 North Market Street, Boston.  
July 15.

## MISCELLANEOUS.

To the Editor of the New York American :

I read with pleasure in your paper of Friday last, an extract from the Hartford Courier, headed "The Bible," [copied into the Farmer of the 8th inst.] and fully agree in the opinion you express of the beauty and excellence of the article.

I do not suppose, however, that the editor of the Hartford Courier claims to be its author. The extract which you published, is a portion of "The Beauties of the Holy Bible," originally published in England; a copy of which (beautifully engraved and printed upon a card for convenient use) I purchased in London in 1837, which has been upon my table ever since. I have often wished for copies to circulate among my friends. And in the hope that some one may be disposed to publish the whole in a neat and simple form, I send for insertion in your paper, the remainder of the article.

H.

## THE BIBLE.

It is a book of laws, to show the right and wrong.

It is a book of wisdom, that condemns all folly and makes the foolish wise.

It is a book of truth, that detects all errors.

It is a book of life, that shows the way from everlasting death.

It is the most compendious book in all the world.

It is the most authentic and entertaining history that ever was published.

It contains the most ancient antiquities, remarkable events, and wonderful occurrences.

It points out the most heroic deeds and unparalleled wars.

It describes the celestial, terrestrial and lower worlds.

It explains the origin of the angelic myriads, of human tribes and devilish legions.

It will instruct the most accomplished mechanic and the profoundest artist.

It will teach the best rhetorician, and exercise every power of the most skilful arithmetician.

It will puzzle the wisest anatomist and the nicest critic.

It corrects the vain philosopher and confutes the wisest astronomer.

It exposes the subtle sophist and drives diviners mad.

It is a complete code of laws—a perfect body of divinity—an unequalled narrative.

It is a book of lives.

It is a book of travels.

It is a book of voyages.

It is the best covenant that ever was agreed to—the best deed that ever was sealed.

It is the best evidence that ever was produced—the best will that ever was made.

It is the best testament that ever was signed.

It is wisdom to understand it: to be ignorant of it, is to be awfully destitute!!

It is the king's best copy and the magistrate's best rule.

It is the housewife's best guide, and the servant's best instructor.

It is the young man's best companion.

It is the school boy's spelling book.

It is the learned man's masterpiece.

It contains a choice grammar for a novice, and a profound mystery for a sage.

It is the ignorant man's dictionary, and the wise man's directory

It affords knowledge of witty inventions, and it is its own interpreter.

It encourages the wise, the warrior, and the over-comer.

It promises an eternal reward to the excellent, the conqueror, the warrior, the prevalent.

And that which crowns all is, that the *ΑΥΘΙΑ*, Without partiality, and without hypocrisy,

"With whom is no variableness, neither shadow of turning."

IS

G O D !

*Seeds.*—If you have got two sorts of squashes or two kinds of melons or cucumbers planted any where in the neighborhood, calculate that the fruit next fall will be hybrid, that is mixed, partly of one sort and partly of the other. As to the seeds you save from any one of the squashes, melons or cucumbers, do not plant them next year in the least expectation that you will have the original sort again, or even such fruit as you happen to take the seeds from. The agricultural seed stores in Boston, take especial pains to employ men to raise their seeds, who will grow but a single variety of the same species any where on their grounds. In this way they secure the *true* sorts, and people who purchase of them are pretty sure of not being imposed upon or deceived.

Great care should be taken by common cultivators and gardeners in the raising of seeds. The true, original sorts can seldom be raised, if you grow different varieties in the same neighborhood. Corn will mix as far as the seeds from the spindle will blow by the wind; and pumpkins, squashes, melons and cucumbers will mix any where on the grounds where the same bees can fly from one blossom to another.—*Hallowell Cult.*

*A Good Joke.*—A teamster lately lost from his wagon a keg of butter, which was found by a man who carried it half a mile on foot, to the tavern of Mr H. where he found the owner, who thanked him for his trouble. Mr H. (the landlord) observed to him, that he was well paid—that *thank you* was worth 25 cents, and *thank you kindly* was worth 37 1-2 cents. He (the footman) soon called for a dinner, which was forthwith provided. After finishing his meal he inquired the price—the answer was, 25 cents. He then said, "I *thank you kindly*," and moved off. The landlord immediately called to him. "Here, stop my friend and take your change—there is 12 1-2 cents due you—your bill was only 25 cents."

The editor of the Exeter News Letter—a gentleman of the *green bag*, by the bye, says—"If our young men upon leaving college, instead of binding themselves as hopeless slaves to the green bags, or the saddle bags, would more generally engage in agricultural pursuits, it would be better for them and for the country." "Them's our sentiments."

*Boots* says that when he gets married he is determined his wife shan't wear the breeches, as he'll have a woman so much larger than himself that they will not fit no how she can fix it.

Lavater says—"Keep him at least three paces distant, who does not love bread, music, and the laugh of a child."

## SCYTHES, RAKES, &amp;c.

The subscribers offer for sale a very extensive and complete assortment of Scythes, Rakes, &c. consisting in part of 300 dozen Phillips, Messer and Colby's superior Scythes.

50 "	Metcalf's	do	do.
50 "	Taft's cast steel	do.	dn.
25 "	English do. do.	Grass	do.
10 "	do. do. do.	Cradle	do.
10 "	do. do. do.	Border	do.
100 "	Hall's Rakes, superior,		
100 "	Wilder & Eddy's do. do.		
200 "	Common do. do.		
100 "	Clapp's patent Scythe Snaths.		
50 "	Baker's do. do. do.		
100 "	Common do. do. do.		
2500 "	Austin's superior Rifles,		
2000 "	Common do.		
1000 "	Scythe Stones.		
100 "	Grain Cradles superior.		

They would respectfully call the attention of Dealers and Agriculturists to the above assortment, which consists of many of the best kinds now in use, and which they are prepared to sell at the very lowest prices.

JOSEPH BRECK &amp; CO.

New England Agricultural Warehouse and Seed Store,  
51 & 52 North Market Street.

May 20.

To Manufacturers of Agricultural and Horticultural Implements.

The undersigned, (editor and proprietor of the Southern Cabinet of Agriculture, Horticulture, &c.) proposes establishing in Charleston, South Carolina, by the first of August next, a repository for the exhibition and sale of all articles connected with either agriculture, horticulture, or domestic and rural economy, and he invites manufacturers, to forward to him two or three of each article, (unless bulky or costly) to serve as specimens, and to be deposited for exhibition and sale in his rooms. He will act as general agent for such, and where truly meritorious, will endeavor to present them to the notice of the community. All not disposed of, will be subject to the order of the manufacturerers at all times. For further information address the undersigned (post paid) at Charleston, South Carolina. JOHN D. LEGARE.

References, Messrs. J. Breck & Co., Mr Daniel Kinnball, and Messrs. Ellis & Bosson, Boston.

July 15.

## BONE MANURE.

The subscriber informs his friends and the public, that after ten years experience, he is fully convinced that ground bones form the most powerful stimulant that can be applied to the earth as a manure.

Orders for Bone Manure or Oyster Shell Lime, left at the Bone Mill, near Tremont road, in Roxbury, at the New England Agricultural Warehouse and Seed Store, No 52 North Market Street, or through the Post Office will meet with prompt attention.

March 4, 1840.

NAHUM WARD.

## DISHLEY SHEEP.

For sale, twenty full blood Dishley or New Leicester Ewes, and one Ram. Price \$10 each. Apply at the Farmer Office.

June 24.

\*

## DORKING FOWLS.

For sale, a few pairs of pure Dorking Fowls. The stock, of which these are the produce, were procured in Dorking, County of Surrey, England. "Few breeds have a title to boast of so high and long continued a reputation as the Dorking. Upwards of fifty five years have passed, since, while resident in Surrey, I sent to Dorking for my first regular breeding stock: they were then the ancient and superior five-clawed breed of Surrey."—*Moubray on Poultry, 7th Edition.*

This breed attains to a large size, and the hens are the best of layers. Price \$3 per pair. Apply to

JOSEPH BRECK &amp; CO.

if

June 24.

## GARDENERS' KNIVES.

JOSEPH BRECK & CO. have this season imported and now offer for sale a few very superior Garden Knives, for pruning, &c. manufactured expressly for Gardeners, and warranted superior to any article of the kind here imported.

Also—a large assortment of Budding Knives, Grape Scissors, &c. &c.

April 22

## THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing are entitled to a deduction of 50 cents.

N. E. FARMER.

For the New England Farmer.

## DENNIS'S PATENT TROUGHS.

MR EDITOR—I desire through your columns to thank Mr Dennis for his early reply to my queries respecting his invention and the date of it; and while I am happy to concede to him to him all *due* credit for making and applying the lead gutter round trees, for protection against the canker worm, I cannot allow his claim of originality. He states his invention to be "a circular metallic trough and roof, made of one piece of metal, and bent to conform to the shape of the tree—using for that purpose any metal that can be wrought into the proper shape," and "first made by him in the summer or fall of 1836." Now, if I shall show that there is nothing material in this description which was not invented and freely communicated to the public long before, I trust that he will have the magnanimity to admit it, and to authorise his fellow citizens to unite for the extermination of this pest, without the fear of a prosecution, with treble damages before their eyes, and without applying to his agents, (some of whom are far from admitting that any other than skilful mechanics can make them,) to do, what "any industrious young farmer may learn to do in one day."

In the N. E. Farmer vol. 8, page 225, under date of January 25th, 1830, is a very intelligible description of a tin trough, to be one and a half inches deep, with a cover or projection over it, filled with water, to which is added a small quantity of whale oil of the thinnest quality—the interval between the tree and the trough to be filled up with swinging-tow. This is the invention, or proposal, as he mostly calls it, of Mr Lemuel W. Briggs, of Bristol, R. I.; and here we have "the metallic trough and roof." But, says Mr Dennis, *they* were made square, and *my* invention is the circular form. Now it happens, singularly enough, that Mr Briggs, in his above-mentioned communication, in 1830, refers to an invention of tin troughs, by Mr Irish, of Rhode Island, mentioned in the N. E. Farmer, vol. 5, page 409, July 1827, to which he objects that they are *circular*, or as he describes them, "fitted to the shape of the tree." Here then is the invention in 1827 and 1830, of a "circular metallic trough and roof." But Mr Briggs refers us also to the invention of Mr Haughton, of Lynn, (N. E. Farmer, vol. 7, page 94, Oct. 1828,) which is a *circular* trough, made of strong pasteboard, painted, with a roof over it, filled with oil. Here then we have the idea of a circular apparatus strongly developed in October, 1828.

I shall now refer Mr Dennis and your numerous readers to the very accurate and remarkable paper of Gen. H. A. S. Dearborn, on the canker worm, read before the Massachusetts Horticultural Society, and published in the N. E. Farmer, vol. 8, pages 377-8, June 1830—in which, after stating the disadvantages of tarring, he says—"If a vessel could be formed of some cheap material, such as Danvers

pottery ware, or *sheet lead*, in two parts, in the form of semi-circular troughs, placed on the ground and filled with a liquid, &c. &c., it would answer the desired purpose." And a little further on he says: "A sheet lead vessel, or one of some other material, which could be secured to the trunk of the tree, a few feet from the ground, and filled with a liquid of the above named character, would be effectual."

It is worthy of remark that these inventions and suggestions, made from six to eight years before the imaginary invention of Mr Dennis, were submitted to the public in the most free and liberal manner, and published in your useful paper.

It thus appears conclusively that Mr Haughton invented and used "circular troughs" in 1828, and that Mr Irish used "circular metallic troughs and roofs, bent to conform to the shape of the tree," in 1827. Mr Dennis may say, perhaps, that they were of tin and made of more than one piece of metal. To the first allegation it would be sufficient to reply that his specification, as he gives it, does not claim the original use of any particular metal; and if it did claim the introduction of sheet lead, I have shown it was *invented* by Gen. Dearborn and published to the world six years before. To the second allegation, if made, it may be replied that Gen. Dearborn's second proposition of a "sheet lead vessel which could be secured to the trunk of the tree, a few feet from the ground," most obviously points us to the very gutter or trough made and used by Mr Dennis, of one piece of metal, unless the size of the tree should make two pieces expedient.

I feel confident that Mr D., after reading the evidence thus collected from a cursory examination of the N. E. Farmer, will candidly admit, that in 1836 he only hit upon or invented, what was already either in use or suggested and proposed by others. I can readily believe him if he asserts that he was ignorant of these facts, and that the invention was original, as far as regards his own mind; but he must be sensible that, in such case, all exclusive rights under the patent will fall to the ground.

I have not the slightest hostility to Mr Dennis, and have no object in view, other than the promotion of justice and of the interests of agriculturists. If this remedy, which appears to have been the result of the conjoined application of several thinking minds to the subject, can be thrown open to the public, we may hope for the extermination of the canker worm. On the other hand, if this is a patent remedy, many persons who have been acquainted with the expedient for ten or twelve years, will be deterred from its use by the fear of "the 14th section of the law of 1836."

I am aware that the former volumes of your publication contain other facts applicable to the subject, which, should it become necessary, may be laid before the community; and I beg leave to say again, that I do not desire by this open exhibition of them, to injure or wound the feelings of Mr Dennis, but to call the public attention to the matter for the public good. H.

P. S.—My copy of vol. 8 of the N. E. Farmer is

incomplete, not containing the No. for June 25th, 1830, in which, I have reason to think, will be found a description of the use of lead gutters, oil, &c., by Mr P. G. Robbins, of Roxbury; if so, will you have the goodness to publish such part of it as you think material?

From the N. E. Farmer of June 25th, 1830.

## CANKER WORMS.

MR FESSENDEN—My apple trees have for some years past been very much injured by canker worms, and I have diligently endeavored to find out something to check their ravages.

I thought of a plan for that purpose, last summer, and intimated it to a respected friend and farmer in my neighborhood; but deferred putting my thought into action, because experienced men said, "the canker worm's career has always been limited to just so many years. In 1830, you may rely on it, the worms will not appear." Last fall, however, the slugs began to go up. I faithfully tried the *old* remedy, and tarred them autumn, winter and spring. Yet they have been more numerous and destructive the present year than ever. My apple trees now appear as if a blazing fire had raged among their leaves.

On the third of this month I cut a strip of sheet lead, 4 1-2 inches wide, and of sufficient length; formed it on the handle of a pitchfork, like a tube, and had it soldered; then passed a piece of rope through it and bent it around an apple tree, drawing the rope tightly while bending, till the ends met; cut the pipe open and lapped the ends past each other two inches, that they might be hammered well together, and, by a proper cement, say putty or something similar, be made water tight; then brought it to a level and tacked the upper edge to the tree with small pump nails, about six inches apart. Here was a complete circular canal around the tree. I purpose to fill it early in the autumn with winter strained oil, spirits of turpentine, or some other liquid. If this should not lay an embargo on their *commerce*, it must at least stop their *navigation*, for no slug will dare to sail over it. A piece of sheathing paper, cut in proper form and oiled, may be fixed over it to keep out the rain.

If the lead be rolled thin, the expense will not probably exceed two shillings per tree.

I beg leave through your useful journal, to submit the above experiment to my agricultural brethren, for their consideration, with a hope, that if it should not prove altogether successful, it may lead to some better discovery to protect our apple trees from the blasting influence of canker worms

Respectfully yours,

P. G. ROBBINS.

Roxbury, June 19th, 1830.

The greatest man is he who chooses the right with invincible resolution; who bears the heaviest burdens cheerfully; who is calmest in storms, and most fearless under menaces and frowns; whose reliance on truth, on virtue, on God, is most unflinching.—*Channing.*

For the N. E. Farmer.

## RURAL EDUCATION.

No. 1.

If any one should suppose that by rural education, something is meant inferior to city education, he greatly misunderstands my views. After having contended, as I have done, that civilization itself, owes every thing to the labors of the field, the means, and the inspiring objects which not only invite to the contemplation of nature's works, but almost force it upon us, and teach us how to make the most of them, and in some degree to improve and multiply them; I say, after these high pretensions for rural life, and the expressed hope of future progress from the same source, it cannot be supposed that rural education is to assume an inferior rank. So far is this idea foreign from my present thoughts, that I sincerely believe that the highest grade of improvement to which our nature is susceptible, must depend upon the pure moral air, and the necessary and honest labors of the field, for all future progress.

Too much credit has been given to the cities for past improvements. It is true that some of their philosophers have wrought up to considerable advantage the ideas furnished by the country; and their merchants have carried to foreign lands her superfluous products, bringing back in return, new products and some new ideas; and thereby the city philosophers and merchants have contributed to our present stock of comforts and knowledge. Still we must look back to mother earth for the foundation of these city labors.

But whence comes that moral lore, that unique cement which alone keeps society itself from falling asunder? Do the philosophers manufacture it? Do the merchants import it from abroad? Is it to be found in the laws, the usages, the manners, the government or the religion of foreign countries? Are the cities the places where all these exotic plants are the least congenial and least apt to take root? Are the cities the fruitful, congenial soil in which morals thrive best? "What are laws without morals?" was the enquiry of an ancient philosopher: "*Quid proficiunt leges sine moribus.*"

No: the cities have done much good, for which we thank them; and much evil, which we should remember, not in malice, but as a wholesome lesson to the whole human race.

Let not our gratitude to the feudal cities, for their former resistance to baronial despotism, and for having given the first impulse to the return of liberty, blind us to their defects. One of the apostles of our revolution has told us that "great cities were great sores." And what moral tale do not the great cities of Europe tell us? Have not they and their lordly inhabitants—though formerly warm sticklers for liberty and opponents to the steel-clad tyrants—become tyrants in their turn, and swallowed up the fat products of the fields, deprived by partial laws, slowly progressive, the miserable cultivators of every inch of land, and obliged them to live on a scanty allowance of thrice-culled potatoes,—which British writers say is the present condition of the Irish peasantry? But I would not be ungrateful to the cities for the smallest favors;—and I would, if I could in conscience, believe that none of our cities would ever do as other cities have done, even if they had the power.

It will be here remarked that I speak of European cities, as if they were the originators of despot-

ism. I will not lengthen this paper by arguing this point, for I am writing to intelligent men, who know the history of cities, from those of Palestine to the Gulf of Finland, and from Paris to the capital of the Celestial Empire. They may there learn what part cities take in the government of kingdoms; and then ask, pertinently, what despots would do without their potent aid?

But with all due gratitude to the cities for the improvement they have made of the precious talent confided to them by the country, it may be asked, without offence, what would have been the condition of the world at present, if the cities and their mighty rulers had contented themselves with a fair compensation for the labors required of them; which are as useful in their kind, I admit, as those of the fields; and have left the ownership of the soil to those who make it fruitful with the sweat of their brows, and a fair share of the products of those labors? Would the farmers have been less intellectual because they would be less miserably? Would no shaded academic groves have been found in the country, where rural philosophers might have collocated, discussed and compared the vast sum of data fresh to their hands, with all that which the city merchants could bring to them from foreign places? Would the soil of these rural retreats of science be less propitious than the hard pavings and soft morals of the city? Would the quiet, orderly, intelligent labors of nature, prove to be a less inspiring scene to the student, than the discordant din and discrepant action of the city?

If then any physical advantages be conceded to the quiet country, shall I be allowed to ask further, whether the city philosopher be so free from bias, from a thousand sources, as the more independent and isolated inhabitant of the fields? Need I mention the checks and shackles which necessarily impede the free expression of thought in the city philosopher? Look at the history of all cities, and reflect on the fate of the boldest and sublimest benefactors of our race in the cities—Socrates, Galileo, Faustus—and to sum up all, look at Christ, and the place of his suffering. To politicians I would mention the patriot James Otis. To the advocates of human liberty and the lovers of religious freedom, I might cite instances of persecution offered in this orderly city.

I believe that I may conclude, that however well moral science may have thrived in the cities, and by the influence of city interest, manners and habits, it would have made *better* progress in situations more free from these influences. But the principal force of my position does not lie in the relative advantages of the American cities and the American fields, as they now are. I have therefore alluded often to European town and country. In America, town and country are, fortunately, as yet, not so dissimilar. But I may be allowed to use here the principle, however small in degree we may find a similarity between European cities and ours, or European laborers and American independent farmers. That difference is yet enormous, especially between the two latter. May it always remain so: or rather may the time come when no American, of the age of twentyfive, shall be without his farm, in fee simple, and that not mortgaged to banks or city. May our happy independent farmers be sensible of their happiness, jealous of it, and ever watchful to arrest the smallest encroachments. They should not confine their attention to individual cases, because they would be liable to be deceived by false appearances and to attribute the decline of a

labor and the loss of his estate to causes which were not the *real* ultimate causes. But if they would know whether the agricultural interest were rising or otherwise, in the great scale of national prosperity,—if they would know whether the moral and political standard of the farmer were more or less elevated, in comparison with other vocations, now and formerly; they must not compare the houses they live in with those their fathers inhabited, or the clothes they now wear or the food they eat, with that of their ancestors. But they must ask what is their *relative* standing with the members of the other professions. Let them take it for a certain truth, that if they have made one retrograde step, as a class, they are destined to go down to the foot of the hill, sooner or later. They must hold together, as the other classes do, or their fate is sealed.

Individual property is indispensable for the independence of body or mind. Without it, there can be no leisure for mental cultivation. Mental cultivation would seem to be the object of this letter, but I cannot enter upon that subject, specifically, without a foundation, which I am now seeking.

A considerable participation in the soil of Europe by its cultivators, must have existed at various periods of its history, we know; for we read of revolts against the monopolizers of the land, and of agrarian laws being forced upon those monopolizers. How happened it, then, that the cultivators of the soil have been almost universally dispossessed of any share in its property? This miracle could not have been wrought in a day, nor could it have been accomplished at all, if the cultivators, who constitute the almost totality of those nations, had been enlightened on their true interest. The only means then, by which this injustice could have been perpetrated, must have been deception and force united. Force alone could never have accomplished it, for force was with the injured party. Fraud, then, must have been the principal instrument. And here I am sorry to find, that the very shepherds, whose sacred duty it was to protect the confiding flocks from the wolves, were among the principal instruments by which the most useful and most numerous portion of the human race, were dispossessed of every thing which their conspiring, civil and ecclesiastical tyrants could deprive them of,—the soil they had made fertile, and the use of their own minds.

This entire dispossession will not be denied by any one who knows any thing of the state of old countries. And those in whose hands the stolen property is found, must be considered as the thieves, or receivers of the stolen goods as bad as thieves. Before the revolution of France, the royal domain, the nobiliary estates, and the clergy's lands, comprised the whole kingdom. It is the same now in all the rest of Europe; and must remain so, until some terrible revolution bring about the bloody remedy.

I state these facts, merely to show the importance of guarding against similar results, now that it is time, and by the only means by which it can be done. Those means are, *rural education*, which is my text.

Why do I call it rural education? Because that which I have in my mind is more especially for the interest, the permanent interest of the most numerous and the most useful part of the human race; without whose labors all other classes would be useless and would not exist. Surely, the great

and kind mother of all the arts and sciences, should not be the least entitled to filial regard, common rights and protection.

It is for the interest of the next largest class, commerce and mechanics, and its numerous accessories, that agriculture should thrive, and produce a great overplus; for the more of *that* there is in the market, the more have commerce and the arts as stock to work upon. I will not say what may be the interest of some *other* classes: each one may judge of that according to his own notions;—although I will say, that as good citizens and christians, they all ought to rejoice in the success of that occupation which is the basis of society, and may be the means of the greatest degree of happiness and morality of which the human race is susceptible.

Agriculture cannot be made to yield its utmost in any way, but by making it for the *interest* of the producers to raise as much as the soil will produce; and this will never be done but by the owners of the soil. A hired farm may, for a few years, be made to produce as much as it could in those few years, without regard to future crops; but this is not what is understood by the utmost yield of land.

I will here suspend, for a moment, my own speculations, for the sake of offering something more worthy of notice and credit, viz: historical facts.

We learn from the history of Europe, that the land was formerly cultivated by slaves; and we learn, also, that those slaves did not emancipate themselves. They were then emancipated by their owners, who were also owners of the soil. Now, opening the book of human nature, must we not learn, that any change made by these masters of slaves and owners of land, could have been only with a view to their *own* interest? Well, we now learn from history, that these money-loving masters liberated their slaves so far as to leave them only attached to the soil;—that is, without the power of quitting without leave. They also allowed them a small portion of the products of their own labor: and the result was, that the land owners got more from their land than before. Here was one advance of humanity and selfish interest together: a happy coincidence indeed.

The next step taken by the land-owners was, to liberate their slaves more effectually, and to let their lands to them on halves, or other shares, according to circumstances. The benefit of this change was also apparent, and soon became general. The last reform, which is the present state of a large part of Europe, was to lease the land entirely and annually, for a given sum of money or produce. This change was also found to be eminently advantageous to the landlord. There was but one more move to be made, and that was reserved for our happy country. It was to leave the ownership of the whole rural territory in the hands of the cultivators. We now are trying this experiment. But the old test of utility is now broken off. We have no *idle* land-owners or land monopolizers to ask how this change affects *their* interests. There may, however, remain some means of testing the merits of this last change;—thus for example: The American cultivator figures in the double capacity of owner and laborer. Now I would ask him, in his capacity of landlord, whether, by either of the foregoing means, of slavery, semi-slavery, joint stock, or lease, he could enjoy as much from his land as by cultivating it himself? I believe his answer would be in the negative; for if he employed his time in some more profitable occupation,

this would be going out of the comparison. We must therefore suppose his own personal labor of the same value on the farm as elsewhere.

I omitted to notice another improvement made by the landlords, which was to give long leases instead of short ones; for the longer the lease the better will the land be improved by the tenant.

I have now established, as well as I am able, a *reason* and a *basis* for rural education. It will be here foreseen that my object is, the improvement of the mind, with an ultimate view to moral excellence and physical comfort, through *durable* possession of the land, without which the two former can make no progress, and without all three, the American cultivators, now the first class on earth, must see in the distance, its own degradation to the lowest station on earth, viz: the rack-rent tenant of Ireland.

In my next, I shall try to say something rational on the means and manner of education.

WM. FOSTER.

For the New England Farmer.

#### REMEDY FOR MILDEW ON VINES.

MR EDITOR—Having a seedling vine, the fruit of which is extremely subject to mildew, but in all other respects a superior grape, and having resorted to the usual modes of applying sulphur thereto, with little success, I contrived a way to use sulphur which promises to answer my purpose: it is to sublime it directly upon the fruit, from a mixture contained in a pipe.

##### Mixture No. 1.

2 oz. nitre (saltpetre),  
4 oz. rye or maize bran,  
2 oz. sulphur.

##### Mixture No. 2.

2 oz. nitre,  
16 oz. bran,  
12 oz. sulphur.

The nitre is to be finely powdered, and the sulphur free from lumps, and the three ingredients well and thoroughly incorporated together.

The pipe is formed of turned iron, in shape somewhat similar to a common tobacco pipe—a common crucible, perforated at its bottom by a hole 1-8 in., serving as a lining to defend the soldering from the heat.

1. Crucible—3 inches long—circumference at top 7 inches.  
2. Tube—length 15 inches—diameter 3-8 inch.

The bowl of the pipe is grooved together, and united with the tube or mouth-piece by soldering, and also made air tight with solder throughout.—The crucible is united with the tin work by a luting of soft clay and dried.

The only proper time to fumigate is, when the air is perfectly calm; such is the case most frequently at sunrise, or before. A spoonful of mixture No. 1, is put into the bowl of the pipe and lighted with paper, like tobacco. After drawing a few whiffs you begin to blow, and fill up with No. 2, which is the charging, or proper mixture. A dense smoke arises, consisting of hydroguretted sulphur, &c. The bowl is to be refilled occasionally, and its contents adjusted frequently with a poker. Should it take fire it must be instantly withdrawn and stifled with more of No. 2, or with a cover. I tried sawdust at first, but found bran to be less offensive to the smell: no doubt some other vegetable substance would answer better.

This is my first essay; and the wish to have it tried this season by others, induces me to publish it thus early. BENJ. BELL.

Charlestown, July 21, 1840.

#### THE IMPORTANCE OF AGRICULTURE.

We have often been surprised that so little attention is paid to the subject of agriculture by the public writers of this country. It constitutes the most important business of the nation, and is destined, if adequately appreciated and properly followed up, to render this country the granary of a large proportion of the world. Already our products are immense, but they are as a drop in the ocean to what they may become. Millions of acres, the richest and the finest that the sun ever shone upon, are yet to receive the first touch of the spade—while states and territories yet unknown, will one day, not very remote, like infant Michigan, send forth their millions of bushels of wheat, for the support of the great family of man in other sections of the earth. Not a day goes by that emigrants are not bending their footsteps westward—all determined to take up their abiding places among us—to gather the rich treasures of our soil—and thus to add to the general amount of national industry and national wealth.

The pursuit of the farmer is a glorious avocation. He may be said to work under the immediate eye of the Almighty, and to be assisted in his work greatly and indispensably by the Omnipotent Architect of the world. Thus, the very seed that is put into the ground is fostered and encouraged there by the invisible and mysterious power of nature; and the farmer is thus taught in the very outset of his occupation, to look to and depend upon the source that hung the stars in the heavens—that made man in his own glorious image—and who alike paints the rainbow and gives the chrysal glitter to the rain-drop. Is there not something noble in all this? Does it not teach man the affinity existing between the creature and the Creator? Does it not elevate the soul from the mere clod to the source of intellect, of spirit, of existence; to the great fountain of that vivifying principle, which not only animates mortality, but which lives, breathes and moves throughout all creation? We have often thought that a farmer and an infidel were impossible. The very pursuits of agriculture are calculated to have a religious influence upon the mind, and to show man his utter nothingness, without the aid of the great power to whom he is taught to look, by the running stream, the towering oak, the humble blade of grass, and the golden grain field. Agriculture, then, is by no means an ignoble pursuit. On the contrary, we recognise it as one of the most elevated occupations of man.—The farmer is indeed and in truth the lord of the soil, and with a just dependence upon the Great Ruler of the seed-time and harvest, he can laugh to scorn the bubbles of speculation which are blown into existence by the stock gamblers of the day—which please, dazzle and fascinate the eye for a moment—but which, bursting, leave behind the memory of deceit and the emptiness of ruin.—*Farmers' Companion.*

Judge Buol states that British agriculture pays most of the burthens of the government, supports a privileged clergy, and pays more than thirty millions of dollars annually for poor rates, and that its products exceed in value more than 14 times the whole amount of British exports to foreign countries.

From the Albany Cultivator.

### MR COLMAN'S THIRD REPORT.

We have had the pleasure of examining the report of the Agricultural Commissioner for the past year; and are happy to bear our testimony to the ability and zeal with which his arduous duties are performed, and the beneficial effects his labors are calculated to produce. Mr Colman's first report related to the agriculture of some of the eastern counties of Massachusetts; the second report was devoted to the survey of the county of Berkshire; and the present is occupied with the great subjects of wheat and silk.

The legislature of Massachusetts in 1838, offered a bounty on the cultivation of wheat, and the present report illustrates the effect of that law, by showing the number of claimants, the acres sown, and the amount of wheat produced. The number of claimants for the bounty was 3,642; acres sown, nearly 7,000; bushels produced, 108,570; and the average not far from 15 bushels per acre. We acknowledge this result is rather unexpected to us, having heard so much of the incapacity of the New England States to grow wheat: for we much question whether the *spring wheat* crop of any considerable part of New York will average more than the one stated.

The returns from the several towns are very full, and embrace much valuable matter, which has been skilfully condensed in the report. From an examination of the returns, it appears that much injury was done by the grain insect or worm; that there was much smut; some blight from causes unknown; and much suffering of the crop from drought. "It appears also from the returns, that there is scarcely an instance named in which lime or plaster has given any decisive and well-authenticated favorable results. Wood ashes have been frequently used, and large crops have followed."—Ashes, however, sometimes failed.

Mr Colman enters into an extended argument to show that Massachusetts would find her account in producing her bread from her own soil; and his reasonings are in our opinion conclusive. No people can permanently prosper who depend on others for their bread. Every other kind of business must fluctuate; and while some individuals or states grow speedily rich from manufactures or commerce, the tiller of the soil, he who grows his own bread, is alone independent. Mr Colman has most truly said, that "agriculture, in the view of every sound political economist, is the foundation of national wealth." All other means are only accessories.

The report enters largely upon the cultivation of wheat; its diseases, varieties, methods of improvement, and the best mode of culture. The causes of failure he arranges under the head of rust, smut, mildew, and insects. On all these topics his observations are worthy of being studied by every wheat grower, as embracing much condensed information, which will be every where useful. The grain worm is doubtless the most formidable enemy the eastern wheat grower has to encounter, and on this subject Mr Colman recommends most strenuously the use of newly slaked lime, dusted thoroughly over the grain just as it is coming into flower. A single application has proved successful, while in others repetition was necessary. Mr C. announced this preventive some years since, in the *N. Y. Farmer*, but the results of some experiments made by farmers in the valley of the Hudson, did

not seem to justify the opinions entertained of its efficacy; the difficulty might, however, lie in the lime, or the period of its application; and it is well worthy of trial wherever the worm makes its appearance in the wheat crop. There are two kinds of worms which feed on wheat in the ear; one, which has been known for a long time in western New York, and has sometimes produced some injury, though little, when compared with the ravages of the other species in other parts of the country. The other is the worm of New England and the Hudson valley, which, there is reason to hope, has passed the period of its greatest ravages, as it has been less numerous and destructive to the wheat crops for the last two years, than for several years previous.

On the subject of ploughing in clover for wheat, Mr Colman has the following remarks: "I have always been inclined to the belief, which generally prevails, and which Mr Phinney maintains, that the higher the state of luxuriance in which vegetable matter was turned in by the plough, the more the land will be enriched by it. But the experience of one of the best farmers in the State has satisfied me, especially as it has been confirmed by another equally intelligent farmer, and wholly unbiassed by the judgment of any other person, that the land is more benefited by the turning in of the clover crop after it is dried, than when in a state of greenness and full of sap. The opinion is, that if green, it creates an acidity in the soil, prejudicial to the succeeding crop."

In support of the opinion here expressed by Mr Colman, we may adduce that of one of the most successful wheat growers in the western counties, whose crop is usually from 1000 to 1500 bushels. He assured us several years since, that he had done turning in clover when in full vigor for wheat, as from his experience he knew that it "soured the soil," and that it would not recover from such a dressing under three or four years. Still clover was the main stay of his wheat husbandry; but instead of turning it in, he fed or trampled it down upon the land, by cattle or sheep, he preferring the latter, and keeping some three or four hundred for that purpose. His lands are broken up in the fore part of summer, before a great growth of clover is attained; wheat is sown in the fall, and clover seed in the spring. The wheat is plastered and also the clover in the next year; his course embracing four years. Large quantities of clover decay on the ground, and this, mixed with the manure of the animals, and the mass of clover roots at the time of fallowing, gives a progressive improvement to his soil and his crops, which certainly speaks well in favor of the system.

It appears from that part of the report relating to manures for wheat, that lime has been of little or no value when used, and that crops of wheat of about 30 bushels per acre, have been grown on soils in which not a trace of carbonate of lime existed. There was a small quantity of phosphate of lime, however, present, one and a half per cent., and this could not have been without its influence. It is surprising to witness the discrepancy between the results from the use of lime in Massachusetts, as given in the report, and those produced by the same article in some of the middle States. The reason of this want of efficiency in the northern soils, does not appear to be satisfactorily ascertained; but the subject is one of such consequence, as to demand the most rigid investigation. We are inclined to the opinion, that where the other mat-

ters in the soil are right, a very small quantity of lime is sufficient for all the purposes of vegetation; but as lime appears to be an essential part of the wheat and clover plants, it seems clear, that more or less of it is indispensable to their growth, and the perfection of their seeds. The Berkshire marls have not produced the effect expected from them by some; but, if made into compost in mixture with peat, vegetable mould, or animal manures, we doubt not the value of all would be greatly enhanced. Mr Colman's remarks on cleanness of cultivation, and recent agricultural improvements, are very just; but we have room here only to refer to them, and must pass to the second part of the report—that which relates to silk.

The report of Mr Colman on this subject, one which we consider of vast importance to the nation, is without question, the most valuable document yet given to the American public on this topic, and should be in the hands of every one who proposes to enter on the production of silk. His opinions and facts are advanced with fearlessness and discrimination, and the amount of information he has collected and condensed in the report, is truly great. On the subject of the mulberry, the kind of worm, the different methods of feeding, the cost of production, the demand, and the profits of production and manufacture, are all well treated, as well as many other incidental topics connected with these. The report is not intended as a manual for the producer or the manufacturer, but as a general guide to the inquirer; and in this respect will be found unrivalled.

In determining the question of the capability of this country to produce silk, Mr Colman very justly distinguishes between the mulberry speculation and the growth of trees for silk only. To whatever cause we may attribute the mulberry fever of 1838 and 1839, whether, with Mr C. to a conspiracy among a few individuals to defraud the public in this way, or to an ignorance of the results certain to ensue from excessive multiplication, or whether we consider it as only one of the many modes in which the mania which infected the whole nation in those years developed itself, it now matters not; the bubble has burst, and thousands of the mulberry speculators, as well as those in western lands, corner lots, and lithographic cities, have been ruined.

The conclusion to which Mr Colman arrives, after a survey of the whole ground, and we think it is a correct one, is, that we can, and should, make our own silks. After disregarding all the extravagant calculations that have been made, after rigorously making every necessary deduction for the expenses of production, it appears that the silk culture offers as handsome a remuneration for labor, as any of the agricultural pursuits of this country, and in its prosecution embraces the labor of individuals that could be of little service in other pursuits. The production of silk by companies has proved a failure in this country, so far; and it appears very certain that the business, if it succeeds, must be prosecuted as a branch of domestic industry. The manufacture of the material when once produced, is another matter. The production of the raw material, introduced as a collateral branch of industry, not as a principal one, must prove a source of eminent comfort and wealth. There is clearly nothing mysterious in the business; all is simple and easily understood and practiced, by any one that chooses to bring to it the necessary attention and skill. We fully concur in the opinions

expressed in the following extract from the report:—"I take particular pleasure in recommending the culture of silk to my respected friends, the Shakers. They have every element of success; intelligence, skill, exactness, perseverance, abundance of labor, land enough, and buildings already prepared for their operations. They, if any among us, would be the fittest persons to undertake the artificial method of M. Beauvais. Their female aid is of the best description for this culture. They may pursue it to any desirable extent; and I cannot have a doubt, if they should undertake it with their usual care and determination, their enterprise would be crowned with success."

We should be pleased to extract largely from these reports, and shall have occasion often to refer to them as a magazine of facts collected with great skill, and particularly valuable as illustrating all subjects connected with the matters to which they are devoted.

### WHEAT.

The experiments which have been made, under legislative encouragement, in some of the New England States, would seem to have demonstrated satisfactorily, that that part of the United States is abundantly able to produce its own wheat, as well as its corn or potatoes, although as circumstances and prices are, the matter of profit does not seem quite so certain. It has for some time appeared probable to us, that in ordinary cases, when the ease with which wheat is raised in the west is considered, and the low price at which it is afforded, taken into view, eastern farmers, or the most of those in the Atlantic States, can better employ their lands and labor in producing other articles than in raising wheat. There are a multitude of crops of great value, such as corn, grass, oats, roots and other vegetables, of certain growth and ready sale, affording perhaps, a greater profit than wheat at the present time, and as well calculated to improve the soil and promote permanent fertility as that crop.

It becomes, therefore, a calculation of simple profit or loss with the eastern farmer, whether he will at a great expense of labor and manure, raise his own wheat, or by applying that labor and manure to other crops, usually considered more certain, find the means of purchasing what flour he finds necessary for his consumption. In the west, the attention of the agriculturist must necessarily be turned to wheat, as it is the only crop that can bear transportation to market, and of course, the only one in which the fertile new lands of the west can be brought into direct competition with the more worn soils and laborious culture of the east. As a material for bread, as a food for animals, and as an improver of the soil, Indian corn is not behind wheat in importance; and so long as the west is compelled to furnish us her flour at so low a rate, it may be considered questionable whether, as a general crop, corn should not be preferred to wheat.

The time will probably come, when the strong vegetable properties of the western soils being exhausted, labor and manures will be required to continue their productiveness, and then the natural increase in the price of flour may render it proper for the east to enter more fully into the culture of wheat.

There is a feeling among many eastern farmers, notwithstanding the proof that the experience of the last few years has afforded, that the east can

never, under any system of farming, be made to produce wheat as it once did. This opinion is absurd: wheat is properly the grain of the world, and is now grown in increased quantities on lands from which it has been cropped since the days of Julius Cæsar. The renovation of lands, after being reduced almost to sterility, it is true, must be a work of time, and requires usually far more skill and labor than to preserve lands, naturally in good heart, permanently in a state of productiveness.—The true course seems to be, to lessen the quantity of land under cultivation, where it is nearly run down, and thus give to less land the labor and the manure now spread over a larger surface. The deterioration caused by naked fallows can and must be remedied, by a rotation of crops, deeper and finer tilth, and liberal and judicious applications of manures. Naked fallows should never be permitted, unless they become indispensably necessary to free lands from foul stuff; and the cultivation of hoed crops will, if the course is thorough, usually effect this object in a still more complete manner. Green crops, (the roots, &c.) which, having large tops, draw much of their nutriment from the atmosphere, must be alternated with the grain crops; the skinning system abandoned; the ambition to cultivate a great number of acres done away; and in its stead a desire to reap a large product from a few acres, implanted; the principles of the new husbandry be studied and practiced; and the time will come when wheat crops of thirty bushels an acre will not be a novelty on lands now pronounced utterly unfit for its culture.

The excellence and nearness of markets in almost every part of New England; the facilities with which every product of the earth can be disposed of at a handsome profit; the varieties of pursuits, such as the manufacturing, mechanic, and commercial, which furnish profitable employments for multitudes, and prevent the weight of population from pressing on the agriculturist, as it must necessarily do more or less in the west; all contribute to render the production of any single crop of comparatively little moment, and perhaps that of wheat, as a whole, the least of any. Nothing can be more true than that the farmer, if it can be done at a reasonable expense, should grow on his own farm all that he requires in his family, of which the soil is susceptible; but it is also true, that if his bread is the product of his own labor, it in effect matters little whether that labor has been given to wheat, or corn, or vegetables for market, or silk, or any of the thousand things which by exchange can be converted into food with mutual benefit to all parties. But whatever crop may be attempted, the grand object to be kept in view is the permanent improvement of the soil, and any one that effectually accomplishes this, be it wheat, or corn, or roots, cannot in the end be an unprofitable one.—*Albany Cultivator*.

### THE HOLLOW HORN.—A FAIR OFFER.

Within a few days we have heard several farmers from the surrounding country complain that their cattle have the hollow horn. We have had a little experience in the management of cattle, and know something about this "hollow horn," and we are satisfied that it is nothing more nor less than an attendant, a sort of hanger-on, of that worst of all diseases among cattle, the *hollow belly*. We know men who have cattle that during the whole winter have been exposed to the "pitti-

less peltings" of the storms, with a snowdrift or an ice cake for a bed, and with nothing but a scanty pittance of prairie hay or musty straw for food, and who now wonder that their cattle have the hollow horn! The wonder should be that they have any cattle living.

We will make the following proposals to all those owning cattle. Keep them under shelter during the storms and cold weather of next winter. A hovel, built of logs and covered with coarse hay or straw, standing in a dry place, is sufficient for this. Salt them twice a week regularly; give them a sufficiency of wholesome provender, and water at all times, and each of them a mess of potatoes or turnips at least two or three times a week. Keep your working cattle shod, and if you work them hard, feed and nurse them accordingly. Do not beat them; never let them stand in the cold longer than is absolutely necessary; particularly when you drive them to town with a load of grain or wood or for any other purpose; do not let them stand in the street hungry and shivering, hour after hour, while you are in a grocery drinking and carousing. Follow these directions fairly, according to their true intent and meaning, and in the spring we will engage to pay for all the damage you have sustained by the "hollow horn."—*Fort Wayne Sentinel*.

### HELIANTHUS, OR SUN-FLOWER PLANT.

We presume that it is not generally known that this plant, which is often regarded as a worse than useless lumberer of the ground, is cultivated extensively in some parts of the United States, and turned to a very valuable account in a variety of ways. The versatility of its powers, so to speak, are even greater than the morus multicaulis. We have before us a letter from a firm in Pennsylvania, which gives us some interesting facts, which we think are worthy of publicity.

The oil derived from the sun-flower seed is pretty well known. Its excellence for fancy painting and druggist use is said to be confirmed, and we are even told that it is equal, if not superior to almond or olive oil for table use. One acre of ground will produce from forty to fifty bushels of seed, and sometimes much more. Good seed will produce a gallon of oil to the bushel, and the oil has been sold at \$1 50 per gallon when flaxseed oil stood at 90 cents. The refuse after the oil is expressed, is said to be a valuable food for cattle.

The leaf is manufactured into cigars of a mild pleasant flavor, possessing, as it is said, powerful pectoral properties, highly commended by physicians in many diseases of the chest. The leaves, properly cured, will bring from five to fifteen cents per pound.

The stalk, when stripped of the leaf and seed, may be burnt, and a superior alkali made from the ashes.

The comb of the seed, or properly the filaments of the flower, is excellent feed for cattle or hogs.

The helianthus is cultivated in the vicinity of York, (Penn.,) and a gentleman in 1837, cultivated one hundred acres.—*Madisonian*.

The produce of our country in cotton, tobacco, rice and bread stuffs in the year 1839, has been estimated to amount to nearly four hundred million of dollars, thus—Cotton, \$81,000,000, tobacco 15,000,000, rice 4,500,000, bread stuffs 275,000,000.—Probably upwards of \$150,000,000 of this vast amount will be exported to other countries.

**AGRICULTURE IN MASSACHUSETTS.**

**MORALS OF LABOR.**

Whoever had the pleasure of hearing Gov. Hill, at the State House the last winter, at one of the agricultural meetings, will not have forgotten some admirable remarks made on that occasion by this gentleman. If we had access to them, we certainly should transcribe them, as embracing precisely our own opinions in relation to the subject. Our young men in general, when they go to service, or as it is customarily termed, "hire out," seem to think that there is something degrading in the idea of being servants; and bring with them so much of what they deem a proper spirit of independence, that they forget the employer has any rights, and take pride in insolence and ill-manners. Now we protest against meanness and servility, but still more against incivility and insolence. The truth is, that no honest employment is derogatory to any man; and we cannot name a man in the community who is not a servant in some respects to others. Many situations in life, which to the multitude are objects of envy, are situations of extreme drudgery, much more severe both to mind and body than labor on a farm.

The laborer has his rights and duties. Having entered into service for a fixed compensation, unless express exceptions are made at the time of the engagement, he is bound to render his best services on the farm, in the most assiduous and faithful manner, under the direction of his employer, whether he approves that direction or not; and we know of but one rule for an honest man, which is to consider his employer's interest as his own, and do in every respect in the case as he would judge it right to do if the situations were reversed, and he were the employer instead of the employed. The employer is bound on the other hand, to furnish the laborer with a sufficiency of good and wholesome food, suitably prepared; comfortable lodgings; exact no unreasonable service; and treat his laborers with kindness, civil language, and all proper confidence. This comprehends all the mutual duties as we understand them. It often happens that hired men are disposed to make difficulties if two tables are set. In this matter let the householders never yield a hair's breadth of his authority. In many cases it is most convenient to have but one table; but in this respect the laborer has no claims except to a sufficiency of good and wholesome food, prepared properly and seasonably; but he has no right nor shadow of right to interfere with the farmer's domestic arrangements, as oftentimes it must break up entirely that domestic quiet and privacy which constitute the chief pleasures of domestic life. We have no arbitrary distinctions of rank in this country, and every man's standing depends upon his moral character. One man is as honorable as another, who behaves himself as well as another. But then our pursuits in life are very different from each other. Our tastes are not always congenial; and it is not necessary, that under the ridiculous pretence of maintaining a nominal equality, we should sacrifice the comforts of life by associations which are not in truth agreeable to either party. Where it can be done without being offensive or inconvenient, we admit that it would be much more economical and convenient to form but one family; but we maintain that this is entirely at the option of the employer, in respect to which the laborer has no demands whatever.

There is a matter which a few years since gave a great deal of trouble to farmers, which the wholesome decisions of the courts have materially corrected. Then laborers felt that their employers were in their power; and that they were at liberty to quit the service and demand their wages at their pleasure. Sometimes in the midst of planting, or haying, or harvesting, either through mere caprice, but most commonly with the expectation of getting higher wages, they would quit their employer and leave him under every disadvantage. The courts having decided that no man is entitled to his wages who, without good and sufficient cause, fails to continue his agreed term, the employer has a proper remedy in his own hands, which will keep this matter right.

There is another point in this case of the morals of labor, upon which we have not the power to animadvert with too much severity; and that is, a practice among employers of seducing by bribes or intrigues or some vile means, a laborer from the service in which he is engaged. We have known this done so frequently, and under circumstances of such extreme inconvenience and loss to the injured party, that no words can express our sense of its baseness. It is a gross violation of all faith and honor; and a man who would directly or indirectly be guilty of such an act, ought to be pronounced an outlaw of civil society.

The matter of providing for laborers has become a very serious affair; and gross extravagance has come in here as into every other department of life. A hired man, when he demands sixteen dollars a month and his board, generally estimates his board as of no consideration. But in few parts of the State can a man be boarded for less than eight or ten dollars a month; and when the farmer perceives that instead, as the laborer pretends, he is paying only sixteen dollars a month, he is in fact paying twenty-six dollars a month, the burden becomes very heavy. Our habits of living have become too luxurious. The habit of five meals a day which prevails on many farms, is most pernicious to the health. We know well by experience that three meals a day, at 6 A. M., at 12 P. M. and at 6 P. M., with sometimes a cracker or two in the forenoon, is all that is essential or beneficial. Nothing is more unfavorable to health both of body and mind than by frequent eatings to keep the organs of digestion under continual exertion; and to attempt to labor with the stomach filled to repletion. The allowance formerly of a Scotch laborer in time of haying and harvesting, and no men ever labored harder or enjoyed in general firmer health, or were capable of going through greater hardships, was a peck of oatmeal on Monday morning and a gallon of milk a day. This was the week's allowance, and he prepared it in any way which pleased him. The allowance of a field laborer at the South is one and a half peck of corn meal per week and three and a half pounds of pork or bacon, or two and a half pounds of pork and fourteen herring. With this they labor constantly from daylight to dark, with only an occasional hour allowed them some Saturday evening. Their health is good; and we were told by many of them that the supply was in general more than they required. Water is their only drink. Now most certainly we do not refer to such cases as these with any desire that our laborers should be abridged of a single comfort; but as displaying the extremes to which our extravagance leads us; and to show how much less is required than we generally suppose, to maintain the vigor of the human frame, and to support men in health under the severest toil. We are satisfied that our present system of management is actually prejudicial to health and morals. How a remedy shall be found and applied, is more than we can say.

The temperance reformation has been an immense

gain both to employers and laborers. The very personification of evil, in our opinion, is Rum; and the blessed change which even its imperfect progress has produced in the country, is every where apparent, and fills the benevolent bosom with inexpressible joy and the brightest hopes. H. C.

MEDFORD, July 20th, 1840.

MR BRECK—Sir—Having of late been principally engaged in the gardening line, for Dr. S. Kidder, of Medford, Mass., and as he is one of your subscribers I have had opportunity to peruse your papers; and let me say they are not what I expected, but far exceed my expectations, and in perusing them I have been happily disappointed; and for one I think that your paper is one of the most useful and interesting which the farmers could procure:—valuable, not only for its neatness, but for the real subject matter contained in it; and as a friend, I wish you an ample number of subscribers, to sustain you in its publication, not only for the benefit and interest of the farmer, but the public generally.

Your well-wisher,

JAMES M. HARTWELL.

**Massachusetts Horticultural Society.**

**EXHIBITION OF FLOWERS.**

Saturday, July 25th, 1840.

Dahlias—by Messrs Bowditch, Barnes and Walker.  
Bouquets—by Messrs John Hovey, Hovey & Co., W. Kenrick and Walker.  
Carnations—by John Hovey.  
Lilium superbum, (very fine,) by John Prince, Esq.  
Mr Samuel R. Johnson presented some roses and other flowers.  
Gladiolus florabundus, and dwarf double Sunflower, from Parker Barnes, Esq.

For the Committee.

S. WALKER, Chairman.

**EXHIBITION OF FRUITS.**

Saturday, July 18th.

Samuel Downer, Esq., Dorchester, exhibited very fine specimens of Belle Magnifique Cherry.  
A. D. Weld, Esq., Roxbury, presented fine specimens of White and Red Currants and Raspberries.  
Wm. Kenrick, Esq., Nonantum Hill, Newton, sent fine samples of English Gooseberries.  
A. D. Williams, Esq., Roxbury, exhibited superior samples of Red and White Antwerp Currants.  
James L. L. F. Warren exhibited specimens of his new seedling cherry, called "Warren's Transparent"—pronounced by judges to be one of the best late cherries yet produced.

C. Goldman, Esq., Chelsea, exhibited very choice specimens of Black Hamburg Grapes;—they reflected much credit upon the cultivator.

For the Committee,

J. L. L. F. WARREN.

**MILKING COWS.** Good cows need milking regularly three times every twenty-four hours. In fact, if this practice were adopted, our farmers would have more good cows than they now do. We see it stated that a gentleman near Philadelphia, who has adopted the practice of milking thrice a day, has a short horned Durham cow that yielded an average of 33 1-2 quarts a day during the first week in June.—*Exch. pap.*

Flour is selling at Cleveland at \$3 75 per barrel—wheat at about 75 cents per barrel.

**BRIGHTON MARKET.—MONDAY, July 26, 1840.**

Reported for the New England Farmer.

At Market 435 Beef Cattle, 20 Cows and Calves, 2900 Sheep. 60 Beef Cattle unsold.

**PRICES.—Beef Cattle.**—We reduce our quotations to conform to sales. First quality, \$6 00. Second quality, \$5 50 a \$5 75. Third quality, \$4 50 a \$5 25.

**Cows and Calves.**—Sales \$19, \$22, \$25, \$30, \$33, and \$40.

**Sheep.**—Dull. Lots were sold, \$1 33, \$1 35, \$1 37, \$1 58, \$1 75, \$1 88, \$2 00, and \$2 50.

**Swine.**—None at market and no demand.

**THERMOMETRICAL.**

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northernly exposure, weeks ending July 26.

July, 1840.	7 A.M.	12, M.	5 P.M.	Wind.	
Monday,	20	55	70	66	W.
Tuesday,	21	56	86	70	W.
Wednesday,	22	61	85	73	S. E.
Thursday,	23	62	86	72	S.
Friday,	24	63	72	69	E.
Saturday,	25	64	80	71	S. E.
Sunday,	26	62	86	79	S.

The average range of the thermometer has been about the same as it was during the weeks ending July 5 and 12. We had a powerful rain on Friday, commencing at an early hour in the morning and continuing till about noon. Vegetation is very much revived.

**Green House Propagator, and Silk Worms' Eggs.**

Wanted in a permanent location an industrious, steady man, capable of taking charge of a large collection of Green House Plants, skilful at propagating, and a general good manager in all respects. Apply by mail with the most satisfactory references.

Persons wishing superior White Imperial and White Mammoth Silk Worms' Eggs, of crop 1839, can be supplied at \$4 to \$5 per ounce, and eggs of this year's crop, for next year's use, will be supplied at \$2 per ounce to all those who send the cash in advance, within thirty days from this date.

WILLIAM PRINCE & SON.

Floshing, July 29, 1840.

**BERKSHIRE HOGS.**

The subscribers offer for sale a few pair of fall blooded Berkshire Hogs; also, pigs 7-8 blood, crossed with Mackay. Inquire at the New England Farmer office, or at their farm at Brighton. JOSEPH BRECK & CO. July 29.

**REVOLVING HORSE RAKE.**

The Revolving Rake, which has been in general use in most parts of Pennsylvania and New Jersey, is found to be one of the most useful and labor saving machines now in use. One man and horse, with a boy to lead, will rake on an average from 25 to 30 acres per day, with ease, and do the work well. They are coming into very general use in all parts of the country, and will, no doubt, in a few years, supersede the use of the common hand rake. There is a great advantage in this rake over all others, as the person using it does not have to stop the horse to unload the rake.

**GRAIN CRADLES.**

The Grain Cradle is an article which is coming into very general use in the New England States, where they were till of late but little known, although they have been in very general use in the southern and western States, for many years, and which is found to be decidedly the best mode of harvesting grain, as it is supposed one man will cradle five acres in a day when he cannot reap more than one. The difference in gathering a crop is so much in favor of cradling, that we must suppose that it will be the only mode adopted hereafter, and the grain cradle will become of as much use, as an implement of husbandry, as the plough now is.

There has been a very great improvement in the manufacturing of this article, they are now made on the most improved plan; the scythe is well secured and finished in a superior manner and made of the best cast steel.

**TIE UP CHAINS.**

Just received at the New England Agricultural Warehouse, a good supply of those celebrated Chains for tying up cattle. These chains, introduced by E. H. Derby, Esq. of Salem, and Col. Jacques, of Charlestown, for the purpose of securing cattle to the stall, are found to be the safest and most convenient mode of fastening cows and oxen to the stanchion. They consist of a chain which passes round the animal's neck, and by a ring attached to the stall, plays freely up and down, and leaves the animal at liberty to lie down or rise at pleasure, and keeps him perfectly secure. JOSEPH BRECK & CO. July 15.

**STRAWBERRIES! STRAWBERRIES!!**

Those who are desirous of cultivating this delicious fruit are respectfully informed that the subscriber has succeeded, after many years experimenting upon the Strawberry, not only in obtaining new varieties, but in ascertaining the best methods of cultivation. The subscriber would offer to the public, the present season, his *Selected Collection* consisting of seven varieties; they are such as have stood the test of a fair trial for seven years, and are all grown by the subscriber.

Specimens of his Fruits have been exhibited every season at the Massachusetts Horticultural Rooms, and have always commanded an extra price in Faneuil Hall Market.

*Warren's Seedling Methren*, a new and valuable kind, a free bearer, fruit very large and juicy; fruit measuring 5 1/2 inches has been exhibited the present season. This variety can be warranted to be one of the finest varieties grown, and will produce as fine fruit and as large quantity, with the same cultivation, as any other ever offered, although some may ask the modest (!) price of \$5 per dozen. The price of this Seedling is \$5 per hundred plants.

*Methren Castle*—Fruit extremely large, high flavored and showy; specimens of this fruit have been shown this season six inches in circumference. This variety can be said to be very excellent, (when the true kinds is obtained); it is one of the largest late varieties known, profitable and highly worthy of cultivation, all that some growers may say to the contrary, notwithstanding. Price \$3 per hundred plants.

*Keen's Seedling*—A very superior variety, fruit very large, rich dark color, and uncommonly high flavored; has always been considered by English cultivators the best grown. Price \$3 per hundred.

*Royal Scarlet*—Fruit long oval shaped and juicy, very free bearer and very hardy. Price \$2.

*Hautbois*—Fruit larger than English Wood, exceedingly numerous, sometimes yielding 100 berries to the plant. Price \$1.

*Early Virginia*—This is known to be the earliest and best fruit for market, a free bearer, and very hardy.—Price \$2.

*English Wood*—Fruit well known for years. \$1.

N. B. Those who are desirous of cultivating this delicious fruit, would find it for their interest to visit the garden and see the method of cultivation, and satisfy themselves that they can obtain their plants from *first hands*, for it is too often the case that large and attractive advertisements are sent forth to the public by *dealers* in plants, when at the same time they have never grown the kinds offered for sale, and know but little about their cultivation. Attention to this by purchasers, if possible, will save much time and money. Every plant sent from this garden will be warranted to be free from mixtures, and shall also be young and healthy, worth the price paid for them.

All orders directed to the subscriber, enclosing the amount for the order, or with a good reference, shall be promptly attended to, and the plants carefully forwarded agreeably to directions.

JAMES L. L. F. WARREN.

*Nonantum Vale, Brighton, July 25, 1840.*

Orders directed to J. BRECK & Co., will be executed with despatch.

**WANTED.**

A situation as gardener, by a young man who is acquainted with its various branches. The best references can be given. Apply at this office. July 22.

**HUDDING FRUIT TREES.**

Cuttings of fruit trees for hudding, comprising nearly all the choice sorts of Apples, Pears, Plums, and Cherries, known and cultivated in this country or in Europe, all from bearing trees, can be packed in such a manner as to be sent with perfect safety to any part of this country or Europe. Apply by mail to the subscriber, at the Pomological Garden, Salem, Mass. ROBERT MANNING. Salem, July 15.

**FENCE CHAINS.**

Just received from England, at the New England Agricultural Warehouse, 6 casks chains, suitable for making the chain fence, &c. JOSEPH BRECK & CO. July 15.

**TRACE CHAINS.**

Just received, direct from the English manufacturers, 8 casks of Trace Chains, from 6 to 11 feet long, suitable for ploughing or draft chains. JOSEPH BRECK & CO. July 15.

**WHOLESALE PRICES CURRENT.**

## DENNIS'S PATENT TROUGHS.

We extract the following from Dennis's Circular, which we presume will be acceptable to those who design to protect their trees from the ravages of the canker worm. Our correspondent H. in this day's paper, has perhaps made out his case, proving that Mr Dennis is not the original inventor of the circular troughs, and that, consequently, he is not entitled to a patent. Of this, however, we leave our readers to judge and act accordingly. J. B.

DESCRIPTION OF PLATE.

1, canker worms' eggs; 2, a full grown worm; 3, chrysalis; 4, female; 5, male; 6, male with its wings spread—at the left hand the section of a tree with a trough upon it.

The unparalleled success that has attended the application of the patent circular metallic troughs with roofs, in Massachusetts, Rhode Island, Connecticut, New York, and Maryland, has won for it the enviable reputation of being the cheapest and most effectual, and more durable, requiring less care and attention than any other method ever discovered,—as the various certificates testify that are signed by more than fifty persons, who have used them successfully,—induces the subscriber to offer it to those suffering from the effects of the canker worm, with renewed confidence, as where it has been applied in season, that is, previous to the 20th of ninth month, (September) it has, in many instances entirely destroyed them, so that not one could be found upon the tree.

SECTION OF A TREE WITH A TROUGH UPON IT.

DESCRIPTION OF THE TROUGH.

The patent circular troughs, with roofs, are made of a strip of sheet lead, about four inches wide, bent in the form of the figure 2 inverted, with the foot cut off, thus forming a trough and roof of one piece of metal and bending it around the tree so as to conform to the shape of the tree. It is made large enough to leave a space one inch in width around the tree, between the trough and the tree. The ends are then soldered together, thus forming a trough completely round the tree, with a roof over it. Three or more nails are tacked into the tree to support the trough, and the space between the trough and tree is filled with seaweed, hay, straw, or any other substance that will prevent the insects from ascending between the trough and the tree. After the packing has been put in the top, the ends should be daubed with a little tar to stick them together, taking care not to let the tar get upon the trough or the tree, and then it may re-

main for years without further care, or until the tree grows so as to burst open the trough, when a small piece of lead may be soldered in at a trifling expense, and the trough will serve another term of years; and thus the troughs may be increased in size as the trees grow, so long as there is any use for them, and when the lead is taken off, it is worth two thirds of its original cost. There is not a much doubt but that the troughs will always be wanted, as the canker worms have been in some neighborhoods for the last fifty years, according to the authority of the oldest inhabitants.

## CAUTION NOT TO USE COTTON WASTE.

Cotton waste has been sometimes used but is found to absorb the oil that may get upon it, and holds it against the bark of the tree, thereby destroying the bark or greatly injuring it. Any persons, having trees packed with cotton waste, hemp, or tow, would do well to examine them and see that their trees do not become injured.

## EXPERIMENT.

The circular troughs were put upon three orchards belonging to Jonathan Dennis, in Portsmouth, R. I., containing 115 trees, varying in size from three inches to two feet and upwards, at an expense of thirtyfive cents per tree. They were packed with seaweed in 1837 and most of the packing is in good order at present, and likely to last several years more without renewing. Five gallons of cheap fish oil was sufficient for the 115 trees for one year. A very little oil was put into these troughs the 20th of ninth month (September.) After it had remained several weeks a little more oil was added, and from the time the oil was first put in, until the first of fifth month, (May) following, there was a little oil put in twice, and it also received two or three stirrings; putting the oil in three times, and stirring it, giving the trees all the attention necessary, was less labor than it would have been to have tarred the trees one week. This apparatus destroyed the insects so completely, (which, for a number of years previous, had been so numerous as to destroy the fruit) that it was difficult to find one upon the trees, and the crop of apples was so large, as to render it necessary to prop the trees. The value of the apples the first year was equal to three times the expense of the troughs, oil, and attention.

## PROPER KIND OF OIL.

Cod fish oil, or what is termed liver oil, by the dealers in the article is said to be best to put in the troughs, as it will remain the longest without drying, and for that reason is never used for painting, and is about as cheap as any fish oil, being fifty cents per gallon. These troughs should not be filled more than one-third or one-fourth full of oil. It is now well known, that a part of the canker worms leave the ground in the autumn, beginning about the last of the ninth month, (September) and ascend the trees and deposit their eggs. They continue to ascend the trees from the time above mentioned, until the first or middle of the fifth month, (May) following, whenever the weather suits them and the ground is thawed so that they can escape.

## CERTIFICATES.

Having an orchard of rising 100 apple trees that had been badly eaten by the canker worms, for a number of years, I did, in the fall of 1838, have one half guarded with the leaden roof and trough invented by Jonathan Dennis, Jr., of Portsmouth, R. I., and am satisfied that if properly done, and timely care and attention paid to

keep the troughs well supplied with oil, both fall and spring, in the season of the grubs ascension of the trees, it will prove a thorough remedy. At any rate, I was so far pleased with the result of the trial on the first half of my orchard, that I had the residue of my trees furnished with lead in the fall of 1839. The part that was supplied the first, produced about 75 bushels of apples; whereas the other part produced scarcely any, having been eaten up very much by the worms, while the part secured by the troughs was scarcely eaten at all. DAVID BUFFUM.

Middletown, R. I., 2mo. 11th, 1840.

The undersigned having used J. Dennis, Jr's patent trough and roof for preventing canker worms or other insects from ascending trees, for the two years past, are satisfied that it is the cheapest, and most effectual, and more durable than any other method we have any knowledge of, and requires less care and attention; and we take pleasure in recommending it to the public.

New England Agricultural Warehouse and Seed Store, 51 & 52 North Market Street.

May 20.

## BONE MANURE.

The subscriber informs his friends and the public, that after ten years experience, he is fully convinced that ground bones form the most powerful stimulant that can be applied to the earth as a manure.

Orders for Bone Manure or Oyster Shell Lime, left at the Bone Mill, near Tremont road, in Roxbury, at the New England Agricultural Warehouse and Seed Store, No 52 North Market Street, or through the Post Office will meet with prompt attention.

March 4, 1840

NAHUM WARD.

## DORKING FOWLS.

For sale, a few pairs of pure Dorking Fowls. The stock, of which these are the produce, were procured in Dorking, County of Surrey, England. "Few breeds have a title to boast of so high and long continued a reputation as the Dorking. Upwards of fiftyfive years have passed, since, while resident in Surrey, I sent to Dorking for my first regular breeding-stock; they were then the ancient and superior five-clawed breed of Surrey."—*Monbray on Poultry, 7th Edition.*

This breed attains to a large size, and the hens are the best of layers. Price \$3 per pair. Apply to

JOSEPH BRECK & CO.

June 24.

if

## GARDENERS' KNIVES.

JOSEPH BRECK & CO. have this season imported and now offer for sale a few very superior Garden Knives, for pruning, &c. manufactured expressly for Gardeners, and warranted superior to any article of the kind before imported.

Also—a large assortment of Budding Knives, Grape Scissors, &c. &c.

April 22

## THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at \$3 per annum payable at the end of the year—but those who pay within sixty days from the time of subscribing are entitled to a reduction of 50 cents.

TUTTLE, DENNETT AND CHISHOLM, PRINTERS  
17 SCHOOL STREET, BOSTON.

N. E. FARMER.

From the Third Report on the Agriculture of Massachusetts.

### ON DRAINING AND SUBSOIL PLOUGHING.

The statements which I give below, are from an examination had before a large committee of the British Parliament, relating to draining and subsoil ploughing. I at first intended to give only a short abridgment of them; but they are of such remarkable importance, that I have chosen to give them at large. I know they will be read with the greatest interest.

*Statement by T. F. Kennedy, Esq., of Dunure, formerly M. P. for the Ayr Burghs, respecting his experience of the system of Draining and Subsoil Ploughing, recommended by Mr Smith, of Deanston, in the County of Stirling.*

I have practised Mr Smith's system of draining and subsoil ploughing upon my farm, in the county of Ayr, during the last three years, and the result has fully justified every anticipation of benefit. It is applicable to all soils not rocky which have not an absolutely porous subsoil—the great object being, that the subsoil should be rendered artificially porous, and that all rain water should sink on the spot on which it falls, and that no running of water should take place on the surface.

There was, at the outset, considerable difficulty in having the work executed; it was arduous, and those engaged in the superintendence and labor were adverse, because they did not see the principles of the system, or the advantages which were likely to arise. A little encouragement and a distinct intimation that there must be perseverance, overcame every difficulty. This observation applies to the subsoil ploughing, while some difficulty attached to the perfect execution of the drains, in having them made of the full depth of 30 inches, and filled neither too much nor too little, and with all due care in all particulars which must be attended to to secure permanence in the effects. I have invariably made the drains twelve feet apart, in order to secure the effect being complete; being much impressed with the folly of spending a considerable sum per acre in the operation, and still failing to obtain what I may term perfection in the system. I have also used broken stones as the material when they could be obtained within such a distance as to prevent the expense of cartage being excessive; in other cases I have used tiles, with a layer of three or four inches of stones or gravel over them. When stones alone were used, the drains have been uniformly 30 inches deep, leaving 16 inches for the operation of the plough and subsoil plough; where tiles have been used, the depth has been about 24 inches, the same depth for the ploughs being left as in the other cases. A crop of oats has generally been taken after the drains have been executed, and the land has been comparatively dry; but even the visible effect has been very imperfect until the subsoil plough has

been applied. By means of this plough the whole obdurate undercrust of the soil has been broken up, and all water has instantly escaped, and after six or eight months of the alternations of heat and cold, wet and dry, a most remarkable change has appeared in the condition of the soil; what was before obdurate and retentive, has become comparatively mellow and friable, and the longer the time since the operation has been performed, the greater has been the perceptible progressive effect. The operation of the subsoil plough has produced cracks and crevices and interstices to the depth of 16 inches; through these the rain passes off with rapidity, and these crevices are immediately filled by the air of the atmosphere, and during dry and hot weather these cracks and crevices are multiplied to an indefinite extent, and in clay soils to an extent quite remarkable. Instead of resuming its original tenacity, there seems to be a decided change effected in the character of the component parts of the land to the depth the plough has reached. It is for the skilful farmer to apply manure judiciously according to the state of each field. Drilled green crop has followed a crop of oats, and the land which before was unfit to grow turnips, has become fitted for that crop, although perhaps a little rough and cloddy during the first year. Next has come a crop of wheat, and in it has been seen the great and remarkable effects of the system, in the condition of the soil and the quantity of produce. Land which was before, in truth, unfit to carry wheat from extreme wetness, has become altogether the reverse, being sown with wheat without ridges and furrows, being perfectly porous; all rain disappearing as it falls, and being carried off by filtration to the many drains, and each drain having little more than a thread of water to carry off. Possibly the land of which I speak might have previously yielded a precarious produce of 20, or at the utmost 24 bushels of wheat per imperial acre, while in its improved state, the actual produce of the crop of 1835 has been 40 bushels thrashed out, a few bushels of which were not very good in quality, owing to what is now to be mentioned. The fault of the crop was, that it was too strong, and there being much rain while it ripened it was laid down. Had this not occurred, the quality of the whole would have been good, and there is no doubt that six or eight bushels more per acre would have been obtained. The facts, therefore, are most satisfactory, because the result in the first wheat crop may truly be said to be twenty bushels of wheat of extra produce, in return for an expense of 10l. 10s. per acre, which was the cost of the drainage and the extra expense of subsoil ploughing. It ought to be stated that with the turnips, the land was well manured, and subsequently abundantly. After the wheat was carried, and during the winter, the field was ploughed about nine inches deep with the ordinary plough, and remained rough until the month of March, the whole rains of winter, which were excessive, sinking as they fell. Towards the end of March the field was harrowed, drilled, and sown with beans without any manure. The crop is promising, and there can be no doubt that the powers of the soil

which have now been brought into action, will render it abundant. The soil is so powerful, that it is intended to take a crop of wheat after the beans, without any manure, but taking care to make the land perfectly clean; and there is little doubt that the wheat crop of 1837 so treated, will be more productive than that of 1835, because it will be less superabundant in straw, and incur less probable injury from being laid down.

My experience, on a moderate scale, leads me to say, that the system is the greatest discovery which has been made in agriculture, (because it is applicable to soils hitherto almost intractable and most expensive to cultivate,) provided it be applied only where the altitude justifies the undertaking, by securing a climate suitable to valuable crops. It in truth converts almost the worst into the best land—that is, the most powerful in respect of production, because the quality of land to which it is applicable, the heavy clays and retentive subsoils will yield heavier crops after such treatment than the lighter loams and many of those varieties of soil which hitherto have been so pleasant to the agriculturist to cultivate.

The reformation which the system effects on lands which previously were looked on as hopeless, is quite surprising, and no one believes it until it is seen; but again I say, that the whole success depends on the perfect and complete manner in which the operations are executed, as any thing being merely an approximation to the system, will end in disappointment. The expense of what is perfect must not be grudged, and as sure as it is liberally given will it be abundantly repaid. I would also say, that the effects of the draining and subsoil ploughing are dependent on each other; the one is comparatively worthless without the other; the ploughing would be thrown away without the previous draining, and the draining is a poor improvement compared to the combined effect with the subsoil ploughing.

I may state that my bailiff and the ploughmen who worked the subsoil plough, certainly, in the outset thought my orders almost foolish, (who nevertheless carried them into effect faithfully,) but now see the effects of the system, and are fully sensible of the extraordinary benefits resulting from it.

The various views of the advantages might be multiplied to any extent, but a concise statement of them seems to be, that the most obdurate and intractable soils assume a friable and mellow character, and at the same time are rendered permanently most productive. A system which is applicable to 10 acres is equally so, in its principle, to 10,000 or 100,000 acres, and consequently the system becomes a most important national consideration. My decided impression is, that capital judiciously applied in the execution of this system may yield a return varying from 10 to 50 per cent. according to the various circumstances attending the infinite variety of cases in which the system may be carried into effect. Every thing depends on the mode and perfection of execution. If any one thinks of limiting the expense of complete ex-

caution, he may rest assured, that the recompense will be still more restricted, and that it is more judicious to improve one acre well, than to deceive himself by a superficial operation on a more extended surface.

A remarkable effect is, that the harvest is considerably earlier on land so treated than on the same land in its previous state, and it is scarcely necessary to remark, that there will be a constant return for the same seed and labor and manure far greater than when they are applied to land in a naturally wet condition.

*Evidence of James Smith, Esq., inventor of the Subsoil Plough.*

*Chairman.* You live at Deanston?—Yes.

Where is that?—In the western district of Perthshire in Scotland.

Do you occupy a considerable farm in that part of Scotland?—About 300 acres.

Have you improved your farm lately?—I have.

In what way?—Chiefly by thorough draining and subsoil ploughing.

What was the nature of the soil upon your farm?—It was various: there is some part of it rather light soil, some of it gravelly upon the edge of the river, and some lightish loam, with rather a tenacious bottom, and in other parts a stiff sandy clay.

Is it a stiff subsoil?—Some part of it very stiff.

And it was all subject very much to wet?—The greater part of it was covered with rushes and bent before being drained.

Will you describe to the committee your mode of draining?—The principle upon which I drain is to put in drains frequently, so that there may be opportunities for the water to pass off, because I find that in our climate the chief injury arises from the water that falls from the heavens.

Are those drains placed up the furrows or across the land?—They are placed in the same direction that the furrows were before, but I have now no furrows. I lay all my fields down without any furrows. I object to furrows, because water is allowed to collect in a body, and thereby ruins the soil.

The fact is, that those drains are so frequent that they answer the purpose of furrows?—Yes; they answer the purpose of furrows.

How far are they apart?—I wentyone feet, and two feet six inches deep to the bottom.

Do you drain with stones or with tiles?—Chiefly with broken stones, because I have stones upon the land.

You spoke of subsoil ploughing; you are the inventor of a subsoil plough?—I am.

Do you use it after draining?—After draining, I first take a grain crop, and then after the separation of that crop from the ground I subsoil plough.

How far do you fill up the drain with stones?—I put in 12 inches of stones, leaving 18 inches between the upper part of the drain and the surface of the soil, and then I cover them most carefully with very thin sods, overlapping at the joinings, because it is of the first importance to prevent the soil which has been recently removed from running into the drains. There are many drains destroyed by means of the soil getting in at the top.

The water comes in at the side of the drains?—Yes, by fissures in the subsoil.

Will you describe the operation of the subsoil plough?—I have got a plate of it here, (*producing the same*)\* The principle upon which I construct-

ed that plough was this, that I saw it was of the greatest importance to break up the subsoil, especially where it was tenacious. I saw that the common trench plough, when used to break up the subsoil, at the same time turned over the recently moved subsoil to mix with the surface soil, which induced a sort of partial sterility for a time. I then bethought me of having a plough that would move the subsoil, still retaining the active soil upon the surface, and I considered how I should construct it to have the least draught, so that the horses might easily draw it, because I was aware that it would require considerable force. I therefore made the plough as thin as possible in its transverse section, and the share of the plough, which is usually made with a free point not touching upon the lower part of the plough, and I found it was apt in stony land to get knocked out of its place, and therefore I made a mortice in the sock, and inserted the point of the share in this mortice; then in order to move the subsoil as much as possible, I placed an oblique spur upon the one side of the plough, which throws up the subsoil after the furrow has been divided and breaks it, but does not throw it further up than the bottom of the furrow of the active soil.

*Mr Hadley.* Does not the spur increase the draught?—It does not materially.

How many horses does it require to work that plough?—Generally four horses in ordinary subsoils, but upon some it has been necessary to use eight horses.

How deep do you plough?—Sixteen inches from the surface.

*Mr Lock.* What is the depth of the original furrow?—Six inches: we first go on with the common plough and turn over a furrow of the depth of six or eight inches, and then the subsoil plough goes and stirs up the bottom without bringing the soil further up than its original position, then when the common plough comes round again, it throws the active soil upon that part which has been subsoiled.

Then the advantage of stirring up the subsoil is, that the water which falls gets down to the bottom of the second furrow so as to relieve the upper soil from the effects of the rain that falls?—Yes; besides there is a constant operation of the air upon the subsoil, which converts it into soil.

*Mr Cayley.* Is it with a view to draining principally?—With a view first to draining, and then to converting the subsoil into a fit soil for growing plants.

It makes the soil more permeable?—Yes.

How long have you been doing this?—About twelve years.

In the first instance, if you were to turn up that subsoil, it would not be a productive soil, and therefore you prepare it by this course for subsequent turning up when it is prepared?—Yes.

When you conceive it to have come into a proper state for vegetation, do you turn it up at once or gradually?—At once.

Do you find that the soil will be very productive the first year after it is turned up?—I find it so.

Do you stir it up with the old soil?—I subsoil it only once. I then take a green crop, followed by a grain crop; then it lies three years in grass; and then after that, I take a crop of oats; and then after, I turn it up to the depth of sixteen inches.

Then it takes about three or four years to bring the subsoil to a proper degree of preparation?—It does.

After the subsoil has been brought into a proper degree of preparation for vegetation, have you ever tried the experiment of bringing in a certain proportion, say a fourth part of the subsoil after it is prepared, into co-operation with the active soil?—I have, and it answers very well.

Do you consider that the bringing into play the whole of the subsoil at once is a better thing and more productive than holding in reserve a portion of the subsoil?—I think it is.

After turning up the subsoil how many years have you grown crops upon it?—My mode of cropping is a seven years' shift, and I have now four fields undergoing a second shift.

Have you had the experience of what the condition of the previous active soil becomes, from being in a state of rest for several years?—It is all mixed together.

Then the effect of your system is to produce a new soil instead of the old one?—Yes.

*Mr Denison.* According to your plan, supposing you were not to have turned up any of this subsoil, but merely to have had your subsoil plough pass through it, and were to go on cultivating without any thing being turned up to the top, instead of producing sterility, would even that produce an improvement of the crop?—It would, and a continued improvement.

After getting upon land that has been subsoil ploughed, and then ploughing it up again, do you find that the subsoil continues friable?—I do to the bottom.

With strong tenacious soils you do not find that it is run together again?—No.

*Mr Heathcote.* You have no furrows, and you plough 16 inches deep in all parts of the farm?—Yes.

Do you find that the water stands at the bottom of the furrow any length of time before it gets into the drain?—I do not think it does, but I cannot see the bottom of the furrow.

When you turn it up how do you find it?—I find it particularly dry, and sometimes where the land has been poached in consequence of taking off a green crop, still it is perfectly dry at the bottom of the furrow.

You do not find that the treading of horses has any effect upon it at that depth?—None whatever; the effect of the most thorough poaching does not go beyond six inches, and below that it is found quite dry.

Will this subsoil ploughing apply to all species of soils?—I have never yet seen any soil that it would not apply to.

The most retentive stiff soil?—Yes, and the deep bog as well.

*Mr Denison.* After breaking up the subsoil, but without turning it up to the top, suppose the farmer was to continue to plough it seven or eight inches, in that case how long do you think the operation on the subsoil would remain effectual, or how soon do you suppose it would run together again?—I think it would never run together in a solid form, because when it has been turned up there is a constant circulation of the water and the air, which prevents running together again; and when soil is laid in a dry position and exposed to the atmosphere, it seems to get some sort of attractive quality: if you look at any mould you will find that it is all in little globules, and those are gathered together in large masses, forming larger globules which keep the soil open.

Do you think that the mere operation of allow-

\*See First Report of Agriculture of Mass., p. 1.

ing water and air to pass among the soil at a considerable depth in the ground would, to a certain degree, produce that effect upon solid clay of converting it partially into soil?—I think it would.

*Mr Loch.* What was the nature of that soil which you said was covered with bent before you ploughed it up?—A great part of it I did not think worth more than 5s. an acre.

In consequence of what you have done to it, what is it worth now?—I consider that it is worth 2l. an acre to any farmer.

What was the course of cropping that you adopted in the improvement of land?—At first I was rather undecided with regard to the rotation I should follow, till from observation I formed a judgment what was the best course. The mode of rotation I generally followed was this: I drain always, if possible, in the lay or grass, because by draining in the lay the work is more neatly done; then having completed the drains, I take a crop of oats the next year. Upon the greater part of that farm I have been obliged to plough very shallow furrows for the first crop, because there was not more than three or four inches of soil that I dared turn up; then I took a crop of oats, and upon some of the fields I had not more than from 24 to 30 bushels of oats. After the separation of that first crop from the ground, I applied the subsoil plough. Then I gave it another ploughing, and had a green crop; potatoes upon some parts and turnips upon others.

Could you have attempted any of those crops previous to the subsoil ploughing?—Not to advantage.

How long had it been in grass before you turned it up?—Some of it 15 years.

What is the next crop after the turnips and potatoes?—I then lay down what I have had in potatoes with wheat; I sow wheat in the end of the season, as soon as I can get the potatoes up; what I have had in turnips I grow barley upon in the spring, and I sow grass seeds upon both.

You could not have attempted barley upon that soil before?—Not with any success, and not wheat, because the land was so full of moisture that it honey-combed by frost, and so threw out the plants. There was one field especially, after a very severe winter, and with a frost, there was sometimes a space of 20 or 30 square yards from which every plant or vegetable had been thrown, not a bit of grass remaining upon it.

After the wheat what do you take?—I sow grass and barley.

Do you cut the grass for hay?—Some: the other is pastured from the beginning.

What is the nature of the grass it produces?—Very good, and very heavy crops of hay; I have generally about 300 stone, which is about three tons per acre.

Do you think that any improvement is likely to be so valuable for general purposes as frequent draining and subsoil ploughing for strong land?—None.

That, you think, is the most important thing for general purposes of farming that you are acquainted with?—Decidedly.

And applicable to more qualities of soil than any thing else?—Applicable, I should say, to all qualities of subsoil.

And equally applicable to England as to Scotland?—Equally so, and very much wanted. I have a friend who has made an experiment under

any directions in Cheshire, upon very stiff land, Mr Barton; it is the most thorough brick clay I ever saw; an extremely sterile farm in its original state. Mr Barton has been completely successful; he has thoroughly drained the ground and subsoil ploughed, and it is now laid down without furrows, and I there saw a large field of this extremely stiff clay with a beautiful seed surface upon it.

*Mr Denison.* Do you think that it is applicable to a soil where there is a bad gravelly substratum?—I think so; I think any substratum, if it is exposed to the atmosphere for a sufficient length of time, will become fertile. In the most barren country, if you see where a ditch has been dug, on the soil which has been thrown up, you will generally find a richer verdure and strong weeds growing.

White's Account of Draining on Smith's Plan.

The main or leading drains are cut 3 feet deep, 15 inches wide at the top, taper to 6 inches at the bottom, and filled up with stone from 15 to 18 in-

ches. The smaller drains, leading into the main, are 2 feet 6 inches deep, 12 inches wide at the top, taper to 3 inches at the bottom, and filled with stone 13 inches, with turf upon the stone. The stone is first placed on edge, about 6 or 7 inches, and the remaining part covered with stone broken to 2 1-2 inches; a section of these drains is given: the drains are parallel to each other. The subsoil varies much; and the price for cutting the whole, breaking the stones and filling, has invariably been 14 per yard; some part has worked better than others, and, upon the whole, I think the work cannot be done for less. With regard to the distance between the drains, in this part, the work must be put out according to circumstances, which requires much attention, as great expense might unnecessarily be incurred, or the object fail. When the land is ready for the operation of the subsoil plough, a man with a pair of horses turns out the first furrow from 10 to 12 inches wide; then follows the subsoil plough to the depth of 14 inches, taking care not to stir the turf covering the stones in the drains; it is worked at right angles of the drains, and drawn by six horses, two and two abreast. The plough is drawn from an axletree, with double shafts and low wheels; the horses draw perfectly even, and by this mode it is no more than ordinary work.

GAPES IN CHICKENS.

A correspondent of the Albany Cultivator gives the following remedy for the gapes in chickens:

“Remove the worms out of the windpipe and they will get well. This can be done with safety and facility after a little practice, in the following manner. Let some one take the chicken, holding its legs in one hand and placing the other over its back, so as to hold it firm; then let the operator take a small hen's feather or a large pigeon's feather, and strip off the feather from the stem excepting about an inch or inch and a half from the tip end, according to the size of the chicken; wet it a little, and strip that part back so that what remains on the stem will stand back like the barbs on an arrow, excepting the extreme point, which roll a little so as to make a point; then let the operator take the head of the chicken in his left hand, placing his thumb and forefinger on each side of the bill, in such a manner as to hold the mouth open, the neck gently but firmly drawn out in a straight line; then observe the opening back in the tongue, place the feather as near to it as possible, and when the chicken breathes, the windpipe will be open, enter the point quick, and fear not after the point is entered; push down gently from two to three inches, (don't be in too much of a hurry,) then draw out, and turn the feather as it is drawn, and the worms will adhere to the feather, and others will be loosened, and the chicken will sneeze them up frequently, so that they will fly out of their mouths. It is not advisable to enter the feather more than twice at one time; let the chicken go, and if it gapes the day after, you have not got them all; try again. This is a sure cure if attended to; generally you need not perform the operation more than once, but sometimes oftener. The greater part of my chickens, over one hundred in number, have had the disease, and I have lost but one. I have taken out as many as eleven worms at one haul.”

In scalding hogs, dip them in cold water before hot, and the bristles will come out casier.

For the N. E. Farmer.

## RURAL EDUCATION.

No. 11.

Education can never find a true and pure basis, such a one as philosophy could approve, out of the order of nature. That order points to woman, as the first operator on body and mind. The first and most important faculties are taught and cultivated by her. And who shall say, that in the earliest dawn of intellect, the seeds of virtue or vice are not sown by her, through ignorance; for we cannot suppose it ever to be her wish to impair the fruit of her love, the fond hope of her future joy.

Education begins at her hands, from the first moment she applies the infant to her breast. Her every motion is a lesson; and as every motion has a meaning, and a *character* withal, the meaning and the impulse, be they good or bad, patient or impatient, just or unjust, must leave a durable impression. All primary education is imitation; and the infant mind learns only by physical imitation. Can this be doubted by any one who ever noticed the combativeness of the little children of the Irish on Broad street, compared with those of the more polished parts of the city? With reasonable allowance for exceptions, are not children like their parents in temper? I might extend these questions far; but no one will doubt of the influence of a mother over the future character of her child.—But when a mother is almost perfect in herself, and her child is almost the reverse, let not such unfortunate coincidences tend to weaken the faith in maternal example. These cases are very rare, and might be traced almost invariably to their true source, and that somewhere else than in the mother. But how few mothers act always themselves. How many of the best of them are impelled by the unreasonable conduct of others, of their own household or out of it, into temporary fits of humor or passion in the presence of their children. Who has not seen these little farces played over, by the youngest children, on others, or on their dolls. How can a child conceive an idea of imperfection in the beings it looks up to as the gods of its infancy. It must then imitate the good and the bad indifferently. Is it easy to make a young tree which springs crooked from the earth, grow straight? Is it more easy to eradicate that moral tortuousness which is acquired in infancy, from the beloved source of its existence, by wordy precept; and that too, from some cold pedagogue, whose harsh and severe tones are not like the music of a mother's voice? How long does it take rational man to divest himself of the foolish fear of a grave-yard in a dark night? The seeds of this folly were sown in tender youth; and the ripest age with experience and reason, cannot always obliterate them.

The evil spirit, as it is called, manifests itself so early in life, sometimes, that well might superficial observers suspect that it comes into the world with life itself. But such an idea is so foreign from all the perfect works of nature and its Author, that no reasonable mind should harbor it for one moment. All that is imperfect we should in truth as well as in humility attribute to ourselves. If then it be admitted that instead of being all originally bad, we are all originally good, all the imperfections of which we complain are *really* and *substantially* within the reach of remedy; and that remedy is in the hands of him who has the greatest interest in having it applied successfully, viz: MAN.

If I be allowed here to distinguish woman from man, I should say, that woman has the greatest interest of the two, in the moral reform of society. But I cannot enlarge on this pregnant idea in this place.

If what I have presumed above, of the power of primary, maternal education, over *all* the evils of society be not true, vain is the labor of *all* education; and the history of all former progress is a deception. We have then made *no* progress. The social school is in a worse condition than when the schoolmaster first began his task. Education, like every thing, surely had a beginning; and that can be found nowhere but in the cradle; and who will dispute the importance of *beginnings* in all things? At the beginning of two diverging lines in geometry, if the departure be imperceptibly small, yet the consequent distances will be infinite. How then can too much stress be laid on the *beginning* of *that* on which all future happiness depends? Have vice, and crime increased with the progress of society from its simple to its more complex forms? The pulpit tells us that we are all backsliders. This is not very encouraging; but it should not dishearten the brave and virtuous, the true believers in divine wisdom. If we are all backsliders in moral practice, we have surely gained some mental strength wherewith to regain a better foothold on moral and physical truth. And that very backsliding, it may be hoped, may carry us back in thought, to the source of truth, where we may discover the first small, almost imperceptible departure of the two lines of truth and error, and correct it *there*.

To mend the original evil impressions, by after education, is a task which no moralist has, as yet, been able to prescribe the means of doing. All the religions we read of seem to have had this object in view. All the laws which have been made, assume *that* to have been their object. But the present state of the world, after many thousand years experience and mental labor, shows no adequate progress: perhaps *no* moral progress at all, if numbers and crimes were compared, from the first knowledge of society, to the present time. If this appalling truth be admitted, it only goes to show that we have heretofore sought the remedy for moral and physical evil in the wrong place; and must seek for it elsewhere. I wish I could in conscience attribute this error entirely to ignorance. But I cannot, no more than I can believe that the learned judges and clergy, who hung witches and quakers, were ignorant of the sin of those acts. Worldly and selfish motives have certainly impeded the progress of morals and good governments in all countries. We Americans assume to know, by our own experience, and some real progress in morals and government, that certain governments widely differing from our own, do absolutely require for their support, as they are now constituted, ignorance, superstition, poverty and vice. In such countries, therefore, a few learned men might have discovered, long since, the source of their evils, but dared not promulgate it, or propose any effectual remedy. Hence we see no attempts there of a radical cure; but simply palliatives, weak and temporary, to ward off as long as possible, the terrible threatnings of revolution. Education has never been free; and if all subjects which may come under that head were specified here, it is not certain that it could be called free even with us.—I will not, however, contend with its distant forms, before I have examined more closely its small beginnings: and it should be the constant aim of all

those who meddle with this important subject, to make all the means which they employ subservient to the great and only reasonable end of making men better and happier; every other consideration should yield to these.

The heart may be cultivated only in tender youth, though the head may be improved at all ages. If the importance of the former must not yield to the latter, it behoves us to give our special attention to that (the heart.) Interest, pride and ambition will take care of the head; and if legislators had no other regard for *that*, than what was conducive to the improvement of the heart, they would have little else to do, than to show in the spirit of all the general laws they enacted, their *own* regard for justice, which is the heart's own empire.

I will not now open that Pandora's box, which might exhibit in all its ugly features, the general injustice which has pervaded from time immemorial, the statutes of all governments, for the *edification* and *moral improvement* of full grown scholars, teaching them by an exalted example, lessons of fraud which these very lawgivers *declare* they will punish by severe penalties, even to death, if poor *individuals* presume to follow *their* example and neglect their precepts;—but I will for the present, merely ask these wise legislators, these pretended reformers of the world, at least in our boasting America, how they can expect that woman, who only can have the power to give the first important impulse of character to man, will be able to perform this delicate duty, while she is opposed by the tyranny of physical force, the injustice and tyranny of the law, and the tyranny of fashion? She is called upon to make bricks where the straw is refused; and the light of the sun even is shut out from her labors. In the midst of these important labors, if perchance some faint rays of light have pierced the dark cloud of *male* tyranny, and shone upon her for a moment, her sublime lord and master breaks the delicate thread in her hands, and replaces it with a ponderous chain. His superior wisdom commands, and her docile nature obeys;—she is thwarted in a thousand ways, and by as many whims; and perhaps separated from her tender ward at an age when nothing but the tender cares and peaceful example of a happy mother is wanting. If I had not a great aversion to the interference of the laws in domestic concerns, beyond what is indispensable, I would recommend deferring the technical A B C education to the sixth year, leaving the physical and purely moral education entirely in the hands of the mother. But I will not indulge myself in speculating on this difficult branch of the subject; for however desirable a radical reform may be, I can see as well as others, a thousand difficulties in practice, growing out of the present state of society, which admonish us of the imperious necessity of yielding to them now, while we boldly contemplate them, and admit them to be curable in time. The instruments necessary for a reform in education are yet to be created. A better and more general knowledge of the errors of the existing system and its unfruitful results,—a more perfect understanding of all that we require of education, in a moral and political view; and a clearer insight into the means best calculated to accomplish our end, is what should principally occupy our attention. Under this prudent and patient system, however, it may not be inexpedient to make occasionally some gentle innovations, such as the present state of society will tolerate.

The physical education of female children is happily beginning to attract notice; and the most fashionable mothers becoming sensible of the great importance of health, from the want of it, now allow their girls to take strong exercise in the open air. I heard from the lips of Dr. Kirkland, the late learned professor of Harvard University, that if he had to choose between learning and health, he would choose the latter. I may add, that when the heart is right, the head is seldom wrong; and the head may be made right without much technical learning.

After stating what woman can do, when strengthened by the wisdom of society and enlightened on her own duties, powers and interest, I may glance delicately at the evil she now does. Will she believe that she often conspires against her own happiness? Woman ought to be the first to stand up for the promotion of just and equal laws. The smallest attention to her own degraded condition, a few centuries ago, and her equivocal condition now, although greatly improved, will teach her why *she*, in particular, should contend for general justice.—She is a great admirer of splendid talents; so ardent is she in this devotion, that she will, in their favor, overlook the grocest accompanying vices; even those which tend to degrade her own sex. Speak of a man of shining parts in her presence, but without morals, and a sensible, modest man of modest fame, and notice the relative estimation she holds them in. Compare two decidedly vicious characters, the one highly talented or fashionable, and the other less so; and see how differently do the same vices weigh in her mind. Both ought to be excluded from her society; but for what? for their vices. But is this the case? The former, whose immorality is ten times more dangerous, through its fascinating accompaniments, is admitted, and the latter, more harmless, is rejected. The vice then is not that which she seems to abhor; but the absence of power to please. There is a Persian adage which says, "If knowledge *without virtue* were estimable, who could be more estimable than the *devil*."

Woman worships the brave as well as the eloquent. So we all ought to love *true* courage, and eloquent truth. But the eloquent tongue may flatter, and the sharp sword may defend her; but the former may also seduce or slander her, when principle is not its companion; and the latter may lay in the dust the virtuous champion who stands up in her defence when her virtue is assailed, by a man of mere animal courage, but devoid of true honor. Woman will be more just and judicious in these respects, when she understands her interest better. When she has exercised all her power over infant man, then shining parts in man will not be used for sophistical deception in morals, politics, or religion; not even for female seduction; for man so educated will be more virtuous and woman more enlightened. Then too will the champion's sharp sword become less wanted, not only in the cause of woman, but on all accounts; for even now is duelling but a miserable supplement to imperfect laws; which laws will become more perfect, and supercede the *necessity* of that practice, when justice and a true sense of virtue shall rise from the true feminine source, to which I now point, unimpaired by those sinister powers which have so long warped its progress upwards.

We want no better foundation for *that* education which would lead to sound morals, good government,

and pure religion, than *interest*—the interest well understood of men and especially of women.

Social virtue, without a worldly motive, has been too long the chimera of transcendentalists. I use this modern word, as sufficiently expressive of an ancient vague notion of something not within the reach of the senses, or of common sense. Let us be more humble, and come down to the use of the powers given to us; they will answer all our purposes, and we shall be the wiser as well as the better for keeping nearer to nature's limits. Let us then take this well known worldly motive, *interest*, and not despise it, or try to make it despicable by misapplying it. It is a very good motive. It is, in a final analysis, the *only* motive of man. If you must have inspiration, *that* is inspiration: God has inspired it into the hearts of all his creatures.—Seeking for something beyond and above interested motives, something undefinable and unintelligible, has caused us to overlook the true foundation of social perfection. The inconceivable distinction between spiritual and mundane truths; between virtue celestial and virtue terrestrial, have bewildered us, and given too much occasion for moral quacks to build up their own supremacy on our degradation. If we take as our infallible guide that unerring monitor which accompanies all reasonable men, moral as well as political quackery will die for want of aliment; and none but true teachers will be listened to; and it will not then be difficult to distinguish true from false teachers; for those only *are* true who can make themselves understood. There is no mystery in morals or in honest politics.

I shall defer the technical part of my subject, with your leave, Mr Editor, so long as materials may fall under my hands wherewith to widen and strengthen the foundation of education.

We are just beginning to learn the importance of having competent teachers; and in imitation of a French and Prussian practice, some forty years old, are now instituting *Normal* schools for the teaching masters how to teach. I ventured to propose this system about 20 years ago in some of our papers. Two of those papers insisted on changing the world *Normal* into *Moral*, and so it was repeated in others in my absence, and made nonsense.

If then the importance of preparing male teachers for technical education be admitted, who will say that it is of no importance to prepare, qualify, and empower the female cultivators of the heart, without which all the technical knowledge in the world is worthless; nay worse than worthless—it is a new power for mischief; as a knowing man without principle is worse than an ignorant man without vice.

Would you place your child in the hands of a slave to teach him the duties of a freeman? would you confide it to a reputed liar to make it a lover of truth? would you, to inspire it with that lovely candor and youthful frankness which we all admire, and which is the secret charm of youth, choose for it a preceptor, at an age when example is every thing, and precept nothing, whose very condition in society, commands an habitual state of dissimulation—one who was not permitted to speak or act the truth? John Randolph, with all his eccentricities, was a man of truth: and he says, "a man may act a falsehood—he may be maliciously false without opening his mouth." If then example be teaching, and there be an age in which first impressions are almost ineffacable, shall that im-

portant period be unnecessarily exposed to evils for which no adequate remedy has yet been found? Shall Normal schools be instituted for the improvement of the head, and the improvement of the heart be confided to incompetent teachers; to mothers, who are *prohibited* from a duty so interesting to themselves, and so important to social progress?

Lycurgus and his followers down to Owen, were fully aware of the power of education by example. Man's nature has been almost changed by it. Better indeed would it be, as in Sparta, that the iron despotism of rulers should deprive the mother of every care of her child, than to leave her unprepared for this important duty.

WM. FOSTER.

#### TREATMENT OF WOODLAND.

To the Editor of the New England Farmer:

In reply to the inquiry of your friend at Harvard, in your paper of the 22nd inst., I would state, from some experience and more observation, that when woodland is cleared and it is designed to have wood grow again, it by no means should be burnt or ploughed; but secure it from cattle and let it remain untouched, is much the better way; there will sooner be a new and thrifty growth. Besides experience and observation of the fact, it is rational to suppose that it should be so—that is, to me it is rational. Some have an idea that the next growth after clearing, proceeds from the stumps by sprouts. This is, in some measure the case, but not wholly so: there is generally and perhaps always, seed in the ground, sufficient to produce a crop of wood, that are covered with leaves, but when exposed to the sun, soon vegetate. Hence the reason that when a wood lot is cut off, a growth of an entirely different kind of wood takes the place of the former growth: for instance, it frequently happens that where a growth of oak has been taken off, a growth of pine comes next, and so vice versa. Many men I know are not aware of this fact, but a fact it is, which I have observed nearly my whole life, which has been lengthened to more than three score and ten years.

I could write much more on this subject, but not having had much education, which perhaps has made me have a repugnance to writing,—besides, there are so many men of education who write for agricultural papers now-a-days, many of whose productions have more imagination and theory than sound practical knowledge of agriculture, as appears to me, I will forbear, lest I also should be thought a theorist.

A FARMER.

Crops at the west, and particularly in Michigan, have not come in so favorable as was at one time anticipated. A letter from that State says—"If two thirds of a middling crop of wheat is gathered, I shall feel satisfied. The insect commonly called the Hessian fly, has made great havoc in many places. Latterly a new enemy has appeared, called the "anchor worm." They were nearly as numerous as the flies of Egypt. So annoying and plenty have they been, that they would inundate whole fields, and the farmers have in some instances made trenches around their fields and houses, to save themselves. They move in a mass from one field to another. After finishing a repast and crossing a road, the earth is nearly obscured for many rods."

A good farmer is unceasing in his efforts to add to his manure heaps.

## NEW ENGLAND FARMER,

AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, AUGUST 5, 1840.

## AGRICULTURE IN MASSACHUSETTS.

We continue our desultory observations on this subject. To a person accustomed to the farming of western New York, or of the valley of Lancaster in Pennsylvania, or the extensive cultivation of a southern planter, whose "force" consists of one or two hundred effectives, to talk of the agriculture of Massachusetts seems bordering on the ridiculous. We recollect a remark of the late lamented Judge Buel, in some published notes of his on a journey he made from Brighton to Albany, that it was matter of perfect surprise to him, where the people got their bread, and what indeed they did produce. We must admit that Massachusetts farming is comparatively a small affair; and yet, taken in the aggregate, its product would be found very greatly to exceed the crude opinions formed of it. Imperfectly as it is pursued, limited in extent, and in its actual amount of product not yielding perhaps on an average one third what it may be made to yield, its amount in actual pecuniary value would not suffer in comparison with the products of climes esteemed much more favored in climate and the fertility of the soil. The returns of the Assessors made this year to the valuation committee, and the answers demanded on various subjects to the questions required to be put by the United States marshals engaged in the decennial work of taking a census of the Union, will, we believe, disclose results even in regard to the *poor* New England States, which will both surprise and gratify us.

Many a farmer in Massachusetts with his hundred acres, produces all the great supplies for his family of milk, butter, cheese, bread, poultry, eggs, honey, fruit, vegetables, hay, wool, beef, mutton, and pork. He keeps his stock good. He has a yoke of fat cattle to "turn off" every year and a fat ox to "put down;" he has a ton of pork for market; he sells butter and cheese and grain. If he performs the labor with his own hands and the help of his family, then this is all clear gain. If he is obliged to hire some labor, he will find a serious deduction from his profits; but still he will be able to pay this and have in ordinary cases, some little surplus left to add to his little stock. This, we admit, requires skill, diligence, and "stay at home" industry; but by these characteristics many of our farmers are eminently distinguished. This supposes likewise that there is no extraordinary drain in the house; so that when a farmer lays up some of his small earnings upon the shelf, he does not, upon going to look after them a second time, find that they regularly "take to themselves wings and fly away." It supposes that the hands in the house do not require to put on kid gloves in order to sweep the floor; and that they do not dread or disdain being soiled by performing any of the domestic labors of the household. If there ever have been situations in life which we have been disposed above all others to envy, it has been family establishments (and thousands of such are scattered all over our happy commonwealth,) where all the household constitute but one family of parents, sons, daughters, and perhaps grandchildren;—where labor is made light, first by simplicity of living, and next by mutual and unvarying kindness; and where throughout the whole there is to be found but one interest and one heart. This now is one kind of Massachusetts farming, which does not indeed exhibit any great amount of profit in an arithmetical form; but in a social and moral aspect presents an eminent prosperity.

We know however many other farmers, who "when times are good," are able from their farms to pay their labor, to sustain their families, and to lay up their five hundred, and some of them their thousand dollars per year. This we say ought to satisfy the desires of any reasonable man. We know that in the new States, where land is entered at the government price, the farmer finds the value of his farm increased twenty and thirty fold and upwards, by the improvements which he puts upon it. This of course is a source of wealth, with which hardly any thing else can come in competition. But the fact that some of the most fertile land on which the rain ever descended or the sun ever shone, and indeed as much as one can desire, can be had as it were for asking, is an accidental circumstance, which forbids any just comparison between the two cases. Yet the same amount of acres brought into comparison, and the pecuniary results balanced, the profit would often be found on the side of the Massachusetts farmer. We have not been very successful in our enquiries either in Ohio or the superlatively fertile prairies of Illinois, to find farmers of even extended possessions, who are able to lay up their thousand or their five hundred dollars per year.

But all our farming is not of this description. We have some farms of considerable extent; and though it would be difficult to find many farms in the commonwealth where twentyfive acres are annually under the plough, we know of many where at least fifty acres or more might with advantage be annually brought under cultivation; and under proper management of the produce, might furnish from its own resources the means of continual improvement. We have said already again and again on so many occasions and in so many forms, what our views are on this subject, that we shall forbear to press the subject. But we are more and more convinced every day, that Massachusetts is capable of a productive and profitable agriculture; that the ambition of the farmers ought to be more and more stimulated; and in proportion as it prompts to more diligence, more labor, and more enterprise, it will meet in Massachusetts with an ample reward.

We should regret to be thought boastful; and there is no occasion for making comparisons, which in general seldom fail to injure those in whose favor they are made, and to become offensive to those whom they throw into the shade; but we have no hesitation in saying that Massachusetts has conferred upon herself the highest honor for the patronage which she has bestowed upon agriculture; and it is equally to her honor that these efforts have been seconded by many distinguished examples of individual liberality, and by the ready and patriotic co-operation of some of the most eminent men and some of the most powerful minds in our community, who have felt the importance of the interest and given to it the weight and influence of their talents and character. H. C.

## LABOR PROCURABLE.

We are reminded of a duty, which we have a long time unintentionally omitted; but the discharge of which may now be of great importance to the farmers, and at the same time essentially serve the cause of humanity.

The Farm School on Thompson's Island, in Boston harbor, was established for the rescue of unfortunate children, neglected by their parents, or perhaps without any parents to care for them, who are taken, as far as the funds will admit, and placed on this island, where they receive a good and useful education; their morals are carefully watched over, and they are brought up to habits of mechanical or agricultural labor. They are

not criminals or convicts—but unfortunate; and thus rescued from profligacy and ruin. Never was a more benevolent institution. Here now any respectable farmer may always go to obtain as many children as he is willing to take charge of and able to do justice to, who will be bound to him until they are twentyone, upon the most reasonable conditions.

The Female Asylums in Boston and Salem afford the same favorable opportunities in regard to girls. Good families may thus essentially serve their own interests and the cause of humanity, by availing themselves of these advantageous offers. The managers of these establishments are persons of the highest character.

We know a farmer in the State who has now had for some time on his farm, four lads from the house for reformation for juvenile offenders in New York city, and is perfectly satisfied with the experiment. They are under indentures until twentyone, and he is at liberty to return them on commission of any crime. H. C.

## THE POLITICAL CRISIS.

It is not for us in this place to enter the political arena; but we have no hesitation in saying, that within our recollection, a more important crisis in public affairs has never presented itself than that which is approaching in the ensuing national elections. The public, from one end of the Union to the other, are actually breathless: the pulse beats with a power which seems to be felt through the whole frame; and the country is rocked as with the heavings of an earthquake. In such case let no man fail to perform his duty. Disdaining all considerations of a mere party character, let every true man determine to discharge his conscience. It is a case, which admits with an honest mind of no vacillation, hesitation, or distrust, and one in which "The country expects every man to do his duty." This only can save the country. H. C.

## Massachusetts Horticultural Society.

EXHIBITION OF FRUITS.

Saturday, July 25th, 1840.

By Gen. Sumner, Roxbury—Nutmeg Peaches—very delicate—out door culture.

By Mr Miller, Portland—splendid specimens of Peaches, raised under glass.

By Mr O. Johnson, Lynn—a very large cluster of Zinfandel Grapes—also Black Hamburg.

By Mr Grosvenor—handsome Apricots.

By Mr Rundle, Warren Street, Boston—fine specimens of very large Apricots.

By Mr B. V. French—Peach Apricots, Heath's Early Nonsuch and Early Harvest Apples.

By B. Guild, Esq., Brookline—July or Sugar Top Pears—an early variety, but not first rate.

By Mr J. Hovey, Roxbury—Early Harvest Apples—quite large—also, White Currants.

By E. M. Richards—Early Harvest, White Junating, and Red Astracan Apples.

*Vegetables.*—Mr A. Bowditch exhibited specimens of ripe Tomatoes.

For the Committee,

E. M. RICHARDS.

## STRAWBERRIES.

We would call the attention of our readers to the advertisement of Mr J. L. L. F. Warren, of Brighton, in this day's paper, who has as fine a collection of the most approved varieties of Strawberry as can be found in the country. Mr Warren attends to the raising and packing of his own plants, and sends out none but such

as are young and thrifty and well packed, so that they may be sent to any part of the country with safety. To those who wish to form a plantation of this delicious fruit, we would recommend the present as being the most suitable time of the year for it. We can furnish plants from Warren's, Hovey's or from any other place in the neighborhood, at the prices advertised.

JOSEPH BRECK & CO.

BRIGHTON MARKET.—MONDAY, Aug. 3, 1840.  
Reported for the New England Farmer.

At Market 330 Beef Cattle, 95 Stores, 25 Cows and Calves, 2400 Sheep, and 200 Swine.

PRICES.—*Beef Cattle*—We quote to correspond with prices obtained last week for a like quality. Three or four yoke of extra, \$6 25. First quality, \$6 00. Second quality, \$5 50 a \$5 75. Third quality, \$4 00 a \$5 25.

Stores.—Few purchasers only were at market, consequently sales were only effected at a low rate.

Cows and Calves.—\$20, \$23, \$25, \$31, \$35, \$42, and \$16.

Sheep.—Lots \$1 25, \$1 33, \$1 42, \$1 58, \$1 71, \$1 92, \$2 00, and \$2 37.

Swine.—A lot old 4 and 4 1-2, and a lot 4 1-4 and 4 3-4. A lot shoats at 4 5-8. At retail from 4 1-2 to 6.

THEMOMETRICAL.

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northernly exposure, weeks ending August 2.

August, 1840.	7 A.M.	12 M.	5 P.M.	Wind.	
Monday,	27	65	82	53	S.
Tuesday,	23	61	83	73	S.
Wednesday,	29	70	84	77	W.
Thursday,	30	61	85	71	S. E.
Friday,	31	10	88	60	S. E.
Saturday,	1	59	83	67	N. E.
Sunday,	2	62	84	68	S. E.

We have had a fine growing week. Weather fair until Saturday, when more rain fell than at any one time during the summer. Sunday, "dog days weather," cloudy, warm, and light showers.

SUPERIOR NEW STRAWBERRY.

Hovey's Seedling, a new variety, originated in 1835, and now for the first time offered to the public, after a trial of three years, in a bearing state, has confirmed its superiority over every other variety. It belongs to the class denominated *Pine Strawberries*, and may be described as follows:

Fruit, very large, round, never coxcomb-shaped, even in the largest berries. Color, deep shining red. Seeds, inserted in a slight cavity. Flesh, scarlet, firm, abounding with a most agreeable acid and exceedingly high flavored juice. The vines are as hardy as the *Early Virginia*, having stood the severity of the several past winters unharmed; growth vigorous, and the fruit well elevated from the ground on strong stems. A full description of this seedling, with an engraving of the fruit, and some account of its origin, treatment, &c. will be given in the August number of the *Magazine of Horticulture*.

This strawberry was first exhibited at the Massachusetts Horticultural Society's Rooms in 1833, again in 1839, and also the present year, and each year obtained the Society's premium, although in competition with the *Methven*, *Keen's Seedling*, *Downton*, &c. Gentlemen well acquainted with all the other varieties cultivated in this country, have seen the bed in full bearing, and hesitatingly pronounce it the largest, finest, most productive and hardy variety they have ever seen.

The entire stock of plants is in the possession of the subscribers, not one ever yet having been disposed of, and they are now offered for sale, and will be ready for delivery on and after the 20th of August. All orders will be executed in the rotation in which they are received. Plants, \$5 per dozen. All orders from a distance, enclosing the amount for the plants ordered, will be immediately attended to, and the plants promptly sent to the direction desired.

Also a fine stock of plants, of the following sorts, all warranted genuine, or no charge.  
*Methven Scarlet*, \$2 per hundred.  
*Bishop's Orange*, \$5 per hundred.  
*Early Virginia*, \$1 per hundred.  
*English Wood*, \$1 per hundred.

All orders immediately attended to, and the plants speedily forwarded.  
HOVEY & CO.

Agricultural Warehouse and Seed Store,  
7 Merchants' Row, near State St. Boston.  
August 6.

STRAWBERRIES! STRAWBERRIES!!

Those who are desirous of cultivating this delicious Fruit are respectfully informed that the subscriber has succeeded, after many years experimenting upon the Strawberry, not only in obtaining new varieties, but in ascertaining the best methods of cultivation. The subscriber would offer to the public, the present season, his *Selected Collection* consisting of seven varieties; they are such as have stood the test of a fair trial for seven years, and are all grown by the subscriber.

Specimens of his Fruits have been exhibited every season at the Massachusetts Horticultural Rooms, and have always commanded an extra price in Faneuil Hall Market.

*Warren's Seedling Methven*, a new and valuable kind, a free bearer, fruit very large and juicy; fruit measuring 5 1/2 inches has been exhibited the present season. This variety can be warranted to be one of the finest varieties grown, and will produce as fine fruit and as large quantity, with the same cultivation, as any other ever offered, although some may ask the modest (?) price of \$3 per dozen. The price of this Seedling is \$5 per hundred plants.

*Methven Castle*—Fruit extremely large, high flavored and showy; specimens of this fruit have been shown this season six inches in circumference. This variety can be said to be very excellent, (when the true kind is obtained); it is one of the largest late varieties known, profitable and highly worthy of cultivation, all that some growers may say to the contrary, notwithstanding. Price \$3 per hundred plants.

*Keen's Seedling*—A very superior variety, fruit very large, rich dark color, and uncommonly high flavored; has always been considered by English cultivators the best grown. Price \$3 per hundred.

*Royal Scarlet*—Fruit long oval shaped and juicy, very free bearer and very hardy. Price \$2.

*Hautbois*—Fruit larger than *English Wood*, exceedingly numerous, sometimes yielding 100 berries to the plant. Price \$1.

*Early Virginia*—This is known to be the earliest and best fruit for market, a free bearer, and very hardy.—Price \$2.

*English Wood*—Fruit well known for years. \$1.  
N. B. Those who are desirous of cultivating this delicious fruit, would find it for their interest to visit the gardens and see the method of cultivation, and satisfy themselves that they can obtain their plants from first hands, for it is too often the case that large and attractive advertisements are sent forth to the public by dealers in plants, when at the same time they have never grown the kinds offered for sale, and know but little about their cultivation. Attention to this by purchasers, if possible, will save much time and money.

Every plant sent from this garden will be warranted to be free from mixtures, and shall also be young and healthy, worth the price paid for them.

All orders directed to the subscriber, enclosing the amount for the order, or with a good reference, shall be promptly attended to, and the plants carefully forwarded agreeably to directions.

JAMES L. L. F. WARREN.

Nonantum Vale, Brighton, July 25, 1840.

Orders directed to J. BRECK & Co., will be executed with despatch.

WANTED.

A situation as gardener, by a young man who is acquainted with its various branches. The best references can be given. Apply at this office. July 22.

BUDDING FRUIT TREES.

Cuttings of fruit trees for budding, comprising nearly all the choice sorts of Apples, Pears, Plums, and Cherries, known and cultivated in this country or in Europe, all from bearing trees, can be packed in such a manner as to be sent with perfect safety to any part of this country or Europe. Apply by mail to the subscriber, at the Pomological Garden, Salem, Mass. ROBERT MANNING.

Salem, July 15.

FENCE CHAINS.

Just received from England, at the New England Agricultural Warehouse, 6 casks chains, suitable for making the chain fence, &c. JOSEPH BRECK & CO. July 15.

TRACE CHAINS.

Just received, direct from the English manufacturers, 8 casks of Trace Chains, from 6 to 11 feet long, suitable for ploughing or draft chains. JOSEPH BRECK & CO. July 15.

## MISCELLANEOUS.

## OBSERVATIONS ON THE WEATHER.

**Mists.**—A white mist in the evening over a meadow or a river, will be drawn up by the sun next morning and the day will be bright. Five or six fogs successively drawn up, portend rain. Where there are high hills, and the mist which hangs over the lower lands draws towards the hills in the morning, and rolls up to the top, it will be fair; but if the mist hangs upon the hills, and drags along the woods, there will be rain.

**Clouds.**—Against much rain, the clouds grow bigger and increase very fast, especially before thunder. When the clouds are formed like fleeces but dense in the middle, bright towards the edge, with the sky bright, they are signs of a frost, with hail, snow or rain. If clouds breed high in the air, in their white trains, like locks of wool, they portend wind, and probably rain. When a general cloudiness covers the sky, and small black fragments of clouds fly underneath, they are sure signs of rain, and probably it will be lasting. Two currents of clouds always portend rain, and in summer thunder.

**Dew.**—If the dew lies plentifully on the grass after a fair day, it is the sign of another. If not, and there is no wind, rain must follow. A red evening portends fine weather; but if spread too far upwards from the horizon in the evening, and especially morning, it foretels wind or rain, or both. When the sky in rainy weather is tinged with sea green, the rain will increase; if deep blue it will be showery.

**Heavenly Bodies.**—A haziness in the air which fades the sun's light, and makes the orb appear whitish or ill defined; or at night, if the moon and stars grow dim, and a ring encircles the former, rain will follow. If the sun's rays appear like Moses's horn, if white at setting, or shorn of his rays, or goes down into a bank of clouds in the horizon, bad weather is expected. If the moon looks pale and dim, we expect rain; if red, wind; and if of her natural color, with a clear sky, fair weather. If the moon is rainy throughout, it will clear at the change, and perhaps the rain return a few days after. If fair throughout, and rain at the change, the fair weather will probably return on the fourth or fifth day. If the setting sun appears yellow or gold color, and particularly if accompanied with purple streaks, the following day will be fine.

**Wind.**—If the wind veers about, much rain is pretty sure. If in changing it follows the course of the sun, it brings fair weather; the contrary, foul. Whistling or howling of the wind, is a sure sign of rain.

**Meteors.**—The Aurora Borealis, after warm days, is generally succeeded by cooler air. Shooting stars are supposed to indicate wind.

**Animals.**—Before rain, swallows fly low; dogs grow sleepy and eat grass; water fowls dive much; fish will not bite; flies are more troublesome; toads crawl about; moles, ants, bees, and many insects are very busy; birds fly low for insects; swine, sheep and cattle are uneasy, and even the human body.

Where there has been no particular storm about the time of the spring equinox, (March 21,) if a storm arise from the east on or before that day, or

if a storm from any point of the compass arise near a week after the equinox, then, in either of these cases, the succeeding summer is generally dry, four times in five. But if a storm arise from the S. W. or W. S. W., on or just before the equinox, then the summer following is generally wet five times in six.—*Shooter's Annual.*

**Extreme Delicacy.**—The disposition to be agonizingly delicate, is well ridiculed in the following:

"Is there any thing the matter?"

"There is, sir," was the host's reply.

"Have I given any offence?"

"You have, sir."

"Really I am ignorant of it."

"Such language won't suit here, sir."

"My dear sir, *what* language?"

"We were talking of soup."

"We were."

"You mentioned *ox tail*."

"I did."

"That's it, that's it, sir; that sent the ladies blushing out of the room—that highly improper language, which I never heard at any board before, and should not have expected from you."

"Why, sir, I but called it by its proper name. You asked a question and I replied. I am, however, sorry that it has given offence, but I really do not know how I could have avoided it."

"Then, sir, I advise you when you have an occasion another time to speak of that particular soup, do not call it *ox-tail*."

"What shall I call it?"

"*Fly disperser*."

"Thank you, sir: I think I shall remember the '*fly disperser*' soup."

**Love.**—If women do snarl up a feller's heart strings, they keep him out of other scrapes—any body what knows will tell you that. A man that is in love a leetle is not always running into rum holes and other such places. He don't go a gambling, and isn't sneakin' round nights.—*Sam Slick.*

**Green House Propagator, and Silk Worms' Eggs.**

Wanted in a permanent location an industrious, steady man, capable of taking charge of a large collection of Green House Plants, skillful at propagating, and a general good manager in all respects. Apply by mail with the most satisfactory references.

Persons wishing superior White Imperial and White Mammoth Silk Worms' Eggs, of crop 1839, can be supplied at \$4 to \$5 per ounce, and eggs of this year's crop, for next year's use, will be supplied at \$2 per ounce to all those who send the cash in advance, within thirty days from this date.

WILLIAM PRINCE & SON.

Flushing, July 29, 1840.

**BERKSHIRE HOGS.**

The subscribers offer for sale a few pair of full blooded Berkshire Hogs; also, pigs 7-8 blood, crossed with Mackay. Inquire at the New England Farmer office, or at their farm at Brighton.

JOSEPH BRECK & CO.

July 29.

**TIE UP CHAINS.**

Just received at the New England Agricultural Warehouse, a good supply of those celebrated Chains for tying up cattle. These chains, introduced by E. H. Derby, Esq. of Salem, and Col. Jacques, of Charlestown, for the purpose of securing cattle to the stall, are found to be the safest and most convenient mode of fastening cows and oxen to the stanchion. They consist of a chain which passes round the animal's neck, and by a ring attached to the stall, plays freely up and down, and leaves the animal at liberty to lie down or rise at pleasure, and keeps him perfectly secure.

July 15.

JOSEPH BRECK & CO.

**DISHLEY SHEEP.**

For sale, twenty full blood Dishley or New Leicester Ewes, and one Ram. Price \$10 each. Apply at the Farmer Office.

June 24.

\*

**SCYTHES, RAKES, &c.**

The subscribers offer for sale a very extensive and complete assortment of Scythes, Rakes, &c. consisting in part of 300 dozen Phillips, Messer and Colby's superior Scythes.

They would respectfully call the attention of Dealers and Agriculturists to the above assortment, which consists of many of the best kinds now in use, and which they are prepared to sell at the very lowest prices.

JOSEPH BRECK & CO.

New England Agricultural Warehouse and Seed Store, 51 & 52 North Market Street.

May 20.

**BONE MANURE.**

The subscriber informs his friends and the public, that after ten years experience, he is fully convinced that ground bones form the most powerful stimulant that can be applied to the earth as a manure.

Orders for Bone Manure or Oyster Shell Lime, left at the Bone Mill, near Tremont road, in Roxbury, at the New England Agricultural Warehouse and Seed Store, No. 52 North Market Street, or through the Post Office will meet with prompt attention.

March 4, 1840.

NAHUM WARD.

**DORKING FOWLS.**

For sale, a few pairs of pure Dorking Fowls. The stock, of which these are the produce, were procured in Dorking, County of Surrey, England. "Few breeds have a title to boast of so high and long continued a reputation as the Dorking. Upwards of fifty years have passed, since, while resident in Surrey, I sent to Dorking for my first regular breeding-stock: they were then the ancient and superior five-clawed breed of Surrey."—*Mowbray on Poultry, 7th Edition.*

This breed attains to a large size, and the hens are the best of layers. Price \$3 per pair. Apply to

**GARDENERS' KNIVES.**

JOSEPH BRECK & CO. have this season imported and now offer for sale a few very superior Garden Knives, for pruning, &c. manufactured expressly for Gardeners, and warranted superior to any article of the kind before imported.

Also—a large assortment of Budding Knives, Grape Scissors, &c. &c.

April 22.

**SUPERB ROCKET LARKSPUR SEED.**

The subscribers offer for sale a quantity of Superb Double Rocket Larkspur Seed, of their own raising, saved from double flowering plants only, embracing all the different colors. For fine, strong and early plants, the seed should be sown in August.

JOSEPH BRECK & CO.

June 17.

**PURE BLOOD BERKSHIRE PIGS.**

The Society of Shakers at Harvard, Mass., have for sale the Pure Blood Berkshire Pigs. Also, a lot of Berkshire crossed with other Breeds, on reasonable terms at their Village.

Persons wishing to be sure of the clear Berkshire breed may rely on those they offer for sale, as they are the progeny of some of the latest imported from England.

June 24.

**HORTICULTURAL TOOL CHESTS.**

Containing a complete set of Garden tools of superior finish and style, recently received from Liverpool and for sale at the New England Agricultural Warehouse and Seed Store.

May 6.

## DENNIS'S PATENT TROUGHS.

JOSEPH BRECK & Co.—I again solicit the indulgence of replying through your columns to your correspondent H., who has again appeared, and in my apprehension he has gone round the subject without comprehending it at all. And I hope to show him that there is something *materially* different in my description from what was "invented and freely communicated to the public before." I have warned him and others not to use my patent circular metallic troughs with roofs, without my permission in writing, and if they do, they may have "the fear of prosecution with treble damages before their eyes," unless they employ a regularly authorized agent to put them on. H. quotes the communication of L. W. Briggs, which describes tin troughs made square, the trough being made of four pieces of tin soldered at the corners, and the roof was made of four more pieces, and soldered to the trough. These troughs were preferable to tarring the trees, but there was much labor necessary to keep the packing in order, and when the trees grew so as to burst them, it was very expensive making them larger, requiring eight pieces of tin and the soldering of ten joinings. They were found more expensive and less effectual than the circular lead troughs with roofs, which require but one piece of lead and the soldering of two joinings to make them larger. He further cites the experiment of George Irish, who invented the circular tin troughs. As my residence at the time the said Irish put the circular tin troughs upon his trees was within two miles thereof, I will state for the information of H. that they were made of several pieces of tin, a part of which was applied to the bark of the tree, and the others were soldered to them at the lower edge, the upper edge standing out at an angle of 23 degrees from the piece next to the bark, making a circular trough, about 3 inches deep and 2 inches wide at the top, without any roof. If my recollection is correct, these troughs were applied in the summer, and the rough bark was scraped off so that they might fit close to the tree; and before it was time to use them the following autumn or the second, the trees had grown and burst open the tin troughs so that they were useless. They were soldered anew, but to little or no purpose, as they were continually bursting and the liquid leaking out. As there was no prospect of these troughs answering the purpose for which they were invented, they were taken off and thrown in a heap, making a monument that was any thing but agreeable to look upon, being the result of an experiment that cost upwards of three hundred dollars: and George Irish, in preference to tarring the whole of one of the largest and finest orchards in New England, cut down one half of it, and continued to tar the balance until 1838, when he paid me one hundred and twentysix dollars for applying the patent circular metallic troughs with roofs; and the orchard was more effectually clear-

ed from worms than it had been before either by tar or tin troughs. The two foregoing instances were all that I knew of previous to my making the circular metallic troughs with roofs.

H. farther cites a circular trough made by Haughton, of Lynn, and the recommendation of Gen. H. A. S. Dearborn, to use Danvers pottery or sheet lead, and the actual making the circular troughs without roofs by P. G. Robbins, or with paper roofs, for P. G. Robbins nailed the upper edge of the trough to the tree, and of course could not use it for a roof. I have examined the volumes of the New England Farmer, and read the articles H. cites and many others, to see if any thing there described would have any effect upon the validity of my patent: and having a very thorough knowledge of the patent laws, and also attended the circuit court over which Judge Story presides, where several cases touching the validity of patents were tried, and having heard Judge Story give his opinion on numerous doubtful points, I am firm in the opinion that L. W. Briggs using a square trough with a roof, and G. Irish a circular trough without a roof, or P. G. Robbins a circular trough with a paper roof, nor any thing cited by H., nor any thing published in the New England Farmer, has in any degree whatever, any tendency to destroy the validity of my patent right: because I do not claim a patent for a square trough with a roof, nor for a circular trough made of several pieces of metal without a roof, nor for a trough made of pasteboard or of Danvers pottery, nor for a trough made of sheet lead without a roof, or with a pasteboard or sheathing paper roof, which I believe includes all the kinds H. has enumerated. But I do claim a patent right for a circular metallic trough and roof, the trough and the roof or any section of it being made of the same piece of metal. And I will further add for the information of H., that any recommendations or suggestions of Gen. Dearborn or any other person, would have no effect upon the validity of my patent, unless they were put in practice previous to the date of my invention.

I hope H. will excuse me for correcting him where he says "that Irish used circular metallic troughs with roofs bent to conform to the shape of the tree, in 1827." The fact is, Irish used circular metallic troughs *without roofs* in 1827.

"I feel confident after reading the evidence collected" by H. and a thorough "examination of the New England Farmer, that in 1836 I hit upon and invented" what was not in use nor had been suggested or proposed by others, and I hope H. will readily believe from the evidence heretofore offered "that the invention was original as far as it regards myself, and he must be sensible that in such case all exclusive rights under the patent do not fall to the ground," as H. would feign have them, but are good and valid to all intents and purposes: and I am so far from throwing my patent open to the public, that I again caution H. and all others against "using it, for fear of the 14th section of the law of 1836."

Your friend,  
J. DENNIS, JR.  
Portsmouth, R. I., 8th mo., 1st, 1840.

From the Third Report on the Agriculture of Massachusetts.

## EXPERIMENT IN FORWARDING SEEDS.

The subjoined experiment rests upon unquestionable authority. No one could be more relied upon for exactness and care than the eminent man who made it. It is a most striking result. What is applicable to one kind of seeds is doubtless applicable, in a degree, to all seeds; and nothing can more emphatically illustrate the importance of care in the selection of seeds.

H. C.

*Experiment, showing the importance of selecting the first ripe seeds, communicated to the Trustees of the Agricultural Society, by JAMES FREEMAN, D. D., Sept. 1, 1805.*

To ascertain whether the ripening of seeds can be forwarded, by sowing those which are the earliest ripe, I have made experiments, all of which have been successful, on several different sorts. It will be sufficient to mention one only.

In the year 1801, I planted the case-knife bean. The pods first formed, which are commonly those nearest the root, were reserved; and when about the quantity of a peck was fully ripe, they were gathered on the same day. The largest and fairest of seeds were planted the next year, and the first formed pods reserved as before. The same method has been pursued without any variation till the present year; by means of which, whilst the bean has not degenerated in its quality, the ripening of the seeds has been forwarded twentysix days, as will appear from the following table.

	Planted.	Gathered.	No. days.
1801,	May 20,	Sept. 9,	112
1802,	" 11,	Aug. 21,	102
1803,	" 10,	" 8,	90
1804,	" 8,	" 4,	88
1805,	" 6,	July 31,	86

The first column denotes the time of planting the seeds; the second, that of gathering the seeds which were first ripe; and the third, the number of days which elapsed between the time of planting and the time of gathering.

As in the second and following years, I anticipated the time of planting the seeds, (by which means fourteen days have been gained, in addition to the twenty six noted above,) to determine what effect later planting would produce, by giving the seeds more advantage from the heat of summer, in the years 1804 and 1805, I put into the ground a quantity of seed, about a week later than that which was first planted. The event which took place is exhibited in the following table.

	Planted	Gathered.	No. days.
1804,	May 14,	August 8,	86
1805,	" 13,	" 6,	85

As very little time has been gained in the present and in the preceding year, I suppose I have now reached, or nearly reached, the *ne plus ultra*. I delay not, therefore, to communicate to the Trustees of the Agricultural Society, the result of an

experiment which confirms the important truth taught in various parts of their useful publications, that, to ensure an early and good crop, the seeds reserved for future sowing should be those which are the *first ripe*, and which are, in other respects the most perfect.

—  
*Extracts from a letter of Joseph Cooper, of New Jersey, in 1799.*

\* \* \* "This kind of corn I have continued planting ever since, selecting that designed for seed in the manner I would wish others to try, viz: When the first ears are ripe enough for seed, gather a sufficient quantity for early corn, or replanting; and at the time you would wish your corn to be ripe generally, gather a sufficient quantity for planting the next year, having particular care to take it from stalks that are large at bottom, of a regular taper, not over tall, the ears set low, and containing the greatest number of good sizeable ears of the best quality; let it dry speedily, and from the corn gathered as last described, plant your main crop, and if any hills should be missing, replant from that first gathered, which will cause the crop to ripen more regularly than is common, which is a great benefit. The above mentioned method I have practised many years, and am satisfied it has increased the quantity and improved the quality of my crops beyond what any person would imagine, who has not tried the experiment.

"For many years past I have renewed the whole seed of my winter grain, from a single plant which I have observed to be more productive and of better quality than the rest, which I am satisfied has been of great use, and I am fully of opinion that all kinds of garden vegetables may be improved by the foregoing methods."

#### PROGRESS OF VEGETATION DURING THE MONTH OF JULY, 1840.

(Communicated for the N. E. Farmer.)

JULY 4th—Saturday. With the exception of yesterday, which was a dull, lowering day, the weather has been remarkably fine during the week, and we have done little else than attend to the getting of our hay, the crop of which is coming in finely in this section of the country. The grass upon upland was partially injured by the drought in May, but the burden upon rich grass lands and reclaimed meadows is very heavy. The season, thus far, has been most favorable for vegetation of every kind. Potatoes are generally out of blossom, and new ones are brought freely into market. Indian corn has spindled, and promises at present an early and an abundant crop. The second crop of pease are nearly or quite gone, and stringed beans are very abundant. We have also been cutting fruit during the week from a hill of cucumbers planted in the centre of my first hot-bed. After removing from this bed the lettuce, celery, tomatoes, peppers, &c., for which it has been used, the soil had fallen to such a depth as to lead me to fear that we should lose the cucumbers entirely, as it appeared to be impracticable to furnish them with sufficient air, for want of which, the fruit immediately after it was set, damped off. About ten days since we paved the entire bed with suitable sized stones, raising the vines to the light and heat, thereby, as I hope, remedying the evil. Beets are large and fine and fit for the table, but carrots advance slowly. The grapes in the vinery are growing luxuriantly, and I have already commenced

thinning the Sweetwaters, which generally set a greater proportion of small and useless berries than the Hamburg, and which it is important to remove at the early stage of their growth. If suffered to remain, the bunches soon become close and compact, and it is next to impossible to introduce the scissors into the bunches without injuring the fruit.

JULY 14th. We have passed the greater part of the week at haymaking, for which the weather has been less favorable since the 4th—the sky having been partially overcast and threatening rain, of which we have had but a moderate quantity during the summer. Corn and potatoes upon dry land each begin to curl, and to show the effects of drought. Early potatoes are very fine, and the crop upon low lands, which proved nearly a failure last year on account of the continued rains, will be, this season, very heavy. Squash and melon vines are growing luxuriantly, and are both showing a abundance of fruit. We need only a generous rain to gladden the heart of the farmer, and to fill his barns and his storehouses with a superabundance of the fruits of the earth.

AUGUST 1st—Saturday. Having been absent from Ellinglen since the 14th July, on an excursion into Virginia, I have been spared the pain of witnessing the progress of the continued drought, which has in many instances blighted the hopes of the husbandman, and rendered fruitless those labors from which, in the early part of the season, he had every reason to anticipate a most fruitful harvest.

Considering the dry and arid nature of the soil at Ellinglen, our crops have not suffered so much as I had feared before my return. We have entirely lost our crop of potatoes, Chenangoes and Dillinghams, but the Rohans which were planted on the same field, and upon a similar soil and exposure, have been apparently but slightly injured. Beans also were completely ruined by the parching suns of the 15th and 16th ult., when the mercury indicated 92° and 93° at mid-day. Cabbages and ruta bagas, which I left growing finely, have been much injured by the aphides, and it was only by copious supplies of water, both morning and evening, that my gardener succeeded in preserving the grapes, melons and celery from a similar fate.—Beets and carrots have sustained the drought with me remarkably well. Corn has suffered but partially, and we have already gathered several menses for the table.

We have, after all, great cause for thankfulness in the agricultural prospect before us; for had the drought commenced at an earlier period, our crop of hay, which has come in remarkably well, and which has been cured with but a small amount of labor, would have been greatly diminished, and this being the staple crop with our farmers, would have lessened, more than any thing else, the profits of our labor. I have sometimes thought that we farmers are too apt to complain of the season, that it is too hot or too cold, too wet or too dry; and I should question whether there has ever been a season perfectly satisfactory to the entire mass of the farming community. Let us endeavor to correct this error—to look more with an eye of contentment and satisfaction upon our lot in life, resting assured that there are many bright hours in reserve for each one of us—and never forget the heart-cheering promise, that while the sun endureth, seed time and harvest shall not fail.

Soap or strong soap suds should never be used to cleanse oil paints, especially green color.

For the N. E. Farmer.

#### TRIMMING BUCKTHORN HEDGES.

MR BAECK—Sir—In reply to an enquiry in the Farmer of the 22d July, respecting the trimming of the buckthorn hedge, I would state that I have adopted the system of summer pruning in preference to that of spring, for two reasons. My hedges at Ellinglen are purely ornamental, being used merely as partition walls between different portions of my garden grounds, and therefore it is desirable that they should possess during the summer months the appearance most pleasing to the eye of an observer. And secondly, they are trimmed with much greater facility and exactness while the new growth is yet green and succulent; and the growth which immediately puts out after the summer pruning, has in no instance ever failed to ripen itself thoroughly before the approach of winter. Were one desirous of growing a buckthorn hedge which should answer the purpose of a fence around an enclosure for cattle, I am inclined to the opinion that the early spring would be the most suitable time for pruning, and in this case the whole of the summer's growth might be permitted to mature its wood. D.

#### BE MERCIFUL TO YOUR OXEN.

For mercy's sake, in this hot weather, deal gently with your oxen. Do not overload them, drive them too fast, or work them too long in these long days. Another thing—never yoke them up, or attach them to the cart, till all things are ready for you to work by means of them. Some people will yoke up their cattle early, before they have got well rested and fed from the labors of the preceding day; and let them stand eating postmeat a long time, whilst their drivers are getting things in readiness out of season. They have just discovered that the chain is broken, and so the oxen must stand till Dick is sent off to the blacksmith to get it mended. When he returns and all things appear ready, it is discovered that there must be some new stakes made for the hay cart, or the wheels need greasing; and the poor cattle must stand another half hour or hour, eating nothing and basking in the sun, waiting for their sluggish masters to get ready. It stands to reason that oxen cannot work so long or heartily, driven out after standing in the yard or field, acquiring an empty stomach, as they could if yoked up fresh from a cool stable, where they had been eating till the moment of work arrives. Give them, too, a good opportunity to rest in the middle of the day.

There is nothing lost in being reasonably merciful to the brute. On the contrary this is true policy, as well as a dictate of genuine humanity. He who would overtax or abuse a faithful ox or horse, deserves to do his own pulling and trotting, without the aid of these noble servants.—*Maine Cult.*

*Bacon.*—To prevent bacon from getting rusty, after it has been sufficiently cured, put it into a box of the size of the piece of bacon, covering the bottom of the box with hay; then wrap up each piece in sweet hay, and between every piece introduce a laying of hay. This method will prevent bacon from rusting, and keep it for twelve months as good as it was on the first day of salting.

Don't permit stagnant water on your premises: it is a prolific source of disease.

From the Worcester *Aegis*.

The following communication is from a venerable correspondent, of another State. His age and experience entitle his words to all that reverence which belongs to the advice coming from the lips of a patriarch. The benevolent spirit they breathe will secure for his opinions the regard which the young should give to the wisdom of gray hairs.—One who possesses the simplicity of life, purity of views, and the wide and sagacious observation of the old philosopher, had a right to put the name of Franklin to his communication.

#### TO THE YOUNG OF BOTH SEXES.

It is of great importance that persons in early life, should prepare themselves for the part they are to act in society. There is a strong desire in both sexes to rise to respectability, and this is highly commendable; but many persons err in their attempts to gain their object.

A principal cause of the failure of young people to reach the object of their desire is, the attempt to get rich *without labor*. In this way they often aim at an object without the means to accomplish it. Thus, for many years past, young men have entered on business with borrowed capital, to an extent never before known; they have calculated upon profits which were precarious; they have neglected to calculate the chances of sudden declensions in business; they have entered upon house-keeping with extravagant purchases of furniture; they have mostly *failed*, and reduced themselves and families to poverty. The failures and the distress which have occurred in this country within a few years, exceed every thing probably that ever before happened.

Young friends, learn wisdom. It is not the order of Providence that mankind should have blessing and prosperity without labor. It is best for mankind that this should be the order of things; good moral habits are formed by industry; sudden acquisitions of property tend to prevent the formation of such habits: they are often ruinous to morals. Moderate acquisitions of property generate good habits—the habits of prudence, of foresight, and correct calculations of what is practicable.

The desire of reaching a respectable standing in life has led many to renounce labor for books, with the expectation that they can live by learning. But the number of persons who can gain subsistence by learning is comparatively small. The professions are full to overflowing; unless that of the gospel ministry may be excepted. By far the greatest part of mankind are destined to labor, without which society cannot be supported.

In forming a plan of business for life, therefore, the first requisite is to determine the course to be pursued, the occupation which is to be followed, and then to devote all possible attention to gain the qualifications essential to success in that occupation. In this preliminary to success, persons very often make great mistakes.

If a young man is to be a farmer, he must begin when a boy, and continue in that business. He must gain knowledge by experience, and muscular strength by labor. Books and learning will never make farmers.

If a young man is to be a mechanic, he must begin his art when young, and persevere in it, and be thoroughly master of every part of his business. Books and learning can not supply the want of la-

bor and experience. Farmers and artisans can not be made in the school house or college. Most of the studies cultivated in our seminaries of learning, however useful to professional men, are not applicable at all to the common occupations of life. This the writer knows by experience.

It is with females as with males: they desire to live without labor; and thousands of them fail of obtaining a good settlement in life, by aiming at what can not be obtained. Hence the high schools often become nurseries of old maids. The daughters of wealthy men, who are sure of the means of living without labor, and such as are fortunate enough to marry men of affluence, may be justified in devoting many years to languages and sciences which they are never to use; but how small comparatively is this number.

Most of the people of this country possess small estates, which when divided will not support their children. Hence it often happens that children whom the father can support in a genteel style, fail at his death of the means of subsistence. Hence probably no country presents so many instances of young persons of both sexes *educated above their condition*, as the United States. Many persons and families, within the knowledge of the writer, have been ruined or doomed to struggle with adversity all their lives, from this mistake. They begin wrong; they expect to be gentlemen and ladies, without the means of supporting themselves in such style.

Equally mistaken are many of the daughters of poor families. Some of them enter manufactories, where they get good wages, and dress in rich attire; neglecting to gain a thorough knowledge of house-keeping, the very knowledge which they most want to insure them a good settlement. Young men of industry want wives that are good house-keepers. They do not seek females for their dexterity in tending spools; but for those who are accustomed to all the work of a family and to an economical use of money. Such wives are useful auxiliaries in supporting a family; whereas such as are not accustomed to house work, often check or prevent the prosperity of their husbands: sometimes they ruin them.

Much less do men in the ordinary occupations of life, seek for females who have studied geometry, algebra, rhetoric, zoology and the higher mathematics. Such sciences are of no use to them, in discharging their duties as wives, mothers, or house-keepers; they are soon forgotten, and if not, never used; nor do they ever become subjects of conversation. In the course of thirty years observation, the writer has never known a female thus educated to make the least use of such sciences; not even in the families of the affluent. Books on such subjects, read in after life, for the purpose of gratifying curiosity or enlarging the knowledge of the works of nature, may be useful for these purposes among those who have leisure; but not being necessary to qualify females for their duties, should not be a part of school education.

In no particular, is the folly of females more remarkable than in their estimate of labor. They seem to think it disgracing to labor in the family as domestics, when they will labor in manufactories without objection. They do not consider that the proper sphere of females is in the family, and that they cannot fill that sphere without serving an *apprenticeship*, and they should no more disdain it than young men should disdain to be apprentices to mechanics. The young of both sexes must be

subordinate to those who are older, for it is from the experience and knowledge of older persons that they are to qualify themselves to be respectable masters and mistresses themselves. Girls who have no property should seek to be domestics for two or three years, in respectable, well-ordered families; for it is in these they are to learn not only to do all kinds of work, but to improve their minds and their manners. It is the best, if not the only chance which many of them can have, thus to improve, and become respectable mistresses of families.

All young persons should have a competent English education, and for this purpose they should have access not only to the bible, but to the best writings of Watts, Addison, Cowper, and Mrs More. In wealthy and well conducted families the poorest girls may have this advantage. By avoiding domestic service, they deprive themselves of advantages which they can never have in any other business. The pride of females often condemns them to poverty and to a single life. Many and many a female fails to gain a comfortable settlement in life, merely because she is too proud to submit to the apprenticeship of learning the duties of a house-keeper in the character of a hired domestic.

FRANKLIN.

From the same.

#### HONEY BEE.—WEEKS'S PATENT HIVE.

MR EDITOR—While on an excursion in Connecticut, I stopped a day or two with a friend who was engaged in raising bees and obtaining honey by means of Weeks's Patent Hives, which proves to be a very profitable business. These hives have two stories, each containing 30 lbs. The 30 lbs. in the lower story are first made, and when completed, which may be known by inspection, or by weighing, the drawers are placed in the upper apartment and nicely adjusted, so that the bees can readily pass into them. When these are filled they can be withdrawn, and others placed in their stead—thus the bees can be preserved, and the excess of honey secured, without the cruel and wasteful process of destroying the bees, which was formerly adopted to obtain the fruits of the labor of these patterns of industry.

I brought from my friend's bee-house, two drawers of this most beautiful honey, made by a swarm which had been in the hive but five weeks. These drawers contained more than 23 pounds of honey: add to this the 30 pounds already accumulated in the lower chamber, and it will be seen that this swarm of bees had, in a little more than five weeks, made 53 pounds of honey, of excellent quality, which in the market readily commands 25 cents a pound.

From this brief statement, the profits of bees may easily be seen. The swarms sell readily at five dollars when first hived. Thus, the product of the six hives will be in the autumn, 30 pounds of honey for winter use, 30 pounds for market, and five dollars for each swarm of bees. If the old hives make as much honey as the swarms, to this must be added 60 pounds made by each hive, half of which is profit, to wit: 180 pounds.

The profit of the six hives for one year (exclusive of the provision for winter) will be \$207 50: a sum well worth saving to a man who does not need to devote one week's time to the business.

Yours, very truly,

S. B. WOODWARD.

## PEACH TREE GRUBS.

Remove the earth from the roots of your peach trees, and just beneath the surface of the ground, you will probably find places where gum has exuded from the tree. On scraping this away with a knife, you will find a small grub, which is the insect so destructive to peach trees. Cultivators of the peach have resorted to many methods to exterminate this insect from their trees, but generally without success.

The habits of the insect should first be known, then perhaps some method may be devised for an effectual extermination. I have now before me some of these grubs, which I have just taken from some trees where a small quantity of charcoal was placed about the roots last spring. They are white, with a redish brown head, and measure from half to three quarters of an inch in length.

The grub commences its operations the last of September and beginning of October. It appears to pass through the bark just below the surface of the ground and works a passage downwards into the roots, where it remains during the winter. In the spring its course is upwards, and about the middle of May it may be found very near the surface of the earth. The pupa state commences about the first of July.

It appears in the winged state from about the middle of July to the middle of August; then deposits its eggs somewhere upon the outside of the tree, and not beneath the bark.

The young grub, which is hatched about the last of September, passes down and pierces the tree just below the surface of the ground, where the bark is tender, and proceeds as above.

If the earth be removed from the roots in the spring, all the grubs taken out, the loose dead bark cut away, the wound washed with soap suds, a box be made and placed around the roots in such a manner as to run a little below and rise three or four inches above the surface of the ground, and leaving a space of about six inches all around from the trunk of the tree, and if this be filled up with powdered charcoal, I think the tree will be safe from the ravages of this insect, for it will not pass the charcoal to get at the roots, and it cannot while young pierce the hard bark above.

Wash the trees thoroughly two or three times from July to October with strong soap suds. This will destroy all the eggs and young grubs.

Placing a shovelful of charcoal at the roots of the tree and leaving it so that the grubs can pass down without coming in contact with it, will do no good. Neither will any outward application do any good while the grub is under the bark.

All outward applications in order to be effectual, must be made while the insect is on the outside of the tree.

There are some insects which deposit their eggs upon the trunk and branches of trees in the fall, where they remain until spring, when they hatch. Therefore it is well to give all trees a thorough washing in the spring with soap suds. This will clear off all eggs and insects which may be upon them. It also clears off all the old rough bark, and gives them a clear and healthy appearance.—*Detroit Daily Advertiser.*

No man can be entirely independent, yet the farmer should remember that if any one can be said to possess that enviable distinction, he is the man. Let him then be proud of his calling.

## ON WATERING AND FEEDING HORSES.

To prevent all inflammatory disorders arising from the too prevalent practice on the part of the inexperienced, in the use and application of the necessary and proper quantity of both food and water, for the comfort and preservation of the health of horses, and their consequent usefulness, I subjoin the following unerring rule and directions, to secure and insure the health, vigor, and consequent utility of this most valuable and indispensable animal to man.

When a horse is heated from any cause, great care should be taken, while in that state, to allow him to take but a very small quantity of cold water at a time—say not more than two quarts, which may be repeated at intervals during his meals, which should also be limited. New hay and corn should always be rejected, when pure hay and oats can be obtained; the natural and certain tendency of the introduction of either new or green hay and Indian corn (in too great quantities) into the stomach of a horse, is to produce diseases in that organ, and consequently the derangement of his whole system; the animal is therefore rendered worse than useless; for delay, and frequently further remedies are vainly sought for, because it too often happens that from the ignorance of the operator, he adds to the malady, instead of removing it.

Give your horse (after, and while he is heated) one quart of oats or dried corn, with a sprinkle of salt, after his first draught of water, of two quarts. These portions of each, water and food, may be repeated at discretion, during the reasonable but necessary time for the rest of the animal, and you may then with certainty and safety pursue your journey to any distance and time.

*Recipe.*—When the foregoing directions are omitted, and the bad effects are apparent, give the animal the following:

Lincture of Benzoin one ounce; spirits of ammonia one do.; aromatic confection half an ounce; ginger one ounce. To be mixed in one quart of water. When a horse is overheated, this application will relieve him—and it may also be given with success, in case where a horse is affected with choleric or gripes, flatulency in the stomach or intestines, mixed with a pint of warm oil—to be repeated at every three hours until relieved.

WM. COOKE,  
*Veterinary Surgeon.*

## GOOD HUSBANDRY.

The editor of the *Maine Cultivator* (Mr Drew, of Hallowell,) cultivates but a single acre of land, but this he does in such a manner, as to obtain from it an astonishing amount of produce. The following account of the management of his garden will no doubt interest many of our readers:

One third of an acre he devotes annually to corn—the long eared, large kernelled, eight rowed yellow corn, that is not very early, and not very late. With him it has ripened every year for the last ten years that he has cultivated it. The soil he makes rich. He applies to it before ploughing, at the rate of eighteen or twenty cords of long manure, (or six to the third of an acre) and turns it under by the plough. He plants the hills three feet and a half apart one way and three feet the other—*exactly* by measurement with a line. In each hill he deposits a shovel full of old rotten hog manure as will not over stimulate the crop.—From this third of an acre he has realized on an

average for years, over 30 bushels of sound corn for grinding, besides a little pig corn for the hogs in the fall of the year. This is as much corn as he needs in his family; besides a sufficient surplus for fattening one large or two small hogs.—From the same land he ordinarily obtains some two or three hundred pumpkins, which serve important purposes in the family, being, besides, an excellent article for boiling up with the hogs' potatoes, giving a cow, &c. From the same land, he has generally obtained all the dry white beans he has needed in his family to go with his pork—which he raises by the avail of his land, without purchasing of others. The corn fodder is carefully cut and cured, and helps as a subsistence for the cow. So much for one third of an acre. A small portion of land is set apart for the culture of onions. Ordinarily he raises from 50 to 75 bushels on a bed, say six rods square. These he sells on the average at one dollar per bushel—say \$60 per acre. This purchases his flour and rye at common prices. So that from the first third of one acre, and an onion bed, he has all his bread, brown and white.

On two other large beds, he grows generally about 50 bushels mangel wurtzel and carrots. These are for the cows' winter provender. They more than pay for themselves in the milk and butter, to say nothing of the saving of hay and other provender. With a very little hay, together with the corn fodder and roots, a good cow (and he finds it economy always to keep the *best*;) may be kept through the winter.

Potatoes for summer and autumn use are planted on the margin, and wherever there is a vacant chance for a hill, a department is expressly devoted to them, large enough to raise all that are wanted for the table, and enough to spare for the hogs, &c. So far as relates to bread, butter, pork—and he might add, poultry.

Then the rest of the land is devoted to too many things to mention here: beets, parsnips, cabbages, turnips, green beans, peas, green corn, cucumbers, melons, squashes, summer and winter sorts, &c., besides fruit and flowers of various kinds; grapes, Antwerp raspberries, black do., currants, white, red, black and yellow; English and common gooseberries, and a few choice apple, pear, plum, cherry, peach and quince trees. All this from a *single acre*, which he cultivates mostly with his own hands.

*Scab in Sheep.*—The following remarks are from the pen of one of the most experienced and competent wool growers in this country. We have had some acquaintance with the remedies proposed below, and can add our testimony to their value:

"The scab is very contagious, but when observed at an early period, it may easily be cured, or at least prevented from spreading. One of the best remedies is a strong decoction of tobacco, to be applied to the diseased parts, after scratching off the scabs with a comb or other instrument. The decoction of tobacco mixed with lime water and oil of vitriol, and used constantly, when necessary for some time, will generally effect a radical cure. Another excellent remedy is a decoction of hellebore, mixed with vinegar, sulphur; and spirits of turpentine. Internal remedies are of no use, except when the disorder has induced other complaints, by weakening the general health."—*Albany Cultivator.*

He that deserves nothing should be content with any thing.

HEADS GATHERED FOR SEED.

The good and careful farmer takes the pains to select from his wheat and his corn the ears and heads that are earliest ripe for seed. In this way he may always keep these productions up to the mark—nay, if the selection be made with close attention and perseverance from year to year, it cannot be doubted that very great improvement would result from it, and that all grains and plants thus selected, would pass in a few years through a course of melioration to the greatest attainable degree of perfection—if indeed such a degree can be reached.

The young farmer who would begin now to manage on this principle, in regard to all his staple crops, as Mr Baden did many years since with his Baden corn, and who, in the view of his neighbors would persist in carrying out the system under his direct personal supervision, and with the utmost particularity, would not only render a great service to his neighborhood, but might command for his commodities an extra price, that would more than compensate him for his trouble.

Dr. Anderson, in his "Recreations," says:—"Every attentive observer will remark among the plants of almost every kind of crop, some individual stalks which are distinguishable from the others by a great degree of health or luxuriance, or profligacy, or earliness, or some other peculiarity. A friend of mine remarked some years ago, a particular stem of peas among his earliest crop, which came into flower and ripened long before the others. He marked this stem and saved the whole of its produce for seed. These came as much earlier as they had originally done. This produce was also saved for seed; and thus he obtained a particular kind of early pea, that came at least a week before the best sort he could buy in the shops, if sown at the same time with them." The Doctor relates facts similar to this respecting wheat and beans. The general idea he means to inculcate is obvious, and extremely worthy attention.—*American Farmer*.

[The experiment of Rev. Dr. Freeman, published in this day's Farmer, clearly demonstrates that great advantage is to be gained by selecting for seed those heads which are earliest ripe.]

PROTRACTED VITALITY OF SEEDS.

Without admitting such doubtful cases as those of seeds preserved in mummies having germinated, there are many instances of seminal longevity about which there can be no doubt. Books contain an abundance of instances of plants having suddenly sprung up from the soil obtained from deep excavations, where the seeds must be supposed to have been buried for ages. Professor Henslow says that in the fens of Cambridgeshire, after the surface has been drained and the soil ploughed, large crops of black and white mustard invariably appear.—Miller mentions a case of *Plantago Psyllium* having sprung from the soil of an ancient ditch which was emptied at Chelsea, although the plant had never been seen in the memory of man. De Candolle says that M. Gerardia succeeded in raising kidney beans from seeds at least a hundred years old, taken out of the Serbarium of Tournefort; and I have myself raised raspberry plants from seeds found in an ancient coffin, in a barrow in Dorsetshire, which seeds, from the coins and other relics met with near them, may be estimated to have been

sixteen or seventeen hundred years old.—*Hartford Courant*.

The springing up of plants in a soil on which it is known no plant of a similar kind has grown for a century or more, is a fact of such common occurrence in New England, that it hardly attracts notice. Large tracts of land among the Green Mountains, on being cleared and burned over, produce the "high blackberry" in most luxuriant abundance. So, too, in many places what are called "pine barrens," being burned over, are soon covered with shrub oaks. It is a well known fact, that some years ago, when the hills at the westerly part of this city were dug down twenty or thirty feet, and an immense body of earth removed, the new surface was almost immediately thickly sprinkled with the thorn apple (*stramonium*) growing to an uncommon rankness. Where did the seed of this plant come from? or was it the spontaneous effect of the "primal curse"—"thorns also and thistles shall it bring forth"?

A singular instance illustrating the vitality of seed remaining in the earth, is within our own experience. Seven years ago we threw in our garden at Cambridge, a small quantity of the seeds of the common tobacco—intending to use the leaves of the plant in experiments for destroying bugs, worms, &c. No plant produced from this seed has ever been permitted to ripen on the premises, and but one was permitted to flower: yet, there has been no year of the seven, in which new plants have not come up, and it is not a week since we destroyed several of them. Some of the seed must have lived seven years in the earth before it vegetated.—*Boston Courier*.

RAIN.

The quantity of rain that has fallen during the months of May, June and July of the present year in this place, is unusually small. Although we have had thirteen distinct rains, the whole quantity amounts to but 6.78 100 inches, while the average for the last 16 years is 11.36-100, as will be seen by the following table taken from our Rain Gauge Book:

	May.	June.	July.	Amount.
	In. 100	In. 100	In. 100	In. 100
1825	1.91	5.07	1.14	8.12
6	49	4.04	2.08	6.61
7	5.44	2.14	2.72	10.30
8	6.25	6.16	5.00	17.41
9	3.13	2.88	5.99	12.00
30	3.81	4.01	6.09	13.91
1	3.84	4.42	5.13	13.39
2	7.41	54	3.23	11.18
3	2.91	3.97	3.38	10.26
4	6.49	3.69	4.88	15.06
5	2.18	2.16	8.63	12.97
6	2.17	3.73	2.40	8.30
7	6.88	4.06	1.66	12.60
8	3.43	5.09	1.86	10.38
9	5.58	3.16	3.71	12.45
40	2.28	2.41	2.09	6.78

Average for sixteen years, In. 100 11.36  
 Amount for 1840, 6.78  
*Waltham, Aug. 1, 1840.* H.

[*Daily Advertiser*.

The American (Baltimore) Farmer says the crops of the Middle States promise an abundance greater than common, in spite of the reports to the contrary circulated by speculators in bread stuffs.

PROFIT OF BEE-KEEPING.

Col. H. K. Oliver, of this city, has for several years paid great attention to the management of bees; and after a series of experiments and unwearyed diligence, he has now reached a wonderful degree of perfection. His apiaries, we may safely say, are the finest in the State. Col. O. uses the non-swarmling collateral hive, which he thinks better adapted to cities and populous places than any other. We had the pleasure of witnessing the labors of his busy operatives last week, and can assure our readers that it is a sight well worth seeing. The hives are so constructed that one can observe without danger all the operations of these indefatigable laborers, and draw therefrom many a useful lesson.

Col. Oliver has two apiaries, one containing eight, and the other (partly stocked) to contain seven hives. The hives consist of one central and two collateral boxes—the honey being drawn only from the collaterals, leaving that in the central box where the bees are preserved during the cold weather, as stock for their winter supply. Some of them have, in addition to the two collaterals, a top box to contain glasses to be filled by the bees. During the present year ten hives have yielded an average of 50 pounds each, making 500 lbs. of honey, which sells readily here at 25 cents per lb. Some of the hives yield as high as 80 pounds each. The honey is the whitest, clearest, purest we have ever seen, and, fresh from the comb, is truly delicious.

As to the profit of keeping bees, there cannot be a question, the Col. thinks, if they are rightly managed. But like all other stock, they need care and attention, and must not, to be made profitable, be kept in the usual rough boxes of the farmers, nor left to the tender mercies of the moth. By the common method, in order to get the honey, the bees are all killed; but by the improved method, they are all saved alive, and are deprived of only the excess of honey over what is necessary for the winter's consumption. Our townsmen, Messrs Holman and Phippen, have apiaries also, constructed on the same bee-preserving principle, and equally profitable.—*Salem Register*.

*Mites in Cheese*.—We copy the following from the Zanesville Gazette, and shall publish it for the special benefit of cheesemakers and cheesemongers, not doubting that it will materially increase the consumption of the article. Were it as fashionable to drink spirits of turpentine as spirits of wine or brandy, the first might be substituted for the last in its application to cheese, and quite as effectually. As it is, we go for the brandy decidedly, and recommend its use to the possessors of all colonized cheeses.—*Alb. Cult*.

"All who deal in cheese, whether housekeepers or merchants, know their liability to be attacked by skippers, and the better the cheese the more liable they are to such attacks. To drive them out, the following mode will be found effectual, while the flavor of the cheese will be greatly improved. Cut out a large plug in the upper side of the cheese, and fill up the cavity with the best French brandy, and repeating the operation two or three times, when the plug may be restored and pasted over, for the skippers will be found to have left the cheese, making their way outside."

[We trust the above suggestion will not have a tendency to increase the number of cheese-eaters for the sake of the ardent.]

## NEW ENGLAND FARMER,

AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, AUGUST 12, 1840.

## HORTICULTURE.—No. I.

We wish we could say on this subject what we feel; but as there are many cases in which superlatives seem idle, so the most extravagant that we could use would not half express our sense of the value of this art; and the duty of men of taste and public spirit to advance it.

Agriculture comprehends the cultivation of great crops. Horticulture embraces the cultivation of the finest esculent vegetables, the most delicious fruits and the most magnificent and beautiful flowers.

A few years since, and a few ordinary potatoes and turnips and some coarse drum-head cabbages, constituted the whole of the farmer's winter supply. Now, if he chooses, he may with little trouble supply himself with a large variety of vegetables of the finest description. A few years since, and a few coarse apples, some of which perchance might be eatable, though oftener execrable, were laid in for an occasional winter resource. Hundreds and hundreds of farmers, after the season of gathering had passed, never saw an apple in their houses until the harvest came round again. Now, farmers begin to come to the resolution of cultivating the best apples and the best pears, that fruit may be found in their cellars every month in the year. The multiplication of graperies and peacheries, and the cultivation of the most delicious plums, are continually extending themselves, and placing within reach of an industrious and careful man, at even a moderate outlay of expense which few men would find burdensome, if they are not too indolent and selfish to exert themselves, the most delicious luxuries which the appetite can crave. Fruit, said a quaint old friend of ours, was the food of paradise. We know nothing is more conducive to health than ripe fruit of any and every kind. In proportion as we substitute it, especially for young people, in place of meat, we are not certain that, as some very intelligent minds conjecture, we shall not do something towards mending or securing their morals; but we know that we shall do much for their health and innocent luxury.

We want to say something of the cultivation of flowers, but we have not room. We shall not pass over the subject, however, for our heart is in it; and we cannot express in too strong terms our grateful sense of the public spirit and public and substantial beneficence of those gentlemen in Boston, Salem, Dorchester, Watertown, Brighton, Roxbury, and other places in the commonwealth, who have introduced among us the most splendid and magnificent plants, and are laboring with a most commendable zeal to promote this delightful taste and facilitate its cultivation and gratification.

July 16.

H. C.

## HORTICULTURE.—No. II.

We have spoken of this beautiful and most useful art as the means of supplying our tables with the finest esculent vegetables and the most delicious fruits. We remember well when the sweet corn was not known among us; the tomato is comparatively of recent introduction, one of the most salutary as well as agreeable vegetables; and what a delicious treasure has been presented us in the Canada and the Inscious vegetable marrow squash. The Horticultural bean and the Lima bean are modern and valuable acquisitions. Head lettuce and the fine early cabbages could appear only on

the tables of the rich, who could afford the expenses of hot houses and garden frames. Now, the art of cultivating them is diffused, and no farmer is so poor, unless he be bankrupt in all spirit and enterprise, but that his table may be covered with very little care and labor, with these valuable productions in their season, and, if he pleases, out of season. Believing, as we do most strongly, in the conduciveness of vegetable diet to health, especially to the health of children and young persons, regarding much meat as the foundation of many diseases, and oftentimes in its moral tendencies pernicious, as forcing to premature development the appetites and passions of the young, we consider the increase and multiplication of fine esculent vegetables and their more general introduction upon the tables of our farmers, as a signal good. We are not anchorites; or in the more familiar language of the day, *Grahamites*, though we have no hesitation in saying, that we regard Mr Graham as having rendered eminent and permanent benefactions to the community. We have no inclination to renounce or denounce entirely the use of cooked meat; (raw meat or half cooked meat, or blood, we look upon as only fit for cannibals.) but the general habits of the country are, in this respect excessive. Meat three times a day on many tables in the country, is certainly twice too often. Three times a week would be quite frequently enough, where there could be substituted an abundant supply of the best well cooked esculent vegetables. Health would be essentially promoted, and very serious drains upon the purse would be cut off.

The introduction of fine fruits is another of the debts which we owe to the public spirit of gentlemen of the Horticultural Society among us. We have no doubt that with the increasing wealth which industry and enterprise have brought into our community, and the improvement of the public taste, which has sprung from extended means of education, the culture of fine fruits and attention to ornamental gardening, would likewise have advanced. But it cannot be doubted that the public spirited efforts of the Horticultural Society, their addresses, their premiums, their weekly and annual exhibitions, have carried forward the art among us more in ten years than without their labors would have been done in thirty years. The finest fruits produced in any country and capable of being naturalized in our latitude, or forced by artificial heat, are introduced among us, and, as far as practicable, liberally extended. Hot houses and green houses, and extended peacheries and graperies, were a few years since regarded as the exclusive and almost inaccessible luxuries of the very rich. Now they are not an infrequent appendage of the establishment of many a man in moderate circumstances, who justly deems them only a reasonable indulgence. We have in our mind's eye an enterprising farmer, who, disregarding all ornament and embellishment, taking advantage of the southern aspect of a high rock on his grounds, at an expense of fifty dollars in rough boards and old sashes erected a building, which gives him early plants, and an abundant supply of grapes and peaches.

We promised to say something of horticulture, as embracing the cultivation of ornamental trees, shrubbery, and flowers. "Behold, says a divine authority, the lilies of the field, how they grow; and yet Solomon in all his glory was not arrayed like one of these. Doth God clothe these flowers of the field?"—Of all the forms of beauty which this earth presents—so multiplied in number, so diversified in form, so exquisite in perfection, there are none more striking, next to those of the human countenance, than are presented in the vegetable creation; in the form of their stems and leaves and flowers; and in their diversified tints and coloring and

odors. The more closely they are examined the more are we compelled to admire their perfection and adore the unutterable skill of the Divine Artist.

Now we say there is no taste which indicates higher natural refinement of mind than a taste for flowers; there is none more innocent in its indulgences; there is no pursuit to which our hours of recreation, especially those of the fair sex, can be more properly devoted than to their cultivation; and there is no less expensive or more beautiful embellishments, with which we can surround our yards, our door ways, our piazzas, and our gardens. In this respect we may congratulate ourselves that a highly improved taste is advancing all over the country. Great pains are used in many towns in the commonwealth to adorn the roads with ornamental and shade trees; and individual examples of a highly improved taste in the cultivation of flowers and ornamental trees and shrubs, are to be met with numerously in all our villages, and in many of our less populous towns in the interior, where we should least expect them. Our well-conducted horticultural magazines have done much towards this result; and the patronage of the public-spirited friends of rural improvement ought to be the more exerted to sustain the well-conducted and only surviving publication of this class, of our friends the Messrs Hovey, which has done much for this excellent cause.

But how frivolous, say some men, is this taste for flowers; they are only to *look at*, and why should we not devote our time to the cultivation of that which is substantial and suited to sustain life. There is an abundance of time for both these objects. Attention to the one, where the time is well arranged and the habits are industrious, need not interfere with the other. The multiplication even of the most beautiful and splendid rural embellishments around our houses, will demand but small attention, for many of them are of a perennial character and require only a slight occasional attention. Rendering our houses more beautiful, we render them more attractive and valuable. Rendering them more attractive and beautiful we multiply and strengthen the domestic ties which bind us to them; and there is a rich and grateful pleasure and as pure as the virtuous mind can enjoy, in contemplating the results of our own labor and taste in embellishing the little spot of earth which for a while we are permitted to call our own; and in rendering it an object of delightful gratification to every passer by.

But the "flowers are designed only to please the eye," and why should not the eye be pleased? What pleasures more pure, more exquisite, more warming to the heart, more improving to the mind and the affections than those which come through the eye? what may be more enjoyed without injury to the moral taste? and where shall we read more luminously displayed the perfections of the Creator, than in the heavens over our heads, the earth under our feet, and those multiplied departments in his works of visible glory to which the eye alone gives us access.

H. C.

July 18.

## MASS. HORTICULTURAL SOCIETY.

At a meeting of the Massachusetts Horticultural Society held Saturday, August 8th, 1840, the following gentlemen were chosen a Committee of Arrangements for the annual exhibition of fruits and flowers the ensuing autumn:—Sam'l Walker, Wm. Oliver, Isaac P. Davis, L. P. Grosvenor, Thos. Lee, Marshall P. Wilder, Isiah Stickney, Edw'd M. Richards, J. J. Low, Jno. J. Russell, Benj. V. French, Robert Treat Paine, Chas. M. Hovey, Wm. T. Eustis, John Towne, Sam'l Downer, J. E. Teschemacher, Otis Johnson, David Haggerston, W. H. Cowan, Rob't Manning, J. M. Ives, George Brown, M. P. Sawyer, Cheever Newhall, Joseph Breck, Wm. M'Lellan, Wm Kenrick, Jona. Winship, Henry

Sheafe, Sam'l R. Johnson, Eben'r Putnam, J. C. Howard, S. Swetser, P. B. Hovey, J. L. L. F. Warren, Jno. A. Kenrick, Wm. E. Carter, J. W. Russell, Rufus Howe, Sam'l Pond, Jno. Hovey, A. Bowditch.

*Special Committee to Decorate the Hall and to take charge of the Fruits and Flowers.*—Sam'l Walker, L. P. Grosvenor, M. P. Wilder, Wm. Oliver, C. M. Hovey, I. Stickney, E. M. Richards, David Haggerston, S. R. Johnson, J. L. L. F. Warren, J. W. Russell, Wm. McLellan, Rufus Howe, A. Bowditch.

*Committee to make Reports of Flowers, Fruits and Vegetables.*—Sam'l Walker, E. M. Richards, J. L. L. F. Warren.

Attest, E. M. RICHARDS,  
Rec. Sec'y.

**BRIGHTON MARKET.—MONDAY, Aug. 10, 1840.**

Reported for the New England Farmer.

At Market 410 Beef Cattle, 18 Cows and Calves, 2950 Sheep, and 175 Swine.

*Prices.—Beef Cattle.*—First quality, \$6 00 a \$6 25. Second quality, \$5 50 a \$5 75. Third quality, \$4 00 a \$5 25.

*Cows and Calves.*—\$20, \$22, \$25, \$30, \$33, \$35, and \$33.

*Sheep.*—Lots \$1 25, \$1 42, \$1 50, \$1 62, \$1 88, \$2 25, \$2 33, and \$2 50.

*Swine.*—Old hogs 4 for sows, 4 and 4 1-2 for barrows. Lots to peddle 4 and 5. At retail 4 1-2 to 6 1-2.

**THERMOMETRICAL.**

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northerly exposure, weeks ending August 9.

August, 1840.	7 A.M.	12, M.	5, P.M.	Wind.
Monday,	3 68	83	71	S. W.
Tuesday,	4 68	84	74	S. W.
Wednesday,	5 70	85	73	W.
Thursday,	6 58	80	72	S. W.
Friday,	7 60	78	66	W.
Saturday,	8 59	80	66	S.
Sunday,	9 53	82	67	N. W.

Fair weather every day at 12 o'clock.

**SUPERIOR NEW STRAWBERRY.**

Hovey's Seedling, a new variety, originated in 1835, and now for the first time offered to the public, after a trial of three years, in a bearing state, has confirmed its superiority over every other variety. It belongs to the class denominated *Pine Strawberries*, and may be described as follows:

*Fruit*, very large, round, never coxcomb-shaped, even in the largest berries. *Color*, deep shining red. *Seeds*, inserted in a slight cavity. *Flesh*, scarlet, firm, abounding with a most agreeable acid and exceedingly high flavored juice. The vines are as hardy as the Early Virginia, having stood the severity of the several past winters unharmed; growth vigorous, and the fruit well elevated from the ground on strong stems. A full description of this seedling, with an engraving of the fruit, and some account of its origin, treatment, &c. will be given in the August number of the *Magazine of Horticulture*.

This strawberry was first exhibited at the Massachusetts Horticultural Society's Rooms in 1833, again in 1834, and also the present year, and each year obtained the Society's premium, although in competition with the Methven, Keen's Seedling, Downton, &c. Gentlemen well acquainted with all the other varieties cultivated in this country, have seen the bed in full bearing, and hesitatingly pronounce it the largest, finest, most productive and hardy variety they have ever seen.

The entire stock of plants is in the possession of the subscribers, not one ever yet having been disposed of, and they are now offered for sale, and will be ready for delivery on and after the 20th of August. All orders will be executed in the rotation in which they are received. Plants, \$5 per dozen. All orders from a distance, enclosing the amount for the plants ordered, will be immediately attended to, and the plants promptly sent to the direction desired.

Also, a fine stock of plants, of the following sorts, all warranted genuine, or no charge.

Methven Scarlet, \$2 per hundred.  
Bishop's Orange, \$5 per hundred.  
Early Virginia, \$1 per hundred.  
English Wood, \$1 per hundred.

All orders immediately attended to, and the plants speedily forwarded.

HOVEY & CO.  
Agricultural Warehouse and Seed Store,  
August 5. 7 Merchants' Row, near State st. Boston.

**URATE AND POUDETTE.**

An establishment for the manufacture of the Manures called Urate and Poudrette has been erected, at a considerable expense, in the State of New Jersey, near the city of New York; and an act of incorporation has been granted by the legislature of the State of New Jersey, by the name of "The Lodi Manufacturing Company," for purposes of agriculture, wherein it is provided, that 500 shares, a portion of the stock reserved for subscription by farmers and gardeners, within a limited time, shall be entitled to receive 50 bushels of Poudrette yearly for five years, viz. in 1840, 1841, 1842, 1843, and 1844, upon each share of \$100, which is at the rate of 20 per cent. per annum, for those years, and after that period to receive an equal dividend with the other stockholders.

The Manufactory has gone into operation according to law; a sufficient number of shares having been subscribed for that purpose, and capital paid in; and the first dividend has been regularly paid to the subscribers—the next dividend is payable in September. But the Company needs a larger moneyed capital than it now has, to carry it on to better advantage. Inquiries having been made whether all the stock had been taken, and the difficulty at the present time of obtaining funds, to a sufficient amount, from a few individuals, has induced a renewal of this notice to farmers and gardeners, and every other person who may have spare funds, (as every person is now permitted to subscribe,) that there is yet a considerable portion of the reserved stock, which, by law, is to receive 20 per cent. per annum, payable in Poudrette, one half in May, and the other half in September, in the years 1840, 1841, 1842, 1843, and 1844, not yet subscribed for, and the books are now open to receive subscriptions for the same, by any person, whether gardener, farmer or otherwise, at the office of the Lodi Manufacturing Company, No. 73 Cedar Street, in the city of New York. Terms for the reserved stock, \$100 per share in cash; and for the other portion of the stock an instalment of \$25 per share on subscribing, and the residue (being \$75 per share) to be called in by instalments of \$5 per share, after thirty days notice.

These manures have been fairly tested and very generally approved of as being the cheapest and best manures, and more economically applied than any other known substance used for manure.

As the article can be furnished from the city of New York, only to a limited extent, (not more than sufficient to manure 35,000 acres annually,) it must follow, that in a few years it will necessarily be confined to the use of the stockholders alone.

It is important to agriculture, and the enterprise deserves the liberal support of every enlightened farmer. By order,  
WILLIAM M. WILSON, Secretary.

At an election for Directors of the Lodi Manufacturing Company, held at Jersey City on the 6th day of July, 1840, the following persons were elected Directors of the Company, to hold their offices until the first Monday in October next, namely, Anthony Dey and Jacob C. Dey, of New York; J. D. Miller, Andrew S. Garr and Rodman M. Price, of New Jersey.  
August 12.

**Brighton Nurseries and Gardens. For Sale**

A large quantity of superior European and American Ornamental Trees, well calculated for public places, or private grounds, with Fruit Trees embracing a great variety of the most approved kinds and fine sizes. The trees, and all other productions can now be selected and marked, and will be forwarded to any place as soon as it will answer to remove the same.

Also, forty kinds of Strawberry Plants, of the most approved European and American varieties.

Orders may be forwarded via. mail, addressed Messrs. WINSHIP, Brighton, Mass., or left with Messrs. JOSEPH BRECK & CO. Brighton, August 12.

**TO NURSERYMEN AND GARDENERS.**

A well established Nursery and good Vegetable Garden, situated in the State of Massachusetts, near a market for vegetables, and where there is a good demand for trees, together with every convenience for a man with a family, will be let on accommodating terms to a good tenant for a term of years. Address a line stating name and reference (post paid) to J. P. MERRILL, care of Messrs. Breck & Co. Seedsmen, Boston, previous to first of October.  
August 12.

**BUDDING FRUIT TREES.**

Cuttings of fruit trees for budding, comprising nearly all the choice sorts of Apples, Pears, Plums, and Cherries, known and cultivated in this country or in Europe, all from bearing trees, can be packed in such a manner as to be sent with perfect safety to a y part of this country or Europe. Apply by mail to the subscriber, at the Pomological Garden, Salem, Mass.  
ROBERT MANNING.  
Salem, July 15.

**CASES OF TOOLS.**

Just received from England, a few cases of superior horticultural tools, for gentlemen or ladies use, a splendid article in mahogany cases.  
JOSEPH BRECK & CO.

## MISCELLANEOUS.

From the Farmer's Monthly Visitor.

## FARMERS PHILOSOPHERS.

All farmers might and should be philosophers—not like Newton, Locke, or Descartes, for few have the intellect, or time to examine nature as they did—but all have the faculty and time enough to read the book of Nature, which lies wide open, and is so plain that “he who runs may read” many things for curiosity, and some for profit: I will relate a few facts in my blunt way.

A few years since, while standing beside a wall, I heard a splashing in water on the opposite side. Looking over, I saw about eight feet from me, two bullfrogs apparently wrestling. They stood upon their hind legs—took fair hold at the back with their arms (or fore legs, if you please) and tripped, and twisted just like two men in wrestling. Sometimes one would get thrown, then the other. I saw them at this play ten or fifteen minutes. They certainly were not fighting, for neither were hurt. The water was two or three inches deep, just up to their knees; as soon as one gave the other a fall, he would jump off, and both would stand up and take hold again.

## HAWK STORY.

There was a pair of hawks nearly as large as the eagle, which visited our neighborhood for twenty years—how much longer I know not. They were curious and cunning creatures. They generally took five or six chickens annually from each farmer. Nobody could shoot or trap them. One time when I was from home they pounced upon an old hen and killed her, but could not carry her off. I came home soon after, and placed myself in the barn with a double barrel gun about eight rods from the hen. There was a hole through the barn door big enough for the gun barrels. There I waited, expecting they would come back after their prize. They did come back; but whether they saw the barrels or smelt mischief otherwise I know not. They flew round a while—lit several times twenty rods off, and then cleared out forever from the hen.

But the most curious thing about these hawks was their races. About a mile north of my house is a hill, the highest in this town; and southeast from me sixty rods, is another hill two hundred feet high, and nearly perpendicular on the north side. Many a day have I seen these hawks have their races as regular as horses or men. They would fly slowly round in the air, and slowly take their way to the height of land on the north; and then apparently start fair, and with the rapidity of lightning, or at least as fast as they could wing their way, rush to a certain bush on the top of the south hill; and then wheel round and wend their way back again for another race.

One afternoon, (June 1837) I had watched them several rounds. A thought struck me that if I should get behind the bush which was their goal, I might be revenged for the old hen and chickens. Accordingly I placed myself there with my double barrel. They came—I snapped the lock, but it missed fire. I had scarcely ever known it to miss fire before. I felt provoked, for I was sure of both, or one of them at least. They wheeled round—looked scorn at me; but had no more races that day. A few days afterwards I saw them racing again; my revenge was gone—I was glad I had not killed them.

*Another.*—A few years ago I saw in my garden thousands of holes about the bigness of a goose-quill and perfectly round. Supposing there were some insects in these holes that were destroying my garden sauce, I dug some of them out. I found them from three to five inches in depth. They were different from any creature described in any natural history which I have seen. About one fourth of it (its head and neck) was black. It had six legs and some powerful looking claws near the mouth for so little a creature. The body and rest of it was very much like a whitish worm. Its whole length was about an inch. I thought that boiling water would be a good thing to destroy them. I tried it, and killed perhaps three fourths of them; but my carrots, onions, &c. went faster than ever. I then thought it possible that these nameless animals might be carnivorous, which I soon found to be the case, by seeing one of them catch a bug which was passing over his house. I then put some maimed flies near the top of their houses: they were soon dragged to the bottom. I have no doubt they are a real benefit to a garden.

STODDARD.

## SCYTHES, RAKES, &amp;c.

The subscribers offer for sale a very extensive and complete assortment of Scythes, Rakes, &c. consisting in part of 300 dozen Phillips, Messer and Colby's superior Scythes.

50 "	Metcalf's	do.	do.
50 "	Taft's cast steel	do.	do.
25 "	English do.	do.	do.
10 "	do.	do.	do.
10 "	do.	do.	do.
100 "	Hall's Rakes, superior.		
100 "	Wilder & Eddy's do. do.		
200 "	Common do. do.		
100 "	Clapp's patent Scythe Snaths.		
50 "	Baker's do. do. do.		
100 "	Common do. do. do.		
2500 "	Austin's superior Rifles.		
2000 "	Common do.		
1000 "	Scythe Stones		
100 "	Grain Cradles superior.		

They would respectfully call the attention of Dealers and Agriculturists to the above assortment, which consists of many of the best kinds now in use, and which they are prepared to sell at the very lowest prices.

JOSEPH BRECK &amp; CO.

New England Agricultural Warehouse and Seed Store,  
51 & 52 North Market Street.

May 20.

## BERKSHIRE HOGS.

The subscribers offer for sale a few pair of full blooded Berkshire Hogs; also, pigs 7-8 blood, crossed with Mackay. Inquire at the New England Farmer office, or at their farm at Brighton.

JOSEPH BRECK &amp; CO.

July 29.

## SUPERB ROCKET LARKSPUR SEED.

The subscribers offer for sale a quantity of Superb Double Rocket Larkspur Seed, of their own raising, saved from double flowering plants only, embracing all the different colors. For fine, strong and early plants, the seed should be sown in August

JOSEPH BRECK &amp; CO.

June 17.

## GARDENERS' KNIVES.

JOSEPH BRECK & CO. have this season imported and now offer for sale a few very superior Garden Knives, for pruning, &c. manufactured expressly for Gardeners, and warranted superior to any article of the kind before imported.

Also—a large assortment of Budding Knives, Grape Scissors, &c. &c.

April 22

## FENCE CHAINS.

Just received from England, at the New England Agricultural Warehouse, 6 casks chains, suitable for making the chain fence, &c.

JOSEPH BRECK &amp; CO.

July 15.

## TRACE CHAINS.

Just received, direct from the English manufacturers, 8 casks of Trace Chains, from 6 to 11 feet long, suitable for ploughing or draft chains.

JOSEPH BRECK &amp; CO.

July 15.

## STRAWBERRIES! STRAWBERRIES!!

Those who are desirous of cultivating this delicious fruit are respectfully informed that the subscriber has succeeded, after many years experimenting upon the Strawberry, not only in obtaining new varieties, but in ascertaining the best methods of cultivation. The subscriber would offer to the public, the present season, his *Selected Collection* consisting of seven varieties; they are such as have stood the test of a fair trial for seven years<sup>3</sup> and are all grown by the subscriber.

Specimens of his Fruits have been exhibited every season at the Massachusetts Horticultural Rooms, and have always commanded an extra price in Faneuil Hall Market.

*Warren's Seedling Methuen*, a new and valuable kind, a free bearer, fruit very large and juicy; fruit measuring 5½ inches has been exhibited the present season. This variety can be warranted to be one of the finest varieties grown, and will produce as fine fruit and as large quantity, with the same cultivation, as any other ever offered, although some may ask the modest (?) price of \$5 per dozen. The price of this Seedling is \$5 per hundred plants.

*Methuen Castle*—Fruit extremely large, high flavored and showy; specimens of this fruit have been shown this season six inches in circumference. This variety can be said to be very excellent, (when the true kinds is obtained); it is one of the largest late varieties known, profitable and highly worthy of cultivation, all that some growers may say to the contrary, notwithstanding. Price \$3 per hundred plants.

*Keen's Seedling*—A very superior variety, fruit very large, rich dark color, and uncommonly high flavored; has always been considered by English cultivators the best grown. Price \$3 per hundred.

*Royal Scarlet*—Fruit long oval shaped and juicy, very free bearer and very hardy. Price \$2.

*Huambois*—Fruit larger than English Wood, exceedingly numerous, sometimes yielding 100 berries to the plant. Price \$1.

*Early Virginia*—This is known to be the earliest and best fruit for market, a free bearer, and very hardy.—Price \$2.

*English Wood*—Fruit well known for years. \$1.

N. B. Those who are desirous of cultivating this delicious fruit, would find it for their interest to visit the gardens and see the method of cultivation, and satisfy themselves that they can obtain their plants from first hands, for it is too often the case that large and attractive advertisements are sent forth to the public by dealers in plants, when at the same time they have never grown the kinds offered for sale, and know but little about their cultivation. Attention to this by purchasers, if possible, will save much time and money.

Every plant sent from this garden will be warranted to be free from mixtures, and shall also be young and healthy, worth the price paid for them.

All orders directed to the subscriber, enclosing the amount for the order, or with a good reference, shall be promptly attended to, and the plants carefully forwarded agreeably to directions.

JAMES L. L. F. WARREN.

Nonantum Vale, Brighton, July 25, 1840.

Orders directed to J. BRECK & Co., will be executed with despatch.

## TIE UP CHAINS.

Just received at the New England Agricultural Warehouse, a good supply of those celebrated Chains for tying up cattle. These chains, introduced by E. H. Derby, Esq. of Salem, and Col. Jacques, of Charlestown, for the purpose of securing cattle to the stall, are found to be the safest and most convenient mode of fastening cows and oxen to the stanchion. They consist of a chain which passes round the animal's neck, and by a ring attached to the stall, plays freely up and down, and leaves the animal at liberty to lie down or rise at pleasure, and keeps him perfectly secure.

July 15.

JOSEPH BRECK &amp; CO.

## PATENT SPRING BALANCE.

A few of those very convenient spring balances, for family use, a very simple contrivance for weighing small articles.

JOSEPH BRECK &amp; CO. No. 51 and 52 North Market Street, Boston.

July 15.

## THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at \$3 per annum payable at the end of the year—but those who pay within sixty days from the time of subscribing are entitled to a reduction of 50 cents.

TUTTLE, DENNETT AND CHISHOLM, PRINTERS.

17 SCHOOL STREET—BOSTON

N. E. FARMER.

### VISIT TO THE FARM OF E. PHINNEY, Esq., LEXINGTON.

We gave last year an account of the farm of Mr Phinney, of Lexington, which we believe was acceptable to our readers. Our object was to encourage and stimulate others to follow the example of Mr Phinney in their improvements, that like him they might receive ten fold in the amount of their produce. We have reason to believe that the account given was not altogether in vain to the public, but has been instrumental in some measure of calling up the attention of a few to the importance of a more systematic cultivation and liberal outlay in their agricultural operations. We do not wish to convey the idea that Mr Phinney stands at the head of agricultural improvements, or that he has no equals in the vicinity, by our frequent recurrence to his farm, for there are hundreds in the circle of our acquaintance, who like him stand in the foremost ranks, and are making rapid strides towards a better and more perfect mode of cultivation. Having again had the pleasure of spending a day upon this farm, which may truly be styled a pattern one, we will now take the opportunity to communicate a few things, which more particularly struck our attention, and first we will speak of the

#### Orcharding.

We refer our readers to the last volume of the N. E. Farmer, page 61, for the account given of it last year. The trees have made a vigorous growth the present season and are now loaded with a heavy crop of fruit. The Baldwins are remarkably fair, and promise to be of an extra quality and very free from the ravages of the curculio. The continued drought began to affect the crop seriously, and great quantities of fruit had fallen, but the abundant and timely rains have revived the trees and probably as much fruit remains as will be beneficial to the trees, or profitable. We were informed that in the fall of 1838, 700 barrels of good marketable apples were gathered from this orchard, which when it is considered that at that time the trees were but 14 years old, must be thought a very large crop, and a pledge that the expenses which have been incurred in bringing these trees forward would soon be reimbursed, and that hereafter a handsome income would annually be realized as a reward for the extra care and attention which has been bestowed upon them.

The trees are 40 feet distant from each other: most of them have finely shaped heads. It appears that much attention had been paid in their early training to encourage the branches to shoot out in a horizontal direction, as in that position they are not in so much danger of splitting off as those which rise with an angle of 45 degrees or thereabouts. By this mode of training the fruit is more equally exposed to the beneficial effects of the sun, and is more easily gathered. The bark of the trees appears in a fine healthy condition, looking clean and bright: this has been effected by wash-

ing the limbs with potash water. One man was employed thirty days in the spring in performing this operation. The vigor of the trees has been produced in a great measure by keeping the ground in constant cultivation, it having never been laid down to grass since the orchard was planted. Ten acres of the orchard is devoted to the raising of roots for the hogs and other stock. Where the ground is much shaded the crop will barely pay for cultivation: in the intervals between the trees however, the roots are very promising. If the crop pays the expense of cultivation without profit, the object is attained, as by this means the ground is kept clean and light and the growth of the trees promoted and fine fruit produced. The manuring for the crops is rather light, as it is considered that an excess of manure would be injurious to the trees. It was probably owing to forcing the trees too fast, that so many were destroyed by the severe winter a few years since. Fresh soil is taken from the woods and spread under the trees occasionally, which has a good effect. The canker worm has never attacked this orchard, and we hope it will never be subject to their destructive ravages. We mentioned last year instances where trees which had been girdled had been saved by inserting scions from the bark above to the bark below the wound. We saw an example now of a tree which had become so badly damaged about the root that no graft could be inserted, where the tree was saved by setting out small trees around it and grafting the tops of them into the bark above. We doubt whether in either case the trees will be long lived, but as a matter of curiosity they are interesting operations.

We believe there is no danger of overstocking the market with winter fruit, as the demand is constantly increasing. The steam navigation to England will open a way for the disposal of a large quantity, as our fruit is highly esteemed and brings a high price there. Farmers should pay particular attention to this department of cultivation, and have their farms well stocked with none but the best of winter apples: if their fruit is inferior let them proceed without delay to graft over their trees with such as is considered good and saleable, and young trees should be planted from year to year to supply the place of those which are soon to decay.

#### Pears and other Fruit.

The same course is pursued with the other fruit trees as with the apple;—the ground is under cultivation and kept perfectly free from weeds. The peach trees were bending to the ground with fruit: in the intervals where there was a chance for the sun to shed his genial influences, we noticed melons in a flourishing state. The health and fruitfulness of the vines, it was said, was owing to the fact that wherever it was designed to plant a hill, the ground was liberally supplied with virgin soil from the woods. In other places we saw squashes planted in the same way. There are about 700 pear trees on the premises including all the good varieties in cultivation, many of them in full bearing. Mr Phinney has received from time to time

large accessions to his collections from France and other foreign countries, some of which have proved to be fine, while many varieties have been condemned as unworthy of cultivation, and other approved sorts engrafted upon them. His spare moments seem to be occupied, in the proper season, in raising up a succession of young trees, and in engrafting over the old ones. We saw a small nursery containing a number of thousand young pear, peach, plum and other trees, from the seedling upward, and were shown pear stocks imported last spring and budded the same season, which have made a growth this year of two and three feet, in spite of the severe drought: thus he has at all times young trees in readiness to fill up spare ground, or supply the places of such as by disease or accident have been destroyed. The plum trees are in great abundance and variety, but yield no fruit this year. The Isabella grape vines show abundance of fruit and the season thus far has been favorable for maturing it. This variety when fully ripened is very fine, but it is not every year that this is the case, and we have been pained to see hundreds of bushels rendered worthless by an early frost. In our last year's account we noticed a variety of native grape grown upon a massive stone wall, which has proved in many respects more valuable than the Isabella, as it never fails to ripen. This wall now presents a sight worth looking at, as the quantity growing upon it has been estimated at two tons, and the grapes will bring from 6 to 8 cents per lb. the only trouble of which is to gather them.

#### Weeds Subdued.

We were happy to see the extensive crop of roots and the avenues leading through the grounds free of weeds, scarcely a straggling one left to give evidence that the original course included this section of terra firma. There is nothing more grateful to the agriculturist than a clean crop at this or any other season of the year. The expense of manuring is so great that it is a pity to suffer the weeds to draw its richness from the ground. It is not generally understood that weeds are great exhausters of the soil, and that it frequently costs more to support the weeds than it does the crop; then they deprive the crop of light and moisture, and in case of drought, the plant may well say, "my sufferings is intolerable." Before calling upon Mr Phinney, we noticed a crop on another farm quite the reverse of what we have been describing. Here the weeds had gained the ascendancy; the hope of eradicating them with the hoe had passed away, and the only chance left of preventing the crop from smothering was by reaping: to this the owner had resorted, and we noticed a pretty heavy crop. Had this man been "able" to have hired a few days additional help in season, he would not only have had an addition of one third at least to his crop, but his grounds would have been in a far better condition to sustain the next. We could say, as Solomon did when he passed by the field of the slothful, and beheld it covered with thorns and nettles and the stone wall tumbled down—"Then I saw and considered it well: I

looked upon it and received instruction." We should do injustice to the unnamed person to whom we refer, to call him a slothful man—for it is far from the case, as he rises early and toils late, and is ever busily engaged; but he was not wise in attempting to cultivate more ground than he could take care of; and after he had commenced the task found that he "could not afford" to hire additional help for a few days. But by this time we are off of our friend's farm, and will return and say a word about his crop of

#### Indian Corn.

His principal crop of about six acres, is the same variety that he has planted a number of years back, with twelve rows similar to the Dutton, excepting it is rather earlier. It is found that this variety grows a little later every year, and to all appearance will soon be no better than the common corn. There is no danger but that it will fully ripen this year, and the present prospect is that there will be an extra heavy crop. In another field we saw the Brown corn, which seems to answer its description well. We found it was at least a week earlier than the other. It was planted in hills about three feet distant each way, and the prospect for a good crop is as flattering as with the other variety.

#### Subsoil Draining.

In the corn field we were shown a section which was formerly wet, cold and unproductive, that had been reclaimed by under draining and now produced corn as luxuriant and promising as any portion of the field. The drains were cut three feet deep and filled up with stones two feet, those on the bottom so laid as to give a passage for the water; the stones are then covered with earth and all levelled off. We did not ascertain the expense per rod, as it was done at odd jobs and no calculation made; but whether the expense was more or less, it has converted a sterile piece of ground into a fruitful field.

The crop of hay has been abundant, and as the weather was very fine during the season of haying, it was made in the best possible manner. In one section of the farm we were told there was about fifty tons of hay designed for the market.

The drought which has been so severe in many parts of the country, has not done so much injury in this region as was anticipated. The pastures suffered a little, and early potatoes and some other productions of little consequence, comparatively speaking, were somewhat injured; but upon the whole, the prospects of the farmer for a bountiful harvest were never brighter.

Our readers have had a full account of Mr Phinney's piggery by himself: it will not be necessary, therefore, to say any thing more upon this department, only that his hogs were never in better condition at this season of the year than they are at the present time. We hope, not only for him, but for the sake of all our farming friends, that pork will bring a little higher price than it did last year.

With these few remarks we take leave of this interesting farm for the present, wishing its intelligent proprietor continued success in his agricultural improvements, and hoping that his good example will be more generally followed by our farmers.

J. B.

A farmer should never let his wood house be empty during the summer, else he will have to use green fuel in winter; and he who does this has not mastered the A B C of domestic economy.

#### GREEN MANURES—BUCKWHEAT.

Manures cannot be conveniently carried to all parts of a large plantation. They should therefore be applied to the fields near where they are made, and the more distant fields must be enriched with green crops. Tares are much used for this purpose in Europe, but whether these would grow as rank and as rapidly in our dry climate, we are not certain. We think they have not been extensively tried.

Oats have been sometimes sown to be ploughed in, but they give only a small layer when the land is poor. Rye will grow on poor soils, but we must use much seed, or we must let it grow tall, else we have but little to bury with the plough.

Round turnips form a good green crop for the plough, but they will give no top in poor ground. Indian corn has been recommended and partially tried. This is not more exhausting than oats or rye, and no fields not worn down low, probably no green crop would furnish more matter to be covered by the plough, than this one. But on quite exhausted land this would not answer our purpose, and the quantity of seed necessary for such a purpose, would be four or five bushels, quite an objection with economists.

Buckwheat is a grain that will grow on most poor soils. It delights most in dry locations, a soil inclined to gravel or sand. It has many qualities that recommend it highly as an article to be grown for the purpose of filling the soil with vegetable matter, of which it has been much exhausted in the states of which we have spoken.

In the first place, it will grow and produce a handsome layer for the plough, on lands that will produce nothing else. In the second place, we do not find it an exhausting crop. We can raise it many years in succession on our poor lands without any manure, and we very commonly save fifteen or twenty bushels of the grain from an acre. This plant has a very small, fibrous root, and is easily pulled up by the hand. It has also a large branching top that never could get its support from this root. It has therefore probably greater facilities for procuring nourishment from the atmosphere than most plants have.

All theory and all experience unite in showing that this plant takes less from the soil than any other of the same size. In the next place, it has a rapid growth, six weeks, in Massachusetts, being long enough to bring it in full blossom, when it should be ploughed in. Three crops may therefore be turned under in one season in Virginia, and then it will be early enough—(Sept. 1st)—to sow down with grass seed.

Another advantage attends the raising of this for grain or for green crops, the expense is not great. It usually bears the same price as our best corn, and is worth quite as much for fattening animals, and one bushel of seed is enough for the acre. When it is raised for the purpose of saving the grain, we often sow but half a bushel. The straw is also greedily eaten by the young cattle and by horses—colts may be wintered on it. Yet we have known large piles of the straw to be burned in the field where it was thrashed!

None of the various grasses are great exhausters of the soil, and grasses must form one of the series of the rotation of crops. When lands are kept half the time in grass, the roots fill the soil with vegetable matter that turns to manure directly on being turned by the plough, and, by means of rais-

ing more grass, more stock may be kept, and that increases the quantity of animal manures.

The policy of raising so many acres of corn on reduced land, must be abandoned. When more buckwheat can be raised on the acre than is obtained of Indian corn, it should be substituted for corn in a great measure, for it requires not a sixth part of the expense to produce it—and when buckwheat is raised for its grain, if proper care be taken to sow something with it that may be turned in for a green crop in June, the land will prove more productive, year after year.

On the wet and clayey lands of that district of country buckwheat may be sown. Such lands may be treated as we treat our grass lands of that character at the north. They may be turned over in autumn and seeded down again directly to grass.—*Albany Cultivator.*

#### HARVESTING POTATOES.

Never commence harvesting your potatoes till they have come to full maturity, or till the frost has killed the tops down. While the tops are green, the tubers are growing and improving. In digging them, use either the plough or the potato hook. As soon as they are out of the ground let them be picked up. Never permit them to remain out in the sun or air longer than you can possibly help. I am well aware that this direction is at once in opposition to the rule of many farmers, which is, to allow their potatoes to remain out in the sun, *drying* as long as they can, and yet have them picked up on the same day they are dug, in order that as much of the earth as possible may cleave off from them. This is very bad management for potatoes designed for table use; because it renders them strong, or acrid in taste.

Every attentive observer has noticed that that part of the potato which happens to be uncovered in the hill, changes its color to a dark green. This portion is very much injured in taste; in fact it is unfit for use, because it has imbibed from the atmosphere deleterious qualities. As soon as potatoes are dug and exposed to the light and air, this change begins. Every attentive observer has also noticed that potatoes are of the best flavor and quality after they have come to maturity and while they are yet in the ground. The longer they are dug and exposed to light and air, the more of this high flavor is gone, till it is wholly lost, and they become unpalatable and unwholesome. Potatoes that remain all winter in the earth where they grew, are in excellent condition for the table in the spring. In view, therefore, of all these facts, let us prescribe a rule in harvesting the potatoes, which will tend to *perpetuate through the whole season* these excellent qualities. As soon then as practicable after digging, remove the potatoes designed for the table to a *dark* bin in the cellar. After depositing thus the whole crop, or as many as are designed for the table, cover them over with earth or sand, and they will retain their excellent qualities till they begin to sprout in the spring, and require to be removed. When shipped for sea, they ought to be put into casks and covered with sand.—*Alb. Cult.*

*Caution.*—Where potatoes are boiled for hogs, the water in which they are boiled should never be given them, but thrown entirely away, because it contains deleterious or poisonous properties—a fact which is not generally known.

For the N. E. Farmer.

## PREMIUM STRAWBERRIES.

MR EDITOR—I have noticed in the New England Farmer, Yankee Farmer and various other papers, the advertisement of "New Seedling Strawberries," by the Messrs Hovey. They say of their seedling—

"This strawberry was first exhibited at the Massachusetts Horticultural Society's rooms in 1838—again in 1839, also the present year; and each season obtained the Society's premium, although in competition with the Methven, Keen's Seedling, Downton, &c."

Is this true? or have the Messrs Hovey made a mistake? Let us refer to the report of the committee on fruits to the Society, in 1838: vol. 17 N. E. Farmer, No. 30, page 237. Having the honor of being on that committee, I feel called upon to correct such mistakes?

In 1838, the premium was awarded to the Hon. E. Vose, President of the Society.

In 1839, the Messrs Hovey did obtain the premium.

In 1840, (the present year,) the premiums have not been awarded.

I hope the Messrs Hovey did not intend to impose upon or to deceive the public; but as they have been so anxious to warn the public in one of their advertisements, I thought it right also to give them an opportunity to correct their mistakes? hoping at least, they will have the modesty? to alter their advertisements, so that they will agree with the reports of the Society for the future.

I particularly regret that any attempt should be made to deprive the President of the Society of that which he so fairly won in 1838, and I am sorry the Messrs Hovey have assumed the premium for the present year before it has been declared, because it does not agree with their modest? and unassuming? deportment generally.

Hoping this plain method of correcting mistakes? will set matters to rights, I will close, reserving a curious story about seedling strawberries for another paper.

JAMES L. L. F. WARREN.

Nonantum Vale, Brighton, Aug. 14, 1840.

## Massachusetts Horticultural Society.

## EXHIBITION OF FLOWERS.

Saturday, August 15, 1840.

Dahlias—by Messrs Parker Barnes, David McIntire, F. W. Macondroy, John Hovey, William Bacon, J. J. Low, Hovey & Co., J. L. L. F. Warren and S. Walker.

Bouquets—by Messrs John Hovey, R. Howe, Hovey & Co. and S. Walker.

China Asters—Some fine specimens from Mr Wm. Bacon.

Balsams—by Messrs J. J. Low, Hovey & Co., S. R. Johnson and Wm. Bacon. An extra fine single specimen was exhibited by Mr Sprague.

Native plants by Mr E. Wight.

Roses by Mr Samuel R. Johnson.

Among the dahlias we noticed as extra fine flowers, Nimrod? in the stand of J. L. L. F. Warren; Dutchess of Richmond, by Hovey & Co.; Madonna, by D. McIntire; Marquess of Lothian, by P. Barnes; Queen Victoria, by J. J. Low, and Juliet, by S. Walker.

Stramonium —? by Dr Robbins, of Roxbury.

For the Committee,

S. WALKER, Chairman.

## EXHIBITION OF FRUITS.

Saturday, Aug. 8, 1840.

Hon. E. Vose, Dorchester, exhibited superior specimens Shropshirevine and Early Harvest apples and Schyler's apricot.

From S. Pond, Cambridgeport, Pond's Seedling and Apricot plum.

From B. Guild, Esq., a fine pear, name unknown.

From E. M. Richards, Esq., Dedham, the following varieties of apples, all very fine specimens—Early Bough, Red Juneating, Sugar-loaf Pippin, Early Spice, Webb apple, Early Harvest, William's Favorite, Curtis's Early Striped, and Sops of Wine.

From A. Bowditch, Roxbury; Cattin Pears, also Bartlett Pears (unripe.)

From S. Walker, Esq., Roxbury; fine specimens Franc Real de Ete and Green Chissel pears.

From J. Hovey, Roxbury: a basket of very superior William's Favorite apples.

From B. V. French, Esq., specimens of Irish Peach apple.

From J. L. L. F. Warren, Brighton; fine specimens early Royal George Peach (open culture.)

The Messrs Winship, of Brighton, embellished the hall with very superior specimens of "Shephard trees" in full fruit. These valuable and ornamental trees should be more cultivated: they are perfectly hardy and need but to be better known to be fully appreciated. The Messrs Winship have at the present time the finest lot in the country. For the Committee,

JAS. L. L. F. WARREN.

## VEGETABLES.

Fine Water melons and fruit of the Egg Plant, from S. Sweetser, Esq., Woburn.

Early sweet corn, from J. L. L. F. Warren, Brighton.

From E. M. Richards, Esq., Dedham; the finest specimens of the fruit of the Purple Egg Plant ever exhibited at the rooms: they attracted much notice.—It is hoped that more interest will be felt for the future in this branch of the Society's labors, and that the specimens may be increased from week to week.

J. L. L. F. WARREN,

Chairman.

## DESTROYING WEEDS.

It cannot be denied by any one, that those pests of good farming, noxious weeds, have increased, and are increasing, at a most frightful rate in nearly every section of our country. Insignificant in their appearance or results at first, the farmer treats them with contempt, but before he is aware they have obtained a hold on the soil, which enables the intruders to set him at defiance. The only safe course with weeds is to meet them early in the field, and allow them no rest until the extirpation is complete. When plants are propagated only by seeds, as charlock, stein krou, &c. they can be eradicated more easily, than when they are propagated both by seeds and roots, as johnswort, Canada thistle, elder, &c. If the seed of the first is not allowed to ripen, the danger is past, and consequently careful pulling will destroy weeds of this class; but where the roots retain their vitality, or in other words the plant is perennial, the labor of extirpation is much increased. In the Genesee country the stein krou has become so prevalent in the wheat fields, that comparatively little precaution is used against it, and as large quantities of wheat are

annually distributed from that section of the state to others for seed, the spread of that weed is of corresponding extent. So with the Canada thistle, that prince of noxious plants; it has become so extensively spread over most of the northern states, that enormous as the evils caused by its presence on a farm are, it excites little attention, and mixed with clover, timothy, or other grass seeds, is rapidly extending itself to districts and states hitherto exempt. As a first and important step, every farmer should resolve that no consideration shall induce him, to allow any foul stuff to perfect its seeds on his farm. Were this generally or universally done, the most effective cause of increase would be arrested at once. It is nothing less than suicidal to the prospects of a farmer, and inflicting great evils on those around him, to allow such plants as the thistle, johnswort, stein krou, charlock, sweet elder, everlasting, daisy, &c. &c. to ripen their seeds, and propagate unmolested on his premises. Weeds that cannot be pulled should be mown cut or beat down, in such a way that no seed can possibly ripen, and it should also be remembered, that all mutilation or injury done to the leaves or stems of a plant, have an effect in retarding the vigor or spread of the roots, and not unfrequently cause their destruction.—*Albany Cultivator.*

## REMARKS ON THE GENERAL PRINCIPLES OF HUSBANDRY.

1. Whatever may be the nature of your soil, and situation of your farm, remember, that there is no soil so good but it may be exhausted and ruined by bad tillage, and that there is none so bad, that cannot be rendered fertile by good tillage, even barren heath, if it can be ploughed and swarded.

2. The true art of husbandry consists in suffering no crop to grow upon your land, that will so far exhaust your soil, as to lessen the value of your succeeding crop, whatever profit such a crop may afford you.

3. To avoid this, suffer no one crop to grow two years successively, upon the same piece of ground excepting grass, and buckwheat, without the fertilizing aid of rich manures to support the strength of the soil; and even then, a change of crops will generally do best, excepting onions, carrots, and hemp.

4. Every plant derives from the earth for its growth, such properties as are peculiar to itself; this plant, when followed successively for two or more years upon the same ground, will exhaust the soil of those properties peculiar to itself, without lessening its powers to produce some other plants. The fact is most striking in the article of flax, which will not bear to be repeated oftener than once in seven years, and is common to all crops, with the exception of those noticed above.

5. To avoid this evil, arrange your farm into such divisions as will enable you to improve all the variety of crops your land may require, in such regular succession, as to form a routine of five, six or seven years, according to the nature, quality and situation of your farm.

6. This method will make poor land good, and good better. Try and see.—*Farmer's Cabinet.*

A correspondent of the Albany Cultivator gives the following cure for dysentery in horses: Put into a junk bottle one pint of good gin, and one oz. of indigo: shake well together and turn down the horse's throat.

## NOTICES OF FARMS, &amp;c.

Gov. Hill, editor of the Farmer's Monthly Visitor, gives an interesting and instructive account of the farms he visited during a recent journey made by him in Maine, New Hampshire and Massachusetts, from which we make the following extracts.

*Judge Hayes's Farm, South Berwick, Me.*

Passing the boundary of New Hampshire and coming to the State of Maine, we could not decline the invitation of that eminent lawyer-farmer, Judge Hayes, of South Berwick, to ramble again in fair weather over his extensive premises, a view of which in a foul rainy day had given us so much pleasure a little later in the summer of last season.

The Judge informed us that his crop of Black Sea wheat the last year measured fortyone bushels to the acre, and that his spring rye, the seed of which he obtained about ten years ago from the Rev. Jeremiah Barnard, of Amherst, being a kind of rye better than he had ever seen elsewhere, produced full thirty bushels to the acre. His wheat and rye of the present year were sown on ground which produced corn and potatoes last year: if they shall escape blight, rust, and the grain worm or weevil, we cannot doubt the present crop will be at least equal to the last. The rye was already in the head and in full bloom: it stood thicker and heavier on the ground than any field of spring grain we had yet seen. The wheat, which was sown about the 20th of May, had not come to the head on the 3d July; but it covered the ground in rich evenness at the height of about twelve inches, and left no room for the appearance of weeds or any other growth.

The situation of Judge Hayes's house is one of the most delightful that could be imagined. The yards about his mansion and the farm buildings are all ample to their intended purposes: every thing is clean and neat, and there is room to give every article its proper place. The ascent to the house from the road is by successive flights of steps, leaving room for the disposition and display of elegant flowers and shrubbery. Fronting the house on the opposite side of the way is a hay field of twenty-two acres. This ground is naturally of the lightest soil—the knolls upon it have suffered much from the drought of the present summer; but much of the land will this season produce two and some of it three tons of hay to the acre. The road fronting the buildings and leading in the direction of York, pursues its course on the side hill in a circular or half moon shape. At suitable intervals the gutters of the street are turned upon the mowing ground below, by means of bridges and ditches; the value of the irrigation from this source is seen in the addition of at least half a ton of hay growing upon the ground of each overflow.

Directly in the rear of the dwelling house, is a clean and neat kitchen garden, furnishing all the esculent varieties usual in the most extended gardens, with the due portion of currants, gooseberries, etc. In the rear of the garden is an elegant little orchard of grafted apples, from which were sold one hundred dollars worth the last season, after laying in an ample family supply. This orchard is cultivated and was this year growing a crop of oats, which were even and of vigorous growth.

Two acres of ruta бага on Judge Hayes's farm looked far better than any crop of the kind we had seen during the present year. They were put into the ground with Willis's new seed sower, and

fail not to show the advantage to be derived from that valuable agricultural implement over hand sowing, or any other machine within our knowledge. The advantage of this sower is that it operates well on uneven ground and among grass tufts and even rocks, and that it puts seed into the ground in just such quantity as may be desired. The distance of rows may be regulated at pleasure. Judge Hayes, in strong, well manured ground, has placed his rows of ruta бага twenty inches apart.

Judge Hayes has a corn and potatoe field of some twelve acres which had been laid down several years to grass and pasture. His method is to alternate from Indian corn and potatoes to grain and grass and afterwards to pasture. On this ground of the abundance of manure which he makes he spreads at the rate of thirty to forty loads to the acre. The potatoes look remarkably well; but some of the Indian corn failed to come up; some of it was eaten down by the grub after it had come up; and as a whole it looks inferior to many other fields we had seen.

*Reclaimed Meadows.*

We had a more extensive ramble over and view of Judge Hayes's reclaimed meadow than we took at our former visit. This meadow lot consists of about fifty acres, leaving two clumps of eight or ten acres of the higher part grown into wood. The ground was sour meadow, a portion of which had been mowed for a succession of nearly two hundred years: his farm is one of the oldest settlements of the State of Maine. His method of reclaiming this meadow has been the digging one or more main ditches in the most convenient part which should receive and conduct off the water. Where the work of reclamation has been completed, transverse ditches about two feet in depth are placed at the distance of two rods from each other; the mud or earth thrown from the ditches is scattered over the surface between. Before the frost heaves the ground in the spring, sand or gravel is carted on to the amount of a hundred loads to the acre. The effect of this sand is to drive away the sour propensity existing in the surface soil, which is black mud from eighteen inches to three and four feet deep. To this sand is added eight or ten loads to the acre of warming compost or barn yard manure. The whole is harrowed down and clover and herds grass sown upon the surface. For the first three or four years the deepest of this muck soil produces constantly two and three tons of hay to the acre; and with cleaning out and digging down the ditches and spreading the manure once in every five years, Judge H. does not doubt the crop of hay may be kept up on this ground as long as "wood grows or water runs."

*The Manure Makers.*

The ingenuity and industry of Judge Hayes in increasing his quantity of manure, is not less worthy of our notice than it is to be imitated by all good farmers. He keeps up constantly a large family of swine, who as constantly do their day's work in the manure bed, as they eat their portion of daily food. There is an ample bed of black mud or muck in a field upon the hill not far in the rear of the barn or other buildings. From this bed at every convenient opportunity the mud is taken and laid about the yards of the barn, where it is trodden upon by the sheep and cattle; afterwards, with other quantities of mud in its crude state, this is deposited in the hog yards where great and little pigs are kept constantly at work. In this way the

quantity of good manure is annually increased several hundred loads; and Judge H. is able to sell several hundred dollars worth of hay without impoverishing his lands. In summer and early fall he partially sustains his hogs by means of boiled ruta бага thinned out of the growing field when of suitable size.

*Value of the Roller.*

He makes an extensive use of the roller upon ploughed grounds. He stated as a fact which we think to be important to every farmer, that his grass seed had never failed where the ground was laid down with the roller. This instrument, but little used, we consider to be of great value either to wet and heavy or to light and sandy ploughed grounds.

*The Ryal Farm, Medford, Mass.*

This farm has been so long tenanted by its present occupant, that he cannot help treating the premises as his own. The milk of forty to sixty excellent cows has for thirtyseven years poured in a stream of wealth to the occupant of these premises, after furnishing the means for the payment of rent and generous wages to the hired help. Nathan Adams, Esq., the tenant of this farm, seventy-six or seventyseven years of age, superintends it with only the aid of a grandson, who daily drives into the city and deals out the principal article of milk to the customers, some of whom have continued thirty to forty years to receive their supply from the same place. The fine land composing the pastures and mowing grounds of this farm, is situated upon the north side of Winter Hill, known as the encamping ground of Burgoyne's army after it capitulated at Saratoga. Mr Adams was absent in Boston when we called. His lady, 70 years of age but as active as some girls of sixteen in household affairs, informed us that she had under charge, with two female assistants, ten hired men engaged in haying. These men used and were furnished with no ardent spirits. Six pounds of meat were daily measured to be used for the family; to this was added all the lighter food that the appetites of the laborers required. The hired men were furnished at this season with their meals five times a day, of which was a lunch in the field forenoon and afternoon. Five men in winter and ten men in summer were employed on the farm. The forty cows were milked by the men morning and evening within the space of half an hour. Excepting where there was more milk than would supply customers, no butter and cheese were made.

The Ryal farm, which consisted originally of three hundred acres, has been subdivided into two farms; a son of Mr Adams occupies that part nearest the top of Winter Hill; he now keeps his twenty to thirty cows, and employs seven hands in haying time. Under the improving system which has for so many years been practised by the tenants of this magnificent farm, division and subdivision have the grand effect of giving a greater profit to the lesser amount of land cultivated by the individual—a principle that, we trust, is hereafter to be extensively realized in the farming of New England.—What more could an ordinary farmer desire than has been realized by the tenants of the Ryal farm during the last fifty years? If they had been the exclusive owners, they could not have done better; they might not have done as well. Their kind treatment of the land which they did not own, has been returned to them in that abundance which has made them happy and independent.

For the New England Farmer.

### THE BORER.

MR BRECK—Sir—Permit me through the columns of your most useful paper, to lay before your readers some facts respecting that most destructive insect called the borer. I am sensible that much has already been said in relation to this insect; but, as the saying is, it may not be amiss to "stir up the minds of some by way of remembrance," being aware that this insect and fruit trees are too much neglected.

As to the origin of this insect, almost all who have ever written respecting it, have widely differed. Some have supposed it originated in the manure, and have therefore prepared a compost of several ingredients to put about the roots of the tree, in order to nourish it, and provided there were any of them in the manure which was put into the compost, thereby kill them. Again others have supposed that they originated from the fruit which falls upon the ground before ripe, and leaving that it commences its attack upon the tree; and therefore in order to secure themselves in this respect, they have taken pains to pick up once a week all the fruit which falls from the tree before it is ripe. And finally such is the diversity of minds in respect to the borer, that to enumerate them all and enter into particulars respecting them, would fill a bulky volume. Therefore I will pass over the opinions of others on the subject in question, and proceed to give my own. That the borer does not originate in some degree in the manures put about the tree, I am not disposed to deny; indeed, I think it very probable that such is the case, from the fact that all manures contain more or less worms; and as a safeguard, I think it highly commendable as well as beneficial to secure the tree about the roots with a good compost made of something which will destroy the insect and prevent the injury which would, as a natural consequence, result to the tree.

Again that the borer does not originate from the windfalls which lie about the roots of the tree, I cannot deny, although if this is the fact, I have never learned it from practical experience. However as it is not impossible that the insect may originate in this way, I think it would be well to be on our guard, and secure ourselves by picking up all the apples which fall from the tree; and if we do not in this way prevent the depredations of the borer, I am sensible from experience that we shall secure our trees from various other insects, which if the fruit was not gathered up, would in the course of the fall or the next year, appear again to make their ruthless attacks upon the fruit if not on the tree itself.

I have said that I did not deny but that in some degree the borer originates from the manures put about the tree, or from the fruit which falls before it is ripe; but that they originate *solely* in either of these ways, I do not, I cannot believe; because I have extracted borers from the tree, from the roots upward to the height of ten feet. Now if they originate from the manures altogether, how does it happen that they get so high up on the tree, especially when there has been no manure put about the tree for a year, and are found also at the small size of a half inch in length? If they had been in the manure when it was put around the tree, they would have commenced their depredations before, and been of a larger size than half an inch in length. Again, that they originate in the fruit altogether, is a great mistake, as I have found a vast many in

trees which did not bear at all, and those too of a very small size.

But you may ask, from what then does it originate? That is more than I can tell; but I can tell you what I think about it. I think by what I have seen myself and learned from others who were acquainted with the borer, that in general it originates from a certain insect, (of what description I cannot tell,) which in the month of June deposits an egg in the bark of the tree, in various places, which egg in the month of July hatches, or in other words becomes a worm, and that worm is the borer. What makes me think that the borer originates in this way is the fact that soon after washing my trees with potash water, as I was one day examining them, I perceived several small yellow spots upon the bark of the tree, about the size of a pin head, or a little larger it may be, and being led by curiosity to examine them, I found they contained a worm, but at the same time I had no thought of the borer, as it was altogether out of the season to find any, excepting those which had remained in the tree during the winter. But as time passed on, I was again looking at this tree on which I saw the spots; when to my surprise I saw that the yellow spots were gone, and in their stead there were holes. I took my knife and made search, when to my greater surprise, I found that the very small worms I had found before, were now borers, three quarters of an inch in length, and had commenced eating very voraciously between the bark of the tree and the wood. Finding there were many in the trees, though hardly perceivable, I went to the shop and selected as an instrument for extracting them, a gouge, one half inch in width, which I found upon usage answered my purpose well, and if I remember right, I at the time extracted as many as fifteen borers from one tree—three old ones and twelve small ones, and since then I have taken out several more, some of which were higher than I could reach without climbing; still later I have examined more trees, and though I have found none so bad as the one above mentioned, yet I perceive, as the prospect is now, that it will be a fine year for them, I have written this, in order that the farmer and gardener might be on the look out, especially for the young borers: if attended to in season, their extraction may be accomplished without apparently injuring the tree. The first time I attended to the borers was on the 28th of July last, and more or less ever since; and though September is thought to be the best time to attend to them, I think farmers will do well to attend to them as much before that time as is convenient.

If any one would like to see the tree out of which I took so many borers, and at the height I have stated, they can gratify their curiosity by calling on me at Mr Samuel Kidder's, in Medford, as I will with pleasure show them the tree; and if any one can give better proof that the borer originates in any other way than that which I have stated, I should like to hear from them.

Yours, in farmers' love,

JAMES M. HARTWELL.

Medford, Mass., Aug. 6th, 1840.

[REMARKS BY J. B.—Our correspondent is right in his conclusion about the origin of the borer. The subject is now generally well understood by practical horticulturists, and by timely care their trees are preserved from the depredations of this destructive insect. It requires patience and perseverance

to keep them under subjection, and they are, therefore, truly considered a great evil.

There are other instruments quite as effectual as the gouge or crooked wire for the destruction of the borer; and these are the bill and long tongue of the little speckled wood-pecker. Let these birds be encouraged, and much of the labor of the horticulturist is prevented. A friend of ours told us he would not have one of these birds killed for five dollars, and that he suffered no loafer to enter his premises with a gun, and considers the man or boy who injures a bird in the same light as if they robbed his purse.]

For the New England Farmer.

### CIRCULAR LEAD TROUGHS.

MR EDITOR—The several articles which have appeared in your paper of late relating to troughs made of lead or tin, applied to the apple tree to aid in the destruction of the canker worm, bring to my recollection the fact that similar troughs made of lead, were used in this vicinity in the years 1833 and 1834; and I believe in other subsequent seasons. I used them myself of lead in a circular form, applied to the tree in the manner described by Dennis; excepting that I did not leave so large a space between the lead and the tree as he mentions. Where the troughs were properly fitted and care was taken to keep them properly supplied with oil, they constituted an effectual guard against the progress of the insect, and prevented their going upon the tree. The first season I used these troughs, I was much pleased with them, and recommended them to others. They were used at the same time by Wm. Sutton, Esq., of Salem, and others. Subsequently I observed that the bark upon the trees, where the troughs had been fastened, appeared to have been injured. Wherever they pressed against the trees or wherever a nail had been inserted, it became discolored, and peeled off. Some of the wounds thus occasioned have not yet entirely healed. And I have since concluded that the danger of permanently injuring the trees by the use of such troughs, was greater than the advantages to be gained by obstructing the progress of the canker worm. As yet I have seen no preventive so effectual as tar, when properly applied. If care is taken to apply bark or cloth to the tree before the tar is put on, and to remove it at a proper time, there will be little danger of injury by this application. I have no desire to interfere with any man's patent rights, but was very much astonished when I saw in your last paper a description of the article patented, because I think it is not a new invention.

Respectfully, your obt serv't,

J. W. PROCTOR.

Danvers, Aug. 1st, 1840.

The annual Cattle Show, Exhibition and Fair of the New Haven County Agricultural and Horticultural Societies, will take place about the first week in October. The exhibitions of these Societies last year gave a start to the interest already beginning to be felt in the community; and the exhibitions of 1839 will long be remembered as an era in the cause of agriculture. We are informed that arrangements are in progress by both the Societies, which taken in connexion with the uncommon fruitfulness of the present season, will render the exhibition highly attractive.

## NEW ENGLAND FARMER,

AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, AUGUST 19, 1840.

HENRY L. ELLSWORTH, Esq.,

Commissioner of Patents at Washington.

We have too high a personal respect for this gentleman, and too much self-respect, to use in speaking of him the language of flattery; but we have no hesitation in saying that agriculture has not in the United States a more efficient or devoted friend. He is full of information on every topic connected with it. He is taking all possible pains to extend his correspondence in all directions on the subject. He lays under contribution all foreign ministers and agents, all our navy officers visiting different parts of the world, and all the members of Congress and strangers visiting Washington to transmit him the most valuable plants and seeds which can be procured. He has already made most extensive collections; and after reserving samples for exhibition, he places the remainder in the hands of those who will be likely to give a fair trial and a good account of them. He is familiar, likewise, from his situation, with the various patented and improved implements of agriculture, of which models are deposited in his office; and upon some of which he has had experiments tried with a view to test their utility. Every friend to an improved agriculture ought to lend him, as far as practicable, his aid. No man is more accessible, and his objects are wholly disinterested and public. Agriculture is the great interest of the country, without which every other must languish, and upon whose success absolutely and entirely depends the prosperity of every other. H. C.

## MURRAIN AMONG THE CATTLE.

At the west, many instances have occurred this season of a fatal disease among their stock, which baffles as yet all remedy. The cattle are taken, say at night; their eyes seem fixed; they lose all energy; and are dead by the next day. We have not heard of any scientific examinations; but the farmers who have opened the bodies of their animals, report that they perceive no local inflammation, and are wholly unable to detect the secret of the calamity. Such cases as these, in connexion with an interesting case reported to the New England Farmer, from Andover, in a recent paper, of the unaccountable death of three calves, show most emphatically the importance of the veterinary art. We constantly lament that the term *cattle doctor* should be considered degrading, though we cannot feel surprise at it, when we know the miserable and contemptible quackery which is continually practised by the stupid and ignorant jackasses who undertake to practice in this line. We want a veterinary school, in which the science of comparative anatomy and the diseases of the brute creation shall be as thoroughly studied as those relating to the human frame and system. It would open a noble field for science. It might be made a highly lucrative profession in any populous part of the country. Real science and skill would place the profession on a level with other liberal professions, and the actual gain to humanity would be immense. A merciful man is merciful to his beast; and whoever considers man's dependence upon the brute creation, and the obligations he is under to them for service, and labor, and food, on the principles of the plainest justice and duty, to say nothing of his own interest, will feel bound to do whatever he can for their health, comfort, and welfare. H. C.

## WHEAT IN THE WEST.

The crops of wheat in Illinois are almost universally cut off by the rust; and in many cases are not deemed worth the gathering; so that the farmers have turned in their swine upon them. In general, however, there is an ample supply of old wheat on hand; and the price which in many places is now only forty cents, is not likely to rise above fifty cents.

In Michigan the crops were never finer nor more abundant. The supply will be immense and prices must remain low.

In Ohio the crops are abundant and excellent, at least in western Ohio; we are not so well informed as to the river towns. Speculators, however, are penetrating the country in all directions, and seventy cents are demanded and obtained on the shores of Lake Erie. This is for the New York market; but so long as flour remains at four dollars and a half, the millers cannot afford to pay seventy cents and the expense of transportation. The state of the currency, however, greatly avails them, for New York funds will purchase Ohio and Pennsylvania funds at ten to fifteen per cent. discount, and Michigan currency at fifteen to twentyfive. The farmer has no help for this, and in his fortunate ignorance, he does not always perceive it. H. C.

## SLOVENLINESS OF FARMERS.

We do not know whether this is peculiar to farmers; but as our business is with them, we shall let other classes take care of themselves and speak of the farmers only. We are frank to confess that in this respect a great improvement has taken place in the country. But how much room is there for still farther improvement. Look at the wood piles, at the barn yards, at the door ways of many of our farmers; piles of decayed logs; old sleds, old carts, old tools, hoes, shovels, broken forks, old crockery; and five hundred other unmentionables clog up every passage; manure enough is wasted every year to enrich acres of land; and commonly in such cases the hogs and the fowls have as regular ingress and egress into the back door and the front door, as if they belonged to the house: in truth, we have seen certainly in one case, the pig and the child laying down together in the same entry, in the full enjoyment of the *otium cum dignitate*. H. C.

## DITCHING AND DRAINING.

The season of autumn, and of drought especially, is the season for ditching and draining our low lands. For a full account of the improved methods of Scotch draining, we beg leave to refer our readers to the appendix to the Third Report of the Agriculture of Massachusetts, (published in No. 5 of the present vol. of the Farmer,) which we are persuaded they will read with interest and advantage. The method of tile-draining there explained, can scarcely be expected to be adopted by our farmers with small means; but that of draining with small stones is feasible and to be strongly recommended. Covered draining, where it will answer, is always to be preferred to open draining. In making an open drain, be sure to leave the top at least twice as wide as the bottom; making the banks of an even and exact slope; and be sure, likewise, not to leave what is taken out of the ditch on the banks of the ditch in heaps through the coming winter, to assist them in caving in; or to remain overgrown with grass in unsightly heaps for years, to interfere with the scythe. What you undertake to do, do well. Finish one job before you go to another. These we believe are wholesome rules. Give them a fair trial, and then if they do not answer, condemn and renounce them. But first try them.—H. C.

REPORT ON THE GEOLOGICAL AND AGRICULTURAL SURVEY OF THE STATE OF RHODE ISLAND, made under a resolve of the Legislature, in the year 1839. By CHARLES T. JACKSON, M. D. pp. 312.

By the politeness of Wm Rhoda, Esq., of Providence, we have been favored with a copy of this work, but have been waiting for the return of Mr Colman, who we thought would do better justice to it than ourself;—as he is yet detained by sickness at the west, we take this opportunity to commend the work as highly creditable to the State for causing the survey, and to the author for his success in producing so valuable a result to his labors. We think it not only interesting to the State, but to the community generally, and a good appropriation of money which was made for this object.—We trust ere long that surveys of all the States will be ordered, that we may have a complete and full geological and agricultural survey of the Union. We shall hereafter extract liberally from this report, for the benefit of our readers. J. B.

## MASS. HORTICULTURAL SOCIETY.

EXHIBITION OF FRUITS.

Saturday, August 1, 1840.

[For reports of the two last exhibitions, see another page of this day's paper.]

By Capt. Sever, Dorchester—Early Harvest apples.

By John Hovey, Roxbury—Early Harvest apples—very large and fair.

By C. Golderman, Chelsea—Black Hamburg grapes and figs.

By B. V. French—Early Harvest, William's Favorite, Sopsavina and River apples; also two varieties of pears.

By E. M. Richards—White Juneating, Early Spice, Early Harvest, Early Bough, Red Juneating, William's Favorite, Early Striped and Red Astracan apples.

For the Committee,

E. M. RICHARDS.

Tomatoes and an early pumpkin were exhibited by A. D. Jones, Brighton.

## MASS. HORTICULTURAL SOCIETY.

NOTICE.—The Committee of Arrangements for the annual exhibition, are respectfully requested to meet at their rooms, 23 Tremont Row, on Saturday next, at half past eleven o'clock, A. M.

Per order,

S. WALKER, *Chairman*.

THE Committee on Flowers of the Massachusetts Horticultural Society, will hold a special meeting at their rooms, on Saturday next, 22d inst. at 12 o'clock M. A punctual attendance is requested, as business of importance will be brought before them.

Per order,

S. WALKER, *Chairman*.

Boston, Aug. 15th, 1840.

Grasses.—Vast provision has been made in the multitude of grasses, for the support of the gramivorous races of animals. More than eighteen hundred species have been described by botanists; more than three hundred are ascribed to North America; and more than one hundred and twenty are found in the State of New York.

A correspondent of the New Genesee Farmer says that cows may be fed on ruta bagas without imparting a turnip taste to the milk and butter, if they be not allowed to feed on the roots within six or eight hours of milking.

**BRIGHTON MARKET.—MONDAY, Aug. 17, 1840.**

Reported for the New England Farmer.

At Market 325 Beef Cattle, 180 Stores, 35 Cows and Calves, 5200 Sheep, and 300 Swine.

About 1000 sheep unsold.

**Prices.—Beef Cattle.**—A few sales were made on Saturday at a trifle higher than our quotations. We quote the prices of today: First quality, \$5 75 a \$6 00. Second quality, \$5 25 a \$5 50. Third quality, \$3 75 a \$5 00.

**Stores.**—A few sales were effected at very unequal prices. We shall omit quotations until another week.

**Cows and Calves.**—Sales \$15, \$18, \$22, \$25, \$30, \$32, \$40, and \$45.

**Sheep.**—Dull. Lots \$1 25, \$1 33, \$1 62, \$1 88, \$2 00, \$2 17, \$2 25, \$2 33.

**Swine.**—Lots to peddle at 4 a 4 1-4 for sows, and 5 a 5 1-4 for barrows. Old hogs 4 and 5. At retail 4 1-2 to 6.

**THERMOMETRICAL.**

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northerly exposure, weeks ending August 16.

August, 1840. | 7 A.M. | 12, M. | 5 P.M. | Wind.

Day	10	53	78	67	N.
Monday,	11	56	86	71	S. W.
Tuesday,	12	64	80	70	S. W.
Wednesday,	13	66	76	72	S. W.
Thursday,	14	71	82	74	S. W.
Friday,	15	62	78	63	N.
Saturday,	16	60	72	63	S. E.

Four days of the week it was cloudy at 12 o'clock.

The fields, that a few weeks since were parched and dry, now present the freshness of spring, and there is every prospect of the latter harvest being abundant.

**SUPERIOR NEW STRAWBERRY.**

Hovey's Seedling, a new variety, originated in 1835, and now for the first time offered to the public, after a trial of three years, in a hearing state, has confirmed its superiority over every other variety. It belongs to the class denominated *Pine Strawberries*, and may be described as follows:

*Fruit*, very large, round, never coxcomb-shaped, even in the largest berries. *Color*, deep shining red. *Seeds*, inserted in a slight cavity. *Flesh*, scarlet, firm, abounding with a most agreeable acid and exceedingly high flavored juice. The vines are as hardy as the Early Virginia, having stood the severity of the several past winters unharmed; growth vigorous, and the fruit well elevated from the ground on strong stems. A full description of this seedling, with an engraving of the fruit, and some account of its origin, treatment, &c. will be given in the August number of the *Magazine of Horticulture*.

This strawberry was first exhibited at the Massachusetts Horticultural Society's Rooms in 1838, again in 1839, and also the present year, and each year obtained the Society's premium, although in competition with the Methven Keen's Seedling, Downton, &c. Gentlemen well acquainted with all the other varieties cultivated in this country, have seen the bed to full bearing, and unhesitatingly pronounce it the largest, finest, most productive and hardy variety they have ever seen.

The entire stock of plants is in the possession of the subscribers, not one ever yet having been disposed of, and they are now offered for sale, and will be ready for delivery on and after the 20th of August. All orders will be executed in the rotation in which they are received. Plants, \$5 per dozen. All orders from a distance, enclosing the amount for the plants ordered, will be immediately attended to, and the plants promptly sent to the direction desired.

Also a fine stock of plants, of the following sorts, all warranted genuine, or no charge.

Methven Scarlet, \$2 per hundred.

Bishop's Orange, \$5 per hundred.

Early Virginia, \$1 per hundred.

English Wood, \$1 per hundred.

All orders immediately attended to, and the plants speedily forwarded.

**HOVEY & CO.**

Agricultural Warehouse and Seed Store,

August 5. 7 Merchants' Row, near State st. Boston.

**BERKSHIRE HOGS.**

The subscribers offer for sale a few pair of full blooded Berkshire Hogs; also, pigs 7-8 blood, crossed with Mackay. Inquire at the New England Farmer office, or at their farm at Brighton.

**JOSEPH BRECK & CO.**

July 29.

**URATE AND POUHRETTE.**

An establishment for the manufacture of the Manures called Urate and Poudrette has been erected, at a considerable expense, in the State of New Jersey, near the city of New York; and an act of incorporation has been granted by the legislature of the State of New Jersey, by the name of "The Lodi Manufacturing Company," for purposes of agriculture, wherein it is provided, that 500 shares, a portion of the stock reserved for subscription by farmers and gardeners, within a limited time, shall be entitled to receive 50 bushels of Poudrette yearly for five years, viz. in 1840, 1841, 1842, 1843, and 1844, upon each share of \$100, which is at the rate of 20 per cent. per annum, for those years, and after that period to receive an equal dividend with the other stockholders.

The Manufactory has gone into operation according to law; a sufficient number of shares having been subscribed for that purpose, and capital paid in; and the first dividend has been regularly paid to the subscribers—the next dividend is payable in September. But the Company needs a larger moneyed capital than it now has, to carry it on to better advantage. Inquiries having been made whether all the stock had been taken, and the difficulty at the present time of obtaining funds, to a sufficient amount, from a few individuals, has induced a renewal of this notice to farmers and gardeners, and every other person who may have spare funds, (as every person is now permitted to subscribe,) that there is yet a considerable portion of the reserved stock, which, by law, is to receive 20 per cent. per annum, payable in Poudrette, one half in May, and the other half in September, in the years 1840, 1841, 1842, 1843, and 1844, not yet subscribed for, and the books are now open to receive subscriptions for the same, by any person, whether gardener, farmer or otherwise, at the office of the Lodi Manufacturing Company, No. 72 Cedar Street, in the city of New York. Terms for the reserved stock, \$100 per share in cash; and for the other portion of the stock an instalment of \$25 per share on subscribing, and the residue (being \$75 per share) to be called in by instalments of \$5 per share, after thirty days notice.

These manures have been fairly tested and very generally approved of as being the cheapest and best manures, and more economically applied than any other known substance used for manure.

As the article can be furnished from the city of New York, only to a limited extent, (not more than sufficient to manure 35,000 acres annually,) it must follow, that in a few years it will necessarily be confined to the use of the stockholders alone.

It is important to agriculture, and the enterprise deserves the liberal support of every enlightened farmer. By order, WILLIAM M WILSON, Secretary.

At an election for Directors of the Lodi Manufacturing Company, held at Jersey City on the 6th day of July, 1840, the following persons were elected Directors of the Company, to hold their offices until the first Monday in October next, namely, Anthony Dey and Jacob C. Dey, of New York; J. D. Miller, Andrew S. Garr and Rodman M. Price, of New Jersey. August 12.

**Brighton Nurseries and Gardens. For Sale**

A large quantity of superior European and American Ornamental Trees, well calculated for public places, or private grounds, with Fruit Trees embracing a great variety of the most approved kinds and fine sizes. The trees, and all other productions can now be selected and marked, and will be for warded to any place as soon as it will answer to remove the same.

Also, forty kinds of Strawberry Plants, of the most approved European and American varieties.

Orders may be forwarded via. mail, addressed Messrs. WINSHIP, Brighton, Mass., or left with Messrs. JOSEPH BRECK & CO.

Brighton, August 12.

**BERKSHIRE PIGS FROM HAW'S STOCK.**

The subscriber has on hand a few litters, from some of the largest and finest sows in the country, sired by Loring's and other imported boars. Also, the smaller class of Berkshire pigs, which are very beautiful animals, and delicious porkers. Either of the above stocks will be disposed of extremely low by applying to

Z. STANDISH.

N. B. The pigs will be neatly caged and shipped at New York, without extra charge, if required. Unquestionable reference will be given for thorough breeding.

Albany, August 19. 41

**FENCE CHAINS.**

Just received from England, at the New England Agricultural Warehouse, 6 casks chains, suitable for making the chain fence, &c. JOSEPH BRECK & CO.

July 15.

**TRACE CHAINS.**

Just received, direct from the English manufacturers, 8 casks of Trace Chains, from 6 to 11 feet long, suitable for ploughing or draft chains. JOSEPH BRECK & CO.

July 15.

## MISCELLANEOUS.

## NEW ENGLAND.

BY HENRY W. ELLSWORTH, ESQ.

New England! New England!  
How beautiful thy vales—  
Where summer flowers are breathing forth  
Their sweets to summer gales;  
Where soft the wild note breaketh  
From out each dewy grove,  
When lone the night-bird chanteth  
Her even lay of love!

Oh! far beyond the surges wild  
That heat upon thy shore,  
Hath swept the paean of thy fame  
Old ocean's vastness o'er;  
And echoes far the triumph song  
Of that true-hearted band,  
Who gave their homes, their all for God  
And thee, my father-land.

It peals amid the palaces  
Of England's titled sons—  
O'er soft Italia's quivering wires  
Its magic music runs:  
From lofty peak and lowly vale,  
From islands of the sea,  
In joyous notes comes bursting forth  
That anthem of the free!

Majestic are thy mountains,  
Uptowering to the sky!  
Stern monuments that Freedom's hand  
For age hath piled on high!  
Forever may they guard thee,  
As now—the blest, the free—  
Bright Eden-land of nations—  
Proud home of Liberty!

And beautiful the silver streams  
That ripple o'er thy breast,  
In thousand forms meandering  
To seek their ocean rest—  
Aye beautiful! and may they twine  
Forever bright as now,  
A fadeless leaf of lustre round  
Thy clear unruffled brow!

We love them, for their legends tell  
Of deeds and daring true—  
How oft the hunter paddled there,  
War-led, his dark canoe;  
And oft, beside the mossy banks,  
'Mid scenes that linger yet,  
The Indian maid—sweet nature's child—  
Her Indian lover met.

And these are gone—but fairer forms  
Still rove beneath thy skies,  
Whose priceless worth and trusting love  
Gleam forth from laughing eyes:  
Thy daughters! like sweet flowers of spring,  
Bloom 'neath thy fostering care,  
Through coming time, as now, to be  
Thy treasures, rich and rare.

Thy sons! what cline that knoweth not  
The noble and the brave!  
The tamers of the stubborn earth—  
The rovers of the wave.  
Aye! dearly do they love the land  
Their fathers died to gain;  
Their pride, its glory fresh to keep,  
Its honor bright from stain!

New England! New England!  
God's blessings on thee be;  
And ever on those cherished ones  
Fond memory links with thee!  
From this fair land, whose spreading skies  
Like thine, a glory wear,  
My spirit turns to breathe for thee  
A blessing and a prayer!  
Indiana, April, 1840.

BIRDS.—“We often mistake our friends for foes.”  
—How often the woodpecker is shot for his supposed injury to fruit trees, when in fact he is only destroying the vermin which are destroying the tree. And blackbirds, bobolinks, &c., are often shot by boys, because they once in a while pick up a kernel of grain, when perhaps, if left to live, they would destroy worms and insects that would destroy bushels. Even the crow I believe does more good than harm; and instead of a bounty for killing him, there had ought to be a fine. I recollect ten or twelve years ago that the white grub worms were so plenty as to destroy half the grass in some fields. The crows at that time were very busily employed in hunting and digging them for food. Few other birds have the strength of body or form of bill to take them. Did they no good in this? No doubt they saved us many tons of grass in this town; and a little ingenuity in putting up images will save our corn from their ravages. But supposing (which is not true) that some of these feathered songsters do injure us in a pecuniary way:—do we wish any species of them extinct, as the crow, the blackbird, &c.? No! We all I hope, love to see and hear them; for they were made by our common Creator, and have the same right to “vindicate their grain” that we have.—*Farmer's Monthly Visitor.*

## TO NURSERYMEN AND GARDENERS.

A well established Nursery and good Vegetable Garden, situated in the State of Massachusetts, near a market for vegetables, and where there is a good demand for trees, together with every convenience for a man with a family, will be let on accommodating terms to a good tenant for a term of years. Address a line stating name and reference (post paid) to J. P. MERRILL, care of Messrs. Breck & Co. Seedsman, Boston, previous to first of October.  
August 12

## BUDDING FRUIT TREES.

Cuttings of fruit trees for budding, comprising nearly all the choice sorts of Apples, Pears, Plums, and Cherries, known and cultivated in this country or in Europe, all from bearing trees, can be packed in such a manner as to be sent with perfect safety to a y part of this country or Europe. Apply by mail to the subscriber, at the Pomological Garden, Salem, Mass.  
ROBERT MANNING.  
Salem, July 15.

## CASES OF TOOLS.

Just received from England, a few cases of superior horticultural tools, for gentlemen or ladies use, a splendid article in mahogany cases.  
JOSEPH BRECK & CO.

## SUPERB ROCKET LARKSPUR SEED.

The subscribers offer for sale a quantity of Superb Double Rocket Larkspur Seed, of their own raising, saved from double flowering plants only, embracing all the different colors. For fine, strong and early plants, the seed should be sown in August  
JOSEPH BRECK & CO.  
June 17.

## GARDENERS' KNIVES.

JOSEPH BRECK & CO. have this season imported and now offer for sale a few very superior Garden Knives, for pruning, &c. manufactured expressly for Gardeners, and warranted superior to any article of the kind before imported.  
Also—a large assortment of Budding Knives, Grape Scissors, &c. &c.  
April 22.

## STRAWBERRIES! STRAWBERRIES!

Those who are desirous of cultivating this delicious Fruit are respectfully informed that the subscriber has succeeded, after many years experimenting upon the Strawberry, not only in obtaining new varieties, but in ascertaining the best methods of cultivation. The subscriber would offer to the public, the present season, his *Selected Collection* consisting of seven varieties; they are such as have stood the test of a fair trial for seven years and are all grown by the subscriber.

Specimens of his Fruits have been exhibited every season at the Massachusetts Horticultural Rooms, and have always commanded an extra price in Faneuil Hall Market.

*Warren's Seedling Methven*, a new and valuable kind, a free bearer, fruit very large and juicy; fruit measuring  $5\frac{1}{2}$  inches has been exhibited the present season. This variety can be warranted to be one of the finest varieties grown, and will produce as fine fruit and as large quantity, with the same cultivation, as any other ever offered, although some may ask the *modest* (!) price of \$5 per dozen. The price of this Seedling is \$5 per hundred plants.

*Methven Castle*—Fruit extremely large, high flavored and showy; specimens of this fruit have been shown this season six inches in circumference. This variety can be said to be very excellent, (when the true kinds is obtained); it is one of the largest late varieties known, profitable and highly worthy of cultivation, all that some growers may say to the contrary, notwithstanding. Price \$3 per hundred plants.

*Keen's Seedling*—A very superior variety, fruit very large, rich dark color, and uncommonly high flavored; has always been considered by English cultivators the best grown. Price \$3 per hundred.

*Royal Scarlet*—Fruit long oval shaped and juicy, very free bearer and very hardy. Price \$2.

*Hautbois*—Fruit larger than English Wood, exceedingly numerous, sometimes yielding 100 berries to the plant. Price \$1.

*Early Virginia*—This is known to be the earliest and best fruit for market, a free bearer, and very hardy.—Price \$2.

*English Wood*—Fruit well known for years. \$1.

N. B. Those who are desirous of cultivating this delicious fruit, would find it for their interest to visit the gardens and see the method of cultivation, and satisfy themselves that they can obtain their plants from first hands, for it is too often the case that large and attractive advertisements are sent forth to the public by dealers in plants, when at the same time they have never grown the kinds offered for sale, and know but little about their cultivation. Attention to this by purchasers, if possible, will save much time and money.

Every plant sent from this garden will be warranted to be free from mixtures, and shall also be young and healthy, worth the price paid for them.

All orders directed to the subscriber, enclosing the amount for the order, or with a good reference, shall be promptly attended to, and the plants carefully forwarded agreeably to directions.

JAMES L. L. F. WARREN.

Nonantum Vale, Brighton, July 25, 1840.

Orders directed to J. BRECK &amp; Co., will be executed with despatch.

## TIE UP CHAINS.

Just received at the New England Agricultural Warehouse, a good supply of those celebrated Chains for tying up cattle. These chains, introduced by E. H. Derby, Esq. of Salem, and Col. Jacques, of Charlestown, for the purpose of securing cattle to the stall, are found to be the safest and most convenient mode of fastening cows and oxen to the stanchion. They consist of a chain which passes round the animal's neck, and by a ring attached to the stall, plays freely up and down, and leaves the animal at liberty to lie down or rise at pleasure, and keeps him perfectly secure.  
July 15. JOSEPH BRECK & CO.

## PATENT SPRING BALANCE.

A few of those very convenient spring balances, for family use, a very simple contrivance for weighing small articles. JOSEPH BRECK & CO. No. 51 and 52 North Market Street, Boston.  
July 15.

## THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at \$3 per annum payable at the end of the year—but those who pay within sixty days from the time of subscribing are entitled to a reduction of 50 cents.

### RHODE ISLAND AGRICULTURE.

The subjoined extracts from Dr Jackson's Report on the Geological and Agricultural Survey of Rhode Island, will we think be read with interest and profit.

#### Report of the Farm of Hon. Job Durfee, Tiverton.

Farm consists of—ploughed land, 22 acres; grazing 47, mowing 46, orchard 4, wood 30, peat and unreclaimed swamp 10. Total, 159 acres.—Value of land per acre, \$100. Soil, generally stiff loam.

**Crops.**—Indian corn 400 bushels—40 bushels per acre; manured with ten large ox loads of fish compost and barn yard manure. Wheat 14 bushels—20 bushels to the acre, blasted; land manured with fish in 1838. Barley 50 bushels to the acre—injured by the fly. Oats 334 bushels—56 bushels to the acre; not manured the present year; the crop followed Indian corn. Mangel wurtzel 362 bushels—1086 bushels to the acre. Turnips 250 bushels, grown among corn. Hay 46 tons—one ton to the acre.

#### Stock.

Horses,	2, raised 2, valued at	\$140
Oxen,	6, do 4, do	360
Cows,	8, do 8, do	240
Sheep,	100, do 100, do	200
Swine,	12, do 12, do	
Young stock,	12, do 12, do	130
Poultry,		50
Wood,	12 cords.	

#### Produce.

Beef, butter, cheese, milk and wool not estimated.	
Wool, 3 pounds to the fleece.	
Corn estimated,	\$400
Wheat,	20
Oats,	133
Barley,	40
Potatoes,	70
Turnips,	60
Beets,	70
Pumpkins,	15
Hay,	700

1st Question.—What agricultural experiments have you made? (See below for answer.)

2d. What is the results of your researches or observations concerning the use of lime as an amendment to soils, or as an ingredient in composts? I have made no experiments with lime.

3d. Have you used ashes, live or spent, or hard coal ashes, as an amendment, and what is the results of your experience?

I have used spent ashes occasionally, to a limited extent, and as far as my observation extends, with favorable results.

4th. Have you made use of peat for manure, alone or in compost, and with what results?

I have used an imperfect peat, or rather swamp mud, with fish and turf. The compost made a ma-

nure much quicker and more active than any other that I have used, but I doubt whether it will carry a crop to maturity so steady as good stable manure. It does best in wet seasons.

5th. What is your opinion respecting the use of a compost made of 4 cords of peat, 2 cords of stable manure, and 4 casks of lime, well mixed, as a compost manure? Will you please to try it?

To this compost I would add sand, especially if to be used on a close, heavy soil. I have never tried this compost, but certainly think it highly worthy of a trial.

6th. What are the relative values of fish and stable manure?

Fish manure is more active and quicker than stable manure. Fish used alone, exhausts itself in three or four years, unless the crop be consumed on the ground. After being used on corn, it throws up a great crop of grain, (if grain follow,) but the new meadow is too frequently light. Its use should be continued on the new meadow. I cannot speak definitely of their relative values.

7th. Have you used rock weed, ribbon weed, and eel grass for manure, and with what results? I have used rock weed, and eel grass, in composts of the barn-yard, &c., but never alone.

8th. Have you tried any experiments respecting the use of muscle or marsh mud, or of ground oyster shells, clam shells, or ground bones, as amendments to soils?

I have used broken clam shells, the remains of Indian feasts; I think with good effects, but cannot speak definitely. I am beginning the use of marsh mud, but am not as yet able to speak of results.

9th. What means do you use for the prevention of smut in wheat, and to what results do you arrive?

I have steeped my seed wheat in brine for 7 hours, and then lined it, to no effect. I have steeped it for 16 or 18 hours, and then rolled it in ashes, with apparently some beneficial result, but have found no effectual remedy.

10th. What crops are the most profitable to raise on your farm?

Indian corn, oats, barley. (See remarks.)

11th. What is the value of your produce in market?

See the estimates I have put upon the several products.

12th. Do you save the liquid parts of your manure by any vat under your stalls or stables, and have you made any experiments as to the value of such manure? Please mention the results.

I must answer this question in the negative.

#### General Remarks.

In my estimate of the quantity of ploughed land, I include that sowed with grain. My estimate of mowing land includes only meadows.

In my estimate of the quantity of Indian corn raised, I include some raised in my orchard; in ascertaining the average to the acre, I take no note of the orchard land, for I am not able to ascertain what portion of it was planted, it having been

planted with corn only where open to the sun. In fact, for this season, I doubt not that my estimate of this crop is large; but to estimate it at less would deceive. The average, even as it now stands in the return, is much below the common average. I was greatly disappointed in this crop the present year (1839.) I attribute my disappointment to the violence of two gales in August, particularly to the first, which, though less violent than the second, was most injurious, prostrating my corn, which was of an early kind, when just in the milk. My Dutton corn suffered severely; it was not half a crop. Worms also injured the crop severely. I speak now with reference to that part of the crop raised on a newly turned sward. We took from an acre of old ground, where corn was raised the preceding season, fifty bushels, and one hundred bushels of French turnips, besides pumpkins. This was the last planted, and seemed to have suffered least from the winds. I do not think highly of the Dutton corn; nor do I think it generally a judicious practice, in our foggy climate, to cut up corn and shock it.

Our wheat was, up to the period of forming the grain, very promising; it then suddenly shriveled. Was this caused by the honey dew? There was not half a crop.

Barley, years past, was our most valuable grain. It is now a very uncertain crop, owing to the ravages of an insect, the egg of which is deposited in the growing stalk.

The oat crop may appear large, compared with my other crops, but we have measured not only the product but the land, and the return is rather under than over the true amount. The quantity given is the quantity actually taken up. There could not be less than double the quantity usually sown shelled out before it was stacked, and thus entirely lost. From one lot consisting of about an acre and a quarter, we threshed out and measured ninety-six bushels. This was corn land last year, and was then fished at the rate of thirty barrels to the acre, in addition to the usual manuring.

#### Report of the Farm of Gideon Spencer.

DR C. T. JACKSON—Dear Sir—Your blank form of a farm report was put into my hands sometime since, but in consequence of my having been employed the last year in other business than attending to my farm, I cannot fill the report with accuracy. I will, however, give you a brief account of my procedure in farming for about thirty years. In 1808, I commenced farming on the farm I now own, and which was previously owned by my father. I took no pains to make manure, and as was the practice among my neighbors, I milked my cows in the pasture, and let my hogs run in the road.—The land was not then very much exhausted, and we could raise from 15 to 30 bushels of corn to the acre, without manure. This I found was wearing out my land; and in the year 1811, I commenced a new course. I yarded my cattle, carted loam into my cowyard, shut up my hogs, &c., and the next season I planted a larger field of corn than usual, and put the manure all in the hill, and this greatly

increased the crop of stalks, but not much that of corn. I found this would not do, and as I had not manure to spread on a large field in one year, I came to the conclusion to manure a small one; and I carted on and spread twentyfive loads on one half an acre—on another three acres I put on nine; and I raised as much corn on the half acre as I did on the other three acres. I soon afterwards joined the R. I. Society for the Encouragement of Domestic Industry, and heard an excellent address delivered to the said society, by the Hon. Tristram Burgess, from which I received much instruction. My neighbors soon termed me "the book farmer," said that I was following up book recommendations, putting all my manure on to one small lot, and that I should soon have no farm to manage; I nevertheless persevered, and put 50 tons per acre on my corn land, and 15 tons per acre on my meadows, when I laid them down to grass, until I had 12 acres prepared in that way; since which, I have received two premiums from the said agricultural society; one for 102 bushels of corn raised on one acre, and one for a large crop of potatoes. Previous to making the improvement I cut but five tons of hay on my farm, and I now, and have for the last twelve years cut upwards of thirty tons of English hay yearly. A few years since I cleared up and underdrained a cold wet swamp of several acres, which until then had been considered of little or no value. It now produces yearly two tons to the acre. The last season I cut on another lot of one acre, over three tons, and the hay for one year sold in market would pay the whole expense of labor on the same. I believe I am on the road to still further improvement, and am waiting with some impatience for your report of the state survey, and as I am informed by one of the state committee of this survey, that the agricultural part of the survey thus far, can be considered no more than introductory, I presume our legislature will have it completed two or three years hence, when I hope to give you a more detailed account.

I remain yours, very respectfully,

GIDEON SPENCER.

Warwick, April 4, 1840.

*Report of the Farm of Joseph Childs, Portsmouth.*

Farm consists of ploughed land 21 acres; pasture 6; mowing 16 1-2; orchard 2 1-2; total 46 acres.

*Crops.*

Indian corn,	300 bushels on 9 1-2 acres.
Rye,	32 " 2 1-2 "
Peas, sold green,	100 " 1-2 "
Potatoes,	800 " 4 "
Onions, 24000 bunches,	1440 " 2 1-2 "
Mangel wurtzel,	200 " 3-4 "
French turnips,	200 " 1-4 "
Hay,	25 tons 16 1-2 "
Onion seed,	80 lbs. 1-4 "

*Other Produce.*

Apples, 75 bushels.	2000 lbs. beef.
Pumpkins, 6 tons.	2000 lbs. pork.
Cabbages, 200 heads.	300 lbs. butter.
Isabella grapes, 5 bush.	

Stock, gross value, \$385; viz: 2 horses, 2 oxen, 5 cows, 12 hogs, and 40 domestic fowls.

The cost per acre for the cultivation of each crop, I have no means of ascertaining. I use about 350 large ox-cart loads of manure per year, made from fish, sand, sea weed, green weeds, and the

barn yard and hog pens. For two years past I have put into the compost ten casks of lime, which I think has proved decidedly advantageous. I also spread upon the land from 200 to 300 barrels of fish, and 300 bushels of spent ashes. The charges for labor in 1838, which I think will be the same this year, were \$504, exclusive of the labor of myself and my wife, who do as much as can be expected from persons seventyone years of age.

*Questions.*—(See Judge Durfee's report.)

1st. I change my seeds often, and practice a careful rotation of crops with every thing except onions.

2d. Have used lime to some extent for two years and think it does well.

3d. I use 30 or 40 bushels spent ashes per acre, yearly, for onions and grain. They do best for dry land.

4th. Have no peat.

5th. [Not answered.]

6th. Have used fish for 20 years, and think 40 barrels spread on an acre, equal to eight cart loads of common manure.

7th. I use 30 to 40 loads of sea weed yearly, in the hog pens, mixed with sand, dirt, and all the green weeds I can collect. The compost is spread upon the onion and potato fields.

8th. I have not.

9th. I soak seed wheat two hours in strong brine, and mix lime with it while wet. This prevents smut, and assists the growth of the wheat.

10th. Onions are the most profitable crop at present: potatoes come next.

11th. This year, onions sold, delivered in New York, for 50 cents per bushel; rye \$1 16; wheat \$1 50; and potatoes 28 to 33 cents.

12th. My cattle are stalled in the winter. There is no floor to the stables, but they are provided with sufficient litter, sand, &c. to absorb all the liquid manure.

*General Remarks.*

I conceive there is a great deal of useful information to be obtained from the different agricultural journals. In our state, the land has generally been hard worn by constant cropping and light manuring. Much, however, may be done by every farmer, to restore fertility to his soils and increase their productiveness, if he will make good use of all his resources. Let him employ all hands every leisure moment in collecting weeds, leaves, and every article of which manure can be made, into compost heaps for spring use. Let him keep his crops carefully cleaned of weeds during summer, and after the early crops are got in, keep the weeds close, to prevent their going to seed, either by ploughing them in or removing them to his hog pens, and he may rest assured of a rich reward for his labor and care, in the increase of his crops.

(To be continued.)

*Cure for sore backs or galls in horses.*—Rub white lead in sweet oil until a good paint is made, and apply a coating of this to the injured place.—Milk will do where the oil is not to be had. It is one of the effective applications. Some for the same difficulty use a solution of vitriol in water, for a wash; but in most cases the white lead is to be preferred.—*Alb. Cult.*

*Milk.*—18 cows kept by Adam Antony, of North Providence, R. I., give 593 gallons of milk per year.

**RECENT INTRODUCTION OF VALUABLE PLANTS AND GRAINS.**

The most valuable plants and grains which now engage the industry and minister to the support of three-fourths of the world, are of comparatively recent introduction. Whilst the olive, the millet, and the silk, may be traced back to the ages of antiquity, the articles which now feed and clothe the inhabitants of the civilized world, have been more recently discovered by men of science, and brought into cultivation by the skilful agriculturist. A single generation has only passed away since a handful of rice, and a few seeds of cotton, were sown in Charleston, as a *curious*, and no doubt, regarded by many as an idle experiment. They are now such important staples, that they engage the commerce, and regulate, in a considerable degree, the monetary system of the world. The Irish potatoe which has been of the greatest consequence to mankind, was not known in Europe till the days of Raleigh, and found its way into England by a ship wrecked on the coast of Lancashire. During the many severe famines to which Great Britain has been subject, there is no exaggeration in asserting that the lives of millions of human beings have been preserved by this vegetable alone. It is but a little more than a century since the first coffee tree was brought to France, from which all of the trees in the West India islands have originated. The original sweet orange tree, from which all the varieties of that fine fruit in Europe and America have been derived, although a native of China, was shown but a few years ago at Lisbon. The writer of this article, has plucked fruit from the original tree, which produces the Sickle pear now cultivated both in Europe and America, as the finest variety of this fruit in the world. The tree, he believes is still growing in one of the meadows in the vicinity of Philadelphia. Nor is it in the power of any government, by its strictest enactments to prevent the dissemination of fruits, plants and seeds. If the ingenuity of man cannot accomplish it—the birds, the winds and the waves, will effect it. The cocoapalm is now growing on the sands of Florida the nut having been floated from Cuba by the waves of the sea. The sea grape, the shore plum, and more than a hundred other species of West India plants, not omitting the mahogany, have been carried thither either by the winds or the birds. The white headed pigeon is known to visit Cuba every day, whilst it is breeding along the Florida coast, and thus becomes a courier and a planter between the island and main. The severity of the laws of that exclusive and extraordinary people the Chinese could not prevent the productions of their soil from finding their way to other lands—nor could the rigor of the Dutch and the burning of their superfluous spice trees prevent the dispersion of their cherished aromatic plants. The tea shrub of China is now cultivated in Java by men smuggled from Japan, and also flourishes in the vicinity of Charleston—and the spice trees have found their way to the islands of the West Indies and of the Pacific Ocean.—*Southern Cabinet.*

A senseless, rich dressed dandy may be compared to a cinnamon tree—the bark is worth more than the body.

He that spares when he is young, may spend when he is old.

From the New Haven Herald.

### THE CANKER WORMS.

We did not notice the inquiry of the Boston Courier, addressed to us on the subject of the canker worm and grub, until yesterday, when we referred it to a friend conversant with the facts, who has handed us the following communication. Our own observation enables us to say that the remedy practised here has been partially successful, and will no doubt be productive of beneficial results. The process is still pursued for the preservation of our trees, with the substitution of sea weed instead of hay or straw, to fill up the interstice between the trough and the tree. The oil has no contact with the tree, and of course can produce no injury. We think it much more effectual than the course which we observed last summer on the Boston Mall.

*Messrs Editors*—Having paid some attention to the leaden troughs which have been placed around the elms of our city, I will endeavor, in a few words, to answer the inquiries of the Boston Courier respecting them.

Here, I believe, there is but one opinion on the subject. We are all, so far as I know, satisfied from an experience of one year, that they answer as completely as any thing can, the object to be arrived at. We know that thousands and tens of thousands of grubs were destroyed by them; and have a right to infer that not a single grub could have passed them alive, had every precaution been taken which might have been.

As long as the troughs are kept filled with oil, it is not possible for one grub to get over them, except by one of the following modes: sticks falling from the trees are liable to lodge on the troughs, and if they are large enough, may by their weight bear down the upper lid so as almost, if not entirely, to bring it in contact with the lower; or bits of paper, rags, &c. flying in the air, may get lodged in a similar manner; or if the straw or sea weed which is placed between the troughs and trees should be long enough, it may, and frequently does, fall over the troughs; or snow and ice may accumulate and remain on the north side of the trees after the grubs begin to ascend; or, finally, mischievous boys may, and often do, batter the troughs with stones, clubs, &c. In either of these cases a hedge is formed, which the grubs may avail themselves of. The oil may also be driven out by a high wind, or displaced by water getting into the troughs. By a little care and attention all these difficulties may be overcome. Hay was used last season as the filling between the troughs and trees, but it is now believed that sea weed is better; at any rate it has been generally used this season.

The oil in the troughs can in no way injure the trees, for it no where comes in contact with them.

S.

☞ We are glad to hear so good an account of the experiment, and we are in possession of no fact to weaken the force of the argument in its favor, so far as its success in preventing the ascent of the grub is concerned. But we are not quite certain, notwithstanding the positive assurance of both the editor of the Herald and his correspondent, that the oil can in no way injure the tree, "for it no where comes in contact with them." It is not a very easy matter to prevent such a contact, and S. has himself stated that the oil may be driven out of the troughs by a high wind, or be displaced by

rain. In either case, it would be difficult we presume, to prevent its coming in contact with the tree. But as we have no disposition now to make an argument, we simply state the result of our own experience, and let the fact go for what it is worth.

In October last we employed the agent of Mr Dennis (the patentee of the leaden trough,) to place troughs on twelve trees—six apple and six plum—all vigorous and healthy and from four to six inches in diameter. Each trough was fastened to the tree by six nails, and the interstice between the tree and the trough filled with cotton. Great care was taken to replenish the oil in the troughs, whenever it was driven out by high wind or displaced by rain. Both these contingencies happened frequently, and of course the cotton became in the course of a short time completely saturated with oil, and consequently the oil not only came in contact with the bark of the tree, but found its way between the bark and the wood by means of the nails which secured the troughs. About the first of May, the bark just above and below the troughs was observed to be in a state of decay. One trough after another was removed, and the bark found so rotten that it could easily be removed with the finger. Several gentlemen have examined them, and among them Mr Dennis, the patentee. Mr Dennis thinks it was the cotton and not the oil, which has done the mischief, but all the rest are of a different opinion. Whether the trees will ever recover from this injury is yet uncertain; some of them we think will not. The wounds have been kept plastered over with clay, and in some instances the dead and rotten bark has been displaced by that which is young and healthy. One of the apple trees is now loaded with fruit, but nearly destitute of foliage.—*Boston Courier*.

From the Albany Cultivator.

### THE PLACE TO DIG A WELL.

*Messrs Gaylord & Tucker*—I saw in your paper an inquiry for the best mode of finding water, or rather a place to dig a well. I have had some information on the subject, but do not profess to be a very experienced hand at the business. The way I manage is, to choose a clear day, when there are no clouds to interfere with the eye; about one or two o'clock, I go out to the place I wish to look for water; I turn my back toward the sun, and look toward the sky, to examine the vapors that arise from the ground into the air, and if there is a vein of water near in that direction, there will appear a vapor to rise quick to a certain height, and then it will move off on a level, in the same way that the smoke will rise from a chimney over a very hot fire of coals, where there is no smoke, and will rise as high above the surface as the water is below the top of the earth. The facts are, that water must have vent, and the deeper in the earth the water lies, the harder the pressure and the higher it will rise. Now, as I have stated I am not a professed water witch, I would wish to hear from those of more experience, as there are many who do profess to know, and say that they can trace a vein of water not larger than a rye straw, that lies 60 ft. under ground, and tell the quality of the water. As to qualities of water, all I know is, that salt water gives a stronger cloud than fresh, and lime water gives a whiter cloud than pure soft water. Any information that can be given on the subject will be thankfully received.

W. STOWELL.

*Washington's Opinion of Agriculture*.—The following is an extract of a letter from General Washington to Sir Arthur Young, who was fond of agricultural pursuits:—

"The more I am acquainted with agricultural affairs, the better I am pleased with them; inso-much that I can nowhere find so great satisfaction as in those innocent and useful pursuits. In indulging these facts, I am led to reflect how much more delightful to an undebauched mind is the task of making improvements on the earth, than all the vain glory which can be acquired from ravaging it, by the most uninterrupted career of conquests. The design of this observation is only to show how much, as a member of human society, I feel myself obliged to your labors to render respectable and advantageous an employment which is more congenial to the natural dispositions of mankind than any other."

*Horn Distemper*.—Spirits of turpentine rubbed in around the base or the horns, when the disease is in its incipient stages, will usually arrest its progress and effect a cure. If it has so far advanced as essentially to lower the temperature of the horns or horn, (for sometimes only one is attacked,) boring with a large nail gimlet on the under side of the horn, three or four inches from the head, will be necessary. If the horn is found very hollow at this place, another opening still nearer the head may be necessary. The horns must be kept open, that the matter may freely escape; and they should be thoroughly syringed or washed out, twice or three times a day. Salt and water or soap suds is good for this. Allowing the matter in the horn to escape, relieves the distress of the animal, checks the inflammation about the head, and unless delayed too long, effects a cure.—*Ab. Cult.*

*Cure for Wounds—King of Oils*.—This invaluable remedy for wounds in cattle or horses, particularly the latter, has lately been brought before the public by Silas Gaylord, of Skaneateles, and we have known some very surprising cures performed by it, in the case of severe wounds in horses. The following are the directions given for preparing the medicine:

1	ounce of green copperas,
2	' of white vitriol,
2	' of common salt,
2	' of linseed oil,
8	' of West India molasses.

Boil over a slow fire fifteen minutes, in a pint of urine; when almost cold, add one ounce of oil of vitriol and four ounces of spirits of turpentine. Apply it to the wound with a quill or feather, and the cure will be speedily effected.—*lb.*

*Making Bread*.—A late French journal states that an important series of experiments is now going on in the city of Paris, by order of the government, and under the direction of a committee of bakers, to test the value of a new discovery in bread making, that promises the most important results. In the new mode of preparation the flour that formerly made 100 lbs. of bread, now yields from 120 to 125 lbs. The discovery consists in an improved mode of fermenting it, by which a greater quantity of water combines with the gluten, and the nutritious qualities are more fully developed. A loaf of the new bread is found to be equally nutritive with the old, and decidedly improved in flavor.—*lb.*

OBSERVATIONS ON THE SEASON, CROPS,  
&c., IN MERRIMAC Co., N. H.

We commend to our readers the following interesting letter from Levi Bartlett, Esq. to the Rev. Mr Colman, which would have been responded to in his usual happy manner, had he been present to receive it. He has not yet returned from the west: his prolonged stay has been occasioned by severe sickness: the last accounts from him were that he was on his way home and his health improving, and we hope soon to see him.

In relation to the letter we would say, that if our readers are as well pleased with it as ourselves, they will ask Mr Bartlett to favor them with further results of his observations from time to time, and we think the farming interest would be much advanced if practical farmers generally would give us more of their experience and observations, for the mutual benefit of all.

J. B.

Warner, N. H., Aug. 18th, 1840.

MY DEAR COLMAN—Knowing you take a deep interest in every thing relative to agriculture, and that that interest extends too, beyond the limits of your own parish, it affords me a pleasure to communicate to you the results of my observations in an excursion of several days of the past week, among the farming community in a part of Merrimac county, N. H.

From the middle of May to the first of August, this section has been visited with the most severe drought that perhaps ever occurred so early in the season, which has materially affected many kinds of crops, while others have pushed along with a growth wholly unexpected.

Oats, from want of rain, and the attack of whole legions of grasshoppers, will present "a beggarly account of empty" heads. By the way, 'tis just fourteen years since the last great "grasshopper year": have you any data to prove that fourteen years is the period of time when literally "the grasshopper shall be a burden"? It would be of great consequence if this fact could be ascertained, as I know of no crop that suffers from their ravages like the oat. Upon the years of their periodical returns (if they have such,) some other crop might be substituted for the oat.

Corn upon pine and other light and dry lands, up to first of July, never looked better or promised a fairer crop; but the extreme heat and want of rain caused it to go back: the spindle was dried so that the pollen was not matured, and although the corn now shows nearly its usual number of ears, they are very imperfect,—cobs without corn, or the kernels "few and far between"; but upon the stiffer and hardwood soils, perhaps the prospect for an abundant crop never was greater. Better ploughs, more manure, care in selecting the right kind of seed, and more thorough cultivation, has greatly increased the amount of corn per acre within a few years.

I have particularly examined many fields of corn that will give from 60 to 80 bushels per acre and upwards. I saw several kinds of corn, but taking all things into view, I must give the preference to the "Brown corn," introduced to the notice of the public by Gov. Hill.

From the high reputation the Black Sea wheat has obtained for a few years past, there was scarcely any other kind sown: of perhaps more than 150 pieces I saw, it was all of this kind, except one which was the Tea wheat. But from the late sow-

ing to avoid the weevil, and want of rain, much of it did not come up, and it did not tiller or branch out; of course it was very thin, and owing to the wet season of '39 and too great neglect among farmers, to prevent the weeds from seeding in their hoed crops, almost every field of wheat was overrun with weeds, and many of them so much so that they are worth more for fodder for beasts than for bread for man. I believe you have as great a horror for weeds in hoed crops, as old 'Sootie' has for holy water: if so, I wish you would give your readers 'line upon line' till you shall make them all do as I did last year, hoe their corn five times, if nothing short will eradicate the weeds.—We did not find a field of wheat that was entitled to scarcely a fourth premium. I sowed upon one acre on the 12th of May, two bushels of Italian wheat, strictly upon Mr Phinney's system; and I have not seen a piece of wheat that can in any way be compared to it—much of it standing measured 4 1-2 feet, and it gave over 300 large sheaves: it lodged some and suffered by the rust, but it would be called a prime piece of wheat even in a good year.

There is a great abundance of clover and other grasses that have lived through the drought, even upon the tops of two dry hillocks in the piece, to warrant a heavy crop of hay next season; while many of my neighbors who have pursued the old course, with precisely the same kind of land, are now ploughing in their stubble and again sowing grass seed.

Will you be so good as to name this to our mutual friend Phinney, when you see him, and say to him how deeply I feel obliged for the important agricultural information he has so kindly imparted to me.

The early planted potatoes on dry land will but little more than return the seed—but later, and on heavier ground, will give a tolerable crop; but as a whole they will be very light.

I planted four quarts of the English Horse bean, imported by Mr Webster; but they could not stand a broiling sun that carried the mercury up to 130°: they will with me prove a total failure. The several kinds of turnips he introduced will be of incalculable benefit to the country: from the appearance of mine now, I think they will give a greater yield than the ruta baga, but may not prove so good for late keeping. I used some of his barley and oats, and think them a great acquisition, although I got them on too dry a piece of ground.

I traversed the farm and grounds of Gov. Hill, who by the way is the most industrious and hard working man we have in the Granite State. Only think how many irons he has in the fire at the present time;—Receiver General of all Uncle Sam's revenue for New England—a great farm and farmer—editor of the Monthly Visitor and a large weekly political paper—and god-father to one of the great political parties of New Hampshire.—There is no danger of such a man's rusting out. He has made great improvements upon his farm and is now reaping large crops: he has upon his grounds a large and well cultivated market garden.

It is truly gratifying to every lover of our own dear New England, to witness the improvements going forward among our farming community. The well finished and furnished farm houses, the capacious and solid built barns and out houses, well fenced and neatly cultivated fields, neat and clean kept gardens with almost every variety of esculents and many ornamented with flowers and small

fruits, to say nothing of good apples, pears, plums, &c.; handsomely furnished parlors and good collections of minerals, shells, specimens in geology and other interesting curiosities, &c.; and tables laden with useful books and standard periodicals—all goes to prove too that there is a moral and intellectual improvement going forward among the rising generation. The leisure time that used to be spent by the young of by-gone days in 'playing button and blind-man's-buff,' or 'tripping the feet to the music of the violin,' is now scarcely known to the youth of the present time, only as things of other days, like high heeled shoes and hooped petticoats.

I intended to have said something to you in respect to the 'editorials' in the last three or four numbers of the N. E. Farmer, but have only room to respond a hearty amen, for 'them's my sentiments exactly.'

Yours, truly,

LEVI BARTLETT.

From the Farmer's Cabinet.

## MANUFACTURE OF CIDER.

(From the papers of the late Joseph Cooper, Esq.)

Cider is an article of domestic manufacture, which is, in my opinion, the worst managed of any in our country, considering its usefulness; and perhaps the best method to correct errors is to point out some of the principal ones, and then recommend better.

One of the first is the gathering of apples when wet; the next, to throw them together, exposed to sun and rain, until a sourness pervades the whole mass; then grind, and for want of a trough or other vessels sufficient to hold a cheese at a time, put the pomace on the press as fast as ground, then make so large a cheese as to take so long a time to complete and press off, that fermentation will come on in the cheese before the cider is all out; and certain it is, that a small quantity of the juice pressed out after the fermentation comes on, will spoil the product of a whole cheese if made therewith. When either of the above circumstances will spoil the cider, which I know to be the case, don't wonder at the effect of a combination of the whole, which is frequently the case.

As I have very often exported cider, and sold it to others for that purpose, to the West Indies and Europe, without ever hearing of any spoiling, and as it is my wish to make the productions of our country as useful as possible, I will give an account of my method. I gather the apples for good cider when dry, put them on a floor under cover, have a trough sufficient to hold a cheese at once, when the weather is warm; grind them late in the evening, spreading the pomace over the trough to give it air, as that will greatly enrich the cider, and give it a fine amber color; then early in the morning press it off: the longer a cheese lays before pressing off, the better, provided it escapes fermentation until the pressing off is completed. The reason is evident from the following circumstance: take a tart apple and bruise one side, and let it lay till brown, then taste the juice of each side, and you will find the juice of the bruised part sweet and rich, though a tart apple. So, if sweet and sour apples are ground together, and put immediately on the press, the liquor therefrom will taste both sweet and tart, but if let lie till brown, the cider will be greatly improved. I always take great

care to put cider in clean sweet casks, and the only way to effect this is to rinse or scald them well as soon as the cider is out, and not let them stand with a remnant or lees to make them sour, must or stink. When my casks are filled, I place them in the shade, and exposed to the northern air—When fermentation takes place, fill them up once or more a day, to cause as much of the filth as possible to discharge from the berry bung; when it discharges a clear white froth, put in the bung stack, or bore a hole and put a spile in it, and thereby check the fermentation gradually; and when it has subsided, take the first opportunity of clear cool weather, and rack it off into clean casks; to effect which, when I have drawn the cider out of a cask in which it has fermented, I first rise the cask with cool water, then put into a hogshead two or three quarts of fine gravel, and three or four gallons of water; work it well to scour off the yeast or scum and sediment which always adheres to the casks in which the cider ferments; and if not scoured off as above directed, will act as yeast when the cider is put in again, and bring on fretting, and spoil or greatly injure the liquor; after scouring, rinse as before. I find benefit in burning a brimstone match in the cask, suspended by a wire, after putting in two or three buckets of cider; the best method for which process is, to have a long tapering bung, with a large wire drove in the small end with a hook for the match, which for a hogshead should be sufficient to kill a hive of bees. If the cider stands a week or more after racking, previous to its being put into the cellar, rack it again and rinse the casks, but not with gravel, and put it immediately into the cellar. The late made I put in the cellar immediately after or before the first racking, agreeable to circumstances as to the weather. The cider I wish to keep till warm weather, I rack in clear cool weather, the latter part of February or March. It is best to keep the cask full and bunged tight as possible.

To refine cider for exportation or bottling, take of Russia isinglass about an ounce to a barrel, pound it as soft as possible, pick it into fine shreds, put it in a clean earthen pot, pour on about half a pint of boiling water, stir and beat it with a stick split in four parts at the end, and something put in to keep it apart; when it has got thick add a pint of good sound cider, set the pot in a place the most safe and handy, but not too warm; as it grows stiff, add cider as before in small quantities, and repeat the stirring, the oftener the better, if fifty times a day; in two or three days, if it is well dissolved, rack off the cider which is for refining, add of it to the isinglass prepared as above, stirring it well till fit for straining, which do through a linen cloth; then mix the fining and cider together as well as possible, and set it in a proper place for drawing off, giving some vent for some days. If it is not sufficiently fine in ten days, rack it off and repeat the fining as before; but it is best to rack it, fine or not, in ten or twelve days, lest the sediment should rise, which I have known to be the case.

The foregoing operation should be performed previous to the apple trees being in bloom; but I have succeeded best in the winter, in steady cool weather. I have likewise had good success in putting the fining in the cider direct from the press, and set in casks with one head out, taps put in and set in a cool place properly fixed for drawing, and covered; when the fermentation subsides and the scum begins to crack, take it off carefully with a

skimmer, then draw it carefully from the sediment. If it is not sufficiently fine by the middle of winter, proceed as before directed.

The settlings of cider spirits, reduced with water cider, being put into cider in proportion of from two to three gallons to a hogshead, answered the purpose of fining full as well as the isinglass.

JOSEPH COOPER.

2nd mo., 1803.

From the Albany Cultivator.

### FWOULER, SPARE THAT BIRD!

*Messrs Gaylord & Tucker*:—I know of few things more calculated to disturb the equanimity of mind, and ruffle the feelings of a humane man, one who lives among animals and birds, and feels as if they were all personal friends, than to see a shock-headed, straddling thing, calling itself a man, with rusty musket or rifle, creeping about our highways, woodlands or orchards, and popping away at the harmless little creatures that give to the landscape half its charms, and to the eye and the ear half their pleasures.

I know these men cannot look upon birds as I do, or they would not have to be guilty of homicide to know what the sensations of a murderer are, when they wantonly destroy these creatures of the air. I plead not for the hawk or the crow; but for the beautiful songsters that greet the morn with a hymn, flutter over and through our meadows and orchards, and exhibit an instinctive happiness that would reconcile the most morbid misanthropist to life and its cares. I never hear the song sparrow, that with us is usually the first harbinger of spring, without a feeling of gladness that "the winter is over and gone, and the time of the singing of birds is come;" and this feeling is increased, as day after day, the blue bird, robin, tree sparrow, yellow bird, bob-a link, brown thrush, oriole, and swallow, successively arrive, and enliven the woods and fields with their presence, and fill the air with their music.

Tell me not that birds have not memories; that when the mysterious instinct compels their migration from us, they never return to their loved haunts, or again build in the same grove, but go whither accident or chance may direct. Only a few days since, I was standing in the field, and suddenly I heard the far off twitters of the barn swallow, of which not one had yet appeared. Away up in the blue sky, I at last descried him, as he slowly and on weary wing descended from his long flight, and with a song that could not be mistaken but for one of joy that his journey was over, he resumed his accustomed place on the ridge of the barn. In a few minutes he was joined by his mate, and during the hour in which they were resting from their weary way, many were the congratulations that passed between them. On the spot where for years they have built their nest, and reared their young, they are now building, and their absence is like the absence of friends.

And what is the crime charged upon these beautiful birds, that they are doomed to death by every boy or man, who is disposed to show his prowess in shedding their blood? Why they eat our cherries, or perhaps occasionally peck our trees or our sweet apples. This charge is true; but only a very small part are guilty, if guilt there is about it; and must all the acknowledged harmless species suffer for the act of one or two? Where is the man who

can accuse the sparrow, yellow bird, blue bird, swallow, thrush, bob-a-link, lark, and a multitude of others, of preying on his crops or his fruits?—Yet these are sought after and destroyed with as much avidity and hot haste as the most predatory ones. The urchin or the ragamuffin raises his weapon, and the half-warbled song, remains unfinished forever. I have admitted the charge, but if true in its fullest extent, would it justify extermination? Is there no good deed performed—no services rendered to the gardener or the cultivator, which may be plead in extenuation or mitigation? I think there are many, and that the good they do, overbalances many fold, as a strict matter of profit or loss, the trifling injuries they produce. The robin, the cedar bird, and the wood-pecker, are the three of the small birds most destructive to fruit, but these are far from being useless. I this morning saw in my garden, a robin hopping along on the ground; soon I saw it seize a black grub or cut worm, and in a few moments another. These two worms among my melons or cucumbers, would have done me more injury than a dozen robins in my cherry trees, and yet these two formed but a small part of the worms of various kinds this single bird would devour in a day. Of all birds, the cedar bird is to me, perhaps, the only one positively disagreeable; yet I owe to a flock of these birds, that made my orchard their home last year, many a bushel of beautiful apples, as they fed continually on the canker worm that at one time threatened the total destruction of some of my choicest fruit and trees. And the wood-pecker, while you think he is only amusing himself by hammering away on your trees, will, if you observe him closely, be seen ever and anon to thrust his long barbed tongue into a hole, and extract a grub that was perforating and destroying inch by inch your tree. Depend upon it, the wood-pecker will not hurt your trees, if there are about them no insects, or decayed wood, that requires excision.

Before you destroy a bird on your premises, or permit any one else to do it, be certain that you are not about to destroy one of your most faithful friends. Carefully weigh the good and evil they occasion against each other; think of the pleasure and instruction they afford: rise on one of our beautiful mornings before the sun, and hear from copse, and orchard, and grove, the thousand voices of joy and melody that are rising and mingling, and if you have a single feeling that belonged to man in paradise, it will not be necessary to repeat to you—*Fowler, spare that bird!*

A FRIEND TO BIRDS.

*Painting*.—Spirits of turpentine is in most cases used in mixture with paints, because it facilitates the drying rapidly. It decomposes and destroys the vitality of the oil: it should never be used when durability and lustre is required. I have been in the practice of painting my out buildings with pure oil, mixed without boiling, and am satisfied that it is more durable: the drying process is not so rapid, but the coat is harder and more adhesive, and less expensive.

S. W. JEWETT.

Weybridge, Vt.

*Powers of the Arab Horse*.—Fraser, in his 'Tartar Journey,' relates as an undoubted fact, that an Arab horse travelled 520 miles in six days—rested three days, and then went over the same ground in five days.

## NEW ENGLAND FARMER,

AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, AUGUST 26, 1840.

## BANKS AND THE CREDIT SYSTEM.

No. I.

In the condition of the currency no class in the community have a more direct interest than the agricultural. We have been repeatedly charged with holding opinions on the subject of banks and credit of an heretical character. We shall therefore take the liberty of making some remarks on these subjects. These may go for what they are worth. We do not regard the opinions of an humble individual like ourselves, of much importance to any one; and, on a subject in a degree foreign from our general pursuits, we should be among the last to assume an oracular authority; but every man ought to have a reasonable concern for his own consistency; and if the soundness of his opinions is called in question by any one, he should be ready to maintain or renounce them. We shall allude to this subject without any party or political reference whatever. To do otherwise would be incompatible with the neutral character of the *New England Farmer*.

Banks are of various characters. The banks existing among us are those of discount and loan; and it is to these we shall refer. Capital is the surplus accumulation of labor. It consists of whatever we call property; and productive capital is that which in one form or another, or in any form may be applied to the increase of property or wealth; or as it is said, of what has value, whatever may conduce to the subsistence or comfort or improvement of human life and the human condition.

Capital is not in itself productive. It will not increase by any intrinsic principle of vitality or growth. A hundred dollars in gold or silver deposited in a man's chest, will remain a hundred dollars at the end of the year.—A farm or tract of land not cultivated will produce nothing. A ship lying at the wharves—or a factory, let its machinery be of the most perfect character, will give no return, unless the one is freighted and sent upon her destined voyage, and the machinery of the other is made to perform its proper office under the due and diligent application of skill, intelligence and labor, and the sufficient supply of the raw material. For all these purposes capital is indispensable. The means must be at hand to purchase the implements and to pay the labor of cultivating the land; to hire hands, and to furnish a cargo for the ship; and to employ laborers and superintendants, and to furnish the material for the manufactory.

The individuals in these cases, who have the skill and labor, and the good will to apply the skill and labor, have not always the capital which will enable them to do it to advantage. A single pair of hands in most cases can accomplish very little; and in many of the most important and useful arts of productive industry would be wholly impotent. Here comes in the necessity of capital; and in his case of course the necessity of credit, by which he would be enabled to procure the means of managing the concerns, and rendering the trade, the farm, the ship, or the factory productive.

To rely upon the credit of the individuals employed, and obtaining their labor with the condition of paying for it at the close of the operation, would be attended with innumerable inconveniences; and certainly is not practicable on any extensive scale. In general the laborers themselves could not be found to do it, as they require quick returns, that they may obtain the daily bread for their families. To rely upon the aid of insu-

lated individuals for the means of conducting these concerns, is liable to many evils and disappointments; and though there are cases of small operation, in which it might be the most eligible mode, yet it would often result in disappointment; and expose one to extortion and oppression. Banks of loan and discount here furnish the remedy, and the identical means wanted.

The proper design of banks is to collect such capital as may have been accumulated in the community, for the purpose of loaning it in such sums as may be needed for the encouragement of honest trade, useful industry and the various productive arts of life. They offer this advantage to capitalists of small means, that they can place these small means, which perhaps they themselves are incapable of using with advantage and safety, where certainly they ought to be safe and make a fair return. These rills being turned into a common stream the mass is formed.

It is obvious that if the banks were allowed only to loan the exact amount which they receive at legal interest, nothing would remain for the payment of the necessary erections of buildings and vaults; and of the persons employed to keep the books and to manage the concerns of the institution. The State therefore, in the incorporation of a bank, allows it to loan not only to the full amount of its capital paid in, but likewise half as much more; so that a bank with one hundred thousand dollars capital may loan to the amount of one hundred and fifty thousand dollars; and it is from this source, from the anticipation of interest, when notes are discounted, and from the wear and tear of bills, which are consequently lost and never returned to the bank; and from the use of deposits which are made in the bank for a longer or a shorter time; and in some cases from the negotiation of exchanges with distant banks for which a small commission is charged, that the profits of a bank are derived and its expenses paid. These certainly are all honest sources of income; and of which the public have no right to complain, since they received much more than an equivalent in the pecuniary advantages of the institution. Now an institution of this character honestly managed, may be of signal advantage; and especially to a new community, where more than any thing else capital is wanting for the encouragement of labor and enterprise.

An industrious and honest young man, who has spent a long apprenticeship in acquiring a trade, finds himself when ready to enter upon business, perhaps without a dollar to purchase his tools and materials. Credit to him is indispensable. A tradesman, wishing to commence a business, which under a careful, frugal and attentive management, may yield a fair profit and furnish the honest means of success and wealth, is without the means of commencing it: to him credit is indispensable. A merchant's means are too limited for him to prosecute a foreign trade, for which he is well skilled, to advantage, without the aid of capital, which he can only procure upon credit. A manufacturer or an association of individuals, intelligent, skilful and enterprising, and disposed to engage largely in a useful and profitable manufacture, and to put many wheels and many hands in motion, cannot do this without a larger capital than their own funds will supply; they therefore require credit to pursue their operations to advantage.—That is they require capital which they do not possess, and which they can only obtain by borrowing, until their industry, or labor, or skill shall put them in a condition of returning it. Banks furnish these facilities. They furnish them to a much greater advantage than the same facilities could be obtained from individual capitalists; and these institutions among us, under proper management, have been of the greatest benefit.

They have improved agriculture. They have expanded the wings of commerce. They have quickened trade and industry; and they have carried the manufacturing and mechanic arts among us to a perfection and extent which are justly the pride, and the foundation of the wealth of this busy hive in which we live—happy and privileged, though too often disdained New England. Banks are an essential part of the system of credit. It used to be a proverb to say of a man, he is as sure as the bank; which meant that his promises and engagements might be relied upon with absolute confidence.

## Massachusetts Horticultural Society.

EXHIBITION OF FLOWERS.

Saturday, August 22, 1840.

The contributions of flowers by our friends were liberal, and some of the specimens very beautiful. We noticed among them some choice Asters and Balsams, from the garden of Mr Wm. Bacon, of Roxbury. Balsams by Mr Jones, of Brighton, and Mr S. R. Johnson, of Charlestown.

E. H. Derby, Esq., of Salem, presented some very superior specimens of *Nemphœa odorata*.

Dahlias, by Messrs Wilder, Stickney, Low, Goldermann, McIntire, Sprague, Barnes, Howe, Hovey & Co., Warren, A. H. Hovey, Jno. Hovey and S. Walker.—The specimens of *Ne plus Ultra*, by Col. Wilder and Mr Wm. Meller, were very fine. Mrs Bucknall, by Mr Barnes; *Unique*, by Mr Sprague; *Striata formosissima*, by Mr McIntire; *Marquis of Lothian*, by Mr Lew, were extra specimens.

Bouquets, by Messrs W. Kenrick, Jno. Hovey, R. Howe, Hovey & Co. and S. Walker.

Eighteen varieties of *Verbenas*, *Phlox Drummondii*, *Salvia Penoria*, *Erysimum Peroffskyanum*, *Gladiolus floribandus* and Dahlias—from Hovey & Co.

For the Committee,

S. WALKER, *Chairman*.

At a meeting of the Flower Committee it was voted—That the exhibition of the Dahlia for premium, shall take place at the rooms on Wednesday and Thursday, 23d and 24th of September. The flowers for premium must be in the stands before 10 o'clock. After the judges have awarded the prizes the room will be opened for exhibition with the names of the successful competitors attached.

S. WALKER, *Chairman*.

## EXHIBITION OF FRUITS.

The display of fruits this day was principally from S. Pond, Cambridgeport, who exhibited twentyeight dishes of very fine pears and plums—among them we noticed two magnificent Bartlett pears, on one branch, taken from a tree the stock of which was only four years from the seed; and the branch the second year's growth from the insertion of the bud. Other specimens of the Bartlett were also very fine for the season; also Julienno, St. Ghislain and Cushing pears, and the following varieties of plums: Smith's Orleans and Duane's Purple—very large and handsome; Prince's Imperial Gage, Bingham, White Gage, and Bolmer's Washington.

By the President, Hon. E. Vose; very large specimens of the Large Red Sweeting apple, also the St Lawrence Apple, from scions presented by Mr Corsa.

Rev. Gardiner B. Perry, of Bradford, exhibited beautiful specimens of a sweet apple. The scions, Mr Perry informed us, were taken from the original tree in Kingston, N. Y. Those presented were large and very

fair—color, a pale yellow, and of a fine sweet flavor, very tender and juicy.

From the garden of Mrs T. Bigelow, Medford—superior specimens of Rareripe Peaches, grown on the open wall:—among them was a yellow Rareripec, which measured ten inches in circumference.

By James Russell, Roxbury; Apples, without name. By S. Walker—fine specimens of the Frank real d'Ete and Green Chisell Pears.

By S. R. Johnson, Charlestown—fine specimens as usual, of Bolmer's Washington and White Gage plums.

By J. L. L. F. Warren, Brighton—Bingham plums. From the garden of Mr William Greenough, Cambridge—ripe figs, from a tree grown in the open ground.

By A. D. Jones, Brighton—a large Cantelope melon. For the Committee.

P. B. HOVEY, Jr.

EXHIBITION OF VEGETABLES.

From John Hovey, Roxbury—a basket of tomatoes. For the Committee,

RUFUS HOWE.

MASS. HORTICULTURAL SOCIETY.

We wish to call the attention of our horticultural friends to a notice in this day's paper relative to the annual exhibition of the Mass. Horticultural Society, and hope every one will contribute to render the coming exhibition equal, if not superior, to any that has preceded it.

BRIGHTON MARKET.—MONDAY, Aug. 24, 1840.

Reported for the New England Farmer.

At Market 490 Beel Cattle, 440 Stores, 4500 Sheep, and 920 Swine.

Prices.—Beef Cattle.—First quality, \$5 75 a \$6 00. Second quality, \$5 00 a \$5 50. Third quality, \$3 75 a \$4 75.

Stores.—Sales were not brisk; purchasers are hardly willing to pay the cost of the cattle in the country. We noticed sales of Two Year Old at \$14, \$15, and \$18; and Three Year Old, \$24, \$25, \$27, and \$29.

Sheep.—Dull. Lots \$1 25, \$1 33, \$1 42, \$1 50, \$1 67, \$1 88, \$2 00, and \$2 25.

Swine.—Dull. Lots to peddle at 3 1-2 a 3 3-4 for sows, and 4 1-2 a 4 3-4 for burrows. At retail from 4 1-2 to 6.

THERMOMETRICAL.

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northerly exposure, weeks ending August 23.

August, 1840.	7 A.M.	12, M.	5, P.M.	Wind.	
Monday,	17	52	78	66	S. E.
Tuesday,	18	60	82	70	S. E.
Wednesday,	19	69	82	74	S. E.
Thursday,	20	66	87	75	S. E.
Friday,	21	65	88	76	E.
Saturday,	22	66	87	76	S. W.
Sunday,	23	69	89	74	S. W.

Fair every day at 12 o'clock, and almost the whole of the week. Very dry and dusty till Sunday afternoon, when we had several showers and a powerful rain during the evening. This has been the warmest week we have had this season except the one ending July 19.

HORTICULTURAL EXHIBITION.

The annual Exhibition of the Massachusetts Horticultural Society, will take place at their Rooms, 23 Tremont Row, (opposite the Savings Bank) on WEDNESDAY, THURSDAY and FRIDAY, 9th, 10th, and 11th September.

Choice and rare specimens of Fruits and Flowers are respectfully solicited from the members of the Massachusetts Horticultural Society, and from the lovers of the science of Horticulture generally. Committees will be in attendance to receive contributions on Monday and Tuesday, 7th and 8th of September, and the specimens sent will be retained, subject to the order of the owner.

A list, giving the names of the specimens of Fruits and Flowers presented is respectfully requested. By order, SAMUEL WALKER, Chairman Com. of Arrangements. Boston, August 26th, 1840.

GRAIN CRADLES.

The Grain Cradle is an article which is coming into very general use in the New England States, where they were till of late but little known, although they have been in very general use in the southern and western States, for many years, and which is found to be decidedly the best mode of harvesting grain, as it is supposed one man will cradle five acres in a day when he cannot reap more than one. The difference in gathering a crop is so much in favor of cradling, that we must suppose that it will be the only mode adopted hereafter, and the grain cradle will become of as much use, as an implement of husbandry, as the plough now is.

There has been a very great improvement in the manufacturing of this article, they are now made on the most improved plan; the scythe is well secured and finished in a superior manner and made of the best cast steel.

HYACINTHS.

The subscribers have received a large assortment of Double and Single Hyacinths of every color and shade. Also, Tulips of mixed sorts, Crown Imperials, and Lilies; they have also at their garden all the fine varieties of Pæonies, which will be furnished at one day's notice. Lilies and Pæonies, and Crown Imperials, should be planted in August or the first of September. We shall receive a great variety of Bulbous Roots, from Holland, in a few weeks, when notice will be given. JOSEPH BRECK & CO. August 26.

BOY WANTS A SITUATION.

A smart active boy, about 16, wants a situation with a farmer where he can have an opportunity to learn the practice of agriculture, with whom he wishes to stay until age. Inquire of JOSEPH BRECK & CO. August 26.

PATENT SPRING BALANCE.

A few of those very convenient spring balances, for family use, a very simple contrivance for weighing small articles. JOSEPH BRECK & CO. No. 51 and 52 North Market Street, Boston. July 15.

Brighton Nurseries and Gardens. For Sale

A large quantity of superior European and American Ornamental Trees, well calculated for public places, or private grounds, with Fruit Trees embracing a great variety of the most approved kinds and fine sizes. The trees, and all other productions can now be selected and marked, and will be forwarded to any place as soon as it will answer to remove the same.

Also, forty kinds of Strawberry Plants, of the most approved European and American varieties. Orders may be forwarded via. mail, addressed Messrs. WINSHIP, Brighton, Mass., or left with Messrs. JOSEPH BRECK & CO. Brighton, August 12.

FENCE CHAINS.

Just received from England, at the New England Agricultural Warehouse, 6 casks chains, suitable for making the chain fence, &c. JOSEPH BRECK & CO. July 15.

TRACE CHAINS.

Just received, direct from the English manufacturers, 8 casks of Trace Chains, from 6 to 11 feet long, suitable for ploughing or draft chains. JOSEPH BRECK & CO. July 15.

BERKSHIRE HOGS.

The subscribers offer for sale a few pair of full blooded Berkshire Hogs; also, pigs 7-8 blood, crossed with Mackay. Inquire at the New England Farmer office, or at their farm at Brighton. JOSEPH BRECK & CO. July 29.

CASES OF TOOLS.

Just received from England, a few cases of superior horticultural tools, for gentlemen or ladies use, a splendid article in mahogany cases. JOSEPH BRECK & CO.

## MISCELLANEOUS.

## GIVE YOUR BOYS A TRADE.

With the exception of a very few specially designed to fill the learned professions—and these may for the most part be confined to those who are physically unable to get their living by hard work—all boys at the age of sixteen, having previously been well educated at school, should be put to some useful trade. No parent is faithful to his sons, or looks out well for their future prosperity, who suffers them to grow up without an early designation of the business they are to pursue, and an education specially adapted to qualify them for such business. He who enters upon manhood without a trade, as a farmer or mechanic, or without a profession, is but afloat on the uncertain sea of life, without any destination in view, and without rudder, compass, or any of the other means of a successful cruise. He is sent forth amidst society as a mere loafer, an injury and a pest.

It would even be well for boys intended as lawyers, doctors, ministers and merchants, to acquire a trade. Should they succeed in either of those professions, they would yet find meanwhile much convenience from knowing how to cultivate the earth or to use tools; but should they not succeed, a trade would be of vast importance to them as an ultimate and safe resort under the vicissitudes of fortune.

A good trade is a thousand dollars to a young man. It is worth more than money as an inheritance, for this may fail; that never will, if he be industrious.

## ANECDOTE OF A GOOSE.

At the flour mills of Tubberaheena, near Clonmel, while in the possession of the late Mr Newbold, there was a goose, which by some accident, was left solitary, without mate or offspring, gander or goslings. Now it happened, as is common, that the miller's wife had set a number of duck eggs under a hen, which in due time were incubated, and of course the ducklings, as soon as they came forth, ran with natural instinct to the water, and the hen was in a sad pucker, her maternity urging her to follow the brood, and her selfishness disposing her to keep on dry land. In the meanwhile, up sailed the goose, and with a noisy gabble, which certainly (being interpreted) meant, leave them to my care, she swam up and down with the ducklings, and when they were tired with their aquatic excursion she consigned them to the care of the hen. The next morning down came again the ducklings to the pond, and there was the goose waiting for them, and there stood the hen in her great frustration. On this occasion, we are not at all sure that the goose invited the hen, observing her maternal trouble—but it is a fact, that she being near the shore, the hen jumped on her back, and there sat, the ducklings swimming, and the goose and hen after them up and down the pond. And this was not a solitary event: day after day the hen was seen on board the goose, attending the ducklings up and down, in perfect contentedness and good humor—numbers of people coming to witness the circumstance, which continued until the ducklings coming to days of discretion, required no longer the joint guardianship of the goose and the hen.—*Dublin Magazine.*

## FROG FOUND IN COAL.

On Wednesday morning as two colliers, George Ross and James Gardner, were working in one of the rooms of the Old-Muirfield-pit, at Gargieston, they found a living frog embedded in the solid seam of coal, at least twelve fathoms beneath the surface of the earth. The niche in which it had lived was perfectly smooth inside, of the exact shape of the frog, and without a crack or crevice to give admittance to air. The hind legs of the animal are at least a third longer than usual, the fore legs shorter, the toes longer and harder, and its general color is of a bronze shade. It leaped briskly about the moment that it was excavated from its narrow cell. How many centuries it has been shut out from light and air and entombed in its dreary dormitory, it is impossible to say: certain it is, that although diminutive in form, and with great brilliancy of eye, it has a most antediluvian aspect. It inspires us with a kind of awe to be brought into contact with any living being that may have breathed the same air as Noah. If it had but the gift of speech, what a fund of "auld world stories" it would unfold.—*Kilmarnock Jour.*

## A HINT TO THE GIRLS.

We have always considered it an unerring sign of innate vulgarity, when we have heard ladies take particular pains to impress us with an idea of their ignorance of all domestic matters, save sewing lace or weaving a net to encase their delicate hands.—Ladies, by some curious kind of hocus poeas, have got it into their heads that the best way to catch a husband is to show him how profoundly capable they are of doing nothing for his comfort. Frightening a piano into fits, or murdering the king's French, may be good bait for certain kinds of fish, but they must be of that very small kind usually found in very shallow waters. The surest way to secure a good husband is to cultivate those accomplishments which make a good wife.

## TO NURSERYMEN AND GARDENERS.

A well established Nursery and good Vegetable Garden, situated in the State of Massachusetts, near a market for vegetables, and where there is a good demand for trees, together with every convenience for a man with a family, will be let on accommodating terms to a good tenant for a term of years. Address a line stating name and reference (post paid) to J. P. MERRILL, care of Messrs. Breck & Co. Seedsman, Boston, previous to first of October.

August 12.

## BUDDING FRUIT TREES.

Cuttings of fruit trees for budding, comprising nearly all the choice sorts of Apples, Pears, Plums, and Cherries, known and cultivated in this country or in Europe, all from bearing trees, can be packed in such a manner as to be sent with perfect safety to any part of this country or Europe. Apply by mail to the subscriber, at the Pomological Garden, Salem, Mass.

ROBERT MANNING.

Salem, July 15.

## SUPERB ROCKET LARKSPUR SEED.

The subscribers offer for sale a quantity of Superb Double Rocket Larkspur Seed, of their own raising, saved from double flowering plants only, embracing all the different colors. For fine, strong and early plants, the seed should be sown in August.

JOSEPH BRECK & CO.

June 17.

## GARDENERS' KNIVES.

JOSEPH BRECK & CO. have this season imported and now offer for sale a few very superior Garden Knives, for pruning, &c. manufactured expressly for Gardeners, and warranted superior to any article of the kind before imported.

Also—a large assortment of Budding Knives, Grape Scissors, &c. &c.  
April 22.

## URATE AND POUURETTE.

An establishment for the manufacture of the Manures called Urate and Poudrette has been erected, at a considerable expense, in the State of New Jersey, near the city of New York; and an act of incorporation has been granted by the legislature of the State of New Jersey, by the name of "The Lodi Manufacturing Company" for purposes of agriculture, wherein it is provided, that 500 shares, a portion of the stock reserved for subscription by farmers and gardeners, within a limited time, shall be entitled to receive 50 bushels of Poudrette yearly for five years, viz. in 1840, 1841, 1842, 1843, and 1844, upon each share of \$100, which is at the rate of 20 per cent. per annum, for those years, and after that period to receive an equal dividend with the other stockholders.

The Manufactory has gone into operation according to law; a sufficient number of shares having been subscribed for that purpose, and capital paid in; and the first dividend has been regularly paid to the subscribers—the next dividend is payable in September. But the Company needs a larger moneyed capital than it now has, to carry it on to better advantage. Inquiries having been made whether all the stock had been taken, and the difficulty at the present time of obtaining funds, to a sufficient amount, from a few individuals, has induced a renewal of this notice to farmers and gardeners, and every other person who may have spare funds, (as every person is now permitted to subscribe,) that there is yet a considerable portion of the reserved stock, which, by law, is to receive 20 per cent. per annum, payable in Poudrette, one half in May, and the other half in September, in the years 1840, 1841, 1842, 1843, and 1844, not yet subscribed for, and the books are now open to receive subscriptions for the same, by any person, whether gardener, farmer or otherwise, at the office of the Lodi Manufacturing Company, No. 73 Cedar Street, in the city of New York. Terms for the reserved stock, \$100 per share in cash; and for the other portion of the stock an instalment of \$25 per share on subscribing, and the residue (being \$75 per share) to be called in by instalments of \$5 per share, after thirty days notice.

These manures have been fairly tested and very generally approved of as being the cheapest and best manures, and more economically applied than any other known substance used for manure.

As the article can be furnished from the city of New York, only to a limited extent, (not more than sufficient to manure 35,000 acres annually,) it must follow, that in a few years it will necessarily be confined to the use of the stockholders aloe.

It is important to agriculture, and the enterprise deserves the liberal support of every enlightened farmer. By order,  
WILLIAM M. WILSON, Secretary.

At an election for Directors of the Lodi Manufacturing Company, held at Jersey City on the 6th day of July, 1840, the following persons were elected Directors of the Company, to hold their offices until the first Monday in October next, namely, Anthony Dey and Jacob C. Dey, of New York; J. D. Miller, Andrew S. Garr and Rodman M. Price, of New Jersey.

August 12.

## TIE UP CHAINS.

Just received at the New England Agricultural Warehouse, a good supply of those celebrated Chains for tying up cattle. These chains, introduced by E. H. Derby, Esq. of Salem, and Col. Jacques, of Charlestown, for the purpose of securing cattle to the stall, are found to be the safest and most convenient mode of fastening cows and oxen to the station. They consist of a chain which passes round the animal's neck, and by a ring attached to the stall, plays freely up and down, and leaves the animal at liberty to lie down or rise at pleasure, and keeps him perfectly secure.

July 15.

JOSEPH BRECK & CO.

## BERKSHIRE PIGS FROM HAWK'S STOCK.

The subscriber has on hand a few litters, from some of the largest and finest sows in the country, sired by Loring's and other imported boars. Also, the smaller class of Berkshire pigs, which are very beautiful animals, and delicious porkers. Either of the above stocks will be disposed of extremely low by applying to

Z. STANDISH.

N. B. The pigs will be neatly caged and shipped at New York, without extra charge, if required. Unquestionable reference will be given for thorough breeding.

Albany, August 19.

41

## THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at \$3 per annum payable at the end of the year—but those who pay within sixty days from the time of subscribing are entitled to a deduction of 50 cents.

TUTTLE, DENNETT AND CHISHOLM, PRINTERS,  
17 SCHOOL STREET, BOSTON

Stock.—Two horses, 2 cows, 2 hogs. Poultry, 26 turkeys, 13 goslings, 65 chickens. Estimated worth of stock, \$441.

Questions.—(See Judge Durfee's report in last week's Farmer.)

1st. I have used fish mixed with common soil, to great advantage. Likewise, stable manure, spread and ploughed in, for a potato crop, and the crop was as good, and the potato better flavored than when manure was used in the hill.

2d. None.

3d. Have used ashes for cabbages several years, and thoroughly tested their value. Use a pint to each hill.

4th. Have not.

5th. Have not.

6th. There is little difference when fish can be obtained at ordinary prices.

7th. Have used sea weeds of the kind indicated, and found them more valuable upon soil of a gravelly nature than upon stiff loam.

8th. Have not.

9th. Have not raised wheat.

10th. Corn, barley, rye, oats and potatoes.

11th. [Not answered.]

12th. Have generally put earth under my stalls, and have thought that this mould impregnated with the liquor of the stable, is worth thrice as much as other manure.

#### Report of the Rotch Farm, N. Providence, leased and cultivated by Mr Adam Anthony.

I have great satisfaction, says Dr. Jackson, in laying before the citizens of Rhode Island, the very lucid and detailed report of Mr Adam Anthony, who is one of the most intelligent and successful farmers in the State. Mr Anthony cultivates a farm leased of Mr William Rotch, of New Bedford. The farm is situated two miles north of the city of Providence, and the soil is naturally poor, light and sandy, with some patches of thin swamp, having a light covering of black peat. A large portion of this farm was originally almost barren, or supported only a thin forest of pine trees. By chemical analysis of the natural soil, it was found to be an ancient granite diluvium, charged with decomposed vegetable matters, in an acid state. Hence the theory of his improvements by means of ashes, containing alkaline matter and lime.

#### Memoranda furnished by Mr Anthony.

Farm consists of

Ploughed land	30	acres, valued at	\$141	per acre.
Pasture	26	‘ ‘ ‘	70	‘ ‘ ‘
Mowing	18	‘ ‘ ‘	150	‘ ‘ ‘
Wood	30	‘ ‘ ‘	40	‘ ‘ ‘

#### Crops.

Corn, 258 bushels—61 1-2 bu. per acre: soil, sand and sandy loam: manure, 7 cords per acre.

Potatoes, 592 bushels—236 bu. per acre: soil, sand and sandy loam: manure, 7 cords per acre.

Turnips, 1300 bushels—650 bu. per acre: soil, sand and sandy loam: 240 bushels of ashes: manure, 3 1-2 cords per acre.

Barley, 10 tons—1 3-4 tons per acre; cut for fodder: soil, sand and sandy loam.

Hay, 50 tons—2 3-4 tons per acre; 5 acres upland, 3 lowland; sandy; 10 of reclaimed peat bog; 2 acres of upland, top dressed with 5 cords manure per acre.

Millet, 40 tons—2 3-4 tons per acre: soil, sand

dy; 4 1-2 acres no manure—10 ashed, 100 bushels to acre.

Pumpkins, 5 tons from among corn.

Other Produce.—Beef, 9500 lbs.; pork, 567 lbs.; milk, 8764 gallons.

Cost of cultivation per acre.		Value of crop.
Indian corn,	\$49	\$87 25
Barley,	27	31 00
Potatoes,	46	78 00
Turnips,	47	116 00
Hay,	24	49 00
Millet,	24	49 00
Stock.		Value.
1 horse,		\$50
2 oxen,		70
18 cows,		648

North Providence, 12 mo. 2, 1839.

Dr. C. T. JACKSON—*Esteemed Friend*—Having filled such of the blanks in the form appended to the circular as were necessary to the requisite statements respecting my crops of this year, I avail myself of the convenience of a separate sheet to notice such of the questions as I am able to answer.

I have made no experiments that have been sufficiently carried out to be of other importance than as affording suggestions for further trial and more accurate and extended observation. Of this character are those with nitre, potash, &c., of which a statement has already been given. It may be well, however, to repeat it here. Several plats of ground, each containing a rod, half a rod apart, on a field of sandy soil which had been recently sown with millet, without manure, were treated in the following manner: one with lime, one with ground oyster shells and another with salt—four quarts to each: one with a peck of recent, another with the same quantity of spent ashes: the next with potash and the last with saltpetre—each a pound. The lime and oyster shells produced no effects, the millet being no better than on the undressed ground about them. Salt had been furnished in too large a quantity, and destroyed most of the seed. The few plants that came, however, grew very luxuriantly. There was no perceivable difference in the ashed portions, the crop being alike better than on the intermediate spaces. Potash and nitre gave the best results, the latter the most striking. The ground was in fine condition. It produced at least three and a half tons of millet to the acre.

I have tried lime in but a few instances, and not at all in composts. In a potato drill, on a sandy loam, it was evidently injurious to the crop; and as a top dressing for grass grounds, on a sandy soil, the other a reclaimed bog abounding in vegetable matter, it was of no perceivable benefit.

Spent wood ashes have been the principal manure which I have used in amending the condition of light loams and sandy and gravelly soils. On all these they are used to great advantage; and to a profitable result in the improvement of the two last mentioned, combined with the growing of clover they are almost indispensable, especially if the soil be of very sterile character.

Besides the experiment above noticed with ground oyster shells, I have applied them to sandy and to loamy soil for grass and for turnips, but without effect.

Bog mud of peaty character has been used to some extent in my manure trenches, and is deemed excellent for the purpose—more valuable than loam.

On the sandy and poorer grounds of the farm millet and clover are the most profitable crops. On those of firmer texture the root culture has given the best results. A part of the difference in the superior profit, however, is but apparent. Requiring most or all of the season to perfect their growth, they prevent, without some intervenient crop, late summer or early fall seeding, the seasons, I believe, in which lands in high condition are most profitably laid down to grass. The value of the produce of the farm this year, inclusive of pasture feed and the products of garden grounds, (included in the ploughed land, but not otherwise noticed,) is \$2840. And it appears on examination of my accounts, that its conversion into the forms in which most of it is disposed of, is not likely to give a very dissimilar result. Sales have been made to the amount of \$2962 84, and there is on hand \$669, worth more than at the commencement of the year. To this should be added \$600 for the manure made by the stock; making in the aggregate \$4231 84. From this sum should be deducted the cost of the grain purchased, and the hogs and cattle fattened, which amounts to \$1214 65, leaving a balance of \$3017 19 as the value of the produce. The excess over the first estimate of \$177 19, will probably defray all extra expense incurred by the disposition which is made of it.

The liquid manure from the stock is saved, but has never been separately applied. Both this and the solid matter are received into a trench in the rear of the cattle stalls, and with the admixture of bog mud or loam, make a compost much more valuable than ordinary stable manure. Six dollars a cord for it may be thought to put an end to all profitable results in farming, but the effects of its application sustain me in this opinion of its value. It is charged at five dollars, in my estimates of the cost of crops, one sixth part, I consider, as being appropriated by the soil to its own improvement.

I have limited my estimates in regard to crops, to such only as have been raised on the farm this year. There are others, in the culture of which I have had some experience; such as oats, beets and carrots. Oats, in general, give about the same results as barley. Beets and carrots cost more in the cultivation than ruta bage; beets perhaps 6, and carrots \$12 an acre. The product, with me, has been about the same, and they are probably of equal value. The difference, if there be any, as food for stock, has escaped my observation. In regard to beets, however, I speak only in reference to the scarcity and yellow French. The white and red are said to be of better quality.

In the valuation of the lands of the farm, buildings have not been included. These, exclusive of the dwelling house, would add about twenty per cent. to their value, and of course, about one and a half per cent. to the cost of crops as interest.

For some further account of the method pursued in my farming operations, and for the result for 1838, allow me to refer thee to a letter addressed to Henry Colman, published in No. 48 of the New England Farmer, for the current year.

Respectfully, and very truly thy friend,

ADAM ANTHONY.

*A Natural Coincidence.*—At the great sale of Durham breeds of cattle which took place lately at Lexington, Ky., we notice among the sales the following coincidence: *Victoria*, purchased at \$1750, and *Prince Albert*, her calf, at \$300.

## HOW TO STOP BLEEDING.

Having noticed several cases of death resulting from loss of blood, I have been induced to offer a few simple directions which will enable any one to understand the nature of the danger and how to apply the remedy. Either an artery or vein may be wounded. The arteries carry the blood from the heart towards the extremities, and the veins return it towards the heart. The blood when an artery is injured flows in jets, not in a continuous stream, and is of a bright florid hue: from a vein it flows with a uniform stream, and is of a dark red color. Bleeding from an artery is much the more dangerous.

The vessels of the thigh, leg and foot are the more liable to be wounded by various accidents; such for example, as that of the late Mr Knickerbacker, who was cut with a scythe and died in half an hour: the artery of the thigh is often wounded by the falling of a pair of scissors or of a knife, in clapping the knees together to catch them. I have known a boy stab another with a penknife so as to open an artery. A celebrated surgeon tells us he has known a fine young fellow lose his life from the alarm of the attendants and confusion of the surgeon. "He was a tall stout young man, who was sitting at table with his companions eating bread and cheese, taking his glass and telling his tale. He had in his hand a sharp pointed table knife, which he happened to hold dagger-wise in his hand, and in the height of some assertion he meant to strike the table, but the point missed and slanted over the table: he had stabbed himself in his femoral artery, and with one gush of blood he fell. When I came I found the young man stretched out upon the floor; he was just uttering his last groan; the floor was deluged with blood. The wound was covered with a confused bundle of clothes, which I instantly whirled off; and the bystanders had the unhappiness to see that the hole was no bigger than what I could close with my thumb, and which, had it not been shut and compressed, would have healed in three days, allowing time for a deliberate operation."

When arterial blood is seen to gush from a wound, let the bystander reflect that the blood is passing from the body into the limb. The member having been exposed as quickly as possible, let him take a pocket handkerchief and tie it loosely, but with a tight knot, around the limb, *above* the wound; then introduce a stick or the handle of a penknife, which will answer perfectly well, and twist it round several times, till the limb is firmly compressed by the handkerchief, and the blood ceases to flow. Indeed the wounded person might do it himself unless the bleeding was very profuse so as to cause his fainting at once. After the bleeding is stopped, the handkerchief may be somewhat relaxed, but still continued around the limb until a surgeon can be called to secure the vessel. In case of a wound of a vein, there is much less danger, and moderate compression *below* the wound will retain the blood. When a person is suddenly attacked with bleeding from the *lungs*, nothing is so effectual as the use of a nutmeg grated or cut with a knife and administered in a little water or other liquid which may be at hand. I have repeatedly employed it before any other remedy could be procured, and with success.—*N. Y. Eve. Signal.*

*Good Taste.*—The Countess of Huddington, in 1705, sold her jewels to purchase ornamental trees for her estates.

## PROPER AGE OF SHEEP FOR MUTTON.

In England, where mutton forms such an essential part of the food of all classes, great attention has been paid, not only to producing the greatest quantity, but the best quality of mutton. After years of trials and experiments, it seems now to be generally conceded by the writers of the country, that sheep of great size and quick growth, such as the Leicesters, will not give as fine mutton as smaller sheep, and those longer in coming to maturity. In other words, the profit is on the side of the large sheep: the pleasures of eating are with the smaller, such as the South Down. A writer in a late volume on British Husbandry, says:

"A sheep, to be in high order for the palate of an epicure, should not be killed earlier than when five years old; at which age the mutton will be found firm and succulent, of a dark color, and full of the richest gravy; whereas if only two years old, it is flabby, pale and savorless. The graziers, indeed, do not admit this; and we constantly read flaming accounts in the reports of the shows of stock exhibited in various parts of the kingdom, of pens of wethers fattened to an enormous size in extraordinary short periods of time; but if any one chooses to ascertain the difference in quality, let him cause an equal weight of one of these young Leicesters and a five year old South Down, to be stewed, down into broth, and he will find that of the former to be little better than greasy water, while the latter, besides its superior degree of nutriment, possesses all the flavor of full grown meat."

Among the amateur mutton eaters, wether mutton is always considered preferable to that of the ewe, unless the latter has been spayed, in which case, when kept to five years old and well fattened, she is considered by connoisseurs, superior as mutton to any thing else. Youatt, in his work on sheep, says:

"The Leicesters will yield more meat, with the same quantity of food, than any other sheep can do; but when fed too high, as is sometimes the case, so much fat is put on that the muscles or lean seems all absorbed, and the carcass has the appearance and taste of a mass of luscious fat."

The propensity to fatten, or to come to early maturity in some of the improved animals, is a source of great profit to the breeder; but the consequence to the consumer is, that for mutton he gets neither lamb nor mutton; and when steers of eighteen or twenty months old are converted into beef cattle, so far as weight is concerned, the meat, it is clear, is neither veal nor beef, but a compound of both, and not equal to either. As a general rule, it may be remarked, that all animals should be killed while the flesh is in the white state of the young animal, or when it has reached the firm red fibre of maturity—a result which a forced growth and fattening does not seem to hasten in the least.—*Genesee Far.*

## PIG MANURE FOR FRUIT TREES.

Sir—I noticed in your last number a paragraph giving an account of a new mode to promote the growth of trees, now in operation at Welbeck, an estate of the Duke of Portland, by confining pigs in pens under them.

As far as I know, its use may be new as regards forest trees, but I have known this method in use above thirty years in Kent, to promote the growth of the apple tree and render it more productive.—The method originated in consequence of observing those orchards adjoining the farm-steads where

the pigs constantly grazed, to be much more productive, and yielding finer fruit than those orchards where the grass was mown, or even those where the soil was tilled, and also supposed to be less subject to blight. For this purpose, moveable styes are placed on wheels in the pens. The manure is powerful, and rendered more or less so according to the nature of the food made use of.—This method is generally practised in the winter season, and its effects are conspicuous in the spring, for the trees generally present a vigorous and healthy appearance, and its effect on the soil is equally powerful. In fact it may be rendered too powerful for the trees. It is best used with moderation, and occasionally repeated; but, after all, its effects are not so uniform and lasting as in those orchards where, as before observed, swine constantly graze and are fed.—*English pap.*

## THE FLOUR TRADE.

There is truth in the following article from the New York Star. It has too often been a serious error among dealers and speculators in flour, when a demand has arisen from England, to run up prices so as to exceed the limits of the English orders, and thus prevent the sale of thousands of barrels for that market. Long experience has shown that speculations based on the chances of the harvests in England, have, with but very few exceptions, resulted in losses to the American shipper. The true policy in this country is to be a seller to the English, whenever they want breadstuffs and we have them to spare, as is the case now.—*Baltimore American.*

**WHEAT FLOUR FARMERS.**—There is a most astonishing infatuation among the dealers and growers of this essential staff of life, to bring up the prices always beyond *five dollars* a barrel, and thus unintentionally stop the sale for exportation to England.

We have warned our friends, raising and dealing in this article, that there are millions of bushels and barrels on the continent of Europe, always ready for sale to English agents, whenever they can afford to pay \$5; and these depots of continental grain are so much nearer at hand than ours, that it procures, even at the same price, the preference, except as to age.

The Falls of the two last seasons would have carried off five millions of barrels to England in wheat and flour, and brought twentyfive millions of dollars to our country, but for the prices being beyond the limit, at which we repeatedly hinted; and thus five million of British sovereigns found their way to the pockets of the European farmers, and left us with our staple on hand to become stale, and finally be offered for sale in small lots at a depreciation.

*To make Vinegar.*—A fig would we give for all the slops called 'vinegar,' made in grocery and confectionary shops, from the rinsings of grog glasses and tea pots. Give us the real old cider vinegar for all that. Do you wish to know how to make it? Just take an oaken cask, and put it, during warm weather, in the garret, under the eaves, where it will be warm. Into this turn one or two gallons of clear, fermented cider—leave the bung out: in two or three weeks this will be sharp vinegar, with nothing to receive additional supplies of cider, which may be turned into it every little while, till the barrel is full.—*Maine Cult.*

## GREAT AGRICULTURAL MEETING IN ENGLAND.

## SPEECH OF THE AMERICAN MINISTER.

We publish below the speech of Hon. A. Stevenson, our Minister to England, at the grand agricultural meeting at Cambridge, Eng., on the 14th of July. After the Cattle Show, which lasted two days, there was a splendid dinner, the Duke of Richmond being in the chair. A large number of distinguished gentlemen were present, and from the accounts we have received of the meeting, it must have been a season of great interest and enjoyment to the immense concourse of people assembled on the occasion. That they dined well, our readers cannot doubt, after reading the following account of the

## BILL OF FARE.

56 lambs, 550 chickens, 120 pieces of roast beef, 120 pieces of boiled beef, 120 pieces of roast veal, 100 hams, 100 tongues, 500 salads, 500 dishes hot potatoes, 100 raised pies, 100 pigeon do., 550 fruit tarts, 2 Cheshire cheeses, 4 Gloster do., 12 Stilton do.—10 barrels of ale (!) and upwards of 2,800 pints of wine (!!)

After the 'Queen' and 'Royal Family' had been given, the next toast proposed by the President was the health of the Hon. A. Stevenson, the American Minister, &c.

MR STEVENSON rose to return thanks, and was received with great cheering. He said that it would be an unworthy affectation if he did not say that this was one of the most remarkable and imposing assemblies that he had ever witnessed in the course of a public life, not very short. He feared that he should not be able to do justice to his feelings or the occasion. The kind and hospitable reception which had been given to him, and the very gratifying manner in which his name had been associated with that of their two countries, demanded his grateful acknowledgments. He received it with pride and satisfaction, greatly enhanced as it was by the kind motives which had prompted it, and the flattering manner in which it had been received by such a distinguished assemblage. (Cheers.) Deeply sensible, however, as he was of the high honor done him, he should but inadequately convey what he felt, if he confined himself to an expression of his individual feeling. (Hear.) In relation to himself personally, it was but a matter of little importance; but in another sense, looking to such an assembly as that, representing not only the great agricultural interests of England, but of the United Kingdom, the kind and liberal sentiments which had been expressed, would do good, and strengthen those relations of amity and peace which existed between the two countries. (Cheers.) He therefore asked leave to thank them in the name of his country, and at the same time to assure them that nothing would be more acceptable to the government and people of the United States than sentiments like those which had been so kindly expressed. (Cheers.) Their noble President, said Mr S., had been pleased to express a wish in allusion to the late negotiations between the two countries, that the present relations of peace and concord might happily long continue for the benefit of both. He need hardly say how cordially and sincerely he united in this wish. This was fortunately, he said, for mankind, not an age of war. The time had long since passed, when hostility and war was regarded as the natural state

of man, and peace only a difficult and dangerous experiment. (Hear.) The soldier and the sword, he thanked God, were no longer the only security for nations. The schoolmaster and not the warrior was abroad. Moral power was taking the place of physical force, and the rulers of the world would soon learn, if they had not already, that they must look for security to their thrones to moral and not physical power, and to the virtue and intelligence of their people. (Cheers.) In this enlightened age, said Mr S., when the love of peace, knowledge, and Christianity was overspreading the earth, was there one Briton, or American, one wise of good man, who would not look upon a war between two such countries as England and America as one of the greatest calamities that could befall mankind? A war against interest, kindred, language, and religion, and for what?—not for principle; not for national honor, (the only justifiable cause for war between nations,) nor for conquest; but a war to settle the geographical lines of a treaty of boundary, the subject legitimately of negotiation and peaceable adjustment. (Loud cheers.) But England and America, he said, were too wise to enter into any such war. Neither, he was sure, would feel itself called upon in vindication of its honor, or in defence of its rights, to embark in war. The security for peace, he said, was in the wisdom and prudence and foresight of the rulers of the two countries, and in the virtue and intelligence of their people. (Cheers.) Their noble chairman, said Mr S., had done him no more than justice in supposing that he had done every thing in his power, both officially and individually, to cherish and invigorate the friendly relations of their two countries, upon the preservation of which he believed the prosperity and happiness of both nations essentially depended. He therefore only spoke the sentiments of his own country when he assured them that its people and government desired peace, solid permanent peace with all nations, but especially good understanding with Great Britain, upon terms compatible with the rights and honor of both.—(Cheers.)

Mr S. then asked whether he might be indulged for a moment in a brief notice of this association, and the great benefits it was calculated to bestow on agriculture. (Cries from all parts of the pavilion to go on.) He rejoiced, he said, in having had it in his power to attend upon the present occasion. Besides the opportunity it afforded him of witnessing for the two last days, proceedings so congenial to his feelings, it enabled him to express in person his deep sense of the high honor which the Society had done him, in deeming him worthy to become one of its honorary members. (Cheers.) He only regretted that it would not be in his power to repay such an honor by some corresponding benefit, worthy of such an association, and of the interest he felt at its success. He could, therefore, only offer the humble tribute of his homage and his best wishes. In such an assembly, it would, he was quite sure, be needless, if he were competent, to expatiate upon the subject of agriculture and its claims to support. He however felt a disposition to throw out one or two suggestions, which might not be entirely unworthy of consideration. (Cheers.) All, he said, concurred in assigning to agriculture a high place in the scale of individual and national interest—(hear, hear)—but yet he thought they did not give it the importance it merited, and to which it justly aspired. In other words, that too many supposed the object of agriculture was alone for

purposes of subsistence. Now a more fallacious opinion could not, he thought, obtain, than that the responsibilities of agriculture stopped at the production of food for eaters: far otherwise—the duties of agriculture, he said, were like those of morality; they spread beyond the circle of providing the means of subsistence, into a wide expanse created by the obligations arising out of a state of society, and were connected with all the great national interests. (Cheers.) Hence the support of government—the encouragement of commerce—the basis of manufactures—the subsistence of the learned professions, depended upon the importance and interests of agriculture. (Cheers.) It was the source from which all classes not only derived subsistence, but prosperity. As an object of universal benefit then, it was justly entitled to universal patronage. (Cheers.)

Mr Stevenson said, that agriculture had been justly considered national property; the whole country one great farm, and the inhabitants as one great family; in which, however, those who worked the least had often the most profit. Now if this was true, as he believed it to be to a certain extent, then those who were not farmers had as great an interest as the farmer himself, inasmuch as the whole class employed in agricultural districts and labor were the first to be subsisted, and that of the other classes out of the surplus; and of course the larger the surplus the greater would be the profit. This was a selfish argument, it might be said; but yet he thought it not the less strong. (Hear.) Of all the modes which had been resorted to in aid of agriculture, the most beneficial were associations of this character—societies for the collection and diffusion of knowledge; the introduction of useful experiments; the writings of able and distinguished men; and that excitement and emulation so essential to all improvement. Science was absolutely necessary to modern agriculture—theory and practice reflected light on each other, and this was the more felt, as of all pursuits there was no class so wedded to old habits, and which are so unyielding, as those who cultivate the soil. This was the case both in the old and new world. He rejoiced, therefore, in the giant strides which agriculture was making in every quarter of the globe, under the beneficial aids of practical science. This was, he said, one of the great benefits which this society would accomplish. (Cheers.) If any man doubted the extent to which science had benefited agriculture, let him visit England and Scotland—England, really, which had justly been said to be the garden of all Europe. And why was it so? simply because its entire surface was cultivated upon principles which were brought to the test of the most rigid and severe experiment; because agriculture was scientifically and philosophically pursued, and because she had such excellent farmers. (Cheers.) It was indeed delightful to witness the system of farming and rural economy throughout the land. If a foreigner wished to know what England really was, he must go into the country and mix with her farmers and yeomanry.

It had been said, he believed, by one of the princes of the reigning family, that the pride of England was in her yeomanry. He re-echoed the sentiment, and was happy to belong when at home to that class. Next he said, to the proud distinction of being an American citizen, was that of being a farmer. (Cheers.) Who could look upon such an assembly as this without feeling himself elevated and gratified? (Cheers.) We see here all classes

united in this great work. The wise and good, the public and private man, those who fill high places, mixing with the farmers and cultivators of the soil upon perfect equality, and the spirit of peace and charity shedding around their holy calm, refreshing alike to the feelings and the intellect. (Cheers.) It was, he said, upon this Society and its wide spreading and far extending purposes, that the eyes of Europe and America were now fixed with a steady gaze. He hoped there would be no disappointment. Viewed in relation to their own country, there was every motive for supporting it—but viewed in relation to its effects upon other nations, as had been justly said, the motive for exertion rose into a much higher and nobler sentiment: it became then the cause not of their country or his, but that of mankind; and who so poor or sordid in spirit as to think only of himself or his country, when the great question was whether the earth should be inhabited and cultivated by enlightened and virtuous and religious men, or by debased and ignorant human beings and hordes of savages? (Cheers.) In conclusion, he could only repeat his thanks for the kindness and honor done him, and his best wishes for the success of their glorious association. He trusted in God, that it might fulfil its high purposes, do honor to its founders, and benefit mankind.

Mr S. proposed as a toast, the health of their noble President, the Duke of Richmond, with three times three, and sat down amid the most enthusiastic cheering.

For the New England Farmer.

#### IMPORTANCE OF PROTECTING BIRDS.

MR BRECK—In my communication on the origin of the borer and my mode of extracting them, I spoke of a narrow gouge as being the best instrument with which I was acquainted for this purpose. The remarks you made in relation to it, saying that "the bill and long tongue of the little speckled woodpecker were quite as effectual," have induced me to send another communication—not that I dissent, but to say that I fully concur with you. I believe from what I have seen and known by experience in farming, that if sportsmen were treated as they ought to be, encroaching as they do upon the public rights, the interest of the agriculturist would be greatly promoted: the birds no longer frightened away from our habitations, would congregate in our orchards and gardens, and rear their young in our midst, and the husbandman might fold up his hands in complacency, for ought that could injure him in the shape of a worm or insect. Nor is this all: we should not only have our trees and gardens freed from insects, but music, sweet music would be heard from every 'bush and tree;' and who is there that does not like to hear the songs of the feathered tribe? Surely if ever there was music that was intended by the Deity to cheer the drooping heart of the farmer and impart joy and happiness, it is the music of the songsters of the grove. How often as he goes out in the morning to engage in the toils of the field, is his heart made glad by the joyful notes that burst from every quarter upon his ear, and sympathizing with the charming sounds, he goes whistling or singing to the plough, rejoicing in Him who created all and pronounced his works very good. Now who would alter this wise and merciful provision of Providence? None! none! unless it is the mean, base, low-lived, loafing sportsman—a set of scamps, destitute of all

moral restraint, who now are, and always have been, a nuisance to all good society.

But again: having our trees secured from the vermin which infest them, and the pleasure we derive in listening to their sweet music, are not all the benefits which we derive from the protection of birds. No—other advantages are numerous, and I presume my employer will not be affronted if I mention one which will result to him in this respect. During the whole time he has been a resident of the place he now occupies, he has never in the least manner discouraged the coming of birds upon his farm and garden by shooting them himself or allowing others to do so: and not even in the time of cherries, when it is customary to put up something in the tree to frighten them away, has he done it; but always allowed them to come and get what they pleased; consequently his trees are not so much infested with insects as his neighbors, and what is worthy of notice, the birds have planted the cherry stones in the grove and about the farm so liberally, that I have no doubt but what three hundred English cherry seedlings may be found upon the place of all sizes. These trees my employer intends to have taken up soon, and put in a convenient place for sale, which if disposed of at the common price, will bring a good round sum—more money than was ever gained in preventing the birds from eating a few cherries, that the owner might sell the more, without saying any thing of the many insects which the birds would destroy in the mean time.

The increase of insects is not only a sure result of killing the birds, but how often have I seen the sportsman discharge his gun into the small branches of the tree, stripping leaves, buds and bark entirely off, and oftentimes cutting off quite a number of the fruit. Cannot and shall not these things be prevented? There is a law to prevent our property from being injured, and if a man injures our trees by shooting into them, ought he not to suffer the penalties of this law? Surely he had, and that too with a double force; but who has ever yet prosecuted a man for shooting birds in his orchards? has it been done by any man? if so he deserves the praise and good wishes of every farmer. If it has not been done, if we have patiently submitted to this outrage upon our property in times past, let us resolve we will do it no longer—let us (the farmers) awake to this subject and say it shall be so no more, and exert ourselves to put a stop to such gross insult and abuse. If you order the sportsman off your premises, he is affronted and thinks he is doing no harm. What strange ideas some men have of property at the present day, to think they may do what they please upon their neighbor's grounds. Would they be pleased to have their own premises thus invaded and their property destroyed? We think not. They know they do wrong, or they would not run away at the approach of the owner. We concur with your friend in considering "the person who destroys the birds on his premises, in the same light as though he robbed his purse."

For one I hope there will be more interest taken in the preservation of birds, so that the time may soon come when they shall become our familiar friends, and feel that we are their protectors rather than enemies.

Yours, &c.

J. M. HARTWELL.

Medford, Mass., Aug. 25th, 1840.

#### MASS. HORTICULTURAL SOCIETY.

EXHIBITION OF FRUITS.

Saturday, Aug. 15.

The variety of fruits was not so numerous this morning as usual. The specimens exhibited, however, were good.

Mr Manning, of Salem, exhibited the Large Red and Green Sweet and Gravenstein apples—the latter a good fall apple. Also, Gross Rousselet (of New Duhamel) and Petit Blanquet pears.

By Mr Walker, of Roxbury, fine English Green Chissel pears.

By Nathaniel N. Dyer, of Abington, the Ginseng apple.

From S. Downer, Large Sweet and William's Favorite apples—both fine specimens.

From A. D. Williams, Roxbury; William's Favorite and two other varieties of apples—both very large.

From Messrs Winship, Brighton; a new Seedling pear, raised from seed of the Heathcot.

From B. V. French, Braintree; Garden Striped, William's Favorite, River and Garden Royal apples—all fine specimens; the latter a seedling.

From John Hovey, Roxbury; very fine specimens of the William's Favorite apple.

From Samuel Swan, M. D., Medford; the Hovey Sweeting—a large and very beautiful apple, more pleasing to the eye than to the taste.

From S. Pond, Cambridgeport; Bingham, White Gage, Pond's Seedling and Apricot plums and Julian pears.

From Capt. J. Clark, Dorchester; variety of Weeping cherries.

From E. M. Richards; beautiful specimens William's Favorite, Sugar-loaf Pippin and Red Juneating apples.

From J. L. L. F. Warren, Brighton; large specimens of Love Apple (Tomato.)

For the Committee,

J. L. L. F. WARREN.

SEED CORN.—We take this opportunity—so as to be in season—to remind our agricultural friends that if they would have the best seed corn and improve their kind for another year, they must not neglect to select the earliest and fairest ears this fall, and preserve them carefully for seed. They may be gathered by the hand from the field as soon as the husks turn white, and should then be traced and hung up where the air will circulate freely all winter, and where the rats and mice will not reach them. In all fields some ears are earlier than others. The earliest selected for seed, will insure a field nearly the whole of which will be ripe as early next year as the ears you gather out for seed this season. If you allow the later ears to be taken for seed, you will find a late crop the next fall. The surest way, therefore, to improve a crop is to be careful in selecting the seed; for it is a universal law of nature that "like begets its like."—*Maine Cultivator.*

A foreign paper says that a short time ago a farmer of the village of St. Dunnet, desired one of his sons who is 79 years of age, to have the horses put to the plough, and went to a field with it. Having worked some time he said, "My children, tell your friends that your ancestor, after his hundredth year, ploughed the field which gives you subsistence. I yesterday reached my hundredth year. Let us return thanks to God."

## NEW ENGLAND FARMER,

AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, SEPT. 2, 1840.

## BUNKER HILL MONUMENT.

The women have at last taken in hand the completion of this patriotic erection; and, as is their wont, to "cap the climax." It has stood long enough to the burning shame of the men, the descendants of those who fell there, and now living in the full enjoyment of the blessings purchased by that noble sacrifice, in a half finished state, until at least some have feared that our liberties might be lost before this commemoration of them should be completed. The orator, at the laying of the corner stone, spoke charmingly of the rays of the sun reflected from the top of this noble spire; yet many a patriot of '76, whose heart was illuminated by the brilliant suggestion, has "died without the sight." But the women, we trust, will now do it; and, if they will get the money, we promise them in this case, that the "confounded" question, as the abolitionists call it, about "woman's rights," will not be called up. They shall have all the merit of carrying up the cap-stone, and of placing upon its glittering summit to their own honor, an imperishable garland.

They are determined to raise at least twenty thousand dollars, and this with pledged contributions, will complete the erection. For this purpose they propose holding a Fair in Quincy Hall, Boston, on the tenth of September, where they will sell all sorts of their nice handy work; and as the fairest of the Fair will be there in all their brilliancy, it will be quite an affair. We are not certain that any of the women themselves will be on sale, though they will be in the market house. Many of the fairest, we know, have long since been taken or spoken for; but upon the presumption that "there are as good fish in the sea as have ever been taken out," we can answer for it that the specimens of the caught fish will present all the encouragement that can be desired to every bachelor to throw in his line.

All the proceeds of the sale (abating the last alluded to,) will go to the completion of this patriotic erection. We invite therefore, the patriotic and liberal of all classes, sexes and parties to attend and help on the good work.

We add, in conclusion, "by authority," to our friends the horticulturists, that a table will be devoted to the sale of fruits and flowers, and presided over by as ready and silver-tongued saleswomen as even Paris can afford. We beg them therefore, to contribute liberally on the occasion from their green-houses and gardens, fruits and bouquets of any and every kind, promising that they shall be gratefully received; and requesting at the same time that they may be labelled with the donor's or producer's name, that the honor of their production as well as the liberality of the donation, may be awarded where due.

H. C.

## LETTER FROM MR COLMAN.

ALBANY, N. Y., Aug. 24, 1840.

JOSEPH BRECK, Esq.—My Dear Sir—I learn that some of my friends at the East are anxious to know what has become of me. This will, I hope, excuse my answering their kind inquiries through the Farmer.

Not being very well, after the publication of my Third Report, with the consent of the Executive, I left home for an absence of three or four weeks, to visit the marl districts in New Jersey and Virginia, to see the application and effects of lime on the crops in Pennsylvania, and especially to look at the silk establishments in Penn-

sylvania, District of Columbia and Virginia. I wished, likewise, to see the Ohio stock and some of the stock and upfields of Kentucky, if my time admitted of it; thinking that in all these respects my inquiries would be directly available to the benefit of the farmers of Massachusetts.

My indisposition increased in my progress through Virginia, and in descending the Western waters I became so sick that it was necessary to put myself at once under the care of a physician, and I was confined some weeks. Exceedingly anxious to return home to my family and duties, I left my sick chamber too soon, and when I reached this place was entirely unable to proceed further.

Under the best medical treatment I am very fast regaining my health and strength, and hope to proceed home in a very few days and again enter upon my duties. In the mean time, though under extreme debility of body, thank God my mind has been left to me, and I have not altogether lost my time, nor been diverted from the objects of my commission as far as my infirmity would admit; and hope in due time to convince my brother farmers in Massachusetts, that in sickness and health I have nothing more at heart than to render them and their great art all the service in my power.

I am, with respect and esteem, your friend,  
HENRY COLMAN.

## DR. JACKSON'S GEOLOGY OF RHODE ISLAND.

We have had the pleasure of meeting with this work by loan on our way, and have recreated a few hours of debility and sickness with its perusal. It shows what skill can do in making something out of little; for the geology of Rhode Island presents few materials for a report. What a pity it is that the Dr. could not have discovered some gold or diamond mine beneath its surface! After all, its lime, its iron and its coal are valuable, and ought, perhaps, to satisfy her. We have no time nor strength for extended remarks. We are re-entering, thank God, with imperfect but with renovated and improving health, upon our public duties; and shall avail ourselves of a convenient season to notice this interesting work more at large. Dr. Jackson's learning is unquestioned; his exactness most praiseworthy; his perceptions rapid, and his industry indefatigable. His geology we shall not discuss at any great length; but as for his agricultural notions, in which he is pleased in the kindest manner to express his difference of opinion from ourselves, we shall be ready entirely to acquiesce in them when they are more exactly defined, and when we have the proof. At present, as far as we understand them, his proof is either deficient, or to our notions it is against the conclusions to which he arrives.

H. C.

## Massachusetts Horticultural Society.

EXHIBITION OF FLOWERS.

Saturday, August 29, 1840.

Bouquets by John A. Kenrick, John Hovey, Rufus Howe, Hovey, & Co. and S. Walker.

Dahlias by Josiah Stickney, Esq., Col. Wilder, Hovey & Co., Messrs David McIntire, H. H. Hovey, John Hovey, Parker Barnes, L. B. Haskell, John A. Kenrick, J. L. L. F. Warren and S. Walker.

Among the various specimens of the Dahlias exhibited, we were much pleased with Castander, by D. McIntire; Priurose, by Col. Wilder; Unique and M. Scult, by J. Stickney; Stone's Yellow Perfection and General Washington, by Hovey & Co.; Marquis of Northampton and M. Scult, by S. Walker.

Mr S. R. Johnson presented some fine Roses and Balsams.

China Asters by H. H. Hovey, John A. Kenrick and J. L. L. F. Warren.

For the Committee,  
S. WALKER, *Chairman*.

Owing to the arrangements making for the Annual Exhibition, on the 9th, 10th and 11th inst., there will be no show of fruits or flowers at the rooms on the 5th inst.

Contributors of fruits and flowers are respectfully requested to send their specimens on Monday and Tuesday next. The exhibition will commence on Wednesday morning at 10 o'clock.

Per order,  
S. WALKER,  
*Chairman Com. Arrangements*.  
Boston, Sept. 1st, 1840.

## PARTICULAR NOTICE.

The Committee of Arrangements will meet at 23 Tremont Row, on Saturday next at half past 11 o'clock.

S. WALKER, *Chairman*.

## FLOWER COMMITTEE.

The Committee on Flowers are respectfully requested to meet at their rooms on Saturday next, 5th inst., at 12 o'clock, M. A punctual attendance is desirable, as stands for exhibition of the Dahlia will be then assigned.

S. WALKER, *Chairman*.

## EXHIBITION OF FRUITS.

The specimens of fruits exhibited this day were all very fine—particularly the peaches, which have rarely been surpassed at former exhibitions, and for a weekly display the tables were very well filled.

The President, Hon. E. Vose, presented beautiful samples of the Grosse Mignonne and Alberge Peaches; also, the Large Red Sweeting Apple, of extraordinary size.

From Mr Manning, two new varieties of apples, which we believe have not been before shown here, called the "Duchess of Oldenburgh" and the "Charlowski"—both very handsome—and the following Pears: Juliene, Summer Rose, Beurre, of Mons and Duquesne d'Ere—the two last of the London Hort. Society; also, the Domine Diel Plum.

E. M. Richards exhibited very large and fine specimens of Seedling Peaches, and a peach called the "Belle of Beaucaire"—a beautiful looking fruit; also, William's Favorite, Red Juneating and Summer Pearmain apples.

Specimens of Peaches, all very splendid, were exhibited as follows: Mignonne, by Mr W. Oliver; Grosse Mignonne and Coolidge's Favorite, by S. Dower; Rare-ripes, Teton d' Venus and George the Fourth, by J. L. L. F. Warren; Rare-ripes, by Mrs T. Bigelow, and Coolidge's Favorite, by Capt George Lee.

By Jacob Hittinger, Charlestown; very fine Nectarines.

S. Pond exhibited a large quantity of Pears and Plums—among them we noticed Juliene and Cushing Pears, and Smith's Orleans, Lombardy, Diamond, and Isabella Plums. The Cushing pears and Orleans plums were uncommonly large and fine.

Pears without a name, by J. Fisher, Brookline.

By Capt. Seaver, of Dorchester; very large apples, without a name.

By Dr Brewer, a very large specimen of the Seckel Pear, from Newark, N. J.

By J. L. L. F. Warren, Prince's Imperial Gage and Green Gage Plums.

A dish of a very small variety of the melon, (called the Mandrake,) beautifully striped, from the garden of Mrs T. Bigelow, Medford, attracted considerable notice.

For the Committee. P. B. HOVEY, Jr.

**FRUIT COMMITTEE.**

The Committee on Fruits are notified to meet at the rooms, No. 23 Tremont Row, on Saturday, the 5th day of September, at half past 11 o'clock, for the awarding the Welles' premium of twentyfive dollars for the best seeding summer apples, which shall have been produced or brought into notice since the year 1829  
Sept. 23, 1840. E. M. RICHARDS, *Chairman.*

**EXHIBITION OF VEGETABLES.**

From E. M. Richards, Esq., Dedham; very superior specimens of the fruit of the Egg Plant.  
From Hon. E. Vose, Dorchester; large Lima beans. These were pronounced by the Committee to be the finest specimens ever exhibited at the hall.  
By Mr J. Hovey, Roxbury; Tomatoes.  
By Mr J. A. Kenrick, Newton; Tomatoes.  
For the Committee,  
AARON D. WILLIAMS.

Judge Pitman is expected to deliver the annual address before Rhode Island Society for the Encouragement of Domestic Industry.

Nos. 11. and 111. of H. C.'s communications on Banks and the Credit System, will appear in our next.

**MASS. HORTICULTURAL SOCIETY.**

A stated meeting will be held at the rooms of said Society, on SATURDAY, the 5th day of September, at 11 o'clock, A. M.

E. M. RICHARDS, *Rec. Sec'y.*  
September 2d, 1840.

**BRIGHTON MARKET.—MONDAY, Aug. 31, 1840.**  
Reported for the New England Farmer.

At Market 520 Beef Cattle, 640 Stores, 7500 Sheep, and 1630 Swine.

**Prices.—Beef Cattle.**—The prices obtained last week for a like quality were not sustained. We quote First quality, \$5 50 a \$5 75. Second quality, \$5 00 a \$5 25. Third quality, \$3 75 a \$4 75.

**Stores.**—Two Year Old at \$14 a \$18. Three Year Old, \$22 a \$28.

**Sheep.**—Dull. Many lots were sold for less than they cost in the country. One 75c., one 92c., \$1 12, \$1 20, \$1 33, \$1 62, \$1 75, and \$1 88.

**Swine.**—Lots to peddle at 3 1-2 for sows, and 4 1-2 for barrows. Also lots at 4, more than half barrows. At retail from 4 to 5 1-2.

**THERMOMETRICAL.**

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northernly exposure, weeks ending August 30.

August, 1840.	7 A.M.	12, M.	5, P.M.	Wind.	
Monday,	24	67	77	68	W.
Tuesday,	25	60	76	62	N. E.
Wednesday,	26	54	82	67	S. E.
Thursday,	27	57	78	68	S. E.
Friday,	23	58	73	64	S. E.
Saturday,	29	60	73	65	E.
Sunday,	30	62	78	71	S. E.

Fair every day at 12 o'clock.

**HORTICULTURAL EXHIBITION.**

The annual Exhibition of the Massachusetts Horticultural Society, will take place at their Rooms, 23 Tremont Row, (opposite the Savings Bank) on WEDNESDAY, THURSDAY and FRIDAY, 9th, 10th, and 11th September.

Choice and rare specimens of Fruits and Flowers are respectfully solicited from the members of the Massachusetts Horticultural Society, and from the lovers of the science of Horticulture generally. Committees will be in attendance to receive contributions on Monday and Tuesday, 7th and 8th of September, and the specimens sent will be retained, subject to the order of the owner.

A list, giving the names of the specimens of Fruits and Flowers presented is respectfully requested.

By order, SAMUEL WALKER,  
*Chairman Com. of Arrangements.*

Boston, August 26th, 1840.

**SUPERB ROCKET LARKSPUR SEED.**

The subscribers offer for sale a quantity of Superb Double Rocket Larkspur Seed, of their own raising, saved from double flowering plants only, embracing all the different colors. For fine, strong and early plants, the seed should be sown in August.

JOSEPH BRECK & CO.

June 17.

**Brighton Nurseries and Gardens. For Sale**

A large quantity of superior European and American Ornamental Trees, well calculated for public places, or private grounds, with Fruit Trees embracing a great variety of the most approved kinds and fine sizes. The trees, and all other productions can now be selected and marked, and will be for warded to any place as soon as it will answer to remove the same.

Also, forty kinds of Strawberry Plants, of the most approved European and American varieties.

Orders may be forwarded via. mail, addressed Messrs. WINSHIP, Brighton, Mass., or left with Messrs. JOSEPH BRECK & CO. Brighton, August 12.

**HYACINTHS.**

The subscribers have received a large assortment of Double and Single Hyacinths of every color and shade. Also, Tulips of mixed sorts, Crown Imperials, and Lilies; they have also at their garden all the fine varieties of Paeonies, which will be furnished at one day's notice. Lilies and Paeonies, and Crown Imperials, should be planted in August or the first of September. We shall receive a great variety of Bulbous Roots, from Holland, in a few weeks, when notice will be given. JOSEPH BRECK & CO. August 26.

**BOY WANTS A SITUATION.**

A smart active boy, about 16, wants a situation with a farmer where he can have an opportunity to learn the practice of agriculture, with whom he wishes to stay until of age. Inquire of JOSEPH BRECK & CO. August 26.

**PATENT SPRING BALANCE.**

A few of those very convenient spring balances, for family use, a very simple contrivance for weighing small articles. JOSEPH BRECK & CO. No. 51 and 52 North Market Street, Boston. July 15.

**TO NURSERYMEN AND GARDENERS.**

A well established Nursery and good Vegetable Garden, situated in the State of Massachusetts, near a market for vegetables, and where there is a good demand for trees, together with every convenience for a man with a family, will be let on accommodating terms to a good tenant for a term of years. Address a line stating name and reference (post paid) to J. P. MERRILL, care of Messrs. Breck & Co. Seedsmen, Boston, previous to first of October. August 12.

**BUDDING FRUIT TREES.**

Cuttings of fruit trees for budding, comprising nearly all the choice sorts of Apples, Pears, Plums, and Cherries, known and cultivated in this country or in Europe, all from bearing trees, can be packed in such a manner as to be sent with perfect safety to any part of this country or Europe. Apply by mail to the subscriber, at the Pomological Garden, Salem, Mass. ROBERT MANNING. Salem, July 15.

**FENCE CHAINS.**

Just received from England, at the New England Agricultural Warehouse, 6 casks chains, suitable for making the chain fence, &c. JOSEPH BRECK & CO. July 15.

**TRACE CHAINS.**

Just received, direct from the English manufacturer, 8 casks of Trace Chains, from 6 to 11 feet long, suitable for ploughing or draft chains. JOSEPH BRECK & CO. July 15.

**BERKSHIRE HOGS.**

The subscribers offer for sale a few pair of full blooded Berkshire Hogs; also, pigs 7-8 blood, crossed with Mackay. Inquire at the New England Farmer office, or at their farm at Brighton. JOSEPH BRECK & CO. July 29.

**CASES OF TOOLS.**

Just received from England, a few cases of superior horticultural tools, for gentlemen or ladies use, a splendid article in mahogany cases. JOSEPH BRECK & CO.

**GARDENERS' KNIVES.**

JOSEPH BRECK & CO. have this season imported and now offer for sale a few very superior Garden Knives, for pruning, &c. manufactured expressly for Gardeners, and warranted superior to any article of the kind before imported.

Also—a large assortment of Budding Knives, Grape Scissors, &c. &c. April 22.

## MISCELLANEOUS.

## THE BISHOP AND HIS BIRDS.

A worthy bishop, who died lately at Ratisbon, had for his arms two fieldfares, with the motto, "are not two sparrows sold for a farthing?" This strange coat of arms, had often excited attention, and many persons had wished to know its origin, as it was generally reported, that the bishop had chosen it for himself, and that it bore reference to some event in his early life. One day an intimate friend asked him its meaning, and the bishop replied by relating the following story:—

Fifty or sixty years ago, a little boy resided at a village near Dillengen, on the banks of the Danube. His parents were very poor, and almost as soon as the boy could walk, he was sent into the woods to pick up sticks for fuel. When he grew older, his father taught him to pick the juniper berries, and carry them to a neighboring distiller, who wanted them for making Hollands. Day by day, the poor boy went to his task, and on his road he passed by the open windows of the village school, where he saw the schoolmaster teaching a number of boys about the age of himself. He looked at these boys, with feelings almost of envy, so earnestly did he long to be among them. He knew it was in vain to ask his father to send him to school, for he knew that his parents had no money to pay the schoolmaster; and he often passed the whole day, thinking, while he was gathering his juniper berries, what he could possibly do to please the schoolmaster, in hope of getting some lessons. One day when he was walking along, he saw two of the boys belonging to the school, trying to set a trap, and he asked one what it was for? The boy told him that the schoolmaster was very fond of fieldfares, and they were setting the trap to catch some. This delighted the poor boy, for he recollected that he had often seen a great number of these birds in the juniper wood, where they came to eat the berries, and he had no doubt but he could catch some.

The next day the little boy borrowed an old basket of his mother, and when he went to the wood, he had the great delight to catch two fieldfares. He put them in the basket, and tying an old handkerchief over it, he took them to the schoolmaster's house. Just as he arrived at the door, he saw the two little boys, who had been setting the trap, and with some alarm he asked them if they had caught any birds. They answered in the negative; and the boy, his heart beating with joy, gained admittance into the schoolmaster's presence. In a few words he told how he had seen the boys setting the trap, and how he had caught the birds, to bring them as a present to his master.

"A present, my good boy!" cried the schoolmaster; "you do not look as if you could afford to make presents. Tell me your price, and I will pay it to you, and thank you besides."

"I would rather give them to you, sir, if you please," said the boy.

The schoolmaster looked at the boy as he stood before him, with bare head and feet, and ragged trowsers that reached only half way down his naked legs. "You are a singular boy!" said he; "but if you will not take money, you must tell me what I can do for you; as I cannot accept your present, without doing something for it in return. Is there anything that I can do for you?"

"Oh, yes!" said the boy, trembling with de-

light; "you can do for me what I should like better than anything else."

"What is that?" asked the schoolmaster, smiling.

"Teach me to read," cried the boy, falling on his knees; "oh, dear, kind sir, teach me to read."

The schoolmaster complied. The boy came to him at all his leisure hours, and learnt so rapidly, that the schoolmaster recommended him to a nobleman, who resided in the neighborhood. This gentleman, who was as noble in his mind, as in his birth, patronized the poor boy, and sent him to school at Ratisbon. The boy profited by his opportunities, and when he rose, as he soon did, to wealth and honors, he adopted two fieldfares as his arms."

"What do you mean?" cried the bishop's friend.

"I mean," returned the bishop, with a smile, "that the boy was MYSELF."

DO AS YOU WOULD BE DONE UNTO.—The horse of a pious man living in Massachusetts, happening to stray into the road, a neighbor of the man who owned the horse, put him into the pound. Meeting the owner soon after, he told him what he had done; "and if I catch him in the road again," said he, "I'll do it again." "Neighbor," replied the other, "not long since I looked out of my window in the night, and saw your cattle in my meadow, and I drove them out, and shut them in your yard—and I'll do it again." Struck with the reply, the man liberated the horse from the pound, and paid the charges himself. "A soft answer turneth away wrath."

REVOLUTIONARY ARMY.—We find the following in an old Vermont paper: The number of regulars furnished to the revolutionary army, were, by New England, 147,441; by the Middle States, 56,571; by the Southern States, 56,997. It appears by the above, that New England, consisting of New Hampshire, Massachusetts, Rhode Island, and Connecticut furnished more troops for the defence of the country, than the other nine states, by 3872. The number of troops furnished by South Carolina, was 6,448; Massachusetts, 67,907. Georgia, 2697; Connecticut, 31,939.

TO TAKE OFF THE IMPRESSION OF PRINTS.—Take Venice or Windsor soap, which must be cut into small pieces; a certain quantity of potash, with as much quick lime, and boil the whole in a pot. Wet the engraved side of the print gently with this liquor, then apply to it a sheet of white paper, and roll it several times with a roller, in order that the impression may be complete.

NEW INVENTION.—It is said, that a cute Yankee, in the Old Bay State, has invented a kind of musical clock, that he has attached to a cradle, and the musical department *sings* the baby to sleep. This cute *labor saving* machine, it is thought will induce many wary bachelors to forego their celibacy, and venture upon a series of connubialities.

A PROFITABLE VOYAGE.—Mr Hatch informs us that the ship Hector arrived at New Bedford, from the Pacific, last evening, with a cargo of twenty seven hundred barrels of oil—having been out only twenty-six months! The cargo is worth about *eighty thousand dollars!*—*Transcript.*

## URATE AND POUURETTE.

An establishment for the manufacture of the Manures called Urate and Poudrette has been erected, at a considerable expense, in the State of New Jersey, near the city of New York; and an act of incorporation has been granted by the legislature of the State of New Jersey, by the name of "The Lodi Manufacturing Company" for purposes of agriculture, wherein it is provided, that 500 shares, a portion of the stock reserved for subscription by farmers and gardeners, within a limited time, shall be entitled to receive 50 bushels of Poudrette yearly for five years, viz. in 1840, 1841, 1842, 1843, and 1844, upon each share of \$100, which is at the rate of 20 per cent. per annum, for those years, and after that period to receive an equal dividend with the other stockholders.

The Manufactory has gone into operation according to law; a sufficient number of shares having been subscribed for that purpose, and capital paid in; and the first dividend has been regularly paid to the subscribers—the next dividend is payable in September. But the Company needs a larger moneyed capital than it now has, to carry it on to better advantage. Inquiries having been made whether all the stock had been taken, and the difficulty at the present time of obtaining funds, to a sufficient amount, from a few individuals, has induced a renewal of this notice to farmers and gardeners, and every other person who may have spare funds, (as every person is now permitted to subscribe,) that there is yet a considerable portion of the reserved stock, which, by law, is to receive 20 per cent. per annum, payable in Poudrette, one half in May, and the other half in September, in the years 1840, 1841, 1842, 1843, and 1844, not yet subscribed for, and the books are now open to receive subscriptions for the same, by any person, whether gardener, farmer or otherwise, at the office of the Lodi Manufacturing Company, No. 73 Cedar Street, in the city of New York. Terms for the reserved stock, \$100 per share in cash; and for the other portion of the stock an instalment of \$25 per share on subscribing, and the residue (being \$75 per share) to be called in by instalments of \$5 per share, after thirty days notice.

These manures have been fairly tested and very generally approved of as being the cheapest and best manures, and more economically applied than any other known substance used for manure.

As the article can be furnished from the city of New York, only to a limited extent, (not more than sufficient to manure 35,000 acres annually,) it must follow, that in a few years it will necessarily be confined to the use of the stockholders alone.

It is important to agriculture, and the enterprise deserves the liberal support of every enlightened farmer. By order,  
WILLIAM M. WILSON, Secretary.

At an election for Directors of the Lodi Manufacturing Company, held at Jersey City on the 6th day of July, 1840, the following persons were elected Directors of the Company, to hold their offices until the first Monday in October next, namely, Anthony Dey and Jacob C. Dey, of New York; J. D. Miller, Andrew S. Garr and Rodman M. Price, of New Jersey.

August 12.

## TIE UP CHAINS.

Just received at the New England Agricultural Warehouse, a good supply of those celebrated Chains for tying up cattle. These chains, introduced by E. H. Derby, Esq. of Salem, and Col. Jacques, of Charlestown, for the purpose of securing cattle to the stall, are found to be the safest and most convenient mode of fastening cows and oxen to the stanchion. They consist of a chain which passes round the animal's neck, and by a ring attached to the stall, plays freely up and down, and leaves the animal at liberty to lie down or rise at pleasure, and keeps him perfectly secure.

July 15.

JOSEPH BRECK & CO.

## BERKSHIRE PIGS FROM HAWK'S STOCK.

The subscriber has on hand a few litters, from some of the largest and finest sows in the country, sired by Losing's and other imported boars. Also, the smaller class of Berkshire pigs, which are very beautiful animals, and delicious porkers. Either of the above stocks will be disposed of extremely low by applying to

Z. STANDISH.

N. B. The pigs will be neatly caged and shipped at New York, without extra charge, if required. Unquestionable reference will be given for thorough breeding.

Albany, August 19.

41

## THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at \$3 per annum payable at the end of the year—but those who pay within sixty days from the time of subscribing are entitled to a deduction of 50 cents.

17 SCHOOL STREET—BOSTON

N. E. FARMER.

### BANKS AND THE CREDIT SYSTEM.

No. II.

The first exchanges of men were of what we call barter, in which one article was given directly for another—as a skin for a bushel of grain, or grain or skins for a cow; or other forms, in which articles were exchanged in kind. This, for various and obvious reasons, was a very inconvenient mode of traffic. Men presently found that some fixed representative of value was needed, by which exchanges could be made with more ease and with exactness. The precious metals have been adopted by all civilized and semi-civilized nations as this representative of value, this medium or standard of exchange; and by these means business or exchange or traffic is carried on with fractional precision. In themselves the precious metals are not so valuable as iron or lead or copper; that is, they are not susceptible of being applied to so many of the practical uses of life; but from their scarcity, and their little liability to corrosion or wear, they have been universally adopted as a currency or medium of traffic and exchange. It will be obvious upon reflection that the first and an indispensable requisite in a currency or standard of value or medium of exchange is, that it should have an *intrinsic, admitted, fixed and permanent value*. This, we repeat it, is essential; and must never be lost sight of. Without this, every thing would be thrown into confusion. The power of no government on earth can sustain a currency without this basis of confidence. The precious metals alone furnish that basis. Governments have often attempted by arbitrary enactments to fix a scale of prices, and to make other things than gold and silver a legal tender in payment of debts; but the consequences have always been disastrous. The currency thus attempted to be sustained by the force of law, has gone down in proportion to the violence of the efforts made to maintain it.

A bank, to have the confidence of the public, must rest its credit upon its perfect capacity to meet all its obligations promptly and perfectly according to their tenor: if its notes are on demand, whenever they are presented; if on time, when that time arrives. There must be no evasion, or hesitation, or delay. It is allowed to issue its credits in the form of notes, usually payable on demand at its banking house. If these notes are expected to have currency as cash, they may be as good as cash by being able always to command it.

Banks have been established on various foundations: sometimes on the pledge of real estate; sometimes on the pledge of public stocks; sometimes on the association of individuals, who united their joint credit and gave their own personal security for the redemption of their notes. Such a capital is in the first place necessarily fluctuating in its value; and in the next place, such bills are not convertible into specie, and therefore do not answer the purpose of exchange. Banks which rest exclusively upon mere personal credit, excepting

in some such extraordinary cases as that of Girard, are utterly unsafe. A bank is safe only when it rests upon a specie basis—a basis of gold and silver, and is prepared to cash all its demands on presentation.

The State understood this in the first creation of banks; and therefore it provided that no bank should go into operation until two thirds of its capital stock should be paid into the vaults of the bank in good faith, there to remain for the use of the bank in case a run should be made upon it, and for the security of the public against the insolvency of the bank. This wholesome provision, though remaining untouched on the statute book, has long since been utterly disregarded in the modern system of banking. It is obvious that there could be no actual loss to the public from keeping this specie on hand, because it would be represented in full by the notes of the bank; but had this wholesome provision been strictly maintained, we should never have heard of broken banks and the suspension of specie payments.

But it is said, since the multiplication of banks, this has been impossible, for no bank can keep out but a comparatively small portion of its capital, owing to the severe competition of other banks. This competition has undoubtedly its advantages; but in any case the same proportion of specie to its issues should be maintained; and no bank ought to be considered as safe, nor should be tolerated by law, where it has not always on hand a specie capital at least equal to two thirds of its issues or discounts. If there is a deficiency, it should at once, for the security of the community, supply that deficiency. It may be said that its creditors are all good, and the obligations of the bank will in any event be made secure. This may be true and ought always to be true; but the objection in the case is, that this property is not convertible. The true value of a bank note consists in being at once convertible into gold and silver; the moment it loses this capacity it at once depreciates in value, and the loss falls upon the holder; and sometimes to his most serious inconvenience.

It may be said again, that this condition of retaining such an amount of specie in the vaults of the bank is incompatible with the number of banks in the State or country. The answer to this is then, that we have too many banks. We have pushed the credit system too far. The truth is, all credit to be sound must rest upon a solid basis. There is no mystery in this case. Men make a great flourish about the principles of banking, as though they were so complicated that a common man could not understand them. A common man can understand the principles of common honesty in any case; and if the mysteries of banking differ at all from these, we leave it to those to explain who understand them. A merchant's credit is sound just in proportion to his ability to meet his demands exactly according to their tenor, and no farther. Extraordinary and unlooked for emergencies may arise, when he may ask an indulgence from his creditors. He will seek it with great hesitation. Corporations should be held to a severer

rule; and though we confess there may be great cases, such for example as the unexpected occurrence of a war, or some contingency, which might threaten at once to rob them of all their specie; yet in general they should be held to an absolute enforcement of the law.

Banks, then, resting upon a specie basis, and whose credit is secured by all the guards which human wisdom or virtue can devise, for nothing short of this should satisfy a wise legislator and an intelligent community, are of an immense benefit to such a community as ours. Besides the convenience of their notes and the facilities which they give to exchange, the concentration of capital so as to render it available to all classes where industry and enterprise are to be encouraged, and the actual increase of capital by fifty per cent., which can be done with safety under proper management, render a most important service to the poor, industrious and productive classes—advantages of which they can avail themselves by no other means. The banks of Massachusetts and New England, with some few most disastrous and humiliating exceptions, have hitherto maintained an undoubted credit throughout the Union; and they have been in a great degree the foundation of the prosperity of New England.

We shall speak hereafter of some of the abuses of banking and the credit system, if there are those who are willing to read our lucubrations. H. C.

August 21.

### BANKS AND THE CREDIT SYSTEM.

No. III.

We promised a continuation of our remarks on these exciting topics. They may be worth little; they may be worth nothing. They may show only a profound ignorance of what are technically called the principles of banking. We can promise nothing other than the impressions and opinions of a mind honestly inquisitive after truth; of one whose knowledge of them has never extended to any of the mysteries of the art; and who has in the case no party or political feelings whatever to gratify. As we have before said then, let them pass for what they are worth.

A bank, in the first place supposes, that there is an actual accumulation of capital upon which it is to be founded; otherwise it has no substantial basis. It certainly is not enough for the security of the public that certain individuals, however respectable and responsible, pledge to the community their own personal credit and issue their notes of hand as currency. No such bank as this would be relied on. Each of these individuals is liable to failure. The notes might be paid on demand or not, as it might happen; and that, which is first of all things demanded in a bank, a foundation of perfect confidence, would be wanting. The object of a bank is to loan money; but what sort of a bank is that which has no money to loan. The credit of a bank must be unquestioned. Its notes must be regarded as equivalent to their nominal amount in specie, and at any time convertible into specie

at pleasure; otherwise they become liable to distrust, depreciation and fluctuation, which subjects the holder to serious and oftentimes ruinous losses. No bank can maintain its notes at par value where there is any question of the ability and readiness of the bank to redeem them according to their tenor.

In the original incorporation of banks in the Commonwealth, this was perfectly understood and provided for. There were men engaged in the establishment of the first banks, who had passed through all the miserable fluctuations of the revolutionary currency; and many of whom had pungent recollections of these times, without doubt, in piles of this pictured government money lying in their drawers, which perhaps had fallen in their hands to a value less than the paper on which its nominal value was stamped. On this account it was provided in the general banking law, that before a bank went into operation, two thirds of its capital should be "*bona fide paid in in gold and silver, to be kept there for the use of the bank.*"—This provision still remains on the statute book. Had it been always enforced, we should never have heard of the failure of banks or the suspension of specie payments. Nor would the public have ever suffered loss or inconvenience from this, what some would term, hoarding the specie; because this specie might always be represented by the bills of the bank, which under such circumstances, being always convertible into specie at pleasure, would, as a currency, be far more convenient than specie.

We lay it down as a fixed principle, that a bank ought never to fail. A suspension of specie payments, a refusal to pay its notes in specie on demand, agreeably to their tenor, is a failure; is a bankruptcy in every sense of the word. The discussion of the question by the banks whether they shall suspend specie payments, and how long they shall continue this suspension, and when they shall resume, and how far they shall resume, is an outrage upon all justice and right; and so far from being countenanced or commended, ought to be signally rebuked and visited with the severest retribution of the laws.

If it be said that there is not specie enough in the country on which to found such a system of banking, then it seems we have not the capital for secure and honest banking; and ought not to have a bank, which cannot thus provide for itself; or otherwise we ought to seek foreign capital, which would always be to be had, if full confidence could be placed in our system of banking. It is because our system of state banking, I do not limit the remark to Massachusetts, has been justly deemed entirely insecure, that our State bank stocks find little or no market in Europe.

But it may be asked, to put an extreme case, suppose a bank with one hundred and fifty thousand dollars capital, and the full amount discounted should be run upon for specie. Upon our supposition she has but one hundred thousand dollars in specie to pay with if called upon. Now in the first place no such run is likely to take place, certainly if other banks are managed on the same just, honorable and legal principles. If attempted it could not be done at once without giving some time for the bank to provide for such an emergency. But the thing itself is scarcely possible, as it supposes all the notes of the banks to be concentrated in a few hands; or a conspiracy among the holders of the bills to effect the ruin of the bank, a thing which will not happen, unless the bank by its misconduct brings itself under suspicion. But let

us suppose an extreme case. We have no hesitation in saying that the Bank should, by any sacrifice whatever, meet its demands punctually, fully and exactly. Failure or refusal to do this, should never come into its calculations. We know many high-minded merchants, men of whom it is only just to say, they rank among the nobles of the land, who act only and fully upon these principles. They would not fail or suspend, while they had any means of avoiding such an occurrence. In the late difficult crisis they made most tremendous sacrifices, by paying exorbitant interest to the Jews and sharpers, who lung round them like the Cossacks upon the flanks of Napoleon's army in his retreat from Moscow. They might have suspended, but they felt their mercantile honor, which they valued next to their lives, was at stake, and they would not, while they could, ward off the blow, though it might require in order to maintain their honor, the surrender of the last dollar, the hard earnings of many a year's labor and toil.

A bank surely should act upon as high principles of right and duty. Unless by some wholly unlooked for emergency, such as the sudden breaking out of a war, or revolution in the government, a bank should consider a failure or suspension impossible. We use the terms as synonymous. A suspension of specie payments from inability to meet its demands exactly according to their tenor, is bankruptcy; and its effects are always disastrous; first in the depreciation of its stock, and second in the depreciation of its bills or notes, by which suffering and loss are often widely and severely extended; and lastly in the general distrust which it at once creates towards all banking institutions and all paper currency. When a bank assumes the right to suspend at its pleasure, and gravely, with an arrogance which we hardly choose to designate, in defiance of law and right, chooses to discuss the question of how long the suspension shall continue, we should like to inquire whether its customers are at liberty to act upon the same principle; and whether its heaviest debtors will be spared and indulged when they choose at their pleasure to suspend the payment of their notes which the bank has discounted? Shall a corporation, enjoying singular privileges in the community, be allowed to violate all principles of commercial honor and right in a case where an individual in debt to the same corporation, would be held to the extreme rigor of the law, and be degraded from the high standing which he occupied, if he failed to meet his engagements? It is not enough in such case to say the bank is secure; its means are ample, and it will presently meet all its engagements. This may not be generally known, or may not secure universal confidence. Its stock and its notes are at once depreciated; and those who hold them cannot wait for an ultimate settlement, and must dispose of them at a most serious loss. At the failure of the Commonwealth Bank in Boston, for example, thousands and thousands of its bills were sold at 50 per cent. discount; though it was well known that under the law rendering the stockholders responsible to the amount of their shares, it was not probable there would be any eventual loss upon them. The stock of the United States Bank, much of which was bought at 125 dollars per share, owing to its suspension has commanded only 50 dollars in the market. How many of its stockholders must be utterly ruined by such a result.

Honor and punctuality are the soul of a commercial community. It is much to be feared that they

are not estimated as they ought to be. If the effects of a failure to meet his engagements exactly and punctually, were always limited to an individual, the evils of failure would be comparatively trifling. But it is not so. In an active business community, men of business are desirous to employ all the means they can command. They incur obligations on the presumption that the obligations of others to themselves will be punctually fulfilled. These obligations are spread in infinite ramifications like net-work over the whole community. A failure in one case may be felt throughout the whole, and the negligence, or inadvertence, or want of punctuality in some single individual, may bring inconvenience and ruin upon thousands.

We say, therefore, that a bank should not fail. It should not allow itself to be put into a condition to fail. Such a contingency should be hardly within the limits of possibility. The banks never would have failed and never would fail, if they strictly conformed to the provisions of the law as to the amount of specie in their vaults. But the answer to this is that the banks then could never do any business, and that there is not specie enough for these purposes. Then it seems in the first place we have too many banks, or otherwise they would do business to the extent of their capital, and this is all they ever should do. If in the next place we have not specie enough, then it seems the capital is actually wanting on which alone a secure banking system can rest. A bank should take no extraordinary risks. It is of no advantage to the community and seldom to the individuals themselves, to loan money to those persons whose credit is in any measure suspicious or uncertain. We know at least one bank in the State, to its high praise be it spoken, which, we believe, has in the course of twenty years of banking, never lost a single dollar from its creditors. This shows a vigilance, a rigid adherence to fixed rules and punctuality and sound judgment in the management, which are worthy of all praise. There is little danger of the failure of such a bank.

August 28.

H. C.

*Mutton Broth for the Sick.*—Have a pound and a half of a neck or loin of mutton; take off the skin and the fat, and put it into a sauce-pan; cover it with cold water, (it will take about a quart to a pound of meat,) let it simmer very gently and skim it well; cover it up, and set it over a moderate fire, where it may stand gently stewing for about an hour; then strain it off. It should be allowed to become cold, when all the greasy particles will float on the surface, and becoming hard, can be easily taken off, and the settlings will remain at the bottom. N. B.—We direct the meat to be done no more than just sufficiently to be eaten; so a sick man may have plenty of good broth for nothing; as by this manner of producing it, the meat furnishes a good family meal. This is an inoffensive nourishment for sick persons, and the only mutton broth that should be given to convalescents, whose constitutions require replenishing with restorative aliment of easy digestion. The common way of making it with roots, onions, sweet herbs, &c. &c. is too strong for weak stomachs. Plain broth will agree with a delicate stomach, when the least addition of other ingredients would immediately offend it.

How can a farmer expect to gain wealth who consumes all he raises and runs in debt for all he buys

## A BARN WORTH LOOKING AT.

The Shakers at Alfred, Me., as we learn from the Farmer's Monthly Visitor, have a barn 143 feet in length by about 50 feet in width, and three stories in height from the basement to the plates; on one end, say thirty feet beam, and at the other from eighteen to twenty feet. The entrance to the barn with loaded teams of hay or grain is on the third or upper story. As the building stands on a side hill reaching up and down lengthwise, the entrance is of no very steep ascent on the upper end of the barn. The load of hay is pitched down either upon the scaffolding over the cattle stalls, or where there is no stall to the double depth of the bays below. The quantity of hay or other barn material that this building will contain after leaving ample space for the cattle, is immense; and instead of disposing of the hay by lifting and pitching over head, the greater portion is merely thrown over.—The ample barn floor extending the whole length of the building, is constructed on the principle of a moderately inclined plane, so that the empty cart or other vehicle, separated from the oxen or horses, runs back itself to the entrance without backing the whole together, as is ordinarily done in common barns where there cannot be a passage through. This upper entrance and floor are at no time an interference with the floor below fronting the cattle stalls, from which they are supplied with their daily food. On this story, as an unusual convenience in a common barn, are apartments for keeping cows expected soon to calve, and for keeping the nursing calves. In the basement, beneath the cattle stalls, on the one side, the manure is dropped down to be kept under cover, and on the other side is a spacious cellar, in which root crops are kept free from frost during the winter. In the rear of the cattle-stall-side of the barn, is a large barn yard, hollowed out from the centre to the sides, so as to catch and retain the strength of every thing running into it. Into this yard, which had been cleared of every thing the past spring, a load of black muck or mud from the swamp at no very great distance, has been recently carted. The cattle kept here, or hogs running upon and working it over in the course of the summer, convert every material deposited in a yard thus constructed, into an extra quantity of the very best manure.

## FRUIT TREES.

The following extracts from a foreign work will show the young people of our country how they keep up a succession of fruit trees in Germany, and perhaps it may stimulate some of them to imitate so laudable an example.

"In the duchy of Gotha, in Germany, there are many villages which obtain a rent of many hundred dollars a year for their fruit trees, which are planted on the road-side and on the commons. Every new married couple is bound to plant two young fruit trees. The rent arising from the trees thus planted is applied to the uses of the parish or town.

In order to preserve the plantations from injury or depredation, the inhabitants of the parish are all made answerable; each of whom is thus on the watch over the other; and if any one is caught in the act of committing any injury, all the damage done in the same year, the authors of which cannot be discovered, is attributed to him, and he is compelled to atone for it, according to its extent, either by fine or corporal punishment."

"A gentleman at Colechester, England, makes it

a rule whenever he builds a cottage, to plant a vine against its walls, and two or three apple and pear trees near to it, or in the garden, and thus he confers a greater benefit on his tenant, by giving him an innocent source of gratification to his children, and an excitement to a little extra industry on his own part, than if had let him a comfortable, mean looking hovel, at half the rent."

A few ornamental trees and shrubs, disposed with good taste about a farm-house, add much to the beauty and pleasantness of the scene; and they never fail to make a favorable impression on the mind of a visitor, of the character of the inmates of the mansion. A season should never be suffered to pass by without some addition being made by the young people, to the ornaments of the yard, garden or lane leading to the house. Some families have displayed their industry, taste, and good judgment in this respect so conspicuously as to command the admiration of their neighborhood, and to excite the curiosity of travellers to inquire "who lives there?"—*Farmers' Cabinet.*

From the Farmer's Cabinet.

## HEN'S EGGS.

I notice in the Farmers' Cabinet for 4th mo. last, p. 275, an inquiry as to the truth of the assertion, that hen's eggs which are round produce female chickens, and those which are long or pointed, produce males.

When a boy, I was in a situation to be able to indulge my fondness for fowls, and often raised chickens. Without ever having heard of the above facts, I discovered that the eggs which approached the nearest to roundness always produced females, and those which were pointed at one end always produced males. I acted accordingly, and always succeeded in obtaining females or males, according as I wished.

After a lapse of a number of years, being in Philadelphia market, I happened to mention the fact to one who raised chickens for sale, and who preferred the males, because they grew larger: the information was received with some surprise; but I advised the person to try it, and afterwards was informed of the entire success of the experiment, all males being produced by selecting the long or pointed eggs.

I since find the fact was mentioned by a writer over 2000 years ago. I. H.

## FLOWERS.

Flowers—of all created things the most innocently simple, the most superbly complex! playthings for childhood, ornaments of the grave, and companions of the cold corpse! Flowers, beloved by the idiot, and studied by the thinking man of science! Flowers, that unceasingly expand to heaven their grateful, and to man their cheerful looks: partners of human joys; soothers of human sorrow; fit emblems of the victor's triumphs and the young bride's blushes! Welcome to the crowded hall, and graceful upon the solitary grave! Flowers are, in the volume of nature, what the expression "God is love" is in the volume of revelation! What a desolate place would be a world without a flower! it would be a face without a smile—a feast without a welcome. Are not flowers the stars of the earth? and are not our stars the flowers of heaven? One cannot look closely at the structure of a flower without loving it: they are the

emblems and manifestations of God's love to the creation, and they are the means and ministrations of man's love to his fellow-creatures, for they first awaken in his mind a sense of the beautiful and good. The very *inutility* of flowers is their excellent and great beauty, for they lead us to thoughts of generosity and moral beauty, detached from and superior to all selfishness, so that they are sweet lessons in nature's book of instruction, teaching man that he liveth not by bread alone, but that he hath another than animal life.—*Zion's Advocate.*

*An Orchard destroyed by Canker Worms.*—The orchard of Mr Jabez Giddings, of Rocky Hill, has been overrun with worms for seven years—and is now entirely killed; so that he has determined to cut it down.—Thus he has, by these insects, been deprived of seven years' fruit, and finally of a fine orchard,—which he is now under the necessity of clearing off—all for the want of a little care and labor. By spending an hour per day for six months in the year, and \$1 per annum for tar, an orchard of 50 trees might be preserved. The expense of this operation would not be more than \$20 per annum to any farmer, and most of them would perform it with their own hands, without being felt. The result would be the preservation of the trees, plenty of fruit for family use, and a surplus that would bring at least \$50 a year in the Hartford market. The fruit used at home is a full compensation for carrying the remainder to market. According to this calculation, the balance, in 7 years, is \$210 loss, besides interest. But an orchard that produces an annual income of \$30, is as good as \$500 at interest—this being added, makes Mr G.'s total loss from neglect, over and above all necessary expenses for preservation, not less than \$750— or on an average of \$107 per annum—more than \$2 a year for each tree suffered to be overrun by Canker Worms.—*Hartford Courant.*

*Antidote against Mice.*—Mr McDonald, of Scalps, in the Hebrides, having some time ago suffered considerably by mice, put at the bottom, near the centre, and top of each of his stacks of grain, as they were raised, three or four stalks of wild mint with the leaves on, gathered near a brook in a neighboring field, and never after had any of his grain consumed. He then tried the same experiment with his cheese, and articles kept in store, and with equal effect, by laying a few leaves, green or dry, on the articles to be preserved.

*Poultry.*—When, says M. Bosc, it is wished to have eggs during the cold season, even in the dead of winter, it is necessary to make the fowls roost over an oven, in a stable, in a shed where many cattle are kept, or to erect a stove in the fowl house on purpose. By such methods, the farmers of Auge have chickens fit for the table in the month of April—a period when they are only beginning to be hatched in the farms around Paris, although further to the south. It would be desirable that stoves in fowl houses were more commonly known near great towns, where luxury grudges no expense for the convenience of having fresh eggs."

By the growth of root crops and planting, Mr Coke, the great English farmer, has increased the rental of his estates from 25,000 to \$200,000 per year.

## AN ENGLISHMAN'S ACCOUNT OF OUR COUNTRY.

In the British Farmer's Magazine for July, we find the following notice of Mr Edmund Edmund's letter to the farmers of England, after having been to the United States to look after a *pauper* he had sent out. He has given to his countrymen a curious account of the agriculture of our country, so mixed up with ignorance and prejudice, that we think our readers will be amused by the perusal of it.—It is lucky Mr Edmunds escaped as he did with life, after having his ears greeted "with the loud horrid noise of the bull toads, which weigh from three to four pounds each." We sincerely hope he will not venture the lives of any more of his *paupers* on this side the Atlantic; for after hearing his description of our climate and the dangers to which we are exposed from heat, cold, grasshoppers and bull toads! we shall set him down guilty of manslaughter at least, by thus endangering their lives. No—let him keep his *paupers* at home, and feed them on fat bacon and cabbage, rather than send them here "to slave in the heat, toil in the cold, and starve on pickled pork and potatoes." J. B.

"A WORD TO THE WISE"—*A Letter to the Farmers of England.* By Edmund Edmunds, Braunston, Northamptonshire; a Farmer, lately returned from the United States of America.—London: Hamilton & Adams. 1840.

A very sensible, and we are inclined to think a very faithful (!!!) account of a land, of which we are further inclined to think more lies have been told than of any other of our emigrating points.—Mr Edmunds had *heard* much of America, especially from a *pauper* whom he had been the means of sending out thither, and who represented it as a land flowing with little short of milk and honey. He resolved to *see* and judge for himself, and it is the object of the letter in question to give the results of his investigation.

"I went up to Palmyra, a pleasant village in the State of New York, because there I was to meet my son, a young man about twenty years of age, for whom in England I had no more chance of taking a farm than I had for myself; and there too was the man whom I had prevailed on the parish to send out, and who, knowing the interest I had taken in his welfare, had written to me such letters of his great prosperity. But how did I find him? Did I find him the gentleman farmer his letters had led me to suppose he was? No. I found him as poor as when he was the village cobbler of Braunston, and I may say apparently less comfortable in every point of view. The land which he had boasted of as his estate was not his own; and he was looking forward to the approaching harvest with dread of the heat and labor with which it was to be gathered."

We should like much to have the result of the son's experience, the young man of 20, above alluded to, and to know how far it corresponded with that of his father. Meanwhile, we shall give such extracts from the letter of the latter as we think may interest the general reader.

"The Americans always reckon by dollars and cents, each cent being the hundredth part of a dollar; but as I am not writing for Americans but Englishmen, I shall give the value of every thing in English money.

"As respects the land, *I was not at all deceived.* It is light and easy to till. An acre a day may be ploughed with two horses abreast driven with reins. The land being fertile the crops for a while grow very luxuriantly, exciting hopes which are not unfrequently disappointed; for supposing a crop of wheat should escape the blight, or, as the Americans call it, the rust, which in two or three days will so utterly destroy a whole field that there shall not be a grain of corn in it; supposing it should escape, what from the excessive heat all the low lands are particularly subject to, yet from the heat alone, when it does no particular injury, the vegetation is so quick, and the grain ripens so long before it has had time to perfect its growth, that the kernel is very small and light, and altogether very inferior to what it would be in a better climate. Wheat, in a good season, will not yield more than from about 15 to 20 bushels an acre, and being small and dry it lies close, and weighs from 60 to 64 lb. per bushel. In the States further west, it averages about 25 bushels per acre; but the price is lower, in consequence of its having to travel so many hundred miles to market, in order to its being exported, or to supply the Eastern States. If a crop of wheat in Ohio is larger than in the State of New York, it is of less value; so that the farmer's gain is about equal in each State.

"As I took out with me a bushel of good English wheat of the primest quality, I sometimes could not restrain my English feeling when I heard the Americans proudly boasting of the produce of their country, and vainly talking of it, as if the like could never be seen. When they seemed to be all agreed and had quite settled the point in their own mind that there was no wheat like their own, out I used to pull my sample of good bold English wheat, fat and plump, and showed them, to their great surprise, such wheat as I knew their country could not grow. When I did this on board a steamer, they came round about me like bees—all the cry was, 'I wonder much,' 'I wonder much?' 'and does such grain as this *really* grow in England?' and then one and another, forgetting his American independence, was presently asking for a few grains just to set in his garden.

"The Americans grow great quantities of Indian corn, which, being natural to the soil and climate, will yield from 30 to 100 bushels per acre, according to the land, and the good husbandry with which it is farmed. It is set in rows wide enough for a plough to go between, about the end of April or beginning of May; it grows from five to eight feet high, and puts forth a number of broad leaves, which are good fodder for cattle. It is a great article with the American farmer, and, as a never failing crop, it is his chief dependence, and much relied on by him for the keep of *all* his stock through the severities of an American winter.

"The land would grow good Swede turnips, but they are not cultivated. It would not pay to give men a dollar a day, that is four shillings, and their board, to pull them up and house them; the farmer has no stock that would pay to eat them, and they would all perish if left in the ground.

"The meadows, generally speaking, look pretty good, and will average about two tons an acre; but the hay, made of red-top or timothy grass, growing from three to four feet high, is very coarse, and there is not much nuture in it. The stock which are grazed in such meadows never become fat. If they are in good order as stores, that is as much as you must ever expect to see. I never

saw any thing at all like fat beef or mutton in the thousands of miles I travelled.

"During my stay, I spared no trouble or expense to gain all the information I could collect, being very desirous to know whether America was what it had been represented or not. And from my own observations, I made those calculations which every man of my age and experience ought to make, before he thinks of settling down in a country which appears one thing in American books and private letters, and another as it is observed with the eye of an English farmer capable of forming a correct judgment.

"The American horses, with their long tails, are *all* of the nag kind, vary in price from £10 to £30, and are, taking them generally, so very good, that I may say they are superior to our own. They are well made, good tempered, and are mostly used for harness, and a span or a pair abreast in a light wagon, will trot along well. The Americans take great care of them, and will give them corn twice a day, when there is plenty of grass, yet they are never in any better condition than what we call good working order. But I regard America as a country in which neither man nor beast can thrive, for there is but very little enjoyment for either. Every living creature must feel, more or less, the close sultry heat of an American summer, and the piercing cold of an American winter.

"As I should be sorry to misrepresent any thing, though so much was misrepresented to me, I must now state that the cows are very good and useful for a dairy. They are of every breed, and worth from £8 to £10 each. In their frame they are what we should call beasts of six or seven score a quarter. But the farmer, who should keep ten or twelve for a dairy, is subject to a very great loss in the calves. There being no market for veal at 6d. or 7d. per lb. as in England, the calves that are not wanted for rearing, after they have been kept about ten days to draw the cow's bag, are knocked on the head, skinned, and thrown to the pigs, the price of stock being so low, the farmer has no inducement to rear more calves than he is likely to want to keep up his own stock, and to *save buying.*

"The sheep, a mixed breed of Spanish merino and Saxony, are worth about six shillings a head. They are very much like an ill-bred Southdown in poor condition, and will cut from 2 to 3 lb. of wool each. When fed on an American pasture, they weigh about 10 or 12 lb. a quarter, and the meat, whether beef or mutton, is worth 2 1-2d. or 3d. per lb. The lambs, which when fat are worth four or five shillings each, are weaned at the latter end of April, or the beginning of May. In consequence of the winters being so very long and cold, the springs are late; and the ground being covered with snow the greater part of the winter, the farmer is obliged to fodder his ewes from the middle of November till the middle of May on hay and Indian corn. Now I would ask, what is to pay for keeping, we will say, fifty ewes for a year, and for shepherding them as they ought to be attended to, in a country where men and cattle suffer so much from the oppressive heat of the summer, and the piercing cold of the winter? If we reckon that fifty ewes have one lamb each, and they seldom have more, and supposing them all reared without the loss of a single sheep, for I am quite willing in my calculations to give America every advantage, what then? why the farmer, after twelve months' keep, has got fifty ewes that will not cut more than 3 lb. of wool one with another, and he has, at most,

fifty fat lambs, worth £12 10s., for they will not fetch more than five shillings each. In England, the keeping of sheep is, in every point of view, a profitable part of farming; but what is to be gained from it in America? As I thought on the keeping of sheep in America, and compared it with the same stock in England, I could not help saying to myself, 'this is indeed fine farming,' and is this part of the farming for which I have left the shores of old England and all its comforts, to come here and be surfeited with pickled pork, and toil like some poor wretched negro slave in South Carolina, and live, too, as I have never been accustomed to do, on a perfect level with my laborers. What if there is 'no rent to pay,' the land must be bought and paid for; and what is there to pay you any interest for money expended in land and stock? What is there to enrich you after years of servitude, and enable you to return to England, to end your days where they began, surrounded with the comforts which an Englishman is privileged to enjoy? Is the reader thinking what a fine opportunity I had of improving their breed of sheep, and immortalizing the name of Edmunds as the great benefactor of the country? What a fine opening for becoming a great sheep breeder! Though I did not cross the Atlantic in pursuit of fame, yet I was not insensible to the importance of introducing a very superior breed of sheep, and it was for that purpose that I took with me eight such excellent long-wooled tups. But did they maintain their English character and good properties, and keep up their healthy appearance? No. I saw them degenerate daily, faster than I thought it possible for any creatures to do. When they landed they were in good condition, but I could not keep it up. Though I set great store by them, and they were all the stock I had to attend to—though they had the best pasture the country afforded, and were well shaded with trees—had as much as they could eat of oats, peas, Indian corn and potatoes—still they got poorer and poorer, worse and worse every day, till at last they became very thin, and their wool so harsh, without any moisture or nature in it, that it was certain they would never cut a good fleece again. But the heat was so intolerable to them, that they had no more comfort of their lives than I had, who at that time was obliged to change my shirt at least twice a day, though I had nothing to do but to sit still in the house.

"From my own experience, I can only speak of the overpowering heat of the summer, that moist, relaxing, melting kind of heat, which unfits a man for every thing and makes existence almost a burden. I may venture, however, to assert with truth, and therefore without any fear of contradiction, that the winters are most severe. Cows with their tails frozen off, would have given the lie to any American who should have maintained that their winters were not more severe than ours. But I heard enough of their winters from the Americans themselves, to convince me that a winter's residence in the State of New York is not more desirable than my summer one, which has made such a lasting impression on my mind."

Again—

"Of the States west of New York I can say but little, except that every one told me how subject they were to the ague, and that if I went to settle in either of them I could not escape it. This report I have had confirmed, and my opinion is, from all I have heard, that there is not so great a difference in any of the Western States as any one

would suppose. A nephew of mine complained exceedingly of the heat of Illinois, and I have no doubt he would have found the winters very cold, if after coming to England he had determined to return to his claim, which he had marked out, and which, as far as the land was concerned, held out every prospect that America could present to a young man well qualified for encountering the difficulties which every settler must expect. I am convinced from my own experience, that the Englishman who goes to the United States must expect to find himself not only destitute of the comforts to which he has been accustomed, but many inconveniences which he did not reckon upon. The intolerable bite of mosquitoes; houses swarming with bugs, and so full of black flies that they get into every thing; they are in your tea cup, half a dozen at a time, before you can swallow your tea, and you must pick them off your butter, soft with the heat, before you can spread it on your bread. The chirping of *myriads* of crickets and grasshoppers, trifle as it may appear in comparison with mosquitoes and bugs, is so wearisome, that it becomes quite a nuisance; and as for the American forests, they are as gloomy and dull as any thing you can imagine. No singing birds to delight and cheer you, and for a while make you forget, *if you can*, the country you have left behind. 'No voice of the turtle is heard in the land;' but, after sunset, the doleful croaking of three or four sorts of toads, with the loud horrid noise of the bull toads, which weigh from three to four pounds each; such are the sounds which break the death-like silence of a grand American forest, with its lofty pines and magnificent trees of almost every description.

"There is, no doubt, a great deal of sickness and innumerable deaths occasioned by the exhalations which arise from the swamps, and which are not likely to be drained till labor is cheaper and produce of more value. There is, in fact, *no capital*—and where there is no capital you cannot expect improvement.

"But the one grand objection to the United States is that of which I was most ignorant—the *climate*. It does not suit the Americans, and it cannot suit an English constitution, to work in a country where there is not, for many days, a breath of wind stirring, and where it is impossible to conceive heat more close and sultry; the thermometer in the summer is often, for days together, at 90 degrees in the shade; and in the winter 30 degrees, and even lower than that, below zero. If a man have 'bones of iron and flesh of brass,' he may be proof against all such great extremes; but if he have the constitution of men in general, let him be ever so stout, he will soon look as thin and sallow as his neighbors. Go where you may, and look which way you will, you never see the ruddy bloom of health which meets you every where in England, nor old men and women of between eighty and ninety, as you will see in almost every English village. It is the climate that carries off the population so fast, that I doubt whether it would ever become a populous country, were it not for the immense tide of emigration flowing in, more or less, from every country in Europe; more than 4000 emigrants having arrived at New York in four days. It is the climate of America which is the grand obstacle to its prosperity—it is the climate which disheartens and sickens the man who dwells under its influence; for it is a power which he cannot resist; other difficulties might all be overcome, but with this he struggles in vain."

He at length resolves to return to old England:

"Let not my reader suppose for a moment that I was the only person who returned to England with such views of America, that I would on no consideration ever go to it again. There were hundreds who left the very day I left, and I know that thousands and tens of thousands were left behind because they could not return; and if, after all I have heard, and seen, and felt, I did not warn my fellow countrymen, and let them reap at home all the advantages of what I learnt abroad, at no little cost and trouble, I should be wanting in the discharge of a duty which I consider my brother farmers have a right to expect from one who, I trust, will never be chargeable with indifference to the happiness and welfare of any man. *I was deceived*, and I would not have you deceived, and go out to America with expectations which I am sure cannot be realized. Every person who intends to settle in a distant country, should know well the climate of the country in which he intends to settle; that I can say, from my own experience, is the *first* and most important point; for if the emigrant is to do any good, he will need all the advantages that a temperate climate can afford, to give success to his exertions. Now, the climate of America, as I observed its effects on others and *felt* them too, on *my own* constitution, does not promise the enjoyment of that health and strength, without which human life soon becomes a burden, and the prospects of success are but very hopeless. Though I went out with some capital, quite as much as was necessary, and with a determination to work and make the best of every thing, and with no idea of setting up for a fine gentleman, yet I could not discover any thing in America that held out those prospects which I certainly was led to hope for, and which every man naturally expects to find who has left his own country. If a man of sober and industrious habits—and it is no use for men who are not sober and industrious ever to think of emigrating to *any* country—I say again, if a man of sobriety and industry, and a few hundred pounds in his pocket, must, if he goes to America, slave in the heat, and toil in the cold, and get nothing better than pickled pork and potatoes, he had better stay at home, and eat fat bacon and cabbage in England, and make the best of what little he has in his own country, amidst his own relations and friends, than banish himself from all those comforts of life to which he has been accustomed, and sail away to a country where *produce is cheap, labor dear, money scarce, and climate unhealthy.*"

*Hoing Ruta Baga.*—On ground of any common degree of fertility, the distance of one foot at least should be allowed between these roots, except they be in drills three feet asunder, when they may be suffered to stand a little nearer. If sown broadcast, eighteen inches square should be allowed to each root. If the land is rich enough, they will be so much larger in consequence of this increased space, as considerably to increase the amount of the crop, and greatly diminish the labor of harvest.

We have observed, on the best soil, well manured previous years, where the crop had been sowed broadcast, and two feet square allotted to each plant, roots weighing from ten to fifteen pounds, and yielding about fifteen hundred bushels per acre. If the soil be poor, the roots must be much nearer together, as they will not grow large, and number must be made to compensate for magnitude.

## NEW ENGLAND FARMER,

AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, SEPT. 9, 1840.

## THE LABORING CLASSES.

The condition of the laboring classes in Europe and in this country is exciting strongly the attention of the reflecting and humane. It is not our intention, certainly at this time, to go into the subject. Among the laboring classes are comprehended many more than most persons, at first glance, apprehend. The merchant at his desk, is often one of the hardest of laborers; and Mr Dane, of Beverly, who compiled a most valuable digest of the laws, valuable to every class in the community, and spent regularly for more than forty years, sixteen hours a day in close application to this business, certainly labored as intensely and severely as any man that can be found among us. If we look at the hard student, who in many cases by the offspring of his mind, renders extensive, essential, and permanent aids to the community, and to the laboring and mechanical community in particular, and see his pallid and wasted features, and hear his complaints of indigestion, disturbing dreams, fruitless efforts and sleepless nights, we shall be disposed to include him among the hardest of laborers.

But the classes which are generally referred to in speaking of the working classes, are those who work with their hands, with their muscles, with their bodies. The sufferings of these classes are in many countries extreme, and have just claims to all the commiseration which the humane can feel for them. In many countries they are poorly fed, or rather starved; not half clad, live in unhealthy, subterranean, wet, ill-ventilated habitations; and are doomed to toil, which is almost incessant, leaves no time for domestic comforts and scarcely for sleep. Philanthropic minds look at these things with exquisite pain, and are devising means to remedy these terrible evils. They are shocked at the anomaly, that those who produce the loaf must always be satisfied with the under-crust, however burnt or hard-baked, and not always get the whole of that; and that the finest of the flour and the whole of it goes into hands which are not so much as soiled with making the bread, after the corn has been grown.

We feel in many cases the extreme injustice of this; but where is the remedy? There may be alleviations, but there can be no perfect remedy until the whole constitution of society is changed, and until human nature is changed. Whoever thinks to change the constitution of society or to change human nature, may as well think of levelling the Rocky mountains and of making the Mississippi flow into the Oregon. Some minds with large hope fancy they see day-light on this subject; but our hope is small, and though we have been dreaming for some time about the good that is to come to human nature presently, we do not think the night is passed; we do not believe that even midnight has yet come. Our melancholy convictions are founded upon two considerations. First, Christianity among us, as a law of universal justice and universal love, is a mere name. We have scarcely yet learnt the first three letters of the alphabet. Secondly, the disposition and tendency to abuse power is the great sin of human nature. Where is the man who can say that in this matter he is blameless? Now then as soon as you give men education, property or political power, and, as we term it, elevate them in the community, they feel the power; they become antagonistical to the class below them, on whose labor they depend; they cease to wish to bring

them to an equality with themselves; they abuse their power. In general the novelty of the possession of power renders these people liable to its grossest abuse. Manumitted slaves make the most cruel of all task-masters; and men raised from the lowest oppression to rank and power, have always proved the most unrelenting and despotic. Under these circumstances, what hope is there for ignorance, weakness, poverty and mendicancy in its struggle against intelligence, selfishness, and political power? Look, say you, to the justice and humanity and magnanimity of society? Yes! look to these with a witness, as you would look to the tiger to drop the lamb, into which he has just fleshed his teeth; and is now regaling on the sweetness of the fresh blood.

In our country, thank God! we can hardly be said to have such a class as we have described. In Great Britain no laboring man can ever expect to become a freeholder; nor to rise above the condition in which he and his ancestors before him have trodden the beaten round of toil. In our country a man may become any thing which he chooses to make himself. He may be a freeholder; and he and his children may aspire to the highest dignities of the State; and to the undisturbed possession of the fruits of his honest industry. Cheap land and of the highest fertility may be had almost for asking. Every man is at liberty to choose his own profession and for his children after him; and industry and frugality joined with moral integrity, are sure (extraordinary contingencies excepted,) of competence and honor.

If the laboring classes—we speak particularly of the male portion, for women are bound by customs and circumstances which prevent their commanding their condition—forefeit their independence or fail to maintain it in our country, it must be their own fault. The great danger of this lies to a considerable extent, in the melancholy fact of their forsaking the pursuits and employments of agriculture and the wholesome equality and manliness of rural life, to crowd into cities, to become petty traders, ostlers, bar-keepers, porters, servants, coachmen, footmen, and indeed any thing and every thing, however servile, by which they can without *too much work* acquire ready money. Of this numerous class of young men, supplied as it is by the most costly drafts upon the country, though as we well know, there are many honorable exceptions, yet the great mass become perfectly effeminate; spend in dress and dissipation as much as they earn; fall a prey to the numerous temptations of city life; or become abandoned to the gross vices of which they are frequently called to be the ministers or panders for others. We have so little hope of human nature, that we see no remedy for this; and fear in spite of all the noble aspirations and confident labors of philanthropy, the world will go on as it is. H. C.

## DEATH OF DR HENRY PERRINE.

The papers recently announced an attack by the Florida Indians, in number one hundred, upon Key West, and the cruel destruction of many of the inhabitants; among the rest the valuable man whose name is at the head of this article. He was eminently distinguished by his botanical researches and his devotion to natural science. His communications to the public press on these subjects have been numerous and many of them instructive and valuable. He had been employed by the government in the cultivation of valuable tropical plants, with a view to their propagation in the States; and his researches and experiments promised to be of much utility. It is but recently that we received a long communication from him, written with all the enthusiasm of scientific pursuit. But a mournful Providence has prematurely sealed his fate.

This Indian warfare is horrible. The savages give no quarter. How upon any principles of human nature can it be expected to be otherwise? We have robbed and defrauded them. We have carried among them the two greatest of curses, the small pox and whiskey.—Whole tribes, as Catlin says, have fallen at the contaminating touch of the white man. We have undertaken to teach them what we call Christianity—a matter in which we seem to be rather poorly instructed ourselves; and the arts of civilization; and when they had made some progress, then we coveted their green fields and golden crops, and have driven them, when the most atrocious frauds failed us, at the point of the bayonet from their homes and the sepulchres of their fathers.—Now we are hunting them with blood hounds; and they perceive that the hour of their utter extermination has arrived. What have we not to expect from savages, in the last gasp of their death struggle! We have a friend who crossed the country with a party of twenty persons, from the mouth of the Missouri to the mouth of the Columbia river. He was six months among the Indians, without seeing a white man, save those of his own party. In this whole time he says his quiet was never menaced nor his life in danger but once, and this from a tribe at war with those among whom he was. He found nothing but kindness and fidelity. Our opinions of human nature are not very exalted; yet after all we believe that there is something in the heart of man, however tawny the skin, which always responds to generosity, kindness, honor and justice, where they have not been outraged and violated; and therefore we believe that for most of the Indian wars in which our country has been so often up to the elbows in blood, the guilty responsibility rests upon ourselves.

These considerations, however, do not at all mitigate the sadness of the calamity which we now deplore, nor lessen the duty of the government to afford adequate protection to our frontiers. H. C.

*Farms in England.*—Nine tenths of the cultivated lands in Great Britain are leased to tenants, who pay from two to five pounds sterling per acre, annual rent. Now, admitting taxes and labor and other expenses to be no higher here than there, it will at once be seen that our common cultivation will no where do much more than pay the price of rent; but by superior productiveness, occasioned by superior cultivation, the British farmer is not only enabled to pay rents and taxes, finding every thing for husbandry, and all articles put upon the ground, and all utensils by which the ground is worked, but he obtains also, wealth from the pursuit of his calling. Mr Curwin stated the produce of an English farm of 894 acres in the year 1811, to be £8,578—equal to \$38,000. On this ground were carried in that year, the almost incredible quantity of 13,746 one-horse cartloads of manure, and in the next year 10,250 more! Suppose the rent of this farm to be \$12 an acre, the expense of manure and its application \$12 more, and the interest on outlay, taxes, and additional labor of cultivation, &c. \$12 more; still there will be left, as profit, \$10 an acre; leaving a clear gain of about ten thousand dollars to the tenant.

A hay farm, near London, of 160 acres, was rented for \$12 an acre, or 1920 dollars a year: the tenant commenced with a great outlay for manure—an outlay which would here be considered at least equal to the value of the land before it was manured; a large outlay for farming implements and for accommodations and wages for laborers; and yet he has been constantly accumulating riches from this farm, after paying all expenses.—*Monthly Visitor.*

BRIGHTON MARKET.—MONDAY, Sept. 7, 1840.

Reported for the New England Farmer.

At Market 375 Beef Cattle, 530 Stores, 4300 Sheep, and 1160 Swine.

Prices.—Beef Cattle.—A small advance was effected, probably occasioned by the limited number at market, and the increased demand this week for the 10th. We quote First quality, \$5 75 a \$6 00. Second quality, \$5 25 a \$5 50. Third quality, \$4 00 a \$5 00.

Stores.—Yearlings, \$8 a \$11. Two Year Old \$14 a \$18. Three Year Old, \$22 a \$28.

Sheep.—Lots were sold at \$1 12, \$1 25, \$1 37, \$1 53, \$1 75, \$1 92, and \$2 00.

Swine.—Lots of 50 to 100 to peddle 3 1-2 for sows, and 4 1-2 for barrows At retail 4 to 5 1-2.

**THERMOMETRICAL.**

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northerly exposure, weeks ending September 6.

Sept. 1840.	7 A.M.	12, M.	5, P.M.	Wind.

**HORTICULTURAL EXHIBITION.**

The annual Exhibition of the Massachusetts Horticultural Society, will take place at their Rooms, 23 Tremont Row, (opposite the Savings Bank) on WEDNESDAY, THURSDAY and FRIDAY, 9th, 10th, and 11th September.

Choice and rare specimens of Fruits and Flowers are respectfully solicited from the members of the Massachusetts Horticultural Society, and from the lovers of the science of Horticulture generally. Committees will be in attendance to receive contributions on Monday and Tuesday, 7th and 8th of September, and the specimens sent will be retained, subject to the order of the owner.

A list, giving the names of the specimens of Fruits and Flowers presented is respectfully requested.

By order, SAMUEL WALKER, Chairman Com. of Arrangements.

Boston, August 26th, 1840.

**FRUIT AND ORNAMENTAL TREES, &c.**

Fruit Trees of all the different species—of the most celebrated kinds. These include Pears, Plums, Apples, Quinces, &c.—the trees of the Peach and Cherry, especially, are of the finest size, and in numbers abounding at this time, and of varieties unsurpassed. The Catalogue of Fruit and Ornamental Trees and Shrubs, Roses and Herbaceous Flowering Plants, will be sent to all who apply: in that Catalogue many of the very best kinds of fruits, so far as proved, are particularly designated by a star.

Also, Grape Vines, Raspberries, Strawberries, Gooseberries, and Mulberries for silk—Scotch Larch, Lindens, Sycamores, Silver Firs, Willows, Elms—Honeysuckles, Dahlias, splendid Pæonies, &c. &c. Trees when so ordered, will be securely packed for transportation to distant places, and all orders promptly executed by

WILLIAM KENRICK.

Nonantum Hill, Newton, near Boston, Sept. 9, 1840. eptD1

**NOTICE.**

The Rhode Island Society for the Encouragement of Domestic Industry, hold their election at their hall, in Pawtucket, on Wednesday the 21st inst. (having been postponed from the 9th inst.)—to meet at 9, A. M. An address will be delivered at 11 o'clock, A. M., by the Hon. Judge Pitman. Dinner will be provided for the members, at the expenses of the Society, at 2 o'clock, P. M.

Butter offered for premiums must be entered by 7 o'clock, A. M., on said day. WM. RHODES, Treasurer. September 9.

**SUPERB ROCKET LARKSPUR SEED.**

The subscribers offer for sale a quantity of Superb Double Rocket Larkspur Seed, of their own raising, saved from double flowering plants only, embracing all the different colors. For fine, strong and early plants, the seed should be sown in August. JOSEPH BRECK & CO. June 17.

**TRACE CHAINS.**

Just received, direct from the English manufacturers, 8 casks of Trace Chains, from 6 to 11 feet long, suitable for ploughing or draft chains. JOSEPH BRECK & CO.

**GRAIN CRADLES.**

The Grain Cradle is an article which is coming into very general use in the New England States, where they were till of late but little known, although they have been in very general use in the southern and western States, for many years, and which is found to be decidedly the best mode of harvesting grain, as it is supposed one man will cradle five acres in a day when he cannot reap more than one. The difference in gathering a crop is so much in favor of cradling, that we must suppose that it will be the only mode adopted hereafter, and the grain cradle will become of as much use, as an implement of husbandry, as the plough now is.

There has been a very great improvement in the manufacturing of this article, they are now made on the most improved plan; the scythe is well secured and finished in a superior manner and made of the best cast steel.

**Brighton Nurseries and Gardens. For Sale**

A large quantity of superior European and American Ornamental Trees, well calculated for public places, or private grounds, with Fruit Trees embracing a great variety of the most approved kinds and fine sizes. The trees, and all other productions can now be selected and marked, and will be for warded to any place as soon as it will answer to remove the same.

Also, forty kinds of Strawberry Plants, of the most approved European and American varieties.

Orders may be forwarded by mail, addressed Messrs. WINSHIP, Brighton, Mass., or left with Messrs. JOSEPH BRECK & CO.

Brighton, August 12.

**HYACINTHS.**

The subscribers have received a large assortment of Double and Single Hyacinths of every color and shade. Also, Tulips of mixed sorts, Crown Imperials, and Lilies; they have also at their garden all the fine varieties of Pæonies, which will be furnished at one day's notice. Lilies and Pæonies, and Crown Imperials, should be planted in August or the first of September. We shall receive a great variety of Bulbous Roots, from Holland, in a few weeks, when notice will be given. JOSEPH BRECK & CO. August 26.

**GARDENERS' KNIVES.**

JOSEPH BRECK & CO. have this season imported and now offer for sale a few very superior Garden Knives, for pruning, &c. manufactured expressly for Gardeners, and warranted superior to any article of the kind before imported.

Also—a large assortment of Budding Knives, Grape Scissors, &c. &c. April 22.

**BOY WANTS A SITUATION.**

A smart active boy, about 16, wants a situation with a farmer where he can have an opportunity to learn the practice of agriculture, with whom he wishes to stay until of age. Inquire of JOSEPH BRECK & CO. August 26.

**PATENT SPRING BALANCE.**

A few of those very convenient spring balances, for family use, a very simple contrivance for weighing small articles. JOSEPH BRECK & CO. No. 51 and 52 North Market Street, Boston. July 15.

**FENCE CHAINS.**

Just received from England, at the New England Agricultural Warehouse, 6 casks chains, suitable for making the chain fence, &c. JOSEPH BRECK & CO. July 15.

**BERKSHIRE HOGS.**

The subscribers offer for sale a few pair of full blooded Berkshire Hogs; also, pigs 7-8 blood, crossed with Mackay. Inquire at the New England Farmer office, or at their farm at Brighton. JOSEPH BRECK & CO. July 29.

## MISCELLANEOUS.

## ANECDOTE OF THE HORSE.

On a tour to the White Hills, I rode a fine light-grey saddle pony, by the name of *Federal*; he and I had become well acquainted, and he was a most noble-hearted fellow; I thought I could see the best way to ascend, and he clambered up by my directions—he would do anything for me. We got at last upon the peak, where was a level of some yards square, and *Federal*, who had never before been so high in the world, as we slackened the rein, turned three times round to enjoy the prospect, and then set up a scream of delight! it was not a neigh or a whinner, nor any common mode of speech for a horse—it was a regular *hurra!*

After a while, we turned to descend, and I gave *Federal* the rein; it seemed at times a ticklish job, but he managed it well; he stopped now and then and made a survey, as carefully as could be done by a civil engineer, turning, and tacking, and working ship like an old sailor amongst breakers, and being careful, and surefooted, he came down as safe as a tortoise. But we brought up at last against a fence, having taken a different route from that by which we ascended; we rode at the fence fairly, but *Federal* stopped short—tried it again—it was no go—I stopped a moment, I felt sure that he would have done his best for me at any time, and would have broken his neck sooner than have refused, had he known exactly what to do: I therefore talked kindly to him, coaxed him, patted his neck, and when I saw his head raised up two or three inches, and his ears pricked up brightly, and felt the muscles of his side swell under the saddle, I knew he had caught the idea—that was all he wanted—I gave him the hint to try it, and over he went, like a swallow, and at least two feet higher than needful, for he meant to make a sure job of it. He no sooner touched the ground on the other side of the fence, than he wheeled about, looked at it, snorted, as much as to say “what do you think of that,” and trotted on. During our journey afterwards, *Federal* was looking out for an excuse for leaping; a log of wood, a run of water, or a low culvert he uniformly pricked up his ears at, and leaped over, giving a snort each time, to express his joy at having accomplished a new feat. *Federal* needed only to understand what I wanted, he would then do his utmost towards its accomplishment: no whipping, pulling, jerking, or spurring would ever have compelled him to take the leap at the fence; but with a moment to think about it, and a little kind flattery, he flew over like an experienced hunter. A horse may be taught, like a child, by those who have won his affections, but the method of teaching is to show him distinctly what you wish him to do, and not to beat him because he does not understand you, and perform at the outset.—*Boston Times*.

## UNREASONABLE FEAR FROM THUNDER.

A young man who for some years was so terrified by thunder and lightning, as to be on the point of falling into fits at their approach, found very great benefit from the following reflections, which a friend sent him for his most serious and frequent consideration.

Unreasonable and excessive apprehensions, caused by thunder and lightning, chiefly originate in prejudice, or in an erroneous idea that they are

constantly the effect of God's displeasure and ministers of his wrath. Were men to consider that this phenomenon, so alarming in appearance, is the effect of natural causes, that it contributes to the welfare of mankind in purifying the atmosphere, charged with noxious exhalations, removing the danger of pestilence, reason and gratitude would cause them to rank them among the many other favors of Heaven.

To diminish these ungrounded apprehensions, the timid should be informed that of 750,000 persons that have died in London, within a space of thirty years, two only fell victims to lightning. They should also be informed that they unreasonably prolong their fear at each shock. He who has time to dread the consequences of a flash of lightning, is already out of its reach.

It is the lightning alone that can hurt us, and if we have seen it, it is folly to grow pale, and tremble at the clap of thunder, and to stop our ears against the noise, which announces all dangers to be past.

The greater the interval between the thunder and the lightning, the more removed is the danger.

If with our finger to the pulse, we can count in the time twelve or thirteen pulsations, we calculate that the storm must be three miles distant. But the very best preventive against this or any other alarm, is the testimony of a good conscience. Tranquil and firm, the just man fears not unreasonably the judgments of Heaven. He knows that at the order of God, all nature flies to arms against the sinner, and at the same time feels that the just man is under the safeguard of Heaven.

His Creator, the God whom he loves, is the Master of the Universe, and rides on the wings of the lightning! He has his time for threatening, and his time for punishing. Fear should be a stranger to those whose glory it is to love God, and to confide in Him even when the earth shakes to its very centre with His thunder, and appears to be groaning in the agonies of dissolution.—*Poughkeepsie Journal*.

## HOW TO ACQUIRE HEALTH.

Walker, in his “Original,” lays down the following rules for attaining high health.—They are worth remembering:

“First, study to acquire a composure of mind and body. Avoid agitation or hurry of one or the other, especially just before and after meals, and while the process of digestion is going on. To this end, govern your temper—endeavor to look at the bright side of things—keep down, as much as possible, the unruly passions: discard envy, hatred and malice, and lay your head upon your pillow in charity with all mankind.—Let not your wants outrun your means.—Whatever difficulties you have to encounter, be not perplexed, but only think what is right to do in the sight of Him who seeth all things, and bear without repining, the result. When your meals are solitary, let your thoughts be cheerful; when they are social, which is better, avoid disputes, or serious argument on unpleasant topics. ‘Unquiet meals’ says Shakspeare, ‘make ill digestions,’ and the contrary is produced by easy conversations, a pleasant project, welcome news, or a lively companion. I advise wives, not to entertain their husbands with domestic grievances about children or servants; not to ask for money, nor produce any unpaid bills, nor propound unreasonable, provoking questions.”

## URATE AND POUURETTE.

An establishment for the manufacture of the Manures called Urate and Poudrette has been erected, at a considerable expense, in the State of New Jersey, near the city of New York; and an act of incorporation has been granted by the legislature of the State of New Jersey, by the name of “The Lodi Manufacturing Company” for purposes of agriculture, wherein it is provided, that 500 shares, a portion of the stock reserved for subscription by farmers and gardeners, within a limited time, shall be entitled to receive 50 bushels of Poudrette yearly for five years, viz. in 1840, 1841, 1842, 1843, and 1844, upon each share of \$100, which is at the rate of 20 per cent. per annum, for those years, and after that period to receive an equal dividend with the other stockholders.

The Manufactory has gone into operation according to law; a sufficient number of shares having been subscribed for that purpose, and capital paid in; and the first dividend has been regularly paid to the subscribers—the next dividend is payable in September. But the Company needs a larger moneyed capital than it now has, to carry it on to better advantage. Inquiries having been made whether all the stock had been taken, and the difficulty at the present time of obtaining funds, to a sufficient amount, from a few individuals, has induced a renewal of this notice to farmers and gardeners, and every other person who may have spare funds, (as every person is now permitted to subscribe,) that there is yet a considerable portion of the reserved stock, which, by law, is to receive 20 per cent. per annum, payable in Poudrette, one half in May, and the other half in September, in the years 1840, 1841, 1842, 1843, and 1844, not yet subscribed for, and the books are now open to receive subscriptions for the same, by any person, whether gardener, farmer or otherwise, at the office of the Lodi Manufacturing Company, No. 73 Cedar Street, in the city of New York. Terms for the reserved stock, \$100 per share in cash; and for the other portion of the stock an instalment of \$25 per share on subscribing, and the residue (being \$75 per share) to be called in by instalments of \$5 per share, after thirty days notice.

These manures have been fairly tested and very generally approved of as being the cheapest and best manures, and more economically applied than any other known substance used for manure.

As the article can be furnished from the city of New York, only to a limited extent, (not more than sufficient to manure 35,000 acres annually,) it must follow, that in a few years it will necessarily be confined to the use of the stockholders alone.

It is important to agriculture, and the enterprise deserves the liberal support of every enlightened farmer. By order,  
WILLIAM M. WILSON, *Secretary*.

At an election for Directors of the Lodi Manufacturing Company, held at Jersey City on the 6th day of July, 1840, the following persons were elected Directors of the Company, to hold their offices until the first Monday in October next, namely, Anthony Dey and Jacob C. Dey, of New York; J. D. Miller, Andrew S. Garr and Rodman M. Price, of New Jersey.  
August 12.

## TIE UP CHAINS.

Just received at the New England Agricultural Warehouse, a good supply of those celebrated Chains for tying up cattle. These chains, introduced by E. H. Derby, Esq. of Salem, and Col. Jacques, of Charlestown, for the purpose of securing cattle to the stall, are found to be the safest and most convenient mode of fastening cows and oxen to the stanchion. They consist of a chain which passes round the animal's neck, and by a ring attached to the stall, plays freely up and down, and leaves the animal at liberty to lie down or rise at pleasure, and keeps him perfectly secure.  
July 15. JOSEPH BRECK & CO.

## BERKSHIRE PIGS FROM HAW'S STOCK.

The subscriber has on hand a few litres, from some of the largest and finest sows in the country, sired by Losing's and other imported boars. Also, the smaller class of Berkshire pigs, which are very beautiful animals, and delicious porkers. Either of the above stocks will be disposed of extremely low by applying to  
Z. STANDISH.

N. B. The pigs will be neatly caged and shipped at New York, without extra charge, if required. Unquestionable reference will be given for thorough breeding.  
Albany, August 19. 41

## THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at \$3 per annum payable at the end of the year—but those who pay within sixty days from the time of subscribing are entitled to a deduction of 50 cents.

### BANKS AND THE CREDIT SYSTEM.

No. IV.

We spoke at large in our last of the necessity of a bank maintaining an undoubted and unsuspected credit; and in order to this, of its resting its operations and credit upon a specie basis. This only can be considered as a perfectly secure foundation. The formation of banks was authorized in Michigan, whenever twelve persons would associate, and pledge for the redemption of their notes a certain amount of land. We do not know the precise form in which this was to be done; but we suppose these securities were lodged with some officer of the government; nor do we know by what rule the land was valued. The scheme, as might be expected, exploded; the notes immediately depreciated; they were not convertible into money; and we counted in a single paper published in Detroit the present month, no less than nine banks whose assets were advertised to be sold by the sheriff; these assets consisting of worthless debts, a banking house, and a few chairs and tables.

In New York the system of what is called free banking has been adopted. As we understand it, any number of individuals are allowed to associate for banking purposes and issue their bills, upon their depositing with the Comptroller of the State a specified amount of available stock, sufficient in his opinion to secure the community against loss, should they fail to redeem their issues. This is as yet an experiment; and liable to so many abuses, that we predict its failure in any extraordinary emergency. The notes of these banks, many of them, became at once distrusted and depreciated, until the government required that every bank wherever situated, should redeem its bills in specie in New York at half per cent. discount. There seems no good reason why the holders of the bills should be subjected even to this loss. Under this system of free banking, several fraudulent and mushroom banks have already sprung up, who have to a certain extent succeeded in their impositions; and there seems, in our apprehension, ample room for more. In the present deranged state of the currency, men are willing to take and give almost any thing in the shape of money; and it is wonderful with what philosophical forbearance and patience they submit to the loss. Most men, however, in such cases, are pretty careful not to make themselves the depositaries of any considerable sum for any length of time, but pass it off as soon as practicable after receiving it.

We believe that no bank is safe that does not rest upon a specie basis. We hold that no bank has a right to suspend specie payments at its pleasure, either for a longer or a shorter time. We hold that no bank ought to be indulged or tolerated in the community a day, which is not ready and prompt to redeem its notes in specie exactly according to their tenor. If these principles had been maintained, and they are no other than what

the law contemplates and enforces, we should never have heard of bank suspensions and failures.

The banks at present in the country are in very bad odor. The public indignation, exclusive of all party considerations, is loud and deep against them; and many of the best minds in the community have been led to distrust the justice and expediency of the whole system. The aim of every friend to the public good should be to correct the abuses which have crept into it. The notion of getting entirely rid of banks in our community, is perfectly idle. The people have so long enjoyed the advantages and facilities which they furnish, that they will not give them up. The United States government may refuse if it will, and as long as it will, the establishment of a national bank, and may pile its systems of cash duties and sub-treasuries one upon another as high as it pleases; but it cannot control the States in their legislation, and banks the States will have.

The banks have brought the odium they suffer upon themselves. While we accord all due praise to those banks who have conducted their business with perfect honor, and such there are in New England and out of it, we are compelled to say of a large proportion of the banks throughout the country, their conduct has been most fraudulent and atrocious. In Boston and its vicinity, where mercantile honor has always stood so high, to our deep humiliation at least eleven banks almost at the same time exploded, and scattered loss and suffering throughout the community. They violated, and therefore forfeited their charter. Their notes were immediately at a large discount: many are entirely worthless. The notes of some of them have been redeemed: the notes of several of them never can be, because nothing is left in the vaults, or as nothing *was ever there* to be left. The defalcations of banks in other parts of the Union have been tremendous. In Michigan millions were lost. In Mississippi, the famous bank of Brandon is supposed to have issued upwards of eighty millions of dollars, not a note of which is worth more than the paper on which it is engraved. The mammoth Bank of Pennsylvania, by its speculations and trading character, has depreciated its stock fifty per cent., and its notes are much below their par value. A traveller as soon as he passes out of New England and New York, is subjected to infinite vexations in the uncertain, worthless and depreciated currency which he is compelled to take. This comes of banks without capital, or banks violating their charters and acting in defiance of law as well as of justice.

That many banks have been created in New England without a capital as well as in other parts of the country, there can be no doubt. The law is explicit, that no bank shall go into operation "until two thirds of the capital stock are *bona fide* paid in in specie, there to remain for the use of the bank." Language need not be more direct. Now how is this provision grossly evaded. On a certain day commissioners are appointed and required to examine the means of a bank about to go into operation. The money representing the capital is

hired of some other bank for the occasion, for that day or that hour. None of it belongs to the bank whose supposed condition is examined. It is shown for the occasion; and as soon as the occasion is over, it is returned to the bank of which it hired or borrowed. When shown to the commissioners, some of the officers of the bank make solemn oath that it has been *bona fide* paid in as a part of the capital, and is there to remain for the use of the bank! Some people smother their consciences by calling this oath a mere formality, or as they denominate it, a "custom house oath;" but if it be not deliberate perjury, then we do not know the use of the terms.

A second abuse in banking is discounting upon stock. In a case as described above, where in truth little or no capital is paid in, where stockholders are allowed to have loans to the amount of seventyfive per cent upon their stock, the certificate being deposited with the cashier, the effect is obvious. If we suppose in the first place that no, or comparatively no capital was actually paid in, then the certificate is in a degree worthless so far as the public security is concerned; and in any case it is essentially diminished by the substitution of an individual's private security or note for three quarters of the amount, for that which ought to represent so much actual specie. Such a bank then rests not upon a specie capital, but for at least three fourths of its capital where stockholders avail themselves of their privilege, upon the mere notes of individuals without even an endorsement.

A third abuse of banking is, where, as in too many cases, the getters up of the bank are themselves borrowers, not capitalists or lenders of money. It is obvious to what abuses the funds of the bank may be applied, and what motives to favoritism are presented, when those who have the exclusive control of the moneys of the bank, themselves want to use them. No director or officer of a bank should, under any circumstances, be allowed the use of the money of that bank or to become its debtor. The public have justly felt indignant, when in times of severe pressure, the notes of good customers have been refused to be discounted, while at the same time the directors of the bank, by a system of log-rolling, could obtain money; and by the agency of a broker, purchase out of doors these same notes, which were refused to be discounted at the bank, at a large discount, and then lodge them in the bank at their full value, of course as security for the money which they themselves had borrowed, making themselves a large per centage without incurring any responsibility whatever. These practices, we do not say to how great an extent they prevail, certainly not at all with men of honor and principle, are too well authenticated to be denied.

Another abuse, of which great and just complaint has been made, has been favoritism in making loans. Oftentimes one man can obtain his thousands where another, whose security was equally sound, could not obtain his hundreds. A bank, we admit, has a perfect right to loan its funds according to its best discretion, where the security is

satisfactory; and an individual or a corporation requiring funds and operating on a large scale, do not act for themselves alone, but their success and operations involve, of course, the interests of many others; but it is obvious that in proportion to the amount the risk is increased; an offensive monopoly is allowed; and in a business community, in times of severe pressure, where so many are struggling for existence, a bank instituted for the general good should deal with an equal and impartial hand. What is to be said of cases, where in a bank with a capital of one hundred thousand dollars, two individual directors obtain almost as a permanent loan, more than sixty thousand dollars: in another case, where the bank has a capital of a million, a single individual is favored to the amount of three hundred and twenty thousand dollars; and another case recently disclosed, where in a season of universal distress and pressure, a single house of brokers and speculators, could obtain a discount of more than two millions of dollars. We leave others to answer.

Another too common abuse of banking powers has been excessive loans. Nothing can justify going beyond their legal rights in this respect. This however is often done; and we have known a bank, with two hundred and fifty thousand dollars capital, discounting to the amount of more than a million. The public have no security where such practices are allowed.

We might add considerably to the catalogue of banking abuses; but we forbear, save in naming one. A bank should engage in no form and in no case whatever, in trade or speculation. The legitimate object of banking is not, in the mercantile sense of the term, the making of money. A bank is not a trading house nor a broker's office. The proper object of a bank is a place of deposit of surplus capital in a situation of perfect security, and where it can be loaned for the benefit of the community. It has a right, therefore, to legal interest for the money deposited, to the discharge of all its necessary expenses, and to any profits which may accrue from the use of money deposited in its care. It may likewise lawfully avail itself of any advantages arising from the exchange of foreign money, and for the negotiation of exchange with distant places. In all these respects the public are essentially benefited; and these may be managed with perfect security to the bank. But it is not so when a bank enters into trade or speculation of any kind: it then clearly departs from the true principles of banking. It exposes its stock to loss and its notes to depreciation; and therefore assumes risks, which were never contemplated in its charter; and especially as by its extraordinary command of funds it may in many cases monopolize any branch of trade, and control the business operations of the community in a way in which they will not and ought not readily to acquiesce.

The United States Bank of Pennsylvania presents a striking lesson on this subject. The true history of its transactions in cotton is not known. If it obtained and forwarded the cotton of the planters with a view to save itself from loss from the large debts of these planters, the motives are commendable: but the fault lies in so largely extending its discounts. If its object was a mere speculation in cotton, as any other mercantile concern, this was wholly foreign from its proper objects, and no one but the parties concerned can lament the retribution which has fallen upon it. If its object was, as is professed, to secure the cotton

planters from loss, by monopolizing the supply and so maintaining the price of cotton, it has seen the folly of attempting by any artificial interference, to sustain a particular interest and to control the laws of trade. These great laws like the great laws which regulate every department of nature, are as fixed and uniform in their operation as the ebb and flow of the tide, and cannot be managed by human skill and cunning. Any attempt to subvert, escape from, or obstruct them, is as wise as Canute's determination to stop at his royal command the flowing of the sea, or, to use a humbler comparison, as it would be to shut the cellar door to keep out an earthquake. The course pursued by this bank, its losses, its suffering its bills to be dishonored, and the depreciation of its stock, have done an immense disservice to the cause of legitimate banking generally, and deeply and most injuriously affected the currency of the country.

H. C.

From the Farmer's Cabinet.

#### BOOK FARMING.

MR EDITOR—Sir—On a visit to a young and neighboring farmer, one who has left the busy town for the peaceful country, as he says, and who reads the agricultural works of the day in his own defence, I saw many things about his house and premises which even I, an old farmer, with perhaps a pretty strong spice of prejudice, especially against book farming, at once could perceive were improvements upon the old plans adopted by my grandfather. I had called upon him to offer my services by way of advice, but I vow that before I entered the house, I was sensible that I had come to the wrong place for that business—so I made what is called a virtue of necessity, and held my tongue. Why, Mr Editor, before I left him, I found that he was the oldest in point of knowledge, and only wanted a little practice to render him by far a better manager than myself: I guess he talked "like a book," and had chapter and verse at his fingers' ends for every thing he did; and something better than that too, for he had the modesty to listen, while I described some of our old-fashioned modes of management, which, however, he would demolish, although very quietly, in about half a minute, by turning to his books, in which, I declare, he seemed to have the power to find just what he looked after; and the truth of his notions was, I am compelled to say, as plain as A, B, C. There is one thing, however, in which I think he is wrong: he says we do not, according to his calculation, plough deep enough. Now I think, if any thing, we plough too deep, and so I told him; but he only answered he was young, and was desirous of getting information by *buying* it, and was making *experiments* which would convince him of the truth or falsehood of the theory; and then he asked me if I had ever given the thing a fair trial? which I was bound to say I had not: and there, Mr Editor, these youngsters have the advantage over us—for nothing will satisfy them but rooting to the bottom of things; and it was in vain for me to say, as I did repeatedly, "he may be sure that I was right in my notions on that subject, and he would find it so."

His dairy cows, which he had bought but the last year, were all of the proper age and in full milk, for he told me, as often as he was convinced that he had a bad milker, he sold her right away and bought another; for, added he, "my books

tell me there is more than a hundred per cent. difference between a good and a bad milker, for while a good milker gives a *profit*, a bad milker gives a *loss*." This was physic to me, for I knew that one-half my dairy cows were too old or too young, and the other half far from good—so I said nothing.

But there was one thing in which he shamed me, and that was, the way in which he had changed the situation of his cattle yard, so as to prevent the drainage of the dung from passing over the high road and down the ditch, as had been the case for the last age or two, and this he had done so easily too, for, by digging up the bottom of the old yard two or three feet in depth in the centre, he had east it hollow, and obtained by these means many hundred loads of the richest mould, exactly in the place where it was required, and all without the cost and labor of carting, to act as a sponge to soak up the drainage of the yard during the winter; and now I found him turning it up with his long manure, a heap, I had almost said, as large as a little barn! this was killing two birds with one stone, you see, and I wondered how the idea could have entered his head—for I am sure it had never entered mine—but he took down a book where there was a picture of a cattle yard as natural as life, and pointed out the advantages of the alteration, and made a calculation of the saving it would be to him in the course of the year, in the article of manure, that quite astonished me; and then he went to work with his figuring to show the quantity of capital mould he had obtained, merely by digging; multiplying together, as he called it, the length and breadth by the height, and turning the whole into loads, without ever loading a bit of it—I declare it made me feel all-over-like to see him go from Dan to Beersheba in about a whistle!

But there was a machine in a shed at the end of the house, that was a caution to me: it was a large grindstone set upon rollers, so true, that with a single finger it might be set off as though it would go for a month: now that was a tool which I had promised to get for the last ten years, but never found time to do it, although it has cost me hundreds of hours, and something more than *time*, to go to the tavern a mile off, every time we want to grind a scythe, or hook, or axe, and operate upon an old, worn out, rickety thing, about as smooth as the back of my hand—a quality which it never before struck me was chosen by the owner and tenant of the tavern, for the purpose of keeping the noses of his customers so long at the grindstone, as to bring on a desire for drink; and, now I think of it, it is placed in the nine-pin alley! I would have passed without noticing it, but my young friend remarked, "here is the cheapest article I ever bought; it is large and cuts so readily that it is no labor to use it: I guess it has saved me about the amount of a rent already: all our tools, from the knives of the table to the hoes, spades, shovels, and pick-axes, are kept sharp, and it is a pleasure to work with them; at haytime and harvest, we generally give our scythes a touch every morning, which saves hours in the day and many a weary back, besides cutting the crops closer and cleaner: I cannot calculate the value of such a convenience, because I have never been without one!" but I thought I *could*, and from that moment determined to get one right away. He had many other strange things about him, a description of which I must reserve for another opportunity.

ONE OF THE OLD SCHOOL.

## CATTLE SHOW,

*Exhibition of Manufactures and Ploughing Match, at Westboro', Mass., Oct. 7, 1840.*

The Directors of the "Agricultural Society of Westboro' and Vicinity," propose a Cattle Show, Ploughing Match, and Exhibition of Manufactures, at Westboro', on Wednesday, the 7th day of October next, at 9 o'clock, A. M., and will distribute as premiums, *agricultural publications*.

Competent judges have been appointed on the committees for awarding the premiums.

The undersigned, appointed a committee by the Directors of the Agricultural Society of Westboro' and Vicinity, to make all necessary arrangements for the 7th of October next, propose that premiums be awarded

- For the best milch cow,
- For the next best " "
- For the best bull not less than one year old,
- For the best bull calf,
- For the best 3 years old heifer,
- For the best 2 " " "
- For the best 1 year " "
- For the best heifer calf,
- For the best pair of working oxen, not less than 4 years old,
- For the best 3 years old steers,
- For the best 2 " " "
- For the best 1 year " "
- For the best ox fattened for slaughter,
- For the best boar,
- For the best breeding sow,
- For the best pen of fat hogs, not less than three, belonging to one person,
- For the best weaned pigs, not less than three in number.

The committees will have regard to the product of milk and butter, manner of keeping and time of calving of the cows, and the manner and expense of raising and keeping other stock, an account of which must be given to the appropriate committees on the day of exhibition. Persons intending to offer any species of stock, must give notice to the Secretary on or before the 6th day of October, the day preceding the Show, at 7 o'clock. The owners of working oxen or cattle are requested to furnish a chain for each yoke.

*Domestic Manufactures.*

- For the best butter, not less than 12 lbs.
  - For the next best " " 12 lbs.
  - For the best lot cheese, not less than 50 lbs.
- The butter must be exhibited in boxes, and the owners of butter and cheese must have a private mark, and any public mark must be concealed so as not to be known by the committee.

It is hoped that other articles of manufacture may add to the interest of the exhibition. A committee will examine all that may be offered. Publications are reserved and will be distributed in gratuities to persons who shall exhibit articles of skill and utility. Every article of manufacture must be entered and delivered to the person appointed to receive them, before 2 o'clock the day preceding the exhibition.

*Ploughing Match.*

- For the best work with double team,
  - For the next best work with do.
  - For the best work with single team,
  - For the next best work with do.
- The great object of this part of the exhibition is

to excite emulation in the use of the most important instrument of agriculture. The ploughs and oxen and ploughmen must be those used and employed on the owner's farm. Those persons who design to become competitors must give notice to the Secretary before the first day of October next. The ploughs must be on the ground designated precisely at 9 o'clock, A. M.

All stock offered for premium or exhibition, must remain in the pens until 3 o'clock.

Ploughing match will commence at 9 o'clock precisely.

An address will be delivered in the meeting house at 11 o'clock, immediately after which there will be a trial of working oxen.

Dinner will be provided for those who furnish themselves with tickets before 10 o'clock, which may be found at the hotel of D. Brigham, and at the different stores.

Premiums will be declared at the meeting house, after dinner, on the ringing of the bell.

The committees are requested to meet at the Town Hall, at 8 o'clock precisely.

G. DENNY,  
ABIAH STONE,  
J. A. FAYERWEATHER,  
THOMAS STONE,  
CHARLES P. RICE,  
*Committee of Arrangements.*

The publications will be distributed within twenty days after they are awarded; if not called for in two months, they will be considered relinquished.

LOVETT PETERS, *President.*

GEO. DENNY, *Sec'y.*  
*Westboro', Sept. 4, 1840.*

## PREVENTIVES OF SMUT.

We take the following from the British Farmer's Magazine, into which it is copied from Bell's (London) Weekly Messenger:

Having observed in a contemporary paper, instructions for dressing seed wheat, in which lime is recommended to be mixed with the blue vitriol, I am induced to beg the favor of your inserting the following observations. I have been an advocate, and as far as my limited sphere has allowed, an establisher of the vitriol dressing for wheat for several years; but, at the same time, I have most strenuously insisted upon the injurious effects of using lime with it, as at variance with the laws of chemical science. For instance, sulphate of copper, commonly called blue vitriol, is a chemical combination of copper with sulphuric acid: this acid has a greater affinity for lime than copper; consequently in the plan referred to, the acid passes from the copper to the lime, and forms sulphate of lime, which resembles in appearance and utility what is known by the name of plaster of Paris; and thus, just in proportion to the quantity of lime used, the vitriol is deprived of its preventive quality, and you get as a substitute a perfectly useless substance.—My directions are as follows: dissolve one pound of vitriol in a kettle of boiling water, then add as much cold water as will make three pails full of liquor, steep the wheat in the liquor about 20 minutes, turning and skimming it well; strain it off in a skep over another tub, and in 12 hours it is fit for use. The wheat, when thus dressed, will keep sound for many weeks, and the liquor which remains is equally efficacious for fresh wheat. The above plan, as far as my observations have extend-

ed, has never failed to secure a sound crop, and by adding double the above quantity of vitriol, the most bladdered wheat has been used with equal success. I feel confident, if the above directions be strictly adhered to, the use of the vitriol will be highly appreciated by every agriculturist in the kingdom.

JAS. B. CUTTING.

From the British Farmer's Magazine.

## SALT AND LIME.

Now I am an humble farmer, but this much I have tried as an experiment, though I have not exactly completed it, because I have not thrashed out the corn. I sowed two acres and a half of wheat, and to the first half acre I put an application of salt, and to the next half acre salt and lime, and to the next lime alone. This was on heavy land, and where I put the salt and the salt and lime, I am thoroughly convinced I had two comb an acre more. To the day the land was ploughed up, you could see to an inch where the salt and the salt and lime went, and there was one hoeing less required on that part than on the other. I have been particularly careful in separating the crops of the different half acres, and after a time I will give you the result: I think I shall have a good report to make of the salt and lime. I think salt and lime best. On the light frothy land, I think there would be a great increase from a mixture of salt and lime. Mr C. Johnson refers you to several gentlemen as giving testimony to the beneficial results—amongst others to Sir Thomas Ackland, who is a great experimental farmer, and to come nearer home, to Mr Chaltis, of Panfield, who, I believe, is since dead, and his certificate was, that he grew upwards of six bushels an acre more, and the wheat was worth one pound a load more.—*Mr Elwes, South Suffolk Association.*

The next subject was partly taken up by the chairman; I mean a mixture of salt and lime. This is an easy application: it is only for the farmer to buy 100 bushels of lime, and put 50 bushels of salt in a clamp dug as if for potatoes or mangel wurtzel; lay it altogether, and mix it up with water till it comes to the consistency of mortar; cover it up close, and let it lay three months, and then apply it to the field either by sowing or spreading it; 30 bushels an acre is the outside on land for barley, or wheat, or grass; and when the grass is subject to moss it will be very beneficial. Where lime is applied to pasture, there you are sure to see what is called Dutch clover, and you will always find it to be so.—*Mr Mapletoft.*

*Agriculture.*—If agriculture were the universal employment of mankind, and every one found his support from the labor of his hands, we should hear no more of treachery or violence: peace, tranquility, and contentment of mind and heart, would establish their residence upon earth. I have never yet met with the person with whom I would willingly change situations; nor have I ever to the present hour, felt any want, or the slightest inclination to covet the possession of what belonged to another.—*Klijogg.*

*Lime.*—A Pennsylvania paper states that a Mr Cadwell, of Valley township, near Danville, raised 400 bushels of wheat from a field of land the past season. Five years ago the product of the same field was but thirty bushels. In the mean time, Mr C. has spread 1500 bushels of lime on said land.

For the New England Farmer.

### AGRICULTURAL IMPROVEMENTS.

MR COLMAN—The great improvements made in agriculture within the last twenty years, and the impetus given to it by agricultural societies, books and periodical papers, is evident to every man of observation. And that there is room for further and still greater improvement is beyond question.

Ploughing matches have proved that a yoke of oxen can plough at the rate of several acres a day, and they have also called into use a great variety of ploughs, and very much lessened the labor of turning up the glebe. But from the almost endless variety of patterns of this implement, there does not seem to be any one kind that in public estimation takes the lead of all others. And such is the dispositions of many persons to buy the cheapest priced article, that almost any thing in the shape of a plough will find purchasers, if 'tis nominally cheap; but there are others who are willing to pay liberally if they can be sure of a good article. I saw at your mechanics' fair in Boston, last September, several kinds of well made and handsomely finished ploughs; but I should have felt much embarrassed in awarding a premium without a trial of them in the ground. For one I am much gratified that there is to be a trial of the comparative merits of the several kinds now before the public. It is the only sure and right test, and to that mechanic who makes the best article let him have the credit of it till another can outdo him: it is the only way of making advances towards perfection. If 'tis a project of "fancy farmers" it is also a project that I fancy; and I am one of the "huge paw" farmers. Another important step towards improvement is the liberal premium offered by the Plymouth county society, in the management of three pieces of land of half an acre each; one by ploughing in with the sward a given quantity of manure; one by spreading and harrowing the same amount of manure after the land is ploughed; the third without manure. First year in corn; second in grain; third in grass,—the crops to be accurately measured and weighed. That course will decide the difference, if there is any, in the application of the manure; also the true value of it. There is such a difference in farming in the same neighborhood in many places, that if there is *but one* right and profitable way it is of great importance that it should be known. Within the distance of about one mile from where I am now writing, there are four or five farmers, who all manage differently. Farmer A. carts all his winter made and coarse manure and turns it under with his greensward in May. B. suffers his to lie in the yard and at the hovel windows through the summer, carts it out upon his sward land in September and October, and ploughs it under for his corn crop next season. C. breaks up his sward land in the autumn; next year sows to oats; in September carts out his manure and turns it in with the stubble for hoed crops the next year. D. lets his manure lie in the yard and at the hovel windows till fall; then carts it out into large heaps; next spring applies it all in the bill for his corn and potato crop. Yet each man thinks his own the best course. They do not vary from it, nor try any experiments, and none of them cart any muck, leaves or loam into their yards to mix with their manures to imbibe the light or retain the gaseous parts.

There seems also to be some difference of opinion among farmers in relation to improving their lands by ploughing in vegetable matter, whether in its green or dried state. A few weeks since I saw a very good farmer mowing a crop of oats, and drying them before ploughing in—while most farmers plough in such crops while green and full of sap. Now that one or the other way, is the best and most profitable is morally certain, and the only way of determining is by actual and carefully conducted experiments.

The late Col. Taylor, of Virginia, enriched and very much improved his large plantations by ploughing in dried clover, and has assigned his reasons for it in preference to the practice of turning in green crops, but they are too lengthy to quote in this sheet. In some parts of Pennsylvania they grow wheat every other year, let it remain in clover alternate years till it is fairly in blossom, then turn in their cattle and pasture it till time to plough for winter wheat. Their lands are continually improving by this course. A Mr Pomeroy, in reply to the printed questions of the trustees of your State Agricultural Society, stated it as his practice to plough in dried clover in preference to turning it in green. To this the trustees dissented. Mr Keeley, of Haverhill, has proved beyond all doubt the great value of ploughing in green vegetable matter, and of that fact I have no doubts myself.—But whether green or dried is the *best* course, I am not quite so clear about. It is a common saying, cultivate a *little* land and manure and cultivate *that* well. But you, Mr Editor, some time ago, broached a new and I think a more correct doctrine—that is, to cultivate a *good deal* of land, and that *well*: but that cannot be done unless we resort to some other means than the mere droppings of our stock for manure, and many good farmers are sensible of that, and are trying to enrich their grounds by ploughing in vegetable matter. Therefore it seems important that the question should be settled, as to the best and most profitable method of availing ourselves of this great auxiliary.

I had a few other hints in my "mind's eye" when I began this: but have already spun it out to such a length that I fear it will deter you from sticking the *type* for it. B.

Sept. 7, 1840.

### MANURING.

The bulk of the manure on a farm should ever be bestowed upon those crops designed for the support of the live stock, by which measure, and the use of the hoe or cultivator, these fallows, as they are very properly termed, will be in a most rich, clean and elegant order for the production of corn or grain of any kind; and this measure is absolutely essential upon soils apt to run riot from superabundant fertility, when fresh dunged and sown with grain broadcast, when the consequence too often is one continued bed of weeds and a forest of straw, borne down by its own weight, and destroyed by the rust. The true management of dung in the farm yard, is to get it ready for use, that is, to expedite a due fermentation as early as possible, by throwing it into convenient situations in heaps of advantageous size. Dung hills of moderate size are most favorable to fermentation, and are, besides, ready at hand for choice on any emergency; and it is very much better to continue at every opportunity, to make dung hills in proper situations, either at home or in the fields, than to

suffer the dung to lie all the season in the yard, trodden down hard by the cattle and exposed to a winter flood of rain. Every dung heap should rest on a foundation of mould, so placed as to catch the draining of the manure, which would else soak into the earth and be lost, but which, fully impregnating the bottom layer of mould, renders it nearly equal in richness with the rest: and the dung ought to lie loose, that there may be space for the act of fermentation. It would doubtless be advantageous to have the dung under cover, but such convenience is rather out of the question on account of the expense; nevertheless a covering of earth is no despicable substitute. Various receipts are given for the making of compost—some of them laughable enough, on account of the expensiveness, scarcity, or hard names of the ingredients; but the best way is for the farmer to get all the various articles of manure he can possibly lay his hands on, the fatter the better, and with them form his compost heap: the different ingredients should lie as equally as possible, nor ought lime or ashes to come in immediate contact with dung, but with earth or vegetables; and every practical man knows when to turn it over and divide and break the elods and adhesions.—*Lawrence.*

### EUROPEAN HUSBANDRY.

The new husbandry of England and Scotland presents a most gratifying fact, which ought to be realized and understood here. Our men of capital invest their money in almost any thing, sooner than in either purchasing farms or making improvements upon them. In England, the policy of the law is, to continue the ownership of the soil in a succession of families, so that the greater enterprise is to be found, not in the owners of the land, but in those who pay a high price for the use of it: the improvements there are more generally made by the tenants than by the owners. The eminent success of the venerable farmer of Norfolk—Mr Coke, of Holkham—presents a case worthy our admiration. The product of his whole estate when he came into possession, was little more than two thousand pounds per annum: twenty years ago his income from rents had advanced to twenty thousand; and it is now said to be more than *forty thousand* pounds, or exceeding two hundred thousand dollars! In adding this great increase to his wealth, Mr Coke has not made thousands poor, as he might have done, if his estate had been money, and that money had accumulated from use, even at no more than the lawful interest: the value of his property has been increased in the course of the time of his active life, from thirty to forty fold, and no human being under the sun is the poorer for it: he has lived all the time in a style of princely magnificence, and even what has been expended in mere ornament, has made the world no poorer, but dispensed favors to the poor, who have received in the expenditure, not what is wrung from the hard hand of labor, but the surplus that has been left after labor had received its full remuneration. The wealth of Mr Coke has been the increase of the capital of the country: the acre of ground that is now worth twenty and thirty for one, is worth nothing less to the community in which he lives, *than to himself*: its increased value to *him*, is also increased value to *them*.—*Hon. J. Hill's Address.*

*Wheat.*—More than one hundred and fifty varieties of this grain are known to exist.

## PLOWING.

Farmers have been considerably divided in opinion on two points connected with ploughs, or rather with ploughing; one of these regarding the manner in which the furrow slice should be turned over; and the other, the depth to which land should be ploughed. Some have contended that the furrow slice should never be laid flat, but always in such an inclined position, that the edge of one slice should just rest on the next one, leaving under the edge so raised, a vacancy nearly as deep as the thickness of the furrow slice. This, it is contended, is advantageous, by hastening decomposition, and by allowing water to pass freely off without injury to young plants. Other farmers maintain as strenuously that the furrow slice should in all cases be laid perfectly flat, or reversed in such a manner that a field after ploughing should be as level as before, the plough simply reversing the surface of the slice. In this, as in a majority of controverted points, our experience and observation leads us to conclude that both sides are partly right, and both partly wrong. We have found that, if on lands strong and with a tenacious or impervious subsoil, which retained for some time what water fell upon it, the furrow slice was slightly lapped, so as to leave a space below, young plants suffered less from a wet season, or an undue accumulation of water, than they would if the furrow slice was fully inverted, and the surface made smooth and even. On the contrary, we have been led to believe that on a light soil, or one inclining to be dry or porous, it was better to invert the surface completely, and by rolling, render the surface smooth, and its particles as compact as possible. A surface so treated, will retain its moisture longer than if left in a state more loose and friable, and the conducting power will be increased by the particles being brought more closely in contact. Let the farmer, then, whose subsoil is impermeable to water, lay his furrows as dipping as he pleases; the more space below, the better for him; but on a light porous soil, lay the surface flat, and make it as dense as it well can be. The benefit, which compressing sandy soils confers, is well understood in Norfolk, in England, where the treading of the sheep in feeding the turnips in the field, is considered not the least beneficial part of the culture required for the production of wheat.

Nearly the same remarks may be applied to the other controverted point, viz: that which relates to the depth of ploughing. The propriety or impropriety of deep ploughing must be determined by the soil itself; by its condition, in reference to a supply of vegetable matter in the soil, and the depth to which it has been formerly ploughed. Where the stratum of fertile soil is thin, and the subsoil, no matter from what cause, incapable of promoting vegetation, it is bad policy to bring this infertile subsoil to the surface, as a stratum in which seeds are to germinate. And where the soil is permeable to the depth of twelve or eighteen inches, or as low as the plough can penetrate, and is filled with fertilizing materials, deposited by the processes of nature, or by manure applied to the surface in cultivation, then the plough may run deep without fear of injury to the present crop, and the certainty of benefit to the future ones. We think the true method of rendering any soil deep and fertile, is to plough no deeper, and bring up no more of the infertile earth at a time to the surface,

than can be thoroughly corrected by manures, to be incorporated with it, and thus made friable and productive. At each successive ploughing, if this course is followed, the soil will be gradually deepened and rendered productive to any desired depth. By pursuing this course of manuring and ploughing, Judge Powell rendered his soils fertile to the depth of fourteen inches, and where the roots of plants have this depth of good earth to range in and seek their food, the farmer can hardly fail of securing first rate crops. Every part of a soil so prepared, is fit for the germination of seeds to the lowest depth to which the plough can reach; and the more thorough the ploughing is given, the greater will be the surface exposed to the benefits of aeration, or the ameliorating influences of the atmosphere. One of the greatest differences between the old and the new husbandry, depends on this question of ploughing. In the old mode, the plough was used year after year to the same depth, and the manure applied with reference to the crop solely, while the improvement of the soil was wholly left out of sight. As a natural consequence, "there was no depth of soil," and when manure failed, the fertility of the land was gone, with scarcely a possibility of renovation under such a process. In the new husbandry, the permanent improvement of the soil, by gradual manuring and deepening, is kept steadily in view; and hence the accumulation and use of manures has received an additional importance. The garden is usually far the most fertile part of the farm, and this is brought about by the gradual incorporation of manures with the subsoil raised at each successive ploughing, until the requisite depth and fertility is gained. On lands long ploughed to a uniform depth, as they were under the old system, the pressure of the plough on the same surface, gradually formed an impenetrable strata, thus forming a fatal obstruction to the roots of plants, where it did not naturally exist. In England, on soils inclining to clay, and which have been under the plough occasionally, or almost perpetually for centuries, this impermeable *pan* is common, and one of the most decided advantages found to result from the subsoil plough, is the breaking up and demolition of this artificial construction to the spread and depth of the roots of plants. On the old cultivated fields of New England, the same difficulty exists more or less, and can be removed, and the soil rendered fertile by the same means so successful abroad.

The too frequent ploughing of land is not to be recommended in any case, and unless absolutely required to destroy foul weeds, it should receive no further moving than is requisite to fit it for a crop. The great mistake of Tull, was, that ploughing or pulverization would supersede the use of manuring. But experience shows, what indeed philosophy inculcates, that beyond a certain point, ploughing is injurious; and that, though essential benefits are derived to the soil from the action of atmospheric agents, manuring in some form, is indispensable to successful farming. It may be said that an application of manure should take place every time land is either ploughed and cropped. On land that has been brought to a high state of fertility, the decomposition of the rich sward will usually prove a sufficient dressing for a single crop; but for a repetition or rotation of crops, manures cannot be withheld without a certain deterioration of the soil, and a probable lessening of the crop. Ploughing and manuring must go to-

gether, and without this combination, each will be found defective and incapable of producing such results as are certain to ensue when both separate processes are skillfully united. We are therefore disposed to consider every decided improvement in the plough, as a sure indication of progress in agriculture; a proof that another step in the correction and dissipation of ancient error has been gained; and the way opened and the means provided for still further and more important advances.—*Albany Cultivator*.

From the same.

## PRESERVING WINTER APPLES.

MESSEURS. GAYLORD & TUCKER—Last April a year, I visited a friend, when he made me a present of a large dish of fine flavored apples, and it being out of season to have apples in such a good state of preservation. I inquired his mode of keeping them. He informed me that in the fall he made a box six feet long and two feet deep, which he sunk into the ground to a level with the surface, then he filled the box with sound apples, and covered it with boards in the form of a roof, but leaving an opening at both ends. The roof he also covers with straw and earth, to the usual thickness of an apple or potato hole. In this condition he leaves it till the apples are frozen, but as soon as a thaw comes, he makes it perfectly air tight, and in a few days the frost is altogether removed, and the apples are as fresh and perfect as when they were taken from the trees.

I am aware that this is an excellent plan, because I know that most of the apples and potatoes in holes rot and decay, in consequence of the warm and foul air accumulating having no opportunity to escape. I thought, however, to improve it. I consequently, last fall, buried my apples in the usual way; then I took four strips of one inch boards and nailed them together in the form of a chimney, leaving a vacancy in the middle, of one inch square; this I placed in the centre of the apple hole, the end resting on the apples inside, and the other end projecting two feet above the ground. This succeeded far beyond my expectations. The vacancy in the chimney was barely sufficient to permit the warm and foul air to escape, and not so large as to let the frost in to affect the apples. My family, during the winter, whenever they wished to have apples for consumption, only removed the chimney and reached in with the hand to get a supply, and then replaced it again; and I can assure you, that of eight bushels which were thus buried, only three rotten and five or six slightly affected apples were discovered, whereas my neighbors, who buried their apples in the old fashioned way, lost a large quantity.

WILLIAM J. EYER.

*Cattawissa, Pa. July 7th, 1840.*

*Importance of Agriculture.*—The world is in a fair way to be driven into an appreciation of the importance of agriculture, and the great truth will yet be understood, that to the labor of the husbandman, to the production of actual wealth from the soil, more than to all the transmutations and changes such wealth may afterwards undergo, is national prosperity owing. The interests of the world are identified; it is only when these interests are disarranged by ignorance or cupidity, that general distress ensues.—*lb.*

## NEW ENGLAND FARMER,

AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, SEPT. 16, 1840.

## ENGLISH AGRICULTURE.

It is highly gratifying to observe the renewed and strong interest now taken in agriculture. Some years ago this interest seemed to be at its height, under the enlightened, indefatigable, and intense devotion of Sir John Sinclair and the Rev. Arthur Young. Aided by many intelligent coadjutors and enjoying the liberal patronage of the government, they effected immense benefits to the agricultural interest. They awakened universal attention. They obtained the establishment of a national board of agriculture; they procured surveys of all the counties of England, which were published by the order and at the expense of the board; and full and statistical returns of all the parishes in Scotland. These, Sir John Sinclair embodied in his general report of the agriculture of Scotland. In addition to this he published in two octavo volumes a distinct treatise of the husbandry of Scotland, one of the most valuable works ever given to the agricultural public; and after this, what he denominates his Code of Agriculture. This has been through several editions abroad, and has also been published in this country with notes by the American editor. This book was intended, from a general survey of the whole ground which he had passed over, to collate, combine, and condense the most valuable information and the most useful, practical and settled points and principles of agriculture; and must long remain a standard work on this subject. In addition to this he visited Flanders, and published some remarks on the agriculture of that country—a very imperfect work on that subject, because the kindling of a war between France and England obliged him suddenly to return home before he had accomplished his researches. In addition to this, an agricultural society in England had, at their own expense, sent out the Rev. Mr Radcliffe to Flanders, who published an interesting account of his tour, with very full details on the objects of it—a highly instructive volume.

At the same time Arthur Young published in many volumes his agricultural tours through the several parts of England, which are full of entertaining and practical observations. Many other highly intelligent writers entered the lists, and the science inseparable from the practice always advanced with rapid strides. About this time Sir Humphrey Davy, with his admirable genius and learning and attractive manner, could render a course of lectures on agricultural chemistry interesting to a very full attendance of the highest order of the nobility and gentry of both sexes. This was the "book farming" part of the business, which kindled a flame that illuminated all of England, and was reflected upon this country, where it was eagerly drank in by such minds as Washington, and other distinguished minds, particularly in our own good State of Massachusetts, in New York and in Pennsylvania. If nothing else came of it, it every where set the plough to work, and revealed to men the high importance of this great interest and its capability of improvement far beyond what it had already reached.

The Bath Society about the same time distinguished itself by its many valuable publications; and many individuals came forward with the communication of highly important experiments in cultivation. Great attention, likewise, was paid to the improvement, more particularly of sheep and horned cattle; and this attention

and interest seem to have been kept up without intermission to the present time.

We should be very glad, if the means, which are in our possession, were at hand where we write, to substantiate and exhibit the immense improvements which were effected under such influences and agencies. We shall have, we trust, some future opportunity of demonstrating this. We have only to say that they were most obvious and extraordinary, and amply compensated the labors and fulfilled the predictions of those patriotic individuals by whom they had been brought about. After a while, as it happens with all human affairs, the flood tide began to ebb; and for a while, with the exception of the improvement of the live stock of the country, as above alluded to, the attention to this great subject seemed to flag; and from the advancement of the science and the bettering of the practice, it was directed principally to the discussion and controversy respecting what are called the Corn Laws, which with a view to protect the landlord and grower of grain, forbid the introduction of foreign wheat or flour, until from scarcity or other circumstances, wheat has reached a certain price fixed by statute.

Things have now changed. The direct and practical improvement of agriculture is now claiming a deep interest throughout the United Kingdom. Men of science are turning their attention to it. Men of the highest wealth and rank are turning their attention to it. What is better than all this, the practical cultivators of the soil are turning increased and exact attention to it, and are communicating the results of their inquiries and experiments through the medium of the agricultural journals. The Highland Society of Scotland, has distinguished itself by the valuable communications which it has given to the public. A new national agricultural society has been formed, which embraces gentlemen of the highest rank and influence, and extensive landholders, and vast numbers of practical farmers, who hold their annual cattle shows, where every stimulus which distinction and substantial golden rewards can apply, are presented to competition and excellence. They have published four numbers of an agricultural journal, designed to be continued, and whose continuance is greatly to be desired, if the numbers already given are to be regarded as a fair sample of what may be expected. At their great meeting at Smithfield the last year, our distinguished fellow-citizen, Mr Webster, addressed the meeting, being called up by a complimentary toast to his own country. This year the meeting was addressed by our Ambassador at the court of St. James, Mr Stevenson. We gave Mr Webster's admirable remarks on the occasion, and we hope the publishers of the Farmer will give Mr Stevenson's to their readers, which do him equal honor. [Mr Stevenson's speech has been published in the Farmer.] One sentiment embodied in it, coming from a Virginia planter, is sufficiently remarkable—viz:

"It (agriculture) became then the cause not of their country or his, but that of mankind; and who so poor or sordid in spirit, as to think only of himself or his country, when the great question was, whether the earth should be inhabited and cultivated by enlightened, and virtuous, and religious men, or by debased and ignorant human beings and hordes of savages?"

A noble sentiment, most truly, which if acted upon to its just extent, might well inspire bright hopes in the bosoms of the philanthropic and humane.

This encouragement to agriculture in England, we hail not merely with pleasure but enthusiasm. We want to say much more than we have room for. Its effects will scarcely fail to be felt in our country almost as

much as at home. We are now but twelve days apart. The London papers come to us wet from the press. The two great nations—the mother and the daughter—are beginning to have but one pulse; and every stirring of the waters in that land of our fathers, sends not its ripple but its wave to our shores.

Let us encourage a generous and noble competition in this most generous and peaceful of all arts. We are no longer in leading strings; and if we cannot move on in our agricultural improvement with an equal step, let us see that we do not lag far behind. H. C.

## FINE PEACHES.

We acknowledge the receipt of a generous box of delicious peaches from our friend E. Phinney, Esq, of Lexington, the product of his orchard. For size and flavor we have not seen or tasted any that will compare with them. Fruit of this description will sell for 37 1-2 to 50 cents per dozen in our market. Is not this a sufficient inducement to those who live at a marketing distance to raise good fruit? Does it cost any more to rear a tree producing good fruit than it does to raise a tree whose fruit is indifferent or bad? No; certainly not; and there is no excuse for inferior fruit. Every farmer may have as good fruit as this we have tasted, by first obtaining good varieties and then by paying proper attention to his trees. J. B.

## MASS. HORTICULTURAL SOCIETY.

NOTICE.—The premiums for the best Dahlia will be awarded on Wednesday, the 23d inst. The specimens must be in the stands before 10 o'clock, A. M. All the cultivators who intend to compete for the prizes are respectfully invited to meet at the Hall, 23 Tremont Row, on Saturday next, at 11 o'clock, as judges will then be appointed and arrangements made for the Dahlia show.

It is hoped that all the cultivators will be present at the meeting. Per order,

S. WALKER, *Chairman*.

Sept. 12th.

PERSIAN GARDENS.—There is no luxury in Persia comparable to their extensive grounds, planted with the choicest fruit trees. These grounds are left open to the stranger, and although belonging to many proprietors, their boundaries are merely a row of trees or a gutter of water. The Persian mode of irrigation is ingenious and complete, their soil most prodigal—their peaches, melons and grapes of a flavor unknown in Europe.—Then they have their olive grounds, which are very extensive; and the luxury on horseback of inhaling the odor in a thicket of flowers for miles around, must be felt in order to be appreciated. It is customary to form parties and spend whole days in the gardens, pitching a tent, &c., but this is unnecessary, since the night air gives no humidity. Give a "punard" or sixpence to the proprietor and you may remain in his garden all day and surfeit yourself with fruit, which forms much of the summer food of the Persians.—*Persian Reminiscences*.

QUINCE BUSHES.—A correspondent of the Journal of Commerce, at Norwich, Conn., says that while quince bushes were generally killed in Connecticut last winter, he noticed a cluster of them standing in his native garden, just as they did forty years ago, and that the secret of their safety, he presumes, may be found in the fact that they stand close under the north side of a stone wall, which so shades them as to retard the starting of the sap until the hard frosts are over.

**BRIGHTON MARKET.—MONDAY, Sept. 14, 1840.**

Reported for the New England Farmer.

At Market 380 Beef Cattle, 675 Stores, 4800 Sheep, and 975 Swine.

**Prices.—Beef Cattle.**—The prices obtained last week were fully sustained. We quote First quality, \$5 75 a \$6 00. Second quality, \$5 25 a \$5 50. Third quality, \$4 00 a \$5 00.

**Stores.**—Yearlings, \$8 a \$11. Two Year Old \$14 a \$18. Three Year Old, \$22 a \$28.

**Sheep.**—Dull—lots were sold at \$1 12, \$1 25, \$1 42, \$1 66, \$1 75, \$1 88, and \$2 00.

**Swine.**—Dull, and prices have further declined. Lots to peddle 3, 3 1-8, 3 1-4, and 3 3-8 for sows, and 4, 4 1-8, 4 1-4 and 4 3-8 for barrows. At retail 3 1-2 to 5.

**THERMOMETRICAL.**

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northernly exposure, weeks ending September 13.

Sept. 1840.	7 A.M.	12 M.	5 P.M.	Wind.	
Monday,	7	54	75	66	N. E.
Tuesday,	8	55	81	63	S.
Wednesday,	9	64	78	73	S. W.
Thursday,	10	64	82	62	S. E.
Friday,	11	56	70	55	N.
Saturday,	12	50	60	54	N. E.
Sunday,	13	45	62	57	N.

Fair weather every day at 12 o'clock.

**FRUIT AND ORNAMENTAL TREES, &c.**

Fruit Trees of all the different species—of the most celebrated kinds. These include Pears, Plums, Apples, Quinces, &c.—the trees of the Peach and Cherry, especially, are of the finest size, and in numbers abounding at this time, and of varieties unsurpassed. The Catalogue of Fruit and Ornamental Trees and Shrubs, Roses and Herbaceous Flowering Plants, will be sent to all who apply; in that Catalogue many of the very best kinds of fruits, so far as proved, are particularly designated by a star.

Also, Grape Vines, Raspberries, Strawberries, Gooseberries, and *Mulberries for silk*—Scotch Larch, Lindens, Sycamores, Silver Firs, Willows, Elms—Honeysuckles, Dahlias, splendid Pæonies, &c. &c. Trees when so ordered, will be securely packed for transportation to distant places, and all orders promptly executed by

WILLIAM KENRICK.

Nonantum Hill, Newton, near Boston, Sept. 9, 1840.  
eptD1

**NOTICE.**

The Rhode Island Society for the Encouragement of Domestic Industry, hold their election at their hall, in Pawtuxet, on Wednesday the 23d inst. (having been postponed from the 9th inst.)—to meet at 9 A. M. An address will be delivered at 11 o'clock, A. M., by the Hon. Judge Pitman. Dinner will be provided for the members, at the expense of the Society, at 2 o'clock, P. M.

Butter offered for premiums must be entered by 7 o'clock, A. M., on said day. WM. RHODES, Treasurer.  
September 9.

**TRACE CHAINS.**

Just received, direct from the English manufacturers, 8 casks of Trace Chains, from 6 to 11 feet long, suitable for ploughing or draft chains. JOSEPH BRECK & CO.

**BONE MANURE**

The subscriber informs his friends and the public, that after ten years experience, he is fully convinced that ground bones form the most powerful stimulant that can be applied to the earth as a manure.

Orders for Bone Manure or Oyster Shell Lime, left at the Bone Mill, near Tremont road, in Roxbury, at the New England Agricultural Warehouse and Seed Store, No 52 North Market Street, or through the Post Office will meet with prompt attention.  
March 4, 1840. NAHUM WARD.

**HORTICULTURAL TOOL CHESTS**

Containing a complete set of Garden tools of superior finish and style, recently received from Liverpool and for sale at the New England Agricultural Warehouse and Seed Store.  
May 6. JOSEPH BRECK & CO.

**GRAIN CRADLES.**

The Grain Cradle is an article which is coming into very general use in the New England States, where they were till of late but little known, although they have been in very general use in the southern and western States, for many years, and which is found to be decidedly the best mode of harvesting grain, as it is supposed one man will cradle five acres in a day when he cannot reap more than one. The difference in gathering a crop is so much in favor of cradling, that we must suppose that it will be the only mode adopted hereafter, and the grain cradle will become of as much use, as an implement of husbandry, as the plough now is.

There has been a very great improvement in the manufacturing of this article, they are now made on the most improved plan; the scythe is well secured and finished in a superior manner and made of the best cast steel.

**Brighton Nurseries and Gardens. For Sale**

A large quantity of superior European and American Ornamental Trees, well calculated for public places, or private grounds, with Fruit Trees embracing a great variety of the most approved kinds and fine sizes. The trees, and all other productions can now be selected and marked, and will be forwarded to any place as soon as it will answer to remove the same.

Also, forty kinds of Strawberry Plants, of the most approved European and American varieties.

Orders may be forwarded via. mail, addressed Messrs. WINSHIP, Brighton, Mass., or left with Messrs. JOSEPH BRECK & CO.

Brighton, August 12.

**HYACINTHS.**

The subscribers have received a large assortment of Double and Single Hyacinths of every color and shade. Also, Tulips of mixed sorts, Crown Imperials, and Lilies; they have also at their garden all the fine varieties of Pæonies, which will be furnished at one day's notice. Lilies and Pæonies, and Crown Imperials; should be planted in August or the first of September. We shall receive a great variety of Bulbous Roots, from Holland, in a few weeks, when notice will be given. JOSEPH BRECK & CO.  
August 26.

**GARDENERS' KNIVES.**

JOSEPH BRECK & CO. have this season imported and now offer for sale a few very superior Garden Knives, for pruning, &c. manufactured expressly for Gardeners, and warranted superior to any article of the kind before imported.

Also—a large assortment of Budding Knives, Grape Scissors, &c. &c.  
April 22.

**BOY WANTS A SITUATION.**

A smart active boy, about 16, wants a situation with a farmer where he can have an opportunity to learn the practice of agriculture, with whom he wishes to stay until of age. Inquire of JOSEPH BRECK & CO.  
August 26.

**PATENT SPRING BALANCE.**

A few of those very convenient spring balances, for family use, a very simple contrivance for weighing small articles. JOSEPH BRECK & CO. No. 51 and 52 North Market Street, Boston.  
July 15.

**FENCE CHAINS.**

Just received from England, at the New England Agricultural Warehouse, 6 casks chains, suitable for making the chain fence, &c. JOSEPH BRECK & CO.  
July 15.

**BERKSHIRE HOGS.**

The subscribers offer for sale a few pair of full blooded Berkshire Hogs; also, pigs 7-8 blood, crossed with Mackay. Inquire at the New England Farmer office, or at their farm at Brighton. JOSEPH BRECK & CO.  
July 9.

## MISCELLANEOUS.

## THE MOCKING BIRD.

Mr Rennie, in an article on American song birds in the Magazine of Natural History, has an interesting account of the mocking bird, which he says seems to be the prince of all song birds, being altogether unrivalled in the extent and variety of his vocal powers; and, besides the fulness and melody of his original notes, he has the faculty of imitating the notes of other birds, from the clear mellow tones of the wood thrush to the savage scream of the bald eagle. In measure and accents he faithfully follows his originals, while in force and sweetness of expression he greatly improves upon them. His own notes are bold and full, and varied seemingly beyond all limits. They consist of short expressions of two, three, or at most five or six, syllables, generally expressed with great emphasis and rapidity, and continued with undiminished ardor, for half an hour or an hour at a time. While singing he expands his wings and his tail, glistening with white, keeping time to his own music, and the buoyant gaiety of his action is no less fascinating than his song. He often deceives the sportsman, and even birds themselves are sometimes imposed upon by this admirable mimic. In confinement he loses little of the power or energy of his song. He whistles for the dog; Cæsar starts up, wags his tail, and runs to meet his master. He cries like a hurt chicken, and the hen hurries about, with feathers on end, to protect her injured brood. His imitations of the brown thrush are often interrupted by the crowing of cocks; and his exquisite warblings after the blue bird, are mingled with the screaming of swallows, or the cackling of hens. During moonlight, both in the wild and tame state, he sings the whole night long. The hunters, in their night excursions, know that the moon is rising the instant they begin to hear his delightful song. His natural notes partake of a character similar to those of the brown thrush, but they are more sweet, more expressive, more varied, and uttered with greater rapidity.

## VIRTUES OF COLD WATER.

Our readers have seen it announced that a new set of medical aspirants in Germany profess to cure all diseases by the internal and external use of cold water. A considerable laugh has been raised at their expense, but for our part, we do not think they are altogether off the track. Using cold water—and that only—for a constant drink, and bathing repeatedly, will cure more maladies than most persons would imagine. Let the invalid who drinks excessive quantities of warm liquids, or liquids of a worse character, and who neglects to purify his blood with frequent ablutions—let him try the above experiment, and if he does not find himself better in the course of six months, his disease is probably of a nature which medicine itself will not reach. We do not, however, go altogether with the M. D.'s mentioned above; we do not believe cold water will do every thing, though we seriously think it will do much. Diet, air, and exercise, are the three great principles of health. We have known persons to be cured by these when pronounced incurable by the physicians. But such is our opinion of cold water that we think it deserves to be classed with the principles just spoken of.—*Philad. Ledger.*

*A Beautiful Sentiment.*—The late eminent judge, Sir Allen Park, once said at a public meeting in London:

"We live in the midst of blessings, till we are utterly insensible of their greatness, and of the sources from whence they flow. We speak of our civilization, our arts, our freedom, our laws, and forget entirely how large a share of all is due to Christianity. Blot Christianity out of the pages of man's history, and what would his laws have been—what his civilization? Christianity is mixed up with our very being and our daily life; there is not a familiar object around us, which does not wear a different aspect, because the light of Christian hope is on it—not a law which does not owe its truth and gentleness to Christianity—not a custom which cannot be traced, in all its holy and healthful parts, to the Gospel."

When Noah planted the first vine and retired, satan approached and said—"I will nourish you, charming plant!" He quickly fetched three animals—a sheep, a lion, and a hog, and killed them one after another near the vine. The virtues of the blood of these three animals penetrated it, and are still manifest in its growth. When a man drinks one goblet he is then agreeable, gentle, friendly. That is the nature of the lamb. When he drinks two, he is like a lion, and says, "Who is like to me?" he then talks of stupendous things. When he drinks more, his senses forsake him, and at length he wallows in the mire. Need it be said that he resembles the hog.

*A Good Reference.*—"Do you know Mr ——?" asked one friend of another, referring to an old gentleman who was famous for his fondness for the extract of hop.

"Yes, sir, I know him very well."

"What kind of a man is he?"

"Why, in the morning, when he gets up he is a beer barrel; and in the evening, when he goes to bed, he is a barrel of beer."

The Marshall in Cincinnati, who has furnished several paragraphs for the newspapers, in his rounds of census taking, gives the following: In the fifth ward of that city he states that he found two instances of the instability of fortune. In destitute circumstances dependents for the bread of the day on the labors of the day, were two women, one a grand daughter of a distinguished Governor of Massachusetts, and the other a cousin of a late Governor of New Jersey.

An Irishman from the bogs, having to put a letter on board a vessel, arrived too late, for the barge had put off for the vessel with a full sail; the Irishman ran along the shore and kept up with the boat. As it was going to weather the point, they lowered sail; the fellow being nearly exhausted, gave up the chase, crying, "arrah, honey! if you're going to strip to it, the devil himself can't catch you!"

Mr Marsh, a chemist, connected with the Royal Arsenal, England, has discovered that iron, which has remained a considerable time under water, when reduced to small grains, or an impalpable powder, will become red hot and ignite any object with which it may be brought in contact.

## URATE AND POUURETTE.

An establishment for the manufacture of the Manures called Urate and Poudrette has been erected, at a considerable expense, in the State of New Jersey, near the city of New York; and an act of incorporation has been granted by the legislature of the State of New Jersey, by the name of "The Lodi Manufacturing Company," for purposes of agriculture, wherein it is provided, that 500 shares, a portion of the stock reserved for subscription by farmers and gardeners, within a limited time, shall be entitled to receive 50 bushels of Poudrette yearly for five years, viz. in 1840, 1841, 1842, 1843, and 1844, upon each share of \$100, which is at the rate of 20 per cent. per annum, for those years, and after that period to receive an equal dividend with the other stockholders.

The Manufactory has gone into operation according to law; a sufficient number of shares having been subscribed for that purpose, and capital paid in; and the first dividend has been regularly paid to the subscribers—the next dividend is payable in September. But the Company needs a larger moneyed capital than it now has, to carry it on to better advantage. Inquiries having been made whether all the stock had been taken, and the difficulty at the present time of obtaining funds, to a sufficient amount, from a few individuals, has induced a renewal of this notice to farmers and gardeners, and every other person who may have spare funds, (as every person is now permitted to subscribe,) that there is yet a considerable portion of the reserved stock, which, by law, is to receive 20 per cent. per annum, payable in Poudrette, one half in May, and the other half in September, in the years 1840, 1841, 1842, 1843, and 1844, not yet subscribed for, and the books are now open to receive subscriptions for the same, by any person, whether gardener, farmer or otherwise, at the office of the Lodi Manufacturing Company, No. 73 Cedar Street, in the city of New York. Terms for the reserved stock, \$100 per share in cash; and for the other portion of the stock an instalment of \$25 per share on subscribing, and the residue (being \$75 per share) to be called in by instalments of \$5 per share, after thirty days notice.

These manures have been fairly tested and very generally approved of as being the cheapest and best manures, and more economically applied than any other known substance used for manure.

As the article can be furnished from the city of New York, only to a limited extent, (not more than sufficient to manure 35,000 acres annually,) it must follow, that in a few years it will necessarily be confined to the use of the stockholders alone.

It is important to agriculture, and the enterprise deserves the liberal support of every enlightened farmer. By order,  
WILLIAM M. WILSON, Secretary.

At an election for Directors of the Lodi Manufacturing Company, held at Jersey City on the 6th day of July, 1840, the following persons were elected Directors of the Company, to hold their offices until the first Monday in October next, namely, Anthony Dey and Jacob C. Dey, of New York; J. D. Miller, Andrew S. Garr and Rodman M. Price, of New Jersey.

August 12.

## TIE UP CHAINS.

Just received at the New England Agricultural Warehouse, a good supply of those celebrated Chains for tying up cattle. These chains, introduced by E. H. Derby, Esq. of Salem, and Col. Jacques, of Charlestown, for the purpose of securing cattle to the stall, are found to be the safest and most convenient mode of fastening cows and oxen to the stanchion. They consist of a chain which passes round the animal's neck, and by a ring attached to the stall, plays freely up and down, and leaves the animal at liberty to lie down or rise at pleasure, and keeps him perfectly secure.

July 15.

JOSEPH BRECK & CO.

## BERKSHIRE PIGS FROM HAW'S STOCK.

The subscriber has on hand a few litters, from some of the largest and finest sows in the country, sired by Loring's and other imported boars. Also, the smaller class of Berkshire pigs, which are very beautiful animals, and delicious porkers. Either of the above stocks will be disposed of extremely low by applying to

Z. STANDISH.

N. B. The pigs will be neatly caged and shipped at New York, without extra charge, if required. Unquestionable reference will be given for thorough breeding.

Albany, August 19.

41

## THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at \$3 per annum payable at the end of the year—but those who pay within sixty days from the time of subscribing are entitled to a reduction of 50 cents.

TUTTLE, DENNETT AND CHISHOLM, PRINTERS,  
17 SCHOOL STREET, BOSTON.

N. E. FARMER.

### DOMESTIC ECONOMY.

The month of September is the month for preserving fruits, &c., and for the benefit of our lady readers, who wish to furnish for their tables a supply of fashionable sweetmeats, pickles, &c., we devote this chapter of our domestic economy to those subjects exclusively.

Where the fruits to be preserved are very delicate, or sweetmeats of a superior quality are desired, white or loaf sugar will be best; but for most kinds of fruit, or ordinary preserves, good brown or maple sugar will do very well. Brown sugar requires clarifying or cleansing, which is done by dissolving it in a small quantity of water with a gentle heat, then, after cooling, stirring in the whites of eggs well beaten, and gradually heating the syrup until all the impurities rise to the surface, when they are to be skimmed off, and the clarified syrup left pure for preserves.

Any kind of fire-proof ware will do for the making of preserves, with the exception of iron; but as most of the fruits contain more or less acid, brass or coppered vessels tinned are the best. In no case should they be allowed to stand in any such vessel to cool, as injurious consequences might ensue. Stone, or china, or glass, make the best vessels for depositing sweetmeats in, as they furnish nothing injurious for the acids to act upon. After preserves are made, the pots must be covered close, kept in a cool place, frequently looked to, and if about to ferment, let the syrup be poured off, scalded, and returned to them while hot. A paper wet in good brandy and laid on the surface of the sweetmeats, will assist much in their preservation. As a general rule, a pound of sugar to a pound of fruit is sufficient; but some kinds of fruit require more, and others will do with less than an equal quantity, according to its ripeness or the acid it contains.

**Pears.**—When made into preserves this fruit requires three quarters of a pound of sugar to a pound of pears. Syrup made as directed from brown sugar is good. Put the pears in the syrup and boil them till soft. The astringent or choke pears are good for preserving. A little ginger tied in a bag and boiled with the fruit improves their flavor, or lemon, or orange sliced, may be added at pleasure. To make *Pear marmalade*, boil the pears with the skins on; when soft rub them through a sieve, and put to each pound of pulp three fourths of a pound of sugar. Stew it slowly till it is a thick jelly. Marmalades must be stirred constantly, or they burn on the kettle.

**Quince.**—This fruit makes the best of preserves and one the least injurious to health. Pare and cut the fruit in slices an inch thick, taking out the cores carefully, so that the slices remain in the form of a ring. One pound of sugar is required for a pound of fruit, and white sugar is to be preferred. Dissolve the sugar in cold water, a quart to a pound, put in the sliced quinces and let them remain half a day. They are then put over a slow

fire, and boiled gently, always having sufficient syrup to cover the quinces. When a small splinter will go through them easily, they are done, and are to be turned out. In about a week turn off the syrup and boil it down so that there will be just enough to cover the fruit. They must be ripe to preserve good in this way. The parings and cores of quinces are used for *marmalade*, which is made by stewing them in a small quantity of water over a fire till soft, then rubbing them through a sieve, and adding to each pound of strained quince a pound of sugar. Put the vessel on a few coals, and stir constantly for one hour. When cold, it cuts smooth if sufficiently stewed, making a jelly of the richest kind.

**Plums.**—This fruit requires equal weights of sugar and fruit. Boil the plums slowly in the syrup for ten minutes; turn them in a dish and let them remain four or five days; then boil again till the syrup appears to have penetrated the plums fully. Put them in jars, and in about a week turn off the syrup, scald it carefully, and return it while hot.

**Apples.**—Tart mellow apples are the best for preserves, and they must be pared and the cores taken out with a small knife. Three fourths of a pound of sugar, a tea spoonful of ginger tied in a bag, and water to cover the apples, is allowed to a pound of fruit. The apples must be put into the prepared syrup when it is lukewarm; boil them till they are transparent; and when taken up and partly cooled, put in a little essence of lemon. In a week turn off the syrup, boil it, and return it hot to the fruit. The Siberian crab apple makes a superior sweetmeat, preserved as above, whole and without paring.

**Barberries.**—Barberries preserved, approach in their qualities the nearest to the East Indian tamarinds, and like them are frequently found useful in fevers. The fruit should be fully ripe and allowed to remain on the stems. The syrup must be rich, using as much sugar as fruit; when made, and lukewarm, put in the barberries and boil them till they appear penetrated by the syrup. An orange sliced is thought by some to improve the flavor.

**Tomatoes.**—An experienced lady gives the following directions for preserving this fruit. "Take them while quite small and green, put them in cold clarified syrup, with an orange cut in slices to every two pounds of tomatoes. Simmer them gently over a slow fire for two or three hours. There should be equal weights of sugar and tomatoes. If very superior preserves are wanted, allow two fresh lemons to three pounds of tomatoes, pare thin the rind of the lemons so as to get none of the white part, squeeze out the juice, mix the parings, juice and cold water sufficient to cover the tomatoes, and put in a few peach leaves, and powdered ginger tied up in bags. Boil the whole gently for three fourths of an hour—take up the tomatoes, strain the liquor, and put to it a pound and a half of white sugar for each pound of tomatoes. Put in the tomatoes and boil them gently till the syrup appears to have entered them. In the course of a week turn the syrup from them, heat it scalding hot, and

turn it on the tomatoes. Prepared in this way, they resemble West India sweetmeats."

**Water Melon Rinds.**—The rind of a good ripe water melon cut into small strips and boiled in water till tender, with a teaspoonful of saleratus and a dozen peach leaves to two quarts of water. The rinds are then to be taken out and soaked in alum water an hour. For the syrup, allow as much sugar as rind. Put the rinds in the syrup while cool, with ginger tied in a bag. Boil till the rinds are soft, and when partly cooled, add some essence of lemon. In the course of two or three days, take out the ginger, turn off the syrup, and boil it till there is just enough to cover the rinds; return it to them while hot.

**Pickling—general directions.**—Brass should be used for vessels in the process, thoroughly cleansed before using, and no vinegar allowed to cool in them. This precaution is necessary to prevent the formation of verdigris, an active poison. Boil alum and salt in the vinegar, in proportion of half a tea cup of salt and a table spoonful of alum to three gallons of vinegar. Vessels that have any grease about them will not do for pickles. Stone and wood are the only proper materials in which to keep pickles when made. All pickles should be stirred up occasionally. When any scum rises, the vinegar needs scalding. Pickles may be spiced or not at pleasure; and when the vinegar becomes weak from use, it may be thrown away and fresh vinegar substituted. Good, but not the sharpest vinegar, is the best for pickles.

**Cucumbers.**—The best are those that are small and green, and those of a quick growth. Turn boiling water on them as soon as picked; let them remain five hours, and then put them in cold vinegar, with alum and salt in the proportion of a spoonful of the former and a tea cup of the latter to a gallon of vinegar; add vinegar as you add cucumbers; and when you have done collecting cucumbers, turn the vinegar from them, and scald and skim it till it is clear, then put in the pickles and let them scald without boiling for a few minutes, and return them to their vessel while hot. Cucumbers may be preserved in salt or saturated brine, for any length of time, and then prepared for pickling by soaking and scalding. In the preparation of these pickles, no salt will be needed in the vinegar. Peppers are added to the vinegar while hot, and before it is turned over the pickles.

**Peppers.**—Take those that are fresh and green, soak them in salt and water eight or nine days, changing the brine each day, and keeping them in a warm place. If they are not wanted very fiery, make a slit in them and extract the seeds, being careful not to mangle the pepper. If it is desired to stuff them, chop white cabbage fine, season it highly with mace, cinnamon, cloves, and nasturtiums if liked, and fill the peppers with the mixture. Sow them up carefully and put them in cold spiced vinegar. Tomatoes may be treated in the same way, and when green are very good pickled with the peppers. Peppers are one of the best of pick-

les, but those used must not be allowed to grow hard or tough before gathering.

**Nasturtiums.**—Gather them when small and green; put them in salt and water, and change them once in three days. When the gathering is done, turn off the brine, and pour on scalding hot vinegar. Season at pleasure, though generally used without.

**Mangots.**—These are made of green muskmelons, as late in the season as possible. The common muskmelons make the best mangots. A small piece is cut from the side, and the seeds carefully scraped out; it is then soaked in salt and water three or four days; when taken out, it is sprinkled on the inside with powdered cloves, pepper, nutmeg, and filled with strips of horse radish, cinnamon, small string beans, small pieces of flag root, nasturtium, small onions, radish tops, &c. The crevices are filled with whole mustard seed. The piece of melon is then put back and a piece of white cotton cloth sowed around it. The melon is then placed in a jar, and vinegar prepared with alum, salt and pepper eorns, as for cucumbers, made boiling hot, is poured over it.

**Cabbages.**—Quarter the firm head of the cabbage; put the parts in a keg, sprinkle on them a good quantity of salt, and let them remain five or six days. To a gallon of vinegar put an ounce of mace, and one of pepper corns and cinnamon. Cloves and allspice may be added, but they darken the color of the cabbage. Heat the vinegar scalding hot, add a little alum, and turn it while hot on the cabbage, the salt remaining. It is necessary to turn the vinegar from the cabbage several times, return it again while hot. This makes them tender. Purple cabbages, the heads not large, but fine and firm, are best for pickling.

**Pickling Oysters.**—Boil and strain the liquor, first taking the oysters from it. Rinse the oysters and see they are free from pieces of shells. Put them in the liquor while boiling; boil them one minute, then take them out of it, and to the liquor put a few pepper corns, cloves and a blade or two of mace; add a little salt, and the same quantity of vinegar as oyster juice. Let the whole boil fifteen minutes and then turn it on to the oysters. If the oysters are to be kept any time, they must be bottled and corked as soon as cold.—*Albany Cult.*

**Herbs.**—There are many herbs used for culinary purposes, such as sage, summer savory, parsley, &c., and for medicinal purposes, such as tansy, wormwood, arsmart, penny royal, &c. which should be saved as they arrive at the proper state. They are generally in their greatest perfection, when the foliage is fully expanded, and they begin to flower. At this time in a dry day, they should be collected and dried in the shade. When the moisture is entirely exhausted, they must be pressed into masses of four or five inches square, papered and labelled. Put into a dry box and in a dry place, they may be kept almost any length of time. The farmer during the winter finds occasional use for herbs in treating diseased animals, and the want of them or the trouble of procuring them, in running over the neighborhood to beg them, is far greater than that of saving them.—*Ibid.*

A Cincinnati paper says that 400 miles of hogs were killed in that city the last year. That seems to be a new way of counting swine.

From the Albany Cultivator.

### MILKING.

“Is there any remedy to keep a cow from holding up her milk? or in other words, to make them give it down when weaning the calf? I have two cows that hold up their milk at such times, so that they would dry themselves up in a short time: one of them I have milked for two hours at a time, and could get but very little milk, and then let in the calf and she would give it down in a moment. I have been compelled to let my calf suck through the summer and fall to get any milk. Any information on the subject will be gladly received.

Middlebury, Ia., July, 1840. A. FREEMAN.

Gentle treatment at all times: accustoming the heifer to having her udder handled before calving; and milking her at first while the calf is about her, if she shows any disposition to retain her milk, will usually prevent a cow from holding up her milk. We have never had a cow addicted to this practice, and we know of no remedy for the habit, disagreeable as it is, when once contracted. A writer in a former volume of the *New England Farmer* asserts that placing a rope around the horns of a cow when in the stanchels and drawing her head high while being milked, will not only prevent her kicking, but is a remedy for her holding up her milk. This may be reasonable, as elevating the head must prevent that contraction of the muscles and curvature of the back, always observable when a cow holds up her milk or kicks. If any of our correspondents know a remedy, and will communicate it, it shall have a place with pleasure.

### DESTRUCTION OF BIRDS.

By far the greater number of small birds are supported by feeding upon insects and grubs. Each particular species of bird are fond of a particular species of insects or worms, as their favorite food; seldom can two birds of different species be found that are chiefly fed with the same kind of insects. Hence it follows, that by destroying birds we encourage the increase of the insect tribe; and by destroying a particular species of birds, we encourage the increase of that particular tribe of insects they are most fond of as articles of diet. It happens very fortunately that the birds which are most useful to man, as devourers of insects, are too small to be of much value to the sportsman. The sparrow tribe, on this account, are suffered to live, and a vast deal of service do they perform to the agriculturists, by picking up the worms and insects which infest his orchards, and the little grubs which are destined to become the enemies to vegetation after they have arrived at maturity. The woodpeckers, likewise, are suffered to escape on account of their unprofitableness in the market. These little birds are undoubtedly the means of saving whole forests from destruction by the ravages of insects; and were any particular species of woodpeckers to be suddenly annihilated, we should probably soon discover the office which they performed in the economy of nature, by seeing a certain kind of timber in our forests destroyed by that kind of insects which were formerly devoured by this species of bird.

It is well known that the locust tree, which affords some of the most valuable timber for posts in the country, on account of its hardness and durability, is very materially injured by a peculiar species of worm, from which all the care and ingenu-

ty of the most scientific agriculturist has not been able to protect it. In other parts of this country this valuable tree is not subject to the attacks of this destructive worm. Now may it not be a reasonable supposition, that the species of birds which nature has provided for feeding upon these locust worms, are wanting in this part of the country, and as a necessary consequence, this species of worms become exceedingly numerous and destructive? Agricultural societies have formerly offered prizes for the best means of destroying the locust worms. Might it not be a successful means of destroying them, to ascertain the kind of birds that feed upon them, and to encourage the propagation of them in this part of the country? It has been pretty well ascertained by naturalists that even those birds that are usually considered mischievous, perform services to the farmer which greatly overbalance all the mischief they do. Probably there is not a mischievous caterpillar in our orchards which is not the favorite food of some kind of bird; and could this bird only be known and its number increased, we might save the farmer from many a ruined harvest.

### LUCERNE.

This grass delights in a deep sandy loam. The land should be thoroughly cleaned of all weeds, or the seed should be sown in drills, so that the plants may be hoed until the weeds are subdued. Mr S. Howard states in the *Zanesville (Ohio) Gazette*, that he sowed a small quantity of seed in drills, the last week in May, on the “river bottom.” The last of July it had reached eighteen inches in height, when it was cut and fed green to hogs and milk cows, who both ate it voraciously. In four weeks it had again grown to the same height, when it was cut the second time: on the first of November it was again cut, the crop being heavier than either of the preceding. A piece of very flourishing red clover adjoining, on precisely similar soil, did not yield near half as much as the lucerne. Mr H. has no doubt but it may be cut, after the first year, five times in a season, and that it will yield a ton and a half per acre of hay at each cutting. The culture of lucerne has formed a distinguishing feature in the agriculture of France, where it has been in use for more than 250 years. The crop is there estimated at from five to seven tons to the English acre.—*Albany Cult.*

We understand, says the *Worcester Ægis*, that Daniel Webster and Isaac Hill have consented to attend the approaching Cattle Show in this town, and to deliver addresses on the occasion. Addresses will probably be given by other distinguished farmers, who are expected to be present on the occasion.

**Compost Manure.**—M. Quenard, an experienced cultivator of France, recommends as perfect, a compost prepared as follows: 1. A layer of green stuff taken from a pond. 2. A layer of quick lime, ashes and soot. 3. A layer of straw and green grass. 4. The same as first. These layers to be repeated as often as need be. Holes are then made through the several layers, and sufficient water introduced to saturate the mass and cause a thorough mixture of the vegetable and alkaline substances.

From the British Farmer's Magazine.

### MANURES.

With regard to the subject of manures, I do think that, highly as many farms are cultivated, well as many gentlemen husband those resources which their capitals give them, the subject of manures is not sufficiently attended to. On most farms, even where the state of cultivation is very high, manure, both as regards quality and quantity, and its due application to the different species of produce to which it ought to be applied, so as to produce the greatest and best possible results, is not in all cases sufficiently studied. It is to that I would wish to call your attention. Many artificial manures are now beginning to be used—I mean such manures as nitrate of soda, saltpetre, and so forth. But there is another kind of manure that is very little used by English farmers: I mean liquid manure. And upon this subject you will find an excellent article in the present month's number of the "Farmer's Magazine," to which I would direct your notice, and a perusal of which would well reward your time. But to meet all the circumstances in which the different kinds of manure can be fairly applied, I would strongly recommend to you the study of agricultural chemistry. The subject is neither so difficult as many imagine, nor does it embrace so wide a field as many gentlemen would at first suppose, who are thereby prevented to enter upon it. You must begin at the beginning, and if you make yourselves acquainted with the different parts of the earth, and go into the elementary substances that compose the vegetable world, you will be soon able to derive considerable advantages from it, when added to your experimental knowledge as a farmer. I am not so sanguine as to believe, that a good chemist would make a good farmer, as a chemist, but I am convinced that it would be better for the farmer, if he would add chemical knowledge to his agricultural knowledge and experience; for he would then be able to go a-head in the race with his brother farmers. Besides the advantages would also be great, in a pecuniary point of view; and to you who have the opportunity of viewing the "fair form of nature," and seeing the various changes which take place in the process of vegetation, it is also peculiarly applicable. It is very clear that chemical knowledge enlarges the mind of the individual so much as to impel him to "look from nature up to nature's God." He can then see how the Almighty chemist can, with three or four elementary principles, compose the most apparently dissimilar substance. The perfume of the rose, the various effluvia of different plants, are composed precisely from the same elementary substances, as well as the nutritious principle and the most deadly poison; but wonderfully elaborated by the Almighty chemist. While pursuing your vocations, will it not afford great gratification to you to be able to trace back the effect to the cause? and when the winter season arrives with its frosts and snows, you will know that it is preparing new forms of vegetable life to give beauty and plenty to the land.—*Mr Reynolds, Yorkford Farmer's Club, December, 1839.*

A very interesting discussion took place at the Braintree and Bocking Farmer's Club, February meeting, in which Mr W. Huntley, Mr Lungley, Mr Beadel, Mr W. F. Hobbes, and other gentlemen took part, and the meeting came to the con-

clusion that the practice of fermenting manure as is usually done, not only decreases the quantity, but deteriorates the value and effect; and that it is more advantageous to apply manure that has undergone but little fermentation. It was resolved that the committee should adopt means for ascertaining, by actual and careful experiment, the advantages arising from the use of raw, partially fermented, and rotten manure. The second subject also excited great interest; and the advantages of using what are called artificial manures for root crops came prominently before the meeting, as by means thereof a great saving of yard manure could be effected, which might be reserved for corn crops. Several gentlemen who had tried them upon a small scale expressed themselves well satisfied with the results; and that the most economical and effectual mode of applying them was by drilling the manure in with the seed. Some particulars were given by Mr Beadel of the result of applying saltpetre. He had tried it upon wheat, barley, and oats, upon sandy and clay soils: upon the wheat it had no beneficial effect, but when applied to barley it increased the produce of grain 15 bushels, straw 670 lbs. per acre; and the oats 20 bushels, straw 1940 lbs. per acre. Mr Huntley, also, had found great advantage from the use of saltpetre for mangel-wurzel upon heavy lands, by a great increase of produce. Several gentlemen having expressed a wish that the subject should be gone further into, it was resolved that it be resumed at the next monthly meeting of the club; and the party separated about half-past seven, much gratified with their first meeting. We cannot but congratulate the club upon this auspicious beginning, and we doubt not these meetings will tend to benefit the members themselves, and agriculture in general, by the spread of sound practical information. It is to be hoped that the example set by the Braintree and Bocking Club will be generally followed; the advantages resulting from the interchange of information, drawn from experience and practice of individuals, must do much towards raising agriculture to that position which its importance merits.

### EXTRANEOUS MANURES—NITRATE OF SODA.

It is reported, that a remark was made by Lord Kames, 90 years ago, that such improvements would be made in agricultural chemistry, that sufficient manure for an acre would one day be carried in a man's coat pocket; and that a trite answer was made to the remark, that the produce from such manuring would then be brought away in the waist-coat pocket. Now, although this period has not yet arrived, yet something approaching to the small quantity of manure necessary to give vigor to an acre of wheat, has been proved on Guilford Downs during the past year; not that this kind of manure alone was taken up by the crop, but that it formed a great stimulator to the extra growth there cannot be a doubt; bringing into activity probably some latent manures lying in the ground; for a strong alkali will convert oleaginous matters into saponaceous consistency, and in that state becomes soluble in water: hence it is taken up by the spongiolets of the roots in a liquid state. Those persons who consider quantity necessary in manuring ground are sadly mistaken, intimate mixture with the soil, and capability of becoming readily soluble, being necessary points for consideration. In March, 1839, Mr John Ryds, bailiff to Frederick Mangles, Esq., of Down Farm, Guilford,

dressed over many acres of wheat with 1 1-2 cwt of nitrate of soda to the acre, leaving about half an acre in the middle of the field undressed. The difference in the color of the wheat was seen in the course of 10 days; when nearly ripe, the straw had the appearance of being 9 or 10 inches longer than the other part, and much stronger; at reaping, seven rods of each part were measured, cut, and kept separate; the nitred part produced 24 sheaves, containing 11 gallons of wheat and 54 lbs. of straw; and where the seven rods were not so dressed, the produce was 16 sheaves, containing 6 1-2 gallons of wheat and 40 lbs. of straw.

From Bell's Messenger.

### USEFUL ANIMALS OFTEN DESTROYED AS HURTFUL.

Multitudes of animals are most unmercifully destroyed from ignorance of their uses, from an idea that they are noxious or injurious to some petty concern of a field or garden: and at the very time they are rendering important services to man, they are mowed down as if they were his sworn enemies, and had conspired against his life. Hence the rooks in some parts of England were at one time in danger of being extirpated, as we learn from the author of "A Philosophical Survey of the Animal Creation." "The rook," says he, "is a species of crow that feeds upon worms produced from the eggs of the May-bug. As these and all the winged insects in general are to be supported by the roots of plants, they deposit their eggs pretty deep in the earth, in a hole they dig for that purpose. The worms and caterpillars, upon which the rooks feed, are not exposed to the mercy of this bird till the earth is thrown up. Hence it is that rooks always frequent lands recently cultivated, that the sight of the husbandman with his plough puts them in action, and that they search with so much assiduity about the furrows newly formed. Wherever the banishment or extirpating of rooks has been carried into effect, the most serious injury to the corn and other crops has invariably followed, from the unchecked devastations of the grub and the caterpillar. Many birds besides rooks are destroyed, under the mistaken idea that they are injurious to the garden or orchard, at the very time they are most useful to both, in feeding themselves and their nestlings on grubs and caterpillars. The common sparrow, though proscribed as a most mischievous bird, destroys a vast number of insects. Bradley has calculated that a single pair, having young to maintain, will destroy 3360 caterpillars in a week. Also the blue titmouse often falls a victim to ignorance, in consequence of the injury it is supposed they do to fruit trees, though we have evidence of its being a friend rather than enemy to horticulturists. Quadrupeds, as well as birds, suffer much under slanderous imputations, as can be attested by the badger and the hedgehog."

THE AMERICAN INSTITUTE.—The 13th annual Fair of this institution will open at Niblo's Garden, New York, on the 5th, and continue open till the 16th of October.

HEAVY FLEECE.—It is stated in the papers, that Mr S. Brownell of Chautauque Co. in this state, sheared this season, 14 lbs. of wool from a Saxony sheep, which weighed, after the fleece was taken off, 130 lbs.—*Alb. Cult.*

## WINSHIP'S NURSERIES.

Many of our readers, probably, have never visited these celebrated nurseries, though they must be familiar with their name and character, for we believe there are but a few of our subscribers who have not at some time ordered trees or plants from them through us or otherwise. A ramble among the young and vigorous trees, shrubs and plants, collected from all parts of the world, must, when clothed in their foliage of various shades, and flowers of every hue, give pleasure even to the most careless observer of the vegetable creation: but to him who loves to observe and compare the endless variety contained in the vegetable kingdom, will esteem it a rare treat to devote a few hours in walking over these well kept grounds. Not long since we took a friend of ours from Maine to these nurseries, who observed, that although he had seen much to admire in and about the city, yet he had been much more gratified by examining the various species of trees and plants here than by all the rest he had seen.

The nurseries of the Messrs Winship were commenced about eighteen years since. Until that time the assortment of fruit trees for sale was very meagre in comparison to what it is now; and as to ornamental trees and plants, we may safely say very little had been done in the nursery line to form a collection for the accommodation of the public. If a gentleman wished for plants to ornament his ground, he was obliged to pick up a variety from the garden of friend A. and another from friend B., and so on, but after all he could obtain from all the sources, he could command but a scanty supply. A new era commenced in floriculture and ornamental gardening when the Messrs Winship, by untiring diligence and persevering enterprise, collected from Europe and America their extensive collection and offered their rare treasures to the public. It should be remembered that there did not exist at that time the same facilities for obtaining plants from abroad as we have now, and we think these gentlemen are entitled to much credit for their unceasing efforts and unremitting industry in bringing their nursery to its present condition.

The nurseries cover over 25 acres of ground, most of it quite level: the southern portion descends to the south, where a small streamlet winds its way at the bottom, giving a little variety, and affording facilities for watering and other advantages. It is situated five miles from Boston, on the Worcester rail road, and is the first stopping place from the city. A person wishing to visit the gardens from the city, may reach them in fifteen minutes; or, if they would prefer an omnibus, there is one that runs three times a day into the city and back. The grounds are intersected with numerous broad avenues and walks, by which every part is made accessible, and the great beauty of it is, these avenues and walks are always in fine order. The borders form an extent of at least one mile, and are filled with a great variety of herbaceous plants and shrubs, which through the season of flowers present a gay and brilliant appearance. There is on the establishment a well filled green house from which an extensive collection of choice plants may at any time be selected.

We were informed that the nurseries embrace the following varieties of fruit trees: apples 230; almonds 4; apricots 30; cherries 53; currants 22; gooseberries 105; grapes 65; mulberries 10; nec-

tarines 25; pears 200; peaches 103; plums 75; quinces 8; barberries 4; blackberries 10; raspberries 14; strawberries 30; nut trees 18.

Of ornamental trees, shrubs and plants—forest trees of the first class 63; second class 55; shrubs 197; evergreen trees and shrubs 67; honeysuckle and Azalea 43; hardy roses 300; Scotch roses 64; Pæonies 40; Chinese chrysanthemums 20; Iris 20; herbaceous perennials between 200 and 300 varieties.

To describe even some of the more prominent species would take more time than we could spare, and occupy more space than would be desirable for one paper. One of the most elegant trees, according to our fancy, is the Shephardia eleagnoides or Buffalo Berry. This beautiful tree was first noticed by Professor Nuttall during his travels in Missouri in the year 1810, and named after his friend, Mr Shephard, of Liverpool. The seeds of the original tree now in this nursery, were collected by Col. Saelling, of the city of Boston, and forwarded to John S. Skinner, Esq., of Baltimore, and from thence to the Messrs Winship. The tree is perfectly hardy and will thrive in almost any soil or climate. The tree forms an elegant continual ornament for any gentleman's grounds, being in summer clothed with a rich egg leaved foliage, bright green on the upper side, and delicate silver beneath; and in autumn and winter red, with thick clusters of its fruit. This latter is in size and shape like a currant, and in taste has a pleasant tartness, which I can liken to nothing else I have tasted. Preserved, it makes an elegant jam."

In ordering these trees it should be remembered that it is necessary to have a pair, otherwise they will not fruit, as they are male and female. Specimens of hedges formed of the Shephardia may be seen on the premises, and for this purpose will undoubtedly be a great acquisition to the country. The hedge in front of the house of Jonathan Winship, Esq. is perfect. It is six years from seed and two since it was set, and now forms a close hedge sufficient to keep off cattle. Specimens of hedges formed of the three thorned Acacia, buckthorn, arbor vitæ, &c., are also to be seen. Gentlemen wishing to plant hedges would do well to examine these specimens before they commence operations.

Many of the forest trees are of a large size; to those who wish to ornament their grounds or the road side, they will find every thing to their mind in this line and no mistake. Here are the English and American Linden, horse chesnuts, rock and other maples, English and American elms, superb Scotch and American larch, spruce, fir, arbor vitæ, mountain ash, silver leaved abele, weeping and hoop leaved willows, and many others too numerous to mention, every thing in fact to please the eye. The time is near at hand when all hardy trees that shed their leaves, may be moved with the greatest safety. Evergreens do best in the spring; hardy fruit trees may also be transplanted in the autumn. Peach trees should be moved in the spring, as they are liable to be winter killed if transplanted in the fall. We recommend to our friends to call and see for themselves and make their own selections, or send their orders to us and we will do it for them. J. B.

*Moths.*—The best preventive of clothes being infested with this destructive insect is, to take them out frequently and brush and air them.

## ESSEX AGRICULTURAL SOCIETY.

The annual exhibition by the Society will be at Georgetown, on *Wednesday, September 30th*. The Trustees and Committees will meet at Savory's Hotel, at 9 o'clock, A. M.

All claims for premiums to be awarded on the day of exhibition, must be entered with the Secretary of the Society or his agent, on or before 9 o'clock, A. M. that day. All other claims for premiums must be handed or forwarded to the Secretary in writing.

All articles of domestic manufacture must be entered with the agent of the Secretary, at the hall near the hotel, where they will be exhibited. After the Committee have closed their examination, the hall will be open for visitors.

Butter, cheese, fruits and flowers, will be deposited at rooms provided for this purpose, under the direction of the several committees who have charge of these subjects.

All animals or articles exhibited will be required to remain for the inspection of the public until 3 o'clock, P. M.

The ploughing match will take place on a field near the village, at 10 o'clock, A. M. under the direction of the Committees. The examination of working oxen will be immediately after.

The several committees will proceed in the discharge of their respective duties as soon as practicable after 10 o'clock. All claimants who have statements or information to give the committees will take care to be at their posts when the committees require it.

Gentlemen who have fine fruits or superior vegetable productions of any kind, and who feel an interest in advancing the objects of the Society, are respectfully requested to bring them forward.

In addition to the premiums heretofore offered, there will be paid the present year, one hundred dollars, by the State Society, for the best animals exhibited from this or any other county in the commonwealth.

Those who intend to plough, must give notice to the Secretary or J. Russell, Esq., at Georgetown, on or before the Monday next preceding the exhibition. The members of the Society and invited guests will dine together at half past 1 o'clock, P. M.

At 3 o'clock, P. M. the Society will meet at Rev. Mr Braman's meeting house, to hear an address by Asahel Huntington, Esq., of Salem; after which the reports of the several committees will be submitted, and the usual business of the annual meeting transacted.

*NOTE.*—The Committee of Arrangements have taken care to provide suitable rooms for the accommodation of ladies who may attend the exhibition, where they will be furnished with such refreshments as they may need, in the lower story of the hall, where the manufactures will be exhibited.

Per order,

JOHN W. PROCTOR, Sec'y.

Dawers, Sept. 12, 1840.

*Use of Slates in ripening Fruit.*—A grape vine branch trained over a small slate roof facing the south, was noticed to be extraordinary early in perfecting its fruit. The grapes on this roof were ripe and black whilst those on the rest of the branch were yet green. This, effect, evidently due to the heat accumulated in the slates from the rays of the sun, has been advantageously applied in assisting the ripening of wall fruit.—*French pap.*

## ARTIFICIAL INCUBATION—THE ECCALCOBION.

This is a contrivance for hatching eggs by artificial heat. It differs from the Egyptian method of artificial incubation by means of *mammals*, or ovens heated immediately by fire, which was tried in Paris by De Reaumur, and in London by Mr Mowbray; and also from the more recent attempt at the Egyptian hall, by means of steam. In what way the heat of the Eccalcobion is produced, we are not informed; probably it is by hot water: certainly the operation is simple and effective, as abundant living proofs testify.

In an oblong wooden case, about nine feet in length, and three feet in width and depth, entirely insulated, and divided into eight compartments, each closed by a glazed door darkened, the eggs are placed on cloth, without any covering: here they remain for twentyone days, the period of incubation: at the expiration of which time, the chick liberates itself, and the next day is running about and pecking its food as lively as if it had the hen's wings to shelter it. The Eccalcobion is capable of containing upwards of two thousand eggs, and of hatching about a hundred daily; and though some failures occur from natural causes, the machine, unlike the parent bird, never addles the egg.

It is always contrived that one compartment shall exhibit the last stage of incubation; and this being open, the visitor may not only hear the faint chirp of the imprisoned chick, but watch its attacks on its oval cell, till, having broken the shell all round, it bursts the integuments and liberates itself. At first emerging into this new state of existence, the light and the human eyes gazing on the little chick, together with its extreme weakness, make it appear as if it would fain retire into its confinement again; it staggers, closes its eyes, and falls down in an apparently exhausted state, but soon revives, though but for a short time; as soon as it can take food, however, it gains strength rapidly. In the last stage of incubation, the egg may be held in the hand, or placed in a lady's bosom; where, if any fair visitor be so minded, the chick may come to light.

In a case fitted with lenses, placed before eggs in different stages of incubation, lighted by gas, the appearances through the shell may be observed; and on a table are placed the contents of several eggs at successive periods of incubation, showing the formation of the embryo, from the first day, (as seen under the microscope) to the complete bird, coiled up in its oval form. To trace the gradual development of the eyes, the bill and cranium, the heart and circulating system, the feet, feathers, &c., is exceedingly interesting.

The fledglings are placed in partitions and supplied with food, and the room rings with their chirping.

The Eccalcobion process is of course applicable to eggs of every species of bird, but none other than those of the common gallinaceous fowl have been reared: parties bringing the eggs of other birds, however, can have them hatched by the machine, as the same temperature (about ninetyeight degrees of Fahrenheit) is applicable to all, from the wren to the eagle. The introduction of the Eccalcobion into general use, will supply abundance of fowls for the table at a very cheap rate, and with very little trouble: the machinery of the Eccalcobion is also applicable to a variety of scientific purposes, where an even and pervading temperature is required; as it may be regulated at plea-

sure up to three hundred degrees of Fahrenheit.—*London paper.*

From the American Farmer's Companion.

## MANURES.

*Mr Editor*—As the success of the farmer in raising large crops in a great measure depends upon the amount of manure that he may accumulate, and the manner in which it is applied, it would, perhaps, be interesting to many of your readers, to know how they might be most successful in accumulating manure. For the benefit of such, I send you the following method, which has been tested for many years.

First, that part of the yard intended for the management of manure, is so formed as to be six inches lower in the centre than any other part, so as to retain more or less of the urine, which is the very essence of manure, and a portion of which is necessary to create fermentation; and that there be no loss in case of excessive rains, I have a pit at one end of the yard with drains leading to it, to catch all the superabundant liquid that may be drawn from the yard, which liquid, when fermented, I apply to the soil by means of a large watering pot made for that purpose. But to return—the yard being prepared, I cover it with refuse straw and other vegetable matter, about one foot in depth; this layer is covered with manure from the stables to about the same depth, taking care to keep the horse manure on one part, and the other kinds on the other part. I then cover the manure with another layer of straw, leaves, or any other kind of vegetable matter that I may have at hand, so as not only to prevent the strength of the manure from evaporating, but the refuse by this method will undergo fermentation and absorb the superabundant moisture that may be in the manure. The next time in cleaning the stable, I reverse the plan of covering with manure, potting the horse manure on that part where the cow manure was put at the first covering; so as to produce equal heat in fermentation—the horse manure containing the most heat of the two, and so I continue reversing the manure, and cover with alternate layers of refuse straw from time to time, until the whole is well fermented, which will be in about six months from the time of commencing. By this method, with twelve or fifteen head of stock, from a thousand to fifteen hundred loads of well fermented manure may be accumulated every year; but perhaps some may object to this method on account of the amount of straw and other refuse required to cover the manure with alternate layers. To such I would say, that leaves, bog roots, weeds, green bushes, and many other substances may be gathered on a farm, which, if mixed with manure, so as to undergo fermentation, will amply repay for the time and labor spent in gathering.

In the next place, the manner of applying manure. Now, all admit that it is applied for the purpose of nourishing the plants, roots or grain, to which it is applied—if so, reason and common sense will teach us that the nearer it gets to the root the better. Furthermore, we all admit that when it is applied as a top dressing, that a greater part of the strength is evaporated; on the other hand when ploughed in to the depth of six or eight inches, as is frequently done, in open and porous soils, much of the strength sinks beneath the reach of the roots; therefore, in order to avoid both extremes, when applied to corn ground, harrow it in

with the cultivator to the depth of about three inches, and when applied to wheat ground, after the ground is completely prepared, apply the manure and plough it in with the wheat, to about the same depth as that of corn, and with every other kind of roots in a similar manner.

AN OLD FARMER.

## PREMIUMS ON PLOUGHS.

The Trustees of the Massachusetts Society for Promoting Agriculture, in their premium list for 1840, offer the following premiums:

1st. For the best plough that will turn the sod over and lay it flat; regard being had to the strength of the plough, easiness of draft, excellence of the work it performs, and its cheapness—one hundred dollars.

It is expected that two ploughs of different sizes of the same model, will be produced.

2d. For the best plough that shall lay the sod on edge or obliquely, and not flat, regard to the qualities above mentioned—seventyfive dollars.

It is expected that two ploughs of different sizes of the same model, will be produced.

Competitors for these premiums will be admitted from any of the States, and claims may be sent to Benjamin Guild, Esq., Recording Secretary of the Society, in Boston, on or before the ninth day of October next.

The trial of ploughs has been appointed to be had in Worcester, on Tuesday, the 13th day of October next, and the Committee of Arrangements of the Worcester County Agricultural Society, have been charged with the duty of making the necessary arrangements for the occasion.

It is expected that the presidents of the several agricultural societies in the State, will constitute the committee for awarding these premiums.—*Worcester Egis.*

## FLOWERS, TREES, SHRUBBERY.

We are not about to philosophize at all, but we wish to ask the farmer—the man who has a house and lot with it—the owner of any spot of solid earth—why it is that he does not more often realize the power which he has to make himself master of a literal paradise? Our poets always talk of green leaves, and fresh flowers and noble trees, as things belonging, of course, to a blessed place. Our hymns tell of “flowery plains” and “trees of life immortal;” and all our representations of happy places and scenery, include them as a matter of course. Why cannot this be realized? The man who has a house, a garden, a yard, or a farm, can, with a little care, have all these, although he can lay no claim to wealth. There is wisdom in cultivating these lovely adornments; and although we promised not to philosophize, we cannot help saying that there is more philosophy in these notions than most good people imagine. There is reason as well as poetry. And he who has about his dwelling these children of the earth, will have, among the songsters of the air, and the fragrance and music which will come on the breath of summer through his open windows, that which will sweeten his intellectual associations as well as regale his senses.

Now, if this little article should be the means of planting a hundred trees and flowers, we should not be surprised to find out in the end, that it had cherished also a hundred domestic virtues.

## NEW ENGLAND FARMER,

AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, SEPT. 23, 1840.

## MANURES.

Experiments are reported as having been recently made in England with saltpetre, with much success. In the cases referred to it was applied to wheat; but its application to other crops has proved equally favorable and encouraging. It is not a new experiment. We know several cases in this country of its successful application, of which we shall speak hereafter; but we shall give the experiment now referred to in detail, because it seems to have been made with considerable care, and its results are professedly given with exactness.

The Harleston (England) Farmers' Club put it to their members as a subject of the highest moment, to make exact observation and experiments with various manures. Certainly no matter connected with the improvement of agriculture can be of more importance.—At a recent meeting the subject of saltpetre was discussed. Various experiments were reported. We select one of the strongest cases, they say, "the application of saltpetre as a top-dressing to wheat after pease, on a light land with a gravelly subsoil."

"One hundred weight per acre was sown by hand on the 6th of April, and to prevent any error which might have arisen from a difference in soil of one side of the field from another, the saltpetre was carefully applied on every two alternate ridges. The two crops were reaped, stacked, and threshed separately; and the result was an increase of six bushels of wheat, and upwards of two and a half hundred of straw per acre, obtained at an outlay of 27s. sterl'g only, as follows:

Produce per acre of wheat which had been manured with saltpetre,	St.	lb.		
	160	21-2		
Produce without saltpetre,	133	12 1-2		
			Increase,	26 4
Produce per acre of straw with saltpetre,	Cwt.	St.	lb.	
	23	4	13	
" " " without saltpetre,	20	7	8	
			Increase	2 5 5

Cost of the saltpetre was 27s. sterl'g per cwt. The wheat of course was winter wheat, and it was sown broadcast. A stone is 14 lbs.

The Society proceed to report:—"It is the unanimous opinion of this meeting, that saltpetre is a most valuable addition to our list of manures. Strong evidence has been given of the benefits conferred by it on wheat, clover, and other layers, and tares on light land; and on clover layers on heavy land: in each case the saltpetre was applied in the month of April, and at the rate of one hundred weight per acre. The effect would probably be increased (but this is at present unsupported by evidence) by applying only half the quantity of saltpetre at first, and the remaining part a few weeks afterwards."

The experiments which have come under our own observation, have been upon grass and wheat. The effect upon grass was quite remarkable. The wheat was in a growing state; the saltpetre applied when six inches in height; the quantity per acre not noted; the difference between the part not dressed with saltpetre and that to which it was applied was obvious and striking; the wheat was then in flower; it was intended that the result should be accurately observed; and we hope presently to be put in possession of it.

Any person of common observation, and at all interested in such subjects, cannot fail to observe the immense quantities of manure which are absolutely thrown away on our farms, in our cities, and about our roads and buildings. What a blessing it would be, if we had something of the reported frugality of the Chinese, on the score of cleanliness and health, as well as interest. How few of our farmers ever think of saving their soap suds. We fear, without meaning any reproach upon the gude housewives, that some of them do not hear of such a thing as soap suds as often as might be useful! But how few ever think of saving and applying it; and yet it is a most valuable manure; and by having a vault or pool in which to deposit a pile of loam, or large heap of earth, by regularly throwing the contents of the wash tub upon it, might be converted into the means of greatly enriching the land; and what tuns upon tuns of the most valuable liquid manure, by a little pains-taking and contrivance, might be obtained in the city, by farmers, who are now willing to come four and six miles and transport fire-fanged and dried horse manure at a cost, before it reaches their farms, of six and eight dollars a cord.

The French are now taking great pains to save the water in which the wool is washed at the woollen factories, full as it is of soap and animal oil, and find it a most valuable application to their lands. We have long known the value of the refuse wool; and we have stood by the mill-shute in Lowell more than once with feelings of serious regret, when we have seen the wash from their woollen factory, full of enriching matters, mingling with the waters of the river and passing off into the ocean, as so much valuable material absolutely thrown away.

Our highly respected friend Bement, of Albany, has made some very successful experiments with hogs' bristles, applied in his potato hills and in other forms. He speaks of their beneficial effects as quite remarkable; and we promise ourselves the pleasure of hearing from him on this and the use of various other manures, in which he has been experimenting. We can confidently rely upon his observations and experiments as intelligent and exact; and the results which he gives under his own hand, as certain. H. C.

## BOOK FARMING.

A writer in a late "American Farmer," in speaking of the Third Report of the Agriculture of Massachusetts, is pleased to refer to the statement made in that Report of De Candolle's learned theory of vegetation, respecting the excretory organs of plants, and the belief of this philosopher and eminent botanist, that in many cases owing to the peculiar excretions of a plant, the ground on which it is grown becomes unfitted, until a different crop or some length of time has intervened, for the repetition of the same crop on the same land. This excretory power in plants has been most fully established by various striking experiments; and the theory, whether true or false, is not without very strong evidence, and certainly contains nothing unphilosophical or improbable.

The wise gentleman, however, says, as soon as he reaches this passage and reads of the digestive organs of plants, he admires the wonders of book farming, and lays down the paper in disgust.

Now we have high authority for "not answering a fool according to his folly;" but we should like to ask this gentleman, if we deemed him capable of understanding the question, why plants should not have organs of digestion? We should like to ask him if he ever heard of the sexes of plants—of the organs of generation in

plants, so that by art a species can be modified or changed? We should like to ask him whether plants can be fed and their growth hastened or promoted by artificial appliances? We should like to ask him how they take up their food from the earth and the air—and whether he ever heard of the sap vessels of plants, by which their circulations are carried on and their juices elaborated? But in truth, what would be the use of asking such a man any thing?

When men now-a-days undertake to talk about book farming, and to feed the prejudices and folly of the vulgar by their sneers at all curious inquiries into the most wonderful and curious of nature's mysteries, we should like to know of them what subject demands more strongly, what subject will more fully repay the highest efforts of the highest philosophy than agriculture? All the distinguished improvements which have ever been made in this art and science, have sprung not from the mere ignorant plodders, but from the application to the subject of the highest order of intelligent minds. Away then with the contemptible nonsense about book farming, let it come from what source it may. H. C.

## ROSE BUSH SLUG.

We publish the following communication without a signature, in a lady's hand-writing, in which the writer thinks she has discovered a remedy against the ravages of the rose bush slug. Should this prove to be the case, we have no doubt but what the Horticultural Society will award her the premium.

DANVERS, Sept. 5th, 1840.

To the Publisher of the New England Farmer:

Sir,—Having seen a notice in your paper last June, wishing for any one to inform you how to destroy the Rose Bush Slug, I send you a remedy which I have used successfully.

I should think the slugs had eaten more than half the leaves off my bushes: I thought there could not be one left one week longer. I took my castor of black pepper and shook it over my bushes three different times when the dew was on: the slugs ceased eating entirely, which leads me to think that black pepper will stop their ravages.

If in a future season this should prove a remedy with yourself and others, and the Horticultural Society's Committee should think me entitled to the premium, please direct a line to Ebenezer King, of Danvers.

P. S.—I think the slugs begin at the bottom of the bush; they took every leaf as far as they went.

## Massachusetts Horticultural Society.

EXHIBITION OF FRUITS.

Saturday, Sept. 19, 1840.

By Mr Samuel Pond, Cambridgeport; Surpasse, Virgalieu and Spanish Bon Chretien Pears; Lombard and Semionna Plums—fine specimens.

By J. L. F. Warren, Brighton; Porter apples; Prince's Red Rarerie and Royal or Teton de Venus Peaches; Musk Melons grown from seeds brought from Paris by Rev. Mr Pierpont—judged to be a new variety.

By Mr Edward Sharp, Dorchester; Large White Peaches.

By Mr Samuel Whiting, Dedham; Seekle Pears.

For the Committee,

B. V. FRENCH.

## MASS. HORTICULTURAL SOCIETY.

At an adjourned meeting of the Massachusetts Horticultural Society, held September 12th, 1840—

*Resolved*, That the thanks of the Society be presented to the ladies and gentlemen who have so generously

contributed plants, flowers and fruits to the twelfth annual exhibition of the Society.

*Voted*, That the thanks of the Society be presented to the Committee of Arrangements, and particularly to Mr Walker, the Chairman, for the manner in which they have executed their duty, in the decoration of the hall and other arrangements, which have added so much to the interest of the Society.

Attest, **E. M. RICHARDS,**  
Recording Sec'y.

We have just received from a subscriber a paper containing a list of premiums offered by the New Haven County Agricultural Society, to be awarded at their Annual Fair, to be held on Wednesday the 30th inst. As we did not receive it until our paper was all set up, we are obliged to omit the list of premiums.

**ACKNOWLEDGEMENTS.**—We have received from Mr S. Little, of Buxport, Me., a box containing a number of varieties of plums. Also, a box of fine native grapes from Mr Elias Holden, of Danvers, which we shall more fully notice next week.  
**J. BRECK.**

If (says the Albany Cultivator) a man would understand the value of agriculture—if he would learn to prize the art of all arts, the one that confers wealth and bread on the world—if he would see the true nobility of the country, the real sovereigns of the United States—if he would learn to look upon labor in its true light, honorable and useful to all—if he would have his heart gladdened at the successful results and rewards of honest industry, let him go among active, intelligent, practical farmers—men who in their practice enforce the same salutary lessons they embrace in their theory or inculcate with their pen.

The discovery of the means of destroying slugs by strewing common salt upon them, belongs to Dr Rousseau, who having thrown a small quantity of that substance on a plank in his garden, covered with those insects, all that came in contact with the salt perished.

**BRIGHTON MARKET.**—MONDAY, Sept. 21, 1840.  
Reported for the New England Farmer.

At Market 525 Beef Cattle, 720 Stores, 4300 Sheep, and 1125 Swine.

**PRICES.**—*Beef Cattle.*—The prices obtained last week for a like quality were not sustained. We quote a few extra at \$6 00. First quality, \$5 50 a \$5 75. Second \$5 00 a \$5 25. Third quality, \$4 00 a 4 75.

*Stores.*—Yearlings, \$8 a \$11. Two Year Old \$14 a \$18. Three Year Old, \$22 a \$28.

*Sheep.*—Lots were sold at \$1 17, \$1 25, \$1 37, \$1 50, \$1 66, \$1 83, \$1 92, \$2 00, and \$2 50.

*Swine.*—Lots to peddle were sold at 3 and 3 1-4 for sows, and 4 and 4 1-4 for barrows. At retail from 3 1-2 to 5 1-2.

**THERMOMETRICAL.**

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northerly exposure, weeks ending September 20.

Sept. 1840.	7 A.M.	12, M.	5, P.M.	Wind.	
Monday,	14	42	63	54	E.
Tuesday,	15	49	59	56	E.
Wednesday,	16	46	74	64	S. E.
Thursday,	17	57	74	66	S. E.
Friday,	18	60	80	67	S.
Saturday,	19	62	49	56	S.
Sunday,	20	61	70	64	S. W.

Fair weather at 12 o'clock, every day except one.

**MASSACHUSETTS HORTICULTURAL SOCIETY. NOTICE.**

The Annual Meeting of the MASSACHUSETTS HORTICULTURAL SOCIETY, will be held at their Rooms, No 23 Tremont Row, on SATURDAY, the 3d of October next, at 11 o'clock, A. M. for the choice of officers for the year ensuing, viz. a President, four Vice Presidents, a Treasurer, a Corresponding Secretary, a Recording Secretary, a Council, an Executive Committee, and Standing Committees on Fruits, Flowers, Vegetables, the Synonyms of Fruits, the Library, and Finance.  
**E. M. RICHARDS, Rec. Sec'y.**  
Sep. 23, 1840.

**FRUIT AND ORNAMENTAL TREES.**

Gentlemen at a distance, wishing to purchase trees, are informed that we will select from the following nurseries Fruit and Ornamental Trees, Plants and Shrubs of every description that may be desired, and pay particular attention to their packing, and forward them to any part of the country.

From Messrs Winships', Brighton  
William Kenrick's, Newton.  
John A. Kenrick's, Do.  
S. & G. Hyde, Do.  
Samuel Pond, Cambridgeport.  
Botanic Garden, Cambridge.  
Robert Manning, Salem.  
J. L. F. Warren, Brighton.  
Breck & Co., Brighton.

The present is the best time, to transplant all hardy trees and shrubs.  
Orders will be received for Plum, Pear and other Stocks, Hedge Plants, &c.  
**JOSEPH BRECK & CO.**  
Boston, Sept. 23, 1840.

**FRUIT AND ORNAMENTAL TREES, &c.**

 Fruit Trees of all the different species—of the most celebrated kinds. These include Pears, Plums, Apples, Quinces, &c.—the trees of the Peach and Cherry, especially, are of the finest size, and in numbers abounding at this time, and of varieties unsurpassed. The Catalogue of Fruit and Ornamental Trees and Shrubs, Roses and Herbaceous Flowering Plants, will be sent to all who apply: in that Catalogue many of the very best kinds of fruits, so far as proved, are particularly designated by a star.

Also, Grape Vines, Raspberries, Strawberries, Gooseberries, and Mulberries for silk—Scotch Larch, Linceus, Sycamores, Silver Firs, Willows, Elms—Honeysuckles, Dahlias, splendid Pæonies, &c. &c. Trees when so ordered, will be securely packed for transportation to distant places, and all orders promptly executed by

**WILLIAM KENRICK.**  
Nonantum Hill, Newton, near Boston, Sept. 9, 1840.  
eptD

**TRACE CHAINS.**

Just received, direct from the English manufacturers, 8 casks of Trace Chains, from 6 to 11 feet long, suitable for ploughing or draft chains.  
**JOSEPH BRECK & CO.**

**BONE MANURE**

The subscriber informs his friends and the public, that after ten years experience, he is fully convinced that ground bones form the most powerful stimulant that can be applied to the earth as a manure.

Orders for Bone Manure or Oyster Shell Lime, left at the Bone Mill, near Tremont road, in Roxbury, at the New England Agricultural Warehouse and Seed Store, No 52 North Market Street, or through the Post Office will meet with prompt attention.  
March 4, 1840

**NAHUM WARD.**

**HORTICULTURAL TOOL CHESTS**

Containing a complete set of Garden tools of superior finish and style, recently received from Liverpool and for sale at the New England Agricultural Warehouse and Seed Store.  
May 6.  
**JOSEPH BRECK & CO.**

**PATENT SPRING BALANCE.**

A few of those very convenient spring balances, for family use, a very simple contrivance for weighing small articles.  
**JOSEPH BRECK & CO.** No. 51 and 52 North Market Street, Boston.  
July 15.

**FENCE CHAINS.**

Just received from England, at the New England Agricultural Warehouse, 6 casks chains, suitable for making the chain fence, &c.  
**JOSEPH BRECK & CO.**  
July 15.

**BERKSHIRE HOGS.**

The subscribers offer for sale a few pair of full blooded Berkshire Hogs; also, pigs 7 8 blood, crossed with Mackay. Inquire at the New England Farmer office, or at their farm at Brighton.  
**JOSEPH BRECK & CO.**  
July 9.

## MISCELLANEOUS.

## THE BLACKBIRD'S SONG.

It is not in the wild valley flanked with birch slopes, and stretching far away among the craggy hills, that the music of the blackbird floats upon the evening breeze. There you may listen delighted to the gentle song of the mavis; but here, in this plain, covered with cornfields and skirted with gardens, sit down on the green turf by the gliding brook, and mark the little black speck, stuck as it were upon the top twig of that tall poplar. It is a blackbird; for now the sweet strain, loud but mellowed by distance, comes upon the ear, inspiring pleasant thoughts and banishing care and sorrow. The bird has evidently learned his part by long practice, for he sits sedately and in full consciousness of superiority. Ceasing at intervals, he renews the strain, varying it so that, although you can occasionally trace a repetition of notes, the staves are never precisely the same. You may sit an hour or longer, and yet the song will be continued; and in the neighboring gardens many rival songsters will sometimes raise their voices at once, or delight you with alternate strains. And now, what is the purpose of all this melody? We can only conjecture that it is the expression of the perfect happiness which the creature is enjoying, when untouched by care, conscious of security, and aware of the presence of his mate, he instinctively pours forth his soul in joy, and gratitude and love. He does not sing to amuse his mate, as many have supposed; for he often sings in winter, when he is not yet mated; nor does he sing to beguile his solitude, for now he is not solitary; but he sings because all his wants are satisfied, his whole frame glowing with health, and because his Maker has gifted him with the power of uttering sweet sounds.—*Macgillivray's British Birds.*

## A BOTTOMLESS LAKE.

A writer in the Troy (N. Y.) Mail, gives the following account of a remarkable pond in Sussex county, in the State of New York.

"White Lake is situated about one mile west of the Paulus Kill, in the town of Stillwater. It is nearly circular. It has no visible inlet, but its outlet is a never failing stream of considerable magnitude. The name is derived from its appearance. Viewed from a little distance it seems of a milky whiteness, except a few rods in the centre, which by the contrast appears perfectly black. The appearance itself is singular enough, but the cause is still more remarkable.

From the centre or dark portion of the lake, at stated seasons, innumerable quantities of shells are thrown up, of various sizes and forms, but all perfectly white. These float to the shore, and are thrown upon the beach, or sink into shallow water. Hundreds of bushels might be gathered from the shore after one of these periodical up-risings; and the whole soil for several rods on every side of the lake, is composed of these shells, broken or decomposed by the action of the weather. In the centre of the lake, bottom has never been found, although it has been sounded to the depth of several hundred feet.

Where then is the grand deposit from which has been swelling up since the memory of man, these countless myriads of untenanted shells? Is it possible that though far remote at an elevation of several hundred feet above them, this bottomless

well may, by some subterranean communication, be connected with the grand shell marl deposit in the eastern part of the State?"

## CHINESE FOOD.

With nothing more than a few beans, the meal of rice, and corn, and some spices and herbs, the Chinese prepare a variety of savory dishes. Horse flesh, rats and mice are standard articles of food, and sold publicly at the butcher's. Birds' nests are another article of food, but neither mud nor sticks enter into their composition. The nests are found in the rocks along the coasts of Tonquin, &c. and are built by birds resembling the swallow. They are constructed, as is supposed, of a small species of sea-fish, cemented by a glutinous matter exuding from the bird itself; and when fully formed, resemble the rind of a large candied citron. Bears' paws form another favorite dish. They are rolled in pepper and nutmeg and dried in the sun. When about to be dressed, they are soaked in rice water to make them soft, and then boiled in the gravy of a kid, and seasoned with various spices.—*London Weekly Review.*

## TO APPRENTICES.

The only way for a young man to prepare for usefulness is to devote himself to study during his leisure hours. First, be industrious in your business. Never complain that you are obliged to work; go to it with alacrity and cheerfulness, and it will become a habit that will make you respected by your employer and the community. Make it your business to see to and promote his interest: by taking care of his you will learn to take care of your own. Second, be industrious in your studies. Few persons can complain of a harder master than Franklin's, yet he had laid the foundations of his greatness while an apprentice. Success depends not on the amount of leisure you may have, but upon the manner in which it is employed.

In Lambyaque, Peru, are to be seen the stupendous graves of the Indian kings, who must have died in the times of Incas. These stupendous mounds of earth are just upon the outside of the city, and are built of sun-dried brick, and are of the most gigantic dimensions: some of them are 3000 feet in circumference and over 150 in height, and must have required a long time and a deal of labor in their erection. One of them was opened in Truxillo, and silver and gold taken from it amounting to over \$2,000,000. A company of merchants have been organized, and are now opening several others in search of more hidden treasure.—*N. Y. Express.*

*Indian Superstition.*—Near Fort Leavenworth, in Platte county, Missouri, is the grave of a distinguished Pottawatamie chief. The editor of the Hannibal Monitor has often seen members of the tribe standing in sad silence before it. In the long summer nights, from nightfall to daybreak, a bird unknown, except by some of the woodsmen, pours out a melancholy strain of music. The Indians say it is the "spirit bird" hanging over the tomb of the chieftain.

There is a lady near Brooklyn, N. Y. 113 years of age. She says she can milk the cows as readily now as she could 100 years ago.

## GRAIN CRADLES.

The Grain Cradle is an article which is coming into very general use in the New England States, where they were till of late but little known, although they have been in very general use in the southern and western States, for many years, and which is found to be decidedly the best mode of harvesting grain, as it is supposed one man will cradle five acres in a day when he cannot reap more than one. The difference in gathering a crop is so much in favor of cradling, that we must suppose that it will be the only mode adopted hereafter, and the grain cradle will become of as much use, as an implement of husbandry, as the plough now is.

There has been a very great improvement in the manufacturing of this article, they are now made on the most improved plan; the scythe is well secured and finished in a superior manner and made of the best cast steel.

## Brighton Nurseries and Gardens. For Sale

A large quantity of superior European and American Ornamental Trees, well calculated for public places, or private grounds, with Fruit Trees embracing a great variety of the most approved kinds and fine sizes. The trees, and all other productions can now be selected and marked, and will be for wanted to any place as soon as it will answer to remove the same.

Also, forty kinds of Strawberry Plants, of the most approved European and American varieties.

Orders may be forwarded via. mail, addressed Messrs. WINSHIP, Brighton, Mass., or left with Messrs. JOSEPH BRECK & CO.

Brighton, August 12.

## HYACINTHS.

The subscribers have received a large assortment of Double and Single Hyacinths of every color and shade. Also, Tulips of mixed sorts, Crown Imperials, and Lilies; they have also at their garden all the fine varieties of Pæonies, which will be furnished at one day's notice. Lilies and Pæonies, and Crown Imperials, should be planted in August or the first of September. We shall receive a great variety of Bulbous Roots, from Holland, in a few weeks, when notice will be given. JOSEPH BRECK & CO.

August 26.

## GARDENERS' KNIVES.

JOSEPH BRECK & CO. have this season imported and now offer for sale a few very superior Garden Knives, for pruning, &c. manufactured expressly for Gardeners, and warranted superior to any article of the kind before imported.

Also—a large assortment of Budding Knives, Grape Scissors, &c. &c.

April 22.

## TIE UP CHAINS.

Just received at the New England Agricultural Warehouse, a good supply of those celebrated Chains for tying up cattle. These chains, introduced by E. H. Derby, Esq. of Salem, and Col. Jacques, of Charlestown, for the purpose of securing cattle to the stall, are found to be the safest and most convenient mode of fastening cows and oxen to the stanchion. They consist of a chain which passes round the animal's neck, and by a ring attached to the stall, plays freely up and down, and leaves the animal at liberty to lie down or rise at pleasure, and keeps him perfectly secure.

July 15.

JOSEPH BRECK & CO.

## THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at \$3 per annum payable at the end of the year—but those who pay within sixty days from the time of subscribing are entitled to a deduction of 50 cents.

N. E. FARMER.

From the British Farmer's Magazine.

### OBSERVATIONS ON THE EXCRETORY POWERS OF PLANTS, &c.

The lately discovered doctrine of the excretory powers of the roots of plants, although it was rather startling to us, and slowly received at first, is now beginning to be embraced by the generality of scientific men. The doctrine being first adopted and promulgated by several leading men, about the same time in England as well as on the continent, gained for it a ready acceptance with many, who, however, had some difficulty in explaining and proving what they professed to believe. That the soil immediately in contact with the roots and other parts of the plant which grows in it, must receive some kind of taint, either by exudation, respiration, or other mode of discharge of its fluids, is perfectly feasible; and that this taint is appreciable by our senses, both of sight and scent, is undeniable. But whether this taint or discharge from the plant be *poisonous*, or only *useless* to plants of the same kind which succeed, is the question not yet clearly decided. Objectors insist that it is not what is *left* that is deleterious, but what is *taken away* which renders the soil less suitable to the second crop of the same kind. Every different species of plant, say they, selects its own peculiar kind of food, and therefore the second cannot find so much as the first, unless the exhausted plot be replenished with that of which it has been deprived. But the abettors of the exudation notion, say this is impossible; that no replenishment of even the richest dress will operate so as to make the second as good as the first crop. This is, perhaps, carrying the idea of excremental poisoning too far; because a farm may be so exhausted under a *regular rotation* of cropping, as to be at last unfit to bear any kind of crop until again visited by the dung cart. We often see in cottage gardens onions and cabbages repeatedly grown on the same spot, without any material falling off, provided the annual application of ashes and other sweepings about the house are bestowed to assist the crop.

It is quite possible, however, that one species of plant may be not only unhurt by the exuvia of another, but even thrive in it, as beans and wheat are known to do, alternating for many consecutive years. And moreover, as beans, drilled and properly labored by horse and hand hoes, are a cleansing crop, and if the drills of this year were to occupy the intervals of those of the last, it might be possible, as Tull used to say, to grow beans every year upon the same field; but this, for many reasons, would not be eligible, even if practicable.

But some of those who strenuously support the theory of Professor De Candolle, relative to the injurious ejections of previous crops, not only insist on the validity of the professor's opinion, but maintain that it is consistent with a fixed law of nature, namely, that no plant is destined by nature to occupy constantly the same station. That they

are constitutionally endowed with powers or tendencies by which they desert or fly from the place of their birth; as if by a kind of perception they knew that their parents had devoured all the food which they would require for themselves.

We have many instances of the progeny forsaking the mother; some seeds have parachute wings to fly away with; others are contained in seed vessels, which when acted upon by the heat of the sun, burst with such elastic force as to scatter the seeds to a considerable distance around. By many other means are seeds dispersed: by winds, by currents of water, by birds and other animals. But besides seeds, plants have other modes of increase or extension: witness the numerous offsets and suckers produced by many different sorts of plants, and all these take divergent directions, so that they should not rob the parent or be starved themselves. The strawberry plant is a familiar example of how far the living progeny depart from the mother's station before they fix themselves in the ground. To these instances a hundred others might be adduced; all which go to prove that plants are constitutionally inclined to a change of place. Trees, indeed, are fixed to one spot; but they are ever finding fresh pasture by the extension of their leading roots, as is the case with all other perennial plants.

But, after all, the question recurs—is this diverging tendency a natural law of vegetation, or is it because antecedent production exhausts or poisons the soil, so as to render it unfit for the purposes of subsequent production?

We know that newly broken up land, whatever its quality may be, is always more suitable to any crop than that of the same quality which has been long cultivated; showing that there is a *something* in maiden soil which is fugitive. What that something is, has never been discovered by practical men, nor has it been investigated by the chemist, though an object well worth the researches of science.

That the fertility of exhausted land may be renewed by additions of manure, is well known; and it seems that the dress restores that which has been abstracted by the previous crops; or, at least, supplies a substitute. On the knowledge of this fact all our best systems of agriculture are founded; and whether land be exhausted or poisoned by previous cropping can make no difference in the culture, so that the rules of rotation, as established by long experience, are strictly attended to, and no cross-cropping pursued, unless for some manifest prospective advantage.

That a change of soil, and even a *change of air*, are beneficial to all kinds of terrestrial plants, are well confirmed facts; and nothing conduces so much to the advantage of the farmer as a frequent change of seed. Now, how a change of soil without it being of better quality, and especially, how a *change of air*, without reference to its temperature, can be so exciting and congenial to foreign or strange plants, is one of those mysteries in cultivation which we cannot readily fathom. It must be observed, however, that such effects are only

seen between the fortieth and sixtieth parallels of latitude; because beyond those bounds an interchange would be too extreme; though there are some exceptions to this rule, for the Mazagan beans of Egypt do well in this country, and some native plants of Siberia do equally well in Britain. But the farmer's range in making such changes is confined to the seed of corn, grasses, potatoes, &c.; and, next to obtaining clean seed of the *best varieties*, most suitable for his own land, is the procuring them from the most distant parts of the kingdom, or at least from some neighboring county.

From the same.

### REPORTING EXPERIMENTS WITH ARTIFICIAL MANURES.

In all our agricultural publications now issuing from the press, we see many accounts of experiments made for ascertaining the value of certain substances recommended as manures, either for top-dressing or ploughing in. Some of these accounts are elaborately, and, no doubt, faithfully written; and sometimes favorable, or, as it may happen, unfavorable. Sometimes, too, we are told of the same material having contrary effects on land of precisely the same character, especially if situated in distant parts of the kingdom. Now, these discrepancies may often arise from ignorance or want of consideration of the peculiar effect or action of the material employed.

Besides the various substances which have been used as manures from time immemorable, there are others, chiefly minerals, which are brought into use with various success. The reports of such trials are not always uniform; and defective in so far as the character of the weather or season following the application is omitted to be stated. In my own practice I have used soot extensively for top-dressing wheat, and have harrowed and rolled it in; but if a dry spring and summer followed, the soot was of no service. I have used chalk and lime as dressings for light gravelly land; but if a wet season succeeded, little or no immediate effect was observable. The same result followed the application of salt, on the same description of land, under the like circumstances of season. And the reason for the non-efficiency of these three last named substances was perfectly obvious: all three are ready absorbents of water from the air, and in dry seasons are eminently useful to growing crops; whereas, in a showery time, the crops need no such assistance.

Saltpetre and nitrate of soda are at present fashionable top-dressings; and those best acquainted with these substances affirm that they are often judiciously used. On wet tenacious land they can never be so efficacious as on dry sandy or gravelly soils; nor in wet seasons so much as they certainly must be in dry. If I be not mistaken in attributing to them such effects, they will always be considered as doubtful fertilizers; because they must be used before it can be ascertained, except by conjecture, what sort of season is to follow.

Mr Cuthbert Johnson observes, that "the agricultural uses of saltpetre have not been examined so carefully or generally as they ought to have been;" and G. Kimberley, Esq., of Trotsworth, "regrets that it has been hastily adopted, without reference, in many cases, to season, soil, climate or quantity; and as a few fortunate experiments have started into a fashion the use of these articles, so one or two unseasonable or improper applications have at once condemned them to neglect and oblivion."

Such reports show decidedly how necessary it is to know correctly the effects of those artificial manures; whether as the food of plants, or improvers of the staple; whether as excitors of vegetation or solvents of the nutritive matters already in the soil; and also under what circumstances of weather or season they are most active, or altogether neutral. These are questions for the agricultural chemist to prosecute; so that no farmer need work in the twilight, or be in doubt concerning the direct effects of any manure which comes recommended from competent authorities.

And in all future reports of experiments made with any of those uncommon articles of manure, the reporter should not omit to state what kind of weather has prevailed during the experiment; for the effects, especially of saline substances, are very much determined by the state of the weather.

J. MAIN.

{Our respected correspondent is right. Much of the success or otherwise of these, and many other manures we could name, must depend on peculiar circumstances of soil and season. We have heard saltpetre abused one year, and highly extolled in another; although tried on the same soil, the same description of crop, and by the same person.—Ed.]

#### HENERY.

This is a new term to us, and when we first noticed the article which is subjoined, we were at a loss to define its meaning; but we soon discovered that it was upon a subject that is too much neglected by our farmers, and laid it by for insertion in our paper. Our attention is again called thereto by the reception of a letter from one of the most eminent and successful agriculturists in the United States, the proprietor of the *Three Hills Farm*, near Albany, who, in discoursing of other matters, thus introduces the subject of poultry, which we think worthy the attention of all those who wish to enjoy the luxury emanating from the "*Henery*." It is also particularly worthy the attention of those residing near the markets, where they can obtain an average price of 18 3/4 cents per dozen the year round for eggs, and \$2 1/2 to \$3 per dozen for chickens. Mr Bement observes:

"I am now paying particular attention to poultry, have built me a poultry house and enclosed a yard for them to roam in. In this section considerable attention is being paid to poultry. Since I built my poultry house, several have followed suit, and I have no reason to regret the expense; for, from 60 hens, we obtained in six months, 2600 eggs; whereas in former years, when I kept from 80 to 100 hens, 400 and 500 were all we obtained during the year. Besides they are not half as much trouble on the farm."—*American Farmer*.

From the Maine Cultivator.

#### HENERY—NOT HENRY.

*Henery*, says our neighbor Adams of the Tem-

perance Gazette, is to *hens*, what piggery is to pigs, or rookery is to rooks,—he might have added, or hoggery to hogs, and cowery to cows. We are glad to find him so learned in these matters, and especially to see him willing to turn his knowledge to a *practical account*.

During a late visit in Winthrop, he noticed the *henery* establishment of Rev. D. Thurston, which as he thinks it an improvement on the common method of keeping hens, he thus describes in the last Gazette:

"IMPROVED HENERY.—We are not sure that *Henery* is a dictionary word, but we suppose that our readers will understand it. If not, we would say that *henery* is to hens, what piggery is to pigs, or rookery to rooks: a place where these useful feathered bipeds congregate and perform the appropriate duties of their station. We lately met with one of these establishments, which seemed to us so excellently adapted to its purpose, that we have thought it worth a brief description.

First, then, in the upper part of the barn is an apartment 12 feet square, boarded so as to prevent the escape of what is put within it. Here the fowls are to roost, lay their eggs, and perform all their in-door work. At the distance of a rod and a half from the barn, on the borders of the garden, is another apartment of about the same dimensions as the first, surrounded by a high fence, made of lath stuff, sawed two inches wide, and nine feet long, and put on close enough to prevent the hens from getting out. These two apartments are connected by a covered way, which passes from the scaffold of the barn in what some would call a *slantindicular* direction, to the fence, about three feet from the top, and is continued down to the ground in the inside of the yard. This is made tight top and bottom, and on one side, but with open work on the other side. Through this covered way, the inmates of the establishment pass when they choose, taking the air and enjoying the prospect, and when they come into out door apartment, they indulge, *ad libitum*, in their favorite amusement of scratching dirt and devouring gravel.

The result of the whole is, they are kept under perfect control, and yet enjoy all that liberty which is essential to their health and comfort, and when you want a fresh egg, you have only to lift a lid over a row of little apartments, in which their nests are made, and you will find at almost any time of the day, a plentiful supply. The little chickens too, as soon as they are large enough to make excursions abroad, will be ready to perform an excellent service in the garden, by devouring the grubs and insects. Thus the inhabitants of our villages and of our cities even, who have "scope and verge enough" to possess a barn and a garden, can keep as much poultry as they choose, without infringing in the least upon the laws of good neighborhood. Those who may wish to inspect the establishment we have described, may be gratified by calling on the Rev. D. Thurston, of Winthrop."

The plan, doubtless, is a good one. By such an enclosure, the fowls are kept from doing damage in cultivated grounds, are prevented from roving to their own hazard and injury, and will, if properly fed, lay their eggs and rear their young better, than if they enjoyed a more enlarged liberty. Care should be taken, however, when they are confined, to supply them liberally with water, gravel, lime and animal food—such as fresh meat, worms, &c.

In this way, people in large villages and cities can keep hens as well as if they lived on farms in the country. Indeed, it would be better for farmers if they would, at certain seasons of the year, keep their poultry in such an establishment.

We do not know as we understand the necessity or the benefits of *separating* the yard from the barn, by the distance of a rod and a half of unoccupied ground, connected by the "covered way," or tube leading from the barn to the yard. Our establishment differs from the foregoing chiefly in this particular. The yard is directly attached to the back side of the barn, from the wall of which a roof projects, under which are poles for roosts. This is a shelter from the rains and winds. On a level with the floor of the barn, two holes are cut, several feet distant from each other, sufficiently large to enable a hen to enter one and skulk out of the other into the yard again if she wishes. The hens like secrecy in these important matters. Within the barn is a long chest, covered by a lid, having a communication with the yard by the holes aforesaid. The chest is partitioned off into nests, where each hen is allowed to lay her eggs "alone in her glory," little suspecting, perhaps, that the top of her excellent place of concealment is liable to be opened, and her eggs taken away by human stratagem.

*Value of taking an agricultural paper.*—A gentleman residing not far from the limits of Maryland, to whom we have recently sold some fine animals, writes us, as the advantage of taking an agricultural journal near home, that he was on the point of sending to the eastward, where he would have paid more than double the price for the same quality of animals. He also remarks: "I recollect too, my manager on the Ohio told me had saved a valuable horse by some recipe in the *American Farmer*." Has it never occurred to the reader that in many instances he has been enabled to save the price of a dozen volumes of the paper, by the knowledge obtained from a single No. relative to the treatment of his cattle, horses, sheep, &c., or by some improved mode of operation in his pursuits? and yet how frequently it occurs that the small pittance required for a year's subscription is delayed far beyond that period, and the editor and publisher thereby deprived of the reward of their labors, from the sheer neglect of those who ought to be reminded by the reception of each No., of their moral obligation to "*pay the printer*."—*American Farmer*.

Many a firm when fresh, has been rendered sterile and unproductive in a few years, by skimming the surface. Deep ploughing brings up latent animal and vegetable particles favorable to the growth of plants, renders the soil loose and friable, and above all, prevents the ground from washing. Hilly land should always be ploughed in a circular direction, and if at the same time it is broken deep, it is rarely the case that hills will not retain all the rain that falls upon them.—*Agriculturist*.

*Product of the Monument Fair.*—We are authorized by the Treasurer of the late Monument Fair, to say that sufficient progress has been made in the settlement of the various accounts to authorize the belief that the net proceeds will not fall short of *twentyfive thousand dollars*.—*Boston Courier*.

## GRAND DAHLIA EXHIBITION.

The exhibition of Dahlias by the cultivators of this splendid flower, took place at the Horticultural Society's rooms on Wednesday, 23d inst. and closed on Saturday evening at 6 o'clock.

The flowers entered for premium were numerous, of beautiful form, and of all the various colors.

The principal contributors were Col. Wilder, J. J. Low, J. Stickney, Hovey & Co., Breck & Co., D. Haggerston, J. T. Buckingham, P. G. Seabury (of New Bedford), Jno. A. Kenrick, Wm. Kenrick, D. McIntire, F. W. Macondray, S. Sweetser, Wm. Bacon, W. Meller, W. E. Carter, P. Barnes, Messrs Winship, H. W. Dutton and Samuel Walker.

The following are the prizes awarded by the Committees, viz: Premier prize to Col. Wilder, for the best six dissimilar blooms, \$15. For the best Dahlia, of any color, a prize of \$5 to Col. Wilder. A gratuity of \$5 to J. J. Low for the 2d best single bloom, called the Springfield Major (?) The above three prizes were open to all cultivators.

*Division A.* Open to all cultivators of more than two hundred plants, in classes, viz: Class 1. For the best twentyfour dissimilar blooms, a prize of \$8, Col. Wilder; for the second best twentyfour dissimilar blooms, a prize of \$6, J. J. Low.—Class 2. For the best twelve dissimilar blooms, a prize of \$6, J. Stickney; for the second best twelve dissimilar blooms, a prize of \$4, Hovey & Co.—Class 3. For the best six dissimilar blooms, a prize of \$4, D. Haggerston; for the second best dissimilar blooms, a prize of \$2, John A. Kenrick.

*Division B.* Open to all cultivators of less than two hundred plants, in classes, viz: Class 1. For the best twentyfour dissimilar blooms, a prize of \$8, D. McIntire. Class 2. For the best twelve dissimilar blooms, a prize of \$6, S. Walker; for the second best twelve dissimilar blooms, a prize of \$4, S. Sweetser. Class 3. For the best six dissimilar blooms, a prize of \$4, W. Meller; for the second best dissimilar blooms, a prize of \$2, W. E. Carter.

The six premium blooms from Col. Wilder were, Primrose, Dodd's Mary, Marshal Soult, Rose Superior, Lady Bathurst, Suffolk Hero.

The best specimen bloom by Col. Wilder—*Primrose.*

The second best bloom by J. J. Low—*Springfield Major.*

Twentyfour blooms by Col. Wilder, viz: Lady Bathurst; Marshal Soult; Suffolk Hero; Glory of Plymouth; Healey's Penelope; Topaz; Castandi; Harwood's Defiance; Rival Sussex; Standford's Contender; Dodd's Mary; Ne plus ultra; Eva; C. Liverpool; D. Glory; Ovid; Sp. Rival; Lord Byron; Rosetta; Striata; Dennisii; Sir H. Fletcher; Stone's Yellow Perfection; Mrs Rushton.

Twentyfour blooms by J. J. Low, viz: Springfield Major; Suffolk Hero; Purple Perfection; Lady Dartmouth; Countess of Mansfield; Warminster Rival; Sunbury Hero; Blandina; Grand Purple; Queen of Scots; Sir H. Fletcher; Maria Edgeworth; Horsham Rival; Marshal Soult; Lilac Perfection; Exquisiter; Sulphurea Elegans; Mrs Rushton; Striata; Triumphant; Red Rover; Rival Sussex; Unique; Napoleon.

Twelve blooms by J. Stickney, viz: Lewisham Rival; Castandi; Ansel's Unique; Fire Ball; Virgin Queen; Eva; Striata Formosissima; Marshal Soult; Clark's Julia; Standford's Contender; Sulphurea Elegans; Essex Rival.

Twelve blooms by Hovey & Co., viz: Washing-

ton; Sulphurea Elegans; Independent; Cambridge Hero; Blandina; Royal Standard; Reliance; Madonna; Zeno; Unique; Horticulturist; Duchess of Richmond.

Six blooms by D. Haggerston, viz: Suffolk Hero; Beauty of the North; Mary Queen of Scots; Perfection; Fowler's Queen Victoria; Sulphurea Elegans.

Six blooms by Jno. A. Kenrick, viz: Beauty of Bedford; Unique; Dodd's Mary; Napoleon; Ariel; Dennisii.

Twentyfour blooms by D. McIntire, viz: Castandi; Hope; Miss A. Broadwood; Lady Bathurst; Lord Liverpool; Marshal Soult; Suffolk Hero; Fire Ball; Striata formosissima; Medona; Countess of Liverpool; Sir Robert Peel; Ne plus Ultra; Splendissimo; Clark's Julia; Bowman's Premier; Bontishall; Eva; Unique; Coronation; Rival Sussex; Middlesex Rival; Rienzi; Lord Injustly.

Twelve blooms by S. Walker, viz: Horsham Rival; Sulphurea Elegans; Fowler's Queen Victoria; Princess Victoria; Gem; Eva; Napoleon; Suffolk Hero; Duchess of Richmond; Ne plus Ultra; Unique; Bowling Green Rival.

Twelve blooms by S. Sweetser, viz: Summum Bonum; Cambridge Hero; Princess Victoria; Sesostris; Mrs Rushton; Unique; M. Edgeworth; Countess of Mansfield; Rienzi; Striata formos.; Marshal Soult; Quilled Perfection.

Six blooms by William Meller, viz: Hope; Lady Dartmouth; Quilled Perfection; Ne plus Ultra; Countess of Torrington; Countess of Mansfield.

Six blooms by William E. Carter, viz: Chandler's Magnificent; Mrs Rushton; Lady Milton; Eva; Golden Sovereign; Dodd's Mary.

The judges appointed to award the premiums on *German Asters and other annuals*, give the prizes on *Asters*, viz:

The first prize of \$5 to Hovey & Co.: the second of \$3 to J. J. Low.

*Annuals.*—The first prize of \$3 to J. Breck & Co.: the second of \$2 to Hovey & Co.

Per order,

S. WALKER, *Chairman.*

Sept. 25th, 1840.

## FINE NATIVE GRAPES.

We acknowledge the receipt of a box of fine native grapes from Mr Elias Holden, of Danvers.—We are partial to our native grapes, and think there are some varieties fully equal to the Isabella, and more sure of ripening. If they are not to be compared with the delicious foreign grapes of our green houses, they are better than none. The best varieties should be transferred to the garden and cultivated, until we can get a better sort, which we think may yet be done by planting the seeds of the best sorts, and then again from the seeds of these. In a few generations of plants, there is no doubt our own grapes may be very much improved, and perhaps made equal to any foreign variety.—Why should there not be the same chance of getting good varieties from the wilding grape as from the wild apple or pear? It will be a very important acquisition to obtain a hardy early variety of grape, which will flourish without protection and at the same time give fruit destitute of the acid, foxy taste of our wild varieties. That this may be done, we have no doubt, if we may reason from what has been done with every other species of fruit and flowers, where the experiment has been

made. To the horticulturist who has leisure, it would be an interesting experiment, and should a whole lifetime be spent in obtaining the desired object, it would be an ample remuneration, in thus giving to his country this additional luxury to the dessert. I. B.

## GRAPES.

It is believed that there are native grapes in our fields and woods, fully equal to any of the European table or wine grapes. Several individuals in Boston, have been busy in making collections of them, and have been successful beyond their most sanguine expectations. Mr Boyden, of Foxborough, has discovered a native white grape in that neighborhood, which is pronounced equal to the European Sweetwater, and can only be distinguished from it by a careful investigation. It will no doubt improve by cultivation, and if productive will be a valuable acquisition, as native grapes will need no pruning, and no protection in the winter. We found last year, among a quantity of the common wild purple grape, a few of a kind fully equal to any of the European varieties, having a thin skin, sweet, and free from the foxy taste so common to our native grapes. We made diligent inquiry for this vine, but were unable to procure it. If any of our readers find any vines furnishing superior fruit, they will do well to mark them now for transplanting early next month. The best kinds will command high prices when the good quality of the fruit becomes generally known.—*Newburyport Herald.*

## MANURE IS WEALTH.

In our intercourse with some of the farmers residing within forty or fifty miles from New York, on Long Island, we have been surprised at the instances related to us of the profitableness of farming. Some farmers, known to have labored and toiled hard, have continued yearly to fall in arrears until they have commenced buying manure. Fiftysix cents are given per earthen load at the landing, for the apparently worthless dirt swept from the street. This applied at the rate of twenty loads produces wealth. The very farmers who could not obtain a living by using only manure made on their farms, have in a very few years, not only freed their farms from incumbrances, but purchased others in addition, and are now, from the yearly profits of their farm, putting money out at interest. If then it is found so profitable to buy manure, and be at the various expenses attending the carting, how very important is it to give special attention to increasing the quantity and improving the quality of that made on the farm. There is no question but that almost every farmer can double the quantity of his domestic or yard manure, without scarcely any additional expense. It is thought too, that at least fifty per cent. of the nutritive properties of yard manure are lost by drenching of rains, excessive fermentations, and injurious application to soil. The more we consider this subject the greater does it become in importance, and justly regarded as the primary object in farming.—*N. Y. Farmer.*

The army worm must be a truly formidable scourge to the planter at the South. It is said to sweep off one hundred acres in a night, leaving neither leaves nor bolls of cotton on the stalk.—There is no possible way of arresting the legion.

From the Albany Cultivator.

#### NOTES OF A TOUR.

*Gentlemen*—In a recent tour of considerable extent and variety, in the eastern section of our country, I have met with many things to gratify the friends of agricultural improvement. Through the whole length and breadth of this favored land, the constant operations of industry, under the guidance of intelligence and taste, are clearly discernible. The rugged forests are every where disappearing, and their places supplied with green pastures, luxuriant meadows, or abundant crops; or if woodlands are still retained, the new growth of selected trees shoot up with a grace and beauty seldom found in the dense and matted masses of our native wilds. The log cabin gives place to the handsome cottage, and the slight, frail tenement of the pioneer, to the substantial farm-house or more elegant mansion of the wealthy husbandman. Nor does the career of improvement stop with the more convenient and accessible portions of the soil; every where nature is pursued in her remotest haunts, and every where subdued; and from the self-sustained luxuriant bottoms to the verdure-clad summits of the loftiest hills, the untiring energy of our Anglo-Saxon race is throughout conspicuous. The highways are made better and more direct, and the *lightning paths*, with their fierce engines glaring like meteors through the sky, convey the traveller from point to point with such rapidity, as to leave him all his time for his favorite pursuits or observations, requiring scarcely an appreciable portion of it for locomotion.

#### DRAINING.

One feature of recent improvement was peculiarly gratifying, and in it I thought I perceived the influence of what is too often sneeringly called *book farming*—a term, I venture to say, that was never sincerely used, but where stupidity or stubbornness reigned supreme. To a considerable extent, ditching and draining low lands has been practiced, and in every case with entire success. Land that before yielded scarcely a handful of coarse herbage during the season, by the expenditure of a few dollars in ditching and putting it into a state of cultivation, has been made worth 50 to \$150 per acre; for almost invariably the low swamp lands, when freed from water, are vastly the most productive. Much controversy exists as to the *mode* of draining best suited to our country, and the question yet remains unsettled. It is undoubtedly proper that the plan should vary with the situation of the land.

It would seem, on a hasty view of the subject, that the labored efforts of some well disposed persons to introduce the expensive modes adopted in Europe into our own country, are as inappropriate as if the attempt were made to introduce the paraphernalia of royalty or a church establishment into our republican institutions. Their system is *thorough underdraining*, principally with tiles or loose stones, placed at a sufficient depth to allow a coating of soil deep enough for all the operations of husbandry to be carried on as if no drains existed; and this is undoubtedly the *perfection* of draining; but the expense of this in our country would be from 50 to \$150 per acre; an outlay so excessive that we apprehend for half a century to come, it cannot be practiced here unless in the neighborhood of large cities, where land is worth from 300

to \$600 per acre for cultivation, the price of good farming lands in Europe. The system *may* be applicable and advantageous to this country, and it is much to be wished that some wealthy and patriotic individual would institute a series of scientific and practical experiments on this subject, and communicate the result, and it is possible it might be found, after all the expense, the capital would be more judiciously invested than if expended in additional land, to be cultivated in our hurried and imperfect manner. If once, however, but generally adopted, our whole career of border extension and colonization must be abandoned, and the constantly expanding wave of emigration must contract and speed its reflux force centreward again, for we have *run around* land enough on this continent already, to sustain, with proper cultivation, a nation of untold millions. Can our national taste for adventure and western emigration be checked and turned into the more sober and perhaps rational pursuits of a highly cultivated husbandry? We think not: a truce then to underdraining with us, for without the countless hordes that are yearly migrating westward, like the locusts of Egypt, we cannot pursue it to any extent.

There is much, however, we can do in this matter, and at a trifling expenditure of manual labor. And here I will mention one mode of underdraining, probably of Yankee invention, as I have never seen a description of it. It is performed in heavy clay lands, where ditches are most required, by excavating a trench, say of 12 inches wide, with perpendicular and parallel sides, to the depth of 12 inches; or if it is contemplating using a subsoil plough, to the depth of 16 inches, then from the centre of the bottom a sub-ditch is excavated, of 5 to 6 inches square. The sod taken off the entire width from the top is then inverted and placed at the bottom of the upper ditch, and becomes a durable cover when filled to the top, thus doing away with the large expense of tiles or stones.

Our system must essentially combine economy with utility, and this can be effected to a very great extent in *surface drains*. These should exist wherever water remains on the ground after rains, or when it is too much saturated with springs in the vicinity. No stagnant water should ever be allowed in a civilized country, for besides its effectual hostility to all useful vegetation, it poisons the atmosphere and becomes the prolific source of half our diseases and deaths. If a systematic course be pursued in all the operations of the farm, much draining may be effected with scarcely any additional trouble and expense. For instance, all clay and flat lands should be ploughed into narrow ridges, and every successive ploughing should be directed to make the more elevated portions higher, and the depressed ones still lower, always preserving an outlet, that the water accumulated in the last shall be carried off freely, and by this means the whole surface becomes a succession of surface drains without the expenditure of a day's labor to an acre. In many instances, however, main ditches will require to be cut for a considerable distance, to get sufficient depth and slope to carry off the water rapidly, and when the principal drain is made, the tributaries can be completed at a trifling expense, either with the plough and hoc or the spade. To illustrate my meaning, I will describe the manner of draining a piece of land I recently adopted. The lot consists of a stiff clay, running back from the Niagara river, with a gradual ascent

of not more than five or six feet for a mile. It is traversed through the whole distance with irregular undulations, but the ridges almost universally running parallel with the river. At right angles with the river and across these, I run a ditch four feet wide at the top, two feet at the bottom, and from one to three and a half feet deep, so as to preserve a uniform descent on the bottom, thus cutting transversely all these longitudinal ponds, for they were nothing else in ordinary wet seasons, and a little additional work with the spade or plough, effectually carries off all the surface water. The whole expense of this does not exceed one dollar per acre. Now let us see the profits of this operation. If this land be worth \$60 per acre, to cultivate in its original condition, and much of it has been sold at higher prices, and one fourth of it was covered with water, which was generally the case to a sufficient extent to prevent the growth of nutritious vegetation—by expending one dollar I increase the productive land by the addition of another third to the original amount, which is equivalent to increasing the value of the investment one third of \$60, which gives me \$20 gain for one expended.

I have seen an acre of marsh grown up with rushes and cat tails, that could be drained by one man's labor in two hours, and when done, it would be worth any two acres on the farm, and yet to this moment it has not got into the brain of the owner or a dozen of his intellectual predecessors, that this could or ought to be done; and it may have been the cause of half the diseases in the neighborhood for two centuries! These men have never been troubled with *book farming*—nor did they ever take the Cultivator: from such noddles, and such only, are we ever to look for hostility to either.

#### CATTLE, SHEEP AND SWINE.

In stock, I was glad to notice considerable improvement. Through New England there seems to be little difference in their herds for the last 20 years, except in the gradual improvement of their native cattle. And it is possible, after all, that our Yankee kindred may be mainly right as to *breed*. The accidental circumstance of the port for the embarkation of our pilgrim forefathers to their future varied and picturesque abode, happily afforded them a convenient source of supply from the herds of fine Devons that abound in the neighborhood of Plymouth, (England) and from them, with more or less admixture, have descended the present extensive herds of the eastern States. These animals, though habituated to a warm climate, which was but a temporary inconvenience, are entirely suited to the character of the country they were destined to inhabit: their smaller body, longer and sinewy legs, and especially their great susceptibility of taking on flesh, rendered them easy and profitable feeders, and their extreme richness of milk, superior working and excellence of beef, has justly made them a favorite breed to the present day. They do not give the extent of product on the same number of legs as the Short Horn, the Herefords, and some others; but if they yield as much or more for the quantity of attention and feed consumed, they answer all the ends required by the intelligent herdsman. The native cattle have, to a slight extent, been crossed with new importation of Devons, improved Short Horns and Ayrshires, but this has only been done to a limited degree, and with great carelessness; for on personal inquiry I have found that some of the most intelligent and liberal

mindful citizens, hitherto instrumental in procuring these animals from abroad, have not now a single pure blooded animal in their herds. There is the grand fault with our Yankee breeders, the total neglect of pedigree and purity of blood, for unfortunately their ancestors, in abjuring a hereditary nobility and the rights of primogeniture, carried their reform from the biped to the quadruped, and made genuine democrats of the whole race.

The principle of placing every man on his own merits, is undoubtedly a good one, though it may be controverting the authority of an omniscient providence to deny that the son of wise and virtuous parentage, is not more to be relied on, other things being equal, than the child of ignorance and sin; but in the animal economy there is none of that human dependence on ancestry, for no truth has been more fully established as a general rule, than that "like produces like." We must, then, in accordance with this principle, look for capacity in producing good animals, not only to what the individual under consideration is in itself, but also to what its ancestry has been on both sides for generations, as characters they faintly exhibited, or scarcely discernible in an individual, may, from its long inheritance be so grafted with the constitution, as to be reproduced in successive generations to a great degree.

In swine a considerable improvement has taken place, so far as a cursory view would enable me to judge: their legs and snouts have been shortened; their ears set up and trimmed off; their backs become broader, and a portion of their bristles put on the other side of their skin and converted into good pork, and the *toute ensemble* of the grunting tribe has been very perceptibly bettered. And this improvement, so far as my observation extended, has invariably been the result of the infusion of a large portion of the Berkshire or China blood. This origin was generally sufficiently obvious at the first glance, but in one instance where very fine pigs were shown me, with a long body, broad back, and sustained through the whole length, and terminating in a finely rounded ham; thin hair and no bristles; large of their age and kind feeders, yet entirely white, I was struck with the perfection of their form, and thought if rivals were to be found for the Berkshires, they were then before me; but looking a little farther on the same premises, I saw a fine, pure Berkshire sow, which on inquiry, proved to be the dam of the perfect pigs; the mystery was at once solved; they had embodied all their superiority from the female ancestry. There was another superior lot of pigs I saw at the Worcester hospital, produced from successive crosses of the China on the Bedford, which the intelligent head of that well conducted and magnificent establishment informed me, with ordinary keep, usually gained one pound per day for the first twelve months, at which age they are slaughtered. Their great size they get from the Bedford, and their great thrift from the China. The truth is, that the Berkshire and the China are the perfection of the hog kind; and these perfections have been so thoroughly bred into them for successive generations, that they impart a much larger share of improvement in a cross than any other, and perpetuate it through a remote posterity.

But on the subject of stock, as that of drains, it is too generally the case that our farmers are "penny wise and pound foolish;" they object to the first cost, when in both instances they would frequently be repaid the first year, and have their in-

vestment left as capital, yielding a large income annually thereafter. It is to be hoped the prevailing spirit of the age, whose every aspiration is onward, onward, will not fail to inspire them with a just appreciation of their true interests.

Very respectfully, yours,  
Buffalo, N. Y. R. L. ALLEN.

#### THE DURHAM COW "BLOSSOM."

Observing in the Pennsylvania Inquirer a short time since, a statement of Mr J. Gowen's celebrated cow *Dairy Maid's* yield of milk for one week, which he states is "unprecedented, being on an average rather over 33 1-2 quarts per day," I concluded to try my cow *Blossom*, a statement of whose milking for one week you will find below, and by which you will perceive she averaged for the week over 35 quarts per day, and yielded 13 1-4 pounds of well worked butter. Not having a spring house we are obliged to keep our milk in a cellar, which at this season of the year every one acquainted with the process of butter making knows would be unfavorable for a large yield. My dairy maid is firm in the belief that at a cooler season, or with a spring-house, the cream she had from *Blossom* for the week would have yielded 15 or 16 lbs. of butter.

Uncommon as this produce may be, I do not consider it more so than the fact of her having never been dry since she had her first calf, more than two years ago, and in the space of 25 months has produced five living calves, viz: on the 5th of April, 1838, she had her first calf (Delaware); on the 4th of July, 1839, she had twins (Liberty and Independence); and on the 16th of May, 1840, she had twins again (Romeo and Juliet); and I think I can safely say that during the whole of that time she has averaged full 20 quarts per day: she gave 25 quarts per day with her first calf, and made nearly 12 lbs. of butter per week.

As I consider it an injury both to the cow and calf to milk up to calving, we tried both last year and this to get her dry a few weeks before the time, but found it impossible, although we kept her off of grass for some days.

As you may suppose, such constant milking keeps her very much reduced: if she could be got dry for a time, so as to gain flesh, I think her yield would be much greater, but I am satisfied with it for the present, and until I see it beaten; when that is done I will try again, for the credit of little Delaware.

*Blossom* is a thorough-bred Short-Horned Durham, roan color, calved in 1835, bred by Charles Henry Hall, Esq., of New York, of whom I purchased her when two years old; she was got by *For's Regent*, dam the imported cow *Leonora*, (a great milker) by a son of *Lancaster*, &c.

Very respectfully,  
Woodside, June 29, 1840. SAM'L CANBY.

#### *Blossom's Yield of Milk for one Week.*

Being on average over 35 quarts per day.—*Delaware Jour.*

#### WATERMELONS.

If the facts connected with the culture and product of watermelons in this town, the present season, could be collected, we believe it would astonish the reader. On the sand plain, a little east of Mr Henry Sern's house, on land not sufficient, it was supposed, to bring white beans to maturity, Mr John M. Hendrick has a watermelon patch of between five and six acres, comprising about 2000 hills. He only manured the ground in the hill. It is about three weeks since he began to pick them, yet there are great quantities still unripe, and the vines are in blossom. The yield is almost incredible. From two seeds were raised five melons, two of 32 lbs. each, two of 27 lbs. each, and one of 16 lbs.; making 134 lbs. On the 28th inst., he picked about seven tons. The whole yield of the patch he thinks will average 75 lbs. to the hill. He has picked a number which weighed from 30 to 40 lbs. and he had one which weighed over 40 lbs. That the melons are of prime quality, we have had opportunity to know. Mr Hendrick has sold as fast as they became ripe. He has a log cabin on the field, where parties can enjoy a feast of the fruit. Mr Lombard and Mr Dart, at the south end of the town, have also raised large quantities—but we are not possessed of any facts in relation to them.—*Springfield Republican.*

#### PERIOD OF GESTATION IN COWS.

One of the most satisfactory experiments relating to the subject on record, is the one made by Earl Spencer, and the particulars of which are given in the second number of the English Agricultural Society's Journal.

The table given contains the results in the case of seven hundred and sixtyfour cows, and the following statements abridged from the paper, will exhibit some of the most important of the details:

*First.* It appears that the period of gestation varied from 220 days to 313 days; or no less than 90 days. Lord Spencer was, however, unable to rear any calves produced under 242 days. All under 260 days and over 300, he thinks are decidedly premature, or irregular.

*Second.* As 314 cows calved before the 284th day, and 310 after the 285th day, the average period of gestation must be considered as between 284 and 285 days; although the time stated in the work on cattle by the London Society, states it at 270 days.

*Third.* It appears, that omitting those considered as premature or irregular, the cows whose period of gestation did not exceed 286 days, produced 233 cow calves, and of bull calves 234; while from those whose period exceeded 286 days, the cow calves were only 90, and the number of bull calves was 152. This certainly gives some support to the opinion so prevalent among farmers, that when a cow exceeds the usual time, the produce will be a bull calf.

*Fourth.* There were 7 cases of twin cow calves; 5 cases of twin bull calves; and 11 cases of twin cow and bull calves. Earl Spencer has never had a case in which the sexes were different, in which the heifer was a breeding one; they have uniformly been what are termed *free martins*. The cattle of which the above record has been kept, are the pure improved Short Horn Breed, and one of the finest herds in Great Britain.—*Albany Cult.*

Treat your brutes like men.

## NEW ENGLAND FARMER, AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, SEPT. 30, 1840.

### BANKS AND THE CREDIT SYSTEM.

Having spoken of the abuses of banks, we now proceed to say something of the abuses of credit. Credit is a most important element in every commercial community. It is difficult to see how the business of life can be carried on without it. Where the arts of life have made any progress, the division of labor is not only convenient but essential; and it will become more complete in proportion as society becomes more civilized and improved. Hence the necessity we are under of serving each other; and of one man's being able to command the services of others. Many of the operations of life in the arts and in all business concerns, require time for their accomplishment. We apply the labor and must wait the return. Every voyage must be considered as a system of credit. Every agricultural operation is, in a certain sense, an operation of credit. We invest our money and our labor with a view to a return at some future day. But then it is obvious that the capital or labor must be invested or there can be no return. No man expects a harvest without sowing the seed.

In business life, as we have said, credit is indispensable. It is power—the power of action, of improvement, of success, of wealth; without which the poor man would with extreme difficulty rise above his poverty; and unless we abolish all the present relations of property, would find the road to wealth and even to subsistence toilsome and discouraging. A young man with a disposition to labor and habits of industry, having acquired a trade, comes of age without a dollar. He wants a shop, tools, materials for his work, and subsistence until he can manufacture the articles of his trade, so as to obtain a return for his labor; and these he must obtain on credit, or he cannot obtain them at all. An enterprising young man, devoted to agriculture, wishes to obtain a farm. He must have implements, seed, manure, and stock. Now if all these are to be paid for before he can obtain them, in most parts of our country his case would be, if not hopeless, extremely discouraging. But if he can obtain such an establishment upon a reasonable credit, his industry and good management, stimulated by this very debt, will in due time enable him to become the freehold possessor of the farm. So likewise in almost every branch of business, men require other capital than their labor to render that labor effectual.

We might illustrate this subject much more fully, but the value and utility of a well regulated credit are too obvious. It is an immense advantage to any business community and especially to a young community, to have an accumulation of capital of which to avail themselves for use, for production, for improvement; and it would be the same as if it did not exist, if the possessors of this surplus accumulation were in any respect forbidden or prevented from using or loaning it. We are much in the habit of looking upon a creditor, a capitalist, a lender of money with disrespect or hostility. But why should it be so? If he abuses his power to purposes of oppression, if he violates the law by the exacting of enormous or usurious interest, if he takes severe or cruel advantage of the necessities of the distressed, he may justly be blamed and condemned. But if, on the other hand, he is ready to loan his money for the benefit of the community, and takes no improper advantage, he is most justly entitled to a fair, certainly to a legal compensation for its use, and is to be regarded as a benefactor to the community. Nothing can be more absurd than the clamor often raised against the introduc-

tion of foreign capital into the country and the consequent amount of interest money we are obliged to pay for it. No honest man can for a moment object to payment for the use of this capital. The borrowing is of our own choice, and every reflecting mind must perceive of what great advantage, under proper use and management, it may be made to our young and growing country.

Of the abuses, or we may say, the bad uses of credit, we shall say little. It is a great error to suppose that we cannot have too much credit or too much capital. We have always too much when we have more than we can apply to legitimate and useful purposes; and are thus tempted to undertake hazardous and extravagant enterprises and speculations. We have had some lessons on this subject which ought not to be forgotten. In 1836, when the country was deluged with bank issues, individuals instead of making application for loans were importuned to borrow; and we have been credibly informed that such was the eagerness of some banks (since of course defunct) to loan their money, that their notes were left at grocer's stores in some parts of the city, in order to find customers. Indeed, it was the object of the banks, as far as possible, to extend their issues, and this of course induced them to discount far beyond the limits of safety; and the natural consequence was loss and ruin, often to both parties, the borrowers and the lenders. The loss and ruin however, in many cases to these parties were merely nominal. Such banks having been established without actual capital, and the borrowers being in general equally destitute, by the failure of the banks or of their enterprises, they were in no worse condition than when they began their operations; but the loss fell upon those who held the bills, who had received them for other property, or for their labor; and upon them it operated as a serious fraud.

Two great evils come from a redundancy of borrowed capital in the community, or in other words, from too great facilities and an excess of credit. The evils are not limited to two; but we shall on this occasion point only to two as the most prominent. The first is the waste of money. There is a delusion liable to creep upon and obscure the strongest minds; and that is the belief that borrowed money is our own. We spend it therefore, as if it were not to be returned; upon our own accommodation, upon dress, furniture, matters of mere ornament and embellishment, in pleasure and luxury. In this case it is never returned. We throw it overboard and cannot fish it up again. We may sometimes bring the fragments to the surface; but it serves only to demonstrate the irretrievableness of our loss. It is like water spilt upon the ground. But pay day never drops out of the calendar. It comes round much sooner than we expect; and under these circumstances hundreds and thousands find themselves bankrupt. They have lost not only the borrowed money, but any other little property which they had when they contracted the debt, has become now involved, and perhaps is insufficient to liquidate it. We have portrayed no fictitious case; but cases with which our community abounds. Credit, under such circumstances, proves a bitter curse.

The second evil that springs from a redundancy of borrowed capital or facilities of credit, is the offering of inducements to speculation and to enterprises of hazard. Speculation, in general, deserves no other name than gambling. It is adventuring property upon contingencies which human sagacity cannot foresee, nor human power control. If the event is certain, and just in proportion as it is certain, it ceases to be speculation. Uncertainty appertains to every thing that is human. Every voyage at sea, every spring sowing and planting is, in a certain degree, a speculation. But the hazards

here encountered are incidental to our nature and condition, and we cannot escape them. Speculation, properly so called, is operating upon hazards, uncertainties, chances, contingencies, which are not matters of any exact calculation; and which, though not always as uncertain as the cast of a die, yet in general may be regarded as of equally doubtful result. Into such risks men are always likely to be led, whenever they can find the means of engaging in them. The passion for adventure, springing from self conceit, and an almost mysterious confidence in our own success and good luck, finds easy admission into every bosom, and when enkindled and nourished burns with an almost unquenchable flame. Men in possession of money, which has not been earned by labor, will rush into any hazard; and the history of the years 1836 and '37 shows into what frenzy the mind of the whole community may be driven, under an extraordinary accession of the means of indulgence. Fortunes were made in a day. A fictitious and exaggerated value was attached to every thing susceptible of traffic. The most extravagant enterprises were entered upon; the most enormous luxuries indulged in, until presently the reaction came in all its bitterness; and the *delirium tremens* at last passed off, leaving the social body wasted, exhausted, and with difficulty capable of resuscitation.

We have little more to add in this case; but that little must wait a more convenient occasion. H. C.

**CORRECTION.** In our second number we stated that before a bank could go into operation, two thirds of the capital stock must be *bona fide* paid in, to remain as part of its capital or for the use of the bank. In the situation in which the article was written, the laws of Massachusetts were not accessible. This must be our apology for stating "two thirds" instead of "not less than one half," which the law provides. We are always anxious to be precise and true; but the error in this case does not affect the argument nor the principle. In the original law incorporating the Massachusetts Bank, it is said, this is to be "held as security against any demand which may be made against the bank." In the general banking law of the State, it is provided that it shall remain as part of the capital of the bank. H. C.

### CATTLE SHOWS AND FAIRS.

The Cattle Shows at Pittsfield and Northampton are to be held on the 7th and 8th days of October. The address at Pittsfield to be delivered by that eminent friend of horticultural and agricultural improvement, Henry A. S. Dearborn, Esq., of Roxbury. The address at Northampton has been expected from Hon. D. Webster.

The Essex Agricultural Show takes place at Georgetown on the 30th of Sept. The address will be given by Asabel Huntington, Esq., of Salem.

The Worcester Agricultural Show takes place on the 13th and 14th of October. The trial of ploughs is to be made on the 13th inst. under the supervision of a Committee of the Massachusetts Agricultural Society. It is announced that one hundred dollars will be given as a premium for the plough best suited to lay the furrow slice flat; and seventy-five dollars for the plough best adapted to lay the furrow slice at an oblique angle, or as it is commonly termed, lapping. The competition is open to the whole country.

Two addresses are announced to be given at Worcester at the Cattle Show; one by Hon. Daniel Webster, of the U. S. Senate, and one by Hon. Isaac Hill, ex-Governor of New Hampshire. "Speed the plough." Worcester Cattle Shows have been always remarkable for their show of bipeds; and when two such Belgian giants in agriculture are to show what they can do in running a furrow or mowing a sward, what farmer, who can be, will not find an irresistible attraction, to be present.

The town agricultural Show and celebration of Westboro' and its vicinity, under the auspices of some as devoted friends to agricultural improvement as the State contains, will be held on the 7th of October. Our friend Breck has consented to address them on the occasion; and therefore we promise, without meaning

that he shall hear of it, a box of ripe and delicious fruit crowned with a charming bouquet of flowers.

The Windham County Agricultural Society, Conn., hold a Cattle Show at Norwich on the 8th inst.

The Middlesex Society's Cattle Show and Fair will be holden at Concord, on the 7th of October. Mr Hoar, son of Hon. S. Hoar, is expected to deliver the address.

The Plymouth County Cattle Show and Fair will take place at Bridgewater, Oct. 7th. Rev. Mr Ward, of Abington, will deliver the address.

We are not in a situation from authentic sources to complete our list. The Pawtucket, R. I., New Haven, Conn., Keene, N. H. Societies all hold their anniversary shows the ensuing month. Our only regret is, that the coincidence of several of the appointments prevents our attendance at all within the State, and our acceptance of invitations with which we have been honored from other States.

The American Institute opens its magnificent display of manufactures and improvements in the mechanic arts the first week in October; and it will be continued to the middle of the month. A ploughing match or trial of ploughs, and a show and sale of improved Short Horn cattle and sheep will take place at the same time, under the auspices of the public-spirited managers.

It is delightful to contemplate these appointments, whose object and effect must be good and good only. It will be particularly refreshing in this season of universal gatherings, to get rid at least for one or two days, of the abouts of party fervor and the banners of political triumph; and to riot in the unstinted bounties of Divine Providence, without a single feeling but that of universal good will, of emulation in which no malignity can mingle; and of religious gratitude that our lines are cast in a spot than which the sun sheds its rays upon none more favored or happier.

H. C.

Want of space compels us to omit notices of the Horticultural exhibition and the Monument Fair.

**BRIGHTON MARKET.—MONDAY, Sept. 28, 1840.**  
Reported for the New England Farmer.

At Market 675 Beef Cattle, 330 Stores, 3500 Sheep, and 1160 Swine.

Prices.—Beef Cattle.—A small advance was effected from last week. We quote First quality, \$5 75 a \$6 00. Second \$5 25 a \$5 50. Third quality, \$4 00 a 5 00.

Stores.—Yearlings, \$8 a \$11. Two Year Old \$14 a \$18. Three Year Old, \$22 a \$28.

Sheep—Sales quick. Lots \$1 33 \$1 50, \$1 71, \$2 00, \$2 25, \$2 50, and \$2 75.

Pigs—Lots to peddle were sold at 3 and 3 1-4 for sows, and 4 and 4 1-4 for barrows. A lot at 2 3 4 and 3 3-4, and a lot extra at 3 3-8 and 4 3-8. At retail from 4 to 5 1-2.

**FRUIT AND ORNAMENTAL TREES.**

Gentlemen at a distance, wishing to purchase trees, are informed that we will select from the following nurseries Fruit and Ornamental Trees, Plants and Shrubs of every description that may be desired, and pay particular attention to their packing, and forward them to any part of the country.

- From Messrs Winships', Brighton
- William Kenrick's, Newton
- John A. Kenrick's, Do.
- S. & G. Hyde, Do.
- Samuel Pood, Cambridgeport.
- Botanic Garden, Cambridge.
- Robert Manning, Salem
- J. L. L. F. Warren, Brighton.
- Breck & Co., Brighton.

The present is the best time, to transplant all hardy trees and shrubs.

Orders will be received for Plum, Pear and other Stocks, Hedge Plants, &c.

**FRESH GARDEN SEEDS.**

We would inform our customers and friends that we are now receiving our supply of fresh Garden Seeds, most of which have been raised under our own inspection, from fine selected roots; which we warrant to be of the purest quality of the growth of the present season.

Agricultural Books.  
Agricultural Implements.  
Seed and Implement Catalogues sent to all applicants gratis, and all orders promptly attended to.

JOSEPH BRECK & CO.

Boston, Sept. 29, 1840.

The Lowell Journal, Worcester Spy, New Bedford Mercury, Yeoman's Gazette, Northampton Courier, Providence Journal, Norwich Aurora, Essex Banner, Springfield Republican are requested to insert the above 4 times.

**IMPROVED VEGETABLE STEAMER.**

Just received at the N. E. Agricultural Warehouse and Seed Store, Dr Warren's Patent Cylinder Vegetable Steamer, for steaming all kinds of vegetables for Swine, Cattle, &c. in large or small quantities. It can likewise be used for family purposes

- A, the pipe for filling the boiler with water.
- B, safety valve for letting off extra steam, in case the pressure should get too high.
- C, steam pipe passing from boiler to cask
- D, pipe to supply the boiler with water from a cask or box which is to be placed in such manner as to keep the boiler about two thirds full of water at all times, which answers as a complete self-regulator for supplying the boiler with water.

The above cut is not a true representation of the boiler, as it appears at least one half larger than it really is, in proportion to the cask. The boiler is merely a small size cylinder stove, with the fire inside, and surrounded by a sheet of water from which passes a steam pipe to the barrel or box, the cask or box can be removed so as to discharge the vegetables without any alteration of the boiler or steam pipe.

The steamer can be removed from place to place without any difficulty. Wood or coal can be used, and a few cents worth of either will steam a large quantity of vegetables. A number of them have been in operation, and found to give universal satisfaction.

Farmers and others are invited to call at our Warehouse and examine the article, which they will find to be a very neat and cheap apparatus for the purpose. Price \$12, and with handles \$13.

JOSEPH BRECK & CO.

No. 51 and 52 North Market street, Boston.

September 30.

**BRIDGEWATER CATTLE SHOW.**

The Plymouth County Agricultural Society will hold its Anniversary for Cattle Show and Exhibition, at Bridgewater on Wednesday, the 7th day of October next. The Trustees will meet at the Academy at 8 o'clock, A. M. for transacting business, and at 9 o'clock the members of the Society will assemble at the same place for the election of officers, &c. After which they will proceed in order to the Dining Hall, at Holmes & Eaton's Hotel, and from thence, after refreshments, to the Rev. Mr Doggett's Meeting House, where an Address will be delivered by the Rev. Mr Ward, of Abington.

Immediately after the exercises in the Church, the Reports of the several Committees will be made, and the premiums awarded.

The members of the Society will be furnished with Tickets for the Dinner, at the meeting for the choice of officers.

The Academy Hall will be open for the reception of Manufacturers, Articles of the Dairy, &c., the day previous to the exhibition; and all articles intended for premium must be presented before 9 o'clock on the day of Exhibition.

The Committees for awarding Premiums are particularly requested to be present at an early hour.

Per order: ABRAM WASHEURN 2d,  
Chairman of Committee of Arrangements.  
Bridgewater, Sept. 18, 1840.

**PREMIUM ON PLOUGHS.**

The Trustees of the Massachusetts Society for Promoting Agriculture, having stated, in their offer of premiums for the best Ploughs that notice would be given of the time and place, at which the Committee would be ready to prove the ploughs; they do hereby give notice, that the Committee will be prepared with land and oxen, and will attend to the duties assigned them, at Worcester, on TUESDAY, the 13th day of October next, at 10 o'clock, A. M.

Per order: BENJ. GUILD, Sec'y.  
Boston, Sept. 30, 1840.

**WHOLESALE PRICES CURRENT.**

## MISCELLANEOUS.

## AN INSTRUCTIVE SKETCH.

BY MRS SIGOURNEY.

It is the duty of mothers to sustain the reverses of fortune. Frequent and sudden as they have been to our country, it is important that young females should possess some employment, by which they might obtain a livelihood in case they should be reduced to the necessity of supporting themselves. When families are unexpectedly reduced from affluence to poverty, how pitiful and contemptible it is, to see the mother desponding or helpless and permitting her daughters to embarrass those whom it is their duty to assist and cheer.

"I have lost my whole fortune," said a merchant as he returned one evening to his home; "we can no longer keep our carriage; we must leave this large house. Yesterday I was a rich man. Today there is nothing I can call my own."

"Dear husband," said the wife, "we are still rich in each other and our children. Money may pass away, but God has given us a better treasure in those active hands and loving hearts."

"Dear father," said the children, "do not look so sober. We will help you to get a living."

"What can you do, poor thing?" said he.

"You shall see, you shall see," answered several cheerful voices. "It is a pity if we have been to school for nothing. How can the father of eight children be poor, when we can work and make you rich again?"

"I shall help," said the youngest girl, hardly four years old. "I will not have any new things bought, and I shall sell my great doll."

The heart of the husband and father, which had sunk within his bosom like a stone, was lifted up. The sweet enthusiasm of the scene cheered him, and his nightly prayer was like a song of praise.

He left his stately house: the servants were dismissed: pictures and plate, rich carpets and furniture were sold, and she who had long been the mistress of the mansion, shed no tear. "Pay every debt," said she, "let no one suffer through us, and we may yet be happy."

He rented a neat cottage and a small piece of ground a few miles from the city. With the aid of his sons he cultivated vegetables for market. He viewed with delight and astonishment the economy of his wife, nurtured as she had been in wealth, and the efficiency which his daughters soon acquired under her training.

The eldest one assisted her in the work of the household, and also assisted the younger children. Besides, they executed various works which they had learned as accomplishments, but which they found could be disposed of to advantage. They embroidered with taste some of the ornamental parts of female apparel, which were readily sold to a merchant in the city.

They cultivated flowers, and sent bouquets to market in the cart that conveyed the vegetables: they executed plain needle work. Every one was like a bee hive.

"I never enjoyed such health before," said the father.

"And I never was so happy before," said the mother.

"We never knew how many things we could do when we lived in the great house," said the children; "and we love each other a great deal better here. You call us your little bees."

"Yes," replied the father, "and you make just such honey as the heart loves to feed on."

Economy as well as industry was strictly observed—nothing was wasted. Nothing unnecessary was purchased. The eldest daughter became assistant teacher in a distinguished female seminary, and the second took her place as instructress to the family.

The little dwelling, which had always been kept neat, they were soon able to beautify. Its construction was improved, and the vines and flowering trees were replanted around it. The merchant was happier under his woodbine covered porch, in a summer's evening, than he had been in the showy drawing room.

"We are now thriving and prosperous," said he; "shall we now return to the city?"

"Oh no, no," was the unanimous reply.

"Let us remain," said the wife, "where we have found health and contentment."

"Father," said the youngest, "all we children hope you are not agoing to be rich again; for then," she added, "we little ones were shut up in the nursery, and did not see much of you or mother. Now we all live together, and sister, who loves us, teaches us, and we learn to be industrious and useful. We were none of us happy when we were rich, and did not work. So father, please not be a rich man any more."

*To produce light by friction.*—This may be done by rubbing two pieces of fine loaf sugar together in the dark; but in a much greater degree by two pieces of silex or quartz. By this means one may distinguish the time by a watch; but what is more surprising, the effect is produced equally strong, by rubbing the pieces of quartz together under water.

## Brighton Nurseries and Gardens. For Sale

A large quantity of superior European and American Ornamental Trees, well calculated for public places, or private grounds, with Fruit Trees embracing a great variety of the most approved kinds and fine sizes. The trees, and all other productions can now be selected and marked, and will be forwarded to any place as soon as it will answer to remove the same.

Also, forty kinds of Strawberry Plants, of the most approved European and American varieties.

Orders may be forwarded via. mail, addressed Messrs. WINSHIP, Brighton, Mass., or left with Messrs. JOSEPH BRECK & CO. Brighton, August 12.

## HYACINTHS.

The subscribers have received a large assortment of Double and Single Hyacinths of every color and shade. Also, Tulips of mixed sorts, Crown Imperials, and Lilies; they have also at their garden all the fine varieties of Pæonies, which will be furnished at one day's notice. Lilies and Pæonies, and Crown Imperials, should be planted in August or the first of September. We shall receive a great variety of Bulbous Roots, from Holland, in a few weeks, when notice will be given. JOSEPH BRECK & CO.

August 26.

## GARDENERS' KNIVES.

JOSEPH BRECK & CO. have this season imported and now offer for sale a few very superior Garden Knives, for pruning, &c. manufactured expressly for Gardeners, and warranted superior to any article of the kind before imported.

Also—a large assortment of Budding Knives, Grape Scissors, &c. &c.

April 22.

## TRACE CHAINS.

Just received, direct from the English manufacturers, 8 casks of Trace Chains, from 6 to 11 feet long, suitable for ploughing or draft chains. JOSEPH BRECK & CO.

## FRUIT AND ORNAMENTAL TREES, &amp;c.

Fruit Trees of all the different species—of the most celebrated kinds. These include Pears, Plums, Apples, Quinces, &c.—the trees of the Peach and Cherry, especially, are of the finest size, and in numbers abounding at this time, and of varieties unsurpassed. The Catalogue of Fruit and Ornamental Trees and Shrubs, Roses and Herbaceous Flowering Plants, will be sent to all who apply: in that Catalogue many of the very best kinds of fruits, so far as proved, are particularly designated by a star.

Also, Grape Vines, Raspberries, Strawberries, Gooseberries, and Mulberries for silk—Scotch Larch, Lindens, Sycamores, Silver Firs, Willows, Elms—Honeysuckles, Dahlias, splendid Pæonies, &c. &c. Trees when so ordered, will be securely packed for transportation to distant places, and all orders promptly executed by

WILLIAM KENRICK.

Nonantum Hill, Newton, near Boston, Sept. 9, 1840.  
ep1D1

## BONE MANURE

The subscriber informs his friends and the public, that after ten years experience, he is fully convinced that ground bones form the most powerful stimulant that can be applied to the earth as a manure.

Orders for Bone Manure or Oyster Shell Lime, left at the Bone Mill, near Tremont road, in Roxbury, at the New England Agricultural Warehouse and Seed Store, No 52 North Market Street, or through the Post Office will meet with prompt attention.

March 4, 1840.

NAHUM WARD.

## HORTICULTURAL TOOL CHESTS

Containing a complete set of Garden tools of superior finish and style, recently received from Liverpool and for sale at the New England Agricultural Warehouse and Seed Store, May 6.

JOSEPH BRECK & CO.

## PATENT SPRING BALANCE.

A few of those very convenient spring balances, for family use, a very simple contrivance for weighing small articles. JOSEPH BRECK & CO. No. 51 and 52 North Market Street, Boston.

July 15.

## FENCE CHAINS.

Just received from England, at the New England Agricultural Warehouse, 6 casks chains, suitable for making the chain fence, &c.

JOSEPH BRECK & CO.

July 15.

## BERKSHIRE HOGS.

The subscribers offer for sale a few pair of full blooded Berkshire Hogs; also, pigs 7-8 blood, crossed with Mackay. Inquire at the New England Farmer office, or at their farm at Brighton.

JOSEPH BRECK & CO.

July 9.

## MASSACHUSETTS HORTICULTURAL SOCIETY.

## NOTICE.

The Annual Meeting of the MASSACHUSETTS HORTICULTURAL SOCIETY, will be held at their Rooms, No 23 Tremont Row, on SATURDAY, the 3d of October next, at 11 o'clock, A. M. for the choice of officers for the year ensuing, viz. a President, four Vice Presidents, a Treasurer, a Corresponding Secretary, a Recording Secretary, a Council, an Executive Committee, and Standing Committees on Fruits, Flowers, Vegetables, the Synonyms of Fruits, the Library, and Finance.

E. M. RICHARDS, Rec. Sec'ry.

Sept. 23, 1840.

2p

## TIE UP CHAINS.

Just received at the New England Agricultural Warehouse, a good supply of those celebrated Chains for tying up cattle. These chains, introduced by E. H. Derby, Esq. of Salem, and Col. Jacques, of Charlestown, for the purpose of securing cattle to the stall, are found to be the safest and most convenient mode of fastening cows and oxen to the stanchion. They consist of a chain which passes round the animal's neck, and by a ring attached to the stall, plays freely up and down, and leaves the animal at liberty to lie down or rise at pleasure, and keeps him perfectly secure.

July 15.

JOSEPH BRECK & CO.

## THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at \$3 per annum payable at the end of the year—but those who pay within sixty days from the time of subscribing are entitled to a reduction of 50 cents.

TITTLE, DENNETT AND CHISHOLM, PRINTERS  
17 SCHOOL STREET, BOSTON

N. E. FARMER.

For the New England Farmer.

### BOOK FARMING.

The advantages of the farmer's study of scientific works, and of his attention to those branches of general knowledge which bear on his profession, cannot be too strongly nor too frequently urged. Once it was considered quite inconsistent with his practical good sense, should he give heed to the hints and theories of those works which pertain to the analysis of matter, or which treat of the component parts of the material on which his labors are spent, or which let him into the secrets of nature, with which his own pursuits are intimately connected. Such studies and the experiments to which they lead were derided, and it is to be regretted that this prejudice yet lingers among us. *Book farmers*, as they are sneeringly called, are yet too scarce. Yet why, let us ask, should the agriculturist be intuitively possessed of knowledge in the successful pursuit of his labors, to a greater degree than obtains with any other individual? Do we find that any occupation of life has never received from the advances of science and knowledge a proportionate benefit? How can he, to whom the earth shall yield its wondrous increase, be enabled to say to it, give me the entire compensation for my labors, without the experience of those who have preceded him in those same labors? The simplest farmer then, is indebted if not to books, yet to the material and stuff of which these despised books are made. The very compost he uses in the shape of manure from his barn yard, experience had to tell him was necessary to his culture. And if stern necessity obliges him to have constant recourse to the study of the operations of nature in his own experience, where can be the danger or the harm of employing the experience of a higher character, which the various works of modern science have put into his hands?

It has been much the fashion, Mr Editor, to laud the pursuits of farming, and unlike most fashions, this is an excellent one. But we should not forget, that while farming was the first occupation of man, yet it is dependant on every other pursuit for its success. To sink it to the level of its primitive condition, by denying it all the means which Providence and the energies of the mind have furnished, will most assuredly bring it speedily into contempt. Every thing else has gone on progressively, and why should this, the most curious and wonderful in its details and end, be an exception? We could wish that every young man in our country villages destined for this occupation, was enabled to receive that education by which he should become the intelligent and inquiring culturist. Then would agriculture rise to the rank to which it was destined, and the barren rocks and wildernesses of our country would blossom like the rose.

Modern researches have demonstrated the capability of every natural soil, however unpropitious to appearance, of producing in abundance some

useful vegetable. Acres of waste land might be thus rendered productive, and increased agricultural means would necessarily promote increased prosperity.

Around me are farms of wide extent and of impoverished condition. And why impoverished? Because, first, too much has been hitherto tilled, and, second, because the old-fashioned culture has been pursued. A little book farming, I am certain, would remedy this evil in no slight degree. Why were those old rye fields suffered to become moving deserts, threatening destruction by their drifting sands? For years scarcely the value of the seed was their crop. A little book knowledge would have taught my neighbors a better course of culture, and now when it is too late, or their means are diminished, they begin to see the evil of their ways. Who would have thought, before the times of book farming, of a single farmer's realizing from his orchard some fifteen hundred dollars in the sale, not of the old fashion and almost worse than useless *cider*, but of first rate and delicious apples for the table. From whence came these varieties of fruit, yes and of grain, but from the researches of book-makers, and whence their produce, but from the book farmers. Let then no heed be given to the vulgar sneers of the ignorant in such matters, or of the prejudiced and willfully blind. Thanks to Providence that we live in the age of books and learning, and that the human mind is busily employed in these pursuits which will tend to the benefit, not of individuals, but of mankind.

The writer, though no farmer in practice, yet esteems himself, (and perhaps this is his vanity,) no idle or careless *looker-on* the pursuits of the agricultural interests. To no class of his fellow citizens does he accord a more hearty respect, and for their progress and success no one wishes more. Persuaded of the intimate connection of every branch of science with their pursuits, he anticipates a new era in the cause of agriculture, when the prejudices and errors of the past shall be swept away.

### THE TREATMENT OF SICK ANIMALS.

There are so many erroneous notions prevalent in the community respecting injured or diseased domestic animals, and such unnatural and injurious practices as a consequence of these incorrect views, that no apology is necessary for an attempt to subserve the cause and interests of these useful creatures, who, if they had tongues to speak, would tell sad tales of the wrongs to which they have been, and still are, too often subjected.

We do not propose to give an essay on the particular cases that require attention—our object is rather very briefly to ask the owners of domestic animals to be guided by a few correct principles, which are applicable to nearly all cases, and which will at least prevent our doing harm where we are not able to effect much good.

In the first place, then, we would insist, that when an animal is well he never requires any med-

icine—and when he is sick, we would protest against his being dosed with articles that are said to be good for a particular disease, without any reference to its violence or the symptoms, as common sense would dictate; that remedies the most opposite in their character and effects may be equally advantageous in different periods of a case.

Always distrust the man and the remedy, when your friend declares that an article is always '*good*' or a '*certain cure*' for a disease, without reference to its symptoms—prescribing for the name of the disease, rather than the disease itself: this is the very essence of quackery, in man or beast.

A large proportion of the diseases of animals closely resemble those of the human family, require a treatment conducted upon the same general principles—with some variations and some peculiarities, it is true, but none of those outrageous departures from common sense which are too frequently witnessed.

A horse with pleurisy, or inflammation of the lungs, or apoplexy, requires a widely different treatment from one with colic or with worms. There is no more mystery about the diseases of a horse or an ox than about those of a man, and a violation of natural laws is as productive of pain and injury in one as the other.

There is, too, a great propensity every where to resort to active treatment in all cases—a feeling that is encouraged by the ignorant or designing for selfish purposes. An adviser in sickness is often most useful and shows most skill where he only tells what is to be avoided and waits for indications for more active measures—doing little more than preventing ignorant but well-meaning persons from interfering with salutary changes that may be going on.

Remember that there is a restorative power in nature, to which it is always better to trust, than to direct active remedies without knowing for what particular purpose they are given.

There is never occasion for the administration of the disgusting combinations which the poor animal is made to swallow, from the whim of an ignorant horse or cow doctor. Many a fine beast has been lost by his owner trusting to such prescriptions.

When your animal has fever, nature would dictate that all stimulating articles of diet or medicine should be avoided. Bleeding may be necessary to reduce the force of the circulation—purging, to remove irritating substances from the bowels—moist, light and easily digested food, that his weakened digestion may not be oppressed—cool drinks, to allay thirst, and to some extent, compensate for diminished secretions—rest and quiet, to prevent undue excitement in his system, and so on through the whole catalogue of diseases—but nothing to be done without reason. Carry out this principle and you will probably do much good—hardly great harm;—go on any other, and your measures are more likely to be productive of injury than benefit. But, as we have before said, our object now is not to speak of diseases in detail—it is rather to en-

courage our agricultural friends to *think* before they *act*—to have a reason that will bear examination for every step in the management of a sick or injured animal—to remember they have a powerful assistant in *nature*, if she is fairly used—and that specifics, as they are called, are much fewer and less to be trusted than their proprietors would have us believe. We might, indeed, almost sum up what we would desire in one general direction of five words—TREAT YOUR BRUTES LIKE MEN.—*Farmer's Cabinet.*

From the Albany Cultivator.

#### GRINDING CORN IN THE EAR.

"MESSRS EDITORS—Can you, or any of your subscribers, give any information on the additional value that would be conferred by grinding the cobs with the corn for feeding animals; and if any, what kind of mill would be the best for grinding? A CORN GROWER."

Some experiments have been made in this country to test the value of the cob when ground with corn, as an article of food, and we believe they uniformly proved successful; but the difficulty of providing fixtures for grinding, and the little attention usually paid in this country to savings of this kind, has had the effect to prevent the attention of farmers from being much directed to this mode of preparing food for animals. That a great saving would be made in feeding corn meal, by grinding the cob with the grain, might be reasonably inferred from the fact that when corn meal is fed to horses, it requires to be mixed with some coarser food, such as cut straw or hay; and that so mixed, a smaller quantity causes the animal to thrive better, and perform work as well, as a larger quantity of meal without such mixture would. Pure corn meal does not appear to sufficiently distend the stomach to bring into exercise its digestive faculties fully, without taking so much as to clog that organ and impair its functions eventually. For this reason, a mixture of less nutritive materials is desirable; and one of our most successful feeders of pork has assured us, that he always mixed oats with his corn, in the proportion of one fourth, previous to grinding, and thinks he should find a profit in exchanging corn for oats, bushel for bushel, rather than feed the former to his pigs clear. It appears, from recorded experiments, that the cob, though doubtless possessing no inconsiderable portion of nutriment in itself, make about the requisite mixture with the grain, and hence is of great value for the purpose of feeding.

In the N. E Farmer, for 1825, may be found a communication from the Rev. H. C. Perley, giving the history of some experiments made by him in feeding with corn and cob meal. Mr Perley broke his corn and cobs together by pounding, and the mixture was then ground in common corn millstones. "Meal made of this composition, I scalded, and made about as thick as common hasty pudding; or mixed about one peck of meal with three pecks of boiled potatoes, thickened to the consistency of pudding. With this kind of food and what wash was made in the family, I constantly fed my swine; there were none in the neighborhood grew so fast, or were fit to kill so early in the autumn. The neighbors were surprised that my hogs looked so white and grew so well, being fed as they were, with cob meal, potatoes, and the wash of four cows. Some ridiculed the notion, others disputed and dis-

believed the account; but finally all were obliged to believe the fact, though reluctant to repeat the experiment. I am this year using the same discovery and process of cob meal, and can show better swine than any of my neighbors can produce of the same age." Mr Perley had one batch of bread made of this mixed meal, combined with rye flour in the usual proportions, and found it as light, moist, sweet, and palatable, as that made from pure corn meal.

According to Dr Mease, the practice of grinding corn with the cob, is common among the German inhabitants of Pennsylvania. They consider the practice as a great improvement in the feeding of corn, and many of their mills have an apparatus for grinding. Dr Mease adds, that "corn meal alone is too nourishing or heating, and it is, therefore, by those who use it, mixed with a portion of cut straw, and coarsely ground rye or shorts, and in this state constitutes the daily food of that fine body of draught horses that do so much credit to our carters and draymen of Philadelphia, and the industrious farmers of the state at large."

That the cob of corn contains considerable nourishment in itself, is very probable; indeed, instances are on record, in which poor people, in times of a scarcity of food for animals, have converted them to a good use by pounding and boiling them, and feeding out with a small quantity of cut corn leaves or straw. On such food, cattle have some time subsisted, and even seemed to be in good heart, if not to thrive.

In the Mass. Agric. Reports for 1823, is a communication from Mr Rice, of Shrewsbury, on the subject of feeding cattle, which constituted a part of his business, in the course of which he gives an account of one of his experiments in using cob meal.

"The second year, if I mistake not, in which I made use of cob meal, I thought I would try an experiment by feeding one ox with corn and oats ground, the other with corn and cobs, having a yoke of oxen so even matched, that no one who viewed them was satisfied which was the best; accordingly I fed them as above. The cob is computed to make a little more than one third, therefore, I mixed the other with one third oats as was my former mode. I gave each ox an equal quantity at a time, except the one which had corn and oats sometimes became dainty, and would not eat his allowance, while the other kept a regular course. The allowance for both was a little over three pecks per day. When taken to market and killed, they weighed twentyeight hundred and a half; the one fed on corn and oats weighing half a hundred the most, while the one fed on corn and cob meal was considered half a dollar per cwt. the best beef. The one fed on corn and cobs had 163 lbs. of tallow, the other 162 lbs."

From this, and other experiments, it would seem that cobs ground with corn, add to its value for the purposes of feeding, nearly or quite as much as would the same quantity of oats. If such is the case, there can be little room for doubt as to the propriety of making the practice of grinding the cob with the corn general, where this grain is used for feeding.

The mill used in Pennsylvania, is one invented by Evans, and much resembles the ordinary plaster mill in its operations. A cast iron screw revolves over a grate fixed in the bottom of a strong hopper iron lined. The ears of corn thrown into the hop-

per are taken hold of by the screw, broken to pieces, and then they fall through the grate into a spout, by which they are guided to the millstones. Dr Mease, however, strongly condemns the use of the same mill for grinding both plaster and cobs, as without great precaution, the plaster will be mixed with the cob meal, and produce dangerous concretions in the intestines of the animal eating it. In some parts of the country a common pair of millstones are used, the opening in the upper being made larger than usual, and the stones being more bosomed out, or made to fit less close in the inner part, than when used for grain. It is believed that corn in the cob might be broken sufficiently fine in a common iron bark mill, to admit being ground in ordinary mill stones without difficulty. We should think that in any district where Indian corn is extensively grown, a miller would find it for his interest to attach a cob cracker to his machinery, as we are confident the farmers would find themselves well repaid by the great saving and superiority of the meal so made, for feeding.

#### MASS. HORTICULTURAL SOCIETY.

EXHIBITION OF FRUITS.

Saturday, Sept. 26, 1840.

From Mr William Hurd, of Newton; choice specimens of Spice, Hervey, and Cat-head apples, Blood Peaches and Quinces.

From Samuel Walker, Esq., Roxbury; two varieties of pears, names unknown—one of fine flavor—a desirable kind.

From Hon. Elijah Vose, Dorchester; fine specimens of Yellow Raricripe and Orange Clingstone peaches.

From S. Downer, Esq., Dorchester; Pond's seedling, Isabella, Catawba, and Miller's Burgundy Grapes.

From Hall J. Howe, Esq., South Boston; superior specimens of Isabella Grapes.

From Joseph G. Coolidge, Esq., Cambridge; a fine specimen of Red apples, name unknown, now in eating—in size, color and flavor similar to the Red Joncating.

From Dr. Burnett, of —, by Mr Walker; a fine specimen of the Burnett pear.

From Nathaniel Clapp, Esq., Dorchester; Brocas Bergamot pears—which for size and flavor have not been excelled at any exhibition; also the Heathcote, not in eating.

From Mr. J. L. F. Warren, Brighton; Teton de Venus and Lemon Clingstone peaches of extra size and beauty; also a large kind, name unknown, and a Seedling, past eating.

From Miss Gills, Washington street, Boston; a Seedling pear, from the Bartlett. This tree has shown fruit for three or four years past; and has given evidence of its excellence for size, beauty and flavor worthy of its progenitor. The committee have named it the Gill pear.

From Frederick Tudor, Esq., Nahant; Belle et Bonne, Bleeker's Meadow, Bezi Vaet, Pope's Quaker, Napoleon and Buffum pears; Reinnet Gourmand apples and Sweetwater grapes; all field culture at Nahant. Mr Tudor has shown good taste in his selection of fruits, and his cultivation is an evidence that none need despair. His exhibition of pears will rank with the best.

For the Committee,

BENJ. V. FRENCH.

A good life is the best philosophy.

For the New England Farmer.

### ANNUAL MEETING OF THE RHODE ISLAND SOCIETY.

The Rhode Island Society for the Encouragement of Domestic Industry held their annual meeting at Pawtuxet on the 23d of Sept. inst.

To their honor be it said, that from a high sense of the moral obligation which was considered due to the public, the standing committee agreed to dispense with all show and parade, and substitute a moral and enlightened course: it being admitted that no useful instruction can possibly result from the scramble of a ploughing match, or from the exhibition of a few animals that were reared in the immediate neighborhood: (for those at a distance can not be driven.)

The time has long since passed when household manufactures required the fostering aid of a society. As the staple products of the soil can not be exhibited, written statements of the mode and cost of cultivation are necessarily made out and forwarded to the committee on agriculture:—butter and cheese are examined at an appointed time and place:—all agricultural experiments, for which premiums are offered, are adjudged also from the written statements of the applicants.

Under this improved arrangement, the disgraceful and demoralizing effect of drawing together, as formerly, an intemperate rabble, is wholly avoided. The Society have acted under the meritorious influence of this consideration, that whatever promotes intemperance is wholly inconsistent with their profession of encouragement to domestic industry. Perhaps on this ground it is not in the least objectionable that they should deny the use of wine at their annual dinners. Wine may promote conviviality on festive occasions; still it must be admitted that excitement drawn from a higher source is preferable. The rising generation of young husbandmen have come to congratulate each other that their fathers have elevated the standard of mental improvement in the broad field occupied by the yeomanry of our country. Their progress is and must remain to be onward. Those benevolent spirits who hail with delight every manifestation of improvement that tends to exalt mankind, would have met a two-fold gratification at the Society's dinner table. In addition to substantial viands, might here be found a rare collection of choice vegetables, several new and valuable kinds of potatoes, beets, turnips, squashes, beans, tomatoes, &c. &c., all presented in the most inviting style, affording an instructive lesson even to the already good housewife. The bountiful products of the season, through the influence of the nymph Pomona, gave the means of loading their table with French and Isabella grapes, a great variety of pears and apples, both foreign and domestic, which have been brought into notice of late by our indefatigable horticulturists; green and white fleshed melons, from seed procured at Minorca, Alexandria, Constantinople, Naples and Rome. The display of peaches must at this season be limited to the Heath, late York and some others. With a profusion of such blessings before them, no foreign aid was required to bring out the Attic eloquence of those who were called upon and encouraged by the happy efforts of the venerable President: much valuable instruction might naturally be looked for from such a body of practical farmers. Although their style of address might unavoidably be some-

what colloquial, still the interest of those present would be the more excited. This most important class of our community possess a fund of common sense, ray knowledge; and clear and distinct ideas were never known to exist unattended by a command of language suited to their correct expression.

This first experiment of the Society on their new plan having met with the deserved approbation of the moral and enlightened portions of the community, promises well for the future.

A SPECTATOR.

Worcester, Sept. 29th, 1840.

For the N. E. Farmer.

### THE SCIENCE OF LANGUAGE USEFUL FOR FARMERS.

We once heard a disputation on the utility of the knowledge of the languages for the farmers—rather a novel subject to be sure, to call people together to listen to, yet it had the success to 'bring out a full house,' and the spirit with which it was pursued was of so calm, yet of so thorough a nature, that the attention of the audience was actually held, though not 'in durance vile,' through the whole of a session of several hours. And here we anticipate that the kind reader of our essays will begin to imagine that we are 'running off the track'—that language is *not* so much of a science as it might be. We, however, as we pursue the tenor of our way, can consider it in no other sense than as belonging to a class of facts capable of investigation, and of being reduced to system and order; hence it is matter for scientific investigation. In favor of the proposition that a knowledge of the *ancient* classics was beneficial to those engaged in terraculture, it was asserted that a man would hoe his potatoes more thoroughly, and a woman wash her dishes with greater speed and more neatness, when well versed in the Greek and Latin, than though they had no acquaintance with them. We certainly believe, that a well educated man will discharge all the duties of life, however menial they may be, more to his own mind and interest and to the general acceptance of others, than one whose days of childhood and leisure moments of youth and maturer years, have been spent in a sort of 'brute unconscious gaze,' investigating nothing unless the things that it is least necessary for them to know; and as for an ignorant woman, ah, she is a perfectly unendurable commodity, one that we can in no wise fellowship—in far too many cases an invidious gossip, a thing pretendedly well acquainted with all of other people's matters, and much better acquainted with their needs and wants than themselves.

A knowledge of the ancient languages is essentially necessary, to some extent at least, for all who would familiarize themselves with the natural sciences. Herbs and plants, and indeed every subject of natural history may, and indeed in innumerable cases do, have different provincial names, in all regions, varying frequently in passing over a very small extent of territory. With such a state of things existing, it would be almost impossible to arrive at a proper conclusion with regard to things, were there no remedy. The Latin and Greek very happily lend their aid to extricate us from this state of things, for to a greater or less extent they are languages studied by all civilized nations. Hence they are common languages, known and understood every where; and for this reason the scientific

names of the subjects of history are given in them, merely to prevent a confusion of tongue. We now take it for granted that a farmer should be acquainted with the natural sciences, and if so, a knowledge of the languages may be conceived indispensably necessary to his success. But of all things a man should be thoroughly versed in the knowledge of *his own* tongue. What horrid absurdities would often escape his utterance if this were invariably possessed by him! What 'running to and fro' and gathering together of misplaced words and unmeaning sentences would be avoided if this were the fact! Let it be investigated as a *science*, let all its parts and bearings be brought together, and each part put in its appropriate place, and the beautiful system of facts which science every where develops, will appear.

But there are excellencies found in the study of the classics, aside from those which their use in the other sciences require, which render them worthy of investigation. They have a style worthy as a model for present times; their historical relations are of a pure and interesting character, possessing excellencies of which they are sadly shorn in most translations. The *Georgics* of Virgil, though they may contain some antiquated notions, appropriate to the age and country in which they were written, should be known and read by every farmer in their original dress, not only as relics of an age long since buried, but as containing, at least, sound maxims, worthy to be enforced by a people who claim higher precedence to knowledge and experience than he who wrote them, and his approving contemporaries.

Yours, truly,  
Mount Osceola.

### DESTRUCTION OF ROSE-BUSH INSECTS.

Windham, N. H., Sept. 30, 1840.

Messrs J. Breck & Co.—Gentlemen—The name of the Chairman of the Committee on Flowers of the Mass. Horticultural Society not being by me, I address you, with a certain prescription for the destruction of insects attacking rose bushes, leaving the bush unharmed, which has been tested by several years experience.

When the stock, stem and leaves have been literally covered, a sprinkling of *Scotch snuff*, alias yellow snuff, has dispossessed them. If possession is regained, which has very rarely occurred with me, a second dose has ended the contest.

Why should *not* snuff be effective, when the nasal twang of the human subject, under the voluntary infliction of this narcotic poison, bears such sad testimony of its destructive power?

Yours,

S. FESSENDEN.

*Silk*.—The importance of the manufacture of silk is shown by the annual official statement of the commerce of the United States. From that document it appears the value of silks imported during the year ending the 30th of September last, was

	\$23,139,823
Sewing silk,	809,534

Total, \$23,949,357

This is nearly double the amount of any other article imported in the United States, and an enormous sum to pay for a single article in one year.—*N. Y. Sun.*

LUCERNE—(*Medicago sativa*.)

In our previous volumes, several articles on the character and cultivation of this plant have already been given to our readers; but we cannot resist the high praises given it, and select another from the many we find in our cotemporaries. We are not aware of any attempt to cultivate it in Kentucky, but we believe that it would prove very useful. The excellencies of this grass are its great product and long continuance—yielding from three to five, sometimes even eight tons per acre, and continuing from one sowing from six to ten years, depending upon situation and soil, and a proper preparation of the ground at the sowing. It resists the effect of drought, by means of its long, deep growing roots. It is best used by assailing; that is, cutting and feeding it green; or by (*tethering*) confining the animal to be fed, to a very small space at one time, or in hay. In the last mentioned it is treated as clover, but the first is the way in which we suppose it would be most profitable to us. An acre, or two acres sown near the stable, would furnish the horses with an abundance at every feed from May to October. We would be glad to hear of some one trying the *experiment*, if no more. We are informed that the seed cost from twentyfive to thirty cents per pound.—*Franklin Farmer*.

LUCERNE.—As we have expected, and as it deserves, this plant is attracting more of the public attention. This is the result of the merits of the plant itself, and a growing disposition among agriculturists to diversify their crops more than they have done heretofore, and especially to make, as it is their obvious interest to do, better provision in the way of grasses and roots.

A very sensible writer in a late number of the Farmer's Cabinet, who is justly impressed with the great value of *lucerne*, and who has evidently been a close observer of its character and habits, makes in regard to its cultivation the following remarks.—*Amer. Farmer*.

"My experience in raising this astonishing crop has been pretty extensive, and as I have long been convinced that it is peculiarly suitable to many parts of this country, I would detail a mode in the culture, which, in suitable situations and under favorable circumstances would, I am convinced, be attended with perfect success.

The land designed for it should be summer-fallowed, the weeds being carefully gathered after every ploughing, and not a moment should be lost in bringing forward as many crops of seed-weeds as possible, by frequent ploughings and harrowings, turning them down as fast as they come. Before the last ploughing, a covering of well-rotted manure should be spread on the land, and this being turned in, the seed, twelve or fourteen pounds per acre, should be sown broadcast, in August or September, unaccompanied with any crop, and be immediately rolled in. In the middle and southern States there would be no danger of its being injured by the winter cold, provided it be protected by the usual quantity of snow, and although the weeds which might still remain in the soil, may spring up with the lucerne, yet as they would be prevented from growing in the winter, that crop would shoot earlier in the spring than they, and would soon out-top and overgrow them; while four or five cuttings of the lucerne during the next summer would prevent these weeds from obtaining even a chance of success.

It is a mistaken idea that lucerne requires a

rich soil; this is by no means the fact; indeed I have known several attempts to raise it on such soil, in consequence I think of this very circumstance; but a *suitable* soil is quite necessary, and what that is, is not sometimes easily definable beforehand; but experiments on a small scale will soon point them out. The *subsoil* for this crop is of much more importance than the surface, and the most prolific crops have been obtained from soils supposed too barren to produce any profitable yield whatever. Ashes form an excellent top-dressing for lucerne, as they contain no seeds of weeds, and this is a circumstance of incalculable importance to its future well being: all other manures should be applied during the frosts of winter, for before the seeds of the weeds, which might be contained in them, can vegetate in the spring, the lucerne has started, and will then keep the lead; and when the crop has taken full possession of the soil, nothing appears more tenacious of life, or equal to cope with it, especially during a season of drought, when all other vegetation has disappeared from the face of the earth; then, I have often known it to shoot away at the rate of two inches in height every twentyfour hours. It has been the custom in some places, to raise the crop on a seed-bed, and transplant the roots, but this is changing the nature of the plant, for its peculiar characteristic—a tap-rooted plant—is thus destroyed; and however much it might thereafter flourish on good soils, it is not so fitted to *pump up*, from the depth of twelve or fourteen feet, moisture sufficient to sustain a crop of eleven tons per acre, during the hottest season of the year; nor is it, after that, so well able to cope with the weeds, as its strength is never so great as when its roots are deep, and form a woody crown about three inches in diameter, bidding defiance even to the ploughshare, and seeming to gain strength from the roughest treatment.

Nor is the very general practice of drilling the seed, and keeping the rows clear of weeds by the hoe, at all to be recommended; it is thus made to flourish, but it is at the cost of too much labor and expense; nor have I ever known a hoed crop at all to be compared with very many that I have seen broadcast, and which had been raised with little expense or labor. The observation, at page 258, vol. 3, of the Cabinet, that unless the lucerne crop is sown in drills, and kept clear by hoeing, it will never answer to the farmer, is erroneous—nothing can be further from the fact—thick sowing in the autumn or late summer on a clean and suitable soil, will render quite unnecessary drilling and hoeing; and will insure larger crops than can be obtained by any other mode of management.

Lucerne has been denominated an impatient crop, but on suitable soils, nothing succeeds so well or with less trouble; the seeds start in a very few days, and the growth of the plants is at first as decided and rapid as the common red clover; but it must be admitted that after this, it seems ready to give way to a crop of weeds, and the most promising prospect is often destroyed in a few days. But to those who are acquainted with its habits, the cultivation is neither difficult or hazardous, and when it once decides the question "to grow or not to grow," in the affirmative, there is no crop on earth that can at all keep pace with it; and it is then a crop for life, or thereabouts. The best crops which I ever knew, were those which grew on the sea shore, not two feet from high water mark—nay, I have known it grow and flourish on the sea beach, overflown by every spring tide, with-

out suffering the least injury from it. Those crops grew on white sand, with not a particle of earth to be seen in its composition, and there were, of course, no weeds to impede its growth; but, at the depth of several feet, this bed of sand was found resting upon a substance of fine light mould, into which the roots had penetrated and produced crops which were truly astonishing in their bulk and vigor; and upon these fields it had been customary to tether cows during the whole summer, for ages, without manure, and yet no diminution of its strength was ever dreamt of. During the whole of the winter, not a blade of lucerne was to be seen, the roots had all been covered by a light coat of sand, which had been blown up from the beach: this protected the crop from the frosts; and very early in the spring, the shoots of lucerne would be found penetrating it in all directions, like asparagus plants, and in a few days they would spread the surface like a carpet, furnishing, in about the space of two weeks, excellent food for cattle of every description, and upon which hogs would fatten. fit for slaughter; it being remarkable that these last, after masticating even the woody stalks of the plant, would not eject any portion of it, but swallow the whole." VIR.

## RECLAIMED MEADOWS.

There are in all parts of our country more or less lands called swamps, bogs, or bog-meadows, as they may happen to be bare, or productive of a little worthless grass. Now such spots are usually the richest part of a farm, being points on which for ages the most valuable parts of the surrounding fields, the salts, manures, and fertile mould, have been centred, and where they have been preserved as in close reservoirs ready to reward the hand and the labor that, directed by skill, should endeavor to turn them to account in the cultivation of land.

One of the surest indications of an improved agriculture in this country, is the notices that frequently meet our eyes in the contemporary journals, as well as those furnished for the Cultivator, of the reclamation of these long neglected places, and their extreme productiveness when brought under cultivation. They are found not only to be reservoirs of the richest manures, requiring only to have the acidity which such wet places are sure to give the vegetable matter collected in them, corrected by lime or fermentation, by mixture with other manures, but by proper treatment, to be capable of giving crops of roots or grass of the most luxuriant kind.

If it is desirable to convert the earth of these natural meadows into manure, the best method is to draw it in the summer or fall to the barn yard, which should be covered to the depth of at least a foot with the transported material. This will absorb the liquid manure of the yards, be mixed by the feet of the animals, with the long manure made from waste stalks, hay, straw, &c., and in the spring when wanted for the crops, will be found more valuable than barn yard manure usually is.

If it is desired to cultivate the earth where it is, or convert the swamp into first rate tillable land, thorough draining in every part must be attended to, or nothing can be done to advantage. If made dry enough for the plough, let the surface be fully pulverized with that implement. If bogs or brush abound, they must be grubbed and burned, and a dressing of lime or ashes, or even mere common sand or gravel, will produce an excellent effect.—*Alb. Cult.*

For the N. E. Farmer.

### COWS HOLDING UP THEIR MILK.

*Mr Editor*—Sir: I am not in the habit of writing for any publication, but as I have just commenced farming with my father, who is one of the best managers of the old school, I feel very much interested in whatever I see or hear relative to the management of a farm. I thought I might be of use to some one by giving my father's mode of treating a cow that holds up her milk on taking away the calf, or at any other time. In the first place he ascertains what kind of food the cow likes best; whether it be meal, oats or potatoes:—he takes the food and coaxes her to one corner of the yard or into the stable; gives it, and begins to milk:—if the cow refuses to give her milk, he tries the same the second time, and has always succeeded to get the milk as freely as from any other cow, unless the food was neglected, or contained something which she did not like. My father bought a young cow last winter: she had her calf quite early in the spring: on taking away the calf she held her milk, giving it down only once in two or three days: he tried several experiments, (not liking the trouble of feeding,) till the cow was nearly dry: finding none of them effectual, he began to feed, and never has been troubled since. The cow says, no supper no milk. This is the fourth or fifth cow of this description he has had, and has always succeeded in getting the milk as freely as from any other cow. J. C.

For the New England Farmer.

### CANKER WORM TROUGHS.

*Mr Colman*—Dear Sir:—Having a few apple trees that I wished to protect from the ravages of the canker worm, I was induced to make a trial of the lead troughs recommended by yourself and others, and now in pretty general use. I have found them answer the purpose very well: they have so far protected my trees from the worms: but I have recently discovered that worms and other bad insects have bedded themselves in the cotton between the lead and the tree: the bark appears to be considerably eaten and dead, and I am apprehensive that the trees have sustained serious injury. I have heretofore had great confidence in these leads as an effectual remedy, but did not for a moment suspect there was danger of any damage or difficulty from such a source. Now I am satisfied that they will do as much hurt as good, unless this difficulty can be obviated. I have thought of a remedy, but prefer that the maker or inventor of the article should suggest one himself, before I expose my own ignorance.

If you consider these remarks of any consequence, you can insert them in the N. E. Farmer, and oblige one and perhaps more of your

Oct. 1, 1840.

SUBSCRIBERS.

There have been frosts recently all over the country as far south as Charleston. Happily the protracted warm weather of the past summer advanced crops so rapidly that they were out of the way, or nearly so, before Sir Jack showed his teeth. —*Bost. Times*.

If, says the Boston Times, 'the undevout astronomer is mad,' the undevout gardener must be a *lusus nature*.

### FARMER'S FESTIVAL.

The Exhibition at Georgetown on Wednesday, by the Essex Agricultural Society, was well sustained. In many respects it far exceeded any thing of the kind heretofore witnessed in the county. The number and character of the animals exhibited was worthy of the occasion. And the number of those present to examine them, indicated that the pursuits of the farmer are not second to any other in awakening the attention of the public. It is pleasing to see so lively an interest manifested in the promotion of objects so directly calculated to benefit society. It is pleasing also to witness individuals of every creed and party, cordially co-operating without jealousy, for the general good.

There were 18 teams engaged in the ploughing match, and their work received the highest encomiums from the committees.

Four and twenty pair of working oxen were entered for premiums—several of which were of the very first class of this useful animal.

The show of fat cattle was mcagre, there being but one decent ox among the number. In a county so fond of good living and so able to afford it, this is not as it should be.

Of bulls, there was a great display of fine animals—more than 20 being on the ground. Some of these were equal to any we have seen elsewhere.

About 10 pairs of steers were exhibited, some of which were of the first class.

Of milch cows, the exhibition was superb. There were 13 cows entered for premium and several others for exhibition. Judging from their appearance and what was said of them, we should think our farmers are learning to put a proper estimate on this most valuable animal. We know not how they can better promote their own interest, than by careful attention to the selection and feed of their milch cows.

There were 24 heifers exhibited, that promised to equal their mothers.

Of calves, there were but few—no premium being offered for them until they have passed the first year—it being impossible to judge of their value at maturity.

Of swine, as heretofore, Essex will not yield the palm to any one. The exhibition of this class of animals, of the various kinds, was very numerous, many of them approached very near perfection. Those of the Berkshire breed had the preference.

There was a very fair exhibition of the products of the dairy; there being about a dozen entries for the premiums offered for butter, and four for cheese. We understood the committee to speak of the butter as much superior to that of former years.

In the hall for domestic manufactures we noticed a rich exhibition of useful articles. The number of entries was about 149, comprising the usual variety. The display of hearth rugs was highly creditable to the taste and industry of those who made them. Among the articles exhibited was a silk gown made by a lady now 93 years of age, from silk of her own raising. The chairman of the committee pleasantly suggested to the Trustees the expediency of offering a premium to that *young lady* who should produce a similar gown, as her own handiwork; and then as the best reward that could be given to the best *young farmer* in the county, the young lady herself.

A great variety of fruits were exhibited from various parts of the county; and a beautiful display of flowers by several public-spirited gentlemen from Salem.

There were various entries for the premiums offered for crops, cultivation of mulberry trees, experiments, &c., the reports on which will not be matured until the close of the year.

The address by Mr Huntington was replete with good taste and sound instruction, and will be referred to by our young men as a valuable guide in their pursuits of life.

The Society were favored with a beautiful hymn from Mr Lunt, of Newburyport.

On the whole, although much more might have been done, there is no good reason for complaint of this exhibition. P.

Danvers, Oct. 1, 1840.

[Salem Gaz.]

*Agricultural Papers*.—Nothing has contributed so much to the improvement of agriculture in our country as this class of publications. No farmer is so poor that he can afford to do without one. They serve as the vehicle by which a vast amount of information is disseminated, and the experience of a large number of practical men is brought into active operation. To be a 'book farmer,' is not now as formerly, a term of reproach, and few farmers of intelligence in the country are now ashamed of the title. These publications have induced a spirit of inquiry, and if all men engaged in agriculture cannot become experimental farmers, still they may profit largely from the experiments of those who can. Another good arising from them has been, to induce men no longer blindly to follow in a beaten track, because their fathers did so before them, but to inquire for themselves the *reason* why certain causes produce certain effects, and to endeavor to learn from them some new modes of application. The great and paramount importance of the agricultural interest is now fully demonstrating itself, and he should indeed be regarded as a benefactor to his country, who shall conduce in any degree to the improvement of that interest.—*Philadelphia North American*.

*Setting Fruit Trees*.—Mr Editor: I wish to say a few words through your useful paper respecting the time for setting fruit trees. Many suppose that it is almost useless to set them in the autumn, on account of their liability to be killed by the frost.

Having for several years had opportunities for constant observation, I am satisfied that all sorts of trees, vines and plants, may be as safely transplanted in the fall as in the spring, if done somewhat earlier than they are usually done in this vicinity.

An instance came under my notice in this town, where a large number of trees (about fifty) were set in the middle of October, and the owner having occasion to remove some of them about six weeks after, they were found to have thrown out fibres from the extremities of the roots. These having a firm hold were prepared for winter, and not one of the whole were lost; while those which are not set till the middle or last of November, have no time to take root before the ground is closed by the frost, and in that way many of them are lost.—*Massachusetts Spy*.

*Birds*.—Birds have often seemed to me like the messengers from earth to heaven—charged with the homage and gratitude of nature, and gifted with the most eloquent of created voices to fulfil the mission.—*Bulwer*.

## NEW ENGLAND FARMER,

AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, OCT. 7, 1840.

## NEW HAVEN AGRICULTURAL AND HORTICULTURAL EXHIBITION.

The New Haven County Agricultural Society, of Connecticut, held their anniversary on Wednesday, the 30th ult. This Society has for a length of time lain dormant; but by the liberal exertions of some spirited friends of public improvement, was last year waked up; and has distinguished itself by its exhibitions of the last and the present year.

The exhibition of the Horticultural Society took place in the second story of the State House, the hall and several rooms of that building being devoted to that purpose. The hall was arranged and decorated with exquisite taste, and with its flowers and fruits presented in the evening a beautiful display, almost a fairy palace.

The apples and pears were uncommonly fine. The peaches were handsome though not numerous, on account of the lateness of the season. The show of grapes, especially considering that all were raised in the open air, was admirable. There were various other specimens of fruit, which we have not room to particularize.

The bouquets of flowers were done up with a tastefulness of arrangement we have never seen surpassed; and evidenced the skill of the cultivators. The show of culinary vegetables, carrots, beets, parsnips, turnips, potatoes, celery, salsify, the egg plant, and the larger fruits, such as musk and water melons, and tomatoes of several varieties, sweet potatoes and other vegetables, which do not at this moment occur to us, and squashes of various kinds, we must say has never been equalled within our knowledge; and we do not believe could be surpassed in any part of the country.

The agricultural rooms, distinct from the horticultural rooms, presented on Wednesday a truly magnificent exhibition of field products, with the exception of the smaller grains. Of these there was but a single sample of wheat, several samples of rye, and some of oats and buckwheat. The show of wheat and rye was quite inferior; one sample of oats very good; the buckwheat likewise was good. The show of vegetables was here considerably extended, and of the very finest description; and the display of Indian corn of various kinds was rich, far beyond any thing we have ever witnessed.

The pens were well filled with cattle. In young stock and in fat cattle the exhibition was quite limited, though there were two yoke of fat cattle which deservedly attracted much attention. Many milk cows were presented of very promising appearance, though no particular account of their products was given. Of improved Durham Short-Horns there was a numerous and beautiful herd exhibited by Mr H. Whitney, of New Haven, and Mr Townsend, of East Haven. A Short-horned bull and an imported cow, of Mr Whitney, equal the best animals that we have ever seen. Mr Townsend's stock was excellent.

The exhibitions of the day were distinguished by a team of more than three hundred yoke of working oxen from the neighboring towns. The cattle, with scarcely an exception, were almost all red and marked every where with the Devon blood. There were many animals of pure Devon, we presume descended from the stock presented some years since by Mr Coke, now Lord Leicester, one of the best breeders of Devons in England, to the Messrs Hurlbut, of Connecticut. The cattle were not only remarkable for their size, color and form, but likewise, and particularly, for their high con-

dition, showing excellent keeping, and likewise for very skilful training. It would be difficult to conceive of a show of this kind in this respect more gratifying or honorable.

At two o'clock an address was delivered in the church; the reports were read and the premiums announced.—The proceeds of one of the farms presented for premium, exceeded 4000 dollars; the size of the farm was 168 acres. We are promised a copy of the report on farms, which was drawn up with great care, and shall lay it as soon as received before our readers.

We should be glad to extend our remarks, but must withhold them. The exhibitions both of the Horticultural and Agricultural Societies, passed off with singular success, and conferred much honor on those enterprising and public-spirited gentlemen, who have given their time and labor and energies to make the occasion what it should be. H. C.

## DEFERRED NOTICES.

**BUNKER HILL MONUMENT FAIR.**—This was continued open seven days. The amount paid for entrance money at fifty cents the first day, and twentyfive cents the succeeding days, amounted to ten thousand dollars. Nearly forty thousand admissions were granted. The most important point is understood to have been gained: the sum realized from admissions and sales, and from public-spirited contributions, though not yet announced, is said to meet the expectations of those who got up this very agreeable mode of picking people's pockets with their full and delighted consent. It will be quite a jubilee in the State when the cap-stone is fixed upon this magnificent shaft. H. C.

**HORTICULTURAL EXHIBITION.**—The Massachusetts Horticultural Society in their turn, feasted the eyes of the public with a splendid exhibition of plants and flowers and fruits, which did the highest honor to the cultivators. The show of Dahlias was remarkably gay and brilliant. Of the fruits, we could judge only by the eyes; but we have no doubt they were found equally grateful to the taste.

This Society has conferred immense benefits upon the community in what it has done to improve the public taste; to refine the moral sentiments of society by presenting to their admiration the most beautiful creations of nature; and to increase the comforts of life and contribute to the public health by multiplying simple and innocent luxuries, in the form of delicious fruits.

Such an exhibition of flowers, fruits, and fine vegetables may well make us satisfied with even our harsh climate; and abate all envy of the tropical regions, with their genial suns and their burning fevers. H. C.

**VEGETABLE STEAMER.**—We would call the attention of the agricultural community to the advertisement in this day's paper of the Vegetable Steamer, invented by Dr. J. Wright Warren, of this city. It is a cheap, compact article, of cast iron, and an apparatus which, for economy, will we think supercede all others for the purpose of steaming vegetables for stock; also, heating water, cooking, &c. J. B.

## Massachusetts Horticultural Society.

## EXHIBITION OF FLOWERS.

Saturday, Oct. 3, 1840.

The exhibition of Dahlias today was one of the finest displays of superb specimens that were ever seen in the Society's rooms. The following are the names of the exhibitors:

From Mr Walker, upwards of a hundred blooms—among them Fire Ball and Suffolk Hero were splendid;

from J. J. Low, 25 blooms; from J. Stickney, about 60 splendid flowers—among which we noticed Essex Rival, Miss Johnson, and Ne plus Ultra—all extra; from J. Breck & Co., 50 blooms; from S. Sweetser, upwards of 50 blooms; from M. P. Wilder, about a hundred fine flowers—Yorkshire Hero, Topaz and Premier were very beautiful; from Hovey & Co., 50 blooms—among them a splendid Royal Standard; from D. McIntire, 40 fine blooms—Castander, large and fine; from J. L. L. F. Warren, 30 blooms; T. Mason, 40 flowers; J. A. Kenrick, 20 flowers; and John Howe, 20 flowers.

Bouquets were also furnished by Messrs Walker, W. Kenrick and J. Hovey.

## NOTICE.

If the weather continues fair the next week, it is the intention of the cultivators of the Dahlia to have an exhibition on Saturday, the 10th—at which time prizes will be awarded for blooms in classes, as follows:

Class I. Best 12 blooms (dissimilar.)

2d " 12 " "

Class II. Best 6 dissimilar blooms.

2d " 6 " "

Class III. Best flower of any class.

2d " " " "

A prize can be taken in each class, all of which are open to cultivators. The prizes will be proportioned to the number of entrances, viz: For Class I., \$1; Class II., 50 cents; Class III., 25 cents.

The flowers must all be in the room and arranged for the judges by 10 1-2 o'clock, or they will be excluded from premium. C. M. HOVEY, Chairman.

## EXHIBITION OF FRUITS.

From L. P. Grosvenor, Esq.; fine specimens of Green Sylvanhe and Urbaniste pears; also, Wilkinson, Dr. Hunt's Connecticut, Passe Colmar, and a kind unknown. Also, specimens of the Chandler apple, from the seedling trees.

From Turell Tufts, Esq., Medford; specimens of a beautiful red apple, now at maturity—unknown to the committee.

From Lemuel Dana, Esq., Dedham; a dark red winter apple—name unknown to the committee.

From Hon. E. Vose; fine specimens of Winter Warden pears and Hawthorndean apples.

From John D. Wolf, Esq., Brighton; two varieties of apples, large and handsome; sent to the Society as the Seekno further and Baldwins: unknown to the committee as such.

From S. G. Whiting, Esq., Dedham; a large seedling Sugar Pear and a kind unknown to the committee, large, and probably a good baking pear; also, the St. Michael pears.

From Marshall P. Wilder, Esq.; Thompson Pear, of superior flavor, fully answering the expectation of the committee, from the name it bears.

From J. L. L. F. Warren, Esq.; fine specimens of Isabella grapes.

From Capt. Macendray, Dorchester; Pears—a fine specimen—name unknown.

From Samuel Downer, Esq., Dorchester; a fine specimen of the Snow apple.

From Mr Jabez Fisher, Brookline; fine specimens of the Passe Colmar Pears.

From Edward Sharp, Esq., Dorchester; a fine specimen of Wilkinson pears.

From Mr George Bird, Walpole; a specimen of large, handsome, good flavored, red fall apples, now at maturity—name unknown.

From George Lee, Esq., West Cambridge; a specimen of very large, handsome Ribstone Pippin.

From Mr John Dunklee, Brighton; Blue Pearmain apple.

From J. Harris, Esq., Boston; a fine specimen of St. Michael Peara—reminding the committee of the fruit as it was, twentyfive years since.

From Gen. J. Newhall, Lynnfield; a good specimen of a seedling apple—fruit not in eating. This parcel was offered for premium, but can be better judged of when at maturity.

From Mr Joseph Burrell, Quincy; native seedling Pears, of his own production; beautiful in appearance and fine in flavor, worthy of cultivation. The committee have named this the Burrell Pear.

For the Committee,

**BENJ. V. FRENCH.**

**BRIGHTON MARKET.—MONDAY, Oct. 5, 1840.**

Reported for the New England Farmer.

At Market 1025 Beef Cattle, 640 Stores, 3500 Sheep, and 1125 Swine.

We have had an easterly storm of three days continuance, which we have not had before for a long time.

**Brighton Nurseries and Gardens. For Sale**

A large quantity of superior European and American Ornamental Trees, well calculated for public places, or private grounds, with Fruit Trees embracing a great variety of the most approved kinds and fine sizes. The trees, and all other productions can now be selected and marked, and will be forwarded to any place as soon as it will answer to remove the same.

Also, forty kinds of Strawberry Plants, of the most approved European and American varieties.

Orders may be forwarded via. mail, addressed Messrs. WINSHIP, Brighton, Mass., or left with Messrs. JOSEPH BRECK & CO. Brighton, August 12.

**PREMIUM ON PLOUGHS.**

The Trustees of the Massachusetts Society for Promoting Agriculture, having stated, in their offer of premiums for the best Ploughs, that notice would be given of the time and place, at which the Committee would be ready to prove the ploughs; they do hereby give notice, that the Committee will be prepared with land and oxen, and will attend to the duties assigned them, at Worcester, on TUESDAY, the 13th day of October next, at 10 o'clock, A. M.

Per order: **BENJ. GUILD, Sec'y.**

Boston, Sept. 30, 1840.

**BOX FOR EDGINGS.**

For sale by JOSEPH BRECK & CO., a lot of very superior BOX. Oct. 6.

**IMPROVED VEGETABLE STEAMER.**

Just received at the N. E. Agricultural Warehouse and Seed Store, Dr Warren's Patent Cylinder Vegetable Steamer, for steaming all kinds of vegetables for Swine, Cattle, &c. in large or small quantities. It can likewise be used for family purposes.

- A, the pipe for filling the boiler with water.
- B, safety valve for letting off extra steam, in case the pressure should get too high.
- C, steam pipe passing from boiler to cask
- D, pipe to supply the boiler with water from a cask or lux which is to be placed in such manner as to keep the boiler about two thirds full of water at all times, which answers as a complete self-regulator for supplying the boiler with water.

The above cut is not a true representation of the boiler, as it appears at least one half larger than it really is, in proportion to the cask. The boiler is merely a small size cylinder stove, with the fire inside, and surrounded by a sheet of water from which passes a steam pipe to the barrel or box, the cask or box can be removed so as to discharge the vegetables without any alteration of the boiler or steam pipe.

The steamer can be removed from place to place without any difficulty. Wood or coal can be used, and a few cents worth of either will steam a large quantity of vegetables. A number of them have been in operation, and found to give universal satisfaction.

Farmers and others are invited to call at our Warehouse and examine the article, which they will find to be a very neat and cheap apparatus for the purpose. Price \$12, and with handles \$13. **JOSEPH BRECK & CO.**

No. 51 and 52 North Market street, Boston.

September 30.

**FRUIT AND ORNAMENTAL TREES.**

Gentlemen at a distance, wishing to purchase trees, are informed that we will select from the following nurseries Fruit and Ornamental Trees, Plants and Shrubs of every description that may be desired, and pay particular attention to their packing, and forward them to any part of the country.

- From Messrs Winships', Brighton
- William Kenrick's, Newtoa.
- John A. Kenrick's, Do.
- S. & G. Hyde, Do.
- Samuel Pond, Cambridgeport.
- Botanic Garden, Cambridge.
- Robert Manning, Salem.
- J. L. L. F. Warren, Brighton.
- Breck & Co., Brighton.

The present is the best time, to transplant all hardy trees and shrubs.

Orders will be received for Plum, Pear and other Stocks, Hedge Plants, &c.

**FRESH GARDEN SEEDS.**

We would inform our customers and friends that we are now receiving our supply of fresh Garden Seeds, most of which have been raised under our own inspection, from fine selected roots; which we warrant to be of the purest quality of the growth of the present season.

Agricultural Books.  
Agricultural Implements.  
Seed and Implement Catalogues sent to all applicants gratis, and all orders promptly attended to.

**JOSEPH BRECK & CO.**

Boston, Sept. 29, 1840.

The Lowell Journal, Worcester Spy, New Bedford Mercury, Yeoman's Gazette, Northampton Courier, Providence Journal, Norwich Aurora, Essex Banner, Springfield Republican are requested to insert the above 4 times,

## MISCELLANEOUS.

## TILLAGE.

" 'Tis folly in the extreme to till  
 Extensive fields and till them ill;  
 The farmer pleased, may boast aloud  
 His bushels sown, his acres ploughed,  
 And pleased, indulge the cheering hope  
 That time will bring a plenteous crop;  
 Shrewd common sense sits laughing by,—  
 For when maturing seasons smile,  
 Thin sheaves shall disappoint his toil.  
 Advised, this empty pride expel;  
 Tilt LITTLE, and that little WELL.  
 Of taxing, fencing, toil, no more  
 Your ground requires when rich than poor;  
 And more one fertile acre yields,  
 Than the huge breadth of barren fields.  
 " Neat be your farms; 'tis long confessed  
 The neatest farmer is the best.  
 Each bog and marsh, industrious drain,  
 Nor let vile balks deform the plain;  
 No bushes on your headland grow,  
 For briars a sloven's culture show.  
 Neat be your barns, your houses neat,  
 Your doors be clean, your court-yards sweet;  
 No moss the sheltering roof enshroud,  
 Nor wooden panes the window cloud,  
 No filthy kennels foully flow,  
 Nor weeds with rankling poison grow;  
 But shades expand and fruit trees bloom,  
 And flowering shrubs exhale perfume;  
 With pales your garden circle round;  
 Defend, enrich, and clean the ground;  
 Prize high the pleasing, useful rood,  
 And fill with vegetables good."

From the Albany Cultivator.

## MAKING AUGER HOLES WITH A GIMLET.

" My boy what are you doing there with that gimlet?" said I the other morning to a flaxen haired urchin, who was laboring away with all his might at a piece of board before him. " Trying to make an auger hole!" was his reply, without raising his eyes or suspending his operations.

" Precisely the business of at least two-thirds of the world, in this blessed year of our Lord 1840, is this making auger holes with a gimlet;" I said to myself, as I walked musingly onward.

Here is young A., who has just escaped from the clerk's desk behind the counter. He sports his mustaches; wears his hair long; has acquired the power of being shaved; carries a rötan; drinks champaign when he can command an X to purchase a bottle, and treat a friend to a dinner; talks large of the price current, fall of western stocks, and profits of banking; stands in his boots two inches taller than Astor or Appleton; and speaks of foreign exchanges as would Rothschild or Biddle. He thinks he is a great man, when all others know he is only making auger holes with a gimlet.

Mr B. is a rabid politician. He has labored hard at caucuses, at ward and town meetings, has talked of the dear people till the words flow parrot like from his lips, and has done a full share of the dirty work of party for years. Office has been the lure held out to lead him onwards, and which has made him neglect his business, spend his time in hunting up recruits, drilling the refractory, and qualifying himself for bar-room argument

and stump oratory. He can settle the affairs of the nation in a trice; diplomacy has no intricacies for him; he has shaken hands with the president, and is a great man. He will soon be used up, and cast aside; and will then see, as others now do, that he is chasing a jack o'lantern, that he is making auger holes with a gimlet.

There is Miss C., who is really a pretty girl, and who might become a woman, a man of sense would be proud of. Now, she apes the *ton* in all things; reads exciting novels, goes to the opera, admires Celeste's dancing, has nearly ceased to blush at the most indecent nudity, lounges on sofas, glories in her idleness, keeps her bed till noon, coquets with male animals as feminine as herself, imagines she is a belle, forgets that her father was a cooper, lisps of high life, and plebeian presumption, and is in a fair way to ruin herself. All this comes of her belief that an auger hole can be made by a gimlet.

Mr D., whom I have just passed, may be put down as a distinguished professor of the gimlet. He was a farmer. His father left him a fine farm free of incumbrance; but speculation became rife, fortunes were made in a twinkling, and D. fancied "one thing could be done as well as another." So he sold his farm, and bought wild lands in the prairies, and corner lots in lithographed cities; and began to dream of wealth worthy of "golden Ind." Work he could not; it had suddenly become degrading. Who could think of tilling or being contented with a hundred acres of land, when thousands of acres in the broad west were waiting for occupants or owners. D. was not the man to do it, and he operated to the extent of his means. At last the land bubble broke; lithographed cities were discovered to be mere bogs; and prairie farms, though the basis of exhaustless wealth, worthless unless rendered productive by labor. But D.'s beautiful farm is gone, and as he is now preparing on compulsion to become a pioneer in the west, he feels that it is difficult to make auger holes with a gimlet.

Mr E. is the representative of quite a class. He had his attention awakened to the subject of religion, and obtained new views of its importance and his own obligations. Believing what cannot be disputed, that love to God and good will to man, is the only true source of happiness, and feeling, as every benevolent mind must, a desire for the welfare of his race, he fancied himself called to declare these truths to the world; and forsaking his lapstone, his anvil, or his plough, became without delay an expounder of the scriptures, a self-delegated instructor of mankind. He forgot that the age of miracles had ceased; and that the ability to teach must now be acquired by the slow but necessary process of human learning. He begins to have misgiving that he has mistaken his call; and will probably discover, when too late to rectify the error, that he has spent the best half of his life in trying to make auger holes with a gimlet.

OBSERVER.

## HYACINTHS.

The subscribers have received a large assortment of Double and Single Hyacinths of every color and shade. Also, Tulips of mixed sorts, Crown Imperials, and Lilies: they have also at their garden all the fine varieties of Pæonies, which will be furnished at one day's notice. Lilies and Pæonies, and Crown Imperials, should be planted in August or the first of September. We shall receive a great variety of Bulbous Roots, from Holland, in a few weeks, when notice will be given.  
 JOSEPH BRECK & CO.  
 August 26.

## FRUIT AND ORNAMENTAL TREES, &amp;c.

Fruit Trees of all the different species—of the most celebrated kinds. These include Pears, Plums, Apples, Quinces, &c.—the trees of the Peach and Cherry, especially, are of the finest size, and in numbers abounding at this time, and of varieties unsurpassed. The Catalogue of Fruit and Ornamental Trees and Shrubs, Rosas and Herbaceous Flowering Plants, will be sent to all who apply: in that Catalogue many of the very best kinds of fruits, so far as proved, are particularly designated by a star.

Also, Grape Vines, Raspberries, Strawberries, Goose berries, and *Mulberries for silk*—Scotch Larch, Lindens, Sycamores, Silver Firs, Willows, Elms—Honeysuckles, Dahlias, splendid Pæonies, &c. &c. Trees when so ordered, will be securely packed for transportation to distant places, and all orders promptly executed by

WILLIAM KENRICK.

Nonantum Hill, Newton, near Boston, Sept. 9, 1840.  
 eptD1

## BONE MANURE

The subscriber informs his friends and the public, that after ten years experience, he is fully convinced that ground bones form the most powerful stimulant that can be applied to the earth as a manure.

Orders for Bone Manure or Oyster Shell Lime, left at the Bone Mill, near Tremont road, in Roxbury, at the New England Agricultural Warehouse and Seed Store, No 52 North Market Street, or through the Post Office will meet with prompt attention.

March 4, 1840.

NAHUM WARD.

## HORTICULTURAL TOOL CHESTS

Containing a complete set of Garden tools of superior finish and style, recently received from Liverpool and for sale at the New England Agricultural Warehouse and Seed Store.

May 6.

JOSEPH BRECK & CO.

## PATENT SPRING BALANCE.

A few of those very convenient spring balances, for family use, a very simple contrivance for weighing small articles. JOSEPH BRECK & CO. No. 51 and 52 North Market Street, Boston.

July 15.

## FENCE CHAINS.

Just received from England, at the New England Agricultural Warehouse, 6 casks chains, suitable for making the chain fence, &c.

JOSEPH BRECK & CO.

July 15.

## BERKSHIRE HOGS.

The subscribers offer for sale a few pair of full blooded Berkshire Hogs; also, pigs 7-8 blood, crossed with Mackay. Inquire at the New England Farmer office, or at their farm at Brighton.

JOSEPH BRECK & CO.

July 9.

## GARDENERS' KNIVES.

JOSEPH BRECK & CO. have this season imported and now offer for sale a few very superior Garden Knives, for pruning, &c. manufactured expressly for Gardeners, and warranted superior to any article of the kind before imported.

Also—a large assortment of Budding Knives, Grape Scissors, &c. &c.  
 April 22.

## TRACE CHAINS.

Just received, direct from the English manufacturers, 8 casks of Trace Chains, from 6 to 11 feet long, suitable for ploughing or draft chains. JOSEPH BRECK & CO.

## TIE UP CHAINS.

Just received at the New England Agricultural Warehouse, a good supply of those celebrated Chains for tying up cattle. These chains, introduced by E. H. Derby, Esq. of Salem, and Col. Jacques, of Charlestown, for the purpose of securing cattle to the stall, are found to be the safest and most convenient mode of fastening cows and oxen to the stanchion. They consist of a chain which passes round the animal's neck, and by a ring attached to the stall, plays freely up and down, and leaves the animal at liberty to lie down or rise at pleasure, and keeps him perfectly secure.

July 15.

JOSEPH BRECK & CO.

## THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at \$3 per annum payable at the end of the year—but those who pay within sixty days from the time of subscribing are entitled to a reduction of 50 cents.

TUTTLE, DENNETT AND CHISHOLM, PRINTERS,  
 17 SCHOOL STREET, BOSTON.

N. E. FARMER.

### REPORT OF THE ANNUAL EXHIBITION OF THE MASSACHUSETTS HORTICULTURAL SOCIETY—SEPT., 1840.

By a vote of the Massachusetts Horticultural Society, it has fallen to our lot to prepare a report of the annual exhibition. In the performance of this duty, if we were to follow the impulse of our own feelings, we should probably say too much in praise of our first love, the productions of *Flora*, and let our imagination run riot in an attempt to describe the beauties of the many fair specimens presented for our admiration; but we are reminded by *Pomona* that *her* offspring have a claim upon our special notice; and we should prove recreant to our trust were we to omit giving, at least a passing notice of some of the fine varieties of fruits which crowded our tables, and added so much to the gratification of our visitors. There was the Grape, with its luscious juice, apparently ready to burst the blooming covering which concealed that "maketh the heart glad": the Bartlett pear, which seemed to say, "come taste me and try me: I have but few equals and no superiors." The Graepstein apple was a temptation which almost set over injunction of "touch not" at defiance. The plums, encircled with imperial purple, and with flavor rich "beyond compare." Peaches, with colors various, and with qualities beyond the pale of our description;—all these our readers will perceive, by a reference to the report of the Chairman of the Fruit Committee, made but a part of the great whole.

Who of all the lovers of *Flora*, could behold the various specimens of flowers, from the gorgeous *Gloriosa superba* to the humble *Viola tricolor*, and not have his, or her, better feelings aroused into action—his thoughts raised to admire—his heart warmed with love, and his soul to burn with ecstatic desire to know more of the worth of Him who made them all; who formed them with graces and tinted them with colors so diversified, and scattered them with liberal hand wherever man is found.

With these for preliminary remarks, we shall now proceed to give a detailed account of the exhibition, which commenced on Wednesday, the 9th inst., at noon, and closed on Friday, 11th inst., at 6 o'clock, P. M. During that period the hall was visited by many distinguished strangers from various parts of the Union, who had assembled in our city to join the Whig procession at Bunker Hill.—It was gratifying to the committee of arrangements to learn from those gentlemen that an increasing interest in the pursuits of horticulture is now manifest in various parts of our country. We rejoice to know this, as we consider Horticulture is like Virtue—the more it is practiced the more lovely it will appear; and it may be said of it, as of Virtue, its ways are ways of pleasantness and all its paths are paths of peace."

Per order,  
SAMPL WALKER,  
Chairman Com. Arrangements.

Boston, Sept., 1840.

### EXHIBITION OF FLOWERS.

*Plants.*—From J. P. Cushing, Esq.;; *Latania borbonica*; *Phœnix dactylifera*; *Cycas revoluta*; *Chamærops humilis*; *Thea viridis*; *Begonia* sp.; *Photinia arbutifolia*, &c.

From Messrs Winship; *Eugenia australis*; *Erica spuria*; *Buxus arborescens*; *Begonia argyrostigma*; *Musa rosacea*; *Ardisia colorata*; *Acacia* sp.; *Eriobotrya japonica*; *Ficus elastica*; *Fuchsia coccinea*; *Eucomis vittata*; *Vallota purpurea*; *Cereus speciosissimus*; *Opuntia brasiliensis*; *Cereus cylindricus*; *Campanula pyramidalis*; *Melaleuca dimorpha*, *heliotropes*; *verbenas*; *roses*; *geraniums*; *Tradescantia discolor*; *Funkia japonica*; *Vinca rosea*; *Belladonna lily*; *Amaryllis Josephine* (in flower); and other plants, to the number of upwards of forty; also, branches of the *Shepardia argentea*, full of fruit.

From W. E. Carter, Botanic Garden: *Tecoma capensis*; *Magnolia grandiflora*; *Cratægus glabra*; *Beaufortia decussata*; *Rhododendron arboreum*; *Illicium floridanum*; *Hakea gibbosa*; *Rochea falcata*; *Laurus excelsa*; *Taxus chinensis*; *Callistemon saligna*; *Liatris latifolia*; *Vallota purpurea*; *Nandina domestica*; *Dracæna fragrans*; *Hibiscus Manihot*; *Eriobotrya japonica*; *Melaleucas*; *daphnes*; *acacias*; *fuchsias*; *ericas*; *diosmas*; *myrtles*; *petunias*; *azaleas*, &c; in all upwards of sixty plants: also, a fine cut specimen of *Hedychium Gardnerianum*.

From W. Meller: *Hoya carnosa*; *Fuchsia tenella* and *globosa*; *Citrus myrtifolia*; *Plumbago capensis*; *Diosma ericoides*; *Gloxinia speciosa*; *Eugenia australis*; *Thuja orientalis*; *Lauristinus*; *heliotropes*, &c.

From Capt. Sumner, Boston: two Chinese plants—remarkable curiosities; and which attracted, and deservedly so, universal attention. They illustrated fully the Chinese system of gardening, presenting a garden in miniature.

From J. L. L. F. Warren: variegated holly; common holly; silver-edged Box; *Stapelia* sp.; *Eugenia australis*; *Fuchsia gracilis*; *Erica concinna*; *roses*; *rosemary*, &c. &c.

*Cut Flowers.*—From E. H. Derby, Salem: *Amaryllis Belladonna*; do. var.? *Oxalis* sp.? and *Nymphæ odorata*.

From John Lewis Russell: a fine bouquet, composed of the following native plants: *Liatris scariosa*; *Gentiana crinita*; *Neottia spiralis*, and *Polygonum articulatum*.

A magnificent specimen of *Gloriosa superba*, from Madam Lowell, Roxbury, attracted great admiration.

From S. Walker: fine pansies, and specimens of *Tigridia conchiflora*.

From W. Kenrick: roses in variety.

From D. Haggerston, a collection of several varieties of *verbenas*.

Noisette roses, very fine, from S. R. Johnson.

A bunch of superb German asters, from Mr Arnold, Cambridgeport.

German asters from Josiah Stickney. Asters from J. A. Kenrick and S. Sweetser.

*Verbenas* from J. Breck & Co.

From Hovey & Co.: a collection of superb *verbenas*, including the following twenty species and varieties, many of them new and very splendid, viz: *Verbena chamædrifolia*; *Arraniana*; *Twædieana*; and *T. superba*; *Eyreana*; *teucroides*; *incisa*; *Binneyana*; *fulgens*; *Wales's seedling*; *Winchesterii*; *Russellii*; *Colcordii*; *Pepperi*; *ignescens*; *Hirstii*; *Richardsonii*; *Powellii speciosa* and *venosa*. Hovey & Co. sent a collection of ten varieties of most superb double balsams, viz: rose, purple, scarlet, white, mottled, scarlet spotted, crimson spotted, purple spotted, striped and ruby colored.

Messrs Winship sent a basket of *Passiflora quadrangularis*.

*Dahlias.*—From Josiah Stickney: *Ansell's Unique*; *Horsham Rival*; *Ingham's Canute*; *Rienzi*; *Sulphurea elegans*; *Essex Rival*; *Clark's Julia*; *Virgin Queen*; *Striata formosissima*; *Stanford's Contender*; *Rosa superba*; *Grand purple*; *Marshal Soult*; *Fire Ball*; *Ne plus ultra*; *Elphinstone's Coronation*; *Corinne*; *Reliance*; *Climax*; *Eva*; *Red Rover*, &c.

From P. Barnes: *Suffolk Hero*; *Unique*; *Clio perfecta*; *Quilled Perfection*; *Coronation*; *Middlesex Rival*; *Sunbury Hero*; *Beauty of the North*; *Conqueror of Europe*; *Metropolitan Perfection*; *Striata formosissima*, *Red Rover*, &c. &c.

From Hovey & Co.: *Marshal Soult*; *Horticulturist*; *Striata formosissima*; *Horatio*; *Beauty of the North*; *Mrs Rushton*; *Stone's Yellow Perfection*; *Gen. Washington*; *Reliance*; *Mrs Cox*; *Red Rover*; *Glory*; *Sulphurea elegans*; *Splendissima*; *Independent*; *Duchess of Richmond*; *Sir Henry Fletcher*; *Rosetta*; *Unique*; *Lord Liverpool*; *Eva*; *Quilled Perfection*; *Princess Victoria*; *Blandina*, &c.

From J. A. Kenrick: *Duchess of Richmond*; *Ne plus ultra*; *Rival Yellow*, &c.

From M. P. Wilder: *Mrs Rushton*; *Unique*; *Strata formosissima*; *Ne plus ultra*; *Beauty of the Plain*; *Red Rover*; *Ovid*; *Advancer*; *Sir Henry Fletcher*; *Castanda*; *Duchess of Richmond*; *Eva*; *Iver Hero*; *Flora Hastings*; *Contender*, (*Stanford's*); *Horticulturist*; *Bonny Jean*; *Lewisham Rival*; *Clio perfecta*; *Girling's Heroine*, &c. &c.

From D. Haggerston: *Eva*; *Beauty of King-scote*; *Princess Victoria*; *Striata formosissima*; *Marshal Soult*; *Unique*; *Metropolitan Calypso*; *Angelina*; *Splendissima*; *Clio perfecta*; *Dennisii*; *Red Rover*; *Lady William Powlett*; *Gen. Washington*; *Beauty of the North*, &c.

From Joseph Breck & Co.: *Striata formosissima*; *Angelina*; *Duchess of Richmond*; *Unique*; *Rival Sussex*; *Dennisii*; *Globe*; *Countess of Liverpool*; *Metropolitan Calypso*; *Paragon*, &c.

From R. Howe: *Mrs Rushton*; *Desdemona*; *Dennisii*; *Madonna*; *Suffolk Hero*; *Angelina*; *Red Rover*; *Countess of Liverpool*, &c.

Cushing ; Wirtemberg ; Seckle ; Cumberland ; Dix ; Andrews ; Urbaniste and Bartlett.

From George Brown, Beverly: Pears.—Bartlett ; Seckle ; Passe Colmar ; Van Mons ; Napoleon ; Bergamot ; Nonpareil ; Summer Thorns ; Catillac, and other varieties. Nectarines. Apples.—Brattle White ; Green Sweeting ; Drap d'Or ; Pomme d'Appi ; Siberian Crab and Holland.

From J. Fisher, Brookline: Pears.—Bartlett ; Andrews ; Seckle ; St. Michael ; Cuisse Madame ; Cushing and Wilkinson.

From Dr. Burnett, Southboro': Burnett pears.

From George Lee, Cambridge: Red Calville and Ribstone pippin apples. Melons.—Minorca and Imperial Water.

From E. T. Hastings, Boston: St. Michael pears.

From John Hovey, Roxbury: Peaches.—Two varieties. White Sweetwater Grapes—open culture.

From Frederick Tudor, Nahant: Petit Madame and Winship Peaches.

From Thomas Johnson, Chelsea ; Citron melons.

From Charles Johnson, Weston: Wirtemberg and Seckle pears. Hawthorndean apples.

From — Dyer, Abington: Apples.—Brown Sweeting ; Beam, (very large) ; Black Bantoc ; Elijah and one other variety.

From Elias Phinney, Lexington: Pears, viz: Warden ; Easter Beurre ; Beurre Diel ; Sylvange Verte ; Williams' Bon chretien ; Andrews ; Beurre Knox ; Cushing ; Chaumontel ; Long Green ; Chelmsford Palfrey ; Dix and a French variety. Apples.—R. I. Greening ; Baldwin ; Monstrous pippin ; Bellflower ; Late Juneating ; River ; Porter and Hawthorndean. Peaches.—Grosse Mignonne, Royal Alberge ; Rhode Island Rareripe and French Rareripe. Also, Black Hamburg ; White Frontignac ; White Sweetwater ; Bartlett and Palfrey Grapes—the two last native varieties. Among Mr Phinney's numerous collection, were many fine varieties, and his specimens generally were very large and handsome.

From E. M. Richards, Dedham: Apples.—Porter ; Hawthorndean ; Walpole ; Fall Sops of Wine ; Summer Pearmain ; Marseilles Red ; Fall Pippin ; Red Ingestre and Yellow Ingestre. Pears.—Harrison ; Porter and Cushing.

For the Committee on Fruits,

E. M. RICHARDS, *Chairman.*

#### VEGETABLES.

The number and variety of specimens contributed this season, have been very limited. The Committee regret that so little interest has been manifested to sustain this important branch of our interests. The following are the only specimens presented at our annual exhibition.

From T. Johnson, Chelsea: Canada crook neck Squash ; Ladies parching corn, (ripened in 97 days) ; Early Canada Corn, (very fine specimens.)

From Harrison Gray, Roxbury: Spanish Tomatoes.

From N. N. Dyer: 2 ears Brown Corn 13 inches long.

From E. Phinney, Lexington: a Tippecanoe Squash, weighing 137 lbs. This was truly a fine specimen, and attracted much attention. Also a large African Squash.

From A. D. Williams, Roxbury: fine specimens of crook-neck Squashes ; do. Autumnal Marrow do. ; Tomatoes and Blood Beets.

From Hovey & Co.: very pretty specimens of the White Carrot.

From Richard Ward, Roxbury: large Lucia Beans.

From John Hovey: Tomatoes.

From J. L. L. F. Warren, Brighton: Specimens of the Seven Year Pumpkin ; Marrow Squash, growth of 1839 ; Marrow Squash, the present year ; Sugar Beet.

The Committee, in presenting their annual report, respectfully urge the necessity of renewed attention to this department, as they feel confident that every member can do something that will, for the future, add much to the interest of all.

For the Committee,

JAMES L. L. F. WARREN,

*Chairman.*

*Domestic Conveniences—Cisterns.*—Every farmer should give particular attention to convenience of his household department. Female labor may be lessened to a surprising degree by studying this part of domestic economy. To contribute our mite, we here briefly give an account of the construction of a rain-water cistern of our own.

The pit for the cistern was dug so that the outside of the cellar wall formed a part of one side. The wall was built of cobble stone in common lime mortar, one foot in thickness. The bottom, which was hard pan, was first covered with cobble stones, of uniform size, laid in water-lime mortar ; a coat of the same mortar was laid upon this ; and a second coat of smaller stones completed the bottom. The whole inside then received two coats of water-lime mortar. By applying these to the walls before they had become dry, and then drying very gradually, they were wholly free from cracks. After remaining a few weeks, protected by boards from the sun,—the upper edge of the wall was covered with a layer of water-lime mortar ; two inch white oak planks covering the whole, (except a small curb, for the entrance of water and cleaning the cistern,) was laid on this mortar ; a coat of water-lime mortar was then spread upon the plank ; thick white oak slabs were laid again on this coat of mortar ; another coat of mortar upon the slabs, and several inches of compact earth, forming with the planks and slabs, a little more than a foot in thickness, completed the covering. This is sufficient to prevent the water from freezing in the coldest weather, though the curb, (18 in. by 2 ft.) is left open. It also prevents all access of surface water.

The cistern adjoins the kitchen, and a lead pipe, one inch in diameter, passes from near the bottom, through the cellar wall, obliquely upwards, to the kitchen floor, where it is attached to the lower end of a small pump. Thus, plenty of rain water is at all times at perfect command. The cistern is between 6 and 7 feet in diameter, about five feet deep, and holds about 40 barrels. Care should be taken to procure good water lime, failure often arising from bad material.—*New Genesee Farmer.*

*Farmers' Holidays, Fairs, &c.*—We give notice of quite a number of agricultural meetings and fairs to be held this month ; and there are many at a distance of which we have not received notice.—We wish all of our readers may have an opportunity of attending one or more of these fairs. They are calculated to promote the best interests of society in general, and of farmers in particular ; and therefore all should co-operate, and lend their aid and influence to sustain these organizations. These

meetings afford an opportunity for a friendly interchange of feelings and sympathies, so desirable among all classes, but so much neglected among farmers. They should have at least once a year, a general jubilee, where they can all meet as brothers and friends, engaged in the most noble and important of all occupations—where they can come together and compare views ; rejoice together over present attainments, and devise means for future advancements. We say then, come one and all, with your families and friends, and bring your choicest animals and productions, not forgetting the ornamental as well as the more strictly useful ; and if you are not delighted and well rewarded for your time and trouble, we shall be sadly mistaken.—*New Genesee Far.*

*Flowers and Shrubs.*—Why does not every lady who can afford it—(and who cannot?)—have a geranium or some other flower in her window? It is very cheap—its cheapness is next to nothing if you raise it from seed, or from a slip ; and it is beauty and a companion. It was the remark of Leigh Hunt, that it sweetens the air, rejoices the eye, links you with nature and innocence, and is something to love. And if it cannot love you in return, it cannot hate you ; it cannot utter even a hateful thing, even for your neglecting it ; for though it is all beauty it has no vanity ; and such being the case, and living, as it does, purely to do you good, and afford you pleasure, how will you be able to neglect it? We receive, in imagination the scent of these good natured leaves, which allow you to carry off their perfume on your fingers for good natured they are in that respect above all other plants, and fitted for the hospitality of your room. The very feel of the leaf has a household warmth in it—something analogous to clothing and comfort.

*MANY HEADED WHEAT.*—The many headed wheat is an indigenous plant of California ; six heads of which were procured by Major Spreng, from a man in the Osage nation of Indians, who had been trading in the Pacific Ocean. The six heads produced six hundred grains ; which were planted by Alpheus Baker, of Abbeville, S. C., the production of which was ten thousand heads. The ground on which the wheat grew was measured by an accurate surveyor—the heads counted—and one head shelled out, and the grain weighed ; a calculation was made, the result of which was, that the wheat produced at the rate of two hundred and thirty bushels to the acre. It was planted about the last of January, and cut on the 10th of June. The land on which it grew poor and sandy, and was unassisted by manure.—*Wilkes Co. (Ga.) News.*

*A Fact.*—Accidents sometimes lead to important results. A cypress vine was planted on sand loam, fertile for common crops, but grew only 1 inch or two, and continued stationary for several weeks. A quantity of soap suds was then thrown upon it, and it immediately commenced a vigorous growth, and advanced further in twenty-four hours than it had done in weeks before.—*New Gen. F.*

A Dublin paper says that a single grain of wheat in the garden of Mr Fortescue, produced six hundred and fifty grains ! The stalk was eight feet in length.

From S. Walker: Mrs Rushton; Eva; Marshal Soul; Striata formosissima; Desdemona; Horsnam Rival; Unique; Princess Victoria; Ne plus ultra; Diana; Victory; Napoleon; Lady Webster; Lady Dartmouth; Lilac Perfection; Sulphurea elegans; Suffolk Hero; Beauty of West Riding, &c.

From W. E. Carter: Striata formosissima; Mrs Rushton; Glory; Quilled Perfection; Countess of Liverpool; Dennisii; Rival Sussex; Unique; Metropolitan Calypso, &c.

From J. L. L. F. Warren: Dahlias, of several kinds. Dahlias were also furnished for the wreaths and decorations by most of the cultivators.

*Bouquets*.—A superb bouquet, for one of the large alcoves, was contributed by Messrs Hovey & Co.

From Messrs Winship: smaller bouquets.

From W. E. Carter: bouquets; the two latter filled the smaller alcoves in one corner of the room. Mr Walker contributed the large and two smaller ones, which filled the three alcoves in the opposite corner. Besides these, bouquets were sent by R. Howe, W. Kenrick, John Hovey, W. Meller, J. A. Kenrick, &c.

For the Committee,

S. WALKER, *Chairman*.

#### FRUITS.

"The juicy pear

Lies in a soft profusion, scattered round."

From E. Vose, Dorchester, President of the Society: Pears.—Napoleon; Petre; Bartlett; Long Green; Winter Warden; Cushing; Roi de Wurtemberg; Lewis and Urbaniste. Apples.—Hawthorndean; Lady Haley's; Nonsuch, and Large Sweeting. Melons.—Green flesh; Cantaloupes; Minorca and Nutmeg—all very fine specimens, as usual.

From Mrs J. Heard, Watertown: fine Broca's bergamot pears.

From Samuel Pond, Cambridgeport: Pears.—L. Ghislain; Passe Colmar; Napoleon; Andrews; Surpasse Virgalieu; Dix; Andrews' Julienne; Duchess d'Angouleme; Wilkinson; Easter beurre; Beurre Diel; Bartlett and Cushing. Plums: Diamond, Semanna and Lombard. Mr Pond's specimens were all very large and beautiful.

From M. P. Wilder, Dorchester: Pears.—Bartlett; Bonchretien fondante; Roi de Wurtemberg; Beurre bronze; Fulton; Columbian Virgalieu; Easter beurre; Surpasse Virgalieu; Dix; Louisonne d' Jersey; Cumberland; Napoleon; Prince's St. Germain; Cushing; Duchess d'Angouleme; Heathcote; Urbaniste; Belle Lucrative; Belle etonne; Raymond; Rousseneb; Seckle; Wilkinson; Queen Catharine; Thompson; Glout morveau; Garnons; Belmont; French; Bleeker's meadow; Summer Thorn; Fourery Bouvier; Fontante du Bois; Seckle, or Quincy stock; Forelli? Beurre Diel; Whitfield; Chaumontelle; Passe Colmar; do. second crop on new wood; Burgomaster; Iron; Beurre d' Aremberg and Catillac. Among Col. Wilder's numerous varieties, were many very large and beautiful specimens.

From Richard Ward, Roxbury: Pears.—Bartlett; Seckle and Andrews. Peaches: several sorts.

From J. W. Lamb, Newton; Bartlett pears and variety of apples. Quinces.

From J. A. Kenrick, Newton: Apples.—Hubbardston Nonsuch; Kilham Hill; York Russett; J. Greening; Baldwin; Cogswell; Dutch Cod-

lin; Pumpkin Sweet; Rambour franc; Porter; Yellow Crab and High Top Sweeting. Peaches.—Cutter's Yellow Rareripec; Momiiana Pound; Heath; Van Zandt; Superb and Welle's freestone. Pears. St. Michael and Andrews'. Melons.—Water.

From John Fowle, Roxbury: Bartlett pears.

From A. D. Williams, Roxbury: Pears.—Bartlett; Capiaumont; Chelmsford; Andrews; Cushing and Summer Thorn. Apples.—Fall Sops of Wine; Porter and Ladies.

From S. R. Johnson, Charlestown; Large clusters of White Frontignac and White Chasselas grapes—open culture.

From J. P. Cushing, Watertown: Grapes.—Black Hamburg; Black Maroe; White Sweetwater; St. Peter's; Grisly Frontignac and Muscat Alexandria: all large and very fine clusters.

From Thomas Waterman, Boston: Seedling peaches.

From Perrin May, Boston: Brown beurre and Good Christian pears—fine.

From A. D. Capen, Dorchester: Seckle pears. From J. Gardner, Dorchester: Gravenstein apples.

From Cheever Newhall, Dorchester: Pears.—Harrison; Napoleon; St. Michael; Wilkinson; Dix; Urbaniste; Bartlett; Wurtemberg; Bleeker's meadow and Knight's seedling. Porter and Gravenstein apples. Native black grapes.

From Messrs Winship's Nurseries, Brighton: Pears.—Amory or Andrews; Capiaumont and Wurtemberg. Gravenstein apples.

From R. Manning, Salem: Apples.—Emperor Alexander; Foll Harvey; Gravenstein; Murphy; Red Crab; Ribstone pippin; Swaar; Beauty of the West; Victorious Rennette. Pears.—Althorp Crassani; Beurre Bosc; Buffum; Beurre van Marum; Bonchretien Turk; Belle Lucrative; Beurre bronze; Bishop's Thumb; Beri de la Motte; Cushing; Cabot; Beri Chaumontel; Beurre Duval; Flemish Beauty; Foster's St. Michael's; Fulton; Bergamette de Automne; Harvard; Golden Beurre of Bilbao; Huguenot; Hacon's Incomparable; Hecicart; Valee Franche; Jutte or Buitt; Jalonsie; King Edward; Long Green; Petre; Pope's Russet; Rouville; Wredow; Frederick de Wurtemberg; Williams' Melting; Surpasse Vergoulouse; Naumkeag; Winter Nelis; Urbaniste; Garnon's; Green Pear of Yair; Fondante du Bois; Louise bonne Real; Forme de Delices; Alpha; Dearborn's Seedling. Mr Manning's collection of pears is probably more numerous than any in the U. S.

From John M. Ives, Salem: Roi de Wurtemberg; Belle Lucrative; Napoleon; Raymond; Beurre Bosc; Williams' Bon Chretien; Early Beurre (of Prince's catalogue); Beri Montigny; Cushing, Passe Colmar and Washington pears.—Michael Henry Pippen; Danvers Winter Sweet; Swaar; Rambo, or Romanite; Wellington; Drap d'Or; Mela Carla; Camfield, or Newark Sweeting apples. Sharp's Emperor; Cruger's Seedling and Blue Imperatrice plums. Skillman's Netted and Murray's Pine-apple melons. In the above list are contained some fine sorts.

From Joseph Balch, Roxbury: Grapes.—Grey Frontignac; Black Prince; Blanquette; purple French, and a variety, name unknown—beautiful clusters.

From Gen. Sumner, Roxbury: Raspberries.—Second crop on new wood. Pears.—Green Muscat; Summer Thorn; Heathcote and Broca's Bergamot.

From Mrs Gibbs, Boston: Garnon's, St. Michael's and St Germain pears.

From Joseph Pines, Hanover, N. H., Sweet Baking apples.

From B. V. French, Braintree: Apples.—Ortley Pippin; Black; Mela Carla; Monstrous Pippin; Yellow Bellflower; Court pen du plat; High top Sweeting; Porter; Garden Royal; Adams' Sweeting; Hawthorndean; Garden striped; Pomme d' Niege; French's Sweet; Fall Sops of Wine; Dutch Codlin; Burasoe; Sweet Greening; Templeton Winter Sweet and Red and Green Sweeting. Pears.—Chelmsford; Passe Colmar; Ronville; Arch duke of Austria; Cushing; Bartlett; Howard; King's bon chretien; Beurre van Marum and Monsieur le Cure. Mr French's fruits made quite a display.

From J. L. L. Warren, Brighton: Grapes.—Sweetwater; open culture. Apples.—Porter; Monstrous pippin; Ladies and River. Pears.—Urbaniste; Washington; Roi de Wurtemberg. Peaches.—Rareripec; Prince's Red and Natural. Plums.—Two varieties. Water-melon.—Imperial. Several of Mr Warren's specimens were fine.

From Col. Perkins: Grapes.—Black Hamburg; Grisly Frontignac; White Frontignac; Muscat of Lunel; do. of Alexandria; White Nice; St. Peter's; Golden Chasselas, and White Sweetwater. Peaches.—New Royal George and Grosse Galande. Nectarines.—Bromfield and Elruge—all splendid specimens.

From Mrs Bigelow, Medford: Peaches.—Seedlings (two varieties) and Jaque's Rareripec. Pears. Bon chretien and St. Michael. Apples.—Monstrous Pippin and Blue Pearmain. Striped Mandrake melons—all very beautiful.

From William P. Richardson, Salem: Ribstone pippin apples. Seckle, Broca's Bergamot and Roussellette d' Rheims pears—fine.

From John J. Low, Roxbury: Apples.—Ribstone pippin; Gloria mundi; Bellflower; Mackay; Sweeting and Blue Pearmain. Pears.—Johannot; Andrews; St. Michael, Sylvange Vert; Urbaniste and Fulton.

From S. H. Colton & Co., Worcester: Seedling peaches and Seedling apples.

From J. Parkinson, Brighton: L'Ecure and Duchesse d' Angouleme pears.

From C. Warren, Brighton; Bartlett pears.

From E. Newbury, Brooklyn, N. Y.; Jaque's Yellow Rareripec peaches—fine.

From Wm. Pratt, Watertown: Pears.—Andrews. Black Hamburg; Frontignac and White Sweetwater grapes—good specimens.

From Clement Sharpe, Roxbury: Imperial Water melons—weighing 22 lbs.

From F. Baker, Boston: Apples, of very large size.

From Samuel Walker, Treasurer of the Society, Roxbury: Pears.—Wilkinson; Orange; Belle de Brussell's; Bergamot and another sort. Plums: Coe's Golden-drop.

From C. Comstock, Poughkeepsie, N. Y.: Virgalieu and St. Michael's pears. Spice and Hagloe crab apples.

From Samuel Downer, Dorchester: Pears.—Dix, Roi de Wurtemberg; Urbaniste and Marie Louise. Apples: Red and Green Sweeting; Hawthorndean and Lyseom.

From George Newhall, Dorchester: Apples.—Hubbardston Nonsuch; Pumpkin Sweet; Belle et Bonne; Bellflower and Porter. Pears.—Fulton;

## WESTBORO' CATTLE SHOW.

The first exhibition of the Westboro' Agricultural Society took place on Wednesday, the 7th inst. under the most favorable auspices. The day was one of the finest that could be desired, and one of great interest to the inhabitants of the town, as well as many from the vicinity and strangers. It was truly a farmer's holiday, and will long be remembered by those who had the happiness to participate in the rational pleasures of the day. The town hall, a handsome and commodious building, was opened as a receptacle for domestic manufactures, butter, fruit, vegetables, &c.

The ornamenting of the hall was confided to the oversight of the young ladies, who exhibited much taste in the arrangement of the evergreens and flowers, for which the wild woods and fields as well as the gardens, were laid under heavy contribution.

Among the domestic manufactures, we noticed carriages, agricultural and edge tools, pumps of various patterns, furniture, stoves, leather, carpets, counterpanes, hearth rugs, and a great variety of fancy articles, the handy work of the young ladies, tastefully arranged by their own hands—whose presence greatly added to the interest of the scene. There was also a curious *jet d'eau* in play, supplied with water from the gallery, which attracted much attention, especially from the youngsters.

The butter presented a most inviting appearance and sustained the high character for which the town and vicinity have been noted. It would have bothered us, had we been on the committee for butter, to have awarded the premium, as it must have required a very acute taste and smell to have decided which was best. All the samples, which were numerous, appeared first rate.

There was a good show of apples, fine vegetables and samples of seed corn—one from Moses G. Maynard, from a crop of 97 bushels to the acre, without extra labor. It had been duly weighed and measured.

The following account of a rye crop was taken from a box containing a sample of the rye:

"Westboro', Oct. 6, 1840.—Account of my crop of spring rye this season. I have raised on one acre and 150 1-2 rods, fortyseven and a half bushels: quantity of seed, three bushels. The ground was ploughed and harrowed with an iron harrow, quite the first of April. About a week after, the grain and hay seed were sown and lightly ploughed in: this ground was then harrowed with an iron harrow, and also with a bush harrow. The ground was planted with corn last season, of which I raised a good crop. Quantity of manure last season, 50 loads, of an ordinary quality.

JONAS A. STONE."

All the productions and articles were so arranged as to present an interesting show—not quite so extensive to be sure as the Mechanics' Fair—but considering it a town affair, very respectable and encouraging, for the first effort.

The numerous horse sheds near the meeting house, were converted into pens to accommodate the cattle and swine.

The show of swine was as good as we have ever witnessed at any county exhibition, in proportion to the number of entries, and we should not perhaps say too much, if we pronounced it the best. The breeds were mostly Berkshire, full or half bloods.

Among the milch cows, heifers, steers, bulls, &c. there were many fine specimens: we noticed a pair of twin two year old heifers, of very promis-

ing appearance, from a cow that had afforded fifteen pounds of butter per week.

The cows of Lovett Peters, Esq., President of the Society, all made their appearance on the occasion—10 or 12 in number—first rate animals, gallanted by a fine young Durham bull.

Mr Harrison O. Fay obtained the first premium for milch cows. He stated that the value of the produce from the animal exhibited, was in the year 1838, \$86; in 1839, \$83; and thus far the present year, \$75: the odd cents we do not remember.

There were present 80 yoke of Oxen. As they were formed into one team and paraded through the streets drawing a hay load of wood, they presented a pleasing sight: it was certainly "a long pull and a strong pull," if it was not "a pull altogether." It was an interesting procession: a great majority of them were first rate animals.

For the ploughing match 6 double and 4 single teams were entered: the work was done in a workmanlike manner, and in no way interrupted by the spectators, who behaved with the greatest decorum and propriety through the day.

There was an address in the meeting house at 11 o'clock, that was patiently listened to by a large audience; but it being the writer's first effort of the kind, and unused to public speaking, could not have been deeply interesting. The politeness and forbearance of the hearers were, however, highly gratifying.

After the exercises of the house were closed, the trial of the strength of working oxen took place, giving the usual interest. We were very sorry, however, to see a pair of yearling steers hitched to the cart and made to draw the load designed for heavy oxen up the hill or part way. They worked admirably for such young creatures, and showed how well they had been trained; but it was most too cruel to put them to so severe a test.

At half past two, a large company sat down to a first rate, substantial dinner, provided by Mr Brigham, and partaken of in as social, cheerful manner as if stimulated by wine or strong drink; and much more agreeable no doubt to a great majority present, and equally satisfactory to all.

After the dinner was despatched the company proceeded to the meeting house, where the premiums were awarded, which consisted in agricultural papers. Before night the assembly had dispersed to their respective homes, well pleased, no doubt, with the result of their first experiment.

We consider the formation of this Society a very happy circumstance to the farmers of the town and vicinity. It will be more beneficial to them than the county society, as they have monthly meetings for discussing agricultural subjects, and better opportunities to come to the practical results of farming. Here they can compare notes, relate each other's experience, and tell of their failures and success. While county societies should be encouraged and sustained, and the interest of their exhibition greatly increased, associations should be formed in every town for the advancement of agriculture and domestic manufacture, and a day set apart for a holiday, like the one we have now enjoyed. It will give an opportunity for all the inhabitants of a town, of all classes, to meet together without regard to political or religious sentiments, and unite in harmonious feeling, in the innocent enjoyment of the festivities of the day; and when conducted on temperance principles,

must have a good moral bearing upon their personal character. J. B.

## LARGE CORN CROPS.

To the Editor of the New England Farmer:

Having for several years past succeeded in raising very large crops of corn on my dairy farm, in the Winepisseogee lake, New Hampshire, and several times received a premium from the agricultural society of Strafford county, for crops varying from 110 to 131 bushels per acre, I have found it a little difficult to satisfy some gentlemen in our vicinity that the measure was accurate. They suggested that the only mode of arriving at a correct result was, to weigh the entire crop. I accordingly requested Capt. Paul P. Pillsbury, the very skilful and intelligent manager of my estate to test the quantity of his next large crop in the ear by the scales.

He writes me from Cow Island under date of Sept. 27th, 1840, as follows:

"Your Massachusetts people doubt our raising as much corn on an acre as we have entered for premiums. This year there is no premium offered, but I have been as exact with regard to the corn as if it were to be entered for premium. I weighed all the crop raised on one acre, and it weighed 9216 lbs. I then shelled a portion to ascertain how many pounds it would take when first gathered to make a bushel, and it took 71 lbs. for one bushel. I have kept it apart in order to know how many bushels it would make when shrunk.

Dr. C. T. Jackson called on me a few days ago, he expressed a desire that I should send a small trace of the corn to Boston, to be hung up in some public place. I will put one or two small traces into a box, and send them when I send the cheese. I think they would not disgrace the best parlor in Boston."

By this you will perceive that the quantity raised upon a single acre as ascertained by weight immediately after it was gathered, was 129 3-4 bushels, a crop which will compare very advantageously with the produce of any portion of the soil of the fertile West; and will, I trust, do no discredit to a State Street farmer.

Yours very respectfully,

E. H. DERBY.

*Preservation of Cabbages.*—The following method of preserving cabbages for winter use, are the result of experience:

The cabbages should be gathered before injury is done them by the severe fall frosts; the heavy outside leaves should remain on the stalk. Fix a string or cord round the stump near the roots, suspended from the sleepers with the heads downward in a cool cellar, and they are ready and fit for use at all times. Cabbages kept in this manner retain all their peculiar flavor and sweetness: the whole virtue of the stump and leaves is concentrated in the part which is used, are handy of access, occupy but little room which would be occupied for other purposes, and seldom, if ever, rot. The outside leaves wilt and contract, and in time become quite dry, which form a sort of coating that serves to exclude the air from the inside of the head.

Another method practised by some, and highly recommended, is to cut the head from the stump pack close in a sack, taking care to fill up the vacancies with dry chaff, thereby excluding the air and keep in a dry cellar.—*Albany Cult.*

**VEGETABLE DIET.**—There cannot be a doubt that the diet of the Irish is highly favorable to vivacity and talent. It is stated in the Code of Health, that "vegetable food has a happy influence on the mind, and tends to preserve a delicacy of feeling, a liveliness of imagination, and an acuteness of judgment, seldom enjoyed by those who live principally upon animal food. The latter is better calculated for those who labor with the body; but the celebrated Franklin ascertained that a vegetable diet promoted clearness of ideas and quickness of thought, and that a transition from vegetable to animal food produces injurious effects. A friend states that he has more than once selected from his tenant's children a boy remarkable for that smartness of intelligence so common in the Irish youth, while in the capacity of errand boys on the farm, or helpers in the stables, and before they became pampered with better food than their parents' cabin afforded. The lads were at first lively and intelligent, and displayed a degree of shrewdness exceeding what is generally met with from youths of a more exalted walk of life in England. But he invariably found that in proportion as these boys were better fed, they relaxed in activity, became dull and stupid; and he is confident the change in disposition sprung from the effect of change in diet, and was not owing to corruption of mind from their intercourse with the other servants. In fact they lose all that vivacity of manner so inherent in the Irish boys, whether born in the vast bog of Allen, or in the dry and rocky counties of Mayo and Galway. He is therefore inclined to think that the character of the people does not depend so much upon climate or soil, as upon food, for no part of the globe can differ more than these parts of that kingdom.

A potato diet is found greatly to improve the quality of the blood. Hence roasted potatoes have been successfully employed as a specific against the sea scurvy, when other remedies have failed.—*Sir John Sinclair.*

**Bone Dust for the Cultivation of Grain.**—The exportation of bones from Germany to England, constitutes a singular epoch in the annals of commerce. Myriads of tons have been already exported without glutting the market, or causing a cessation of the demand. In the North Sea, mills have been erected to pulverize them. This bone powder or bone dust was long ago exclusively applied to the purposes of hot houses by German horticulturists; but the English, emboldened by their riches, have extended its use to general objects of agriculture, and fertilize, by these expensive means, their cold, humid, and poorest land; and have thus brought the uplands of Nottinghamshire, the western parts of Holderness, &c., into the highest state of cultivation, both in point of extent and intensity of fertility. There is, consequently, a proverb "that one ton of German bone dust saves the importation of ten tons of German corn." As Malta formerly covered her naked rocks with foreign soil, so does England now fertilize her clay and sandy heaths with German bones. Near the sea coast even the churchyards are robbed of their venerable relics, which is only ironically excused by rendering the German bone trade popular. An agriculturist, being rendered attentive by this vast exportation, instituted privately some comparative experiments, the results of which prove that bone dust acts in the cultivation of ground, as compared to the best stable manure, 1. In respect of the

quality of corn, as seven to five. 2. In respect to quantity, as five to four. 3. In respect to the durability of the energy of soils, as three to two. It produces several collateral advantages: 1. It destroys weeds. 2. It diminishes the necessity of suffering the land to lie fallow. 3. This concentrated manure, or substitute for manure, is more easy of conveyance, less laborious to spread, and can with facility be applied to the steepest vineyards or other inaccessible lands, either mountainous countries or wet meadow land. 4. It renders agriculture practicable without cattle breeding, grazing, &c.—*Repertory of Inventions.*

#### STAGNANT WATER.

Of all the causes that contribute to render soils poor and worthless, we believe there is none more active than stagnant water, on the surface or immediately below. Such soils are invariably close and tenacious, and commonly quite unproductive. Where there is a retentive subsoil, the surface generally abounds in clay, is difficult to work, and gives a less reward to labor than almost any other. This is owing to the stagnant water held by it, as none of the valuable plants can flourish in a soil so constituted. Land is liable to injury from this cause, on which water during wet weather rests on the surface for even a short period, for the roots of a plant cannot penetrate a soil freely, in which the density is such that rain water does not freely sink through it to the natural drains in the subsoil, below the ordinary range of the roots of plants. Water is essential to the growth and perfection of plants, but water that does not circulate, or which exists in too great quantities, is fatal to them; and the first thing to be done, is to free soils from this incumbrance, if we would give it productiveness, and render it easy of culture.

It is from these well known effects of stagnant water, when on the surface, or within reach of the roots of plants, that the necessity of draining arises, and which system of operating, when fully carried out, completely changes the character of lands submitted to such a course. Manures applied to soils abounding in stagnant water, can produce little effect; the salts they contain are diluted, and cannot produce that action, or circulation of atoms, which appears absolutely necessary to productiveness. In clay, or in stagnant water, where substances are not exposed to heat and atmospheric agencies, decomposition is slow. Every farmer knows that manures produce much more effect on loam, gravel, or drained clay soils, than on those so retentive as to have water on or near the surface. Draining them, and aeration, or the exposing the soil to atmospheric action, to the influence of the sun and air by deep ploughing, seems to be the only thing that can be relied on to correct this serious evil.

Instances indeed occur in which the wetness of land is produced by springs, which rising from the earth, spread over it; but in far the greatest number of cases, the stagnant water is owing to a retentive subsoil, that prevents the escape of such water as falls upon it. In either case, however, the remedy is the same; and in the language of Morton on Soils, complete and perfect draining is the foundation of all improvement in husbandry, and it should, therefore, be the first step we take in attempting to improve or ameliorate the soil.

A very large proportion of the lands in this country, are of that class that suffer more or less from the accumulation of water. No person can

traverse it in various directions, without being sensible of this fact; and in consequence of such liability to suffer, the land in many districts is cold and poor, as land not freed from stagnant water always must be. The hard pan lands which cover so large a portion of the country, may be named as belonging to this class, though some of these contain more clay than others, and are therefore more shallow and difficult to work than others, where the subsoil, although still too retentive, lies deeper, and is therefore not so injurious as the first kind is well known to be.

Much of this hard pan, when freed from its stagnant water, drained and ploughed, will become very fertile and productive; indeed there is no case in which a soil cannot by sufficient labor and expense, be made precisely what is desired. The native earths that go to constitute soils, the clay, sand, and lime, in themselves do not make a soil productive; properly mixed and proportioned they constitute a base for the action of the vegetable and animal manures, and the various salts or stimulating agents, that excite the organs of plants to vigorous action, and enable them to make these secretions from the matter furnished them, to be appropriated to the growth of the plants. Man, then, has only to do what nature in some cases has herself done; that is, to proportion the several ingredients that go to make a productive soil, that the desired result shall be attained. Chemical analysis has here come to the aid of the agriculturist, and shows him precisely the proportion of the earths, and the nature of the ingredients that are necessary to make a soil fertile, and the causes that tend to advance or retard such a consummation. Where water is too abundant, it must be removed by draining; where the soil is too compact, it must be loosened by deep or subsoil ploughing; where the proportion of clay is too great, sand must be added until it is sufficiently friable; if lime is absent, it must be added; if animal or vegetable matter be wanting, it must be supplied; and if the soil is too light and porous, clay will be found a remedy most effectual.

Whatever difference of opinion, therefore, may be entertained of the best methods of freeing land from stagnant water, there can be no reasonable doubt of its propriety or necessity. To the farmer who has lands wet, cold, and difficult to cultivate, we would say, free your soil from all stagnant waters to the depth of eighteen or twenty-four inches; loosen it to that depth, either at once or gradually, and there will be no difficulty, under a judicious course of cultivation, of producing on lands now of little value, all the most important products of agriculture.—*Albany Cultivator.*

**CURING HAMS.**—A correspondent of the Farmer's Cabinet gives the following method of preserving hams:

I turn my barrel over a pan, or kettle, in which I burn hard wood for seven or eight days; keeping a little water on the head of the barrel, to prevent it from drying. I then pack two hundred weight of ham in my barrel, and prepare a pickle, by putting six gallons of water in a boiler, with twelve pounds of salt, twelve ounces of saltpetre, and two quarts of molasses. This I stir sufficiently to dissolve the salt, &c., and let it boil and skim it. I then let it cool and pour it on my ham, and in one week I have smoked ham, very tender, of an excellent flavor, and well smoked.

## NEW ENGLAND FARMER,

AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, OCT. 14, 1840.

## CREDIT.

We promised some farther observations on credit; and having given them, shall relieve our readers from any longer discussion of these subjects for the present.

There are two kinds of capital—actual and fictitious; and actual capital may be considered in two aspects—as productive and unproductive. Actual capital is that which has a real and substantial existence; as land, houses, buildings, machinery, ships, cash or specie.—Fictitious capital is that which is made capital by a legal fiction; by a mere conventional agreement; that which we ourselves create at our own pleasure, and hold and exchange as the representative of value; such as notes of hand, bills of exchange, bank notes, and all other paper currency. The value of the precious metals, or rather the standard of their value, may be considered as in some measure conventional; yet as they have an intrinsic and universal value, and are the representative of wealth among all nations who have a currency; and as they are to a great degree imperishable, and not to be produced at our pleasure, we may consider them as actual capital. In the business of life fictitious capital answers every purpose of actual capital, so long as its credit can be maintained, or while society is willing to receive it as such. But in order that it may be regarded as the true representative of real wealth, it must be as we have shown, capable of being converted into real wealth. When this ceases to be the case, its value ceases, of course.

Productive and unproductive capital are easily understood. That which is capable from its use of giving a return, is productive: that which gives no return is unproductive. A house, which we lease and for which we receive a quarterly or an annual rent, is productive; but a house upon a farm, which we occupy, and all the necessary buildings for the storage or protection of our produce, is unproductive. The cost of these is an expenditure which is indispensable, but for which we get no return. So, likewise, in regard to a factory. The buildings, the dams and sluice ways, the machinery, the houses for the operatives, are all to be considered as unproductive. We can not do without these; yet they are, properly speaking, so much unproductive capital. The money expended in raw material, whose value in passing through the various processes of the manufacture is often increased a thousand fold, and in the labor which conducts these operations, is to be considered as productive. So, likewise, money invested in shipments, in stocks, in cultivation, and in any agricultural improvement which renders the land more fruitful, is productive. Money which is hoarded up without use, is unproductive. All money expended in mere ornaments or embellishments, which do not render the property to which they are applied more lucrative or productive, must be regarded in the light of unproductive capital.—If a house for being painted will yield no more rent than if it were suffered to remain plain, the expense of painting it is placing capital where it is unproductive, and is lost. The erection of a fence sufficient to protect our crops and fields is indispensable; but the investment of capital in its erection is unproductive; and all expenditure upon this fence in the way of ornament, is a waste of capital, as far as any return is concerned. It may increase the intrinsic value of the property, and render it more saleable in case it should be desirable to sell it; but it is useless in respect to any productive return.—

We need not proceed farther with these illustrations. Productive and unproductive capital seem in some cases to be so nearly allied that it is difficult to distinguish them; but all that which has no tendency to increase, though such expenditures are in many cases indispensable, must be classed with the unproductive.

Credit is wealth: that is, it commands wealth, and answers every purpose of wealth. It is so much capital, which its possessor may employ as he would any capital of a substantial or real character. As it brings with it equal facilities for good, so is it equally liable to abuses as wealth. In general with us it comes in the form of bank loans; and consists in money obtained from the banks. The credit, therefore, of which we mean to speak in this case, is borrowed money, which is supplied by the banks, and for the supply of which they are created.

Now as we have said, there may be too much capital and too much credit in a community. We mean particularly for purposes of business. Certainly we do not mean to say there may be too much wealth; because, where it is already acquired or accumulated, those who have it may employ it, as they will, in public improvements and embellishments, whether they may be productive or unproductive; for if not productive in a pecuniary view, they may be productive in gratification and in various other ways to the whole community. But this is not the case with matters of business. Here, if there be more capital than can be employed with advantage, there is too much; and where capital is abundant and credit easy, men are liable to be led into numerous and gross abuses. Credit is of great value where it serves as a stimulant to industry; but it is a curse where it encourages or becomes the means of extravagance, gambling, dissipation or profligacy. Now there can be only a certain amount of business, profitable business done in a community; and beyond that, capital is not needed; and indeed is often much worse than useless.

We have in this case the illustrations of history and of personal experience, which are much more striking and instructive than any other. Look back then to the memorable year of 1836, when the community was flooded with bank capital; when money was almost crowded upon the borrower; and the credit of few men was so poor that they could not obtain it. What was the consequence of this excessive repletion? Disease and death, as in the human system; or in other words, universal embarrassment and almost universal bankruptcy. Out of twelve hundred dry goods merchants in New York, it has been confidently stated that not more than sixty have escaped insolvency; and this applies to other classes in the community as well as to the merchants; and many staid farmers caught the almost universal frenzy, and in the rage for suddenly growing rich, their whole farms went down in the general wreck.

The first evil effect was a sudden advance in luxury beyond all precedent. This showed itself in houses, style of living, dress, servants, equipages, jewelry, amusements, and all the usual accompaniments. A great deal of this was the effect or fruit of borrowed money. Men used it as if it were their own; sometimes without ever intending to repay it; but by various modes of assigning their property or concealing it, meaning from the beginning to enrich themselves and thus to set their creditors at defiance. In other cases they were calculating upon some extraordinary contingency, some strange turn of the wheel of fortune, some unheard of success, that should enable them to meet the day of payment, which in truth was certain to come long before they would be ready for it.

The second effect was, to produce a spirit of universal speculation in lands, houses, trees, stocks, and projects and enterprises of every description—the disastrous effects of which have been, and must continue to be, long and most seriously felt. Few persons by extraordinary freaks of fortune became enriched; but the great mass engaged in these wild speculations, were stripped of all former accumulations and left to suffer the most bitter retributions of their madness and folly.

Credit thus abused, fictitious capital thus created was, and ever must prove, a great curse to the community. The sudden and most inflated rise of prices beyond all reasonable bounds, was a general evil, by creating false expectations and leading to the most reckless and hazardous adventures; and more especially by breaking up and inducing men to abandon all habits of honest industry and frugality, and seek shorter modes of acquiring wealth, which in themselves are but too often based on fraud, and expose human virtue to the most severe perils.

We are sensible that we leave this subject here in a very imperfect form; and we have hardly entered upon the abuses of credit. We cannot now, however, extend our remarks; and shall conclude by saying, that all means or methods of acquiring wealth other than by honest industry and frugality, are to be discouraged, as too often leading to immorality; as removing the most effectual securities against the waste and abuses of wealth; and as being ordinarily inconsistent with the equal rights of mankind.

H. C.

**KILLING CANADA THISTLES.**—A correspondent of the New Genesee Farmer says,—It will sometimes be found more convenient to kill Canada Thistles by the application of salt, than by the ordinary method of tearing them up with the plough. A small patch, especially if it be in pasture or meadow, may thus be destroyed without materially injuring the sod. The way is for a man to go over the ground with a hoe, carefully cutting off each plant just below the surface of the ground, and a boy to follow after and put a small dose of salt on the uncovered roots, say one to two tea-spoonfuls to a root, until every plant has been supplied. It is quite probable that a month or two afterwards a few sickly looking yellow plants may appear, but if they do, another similar course of treatment will be effectual.

Any sharp hoe will answer for cutting them off, but experience will show that labor can be saved by a little different construction. The hoe should be narrow and a little heavier than common. For instance, something in the shape of a chopping axe, with the handle put in at right angles with one of the flat sides. It should not, however, be as heavy as an axe. The required weight being merely that which is necessary to give force enough to the blow to sever the root without difficulty. Such a hoe will be found very convenient for cutting up docks, burdocks, &c.

Canada Thistles should be cut up as soon as they are in flower, and as much sooner as is convenient. Hence the sooner it is done, the better.

A gardener at Glasgow, having noticed that a piece of woollen rag which had blown upon a currant bush, was soon covered with caterpillars, he placed pieces of woollen cloth in every bush in his garden, and found the next day that the caterpillars had universally taken to them for shelter. In this way he destroyed many thousands.

An infusion of elder leaves is recommended by an English paper as good to sprinkle over rose buds and other flowers subject to blights and the devastations of insects.

**BRIGHTON MARKET.—MONDAY, Oct. 12, 1840.**

Reported for the New England Farmer.

At Market 1500 Beef Cattle, 825 Stores, 3000 Sheep, and 1475 Swine.

**PRICES.—Beef Cattle**—We quote to correspond with last week, viz. First quality, \$5 50 a \$5 75. Second quality, \$5 00 a \$5 25. Third quality, \$3 75 a \$4 75.

**Barrelling Cattle**—The Barrellers purchased quite liberally at about \$5 for Mess and \$4 for No. 1.

**Stores**—Yearlings, \$6 a \$9. Two Year Old \$12 a \$18. Three Year Old, \$21 a \$27.

**Sheep**—Lots were sold at \$1 33, \$1 50, \$1 75, \$1 88, \$2 00, \$2 17, \$2 37, and \$2 75.

**Swine**—Lots to peddle at 3 a 3 1-2 for sows and 4 a 4 1-2 for barrows. Two lots to close, for something less than 3 and 4. At retail, 4 and 5.

**THERMOMETRICAL.**

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northerly exposure, week ending Oct. 11.

Oct. 1840.	6 A.M.	12, M.	6, P.M.	W.
Monday,	5 44	68	55	W.
Tuesday,	6 48	72	64	W.
Wednesday,	7 50	61	51	S. E.
Thursday,	8 40	60	53	E.
Friday,	9 50	54	50	E.
Saturday,	10 36	51	47	E.
Sunday,	11 46	56	60	S.

We had a slight frost on Saturday morning, but not enough to injure the tenderest plants.

The time has been wrong in some of the last papers. It should have been as now, 6, 12, and 6, since it was altered from 5, 12, and 7 o'clock.

**DESIRABLE FARM FOR SALE OR TO BE LET.**

That valuable farm, situate in North Salem, about a mile from the centre of the city of Salem, and commonly known as the Dodge Farm, containing about seventy Acres of excellent Land, with a large three story Dwelling House, Farm House, and out buildings. The Fruit Trees upon it produce about two hundred barrels of Apples. There is a Muscled bed and sea weed on the premises, which furnish an abundance of Manure for the whole farm; and the city of Salem affords a ready market for the produce of the farm. This estate would be sold reasonably if immediately applied for, and most of the purchase money might remain on mortgage; or it would be leased out on fair terms for five years. For further particulars apply to

**JAMES ANDREWS & SON.**  
No. 59 Commercial wharf, Boston.

N. B.—Or this farm would be exchanged for productive real estate in Boston.  
Oct. 14th. is2w

**FRUIT AND ORNAMENTAL TREES, &c.**

Fruit Trees of all the different species—of the most celebrated kinds. These include Pears, Plums, Apples, Quinces &c.—the trees of the Peach and Cherry, especially, are of the finest size, and in numbers abounding at this time, and of varieties unsurpassed.

Also Grape Vines, Raspberries, Strawberries, Gooseberries, and Mulberries for silk—Scotch Larch, Lindens, Sycamores, Silver Firs, Willows, Elms—Honeysuckles, Dahlias, splendid Pæonies, &c &c. Trees when so ordered, will be securely packed for transportation to distant places, and all orders promptly executed by

**JOHN A. KENRICK.**

Newton, near Boston, Oct 14

**Brighton Nurseries and Gardens. For Sale**

A large quantity of superior European and American Ornamental Trees, well calculated for public places, or private grounds, with Fruit Trees embracing a great variety of the most approved kinds and fine sizes. The trees, and all other productions can now be selected and marked, and will be forwarded to any place as soon as it will answer to remove the same.

Also, forty kinds of Strawberry Plants, of the most approved European and American varieties.

Orders may be forwarded via. mail, addressed Messrs. WINSHIP, Brighton, Mass., or left with Messrs. JOSEPH BRECK & CO.  
Brighton, August 12.

**FRUIT TREES FOR SALE.**

At the Pomological Garden, Salem, Mass., a good collection of Fruit Trees of the best Native and Foreign varieties. Apply by mail to the subscriber,

**ROBERT MANNING.**

Salem, Oct 14, 1840.

**GREEN'S PATENT STRAW CUTTER.**

**JOSEPH BRECK & CO.** at the New England Agricultural Warehouse and Seed Store Nos. 51 and 52 North Market Street, have for sale, Green's Patent Straw, Hay and Stalk Cutter, operating on a mechanical principle not before applied to any implement for this purpose. The most prominent effects of this application, and some of the consequent peculiarities of the machine are:

1. So great a reduction of the quantum of power requisite to use it, that the strength of a half grown boy is sufficient to work it efficiently.
2. With even this moderate power, it easily cuts two bushels a minute, which is full twice as fast as has been claimed by any other machine even when worked by horse or steam power.
3. The knives, owing to the peculiar manner in which they cut, require sharpening less often than those of any other straw cutter.
4. The machine is simple in its construction, made and put together very strongly. It is therefore not so liable as the complicated machines in general use to get out of order.

**IMPROVED VEGETABLE STEAMER.**

Just received at the N. E. Agricultural Warehouse and Seed Store, Dr Warren's Patent Cylinder Vegetable Steamer, for steaming all kinds of vegetables for Swine, Cattle, &c. in large or small quantities. It can likewise be used for family purposes

- A, the pipe for filling the boiler with water.
  - B, safety valve for letting off extra steam, in case the pressure should get too high.
  - C, steam pipe passing from boiler to cask
  - D, pipe to supply the boiler with water from a cask or box which is to be placed in such manner as to keep the boiler about two thirds full of water at all times, which answers as a complete self-regulator for supplying the boiler with water.
- The above cut is not a true representation of the boiler, as it appears at least one half larger than it really is, in proportion to the cask. The boiler is merely a small size cylinder stove, with the fire inside, and surrounded by a sheet of water from which passes a steam pipe to the barrel or box, the cask or box can be removed so as to discharge the vegetables without any alteration of the boiler or steam pipe.

The steamer can be removed from place to place without any difficulty. Wood or coal can be used, and a few cents worth of either will steam a large quantity of vegetables. A number of them have been in operation, and found to give universal satisfaction.

Farmers and others are invited to call at our Warehouse and examine the article, which they will find to be a very neat and cheap apparatus for the purpose. Price \$12, and with handles \$13. **JOSEPH BRECK & CO.**

No. 51 and 52 North Market street, Boston.  
September 30.

**ALDERNEY STOCK FOR SALE.**

One COW and two HEIFERS, full blooded Alderney, for Sale. Cow \$50; two Heifers \$30 and \$40. Inquire at this office.  
Oct. 14

## MISCELLANEOUS.

From the Albany Cultivator.

## PAUPERISM.

One of the greatest drawbacks to the prosperity of Great Britain, the load that hangs with more than millstone weight on the necks of her producing classes, is her pauper system; originating in some of the best feelings of the heart, but wrongly directed, and so frightfully abused, as to have become an almost unmitigated curse, instead of a blessing to the community. The true end of all legislation on subsistence, as connected with poverty, should be based on the fact that every one able to labor, is bound by the original law of God, and of society, to support themselves, and that every measure that tends to infringe this rule, whether by encouraging idleness, or by appropriating the labors of the industrious, must, in the end, result in unmingled evil to all concerned. Ill directed aid to the poor, tends to encourage them in their habits of improvidence, and perhaps profligacy; and depresses and discourages the efforts of the honest and industrious. It was Burke, we believe, that said, "every man was as idle or lazy as he could be," or, in other words, that nothing but the dread of want prompted men to exertion. Now without stopping to inquire as to the extent in which this is true, it is very evident that men very readily acquire the habit of living on the labors of others; that this is soon done without any apparent feelings of reluctance or shame; and that nothing has a more direct tendency to destroy all honorable independence of feeling and conduct in the mass of a people, than to know the idle and improvident are sure of support, without care or labor on their part. This, experience in England, if not in this country, has abundantly proved.

We believe that with many, the influence and example of the foreign vagabonds who, educated and instructed as beggars at home, prowl around our streets, subsisting on charity, and imposing on the credulous, is most destructive and contagious. While we welcome to our shores the poverty-depressed, but honest laborer of Europe, we cannot avoid deeming the multitudes of paupers and profligates poured in upon us, as one of the most serious evils of the day. They not only subsist themselves on the earnings of the frugal and industrious, but by their example, they deprave the morals, and unsettle the habits of many, that had before, by the fear of public opinion, or some remaining sense of shame, been capable, or compelled, to support themselves.

Strange as it may seem to the honest, industrious laborer, whether farmer or mechanic, that the man who is able to dig, should not be ashamed to beg; it is certainly true, that the numbers of those who subsist on the public bounty in this country, has been rapidly increasing, and the tax paid by the man who works, to support the idler and the pauper, has increased in a corresponding ratio. Society is bound to take care of those unable to take care of themselves; those, who by an act of God have been rendered incapable of providing for their own wants; but neither justice or policy, requires any thing more than this. The clearest dictates of human nature, the soundest principles of philosophy and economy, no less than the voice of inspiration, proclaim that labor and bread are to go together; that if a man will not work, neither

shall he eat. If you wish to make a man worthless and depraved; if you wish to destroy him in his own estimation and that of others; if you wish to root out the last spark of independence and manly feeling from his bosom, make him a voluntary pauper, and teach him to accept of charity without a blush, and the work is done.

We have been led to these remarks, by an examination of the "Report of the Secretary of State, transmitting abstracts of the returns of the Superintendents of the poor in the several counties of this State, for the year 1839." It is an interesting document, to be read and reflected upon by every friend to his country. England has found her poor rates increased to the fearful sum of forty millions of dollars, annually; and although the past year shows a slight falling off from former years, in the expenses, yet the rapid annual increase, shown in the tables given, proves that the same causes are at work here, as there; and if not timely checked by an improved system of general education, and the inculcation of a spirit of self-reliance and independence, will eventually produce the same bitter fruits. We may add that the examination of the poor-house and pauper returns, as well as those of the prisons of the State, demonstrates that nine-tenths of the pauperism, degradation, and crime of the country, is owing to intemperance, to the unrestricted use of ardent spirits.

We add a few of the general results, as shown in the report.

"The whole number of paupers relieved and supported during the year ending 1st December, 1839, was 48,713. Of these, the county paupers were 45,899; and the town paupers, 2,814."

Of these, the number supported in the city of New York was 22,778.

Of the persons who received relief in 1839, there were,

Foreigners, . . . . .	7,607
Lunatics, . . . . .	880
Idiots, . . . . .	265
Mutes, . . . . .	58

## FRUIT AND ORNAMENTAL TREES.

Gentlemen at a distance, wishing to purchase trees, are informed that we will select from the following nurseries Fruit and Ornamental Trees, Plants and Shrubs of every description that may be desired, and pay particular attention to their packing, and forward them to any part of the country.

From Messrs Wmships', Brighton  
William Kenrick's, Newton.  
John A. Kenrick's, Do.  
S. & G. Hyde, Do.  
Samuel Pond, Cambridgeport.  
Botanic Garden, Cambridge.  
Robert Manning, Salem.  
J. L. I. P. Warren, Brighton.  
Breck & Co., Brighton.

The present is the best time, to transplant all hardy trees and shrubs.

Orders will be received for Plum, Pear and other Stocks, Hedge Plants, &c.

## FRESH GARDEN SEEDS.

We would inform our customers and friends that we are now receiving our supply of fresh Garden Seeds, most of which have been raised under our own inspection, from fine selected roots; which we warrant to be of the purest quality of the growth of the present season.

Agricultural Books.  
Agricultural Implements.  
Seed and Implement Catalogues sent to all applicants gratis, and all orders promptly attended to.

Boston, Sept. 29, 1840.

4W

The Lowell Journal, Worcester Spy, New Bedford Mercury, Yeoman's Gazette, Northampton Courier, Providence Journal, Norwich Aurora, Essex Banner, Springfield Republican are requested to insert the above 4 times.

## FRUIT AND ORNAMENTAL TREES, &amp;c.

Fruit Trees of all the different species—the most celebrated kinds. These include Pears, Plums, Apples, Quinces, &c.—the trees of the Peach and Cherry, especially, are of the finest size, and in numbers abounding at this time, and of varieties unsurpassed. The Catalogue of Fruit and Ornamental Trees and Shrubs, Roses and Herbaceous Flowering Plants, will be sent to all who apply; in that Catalogue many of the very best kinds of fruits, so far as proved, are particularly designated by a star.

Also, Grape Vines, Raspberries, Strawberries, Gooseberries, and *Mulberries for silk*—Scotch Larch, Lindens, Sycamores, Silver Firs, Willows, Elms—Honeysuckles, Dahlias, splendid Pæonies, &c. &c. Trees when so ordered, will be securely packed for transportation to distant places, and all orders promptly executed by

WILLIAM KENRICK.

Nonantum Hill, Newton, near Boston, Sept. 9, 1840.  
eptDI

## BONE MANURE

The subscriber informs his friends and the public, that after ten years experience, he is fully convinced that ground bones form the most powerful stimulant that can be applied to the earth as a manure.

Orders for Bone Manure or Oyster Shell Lime, left at the Bone Mill, near Tremont road, in Roxbury, at the New England Agricultural Warehouse and Seed Store, No 52 North Market Street, or through the Post Office will meet with prompt attention.

March 4, 1840.

NAHUM WARD.

## HORTICULTURAL TOOL CHESTS

Containing a complete set of Garden tools of superior finish and style, recently received from Liverpool and for sale at the New England Agricultural Warehouse and Seed Store.

May 6.

JOSEPH BRECK &amp; CO.

## PATENT SPRING BALANCE.

A few of those very convenient spring balances, for family use, a very simple contrivance for weighing small articles: JOSEPH BRECK & CO. No. 51 and 52 North Market Street, Boston.

July 15.

## FENCE CHAINS.

Just received from England, at the New England Agricultural Warehouse, 6 casks chains, suitable for making the chain fence, &c.

July 15.

JOSEPH BRECK &amp; CO.

## BERKSHIRE HOGS.

The subscribers offer for sale a few pair of full blooded Berkshire Hogs; also, pigs 7-8 blood, crossed with Mackay. Inquire at the New England Farmer office, or at their farm at Brighton.

July 9.

JOSEPH BRECK &amp; CO.

## GARDENERS' KNIVES.

JOSEPH BRECK & CO. have this season imported and now offer for sale a few very superior Garden Knives, for pruning, &c. manufactured expressly for Gardeners, and warranted superior to any article of the kind before imported.

Also—a large assortment of Budding Knives, Grape Scissors, &c. &c.  
April 22.

## TRACE CHAINS.

Just received, direct from the English manufacturers, 8 casks of Trace Chains, from 6 to 11 feet long, suitable for ploughing or draft chains.

JOSEPH BRECK &amp; CO.

## TIE UP CHAINS.

Just received at the New England Agricultural Warehouse, a good supply of those celebrated Chains for tying up cattle. These chains, introduced by E. H. Derby, Esq. of Salem, and Col. Jacques, of Charlestown, for the purpose of securing cattle to the stall, are found to be the safest and most convenient mode of fastening cows and oxen to the station. They consist of a chain which passes round the animal's neck, and by a ring attached to the stall, plays freely up and down, and leaves the animal at liberty to lie down or rise at pleasure, and keeps him perfectly secure.

July 15.

JOSEPH BRECK &amp; CO.

## THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at 33 per annum payable at the end of the year—but those who pay within sixty days from the time of subscribing are entitled to a reduction of 50 cents.

## DUTCH DAIRIES.

A writer in the Journal of the English Agricultural Society, in an article entitled "Rural Economy of Schleswig, Holstein, and Lauenburg," gives an instructive account of the dairies of the Hollanders and their mode of making butter, from which we extract the following:

"The pride and boast of the Holsteiner is his dairy; and the fame of Holstein butter, which, if we except that made in Holland Proper (or Delfland,) may well claim to be the best in the world, not only justifies his preference, but may render a sketch of those peculiarities of management, by which the Holstein dairy system is more especially distinguished, neither uninteresting nor useless to the English farmer. These may be chiefly classed under four heads, viz: the buildings and utensils; the time of milking, and number of hands employed; the management of the milk; and the mode of working, salting, and packing the butter.

The buildings indispensable to a large dairy (which varies from 100 to 400 cows) are, a milk cellar, a butter cellar, a churning house, (and closely adjoining the horse-mill, by which the operation of churning is invariably effected), a cheese room, and a kitchen, in which not only the various utensils are washed, but the food cooked for all the persons immediately engaged in the dairy-work; to which must commonly be added their sleeping and eating apartments, as, on large estates, the whole of the establishment is usually kept apart from the mansion house. The size and site of the milk cellar are esteemed matters of first rate importance: it ought to front the north; be shaded from the southern sun by rows of trees—elder being especially selected for this purpose, and indeed placed if possible near the windows, on account of their influence in keeping off the insect tribes; and a thatched projecting roof is preferred, affording greater protection from the heat: while, in choosing the site, peculiar care is taken to place the dairy beyond the reach of every thing calculated to generate bad odors, or in any way taint the atmosphere. The size of the milk cellar must necessarily be regulated by the number of cows; but it should always be calculated to contain the produce of four milkings; and as the milk dishes usually occupy a space of two feet square, the produce of 100 cows, giving on an average 8 quarts per day, (a large average for the cows of this country throughout the year,) would fill 50 milk dishes at each milking, and would require a ground surface of 500 square feet, as the milk dishes are invariably placed on the floor, the amount of each milking a little apart; and there must unavoidably be spaces left, to enable the dairy maids to go through their various operations of skinning, sieving, and removing cream, &c. The floor, though sometimes flagged, is more generally of brick, neatly fitted, so that no water may lodge in the joints; and always gently inclined, with a grated opening

at the lower end, to facilitate the mopping and washing of the floor, which is never omitted to be done twice a day, notwithstanding that every avoidable impurity is carefully guarded against, and every drop which may fall at the time of the milk being strained, is instantly wiped up. A great improvement has been recently made in some newly arranged dairies, by dividing the floor into compartments with brick ledges, from 3 to 4 inches high, between which the milk dishes stand; and the compartments (the lower extremity of which is fitted with a small sluice) being filled, by means of a pump, with cold water twice a day, the milk is preserved so cool as to prevent all approach to acidity for several hours longer than when placed on a dry floor: thus affording, even during the summer solstice, sufficient time for a complete separation of the milk and cream, without which the full proportion of butter cannot be obtained. For effectuating the same desirable result, ice is frequently resorted to in sultry weather, either by dropping a piece of pure ice in each milk-pan, or by placing a pailful in the dairy, which, by giving off its cold, sensibly lowers the atmospheric temperature.

It is considered necessary that the milk cellar should be sunk from 3 to 4 feet in the ground; be from 16 to 18 feet high (the best have an arched roof, as being more conducive to coolness than boards); and be furnished with two rows of windows, (and, if possible, on three sides, north, east and west,) to secure a thorough air. The lower range consists of wooden trellis work, provided inside with gauze frames to exclude insects, and outside with hanging shutters, which can be lowered and elevated at pleasure. The upper range is furnished with glass sashes when light only is requisite, which are exchanged for gauze frames, when more coolness is desirable. The butter-cellar also, must be light, airy and cool; being likewise sunk in the ground, and the same precautions adopted as in the milk cellar, to secure an abundant current of pure air. In it the butter, when carried from the churning house, is worked, salted, and packed; and the filled butter casks ranged on clean boards, somewhat elevated above the floor, to admit a free passage of air, are weekly turned and wiped.

Next in order comes the churning house, which differs in no respect from similar arrangements in England, excepting that, of late years, the perpendicular movement of the churn staff has been exchanged for the rotatory,\* which is found to churn in a shorter time, and with less risk of producing, even in hot weather, what is called oiling.

The cheese room is never admitted near either milk or butter cellar, and is, in newly arranged dairies, placed as far as may be from them. In fact, as cleanliness forms the great object of the Holstein dairy system, the closest attention is paid to guard against every impurity, and to remove every thing from the vicinity of the dairy which could, by possibility, exercise a sinister influence on the very susceptible substances of milk and butter; which suffer, to a degree those unaccustomed to

\*Seventytwo revolutions per minute.

observe it would little suspect, from a tainted atmosphere. As the preparation of cheese is better understood in England than here, I will only mention that three sorts are made—sweet milk, skimmed milk, and occasionally what is termed cream cheese; and shall now proceed to describe the management of the milk, first enumerating the number of persons required. These consist, in large dairies, of a meyer or overseer, a cooper, one or two cow herds (as may be requisite,) one or more swine herds, an upper dairy woman, and dairy maids in the proportion of 1 to every 18 cows. The overseer's duty involves a general charge of the cattle, whether in health or sickness, with a competent knowledge of their diseases and the remedies; he is responsible for the swine being properly cared for; that the calves, whether fattening or rearing for stock, are regularly and suitably fed; that the cow herd does his duty; that the hours of milking are punctually adhered to; and that every thing and every person is in proper place and keeping. He must further pay strict attention that the cows are milked thoroughly out, on which so very much depends; as not only the cow which is allowed to retain any portion of milk diminishes her produce by so much from day to day, but the last, being by far the richest part, a loss of butter is incurred, much more than proportionate to the quantity of milk, by this culpable negligence or laziness. According to the observations of an accurate examiner, Dr. Schubler, the first drawn milk contains only 5, the second 8, and the fifth 17 per cent. of cream! If the number of cows be not above a hundred, the overseer can also undertake the cooper work; which, when wooden milk dishes are used, in addition to the cream barrels, milking pails, and butter casks required in the course of a year, is a consideration both of time and expense. But in large dairies, a cooper is kept in addition, who, however, must likewise milk a certain number of cows, assist in carrying the milk, feeding the cows when housed, or any other dairy work which a man is capable of. The wages of these two persons vary according to the extent of the dairy, but may be averaged the first at 60, and the second at 40 dollars per annum.

The dairy maids, besides milking, cleaning the vessels, &c., work in the garden in summer, spin in winter, and wash, bake, brew and cook for their own establishment, under the superintendence of the upper dairy woman, who is by far the most important personage in it, as on her skill, attention, and diligence depend, in great measure, both the quantity and quality, and, by consequence, the profit of the produce. She must not only thoroughly understand, but accurately observe, the moment when the milk should be creamed; the degree of acidity it must attain in the cream barrels; its temperature, whether requiring the addition of warm or cold water to the churn, as well as the all-important operations of kneading, beating, salting, and packing the butter. She must not only be punctiliously clean herself in person and work, but keep a strict eye over the cleanliness and order of her subordinate maidens. In very large dairies

the upper woman has full employment, without milking, and needs the assistance always of one, and sometimes of two, of the more experienced dairy maids, in butter and cheese making; but in smaller establishments she milks a certain number, generally 10 cows, while each of her subordinates have 18; her wages are usually 55 to 60, that of her chief assistants 22, and that of the others 18 dollars per annum.

During summer the dairy people must rise at three, and even two in the morning, if the weather be very hot; for which they are indemnified by two hours' sleep, from 1 to 3 in the afternoon. At 4 they commence milking, which takes place in the field, and generally occupies two hours. At the beginning of the season each girl marks her own cows by tying a particular colored ribbon round their tails, and in some places they adopt the precaution of the milkers carrying a string on which they cast a knot as each cow is successively milked, thus securing against one being forgotten. As the fields are large, and often at a great distance, the transport of the milk is facilitated by the very simple contrivance of a long, low, four-wheeled, one-horse wagon, in the side bars of which strong iron hooks are inserted, at such distances that the milk pails, containing from 30 to 40 quarts each, may swing free of each other, and these, though filled nearly to the brim, are prevented spilling, notwithstanding many a rude jolt over the rough, and often deeply rutted road, by merely having thin pieces of wood, about the size of a dinner plate, floating on the surface: a practice, indeed, universal in these countries, when pails with any liquid are carried even in the hand. The milk when brought to the dairy is immediately strained through a hair sieve into the vessels, whether of wood, earthen ware, copper tinned, zinc, cast iron, (lined with a china-like composition,) or glass, placed in rows on the floor. All these different kinds of utensils have been tried with various success, in the hope of discovering how, in hot weather, more especially when a thunder storm is gathering, the milk can be guarded against a too early acidity; for, as it is a fixed and invariable rule that the cream must be removed from the milk before the latter gets at all sour, and an equally established fact, that all the oily particles cannot be obtained in a shorter period than 36 hours, vessels in which, during sultry, and especially damp weather, the milk could be kept the due time, are a great desideratum. As yet, however, there reigns much diversity of opinion on the subject, and shallow wooden vessels, as nearly as possible equally wide at top and bottom, containing when full about 8 quarts, but in which during summer seldom more than 6 quarts are poured, are in most general use. The tinned copper milk pans are very costly, and must be carefully watched lest they should require retinning. The zinc are as yet little known, and the assertion of their effect in better severing the cream from the milk, not sufficiently proved. The cast iron, lined with enamel, though assuredly durable and very clean, seem too expensive; and the glass have many opponents on account of their brittleness, and the vague notions respecting glass and electricity inducing the idea, that if the electric fluid get into the milk it cannot get out again! whereas, as it is ascertained that it always attaches itself to a conductor, and, in the absence of any thing more attractive, runs along the surface, it is more likely that the milk should be protected in glass, which is a non-conductor, than in

any other substance. In my dairy which contains upwards of 180 cows, the glass vessels have been used for 4 years; and I give them a decided preference over all others. Their form is good, being 16 inches broad at the top and 12 at the bottom: the glass is dark bottle-green, transparent, and perfectly smooth, about one eighth of an inch thick, and provided with a rounded rim at the upper edge, which makes it easy to retain a safe hold of them even when full. They contain 8 quarts, but never receive more than 6. They cost 8d. a piece, and their durability may be estimated by the fact, that to encourage carefulness, each dairy maid is allowed one dollar per annum extra, as *pan money*, being bound at the same time to pay 10d. for each one she breaks, yet hitherto no girl has broken to the extent of her dollar. It is self-evident that acidity cannot be communicated to glass, and the ease and rapidity with which they are cleaned, requiring merely to be first washed with lukewarm water, then rinsed in cold water and placed in a rack to dry, effect such a saving in fuel and labor (diminishing the number of our dairy maids by at least 2,) that the less quantity of butter obtained, supposing (which I by no means concede) that the milk, during a few weeks in summer, does sour sooner, and consequently throws up less cream in glass than in wood, is more than compensated by the lessened expense of the establishment, not to mention the great advantage of attaining the indispensable cleanliness and purity of the vessels, with more certainty, because at a less expenditure of time and trouble. Although it is an ascertained and undeniable fact that the quality of butter depends much on the nature of the pasture, the locality of the dairy, the universally prevailing cleanliness of the whole management, and very essentially on the purity of the water employed, still I ascribe much of the reputation which our butter has of late years enjoyed (and which is verified by our obtaining at all seasons one penny per pound above the market price in our neighborhood) to the beneficial introduction of glass milk dishes.

It has already been stated as a rule, that the cream must be removed from the milk before any acidity is perceptible, if butter of first rate quality is looked for; and it has been found by experience that a cellar temperature of from 60° to 62° Fahrenheit, is the most favorable; a complete disseverment of the cream then taking place in 36 hours: whereas a greater degree of warmth, though it quicken the separation, still more hastens the souring process, which operates injuriously not only on the quality but the quantity of butter. In a cold temperature, the separation is effected much more slowly, so that 48 or even 60 hours may be required; this, however, is the longest period that may be accorded without incurring the risk of imparting a rank, unpleasant flavor to the butter, which even if not perceptible on its being first churned, manifests itself very shortly afterwards.

The commencement of acidity in milk is indicated by a very slight wrinkling of the cream, and a scarcely perceptible acid taste. So soon as these signs appear, the work of skimming must begin, even though the milk have only stood 24 hours; and the cream is poured through a hair sieve (which is kept for this purpose, and must never be used to strain up the new milk with) into large barrels, containing about 240 quarts each (usually sufficient for one churning,) in which it remains till the necessary sourness is attained, which in summer follows in 24, in winter seldom under 36 or 48

hours; unless when the small quantity of milk admits of it being partly strained at once into the cream barrel, and the remainder added without skimming from the milk pans when cool. This method, undoubtedly, gives at all seasons the greatest return of butter, but as is generally believed, not of so rich a quality as that produced from cream alone; and, moreover, in a large dairy, during the time the cows are in full milk, would occasion much additional trouble, an almost ceaseless churning, and a total prevention of cheese making. The cream having attained its requisite acidity, during the advance to which it must be frequently stirred with a small churn staff to prevent it coagulating, technically called becoming cheesy, the next object of the dairy woman's skill is, the degree of warmth or coolness which must be imparted in order to secure good butter. In warm weather the churn is rinsed with the coldest procurable water, in which a piece of pure ice is often thrown, and sometimes, though more rarely, cold spring water is added to the cream about to be churned, which operation is then always performed either very early in the morning or late in the evening. In cold weather, on the contrary, warm water is applied, both to rinsing the churn and to the cream itself. The churning being completed, the butter is taken off by means of a large wooden ladle, and carried in a tub directly to the butter cellar, where, in a large trough, hollowed out of the trunk of a beech or oak, very smoothly polished off inside, and provided with a plug hole at the lower extremity, (beneath which a small tub is placed to receive the expressed milk,) the butter is slightly worked, and salted with the purest salt, then moulded with the wooden ladle into a mass at the upper end of the trough, and left for some hours to soak and drain. In the evening it is thoroughly kneaded and beat, or rather slapped, the dairy maid repeatedly lifting a piece of from 3 to 4 pounds, and slapping it with force against the trough, so as to beat out all the milky particles; and thus, lump after lump being freed from extraneous matter, the whole mass is spread out, receives its full proportion of salt (in all about 1 1-8 oz. per pound,) which is worked with the utmost care equally through it, and again moulded into one compact mass. The butter in Holstein is seldom if ever washed, as water is believed not only to rob it of its richness and flavor, but as being itself susceptible of putrefaction, to be equally inimical as milk, to its preservation. When a sufficient quantity is ready to fill a cask, the several churnings are once more kneaded through, a very little fresh salt added and packed into the barrel, which is made of red beech wood, water tight, and previously carefully washed and rubbed inside with salt. Much attention is paid that no interstice shall remain either between the layers of butter or the sides of the cask. A cask is never begun to be filled until it can be completed, as thus alone the butter can be exactly of the same flavor and color, which is probably one reason why small dairies, under whatever management never produce such good butter as large ones, as the small churnings must remain long exposed to the air, until the requisite quantity is in readiness.

The qualities of first rate butter are considered to be, 1st, a fine, even, yellow color, neither pal nor orange tinted; 2nd, a close, waxy texture, in which extremely minute and perfectly transparent beads of brine are perceptible; but if these drop be either large or in the slightest degree tinged with milk color, it indicates an imperfect workin

of the butter; while an entirely dry, tallowy appearance, is equally disapproved; 3rd, a fresh fragrant perfume, and a sweet kernelly taste; 4th, good butter will, above all, be distinguished by keeping for a considerable time, without acquiring an old or rancid flavor. \* \* \* \*

The quantity of food which can be afforded to the cows during winter, is ascertained at the beginning of the season, when the harvest returns are known; and in plentiful years the calculation is, that each cow should be allowed 3 sacks of grain, (generally oats of 140 lbs. each sack,) 3900 lbs. of straw, including bedding, and 1800 lbs. of good hay; whilst for every hundred pounds of hay less, she must receive 25 lbs. of grain more, or vice versa.

As during the winter months, when the cows are confined to dry food, the butter loses its fine yellow color, the defect is sought to be remedied by an admixture of coloring matter; and indeed a high color in butter so much regulates its price in some markets (as in Spain and Portugal,) that the export merchant insists on the desirable shade being imparted when it ceases to be natural. The best ingredients for this purpose are found to be, a mixture of annotta and turmeric, in the proportion of 5 oz. of the latter to 1 lb. of the former.

The average quantity of milk obtained here from good stock, may be estimated at from 2000 to 3000 quarts per annum, according to the food and care bestowed on them; and the produce of which has been calculated in the following ratio; every 100 lbs. of milk will give 3 1-4 lbs. of butter, 6 lbs. fresh cheese, 14 lbs. butter-milk (exclusive of the water added before and after churning,) and 76 3-4 lbs. of whey; and, though the qualities of individual cows, the nature of their pasture or other food, and the atmospheric changes, occasion an almost endless variety of result, still it may be considered as a fair average that 15 quarts of milk are required for a pound of butter; for although from some cows a pound may be obtained from 12 quarts, yet others and even the same cows, at different seasons and with different food, (such as beets or raw potatoes,) will not produce a pound of butter from less than 17 or 18 quarts. On the whole, it is esteemed a fair return in these duchies when the average produce of the dairy amounts to 100 lbs. of butter and 150 lbs. of cheese per cow. When calves are fattened for the market, so much butter and cheese cannot be expected—from the generally received opinion that fine veal (and the veal of these countries is very fine,) can only be secured by feeding with milk fresh from the cow; they are usually fed for 10 or 12 weeks, and attain the weight of from 120 to 150 lbs. when slaughtered.

**Massachusetts Horticultural Society.**

**EXHIBITION OF FRUITS.**

Saturday, Oct. 10, 1840.

Pears.—By the President, M. P. Wilder, Esq., the following varieties: Belmont; Columbian; Heathcote; Urbaniste; Chaumontel and Thompson.

By R. Manning: Hacon's Incomparable; Calabash; Beurre Bronze; Marie Louise; Jalousie and Fulton.

By S. Pond: Surpasse Virgalieu; Beurre Diel; Urbaniste; Wilkinson and Dix—the last uncommonly fine.

By E. M. Richards: Heathcote.

By S. Downer: Dix and Lewis.

By J. L. L. F. Warren: Duchess d' Angouleme.

From the garden of Dr. Adams, Boston: Splendid specimens of St. Michael's and St. Germain.

Apples.—By S. Downer: Seck-no-Farther; Lady Apple; Hawthorndean; Sun Apple and Lysecom.

By M. P. Wilder, Esq.: Fall Sopsavine? a fine apple.

From the garden of Josiah Robbins, Esq., Plymouth: specimens of the Monstrous Pippin, one of which weighed 1 lb. and 3 oz.

By J. L. L. F. Warren: Hubbardston Nonsuch; Pearmain, and one variety without a name.

From the garden of C. H. Eldredge: three varieties of Apples for names—one of which was the Hubbardston Nonsuch.

From the garden of Mrs Bigelow: fine specimens of apples without names.

By S. Downer: specimens of the Orange Quince.

By B. Whipple, Charlestown: Portugal Quinces.

By G. W. Macondray: Orange Quinces.

Grapes.—From the garden of Perrin May, Esq.: very fine Black Hamburgs—open culture.

By S. Downer: Catawba.

By C. Golderman, Chelsea: Isabella.

From E. M. Richards: Seedling Clingstone Peaches—very fine.

For the Committee,

P. B. HOVEY, Jr.

**OFFICERS OF THE MASS. HORTICULTURAL SOCIETY.**

At the annual meeting of the Society held October 3d, 1840, the following gentlemen were elected officers for the ensuing year:

*President.*

M. P. WILDER.

*Vice Presidents.*

WILLIAM OLIVER,

B. V. FRENCH,

JONA. WINSHIP,

C. NEWHALL.

*Treasurer.*

S. WALKER.

*Corresponding Secretary.*

**ACKNOWLEDGEMENTS.**

We have received of Capt. Chandler, from the House of Industry, some of the largest beets ever raised in this country without exception. One French Sugar weighs 28 lbs., and a Mangel Wurtzel 26. We defy the agricultural community to produce larger. We have also received from the same gentleman, some specimens of the Globe Mangel Wurtzel. The seed was imported from England last year. They are said to be superior to other kinds on account of the smallness of the tops and producing more to the acre.

Through the politeness of Mr Isaac Parker, of Lexington, we have been favored with a bunch of raspberry bushes, covered with splendid ripe berries, fruit of the second crop. It is very seldom we have a season warm enough to ripen two crops of fruit. We consider them quite a curiosity.

Lovett Peters, Esq., of Westboro', has sent us a box of different kinds of apples. Among the rich varieties it contained, were the Lysecom and the 'Sopsavine' or 'Sops of Wine.' These last are some of the finest flavored fruit we have tasted: the inside is a very dark red or blood color.

J. B.

Maj. John Mason, of Gloucester, raised this season six crook-necked squashes from a single seed weighing one hundred and eighteen lbs. twelve oz.

## CATTLE SHOWS.

The Cattle Shows and agricultural exhibitions are now coming upon us so thickly and in such rapid succession, that we must bestir ourselves to keep up with them. We shall endeavor, however, to give some general notice of those which we have attended or of which we have information from others; and wait for more full and detailed reports hereafter.

*Show of the Hampshire, Franklin and Hampden Agricultural Society.*

This was held on the 7th and 8th October, at Northampton; the former day being devoted to the exhibition of cattle and manufactures, and the second to the ploughing match.

A large assemblage of people were present; but these were principally from short distances; and very few came from the remote parts of the district embraced by this Society. This circumstance has been long and is much to be regretted. This Society has sometimes been migratory, and held its anniversaries at Springfield or at Greenfield. But very great inconveniences and disadvantages attend this change of place; and as the territory is so large, which is the only good reason we can give for the non-attendance of farmers from the remote parts, we hope that soon a society will be formed for each of these strictly agricultural and highly productive counties. There is no part of the State which can, if it will, show better or more intelligent husbandry. These societies and gatherings of the farmers are adapted to render the most essential service to the agricultural interests; they have already done immense service to husbandry; they are strongly encouraged by the liberality of the State; they are liable, when well managed, to no reasonable objection, and they afford a delightful and profitable occasion for social intercourse.

The show of cattle on this occasion was highly interesting. There were many superior animals of native stock. As the pens were not labelled with a particular account of the animal or animals enclosed, (an omission very general at our cattle shows, but which should be corrected,) we were unable to enter into their respective merits otherwise than from their external appearance. A cow belonging to Samuel Whitmarsh was admirable in appearance and was said to be highly productive in milk. It was stated that she had given upwards of twenty quarts of milk per day. She was of mixed blood, a cross of the Durham Short-Horns, and was raised by Mr Whitmarsh. A cow belonging to Mrs Hont, was a fine animal in every respect. She was of native stock. She had often given more than sixty pounds of milk per day. A beer quart of milk weighs about two lbs. and one quarter. This would be equal to more than twenty-six quarts per day, beer measure. This is a noble yield, and seldom equalled. There were other fine animals in the pens, but we could get no account of them.

The show of fat cattle was not large, nor of young cattle. Of bulls the show was grand. A bull shown by George Grennell, of Greenfield, descended from Gov. Lincoln's stock at Worcester, a bull owned in Hadley and sired by Nelson, formerly owned by Mr Huntington, of Hadley, were noble animals of the improved stock. The Ayrshire bull, owned by the Massachusetts Society and designed to improve the dairy properties of our stock being

from the best dairy stock in Great Britain was shown. His appearance indicated little symmetry or beauty, but great weight and thrift. Several other fine bulls were exhibited, but we are without advice as to their character or history.

The great attraction of the day was towards the truly magnificent team of Mr Chapin, of Springfield, of four pairs of as noble working oxen of native stock as ever came under the yoke, and in high condition. Not less attractive was the show of improved Durham stock of Pauli Lathrop, of South Hadley. This consisted of several cows, some of them imported, and some bred by this gentleman, most admirable in their appearance; of several young animals, and especially two heifers coming three and weighing over 1200 lbs. each, of extraordinary beauty and thrift, and other animals, which we cannot particularize. A cow belonging to Henry Whitney, of New Haven, and recently imported of the pure Short Horns, was as fine an animal as we have ever seen of the kind. She was shown among Mr Lathrop's stock. This gentleman, with his brother, has spared no pains nor expense to breed a stock of the highest character for valuable points and purity of blood; and while they are conferring a great benefit upon their country, we are happy to learn that they are receiving an ample remuneration from their exertions. We shall not particularize farther in regard to this stock, as Mr Lathrop has promised us a particular account of them, which we shall hereafter lay before the public. We add only our opinion, that the exhibition of improved stock made by these gentlemen on this occasion, has never been equalled or approached in Massachusetts.

The exhibition of swine was admirable. The Berkshire seem every where destined to carry the day. The show of domestic manufactures was quite limited. Some squashes or pumpkins from the President of the Society, were among the mammoth products of the vegetable kingdom; two weighing over 180 lbs. and one over 196 lbs.

An address was delivered on the occasion, on the Agriculture of Massachusetts, to a full and attentive audience; and the first day having passed off so auspiciously, we have only to express our regret that we could not, on account of previous engagements, have the pleasure of witnessing the ploughing match, which was to take place on Thursday. Of this we shall give a particular account hereafter.

H. C.

## WORCESTER HORTICULTURAL SOCIETY.

The first exhibition of fruits and flowers by the Worcester Horticultural Society, commenced on Tuesday, the 13th inst., at the South Town Hall.

We were highly gratified to witness the rich display of fruits and flowers which our horticultural brethren of Worcester and vicinity contributed for the occasion. This, their first effort, does them much credit, and proves that although they have not until the present time associated themselves together, they are not much in the back ground in relation to their horticultural productions.

We find in the National *Ægis* a detailed account of the exhibition, from which we make the following extracts:

"The Society was formed by a few individuals who were desirous of aiding with their efforts in the improvement of the cultivation of the gardens and orchards, and who wished to contribute by such means as were in their power for the common

benefit. The possibility of making a good exhibition was doubted by many; the undertaking was considered as hopeless by some; and was openly opposed by two individuals alone; but it went on without their help and against their influence.

Our citizens were not aware of the extent of their own resources, nor of the generosity of those friends from abroad, who have contributed with a free heartedness and liberality beyond all expectation and above all praise which words can convey.

The exhibition was opened on Tuesday morning, and was as magnificent as any which has ever before been held in New England.

The hall was decorated with some of the paintings gathered from the houses of Worcester. The union of the works of artist skill with the fair fruits and flowers, was a new experiment, and none who have witnessed the exhibition can have failed to realize the agreeable effect of the alliance of nature and art. If more time had been afforded, a collection might have been formed which would have rivalled that which has always excited admiration in the gallery of the Athenæum. Compared with the abundance which remains in the homes of our citizens, the exhibition is very small."

The paintings alone formed a most interesting exhibition, numbering between 60 and 70 pieces, many of them rare and valuable. The show of apples was very fine, embracing all the varieties esteemed among us, and the very best specimens, with many others equally good, to all appearance, but with which we are not acquainted.

The *Ægis* observes that "the pears held a convention," and enumerates about 50 varieties. There were many superior specimens.

Some good late peaches were exhibited by A. H. Green, of Worcester. The late period of the season prevented the specimens of these fruits from being numerous.

Of quinces, there were the Orange, Pear, Apple and quince.

Semina Plums, of rare beauty, were sent by Mr Samuel Pond, of Cambridgeport.

Catawba, Isabella, Black Hamburg, Muscat, and White Sweetwater grapes, were spread in glorious clusters along the tables.

Figs grown in the open air, were shown by J. L. L. F. Warren, of Brighton.

The Rolan Potatoes, of immense size, and looking as if they were susceptible of no improvement, except that of roasting, were in their immense magnitude.

Squashes were abundant, and some immense in size. There were present the good old crooked necked, the Bush Orange, Early Scollop, Acorn, Long Warded, Cornucopia, Cecoa Nut, and Autumnal Marrow.

The Pumpkin of New England did not honor the festival with its presence, and all the owners of these golden tinted fruits should take shame to themselves that they did not allow the best productions of their fields to grace the festival of the florists and gardeners of Worcester.

Mighty cabbages came to the hall: the Ruta Bagas attended in their majesty: the beets seemed willing to heat themselves: the Carrots were of prodigious size and brilliant color.

Indian corn appeared in the most beautiful form of arrangement. The golden ears were tastefully braided together in wreaths entwined with laurel, and suspended like chandeliers from the roof, and when illuminated at evening by the lamps, appearing splendidly. Excellent varieties were exhibi-

ted: among them were the fruits of Massachusetts, Michigan, and Illinois, with the Sweet, Eight Rowed, Rice, and Parching corn.

Among the most interesting objects of the exhibition, was some honey of delicious flavor, and remarkable transparency and delicacy, contained in two large boxes presented by Henry Snow, Esq., of Shrewsbury. The honey is taken from the hives in boxes, without destroying the bees; the boxes being placed over the hive, which is perforated, to allow the bees to pass up and deposit their honey. The honey taken in this way is free from all bee bread and young brood. One box contained 34 pounds, the other 22. Mr Snow informs us that from three hives, this year, he has taken eighty pounds of honey, leaving a sufficient quantity to winter the bees. This method does not prevent their swarming as usual."

The unusual mild autumn has been highly favorable to the floral tribe. Many fine annuals which are destroyed by the first frost, were exhibited at this time in all their beauty. "But the pride and crown of the whole was the Dahlia, the 'queen of the autumn,' in all her endless variety of costume."

The enumeration of all the varieties would be too tedious: we would refer to the report of the Massachusetts Horticultural Society's exhibition of last week: about all the varieties reported there were exhibited on the occasion. The number of contributors was very large; about 40 from Worcester; 25 from this vicinity. From the Massachusetts Horticultural Society there was a delegation of eight or ten members, who all made liberal contributions of fruit and flowers, as well as other members not present. All who witnessed this interesting exhibition were highly gratified: it will produce a salutary effect. We rejoice with our Worcester friends that they have been so signally successful in their first onset. They have made a good beginning, and we believe it has given the cause of Horticulture an impetus which will ever after be felt in the town and surrounding country.

J. B.

### INTERESTING TRIAL OF PLOUGHS

*For the State's Society's Premiums.*

This interesting trial took place at Worcester on the 13th inst., about one mile from the village, and was a day of no little excitement to the competitors as well as to the numerous company of intelligent practical farmers, and other gentlemen from various parts of the country, who witnessed the scene. The business in the field commenced about 11, A. M. The following gentlemen entered the lists, viz: Messrs Prouty & Mears, Boston; Mr Wilson, Greenfield, Mass.; James Stewart, West Newbury, Mass.; Charles Howard, Hingham, Mass.; Ruggles, Nourse & Mason, Worcester, Mass.; Peter Thatcher, Attleboro', Mass.; Barnaby & Moor, Ithaca, N. Y.; Cornelias Bergen, Brooklyn, N. Y.; E. G. Whiting, Rochester, N. Y.; Perley Tapley, Danvers, Mass.

There were some other entries made, but for some reason not known to us, did not contend for the prizes: among them we noticed the name of Mr Moor, of Wisconsin Territory.

The premiums offered were \$100 for the best plough to turn the furrow slice flat, and \$75 for the best plough to lay it an angle of fortyfive degrees. Open to the whole country.

The committee who decided the contest, were

practical and scientific men, fully competent to discharge the important duties devolving upon them, and in whom, we believe, all interested in the trial reposed perfect confidence.

The first trial was for the prize of \$75, for the best plough to turn the furrow slice obliquely. It was easily anticipated by the spectators to whom this premium would be awarded, as it was evident to all that Charles Howard, of Hingham, had distanced his competitors and gained the victory.— This was announced officially by the committee on the following evening, that Charles Howard was entitled to the premium of \$75. He exhibited two ploughs of different size for this mode of ploughing, which were equally perfect in their construction, only one of which was tried.

Who should have the other premium, was a subject of some discussion among the lookers on. It was, however, generally agreed when the committee adjourned for refreshment at 4, P. M., the ploughs having all been tried, that it lay between the three principal manufacturers in New England, viz: Prouty & Mears, Charles Howard, and Ruggles, Nourse & Mason. The ploughs from all these gentlemen made good work and evinced much improvement in their construction. After a sub-committee returned to the field and handled the ploughs themselves, it was evident, to our own mind, that the chance lay between Prouty & Mears, and C. Howard. Their ploughs ran with wonderful ease and were the admiration of all—doing their work perfectly, and sometimes for rods without the necessity of laying the hand upon them. We believe, ourselves, that Howard's plough, for laying the furrow slice flat, has no superior, and imagine the committee themselves were at some loss on which to bestow the premium. They gave it, however, to Prouty & Mears. With this decision we are satisfied, largely as we are interested in Howard's, inasmuch as the committee expressed their opinion that there was no second in the case, both ploughs stood No. 1. We are willing to stand with our neighbors at the head and here will shake hands and wish them success; but at the same time do not acknowledge any superior plough to Howard's, for all kinds of work, taking into consideration rough land, deep ploughing. Howard's are acknowledged to be the most substantially made.

An official detailed report will be made in a few weeks, which may be looked for with much interest by our agricultural friends, and will undoubtedly be a document of the greatest value and interest upon the subject which has appeared in the country, as from the ability of the committee, their devotion to the object, and the means they had in their power, will enable them to give many interesting facts in relation to the different degrees of power required for the different ploughs.

J. B.

*Munificent Donation.*—The Treasurer of the Bunker Hill Monument Association acknowledges the receipt of the donation of ten thousand dollars from Amos Lawrence, Esq., of this city, which was some time since conditionally pledged towards the completion of that patriotic enterprise.—*Bost. Times.*

*Thanksgiving.*—The Governor and Council have appointed Thursday, the 26th day of November, as a day of thanksgiving in the Commonwealth of Massachusetts.

### NEW ENGLAND FARMER,

AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, OCT. 21, 1840.

Having received the official account of the trial of ploughs at Worcester, we are compelled to exclude the communication of H. C., as we consider it important that the report should appear this week, as there is much inquiry for it, and furthermore incorrect accounts have appeared, which we deem it important to rectify.

The report was not received until after our communication on this subject, in the preceding column, was in type.

J. B.

#### IMPORTANT REPORT.

REPORT OF THE COMMITTEE OF THE STATE SOCIETY APPOINTED TO AWARD THE PREMIUMS ON PLOUGHS.

At the interesting trial of ploughs at Worcester on the 13th, the following report was made:

"The Trustees of the Massachusetts Society for the Promotion of Agriculture, impressed with the idea that a portion of their funds could not be better employed than in an earnest effort, by liberal premiums, to invite the attention of the public, as well as the skill of the mechanic, to the important improvements in agriculture—more especially to what stands foremost in the view of the agriculturist, the PLOUGH—were induced to offer—For the best plough, which would turn the sod flat—one hundred dollars; and for the best plough that would lay the sod edgewise or obliquely, seventyfive dollars—and due notice having been given, and the co-operation of the several county Agricultural Societies having been solicited, and the particular aid and assistance of the Worcester Agricultural Society having been most freely and obligingly had—The Committee proceeded under these favorable auspices, on the 13th of October, to make trial of the several ploughs presented for premium.

It is necessary to observe that there were many improvements in what had been formerly in use.

But there were but two premiums to bestow; and after a careful consideration, the Committee came to the following conclusion with great unanimity:

That the premium of one hundred dollars be paid to Messrs Prouty & Mears, for their sod plough.

That the premium of seventyfive dollars be paid Mr Charles Howard, for his plough B. No. 2.

All which is submitted.

(Signed)

BENJ. MILLS, Pittsfield.  
LEVI LINCOLN, Worcester.

Committee.

The following is the report of a sub-committee on the same subject, going into greater detail on the construction and peculiarities of the various ploughs.

The Committee appointed to examine and decide upon the several ploughs entered for the premiums of the Massachusetts Society for Promoting Agriculture, at Worcester on the 13th Oct., 1840, after awarding the premiums, having appointed a sub-committee to report more specially on the merits and peculiarities of the respective instruments: the said sub-committee accordingly report:

That the importance of the decision to be made by the whole committee was a subject of frequent conversations, in which all agreed that the interests of the agriculturists of our community might be as seriously affected by their award, as by the action of any agricultural committee that has ever reported in our commonwealth. Good ploughing is absolutely essential to good and successful husbandry; and good ploughing is with great difficulty performed with any other than a good plough. Our decision, it was thought, might possibly influence numbers in their purchase of this important implement; and with this thought in our minds, we could not fail to recognize the duty of giving to the several ploughs entered for premium, as fair and full a trial as time and opportunity would permit.

Some of the committee having been detained an hour or two by a slight accident on the railroad, we were obliged to defer the commencement of our examination until about 11 o'clock. The first operation was to run furrows so that we might have narrow lands of about five rods in length. Then fifteen ploughs were brought on and used successively. Each competitor was allowed to furnish his own ploughman; to make his furrow of whatever depth and width he chose; and thus to give us his own specimen of the work of his own instrument. Each was allowed to turn several contiguous furrows. The Dynamometer, or measurer of the power required to draw the plough, was applied to each, through two or more furrows. This power was noted down; the depth and width of these furrows were measured; and our eyes scanned the work of each. About five hours were consumed in the trial thus far.

After having taken some refreshments, several members of the committee, whose hands were not entire strangers to the plough-handle, went to the field and severally tried such of the ploughs as either of them was disposed to follow. On the following day, also, they held several of the ploughs; and they all agreed in the opinion that the ploughs of Mr Howard and those of Messrs Prouty & Mears, are managed with great ease and comfort by the ploughman, and that each when left to itself holds on in its proper position and course, where the sod is uniform and free from stones. They agreed, also, that the form and position of the beam-handle of Messrs Ruggles, Nourse & Mason's plough is such that the ploughman cannot walk in the furrow erect and comfortably when the plough is in a position to make good work. They think, too, that this plough when left to itself tends to narrow the furrow slice and run out; and therefore that a constant, though slight, effort on the part of the ploughman, is required to keep it in its place. It is true, however, that in the hands of a skilful holder, this instrument, in shallow and flat ploughing, makes as handsome work as any that we have seen. But where all make work handsome enough, those must be considered best which make the smallest draft upon the strength of the team and the skill and comfort of the ploughman.

In relation to the ploughs of Messrs Prouty & Mears and those of Mr Howard, we mean not to say or do anything which shall be construed as a recommendation of the one above the other. It is believed that if we were intending to purchase soon for our own use, (and two of us at least are intending this,) that we should not all prefer the plough of the same manufacturer. The premiums are not first and second, but each is first for its kind of work. We may state that the whole committee, with little previous conference of opinion, when proceeding to give in *by ballot*, the name of the maker who should receive the premium for flat furrows, manifested the greatest agreement possible short of perfect unanimity; and that in designating, by the same process, who should receive the premium for lapping fur-

rows, there was entire unanimity. Should our opinion be asked as to which of the ploughs we should prefer for use on a farm, we might perhaps say to the inquirer, if your land is mostly light and easy to work, try Messrs Prouty & Mears's first; but if your land is heavy, hard or rocky, begin with Mr Howard's. Mr Howard's is the heavier and probably the stronger of the two. Both are of good workmanship, and will doubtless do good service. We would say this, also, of the ploughs of Messrs Ruggles, Nourse & Mason, which are in no respect inferior to the others, excepting the particulars previously specified. We believe that the makers of best ploughs will find this company powerful competitors, for they are now close upon the heels of those whom the committee consider decidedly far ahead of all others whose implements they have seen. In this place we will thank them for exhibiting a specimen of the work of a subsoil plough—an instrument which will doubtless be as useful on many of our soils as it is known to be in England.

The power required to turn over a given quantity of earth by a plough, is a very important consideration. This power can be measured with great accuracy; greater than many of the committee had supposed before they witnessed the operation. The Dynamometer, inserted between the plough-beam and the chain, measures with great accuracy the strength exerted by the team. Suppose the strength applied be the same that would be required to raise 336 lbs. over a single pulley; suppose also that the depth of the furrow is 6 1-2 inches and the width 13 inches. Multiply 13 by 6 1-2 and you have 84 with a fraction. Now if 336 lbs. of power will take up and turn over 84 inches of earth, then 112 lbs. will turn 28 inches. Tried in this way, the ploughs exhibited showed the following results. The power in each case is 112 lbs.

#### First Ploughs for lapping furrows.

By Charles Howard, Hingham,	29 1-2 inches.
‘ Ruggles, Nourse & Mason, Worcester,	24 ‘
‘ John Wilson, Deerfield,	21 1-2 ‘
‘ Stevens's plough, Barnet, Vt.	20 ‘
‘ James Stewart, W. Newbury, (Scotch Plough,)	19 1-2 ‘
‘ Cornelius Bergeon, Brooklyn, N. Y.	18 ‘
‘ Barnaby & Moores, Ithica, N. Y.	17 2-3 ‘
‘ E. G. Whiting, Rochester, N. Y.	18 ‘

#### For flat furrows.

By Prouty & Mears, Boston,	27 1-2 inches.
‘ Charles Howard, Hingham,	25 ‘
‘ Ruggles, Nourse & Mason, Worcester,	24 ‘
‘ Barnaby & Moores, Ithica, N. Y.	18 1-3 ‘
‘ E. G. Whiting, Rochester, N. Y.	14 ‘
Another plough by Prouty & Mears,	26 ‘
‘ Charles Howard,	25 ‘

The above table, containing results arrived at, not by estimation, but by measurement, is given to the public, in the full belief that it will be acceptable to all farmers who may read it, and that it will be useful to many manufacturers of ploughs; for here are exhibited some remarkable and highly important facts. Taking the extremes, we find 112 lbs. power applied to one of Howard's ploughs turning over 29 1-2 inches of earth, while the same power at one of Mr Whiting's ploughs will turn only 14 inches—a difference of more than 100 per cent. The structure of the plough, therefore, must be an important matter to the farmer's cattle; and the committee think they may add, that the excellence of the work performed with the ploughs was, with few exceptions, in the direct ratio of the ease of draft. Had our cattle the gift of speech, their proverbial patience would hardly hold them back from saying to their owners—“Pay more attention to the structure of the plough.”

The committee cannot forbear to call the particular attention of farmers to the vast difference in the power required to move ploughs which are all doubtless considered excellent in those sections of the country from which they were brought. Ploughs were exhibited from places hundreds of miles distant from each other, and all subjected to the same test—a test as accurate as scales and figures make; and it is apparent that the work which one yoke of oxen can perform easily at one plough will require two yokes at another. Farmers usually and properly judge by comparison, and when holding the best plough they have ever seen, suppose it the best in the world. We request them to weigh well such facts as are detailed in this report, and to estimate the profit of saving one half, one fourth, or even one eighth of their team labor. A saving of even more than one half is possible by the farmers of some sections of the country.

We learn that three at least of those manufacturers who have been most successful at this exhibition, have been prompted by the offer of these premiums to revise their models of ploughs. The result cannot be other than highly beneficial to the interests of agriculture, and we have no reason to doubt that still farther improvements may be made.

In conclusion, we of the sub-committee, members of county societies, but not of the state society, hope that we may be allowed to express to the Trustees of the Massachusetts Society for the promotion of Agriculture, our thanks, both as individuals, and as members of county societies, for the benefits that will obviously result both to the *ploughman* and to the *reaper*, from the offering of their premiums. Were it in our power to call time and experience out of the future and assemble around us now, those who will be farmers in our country a few years hence, we doubt not we could obtain for you an unanimous vote of thanks—and could we call “the cattle from a thousand”—*furrows*—their thanks for a *less galling yoke*, would be no less sincere.

WILLIAM CLARK, Jr.  
ALLEN PUTNAM,

For the Sub-Committee.

October 16, 1840.

☞ Through the carelessness of the compositor, the usual order of our pages was sadly reversed in our last number—the third page filling the place of the second. We particularly regret this disarrangement on account of its mangling the report of Mr Walker. We trust that a like vexatious blunder will not again occur.

☞ In the account of the Westboro' Cattle Show, in our last number, 4th page, 2d column, 15th line from the top, for “hay load” read *hug* load.

*The Nobility of Labor.*—Ashamed to toil art thou? Ashamed of thy dingy workshop and dust labor field; of thy hard hand scarred with service, more honorable than that of war: of thy soiled and weather-stained garment, on which mother nature has embroidered mist, sun and rain, fire and steam—her own heraldic honors! Ashamed of these tokens and titles, and envious of the flaunting robes of imbecile idleness and vanity? It is a treason to nature—it is impiety to heaven—it is breaking heaven's great ordinance for human improvement. Exertion is nobler than enjoyment. The laborer is greater and more worthy of honor than the idler.

I call upon those whom I address, to stand up for the nobility of labor. Toil, I repeat, toil—either with the brain, the heart or the hand—it is the only true manhood, the only true nobility.—*Rev. O. Devoy.*

**BRIGHTON MARKET.—MONDAY, Oct. 19, 1840.**  
Reported for the New England Farmer.

At Market 3000 Beef Cattle, (including all which were left at the Slaughter Houses of the Barrillers,) 850 Stores, 7800 Sheep, and 1050 Swine.

Places — Beef Cattle — First quality, \$5 50 a \$5 75. Second quality, \$5 00 a \$5 25. Third quality, \$3 75 a \$4 75.

Barrelling Cattle.—A large number sold, Mess \$5; No. 1 \$4. Other numbers at less prices.

Stores — Yearlings, \$5 a \$9. Two Year Old \$12 a \$18. Three Year Old, \$21 a \$27.

Sheep — Dull A large number unsold. We quote lots \$1 25, \$1 33, \$1 58, \$1 75, \$1 88, \$2 12, \$2 37, and \$2 62.

Swine — Lots to peddle at 3 a 3 1-4 for sows and 4 a 4 1-4 for barrows. Small lots selected barrows at 4 1-2 a 4 3-4. At retail, 4 and 5 1-2.

**THERMOMETRICAL.**

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northerly exposure, week ending Oct. 18.

Oct. 1840.	6 A.M.	12 M.	6 P.M.	Wind.	
Monday,	12	63	66	50	N.
Tuesday,	13	34	49	41	N.
Wednesday,	14	41	68	59	N.
Thursday,	15	39	54	45	N
Friday,	16	30	45	43	N.
Saturday,	17	27	49	40	S. E.
Sunday,	18	40	60	50	S. E.

Thursday and Friday nights we had a smart frost, and the first to do any injury.

Fair every day at 12 o'clock, except Sunday.

**RUTA BAGA AND BROWN CORN.**

A few tons of Ruta Baga at \$3 per ton. Likewise Brown Corn.—This variety matures in a little over three months, in my opinion, yields as much as any other kind. Those farmers who are desirous of changing seed, may get supplied by calling on G. C. HAWKINS, Charlestown,—One mile from Cambridge Colles, on the Charlestown road.  
Oct 21. 3w

**WALKERS'S FINE TULIPS.**

For sale at No. 52, North Market street, a great variety of Walker's fine named Tulips, at \$3 per dozen, with their names. Many of the original Bulbs cost five times that sum. Those who intend to set out a tulip bed, will do well to call soon, as October is the best month for this business. Fine Mixed tulips without names, \$1 per dozen. Also Hyacinths of every variety, embracing all the most approved sorts, with a great variety of other bulbous roots.

JOSEPH BRECK & CO.

Boston, Oct. 21, 1840.

**FRUIT TREES FOR SALE.**

At the Pomological Garden, Salem, Mass., a good collection of Fruit Trees of the best Native and Foreign varieties. Apply by mail to the subscriber.

ROBERT MANNING.

Salem, Oct 14, 1840.

**HORTICULTURAL TOOL CHESTS**

Containing a complete set of Garden tools of superior finish and style, recently received from Liverpool and for sale at the New England Agricultural Warehouse and Seed Store.

JOSEPH BRECK & CO.

May 6.

**PATENT SPRING BALANCE.**

A few of those very convenient spring balances, for family use, a very simple contrivance for weighing small articles. JOSEPH BRECK & CO. No. 51 and 52 North Market Street, Boston.

July 15.

**FENCE CHAINS.**

Just received from England, at the New England Agricultural Warehouse, 6 casks chains, suitable for making the chain fence, &c.

JOSEPH BRECK & CO

July 15.

**BONE MANURE**

The subscriber informs his friends and the public, that after ten years experience, he is fully convinced that ground bones form the most powerful stimulant that can be applied to the earth as a manure

Orders for Bone Manure or Oyster Shell Lime, left at the Bone Mill, near Tremont road, in Roxbury, at the New England Agricultural Warehouse and Seed Store, No 52 North Market Street, or through the Post Office will meet with prompt attention.

March 4, 1840.

NAHUM WARD.

**GREEN'S PATENT STRAW CUTTER.**

JOSEPH BRECK & CO. at the New England Agricultural Warehouse and Seed Store Nos. 51 and 52 North Market Street, have for sale, Green's Patent Straw, Hay and Stalk Cutter, operating on a mechanical principle not before applied to any implement for this purpose. The most prominent effects of this application, and some of the consequent peculiarities of the machine are:

1. So great a reduction of the quantum of power requisite to use it, that the strength of a half grown boy is sufficient to work it efficiently.
2. With even this moderate power, it easily cuts two bushels a minute, which is full twice as fast as has been claimed by any other machine even when worked by horse or steam power.
3. The knives, owing to the peculiar manner in which they cut, require sharpening less often than those of any other straw cutter.
4. The machine is simple in its construction, made and put together very strongly. It is therefore not so liable as the complicated machines in general use to get out of order.

**IMPROVED VEGETABLE STEAMER.**

Just received at the N. E. Agricultural Warehouse and Seed Store, Dr Warren's Patent Cylinder Vegetable Steamer, for steaming all kinds of vegetables, for Swine, Cattle, &c. in large or small quantities. It can likewise be used for family purposes.

- A, the pipe for filling the boiler with water.
  - B, safety valve for letting off extra steam, in case the pressure should get too high.
  - C, steam pipe passing from boiler to cask
  - D, pipe to supply the boiler with water from a cask or box which is to be placed in such manner as to keep the boiler about two thirds full of water at all times, which answers as a complete self-regulator for supplying the boiler with water.
- The above cut is not a true representation of the boiler, as it appears at least one half larger than it really is, in proportion to the cask. The boiler is merely a small size cylinder stove, with the fire inside, and surrounded by a sheet of water from which passes a steam pipe to the barrel or box, the cask or box can be removed so as to discharge the vegetables without any alteration of the boiler or steam pipe.
- The steamer can be removed from place to place without any difficulty. Wood or coal can be used, and a few cents worth of either will steam a large quantity of vegetables. A number of them have been in operation, and found to give universal satisfaction

Farmers and others are invited to call at our Warehouse and examine the article, which they will find to be a very neat and cheap apparatus for the purpose. Price \$12, and with handles \$13. JOSEPH BRECK & CO.

No. 51 and 52 North Market street, Boston.

September 30.

**ALDERNEY STOCK FOR SALE.**

One COW and two HEIFERS, full blooded Alderney, for Sale. Cow \$50; two Heifers \$30 and \$40. Inquire at this office. Oct. 14

## MISCELLANEOUS.

## PROGRESS OF MODERN TRAVELLING.

Our fathers were—and that within the memory of man—contented to convey their goods from town to town on pack-horses. Narrow roads, which barely admitted a string of these beasts, burdened with the needs of many towns, run over hill and dale, and often were found worn deep between steep banks by the persevering traffic of ages, and overhung by trees, which had spontaneously sprung and grown over them, rendering them cool and pleasant. But the affairs of our worthy ancestors became sensibly on the increase. The string of pack-horses slowly progressing over the wolds and through forests were found not equal to the demands of commercial exchange and speed; and they set their wits to work, and lo, Pickford's and Pettifor's wagons, and others, their contemporaries, appeared, piled up in ponderous stateliness, and drawn by horses in bulk next to elephants. For their convenience, the old roads were deserted as too narrow, or filled up as too slumberously profound. New roads of an airy width were laid down, and Mr McAdam showed himself, with his necromantic hammer and pebble-guage in his hand, and coaches came galloping after him at ten miles speed per hour, loaded with eager and still impatient negotiators; roads of granite, or of limestone, however smooth, or however wide, or however covered with wagons, coaches, mails, horsemen, and the infinite variety of carriages of pleasure, travel, and parade, which now appeared on them, were found too few, and canals were cut; locks—wonderful things in those days—were invented; and heavy boats and light barges hastened to convey their freights of living things, and things for the living—market goods and market people, to the places where they were wanted or where they wanted to be. Well done, Englishmen! Things were come to a pretty good pass, it was thought. People said, wondering to one another—'If our grandfathers could but rise from their graves and see all this, how they would stare!'

But it was soon found that the population and the needs of the country had outgrown even these accommodations. There was a cry for more conveyance and more speed. Some talked of balloons, some of velocipedes, and some of perpetual motion. The old and the orthodox said, 'Let well be: things move fast enough. There is no rest, no repose, no steadiness in this generation: all is hurry, hurry, hurry. It is perfectly distracting.' They even looked back to the old hollow roads and string of pack-horses with affectionate yearnings. Nevertheless a set of pig-headed fellows were busy with their brains; and began to utter strange speeches about the powers of steam. It was a thing which was to work our mines and mills, impel our ships, and convey us, with the velocity of a comet, from one place to another. Old men, and wise men too, laughed at such Quixotic vaporings; yet spite of their laughter, there were heard great hammerings, and filings and fizzings, in the workshops of Watt and Bolton; and presently that mighty monster, the steam engine, was seen pulling up buckets of water and heaps of ore out of the earth, and turning a thousand spindles in our factories. It has become locomotive, has mounted the roads and the ships prepared for it, and is now flying from town to town and country to country, with us and our concerns in a manner so wonderful, that we shall

soon find ourselves past wondering at any thing. Do we not ride at the rate of thirty miles an hour and grumble at such a snail's pace—go over to America in ten days, and think it about five too long—and hear news from the East Indies in a little more than a month? Well done, Englishmen! as our fathers said, so say we—that is pretty well for another fit.—*William Howitt.*

"I wonder what makes my eyes so weak," said Snooks to Sniggins. "Why, they are in a weak place," said the latter.

"I'm getting fat," as the loafer said when he was caught stealing lard.

"It is much more blessed to give than to receive," as the boy said when the schoolmaster whipt him.

## FRUIT AND ORNAMENTAL TREES.

Gentlemen at a distance, wishing to purchase trees, are informed that we will select from the following nurseries Fruit and Ornamental Trees, Plants and Shrubs of every description that may be desired, and pay particular attention to their packing, and forward them to any part of the country.

From Messrs Winships', Brighton  
William Kenrick's, Newton.  
John A. Kenrick's, Do.  
S. & G. Hyde, Do.  
Samuel Pond, Cambridgeport.  
Botanic Garden, Cambridge.  
Robert Manning, Salem.  
J. L. L. F. Warren, Brighton.  
Breck & Co., Brighton.

The present is the best time, to transplant all hardy trees and shrubs.

Orders will be received for Plum, Pear and other Stocks, Hedge Plants, &c.

## FRESH GARDEN SEEDS.

We would inform our customers and friends that we are now receiving our supply of fresh Garden Seeds, most of which have been raised under our own inspection, from fine selected roots; which we warrant to be of the purest quality of the growth of the present season.

Agricultural Books.  
Agricultural Implements.  
Seed and Implement Catalogues sent to all applicants gratis, and all orders promptly attended to.

JOSEPH BRECK & CO.

Boston, Sept. 29, 1840.

4w

The Lowell Journal, Worcester Spy, New Bedford Mercury, Yeoman's Gazette, Northampton Courier, Providence Journal, Norwich Aurora, Essex Banner, Springfield Republican are requested to insert the above 4 times.

## BOX FOR EDGINGS.

For sale by JOSEPH BRECK & CO., a lot of very superior BOX. Oct. 6.

## HYACINTHUS.

The subscribers have received a large assortment of Double and Single Hyacinths of every color and shade. Also, Tulips of mixed sorts, Crown Imperials, and Lilies: they have also at their garden all the fine varieties of Pæonies, which will be furnished at one day's notice. Lilies and Pæonies, and Crown Imperials, should be planted in August or the first of September. We shall receive a great variety of Bulbous Roots, from Holland, in a few weeks, when notice will be given.

JOSEPH BRECK & CO.

August 26.

## GARDENERS' KNIVES.

JOSEPH BRECK & CO. have this season imported and now offer for sale a few very superior Garden Knives, for pruning, &c. manufactured expressly for Gardeners, and warranted superior to any article of the kind before imported.

Also—a large assortment of Budding Knives, Grape Scissors, &c. &c.  
April 22.

## TRACE CHAINS.

Just received, direct from the English manufacturers, 8 casks of Trace Chains, from 6 to 11 feet long, suitable for ploughing or draft chains. JOSEPH BRECK & CO.

## DESIRABLE FARM FOR SALE OR TO BE LET.

That valuable farm, situate in North Salem, about a mile from the centre of the city of Salem, and commonly known as the Dodge Farm, containing about SEVENTY Acres of excellent Land, with a large three story Dwelling House, Farm House, and out buildings. The Fruit Trees upon it produce about two hundred barrels of Apples. There is a Muscle bed and sea weed on the premises, which furnish an abundance of Manure for the whole farm; and the city of Salem affords a ready market for the produce of the farm. This estate would be sold reasonably if immediately applied for, and most of the purchase money might remain on mortgage; or it would be leased out on fair terms for five years. For further particulars apply to

JAMES ANDREWS & SON,  
No. 59 Commercial wharf, Boston.

N. B.—Or this farm would be exchanged for productive real estate in Boston.  
Oct. 14th. is2w

## FRUIT AND ORNAMENTAL TREES, &amp;c.

Fruit Trees of all the different species—of the most celebrated kinds. These include Pears, Plums, Apples, Quinces, &c.—the trees of the Peach and Cherry, especially, are of the finest size, and in numbers abounding at this time, and of varieties unsurpassed. The Catalogue of Fruit and Ornamental Trees and Shrubs, Roses and Herbaceous Flowering Plants, will be sent to all who apply: in that Catalogue many of the very best kinds of fruits, so far as proved, are particularly designated by a star.

Also, Grape Vines, Raspberries, Strawberries, Gooseberries, and *Mulberries for silk*—Scotch Larch, Lindens, Sycamores, Silver Firs, Willows, Elms—Honeysuckles, Dahlias, splendid Pæonies, &c. &c. Trees when so ordered, will be securely packed for transportation to distant places, and all orders promptly executed by

WILLIAM KENRICK.

Nonantum Hill, Newton, near Boston, Sept. 9, 1840.

## Brighton Nurseries and Gardens. For Sale

A large quantity of superior European and American Ornamental Trees, well calculated for public places, or private grounds, with Fruit Trees embracing a great variety of the most approved kinds and fine sizes. The trees, and all other productions can now be selected and marked, and will be forwarded to any place as soon as it will answer to remove the same.

Also, forty kinds of Strawberry Plants, of the most approved European and American varieties.

Orders may be forwarded via. mail, addressed Messrs. WINSHIP, Brighton, Mass., or left with Messrs. JOSEPH BRECK & CO.  
Brighton, August 12.

## TIE UP CHAINS.

Just received at the New England Agricultural Warehouse, a good supply of those celebrated Chains for tying up cattle. These chains, introduced by E. H. Derby, Esq. of Salem, and Col. Jacques, of Charlestown, for the purpose of securing cattle to the stall, are found to be the safest and most convenient mode of fastening cows and oxen to the stanchion. They consist of a chain which passes round the animal's neck, and by a ring attached to the stall, plays freely up and down, and leaves the animal at liberty to lie down or rise at pleasure, and keeps him perfectly secure.

JOSEPH BRECK & CO.

### N. E. FARMER.

#### WORCESTER AGRICULTURAL SOCIETY.

The twentyfirst annual festival of the farmers of Worcester county, was held on Wednesday, Oct. 14th. The festival came in the most beautiful month of the seasons of New England, and was held under the most cloudless and bright skies which smile on the autumnal days. From the circumstance that the postponement of the show from the time first fixed prevented interference with other exhibitions, our friends and neighbors who have usually been deprived of the opportunity to visit us, were enabled to be present. No accurate estimate of the numbers in attendance can be made: the substantial yeomanry and husbandmen were here, and no finer show of men was ever made: it is probable that at least twelve thousand persons participated in the innocent festivities and useful exercises of the day. Never was an assembly more exemplary in conduct: no riot, disorder, accident, or difficulty of any kind, is known to have thrown a single shadow over the brightness of a happy occasion: to the contrary, the numerous spectators departed pleased and gratified with the interesting exercises and exhibitions of the holiday.

The Society was honored by the presence of gentlemen connected with agricultural publications, with horticulture, and with the improvement of the soil. Among them were the editors of the Farmer's Visitor, N. E. Farmer, Yankee Farmer, and Horticultural Magazine, the Commissioner of the Agricultural Survey, the Hon. John Wells and Mr Codman, of the Massachusetts Agricultural Society, and delegates from each of the county societies of the commonwealth, with many strangers.

The animals of the farm were more numerous in quantity and more excellent in quality than ever before. On turning over the records of the society, it is pleasant to notice, that from the commencement in 1819 to the present, there has been a regular and progressive increase in the favor with which the institution has been regarded, and in the evidence of the beneficial influence it has exerted.

Having no political connexions or alliances, it has furnished common ground where all might meet as friends, and join in united efforts for the good of the community. Party and sect have alike been forgotten, and catholics and protestants, defenders and opponents, of the principles and practices of the administration, have stood side by side and given their hearts and hands to the work of being useful. No one but jealous and discontented partizans ever suspected that the condition was otherwise; and no one who was not impelled by morose and disturbed feeling, has ever suggested that there could be improper motives in those who have given time, labor and money, to promote the purposes of one of the best of all our local associations.

The whole number of cattle, sheep and swine was five hundred and forty. The abstract from the Secretary's books below, contains a comparative view of the statistics of his department.

### A TABLE

Showing the number of Animals exhibited each year at the Cattle Show of the Worcester County Agricultural Society, and the number of towns from which they were brought.

133 269 259 276 311 342 415 540

The ploughing match commenced at 9 o'clock of the morning, and was conducted with great spirit. The forenoon was occupied with the trial of working oxen, and the examination of the stock in the pens.

About 1 o'clock the members of the Society and their guests, formed a procession, and proceeded to the Central Hotel, where the table was spread with extraordinary elegance by Mr Cyrus Stockwell: those who were not deprived by the engagements of duty as marshals, members of committees, or by the labors of other officers, from partaking of the abundant repast, speak of the exhibition on the festive board as well suited to the excellence of the other departments, and the workmanlike performances of those who attended to the liberal entertainment, as giving abundant testimony of their satisfaction.

The President of the Society was at the head of the table: the Rev. Mr Smalley of the Union church officiated as chaplain, and after brief space had been allowed for refreshment, the former ad-

ressed the company and afterwards the guests, by allusion to the general topics of the occasion, and to the official station or public relations of each, in a manner which called from them appropriate responses. The Rev. Henry Colman and the Rev. Allen Putnam, of Danvers, offered pleasant remarks and good sentiments, which we expect to be enabled to report at length.

A few of the sentiments announced by the President, furnished to him by the pens of skilful writers, are given below, without regard to the order in which they were announced.

The Garden—Man's home in his first estate, it is still redolent with the "odors sweet" of Paradise.

The only shares that pay a sure dividend, *plough-shares*.

Woman—Without her, Eden was a desert; with her, the desert is an Eden.

The Liberty Tree—We should be careful while we pluck the *fruit*, not to break the *branches*.

The first instance of profanity in the world—when the first apple *danned* the first pair.

The Agricultural Commissioner—Why can he impart new *warmth* to the interest felt in agriculture? Do you give it up? Because he is a *Coleman*.

The Norwich and Worcester Railroad.—Being *Rocked-well* in its infancy, it has become a blessing to its parents, whose hearts it has riveted with "hooks of iron."

The North-eastern Boundary—Why is Uncle Sam like a horse that won't stand cropping? Because he won't give up any part of his *Maine*.

New England Soil—It may be cold and rugged, but it yields the best of all harvests—intelligent, virtuous, and free MEN.

That culture where each successive crop enriches the soil; where the fruits are used without being consumed, and distributed without being diminished—the culture of the mind.

Woman—She spoils us *with an apple*: she atoned for the wrong by *forming a pair*.

The Capital of the Farmers of Worcester County—Safely invested in those *capital stocks* which have always borne *premiums*.

In allusion to the presence of Hon. Isaac Hill, the editor of the Monthly Visitor, and one of the guests of the Society, the President gave

New Hampshire—From which the agricultural Visitor is always a most welcome guest.

By the Hon. Isaac Hill, of the Farmer's Visitor, — the Memory of Levi Lincoln, the elder: The generous friend of agriculture as the last business of his life. His race have emulated the grand example of their illustrious progenitor; and to them is the "heart of the commonwealth" indebted for much of its agricultural pre-eminence.

By Mr Joseph Breck, of the New England Farmer.—The Farmers of Worcester County: Their works, as this day exhibited, are the best proofs of their merits.

By Mr C. M. Hovey, of the Horticultural Magazine.—The Agricultural Society of Worcester, and

its lately organized associate, the Worcester Horticultural Society: Patrons and promoters of agriculture and horticulture. The efforts of the former in encouraging agriculture, is sufficient evidence that the labors of the latter will exert an equally beneficial influence in spreading a taste for horticulture.

By Mr S. W. Cole, of the Yankee Farmer.—Agricultural Improvement: The day has arrived when it is acknowledged that in agriculture, as in all other professions, "knowledge is power."

In behalf of the Massachusetts Horticultural Society, by Col. M. P. Wilder, President.—The Worcester Horticultural Society: We welcome her as a younger sister: we extend to her the right hand of fellowship: we pledge her our assistance and friendship, and we regard this, her first exhibition, as a most valuable assurance of her future growth and usefulness.

By Mr James L. F. Warren, of Brighton.—Worcester—Town and County: Renowned for the wisdom and patriotism of her statesmen; for the skill and industry of her manufacturers and mechanics; the practical knowledge and perseverance of the cultivator; of her soil, and the unbounded hospitality of her citizens.

Many other excellent sentiments were offered by the members and guests of the Society, which the hurry of the occasion and the engagements of the Secretary prevented him from preserving or reporting; but which we may hope hereafter to furnish.

After more than an hour had been passed at the table, with that enjoyment which hurried time along rapidly, the Society proceeded to the Union church, where they were first addressed by the President. He alluded in terms of affectionate respect, to the late Recording Secretary, Henry Wheeler, Esq., whose brother died while holding the same office, and rendered a just tribute to the memory of the officer of whose services the Society were deprived by the sudden dispensation of Providence, and to those of his kindred who had so zealously and faithfully co-operated in promoting the prosperity of the association. If any delay had occurred in the execution of the arrangements of the occasion, it had been in consequence of this affliction, and because the heavy labors of the occasion had devolved suddenly upon those oppressed with other toils.

It was stated that the Hon. Daniel Webster and Mr Senator Hubbard had been invited to address the Society, and the regret which all felt for their absence was expressed. After adverting to some topics of general interest, and congratulating the Society upon the continued and increasing favor of the public, and bidding welcome to the numerous guests who had honored the festival by their presence, he introduced the Hon. Isaac Hill, to the assembly.

Gov. Hill, of New Hampshire, made an excellent practical address, in which he proved conclusively the exceeding bad policy of young men, emigrating from New England to the west, with the expectation of bettering their fortunes, and that the soil of New England will better repay the efforts bestowed in a judicious cultivation, than any of the far-famed valleys of the west.

He spoke of various ways in which farmers ought to economize in time, in labor, and in the investment of capital; and of the mutual relations and good understanding which ought to subsist between the farmer and the workmen whom he employs, in

order that their connexion may be agreeable and advantageous to both.

He observed that the "true economy of the farm" should be the motto of every one concerned in agriculture; and that true economy consisted, in part, in a constant annual improvement of the soil, so that each succeeding year it may produce a larger crop than the year preceding.

In discussing the economy of labor, he observed that labor-saving machines and improved implements of husbandry ought to be sought for by the farmer, but that judgment and sound calculation should be used in their selection, for "to purchase an ingenious and expensive machine that is but little used in every farming operation, will be an expenditure that the farm will not return; for instance, to purchase an improved seed-sower, costing from twenty to thirty dollars, to save a single day's work in a year, would be injudicious."

We forbear to enter into any extended notice of the address of Gov. Hill, as we have the pleasure of assuring our readers, that from correct notes, we shall soon furnish to them a full and complete copy of his sound and acceptable remarks.

The Rev. Henry Colman spoke with great eloquence and beauty, comparing the advantages and disadvantages of the east and west; illustrating the blessings bestowed by Providence on our own New England—its natural and physical condition and resources, and painting the excellence of its moral, social and religious institutions, in that elevated tone which made the heart beat quick, and the spirit of the native of the Bay State feel proudly.

J. P. Cushing, Esq., of Watertown, generously sent for exhibition some of the finest neat cattle of the Ayreshire breed which have ever been seen in this portion of the Commonwealth, and with great liberality presented one of them to the Society, which had been imported by himself at great expense. He also permitted two fine swine, half Chinese and half Berkshire blood, (dear little beauties both,) to be placed in the pens. Whether these breeds are the best for the farmer in preference to others, is a question about which there would be difference of opinion: there could have been none as to the superior excellence of the animals, or of the munificence of the owner. The thanks of the Society were publicly tendered to Mr Cushing, and as a testimonial of grateful acknowledgment for the interest he had taken in the objects of the association, by an unanimous vote he was admitted an honorary member, a mark of respect conferred before on two occasions only, when President J. Q. Adams, the late chief Justice Parker, and the Judges of the Supreme Judicial Court accepted the same relation.

After the addresses the several committees presented their reports on the subjects confided to their examination.—*Worcester Ægis.*

#### Massachusetts Horticultural Society.

##### EXHIBITION OF FRUITS.

Saturday, Oct. 17, 1840

By E. S. Rand, Esq., of Newburyport; beautiful specimens of the following pears, viz: Chaumontel, Monsieur Jean, Lewis and Cross. The Cross pear is a new variety, which originated from seed in a garden in Newburyport. Although not at perfect maturity, they gave indications of being a very fine fruit. Part of them were reserved by the committee for a more definite examination and re-

port. Also, a small pear having the local name of Winter Catharine: its origin is unknown, and in comparison with our large Winter baking pears, does not appear to deserve cultivation.

By Mr Pond, of Cambridgeport; baskets of large and most beautiful Dix pears and Isabella grapes.

By E. Vose; the King of the Pippins apple:—this is a new variety, figured and described in the Pomological Magazine, No. 117. Its appearance is uncommonly beautiful. It is reserved till its period of maturity.

M. P. Sawyer, Esq. exhibited a basket of Wilkinson Pears, the produce of a standard tree in his garden at Portland, Maine. With these fine specimens before us, we could not but express our surprise, that the best varieties of the pear are almost unknown in Portland market.

From Col. C. Dagget, Andover, Conn., and from the Rev. W. Allen, North Andover, Mass., specimens of large and handsome apples, the names of which at present are unknown to the committee.

From Mr W. H. Montague, a basket of apples, which grew on a tree planted out by Penning White, the first white male born in New England.

From J. C. Dodge, Esq., of Attleboro', Mass., a basket of Isabella grapes, grown under glass, and said to be much improved by this method of cultivation, such however has not been the experience of the committee.

Messrs Hovey & Co. exhibited specimens of the Baltimore and Diap d'Or apples, and a basket of very superior quinces.

M. P. Wilder, Esq. exhibited the Beurre Duval and Autumn superb pears. The Beurre Duval is a very fine early winter fruit, for a description of which the committee refer to the Catalogue of the London Horticultural Society, 2d edition, No. 101.

Mr Warren, of Brighton, exhibited two sorts of apples—one supposed erroneously to be the Wellington; the other was sent to Mr Warren by Dr. Green, of Worcester: it is a large, handsome sweet apple, of a bright yellow russet color, and in the opinion of the committee highly deserving of cultivation.

Mr Austin exhibited a basket of Dix pears, from the original tree in the garden of Mrs Dix, in Boston.

Exhibited by some person unknown, specimens of a second crop of fruit of the native white raspberry.

Mr Richards exhibited the Capsleaf and St. Michael's pears, and Bixford and Lyseum apples: we think these apples are not surpassed by any other variety exhibited the present season.

Mr Manning exhibited the Beurre Bronze, Beurre Van Marum and Croft Castle pears: the scions of the Croft Castle were received from the late Mr Lowell and Gorham Parsons, Esq.: it is one of the new pears raised from seed by the late Mr Knight: we think it will not be excelled by any other of the large class of fine pears produced by that gentleman.

J. P. Davis, Esq. exhibited the following pears, from the garden of Mr Cushing, in Watertown, viz: Duchesse d'Angouleme, Chaumontel, Passe Colmar, St. Michael's and St. Germaine. They were very choice specimens, raised under the most improved system of cultivation. The St. Michael's and St. Germaine were equal to the very best productions of former years.

Mr Davis also exhibited specimens of the Tallman Sweet apple, from the garden of Mr Tallman,

in New Bedford. The character of this apple for the table and baking stands very high.

John Hooper, Jr., Esq., of Marblehead, exhibited the following pears, viz: Beurre Diez, Duchess d'Angoulême, Passe Colmar, Josephine, and one sort unknown to the committee: they were fine and large specimens, some of them remarkable as being the produce of trees imported the present year from France by Samuel G. Perkins, Esq.

For the Committee,

ROBERT MANNING.

BEST AGE OF THE HORSE.

Some difference of opinion appears to exist as to the time in which the horse is best fitted to perform labor, or rather respecting the age at which a horse intended for labor can be most profitably purchased. There is a general feeling in favor of young horses, and most individuals who wished a horse to perform hard work for five or six years, would choose one not more than four years old to begin with. We doubt whether this would be the best course, and imagine that one of seven years of age, will for five or six years do more work, and be more confidently relied on, than one younger. It is very true that where a farmer or other person is intending to keep or wear out his horse, one at four, may properly enough be chosen; but where five or six years of severe labor, without regard to other circumstances, is required, an older horse is unquestionably to be preferred.

A principal reason, and in our opinion a decisive one, for choosing a horse of greater age than four years for severe work, is, that at that age, the horse is immature, and of course unfit for great or long continued exertion. They have the life and the spirit, but the muscular energy is wanting. The bones have not acquired the hardness, and the tendons the firmness, necessary to prolonged effort, and any action in which these elements are essential to success, must either end in a failure, or be accomplished at an injurious expenditure of physical energy and power. We may learn much respecting the capacity of animals for labor, from what we know of the effects of muscular exertion on ourselves. The man under twenty may be active and capable of a great effort, but he is wanting in the powers of endurance. There is not the firmness of muscle essential to severe and continued action. Taking the comparative ages to which man and the horse live, as a standard, and allowing that the man is incapable of his greatest and continued efforts, until he is twenty-five or past, the horse should certainly not be less than seven or eight, to answer the same conditions. Overtasking does not produce the same effect on the man, as it does on the boy; and the horse at twelve, will scarcely feel fatigue at efforts which would have ruined him at the age of three or four. Light loads, short stages, and frequent stops while traveling, may enable a young horse to make a journey without injury; but where a heavy load is to be moved, or a quick pace is required, or on a farm a thick sward is to be turned, a horse under seven or eight, should not be chosen; and at such severe work, the eight year old, will last longer than the four year old.

It is a saying among English sportsmen, that what is required for a first rate hunter, or a horse of great work, is young legs and an old mouth; that is, horses that have done little until five or six, and of course while their hubs are elastic, are at the same time in full muscular vigor. Elwes,

the great miser, never allowed a colt to be broken until six years old; and when his horses were twenty or more years of age, his animals always led the field in the chase. Stage coach proprietors do not consider a horse past the most severe pace, or age, until after their sixteenth year. It must be admitted, however, that much is depending on constitution and treatment, and when these are good, a horse lasts much longer than has been generally supposed. It is stated in an English journal, that at this time there is a surgeon near Finsbury Square, London, who has a grey mare upwards of forty years of age, which still does her work in admirable style. At thirty-six years of age, this animal performed the distance of eighty miles a day, on two successive days; and one hundred miles in one day, and without exhibiting any indications of being severely tasked. An extraordinary instance of what the horse can perform, is given in the New York Spirit of the Times of June 6th, from which it appears that the horse *Elo*, a six year old gelding, on the 12th of May, trotted between sun and sun, one hundred and six miles, carrying 470 lbs. The match took place near Boston.

We think we hazard little in the assertion, that while no animal is more deserving of attention to his improvement than the horse, there is none to which, among the mass of our farmers, so little attention is paid. It is enough, if the animal attached to the carriage or the plow is a horse; it matters but little what is his performance, or his bearing; and unfortunately, such as are unfit for the most drudges, are selected to perpetuate the race. For our farm horses, we do not want the Arabian or the English blood horse: we require more weight, more bone and muscle, than these afford; but we do want some of their activity, and powers of endurance, and all these desirable qualities, it is believed, can be obtained by a proper selection, and by crossing. Some of the best horses in England, for the carriage or the farm, are the produce of a cross between the Cleveland bay, or the Suffolk Punch, and a half blood horse, combining the essential requisites of weight and action, as far as they can be united; and that a similar process here, would be attended with the same beneficial results, does not admit of a question. Farmers should discard the caricatures of this noble animal, that disgrace their premises; in breeding, give a preference to *good*, rather than to *cheap* cattle; beware working their colts too young, or too severely; let the food correspond to the labor; and always remember that "it is the pace that kills the horse;" whatever may be his business, or his condition.—*Albany Cultivator*.

*Market Wagons*.—Mr. Moses Chamberlin, of Braintree, was brought up before the Police Court of Boston last week on the complaint of Daniel Rhodes, Esq. Clerk of Faneuil Hall Market, from selling provisions from a wagon within the limits of the Market, contrary to a City by-law which prohibits persons from selling in that manner, unless they actually reside more than fifteen miles from the city, and bring to market the produce of their own or their neighbors farms. Mr. Rhodes said the defendant had violated this law many times, and had been fined once or twice, but paid no attention to the notice or the entreaties of the city officers. The example which he afforded to others induced frequent violations of the law, and caused much trouble at the Market. The Court, upon this view of the case, ordered him to pay a

fine of \$10 and costs of prosecution; and told him that if he offended in this way again the fine would be increased to \$20 and the costs.

*Ancient Pear Trees*.—The ancient Pear Tree, planted in 1628, by Governor Endicott, on his farm in Danvers, is yet in full life, and has this year produced a crop of good pears. It is a Bon Christian.

In Eastham, on Cape Cod, is another Pear Tree, planted in 1640, by Gov. Prince, in his garden. It is a flourishing lofty tree, and produces on an average fifteen bushels a year.

Lately there were two Pear Trees, standing in the garden of the Wyllis family, at Hartford, which was brought from England to Connecticut in 1633; and also, there was lately another in third avenue, in New York, which was brought from Holland and planted in 1617.

*Preserving Winter Apples*.—We believe the secret of preserving winter apples depends greatly upon doing every thing *well*, as well as upon the *mode*.

As preserving them in barrels is generally found most convenient, a few suggestions under this head may not be unacceptable.

The apples having been carefully picked, and great care should be exercised in this particular, as rotting generally commences at bruises, they are to be carefully laid in the barrels, very gently shaken down, and when the head is put in, it should press upon them sufficiently to prevent all rattling when the barrels are removed. This pressure never injures them nor causes them to rot, if the barrels are not opened before the apples are needed for use. A layer of straw is found to do more injury than good. The barrels should then be placed on the north side of a building, or the coolest place to be obtained, protected from rain by boards, until the approach of very severe weather, when they are to be removed to the cellar, where they should remain undisturbed until needed for use. The cooler apples can be kept without freezing, the less liable are they to decay.—*New Genesee Far*.

*Cheese in Ohio*.—We find in the Cincinnati Daily Chronicle, a very interesting article on the subject of cheese, its consumption and the extent of its manufacture in the West. In 1823, two gentlemen of Portage county, Ohio, commenced supplying the river towns with this article by bringing it to Cincinnati in a skiff about 1500 lbs of cheese. From this small beginning, the business has increased till their sales have amounted, for the last six years, to between 200 and 300 tons per annum, three-fourths of which is sold in Cincinnati, the balance in Louisville and other towns down the river. In the single township of Aurora, in Portage co. Ohio, there have been made between 250 and 300 tons of cheese yearly, for the last ten years, which has netted the farmers about 6 cents per lb. one year withing another. The amount of Western Reserve cheese sold in Cincinnati yearly, is estimated at between 800 and 900 tons, for the last six years, and is annually increasing. The price is generally ranged from 7 to 9 cents, and has been as high (in the autumn of 1838) as 12 1-2 cents; it has never been so low before, as at present, 6 1-2 cents, for ten years past.

SUGAR MAPLE—SUGAR.

Next to the pines and oaks, there seems to be no trees in the country of more extensive celebrity than the sugar maple. The extraordinary neatness of its appearance, and the beauty of its foliage, which in summer is of the liveliest green, and in autumn assumes the richest and most glowing red, are sufficient to recommend it as a beautiful ornament in our gardens and avenues. The bark is remarkably smooth, and the tree is infested, we believe, by no insect, nor subject to any maladies. The branches are disposed with much regularity, though without stiffness, and so arranged, that their usual outline is an elegant oval. It is to this tree we are chiefly indebted for the beautiful curled and bird's eye maple, employed in cabinet work, which rivals, if it be not admitted to surpass in brilliancy and richness, the finest woods of tropical climates. But the sugar maple derives its chief reputation, as well as its name, from the qualities of its sap. A large portion of the sugar used in many parts of the country, the western districts of Vermont and New York for instance, is derived from the maple. Michaux remarked, nearly thirty years since, that at least ten millions of pounds of this sugar were then annually made in the United States. This quantity is far less than might be procured, from the same source, in case of necessity. According to Dr. Rush, the northern part of New York and Pennsylvania alone, contained at the same period, thirty millions of sugar maple trees; and if we suppose each tree to yield, on an average, from two to four pounds of sugar annually, the product would go far towards supplying the whole consumption of the country.

The maple sugar can be made of a quality equal to the best imported. We have seen it formed into very good loaf sugar. It is, however, in a brown state that it is generally used. To manufacture it, requires a great expense not only of labor, but of fuel; and hence it probably cannot be sold, at a distance, for a price which will enable it to compete with the imported article. The sap of the tree, or maple juice, as it is called, is greedily coveted by wild and domestic animals, who break through enclosures for the sake of obtaining it, and is generally an agreeable and wholesome beverage. We have been informed, however, of one instance, in which it is proved to be of a highly intoxicating quality. This circumstance occurred about thirty years since in the western part of New York. All the sap procured from the maple trees of an extensive district, was found to have undergone a vinous fermentation; and children who drank it freely were in some cases rendered delirious for two or three days. We have heard of no other instance of this phenomenon, nor have we learned that any probable explanation has been given of its cause.

*N. A. Review.*

PUMPKINS.

*Salem, Oct. 14th, 1840.*

Dear Sir,—In the spring of 1839, I received from my son, who resides in Indiana, two seeds of the Harrison or Tippecanoe Pumpkin. The account given of them at the time I considered most extravagant. It was stated that some of them grew so large that it took two men to lift one of them in to a wheelbarrow. I planted them in my garden; the vines grew very luxuriantly, covering a space of ground at least fifty square feet. The produce was ten pumpkins, weighing 896 lbs. Some of

them measured five feet eight inches in circumference, and weighed 112 lbs. I was so well pleased with the result of the experiment, that I determined last spring to try the field culture of them. I planted several rods of ground, about the middle of May, in hills nine feet apart, with a good allowance of manure in each hill. The vines grew very luxuriantly, and the whole ground seemed to be literally covered with pumpkins, so much so as to attract the attention of every person who viewed them. Several of them were immensely large, weighing 116 lbs. Wishing to ascertain the weight of the whole crop, as near as possible, I sent one wagon load to the public scales, and found the weight to be 1810 lbs. The same wagon was used to get in the remainder of them, and filled the same as the one sent to be weighed. There were twelve loads and a part of one, weighing 500 lbs., making in the whole 22,220 lbs., or at the rate of 50,788 lbs. the acre. The fruit appears richer, the meat much thicker, and the shell softer than our common pumpkins, and admirably adapted to the feeding of stock. It will give me pleasure to furnish seed to any person who may wish for them.

Respectfully, yours, &c.

E. HERSEY DERBY.

*Boston Courier.*

COMPARATIVE VALUE OF ARTICLES USED AS FOOD.

Professor Silliman has given a translation of M. Dombasle's experiments with several articles in feeding animals. Seven lots of seven sheep each were selected of nearly equal weight, kept in separate divisions of the stable, the weight of each lot ascertained once a week, the experiment continued five weeks. One of the lots was fed exclusively on lucerne hay, of which each sheep was found to eat fifteen pounds per week. Each of the other lots received half the quantity of lucerne, and enough of the other kinds of food named to keep them in good health, and of the same weight. The kinds of food used were, *dry lucerne, oil cake, oats and barley, raw potatoes, cooked potatoes, beets and carrots*; of these substances, the quantity found necessary to equal the half ration or 7 1-2 pounds of lucerne, withheld from all the lots excepting the first, was as follows:—

Oil cake,	4 1-2 lbs.
Barley,	3 1-2 "
Oats,	3 "
Raw potatoes,	14 "
Cooked potatoes,	13 "
Beets,	16 "
Carrots,	23 "

or in other words, 23 pounds of carrots were only equal to 7 1-2 pounds of lucerne hay, 4 pounds of oil cake, or three pounds of oats. It may be remarked that the quantity of water drank by each lot of sheep was also accurately ascertained, and while those fed on grain and oil cake used during the experiment about 200 hundred quarts of water to each lot, those fed on roots did not use 100 quarts; and those on carrots, only 36 quarts.

Oliver Ames, of West Bridgewater, Mass., commenced life by making a dozen shovels, which he took to market in a wagon. He now owns three extensive factories at Easton, Braintree, and West Bridgewater—employs sixty workmen, and has four teams to carry his shovels to market. His profits are \$20,000 annually.

SALT FOR ANIMALS.

The importance of furnishing salt to domestic animals, does not appear to be sufficiently understood. Though all are aware of the avidity with which animals eat it when given them; there are many who scarcely salt their animals through the season. Now it is evident that animals should have it at all times at their command. They will never eat more than is good for them, and it is essential to their health and comfort. The quantity allowed in Spain for 1000 sheep, is 25 quintals—probably twice the amount the same number usually get in this country; and this quantity is consumed by them in about five months, they getting little in the winter or while journeying to and from their mountain pastures. Lord Somerville allowed a ton of salt to a thousand sheep, and found they consumed the most in the spring and fall, and at these seasons it was probably most useful to them as a security against disease. Of its value for animals in a medicinal point of view, the following fact, stated by the celebrated Curwen, must be deemed decisive:

"Before I commenced giving my cattle salt, my farrier's bill averaged 58 pounds per annum, (or more than 250 dollars,) and since I have used salt, I have never paid in any one year over five shillings."

Where cattle have access to sheds, troughs with a constant supply of salt in them, should be kept for their use. Where they must be salted in the fields, troughs should be placed, and salt supplied frequently. There will, in exposed troughs, always be more or less loss from rain, but that should not prevent a supply. It has been found an excellent practice where sheep alone come to the troughs, to put a little tar on the bottom and sprinkle the salt upon it. In this way a small portion of the tar is taken with the salt, and is not only found conducive to health, but, rubbed in this way over the nose, serves to prevent the attacks of the *Esthus ovis* or sheep fly.—*Alb. Cult.*

PROTECTION OF SHEEP.

The point which my very few observations will embrace is the extraordinary increase in the growth and condition of sheep by being fed under cover, in an open yard, with a shed in it. This idea had no doubt occurred to many others besides myself, but I am not aware that any one has so fully examined into the effects attending that inquiry as I happened to do in the course of last winter and the winter before. Gentlemen, the principle is one that we have acknowledged in every practical way, by every thing that eats, namely, that if it has plenty to eat, is warm and has nothing to do, it is very likely to increase. I certainly was not aware, until by repeated experiments I tested the truth of it, namely, that the same animals when placed in the shade and kept warm, not only increased rapidly, very much more rapidly in their condition and weight than when out in the open air, but also that they consumed a much smaller quantity of food. This I have tested, both last year and this. I have not the papers by me to refer to, but as far as my recollection goes, it is this, that the quantity of food consumed was less by at least one third, and that the increase of weight was fully one third, taking it in round numbers.—*J. W. Childers, in the British Farmer's Magazine.*

## NEW ENGLAND FARMER,

AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, OCT. 23, 1840.

We have received a communication from Mr Colman on the trial of ploughs at Worcester, but on account of its length, shall be obliged to defer it for the present.

## GREAT POTATO VINE.

Mr T. P. Merriam, of Chelmsford, has sent us a gigantic potato vine, measuring nine feet in length, which he states grew from the seed this season; he further states that the potatoes far exceeded the vine in growth. If he means to be understood that they exceed the vine in length, they must be enormous indeed. We think he is mistaken about their having been produced from seed the present season, as the tubers are generally very small at first and do not attain their full growth or a number of years. This story, however, is much more credible than one copied into the Boston Cultivator, about a new variety of potatoes raised by a Mr Smiley, of Augusta, Me., from the excrescences he found growing upon the stem of a gilliflower. We copy a notice of the account from the Maine Farmer:

"NEW WAY TO MAKE POTATOES. Friend Drew of the Maine Cultivator, tells a long and a curious story of some potatoes that were raised by Mr John Smiley, of Augusta, from some germs or excrescences that he found projecting from a stalk of the gilliflower. This excrescence was planted by Mr Smiley, and some very fine potatoes are the result.

Brother Drew calls upon us, among others, to explain the phenomenon. We may as well be honest and say we can't do it.

This growing potatoes from the stem of a gilliflower, is a Yankee trick we have never tried, nor seen tried, although we have long since learned to be cautious in denying every thing in vegetable physiology that we can't understand."

Since writing the above, the following communication has come to hand, together with one of the potatoes said to be produced from the gilliflower.

We are astonished that any person of common sense should for a moment believe that a result of this kind could be produced. Mr Smiley was undoubtedly deceived. We publish Mr Drew's account of it, as after what has been said, many of our readers may be desirous to see it. We might as well expect that an oak would produce pumpkins, or an apple tree a squash, as that a gilliflower should produce a potato. J. B.

For the New England Farmer.

AUGUSTA, Me., Oct. 26, 1840.

REV. H. COLMAN—My Dear Sir—I herewith send you a potato, the peculiarity of which consists in its origin, which I would thank you to explain, if you can, on some principle of natural science. I confess I cannot do this.

The facts are these: two years ago this autumn, Mr John Smiley, a very respectable member of this town, noticed on the stem of a common gilliflower, which some of the female members of his family had cultivated that season in a flower pot, several excrescences or "warts," as he called them, protruding from the junction of each leaf with the main stalk. He thought they appeared to be perfect substances, having vegetable life, and conjectured that they might be latent seed of the plant, which would vegetate. Indeed, he says he recollects to have read in some old book, several years ago—a No. of some

encyclopædia, he thinks—an account of the origin of the potato, which was attributed by some "beautiful flower;" and as these excrescences resembled little sun-burnt potatoes about the size of peas, he was led to inquire within himself, whether this might not have been the "flower" from which the potato first sprang. Accordingly he gathered the seeds and preserved them during the ensuing winter. In the spring of last year he prepared a bed in his garden and planted them out, one seed in a place, he precise spot where each was inserted being indicated by a small stick thrust into the earth. Impatient to see whether the seeds would germinate, he occasionally dug down to them and watched their progress. Two of them he found sprouted. The others he thinks were touched with frost in winter. He watched the sprouts till they appeared above the surface, and then cultivated them carefully through the season, loosening the earth and keeping them free of weeds, &c. He is perfectly sure, from actual inspection, that the sprouts which he cultivated came from the seeds planted. In autumn he dug from these two plants over half a peck of potatoes! the average size of which was above that now sent you. And from both plants they were all of one sort. He saved the potatoes during last winter and planted them all last spring. The product was about three bushels of potatoes, one of which I send for your examination. They are excellent, fully equal for baking to the celebrated "Bumans." But this is of minor consequence in the object of this letter. Can you explain any natural relation between the gilliflower and the potato? Is the latter not an original tuber; but is it the chance production of some freak of nature?

I was at first as incredulous as you may be, as to the fact of the potato being the progeny of the gilliflower; and tried all the tests of the accuracy of Mr Smiley's knowledge of which I could think. He is sure the potatoes did not come from seeds accidentally dropped from the balls; first, because his bed was not exposed to such seeds; none such came up elsewhere in it; he saw the sprouts from the gilliflower excrescences and watched their progress. Moreover, but one sort came from them, which is not the case where potatoes are produced from the balls, and these the first year attained their full size. A neighbor of his, Mr Shaw, has tried the same experiment with the same results. A family in Sidney, by the name of Howard, from whom Mr Smiley's family received the original seed from the pods of the gilliflower, have also raised potatoes from the same "warts." Under these circumstances I cannot withhold my belief in the statements of persons who are certainly very honest and worthy citizens, and can have no motive to deceive.

In the hope that you may be able to explain this matter, I send you this communication accompanied by one of the potatoes for your examination.

Very truly, yours in editorial labor,

WILLIAM A. DREW.

The art of agriculture is to raise the fruits of the earth. The science of agriculture is to understand the character and habits of plants and animals, the peculiarities of climate, the composition and qualities of soils and manures, the action of the elements, as they are called, of air, heat and moisture, the conditions of the weather, or the whole subject of sunshine, winds, rain, and frost, and the principles, so far as they are discoverable by man, upon which these things act singly or in combination. In short, an accomplished agriculturalist must understand, generally, and in my, physiology, botany, geology, chemistry, meteorology and geography.

## SETTING OUT FOREST AND FRUIT TREES.

Now is the time to transplant trees, and we hope those who have the means, and the time to attend to it, will not neglect to do it. If every man should set out his tree, a great deal would be done. We are inclined to think that autumn is the best time, on the whole to set out trees. The ground gets settled about them and they are all ready to profit by the first impulse of the spring and to go forward with the rest of the vegetable kingdom.

We were pleased with a plan which a friend adopted to insure the growth of some evergreens. He had been unsuccessful in transplanting some fir trees. He therefore went, about the this time of year, and dug a trench around some of pretty good size—thus making a circular ditch of some three or four feet in diameter. He then dug holes at home, where he designed to set them. After the cold weather had come, and the ground had become frozen, he went with a crowbar and took up the trees. A large clump of earth adhered to the roots which nearly filled the holes that he had made, and by putting in a little more earth around them, completely fixed them in the ground, and they started out in the spring as if they had never been disturbed or moved from the place of their birth. We want more apple trees growing. For some reason or other, we believe that apple trees are not so longlived in this latitude as farther south. It may be, because they bear more constantly, or because the extremes of heat and cold are greater. But it is not so much matter what the cause is. If it be a fact that they are not so longlived, it is so much the more necessary that young trees should be set out oftener, in order to take the place of those which may decay. But even if they do not decay, there are not yet enough growing among us. Apples are just beginning to be valued as green food for hogs and sheep, &c. &c. We know of some farmers who have kept their hogs in their orchards this fall, without giving them much if anything else, to eat, and they are in complete order. With a little feeding on corn, or barley meal, they will soon be excellent pork. We hope that the season will not pass away without setting out one tree at least, either for ornament or use.—Maine Farmer.

## MASS. HORTICULTURAL SOCIETY.

EXHIBITION OF FRUIT.

Saturday, Oct. 25, 1840.

From Hon. Charles Jackson, Brookline; Passe Colmar Pears, and a kind unknown, large, handsome, juicy, and of fine flavor.

From Samuel Pond, a fine exhibition of Dix Pears, also Isabella Grapes from John Hovey, Roxbury; Quinces.

From Samuel Walker, Burgomaster Pears of Boston.

From Edward Crutt of Boston, Dutchess d' Angouleme, Saint Germain and Platts. Bergamot Pears, of superior size and appearance.

From B. V. French, Blecker's Meadow, Wilkinson, Benne Van-Maron and Phillips Pears.

From M. P. Wilder, Glout Moreaux and Blecker's Meadow Pears, excellent.

From H. J. Hovey, South Boston, a fine specimen of Isabella Grapes in bunches, clusters thick, berries full and of fine flavor.

For the Committee,

B. V. FRENCH.

Paint your Tools.—Every farmer should be provided with a small quantity of the coarser kind of paints—a few paint pots and brushes and paint oil. It is very

easy to mix them, and by keeping a small supply, he might keep his implements always in a good state of preservation. The expense would be trifling, and the trouble next to nothing; and besides it is wisely or laudably that we can neither sow nor reap without trouble. The greatest of all troubles must be that of having nothing to do. To have a place for every tool on the farm, and to keep them all painted and in good order, and when not used, protected from sun and air, ought to be an amusing as it is undoubtedly a binding obligation on every farmer.—*American Farmer.*

Gov. Ellsworth of Connecticut has issued his Proclamation appointing Thursday, 19th of next month, as a day of public Thanksgiving.

BRIGHTON MARKET.—Monday, Oct. 26, 1840.

Reported for the New England Farmer.

At Market 3300 Beef Cattle, 775 Stores, 8500 Sheep, and 875 Swine.

*Pigs* — Beef Cattle — First quality, \$5 50 a \$5 75. Second quality, \$5 00 a \$5 25. Third quality, \$3 77 a \$4 75.

*Boirelling Cattle*.—Mess \$5; No. 2 \$1.

*Stores* — Yearlings, \$5 a \$9. Two Year Old \$12 a \$18. Three Year Old, \$21 a \$27.

*Sheep* — Lots were sold at \$1 25, \$1 35, \$1 42, \$1 62, \$1 75, \$1 92, \$2 00, and \$2 75.

*Swine* — Sales quick at a small advance. Lots to peddle at 3-1-4 a 3-1-2 for sows and 4-1-4 a 4-1-2 for barrows.

THERMOMETRICAL.

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northern exposure, week ending Oct. 25.

Oct. 1840. | 6 A.M. | 12, M. | 6 P.M. | Wind.

Monday,	19	43	59	59	S. W.
Tuesday,	20	62	71	62	W.
Wednesday,	21	52	54	51	E.
Thursday,	22	43	50	45	E.

Saturday,	24	41	49	40	N.
Sunday,	25	36	41	35	N. E.

Cloudy 4 days at 12 o'clock.

About one o'clock this morning we had some heavy thunder, which has been followed by a snow storm; about three inches has fallen, and it still falls fast.—6 o'clock, Monday, Oct. 26.

COWS WANTED.

Wanted to hire on fair terms 2 or 3 good Cows that will give a good quantity of Milk through the winter,—or would purchase if preferred. Any communication addressed to Taunton Post office, box 26, will be immediately attended to. Oct. 25.

GREEN HOUSE PLANTS, &c. &c.

The subscriber can furnish every variety of Green House Plants or Garden Shrubs, in the very best order. Also—Dahlia roots, (all the new varieties); Black Hamburg Sweetwater, and Isabella Grape vines; Roses and Peonies; Hornsuckles, and other creepers; Black, White, and Red Currant trees; White and Red Antwerp Raspberry vines; Asparagus and Rhubarb roots, &c.

Orders by mail will be promptly and faithfully executed; or they can be forwarded to, or left with J. Breck & Co.

JAMES L. L. WARREN.

Oct. 25. Nonantum Vale, Brighton.

WILLIS'S LATEST IMPROVED VEGETABLE CUTTER.

For sale at the New England Agricultural Warehouse, No. 51 and 52 North Market Street, Boston, Willis's Latest Improved Vegetable Cutter. This machine surpasses all others for the purpose of cutting Ruta Baga, Mangel Wurtzel, and other roots. The great objection to other machines, is their cutting the roots into slices, which makes it almost impossible for the cattle to get hold of them; this machine with a little alteration, cuts them into large or small pieces of such shape as is most convenient for the cattle to eat. It will cut with ease from one to two bushels of roots per minute. JOSEPH BRECK & CO. Oct. 25.

GREEN'S PATENT STRAW CUTTER.

JOSEPH BRECK & CO. at the New England Agricultural Warehouse and Seed Store Nos. 51 and 52 North Market Street, have for sale, Green's Patent Straw, Hay and Stalk Cutter, operating on a mechanical principle not before applied to any implement for this purpose. The most prominent effects of this application and some of the consequent peculiarities of the machine are:

1. So great a reduction of the quantum of power requisite to use it that the strength of a half grown boy is sufficient to work it efficiently.

2. With even this moderate power, it easily cuts two bushels a minute, which is full twice as fast as has been claimed by any other machine even when worked by horse or steam power.

3. The knives, owing to the peculiar manner in which they cut, require sharpening less often than those of any other straw cutter.

4. The machine is simple in its construction, made and put together very strongly. It is therefore not so liable as the complicated machines in general use to get out of order. Oct. 14.

ALDERNEY STOCK FOR SALE.

One COW and two HEIFERS, full blooded Alderney, for sale. Cow \$50; two Heifers \$30 and \$40. Inquire at this office. Oct 14.

BONE MANURE

The subscriber informs his friends and the public, that after ten years experience, he is fully convinced that ground bones form the most powerful stimulant that can be applied to the earth as a manure

Orders for Bone Manure or Oyster Shell Lime, left at the Bone Mill, near Tremont road, in Roxbury, at the New England Agricultural Warehouse and Seed Store, No. 52 North Market Street, or through the Post Office will meet with prompt attention.

March 3, 1840

NAHUM WARD.

FRUIT TREES FOR SALE.

At the Ponoiological Garden, Salem, Mass., a good collection of Fruit Trees of the best Native and Foreign varieties. Apply by mail to the subscriber.

ROBERT MANNING.

Salem, Oct. 14, 1840.

FENCE CHAINS.

Just received from England, at the New England Agricultural Warehouse, 6 casks chains, suitable for making the chain fence, &c. JOSEPH BRECK & CO. July 15.

WALKER'S FINE TULIPS.

For sale at No. 52, North Market street, a great variety of Walker's fine named Tulips, at \$3 per dozen, with their names. Many of the original bulbs cost five times that sum—Those who intend to set out a tulip bed, will do well to call soon, as October is the best month for this business. Fine Mixed tulips without names, \$1 per dozen. Also Hyacinths of every variety, embracing all the most approved sorts, with a great variety of other bulbous roots. JOSEPH BRECK & CO. Boston, Oct. 21, 1840.

RUTA BAGA AND BROWN CORN.

A few tons of Ruta Baga at \$8 per ton. Likewise Brown Corn.—This variety matures in a little over three months, in my opinion, yields as much as any other kind. Those farmers who are desirous of changing seed, may get supplied by calling on G. C. HAWKINS, Charlestown,—One mile from Cambridge Colleges, on the Charlestown road. Oct. 21.

ENGLISH ACORNS AND SPANISH CHESTNUTS.

Just received and for sale, a few quarts of English Acorns. The tree is very beautiful, and one of the most ornamental of the English forest trees. Also a few Spanish Chestnuts,—twice as large as the common sort,—price 50 cents per quart. JOSEPH BRECK & CO. Oct. 23.

SUPERB MIXED TULIPS.

For sale a few dozen of Walker Tulips of superb mixtures at \$2 per dozen, consisting of many of the choicest varieties. Oct. 23. JOSEPH BRECK & CO.

## MISCELLANEOUS.

## BRIEF DISCOURSE.

TEXT—"There is a way that seemeth right to a man, but the end thereof;" &c.

We hope it will not be deemed sacrilegious to quote here this sublime precaution from oracles of divine truth, as a text to discourse from in the manner which follows, although in aid of subjects of somewhat a secular nature, appertaining, however, to morality.

It may seem right to a man—to neglect paying his debts for the sake of lending or speculating on his money, but the end thereof is—a bad paymaster.

It may seem right to a man—to attempt to live upon the fashion of the times, but the end thereof is—disgusting to all sensible folks, and ruinous to health, reputation and property.

It may seem right to a man—to attempt to obtain a livelihood without industry and economy, but the end thereof is—hunger and rags.

It may seem right to a man—to keep constantly borrowing of his neighbors and never willing to lend, but the end thereof is—very cross neighbors.

It may seem right to a man—to be always trumpeting his own fame, but the end thereof is—his fame don't extend very far.

It may seem right to a man—to trouble himself very much about his neighbor's business, but the end thereof is—great negligence of his own.

It may seem right to a man—to be constantly slandering his neighbors, but the end thereof is—nobody believes any thing he says.

It may seem right to a man—to indulge his children in every thing, but the end thereof is—his children will indulge themselves in dishonoring him.

It may seem right to a man—to put off every thing that ought to be done today until tomorrow, but the end thereof is—such things are not done at all.

It may seem right to a man—to obtain his news by borrowing and stealing of his neighbors, but the end thereof is—annoyance to his neighbors and fraud upon the printer.

It may seem right to a man—to pay every body before he pays the printer, but the end thereof is—he pays the most needy last, if he pays them at all.

It may seem right to a man—to be incessantly occupied in hoarding up the treasures of this world, but the end thereof is—he has none in the world to come.

*The last Shark Story.*—As an offset to some of the 'heart rending' shark stories which we often see in the newspapers, the New Orleans Picayune, gives the following, which is singular and horrid to an extraordinary degree:

"Once upon a time when the packet ship Coriolanus was returning from Liverpool to New York, the carpenter, a very worthy man, was taken sick, and after a brief illness expired on shipboard. He had an interesting son, who was his assistant as ship carpenter, and the boy loved his father with the most tender and filial affection. The poor youth's heart was almost broken at the loss of his parent, and no persuasion could induce him to leave the body.—The usual preparations for a funeral at sea were made; the poor carpenter was sewed up in his winding sheet, and with him was put an old grindstone, hatchet and chisel, to carry him down

to his long rest in the ocean. The poor boy grew frantic when his father was about to be committed to the waves, and was obliged to be held off by the sailors. At length, just as the fatal lurch of the vessel was taking place, the boy, with the strength of a maniac, broke from the sailors and dashed himself upon the body at the very moment that it was sliding over the ship's side. It was too late to save him, and clinging wildly to the dead body of his father, the hapless boy was seen to make one swift plunge, and disappear forever down, down, into the eternal caverns of the mighty ocean.

This was in lat. 97, long. 79, which was duly entered on the log-book. The Coriolanus arrived at New York, completed all the business preparatory for her next trip, and sailed again for Liverpool.

[Take in a long breath, reader—it's coming.]

When in lat 63, long. 48, an enormous shark was caught, and when hauled upon deck a most extraordinary noise seemed to proceed from the huge monster's stomach. The creature was opened, and there was the father, the son, the grindstone, the hatchet, and the chisel. O, if it aint true, then never may another fish story be believed! The poor carpenter had not died, but was only in a trance when they buried him, and there he was, sharpening his hatchet, while the son was turning the grindstone! they having resolved to cut their way out of the shark's stomach!"

## FRUIT AND ORNAMENTAL TREES.

Gentlemen at a distance, wishing to purchase trees, are informed that we will select from the following nurseries Fruit and Ornamental Trees, Plants and Shrubs of every description that may be desired, and pay particular attention to their packing, and forward them to any part of the country.

From Messrs Winships', Brighton  
William Kenrick's, Newton.  
John A. Kenrick's, Do.  
S. & G. Hyde, Do.  
Samuel Pond, Cambridgeport.  
Botanic Garden, Cambridge.  
Robert Manning, Salem  
J. L. L. F. Warren, Brighton.  
Breck & Co., Brighton.

The present is the best time, to transplant all hardy trees and shrubs.

Orders will be received for Plum, Pear and other stocks, Hedge Plants, &c.

## FRESH GARDEN SEEDS.

We would inform our customers and friends that we are now receiving our supply of fresh Garden Seeds, most of which have been raised under our own inspection, from fine selected roots; which we warrant to be of the purest quality of the growth of the present season.

Agricultural Books.

Agricultural Implements.

Seed and Implement Catalogues sent to all applicants gratis, and all orders promptly attended to.

JOSEPH BRECK & CO.

Boston, Sept. 29, 1840.

4w

The Lowell Journal, Worcester Spy, New Bedford Mercury, Yeoman's Gazette, Northampton Courier, Providence Journal, Norwich Aurora, Essex Banner, Springfield Republican are requested to insert the above 4 times.

## BOX FOR EDGINGS.

For sale by JOSEPH BRECK & CO., a lot of very superior BOX. Oct. 6

## HYACINTHS.

The subscribers have received a large assortment of Double and Single Hyacinths of every color and shade. Also, Tulips of mixed sorts, Crown Imperials, and Lilies; they have also at their garden all the fine varieties of Peonies, which will be furnished at one day's notice. Lilies and Peonies, and Crown Imperials, should be planted in August or the first of September. We shall receive a great variety of Bulbous Roots, from Holland, in a few weeks when notice will be given.

JOSEPH BRECK & CO.

August 26.

## TRACE CHAINS.

Just received, direct from the English manufacturer, 8 chains of Trace Chains from 6 to 11 feet long, suitable for ploughing or draft chains. JOSEPH BRECK & CO.

## DESIRABLE FARM FOR SALE OR TO BE LET.

That valuable farm, situate in North Salem, about a mile from the centre of the city of Salem, and commonly known as the Dodge Farm, containing about SEVENTY Acres of excellent Land, with a large three story Dwelling House, Farm House, and out buildings. The Fruit Trees upon it produce about two hundred barrels of Apples. There is a Muscle bed and sea weed on the premises, which furnish an abundance of Manure for the whole farm; and the city of Salem affords a ready market for the produce of the farm. This estate would be sold reasonably if immediately applied for, and most of the purchase money might remain on mortgage; or it would be leased out on fair terms for five years. For further particulars apply to

JAMES ANDREWS & SON,  
No. 59 Commercial wharf, Boston.

N. B.—Or this firm would be exchanged for productive real estate in Boston.

Oct. 14th.

is2w

## FRUIT AND ORNAMENTAL TREES, &amp;c.

Fruit Trees of all the different species—of the most celebrated kinds. These include Pears, Plums, Apples, Quinces, &c.—the trees of the Peach and Cherry, especially, are of the finest size, and in numbers abounding at this time, and of varieties unsurpassed. The Catalogue of Fruit and Ornamental Trees and Shrubs, Roses and Herbaceous Flowering Plants, will be sent to all who apply; in that Catalogue many of the very best kinds of fruits, so far as proved, are particularly designated by a star.

Also, Grape Vines, Raspberries, Strawberries, Gooseberries, and Mulberries for silk—Scotch Larch, Lindens, Sycamores, Silver Firs, Willows, Elms—Honeysuckles, Dahlias, splendid Peonies, &c. &c. Trees when so ordered, will be securely packed for transportation to distant places, and all orders promptly executed by

WILLIAM KENRICK.

Nonantum Hill, Newton, near Boston, Sept. 9, 1840.

eptD1

## FRUIT AND ORNAMENTAL TREES, &amp;c.

Fruit Trees of all the different species—of the most celebrated kinds. These include Pears, Plums, Apples, Quinces, &c.—the trees of the Peach and Cherry, especially, are of the finest size, and in numbers abounding at this time, and of varieties unsurpassed.

Also Grape Vines, Raspberries, Strawberries, Gooseberries, and Mulberries for silk—Scotch Larch, Lindens, Sycamores, Silver Firs, Willows, Elms—Honeysuckles, Dahlias, splendid Peonies, &c. &c. Trees when so ordered, will be securely packed for transportation to distant places, and all orders promptly executed by

JOHN A. KENRICK.

Newton, near Boston, Oct. 14

## Brighton Nurseries and Gardens. For Sale

A large quantity of superior European and American Ornamental Trees, well calculated for public places, or private grounds, with Fruit Trees embracing a great variety of the most improved kinds and fine sizes. The trees, and all other productions can now be selected and marked, and will be for warded to any place as soon as it will answer to remove the same.

Also, forty kinds of Strawberry Plants, of the most approved European and American varieties.

Orders may be forwarded via. mail, addressed Messrs. WINSHIP, Brighton, Mass. or left with Messrs. JOSEPH BRECK & CO.

Brighton, August 12.

## TIE UP CHAINS.

Just received at the New England Agricultural Warehouse, a good supply of those celebrated Chains for tying up cattle. These chains, introduced by E. H. Derby, Esq. of Salem, and Col. Jacques, of Charlestown, for the purpose of securing cattle to the stall, are found to be the safest and most convenient mode of fastening cows and oxen to the stanchion. They consist of a chain which passes round the animal's neck, and by a ring attached to the stall, plays freely up and down, and leaves the animal at liberty to lie down or rise at pleasure, and keeps him perfectly secure.

July 15.

JOSEPH BRECK & CO.

## THE NEW ENGLAND FARMER.

Is published every Wednesday Evening, at \$3 per annum payable at the end of the year—but those who pay with a certain days from the time of subscribing are entitled to a deduction of 50 cents.

TUTTLE, BENNETT AND CHISHOLM, PRINTERS.

N. E. FARMER.

WORCESTER AGRICULTURAL SOCIETY.

Report of the Committee on "Woolen Manufactured Articles."

The Committee on "all other manufactured articles" have attended to the delightful duties laid before them, and beg leave to report.

They regret that this very definite part of the program has not been so extensive and various as former sessions.

The first articles which came under the notice of the committee were some very beautiful artificial flowers, made of feathers, by Mrs. Enos, Dorr, Worcester. So far as beauty is concerned, Nature has rarely made flowers more beautiful. They were evidently hardy little gems, and which as sweetly in a December frost as in the sunny summer. Had they possessed a few drops full of odor from Nature's Laboratory, they would have equalled any wreath she had ever woven.

Then came some paper lamp lighters, by Miss Rebecca, of the State Lunatic Hospital. They were very pretty, and so was the little girl that made them, for her sweet and smiling face was on the other side of the show box.

Some of Whittmore's patent set cards, made by Geo. Upham, of Leicester, were presented for inspection. They were very neat and thorough articles, and forcibly reminded one of the ordering operation they would introduce into the general subjected to their administration.

Some needlework by Miss Ellen T. Harrington, Shrewsbury, a little girl 8 years old. It was a scene of the State Lunatic Hospital with the grounds around. The green trees were all seen in their appropriate places. The walks stretched away in the distance and wound away on sight. The building was represented just as an architect formed it, and from the windows you could almost hear the comfortable inmates give vent to their feelings to the committee as they gazed towards it. A gratuity of \$10 is recommended.

The one was a wrought muslin cape by Miss Eliza Goodale, of Spencer, and one by Mary E. Hastings, of Millbury. They were both very elegant, and showed the delicate taste of the wearers. The Cape—who has not heard of catching the Cape? and yet there are thousands who never had a heart to do it. It must be confessed that there are often great difficulties attending the act of getting around it, but yet the one who catches it has beyond amply repays for all the trouble.

Next were some beautiful lace veils—one by Miss Lydia Goddard of Spencer, one by Mrs. Daniel Howe, made of silk produced by Mr. Howe, of Worcester, and two by Silvia Holbrook, of Worcester. They were all beautiful. The committee think that Mrs. Howe's deserved a gratuity of \$1 and Miss Holbrook's two veils a gratuity of \$2.—

There is not an article of female dress so exceedingly vexatious and annoying as the veil. The eye, it is said, is never satisfied with seeing; how vexatious must it then be for the intellects one veil to stop in and conceal the prettiest thing it has to look upon. We recommend its use to be dispensed with, especially in presence of your committee.

There was a pair of beautiful paper card racks with flowers formed by being pricked with a needle. They seemed much nearer like their constituents than representatives generally do. It was done very neatly. If it is with ends as with men, that "station charms them," we can hardly think of a more charming situation than these simple racks afforded.

A worsted indispensable made by Miss Ann Lincoln, of Worcester, was seen. It was an exceedingly beautiful piece of work.

Four woolen work bags, made by Mrs. Ruth Watson, of Spencer, 59 years old, which demonstrated to all, that even 60 years have not been sufficient to blot out that skill and dexterity which are required in producing works of ingenuity and taste. May she live a thousand years.

A lamp ring by Miss Ann Lincoln, and one by Miss Sophia Harrington, of Spencer, next came under notice. They were of exquisite workmanship, and looked as though a leap set upon them ought to give a better light than in an ordinary situation.

There was a shell work box made by Mrs. J. Nelson, of Leicester. It was a wonderful monument of ingenuity, industry and skill. It was completely covered over with every variety of shells, arrayed in the most tasteful order and elegance. Your committee did not have time to count them, but upon a rough guess they would state the number at about eleven thousand seven hundred and eighty-four. A shell lamp stand stood near, formed by the same for head, and although of minute compass, yet the same skill and taste were eminently conspicuous.

Two richland shawls, spun colored and woven by Lucy M. Hensley, of Worcester, which were by local ladies they had been woven for some genuine Highland Lassie, to trip along to Kirkcubright sweet banks and bays of that bonnie land.

Two wrought worsted table cloths were sent here by Mrs. C. Russell, of Oxford. Little balls were wrought all over them, and flowers by strewed in every direction, and purple grapes were hanging in rich clusters from their creeping vines. Table cloths are the very substratum of the well stored board. If it were not for them, we should have nothing but plain, hard board. Every one, therefore, who likes good fare, must be a friend to table cloths.

A bed quilt by Charity King, a colored lady, who had been a slave in Maryland till within a year, and who is now 73 years of age, showed that freedom is decidedly favorable to the production of good labor. We wish her joy of her freedom.

A piece of brown lace curtains, draped, consisting of 36 yards, by Miss Beza R. Estabrook, of

Rutland, was not of the width required by the rules of the Society for a premium. It was pronounced splendid by all who saw it, and one of your committee seemed to have such an inordinate desire to possess it, that the rest of us really began to be apprehensive for its safety, and as an equivalent for the jeopardy in which it was placed, they recommended a gratuity of \$2. This unpretending article is a real friend to our race. It clings to us in infancy, and in mature years it ministers to our wants in a thousand different ways. It is worthy of a premium.

Mr. John Pringle, of Millbury, a blind man, sent a door mat to the same, which was a fine specimen of skill. How he could arrange the colors so tastefully we cannot see, and are inclined to think he cannot.

No straw bonnet was exhibited which possessed sufficient excellence to take a premium.

There was a grass bonnet, however, which took the premium of five dollars as quick as the committee cast their eyes on it. It was made by Miss S. H. Dins, of Oxford, of red top grass. The prettiest face in Christendom might not be ashamed to take shelter under it. "All flesh is grass," and some bonnets, might be added now-a-days.

A wrought muslin collar by Caroline P. Raymond, of Worcester, was a very neat and beautiful article. There is something exquisitely beautiful in beautiful needlework. Every association connected with it is delicacy and beauty. "O! that I were a girl upon that hand," said the loveliest Roman. How much more charming to have been Juliet's collar!

Miss Maria E. Barnes, of Leicester, let the committee see a beautiful fire screen. Flowers lay blushing in their own loveliness, and little birds sat gazing at them as though they had lost their melody in the loveliness of the scene.

Eleven substantial and beautiful carriage whips, came there from Mr. Samuel J. Emerson, of Worcester. The handles are covered by a very complicated and ingenious machine which does the thing up as neatly and expeditiously as economy or intelligence could desire, and as symmetrically as pride could wish. The lashes are made of leather, and at first it seemed that they came under the jurisdiction of the committee on Manufactures of Leather and Wood, but then the handles were not leather or wood, and so "the committee on every thing else," concluded to take the handles and give the lash to the other committee.

John P. Kettell presented a case containing six silk hats and four otter caps. From the superior excellence of the silk hats, the committee thought Mr. Kettell entitled to the first premium of \$6.

Mr. Nathaniel Teal sent a case consisting of six silk hats, six fur hats, four otter caps, and twelve pairs gloves. The silk hats the committee thought entitled to the second premium of \$4.

Of the whole class of dress intended for human protection the hat stands dosest by the head. It can sustain no economy, not only here use it would be a serious inconvenience to wear it on the

feet, but because it protects from the winter's cold and summer's heat, those tell-tale protuberances, which phrenologists tell of, which, like potatoe hills, expose the amount of mental and intellectual momentum which lies beneath. Although it changes its shape as often as the fop his dress, it must be admitted that it is often of more worth and service than all its shelters.

Twelve pairs Half Hose, from Holden Peor House, and if every thing there is as poor as those Hose, it must be a delightful place. Eight pairs Woollen Half Hose, made by Tirza L. Sibley, of Oxford, bore away the first prize of \$3 00. Seven pairs do., by Eliza C. Clapp, of Leicester, took the second of \$2 00. Then there were six pairs Woollen Stockings by Mrs. J. Southgate, of Leicester, which were pronounced excellent. And two pairs Woollen Stockings, and four pairs Mittens, spun and knit by Widow Solomon Dwinuel, of Milbury, 88 years old; and last, not least, two pairs Ladies' Hose, for which the Trustees of this Society have very ungalantly provided no reward. It is hoped that as some of the Trustees change their relative position this year, they may be a little more mindful next time, of the claims of the ladies. As the hat forms a shelter for the seat of intellect, so does the sock of the understanding, and its claims, for that reason, should not be forgotten.

There was a miniature Bureau, made by Amos Evans, jr., of Worcester, at the Show. There is so much quackery now-a-days in every thing *but* *physic*, that your Committee feared that this might not be real mahogany. It looked like mahogany—the branches were distinctly visible, as in mahogany—it had received a very bright and smooth polish as in the best of the article that was ever worked, and standing a few feet from it, a person would, without hesitation, pronounce it real mahogany—but when your committee came to examine it more critically and thoroughly they found it was mahogany.

A pair of tufted Crickets, with flowers beautifully inwrought, and made in elegant style, was sent by Sarah Whittmore, of Leicester. And another pair equally as beautiful, by Miss M. E. Barnes, of Leicester, only twelve years old. The old Popes of Rome used to take infinite delight in putting their feet upon the necks of Kings and Princes, but it really does seem that those Crickets would be a more eligible foot stool, than the empty shell of an idiot king. A gratuity of \$1 00 is recommended to Maria E. Barnes.

A Plute, by Charles S. Ellis, of Worcester, was of such exquisite finish, that it seemed that but a breath was wanting to set it to discoursing sweet music. He sent likewise a lot of Umbrellas and Canes, all of which were elegantly made. The Umbrella is a very useful and vexatious article,—useful when it is over our head in a shower,—vexatious, when we are caught out in a shower without one. It is uncertain who is the inventor of them, unless it was those wicked men who said "we will not have this man to reign over us."

There was a splendid Palm Leaf Hat, split and braided by Charlotte P. Bryant, of Royalston. Economy, in her palmiest days, could not invent a more neat and durable hat. Royalston must indeed be a Royal Town, if all her productions are as fine. A gratuity of \$2 00 is recommended.

There were Coverlets enough to smother the whole of your Honorable Committee. Mrs. Lucinda Slade, of Paxton, sent one which took the sec-

ond premium of \$3 00. Lucy Rice of Charlton, sent the best, and took the first premium of \$4 00. Miss Abigail Hartwell, of West Boylston, presented a very fine one. Hepsibeth Wilcut, of Brookfield, sent thither another. Mrs. Esther Young of Leicester, followed in "the footsteps," and gave us for inspection a very fine one, and Mrs. Lucy H. Hersey presented a fine specimen of her handiwork.

Then came the Rugs. There was quite a contest between the committees, which should have them, and this committee conquered, for they had a lot of Pistols, and eleven Horse Whips to enforce their arguments.

Mrs. E. W. Gilman, of Oxford; E. Gardner, of Leominster; Mrs. Ruth E. Gleason, aged 58, of Brookfield, presented very fine and elegant Rugs, Mrs. Ira Bryant, of Worcester had a very pretty woollen one, Mrs. Charissa Russell, of Oxford, another beautiful one, and Mrs. Alexander H. Wilder let us see one which elicited the admiration of all. Elizabeth Wilson, of Deerfield presented a very curiously wrought one, which created quite a discussion as to its mode of creation. A fine one by Mrs. Cowdin of Rutland, an old lady 75 years old, and almost blind, deserved a premium of one dollar.

There was one, made by Miss Lucy M. Farwell, which seemed to be political all over. "American Manufactures, Harrison & Tyler, Davis & Hull," were inwoven very curiously, and the Ship of State lay there ready to take on board her new pilot. It was a very fine Rug. Mrs. James Draper, of Spenceer, sent a most splendid affair. It was richly interwoven with park scenery, and if your committee had had a pistol well-loaded, they might have killed two as handsome deer as ever was poached in a royal forest.

Mrs. Elizabeth B. Wilson, and her two children, one in her arms, and one by her side, came there in all their loveliness, on canvass. The brush of Mrs. Wilson did it all too. Ovid tells of a young blade by the name of Narcissus, who saw himself in a crystal spring, and was love-sick all the rest of his life. There may be no danger in the present case, but really, such a group on canvass, makes a very beautiful picture.

A very beautiful Moss Basket was sent here by Miss Mary Bigelow, which showed her skill and taste. May she be blessed in her basket and in her store.

A Lady's Travelling Bag, of silk and wool, by Mrs. Jos. Pratt, of Worcester, was an exceedingly pretty thing. Flowers were inwrought in very beautiful taste. Another wrought in eruel, by Miss Jane Leggett, of Worcester, was by its side, and was a sweet little thing.

Mr. Charles P. Chapin, of Worcester, had by his Circian art, transformed some old wooden chairs into as fine mahogany as nature ever grew, with this difference, he put the branches just where they ought to be, but nature never does her work to order. He turned some pieces of old board into beautiful marble, except that it was not quite heavy enough. His Centre Table was a very wicked counterfeit. The leg was a fac simile of oak, and the leaf looked as if it had, in reality been taken out of Nature's quarry, and polished to the utmost perfection. If nature punishes counterfeiters as men do, Mr. Chapin cannot escape a life of hard labor in the quarries. We recommend a gratuity of \$3 00.

An ancient philosopher was once asked to go

and listen to an eulogy on Hercules. He acknowledged the courtesy by saying, "who ever blam him?" So with Tolman and Russell's carrying. It would be entirely superfluous to puff them, as question might naturally be asked, "who ever fou fault with them?" There was one carriage however, which deserves notice. We advise the community especially, if he be a married man to get one. It is a beautiful four wheeled Chaise, j large enough to hold a man and his wife, but o push back the seat and presto! change! it becom a Carryall capacious enough not only for a m and his wife, but all the little responsibilities whi may be imposed upon them. There was anot Travelling Carriage, in which four persons co comfortably enseoince themselves and enjoy a co comfortable chat while the storm might be battl without from every quarter of the compass, and t body but poor Tom, on the outside seat, be "a col

Mr. Silas Dinsmore of Worcester, brought so Reeds of his own manufactory, and they were p nounced fine, well made articles.

A delicate and elegant Apron, made of raw si by Sophia Stuart of Worcester, came under th notice. There is not a greater jilt among items of female dress, than the modern apron. professes to be a very simple article, and yet of arrays itself in gaudiest attire. Eve had an ap made of Fig leaves, Europa was gathering flow in her apron when her Olympian visitor came : carried her off to a ride, and and Goody Bla when she picked up Harry Gill's hedge, wore apron. How singular that these three ladies sho have been the only ones antecedent to the pres generation, who ever wore an apron.

Mrs. Newton of Worcester, sent for exhibit a very beautiful Vest. The material was fine : rich, but her own cunning fingers had added m a gem to its beauty.

An imitation mahogany Picture Frame, by C Waldo Flagg, an apprentice to Mr. Chapin, : examined. He is evidently learning the old tr of counterfeiting so successfully practised by : Chapin. Another by Augustus Carey of Worc ter, made of real mahogany, was a very splen article. It enclosed the picture of a lady, fair Hebe, and the Frame was as "handsome as a p ture."

Moses Spooner and Lady, and four or five otl : whose names your committee had no means of : certaining, had got upon the upper shelf of : Hall, and there they stood gazing upon the ercl beneath. Miss Susan Paine, however, who pain : them all and herself too, was modestly seated : the lowest shelf. We trust, however, from : specimens of her skill, she is not finally laid u : the shelf.

Miss Caroline E. Fay of Southboro, a little : only 6 years old, brought there a beautiful roil woollen Rug. "By their fruits ye shall knv them." What a little pretty rosy checked Che : this rule would make Miss Caroline. She ric : deserves a gratuity of a dollar.

A splendid specimen of Book Binding, by E-zillai Spencer of Worcester, your commit : thought, was entitled to a gratuity of \$1 00.

A most elegant Lamp Rug, came all the v from Warren, R. I., created by the fair hand : Miss Maria Anthony. The old Bay State fr : her very heart, welcomed it as a worthy repres : tation of her little sister Rhoda.

Mary S. Gray of Paxton, sent a pair of Ot : mans of exquisite finish. The Committee did t

them till to day. The rules of the Society require that all articles should be entered before 11 o'clock A. M. of the day previous to the fair. Any were not entered till to day, which might, otherwise, have been entitled to a premium or bounty.

Six substantial wool Hats, three white and three black, were sent in by Mr. Blackman of Worcester. Mr. Blackman is evidently no respecter of persons.

The silk worms of Erastus Gunn of Tatnuck, sent some of their Cocoons to the show. They were done up in the best style of that class of manufacturers. It is however, respectfully suggested, whether it would not be an improvement if the silk worm should contrive some expedient to the color: that fancy or fashion require in the cocoon. "Dyed in the wool" is essential not only to woollen cloths and politics, but in silk also. It therefore respectfully requested that the silk worm should die in the cocoon.

Messrs. T. W. & C. P. Bincroft had there a most superb and aristocratic Centre Table, of mahogany. The exterior was, without controversy, the very first quality of Mahogany, with elegant panels spreading about wherever beauty would possess. Your Committee did not submit the inferior to the usual Yankee test, because they had a jack knife at hand. This table was made, at their own manufactory which is under the care of Mr. A. Carey, by W. Bradford.

In consequence of the neglect of many individuals to comply with the requisitions of the Society, it is very probable that many articles may have escaped notice.

In consequence of a severe calamity, accompanied by a large loss of property, the Committee were unfortunately deprived of the aid and assistance of Mr. Bemis of Spencer, to day.

All of which is respectfully submitted,  
**CHARLES THURBER, Chairman.**

**REPORT ON WORKING OXEN.**

The Committee, though a portion of them were pressed into the service at a somewhat late hour, have attended to the duty assigned them, and submit the result of their examination.

Sixteen yokes of working oxen entered the list, the half of which came from the towns of Sutton and Charlton, and all from that portion of the county lying south of Worcester. The load drawn, by which to test the merits of the teams, consisted of 200 pounds. The committee have found it extremely embarrassing to distribute the premiums with very nice discrimination, in consequence of the near approach to equality in most of the excellencies of the teams. Indeed, so difficult has it been to rest satisfied with any selection of the candidates for the awards, that the committee have almost been driven to decide claims among rival oxen, as judges sometimes adjudicate for another class of litigants, upon "distinctions without a difference."

It was at length concluded that the several premiums be awarded as follow:

- To James Leach, Westboro', first premium, \$12
- To Simon Carpenter, Charlton, second do 10
- To Harvey Dodge, Sutton, third do 8
- To Tyler Carpenter, Charlton, fourth do 5

The committee would particularly make mention of the oxen exhibited by Salmon Hathaway, of Grafton, which were quite as large as any upon

the ground, and one of the premiums would have been awarded to Mr Hathaway, had not the age of his team (7 years) given it a less conspicuous place in the minds of the committee, than other yokes nearly or altogether equal to this in other respects, and younger.

In the course of the examination the committee have been struck with the importance of *well mating* and *well breaking* oxen in their youth. They believe, that among oxen, as well as in the society of those who rank higher in the scale of being, it is important to heed the admonition *not to be unequally yoked together*—and while they regard a similarity in color as less important in the former case than in the latter, it strikes them with force that equality in size is more essential in the former than in the latter society. Being well mated, they may the more easily be well trained. Both in forward movements, and in backing, the pair may be so well taught in the way they should go, that when old they will not swerve either to the right or to the left. To effect this, it has been suggested to the committee, by the exhibition of today, that much self-denial on the part of the driver, much coolness of temper, more training by motion, and less by voice, may be highly advantageous. It is apprehended that too often the driver underrates the sagacity of the ox. It is in pursuance of that beautiful order of things which always marks the arrangements of Divine Providence, that the qualities are apportioned among the various animals, as their uses require. The ambition of the horse is needed for his calling—the excess of it is his obstinacy. The quiet and submissive docility of the ox is wanted for his field of labor; the excess of it is his laziness, and it is this which far too frequently brings from his master angry words and heavy blows. If the ox be respected more, will he not respect his owner more? May he not be taught more than he is, by motions—by those mystic signs which all domestic animals can read by their sagacity, and obey almost by instinct?

The Committee believe, that while nothing can gainsay the authority which declares that "the ox knoweth his master's crib," experience has shown that he also knoweth, will appreciate, and will recompense his owner's wants, when reasonably expressed—his kindness, whenever received.

**A. H. BULLOCK, Chairman.**

**PEARS.—INFORMATION WANTED.**

We find the following in the *Western Farmer and Gardener*, published at Cincinnati, with a request to copy:

There is a subject connected with the cultivation of the pear, upon which we should gladly be informed. Pear stocks being much more inaccessible to our nurserymen, than apple, they are in the habit of working the former on the latter, and do so the more readily, as it has been found here that the Seckel, and some of the other smaller pears, are improved by being grafted on the apple. We ate a Seckel pear a few days ago, of a most unusual size and flavor, taken from such a tree.—Will this hold good with the large, melting, juicy pears? and, what is of still more importance, how does it affect the *durability* of the tree? We find it generally allowed, that fruit of any kind is affected to a certain extent by the nature of the stock used. Miller says, decidedly, that the common crab stock causes apples to be firmer, to keep longer, and to have a sharper flavor; and he is equal-

ly confident that if the breaking pears be grafted on quince stocks, the fruit is rendered gritty or stoney, while melting pears are much improved by such stocks. Therein he agrees with what we have stated as the result with the Seckel pear, which on a pear stock is small, though free from grit, which we should expect to find if on a quince or thorn stock. Thus, however, does not agree with Lord Bacon's doctrine, that "the cion overruleth the graft quite, the stock being passive only," which, as a general proposition, is in a great measure true. The distinct characteristics of the *engrafted* fruit remaining unchanged, although the qualities of the fruit itself are partially affected.—Will some of our eastern friends, Messrs. Hovey, Manning, Ives, Downing, &c., (our acquaintance with all of whom, though not *personal*, is by no means of yesterday,) who have been enabled to put the experiment to the test of time, enlighten us? I have found, in my own experiments, that where the quince or thorn stock is used, the graft lives and thrives a few years, perhaps bears once or twice, but soon shows signs of decay, and in five or six years dies. The late Mr Knight observes the same thing, and gives as his opinion, that "a stock of a species or genus different from that of the fruit to be grafted upon it, can rarely be used with advantage, unless where the object of the planter is to restrain or debilitate." In grafting the pear upon the apple root, we have rarely, though in a few solitary instances we have found that a union took place between the root or graft—yet the pear grows, being evidently supported by an absorption of moisture at least, from the root, until it had thrown out roots of its own. We have repeated inquiries made of us by individuals who wish to plant out pear orchards, as to the best varieties to be used, and particularly of the very early kinds, and in our answers were guided principally by the published experience of the gentlemen named above; but owing to the limited stocks and assortments of choice pears here, as yet, few of the fine varieties there spoken of can be obtained—we know of only a few hundreds fit for market. Will the gentlemen we have named, oblige us by forwarding to the office of the *Farmer*, a *priced* catalogue of all their choice fruits, and particularly those new kinds which have fruited with them, checking off those they have not already spoken of? By doing so they will benefit the cause we advocate, and enable us, probably, to send them some orders. **T. A.**

**Eggs.**—Two thousand years ago it was well known that long eggs when hatched produced males, and round eggs females. We see the same thing has been re-discovered, and claimed as an important addition to modern facts! Solomon was not far from right when he said there was nothing new under the sun.—*Alb. Cult.*

**SAVE YOUR FIRE WOOD.**—Mr Madison, in his notices of agriculture, says—"Of all the errors in our rural economy, none perhaps is so much to be regretted, because none so difficult to be repaired as the excessive and injudicious destruction of fire wood. It seems never to have occurred, that the fund was exhaustible, and that a crop of trees could not be raised as quick as one of wheat or corn."

Poverty looks in at the windows of the industrious man, but never enters.

## MIDDLESEX AGRICULTURAL SOCIETY.

*Report of the Committee on Swine.*

The Committee on Swine have attended to their duty, and submit the following report:

They found an unusually large number of entries for the different premiums of the Society.—The task of deciding between the merits of each—of assigning to each a place in the scale of excellence, where there were so many excellent points—was a difficult one. Your committee do not expect that they can have given perfect satisfaction by their award, although they have striven to be accurate and just. It was matter of great regret that the funds of the Society would not allow of additional premiums and gratuities. There were many animals present deserving of premiums. The committee have awarded as follows, viz:

To Horatio C. Merriam, of Tewksbury, for the best boar, the first premium of	86
To John Leathe, of Woburn, for the next best,	5
To Leonard Hoar, Jr., of Lincoln, for the best breeding sow,	6
To Abel Wheeler, of Lincoln, for the next best,	5
To Joseph Darby, of Concord, for the best pigs six months old,	4
To Abel Gleason, of Wayland, for the next best,	3

In some instances the committee were precluded from awarding premiums to certain animals, from the fact that the same animals had heretofore received the Society's premium, to which they would otherwise have been now entitled.

Several specimens were sent in for exhibition, which the committee regret they are not able to notice as their merits deserve.

Your committee further desire to call the attention of the Society, very briefly, to the subject of the rearing of swine by the farmers of Middlesex. They regard the matter as of high importance. They think it worthy of serious attention, and they are constrained to believe that this farming community generally is not possessed of such accurate information and confirmed details of experiment as it possesses on all the other matters of daily occurrence in a farmer's life.

This is regarded as the funny committee of our show. Your Chairman of the Hog Committee is expected to give a funny toast at the dinner table, and to excite the risibles of all the members of the Society in his annual report of the award of premiums, and by a lecture on pigs and hogs, to castigate all the vices of the community, social, political, professional and religious. All this has been of course exceedingly pleasant, and doubtless the most agreeable method of spending a few moments of our day. The effect of the matter has been, to make of subordinate, that which your committee think of the very first importance, viz: the true value of this branch of practical husbandry.

An old maxim says, "a hog is a hog, and you can't change the nature of the beast." Now, though maxims are generally the expressed and compressed wisdom of ages of experience, we yet beg leave to differ from this particular one. You can change the beast. Take that most absurd, most ridiculous, most laugher-moving of all the sights that are ever seen on the face of the earth—a common swine of the old-fashioned breed, and see what has been done with him. Consider the animal an instant—view his legs, as long as a crane's, and as large as good-sized merchantable birch wood, and as fleet as those of a greyhound;

his nose like a pickaxe; and his back sharp as a cross cut saw, and able to go through a white oak rail at a single pass. We have seen some unfortunate and much to-be-pitied individual undertake to drive the creature, and know that nobody, except the driver, can help tumultuous laughter. We have heard his melodious voice of song, and know that at it no one can help shuddering. We have ministered to his appetite, and know that we could not help groaning at the insufficiency of all human exertions to satisfy an appetite that never ceases craving. Now compare this animal—would that we could say that the race was nearly extinct—compare this sort of creature with one of the best breeds now in public favor—the Berkshire, or Mackay, or China, the Moco or the Byfield. Look at the short, slender legs, the small bones, the well placed head, the deep chest, the straight, broad, flat back, the full quarters, the fine grained flesh, the great aptitude to fatten, the cleanliness of his habits, the absence of noise, the increased weight given him at a less expense and in shorter time.

In point of fact, swine are like all other animals in this respect. Within 100 years past, horses, cows, oxen and sheep, have been doubled in size, in beauty and in value. As far as the matter has been attended to, the same thing holds true of swine. Good farmers—scientific men—have bettered the race. It has been done by judicious crossing of different breeds, by careful nurture, by management, by attention to their food and their pens and yards. No man need now have a bad or poor hog. He may obtain a good animal of a choice breed. He may produce more pork, of a better quality, and at a less expense than formerly. Good economy now requires him to look as carefully at the animal he is purchasing, as he would look at any other class of stock; and with reference to something like the following class of points: 1st. The purchaser should look for a breed of purity of blood, which fattens readily on little food, matures early. 2. The head should be small, and short, and sprightly; the chest deep and broad; the ribs arched; the neck short and thick, well set with bristles; the limbs small and fine boned; the bristles soft like hair; the ears generally small and erect; the legs short; the quarters full; the skin soft and elastic. 3. The carcass should be round, full and compact, possessing lateral extension and a length in proportion to this.

But the selection of animals according to these or other equally good rules, is not all. It is in fact but a small part of the battle. Next comes for our consideration, in order to gain the end at which we aim, the whole matter of economic management. There is a matter of food; whether it shall be cooked by steaming; of what it shall consist; and what particular articles of food make the animals thrive most. Then again how much work shall they be required to do; what time should be spent in the fattening, and at what season of the year should it commence. Should our swine be kept in pens or yards; and in what kind of pens or yards, and what is the most economical plan of a piggery? In what way can these animals make the most manure, and what substances should be given them on which to work? And what number of animals should a farmer raise? Upon these topics your committee do not design to enlarge at this time. There is a vast amount of information existing all around us, which any one so disposed may easily learn. The matter of management is better understood than any other part of the sub-

ject. Your committee will only say in regard to the last item, that the best rule they can lay down for determining the number of swine any farm should keep, is the following: the poorer the farm, the larger the number of hogs; because the poorer the farm is, the greater need is there of the recuperating power of the pig-sty.

The important part of the subject yet remain behind; and the one which your committee most desire to urge upon the attention of the Society and all the farmers of Middlesex; they mean the great advantage of the rearing of hogs as a manure agent in the cultivation of the farm. We are situated that the raising of pork as a staple produce is not of much consequence in itself. We are near the great market of New England; we have extensive markets in our midst, so that all the surplus produce which we can raise, of what sort or nature soever, can be once and easily disposed of. We are highly favored in this respect. The problem of a Middlesex farmer is how he can raise the greatest quantity of surplus produce; how he can make his land most productive; how he can fertilize his sterile uplands, and bring into use the wet lowlands.

It has been said, time and again, and always accompanied by some expression of regret, that we have not so productive lands as the fertile prairie of the West. Your committee do not agree with this. Our lands may not be so easily cultivated as these same prairie and meadow lands. But they are as productive. The rough, rocky hills of New England, tilled by hard knocks and hard do, and by the pouring sweat of an energetic man, cannot be beat in quantity of produce. The largest crops of any and every kind of produce raised in the two sections, have been raised here on hills and in our swamps. We have much plain land that may be made good, and much good land that is thought to be poor. The problem is, how to render both as productive as they may be made.

We all understand the agents to be used in working out the problem. We must manure our uplands and drain our swamps. How shall we do this? The farmers cry out, "We can't manure, we don't make enough, and we are not able to produce." Friends, you can manure; you have each one of you peat bogs and pig styes, or if you have not peat bogs, you have swamp mud, which answers equally well. Your committee are firm in their opinion that these are the two agents by which our tall sides and our valleys are to be made good, and to wave with the luxuriant grain, or pour forth in profusion the succulent and nourishing root.

The great value of peat is just beginning to be understood by us. It has long existed in profusion on our farms. We have begun to find out its value as a fuel, and in getting it out of its native swamps for that purpose, we have been surprised to find the unsightly and sterile swamp start in life, and pour into our granaries and barns great quantities of produce from a single acre, than we have been able to raise on any other land. This of course suggests an analysis of the mud of which the swamp is composed; and on such analysis we find that there is more fertilizing vegetable substance in this than in any other soil. It has been drained from the hillsides through a long succession of years; it is, in fact, so to speak, the concentrated essence of the fertilizing qualities of soils. Now as it has been drained from the uplands we seek to restore it to the same place from

its present situation where it is in excess; and by the process, on the principle that an excess is as bad as a deficiency of any fertilizing quality in a soil, we make both portions much better.

There is not now time to state the abundant facts which exist and which prove the proposition that peat compost—when it is, to say, peat decomposed and mixed with some portion of stable manure, is as powerful a manure and as profitable as stable manure, or any other, except, perhaps, bone manure, poudrette and urate, and we know many farmers who much prefer it as an economical manure, to these latter substances.

This does not rest on theory. Examine many farms which are in our country and their manure beds and compost heaps. Read the analysis of peat and remarks on peat compost, by Drs. Dana and Jackson. Read the Agricultural Reports of the Commissioners of Massachusetts, Maine and Rhode Island. Collect all the facts which are existing, and you must have the same opinion. Your committee will content themselves with a single statement of a fact which they know to be correct. By the entreaties of a distinguished chemist and agriculturist, a farmer in Rhode Island was induced to make trial of this compost. He proceeded as follows. In the spring he got out his peat mud, which was of a good quality, and mixed it with common stable manure, in the proportion of four loads of the mud to two of the manure, putting in the heap just fine enough to make the whole ferment and decompose. In proper time this was worked over twice. It was applied in the manuring of a field of corn, which field was of the same elevation, the same exposure, and the same nature of soil throughout. The gentleman with this manure and equal quantities and in the same fashion as the rest of the piece of ground, a few rows running through the centre of the field, each way, so that they formed a cross. The rest of the piece received good stable compost. When the corn was setting its ears, you could stand, (in the words of the farmer,) a quarter of a mile off, and distinguish these particular rows from the others by their greater height and deeper color. At the harvesting, these same rows produced something like a quarter more corn than any equal portion of any other part of the field. The experiment was regarded in the neighborhood as most wonderful and entirely decisive.

Your committee state the great value of peat compost as a fact. They believe that it is to be the regenerating agent of all our sterile fields. But they ask no one to believe likewise on the committee's authority. They only desire full examination of the subject.

Assume it however, as a truth, and of how great importance becomes the knowledge of the best ways of reducing their substance to a manure! It may be done in two ways—by the use of lime, or by the agency of the pig-sty. Now lime with us, is rather an expensive article, and although we had better use it than not have our compost; yet if we can produce its effects without any outlay of money, on our own means, why, according to Poor Richard, we shall have done the best. Now swine, the working hogs of the piggery, are this agent. The peat mud may be entirely and perfectly decomposed, by being thrown into the pig-pen, by being worked over by the industrious occupant thereof, and mixed with the urine and wash of the pen. And what is the result that we have attained by this? An increased, greatly increased

quantity of excellent manure, with which to fertilize our uplands, and an improvement of our peaty, boggy swamps, which have heretofore only been a terror and useless.

Your committee would desire to enlarge upon this fact and to give copious illustrations. They must content themselves with two remarks: 1st, that by the proper attention to breed, &c., which we have mentioned in the former part of the report, our hogs will pay for their keeping by their pork, thus leaving all the manure they have made as the farmer's profit. There are scores of farmers in Middlesex whose experience, whose accurate kept account books, prove this assertion beyond the shadow of a doubt. 2d, That we find all our most successful farmers in this region keeping a large number of hogs—bestowing much care on their management and manufacturing manure in the way we have mentioned. The only wonder is that their notorious example has not been more generally followed; as it is now a truth that wherever you find a large piggery, you find a productive, profitable farm. There is much truth in that old maxim which we have all heard, which says, 'show me a man's hog pen, and I will tell you what sort of a man he is.'

In leaving this highly important subject, which your committee felt constrained to bring to the attention of the farmers of Middlesex, a book by H. W. Ellsworth, published in Boston about a year since, [by Weeks, Jordan & Co.] entitled "The American Swine Breeder, a Practical Treatise on the Selection, Rearing and Fattening of Swine." It contains a mass of valuable information, which as far as we know, can be found no where else.—No purchaser will ever regret its purchase money.

Respectfully submitted, by

A. H. NELSON,

for the Committee.

From the Boston Courier.

### THE CANKER WORM.

To the Editor of the Courier:

Will you do me the favor to give the following commutation an early insertion in your paper.

Ever since the recent hard frosts, I have been looking for the coming of the parents of the canker worm, and discovered them for the first time this season, on the afternoon of the 23d instant.—A few of the wingless females were seen also crawling up the trunks of the apple and elm trees on the 24th; but I believe that no more have risen from the earth since the evening of that day.—Should mild weather follow the unseasonable snow storm of this morning, these insects may be expected to rise in great numbers; for the earth will then be in the most favorable condition for their escape from it. I beg leave, therefore, to urge all persons whose grounds are exposed to the destructive visitations of these insects, immediately to guard their apple, cherry, plum and elm trees, from the ascent of the wingless females, or grubs, as they are sometimes called, by surrounding the trunks with a belt of clay mortar, or a strip of old canvass, to receive a coat of hot tar on every mild day during the autumn and beginning of spring; or, by fixing around the trees tin or leaden troughs, to be filled with some cheap kind of oil. If the latter method is employed, it will be best previously to cover the trunks, below the troughs, with white wash or clay paint, to absorb the oil that may be blown out of the troughs, and prevent it

from injuring the bark. The troughs ought not to be mixed to the trees, but should be supported by a few wooden wedges, driven between them and the trunks. Every person whose trees are exposed to the attacks of canker worms, if he neglects to use these simple and comparatively cheap means to guard them from injury, is almost as culpable as he who should kindle a great fire on his own premises, when he knows that by so doing he will run the risk of destroying his neighbor's property.

In the hope that this reasonable hint will have its due influence,

I remain, very truly, your friend,

T. WILLIAM HARRIS.

Cambridge, Mass., Oct. 26, 1840.

EARLY WINTER.—Good old father Winter called here on his way to the North, early in this week. Soon after midnight on Monday, a north east storm commenced with all the rigor of a December tempest. By morning light the fields were covered with snow to the depth of four or five inches, and those who at evening walked among the rustling leaves which strewed the woods where autumn had spread her robe of many colors, found themselves suddenly among the scenery of deep winter.

Such a tempest falling among the bright and sunny days of October is rare, and has not often occurred before. From the newspapers we learn that it was attended along the sea coast with vivid lightning, and in some places with heavy hail.—*Worcester Express.*

WORK FOR THE SEASON.—There is no part of the year in which the farmer should be idle. Improvements about a farm might be endless, and yet all of them important. Fences should be righted, and new ones made where needed, and the corners of all well cleaned out. It is now the most favorable season for tightening the roofs of your houses, Stables, barns, sheds, and corn houses, should be put in order. He who neglects having comfortable houses and shelters for his horses, cattle, sheep, and even hogs for winter, may expect to sustain loss. It is an established point, that stock will keep fat on much less food when housed, than if exposed to the severities of the weather. Indeed, I should have said, it is impossible to keep stock in fine health and condition without protection from cold and storms. Much less food, too, is required, when animals are regularly fed, watered and attended.—*Kentucky Far.*

PLANTING FRUIT TREES.—Now is the season for those who intend to plant out fruit trees to exert themselves. It is much better to do it now than to put it off till spring. Not only is it better for the trees, as they are thus enabled to establish themselves in their new situation before the spring opens, and they bud out—the fall and winter rains settling the earth firmly about the roots, which are by no means idle during the long winter months—but the farmer has more leisure now than in the hurry of spring work. At this season of the year, too, the nurseries are well stocked; the handsome, healthy looking plants have not been culled out, leaving generally but a poor choice for those who have neglected planting till spring. If some fresh light mould from the woods or road sides be put in the hole for the reception of the tree, it is thought to act beneficially in giving the young roots a start.—*Western Far. & Gard.*

## TRIAL OF PLOUGHS AT WORCESTER.

On Tuesday, 13th inst., came on at Worcester an important trial of ploughs. This was appointed by the Trustees of the Massachusetts Agricultural Society, who offered two liberal premiums: "1. For the best plough that will turn the sod over and lay it flat, regard to be had to the strength of the plough, easiness of draft, excellence of the work it performs, and its cheapness, \$100—2. For the best plough that shall lay the sod on edge or obliquely, and not flat, regard being had to the qualities above mentioned, \$75."

The competition was open to the whole country; and the award was to be made by a committee formed to secure, as far as possible, an intelligent and impartial decision. In this case the committee consisted of John Welles, Benj. Guild and Henry Codman, Trustees, and John Prince, of Roxbury, of the Massachusetts Agricultural Society; Levi Lincoln, President of the Worcester Agricultural Society; Benjamin Mills, a delegate from the Berkshire Agricultural Society; William Clark, from the Hampshire, Hampden and Franklin Agricultural Society; Isaac Alden, of Bridgewater, from the Plymouth Agricultural Society; Peter Thatcher, president of the Bristol Agricultural Society; S. R. Phelps, of Marlboro', from the Middlesex Agricultural Society; Allen Putnam and N. W. Hazen, from the Essex Agricultural Society. The trial was had in an open and level field, about a mile from the town of Worcester, upon a green sward, a loamy soil, and comparatively free from stones—well adapted for the experiment.

The committee have made a full report on the subject, announcing their award, which we have already had before the public; and which has been read with general interest. We shall go into some farther details on the subject, which we had prepared to submit to our readers in an earlier paper; but we shall not intentionally trespass upon the report or province of the committee.

The ploughs entered for the competition were as subjoined; some of them for the premium on laying the furrow slice flat—some for laying it at an oblique angle, and some for both kinds of work.

Plough No. 1	was from John Wilson, Deerfield, Mass.
" " 2	" Prouty & Mears, Boston,
" " 3	" Wilkie's Scotch plough, imported.
" " 4	" Charles Howard, Hingham, Ms.
" " 5	" Ruggles, Nourse & Mason, Worcester, Mass.
" " 6	" Barnaby & Mooers, Ithaca, N. Y.
" " 7	" Cornelius Bergen, Brooklyn,
" " 8	" E. G. Whiting, Rochester,
" " 9	" Henry Stevens, Barnet, Vt.

Ruggles, Nourse & Mason, Prouty & Mears, and C. Howard, had several ploughs of their manufacture in the field. The varieties adapted to different kinds of work, and mainly differing from each other in size and the forms of the mould-boards. It would be difficult to point out these differences without a personal inspection of the implements.

Plough No. 3 was an imported Scotch plough, made by Wilkie and considered an improvement on Small's celebrated Scotch plough. It was sent by B. Lorr, Esq., from his farm at Indian Hill, West Newbury, Mass., and managed by a first-rate ploughman, James Stewart, his farmer at Indian Hill. It would be called a swing plough, though it had a wheel within the mould board and land side, designed to assist as a fulcrum in raising the point from the ground, and in the turning and general management of the implement. It is said that this wheel has been found by accurate measurement in England, to diminish the draught required. It can only do this by elevating the hinder part of the sole of the plough and consequently lessening its friction on the bottom of the furrow. Since writing the above, we have found the following account of Wilkie's plough in an English publication: "This plough was invented by the late Mr Wilkie in 1825. We consider this as by far the most perfect implement of the plough kind, that has hitherto been produced. The wheel is placed so as to incline from the perpendicular at an angle of about 30 degrees; and following in the angle of the furrow cut by the collar and share, it ensues a greater degree

of steadiness in the motion of the plough than when rolling only in the bottom of the furrow."

Mr Howard, we understand some years since applied a wheel in a similar way to one of his ploughs, but it was not approved. We have not the particulars and do not know whether it were placed perpendicularly or obliquely. For the purpose of turning a plough so difficult of management as this to any but an experienced hand, it must be useful; but for any other purpose, in our view its utility remains to be proved. We cannot conceive that it should steady the plough. This plough was composed almost wholly of iron; and the mould board approached as nearly as possible to the form of a wedge.

Plough No. 9 was likewise a plough with a mould board fashioned in a degree after the Scotch model. The handles and beam were of wood. This is an admirable plough for tapping the furrow slice, and the form of its mould board for that purpose excellent. This plough was in the ploughing match the next day, the ploughman entering merely as an amateur and not a competitor, which, as he was from a different county, the rules of the Society forbade. The work performed by it, with an excellent ploughman at its heels, was not surpassed on the field.

Plough No. 6, from Barnaby & Mooers, of Ithaca, N. Y., was a plough of singular construction, and displaying much ingenuity. It had two mould boards, and by touching a spring with the foot, each might be used alternately for a mould board or a land side, at the pleasure of the holder. By this arrangement there is no occasion for carrying the plough round at the end of the furrow; the cattle in turning by the help of the ploughman, will at once adjust it. The cattle are brought immediately round, the horse or ox walking now in the furrow, that walked before on the land; and the plough coming back and turning the slice into the last furrow which had been made. By an easy adjustment this plough was susceptible of having both mould boards equally extended and then being worked as a double mould board plough. This plough appeared with its name, SUPERSEDER, in capitals upon its beam, from its supposed adaptedness to take the place of other ploughs in doing various kinds of work. This plough has received several honorary notices. The two mould boards and the power of changing them at the end of the furrow, is not original; but the machinery by which this is done we have not seen before.

Plough No. 7, known as the Be gen plough, is celebrated in the neighborhood of New York; and there has the general preference. It is capable, with a good ploughman, of doing admirable work, as we have seen on another occasion. The workmanship of the plough was very clumsy; and it is afforded at a proportionally small price. The cheapness will be considered by many persons as a recommendation, provided the workmanship be deemed sufficiently good for all purposes of use. Its strength could not be questioned.

Plough No. 8 was well made and of good form for some kinds of work. The shape of this mould board, compared with many ploughs used in the country, is much to be commended, though the draft required was much against it.

Plough No. 1 is well suited to the objects to which it is principally applied, that of ploughing in stubble and cover; and the refuse of broom corn. It is approved by many farmers on Connecticut river. It does not appear well suited to ploughing green sward, from the shortness of the mould board, and a want of curvature on its upper part, for which reasons it breaks rather than turns the sward. This likewise occasions a heavy draught.

Plough No. 2 from Prouty and Mears is denominated by those ingenious mechanics the "Central Draught." The land side of the plough is inclined to the right at an angle we should suppose of some ten or fifteen degrees; the point of the share diverges from the line of the beam very considerably towards the left; and thus the great effort of the plough, if we may be allowed the expression is continually to make towards the land, cutting under the land at an angle corresponding to the obliquity of the land side of the plough. It is obvious on examination that the furrow side, where it is designed to be laid flat will be cut in this case in a form to shut in more perfectly than if the furrow slice be formed with perpendicular sides. In order to test perfectly the effect of such arrangement it would have been necessary to have held the plough, which we had no opportunity of doing; but without doing this it would be natural to infer that the power of draught and the difficulty of holding must be increased.

It is intended however, that a contrary effect from this should be produced.

That a plough should "draw true" as the expression is, or as the English call it, should "swim fair" is a material requisite. Ploughing should, as far as possible in the same land be of equal depth and equal width of the furrow slice; and the plough in order that it should "hold easy" should constantly tend to keep itself in an upright position. All diversion of its point from a line parallel or coincident with the draught increases the power of draught required; and the difficulty of holding. The point of the share may be sharpened by being flattened or cut down on the upper side; but it should in no case be turned upwards or downwards, or towards, or from the land. These being adjusted we apprehend that the centre of traction and the line of draught will depend more upon the length of the beam and of the chain and the mode of attaching it to the beam by the bridle than upon any particular form of the plough. The experienced and observing ploughman will easily himself adjust this; and any advantage supposed in this case to be derived from the form of the plough does not appear to us, as at present advised, fully established. This however can be best determined only by actual trial.

Nos. 4 and 5 Howard's ploughs and those of Ruggles, Nourse & Mason, as well as those of Prouty & Mears, are all finished with great care and show the skill with which our mechanics execute their work. It is with no view of disparaging others, that we say that the finishing of Howard's ploughs displays great neatness and strength. The ploughs exhibited we understand were selected from a promiscuous collection at the store of Messrs. J. Breck & Co. and presented the usual style of workmanship. The implements presented by Ruggles & Co. and Prouty & Mears were, we should infer, particularly prepared for the occasion and much pains and some expense incurred in the style of getting them up. They were certainly very handsome though the finish could add nothing to their intrinsic value as implements of husbandry.

For a mere spectator on this occasion to compare minutely the different ploughs was impossible. We shall not undertake it. The Committee in their report have pointed out differences, which could only be ascertained by holding, for which we had no opportunity in respect to Ruggles, though we have stood many a day between the handles of Howard. All that time Howard's plough was highly esteemed; and since that time it has been the subject of constant improvement. We are not willing to admit that any thing of human art has reached the limits of perfection, but we believe that no better ploughs for any and every kind of work, all circumstances being taken into consideration, are at present to be found than those of Howard. The mould board has been extended since it was first produced: every effort has been made which experience suggested to improve it, and a shoe has been applied in a very substantial manner to the level side, which essentially contributes to the strength and durability of the implement.

In a plough formed upon approved mathematical principles excepting near the end of the share, which is flattened to allow of its easy passage under the sward, the curvature of the mould board should pass gradually through a quarter of a circle of 90° until it reaches a point where a line drawn from the top of the mould board to the shoe or heel of the plough would be exactly perpendicular. The furrow side is then placed in an upright position; and beyond this point, the curvature of the mould board should be extended sufficiently to invert the sod in such an angle as it is desirable it should lay in. This, as we have said, must depend much upon the ploughman, though it is desirable that the shape of the plough should be such as to require as little as possible the skill of the holder. The extension of the mould board beyond this point would increase the friction and consequently the power required for the draught; and on the other hand too short a mould board tends to break the furrow slice and leave the ground in heaps.

The instrument for gauging the draught is an English invention called a Dynamometer or measurer of power. It is well described by the Committee. It is attached to the end of the beam of the plough with the chain hitched to the other end and upon the same principle as the modern instrument with a hook at one end and a ring at the other, and a cross index in front for weighing small matters in place of the old fashioned steel-yards. This instrument forms a link in the line of draught; and according to the power required to move the plough,

the bows of the instrument, which are of steel are lengthened and contracted, and these differences are indicated by a hand, which traverses upon a semi-circular scale of brass, which is graduated into hundreds, halves, and quarters. So that the number indicated by the hand may be supposed to mark the number of pounds weight required to move the plough. It is difficult to make ourselves intelligible without a plate and this we design to furnish in a future paper. As on account of the different qualities of the soil through which the plough passes, the different depths of the ploughing, the different widths of the furrow slice, the differences in the speed of the team at different times, and occasional obstructions from small stones, the hand would travel slowly or with rapidity and sometimes range through a large space, the true degree as far as indicated by the instrument was necessarily matter of judgment, through as near an approach to exactness was doubtless made as is to be expected.

For the sake of an illustration, we shall give an example of the different comparative results, premising that on account of differences in the depths and widths of the furrow slices the true result can be determined only by that mixed calculation which the Committee have adopted. In our opinion the depth and width of the furrow slice should be prescribed by the Committee. It should of course be uniform and the competitors should be rigidly held to it. The Committee thought differently; and we do not mean to question the soundness of their judgment whatever partiality we may have for our own. The statistics are from our own private minutes as taken from their verbal reports on the field, and the Committee are not responsible for our accuracy.

In the trial of ploughs for laying the furrow slice at an oblique angle the results were as follows:—

No. of Plough.	Depth of furrow.	Width.	Power of Draught in cwt.
1	6 in.	14 in.	3 3-4
3	6 1-2	9 1-2	3
4	6 1-2	13	2 7-8
5	5	11 1-4	2 1-2
6	5 1-4	11 1-2	3 1-2
7	5 3-4	11 1-2	3 3-4
8	4 1-4	9	2 1-4
9	5 1-2	10	2 3-4

No. 2, though entered second on the list, taken by the committee, was designed solely for ploughing flat. We give it in this case because we have room only for one table. Two ploughs from the same firm were entered for this object: we give the result of one only:

No. 2.	Depth of furrow.	Width.	Power of draught in cwt.
	6 in.	12 in.	2 5-8

From these elements will appear the care and exactness with which the committee sought to perform a duty sufficiently perplexing; and in which the most honest and intelligent are liable to errors of judgment. As respects the fractions given in the depths and widths of the furrows, we have little confidence in them; and so, likewise, in regard to measuring eighths on the dynamometer; but they show at least the solicitude of the Committee to be scrupulously exact.

The committee having allowed the various competitors to plough an equal quantity of land with their own ploughman, afterwards by a sub-committee made an experiment with several ploughs themselves. This was certainly a judicious mode of arriving at a correct decision. We did not attend the farther trials made on the ensuing morning, from the necessity of being in another field.

Our limits oblige us to postpone some farther remarks on this important experiment. H. C.

Massachusetts Horticultural Society.

EXHIBITION OF FRUITS.

Saturday, Oct 31, 1840.

By M. P. Wilder, Dorchester; Pears—Passe Colmar, Beurre Diel, Beurre d'Arenburg—each of very first quality.

By Cheever Newhall, of Dorchester; Pears—Bleeker's Meadow, (sweet and fair.) Wilkinson, (admirable,) Dix, (do.) Gravenstein apple—beautiful.

By John Paine, of Roxbury; Marie Louise, (very excellent,) and Urbaniste Pears—passed ripe, but of uncommon size.

By Joseph Faleh, of Roxbury; Grapes from France—open culture—without a name—of good promise.

For the Committee,

W. M. OLIVER.

BRIGHTON MARKET—MONDAY, NOV. 2, 1840.

Reported for the New England Farmer

At Market 3550 Beef Cattle, 1000 Steers, 8400 Sheep, and 1800 Swine. A large number of Beef Cattle and a still larger number of Sheep unsold.

Prices—Beef Cattle—Prices have declined, and we reduce our quotations. First quality, \$5 25 a \$5 50 Second quality, \$4 75 a \$5 00. Third quality, \$3 50 a \$4 50

Barrelling Cattle—We reduce our quotations, at which prices the barrellers purchased a full supply.—Mess \$4 75; No. 1 \$4 00; No. 2 \$3 00.

Stores—Yearlings, \$5 a \$9. Two Year Old \$12 a \$18. Three Year Old, \$21 a \$27.

Sheep—'Dull,' and the market "glutted." Lots were sold at \$1 25, \$1 33, \$1 37, \$1 50, \$1 75, \$1 80, \$2 00. \$2 33 and \$2 50.

Swine—Sales quick. Lots to peddle at 3 1-2 for sows and 4 1-2 for barrows. At retail from 4 1-2 to 5 1-2.

THERMOMETRICAL.

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northernly exposure week ending Nov. 1.

	Oct. 1840.	6 A.M.	12 M.	6 P.M.	Wind.
Monday,	26	34	35	33	N. W.
Tue-day,	27	28	34	32	W
Wednesday,	28	32	50	46	S. W.
Thursday,	29	47	65	60	S.
Friday,	30	62	67	58	S.
Saturday,	31	43	47	46	E.
Sunday,	1	40	47	42	N.

COWS WANTED.

Wanted to hire on fair terms 2 or 3 good Cows that will give a good quantity of Milk through the winter,—or would purchase it preferred. Any communication addressed to Tamnton Post office, box 26, will be immediately attended to. Oct. 28. 3w

GREEN HOUSE PLANTS, &c. &c.

The subscriber can furnish every variety of Green House Plants or Garden Shrub, in the very best order. Also—Dahlia roots, (all the new varieties); Black Hamburg, Sweetwater, and Isabella Grape vines; Roses and Pæonies; Honeysuckles, and other creepers; Black, White, and Red Currant trees; White and Red Antwerp Raspberry vines; Asparagus and Rhubarb roots, &c.

Orders by mail will be promptly and faithfully executed; or they can be forwarded to, or left with J. Breck & Co. JAMES L. F. WARREN, Oct. 23. Nonantum Vale, Brighton.

WILLIS'S LATEST IMPROVED VEGETABLE CUTTER.

For sale at the New England Agricultural Warehouse, No. 51 and 52 North Market Street, Boston, Willis's Latest Improved Vegetable Cutter. This machine surpasses all others for the purpose of cutting Ruta Baga, Mangel Wurzel, and other roots. The great objection to other machines, is their cutting the roots into slices, which makes it almost impossible for the cattle to get hold of them; this machine with a little alteration, cuts them into large or small pieces, of such shape as is most convenient for the cattle to eat. It will cut with ease from one to two bushels of roots per minute. JOSEPH BRECK & CO. Oct. 23.

FRUIT TREES FOR SALE.

At the Pomological Garden, Salem, Mass., a good collection of Fruit Trees of the best Native and Foreign varieties. Apply by mail to the subscriber. ROBERT MANNING.

Salem, Oct 14, 1840.

FENCE CHAINS.

Just received from England, at the New England Agricultural Warehouse, 6 casks chains, suitable for making the chain fence, &c. JOSEPH BRECK & CO. July 15.

WALKERS'S FINE TULIPS.

For sale at No. 52, North Market street, a great variety of Walker's fine named Tulips, at \$3 per dozen, with their names. Many of the original Bulbs cost five times that sum. Those who intend to set out a tulip bed, will do well to call soon, as October is the best month for this business.

Fine Mixed tulips without names, \$1 per dozen. Also Hyacinths of every variety, embracing all the most approved sorts, with a great variety of other bulbous roots. JOSEPH BRECK & CO.

Boston, Oct. 21, 1840.

MISCELLANEOUS.

HORRIBLE ADVENTURE.

At the period when Murat was about to invade Sicily, the Chevalier R——, pay-master general of the Neapolitan forces, was travelling through Calabria for the purpose of joining the army, having been to Naples to make arrangements for the transmission of a quantity of specie.—He had sent on his servant before him, to prepare his quarters at the town of——, expecting to arrive there himself at nightfall; but the day being very sultry, he had halted on the road, and at nine o'clock in the evening, found he was still at a considerable distance from the proposed end of his journey. He was so much harassed and fatigued that he determined to put up for the night at the first convenient house. He at length entered an old romantic building on the road side, inhabited by a man and his wife, the former a stout muscular figure, with a swarthy countenance almost wholly shrouded in a mask of bushy whiskers and mustachios. The traveller was received with civility, and after partaking of a hearty supper, was conducted up an old crazy staircase, to his apartment for the night. Not much minding the appearance of the place, and finding no lock upon the door, he fixed a chair against it; and after priming his pistols, put them carefully under his pillow. He had not long been in bed, when he heard a noise below, as of persons entering the house; and, some time afterward was alarmed by the sound of a man's footstep on the staircase. He then perceived a light through the crevice of the door, against which the man gently pressed for admittance, but finding some resistance, he thrust it open sufficiently to admit his hand, with extreme caution removed the chair, and entered the apartment. The chevalier then saw his host with a lamp in one hand, and a huge knife in the other, approaching the bed on tip toe. The chevalier checked his pistols beneath the bed clothes, that the noise of the spring might not be heard. When the man reached the side of the bed, he held the light to the chevalier's face, who pretended to be in a profound sleep, but contrived nevertheless, to steal an occasional glance at his fearful host. The man soon turned from him, and after hanging the lamp on the bed post, went to the other end of the room and brought to the bedside a chair, on which he immediately mounted, with the tremulous knife still in his hand.—At the very moment that the chevalier was about to start up from his bed and shoot him, the man in a hurried manner cut several enormous slices from a piece of bacon that was hanging over his bedstead, though it had been wholly unnoticed before by the agitated traveller. The host then passed the light before his eyes again, and left the room in the same cautious way in which he had entered it, and unconscious of the danger he had escaped, returned to a crowd of new and hungry guests below stairs, who were of course not very sorry to perceive that he had saved his bacon.

*Unnecessary Advice.*—A country gentleman, who fills every situation necessary to constitute him 'lord of the village,' and who has taken some pains to sustain the rustic inhabitants in the proper signs of respect due to him, being lately on a horse some what given to shy and observing a lad walking before him, called out, 'I don't take off your hat.' The youth turning his head, very innocently answered, 'I won't a goat to, sir.'

FRUIT AND ORNAMENTAL TREES.

Gentlemen at a distance, wishing to purchase trees, are informed that we will select from the following nurseries, viz:—John and Jacob of New Ipswich, and Shrubbs of every description that may be had, and to pay particular attention to the picking and forwarding them to any part of the country.

- From Messrs Winships, Brighton
- William Winkles, New York
- John A. Kennick's, Do
- S. & G. Tyler, Do
- Samuel Paul, Cambridgeport
- Louise Garden, Cambridge
- Roger Manning, Salem
- J. L. L. P. Warren, Brighton
- Trick & Co., Brighton.

The present is the best time to transplant all hardy trees and shrubs. Orders will be received for Pines, Pear and other Stocks Hedge Plants, &c.

FRUIT GARDEN SEEDS.

We would inform our customers and friends that we are now receiving our supply of fresh Garden Seeds, most of which have been raised on our own inspection from the seed of the best quality, which we warrant to be of the purest quality of the growth of the present season.

Agricultural Books, Seed and Improvement Catalogues, sent to all applicants gratis, and answered promptly attended to.

JOS. P. A. BRECK & CO.

Boston, Sept. 29, 1840. The Lowell Journal, Worcester Spy, New Bedford Mercury, Yeoman's Gazette, Northampton Courier, Providence Journal, Norwich Aurora, Essex Banner, Springfield Republican, are requested to insert the above Notices.

HYACINTHS.

For sale by JOSEPH BRECK & CO, a lot of very superior BOX. Oct. 6

The subscribers have received a large assortment of Double and single Hyacinths of every color and shade. Also Tubers of mixed sorts, Crown Imperials and Tulips; the latter also of their garden and the fine varieties of Crocuses which will be furnished at one half's price. Lilacs and Egg-roses, and Crown Imperials, should be planted in August or the first of September. We also receive a great variety of fabulous Roses, from Holland, in a few weeks when no more will be given. JOSEPH BRECK & CO. August 26

TRADE CHAINS.

Just received, direct from the English manufacturer's works at Ulster Chains from 1 to 12 Long shackle for ploughing or draught claims. JOSEPH BRECK & CO.

GREENS PATENT SPRAY CUTTER.

JOSEPH BRECK & CO. of New England Agents for a Warlike saw, Spraying No. 1 and 2 with Mack's Steel, have on stock Green's Patent Straw, Hay and Milk Cutters, of various sizes, and a portable engine, adapted for many implements of the farm, &c. The most prominent of these is a portable engine of the consequence and durability of the machine.

1. It requires a small quantity of power requisite to use it, that the strength of a half grown boy is sufficient to work it efficiently.
2. With even this moderate power, it easily cuts two bushels a minute, which is full twice as fast as has been effected by any other machine, whether worked by horse or steam power.
3. The knives, owing to the peculiar manner in which they cut, require sharpening less often than those of any other slow cutter.
4. The machine is simple in its construction, made and put together very readily. It is therefore not so liable as the complicated machines in general, to be got out of order.

Oct. 14

ENGLISH PATENT AND SPANISH GREENS.

Just received and for sale a few quarts of English and Spanish Green Peas, very fine and not at all inferior to any of the English ones. Also a few Spanish Peasants—twice as large as the common sort, and of a very superior quality. JOSEPH BRECK & CO. Oct. 28.

D. SUGAR FARM FOR SALE OR TO BE LET.

This valuable farm, situated in North Salem, is a valuable one from the centre of the city of Salem, and is commonly known as the Dodge Farm, containing about six acres of excellent land, with a large three-story dwelling house, Farm House, and out buildings. The Farm Trees upon it produce about two hundred barrels of Apples. There is a Muscadine tree set out on the premises, which furnish an abundance of Muscadine for the whole family and the city of Salem. It is a very rare and valuable produce of the soil. This estate would be a reasonable and immediately a field for and most of the produce, so many would remain on the estate, or it would be lease out on fair terms for five years. For further particulars apply to

JAMES ANDREWS & SON, No. 59 Commercial wharf, Boston.

N. B.—If this farm would be exchanged for productive real estate in Boston. Oct. 14th 1840

FRUIT AND ORNAMENTAL TREES, &c.

Fruit Trees of all the different species, and of the most celebrated kinds. These include Peaches, Plums, Apples, Quinces, &c.—the trees of the French and cherry, especially, are of the finest size, and in numbers amounting at this time, and in various unsurpassed. The Catalogue of Fruit and Ornamental Trees and Shrubs, Roses and other beautiful flowering plants, will be sent to all who apply, in that language many of the very best kinds of fruits, so far as proved, are particularly distinguished by a star.

Also Grape Vines, Raspberries, Strawberries, Gooseberries, and Mulberries for silk—Scotch Larch, Larches, Sycamores, Silver Firs, Willows, Elms—Honey-suckles, Dahlias, splendid Crocuses, &c. &c. Trees when so ordered, will be securely packed for transportation to distant places, and all orders promptly executed by

WILLIAM KENRICK.

Brighton Nurseries and Gardens. For Sale.

A large quantity of superior European and American Ornamental Trees, well calculated for public places or private grounds, with Fruit Trees embracing a great variety of the most approved kinds and the sizes. The trees are all in full perfection, can now be selected and packed, and will be forwarded to any place as soon as it will answer to remove the same.

Also forty kinds of Strawberry Plants, of the most approved European and American varieties.

Orders may be forwarded via mail, addressed Messrs. WINSHIP, Brighton, Mass., or left with Messrs. JOSEPH BRECK & CO. Brighton, August 12

THE UP CHAINS.

Just received at the New England Agricultural Warehouse, a good supply of those celebrated Chains for tying up cattle. These chains, introduced by E. H. FERRY, Esq. of Andover, and Col. Jacques, of Charles town, for the purpose of securing cattle to the stall and found to be the most and most convenient mode of fastening cows and oxen to the stallion. They consist of a chain which passes round the animal's neck, and by a ring attached to the stall, plays freely up and down, and leaves the animal at liberty to lie down or rise at pleasure, and keeps him perfectly secure. July 15 JOSEPH BRECK & CO.

THE NEW ENGLAND FARMER.

Is published every Wednesday Evening at \$3 per annum in advance or at the end of the year—but those who pay when still lay from the time of subscribing are entitled to a deduction of one cent.

### TRIAL OF PLOUGHS AT WORCESTER.

#### No. II.

The trial of ploughs at Worcester on the 13th October, has created so much interest in the agricultural community, that we continue our remarks upon it, our limits in the last N. E. Farmer obliging us to cut short our observations.

The award of the Committee of the premium of one hundred dollars to Prouty & Mears, for the plough best adapted to lay the furrow slice flat, and to Charles Howard, for the plough best adapted to lay it at an oblique angle, the premium of seventy-five dollars, have given, we believe, general satisfaction. Where men's private interests or friendships are immediately affected, universal acquiescence is scarcely to be expected. In a case of competition so close, and in which the claimants come up in a line in a sort of lock-step, as the state prisoners march to their work, almost treading upon the heels of each other, it is extremely difficult to distinguish between them. Our own judgment would have given a somewhat different award from that of the Committee; but we have not for that reason, any less respect for the judgment of the Committee. They had more and different elements on which to form their opinions than what we possessed; and the impartiality and disinterestedness of their decision are unquestionable.

The report of the sub-committee, which is drawn up with ability, is silent in some respects, where information was desired, and the public had some reason to expect it. This may have arisen from a strong desire to satisfy early the impatience of the community to see their report.

In the conditions of the award, regard, it was said, was to be had "to the strength of the plough, easiness of draft, excellence of the work it performs, and its cheapness." The Committee rest mainly upon the *easiness of draft*. Nothing is said of the *strength of the respective ploughs* nor of their *cheapness*. We heard no statement of price required or given in, though it may have been done without our knowledge.

In respect to the "excellence of the work" performed by the plough, "the committee think they may add that the excellence of the work performed with the ploughs, was with few exceptions in the direct ratio of the ease of draft." These few exceptions being left both in number and name, to conjecture, the assertion of the committee may safely stand. We wish, however, they had been more explicit. We have no hesitation, and we are willing to risk what little agricultural reputation we have, in saying that the best work in laying the furrow slice at an oblique angle, was done by James Stewart, of West Newbury, with Wilkie's Scotch plough. We refer particularly to the work performed in the afternoon, and not seen, we believe except by a few of the Committee. It was beautiful and exact, and approached the perfection of the art. The work done by the Barnet plough

was admirable. The work done by the ploughs of Ruggles & Co., was excellent, and especially as seen the ensuing day at the county ploughing-match, though the efforts of the ploughman in the management of this plough, (himself exceedingly skillful), were so much more severe than were necessary, that some persons pleasantly suggested that the dynamometer should be applied to him as well as to the plough.

The furrows, where the trial was had, were too short for the work to be done to the best advantage; and the different ploughings should not have been laid upon each other, but each ploughing should have been kept wholly distinct from its neighbor. In an experiment entirely novel among us, it is not surprising that the arrangements should not have been perfect; but it is surprising that they should have been so unexceptionable as they were.

Several interesting points of discussion came up; and questions were involved in the case, which could hardly have been anticipated. In one matter we should be at issue with an opinion maintained by many persons; whether held and acted upon by the committee, we do not know. We will state the case.

The premium, it was understood, should belong to the plough. Now in order to determine the excellence of a plough by actual trial, should the skill of the ploughman be at all taken into consideration? Many gentlemen were of opinion that it should not be: because, it was said, that a skillful ploughman, with a comparatively poor implement, would do better work than a poor ploughman with a good plough. In such a trial as this, therefore, upon this presumption it would seem as though skill and excellent management in ploughing were likely to be prejudicial to success, because, in a result at all doubtful, it might be said, that the good work was the effect of the ploughman's superior art. If any improper bias could be supposed to have operated in this case, certainly not intentionally nor consciously, this was likely to have its influence, as there were in the field two, perhaps three ploughmen of masterly skill. Be this, however, as it may, we have no disposition to give any encouragement, directly or indirectly, to ignorance, which is avoidable, or to indolence or negligence in any case. We have no desire for farming implements which will go of their own accord, and equally well under a careless as a careful superintendence. We therefore, without a question, regard *that as the best implement, which in the best hands will do the best work*. The excellence of the work which it is capable of performing is the test of the excellence of the implement, as far as that point is concerned. In the final judgment of the Committee various other matters were of course to be considered. The cheapness of agricultural instruments is a matter of much importance. On this point the Committee have given us no light. The first matter to be sought after in an agricultural implement is, that it should be suited to the purpose for which it is designed. Next to this its durability and strength are to be considered. These points being secured, its cheapness comes next.

Ornament or embellishment are quite secondary matters and often out of place; save only the general consideration, that the more handsome and finished an implement is, the more care will generally be taken of it. The expenses of a farmer for tools and carriages, on a large farm especially, are always great, and must demand his attention, unless he means to live by borrowing, a habit which is utterly disgraceful and mean, and which renders a man a perfect nuisance to his neighbors.

In respect to rollers, for example, we have known the prices vary from seven to fifty dollars, and a roller costing fifteen dollars was as good as we could desire. For cutting machines we have known paid three dollars, and have paid sixtythree dollars for one of Eastman's. Green's at thirty, has been perfectly effectual. We mention these cases to show how much expense is often incurred without any advantage.

We did not learn the prices of all the ploughs presented for trial, and could have wished the committee had given them, since the cheapness of the implement was to be taken into their calculation. Wilkie's Scotch plough being made almost wholly of wrought iron, beam as well as handles, excepting the mould-board, must be an expensive instrument; and the difficulty of handling by persons unused to it, will prevent its extensive adoption among us. We believe the excellent form of the mould-board of this plough might be preserved; and framed with wood by some of our ingenious mechanics, it would come much into use. The Barnet plough, in which this has been to a degree attempted, is priced at seven dollars, but made far in the interior where labor and materials are low. The Bergen plough, capable of doing very good work, sells for seven dollars, but the workmanship is ordinary and coarse. The plough of Barnaby & Mooers, of Ithaca, N. Y., called the SUPREMACY, with two mould-boards, and made in a substantial and neat manner, sells for twelve dollars. The No. of Howard's plough which obtained the premium, is sold for twelve dollars, but this without roller or cutter. The plough of Prouty & Mears which obtained the premium, is sold without roller or cutter for eleven and a half dollars. With other prices we are not acquainted. The farmer who would live by his farm, must practice the most rigid economy; and we recommend to him, where his great object, the doing of his work in the best manner, can be attained without it, to pay nothing for his fancy; unless with one only exception, his industrious wife wants a new gown or bonnet.

As it respects the manner in which the furrow slice should be laid, whether perfectly flat or at an oblique angle, as we have said, this depends as much upon the adroitness of the ploughman as upon the form of the plough. There are exceptions, however, to this remark, as with the Scotch plough it is almost impossible to lay the furrow slice flat. The Scotch farmers never practice this kind of ploughing. Where land is to be ploughed, and without other cultivation than that of harrowing, immediately laid down to grass again, a practice which in many cases is much to be commended,

there can be no objection to 'shutting the slice in,' as it is termed, and laying it as flat as possible; but where land is wet and to be sowed with winter grain, or ploughed in the spring for cultivation, we should much prefer that the sward should be laid obliquely or at an angle of fortyfive degrees. At this angle, it can be demonstrated, that a larger amount of surface is exposed to the action of the air than at any other, an influence of the highest importance; and at the same time where land is wet, in the small channels made by the lapping of the furrow slices, a passage is left for the discharge of superfluous water. At the same time a deeper and more friable surface is presented for cultivation; and where the ploughing is well done, the decomposition of the vegetable matter turned under is equally well secured. The turning of the furrow slice so as to lay it flat or at an oblique angle, must depend, as we have said somewhat upon the shape of the plough, much upon the skill of the ploughman; and not a little upon the relative proportions, which the width and depth of the furrow slice bear to each other; it having been found that a furrow slice of ten inches in width requires a depth of about seven inches to lay it at an inclination of 45°. When a depth of only four inches is prescribed, as was the case for the single teams at the county ploughing-match the ensuing day, and the width of the furrow slice is at the pleasure of the ploughman, it would be difficult to lay it otherwise than flat.

We deem it a duty, as a warning hereafter, to express our regret that any suspicions should have been excited of an attempt by finesse to produce a false impression of the actual power of draft required by the plough, by reducing the depth of the furrow after the dynamometer was applied. We do not say that this was done or if done, that it was done by design; but it was suspected to have been done. We certainly shall not say by whom these suspicions were entertained or to what plough they applied; but they existed, and give us occasion to speak not of the intrinsic wrong merely, but to say that in such cases always all attempts at over-reaching or deception of any kind, are sure to operate with a fatal effect against the success of a competitor, where under other circumstances he might have claimed it.

Upon the whole the experiment was well conducted and its results will be most important to the country. The Trustees of the Massachusetts Agricultural Society, who by their intelligence and public spirit so liberally seconded and forwarded the experiment, will not deem it disrespectful or any thing more than an act of justice to say, that this plan of a trial of ploughs originated with John Prince, Esq., of Roxbury, for some years a member of the board, and as intelligent, practical and zealous a friend of agricultural improvement as has ever labored in the State. We are happy that he should have enjoyed the pleasure of witnessing the success of his project: and of anticipating with certainty its future beneficial results. We hope this premium will be continued; and that an earlier and more extensive publicity will be given to it. We can hardly account for the general silence of the agricultural papers on the subject previous to the trial.

The Trustees of the Massachusetts Agricultural Society deserve, likewise, the grateful acknowledgements of the agricultural community for the liberal manner in which they conducted this experiment. Our community, generally, are little sensi-

ble to the benefits which have been derived from the services of these gentlemen. We have been familiar with their operations for more than thirty years, and with their previous history, though no farther connected with them than as a member of the Society; and we confidently assert that the first impulse to agricultural improvement in the State and in the country was given by their association; that the present improved condition of agriculture in Massachusetts is mainly due to them; that they have most liberally without fee or reward, expended their time, money and services for the useful objects of their association; that no agricultural board in the country has done or been willing to do more; that no Society, with the exception of the Philadelphia Agricultural Society, with Judge Peters, Judge Tilghman and Dr. Mease at its head, has ever done one quarter so much; and that their annual prospectus and offer of premiums, shows a most judicious selection of objects and a liberal and discreet distribution of the funds in their keeping. They certainly do not need this humble tribute at our hands; but they will not, we trust, be offended that we render "honor to whom honor is due."

We have farther remarks on the trial of ploughs to submit to our readers, which will be found under the editorial head.

H. C.

From the Farmer's Monthly Visitor.

#### THE BROWN CORN, &c.

Moultonborough, N. H., Oct. 12th, 1840.

HON. ISAAC HILL—The lively interest that you have heretofore manifested in relation to the Indian corn crop, which holds such an important rank in agriculture, induces me to furnish you with some remarks on another year's experience in raising Indian corn. As there are no society premiums offered on crops the present year, there would have been nothing to induce me to measure an acre of corn so exact, had it not been by the request of Dr. C. T. Jackson, who has recently visited me and seen my corn standing in the field. I have, therefore, been very exact in measuring one acre of ground before harvesting the corn, and have personally attended in harvesting and weighing the whole of the crop, of which I have sent you a fair specimen. I have made a pretty correct estimate of the expense of manure and labor on the said acre of ground the present year, which is as follows:—

Manure, 40 loads, at \$1 per load,	\$40 00
Labor of drawing manure and spreading;	
9 days work,	6 75
Ploughing twice; 6 days work, and plough \$1,	5 50
Harrowing twice; 2 days work,	1 50
Planting; 6 days work, \$4 50, and seed corn,	
half bushel, 75 cts.	5 25
Hoeing; 10 days work,	7 50
Topping stalks; 4 days work,	3 00
Harvesting; 10 days work,	7 50
<hr/>	
Total, reckoning labor and board at 75	
cents per day,	\$77 00

The crop of corn raised on the acre is 8531 lbs., and estimating 70 pounds for a bushel, makes 121 bushels and 3 pecks. Calculating the crop of corn to be worth \$1, and the fodder equal to two tons of hay at \$10 per ton, \$20; estimating the acre before the manure was put on at \$50, and \$120; interest \$3 for one year added on to the \$77 makes \$80; deduct the \$80 expense from the \$120 in-

come, makes \$40 nett income, and the acre of land worth at least \$20 more than it was one year ago, which is in reality \$60 net income. Besides, 5480 pounds of the corn is neatly traced up for seed, and is the finest lot of seed I have ever had.

Suppose I had cultivated the same acre of ground in the ordinary way: say put on

10 loads of manure,	\$10 00
Plough and harrow once,	3 50
Planting, \$4 50; small seeds, 50 cts.	5 00
Hoeing,	7 50
Topping stalks and harvesting,	5 00
Interest on the land,	3 00

The whole expense of cultivating in this way is, \$34 00

30 bushels of corn would be a fair estimate, and fodder equal to one ton of hay, which would make \$40. Deduct the \$34 expense from the \$40 income, and we have \$6 nett income, and the land not at all improved. Thus by adding 30 loads of manure and a little labor, we gain \$60 stead of \$6.

The above estimate is a fair contrast between the two modes of cultivation, and shows the great advantage of the one over the other. I have raised over two hundred bushels of corn the present season, and have about one hundred bushels of very fine seed. By the specimen of corn which I have sent, you will see some eight rowed, some ten, and some twelve. The two ears braided together grew on one stock. I planted all eight rowed, but the abundant increase of the crop increases the rows on the ear and shows that improvement is still in progression.

The specimen of wheat which I have sent you is the superior *Siberian white bearded wheat*. It was sent to me by Hon. H. L. Ellsworth, from the Patent office at Washington. I have raised eight bushels the present season, and I think it bids fair to be the best wheat ever cultivated in this part of the country. The straw is bright as silver and not liable to rust. It stands the drought better than the Tea wheat, is free from smut, and is clear from any other grains.

Yours, with much respect,

JOHN BROWN, 2d.

*Preservation of Cabbages.*—The following methods of preserving cabbages for winter use, are the result of experience:—

The cabbages should be gathered before injury is done them by the severe fall frosts; the heavy outside leaves should remain on the stalk. Fix a string or cord round the stump near the roots, suspended from the sleepers with the heads downward in a cool cellar, and they are ready and fit for use at all times. Cabbages kept in this manner retain all their peculiar flavor and sweetness; the whole virtue of the stump and leaves is concentrated in the part which is used, are handy of access, occupy but little room which would be occupied by other purposes, and seldom, if ever rot; the outside leaves wilt and contract, and in time become quite dry, which form a sort of coating that serves to exclude the air from the inside of the head.

Another method practised by some, and highly recommended, is to cut the head from the stump, pack close in a sack, taking care to fill up the vacancies with dry chaff, thereby excluding the air, and keep in a dry cellar.—*Albany Cult.*

## A BRILLIANT STUCCO WHITEWASH.

Many have probably often heard of the brilliant and lasting whitewash upon the east end of the President's house at Washington. The following is a correct recipe for making it:

Take clean lumps of well burnt lime, (say five or six quarts,) slack the same with hot water in a tub, (covered, to keep in the steam,) pass it in the fluid form through a fine sieve; add one fourth of a pound of whiting or burnt alum, pulverized; one pound of good sugar; three pints of rice flour, made into a thin and well boiled paste, and one pound of clean glue, dissolved by first soaking it well, and then putting it into a small kettle, which should again be put into a larger one filled with water, and placed over a slow fire. Add five gallons of hot water to the whole mixture.

This wash is applied, where particular neatness is required, with a painter's brush. It must be put on while warm, if upon the outside of the building—if within doors, cold. It will retain its brilliancy many years. There is nothing of the kind that will compare with it. About one pint of the mixture will cover a square yard upon the outside of a house, if properly applied. If a larger quantity than five gallons is wanted, the same proportions must be observed in preparing. Coloring matter may be added, to give it any required shade.

Will some one try it, and communicate the result?—*Genesee Farmer*.

*Greatest Crop of Corn yet noticed.*—We are pretty confident that the islands of the Winnepesaukee Lake in New Hampshire, will bear away the palm of the largest crops of corn the present year. Capt. Pillsbury, upon the Derby farm, which embraces the Cow island, has this year several acres planted with the Golden Sioux, being of the same kind with the Dutton or Phinney corn. The corn was planted in hills at the distance of two feet one way by three feet the other. As the best method of ascertaining the quantity of corn upon an acre, Capt. Pillsbury has adopted the more certain method of measuring by weight. The whole weight of a measured acre of the Golden Sioux corn, upon Mr Derby's farm, was 9216 pounds: this, at 70 lbs. to the bushel, would measure 131 6-10 bushels to the acre.

Of the species of Black oats, as high as 94 bushels to the acre without manure, were raised on the fields which produced the great crop of last year. This is an extraordinary crop for the present year.

The average crop of wheat—larger than we have heard in the State the present season—was 34 bushels to the acre upon the Derby farm.

For the foregoing information we are indebted to Doctor Jackson, the State Geologist, who has visited the farms upon the Lake islands. Doctor J. says, there is nothing in the soil of these islands differing from that of the highland townships in the vicinity.—*Farmer's Month. Visitor*.

*New method of destroying the Black Grub, or Cut Worm.*—The destruction of crops by the cut worm is incalculable in most parts of the United States, and countless remedies, have been offered, but not one strikes us more forcibly than the following, taken from a number of the *Genesee Farmer*. The secret consists in turning up the ground with the plough during the winter, so as to freeze the eggs. A correspondent of Judge Tucker says, "one of my

neighbors wishing to try the experiment, broke up one of his fields, adjoining the field of another neighbor—the two fields being separated only by a worm fence—during the warm spells in winter, when the ground ploughed during the day would freeze at night. The spring following he again broke up the ground and planted it in corn, but not a cut worm was to be seen the whole season; while his neighbor, who ridiculed the idea of breaking up ground in the winter to prevent the cut worm from destroying the corn, broke up in the spring and planted it in corn; but what was his surprise when he saw his field filled with cut worms and his corn almost destroyed, while the adjoining field of his neighbor remained unmolested." The writer says, many similar experiments have been made, and with universal good success.—*The Agriculturist*.

*NEW ENGLAND GIRLS.*—Rev. Mr. Morrison of New Bedford, in his Petersburg centennial sermon, says:—"Early in our history, the hand card, the little wheel and the loom with the hand shuttle, were almost the only instruments of manufacture in the place. The grandmother of Gov. Miller paid for four hundred acres of land in fine linen, made entirely (except getting out the flax) by her own hands. The Farmer's Monthly Visitor remarks on the above incident as follows: 'Here is an example for the ladies of New England that would be worth following. Affected female delicacy or refinement have surely nursed a race inferior to the first mothers of our land. We know not how or why the linen hand wheel has been thrown aside. It ought to be restored.'

'So ought the farmers of New England to keep up the fashion of growing flax. This article, on a well prepared ground, may be made a source of profit. Where the climate is too severe for the growth of the mulberry, let the experiment of raising flax be revived. Family manufacture of linen will best indicate the talent of both male and female. He must be a good farmer who knows how to raise a good crop of flax—to save and secure the valuable seed—to dew rot or water rot it, and finally to break and to clean the flax fit for the hatchel. And the young lady, who, under the guidance of a faithful mother, has hatcheled and spun the beautiful fibre upon the hand wheel, wove and whitened her damask linen table cloths, her twenty pair of sheets, with double sets of pillow cases, her white fringed window curtains, etc., will better recommend herself to a good husband, than she who has had thousands expended in teaching her the use of the piano forte, which, if she ever had a taste to play, must be thrown away in a day or a month after marriage.'

## LARGE AND SMALL FARMS.

We have before alluded to the mania which seems to be cherished by farmers in this country for large farms—for cultivating many acres of land. The subject is well handled in the following article from the *Farmer's Cabinet*:

"I wish my brother farmers would think very seriously on the advantages to be derived from the system of cultivating no more land than can be well manured. The desire of more land has been the ruin of thousands, who would at this time have been well off, if their friends had deprived them of one half the acres which they at one time possessed; while the extra labor and anxiety consequent upon a business so spread abroad, are all that many

have gamed, and all they had a right to expect to obtain. And it would appear to be a fatality to which persons of this sort are subject, for they would surely be able to see *the nose in the middle of the face*—for one is not more plain than the other. If ten acres of land can be made to yield as much as one hundred, merely by concentrating upon the means of improvement, the labor and care necessary for the cultivation of one hundred acres, the result must be profit of mind, body and substance, absolutely astonishing! Now only for a moment calculate the difference in labor, in hauling the manure over one hundred acres instead of ten, and after that the spreading of it abroad! Then comes ten times the ploughing, harrowing, sowing with ten times the quantity of seed, hoe-harrowing, mowing or reaping, and binding and raking over one hundred acres instead of ten, and extra carry-crops; and after all this, *ten times the rent to pay*—I declare it appears to be a species of insanity, this desire for more land.

I have lately seen a farm where all these evils are embodied—of excellent natural fertility, fields large and lying on an easy declivity, with every facility for permanent improvement, marl of the richest quality in the middle of the estate, and within three feet of the surface. Now, if the owner of this fine farm of about two hundred acres, would confine his labors to ten acres of land adjoining his house, and give all the rest to the stock upon the farm, only mowing the weeds to prevent them seeding his and his neighbors' land, I believe he would then make a profit while at present he must make a loss.

I was told recently of a farmer who cultivated one acre of land adjoining a field of thirty acres—both were planted with rye; and at harvest a bet was made that the yield of the one acre was equal to that of the thirty acres; this was, however, lost, for the crop of thirty acres measured exactly *three quarters of a bushel more than the one acre*—these fields I have seen; and I have also seen another field, where the owner offered to dispose of the crop of rye for a dollar an acre, but could get no purchaser at that price.

Now, is it not much better to double the crop than to double the number of acres? But I have land lying before me, which would yield five hundred per cent more than it now does, by extra management.

AN OLD FARMER.

*The Cotton Crop.*—The Mississippian of the 25th ult. says: "The developments so far go to show that the crop of cotton in Mississippi will be unusually short; say at least a third less than for several years past. In the Spring, the State was visited by a number of severe freshets and hail storms, which destroyed many fields, and subsequently the growing crop was much injured by the rust, and of late the crop has been infested in a most destructive manner by the army worm. The price of the staple, however, is looking up, and it may be expected that the shortness of the crop will not be materially felt."

Our farmers are improving the fine weather to bring in their produce. The chief article thus far is onions, of which several loads arrive daily. The crop this year has been a fair average one per acre, though the quantity raised is perhaps double that of any preceding year. The usual product is about three hundred bushels per acre.—*Peoria Register*.

## WORCESTER HORTICULTURAL SOCIETY.

*Report of the Committee on Paintings.*

The Committee on Paintings, having, in such manner as circumstances would permit, attended to the duties assigned them, make their report.

It is a subject of congratulation that such choice and varied specimens of this art are to be found in and about Worcester. It is not less gratifying to perceive among those who possess these treasures, a most liberal disposition to extend to their fellow citizens the pleasure and advantage afforded by an examination of productions of genius and taste.

Although it has been customary, at the exhibition from which the farmers' annual festival derives much of its animation and interest, to introduce among the articles emphatically denominated useful, more or less of those properly pertaining to the fine or elegant arts, a collection of such works, upon an extended scale, has not been attempted. A design of this nature has had its origin with the establishment of a new association, intended to promote those branches of culture which include matters of luxury and ornament. We believe, however, that a gallery of paintings has not heretofore, by similar societies, been appended even to a display of fruits and flowers. There is, therefore, something of novelty in the plan, and it will perhaps be expected, at the outset of such an undertaking, that a few remarks should be made respecting its practical use, and its connection with other objects of agricultural and horticultural celebrations. As yet, no premiums even of an honorary character, have been proposed for this department of the exhibition. In the choice, therefore, between attempting a few hasty general observations, or a few hasty descriptions or criticisms of particular paintings, we have decided upon the former as more appropriate now, while for the latter purposes better opportunities will probably exist hereafter.

The sphere of the agriculturist, who owns the land he tills, and applies to his private use the results of the seed he has planted, is not limited to the growth of supplies for merely indispensable wants. The earth produces fruits that gratify his finer appetites as freely as it yields corn and potatoes. Flowers, too, spring up beneath his feet, and invite his eye to an appreciation of beauty in its compound elements of form and color. In short, he who cultivates the soil is surrounded by endless means of harmless luxury, and is in the midst of the purest sources of true refinement; and if his ears is fully opened to the voice of nature, in whose bosom he dwells, he will hear it calling him to enjoy the charms of varied flavors, of rich hues, and of the lights and shades of scenery, as loudly as to reap the grain or kill the fatted calf.

We find, indeed, a most natural and connected step of advancement from plain and simple agriculture to horticulture, whose objects of cultivation appeal to tastes that are reached and gratified through the medium of sight as well as to the relish of the palate. The art of horticulture, embracing as it does the rearing of both ornamental and fruit trees, the growth of flowers and shrubbery, and the general improvement of grounds, stands, as it were, between the homelier offices of husbandry and the highest arts of refined life. It is favorably situated for bringing these into a mutual and useful alliance. If it owes most to the practical employments of the one, a knowledge of the nice and deli-

cate principles on which the others depend, can alone carry it to perfection.

Experience teaches us, that a sensibility to the beauties of proportion and of color, although universal in the human constitution, needs to be educated by observation and comparison in order to a just and correct action when practical judgments are required, and the owner of a farm or country estate, which he seeks to render attractive to the eye of taste, will, without these advantages, be as likely to fail of producing the effects he aims at, as he would of raising good crops without a knowledge of the influences of soil, and position upon their qualities.

It may be said, that nature is the great school where knowledge and experience upon these subjects is best taught and most readily acquired, and to her we may be referred for all that is needful to be learned. It is true that nature is the original source and only perfect standard of taste; yet the best preparation for a profitable observation of nature, is, undoubtedly, a study of her varied features as delineated upon the canvass of the artist. The attention is there drawn to a more particular examination of effects, and the philosophy of their production, and we can there more readily distinguish the means by which those arrangements of vegetable forms, and of lights and shades of foliage, most grateful to the eye, may be accomplished upon our own estates. The harmonies of color, too, subject to as regular laws as the harmonies of sound, are there most instructively manifested. The art of drawing, it is well known, presents to the cognizance of those who practice it, a thousand peculiarities of form and hue, in objects of every kind, from the leaf of a flower up to the outlines of a landscape, which the casual observer would pass by unnoticed. In truth, any one who owns a portion of nature's domain, however small, will find that the pencil of the painter can teach him lessons that may increase his ability to improve and enjoy that which he possesses.

One of the most important secrets of a painter's skill, is the selection of objects that are appropriate to the scene he represents, and in keeping with the general character of the picture. If he were to place a palace or a temple in a barn-yard, or set off a farm house with gay colors and fanciful architecture, we should see at once that he violates the proprieties of his subject. If he prefers the showy to the natural and simple, or fails to leave in shade that which is displeasing, as well as to bring out into distinct view that which is agreeable, we pronounce him deficient in the genius of his profession. Yet how constantly do we see these points neglected, or mistaken, in and about our grounds and dwellings. It is not that sufficient pains are omitted to be taken, or sufficient expense incurred in such arrangements. The error often lies in an excess of these. Instead of the quiet and simple styles, taught by the true artist, where the economical hand of nature is employed to furnish decorations and conceal deformities, a style more ostentatious, more expensive, less convenient, and, to use a much abused term, less genteel, is apt to prevail. The fact is, that an eye and a judgment unpracticed in such discriminations can seldom carry out in execution an intended design. The forms, colors, and positions of things, do not appear after completion as the fancy had anticipated; and he who contrived the plan may perceive as readily as any body, that he has not succeeded in satisfying himself or others.

That cost in matters of taste which fails to accomplish its purposes, is, certainly, so much money worse than wasted, as defects generally become conspicuous in proportion to the display that attends them. The art which teaches that the most genuine elements of beauty are also the cheapest, since a strong argument to the purse can be adduced in its favor, has a right to claim a place among the useful and practical ones. Illustrations of a part of our remarks may be found in every village. Dwellings unsheltered by tree or shrub present boldly to the eye every defect of form and finish. If painted, a glaring color displays more strongly the want of grace and proportion. If unpainted, that deficiency is apt to be made more strikingly manifested by a few variegated strokes of the painter's brush passed up and down the corners and along the sills. If something beyond this is attempted, we shall be likely to see imitation marble steps, quarried from the brain of some mechanical artist. If there is a portico, strange looking figures blue or green appear crawling up the columns. But the chief seat of elaborate and varied ornament is usually the door, made to exhibit, upon its artificial mahogany frame and maple panels, a tortuosity of knot and grain that nature, in the wildest of her vegetable freaks, never equalled.

Who that should see these in a picture would fail to perceive their incongruity and ugliness, while the humblest abode, which the vine or the tree have adorned with their drapery, and whose modest color permits its rude outlines to mingle with the unstudied forms of nature, becomes an object of beauty and interest. There is no building, however ill proportioned, no material however coarse, that may not, by the simplest means, be made to assume an air of beauty and respectability which the carpenter and house painter alone could not impart.

Every land-holder has in his possession the materials of a great and perfect picture. His field and forests furnish the ground-work into which may be wrought every form and hue of beauty. His harvests, his fruits, his vegetables and flowers, ripening and glowing in the sunshine, provide him colors that art cannot excel. In combining and arranging these materials he becomes an artist, and, like other artists, needs to qualify himself by a study of proper exemplars, not so much for the sake of finding something to imitate, as to improve his taste and rectify his judgment.

It is vain to say, that these things are of no practical importance to the farmer and the husbandman, on the ground that their efforts are directed not to ornament but to profit. Almost every New England farmer is at some cost in improving the appearance of his homestead. We would have him do it by the very means that are the sources of his thrift. Order and neatness are unquestionably favorable to the closest calculations of pecuniary gain; and elegance, if attempted by appropriate means, can be obtained without additional expense.

If our remarks are correct, residents of the country are the people among whom the arts of design may produce the most general and advantageous influence, yet they are the very persons usually debarred from the best opportunities of cultivating the faculties upon which these are founded. Collections of good paintings, for instance, are seldom seen except in large towns and cities, where but few, comparatively, from the agricultural districts are accustomed to visit them. We therefore, consider the plan of connecting such an ex-

hibition with our rural festivals as a valuable improvement which we hope will be continued and extended, and one that can be productive of none but good effects.

It would be a great omission, in speaking of any branch of the fine arts, not to allude to their refining influence upon society. A perception of the beautiful and the appropriate is the real basis of refinement. In France and Italy, where, among all classes, works of art are appreciated, the manners of the people, to some extent, partake of the graceful result of these tastes. Foreigners pronounce Americans to be especially deficient in such characteristics. Yet from the equal relations, we all sustain to each other, Americans most need that influence, which, by rounding off the rough edges of individual characteristics, fits man for easy and comfortable intercourse with his fellows. True refinement is the most aristocratic principle in the world, approaching nearer to the simplicity of nature just in proportion to the degree of its culture; and he who has accustomed himself to contemplate the elements of beauty in the external world, or their embodiment by the human intellect in words, or in the forms of art, will find himself prepared to fill with propriety any social position.

With regard to the pictures that composed the collection we have just witnessed, we can only say, they would have done honor to any exhibition, in any place—that they are most creditable to the taste of our citizens, and have been submitted to the use of this society with that liberality which a love of art usually inspires. A list of the subjects with the names of owners has been published. We are informed, by those who best know, that additions of new and valuable paintings may be expected annually to give novelty to the exhibition.

For the Committee,

S. F. HAVEN, *Chairman.*

From the Mark Lane Express.

**PRACTICAL IMPROVEMENTS IN AGRICULTURE.**

Sir,—One of the most important subjects for the attention of the practical agriculturist is the nature of manures, the manner in which they act, and the best mode of their application. It has long been known that certain substances blended with the soil have the effect of accelerating the growth of vegetables and increasing the crop; but the manner of bringing them into action, and of adapting them to the nature of the soil to be improved, has long been a subject of discussion. Chemistry, and more particularly that branch of it which shows the nature and composition of soils, will assist in this research, inasmuch as it should be the study of the farmer to correct the defects and supply the deficiencies of the land on which his efforts are applied.

Plants, not possessing the powers of locomotion, can only thrive in those spots which contain the juices necessary for their support, and as the organs through which they derive what may be called their food, are extremely small, it follows that every matter to be introduced into them must be in a state of solution. Fermentation is not necessary to prepare the food of plants, although solutions intended to nourish them must not be too concentrated, or the vegetable organs will become clogged, and the transpiration by the leaves prevented. The great object in the application of manure should therefore be to afford as much soluble mat-

ter as possible to the roots of the plant so gradually as to ensure its being taken up and consumed in forming its sap and solid parts. All vegetable manures contain a large quantity of fibrous and insoluble matter, which must undergo certain chemical changes before they can be made thus available. Animal matters decompose more readily, and are sooner prepared for use. The principal substances, either constituting the bodies of animals, or found in their blood or excrements, are gelatine, fibrine, mucus, fatty or oily matter, albumen, urea, uric acid, saline, and earthy matters. All these substances may be used for manure, and require more or less soluble in water; those that are easily dissolved should not be exposed to fermentation or putrefaction, and those processes are only useful when the manure consist principally of animal or vegetable fibre. Gelatine, when combined with water, becomes jelly, and is easily soluble. Fibrine is not soluble in water, but by the action of acids it becomes analogous to gelatine; putrefaction with heat and exposure to the air, will reduce it from a solid to a liquid, and a considerable quantity of ammonia and carbonic acid is formed. Mucus is easily soluble in water. Animal fat and oils and albumen are also soluble. Urea is very much so, and readily undergoes putrefaction. Uric acid consists of carbon, hydrogen, oxygen, and azoti, and is least liable to undergo the process of fermentation. According to the different proportions of these principles in animal substances, the changes they undergo are different—the progress of their decomposition is less rapid when mixed with saline or earthy matter than when they are principally composed of fibrine, albumen, gelatine, or urea. Ammonia, is given off by animal compounds during their putrefaction, and is formed by hydrogen and azoti; the other products are similar to those afforded by the fermentation of vegetable substances, and the soluble substances formed abound in carbon, hydrogen, and oxygen, which may be called the constituent parts of vegetables.

The fertilizing power of all these substances, when properly applied is very great, but it often happens that they are wasted by being allowed to remain exposed to the air, till they are either destroyed by birds of prey or decomposed.—Their use, indeed is not common except in certain cases, which I shall afterwards point out.

I am, sir, yours very obediently,

A YEOMAN OF KENT.

From the Western Farmer and Gardner.

**A COMPARISON OF THE DIFFERENT BREEDS OF SHEEP.**

In the Western States, where land is, of course, not so valuable as in the East, the Bakewell breed of sheep, although of a more tender constitution than the Southdown and Cotswold, and of coarser and smaller fleece, may be advantageously kept for their wool, notwithstanding its quality is rather coarse; it appears, however, from all the information on this subject, (the comparative value of the breeds of sheep,) that the Southdown and Cotswold, are much hardier, better nurses of their lambs, and require less attention through our winter, and will live on shorter pasture in summer. The Merino and Saxon sheep, have often too much the same objection as the Bakewell; they are of rather weekly constitutions, and not very good in rearing their lambs. Some of the Southdown wool is pret-

ty fine and makes good cloth: the mutton is, perhaps, superior to all other kinds, (excepting some of the small Welsh breeds,) their constitutions are very vigorous and strong, and they will make a living in any situation. The Cotswold are equally hardy, but want richer keep than the Southdown, their fleeces weigh heavy, and their quarters have been known to reach 80 pounds in England. Some of the Southdown and Cotswold lambs have weighed, at six months old, 60 pounds, and when full grown 240 pounds. It seems, amongst many other "hard cases" in agricultural efforts for improvement among farmers, very difficult to convince people of the benefit they derive from having good stock. They complain too much of the first cost, without considering that in two or three years there is a fair prospect of not only seeing their money back again, but probably ten times as much more. We do not wish to advise farmers to go beyond their means on much uncertainty, but we do say, that twenty dollars laid out for the best breed of pigs, and fifty to one hundred dollars for sheep, or one hundred to two hundred dollars towards improving their cattle, will with proper management and attention to the sale of their produce, pay a handsome profit at the end of a few years, besides supplying superior articles at cheaper keep (on account of the fattening properties of the best breeds) for domestic use, and enjoyment of both sight and taste. We subjoin, in the first place, a comparative statement of the value of the different breeds of sheep.

Saxon Lamb 6 months old, weighing 18 lbs.			
at 6 cents,			\$1 08
Merino Lamb	do.	do.	20 1 20
Bakewell	do.	do.	30 1 80
Cotswold	do.	do.	60 3 60
Southdown	do.	do.	50 3 00

In the second place, their wool			
Saxon fleece weighing 3 lbs. at 40 cents			\$1 20
Merino	do.	3 31	93
Bakewell	do.	5 20	1 00
Cotswold	do.	10 25	2 50
Southdown	do.	5 31	1 55

Of course this is rating the best breed of sheep at the price of the common kind, which cannot be, for a long time to come. These animals are now worth about twenty dollars each at least.

In the third place we give a comparative statement of the sheep when full grown:—

Saxon Sheep weighing 50 lbs. at 4 cents			\$2 00
Merino	do.	60 4	2 40
Bakewell	do.	110 4	4 40
Southdown	do.	240 4	9 60

E. J. H.

*Rohan Potatoes.*—The Shakers at Enfield, N. H. have raised the present season from one potato of the Rohan kind weighing 7 oz., 171 lbs. or 2 1-2 bushels. One eye produced 12 lbs. 3 oz., and one potato weighed 3 lbs. 5 oz. We doubt if our farming friends can produce a greater yield from a single potato than has been done by the Society of Friends at Enfield.—*Fur. Monthly Visitor.*

*A TRUTH.*—The farmer who consumes all he raises, and runs in debt for what he buys, is certainly in a bad way; and a nation that pursues the same course must expect to arrive at the same result, namely, bankruptcy.—*Alb. Cult.*

The number of sheep in Vermont is estimated at not short of 1,170,000,

NEW ENGLAND FARMER,  
AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, NOV. 11, 1840.

TRIAL OF PLOUGHS.—No. III.  
[Concluded.]

The trial of ploughs at Worcester being still a subject of much interest among the farmers, we hope we shall be excused for some farther remarks upon it.

We ask leave to suggest, with the highest respect for the judgment of the Trustees, that if these premiums should be continued, they will omit the condition, that two ploughs of the same pattern and of different sizes should be produced. Where competitors come from a great distance, this condition would impose on them a considerable inconvenience without an equivalent advantage, as the model, being all that is desirable, may be obtained as well from one as from more ploughs of the same pattern. We should be glad to invite as extensive a competition as possible. If the ploughs used in other parts of the country are better than ours, we shall be benefited by seeing and trying them. If ours are better than theirs, they will derive a corresponding benefit from our improvements. We were glad that in this competition the palm of superiority should have been awarded to the skilful mechanics of our own state; but we should not have been sorry if it had fallen justly to others. Such a result would have operated at once as an incentive to new exertions and new improvements. Our Massachusetts mechanics would never be satisfied to remain distanced in any honorable competition. The public gains immensely by such competitions; the mechanics, if this is the effect of failure upon them, will certainly lose nothing. We heard considerable regret expressed that some other individuals, distinguished for the excellence of their workmanship, did not obtain a premium. This is a benevolent feeling; but there certainly is no reason why every other disappointed competitor should not be entitled to an equal sympathy. In a case where only two premiums are to be awarded, ten persons cannot be honored with them. The disappointed competitors should feel no other concern in the case than that involved in a determination by every means in their power to excel those who have now distanced them. If this decision were to be perpetual, and must fix the rank of these ploughs for all time to come, it might indeed seriously affect their interests; but it is not so. The field of competition is still open; the upper round of the ladder is not yet reached; perfection in the implement still lies in the distant prospect; and another year may find those now disappointed coming out of the race a full length before the rest.—This is the spirited emulation which we wish to see excited, and from which we may expect a constant improvement. Every generation is disposed to consider itself as having reached the perfection of the arts. A wise man will not permit himself to be betrayed by this overweening self-esteem. The progress of the mechanic arts among ourselves has been so extraordinary that a plough deemed excellent in its construction thirty years ago would now be worth little more than its actual value in oven-wood and old iron. Who shall presume to set limits to the progress of the arts?

The very last Farmer's Magazine (London) for October gives a plate and an account of a newly invented and patented plough, "unlike," it is stated, "any other ever offered to the public; possessing greater advantages in every point of view, in its adaptation to various soils and seasons. The greatest nicety in the draught is assisted through a peculiarly constructed hake, no way liable to get out of order. Indeed every day's in-

formation affords encouragement to hope these ploughs from their proved utility will supersede all others."—We know nothing of this plough other than what is here stated; but the confidence with which this statement is made, shows at least that a remarkable improvement is supposed to have been effected.

The Committee have not laid too great stress upon the comparative ease or difficulty of draught in different ploughs. Forty years ago a "breaking up" team was a formidable affair. Never less than two yoke, frequently four, and often five yoke of oxen, with two men to drive, one to hold the plough, one to "keep her in," by riding upon the beam, and one to follow the plough in order to mend the baulks, and with a hoe to turn the furrow slice, which would not go over without being assisted, were customarily required in this great operation. Then the field after being ploughed, presented any thing but a neat appearance, and looked more as if it had been rooted by the hogs than if it had been broken up by art and skill. Now unless the soil is very tenacious and difficult, the operation is accomplished often by one, seldom more than two yoke of oxen are needed, with only a man and a boy; and the sward is inverted with neatness and precision, so that it may be brought at once into nice cultivation.\*

The power of draught required for different ploughs, is at this time exciting great attention in England. Ploughing is one of the most expensive operations on a farm; and when we consider always the great cost of brute labor, since it is ordinarily estimated to require the produce of three to five cultivated acres per year to support a horse, the saving of fifty per cent. of this expense, with many other incidental and unavoidable charges, the subject assumes a serious importance.

The experiments made by Henry Handley, Esq., M.P., on wheel and swing ploughs present the subjoined results. (July 1839.)

"A stubble field of a sandy loam was selected; partly up and down hill, and partly on a level. The ploughs all by the same maker, were set to the same gauge, viz: furrows six inches deep and ten wide, drawn by a pair of horses abreast, and held by the best men that could be procured, who were occasionally changed from one plough to another. The instrument employed to test them was a draught dynamometer, on Regnier's principle, which had been previously proved, by the suspension of weights, to register with accuracy."

Description of Ploughs.	Weight of each Plough.		Draught.	
	ewt.	qrs. lbs.	ewt.	qrs. lbs.
Rutland, with wheels,	1	3 22	2	1 21
Bedfordshire with wheels,	1	3 26	2	3 24
Lincolnshire swing,	1	0 18	3	0 0
Lincoln Heath,	1	1 1	3	0 11"

The next experiments, which we shall quote in this case are those of Philip Pusey, Esq., M.P., from a paper recently given to the agricultural public, entitled "Experimental Inquiry on Draught in Ploughing." In these two very able communications from Mr Handley and Mr Pusey, to the Royal Agricultural Society, there are many matters of great interest to the farmers and highly instructive, which we propose at an early occasion to lay before our readers; but we must at present

"It is impossible for any man to witness a "breaking up" of this kind without being forcibly reminded of the reflection made by a Dutch commentator on that passage in the book of Kings, where it is said that Elisha was found ploughing with twelve yoke of oxen.—'Well,' said the commentator, 'it is no wonder that Elisha was glad enough to quit ploughing for preaching, if he could not break up with less than twelve yoke of oxen.'"—Quincy's Address at Brighton.

content ourselves with brief abstracts of results and imperfect explanations.

"The first trial was made last September between an old Berkshire plough, a small one-wheeled wooden plough, made by Hart, Ransome's Rutland plough, and some others. The field was a clean oat stubble; the soil a sandy loam, moist with rain; the furrow 9 inches wide and 5 inches deep. The draught of the Berkshire was 3 cwt.; of Hart's plough less than 2 cwt.; and of the Rutland plough, somewhere between these two numbers. Thus it appeared that within one small parish, the same work was performed on the one farm by two horses, as on the other by three, (the smallest number ever attached to the Berkshire plough) and that too with greater ease to the two horses than the three."

Mr Pusey, however, was not satisfied with the power gauge employed by him, owing to the variations occasioned by the inequalities of the surface and the rapidity in some cases of the horses' motion, which made it difficult to mark the degrees on the index with exactness. This evil was, however, afterwards remedied by an improved instrument, which he does not particularly describe.

The next trial was November 6. "The soil a sandy loam, free in working when wet; but notwithstanding its lightness, a little adhesive; a clean wheat stubble. The depth of the furrow was 5 inches by 9 wide. The ploughs drawn by two horses." An English stone is 14lbs avoirdupois.

1. Ferguson's Improved Scotch Swing plough, 19 stone.
2. Clark's do. 20 "
3. Hart's Improved Berkshire, one wheel, 14 "
4. Ransome's F. F., two wheels, 14 "
5. Ransome's F. F., Swing, 18 "
6. King's Swing, 18 "
7. King's one wheel, 17 "
8. Rutland's, Ransome's, N. L., two wheels, 17 "
9. Old Berks, 23 "
10. Holkham plough, two wheels, 18 "

On this trial, Mr Pusey observes, "1st. That the Scotch ploughs were the heaviest in the field for the horses, except the old Berkshire; and more than 35 per cent. worse for them than the two lightest ploughs which were Nos. 3 and 4.

"2d. That F. F., which on the same spot of ground and in the same state of moisture, had been 24 stone or 23 stone, now that its mould board was cleaned, drew 18 stone only. This appears to show the importance of the saving the plough iron from being honey-combed as we often see them by rust.

"3d. Ransome's F. F., as a swing plough, was 4 stone, or 23 per cent. heavier than the same plough with its wheels on; and it then equalled in lightness the plough of Hart's, with which it was sent to compete.

"4th. Putting the old Berkshire aside, the four easiest ploughs of the remaining eight, were four distinct wheel ploughs; and the four severest for the horses were four swing ploughs.

"5th. If we once more compare the two ploughs in daily use on this very soil we find Hart's at 14 stone, and the old Berkshire at 23 stone: that is to say, worse by 2 stone for its three horses than Hart's for its two."

These are certainly very important inferences. In another trial on a dark mould on a sub-soil of blue clay, the furrow 6 by 9 inches, "the farmers of this land were all of opinion that even iron mould-boards must not be used upon it, because this clay adheres so much more to iron than to wood." This remark is well worth considering.

The next trial was on a very free, brown, loamy sand, of good quality, without stone, gravel, or clod, resting on a pure yellow sand, on the coral-rag formation.

Inches. Inch. Inch. Inch.

Furrow 4x9 5x9 6x9 7x9

1. Ferguson's	18	19	19	22
2. Clark's	17	17	18	21
3. Hart's	11	12	16	18
4. F. F. Ransome's two wheeled	12	13	18	21
5. F. F. Ransome's Swing,	16	16	18	21
6. King's Swing	15	15	18	20
7. King's one wheel	16	17	21	23
8. Rutland N. L.	16	16	18	20
9. Old Berks	21	21	24	31

Mr. P. remarks "that Hart's plough on this land might be drawn by one strong horse; it still maintains a slight superiority over its competitor F. F. with wheels; and the latter a considerable one, 25 per cent. over its duplicate as a swing plough, excepting at the lower depths, where the wheels from the lowness of the beam had not room to turn"

Other interesting trials are given but our limits do not admit of our going farther into them. The comparative ease of draught between wheel and swing ploughs, the power required to draw a plough on the surface compared with that required to draw it in the furrow, different forms of mould-boards, the use of one or two wheels, the action of the share, the bridle at the end of the beam, or what we call the clavis, the depth of ploughing, sub-soil ploughing, and many other topics connected with this subject remain to be discussed; and will come along as our convenience and the indulgence of our readers will permit.

We shall now close with some short remarks on another topic. We still find men, claiming respect from others for their intelligence, and even setting themselves as the instructors of others, endeavoring to flatter the prejudices of the vulgar by speaking contemptuously of book learning and what are called gentlemen farmers. Away with such despicable nonsense! It will be seen that these experiments upon this first of all instruments, and of such immense importance to the farmers, have been undertaken and conducted both in England and here by men of the highest intelligence and education, availing themselves of the best practical skill which can be obtained. We should be glad to know what ignorant and stupid fellow ever made any improvement in anything? We should be glad to know what improvement in the arts has ever been made but by men of profound minds, of philosophical inquiry, and enlarged knowledge, at least in their particular department.

There never would have been an agricultural society in the country had not men of education and inquisitive minds taken hold of it. There is not now in the Commonwealth a single agricultural society which is not mainly indebted to the men of education and cultivated minds for its prosperity. The Agricultural Society at Worcester is a striking example. It has been established twenty two years. It has gone on in a steady course of improvement and is now eminently prosperous. It has trebled at least the agricultural wealth of the county. Now is there a Farmer of candid mind or indeed of any mind at all, who will not admit and gratefully acknowledge that this has been mainly owing to the intelligence, public spirit, and disinterestedness of the gentleman farmer, the scholar, who has always presided over it; and who by his admirable address has united with him in these public efforts other, and many of the first and most cultivated minds in the county.—If indeed in this most important of all arts, an art offering abundant matter for philosophical investigation and experiment, ignorance is to be placed upon a footing with knowledge, and the aids of education and science are to be disdained, we may as well go back to the savage state, plant our corn with a clam shell and grind it with a paving stone.

H. C.

**ERRATA.**—In the Farmer of last week, page 142, 2d column, line 9th from bottom, for 'furrow slide' read furrow slice; 3d col. 44th line from bottom, for 'all that time' read at that time; 33d line from do., for 'level side' read land side; 23d line from do., for 'furrow alida' read furrow slice; 6th line from do., after 'other' insert end.

**SILVER FIR AND SPRUCE SEEDS.**

Just received at the New England Farmer Office, a few Bushels of the seed of the Silver Fir, Spruce. Also—English Oak, a fine specimen; Spanish Chesnuts, (very large); with a variety of other tree seeds.  
Nov. 10, 1840. JOSEPH BRECK & CO.

**BRIGHTON MARKET.—MONDAY, NOV. 9, 1840.**

Reported for the New England Farmer

At Market 1500 Beel Cattle, 600 Stores, 3800 Sheep, and 520 Swine.

**Prices.—Beef Cattle**—In consequence of the Election and the storm, purchasers were scarce and sales few. We quote first quality, \$5 25 a \$5 50. Second quality, \$4 75 a \$5 00. Third quality, \$3 50 a \$4 50.

**Barrelling Cattle.**—Prices further reduced. We quote Mess \$1 50; No. 1 \$1 00; No. 2 \$3 00.

**Stores.**—No sales effected to day  
**Sheep.**—Lots were sold at \$1 33 \$1 42, \$1 75, \$1 88, \$2 00, \$2 33 and \$2 50.

**Swine**—Lots to peddle at 3 1-2, 3 5-8, and 3 7-8 for sows and 4 1-2, 4 5-8, and 4 7-8 for barrows. At retail from 4 1-2 to 5 1-2.

**THERMOMETRICAL.**

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northerly exposure, week ending Nov. 8.

Nov. 1840.	6 A.M.	12 M.	6 P.M.	Wind.

**FARM FOR SALE.**

The subscriber offers for sale that valuable Farm, situated about 3-4ths of a mile below the First Parish Meeting House, on the Stage road, and commonly known as the Judge Prescott farm, containing about 170 acres of superior land, in a good state of cultivation, with two dwelling houses, four barns, and other out buildings. The farm is remarkably well watered with soft water, conveniently fenced, has nearly forty acres of large, handsome wood and timber standing on it, with an orchard of grafted Apple, Pear, Peach, Plum, and Cherry trees, and might be easily divided into two Farms. The estate will be sold reasonably. If five thousand dollars be paid on receipt of the deed, the remainder may lay on mortgage to suit the convenience of the purchaser. For further particulars, apply to the subscriber, living on the premises. WM. SALISBURY.

Groton, Oct. 26, 1840. eow.

**FRUIT TREES FOR SALE.**

At the Pomological Garden, Salem, Mass., a good collection of Fruit Trees of the best Native and Foreign varieties. Apply by mail to the subscriber,

Salem, Oct. 14, 1840. ROBERT MANNING.

**COWS WANTED.**

Wanted to hire on fair terms 2 or 3 good Cows that will give a good quantity of Milk through the winter,—or would purchase if preferred. Any communication addressed to Taunton Post office, box 26, will be immediately attended to. Oct. 23. 3w

**GREEN HOUSE PLANTS, &c. &c.**

The subscriber can furnish every variety of Green House Plants or Garden Shrub, in the very best order. Also—Dahlia roots, (all the new varieties); Black Hamburg Sweetwater, and Isabella Grape vines; Roses and Pæonies; Honeyuckles, and other creepers; Black, White, and Red Currant trees; White and Red Antwerp Raspberry vines; Asparagus and Rhubarb roots, &c.

Orders by mail will be promptly and faithfully executed; or they can be forwarded to, or left with J. Breck & Co

Oct. 23. JAMES L. L. F. WARREN, Nonantum Vale, Brighton.

**WALKER'S FINE TULIPS.**

For sale at No. 52, North Market street, a great variety of Walker's fine named Tulips, at \$3 per dozen, with their names. Many of the original Bulbs cost five times that sum—Those who intend to set out a tulip bed, will do well to call soon, as October is the best month for this business.

Fine Mixed tulips without names, \$1 per dozen. Also Hyacinths of every variety, embracing all the most approved sorts, with a great variety of other bulbous roots. Boston, Oct. 21, 1840. JOSEPH BRECK & CO.

**FENCE CHAINS.**

Just received from England, at the New England Agricultural Warehouse, 6 casks chains, suitable for making the chain fence, &c. JOSEPH BRECK & CO. July 15.

## MISCELLANEOUS.

"SHIPPED IN GOOD ORDER AND WELL  
CONDITIONED."

The following remnant of the early times, when women were willing to get married and not ashamed to own it, is a letter accompanying a shipment of marriageable ladies, made from England to the colony in Virginia. It is dated—

"London, August 21, 1621.

"We send you a shipment; one widow and eleven maids, for wives of the people of Virginia: there hath been especial care had in the choice of them, for there hath not one of them been received but upon good commendations.

In case they cannot be presently married, we desire that they may be put with several householders that have wives, until they can be provided with husbands. There are nearly fifty more that are shortly to come, and are sent by our Hon. Lord and Treasurer, the Earl of Southampton, and certain worthy gentlemen, who, taking into consideration that the plantation can never flourish till families be planted, and the respect of wives and children for their people on the soil, therefore having given this fair beginning; reimbursing of whose charges, it is ordered that every man that marries them, give one hundred and twenty pounds of best leaf tobacco for each of them.

We desire that the marriage be free, according to nature, and we would not have those maids deceived and marry to servants; but only to such freemen or tenants as have means to maintain them. We pray you, therefore, to be fathers of them in this business, not enforcing them to marry against their wills."

## BOSTON AND ST. LOUIS.

The western people generally, are not probably aware that the great enterprise of connecting St. Louis with Boston, by a chain of rail roads, is going forwards with prospects of speedy accomplishment. The whole line of the road is already chartered. The distance from St. Louis to Boston is about twelve hundred and seventyfive miles. Of this will be completed next year from Boston to Buffalo, five hundred and thirtyfive miles—in Ohio on the shore of Lake Erie, sixtythree miles—in Michigan, near the south line, sixtyfive miles—total, six hundred and sixtythree miles—more than half the whole distance, and embracing two thirds of the whole expense. The works in the west are for the present suspended for the want of funds, but it is expected that operations will be resumed at an early date. Here is enterprize exhibited on as grand a scale as the wildest fancy could have imagined. Ten years ago, a plan to connect Boston with St. Louis, would have been regarded as visionary as a scheme to bridge the Atlantic ocean. But a few years will witness the accomplishment of the project, and the extension of the road, perhaps, many miles westward.—*Wheeling Gaz.*

*A dog worth having.*—The Baltimore Sun states that Mr Knight, of the Holiday Street Theatre, while passing along the street, the other day, accidentally dropped his pocket-book, containing \$50. When he had proceeded some distance he discovered his loss, and was about retracing his steps to search for the book, when he met his dog running up to him with the pocket-book in his mouth.

## FRESH GARDEN SEEDS.

We would inform our customers and friends that we are now receiving our supply of fresh Garden Seeds, most of which have been raised under our own inspection, from fine selected roots; which we warrant to be of the purest quality of the growth of the present season.

Agricultural Books.  
Agricultural Implements.  
Seed and Implement Catalogues sent to all applicants gratis, and all orders promptly attended to.

Boston, Sept. 29, 1840. JOSEPH BRECK & CO.

The Lowell Journal, Worcester Spy, New Bedford Mercury, Yeoman's Gazette, Northampton Courier, Providence Journal, Norwich Aurora, Essex Banner, Springfield Republican are requested to insert the above 4 times.

## TRACE CHAINS.

Just received, direct from the English manufacturers, 3 casks of Trace Chains, from 6 to 11 feet long, suitable for ploughing or draft chains. JOSEPH BRECK & CO.

## BONE MANURE

The subscriber informs his friends and the public; that after ten years experience, he is fully convinced that ground bones form the most powerful stimulant that can be applied to the earth as a manure.

Orders for Bone Manure or Oyster Shell Lime, left at the Bone Mill, near Tremont road, in Roxbury, at the New England Agricultural Warehouse and Seed Store, No. 52 North Market Street, or through the Post Office will meet with prompt attention.

March 4, 1840.

NAHUM WARD.

## RUTA BAGA AND BROWN CORN.

A few tons of Ruta Baga at \$8 per ton. Likewise Brown Corn.—This variety matures in a little over three months, in my opinion, yields as much as any other kind. Those farmers who are desirous of changing seed, may get supplied by calling on G. C. HAWKINS, Charlestown,—One mile from Cambridge Colleges, on the Charlestown road. Oct. 21.

3w

## HYACINTHS.

The subscribers have received a large assortment of Double and Single Hyacinths of every color and shade. Also, Tulips of mixed sorts, Crown Imperials, and Lilies; they have also at their garden all the fine varieties of Paeonies, which will be furnished at one day's notice. Lilies and Paeonies, and Crown Imperials, should be planted in August or the first of September. We shall receive a great variety of Bulbous Roots, from Holland, in a few weeks, when notice will be given. JOSEPH BRECK & CO. August 26.

## GREEN'S PATENT STRAW CUTTER.

JOSEPH BRECK & CO. at the New England Agricultural Warehouse and Seed Store Nos. 51 and 52 North Market Street, have for sale, Green's Patent Straw, Hay and Stalk Cutter, operating on a mechanical principle not before applied to any implement for this purpose. The most prominent effects of this application, and some of the consequent peculiarities of the machine are:

1. So great a reduction of the quantum of power requisite to use it, that the strength of a half grown boy is sufficient to work it efficiently.
2. With even this moderate power, it easily cuts two bushels a minute, which is full twice as fast as has been claimed by any other machine even when worked by horse or steam power.
3. The knives, owing to the peculiar manner in which they cut, require sharpening less often than those of any other straw cutter.
4. The machine is simple in its construction, made and put together very strongly. It is therefore not so liable as the complicated machines in general use to get out of order. Oct. 14.

## ENGLISH ACORNS AND SPANISH CHESNUTS.

Just received and for sale, a few quarts of English Acorns. The tree is very beautiful, and one of the most ornamental of the English forest trees. Also a few Spanish Chesnuts,—twice as large as the common sort—rice 50 cents per quart. JOSEPH BRECK & CO. Oct. 28.

## FRUIT AND ORNAMENTAL TREES.

Gentlemen at a distance, wishing to purchase trees, are informed that we will select from the following nurseries Fruit and Ornamental Trees, Plants and Shrubs of every description that may be desired, and pay particular attention to their packing, and forward them to any part of the country.

From Messrs Winships', Brighton  
William Kenrick's, Newton.  
John A. Kenrick's, Do.  
S. & G. Hyde, Do.  
Samuel Pond, Cambridgeport.  
Botanic Garden, Cambridge  
Robert Manning, Salem.  
J. L. L. F. Warren, Brighton.  
Breck & Co., Brighton.

The present is the best time, to transplant all hardy trees and shrubs.

Orders will be received for Plum, Pear and other Stocks, Hedge Plants, &c.

## FRUIT AND ORNAMENTAL TREES, &amp;c.

Fruit Trees of all the different species—of the most celebrated kinds. These include Pears, Plums, Apples, Quinces, &c.—the trees of the Peach and Cherry, especially, are of the finest size, and in numbers abounding at this time, and of varieties unsurpassed. The Catalogue of Fruit and Ornamental Trees and Shrubs, Roses and Herbaceous Flowering Plants, will be sent to all who apply: in that Catalogue many of the very best kinds of fruits, so far as proved, are particularly designated by a star.

Also, Grape Vines, Raspberries, Strawberries, Gooseberries, and Mulberries for silk—Scotch Larch, Lindens, Sycamores, Silver Firs, Willows, Elms—Honeysuckles, Dahlias, splendid Paeonies, &c. &c. Trees when so ordered, will be securely packed for transportation to distant places, and all orders promptly executed by

WILLIAM KENRICK.

Nonantum Hill, Newton, near Boston, Sept. 9, 1840.  
eptD1

## FRUIT AND ORNAMENTAL TREES, &amp;c.

Fruit Trees of all the different species—of the most celebrated kinds. These include Pears, Plums, Apples, Quinces, &c.—the trees of the Peach and Cherry, especially, are of the finest size, and in numbers abounding at this time, and of varieties unsurpassed.

Also Grape Vines, Raspberries, Strawberries, Gooseberries, and Mulberries for silk—Scotch Larch, Lindens, Sycamores, Silver Firs, Willows, Elms—Honeysuckles, Dahlias, splendid Paeonies, &c. &c. Trees when so ordered, will be securely packed for transportation to distant places, and all orders promptly executed by

JOHN A. KENRICK.

Newton, near Boston, Oct. 14.

## Brighton Nurseries and Gardens. For Sale

A large quantity of superior European and American Ornamental Trees, well calculated for public places, or private grounds, with Fruit Trees embracing a great variety of the most approved kinds and fine sizes. The trees, and all other productions can now be selected and marked, and will be for warded to any place as soon as it will answer to remove the same.

Also, forty kinds of Strawberry Plants, of the most approved European and American varieties.

Orders may be forwarded via. mail, addressed Messrs. WINSHIP, Brighton, Mass., or left with Messrs. JOSEPH BRECK & CO.

Brighton, August 12.

## TIE UP CHAINS.

Just received at the New England Agricultural Warehouse, a good supply of those celebrated Chains for tying up cattle. These chains, introduced by E. H. Derby, Esq. of Salem, and Col. Jacques, of Charlestown, for the purpose of securing cattle to the stall, are found to be the safest and most convenient mode of fastening cows and oxen to the stanchion. They consist of a chain which passes round the animal's neck, and by a ring attached to the stall, plays freely up and down, and leaves the animal at liberty to lie down or rise at pleasure, and keeps him perfectly secure.

July 15.

JOSEPH BRECK & CO.

## THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at \$3 per annum payable at the end of the year—but those who pay within sixty days from the time of subscribing are entitled to a reduction of 50 cents.

TUTTLE, DENNETT AND CHISHOLM, PRINTERS.

17 SCHOOL STREET, BOSTON.

N. E. FARMER.

### CONNECTICUT AGRICULTURE.

We are very happy in seeing our sister State, the land of steady habits, waking up with a spirit of agricultural improvement, which we are persuaded will not be suffered to flag; and from which the best results may be anticipated. Connecticut formerly had several agricultural societies; for several years, however, they have slumbered and slept. But the wise virgins have arisen and trimmed their lamps. May they burn with a clear, a steady, and a constantly more and more diffusive light.

At a late session of their legislature, the government granted to each county society the sum of two hundred dollars, to be expended in premiums and for the encouragement of agriculture, provided that each society would among themselves raise an equal sum for the same objects. The New Haven County Society, the New London and Windham County Society, and the Hartford County Society, each availed themselves of this offer; and we know not how many others. The Shows and Fairs of each of these societies the present autumn, we have had the pleasure to attend, and with high gratification. Finer exhibitions of vegetable products we know could not be presented in any part of the country. The show of stock, likewise, was highly creditable. At New Haven, upwards of three hundred yokes of as fine working cattle, in respect to condition and appearance as can any where be found, were on the ground; and at Hartford four hundred and thirty yokes. At each of these places a large collection of farmers and farmers' wives and daughters were assembled to assist at and to enjoy the festival. Men of the highest distinction in the State lent their ready aid, and such occasions must be productive of the highest good.

We feared that we might be considered rather "breachy" in being found three times in our neighbor's pasture; but we escaped without being either backed or impounded. The truth is, the bars were taken down for us, and we were very kindly invited to come in. How could we refuse, with our strong desire to break down every sectional prejudice, and to cultivate a spirit of universal fraternity? We had likewise the honor of an invitation to go into New Hampshire, which sickness compelled us, to our great regret, to decline.

The New Haven County Society have published their "Transactions." The able report on farms we have the great pleasure today in part to lay before our readers. The remainder will immediately follow. It is exceedingly well drawn up; and will be read by our farmers with profit and pleasure.

Connecticut is eminently suited to be an agricultural community. She has much good soil. In many places she abounds in the means of enriching her soil. She has access in every direction to the best markets. Besides all this she has an intelligent, industrious, frugal, sober population, well edu-

cated and enured to habits of labor and self dependence. Her manufacturing industry has made her eminent throughout the world. We do not mean, if we can help it, that she shall bear away the palm in agricultural improvement from our own State; but let her do it, if she can; and no miserable self-conceit nor mean jealousy shall prevent our spurring her on to the most spirited competition. She belongs to us and we to her. What she gains, we shall gain. We will cheerfully give and take; and the honor acquired by any one of the children of the same family is necessarily reflected upon all the rest.

H. C.

### NEW HAVEN COUNTY AGRICULTURAL SOCIETY.

#### *Report of the Committee on Farms.*

The Committee on Farms beg leave to report: That they have devoted six days to the discharge of the duties of their appointment, in visiting the several farms in the different sections of the county presented for the premiums offered by the Society. All the farms thus presented were visited by our committee between the 20th and 30th of June.

The object aimed at in this examination is *utility*, a practical benefit to the farming interest of the county. This object the committee have constantly kept in view. No effort, therefore, will be made at eloquent dissertation or rhetorical display. Their aim is to present the principles on which they proceeded, the facts on which they proceeded, the facts which they found, and the conclusions to which arrived, in plain and simple language, suited to the useful and important subjects which they discuss.

It appeared essential, in the outset, that the committee should definitely determine what were the principles on which they were to make their decision.

The premiums are offered for the "*best cultivated farms.*" The most productive land, or that which is in the highest condition, is not necessarily the best cultivated. Accidental circumstances, or the judicious and careful husbandry of a former occupant may have brought it into such condition, that even with inferior culture it will produce heavy crops. So of a farm at large. By moderate cropping and careful nursing, the deterioration incident to ordinary farming may have been avoided, and the whole farm to a degree retain its pristine fertility, while the cultivation remains the same that has been pursued time out of mind.

And here the committee would remark, that the general system, or outline of husbandry, pursued in any country, is such as experience has proved to be best adapted to the soil and climate; and it is only by such judicious and careful modifications of this system, as the progress of society in science and the arts may suggest, and accurate and repeated experiments approve, that any amelioration in that system can be effected. Such modifications are continually made, and the thorough farmer finds exercise for his most careful discrimination and his best judgment in selecting from the multi-

tude of experiments urged upon the confidence of the community by plausible statements and the published results of small trials—such changes as shall not only be consistent with the general system, but shall also be improvements upon it. If, therefore, the system as it prevailed with us a half century since is still continued by any farmer, without the adoption of such modifications as experience has proved to be beneficial, he is evidently behind the age, and his farm can by no means be said to be even *well cultivated*.

On the other hand, although a farm may be less productive by reason of a lighter soil or previous and long continued injudicious and close cropping, yet the present occupant, by careful management in relaying his fences, draining his low lands, and deepening his soil, in a careful and thorough preparation and application of manure—in eradicating bushes and weeds—breaking up old head lands and unreclaimed pastures—in judicious courses of cropping varied to conform to the different soils, and in improving his buildings and other conveniences, may obtain a far richer result than he who pursues the old way upon better and more productive soil. True, a part of the results of his industry remains upon his land, but what better course can a farmer adopt than one which continually raises the condition and character of the soil upon which he labors. Such continued improvement has a direct and wholesome influence upon the mind of the farmer himself, and leads him to greater personal efforts and to higher attainments.

The dealer in money rejoices in such investment of his funds as will bring him compound interest. How much more should the farmer delight in that management of his land which renders soil before unproductive, and it may be unfit for cultivation, because it produced less than a fair equivalent for the outlay of interest, taxes, seed and labor, not merely more fruitful—but even highly productive and rich. The interest upon the original cost of the land, and the taxes, remain the same, the quantity of seed is not increased, nor is more labor required in the cultivation, while the crop is often doubled, or even tripled. The additional product is attributable to the improvement which has thus been effected upon the soil, and if this is as it should be, a thorough and permanent improvement, it becomes a part of the farmer's capital, and all the return above the former average is clear profit upon the capital thus created. How delightful to the farmer the consciousness that his thoroughly cultivated farm is not only a source of profit, but is also continually and rapidly improving.

We see, therefore, that the quality and condition of the land, and the amount of crops obtained, are not alone to be considered in determining the question which is the *best cultivated farm*. Were we to decide simply which is the best farm, without regard to the cultivation, a careful examination of the premises alone would be all which would be needed in order to arrive at a correct result. But when the inquiry includes also the cultivation, although it is necessary to examine the land in order to judge correctly of the results of such cultiva-

tion, so far as they can be determined by inspection, such examination is by no means all which is required. It is necessary in every instance, by careful observation and inquiry, to ascertain what the cultivation is, what is its application and what its results. And here the committee would remark, that under the term cultivation is included every, even the slightest labor of the farmer, from the first motion of the plough to the transfer of the products of the soil to the hands of the purchaser.

Nor is it important in this point of view to obtain statements of the mode of cultivation and the products of cherished portions of the farm only. It is the cultivation of each farm as a whole, which your committee have aimed to obtain.

In order to raise large crops on particular favored enclosures, many farmers rob their farms generally, and dress small pieces so heavily as essentially to injure them, or at least to occasion great waste. There is a point in all land, the staple of the soil, a degree of fertility, when not affected by injudicious cropping, which the peculiar combination of the soil produces. This point it cannot be made to exceed by any dressing which does not change its nature, and therefore those efforts frequently made to induce an excess of fertility in small enclosures, so often end in disappointment and disgust. The pains and labor expended on such enclosures, and the crops obtained from them, have little bearing upon the general result.

It will readily be perceived, therefore, how immensely the field of inquiry is enlarged by the nature of the questions submitted to the decision of your committee, and how much more important is a correct conclusion in this case than in matters to be decided by other committees, since here the decision embraces, and is made upon the whole system, and all its varied operations and results—while there the question in each instance affects merely the results of a single branch of that system.

Impressed with these considerations, the committee first carefully examined the whole of each of the several farms, being accompanied by the owner himself, and deriving from him on the spot such explanations and statements as they deemed necessary for a thorough knowledge of the condition and mode of cultivation of each separate lot. They then obtained by examination and from the applicant a thorough and detailed description of the farm, including the form, size, division, soil, fences, water, &c., a minute statement of the different rotations of crops, with the precise mode of cultivating each particular crop, and the average product—the manner of preparing and applying manures, and the different kinds used—the condition and extent of the land mowed, the kinds and quantity of seed sown, the treatment of the land, the mode of curing the hay, and the amount produced—the kind and quantity of fruit and its use—the stock, their breed, quality, number of various kinds, and their condition—the amount of labor employed, with the proportion hired, and the price paid—the woodland, its quality and condition—the buildings, their convenience and the order in which they are kept—and lastly, the kind and value of the different articles sold from the farm.

The data thus obtained are as much condensed and simplified in the following notices as is consistent with a fair description of each farm. It was thought by all means advisable to give the facts, in order that the farmers might draw their own conclusions from them. If it should be supposed by some that the committee have gone too much into

detail, they beg leave to suggest that what seems plain to one may not be so to another, and that in their opinion the value of their report (whatever that may be) arises principally from this very minuteness.

#### *Farm of Mr Davis.*

Your committee first visited the farm of Mr John B. Davis, of Derby. This farm, containing seventy-five acres, and formerly for many years owned and occupied for the culture of garden seeds, by Mr Leman Stone, lies upon both sides of the turnpike from this city to Derby, and about one mile this side of the latter place. It is beautifully situated upon an eastern exposure, and consists of rolling land, with a very considerable average descent to the east, and forms nearly an oblong square, fifty-five acres on the west and twenty on the east side of the turnpike.

*Soil.*—The soil is principally a dark sandy loam, upon a subsoil of red loam, and is retentive of moisture.

*Water.*—The farm is watered by a brook, which courses along its eastern boundary, and a small stream running directly through its centre. By means of a conduit, this latter rising from springs on the northern border of the farm, affords a full supply of the purest water at the house and barn.

*Buildings.*—The house, with the barn and shed adjoining, were erected by Mr Davis, and are in good repair, but as little stock is raised or kept upon the farm, less attention is paid to convenience of arrangement and labor-saving fixtures, than upon other farms visited by your committee.

*Fences.*—A portion of the fences are excellent, and they are generally good; yet here, too, less care is discoverable than on many farms would be considered indispensable.

*Cultivation.*—The land generally, is in excellent condition. The portion so long occupied by Mr Stone for raising garden seeds, and also until recently so occupied by Mr Davis, has been kept up to the staple of the soil by heavy and constant manuring, and careful cultivation, and is uncommonly fertile. Your committee admired the exceeding thrift and vigor of the vegetation upon it. The other portions of the farm, particularly the meadows, have been greatly ameliorated by the present occupant, in the adoption of the improved system of cultivation, introduced within the sixteen years of his occupancy. All the farm, except the woodland, has been subjected to the plough, and by thorough manuring, and a course of cropping adapted to the soil, its fertility has been greatly increased. Hay is the principal object aimed at in the cultivation, and therefore only small portions of ground are tilled on which the cultivated grasses have become less luxuriant. These afford occupation during the portion of the year not required for the care of the meadows, and in securing the crop of hay and fruit.

*Rotation of cultivated crops.*—The only routine of crops now adopted on the farm, extends through three seasons, and consists, 1st, of corn on sward, with manure; 2d, potatoes, with manure; 3d, winter rye, or oats, with grass seed. Turnips are sometimes interposed after early potatoes and are succeeded by oats.

*Corn.*—The Dutton and White Flint varieties are preferred. Twenty double loads of manure per acre are spread upon grass and the land is ploughed clean with a deep furrow. In the first or second week in May, holes are dug four feet

apart each way, and a small handful of plaster and ashes dropt in each hill and mixed with the soil. The corn is immediately planted, three or four kernels to the hill, is ploughed three times in one direction and hoed three times. Generally the top stalks are cut and the crop husked in the field, with an average yield of seventy bushels.

*Potatoes*—are planted after corn, with equal manure and two ploughings, (the early on ridges, and the ordinary crop in the latter part of May, without ridging,) in hills two feet, and on rows three feet apart. For seed, one potato of ordinary size is used in each hill, requiring 8 to 10 bushels per acre. They are hoed twice, being ploughed both times, are dug in October and November, and yield two hundred bushels to the acre.

*Rye.*—After corn or potatoes the land is ploughed and harrowed, one bushel of rye is sown and harrowed in, and the grass seed covered with a bush. The ordinary yield is twenty-five bushels.

*Turnips.*—After early potatoes the land receives a single ploughing, and four to six cords of compost. It is again ploughed and harrowed, and the seed mingled with plaster and sown broad-cast both ways, is bushed in. Four hundred bushels is considered a fair crop. No ruta baga is raised.

*Oats*—are sown after potatoes or turnips. The land being ploughed and harrowed once, two and a half bushels are sown and ploughed in, and harrowed, and grass seed covered with the bush. The crop this season was by far the finest which your committee saw. Seventy bushels is the ordinary crop.

*Manure.*—Seventy-five loads are annually made in the usual manner in the barn-yard and hog-pen, and fifty purchased at two and a half dollars per cord.

One ton of plaster in each year is used to much advantage, being generally sown with ashes upon mowing lands.

Half a ton of shell lime is added to the compost heap, and is considered almost indispensable.

About fifty bushels of ashes are also purchased each season, and with those made are applied to the farm.

*Meadows.*—Twenty acres are in meadow, all of which has been cultivated and seeded in different years. It remains in grass from six to eight years, with occasional top dressing, as needed, of plaster and ashes. It is fed closely in the fall and in the spring, until May. One peck of herd's grass is used in seeding. The average crop of hay is estimated at two and a half tons per acre.

*Pastures.*—These are fair and are evidently not over fed. They are occasionally manured with plaster, and when the grass begins to fail are fallowed for rye and grass.

*Fruit.*—The orchards are in admirable condition; they bear every year and are not molested by canker worms. Five hundred dollars were received last year for winter apples of the choicest varieties, and forty dollars for cider sold, besides thirty barrels kept. All droppings from scattering trees are eaten by stock, and apples are fed to hogs, and occasionally to the oxen and horse.

*Labor.*—Although Mr Davis resides on the premises, the farm is leased to Mr Austin. The lessee and one hired man at \$15 per month, are employed through the year, in addition to the labor performed by Mr Davis. One extra hand is hired through haying and harvest.

*Stock.*—The stock upon the farm consists of two pairs of uncommonly fine oxen; two milch

cows, of native breed, giving an average of 17 quarts of milk daily; seven hogs, of which four are for fattening; thirty-five Bakewell sheep, yielding an average of 5 lbs. of wool, and lambs weighing 125 lbs. at five months; and a single horse for light work. Fifty to one hundred chickens are raised for family use.

*Receipts.*—The following is the estimate presented by Mr Davis, of the average value of the different products annually sold, viz:

Apples and cider,	\$500
Hay,	200
Potatoes,	100
Pork,	80
Sheep,	75
Grain,	75
Wool,	25
	<hr/>
	\$1055

No precise account was rendered the committee of the amount expended for labor and articles for the farm.

(To be continued.)

### THE CUT WORM—FALL PLOUGHING.

SIR—How almost universal is the notion that the cut-worm feeds upon the grass which is turned down on the sod late in the spring, as a seed-bed for the corn crop. Now, I believe he is of a very different disposition, and not likely to prefer old sod to new corn; for if this were so, our friends—even those who are accustomed to delay their ploughing for the purpose of thus feeding them—would not so often be compelled to replant, for the third time, their corn crops, while such abundance of sod still remains in the land, preserved, too, for the especial purpose of saving the crop from destruction: depend upon it, such is not the fact, and I have abundant reason to know that the notion is erroneous.

I am an advocate for autumnal ploughing to the greatest extent, especially as preparatory for the corn crop on lay or old sod land, and I will tell you why. This lay, we will suppose, has been made by horses and cattle perhaps for several years; and we know that it is from the droppings of cattle that the bugs of every description make their nests, in which to deposit their eggs or nits; and every one must have observed the curious manner in which the different species carry on this labor, and how, that as soon as they have accumulated a sufficient quantity of dung to form a ball, they sink it to a certain depth into the soil, by undermining it, so as to let it drop by its own weight so gently as not to disturb or change the position in which it was carefully placed before the operation of undermining was commenced. Now, I have no doubt this ball of dung has, by some process, been rendered water and weather-proof on its top surface, and that, therefore, it is capable of resisting the rain and frost of the winter unharmed, sheltered by such a weather-proof, neatly-formed and elegantly-ounded roof above. But the act of turning the sod before winter, reverses the order of this wise arrangement, and not only exposes these balls to the action of the rains and frosts, but supposing the top of each ball to be water-proof, it then becomes an impervious cup, in which the water might be supposed to be retained, to the destruction of the egg, or whatever the deposit might have been.

Now this *theory* if you please, appears so feasible, that one would suppose it might carry some

weight with it on that very account, and yet an old neighbor at my elbow is even now exclaiming, "I tell you I have tried it, and it will not do, any how you can fix it; it is all theory, and that you may depend upon." But I tell him I have found that it *will do*, if the work be properly done; but all the land must be turned up, for if half of it be left unremoved, it is but reasonable to expect that at least one half the number of nests will furnish myriads of cut worms to prey upon the corn crop. And my old friend admits that he has not been over-particular in his ploughing, considering it, at that season of the year, only a piece of sham work, as he calls it, with the furrow slice about eighteen inches wide, and not always ploughed clean or turned over—a sort of rafting, as he terms it—so that, from his own account, it is easy to conceive why he has not found autumnal ploughing effectual for the purpose of destroying the cut worm. I am particularly nice about this part of the business, for, after ascertaining the depth to which it is necessary to penetrate, to turn up the dung balls, I am careful to set the plough thereto, and then, by not taking a furrow wider than I can well turn over, and determining not to leave an inch of the land unremoved, I am sure to succeed in my plan of destroying the eggs of the cut worm, which is far better than to keep them to feed in for spring upon the sod turned down for their benefit.

But what would we say to a gardener who should argue against autumnal cultivation, with the view to supply his vermin with plenty of food in the spring? Farming is gardening in all true principles; and it is a fact, that spade labor in the field would relieve us from nine tenths of the evils that we have at present to encounter, as is well known in those countries where, unfortunately, the price of manual labor is so poorly paid as to warrant its adoption. I know that to many it appears almost paradoxical, how we, in this country and climate, with a set of agricultural implements far superior to those in use in any country under the sun, contrive to do so much of our field labor so ineffectually as we do; and were it not for the notion I have taken up—and which I have reason to believe is just, namely, that all our occupations are performed too hastily—I should myself be quite unable to account for it; and here is the proof: my old friend at my elbow is at this moment boasting of having ploughed two acres and a half a day, "ploughing round and round, with a furrow about a foot and a half wide, with a pair of horses, tickling up their tails," as he expresses it, "in a way 't would do you good to look at." Depend upon it, this is the cause; but if we would give our lands *three* times the ploughing, and *four* times the harrowing, rolling and cleaning that they now receive, and all applied with *five* times the care, we should find the benefit resulting therefrom to be *ten* times the value at harvest, as well as our future operation.

Now I know of no one who takes more pains in the after-cultivation of his corn, than my ancient friend above mentioned: he is sure to be the first in all its different workings and counter-workings its cross-ploughings and cross-hoeings, and it is a "savor of a sweet smell," when his neighbors assure him there is no crop in the country that can compare with his; and yet, strange to say, all his other labors are neglected, his other crops are grown over with weeds, which stare at you over the fence as you walk along, and it is in vain to look for his hills of potatoes until the weeds are

mown off with the scythe; for he has found that no crop, except corn, will pay for the labor of cleaning! But the fact is, the management of his corn crop has grown into a *propensity*, as Frank says in the dialogues, and that he must indulge in, even if it be to the neglect of almost every other duty upon the farm; and to give him time for this, all other operations are hurried and only half performed; indeed, wherever the corn has failed in a hill, you will always see its place occupied by some large weed, which about keeps pace in growth with the corn, having received with it the regular cleaning and cultivation with the hoe harrow; but it is not removed, because there is no time for it! And the weeds around the sides of the said corn, are, in the mean time, permitted to grow and flourish and perfect and shed their seeds unmolested, because there is no time for their eradication, no not even with the scythe! I often think, while walking over his fields with my old friend, if I were his minister, I would now and then give him a touch from the words, "these ought ye to have done, and not to leave the other undone."

No one can tell the advantage of superior cultivation of the soil, and the benefit to the crop from the total eradication of weeds. The crop is increased thereby, not only in quantity but in quality also. It has been calculated that a strong weed, growing in a crop of wheat, will draw away a great portion of the nourishment from six plants of the wheat; thus rendering the produce inferior, both in the quality and quantity—a matter of the most serious importance. And Col. Smith has shown by an account published in the Germantown Telegraph of the 12th of August, that merely by the power of superior cultivation, he has this year obtained a crop of most excellent hay, amounting to more than two tons per acre, from land that has had no manure for the last nine years. He states as follows: he has a field belonging to his farm which has not been manured for nine years, and yet it yields, the present season, more than two tons of superior hay per acre. The first six years of the nine was in grass; then corn, then oats, and then grass again. He attributed this unusual success, on a soil only ordinarily good, to the high degree of tillage which it received, and the entire annihilation of weeds.

The lesson to be learnt from this is, one half the quantity of manure might be saved by superior tillage and the eradication of one half the crop—the *weeds*—that being about the proportion to the grain, throughout a great part of the country. But is it a fact that agriculture will not pay for good management? Then the cultivation of the soil is the *only* science that will not pay a premium upon the outlay of skill and capital that may be embarked therein.

But is this the season to plough for the destruction of the cut worm, and if we would set honestly to the task, there is no doubt it would be accomplished: lands ploughed deep and laid up dry for the winter will be benefited to the extent of a dressing of manure, and can be cultivated much earlier and to greater advantage in the spring: in short, *autumnal ploughing is the soul of good husbandry.*—*Farmers' Cabinet.*

The Pawtucket Chronicle chronicles the fact of the production of a quince on the grounds of J. T. Fales, measuring 14 1-2 inches in circumference, and weighing one pound seven ounces.

### LOW FARES IN PUBLIC CONVEYANCES AND AT TAVERNS.

We have received from a friend the subjoined statement on the effect of making the fares on rail roads and public conveyances as low as may conveniently be done. This is only one among innumerable examples in respect to public conveyances where the same result has followed; and the cheaper the fare the greater has been the profit. There is a point, to be sure, below which one would not think of going: but the great mass of every community, embracing about seven eighths of them, are obliged to calculate very closely as to what they can afford; and will be induced to travel when fares are very light, when they would never think of doing it while fares are high, or considered high. This applies especially to short distances. We have no doubt whatever that if, for eight months in the year, the fare from Boston to Salem was twentyfive instead of fifty cents, from Boston to Lowell fifty cents instead of a dollar, from Boston to Worcester one dollar instead of one dollar and fifty cents, and from Boston to Providence one dollar, the travel on every one of these routes would be quadrupled. We saw a proposition a few days since, from a gentleman whose authority is entitled to great respect, to raise the fare from Boston to New York to, and to fix it permanently at, six dollars instead of five. For those who travel, undoubtedly the fewer passengers the more comfort; but for the profit of the companies, no measure could be more ill-judged. We have no doubt, for six months in a year, if they would carry passengers from Boston to New York for three dollars instead of six, and this might be easily and safely done in boats which should make the whole passage by daylight, the receipts of the company would be double what they would be at six dollars. The same remark applies likewise to public houses. If at the stage dinner houses, for example, the dinner was charged at twentyfive cents, and this in most places can be well afforded, scarcely a passenger would fail to dine. Now the price being fifty cents, not one passenger in six takes any dinner. This may be seen on rail roads. In travelling from Boston to Springfield, at Framingham, at Worcester and at Warren, there is an almost universal rush to the tables, even with passengers who have breakfasted in Boston, to get a lunch or refreshments, which they do, often times, at great personal inconvenience, for 12 1-2 or 25 cents. If the breakfast or dinner were half a dollar, though it might be even much better than it is, not one in ten would think of taking it. So it is in stage coaches, as every man who travels much, may soon discover, if he will but make careful observation of the ease. A few weeks since, where we were travelling in a stage coach with six passengers, two only took breakfast at the stopping place; the other four remaining in the stage, simply because they would not pay fifty cents for a breakfast, which they knew in that place was about four times its actual cost, or because they could not afford it. They avowed the charge for the meal to be the reason why they would not partake of it; and if you could come at the truth in other cases, in a great majority of them this would be found to be the true cause of their abstinence. H. C.

ULSTER RAILWAY—(8 MILES.)

(From the Fifth Report to the British Parliament on Railways—p. 425.)

Receipts for passengers, from 19th August, 1839, to 31st January, 1840:

1st class, 17,931 passengers at 1 1-2d., equal to 3 cents per mile,	£895
2d class, 166,690 passengers, at 3-4d., equal to 1 1-2 cent, per mile,	4,167
Together, 184,621 passengers.	£5,062

It is thus very clear that more than four fifths of the revenue from passengers comes from those who pay 1 1-2 cent per mile.

### ALDERNEY COWS.

From a highly respected friend in Providence, we have received some inquiries respecting this breed of cows, and whether they are best suited for beef or milk. We have seen several of them. They are small in size and generally inferior in shape and appearance, and seldom exhibit much thrift. They are not to be chosen for beef. They are not remarkable for giving great quantities of milk, but they are remarkable for giving milk of extraordinary richness; and persons in England and this country keep them for the sake of the rich cream for their tables. They are in general of a light red or a grey dun or fawn color, with small and crooked horns. Reuben Haines, of Germantown, Penn., in 1823, says—"I have now a little full bred Alderney cow, reared on my farm, which will be only four years old next harvest. She had her third calf on the first of last month; and on the nineteenth we had rather more than ten pounds of delicious butter from twelve quarts of her cream, obtained from fourteen milkings; that is, in one week. Her only food through the winter has been good hay and brewers' grains—the latter article well known to be useful in promoting the secretion of milk, but not increasing the quantity or improving the quality of the butter. One remarkable property of the cream of the Alderney cow is, the readiness with which it is converted into butter."

John Lawrence says, that "an Alderney cow that had strayed on the premises of a friend of his, and remained there three weeks, made nineteen pounds of butter each week, and the fact was held so extraordinary, as to be thought worthy of a memorandum in the parish books." (Farmers' Series.)

They are originally from Normandy, in France; and are said, when dried off, to fatten with great ease. They are constantly imported into England, being admired for the properties to which we have above referred; but some disappointment has occasionally occurred, for the true reason that the pasturage in England is not so good as in their native land. Like all other animals from whom we are to look for any thing valuable, they require liberal feeding and the best care. We must not expect impossibilities. We remember very well a friend's having purchased a cow from a town abounding in the richest pasturage; and upon taking her to his own inferior pastures she fell very much short of the yield which he had been informed she had been accustomed to give. He complained to the seller of the cow that she had not fulfilled his recommendation. "Why," said the farmer, "I sold you the cow, but I did not sell you my pastures too."

H. C.

Buerhaave, says Dr. Johnson, was never soured by calumny and detraction, nor ever thought it necessary to confute them; "For," said he, "they are sparks, which if you do not blow them, will go out of themselves."

### WORCESTER AGRICULTURAL SOCIETY.

#### Report on Fat Cattle and Milch Cows.

The Committee having attended to the duties assigned them, beg leave to offer the following Report:

The number of fat cattle offered for premiums were ten, viz:

By Gardner Wilson, of Leicester, one Fat Ox weighing 2385 lbs., six years old.

By Luke Baker, of Rutland, two Fat Oxen weighing, one 2215 lbs., the other 2285 lbs., seven years old.

By Jedediah Estabrook, of Rutland, two fat oxen weighing, one 2195 lbs., the other 2125 lbs., seven years old.

By L. & E. L. Barnard, of Worcester, three fat Oxen, one weighing 2580 lbs., one 2260 lbs., and one 1980; two of them eight years old, one seven years old.

By Silas Dudley, of Mendon, two fat Oxen, one weighing 2350 lbs., the other 2100 lbs.

Also, one fat Cow was offered for exhibition, by John Boyd, of Shrewsbury, weighing 1790 lbs. No premium is offered by the Society for fat cows. The cow exhibited by Mr. Boyd was a very fine animal, and he is entitled to the thanks of the committee for his public spirit in offering so good a animal, without the prospect of pecuniary reward.

The Committee were highly gratified with the exhibition of Fat Cattle, believing they will compare well with all previous exhibitions, and greatly surpass many. They have awarded the first premium of \$20, to Jedediah Estabrook, of Rutland for his Yellow Ox.

The second premium, of \$15, to Luke Baker, of Rutland, for his Yellow Ox.

And the third premium of \$10 to Silas Dudley of Mendon, an ox fattened under the care of M. Oliver B. Everett, well known in that section of the country for his skill and fidelity in this important branch of the farming interest.

The number of Milch Cows offered for premiums were seven, and one for exhibition only.

One by Matthew Connel, of Leicester, six years old

" " Geo. Ainsworth, Worcester, three last spring

" " Joseph Slayton, Brookfield, seven years old

" " W. Blanchard, Charlton, seven years old.

" " T. B. Eaton, Worcester, four years old.

" " Daniel H. Fitch, Leicester.

" " James Leach, Southboro'.

The Cow offered for exhibition, was owned by J. P. Cushing, of Watertown, imported from England in 1836, of the Ayreshire breed, called the Venus, and deservedly so, as she was a beautiful specimen of that fine breed of cattle; and the Committee and Society are highly gratified at the interest taken in our Shows, by distinguished agriculturists, in other sections of the State, and a particularly obligated to Mr. Cushing, who has made the Society a splendid donation of a Bull, the Ayreshire breed.

The first premium of \$15, was awarded to W. Blanchard of Charlton, for the best Milch Cow. From the 17th to the 27th of June, she gave two quarts of milk per day, and made 17lbs. during the period. From the 10th to the 20th of September she gave 15 quarts of milk per day, and made 11 1-2 lbs. of butter. The cow calved on the 26th of April, and the calf was slaughtered the 9th of June,—the calf weighed 110 lbs.—the skin, 1-2 lbs.

The second premium of \$10, was awarded

Thomas B. Eaton, of Worcester. From the 17th to the 27th June, she averaged 16 qts. of milk per day, weighing about 43 lbs. From the 10th to the 20th of September, 11 qts of milk, Mr. Eaton states, "That since the middle of May, I have sold 1478 qts. of milk and supplied my family, of from 8 to 10 in number, with milk and cream."

The third premium of \$8, was awarded to Dana H. Fitch, of Leicester. Mr. Fitch made in three weeks in June 33 1-4 lbs. of butter from his cow, besides using 3 pts. of new milk and some cream per day. In three weeks in September he made 21 lbs. 9 oz. of butter. From the second of June to the present time, he has made from this cow 148 lbs. of butter.

The other cows exhibited, did not come in competition with those to whom premiums were awarded, as they had not complied with the requisitions of the Society.

All of which is respectfully submitted,

C. C. P. HASTINGS, *Chairman.*

#### Ploughing Match with Double Teams.

The Committee on Ploughing with double teams present the following report:

That there were nine teams entered which performed their work in the time stated, as follows:

No. 1. Marshall Pratt of Oxford—in 1 hour and 9 minutes; team 1 yoke 3 year olds, 1 yoke 2 year olds; No. 2. David Carpenter, of Charlton—time 1 hour 6 minutes; team 3 and 4 year olds; No. 3. Leonard Wheelock of Grafton—time 1 hour 10 minutes; team yearlings and 3 year olds; No. 4. Joseph Dudley of Sutton—time 1 hour 21 minutes; team 2 and 4 year olds; No. 5. Stephen Marsh, Jr. Sutton—time 1 hour 21 minutes; team two yoke two year olds; No. 6. Dexter Putnam, Sutton—time 1 hour 17 minutes; team 2 yoke 3 year olds; No. 7. Simon Carpenter, Charlton—time 1 hour 11 minutes; team 3 and 4 year olds; No. 8. John McLellan, Sutton—time 1 hour 10 1-2 minutes; team 2 and 3 year olds; No. 9. Paul Goodale, Worcester—time 1 hour 13 1-2 minutes; team 2 yoke 5 year olds.

The Ploughs were all of Nourse's make, but some were of different patterns from the rest.

The Ploughing was all well done,—the ground was not uniformly favorable—some of the lands, one eighth of an acre each, were stony, under the surface, throwing the plough out, and breaking the evenness of the furrow.

The Committee take pleasure in stating that each land was ploughed well—the teams were well trained, and the ploughmen were expert and well skilled in their work.

Ploughing is an important branch in the business of agriculture; and as an encouragement to competition, the Committee unanimously recommend that the society bestow a gratuity of two dollars on each of the remaining competitors.

All of which is respectfully submitted.

By order of the Committee,

DAVID HENSHAW, *Chairman.*

#### Ploughing Match with Single Teams.

The Committee on Ploughing Match with Single Teams, make the following Report. Nineteen teams were entered in the Society's books, and eleven competed for the premium and performed the labor as follows:

No. 12. Tyler Carpenter, Sutton—50 min.; oxen 4 years old. No. 13. Loren Carpenter, Charlton—55 min.; oxen 3 years old. No. 14. Reuben

Carpenter, Charlton—50 min.; oxen 4 years old. No. 15. Nathaniel Dodge, Sutton—58 min.; oxen 5 years old. No. 16. Alonzo Dana, Oxford—55 1-2 min.; oxen age not noted. No. 18. David Carpenter, Charlton—51 1-2 min.; oxen 6 years old. No. 19. Leonard Wheelock, Grafton—54 min.; oxen 3 years old. No. 20. Elbridge G. Wheelock, Milbury—57 min.; oxen 4 years old. No. 21. William Eames, Worcester—56 1-2 min.; oxen 4 years old. No. 23. James Leach, Westboro'—51 1-2 min.; oxen 5 years old. No. 25. Elijah L. Case, Grafton—60 min.; oxen 4 years old. No. 27. George W. Rugg, Worcester—entered the Match for exhibition only, and completed his ploughing in 38 1-2 min.; oxen 6 years old.

The Committee hazard nothing in saying that too much praise cannot be bestowed on those who took part in this exhibition. The skill of the ploughmen, who performed a double service, and the masterly workmanship displayed in turning the sod with such perfect smoothness, rendered the exhibition one of uncommon interest. The ground selected was not uniformly good, consequently some allowance was made to those who drew the most unfavorable lots.

In an exhibition like this where it may be truly said that all excelled, it was found to be a task of no ordinary difficulty to do justice in awarding the premiums.

Within the last few years great improvement has been made in the construction of ploughs, which has tended very much to facilitate their movement; and as this is the most important implement of husbandry known to the farmer, it is to be hoped that still greater improvements may yet be made. The ease with which the plough in its present state of perfection is managed, has enabled many farmers to make a great saving of expense by dispensing with a driver—or otherwise uniting ploughman and driver in the same person.

Dr. Franklin, whose sage advice was frequently offered to his countrymen in his own peculiar way, has the following maxim with which every one is familiar.

"He that by the plough would thrive,  
Himself must either hold or drive."

But had it been the good fortune of that great man to have lived among the present generation of Yankees, so renowned for their inventions and enterprise; as his mind was always in advance of the march of improvement, it is probable that his advice would have been meted out in something like the following strain.

He that by the plough would thrive  
Himself must always hold and drive.

In offering this improvement upon the *advice* of Dr. Franklin, the Committee feel assured that all who witnessed the ploughing match, which was universally admitted to have been unequalled by any similar exhibition, will bear testimony that its truth was fully demonstrated.

The Committee take great pleasure in expressing their gratification that so many of the enlightened and enterprising yeomanry of the county were present to witness this exhibition; and they confidently indulge the hope that each succeeding year will bring with it new inventions and improvements to benefit mankind; and that all who are engaged in cultivating the soil, will feel it a duty to contribute in some way towards improving this important branch of national industry, which must always tend to promote the "greatest happiness of the greatest number."

J. G. THURSTON, *Chairman.*

From the Farmer's Cabinet.

#### ROTATION OF CROPS.

Ma EDITOR—In your very valuable paper I have found contained much valuable information on the subject of agriculture, from the application of which, in many instances, I have realized immense benefit. One question, however, of paramount interest to farmers, still remains unsettled, and that is—What system of rotation of crops should be adopted, with a view to immediate profits and the continual improvement of the soil? I have carefully remarked many experiments which have been made in my own neighborhood, in this particular branch of husbandry, and among the many instances of failure, there has been one of success, which it is my present purpose to communicate, for the benefit of such as may see proper to improve the hint. The example to which I refer is that of an old, practical, hard-working farmer, who commenced in the world as a day laborer, and who is now worth at least one hundred thousand dollars, not taking into the account many heavy pecuniary losses he has at various times sustained. This man, when thirty years of age, by the avails of his industry, added to a small legacy, was enabled to purchase and pay, in part, for a farm of one hundred and thirty acres of land, one hundred of which was under cultivation, but in a very low state. The farm is altogether upland, with a soil composed of loam, clay and sand, in chief of which the latter preponderates, the former being least considerable. When he commenced farming, he adopted a particular system of rotation, to which he has implicitly adhered from that time to the present, which is forty years, and his success is the best comment on the worth of the experiment. His mode was as follows: having divided his farm into eight fields of equal size, as near as possible, three of those fields are sowed with wheat each year, one with rye, one planted with corn, two in clover, and one an open fallow, on which corn had been raised the year previous. One of the two clover fields is kept for mowing, the other for pasture, both of which are ploughed as soon after harvest as possible and prepared for wheat in the fall. All the manure which is made on the farm for one year, is hauled in the spring on the field intended for open fallow, which is then ploughed, and after one or two cross-ploughings through the summer, is also sowed with wheat in the fall. The field on which rye is sown, is that from which a crop of wheat had been taken the same year, and which had yielded three crops. Corn is planted on the field from which rye had been gathered the year previous, the stubbles of which are ploughed down in the fall. Clover seed is sown early in the spring on two of the wheat fields, those which have been most recently manured. By this method, each field yields three crops of wheat, two of clover, one of rye and one of corn, every eight years. Each field, in the meantime, has lain an open fallow, and received a heavy dressing of manure, perhaps at an average of fifteen four-horse loads per acre. His crop of wheat is seldom less than fifteen hundred bushels, but often much more. His average rye crop is about four hundred and fifty bushels, and his corn crop, annually, about five hundred bushels—all which grain, at the present low prices, would amount to more than *two thousand dollars* annually, and at former prices to double that amount, and his farm is withal very highly improved.

Yours,

P. W.

**NEW ENGLAND FARMER,  
AND HORTICULTURAL REGISTER.**

BOSTON, WEDNESDAY, NOV. 18, 1840.

**AN AMERICAN PLOUGH AT A BRITISH AGRICULTURAL SHOW.**

In the October number of the British Farmer's Magazine, it is stated that at the agricultural meeting and show of the British Royal Agricultural Society at Cambridge, an American plough was sent expressly for exhibition. It attracted much attention. It is remarked, that "a test of its properties was made in a part of the field not included in the space for the operations of the competitors for the prizes. His grace the Duke of Richmond, handled this plough in a masterly manner, but it did not do its work well until the coulter was placed to it. It is simple in its construction, but we say not very efficient. Those who saw it worked, thought it capable of much improvement."

We should be happy to learn what spirited individual sent this plough abroad; and then what plough was sent. The circumstance in the case which cannot fail to be remarked with peculiar pleasure, is the fact of the plough having been held and "in a masterly manner" by one of the first peers of the realm. It is gratifying to see the most eminent men in the country not only as it is termed, "lending their patronage" to the art, but by direct intermingling with the farmers, taking a part in the business of the farmer's holiday; and as in this case, actually holding the plough—thus contributing to exalt the too long degraded profession of a practical farmer in public estimation and respect. So different is the state of society with us, and so little familiar are we with the artificial distinctions of rank prevailing in aristocratic countries, that we can hardly estimate, as it would be so deemed in Great Britain, the extraordinary condescension of this act.

Mr Coke, of Holkham, now an old man, many years an independent commoner and recently exalted to the peerage, has for a long time stood at the head of the agricultural interests of the country. His husbandry has been the means of renovating the whole county of Norfolk, and of making one of the least fertile territories in England, one of the most improved and productive. His annual cattle shows or sheep shearings were always numerously attended; his hospitality was unbounded; and it was usual for him to have for three successive days, six hundred persons of respectability and distinction to dine with him, besides making abundant provision for a vast number of other persons in attendance. His lands embrace a large extent of territory and are divided among a numerous tenantry, who revere him as a father. As an evidence of the extraordinary success with which he has applied an abundant capital to agriculture, the late lamented Mr Lowell stated at Brighton some years since, that he had increased the rental of his estates by his improvements, from twenty-five thousand to two hundred thousand dollars per year. This seems enormous, but the facts are unquestionable. So remarkable was his cultivation for its cleanness, that it was deemed extraordinary to find a single weed growing among his wheat crops. He may be considered we suppose, if not the originator, at least the most effectual promoter of the turnip husbandry in Norfolk. The turnips are fed off the ground by sheep, a practice which the climate of England admits of, and being cultivated with excessive care, leave the ground in fine condition for the grain crops, which are to succeed them.

The Duke of Richmond, Lord Althorp, (now Earl Spencer) and the Duke of Portland, with many other gentlemen of distinguished rank, and others, members

of Parliament, are now devoting themselves with great energy and effect to the advancement of the agricultural interest, which since the death of Sir John Sinclair and his coadjutor, Arthur Young, has got along as it could.

The state of society with us is of course, from the nature of our government, entirely different from that which exists there. But we have men among us, if not adorned with any of the stars and garters of artificial rank, yet holding as high a place in public estimation and respect, and therefore on account of their education, wealth, and public stations, wielding as powerful an influence upon public opinion. It is gratifying to see such men in various parts of our country, taking a deep interest in this subject. They can confer no more beneficial service on the community than by rendering the business of farming and the profession of agriculture more and more the objects of interest and regard.

Whoever looks into our cities will see crowds of young men who have left the humble labors of the country, not always because they disdained them, but very often because they felt that farmers constituted a sort of lower *caste* in the community and because they wished to rise to the condition of gentlemen. It certainly is desirable, as far as possible, (how far that may be we presume not to say,) to disabuse the public mind of sentiments so false and vicious; and let it be understood that the true honor and respectability of a man consists not in the particular employment or profession in which he is engaged, but in honest and useful industry, in a cultivated mind, in self-respect, and in virtuous morals; and that no man holds, in truth, a higher rank in the community than the man who with these qualifications, tills the earth for his bread.

They will see, likewise, in our cities, crowds of young men, the sons of rich men, who have been the creators of their own fortunes, wasting their time in idleness, mere loafers, too proud to work, crowding into professions already filled to overflowing, oftentimes mere fortune-hunters, or speculators and gamblers, and destined to fritter away life in absolute sloth and indulgence, or perhaps to a darker fate, and to squander it in profligacy and dissipation. How singularly happy would it be for such persons, if they could be inspired with a taste for rural pleasures and pursuits; and if the parents, of their abundant wealth, could plant them as respectable freeholders upon the soil, to till and enrich and adorn it; by honest industry to secure their own health and long life; and provide for their own families and train them up in habits of useful labor and frugal living, if through the felicity of early marriages, Divine Providence should see fit to bless them with families to be thus trained.

H. C.

**THRESHING MACHINE.**

At the late exhibition of the British Royal Agricultural Society, a threshing machine was exhibited which turned out wheat at the rate of fifteen coombs or sixty bushels per hour, as proved by after measurement. This is most extraordinary work. We infer from its being exhibited in the show yard at Cambridge, that it was a movable machine, though most of the English machines are fixtures. This, however, is not certain. We should have been glad to have known something of its construction and cost, but nothing is stated in relation to these points. Three hundred bushels per day is the largest quantity which we have ever heard of any American machine being capable of throwing out. This, however, is mere rumor, and does not rest upon any authentic testimony. The machines in common use will not turn out more than one hundred bushels of wheat or rye per day, and one hundred and twenty of oats; and besides horse-power, it will require at least

four hands to supply the grain and take away and bind the straw.

At Indian Hill farm in West Newbury, is a threshing machine on the Scotch plan, erected at considerable expense and occupying a good deal of room. It threshes and cleans the grain perfectly at the same operation. It requires four to six horses to drive it to advantage. How many bushels of grain it will turn out in a day we are not apprised; but nothing comparable to what is stated of this English machine.

The Shakers at Canterbury, N. H., have a threshing machine driven by water, which operates well and to much advantage. This would be an excellent arrangement for a farming neighborhood, where much grain is raised and a good water-power is at hand. The customary price paid for threshing in many parts of the country by flail, is one bushel in ten. This is a very high price for wheat. The threshing by flail, compared with the work done by a good machine, is often at a considerable loss. In passing wheat that was considered well threshed by flail, afterwards through a good machine, we have obtained at the rate of full two quarts to a bushel. It strongly reminded us of the condition of the Irishman's straw, who upon being asked how he kept his horse in so sleek and fine a condition, replied, "An faith," says he, "my hiny, he has nothing to ate but whate straw, and that is not half threshed." H. C.

**ON A LARGE SCALE.**

At the show of cattle and implements at Cambridge, in England, in September last, the money received for admission into the yards to see the cattle and implements, was from 1600 to 1650 pounds sterling, or upwards of 8000 dollars. The number of persons at the dinner, including ladies, was 3000. Ten dollars, and in some cases even fifteen dollars each, were offered for tickets. A particular object of attraction without doubt was to hear the agricultural speeches of distinguished individuals.

H. C.

**CONDITION OF SOCIETY IN ENGLAND AND THE UNITED STATES.**

At the meeting of the Royal Bucks Agricultural Society at Aylesbury, England, on the 10th September, the fact may strike some of our simple republicans with a degree of surprise, that when it came to the distribution of prizes, which were given in cash and in articles of clothing, "the several recipients were then called in, and his grace the Duke of Buckingham having addressed them upon their past good conduct, the prizes were handed to them with a printed testimony of their success, and a glass of wine each, to drink the health of the farmers present." How much happier is the condition of society among us, how much more favorable to the proper elevation of the laboring classes, and how much more beneficial in its influence upon the character of the rich and distinguished, where men are not "called in and furnished standing with a glass of wine," but come of their own accord and of their own right, and with a self-respect arising from the consciousness of their own personal independence, sit down at the same table with the most distinguished men in the community upon terms of perfect equality; and buy their own clothing, and fill their own glasses for themselves. The industrious, honest and virtuous yeomanry are the true nobility of our land. They can show themselves worthy of this rank only by cultivating their minds as well as the soil; and determining to extirpate every weed in their moral habits and characters, with even far more resolution and thoroughness than the weeds among their growing crops.

H. C.

**HARTFORD COUNTY SOCIETY REPORTS.**

We have to thank some friend for the reports and awards of the various committees at the Hartford County Cattle Show and Fair, on the 5th and 6th inst., held at Hartford, Conn. They do honor to the Society, who are entering upon a new career of duty with great spirit, and before whom is opened a wide sphere of usefulness. They will receive our early attention. If some parts of our good old Commonwealth, which we shall not name, do not soon wake up from the long and dreamy nap in which they have been sunk, they may depend on it, Connecticut will have got out of sight in the progress of improvement, before they have got on their shoes and stockings.

H. C.

WEST BRIDGEWATER, NOV. 6, 1840.

DEAR SIR,—I take the liberty to send you by Mr Barrel, a box of seedling apples, with a request that you will forward a part of them to the Horticultural exhibition to-morrow. My only motive in thus forcing them on your notice and that of the Society, is, that the kind may be known to the public, especially to the cultivators of good fruit. The tree originated on my farm, is a good bearer, and I consider it one of the most valuable fall apples with which I am acquainted; they are fit for use in September and can be kept till December. You may call them Kingman's Seedling. I shall be happy to furnish scions to any gentlemen who may desire them, gratis. Make such disposition of this scrap as you think best.

Yours, respectfully,

JOSEPH KINGMAN.

[The apples, as above, came safe to hand, and we find them about middling. The flesh is very tender and juicy, the flavor a pleasant acid with a little astringent taste, which will prevent their being classed among the best of eating apples. Their appearance is very fine, yellow with brown speck, and medium size. When compared with the Lyscom, Porter and other fine fall apples they must be called second rate.]

J. B.

BRIGHTON MARKET.—MONDAY, NOV. 16, 1840.  
Reported for the New England Farmer.

At Market 1900 Beef Cattle, 825 Stores, 7500 Sheep and 2050 Swine.

PRICES.—Beef Cattle—First quality, \$5 25 a \$5 50. Second quality, \$4 75 a \$5 00. Third quality, \$3 50 a \$4 00.

Barrelling Cattle—Mess \$4 50; No. 1 \$4 00; No. 2 \$3 00.

Stores.—Yearlings \$5 a 9, Two Year Old \$12 a 18, Three Year Old \$21 a 27.

Sheep.—Dull, Lots were sold at \$1 20, \$1 33, \$1 42, \$1 02, \$1 75, \$1 92, \$2 00, \$2 33, \$2 42 and \$2 50.

Swine.—Lots to peddle at 3 3-8, a 3 1-2, for sows and 4 3-8, a 4 1-2, for barrows. At retail from 4 1-2 to 5 1-2.

**THERMOMETRICAL.**

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northerly exposure, week ending Nov. 15.

Nov. 1840.	7 A.M.	12 M.	5 P.M.	Wind.

**SILVER FIR AND SPRUCE SEEDS.**

Just received at the New Eng'and Farmer Office, a few Bushels of the seed of the Silver Fir, Spruce. Also—English Oak, a fine specimen; Spanish Chestnuts, (very large); with a variety of other tree seeds.

Nov. 10, 1840.

JOSEPH BRECK & CO.

**Better Late than Never!**

The subscribers have received from Holland an additional supply of fine Bulbous roots, such as Hyacinth all colors, Double and Single. Polyanthus Narcissus, of sorts. Narcissus, Double and Single. Crown Imperials, of sorts. Crocus, of sorts. Ranunculus do. Anemones do. Tulips, fine mixed Double and Single, Early and Late. Iris, English and Persian. Lillies, &c.

Boston, Nov. 17, 1840.

JOSEPH BRECK & CO.

**GRINDSTONES.**

An extensive assortment of Water and Hand Grindstones constantly on hand and for sale by AMMI C. LOMBARD & CO. 13 Lewis's Wharf. Nov. 17.

**FARM FOR SALE.**

The subscriber offers for sale that valuable Farm, situated about 3-4ths of a mile below the First Parish Meeting House, on the Stage road, and commonly known as the Judge Prescott farm, containing about 170 acres of superior land, in a good state of cultivation, with two dwelling houses, four barns, and other out buildings. The farm is remarkably well watered with soft water, conveniently fenced, has nearly forty acres of large, handsome wood and timber standing on it, with an orchard of grafted Apple, Pear, Peach, Plum, and Cherry trees, and might be easily divided into two Farms. The estate will be sold reasonably. If five thousand dollars be paid on receipt of the deed, the remainder may lay on mortgage to suit the convenience of the purchaser. For further particulars, apply to the subscriber, living on the premises.

WM. SALISBURY.

Groton, Oct. 26, 1840.

ew.

**FRUIT TREES FOR SALE.**

At the Pomological Garden, Salem, Mass., a good collection of Fruit Trees of the best Native and Foreign varieties. Apply by mail to the subscriber.

ROBERT MANNING.

Salem, Oct 14. 1840.

**GREEN HOUSE PLANTS, &c. &c.**

The subscriber can furnish every variety of Green House Plants or Garden Shrub, in the very best order. Also—Dahlia roots, (all the new varieties); Black Hamburg, Sweetwater, and Isabella Grape vines; Roses and Pæonies; Honeysuckles, and other creepers; Black, White, and Red Currant trees; White and Red Antwerp Raspberry vines; Asparagus and Rhubarb roots, &c.

Orders by mail will be promptly and faithfully executed; or they can be forwarded to, or left with J. Breck & Co.

JAMES L. L. F. WARREN,

Oct. 23.

Nonantum Vale, Brighton.

**IMPROVED VEGETABLE STEAMER.**

Just received at the N. E. Agricultural Warehouse and Seed Store, Dr Warren's Patent Cylinder Vegetable Steamer, for steaming all kinds of vegetables for Swine, Cattle, &c. in large or small quantities. It can likewise be used for family purposes.

A, the pipe for filling the boiler with water.  
B, safety valve for letting off extra steam, in case the pressure should get too high.

C, steam pipe passing from boiler to cask.  
D, pipe to supply the boiler with water from a cask or box which is to be placed in such manner as to keep the boiler about two thirds full of water at all times, which answers as a complete self-regulator for supplying the boiler with water.

The above cut is not a true representation of the boiler, as it appears at least one half larger than it really is, in proportion to the cask. The boiler is merely a small size cylinder stove, with the fire inside, and surrounded by a sheet of water from which passes a steam pipe to the barrel or box, the cask or box can be removed so as to discharge the vegetables without any alteration of the boiler or steam pipe.

The steamer can be removed from place to place without any difficulty. Wood or coal can be used, and a few cents worth of either will steam a large quantity of vegetables. A number of them have been in operation, and found to give universal satisfaction.

Farmers and others are invited to call at our Warehouse and examine the article, which they will find to be a very neat and cheap apparatus for the purpose. Price \$12, and with handles \$13.

JOSEPH BRECK & CO.

No. 51 and 52 North Market street, Boston.

September 30.

**WALKER'S FINE TULIPS.**

For sale at No. 52, North Market street, a great variety of Walker's fine named Tulips, at \$3 per dozen, with their names. Many of the original Bulbs cost five times that sum. Those who intend to set out a tulip bed, will do well to call soon, as October is the best month for this business.

Fine Mixed tulips without names, \$1 per dozen. Also Hyacinths of every variety, embracing all the most approved sorts, with a great variety of other bulbous roots.

Boston, Oct. 21, 1840. JOSEPH BRECK & CO.

## MISCELLANEOUS.

## THE TIMES.

Never were there such times as the present: they are so hard: they never were so hard before, and never will be again. The weather is too cold; the weather is too rainy; the weather is too dry. There is no business doing. Every thing is going to ruin. Such times were never known within the memory of the oldest inhabitant: (the oldest inhabitant, by the way, are generally those with the shortest memories.) Such is the theme, and such has been the theme ever since our recollection, and "within the recollection of the oldest inhabitant." But still the world jogs on in the same old way, and although each successive year brings round harder times than the preceding, yet somehow or other, people make out after a fashion to live through them. They don't starve, at least in this country, but the cry must be kept up. With some, one year is harder than any previous one, but with others it is the reverse. Ups and downs we must all expect, but we have come to the conclusion that on a general average, one year is about as hard as another. The cry of hard times will probably continue to be kept up as long as the world lasts: but to continually preach hard times does not afford a man a living. The harder the times, the harder he must work, and hope for a better state of things. A man cannot expect the public to support him unless he exerts himself. Idleness and a continual cry of hard times are not the way to get along. Industry and frugality are necessary, and nothing will soften the hardness of the times so much as labor and a strict and faithful attention to business.—*Bost. Transcript.*

**BEANS.**—Among the standing products of New England, next to ice and pumpkins, beans take the lead. Vessels fitted out in that part of the country, carry a barrel of beans to every half barrel of bread, and a quintal of codfish to every ten pounds of beef. A Beverly captain once hoisted his colors at half-mast, on the wide ocean, and thus operated on the humanity of another captain, who came down and boarded him. There was found bread enough, water enough, fish enough, beef and pork enough; but only three barrels of beans, for ten men, who had yet a month's passage before them. It is unnecessary to say that the circumstances of the case authorized the signal of distress.—*N. Y. paper.*

**CHARITY.**—"I fear," said a country pastor to his flock, "when I told you in my last charity sermon that philanthropy was the love of our species, you must have understood me to say *specie*, which may account for the smallness of your contribution! You will prove, I hope, in your present contribution, that you are no longer laboring under the same mistake."

The following paragraph is going the rounds of the newspapers. The incident is so 'unnatural' that we frankly confess we don't believe it!

**"Strong Proof of Friendship.**—Capt. Beave, of the Niagara militia, owned a duck so much attached to him, that she actually plucked and roasted herself, having previously eaten a quantity of sage and onions by way of 'stuffing!'

A soldier, who was once wounded in battle, set up a terrible bellowing. An Irishman who laid near, with his legs shot off, immediately sung out, 'Bad luck to the likes of ye—do ye think nobody is killed but yourself.'

The Western Rail Road Bridge, now building at Springfield, will be the finest and most substantial structure on Connecticut river, if not the best in New England. The piers are built of hewn granite, and cemented together. The cost of the structure is estimated at about 200,000 dollars.

It is said that short dumpy people are more humorous than long lank folks, on the ground that brevity is the soul of wit.

**A new Crop.**—A paper in the interior of the State of Louisiana says the "hurricane" crop promises remarkably well.

**Dumb Wives.**—It is said the male grasshopper sings, and not the female. What a happy set grasshoppers must be—they have *dumb* wives.

Incendiaries are again at work in Mobile.—Within one week three attempts were made to fire a block of buildings in the rear of the Unitarian Church.

**A Shave.**—A barber's shop at St. Louis was robbed a few days ago of \$270.

## GREEN'S PATENT STRAW CUTTER.

JOSEPH BRECK & CO. at the New England Agricultural Warehouse and Seed Store Nos. 51 and 52 North Market Street, have for sale, Green's Patent Straw, Hay and Stalk Cutter, operating on a mechanical principle not before applied to any implement for this purpose. The most prominent effects of this application, and some of the consequent peculiarities of the machine are:

1. So great a reduction of the quantum of power requisite to use it, that the strength of a half grown boy is sufficient to work it efficiently.
2. With even this moderate power, it easily cuts two bushels a minute, which is full twice as fast as has been claimed by any other machine even when worked by horse or steam power.
3. The knives, owing to the peculiar manner in which they cut, require sharpening less often than those of any other straw cutter.
4. The machine is simple in its construction, made and put together very strongly. It is therefore not so liable as the complicated machines in general use to get out of order.

## ENGLISH ACORNS AND SPANISH CHESNUTS.

Just received and for sale, a few quarts of English Acorns. The tree is very beautiful, and one of the most ornamental of the English forest trees. Also a few Spanish Chesnuts, —twice as large as the common sort—price 50 cents per quart. JOSEPH BRECK & CO.

Oct 23.

## HYACINTHS.

The subscribers have received a large assortment of Double and Single Hyacinths of every color and shade. Also, Tulips of mixed sorts, Crown Imperials, and Lilies: they have also at their garden all the fine varieties of Pæonies, which will be furnished at one day's notice. Lilies and Pæonies, and Crown Imperials, should be planted in August or the first of September. We shall receive a great variety of Bulbous Roots, from Holland, in a few weeks, when notice will be given. JOSEPH BRECK & CO.

August 26.

## FRUIT AND ORNAMENTAL TREES.

Gentlemen at a distance, wishing to purchase trees, are informed that we will select from the following nurseries Fruit and Ornamental Trees, Plants and Shrubs of every description that may be desired, and pay particular attention to their packing, and forward them to any part of the country.

From Messrs Winships', Brighton  
William Kenrick's, Newton.  
John A. Kenrick's, Do.  
S. & G. Hyde, Do.  
Samuel Pond, Cambridgeport.  
Botanic Garden, Cambridge  
Robert Manning, Salem.  
J. L. L. F. Warren, Brighton.  
Breck & Co., Brighton.

The present is the best time, to transplant all hardy trees and shrubs.

Orders will be received for Plum, Pear and other Stocks, Hedge Plants, &c.

## FRESH GARDEN SEEDS.

We would inform our customers and friends that we are now receiving our supply of fresh Garden Seeds, most of which have been raised under our own inspection, from fine selected roots; which we warrant to be of the purest quality of the growth of the present season.

Agricultural Books.

Agricultural Implements.

Seed and Implement Catalogues sent to all applicants gratis, and all orders promptly attended to.

JOSEPH BRECK & CO.

Boston, Sept. 29, 1840.

4w

The Lowell Journal, Worcester Spy, New Bedford Mercury, Yeoman's Gazette, Northampton Courier, Providence Journal, Norwich Aurora, Essex Banner, Springfield Republican are requested to insert the above 4 times.

## TRACE CHAINS.

Just received, direct from the English manufacturers, 8 casks of Trace Chains, from 6 to 11 feet long, suitable for ploughing or draft chains. JOSEPH BRECK & CO.

## BONE MANURE

The subscriber informs his friends and the public, that after ten years experience, he is fully convinced that ground bones form the most powerful stimulant that can be applied to the earth as a manure.

Orders for Bone Manure or Oyster Shell Lime, left at the Bone Mill, near Tremont road, in Roxbury, at the New England Agricultural Warehouse and Seed Store, No. 52 North Market Street, or through the Post Office will meet with prompt attention.

March 4, 1840.

NAHUM WARD.

## Brighton Nurseries and Gardens. For Sale

A large quantity of superior European and American Ornamental Trees, well calculated for public places, or private grounds, with Fruit Trees embracing a great variety of the most approved kinds and fine sizes. The trees, and all other productions can now be selected and marked, and will be forwarded to any place as soon as it will answer to remove the same.

Also, forty kinds of Strawberry Plants, of the most approved European and American varieties.

Orders may be forwarded via. mail, addressed Messrs. WINSHIP, Brighton, Mass., or left with Messrs. JOSEPH BRECK & CO.

Brighton, August 12.

## TIE UP CHAINS.

Just received at the New England Agricultural Warehouse, a good supply of those celebrated Chains for tying up cattle. These chains, introduced by E. I. Derby, Esq. of Salem, and Col. Jacques, of Charlestown, for the purpose of securing cattle to the stall, are found to be the safest and most convenient mode of fastening cows and oxen to the stanchion. They consist of a chain which passes round the animal's neck, and by a ring attached to the stall, plays freely up and down, and leaves the animal at liberty to lie down or rise at pleasure, and keeps him perfectly secure.

July 15.

## NEW HAVEN COUNTY AGRICULTURAL SOCIETY.

Report of the Committee on Farms.

(Continued.)

### FARM OF MR. TOWNSEND.

The next farm visited by your committee was that of Mr Wm. K. Townsend, of East Haven, situated on the eastern border of New Haven harbor, and including the salt meadows on its margin.—From these meadows the land rises with a gentle acclivity to the summit of the ridge upon which the road from New Haven to the light house crosses the farm, and where also the house and farm buildings are situated. It thence descends slightly to the east, to a swail through which there is a small run of water. The hill east of this swail is covered with a thrifty growth of wood, and constitutes the principal wood land of the farm.

**Farm.**—The farm is nearly square and consists of 43 acres of salt grass and 118 acres of upland, 40 of which lies upon the east side of the road. It has a north-western exposure, affording a beautiful view from the harbor.

**Buildings.**—These are all arranged with a due regard to convenience, and are in good condition. The barns and piggery have been erected by the present proprietor, after approved models, and prove conclusively that much labor may be saved by judicious arrangement, with but trifling additional expense. For each implement of husbandry a special and convenient place of deposit is also provided. As much attention has been paid to the rearing of neat cattle and hogs upon this farm, it has been a leading object with the proprietor to have all matters connected with those branches of husbandry carefully arranged. Farmers about making similar erections may derive many useful hints from an examination of these premises.

**Fences.**—The fences upon the farm throughout are good, and those which have been remodeled in the course of improvement pursued by Mr Townsend, are strong and durable. His walls with posts and rails, may well be examined as specimens of fences exceedingly permanent and yet not unreasonably expensive.

**Soil.**—The soil of the farm is a sandy and gravelly loam, upon a gravelly subsoil. In some small portions there is a slight admixture of clay. Compared with some of the deep rich soils of the county, it is naturally light and thin, but is capable of being brought into a state of high cultivation, and of producing heavy crops, less luxuriant perhaps in the amount of vegetation than those upon soils more retentive of moisture, yet of excellent quality, wasting less in the curing, and telling well in weight and measure.

**Cultivation.**—The general cultivation is thorough and good. It is an object with the proprietor to have his whole farm in a state of improvement. To effect this he reclaims successive portions from the condition in which it was left by the former

occupant, by careful and thorough tillage, collecting the rocks and stones into strong and durable fences, and applying a heavy coating of manure. Under this course his whole farm, with the exception of two fields not yet reached in the regular order, has been thoroughly cultivated and greatly and permanently improved.

After such improvement, however, these lands are not, as is too often the case, again reduced to their former condition, or rendered still less productive, by injudicious and excessive cropping, without any return to the soil; but by such subsequent careful treatment, as every good farmer ought to give his land, they are kept constantly improving.

**Rotation.**—Two different courses of cropping are followed, the one extending through three seasons, with two coatings of manure; the other through two only, with a single application of manure. The former is after grass—corn with manure, potatoes with manure, and winter rye or barley with grass seed. The latter is corn, potatoes, pumpkins, or turnips, after grass with manure, and winter rye or barley with grass seed.

**Corn.**—Is planted only on sward. Twenty or 25 double loads of manure per acre being spread, the land is ploughed deep and clean, is rolled and planted during the first or second week in May, five kernels to the hill, and three feet three inches distant each way. The crop receives three hoeings without hilling, being dressed both ways at each hoeing with the horse plough or cultivator. Fifteen bushels of ashes or three bushels of plaster per acre, are applied to the hills before the second hoeing. The crop is cut up at the ground and stacked usually in the last of September, yielding 70 bushels per acre. The seed before planting is soaked in tar water to prevent the ravages of worms and birds.

**Potatoes.**—Are cultivated for the New Haven market. The Mercers are the favorite and most productive variety. The Scotch Greys, Mohawks and Pinkeyes, are also raised, to suit the various tastes of customers. Land the previous year in corn receives 20 loads of manure, and is ploughed clean. For Mercers the rows are two and a half feet apart; for other varieties three feet, and the hills upon the row one and a half. For early market they are planted in April; for the general crop in the latter part of May, and are dressed with the cultivator and hoed twice. The early planted are dug for market in time for a crop of rye, the regular crop as late as the season will allow. For seed, potatoes of ordinary size are cut into two pieces, and one piece is put in each hill. Thus treated, they produce 250 bushels to the acre.

**Rye.**—Is sown after corn, potatoes, pumpkins, or turnips, with two ploughings and one harrowing, and the seed is covered with the harrow. One and a half bushel of seed is sown, and the actual measured average for several years is twentyfive bushels.

**Oats.**—Being considered not as profitable as barley, are seldom raised, and only with peas for feed.

When thus sown, they produce an average of 45 bushels.

**Wheat.**—Is occasionally sown, but is thought less sure, and generally profitable, than rye and barley.

**Barley.**—Is sown on land prepared as for oats, and yields an average of 32 bushels. It is considered the best white spring crop raised.

**Pumpkins.**—Of different varieties are raised as food for cows and hogs. Turf land is ploughed clean, rolled and marked out in lines 10 feet apart both ways. At the intersection of the lines, the turf is dug out and the hole filled with manure and earth. Six or eight seeds are planted in each hill, the two most vigorous shoots only being allowed to remain. Great crops are thus obtained, and are found invaluable in the dairy.

**Ruta Baga.**—The land is prepared in the fall as for common turnips. In the spring the seed is planted in drills, and hoed sufficiently to keep the weeds entirely subdued. The common white turnip is raised only as fall feed for cows.

**Manure.**—Three hundred double loads are annually made on the farm, of which over fifty are from the hog-pen. All refuse vegetable matters are collected in the yard. Sea weed is used in the hog-pen only, as it is found not to decompose in the open yards. All the manure is applied in a fresh state upon land to be ploughed, except that a large compost heap is prepared during summer for root crops and meadows. As much is applied on land to be ploughed as the plough will cover, usually twentyfive double loads. But few fish are used, though taken in the vicinity, because they are considered not worth the time and expense requisite to procure them. No manure is purchased.

Of plaster about three fourths of a ton is annually applied to the meadows and pastures.

Shell lime to the amount of 60 bushels is added to the compost heap.

**Meadows.**—Thirty acres are in meadow. None has been seeded within three years; attention for that time having been given more particularly to the pasture land. The meadows are depastured by cows closely in the fall, but not in the spring. As the grass loses its vigor in different places, manure from the compost heap, at the rate of fifteen loads per acre, is applied and spread in the fall. Ten quarts herd's grass, four of red top, and two of red clover, is the usual quantity of seed. No hay is ordinarily sold or bought. In haying, a portion of the men continue to mow until time to cart in the afternoon. The boys, and occasionally one man, ted, open and turn, until from two to three, P. M. They then with the revolving horse rake put the whole into heaps in a surprisingly short time. All the hay sufficiently made is carted, and the remaining heaps dressed off with a hand rake. The hay being thus secured while warm from the influence of the sun, is found to be sweeter and better relished by stock.

**Pastures.**—Of these there are 56 acres divided into five lots, four of which are fed exclusively by cows. They are changed each week. In this manner fresh feed, and it is believed a much larger

quantity is obtained. Ten quarts of herd's grass, four of red top and four of clover, are sown for pasture. A crop of hay is usually cut the first season after sowing. Mr T. has also a tract of land of 100 acres in the north-east part of the town, which is devoted entirely to the pasture of the cows out of milk, and young stock. This land not being a part of the farm offered for premium, was not visited by your committee.

**Wood.**—This is principally young and thrifty, and has increased with great rapidity for several years. It is believed that the fact that it is not pastured has an important bearing upon its growth.

**Water.**—It is an important matter on every farm that there should be water for the use of stock in every lot. Four springs and two small streams running through the farm, in connexion with a judicious arrangement of the different lots, afford this desirable result.

**Fruit.**—Eight acres are in orchard, producing apples of nearly every variety. Early apples are sold in the city at one dollar per bushel. The trees are thrifty and bear well. The quality of the fruit and the vigor of the trees have been much improved by pasturing the orchards with hogs. Last year, though the crop was light in this region, over \$200 was received for apples sold. The residue were fed to hogs, cows, oxen and horses. They are considered excellent for working oxen. Sweet and sour are used indiscriminately.

**Stock.**—One yoke of oxen are kept for farm work. They are seldom raised upon the farm, more profit being derived from the breeding of improved stock. Eighteen cows of the Durham breed, in full or in part, are kept for the milk furnished in the city. Those in milk give a daily average through the summer, of 110 quarts, besides the milk and butter used in the family. Last year, nine calves were raised. The others were sold at three days old. Through the winter the cows are stabled in the basement of the barn, and receive each daily, beside fresh hay, a bushel of cut feed, consisting of salt hay and shorts, or oil cake. In spring, until the 10th of May, they are turned to pasture through the day, still receiving their cut feed, and in the fall they are fed with turnips, pumpkins, &c., after the fall feed becomes short. Twenty head of young stock, and one splendid pair of fat oxen, of the Durham breed, are also kept.

Few farmers in Connecticut have accomplished more in improving the breed of cattle among us than Mr Townsend. His fine cows and other stock of the short-horned Durham breed, reared by himself, prove conclusively that the race need not degenerate on the comparatively short feed of this county. The valuable stock upon the farm has all been raised by Mr T. and constitutes a portion of the profits of the farm for several years past. The original imported animals, from which the whole stock was derived, have been sold at a very considerable advance upon their cost. In feeding stock a great saving is effected by the thorough use of the cutting box. The salt hay and all coarse hay, is thus cut, and being mingled with feed is consumed without waste.

**Hogs.**—This stock, 70 in all, consists of 12 breeding sows with their pigs, 2 boars, and 4 fall pigs for fattening. They are generally of the "Thin Rind" breed, so deservedly celebrated wherever known. Two litters of pigs are annually obtained from each sow. A few Berkshires are kept in order to test their good qualities.

**Sheep.**—Of these there are thirtytwo of the Bake-

well breed. They are in good condition, and are fine specimens of the breed; which, on account of the large lambs, heavy fleeces, and excellent mutton it produces, is well worthy the careful attention of our farmers.

**Horses.**—Two are kept for work, one of which is driven in the milk wagon.

**Poultry.**—Turkeys, fowls and ducks (but no geese) are raised for family use only.

**Labor.**—One man is hired by the year, and one for eight months, for farm work, and other labor through the summer, equal to one man for six months. The milk is now, and for three summers past has been, delivered in the city by Mr Townsend's son, of 15 years. One other son, still younger, is employed on the farm. Mr Townsend himself, on account of feeble health, relies but little upon his own labors in the operations of the farm.

It is found that the use of the revolving horse rake in securing the crop of grass saves a great amount of time, and enables the men emphatically to "make hay while the sun shines." The hay is put up with far less labor and more rapidly, and is readily secured on the appearance of the coming shower. In all cases it is so secured before the falling of the dew. Mr Townsend estimates that this simple instrument saves him the labor of at least two extra hands during the season of haying, beside enabling him to secure his hay in better condition.

It may well be questioned whether much less progress is not made by our farmers generally, than would result from more attention to accurate accounts of their outlays and income, not merely in respect to their business generally, but also in relation to each separate tract and lot of land upon their farms. When their accounts are properly kept, (and they are so kept with far less time and trouble than any person who has never made the attempt would believe,) the farmer at a single glance discovers what particular crop, and what precise cultivation of that crop is best adapted to each separate lot and yields him the best return. Statements thus founded upon certain data are entitled to more confidence than those which have for their basis mere belief, since as a general rule, crops tell better in the eye of the producer than they do in the half bushel. Your committee are of opinion that this remark applies to the statements they received respecting some of the farms which they visited. In fact, from no one of the applicants, except Mr Townsend, have they been able to obtain accurate and regular accounts of all the results of the operation upon their respective farms. They, however, wish it to be distinctly understood, that they do not believe that in any instance there was any intentional over-estimate.

From his farm accounts, Mr Townsend has furnished your committee with a statement of the prominent items of his actual receipts and expenditures relating to the farm for the last year. The following table shows the cash received during that time, over and above the consumption of a large family, viz:

Fruit,	\$200 00
Vegetables,	50 00
Neat stock,	1310 00
Hogs and pigs,	585 00
Wool,	50 00
Milk, butter and calves,	2143 00
Rent of stock,	50 00

Gross income in 1839,	\$4388 00
Deduct cash paid for labor and feed for cows,	1452 00
Net income in 1839,	\$2936 00

#### MR WOOSTER'S FARM.

During a tour into the north-west part of the county, the committee visited two farms in Middlebury, and three in Cheshire. The first was that of Mr James D. Wooster, of Middlebury. This farm contains 240 acres and lies in nearly an oblong square, with an irregular outline, at the northern extremity of an extensive valley, and occupies the whole to the adjoining hill tops. It has thus a fine southern exposure, and is nearly in distinct view from the house, which is situated near the centre of the farm.

**Buildings.**—These are all in good condition, and are carefully arranged in reference to convenience and economy in the raising and feeding of stock. They are so placed that all waste flows directly upon the mowing ground. The effect proves conclusively the importance of more attention among farmers to this mode of enriching their land. The sills of the buildings are protected from decay by placing them flush with the face of the underpinning, and extending the covering some distance below. The hog pen, situated on the side of a hill, is surrounded by massive walls, and entirely flagged with flat stone, and affords an excellent opportunity for the annual manufacture of large quantities of manure.

**Soil.**—The soil is excessively hard and rocky, (so much so in some places as to be unfit for cultivation,) with swales of low ground, and some swamp in the bottom of the valley. From the bottom of the valley, where only there is a small amount of level ground, the land ascends through the whole extent of the farm, for the greater part with a steep acclivity. There is in fact scarce an acre of level land in the whole.

**Cultivation.**—The farm is devoted principally to pasture and hay for the raising of stock. For that purpose it is cultivated in the usual manner, but with more than ordinary care. No bushes or weeds are to be seen throughout the whole extent.

**Fences.**—These are excellent. The only objection was their great height, and that objection had reference merely to the personal convenience of your committee. They are in part stone wall with two rails, supported by posts or blocks; but principally of six rails. The walls are, many of them, of immense size, and are all set into the earth from 6 inches to 2 feet. The foundations are thus laid in the ground because of the action of the frost on the soil, and the peculiar shape of the stones used, but principally in order to dispose of the superabundant material. In the construction of the rail fences the timber is split on the ground where the fence is to be laid, and by selecting in succession those which adjoined each other in the timber, the rails are made more perfectly to match, and the spaces are more regular and uniform.

**Rotation.**—So little of the farm is in reality arable land, that no regular routine is followed. Generally corn is planted after grass. This is followed either with potatoes, or oats and grass. Potatoes are succeeded by oats and grass.

**Corn.**—The land is enriched by stock shut upon it, or is manured from the yard without any rule as to quantity; is ridged up and planted on the rows generally, and hoed twice; or it is ploughed clear

and the corn planted in rows 3 feet apart each way, and hoed twice or three times. Plaster or ashes is usually applied before the corn is up. The tops are cut, and the corn picked in the field. The Canada is the usual variety raised, and produces forty bushels.

**Oats**—Of the common kind are raised after corn or potatoes. The seed is first sown, two ploughings are given, and the grass seed covered with a bush. They produce 35 bushels, and are cut when two-thirds changed.

**Rye**—Is raised upon fallows of pasture land. The land is broken up, cross ploughed and the seed ploughed in. It is thought better by Mr W. to cover the seed with the bush, as the plough generally buries it too deep. The grain is cut with a cradle and put into shock stacks.

**Pumpkins**—Are raised only with corn.

**Turnips**—A small quantity only are usually sown for family use—so also of buckwheat.

**Manure**—This accrues in the ordinary way in the yard. No estimate of the usual quantity could be obtained. It is applied principally to the meadows, and occasionally to plough land, and is used freely when at all. None is purchased.

Two tons of plaster are annually used on meadows and pastures, and on corn and potatoes. Ashes are highly esteemed. All which can be obtained are purchased, and with those made are applied to the farm.

**Meadows**—These, amounting to over thirty acres, are principally natural, but prepared and leveled with great care and at great expense in the removal of stones and rocks. They are manured as the grasses become thin, and produce one and a half tons per acre. Before the lower leaves turn, the grass is cut. It is spread and put in heaps, and the next day is opened, turned and carted. When grass seed is sown, four quarts of herd's grass and two of clover is the usual quantity.

**Pastures**—These are all natural except a small proportion which have been sown with grass after fallow for rye. Not more than twentyfive acres in the whole are arable, and that only to a man born among rocks.

**Woodland**—Of this, including the rocks, there are over sixty acres. It is all depastured.

**Water**—The farm is admirably watered by more than fifty springs and several streams. By means of a conduit, the purest spring water is carried to the door and to the different barns.

**Drains**—On this farm there are five covered drains, built by Mr W. These have been found of incalculable advantage, and have changed what was formerly marshes into prime mowing land.

**Labor**—One man through the year at \$150, and other labor equal to one man the third part of the year, is employed, in addition to the great amount of work performed by Mr W. himself.

**Stock**—Two yokes of oxen, 7 cows, and 21 calves, yearlings, and two year olds, all a cross of the native and Devon breeds, and very fine, and raised on the farm, constitute the present stock.

**Hogs**—Eight are usually fattened with apples and the slops from the dairy. Yearlings usually weigh from 300 to 350; spring pigs 250 lbs.

**Sheep**—The flock has been much reduced, and now only 55 Merinos are kept, producing 3 lbs. each of wool. No lambs are sold.

**Horses**—One only is kept for family use.

**Poultry**—Chickens are raised for family use but not for sale, as they are believed to "cost double what they fetch."

**Bees**—Your committee were gratified to find that the good old practice among farmers of keeping bees, might still be advantageously pursued. Indeed, it is a matter of surprise that every person residing in the country does not possess at least one swarm. So little attention is requisite, and under ordinary care the return is so immediate and so large upon the first cost, that it might reasonably be supposed that all would at least secure the luxury of honey for their families, if indeed they did not seek for profit.

Mr Wooster's swarms in his yard, and his bureau hive in his chamber, all indicated a liberal return for his outlay and care.

**Receipts**—These were hastily estimated as follows, viz:

Oats,	\$35
Rye,	50
Stock,	125
Pork,	50
Wool,	35
Wood,	75
Butter and cheese, say	100
	—
	\$470

Of the butter and cheese no account has been kept, and no accurate estimate could be obtained. The average sale of wool in previous years is \$140.

#### MR GAYLORD'S FARM.

The next farm in order as visited by your committee was that of Mr William Gaylord, of Middlebury, containing 52 acres, and lying in a compact and nearly square form, in the north-west part of the town.

**Soil**—The soil is principally a gravelly loam, filled with stones and retentive of moisture.

**Buildings**—These, except the barn, are in reasonable repair. The barn, and buildings, and fixtures around it, have been too much overlooked to indicate a first rate farmer in their owner.

**Cultivation**—The cultivation of the farm is uncommonly good. Little brush and few weeds are to be seen. A very considerable portion of the land has been greatly improved. In fact, much of it has been raised from poor stony pasture to smooth and rich mowing ground.

**Fences**—When Mr Gaylord, six years since, entered upon the farm, the fences were poor and principally of rails. Now, many of them are of stone, well laid and of surpassing size, all collected and laid by Mr G. with his own hands.

**Rotation**—One leading object has been the improvement of the land by the cultivation of clover and the use of plaster. For this purpose short rotations have been adopted. The only course of crops now pursued is, after grass, corn and potatoes with manure, followed by oats and grass seed.

**Corn**—The Dutton variety is preferred. The manure being spread on grass land, with reference to the quantity on hand, and the ground to be tilled, the land is ploughed clean with a deep furrow. About the middle of May the corn is planted, three feet apart each way, four kernels in the hill, the seed being soaked and rolled in plaster. It is ploughed one way only and hoed three times, and yields 50 bushels per acre. The tops are generally cut and the corn picked in the field, although occasionally it is cut at the bottom and stacked.

**Potatoes**—Are cultivated in all respects as corn, (except that they are hoed but twice,) with an average product of 200 bushels. The English whites

only are raised. They are planted in the early part of May, with from 12 to 15 bushels of seed, without cutting, and are dug in the early part of October.

**Oats**—These are sown after corn and potatoes. The land is ploughed twice, and the seed, two and a half bushels, is covered with the harrow. They are cut when two-thirds changed, and produce 50 bushels to the acre.

**Rye**—Is raised only after fallow of pasture land. The ground is ploughed three or four times according to its tilth, and the seed (one and a quarter bushels) harrowed in. The crop, averaging 20 bushels, is cut with the sickle, lies one day and is then put into shock stacks.

**Pumpkins**—Are raised with corn only.

**Roots**—White turnips and ruta бага are raised. The land is ploughed four or five times, and the seed sown broadcast with plaster. Half an acre last year produced 350 bushels.

**Manure**—Pains is taken to collect materials for this indispensable article. About 100 single loads are annually made, and small quantities are purchased when it can be obtained.

One ton of plaster is applied to meadows, pasture, and plough land. Two bushels are sown on mowing land each alternate year.

A few ashes are bought. They are sown broadcast, 50 bushels to the acre, upon meadow and plough land.

A single load of shell lime was procured last year. No effect has been perceived from its use.

**Meadows**—About ten acres are in meadow, nearly all of which is cultivated, and produces an estimated average of two and a half tons per acre. It is manured only with plaster and ashes, and ploughed at the expiration of six years. The grass is cut in the early part of the day in July, tedded and put into winrow. The second day it is opened, turned, and carted. For mowing land, four quarts of clover and eight of herd's grass seed is sown.

**Pastures**—These are principally natural and are good. A part which have been cultivated are excellent. These are permitted to remain in grass until the manure is exhausted.

**Woodland**—Twenty acres are in wood and lie open to the common.

**Water**—The farm is tolerably watered by springs which are seldom dry; a small stream through the centre and a large pond on the western margin.

**Stock**—This consists of one yoke of oxen and five cows. None are raised on the farm. Ten to fifteen head of young cattle are usually wintered with an advance in value of about \$100.

**Hogs**—Three fall shoats, of the common breed, are fattened and are made to weigh from 300 to 350 pounds.

**Sheep**—Twentyfive are kept, and average four and a half pounds of wool.

**Horses**—One is considered necessary for family use.

**Poultry**—Chickens only are bred for the use of the family.

**Labor**—All the work upon the farm, including the laying of the heavy stone walls, is performed by Mr Gaylord himself, with the aid of a small boy taken by him to bring up, and a few days work hired in haying and harvest.

**Receipts**—These, as given your committee by Mr Gaylord, amounted to \$358, as follows: profit on stock wintered, \$100; pork sold, \$50; wool, \$58; butter and cheese, \$150.

(To be continued.)

## THE GILLIFLOWER POTATOES.

As chroniclers of whatever may be deemed useful or curious in the developments of the vegetable kingdom, we were disposed two or three weeks ago to mention what came to us supported by credible witnesses as a fact in relation to the production of a potatoe from a lateral bulb or seed from the stem of the gilliflower. When facts come to us, sustained by credible witnesses, whose testimony stands the test of a faithful cross examination, we think it our duty to seek for an explanation rather than arbitrarily to deny the fact. As the best explanation it was in our power to afford, we queried whether it might not be that the potatoe is not an original tuber, but the chance production of some freak of nature—such freaks, we know, nature does play sometime, which have given birth to new productions. The fact that the potatoe is capable of producing its kind in *two* ways—by seed from the balls, and by sprouts from its own fruit,—favors the conjecture that behind these two causes of reproduction, may, originally have resided *one*, of which the agricultural community may not have been aware. At least we thought the matter worthy of inquiry, and hence after stating the facts as they had come to us, we requested Rev. H. Colman, Gov. Hill, Dr. Holmea and Mr. Cole to allow the public the benefit of their knowledge of natural science, so far, if they could, as to explain the mystery.

As a farther act of editorial and personal respect and courtesy, last week we forwarded to Mr. Colman, editor of the N. E. Farmer, one of the potatoes with a communication describing the process of its production, and respectfully asked his attention. Such attentions amongst fellow editors we think friendly, and should be received at least in the same spirit of courteous good will.

We find in the last N. E. Farmer, our communication published at length, without its having passed, probably, into the hands of the Editor from whom a notice was solicited. Instead of this, Mr. Breck, publisher of the Farmer, of whom we made no request, has seen fit to publish the letter, without the knowledge of the Editor we suppose, and our respectful intentions he treats almost as an insult. "We are astonished," says he, "that any person of common sense should for a moment believe that a result of this kind could be produced. Mr. Smiley was undoubtedly mistaken." That settles the matter. The *dictum* of Mr. Breck is enough—at least in his estimation. He has a most convenient way of disposing of a subject, and is *unusually* courteous to the well designed attentions of a neighboring editor. "Mr. Smiley was *undoubtedly* mistaken." It may be hard to make Mr. S. believe this, after all the tests of his knowledge which he has—but Mr. B. says he was, and so it must be. "As well might we expect that an oak would produce pumpkins, or an apple tree a squash, as that a gilliflower should produce a potatoe." Nevertheless there are many things which Mr. Breck might not expect, that are very true after all. Would he expect there are such creatures in his field as sheep, as long as he cannot account for their original? Would he expect oats as the fruit of barley sown? Would he expect a white Albino from black African parents? Let him be "*astonished* that any person of *common sense* should for a moment believe" in such productions, so long as he cannot explain the causes of them.

We are yet in hopes that Mr. COLMAN, the Ed-

itor of the N. E. Farmer, will favor us with his attention, in which case we know he is too much of a gentleman not to treat our request with a better explanation than a gruff denial of the fact.—*Maine Cultivator*.

[REMARKS BY THE CONDUCTOR.—We wish to correct one error under which Mr Drew appears to labor in relation to the editor of the N. E. Farmer. Mr Colman has furnished a large amount of highly important and useful matter for the paper, as all our readers know; but he has never announced himself as editor, nor taken upon himself that responsibility. Being in the employ of the State, and most of the time absent in the agricultural survey, it would hardly be possible for him to attend to the duties of conducting a paper. For this present season we did not see him for three or four months, and since his return from the west, he has been travelling the greater part of the time, engaged in his official labors.

Communications are frequently addressed to Mr Colman, as editor of the N. E. Farmer, which Mr Breck does not think improper to open and answer if necessary, without considering that he is committing an improper act, any more than Mr Drew does when he receives a communication for the Cultivator. If Mr Drew or any other person calls upon the editor of the N. E. Farmer to answer any inquiry, it is in Mr Breck's place to attend to it; but should Mr Colman be present, in deference to his superior knowledge, it is very likely it would be handed over to him for his opinion, if it was a matter of any consequence. We hope we are understood under this head.

We are sorry to be thought uncivil or lacking in courtesy towards our publishing or editorial brethren; but when such foolery and nonsense as gilliflower potatoes, are brought before the public by the editor of an agricultural paper, and a call is made for an explanation of an impossibility, as every one at all acquainted with vegetable physiology will see at once, or any one else we should think who had common sense, we acknowledge that we were a little surprised, and expressed ourselves as we did, not meaning any offence. The case of a white Albino from a black African parent, is not a parallel case, by any means: all the human family are one species, although they are divided into different races, have different complexions, &c. As it is in the vegetable kingdom, so it is in the animal; among the different species there are monstrosities and sports innumerable, yet the specific character of the animal or plant is not materially affected. There is no instance on record of any new species having been brought into existence since the creation: it is an absurdity.

As to sheep and every other race of animals or plants, we have always supposed they were included in the creation at the beginning, and that neither a sheep or a potato comes by chance.

Will the editor of the Cultivator inform us who has ever "sowed barley and reaped oats": this is another new idea. There must be something peculiar in the state of things in Maine, if such results are produced. "Do men gather grapes of thorns or figs of thistles?" Such things were not expected in our Saviour's time, and have the laws of nature changed? "And the earth brought forth grass, and herb yielding seed after his kind, and the tree yielding fruit, whose seed was in itself after his kind, and God saw that it was good." From this we may infer that every plant reproduces it-

self, if we understand the passage right, and in no other way is it intimated that they can be produced.

As to the origin of the potato, our friend seems to be in the dark, and as the "*dictum*" of Mr Breck may not be considered conclusive by the editor of the Cultivator, we would refer him to Loudon's Encyclopædia of Gardening, page 623, where he will learn that the potato grows in the wild state in the mountainous parts of S. America. The London Horticultural Society, in their reports, vol. 5, page 257, observe that "some tubers of the wild potato have been received by the Horticultural Society and grown by them: they differ so little from those of the cultivated potato, that Sabine conjectures that the original cultivators of this vegetable did not exercise either much art or patience in the production of their garden potatoes." Our friend Mr Haggerston, a gentleman as well acquainted with the vegetable kingdom and as able a cultivator as any other person in the country, informed us that in England he had seen potatoes grown from tubers recently introduced from their native plain or mountain; that they were the size of a man's thumb and very full of eyes. The idea that the potato may be "the chance production of some freak of nature," is truly ridiculous, and never would have been noticed, were it not that we felt it a duty we owe to the community at large, to express our disapprobation of such humbuggery, too much of which already exists in the minds of the credulous and ignorant. Who has not heard of yellow roses made by budding white ones on the barberry bush, and black ones by budding upon the black currant, and striped tulips manufactured to order by drawing different colored silk through the bulb, and a hundred other wonders performed in the same unnatural way? Such ideas are common, and we are often gravely asked if such things are not so!

As to the inquiry, "Can you explain any natural relation between the gilliflower and potato," we would remark, that neither in the natural or artificial classification of plants, is there the most distant connexion, nor is there a possibility that a hybrid could be produced between the two plants so different in their structure, habits and properties as the gilliflower and potato, and much more that a potato could in any way be produced from the diseased stem of a gilliflower.—J. B.]

Massachusetts Horticultural Society.  
EXHIBITION OF VEGETABLES.

Saturday, Nov. 14, 1840.

S. Pond, Chairman of the Committee on Vegetables:

SIR—I have exhibited at the Horticultural rooms today, thirtyone varieties of turnips. They are the product of seed imported by me last season from Scotland. I had fifty varieties. I gave a portion of the seeds of each variety to Daniel Chandler, Esq., of the House of Industry; Dr. Holmes, of the Maine Farmer; Mr Drew, of the Maine Cultivator; S. W. Cole, of the Yankee Farmer, and David Haggerston, Esq., of Watertown. The turnips exhibited were cultivated by Mr Haggerston, to whom I am greatly indebted for the care he has bestowed upon them. Some of the varieties are not matured, as they were planted late. I have not yet heard from the other gentlemen who had the seeds. Many of these varieties will be found superior to any that we have in the country.

Very respectfully,

Boston, Nov. 14, 1840. C. P. BOSSON.

The following are the varieties of turnips sent

by Mr Bosson: Green Top Yellow Bullock, Hood's Yellow, Lewisham Oxheart, Lawrence's Yellow Tankard, Old Scotch Yellow, Purple Top Searlet, Pomeranian White Globe, Green Tankard, Long Black, Yellow Stone, White Stone, Large Norfolk, Improved Yellow Stone, Purple Top Hybrid, Dale's Hybrid, White Flat Winter, Lawton's Hybrid, Yellow Tankard, Red Round, Red Globe, Green Top Yellow, Green Round, Green Top Yellow Oxheart, Purple Top Yellow, Flat Dutch, Early Snowball, Yellow Maltese, Green Globe, Yellow Altringham, Pollock's Fine Green Top, Early Stone, Yellow. The most or all of the above are new varieties and well worthy the attention of the farmers.

Celery from Col. Isaac Davis, Worcester.

SAMUEL POND, *Chairman*.

#### EXHIBITION OF FRUITS.

From Col. Wilder, Dorchester, President of the Society; Passe Colmar, Beurre d' Aremburg, Columbian and Burgouaster, of Boston, or Mr La Cure Pears—excellent specimens, being four of the most desirable kinds of the season for size, flavor and beauty.

From Mr E. Wight, Dedham; Red apples.

From Mr John W. Scudder, Barnstable; a fine specimen of ripe Cranberries. Mr S did not advise us of their being cultivated, which we understand the Barnstable people do in great abundance and perfection. These were excellent, as the two specimens of preserves which accompanied them testified.

From Mr E. Vose; King of the Pippins apples.

From Mr R. Manning; Pears—Von Mons, (No. 70,) Bishop's Thumb, Princess de Orange, Winter Nelia and Beurre Duval. Bishop's Thumb and Beurre Duval rank high in point of flavor.

From Mr Wm. Oakes, Ipswich; a basket of Minister apples, beautiful in appearance; the specimen was past its prime: having become withered, the flavor could not be judged rightly of.

For the Committee,

BENJ. V. FRENCH.

Worcester, Nov. 16th, 1840.

JOSEPH BRECK—Dear Sir—I take the liberty to send you herewith a few "Sweet Russets," a very rich eating apple, excellent for roasting and baking. They originated on the farm of my father in this place. The tree is a good bearer; the fruit generally fair. They have been in bearing about 140 years. Will you give them a trial, and present for exhibition at the Massachusetts Horticultural Society as a native seedling; and oblige

Yours, &c.,

A. H. GREEN.

[We have sent to the Horticultural rooms a part of the above, and "tried" the remainder, and find them to be a superior variety and worthy a place in every orchard.—J. B.]

#### HARTFORD COUNTY AGRICULTURAL SOCIETY.

The fourteenth Cattle Show and Fair of the Hartford County Agricultural Society was held at Hartford on the 5th inst. and was attended by an immense concourse of persons, including agriculturists from all parts of this and the adjacent States, and many of the most eminent of our statesmen, including His Excellency William W. Ellsworth, and His Honor Lieut. Governor Hull, from the State of Massachusetts, Judges of the Supreme, Su-

perior, and County Courts, and other distinguished strangers, delegates from like institutions, and several others. The morning was brilliant and auspicious for examining and awarding the premiums for live stock. The show of stock was without a doubt the best that was ever exhibited in this State. The bullocks, colts, and neat stock were particularly animals of general admiration. The show of Improved Durham short horns, and full blood Holdernesses, native and cross breeds, were also numerous; the Berkshire, Spanish and native swine; and the Merino, South Down, Bakewell, Dishley and native breed sheep were equally deserving of commendation. In fact, where all were good, it would be invidious to make comparisons. The grand total number of stock exhibited in the Park and on the grounds, were seven hundred and fiftyfour specimens.

At 2 o'clock, P. M., a procession was formed in the State House, and with martial music under the direction of the grand and assistant marshals, proceeded to the South Meadow, where the ploughing match was witnessed by thousands on foot, in barouches, coaches, hacks, gigs, waggons, and on horseback, who appeared delighted to witness nine ploughs in operation at once, which reminds us of the noble sentiment contained in Lieut. Gov. Hawley's letter, regretting that his engagements would not permit him to be present, although he contents himself with sending "Speed the plough," among his sincerest wishes for the prosperity of the Society. The successful competitors ploughed the quantity set out, being three sixteenths of an acre each, in twentyseven, thirty, and thirtyfive minutes; all performed the labor in a farmer-like style, although the land was a strong sward, yet none of the teams or ploughmen appeared in the least fatigued. After which the procession returned to the City Hall, where the exhibition of domestic manufactures, vegetables, fruits, &c., was held, which were of a high order and are deserving of commendation.

On Friday 6th Nov., the Society met again, and having attended religious services and listened to an address on agriculture, proceeded to award and bestow the prizes. Our limits do not allow us to insert the reports in full with the names of the successful competitors.

#### Report of Committee of Inspection.

The Committee on Stock, Report:—That the amount and quality of the Stock presented were superior to any similar exhibition ever before witnessed in Hartford County. The improvement, your Committee believe was commenced under the influence of the former operations of this Society; and it must be truly gratifying to the lovers of fine Stock to see what has resulted from the laudable and persevering enterprize of the Farmers in the County during the suspension of the Society's operations.

There were five divisions of your Committee. One to judge on working oxen; one on bulls and fat cattle; one on cows and sheep, one on trains of working cattle, and one on Horses and Swine.

The collection of working oxen offered for premium was large and generally very fine, and your Committee would gladly have awarded more premiums had it been in their power.

The trains of working oxen exhibited consisted of 12 good yoke from Windsor, 15 from Wethersfield, many of them superior; 50 yoke of fine se-

lected cattle from Hartford; 74 from East Windsor, and 79 from Farmington. The Committee had much difficulty in deciding between the two trains from Farmington and East Windsor, both being highly meritorious. Your Committee cannot do justice to their own feelings without recommending that a gratuitous premium be awarded to the town of Farmington of fifteen dollars.

The exhibition of bulls was large and fine, and would have done honor to any show in our country, embracing foreign, native and mixed breeds.

The committee found it difficult to decide, and regret that the different kinds of animals were not placed together for their convenience, thereby enabling them to form an opinion from close comparison more readily and more satisfactory to their own minds.

There were but two fat oxen on the ground, both of which were highly meritorious.

The committee were pleased to see so many good cows, embracing both foreign and native breeds, showing a good degree of attention to this important domestic animal.

The exhibition of sheep was not so full as could have been desired. There were a few specimens of fine South Down, Dishly and Merino breeds.

The fat wethers presented were not, in the judgment of the committee, worthy of the Society's premium offered on that kind of stock.

The committee regret that there was no competition on horses, there being but one two years old colt on the ground.

The exhibition of swine was very superior, showing great improvement within a few years on that very valuable kind of stock.

The committee regret that several very fine animals were not entered on the stock book in time to enable them legally to compete for the society's premium.

There was a great number of remarkably fine animals exhibited whose excellences we would gladly enumerate in particular, would not a minute description render our report altogether too lengthy. But such a description is the less demanded, as there was a large collection of intelligent and practical farmers present who were evidently delighted, and we doubt not greatly benefited by their own examination of the good qualities combined in those noble animals; and we confidently believe the exhibition will give a new impulse to the spirit of agricultural improvement in the county.

All of which is respectfully submitted,

D. W. GRANT, *Chairman*.

*American Copper.*—A late number of the Wisconsin Enquirer says that Messrs. W. Alfred and P. W. Thomas of New Baltimore in that territory, have met with complete success in their experiments on smelting copper ore. They constructed a very simple furnace which cost only ten dollars, in which they smelted on the 28th of Sept. last, 2,500 pounds of ore, from which they obtained nearly 700 pounds of good pig copper, pronounced by good judges to be superior to the South American pig copper. The time occupied in procuring from the ore the above amount of copper, was only nine hours. Neither Mr. Alfred nor Mr. Thomas had any experience in the business of smelting, and the result is justly deemed a matter of great consequence to that territory, which abounds in rich copper ore.

## NEW ENGLAND FARMER,

AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, NOV. 25, 1840.

## SILK CULTURE.

We have been favored by several gentlemen with returns and accounts of their success the past year in the culture of silk, which we shall have much pleasure in laying before our readers, as soon as we get the floor clear of some other matters which now occupy it. Every observing mind, familiar with the history of mankind, knows that what we call the public is an animal, we will not say diseased, but peculiar in his constitution; subject, in common parlance, to fits and starts; the creature of impulse; spasmodic in almost all his motions; and passing continually by a sort of pendulous movement from one extreme to another. Today he is all passion; tomorrow he will be in the same matter all apathy. Today his credulity knows no bounds; tomorrow he will be found as faithless, though the evidence in the case is the same without addition or alteration. He sets up his idol this week and hurls his anathemas against every one, who refuses to join in his homage. Next week the idol is despised; his altars overthrown, and the worshippers, whom he himself had dragged to the shrine, are now the victims of his relentless persecution. This applies to the community as a community; and to individuals likewise, for individuals in truth make up the mass.

This capriciousness is seen, likewise, in almost all the concerns of life, so that a public opinion, public approbation or public censure are very imperfect tests of the merit or demerit of men or things. The tide which is now at its flood will soon go down to its ebb; but then it will no sooner have reached that point than it will begin again to swell until it reaches its full height.

Every person, who has much to do with mankind, must make his calculations with reference to this caprice and fickleness. He is sure to meet with it, because it is a fixed element in the human constitution. Let him frame his judgments accordingly. He need not condemn because the public condemn; nor approve because they approve. He need not deem it necessary to desert any object of pursuit, simply because they desert it; nor to take it up because it happens to be popular. Let him ask, in any case of inquiry or experiment, for the evidence, the actual results, the facts, and be determined as they shall preponderate on the one side or the other.

All these observations especially apply to the subject which we have placed at the head of this article. The silk culture has had several seasons of flood and as many of ebb. It is now withdrawn as matter of popular excitement and is to be judged of by its actual results. These results will be what we have all along predicted, in a high degree encouraging. We have never joined with those who maintained that the silk culture was to be the great and almost exclusive business of the country; and that almost every other branch of husbandry was to give way to it. Our views, however, on the subject have been so fully given to the public in the Third Report of the Agriculture of Massachusetts, that we do not deem it necessary to go farther into it.

Every position, however, taken in that report, will be fully confirmed; and the result is much more likely to surpass than to fall short of our calculations. A great many persons who entered the business as mere speculators in mulberry trees, having burnt the ends of their fingers off by their folly, now cry out against the whole

business as, in vulgar parlance, a *humbug*. This determines nothing. A great many persons, who have undertaken the culture and production of silk, have almost wholly or totally failed. Their worms were hatched before their foliage was ready or the number of the worms was wholly disproportionate to the amount of feed prepared for them. Or their eggs were not preserved properly: many of them were perhaps put into the ice house after half of them had begun to come out; or they were brought by too sudden a removal from the ice house into the warm air or sunshine. In many cases, through want of ventilation or too much crowding, the health of the worms has been destroyed; and they have perished by thousands and thousands, just as the cultivator was expecting to realize his golden harvest. All these and fifty other of what we call accidents, have happened and disappointed the hopes of many. A large portion of these persons stand ready to cry out against the silk culture as a delusion and to renounce it in disgust. This does not determine the case. What men in general call accident, is commonly the result of negligence or inexperience, or ignorance. It is very convenient to charge it to accident, a matter which, properly speaking, has no existence in human affairs, but serves very conveniently as a scape-goat for the sins of those who presume to think that they can control instead of being willing to submit to the fixed laws of nature.

We have had no sympathy with those persons (and there are many such, who have acted under the apprehension or presumption that the silk culture differed from all other of the concerns of life, and could be managed without any particular care or knowledge; and was sure to succeed with the most imperfect or even with no attention. Nothing valuable in life can be so accomplished, and it is utterly idle to expect it. Labor, intelligence, skill, care, discretion, perseverance, are the invariable price of all that is truly worth having, in business, learning, and morals.

Our letters and communications will show that the silk culture the past year has succeeded as fully as we had a right to expect; that many discouragements have occurred, which more experience will enable us to guard against; that it is destined to prove a source of ample profit to those who pursue it under ordinarily favorable circumstances, and with ordinary diligence and knowledge and care; that we may look upon its introduction into the country as a distinguished blessing; and that the certain and wide extension of its culture, is one of the brightest spots in the prospects of New England husbandry.

We have a good deal more to say on the subject, but shall leave it until we present at large the communications which we have received. H. C.

## AN ENGLISH BEE.

"It is a laudable custom in some parts of England when a person enters upon a farm, for the occupiers around to send their teams and plough a portion of land for him, especially his wheat land towards Michaelmas. Mr Glover, of Bradwell Grove, Eng., having taken Down's farm, several of the neighboring farmers sent their teams on Thursday 17th Sept., and ploughed a 24 acre field of two years seeds in about four hours, with a meritorious consideration of the interests of agriculture. There were thirty ploughs in the field."

This is what in this country we should call a Bee. It is often done in various places in cases of erecting a house, removal, getting a year's wood, husking, &c., and especially in various services of ploughing, planting, manuring and gathering crops, when a neighbor is sick.

Such offices of kindness cannot be too much practised. They cost little, compared with the benefits they confer and the pleasure they impart; and often most beautifully illustrate the aphorism of scripture, that "it is more blessed to give than to receive." H. C.

## THE ELECTION.

We congratulate our friends upon the termination of the political campaign. We do not mean upon the result, because we are not allowed here to say what we think on that subject; the New England Farmer has no politics, though New England farmers are pretty strongly impregnated in this matter; but we congratulate the whole country that the storm is over, and the ship likely now to get quietly into port. We have had a pretty heavy sea going and there was some little risk of foundering; but a kind Providence has enabled us to weather the gale.

We are soon to ship a new master, and new officers, we suppose, of course. There is no changing the crew, excepting as they die off and are thrown overboard. Heaven grant us a prosperous voyage; no "hazing" the sailors; no knocking off their "duff" on Sundays, and no pilloining their perquisites on the part of the officers.

It would be idle to suppose that we shall always have smooth sailing or prosperous gales. This is not the course of human affairs; but Heaven grant wisdom and a good look out to the man at the helm; a deep sense of his own responsibility and the value of the interests committed to his charge; and may the ship of state be kept clear of the quicksands and the rocks; and after the next four years voyage, come into port with her hull sound, not a treenail out nor a plank started; every sail filled, a broad pennant flying at her royal-mast head, her stars and stripes glittering at her peak; and officers and crew equally happy in each other and in the prosperous issue of the cruise. H. C.

*Geoponical.*—Joseph Kingman of West-Bridgewater has sent to Mr. Breck of the New England Farmer a barrel of seedling apples. Mr. Breck acknowledges the receipt of the apples, and finds them "about middling." We should be middling glad to receive a similar present.—*Boston Courier.*

Our friend of the Courier is always disposed to make himself merry with his friends; and he is a lucky fellow, who escapes the snapper of his whip. Wo be to his enemies, who receive the full weight of his lash. In the case above referred to he mistook the amount of the *douceur*. The apples were sent and a barrel was sent; but in was not a barrel of apples; but some apples sent by a Mr. Barrel. If he wishes this barrel forwarded, we will do our best, to send it along, when it next makes its appearance, if he will pay the truckage.

The term "about middling" is, we admit, a Yankeeism of rather a vague signification. An old man in Connecticut to the inquiry how he did, putting his hand upon his stomach always answered "about middling." His complaint went under the name of the "middlings." This does not exactly meet our position; but if the editor of the Courier chooses, he may understand the apples to have been pretty good for the stomach; and our wish that any that may be sent to him may be of a superior quality.

☞ We have to thank Mr. A. A. Lawrence for his politeness in presenting us with a small parcel of Tuscan clover seed, represented as remarkable for its luxuriance and productiveness. We shall take care to place it where its good qualities may be fairly tested; and should it prove a valuable acquisition, it shall be freely distributed.

Our citizens who go abroad, our shipmasters and naval officers, may often render a distinguished service to the country by the introduction of valuable seeds and plants. They have already rendered essential benefits in this way, and will find us always prompt to co-operate in their patriotic intentions. H. C.

**BRIGHTON MARKET.—MONDAY, NOV. 23, 1840.**  
Reported for the New England Farmer

At Market 1700 Beef Cattle, 750 Stores, 5700 Sheep and 1420 Swine.

Several lots of Beef Cattle, two or three hundred Stores—a thousand or more Sheep and several hundred Swine unsold.

PRICES.—Beef Cattle.—First quality, \$5 25 a \$5 50. Second quality, \$4 75 a \$5 00. Third quality, \$3 50 a \$4 00

Barrelling Cattle.—Mess \$4 50 a \$4 75; No. 1 \$4 00; No. 2 \$3 00.

Stores.—Yearlings \$4 50 a 8 50, Two Year Old \$11 a 18, Three Year Old \$21 a 27.

Sheep.—Dull, Lots were sold at \$1 25 \$1 37½ \$1 50 \$1 62, \$1 83, \$2 00, \$2 17, and \$2 37.

Swine.—The prices obtained last week were not fully sustained. Lots to peddle 3 a 3 1-2, for sows and 4 a 4 1-2 for barrows. At retail, 4 to 5 1-2.

**THERMOMETRICAL.**

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northerly exposure, week ending Nov. 22.

 **WILLIAM PRINCE & SON,** Flushing, near New York, offer their usual very extensive assortment of Trees, Shrubs and flowering plants, a most splendid assortment of Bulbous Roots and Dahlias, including all the new varieties, and the most magnificent collections possible of China, Roses, Camillas, Chinese Azaleas, Geraniums, and other Green House Plants. Also Garden and Agricultural Seeds, all of which will be sold low to suit the times, and a large discount made for cash.

Mulberries of all the different kinds for Silk, including the New Circassian with monstrous foliage and perfectly hardy character.

Orders sent by mail will receive prompt attention and priced Catalogues will be sent to all who apply post paid. Nov. 23. 3w.

**Better Late than Never!**

The subscribers have received from Holland an additional supply of fine Bulbous roots, such as Hyacinth all colors, Double and Single. Polyanthus Narcissus, of sorts. Narcissus, Double and Single. Crown Imperials, of sorts. Crocus, of sorts. Ranunculus do. Anemones do. Tulips, fine mixed Double and Single, Early and Late. Iris, English and Persian. Lillies, &c.

Boston, Nov. 17, 1840. JOSEPH BRECK & CO.

**FARM FOR SALE.**

The subscriber offers for sale that valuable Farm, situated about 3-4ths of a mile below the First Parish Meeting House, on the Stage road, and commonly known as the Judge Prescott farm, containing about 170 acres of superior land, in a good state of cultivation, with two dwelling houses, four barns, and other out buildings. The farm is remarkably well watered with soft water, conveniently fenced, has nearly forty acres of large, handsome wood and timber standing on it, with an orchard of grafted Apple, Pear, Peach, Plum, and Cherry trees, and might be easily divided into two farms. The estate will be sold reasonably. If five thousand dollars be paid on receipt of the deed, the remainder may lay on mortgage to suit the convenience of the purchaser. For further particulars, apply to the subscriber, living on the premises. WM. SALISBURY.

Graton, Oct. 26, 1840. cow.

**FRUIT TREES FOR SALE.**

At the Pomological Garden, Salem, Mass., a good collection of Fruit Trees of the best Native and Foreign varieties. Apply by mail to the subscriber.

ROBERT MANNING.

Salem, Oct. 14, 1840.

**GREEN HOUSE PLANTS, &c. &c.**

The subscriber can furnish every variety of Green House Plants or Garden Shrub, in the very best order. Also—Dahlia roots, (all the new varieties); Black Hamburg, Sweetwater, and Isabella Grape vines; Roses and Peonies; Honeyuckles, and other creepers; Black, White, and Red Currant trees; White and Red Antwerp Raspberry vines; Asparagus and Rhubarb roots, &c.

Orders by mail will be promptly and faithfully executed; or they can be forwarded to, or left with J. Breck & Co.

JAMES L. L. F. WARREN,

Oct. 23. Nonantum Vale, Brighton.

**SILVER FIR AND SPRUCE SEEDS.**

Just received at the New England Farmer Office, a few Bushels of the seed of the Silver Fir, Spruce. Also—English Oak, a fine specimen; Spanish Chesnuts, (very large); with a variety of other tree seeds.

Nov. 10, 1840. JOSEPH BRECK & CO.

**GRINDSTONES.**

An extensive assortment of Water and Hand Grindstones constantly on hand and for sale by AMMI C. LOMBARD & CO. 13 Lewis's Wharf. isly. Nov. 17.

**WALKER'S FINE TULIPS.**

For sale at No. 52, North Market street, a great variety of Walker's fine named Tulips, at \$3 per dozen, with their names. Many of the original Bulbs cost five times that sum—Those who intend to set out a tulip bed, will do well to call soon, as October is the best month for this business.

Five Mixed tulips without names, \$1 per dozen. Also Hyacinths of every variety, embracing all the most approved sorts, with a great variety of other bulbous roots.

Boston, Oct. 21, 1840. JOSEPH BRECK & CO.

**FRESH GARDEN SEEDS.**

We would inform our customers and friends that we are now receiving our supply of fresh Garden Seeds, most of which have been raised under our own inspection, from fine selected roots; which we warrant to be of the purest quality of the growth of the present season.

Agricultural Books. Agricultural Implements. Seed and Implement Catalogues sent to all applicants gratis, and all orders promptly attended to.

JOSEPH BRECK & CO.

Boston, Sept. 29, 1840. 4w

**Brighton Nurseries and Gardens. For Sale**

 A large quantity of superior European and American Ornamental Trees, well calculated for public places, or private grounds, with Fruit Trees embracing a great variety of the most approved kinds and fine sizes. The trees, and all other productions can now be selected and marked, and will be forwarded to any place as soon as it will answer to remove the same.

Also, forty kinds of Strawberry Plants, of the most approved European and American varieties.

Orders may be forwarded via. mail, addressed Messrs. WINSHIP, Brighton, Mass., or left with Messrs. JOSEPH BRECK & CO. Brighton, August 12.

**BONE MANURE**

The subscriber informs his friends and the public, that after ten years experience, he is fully convinced that ground bones form the most powerful stimulant that can be applied to the earth as a manure.

Orders for Bone Manure or Oyster Shell Lime, left at the Bone Mill, near Tremont road, in Roxbury, at the New England Agricultural Warehouse and Seed Store, No. 52 North Market Street, or through the Post Office will meet with prompt attention.

March 4, 1840. NAHUM WARD.

**WILLIS'S LATEST IMPROVED VEGETABLE CUTTER.**

For sale at the New England Agricultural Warehouse, No. 51 and 52 North Market Street, Boston, Willis's Latest Improved Vegetable Cutter. This machine surpasses all others for the purpose of cutting Ruta Baga, Mangel Wurzel, and other roots. The great objection to other machines, is their cutting the roots into slices, which makes it almost impossible for the cattle to get hold of them; this machine with a little alteration, cuts them into large or small pieces, of such shape as is most convenient for the cattle to eat. It will cut with ease from one to two bushels of roots per minute. JOSEPH BRECK & CO.

## MISCELLANEOUS.

From the Truiston Whig.

LONG CLOSE IMPRISONMENT, AND SUD-  
DEN EMANCIPATION.

Visiting at the house of a friend—an intelligent and voracious citizen, in Middleboro', a few weeks since, I found him digging a well upon his premises, near his buildings. He informed me, that he had penetrated into the earth between nine and ten feet, when he came to a large flat stone, or kind of ledge, that covered nearly the whole bottom. The stone appeared to be of the softer kind of granite, composed rather of flakes, than a solid mass, with seams closely united, and though adhering pretty firmly, not very difficult to be started and separated by the bar. He proceeded to break up this mass of stone, which was effected by breaking it in pieces, and sealing it off. But, what was his surprise, when breaking and sealing and raising up a large piece of this stone, a living toad emerged from the place, in which he had been imbedded. He described him as a toad of the ordinary size, and appearance, except in the color. Instead of the dun, or dark gray, he appeared somewhat of the shining color of stones, and the margin of streams, in the vicinity of ore. When released from his close confinement, he leaped with all the strength and agility of the most vigorous and active of the race, uttering a kind of scream, as he advanced, something like a tree-toad, so loud and shrill as to attract the attention of the children playing in the door-yard. And in the true spirit of our free institutions, and the age in which we live, he was not only suffered to go at large, but even helped out of the pit, and put upon the surface of the earth, and look up his old friends, if he had any, and mingle with free population.

How he came there, or how long he had been imprisoned, in this snug stone cell, must be altogether matter of conjecture. The little cell he occupied, seemed but just large enough to hold him, without the least room to turn, or at all change his position. The fissures in the rock must have been rather favorable to him, on account of air, and possibly, occasional drops of water, though closely adhering, and by no means large enough to admit an insect.

Some suppose the time was, when all the territory south of Boston, commonly called the cape, was submerged in water; and suppose it is pretty clear that geological appearances, as far as developed, form the idea. But I do not see that this accounts for the position of the toad in question. And even if the deluge would account for it, it would seem to be almost cruel to adjudge him to have had so long an imprisonment. Perhaps the most probable theory is, that many years ago he imbedded himself in that kind of earth which most readily petrified—the earth hardened and confined him, until the earth rose over him by the natural accumulation of that which grows upon its surface, to the height of near ten feet. How long it would take such earth to petrify, or such an amount of soil to accumulate, I am unable to tell. Perhaps some learned geologist, or some acute naturalist, will be good enough to inform us.

Middleboro', 1840.

P. C.

*The Career of Crime.*—A few years ago, as I was walking through my native village, on an er-

rand, in the dusk of the evening, I saw two young men rush from a shop, one pursuing the other. They were brothers. The oldest had a leather strap in his hand. He caught his brother, and after a severe struggle in which many blows were given and received, succeeded in throwing him down and severely whipping him with the strap. I was then a child, and the scene produced an impression upon my mind which will never pass away. This occurred about fifteen years ago. Since that time I have neither seen nor heard from these two individuals, till a few days since, I read in a newspaper that this very person who then whipt his brother is sentenced to death for the murder of his wife. The two events I could not but connect in my mind though fifteen years apart.

What a warning to parents to restrain the passions of their children.

What a warning to children to avoid contention and to check the risings of anger.—*Barry Gazette.*

*"Lead us not into temptation."*—Three Indians in the vicinity of Green Bay became converts to the temperance cause, although previously given to "put the enemy into their mouth that stole away their brains." Three white men formed the charitable resolution of trying their Indian sincerity. Placing a canteen of whiskey in their path, they hid themselves in the bushes to observe the motions of the red men. The first one recognized his old acquaintance, and with an "ugh!" and making a high step, he passed on. The second laughed, saying "me know you!" and walked around. The last one drew his tomahawk, and dashed it to pieces, saying, "ugh! you conquer me—now I conquer you."

*New Alloys in Metal.*—A curious and valuable discovery has been made in the alloy of metals. A manufacturer of Paris has invented a composition much less oxidable than silver, and which will not melt at a heat treble that which silver will bear; the cost of it is less than 4d an ounce. Another improvement is in steel; an Englishman at Brussels has discovered a mode of casting iron so that it flows from the furnace pure steel, better than the best cast-steel in England, and almost equal to that which has undergone the process of beating. The cost of this steel is only a farthing per pound greater than that of cast iron.—*Mining Journal.*

When I see a man who affects to doubt every thing he hears. I never hesitate about writing him down as an ass. A great doubter is a solemn and self-conceited pig.—*Fraser's Magazine.*

*Hungarian Yeast.*—The yeast prepared by the Hungarians will keep for a whole twelvemonth. During the summer season they boil a certain quantity of wheat bran and hops in water. The decoction is not long in fermenting; and when this has taken place, they throw in a certain portion of bran to form the whole into a thick paste, which they work into balls that are afterwards dried by a slow heat. When wanted for use, they are broken, and boiling water is poured upon them; having stood a proper time, it is decanted, and in a fit state for leavening bread. The Romans prepared their yeast much in the same way; taking wine in a state of fermentation, and working up a given quantum of the flour of Millet with it; the paste thus obtain-

ed was made into balls and dried. It often happens that the yeast, the leavened dough itself, will become acid in summer, and acidulate the bread; this may be remedied by throwing some fingers of carbonate of magnesia in yeast or paste.—*Foreign Literary Gazette.*

*Bursting of Stoves.*—The Philadelphia Gazette relates an instance of the bursting of a stove from covering up the fires. It was a large common stove in the laboratory of a chemist, and had been partly filled with wet or damp anthracite coal placed on ignited coal, and the whole covered with ashes. In an hour or so afterwards a tremendous explosion occurred, and on entering the laboratory the stove was found blown into pieces, and the pipe split asunder to the ceiling. The phenomenon is attributed to the accumulation of gas in the stove before the fire burst into a flame, and when the flame touched it the explosion followed. The case is mentioned as a warning to house keepers.

Marrying a lady for her beauty, is like eating a bird for its singing.

## GREEN'S PATENT STRAW CUTTER.

JOSEPH BRECK & CO. at the New England Agricultural Warehouse and Seed Store Nos. 51 and 52 North Market Street, have for sale, Green's Patent Straw, Hay and Stalk Cutter, operating on a mechanical principle not before applied to any implement for this purpose. The most prominent effects of this application, and some of the consequent peculiarities of the machine are:

1. So great a reduction of the quantum of power requisite to use it, that the strength of a half grown boy is sufficient to work it efficiently.
2. With even this moderate power, it easily cuts two bushels a minute, which is full twice as fast as has been claimed by any other machine even when worked by horse or steam power.
3. The knives, owing to the peculiar manner in which they cut, require sharpening less often than those of any other straw cutter.
4. The machine is simple in its construction, made and put together very strongly. It is therefore not so liable as the complicated machines in general use to get out of order.

Oct. 14.

## ENGLISH ACORNS AND SPANISH CHESNUTS.

Just received and for sale, a few quarts of English Acorns. The tree is very beautiful, and one of the most ornamental of the English forest trees. Also a few Spanish Chesnuts, twice as large as the common sort—rice 50 cents per quart. JOSEPH BRECK & CO.

Oct 28.

## HYACINTHS.

The subscribers have received a large assortment of Double and Single Hyacinths of every color and shade. Also, Tulips of mixed sorts, Crown Imperials, and Lilies; they have also at their garden all the fine varieties of Pæonies, which will be furnished at one day's notice. Lilies and Pæonies, and Crown Imperials, should be planted in August or the first of September. We shall receive a great variety of Bulbous Roots, from Holland, in a few weeks, when notice will be given. JOSEPH BRECK & CO.

August 26.

## THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at \$3 per annum payable at the end of the year—but those who pay within sixty days from the time of subscribing are entitled to a deduction of 50 cents.

[NO. 22.]

N. E. FARMER.

### NEW HAVEN COUNTY AGRICULTURAL SOCIETY.

Report of the Committee on Farms.

[Concluded.]

MR ALLEN'S FARM.

From Middlebury your committee passed across to Cheshire. They there visited the farm of Mr Claudius Allen, formerly called the Law farm. It contains 180 acres, and, except a piece of woodland at its eastern extremity, lies in a parallelogram, having its greatest length from east to west. It is situated about half a mile north of the centre of the town, and is intersected by the Cheshire turnpike, and also by the old road running upon the top of the hill west of the turnpike. The buildings are all upon the old road, and upon nearly the highest ground on the farm, and such is the descent that all the wash is carried on to the farm itself.

**Soil.**—The soil is principally a deep sandy loam. On some parts of the farm gravel prevails. Under the soil on the hill, grey sand-stone is found at various depths. Elsewhere, the subsoil is gravel and sand.

**Buildings.**—These are ancient, but in good repair, and tolerably convenient. The barns have thatched roofs, for which your committee are not advocates. The cider mill under the barn is well worth the attention of all interested in that branch of farming operations.

**Cultivation.**—Hay and pasture are the main objects aimed at in the cultivation. There is a neatness about the lots not as often found as the interests of our farmers would seem to require. No bushes or weeds were to be seen, and the whole farm is well cultivated and in good condition.

**Fences.**—Of these there are three kinds—stone walls with rails on the top, posts and rails, and worm fences. They are generally very fair.

**Rotation of Crops.**—Three different rotations are pursued, extending through three seasons, and one occupying only two. They are, 1st, after grass; corn with manure; oats; and rye with grass; 2d, buckwheat on sward which has been mowed, with one ploughing; potatoes or corn with manure; and oats or rye with grass; 3d, rye with manure; corn with manure; and oats and grass; 4th, turnips; and oats with grass. Grass seed is occasionally sown with the turnips.

**Corn.**—Is planted in the early part of May, on grass, or after rye or buckwheat, with ten double loads of manure, in rows three and a half feet apart, hills three feet distant on the rows, and three or four kernels in the hill. Plaster is put into the hill, and also on the corn after the first hoeing. The seed is also soaked in tar water. The Dutton and Tuscarora varieties have heretofore been cultivated; this year they have given place to the White Flint and the China Tree. The crop is hoed three times, being ploughed in the same direction each time. It is either cut up and stacked in the field, or the tops are cut and the corn picked,

and the bottoms then cut up and secured. It produces 40 bushels per acre.

**Potatoes.**—For this crop the land is prepared as for corn, except that the rows are but three and the hills on the rows two feet apart: the seed is cut, and 8 to 10 bushels used: they are hoed twice, plastered after the first hoeing, and produce 250 bushels. The Orange, Pink-eyes, Mercers, and now a few Rohans are raised.

**Oats.**—Succeed corn or potatoes. The rows are split and the land harrowed, two bushels of seed is sown and ploughed in, and the grass seed covered with the harrow: 35 bushels is considered an average crop: they are cut when two thirds changed.

**Rye.**—Is sown during the first week in September, either upon fallows or after oats. Fallows are ploughed and harrowed twice, and the seed (one bushel per acre) is ploughed in. After oats two ploughings and one harrowing are given. The ordinary crop is twenty bushels.

**Wheat.**—For this the land is prepared as for rye, except that a much larger quantity of manure is applied. One and a half bushels of seed is sown, with an average product of 15 bushels.

**Pumpkins.**—These are planted in hills six feet apart, on land prepared as for corn, and are also manured in the hill; two vines only are permitted to remain in each hill.

**Roots.**—Carrots, ruta бага, and white and yellow turnips are usually raised: the land is carefully cultivated, and the seed sown in drills: the last year's crop was estimated at 1000 bushels; 500 however, is the usual crop.

**Meadows.**—These, 35 acres in the whole, are of cultivated grasses, and are not manured except with plaster: two quarts of herd's grass is sown in the fall, and two of clover in the spring, and the same quantity of each kind is used when sown in the spring: the grass is cut, tedded, and put into heaps, and the next day opened and carted, and averages one and a half tons. Being grown upon upland meadows, it cures with great facility.

**Pastures.**—With a single exception these are all cultivated: the same quantity of seed is sown as for mowing. Plaster is occasionally sown, but not regularly, because it brings in large quantities of red clover.

**Woodland.**—Twentyfive acres are in wood, of thrifty growth. A fine tract at the eastern extremity of the farm is not pastured.

**Water.**—For an upland farm this is tolerably watered, the arrangement being such that there is water the principal part of the year, in every lot except three, and those open into a small pasture which is well supplied.

**Manure.**—200 double loads are annually made, by the collection of various matters into the yards, and eight double loads per acre is the usual dressing: 500 loads of muck have been carted from a swamp on the farm with decided advantage.

Of plaster, three tons a year are used on corn and potatoes, and cultivated grasses, at an average of two bushels per acre.

All the ashes which can be obtained are annually purchased.

One thousand bushels of shell lime, and one hundred of stone lime, have been used on the farm recently without perceptible effect, except in the compost heap.

**Stock.**—This consists of one yoke of fine oxen, and eight cows, each yielding 15 quarts of milk: these are nearly all young, and were bred on the farm.

**Hogs.**—Fall shoats, of the common kind, are fattened for market, and weigh from 300 to 350 lbs.

**Sheep.**—10 of the Bakewell breed are kept, yielding 5 lbs. each of wool.

**Horses.**—2 are employed for family use and in work on the farm: the ploughing in corn and potatoes is done with a horse.

**Poultry.**—Geese, chickens, ducks, and turkeys, are extensively raised for sale, and are considered a source of profit.

**Labor.**—2 sons of Mr Allen, both working men, one man hired by the year at \$13 per month, and also one at \$1 25 per day through haying and harvest, are employed on the farm.

**Receipts.**—The average receipts, as estimated by Mr Allen, are, for

Grain,	\$400
Stock,	300
Hogs and pork,	200
Hay,	100
Butter and cheese,	200
Fruit and cider,	300
Vegetables,	50
Poultry,	50
	<hr/>
	\$1600

MESSRS SPENCER'S FARM.

The last farm visited by your committee is that of Messrs Christopher and Samuel Spencer, of Guilford. The whole farm occupied by them consists of 380 acres, and lies in various detached pieces in various parts of the town. The home lot of 60 acres, and a tract of 75 acres on the shore east of Sachem's Head, only were presented for premium.

**Soil.**—The home tract is principally of a light sandy soil, with some rocky knolls, and is generally very feasible and free from stone: that on the point is, or rather was, excessively hard and stony: both tracts are now in excellent heart and produce heavy crops.

**Cultivation.**—The land is generally well cultivated: the object appears to be to obtain great crops, and also to enrich the land; but this is done with less regard to expense in labor and manure, than the small farmer with limited means finds requisite for his profit; nor is there that minute attention which, in farming as elsewhere, lies at the foundation of success.

**Fences.**—On the home tract these are reasonably good, being principally of rails. On the point, they are of stone, and are good. In this department, however, there is some want of system and order is apparent.

**Buildings.**—These are numerous and constructed in the ordinary manner, without that attention to convenience which might be expected on a farm wintering so large a stock. They are, however, in good condition, and the committee found here also a convenient work room with proper tools.

**Rotation of Crops.**—The regular rotation followed on the farm is, after grass, corn with manure, applied in the fall; potatoes with manure; rye with grass. This course is occasionally extended one season by interposing oats after potatoes.

**Corn.**—For this crop, 20 loads of rotten manure are spread on grass land in the fall. In the spring the land is ploughed clean, and the corn planted, five kernels to the hill, in rows each way three and a half to four feet apart, is ploughed both ways, hoed three times, and manured with ashes on the hill. It is cut up as early as the condition of the corn will permit. The yellow variety is preferred, and under this course produces 50 bushels.

**Potatoes.**—This crop is sometimes planted on land prepared as for corn, but generally after corn. The land is ploughed clean, and the seed, eight bushels selected potatoes, one in the hill, is planted in rows three and a half feet apart: two hoeings are given, and 200 bushels obtained. Mercers and English Whites are cultivated for eating and Lady Fingers for stock.

**Oats.**—Follow corn or potatoes: two ploughings are given, one half the seed (two and a half or three bushels to the acre) is sown and ploughed in, and the other half is then sown and ploughed in: they are cut when half changed, and yield thirty bushels. Special pains is taken to change the seed often.

**Rye and Wheat.**—Are sown together after corn and potatoes, with two ploughings; the seed, one and a half bushels, being also covered with the plough, and the grass seed bushed in. On strong land in good condition this admixture is found advantageous, and twentyfive bushels per acre are obtained.

**Pumpkins.**—Are planted only with corn.

**Roots.**—White turnips are raised, and also some 300 bushels of Ruta Baga. The latter are sown about the first of July.

**Manure.**—Three hundred loads are annually made in the yards. Every thing suitable is carted in. Much of the manure, however, is suffered to remain exposed to the action of the elements in open yards through the summer, and in the fall is carted out and spread on land to be ploughed the succeeding spring. That here is an enormous waste appears from the fact, that when the same number of loads of fresh manure are applied, side by side in the spring, the effect upon the crop is found to be at least equal, while the quantity of vegetable matter contained in the fresh manure is little more than half that in an equal quantity spread in the fall.

Ashes are applied to corn only.

**Salt Muck.**—Two hundred double loads of this are annually carted from an estuary of the sea near the land on the point: the muck is thrown out with an ox shovel in the winter, and carted, when dry, in the spring. The excavation is re-filled by the spring tides.

It is believed that this species of manure will, ere long, more than supply the absence of fish, which are becoming scarce, and are already too high priced to be profitable. Indeed, it is unheatingly asserted by those whose opinions are wor-

thy of high respect, that in any mode of application other than through the compost heap, fish injure the land more than they benefit the crop, unless indeed the land is already so light that no other mode of forcing a crop can be resorted to, and even then that the cost exceeds the profit. They claim that the same expense applied directly to the farm in careful cultivation, and in the shape of manure made on the land, will produce better crops, and at the same time greatly improve the farm itself, while under the fish husbandry, without other manure, beside the great expense, and the pollution of the whole atmosphere, the land becomes annually less and less capable of producing heavy crops.

If, however, the land is sufficiently tilled, thoroughly to incorporate with it the decayed fish, or if the fish are used only as a component part of the compost heap, it is believed that this deterioration may be avoided.

Salt muck has an entirely different operation. There is in it enough of rich vegetable and animal substance to produce an immediate and admirable effect, and it also, by reason of the earthy matter contained in it, changes in a degree the character of the soil itself. It thus has a direct and immediate effect, which at once more than repays all the labor and expense of the application, and also a permanent influence in ameliorating the soil.

An examination of the land of the Messrs Spencer, at the Point, will satisfy any one of the excellence of this kind of manure.

**Fish.**—The Messrs Spencer, being owners in two fisheries, annually apply, of those not readily sold, some 200,000 to their out-lands. None are put upon the home tract, and few upon the land at the Point: they are applied to moist land, not being considered of much value on dry soils.

**Meadows.**—On the two tracts exhibited to your committee, there are 40 acres of fresh and 25 of salt or tide meadows: the former have all been cultivated, remaining in grass, without manure, six years, and producing, by estimation, two and a half tons per acre. The tide meadows give one and a half, much of which is the black variety. The cutting of the upland grass commences about the first of July. It is mowed and spread, the next day placed in heaps, and the third day carted after opening. On some of the home meadows the crop of grass was enormous. For meadows, ten quarts of herd's grass and clover seed are sown, the former in the fall, and the latter in the spring.

**Pastures.**—These are principally cultivated:—those upon the point have been enriched by salt muck, and are excellent: they are fallowed, with four or five ploughings, for rye, and are mowed the first season after being stocked with grass.

**Stock.**—Six yoke of oxen, raised on the premises, are employed for farm work. They are pure red, and fine specimens of the working oxen of our native breed. The cows raised on the farm are also of native breed, and yield 14 quarts of milk each through the season. There are also 36 head of younger stock, all of the same color and breed, raised on the farm and in fine condition.

**Hogs.**—The common breed are raised for fattening for family use, and for payment of workmen, &c.

**Sheep.**—Thirtysix of the Bakewell, and a cross with the Merinos are kept. This crossing is found to succeed admirably: the half blood produces 5 lbs. of wool and a much larger carcass than the Merino.

**Horses.**—Two are kept for work on the farm and one for family use.

**Poultry.**—Chickens, turkeys and geese, are raised for family use and also for sale.

**Labor.**—One of the owners, and two sons of the other, all emphatically working men, with four men hired for eight or nine months, and one also through the winter, perform the labor of the farm.

**Woodland.**—On the whole farm there are 150 acres. It is thrifty and not pastured.

**Water.**—The two tracts visited by the committee are well watered by streams and springs.

**Receipts.**—As estimated by Mr Spencer:

Grain,	\$50
Stock,	300
Hogs,	50
Hay,	150
Butter and cheese,	30
Potatoes,	300
Turnips,	150
Poultry,	20
Wood,	20

\$1070

Having thus explained their views of the principles upon which a decision in respect to the award of premiums should be made, and given a detailed view of the condition and mode of cultivation pursued on each farm presented for their inspection, your committee now proceed to the far more difficult duty of examining the claims of the different applicants and of determining the order in which the several farms should be placed.

The wish of the committee would be, if consistent with their duty, to give all the premiums to small farms, because they are persuaded that the subdivision of the country into farms of that description, occupied and cultivated by the owner of the soil, is, in New England, most conducive to a healthy state of society and to the prosperity of agriculture. The farmer who, by his personal industry, cultivates, and in a short time pays for, a small farm, and at the same time raises his land from a neglected and impoverished state, to a high and productive condition, deserves, in the judgment of your committee, a far higher meed of praise than he who with abundant capital and extended facilities causes his broad acres to be cultivated even in the most approved mode of husbandry.

With these views your committee felt great embarrassment in respect to the award of the first premium. In their judgment, the question lies between the first two farms visited by them. That of Mr Davis is an excellent farm, of strong, rich soil and in good condition, and Mr Davis has, by his industry in the care of his farm, and by the raising of garden seeds, during the time he has occupied the place, far more than paid its first cost, and also the cost of the buildings erected upon it, and has greatly improved the condition and increased the fertility of his land. Your committee are not disposed to say a single word to detract from the deservedly high character of the farm, or of Mr Davis as a cultivator.

Under all the circumstances, however, and after a full and careful examination of the matter in all its bearings, they feel constrained to award the first premium to Mr Townsend, of East Haven.

Mr Townsend took possession of his farm several years since, when, by heavy cropping, mismanagement and neglect, it was entirely worn down and unproductive, and its buildings and fences

were in a dilapidated condition. Placing upon the farm a sufficient number of cows to consume its annual produce, he entered at once into the milk business. For several years his profits, above the support of a large family, were expended in reclaiming and improving his soil, in rebuilding his fences, and in erecting and repairing his farm buildings. He early commenced the raising of Durham stock and English hogs, and by careful personal attention and oversight has rendered his land rich and productive, brought his farm into a high state of cultivation, obtained a valuable stock both of cattle and hogs, and receives a large annual income above all his expenses.

This, as your committee believe, has all been effected with but a small additional outlay of capital, and is in fact the result of a thoroughly digested system adapted to the peculiar circumstances of the location and the character of the soil, and carried into complete execution by the activity, industry, and personal efforts of Mr Townsend.

It is certainly true that all this might never have occurred had the farm been so far distant as to preclude the furnishing of milk in the city. That circumstance, however, has reference now only to the amount of the profits, and does not affect the character of the cultivation. Allowance also must be made for the fact, that Mr T. possesses outlands for pasture. This also merely increases the receipts of the farm.

*Second Premium.*—In respect to the second premium, your committee felt less hesitation. They considered Mr Davis's farm better land, and, as a whole, better cultivated than either of the remaining six.

*Third Premium.*—The third premium they have awarded to James D. Wooster, of Middlebury. They consider Mr W. entitled to all praise for the good condition into which he has brought his farm, naturally so hard, stoney, and unproductive. Those born and living upon our plains can have little idea of the immense amount of labor thus expended. Although the crops by the acre, and the estimated receipts are less than those of several of the remaining, still the well arranged buildings, all in excellent condition, the admirable fences, the improvement effected by judicious draining, the general air of careful and thorough tillage upon the farm as a whole, and his fine stock, entitle this farm, in our judgment, to the third place on our list.

All which is respectfully submitted, by order of the Committee.

CHARLES ROBINSON,  
Chairman.

#### USEFUL HINTS.

It should be the business of every prudent agriculturist on the commencement of winter, to overhaul all his tools and implements, and to have such as need it repaired, so as to be in readiness for the ensuing season's operations; nor should he permit any thing of the kind to remain exposed to the weather—ploughs, harrows, carts, and indeed every thing of the kind, should be carefully put away under cover.

All leather gearing should be thoroughly rubbed with neat's foot oil. By being thus cleaned, three or four times a year, they will last as long again as they would if not thus treated, and the reason is obvious; the sun and air extracts from the leather

its oleagenous principle, which must be supplied, or, as a necessary consequence, it will crack and ultimately break.

Be careful of your stock during this and the ensuing inclement and severe months, and be sure to give them their food at least three times a day. If you have no stables or sheds for your stock, provide them with shelter, if it be nothing more than one made of pine brush, for all animal creation delights in being kept comfortably warm. Stock of all kinds should be salted twice a week.

If you have any beeves that you are fattening for sale or for home consumption, you will greatly facilitate your object by feeding four or five times in the course of the day, and at least once a week giving a quart of flaxseed boiled into a jelly, and given in a mess of corn meal. The animals should be kept constantly in a stall, and be curried and well rubbed down night and morning. No filth must be suffered to accumulate in their stalls, and their manger should be washed out once a week with a solution of salt and water. A handful of pulverized chalk should also once a week be mixed with their feed.—*American Farmer.*

For the New England Farmer.

#### THRESHING MACHINE.

GENTLEMEN—In your last week's paper, under the head of Threshing Machine, you allude to mine, but do not give the description so fully as I think it deserves, I will therefore make a long story of it, which you may publish or not, as you think proper, without giving any offence.

In 1826 I commenced farming on the Scotch system of angular ploughing, rotation of crops, draining, &c. The man I first employed said I must have a threshing mill on the Scotch plan—stationary and to be moved by at least four horse power: he stated that it could be constructed to thresh clean seventy bushels per hour and that in Scotland those owning mills would thresh for one half the straw and chaff, and labor being higher here, we could obtain all the straw and chaff, which would assist the manure.

Not having full faith in the plan, I caused one to be constructed in a cheap manner, which threshed and winnowed, in presence of the late Hon. Timothy Pickering, Hon. E. H. Derby, Gorham Parsons and others, distinguished for their taste in agricultural matters, 76 1-2 bushels oats in one hour, cleaning them fit for market. Mr Parsons held the watch during the time.

The quantity we had to thresh for others being great, and my faith having been firmly fixed, (partly by seeing ninety tons of straw left on the farm in one year, and seeing farmers bring their grain 8 miles,) induced me to rebuild the mill in the best manner possible, substituting iron for wood whenever it could be done: this was in 1830, and it has not had one cent expended on it since, and will thresh and clean 65 bushels wheat or 80 bushels oats in one hour, with one boy to drive the horses, one man to feed the mill, one to hand him the grain, and one to measure it up. The chaff falls at one end, the straw at the other; the heavy grain runs down one spout all winnowed, and the light at another.

The expense of a machine of this kind, to purchase and hire every thing, I should estimate at \$300; but as I have mechanics hired by the year,

and who done the work on my machine when at leisure, I do not think it cost me so much as the sum above stated. That it paid long since for the cost, I am well satisfied.

The horse power is constructed for 6 horses, although sometimes we use but 3. It is the best place to train a colt for harness I ever saw. We have trained our own and many neighbors', and never found it to fail, even with the most refractory and stubborn.

The horse-power is outside the barn, covered with a thatched roof 32 feet diameter: the machine occupies 15 feet by 10 in the basement or cellar of the barn, and the same above.

I am well convinced these machines should be stationary to do the work well, but I saw them on the same principle, for two horses, on many farms in Scotland and England, moving from one farm to another; but, like a grist or any other mill, the more firm they are the better work they will do.

I am certain no farmer could make a better investment than to supply himself with a machine of this kind. If any of your readers should need one, I have patterns of the castings of mine, and could recommend a good mechanic to construct it.

Yours, &c. BENJ. POORE.  
*Indian Hill Farm, near Newburyport, Mass.*

*An Exhortation to Farmers' Daughters.*—Our fears are, not that there are not many excellent dairy women in the land, but that the benefits of their knowledge and practice will be lost in the new generation that is springing up. Hundreds and thousands of farmers' daughters leave the homes of their mothers and seek other employments, as if it were a disrelish of that which may be practically more and more scarce. The occupation is stripped by the demand for young women as operatives in factories, as milliners or sewers, shoe binders or straw braiders, or in some other mechanical operation. How few thus employed come short of the qualifications of the virtuous maid who obtains the best part of her education under the roof of her own father, from the instruction of her mother that knows how to do everything coming within the province of the wife of a thriving farmer—who is entirely at home in all that pertains to the dairy, the economical use and due preparation of articles of food and clothing, and who suffer none of her household to "eat the bread of idleness."

If not to the rising fair generation, to whom shall we look for the hands that are to supply so important a portion of subsistence as the products of the dairy? The farmer may keep his forty, fifty, or a hundred cows: if there be none meet to oversee and lead in the preparation of the milk after it goes to the dairy room—if their be no female to prepare the vessels, none to direct in straining and setting of the milk, the extrication and disposition of the cream, the churning into butter, the separation of the buttermilk, the clean and perfect salting down—if all this is expected of men, and not women; how miserably shall we hereafter drop away in the produce of a most profitable and most useful article in the production of the farm at that precise time when there is the most sure encouragement for the farmer to enter upon and persevere in the business of the dairy?—*Hill's Monthly Visitor.*

The whole work in ploughing an English statute acre, may be estimated as extending to 20,416 yds., or eleven miles and nearly five furlongs.

## ADDRESS

*At the Philadelphia Agricultural Exhibition.*

BY NICHOLAS BIDDLE, ESQ.

GENTLEMEN—We are assembled to witness our first exhibition since the recent donation by the State. Our Society, while engaged with all its own resources in improving our agriculture, appealed to the Legislature, as consisting mainly of farmers; and asked that, while so many millions were expended in the transportation of our productions, something should be given to assist in rendering those productions themselves more abundant and more valuable. Accordingly a law was passed, placing, every year, at the disposal of the Society, a sum of fifty dollars for each member of the Legislature for the city and county of Philadelphia, to be paid out of the taxes to be raised within the city and county. This, though small in amount, is important from its example; nor, in entering upon the first enjoyment of it, should we omit our thanks to the Legislature for this mark of regard for the farming interests, to the members from the city and county who liberally supported it, and more especially to those members of this Society to whose exertions we owe the success of this application, among whom it would be great injustice not to name Geo. W. Roberts, R. T. Potts and Capt. Thomas Hayes; but in an especial manner are the acknowledgements of all farmers due to Mr James Gowen, who is always in the front rank where public spirit or private liberality is needed.

The Society have thought that no employment of the additional means confided to them would be so useful as to bring the farmers together, to exhibit the best specimens of their industry; and by small but honorable premiums, to encourage a generous competition in every branch of farming production. The prizes for the best crops must be decided at a later part of the season. But the exhibition of farming stock and farming implements is now before you; and it is made my duty to add something appropriate to the decision. This I do cheerfully; and what I shall say will be very plain, very practical, and, as you will learn with pleasure, very short. My purpose is to say a few words about the real condition of farming in Pennsylvania; its natural advantages; its acquired means; and then suggest such improvements as may make our farms more productive.

There are perhaps few portions of the earth more favored by nature than Pennsylvania. Her soil is excellent and various—while even the parts least adapted in themselves for agriculture furnish the best encouragement to it; for the hills which reject the plough are filled with coal and iron, which collect large masses of the people to be fed by the farmers. Her climate is a happy medium between the long winters of northern regions, which close the earth for so many months against farm labor, and consume so much of its produce in carrying the farm stock over long months of idleness, and, on the other side, the unvarying heat of southern latitudes, often unhealthy and unproductive, where both man and cattle degenerate. In this climate almost every production may be naturalized, so that in point of soil and seasons, and variety of productiveness, Pennsylvania is distinguished.

These natural advantages she has also the means of improving by artificial means; for the limestone, so great an element in farming, is found everywhere in great abundance. Plaster of Paris is obtained easily and at low prices, from her neighbor, New

York: the large cities furnish vast supplies of animal manure, while on the other side of the Delaware lies a great belt of green sand, erroneously called marl, an original deposit of the ocean, where, among bones of extinguished races of animals, and relics of a submerged world, there is brought up this sand, highly useful even in its natural state; and if mixed with lime, as it should be, of great efficacy.

The implements of husbandry come next in order, and these we have of the very best kind; much better than similar implements in Europe—lighter, more easily handled; and there are one or two in common use with us, such for instance, as the horse-rake, and that giant instrument, the cradle, which are unknown or unused abroad. In truth, our people have had so much to do, with comparatively small means, that their ingenuity has been tasked to invent the most efficient instruments, and to make the most active use of them. Thus there are two words in almost all languages, and well defined in most dictionaries, but of which Europeans have scarcely any idea, and these are the axe and the plough. To cut down a tree, the great business of American settlers, is a strange event to a European farmer. And then it may make us smile to see, as we may on the continent of Europe, at the present time, a whole drove of horses—I have myself actually seen eight in a single plough—and sometimes the whole quadruped force of the farm, three or four cows, and perhaps a bull or two, with the aid of several horses, toiling slowly through the great work of turning up the sod—nay, even in some parts of England, at this moment, may be seen six large horses with two full-grown men, returning from the field, after having ploughed during the day, three quarters of an acre, where one of our ploughmen, with a pair of horses, would have got through an acre and a half.

From the implements, let us turn to our stock of animals.

And first of our Horses. Beginning with the highest blooded stock, I think it probable that the United States possess quite as good a race as there is in Europe. The prevailing opinion is that the Arabian horse is the original of that animal. I doubt the historical fact; but if it be so, he is the parent stock of the horse, just as the father of all apples is the crab, which has been sweetened by cultivation into the bell-flower. Undoubtedly the Arabian has improved the English horse—has given him finer sinews, more compact bones, and greater intelligence, till the cross has become avowedly the first of his kind. The truth is, that a race is but a quick succession of long jumps, and the little light Arab is out-jumped by the gigantic stride of the stronger, larger, longer-legged English horse, and would distance him on any course in Europe. Indeed, the very first Arabian imported into England two centuries ago, called the Markam Arabian, was constantly beaten; and my opinion is, that no Arabian horse ever did win a race in England. The belief of our breeders is, that whatever good there is in the Arabian is exceedingly slow in showing itself; that he has already given to the English horse all he can give, and that it is on the whole better to adhere to the highest bred English stock, rather than risk its degeneracy by any inferior mixture. Our blood horses, therefore, come directly from England; and it is rather odd that the King of England's stables—while there was a King and he had stables, furnished the highest priced horses for republican

America. Of the comparative estimation of the English and Arabian horse, we have lately seen a striking example. The Imam of Muscat sent to the President of the United States two Arabian horses, which, from the character of the giver, we are bound to presume were of the highest class. These horses were sold at public auction, and no one could be found to give more for them than six hundred and fifty dollars for one, and six hundred and seventy-five for the other. Now, in the same neighborhood where these were sold, are very spirited breeders, who would not buy these Arabians even at so low a rate, but who had actually bought from the stables of the King of England, at the price of twenty-five thousand dollars, PRIAM, one of whose colts is in the exhibition here. Even as between the English breed and our own, the impression on this side the water is, that for some time past the tendency of English breeding is leggy, and that the descendants of the English stock, in this country, have more endurance, more bottom for long heats than their English ancestors. The question, whenever it is tested, will be decided by a few seconds. This style of horse, although the use to which he is generally applied, is out of the way of the farmer, is yet very interesting to us, for his good qualities all come down through the inferior races; and the Godolphin, to which the English horse owes much of his superiority, was actually a cart-horse in Paris.

Our ordinary race of farm-horses is extremely good. The warmth and variability of the climate have settled down the stiff and heavy frame of the European horse, and given us a race of quick, alert animals, admirably fitted to second the activity of the farmer himself.

So with respect to Cattle, we have almost every variety, and the best of all varieties. The emigrants often bring their best and favorite animals; the passenger vessels bring cows to give milk during their voyages, and be then profitably sold here, and these are generally of the highest kind; commerce imports, from every quarter, the animals which will pay best, and are therefore the best at home; and spirited breeders have gone over into the English markets and brought over some of the highest priced animals. The result is, we have a great accumulation of stock of every description. There are the Aldernays, with their rich milk, itself a cream. The Ayrshires, copious givers of milk strongly inclined to butter, with forms fitted for the butcher. The Devons, an ancient race, brought by the first settlers of New England, and indicating their descent by their strong resemblance to the improved Devons, with which our stock has been of late years abundantly recruited. Fitted, by their milkiness, for the dairy; by their delicate flesh for the knife; by their quickness, for the plough; they claim to be second to no other race; and if second to any, only to the short-horned Durham, which is so familiar to us all as to require no description, which undoubtedly now unites the greatest number of suffrages in its favor, as combining the qualities of abundant milk, of easy fattening, of early maturity, and of excellent food, more than any other race of horned cattle.

Of Sheep, too we have all the varieties. The Leicester, with their early fitness for the knife, and their large carcasses and large wool; the Merino, for its smaller yield of rich wool; the South-down, excellent for both wool and carcass; and finally, we have a less-known breed coming into reputation; it is the Tunisian, or broad-tailed

sheep, originally sought mainly for their carcass, but, having proved itself very hardy, when acclimated, when crossed by other breeds, so as to acquire a finer wool, it may become a standard stock among us. Nor are we less favored in

*Swine.* We have all the breeds; among others peculiarly our own, is what is called the Chester county breed and the Berkshire breed, just coming into great and deserved estimation among us. Even the common breeds that run about, without knowing their extraction, are often admirable. I remember well that the Pennsylvania Quaker farmer, Jacob Brown, Commander-in-chief of the American army during the last war, told me how much he was struck with the beauty of the hogs which he saw running about Philadelphia, and I have often had occasion to admire them.

Of all these various animals we have specimens now before us which we may all examine, and, if we desire it, obtain them at reasonable rates—and no one can doubt the real economy to a farmer of possessing these improved breeds. An inferior animal takes as much trouble and as much food as a good one, and then the care and the expense are often thrown away upon cattle that will give neither milk nor beef. How many stunted milk cows do we see who may be said to go dry all the year round—how many steers who, after emptying a corn-crib, at last, in the spring, look like the crib itself, all ribs without, and hollow inside. But crossing and training create animals who turn at once into milk or beef every thing we put into them—who give plenty of milk if you want milk, plenty of fat if you desire beef; and who coming earlier into the dairy or the market, save a whole year's expense of feeding. I hope, therefore, that we may profit by the present opportunity of improving our stock, and encourage the spirited breeders who place the means of doing it in our power.

Nor are the productions of Pennsylvania less numerous than its animals. The great staples are wheat, rye, barley, oats, buckwheat, and above all, Indian corn—a plant not estimated in Europe, but one of the most valuable presents which the new world has made to the old—worth almost all others in the extent of its yield and the variety of its use—with a stalk ten or fifteen feet high, every inch of which is useful in the barn yard, and a grain which to men supplies a variety of healthful and delicious dishes, and to cattle is the quickest fattener, while it gives the last exquisite flavor to their flesh.

Having thus spoken of the advantages which we Pennsylvania farmers enjoy, I proceed to the less agreeable, but more profitable inquiry, why our farmers are not so productive as they ought to be; and I make the comparison between Pennsylvania and England, because I think England, on the whole, the best farming country in Europe; our English friends must understand that, while we amuse ourselves occasionally with some of their peculiarities, we pay them the highest compliment we can, by proposing them as the constant models of our farming. Now, why is it that, with all the natural advantages in our favor, the English farmers beat us? I will tell you what I think of it.

In the first place, we do not do justice to our own profession. Farming is not liked, either among the young people, because it is considered a lonely exile from gaiety—or among the calculating, because it is thought unproductive. This last is, I think a total misapprehension; and as I regard its correction essential to our success, I venture to

say that farming ought to be more profitable in Pennsylvania than in England. The common notion is, that the high price of labor in Pennsylvania makes farming unproductive, and the opinion is repeated without examination, till at last it is generally believed. Now the productiveness of farming, like the productiveness of every other occupation, depends on the expense of raising an article, and the price you can get for it when it is raised. These expenses are, the rent of the land, the taxes, manure, the prices of laboring cattle, of laboring implements, and of laboring men.

The land which can be rented in America for two or three dollars, could not be rented in England under ten or twelve dollars an acre—so that already the land itself costs three or four times as much. When you have got possession of the land, the tax-gatherer and the tithewoman soon make their appearance, and take from the farmer fifty-three per cent. on his rent. Here there are no tithes, and the tax out of the immediate vicinity of the city improvements, would scarcely be one-tenth of the English tax—so that, while on an English farm of two hundred acres the rent and charges would be about

	\$3000
The same rent and charges would be	700
<hr/>	
Making at once a difference of	\$2300

Next, all manures are cheaper in Pennsylvania—cheaper in themselves, and rendered more cheap by the facilities of transportation.

*Laboring horses* are about one fourth cheaper in Pennsylvania; and, moreover, the work which two horses do in England is generally here done by one. Cows, too, are much cheaper here.

*Laboring implements* are cheaper and better, the wood being so much lower-priced and durable. Of all these elements of work, there remain only *laboring men*, who are cheaper in England; they are cheaper by about 30 or 35 per cent.; but even say that wages are 50 per cent. higher in Pennsylvania than in England. But then although the nominal rate of wages is higher, yet you actually get more work done for the money. The climate gives you more long working days than can be relied upon in the climate of England, where out-door work is necessarily much suspended, and the American laborer works better, for the very reason that he is better paid. And the proof, which seems decisive, is, that although money wages are higher here, piece-work, contract work—whether to dig a canal or reap a field—is done cheaper in America. And, accordingly, one of our most intelligent Philadelphia county farmers, Mr Walker, an Englishman, always declared that his farm-work was done 20 per cent. cheaper in Pennsylvania than in England. But supposing it to be higher—labor is only one of the elements—for we have seen that the rents are three or four times as high—manures, implements, cattle, all dearer—and far overbalancing any difference of wages, were it even real.

Let us now see what are the prices obtained for what is raised. Wheat is higher in England—flesh markets are higher. But wheat forms only one fourth of the crop; and, on the other hand, the great staple, wool, is dearer here; potatoes are twice or thrice as high here; and, therefore, the English compete with us in our own market; turnips, cabbages, all vegetables generally dearer; so that, after all, taking the average, farm produce is not higher or very little higher in England, while all the materials of raising it are much high-

er there; so that, on the whole, farming ought to be as lucrative in Pennsylvania as in England.

With regard to wages, it may sound strangely, yet I believe it to be true, that the real interest of all farmers is, that wages should be high, and for this reason. A laboring man is not a mere machine—a human poor-box—into whose mouth is put a daily number of cents, never to re-appear, but a living being, with wants and desires, which he will not fail to gratify the moment he possesses the means. If he can earn only a scanty pittance, just enough to keep him alive, he starves on accordingly—his food, bread and water, half-fed, half-clad, a wholly untaught animal, with a useless mouthful of carnivorous teeth; but if wages increase, he instantly employs them in comforts, in clothes for himself and family, and as he rises in the scale, ventures on the taste of meat. He employs a tailor, a shoemaker, a hatter, a butcher, and these in turn purchase the materials of their trade from the farmer himself. The laborer becomes thus a customer of himself, and the payer of other customers, and the farmer receives back, with abundant interest, the difference which he advances in the first instance between high wages and low wages. It is for this reason that one of our shrewdest farmers used to say, Yes, give our laborers good wages and they will buy our beef. Thus, too, the bounties of Providence go round a beneficent circle; and, after making a laborer better fed, better taught, in short, a better man, the farmer himself is richer for the very benefits he dispenses. Depend upon it, there is no surer sign of national prosperity than high wages; and God grant that for many a long year it may be the lot of our countrymen, who subsist by the labor of their hands, to work well, to be paid well, and to live well.

And now we come to the real reason why our crops do not equal those of England. It is, that our farms are all too large—too large for the means we employ in farming them. Agriculture is the only pursuit I know, where the owner does not employ his capital in his business. He rents or buys a large farm, and then has nothing left to stock it with. He might as well rent a large store without goods enough to fill a single corner of it. In England, it is supposed necessary, before renting land, that the tenant should have a working capital of thirty or forty dollars an acre, to employ. It is calculated that, besides lime and other enriching substances, the cost of the mere animal manures applied to the soil of England amounts to 300 millions of dollars; being more than the value of the whole of its foreign commerce. Yet the grateful soil yields back with interest all that is lavished upon it. And so it would do here, if we would only trust the earth with any portion of our capital. But this we rarely do. A farmer who has made any money spends it not in his business, but in some other occupation. He buys more land when he ought to buy more manure; or he puts out his money in some joint stock company, to convert sunshine into moonshine; or else he buys shares in some gold mine or lead mine. Rely upon it, our richest mine is the barn-yard, and that whatever temptations stocks or shares may offer, the best investment for a farmer is *live stock* and *plough-shares*.

(Concluded next week.)

**FIREWOOD.**—Be sure to have as much wood cut and hauled into your yard this month, as will last you until the beginning of next winter.

**NEW ENGLAND FARMER,  
AND HORTICULTURAL REGISTER.**

BOSTON, WEDNESDAY, DEC. 2, 1840.

**SOUTHBORO' AGRICULTURAL SOCIETY.**

We had the pleasure a few days since, of attending the meeting of the Southboro' Agricultural Society, and the opening of their new Town Hall, designed for the transaction of public business, and as a Lyceum lecture room. The lower story is appropriated to a high school for both sexes. The building is a neat and convenient structure; and does much credit to the taste of the architect and the public spirit of the town.

The establishment of what are called Lyceums in our towns and cities, is a remarkable feature in the condition of society among us, and makes an essential part of the system of public education. To whom these institutions owe their origin is not fully determined; but we believe to Mr Holbrook, a distinguished scientific lecturer, and now an instructor of youth in the interior of Pennsylvania. In this matter he has conferred an eminent benefaction upon the community.

A Lyceum, in the modern sense of the term, is an association of persons for mutual literary and scientific improvement. It is understood in its most improved form to comprehend a course of lectures on scientific subjects or subjects of general instruction and utility; occasional and free discussions on subjects of this nature, excluding always the two great bones of contention, religion and party politics; a social library of practical and instructive books; and a philosophical apparatus, designed for experiment and illustration. There should be added to this a museum of natural history, embracing such specimens in mineralogy, geology, botany and other departments of natural science as may be interesting and instructive.

Now we can conceive of no institutions better adapted to general improvement and social enjoyment; and the agreeable and beneficial effects of them, wherever they have been instituted and conducted with spirit, have been all that could be expected. They require the public spirited exertions of some leading individual or individuals to get and to keep them under way; for what is left as the concern of the mass will never be accomplished; and we have long since learnt that there must always be some fil-horses, upon whom the burden of holding and drawing the load must fall. It may be attended with some expense; but the expense is comparatively trifling, and nothing in view of the advantages to be derived from the institution. Even where the lecturers are paid, and in most parts of the country their services are gratuitous, the expense divided among numbers amounts to little. What mechanic in the country cannot afford to give two or three days-work in a year to this excellent object? and what farmer cannot, without even feeling it, give a cheese; or eight or ten pounds of butter, or half a dozen bushels of potatoes or two bushels of grain to this most useful purpose. Of all the complaints which are made of public burdens and taxes, those certainly are the most unreasonable of all unreasonable ones, which demur to such taxes as these; and how few men are there among us, who could not save out of their unnecessary, in many cases foolish, in some, vicious and hurtful expenditures, ten or twenty times as much annually as would meet these necessary demands.

The meeting at Southboro' on the evening referred to, was the meeting of their Agricultural Society; and the address delivered to them on that evening took the

place of a Lyceum lecture. Southboro' is essentially, we had almost said entirely, an agricultural town, and distinguished for its good and prosperous husbandry. The principal farmers of that town, after the excellent example of their neighbors in Westboro', have associated themselves as an agricultural society, and design to have frequent meetings for agricultural conversation and inquiry. If well managed, they cannot fail to be productive of the very best effects. There can be no jarring materials in the objects of their association, to disturb their harmony. The farmers will detail fully their experiences and the actual results of their operations and experiments. The meetings will serve to keep up a lively interest in this great subject. They will be the means of exciting a strong emulation, which unlike emulation in most other matters, can here produce no ill humor or malignity; and they will be instrumental, and perhaps more so than any other means which could be adopted, of diffusing much valuable information.

We wish such a society could be formed and conducted with a proper spirit and vigor in every town in the Commonwealth. We know no means by which we should be likely to approach so easily and so nearly the obtaining of correct and exact statistical returns. These are particularly desirable; and the great importance of the agricultural interest can never be justly appreciated until these are obtained.

The practice, likewise, of holding town Cattle Shows, as has been done at Barre, Petersham, Hardwick, Westboro' and several other places, has been productive of the best results. We hope they will be increased and extended to most of the agricultural towns in the Commonwealth; and respectfully commend these suggestions to our brother farmers. In some places merely nominal distinctions and premiums have been awarded. A little liberality on the part of the farmers of a town, or of two or three towns united, would make up a small purse, which would enable them to bestow premiums more substantial, and consequently much more inspiring. This project of town societies for agricultural purposes is not novel. Several years since, the Massachusetts Agricultural Society addressed a series of most important inquiries to several town societies in the Commonwealth, to which the society at Marlboro', at Shrewsbury, at Danvers, and at Newbury gave valuable answers, which are to be found in their memoirs. Some of these societies undertook the establishment of agricultural libraries. It would be happy for the Commonwealth if this plan could be every where revived and extended.

The farmers owe it to themselves to do every thing which lies in their power to elevate and improve their profession. This can be done only by improving themselves; their own minds. The long winters of New England afford the most favorable opportunities for this improvement; and the multiplication of Lyceums and the cheapness and abundance of books, bring the facilities of knowledge within every man's reach.

H. C.

**MR BIDDLE'S AGRICULTURAL SPEECH.**

We give today a portion of a speech made by Nicholas Biddle, Esq. at the late agricultural exhibition in Philadelphia. It does him great honor. It is perspicuous, sensible, instructive, and abounding in humor. We commend it to our readers as matter of rich entertainment. Mr Biddle some years since delivered a very sensible and agreeable speech on a similar occasion, which, if we could lay our hands upon it, we should be very happy to give it to our readers, as we recollect reading it with great pleasure; and it was never republished here.

His remarks in the present case upon the improvement of the breed of horses and the present condition of the Arabian horses, generally supposed to be the best horses in the world, are very striking. His comparison between the prices of labor in this country and in England, and the profits of farming in the two countries, equally deserve attention.

There can be no reasonable doubt that agriculture, even in New England, pursued with skill, enterprise and a proper measure of industry, with as much capital to be employed as the case will warrant, affords as certain and reasonable a profit as any branch of industry among us.

We congratulate this gentleman upon having both the taste and the ability to retire from the perplexities and embarrassments of financial concerns and the stormy sea of politics, to the peaceful pursuits of husbandry and the cultivation of his own beautiful farm on the banks of the Delaware.

H. C.

**CLOSE OF THE SEASON.**

The 20th of November, when it is understood that pasturage in New England ceases and cattle come to the barn, has already arrived, and the impetuous year is hurrying on with an unrestrained and unrestrainable rapidity. The month of November just closed, has been only a succession of storms, rains and snows, and as well as we can remember, we have had not a single fair day. We shall soon have a report of the quantity of rain which has fallen within the month, and there can be little doubt that it will prove as large an amount as has ever been known to fall in the same length of time. The rain, however, did not begin until the crops were every where secured; and larger crops or crops in better condition were never before gathered. We have been repeatedly asked in a complaining tone, what are we to do with the abundance on our hands? There are, indeed, many persons whom no condition of things will satisfy, and therefore they need no counsel, for it would be only casting pearls before swine. But to the pious, grateful and benevolent, to whom the accumulation of money is not the business and end of life, we only say, keep that which will keep, and which is beyond your necessities, until a time of scarcity; of your abundance give the more freely to those who want; and above all things be thankful that, by the abundance of the earth and the consequent cheapness of provisions, the comforts of life are widely extended among the poor and with that class of persons to whom such abundance from its rareness is so much the more valued.—H. C.

**SUCIDES.**

The papers of the last week recorded in melancholy succession four remarkable cases of suicide. We deem it proper enough to announce the deaths in such instances; but that is all that should be done. It is neither necessary nor useful to state even the fact that they were suicidal; but we deem it an absolute offence against good morals and humanity to go at all into the details. Nothing is gained by so doing, but to administer to a morbid curiosity; and it seems cruel to the friends to blazon such melancholy facts abroad, and cruel to the public to place such dreadful pictures before the imagination, when no possible advantage can arise from it. Indeed much positive evil may grow out of it, for who can doubt that persons are led by the recital continuing to haunt the mind, to the imitation of such frightful examples.

In the particular cases referred to, it would seem that each individual was blessed not only with a competency but an abundance and profusion; and stood well

with the world. So that riches are not all that is requisite to make men contented and happy. Indeed it happens that rich men often die of the fear of coming to want; from which the poor or those in moderate circumstances seldom or never suffer. We know not the particular causes which operated upon the minds of these unhappy victims of insanity; but we know enough to satisfy us that the duty of keeping the mind is among the highest of all duties; as the greatest of all earthly blessings is a sound mind in a sound body. "Strange that a harp of thousand strings should keep in tune so long." H. C.

**Massachusetts Horticultural Society.**

EXHIBITION OF FRUIT.

Saturday, Nov. 21, 1840.

**PEARS.**—From Robert Manning; Bishop's Thumb and Bonne Louise.  
From E. M. Richards; Bonno Louise.  
From B. V. French; Chaumontelle.  
From J. D'Wolf; Monsieur le Cure.  
From Wm. Pratt; Bonne Louise.  
**APPLES.**—From Wm. Oakes, of Ipswich; Minister Apple, from the original tree.  
From E. W. Pike, of Exeter, N. H.; large sweet apple, yellow green color.  
From A. H. Green, Worcester; sweet Russet apples, from seedling tree.

For the Committee,

L. P. GROSVENOR.

**MASS. HORTICULTURAL SOCIETY.**

A stated meeting will be held at the rooms of said Society, on Saturday the 5th instant, at 11 o'clock, A. M. E. M. RICHARDS, Rec. Sec'ry.  
Dec. 2d, 1840.

**BRIGHTON MARKET.—MONDAY, NOV. 30, 1840.**

Reported for the New England Farmer.

At Market 950 Beef Cattle, 375 Stores, 3600 Sheep and 775 Swine.  
Several lots of Sheep and two hundred Swine were reported last week.

**PRICES.—Beef Cattle.**—We quote to correspond with last week. A very few choice cattle sold probably for something more than our highest quotations of last week and this. We quote First quality, \$5 25 a \$5 50. Second quality, \$4 75 a \$5 00. Third quality, \$3 50 a \$4 00.

**Barrelling Cattle.**—Mess \$4 50 a \$4 75; No. 1 \$4 00; No. 2 \$3 00.

**Stores.**—Yearlings \$5 00 a 8 50, Two Year Old \$11 a 18, Three Year Old \$21 a 27.

**Sheep.**—Dull. Lots were sold at \$1 25, \$1 33, \$1 50 \$1 67, \$1 92, \$2 12, \$2 25, and \$2 37.

**Swine.**—Lots to peddle at 3, 3 1-4, 3 1-2 and 3 3-4 for sows, and 4, 4 1-4, 4 1-2 and 4 3-4 for barrows. At retail, 4 to 5 1-2.

**THERMOMETRICAL.**

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northerly exposure, week ending Nov. 29.

Sunday,	29	23	44	S.

**FRESH GARDEN SEEDS.**

We would inform our customers and friends that we are now receiving our supply of fresh Garden Seeds, most of which have been raised under our own inspection, from fine selected roots; which we warrant to be of the purest quality of the growth of the present season.

Agricultural Books.  
Agricultural Implements.

Seed and Implement Catalogues sent to all applicants gratis, and all orders promptly attended to.

JOSEPH BRECK & CO.

Boston, Sept. 29, 1840.

4w

**WILLIAM PRINCE & SON,** Flushing, near New York, offer their usual very extensive assortment of Trees, Shrubs and flowering plants, a most splendid assortment of Bulbous Roots and Dahlias, including all the new varieties, and the most magnificent collections possible of China, Roses, Camillas, Chinese Azaleas, Geraniums, and other Green House Plants. Also Garden and Agricultural Seeds, all of which will be sold low to suit the times, and a large discount made for cash.

Mulberries of all the different kinds for Silk, including the New Circassian with monstrous foliage and perfectly hardy character.

Orders sent by mail will receive prompt attention and priced Catalogues will be sent to all who apply post paid. Nov. 23. 3w.

**Better Late than Never!**

The subscribers have received from Holland an additional supply of fine Bulbous roots, such as

- Hyacinth all colors, Double and Single.
- Polyanthus Narcissus, of sorts.
- Narcissus, Double and Single.
- Crown Imperials, of sorts.
- Crocus, of sorts.
- Ranunculus do.
- Anemones do.
- Tulips, fine mixed Double and Single, Early and Late.
- Iris, English and Persian.
- Lillies, &c.

Boston, Nov. 17, 1840. JOSEPH BRECK & CO.

**GREEN HOUSE PLANTS, &c. &c.**

The subscriber can furnish every variety of Green House Plants or Garden Shrub, in the very best order. Also—Dahlia roots, (all the new varieties); Black Hamburg, Sweetwater, and Isabella Grape vines; Roses and Paeonies; Honeyuckles, and other creepers; Black, White, and Red Currant trees; White and Red Antwerp Raspberry vines; Asparagus and Rhubarb roots, &c.

Orders by mail will be promptly and faithfully executed; or they can be forwarded to, or left with J. Breck & Co.

JAMES L. L. F. WARREN,

Oct. 23. Nooantum Vale, Brighton.

**SILVER FIR AND SPRUCE SEEDS.**

Just received at the New England Farmer Office, a few Bushels of the seed of the Silver Fir, Spruce. Also—English Oak, a fine specimen; Spanish Chesnuts, (very large); with a variety of other tree seeds.

Nov. 10, 1840. JOSEPH BRECK & CO.

**GRINDSTONES.**

An extensive assortment of Water and Hand Grindstones constantly on hand and for sale by AMMI C. LOMBARD & CO. 13 Lewis's Wharf. 157. Nov. 17.

**WALKER'S FINE TULIPS.**

For sale at No. 52, North Market street, a great variety of Walker's fine named Tulips, at \$3 per dozen, with their names. Many of the original Bulbs cost five times that sum—Those who intend to set out a tulip bed, will do well to call soon, as October is the best month for this business.

Fine Mixed tulips without names, \$1 per dozen. Also Hyacinths of every variety, embracing all the most approved sorts, with a great variety of other bulbous roots.

Boston, Oct. 21, 1840. JOSEPH BRECK & CO.

**WILLIS'S LATEST IMPROVED VEGETABLE CUTTER.**

For sale at the New England Agricultural Warehouse, No. 51 and 52 North Market Street, Boston, Willis's Latest Improved Vegetable Cutter. This machine surpasses all others for the purpose of cutting Ruta Baga, Mangel Wurzel, and other roots. The great objection to other machines, is their cutting the roots into slices, which makes it almost impossible for the cattle to get hold of them: this machine with a little alteration, cuts them into large or small pieces, of such shape as is most convenient for the cattle to eat. It will cut with ease from one to two bushels of roots per minute.

Oct. 28. JOSEPH BRECK & CO.

**FARM FOR SALE.**

The subscriber offers for sale that valuable Farm, situated about 3-4ths of a mile below the First Parish Meeting House, on the Stage road, and commonly known as the Judge Prescott farm, containing about 170 acres of superior land, in a good state of cultivation, with two dwelling houses, four barns, and other out buildings. The farm is remarkably well watered with soft water, conveniently fenced, has nearly forty acres of large, handsome wood and timber standing on it, with an orchard of grafted Apple, Pear, Peach, Plum, and Cherry trees, and might be easily divided into two Farms. The estate will be sold reasonably. If five thousand dollars be paid on receipt of the deed, the remainder may lay on mortgage to suit the convenience of the purchaser. For further particulars, apply to the subscriber, living on the premises.

WM. SALISBURY.

Groton, Oct. 25, 1840.

cow.

## MISCELLANEOUS.

## WALLACE AND THE PIRATE.

BY SIR WALTER SCOTT.

During the brief career of the celebrated Sir William Wallace, and when his arms had for a short time expelled the English invaders from his native country, he is said to have taken a voyage to France with a small band of trusty friends, to try what his presence (for he was respected through all the countries for his powers,) might do to induce the French monarch to send a body of auxiliary forces or other assistance, to aid the Scots in regaining their independence.

The Scottish champion was on board a small vessel, and sailed for the port of Dieppe, when a sail appeared in the distance, which the mariners regarded with doubt and apprehension, and at last with confusion and dismay. Wallace demanded to know what was the cause of their alarm. The captain of the ship informed him that the tall ship which was bearing down for the purpose of boarding that one which he commanded, was the ship of a celebrated rover, equally famed for his courage, strength of body and successful piracies.

It was commanded by a gentleman by the name of Thomas de Longueville, a Frenchman by birth, but by practice one of those pirates who call themselves friends to the sea, and enemies to all who sail upon that element. He attacked and plundered vessels of all nations, like one of the ancient Norse sea kings, as they are termed, whose dominion was upon the mountain waves. The master added that no vessel could escape the rover by flight, so speedy was the barque that he commanded; and that no crew, however hardy, could hope to resist him, when, as was his usual mode of combat, he threw himself on board at the head of his fellows.

Wallace smiled sternly while the master of the ship, with alarm in his countenance and fear in his eyes, described to him the certainty of their being captured by the Red Rover, a name given to de Longueville, because he usually displayed the bloody red flag, which he had now hoisted.

"I will clear the narrow seas of this rover," said Wallace.

Then calling together some ten or twelve of his followers, Boyd, Keril, Seton and others, to whom the dust of the most desperate battle was as the breath of life, he commanded them to arm themselves and lie flat on the deck so as to be out of sight. He ordered the mariners below, except such as were absolutely necessary to manage the vessel, and he gave the master instructions, upon pain of death, so to steer as that, while the vessel had the appearance of attempting to fly, he should in fact permit the Rover to come up with him and to do his worst. Wallace himself then lay down on the deck, that nothing might be seen which would intimate any purpose of resistance. In a quarter of an hour De Longueville's vessel ran on board that of the champion, and the Red Rover casting out grappling irons to make sure of his prize, jumped on deck in complete armor, followed by his men, who gave a terrible shout as if the victory had been already secured. But the armed Scots darted up at once, and the Rover found himself unexpectedly engaged with men accustomed to consider victory as secure when they were only opposed as one to two or three.

Wallace himself rushed on the pirate captain, and a dreadful strife began betwixt them with such fury, that the others suspended their own battle to look on, and seemed by common consent to confer the issue of the strife to the fate of the combat between the two chiefs. The pirate fought as well as man could do. But Wallace's strength was beyond that of ordinary mortals. He dashed the sword from the Rover's hands, and placing him in such a peril that to avoid being outdone, he was fain to close with the Scottish champion, in hopes of overpowering him in the grapple. In this he was foiled. They fell on the deck, locked in each others arms, but the Frenchman fell undermost; and Wallace, fixing his grasp on his gorget, compressed it so closely, notwithstanding it was made of the finest of steel, that the blood gushed from his eyes and mouth, and he was only able to ask for quarters by signs. His men threw down their arms when they saw their leader so severely handled. The victor granted them all their lives, but took possession of their vessel and detained them as prisoners.

When he came in sight of the French harbor, Wallace alarmed the place by displaying the Rover's colors, as if De Longueville was coming to pillage the town. The bells were rung backwards, horns were blown, and the citizens were hurrying to arms, when the scene changed. The Scottish lion on his shield of gold was raised above the piratical flag, and announced that the champion of Scotland was approaching, with his prey in his clutch. He landed with his prisoner, and carried him to the court of France, where, at Wallace's request, the robberies which the pirate had committed were forgiven him, and the King even conferred the honor of knighthood on Sir Thomas de Longueville, and offered to take him into his service. But the Rover had contracted such a friendship for his victor, that he insisted on uniting his fortunes with those of Wallace, with whom he returned to Scotland, and fought by his side in many a bloody battle, where the prowess of Sir Thomas de Longueville was remarked as inferior to that of none save his heroic conqueror. His fate also was more fortunate than that of his patron.

Being distinguished by his beauty, as well as by the strength of his person, he rendered himself so acceptable to a young lady, heiress to the ancient family of the Charteris, that she chose him for a husband, bestowing on him with her hand the domains annexed to it. Their descendants took the name of Charteris, as connecting themselves with their maternal ancestors, the ancient proprietors of the property, though the name of Thomas de Longueville was equally honored among them; and the large two-handed sword with which he mowed the ranks of war, is still preserved among the family monuments. Another account is that the family name of De Longueville was Charteris.—The estate afterwards passed to a family of Blairs, and is now the property of Lord Grey.

The St. Louis Pennant objects to the phrases, "beastly drunk" and "drunk as a beast," sometimes used to describe people in a state of intoxication. It is a gross slander upon the beast creation. We never saw a beast that was not too respectable to get drunk: man is the only animal that is mean enough to do it. Shame, shame upon him who calls himself lord of the creation, and yet makes himself lower than the very swine.

*Too much Physic.*—It is an opinion which we have formed after much observation of the habits of different persons and families in the employment of physicians, that if there was not ever over one dose of physic administered where there are ten, the ages of men and women would be much lengthened out. Irregularity of habits, want of exercise, fancied inability to move about, very soon put a person into the condition of sending for a doctor; and when the doctor comes, nothing will satisfy short of a dose of physic. That too much physic is taken, is not so often the fault of the physician as of the patient. The administration of the first dose lays the foundation for a second: if it rectifies the passage of the bowels, or the quality and circulation of the blood, nature will require the aid of the same artificial stimulant so soon as the effect passes away. Thus we find many persons who never can pass by certain times and seasons without going through sundry severe operations of medicine. The consequence is sooner or later that the constitution is undermined, and the career of life shortened sometimes ten, twenty, thirty, fifty years.—*Farmer's Monthly Visitor.*

## GREEN'S PATENT STRAW CUTTER.

JOSEPH BRECK & CO. at the New England Agricultural Warehouse and Seed Store Nos. 51 and 52 North Market Street, have for sale, Green's Patent Straw, Hay and Stalk Cutter, operating on a mechanical principle not before applied to any implement for this purpose. The most prominent effects of this application, and some of the consequent peculiarities of the machine are:

1. So great a reduction of the quantum of power requisite to use it, that the strength of a half grown boy is sufficient to work it efficiently.
2. With even this moderate power, it easily cuts two bushels a minute, which is full twice as fast as has been claimed by any other machine even when worked by horse or steam power.
3. The knives, owing to the peculiar manner in which they cut, require sharpening less often than those of any other straw cutter.
4. The machine is simple in its construction, made and put together very strongly. It is therefore not so liable as the complicated machines in general use to get out of order.

Oct. 14.

## ENGLISH ACORNS AND SPANISH CHESNUTS.

Just received and for sale, a few quarts of English Acorns. The tree is very beautiful, and one of the most ornaments of the English forest trees. Also a few Spanish Chesnuts—twice as large as the common sort—rice 50 cents per quart.

Oct 23.

JOSEPH BRECK &amp; CO.

## HYACINTHS.

The subscribers have received a large assortment of Double and Single Hyacinths of every color and shade. Also Tulips of mixed sorts, Crown Imperials, and Lilies; they have also at their garden all the fine varieties of Peonies which will be furnished at one day's notice. Lilies and Peonies, and Crown Imperials, should be planted in August or the first of September. We shall receive a great variety of Bulbous Roots, from Holland, in a few weeks, when no time will be given.

August 26.

JOSEPH BRECK &amp; CO.

## THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at \$3 per annum payable at the end of the year—but those who pay within sixty days from the time of subscribing are entitled to a deduction of 50 cents.

[NO. 23.]

N. E. FARMER.

## ADDRESS

*At the Philadelphia Agricultural Exhibition.*

BY NICHOLAS BIDDLE, ESQ.

[Concluded.]

Another defect of our farmers is, that we do not raise sheep enough. Some years since we were among the first to import the merinos, and to indulge in the wildness of that extravagance, until we had secured vast numbers of these high-priced animals, without any previous accumulation of roots to sustain them, and then found that we should have to purchase expensive food for them. That at once disenchanting us. It was then seen that not only in palaces but in sheep-folds "a favorite has no friends." To enthusiasm succeeded disappointment and disgust, and these unhappy victims were sacrificed to the knife, for no other crime than their appetite. We have not yet overgrown this horror—but it was entirely our own fault. There are many parts of the State where sheep would take care of themselves, in the woods, during the greater part of the year, and the root crops would furnish a cheap and wholesome support during the remainder.

And this leads to the great improvement, which of all others we most need, which is the multiplication of root crops. No soil can withstand a succession of grain crops; and, instead of letting it lie fallow, in order to recruit from exhaustion, as was the old plan, the better practice now is, to plant in the same field a crop of roots. These draw their nourishment from a lower region than the grain crops do; they derive a great part of their food from the atmosphere by their large leaves, which at the same time shelter the soil from the extreme heats; they provide a fresh and juicy food for cattle during the winter, thus enabling us to keep a large stock, which, in addition to the profit of them, furnish abundant manure with which to return to the grain crops. Now this should be our effort—more roots, more manure, then more grain. We cannot much err in the choice of these roots. Common turnips, Swedish turnips, mangel wurtzel, are all good, though in various degrees; but, perhaps, the sugar beet will be found the best of all—not for the purpose, at least at present, of making sugar—but as the most nutritious food for cattle, and the most milk-producing vegetable for cows in winter. These root crops will grow abundantly; and what I would especially desire to see is, that we should confide in our long and mild autumns, and see if they would not yield us a crop of roots planted immediately as the grain harvests were removed, so as to be ready by winter for the cattle.

Another thing which we should strive to amend is, the unfarmer-like and slovenly appearance of our fields. Clean cultivation is like personal neatness to an individual—a great attraction to a farm; but who can see without mortification our fields of Indian corn or potatoes, just as they are verging to

maturity, out-topped and stifled by a rival crop of weeds, which seem waiting with impatience for the removal of the real crops, when they and all their seed may take exclusive possession of the ground! The rule of farming should be, never to let any thing grow in our fields which we did not put there; and the value as well as the beauty of the crop, would more than pay the expense of removing these noxious intruders.

Nor do we pay sufficient attention to our gardens. We are too often content with a small enclosure, where a few peas and beans and a little sallad are left to struggle with a gigantic family of weeds—not to speak of the frequent inroads from the pigs—and what can be saved comes at last on our tables the scanty companions of the masses of animal food which form almost our exclusive subsistence. For such a wilderness, how easy would it be to substitute the cheap and wholesome luxury of many vegetables which would grow without the least trouble, and, while they gave variety to our tables, would diminish our excessive and expensive use of animal food.

The same want of neatness pervades the exterior of our dwellings. We look in vain for the trim grass-plot, the nice border, the roses, the climbing vines, and all the luxuriance of our native wild flowers. These cheap and easy works, which seem trifles, make up the great mass of enjoyments; they are the innocent occupations of the young members of the family—the elegant luxury of them all; and they impress even a passing stranger with a sense of the taste and ease of the farmer.

In fruits, too, we are deficient. Our climate invites us to plant, and there is scarcely a single fruit which will not grow in the open air, and all of them prosper with a little shelter. Undoubtedly there are insects which infest them; but these, care will exterminate. Undoubtedly some species are short-lived, but it is easy to provide a succession; and even many productions which we used to think uncongenial to our climate, will succeed if we only try them. For instance, I am satisfied, from my experience, that every farmer may have his patch of grapes quite as readily as he can his patch of beans or peas. He has only to plant his cuttings as he would Indian corn, at a sufficient distance to work them with the hoe-harrow. They will live through the winter without any covering, and with less labor than Indian corn, because the corn requires re-planting every year, while the vines will last for a century. He will thus provide a healthful, pleasant fruit for his family use, or a profitable article for the market.

I was about to name one mere improvement, but I hesitate about it—I mean the substitution of oxen for horses on farms. All the theory is in favor of the ox. He costs little, works hard, eats little; and when we have done with him he is worth more than when we began; whereas a horse costs much, eats much, and when he dies is worth nothing. Yet, after all, it will be difficult to bring the ox into fashion. He has a failing which, in this country, is more fatal than madness to a dog—he cannot "go ahead;" and it seems a severe trial for our

impatient American nature to creep behind an ox plough, or to doze in an ox-cart. And then there is a better reason, in small farms, where both oxen and horses cannot be kept, for the preference of the horse. The ox can do only farm work, and is utterly useless for the road. He is of no benefit to the farmer's family. We can neither make a visit with him, nor go to church with him, nor go to court with him; and if the present immense political assemblies are to continue in fashion, they would be like the buffalo meetings in the prairies, and it would be more difficult than it now is in political conventions to find whose ox gored his neighbor's.

There was one caution which I would have ventured to offer some years ago, against the indulgence of expensive habits of living, and an undue preference of things foreign over the fruits of our own industry—but which, I rejoice to think, is no longer necessary. Long may it continue so. Simplicity and frugality are the basis of all independence in farmers. If our mode of living be plain, it belongs to our condition; if our manners seem cold, or even rough, they are at least natural, and their simple sincerity will gain nothing by being polished into duplicity. Though Italian mantelpieces and folding-doors are indispensable to happiness in cities, they are not necessary to the welcome of country hospitality. If a finer gloss be given to foreign fabrics, let us be content with the simpler dresses which come from our own soil and our own industry; they may not fit us quite as well, but, rely on it, they become us far better; and if we must needs drink, let us prefer the undiluted juice of our own orchards to all exotic fermentations—even of that bad translation into French of our own cider, called champagne.

I have spoken of farms and farming; let me add a few words about the farmer. The time was, when it was the fashion to speak of the Pennsylvania farmer as a dull, plodding person, whose proper representative was the Conestoga horse by his side; indifferent to the education of his children, anxious only about his large barn, and when the least cultivated part of the farm was the parlor. These caricatures, always exaggerated, have passed away, and the Pennsylvania farmer takes his rank among the most intelligent of his countrymen, with no disposition for improvements beyond the natural caution with which all new things should be considered before they are adopted. But an unwillingness to try what is new, forms no part of the American. How can it be, since our whole government is a novelty; our whole system of laws undergoing constant changes; and we are daily encountering, in all the walks of life, things which startle the more settled habits of the old world. When such novelties are first presented, the European looks back to know what the past would think of it: the American looks forward to find how it will affect the future;—the European thinks of his grandfather—the American of his grandchildren. There was once a prejudice against all these things—against what was called theory and book-farming;—but that absolutely has passed away. In all other oc-

cupations, men desire to know how others are getting on in the same pursuits elsewhere; they inform themselves of what is passing in the world, and are on the alert to discover and adopt improvements. The farmers have few of these advantages; they do not meet at exchanges to concentrate all the news of commerce; they have no factories, where all that is doing among their competitors abroad is discussed; no agent to report the slightest movements which may affect their interests. They live apart, they rarely come together, and have no concert of action. Now this defect can be best supplied by reading works devoted to their interests, because these may fill up the leisure hours which might otherwise be wasted in idleness or misemployed in dissipation; and as some sort of newspaper is almost a necessary of life, let us select one which, discarding the eternal violence of party politics, shall give us all that is useful or new in our profession. This society has endeavored to promote such a one in the Farmer's Cabinet, a monthly paper, exclusively occupied with the pursuits of agriculture—where we may learn what is doing in our line over all the world, at so cheap a rate that, for a dozen stalks of corn, or a bushel of wheat or potatoes, we may have a constant source of pleasing and useful information.

I think, however, that we must prepare ourselves for some startling novelty in farming. We were taught in our youth to consider fire and water as the deadliest foes. They are at last reconciled, and their union has produced the master-power of the world. Steam has altered the whole routine of human labor; it has given to England alone the equivalent in labor of four hundred millions of men. As yet, commerce and manufactures alone have felt its influence, but it cannot be that this gigantic power will long be content to remain shut up in factories and ships. Rely upon it, steam will before long run off the track into the fields, for, of all human employments, farm-work is the most dependent on mere manual labor. Be not, therefore, surprised if we yet live to see some steam-plough making its hundred furrows in our fields; or some huge engine, like the extinct mammoth, roving through the western forests, and mowing down the woods, like a cradler in the harvest-field. Wild as this seems, there is nothing in it stranger than what we have all witnessed already. When Fulton and Oliver Evans first talked to us about the steambot and the railroad, we thought them insane, and already we enjoy more than they ever anticipated in their most sanguine moments. One of these applications of steam—the raising of water for agriculture—I have already attempted, in my own small way. You know that the greatest enemy of our farming is the drought of mid-summer, when all vegetation withers, and the decaying crops reproach us with suffering the magnificent rivers by their sides to pass away. In the southern climates of the old world, men collect, with great toil, the smallest rills, and make them wind over their fields;—the hand-bucket of Egypt, the water-wheel of Persia, all the toilsome contrivance of manual labor, are put in requisition to carry freshness and fertility over fields not wanting them more than our own. With far greater advantages, absolutely nothing has yet been done in that branch of cultivation; may we not hope that these simple means of irrigation may be superseded by steam, when a few bushels of coal may disperse over our fields, from our exhaustless rivers, abundant supplies of water.

All these improvements which may adorn or benefit our farms, are recommended to us not only by our own individual interests, but by the higher sentiment of our duty to the country. This is essentially a nation of farmers. No where else is so large a portion of the community engaged in farming; no where else are the cultivators of the earth more independent or more powerful. One would think that in Europe the great business of life was to put each other to death; for so large a proportion of men are drawn from the walks of productive industry and trained to no other occupation than to shoot foreigners *always*, and their own countrymen *occasionally*;—while here, the whole energy of the nation is directed with intense force upon peaceful labor. A strange spectacle this, of one, and only one, unarmed nation on the face of the earth! There is abroad a wild struggle between existing authority and popular pretensions, and our own example is the common theme of applause and denunciation. It is the more important then, for the farmers of this country to be true to their own principles. The sod is theirs—the government is theirs—and on them depends mainly the continuance of their system. That system is, that enlightened opinion and the domestic ties are more stable guarantees of social tranquility than mere force, and that the government of the plough is safer, and, when there is need, stronger than the government of the sword. If the existing dissensions of the old world are to be settled by two millions of soldiers, all ours will soon be decided by two millions of voters. The instinct of agriculture is for peace—for the empire of reason, not of violence—of votes, not of bayonets: Nor shall we, as freemen and members of a fireside profession, hesitate in our choice of the three great master-influences which now rule the world—FORCE, OPINION, and AFFECTION—the *cartridge-box*, the *ballot-box*, and the *band-box*.

From the Farmer's Cabinet.

#### OLD TIMES IN GARDENING.

Permit me, Mr Editor, to transcribe, from the pages of an old work on gardening, a few curious recipes for the propagation and management of fruit trees, which will amuse your readers as much as did the article in the last number of the Cabinet, entitled "Old Times in Medicine." It is indeed surpassing strange that the writers of such superlative nonsense should ever have obtained readers, whose faith would be strong enough to permit them to receive it for truth, but our surprise is in a measure abated, when we read at the commencement of this work, "and for writing and reading, it skilleth not whether the farmer be able to do it or no; you shall not put him to make reckonings of long time, neither yet of more things than his memory may well carry away."

How blessed, indeed, are we who live in this age of light and reason! The reflection ought to inspire us with a reverence for the *privilege* of reading and writing, which we enjoy, and instead of holding book-knowledge in contempt, we cannot be sufficiently grateful that by it we are brought to see the egregious folly to which those are liable who are deprived of these blessings. S. DALE.

#### SPECIAL OBSERVATIONS.

1. "If you hollow the branch of a cherry-tree, taking away the pith, and after set it again, it will bring forth fruit without any stone.

2. To make cherries and peaches of an aromatic taste and smell, at the time of grafting wet the grafts in honey, and put therein a little of the powder of cloves, nutmegs and cinnamon, and the fruit will have a taste of them.

3. To have medlars in their greatness, so that one may be better than twenty others, graft them on a *gooseberry bush*! and at the grafting thereof, *wet them*.

4. To have mulberries early ripe, graft in the increase of the moon, three or four days before the first quarter, for how many days the moon is old when grafted, so many years will it be before the tree brings forth fruit.

5. To have nuts without shells, take a kernel which is sound, wrap it in wool, or the leaves of the vine, and so plant it, and the nut-tree coming thereof, will bring forth nuts without shells.

6. To cause an oak or other tree to continue ever-green, graft it upon a *colewort*!

7. Write what you will in the eyelet of the fig-tree which you mean to graft, and the fig growing therefrom will contain the said writing.

8. The fig-tree will not lose his fruit if you cast about it pits while the *seven stars* do appear, watering the foot with salt brine.

9. The pear tree will have a fruit smelling like roses, if you put into the cleft, at the time of grafting, the leaf of a sweet-smelling rose: by this piece of cunning, roses become to smell of musk and cloves.

10. To make peaches red, take up the stone after you have planted it seven days, open the shell, put into it some vermilion, and plant it again: or if you graft the peach tree upon the *red rose tree* the fruit will be red.

11. Pierce the body of the peach tree and take away the pith, and you will have peaches without stones.

12. To make the fruit of the bitter almond sweet, water the tree with warm water, opening the ground at the root.

13. To make apples red, plant red roses near them.

14. Graft the peach upon the almond tree, and you will have fruit, both peaches and almonds, whose rind and kernel will be good to eat.

15. Graft an apple with a peach, and the peach upon a pear, and you shall have strange fruit, called peach apples and peach pears to eat.

16. To have peaches or almonds to grow with letters written on them. After that you have eaten the peaches or almonds, steep the stone two or three days; afterwards open it softly, take out the kernel, and with a brass pen write upon the rind what you please, but not deep; replace the kernel, wrapping it about with paper or parchment, and so plant it, and the fruit growing thereupon will be written and engraved!"

LARGE YIELD OF CORN.—*New Hampshire outdone*.—We see a certificate signed by William P. Hume, George Moore, Joseph H. Clay, and R. P. Rankins, that George W. Williams, of Bourbon Co. Ky., raised the past season on one acre of ground, *one hundred and fifty-eight bushels of corn*. Thus we have evidence to believe, that one acre well cultivated, will produce as much as six acres without proper preparation.—*Nashville Agriculturist*.

Bank up your houses and list your doors: be particularly careful, also, to SHUT THE DOOR.

## PINE TREE BORER, &amp;c.

We take the subjoined extracts from a letter received from our much esteemed friend, Dr. S. Blanding, of Columbia, S. C. The letter was not intended for the public eye, and if we have committed any offence in extracting from it for our columns, we would offer in extenuation, that it is a practice with us to publish every thing that comes into our hands which has a tendency to benefit the agricultural community, or in other words, to promote the good of "the greatest number." J. B.

COLUMBIA, S. C., Nov. 20. 1840.

Ma J. B. ECK.—\* \* \*—I have noticed in the N. E. Farmer several notices of the Borer and the methods of saving the fruit trees from their destructive influence, and it occurred to me that a few words would be interesting, on the destruction to our pine timber by the *Bastriehus* that attacks the pine forests in June and July, so as to destroy often acres before its ravages are checked. It is often invited to the attack by the limbs being broken off or a tree falling down by wind or the axe in June, and from that the insect extends its work to the adjoining trees. On my way from Newberry C. H. to Columbia, 45 miles, I counted over 100 places where from 5 trees to twenty acres had been destroyed by them this year. They deposite the egg in the bark and the worm feeds upon the tender ring of the new growth, and so thoroughly do they consume it that the whole bark may be peeled off. No other wood but the pine is touched by them. The insects are so numerous that woodpeckers are collected in great numbers to feed on them. Whether they stop their ravages I know not; but probably the wood becomes too hard to favor their farther progress. They have been more destructive this year than I have ever known them.

*Ochra a valuable Vegetable.*

I have collected a considerable quantity of *Ochra* seed to send you. I think you have not introduced it into your markets yet as a vegetable. It is one of the finest vegetables for summer use in the world. It is boiled and eaten with drawn butter, or cut fine and boiled in soups, which with the tomato makes the king of soups. We use so much of these vegetables that it makes the soup thick. Try it and taste for yourself, and if you do not say the half had not been told you, I 'reckon' I'll not 'guess' again. The pod is gathered for use before it gets fibrous. This vegetable if once introduced among you would never be laid aside. It comes into use nearly as soon as the tomato, and is in full growth at frost. I had a stalk this year ten feet high with five branches. It should be planted 2 or 3 feet apart, according to the soil, and it will branch and bear much better. It may be sliced up and dried when young and used in soups in the winter. I have some of the pods to put up for you on the stalk, that you may see how they grow. If it is not convenient for you to raise them, put them into the hands of some of your friends and get them into use. It is a most healthy vegetable, and very productive.

*Spirit of Improvement manifest.*

There is a great spirit of improvement waking up in this State, and many persons are seizing hold of such things as come out new to them, with a desire to understand their causes. I wrote a note to the 'Southern Planter,' saying that a young planter had over cropped himself and had to turn

out one half of his corn to the grass after the first ploughing, and the other half he had ploughed three times deep and thoroughly, and at that time (1st July) he was astonished to find his neglected field much better than that he had nursed so well. It excited inquiry, and I was called on to give the rationale, which I did in a way to keep up inquiry rather than explain fully what I did not understand. I used 'the better part of valor,' and got off with high compliments to the sagacity of inquiring correspondents, and leaving the impression that I have a world of wisdom locked up in my own bosom.

There is a vast deal of fine stock of every kind coming into the southern States—cattle, sheep, hogs, dogs, geese, turkeys and hens, and the various kinds of grains and other vegetables and fruits, so you will see that great improvements must necessarily be the result.

*Remarkable Instance of the Energies of the Mind overcoming the infirmities of the Body.*

I wish you to notice the report of the Monticello Fruit Committee. Wm. Summer, chairman, has been in such bad health, from an affection of the spine and scrofula, that he has never been to school. He gets about on crutches. He has been instructed by his brothers at home, and is now a fine scholar and one of the most intellectual experimenting horticulturists and fruitists we have. He is doing a great deal in improving stock and fowls, geese, turkeys, &c., and will be a light to the agriculture of the State. He is establishing an extensive nursery for the sale of all kinds of fruit and ornamental trees. It is a noble instance of the energies of mind overcoming the most distressing bodily infirmities.

Yours, &c.,

S. BLANDING.

For the New England Farmer.

## CANKER WORM TROUGHS.

Will the editor of the N. E. Farmer be so kind as to permit me to reply to the communication of J. W. Proctor, dated Aug. 1st, 1840. It was my intention to have replied to his communication soon after it was published, but having been so constantly occupied in making the necessary arrangements to supply as many of the community that were suffering from the depredations of the canker worm as possible, I have been prevented from obtaining the necessary information so as to make an earlier reply. Having recently called upon J. W. Proctor, Esq. to make some inquiries about the lead troughs used by him in 1833 and 1834, I was so unfortunate as not to find him at home. As he remarked in his communication that the same kind of troughs were used by Wm. Sutton, Esq., I proceeded to call upon him and he very kindly showed me one of the troughs alluded to by J. W. Proctor; it was a broad shallow trough made of a piece of sheet lead about four inches wide, which is about the same width that I use to make the trough and roof. It had scarcely the slightest resemblance to my deep leaden troughs with roofs. His using such troughs as the one shown me by Mr Sutton, does not affect the validity of my patent for the circular lead troughs in the least degree. Upon reading J. W. P.'s communication again, I find his language is very guarded, but whether intentionally or not, I shall not undertake to determine. He says that "similar troughs" were used in 1833 and 1834, but says nothing about their hav-

ing any roof. He further says, "I have no desire to interfere with any man's patent rights;" if he is honest in his desires, I hope in future he will inform himself better what the claims of an inventor are before he does any thing that has a tendency to call in question their validity.

The public or individuals who use a new invention, most generally derive a great benefit therefrom, while the inventor is seldom much benefited and most generally suffers much loss by the expenses incurred in introducing his invention to the public.

I wish also to state for the information of the writer who signs "Subscribers," under date of Oct. 1st, 1840, that if seaweed is used to pack the space between the trough and the tree, there will be no danger of worms or insects injuring the bark under the seaweed. During the past season the troughs upon a large number of trees have been taken off to make them larger, where seaweed was used for packing, and the bark was found to be perfect where the packing had remained three years without being changed. I have been accustomed to observe seaweed for the most of my life in all the various situations in which it is used for farming purposes, and I do not remember ever finding a mouse nest or the nest of any kind of worm or insect in it under any circumstances; and those who cannot readily obtain seaweed should apply a few coats of whitewash, and if the lime is not effectual of itself, a little salt or copperas, or some other poisonous substance that will not injure the tree, will, I have no doubt, prove an effectual preventive, if hay, straw or corn husks are used for packing. Cotton waste, tow nor any other substance that will absorb the oil and hold it in contact with the bark of the tree, should never be used, as the oil is liable to kill the bark and of course the tree.

Thy friend, truly,

J. DENNIS, JR.

Portsmouth, R. I., 11th mo., 23d, 1840.

For the New England Farmer.

To THE EDITOR:—I notice in thy valuable paper of 10th mo. 7th, an article signed 'Subscribers,' complaining that "worms and other bad insects bedded themselves in the cotton between the lead and the tree." I wish simply to state for the information of all interested, that I have repaired a large number of troughs where seaweed was used for packing—that is, I took them off and made them larger and put them on again; and in no case had any damage happened to the tree, although the packing had remained three years without being removed, and the bark under it was as perfect and healthy as on other parts of the tree. Hence I conclude that when any have suffered damage, it is in consequence of their not using the right kind of packing.

Thy friend,

SAMUEL DENNIS.

Portsmouth, R. I., 11th mo., 30th, 1840.

*Management of Orchards.*—Before the ground freezes in autumn, dig the earth five or six inches deep round the fruit trees, and the distance of eight or ten inches from each; remove it to a suitable place and burn it with dry brush, or whatever combustible is convenient, to destroy the germ of the canker worm and other hurtful insects. Mix this burnt earth with lime or ashes, and a double crop may be expected next season.—*Nashville Agriculturist.*

POUDRETTE.

New York, Oct. 21st, 1840.

Mr J. Breck, Editor of the N. E. Farmer:

DEAR SIR—I was desired, a few days since, to send a barrel of Poudrette to your care for Mr J—B—, of C—, Mass., which I did; and sent one also to the address of Joseph Breck & Co., as the editors of the New England Farmer: they were put on board of schooner Benjamin Bigelow, Baxter, master, on the 16th inst., and I hope you will use that sent for your use in a manner to satisfy yourself as to the value of the article prepared by the "New York Poudrette Company"; as I wish it to stand or fall by its own merits, and not to be judged of by that furnished by others. In order to give you an idea of the opinion entertained of it by those who have used it several years in succession, I will give you an extract from a letter written by a practical farmer of intelligence, character and wealth residing on Long Island, (Wm. Wickham Mills, Esq.,) who has used it three seasons with very favorable results—and especially so on wheat the past season. Mr Mills says in a letter dated August 9th, 1840, that "My wheat came in well where I used poudrette last fall. It stood the winter well, and the berry is fine; but where I used bone, about the same cost per acre, in the same field, it was winter killed, and very much shrunk, and I should judge not half the number of bushels per acre. Where I used it this spring the results are very favorable. I used it on corn, side by side with the best yard manure, and so far it is decidedly the best, and I have no reason to doubt that it will continue so through the season. I also used it in my garden, and it never looked better. I have a good opinion of it, especially for spring use; and I should like to use some of it on wheat this fall, as it did so well the past season."

Where Mr Mills is known his opinions and statements are highly appreciated. You will also find a statement of his in the pamphlet which I send you, together with several letters from other gentlemen, practical farmers, of Long Island.

There has been much inquiry, and I may say doubt, as to its value for after crops, or for grass when applied to wheat on seeding down. Many persons suppose that Poudrette will not be a lasting manure. This is a question that could not be satisfactorily answered by me, as I knew of no one who could speak from experience, until this season, on account of the recent introduction and use of Poudrette. I am now, however, able to speak directly on that subject, and will give you one case in point, out of several.

Mr Brewster Wood, of Huntington, L. I., became a share holder in our company in December, 1837. In the year 1838 he used 150 bushels; and from his son, who worked on the farm, I have the following statement, viz:

"We used poudrette on corn in 1838, half a pint to the hill,\* along side of corn manured with stable manure, in what was considered equal value, and found that the poudrette produced the best corn. We tried it in that way three seasons in succession, with similar results. We also used it on wheat, applying 30 bushels in the fall and 30 bushels in the spring. The wheat was very good, and the grass following it was first rate. It has been mowed two years and the second crop was

\*The ordinary quantity used for corn is about one gill, or a handful to the hill.

better than the first. In 1839 we cut a crop of hay and then of clover in the fall from it. We also used poudrette on buckwheat—about 10 bushels to the acre, and its effects were beyond our expectations; whilst on a small piece adjoining, where no poudrette was used, there was not more than half a crop. A fine crop of oats was raised where poudrette had been used on corn the year before."

I might increase these statements if it were necessary, but it appears to me that it is not, as every farmer who will reflect one moment must come to the conclusion that it must be a valuable manure in all cases, but especially so to those who have to transport their manure to any considerable distance; and by way of illustrating its value to those living at a distance from a supply of manure, I will give you on the next page a comparative statement, showing the economy of using poudrette instead of stable manure, and also the additional economy to those who purchase stock in the "New York Poudrette Company." But in order to a fair comparison, it is proper to state that a bushel of poudrette may be estimated equal in value to one of our city cartloads of street manure, and a bushel and a half of poudrette as equal to one of our manure cartloads of stable manure, as it is sold here to the farmers at 50 cents per load.

I will now suppose three farmers, residing on Long Island, or in Connecticut, or elsewhere, at the distance of two, three or four miles from the landing, who are disposed, each, to manure ten acres of land every year for 5 years, and are obliged to bring their manure from this city. Farmer A uses stable manure, farmer B purchases poudrette annually, and farmer C takes stock in the New York Poudrette Company—and the accounts will stand something as follows at the end of five years:

No. 1. A manures 10 acres with 20 city cartloads of stable manure at 50 cts. per load,	\$100
Freight by sloop to the landing, 20 cts. per load, 200 loads,	40
Haulage from landing on to the farm, 20c. per load,	40

Total cost of manuring 10 acres as above per year,	\$180
	5

Total cost for 5 years,	\$900
-------------------------	-------

No. 2. B manures 10 acres with 30 bushels of poudrette per acre; 300 bu. at 35 cts.,	\$105 00
Freight on 300 bushels at 5 cts. per bu.	15 00
Haulage from the landing to the farm, 7 loads of 43 bu., at 75 cts. per load,	5 25
Bags to transport it in—50 bags at 22c.	11 00

Total cost of manuring 10 acres with 30 bushels of poudrette per acre per year,	136 25
	5

Total cost for 5 years,	\$681 25
-------------------------	----------

No. 3. C purchases three shares of stock in the New York Poudrette Company, which give him 300 bushels of poudrette annually, or the necessary quantity for 10 acres—and his account will stand thus:

Three shares of stock in the N. Y. P Co.,	\$300 00
Interest on the cost of 3 shares for 5 yrs. at 7 per cent.,	105 00
Freight on 300 bu. per year or 1500 bu. at 5 cents,	75 00

Haulage of the same from landing to the farm, 75 cts. per load,	26 25
Bags, 50 per year for 5 years, or 250 at 22 cents,	55 00

Total cost to a share-holder to manure 10 acres for 5 years,	\$561 25
--	----------

Showing a saving over B who purchases poudrette annually, of \$120; and over A who uses stable manure, of \$338 75. This great economy, however, is not the only advantage which the shareholders in this company have; it is indeed only the beginning of it, as the share-holder will be entitled to an equal quantity, or enough to manure his ten acres for thirteen years after the expiration of the first five years, with the cost only of transportation and bags; whilst A and B must encounter the same outlay every year.

I have endeavored to make this comparison in a manner not to be questioned; and it is within the facts where it speaks of the cost of transportation and haulage of stable manure, and it may be relied on; and should you find any thing in it of interest to those who cultivate the soil, you are at liberty to use it as best suits you.

Respectfully, yours,

D. K. MINOR.

ORCHARD GRASS—(*Dactylis Glomerata.*)

In England, where this grass is extensively cultivated, it is called "Round-headed Cock's-foot grass." It was introduced from Virginia into Britain about the year 1780, though it was little known or cultivated for many years after. This grass has been cultivated in small quantities in different parts of the United States; but from the many inquiries relative to its habits and worth, we conclude there is but little known of it in this country. Professor Low says, "it is justly held to be amongst the superior pasture grasses, and is suited for forage as well as for herbage. It is more nourishing in spring than in autumn, and requires to be closely cropped; for, when suffered to grow, it rises in tufts and patches, and loses greatly of its nutritive particles. Oxen, horses and sheep eat this grass eagerly. Cocksfoot should always be sown in combination with other grasses, as the rye grass, the meadow fescue (*festuca pratensis*) and other finer grasses."

George Sinclair, gardener to his grace the Duke of Bedford, ascertained from accurate chemical experiments, that the proportional value which this grass, at the time of flowering, bears to that at the time the seed is ripe, is as 5 to 7, nearly. The proportional value which the grass of the latter moth bears to that at the time of flowering, is as 6 to 10; and to that at the time the seed is ripe, as 6 to 14: 64 dr. of the straws at the time of flowering afford of nutritive matter 1.2 dr. The leaves or latter moth and the straws simply, are therefore of equal proportional value; a circumstance which will point at this grass to be more valuable for permanent pasture than for hay. The above details prove that the loss of nearly one third the value of the crop is sustained if it is left till the period when the seed is ripe, though the proportional value of the grass at that time is greater, i. e. as 7 to 5. The produce does not increase if the grass is left growing after the period of flowering, but uniformly decreases; and the loss of the latter moth, which (from the rapid growth of the foliage after the grass is cropped) is very considerable. These

circumstances point out the necessity of keeping this grass closely cropped, either with the scythe or cattle, to reap the full benefit of its great merits.

Mr Zechariah Cone, in the Oct. No. of the New Genesee Farmer, says—"As to the soil adapted to the growth of Orchard grass, I conceive that moist rich loam is the best, but I have found that when I have sown it among other grasses for pasture, it grows luxuriantly, and in cases of severe drought, when all other grasses are apparently dead, this stands the best, being all the time green and fresh. The best time for sowing the seed I conceive to be about the middle of July or first of August, as probably nature directs this the best time for sowing when the seeds come to maturity, which is about that time or earlier—to be dragged in on mellow land, yet I always stock in the spring with oats, at the rate of a bushel to the acre, and if the oats are not too heavy it generally grows well. Its value for hay, I think, stands as high as any other grass, and for feed and the second crop it stands pre-eminent, as it comes forward earlier in the spring and holds out longer in the fall. I usually cut from two and a half to three tons per acre, exclusive of the seed, which I reap before mowing in the same manner as I would wheat, and generally secure from 15 to 20 bushels to the acre. The second crop generally yields from one and a half to two tons per acre."

The writer last March sowed about a half an acre of Orchard grass in the corner of a lot sown down in timothy and herd's grass, that has been pastured with calves and sheep since July, but it has continued fresh and thriving all the time. There is no doubt it would be one of our most valuable grasses, did our farmers understand well its cultivation, and the manner of consuming it to the best advantage. From our experience and the information from others, we feel entirely safe in giving the following rules:

1st. Strong and loose ground is best for it, but it will bear shading and grow on land that will produce any other kind of cultivated grass. Let the ground be broken well, then harrowed, the seed sown, two bushels to the acre when alone, or one bushel with other grasses, then brush it lightly, roll it, and let it alone. If the season is favorable the set will be good.

2d. Mr Cone directs that the seed be sown in July or August, which is perhaps the natural and best time to sow all kinds of grass; but no one will doubt but February and March are good months for sowing. If the ground is properly prepared, the season favorable, there is perfect safety in sowing in the spring. A good stand of grass might have been secured, by sowing at any time from the first of last February till the last of September, of the present year, but such a season we may not soon see again. This grass does well with clover, herds grass and timothy.

3d. To get the full benefit of Orchard grass, it must be kept in mind that it has to be cut often or pastured closely to prevent it from growing in tufts and bunches.

It affords most nutritive matter also when not suffered to get entirely ripe. The hay if cut at the right time is sweet, and stock are remarkably fond of it.—*Nashville (Tenn.) Agriculturist.*

In France, potatoes are preserved perfectly sound from year to year, by placing them in a dry situation some three feet under ground.

## PLYMOUTH AGRICULTURAL SOCIETY.

### Report on Improvements.

MR PRESIDENT—The applications for premiums in the department assigned the Committee on Improvements have this year been unusually numerous. This circumstance alone is good evidence that the great objects of this Society are receiving more general attention than in past years. In the circuits we have made in the County, other and even stronger evidence of this fact has been presented; we have seen many farmers, not applicants for premiums, engaged in the praiseworthy labors of removing rocks, draining and subduing swamps, extending the area of their fields, making the cultivation easier, and ensuring more abundant crops. There is manifestly a gradual development of the powers of our soils: we hope the work will be encouraged and assisted till travellers will no longer discover any occasion to scoff at us as the mere occupants of sand-banks; till the just reproach, which is now pressing heavily on us, of purchasing more than half our bread stuffs, shall be entirely wiped away. The labor of this association, if prosecuted with a steady view to the promotion of an interest common to every citizen in the county, will have great influence in accelerating so desirable results.

Five claims were entered in May 1839, to the premiums offered for the renovation of swampy land. One claim has been withdrawn and another person prevented from operating by the wetness of the season has made a new entry for 1841. The improvements of the other claimants have been examined and the following awards are recommended.

The first premium \$25, to Perez Crocker, of North Bridgewater; the second \$15, to Nahum Snell, of West Bridgewater. A gratuity of \$5 and one vol. N. E. Farmer to Jonathan Copeland, of West Bridgewater.

The experiment in the application of manure for which a premium is offered, made payable in 1842, is in progress by Nathan Whitman, of East Bridgewater.

Only one regular entry has been made for the cultivation of mulberry trees and the production of cocoons. Lincoln Jacob, of Hingham, has 2600 trees and has fed 6000 worms. The Committee think favorably of Mr Jacob's perseverance and the knowledge he is yearly acquiring in this business, but believe we should not be justified in recommending the award of the first premium, as he reports only about 500 trees in addition to the number for which he received a premium the last year. We recommend a gratuity of \$5 and one vol. N. E. Farmer.

The following persons have entitled themselves to \$9 each for building stone wall—Ezekiel Bemis and Thomas H. Samson, of Pembroke; Nathl A. Eddy and John Wood, of Middleboro'; Barzilai Carey and Lyman Copeland, of North Bridgewater; Freeman Howard, Solomon Howard and Nahum Snell, of West Bridgewater; Jacob Noyes, of Abington, and Benjamin Brown, Jr., of Scituate. In consideration of the quantity of wall built by Mr Brown and various handsome improvements on his farm, we recommend that two vols. Yankee Farmer be given him.

The ranges of wall examined have generally been built in a very substantial and workmanlike manner. We are sorry to have occasion to complain again of the appearance of some built on the highway. Two of the claimants we think blame-

worthy in the neglect of appearances. Haste and carelessness in building wall are easily discovered in any subsequent examination of the work. In situations where many eyes are daily to view it, the builders will always do wisely in bestowing equal attention on breadth and height as on length.

Six regular entries were made of claims to the premiums offered for the collection of materials to enrich fields. We recommend the award of the first premium \$20, to Galen Manley, of North Bridgewater; the second \$15, to Salmon Howard, of West Bridgewater; the third \$12, to Freeman P. Howland, and the fourth \$10, to Chelsias Howard, of Hanson. We also recommend that two vols. Yankee Farmer be given to Nahum Snell, of West Bridgewater, and two vols. N. E. Farmer to Philip Brewster, of Hanson.

Several unseasonable entries have been made to which we have given no attention. Some of the claimants, who were only a single day too late, may think so trifling neglect should not have excluded them; but the observance of some rule is necessary, and if we could have justified ourselves in establishing one beyond that given us by the Trustees, it would have been extremely difficult, if possible, to determine where the stand should be made, as the irregular entries were out of time from one day to sixteen months.

Respectfully submitted,

MORRILL ALLEN,  
JOSHUA EDDY,  
JESSE PERKINS, } *Committee.*

Bridgewater, Oct., 1840.

### A STEAM BOILER WORTH HAVING.

T. Fanning, Esq., editor of the Nashville Agriculturist, gives the following account of a steam boiler of his invention:

"I have been studying some time how to construct a cheap and convenient steam boiler, sufficient to cook food for the horses, cattle and swine on my little farm, and I have at length succeeded exactly to my notion. I purchased a kettle holding 60 gallons, for which I paid \$9, and with the labor of two hands for one day I constructed a furnace out of rough limestone, the cost of which was one dollar more; I then made a box of rough plank, three feet square at the bottom, and high enough to hold about ten bushels; the box was perforated with many holes, by the use of a five quarter auger. The bottom of the box is made with planks 6 feet long, to afford projections to lift it on and off of the kettle. When the cooking process is going on, the top of the box is covered with a piece of carpet, or a close-fitting plank cover to keep in the steam. In using this apparatus, a bushel or two of corn or roots may be put in the kettle, and the box filled with cut oats, corn stocks, turnip tops, beets, potatoes, or any thing else that grows on the farm, and the whole may be thoroughly cooked in the course of an hour or two. The machine will not cost more than eleven dollars, and I consider it worth more on a farm than the best hand that labors in the field."

The tobacco crop in Virginia this year, is estimated at 60,000 hhds., being about 15,000 hhds. more than an average crop.

The silk trade was introduced into England in the 15th century. In the reign of Charles, in 1666, it gave employment to 40,000 persons.

NEW ENGLAND FARMER,  
AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, DEC. 9, 1840.

MERCY TO CATTLE.

Winter is now upon us in earnest, and the farmers will not, we know, be offended, if we should jog their elbow gently in regard to some of the duties which this season brings with it.

"A merciful man is merciful to his beast." Let every farmer think of this daily and hourly during this inclement season. Cattle are not so sensitive as men to the evils of the climate and the severe changes of temperature which we are obliged to pass through, for the obvious reasons that they are more habituated to exposure; that their living is simple; their passions quiet; and above all, their drink is pure water. By luxurious nursing they may be made almost as delicate and as liable to disease as the human species. This is seen in the race-horse, who is taken as much care of as a child, and becomes as tender and susceptible. But though much hardihood may be acquired by habit, and many severe endurance suffered without apparent sensibility, yet it must not be forgotten that these animals under all circumstances are flesh and blood; and therefore feel sensibly the pains of hunger, thirst, and cold; and are subject, likewise, to rheumatisms, colds, coughs, catarrhs, and other ills almost as numerous as the patent medicines advertised in our weekly papers for the benefit of the miserable of the human race. On the score of humanity then, the farmer should consider this. He should not sit down to a warm supper until he knows that his cattle have been well served; and when he lays in his warm bed, and hears the pelting storm of mingled rain and snow and hail beating upon the casements and the roof, his dreams should not be disturbed with the ghosts of half-starved cattle tied to their stanchions, so near to a good mow of hay that they can just touch it with their tongues but not extract a lock; and with the images of barn-doors off their hinges, barn-windows that cannot be closed, barn-floors, through the cracks of which the wind blows a gale; and poor shivering cows and horses lying down in their own ordure, which has not been cleaned out for a week, and with piles of snow around and over them in such abundance as to give the stable little preference over the open yard. We pity the farmer, who is obliged to dream of these miseries, and still more to find in the morning after a cold north-east snow storm that his most vivid dreams are only sober realities. We pity such a man because he is destitute of the best feelings of a man; but we pity his cattle still more. They are the real sufferers, without the possibility of complaint.

Another outrage we protest against, though it is too common to excite attention. We allude to the practice of leaving horses, taken often out of warm stables, and oftentimes driven hard, to stand hour after hour by day and night, exposed to the cold, to wait your pleasures. Sometimes this is done in going to meeting—a very good object, we admit; and if the horses come under the old-established rule that "nobody gets cold in going to meeting," why then we need not distress ourselves with concern for them. But whatever might be the case, if they were carried into the meeting house, we have doubts whether the efficacy of this rule applies to those who are kept out of doors to feel the bitter winds as they whistle round the corners of the great building; and we believe if these horses should be invited to the next Chardon street convention, they would join the

party for putting down the clergy and public worship, at least in winter time, or else be carefully blanketed and sheltered; and not while their masters and mistresses are drinking in the pure streams of orthodoxy, like ambrosia or nectar, along side of a warm stove, in cushioned pews and with bear-skins for their feet, they, poor things, without any benefit of the preaching, are obliged for their owner's sins to do penance out of doors in a white sheet of snow. We say, make provision for the comfort of the beasts who carry you to church, or else carry yourselves to church.

We should like to say a word here in behalf of city horses; but then it would be high treason to put a word in edgewise against the *rational* and *reasonable* and *truly christian* pleasures of that part of the creation, the rich and fashionable, for whose use and pleasure no doubt this world and all it contains were exclusively made; and therefore we nor the horses shall make any complaint. It is glory enough for any city horse or driver after being in the harness or on the box all day, to wait upon these people to their dissipations at ten o'clock at night, and to stand out shivering in the storm and cold until two or three o'clock in the morning.—What do these horses or their drivers want of rest or warmth? Can't they be satisfied with the *honor!* of transporting to their homes these graceful girls—an honor for which, in the case of Miss Elssler, the Baltimorean exquisites contended with their superiors the horses, and came off victorious? and can't these drivers be kept warm by hearing the music of the violin and hagle, and the popping off of the champagne bottles like a bunch of Chinese crackers; and occasionally peeping through the side windows and seeing the young swains and nymphs, in all the naturalness of pastoral life, clasping each other round the waist and knocking their knees and their toes together and whirling round like so many humming tops, in a *charming* and *modest* German waltz? One would think instead of being paid, these people ought to pay something for the privilege of witnessing these refined indulgences of the intellectual and fashionable; and of waiting until morning upon their pleasures; although it does rob them of sleep and breaks up all the quiet of their families.

But we have got off the track, locomotive and all.—We began with talking about mercy to the dumb beasts. Now farmers, we say it with all good will and respect, do look about you. See that your cattle are made comfortable. Do not let them be unnecessarily exposed to the cold. We would not have the temperature of your stables too warm. But there is little danger of this; and remember that they may better be exposed in open sheds, than to be tied up in barns full of cracks and crevices, where the cold wind blows upon them in some single minute streams; as you know how much more liable you yourself are to suffer from a little stream of wind upon the back of your neck or some other sensitive part, through a broken pane of glass in a room which they have forgotten to stop up with an old hat or a red petticoat, than from an open door, or indeed, in many cases, than you would be uncovered out of doors.

Keep your cattle clean and dry. Feed them regularly and in small quantities at a time. In a large barn with a large herd of cattle, a man should be kept constantly handing them their hay and provender in small quantities during the feeding hours. See that they are carefully carded and kept smooth. Your cows with calf require particular care and attention. They have two months to feed instead of one. Let their watering place be sheltered and easily approached; and give them the water warm from the well rather than that

which is mixed up with ice in the trough. In fine, care for them as you would for your children. Remember that they are flesh and blood like yourself. If they are not human yet they demand humanity of you, whom God has made human that *you* might take good care of *them*. The better care you take of them, the better care they will take of you. They feed you; they clothe you; they wait upon your pleasures. They are dependent upon you and entrusted to your care. They are even destitute of the power of resistance or complaint; and what sort of an animal is he, does he call himself a man! who, under these circumstances, will abuse or neglect them?

This sermon is long enough for this occasion, but we mean to preach upon this text again, as the minister says, "at a more convenient season." H. C.

TEMPERANCE.

In the political whirlwind which has recently passed over the country, many good enterprises have been, if not wholly wrecked, at least for a while laid prostrate with the ground. Time only can show whether they will ever come up again. Of some, we confess our hopes are faint; but of others we never will despair, while life lasts, while reason holds its place, or until the clouds of atheism shall settle in thickest darkness over our minds. May a merciful Heaven preserve us from such a calamity.

Among the great causes of the highest humanity which we trust will live and flourish, that of temperance holds a place scarcely second to any. Yet even this cause has been for awhile merged in the muddy sea of politics; and possibly there are those, who have thought it "gone for good." But, thank Heaven, it is not so; and some of the members of the Humane Society, the *truly* Humane Society, have dragged it again to the surface; and have so far resuscitated it that it breathes once more and gives indubitable signs of life; thanks to their divine art, and a perseverance in good, which can only be breathed into their souls from Heaven.

We refer in this matter to a meeting held in Boston on Sunday evening last, to inquire if any thing, and, if any thing, what could be done, to arouse the interest in this great subject, which has so long slumbered; and to place this glorious object again upon the pedestal from which it had been rudely thrown.

The meeting, on account of the violence of the storm, was not so fully attended as was hoped; but we saw there many old faces, still radiant with hope; and heard some voices of old friends eloquent still with encouragement and the imperative commands of duty. Let them sound the hagle still louder, and rally the scattered hosts.

There is no class in the community more interested in the cause of temperance than the farmers. There is no class in our whole community, who have been more benefited by the progress already made than they have been. Out of the whole number of farmers in Massachusetts, and our observation is somewhat extensive, not one in thirty, we believe, gives or uses or suffers to be used one drop of ardent spirits upon his premises. What a blessed revolution this is! Many a farmer, who was fast verging towards the Maelstrom of mortgage and foreclosure through his intemperance, has been rescued from the brink of destruction and now stands out in the proud consciousness of a freehold possession.

But what shall we do that we may further this great cause? Laws are impotent, where public opinion is arrayed against them. Public opinion is sovereign where it can be brought to bear in all its force upon almost any subject. The purification of public opinion, therefore,

the putting that right and keeping it right, is that object at which the friends of temperance should direct all their efforts. Women, among us, are comparatively sober. A drunken woman is looked upon with shame and abhorrence even by the most degraded drunkard himself, if he ever has a lucid moment. Let public opinion then be brought to that point that it shall be considered equally disgraceful for a man to go to a bar and drink as it would be for a woman to do so; and as infamous and disgraceful for him to be found disguised in liquor as it would be for her to be seen rolling in the gutter. It is so in fact, whether we think so or not; and it is for us, by presenting the subject to the public constantly, and in its just aspects, to bring the public judgment in this case to its proper bearing. We believe that it can be done: God grant that it may be done. H. C.

**BRIGHTON MARKET.—MONDAY, DEC. 7, 1840.**

Reported for the New England Farmer

At Market 800 Beef Cattle, 420 Stores, 3300 Sheep and 300 Swine.

Several hundred Beef Cattle unsold.

Prices.—Beef Cattle.—We quote First quality \$5 25 a \$5 50. Second quality, \$4 50 a 4 75. Third quality, \$3 25 a \$3 75.

Barrelling Cattle.—Former prices could not be obtained, and a few sales only were made. Several of the large Barrellers have finished slaughtering for the season. The following prices were offered, viz: Mess \$4 25. No. 1 \$3 75; No. 2 \$3 00.

Stores.—Yearlings \$5 00 a 8 50, Two Year Old \$11 a 18, Three Year Old \$21 a 27.

Sheep.—Lots \$1 25 \$1 33, \$1 42 \$1 62, \$1 88, \$2 25, and \$2 50.

Swine.—Two lots to peddle at 3 1-2 and 4 1-2. At retail, from 4 to 5 1-2.

**THERMOMETRICAL.**

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northernly exposure, week ending Dec. 6.

Dec. 1840.	7 A.M.	12, M.	5, P.M.	Wind.

Sunday,	6	12	30	E.

**POUDRETTE.**

This valuable manure may be had on application to the subscriber, at the office of the "New York Poudrette Company," No 120 Nassau street, New York. It is in-odorous, and may be transported in barrels, on board of any vessel or steamboat, without offence—and it will be found an exceedingly valuable article as a fertilizer on any soil, and for any crops; but more especially for gardens and flowers, as there are no foul seeds in it. Poudrette has been used for three seasons with entire success on Long Island, by many practical farmers, as may be ascertained from letters and statements made by them, and published at this office in a pamphlet containing also the "act of incorporation," granted to the Company by the Legislature of the State of New York; and other facts in relation to the subject. Price 35 cents per bushel. Barrels cost 25 cents each, and hold 4 bushels. Persons wishing to make an experiment on a small scale can obtain one barrel by enclosing a two dollar current bank bill—or three barrels by enclosing five dollars, free of postage. On receipt of the money the article will be put up and forwarded as directed.

\* Price of shares, one hundred dollars—which entitles the holder to one hundred bushels of poudrette annually, during the term of the charter; fifty bushels in time for spring use, and fifty bushels in time for fall use. Shares taken soon, will be entitled to the spring dividend—and, if desired for experiment, a few bushels may be had this fall.

All orders, or applications in relation to the business, must be made to the subscriber, 120 Nassau street, New York.

D. K. MINOR.

I wish it distinctly understood that the "New York Poudrette Company" is in no way connected with the "Lodi Manufacturing Company," of which Anthony Dey and Peter Barthelemy are, or were, the managers.

Dec. 9, 1840. 3m. D. K. M.

**SILVER FIR AND SPRUCE SEEDS.**

Just received at the New England Farmer Office, a few Bushels of the seed of the Silver Fir, Spruce. Also—English Oak, a fine specimen; Spanish Chestnuts, (very large); with a variety of other tree seeds.

Nov. 10, 1840. JOSEPH BRECK & CO.

**WILLIAM PRINCE & SON**, Flushing, near New York, offer their usual very extensive assortment of Trees, Shrubs and flowering plants, a most splendid assortment of Bulbous Roots and Dahlias, including all the new varieties, and the most magnificent collections possible of Chioia, Roses, Camillas, Chinese Azaleas, Geraniums, and other Green House Plants. Also Garden and Agricultural Seeds, all of which will be sold low to suit the times, and a large discount made for cash.

Mulberries of all the different kinds for Silk, including the New Circassian with monstrous loilage and perfectly hardy character.

Orders sent by mail will receive prompt attention and priced Catalogues will be sent to all who apply post paid. Nov. 23 3w.

**GREEN HOUSE PLANTS, &c. &c.**

The subscriber can furnish every variety of Green House Plants or Garden Shrub, in the very best order. Also—Dahlia roots, (all the new varieties); Black Hamburg, Sweetwater, and Isabella Grape vines; Roses and Pæonies; Honeysuckles, and other creepers; Black, White, and Red Currant trees; White and Red Antwerp Raspberry vines; Asparagus and Rhubarb roots, &c.

Orders by mail will be promptly and faithfully executed; or they can be forwarded to, or left with J. Breck & Co

JAMES L. F. WARREN,

Oct. 23. Nonantum Vale, Brighton.

**GRINDSTONES.**

An extensive assortment of Water and Hand Grindstones constantly on hand and for sale by AMMI C. LOMBARD & CO. 13 Lewis's Wharf. 1840. Nov. 17.

**WILLIS'S LATEST IMPROVED VEGETABLE CUTTER.**

For sale at the New England Agricultural Warehouse, No. 51 and 52 North Market Street, Boston, Willis's Latest Improved Vegetable Cutter. This machine surpasses all others for the purpose of cutting Ruta Baga, Mangel Wurzel, and other roots. The great objection to other machines, is their cutting the roots into slices, which makes it almost impossible for the cattle to get hold of them; this machine with a little alteration, cuts them into large or small pieces, of such shape as is most convenient for the cattle to eat. It will cut with ease from one to two bushels of roots per minute.

JOSEPH BRECK & CO.

Oct. 23.

**FARM FOR SALE.**

The subscriber offers for sale that valuable Farm, situated about 3-4ths of a mile below the First Parish Meeting House, on the Stage road, and commonly known as the Judge Prescott farm, containing about 170 acres of superior land, in a good state of cultivation, with two dwelling houses, four barns, and other out buildings. The farm is remarkably well watered with soft water, conveniently fenced, has nearly forty acres of large, handsome wood and timber standing on it, with an orchard of grafted Apple, Pear, Peach, Plum, and Cherry trees, and might be easily divided into two Farms. The estate will be sold reasonably. If five thousand dollars be paid on receipt of the deed, the remainder may lay on mortgage to suit the convenience of the purchaser. For further particulars, apply to the subscriber, living on the premises.

WM. SALISBURY.

Groton, Oct. 26. 1840. eow.

**FRESH GARDEN SEEDS.**

We would inform our customers and friends that we are now receiving our supply of fresh Garden Seeds, most of which have been raised under our own inspection, from fine selected roots; which we warrant to be of the purest quality of the growth of the present season.

Agricultural Books. Agricultural Implements. Seed and Implement Catalogues sent to all applicants gratis, and all orders promptly attended to.

JOSEPH BRECK & CO.

## MISCELLANEOUS.

## ORIGIN OF VARIOUS FRUITS, &amp;c.

## RAISINS.

In Spain and Turkey, where the vine grows naturally and luxuriantly, if the grapes be gathered and dried in the sun they keep their flavor best. In many instances they are dried in ovens, but in this mode they do not retain their exquisite taste so well, though the process being more rapid, the greatest bulk of this kind of fruit brought over to America, is thus prepared. Commerce, dealing in quantities, must often make the quickest, or the cheapest mode.

When they dry raisins in the sun, they frequently tie together two or three neighboring bunches, and while yet on the vine, dip them into a hot lie of wood ashes, having in it a little olive oil. The effect is, slightly to shrivel and harden the skin. In a few days, the bunches are cut off, and dried in the sun. Those called raisins of the sun, and jar raisins, are managed in this manner. Some of them have a fine blue bloom upon them; and some seem almost candied over with their own sugary sweetness.

Malaga raisins come from that part of Spain so called. Smyrnas come, as the name intimates, from Smyrna in Asia Minor. But these fruits, though excellent for making wine, are not reckoned fit for the table.

## ALMONDS.

The tree which produces almonds nearly resembles the peach, both in leaves and blossoms. It grows spontaneously only in warm countries, as Spain, and particularly Barbary. The almond harvest, in the island of Majorca, is a very merry season. Almonds are of two kinds, sweet and bitter; the Jordan almond is of the highest quality, and the bitter almonds are mostly from Barbary. The best almonds are exported from Malaga. In medicine, the oil drawn from almonds is found useful; and that extracted from the bitter one, if dropped into the ear, proves efficacious in cases of deafness.

## FIGS.

Figs are much cultivated in the Archipelago, where they serve almost as bread to the inhabitants. The best are those which come from Turkey, packed in cases or drums. While fresh, they are excellent eating; and like grapes, they are dried sometimes by the sun, and sometimes by fire. They are covered with the candy of their own sweetness, and are full of a delicious seedy pulp. Figs of a good quality grow in the southern states.

## PRUNES.

Prunes were once plums. Some very rich ones neatly done up in little baskets, are called French plums. The prunes have been dried in an oven. They come to us chiefly from Bourdeaux.

## ORANGES.

Oranges are thought to have been originally brought from China. They were introduced into Portugal many years ago; and it is said that the very tree first planted there is still alive; and it is that from which all the orange trees of Europe have been produced. A great many oranges are brought from Seville, in Spain, and the island of Malta, situated in the Mediterranean, furnishes an abundance. Oranges come to great perfection in the West Indies, and those of the Bermudas are of

an extraordinary size. Oranges are sometimes raised in green houses with success; and they thrive tolerably well in the southern states, but do not form an article of extensive exportation from thence.

## LEMONS.

The ports of Lisbon and Malaga, are the principal shipping places of lemons; and they come packed in cases and boxes. They are always shipped while green, and generally become quite yellow before they reach this country. The lemons of the Bermudas are large, and of fine flavor.

## CITRONS.

The citron is a sort of a lemon, but larger, finer, and more fragrant. They are brought preserved from Maderia. They grow likewise to great perfection in many parts of Italy.

## TAPIOCA.

Tapioca is a species of starch or powder, prepared from the roots of the *Jatropha manihot*, an American plant. The roots are peeled, and subjected to pressure in a kind of bag made of rushes. The juice which is forced out is a deadly poison, and is employed by the Indians to poison their arrows; but it deposits gradually a white starch, which, when properly washed is innocent. What remains in the bag consists chiefly of the same starch. It is dried to smoke, and afterwards passed through a kind of sieve. Of this substance the cassara bread is made, as well as our excellent modern puddings.

## ARROW-ROOT.

Arrow-root is the pith or starch of the root *Maranta mundinacea*. It has received its common name from its being supposed to be the antidote to the poisoned arrows of the Indians. The powder is prepared from roots a year old. It is reckoned a wholesome and nutritious food; it is often adulterated, when in the shops, with the starch of flour or potatoes. It is a native of South America; but it has long been introduced into the West Indies, where it forms a pretty important article of cultivation.

**THE WONDERS OF HORTICULTURE.**—Innumerable are the advantages which mankind have derived from the horticulturists. Few would suppose that the peach (from which branched the nectarine) had its origin in the wild lime. That favorite edible, colery, springs from a rank and acid root, denominated snallage, which grows in all sides of ditches, and in the neighborhood of the sea. The hazlenut was the ancestor of the filbert and cabnut, while the luscious plum can claim no higher source than the sloe. From the sonac crab issues the golden pippin, and the pear and cherry originally grew in the forest. The garden asparagus, which grows, though not very commonly, in stony and gravelly situations near the sea, when growing spontaneously is a diminutive plant; and none indeed but a practised eye, examining into the species which is reared by artificial culture, can discern the least resemblance. Wondrous to relate, the cauliflower, of which the broccoli is a sub-variety, derives, together with the cabbage, from the colewort; a small plant, in its natural state, and scanty leaves, not weighing half an ounce. The Craube Maratima, which is found wild adjacent to the sea, has been improved into sea-kale; the invaluable potato is the offspring of

a bitter American root of spontaneous growth; and the all tempting pine-apple descends from a fruit, which, "in foreign climates, grows wild by the side of rivulets, and under the shade of lofty trees.—*Gardener's Gazette*.

**THE ATMOSPHERIC RAILWAY.**—The English have succeeded in propelling huge rail road cars, at the rate of thirty miles per hour, "by means of the atmosphere forcing its way into an exhausted tube or pipe laid down between the rails." A London paper reports, that experiments have been attended by the Government Commissioners, Sir Frederic Smith and Professor Barlow, with the greatest satisfaction. "Several of the most eminent engineers and practical men were also present, and expressed themselves perfectly satisfied with the results." It must seem wondrous to those who have been accustomed to seeing the "cumbersome locomotive engines roaring and smoking along the lines of a rail road," to view them moving with such speed, without any perceptible power to put in motion the vast machinery. The world is ever learning, but will never be able to come to the knowledge of the truth.—*Nashville Agriculturist*.

Dr Franklin said, "When I see a house well furnished with books and newspapers, there I see intelligent and well informed children; but if there are no books or papers, the children are ignorant if not profligate."

Just so. The doctor was a sensible man. A newspaper in every family—a Bible in every family—and a school in every district—all valued and studied as they deserve to be—are the principal supports of sound and civil liberty.

## GREEN'S PATENT STRAW CUTTER.

JOSEPH BRECK & CO. at the New England Agricultural Warehouse and Seed Store Nos. 51 and 52 North Market Street, have for sale, Green's Patent Straw, Hay and Stalk Cutter, operating on a mechanical principle not before applied to any implement for this purpose. The most prominent effects of this application, and some of the consequent peculiarities of the machine are:

1. So great a reduction of the quantum of power requisite to use it, that the strength of a half grown boy is sufficient to work it efficiently.
  2. With even this moderate power, it easily cuts two bushels a minute, which is full twice as fast as has been claimed by any other machine even when worked by horse or steam power.
  3. The knives, owing to the peculiar manner in which they cut, require sharpening less often than those of any other straw cutter.
  4. The machine is simple in its construction, made and put together very strongly. It is therefore not so liable as the complicated machines in general use to get out of order.
- Oct. 14.

N. E. FARMER.

From the Journal of the English Agricultural Society.

### AN ESSAY

*On making Compost heaps from liquids and other substances; written on the evidence of many years experience.*—To which the prize of ten sovereigns was awarded.—By JAMES DIXON, Esq., Secretary to the Manchester Agricultural Society.

The force and power of an agriculturist to produce good crops mainly depends on the manures he can command; and how to derive the greatest possible benefits from his immediate resources is one of the most useful subjects that can engage his attention. The English Agricultural Society having offered a premium for the best mode of making compost heaps, I venture to forward the committee my ideas on this most important branch of rural management; and in doing this I shall state the course I have pursued in this particular for many years, and in which every additional experience inclines me not to make any systematic alteration.

My farm is a strong, retentive soil, on a substratum of ferruginous clay; and being many times disappointed in what I considered reasonable anticipations of good crops, I determined on a new system of manuring. Though quite satisfied of the expense which would necessarily be incurred by my plan, I still determined on its adoption. At the onset I effectually drained a considerable part of my farm. My next object was how to improve its texture at the least cost—(perhaps I may be allowed to state that my holding has always been at rack-rent); for this purpose we carted great quantities of fine sawdust and peat earth or bog; we had so far to go for the latter, that two horses would fetch little more than three tons in one day—one horse would fetch three cart-loads of sawdust in the same time. Having brought great quantities of both peat and sawdust into my farm yard, I laid out for the bottom of a compost heap a space of considerable dimensions, and about three feet in depth: three fourths of this bottom was peat, the rest sawdust; on this we conveyed daily the dung from the cattle sheds, the urine also is conducted through channels or wells for its reception,—one on each side of the compost heap;—common water is entirely prevented from mixing with it. Every second day the urine so collected is thrown over the whole mass with a scoop, and at the same time we regulate the accumulated dung. This being continued for a week, another layer, nine inches or a foot thick, of peat and sawdust (and frequently peat without sawdust) is wheeled on the accumulated heap. These matters are continuously added to each other during winter, and in addition once in every week never less than 25 cwt., more frequently 50 cwt., of night-soil and urine; the latter are always laid next above the peat or bog earth, as we think it accelerates their

decomposition. It is perhaps proper here to state that the peat is dug and exposed to the alternations of the weather for several months before it is brought to the heap for admixture; by this it loses much of its moisture. In some cases, peat contains acid or astringent matters, which are injurious to useful vegetation. On this I have not tried any decided experiment, but am led to the supposition by frequently seeing stones, some in a partial state of decomposition, others wholly decomposed in bogs, and at the depth of several feet from the surface. Some years' experience has convinced me of the impropriety of using recently dug peat; proceeding in the manner I recommend, it is superior and more convenient on every account—very much lighter to cart to to the farm-yard or any other situation where it is wanted; and so convinced am I of its utility in composts for every description of soil, except that of its own character, that wherever it can be laid down on a farm at less than 4s. per ton, I should recommend every agriculturist and horticulturist that can command it, even at the cost here stated, to give it a fair trial. So retentive and attractive of moisture is peat, that if liberally applied to any arid, sandy soil, that soil does not burn in a dry season, and it so much improves the texture and increases the produce of an obdurate clay soil, if in other respects rightly cultivated, that actual experience alone can fairly determine its value.

For the conveyance of night-soil and urine, we have the largest and strongest casks, such as oils are imported in; the top of which is provided with a funnel to put the matters through, and the casks are fixed on wheels like those of a common dung-cart. For the convenience of emptying this carriage, the compost heaps are always lower at one end; the highest is where we discharge the contents, in order that they may in some degree spread themselves over the whole accumulation: the situation on which the wheels of these carriages stand while being discharged is raised considerably; this we find convenient, as the compost heap may be sloped six or seven feet high: low compost heaps, in my opinion, should be avoided. The plan here recommended I have carried on for some time. I find no difficulty in manuring my farm over once in two years; by this repetition I keep up the fertility of my land, and it never requires more than a moderate application of manure.

I am fully aware that there are many localities where neither peat nor night-soil can be readily obtained; but it is worth a farmer's while to go even more than twenty miles for the latter substance, provided he can have it without deterioration: the original cost is often trifling. On a farm where turnips or mangold are cultivated to some extent, the system here recommended will be almost incalculably advantageous; a single horse is sufficient for one carriage—mine hold upwards of a ton each; six tons of this manure in compost with peat, or, if that is not convenient, any other matters, such as ditch scourings, or high headlands which have been properly prepared and laid dry in a heap for some time, would be amply sufficient for

an acre of turnips or mangold. This manure is by far the most invigorating of any I have ever yet tried; bones in any state will bear no comparison with it for any crop; but it must be remembered that I write on the supposition that it has not been reduced in strength before it is fetched.

Convenience frequently suggests that compost heaps should be raised on different parts of a farm; but, unless in particular instances, it is well to have them in the yard: in the farm-yard, all the urine from the cattle stalls may be employed with the greatest economy; and be it remarked that the urine from animals, in given weights, is more powerful than their solid excrements.\* How important then must it be to the farmer to make the most extensive and the most careful use of this liquid. It is sometimes carted on the land, but that practice will not bear a comparison with making it into composts in the manner here recommended. Great waste is often made in putrescent manures after they are carted on the land; instead of being immediately covered or incorporated with the soil, we not unfrequently see them exposed for days together in the hot rays of a scorching sun, or to the injurious influences of a dry wind. I have before stated that compost heaps should on many considerations be raised in the farm-yard; still circumstances are frequently such that it is more proper to make them at some distance in the fields. If a headland becomes too high by frequent ploughings or working of the land, in that case it should be ploughed at the time when clover or mixed grass seeds are sown with a white crop, for instance, barley or oats, and clover for the year following: a headland might then be ploughed, and a number of cart-loads of some manure heaped from one end to the other. Immediately after this it should be trenched with the spade (or what is sometimes called digging,) and ridged high, in order that an action should take place between the soil and manure; by this means the mass would soon be in a condition for turning over, and any ditch scourings, or other matters which had not in the first instance been used, might now be added to the mixture. The heap should then be allowed to remain closed for a few weeks, then turned over again; at this turning, in all probability, the mass would be much reduced; if sufficiently reduced, raise the ridge of compost well on both sides, but, instead of its top being pointed, make a trench or cavity on the top from one end of the heap to the other. This cavity should be made tolerably retentive of moisture, which may be effected by treading with the feet; carriages of night soil or urine from the cattle stalls may then be emptied into the trench, and the bulk of the heap would determine how many were required; this being done, a little earth should be thrown into the trench, and the heap allowed to remain in that state until the middle or latter end of autumn; it will then be ready for another turning; but at this time care must be

\*This must be taken with some limitations, for urine contains 90 to 95 per cent. of water; and unmixed dung contains all the salts of urine, besides much mucus and other substances.—W. L. RHAM.

taken to have the heap well made up at the sides and pointed at the top; in this situation rain will be thrown off, and the compost preserved dry until winter presents some favorable opportunity for laying it on the young clover, wheat, or for making any other use of it which may be required.

The beneficial effects of top-dressing young clovers or mixed grass seeds is scarcely ever regarded with due attention. By this help crops are not only much increased, even 30 or 50 per cent., but they are also ready for cutting much sooner, which in a backward spring gives the stock farmer inestimable advantages for sorting his cattle, and thereby raising manure at his pleasure. The full effects of this practice I first experienced in the dry season of 1826: I had some clovers which had been manured the previous winter; my land was soon covered with crop, and that so vigorous a one, that the hot weather did not overpower it. My cows that summer were tied up during the day-time, and in the night they were turned out into the pastures; most of the stock in my district were much distressed from over-heat as well as from being short of food for some weeks; milk yielded little butter, scarcely any for a time was offered in our large market town:—no doubt that year will be remembered by many gentlemen on the Agricultural Society's committee. I, however, was under no difficulties on account of the season: my clovers produced plenty of food for my cattle, and in return they yielded as much milk and butter as I ever recollect from the same number. I am persuaded that the same satisfactory results would have followed if the same system had been adopted for feeding stock; it was that year my attention was first directed to raising compost heaps from urine. This I now do frequently without the help of any dung from the cattle-stalls; the same occasion called my mind to another matter well worthy every farmer's attention—I allude to the great superiority of the manure raised in summer soiling to that produced in the stalls during winter. I verily believe the difference is fifty per cent. unless stock are fed in a great measure during winter with artificial food. In an arrangement for making compost heaps from urine, I would recommend a receptacle to be made at the back of the cattle stalls just outside the building; this should hold about 20 cartloads of mould, or any other matters to be employed; if its situation were a little lower than the cattle-sheds all the urine would pass into it, and remain there until the mass is completely saturated, which will be sufficient; when the earthy matters are covered over with it, the compost may then be thrown out and the proceeding again renewed. In order to show part of the benefits of this practice, I beg here to observe that the most foul or weedy mould may be used; the action of the urine, if not reduced by water, is so powerful, that wire-worms, the black slug, many other destroying insects, and all vegetables, weeds, &c., when in contact with the urine for a time are deprived of their living functions. The situation for raising this compost should be protected from the weather by a covering similar to a eart-shed; indeed, the deteriorating influences of rain, sun, and arid winds, on all putrescent matters or compost are so serious, that in my humble judgment it would be worth while to have places under cover where these are usually laid down.

I beg to conclude this essay with some observations made on a former occasion: No amelioration connected with the rural art is of more lasting im-

portance than correcting the constitutional defects of a soil. The best horticulturists and market-gardeners are many of them perhaps, unacquainted with the theory, yet perfectly understand the great results from that practice; and in this particular information they are all of them superior to many practical farmers. How often do we see a stiff soil sterile in a great degree from that cause only; yet in the vicinity of a sandpit and adjoining most bogs there is a considerable breadth of coherent land, which might be made double its present value by judicious and liberal top-dressings of peat, which is also unproductive from causes of a contrary nature. The present poverty of many extensive tracts of land is a manifest exhibition of the want of skill or enterprise of their owners and cultivators.

From the Albany Cultivator.

### THE SHORT HORNS AND HEREFORDS.

I have been for some years a subscriber to the Cultivator, and have been much instructed by the frequent notices of fine specimens of stock that have from time to time appeared in different numbers. Of late those notices, generally accompanied by a beautiful portrait, have become more frequent, and so far as I have had an opportunity of forming a judgment upon the plan, it is a good one—the youth particularly, are attracted by the picture, and are anxious to read about it and see what it is. This generally creates a taste, and often enlarges it where it has been already created, and the results in both cases are highly beneficial.

The only objection I see to the present strife about cattle is, that the object mainly appears to be, who shall produce the *largest* specimen of the species. Other considerations appear to be generally merged in this. Whether or not this will be productive of good to the country, is a question it would be well for the community to examine closely. The opinion that the domestic animals of a country should be well suited to the usual and ordinary accommodations that can be conveniently had for them, meets with universal approbation. Now, if the great strife is, who shall produce the most extraordinary animal, of course extra food and accommodation of every kind must be provided for all the stock intended for competition, often to the manifest injury of the other stock of the same farmer—a very few “brag beasts” are kept, and often a large number of cattle that are not worthy of commendation.

Another matter of surprise, not only to me but to many others who derive their book knowledge of these matters from your paper, is the effort now apparently making both in England and America to elevate a different breed of cattle over the heads of the Durhams. I have particularly examined the account of the recently imported Herefords in the few last numbers of the Cultivator, and read the appended recommendations. I have never seen a sample of the Herefords, but have been familiar with their history as recorded by Mr Youatt, in his work on British Cattle; and taking the text as laid down by him minutely, the recent discoveries of excellencies in these cattle, calculated to place them before the Durhams or Short Horns, have been matters of considerable surprise. This, to some of the advocates of the Herefords, may sound strange; but the strangeness of the observation will disappear, if they examine fully the chapters devoted by Mr Youatt to the different breeds of

cattle, in what may be now, strictly speaking, called their native country. If I understand the work referred to, the engravings in it are calculated for correct representations of the living animals, and, independent of the writings, they alone will be sufficient to satisfy any breeder that some of the allegations made of the superiorities of the recent importations of Herefords, if they resemble their progenitors, cannot be correct. If these statements are correct, and the appearance and test of the animals will prove it, then “improvement has been extended to them.” If they have now properties that the breed in the time of Youatt's writings had not, it is a very important question to know how they have acquired those properties. Mr Youatt says, “the Hereford cow is apparently a very inferior animal. Not only is she *no milker*, but even her *form* has been sacrificed by the breeder.”—These observations of positive facts, for such we must take them to be when from a standard work, do not read well with the recent assertions of Mr Sotham and Mr Bement—the first of whom holds out the idea that they are *equal* to the Short Horn or Durham, and the latter that they are very good milkers and large. The little gentleman, however, states that he has understood their qualities for milk have been “recently improved.” How have they been improved in their quality for milk? Not certainly by breeding among themselves, for the trite and true axiom is settled, I believe, that “like will beget like.” If then the Herefords in the time of Youatt, and for years before that, were “no milkers,” how has the present improvement in that quality been effected? It must have been by the aid of some other breed, celebrated for their possession of that quality, and by whose aid, also, the *form* of the Hereford cow has been so materially improved; for Mr Sotham says, his are fine looking animals, and so says Mr R. L. Allen, if I recollect right, who states that he saw them near Albany.

Now, Messrs Editors, may it not be possible that we are at the commencement of another “stock mania,” by which John Bull is about to realize thousands from the farmers of America, by selling them a compound breed of beautiful cattle, the essential qualities of which have been derived, and that very recently, from the Short Horns, that we have been making heavy importations of, for years back? Let any candid man answer the question to his own satisfaction. See what the Herefords were—hear what they are now, and then say if there is any impropriety in charging their admitted “recent improvement” in points in which the Short Horns excel, to an admixture with them. If such is the fact, and we have a number of the finest specimens of the Short Horns, cannot we, by judicious crossings and attention to these matters, form for ourselves, if I may be allowed the expression, a breed of grade cattle, without expending enormous sums to pay our transatlantic neighbors for doing work that we ought *now* to do for ourselves? The state of the times is such as to call loudly upon every man in every station of society to do his duty to himself and to his country; and I state it boldly, without fear of contradiction that there is now abundant materials in our own country, to remain by judicious breeding, the purity of the full bred Durham, and to commingle their perfections with the stock of our own country, in such a manner as to produce a race of animals equal to that of any other country under the sun, for dairy properties as well as for the butcher.

It appears to me that the community—for there in part the fault lies—lay too much stress upon the fact of “recent importation.” The breed is than said not to have deteriorated, &c. Now we all know that the importation of stock has been carried on ever since the settlement of the country more or less, and we also know, if there is any truth in certificates, that we have hundreds of the best samples of horses, cattle and hogs, now in America, of different breeds and different families of the same breed, and admittedly enough to start with. Now let us see a little *American* spirit displayed, and a large amount of determination diffused among our farmers and others, to foster and encourage those who have expended their money and spent their time in procuring and rearing a superior breed of cattle and swine. The idea of deterioration, where proper attention is paid, is all ideal; the race of man, all will readily admit, has not deteriorated. Why then should cattle? Let our character as agriculturists and stock breeders be stamped with more nationality, and let us foster our own enterprising breeders. Let an *American Herd Book* be opened, and breeders be fully assured of the quality of the animals they purchase, and let them prefer purchasing from American breeders, and the race of cattle and swine will be no worse than those we are paying large prices for, and running the risk of carrying across the Atlantic.

Respectfully, yours,

J. H. HEPBURN.

From the Farmer's Cabinet.

#### CORN-COB MEAL.

SIR,—As the question of the value of the cob in feeding, when ground with the corn, is again coming into consideration, perhaps the following extract from “Steward's Stable Economy” might go far to decide it, in the minds especially of those who know that the cob is equal in *quantity* to the corn—the only consideration which is necessary in the present stage of the question: on some future occasion, it may be shown that the cob itself is fully equal in *quality* to the same quantity of oats for this purpose.

“Condensed food is necessary for fast working horses; their food must be in less compass than that of the farm or cart horse, but to this condensation there are limits. Grain affords all, and more than all, the nutriment a horse is capable of consuming, even under the most extraordinary exertion; his stomach and bowels can hold more than they are able to digest; something more than *nutriment* is therefore wanted, for the bowels must suffer a moderate degree of distension, more than a wholesome allowance of grain can produce: they are very capacious; in the dead subject more than 30 gallons of water can be put into them; and it is thence evident they were not intended for food in a very condensed form, for it seems natural that they require a moderate degree of pressure or dilation to assist their functions, they must have something to act upon. Now, when hay is very dear and grain cheap, it is customary in many stables to give less than the usual allowance of hay and corn, but the alteration is sometimes carried too far, and is often made too suddenly: the horses may have as much as they will eat, yet it does not suffice without fodder, and, having no hay, they will leave the grain to eat the litter: a craving sensation of emptiness seems to arise, and the

horse endeavors to relieve it by eating straw. The sensation cannot be that of hunger, else the horse would devour his corn; but whilst he has plenty of grain and plenty of litter, the diminished allowance of hay is borne with impunity. But when a sufficiency is not obtained in *any* shape, the horse loses appetite and becomes emaciated; his bowels are confined, his flank is tucked up, and his belly almost disappears; in general he drinks little water, and when he takes much he is apt to purge. His belly is often rumbling, the bowels apparently containing a large quantity of air, which occasionally produces colicky pains; these horses are very liable to crib-biting and wind-sucking, and it is certain that these diseases are very rare amongst those that live on bulky food.

When the ordinary fodder is very dear, its place must, therefore, be supplied by some other, which will produce a wholesome distension of the stomach, although it may not yield so much nutriment: straw, roots, either or both, may be used in such cases; the tucked up flank, and the horse's repeated efforts to eat his litter, show that his food is not of sufficient *bulk* to sustain nature in her operations. And when *work* demands the use of condensed food in a horse that has been accustomed for some time to bulkier articles, the change must be made by degrees and with the greatest caution; remembering, that coming from grass or the straw yard, the horse, for a time, requires more fodder than would be proper or necessary to allow him at his work, after a season.”

Now, it would appear that the cob, ground with the corn, would be just the proper quantity of fodder for mixing with the corn, the condensed food, for almost all purposes; and nothing, surely, can be mingled with it more readily and conveniently, or so profitably as the cob, which, at the same time, saves the expense of shelling. When, therefore, the philosophy of the arrangement comes better to be understood, we may expect that to grind the cob with the corn will be the general practice, for the feeding of stock of all descriptions.

B. D

From the Farmer's Gazette.

#### GEESE.

MR STORER—In No. 2 of the Gazette, you desired information or hints, in relation to the breeding and management of horses, cattle, swine, sheep, &c. Now if ‘&c.’ means a goose, or geese, I have a word to say in relation to them, and this decidedly in their favor. Geese can be raised, in a proper situation, at a profit far greater than almost any other stock. But to do this, more attention is required than is usually bestowed on their keeping and management.

But let us make an estimate of the profit on a flock of ten old geese, in the manner they are generally kept by most farmers. We will suppose that the goose-keeper (for there are many who are not farmers) commences operations by purchasing ten geese in the spring before they begin to lay, at one dollar each, which is a quarter more than they can frequently be obtained for. Eight of the ten geese (for two should be ganders) will have on an average ten goslings each, but allowing one half for paper calculation and probable loss through the season, it will leave us with a flock of fifty, old and young, worth when well dressed for the market, not a dollar, the original cost, but only half this sum, and you have twentyfive dollars. In

addition to this, every old goose will yield a pound of feathers, and every young one three fourths of a pound, making in all, forty pounds, which are always worth fifty cents a pound—making twenty dollars for feathers alone, which added to the twentyfive gives us fortyfive dollars. Then deduct ten from this, as the original cost of the old geese, and we have a nett profit of thirtyfive dollars. I say nett profit, for there is not one goose-keeper in ten that feeds his flock, either old or young, after the grass has started in the spring, until fattening time in the fall; and then the large quills will more than pay for their extra food.

The above calculation is made, having reference to the usual mode of managing this fowl, which is no management at all. Because, in the first place, they have generally no place to obtain their food, but on the open commons, except such as they too often steal from meadows and mowing grounds, to the great injury of the standing grass, to the feelings of its owner, and very frequently putting their own necks in jeopardy.

But on the other hand, if the owner will provide a good warm and dry—dry what? Why, if *henery*, (a place for keeping hens,) is an English word, then *goosery* is. Well then, let him provide a good, warm and dry *goosery* for the accommodation of his geese while laying and hatching, and attached to this, a large (or if not a large, then a small) pasture, where they may have at all times access to green grass and a small stream or pond of water, with due attention and the right breed, which in my opinion are the Bremen, and my word for it, with only ordinary good luck he will receive more than ordinary profit on the care bestowed and capital employed. Bremen geese are larger than the native breed, are always white, and yield on an average from one to three ounces more feathers, and these of a better quality, (having more down attached to them) than those of the native brown goose.

As the season is so far advanced, and Thanksgiving day for this year is past, I shall not attempt to inform the readers of the Gazette how a goose may be made perfectly fat in five days, but will defer it, at least for the present. There is not a doubt, however, but that a profit far greater than is generally supposed may be derived from the keeping of geese.

LEXOS.

The smallest-bird of America is the humming bird, and of Europe the golden-crested wren. The smallest quadruped in the world is the pigmy mouse of Siberia. The most diminutive plant is the arctic raspberry, which is so small that a six-ounce phial will hold the whole—branches, leaves and fruit.

*To ease the pain of a tooth.*—Those who have “killing tooth-aches” (says the Nashville agriculturist,) can have relief in ten minutes or less, by putting a mixture of equal parts of alum and common salt into the affected tooth by means of a little cotton plug. Permanent relief is never obtained while there are decayed teeth in the mouth.

It is supposed the amount of cotton exported to England during the year ending September 1840, was about 465,000,000 lbs., which at 8 cents per pound, would amount to 37,200,000 dollars.

Look well to your fires these nights.

THE WAGES OF LABOR.

The following is an abstract of documents lately presented to the British Parliament, containing answers to questions put to foreign consuls by the Secretary of State, having reference to the condition of the agricultural peasantry.

RATES OF WAGES.

Country and its tribe.	Description of laborers.	Yearly wages.	Daily wages.	With or Without Board, Dwelling.	Country and its tribe.	Description of laborers.	Yearly wages.	Daily wages.	With or Without Board, Dwelling.

—	—	—	with	Farm servants, Laborers,	—	—	6	without		
—	—	—	without	—	—	—	—	without		

It will be seen by the above table that in France yearly wages for an able-bodied man range from

48 to 250 shillings, and day laborers get in that country from 4 1-2 to 15 pence per day; and whenever they get as much as 5 pence they have to find themselves. In Germany, wages are still lower, and range by the year between 52 and 100 shillings, and day laborers receive from 4 1-2 to 7 pence per day, and find themselves in food. In South Holland, farm hands get by the year from 200 to 250 shillings, and day laborers from 3 to 4 pence per day, and are found. Whoever will take the trouble to examine the table, which is official and authentic, will see that in all these countries—France, Germany, Netherlands, Italy—wages by the year for an able-bodied, sound, healthy man, no where exceed 250 shillings; and, in many instances fall as low as 40, 50 and 60 shillings; and the daily wages range from 3 to 9 and 12 pence, rising in one place, and only one, to 20 pence, and the laborer finding himself! What hope is here for a man born the son of poor parents, ever to better his condition? What ray of hope is there to stimulate him to exertion? None. He who is there born a peasant dies a peasant. Those born to the plough die at the plough-tail; and all that the longest life of laborious toil can procure for them is coarse and scanty means of subsistence.

We may add, by way of making these statements more intelligible, that the shillings and pence referred to in this table are of sterling British money, and that a sufficiently near approximation to our coin is made by just doubling the sum. Thus, when it is stated that in Germany wages vary from 4 1-2 to 7 pence a day—the laborer finding himself—the amount in our money may be put down at from 9 to 14 cents! On the continent of Europe, it will be seen, that nowhere can an able-bodied, industrious, hardworking man earn more than 250 shillings a year, or from \$55 to \$60, while the average price of such labor does not exceed \$30 per annum.—N. Y. American.

DAMP STABLES.

To the Editor of the Farmer's Cabinet:

SIR—When I came to the farm which I now hold by purchase, I found the stables built under large trees and near a spring of water, with a northern aspect; my horses were soon in poor condition, with long and rough coats, and almost always lax in their bowels, nor could I get them up by extra food or lighter work; but my cows suffered most, for they were always sick; their milk fell off, and their butter was poor and of a bad color and taste, and four of them slipped their calves before their time: when the spring came, they left their winter quarters in a worse state than I had ever seen them, and two of them died from the scours on going to pasture. On inquiry, I found that the tenant who had left, had always been, what the neighbors termed, unfortunate in his horses and cattle, and from that cause, more than any other, he had not been able to make both ends meet. The truth flashed upon me in an instant, and in a very little time longer than it has taken me to tell you my story, I had commenced pulling down the stable, the unhealthiness of which had been, I was convinced, the cause of all the evil and all the loss, and it was not more than two days before there was not left one stone upon another of the whole fabric. I now set to work and erected another on higher ground, removed from water and clear from the shade of trees, with a south-east aspect and dry capacious yard; and from that day I have

had neither sickness nor sorrow in my out-door household; my horses live on less food, are always sleek and in good working condition, and my cows are a credit to their keep; our butter brings two cents a pound more in the market, and for the last year our sales are more than doubled from the same number of cows, and the same pasturage; and no more premature calves. Instead of watering my cattle, as heretofore, at the spring under the trees—the water cold, with a deadly taste and bad color—I sunk a well and put in a pump, and at a long trough in the yard for the summer, and another under shelter for the winter, my cattle slake their thirst, without setting up their coats as they always used to do after drinking at the hole under the trees; even when the weather was warm, they were accustomed to shake all over as though they were in a fit of the ague, after drinking their fill of this water; and to this, with the bad aspect of the stables, I attribute all the sickness and misery which I have experienced amongst my cattle and horses.

I have been induced to tell you the above, by reading in a valuable English work, called "Stable Economy," some observations which would go to show that the writer, like myself, had enjoyed the experience of the truth of what he so well describes; and as they fully corroborate all my convictions, I should be glad of the opportunity to present you readers with what he advances on the subject, if it meets with your approbation; and am your constant reader, M.

"A damp stable produces more evil than a damp house: it is there we expect to find horses with bad eyes, coughs, greasy heels, swelled legs, mange, and a long, rough, dry, staring coat, which no grooming can cure. The French attribute glanders and the farcy to a humid atmosphere, and it is a fact that in a damp situation we find these diseases most prevalent: when horses are first lodged in a damp stable, they soon show how much they feel the change; they become dull, languid and feeble, the coat stares, they refuse to feed, and at fast work they cut their legs in spite of all care to prevent them: this arises from weakness; and while some of the horses catch cold, others are attacked by inflammation of the throat, the lungs or the eyes; most of them lose flesh rapidly, and the change produces most mischief when it is made in the winter season. Horses in constant and laborious employment must have good lodgings and kind treatment; but where the stables are bad, the management is seldom good, and it is no exaggeration to say, that hundreds of valuable horses are destroyed every year by the combined influence of bad stables and bad management. And although excessive toil and bad food have much to do in the work of destruction, every hostile agent operates with most force where the stables are of the worst kind.

Stables should always be erected on dry ground or that which will admit of perfect draining, with the surface a little sloping. Stables built in a hollow or on marshy land, are always damp, and when the foundations are sunk in clay, no draining can keep the walls dry; the dampness will follow up the walls from the deepest foundation. It is true that damp stables may be rendered less uncomfortable by strewing the floor with sand or sawdust, and, in some cases, a stove-pipe might be made to pass through the stable near the floor, but such stables are liable to frequent and great altera-

tions of temperature at every change of the state of the atmosphere. Some of the means usually employed against dampness in dwelling houses might be adopted in the construction of stables, so as to prevent the walls from absorbing the moisture of the soil, such as a foundation of whinstone to the surface of the ground, covered with a coat of Roman cement or a sheet of lead; or the foundation may be sunk so low as to admit of its being laid in coal dust or other substance which does not absorb water; and, although precautions of this kind may sometimes prove salutary, they ought not to be trusted to where a dry, airy, healthy situation can be obtained; frequently white-washing the walls with lime seems to have an influence in removing moisture and keeping them dry. The owner of a damp and uncomfortable stable often wonders why so many of his horses catch cold; 'there are always some of them coughing;' now, if he were to make that stable his abode for four-and-twenty hours, he would have but little to wonder at. Large stables are objectionable, and have nothing to recommend them but cheapness in the erection, so that when it is more important to have a cheap than a healthy stable, a large one may be indulged in; the saving in the end, however, may eventually prove a loss, if the builder of the stable be the owner of the horses. A very large stable cannot easily be ventilated; it requires a lofty roof to give any degree of purity, and contagious diseases once introduced into such, spread rapidly and do extensive mischief before they can be checked."

From the same.

#### POTATO PLANTING.

MR EDITOR—I too, must beg permission to endorse the account which follows. I have proved it, therefore I speak with confidence as to the results. In a visit to an excellent agriculturist, I found him cutting his potatoes for seed, and prevailed upon him to select the tops only for planting, reserving the remainder of the potatoes for culinary purposes; he will by this time, have taken up the crop, and would he—he is one of your subscribers—inform us of the result.

In my memorandum-book I find these entries:—29th March, planted, this day, fifty pounds weight of the tops of potatoes which had been reserved, while preparing the bulbs for cooking for the use of the household, by merely cutting off a thin slice and throwing it by in a basket, during the winter, which was placed out of the reach of the frost.—24th September, dug up the potatoes which were raised from the thin cuttings from the tops of the roots while preparing them for the house; they are uniformly large and fine, particularly clean from scab, and, without exception, the best crop I ever grew; the quantity planted was just 50 lbs., and from them I have this day taken up *one ton*. But now allow me to turn to the account spoken of above, which is copied from the 'Agricultural Almanac' for 1823, and which is never the worse for keeping.

P. G.

"The following improvement in the culture of potatoes, is taken from the American Farmer, and is extracted from the Almanac, not only under a conviction of the reasonableness of the practice, but from actual experience of its verity. Whenever the writer has himself superintended the cutting of his seed potatoes, he has uniformly succeeded in this mode of preparing the seed, but when the

persons employed were left to their own government, all the parts of the potatoes were indiscriminately cut and planted: the difference in the crop has evinced the necessity of the farmer's attention to the whole detail of the affair: this branch of the culture is too generally committed to boys, or ignorant and careless laborers. The bottom of the potato is no better than the starch of grain, intended by nature to nourish the tendrils thrown out in the first efforts of vegetation; the residue rots and perishes in the ground; therefore the practice of preserving it for the use of the household is a saving instead of a waste. By judiciously cutting the bulb, there will be enough of the pabulum for the tendril or young fibre thrown out by the eye, to subsist upon; indeed, if only the cut containing the eyes were generally used in planting, it is clear that the crop would be the most abundant: this practice had been known to, and often proved by, me, many years before the account of it in the following extract was seen.

[From the American Farmer of 12th April, 1822.]

"A correspondent has requested us to insert the following. The first year, he says, I cut the potatoes in three pieces, the top, the middle, and the bottom parts, and planted them in three rows. The top plant was ten days earlier than the middle plant, and a much greater crop; the middle plant was earlier than the bottom, and a better crop, the bottom producing but a very indifferent crop.

For some seasons past, I have only planted the top eyes, and I may safely say I have the best crop and the driest potatoes in the country. None need be deterred from this plan on the ground of waste, for after the top is cut off, the remainder keeps better and longer fit for use than if the potato were preserved entire; and as a proof of this, lay a whole potato on the ground, or in any exposed place, and it will show that the top plants grow and are many inches in length, before there is any growth from the bottom."

P. S.—If housekeepers in towns were to preserve the cuttings of the tops of their potatoes during winter, and preserve them as above, there would be more than sufficient to plant all the country, without the cost of a single cent for seed!

*How to boil Irish Potatoes.*—Good and indifferent potatoes depend very much upon the manner in which they are prepared for the table. Some cooks always have heavy, hard, watery potatoes; while others, for the most part, have them dry, mealy, and excellent. This difference depends, generally, upon the difference of cooking. The first cook puts the potatoes into cold water, warms them through by a slow fire, and cools them as slowly; while the other puts them into boiling water, stirs the fire till they are *just dun*, takes them out immediately, throws a wet cloth round them, and gently squeezes each with the hand till it cracks open, for the watery particles to escape in the form of steam, then peals them and they are exactly right. By this plan, almost any potatoe will eat well.—*Nashville Agriculturist.*

*Taste for Reading.*—If I were to pray for a taste which should stand me in a stead under every variety of circumstances, and be a source of happiness and cheerfulness to me through life, and a shield against its ills, however things might go amiss, it would be a taste for reading.—*Sir J. Herschell.*

#### Massachusetts Horticultural Society.

EXHIBITION OF FRUIT.

Saturday, Nov. 28, 1840.

B. V. French, Esq. exhibited the following apples, viz: Winter Queen, Danvers Winter Sweet, Pennock's Red Winter, Red Doctor, Been apple, Pomme Gris, Cumberland Spice, Newark King, Winter Spice, Dominiska, and four unnamed sorts. Also, Monsieur le Cure Pears.

Mr Manning exhibited the following apples, viz: Sam Young, (Pomological Magazine, No. 130,) Bordie Tricolor, Victorious Reinette, Reinette Coeur d' France, and a small apple taken from a tree at Elsineur, in Denmark, by Capt. Wheatland, of Salem, in September last. Also, Bishop's Thumb, (London Hort. Soc. Catalogue, No. 125,) Pas-se Colmar, and Beurre Diel Pears.

The Reinette Coeur de France, is the produce of a dwarf tree received from the Messrs Bauman, of Bolwiller, France: it is of medium size, dark red skin, yellow flesh, and extremely high flavored.

The following description of one of the apples exhibited, the Committee have extracted from the work of Mr Christ, a German Pomological author:

"No. 13. Victorious Reinette, (Reinette Triomphante,) an uncommonly fine, large and well formed apple, which on being deposited on the floor, acquires a deep yellow tint, marked with starry points, and frequently brown rough spots, or large warts: its eye represents a regular star, its flesh beneath the tender skin is yellow, firm though delicate, yielding abundance of juice, that possesses a pleasant aromatic flavor; it ripens about Christmas and may be kept till March. The tree grows luxuriantly and becomes of considerable size."

For the Committee,

ROBERT MANNING.

AGRICULTURE.—He who has dominion over an acre, and rescues it from barrenness, and covers it with a smiling harvest, has more virtuous self-approbation than the conqueror of large territories, waste and desolate. The culture of the earth savors of filial affection. It is our bounteous mother; it affords us nourishment, and shelter and shade—fertile streams—fragrant flowers and refreshing fruit. We should love it for the sake of the living—for the sake of the dead. A beautiful plant, or a luxuriant vine, may suggest to a poetical mind the spirit of departed beauty, putting forth again from the earth where its form was inurned.

AGRICULTURAL PURSUITS.—I tell those who are entering upon a life, that they will find no pursuit which gives more satisfaction—I will say the will find no pursuit which will give so just an occupation of their time with less annoyance and less disturbance to their tempers, than that of agriculture; no other in which they will feel such satisfaction that they are doing good in pursuing their own pleasures at the same time that they are improving the soil. It is a pursuit to which one and all of us should wish success. It is one of those pursuits which is most delightful to follow: it is a pursuit which may be carried on without time ever hanging heavily; an occupation interesting in the highest degree; and while the agriculturist is promoting his own interest, he also promotes the interest of every one of his neighbors. I have found no employment in the course of my life which afforded me so much real pleasure, as the promoting of agriculture by my own endeavors and by assisting the endeavors of others.—*Earl Spencer.*

**NEW ENGLAND FARMER,**  
AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, DEC. 16, 1840.

**PROJECT FOR A NATIONAL MUSEUM OF AGRICULTURE AND THE MECHANIC ARTS.**

We give below the plan of Mr Ellsworth, Commissioner of Patents at Washington, respecting the establishment at the seat of the National Government, of a museum of agricultural products and implements, and of mechanical and manufacturing machines, products and improvements. We beg leave to add our strong wishes for the perfect success of the project. It cannot fail to be of great value to the country.

In the erection of the new building designed for the Patent Office, a spacious hall has been finished and appropriated to this object. Mr Ellsworth has already devoted himself with eminent assiduity and zeal to the collection of seeds and samples of the most valuable agricultural products from different parts of the country, and likewise from foreign countries; and these seeds he has circulated through the country with great liberality. In respect to patented machinery in agriculture or in the mechanic arts, the patent office already affords to the curious mind a study for years. This collection is rapidly extending, as, indeed, there are no limits to invention. Some years since, the number of washing machines entered for patent exceeded four hundred. The various inventions for cooking, and heating apartments, are well nigh innumerable—certainly past all remembrance; and the number of ploughs and improved agricultural instruments fall little short of other inventions. It is not always easy to judge from a model merely, the value of a machine or invention. It is Mr Ellsworth's plan, as far as he can accomplish it, to obtain the thing itself. So, likewise, of agricultural products—those which are not perishable but capable of preservation, he designs, as far as practicable, to obtain in the form in which they grew; grain not only shelled but in the sheaf, and Indian corn in the husk and on the stalk. His wish likewise is, to procure from the manufacturers specimens of all their works. In respect to many articles of manufacture, this will be easy: hats, shoes, whips, combs, buttons, all articles of straw, leather, metal, wood, glass, china, stone, et cetera, this may not be difficult and would be exceedingly interesting. In respect to cloths and articles, which like cloths, are liable to fade, and upon which, likewise, important improvements are constantly in progress, this will hardly do our manufacturers justice; though if such samples are procured from year to year, they will constitute an exact record of the progress of the arts.

The advantages to accrue from such an establishment, if carried out according to the liberal plans of the Commissioner, will be very great to individuals and to the public at large. Until the State of Massachusetts caused to be taken and published statistical returns of all her manufactures, of their kinds and variety, of the amount of capital employed and the value of the manufactured article, no individual in the State had any just idea of their extent and amount. When at the Mechanics' Fairs held in Boston and New York, specimens of these various articles and products were exhibited, no one could repress his surprise at their variety, ingenuity, and the perfection to which the arts had reached among us. The facts disclosed and established in each case have done immense service to the State and the country. They have demonstrated the importance of domestic industry as the foundation of public wealth.

They have shown us that the true secrets of our strength and independence lie in our ability to supply our own wants. They have done a great deal to stimulate invention and improvement, by bringing the various products of ingenuity, skill and industry in direct comparison with each other. They have exalted our own just self-respect; and extended the reputation and credit of our country abroad.

Mr Webster on his return to the country from his late visit to England mentions a fact, which strikingly illustrated this matter. He was consulted by a foreign capitalist as to the expediency or security of investing funds in the stocks of our State, then for sale in the English market. He put into the hands of the inquirer a copy of the Statistical Returns of the Manufactures of Massachusetts, prepared by the intelligent and industrious Secretary of State, and published by order of the Government, showing that the avails of the domestic industry of Massachusetts amounted to 91,000,000 of dollars. The gentleman shortly returned the book, giving orders at once to invest a very large amount in the securities of the State, under the conviction that a commonwealth so pre-eminently distinguished for its productive industry could not fail to secure its just obligations.

This proposed collection at Washington will meet the purposes of a great mechanics' fair. It will exhibit the improvements in the arts, and give some just notions of the immense results of our national industry. As Washington is the great centre of confluence of intelligent men from all parts of the country, it will be the best mode that could be adopted of communicating the knowledge of what has been done; and diffusing this knowledge throughout the whole country. It will enable persons in pursuit of particular implements or articles of manufacture, to know at once where they can be best supplied. It will furnish to the manufacturers themselves and the inventors of any improvement in the arts, one of the best opportunities which they could ask for advertising what they have done and what they have to dispose of. It will constitute a place of interesting resort and rich gratification to the curious and intelligent; and form in the end a museum of the mechanic arts as instructive, and in many respects as gratifying, as the finest museums of the fine arts in the old world.

Precisely the same plan proposed by the Commissioner of Patents for a national museum, we proposed three years since for a State museum. We then printed and published a circular, detailing the plan and soliciting contributions. We requested the republication of the circular, as matter of courtesy, in the different papers of the State. We believe not a single city paper deemed it worthy of notice, and not more than half a dozen country papers gave it place in their columns. A few friends sent us some collections. Many more, promised us contributions, but forgot their promises. We laid out some money in making collections. But, without a room for their deposit, without funds to pay the ordinary expenses of collection, and above all, without the co-operation of the farmers and mechanics, what could be effected? We still have hopes to live to see, under more efficient hands, this plan accomplished. We have full confidence in its practicableness and its great utility. Above all, we hope that the liberal views of the Commissioner of Patents will be heartily seconded in every part of the country, and that Congress will in their liberality give him all the means he can need or ask for the perfect accomplishment of this excellent object.

H. C.

The following is the circular from the Patent Office above alluded to:

PATENT OFFICE, Nov. 20, 1840.

Notice is given that the Hall in the *New Patent Office* for the exhibition of manufactures, is now completed. The Hall is spacious, being 273 feet long, 63 feet wide, 30 feet high, and *fire-proof*.

Agents whose names are annexed, will receive and forward free of expense, articles which may be deposited with them. These articles will be classified and arranged for exhibition, and the name and address of the manufacturer (with the prices when desired) will be carefully affixed. Few, it is presumed, will neglect to improve the opportunity now presented of contributing their choicest specimens to the *National Gallery of American Manufactures*, where thousands who visit the Seat of Government will witness with pleasure the progress of the arts in these United States.

If fairs, in limited sections of our country, have excited interest, what must be the attractions of a national exhibition, enriched by daily additions.

The agriculturist may be gratified to learn, that commodious rooms are provided for the exhibition of agricultural implements, and also for the reception of seeds for exhibition or distribution.

The Commissioner of Patents, being authorized to collect agricultural statistics, avails himself of this opportunity to solicit information of the condition and character of the crops in the several sections of the country. These data will aid him in presenting with his annual report, the aggregate amount of products of the soil, and it is hoped that the public may be guarded in some measure from the evils of monopoly, by showing how the scarcity in one portion of the land may be supplied from the surplus in another.

Names of agents who will receive and forward packages for the Patent office. Collectors of the Customs at Portsmouth, N. H., Portland, Me., Burlington, Vt., Providence, R. I., Philadelphia, Baltimore, Richmond, Charleston, Savannah, N. Orleans, Detroit, Buffalo, Cleveland. Surveyors of the Customs—Hartford, Ct. St. Louis, Pittsburgh, Cincinnati, Louisville; R. H. Eddy, Boston, Mass; David Gardiner, (Custom House) New York.

HENRY L. ELLSWORTH,  
Commissioner of Patents.

Editors are very respectfully requested to give the above an insertion in their papers.

**INCREASE OF WEALTH.**

The English have blockaded Canton, the principal port of China, and the consequence is, the entire interruption of the trade. The effect has been to enhance the prices of teas nearly fifty per cent; and by these means some persons have realized profits to an immense extent. The profits upon a single Canton ship have been stated at 300,000 dollars! and three commercial houses in Salem are represented to have obtained in the advance upon teas, the vast amount of 1,500,000 dollars—if any farmer can enumerate such a sum. Some houses in Boston have been equally fortunate. The public, under these circumstances, are congratulated upon the vast increase of wealth in the country. But how obvious is this delusion. There is no increase of wealth in the country by this operation. Unless the tea is exported not a dollar is added to the wealth of the country by this result. It is merely taking money from the pockets of the consumer to put it into the pockets of the importer—from the individual who buys the tea for use, and giving it to the individual who imports the tea for sale.

We do not say that on the part of the holders or importers of this article there is any thing wrong in this matter. Not at all. It is a lawful trade; and as, under various circumstances, this importation often might have proved a losing concern, and then the community would have had no pity upon them nor felt bound to indemnify them, so on the other hand they have a perfect right to any advantages which come from a natural rise in the market.

But it effects no increase of the wealth of the country, that can be done only by actual production; and actual production is always clear gain. It is interesting further to remark, what immense sums are squandered in the country upon articles either of no intrinsic value, or which we ought to produce ourselves. Tea is not a necessary of life. It is doubtful whether it contributes at all to the nutrition of the human body, how essential soever habit may have rendered it to the comfort of life. Before the American revolution it was a luxury by no means in common use; and it is said to be not many years beyond the remembrance of some now living, that a good woman in the country having received some quarter of a pound of tea, thought the proper use of it was to boil it as greens with her salt pork. Now its use

has become universal, and with many families in the country its use prevails three times a day. But after all it might be dispensed with. If we must use it however, we must import it. We cannot produce it ourselves. But it is not so with silk. This we might produce and to advantage; and we should be most happy if the sanguine expectations of some men might be realized, when we ourselves instead of being importers of silk, might become exporters to a most profitable extent. This indeed would be adding to the real wealth of the country.  
H. C.

Congress are now in session; and the President's Message has been delivered. We are not at liberty to give this document in the New England Farmer; but it will be accessible to our readers through various other mediums. Of one thing, however, we may be certain, whatever interested men may say to the contrary, there never was a country more prosperous than our own; there never was a time or condition of society when industry was better rewarded, justice more faithfully administered, the public peace more secure, or a greater abundance of the fruits of the earth, more profusely distributed. Where are the virtuous, except by extraordinary misfortune, who are not well clothed, well fed, and well housed; and who are without the means of improving their condition? There are none to be found. Why then should we be continually complaining of the spots on the Sun, when they cannot be seen without a telescope of large magnifying power, because of the glowing radiance which surrounds them?  
H. C.

MASS. HORTICULTURAL SOCIETY.

EXHIBITION OF FRUITS.

Saturday, Dec. 6, 1840.

There was a good display of Pears to-day in fine condition for eating.

From S. Downer; D'Arenberg, Passe Colmar, Lewis, Burgomaster, Florelle.

From M. P. Wilder; Passe' Colmar, Columbian Virgeloise, D'Arenberg, Princo's St. Germain, Burgomaster.

From S. Pond; Duches Angouleme, Beurre Diel, Echasserie.

From S. Downer; Ortleyp Pippin, Spitzemberg, Golden Russet, Roxbury Russet, and Pomme d'Ape Apples and Catawba Grapes.

From S. Pond; Musk Quinces.

For the Committee,

L. P. GROSVENOR.

BRIGHTON MARKET.—MONDAY, DEC. 14, 1840.

Reported for the New England Farmer.

At Market 780 Beef Cattle, 240 Stores, 2200 Sheep and 390 Swine.

PRICES.—*Beef Cattle*.—The prices obtained last week were hardly sustained. We quote First quality \$5 25. Second quality, \$4 50 a 4 75. Third quality, \$3 00 a \$3 75.

*Barrelling Cattle*.—Mess \$4 25; No. 1 \$3 75; No. 2 \$3 00.

*Stores*.—Yearlings \$5 00 a 8 50, Two Year Old \$4 18, Three Year Old \$2 1 a 2 7.

*Sheep*.—Sales quick. We note sales at \$1 42, \$1 02, \$1 88, \$2 00, \$2 37, and \$2 75.

*Swine*.—Lots to peddle from 3 to 4 for sows and from 4 to 5 for barrows. At retail, from 4 to 5 1-2.

THERMOMETRICAL.

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northerly exposure, week ending Dec. 13.

SILVER FIR AND SPRUCE SEEDS.

Just received at the New England Farmer Office, a few Bushels of the seed of the Silver Fir, Spruce. Also—English Oak, a fine specimen; Spanish Chesnuts, (very large); with a variety of other tree seeds.

Nov. 10, 1840. JOSEPH BRECK & CO.

GREEN'S PATENT STRAW CUTTER.

JOSEPH BRECK & CO. at the New England Agricultural Warehouse and Seed Store Nos. 51 and 52 North Market Street, have for sale, Green's Patent Straw, Hay and Stalk Cutter, operating on a mechanical principle not before applied to any implement for this purpose. The most prominent effects of this application, and some of the consequent peculiarities of the machine are:

1. So great a reduction of the quantum of power requisite to use it, that the strength of a half grown boy is sufficient to work it efficiently.

2. With even this moderate power, it easily cuts two bushels a minute, which is full twice as fast as has been claimed by any other machine even when worked by horse or steam power.

3. The knives, owing to the peculiar manner in which they cut, require sharpening less often than those of any other straw cutter.

4. The machine is simple in its construction, made and put together very strongly. It is therefore not so liable as the complicated machines in general use to get out of order.

WILLIS'S LATEST IMPROVED VEGETABLE CUTTER.

For sale at the New England Agricultural Warehouse, No. 51 and 52 North Market Street, Boston, Willis's Latest Improved Vegetable Cutter. This machine surpasses all others for the purpose of cutting Ruta Baga, Mangel Wurzel, and other roots. The great objection to other machines, is their cutting the roots into slices, which makes it almost impossible for the cattle to get hold of them: this machine with a little alteration, cuts them into large or small pieces, of such shape as is most convenient for the cattle to eat. It will cut with ease from one to two bushels of roots per minute.  
JOSEPH BRECK & CO.

GREEN HOUSE PLANTS, &c. &c.

The subscriber can furnish every variety of Green House Plants or Garden Shrub, in the very best order. Also—Dahlia roots, (all the new varieties); Black Hamburg; Sweetwater, and Isabella Grape vines; Roses and Peonies; Honeysuckles, and other creepers; Black, White, and Red Currant trees; White and Red Antwerp Raspberry vines; Asparagus and Rhubarb roots, &c.

Orders by mail will be promptly and faithfully executed; or they can be forwarded to, or left with J. Breck & Co.

JAMES L. L. F. WARREN,

Nonantum Vale, Brighton.

FRESH GARDEN SEEDS.

We would inform our customers and friends that we are now receiving our supply of fresh Garden Seeds, most of which have been raised under our own inspection, from fine selected roots; which we warrant to be of the purest quality of the growth of the present season.

Agricultural Books. Agricultural Implements. Seed and Implement Catalogues sent to all applicants gratis, and all orders promptly attended to.

JOSEPH BRECK & CO.

Boston, Sept. 29, 1840.

## MISCELLANEOUS.

## GARDENING FOR LADIES.

The accompanying amusing and instructive observations are taken from an excellent article in the *Gardener's Magazine*, entitled 'Instructions in Gardening for Ladies,' by Mrs. Loudon:—

To derive the fullest enjoyments from a love of flowers, it is absolutely necessary to do something towards their culture with their own hands.—Labor is at the root of all enjoyment. The fine lady, who has a nosegay put on her table every morning by her gardener, has not a tenth of the enjoyment from it that the lady has who has sown the seeds, or stuck the cuttings, and watered and shifted, or transplanted, pruned, and tied up, or pegged down or thinned out the plants, and at last gathered the flowers herself. But we would have ladies of leisure do a great deal more than this. Let them hoe, and rake, and dig and wheel a barrow, and prune and nail wall trees, handle a syring, and work one of Read's garden engines. By these and similar operations, they will ensure health, without which there can neither be good temper, nor any kind of enjoyment whatever, mental or corporal. The grand and all pervading evil among ladies of independent fortune, is *ennui*, which, every body knows, is brought on from a want of rational and active operation. Now the pursuits of botany and gardening supply an occupation which is at once rational and active; and they supply it, not only to the lady who has merely a love of flowers without a scientific knowledge of botany or a taste for the arts of design, and who may, therefore, cultivate her flowers, and perform her garden operations, without a greater exertion of mind than is required from a gardener's labor; but to the scientific lady, whose botanical knowledge, like that of the scientific gardener, may enable her to raise many new kinds of flowers, fruits, and culinary vegetables, by the different processes required for that purpose; and to the lady of artistical taste in drawing, painting and sculpture, who may direct her attention to landscape gardening, and more especially, to the designing of flower gardens, and the introduction in them of the various kinds of ornaments of which they are susceptible; a subject at present as much in its infancy as botany was before the time of Linnaeus. But, say some of our readers, 'What the Duchess of ——— wheeling a barrow, and nailing wall trees!' Yes, certainly, if she has nothing else to do, that will be an occupation equally active and rational. Why not a Duchess as well as a plain mistress? Suppose this Duchess at work in her garden, and that you are not aware that she has any title. Suppose her dressed in the simplest manner, (as were the Vicomte d'Ermenonville's wife and daughters in the gardens of Ermenonville,) what wonder would there be then? Ladies of rank are as much subject to *ennui* as ladies without rank; and every lady, as well as every gentleman, has a portion of the day that she can call her own, when she may indulge in what she likes. If she has not, her life is not worth keeping. Did not the Earl of Chatham, notwithstanding his being prime-minister at a period the most important that ever occurred in the annals of this country, find time not only to lay out his own grounds, but to assist Lord Lyttleton in laying out Hagley? We insist upon it, therefore, that what we propose is just as suitable and necessary for ladies of the

highest rank as it is for those without rank, provided they are equally without rational and active occupation of some other kind.

## GRAFTING PEARS ON THE MOUNTAIN ASH.

At a meeting of the London Horticultural Society, Dr Lindley, read a communication received from R. A. Hornby, Esq., containing some observations on the grafting of pears on the mountain ash. Mr H. states, that it lately came under his notice, while staying in Switzerland, where he found it to be very generally practised, and with great success, the crops being both abundant and sure, in a climate and site (on the high plateau of the Tanur mountain, with a poor and shallow soil) where neither pear nor apple would previously fruit, the effect being to retard the blossoms and give vigor to the constitution. Neither the flesh nor flavor of the fruit was said to be at all affected; budding or grafting being alike successful on either old or young stocks by the usual process. Great care must however be taken that none of the young shoots which the stocks may make during the first season after working, be removed; in the succeeding spring, however, before vegetation commences, all such redundant growth should be cut out closely, and the graft alone be permitted to push in freedom. Its growth will then be luxuriant.

A note on the above communication, by Mr R. Thompson, under gardener in the society's orchard, was also read, in which he states that the mountain ash was one among the various kinds of stocks on which the pear was grafted at the society's garden, on which subject the following observations were made:—

The trees grew very well, but scarcely so vigorously as those on the pear stock, or even on the quince. The fruit was produced at an earlier age of good size, there was no perceptible difference in the flavor when compared with those produced under similar circumstances, but on pear stock, nor was it observed that the blossoms were at all retarded. The trees did not appear as if they would be long lived, owing to the unequal swelling of the respective species. The pear increased in diameter more rapidly than the mountain ash. Still as the latter species is much harder than the quince, and would thrive in almost any soil, it might be advantageously used in some situations.—*London paper.*

## SIGNS OF A POOR FARMER.

He grazes his mowing land late in the Spring. Some of his cows are much past their prime. He neglects to keep the dung and ground from the sills of his buildings. He sows and plants his land till it is exhausted before he thinks of manuring. He keeps too much stock, and many of them are unruly. He has place for nothing, and nothing in its place. If he wants a gimblet, a chissel or a hammer, he cannot find it. He seldom does any thing in stormy weather, or in an evening. You will often perhaps hear of his being in the bar-room, talking of hard times. Although he has been on a piece of land twenty years, ask him for grafted apples, and he will tell you that he could not raise them, for he never had any luck. His indolence and carelessness subject him to many accidents. He loses cider for want of a hoop; his plough breaks in his hurry to get in his seed in season, because it was not housed, and in harvest time, when he is at work on a distant part of his farm,

the hogs break into his garden, for the want of a small repair in his fence. He always feels in a hurry, yet in his busiest day he will stop and talk till he has wearied your patience. He is seldom neat in his person, and generally late at public worship. His children are late at school, and their books are torn and dirty. He has no enterprize, and is sure to have no money, or if he must have it, makes great sacrifice to get it; and he is slack in his payments, and boys altogether on credit, he purchases every thing at a dear rate. You will see the smoke come out of his chimney long after daylight in winter. His horse stable is not daily cleansed, nor his horse curried. Boards, shingles, and clapboards are to be seen off his buildings, month after month, without being replaced, and his windows are full of rags. He feeds his hogs and horses with whole grain. If the lambs die, or the wool comes off his sheep, he does not think it is for want of care or food. He is generally a great borrower, and seldom returns the thing borrowed. He is a poor husband, a poor father, a poor neighbor, a poor citizen, and a poor christian.

## FARM FOR SALE.

The subscriber offers for sale that valuable Farm, situated about 3-4ths of a mile below the First Parish Meeting House, on the Stage road, and commonly known as the Judge Prescott farm, containing about 170 acres of superior land, in a good state of cultivation, with two dwelling houses, four barns, and other out buildings. The farm is remarkably well watered with soft water, conveniently fenced, has nearly forty acres of large, handsome wood and timber standing on it, with an orchard of grafted Apple, Pear, Peach, Plum, and Cherry trees, and might be easily divided into two Farms. The estate will be sold reasonably. If five thousand dollars be paid on receipt of the deed, the remainder may lay on mortgage to suit the convenience of the purchaser. For further particulars, apply to the subscriber, living on the premises. WM. SALISBURY.

Groton, Oct. 25, 1840.

eow.

## POUDRETTE.

This valuable manure may be had on application to the subscriber, at the office of the "New York Poudrette Company," No 120 Nassau street, New York. It is in-odoriferous, and may be transported in barrels, on board of any vessel or steamboat, without offence—and it will be found an exceedingly valuable article as a fertilizer on any soil, and for any crops; but more especially for gardens and flowers, as there are no foul seeds in it. Poudrette has been used for three seasons with entire success on Long Island, by many practical farmers, as may be ascertained from letters and statements made by them, and published at this office in a pamphlet containing also the "act of incorporation," granted to the Company by the Legislature of the State of New York; and other facts in relation to the subject. Price 35 cents per bushel. Barrels cost 25 cents each, and hold 4 bushels. Persons wishing to make an experiment on a small scale can obtain one barrel by enclosing a two dollar current bank bill—or three barrels by enclosing five dollars, free of postage. On receipt of the money the article will be put up and forwarded as directed.

\* \* Price of shares, one hundred dollars—which entitles the holder to one hundred bushels of poudrette annually, during the term of the charter; fifty bushels in time for spring use, and fifty bushels in time for fall use. Shares taken soon, will be entitled to the spring dividend—and, if desired for experiment, a few bushels may be had this fall.

All orders, or applications in relation to the business, must be made to the subscriber, 120 Nassau street, New York.

D. K. MINOR.

It is distinctly understood that the "New York Poudrette Company" is in no way connected with the "Lodi Manufacturing Company," of which Anthony Dey and Peter Barthelemy are, or were, the managers.

Dec. 9, 1840.

For the N. E. Farmer.

## TO SILK GROWERS.

There has been great mismanagement the present year, and some serious disappointments in the manufacture of silk. Some, who intended to have made 100 or more pounds of silk, have fallen far short of their expectations. While some have neglected their trees or destroyed them, others have neglected their silk worms' eggs, had them prematurely hatched, or, while nearly ready to hatch, with the intention of retarding the hatching, placed them in the ice house, or other insecure place, by which the change of temperature was so great or so long continued, as to endanger the health or vitality of the eggs. Broods which were early brought forward for feeding did well; but the after broods, having been submitted to the retarding process in the ice house or refrigerator, were seriously injured. Some did not hatch, and of those which did, some worms became feeble, diseased, soft, yellow, and died; and others lingering through several weeks, or appearing well until the time of going up, would then die; or if able to commence the outskirts of the cocoon, would then cease to wind, and like poor little Robbin in the Woods, lie down and die, in its visible shroud: and among a large crop, only a few be able to make a perfect cocoon. Synaptions of disease may appear, even in the early stages, when negligently or improperly fed, but when well fed in the early stages with chopped leaves, they have done well. The six weeks worm, when fed two weeks with chopped leaves, finished their cocoons, or went up, in twentyfive days. Thousands of worms have been suffocated and destroyed by covering therewith large flaccid leaves. In the early stages of feeding, when the worms wander about and begin to spin a web under their feet, you may calculate on a weak and feeble insect; and if the worm is taken up or removed, it may be found so closely attached to its netting that before it can be separated, a leg may be drawn out, a watery substance follow, and the worm perish. Although the season, or other adverse causes, have so operated that eggs and worms have disappointed the expectation, let no one be discouraged from further trial. Provided the farmer's crop of grain should fail one year, does he neglect to try again? And why not be as sagacious in the silk cause? The silk crop is as sure as any other. Will the cotton planter neglect his cotton field next year because the worm has committed such ravages the present year? and why should not the silk-grower do the same?

Could all the facts of the treatment and management with the eggs of the silk-worm be known, it is believed that one great cause of failure might be traced to mismanagement or attempt to retard the hatching for a late crop and a market for the eggs. The too sudden exposure to great heat or cold is prejudicial to the eggs, especially if the eggs are raised from worthless cocoons.

The ice-house or refrigerator is not so safe as a

deep well with or without water, where the temperature is much the same, winter and summer.

One person, from 100,000 eggs had less than 100 worms which even attempted to wind, and not half of them were worth reeling: the others perished by the way. The person who had charge of them is not discouraged, but having discovered the cause of failure, which was in the ice house, he is determined upon going ahead, and hopes to avoid a similar occurrence.

One person this year has been experimenting upon one quarter of an acre of mulberries, with the view of testing Mr McLean's experiment of last year, and also to convince his incredulous neighbors. He will probably have 9 to 12 1-2 pounds of raw silk from that one quarter of an acre, worth \$5 per lb., say \$50; whereas if the same land had been planted with corn, he might have had 7 bushels at 75 cents—\$5 25; or if with wheat, might have had enough to make one barrel of flour worth \$6 25. It costs no more to transport a pound of silk to market, worth five dollars, than a pound of flour, worth four cents; and while it requires at least six months to mature a crop of wheat for the market, six weeks are sufficient for a crop of silk: and after deducting every possible expense between the culture of a grain and a silk crop, is not the difference of profit so far superior as to encourage some passing notice of silk, and especially when an inferior soil is adapted to the growth of the mulberry? S.

Ma H. COLMAN—Dear Sir—I forwarded you, sometime since, a circular for collection of facts, respecting the silk business, raising cocoons, &c., and having received several answers, at leisure may forward you some of them. Previous to the above circular, I had submitted written questions to several persons friendly to the silk culture, for their experience, opinion, &c. The questions proposed were the following:

No. 1. What kind of mulberry do you consider the best for feeding, to produce the most and best silk?

2. What kind of silk worms do you prefer, to produce the most and best silk?

3. Do the two-crop worms make as much and as good silk as the one-crop?

4. Have you crossed the different breeds, and with what success?

5. Do you consider it necessary to feed as regularly during the night as by day?

6. What is the cost of making raw silk, sewing silk, from cocoons of your own raising?

7. What is the average number of cocoons to the pound of 16 oz., and how many pounds for a pound of silk?

8. How much foliage for a pound of silk? Is there any difference of quality in the foliage of different trees of the same age?

9. The size of your cocoonery; how many worms can be fed; what alteration should you propose?

10. Do you prefer shelves or hurdles for feeding, and what accommodation for winding?

11. At what distance should trees be planted for a permanent plantation?

12. Your opinion of the ultimate success of the silk business and the best means to promote it?

13. How many trees for an acre of land, purposely for feeding worms?

14. Your opinion of taking up and resetting every spring; and whether by use of the spade or the plough?

15. The difference of expense of planting, cultivating, gathering and securing an acre of mulberry, corn, or potatoes?

16. The difference in the quantity of foliage the first year, from planting roots or cutting buds?

17. How many cocoons to a thread, designed for ladies dresses, sewing silk or vesting?

To the above inquiries the answers were at variance with each other, probably from local causes. Several to whom application was made, have not returned a written answer: some said they were incompetent to do it—had not kept a silk journal—others could not find time. But all were decidedly of the opinion that the 12th question could be answered affirmatively. Of the same opinion are intelligent gentlemen who are not silk growers, that *the silk business will ultimately succeed*. There are, however, some cynics who will condemn every thing which does not originate with themselves.

Since the tree mania has met with a collapse, the silk business has begun to assume a healthy condition, which, by individual exertion, perseverance and governmental protection, bids fair to become one of the great staples of our country. The present year has been the experiment year, to test the practicability of growing the article merely, without much regard to the profit. There is much yet to be learned in regard to the best and most economical mode of feeding and reeling. But to promote the culture or growing of silk, until we shall have arrived at more perfection than at present, it will be highly necessary to have the encouragement and bounty in some shape continued a few years more.

Wishing to preserve on the society's files the originals, I shall forward you copies of Mr Huntington's communication and perhaps some others, to be at your disposal.

The exhibition of silk at our late show, wrought upon the domestic reel and wheel, was very encouraging, and showed the practicability of every family making their own common sewings. The silk hosiery made from floss and perforated cocoons, were a substantial article. People are beginning to appreciate the legitimate use of the silk tree.

There have been made only partial returns in answer to the silk circulars. Returns have been made from only 23 towns out of 66: from Belcher-town 22; Northampton, Easthampton, Hadley and Sunderland, 10 each; Amherst 18; Williamsburg 13; Whately and Conway 8 each; Springfield 6; Longmeadow, Leyden, Greenfield, South Hadley, Chesterfield, Goshen, Hatfield and Southampton 2 each; Deerfield 5; Leverett and Rowe one each; Ware has several whose names were not returned;

and it is known that there are several in other towns.

From all of the above towns the whole quantity of cocoons was only about 8000 pounds, and I have no doubt that there has been raised this year at least 10,000 pounds within this agricultural district—sufficient to make 1000 lbs. of raw silk, worth 5000 dollars—a very small sum indeed, in proportion to the capability of the towns. It would be very easy to raise in each town as many pounds of silk as there are inhabitants. By the returns made it appears that more than one fourth of the whole was raised in Northampton. The crops of another year will probably be much greater, and would have been double the present year had there been a sufficiency of healthy worms: millions on millions have perished before or after hatching. One person in this district lost a quantity of imported eggs equal to *twelve millions*. Within my own knowledge, one lot of eggs, called 100,000, wound less than 100 cocoons, and not one half of them were fit to be reeled. The fatality attending the silk worms or eggs this year is unprecedented, in every section of the country from Maine to Georgia. Within the last two years, silkworms' eggs had been sold at an enormous price; next to the mulberry tree, what was sold for ten dollars might be profitably raised for as many cents. This speculation induced many to save all their cocoons last year for eggs, among which were many imperfect and soft cocoons, producing, of course, a feeble progeny; whereas one but the hardest and soundest cocoons should be saved for eggs. To this cause may be traced some portion of the failure. But the greatest injury has probably arisen from the attempt to keep back the hatching, by depositing them in the ice house: too sudden transition and exposure to heat or cold completed the destruction—(so I opine.) In the instance of the loss of the twelve millions, it was entirely attributable to the too long detention in the ice house. I and others had some of them before they had lain too long in the ice house, and they did well and produced a splendid golden pea-nut cocoon; and the loss of the 100,000 is attributable to similar causes.

These results have been discouraging to many, so that it has been made a serious inquiry whether the growing of silk can be made profitable as an agricultural crop. But while some—well-wishers to the silk cause—have been sedulously engaged, working against the wind of popular opinion and the tide of reproach and sarcasm, have, and do entertain, a favorable opinion of the silk cause, ought we not as Americans and as friends to agricultural improvement, bear with and encourage them to go ahead, instead of throwing obstacles in the way? Members of this society (the Hampshire, Hampden and Franklin Agricultural Society,) are in correspondence with some of the most eminent silk growers of the country, who unitedly expressed their confidence in the opinion, that the business may be made so profitable as to engage the attention of all who would be satisfied with a reasonable return for their labor, or have patriotism to assist in diminishing some twenty million of dollars annually expended for an article of luxury.

With due respects, yours, &c.

D. STEBBINS.

#### SILK CULTURE.

Extract of a letter from an experienced cultivator in reply to a printed circular, under date of Sept. 29, 1840:

DEAR SIR:—I have raised this year 197 pounds of cocoons (separate from my others,) upon the foliage of one fourth of an acre, as an experiment, and after rejecting the poorest, had 126 lb. 5 oz.—This was done to test the experiment of Mr McLean the last year; and I expect to have as much silk as he had from the same quantity of land. I had also a further object, which was, to bring conviction home to some of my incredulous neighbors. I have commenced the reeling, and when finished, hope to have some facts worthy of being communicated to the public.

It is my present candid opinion, that one half of the silk which may be raised on a given quantity of land, will fully pay for all the cost of raising, including cultivation, picking leaves and feeding worms, and that the State bounty will fully indemnify for the labor of picking and feeding, board not included. E. M.

REMARKS. The experimenter expresses the opinion that the State bounty will pay for the expense of picking and feeding; but there are other expenses to be brought into account, such as board, rent of land, interest of stock invested, &c.; therefore it seems highly necessary, to encourage the culture, that the bounty should be continued for some years. The worms used were of the six weeks kind; but the leaves having been chopped fine the two first weeks, the worms went up in 25 days. The Chinese use chopped leaves in the early stages, and all with us who have practised the same, have been successful in a healthy crop of worms. S.

Extract of a letter from a highly respectable silk-grower in the county of Franklin, in reply to the silk circular. The writer says that the following persons (names not here mentioned,) were supplied with eggs of his own raising, and that the worms were perfectly healthy; that three fifths of the persons fed with the multicaulis foliage and one with the white mulberry.

One person fed 30,000 worms, consumed 1200 lbs. of multicaulis foliage, and had 70 lbs. of cocoons; another fed 35,000 worms, consumed 1327 lbs. of do. and had 100 lbs. cocoons; another fed 25,000 worms, consumed 817 lbs. of do. and had 75 lbs. cocoons; another fed 40,000 worms with the white mulberry, (leaves not weighed,) and had 105 lbs. cocoons; another fed 8000 worms with multicaulis, (leaves not weighed,) and had 10 1-2 lbs. of cocoons: *four pounds* of these last reeled *half a pound* of raw silk.

The persons who fed the 35,000 and 25,000 worms, chopped the leaves, which they say greatly abridged the labor of feeding, and prevented waste. (The Chinese do the same.) That 13 lbs. of raw silk (peanut) reeled in a style of superior beauty by a lady, was sent to the American Institute for exhibition.

The correspondent closes with the following pertinent remarks:

"If this nation does not become a silk-growing nation, the fault will be her own. We lack nothing bestowed by Providence to become such at once. All that can be wanted is the diffusion of practical knowledge. We have the gift, and the knowledge is exceedingly easy to be acquired. I do not believe that *sudden* fortunes can be acquired by the culture of silk; but it will yield to patience and industry an ample reward. The business is too unpopular at present to flourish, by being asso-

ciated with the mulberry bubble; but I hope the result of this year will convince all grades and classes of its practicability, and lead them to investigate the subject. J. D."

Extract of a letter from an experienced silk-grower in the county of Hampden, under date of April, 1840, in answer to sundry questions:

DEAR SIR—

Having fed worms with the foliage of the white mulberry, the *morus multicaulis* and the large leaf Canton, do not find much difference in the quality of silk. The *quantity* of silk produced very much depends on regular and attentive feeding. I have fed the six-weeks, the one and two crop worms, and am decidedly in favor of the six-weeks kind, as being more profitable, and shall use no other for feeding. Cocoons from the two-crop worms yield only about half so much silk from the bushel as the six-weeks or one-crop.

Of the worms fed on the white and large-leaf Canton, 3000 cocoons weighing 10 pounds, made one pound of silk; but it required 15 pounds of the two-crop to make a pound of raw silk.

I think that worms fed upon the *morus multicaulis* foliage make thinner and looser cocoons, and yield less silk than those fed on the white or large-leaf Canton.

I should think that the average quantity of foliage to make a pound of silk, would rather exceed than fall short of 100 pounds.

As an experiment, I left out about 400 Cantons during last winter, and from appearances I feel quite sanguine that they will stand the weather well on our soil.

Respecting the profits of growing silk, I am of the opinion that it may be made a fair business: our further experience in gathering foliage, using the branches and reeling silk, will increase the profits.

We have made in this place last season (1839) more than 50 pounds of silk, and received 105 dollars bounty from the State (besides the bounty of the agricultural society) and the coming season hope to increase the quantity.

I regret that I cannot give more definite answers to most of your questions. For my own satisfaction the coming season, I intend keeping an exact account of expense and facts relating to it, and if I find any thing worthy of notice, will cheerfully inform you, in aid of your praiseworthy intention of disseminating correct information on this interesting subject.

Respectfully, yours,

W. O. N.

HANLEY, Sept., 1840.

DEAR SIR—You know that I attempted a few years since to do something in the culture of silk in which I was unsuccessful. I have this summer been making another experiment, with which I am better pleased. One principal cause of disappointment, probably was too highly raised expectations of profit. I was unfortunate in several respects: my first crop of cocoons were laid in the garret where the rats ruined them. The next crop were enclosed in tin cylinders: in consequence of confinement, fermentation so weakened the texture as to render it impossible to reel them. During this time there was no market for cocoons, in this region; but the next year offer were made, yet the price and mode of measuring were so precarious and so entirely in the hands of the purchaser, that I abandoned the business in

disgust and as a miserable concern. However, my trees (white mulberry) were left standing: the next autumn and winter they were mostly destroyed by frost. This spring, having a new crop of flourishing trees of other sorts, and being much at leisure, the market becoming more fixed, and, as appeared by the publications, a new spirit of enterprise was waking up the community; and the liberal encouragement given by agricultural societies as also by our General and State legislatures—and, withal, if you can perceive any little spice of patriotism, you may give full credit to that—I was induced to try again, and am pleased to say that, though the profits are no ways splendid, I am satisfied that as a branch of agriculture and domestic economy, the culture of silk, judiciously intermingled with other branches, will pay well for the labor bestowed upon it. It is not my object now to describe the process; this has been done by others, and treatise on the subject may be had at a cheap rate by all who wish for them.

The information contained in the last Report of our Agricultural Commissioner, exhibits the most accurate, enlarged and judicious views, of any thing I have met with.

After all, experience will be found our best teacher. What I have to say is principally the result of my own experience. I began with about thirty thousand silk worms of the common sort, early in the month of May, just as the mulberry leaves begun to be of a suitable size: I had plenty of room, every convenience for feeding, good ventilation, uniform temperature, and no trouble from vermin of any kind. The worms were very healthy throughout every stage, and in about six weeks their work was completed. The cocoons were measured and weighed, when gathered: they measured full six bushels and an half without the floss, and about ten pounds to the bushel, avoirdupois, from which we reeled a little over six pounds and a half of silk. The crysalis stifled by the sun and the few millers which escaped, were preserved for eggs and the eggs deposited in a dry cellar for future use. The labor of setting and taking down the cradles, gathering and distributing leaves, &c., was done at odd spells when nothing else would have been done, and which might have been done by children, for which I make no estimate. I was not at any expense in preparing additional buildings. By courtesy, a corner of our dwelling house in the lower floor, containing one large and two small rooms, was this season fitted up for our new guests, and I have the pleasure to testify on their behalf, that I verily believe the inmates of no family on earth, of the same number, could have been more quiet, or would have left fewer traces, offensive to the most squemish delicacy. Mulberry trees on a small place, may be so arranged as to be ornamental and the expense of leaves trifling.

What I bring into account at this time is for—  
 10,000 silk worms' eggs, at 12 1-2 cts. per thousand, \$3 75  
 Reeling 6 1-2 lbs. of silk at \$1 per pound, 6 50  
 Manufacturing the same into sewing silk, at \$2 25, 14 62  
 \$24 87  
 By return of 6 1-2 lbs. sewing silk worth at the merchant's \$9 per lb. \$58 50  
 24 87

Nett avails of labor, &c. \$33 63

Amount brought forward, \$33 63  
 To which add the bounty on 65 lbs. cocoons at 15 cts. per pound, 9 75  
 For reeling 6 1-2 lbs. silk at 50 cts. 3 50  
 \$46 88

I suppose that if the silk had been manufactured into stuffs would have been worth more.

It may be asked, however, what is 46 dollars to men or women already well enough employed in other pursuits? I answer, it is just 46 dollars saved, and if "a penny saved is two pence earned," it is twice that sum: at any rate it is 46 dollars, ready cash, all added to our other incomes in a very short time and without hard labor: 46 dollars is nearly sufficient to purchase three fashionable dresses for our wives and daughters, or one good or two common cows, or eight barrels of flour—no trifling items in family expenses. Beside, there is patriotism in the enterprise.

If there are a million of families in our country which might as well as not, raise their \$46 worth of silk annually, it would be a saving of as many millions of dollars to our common country; and with a very little additional expense and care, the quantity might be doubled, trebled and quadrupled, by many farmers: indeed, many farmers up and down the Connecticut; and on our hills, on every side, can even now show us their ten, twenty and perhaps thirty pounds of raw silk, the product of the present year. I have heard of one who has raised one hundred pounds of silk this year. Be this as it may, I am well satisfied with what I have done, upon a small scale, and am pleased to have it known too, for the encouragement of others.

From my own experience, I have no hesitation in recommending to every family, so far as it is practicable, to begin the cultivation of silk, and with the means they now have. If they have no trees, then buy a few, or as many as they please, and *feel* their way along as they shall be able, and in a short time they will have accomplished their object; and if they should meet with impediments or mysteries, they will soon vanish. A few trees well planted and the raw material is always at hand, and the artist ready to manufacture it, for no other pay than being fed—whereas the raw material of our cotton or woollen fabrics, is the fruit of hard labor, from year to year at a great expense. But the mulberry once planted, and properly taken care of, will stand and flourish for years, and where it happens to fail can easily be replaced. The beginner is apt to misjudge in nothing more than in the number of worms he thinks he may feed.—In starting the business I know of no better rule than one laid down by a friend of mine from Mansfield. "When you have determined how many worms your trees will feed, take just half the number." It is vexatious in the extreme to be gleaning in the vineyard of others even at the low rate of one cent. per pound for the foliage.

The worst effect of over stocking is, it will produce scanty feeding. To have healthy worms and heavy cocoons the worms must be well fed. As in every other business so in the silk culture, if we would succeed well, we must acquaint ourselves with the best of rules and punctiliously observe them. The whole business should be that of the family. When the Piedmontese reel and the silk loom shall become to our wives and daughters what the distaffs and the spindle of the common wheel, were to their mothers and grandmothers,

then will the culture and manufacture of silk assume its appropriate importance, and then might we expect to see a laudable emulation, not only among the different families, but among children of the same family and of the same school, each having for the season his cradle of silk worms to tend, and eventually give rise to silk factories in our country villages, side by side with our other manufacturing establishments.

Respectfully, yours,  
 D. HUNTINGTON.

Massachusetts Horticultural Society.  
 EXHIBITION OF FRUIT.

Saturday, Dec. 12, 1840.

B. V. French, Esq. exhibited the following apples, viz: Ortlely Pippin, Red Nonsuch, and Monstrous Pippin (Coxe, No. 27.)

M. P. Wilder, Esq., exhibited the following Pears, viz: Passe Colmar, Columbian Virgauleuse and Monsieur le Cure.

Dr. Wight exhibited some large red apples, the name of which is unknown to the Committee.

The Moosieur le Cure having been cultivated under many different names, the Committee are induced to make the following remarks.

It was raised from seed, or first introduced into notice by the curate of a small town near Paris, and for some years was considered identical with the St. Lezin. It has been extensively cultivated in England under the following names—Monsieur le Cure, Dumas, Poire de Clion, Vicar of Wakefield, and Wilmot's new pear.

A letter received in London from M. Vilmoren, of Paris, states that it is a new pear, entirely distinct from St. Lezin—that it is a valuable early winter fruit, and its true name should be Poire de Clion.

It was first cultivated in this country by the late John Heard, Esq., as the "Burgomaster," and described by that name in some Pomological works, and the name of "Winter Bartlett," which it has received in Boston market, will best show the high estimation in which it is held.

For the Committee,  
 ROBERT MANNING.

**Frost Bitten.**—For the information of such as are afflicted with frost bitten hands or feet, we publish the following from the New York Sun:

"Dissolve half a pound of alum in a gallon of warm water; and soak the hands or feet before going to bed for ten or fifteen minutes. I had one of my hands frost bitten, and tried various remedies, and expended five or six dollars, endeavoring to obtain a cure, but all to no purpose, until I tried the above. In my case, I dissolved about three ounces of alum in a quart of warm water, (keeping it pretty warm,) soaked my hands three or four nights, when a cure was effected—the expense was two or three cents

**Rheumatism.**—Take a pint of the spirits of turpentine, to which add half an ounce of camphor; let it stand till the camphor is dissolved; then rub it on the part affected, and it will never fail of removing the complaint. Flannel should be applied after the part has been well fomented with turpentine. Repeat the application morning and evening. It is said to be equally effectual in cases of burns, scalds, and bruises.—*Bay State Democrat.*

## POUDRETTE.

NEW YORK, Dec. 14, 1840.

To the Editor of the New England Farmer:

SIR:—Will you allow me the privilege of laying before the agricultural community the following letter in relation to a subject which at this time is exciting considerable interest among the farmers of this vicinity. The writer hesitates to put his name to it, because (as he says) he is "too young a farmer to appear in print." Allow me to say that his statements are to be relied on, even if he is a young farmer, as he has been too long a merchant of high standing in this city, now retired from business, to mislead others, and especially those who cultivate the soil.

Respectfully, yours,

D. K. MINOR.

To D. K. MINOR—SIR—The enclosed notes of the effect of pourette on various crops are at your service, if you can make them useful without my name, for I am too young a farmer to appear in print.

I hope you may find sufficient encouragement to enable you to increase your business, and that it may become more profitable to you than I fear it has been.

Yours, &amp;c., J. H.

Pelhamdale, Westchester co., Dec. 9, 1840.

As I promised to give you the result of my experiments the past season with pourette as a manure for various crops, I now have to say that I consider it superior to any manure that I have ever used.

On potatoes—the seed and soil the same—those manured with pourette in the drill came up four days earlier than those manured with the best stable manure, and kept, during their whole growth, before them; and when dug, they yielded larger tubers; but as the two parcels were not accurately measured, (some having been used early) I cannot say how much difference there was in their product; but I know those manured with pourette were the largest bulk.

For corn, I think no other manure can come in competition with it. I planted, last season, on sward turned over, (being first manured with common yard dung,) the ground rolled very flat and harrowed—no plough used afterwards—the rows being marked by an ox chain drawn on the ground; the corn dropt, and half a gill of pourette immediately put on the corn, and lightly covered with the hoe. This was done from 25th to 28th of May, as the weather permitted—more than a fortnight after my neighbors had planted.

I was told by many who saw the manner and time of planting, that I should have no crop, but in three weeks my corn was farther advanced than any near me, and it continued of the finest color, and was the best filled of any I saw through the season. It was cut up and removed from the field on the first of September; and when husked, turned out less soft corn than I ever had, in proportion to the quantity of good corn. I can attribute this quick and good growth to nothing but the pourette—as the land was not well tilled; the corn having had only one good hoeing after it came up, and the cultivator was run through it but twice.

As a top dressing for grass, I can speak in the highest terms of pourette. Being anxious to have some parts of a new garden soon in sward, I put some loam, gravel and peat earth on a piece of

swamp ground filled in with stones and rubbish from the walks, and sowed grass seed in October. I could see the grass fairly up before the snow covered it in December; but in March, scarcely any appearance of grass or roots was visible I had the ground raked over and some pourette spread lightly over it, and about half the usual quantity of clover seed sowed on it, and the effect was truly astonishing, for in June it was cut, again in August, and some feed on it in October; and until the snow of the 5th instant it remained beautifully green. A small space, where a shovelfull was accidentally spilled and not well gathered up, grew so luxuriantly that it could be at once perceived on entering the garden.

For turnips, I know pourette to be almost a certain guard against the fly. Mine this year are as fine as were ever raised in the county, and although sowed from 15th July to 1st of September, (the latter after a crop of potatoes;) they have fully matured, and no appearance of injury by the fly from the time of sowing. I put the pourette in the drill, after the turnip seed, and it took but a very small quantity, say so as to look like a train of gunpowder.

For cucumbers, melons, &c., I think pourette mixed with peat earth the best manure that I have tried. I raised very fine watermelons on sand with this compost the past season.

Dec. 9, 1840.

MR EDITOR—May I add, sir, that the writer of the foregoing letter has used pourette prepared by the "New York Pourette Company," three successive seasons, at the rate of 100 bushels a year, experimentally in various ways, and that the bushel is estimated as equal to a city cartload of street manure. He receives one hundred bushels annually, as the dividend on one share in the company which cost one hundred dollars, and he usually carries it home, 14 miles, at four or five loads, in a light pleasure wagon.

Yours, truly,

D. K. M.

## PRESERVATION OF APPLES.

Many who attended the late exhibition of the New Haven County Agricultural Society, saw and admired the apples of the growth of the year 1839, which were presented to the Society by Mr Augustus Foote, of Branford; and the readers of this paper will recollect that we called on Mr Foote, at the instance of a correspondent, for information that might enable others to preserve apples for an equal length of time. Mr Foote was in town the other day, and responded to our call, by calling on us. He states that his apples were kept through the year, without any extraordinary labor or pains on his part. He puts them in an uncovered bin in his cellar, which is made secure from frost. In the spring, instead of opening his cellar and admitting the fresh air, as is usually the case, he keeps it closed tight as in winter. The consequence is that his apples keep sound through the summer.—The apples which attracted attention at our exhibition, were of a variety which Mr Foote calls "Everlastings," but he thinks apples might generally be preserved in good condition through the summer, if kept in a tight cellar. The admission of fresh air in the spring, according to his theory, causes their speedy decay.—*Farmer's Gaz.*

The importation of silk into this country in 1839 amounted to nearly 23,000,000 dollars.

From the Western Farmer and Gardener.

## LARGE AND SMALL FARMS.

SIR:—I wish my brother farmers would think very seriously on the advantages to be derived from the system of cultivating no more land than can be well manured. The desire for more land has been the ruin of thousands, who would at this time have been well off, if *their friends* had deprived them of one half the number of acres they at one time possessed; while the extra labor and anxiety consequent upon a business so spread abroad, are all that many have ever gained, and all that they had a right to expect to obtain. And it would appear to be a fatality to which persons of this sort are subject, or they would surely be able to see the nose in the middle of their face—for one is not more plain than the other. If ten acres of land can be made to yield as much as one hundred, merely by concentrating upon it the means of improvement, the labor and care necessary for the cultivation of the one hundred acres, the result must be profit of mind, body and substance, absolutely astonishing. Now only for a moment calculate the difference in labor, in hauling the manure over one hundred acres instead of ten, and after that the spreading it abroad! Then comes ten times the ploughing, harrowing, sowing with ten times the quantity of seed, hoeing, harrowing, mowing or reaping, and binding and raking over one hundred acres instead of ten, and extra carrying crops; and after all this, ten times the rent to pay: I declare it appears to be a species of insanity, this desire for more land.

I have lately seen a farm where all these evils are embodied—of excellent natural fertility, fields large, and lying on an easy declivity, with every facility for permanent improvement; marl of the richest quality in the middle of the estate, and within three feet of the surface. Now, if the owner of this fine farm of about two hundred acres, would confine his labors to ten acres of the land adjoining his house, and give all the rest to the stock upon his farm, only mowing the weeds to prevent them from seeding his and his neighbor's land, I believe he would then make a *profit*, while at present he must *make a loss*.

I was told yesterday of a farmer who cultivated one acre of land, adjoining a field of thirty acres; both were planted with rye—and at harvest a bet was made that the yield of the one acre was equal to that of the thirty acres; this was, however lost, for the crop of the thirty acres measured exactly *three quarters of a bushel* more than the one acre: these fields I have seen this day; and I have also seen another field, where the owner offered to dispose of the crop of rye for a dollar an acre, but could get no purchaser at that price!

Now, is it not much better to double the crop than to double the number of acres? But I have land lying before me, which would yield five hundred per cent. more than it now does, by extra management.

AN OLD FARMER.

*Hard Times.*—It is our excessive imports that brings hard times. All the Presidents that were ever born, and all the gold and silver dug from our earth, or imported, or all the banks ever made could not make a country prosperous, while the imports are so much greater than the exports as they are in the United States. Light amongst all parties is needed, and light alone will produce reform.—*Agriculturist.*

## ON MAKING PORK AND COOKING FOOD FOR STOCK.

There is no point in the management of a southern agriculturist, in regard to which there is less of management or economy, than in the system of hog-minding, from its beginning to its end. To speak now only of such as one "put up" to be fattened, what can be more ill judged and wasteful than the buildings or pens constructed for fattening, and the careless, wholesale manner in which their uncooked corn is given to them. From the following on making pork, from the Albany Cultivator, the reader may derive some hints that may be serviceable. How very few there are in Maryland, who make for themselves their own pork, as it is called in New England, yet what can surpass a nice piece of family pork occasionally? As connected in some sort with this subject, we select from the same paper some remarks on cooking food for animals. On the economy of this, writers do not entirely agree. Southern farmers almost entirely overlook the practicability of amassing an immense heap of manure from the hog pen. Some eastern farmers contend, that if well managed in that respect, they may be made to pay for the expense of fattening.—*American Farmer*.

"Making pork is one of the most essential interests of the farmer, and may be made one of the most profitable. We question, however, whether, as generally conducted, much money is made by feeding swine, and the reasons are sufficiently plain. In the first place, but little attention, if any, is paid to the kind of hog used for feeding. It is enough, if the animal, caught and caged in the pen, is a hog; the fact that a given quantity of food fed to some breeds will make nearly or quite as much again pork as when fed to some other breeds, is overlooked; and an astonishing quantity of roots and grain is thus annually wasted. In the second place, the mode of feeding is very defective. The food may be good, but if given to the hog unprepared, or uncooked, much of its efficiency is lost. To keep hogs profitably, they should from the first, be kept in a thriving state. Not half fattened at one time, and then allowed to fall away until they are miserably poor; but kept constantly improving from the time they leave the sow until they are ready for slaughtering. It takes a much larger amount of food to raise an animal of any kind allowed to become poor, than to keep one constantly thriving. Again, the time allotted to feeding, is usually too limited; good, firm, heavy pork cannot be made, no matter what may be the feed used, short of three or four months. Hogs may be puffed out, and made to look pretty fair, but their meat will not be hard and firm, and will be affected with the complaint called shrinking in the pot. Hogs fatten much faster in moderate weather, than in severe cold weather; and hence the process of fattening should commence as early as the food to be used can be had. After the process of feeding begins, see that the hogs have enough: to suppose a squealing, ravening hog will fat, is a mistake, but unfortunately a common one.

Farmers in general miss a large part of the profits that might be made from feeding pork, by not paying attention to the making of manure from swine. For corn, a variety of experiments has convinced us there is no manure that can be compared with that of the pig; and the farmer who permits any of this to be wasted, or does not give the animal an opportunity of converting as much

mould, vegetable matter, &c. into manure as can be done, is a great loser in the end. Some able farmers have estimated that the manure made by a lot of pigs, where the proper materials are provided, will fully pay the expense of feeding; but there is no doubt if they do not do this, they will, by fermenting the most enriching compost for crops, add essentially to the ultimate profits of the farmer. To make good pork, a hog should not be less than fifteen months old, kept constantly thriving, not have a yard as large as the farm or the highway, and be fed on good food not less than three months.

*Cooking Food for Animals.*

All are aware that grain of almost every kind greatly increases in bulk by steaming or boiling, and this bulk is greatest at the moment the grain is swelled so as to crack or burst its skin. It is also known that cooked food is far more nutritious to animals than that which is uncooked; and many have gone on the supposition that its increase in value for food was equal to its increase in bulk in cooking. This is doubtless a mistake, as the nutritive power of articles is rarely in proportion to their size, and never perhaps exactly in proportion to their increase of bulk in cooking.

Reaumur instituted a series of experiments to determine the rate of increase in different articles of food most commonly used for animals, and found the result of some of them as follows:

4 pints of oats after boiling, filled	7 pints.
4 " barley " " 10 "	
4 " buckwheat, " " 14 "	
4 " Indian corn " " 15 "	
4 " wheat " " 10 "	
4 " rye " " 15 "	

In the continuation of his experiments to ascertain the effect of such food on animals, he found that with some of these articles, though the bulk was much increased, the total of food required to satisfy the animal, was the same as if no cooking had taken place; or that an animal that would eat half a bushel of oats dry, would eat a bushel cooked with the same ease. The nutritive power was, however, apparently increased, or the whole of it contained in the grain made available; which, when grain is fed whole or raw is rarely the case. On the whole, he came to the conclusion that when wheat, barley, or Indian corn is used for feeding, it is far more economical to boil or cook these grains, than to feed them in a raw state; but that little is gained on the score of economy, when time, fuel, &c. are taken into consideration, in cooking oats, rye and buckwheat.

In determining the question of economy, much we think is depending on the manner in which the cooking of the grain is performed, whether alone or with other substances, such as roots. Alone, corn is the most improved by cooking of any of the grains, and the value of corn meal for making pork, it has been shown by experiment, is almost double when made into pudding. We have long been in the habit of boiling and steaming potatoes for feeding pigs or making pork. With them, in the early part of the feeding, we incorporate apples, squashes, pumpkins, indeed almost any vegetables of which swine are fond. The grain we use, is ground, and either steamed with the roots or mixed with the hot mass in the vats as it is taken from the steamer. As the feeding progresses, the quantity of meal is increased, until towards the last, that material alone. Corn is decidedly the best grain for making pork; peas and barley are next."

From the Farmer's Cabinet.

## PROTECTION OF CATTLE.

Cattle whose bellies are kept well filled, have an active, vigorous circulation of the blood, which keeps them warm during the inclement winter season, provided they have access to an open shed to protect them from wet. It is much to be regretted that so many barn-yards are destitute of open sheds to furnish protection to cattle. Those animals that are furnished with warm stabling during the night, suffer much more for want of protection from wet during the day-time, than if they were exposed night and day to the elements. An advantage of no trifling amount, also, arises from open sheds in a barn-yard, protecting the manure under them from being bleached by rains, which depreciates its value one half. An accurate experiment has been made by an intelligent farmer on this subject, which resulted in proving, that one load of manure which was protected in this manner, goes as far as two loads which had lain exposed to all the rains of the season. A rough shed costs but a small sum, and it matters not how rough and cheap it is made, so that stock can be kept dry under it.

Try it; go to work and erect one yet, though it be already winter; it can be done in a day or two, at a very inconsiderable outlay, and it will pay for itself, with a hundred per cent. profit, before this time twelvemonth.

Have you water near your barn for your stock, or do you permit your cattle to wander abroad for several hours every day in pursuit of it elsewhere? Farmers who permit their stock to get drink where they can find it, and drop their manure where it will be a nuisance rather than a benefit, cannot be called good managers, and such are uniformly rewarded according to their works.

## AGRICOLA.

**BEACH GRASS.**—We have before referred to this grass and its peculiar properties as stock for the manufacture of paper. From repeated experiments, paste-board, bandbox, hanging, and wrapping papers, of a superior quality, have been made from it, which is preferable to the same paper made from common coarse stock, that costs at least double what this grass can be produced for. It is estimated that from 600 to 800 tons of this grows annually on Cape Cod. No use whatever was made of it, till it was discovered by Mr Sanderson that it was of a fibrous nature, and peculiarly fitted for the manufacture of the articles above named. Mr S. has received three premiums from different associations, for the discovery, and holds a patent, and, from want of means, wishes to connect himself with some one who can furnish a part of a capital to commence its manufacture on an extensive scale.—*Boston Transcript*.

A potato diet is found greatly to improve the quality of the blood. Hence roasted or baked potatoes are successfully employed as a specific against the sea scurvy, when other remedies have failed. This discovery was made in France. It is singular that boiled potatoes do not seem to have the same good effects.

**Expense of War.**—The expenditures of the British government for the expenses of wars for six successive years, ending with the battle of Waterloo, which gave peace to Europe, amounted to the enormous sum of £636,016,988.

**NEW ENGLAND FARMER,  
AND HORTICULTURAL REGISTER.**

BOSTON, WEDNESDAY, DEC. 23, 1840.

**CHANGE IN CONDUCTING THE N. E. FARMER.**

In consequence of having our mind fully occupied in superintending and directing the concerns of our Agricultural Warehouse and Seed Store, we have found it impossible to devote the time and attention to the N. E. Farmer which are due to our numerous subscribers, readers and friends. We deem it necessary, therefore, to throw off all responsibility in relation to the paper. The duties of the Agricultural Commissioner calling him frequently to distant parts of the State, render close and constant attention to the paper on his part impossible. We find it important to confide the editorial department to hands less trammelled by other pursuits than Mr Colman and our own; and we have engaged ALLEN PUTNAM, Esq., of Danvers, (formerly a clergyman, but for a few years past a *practical farmer*;) to become editor, after the first of January next. Though by this arrangement we are in danger of losing in part the able assistance of the Agricultural Commissioner, we trust the character of the paper will be sustained.—Mr Putnam is not entirely unknown to the agricultural community. His address before the Essex Agricultural Society, in 1839, has been extensively read and well received. If that performance be a fair specimen of his ability as a writer for farmers, our readers may anticipate much instruction and high satisfaction from his labors. In that address he informs us that he has been an actual laborer on the farm, using with his own hands the plough, the scythe, and other agricultural implements. We saw him between the plough-handles at Worcester, as a member of the committee for awarding the State Society's premiums on ploughs, and he seemed to be in a place to which he was accustomed. Uniting as he does the advantages of a collegiate education, and of actual acquaintance with the labors, condition and wants of a New England Farmer, we think him peculiarly suited to take charge of the *New England Farmer*.  
J. B.

**LECTURES ON AGRICULTURAL CHEMISTRY.**

We understand from a prospectus forwarded us by a friend, and learn it with great pleasure, that Dr Dana, of Lowell, proposes at the request of several of his fellow citizens, to give a course of six lectures on Agricultural Chemistry. There is no man in the country who has given more attention to the subject, or is more competent to discuss these important topics. The public are not ignorant of Dr. Dana's views of vegetation, and the discoveries in the investigation of soils and manures, which, if made by others, are yet original with him; and the fruits of his laborious investigation.

We are not prepared to say that the Dr.'s theoretical notions are correct. This remains to be established; but they certainly have strong arguments in their support; and on a subject so profound, we may patiently wait for farther light and for any and all the light which may be thrown upon it.

At present, in regard to many of the operations of nature in any and every department, we must remain in the dark, hoping for the rising of the sun. The vital action is a profound mystery; we certainly will not say never to be solved, but as yet the solution, for aught we see, is as distant as ever. Wherever it is possible, however, by the investigation of the elements of any substance and the study of its chemical affinities, ac-

tions and relations, to understand how it operates, and this may be done in many cases, those advances in chemical knowledge are most important. This work chemistry has done and is now doing with great success. We say this with particular emphasis and pleasure, not from what has been effected in our own country only, but from the spirit and intelligence with which the subject is pursued abroad, in England, France and Germany, where it seems to have become almost the favorite study of some of the most gifted and enlightened minds.

We have just been looking, with a pleasure that we can hardly express, at a new work by Liebig, on Agricultural Chemistry, laid before the British Association last autumn, and just received here. We have as yet given it a very imperfect examination, because we felt obliged and happy to transfer our copy to a learned friend from the interior. But we shall replace it the moment it is practicable; and satisfy our appetite with one of the richest treats that has as yet over come within our reach. The style of the book is obscure, as written in English by a German, and it is too full of scientific terms for general readers; but we have a large body of intelligent men among our literary and in our farming community, who will read it with the greatest interest.

With the hasty view which we have been able to take of it, we are not willing to give an account of his theories, and the arguments and facts by which he sustains them; but if his notions are well founded, he solves in the most lucid and satisfactory manner the great and difficult questions which have prevailed in regard to soils, vegetable mould and humus, and the alkalies and salts, which evidently play so important a part in vegetation. We hope the book will speedily be republished in this country; and we hear with the highest satisfaction, that a proposition to this effect has been made to some of our publishers, and to add to it notes of explanation and illustration, by a learned Professor at New Haven, long distinguished for his skill in chemistry and geology, and equally for his public spirit and his ambition to be useful.

There are one or two important points established by the book, which we are hardly willing to pass over, because they so fully confirm our own views often expressed, and are so constantly confirmed by observation and experience. The first is, that potash is the most important of all ingredients in the soil, especially for wheat and many other plants. The second is, that the most valuable and efficient of all manures is human urine. In cities, likewise, where the food of the inhabitants is various and more meat is consumed than in the country, this material is the more valuable. We hope our farmers will, as we have often urged them to do, consider this; and avail themselves as they might in various ways, of its advantages. We believe that three barrels of this material properly managed would do as much for them as a cord of stable manure; and it certainly might be obtained and managed with far less trouble, to say nothing of the advantages to cleanliness in our cities and the economy of saving from waste a substance of so much value. We make no apology for treating a subject so homely in this explicit manner. We shall say more of it hereafter; and we hold in utter contempt that false modesty, which hesitates to treat, when use, or health, or science requires, of any of the operations of nature. Evil be to him who evil thinks.  
H. C.

You who are blessed with abundance, remember the poor now—this is the time that want pinches hardest—the charity which alleviates the sufferings of the unfortunate is "twice blessed."

**POUDRETTE COMPANY, NEW YORK—D. K. MINOR.**

In reference to the Poudrette mentioned in the letter of D. K. Minor, on another page of this week's Farmer, and to which reference has been repeatedly made before, we beg leave to add the terms on which shareholders are received into the company. We believe that the price of a share is one hundred dollars. We add an extract from a private letter of Mr Minor, which we have just received—"You will perceive that the shareholders are to receive one hundred bushels *annually* as their return or dividend; which is worth 35 to 40 cents per bushel; and which, if they receive it regularly, will be equivalent to 35 or 40 per cent. per annum; or to a return of their capital with 10 to 15 per cent. interest every four years for 18 years to come. Of course, the inquiry will naturally arise, Will the shareholders receive their dividends as promised? In reply to this I can only say to you that thus far they have received them in full up to July last, even under all the difficulties and prejudices arising from the introduction of such a business, and that I have confidence in my ability to carry it through, and of making a handsome income for myself after giving the shareholders their dividends. My determination is to succeed in the business, and I have *no doubt* of success."

We have thought it best to let Mr Minor speak for himself. We know nothing of the situation of the Poudrette company with which Mr Minor is connected, otherwise than as it appears above. But we know a good deal of Mr Minor, and have known him for several years. We presume he states nothing but what he feels warranted in stating. We are persuaded he would not willingly mislead any one. We believe him to be a strictly upright and honest man. No man ever worked harder for a living; and having been prostrated by a succession of unavoidable misfortunes, growing out of the great fire in New York, we wish him all possible success; and hope that some of the farmers of Massachusetts will, under the prospect of such liberal dividends, take shares in his company.  
H. C.

**POUDRETTE CONTROVERSY.**

Our insertion of the advertisement of the "New York Poudrette Company" in the postscript of which there is a pointed distinction between that company and the "Lodi Manufacturing Company," has induced Mr John Stevens, foreman of the last named company, to send us a long affidavit, in which we have the results of the analysis of the poudrette of the two companies, by three different chemists, who agree substantially in their reports, and make the article manufactured by the Lodi company contain about 160 parts of manuring properties where that of the New York company contains 100 parts. We are requested to insert the entire article, and we would gladly do so, did we suppose the subject as interesting to our readers as it obviously is to the manufacturers. But as its insertion will put us under obligation to insert a rejoinder, should one be sent us, and thus open our columns to a protracted controversy, we must withhold the article, though it is written with apparent justice and candour, and though we are offered compensation for the insertion.  
J. B.

**FIRST REPORT OF THE AGRICULTURE OF MASSACHUSETTS.**

The subscriber asks as a particular favor of any person who has one to spare "either for love or money," a copy of the First Report of the Agriculture of Massachusetts. Gentlemen who were members of the legislature in the year of its publication, received five copies

each. He would very cheerfully pay for a dozen copies, if they can be obtained.  
H. C.

**BRIGHTON MARKET.—MONDAY, DEC. 21, 1840.**

Reported for the New England Farmer

At Market 620 Beef Cattle, 200 Storea, 2400 Sheep and 60 Swine.

**Prices — Beef Cattle**—Our quotations for the first and second qualities last week, were not so high as they should have been, and we quote still higher to day. First quality \$5 75 a 6 00. Second quality, \$5 00 a 5 50. Third quality, \$3 00 a \$4 00.

**Barrelling Cattle**—Prices have not advanced on Barrelling Cattle, and we quote the same.—Mess \$1 25 a \$4 50; No. 1 \$3 75; No. 2 \$3 00.

**Stores**—A few sales only were noticed.

**Sheep**—Sales quick. Lots \$1 50 \$1 75, \$2 00, \$2 33, and \$2 75. Weathers \$3 50, and \$4 00.

**Swine**—A small number only were at Market, consequently no larger lots were sold. A lot of barrows at 5 and a lot at 5 1-2. Lots to retail, from 4 1-2 to 6.

**THERMOMETRICAL.**

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northerly exposure, week ending Dec. 20.

Dec. 1840.	7 A.M.	12 M.	5 P.M.	Wind.	
Monday,	14	32	42	36	W.
Tuesday,	15	30	44	41	S. W.
Wednesday,	16	38	46	34	N.
Thursday,	17	24	28	24	W.
Friday,	18	10	21	14	W.
Saturday,	19	10	23	25	W.
Sunday,	20	12	26	22	N.

**POUDRETTE.**

The subscribers reside in the state of New Jersey, many of us in the vicinity of the works erected by Anthony Dey, of the city of New York, on the Hackensack river, in New Jersey, for the manufactory of Urate and Poudrette, called "The Lodi Manufacturing Company." We have used the poudrette on the Spring Crops this year, 1840. We find it a valuable manure, superior to any other kind that we have ever used, and considering the facility of its transportation to the field, the small quantity required in the application to the crops, the quickness of its operation on vegetable matter, and the ease with which it can be applied,—all tend to recommend its use to the farmer and gardener as the cheapest and best manure, and we recommend it accordingly.

Those of us who have applied it to corn and potatoes think that it ripens those vegetables quicker than any other manure by several weeks.

Dated New Jersey, October, 1840.

- |                      |                   |
|----------------------|-------------------|
| Jacob D. Van Winkle. | P. F. Welsh.      |
| John J. Newkirk.     | G. C. Van Ripper. |
| John Tise.           | George Tise.      |
| Daniel Van Ripper.   | William Wood.     |
| George Demott.       | John Duryee.      |
| Henry Drayton.       | George Newkirk.   |
| Joseph Hornblower.   | Garrret Newkirk.  |
| Corns. Van Winkle.   | Daniel Vreeland.  |

Shares in the above company are \$100 each, and may be had by applying to Anthony Dey No. 73 Cedar St. New York.—The owner will receive 20 per cent. per annum, payable in money, or 50 bushels of Poudrette. The price to those who buy Poudrette is 40 cents a bushel. It costs the Stockholders 12 cents a bushel. One cent worth, that is, 20 Gills, will manure 20 hills of corn, and the like quantity 15 hills of Potatoes.

Newspapers friendly to agriculture will confer a favor on the Farmers and Gardeners by publishing the above.  
Dec. 22.

**FARM FOR SALE.**

The subscriber offers for sale that valuable Farm, situated about 3-4ths of a mile below the First Parish Meeting House, on the Stage road, and commonly known as the Judge Prescott farm, containing about 170 acres of superior land, in a good state of cultivation, with two dwelling houses, four barns, and other out buildings. The farm is remarkably well watered with soft water, conveniently fenced, has nearly forty acres of large, handsome wood and timber standing on it, with an orchard of grafted Apple, Pear, Peach, Plum, and Cherry trees, and might be easily divided into two Farms. The estate will be sold reasonably. If five thousand dollars be paid on receipt of the deed, the remainder may lay on mortgage to suit the convenience of the purchaser. For further particulars, apply to the subscriber, living on the premises.  
WM. SALISBURY.

Groton, Oct. 26, 1840.

eow.

**GREEN'S PATENT STRAW CUTTER.**

JOSEPH BRECK & CO. at the New England Agricultural Warehouse and Seed Store Nos. 51 and 52 North Market Street, have for sale, Green's Patent Straw, Hay and Stalk Cutter, operating on a mechanical principle not before applied to any implement for this purpose. The most prominent effects of this application, and some of the consequent peculiarities of the machine are:

1. So great a reduction of the quantum of power requisite to use it, that the strength of a half grown boy is sufficient to work it efficiently.
2. With even this moderate power, it easily cuts two bushels a minute, which is full twice as fast as has been claimed by any other machine even when worked by horse or steam power.
3. The knives, owing to the peculiar manner in which they cut, require sharpening less often than those of any other straw cutter.
4. The machine is simple in its construction, made and put together very strongly. It is therefore not so liable as the complicated machines in general use to get out of order.

**WILLIS'S LATEST IMPROVED VEGETABLE CUTTER.**

For sale at the New England Agricultural Warehouse, No. 51 and 52 North Market Street, Boston, Willis's Latest Improved Vegetable Cutter. This machine surpasses all others for the purpose of cutting Ruta Baga, Mangel Wurzel, and other roots. The great objection to other machines, is their cutting the roots into slices, which makes it almost impossible for the cattle to get hold of them: this machine with a little alteration, cuts them into large or small pieces, of such shape as is most convenient for the cattle to eat. It will cut with ease from one to two bushels of roots per minute.

**GREEN HOUSE PLANTS, &c. &c.**

The subscriber can furnish every variety of Green House Plants or Garden Shrub, in the very best order. Also—Dahlia roots, (all the new varieties); Black Hamburg, Sweetwater, and Isabella Grape vines; Roses and Pæonies; Honeysuckles, and other creepers; Black, White, and Red Currant trees; White and Red Antwerp Raspberry vines; Asparagus and Rhubarb roots, &c.

Orders by mail will be promptly and faithfully executed; or they can be forwarded to, or left with J. Breck & Co.

JAMES L. F. WARREN,

Oct. 28. Nonantum Vale, Brighton.

**FRESH GARDEN SEEDS.**

We would inform our customers and friends that we are now receiving our supply of fresh Garden Seeds, most of which have been raised under our own inspection, from fine selected roots; which we warrant to be of the purest quality of the growth of the present season.

- Agricultural Books.
- Agricultural Implements.

Seed and Implement Catalogues sent to all applicants gratis, and all orders promptly attended in.

JOSEPH BRECK & CO.

Boston, Sept. 29, 1840.

## MISCELLANEOUS.

## NATURAL HISTORY.

## THE MOLE.

This curious little quadruped seems formed to live wholly under the earth, as if the supreme Being meant that no place should be left wholly untenanted. Were we, from our own sensations to pronounce upon the life of an animal that was never to appear above ground, but be always condemned to hunt for its prey underneath, and obliged, whenever it removed from one place to another, to bore its way through a resisting body, we should be apt to assert that such an existence must be the most frightful and solitary in nature. In the mole, however, though condemned to all these seeming inconveniences, we discover no signs of wretchedness or distress. No quadruped is fatter, none has a more sleek or glossy skin; and, though denied many advantages that most animals enjoy, it is more liberally possessed of others, which they have in a more scanty proportion.

The size of the mole is between that of the rat and the mouse; but it in no way resembles either, being an animal entirely of a singular kind, and perfectly unlike any other quadruped whatever. Its nose is long and pointed, resembling that of a hog, but much longer. Its eyes are so small that it is scarcely possible to discern them; and instead of ears it has only holes in the place. Its neck is so short that the head seems stuck upon the shoulders. The body is thick and round, terminating by a very small short tail, and its legs are so short, that the animal seems to lie flat on its belly. Thus it appears to us, at first view, as a mass of flesh covered with a fine shining black skin, with a little head, and scarce any eyes, legs, or tail. The ancients, and some of the moderns were of opinion, that the mole was utterly blind; but Derham, by the help of a microscope, plainly discovered all parts of the eye that are known in other animals. The smallness of its eyes, which induced the ancients to think it blind, is to the animal a peculiar advantage. A small degree of vision is sufficient for a creature that is destined to live in darkness. A more extensive sight would only have served to show the horrors of its prison, while nature had denied it the means of escape. Had this organ been larger, it would have been perpetually liable to injuries, by the falling of the earth into it; but nature, to prevent that inconvenience, has not only made them very small, but has covered them with hair. Besides these advantages, anatomists mention another, that contributes to its security: namely, a certain muscle, by which the animal can draw back the eye whenever it is necessary, or in danger. Indeed, the whole figure and formation of the mole is most admirably adapted to its manner of living, and strikingly illustrates the wisdom and skill of the Almighty Creator.—*Abbott's Scripture Natural History.*

## THE BEAVER.

The following interesting anecdote of the beaver, is taken from Franklin's Narrative of a Journey to the Polar sea:

"One day a gentleman, long resident in this country, espied five young beavers, sporting in the water, leaping upon the trunk of a tree, pushing one another off, and playing a thousand interesting tricks. He approached softly, under cover of the bushes, and prepared to fire upon the unsuspecting

creatures; but a nearer approach discovered to him such a similitude betwixt their gestures and the infantile caresses of his own children, that he threw aside his gun. This gentleman's feelings are to be envied; but few traders in fur would have acted so feelingly."

## THE RATTLE SNAKE.

The rattle snake finds a superior foe in the deer and the black snake. Whenever a buck discovers a rattle snake in a situation that invites attack, he loses no time in preparing for battle. He makes to within ten or twelve feet of the snake, then leaps forward, and aims to sever the body of the snake with his sharp bifurcated hoofs. The first onset is most commonly successful, but if otherwise, the buck repeats the trial until he cuts the snake in twain. The rapidity and fatality of his skilful manœuvre, leave but a slight chance for its victim either to escape or to inject its poison into its more alert antagonist. The black snake is also a more than equal competitor against the rattle snake. Such is its celerity of motion, not only in running, but in entwining itself round its victim, that the rattle snake has no way of escaping from its fatal embrace.

When the black and rattle snakes are about to meet for battle, the former darts forward at the height of his speed, and strikes at the neck of the other with unerring certainty, leaving a foot or two of the upper part of his own body at liberty. In an instant he encircles him within five or six folds; he then stops, and looks the strangling and gasping foe in the face, to ascertain the effect produced upon his corsetted body. If he shows signs of life, the coils are multiplied, and the serews tightened; the operator all the while narrowly watching the countenance of the helpless victim. Thus the two remain thirty or forty minutes; the executioner then slackens one coil, noticing, at the same time, whether any signs of life appear; if so, the coil is resumed, and maintained until the incarcerated wretch is completely dead. The moccasin snake is destroyed in the same way.

## MIGRATORY INSTINCT OF ANIMALS.

A British officer on board a ship which touched at the Island of Ascension, in her way to England, informed me that they took in several large turtles, and amongst others, one, which, from some accident had only three fins. The sailors on board called it the 'Lord Nelson,' and it was marked in a certain way by having certain initials, and numbers burnt upon its under shell with a hot iron, which marks are never to be obliterated. Owing to various causes, the ship was delayed on her voyage; many of the turtles died, and others became sickly. This was the case of the 'Lord Nelson'; and it was so nearly dead when the ship arrived in the channel, that the sailors, with whom it was a favorite, threw it overboard, in order, as they said, to give it a chance. Its native element, however, appears to have revived it; for two years afterwards the very same turtle was found at its old haunts in the island of Ascension. The proofs brought forward of the accuracy of the statement, place the fact beyond doubt, and afford a wonderful instance of the instinct of this fish. When we consider the vast tract of water which this turtle had to pass, and that the island of Ascension is only a little speck in the mighty ocean, it is impossible not to reflect on that unexplained instinct with wonder, which enabled so unwieldy, and apparently so stupid an animal to find its way back to a rock in the desert of waters.

## JACKDAW.

Swinesherd Abbey, in Lincolnshire, is famous in history as the scene of poisoning King John. An old elm tree, in the avenue leading up to the house, was blown down by a high wind; several young jackdaws were killed in the nests in the hollow tree when it fell; one, however, escaped, and was reared by the children. This bird evinced great sagacity, but there was one circumstance attending it which excited particular observation. When the owner of the house was riding out, the bird appeared to be always watching his return; and the moment he saw him coming up the avenue, he would fly off in search of the groom, and by his extraordinary noise, apprise him of his master's approach. If the man did not attend to him, he would peck at his legs, lay hold of his stocking, and pull with all his might; and the man said he was always made sensible of his master's return, by the peculiar note of the bird. It used to take its stand upon the gate of the stable yard, which commanded a view down the avenue. Like most pets, it came to an untimely end. The poor bird alighted amongst some hot ashes, and was burnt to death.

## INSTINCT OF BIRDS.

Birds have an extraordinary faculty in avoiding danger, although it be not apparent at the time. Some years ago a large and beautiful ash tree was blown down in the vicarage of Newcastle upon Tyne. About 140 distinct rings marked the growth of this tree, and those circles which remained became too minute to be counted; the tree was thus of great age, but was found decayed near the root. A colony of rooks had been accustomed to build their annual nests upon this tree; but on a sudden, and before the tempest which had uprooted it, they deserted, and for no apparent reason, and took up their abode in an ash tree growing near, the situation of which was between the chimneys of the adjoining houses.

## POUDRETTE.

This valuable manure may be had on application to the subscriber, at the office of the "New York Poudrette Company," No 120 Nassau street, New York. It is in-odorous, and may be transported in barrels, on board of any vessel or steamboat, without offence—and it will be found an exceedingly valuable article as a fertilizer on any soil, and for any crops; but more especially for gardens and flowers, as there are no foul seeds in it. Poudrette has been used for three seasons with entire success on Long Island, by many practical farmers, as may be ascertained from letters and statements made by them, and published at this office in a pamphlet containing also the "act of incorporation," granted to the Company by the Legislature of the State of New York; and other facts in relation to the subject. Price 35 cents per bushel. Barrels cost 25 cents each, and hold 4 bushels. Persons wishing to make an experiment on a small scale can obtain one barrel by enclosing a two dollar current bank bill—or three barrels by enclosing five dollars, free of postage. On receipt of the money the article will be put up and forwarded as directed.

\* Price of shares, one hundred dollars—which entitles the holder to one hundred bushels of poudrette annually, during the term of the charter; fifty bushels in time for spring use, and fifty bushels in time for fall use. Shares taken soon, will be entitled to the spring dividend—and, if desired for experiment, a few bushels may be had this fall.

All orders, or applications in relation to the business, must be made to the subscriber, 120 Nassau street, New York.

D. K. MINOR.

I wish it distinctly understood that the "New York Poudrette Company" is in no way connected with the "Lodi Manufacturing Company," of which Anthony Dey and Peter Brithelmy are, or were, the managers.

Dec. 9, 1840.

## THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at 33 per annum payable at the end of the year—but those who pay within sixty days from the time of subscribing are entitled to a deduction of 50 cents.

N. E. FARMER.

### ON THE PROPER MANAGEMENT OF STOCK IN GENERAL.

This is a subject which can only, in this place, be slightly touched upon. It is an object of very great consequence to every husbandman, to expend in the most economical and advantageous manner, the vegetable produce allotted for the maintenance of his stock, and to bestow it chiefly on those from whom he is likely to derive the greatest and the earliest benefit. Notwithstanding many recent and truly valuable improvements, there still prevails, in regard to some particulars, a sad mixture of profusion on the one hand, and penuriousness on the other. The saving to the community, by a careful attention to the feeding of live stock, would be great, and in times of scarcity, would be incalculable. For the attainment of that object, it would be necessary to pay regard to—

1. The due preparation and frugal expenditure of their food.
2. The appropriation of that food to the different sorts respectively, according to the different species and breeds of stock—their different habits and degrees of hardiness—and the different degrees of exercise, and modes of treatment to which which they are subjected; and,
3. The requisite attention to the demands of different periods, the relative effects of different seasons, and the state of the animals themselves, in regard to age, fatness, &c.

The following general rules as to the management of stock, may deserve attention:

1. Animals intended for the butcher, should be kept in a state of regular improvement. The finer breeds are highly fed from their birth, and are almost always fat. With other breeds, and on pastures of inferior quality, this is neither necessary nor practicable. But in every case, the same principle of improvement should be adhered to, and such animals ought never to be allowed to lose flesh, in the hopes of afterwards restoring it by better feeding.

2. The size should never be above that which the pastures can support in a thriving condition. The attempt to raise them to an undue size, by crossing, has been already censured. In regard to size, the stock of every kind, and of all the various breeds, should be proportioned to the quantity and the quality of their intended food.

3. The best pasture should be allotted to that portion of the stock which goes first to market; the next in quality, the breeders; and the coarse pasture to the inferior or growing stock.

4. Great care should be taken, not to overstock pasture, which is attended with great loss to the farmer and the community. This ought to be particularly avoided in regard to young and growing animals. If they are kept poor during one part of the year, they will scarcely thrive during the remainder; and when ill fed, will never attain to their proper size and proportion.

Lastly, the food, whatever it may be, should not

be too suddenly changed. It is seldom profitable to bring lean animals immediately from coarse to rich pastures; and a change from dry to succulent food, and *vice versa*, should be gradually effected. A change of pasture, however, of the same quality, tends to produce a greater accumulation of fat.

It may be proper to add, that nature seems to have designed different sorts of animals for different purposes. A breed of cattle, equally well adapted to the butcher, to the dairy, and to the plough or cart, is no where to be met with; and, so far as experience enables us to judge, these properties are hardly consistent with each other, and belong to animals of different forms and proportions. A heavy Leicestershire sheep, for instance, was never intended to travel great distances, or to search for its subsistence in a rugged or mountainous country. The judicious breeder, therefore, will fix upon one object to be principally attended to; and he will endeavor to rear that species of stock, the best suited to attain the object he has in view, or, in other words, the most likely to pay the most money with the least food. That can only be obtained by an attention to the principles of breeding, and the practice of the most eminent farmers who have excelled in the art.—*Simclair's Code of Husbandry*.

From the same.

### COMMAND OF WATER.

Those to whom good water is accessible, can have no conception of the miseries which attend the want of it; or which are found, when it is only attainable in small quantities or of inferior quality. In the low districts of Lincolnshire, the water is almost every where brackish, and good spring-water is in such request, that carts are sent for it, the distance of seventeen miles. In the wolds of Yorkshire, there are instances still in recollection, before the improved mode of making artificial ponds was discovered, of numbers of animals having perished of thirst: and in Hampshire, the continuance of dry weather, during the autumnal months, has been so great, and the wells became so exhausted, that the labor and expense required to supply the family and the stock, by means of water-carts, was great beyond all conception. To avoid the risk of such serious misfortunes, it was anciently the practice, for the convenience of having water, to erect farm buildings in low grounds, near brooks or rivers. This plan, however, was attended with several disadvantages. The house became damp; the grain, from the moisture of the atmosphere was frequently much injured, and rendered nearly unsaleable, and the land in the neighborhood, was usually found to be in a poor condition, as a great part of the manure was carried down to the stream and lost. Besides, the vicinity to water was liable to accidents of various descriptions. When the advantages, therefore of having a house and offices in the centre of the farm, and rather on an elevated situation, came to be generally understood and admitted, various modes of obtaining a supply of so

essential an article as water, were devised. The chief are, 1. From the roofs of the buildings; 2. Natural springs; 3. Wells; 4. Artificial ponds; or, 5. Artificial rills.

1. *Roofs of Buildings*.—Water for common purposes, may be obtained in most situations, by collecting the rain which falls upon the buildings occupied by the family and their cattle; and the means of freeing it from every impurity, is simple and easy, by two water butts, placed on different levels, for filtrating it, with a tank under ground to preserve it for use. The buildings and yards of a farm are supposed to receive rain sufficient, if duly collected, to supply both the family and the cattle of the place, for at least a considerable part of the year; and ponds, where necessary, may be made in any situation, at a very small expense, for the remainder. Cattle, therefore, ought not to be driven to water beyond the limits of their pasture; and it is not requisite to be fetched in carts from distant places.

2. *Natural Springs*.—Where natural springs are to be met with, they will generally furnish a sufficient supply for family use; but they are seldom adequate to the necessities of a great farming establishment. If sufficient attention, therefore, has not been paid to the collecting of water from the roofs of the farm buildings, in that case, wells or ponds must be resorted to.

3. *Wells*.—In Middlesex and Surrey they have dug wells to a considerable depth, (from 100 to above 560 feet,) before they could procure water. In Essex they have been obliged to go as deep as 500 feet, to obtain water of a good quality, and at that depth they succeeded. In Hampshire they have likewise dug from 300 to 400 feet in depth, through dry, cracked, or fissured chalk rock, and thus have been able to supply whole villages with water, except during the autumnal droughts.

4. *Artificial Ponds*.—In several parts of England, as in Hampshire, in Lincolnshire, and in Norfolk, artificial ponds have been formed, with varied skill and success. In Gloucestershire, such ponds are made, either of a square or a circular shape, and generally so situated, as to furnish a supply to four fields. Three layers of clay, free from the smallest stone or gravel, are so worked in, as to form an impenetrable cement. The whole is afterwards covered with sand and finished with pavement. In Derbyshire, artificial meers, or cattlé ponds, are made in their dry, rocky pastures with great success. Having selected a low situation for the purpose, they deepen it ten or twenty yards across, and spread over the whole excavation a layer, about five inches thick, of refuse slacked lime and coal cinders; then they spread, trample, and ram down a stratum of well-tempered clay, about four inches thick; and upon this they place a second bed of clay, in a similar manner, of the same thickness; the whole of the bottom and edges of the meer is then paved with rubble stones; and small rubble stones, several inches thick, are spread upon the pavement.

A most ingenious, as well as economical mode of making these reservoirs of water, was invented

about the year 1775, by Robert Gardner, a well-sinker by profession, born at Killham, in the East Riding of Yorkshire. Prior to the introduction of his plan of making artificial ponds, many parts of the Yorkshire wolds were scarcely habitable. But by the ingenuity and the exertions of one individual, the difficulties which lay in the way of the improvement of an extensive district, have been removed. They are now universally to be met with in the East Riding, and are widely extended into the North Riding, in situations that require such accommodations.

Ponds are much more eligible than wells, for watering sheep, as few shepherds like the trouble of drawing water from wells; sheep, therefore, depending upon them, are very apt to drink too much water at one time and too little at another. When the ponds are dug on the highest points, they are less apt to be injured by dirt running into them.

5. *Artificial Rills.*—In the North Riding of Yorkshire, there is a tract extending for many miles, entirely destitute of water, except what flows along the bottoms of the deep valleys, by which it is intersected, and little relief could consequently be afforded by streams thus distantly and inconveniently situated, to the inhabitants of the uplands or their cattle. About the year 1770, a person of the name of Ford, devised the means of watering this district, by means of rills brought from the springs that break out at the foot of the still loftier moorland hills, that run parallel to, and to the north of this tract, in some instances at the distance of about ten miles.

These springs he collected into one channel, which he carried in a winding direction about the intervening tract, according to its level, and along the sides of the valleys, until he gained the summit of the arid country which he wished to water; and when this was accomplished, the water was easily conveyed to the places desired, and also to the ponds in all the fields, over a considerable tract of ground.

The plan of thus watering a dry upland country has much merit. It is not expensive, the original charge rarely exceeding 100l. per rill, while it affords a most important accommodation to the occupier, and the value of the property is thereby greatly increased. Though not generally applicable, this plan might certainly be adopted with great advantage in some other situations.

It now only remains to state how farm-yards and fields can best be supplied with so important an article as water, in the abundance that is necessary.

*Water in Farm Yards.*—When cattle are fed in winter on dry food, as hay or straw, no expense should be spared in supplying them with a sufficient quantity of water. It has been ascertained that a bullock who has water at command, will drink of it eight times a day: hence it is evident that he cannot get enough, if only driven twice a day to an adjoining stream or pond. It is therefore advisable, where it can be done, to bring water into a cistern in the fold yard, to which the cattle may go whenever they find it necessary. The cistern may be made of rough masonry, and consequently would not be expensive. There can be no doubt that cattle will improve much more rapidly during the course of a winter, when thus supplied with water, than if they are only occasionally driven to it.

In Derbyshire, cisterns hewn out of large blocks, are not only placed in most cattle yards, but also in

the fields, where the springs on the sides of the hills admit of supplying them. Many of them are so placed, that cattle can approach them on either side, and can avoid being injured by a master beast attacking the others when drinking. For conveying the water to the cisterns, thin zinc pipes are sometimes used. When the water enters at one end of the cistern, level with the surface, and passes off at the other, from the constant change and agitation of the surface of the water, by this stream across it, the cistern is not so apt to be frozen, even in the severest weather, which is an object of much importance to the health of the cattle.
