*Fields.*—A supply of water is an object of the most obvious importance in every field where pasturage is intended. With that view, if there happens to be a small rivulet in the neighborhood of the lands, it may often be distributed in branches, so as to water many fields. Springs, or the collected discharges from drains, may also be applied to the same purpose. All land intended for grazing, requires to be well supplied with water at all times.

In conducting water through fields, it is of material importance to take care, that the slopes be gentle, and not more than sufficient for easy transmission; as when water is conveyed down fence ditches, or open conduits of considerable declivity, it is too apt to do injury in its progress, by washing away the sides of its channels. Sometimes water is collected in a field, not only for the use of the animals pastured there, but also to be afterwards diverted for other uses, as for threshing and other mills, for irrigation, for ponds, for bleaching, and similar purposes. To accomplish these objects, and at the same time to prevent injury from this element, the drains, conduits, sluices, bridges, gates and fence ditches, require to be designed with skill, and constructed with scientific attention.

For the New England Farmer.

#### SEAWEED.

DEAR SIR—What do your friends think of seaweed as a manure? Here, we are as much divided in opinion as the judges in Martinus Scriblerus were whether the three *pie* horses were black or white. One says he can ruin the best land with it in five years; another declares that by using it he can convert "Poverty Point" into another vale of Evesham. At one of our harbors the only use made of it is, to load vessels with it for Taunton and Providence rivers, where it fetches one dollar per ton!! At another part of our island it is used with excellent effect as a top-dressing.

I made up my mind years ago. I believe it to be beneficial on all soils as a top-dressing; but useful on heavy soils only when ploughed in, and that even there it should be used not more than one year in six. Eel grass is altogether different. Ploughed in to any soil it gives for one year a better crop than any kind of barn manure.

Some years ago, before I exchanged beef and pudding for soups and syllabubs—that is, before I gave up farming for trade—I ploughed a field which had a couple of acres of very poor land in it. On a strip running through the middle of it, and being rather poorer than either side, I ploughed in ten large loads of eel grass, very rich and slimy. I planted the whole with corn: that which had the eel grass was at least thirty bushels to the acre: that which had none, was over-estimated at the

seed. I could make an affidavit to the truth of this, and I have seen the like result for at least ten successive years. Mr A——, one of our thriftiest farmers, assures me it never fails, and others speak of the same success in using it. I should like to hear what other people say of it. I.

#### SUCCESSFUL FARMING.

The Farmer's Cabinet relates an instance of the most successful farming we have heard of for some time. It is of an old, practical, hard-working farmer in the neighborhood of Amherst, N. H. who commenced the world as a day laborer, and who notwithstanding he has at various times sustained heavy pecuniary losses in the investment of his funds, is now worth at least *one hundred thousand dollars*. The great secret of his success, from the statement given, we should judge to be *system*, which is a point, we think, in which many farmers fail. There is, however, nothing which can supply the place of a steady and systematic mode of doing business; without it, industry and talents are oftentimes of no avail, and it is as valuable in agriculture as in mechanics, commerce or manufactures. We make the following extract from the article in the Cabinet:

"This man, when thirty years of age, by the avails of his industry added to a small legacy, was enabled to purchase and pay, in part, for a farm of one hundred and thirty acres of land, one hundred of which was under cultivation, but in a very low state. The farm is altogether upland, with a soil composed of loam, clay and sand, in the chief of which the latter preponderates, the former being least considerable. When he commenced farming, he adopted a peculiar system of rotation, to which he has implicitly adhered from that time to the present, which is forty years, and his success is the best comment on the worth of the experiment.

His mode was as follows: having divided his farm into eight fields of equal size, as near as possible, three of those fields, were sowed with wheat each year, one with rye, one planted with corn, two in clover, and one an open fallow, on which corn had been raised the year previous. One of the two clover fields is kept for mowing, the other for pasture, both of which are ploughed as soon after the harvest as possible and prepared for wheat in the fall. All the manure which is made on the farm for one year, is hauled in the spring on the field intended for open fallow, which is then ploughed, and after one or two cross ploughings through the summer, is also sowed with wheat in the fall. The field on which the rye is sown, is that from which a crop of wheat has been taken the same year, and which has yielded three crops. Corn is planted on the field from which rye had been taken the year previous, the stubbles of which are ploughed down in the fall. Clover seed is sown early, in the spring on two of the wheat fields, those which have been most recently manured. By this method, each field yields three crops of wheat, two of clover, one of rye and one of corn, every eight years. Each field, in the meantime, has lain an open fallow, and received a heavy dressing of manure, perhaps at an average of fifteen four-horse loads per acre. His crop of wheat is seldom less than fifteen hundred bushels, but often much more. His average rye crop is about four hundred and fifty bushels, and his corn crop annually, about five hundred bushels—all which grain, at the present low prices, would amount to more than two thousand dollars annually, and at former prices to double that amount, and his farm is with all very highly improved.

#### OLD WHEAT FOR SEED.

In a recent conversation with Mr Wm. Skinner, of Fauquier, an old and experienced farmer, he mentioned that, for experiment, he had sown a few bushels (from four to ten) of wheat of the previous year's crop, in each of his three last seedings, and that he had found the product of the old wheat always much better than that of the new wheat sown adjoining. Indeed, he thought the increase to be not much short of 100 per cent. He could not assign any other reason for the superiority, except that by keeping the seed wheat a year longer than usual, the imperfect grains might lose their vitality, and leave nothing to grow except those of the best quality. We think this totally insufficient to produce the manifest superiority which we are confident Mr S. saw, whether he was or was not mistaken as to its amount. But the experiment is worth repeating, and we hope it will be repeated by as many of our readers as can conveniently obtain old seed of good wheat.

A year ago we heard stated, by a gentleman of Cumberland, a still more remarkable fact, which had been recently observed in that county. A farmer had sown a few bushels of old seed alongside, or perhaps between, the sowing of the balance of his field with new seed. There was no difference between the adjoining parts, except as to the age of the seed. No experiment had been designed, nor was any difference expected; but the result was that, while the crop from the new seed was greatly injured by the Hessian fly, that from the old seed escaped entirely. Our informant understood that there was no doubt of the existence of this remarkable difference in the minds of all

who saw its growth, and that every effort was making to obtain old seed to sow, for experiment, for the last crop. We begged to be informed of the results of these latter trials, but have heard nothing more on the subject; and thence infer that the hopes entertained have been disappointed.—*El. Farmers' Register.*

From the Cincinnati Chronicle.

#### THE RICHES OF THE WEST.

We have before us the agricultural returns of nine townships of Monroe county, N. Y., containing over 22,000 people. The result is astonishing! It is proof conclusive of the immense and almost illimitable resources of these heaven-blessed United States. These towns produce in gross, as follows:

1. Wheat,	558,000 bushels.
2. Oats,	245,000 "
3. Corn,	184,000 "
4. Potatoes,	320,000 "
5. Sugar,	110,000 lbs.
6. Spirituous liquors,	2,200 bbls.

The above is only part! Such trifling affairs as horses, hay, dairies, manufactories, &c. we have not added up. But look at the result. Every living soul, man, woman and child, has in the allotment, as its sharer in the production, 25 bushels of wheat, 12 bushels of oats, 9 bushels of corn, 14 bushels of potatoes, 5 lbs. of sugar, &c. Or any head of a family has 150 bushels of wheat, 72 of oats, 54 of corn, 84 of potatoes, and 30 lbs. of sugar.

Taken as a whole, these townships raise at least four times as much bread stuffs as are necessary for their consumption, and other things in proportion!

But if the reader be a little surprised at this, he will be more so, when he learns that these same towns made \$105,000 worth of butter and cheese; raised \$32,000 worth of fruit; made \$40,000 worth of home cloth; and produced \$450,000 worth of manufactured articles; or \$30 a piece for each living soul. This affords matter for comment, not only on the physical but the moral condition of the country. None but a country in the highest moral condition can produce such a result. These people are not only well off, independent, but they are the richest in the world. Nor is this an isolated example. Our Western Reserve will show the same result; so will many other districts.

Besides these wheat fields rise the village church and the village school. There are happy faces, young and old, around them. Long may they enjoy the peaceful fruits of happy, independent labor!

#### TAXATION IN ENGLAND.

We can inform Brother Jonathan what are the inevitable consequences of being too fond of glory: Taxes upon every article which enters into the mouth or covers the back, or is placed under the foot—taxes upon every thing which is pleasant to see, hear, feel, smell or taste—taxes upon warmth, light and locomotion—taxes on every thing on earth, and in the waters under the earth—on every thing that comes from abroad, or is grown at home—taxes on the raw material, and on every fresh value that is added to it by the industry of man—taxes on the sauce which pampers man's appetite and on the drug which restores him to health—on the ermine which decorates the

judge, and the rope which haaga the criminal! on the poor man's salt and the rich man's spice—on the brass nails of the coffin, and the ribbons of the bride—at bed or board, couchant or levant, we must pay. The school boy whips his taxed top—the heedless youth manages his taxed horse with a taxed bridle, on a taxed road:—and the dying Englishman, pouring his medicine, which has paid seven per cent, into a silver spoon, which has paid fifteen per cent., flings himself back upon his chintz bed, which has paid twenty-two per cent.—and expires in the arms of taxed apothecary, who has paid a license of £100 sterling, for the privilege of practising his caling! His whole property is then taxed from two to ten per cent.; and, besides, the probate, large fees are demanded for burying him in the chancel; his virtues are handed down to posterity upon taxed marble, and he is at length gathered to his fathers—to be taxed no more!—*English Paper.*

#### DISCOVERY IN ELLECTRICITY.

A curious and probably a most important discovery in this branch of natural philosophy, was made about a fortnight ago in a boiler attached to a hauling engine, at Seghill, on the Cramlington Railway, near Newcastle. The engine man, on attempting to lay hold of the lever of the safety valve, received what he described as a severe blow which nearly caused him to fall, he a second time attempted it, and received a similar blow. This having been made known, an examination of the boiler followed, and it was found that the steam which was escaping from a "blower" near to the safety valve was highly charged with electricity. Our informant states that on himself placing one hand in the steam, sparks upwards of half an inch in length were emitted from the other, and this while he stood upon the masonry which was surrounding the boiler; so that had he been upon a glass stool the effects would have been much greater. We are glad to hear that this discovery is being followed up by experiments on other boilers. When the discovery was made, it was considered by many to be owing to the quality of the water used, which was pumped from the coal mine; subsequently, however on trying the steam from a locomotive engine on the Newcastle and North Shields railway, a great quantity of electricity was obtained, and the water used in this case was from the river Tyne. The subject is highly interesting, and we hope that the discovery may lead to useful results: the explosion of boilers has hitherto baffled research and is not improbable that electricity is intimately connected with it.—*Dedham (Eng.) Adv.*

#### USEFUL RECIPE.

A correspondent of the Buffalo Commercial Advertiser gives the following receipt for making a composition which will render wood entirely incombustible:

Take a quantity of water, proportioned to the surface of wood you may wish to cover, and add to it as much potash as can be dissolved therein.—When the water will dissolve no more potash, stir into the solution, first, a quantity of flour paste of the consistency of common painter's size; second, a sufficient quantity of pure clay, to render it of the consistence of cream.

When the clay is well mixed, apply the preparation with a brush to the wood.

For the New England Farmer.

### TREES.

MR EDITOR:—The importance of raising up artificial forests to meet the wants of future generations, seems to be overlooked altogether by our otherwise thrifty countrymen. In less than half a century our sea-coast will be denuded of its present growth of wood, and be as naked as the Hampshire barrens or the hills of Surrey.

In 1828, being then in Philadelphia, I addressed the following paper, with the initials "T. J. R.," to the editor of the American Farmer, which elicited from the ever-to-be-remembered Judge Buel, through the same channel, the reply also sent you, for republication, if you think proper. I must again repeat that the subject is of great, very great importance. If as much had been done within three or four years to grow forest trees as to grow the mulberry, the nation would have felt the effects of the substitution forever.

Yours, truly,

I.

### FOREST AND ORNAMENTAL TREES.

Philadelphia, Oct. 25, 1828.

J. S. SKINNER, ESQ.—Sir,—There is one subject which I should be glad to see more frequently discussed in your truly valuable paper, and that is, the growing of forest and ornamental trees. Wood, both for firing and timber, is yet so plenty, that apprehensions of want on that score are not admitted into our bosoms, and the planting of trees for ornamental purposes is but little attended to, since our men of fortune have removed their families to town for the summer. This must not be, sir; wood in the maritime districts of many of the states is getting to be very scarce; half a century will exhibit many continuous tracts of thousands of acres, as bare of shrubbery as any part of England. As the population of our country becomes dense, our demand for wood will be proportionally increased. A hundred millions of people will require more than ten times the quantity wanted for present consumption. We have it in our power to prepare ourselves with an artificial growth of wood, to meet the evanescence of the natural forest. We may surround our pastures with lofty trees; we may clothe the brows of our rocky hills, and the areas of our "dismal swamps" with a growth of wood which shall meet the wants of posterity, if we but study adaptation and arborical philosophy. You have done much for agriculture, sir: so much, that when I obtain a seat in Congress! my first motion shall be for a grant to you, as liberal as that made by the British government to Forsyth for his "composition." You have it in your power to press upon the attention of your readers, the subject introduced in this letter, to the obtainment of a great deal of useful information, and I doubt not very much to the furtherance of arboriculture.

The little attention given to the planting of trees, I attribute to the difficulties attending it. We have no treatise, strictly practical, to enlighten us, and our own judgments, (as in the infancy of every science,) unassisted by help, will carry us to lame results. To grow trees is generally supposed an easy task. We stand under the shade of the horse chestnut and oak, and because they girt some fifteen feet, and shade half a rood of earth, we fancy it is as easy to raise them as to crack one of their nuts. It is not so; the most tender species of the geranium, or the azalea, may be

grown with fifty times more ease than many of the trees that shoot an hundred feet into the air. An author, quoted by Deane, says, "Not one in a hundred of the acorns planted by me in the month of October, came up." I planted fifty horse chestnuts; two of these only vegetated.

The great difficulty is to get the seeds of trees up; some lie a year in the ground before they sprout, some a few weeks only. Some should be sown in the fall, and some in the spring. Some trees like a wet soil, some prefer the driest; some will grow in an atmosphere highly impregnated with saline qualities; to some, such properties of the air are instant death. Now, sir, in order to bring out your friends and readers, I propose the following queries:

#### I. What is the best manner of growing—

1. The maple, (*Acer*.)
2. Horse chestnut, (*Æsculus*.)
3. Birch tree, (*Betula*.)
4. Common chestnut, (*Castanea*.)
5. Beech tree, (*Fagus*.)
6. Ash, (*Fraxinus*.)
7. Walnut, (*Juglans*.)
8. Tulip, (*Liriodendron*.)
9. Mulberry, (*Morus*.)
10. Pines and firs, (*Pinus*.)
11. Buttonwood, (*Planus*.)
12. Oaks, (*Quercus*.)
13. Locusts, (*Robinia*.)
14. Elm, (*Ulmus*.)

If they are best raised from seeds, at what time, with what preparation, and in what manner should these seeds be sown, and what should be the after-culture of the seedlings? If there be a better method than by sowing the seeds, what is it?

II. What trees are best calculated for my residence? It is within a mile of the sea, upon an eminence, where it receives the winds that sweep the whole expanse of the Atlantic. The soil of a portion is thin, sandy, but free; another portion, loamy and free; a third swampy.

An answer to these queries is respectfully requested. Nothing can excel the importance of the subject. It is in our "maritime frontier" where the scarcity of wood will be first felt; it is upon that frontier where I intend, in the ensuing spring, to put into operation the knowledge I may acquire relating to arboriculture. I doubt not I shall be able to furnish your readers with useful hints on the subject.

#### Reply of Judge Buel.

\* \* \* \* \*

1. The soft, or white maple, sheds its seeds in May. On the 28th of May, 1827, I had a quantity of the seeds gathered and immediately planted.—They grew two feet the first summer, and many of them, which were placed in nursery rows last spring, are five and six feet high. This is one of the quickest growing trees we have, particularly on moist and wet soils, to which it is particularly adapted. It is ornamental, and makes good fuel after it has become partially dry.

2. I have repeatedly planted horse chestnuts in April, with unvarying success, and have nearly four thousand growing, of different ages. The only precautions I would suggest, are, to take care that the nuts do not become heated and rancid, and that they are not covered with too much earth.—From one to two inches is the proper depth to plant. They are fond of a rich, tenacious soil.

5 Beech masts are most successfully planted when they naturally fall from the tree, in autumn, and should be slightly covered.

6. I have planted ash keys in April. A few came up the first summer, but ninety-nine hundredths of them did not vegetate until they had lain in the ground a twelvemonth. The white likes a kind loam; the black, wet and gravelly locations.—Those which came up the first season, and which have grown two seasons, are from two to three feet high.

7. I have not planted any walnuts but the black kind. They were put in the ground in autumn, and vegetated freely. Their growth is rapid since the two first years after planting.

9. Seeds of the mulberry may be planted on a bed of fine mould in May. I have hundreds, and probably thousands, from ten to fifteen feet high, the seeds of which were sown in the spring of 1806. They will soon constitute a fine hedge, where protection from winds is desired.

11. The seed of the buttonwood may be gathered any time during the winter or spring, and sown in April. I sowed in the spring of 1827, and some of the plants are now four to five feet high. This tree may also be propagated by cuttings.

13. The common locust (*Robinia pseudo-acacia*.) is propagated by seeds and succors. The seeds are surrounded by a glutinous shell impervious to cold water. They should therefore be steeped in water nearly, or quite at the boiling point, and sown when you plant beans, as the plants are, when young, very sensitive to frost. When once established, it is difficult to eradicate them, as they send up sprouts wherever the root is sundered or bruised. They are of quick growth, and constitute a valuable timber.

The glutinous resembles the common in its appearance, habits and rapid growth, and is equally prolific in succors. It flowers beautifully, but mine have not produced seeds.

The three-thorned or horny locust, as it is called, (*Gleditsia*.) grows freely from seeds, sown in the spring. I have planted some thousands of these in hedge, with a strong confidence of their proving an excellent plant for live fence. Their growth is rapid, and the wood very hardy and compact.

14. I gathered and sowed the seeds of the elm on the same day (28th May,) that I did the white maple. The best plants are now from two to four feet high.

I have had no experience with the birch, chestnut tulip, pine or oak, and am only commencing my experiments upon the firs; and shall therefore say nothing of the manner of propagating them, except to observe that nature is the best guide in these matters. Follow her laws; plant when the seed falls from its parent tree, and we shall seldom fail of success. Michaux's North American Sylva, may be consulted by your correspondent with profit.

Your correspondent seems to be in the condition of a political candidate for office, perched on an eminence, a mark for every angry wind that blows. I advise him to remove into the vale, out of the reach of the envious elements; or if this cannot be done, to encircle his villa with all the variety of trees that will grow upon his grounds, and by no means omitting fruit trees and evergreens. They may be thinned and fashioned to his taste as they advance in growth. The seeds of all he has enumerated, and many others, may be easily procured; and the expense of nurturing the young plants will not be felt.

J. B.

## THE SILK CULTURE.

The subjoined letter should have been given on the same page with the other communications on the same subject in last week's paper; but was accidentally mislaid. It is valuable on several accounts; particularly for what is said of the seedling multicaulis, of which a full account is given in the Third Report of the Agriculture of Massachusetts; and an account, likewise, of the success which attended the mode of destroying the chrysalis by camphor.

H. C.

Harvard, Oct. 10, 1840.

DEAR SIR—I received your letter of the 17th September: I also received your report on silk last spring, from which I have obtained much valuable information.

I will now endeavor to answer some of the questions proposed in your letter.

I hatched about \$25,000 worms about the 10th of June to feed on the white mulberry. I soon became satisfied that I had more than I could feed on the white mulberry, and I reduced the number to about 100,000, which were healthy and did well till they had nearly come to their growth, and about the time that many of them began to wind, a considerable number appeared to burst open and died. I have heard of many who have lost their worms in the same way. I do not know whether it is a common disease or something new. I have never been troubled in that way before: those that wound up made good cocoons, but not so heavy as I had last year. I had 250 lbs. of cocoons. About the middle of July I brought up about 200,000 eggs to hatch for my second crop; the eggs looked well, but none of them would hatch: on examining the eggs with a glass, I found the worms in the eggs nearly large enough to hatch, but dead. The eggs were put in a large glass bottle and buried in the cellar to the neck of the bottle, with a loose stopper to prevent insects from getting in. I was unable to obtain any more eggs, as nearly all in this vicinity were lost in the same way. I however obtained a small lot of worms, which I fed on the seedling multicaulis. They produced 26 lbs. of good cocoons, making in all 276 pounds. I had fed sufficient to have produced as many more, which I had no use for; consequently I have been unable to decide, as fully as I could wish, which kind of mulberry to prefer. I think, however, that the variety produced from the seed of the morus multicaulis I prefer to any kind I have seen. Those that stood in the ground last winter I cut the tops off near the ground; they started early in the season, and many of them are now over eight feet in height. With this variety I can commence feeding the second crop as soon as the first of July, and I think there is but little risk in keeping the eggs till that time. I have over an acre of these trees which I intend to leave out and cut them off in the same way.

With respect to the number of pounds of raw silk, I am unable at this time to state, as we have not reeled all the cocoons. I had them steamed to destroy the chrysalis, but it was not effectually done, and the moths began to come out in great numbers, and we were obliged to steam them again, which has caused them to reel badly. I put a small part in a box with camphor, as directed in your report. It destroyed them effectually, and the cocoons reeled well. Had I taken the same course with them all, I think I should have had fifty per cent. more silk. I had a reel made from

the drawing in your report, which I think a good one; but we have been unable to use it on account of the cocoons reeling so badly. We are making sewing silk with Brooks's machine.

I am unable to say how many pounds of leaves it requires to make a pound of raw silk, or what is the cost.

Yours, respectfully,

CALVIN HASKELL.

MR HENRY COLMAN.

For the N. E. Farmer.

## MR DENNIS AND HIS 'PATENT' TROUGHS.

Danvers, Dec. 19, 1840.

MR EDITOR—My attention has just been called to a communication of friend Dennis, of Portsmouth, R. I., in reply to my note of Aug. 1, 1840, relating to the use of *leaden troughs filled with oil*, for the purpose of checking the progress and ravages of the canker-worm. So far as the gentleman's object in his communication was to enlighten the community by strictures upon my remarks, he certainly is deserving commendation. I cheerfully concede to him the same privilege that I claim for myself, and do not expect what I submit to the public to be exempted from criticism; and even hope to derive benefit from such criticism. But so far as he would be willing to continue to impose on the community by the exhibition of a pretended *invention* that was *not new*, I leave for others to say in what manner he should be regarded. I certainly shall rejoice when the purpose which he professes to have in view, is accomplished. Our orchards are one of the most beautiful as well as the most valuable appendages of our New England farms; and notwithstanding there is now a healthy action abroad, in regard to the hitherto perverted uses of their fruits, still the fruits themselves are valuable, and new uses will be constantly occurring, so that their cultivation will always be desirable. But so numerous are the impositions practised on the community by patents for trifles entirely unworthy of notice; and so ready are the people to be gulled by patent inventions and patent medicines, that I feel it to be a good service to the public, to caution them against too readily assenting to the representations of those, who under the pretence of disinterested benevolence, have mainly their own selfish ends in view. If I do not mistake, I think it is easy to discover the point in which friend Dennis feels most aggrieved by my remarks. If it be true, as he avers, that the use of such troughs as those to which I referred, prior to his application for a patent, "does not affect the validity of his patent for the circular lead troughs in the least degree," then why is he troubled in this matter? Why turn aside from his busy employment (as he represents it) to combat that which can do him no harm? It may be that friend Dennis's interest misleads his judgment, and that an impartial jury, should the matter be of sufficient consequence to be brought to their notice, will view it in a different light.

It is true that my note was written upon the impulse of the moment, upon reading the notice of the patent, &c., and forwarded without a re-examination. It is true that my knowledge of "the claims of the inventor" was limited and imperfect. The only means of knowing that I had, was what he had seen fit to publish. Judging of those, I do not as yet perceive that my conclusions were erroneous. I frankly admit that I never have seen friend Dennis nor his invention; nor do I know

any thing of it or him, except what he himself says. I would simply suggest to him, that before he again presumes to reproach others for want of being well informed on any particular subject, he should consider how far he is himself justly chargeable with their deficiency of information. If I do rightly understand him, he himself on a second perusal of my letter, finds the language used to be such as to afford no just cause of complaint. But then he would intimate that something more was meant than was expressed—that there was some design in using "language very guarded." I can assure the gentleman that I know of none such—that I have no personal interest at all in this matter;—that I am not, never was, and never wish to be, a dealer in *patents* of any kind; nor have I much confidence in *nine tenths* of those intruded upon the public. And as I can truly say that "I have no desire to interfere with any man's patent rights" that are well founded, and *bona fide* obtained, for subjects worthy of a patent and of his own invention; so, I hold myself ready at all times to expose the false pretences of idle fellows, who seek to live by their wits, without labor, when in fact, all they have are borrowed and not their own.

The first intimation that I had of friend Dennis having called on me, was obtained from his publication before referred to. If he had been so civil as to have left his name and purpose of calling, perhaps I should have saved him the trouble of appealing to the public. But it may be that public notoriety is what he is seeking; and if this he so, I think he will obtain it.

Respectfully, yours, &amp;c.,

J. W. PROCTOR.

NOTE.—Since writing the above, I have seen Col. Sutton, on whom Mr Dennis did call, (although he did not make known to him his name or purpose of calling,) and have also learned something of his visit at Lynn, where troughs similar to his have been in use for years; and am now strongly inclined to believe, what I before only suspected, that he is an impostor; and that his patent right would not stand fire a moment. But whether it will or not, I care not; and should not now have noticed his communication, had it not been for the innuendoes therein contained.

*The Coldest Winters.*—After diligent search, we find that the coldest winters within the last century were those of 1742 and 1780: in both these, Long Island Sound was frozen over; and in the latter winter, cannon were taken on the ice from New York city down to Staten Island. In the winters of 1797, 1800, 1804, and in 1832, New York and Boston harbors were both, for several days, obstructed by large quantities of floating ice; but in no instance do we find mention made of the latter being obstructed, when the former was not. We know of no harbor north of the Potomac, which has not suffered from ice, during intensely cold winters, excepting that of Portsmouth, N. H., which is very deep and rapid.—*U. S. Gaz.*

*Chalk.*—Professor Ehrenberg has made some remarkable discoveries in the course of his various experiments on chalk. He found that a cubic inch possessed upwards of a million of microscopic animalcules; consequently a pound weight of chalk contains above ten millions of these animalculæ, which are invisible to the naked eye.—*Exchange paper.*

## NEW ENGLAND FARMER,

AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, DEC. 30, 1840.

## VALEDICTORY.

"The last time." There is always something a little sad in the use of these terms. Whenever we do a thing which we know we shall not do again, or look at any place, country or person we know we shall see no more, few minds realize the conviction, without at least a sensation of melancholy creeping over them. It seems to be cutting a deep notch on the record of life, which admonishes us how far we have proceeded on our journey, and of the few stages that remain to be accomplished. This feeling of sadness particularly comes over us when we take leave of friends, whom we have been accustomed for years to greet with cordiality; and to whom we have felt that our presence and our reciprocation of good wishes and feelings were not wholly unwelcome. It is with somewhat of these sentiments that we take leave of the readers of the New England Farmer. It is now three years since we have been accustomed, sometimes in full dress and sometimes in undress, to meet them weekly and to have a chat with them on the great subject of our common concern. We fear we have not always satisfied them, for we have seldom satisfied ourselves. We sincerely hope that our respected successor will be much more fortunate. We in the most friendly manner commend him to their kind regards. He has ability, knowledge, skill in writing, experience in farming, and an active and strong interest in the art. These qualities commend him to the regards of the agricultural public. We cheerfully accord to him the palm of superiority in every respect save one; and that is an earnest and indomitable zeal and desire to promote the welfare and elevation, and comforts, and independence of our rural population; and to advance the improvement of our husbandry. In this matter we permit no man to go before us. We assert that no one ever did; and while we have any mind or heart left, we mean no man ever shall.

Our friend, Mr Breck, whose knowledge and ability we have no hesitation now in saying entitle him to the highest respect, has explained the reasons for a change in the management of the paper. We declined in the beginning taking upon ourselves either the *editorial management* or *responsibility*. It would have been incompatible with our official duties to the Commonwealth. He himself wishes to be freed from all care of the paper, that he may give his exclusive attention to the seed business, which is not a small concern. It is right, therefore, that he should seek relief by committing the New England Farmer to the care of a gentleman every way competent to the management of it, and to whom we wish all possible success.

The New England Farmer was an early pioneer in the cause of an improved agriculture. It was not the first periodical devoted to this object. This honor is due to the publications of the Massachusetts Agricultural Society. Next to these, we believe, came the *Ploughboy*, a newspaper published at Albany; then the *American Farmer*, published at Baltimore; and then the New England Farmer, under the editorial care of the lamented Thos. G. Fessenden. The New England Farmer for some time stood alone in New England; but within a few years agricultural publications and periodicals have multiplied over the country in an extraordinary variety and profusion, all showing the increased and increasing interest in this great subject.

To the awakening and maintaining of this interest in the community, the New England Farmer has contributed its full share. We have been familiar with it from its infancy, and much longer acquainted with it than even its present proprietors. Under the care of Mr Fessenden it maintained a high rank for its instructive, intelligent, and practical character. He was always inoffensive, and his pages were often rendered attractive by the sparkling of a delicate and genuine humor. Perhaps no paper among us has been more valued; as is evident from the almost universal practice among its subscribers of preserving it on file.

Since that time we have nothing to say of its character, other than that it has contained its full share of original matter; every pains has been taken to render it practical and useful; and above all to insert nothing which should debar its admission to the families of the most reduced.

Under the care of its new editor we shall be glad to

see its character more highly advanced. It had at first to maintain a hard struggle with the class, then numerous, who were accustomed to sneer at and to declaim against book-farming. That prejudice, with men of any sense, has entirely passed away. Men are as willing now to read upon farming as upon any other subject; and science is hastening to bring to agriculture the most important contributions. There is getting to be an impatience on this subject, which can scarcely be repressed or satisfied; and science has made and is now making discoveries of the highest importance. The New England Farmer will not be backward in communicating this information to the public.

We hope the agricultural public will continue and extend their patronage to the New England Farmer. It will deserve it. We have nothing to say in reference to other agricultural periodicals in the city or out of it, in the State or in other States. Let them speak for themselves. We wish well to them all; and we do not see that the success of one need prejudice the success of any other. The country is large, populous, rich, and increasing; and the ground is not as yet even one tenth occupied. But we are persuaded that the N. E. Farmer will not, for useful and various information, yield her just claims to patronage to any other.

We are free to say that in our opinion the character of the Farmer would be improved by the introduction of a greater variety of topics, and more independence of speech. It is not our fault that this has not been the case. But our friend Breck has so large developments of benevolence, veneration, and caution, that (we say it with all respect) he was always for getting along in accommodation with every body's wishes, or rather so as to offend no one. If we happened to speak of the frauds practiced upon the poor Indians, in the robbery of their lands, why then some miserable dog of a subscriber in Georgia, probably a partaker in this plunder, and very likely related to the blood-hounds imported for the conquest of Florida, would order his paper stopped. If we happened to speak of bank-robberies, (not of banks being robbed,) why then comes a ghostly admonition, that the farmers have nothing to do with the currency; poor souls! they have not half so much to do with it as they would like. If we spoke of temperance, then some rum-drinker or rum-seller would refuse the entrance of the Farmer to his premises. If next we ventured to say the country was prosperous, then the whigs would not have it so; and if we said that business was paralyzed, trade declining, manufactures stopped, then the administration party would be violent in their threats against the author of such libels; and, though perhaps they had never paid for the paper, threaten to withdraw their patronage. We recollect a few months since saying something very civil to the clergy, as we thought it, about the greater usefulness in occasionally preaching agriculture, good morals and good husbandry, than in preaching mystical and disputed doctrines. If we had put our head into a hornet's nest, we should not have had a worse buzzing about our ears. Now under those circumstances, as the paper was not ours, we had several hard raps over the knuckles, and promised to say nothing which could offend any one, black, white or grey—man, woman or child. It was rather difficult for us to do this. If it had been required of us to say what we did not believe, we should have rebelled, of course. But it was only a negative demand, that we should not always say what we *did* think; and, therefore, as in duty bound, we acquiesced. Never again, however, will we sell even this portion of our liberty. We detest slavery in every form; and we mean to hold on to the liberty of speech, what little time we live, always keeping within the law, without let or abatement. Most certainly we would not have the New England Farmer in any respect whatever sectarian or partisan. We would have no passion illuminate and no harsh or low language, above all, no party personalities defile its pages; but no man has a right to be offended with facts; and as matter of *pecuniary* calculation, we are satisfied that by making the Farmer more miscellaneous, and entering with a proper degree of interest into the current topics of the day, and keeping a brief journal of political events, the paper would become more popular and useful, and many more subscribers would be gained than would be lost by such a course. We submit this, however, to wiser heads than our own. Let them settle it.

To the friends, who have obliged us by their personal kindness, and especially to those who have honored the Farmer and favored the public with their agreeable and instructive communications, we offer our sincere thanks; and ask in behalf of the Farmer and the public, a continuance of their favors.

To the respected proprietors of the paper, to its respected editor, to its excellent printers, who have distinguished themselves by the neatness and correctness of its typography, and to its numerous readers, we wish at the commencement of a new year, all the success and prosperity which they can ask for themselves; above all, more intelligence, more success and more prosperity in the greatest and best of all secular arts and that on which all others depend, AGRICULTURE. H. C.

## LECTURES ON AGRICULTURAL CHEMISTRY.

We announced in our last Farmer that Dr. S. L. Dana had agreed to give a course of six lectures on Chemistry in its application to Agriculture, at Lowell, at the instance of several of the citizens of that enterprising place. They mean to be behind no other in their efforts to interest the attention of their young and inquisitive community in practical knowledge, and in the diffusion of useful information. We repeat our reference to this subject, that we may express our hope and desire that Dr. Dana, in the course of the winter, will repeat this course of lectures in Boston; and we take this opportunity to say, that persons desirous of his doing this, will please leave their names at the office of the New England Farmer, or with the Messrs Hovey, of the Gardener's Magazine, Mr Bosson, of the Yankee Farmer, or Mr Buckminster, of the Boston Cultivator, all of whom are respectfully requested to act as agents in the case; and to give some notice of these intentions in their respective publications. Application may likewise be made to the subscriber. Tickets for the course will be one dollar each. An early application is desired.

We express the hope, likewise, that our learned and respected friend, Dr. C. T. Jackson, will likewise, at his early convenience, favor the public with a course of lectures on the same subjects. His learning and observation, together with his enthusiasm in the science, eminently qualify him as an instructor in this case; and we think we may promise him, if he will do this public service, a full and attentive audience. At least, with his consent, no pains shall be wanting on our part, to obtain it. The two courses would not interfere with each other; but they would render each other the more instructive and interesting. H. C.

## AGRICULTURAL MEETINGS.

The usual time for the assembling of the Massachusetts Legislature is on Wednesday next. With present prospects, there will be little delay in the organization of the Government; and we are not likely to be so long in determining who shall be the conductor of the State locomotive as the last year.

As soon as the opportunity presents, the Commissioner will apply to the House for the use of the Hall for the purpose of holding Agricultural Meetings, as has been done the three previous years. These meetings have been well attended; and much interest has been taken in the discussions which they have called forth. They have been instrumental in bringing out and diffusing much valuable information, and creating an interest in the subject, which has been followed by the best effects. The reports of the proceedings and discussions, had at these meetings have been copied into the Agricultural papers all over the country, and into many other of the papers. We cannot doubt that many of our distinguished Agriculturists will favor us with their aid and presence in addresses, and debates; and that the meetings will go off with increased spirit and advantage. H. C.

## Massachusetts Horticultural Society.

## EXHIBITION OF FRUIT.

Saturday, Dec. 19, 1840.

Benjamin V. French Esq., exhibited large and beautiful specimens of the yellow Bellflower apple. This apple is a great favorite in Pennsylvania and New Jersey, and is said to be particularly adapted to the climate of those States. The apples exhibited by Mr. French were raised on his farm in Braintree, and are not surpassed by the very best we have seen in the Philadelphia Market.

Benjamin Willis, Esq. exhibited apples raised in Granite, Bond County, Illinois, they were medium size, rather oblong, pointed at the blossom end, flesh yellow, with a peculiar rich and agreeable flavor. The committee are not able at present, to identify it, or refer it positively to the description of any Pomological author.

For the Committee,  
ROBERT MANNING.

CHANGE OF EDITOR.

Our notice in last Wednesday's paper, that Mr Putnam is to become Editor of this Journal was, on the following morning, alluded to by the Editor of the Boston Courier in the article annexed :

The *New England Farmer* — We learn from a notice in the Farmer, that that Journal is hereafter to be conducted by Allen Putnam of Danvers,—Mr Colman being unable to continue his assistance as editor, owing to other engagements, and Mr Breck finding his attention fully occupied by the business concerns of the Agricultural Warehouse and Seed-store. Mr. Putnam is a good practical farmer and a good scholar and writer—two good qualities, which will secure the popularity of the paper and increase its usefulness.

OUR EXCHANGE LIST.

In the plenitude of our good nature, we have suffered our exchange list to become burdensome. With all the Agricultural periodicals we wish to continue the exchange. Many others also we are desirous of retaining. But we are receiving some sixty or seventy periodicals, that we have no time to open, and which are of no value to us. The list must be abridged because it has become too expensive. Those who do not receive our paper after the first of January will consider the exchange as stopped.

THERMOMETRICAL.

Reported for the *New England Farmer*.

Range of the Thermometer at the Garden of the proprietors of the *New England Farmer*, Brighton, Mass. in a shaded Northernly exposure, week ending Dec. 27.

GRINDSTONES.

An extensive assortment of Water and Hand Grindstones constantly on hand and for sale by AMMI C. LOMBARD & CO. 13 Lewis's Wharf. 1841. Nov. 17.

BACHELDERS' PATENT PLANTING MACHINE

This Machine, recently invented by L. & S. H. BACHELDERS, of Hampstead N. H. is one of the most convenient and labor saving implements ever introduced to the notice of the farmer. It is simple in its construction, and certain and regular in its operation. It is calculated to plant all kinds of seed usually planted in hills or drills.

This Machine is constructed on principles altogether different from all others of similar purpose. It performs the operation of planting without opening a furrow, thereby dispensing with covers, that are continually liable to clog, and get out of order. It simply raises the soil a little, and at the same time drops the seed at any distance desired, when the soil falls back to its original place and is immediately followed by a moveable gauge, that leaves the soil to any depth over the seed which the operator chooses; it also removes all small stones and sods from the ground where the seed is deposited.

This Machine has been in operation during the past season and thoroughly tested by practical Farmers and Mechanics in Massachusetts and New Hampshire, and is pronounced by them a complete and useful Machine, and is allowed by all who have seen it, to be superior to every other implement of the kind now in use in the United States. It operates equally well on wet or dry ground, and is warranted to work well on any ground that can be furrowed with the common plough.

Orders will be received by L. & S. H. BACHELDERS, Hampstead, N. H., or by the subscriber at Haverhill, Mass., their General Agent for the United States, for the Planter, or a right to manufacture and dispose of them. Any communication addressed to either will receive attention.

T. J. GOODRICH.

Deerfield, N. Y. May 27, 1840.

TO THE PUBLIC.—We whose names are hereunto annexed, certify that we have examined *Bachelers' Patent Planting Machine*, and seen it operate on several of our farms in Deerfield, Oneida County: the seed planted thereby seems well planted, wherever the ground is in proper order, and is now coming up; and we believe the Machine fully answers the description given of it in the handbills describing and recommending it, and heartily concur in said recommendation, believing as we do that it will prove a valuable labor-saving Machine, and on good land will soon supersede the labor of planting by hand in the old and common method.

DOLPHUS SKINNER,  
SAMUEL LOOK,  
BENJAMIN NORTHAP.

1841: Dec. 30.

WANTED.

A man and his wife to take charge of a farm house, within six miles of Boston. The man to be well acquainted with farming, the wife to understand a dairy. Enquire at the office of the *New England Farmer*. Dec. 30.

FARM FOR SALE.

The subscriber offers for sale that valuable Farm, situated about 3-4ths of a mile below the First Parish Meeting House, on the Stage road, and commonly known as the Judge Prescott farm, containing about 170 acres of superior land, in a good state of cultivation, with two dwelling houses, four barns, and other out buildings. The farm is remarkably well watered with soft water, conveniently fenced, has nearly forty acres of large, handsome wood and timber standing on it, with an orchard of grafted Apple, Pear, Peach, Plum, and Cherry trees, and might be easily divided into two Farms. The estate will be sold reasonably. If five thousand dollars be paid on receipt of the deed, the remainder may lay on mortgage to suit the convenience of the purchaser. For further particulars, apply to the subscriber, living on the premises. WM. SALISBURY.

Groton, Oct. 26, 1840. eow.

FRESH GARDEN SEEDS.

We would inform our customers and friends that we are now receiving our supply of fresh Garden Seeds, most of which have been raised under our own inspection, from fine selected roots; which we warrant to be of the purest quality of the growth of the present season.

Agricultural Books.  
Agricultural Implements.  
Seed and Implement Catalogues sent to all applicants gratis, and all orders promptly attended to.

JOSEPH BRECK & CO.

Boston, Sept. 29, 1840.

## MISCELLANEOUS.

## NATURAL HISTORY.

## THE QUAIL.

The quail strongly resembles the partridge, but is much smaller, has a more delicate beak, shorter tail, and no spur on its legs. It is found on both continents, but there is a slight difference between the quail of Europe and that of America.

In Europe they are birds of passage, appearing about May, and departing in September, as is supposed, to Africa. In some parts of Europe, however, they appear to remain the whole year. They are about seven inches long; the feathers of the head are black, edged with a rusty brown. The hinder part of the neck and crown of the head are divided by a long, pale yellow line; the breast is of a yellowish red, spotted with black; the feathers on the back are marked with a pale yellow line in their middle, and with iron-colored and blackish bars on their sides.

The American quail, or, as it is called in Pennsylvania and the Southern States, the partridge, does not migrate like the quail of Europe, but remains at home all winter. When the season is unusually severe, they sometimes suffer, however, and whole flocks of them have sometimes been found frozen to death. They are about nine inches in length, usually weighing about half a pound. The bill is black, and their color, generally, is darker than that of the quail of Europe.

The quail constructs her nest in May. It is made on the ground, generally at the foot of a thick tuft of grass, that shelters and conceals it. The materials employed in its construction are leaves and dry grass. About 15 or 20 eggs are usually laid, which are perfectly white. It is thought by some, that they occasionally lay in each other's nests. The young birds attain their full growth about the beginning of September, when they begin to associate in flocks or coveys. About this time, too, sportsmen and trappers begin to persecute them.

During the end of the summer and the beginning of autumn, the well known note of the male bird is every where heard. This note is thought by many to resemble the words *More Wet*, accompanied by a whistling; but this probably arose in part, from a superstitious notion, that the sound, when heard, always foretold rain. Owing to the shortness of their wings, and the rapidity with which they move them, they make, when they fly, a whizzing sound. The American quail is found from New England to Guatimala.

Their food is composed of grain, seeds, insects, &c.; but their favorite articles, are buck-wheat and Indian corn. Their flesh is more juicy and delicate than that of the partridge; and by many is preferred to that of any other bird. The ancients, however, had a strong prejudice against their flesh, from a belief that they fed upon a poisonous plant, called hellebore, and were subject to fits of epilepny. But it is now known that many animals whose flesh we are accustomed to use for food, feed on plants which would be poisonous to us, and this without any injury to them; or, so far as we know, without rendering their flesh at all unwholesome to us.

Quail fighting in Rome and Athens, in ancient times, appears to have been as common as cock-fighting in more modern days. This barbarous and unfeeling practice is even continued at the present time in China, and in some parts of Italy.

## GIZZARD PEBBLES.

The real use of poultry swallowing pebbles so often along with their harder kinds of food, is one of the most curious subjects in natural history.—That they should have to resort to artificial means, apparently more likely to hinder than help them in grinding in their food, is at the first view almost incredible. The gizzard is their millstones, and what they can want with pebbles and gravel, is a complete puzzle to philosophers. However, the poultry tribe went thrive on hard corn without.—They get fat in pens because they have their food ready ground.

“On opening the gizzard of a bird,” says Roget, in his *Bridgewater Treatise*, “it is constantly found to contain a certain quantity of small pebbles, which must have been swallowed by the animal. The most natural reason that can be assigned for the presence of these stones is, that they aid the gizzard in triturating the contained food, and that they, in fact, supply the office of teeth in that operation. Both Fordyce and Hunter concur in establishing the truth of the common opinion, that in all birds possessing gizzards, the presence of the stones is essential to perfect digestion. A greater or less number of them is contained in every gizzard, when the bird has been able to meet with the requisite supply, and they are never swallowed but along with the food. Several hundred were found in the gizzard of a turkey: and two thousand in that of a goose. So great an accumulation could never have been the result of mere accident. If the alleged mistake could ever occur, we should expect it to take place to the greatest extent in those birds which are starving for want of food; but this is far from being the case. It is found that even chickens, which have been hatched by artificial heat, and which could never have been instructed by the parent, are yet guided by a natural instinct in the choice of the proper materials for food, and for assisting its digestion; and, if, a mixture of a large quantity of stones with a small proportion of grain be set before them, they will at once pick out the grain, and swallow along with it only the proper proportion of stones. The best proof of the utility of these substances may be derived from the experiments of Spallanzani, who ascertained that grain is not digested in the stomach of birds, when it is protected from the effects of trituration.

Thus the gizzard may, as Hunter remarks, be regarded as a pair of jaws, whose teeth are taken in, occasionally, to assist in this internal mastication. The lower part of the gizzard consists of a thin muscular bag, of which the office is, to digest the food which has just been triturated.

Stones taken into the stomachs of birds, are seldom known to pass with the feces, but, being ground down and separated by the powerful action of the gizzard, are mixed with the food, and, no doubt, contribute essentially to the health of the animal.”

## THE MARTIN.

The Martin is the most beautiful of the weasel kind. It lives in hollow trees, and produces five or six at a time. When taken young, it is easily tamed, and becomes playful; but it is always ready to make its escape to the woods. It is extremely fond of honey, and sometimes feeds on grain. It prepares itself for sleep in a round form, covering its tail with its head. Sometimes it sleeps two days, and keeps awake as long. Its body is a foot and a half long, and covered with a

thick fur of a darkish brown color. Its fur is held in high estimation.

## ANECDOTE OF A HORSE.

In the war in Spain, some years ago, two horses had long served together in the same brigade of artillery. They had assisted in drawing the same gun, and had been inseparable companions in many battles. One of them was at last killed; and after the engagement the survivor was piqueted as usual, and his food brought to him. He refused, however, to eat, and was constantly turning round his head to look for his companion, sometimes neighing as if to call him. All the care that was bestowed upon him was of no avail. He was surrounded by other horses, but he did not notice them: and he shortly afterwards died, not having tasted food from the time his associate was killed.

*Comparison of Speed.*—A French scientific journal states that the ordinary rate per second

Of a man walking, is	4 feet.
Of a good horse in harness,	12
Of a reindeer in a sledge on the ice,	26

Of a 24 pound cannon ball,	1300
Of the air, which, so divided, returns into space,	1300

## BONE MANURE.

The subscriber informs his friends and the public; that after ten years experience, he is fully convinced that ground bones form the most powerful stimulant that can be applied to the earth as a manure.

Orders for Bone Manure or Oyster Shell Lime, left at the Bone Mill, near Tremont road, in Roxbury, at the New England Agricultural Warehouse and Seed Store, No. 52 North Market Street, or through the Post Office will meet with prompt attention.

March 4, 1840.

NAHUM WARD.

## POUDRETTE.

This valuable manure may be had on application to the subscriber, at the office of the “*New York Poudrette Company*,” No. 120 Nassau street, New York. It is *in-odoriferous*, and may be transported in barrels, on board of any vessel or steamboat, without offence—and it will be found an exceedingly valuable article as a *fertilizer* on any soil, and for any crops; but more especially for gardens and flowers, as there are no foul seeds in it. Poudrette has been used for three seasons with entire success on Long Island, by many practical farmers, as may be ascertained from letters and statements made by them, and published at this office in a pamphlet containing also the “*act of incorporation*,” granted to the Company by the Legislature of the State of New York; and other facts in relation to the subject. Price 35 cents per bushel. Barrels cost 25 cents each, and hold 4 bushels. Persons wishing to make an experiment on a small scale can obtain one barrel by enclosing a two dollar current bank bill—or three barrels by enclosing five dollars, free of postage. On receipt of the money the article will be put up and forwarded as directed.

\* \* Price of shares, one hundred dollars—which entitles the holder to one hundred bushels of poudrette annually, during the term of the charter; fifty bushels in time for spring use, and fifty bushels in time for fall use. Shares taken soon, will be entitled to the spring dividend—and, if desired for experiment, a few bushels may be had this fall.

All orders, or applications in relation to the business, must be made to the subscriber, 120 Nassau street, New York.

D. K. MINOR.

☞ I wish it distinctly understood that the “*New York Poudrette Company*” is in no way connected with the “*Lodi Manufacturing Company*,” of which *Anthony Dey* and *Peter Bartholemey* are, or were, the managers.

Dec. 9, 1840.

## FATTENING PORK.

Madam Glass, in her delectable dissertations on cookery, as a preparatory step towards dishing a sturgeon's nose, first directs the novice in culinary art to catch one; so the preliminary step in making pork is to catch or procure the pigs. On the choice of the animals made for feeding, most of the profit will be depending; and when it is recollected there is an immense difference between the pleasures of feeding daily a pen of sleek, quiet, thriving grunners, and the continual irritation and vexation experienced in dealing out provender to a gang of ungrateful, squealing, squabbling creatures, of whom week a'ter week you are obliged to say, "the more they eat the worse they look," the necessity of attention to this point of selection will be apparent to all. It would be rather difficult at present, in any civilized part of the country, to find any one of the genuine old-fashioned squealers, that used to devour all a farmer's corn, and then weigh from one hundred to one hundred and fifty; but a little observation will show there are multitudes of hogs about the country, but a few shades removed from these, and the task of making pork from such will be found both tedious and unprofitable. In spite of the opposition which has been made by the ignorant and the prejudiced, the good effects of the importation of good breeding hogs, has long been felt in the improvement generally of our swine. In some kind and degree, and under some local or general name, hogs with an infusion of imported blood which has essentially altered their form and propensity to fatten, are to be found all over the country. The Byfield, the Mackay, the Darlington, the Parkinson, and a multitude of other varieties, all originating from some fortunate cross of the imported and native breeds, have for a number of years nearly or quite in the eastern and middle States, displaced the alligator, shad backs, and saw-horse tribe of the original stock. More lately still have been introduced the pigs called the Grass breed, the Irish grazier, and superior to all, as combining the good qualities of all, the beautiful Berkshire. We know that it is a common remark among the stationary or no-movement farmers, that it is the feed and not the breed that makes the hog; and we know too that a more unfounded and injurious notion scarcely exists. Fifty years since, farmers gave their hogs more good feed in making pork than is now done; yet no one will pretend the average weight at that time could be compared with that reached by modern porkers. In conversing with a veteran farmer of nearly 80, a few days since, on this very topic, he remarked, "I remember when with three yoke of cattle and a common cart, I carried to market at a single load, twenty-seven fattened hogs, and all scarcely weighed as much as half a dozen of our best hogs now weigh."

Perhaps as good a breed of hogs for the farmer

as can be found, would be one that with small clean bone and light offals, would weigh at eighteen months and well fattened, about four hundred pounds. There is no possible necessity in a hog of this weight, in having one third of the weight bone, as was the case with the coarse, large-boned, long-legged breeds. There is as much difference in the size of the bones in the improved hogs and the old breeds, as between those of the Arabian and the English dray horse; and while there should always be enough, too great a redundancy of bone is one of the most serious defects in any animal intended for feeding. Select then for fattening, hogs well formed, short snouts, light offals, clean boned, quiet, and if possible of breeds which experience has proved fatten easily, and place the greatest weight where it will be worth the most. The extremes of the hog genus are the Alligator and the Chinese. On the first, food and time are thrown away; the last are, when pure, too small for the farmer who makes pork to sell, but is the most quiet and easily fattened of any breed. Experience has shown that a cross between the Chinese and some variety of fine points, but heavier and larger, makes the best farmer's hogs, and the improved Berkshires are at present deemed the *ne plus ultra* of swinish perfection.

Having selected your pigs, the next thing to be attended to is your hog-house, pen, or place of feeding. Many farmers have their pig-pen as long as the road, or as large as their fields, and affect to wonder they do not derive as much profit from making pork as some of their neighbors, who manage things differently. A pig must be kept comfortable as well as fed, if the farmer would have the full profit of the materials fed out. Pens, where a farmer feeds several hundred hogs, as many of those of the west do, would perhaps be impracticable, or from the low price of pork and the cost of building materials, unprofitable. There the farmer divides his hundred acres of corn into ten or twenty acre fields. When the corn is ripe, his hogs, numerous in proportion to the acres of corn on which they are to be fed, are turned into one of his fields, and gather the corn for themselves; and this they soon become expert in doing. When the first field is cleaned, the hogs are let into another, and so in succession until the whole is devoured, when, if the fields have not been overstocked, the hogs will be fit to be driven to market. This mode of feeding would, however, be ruinous to a large majority of the farmers in the United States, and a more economical method of fattening must be adopted. A hog-house then, with fixtures for preparing their food by steaming or boiling, and attached pens and yards for the use of the swine, are indispensable where much profits in making pork are expected. In arranging the pens, particular reference should be had to the convenience of feeding, and the comfort of the animal. The pen itself should be warm and dry, and the bed free from dirt or manure. Hogs love to have dirt at their pleasure, but no hog wishes to live in it constantly. Experience would seem to show that the more quiet a hog is, and the less he is permitted to exer-

cise his locomotive powers, the faster he will fatten; and hence in many parts of Great Britain, it has become common to give each pig a separate stall, so arranged that he is completely separated from all others, has his part of the trough and his feed entirely to himself, and is not disturbed by the intrusion or voracity of his fellow grunners.— These stalls are so narrow that the hog cannot turn in them, and whether he lies or stands, it is always with his head to the trough. The floor is kept clean by slanting backwards, where a sliding board or door enables a man with a hoe to remove whatever filth or dung may have accumulated in the stall.

Where a number of hogs feed together at the same trough, there are some among them that usually monopolize an undue proportion of the food and of the trough, (in this attempt at monopoly has the genus *sus* been instructed by the genus *homo*?) and to prevent this, some place erect pins in front of the trough, the upper parts secured in a piece of timber parallel with the trough, which will prevent a good deal of this tyrannical usurpation; while others, to accomplish the same end, put wooden pins across the top of the trough, which will prevent the master or mistress of the sty from inserting their nose at one end, and with a single sweep clearing the whole. It is an excellent plan to have the troughs fitted with a board in such a way, that the hogs can be shut from it while the attendant is replenishing it. This may easily be done, by having one suspended over the trough by hinges, or otherwise, in such a manner that it can at pleasure be swung forward and secured, shutting the porkers from the trough or backwards, to allow their access.

A large part of the expense of feeding and fattening swine may be made up to the feeder, if proper arrangements are made about the pen and yard, to have the full benefit of the manure made by the pigs. The value of hog manure is so well known, that it is unnecessary to say a word in its favor here. For corn, it is so far beyond all others we have tried, that for that crop as well as others it may be considered invaluable. Give them a chance, and each pig that is fattened will make at least two loads of good manure. To do this, their pens and yards must be frequently covered lightly with horse littering, for them to root over and work upon. The yards attached must retain the urine and wash of the pens, and into this, with the straw mentioned, should be put an occasional load of muck, weeds, wash of the roads, or almost any substance hogs will work upon, and which will retain the salts and volatile parts of the manure now generally lost. If the porkers do not seem inclined to root over and incorporate the mass, fling over it a few handfuls of corn or barley, and they will soon mix it to the bottom. Keep the pens clean, and keep the manure distributed over the yards. Follow these directions, and the farmer will find himself in the spring in possession of a supply of manure, that applied to his corn in the hill, or otherwise, will give, in the increased crop, an ample reward for the extra labor incurred, in

addition to the permanent benefit afforded the soil.

In making pork the food used, and its preparation is a most essential part of the process; for the most perfect pigs, and the best arranged pens do not make first rate pork without plenty of good food. No good farmer ever attempts to see with how little food he can keep his animals, summer or winter, or fatten them; his object is to ascertain how good food can be most beneficially employed, and made the most profitable. Different substances are of very different values for fattening animals, although a sufficient supply of nearly any kind of food, will cause them to improve; this value in most kinds is very much increased by cooking, or other preparation. A few words will explain why cooked food is more nutritive than that which is in a raw state. Raspail and Biot, by an able and curious series of experiments, proved that the nutritive power of any substance lies in the farinaceous globules, and that to be available, these globules must first have their envelop crushed, or otherwise ruptured. This is partially done by grinding, still more by mastication, but never so completely as by boiling, or subjection to an elevated temperature. In that case the matter in the globules expands, bursts the envelop, and of course is wholly appropriated to the purposes of nourishment. Experiments a thousand times repeated, demonstrate the justness of these conclusions, and prove that the man who attempts to fatten animals on uncooked food, overlooks the simplest principles of domestic economy. Roots and fruit are best cooked by steaming. A large proportion of the pork made at the present day, is partially or wholly fed on potatoes or apples. To give these with profit, steaming is indispensable; and the apparatus is as simple and cheap as it is efficient for doing this. A box or vat of the size required, is made of plank closely grooved and secured at the corners, on the bottom of which common sheet iron is thickly nailed, which will give the box the power of retaining water. This box with a tight lid, is placed on bars of iron over a fire flue, and the substances placed in this are quickly and fully cooked. Steamers made in this way are used for scalding hogs, and by some for making maple sugar.

In the United States, Indian-corn may be considered the main article for feeding swine, although many other kinds of food are used, as circumstances may require. Corn, however, stands so decidedly at the head of all other substances used for making pork, wherever it can be grown, that the best method of feeding it becomes an object of national importance. It is most generally fed to pigs in the ear, frequently thrown upon the ground or the mud—practices far from economical. It is sometimes soaked in water until softened and swelled, or ground into meal and mixed up with water at the time of feeding. Either of these methods is preferable to feeding the grain to them in the ear; but in none of these ways do the hogs derive the full benefit of the corn given them. It should be ground and made into pudding by the addition of a large quantity of water, and long boiling. Should any one have doubts as to the great saving which would be effected by this preparation of corn, we think his doubts would be removed by an examination of the series of experiments made by Mr Colman, of Mass., and to be found in the Transactions of the Essex Co. Ag. Society for 1835, or the abridgement of them in the American Swine Breeder, by Mr Ellsworth. The

experiments of Mr Colman have been repeated and varied many times with the same results, and one recorded in the first volume of the Farmer's Cabinet, made in the most satisfactory manner, shows that the saving of feeding hogs on pudding, over that of feeding on shelled corn, is fully equal to one half of the grain used. Some experiments made in feeding animals with meal made by grinding the corn and cob together, and cooking the whole, would seem to show that the gain in this way was equal to one third of the grain used. This is not improbable, when it is recollected that where food contains large quantities of nutriment, more is usually taken into the stomach than can be appropriated, and is therefore lost. The stomach, to perform its functions completely, requires distention as well as nourishment; and it seems likely that the desired proportion between bulk and nutritive matter, is much more nearly gained by grinding the cob than using the grain without it. It is on the same principle that the oat is found better for the horse than any other grain; namely, because the relation between nutriment and the required bulk for distending the stomach, is better fulfilled in this grain than any other.

But though corn may be considered the best of all grains for making pork, there are others used which are more or less valuable. In England, where corn is unknown, pork is made by feeding peas and barley ground together; and this is probably of all substances, the one that approaches nearest to corn in feeding swine. Roots are also extensively grown for this purpose; apples are very valuable; but whatever may be the article used to begin with, the feeding must be finished with grain or peas. There may be bulk without this, but solidity and sweetness will be wanting. It will resemble meat made at the distillery; the hams will lack firmness, the lard will be oily, the pork shrinks in cooking, or will not wear well.—The best pork, therefore, can only be made by the use of corn, peas or barley; and this should be well understood and practiced upon by the farmer. But in the use of these materials and their preparation, much, if not all of the profit of feeding is depending; and in fattening twenty porkers, some farmers waste food enough to feed at least a quarter more, if properly managed. Let the man who wishes to take lessons in feeding pigs, visit a Shaker's establishment; let him see the attention with which their pens are littered; the neatness with which they are kept; the nicety with which the food is prepared and served out to them, and he will not be surprized at the thrift and condition of hogs so cared for or the profit resulting from the process.

After hogs have reached a certain point of fatness, there is no profit in keeping them longer; for though they consume little food, they gain little in weight, and do not compensate for the care and trouble of feeding. It is true this point is not commonly reached in feeding swine; and more are killed before they have reached the point of greatest profit, (that is before they have become fully larded or their flesh solid,) than after that time.—No small part of the goodness of pork depends upon the operation of killing and dressing; and these should receive strict attention. In bleeding a pig, some will so mangle the throat, and so hack and saw the shoulders with the knife, that more meat will be lost from its bloody state than would pay for dressing the animal in the best manner. Then the scalding and removal of the hair is so imper-

fectly done as to render every part of the rind a nuisance in cooking; whereas this part of dressing a pig should be performed with the greatest care, and finished in the most perfect manner. Two methods of removing the hair are practiced in England. In one, the part of the animal to be scalded is covered with a thick woollen cloth, and this is kept saturated with hot water till the hair and scurf comes off easily and smoothly, and this process is continued by removing the cloth till the whole is finished. In those parts of that country celebrated for their bacon, as Hampshire and Lincolnshire, the animal, instead of being scalded, is singed. He is laid on his side, covered with dry straw, which is burned off, and the operation is repeated until the hair is destroyed. The reason given for this is, that scalding softens the skin, and renders it impossible to make the pork into bacon of the best quality. In this country, scalding is universally practiced, and is generally performed in a tub or kettle, and if effectually performed, is perhaps the best way on the whole, that can be adopted.

After a hog is killed and dressed, the operations of salting and packing are to be performed, and on these much is depending. Hogs should never freeze before cutting up, but should be thoroughly cooled before cutting and salting. If they hang out all night, unless there is danger of freezing, they will cut up better, take the salt well, and make far sweeter pork, than if the operation of cutting and salting is hurried through before there has been time to cool. Heavy, thick hogs require particular attention to being spread open, or there is great danger of their spoiling in the thickest part near the back bone. We have known fine logs so injured in this way, by a little haste in taking them down, and not airing them fully, that they were lost to the grower. Be particular, then, that your hogs cool well. Before commencing operations it is necessary that every thing be in order for packing; that the tubs and barrels are perfectly tight; that the salt be of the best quality and in abundance; and then the pork may be cut according to the purpose of the proprietor, whether intended for bacon, barrelling or domestic use.

None but good salt should be used in packing pork. Rock salt, or Onondaga coarse salt is the best, and where they can be obtained, should always have the preference. The common salt of Onondaga or Kenhawa, or Turk's Island, will do very well, but all of these have some impurities, that more or less injuriously affect the meat. Perhaps there is no salt superior to the Onondaga coarse salt, or that made by evaporation, for any purpose where strength and purity are the main considerations. At Cincinnati, the great pork market of the United States, 50 lbs. of Turk's Island salt is allowed to a barrel, or 200 lbs. of pork; and in addition to this, salt added to water to the point of saturation, or strong brine, is used to fill the barrels after heading. Of Rock salt, or Onondaga coarse, from half a bushel to three pecks is used for 300 lbs., the barrels to be afterwards filled with saturated brine.

Almost every farmer has his own method of cutting up his hogs, and packing them; while the law prescribes the manner of packing when intended for the market; and multitudes of recipes for pickling pork or hams may be found in the agricultural and other publications of the day.

[We are compelled to defer the residue of the article until our next.]

## GUINEA GRASS.

"Before I conclude the subject of experiments, I will here call your attention to one which I stated two or three years ago. It was made with guinea grass which I neglected after two trials, from a belief that it could not here be acclimated. In this I find myself mistaken, for a small spot which was not destroyed, has increased so much as to become a thick mat of grass that reached this year, a height of at least five feet, in land by no means rich, and ripened its seed. I can now certainly say of it, that you may cut it four, and in good seasons five times, that in good land, each cutting will be about three feet high, and that it stands drought better than any other grass I have ever tried. It is best propagated by the roots, which should be cut into pieces two or three inches long, and planted about three inches deep, in rows fifteen inches by eight or nine apart. The ground requires cultivation the first year. I cannot say to what kind of soil it is best adapted, having tried it only in high land, the soil of which is rather light."

## "CLEAR AS MUD."

"My last experiment I have felt some scruples in mentioning, lest I should excite in my hearers, the same very annoying reminiscences which the bare word—*Multicaulis*, never fails to awaken in my own mind. But the statement of unsuccessful trials is as often useful to us, as of those which succeed best; and this fact encourages me to proceed.—Know then, my good friends, that having been among the afflicted with the *Multicaulis* humbug, I naturally sought to alleviate my sufferings by striving to make some use of those far-famed treasure-bearing bushes, which when the golden harvest time came, that was to fill all our coffers to overflowing, I could neither sell, at any price whatever, nor even give away. The periodicals that had been the chief speakers of the epidemic, set to work, immediately after it had seized almost every body, to cheer our drooping spirits, by proving, "as clear as mud," (if I may be pardoned for using a vulgarism,) that to retrieve all our losses, we need do nothing more, than forthwith to commence raising silk worms. To this, therefore, very many of us hastened, as to a last hope; and among the rest of the valetudinarians—your humble servant. One of my daughters persuaded me to the undertaking, and at it we went, certainly with the honest purpose of doing our best.—We bought three ounces of eggs of two or three of the best varieties of the worms, which cost \$17.50 cents. They hatched at the usual time; began to spin without any night feeding after 9 o'clock, quite as soon as any which the papers reported to have been nursed night and day; but were watched and fed with unremitting attention, from day light until bed time, so long as their precious health required particular care; indeed I never saw more bestowed—even upon the infant children of a family. The produce of these three ounces of eggs was only thirteen bushels of cocoons, for which I have found no market at all, any where near me, although I have been told that I may possibly get three and a half or four dollars, if I will be at the trouble and expense of sending them, at my own risk, as far as Baltimore or Philadelphia. Now, supposing I could sell at the highest price, which is not probable, as our cocoons are only of medium quality, the balance, after deducting the first cost, would be \$34.50. This pittance would be the

whole earnings of my daughter, and at least six other persons—constantly employed, for seven or eight weeks in this hopeful business of nursing silk worms, and taking care of their cocoons. The least profitable of all the employments they could have pursued, would have brought them in more money. But then they would have lost the brilliant chance of taking rank among the disinterested and patriotic encouragers of "the silk culture in the United States," who have been so outrageously puffed from one end of the Union to the other; although in fact, like all other originators of new schemes to succeed in the old business of making money, patriotism had no more to do with their motives, than had any other honest project solely for the promotion of their own individual interests. A due regard to this is always laudable in every body, and as such, well deserves to be commended; but when we go so far as to ascribe it to love of country, as has been done, most profusely, in this *Multicaulis* and silk worm business, I must, for one, protest against any such gross abuse of language.—*Mr Garnett's Address.*

## TO CURE THE CHOLIC IN HORSES.

Make and give him a drench composed of a table spoonful of strong mustard, dissolved in a black bottle of water. Having prescribed and described the drench, how is it most conveniently administered? Raise the horse's head high in the air, and give the dose from a junk or black bottle. For this purpose every farmer should have a bottle at hand, (always kept in one and the same place, and so with many other things) the neck of which, to prevent its breaking in the horse's mouth, should be well seized or wrapped round with twine. If it be uncertain when the horse was taken, as in that case there will be danger of inflammation, on discovery of the disorder, *breathe a vein immediately*. The remedy here described, is said to be immediate and infallible. How apt most farmers are to wait until the case occurs, and life and death hang on the issue of the moment, before they inquire about the cure—and how many there are who do not keep on hand the ingredients to fill up the simplest prescription. Be it then remembered from this time forth—a table spoonful of mustard for the worst cholick, and furthermore—keep always at hand a black bottle—strong mustard—sulphur—glauber salts—and phlemites to bleed with. To make the horse swallow, when his head is thus elevated, instead of choking him or squeezing his gullet or windpipe, from which inflammation may supervene, give him a smart slap on the lips, with the open hand.

P. S.—Some prudent farmers, keep at hand, with which to give drenches most conveniently, a well shaped cow's horn, with the little end sawed and smoothed off; through that pour down the dose from the bottle.

*Good Medicine for Hogs.*—When your hogs get sick, you know not of what, give them ears of corn, first dipped in tar, and then rolled in sulphur. 'Tis ten to one but it arrests the disease.

*Remedy for Foul Noses in Sheep.*—Make a small mop, by wrapping a rag about the end of a stick—dip this in tar, taking up as much as will adhere to it—roll this around in salt, and then thrusting it into the sheep's mouth, hold it there until he is forced to withdraw and swallow the tar and salt, and your sheep will soon get good health and clean noses.—*American Farmer.*

From the All any Cultivator.

## TO MAKE HOME PLEASANT.

The way to make a man's home more pleasant than any other place is, that he should endeavor to please his wife, and accommodate her with every convenience, that she may have his meals, &c. prepared with the least possible attention and labor. There should be good water near at hand, an article wanted every few minutes; a house well planned, and every thing so arranged as to facilitate her operations; hence the necessity of her having every convenience to direct her servants in this three-times-a-day business, of all others the least animating, as it is never done; she will, as she ought, enjoy her husband's smiles of approbation for her attention and good management, and also partake with him of the good things prepared by her care; yet this is often her principal remuneration for a sameness in her employment which continues through life.

But the husband has many things to stimulate him to exertion. Sometimes popularity, or a prospect of gain. If a farmer, his growing crops; the increasing thriftiness of his stock; and more than all, the amount of annual receipts arising from a well conducted farm, all combine to encourage him and lighten his labors: his wife having her household affairs well arranged, is thereby enabled to assist in the despatch of his business, by having her part regularly performed, establishing a union of interest, and consequently affection, which never fail to make home desirable.

But as money alone will not make home pleasant, with it a proper expenditure of it, and as we all have appetites and senses to please, the necessity of planting around our dwelling a variety of the best fruits, is obvious to every one—such as will furnish the kitchen and table with a succession all the year; also a portion of the grounds should be suitably planted with ornamental trees, a part evergreen and a part with deciduous shade trees; the former by their dense green leaves protect from the north-western blast, and their lively appearance beguiles the gloomy aspect of winter, whilst the broad leaves of the latter planted along the avenues, afford a shade from the scorching sun.

The yards and garden may be adorned with flowers to bloom in succession all the season, but to attain both profit and pleasure from fruits and flowers, they should be planted in a soil somewhat rich, and receive regularly during the summer season, sufficient cultivation to keep the ground mellow and free from weeds—these together with good farm crops will render a man independent; he visits his neighbors more from duty or necessity than pleasure; he enjoys more at home. A family thus situated has great cause to be thankful to a kind Providence for blessings bestowed, and they should be very cautious about selling a home thus improved, if middle-aged or in the down-hill of life; as many thereby unsettle and unfix themselves at a time when rest and repose are desirable, and disqualify themselves from answering the great end of their creation. **ROBERT SINCLAIR, SEN.**

*A Good Pig.*—Mr Bailey Birge, of Norfolk, Ct., lately butchered a pig 8 months and 21 days old, which weighed when dressed, four hundred and fortythree pounds. The pig was a half blood Berkshire, crossed with some native breed. For some time before it was butchered, it could not rise.

## THE GILLIFLOWER POTATOES.

The new editor will not dig up the buried hatchet. Had Mr Breck and Mr Drew known each other as well as the editor knows each of them, the warfare probably would have been less fierce. The pen which writes our friend Breck an ignoramus, in *Botany*, writes also its own ignorance of his attainments; while doubts of Mr Drew's good sense and sagacity will never arise in the mind of any one who knows him. Each of them is too good a man to be hewn down, and having our foot over the hatchet, we will strive to keep it under ground.

Annexed we give an attempt to explain the phenomenon which Mr Smiley supposes that he witnessed. The suppositions presume so much upon Mr Smiley's ignorance, that we apprehend the explanation may not be very satisfactory to him. In the reflections, particularly the last two paragraphs, is matter which we would earnestly recommend to the attention of farmers.

For the New England Farmer.

## THE GILLIFLOWER POTATO MYSTERY EXPLAINED.

*Necessity of Book Learning among Farmers.*

MR EDITOR—I noticed in a late number of the New England Farmer, an article in which a Mr Smiley stated that he had had a *Gilliflower* which produced knobs or bulbs, that made potatoes; and accompanying this statement was a request, that the phenomenon might be explained; and as the curious statement of Mr Smiley seems to have given rise to some excitement, I offer you the following solution of the mystery.

I have in my garden a number of flowering plants, which are known in this neighborhood by the name of *Tiger Lilies*. They are probably the *Lilium superbum* of the botanists. The habit of these plants is curious. They produce stately stalks, which grow to the height of from three to six feet, and on these stalks grow large and beautiful flowers; and the stalks not only produce flowers, but they are peculiar also for producing a multitude of small liliaceous, or coriaceous, dark brown bulbs. A number of these bulbs are now lying before me on the table.

These bulbs fall in great abundance around the large stalks on which they grow, and if they happen to be wholly or only partially covered with dirt, they take root and produce flowering stalks, while the root grows to a large liliaceous, or coriaceous bulb. Now I suppose that there are thousands of persons who do not know the difference between the *Lilium superbum* and a *Gilliflower*—and some of these persons would probably be disposed to consider *potato* to be a generic name for every kind of vegetable bulb or tuber, whether that bulb or tuber was liliaceous, alliaceous, coriaceous or otherwise; or whether it grew above ground, like the onion and garlic, or whether it grew below ground, like the *Dahlia* and the *convolvus Batus*.

Thus, then, Mr Editor, by supposing that Mr Smiley mistook the *Lilium superbum* for a *Gilliflower*, (and by the way I have just supposed that some persons might easily and honestly do this,) and by supposing that Mr S. also mistook the liliaceous bulb of the root of the *Lilium superbum* for a potato, we may not only account for the strange statement of Mr Smiley; but we may do it without charging him with intentional falsehood.

This explanation, however, leads us to make reflections like the following.

What sad mistakes a want of *book knowledge*, among farmers, is liable to produce!

The American editor of Sir Humphrey Davy's lectures on Agricultural Chemistry, says, (page 256, 2d American edition, 1819,) "there are 215 proper grasses which are capable of being cultivated in this climate." Now how can a farmer possibly identify any particular one of these grasses or any other plant, which is recommended to him, or which he wishes to cultivate? or how can he be sure not to mistake a *lily* for a *gilliflower*, without he has some knowledge of Botany?

How can a farmer *easily* inform himself of the nature of the subsoil, where he wishes to make improvements, dig wells, make roads, &c., or accommodate the different kinds of plants, unless he *knows something of geology*?

How can a farmer understand, how to take the greatest advantage of his manures, or how can he understand the best method of nourishing those plants, which are to produce his crops, unless he has some knowledge of Chemistry?

Most persons who manage even large estates, get their clear gains, and consequently their subsistence, from a small part of their possessions.—Now how can a farmer "count the cost" and be sure to gain by his business, so as to render his life easy, or even so as to avoid bankruptcy, by mismanaging his estate and his affairs, unless he ascertains the gain or loss produced by the management of each particular field and each particular crop? And how can he keep accounts, not only with his whole farm, but with each particular field, and each particular crop, so that he may know not only the whole amount of gain or loss, which the management of his *whole estate* occasions him, but may also understand and see how much each field, and each particular crop contributes to that gain or loss, unless he understands something of arithmetic and book-keeping?

He then, who wishes to raise the standard of agriculture amongst us, most not only encourage manual labor amongst us, but without the fear of making book farmers, he must encourage, also, the habit of carefully observing and recording the operations of nature, and he must encourage the cultivation of those sciences on which a knowledge of agriculture so very much depends.

I remain, very respectfully,

Your friend and humble servant,

A. M. H.

East Haddam, Conn., Dec. 8th, 1840.

For the N. E. Farmer.

## WATER FOR STOCK.

As a general thing, our farmers do not appear to be sufficiently impressed with the importance of furnishing their cattle with a constant supply of water during winter—a period usually of long continuance in our climate, and which from its severity, and the almost perpetual confinement of cattle to the barn or yard, requires the utmost sedulity and attention on the part of the farmer to retain them in "health and heart."

Domestic animals of all descriptions, require water much more frequently than those who are not critically familiar with their habits would be led to suppose. Even the sheep, which by our worthy forefathers, was supposed to be capable,

not only of existing without water, for an indefinite period, but to be so capacified by nature as to derive an actual advantage from its privation, has been ascertained to be no less benefited by a free access to water than is the ox or cow; and it is presumable that, in situations favorable to its attainment, the sheep would be a no less frequent visitor to the trough than either, and that it would derive advantages no less essential from the free indulgence of its bibaceous propensities, whether in the yard or pasture.

My own situation, the present season, has thus far been such as to enable me accurately to examine the habits, not only of the sheep, but of the ox, cow, horse, and the other domestic animals usually found upon the farm, and to test, by the ordeal of critical experience, the truth of the "*book farming theory*," which assigns the former a place among those quadrupeds in which nature has implanted a "propensity for the running brooks"—a propensity indeed, no less vehement in them than in their laboring companions of the farm, and which, whenever they are debarred the requisite facilities for its free and unrestricted gratification, is always a pregnant source of the most painful discomfort and disease.

It is true that the sheep will sometimes "winter well" in situations in which no water is to be had; and I am acquainted with some farmers who, adhering rigidly to the old theory, are in the habit of keeping their flocks in close and confined situations during the winter months, and supplying them only with *snow*. But this is bad policy, and is not only a most serious drawback upon the comfort and well being of its innocent victims, but an error involving the most deplorable consequences, oftentimes both to the owner and his flock. The numerous maladies to which the sheep is subject, during their confinement to the barn, and by which such vast multitudes of them are annually destroyed, are indubitably attributable, in a great measure, to the deteriorating influences of this habit. Thousands of these valuable animals are annually sacrificed in this way. The long privation which they are compelled to endure, emasculates and weakens the system by destroying the digestion, to which water is a most essential adjuvant, and prepares the way for those formidable diseases to which they are always more or less liable in the spring, and which when once seated, defy every effort at their removal and consummate their climax by a lingering and painful death.

There is also another serious disadvantage attending this practice: I allude to the difficult which is often experienced by most farmers, who thus manage their flocks, in raising lambs; the increase of the flock being usually weak and debilitated, and presenting none of the energy and healthfulness of aspect which characterizes the offspring of healthy and well fed dams. The almost inevitable consequence of this fatal predisposition to disease, is an early and premature death, or a brief and lingering continuance in a state of perpetual suffering from cold and hunger, the consequence of a lack of nourishment, and which inattention to the mothers has rendered it impossible for them, to furnish their physical weakness and debility, to supply.

More on this subject anon.

H. D. W.

Windham, Me., Dec. 29th, 1840.

It is easy to tell a good farmer by the appearance of his premises.

For the N. E. Farmer.

## TOOLS.

It is an old adage but a true one, that "he must indeed be a good workman who can afford to work with poor tools;" and in none of the various departments of productive industry, we opine, is the truth of this *dictum* more fully and frequently verified, than in that of farming.

To be compelled to labor with a poor tool, is, in our estimation, the *ne plus ultra*, the veritable *ultima thule* of rural misery. No man can be a good christian, a kind neighbor, or a placid, even-tempered parent, whose "*Ebenzer*," to adopt a vulgar but not inexpressive synonym, is perpetually chafed and stimulated to acts of rebellion, by the annoyance inseparable from the fate of being compelled to work with poor tools; nor is it possible for any one, of a benevolent and sympathetic temperament, to observe his grievous and incessant perplexities in the restless pursuit of his thorny and up-hill vocation, without feeling a just contempt for the indolence or parsimonious meanness which condemns him to the hapless condition of laboring with inadequate tools.

We are acquainted with a person who, for years past, has madly attempted to manage a not small farm with the assistance of a four-wheeled cart, an old harrow, and a broken plough. The only animal he "uses" is a borrowed horse, blind of one eye, and lame of three legs, and so reduced in flesh withal as not unfrequently to render his possession a subject of clamorous debate between his master and the crows. The legitimate consequence of this system of procedure is *poverty*—for although he is a "respectable citizen" in other points of view, no one is disposed to accommodate him by the loan of tools, or to extend to one who is "*sans* every thing," those kindly benefactions for which in his present situation, it would be madness to anticipate a return. With such a farmer, it is no wonder if the world sometimes "moves wrong," and the yoke of conubial life, instead of being, as the dreary ancients denominated it, a "yoke of gold," should sometimes sit upon the wearers with the crushing oppression of a yoke of lead.

For the New England Farmer.

## HOT BEDS.

MR EDITOR—Various experiments have been made in order to prepare the best hot bed. Some cultivators prefer plain horse manure; some mix it with leaves; some take leaves only.

Now, sir, being desirous of trying the leaves and having abundance, I wish to know the *best* method of preparing a hot-bed of *oak leaves*. Will you give directions in your next number, for I wish to start one in February. Can it be done with leaves only, or should manure be added? If you will give me some hints, or if some of your subscribers will give an article to the public through your paper, it would be a favor to many of your readers.

O. K.

☞ Any one of our friends would greatly oblige us by furnishing the information sought for in the article above. We extract the following paragraphs

from the "Young Gardener's Assistant," which may be acceptable to many of our readers, though they do not meet the inquiry of our correspondent.—Ep.

"Some gardeners make their beds on the level ground, but it is always safest to make them in pits from eighteen inches to two feet deep. In order to do this, the pits should be dug in autumn, or a heap of dung may be deposited on the ground intended for the beds before the frost sets in, and good earth may be obtained from the pits without any difficulty.

The frames should be made of good sound planks—the back plank may be two feet wide, and the end ones may be so sloped as to make a fifteen inch plank do for the front. A frame calculated for four sashes of three feet in width by six in length, as above described, should be nearly thirteen feet long, and about six broad at the top.

The frame being set over the pit, and properly fastened, the fresh dung should be spread regularly in the pit to the depth of twenty to twenty-four inches; if the dung be in a good heating condition, cover it with six or eight inches deep of mould, then lay on the sashes, and protect the beds from the inclemency of the weather. In two or three days the rank steam may pass off; it will then be necessary to stir the mould before the seed be sown, to prevent the growth of young weeds that may be germinating; then sow the seed either in shallow drills or broadcast, as equally as possible, reserving a small quantity of the warm mould to be sown or sifted over the seeds."

"In preparing dung or other heating materials for hot-beds, or forcing pits, let it be kept secure from heavy falls of snow or rain, and frequently turned over preparatory to its being made into a bed.

Previous to making hot-beds, select a situation that is well protected by a close fence or wall, and not in any way connected with any building calculated to harbor rats, mice, moles, &c., which are very apt to take up their abode in warm dung, to the great injury and sometimes the destruction of the beds. It is necessary that the foundation for the beds be drily situated, and not liable to be inundated with water from melted snow."

From the Farmer's Cabinet.

## MANURE.

*Enrich the Soil and Prosperity follows.*

MR EDITOR—Manure is the capital of the farmer, and without it little can be done in the farming line to profit. Every one ought, therefore, to be on the alert to increase the quantity, by every means in his power, for there is nothing that compounds interest like manure. If any one disputes this, let him make a fair experiment and see if the result don't prove its truth. Take an acre of ground and give it a good dose, and compare it with an adjoining acre, previously in a similar condition, and then there will be no mistake. Put in the bottom of the dung-yard some absorbent material to take up the fluids—occasionally spread over the whole surface a layer of earth, sods from the road-side or a ditch bank, and bring in all the weeds, potato stalks, leaves, spent ashes, the manure from the poultry roost, and every other offal material, either animal or vegetable, that can be collected together. Every little helps, and of little

things great ones are composed. The manure heap is the foundation of all good farming, and those who do not attend to this most essential matter, will fail in proportion to their neglect in all the operations of the farm. It is no small matter to raise 40 to 60 bushels of corn to the acre, instead of 20 or 25, or other crops in the same proportion, the labor being the same. I have long noticed that thriving farmers go on progressively increasing the quantity of manure annually, and those who are going down hill, are generally preceded in their downward progress by a gradual collapse of the dung-hill. Keep up your manure heap, and, as if by sympathetic action, your purse will swell amazingly. Manure begets grain and grass, and grain and grass beget more manure; and so on to the end of the chapter of prosperity. No manure, but little grain or grass, and little grain and grass tends to less and less, till the county poor-house seems as if it had seated itself next neighbor to our bare fields.

O.

From the same.

## THE CABINET.

*Read, and Learn to be Wise.*

MR EDITOR—Having been a subscriber for the Farmers' Cabinet from the beginning, I think it right to inform you that I am delighted with your labors. The magnificent style in which the late numbers have been adorned with the portraits of some of the finest animals in the country, is above all praise. You give us too much for our money. Some single numbers are worth a whole year's subscription. From what I have said, however, you are not to suppose I wish you to relax in your exertions, but to express a hope that the farmers every where will patronise a work which is so well worthy their attention. Only think of the good done by it to the young people in our families, girls as well as boys, for they all read it with avidity, and are doubtless made wiser and better by your labors. The only way in which our agriculture is to be improved is by instructing the rising generation in the principles as well as the practice of the art.

Old folks are apt to think they know enough already, although they may actually be very ignorant, but the young ones are the stuff that will take a new impression most easily, and there the result of your labors will be most conspicuous. The day is now gone by, never to return again, I trust, when farmers thought it useless to record their own experience or to read the experience of others.

We are rapidly becoming a thinking people, and people who reason and think, like to be informed of the reasonings and thoughts of others in the line of their profession.

Doctors and lawyers have their books, detailing the practice and opinions and judgments of those who have preceded them, as well as of their contemporaries; mechanics and artists have their books, furnishing all the current improvements in their respective occupations; and why should not farmers, who furnish subsistence for the whole of them, have their books too? Go ahead, tell us all about horticulture and domestic economy, and the principles which govern them, and though some of us perhaps may be conceited or ignorant enough to suppose we want no further instruction, yet I am sure your labors will not be lost on a people who are daily increasing in intelligence, and are annually adding to their wealth.

B. F.

**NEW ENGLAND FARMER,  
AND HORTICULTURAL REGISTER.**

BOSTON, WEDNESDAY, JAN. 6, 1841.

**TO THE AGRICULTURAL PUBLIC.**

The proprietors and publishers of the New England Farmer trust that the arrangement which makes Mr Putnam editor, will contribute much to the usefulness of their paper. During the last two or three years, while there has been no one whose time has been mainly devoted to the preparation of matter for these pages, it could not be otherwise than that the work should fall below the rank it might take when conducted by one who made its care his chief occupation. The work is now to be supplied with that important appendage, a *head*. Mr P., previously a stranger to us, made himself favorably known by an address before the Essex Agricultural Society in 1839, and by the part he took in the agricultural meetings at the State House last winter. The character of his performances on these occasions bespoke his fitness for the place we were anxious to fill as soon as the proper man could be found. Without any knowledge of his circumstances or wishes, we made application to him, and, though for a time his engagements prevented his giving us any aid, we are happy now in securing his services. The opinions expressed to us since we announced the arrangement, confirm the expectation that he will meet our wants and the wants of our readers. We know not where else the man can be found who with Mr P.'s education, talents and character, has made himself so practically acquainted with common farming labors and operations; who for month after month and year after year, has used the axe, the dung-fork, the plough and the scythe, for the purpose of regaining the health which had been lost in the discharge of professional duties. A mind, disciplined as his had been, by previous study, would naturally familiarize itself with the principles of the business about which his hands were employed, and in which he took pleasure. His previous professional labors have given him that practice with the pen which fits him well to communicate the information he has been acquiring. We believe, too, that he possesses a large share of *common sense*, an important qualification in one who is to write for common men. We give up the paper entirely to his direction; and we ask our friends to aid him generously by contributions and subscriptions. It is very desirable that our list of subscribers should be enlarged, and we sincerely hope that our friends will aid us in this matter. Every addition to the list contributes largely to Mr P.'s emolument and increases both his means and his obligations to render the paper more valuable. With this introduction we leave him to speak for himself.

J. B.

Exchange papers are respectfully requested to copy.

**INTRODUCTORY.**

Mr Breck recently introduced us to the readers of the New England Farmer as its future editor. The time has come when we must commence our labors. The duties assumed will task our powers to the full extent of their reach. To sustain the high character of this paper, and make it meet the wants of our agriculturists, may require greater resources than are at our command. We should have shrunk from seeking the place, but when the proprietors sought us to fill it, our circumstances and tastes both inclined us to the trial.

When, last summer, we hung up the scythe for a few moments to read the letter which invited us here, the question instantly arose, whether we were competent to

succeed the able and discreet Fessenden and the inquisitive and laborious Colman? We answered *no*. We still say *no*. But we will endeavor to do what we can. Excuse us, reader, from promising more.

To unfold intelligibly the science, and to give wise rules for the art of husbandry, require a rare combination of attainments. Knowledge of agricultural chemistry, familiar acquaintance with farming operations, an eye observant of the forms and operations of nature, a sound and discriminating judgment, eagerness to learn something new, and a watchful care not to prefer the *new* to whatever in the *old is better*;—these, together with a concise, perspicuous, and forcible style of composition are all desirable in a writer for practical farmers. We fall below our standard, but hope to rise towards it. Buel and Fessenden furnish streams of light and wisdom remarkable for purity and worth. Few among their survivors may expect to rival them in the perspicuity and soundness of their teachings. We hope to profit by their example.

**Our Course.** The opinion expressed by Mr Colman in the last Farmer, that the paper would be rendered more popular and have its circulation increased by admitting to its columns more miscellaneous matter, perhaps may be well founded. It is true, that for the last few years, the list of subscribers has been diminishing; and other papers, treating upon a greater variety of topics, have perhaps supplanted this in many instances. But we are not satisfied that the cause lies in a limitation of the topics discussed. Other papers, partly agricultural, have been multiplying in number and have been industriously carried directly to the doors of our farmers, while no efforts have been made to obtain new subscribers for this one. Reports have been in circulation that this was the aristocratic paper, designed for a class of readers more scientific and more at leisure than the laboring man. Whether the reports have been well founded or not, there shall be no ground in future for a charge that the editor overlooks the wants or transcends the intelligence of the common farmer. The blood in his veins comes through a line of ancestors, who, successively, have earned a subsistence by their own toil, on the same fields, for precisely two hundred years. He belongs to the farming class by birth, by early associations, by recent toils, and by his tastes. His labors will be devoted to them. And what do they want? It is believed that there is a large class in New England, who desire to have this pioneer of New England agricultural papers, one that shall treat concisely, prudently, and constantly upon the common branches of ordinary husbandry; which shall be *worth preserving and binding* as a reference book; which shall contain but little matter foreign to their own pursuits; which shall furnish them from week to week valuable instruction; which shall help them to understand better their own business and interests; which shall lead them to *think and inquire*; which shall improve their own minds and the minds of their children: No reasonable effort on our part shall be spared to fit our pages for meeting this want; and if we succeed, the good sense of our yeomanry will lead them to reward us more liberally in the end, for *instructing* than they would for *idly entertaining* them.

It would be mortifying to have this oldest of New England agricultural journals decline in our hands; and we must thus early bespeak the kind and constant aid and indulgence of its friends. Our own deficiencies, we trust, will be supplied by contributions from those who have heretofore enriched these columns. And we invite them all, whether personally known to us or not, to send in the results of their experience, their inferences, opinions and inquiries. Others also—*many others*,

we hope, will come to our assistance; and we invite the *common farmer*, wherever he may belong, to send us the fruits of his experience, and to propound his inquiries. If unwilling to write, he is invited to call upon us at Mr Breck's warehouse, where we shall be always happy to see him and to exchange opinions. Let no one keep away because he is a stranger, or because he wears a striped frock and cow-hide boots; let him come as a farmer, and he shall be welcome. As to the frock and boots—*such boots*—we have worn them enough to know that no garments are more comfortable and none more respectable. Common farmers, these pages should be devoted to your interests, and unless you make known your wants, they cannot well be met. Give information of your success, your failures, your knowledge, and your doubts. The editor's object will be to furnish you with the best information and advice at his command.

The composition and application of manures, the growing of grasses, grains and roots, the management of the dairy, the breeds and management of cattle, sheep and swine, are the important matters to the mass of our husbandmen; and to these, *primarily*, will our pages be devoted. Beet sugar and silk, as yet, in our vicinity, receive too little attention to render them fit topics for extended discussion in columns prepared for the benefit of New England tillers of the soil. Fruits, implements of husbandry, vines, and all the various articles of common cultivation and use among the great bulk of farmers, may claim attention in our columns.

At our first survey of the editorial *farm*, it seems to us vaster than we can manage; parts must be neglected; we shall fail to acquire the reputation of a thorough husbandman. Some will find one fault and some another. By the wool grower we shall be called an indifferent shepherd, knowing but little about the fleecy tribes and devoting too little of our time to their habits and wants. Those who look to the dairy as their chief source of income, will accuse us of inattention to the cow: around the city of notions and elsewhere, conflicting notions in relation to our doings will prevail. Some will think that we do too little—others too much, upon our patch of roots, our corn, our wheat, or our grass lands. Some will think we plough too deep, others too shallow. One will laugh at us for planting some *small* corn that ripens early, and another for having a large kind that the frost *may* bite. Good friends, we cannot please you all, and shall best consult your good and our own by trying to please ourselves. Wiser than Mr Colman deems himself, we have sold none of our liberty of speech: no one has proposed to purchase it: we shall speak our mind "without let or abatement," but it will be mostly upon *agriculture*, and not upon disputed questions in morals, politics and religion.

ALLEN PUTNAM.

**MR COLMAN'S ADDRESS.**

We have just received an address by our Agricultural Commissioner, before "Connecticut Agricultural Society, in 1840"—but have yet had no time to examine its pages.

**HINT TO FARMERS IN THE LEGISLATURE.**

During the last winter, many of our practical agriculturists felt a want of opportunity for more free conversation, and thorough questioning of each other, than was afforded in the meetings called by the Agricultural Commissioner. May it not be well to form an Agricultural Society among the members of the Legislature for holding such meetings, as practical men shall deem suited to their wants? The Editor is ready to join with others in such an association and will esteem it a favor if others will give him their opinions. The meetings

here suggested should not and would not interfere with any which might be called by Mr Colman.

Members of the Legislature we invite to call upon us at No. 51 and 52 North Market St.

**NEW ENGLAND FARMER.**

Rev H Colman, who has hitherto contributed largely to the columns of the New England Farmer finding his labors as Agricultural Commissioner of Massachusetts too onerous to allow him time to write for that paper, Mr Breck, the publisher, has engaged Rev. ALLEN PUTNAM to be its regular Editor from and after the 1st of the present month. Cordially do we extend the right hand of fellowship to brother Putnam as an Agricultural Editor, and desire for him much success in his new field of labor. Mr P. was formerly a Unitarian clergyman in Augusta, Me. and it was our pleasure there to enjoy a personal acquaintance with him.—Since he left Augusta and the pastoral office, he has been a practical farmer in Danvers, Mass. We think him well qualified to cultivate the soil of earth in the soil of mind. Some how or other, these clergymen, both in England and America, are excellent friends of farmers, and of the farming interest? And why should they not be? That is the purest and most virtuous employment of life, and brings men nearer, than any other, to their God.—*Me. Cultivator.*

**NEW EDITOR.**—Rev. Allen Putnam, of Danvers, has taken charge of the Editorial department of the New England Farmer. We wish him success in the enterprise. Mr Putnam brings with him the requisites of a good Editor, and we have no doubt will do honor to the paper, and justice to its patrons.—*Maine Farmer.*

**Massachusetts Horticultural Society.**  
EXHIBITION OF FRUIT.

Saturday, Dec. 26, 1840.

Beurre d'Arcmberg Pears—fine—from S. Downer, Esq. Pears without name from J. L. Russell, Chelmsford Pears without name, from Dr. E. Wight, Boston. Specimens of the Marigold Apple, grown by Wm C. Chapin, Esq., Providence, R. I., were exhibited, and pronounced by the Committee very fine. They are thus described in Kenrick's New American Orchardist—"Very handsome, of medium size; striped with red on a yellow ground; the flesh yellow, rich, saccharine, subacid and fine flavored. The fruit keeps till June. The trees do not suddenly come into bearing, but afterwards bear good crops." For the Committee,  
**J. L. L. F. WARREN.**

**THERMOMETRICAL.**

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northerly exposure, week ending Jan. 4.

**BRIGHTON MARKET. — MONDAY, JAN. 4, 1840.**  
Reported for the New England Farmer.

At Market 290 Beef Cattle, 60 Stores, 1600 Sheep and 50 Swine.

**Prices.**—Beef Cattle—Last weeks prices were fully sustained. We quote first quality \$5 75 a 6 00. Second quality, \$5 25 a 5 75. Third quality, \$4 25 a \$5 00.

Sheep—Dull. Lots \$1 50, \$1 75, \$1 92. Wethers \$3 25, \$3 50 and \$4 00.

Swine.—One lot at about 4c. At retail, 5 and 6.

**LAMP OIL—PURE SPERM OIL.**

E. T. HASTINGS & CO. No. 101 State St. keep constantly for sale, Winter, Spring and Fall Sperm Oil, bleached and unbleached; which they warrant to be of the best quality and to burn without crusting.

Oil Canisters of various sizes.  
Boston, Jan. 1, 1841. isly

**GRINDSTONES.**

An extensive assortment of Water and Hand Grindstones constantly on hand and for sale by AMMI C. LOMBARD & CO. 13 Lewis's Wharf. isly. Nov. 17.

**BACHELDERS' PATENT PLANTING MACHINE**

This Machine, recently invented by L. & S. H. BACHELDER, of Haverhill N. H. is one of the most convenient and labor saving implements ever introduced to the notice of the farmer. It is simple in its construction, and certain and regular in its operation. It is calculated to plant all kinds of seed usually planted in hills or drills.

This Machine is constructed on principles altogether different from all others of similar purpose. It performs the operation of planting without opening a furrow, thereby dispensing with covers, that are continually liable to clog, and get out of order. It simply raises the soil a little, and at the same time drops the seed at any distance desired, when the soil falls back to its original place and is immediately followed by a moveable gauge, that leaves the soil to any depth over the seed which the operator chooses; it also removes all small stones and sods from the ground where the seed is deposited.

This Machine has been in operation during the past season and thoroughly tested by practical Farmers and Mechanics in Massachusetts and New Hampshire, and is pronounced by them a complete and useful Machine, and is allowed by all who have seen it, to be superior to every other implement of the kind now in use in the United States. It operates equally well on wet or dry ground and is warranted to work well on any ground that can be furrowed with the common plough.

Orders will be received by L. & S. H. BACHELDER, Haverhill, N. H., or by the subscriber at Haverhill, Mass., their General Agent for the United States, for the Planter, or a right to manufacture and dispose of them. Any communication addressed to either will receive attention.  
**T. J. GOODRICH.**

Deerfield, N. Y. May 27, 1840.

**TO THE PUBLIC.**—We whose names are hereunto annexed, certify that we have examined Bachelder's Patent Planting Machine, and seen it operate on several of our farms in Deerfield, Oneida County; the seed planted thereby seems well planted, wherever the ground is in proper order, and is now coming up; and we believe the Machine fully answers the description given of it in the handbills describing and recommending it, and heartily concur in said recommendation, believing as we do that it will prove a valuable labor-saving Machine, and on good land will soon supersede the labor of planting by hand in the old and common method.

**GREEN'S PATENT STRAW CUTTER.**

**JOSEPH BRECK & CO.** at the New England Agricultural Warehouse and Seed Store Nos. 51 and 52 North Market Street, have for sale, Green's Patent Straw, Hay and Stalk Cutter, operating on a mechanical principle not before applied to any implement for this purpose. The most prominent effects of this application, and some of the consequent peculiarities of the machine are:

1. So great a reduction of the quantum of power requisite to use it, that the strength of a half grown boy is sufficient to work it efficiently.
2. With even this moderate power, it easily cuts two bushels a minute, which is full twice as fast as has been claimed by any other machine even when worked by horse or steam power.
3. The knives, owing to the peculiar manner in which they cut, require sharpening less often than those of any other straw cutter.
4. The machine is simple in its construction, made and put together very strongly. It is therefore not so liable as the complicated machines in general use to get out of order.

**WHOLESALE PRICES CURRENT.**

## MISCELLANEOUS.

The following excellent article is from the Vermont Watchman and State Journal. It abounds in judicious advice to both mothers and daughters. Happy would it be for our land, aye, for our race, were the true ends of female education understood and kept constantly in view. The instances in which men of sense and worth become dupes, are only the exceptions, not the general rule. So that if there be mothers who aim only at getting their daughters well married—or daughters whose chief object is to get well married—they defeat their own purposes just so far as practical acquaintance with household labors and vigilant discipline of the heart are sacrificed to the spurious gentility of parlor listlessness and free participation in heart-corrupting gossip. The wise ones of the other sex are seldom caught by folly; the foolish are not worth catching. Habits of active industry, of neatness and frugality; together with good sense, solid intellectual attainments, charity in judging others, and unflinching kindness, are woman's befitting ornaments in all ranks of society. Decked in these, she will make her appropriate and happy influence felt both at the fire side and in society. Wearing these, changes of fortune can neither make nor ruin the sources of her highest enjoyments. When educated for usefulness she is educated for happiness and respectability.—En.

## BROTHER JONATHAN'S WIFE'S ADVICE TO HER DAUGHTER ON THE DAY OF HER MARRIAGE.

Now, Polly, as you are about to leave us, a few words seem appropriate to the occasion. Although I regret the separation, yet I am pleased that your prospects are good. You must not think that all before you are Elysian fields. Toil, care and trouble are the companions of frail human nature. Old connexions will be dissolved by distance, by time and death. New ones are formed. Every thing pertaining to this life is on the change.

A well cultivated mind united with a pleasant, easy disposition, is the greatest accomplishment in a lady. I have endeavored from the first to the present moment, to bring you up in such a manner as to form you for future usefulness in society.—Woman was never made merely to see and be seen; but to fill an important space in the great chain in nature, planned and formed by the Almighty Parent of the universe. You have been educated in habits of industry, frugality, economy and neatness, and in these you have not disappointed me.

It is for the man to provide, and for the wife to care and see that every thing within her circle of movement, is done in order and season; therefore let method and order be considered important. A place for every thing and every thing in its time, are good family mottos.

A thorough knowledge of every kind of business appropriate to the kitchen, is indispensable, for without such knowledge a lady is incapable of the management of her own business, and is liable to imposition by her servants every day. But in those things you have been instructed.

You will be mistress of your own house, and observe the rules in which you have been educated. You will endeavor above all things to make your fireside the most agreeable place for the man of your choice. Pleasantry and a happy disposition will ever be considered necessary to this important end—but a foolish fondness is disgusting to all.

Let reason and common sense ever guide—these aided by a pleasant, friendly disposition, render life happy; and without these it is not desirable. Remember your cousin Eliza. She married with the highest prospects; but from a petulant, peevish, and complaining disposition, and negligence, every thing went wrong; and her home became a place of disquietude to her husband. To avoid this, he sought a place to pass away vacant time, where, associated with those more wicked than himself, he contracted the habit of intemperance, and all was lost—and poor Eliza was thrown upon the charity of her friends.

Be pleasant and obliging to your neighbors—ready to grant assistance when necessary. Be careful of their characters, and do not readily believe an ill report. Throw the mantle of charity over their failings, knowing that we are human and liable to err. Abhor a tattler, and give no place to the reports of such. However strong a provocation may be, never contend for the last word.

Let your bible show that it is used. Give no place to novels in your library. Let history, biography and travels be read, when time and opportunity admit—without interfering with the important duties of the family. Be not ignorant of the events of the time being—therefore read some journal of the day.

As to friends who may call on you—never be confused or in a hurry; treat them with hospitality and politeness, and endeavor to make them happy in their own way. Never tease them to do this or that which they do not prefer. True politeness consists in an easy and pleasant deportment, and making our friends easy, and permitting them to enjoy themselves in that way which is most pleasing to them.

Speak with deliberation. The other sex tell us that “the female tongue is never tired;” be it so: let it be regulated by reason.

At the close of the week, if possible, let all your work, for the time, be done; so that on Sunday you may improve your time in such a manner as will be appropriate to the day, and never, extraordinary exceptions, let your seat be vacant at church.

As to dress—decency is becoming to all, but extravagance opens a door to want; follow the fashion of the day so far as decency and good sense will approve, but avoid singularity. Be not troubled for what you have not; be thankful for, and take care of what you have. A leghorn hat loaded with flowers, will not cure the head ache, nor a gold watch prevent the consumption.

GEORGIA SILK.—The Macon Telegraph says—“At a late term of the Inferior Court of this county, one of the presiding judges appeared on the bench with silk stockings, silk handkerchief, &c., made by his own family or some of his friends, of the production of their own cocooneries. The next day another of the judges, A. E. Ernest, Esq., appeared in a full suit of silk, (including coat, vest, pantaloons, stockings, pocket handkerchief and stock,) produced and manufactured wholly and entirely in his own family. Judge E. is of opinion that domestic silk will, before many years, be found the most economical article for negro clothing as well as ladies and gentlemen's dresses.”

FLIGHT OF BIRDS.—A crow will fly at the rate of 25 miles an hour, a hawk 40, and an eagle 80.

## POUDRETTE.

The subscribers reside in the state of New Jersey, many of us in the vicinity of the works erected by Anthony Dey, of the city of New York, on the Hackensack river, in New Jersey, for the manufactory of Urate and Poudrette, called “The Lodi Manufacturing Company.” We have used the poudrette on the Spring Crops this year, 1846. We find it a valuable manure, superior to any other kind that we have ever used, and considering the facility of its transportation to the field, the small quantity required in the application to the crops, the quickness of its operation on vegetable matter, and the ease with which it can be applied.—all tend to recommend its use to the farmer and gardener as the cheapest and best manure, and we recommend it accordingly.

Those of us who have applied it to corn and potatoes think that it ripens those vegetables quicker than any other manure in several weeks.

Dated New Jersey, October, 1846.

Jacob D. Van Winkle.	P. F. Welsh
John J. Newkirk.	G. C. Van Riper.
John Tise.	George Tise.
Daniel Van Riper.	William Wood
George Demott.	John Duryee.
Henry Dayton.	George Newkirk.
Josiah Hornblower.	Garret Newkirk.
Corns. Van Winkle.	Daniel Ireland.

Shares in the above company are \$100 each, and may be had by applying to Anthony Dey No. 73 Cedar St. New York.—The owner will receive 20 per cent. per annum, payable in money, or 50 bushels of Poudrette. The price to those who buy Poudrette is 40 cents a bushel. It costs the Stockholders 12 cents a bushel. One cent's worth, that is, 20 Hills, will manure 20 hills of corn, and the like quantity 15 hills of Potatoes.

Newspapers friendly to agriculture will confer a favor on the Farmers and Gardeners by publishing the above.  
Dec. 22.

## BONE MANURE.

The subscriber informs his friends and the public, that after ten years experience, he is fully convinced that ground bones form the most powerful stimulant that can be applied to the earth as a manure.

Orders for Bone Manure or Oyster Shell Lime, left at the Bone Mill, near Tremont road, in Roxbury, at the New England Agricultural Warehouse and Seed Store, No 52 North Market Street, or through the Post Office will meet with prompt attention.

March 4, 1846.

NAHUM WARD.

## POUDRETTE.

This valuable manure may be had on application to the subscriber, at the office of the “New York Poudrette Company,” No 120 Nassau street, New York. It is in-odorless, and may be transported in barrels, on board of any vessel or steamboat, without offence—and it will be found an exceedingly valuable article as a fertilizer on any soil, and for any crops; but more especially for gardens and flowers, as there are no foul seeds in it. Poudrette has been used for three seasons with entire success on Long Island, by many practical farmers, as may be ascertained from letters and statements made by them, and published at this office in a pamphlet containing also the “act of incorporation,” granted to the Company by the Legislature of the State of New York; and other facts in relation to the subject. Price 35 cents per bushel. Barrels cost 25 cents each, and hold 4 bushels. Persons wishing to make an experiment on a small scale can obtain one barrel by enclosing a two dollar current bank bill—or three barrels by enclosing five dollars, free of postage. On receipt of the money the article will be put up and forwarded as directed.

\* Price of shares, one hundred dollars—which entitles the holder to one hundred bushels of poudrette annually, during the term of the charter; fifty bushels in time for spring use, and fifty bushels in time for fall use. Shares taken soon, will be entitled to the spring dividend—and, if desired for experiment, a few bushels may be had this fall.

All orders, or applications in relation to the business, must be made to the subscriber, 120 Nassau street, New York.  
D. K. MINOR.

I wish it distinctly understood that the “New York Poudrette Company” is in no way connected with the “Lodi Manufacturing Company,” of which Anthony Dey and Peter Barthelémy are, or were, the managers.  
Dec. 9, 1846. 3m. D. K. M.

## THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at \$3 per annum payable at the end of the year—but those who pay within sixty days from the time of subscribing are entitled to a deduction of 50 cents.

TUTTLE, DENNETT AND CHISHOLM, PRINTERS  
17 SCHOOL STREET, BOSTON

### N. E. FARMER.

The following from the Albany Cultivator, contains good instruction and advice, which are not less timely in January than in December, the month for which the article was written.

#### WORK FOR THE MONTH.

*Care of Stock in Winter.*—From December until April, in our northern climate, and in a greater or less degree in more southern ones, the great business of the farmer consists in the care of his domestic animals. One of the great sources of loss to the farmer is the wretched condition in which his animals are frequently kept: their wool, their milk, and their ability to labor being in a great measure determined by their mode of keeping during the winter. Without shelter, without water, without food, or at best an irregular and partial supply, it must be expected that disease will invade his flocks and herds, and occasion losses that months of hard labor will be required to counterbalance.

At the commencement of winter, the farmer should carefully examine the condition of all his animals; ascertain whether any are unwell, weak, low in flesh, and the cause. Such animals require particular attention. One diseased animal may infect a hundred if brought into close contact with them; a weak, poor animal will fare worse with a number than alone, and the chances of getting through the winter are proportionably abridged; and all such must have good care and attention, or there will be a total loss. If there is one truth respecting animals more deserving of remembrance than another, it is that the animal entering the winter months in high condition, is already half wintered; that is, the care and food required to bring him out well and hearty in the spring, will not be one half as much as will be required by the one that commences winter, spring poor. A fat, strong animal, will be warm and comfortable, where a poor, weak one can hardly live, and the hearty vigorous one will digest and assimilate food which the weak one would scarcely taste. All weak and sickly animals at any season of the year, and particularly in the winter, should be kept by themselves, and receive the best care, and the best keeping possible.

Shelter for animals is a point too often neglected by farmers. Their sheep or cattle are left to find the warm side of a stack or fence, during our winter storms of snow or rain as they best can; and when the former die off by the dozen in March, or his cows are "on the lift" for a month or two in the spring, the owner affects to wonder at the cause, or why his neighbor who has good sheds is not as unlucky as himself. Domestic animals must have a shelter; it is as necessary for them as it is for man, and one may as well talk of comfort without it as the other. Few things are more trying to the men who has a soul, than to see a flock of sheep crouching in a corner of the fence half buried in snow; a few lean cows, their feet so drawn together by cold and hunger that all might stand in

a half bushel; half a dozen swine of the alligator breed, squealing, and their noses imploringly turned to the place where the trough should be; and the same air of discomfort and misery pervading every thing on the premises. Where animals are kept in this way we instinctively expect to find the windows of the house stuffed with cloaks and old hats, and the owner at the fire-side of the nearest tavern or grogshop, and rarely will such expectation be disappointed. It is very true much less attention was paid to the shelter of animals than now, and it is equally true that the difference in the mode of keeping was not greater than that existing in the wool, size, maturity and value of the respective animals.

Water is another essential thing in the winter management of animals, but it is a thing more frequently neglected than almost any other matter connected with their comfort. Cattle are often allowed during the severest storms, to go half a mile to drink, and require a good feed and an hour in a warm stable to counteract the effects of the labor of wallowing through the snow. In addition to this, their drink is frequently found in a slough, and the animal is covered to the knees in mud, which is left to freeze, stiffen the legs, and by retarding the circulation cause their freezing. It is no disadvantage to cattle to go a suitable distance to water, but rather a benefit, as promoting circulation in the feet, and thus preventing diseases of the extremities; but the place of resort should be free from mud, and room for the animals to approach without crowding or fighting. Sheep are almost universally the victims of neglect in respect to water; while, although they can live without it, water is as essential to their comfort, and used by them as constantly as it is by cattle. There are few farms on which, with a very little expense, plenty of water may not be had sufficiently near the barn for all the purposes of stock; and where buildings are to be erected, particular reference should be had to this point.

Animals should be salted in the winter with the greatest attention and regularity. Farmers are too careless about this in summer, and are apt to neglect it altogether in winter—a course which requires reformation at once. It is necessary for their health, gives an appetite, and summer or winter they should always have access to salt. Where a farmer has no sheds or troughs for salting, the best way is to make a strong brine and sprinkle it over the hay, straw or other fodder they are to receive. Such food will be eaten more cleanly, and there will be no waste of the salt.

Regularity in foddering or feeding all animals, is very necessary. Experience has shown that a given quantity of food will keep an animal in much better condition when fed to them at regular hours, than when given to them without order and at hazard. In the former case the animal in the intervals of feeding is quiet; he has taken his meals and is expecting nothing more until the stated hour arrives, for all animals soon acquire the habit of computing time quite accurately; in the latter case he is continually restless and uneasy—bleating,

bellowing, or squealing, and wasting what nourishment he receives, in expectations and efforts to obtain more. Feed your cattle regularly then, whatever may be the kind of food. This half starving animals, feeding them as it suits your convenience, keeping them without salt or water, and thinking they can get along without shelter, is bad policy, and should be repudiated at once by every man who would be merciful to his beast, or find in his pocket satisfactory evidence that keeping stock is not a losing business.

*Preparation of Fire Wood.*—Another thing to be attended to in the winter is the getting of wood for the year. This work must not be put off till the last of the season, since if this is the case, the farmer has too often the pleasure of drawing his wood a *jug* at a time, and finding when he comes to cut it, (perhaps when he should be haying or reaping,) that it is so filled with gravel, that his axe will require grinding after each operation. The wood-house must be filled in the winter for the next season's use, that green wood and smoke, and the sour looks of the good woman, and the delay incident to bad wood and worse fires may be avoided. Where a saving of fuel is desirable, and this is decidedly the case with most farmers in this country, it is better to use the saw in preference to the axe as far as is practicable. But where the axe is used, care should be taken to gather up the chips if the wood is cut in the wood lot instead of the yard, as we have found by experience that a chopper in cutting up three cords of four feet wood, will make a full wagon load of chips, which for many purposes are the most valuable part of the wood, and too frequently now wholly lost for the use of fuel.

Where there is no wood-house the fuel should be drawn, split, and closely piled in such a way that a roof of boards may be placed over it to protect the wood from the weather while seasoning, and after it is dried. The difference between protected wood and that exposed, is nearly as great as that between wood made from green trees and from dead ones. The more hard, heavy and sound fire wood is, the better it will be when dried, and the least decay or exposure to the elements after cutting, is prejudicial. Some have contended that part of green wood is preferable to having it wholly dry. This is a decided mistake; as the experiments of Count Rumford proved that the difference in the heat given out, was precisely equal to that required to evaporate the same quantity of water as was contained in the green wood.

*Improvement of the Mind.*—And now, when your animals and every thing within doors is well and snugly cared for, is the time during the winter evenings, and days when the storm confines you to your homes, to store the mind with useful knowledge, and avail yourself of the means of educating and schooling the man as well as the child, which happily are within the reach of every American citizen. Books, magazines, papers on all subjects and in profusion exist; New York and Massachusetts have placed excellent collections within the

reach of every one; and the whole genius of our institutions, the history of our most distinguished men, and the undisputed advantages of knowledge, invite to a perusal. The demand is made upon the farmer as well as others, and none can be more interested in the acquisition than he. The successful prosecution of his business; the duty owed to himself and his country; the necessity of intelligence to the continuance of our institutions; all require and force upon the farmer the propriety of employing every leisure hour in strengthening and improving the mind.

There are many who seem to suppose that where the man or woman has learned to read and write, or mastered perfectly the rudiments of education, the work is done, and he has nothing more to think of in the way of learning. This is a serious mistake; and it is as fatal to the liberally educated, and as common to them, as to him whose learning has been gained at the district school. When the boy or the man leaves the school or the college, they are not educated, however great may have been their acquirements. The means only have been gained of obtaining an education, and without their continued use and unwearied application, a man may live many years very learned, and die at last little better than a fool. It is this education of the mind, the turning of knowledge to practical uses, which has marked the rise of the greatest men in this or any other country. Read, then, acquire knowledge, use it faithfully, and be an honor to your country. On the use you make of your winters much is depending, and the work of educating the mind is one that cannot be neglected with impunity.

As every farmer should keep a record of his farming operations, the account of his receipts and expenditures, and the manner in which his course of cropping has been conducted, the close of the year or the winter forms an excellent time for examining it carefully, and correcting any errors in practice that may be discovered. Especially look over your list of purchases (it is to be hoped you did not run in debt for any thing,) and see whether any useless articles were purchased—a course to be strictly guarded against in future. Never buy a thing you do not want, however cheap it may be, for if this is done, you will soon find yourself unable to obtain the articles you need. The Farmer's Book is an essential part of every farming establishment, useful in many respects, and by no means to be overlooked. One half of the failures and mishaps of life, arise from a neglect of the past and the lessons it teaches. It is the part of the wise to profit by these, to know and shun past errors in a future course; and to do this, such a record is indispensable. Years are the monuments that mark our course; their lapse should show the lessons each one must have taught, have not been in vain.

From the Spirit of the Age.

#### OCCUPATIONS.

There is not a more foolish notion afloat in the world, than the one that it is the *occupation* that gives character to the man. One occupation, as the means of 'getting a living,' as the phrase goes, is precisely as high and creditable as another, provided that it be honorable, and in accordance with the laws of God and man. The man who holds the plough, hammers his iron, or drives his peg, to

support himself and his family, with the necessaries and comforts of life, is not a whit below the one who measures tape behind the counter, mystifies the law at the bar, or presides at the councils of a nation. There is a vulgar and most pernicious feeling abroad in the community on this subject. Fathers must educate their sons for one of what is called 'the learned professions.' Mothers, must marry their daughters, to a lawyer, a doctor, a clergyman, or a merchant. Horror! the good lady would as soon think of marrying her beautiful daughter to a Winnebago, as to a homely, industrious, and honorable mechanic. Why, the family would be disgraced, the name dishonored.—No! no! The business of a carpenter, a blacksmith or a farmer, is not so *respectable* as that of slaving notes, drawing stolidity from the desk, peddling rotten wood for pills, or selling snuff and tobacco. And yet, the duties of all the learned professions, as well as those of a mercantile life, are performed for the same reason that the shoemaker waxes his thread, and the farmer plants his potatoes, viz. to *obtain a living!* Still, a set of miserable, upstart fools, who are almost universally low-bred people themselves, people who have begun life in the ditch, endeavor to establish in society artificial distinctions, distinctions which they vainly hope will elevate them above the common mass from which they were taken, and give to them, an importance which innate worth and honesty could not command for them. Labor is labor. Honest labor is honest labor. Honest and honorable labor are the same, whether performed by the king or the beggar, and is just as honorable in one as the other. It is true, that all men, by habit and by taste are not fitted to pursue the same vocations, and that there are natural *divisions*, not *distinctions*, as the word is commonly used, created by habit and taste. This is as it should be, and fits us for a discharge of all the peculiar duties that devolve upon us as members of society. But to say, that because a man performs any given duty, however humble, though necessary that duty may be, necessarily degrades him, or renders him less meritorious, than his neighbor, who performs another duty, yet not more faithfully; is to say that we still adhere to the monarchical principles of the old world.

Let the father educate his son to some honorable calling, and if he have a predilection for any particular business, as is often the case, let him follow it, if it be possible—it is the man that ennobles the business, not the business that ennobles the man—and not spend a thought upon the distinctions in occupations, honorable and honest, that fools have attempted to build up. Let children be taught to be honorable, honest, and upright, to set a proper value upon the riches of a world which is only, at best, a bubble, blown into existence to-day to burst to-morrow, and to understand that the only true and real distinctions in society are those of virtue and vice, and that the only true and enduring riches are an intellect duly cultivated, affections schooled, and a heart that knows no guile.

#### MR COLMAN'S ADDRESSES.

Last week we acknowledged the receipt of an address from the Agricultural Commissioner.—Upon opening the book, we find it containing three distinct addresses—one delivered at New Haven—one at Norwich—and the third at Hartford. From the first, which is pleasant and appropriate, we make the following extracts.

#### FALSE DELICACY.

The nature of soils has been long a subject of philosophical investigation; and that, with the application and operation of manures, seems now to be holding in reserve for chemistry its most brilliant triumphs. Do I offend a fastidious ear by a reference to a topic so humble? In looking at the masterpiece of human genius in sculpture, the Venus de Medicis, the vulgar mind brings away from the contemplation no higher sentiment than that it is naked. The pure and disciplined mind hardly conscious of this fact, and feeling the responsive movements of the divinity within itself, admires with adoring wonder the triumphs of genius in this sensible imbedment of the highest beauties of form in the works of the Creator. So it is with other objects in nature, so much depends upon the eye with which we look at them. The vulgar mind, in the heap of manure by the road side, thinks only of its offensiveness and corruption. The well disciplined mind regards it as an element in one of the most affecting miracles of the divine power, and adores that beneficent agency, which, in its mysterious operations, converts this refuse into fruits and flowers.

#### CITY AND COUNTRY MANNERS.

Agriculture, as a pursuit, commends itself to persons of refined taste and sentiment. I know how I shall startle the ear of city fastidiousness by such an assertion; but I rely upon your candor that I shall not offend by the expression of my honest convictions. There is much in the country that is vulgar, rude, and offensive. There is no occasion for this. This is not the fault of the country. But is there more of this in the country than is to be found in cities? These things depend much upon ourselves. The artificial forms of social intercourse do not prevail in the country as in the town—at least they are not the same; but it is often delightful to lay aside, at least for a while, the buckram and the starch. I have been through life familiar with all classes of people. I have been many years a citizen in the cities, and a farmer among the farmers. I have been a frequent visitor in city palaces, and many a time an indweller of the humblest mansions in the secluded parts of the country; and I must say, without derogating from the refinements of the most approved society in the cities, that the comparison in respect to courtesy and civility would not turn out to the disadvantage of the country. True politeness is not matter of mere form or manner, but of sentiment and heart. There are rude and vulgar people everywhere; but will not a sober judgment pronounce it as great a rudeness to be sent knowingly away from the door of one who calls herself a friend by a servant with a lie put in his mouth, as to be received by the kind woman who welcomes us heartily to her wash-tub or her spinning-wheel, and sweeps a place for us without apology to sit down at her kitchen fire? You will pardon the homeliness of my illustrations. You may thread your beautiful valley from the ocean to the mountains; you may, as I have done, follow the silver stream, whose honored name is borne by your Commonwealth, from the place where it deposits its contributions in the mighty treasury of the sea, to its gushing sources under the snow-clad summits of the north, and traverse every State whose borders are laved by its gentle waters, and good manners on your part will be invariably met with a corresponding civility. Excepting among the vicious and depraved, you will find no rudeness un-

less you are so unfortunate as to provoke it by your own arrogance.

It is folly to carry city manners and customs into the country. This destroys the simplicity which constitutes the charm of rural life. If you have no real taste for rural pleasures, no interest in rural concerns, no disposition for rural labors; if you are afraid of soiling your hands or brown- ing your cheeks; if you can make no friends with the flocks that whiten the fields, nor the birds that make the hills and forests vocal with melody; if you are unwilling that the earliest rays of the dawn should disturb your repose, and your heart kindles with no enthusiasm in the golden sunset, then flee the country as you would the Siberian desert. It would be to you only a land of discom- fort and solitude.

#### NEW ENGLAND AND THE WEST.

I have lately returned from a visit to the far West; from the Illinois prairies, beautiful and fer- tile beyond description. This land has been to be had almost for the asking. I am not disposed to underrate any of the advantages of this land of promise, farther than to say, that I am more than ever satisfied with New England. The boast of this western country is that the crops require no manuring and little cultivation. Under present circumstances, the land, allowing the enclosure to be such as to require only twenty rods of fence to an acre, cannot be fenced with a worm fence un- der six dollars an acre. This is to be added to the cost of the land. The first year's breaking up, when in general no return of any value is obtained, is done at an expense of two dollars and a half per acre. This, likewise, is to be added to the cost of the land. We come now to the second year, when it is to be ploughed at an expense of two dollars and a half or two dollars per acre; the corn is to be planted and covered; it is to be harrowed with a cultivator at least three times, which at cur- rent prices of labor cannot be estimated at less than two dollars; and it must be gathered, and husked, and cribbed at an expense I leave you to estimate. The rough fodder is deemed of no value. The crop ordinarily will not exceed forty bushels, but sometimes rises to fifty. Place it at fifty. The present price varies from fifteen to twenty cents. It can scarcely ever be expected to rise above twenty-five cents. This would give a return of twelve and a half dollars to the acre, out of which you must deduct at least seven dollars for the cultivation. This certainly is not to be com- pared with our New England profits, as far as this branch of husbandry is concerned. Labor must continue to be high in the western states. Cheap land will make high wages. I have not time to consider other branches of husbandry in the West.

#### MASS. HORTICULTURAL SOCIETY.

At a meeting held October 24, 1840—

*Voted, unanimously,* That the thanks of this Soci- ety, with a piece of plate, as a testimony thereof, be presented to the Hon. E. Vose, for the many valuable services rendered to the Society, during the period he has discharged the duties as its Presi- dent.

*Voted,* That the sum of one hundred dollars be appropriated for this purpose, and that a committee be appointed to procure a piece of plate, and cause a suitable inscription to be engraved thereon, and present the same with the thanks of the Massachu- setts Horticultural Society.

Messrs Samuel Walker, E. M. Richards and Josi- ah Stickney, were chosen said committee.

At a meeting of the Mass. Horticultural Society held January 2d, 1841, Mr Walker transmitted the following correspondence—whereupon it was

*Voted,* That the same be entered on the records of the Society and published in the New England Farmer.

Attest,

E. M. RICHARDS, *Rec. Sec'ry.*

Roxbury, Dec. 25th, 1840.

DEAR SIR—The undersigned have the honor of being a committee appointed by the Massachusetts Horticultural Society to present you the thanks of the same, with a piece of plate, as a testimonial of the high sense entertained of the many and valua- ble services rendered by you to the Society, during your connection with it as its President.

In requesting your acceptance of this token of respect, we cannot forbear alluding to the prosper- ous condition in which you leave the affairs of the Society; we attribute this mainly to the able and efficient manner in which you have discharged the duties and responsibilities connected therewith.

Permit us, dear sir, to add, in the performance of this our duty, that we have great pleasure, in- dividually, (as well as on account of the Society), in expressing the high esteem in which we hold your services.

Accept our best wishes for your long and con- tinued happiness.

Very respectfully, your obt' servants,

S. WALKER,

E. M. RICHARDS,

JOSIAH STICKNEY,

} *Committee.*

To the HON. ELIJAH VOSE, Dorchester.

Dorchester, Dec. 26th, 1840.

GENTLEMEN—I have had the honor of receiving your letter of the 25th instant, communicating to me, by the request of the Massachusetts Horticul- tural Society, the expression of its approbation of my official conduct whilst connected with it. I as- sure you, gentlemen, that I conceive this manifes- tation of the good opinion of the Society with great sensibility, more especially, as emanating from those who have so long been the eye witnesses of the conduct which they have seen proper to approve.

To whatever extent it may have fallen to my share to participate in the direction of the affairs of the Society, it has been a paramount object to render it, as far as possible, subservient to the public welfare, by fostering a taste for the various branches of culture which it has been its especial object to promote, by elevating the standard of that taste, and disseminating its influences, so that the beneficial effects, both moral and physical, of the interesting pursuits of horticulture, might be more sensibly felt throughout the community. It is a source of gratification to believe that exertions to this effect are appreciated.

I beg you to convey to the members of the Soci- ety my sincere thanks for this testimonial of their regard, and to accept my acknowledgements for the flattering manner in which you have tendered to me the beautiful article presented by them. I shall always highly value it, on account of the in- teresting associations connected with it.

With sentiments of great respect,

I am very truly, yours,

ELIJAH VOSE.

To S. WALKER, E. M. RICHARDS and JOSIAH STICKNEY, Esqrs.

From the Albany Cultivator.

#### HOT AIR FURNACE.

*Messrs Gaylord & Tucker*—I have recently be- come a subscriber to the Cultivator published in Albany, N. Y., which I find to be a very valuable paper. On perusal of the April No. of said paper, I find a description of a *Hot Air Furnace*, which has engaged my particular attention. The reason was, it so very nearly resembled a furnace I had constructed in a house of my own, built in 1836; I have used that alone since that time to warm my whole house except my kitchen. The part warmed consists of two rooms below, 16 by 17 feet square, entry 8 by 16 feet, 2 rooms above, 14 by 14 feet, 2 rooms above, 8 by 9 feet, entry above, and 2 rooms above in the L over my kitchen, 8 by 16 each.—The construction of my furnace was original with me. I so arranged the arch upon which my chim- ney was to stand as to make that the furnace of it- self, which I consider an improvement on yours.

I left apertures 7 inches in diameter, same as those marked in yours E. E., which passes up through both my hearths to supply hot air in my lower rooms, which are as before stated, 16 by 17 feet square each. To conduct hot air into my chambers, I left two flues each about four inches square in my chimney which led from the hot air chamber of furnace into each of my two large chambers above, and came out of the chimney about five inches above the chamber floor, by means of a tin pipe inserted into the chimney horizontal- ly, to extend from the flue into the room. Those pipes can be closed by a tin cover, similar to that of a tin pail, which can be opened and shut at pleasure. My smoke flue was carried up in the chimney, beginning at the hot air chamber, no larger than the stove pipe, and directly between the two hot air flues (with only one thickness of brick between) and extended to the top of my chim- ney. The stove that I have used is nothing but a common box stove of large size, say 2 1-2 feet long, 16 inches square. Upon the top of this stove I have one large round drum about 16 inches in di- ameter, and nearly as long as the stove, and above that I had two small drums only six inches in di- ameter, but extended the length of my hot air cham- ber, and then into the chimney above. In addition to the above, I had a pipe for hot air made of brick, placed upon a plank supported for the purpose, to lead from the side of my furnace near the top, and extended about 7 feet through my cellar, (which is kept apart for the furnace) and leads up into my entry by a ventilator. This keeps the entry or hall which is about 8 by 28 feet, perfectly warm as well as my whole house. In half an hour after a fire is built in the morning, you would be comfortably warm in any room or entry even when the mercury stands 15° below zero outside, which is not unfre- quently the case in this climate. My stove had no grate on the bottom, neither had I an ash-pit. In other respects, my furnace resembles that repre- sented in your paper. This is found such an im- provement in this country, that many have followed my example, and many others have even laid 'up' in cities, and adopted mine. The first year I used my furnace, I burnt about twelve cords soft wood, pine and spruce. I would prefer a stove for my furnace such as you recommend, but none are to be had in this section of our country.

Truly yours, LEVI L. LOWELL.  
*Calais (Me.) Sept. 27, 1840.*

From the Albany Cultivator.

## MANAGEMENT OF PORK.

[Concluded.]

In Europe, the Russian pork bears a high price; and its quality is supposed to be owing to the pickle in which it is preserved. This is called the "Empress of Russia's Brine," and is prepared as follows: boil together over a gentle fire six pounds of common salt, (that in most common use in Russia is rock salt,) two pounds of powdered loaf sugar, three ounces of salt petre, and three gallons of spring or pure water. Skim it while boiling, and when quite cold, pour it over the meat, every part of which must be covered with the brine. Small pork will be sufficiently cured in four or five days; hams intended for drying, in two weeks, unless they are very large. This pickle may be used again and again, if it be fresh boiled up with a small addition to the ingredients. Before putting the meat into the brine, wash it in water, press out the blood, and wipe it clean.

Pickling tubs should be larger at the bottom than at top, by which means when well packed, the pork will retain its place until the last layer is exhausted. When the pork is cool, it may be cut up, the hams and shoulders reserved for bacon, and the remainder salted. Cover the bottom of the tub or barrel with rock salt, and on it place a layer of meat, and so on till the tub is filled. Use the salt liberally, and fill the barrel with strong brine, boiled and skimmed, and then cooled. The following method of preparing hams and shoulders is a good one; as many who have tried it in substance can testify.

To ascertain the probable weight of the meat to be prepared, weigh a number of the hams and shoulders. Then pack them with rock salt in a suitable tub or cask, being careful not to lay the flat sides of the large pieces upon each other, and filling the intervals with hocks, jowls, &c. To every 300 lbs. of meat, then take twenty lbs. of rock salt, or Onondaga coarse salt, one lb. of salt-petre, and fourteen lbs. of brown sugar, or half a gallon of good molasses, and as much water (pure spring water is the best) as will cover the meat: put the whole in a clean vessel, boil and scum; then set it aside to cool, and pour it on the meat till the whole is covered some three or four inches. Hams weighing from 12 to 15 lbs. must lie in this pickle about five weeks; from 15 to 25 lbs. six weeks; from 25 to 45 lbs. seven weeks. On taking them out, soak them in cold water two or three hours to remove the surface salt; then wipe and dry them. It is a good plan in cutting up to take off the feet and hocks with a saw instead of an axe, as it leaves a smooth surface, and no fractures for the lodgment of the fly. Some make only six pieces of a trimmed hog for salting; but it is more convenient when intended for domestic use, to have the side pork, as it is called, cut in smaller pieces.

The goodness of hams and shoulders and their preservation, depends greatly on their smoking as well as salting. Owing to some misconception of the smoke-house, to the surface of the meat not being properly freed from saline matter, or other causes, it not unfrequently happens that during the process of smoking, the meat is constantly moist, and imbibes a pyroligneous acid taste and smell, destructive of its good qualities. The requisites of a smoke-house are, that it should be perfectly dry; not warmed by the fire that makes the smoke; so

far from the fire that any vapor thrown off in the smoke may be condensed before reaching the meat; so close as to exclude all flies, mice, &c., and yet capable of ventilation and escape of smoke. The Westphalian hams are the most celebrated in Europe, principally cured at and exported from Ham-burg. The smoking of these is performed in extensive chambers in the upper stories of high buildings, some of four or five stories; and the smoke is conveyed to these rooms from fires in the cellar, through tubes on which the vapor is condensed and the heat absorbed, so that the smoke is both dry and cool when it comes in contact with the meat. They are thus kept perfectly dry, and acquire a color and flavor unknown to those smoked in the common method. Hams after being smoked may be kept any length of time, by being packed in dry ashes, powdered charcoal, or by being kept in the smoke-house, if that is secure against the fly, or a smoke is made under them once a week. When meat is fully smoked and dried, it may be kept hung up in any dry room, by slipping over it a cotton bag, the neck of which is closely tied around the string which supports the meat, and thus excludes the bacon bug, fly, &c. The small part of a ham, shoulder, &c. should always be hung downwards in the process of smoking, or when suspended for preservation.

From the same.

## WINTER BUTTER.

Of all the products of the dairy, there is none more extensively used than butter; and there is none, the preparation of which requires more care, or better repays a little extra attention. The difference between good and bad butter is as wide as between the zenith and the nadir; and there is nothing more advantageous to the dairymaid, or more to be coveted by her than a high reputation for the quality of this article. Good butter always indicates good order, great neatness, personal supervision, domestic industry, and skill in house-wifery; and when a man carries an inferior article to market, the opinion entertained of his wife is directly the reverse of this.

The first thing to be attended to in making sweet butter, and butter that will keep, is the perfect purity of every thing used in the manufacture. Not only the vessels used, the pails, pans, churns, &c., but the room in which the milk is set, and the air which circulates in it, while the cream is rising, should be clean and free from every offensive odor whatever.

The temperature also of the milk while rising, and of the cream while churning, is of much moment. Cream on the milk will be injured or melted, by too high a temperature, as well as while the churning process is going on; and if the temperature is too low, the cream rises so slowly that it becomes bitter and the butter of course is unpalatable. A temperature of from 50° to 60°, has been thought the best for the milk room, and from 60° to 65° will make good butter. The churning after it commences, should proceed without intermission until the butter is formed, and separated from the milk as far as it can be in this stage of the process.

The salting of the butter is a matter essential to its good quality. Too frequently, salt of a coarse, inferior description is used; and so much is put in that it remains undissolved, gritting like sand in the teeth, and provoking uncomfortable thirst. The

salt for butter should be of the purest kind, made as fine as it can be by grinding, and if a little powdered salt petre is mixed with it, it will be none the worse. Some have recommended five pounds of good salt, eight ounces of salt petre and one pound of first rate loaf sugar, thoroughly incorporated and used for salting, at the rate of an ounce and a half to the pound of butter. If the salt is of the right kind, and the butter is correct in other respects, it may be questioned whether the addition of any foreign ingredient is not to be deprecated.

The great point in making good butter, and that which will keep, is the freeing it from all buttermilk; and if every thing else is well done, if this point is overlooked, good butter is impossible for any length of time. The mixture of milk in any degree with the butter is sure to produce frowiness or an unpleasant taste to the butter; and the entire freedom from this, constitutes the grand secret of making good butter. There are many who think washing butter with water incompatible with retaining the rich flavor, but if the water is cold and pure, it is scarcely possible any thing should be washed away, the buttermilk which destroys the flavor of all butter excepted. Besides, the best butter in the world and that which in all markets commands the best price, viz: Dutch butter, is invariably made in this way; and where the example has been followed by others, it has rarely failed of success. If any, however, doubt the propriety of washing butter, they may use any method they choose, provided the milk is separated perfectly. Perfectly freed from the substance that causes it to assume the putrid frowy taste of bad butter, it may be kept with almost as much ease as tallow; and solidity in packing, clean, sweet vessels, and a low temperature, will ensure its keeping for any reasonable time. Let no one expect good butter, however, so long as coarse, impure salt is used, or a particle of the buttermilk is allowed to remain in it.

The following article is copied, not mainly for the purpose of publishing the fact that Mr Williams obtained a large crop of corn, for the knowledge of such a fact is of but little use, unless there are some peculiarities in the mode of producing it which may be imitated by others. The principles which governed this Kentucky farmer are applicable in all the States, and are in perfect accordance with the results to which our own observations have led us, and which we have before made public. The roots of the growing crop must be spared by the hoe, the cultivator and the plough; while the surface of the land is so often stirred as to afford free action to *light* and *air*. Deep ploughing between the rows, and high hilling may hasten the maturity of the crop; we believe it will cause corn to ripen several days earlier; but it is done at the expense of productiveness. The crop will be less.—Ed.

From the Kentucky Farmer.

## EXPERIMENTAL CROP OF CORN.

DEAR SIR—You will be pleased no doubt to learn the result of an experiment made by me in the cultivation of corn. The certificate below, will show the quantity of ground cultivated and the amount of product, and it remains only to describe the character of the soil and seed, and the mode of cultivation.

The soil was good, but not new. It had been in meadow for many years previous to the last seven. The five first of last seven, it was in heap: the last but one it was in rye, and the last in seed hemp.

The seed was of a variety well known in this neighborhood, particularly among distillers, who speak of it as yielding more spirits than any other kind. It is yellow, and has a medium ear in size, a firm deep grain, very small red cob, shells easily, and in shelling yields abundantly. For several years past I have been improving it by a careful selection of seed, and the result has been an increase in the number and size of the ears. It matures about two weeks earlier than other corn commonly does.

In its cultivation I was governed by the principles, that the roots were not to be broken; that a good bed was to be given the roots to occupy; that light and heat should get to them equally, and that the whole power of the soil should be brought into action without being burdened. I first, as soon as it could be done after the frost was out of the soil, gave it a deep ploughing with a Cary plough. In April, just before planting, I spread over the whole surface a thin coat of fresh stable manure in its unfermented state; then cross ploughed with the same plough; then harrowed; then laid off rows two feet apart with a shovel plough; dropped the seed in the bottom of these rows, as near one foot apart as I could; covered with hoes, and in so doing made the surface level, every clod being crushed with the eye of the hoe, and I then pressed the whole down tight with a good roller. When the corn was about one foot high, I had the weeds cut with a sharp hoe by scraping: great care was taken not to break the surface nor to hill the corn. It had but one hoeing of this sort, and the laborer was about one day in doing it.

The manure, though green from the stable, as the season was wet, was of much service, which I suppose would not have been the case, had the season been dry.

In my opinion the experiment proves unequivocally, that in wet or rainy seasons, such as the past has been, a crop of corn may be trebled, and that with a great reduction of labor. What could be done such a year as was that of 1839, remains to be tested. Very respectfully, &c.,

GEO. W. WILLIAMS.

Bourbon county, Sept. 24, 1840.

We do certify, That we have this day accurately measured the quantity of corn grown by Geo. W. Williams, as an experiment in the mode of cultivation that we have also accurately measured the land cultivated by him, and we find the land contains one acre and one eighth of an acre, and the quantity of corn is one hundred and seventy-eight bushels, making at the rate of one hundred and fifty-eight bushels and two ninths of a bushel to the acre

WILL. P. HUME,  
GEO. MOORE,  
JOSEPH H. CLAY,  
R. P. RANKINS.

*Cooking* *Us.*—Take beets of middle size, and after removing the tops and dirt, roast them in a fire as potatoes are roasted. When done, they are peeled and set up in the usual manner. One who has tried them in this way, says they are much sweeter and richer than when boiled.—*Alb. Cult.*

We have received through the hands of Mr Colman, the following communication. Our impression is, that Mr C. withheld it from publication hoping to find time for appending to it some remarks of his own; but failing to do as he designed previously to closing his connexion with the paper, he has placed the article at our disposal. It is from the same pen that has furnished our readers with interesting and instructive communications relative to the great west. We insert it with pleasure, and express a hope that we shall often be furnished with matter from the same source.—Ed.

For the New England Farmer.

#### SMALL FARMS.

A long chapter might be written upon this subject, but I will endeavor to condense my remarks into a short one.

The Massachusetts Agricultural Society offers premiums for the best farms containing not less than seventy acres; from which it may be inferred that smaller farms cannot (in the opinion of the Trustees) be cultivated to advantage, or, that owners of smaller cannot make improvements worthy of encouragement.

Whatever may be the reason for excluding farms of less than seventy acres, I believe that a great error is committed in doing so, and the following are some of my reasons.

Large farmers are seldom experimentalists, excepting gentlemen of large fortunes who are not dependent upon the income of their farms for support, and such need no premiums to induce them to make improvements.

Generally, fewer hands are employed upon large farms in proportion to their size than upon small ones, and they are not so well cultivated, excepting as above, the cases of opulent owners.

Taking the average of farms in New England, it is necessary to have a force equal to one full hand to every ten acres, in order to cultivate it well. One who cultivates a small farm will generally have nearly or quite this force in his own family, but owing to the high price of labor, large farmers will not have nearly so large a force.

By holding out encouragement to large farmers only, the sentiment is inculcated that large farms are necessary to realize the greatest benefit, and young men are often induced to go beyond their means, to purchase a large farm which they are unable to manage properly, in consequence of the straitened circumstances in which they find themselves; or, if they have prudence enough to foresee this difficulty, they will emigrate where their little capital will purchase such a quantity of land as they suppose is necessary for profitable farming.

All will admit that thorough cultivation is the most profitable, and, as small farms are generally cultivated better than large ones, for the reason above given, it follows that small farms are more profitable than large ones, according to their size, and I am satisfied from my own experience and observation, that they are so, not only in New England but even in the fertile valleys of the west.

The great error of our farmers is, attempting to cultivate too much land. The cultivation of small farms is not only more profitable, but there are political and moral advantages resulting from such a system which ought not to be overlooked. The crowning glory of New England is the subdivision of estates and the ownership of the soil being vested in the cultivators, and the consequent indepen-

dence of our yeomanry. Now this system ought to be preserved and extended, so that instead of a farmer's son being encouraged to burden himself with debt to purchase his brothers' interests in the homestead, it should be divided among them that the number of independent farmers may be increased as much as possible.

The advantages of such a system are many, and too obvious to need further remark.

But it may be said that it is necessary to limit the premiums to farms over a certain size, to shut out the few highly cultivated acres around the rich man's mansion from coming in competition with ordinary farms. This may be true, but it is not necessary to place the limit so high as to exclude a very great number of the best cultivators in the country, when all the objects proposed may be better promoted by bringing small farms into competition with others. It seems to me that the limit should be as low as 25 or even 20 acres.

If my views are incorrect, I should like to have you or some of your correspondents put me right. Perhaps at some future day I may add something more upon this subject.

J. GOULD.

Sharon, Mass., Oct. 1840.

For the N. E. Farmer.

#### CIRCISSIAN MULBERRY.

This most important and rare variety bids fair to form a new era in the silk culture, on account of its extreme hardy character and profusion of foliage of the largest dimensions.

The leaves are about the size of the famous *Multicaulis* mulberry, but more fleshy and nutritious, and of greater weight, and this tree will consequently afford more for silk worms than any other variety.

The wood is remarkably firm and will withstand the winters of Quebec. Its growth is truly a subject of amazement, being fifty per cent. greater than the rapid-shooting *Multicaulis*.

Most of the trees raised from cuttings the present season, now exceed six feet in height, and some of them seven feet, being nearly double the height of all other kinds in the same field.

It cannot fail to be a great acquisition, and particularly so to New England.

W. P.

Flushing, Dec. 30.

[Communicated.]

#### GOOD USE FOR TOBACCO.

Not long since a rat took it into his head to cut holes in my house. I tried a variety of experiments to keep him out without effect. At last I boiled a strong decoction of tobacco, and poured it hot on the places where he was at work. He has quit his depredations, although in one place he had cut the hole almost large enough to creep through. I have tried the same experiment in other places, and find that rats will not eat wood saturated with tobacco juice. Would it not be well if some one building houses or barns, would try it on a large scale? The cost will be trifling, and as I ask nothing for the discovery, all may try it who are disposed to do so.

A RAT HATER.

*Salt for Poultry.*—The Franklin Farmer contains a notice of a farmer's wife in that vicinity, who killed her flock of thirty young turkeys, by giving them a pint of meal wet up with a large spoonful of salt.—*Alb. Cult.*

NEW ENGLAND FARMER,  
AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, JAN. 13, 1841.

RESPECTABILITY OF THE FARMER'S OCCU-  
PATION.

Community appreciate the merits of the hardy tillers of the soil. They are called the bone and muscle of the body politic. They are trusted and honored. For all offices which any one among them is competent to fill, his pursuit is a recommendation. Other things being equal, no other man is so likely to win the suffrages of his fellow-citizens as the plain, honest farmer—What though the gentlemen of the bar are often called to fill places of honor and emolument? It is because their education and pursuits fit them for more prompt and accurate discharge of the duties imposed, and hence it is for the *public good* that they should be employed. Wherever the farmer lives, who informs his mind, wisely cultivates his heart, blends dignity and modesty in his deportment—indulges in no envious complaints of those who wear a finer coat and more highly polished boot—who truly *respects himself* and his fellow-farmers—wherever such an one lives he is respected; wherever he appears he is respected; we care not if it be among the most wealthy and the most refined of the metropolis, for even there he would be as highly respected as in any circle he could enter. The fact that he would not be as cordially invited to the table of a city capitalist as to that of the laboring man will not impair the justness of the remark: it is not want of respect that withholds the invitation; but it is a dissimilarity of tastes and habits such as would make the farmer himself uncomfortable at the board of one accustomed to all the luxuries which wealth can procure, and to the style of city gentility. We do not ask the public to prize more highly than is their wont, those who gather from the lap of our generous mother earth her nourishing gifts. But we do ask these producers of our daily food, ever to regard their own pursuit as one of the most honorable of all occupations, and to be contented and grateful while permitted to pursue that laborious calling, which while it brings food and raiment, generally brings, also, health, good digestion and sweet repose.

SQUARE YOUR ACCOUNTS.

Sally, a neat and busy housewife, scoured the kitchen, floor and walls. Jonathan came in from the barn, and missing his chalk figures, exclaimed, "Why! wife what have you been about?" "Scouring the kitchen," replied Sally. "Scouring the kitchen!" said he, "you have been rubbing out all my accounts." Here was a pause. "Jonathan," said she, "can't you remember them all, and put them down again?" "I'll try," said he. At it he went, but at length there came a pause. "Do you think," she asked, "that you have got them all down?" "I don't know," said Jonathan, "whether I have got them all down or not, but I am pretty sure that I have got them *against better men*." Farmers, beware, lest the neatness of your neighbor's wife be turned to your disadvantage. How many of you make your records where a brush of the busy mop may efface them! and how many more make them upon the tablets of an untrustworthy memory! This is not wise. Keep accurate and full accounts, *in a book*, of all the items that are to be considered in your settlement with your neighbors. When he takes of you a bushel of potatoes in planting time, charge him with them, and give him credit for the use of his harrow; credit him for the oxen used in breaking up; and charge

him with the use of your wagen when he went to market. Let your books show precisely how you stand with every man. This is the only possible way in which most of you can do justice to yourselves and your neighbors. You object to the trouble. Some trouble there is about it, but *not much*. Let the book, pen and ink be kept in a convenient place, and the work will require but a minute or two each evening. "Ah! Mr editor," one says to me "if my fingers were as familiar with the pen as yours, it might be but a minute's work." My good sir, do it for a few weeks, and your fingers will get used to the work; will do it readily; and will serve you well for doing such other writing as you now call upon your son, your daughter, or the squire to execute. At the beginning of the year square accounts with every one; if you cannot pay the money, give a note or due-bill; if your neighbor cannot pay, take his note or due-bill. Square the books; take an account of stock; learn how you stand; put the whole on record; and ascertain your ways and means for getting through the next year. These things would have been more appropriate in December, but they will be serviceable now, if they prompt you to execute by the first of February what should have been done a month earlier. Those who know how their accounts stand and who look forward to the ways and means, make the most thriving farmers.

DIALOGUE ON COWS: COMING NEAR TO  
FACT.

A. They say, neighbor B. that you was fool enough to give \$50, in November, for that line-backed cow of yours, when she would calve in April. Is it true?

B. Yes, neighbor A., I was just such a fool as that.

A. I wonder at you; you could have bought two cows of the same age and size for the money. How could you do it?

B. I will tell you how. The cow was six years old; had made 12 1-2 lbs. of butter per week through the month of June, and did proportionally well in the other months. I thought her worth the money.

A. Well, I guess, now that you have owned her four years, you have found out your mistake. When old she will be worth no more than an ordinary cow, and it costs a great deal to keep her.

B. Yes, it costs considerable to keep her, and when it shall be necessary to beef her, she will be worth no more than an ordinary cow of her size and condition. I must lose 25 dollars on her then.

A. I thought you would discover your folly.

B. Perhaps I shall, but I have not done it yet.

A. I thought you said you must lose 25 dollars.

B. Yes, but you have not inquired whether she had earned enough to enable me to meet *that loss*, and yet be on the whole no loser by her.

A. No. But I will inquire. Has she done it?

B. Her butter at 25 cents per pound, has been worth yearly, say 66 dollars. The skimmed milk at 1-2 cent per quart, has been worth 10 dollars and a half, for making pork. She has brought two cow-calves, one of which when 3 years old, I was offered 60 dollars for, without her calf. The other, two years old, gives the richest milk of any cow I have. At this time, December, when she gives but little, *four quarts and a pint*, of her milk makes a pound of butter.

A. What does it cost per year to keep the cow?

B. 50 dollars.

A. What is it worth to insure her against fatal disease and accident?

B. Six per cent on her cost.

A. Can she then be as profitable as an ordinary cow, taking into account keeping, interest, and risk?

B. That is the *question*; and I wish you to help me answer it. Please name the cost and income of an ordinary cow.

A. The cow costs twentyfive dollars: it is worth forty dollars per year to keep her: the income may be two thirds what you have named from yours. Butter, fortyfour dollars; skimmed milk, seven dollars; five dollars must be credited to her for the less labor in milking and making butter.

B. Agreed. Now let us look at the debt and credit of each.

\$50 Cow.		\$25 Cow.	
Dr.	Cr.	Dr.	Cr.
Keeping, \$50	Butter, \$66	Keeping, \$40	Butter, \$44
Interest, 3	Sk. milk, 10½	Interest, 1 25	Sk. milk, 7
Insurance, 3		Insurance, 1 25	less labor, 5
\$56	\$76½	\$42 50	\$56
	56		42½
		\$20½	\$13½

Taking the \$13 50 from \$20 50 leaves me seven dollars annual profit from the good cow, above that of the ordinary one. This seven dollars with its interest will at the end of seven years amount to \$57 83. Besides we must not overlook the chances of getting from the good cow more valuable calves. And now, neighbor A. you may judge whether I can afford to lose the \$25 at the end of seven years.

A. I judge myself to be the fool, and thank you.

C. And, neighbors, I thank you both; for your conversation and figures have led me to suspect that if I had kept 8 cows worth \$50 apiece for the last seven years, instead of my 10 worth \$25 each, I might have been about \$230 the richer for it, besides having derived much more pleasure from taking care of the good ones.

HAY SEED AMONG CORN.

We saw an article in one of the southern papers a few weeks since, mentioning that some one, we think in the middle States, had sown clover seed among his corn; and the inquiry was added, "whether any one at the North or East had tried it?" In reply, we would inform the inquirer that Hon. Wm. Clark, of Northampton, Mass., has for many years been accustomed to lay down his light lands to grass in that way. His communications upon the subject led to the trial of this process upon the farm where we have earned our bread. And we are disposed to recommend a trial of this method. Our belief, founded upon the observation of results in four different seasons, is that the seed will be less likely to fail in this way than when sowed among grain; that the first crop is much more free from weeds; is entirely free from dead grain stalks; is easier to mow; is usually abundant; and better in quality. We think that grass lay thus made, holds out better than other. By this process the young grasses are exempted from the baneful influences of the overshadowing grass, and from the withering heat to which they are exposed when the grains are removed. They are saved from the stinting to which they are usually subjected.

The process.—Spread all the manure; *see no hill*; and at the last time of hoeing, say the middle of July, sow the grass seed among the corn; pass through with the horse-harrow or cultivator, (simple *plow* teeth are best), then hoe, making all smooth, & the work is done. At the proper time cut the *grass* as near the ground as can conveniently be done. Would the grass do well, the stubbs would probably *seed* so much as to offer very little obstruction to the *seed*. But if one be fearful that it might be otherwise, *may* take, as is our custom, an old adze or a strong *heavy* hoe, and go

over the field while the ground is frozen and by a single blow at each hill pare all smooth. An acre may be gone over by an active boy in three or four hours. After the frost is out, let the ground be rolled. In the early part of the season, appearances will be unpromising for a crop; but about the middle of June it will come forward rapidly, and about the 10th or 15th of July will be fit to cut. Land, we suppose, can be laid down as smooth in this way as any other; though we have not heretofore been very particular in this respect, and our grounds, though even enough to work upon without inconvenience, are not made quite as level as when a grain crop is put on.

The last season we took up grass land in the spring; planted to corn, and in July seeded down to grass.

We do not advise any beginners to make extensive experiments, but we do think it will be found good husbandry to adopt this process to a considerable extent on many farms.

**THERMOMETRICAL.**

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northerly exposure, week ending Jan. 10.

Jan. 1841.	7 A.M.	12, M.	5, P.M.	Wind.
Monday,	4	4	10	W.
Tuesday,	5	4	14	W.
Wednesday,	5	33	39	S.

Saturday,	9	36	36	N.
Sunday,	10	30	30	N.

**BRIGHTON MARKET. — MONDAY, JAN. 11, 1840.**

Reported for the New England Farmer

At Market 320 Beel Cattle, 120 Stores, 3300 Sheep and 60 Swine.

Prices.—Beef Cattle—We quote to correspond with last week, viz. First quality \$5 75 a 6 00. Second quality, \$5 25 a 5 75. Third quality, \$4 25 a \$5 00

Sheep—Dull and many lots sold for less than they cost in the country, \$1 25, \$1 50, \$1 75, \$2 00, \$2 50, \$3 00, \$3 50 and \$3 75.

Swine.—A lot at about 4c. Lot at retail from 4 1 2 to 6.

**GRINDSTONES.**

An extensive assortment of Water and Hand Grindstones constantly on hand and for sale by AMM C. LOMBARD & CO. 13 Lewis's Wharf. N.Y. Nov. 17.

**WILLIS'S LATEST IMPROVED VEGETABLE CUTTER.**

For sale at the New England Agricultural Warehouse, No. 51 and 52 North Market Street, Boston, Willis's Latest Improved Vegetable Cutter. This machine surpasses all others for the purpose of cutting Ruta Baga, Mangel Wurzel, and other roots. The great objection to other machines, is their cutting the roots into slices, which makes it almost impossible for the cattle to get hold of them: this machine with a little alteration, cuts them into large or small pieces, of such shape as is most convenient for the cattle to eat. It will cut with ease from one to two bushels of roots per minute.

JOSEPH BRECK & CO.

**GREEN'S PATENT STRAW CUTTER.**

JOSEPH BRECK & CO. at the New England Agricultural Warehouse and Seed Store Nos. 51 and 52 North Market Street, have for sale, Green's Patent Straw, Hay and Stalk Cutter, operating on a mechanical principle not before applied to any implement for this purpose. The most prominent effects of this application, and some of the consequent peculiarities of the machine are:

1. So great a reduction of the quantum of power requisite to use it, that the strength of a half grown boy is sufficient to work it efficiently.
2. With even this moderate power, it easily cuts two bushels a minute, which is full twice as fast as has been claimed by any other machine even when worked by horse or steam power.
3. The knives, owing to the peculiar manner in which they cut, require sharpening less often than those of any other straw cutter.
4. The machine is simple in its construction, made and put together very strongly. It is therefore not so liable as the complicated machines in general use to get out of order.

**LAMP OIL—PURE SPERM OIL.**

E. T. HASTINGS & CO. No. 101 State St. keep constantly for sale, Winter, Spring and Fall Sperm Oil, bleached and unbleached; which they warrant to be of the best quality and to burn without crusting.

Oil Canisters of various sizes.

Boston, Jan. 1, 1841.

1st y

**BONE MANURE.**

The subscriber informs his friends and the public, that after ten years experience, he is fully convinced that ground bones form the most powerful stimulant that can be applied to the earth as a manure.

Orders for Bone Manure or Oyster Shell Lime, left at the Bone Mill, near Tremont road, in Roxbury, at the New England Agricultural Warehouse and Seed Store, No 52 North Market Street, or through the Post Office will meet with prompt attention.

March 4, 1840.

NAHUM WARD.

**FARM FOR SALE.**

The subscriber offers for sale that valuable Farm, situated about 3-4ths of a mile below the First Parish Meeting House, on the Stage road, and commonly known as the Judge Prescott farm, containing about 170 acres of superior land, in a good state of cultivation, with two dwelling houses, four barns, and other out buildings. The farm is remarkably well watered with soft water, conveniently fenced, has nearly forty acres of large, handsome wood and timber standing on it, with an orchard of grafted Apple, Pear, Peach, Plum, and Cherry trees, and might be easily divided into two Farms. The estate will be sold reasonably. If five thousand dollars be paid on receipt of the deed, the remainder may lay on mortgage to suit the convenience of the purchaser. For further particulars, apply to the subscriber, living on the premises.

WM. SALISBURY.

Groton, Oct. 26. 1840.

ew.

**FRESH GARDEN SEEDS.**

We would inform our customers and friends that we are now receiving our supply of fresh Garden Seeds, most of which have been raised under our own inspection, from fine selected roots; which we warrant to be of the purest quality of the growth of the present season.

Agricultural Books.

Agricultural Implements.

Seed and Implement Catalogues sent to all applicants gratis, and all orders promptly attended to.

JOSEPH BRECK & CO.

Boston, Sept. 29, 1840.

**TIE UP CHAINS.**

Just received at the New England Agricultural Warehouse, a good supply of those celebrated Chains for tying up cattle. These chains, introduced by E. H. Derby, Esq. of Salem, and Col. Jacques, of Charlestown, for the purpose of securing cattle to the stall, are found to be the safest and most convenient mode of fastening cows and oxen to the stanchion. They consist of a chain which passes round the animal's neck, and by a ring attached to the stall, plays freely up and down, and leaves the animal at liberty to lie down or rise at pleasure, and keeps him perfectly secure.

July 15.

JOSEPH BRECK & CO.

## MISCELLANEOUS.

## IN DEBT AND OUT OF DEBT.

Of what a hideous progeny of ill is debt, the father! What lies, what meanness, what invasions on self-respect, what cares, what double-dealing! How, in due season, it will carve the frank open face into wrinkles; how, like a knife, 'twill stab the honest heart. And then its transformations! How it has been known to change a goodly face into a mask of brass; how, with the "damned custom" of debt, has the true man become a callous trickster! A freedom from debt, and what a nourishing sweetness may be found in cold water; what toothsome-ness in a dry crust; what ambrosial nourishment in a hard egg! Be sure of it, he who dines out of debt, though his meal be biscuit and an onion, dines in "The Apollo." And then for raiment; what warmth in a threadbare coat, if the tailor's receipt be in the pocket: what Tyrian purple in the faded waistcoat, the vest not owed for; how glassy the well worn hat, if it covers not the aching head of a debtor! Next, the home-sweets, the out-door recreation of the free man. The street-door knocker falls not a knell on his heart; the foot on the staircase, though he live on the third pair, sends no spasm through his anatomy; at the rap at his door he can crow forth "come in," and his pulse still beat healthfully, his heart sink not in his bowels. See him abroad, how confidently, yet how pleasantly, he takes the street; how he returns look for look with any passenger; how he saunters; how, meeting an acquaintance he stands and gossips! But, then, this man knows not debt; debt, that casts a drug into the richest wine; that makes the food of the gods unwholesome, indigestible; that sprinkles the banquets of a Lucullus with ashes, and drops soot in the soup of an emperor: debt, that, like the moth, makes valueless furs and velvets, enclosing the wearer in a festering prison, (the shirt of Nessus was a shirt not paid for;) debt, that writes upon frescoed walls the hand-writing of the attorney; that puts a voice of terror in the knocker; that makes the heart quake at the haunted fire-side; debt, the invisible demon that walks abroad with a man; now quickening his steps, now making him look on all sides like a hunted beast, and now bringing to his face the ashy hue of death, as the unconscious passenger looks glancingly upon him! Poverty is a bitter draught, yet may, and sometimes with advantage, be gulped down. Though the drinker make wry faces, there may, after all, be a wholesome goodness in the cup. But debt, however courteously it be offered, is the cup of a siren, and the wine, spiced and delicious though it be, an eating poison. The man out of debt, though with a flaw in his jerkin, a crack in his shoe-leather, and a hole in his hat, is still the son of liberty, free as the singing lark above him; but the debtor, though clothed in the utmost bravery, what is he but a serf out upon a holiday—a slave to be reclaimed at any instant by his owner, the creditor? My son, if poor, see wine in the running spring; let thy mouth water at a last week's roll; think a threadbare coat the "only wear;" and acknowledge a white-washed garret the fittest housing place for a gentleman: do this, and flee debt. So shall thy heart be at peace, and the sheriff be confounded.—*Douglass Jerrold in "Heads of the People."*

LEGISLATORS, by Sam Slick.—"Nothin' on this side of the water makes so big a fool of a man, squire, he continued, as goin' to the house of representatives without bein' fit for it. Them that haint jist got the right weight of ballast are upset in no time, and are turned bottom upwards afore they know where they be. Them that are a little vain by natur', get so puffed up and consaited, they become nothin' but laughin' stocks to all the world, and most ridiculous fools;—while them whose principles ain't well anchored in good holdin' ground, let the rogue peep out o' their professions plainer than they are a-thinkin' on. The skin of the beast will show through, like an Irishman's elbow, though he has three coats on. But that ain't the worst of it neether. A man is apt to become bankrupt in business, as well as in character by it. Deiu' big and talkin' big for three months in the year, and puffin' each other up till they are ready to burst with importance, don't convene with sellin' tape by the yard, or leadin' on carts when they return home to their business. In short, squire, a country ought to be a rich country, with larned men in it, and men o' property to represent it, or else assembly work is nothin' but high life below stairs, arter all. I could point you out legislators on this here continent, where the speakin' is all kitchen talk, all strut, brag, and vulgar impedence. It's enough to make a cat sick to hear fellers talk of independence who are mortgaged over head and ears in debt, to listen to chaps jawin' about public virtue, temperance, edication, and what not all day, who spend the night in the back-room of a market tavern, with the key turned, drinkin' hail-storm and bad rum, or playin' sixpenny loo. If mankind only knew what fools they were, and how they helped folks themselves to fool them, there would be some hope of them, for they would have larnt the first lessons of wisdom."

The following "remarks on fits" were published in the Cincinnati Chronicle a few years since, but as the present appears to be an unusually fruitful time for suicides, and consequently for "the blues," a gentleman has expressed to us the opinion that their re-publication would not be improper:

## PLAIN AND PITHY REMARKS OF OLD HUMPHREY ON FITS.

We are most of us subjected to fits; I am visited with them myself and I dare say you are also.

For fits of passion—walk out in the open air: you may speak your mind to the winds without hurting any one, or proclaiming yourself to be a simpleton.

For a fit of idleness—count the tickings of a clock. Do this for an hour, and you will be glad to pull off your coat and work like a negro.

For a fit of ambition—go into the church yard and read the grave stones. They will tell you the end of ambition. The grave will soon be your bed chamber, and the earth your pillow, corruption your father, and the worm your mother and sisters.

For a fit of repining—look out for the halt and blind, and visit the bed ridden, and deranged, and they will make you ashamed of complaining of your lighter afflictions.

For fits of despondency—look on the good things which God has given you in this world, and at those which he has promised to his followers in the next. He who goes into his garden to look for cobwebs and spiders will no doubt find them, while he who

looks for a flower, may return into the house with one blooming in his bosom.

For a fit of doubt, perplexity and fear—whether they respect the body or the mind, whether they are a load for the head, the shoulders, or the heart, the following is a radical cure, for I had it from the Great Physician; "Cast thy burden on the Lord, and he will sustain thee."

## POUDRETTE.

The subscribers reside in the state of New Jersey, many of us in the vicinity of the works erected by Anthony Dey, of the city of New York, on the Hackensack river, in New Jersey, for the manufactory of Urate and Poudrette, called "The Lodi Manufacturing Company." We have used the poudrette on the Spring Crops this year, '840. We find it a valuable manure, superior to any other kind that we have ever used, and considering the facility of its transportation to the field, the small quantity required in the application to the crops, the quickness of its operation on vegetable matter, and the ease with which it can be applied.—all tend to recommend its use to the farmer and gardener as the cheapest and best manure, and we recommend it accordingly.

Those of us who have applied it to corn and potatoes think that it ripens those vegetables quicker than any other manure by several weeks.

Dated New Jersey, October, 1840.

Jacob D. Van Winkle.	P. F. Welsh.
John J. Newkirk.	G. C. Van Ripper.
John Tise.	George Tise.
Daniel Van Ripper.	William Wood.
George Demott.	John Duryee.
Henry Drayton.	George Newkirk.
Josiah Hornblower.	Garret Newkirk.
Corns. Van Winkle.	Daniel Vreeland.

Shares in the above company are \$100 each, and may be had by applying to Anthony Dey No. 73 Cedar St. New York.—The owner will receive 20 per cent. per annum, payable in money, or 50 bushels of Poudrette. The price to those who buy Poudrette is 40 cents a bushel. It costs the Stockholders 12 cents a bushel. One cent worth, that is, 20 Gills, will manure 20 hills of corn, and the like quantity 15 hills of Potatoes.

Newspapers friendly to agriculture will confer a favor on the Farmers and Gardeners by publishing the above.  
Dec. 22.

## POUDRETTE.

This valuable manure may be had on application to the subscriber, at the office of the "New York Poudrette Company," No. 120 Nassau street, New York. It is in-odoriferous, and may be transported in barrels, on board of any vessel or steamboat, without offence—and it will be found an exceedingly valuable article as a fertilizer on any soil, and for any crops; but more especially for gardens and flowers, as there are no foul seeds in it. Poudrette has been used for three seasons with entire success on Long Island, by many practical farmers, as may be ascertained from letters and statements made by them, and published at this office in a pamphlet containing also the "act of incorporation," granted to the Company by the Legislature of the State of New York; and other facts in relation to the subject. Price 35 cents per bushel. Barrels cost 25 cents each, and hold 4 bushels. Persons wishing to make an experiment on a small scale can obtain one barrel by enclosing a two dollar current bank bill—or three barrels by enclosing five dollars, free of postage. On receipt of the money the article will be put up and forwarded as directed.

\* Price of shares, one hundred dollars—which entitles the holder to one hundred bushels of poudrette annually, during the term of the charter; fifty bushels in time for spring use, and fifty bushels in time for fall use. Shares taken soon, will be entitled to the spring dividend—and, if desired for experiment, a few bushels may be had this fall.

All orders, or applications in relation to the business, must be made to the subscriber, 120 Nassau street, New York.

D. K. MINOR.

I wish it distinctly understood that the "New York Poudrette Company" is in no way connected with the "Lodi Manufacturing Company," of which Anthony Dey and Peter Barthelemy are, or were, the managers.

Dec. 9, 1840. 3m. D. K. M.

## THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at \$3 per annum payable at the end of the year—but those who pay within sixty days from the time of subscribing are entitled to a deduction of 50 cents.

### N. E. FARMER.

#### FUEL.

*Economy of Fuel.*—We have examined, with interest, a small work, detailing "Experiments to determine the comparative quantity of heat evolved in the combustion of the principal varieties of wood and coal used in the United States for fuel; and also to determine the comparative quantity of heat lost by the ordinary apparatus made use of for their combustion.—By Marcus Bull."

The experiments seem to have been made with great care and accuracy, and the results afford matter of interest to every householder.

Mr Bull has computed the cost of fuel consumed in Philadelphia, in a given year, to be \$80,043, which being divided among the population, gives \$7 04 as the average cost of fuel to each inhabitant, supposing the consumption to be equal. Adopting this estimate as a fair average for the population within ten miles of tide-water, in the Atlantic States, from Maine to Georgia, it gives an aggregate of twentyone millions of dollars as the annual cost of fuel for this portion of population, which is assumed to amount to three millions and a half of our population at half the above price, or \$3 50 to each individual, he gives us an aggregate amount of about fiftyone millions of dollars as the total annual expense of fuel for every purpose in the United States.

The economy of fuel is to be studied—1, in the kind to be selected for use; 2, in its quality and preparation for use; and 3, in the choice of the apparatus in which it is to be used.

*In regard to wood.*—The quantity of heat evolved by a cubic foot of the several kinds, when in a perfectly dry state, is very nearly in the ratio of their specific gravity, or relative weight, as for example, the specific gravity of shell-bark hickory being 1.000, a cord weighs 4,469 lbs.; by the same scale, the specific gravity of white pine is .476, and the cord weighs only 1,868 lbs. The quantity of heat evolved by a pound of white pine is as great as that evolved by a pound of hickory. The difference in value arises from the great disparity in weight—the hickory weighing as 22, and the pine as 9—and their relative value being hickory 100, white pine 42—or the first being considerably more than twice as valuable as the latter.

*Charcoal* forms a considerable item of fuel; and the facts which Mr Bull has given us upon this subject will be found to be new and interesting. The value of charcoal, like that of wood, is principally to be determined by its weight—a pound from one kind of wood affording about as much heat as a pound from another kind. The quantity, or rather weight, of charcoal, afforded by the different kinds of wood, is nearly in proportion to the relative weight of the wood. Thus hickory produces 26.22, the specific gravity of the dry coal being .625; while the white pine produces 24.35, and the specific gravity of the dry coal being only .298. Thus, whether burnt in the form of wood or of charcoal, a cord of hickory affords more than twice

the heat that is found in a cord of white pine. The value of charcoal, however, depends much upon the manner in which it is prepared. The more completely the atmospheric air is excluded from the wood, while under the process of being charred, and the more heat that is given to it, the *heavier*, the *harder*, and the *better* will be the product.—The best charcoal will be found of a slate color on its surface, dense, sonorous and brittle; while inferior qualities approach to a jet black, and are soft and powdery, upon the exterior. To obtain the best quality, Mr Bull recommends that the wood be piled in a single tier, that charcoal dust be interposed between the wood, that the pile be covered with clay, and then a layer of sand, to close the cracks which the fire may cause in the clay, and that the fire be communicated at the exterior base, and in the centre and from the top. An intelligent collier, who partially adopted Mr Bull's recommendation, gained by it 10 per cent. in quantity by measure, and Mr B. found the coal nearly 20 per cent. heavier than usual. If these facts are correct, and we have no reason to doubt them, it would be an excellent police regulation in our towns, to have charcoal sold by the weight, instead of by measure, and would ultimately be beneficial to the seller as well as to the buyer.

The loss in weight which wood undergoes in drying, and the moisture which it absorbs, by exposure, after it has become dry, are matters of considerable interest to the farmer and the consumer. Hickory wood cut green and made absolutely dry, experienced a diminution in its weight of 37 1-2 per cent., white oak lost 41 per cent., and soft maple 48 per cent., or very near one half. Both wood and charcoal, after being made perfectly dry, absorbed in twelve months under cover, from 8 to 12 per cent. of moisture.

If we assume, says Mr B., the mean quantity of moisture in the woods when green, at 42 per cent., the great disadvantage of attempting to burn wood in this state, (or transport it at a distance,) must be obvious, as in every 100 pounds of this compound of wood and water, 42 pounds of aqueous matter must be expelled from the wood, (or transported;) and as the capacity of water for absorbing heat is as 4 to 1, when compared with air, and probably greater during its conversion into vapor, which must be effected before it can escape, the loss of heat must consequently be great.

[From the table given by Mr Bull, we extract the following, showing the value of the different kinds of wood in most common use.]

	Specific gravity of dry wood.	Avoirdupois lbs. of dry wood in a cord.
White ash,	.772	3.450
White beech,	.724	3.236
Black birch,	.697	3.115
Chestnut,	.522	2.333
White elm,	.580	2.592
Shell-bark hickory,	1.000	4.469
Pig-nut hickory,	.949	4.241
Red heart hickory,	.829	3.705
Hard maple,	.644	2.878

Soft maple,	.597	2.668
White oak,	.855	3.821
Shell bark white oak,	.775	3.464
Red oak,	.728	3.254
Pitch pine,	.426	1.904
White pine,	.418	1.868
Lombardy poplar,	.397	1.774

The relative value per cord of the above woods is given in Mr Bull's table, from which it appears that if hickory is worth one dollar, pig nut hickory is worth 95 cents, hard maple 60 cents, white oak 81 cents, white pine 42 cents, pitch pine 43 cents, &c.

*Economy of Burning.*—Mr Bull's experiments were made in a sheet iron stove, with 42 feet of two inch pipe, having about 20 elbows. A thermometer placed at the mouth of this pipe indicated the same temperature as another hung against the wall of the room, which showed that all the heat given off by the combustion of the fuel, was retained in the room. On the supposition that 100 lbs. of fuel consumed in this stove, would maintain a temperature of 60 degrees for 12 hours, he found, that to maintain the like temperature for the same time by other apparatus, the fuel must be increased as follows:

	lbs.
In the experiment stove it required	100
In the sheet iron cylinder stove, the interior surface coated with clay lute, with 9 elbow joints, and 13 1-2 feet of 2 inch pipe,	105
In a like stove and pipe, with 3 elbow joints,	122
In a like stove, and similar pipe and joints, but the pipe placed more vertical than the preceding,	128
In a like stove, with 5 feet of pipe and one elbow	149
In a like stove, without clay lute, one elbow, and five feet of four inch pipe,	222
In an open Franklin, with one elbow, and 5 feet of six inch pipe,	270
In an open ordinary parlor grate,	555
In an open chimney fire place,	1,000

It would seem from these experiments, that nine tenths of the heat given off by fuel burnt in an ordinary fire-place, are carried off in the draft, without benefiting the room; that nearly one half is wasted when the fuel is consumed in an open parlor grate, and that lining a stove with fire brick or clay lute, produces a great economy in fuel.

The experiments afford important suggestions to the housekeeper. Assuming as data, that four cords of dry shell-bark hickory, burnt in a sheet iron cylinder stove, with five feet of pipe and one elbow, will warm an ordinary room during the winter months, it will require to keep up the like temperature, in a similar stove, the following quantities of other materials:

Hickory, as stated,	4	cords.
White oak,	4 3-4	‘
Hard maple,	6 2-3	‘
Soft maple,	7 1-5	‘
Pitch pine,	9 1-7	‘
White pine,	9 1-5	‘
Anthracite coal,	4	tons.

[Albany Cult.]

## AGRICULTURAL MEETINGS

Will be held at the State House on the evening of *Thursday*, each week, at 7 o'clock. Subject for consideration tomorrow evening—*The Cultivated Grasses*. As we, at the request of the Agricultural Commissioner, named a subject, liberty we trust may be taken to specify a few of the points of inquiry embraced under the general head. What kind or kinds are best suited to moist, what to dry, and to intermediate lands? What to lands in a high state of cultivation? In ordinary condition? In a poor condition? Is it best to sow one kind only or several varieties? If several, what kinds shall enter into the mixture? How much seed to the acre? At what season is it best to sow? Shall it be sowed alone or with some other crop? If with another, what crop is best? What worst? Which variety makes the best food for putting *flesh* upon horned cattle? Which produces the most *milk*? Which is best for horses? Which for sheep? What are economical top-dressings for grass lands? What the best age at which to cut the different grasses? What the best modes of curing? &c. &c.—ED.

## EFFECTS OF MANUFACTURES UPON AGRICULTURE.

Commercial and manufacturing pursuits withdraw a large portion of our people from agricultural labor, as they promise higher wages and ready money. It has been supposed and confidently maintained among us, that manufactures, especially, would operate as an encouragement to agriculture, by creating a quick market for its products in the villages, which spring up wherever these establishments are planted. But the effect has been to withdraw a large amount of labor from the farm, and render it difficult and discouraging, through the scarcity and consequent high prices of labor, to carry on, to any considerable extent, and with any enterprise, the business of the farm. Perhaps we are not yet sufficiently populous to furnish an ample supply of labor to our farms, and the extensive manufacturing and commercial establishments, which are in operation among us. As our population advances, we shall have people enough for all the departments; but, hitherto, trade and manufactures as carried on among us, have operated, in some respects, to the hindrance of agriculture; and I shall be forgiven, I hope, in expressing my mortification and regret, in observing the crowds of young men in our cities, who, instead of brightening their hoes, and standing behind their ploughs, prefer to rub the brass bell knobs, and stand behind the tables; or, else, with the muscles of oak, made to breast the wind, to turn up the soil, and to gather the harvest, choose, in their miserable effeminacy, to thrust themselves into woman's sphere, and putting on the dandy's uniform, become transformed into a sort of gum elastic exquisite, to stand behind counters, and measure out pins and ribbons. Still more is it to be lamented, that now in the country, the milkmaid's elastic step, and neatly tied up locks, and ruddy cheeks, and sparkling teeth, is a picture to be found only in the lumber garret of some secluded antiquarian, who, poor soul! has never heard of the *Mirror of Fashion* or the *Lady's Magazine*.

These things have operated, in a great degree, to the hindrance of agriculture; and, for this reason, many cultivated lands in the State, have been abandoned to wood; and dairy establishments,

which were once extensive and productive, have been given up, from the impossibility of obtaining women, who were either willing or capable of drawing the milk, or manufacturing it after it was drawn. Indeed, in the progress of refinement, fast spreading itself through the country, our young men and women are beginning to look upon a cow, as a non-descript animal, escaped from some strolling menagerie, and the very odor of the barn, is likely to throw them into hysterics; while, to the same delicate class, the fumes of segars in volumes thick enough to cloud the sight, or the mephitic vapors of a crowded theatre, or ball room, or the exquisite odors of a broken gas-pipe, are inhaled as nectar.—*Colman's Address at Norwich*.

*Awfully Genteel*.—We happened the other day to hear a young woman—very pretty she was too—expressing the most profound ignorance respecting domestic economy. Credit her own words, and you would believe that she does not know how a potato looks before it is cooked—or whether it grows upon trees with a shell like a walnut, or is a domestic animal, fed on corn, and slaughtered for the table. She would have her friends—or perhaps she would say her acquaintances—suppose that she never was nearer to a kitchen than in the hall on the lower floor; and that she has no more idea of culinary operations than Robinson Crusoe's man Friday possessed. Yet we are ready to stake our life upon the fact that if she was not born in a kitchen, she was educated as a scullion; and that her fingers were in her earlier youth—she is young yet—much more familiar with brasses on the area palings and with the interior of the stew pans, and with ashes in the grates, than with the piano forte keys or with cambric needles. Nothing but a ridiculous desire to conceal what would be no disgrace to her, if known, could tempt her to such ridiculous and lying affectation.

No true lady is ashamed of a knowledge of the details and duties of a household—but on the contrary would be extremely mortified at ignorance of such essentials. It is no matter if fortune has so blessed her that she need not soil her fingers in domestic occupations. A knowledge of them is absolutely necessary to procure their performance by servants. She is a wretched butt of kitchen malice, and a victim of wanton waste, who cannot detect servants in their misdoings by her own knowledge. To command the respect and obedience of servants, a housekeeper should be so well informed as to be able to answer them upon questions, sometimes maliciously put. Her eye should never lose sight of any part of the domestic establishment; and she should be qualified to oversee understandingly also. Else might a man rich as Cræsus be beggared by his kitchen, and still be fare none the better for it.—*N. Y. Tuttle*.

From the Farmer's Register.

## TO SMALL FARMERS.

I frequently hear small farmers say, "Ah! it is well enough for Mr S-and-so to read the Register, and try experiments; but it will not do for me."—Neighbor, if this is your case, let me tell you that I am a small farmer, and I can testify that the reading of agricultural works has been of great advantage to me, and I am sure will be to you, if you will read them. Perhaps you will say that the correspondents of the Register propose plans of

improvement on too large a scale for you. This may be, generally speaking; but then, when we read, we must reflect how far this or that can be applied with advantage on our own little farms. And again, I know many small farmers who are fully competent to write for the Register, and by not doing so they neglect to discharge a duty which they owe their brother farmers. The hand which is now using this pen, a few minutes ago was using the hoe—and to much better effect too; but you see Mr Ruffin has not rejected this piece because my ideas are not couched in elegant or purely grammatical language.

But to the point. Small farmers should attend to small matters, and some big ones too; and the first of these is the improvement of their minds. The reading of agricultural works, as well as all other good books, has a powerful tendency to effect this desirable object. Next, the improvement of our morals. Let us have our consciences "void of offence towards God and man," that we may enjoy fully the bounties of Providence. Then the improvement of our little farms, which we should not only do as a matter of necessity, but as a duty which we owe to our God and to our posterity. This is to be done in a variety of ways. We should be as careful to store up food for our crops as we are for our families. No ashes, slops, bones, sweepings of the yard or kitchen, or litter of any kind, should be lost, that can be converted into manure, and cultivate no land without its being manured well. Let a fruit tree be planted on every little unoccupied spot of ground near the homestead. Concentrate your labors on a small spot. Keep no more stock than you can keep well. Dispense with your useless dogs, and such like. Subscribe to the *Farmers' Register*, or some other agricultural paper, and you will soon have cause (as I now have) to be thankful to the editor and his correspondents for the great benefit they have done you. Your farm will afford more profit and more pleasure; it will inspire a feeling of manly independence and gratitude to a kind Providence; you will be a fitter subject of a republican government; in short, you will attain the enviable title of  
A RICH POOR MAN.

## OLD AND YOUNG SOWS AS BREEDERS.

If the opinions contained in the following article are sound, our farmers may be suffering loss from ignorance or neglect of them. The custom here is to commence fattening the sow as soon as her first litter are weaned. We seldom have any other than "gilt pigs." Can any of our friends give information upon this subject?—ED.

From the Farmer's Cabinet.

MR EDITOR—I wish to add my testimony to that of "Siam," at page 42 of the Cabinet for August: I have never been able to rear the first litter of pigs from a young sow with credit to myself or profit to any one, and it is now my practice to kill them for roasters, rather than make another attempt. I have, however, seen some who have been more fortunate, but as a general rule, I believe the thing, as I have stated it, is well established; and in a paper which I have now before me, "The Carolina Planter," I find the following observation:

"It is a fact of common observation, with even our old servants who have long been hog-minders, that the first litter of pigs from a young sow, or as they call them, *gilt pigs*, are naturally of a feeble

constitution and unthrifty, and difficult to raise, and even if raised, never perhaps acquire the size and weight that litters of the same sow do afterwards.

And, in addition to this, I would say, I have raised more than twenty calves from young cows—their first calves—and have never failed in obtaining them fine, strong and healthy; nay, if I were to double the number, I should not be beyond the truth. Can any of your readers account for a phenomenon that is so generally accredited, as to have grown into a proverb—"the calf of a young cow, the pig of an old sow."

**Large Crops of Corn.**—The numbers stated below, indicate his quantity of corn per acre raised upon five acres by each of the gentlemen to whose names they are appended. The corn and land upon which it grew were measured in the presence of competent men of undoubted correctness. Some difference existing as to the manner of measuring the acre producing one of the highest quantities, they are both put down at the minimum computation.

Walter C. Young,	192 1-2
Joseph Bryan,	192 1-2
Moses Hunter,	127
L. Singleton,	113
Isaac Brackley,	108
James Shelby,	110

[Kentucky Farmer.]

The editors of the Kentucky Farmer will confer a favor by informing us how these crops were cultivated and measured; what the variety of corn; and whether at the west they measure on the cob. Until these things are known, we must be allowed to doubt whether 192 1-2 bushels, Yankee measure, have been grown on an acre.—Ed.

From the Albany Cultivator.

### THE TREE CORN AND ROHANS.

**Messrs Gaylord & Tucker.**—From the extent of the correspondence to which my article on the beet root and Tree corn has introduced me, published in your paper a while since, I am disposed to believe that a knowledge of the result of my experience with these articles will be acceptable to some of your readers. I have, therefore, forwarded it, to be disposed of as you please.

In the spring, I prepared an excellent piece of ground, of uniform quality, and planted it in three equal proportions, with Tree corn, Red Blaze, and Dutton. The season has been a long one, and very favorable to the growth of corn. The whole came forward and apparently prospered well. I have now completed my harvest, and here follows the result. The Dutton gave me seventy bushels of the finest corn I ever saw, per acre; the Red Blaze gave fifty, and the Tree corn twenty-five bushels. Last year the Tree corn gave me 106 bushels, more than 50 of it sound and good, to the acre, with stalks more than 10 feet high, and very thick and stocky, with numerous ears upon each. This year, the stalks are between 7 and 8 feet high, slender, with one ear, and sometimes a very small one besides, on each stalk. This result to me was very unexpected. I planted from the finest corn to be selected, and calculated on an improvement, instead of so fatal a deterioration. All my neighbors suffered precisely with myself.

Perhaps no corn ever planted in this latitude, if suffered to get ripe, will reward to husbandman so bountifully as the Dutton. For the last two years, I have observed it with much care, and find it about twelve days behind the red blaze, or white flint, in ripening, but vastly superior in product.

In my catalogue of humbugs this year, I place the Rohan potato at the top. As this thing has taken so extensively, it is important that its true character should be promptly understood: and I will contribute my mite of experience to this object. My Tree corn dwindled into insignificance in a hurry, but the Rohan potato has beat it outright in this contest. In 1839, I raised from seed had at Albany, at the rate of 800 bushels per acre; the potatoes of course very large. This year, I planted from my last year's product, one acre; and have now estimated my crop at less than 30 bushels—the potatoes small and few. The ground was good, the season favorable, and the crop well cultivated. I selected a small spot in my garden, as rich as I dare make it, and planted early with some of the best of my seed; it was nursed with the utmost care, and although the growth of vines was not great, yet the yield was scarcely greater than the amount of seed planted. But this is not all; the quality of the potatoes is abominable: no man would eat them in his right senses; and they are undoubtedly as poor for stock as the table. I have extended my inquiries as far as I have been able to do, and find myself as well off with my Rohans as my neighbors. If the quality of the potatoes were worthy of the expense, seed perhaps might be brought from the south, and the product kept up. But as we have so great a variety of better potatoes, I think in this latitude, the Rohan potato will rank with many other exploded humbugs.

Respectfully yours,

SAMUEL GUTHRIE.

Sackett's Harbor, N. Y. Oct. 24, 1840.

### Reciprocal interest of the Farmer and Mechanic.

—There are many things which the farmer ought to raise, in order to prevent his land from growing worse, which will not bear to be carried to a foreign market. The whole attention of the farmer is turned to such things as he can sell. It is, therefore, the interest of the farmers, that there should be a great many people around them who are not farmers, and who will buy and consume those things for which there is no foreign demand. The home market, besides taking many things the foreigner does not want, is also more steady than any foreign market. It is then very important to have the consumers among us; and it is for this reason we ask mechanics and manufacturers to join us and show what they can do. Farmers, already can buy from their neighbors, and pay in truck, many articles for which formerly they must have sent to cities, and to foreign countries. Many here recollect when a man was not thought to be genteelly dressed without an imported hat on his head, and then it was said the imported hat was the cheaper according to its quality. Perhaps it might then have been so in money, (though not now,) but we should consider how many hats were paid for with potatoes and cabbages. Never one. The principle then is plain. The land will never be cultivated in the best manner till it shall be the interest of the farmer to raise all those things which help to keep his land from growing worse. The farmer can never be encouraged to do this so

long as his products must seek a distant market, for many of these articles will not bear the expense of transportation. It is said the improved farming of England was encouraged by the introduction of the culture of turnips from the continent more than by any one thing.—The manufacturers bought the wool and the meat of the animals that fed on the turnips. This is one of the hundred ways in which this thing works in a circle. The greater the variety of employments, the cheaper each sells his products, and yet the more profit each enjoys.—*Farmer's Cabinet.*

**Harvest Thoughts.**—The following beautiful quotation is from one of Bishop Heber's Pariah Sermons:—"When we witness the many dangers which threaten the springing of the rising corn: when we reckon up, in our thoughts, the opposite dangers of drought or of moisture, of parching heat or of pinching or untimely cold; the blights, which may taint the ear; the worm which may consume the root; and all the other alarms which the husbandman feels or fears; we cannot but be aware that something more than the industry of man is required to make him happy or prosperous, and that it is with good reason, that in our daily prayers, we ask our "daily bread" of God; since no day in the year can be found in which His blessing is not needed, either to preserve the seed, or to prosper the tender stalk, or to fill the ear, or to rebuke the mildew or the storm, by which the maturer crop is endangered. And, even when the food of many days is waving before our eyes, we cannot choose, but feel an anxious joy, a solemn, and in some degree a mournful thankfulness, when we compare our own unworthy lives with the unbounded mercy of God; when we recollect how little and how seldom we have thought of Him, who careth for us continually; and when we tremble, lest, even now, our sins should interrupt the stream of His mercy, and that the improper use which we too often make of plenty, should, even yet, turn our abundance into hunger."

**Cure for the Bite of a Rattlesnake.**—The editor of the Cheraw, S. C. Gazette, says *aqua ammonia* (water of ammonia) fresh and pure, in doses of a teaspoonful at intervals of from 15 minutes to an hour, in water, is an infallible remedy for the bite of any snake. This is the dose for an adult, and the medicine is not to be relied upon if the bottle in which it is kept has been frequently opened.

In an early number of the American Journal of the Medical Sciences, is a paper containing a history of numerous cases successfully treated by ammonia.—*Alb. Cult.*

**Cabbage Worms.**—A writer in the Southern Cultivator, says he "had a square of very fine cabbages in his garden, upon which the worms had commenced making great ravages. Pennyroyal was gathered and scattered over the cabbage-heads plentifully, and the work of destruction ceased."—The writer did not know whether the discovery was a new one, but it seems to have been a very easy and effectual one, and well worth a trial.—*Alb. Cult.*

Salt may be safely mixed with food given to geese or goslings, but is fatal to turkeys of chickens. A friend of ours lost 50 chickens by their eating a mixture of salt and meal intended for his horse.—*lb.*

For the New England Farmer.

### RUTA BAGA.

MR EDITOR—In the summer of 1839, I sowed 3-4 of an acre of ground with ruta bagas and 1-4 of an acre adjoining with Dale's Hybrid. The ground was all prepared alike and the seed sown on the same day. They all came up well, and in the early part of the season Dale's turnip grew more rapidly than the ruta bagas, and promised an abundant crop. But when the roots had attained the size of my finger, they began to rot; and I believe I had not a turnip on the piece worth pulling. None of the ruta bagas died. I concluded that Dale's turnip was a less certain crop than the others, and that I would try no more of them.

About the 25th of June last I sowed half an acre with ruta bagas. They came up well; but by the time the roots were 1-4 of an inch in diameter, I found they were dying. I did not examine them particularly for some days; or, perhaps, weeks, after I made the discovery. When I did examine them, however, I found they were rotting in the middle, and when the rot had reached the outside of the root, the top died. On many which were not dead, I found a small puncture on the side, and on cutting the root open, I found it had been eaten hollow near the top. On pulling up and closely inspecting a large number of them, I found in two or three a small white maggot, about the size of the largest we see in cheese.

In pulling my crop, which though a light one was not an entire failure, I found many of the turnips, which had grown to a good size, were hollow; and many of them were quite defective. All the crops of ruta bagas which I have noticed in this quarter this season were rather light.

Now, Mr Editor, I wish to know whether it is common for ruta bagas to suffer from this kind of worm; and if so, whether there be any remedy? Or is my disappointment owing to some mistake of mine? That this question may be answered, I will state my management and the manner the ground had been previously treated. The soil is a sandy loam. In the spring of 1838 it was covered with a straggling sward, which was ploughed in for corn, after being well manured from the barn. In the fall, lime was applied at the rate of eight casks to the acre. In the spring of 1839 it was again manured from the barn and ploughed for mulberry trees. Twentyfive or thirty loads of compost, made of stable manure, loam and lime, to the acre were covered in the furrow with the trees. Before hoeing, a top-dressing of 25 bushels of crushed bone and 25 bushels of leached ashes was applied to the acre. And as I was desirous of getting a large growth, after hoeing I added 25 bushels of powder to the acre. In the summer, I sowed common turnips between the rows. The crop this year showed that the land was in good condition.

In the spring of 1840, the land was ploughed and lay in the furrow till the time of sowing ruta bagas, when it was harrowed, ploughed a second time and then harrowed well. Light furrows were then opened with a horse plough, a dressing of bone manure was put in the furrows and slightly covered with dust, when the seed was sown in the furrows, by means of a drill barrow.

If you, Mr Editor, or any of your correspondents, can tell me the cause of my failure, and the remedy (if any,) I shall be highly gratified. I think more light may be elicited by farmers publishing

their failures, than by their publishing their success.

R. R. P.

Manchester, Ct., Jan. 7, 1841.

[We have seen crops of ruta бага similarly affected. Have conjectured causes. Sometimes the question with us has been, whether the evil were not caused by the use of unfermented manure in the drills; and at other times we have asked whether it were not early sowing. R. R. P. has here shown that the cause must be different from either of these. He is entitled to thanks for "publishing his failures," and we would aid him to a solution of his difficulties were it in our power; but we can only join him in a request that some one will give the needed information. We will simply ask whether he or any one else has ever seen a crop suffer in this way, excepting upon free or light soils and those highly manured. On tenacious and moist lands, and upon sward land we do not recollect ever witnessing such failures.

The inquiry relative to Mr Ingersoll's piggery accompanying the above communication we have not published, because, we are led to believe that the communication, referred to, once made in these columns, was never worthy of credit (we know not from whom it came,) and because the gentlemen is not now in this vicinity.—Ed.]

### NEW SEEDLING CAMELLIA WILDERII.

One of the most popular ornamental green house plants of the present day is the Camellia Japonica, of which there are more than 500 varieties, described in a work recently published in France, by the Abbe Berlioz, worthy of a place in the conservatory, many of them magnificent and costly, and a great majority produced within a few years by the celebrated florists in Europe, by cross impregnation. Some few very fine varieties have been produced in our own country by Floy, Landreth, and others.

Marshall P. Wilder, Esq., of Dorchester, has had in his possession more than 300 of the very best varieties of this plant, most of which have displayed their interesting and elegant flowers, and have been examined from time to time with much interest by the writer. Mr Wilder has been very successful in ripening seed from many of the choicest kinds, the flowers of which were crossed with other fine sorts, and he has now in different stages of growth, from one to four years old, over 600 seedlings. It might be expected that from this large number, some few fine varieties would be produced worthy of a name and place among their parents, and we have been anticipating a share in the owner's pleasure in beholding something novel. We had no idea, however, that Mr Wilder would so soon be rewarded by a flower that would surpass in perfection and eclipse all that had preceded it. But this, according to our fancy, is the case. We have within a few days had the pleasure to examine this beautiful production and must say that it stands unrivalled by any Camellia which has come under our observation. It is four years from seed. Its parents were the Single Red, fertilized by the variety C. punctata, a fine, double white delicately spotted and marked with red. The size of the new variety is four inches in diameter; color, a most beautiful clear rose; form exquisite, every thing that could be desired; petals being of the most perfect rose leaf shape, arranged with the greatest regularity in the shell form, from circumference to

centre. The flower is very deep from the back to its centre, forming a semi-spherical ball, and has a bold and showy effect. But what gives this variety its great excellence when compared with those established favorites, the old Double White, Lady Hume, Landrethii, &c., is its broad round petals with scarcely a notch or serrature on the edge, and retaining a round full bosom at the centre even when fully expanded.

Those who are acquainted with this family of plants, will be able to judge of the value of such an acquisition as the Camellia, which is the subject of this article, by referring to our Horticultural Journal, vol. iv. page 26, where it is stated that Mr Wilder had received a Camellia from Germany, which his correspondent had paid two years before twenty-six guineas for a plant of seven leaves. If after ten or twelve years Mr Wilder had succeeded in producing this Camellia, he might thus have considered himself as amply rewarded for his exertions. No doubt this variety will be considered as one of the first class, as long as the family exists. It has been suggested to Mr Wilder that he gives it his own name—if so, it will be known as C. Wilderii. It will be propagated as fast as possible and will be found ere long in the best European and American establishments. We noticed a number of other promising looking seedlings in bud, and from the pains which have been taken with them by crossing the best varieties with those of equal value but of different characters, we may hope to be able to announce hereafter other fine new varieties, but we doubt whether it will fall to the lot of Mr Wilder to produce another combining so many points approaching perfection as the one now described. J. B.

### SILK: THE OTHER SIDE OF THE PICTURE.

The following communication is timely and acceptable. The leading views contained in it are in near accordance with what we believe to be the prevailing opinions in this vicinity. Consequently little need be said in our columns in this strain.—We admit the communication cheerfully, because of our desire to make it distinctly understood, that while in our hands, the paper will contain only a small portion of matter in favor of the silk business. Little need be said against it. There is in us something like a belief that the time may come when New England will grow her own silks. When she shows a disposition to do this, we are ready to encourage. We oppose no obstacles: we give no help, because we might allure men on to their injury.—Ed.

For the N. E. Farmer.

MR EDITOR—I noticed recently in your paper an article containing the experience of an unsuccessful silk-grower. It is high time, I think, that the public should be furnished with many more similar statements, for there is no doubt they can be made, if the desire to promote the public good can triumph over self-interest and pride of opinion. We have too long been presented with only one side of the picture, and that side colored with a tints which a glowing imagination could give to it. The experiment of raising our own silk has been pretty fairly tested, and I will not say has fairly failed; but has not as yet to my knowledge succeeded.

There are many substantial reasons why it can not succeed here in New England. It may be

laid down as an axiom that those productions that suit not the climate, soil and situation of a country, cannot be advantageously produced in such country. How stands the facts, then, with regard to the growing of silk? In the first place, the mulberry tree, and especially that species known as the *Morus Multicaulis*, is difficult of raising in New England. The favorite *Morus Multicaulis* will, indeed, attain to a most prodigious growth in a single year, but it will not stand our severe winters, unless guarded in some such way as to make it altogether too expensive to be undertaken on any extended scale. The trees must either be removed to a cellar, or embedded in manure, and neither of these operations have been tried for a series of years so as to determine the question whether the trees will survive or thrive through them all.

In the next place, our summer season is so short that even supposing the trees are living at the commencement of it, they are so long in putting out and bringing to maturity their leaves, that there is no certainty of having food for the worms at the time they need it. I know there is a favorite remedy for this difficulty, viz: by placing the eggs in an ice-house and thereby delaying the hatching of them till the leaves are grown. But it is no easy matter to retard this process till the precise moment required—the ice begins to be consumed or melted, and the little prisoners escape into life early to meet a speedy death by starvation. Such I have known to be the fact in many instances.

In the third place, granting the worms hatched out and with plenty of food, where are the hands to supply them with that food—to take care of them and manage the details of the cocoonery, till the silk is ready to be reeled, and ready for the market? Have we the surplus population here to attend to these matters with profit? Can we compete with France or Italy in this respect? Have we not a large demand already for female help for our factories, for binding shoes and other such employments, and especially for the kitchen and the dairy, than can be supplied?

But I will not go further at this time into the consideration of a subject so important to the community, hoping, however, that what has been said may have the effect to call forth an expression of the views and experience of others upon it. While we should aim at improvement in our productions, let us be careful lest we push our experiments on too large a scale, and upon the wrong track: let us not leave the certain good we have, and fly to that we know not of. A PLAIN FARMER.

From the Albany Cultivator.

#### REARING CALVES ON FLAXSEED AND HAY TEA.

*Messrs Editors*—Permit me through the medium of your valuable periodical, to thank my friend of Washington, for his favors bestowed on me, the which through your politeness I have received, and in reply to his question as to my way of rearing calves, I reply that I believe not one of the calves I raised, ever received a drop of milk from the cow. My cows were watched closely, and as soon, and in fact in more than one case before they did stand, they were carried in the pen I had prepared for them; their mouths were then filled with salt, (this by the by was done at least once a day, until they were turned in pasture.) In preparing the flax seed, we put half a pint of seed to three quarts of

water, and boiled it till it became a jelly; then boiled water on hay, so that when the hay tea and flax seed was mixed, it was but little thicker than milk; this, when about blood warm, was put in a trough, and it was but a little time before this was the only trouble we had with them. We every day put fresh hay in their pen, and I have seen my calves at 7 days old eating considerable of the finest of the timothy hay, and it was really amusing to see the sprightliness of a calf at 4 and 5 days old, that had never tasted milk, which is so contrary to the common way of rearing them; but it convinced me of the saying of Sam Patch, that some things can be done as well as others. I have never tried this mode of raising pigs, but I intend to with some of the first litter I have, and will let you hear of my success. I see only one obstacle in the way, and that is to learn them to drink, for I think if this method is adopted it must be done without the pigs having any milk. I think we must obey the command in fact and deed, to train it up in its infancy in the way we would have it go, if we expect success. E. S. WILLETT.

From the same.

#### USE OF BARILLA IN VIRGINIA.

*Editors of the Cultivator*—Having seen in the October No. of your valuable paper, an inquiry respecting the best mode of applying barilla, or leached ashes, to the soil, and having made several trials of it, I deem it my duty to give the results of my experiments in its use. I must premise by saying that until I commenced the use of it, those who had it to dispose of, were in the constant habit of selling it to the captains of the northern vessels, as *ballast*, on their homeward voyages, at about *seven cents* per bushel. My first trial of it was on a small lot of ruta бага; a part of the lot was highly manured by my cows during the preceding winter, and the balance with barilla, at the rate of about 100 bushels per acre; the portion having the barrilla was decidedly the best. The next spring, I tried it on my corn, by putting it in the hill before planting, and chopping it well in, at the rate of about 50 bushels per acre; but I found it too hot to be applied in this manner, although the corn was improved by it. I can now plainly perceive the benefit arising from its use, by the improvement to the succeeding crops. My third, and in my opinion, most successful mode of using it, was by scattering it on a heavy coat of weeds in the fall, and ploughing it under immediately, the land being intended for corn the ensuing year. By the side of this piece was another highly manured with compost from my farm yard. I think the corn was better on that part having the leached ashes; and the succeeding crop of oats and clover was greatly superior. I have used it this fall on my ruta бага at the rate of 100 bushels per acre. My crop is only a moderate one, having been sown late, and the fall being too dry for it.

The dawn of a better day for agriculture is appearing to the view; and our southern farmers, profiting by the examples of their northern brethren, are beginning to turn their attention to the improvement of the soil, the first grand desideratum of which is the increase of manures. It is not, as formerly, the object with Virginia farmers, to see who can first procure a crop of broom straw and pine from their land, but who can improve his land fastest. Several years ago, I remember to

have heard gentlemen, who called themselves *farmers*, say they had no time to devote to making manure; and that they hardly had spare time to haul out what was made in the ordinary way. This reminds me of an anecdote told of a gentleman formerly a resident of King and Queen county, who said he never made but one *good* crop of wheat, and it nearly ruined him to get it to market.

Yours, truly, RICHARD HILL, Jr.

#### DOCKING HORSES.

We are sorry to perceive that the barbarous, cruel, and injurious practice of docking and nicking horses is again beginning to be looked upon with favor, after some years of merited disuse.—We wish to enter a decided protest against the system, as injurious to the horse and offensive to good taste. A handsome flowing mane and tail constitute the most graceful and useful appendages to this noble animal, and are essential both to his strength and comfort. None but a narrow-minded, ignorant man, would have in the first place ventured on such a violation of vested rights; and none but blockheads or jockeys, destitute of the better human feelings, could have perpetrated or tolerated the innovation. We are not in the habit of indulging in unkind feelings against our fellow men, however useless or ridiculous their conduct may be, but when we have seen a docked horse turned out to grass, and obliged, between every mouthful of food, to employ at least as much time in biting off flies, as he uses in eating, a loss of time and labor, that a tail, in its natural state, would have entirely prevented, we have almost wished that the perpetrator of the outrage, in a state of nudity and his hands tied, could be placed in some of our swamps, for half an hour, in order to realize the pleasure an unprotected animal must experience when exposed to the assaults of mosquitoes, ox, horse and gad flies.

It is impossible that a docked horse should be as vigorous and strong as he would have been had this operation never been performed. A division of the strong tendons and muscles that have their termination in the tail, must of necessity inflict an irreparable injury. A few years since, an English gentleman had a fine hunting horse, that would carry his rider over a five barred gate with ease; but the tail was not in fashion, it was not carried to suit him, and he had him nicked; the result was that when he got well, he could scarcely carry him over two bars. "Thus" said he, "I spoiled a good horse, and no wonder; for the operation weakened his loins, a result that might have been reasonably expected from the severing of two such muscles."

Race horses, we believe, are never docked or nicked. Their muscular powers are all wanted, and that too, where nature placed them. The hair of the tail is cropped, as any one may see in the fine prints that accompany the English sporting journals; but the man who should undertake by the use of the knife, and the division of the tendons, to improve nature, would justly be deemed insane. The same argument that prevents the mutilation of the race horse, should prevent that of the carriage or farm horse. The trifling inconvenience the tail occasions when in the harness, should be tolerated for the sake of the greater beauty of the animal. Let who will prefer jockey horses, we shall consider those the best upon which the axe or knife has never passed.—*Maine Cultivator*.

NEW ENGLAND FARMER,  
AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, JAN. 20, 1841.

FARMING.

*Can Farming be an Intellectual Pursuit?*

The subjects of inquiry and reflection that lie scattered over the farmer's fields are numerous enough and vast enough to give constant and full employment to the most active and the most comprehensive mind. Each tree and plant, each meadow and each hill, every domestic animal, and every operation upon the farm may furnish food for the intellect. The laws of nature—the rules by which the Invisible ever acts—must be known in part and regarded by every cultivator of the soil.—The more fully one understands these laws, the more successful may he be in directing his own labors along their course and making them his successful co-workers in producing an abundant harvest. For instance, should it be true that in every soil of good depth and fertility, each blade of corn will send out its roots at that distance below the surface of the ground which will place them in the temperature and moisture most favorable to their health and to vigorous action, then *he* avails himself most successfully of nature's aid, whose *how* neither increases nor diminishes their covering—If, in certain lands, those roots cannot find earth that is not more moist than they desire, then *he* does wisely whose plough opens furrows between the rows by which the superabundant moisture may be drawn off. If one infers that his crop, without his help, probably will not mature before the frosts of autumn, then it may be good husbandry to cut the roots of his corn with the plough; check the growth, and hasten the maturity of his crop. He that would be a successful cultivator, must learn at what stage of its growth his crop demands the most nourishment, and must know the degree of fermentation his manure should undergo *before its application*, in order to impart the greatest amount of food in that month in which it is most needed. The points of inquiry and observation are countless in number, difficult of solution, and may keep the mind ever on the alert. He who learns most and wisely applies his knowledge, will be the most successful farmer.

We say to all tillers of the soil, observe, compare, reflect, study: become a *thinking class*, for thus you will make your occupation more interesting and more profitable. Even in small matters, thought may be turned to profit. A few years since we were topping turnips by the side of a younger brother. Each had his separate basket, and he would fill his six times to our five. We thought our hands moved as quickly as his, and asked why we did not accomplish as much. Watching and comparing movements, we soon saw that in the operation upon each turnip we made one motion which he found no occasion for. A little practice enabled us also to dispense with it and to accomplish the work with greater dispatch.

The time is fast coming when our farmers must look at more intently, and comprehend more clearly, the principles of good husbandry. And we fondly hope that the boys on our farms will be encouraged and aided to inquire into and to master the reasons for every practice upon the homestead. Let them know *why* the thing is done; *why* one process is to be preferred to another.—Let them ask,—yes, grey-haired farmers, even though you may be made to blush because you can give no other reason than that your father always did so, and you have always done so,—yes, let the boys ask; let them

learn whether the old mill-horse paths in which you and your father have been going round and round for half a century and more, are the best paths. It is only by making the pursuit more intellectual that you can make the intelligent and inquisitive boy contented with agricultural labors. Thus only can you fit him for successful competition and respectability among those who are fast coming up to take the places which we now fill. Rich treasures of knowledge can be found in the barn, the hog-pen, the manure heap and in the soil of every field and pasture upon the farm. Let the boys seek for the wealth, and do not forget to join them in the search.

FIELD PREACHING—No. I.

Having been in former years accustomed to sermonizing, our pen has a kink that way, which it is difficult to straighten out. We have left the pulpit and taken the field: can we preach there? What say, farmers, shall we let the pen indulge in its old habits a little? Will you read a few short sermons? Here follows the first one.

*Be thou diligent to know the state of thy flocks and look well to thy herds.—SOLOMON.*

This proverb, my hearers, is addressed to *you*; to owners and tenders of the animals from which our bellies are filled, our backs clothed, and our feet shod—the sheep and the cow. In giving you dominion over the beasts of the field, the Chief Shepherd has imposed also the duty of taking good care of those over whom you are appointed to rule. Though in early summer he “tempers the wind to the shorn lamb,” yet he expects you to protect the flocks from the bitings of winter's cold, and the peltings of winter's storms. Neglect to provide comfortable lodgings for your stock, argues disregard to the will of Him who gives those flocks that roam “upon the thousand hills;” it fails to win the smile of Him who “gives the increase.” *Comfort* is the choice and nourishing food of all those mute dependants, whose “eyes wait upon you to give them their meat in due season.” Let them be well protected. Also, let them daily find you *early at the barn*, shaking well the matted hay that it may yield more readily and fully to the action of their grinders, and thus become more digestible and nourishing; let them find you mixing well together the hays of various qualities, that the food may be rendered more palatable; let them find you inferring that as you yourself relish changes in diet, so they too may like to have their fodder sometimes varied; let them find you patiently dealing out their feed in quantities so small that they may never be forced to take in hay that has become offensively fouled by their own breath. Supply them abundantly with water—good water. Keep them dry and clean. Feed them too with *animal magnetism*—that is, elbow-grease,—that is, the curry-comb. It is cheap food, contributing to comfort, thrift and good appearance. Treat them with gentleness, supply them diligently with good food and drink, keep them comfortable—and then the ear of faith will daily hear the voice of Him who speaks through the speechless brute, saying “I will repay.” The laws of the Immutable will never permit a man to prosper in his flocks who has no heart for them—no sympathies with them—no fondness for them—no devotion to their comfort and wants.—The dull eye, the down-bent head, the up raised back, the projecting hips, the hedge-hog hairs, and the dung-bound hide, of the half-starved and half-frozen beast, will all find tongues by which the Invisible will say to the merciless owner, in startling tones, “I will repay.”

COMMON SCHOOLS.

Though *common*, these humble seminaries are mighty agents: they are the lever which has raised New England to her high position. Much as we are indebted to colleges, academies, and other similar institutions, we owe more—inestimably more—to *common schools*. Opening their doors to all, sowing the seeds of learning broadcast over the land, their contributions to intelligence, and consequently to prosperity and enjoyment, though bestowed in small portions to each, yet in the aggregate swelled to a vast amount. From these primary assemblies, ooze out the rills, which conmingling form the streams that are ever washing out our moral and political stains. Stop the flowings of these waters, and our fair land would fast blacken with ignorance, vice and crime. Liberty would lose her richest nourishment, philanthropy her most invigorating draughts, christianity her invaluable supplies.

Christians, philanthropists, patriots—cherish these nurseries of the mind and heart of the next generation. Place them so high that the children of the *rich* shall be sent here to meet and mingle with those of the poor; here let all classes early take lessons in republican equality; let the children of the wealthy here learn in early life that they are being trained up for scenes in which the most industrious, the most intellectual, the most deserving are to be at the head of the class; here let the poor boy learn that when he outstrips the rich man's son in the race of learning or moral excellence, that the prize of distinction or approbation will be bestowed upon himself.

Farmers, these schools are invaluable to your children and to your country. Few higher duties rest upon you than that of lending wise, generous and constant aid to the school in your own district; notice and encourage the teacher; by precept and example influence all parents to send their children to the school; supply your children well with books; let them be at school in season, and constant in attendance; help cheerfully to make the house comfortable. These points are all of them important; each is worthy of serious thoughts; and when well considered in all their bearings and influences, you cannot fail to see that faith in our country's future eminence and true greatness must rest mainly upon the efficiency and high character of the *common school*.

AGRICULTURAL MEETING AT THE STATE HOUSE.

On the evening of Thursday last about two hundred gentlemen met in the Representative's Hall, for the purpose of conference upon agricultural subjects. When the meeting had been called to order, and a chairman and secretary pro tem. had been chosen, the Agricultural Commissioner addressed the meeting for about an hour. Our position in the house was unfavorable for taking notes, but as far as we recollect, he compared the condition of New England farmers, with the tillers of the soil in various other parts of the world, and maintained that we have abundant reason for gratitude and contentment: contentment with what Providence and society have done for us, though not with our own advancement in the science and art of husbandry.

Dr C. T. Jackson was invited to favor the meeting with some account of the soil of the Islands in Winnepesaukee lake, so famous for its produce of corn. In his opinion, this soil is not naturally of greater fertility than that of many other spots in New England. Favorable position, plentiful manuring, and careful tillage, produce the extraordinary results. One fact was disclosed by him of which we were ignorant; which is, that the mi-

nute roots of living plants exert powerful chemical action in decomposing rocks and the very small stones—gravel stones—which abound in our lands. The roots of bulbs in glasses lie has found corroding the glass, and extracting from this hard substance a portion of its food. In these living roots there is greater chemical power than nitric or sulphuric acids exert, for the glass is unaffected by them.

**GEN. DEARBORN'S ADDRESS.**

Our thanks are due to Gen. H. A. S Dearborn for a copy of his learned and interesting address before the Berkshire Agricultural Society. This work is replete with valuable historical and statistical information. It abounds in texts for the political economist. We shall extract from it for our columns.

**SURVEY OF RHODE ISLAND.**

Dr C. T. Jackson has favored us with a copy of his Geological and Agricultural Survey of Rhode Island. We have had no opportunity yet to examine its contents.

**THERMOMETRICAL.**

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northernly exposure, week ending Jan. 17.

Jan. 1841.	7 A.M.	12, M.	5, P.M.	Wind.
Monday,	11 30	36	38	N. W.
Tuesday,	12 39	34	34	W.
Wednesday,	13 30	32	30	E.
Thursday,	14 20	25	22	N.
Friday,	15 20	30	29	N. E.
Saturday,	16 21	40	34	N. E.
Sunday,	17 36	50	55	S.

**BRIGHTON MARKET. — MONDAY, JAN. 18, 1840.**

Reported for the New England Farmer

At Market 210 Beef Cattle, 100 Stores, 1100 Sheep. Prices.—*Beef Cattle*—About half the Beef Cattle were purchased Saturday, some of which were re-sold to day at an advance, and sales were quite unequal. We quote a few extra, \$6 00. First quality \$6 00 a 6 25. Second quality, \$5 50 a 6 00. Third quality, \$4 50 a \$5 25. *Sheep*—Lots were sold at \$1 75, \$2 25, \$3 00, \$3 50, and \$4 00. *Swine*.—None at Market.

**WILLIS'S LATEST IMPROVED VEGETABLE CUTTER.**

For sale at the New England Agricultural Warehouse, No. 51 and 52 North Market Street, Boston, Willis's Latest Improved Vegetable Cutter. This machine surpasses all others for the purpose of cutting Ruta Baga, Mangel Wurzel, and other roots. The great objection to other machines, is their cutting the roots into slices, which makes it almost impossible for the cattle to get hold of them; this machine with a little alteration, cuts them into large or small pieces of such shape as is most convenient for the cattle to eat. It will cut with ease from one to two bushels of roots per minute. **JOSEPH BRECK & CO.**

**GREEN'S PATENT STRAW CUTTER.**

**JOSEPH BRECK & CO.** at the New England Agricultural Warehouse and Seed Store Nos. 51 and 52 North Market Street, have for sale, Green's Patent Straw, Hay and Stalk Cutter, operating on a mechanical principle not before applied to any implement for this purpose. The most prominent effects of this application, and some of the consequent peculiarities of the machine are:

1. So great a reduction of the quantum of power requisite to use it, that the strength of a half grown boy is sufficient to work it efficiently.
2. With even this moderate power, it easily cuts two bushels a minute, which is full twice as fast as has been claimed by any other machine even when worked by horse or steam power.
3. The knives, owing to the peculiar manner in which they cut, require sharpening less often than those of any other straw cutter.
4. The machine is simple in its construction, made and put together very strongly. It is therefore not so liable as the complicated machines in general use to get out of order.

**LAMP OIL—PURE SPERM OIL.**

**E. T. HASTINGS & CO.** No. 101 State St. keep constantly for sale, Winter, Spring and Fall Sperm Oil, bleached and unbleached; which they warrant to be of the best quality and to burn without crusting. Oil Canisters of various sizes. Boston, Jan. 1, 1841. *istly*

**GRINDSTONES.**

An extensive assortment of Water and Hand Grindstones constantly on hand and for sale by **AMMI C. LOMBARD & CO.** 13 Lewis's Wharf. *istly*. Nov. 17.

**FARM FOR SALE.**

The subscriber offers for sale that valuable Farm, situated about 3-4ths of a mile below the First Parish Meeting House, on the Stage road, and commonly known as the Judge Prescott farm, containing about 170 acres of superior land, in a good state of cultivation, with two dwelling houses, four barns, and other out buildings. The farm is remarkably well watered with soft water, conveniently fenced, has nearly forty acres of large, handsome wood and timber standing on it, with an orchard of grafted Apple, Pear, Peach, Plum, and Cherry trees, and might be easily divided into two Farms. The estate will be sold reasonably. If five thousand dollars be paid on receipt of the deed, the remainder may lay on mortgage to suit the convenience of the purchaser. For further particulars, apply to the subscriber, living on the premises. **WM. SALISBURY.** Groton, Oct. 26, 1840. *eow.*

**FRESH GARDEN SEEDS.**

We would inform our customers and friends that we are now receiving our supply of fresh Garden Seeds, most of which have been raised under our own inspection, from fine selected roots; which we warrant to be of the purest quality of the growth of the present season.

Agricultural Books. Agricultural Implements. Seed and Implement Catalogues sent to all applicants gratis, and all orders promptly attended to. **JOSEPH BRECK & CO.** Boston, Sept. 29, 1840.

**TIE UP CHAINS.**

Just received at the New England Agricultural Warehouse, a good supply of those celebrated Chains for tying up cattle. These chains, introduced by E. H. Derby, Esq. of Salem, and Col. Jacques, of Charlestown, for the purpose of securing cattle to the stall, are found to be the safest and most convenient mode of fastening cows and oxen to the staebion. They consist of a chain which passes round the animal's neck, and by a ring attached to the stall, plays freely up and down, and leaves the animal at liberty to lie down or rise at pleasure, and keeps him perfectly secure. July 15. **JOSEPH BRECK & CO.**

**TRACE CHAINS.**

Just received, direct from the English manufacturers, 8 casks of Trace Chains, from 6 to 11 feet long, suitable for ploughing or draft chains. **JOSEPH BRECK & CO.**

## MISCELLANEOUS.

## SERMONS.

In the New York Sunday Morning Mercury, a popular writer, called "Dow, Jr.," weekly exhorts its readers. They are quaint productions and have the air of novelty, as well as originality. The following is a specimen. The moral is good and the similitude is an easy and natural one."

"My friends, allow me to show you how the human body is likened to a house. My text explains this, it says that the big bones are the main timbers: very true. It also says that the ribs are laths, well plastered; but I should say that they are rafters that run into the ridge-pole, or back bone. The mouth is the door, and the nose is the chimney—especially for smokers. The throat is an entry that leads to the kitchen of the stomach where all sorts of food are cooked up; the lungs are the bellows that blow the flame of life, and keep the pot of existence always boiling; the heart is the great chamber, where the greatest variety of goods imaginable are stored; some good, many bad, and a few rather middling.

"In this way, my hearers, you see the house of the human body is formed; and since it is a house of no small value, you ought to be careful of it, keep it well swept and never let cobwebs of sin gather in the corners of its apartments. I beseech you, especially, to look after the great chamber of the heart, and see that every thing there is arranged according to the very letter of morality. If there is any useless rubbish there, clear it out to make room for goods that are saleable in the markets of the virtuous. The chambers of some hearts present an awful dirty appearance! I should like to walk into them with a brand new broom; the way I'd brush out sin and sand the floor with virtue, would be a caution to depravity!"

## AGE OF TREES.

Some of the cedars of Mount Lebanon, measured in 1660, by Maundrell and Pocock, were found to have been nearly 800 years old—the English yew trees of Fontaine Abbey, in the county of York, had survived 12 centuries, those in the churchyard of Crowhurst, in Surry, 1400 years—that of Fotheringill, in Scotland, from 2500 to 2600—that of Braburn, in Kent, 3000. These travellers describe two other trees of a most remarkable character, the Baoback, estimated to be 5150 years old, and the cypress of Taxodium, in Mexico, 117 feet 10 inches in circumference, still more aged. A sycamore near the ruins of Heliopolis, according to the tradition in Egypt, existed before the visit of Joseph and Mary, and they sat under its shadow and drank water from a neighboring well. Another of the same species, termed the sycamore of the Bosphorus, and computed to have been 4020 years old, has disappeared, leaving ten sprouts which sprang from the stump; one of which being measured, was found to be 1050 years of age; and it is possible others equally old have been destroyed, and that the present trees are the second remove from the parent stock. The celebrated chestnut of Mount Etna, 2660 years old, grew from the stump of a felled tree.

In America, more than a hundred and forty different species of trees attain an elevation of thirty feet and upwards; while in Europe only thirtyseven

grow to that height, but eighteen of which enter into the composition of forests, and only seven are employed for domestic or maritime purposes.—There are stated to be 53 species of the oak, in North America, 17 of the pine, and 8 of the maple. We have 11 species of walnut, while not one is indigenous to Europe, the variety commonly cultivated there being a native of Persia.

**LANGUAGE OF ANIMALS.**—The acuteness of the sheep's ear surpasses all things in nature that I know of. A ewe will distinguish her own lamb's bleat, among a thousand, all bleating at the same time, and making a noise a thousand times louder than the singing of psalms at the Cameronian sacrament in the fields, where thousands are congregated—and that is no joke either. Besides, the distinction of voice is perfectly reciprocal between the ewe and lamb, who amid the deafening sound, run to meet one another. There are few things which have ever amused me more than a sheep shearing and then the sport continues the whole day. We put the flock into the fold, set out all the lambs to the fill, and then send the ewes to them as they are shorn. The moment that a lamb hears its dam's voice, it rushes from the crowd to meet her, but instead of finding the rough, well clad, comfortable mamma, which it left an hour or a few hours ago, it meets a poor, naked, shrivelling—a most deplorable looking creature. It wheels about, and uttering a loud, tremulous bleat of perfect despair, flies from the frightful vision. The mother's voice arrests his flight—it returns—flies, and returns again, generally for ten or a dozen times, before the reconciliation is made up.—James Hogg.

**"LIFE" IN AN OYSTER.**—The liquor in an oyster contains incredible multitudes of small embryos, covered with small shells, perfectly transparent, swimming nimbly about. One hundred and twenty of those in a row, would extend one inch. Besides these young oysters, the liquor contains a great variety of animalculæ, five hundred times less in size, which emit phosphoric light. The list of inhabitants, however, does not conclude here, for besides the last mentioned, there are three distinct species of worm, called the oyster worm, found in oysters half an inch in length, which shine like the glow worms. The sea-star, the cockle, and the muscle, are the great enemies of the oyster. The first gets into the shell when they gape, and sucks them out.

When the tide is flowing, oysters lay with the hallow side downward, but when it ebbs they turn on the other side. Query:—How do those manage that are attached to rocks? Do they, like a cunning politician, go with the tide? What a lesson may be drawn from the economy of the oyster! The loose ones, it seems, are always 'on the fence.'

**AN APOLOGY.**—When John Clerk (Lord Eldon) was at the bar, he was remarked for the sang froid with which he treated the Judges. On one occasion, a junior counsel, on hearing their lordships give judgment against his client, exclaimed that 'he was surprised at such a decision!' This was construed into contempt of court, and he was ordered to attend at the bar the next morning. Fearful of the consequences, he consulted his friend John Clerk, who told him to be perfectly at ease,

for he would apologize for him in a way that would avert any unpleasant result. Accordingly when the name of the delinquent was called, John rose and coolly addressed the assembled tribunal: 'I am very sorry, my lords, that my young friend has so far forgot himself as to treat your bench with disrespect; he is exceedingly penitent, and you will kindly ascribe his unintentional insult to his ignorance. You must see at once that it did originate in that. He said he was surprised at the decision of your lordships! Now, if he had not been very ignorant of what takes place in this court every day—had he known you but half as long as I have done, curse me if he would be surprised at anything you did.'

## POUDRETTE.

The subscribers reside in the state of New Jersey, many of us in the vicinity of the works erected by Anthony Dey, of the city of New York, on the Hackensack river, in New Jersey, for the manufactory of Urate and Poudrette, called "The Lodi Manufacturing Company." We have used the poudrette on the Spring Crops this year, 1840. We find it a valuable manure, superior to any other kind that we have ever used, and considering the facility of its transportation to the field, the small quantity required in the application to the crops, the quickness of its operation on vegetable matter, and the ease with which it can be applied,—all tend to recommend its use to the farmer and gardener as the cheapest and best manure, and we recommend it accordingly.

Those of us who have applied it to corn and potatoes think that it ripens those vegetables quicker than any other manure by several weeks.

Dated New Jersey, October, 1840.

Jacob D. Van Winkle.	P. F. Welsh
John J. Newkirk.	G. C. Van Riper.
John Tise.	George Tise.
Daniel Van Riper.	William Wood
George Demott.	John Durjee.
Henry Drayton.	George Newkirk.
Josiah Hornblower.	Garret Newkirk.
Corns. Van Winkle.	Daniel Vreeland.

Shares in the above company are \$100 each, and may be had by applying to Anthony Dey No. 73 Cedar St. New York.—The owner will receive 20 per cent. per annum, payable in money, or 50 bushels of Poudrette. The price to those who buy Poudrette is 40 cents a bushel. It costs the Stockholders 12 cents a bushel. One cent's worth, that is, 20 Gills, will manure 20 hills of corn, and the like quantity 15 hills of Potatoes.

Newspapers friendly to agriculture will confer a favor on the Farmers and Gardeners by publishing the above.  
Dec. 22.

## POUDRETTE.

This valuable manure may be had on application to the subscriber, at the office of the "New York Poudrette Company," No 120 Nassau street, New York. It is in-odorless, and may be transported in barrels, on board of any vessel or steamboat, without offence—and it will be found an exceedingly valuable article as a fertilizer on any soil, and for any crops; but more especially for gardens and flowers, as there are no foul seeds in it. Poudrette has been used for three seasons with entire success on Long Island, by many practical farmers, as may be ascertained from letters and statements made by them, and published at this office in a pamphlet containing also the "act of incorporation," granted to the Company by the Legislature of the State of New York; and other facts in relation to the subject. Price 35 cents per bushel. Barrels cost 25 cents each, and hold 4 bushels. Persons wishing to make an experiment on a small scale can obtain one barrel by enclosing a two dollar current bank bill—or three barrels by enclosing five dollars, free of postage. On receipt of the money the article will be put up and forwarded as directed.

\* \* \* Price of shares, one hundred dollars—which entitles the holder to one hundred bushels of poudrette annually, during the term of the charter; fifty bushels in time for spring use, and fifty bushels in time for fall use. Shares taken soon, will be entitled to the spring dividend—and, if desired for experiment, a few bushels may be had this fall.

All orders, or applications in relation to the business, must be made to the subscriber, 120 Nassau street, New York.  
D. K. MINOR.

I wish it distinctly understood that the "New York Poudrette Company" is in no way connected with the "Lodi Manufacturing Company," of which Anthony Dey and Peter Barthelmy are, or were, the managers.  
Dec. 9, 1840. 3m. D. K. M.

N. E. FARMER.

### HARTWELL CORN.

Calling upon the Agricultural Commissioner last winter, we saw, in a glass upon his table, a small quantity of corn. "Mr Colman," said we, "I want that corn." "You can't have it, for I am to exhibit this at the State House, where I shall read a letter from Dr. Hartwell, of Southbridge, by whom it was raised, in which he gives an account of his mode of cultivation and of the yield." "Can some be obtained from him?" "Yes, I will furnish you with some in the spring." He fulfilled his promise and I received two ears. The reason of my request, made before any inquiry into its excellence, was the size of the kernel. I had never before seen northern yellow corn so large. What I subsequently received on the cob, was somewhat less in size. This was planted by my father, Daniel Putnam, of Danvers, in the same field with six other varieties, viz: a large late redish corn, (probably the Brown corn increased in length of ear, size of stalk, and lateness of ripening, by having been for any successive years grown on fields which are usually pretty well manured,) the Parker corn, the Tuscarora, a Badenized Canada corn, an early eight-rowed corn, called there the Richards corn, and another eight-rowed corn obtained from Schuyler Shepard, Esq., of Mansfield.

The redish corn and the Parker were much more highly manured than the others. The first of these, under similar treatment, was from 15 to 20 per cent. more productive than the latter. The Hartwell, Richards, Shepard, large Canada and Tuscarora were on land that had been pastured for five or six years preceding, and the only manure was a common shovelful to the hill of barn and hog-yard manure, mixed and partially rotted; say 3 to 4 loads to the acre. The ground and crop were not measured with the accuracy which is needful to satisfy statements for the public. I will only say that the Hartwell corn ripened the earliest of any on the field; gave the greatest yield of any of these last named corns; was very large considering its mode of cultivation; that the stalk is small, the ear eight-rowed, cob medium sized, and kernel quite large. We think it combines the two desirable qualities of productiveness and early maturity to a greater extent than any corn which has come under our notice. We have ordered and received from Dr. Hartwell a bushel and a half for our own planting next season; a friend to whom we described it has obtained the same quantity; and Messrs Breck & Co. have procured a few bushels of it for supplying those whom our statements may render desirous of giving it a trial. The ears on the top of the box just received are not as large as those furnished us last spring, and we have not since seen as large kernels as those which originally attracted our notice. Still the corn on hand is very fair. The accompanying letter will perhaps assign a satisfactory cause for the diminution in size. We do not in this crop or any other, advise farmers to plant for the main crop any variety

with which they are unacquainted; but a trial of different kinds in small quantities, is attended with but little risk of loss, and may lead to valuable discoveries.—Ed.

Southbridge, Jan. 8, 1840.

DEAR SIR—Agreeable to your request, I have forwarded twelve bushels of my seed corn per railroad—six of which is shelled and the remainder in the ear. It is directed to Jos. Breck & Co., Nos. 51 & 52 N. Market st.

The history and origin of this corn, I am unable to trace farther back than the year 1835. It was selected by myself in consequence of its maturity during the short and cold seasons of 1835 and 6, when most of the crop was cut off in New England by frost. In consequence of my having selected and improved this corn, and also of my bringing it into notice, it bears the name in this section, of the "Hartwell corn." The best method I have found from different experiments which I have made in growing this corn, is to prepare the ground, by spreading on it about 40 loads (13 cords) of green or long stable manure to the acre, with two or three ploughings according to the adhesiveness of the soil; then to furrow the ground one way only—furrows four feet apart. About one quart of fine fermented manure, the geine of which has become soluble, should be put in the hills (3 ft. apart) for the purpose of invigorating the tender plant during the cool weather which we experience about the last of May. I should insist on the distance of 4 feet one way in the rows for the purpose of ploughing between them. Perhaps an improvement might be made in planting three kernels in the hill, at a distance of 1 1-2 ft., which would give the same number of stalks to the acre and also would increase somewhat the labor of cultivation. I recommend unfermented manure for spreading in consequence of a large portion of the geine being insoluble until the last of August, when the most nutriment is needed, at the age of fructification or seeding: if the whole of the manure were fermented and the geine made soluble, so that the absorbent vessels could take it up before August, too much of it would be exhausted by the stalk, which would produce an overgrowth, and too little nutriment matter would remain for supplying the great draft at seeding time. By planting the corn in hills four feet one way by three the other, with six kernels in the hill, it gives twelve square feet of surface to the hill, or two square feet to each stalk—making 3630 hills to the acre. Eight large ears of this corn will produce a quart of kernels—good with a good season, the land well prepared and the crop well tended, with the double ears upon the stalk, will yield one quart to the hill or 112 bushels to the acre—which I have actually raised. Last year, however—(owing to the ground on which it was raised, it being the poorest piece of land we cultivated)—the yield was somewhat smaller than the year before.

My corn was planted last year on the 9th and 11th of May, and hoed the first and third weeks in June and first week in July. The soil was cold,

wet and springy about the time of planting and hoeing. The crop was ripe and harvested by the 20th of September—which gave me an opportunity of seeding the ground with winter rye and grass, which I find the best way of obtaining a crop of grass. Last year I had 8512 lbs. of hay (herds grass and red top) from 1 1-4 acre of land—the first cutting obtained in the above way.

Much argument has been had by agriculturists with respect to the farming implement, the cultivator. I use the plough exclusively. I think a little reflection will determine the peculiar merits of each. In moist and adhesive soil, where the surface becomes compact by the falling of the spring and summer rains, (like mine,) the plough deserves the preference; and also the hilling up of the corn: but in sandy, loose soils, which have little attraction for moisture, I think I should prefer the cultivator.

Yours, respectfully,

S. HARTWELL.

### EXTRACTS FROM GEN. DEARBORN'S ADDRESS AT PITTSFIELD.

"The first act of civilization was the cultivation of the earth; and during the progress of nations in the route of improvement, no other branch of industry has maintained such a direct, uniform, powerful and salutary influence. It has not only accomplished more than all the others, but has been the primary cause of those remarkable physical and moral developments which have been produced by the unceasing efforts of man, to ameliorate his condition and elevate his character.

"Agriculture clothes and feeds nearly the whole civilized population of the globe; rigs, spreads the sails, and supplies the great bulk of the freight of navigation, and its multifarious products constitute the chief articles of trade. It has still other and higher claims to respect; and among the most imposing, are its magnificent achievements and widespread conquests; and however inapplicable these belligerent terms may appear, when applied to that pacific pursuit, it is confidently believed that they have been more truly glorious than those of all the fleets and armies which have ever triumphed on the deep and on the land: but in such a gradual, noiseless, and unobtrusive manner have they been accomplished, that they have not attracted that marked attention of the historian to which they are so pre-eminently entitled. There was no remarkable movement which became the subject of universal speculation and comment—no splendid event—no startling incident—no dazzling pageantry, which either excited astonishment from their magnitude, or special and deep interest from their direct or ultimate influence on the civil and military institutions of nations. Yet when attentively examined as the silent, peaceful and unostentatious, but momentous causes of human advancement, and the extent of their influence is measured by the magnitude and real value of the results, the seemingly rash assertion which has been made, instead of being in any degree extravagant, will be found, on a

thorough investigation, to be fully sustained by an array of facts which put incredulity at defiance.

"If wars and battles have rendered the names of victorious chieftains memorable throughout the world, has not agriculture given an infinitely more commendable, precious, and lasting fame to those really great and good men, who have acquired distinction as the benefactors, rather than the exterminators of their race? Will not the admirable characters and eminent deeds of the latter, become more extensively known and more highly appreciated, as the bounds of human intelligence and civil liberty are enlarged, while the blood-stained laurels of the warrior will have perished, or be considered as revolting emblems of their crimes; and their martial feats, instead of exciting respect and emulation, will be converted into subjects of indignant execration and abhorrence?"

"Only fifty years since, and the whole of that broad and lengthened region which extends from the fountains of the Atlantic rivers to the western verge of the vale of the Mississippi, was one entire wilderness. Now it contains eleven states and three flourishing territories, whose aggregate population amounts to more than seven millions.

"These are the glorious achievements of untiring rural industry—the splendid triumphs of civilization—the indisputable victories and magnificent conquests of Agriculture. Yes, of Agriculture—for by the axe and the plough were laid the immense foundations on which was reared this mighty and prosperous republic; and its patriotic and independent yeomanry now constitute at least seven tenths of the entire population."

"It was not before the reign of William and Mary that agriculture, manufactures, foreign trade and navigation began to make a decided and vigorous onward movement. Even as late as the commencement of the eighteenth century, and during the brilliant reign of Queen Ann, the commercial fleet of the kingdom was estimated at only about 70,000 tons, and now it numbers 25,000 vessels, whose aggregate tonnage is 2,783,000. The annual consumption of grain has increased to 240,000,000 of bushels, all of which is generally raised in the country. The products of agriculture of every kind in the year 1833, have been valued at the enormous sum of \$1,250,000,000, and those of manufactures amount to \$750,000,000.

From 1792 to 1839, the population of the United Kingdom has increased from 12,680,000 to 27,250,000; and the exports have arisen from 25,000,000 to 105,000,000, and the imports from 12,659,000 to 61,268,000 of pounds sterling.

"The invention of the steam engine, and the substitution of machinery for manual labor, with the consequent development of the powers of those two grand elements of national industry, coal and iron, have been the chief causes of that tremendous impetus which has been given to the arts in Great Britain. With the aid of machinery, one hundred persons can manufacture as much cotton as would have required ten thousand only forty years since; and the cotton now manufactured in that country, would require, without the aid of labor-doing machinery, 10,000,000 workmen; and all the various articles which are thus made, could not be manufactured by 200,000,000 of men.

"It may be truly said, that Great Britain has attained a more exalted position than has ever been

reached by any other nation. In letters and science; in the useful and ornamental arts; in agriculture, trade, navigation and manufactures; in prosperity, riches and power; in eloquence and arms; in the refinements and embellishments of civilization; in the grandest efforts of genius and most brilliant displays of talent; in all that elevates man and nations, that kingdom is a glorious example for the whole globe. It may there be seen how far the human race can be advanced, when the interests and rights of the people, and the grandeur of the nation, become the main subjects of consideration on the part of the most enlightened men and of the government."

"It is not surprising that among the most important subjects which the illustrious Washington urged upon the attention of the first Congress which assembled under the great charter of our liberties, were—"the advancement of agriculture, commerce and manufactures; the promotion of science and literature; the expediency of giving effectual encouragement to the exertions of skill and genius, in producing new and useful inventions; and of facilitating the intercourse between distant parts of the country."

"In accordance with these enlarged views, laws were successively passed for encouraging and fostering those all-important objects; and such has been the salutary influence of a continued protective policy, that the annual productions of woollen manufactories amount to 40,000,000; of cotton to 60,000,000, and including those of all other materials, to 350,000,000 of dollars; and adding the earnings of agriculture, and every other branch of industry, the national production has been estimated, by one of the most distinguished statistical authors of our country, at \$1,200,000,000.

"The navigation of the United States has been augmented in a like remarkable manner, as the vessels employed in the coasting and foreign trade and the fisheries, now exceed 2,000,000 tons; being more than two thirds as much as that of Great Britain, and nearly quadruple that of France. The increase in population has been quite as extraordinary, for it must exceed, at this time, 15,000,000.

"From the facts which are to be obtained from the history of those nations that have become the most distinguished for their progress in manufactures, trade and navigation, it is apparent that agriculture has ever kept in the advance, and been not only the creator and pioneer, but the foundation and perpetual support of each and all of them.

"In Great Britain, where manufactures and navigation have been the most fostered, and have flourished the most within the last century, it has been ascertained that the persons employed in agriculture amount to over 9,000,000, while those engaged in the industrial arts were less than 4,000,000. Not half of the latter, however, were employed in producing articles for the foreign markets, while neither the number of people or the wealth acquired by them, was a fourth part of that which is produced and maintained by the agricultural industry.

"Agriculture in the United States, besides supplying the demand for home consumption, furnishes three fourths of the exports of domestic articles, and manufactures only a tenth. The disparity, however, between the exports of the raw material and of manufactures, is conclusive evidence that we have not sufficiently extended the latter, and are too much dependent upon other nations for articles that could as well be made in our own."

For the N. E. Farmer.

#### BORROWING AND CREDITING.

In one of the late numbers of the Farmer, I observed, in an editorial article on squaring accounts some remarks as to borrowing. It was there stated that such articles as were loaned a neighbor should be charged to him, and articles borrowed credited. My object at this time is to inquire how far this rule is to be carried out—to what article and in what cases it is to extend? It is obvious that if I have a complete set of farming implements—and we are told that every farmer should have—I shall be under the frequent necessity of lending some one or more of these implements to my less fortunate neighbors. Now shall I charge them with the use of such implements, and receive payment either in money or work, or shall I gratuitously grant the use of them? If I make the charge an exact payment, it will, in many cases, operate to total prohibition of their use by others: if I charge nothing for their use, I may be troubled to such an excess for the loan of such articles by others, as to amount almost to a prohibition of their use by myself. It seems clear, therefore, that neither of these rules can be indiscriminately adopted.

But how stands the case? Are there many farmers whose stock of tools is so complete that they have no occasion to borrow of their neighbors? Very few, I will venture to say—very few, excepting only your wealthy and fancy farmers. Why, farmer, for example, has the improved seed sower, rollers, horse rakes and cultivators? You may say that every farmer ought to possess them—but still every farmer does not possess all of these—other improved implements, and till he is able to purchase, he may wish to borrow of others, and others in return to borrow of him such articles as they may themselves be in want of. No what rule shall be adopted to regulate this mutual borrowing? I confess I do not like the system of charging, or offsetting the use of one thing against the use of another. It seems to be carrying into neighborhood, where offices of mutual kindness should prevail, a system only of dollars and cents—a system which will allow of nothing to be done without a *quid pro quo*, as the lawyers say—or, in other words, without an equivalent received.

An implement is very valuable and of such a character that one will suffice for the wants of a large neighborhood—as a threshing or winnowing machine—why, in such instances, let the owner charge a fair compensation for its use. But to charge for the use of a harrow, plough or rake—mean for every occasional loan of such common articles, of however short duration—seems to me rather too strict and exclusive: by doing so, should much fear that I should enjoy no enviable reputation among my neighbors.

I would not, however, be understood to favor the principle which some seem to act upon, of living by borrowing. Your mere borrower, where he has the means to be above it, is the most despicable character in community. I have known a man to keep his own wheelbarrow housed for years, and all the while live by borrowing his neighbor's. Such fellows are soon found out and treated according to their deserts. But the conduct of such men, and the evils to which borrowing sometimes subjects us, are not sufficient reasons with me, for refusing a reasonable request to lend. I remember, when such requests are made, that there is no individual, however well off, who is absolutely ir-

pendent of his neighbors. He has wants and necessities which some time or other will compel him, despite of all his rules to the contrary, to ask aid of others. I remember too, that there are many members of the human family less wealthy than others, and that a helping hand should ever be extended to those who need it, even if it be done through the medium of *borrowing*.

#### A PLAIN FARMER.

[We meant only to say that all such items as the customs of the neighborhood would bring into the accounts between neighboring farmers, should be recorded in a book, and not left to memory to remain. Many small loans doubtless will be, and certainly should be, made without charge. It was not our purpose to advise differently; but we still say, let whatever, according to prevailing custom, is to be paid for, be entered on the account book.—P.]

From the Farmer's Cabinet.

#### SOWING GRASS SEED.

*Thick and even, not thin and irregular, is the true interest.*

One of the most frequent errors in agricultural operations, is sowing grass seeds too thin and unevenly: great is the loss in either case, while nothing is easier than to remedy both. In the spring of 1838, clover seed was very scarce and dear; some sowed none, and others scattered it as thin as possible over the ground, and the effects of this proceeding have been visited with great severity on the delinquents. There has been a deficiency of hay and pasture, a thin, bare sod to plough down; the manure heap has shrunk in its dimensions for want of provender, and the subsequent crops have been proportionably starved and diminished. This season clover seed is very abundant, cheap and of good quality, and it might be well for the provident to lay in a store against a season of scarcity and high prices, and this may readily be accomplished by putting it in a tight, dry cask, through the bung-hole, and bunging it up and keeping it in a dry place, where it is believed it will remain good for several years to come. Clover should be one of the grasses sown, but other seeds should always accompany it, as there is a larger crop where several kinds of grasses are grown together, sometimes the season being favorable to one and not to another. Many farmers begin to think it more profitable to raise orchard grass than timothy, where selling of hay is not intended, as it furnishes more pasture, both early and late, and is equally good, if not better, for home use as hay. Timothy bears a higher price in the market than other kinds of hay, and the reason probably is, that horses eat less of it in a given space of time, as it is a good deal of work to chew it; hence, tavern-keepers uniformly prefer it, being for them more economical.

From the same.

#### PEACH TREES.

Gentlemen of great experience in the cultivation of the peach assert that the decay of this valuable tree is in a great measure, and principally, owing to the practice of grafting: an imperfect union takes place; sickly growth is the consequence, and the diseased tree is then rendered vul-

nerable to the attacks of the worm, which completes its destruction.

Now, if we would have healthy peach trees, we must not do violence to nature; we must cultivate from the stone; and although we might find some bad and worthless fruit, we shall have much that is excellent, and obtain new and valuable varieties by planting the seeds of those only which are very superior. A gentleman has just informed us that he has obtained peaches of most delicious flavor from trees the third year from the planting of the stone, without grafting or budding: and by far the finest peaches exhibited at the late horticultural meeting in Philadelphia, bearing the name of the Tippecanoe Peach, were produced by the above means, the planter, it is said, having reserved the stone of a remarkably fine peach, which he purchased in the Philadelphia market for twelve and a half cents, and the tree from which had never been either grafted or budded. There are still in existence many large and aged peach trees, which have never been removed from the place where the seed was planted, or either grafted or budded, but which continue to produce large crops of the finest fruit. Nothing is easier than to plant a row every year of the seeds of the finest peaches to be obtained for money in the market, and pruning them in their places until they produce fruit, at which time those of inferior sorts could be grafted, and others of fine flavor might be permitted to remain, with the expectation of their retaining health and vigor for many years to come.

#### FARMING.

If one half the zeal, energy and expense which have been exhibited for electioneering purposes were bestowed upon agriculture—if the people were half as anxious to improve and beautify their fields, and half as angry with their thistles, thorns and bad fences, as they are with their political opponents, we should have more productive fields, less complaint of poverty, more ability for charity, and abundantly more good feeling. From Maine to Georgia, the son ploughs as his father did before him, and the great mass of farmers as stationary in theory as they are in practice; nine in ten believe at this moment that book-farming is the mere, useless, visionary dreaming of men that know nothing of practical agriculture. The real benefactor of mankind is he who causes two blades of wheat to grow where one grew before; his fields are his morn and evening theme, and to fertilize and improve his farm is his prime temporal object. All national aggrandizement, power and wealth may be traced to agriculture as its ultimate source—commerce and manufactures are only subordinate results of this main spring.

We consider agriculture as every way subsidiary not only to abundance, industry, comfort and health, but to good morals and ultimately even to religion. We regard the farmer, stripped to his employment and cultivating his lands, as belonging to the first order of *noblemen*; we wish him bountiful harvests, and invoke upon him the blessing of God in all his undertakings: may peace be within his walls.—*Selected.*

The true farmer is a philanthropist. He labors not only to provide for his own wants, but he is urged by a constant desire to leave the world better and more beautiful than he found it, and add to the stock of human comforts.

#### THE PRODUCING CLASSES.

Every student of history is aware that a large majority of the warriors and statesmen of the revolution were from the producing classes—were, before they were called upon to relinquish the implements of industry, laboring men. But look into the Legislature of this and other States for the last fifty years, and what proportion of producers do we find? Is it contended that lawyers are the best qualified to form laws? Look at the cumbrous details of chancery practice of our own State—the jarring systems of law and equity, (as if law and equity might with propriety differ!)—the annual acts explanatory of other acts which were wrought up with so much *legal skill* that even their own framers could not understand them!—the multitude of laws “which no man can number,” and which are constantly accumulating—look at these things and then tell us if it is necessary to fill our Legislature with lawyers, because of their presumptive knowledge in forming laws? Is it contended that there is not sufficient talent to be found in the laboring classes? I answer in the eloquent language of Channing—“Real greatness has nothing to do with a man's sphere. It does not lie in the magnitude of his outward agency, in the extent of the effect which he produces. \* \* \* A man brought up to an obscure trade, and hemmed in by the wants of a growing family, may, in his narrow sphere, perceive more clearly, discriminate more keenly, weigh evidence more wisely, seize on the right means more decisively, and have more presence of mind in difficulty, than another who has accumulated vast stores of knowledge by laborious study; and he has more of intellectual greatness. Many a man, who has gone but a few miles from home, understands human nature better, detects motives and weighs character more sagaciously than another who has travelled over the known world and made a name by his reports of different countries.”

I would not preach up a crusade against the legal or any other profession. I would not drag them down, but I would *raise the producer up*—raise him up *in his own estimation*. I would sound a trumpet-peal in his ear to arise and assert the dignity of his calling. Man was formed to labor and to be useful. The primal curse of labor was a blessing in disguise. There should be no drones in the great hive of humanity. Labor ennobles its followers. The farmer as he goes forth in his fields to converse with nature and nature's God, feels his soul dilate and expand under the benign influences about him. The bright sun, the refreshing breeze, the genial shower, are all blessings from a parent's hand. As he casts his eye upon the distant prospect, glittering in the auroral light of spring, or fading into the sober hues of autumn, his feelings harmonize with the outward agencies which surround him. He stands as it were in the visible presence of his Creator, and passion and selfishness are rebuked. There is no hum of excited crowds to drown the small still voice of reason and conscience. He stands erect in the conscious dignity of a *man*,—honest toil hath given him the nerves and physical vigor of a man,—reason, reflection, conscience, and brotherly love have expanded his soul to the dimensions of that of a man.—*Albany Cult.*

*Blind Stagers in Sheep.*—Half a pint of hogs lard melted and poured down a sheep, will cure the blind stagers in ten minutes.—*Id.*

For the N. E. Farmer.

### ORGANIC MATTERS IN OUR SOILS.

MR PUTNAM—Dear Sir—1 was somewhat surprised on taking up the last number of the North American Review, to find that the views published by Professor Hitchcock on the above subject, were still maintained.

I had supposed that since the discovery of the erenic and apocrenic acids in the soil, that the *indefinite* and *indescribable* compound called geine, had been consigned to the shades, as having been merely the step used by the laborers in the field of agricultural chemistry, in advancing that science to its present position.

I am sorry to see geine still gravely advanced as a simple substance, with known chemical powers, instead of giving it its true name and character, that of a mere *name*, given by M. Berzelius to a substance, the composition of which he had not been able to discover.

This substance has been proved by the most rigid chemical examination, to consist of the erenic and apocrenic acids, combined in different proportions.

It seems now as absurd for a chemist to use the term of geine, as it would be for a student in algebra to express his results by the unknown quantity which has enabled him to obtain them.

Though a system of analysis has been published which was founded on the hypothesis of geine, it was sometime since, and the gentlemen who then advanced those views, may have since changed their minds upon the subject, but the author of the reviews to which I have referred, whom we have every reason to suppose is impartial, should be able to bring forward some facts, in support of a theory, which *he* has advanced in the present state of the subject.

Though I am aware, sir, that you prefer to see your columns filled with practical matter, I consider the present subject to have so important a bearing on very many of the every day operations of the farmer, that I trust you will pardon the length of my observations.

M. B. W.

[Upon the subject here noticed we are not qualified to express an opinion. We willingly insert the communication, because we infer that it comes from a laboratory where analyses are made with great exactness.—Ed.]

For the New England Farmer.

### TRANSPLANTING TREES.

This has become a thrice hackneyed subject, as we are well aware, yet we know of no better way of awaking the public interest in it, than by keeping it continually before the people. Such an interest we are happy to see increasing, and at the same time we have hopes that it will become general. The great reason, if we mistake not, why every body does not put out at least one tree, is, that through mismanagement, many who do it lose their labor. For ourselves, we can see no reason why a tree properly transplanted should die any more than a cabbage. The care which is requisite to one, will insure success with the other; and he who successfully plants a tree, plants an object which he and his contemporaries may admire all their days, and leave for the admiration of future generations.

With respect to the time of transplanting, it may with *proper care* be done *any time*. Yet there is a *best time*, but *when this is*, seems to be held different by various cultivators. We do not decide nor aim to do it. We will, however, state, that we transplanted evergreens every month, commencing in May and finishing in November, (except August,) with *entire success*. Still the time which we prefer is, when they are in most vigorous growth; for at that time, less care is necessary, in taking a portion of the soil with the roots than at any other period. Those we removed the latter part of the season were from low lands, and we generally selected such as had sprung up from old moss-covered logs, the soil a sufficiency of it, being easily removed with such. Evergreens should in no case be pruned, as their low branches form an important item in their beautiful growth. The horrid practice of taking off the tops of trees, is yet too common. They can never acquire a large beautiful growth when this prevails, and we should almost as soon think of cutting off a favorite calf's head in order to have it grow without eating, as of reducing a tree to a stump in order to make it live.

What a luxury to the traveller are trees by the wayside. Travelling with a friend, during some of the sultry days of last July, in the river region of Columbia and Dutchess counties, (N. Y.,) we had full opportunity of testing their utility, for we passed more than one long row of large beautiful cherry trees, rendered still more pleasant by the rich fruit clustered upon them, of which the owners made us as welcome as to the water from their wells. Here was a double luxury—agreeable shades to screen us from the sun as we passed along, and cheering fruits to refresh our parched lips. Were such hospitalities extended over the country, what a lovely land it would be. And how easily such improvements might be effected! Individual action in a few years would accomplish the whole. Let individuals who have commenced, go on, and "others seeing their good works," must eventually follow in their train.

For the New England Farmer.

### WOOD AND WOODLANDS.

As long as summer and winter, cold and heat hold their appointed seasons—as long as ships float on the ocean, men build houses or manufactories and furnish them, or ride in carriages, so long timber lands will be an object worth preservation. And the experience of each succeeding year goes to prove more fully that their preservation is a matter of growing importance, if we have any regard to the comfort or convenience of those who are to succeed us in the drama we are now acting.

Practice with regard to them seems about as variable as the number of individuals adopting it, so that if a right way is known it is not in all cases pursued. The habit most generally prevailing, of going into woodlands and selecting the oldest and decaying timber, has its objections; for where it is pursued, a great quantity of smaller trees are necessarily destroyed in felling it, and more in getting paths about in different directions, by which means the land in a few years becomes thinly clothed. So that on the whole we are inclined to think that the most judicious way of managing woodland is, to cut off all as circumstances require; then a new and even growth will spring up, unbrok-

en by paths, and unspotted by a patch cleared here and another there, with but little probability of a succeeding growth upon them. Where woodlands have cleared patches in them on which grass is beginning to show itself, we would recommend setting locusts, and in a short time such places will become well wooded.

From the Farmer's Cabinet.

### HESSIAN FLY.

*Discovery believed to have been made in relation to the Hessian Fly.*

A paper presented to the American Philosophical Society by Miss Margaretta H. Morris, of Germantown, and relating to the above mentioned subject, was subsequently ordered by that body to be published in their Transactions. As, however some time will elapse before the appearance of the number of the Transactions which will contain the paper, we have thought that we could better serve the agricultural readers of the Cabinet by extracting the information given in a journal recently authorized by the Society to be published by its secretaries, in an abridged form and of earlier appearance. In the proceedings just printed for November and December, 1840, we find the subject mentioned, in some paragraphs of which we herewith subjoin a copy.

"The committee, consisting of Mr Nuttall, M. Lea, and Dr. Coates, to whom was referred a communication by Miss Margaretta H. Morris, on the *Cecidomyia* destructor or Hessian Fly, reported in favor of publication, which was ordered accordingly.

"The committee express the opinion, that should the observations of Miss Morris be ultimately proved to be correct, they will eventuate in considerable benefit to the agricultural community, and through it to the public. Miss Morris believes she has established, that the ovum of this destructive insect is deposited by the parent in the seed of the wheat, and not, as previously supposed, in the stalk or culm. She has watched the progress of the animal since June, 1836, and has satisfied herself that she has frequently seen the larva within the seed. She has also detected the larva, at various stages of its progress, from the seed to between the body of the stalk and the sheath of the leaves. In the latter situation it passes into the pupa or flaxseed state. According to the observations of Miss Morris, the recently hatched larva penetrates to the centre of the straw, where it may be found of a pale greenish-white semi-transparent appearance, in form somewhat resembling a silk worm. From one to six of these have been found at various heights from the seed to the third joint. They would seem to enter the pupa state about the beginning of June.

"This fly was not observed by Miss Morris inhabit any other plant than wheat.

"To prevent the ravages of this destroyer of the grain, it will be proper to obtain fresh seed from localities in which the fly has not made its appearance. By this means the crop of the following year will be uninjured; but in order to avoid the introduction of straggling insects of the kind from adjacent fields, it is requisite that a whole neighborhood should persevere in this precaution for two or more years in succession. This result was obtained, in part, in the course of trials made by M. Kirk, of Bucks county, Pa., with some seed whe-

from the Mediterranean, in and since the year 1837. His first crop was free from the fly, but it was gradually introduced from adjacent fields; and in the present year the mischief has been considerable. As Miss Morris states that the fly has never made its appearance in Susquehanna and Bradford counties, seed wheat free from the fly, might be obtained from these and probably from other localities.

"The committee recommend that the conclusions of Miss Morris may be subjected to the only efficient test—repeated observations and effective trials of the precaution she advises."

Believing the above to be an observation of very considerable importance, and sincerely hoping that repeated trials and examinations may confirm its correctness, we have prepared the present notice for the Cabinet, in order to bring it before the agricultural community.

Miss Morris's observations and inferences agree very well with what we know of the habits of many insects. Thus they are, as a general rule, not produced till their food is ready for them; while their eggs appear to approach the seeds of plants in the power of enduring long delay and some violence, before they lose their vitality and faculty of development. The eggs of silk-worms are kept for various periods, and still retain the susceptibility of being hatched. How long this power, in some insects, may be capable of enduring, has not been ascertained; but the presumption arising from their analogy to seeds leaves it by no means certain, (until observations are made,) that the period may not be one of magnitude. The lower animals are said by naturalists to approach, in constitution, much more nearly to vegetables than to the more complex beings of their own class; and this is acknowledged to be strikingly exemplified in the instance we have been reciting. Something analogous may be perceived in the instance of the common fowl; in which species, the eggs first laid are allowed to remain till enough are accumulated for the parent to commence sitting, and without in any way injuring the product.

That highly and justly distinguished American naturalist, the late Thomas Say, has left us an entomological description of the Hessian Fly, in the first volume of the Journal of the Philadelphia Academy of Natural Sciences. He appears never to have identified the insect in an earlier portion of its life than the flax-seed state. Thus, he describes the larva, first state or maggot of the animal, as resembling the pupa or second state, except in the dark, reddish brown color of the latter; and alleges that, "when taken from the culm, it is almost inert, exhibiting very little motion to the eye." This was in 1817; and as that eminent writer was principally occupied in the task, then new, of describing and classifying American insects in their perfect forms, it is entirely credible that he might have erred in relation to their earlier stages; nor is it wonderful that, in twentythree years, further discoveries should be made, and his account corrected. What Mr Say calls the larva, will, if Miss Morris be correct, be considered the early period of the pupa.

The discovery of Miss Morris, then, appears principally to resolve itself into the fact of the egg being deposited in the seed; and into the history of the pale, green worm or larva, as the primary stage of the animal's existence. The account of its periodical change given by Mr Say is confess-

edly conjectural: and insufficiently explains the preservation of the species through the winter. His words are, "The history of the changes of this insect is probably briefly this." He then proceeds to describe the parent insect in depositing its eggs within the sheath of the leaves, near the root of the plant, the fixed mode of life of the flaxseed substance, together with the indentations produced in the straw, the distortion of the flaxseed worm when crowded, and the death of the plant. He then adds the following notice, which ends the recital: "The perfect fly appears early in June, lives but a short time, deposits its eggs, and dies—the insects from these eggs complete the history by preparing for the winter brood. The words would seem to imply that there are *two* broods of these flies; one for summer and one for winter. If "preparing for the winter brood," means laying the eggs which are to produce them, why are not the flies seen in the end of October; before which time the sheaths of the leaves and the straw itself of the winter wheat do not exist, and at which period no fly of any description is to be met with in the fields? If, on the other hand, "the insects from the eggs laid in June," are *themselves* "the winter brood," they are to be found in the stubble after harvest; and cannot possibly be the same individuals that are found next spring in the damaged stalks of the new crop.

According to the facts believed to be ascertained by Miss Morris, the difficulty at once disappears. The fly lives only ten days; during which time it deposits its eggs. The eggs remain unaltered till the wheat sprouts; and the young worm is then below the surface of the earth, in a substance which is not frozen, and which supplies him with food.

The residence of the worm, as described by Miss Morris, within the hollow of the straw, is precisely like that of certain other insects. The animal that destroys the more luxuriant shoots of the parsley-leaved elder, and which, in its perfect state, becomes, as we are informed, a beetle of splendid coloring, passes its larva-existence within the pith of the plant. Additional examples, we believe, are not difficult to be obtained.

To the directions given in the "Proceedings" for avoiding the production of this pernicious insect, little seems necessary to be added. We are inclined, however, earnestly to repeat the recommendations of further trial and observation. It would seem that the farmer who uses seed wheat from a district ravaged by this animal, actually commits the absurdity of planting Hessian flies for the benefit of his next year's crop!

The precise period at which the minute green worm escapes from the hollow of the straw, to repose and undergo its subsequent changes beneath the sheath of the leaf, is not ascertained with accuracy; and may furnish a question for investigation. We are informed that Miss Morris is continuing her observations on growing wheat, in which she will probably ascertain the fact. It is in the power of our readers to confirm or reject her conclusions, both in this and in what she regards as already established.

There is no duty greater in this age, than to use every laudable exertion to promote the cause of agriculture—this is most successfully done by disseminating agricultural journals. Let every farmer feel that, as a patriot, he must exert himself to effect this object, and the light which is most needed will soon be supplied.

## LETTER TO THE EDITOR.

New Berlin, Penn., Jan. 12, 1841.

To the Editor of the New England Farmer:

Having been a subscriber to your paper for sixteen years, I feel the interest of an old friend in its welfare. I have hitherto been content to send my money: I read the paper without any personal communication with the editor, either by way of encouragement or complaint. It is true I had no ground for complaint, for I always had my money's worth; and I supposed the most valuable encouragement was to take the paper and pay for it in advance. From your introductory, we are bound to believe you a very modest man, to whom an approving word might be useful. I approve fully of your resolution to use "a watchful care not to prefer the *new* to whatever in the *old* is better." I consider this a principle that ought to be made prominent in an *agricultural* periodical. In this, as in many other things, too many believe novelties to be improvements. I have always had a strong attachment to the *old paths*, and do not feel disposed to deviate from them, except on full proof. But this full proof can be had, and that too without much risk. For that reason I have always about here discouraged extensive experiments. Make trial, in a small way—keep accurate accounts, so that the results are certain, and then every step forward may be a sure one. There is another consideration of great importance. Does the old way afford a fair living profit? If it does, change cautiously. If it does not, it is fair to risk something in making a change.

Many men, not seeing the reason for a thing, believe forthwith there is none. This is often jumping too far at a conclusion: Very frequently the change proves that there was a reason, though not before apparent.

I am pleased with the course you have marked out for yourself. We subscribe for an agricultural paper, and you will give us what we subscribe for. If it cannot be sustained so, let it be known; and proclaim that you publish a periodical *melange* because farmers will not support a newspaper purposely published for themselves. I hope this may not be necessary, for this is one of the old ways I do not like. Perhaps you remember (I do) a periodical on medicine and agriculture, published by Dr. Daniel Adams. It is so long ago that it makes me feel very old when I think of it. If I do not mistake, it was very short-lived. Since that, what a number and variety of publications on each of these subjects have been well sustained! You are right: we want instruction in *farming* from you. We do not want from your paper, information on politics, law, medicine, or theology; nor (if you will allow me to say so,) do we want dogmatism on *any* subject. Nor will you need to resort to any of these. If you stick to the hills and dales, the mud holes and peat bogs, the sand banks and clay flats of your *editorial farm*, you will have *no place* for other matters.

Very respectfully,

JAMES MERRILL.

[This favor from our stranger-friend is most welcome. We hope to requite it by faithful efforts to furnish him with a paper suited to his tastes and wants.—Ed.]

Mr G. Bancroft, of Reading, Mass., has a sow which in 13 months has produced him 53 pigs at three litters.

NEW ENGLAND FARMER,  
AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, JAN. 27, 1841.

PRICE REDUCED.

In future the terms of this paper will be \$2 per year in advance, or \$2 50 if not paid within thirty days.

FIELD PREACHING—No. II.

Where no wood is, the fire goeth out.—SOLOMON.

So says the wise man : so says common observation : but some of you, my hearers, don't—don't what? Don't believe it, I liked to have said. And if I had said it, that super-effeminate and vulgarly genteel girl who is afraid of degrading herself or soiling her fingers by going to the wood-pile for a new supply; that careless boy, who forgets to bring the wood—morning and evening; that lazy boy, who "cuts" acquaintance with the axe; that cold-hearted husband and father, who neglects to get up a year's supply at the most convenient season—each would be a good witness to prove that I did not very essentially over-state.

"The fire goeth out." Rather an uncomfortable consequence when the dinner is to be cooked; or when Jack Frost has his fingers on the door latch; for he, faithful servant, if he don't smell fire through the key hole, is sure to walk in and give the whole family the ague. "Where no wood is," he is sure to come; and where none but green wood is, you think him rather too intrusive and troublesome; for he makes a shaking there. But, my friends, don't blame him. He is only doing his duty under a commission from the Highest Court. If he come in, the fault is yours and not his. Therefore, in season prepare means for keeping the fire blazing. In this, your least busy season, my firming friends, let the sound of the axe echo in the woods; let the team wend its way among rocks and stumps and over sloughs and ponds, while this faithful Jack holds up the wheels or the sled-shoes. Looking forward to the wants of the next generation, with benevolent economy, cut clean in the wood lot as far as you go. Work up the wood in winter; house it in the spring or early summer; and then may you anticipate, when winter comes again, that He will bless you with the comforts of a cheerful fire, whose servant said, that "where no wood is, the fire goeth out."

The flames of conjugal, parental, filial and fraternal affection will grow dim, if not fed by the fuel of kind acts and attentions. Fires of philanthropy will die out if not nourished by good deeds to man. Where the oak and walnut of christian truth are not taken home and housed, the fires of piety will burn with but a sickly flame. Where no moral wood is, the moral fire goeth out.

SECOND AGRICULTURAL MEETING AT THE STATE HOUSE.

On Thursday evening last, the organization of the meeting was completed by the choice of

Hon DANIEL P. KING, of Danvers, *President*.

ALLEN PUTNAM, of Danvers, *Secretary*.

*Committee of Arrangements*.—William Lincoln, Worcester; Horace Collamore, Pembroke; Cornelius Delano, Northampton; Calvin Cooley, Hawley; John Prince, Roxbury; Andrew Dodge, Wenham; Asa G. Sheldon, Wilmington; Hon. Isaac Hill, Ed. Monthly Visitor; Mr Buckminster, Ed. Boston Cultivator; Mr Cole, Ed. Yankee Farmer; and the President and Secretary *ex officio*.

Subject for discussion, as previously announced, was the *Cultivated Grasses*.

Mr Colman, Agricultural Commissioner, stated that there are more than 60 such grasses, but that he should confine his remarks to a few of the more common.—Herds grass or timothy yields well; two tons to the acre is a good crop, though four tons have been obtained; it is an enduring grass, lasting 6 or 7 years, after which period it is best to turn the sod; cattle are fond of it. Would sow 1-2 bushel seed to the acre; no harm in sowing more; when thick the hay is finer; moist but not wet soil best suited to it. According to chemical analysis it is most nutritious if suffered to ripen before it is cut, though our animals like it better when cut young.

There are two kinds of Dutch clover, Northern and Southern, differing in the time of their ripening. The broad leaves take much nourishment from the atmosphere, and the tap root when it decays furnishes nutriment to the other grasses. It ameliorates the soil. As food for stock it is inferior when cured in the common method, i. e. when allowed to become nearly ripe before cutting and then dried thoroughly in the sun. Some practical men maintain that if cut younger and made in cock, its quality as food is as good as the other grasses. The Southern though less productive than the northern, is to be preferred; makes better hay; should be sowed in winter or spring and not in autumn. It is valuable as a green crop to turn in; if it be rank, roll and harrow before ploughing and then it can be easily turned under. Should it be green or dry when turned in? The field of one man who tried it in both states, indicates that the dry is best: 4 to 6 lbs. of seed to the acre. There is one objection to it as pasturage; horses are salivated or made to salver by its use.

Red top is as good as any grass; good for milch cows and horses; requires a soil that is *not wet*: 3 to 4 pecks of seed to the acre.—Orchard grass grows quick; can be cut frequently; is sweet; the cattle relish it.—Lucerne is good for soiling; may be cut 4, 5 or 6 times a year. Must be tilled the first year or the weeds will kill it; lasts 8 or 10 years. A small plat may be cultivated to advantage; will not do on wet soil: from 16 to 18 lbs. of seed to the acre.

Gypsum, as a top-dressing, 1 bushel or 1-2 bushel to the acre, once in two or three years, is in many places very serviceable. Is not fully satisfied as to the utility of lime. Saltpetre has been used to great advantage. Wood ashes are good, but in great quantities will cause moss to grow, particularly in moist or wet lands: peat ashes will do the same.—Kelp grass, kelp, rockweed and salt-hay are good top-dressings.

Mr Buckminster, Editor of the Cultivator, agreed with Mr C. in most respects, yet differed from him in a few points. Thought clover, pound for pound, as good as herds grass; recommended sowing them together; and cutting so early that the clover stalks (the principal part) should be good fodder. Clover, no doubt, is a good crop to plough in, but the difficulty is to get crop enough to be worth ploughing in. Buckwheat will answer better for this purpose on poor lands: he doubted whether it is well to let the crop dry before it is turned under. Was in favor of cutting English grasses young, but thought that our wet meadow grasses were worth more if not cut until they were ripe. Had sometimes sown hay seed among corn at *hilling time* (no hill made) and found it to do well.

The Editor of this paper had never heard before that clover would *salivate* the horse. On one side of his father's farm the horses found nothing that produced this effect, though clover was often eaten by them there: on the other side *lobelia* grows, and there the slobbers or slavers are produced. He stated one or two facts

from which he was inclined to infer that clover hay was better than red-top for producing *milk*. Also he gave an account of the sowing of hay seed among corn; the substance of which may be found in No. xxviii. of the present volume of the N. E. Farmer.

Mr Collamore, of Pembroke, stated that by the application of compost top-dressings in the *spring*, he had sometimes, (in dry seasons) done more harm than good; has found it best to apply them in the autumn. Sea weed he thinks not valuable; but kelp and rock weed are. Ashes should be spread on sandy loam. Lime is sometimes serviceable; it should be used in compost.

Mr Cole, of the Yankee Farmer, expressed the opinion that the salivation of the horse might be produced by something else than either clover or *lobelia*. The remainder of his remarks we do not retain; but as the meeting adjourned while he had the floor and as the same subject will come up at the next meeting, we hope then to preserve what he may offer.

AGRICULTURAL SCHOOL.

We understand that an association has been formed by several gentlemen in this city and vicinity, for the purpose of establishing a "Practical Institute of Agriculture and Education." The design of this institution is to furnish the means of a liberal education to those who are not intended for the learned professions. The principles of science, which lie at the foundation of the practical arts of life, will form the chief objects of attention, while the study of the languages will occupy a subordinate sphere. It is intended to combine the study of scientific agriculture with its practical operations, to illustrate the great improvements of modern husbandry by actual experiment; to increase the attachment of the farmer to the cultivation of the soil, by showing the dignity of the pursuit, and the knowledge and ability which it demands, and thus to prepare young men, who propose to make agriculture the business of their lives, for the intelligent discharge of the duties of their calling.

The want of an institution of this kind has been deeply felt and loudly expressed. No branch of education has been more neglected, though its unspeakable importance is admitted, than the professional education of those who seek their subsistence by tilling the earth. Our most enlightened agricultural publications have been urgent in their appeals to the community in behalf of such an institution; the friends of popular education have set forth its claims in a convincing manner: legislative patronage has been earnestly solicited both in Massachusetts and New York for the establishment of one on a large scale; proposals have been made to connect a department for this purpose with some of our most distinguished colleges; and no one acquainted with the character of our New England population can doubt for a moment, that an institution of this description, conducted in a judicious and efficient manner, would receive the favor of the public, and prove of wide practical utility. The eminent success of Von Thar, in Prussia, and of Fellenberg, in Switzerland, it would seem, ought not to surpass that of an institution so congenial with the spirit of our government and the character and habits of our citizens.

"When we consider," says the late lamented Judge Buel, of Albany, among the last words probably which ever fell from his pen—"when we consider that agriculture is the great business of the nation—of mankind, that its successful prosecution depends upon a knowledge in the cultivators of the soil, of the principles of natural science, and that our agriculture stands in special need of this auxiliary aid—we cannot withhold our surprise and regret, that we have not long since estab-

lished professional schools, in which our youth, or such of them as are designed to manage this branch of national labor, might be taught, simultaneously, the principles and practice of their future business of life, and on which, more than any other branch of business, the fortunes of our country, moral, political and national essentially depend. We require an initiatory study of years in the principles of law and medicine, before we permit the pupils to practice in these professions. We require a like preliminary study in our military and naval schools, in the science of war and navigation, ere the student is deemed qualified to command. And yet in agriculture, by which, under the blessing of Providence, we virtually "live and move and have our being," and which truly embraces a wider range of useful science than either law, medicine, war, or navigation, we have no schools, we give no instruction, we bestow no governmental patronage."

The proposed institution is undertaken on the sole responsibility of a few individuals, whose interest in agriculture and science has led them to engage in the enterprise; and the internal arrangements they have made, we learn, are of a character which those who are concerned must will ensure the management of the institution with great economy, efficiency and completeness.

It is contemplated, we also understand, to connect with the institution a department for classical learning, in which pupils will be prepared for admission to any of the New England colleges, or be instructed in a course similar to that which is pursued by undergraduates, while at the same time, they will have an opportunity to study the sciences on which agriculture is founded, and to engage in its practical details to such extent as may be desired.

It is intended, if a suitable degree of encouragement should be given to the enterprise, to open the institution for the reception of a limited number of pupils, in the course of the ensuing season, and to enlarge its operations in proportion to the favor it shall receive from those for whose benefit it is designed.

We have here given what we understand to be the objects of the gentlemen concerned; objects certainly worthy of public attention; and we hope that prudence and efficiency will so mark the course as to win and secure to the projectors public favor. We are pleased that they have no design to ask for legislative aid, because we doubt whether such an animal as this body would be long suffered to feed quietly at the public crib.

#### THERMOMETRICAL.

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded North only exposure, week ending Jan. 24.

Jan. 1841.	7 A.M.	12 M.	5 P.M.	Wind.
Monday,	18	29	26	17 S. W.
Tuesday,	19	6	15	14 N.
Wednesday,	20	15	20	17 N.
Thursday,	21	20	33	32 N. W.
Friday,	22	31	32	31 N. E.
Saturday,	23	19	30	17 N. W.
Sunday,	24	23	36	34 S. E.

#### BRIGHTON MARKET. — MONDAY, JAN. 25, 1840.

Reported for the New England Farmer

At Market 385 Beef Cattle, 80 Stores, and 860 Sheep. 25 Beef Cattle unsold.

PRICES.—Beef Cattle—Sales were not very quick, and the prices obtained last week for some qualities were not sustained. We quote a few extra, \$6 50.—First quality \$6 00 a 6 25. Second quality, \$5 25 a 5 75. Third quality, \$4 25 a \$5 00

Sheep—Lots were sold at \$2 00 and \$2 50. Weathers, \$3 00, \$4 25, \$4 50 and \$5 00.

Swine.—None at Market.

#### WHOLESALE PRICES CURRENT.

Corrected with great care, weekly.

SEEDS. Herds Grass, per bu. \$3. Red Top, 75 to 80 c. Clover—Northern, 12 c. per lb.—Southern, 10 c. per lb. Flax Seed, \$1 37 to 1 50 bu. Lucerne, 25 c. per lb.

FLOUR. Howard Street \$5 37—Genesee \$5 31—Ohio \$5 12.

GRAIN. Corn—Northern Yellow 60 to 61 c.—Round Yellow 57 to 58—Southern Flat Yellow 55—White 53. Rye—Northern 65 to 67—Southern 60 to 65. Oats—Southern 35 to 38—Northern 40 to 44.

PROVISIONS. Beef—Mess \$10 50 to 11 00—Prime \$6 50—No. 1 \$9 00. Pork—Extra—15 00—Clear 14 50—

Mess \$13 00. Hams—Northern 9 c. per lb.—Southern, none. Lard—Boston 9 c. per lb.—Southern, 8 to 8 1-2. Butter—Lump 18 to 22—Firkin 12 to 18—Shipping 8 to 14. Whole Hogs 5 1-2 to 6 c.

HAY, per ton, \$17 to 17 50—Eastern Screwed \$12 to 13 50

CHEESE—Old 11 c.—New 8.

EGGS, 25 to 30 c. per dozen.

POULTRY—Chickens 11 to 12 1-2 c. per lb.—Turkeys 12 1-2—Geese 10.

WOOL—The market for this article has not experienced any change of late. Polled Wool is rather scarce, and there is but a limited supply of low Fleeces and of fine Fleeces the stock is also moderate. Prime or Saxony Fleeces, washed, lb 50 to 55 c.—American full blood, washed, 47 to 50—Do 3 4 blood, washed, 44 to 46—Do. 1-2 blood, washed, 36 to 40—1-4 and common do, 35 to 37—Smyrna Sheep, washed, 20 to 23—Do. unwashed, 10 to 14—Bengalia Sheep, 8 to 10—Buenos Ayres unpicked, 7 to 10—Superfine Northern pulled lamb 43 to 46—No. 1 do. do. 37 to 42—No 2 do do 26 to 30—No 3 do do 18 to 20.

#### GARDEN SEEDS.

For sale by JOSEPH BRECK & Co. at the New England Farmer Office, No. 51 and 52 North Market St. Boston. The subscribers would inform the public that they have now on hand the largest collection of seeds ever before offered by sale in this city, embracing every variety of Field, Kitchen, Garden, and Ornamental Flower Seeds desirable for this or any other Climate.

Our seeds are either raised under our own inspection or imported from responsible houses in Europe, and having taken extraordinary pains to obtain such as are pure and genuine, we can confidently recommend them to our customers and friends, and feel assured they will prove satisfactory to all who try them.

Dealers in seeds are requested to forward their orders in season. Boxes for retailing from 3 dolls. and upwards will be sent out on commission allowing a liberal discount and take back what remain unsold.

Letters and orders with good reference will meet with prompt attention.

#### FIELD SEEDS.

Sugar Beet.	Ruta Baga.
Mangel Wurtzel.	Ballatine's New Royal do.
New Red Globe do. } superior	White Tankard Turnip.
Yellow do. } varieties.	Red do.
Carrot Long Orange.	Red Round do.
" Altringham.	White do.
" New White, extra fine.	White Globe do.
Pumpkin, sorts.	Green Round do.
Wheat—various sorts.	Purple Top Hybrid do.
Barley, do.	Buckwheat.
Rye, do.	Broom Corn.
Potatoes, do.	Millet.
Indian Corn, do.	Buckthorn. } for Hedges.
Oats, do.	Locust.

#### GARDEN SEEDS.

Artichoke, Asparagus, Beans of every description, Beets of sorts, Borecole, Broccoli, Brussels Sprouts, Cauliflower, Caraway, Celery, of the most improved sorts, Cabbage 20 sorts, Carrot, all the varieties, Cucumber do, Cress, Egg Plant, Endive, Indian Corn, Kale, Leek, Lettuce in great variety, Melons, do. Martynea, Mustard, Nasturtium, Okra, Onion of sorts, Pepper do. Pumpkin do. Parsnip, Parsley, Peas, a very great variety, Rhubarb for tarts, Radish of sorts, Salsify, Squash of sorts, Tomato, Turnip 20 varieties.

#### SWEET AND POT HERBS.

Thyme.	Sweet Basil.
Sweet Marjorum.	Lavender.
Sage.	Lemon Balm.
Summersavory.	Anise.
Medicinal Herbs, &c.	

#### ORNAMENTAL FLOWER SEEDS.

Three hundred varieties, embracing all the finest sorts. Packages of 20 fine sorts for one dollar.

Those who prefer to have their Seeds put up in papers ready for retail, can be accommodated—each packet neatly closed and labelled with printed directions. Price 50 cents, per dozen papers, which are retailed here at 6 1-4 cents each.

Fruit and ornamental trees, of the greatest variety, supplied at nurseryman's prices, and orders solicited. These will be packed, when required, to go to any part of the U. States. JOSEPH BRECK & CO.

Boston, Jan 27, 1841.

#### BONE MANURE.

The subscriber informs his friends and the public, that after ten years experience, he is fully convinced that ground bones form the most powerful stimulant that can be applied to the earth as a manure.

Orders for Bone Manure or Oyster Shell Lime, left at the Bone Mill, near Tremont road, in Roxbury, at the New England Agricultural Warehouse and Seed Store, No 52 North Market Street, or through the Post Office will meet with prompt attention.

March 4, 1840.

NAHUM WARI.

## PURE SPERM OIL.

### EDMUND T. HASTINGS & CO.

E. T. HASTINGS & CO. No. 101 State St keep constantly for sale, Winter, Spring and Fall Sperm Oil, bleached and unbleached; which they warrant to be of the best quality and to burn without crusting.

Oil Canisters of various sizes.

Boston, Jan. 1, 1841.

181y

#### GREEN'S PATENT STRAW CUTTER.

JOSEPH BRECK & CO. at the New England Agricultural Warehouse and Seed Store Nos. 51 and 52 North Market Street, have for sale, Green's Patent Straw, Hay and Stalk Cutter, operating on a mechanical principle not before applied to any implement for this purpose. The most prominent effects of this application, and some of the consequent peculiarities of the machine are:

1. So great a reduction of the quantum of power requisite to use it, that the strength of a half grown boy is sufficient to work it efficiently.
2. With even this moderate power, it easily cuts two bushels a minute, which is full twice as fast as has been claimed by any other machine even when worked by horse or steam power.
3. The knives, owing to the peculiar manner in which they cut, require sharpening less often than those of any other straw cutter.
4. The machine is simple in its construction, made and put together very strongly. It is therefore not so liable as the complicated machines in general use to get out of order.

#### WILLIS'S LATEST IMPROVED VEGETABLE CUTTER.

For sale at the New England Agricultural Warehouse, No. 51 and 52 North Market Street, Boston, Willis's Latest Improved Vegetable Cutter. This machine surpasses all others for the purpose of cutting Ruta Baga, Mangel Wurtzel, and other roots. The great objection to other machines, is their cutting the roots into slices, which makes it almost impossible for the cattle to get hold of them: this machine with a little alteration, cuts them into large or small pieces, of such shape as is most convenient for the cattle to eat. It will cut with ease from one to two bushels of roots per minute.

JOSEPH BRECK & CO.

#### FARM FOR SALE.

The subscriber offers for sale that valuable Farm, situated about 3-4ths of a mile below the First Parish Meeting House, on the Stage road, and commonly known as the Judge Prescott farm, containing about 170 acres of superior land, in a good state of cultivation, with two dwelling houses, four barns, and other out buildings. The farm is remarkably well watered with soft water, conveniently fenced, has nearly forty acres of large, handsome wood and timber standing on it, with an orchard of grafted Apple, Pear, Peach, Plum, and Cherry trees, and might be easily divided into two Farms. The estate will be sold reasonably. If five thousand dollars be paid on receipt of the deed, the remainder may lay on mortgage to suit the convenience of the purchaser. For further particulars, apply to the subscriber, living on the premises.

WM. SALISBURY.

Groton, Oct. 26, 1840.

eww.

## MISCELLANEOUS.

## QUALITIES OF ANIMAL AND VEGETABLE FOOD USED IN DIET.

**BEEF.** When this is the flesh of a bullock of middle age, it affords good and strong nourishment, and is peculiarly well adapted to those who labor, or take much exercise. It will often sit easy upon stomachs that can digest no other kind of food; and its fat is almost as easily digested as that of veal.

**VEAL** is a proper food for persons recovering from indisposition, and may even be given to febrile patients in a very weak state: but it affords less nourishment than the flesh of the same animal in a state of maturity. The fat of it is lighter than that of any other animal, and shows the least disposition to putrescency. Veal is a suitable food in costive habits; but of all meat it is the least calculated for removing acidity from the stomach.

**MUTTON**, from the age of four to six years, and fed on dry pasture, is an excellent meat. It is of a middle kind, between the firmness of beef and the tenderness of veal. The lean part of mutton, however, is the most nourishing and conducive to health, the fat being hard of digestion. The head of the sheep, especially when divested of the skin, is very tender; and the feet, on account of the jelly they contain, are highly nutritive.

**LAMB** is not so nourishing as mutton; but it is light, and extremely suitable to delicate stomachs.

**PORK** affords rich and substantial nourishment; and its juices are wholesome when properly fed, and when the animal enjoys pure air and exercise. But the flesh of hogs reared in towns is both hard of digestion and unwholesome. Pork is particularly improper for those who are liable to any foulness of the skin. It is almost proverbial that a dram is good for promoting its digestion: but this is an erroneous notion; for though a dram may give a momentary stimulus to the coats of the stomach, it tends to harden the flesh, and of course to make it more indigestible.

**SMOKED HAMS** are a strong kind of meat, and rather fit for a relish than for a diet. It is the quality of all salted meat that the fibres become rigid, and therefore more difficult of digestion: and when to this is added smoking, the heat of the chimney occasions the salt to concentrate, and the fat between the muscles sometimes to become rancid.

**BACON** is also of an indigestible quality, and is apt to turn rancid on weak stomachs; but for those in health it is an excellent food, especially when used with fowl or veal, or even eaten with peas, cabbages, or cauliflowers.

**GOAT'S FLESH** is hard and indigestible; but that of kids is tender, as well as delicious, and affords good nourishment.

**VENISON**, or the flesh of deer, and that of hares, is of a nourishing quality, but is liable to the inconvenience, that, though much disposed to putrescency of itself, it must be kept for a little time before it becomes tender.

**THE BLOOD OF ANIMALS** is used as an aliment by the common people, but they could not long subsist upon it, unless mixed with oatmeal, &c., for it is not very soluble, alone, by the digestive powers of the human stomach, and therefore cannot prove nourishing.

**MILK** is of very different consistence in different animals: but that of cows being the kind used in diet, is at present the object of our attention. Milk,

where it agrees with the stomach, affords excellent nourishment for those who are weak and cannot digest other aliments. It does not readily become putrid, but it is apt to become sour on the stomach, and thence to produce flatulence, heart-burn, or gripes, and in some constitutions, a looseness. The best milk is from a cow at three or four years of age, about two months after producing a calf. It is lighter, but more watery, than the milk of sheep and goats; while, on the other hand, it is more thick and heavy than the milk of asses and mares, which are next in consistence to human milk.—On account of the acid which is generated after digestion, milk coagulates in all stomachs; but the caseous or cheesy part is again dissolved by the digestive juices, and rendered fit for the purposes of nutrition. It is improper to eat acid substances with milk, as these would tend to prevent the due digestion of it.

**CREAM** is very nourishing, but on account of its fatness, is difficult to be digested in weak stomachs. Violent exercise after eating it, will, in a little time, convert it into butter.

**BUTTER.** Some writers inveigh against the use of butter as universally pernicious; but they might with equal reason condemn all vegetable oils, which form a considerable part of diet in the southern climates, and seem to have been beneficially intended by nature for that purpose. Butter, like every other oily substance, has doubtless a relaxing quality, and if long retained in the stomach, is liable to become rancid; but if eaten in moderation, it will not produce those effects. It is, however, improper in bilious constitutions. The worst consequence produced by butter, when eaten with bread is, that it obstructs the discharge of the saliva in the act of mastication or chewing; by which means the food is not so easily digested. To obviate this effect, it would be a commendable practice at breakfast, first to eat some dry bread, and chew it well, till the salivary glands were exhausted, and afterwards to eat it with butter. By these means such a quantity of saliva might be carried into the stomach, as would be sufficient for the purpose of digestion.

**CHEESE** is likewise reprobated by many as extremely unwholesome. It is doubtless not easy of digestion: and, when eaten in a great quantity, may overload the stomach; but if taken sparingly, its tenacity may be dissolved by the digestive juices, and it may yield a wholesome, though not very nourishing chyle. Toasted cheese is agreeable to most palates, but is rendered more indigestible by that process.

**POWLS.** The flesh of birds differs in quality according to the food on which they live. Such as feed upon grain and berries, afford, in general, good nourishment; if we except geese and ducks, which are hard of digestion, especially the former. A young hen or chicken is tender and delicate food, and extremely well adapted where the digestive powers are weak. But of all tame fowls, the capon is the most nutritious.

**TURKEYS, &c.** Turkeys, as well as Guinea or India fowls, afford a substantial nutriment, but are not so easy of digestion as the common domestic fowls. In all birds, those parts are the most firm which are most exercised: in the small birds, therefore, the wings, and in the larger kinds the legs, are commonly the most difficult of digestion.

**WILD FOWLS.** The flesh of wild birds, in general, though more easily digested, is less nourishing than that of quadrupeds, as being more dry, on ac-

count of their almost constant exercise. Those birds are not wholesome which subsist upon worms, insects and fishes.

**EGGS.** The eggs of birds are a simple and wholesome aliment. Those of the turkey are superior in all the qualifications of food. The white of eggs is dissolved in a warm temperature, but by much heat it is rendered tough and hard. The yolk contains much oil, and is highly nourishing, but has a strong tendency to putrefaction; on which account, eggs are improper for people of weak stomachs, especially when they are not quite fresh. Eggs boiled hard or fried are difficult of digestion, and are rendered still more indigestible by the addition of butter. All eggs require a sufficient quantity of salt, to promote their solution in the stomach.

**FISH**, though some of them be light and easy of digestion, afford less nourishment than vegetables or the flesh of quadrupeds, and are, of all the animal tribes, the most disposed to putrefaction. Salt water fish are in general the best; but when salted, though less disposed to putrescency, they become more difficult of digestion. Whittings and flounders are the most easily digested. Acid sauces and pickles, by resisting putrefaction, are a proper addition to fish, both as they retard putrescency and correct the relaxing tendency of butter, so generally used with this kind of aliment.

**OYSTERS AND COCKLES** are eaten both raw and dressed; but in the former state they are preferable; because heat dissipates considerably their nutritious parts as well as the salt water, which promotes their digestion in the stomach: if not eaten very sparingly, they generally prove laxative.—*Medical Intelligencer.*

## POUDRETTE.

The subscribers reside in the state of New Jersey, many of us in the vicinity of the works erected by Anthony Dey, of the city of New York, on the Hackensack river, in New Jersey, for the manufactory of Urate and Poudrette, called "The Lodi Manufacturing Company." We have used the poudrette on the Spring Crops this year, '840. We find it a valuable manure, superior to any other kind that we have ever used, and considering the facility of its transportation to the field, the small quantity required in the application to the crops, the quickness of its operation on vegetable matter, and the ease with which it can be applied,—all tend to recommend its use to the farmer and gardener as the cheapest and best manure, and we recommend it accordingly.

Those of us who have applied it to corn and potatoes think that it ripens those vegetables quicker than any other manure by several weeks.

Dated New Jersey, October, 1840.

Jacob D. Van Winkle.	P. F. Welsh.
John J. Newkirk.	G. C. Van Ripper.
John Tise.	George Tise.
Daniel Van Ripper.	William Wood.
George Demott.	John Duryee.
Henry Drayton.	George Newkirk.
Josiah Hornblower.	Garret Newkirk.
Corns. Van Winkle.	Daniel Vreeland.

Shares in the above company are \$100 each, and may be had by applying to Anthony Dey No. 73 Cedar St. New York.—The owner will receive 20 per cent. per annum, payable in money, or 50 bushels of Poudrette. The price to those who buy Poudrette is 40 cents a bushel. It costs the Stockholders 12 cents a bushel. One cent's worth, that is, 20 Gdls, will manure 20 hills of corn, and the like quantity 15 hills of Potatoes.

Newspapers friendly to agriculture will confer a favor on the Farmers and Gardeners by publishing the above. Dec. 22.

## GRINDSTONES.

An extensive assortment of Water and Hand Grindstones constantly on hand and for sale by AMMT C. LOMBARD & CO. 13 Lewis's Wharf. 15th. Nov. 17.

## TRACE CHAINS.

Just received, direct from the English manufacturer, 8 casks of Trace Chains, from 6 to 11 feet long, suitable for ploughing or draft chains. JOSEPH BRECK & CO.

# NEW ENGLAND FARMER, AND HORTICULTURAL REGISTER.

PUBLISHED BY JOSEPH BRECK & CO., NO 52 NORTH MARKET STREET, (AGRICULTURAL WAREHOUSE.)—ALLEN PUTNAM, EDITOR.

VOL. XI.]

BOSTON, WEDNESDAY EVENING, FEBRUARY, 3 1841.

[NO. 31.]

N. E. FARMER.

The English Agricultural journals for the last few years, have contained many articles upon the practice of subsoil ploughing. Our readers, we suppose, understand this to be the use of a plough having a narrow *double share*, or a small share on each side of the coulter and no mould-board. It is used in each furrow after the common plough, and breaks up and stirs the sub-soil to the depth of several inches, without bringing it up and incorporating it with the soil. Many farmers in England have derived great advantages from this process, in connection with under-draining. Others have found it waste labor. The January No. of the Journal of the Royal Agricultural Society of England contains a communication upon this subject by H. S. Thompson, Esq., parts of which we extract below

Heretofore we have received the impression that our transatlantic co-workers deemed this process peculiarly suited to stiff and heavy soils, consisting mostly of compact, adhesive clays. They now begin to intimate that shallow soils of the lighter kinds may be quite as susceptible of improvement under this process as any others. We have often conjectured that it must be thus; and have supposed that many of our shallow, gravelly and sandy soils in New England would be rendered more retentive of moisture and more fertile by simply subsoiling without under-draining. Some of the observed facts, leading to the supposition are, that we have seen apple trees growing better in gravel that had been moved, than in the deepest and richest mould; that grass, on a narrow strip where the subsoil had been thrown out and replaced when putting down the logs of an aqueduct, was much more abundant than on the adjoining portions of the field: that an immense—a *mammoth* squash had grown upon an unmanured gravel heap that had been formed when digging a well. The loosening of the sub-soil, making it more pervious to air and water—bringing many particles into contact with particles that have not touched them before, and thus perhaps promoting slight fermentations and new chemical combinations, may fit the sub-soil to attract, receive and nourish the roots of plants. Can our practical men give us any useful facts or observations upon this subject? The matter is worthy of attention.

### ON SUBSOIL PLOUGHING.

BY H. S. THOMPSON, ESQ.

Public opinion is still much divided on the subject of subsoil ploughing. Some very eminent farmers maintain that it is lost labor; while others, equally eminent, think no system of husbandry complete without it. When men of sense and experience differ respecting matters of fact which have come under their own observation, it will generally be found that, like the travellers disputing about the color of a chameleon, neither would be wrong if he would only allow his opponent to be right. To take a case in point:—one farmer of my acquaintance, drained deep and used the sub-

soil plough with every precaution and care, yet found it fail; another, following precisely the same plan, permanently improved the texture of the soil: both were anxious that their friends should profit by either the example or the warning, and lost no opportunity of making the result public. For want of a better term, both experiments were said to have been made on *stiff* soils: both are credible men; and the natural result of such conflicting testimonies is, that the question remains undecided. Here we feel the want of some acknowledged classification of soils, founded on chemical analysis. No two witnesses could be more directly at issue than those alluded to above: and very possibly, both one and the other may have been quoted by the supporters or opposers of the subsoil plough as triumphantly establishing their position. The moment, however, that the two experiments are referred to their place in the geological map, the whole difficulty vanishes. One was made in a stiff, marly clay, on the new red sandstone formation; the other on that most tenacious of all soils, the lias clay: the one was permanently improved; the other ran together again almost as soon as done.

It would be but waste of time to give any additional proof of what has already been fully established, viz: that on some soils the subsoil plough has been eminently useful; that on others it has signally failed. The grand desideratum, at present, is the discovery of some test which shall enable us, on the examination of any given soil, to pronounce tolerably confidently that it would be advisable or useless to subsoil it. I feel fully persuaded that the per centage of alumina, or pure clay, in any soil, furnishes the required criterion. In the two instances quoted above, I procured an analysis of the soils, and found that, in the one in which subsoiling was of no use, the proportion of alumina was twice as great as in the other: this most unexpected result first suggested the rule above stated; and in all the cases which I have since had an opportunity of examining, it has been fully confirmed. A rule of this kind can only be established by numerous experiments on various soils; but if those gentlemen who are anxious to promote agricultural improvement, would kindly forward to the secretary of the Yorkshire Agricultural Society the result of their own experiments with the subsoil plough, accompanied by either an analysis of the subsoil on which it was tried, or even a specimen of the subsoil for analysis, the question of subsoil ploughing would very soon be set at rest; and it would be as easy to point out the soils which would be benefited by it, as it is now to distinguish turnip and barley soils from those adapted for wheat and beans.

I will now state the steps taken to test the truth of the rule above mentioned, viz: that the per centage of alumina ought to guide us in the selection of soils for subsoiling. I wrote to several gentlemen whom I knew to have used the subsoil plough, and on whose accuracy I could rely, and begged that they would furnish me with some account of their experiments, and send me a specimen of the subsoil for analysis. I have, wherever practicable,

given the account in the words of the writer; and can only regret that the shortness of the time has prevented my collecting more evidence on the subject. The following essay was sent me by that very intelligent farmer, Mr Black, land-agent to the Earl of Zetland, at Marske, in Cleveland.

“There is probably no agricultural operation that has been so strongly recommended by some, and so much censured by others, as subsoil ploughing. Its advocates have represented it as the great panacea for all soils and situations; and its introduction, they say, will form a new epoch in agriculture. Believing that neither party have viewed the subject properly in all its bearings, I beg leave humbly to offer a few remarks, first, on the soil that will receive the most permanent improvement from subsoil ploughing; and, second, where it can be of no utility. The soil that I believe will receive the most permanent improvement from subsoil ploughing is one in which silica predominates; indeed all shallow soils, of the lighter kinds, will be improved by it; and particularly so if there is any moorland pan, or indurated incrustations, formed by the weight of the plough going for a number of years at the same depth, or from other causes. If the subsoil is of good quality, and a greater depth of furrow is wished for, the subsoil plough may be used with advantage; the percolation of water prepares the subsoil for amalgamation with the surface. Strong clayey land cannot be permanently improved by subsoil ploughing. Alumina is a tenacious, compact, adhesive substance; its parts are in minute divisions, and have great affinity for each other. In September, 1838, I subsoiled two fields of 10 acres each, which had been previously drained, and as the *nomenclature* of soils is not at all intelligible, and has led to much mischief in detailing experiments, I send you the analysis of 300 grains of the field since ploughed.

300 grains consisted of—

	Grains.
Moisture,	61
Soluble matter, principally vegetable,	3
Lime, in the state of carbonate,	2
Peroxide of iron,	50
Alumina,	130
Silica, or fine sand,	20
Vegetable matter,	33
Loss,	1
	300

“One of these subsoiled fields produced 35, and the other 27 1-2 bushels of wheat per acre; the field that produced the greatest number of quarters per acre was subsoiled across the drains; the ether parallel with them. I do not attribute this great falling off per acre altogether to the parallel subsoiling, although I think the other is decidedly the best method. In December, 1839, one of the fields was ploughed, but no traces remained of the subsoil plough having been used. I expected, from the complete breaking up of the subsoil, that the parts would have remained distinct for years; but

such was not the case: they had all run together, and were as compact as when first moved by the plough, without even the appearance of water-shake or fissure. This I was not prepared to expect. Separated by a fence only is another field of a similar description, which was fallow at the same time, but not subsoiled; the crop on this field was quite equal to the other. A neighbor subsoiled one acre of a field which was sown with beans; this field I frequently saw through the summer, and during that period the part subsoiled was by no means superior to the other."

On reading this account my attention was naturally arrested by the great difference between the produce of the two fields subsoiled by Mr Black; and as it was important to ascertain whether any sufficient cause could be assigned independent of the different methods adopted in subsoil-ploughing them, I addressed him the following questions:—Is the field which produced 35 bushels per acre of better quality than the one which produced 27 1-2; or was it better manured, or the seed time more favorable? His answer was as follows:—"The land (viz., that which produced 35 bushels) is much inferior. I ascribe the superior crop to the field having been more recently drained than the other. I have always found the first crop after draining above an average. Lime, too, was applied to this field two years before, which did not appear to have acted until the water was taken off: and last, although not least, it was subsoiled across the drains. As regards manure, I consider the fields alike in that respect. Both fields were sown under favorable circumstances." Draining after lime appears quite adequate to account for this increased produce; but even should we attribute a portion of it to subsoiling across instead of parallel to the drains, the whole effect seems to have vanished before the next ploughing, as we read in Mr Black's account. In confirmation of Mr Black's views, I will quote the opinion of Mr Vansittart, of Kirkleatham, whose experiments I had an opportunity of observing whilst in progress. I need hardly add that they were made in the most judicious and effectual manner. "Upon subsoiling I have nearly made up my mind, and am satisfied that it is not of permanent use on this soil." We have here the experience of Mr Vansittart, Mr Black, and a neighboring farmer, all of whom agree in thinking that subsoiling is of no use on their land. The quality of land is the same in all: consisting of a level and uniform tract of that peculiarly tenacious soil, the lias clay, containing, as we see by the analysis furnished by Mr Black (made at Edinburgh,) no less than 43 per cent. of alumina or pure clay. The next evidence I shall adduce is that of Mr Stevenson, of Rainton, near Boroughbridge, a very enterprising and judicious tenant-farmer; whose farm chiefly consists of a stiff red clay, on the red sandstone formation. He began by subsoiling 17 acres in the winter of 1835-6: the summer following, these 17 acres grew a remarkable crop of turnips, though the year was in general a failing one for that crop. The turnips were followed by barley, seeds, wheat—all good crops. When ploughed deep again for turnips, at the end of the course, it was found to work much lighter than the land not subsoiled. The man who held the plough in both instances found a great difference in the mellowness of the soil turned up, and consequently in the labor of the horses. The subsoil, on analysis, showed 24 per cent. of alumina. The exact analysis is as follows:

Specific gravity, 2.070.	
100 parts contain—	
Of water of absorption,	7
Silica,	55
Alumina,	24
Oxide iron,	7 1-2
Soluble matter,	2
Loss,	4 1-2
	100

Mr Stevenson found so much benefit from the operation, that he has since subsoiled 27 acres, and means to continue it on a large scale. A glance at the experiments above described enables us to make a first approximation to the solution of this much debated question. It appears probable that a soil containing not more than 24 per cent. of alumina may be subsoiled with advantage, but that when it exceeds 40 per cent. no permanent improvement is derived from the operation. Many more experiments must be made before this approximation can be so modified as to make it of general application: and I would beg to suggest to those gentlemen who may feel disposed to assist in the inquiry, that any account of the use of the subsoil-plough on land containing more than 24 and less than 40 per cent. of alumina would be particularly valuable, as the first point to ascertain is, the maximum quantity of alumina which may exist in land without making it unfit for subsoiling. From what has been stated above, there is reason to suppose that this maximum point lies between 24 and 43 per cent.; every experiment, therefore, made on soil containing more than the one and less than the other, reduces the doubtful soils within narrower limits. It would also be advisable to try the effect of subsoiling on two soils containing equal quantities of alumina, but otherwise differing in the composition, as it is possible that other substances, in combination with alumina, may in some degree affect the result.

I have thus far confined myself to stiff soils; but as the subsoil-plough has been little used on light land, and its effect therefore is little known, the following paper from Mr Denison, of Kilnwick Percy, will be read with great interest.

[Mr Denison's operations were made on a field consisting of sandy hills, light, blow-away soil, and marshy hollows—peaty soils. After having described the drainage and its expense, he says:]

"The first process after the drains were complete was in the months of March and April to pare and burn; and to sow rape and turnips, drilled with half-inch bones and soot in the following month. The crop was not at all regular; being good where the soil was deep and black, but very bad where it was sandy: the sole being hard and the action of the sun having great power to the very roots of the plants.

"In the winter of the same year, after the turnips and rape were consumed, I ploughed land in the direction of the old furrows, and the subsoil plough followed, worked by two oxen and four horses; loosening the hard sandy sole on the higher ground, and tearing up the roots of the rushes, &c., on the low. In this state the land lay till the month of April following, when Finlayson's drag-harrow was applied across the ploughings, which brought up all the roots and rubbish to the surface; these were then raked off and burnt. I then sowed the black Tartarian oats, and ploughed them in;

the ground was then harrowed and pressed down with a clod-crushing roller, made by Mr Croskill, of Beverley, which implement has been of the greatest service to me in almost every stage and crop. It has been the means of consolidating the earth, which would otherwise have been too light, and it has kept the moisture in also. It has a decided advantage over every other kind of roller in this respect, because it leaves an uneven surface instead of a flat one, from which the rain, in sandy land especially, is apt to run off without nourishing or refreshing the crop.

"The oats came out very healthy and had no check: in sixteen weeks from the time of sowing they were reaped, and when thrashed yielded 10 1-2 quarters per acre, which were sold at 26s. per quarter, and this from land that was let two years before at 2s. 6d. per acre.

"I calculate the expense of subsoil ploughing, according to my mode of using it, at 26s. per acre, thus:

Four horses and two men, per day,	14s.
Two beasts and one man,	5s.
	19s.

These will do 3 roods per day. The oxen are yoked to the plough, and the four horses precede. I sowed 40 acres with oats, of the same flat of land that had been pared and burnt, but not subsoiled, from want of time. The produce of this was not more than 3 qrs. per acre, and straw small and short; a very fair proof of the advantage of subsoiling.

"I have now 100 acres of wheat and oats growing on what was the very worst part of the whole property, and considered perfectly useless. It has been drained, pared and burnt, and subsoiled exactly after the mode detailed; and it looks as promising as what was so good last year. The land upon which I had potatoes exhibits as decided a superiority; and I shall in another year be able to state what effect subsoiling has upon the turnip crop as upon the produce of the wheat.

R. DENISON."

For the New England Farmer.

MARL.

MR EDITOR—We were viewing the improvements on a farm the last autumn, and the owner directed our attention to a small hollow, less probably than half an acre, which he described as containing peat of a very superior quality. Taking a cursory survey of the surrounding land, and especially of the road which had manifestly contributed to the increase of substances in the hollow, we suggested the expediency of searching below the peat bed for marl. A distinguished literary gentleman was standing with us, who expressed the opinion that the search would be in vain there or elsewhere in New England. We heard the expression of this opinion with great surprise, for we had been applying what we supposed marl to our land thirty years, and with evident good effect.—Professing nothing beyond practical knowledge, we determined to embrace an early opportunity of consulting the books in our possession, and ascertain, if possible, what name scientific men had given the substances which we had used and called marl. The examination has not been attended with all the success desired. Under many, if not all peat beds, there is an nuctuous substance,

which seems not to have been noticed by writers, excepting in regions of lime formations, when it is called marl. Professor Hitchcock says, "Marl for our farmers scarcely exists in the State, except in a few places in Berkshire county, where it is of little use, because the soil already contains so much calcareous matter." The Professor, with other scientific men, supposes in every substance entitled to the name of marl, there must be a certain per centage of lime; therefore he never expects to find marl except in places where there are lime formations or sea shells. May it not be true that there are other substances than lime and other operations in nature than the direct action of this, that will solve the tenacity of clay and prepare it for the seat and nourishment of plants? May not time dissipate the tannin principle from the lowest stratum of the peat bed, introduce a portion of some kind of earth and thus form a richer ingredient for dressing fields than surface peat would make? We are confident from experience it is so. And we believe if Dr. Hitchcock had been engaged in an agricultural, instead of geological survey, that he would have discovered treasure for the farmer beneath the peat bed, and would have urged the citizens of Nantucket, Barnstable and Plymouth counties not only to apply peat to enrich their fields, but to search with diligence for more valuable substances buried under it. These substances we have been in the habit of calling marls. It may be a misnomer—if it be, there cannot be so much wrong in the use of it, as there is to neglect to examine and apply the substances. We have always found them useful to some extent; no doubt the value will very much depend on the original purity of the peat, the character of the surface soil around the bed and the foundation on which it rests. Analysis will prove an important aide to those capable of performing the process, and the results of experience, if we will wait for them, are something more certain. M. A.

#### INQUIRIES CONCERNING BEES.

MR EDITOR—Sir—I have often seen the remark in your valuable paper, that "every man has a tongue, and if not a tongue, has a pen; and when he wants information why should he hesitate or be ashamed to ask for it?" Feeling, sir, that you are willing to bestow information, and are happy in diffusing knowledge, I give the liberty to ask you a few questions, which those acquainted with the subject, may appear simple; but to me, as I am not versed in the subject, may be highly useful. The questions are these: 1st, what is the best kind of house for bees? 2d, will bees do better out of doors exposed to all the cold of our winters, than to be carried in into a barn or some other place where they will be kept warm during the winter season? 3d, how is a house made out of doors, tight on all sides, and with a wide door in front, and back of the hives, that in cold weather they may be shut up, and in warm weather let down, answer? and would this do as well as a house open at all seasons in front of the hives; and what is the best kind of a house? By answering these questions you will much oblige a young farmer and a constant reader of your paper.

Yours, &c.

JAS. M. HARTWELL.

Medford, Jan. 26, 1841.

For the New England Farmer.

#### CURE FOR SPAVIN IN HORSES.

MR EDITOR—Having for several years practiced more or less as a farrier, and wishing to benefit the public by what I have learned, I send you the following recipes for the cure of spavin in horses; for the efficacy of which, not only myself but many of my townsmen can vouch.

Take a strong mixture of copperas and vinegar, with which rub the part affected, keeping the horse dry and stirring him only enough for exercise.

Again.—Take about a pailfull of urine into which throw a quantity (the more the better) of old rusty iron; put the vessel near a fire, and let it stand 3 or 4 days, stirring it occasionally, when it will be fit for use. Apply this mixture twice a day—and in all cases it will soon effect a radical cure, or at least prove highly beneficial.

Yours, &c.,

WM. HARTWELL.

Hillsborough, N. H., Jan. 25, 1841.

For the N. E. Farmer.

#### THE SUCCESSFUL FARMER.

MR EDITOR—I noticed an article in your paper of Dec. 30, taken from the Farmer's Cabinet, stating the good success of an aged farmer in the vicinity of Amherst, N. H. It appears from the statement that his average crop of grain on a farm of 130 acres, was 1500 bushels of wheat, 450 bushels of rye and 500 bushels of corn, annually. His farm was divided into eight fields of nearly equal size; three of which were sowed with wheat, one with rye, and one planted with corn. Consequently his average crop of wheat would be about 31 bushels to the acre, and rye about 28 bushels to the acre, and that his land was manured only once in eight years. Further, it says that the great secret of his success is *system*—that is, change of crops. Now it seems to me that to raise such crops, there must be some secret that is not made known in the statement.

I wish the editor of the Cabinet would be kind enough to give all the particulars in regard to the management of the farm; also, the man's name and place of residence. I should like to visit such a farm, as more can be learned by seeing than by reading.

AN INQUIRING FARMER.

[The article alluded to above was not copied from the Farmer's Cabinet, published at Amherst, N. H., but from the paper of the same title published at Philadelphia—and the successful farmer's locality is probably in the vicinity of that city.]

[Communicated.]

#### HOOF AIL OR FOULS IN HORSES.

The subscriber, having discovered certain substances which are an effectual cure for the fouls in cattle, wishes to give notice to the public, that he makes them into a salve and prepares it in boxes for delivery at 50 cents per box. As this disease is painful and fatal, if not checked in season, it would be well for all owners of cattle to keep this salve on hand. And if used according to my directions, I will warrant a speedy cure in all cases. For the correctness of the above, I will refer to the following gentlemen who reside in Roxbury.

BENJAMIN GUILD.

West Roxbury, Jan. 12th, 1841.

We, the undersigned, do highly recommend the above salve of Mr Guild, for that dreadful disease in cattle called fouls. We have applied it repeatedly, and always found an immediate cure.

John T. Whittemore, C. P. Hartshorn,  
Benjamin D. Lyon, Laban Adams,  
George W. Mann, William Keith,  
Aaron Cass, William Mayo,  
William Palmer.

N. B.—The salve may be had at the New England Agricultural Warehouse of Joseph Breck & Co.

#### THE WONDERFUL CIRCASSIAN MULBERRY.

We admitted, a few weeks since, a short article in relation to this mulberry. Some Connecticut "Yankee" has sent us a very entertaining communication upon the subject. Among other things he says, I caution the honest yeomanry of New England to be upon their guard; to be more cautious regarding all kinds of humbugs during the administration of ——— than ———," &c. We are ready enough to avow ourself a *whig*, but the cant phrases of politics are out of place in our columns, and the personal allusions of said "Yankee" are more cutting, though playful, than it is right for us to insert from an unknown writer. His general aim is good, and in it we join him; that is, we say beware of humbuggy.—Ed.

From the Albany Cultivator.

#### LARGE CROP OF CARROTS.

Messrs Gaylord & Tucker—Having a yard containing eight rods of ground where sheep had been yarded, I was induced to sow it to carrots. I ploughed and harrowed it, raked off the lumps and stones, (it being of a gravelly soil,) and sowed it in the month of May, in drills one foot apart; but in consequence of the drought which followed, the crop was materially injured. They were hoed twice and harvested in the month of October, and measured from 6 to 15 inches in circumference, and from 9 to 18 inches in length; the produce was 53 bushels and one peck, equal to 1,065 bushels per acre. I think them equal to the beet for cattle or sheep, and far preferable to the ruta baga, though not so easily raised. No roots fed in winter to milk cows, will give cream a finer color or butter a richer flavor than carrots. A. M.

New Haven, Vt.

A valuable Cow.—Mr Barrows, a little west of this village, is the owner of one of the most valuable dairy cows in the county, if not the very best. She is a mixed breed—Durham and Leopard—and is now about 8 years old. Last summer she produced over 21 lbs. of butter in one week, besides supplying the family with what milk was wanted. Mr B. brought us, last week, one or two rolls of nearly equal size, just made, which we found weighed 7 lbs. and 14 ounces—being nearly 16 lbs. per week this winter. He has been offered \$150 for her, but has refused to take this handsome sum.—Syracuse Jour.

The man who expects to succeed as a farmer, says Von Thier, must unite energy and activity to reflection, experience, and all necessary knowledge.

## PEAT MEADOWS.

There are large tracts of a peculiar soil eminently adapted to improvement in itself, and to the enriching and improvement of other soils, the value of which has scarcely begun to be appreciated. I refer especially to our peat swamps. These are deep deposits of vegetable matter, the accumulation of ages, which, in many cases at an expense which one year's cropping will compensate, may be made in the highest degree productive in grass, potatoes, carrots, and Swedish turnips, and in some cases, as experiment has proved, in corn, rye and wheat. Three tons of English hay per acre are not an unusual crop to be obtained from these lands, and by proper management their productiveness seems almost inexhaustible. I will set aside altogether their value as fuel, though in this respect, within twentyfive miles of a large city, they must be considered, at current prices of fuel, as of very great worth per acre. After two spits of fuel have been taken, the land is still of considerable value to the owner; and if the top-paring, which is unsuitable for fuel, be thrown back, it will in two years afford him a liberal cutting of good fodder for his stock.\* But besides all this, the importance of these grounds, as furnishing abundant resources for his compost heap, and enabling him to enrich his higher and perhaps exhausted grounds, is incalculable. Now the amount of this soil in New England is probably much beyond what most persons would suppose. The island of Nantucket, for example, is calculated to contain 985 acres of peat swamp, from one to fourteen feet in depth, which is almost a tenth of its whole territory; and excluding the four western counties of Massachusetts, which abound less in this kind of soil than its eastern portion, it is calculated that there are at least 80,000 acres or 125 square miles of an average depth of six feet four inches, within this single state. Whether, then, we consider the value of this soil in itself for cultivation, or as furnishing the ready means of restoring that, which has been exhausted, we cannot but acknowledge the advantages which it promises to our agriculture.—*Colman's Address at Norwich.*

## CLIMATE OF NEW ENGLAND.

The next question respects the climate of New England. There is nothing in the climate of New England which forbids or is unfavorable to the prosecution of a successful agriculture. The winters in most parts of New England are long; and cattle are kept at the barn from six to seven months. But if the season of repose is long, the season of labor and toil is proportionately short. With us, though it be reduced to five months, it is long enough to make ample provision for the winter that is to follow. In a northern climate vegetation is accelerated in proportion to the shortness of the season of life and growth; and nature accommodates herself to her necessities. There are extremes of temperature, which most persons would be glad to avoid. If New England does not occupy the desirable medium, yet it will be allowed that her climate is not surpassed by any in respect to longevity; and our winter seasons are universally acknowledged to be favorable to health and to mental vigor. In most parts of New England

\*The editor questions whether this be true as a general remark. The meadow must be remarkably dry in which the land will be worth much for many years after taking out peat two spittings deep.

the climate allows of the maturing of the most delicious fruits; and there are few portions, excepting the most northerly, of her whole territory, where Indian corn may not be matured. For twentyfour years in succession there has been but a single general failure of the crop of Indian corn. This, though extensive, was not universal; and this might have been in a great measure avoided, had suitable pains been taken in the procuring of the earliest seed and the proper management of the land. With the exception of cotton, rice, tea, and the sugar cane, there is not a single great and valuable agricultural product which may not be successfully cultivated in her territory.—*Ibid.*

## MEANS OF ENRICHING SOIL.

The next inquiry which suggests itself is, whether we have the means of enriching our soils and of rendering them as productive as they may be made. We have first, then, the usual supply of animal manure; and as we are not exporters but are importers of agricultural produce to a considerable extent, this being consumed among us, performs its part in restoring what has been taken from the soil, and in further increasing its productiveness.

Further, in extraneous manures we are by no means deficient. I have already spoken of our peat swamps, and of the vast deposits of this vegetable matter, which are scattered over our territory. Several parts of our territory abound in limestone and in calcareous marls, which it is hoped will prove ultimately of great value. Our sea coasts present an inexhaustible supply of sea-weeds and fish, and of marsh and dock mud and muscle bed. Of ashes in various forms we have the usual supplies. Many of our various manufactories furnish directly valuable manures or materials for manure. This may be said, in particular, of our woollen manufactories; comb and brush manufactories; sugar refineries; extensive tanneries; soap factories; oil and candle establishments; glue factories; and slaughter houses. Our large cities and villages furnish the usual resources for manures to the neighboring towns. Many of our lands likewise, are sensitive to the almost miraculous powers of gypsum; and though New England has within itself no considerable deposits of this valuable mineral, yet it is easily procured, and may be furnished to every part of the Commonwealth at a reasonable expense—an expense in no case, where its efficacy is ascertained, such as to discourage its use.—*Ibid.*

## SAVING MANURES.

We have made as yet, small advances in the art of saving and compounding manures. There is little doubt that as much valuable manure is now lost or thrown away, through ignorance or neglect, as is used. The practice of renovating and enriching land by ploughing in green crops, or by inverting the old sward, is seldom practiced among us, although where this has been done, the effects have surpassed the most sanguine anticipations. The introduction of bone manure and poudrette, is likewise recent: but from their proved efficacy and the facility of their transportation, they are likely to prove extraordinarily beneficial. In New Jersey, I have witnessed the most remarkable effects of a newly discovered marl, of an alkaline character, and of great efficacy. It has more than doubled the value of lands in the neighborhood of the pits where it is found. The application of one hundred bushels of this marl to land which under com-

mon cultivation would produce not more than 20 bushels of corn to the acre, causes it to yield 60 bushels, and wheat and clover in proportional abundance. Nor are its effects transient, but it produces a permanent improvement of the soil, the duration of which is not yet ascertained. In this respect it differs most favorably from ashes and many other manures, whose efficacy is continued seldom more than one or two years. At present this marl is delivered at the pits at seven cents per bushel, and might be delivered at many of the ports of New Jersey at a small advance upon that price. The farmers of Long Island have for years been in the habit of purchasing for their wheat fields our leached ashes at a cost of ten and twelve cents per bushel. If these shrewd farmers have then found an advantage in coming to our ports after our drawn ashes, why may not we import marl from New Jersey,—a substance far more efficacious and more enduring in its effects than ashes, at even a less price than is paid for our ashes?

In regard then to manures and the means of enriching our lands in New England, there is no deficiency; but we are greatly wanting throughout the State, in frugality to save the vast amounts which are now wasted; in industry to collect the means around us; and in skill and labor in preparing them for use. In soil, climate, and manures there is no impediment in New England to a successful agriculture.—*Ibid.*

## EFFECTS OF CLIMATE UPON MAN.

Our climate is, as I have remarked, favorable to labor. The severe and relaxing heats of summer are of short duration, and seldom of such intensity as that moderate labor is not in truth a refreshment. The elasticity of our autumnal and winter atmosphere induces to activity, and renders muscular exertion a pleasure. A day in the very depth of winter, spent in collecting wood in the unbroken silence of the leafless forest, with a deep bed of snow under your feet; the battling through the day with a drifting northeast snow storm, bristling with crystals of ice, or the beating your way an opening a sort of subterranean passage through the piled up waves of snow, which sometimes fill up our roads, to the well clad and well fed are often days of as healthful and agreeable an excitement as far as mere physical pleasure is concerned, are ever enjoyed by the more favored children of luxury and indolence in the elysian fields of the tropical zone.—*Ibid.*

## CROPS TO BE CULTIVATED.

My last topic is, what branches of agriculture can be most profitably pursued in New England. I cannot go largely into this subject; for carry I large a sward as I could swing, I could not even mow once half round the field. The simple answer to be given is, that with good husbandry, you may raise, with a fair profit, of whatever the climate will produce, every thing which we need eat, drink, or wear. The first of all rules in domestic economy, as far as the actual wants of the family are concerned, is for the farmer never to go abroad for what he can produce at home. There may be exceptions to this rule among those who reside near the capital, and who are rather gardeners than farmers; but there is no exception with respect to those who dwell in the interior. Beyond this, the farmer must select the objects of cultivation, with a particular reference to his location, soil, aspect, climate, the facility or difficul-

of procuring labor: and especially the market and the demand. He should have some reference likewise, to the permanency or the perishable nature of the crops or products which he raises. In the former respect, Indian corn yields to none other. I have in my possession, an ear of corn grown in the year of the total eclipse, 1806, as sound and perfect as the day on which it was gathered.—*Ibid.*

#### OURS A HAPPY LOT.

We have every reason to thank a kind Providence for the land of our birth, and to cherish and strengthen those bonds of affection which bind us to the place of our nativity. If us climate afford no perpetual summer, use reconciles and even attaches us to its changing seasons; and to the reflecting mind, the generous, intelligent, and pious student of nature, even stern winter is not barren of objects, in the highest degree picturesque, beautiful, sublime and elevating. If its soil is hard, and it requires a bold heart to contend with the difficulties which lie in our way, the efforts which are necessarily called out invigorate the physical frame, and give energy and elasticity to the mind.

There is no ground to complain of the place where Divine Providence has cast our lot. Let us regard it as the highest duty of patriotism, philanthropy and religion, to bring each one his humble but hearty contribution to the general stock of good; and to labor in his vocation, to do what he can and all he can, to improve, elevate, enrich, embellish and make happy the community in which he lives.—*Ibid.*

For the New England Farmer.

#### BEEES.

The last season was peculiarly favorable to the operations of bees, inasmuch as there were fewer high winds to molest them in their labors and less rain to drench the flowers than usual. We believe they made the most of their advantages every where, but have as yet seen no statements of any one's success with them. Being blessed with the "gift of the gab," we presume to offer the result of labors in our own colony, thereby "breaking the ice," and hoping others who have done better, will tell us, and how they managed. We had only three hives on the first of May, and neglected to take up our honey until late in September. Six of our best swarms are wintering, and from the later ones which we "took up" we had 176 pounds of honey. Whether this is doing well or not, we are unable to say, as we have not much experience in the business. It is the best we have ever done, however. Our hives thus far are all of the old-fashion kind, and we kept the swarms scattered in different parts of the garden, in rather shaded positions, standing upon stools raised but little from the ground. We found no appearance of moth in any of the hives taken up, and are rather confident in opinion that the best preventive of their depredations is the healthfulness and vigor of the swarm. Our bees at no time of swarming showed any disposition to emigrate from the premises, though in two or three instances they showed so much dissatisfaction with their hives as to leave them. Keepers of bees are in duty bound to furnish them with as much pasture near home as possible; hence floriculture may become an object with all who keep them—and of all flowers for their benefit, we think mignonette most valuable. W. B.

Mount Osecola, 1841.

#### CAUSE OF THE INEFFECTUALITY OF GYPSUM ON ACID SOILS.

I do not pretend to explain the mode of operation by which gypsum produces its almost magic benefits: it would be equally hopeless and ridiculous for one having so little knowledge of the successful practice, to attempt an explanation, in which so many good chemists and agriculturists, both scientific and practical, have completely failed.—There is no operation of nature heretofore less understood, or of which the cause or agent seems so totally disproportioned to the effect, as the enormous increase of vegetable growth from a very small quantity of gypsum, in circumstances favorable to its action. All other known manures, whatever may be the nature of their action, require to be applied in quantities very far exceeding any bulk of crop expected from their use. But one bushel of gypsum spread over an acre of land fit for its action, may add more than twenty times its own weight to a single crop of clover.

However wonderful and inscrutable the fertilizing power of this manure may be, and admitting its cause as yet to be hidden, and entirely beyond our reach—still it is possible to show reasons why gypsum cannot act on many situations, where all experience has proved it to be worthless. If this only can be satisfactorily explained, it will remove much of the uncertainty as the effects to be expected: and the farmer may thence learn on what soils he may hope for benefit from this manure—on what it will certainly be thrown away—and by what means the circumstances adverse to its action may be removed, and its efficacy thereby secured. This is the explanation that I shall attempt.

If the vegetable acid, which I suppose to exist in what I have called acid soils, is not the oxalic, (which is the particular acid in sorrel,) at least every vegetable acid, being composed of different proportions of the same elements, may easily change to any other, and all to the oxalic acid. This, of all bodies known by chemists, has the strongest attraction for lime, and will take it from any other acid which was before combined with it—and for that purpose the oxalic acid will let go any other earth or metal which it had before held in combination. Let us then observe what would be the effect of the known chemical action of these substances on their meeting in soils. If oxalic acid was produced in any soil, its immediate effect would be to unite with its proper proportion of lime, if enough was in the soil in any combination whatever. If the lime was in such small quantity as to leave an excess of oxalic acid, that excess would seize on the other substances in the soil, in the order of their mutual attractive force; and one or more of such substances are always present, as magnesia, or more certainly, iron and alumina.—The soil then would not only contain some proportion of the oxalate of lime, but also the oxalate of either one or more of the other substances named. Let us suppose gypsum to be applied to the soil. This substance, (sulphate of lime) is composed of sulphuric acid and lime. It is applied in a finely pulverized state, and in quantities from half a bushel to two bushels to the acre—generally not more than one bushel. As soon as the earth is made wet enough for any chemical decomposition to take place, the oxalic acid must let go its base of iron, or alumina, and seize upon and combine with the lime that formed an ingredient of the gypsum.—The sulphuric acid left free, will combine with the

iron or the alumina of the soil, forming copperas in the one case, and alum in the other. *The gypsum no longer exists*—and surely no more satisfactory reason can be given why no effect from it should follow. The decomposition of the gypsum has served to form two or perhaps three other substances. One of them, oxalate of lime, I suppose to be highly valuable as manure; but the very small quantity that could be formed out of one or even two bushels of gypsum, could have no more visible effect on a whole acre, than that small quantity of calcareous earth or farm-yard manure. The other substance certainly formed, copperas, is known to be a poison to the soil and to plants—and alum, of which the formation would be doubtful, I believe is also hurtful. \* \* Soils that are naturally calcareous, cannot contain oxalic acid combined with any other base than lime. Hence gypsum applied there, continues to be gypsum, and exerts great fertilizing power.—*Ruffin's Essay on Calcareous Manures.*

#### Massachusetts Horticultural Society.

##### EXHIBITION OF FRUIT.

Saturday, Jan. 16, 1841.

Benj. V. French, Esq., exhibited the following Apples, viz: Ortley Pippin, Black (Coxe, No. 67) Reinette du Canada; Yellow Bellflower; Winter Nonsuch; Wellington, and one sort unknown. Also, specimens of King's Bon chretien Pear, (so called.)

M. P. Wilder, Esq., exhibited Easter Beurre Pears—very fine.

E. Phinney, Esq., exhibited specimens of a large oblong red apple, name unknown.

S. Downer, Esq., exhibited Easter Beurre Pears, grown in the garden of Capt. John D'Wolf—very handsome. These pears as well as those exhibited by Mr Wilder, were the produce of standard trees, and in size, color, and flavor, were equal to any specimens of this fruit we have ever seen.

Mr Manning exhibited the following Apples, viz: Pumwater Sweet, Bellflower, Sweet Baldwin, Reinette, Noir Sanguine, Cat-head Greening, and one sort unknown. Also, the following Pears: Catillac, Wedale's St. Germaine (Belle d' Jersey or Pound, of American Catalogue,) and Bon chretien Turc, or Flemish Bon chretien, of the London Horticultural Society.

The Canadian Reinette, exhibited by Mr French, was of large size and fine flavor. We give Mr Thompson's opinion of this fruit, in the following extract from the London Hort. Society's Catalogue: "Good bearer, and though large, of excellent quality. Even as a dessert fruit, it is probably the best apple of its size, and surpassed by few of those that are smaller: it therefore deserves extensive cultivation."

The origin of Pumwater Sweet and the Red Sweet Baldwin, are unknown to the Committee: they may possibly prove synonymous with other well known apples. Information on this point is respectfully solicited.

For the Committee,

ROBERT MANNING.

To prevent water from freezing in a pump, it is only necessary to bore a small hole in the pump a few inches below the platform, to allow the water to escape. There is also another advantage from this: the water by agitating the air in the well, purifies it.—*Bangor Whig.*

BOSTON, WEDNESDAY, FEB. 3, 1841.

NEW ENGLAND FARMER.  
A WEEKLY PAPER.

The Editorial department of this paper having come into the hands of the subscriber, he is now authorized by the publishers to inform the public that the price of the paper is reduced. In future the terms will be \$2 per year *in advance*, or \$2 50 if not paid within thirty days.

The Editor's only promise is, that he will endeavor to make the paper instructive and useful to the agricultural community.

His friends and Postmasters who may think him fitted for the duties of his place, will confer a favor by giving this prospectus as wide a circulation as their circumstances will allow, and forwarding the names of such as choose to subscribe.

ALLEN PUTNAM.

N. B.—Postmasters are required by law to frank all subscriptions and remittances for newspapers, without expense to subscribers.

BOOK FARMING.

"Book farming. Do the words produce a sneer? Be that as it may, the *thing*, or what is often stigmatised as *that thing*, is not contemptible. For what is it? Not an attempt to comply with the advice and copy the example of every one who furnishes an article for an agricultural journal; not the adoption of every method of husbandry that is recommended in print; not a departure from all the usages of our fathers and neighbors; not a preference of the theories contained in books to the results of experience. No. I pity the stupidity of the man who thinks that if we use books, we must close our eyes against the light that is beaming upon us from other sources; or that we must become mere theorists, and the victims of ruinous experiments.—What! does a man lose his common sense, his prudence and his judgment, whenever he takes up an agricultural paper or opens a book upon husbandry? Cannot he make himself acquainted with the doings of others without losing his power to judge whether it would be well for him, in his circumstances, to copy their examples? Our brains are not so weak as this. The knowledge acquired from books does not make us all mad. But if it did, there would be more zest and true enjoyment in the learned mad-man's course, than in that of him who has learned out, and who thinks that books cannot make him wiser. I asked what book-farming is? Common book-farming is learning by means of books, new facts, opinions, results of experiments, modes of operation, and the using such parts of the information as can be turned to profitable account in our individual situations. If this be folly, we are content to be called fools. An agricultural paper will be worth to you every month, if not every week, more than its annual cost."

The preceding extract is from an Address delivered by us before the Essex Agricultural Society in 1839, long ere we had any thoughts of being peculiarly interested in the prevalence of such views. Those were our disinterested convictions. No misgivings as to their correctness trouble us now.

Few can be found who would more studiously avoid advising farmers to be guided and governed by what is printed, *solely because it is printed*, than the Editor. His aim is to help farmers to think; to give them such

facts as he can obtain; such opinions as others communicate; such views as he holds. The reader must select from the mass such as may, in his judgment, be turned to useful purposes by himself. He who weekly reads an agricultural paper will find in it food for thought—will be influenced to observe more carefully the processes of vegetation around him, and will thus become a more intelligent cultivator, even though he should never think of complying with the advice of any writer. We must admit to our columns many opinions, the correctness of which we very much doubt. When a practical man sends us facts, we must, in many cases, accompany them by his own views and inferences. In many communications we find some things which do not coincide with the opinions we entertain; but as this does not *prove* them incorrect, they are inserted in order that they may be seen and judged of by the reader. In no other way is it possible to do justice to the many with whom we are connected. While we ask farmers to read, we charge them never to abandon the use of light which comes from experience and their own good sense.

FARMERS' MEETINGS IN THE COUNTRY.

On the evening of Wednesday, two weeks since, we had the pleasure of meeting and speaking before the farmers of Newton. Some gentlemen of that place, desirous of deepening the interest in agriculture, invited us to visit them and make such remarks as we were able, in the furtherance of their object. We trust they may persevere and form an association which will furnish them with opportunity for mutual instruction and inquiry. Such an association in which the results of experiments and observation may be compared, cannot be otherwise than instructive and useful.

On the evening of the last Wednesday, we made a very pleasant excursion to Westboro', where we addressed a large assembly of genuine farmers. Our congratulations were given to them as being among the pioneers in forming town associations. We predicted that such associations will spring up in all parts of New England, and will send forth rills of agricultural knowledge, fertilizing every valley through which they may flow.—We know not any means of widening and deepening the interest in farming, so likely to be efficacious as these local associations. Having in our remarks described several of the ploughs which were tried at Worcester last autumn, we were addressed at the close of the evening by a gentleman, who stated that he purchased the identical plough, of Howard's make, for which a premium was there given; that it does, upon full trial, perform its work precisely as we judged; and that he would not part with it for fifty dollars. We thought this plough surpassed all others in cleaning out its furrows and making them of equal depth on both sides. In our judgment, there is none, taking it in all points, and for all varieties of soil, better than this.

THIRD AGRICULTURAL MEETING AT THE STATE HOUSE.

On the evening of Thursday last, at the State House, the president being absent, Captain J. Prince, of Roxbury, was called to the chair. The discussion was resumed upon the *cultivated grasses*.

The speakers were much the same as last week, and but few important facts were stated in addition to what we have already published. Mr. C. Linn intimated that we misreported him, in stating that the number of *cultivated grasses* is 600—all the kinds (including uncultivated) amount to that sum. Lobelia was rolled over the tongues of the speakers for a long time, but whether the horse will allow it to come in contact with *his* tongue,

remains a profound mystery. The best age at which to cut herds grass and red-top—whether when just passing out of flower, or when the seed is just full, or when they are quite ripe, is unsettled. Each time had its advocates. Chemistry may find more nutritive matter in that which is *ripe*—but our question should be whether the digestive organs of the horse or ox will extract more food from it in that state, than if cut younger.

Subject for to-morrow evening—*Stock*.

FIELD PREACHING.

No. 3.

*Charity envieth not.*—ST. PAUL.

That country Miss who is obliged to form and preserve an acquaintance with the wash-tub and cooking utensils, may sometimes wish that the daughter of wealth might be compelled to exchange places with herself: that boy, whose hands are busied with the shovel and hoe, may think that he who handles the yard stick behind a counter, and he whose hours are devoted to sports for "killing time," have a happier lot than his own; the stirring wife of the farmer is prone to wish that she, like the squire's lady, could sit down in the parlor with "a clean apron" on as often and as long as she pleased; the farmer himself may look with a discontented eye upon those who seem to get ahead with less hard work than comes in his own course. But good friends, young and old, male and female, yours is a condition abounding in as many solid comforts as any other. *Charity will not envy*, and why should you? This envy disquiets its possessor; it blisters the soul in which it burns. Avoid it and seek contentment with your lot. Seek for charity; she is the fruit most profitable for cultivation. Faith is the root fixing itself and feeding in the soil of truth; hope is the heaven-aspiring blade—charity is the immortal fruit. With this ripened in your moral field, you are rich.

THE EXTREMES.—There is a place on earth, where pure joys are unknown, from which politeness is banished, and has given place to selfishness, contradiction, and half-veiled insults. Remorse and inquietude, like fiends that are never weary of assailing, torment the inhabitants. This place is the house of a wedded pair who have no mutual love, nor even esteem.

There is a place on earth to which vice has no entrance—where the gloomy passions have no empire—where pleasure and innocence live constantly together—where cares and labors are delightful—where every pain is forgotten in reciprocal tenderness—where there is an equal enjoyment of the past, the present, and the future. It is the house, too, of a wedded pair, but who in wedlock are *lovers still*.—*St Lambert*.

NEW ENGLAND.—The farmers of New England have every reason to thank God for the condition in which they are placed. They need not sigh for more genial climes nor more fertile soils. These they cannot have without dreadful abatement of health and comfort. Of all the conditions on earth, which it has been my lot to see or read of, I am bold to aver, that I know of none more favorable to health, competence, enjoyment, and moral improvement, than that enjoyed by the rural population of New England. I despise the contempt with which some pretend to look down upon us; and the opprobrium which they have the impudence to cast upon our habits of thrift and frugality. I deem it my highest boast, that I am a New England man and a Yankee. I do not ask to have a living without labor. This would be asking for a curse instead of a blessing, and a boon for which I have no claim. I only ask that

a living shall be secured to me with reasonable labor, and this New England in her various departments of industry promises to all her children. \* \* In the midst of what others deem evils, I see innumerable compensations for which I look in vain to other countries and climes apparently more favored. In whatever direction I turn my eyes, there is every where such an exuberance of blessings to those who will perform their duty, that it would be the height of ingratitude to complain, and the height of folly to abandon a certain good for that which is at best uncertain and doubtful. I cling to her with the warmest affection of a child; and having been so long sheltered and nourished by her never failing care and kindness, I ask only that I may find my last resting place in the lap which gave me birth.—H. COLMAN.

**THERMOMETRICAL.**

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northernly exposure, week ending Jan. 31.

Jan. 1841.	7 A.M.	12 M.	5 P.M.	Wind.	
Monday,	25	29	30	34	E.
Tuesday,	26	28	37	31	N. E.
Wednesday,	27	33	44	40	S. W.
Thursday,	28	34	40	35	N.
Friday,	29	26	33	32	E.
Saturday,	30	24	40	30	W.
Sunday,	31	20	37	35	W.

**BRIGHTON MARKET. — MONDAY, FEB. 1, 1841.**

Reported for the New England Farmer.

At Market 390 Beef Cattle, 70 Stores, and 1250 Sheep. 60 Beef Cattle unsold.

Prices.—Beef Cattle.—We reduce our quotations to conform to sales to day. A few were sold on Saturday at higher prices. We quote a few extra, \$6 25.—First quality \$5 75 a 6 00. Second quality, \$5 00 a \$5 50. Third quality, \$4 25 a \$5 00.

Sheep.—We quote lots at \$2 00, \$2 50, \$2 75.—Wethers, \$3 75, \$4 25, \$4 75 and \$5 00.

Pigs.—None at Market. About 200 are expected next week.

**WHOLESALE PRICES CURRENT.**

Corrected with great care, weekly.

SEEDS. Herds Grass, very little in market, \$3 asked. Red Top, by the bag 60 to 70 c. Clover—Northern, 12 1-2 c. very little in Market.—Southern, plenty, 9 to 10 c. Flax Seed, \$1 37 to 1 59 bu. Lucerne, 25 c. per lb.

FLOUR. Howard Street \$5 37—Genesee \$5 31—Ohio \$5 12

GRAIN. Corn—Northern Yellow 60 to 61 c.—Round Yellow 57 to 58—Southern Flat Yellow 55—White 53. Rye—Northern 65 to 67—Southern 60 to 65. Oats—Southern 35 to 38—Northern 40 to 44.

PROVISIONS. Beef—Mess \$10 50 to 11 00—Prime \$6 50—No. 1 \$9 00. Pork—Extra—15 00—Clear 14 50—Mess \$13 00. Hams—Northern 9 c. per lb.—Southern, none. Lard—Boston 9 c. per lb.—Southern, 8 to 8 1-2. Butter—Lump 18 to 22—Firkir 12 to 18—Shipping 8 to 14. Whole Hogs 5 1-2 to 6 c.

HAY, per ton, \$17 to 17 60—Eastern Screwed \$12 to 13 50

CHEESE—Old 11 c.—New 8.

EGGS 2 1/2 to 25.

POULTRY—Chickens 11 to 12 1-2 c. per lb.—Turkeys 12 1-2—Geese 10.

WOOL.—The market for this article has not experienced any change of late. Pulled Wool is rather scarce, and there is but a limited supply of low Fleeces and of fine Fleeces the stock is also moderate. Prime or Saxony Fleeces, washed, lb. 50 to 55 c.—American full blood, washed, 47 to 50—Do 3 4 blood, washed, 44 to 46—Do. 1-2 blood, washed, 36 to 40—1-4 and common do, 35 to 37—Smyrna Sheep, washed, 20 to 23—Do. unwashed, 10 to 14—Bengasi Sheep, 8 to 10—Buenos Ayres unpicked, 7 to 10—Superfine Northern pulled lamb 43 to 46—No. 1 do. do. 37 to 42—No 2 do do 26 to 30—No 3 do do 18 to 20.

**GARDEN SEEDS,**

For sale by JOSEPH BRECK & Co., at the NEW ENGLAND FARMER OFFICE, No. 51 and 52 North Market St. Boston. The subscribers would inform the public that they have now on hand the largest collection of seeds ever before offered by sale in this city, embracing every variety of Field, Kitchen, Garden, and Ornamental Flower Seeds desirable for this or any other Climate.

Our seeds are either raised under our own inspection or imported from responsible houses in Europe, and having taken extraordinary pains to obtain such as are pure and genuine, we can confidently recommend them to our customers and friends, and feel assured they will prove satisfactory to all who try them.

Dealers in seeds are requested to forward their orders in season. Boxes for retailing from 8 dolls. and upwards will be sent out on commission allowing a liberal discount and take back what remain unsold.

Letters and orders with good reference will meet with prompt attention.

**FIELD SEEDS.**

**ORNAMENTAL FLOWER SEEDS.**

Three hundred varieties, embracing all the finest sorts. Packages of 20 fine sorts for one dollar.

Those who prefer to have their Seeds put up in papers ready for retail, can be accommodated—each packet neatly closed and labelled with printed directions. Price 50 cents, per dozen papers, which are retailed here at 6 1-4 cents each.

Fruit and ornamental trees, of the greatest variety, supplied at nurseryman's prices, and orders solicited. These will be packed, when required, to go to any part of the U. States.

JOSEPH BRECK & CO.

Boston, Jan. 27, 1841.

**WILLIS'S LATEST IMPROVED VEGETABLE CUTTER.**

For sale at the New England Agricultural Warehouse, No. 51 and 52 North Market Street, Boston, Willis's Latest Improved Vegetable Cutter. This machine surpasses all others for the purpose of cutting Ruta Baga, Mangel Wurtzel, and other roots. The great objection to other machines, is their cutting the roots into slices, which makes it almost impossible for the cattle to get hold of them: this machine with a little alteration, cuts them into large or small pieces of such shape as is most convenient for the cattle to eat. It will cut with ease from one to two bushels from s per minute.

JOSEPH BRECK & CO.

**PURE SPERM OIL.**

**EDMUND T. HASTINGS & CO.**

No. 101 State St. keep constantly for sale, Winter, Spring and Fall Sperm Oil, bleached and unbleached; which they warrant to be of the best quality and to burn without crusting.

Oil Canisters of various sizes.

Boston, Jan. 1, 1841.

1841

**GREEN'S PATENT STRAW CUTTER.**

JOSEPH BRECK & CO. at the New England Agricultural Warehouse and Seed Store Nos. 51 and 52 North Market Street, have for sale, Green's Patent Straw, Hay and Stalk Cutter, operating on a mechanical principle not before applied to any implement for this purpose. The most prominent effects of this application, and some of the consequent peculiarities of the machine are:

1. So great a reduction of the quantum of power requisite to use it, that the strength of a half grown boy is sufficient to work it efficiently.

2. With even this moderate power, it easily cuts two bushels a minute, which is full twice as fast as has been claimed by any other machine even when worked by horse or steam power.

3. The knives, owing to the peculiar manner in which they cut, require sharpening less often than those of any other straw cutter.

4. The machine is simple in its construction, made and put together very strongly. It is therefore not so liable as the complicated machines in general use to get out of order.

**BACHELDERS' PATENT PLANTING MACHINE**

This Machine, recently invented by L. & S. H. BACHELDER, of Hampstead N. H. is one of the most convenient and labor saving implements ever introduced to the notice of the farmer. It is simple in its construction, and certain and regular in its operation. It is calculated to plant all kinds of seed usually planted in hills or drills.

This Machine is constructed on principles altogether different from all others of similar purpose. It performs the operation of planting without opening a furrow, thereby dispensing with covers, that are continually liable to clog, and get out of order. It simply raises the soil a little, and at the same time drops the seed at any distance desired, when the soil falls back to its original place, and is immediately followed by a moveable gauge, that leaves the soil to any depth over the seed which the operator chooses; it also removes all small stones and sods from the ground where the seed is deposited.

This Machine has been in operation during the past season and thoroughly tested by practical Farmers and Mechanics in Massachusetts and New Hampshire, and is pronounced by them a complete and useful Machine, and is allowed by all who have seen it, to be superior to every other implement of the kind now in use in the United States. It operates equally well on wet or dry ground, and is warranted to work well on any ground that can be furrowed with the common plough.

Orders will be received by L. & S. H. BACHELDER, Hampstead, N. H., or by the subscriber at Haverhill, Mass., their General Agent for the United States, for the Planter, or a right to manufacture and dispose of them. Any communication addressed to either will receive attention.

T. J. GOODRICH.

Deerfield, N. Y. May 27, 1840.

TO THE PUBLIC.—We whose names are hereunto annexed, certify that we have examined Bachelder's Patent Planting Machine, and seen it operate on several of our farms in Deerfield, Oneida County; the seed planted thereby seems well planted, wherever the ground is in proper order, and is now coming up; and we believe the Machine fully answers the description given of it in the handbills describing and recommending it, and heartily concur in said recommendation, believing as we do that it will prove a valuable labor-saving Machine, and on good land will soon supersede the labor of planting by hand in the old and common method.

DOLPHUS SKINNER,  
SAMUEL LOOK,  
BENJAMIN NORTHAP.

## MISCELLANEOUS.

## CLEARNESS OF SOUND AT NIGHT.

The greater clearness with which distant sounds are heard in the night, is an interesting phenomenon. It was noticed by the ancients, and ascribed to the repose of animated nature. When Humboldt heard the noise of the great cataracts of the Orinoco, his attention was directed to this curious fact; and he was of the opinion that the noise was three times louder during the night than in the day. As the humming of the insects was much greater in the night than in the day, and as the breeze which might have agitated the leaves of the trees, never rose till after sunset, he was led to seek for another cause of the phenomenon. In hot days, when warm currents of air ascend from the heated ground, and mix with the cold air above, of a different density, the transparency of the atmosphere is so much affected, that every object seen through it appears to be in motion, just as when we look at an object over a fire, or the flame of a candle. The air, therefore, during the day, is a mixed medium, in which the sounds are reflected and scattered in passing through streams of air of different densities, as in the experiment of mixing atmospheric air and hydrogen. At midnight, on the contrary, when the air is transparent and of uniform density, as may be seen by the brilliancy and number of the stars, the slightest sound reaches the ear without interruption. M. Chladni has illustrated the effect of a mixed medium by an experiment of easy repetition. If we pour sparkling champagne into a tall glass till it is half full, the glass cannot be made to ring by a stroke on its edge, but emits a dull, disagreeable and puffy sound. The effect continues as long as the effervescence lasts, and while the wine is filled with air bubbles. But as the effervescence subsides, the sound becomes clearer, till at last the glass rings as usual, when the air bubbles disappeared. By re-producing the effervescence the sound is deadened as before.—The same experiment may be made with effervescence of malt liquors; and with still more effect by putting a piece of a sponge, or a little wool or tow into a tumbler of water. The cause of the result obtained by M. Chladni, is that the glass and liquid contained, in order to give a musical sound, must vibrate regularly in unison as a system, and if any considerable part of a system is unsusceptible of regular vibration, the whole must be so.—This experiment has been employed by Humboldt to illustrate and explain the phenomenon of distant sounds being more distinctly heard during the night.—*Encyclo. Amer.*

## THE MAN THAT WISHED FOR DEATH.

The habit of avoiding personal danger, or the instinct that leads to the preservation of life is so strong, that persons who are resolved on suicide, sometimes conduct in a very ludicrous manner, under the fear of that death which they are desirous of procuring.

We have heard a story of a countryman who had made up his mind to "shuffle off his mortal coil," and only waited until he had settled in his mind the most comfortable way of dying. Not being able readily to agree with himself on this important point, he informed a neighbor of his, whom he met with his axe on his shoulder, that he was resolved upon death, and would take it as a

great favor if he would assist him in the accomplishment of his purpose. His neighbor being willing to humor the candidate for a change of worlds, told him he was just going into the woods to chopping, and that if he would accompany him he would fell a tree upon him, and put an end to his life with a very little trouble.

"I'm very much obliged to you," said the weary-of-the-world, "and shall consider myself bound to you for life. I'll go and be killed directly."

Accordingly he followed the axe-man to the woods. A tall tree was chosen, and he was directed where to stand, so as to receive the full force of its fall. He fixed himself on the spot, folded his arms, and prepared to wait the event. The chopper began to lay on the vigorous blows, while the death candidate kept his eye upon the top of the tree, to see when it would fall. He stood very composedly for a while; but at length began to appear uneasy and not perfectly satisfied with his prospects. And while the axe-man seemed to him to redouble his blows, he kept winking and winking, he thought he perceived the tree begin to nod, and that the next moment would be his last. The cold sweat began to issue from his skin, his limbs trembled—he could stand it no longer! He took to flight and never looked behind him until he had got at least forty rods, when he ventured to stop. He was pursued by the axe man, who on coming up, asked him why he ran away.

"Oh," said he, "I was afraid if I staid there I should be killed!"

"I thought," returned the chopper, "you came on purpose to be killed."

"Ah, true," replied the man with great simplicity, "but I forgot that. O how I tremble! If I'd staid there a minute longer, I should have been a dead man. What a crash it made when it fell!"

"Crash! why the tree is standing yet. I merely chopped with the head of the axe."

"With the head of the axe! do you say so? O you cheating rascal! But I'll never trust you to kill me again, I'll be hanged if I do."

## THE HONEY BEE.

This bee, when collecting the pollen of flowers, which constitutes the "bee bread," never passes from one kind of flower to another, as has been supposed. If it first light upon a honeysuckle, it continues to collect from this flower until it has loaded its thighs with as much as it can carry away. The bee is governed in this by an instinct that makes it a co-laborer in the ordinary work of natural re-productiveness. The pollen, or fructifying dust, is carried from flower to flower of the same species, and thus the bee aids the operations of nature by distributing the pollen, necessary to the fruitfulness of plants. If the bee were to pass from a clover blossom, with the pollen adhering to its body, and light upon a honeysuckle, would produce a hybrid, or mongrel species of flower. How wonderful are the orderly operations of nature! and certainly among the most wonderful is this peculiar instinct of the honey bee.

*New Drink.*—"Mr Guzzlefunction, I have discovered a new drink for you. Suppose you try a little."

"Well, I don't care if I do: [drinks.] It hasn't got a very bad taste to it; and if my memory serves me right, it is what they call water. I recollect drinking some of the stuff when I was a lad."

## POUDRETTE.

This valuable manure may be had on application to the subscriber, at the office of the "New York Poudrette Company," No 120 Nassau street, New York. It is in-odorously, and may be transported in barrels, on board of any vessel or steamboat, without offence—and it will be found an exceedingly valuable article as a fertilizer on any soil, and for any crops; but more especially for gardens and flowers, as there are no foul seeds in it. Poudrette has been used for three seasons with entire success on Long Island, by many practical farmers, as may be ascertained from letters and statements made by them, and published at this office in a pamphlet containing also the "act of incorporation," granted to the Company by the Legislature of the State of New York; and other facts in relation to the subject. Price 33 cents per bushel. Barrels cost 25 cents each, and hold 4 bushels. Persons wishing to make an experiment on a small scale can obtain one barrel by enclosing a two dollar current bank bill—or three barrels by enclosing five dollars, free of postage. On receipt of the money the article will be put up and forwarded as directed.

\* \* \* Price of shares, one hundred dollars—which entitles the holder to one hundred bushels of poudrette annually, during the term of the charter; fifty bushels in time for spring use, and fifty bushels in time for fall use. Shares taken soon, will be entitled to the spring dividend—and, if desired for experiment, a few bushels may be had this fall.

All orders, or applications in relation to the business, must be made to the subscriber, 120 Nassau street, New York. D. K. MINOR.

I wish it distinctly understood that the "New York Poudrette Company" is in no way connected with the "Lodi Manufacturing Company," of which Anthony Dey and Peter Barthelemy are, or were, the managers. Dec. 9, 1840. 3m. D. K. M.

## POUDRETTE.

The subscribers reside in the state of New Jersey, many of us in the vicinity of the works erected by Anthony Dey, of the city of New York, on the Hackensack river, in New Jersey, for the manufactory of Urate and Poudrette, called "The Lodi Manufacturing Company." We have used the poudrette on the Spring Crops this year, 1840. We find it a valuable manure, superior to any other kind that we have ever used, and considering the facility of its transportation to the field, the small quantity required in the application to the crops, the quickness of its operation on vegetable matter, and the ease with which it can be applied,—all tend to recommend its use to the farmer and gardener as the cheapest and best manure, and we recommend it accordingly.

Those of us who have applied it to corn and potatoes think that it ripens these vegetables quicker than any other manure by several weeks.

Dated New Jersey, October, 1840.

Jacob D. Van Winkle.	P. F. Welsh.
John J. Neekirk.	G. C. Van Ripper.
John Tise.	George Tise.
Daniel Van Ripper.	William Wood.
George Demott.	John Duryee.
Henry Drayton.	George Neekirk.
Jostah Hornblower.	Garret Neekirk.
Cornis. Van Winkle.	Daniel Vreeland.

Shares in the above company are \$100 each, and may be had by applying to Anthony Dey No. 73 Cedar St. New York.—The owner will receive 20 per cent. per annum payable in money, or 30 bushels of Poudrette. The price to those who buy Poudrette is 49 cents a bushel. It costs the Stockholders 12 cents a bushel. One cent's worth, that is 20 Gills, will manure 20 hills of corn, and the like quantity 15 hills of Potatoes.

Newspapers friendly to agriculture will confer a favor on the Farmers and Gardeners by publishing the above. Dec. 22.

## BONE MANURE.

The subscriber informs his friends and the public, that after ten years experience, he is fully convinced that ground bones form the most powerful stimulant that can be applied to the earth as a manure.

Orders for Bone Manure or Oyster Shell Lime, left at the Bone Mill, near Tremont road, in Roxbury, at the New England Agricultural Warehouse and Seed Store, No North Market Street, or through the Post Office will be with prompt attention.

March 4, 1840

## FRUIT TREES.

We publish a report made in the Senate of this State, on the rights of neighboring proprietors, where fruit trees growing in the land of one, overhangs the land of another. The subject was referred to the Judiciary Committee, and when offered, it was remarked by a Senator, that the difficulty though apparently a small one, was frequently recurring, and ought to be settled. The Committee, however, report that the subject has frequently been before the courts in England and this country, and although there have been no adjudications on the question in this State, the law is so well settled, that no special legislation is needed. We find by the report, which is very learned and elaborate, that the subject has elicited as much controversy among the authorities of the Roman law as of the Common law, and that it was thought of sufficient importance to be regulated by distinct enactments, by the framers of the Code Napoleon. The report contains information which is not only curious, but will be useful to those who may have occasion to make a practical application of it.—*Boston Daily Advertiser.*

IN SENATE, Jan. 22, 1841.

The Committee on the Judiciary, who were directed to consider and report, whether any provision by law ought to be made in regard to the owners of adjacent lands, as to fruit and other trees standing near the boundary lines of such lands, ask leave to

## REPORT.

The question whether any action of the Legislature is necessary to declare or vary the rights of adjoining proprietors, on whose lands are trees, which, growing on the land of one proprietor, overhang the land of the other, necessarily involves an inquiry into the present state of the law upon this subject. No case directly involving that law, has ever, to the knowledge of your Committee, been decided in this Commonwealth; but there have been elsewhere decisions sufficient in number, in authority, and in conclusiveness of reasoning, to indicate what would be the result if such a case should occur in our own courts.

There is an apparent discrepancy among the earlier English authorities in relation to this subject. In the case of *Waterman vs. Soper*, 1 Lord Raymond's Reports, 737, decided in 1607, and in an anonymous case in 2 Rolle's Reports, 255, decided in the 20th year of the reign of James I., it was held, that if A plant a tree upon the extremest limits of his land, and the tree growing extend its roots into the land of B, next adjoining, A and B are tenants in common of this tree. But if all the root grows in the land of A, though the boughs overshadow the land of B, yet the branches follow the root, and the property of the whole is in A.—Probably from these cases, in connexion with the well known maxim, "Whosoever owns the ground, it is his up to the sky," originated the impression

which is so universal among the people of this Commonwealth, that the proprietor whose land is overhung by fruit trees, has a right to all the fruit on the overhanging branches.

But these cases are distinctly, and for good reasons, overruled by other authorities, both English and American.

In *Masters vs. Pollie*, 2 Rolle's Reports, 141, decided in the 17th year of James I., it was held that if a tree grow in A's close, though the roots grow in B's soil, yet the body of the tree being in A's soil, the tree belongs to him; and this last case is cited with approbation, and commented upon as overruling the two first, in *Holder vs. Coates*, 1st Moody and Malkin's Reports, 112, decided in England in 1827; in which case it was again held, that "if a tree grows near the confines of land of two parties, so that the roots extend into the soil of each, the property in the tree belongs to the owner of that land in which the tree was first sown or planted."

In *Dane's Digest*, vol. 3, ch. 76, art. 8, sec. 18, the case of *Waterman vs. Soper* is cited, and the compiler states his belief that the principle of that case is not adopted in this country.

In *Lyman vs. Hale*, 11 Connecticut Reports, 177, decided in 1836, after an argument in which all the learning of the subject was exhausted, it was held that "if a tree, the trunk of which stands on the land of A, extend some of its branches over, and some of its roots into, the land of B, A and B are not joint owners or tenants in common of such tree, but it is, with such overhanging branches and the fruit thereof, the sole property of A; and if B gather the fruit from such overhanging branches, and appropriate it to his own use, he is liable in trespass to A.

Your Committee have found no case where it was ever contended to be law, that the property in overhanging branches or fruit passed to the proprietor of the land which they overhung, unless the roots also drew some part of their sustenance from the same land; and it is now well settled that in all cases the fruit and branches "follow the settlement" of the body of the tree. The man who allows the branches of his tree to overhang his neighbor's field, undoubtedly commits a wrong; but he does not thereby lose his title to those branches, any more than he would lose his title to his cattle by their being found trespassing, through his negligence, upon his neighbor's field.

A proprietor of land has a right to undisturbed possession of earth and air, from the limits of his own ground to the sky; but it by no means follows that he shall acquire the ownership of every thing which interrupts or trespasses upon his possession.

The title, then, to the whole tree is in the proprietor on whose land is the trunk. But the proprietor who permits his tree to overshadow or to draw nourishment from his neighbor's land, does that neighbor an injury, and permits a nuisance, for which there are obvious and easy remedies. In *Morrice vs. Baker*, 3 Bulstrode, 198, decided in the 14th year of James I., it was remarked by Justice

Croke, "one may cut down boughs if they hang over his ground." The court of Connecticut, in the case of *Lyman vs. Hale*, already cited, held the same doctrine. The suggestion of Judge Croke is also quoted as good law by Mr Chitty, an English law writer of high authority, in his *General Practice*, 1, 653. "But," he adds, "it would seem that there ought to be a previous request to the neighbor to abate the nuisance, before I proceed to abate it myself."

It is believed, also, that if the party thus injured or annoyed should prefer not to right himself by taking the law into his own hands, a remedy by action would be open to him. The books are full of analogous cases, in which the party injured has sometimes adopted the one and sometimes the other, of these two modes of redress. Thus in 2 Salkeld, 459, and in *Clark vs. Penruddock*, 5 Coke, 101, 102, the cases of "one building his house so as to overhang mine," and of "one building a house so near mine as to throw water upon mine," are referred to as cases of nuisances which are subject to be removed by force without the intervention of legal proceedings; and on the other hand, the 15th of Mass. Reports, 280, *Sumner vs. Finegan*, presents a case where an action was sustained against the defendant, for suffering the spouts of his house to be leaky, to the plaintiff's damage. A case more directly in point is that of *Pickering vs. Rudd*, 4 Campbell's Reports, 220, decided in 1815, where in it was held that when the defendant nails to his own wall a board which overhangs the plaintiff's close, an action of trespass on the case will be sustained against the defendant.

On the question, whether the proprietor of overhanging fruit has a right to pick it up after it has dropped on his neighbor's land, the law is perhaps somewhat unsettled. In *Mitten vs. Fandrye*, Popham's Reports, 162, decided in the 22d year of James I., Judge Doderidge quotes with approbation a case from the year books, 8th ed. IV., to the following effect: "If a tree grow in a hedge, and the fruit fall into another man's land, the owner may fetch it in the other man's land. But in *Anthony vs. Haney*, 7 Bingham's Reports, 192, decided in 1832, the Court limit the operation of this rule to cases where fruit may thus fall by accident; and Chitty, in his *General Practice*, cites this last case as modifying and settling the law upon this point. Whether fruit falling at its maturity from an overhanging branch can be considered as coming within this rule of accident, or whether license to gather must not be presumed in the absence of notice to remove the nuisance, are questions which the other ascertained rights and remedies of the proprietor who is intruded upon, make of very little practical importance.

The Committee believe that the law on this subject, as they have stated it, though perhaps widely different from the common belief, will yet be found so equitable in its principles and so fair in its operations, as to call for no action of the Legislature. They have gone the more minutely into its details, as they have reason to believe that ignorance of the real state of the law and the exact rights of

parties has led to much petty annoyance and ill feeling between adjoining proprietors. The subject, although one apparently of a most trifling character, has been a source of dissension among the proprietors and jurists of the continent as well as of England, and was thought worthy by the great men who framed the Napoleon Code, of being settled by specific and minute enactment. In the Digest of the Civil Law, it is in one place laid down (lib. 47, 7, 6,) that "though a tree be nourished by roots which strike into the land of a neighbor, yet it shall still belong to him in whose ground it was planted." And in another part of the same digest (lib. 41, 1, 7, 13) it is said in substance, that if a tree be planted in one man's land and derives its nourishment from another's, it shall belong to him from whose land it is nourished; and if it is only partly nourished in his land, it shall belong in common to the proprietor of the land on which it was planted, and of the land by which it is partly nourished.

Some of the provisions of the Code Napoleon on this subject are as follows:

"Art. 671. It is not allowable to plant trees of lofty trunk, but at the distance prescribed by regulations actually existing, or by constant and acknowledged usages; and in default of regulations and usages, only at the distance of two metres from the line which separates two estates in trees of lofty trunk, and at the distance of half a metre in the case of other trees and quick hedges.

"Art. 672. A neighbor may require trees and hedges planted at a less distance, to be pulled up.

"He whose property is overshadowed by the branches of his neighbor's trees, may compel the latter to cut off such branches.

"If it be the roots which encroach on his estate, he has a right to cut them therein himself."

Your Committee repeat that neither the above regulations, so far as they differ from our own law, nor any other which have occurred to them, appear to them at once so well adapted to secure the rights of parties, and so free from the imputation of harassing and arbitrary interference, as the rules of common law now in force in relation to this subject. They, therefore, recommend no legislation, and ask to be discharged from the further consideration of the subject.

For the Committee,

GEO. T. DAVIS.

### SILK CULTURE.

The following communication being entirely free from the visionary and speculative character belonging to many articles upon the subject, is readily admitted to our columns.

MR EDITOR—Permit me through the medium of your useful paper, to give a *short* account of my doings in the silk-growing business the past season. I shall omit for the present most of the details which are usually given in statements of this kind.

My feeding commenced at the usual time in the spring, with a small lot of the grey, or what are called sulphur worms. The eggs were obtained from Philadelphia, as my whole supply of this article had failed, from being kept in too damp a place during the winter. At the same time I set agoing a smaller lot of small white or two crop worms, for the purpose of getting eggs to go on with. From these I obtained a full supply of eggs for my sun-

ner's work. The hatching, feeding and winding all went on according to my wishes.

My shelves were three times filled. First with the greys, second with the early second hatching of the whites, and finally with a later company of the same kind.

I used the same bushes over and over again; for on this article most of my cocoons were wound. They had been used for the same purpose in a former year, and now I have laid them by for future use. I have tried various methods for winding, as recommended by the writers on this subject, but still incline for the most part to the old bushing system.

My operations were on a small scale, but all went on with entire success, producing between thirty and forty bushels of good cocoons, besides all which were used for making eggs as above described, and enough for a much larger operation another year.

My trees are small, surrounding my cocoonery, and the leaves were gathered with great facility and little cost; they are of almost all the varieties now in use, as the White, Canton, Alpine, Expansa, but mostly the Multicaulis; and on this latter kind most of my feeding was performed.

All my silk culture was in connexion with farming operations, and my plans are laid for pursuing the business in the same way in future.

Between 4 and 500 bushels of turnips for stock were raised with very little labor between the rows of my trees, on between 3 and 4 acres, besides large quantities which were fed out, tops and all, as the crop was maturing.

I have studied many rules for the management of worms, and for conducting the whole of the silk making business; and am fully satisfied that the most important part of it is to feed the worms well with leaves fresh and good, through the day, and if convenient in the night, with branches or without them. It is quite immaterial to these voracious feeders, in what form their food is dealt out to them. Their progress, maturity and fullness of growth are all essentially promoted by a full supply. Leaves, leaves, is their motto—not by weight or measure, but as many as they can steadily consume.

My white mulberry leaves I use for my first feeding; the trees are in a nursery of many thousands, very close together, and instead of picking the leaves, I take them off branches and all, and in the same manner I have managed with a part of my other trees, and for the future I intend to do so with them all. This method makes more litter, it is true, but the expedition with which the feeding is carried on, and the more healthy position of the worms on beds made in this way, much more than compensates for any disadvantages which it may incur.

I have done something in this business for a number of years, but the past season was the first of my experiment on leaves mostly of modern trees; and I consider I have fully tested their fitness as the proper food for worms, and also the entire adaptation of our country, climate and soil, for the silk-growing business, and the practicability of its successful pursuit.

I am furthermore fully satisfied from the difference I have seen in my Chinese trees, which have been planted a number of years in this part of the country, that they are becoming assimilated to the climate, and that in a few years they will take a

rank among more hardy trees for general or permanent use.

Yours, respectfully,

DAVID BENEDICT.

Pawtucket, R. I., Jan. 27, 1841.

For the N. E. Farmer.

### SIGNS.

MR EDITOR—Farmers, from the nature of their occupation, are constant observers of signs. To them, changes in the weather is a matter of great importance. Accordingly, they are from day to day on the look-out to watch the various indications by which these changes are known, or supposed to be known. Old and experienced farmers frequently acquire great tact, if I may call it so, in predicting changes in the weather. It is a study requiring much discrimination and careful observation of a series of facts,—a study, which should be begun with the farmer's life and end only when his toils and his life are ended. For this purpose, a farmer should keep a regular note book, in which his observations are recorded. In this way he will soon learn that many of the signs which he has been accustomed to regard as certain, are some of them uncertain, and others entirely false and unworthy of confidence. He will be enabled to separate the wheat from the chaff, and to retain the one and discard the other.

But for the want of some such journal or memorial, many farmers adopt all the prognostics they happen to hear of, as sure and indubitable. They are thus led to shape their course by the most fickle and silly rules. From the multitude of signs collected together, they generally find one or more by which to predict the state of the weather tomorrow, and when tomorrow comes, they almost as generally find their predictions falsified. It may be said that this evil cures itself—that frequent disappointment will cause the farmer to disregard all signs. But it is not so: a favorite sign is clung to, as if the reputation of its observer for judgment and discernment, were hung upon it. There is a passion, too, in many minds in this matter, just as there is in lotteries—a passion which ill luck seems rather to strengthen than to diminish.

One great stimulant to this passion is the almanac, a book which occupies the next place to the bible, on every farmer's shelf. Here the changes of the moon are recorded, and their record is consulted with anxious hopes and fears. What influence the changes of the moon has, if any, upon the changes of the weather, I do not feel competent to decide; but I believe it is far less and far less certain than it is in general supposed to be. Then there is the running account for each month, of the probable state of the weather in that month, for which the almanac is consulted. For instance, in one month you will find it recorded, "About this time—look out—for a storm—with cool nights," &c. &c. The poor farmer reads the oracle and looks out—the storm and the cool nights may come and they may not come—but at all events, he keeps looking out, through the year and through the almanac. This is but an unprofitable business, to say the least of it.

The evil, however, does not stop here. The habit of mind engendered by this trusting to vague and ridiculous signs respecting the weather, induces or strengthens a tendency to rely upon signs in other matters. The good old almanac must be

consulted, forsooth, when a calf is to be weaned, to see if the signs are right. Thus a mere arbitrary division of the month is made the great regulator of a subject, with which that division has nothing more to do than with the man in the moon. Some will contend that they have tried the operation of weaning when the signs are right and also when they are not right, and know by experience that in the former case the calf does well, and in the latter, does not. Now it is true that facts are facts, but before they are made the ground-work of practice, they should be well tested. A single fact proves nothing, in cases like this: it may be a mere coincidence, which may not again occur. Besides, when the mind is bent on supporting a particular theory, it is exceedingly apt to look only for facts, and at facts which go to support that theory, and to shut its eyes to those of the opposite character. If the mind were open to conviction from every quarter, and not biassed by preconceived opinions, the result of its observations would be more entitled to confidence. And it is the duty and the interest of every farmer to preserve his mind from all bias and prejudice, either for or against any theory—to keep the mind free to follow in that pathway in which a series of incontestable facts clearly points. By long and patient observation and careful discrimination, it is in the power of the humblest farmer to render the greatest service to the agricultural interest; but by adopting indiscriminately all the whimsical signs floating through the community, he only perpetuates error and ignorance, and obstructs the progress of improvement.

In my next, I will, with your leave, continue my remarks by considering the kindred subject of  
**A PLAIN FARMER.**

For the N. E. Farmer.

**BERKSHIRE AND CHINA SWINE.**

MA EDITOR—I have lately become a subscriber to the Albany Cultivator, (having taken the New England Farmer before,) and in the former I find so much of breeding in-and-in, grades, crosses, &c., that I feel cross at my own ignorance, and knowing no better way to remedy the evil than to try and gather some little experimental knowledge, I would solicit your good offices in finding me a true white China boar, at a moderate price, and not being willing to pay for moonshine, I would stipulate that he must be of the true blood, and not like our Berkshires that we have in this vicinity, a cross between a black log and an alligator, decent in form but miserable feeders, gaining less than half a pound a day on good food, and withal black—a thing that I abominate. I never wish to see a hog over three hundred in weight, (at twelve months, two hundred and fifty,) and if agreeable to his pig-ship, I should be pleased to have him take on fat kindly and eat what I give him, with some decent relish, from respect to the giver, if for no other reason, and not, when I throw to him a good mess of cooked carrots and corn, root it over a moment and then look up in my face and squeal, reminding me of the apprentice in Baltimore, who complained of his master for “starving” him. “Why,” said the magistrate, “what does he give you to eat?” “Why—why—” lisped the scamp, “nothing but bread, and potatoes, and beef, and mutton, and such like!” “Well, what would you have?”—“Why—why—plum pudding, and cake, and roast

turkey, and such like!”—though I believe the highest class of hog feeding would not make our misnamed Berkshires fat well. I say misnamed, because I cannot but believe from such respectable evidence as we get from York State, that the Berkshires are a better hog; but they are black, and I should like to have the pleasure of breeding white hogs, and think, could I get a white China boar, I could breed up some of our best native hogs to my mark. My course would be to go into Brighton market often, and select the best white sows that came there, cover them with the China boar, and then breed back to the China, taking but one cross; should not that one give sufficient size and hardihood, after I had bred up sufficiently I would take another, and if this failed, should stop, not having wit or wisdom enough to know what next to do. Would this course give me good pigs? Will you or your correspondents answer me and oblige  
 A BEGINNER.

Boston, Feb. 2, 1841.

From the Albany Cultivator.

**EXPERIMENT WITH POTATOES.**

Before closing this communication, I would beg leave to give you some of my Irish potato experiments, for since I had the good luck to fall in with your valuable paper, I have seen a number of experiments and theories in relation to the cultivation of this valuable root, some of which I believed, others which I doubted, and others which I wholly disbelieved; and as our country (American Bottom near St. Louis,) is not only destined to be, but now actually is, one of the greatest potato growing sections in the west, I thought that any information on the culture of this root would be necessary to myself and perhaps useful to others.

And first, I will say the potatoes were all planted the same distance apart both ways; the only difference is in the quantity in the hill, and the preparation and quality of the seed. The question among potato growers here is on these points—not on the quality of the ground, the newer it is the better—not on the variety of the article; the large blue taking the decided preference of all others, the Rohans not excepted—not on the kind or manner of manuring; for we scarcely manure our gardens here—not on the mode of culture; all plant and plough them like their corn, only nearer both ways.

I planted five rows side by side, and the hills I experimented on side by side; and

1st row, cut the common size, that is one large potato cut into 4 or 6 pieces, 4 pieces in a hill.	
2d row, 4 pieces in a hill, cut a small again	
3d “ 2 “ “ smallest round ones.	
4th “ 1 “ “ largest, without cutting.	
5th “ 2 “ “ of same size potato.	

I proceeded to dig two hills in each row, and count the number of potatoes in each two hills, and also to weigh them. The result was as follows:

1st row counted 53 potatoes, weighing 10 3-4 lbs.	
2d “ “ 62 “ “ 10 3-4 “	
3d “ “ 36 “ “ 8 1-4 “	
4th “ “ 37 “ “ 12 3-4 “	
5th “ “ 31 “ “ 8 1-4 “	

I observed that those in row 2, had the most small ones and the fewest large ones—the large whole seed certainly furnished the largest potatoes, without any small ones—the balance were pretty much alike in point of quality. What is the most

surprising is that rows 1 and 2, should yield precisely the same weight of potatoes, when only half the quantity of seed was used in the second row, and the only difference is being cut again, having the same number of pieces in a hill, they being only half as large; thus it seems that they ought not to be crowded in the hill. Row 3 with about the same quantity, produced but 8 1-4 pounds which is a bad yield. Row 5 a good yield for the quantity of seed—one fourth the quantity of seed and two thirds the quantity of potatoes compared with the best row 4, (the large whole seed.) Therefore if we want a large yield of potatoes, plant the large ones whole, although they will not go as far as to cut them.

We have cultivated the famous Rohans for the last two years, but they will not begin to compare with our Illinois blues, neither in quality or yield; the blues will, I am satisfied, beat them twentyfive per cent. in both these respects.

THOMAS G. LOFTON.

From the same.

**MANY CROP EXPERIMENTS.**

I have before made known in the columns of the Cultivator, my entire success in a double crop, as to Irish potatoes and pumpkins; or that by planting pumpkins among potatoes after the vines of the latter were of some size, a fine crop of the former overspread the ground, rather to the healthful shading than to the detriment of the potatoes matured underneath.

Of late years I have sowed buckwheat and rye at the same time and on the same ground; and success attended. The buckwheat was cut in the fall, and rye the following harvest. Again, in our hot climate, [North Carolina] and on our light sandy soil, I have hit upon a plan that renders red clover of as certain growth and success as in the Northern States, if not more so. It is by covering the ground with pine leaves after the wheat and clover are sowed; or cover the wheat in the winter and sow the clover in the spring. Last September a year, I sowed a piece of ground with wheat, and clover on the fresh earth immediately after the wheat was harrowed in, and soon after put over most of the surface pine leaves. The wheat and clover were both essentially benefited by the covering, and a remarkable contrast to that left uncovered to test the utility of the plan.

The fifth of August last, I resolved upon a four-fold operation on a piece of ground, and after sowing thereon buckwheat and rye, and then clover, I covered most of it with pine leaves, straw, and green pine boughs, or with the different materials in different places, coated over about an inch thick. The result promises to be very satisfactory; and a most decided difference in favor of the ground thus covered. I had the curiosity, the 5th of October, to measure the buckwheat from a corner of the piece, less than a quarter of an acre, and the produce was five and a half bushels. Both the rye and clover look very promising for next year's crops. Very respectfully, yours,

SIDNEY WELLER.

The most honorable, the most useful, the most independent of men, is the well-informed farmer, who cultivates his own soil, and enjoys the advantages that health, competence, and intelligence are sure to bestow.

Since the discussion was held at the State House upon Grasses, an intelligent farmer has drawn our attention to an article in No. 1, vol. viii., 1824, of the *Agricultural Journal*, edited by the Trustees of the Massachusetts Society for the Promotion of Agriculture, to which work their late president, John Lowell, most beneficially contributed. The notices of the seasons by the "Roxbury Farmer," will long be recollected by all cultivators who have read our agricultural journals. As requested, we most cheerfully republish the article above referred to.

### GRASSES.

BY HON. JOHN WELLES.

In the *Agricultural Journal* of January last, I offered some observations on grasses, and gave the result of an experiment shewing their loss by excitation or the process of drying, in the summer of 1822. This subject has been pursued during the past season, and still farther extended. The variation, in the comparison of the two years, is not, it is apprehended, greater, (except in one or two instances which will be explained) than will often occur from the nature of the soil, difference of season, closeness of vegetation, exposure to the sun, &c. &c. As far as a general principle may be established by experiment, it will, in some degree, go to fix the relative value of our natural grasses, as they prevail in our pastures, or of those artificial grasses which should be selected as fit objects of cultivation. In collecting these several species, I have found the natural grasses which generally prevail in this neighborhood, so few in number, that a short and yet sufficient description of them could be most properly first given with advantage.

The earliest grass we have is the *Avena spicata* (Linn.) or spiked oat grass. It is peculiarly indigenous to the United States, and grows, it is said, as far south as Georgia. This grass ripens so early that it mostly sheds its seed, and thus reproduces itself, and is widely propagated. For this reason, as well as from its short growth, it is undeserving of culture, yielding little to the scythe. But it is of great value for early feed in our natural pastures, in which it abounds. One hundred pounds cut on the 15th July last, gave fifty pounds of hay.

The next grass which we shall mention is the *Poa pratensis*, (Linn.) with us falsely called Red top, a color it never has. This, both in Europe and America, is the common and prevailing grass of the pastures. It grows in almost every soil and situation, and is one of those materials which, as that excellent botanist, Mr Nuttall, of Cambridge, informs me, is used in Europe for the manufacture of bonnets. The color of its top, or panicle, is of a yellowish brown. The number of florets in the spike vary from three to five. The seed is sometimes saved and sown; but these fine spired grasses have so minute a seed, that, either from exposure to dampness and fermentation, or some other causes, which it is difficult to prevent or discover, they too often fail of vegetating, by which great injury and disappointment occurs in the wished-for crop.— Though this grass is amongst those which lose the least in drying, yet, as it presents little to the scythe, it cannot be recommended for culture. It is excellent in our pastures, and comes in naturally as the artificial grasses go out of our mowing lots. Indeed it has a preference with our farmers generally, for horned cattle, over every other grass. One

hundred pounds cut July 17, gave fortysix pounds. It was past flowering.

The notice of our prevailing natural grasses might here be closed, but as the grasses which we shall next describe appear in our pastures, as well as our cultivated grass land, and are mentioned by several writers in answer to the question proposed by the Society, as to "what natural grasses prevail in this part of the country," we shall give their description here.

The grass here called Rhode Island, is the *Agrostis alba*, (Linnaeus) the Marsh Bent grass of England, or the *Agrostis stolonifera*, Schrader, German. Mr Nuttall, to whom I exhibited a sample, pronounces it the famous Fiorin grass of Dr. Richardson and the Irish agriculturists, on the authority of Hooker, who describes "the panicle thereof as purple, and the branchlets patent." The color, at first of the branchlets is of a deep red, and they adhere closely to the spike, but as they flower they become patent and change to a lighter purple. This grass has six to eight branchlets, and flowers more fully than the *Poa pratensis* though often confounded therewith. It is amongst those which lose least by evaporation, and would be a more favorable object of cultivation, were it not liable to the same uncertainty as to its vegetating and producing a crop as the preceding grass, and, from probably a like cause. In Ireland it is said to suit a wet soil, and to produce over six tons to the acre. In this country it does not flourish in such soil, nor does it give a great crop, especially compared with the Herds grass. Still the hay is very excellent, and perhaps not exceeded by any other for its intrinsic value in nutriment. One hundred pounds in early flower, cut July 17th, gave forty pounds.

The grass, in the answer given to the Society called Cambridge, Dog and Garden grass, is the *Triticum repens*. Dr. Elliot calls it the "hurtful blue or Dutch grass." In England it is called couch, knot, or dog grass. Every joint of its root produces a new plant, and it is said to be there, as it is found here, one of the worst weeds and most difficult to extirpate. It resembles wheat, of which it is a species. The best mode to destroy it is to keep the lands longer under the plough, with a frequent use of the hoe, as where this is not done, two years ploughing only not merely multiplies, but occasions it to engross the whole soil. It has a hard woody fibre and is disliked by cattle. It flourishes mostly near cow-wards, and gardens, and is called Cambridge, from its abounding on the salt banks of the Charles river. One hundred pounds cut July 22d, in late flower, gave forty-eight pounds.

The grasses above described are those which prevail in our uplands, and are indigenous here. They are, probably, most of them what Dr. Elliot, in his *Field Husbandry*, denominates English Spear grass, and speaks of as natural to the soil and more hardy. The term English has been applied to our upland hay, ever since the settlement of the country. These, with the red and white clover, and the varieties which nature, in a course of culture, or otherwise, produces, are what give verdure and fertility to the face of the earth.

Of the cultivated grasses, the first in importance is the Herds or Timothy grass, *Phleum pratense* (Linnaeus.) Dr. Elliot says "it is a native, and early discovered in this country by a man of the name of Heard, in Piscataqua." It is doubtless admirably suited to our soil and climate, and not only flourishes in uplands, but may be sowed to

advantage in low grounds, especially when drained or raised with gravel or loam. It often attains in height five feet, and has been known to produce over four tons to the acre. It does not yield much till the second and third years. For which reason it is sown with clover, which being biennial and of shorter duration, gives it space to succeed. In this vicinity, such is the preference given to it, that it sells at about one fourth more than any other hay. It lasts, with one or two top-dressings, six to seven years. The answers to the inquiries of the Society as to the quantity of seed sown, are two to six quarts. There should not be less seed than half a bushel to an acre, which later experience establishes most decidedly. One hundred pounds cut July 11th, gave thirtynine.

Red clover (*Trifolium pratense*) is a most valuable grass: when cut green, it affords an excellent nourishment for cattle in the soiling process, as well as for swine. When made into hay, cattle are exceedingly fond of it. The flower and leaves are apt to separate from the stem, for which reason great care should be taken that it is not made brittle by too much exposure to the sun. It is best cured, as far as may be, in cock, and should be carted after the dew begins to fall. When properly dried, salt is used advantageously, as it may be housed with safety, more green than any other hay. This prevents fermentation and heating, and it is kept in better order. Many in this vicinity not only salt their clover, but all other hay. Lord Somerville observes that he "uses half a bushel of salt to a ton, and its benefit surpasses all belief, producing the best possible effect in color, flavor, and general result;" with damaged hay, he says "it is a great restorative."

The benefit of salt in the culture of the soil being now so generally acknowledged, and the use of it so necessary for cattle in the interior or remote from the sea coast, it is difficult to assign a reason why its use is not more prevalent. To land highly manured, two to four pounds of seed in this neighborhood is used. But in the interior some apply eight pounds, and many more. One hundred pounds cut July 6th, gave twentyfive pounds.

The white clover (*Trifolium repens*) is an abiding grass, sending out roots from every joint, and forming a close mat on the ground, and is very excellent for pastures. But it is found to afford so little to the scythe as to discourage the culture thereof. One hundred pounds cut June 26th, gave twentyseven pounds.

Of the grasses which grow in our meadows two only have been tried. The fowl meadow, which Dr. Elliot supposed to have been brought to Dedham by birds, is said to be the *Pea nemoralis* or marsh meadow grass of England.

It is an excellent grass and deserving of culture. It is believed, however, to have extended itself more by its shedding its seed early than by any artificial means. One hundred pounds cut July 23, gave fiftythree pounds.

The common grasses of our wet meadows it is believed, are various kinds of carex. This in all its varieties is a poor grass, and where the land can be ditched and made to produce a better growth, the means should be taken. It is a bad economy to flood lands with mere water for a long time, to increase a nearly worthless burthen. The effect is to destroy all sweet nutritive tender plants.— One hundred pounds cut 23d July, gave fortyfour pounds.

The "Marine Fox-tail grass," which is the pre-

vailing grass of our salt marshes, we receive from nature without knowing how to aid in its increase. One hundred pounds cut July 18th, gave sixty pounds.

The Black grass (*Juncus bulbosus*) grows principally where the water is freshened by streams from the uplands. It is the most valuable salt grass we have and but little inferior to upland grass, we know no means of artificial increase. One hundred pounds, cut July 18th, gave thirtyeight pounds.

We have too far trespassed on the time of the readers to do more than allude to some of those grasses which have been introduced and proved unsuitable for our culture.

The Wild Oat grass (*Avena elatior*) with the Rye Ray or Durnel grass with which it is said to be confounded, are often seen in our pastures and meadows, but animals seldom touch them. They have a strong woody fibre and afford little nutriment, though well spoken of south of us as well as in Europe.

The Burnet scarcely shews itself for a year and then disappears.

The Succory has been praised by Mr Arthur Young, that distinguished agriculturist, who sent it to Gen. Washington. It has been introduced here, is disliked by cattle, and has become one of the most troublesome intruders in our fields. These with the St. Foin and Lucerne and many others have passed away and seem to have ceased with us to excite expectation. Of the Orchard grass or cocks-foot (*Dactylis glomerata*) the trials I have witnessed do not enable me to speak so decisively as one of the trustees, Mr Prince does, who approves of it. It may be considered as in a course of experiment.

My desire, sir, in the preceding, has been to aid in exciting an attention to the best means of culture for our grass lands. The process of sowing grass seeds was far from universal within the collection of many in this country and is lamentably insufficient now. Its neglect has been complained of even in Europe. It has been contended that nature would furnish according to her own capacity the power of increase in this particular. Thus the soil was to be furnished with the means of promoting vegetation by labor and art. But here these were to stop, and the stimulating principles were to evaporate and be wasted, and one or two good crops lost in waiting for this slow process.

But the blindness of this doctrine is vanishing before the light and improvement of the present age. We learn from experience that the earth presents to industry and skill her ceaseless efforts, and never pauses but from our neglect.

Subjoined is a table showing the loss of weight in drying grasses. The White clover of 1822, was taken in the shade. That of 1823, from a light warm soil exposed to the sun. The Red clover in 1823, was taken in the first year of its product, in close growth, and for that reason falls short of 1822. The Salt grass of 1822, was, I have reason to suppose, a second growth, which accounts for the difference of the two years.

	1822	1823
100 lbs. of green White clover gave—	17½	27
‘ ‘ Red clover	27½	25
‘ ‘ Herds grass	40	39
‘ ‘ Fresh meadow	38	44
‘ ‘ Salt grass	39	60
‘ ‘ 2d crop or English Rowan	18¾	19
‘ ‘ Corn stalks	25	25

100 lbs. of Spiked Oat grass gave	50
‘ ‘ Red Top	46
‘ ‘ Rhode Island	40
‘ ‘ Couch grass	48
‘ ‘ Marine Black grass	38

For the New England Farmer.

CAN MEAL BE COOKED BY STEAM?

ALLEN PUTNAM, Esq.—Sir—When conversing with you in December last, you stated to me your doubts in regard to the use of steamers, as far as respects the scalding of meal, and expressed a desire to learn the result of the experiments I might make. I am now fully satisfied that your doubts are correct, and begin to be dissatisfied with my steamer, as I think I shall be with all that are on a small scale, and have some thoughts of disposing of mine for another purpose, and trying Mott's Agricultural Furnace.

I see by the N. E. Farmer of this week, that the corn [the "Hartwell"] of which you spake to me as coming from Southbridge, has been received. If Messrs Breck & Co. can spare me a bushel, and you will be kind enough to name it to them, I should be glad to have it. W. C. C.

Providence, Jan. 28, 1841.

SUITABLE DRESS.

The labors of the farmer are nearly all such as require a free use of the limbs, especially the arms; cast off, then, those useless, inconvenient bands of the shoulders—those braces; let the lower garments be made short, so as to button close above the hips; lengthen the vest—a coat to meet them—the expense of the latter being nearly or quite saved in the former; and when you go forth to labor, lay aside the outer garment, and nothing restrains the free use of the arms, save the loose shirt. In mowing, raking, or pitching hay; in cradling, reaping, binding or handling grain to the barn; in shovelling, chopping, threshing, fencing, draining, ploughing—in short, in almost any labor the farmer has to perform, such an arrangement of his dress would aid him much—how much, he can not know until he has tried it. I have long proved it by experiment, and, although out of fashion, shall still continue it.

Again—it is thought because the farmer shovels manure, holds the plough, drives the team, and does a hundred other things, that therefore he must, of course, be constantly dirty, not fit to be seen; but it is not so: a shovel is made to handle the manure with, and following the plough or driving the team, may be done without getting dirty, if one is suitably dressed. Every farmer should have a frock—a sort of over-all, to put on outside his vest or coat, as the weather may require, coming just below the knees, and buttoning in front, with a belt around the waist, two pockets, in which to rest his hands, when not immediately engaged—a great luxury—to be made of cotton for summer, and woollen for winter. Such a frock is put on or off without trouble; there is no putting over the head, and it catches all the flying dust that comes from rubbing against the team and elsewhere, and leaves the clothes at the end of the week as clean almost as they were on the Monday morning. It saves much in a cleanly man's feelings; more in the wear and tear of garments, and most of all in the labor and patience of the women, who of course,

deserve, and that righteously, to be consulted in such matters.—*Yankee Far.*

Great Yield.—In the Ithaca Chronicle we find the following statement of the amount and value of production from one fourth acre of land in that village, cultivated by Mr Aaron Curtis, who furnished it for publication.

150 bushels of onions at 50 cts.	\$70
600 heads of cabbages, at 5 cts.	30
50 bushels of beets, at 50 cts.	25
	\$125

120 sugar beet seed produced 1,125 lbs. of beets, or 22 1-2 bushels, occupying 1 1-2 rod of ground, yielding at the rate of 2,400 bushels per acre. Such crops as the above, and those produced by the editor of the Maine Cultivator, Mr Drew, on his acre of land, prove the profit of cultivating but a little land, and doing it well, in a most forcible manner.—*Alb. Cult.*

Good Crops in Old Connecticut.—The New Haven Register says that Mr Wilmot, of West Haven, the past season raised two hundred and seventy bushels of corn and ten bushels of potatoes, on three acres of land; and the Bridgport Standard states that Mr Ellsworth raised on a single acre of land, two hundred and forty bushels of ears of Dutch corn.—*lb.*

LAW AGAINST TOBACCO.—The following blue-law it is said, was enacted by the colonies of Connecticut and Massachusetts, as early as 1630:

"Be it enacted, That no person under the age of 20, nor any other not already habituated to it, shall use tobacco until he has brought a certificate from a physician, stating that it is necessary for his health, when he shall receive a license from the Court. Those who have already addicted themselves to this obnoxious weed, are hereby prohibited from using it in company, at their labor, or on their travels, unless they are at least ten miles from any house; and that only once a day, under a penalty of sixpence for each offence, of which the constables are requested to give information to the District Court. For the fourth breach of the law, the offender shall be imprisoned and kept at hard labor for a time specified, when his tongue shall be burnt through with a red hot iron."

RAPID INCREASE OF ANIMALS.—Naturalists who have spent much of their lives in the study of very small insects, and who have used the most powerful telescopes, relate wonderful stories of their rapid increase. A scorpion, they say, will produce 65 young at a time; a common fly will lay 144 eggs; a leech 150; a spider 170; a female moth 1100; a gall insect 5000.

One naturalist found 12,000 eggs in a lobster; 6000 in a shrimp. Another found 21,000 in a lobster. An insect like an ant has produced 80,000 in a day. Leuwenhoeck computes 4,000,000 in a crab.

A new kind of wheat has been introduced into South Carolina, which is selling rapidly at \$5 a single head! The Albany Cultivator says it is an old humbug in a new dress. It is now called Santa Fe, or Osage wheat. It "can't come in."

**NEW ENGLAND FARMER,**  
AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, FEB. 10, 1841.

**NEW ENGLAND FARMER.**  
A WEEKLY PAPER.

The Editorial department of this paper having come into the hands of the subscriber, he is now authorized by the publishers to inform the public that the price of the paper is reduced. In future the terms will be \$2 per year *in advance*, or \$2 50 if not paid within thirty days.

ALLEN PUTNAM.

N. B.—Postmasters are required by law to frank all subscriptions and remittances for newspapers, without expense to subscribers.

Mr Geo. Tappan is our agent at New Bedford, Mass.

**FOURTH AGRICULTURAL MEETING.**

The Agricultural Commissioner opened the discussion upon live stock, by remarking that in this vicinity we have several distinct breeds of cattle, and also many intermixtures or crosses. The original of what we call our native stock, he believed to have been the Durham (Devon?) of fine dark-red color. In some cases these have been crossed with the Yorkshire, a large and coarse breed. In other cases the cross has been with the Holderness, which are great milkers, though the milk is not rich. The Herefords are large, white in the face, and are doing very well in England.

The improved Durham Short-horns produced originally by Mr Bakewell, have been for the greater part of the last half-century among the most approved in England. There are two lines or races of these in Great Britain—one famous for milking properties. We have had several individuals of this race, which when pure are symmetrical and every way beautiful. Mr C. himself had owned several, but they had failed to meet his expectations, and were at best but ordinary cows.

The Ayreshires are in good repute, and Mr Cushing, of Watertown, is giving them a fair trial. He is very generously giving his young stock to the neighboring farmers, and thus affording our community opportunity to compare this with other breeds.

Some of our native cows are as good for the churn as any of which we have accounts. But the excellent qualities of these animals are accidental; we cannot depend upon their transmission. Care, and long-continued care, in the selection of breeders is necessary for fixing good properties. Our question now is, whether the imported stock, or the improved native is best for New England. We have an herd formed or forming from a cross of a native cow with the imported bull Coelebs, which is extraordinary for richness of milk.

Here Col. Jaques, of Charlestown, who is farming this herd, rose and addressed the meeting. He had long held the opinion that to meet the requirements of New England soil and climate, it might be important to form a breed of our own. For the purpose of effecting this, he started by the purchase of a bull in 1819, for which he paid \$500. This bull, Coelebs, was selected in England, and though he has not his pedigree, he believes him to have been of the Collins' stock, (by which, if we understood him, we are to infer that he was full or nearly full-blooded Durham.) After inquiring and looking long for a suitable cow with which to begin his course, Mr Haskins, of Roxbury, purchased one in Groton, that promised to answer his purpose. This cow's points were good; flank deep, touch elastic and silky. Coelebs was put to her, and she brought first a heifer

calf, and next a bull. These were called Young Groton and Young Coelebs. Subsequently, Col. J. obtained these animals together with the first calf of Young Groton. These are the parents of his herd. Young Groton, the first season of being milked, gave sixteen quarts per day. The family name now is *Cream Pot*—Don Cream Pot, Betty Cream Pot, &c. At this time the family numbers something like sixty.

He thinks much of *blood*—goes for *blood*. Give him time, *nine generations*, and he will breed to order, any color or any shape. Got his first instruction from Jacob; though he thinks there was something besides the peeled sticks producing the results of old. Formerly he fed his stock with a *silver spoon*—fed high; but latterly has given no grain; hay and grass, with from one to two pecks of roots per day to *cows in milk* make his feed. Some pretend that it is *feed* which makes the difference in animals—he says it is the *blood*. As well might you, by manuring, think to make out of the wild pear a St. Michael's, as to produce the peculiar excellences of a breed of animals by the feed. He however, would feed well. The milk from his cows is very rich; the cream is very thick, and yields very little buttermilk. He maintains that 100 pounds of the cream will make 95 pounds of butter. From one of his cows he makes one pound of butter to each four quarts of milk. The cream can be converted into butter by beating it with the spoon in a bowl, in the short space of one or two minutes. This was actually performed on two separate parcels, in the presence of the assembly at the State House. The color, however, was not much changed: it remained white; but we understood that in the course of twentyfour hours it usually becomes of very good butter color. In this case we saw *no* buttermilk.

Many of the remarks by this gentleman we are obliged to omit for want of room. We take the liberty to thank him for the sprightly and interesting manner in which he made his narration, and we most heartily wish him success in his efforts to make for our community an improved dairy stock. We doubt not that he has started upon the right course.

Mr Sheldon, of Wilmington, well acquainted with his subject, next favored us with the points of the good working ox. The head should be long and slender. The short-headed ox may start tolerably quick at the whip, but he will soon forget it. The eye should be sharp but pleasant. The black-eyed ox is apt to run away. For strength he should have a full bosom. For travelling, the legs should be straight, and the ankle smaller than the foot; the toe should be directly forward. If the animal should toe out, the knee will bend in, and the leg will be as much weaker than a straight one, as a crooked stick is weaker than a straight one for bearing a weight placed upon the top: with such a form, the inside claw is liable to be strained. Avoid, he says, the long peaked hoof. Let the back be straight from head to tail—though from the hips backward if he slope a little it is not much of a fault; but do not let him rise in that part. For hardihood, the round built or round ribbed ox—one that is not in danger of knocking his hips off in going through the woods is best. He would have them trained to the yoke when quite young. Three pair early put to work, and not over-worked, would do as much labor as four pair that are not broken until they have nearly attained their growth. A boy put to the trade of a blacksmith will be much stronger than if his employment is to measure tapes and laces. Almost any horse may be made to draw before oxen. He would never harness a colt for the first time at any other hour than in the morning, when he had the full day before him. He would not use the whip. Nor would he have the colt headed from home. Let

his head be towards home, and towards the old horse placed a few rods distant and he will draw.

Mr Jones, of West Tisbury, stated that formerly he had spent considerable time in England, and seen much of the English stock. It is in a high state of improvement. This is true of both cattle and sheep. Both Mr J. and Col. Jaques think well of the South Downs for us. Mr J. doubts whether any breeds of Cattle can be profitably substituted for ours which are derived from the red Herefords. But ours need much attention in order to bring them up to the excellence which they are susceptible of acquiring.

He had understood that it was in contemplation by the Legislature to cut short the Agricultural Survey. He wished it might go on, was willing to pay ten times his share of the tax. England had paid Arthur Young £20,000 pounds for surveys, and Massachusetts would do well to proceed farther. A board of Agriculture he hopes to see established.

Mr Buckminster likes the Ayreshire and Devon breeds of Cattle. Many of the views and opinions of the previous speakers he recapitulated and approved.

We ventured to inquire of Col. Jaques whether there was any reason to believe that where a pound of butter is obtained from a small quantity of milk, that the butter itself is inferior to that from milk yielding less cream? If a cow yield seven quarts of milk per day and make seven pounds of butter per week, will her butter be as good as that from a cow which gives eleven quarts per day and makes seven pounds per week? Results, witnessed by us in two or three instances suggested the inquiry. If we comprehended his reply, he would not suppose the quality of butter affected so much by the quantity of milk as by the blood of the animal.

Though our report is somewhat long we have omitted much that was said at this interesting meeting.—The same subject will come up before the meeting again to-morrow evening. After that is disposed of—*The root crops* will be considered.

**TO CORRESPONDENTS.**

Several communications are deferred for want of room. One from near Fall River is not forgotten. We are not ready to answer the inquiries it contains.

**BOSTON ALMANAC.**

Our thanks are given to the publisher, Mr S. N. Dickenson, for a copy of the second edition of this good, very good, Almanac. The extent and arrangement of its matter will render it highly convenient and useful.

**MEETING OF FARMERS AT SOUTHBORO'.**

On Wednesday evening last we had the pleasure of addressing the farmers of Southboro'. The awakening desire among our agriculturists to gain information relative to the principles of their art, is truly gratifying. It gives us pleasure to contribute our mite whenever opportunity offers. It has been with reluctance that we have yielded to the duty of returning to the city before we could visit the premises of those who have invited us recently to speak to them upon matters pertaining to husbandry. The good people of Newton, Westboro' and Southboro' may depend upon it that when the summer comes we shall steal into their enclosures and take as much knowledge as we have given.

The error of youth is that of thinking itself as wise as age; and the error of age is that of expecting youth to act as prudently as though it had received the benefit of experience.

**THERMOMETRICAL.**

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northernly exposure, week ending Feb. 7.

J. 1841.	7 A.M.	12, M.	5, P.M.	Wind.	
Monday,	8	28	35	30	E.
Tuesday,	9	14	32	14	E.
Wednesday,	10	31	34	22	W.
Thursday,	11	9	26	18	S. W.

Sunday,	14	22	34	30	N.

**BRIGHTON MARKET. — MONDAY, FEB. 8, 1841.**

Reported for the New England Farmer.

At Market 460 Beef Cattle, 60 Stores, and 640 Sheep, and 220 Swine. 100 Beef Cattle unsold.

PRICES.—Beef Cattle.—Better Cattle were at market than we have seen for several weeks; consequently higher prices were obtained, but for a like quality prices were hardly sustained. A very few extra Cattle, \$6 25, a \$6 50. First quality \$5 75 a 6 00. Second quality, \$5 00 a \$5 50. Third quality, \$4 25 a \$4 75.

Sheep.—“Dull.” Lots at \$2 00 and \$2 75.—Wethers, \$3 50, \$4 25, \$4 50 and \$5 00.

Pigs.—One lot of Sows and Barrows at 5 c. A lot to peddle at 4 1-4 for sows, and 5 1-4 for barrows. At retail from 5 to 6 1-2.

**WHOLESALE PRICES CURRENT.**

Corrected with great care, weekly.

SEEDS. Herds Grass, very little in market, \$3 asked. Red Top, by the bag 60 to 70 c. Clover—Northern, 12 1-2 c. Very little in Market.—Southern, plenty, 9 to 10 c. Flax Seed, \$1 37 to 1 50 bu. Lucerne, 25 c. per lb.

FLOUR. Howard Street \$5 37—Genesee \$5 31—Ohio \$5 12.

GRAIN. Corn—Northern Yellow 60 to 61 c.—Round Yellow 57 to 58—Southern Flat Yellow 55—White 53. Rye—Northern 65 to 67—Southern 60 to 65. Oats—Southern 35 to 38—Northern 40 to 44.

PROVISIONS. Beef—Mess \$10 50 to 11 00—Prime \$6 50—No. 1 \$9 00. Pork—Extra—15 00—Clear 14 50—Mess \$13 00. Hams—Northern 9 c. per lb.—Southern, none. Lard—Boston 9 c. per lb.—Southern, 8 to 8 1-2. Butter—Lump 18 to 22—Firkin 12 to 18—Shipping 8 to 14. Whole Hogs 6 to 6 1-2 c.—Pigs 5 c.

HAY, per ton, \$17 to 17 50—Eastern Screwed \$12 to 13 50.

CHEESE—Old 11 c.—New 8.

EGGS, 20 to 25.

POULTRY—Chickens 10 to 12 1-2 c. per lb.—Turkeys 10 to 14—Geese 7.

WOOL—The market for this article has not experienced any change of late. Pulled Wool is rather scarce, and there is but a limited supply of low Fleeces and of fine Fleeces the stock is also moderate. Prime or Saxony Fleeces, washed, lb. 50 to 55 c.—American full blood, washed, 47 to 50—Do 3 4 blood, washed, 44 to 46—Do. 1-2 blood, washed, 36 to 40—1-4 and common do, 35 to 37—Smyrna Sheep, washed, 20 to 23—Do. unwashed, 10 to 14—Bengasi Sheep, 8 to 10—Buenos Ayres unpicked, 7 to 10—Superfine Northern pulled lamh 43 to 46—No. 1 do. do. 37 to 42—No 2 do do 26 to 30—No 3 do do 18 to 20.

**BEEES.**

The subscribers wish to purchase a few swarms of bees, for which a fair price will be paid. Feb. 10. JOS. BRECK & CO.

**WHITE CARROT.**

A quantity of this new and valuable root is offered for sale at the New England Agricultural Warehouse, No 52 North Market street.

Also—New Red and Yellow Globe MANGEL WURTZEL—considered a superior variety. Feb. 10. JOS. BRECK & CO.

**NEW FLOWER SEEDS.**

The subscribers have received from London a choice collection of Flower Seeds, which, with those raised by themselves, constitute all worthy of cultivation. Price from 6 1-4 to 25 cents per paper. Assortment of those marked 6 1-4 cents, 20 papers for one dollar, and others in the same proportion. Feb. 10. JOS. BRECK & CO.

**GARDEN SEEDS,**

For sale by JOSEPH BRECK & Co, at the NEW ENGLAND FARMER OFFICE, No. 51 and 52 North Market St. Boston. The subscribers would inform the public that they have now on hand the largest collection of seeds ever before offered by sale in this city, embracing every variety of Field, Kitchen, Garden, and Ornamental Flower Seeds desirable for this or any other Climate.

Our seeds are either raised under our own inspection or imported from responsible houses in Europe, and having taken extraordinary pains to obtain such as are pure and genuine, we can confidently recommend them to our customers and friends, and feel assured they will prove satisfactory to all who try them.

Dealers in seeds are requested to forward their orders in season. Boxes for retailing from 8 dolls, and upwards will be sent out on commission allowing a liberal discount and take back what remain unsold.

Letters and orders with good reference will meet with prompt attention.

**FIELD SEEDS**

Sugar Beet.	Ruta Bagn.
Mangel Wurtzel.	Ballatine's New Royal do.
New Red Globe do. } superior	White Tankard Turnip.
Yellow do. } varieties.	Red do.
Carrot Long Orange.	Red Round do.
" Altringham.	White do.
" New White, extra fine.	White Globe do.
Pumpkin, sorts.	Green Round do.
Wheat—various sorts.	Purple Top Hybrid do.
Barley, do.	Buckwheat.
Rye, do.	Broom Corn.
Potatoes, do.	Millet.
Indian Corn, do.	Buckthorn. } for Hedges.
Oats, do.	Locust.

**GARDEN SEEDS.**

Artichoke, Asparagus, Beans of every description, Beets of sorts, Borecole, Broccoli, Brussels Sprouts, Cauliflower, Caraway, Celery, of the most improved sorts, Cabbage 20 sorts, Carrot, all the varieties, Cucumher do, Cress, Egg Plant, Endive, Indian Cora, Kale, Leek, Lettuce in great variety, Melons, do. Martyoeca, Mustard, Nasturtium, Okra, Onion of sorts, Pepper do. Pumpkin do. Parsnip, Parsley, Peas, a very great variety, Rhubarb for tarts, Radish of sorts, Salsify, Squash of sorts, Tomato, Turnip 20 varieties.

**SWEET AND POT HERBS.**

Thy	Sweet Basil.
Sweet Marjorum.	Lavender.
Sage.	Lemon Balm.
Summersavory.	Anise.
Medicinal Herbs, &c.	

**ORNAMENTAL FLOWER SEEDS.**

Three hundred varieties, embracing all the finest sorts. Packages of 20 fine sorts for one dollar.

Those who prefer to have their Seeds put up in papers ready for retail, can be accommodated—each packet neatly closed and labelled with printed directions. Price 50 cents, per dozen papers, which are retailed here at 6 1-4 cents each.

Fruit and ornamental trees, of the greatest variety, supplied at nurseryman's prices, and orders solicited. These will be packed, when required, to go to any part of the U. States.

JOSEPH BRECK & CO.

Boston, Jan 27, 1841.

**WILLIS'S LATEST IMPROVED VEGETABLE CUTTER.**

For sale at the New England Agricultural Warehouse, No. 61 and 52 North Market Street, Boston, Willis's Latest Improved Vegetable Cutter. This machine surpasses all others for the purpose of cutting Ruta Baga, Mangel Wurtzel, and other roots. The great objection to other machines, is their cutting the roots into slices, which makes it almost impossible for the cattle to get hold of them: this machine with a little alteration, cuts them into large or small pieces, of such shape as is most convenient for the cattle to eat. It will cut with ease from one to two bushels of roots per minute. Feb. 10. JOS. BRECK & CO.

**GREEN'S PATENT STRAW CUTTER.**

JOSEPH BRECK & CO. at the New England Agricultural Warehouse and Seed Store Nos. 51 and 52 North Market Street, have for sale, Green's Patent Straw, Hay and Stalk Cutter, operating on a mechanical principle not before applied to any implement for this purpose. The most prominent effects of this application, and some of the consequent peculiarities of the machine are:

1. So great a reduction of the quantity of power requisite to use it, that the strength of a half grown boy is sufficient to work it efficiently.
2. With even this moderate power, it easily cuts two bushels a minute, which is full twice as fast as has been claimed by any other machine even when worked by horse or steam power.
3. The knives, owing to the peculiar manner in which they cut, require sharpening less often than those of any other straw cutter.
4. The machine is simple in its construction, made and put together very strongly. It is therefore not so liable as the complicated machines in general use to get out of order.

**PURE SPERM OIL.**

**EDMUND T. HASTINGS & CO.**

No. 101 State St keep constantly for sale, Winter, Spring and Fall Sperm Oil, bleached and unbleached; which they warrant to be of the best quality and to burn without crusting.

Oil Canisters of various sizes.

Boston, Jan. 1, 1841.

1841

**BONE MANURE.**

The subscriber informs his friends and the public, that after ten years experience, he is fully convinced that ground bones form the most powerful stimulant that can be applied to the earth as a manure.

Orders for Bone Manure or Oyster Shell Lime, left at the Bone Mill, near Tremont road, in Roxbury, at the New England Agricultural Warehouse and Seed Store, No. 52 North Market Street, or through the Post Office will meet with prompt attention.

March 4, 1840.

NAHUM WARD

**GRINDSTONES.**

An extensive assortment of Water and Hand Grindstones constantly on hand and for sale by AMMI C. LOMBARDO & CO. 13 Lewis's Wharf. Feb. 17.

**TRACE CHAINS.**

Just received, direct from the English manufacturer 8 casks of Trace Chains, from 6 to 11 feet long, suitable for ploughing or draft chains. Feb. 10. JOS. BRECK & CO.

**FARM FOR SALE.**

The subscriber offers for sale that valuable Farm, situated about 3-4ths of a mile below the First Parish Meeting House, on the Stage road, and commonly known as the Judge Prescott farm, containing about 170 acres of superior land, in a good state of cultivation, with two dwelling houses, four barns, and other out buildings. The farm is remarkably well watered with soft water, conveniently fenced, has nearly forty acres of large, handsome wood and timber standing on it, with an orchard of grafted Apple, Pear, Peach, Plum, and Cherry trees, and might be easily divided into two Farms. The estate will be sold reasonably. If five thousand dollars be paid on receipt of the deed, the remainder may lay on mortgage to suit the convenience of the purchaser. For further particulars, apply to the subscriber, living on the premises. Feb. 10. WM. SALISBURY.

Groton, Oct. 26, 1840.

eow.

## MISCELLANEOUS.

## BOB FLETCHER AND HIS WIFE.

I once knew a ploughman, Bob Fletcher his name,  
Who was old and was ugly, and so was his dame,  
Yet they lived quite contented and free from all strife,  
Bob Fletcher, the ploughman, and Judy his wife.

As the morn' streak'd the east, and the night fled away,  
They would rise up to labor, refresh'd fir the day,  
And the song of the lark as it rose on the gale,  
Found Bob at the plough and his wife at the pail.

A neat little cottage in front of a grove,  
Where in youth they gave their young hearts up to  
love,  
Was the solace of age, and to them doubly dear,  
As it called up the past with a smile or a tear.

Each tree had its thought, and the vow could impart,  
That mingled in youth the warm wish of the heart;  
The thorn was still there and the blossom it bore,  
And the song from its top seemed the same as before.

When the curtain of night over nature was spread,  
And Bob had returned from the plough to his shed,  
Like a dove on her nest he reposed from all care,  
If his wife and his youngsters contented were there.

I have passed by the door when the evening was gray,  
And the hill and the landscape were fading away,  
And heard from the cottage with grateful surprise,  
The voice of thanksgiving, like incense arise.

And I thought of the proud who would look down with  
scorn,  
On the neat little cottage, the grove and the thorn,  
And felt that the riches and follies of life,  
Were dross to contentment, like Bob and his wife.

## THE OLD FARM GATE.

Where, where is the gate that once used to divide  
The old shaded lane from the grassy road side?  
I like not this gate so gay and so bright,  
With its glittering latch and its trellis of white.  
It is pretty I own, yet oh dearer by far,  
Was the red rusted hinge, and the weather warped bar.  
Here are fashion and form of a moderiz'd date,  
But I'd rather have looked on that old farm gate.

'Twas there, where my sisters would gather to play  
In the shadows of twilight, or sunny mid-day.  
How we'd laugh and run wild mid those hillocks of  
sand,  
Where temptations existed no child could withstand;  
But to swing on the gate rails, to clamber and ride,  
Was the utmost of pleasure, of glory and pride,  
And the ear of the victor or carriage of state,  
Never carried such hearts as the old farm gate.

Oh fair is the barrier taking its place,  
But it darkens a picture my soul longed to trace.  
I sigh to behold the rough staple and hasp,  
And the rails that my glowing hand scarcely could clasp.  
Oh how strangely the warm spirit grudges to part  
With the commonest relic once linked to the heart!  
And the brightest of fortune, the kindest fate,  
Would not banish my love for the old farm gate!

## THE SEA'S BOTTOM.

The bottom of the sea seems to have inequalities like those of the surface of continents. Were it dried up, it would present mountains, valleys and plains. It is covered, almost throughout by an im-

mense quantity of testaceous animals, or those who have shells, intermixed with sand and grain. The bottom of the Adriatic sea is composed of a compact bed of shells, several hundred feet in thickness. A celebrated diver, employed to descend into the Straits of Messina, saw there, with horror, enormous polypi attached to the rocks, the arms of which, being several feet long, were more than sufficient to strangle a man. In many seas, the eye perceives nothing but a bright sandy, plain bottom, extending for several hundred miles without an intervening object. But in others, particularly the Red sea, it is very different. The whole body of this extensive bed of water is, literally speaking, a forest of submarine plants and corals, formed by insects for their habitation, sometimes branching out to a great extent. Here are seen the madrepores, sponges, mosses, sea mushroom, and various other things, covering every part of the bottom.—The bed of many part of the sea, near America, presents a very different, though a very beautiful appearance. This is covered with vegetables, which make it look as green as a meadow; and beneath are seen thousands of turtle, and other sea animals feeding thereon. There are some places of the sea where no bottom has yet been found; still it is not bottomless. The mountains of continents seem to correspond with what are called abysses of the sea. The highest mountains do not rise above 25,000 feet; and, allowing for the elements, some suppose that the sea is not beyond 30,000 feet deep. Lord Mulgrave used, in the Northern Ocean, a very heavy sounding lead, and gave out along with it, eable rope to the length of 4,680 feet without finding bottom. But the greatest depth hitherto sounded was by Captain Scoresby, who, in the Greenland seas, could find no bottom with 1200 fathoms or 7,200 feet of line. According to Laplace, its mean depth is about two miles, which supposing the generally received estimates to be correct, as to the proportion the extent of the water bears to the dry land on the earth's surface, would make 290 millions of cubic feet of water.—*Rev. C. Williams's Works.*

## OUR REVOLUTIONARY SIRE.

Alexander Hamilton was hardly of age when he began to play his part in the awful drama of the Revolution, being only 20 when he was taken into the family of the Commander-in-Chief, with the rank of lieutenant colonel; Benjamin Franklin was 59 before he began to be heard of; Samuel Adams 44; James Otis 38; John Adams 35; Josiah Quincy 40; John Hancock 38; and Thomas Jefferson 32, before they were greatly distinguished. And so with all the actors of that age. They were full grown men—workmen—ripened with toil and strengthened by long habits of endurance and self-dependence. WASHINGTON was a surveyor, and in after life a farmer. ("Expressive silence muse his praise!") Knox was a book-binder and stationer. Morgan, (he of the Cowpens,) was a drover,—Tarleton got from him a lecture on that subject. Green was a blacksmith and withal a Quaker, albeit through all his southern campaigns, and particularly at the Entaw Springs, he put off the outward man. Arnold—(I ask pardon for naming him in such company)—was a grocer and provision store-keeper in New Haven, where his sign is still to be seen—the same that decorated his shop door before the revolution. Gates, who opened Burgoyne's eyes to the fact that he could not "march

through the United States with 5000 men," was a "regular built soldier," but after the revolution a farmer. Warren, the martyr of Bunker Hill, was a physician, and hesitated not to exhibit to his countrymen a splendid example of the manner in which American physicians should practice, when called on by their country. Marion, the "Old Fox" of the South, was a cow-boy. Sumpter, the "fighting cock" of South Carolina, was a shepherd's boy. Let it be forever remembered that the men of the revolution were workmen, those of New England especially:—Green, (as we have stated) was a blacksmith; Franklin a printer; Roger Sherman a shoemaker, and Putnam, Stark and Allen were farmers: not a man of them all above his business or ashamed of his calling.

'They were tinkers, and tailors and cobblers, what then? Were they not patriots? were they not men?'

## POUDRETTE.

This valuable manure may be had on application to the subscriber, at the office of the "New York Poudrette Company," No. 120 Nassau street, New York. It is *in-odoros*, and may be transported in barrels, on board of any vessel or steamboat, without offence—and it will be found an exceedingly valuable article as a *fertilizer on any soil*, and for *any crops*; but more especially for gardens and flowers, as there are no foul seeds in it. Poudrette has been used for three seasons with entire success on Long Island, by many practical farmers, as may be ascertained from letters and statements made by them, and published at this office in a pamphlet containing also the "act of incorporation," granted to the Company by the Legislature of the State of New York; and other facts in relation to the subject. Price 35 cents per bushel. Barrels cost 25 cents each, and hold 4 bushels. Persons wishing to make an experiment on a small scale can obtain one barrel by enclosing a two dollar current bank bill—or three barrels by enclosing five dollars. free of postage. On receipt of the money the article will be put up and forwarded as directed.

\* Price of shares, one hundred dollars—which entitles the holder to one hundred bushels of poudrette annually, during the term of the charter; fifty bushels in time for spring use, and fifty bushels in time for fall use. Shares taken soon, will be entitled to the spring dividend—and, if desired for experiment, a few bushels may be had this fall.

All orders, or applications in relation to the business, must be made to the subscriber, 120 Nassau street, New York. D. K. MINOR.

I wish it distinctly understood that the "New York Poudrette Company" is in no way connected with the "Lodi Manufacturing Company," of which Anthony Dey and Peter Barthelemy are, or were, the managers. Dec. 9, 1840. 3m. D. K. M.

## POUDRETTE.

The subscribers reside in the state of New Jersey, many of us in the vicinity of the works erected by Anthony Dey, of the city of New York, on the Hackensack river, in New Jersey, for the manufactory of Urate and Poudrette, called "The Lodi Manufacturing Company." We have used the poudrette on the Spring Crops this year, 1840. We find it a valuable manure, superior to any other kind that we have ever used, and considering the facility of its transportation to the field, the small quantity required in the application to the crops, the quickness of its operation on vegetable matter, and the ease with which it can be applied,—all tend to recommend its use to the farmer and gardener as the cheapest and best manure, and we recommend it accordingly.

Those of us who have applied it to corn and potatoes think that it ripens those vegetables quicker than any other manure by several weeks.

Dated New Jersey, October, 1840.

Jacob D. Van Winkle.	P. F. Welsh.
John J. Newkirk.	G. C. Van Riper.
John Tisc.	George Tisc.
Daniel Van Riper.	William Wood.
George Demott.	John Duryee.
Henry Drayton.	George Newkirk.
Josiah Hornblower.	Garret Newkirk.
Corns. Van Winkle.	Daniel Vreeland.

Shares in the above company are \$100 each, and may be had by applying to Anthony Dey No. 73 Cedar St. New York.—The owner will receive 20 per cent. per annum, payable in money, or 50 bushels of Poudrette. The price to those who buy Poudrette is 40 cents a bushel. It costs the Stockholders 12 cents a bushel. One cent worth, that is, 20 Gills, will manure 20 hills of corn, and the like quantity 15 hills of Potatoes.

Newspapers friendly to agriculture will confer a favor on the Farmers and Gardeners by publishing the above. Dec. 22.

# NEW ENGLAND FARMER, AND HORTICULTURAL REGISTER.

PUBLISHED BY JOSEPH BRECK & CO., NO. 52 NORTH MARKET STREET, (AGRICULTURAL WAREHOUSE.)—ALLEN PUTNAM, EDITOR.

N. E. FARMER.

## MR HUNTINGTON'S ADDRESS.

We have received a copy of the address of Asahel Huntington, Esq., before the Essex Agricultural Society in September, 1840. We had the pleasure of listening to it when originally pronounced, and judged it to be forcible, instructive and practical. We are somewhat in doubt whether duty to the readers of this paper will permit us to fill its pages with a long address. Under the influence of this doubt, we confine ourselves to extracts, even when the whole, in point of merit, deserves the widest possible circulation. After having spoken justly of the propriety of farmers' meetings; after having exhibited reasons why the young Essex farmer should be content to try his fortune in his native county; and after having enforced the propriety on the part of those who are fixed there, of making the most of their pursuit, he puts and discusses an important question in the following extract.

## THE TRUE PROBLEM.

"The true problem to be worked out by every intelligent and enterprising farmer, I take it to be this: to raise annually the greatest possible amount of the most profitable crops, having a single eye to income, immediate or more remote, according to his means, and especially to the gradual and permanent improvement of his farm. The practical farmer, whose own personal labor is his principal active capital, cannot afford to make doubtful experiments on any considerable scale. He cannot afford to improve his farm any faster than he sees the way clear for a certain and compensating profit in the end; and this end may be more or less remote, according to the means at his convenient command. With these limitations and restrictions, the point to be aimed at is, the greatest possible production from year to year.

"The earth is a kind, faithful and generous mother, and she will repay and reward any investment of labor or capital, which is made in accordance with these principles. Particular seasons, from drought, or other causes, may disappoint the expectations or defeat the plans of the husbandman; but I speak of the cultivation of a course of years; and affirm, that the farmer should make from year to year the greatest possible drafts from the earth, always having reference to income or profit, immediate or eventual, and the improvement and amelioration of his farm. In this way, the productive power of a farm, by judicious and efficient husbandry, may be indefinitely extended. Production, properly applied and expended, increases the power of production, so that it would be difficult to prescribe the limit beyond which production might not be carried.

"I am not now speaking in reference to modes of husbandry or cultivation unsuited to the circumstances, wants or condition of the county. I have no reference to modern English agriculture, as distinguished from our own. We all know that the

agricultural productions of that country have been amazingly increased within the last twenty or thirty years, but by modes of cultivation in part, which would not be suited to the circumstances existing among ourselves. I refer to what has been done and is now doing by some of the practical farmers among ourselves with eminent success and with great pecuniary advantage. The cry of the farmer should be perpetual, *give, GIVE, GIVE*—taking care himself to return more strength and nutriment, in the form of manures, than have been exhausted by his crops, in this manner preparing the way for a more liberal draft, at the next season. Thus good agriculture is in some sort a system of exchange of *kinds*, but not of *values*.

"Experience, at all times, has taught the husbandman that animal and vegetable substances, mixed with the soil, afforded nourishment to the plants which it produced. Science has disclosed to us the fact, that the living plants and the dead manure, whether animal or vegetable, are resolvable into the same elementary substances, though existing in different states of combination; so that in supplying animal and vegetable substances to the soil, in a state more or less decomposed, we in fact furnish the same essence which enters into the composition of the germinating and living plant. In supplying manures to the soil, we return to it the same elementary substances, which are drawn from it by the nurture and feeding of the living plant, and this is what I intended by the remark, that good husbandry is a system of exchange of *kinds*, but not of *values*. We thus see, that to secure an increased and increasing production, *MANURE* is the great and principal instrumentality. This is the beginning, the middle, and the end of thriving husbandry.

"To create from the resources of the farm the greatest possible amount of this food for plants, should be the constant aim of every good farmer. This is the ultimate source of his gains, and he must guard all the avenues to it with an ever vigilant watchfulness. The farm must be washed and scoured for the purpose of obtaining this treasure. In this county, we have abundant sources of supplying it, and though all farms are not equally privileged in this respect, yet none are destitute of the means of doing very much in this way. The sagacious farmer will watch with an eagle eye every possible opportunity for increasing the amount and improving the quality of his manure—especially will he see that nothing is lost. All his plans of improvement will have reference to this main and engrossing object. He will not expose his stable manure heap at the end or in rear of his barn, to the impoverishing ravages and inroads of the rains, the wind and the snow; a scandal alike to good taste and good husbandry. The liquids are of no less value in his estimation than the solids, and the most careful expedients are devised, as circumstances require, to see that nothing be lost, but that everything be preserved in the greatest order and perfection. His stable, barn-yard and piggery, are regarded as so many manufactories of manures; and his cattle and swine are each made to contrib-

ute in the best possible manner to this end. "Every hog kept by a farmer," says Mr Phinney, of Lexington, (who is the highest authority on this subject, as well as on all others pertaining to practical agriculture,) "should be required to prepare ten loads of compost manure in the course of a year, which he will cheerfully do if the owner will furnish him with the materials, such as loam, peat, or swamp mud," &c. The same distinguished cultivator assured me, as the result of his experience, that thirty dollars worth of manure judiciously applied to an acre of ground planted with Indian corn, over and above the usual quantity allowed for this purpose, would be compensated the first year, in the increased production of the crop, estimating the corn at one dollar the bushel; and that the additional fertility thus imparted to the soil, available in the greatly increased productions of future years, would be the net profit. He further assured me, and in this I am certain he would be confirmed by the most successful cultivators in our county, that the great secret of good husbandry is *liberal manuring*."

From the Farmer's Register.

## EXPERIMENTS WITH BONE MANURE.

On reading the article headed "Extraneous Manures," page 589, October number of the Farmers' Register, I was reminded of my promise to give you the result of my experiment with bone dust, or more properly speaking, crushed bones, as a manure.

My first application of bone manure was on turnips, in 1838; the result, so far as relates to the first crop and the expense, is stated at page 152-3, vol. 7th of the Register. I have therefore only to add the results of two years' additional experience in the use and effect of bone manure in comparison with stable or other putrescent manures produced on a farm.

In order to ascertain, with as much precision as I could, the requisite quantity of bone per acre, as well as to be precise in its application and comparison with other manures, I laid off an acre of ground which I designed for turnips, and divided it into eightyone equal parts by cross furrows at the proper distance. Upon two thirds of the ground thus laid off, a good two-horse cartload of stable or farm yard manure was dropped in each square, which of course was manuring at the good rate of 81 loads per acre. To other parts of the ground, crushed bones, from the Roxbury, Mass. mills, were applied at the rate of 15, 20, 25, 30, 40, 50, 60, 70, and 81 bushels to the acre, pure as they came to me, without adulteration or admixture of any kind. On the residue of the acre, a compost, consisting of the summer scrapings of the cow yard, without straw or litter of any kind, with only 8 per cent. of bone, was applied at the rate of 12 loads, of 25 bushels each, per acre. The ground had previously been well ploughed early in the spring, and a dressing of sixty bushels of good fresh lime had been applied on the furrow, immediately preceding

the first harrowing. The farm yard manure was regularly distributed on the ground and lightly ploughed in as fast as spread; having previously, as well as every other part of the ground, received a good dressing of plaster of Paris. The bone manure and compost were harrowed in with a heavy two-horse harrow, and the ground so rested until the appearance of rain, the 8th of August, when, immediately preceding a shower, the seed were sown and well harrowed in. The rain which fell was not a soaking one, but a transient summer shower, much of which ran off, especially from that portion of the ground to which the bone manure had been applied; the part manured from the farm yard presented a rather more uneven surface, one consequently more favorable for the reception and retention of rain, which fact was well established by an examination of the ground the next morning, when I found that the moisture had penetrated at least two inches deeper in the one case than in the other, and which circumstance gave to that portion of the ground manured from the farm-yard a very decided advantage over the bone manure for the first two weeks, or until ample rain supplied sufficient moisture. The ground upon which this experiment was made is high and dry, and was, at the time, exceedingly poor stiff clay land, upon which I had in vain, two years in succession, tried to produce black-eyed peas.

The growth of turnips on such parts of the ground as had received not less than sixty bushels of crushed bone, was quite equal in the end to the best growth when the farm manure was used at the rate of 81 cartloads to the acre; whilst the growth on all smaller allowances of bone, was inferior, and most so where the least quantity was used. But on that portion of the ground which was dressed with the *bone compost*, as above stated, the growth throughout was decidedly superior to any other part, and the product, at maturity, was at least one third more than was produced on an equal quantity of the ground manured from the stables.

Of the compost above described, I applied at the rate of 100 bushels per acre, to a poor piece of newly mowed meadow, (in 1838;) the succeeding crop was more than doubled by the application;—the crop of the present year (1840) was still better than the last, and from the after growth this year, I have little doubt of further and progressive improvement for several years to come, as the coarser particles of the bone are not yet entirely decomposed.

The conclusions, then, to which my mind is brought by the foregoing experiments are, first, that when applied at the rate of from 50 to 80 bushels per acre, on the exhausted lands of Virginia, one bushel of crushed bone, is more than equal to one cartload of (25 bushels) of good farm yard manure, in its effect upon the first crop. Secondly, that the effect of bone manure is more durable than that of any putrescent manure usually produced on a farm. Third, that when applied to land which is in good heart, the effect is much more powerful than it is on very poor land. Fourth, that when combined with manure and applied in the form of compost, the effect, both instant and remote, far exceeds any other application of the components when separated with which I am acquainted or ever witnessed. And lastly, if stable manure has to be purchased or even hauled more than half a mile from your own stables, bone manure at 50 cents per bushel, the price it cost me delivered on the farm, is the cheapest manure of the two.

Yours,

THOS. AP C. JONES.

## REPORT ON FARMS.

The Committee of the Massachusetts Society for promoting Agriculture—Messrs Welles, Prescott, Phinney, Codman and Quiney—to whom were submitted the claims and award of premiums on the best Farms, respectfully report.

The trustees have had a strong conviction, that in the use of their own funds, as well as those confided to them for distribution, they could in no way more beneficially contribute to the promotion of agriculture, than in liberal offers of premiums to farmers for instances of the most productive and best cultivated farms; “regard being had, (as the trustees have annually stated) to the quantity of produce. The manner and expense of cultivation, and the general appearance of the farm.”

The more easily to facilitate this, the trustees have annually proposed and published a series of well devised questions for consideration and reply, to which the attention of our industrious and intelligent farmers has been earnestly solicited.

They, therefore, in conformity with this impression, and with a hope of awakening the farmers of Massachusetts to a better sense of the importance of good cultivation, and at the same time of exciting an honorable competition in an exhibition of the best cultivated farms, appropriated six hundred dollars of their funds and the funds entrusted to them for this important object, in manner as follows:—For the best farm, \$200; for the next best, \$175; for the next best, 150; and for the next best, \$75.

The trustees have accordingly for several years past, appointed a committee for the purpose of examining the several applications which might be made, either by themselves or well selected agents, in relation to the aforesaid premiums, as respects the several objects proposed.

It has been a subject of regret heretofore, that the applications were so few. They have, however, successively increased and are now extended to eleven in number, all containing accounts of many useful improvements and judicious experiments, under a conduct and management, indicating an increasing industry, skill, and temperance in our agricultural community, inducing a wish with the committee, that they had more to distribute, where the efforts had been so praiseworthy.

It must be most gratifying to those who look favorably to this primeval employment of man, on which all others so much depend, to see the means of support, comfort, and happiness so diffused and enlarged. And those who are disposed to view it but superficially, cannot be insensible to the beauties which are spread over the face of nature by an improved taste and culture of our mother earth.

The communications of the several persons to whom the premiums have been awarded, will be published at length.

It is to be further noted that several of the applicants are in the full tide of early and successful experiment, and may, by perseverance hereafter, well merit distinguished notice.

After a careful examination and due inquiry in relation to the several applications for premiums, which have been referred to the committee, they ask leave to report as follows:

That the first premium of \$200 be paid to Abel Moore, of Concord.

As his communication is full, and will be herewith before the public, evincing a most extraordinary instance of increased production, by a judi-

icious course of management, few remarks of the committee will be necessary, further than to explain wherein this, as an example, may be safely followed by other farmers, and to suggest some observations for Mr Moore's consideration, as well as that of our other agricultural friends.

The process of restoring to the upland what a long course of heedless culture has taken from it, is well given. The use made of peat or accumulated matter from the low ground—its exposure to the influence of the atmosphere—its mixture with animal manure—and its application as a compost on the cultivated field, are well set forth.

It is to be considered that in this undertaking the sand or gravel were on the spot and beneficially removed. But care should be exercised to avoid covering too deep the long accumulated matter in the low grounds, or a valuable source of enrichment to our fields might be lost.

It may be further suggested for consideration, whether the leaving the low land for so long a period as twelve years, without occasional top dressings, might not occasion a failure of the more valuable cultivated grasses.

The committee ask leave further to report that the second premium of \$175 be awarded and paid to Paoli Lathrop, of South Hadley.

The management of Mr Lathrop is generally highly praiseworthy, and his success in the reclaiming of his low meadow land, is quite decisive of the benefit of that practice.

His efforts in the introduction and dissemination of the Durham short horned stock, have been well exercised, and his observations thereon may be perused by our farmers.

The use of plaster on upland and fields of grain, has been practised, and is well spoken of in this communication. It is doubtless productive of great benefit on a light soil in the interior of the state; but on a wet soil, or near the tide waters, by frequent experiments of several members of the society, it has failed of any manifest utility.

It is referred to Mr Lathrop's consideration, whether he has not fallen short in the use of only one peck of herd's grass with clover to the acre. It is in use by many, to apply double that quantity.

The South Down sheep are spoken favorably of both for their fleeces, and the value of their carcasses.

In the appropriation of the third premium, the committee were somewhat at a loss from the merit and utility of two several applications. They found it, therefore, most consistent with their sense of duty, to divide the said premium of \$150 in manner as follows: to Mr Winchester \$75, to Mr Salisbury \$75.

We think Mr Winchester is a skilful and judicious farmer, and his report may be read to advantage. In the production of one hundred bushels of corn, which was certified by the selectmen in one instance, a great crop was obtained.

When Mr Winchester mentions the production of more than four tons to the acre, he does not say whether it was the result of one or more crops. In a case heretofore published in the Agricultural Journal, where four tons to an acre was raised at a single crop, it was of herds grass only, well set, and five feet three inches to five feet six inches in height, and considered extraordinary. The production of four tons to the acre is rarely effected. Mr Winchester uses plaster to advantage. It is again suggested for consideration, whether the taking, as in this case, a crop for seven years with-

out any top dressing, is an expedient mode for farmers.

Mr Salisbury suggests several modes of cultivation which afford matter for consideration. He takes his crop of spring grain, and afterwards turns in the stubble, &c., as beneficial to the soil, and sows his grass seed, considering this mode as preferable for his grass crop. Late sowing in the fall he disapproves, thinking the frost injurious thereto. He floods a portion of his ground where it is so situated that the waters are turbid and depose a sediment; he thinks this attended with benefit. This practice, however, is not to be commended, unless a considerable sediment is left.

In reclaiming and bringing into production his low ground, he has done well. He has had many disadvantages to encounter in making his land productive.

In relation to the fourth premium, the committee report, that the same be enlarged, and divided as follows: to Mr Reed \$50; to Mr Converse \$50.

Mr Reed has merit in having brought his farm to a good state of production; has done much to make smooth a rugged surface. But in the culture and management of his fruit trees, he is entitled to high praise.

Mr Converse has, by a judicious culture, brought into improvement much waste land by extirpating bushes, &c. He makes beneficial use of plaster, and his collection and application of vegetable substances for the compost heap, have been well. His dairy appears to have been productive, and his farm in a course of good improvement.

To the several applicants it may generally be observed that they fail in not applying a sufficiency of grass seed.

In closing their report, the committee hope that in the several statements, which will be published herewith, some evidences will be given of a progressive improvement in agriculture.

All of which is respectfully submitted by order of the committee.

JOHN WELLES, *Chairman.*

#### NEGLECT OF AGRICULTURAL PURSUITS.

Can any farmer designate to us a single branch of the mechanical arts which manifests so little improvement, as in too many branches of agriculture? We do not deny that very great advances have been made, and wonders have been achieved in some departments, but we are not, as we should be, in the front rank in the march of improvement; and one very obvious reason for this is, the notorious disinclination of farmers to avail themselves of the aid of the great lever of modern science—the Press. The very fact of one item of knowledge having reached the press whence in one day it may be more widely disseminated than it could be orally in a year, is, prima facie, the reason why it should not be rejected as “theory” and “book farming;” for let those imagine, if they can, what would have been the present condition of the world had the spread of all human knowledge been restricted to oral communication! the extent of this bigoted prejudice is scarcely credible; and admitting that the complaints against “theory” are just, why are those who make them, so loth to give us their “practice?” Now, in any neighborhood, five out of ten farmers do not cultivate corn in the same manner, and the quantity produced, varies as much as the manner. Then why not use the readiest means of comparing their different modes, and as-

certain the best? there is no necessity that an experiment should be confined to one acre; let, then, every observant farmer carefully note the process of cultivating his annual crop and the attending circumstances, and report them to the public—he will thus furnish all the data necessary to satisfactory comparisons; and, if it *must* be so, let us know the reason *why* we must content ourselves with from ten to twelve bushels of corn at harvest, when over thirty have been obtained. What would each man know of England and France, did he trust to his individual observation? Ninety-nine hundredths of our knowledge is only the testimony of our fellow-men.—*Kentucky Farmer.*

#### TO MANAGE A REARING HORSE.

In preference to the dangerous experiment of pulling a rearing horse backward, I recommend the adoption of the following method. Whenever you perceive the horse's inclination to rear, separate your reins and prepare for him; the instant he is about to rise, slacken one hand, and bend or twist his head with the other, keeping your hands low. The bending compels him to move a hind leg, and of necessity brings his fore feet down. Instantly twist him completely around two or three times, which will confuse him very much, and completely throw him off his guard. The moment you have finished twisting him round, place his head in the direction you wish him to proceed, apply the spur sharply, and he will not fail to go forward. If the situation be convenient, press him into a gallop, and apply the spur or whip two or three times severally. The horse perhaps will not be quite satisfied with the first defeat, but may be disposed to try again for the mastery. Should this be the case you have only to twist, &c., as before, and you will find in the second struggle he will be more easily subdued than on the first occasion—in fact, you will perceive him quail under the operation. It rarely happens that a rearing horse, after having been treated in the way prescribed, will resort to the trick a third time. But on going into other hands, and having another rider, he will be very likely to have recourse to rearing.—*American Far.*

#### PUMPKIN SUGAR.

We find a notice in the Gardner's Magazine, of a method of manufacturing sugar from pumpkins, for which a patent has been procured by M. L. Hoffman of Hungary. M. Hoffman, together with M. Devay, has established a small manufactory of the article in Zamdor, in which they have already obtained forty hundred of sugar from pumpkins, a small part of which they have also refined. One hundred weight of pumpkins yields as much sugar as one hundred weight of beet roots, but the space of a hectare, namely, two acres, one rood, and thirtyfive perches, yields three or four times as large a quantity of pumpkins, (according to their weight, as the beet root: the space occupied by Indian corn growing between the rows not being included, eight hundred weight of sugar could be raised on sixteen hundred square toises. M. Hoffman has obtained from between twentysix and twentyseven hundred weight of pumpkins, one hundred weight of sugar, and as much syrup. In making the sugar, the pumpkins are cut in pieces, and then, with the rind, are rubbed on a grating, the same as is used for beet root, and the seeds, which produce an excellent oil, are kept separate. One pound of oil is obtained from

five pounds of seed. The juice is obtained from the grated pumpkins in the same manner as from beet root. M. Hoffman obtained from an indifferent press, eightytwo pounds of juice, containing a proportion of sugar of from 3° to 10° according to Baunce. The juice is far preferable to that of beet root, because it does not so soon lose its virtue, but remains good twentyfour hours. It is purified and cleaned by the same process as beet sugar. The pumpkins should be cut up in pieces before they are grated.

This discovery may be of some importance to the agriculture of this country. In the west, where such immense crops of pumpkins may be produced, it will prove more profitable for cultivation than the sugar beet.—*Magazine of Horticulture.*

For the N. E. Farmer.

#### RAISING CALVES.

MR PUTNAM—As various methods are recommended for raising calves, permit me to recommend the mode that I have found most successful.

Take the calves off when two or three days old, or when the skin is dry; learn them to drink; which they will readily do at that age; feed them with new milk about a fortnight, then with skimmed milk, in which a little meal has been boiled; by degrees water may be added, and the meal increased to a pint a day; give them a handful of rowen or clover hay once or twice a day. Follow this method until June, when a good pasture and a plenty of water will be all that they will require.

J. G.

*Choking—Important to Farmers.*—The following method of relieving neat cattle when choked by a turnip or potato, has been tried and found successful in every instance: Pour into the throat of the animal from a junk bottle, a pint or so of lamp or any kind of oil, at the same time rubbing the throat briskly with the hand. Immediate relief will follow.

*Writing on the Green Lawn in Living Letters.*—Bone dust possesses highly nutritious qualities for rows of beans, peas, and of grass, wheat, barley, &c., owing to its quality for absorbing humidity, and its calcareous character. Some of the lawns on estates in Yorkshire, have the names of their owners written on them in a growth of more luxuriant grass, which is effected by drilling bone dust into the tracks of the letters.

*Povrty.*—It is no honor to be rich, and no disgrace to be poor; therefore it is exceedingly foolish to strive after the appearance of wealth, if we are poor, and to be ashamed of the poverty which circumstances have brought upon us. This folly is a source of continual misery, and is seldom productive of any good.

He who borrows from a friend generally has to pay a dollar's worth of acknowledgements and friendly acts for every cent he lends you.

Cultivate your head and your heart as well as your fields.

There is nothing makes a man suspect much more, than to know little.—*Bacon.*

For the New England Farmer.

### PROPER AGE OF SEED WHEAT.

MR EDITOR—Sir—I saw a paragraph in the N. E. Farmer of Dec. 30th, 1840, on old wheat for seed, together with a request for better information, or reasons, on the subject, than had been heretofore offered to the public.

I have paid much attention to the growing of most kinds of grains and other seeds, and after fifty years experience and observation, I think I may hazard a few remarks on the subject matter of inquiry. In the first place I will give a reason why old seed should produce more and better grain than new. It is well known to all agriculturists that all seeds take root before they put forth the blade; and it is necessary that they should root firm in order to produce healthy and robust stalks; therefore, to ensure a good crop, take old seed, and for this reason—it loses its germinating qualities in the blade in a greater proportion than in the root—hence it will not come up so soon after sowing by from three to five days, as new seed—the difference depending altogether on age. During this difference of time, the grain is occupied in rooting firm and deep, and thus becoming able to produce a healthy and robust stalk. This delay gives vigor to the blade, which will be manifested by its dark green color, all which shows maturity in the germinating oil of the seed, which is as necessary as it is to let the grain come to maturity before it is harvested. Blasted or shrunk seed is preferred by many farmers, not that they think it better, but because it will go further; this is however a minor consideration; the true cause is that it has much of the quality of old seed; it loses in a very rapid manner while ripening after it is struck with blight, that portion of vegetating oil which nourishes the blade or quickens vegetation, while the germinating qualities of the root are retained without any apparent loss.

Also, the same paragraph remarks on the ravages of the Hessian Fly. It would appear from those remarks, that its ravages were entirely confined to that portion of the field that was sown with new seed, and that only was attacked. There is a great and grand desideratum—one of the greatest importance to wheat growers (if true;) one that cannot cost the farmer but little more than the interest on his seed for one or more years, which is a minor consideration compared with the preservation and guarantee of a good crop.

There is a cause for all things, and especially for the preference of the fly in his choice. It is the tenderness and the sweetness together that suits his taste much better than the tough and bitter blades of a healthy stalk; this is the only reason that induces the fly to feed exclusively on that portion of the field which is planted with new seed. For proof of the above remarks, I will refer to all grazing and ruminating animals—all which prefer the young and tender shoots to the tough and more mature branches, &c.

I would here suggest to the wheat growers, whether it would not be to their interest to sow a portion of new seed in strips of sufficient size to feed the fly during its ravages or feeding season; or to mix old and new seed together, which might be less trouble as well as less safe.

Respectfully, yours,

THOS. W. LYON.

Northboro', Feb. 8th, 1841.

### REPORTS OF THE MASSACHUSETTS AGRICULTURAL SOCIETY.

*The answers of Abel Moore, of Concord, to the questions proposed by the Massachusetts Society for the promotion of Agriculture.*

1. My farm contains about 130 acres, exclusive of woodland.
2. The soil consists of sand, gravel, peat and loam.
3. To reply in general terms, I consider the best method of improving my lands to consist in an interchange of soils; that is, to carry the peat and mud from the low and wet land to the light upland, and in return, to carry the sandy loam onto the peat land and bogs. This method I have uniformly found to be beneficial. Both lands are benefitted by the exchange. Each seems to supply what the other lacks. A few years ago, I had, in the midst of a piece of mowing land, a sandy knoll, entirely barren, containing about half an acre. This I covered with refuse peat, and sowed grass seed with rye. The grass immediately took, and I have had a good crop of grass on it for three years without manure.
4. I till about 16 acres, and put from 20 to 40 loads of compost manure on an acre, depending upon the kind of crop.
5. My manure is usually applied in a compost, but sometimes for potatoes it is applied in a green state.
6. Sometimes I spread and sometimes I manure in the hill.
7. I turn the sod over as flat as possible and roll it down smooth with a heavy roller, then harrow it, spread on the manure, and harrow or plough it in lightly.
8. I mow from 5 to 6 acres of upland, which yields about two tons of hay to an acre. The great bulk of my English hay grows upon reclaimed peat or meadow land, which I do not call upland.
9. None.
10. I manure all my English mowing about once in three years. I put about 25 cart loads of compost manure to an acre. I seldom make use of any except compost manure, and for the last four years I have purchased none, but made it all on the place.
11. I mow from 25 to 30 acres of low meadow land, part of which is situated on Concord river. The quality of the hay cut on this land is nearly one half of it swail hay, which is very good and spends well; the remainder is common meadow hay, some of which is of an ordinary quality. The quantity of this kind of hay is about forty tons. The greater part of this swail hay grows on the meadows that I have partially reclaimed, but do not manure.
12. The better to explain my answer to this question, I must be permitted to say a word with reference to the situation and former condition of my farm. It is situated about half a mile east of the Concord meeting house, on the great road leading to Boston. Its extent on the road is perhaps a quarter of a mile. On the north side of the road it runs back over the hill from three quarters of a mile to a mile. On the south side, with the exception of about two acres, it embraces all the piece of flat land lying between the great road and the turnpike, and perhaps 25 acres on the south side of the turnpike. The greater part of this land I purchased in 1825—6. After I had purchased, I

found that I had on my hands a large quantity of unproductive land, part of which would produce nothing, because it was so wet and marshy, and the rest would produce nothing because it was so dry and sandy. The land back of the hill, where I now have some 30 acres or more occasionally under cultivation, was so much run out, that it was hardly considered worth cultivating, and a neighbor, who had the use of it one year, paid me no rent, because it was not considered worth any. It is true, that it sometimes produced blackberries, but if the season happened to be dry, even these could not be relied upon. The flats in front of the house, where I now cut my English grass, were composed of swamps covered with bushes, miry bogs, and pond holes, full of lily pads and flags, where the muskrats and bull frogs seemed to hold undisputed possession,—while on the higher land, the woodchucks made their burrows unmolested. This is not mere fancy. I once set an Irishman to clear up some bushes and briars there, and he was actually driven off by one or these animals. Between these bogs and the hill, there was a little strip of upland, which might have produced hay enough to keep a horse and cow, (I do not think it did more,) and this I verily believe constituted the most valuable production of the Prescott Farm, as it was then called.

My first object was to render this land productive: but how to do it was the question. I had no works on the subject, and all the information I could get was what I could occasionally glean from the New England Farmer. One thing was evident, that the land must first be drained. There was a grist mill in the centre of the town, supplied by a stream that run through the land. I exerted myself to get this mill discontinued and it finally was discontinued. This however was insufficient to drain the land. In 1827 I commenced ditching it, and cut my ditches so low that the water would flow back to the head of them, that is, I commenced digging at the lowest part, and dug so low that the water would follow along after. I take especial care to level and slope down the banks of my ditches, so that now the grass grows down to the water's edge. This effected the object so far as draining was concerned, but it did not bring it into English grass. This was the next thing to be effected, and to do it I have tried various methods. I thought that I might plant a crop of corn and potatoes, and then lay it down to grass; but this did not work well, as most of it was too miry to be ploughed, and the ground even after bearing a crop would not become firm. I tried burning, but this did but little good except to rid me of the bushes. Indeed, I once felt fearful that the fire would communicate to the peat below and burn up the whole meadow.

Convenient to this meadow there is a hill composed of sandy loam. I carted on some of this, manured it, and sowed grass seed. This answered the purpose. The ground very soon became firm, the grass seed took, and the yield was altogether beyond my expectations. This plan I have pursued ever since, and it has now grown into a system with me. My whole method consists in this. I first ditch and drain the land, cut off the bushes, and if they are large, pull them up by the roots, and level it down, then spread on about 400 cart loads of sandy loam upon an acre, and 20 cart loads of compost manure, harrow it well, and (usually in the month of September,) sow half a bushel of herds grass and a half a bushel of red top, harrow

**NEW ENGLAND FARMER,  
AND HORTICULTURAL REGISTER.**

BOSTON, WEDNESDAY, FEB. 17, 1841.

**FIFTH AGRICULTURAL MEETING AT THE  
STATE HOUSE.**

On the evening of Thursday last, Mr Sheldon, of Wilmington, who on the week preceding gave us some interesting information relative to working oxen, stated that the shoeing of cattle is of more importance than many persons are accustomed to suppose. Ordinarily our blacksmiths do not make the shoe long enough at the heel. For travelling on pavements, on frozen ground or holding a load when descending hills, if the shoe be not wide and if it do not extend back near half an inch beyond where the foot bears, the shoe is liable to be pressed into the foot and produce lameness. Such shoes are more liable to be pulled off in the mire, and are not very essential for common farming work. The teamster ought to know when lameness is caused by a shoe, and he knows or should know when his ox is properly shod. What is learned in early youth is well remembered; this is as true of steers as of children. Break steers young; some boys may be trusted with the business of breaking them, but must not be allowed to do it in frolic. The best way he knows to teach them to back is, to put a hand under the nose of each, raise the head and press right up to their faces. This process does well with many oxen. The teamster should be careful in language; should never utter words to his team which do not mean something, and which his cattle do not understand. Some language is necessary. He had seen a deaf and dumb man who by motions could manage one pair of cattle well, but failed when he tried three pair.

Something may be known of the horse by his looks, but in him we are more liable to be deceived than in the ox. He has found generally that when the head hollows in from the nose to the top of the head, the animal is generally ambitious, but if not used skilfully is apt to be contrary. Differing from the ox, a good travelling horse sometimes toes out, and will strike the angles. Mr S. supposes the speed in such may be owing to the greater ease with which the balance is preserved when the feet keep near together. For travelling and for strength, he would have the limb short from the gambrel to the footlock, and long from the gambrel to the stifle. The horse should be full—quite full—over the kidneys.

Mr Fay, of New Braintree, inquired of Mr S. whether he would confine steers within a yard when first yoked, and whether he would allow them some time to become familiar with the yoke before he attempted to do much with them.

Mr S. replied that it might be well to keep them where they could not run until they were a little accustomed to the yoke, and that all your doings should be such as to excite no fears that the yoke or any thing else was to hurt them.

Mr Lathrop, of Springfield, next addressed the meeting, and he has been kind enough to favor us with a report of his remarks as follows:

The Teeswater, or unimproved Short Horns, were large, but disproportioned and of loose make. To remedy these defects, Charles Colling, about the year 1795, put a bull of this breed to a polled Galloway cow, and then bred directly back to the original Short Horns, thus taking but one cross of the Galloway breed. It seems that little or no confidence was had in this cross for a long period, for the animals thus produced were termed in derision, *the alloy*. But the sale of 48 animals made

by Mr Colling, in 1810, gave to his herd a reputation which was above competition. These 48 animals sold for £7,115 17s. Of the number, the cow known in the Herd Book by the name of "Lady," brought 206 guineas; Countess, her daughter, 9 years old, brought 400 guineas; the bull Comet, 6 years old, brought 1000 guineas; and 28 of the bulls and cows sold for 5,163l. 9s. or near \$25,000.

By introducing the cross referred to, Mr Colling reduced the size of the original Short Horn, but brought the animal into a more compact form.

It is dangerous, and more especially for one unskilful in breeding, to breed from close affinities. If not done with great judgment it will impair the constitution of the animals produced, and one of the earliest evidences in such animals is a cavity or falling off back of the shoulders.

Never sacrifice good points and symmetry to attain great size. As has been well remarked by a distinguished breeder of Short Horns in the State of New York—"The object to be attained is to produce the greatest animal within the smallest possible compass."

No animal is entirely perfect: some point in the best animal will always be defective. It is not sufficient alone to avoid breeding in and in, but there is much room for the exercise of sound judgment and science in breeding. For instance—if a cow is too long or too short, deficient in the loin, flank or any other important point, she should be put to a bull who is very full in the points where the cow is deficient, and thus correct the defect of the dam in her produce.

The owner of one of the best herds of Short Horns in England, and one of the most scientific breeders of these animals is Earl Spencer. He affirms that the male animal should approach towards coarseness—that the neck should be thick, as evidence of a good constitution—yet that he should be a mellow handler—and he says that he would be unwilling to breed from a male animal that does not possess these two important points.

I believe it to be a well established fact that this race of animals far exceed any other in early maturity; that with good keep they will make greater weight at two or three years old, than any race of cattle which shall have equal advantages.

In a treatise of Rev. Henry Berry on cattle, (and it is believed there is no better authority,) he says the pure Shorts are in color always red or white, and these two colors intermixed, and so far as my knowledge upon the subject extends, it is so; and hence any portion of black or blue hairs, are looked upon with suspicion and considered as evidence of impurity of blood.

This race of animals can be traced back in a direct line for about half a century, and from so long a course of breeding, it is quite apparent that the produce will be like the sire or the dam, or partake in part of the one and part of the other.

In this race of improved Short Horns, some families are very superior, deep and rich milkers, whilst others are fit alone for their readiness to take on fat. The latter are suited to the new parts of our country where their principal object is to make beef to be sent to market, and the former alone suited to our own part of the country for dairy purposes.

I believe it to be well established, that the quality of beef from these animals is at least equal to that of any other breed, and for the butcher they have this advantage over most others; the portions of the animal which are the least valuable are of light weight, whilst the most valuable portion of the animal are of great weight when compared with other animals.

I believe the milking and dairy properties of the Short Horns to be equal, if not superior to any other race—

and when good judgment is exercised in the breeder, that the produce can be relied upon for these properties, with much more confidence than upon any other breed.

I am not prepared to enter much into detail upon this point—but will cite one or two recent instances of the product of the milk of these animals.

A cow owned by Mr Canby of Delaware, has given one week the past season, over 35 quarts of milk per day, another, owned by Mr Gowen of Philadelphia, gave for a week 33 1-2 quarts per day.

In our own herd (it is owned by my brother and myself) two cows have given the past season, for three months each on an average, one 48 pounds of milk per day and the other 45 pounds. They were milked but twice a day and kept on grass only.

Of pure short horns we have 19 animals—and we have 10 more that are high bred.

We have two, two year old heifers last spring and one two years old in the autumn, which weighed severally in October last 1200 lbs, 1175 lbs, and 1065 lbs.—These animals are very compact in their form, and good judges did not estimate them at more than 3-4 of their actual weight.

We have two cows whose dame was sired by Mr Colling's Bull Comet, who was sold for 1000 guineas, and I believe these cows partake of as much of the blood of that superior animal, as any animal now in being.

Mr Dodge, of Hamilton, inquired whether the cross of a Durham bull and native cow was liable to produce a calf of extraordinary size? He had known instances in which the offspring was so large as to injure the cow, and in one case it had proved fatal. He asked also, whether Durham cows are better milkers than natives, and whether large cows generally yield more milk than small ones, because he had noticed that on milk farms around this city, the cows were large, very large.

Mr Lathrop, of South Hadley, replied that a large cease bull, part blood, put to a native cow will produce ordinarily very large calves, but the full blood bull of fine limbs does not. His calves do not weigh more than from 60 to 75 lbs. Col. Jaques confirmed this opinion, adding that a coarse large limbed sire however small his body, would produce a large offspring.

Mr Buckminster, Editor of the Cultivator, was of the opinion that our natives are better milkers than any that are imported. And that in England they miss it, in breeding animals that are too large. Horse, cow, or hog of medium size is better than a large one.

Mr Sheldon thinks that the purchasers of cows for milk farms are not particular as to size, but that their stock attain to a large growth in consequence of being kept high. Large cows in good feed do give more milk, but in short feed the small ones do as well.

Mr Weld of Sturbridge, confirmed the last remark of Mr Sheldon and his views in regard to breaking steers and driving the team were similar to those of Mr Sheldon.

Mr Colman has seen the Durham stock of the Messrs Lathrop, and it is splendid. But he is disposed to maintain that this breed is not fit for us in New England,—has himself owned three pure bloods and four half bloods and not one them was good at the pail. When these cows give a large quantity of milk, there is no extraordinary quantity of butter obtained. These high bred animals require peculiar care and keeping.

Mr D. K. Minor, of New York, being present the subject of live stock was laid upon the table to afford him an opportunity of making some remarks upon poudrette, in the manufacture of which he is concerned. After a few preliminary remarks he inquired whether this kind

of manure was profitable, and expressed the opinion that in cases where farmers must purchase and cart a considerable distance, this would be found an economical article. He estimates one bushel of it as equal in value for enriching land, to 15 or 18 bushels of stable manure. Half a gill, one gill, or one and a half gill to a hill of corn has been used. The one and a half gill is as good as more. One half the quantity is put in the hill at the time of planting and the other half is sown broadcast at the second time of hoeing, and is worked in by the cultivator and hoe. For grain crops 20, 30, and sometimes 40 bushels per acre are used with good effect. The price is \$1 75 per barrel of 4 bushels, at the wharf in New York.

The subject of *live stock* will be resumed for consideration at the next meeting. At the meeting the following week, Dr C. T. Jackson will speak upon Soils and Manures.

**THERMOMETRICAL.**

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northernly exposure, week ending Feb. 14.

Feb. 1841.	7 A.M.	12, M.	5, P.M.	Wind.	
Monday,	8	18	35	26	W.
Tuesday,	9	16	36	34	E.
Wednesday,	10	23	34	29	N.
Thursday,	11	6	13	10	W.
Friday,	12	0	12	10	W.
Saturday,	13	-2	16	12	W.
Sunday,	14	6	22	10	N. W.

**BRIGHTON MARKET. — MONDAY, FEB. 15, 1841.**

Reported for the New England Farmer.

At Market 390 Beef Cattle, 920 Sheep, and 80 swine. 90 Beef Cattle unsold.

**PRICES.—Beef Cattle**—We noticed a beautiful yoke of cattle, unusually large and fat, fed by Mr Sweetser, of Athol, Mass., which were sold for a high price. We quote to correspond with last week. A few extra \$6 25 a 6 50. First quality \$5 75 a \$6 00. Second quality, \$5 00 a \$5 50. Third quality, \$4 25 a \$4 75.  
**Sheep**—Lots at 2 50, 2 75 and \$3 00.—Wethers, \$3 50, 4 25, 4 75 and \$5 00.  
**Swine**.—No lots were sold to peddle, and a few only were retailed at 5c. for sows and 6 for harrows.

**WHOLESALE PRICES CURRENT.**

Corrected with great care, weekly.

**SEEDS** Herds Grass, very little in market, \$3 asked. Red Top, by the bag 60 to 70 c. Clover—Northern, 12 1-2 c. very little in Market.—Southern, plenty, 9 to 10 c. Flax Seed, \$1 37 to 1 50 bu. Lucerne, 25 c. per lb.

**FLOUR**. Howard Street \$5 37—Geesee \$5 31—Ohio \$6 12.

**GRAIN**. Corn—Northern Yellow 60 to 61 c.—Round Yellow 57 to 58—Southern Flat Yellow 55—White 53. Rye—Northern 65 to 67—Southern 60 to 65. Oats—Southern 35 to 33—Northern 40 to 44.

**PROVISIONS** Beef—Mess \$10 50 to 11 00—Prime \$6 50—No. 1 \$9 00. Pork—Extra—15 00—Clear 14 50—Mess \$13 00. Hams—Northern 9 c. per lb.—Southern, noae. Lard—Boston 9 c per lb.—Southern, 8 to 8 1-2. Butter—Lamp 18 to 22—Firkn 12 to 18—Shipping 8 to 14. Whole Hogs 6 to 6 1-2 c.—Pigs 5 c.

**HAY**, per ton, \$17 to 17 50—Eastern Screwed \$12 to 13 50

**CHEESE**—Old 11 c.—New 8.

**EGGS**. 20 to 25.

**POULTRY**—Chickens 10 to 12 1-2 c. per lb.—Turkeys 10 to 11—Geese 7.

**WOOL**—The market for this article has not experienced any change of late. Pulled Wool is rather scarce, and there is but a limited supply of low Fleeces and of fine Fleeces the stock is also moderate. Prime or Saxony Fleeces, washed, lb 50 to 65 c.—American full blood, washed, 47 to 50—Do 3 4 blood, washed, 44 to 46—Do. 1-2 blood, washed, 36 to 40—1-4 and common do, 35 to 37—Smyrna Sheep, washed, 20 to 23—Do. unwashed, 10 to 14—Bengasi Sheep, 8 to 10—Buenos Ayres unpicked, 7 to 10—Superfine Northern pulled lamb 43 to 46—No. 1 do. do. 37 to 42—No 2 do do 26 to 30—No 3 do do 18 to 20.

**WHITE CARROT.**

A quantity of this new and valuable root is offered for sale at the New England Agricultural Warehouse, No 52 North Market street.

Also—New Red and Yellow Glohe MANGEL WURTZEL—considered a superior variety  
 Feb. 10. JOS. BRECK & CO.

**BONE MILLS.**

The subscriber offers for sale Bone Mills on a new and improved plan, which will grind 200 bushels per day, and make it of the proper fineness. They can be put up with small expense, and require but little room. They can be easily kept in repair and are not liable to break with the roughest usage.

They may be used for grinding Barilla, and will do the work in the best manner. Oyster shells, plaster, soap stone, bricks, bark, &c. may be ground by them.

Price \$20. They require about as much power as a small run of mill stones, to be used to advantage, and can, if necessary, be driven by horse power.

Those who wish to purchase can direct to William Aplin, No. 14 1-2 Westminster street, Providence, R. I., or to the subscriber

Ground bones constantly on hand for sale.

WILLIAM CHASE.

Providence, R. I., Feb. 9, 1841.

**GREEN'S PATENT STRAW CUTTER.**

JOSEPH BRECK & CO. at the New England Agricultural Warehouse and Seed Store Nos. 51 and 52 North Market Street, have for sale, Green's Patent Straw, Hay and Stalk Cutter, operating on a mechanical principle not before applied to any implement for this purpose. The most prominent effects of this application, and some of the consequent peculiarities of the machine are:

1. So great a reduction of the quantity of power requisite to use it, that the strength of a half grown boy is sufficient to work it efficiently.
2. With even this moderate power, it easily cuts two bushels a minute, which is full twice as fast as has been claimed by any other machine even when worked by horse or steam power.
3. The knives, owing to the peculiar manner in which they cut, require sharpening less often than those of any other straw cutter.
4. The machine is simple in its construction, made and put together very strongly. It is therefore not so liable as the complicated machines in general use to get out of order.

**PURE SPERM OIL.**

**EDMUND T. HASTINGS & CO.**

No. 101 State St. keep constantly for sale, Winter, Spring and Fall Sperm Oil, bleached and unbleached; which they warrant to be of the best quality and to burn without crusting.

Oil Canisters of various sizes.

Boston, Jan. 1, 1841. 1841

**BONE MANURE.**

The subscriber informs his friends and the public, that after ten years experience, he is fully convinced that ground bones form the most powerful stimulant that can be applied to the earth as a manure.

Orders for Bone Manure or Oyster Shell Lime, left at the Bone Mill, near Tremont road, in Roxbury, at the New England Agricultural Warehouse and Seed Store, No 52 North Market Street, or through the Post Office will meet with prompt attention.

March 4, 1840 NAHUM WARD

**GRINDSTONES.**

An extensive assortment of Water and Hand Grindstones constantly on hand and for sale by AMM C. LOMBARDO & CO 13 Lewis's Wharf. N.Y. Nov. 17.

**TRACE CHAINS.**

Just received, direct from the English manufacturer 8 casks of Trace Chains, from 6 to 11 feet long, suitable for ploughing or draft chains. JOSEPH BRECK & CO.

**BEES.**

The subscribers wish to purchase a few swarms of bees, for which a fair price will be paid.  
 Feb. 10. JOS. BRECK & CO.

**GARDEN SEEDS,**

For sale by JOSEPH BRECK & Co. at the New England FARMER OFFICE, No. 51 and 52 North Market St. Boston. The subscribers would inform the public that they have now on hand the largest collection of seeds ever before offered by sale in this city, embracing every variety of Field, Kitchen, Garden, and Ornamental Flower Seeds desirable for this or any other Climate.

Our seeds are either raised under our own inspection or imported from responsible houses in Europe, and having taken extraordinary pains to obtain such as are pure and genuine, we can confidently recommend them to our customers and friends, and feel assured they will prove satisfactory to all who try them.

Dealers in seeds are requested to forward their orders in season. Boxes for retailing from 8 dolls. and upwards will be sent out on commission allowing a liberal discount and take back what remain unsold.

Letters and orders with good reference will meet with prompt attention.

**FIELD SEEDS**

- Sugar Beet. Rota Baga.
- Mangel Wurtzel. Ballatine's New Royal do.
- New Red Glohe do. } superior White Tankard Turuip.
- Yellow do. } varieties. Red do.
- Carrot Long Orange. Red Round do.
- " Altringham. White do.
- " New White, extra fine. White Glohe do.
- Pumpkin, sorts. Green Round do.
- Wheat—various sorts. Purple Top Hybrid do.
- Barley, do. Buckwheat.
- Rye, do. Broom Corn.
- Potatoes, do. Millet.
- Indian Corn, do. Buckthorn. } for Hedges.
- Oats, do. Locust.

**GARDEN SEEDS.**

Artichoke, Asparagus, Beans of every description, Beets of sorts. Borecole, Broccoli, Brussels Sprouts, Cauliflower, Caraway, Celery, of the most improved sorts, Cabbage 20 sorts. Carrot, all the varieties, Cucumber do, Cress, Egg Plant, Endive, Indian Corn, Kale, Leek, Lettuce in great variety, Melons, do. Martynea, Mustard, Nasturtium, Okra, Onion of sorts, Pepper do. Pumpkin do. Parsnip, Parsley, Peas, a very great variety, Rhubarb for tarts, Radish of sorts, Salsify, Squash of sorts, Tomato, Turnip 20 varieties.

**SWEET AND POT HERBS.**

- Thy Sweet Basil.
- Sweet Marjoram. Lavender.
- Sage. Lemon Balm.
- Summersavory. Anise.
- Medicinal Herbs, &c.

**ORNAMENTAL FLOWER SEEDS.**

Three hundred varieties, embracing all the finest sorts. Packages of 20 fine sorts for one dollar.

Those who prefer to have their Seeds put up in papers ready for retail, can be accommodated—each packet neatly closed and labelled with printed directions. Price 40 cents, per dozen papers, which are retailed here at 6 1-4 cents each.

Fruit and ornamental trees, of the greatest variety, supplied at nurseryman's prices, and orders solicited. These will be packed, when required, to go to any part of the U. States.

Boston, Jan 27, 1841. JOSEPH BRECK & CO.

**WILLIS'S LATEST IMPROVED VEGETABLE CUTTER.**

For sale at the New England Agricultural Warehouse, No. 51 and 52 North Market Street, Boston, Willis's Latest Improved Vegetable Cutter. This machine surpasses all others for the purpose of cutting Rota Baga, Mangel Wurtzel, and other roots. The great objection to other machines, is their cutting the roots into slices, which makes it almost impossible for the cattle to get hold of them: this machine with a little alteration, cuts them into large or small pieces, of such shape as is most convenient for the cattle to eat. It will cut with ease from one to two bushels of roots per minute. JOSEPH BRECK & CO.

## MISCELLANEOUS.

*Too much Eating.*—One of the noble effects of civilization and refinement is to make gluttons of the human species. As the state of society improves, the modes of living become more and more artificial. What were luxuries and extravagances fifty or a hundred years ago, are now matters of course—the mere necessities of life. Our ancestors, who confined themselves to a very simple diet and a little variety of dishes, were seldom tempted to eat too much. But it is next to impossible for the wealthy people of this age to avoid injuring themselves by too much indulgence at the table. They are led into excess by an artificial appetite and all the enticements of cookery. Cookery, by the way, is too much of a science for the good of the public; and of all literary productions, (with the exception of a few late novels,) we think *cookery books* are the least profitable. Every new dish invented is so much added to the bills of mortality. The kitchen is the vestibule of the graveyard; the cook is purveyor to the undertaker. Plutarch says that his countrymen the Bœotians, were remarkable for their stupidity, because they eat too much; they were good for nothing else; and this is generally the case with the great eaters of every age and country. King James I., (called by some the British Solomon,) was shown a man who could eat a whole sheep at one sitting. "What can he do more than another man?" asked the calculating Scotch monarch. "He cannot do as much," was the answer. "Hang him, then," said royal Jamie, "if he eats what would support ten industrious people, and cannot do as much work as one." If people in these times were hanged for similar causes, what an exceedingly busy office would be that of Jack Ketch.—*Franklin Register.*

*The Minister's Advice to Mr Slick on Choosing a Wife.*—"Don't marry too poor a gall, for they are apt to think there is no end to their husband's puss; nor too rich a gall, for they are apt to remind you of it unpleasantly sometimes; nor too giddy a gall, for they neglect their family; nor too demure a one, for they are most apt to give you the dodge—race off, and leave you; nor one of a different religious sect, for it breeds discord; nor a weak-minded one, for children take all their talents from their mothers; nor a ——" "O Lord! says I, minister, how you skeer a body! Where onder the sun will you find a nonsuch like what you describe! There ain't actilly no such critters among women." "I'll tell you, my son, said he, for I'd like afore I die to see you well mated; I would, indeed: I'll tell you, though you talk to me sometimes as if I did n't know nothin' of women. You think nobody can't know 'em but them as romp all their days with them, as you do; but them, let me tell you, know the least, for they are only acquainted with the least deserving. I'll gin you a gage to know 'em by that is almost invariable, universal, and infallible: the character and conduct of the mother is a sure and certain guarantee for that of the darter."

*Reflection.*—If you would increase in wisdom you must reflect. The mere sight of things amounts to nothing. A fool may go round the world and come come back a fool at last, because he has no reflection. One man learns more from a molehill than another does from a mountain.

*Never ask questions in a hurry.*—"Tom, a word with you."

"Be quick, then, I'm in a hurry."

"What did you give your sick horse 't other day?"

"A pint of turpentine."

John hurries home and administers the same dose to a favorite charger, who, strange to say, drops off defunct in half an hour. His opinion of his friend Tom's veterinary ability is somewhat staggered. He meets him the next day.

"Well, Tom?"

"Well, John, what is it?"

"I gave my horse a pint of turpentine, and it killed him as dead as Julius Cæsar."

"So it did mine!"

*No time to read.*—We have often encountered men who profess to believe they have "no time to read." Now we think of it, they have always been men of one character, the points of which are easily summed up. Nine times out of ten, they are men who have never found time to confer any substantial advantage either upon their country, their families, or themselves. They generally have time to go to elections, attend public barbecues, camp-meetings, sales and singing schools, but they have "no time to read." They frequently spend whole days in gossiping, tippling, and swapping horses, but they have "no time to read." They sometimes lose a day in asking advice of their neighbors—sometimes a day in picking up the news, the prices current and the exchanges—but these men never have "any time to read." They have time to hunt, to fish, to fiddle, to drink to "do nothing," but "no time to read." Such men generally have uneducated children, unimproved farms and unhappy firesides. They have no energy, no spirit of improvement, no love of knowledge; they live "unknowing and unknown," and often die unwept and unregretted.—*Southern Cult.*

*Grammatical.*—"How many genders are there?" asked a schoolmaster.

"Three, sir," promptly replied little blue eyes.

"What are they called?"

"Masculine, feminine and neuter."

"Give me an example of each," said the master.

"Why you are masculine, because you are a man; and I am feminine, because I'm a girl."

"Very well—proceed."

"I don't know," said the little girl, "but I reckon Mr Jackson is neuter, as he's an old bachelor!"

*An honorable example.*—The following we find in the Maysville Eagle. It is related of Mr Craddock, a member of the Kentucky Senate:

"Sir, said Mr C., what I have said here today has been said in a rough way, and if it has wounded any senator, I hope he will attribute it to no unkind feelings, but to my want of the polish of education. Sir, your Superintendent of Common Schools has said, that there are many men of families in this Commonwealth who can neither read nor write, and it is but too true; my own marriage bond has my MARK to it, and my son, who now sits in the other House, was a stout boy when I learned to write."

Mr C. is now not only a respectable senator, but a good lawyer. What more need he said in his praise.

An accusing conscience is a bad bed-fellow.

*Curious Facts.*—Mice will live entirely without water; for though, says Dr. Priestley, I have kept them for three or four months, and have offered them water several times, they would never taste it; and yet they continued in perfect health.

The Angora cat has one eye blue and the other yellow.

M. Hanbert saw a regular battle between two species of ants, in which they drew up in lines of battle, with reserves, &c. &c., and fought for four hours, taking prisoners, and removing the wounded till victory decided for one party.

The dam of the northern foxes will follow those who kill her young for 60 or 70 miles, and howl round them by night and day, till she has in some way avenged herself.

*Instructive.*—The following sentence, from the Philadelphia North American, though short, is held by the Boston Courier to contain material enough from which to manufacture a volume: "The road on which ambition travels has this advantage—the higher it ascends the more difficult it becomes, till at last it terminates on some elevation too narrow for friendship, too steep for safety, too sharp for repose; and where the occupant, above the sympathy of men, and below the friendship of angels, resembles in the solitude, if not in the depth of his suffering, a Prometheus chained to the Caucasian rock."

I always listened with pleasure to the remarks made by country people on the habits of animals. A countryman was shown Gainsborough's celebrated picture of the pigs. "To be sure," said he, "they be deadly like pigs, but there is one fault; nobody ever saw three pigs feeding together, but that one on 'um had a foot in the trough."—*Jesse's Gleanings.*

*An acre of land contains—*

4 rods, each rod 40 rods, poles or perches.

160 rods, 16 1-2 feet each.

4,840 square yards, 9 feet each.

43,560 square feet, 144 inches.

174,240 squares of 6 inches each, 36 inches.

6,272,640 inches or squares of one inch each.

"I was terribly put out about it," as the fellow said who was kicked down stairs for making a ro v.

## NEW FLOWER SEEDS.

The subscribers have received from London a choice collection of Flower Seeds, which, with those raised by themselves, constitute all worthy of cultivation. Price from 6 1-4 to 25 cents per paper. Assortment of those marked 6 1-4 cents, 20 papers for one dollar, and others in the same proportion.

Feb. 10.

JOS. BRECK & CO.

## NEW ENGLAND FARMER.

A WEEKLY PAPER.

The Editorial department of this paper having come into the hands of the subscriber, he is now authorized by the publishers to inform the public that the price of the paper is reduced. In future the terms will be \$2 per year in advance, or \$2 50 if not paid within thirty days.

ALLEN PUTNAM.

## POUDRETTE AS A MANURE.

The following practical farmers' analysis, or the results of experiments made with poudrette, as compared with other manures, and by itself, may be of interest to some of your readers; and will tend to show the high value of the article—and especially of that prepared by Anthony Dey, Esq., of New York, which he has represented as being a much better article than that referred to below: of the correctness of those representations, however, I imagine other proof than his assertions or analysis will be required by those who know us both, at home. Of their correctness or incorrectness however, I am willing to let those judge who use the articles.

A gentleman in Westchester county, New York, planted a piece of corn last season, on which he put only half a gill to the hill; of which he gives me the following account. I use his own language, which is as follows:

"For corn, I think no other manure can come in competition with it. I planted, last season, on sward land turned over (being first manured with common yard dung)—the ground rolled very flat, and harrowed—no plough used afterwards; the rows being marked by an ox chain drawn on the ground, the corn dropped, and half a gill of poudrette immediately put on the corn, and lightly covered with the hoe. This was done from 25th to 28th of May, as the weather allowed. More than a fortnight after my neighbors had planted, I was told by many who saw the manner and time of planting, that I should have no crop, but in three weeks my corn was farther advanced than any near me; and it continued of the finest color, and was the best filled of any I saw through the season. It was cut up and removed from the field on the first of September, and when husked, turned out the least soft corn that I ever had, in proportion to the good corn. I can attribute this quick and good growth to nothing but the poudrette; as the land was not well tilled, the corn only having had one good hoeing after it came up; the cultivator was run through it twice."

Thus it will be seen that it may be used in very small quantities, and yet produce very satisfactory results.

Another gentleman, on Long Island, says that he used a gill to the hill of corn, and he had as good corn from it as where he used a *shovelful of good yard manure* in the hill; and that the worms were much less troublesome where the former, than where the latter was used; and others have made the same remark in relation to insects.

On wheat it has been applied experimentally in different quantities. Twenty, thirty, forty, and even seventy bushels have been applied to the acre. A gentleman on Long Island says:

"I used it also on wheat, at the rate of 40, 60, and 70 bushels to the acre. That on which I put forty bushels to the acre, produced as good wheat as where I put 40 wagon loads of stable and barn yard manure—and equally as good as where *sixty or seventy* bushels of poudrette were used. I also used it on all kinds of garden vegetables, and never had better success. I consider it better for corn, *in the hill, than bone.*"

Another gentleman who has used it three years, says, under date of "Smithtown, L. I., Aug. 9th, 1840":

"My wheat came in well where I used poudrette last fall. It stood the winter well, and the berry is fine; but where I used bone, about the same cost to the acre, in the same field, it was winter killed, very much shrunk, and I should judge that there would not be over half the number of bushels per acre. Where I used poudrette this spring, the result is very favorable. I used it on corn by the side of the best yard manure: thus far it is decidedly the best; and I have no reason to doubt but that it will continue so through the season. I also used it in my garden, and it never looked better."

Another gentleman, also residing on Long Island, one of the earliest experimenters with poudrette in this country, says:

"I have used poudrette for three years, on nearly all the varieties of crops usually cultivated on farms in this county, and am entirely satisfied with its results. I consider its introduction as singularly fortunate to the farming interests in this vicinity."

I will refer to but one other gentleman at this time. He is also a resident of Long Island—one of the earliest, now one of the largest, shareholders in the company. He received last year over fifteen hundred bushels on account of dividend. He says:

"Another year's experience in the use of poudrette, has, if possible, increased my confidence in its great utility. My opinion of its high value on most crops was expressed in a former communication, and has been fully confirmed. The past season I applied it principally on oats and wheat. It may be sufficient to say the result was entirely satisfactory. Indeed the convenience and advantages resulting from the use of this article are so great, that one accustomed to possess them would hardly think himself able to carry on farming without it."

I could increase these statements if it were necessary, but I will leave the subject with the simple remark, that the practical farmer or purchaser will find more safety in relying upon the character of those who prepare it, than upon an *analysis* got up by one party for *effect*. As I have before said, I court investigation, and am willing to abide the result of experiment.

By a reference to the advertisement in your paper, those who desire to make an experiment will learn how it may be obtained.

I am, sir, respectfully, yours,

D. K. MINOR.

For the N. E. Farmer.

## AGRICULTURAL CHEMISTRY.

Although I have always valued highly the addition to the stock of general knowledge made by the experiments of Agricultural Chemistry, yet I have hitherto had but little faith in the immediate utility of their labors; having considered the practical knowledge of centuries far beyond the reach of the theoretical knowledge of about a quarter of one. But so ardent has been the pursuit of the scientific details of agriculture within the last few years, and so great the talent enlisted under its banners, that I perceive the distance between practice and theory is rapidly diminishing, and the day when they will meet and mutually support each other is evidently not far distant.

The work of Liebig, on Agricultural Chemistry, noticed by your correspondent, although it contains many errors, clearly arising from closet theory, yet contains also many exceedingly valuable facts and suggestions, and is worthy the perusal of every tiller of the soil.

The chemist can tell in his laboratory the solid ingredients of a soil, but it is evident that the gaseous portion has evaporated and escaped previous to his submitting it to the test. Again, to ascertain the substance most required by any particular crop of vegetation, would seem to require two separate analyses of the same soil, one previous to sowing, the other subsequent to reaping the crop; and these analyses not simply of the solid constituents of the soil, which are often merely the recipients of the most important substances for vegetation, but of the salts and gases; paying particular attention to the neutral salts and gases in that previous to sowing, and to the free or combined acids in that subsequent to reaping. These analyses should also be conducted on a pretty large scale, say a heap formed by two or three wheelbarrows of soil, brought together from different parts of a field, taken from the surface to the depth to which the roots of the crop penetrate. This should be well mixed so as to be perfectly homogeneous—a large portion treated with water, and so on throughout the analysis. It is evident that the comparison of these two parallel analyses would shew the action of the crop on the soil, and the use which it had made of the different ingredients thereof.

Another point of great consequence and one of great difficulty for the chemist to grapple with is, the convertibility of one substance into another during the process of vegetation: then it is thought that seeds have the power of decomposing water and converting it for their use into its component parts or hydrogen: and that the nitrates are made to surrender a portion of their nitrate, &c. the same with ammonia.

To these and many other points of great interest on this subject, the attention of the public in Europe is freely awakened; nor are they without their students here: our best operative chemists are pursuing them with great assiduity. No doubt if supported by the great sovereign here, the public

voice, they will not fall far behind in the race of discovery in Agricultural Chemistry.

J. E. T.

### IMPROVEMENT OF LOW LANDS.

The amount of unimproved land in the county somewhat exceeds that of English and upland mowing, and is more than double that in tillage. A large portion of this land, consisting of low, bog, mud, and peat meadows, is capable of being drained. It is now absolutely worthless, or nearly so. These tracts are distributed through the whole county. Scarcely a farm can be found, which does not contain some land of this description. If susceptible of draining at a moderate expense, these lands, in their present condition, though producing nothing except what is offensive alike to the eye and a just agricultural taste, are *intrinsically* worth more than the average of the first class of upland tillage bottoms. They are virgin soils, and contain vast accumulations of vegetable deposits, furnishing the best aliment for most kinds of plants, and especially for grasses. When drained of the exuberant moisture, and the soil has been sufficiently exposed to the action of the atmosphere, they become extremely productive, and may be kept so at a very inconsiderable expense. This is not matter of speculation, theory, or book learning, but of actual and repeated experiments, made by practical farmers, who have shown us the results, the processes, and the expense of the operation. The transactions of our Society, as published from year to year, contain splendid and most encouraging examples of this kind of husbandry. Among the most recent, I refer you to those of Mr Osborn, of Lynn, and Mr Brown, of Saugus. If any farmer doubt as to the expediency of this mode of cultivation, I would ask him to visit these reformed meadows, as I have done, and see them producing every variety of crop in the greatest richness and abundance. For three successive years past, in the month of June, I have seen one of these reclaimed meadows, containing about twenty acres, under the cultivation of Mr Phinney, the gentleman before referred to, producing between two and three tons to the acre of the best English grasses.

This subject cannot be pressed too strongly on the attention of our Essex farmers. These sunken, sterile, and unsightly meadows contain mines of wealth, and require only the hand of the judicious cultivator to work out the precious metals, in all sufficient and reasonable abundance. I say, again, let every farmer, who is blessed with this species of soil, try the experiment for himself. He may do it on a more limited scale, if he please. If he is unwilling to grapple with one or two acres, let him try one or two rods; and if he should not be perfectly satisfied with the experiment after a fair trial of two or three years, as one of the trustees of the Society, I should not be unwilling to assume the whole expense of all the experiments that might be made, and to become, with my colleagues, personally responsible for such an engagement. I have entire confidence in the feasibility and profitability of this mode of culture; and I hope I may live to see the day when these detached prairies shall become the gardens of Essex, rejoicing the heart and eye of the passing traveller, and returning their golden harvests into the barns and granaries of the husbandman.

Before quitting this topic, I cannot forbear relating an anecdote, which will illustrate the general views here presented. Within the last year, an

aged farmer, who has made himself rich by this mode of cultivation, adopted extensively many years ago, was called as a witness before a sheriff's jury, to estimate the value of a neighbor's land, which had been taken for a highway. The land was a narrow strip of three rods in width, running partly over upland tillage or field, and partly over a meadow, producing coarse and sour grass. Several witnesses were called in behalf of the petitioner for damages to appraise these different soils, and all of them, except the old farmer, estimated the upland considerably higher than the meadow.—When he was called, he reversed the estimate; and the counsel for the county, apparently surprised at this judgment of the old farmer, differing from that of all the other witnesses, and thinking he had caught him napping, exclaimed with a loud voice, (the old farmer being quite deaf,) "do you presume to say, sir, that this meadow land is worth \$70 the acre, and more than this valuable field?" The old farmer, raised a little by the apparent temper and spirit of the question, replied substantially as follows. I may not give the precise words, but I do not mistake the substance of the answer. "I do presume, sir, to say so—and I know so, and there is no mistake. I have worked over these meadows and know all about it. I have sold a good deal of English hay from mine, and I know I get more and better English hay from my old meadows, than I do from my uplands. The fact is, there is a *bottom* and *foundation* in these meadows, which we do not, and cannot find in the uplands, and there is no mistake about it. I do presume, sir, to say again what I have said before, and I know it is true."

### Improving Salt Marsh.

In this connexion, it may be proper merely to advert to the improvements which have been made within a few years in the cultivation of salt marsh by ditching, draining and dykeing. There is a large quantity of this land in the county, fourteen thousand one hundred and thirtynine acres, being just about equal to the quantity in tillage. It is well known that a large portion of this salt marsh is comparatively unproductive. The experiments which have been made, in several instances, at improved modes of cultivation, in the ways referred to, augur well for success. If it is found, on farther experiment, that these lands are susceptible of improvement in these or other ways to the degree which the experiments actually made would seem to warrant us in expecting, it is obvious that a vastly increased productive power may be obtained from this source, and considering the amplitude of the source, it would be difficult to estimate its value or importance. I commend this subject to the special attention of the seaboard farmers, who are mainly interested in these lands.

### Good Culture the most Profitable.

Land that is worth cultivating *at all*, is worth cultivating *well*. If, therefore, an individual find himself in the possession of a farm which will not reimburse the expense of good husbandry, he had better abandon it at once, for all experience teaches, that no man can afford to be a farmer under a system of *bad* husbandry. The earth was not made for thriftless, inefficient, or unskilful cultivators, nor will it yield to such its full increase.

No farmer should feel that he discharges his whole duty, unless the effect of his cultivation is to make his farm *better* every year. He may be sure that it is capable of an indefinite improvement,

and his constant aim should be, to increase and multiply its resources and productive power. The question should not be, whether fifty or an hundred dollars judiciously expended in labor or otherwise, will add so much to the saleable value of his estate, but whether he can receive it back again with good interest. His mode of cultivation should not be based on any idea of the present or prospective value of his farm in the market, but on that of a permanent and continued possession from generation to generation; and that if he do not reap all the benefits himself, he is laying up a certain treasure for his descendants.

### Choice Fruit Trees.

It is believed that the cultivation of all the choice fruits to which our climate and soil are adapted, may be very greatly extended with a certain prospect of abundant remunerating profits. A distinguished cultivator in a neighboring county, informed me that the net income arising from the sale of his Isabella grapes alone, three years ago, exceeded that of his whole farm of one hundred and fifty acres. Another farmer, who has paid particular attention to the cultivation of peaches, informed me a few weeks ago, that his sale of peaches in the Salem market, the present season, amounted in one week to the sum of one hundred and twenty dollars; and that his peach trees, for a series of years, have yielded him an annual income of between four and five hundred dollars. It is to be considered that the Essex farmer finds a great and constantly increasing demand for all the choice productions of the earth. He is in the midst of the most densely populated region in this country. He has a cash market almost at his own door for every contribution that he can bring to it; and as the facilities of intercommunication are constantly increasing, by the operation of that great power of modern times, steam, which is effecting a revolution in the condition and relations of the whole civilized world, the only means by which an Essex farmer especially can successfully withstand the active competition and conflict which these discoveries are adapted to produce, are improved modes of cultivation, with particular reference always to the production of the *BEST* article for the market, whatever it may be. Our husbandry must be a model husbandry. We must make up in fertility of skill, expedients and useful devices, what we lack in the natural fertility of the soil. In this way, and by these means, Essex husbandry, which has a cash market on her own soil, constantly increasing and craving all her rich and choice productions, may successfully maintain her rightful superiority at home, and by a gradual and certain extension and development of her own inherent resources, preserve it in all time to come.—*Mr Huntington's Address.*

As in agriculture, he that can produce the greatest crop is not the best farmer, but he that can effect it with the least expense—so in society, he is not the best member who can bring about the most good, but he that can accomplish it with the least admixture of concomitant evil.—*Lacon.*

The mind, says Bentham, is a field, in which so sure as man sows not wheat, so sure will the devil be to sow tares.

Diamonds have their specks, and the greatest men their foibles.

## REPORTS OF THE MASSACHUSETTS AGRICULTURAL SOCIETY.

## MR LATHROP'S STATEMENT.

1. Of how much land does your farm consist exclusive of woodland?

One hundred and sixty acres.

2d and 3d. What is the nature of your soil?

It consists of clay with a large mixture of sand, with clay subsoil. I find it well adapted to both grain and grass, but think the best method of improving it is to keep the greater part to grass.

4. How many acres do you till, and how many cartloads of manure do you generally put on an acre?

Have ploughed the season past for corn, potatoes, ruta bagas and small grains, 21 1-2 acres.—Have generally put from 15 to 25 loads, as I thought the condition of the soil required.

5. Is your manure applied in a long or green state, or in compost?

The manure made during the winter I choose to have go through a slight fermentation before using. That made during the warmer seasons I convert into compost.

6. Do you spread and plough in your manure put upon fields to be planted, or put it into the hills?

In planting turf grounds in a high state of cultivation, I should only manure in the hills; if rather poor, should plough, then spread a light coat of barn manure and harrow it in, and manure with compost in the hill, to give an early start. If I plant corn on stubble or warm mellow ground, should by all means spread and plough in, though not deep. Manuring such ground in the hill, especially in dry seasons, will give many stalks and but few ears.

7. What is your method of ploughing and cultivating green sward?

To prevent injury to my corn crop by the cut worm, I have usually ploughed green sward in the fall of the year. In the spring I give it a thorough harrowing; manure and plant as described in the foregoing answer.

8. How many acres of grass land do you irrigate?

Not any.

9. How many acres of upland do you mow, and what is the average quantity of hay upon an acre?

About 40 acres: not less than two tons per acre, including rowen, which is taken from only about one fourth of the ground. My upland mowings are manured on the turf in the spring with what manure I can spare from my ploughed grounds, and annually sowed with plaster at the rate of from 60 to 100 pounds per acre. My pasture lands are also sowed in the same way.

10. How many acres of low land not suitable for the plough do you mow?

About ten.

11. What is the quality and quantity of hay cut the present year?

The most part is fine; consisting of white clover, English and timothy. A small portion is rather coarse with a mixture of foul meadow. Quantity about 1 1-2 ton per acre.

12. What is your method of reclaiming low, bog or peat lands, and what has been your success?

The above ten-acre lot described in the answers to questions 10 and 11, is low and was somewhat boggy or hassocy. My method of reclaiming has been deep ditching and cutting off the boga or has-

socs. I have had most wonderful success; increasing both quantity and quality of hay. It has never been manured.

13. How many acres of corn have you planted the present season; what was your mode of preparing the ground and the seed; the kind and quantity of manure used to an acre; the manner of applying it and the quantity of corn raised to an acre?

Planted nine acres. Prepared the ground and manured as described in answer to question No. 6., having planted both turf and mellow ground. Have raised the Dutton corn with great success. Have not harvested all. Six acres of the green sward manured only in the hill with compost, is judged by our farmers to yield fifty bushels to the acre. The three-acre lot was mellow stubble ground, where I raised wheat last year. I carted on at the rate of fifteen or twenty loads of barn manure and ploughed it in last spring. This is harvested, and averages not less than sixty bushels per acre. The seed was soaked in water and rolled in plaster.

14. How many acres of potatoes did you plant the present year; what was your method of planting; your manner of cultivating; and what was the average quantity raised on an acre?

Two and one fourth acres. One acre of Rohans were planted four feet apart each way, measuring from centre to centre, with two eyes in each hill. Three fourths of an acre of Biscuit or Carter, for table use, planted three feet each way. The Rohans were hoed three times; the Biscuit but twice. The Rohans were planted in the same field with the three-acre lot of corn above named, and manured the same as the corn. The produce was 355 bushels. The Biscuit were planted in a pasture without manure, and yielded at the rate of only one hundred and twenty bushels per acre. One half acre planted with various kinds, not accurately measured.

15. What number of acres of other vegetables did you plant; what kinds, and how many bushels of produce have you to the acre, and to what use shall you apply them?

One and a half acre of ruta haga, not gathered. Should judge it to produce 600 bushels to the acre. Shall feed them to all my sheep and cattle, (except milch cows.) Potatoes I design for milch cows and swine.

16. How many acres of grain did you sow the present year; what kind of grain, and at what times; how was the ground prepared; what quantity of seed did you sow on an acre? If you have raised wheat, of what kind; the nature of the soil; and was it sown with or without using lime?

Eight and three fourths. One and three fourths of Italian spring wheat, sowed early in April; ground planted year previous; ploughed but once last spring; sowed at the rate of one bushel and 26 qts. per acre; nature of the soil as described in 2d and 3d answers; sown without lime; sowed about 60 lbs. plaster to the acre after it came up. The produce was 36 1-2 bushels good wheat.—Sowed seven acres of oats about the 20th of April. Ground prepared the same as for the wheat; the same nature of soil. Sowed three bushels seed to the acre. Oats not thrashed; from the number of shocks and what few are thrashed, the produce cannot vary much from 45 bushels to the acre. Have about 100 bushels of rye from land sowed last fall.

17. How many acres have you laid down to grass the present season; at what time did you

sow it; how much seed to the acre; and was it sowed alone or with grain crops?

Eight and three fourths; sowed in April; one peck of herds grass and eight pounds of clover seed to the acre was sowed after the grain was harrowed, and the hay seed was rolled in.

18. What are your means and what your manner of collecting and making manures?

My plan of collecting and making manures is, immediately after haying to cart meadow mud and turf, and place it at the foot of where the manure from stables is to lie during the winter and spring, that it may receive the benefit from what may leach from the heaps. This I have found to be of essential benefit to the compost. My cattle also have the privilege of lying upon it while at the barns. This is left until after haying another year, and then carted where I intend to plant the year following. My hog pens are filled at the same time with the same materials. Often I make holes with an iron bar and fill with corn. The corn pays the hogs for their labor and saves shoveling the manure over. I usually mow the stubble and weeds from my new seeded ground. This is beneficial to the clover and serves to increase the quantity of manure. I also gather weeds, potato tops, &c. to put in the hog pens.

19. How many oxen, cows, young cattle, horses and sheep do you keep through the year? What is the size of your barns, and have you a cellar under them? Is your manure covered?

Usually from 35 to 40 cattle; have now something over 40; one horse and 30 sheep. One barn 64 feet long and 40 wide, 16 feet posts; one 40 feet square with 18 feet posts; one 20 feet square with 11 feet posts, used entirely for hay. A cellar under the first described barn. Only a small share of the manure is covered.

20. Are your cows of native, foreign or mixed breed?

They are of the improved Durham Short Horns, thorough bred; have nineteen, including young stock, of pure blood, such as are termed herd book animals; remainder of stock are mixed bloods.

21. What is your management of calves intended to raise?

I let them run with a cow until they are six or seven months old.

22. How much butter did you make and how many cheeses, and what proportion of it new milk?

Generally have milked only two cows and a heifer; have kept no account of butter or cheese. The milk of two thorough-bred cows was weighed for 90 days; one averaged 48 lbs. per day; the other 45 lbs., on grass only; milked twice only each day.

23. How many sheep do you keep, and of what breed? How many pounds of wool do you get from your sheep? What is your manner of housing, penning, rearing and feeding them, especially in winter and at the time of lambing? What time do they lamb, and what proportion of their young die, and from what cause?

I keep about 30 sheep of the Southdown breed; average fleece between 3 1-2 and 4 lbs. In winter I yard them and give them a chance to go under a shed when they please. I feed them on good hay and a moderate quantity of ruta baga, and am particular that they have plenty of water. A very erroneous idea many farmers have, that sheep do not require water when snow is on the ground. I believe thousands in New England become diseased and die for the want of it. My

sheep commenced lambing the early part of March last spring; lost about one in ten in consequence of getting chilled. Have last March lambs which weigh over 100 lbs. each. I must speak highly in favor of the Southdowns for mutton.

24. How many swine did you keep; what quantity of pork did you make, and of what breed were your swine?

Five old and five young ones. Have not killed my hogs: shall make the average weight near 400 lbs. They are full blood Berkshires.

25. What do you feed them upon through the summer months, and on what do you fatten them?

After potatoes are gone in the spring, I give corn and bran, with the slops of the house, skimmed milk, &c. When apples begin to fall, I make them take the place of the corn. I fatten them on boiled apples, potatoes, pumpkins, corn and corn meal.

26. How many cartloads of manure do you take from your hog styes in a year, and of what materials is it made?

From 30 to 40: made of meadow mud, sods, stubble, weeds, &c.

27. What number of hands do you employ on your farm, and what do you pay for labor?

I employ one man eight months at \$14 per mo.; one seven months at \$13 50, and one boy at \$8 per month for seven months; one man through the winter at \$12 per month. Paid \$52 for extra labor during haying and harvesting.

28. What is the number of your apple trees? Are they of natural or grafted fruit? What use do you make of the fruit?

Have about one hundred. All the young trees are engrafted. Sell all of the choice fruit that I do not want for my family use; feed to my swine and make from 20 to 30 barrels of cider.

29. What number of fruit trees have you exclusive of apple trees?

Have about 30 peach trees, 6 pear trees which bear, and several younger ones, and a few plums and cherries.

30. Have your trees been attacked by canker worms or borers?

They have not.

31. In the cultivation of your farm do you allow the use of ardent spirits?

I do not.

This farm I purchased seven years ago last spring. The hay on the farm was all put in the 64 feet barn the first summer, and did not fill it. The barns described in answer 19th, are all now well filled, and a bay in a barn which I have of my neighbor, which is 50 feet long, 18 feet deep, is nearly filled. The man of whom I purchased, said, in recommendation of the farm, that it would keep twentyfour head, average stock of cattle the year round. I now find it will summer forty and winter fifty, besides one horse and thirty sheep.

PAOLI LA'RHOP.

S. Hadley Canal, 19th Oct., 1840.

#### MR WINCHESTER'S STATEMENT.

1. Farm consists of 124 acres; 66 acres of pasturing, 47 ploughing and mowing, and 11 acres of swail or meadow mowing.

2. Soil consists of clay, loam, peat or meadow mud and gravel.

3. Method of improving has been for thirty years past, to plough up sward land, plant it with corn and potatoes for two years, manure it so as to produce in a favorable season 100 bushels of corn,

(which I have in several instances obtained, and produced in one instance to the Society the certificate of the Selectmen of this town, that they personally harvested, weighed and measured over that quantity from one acre,) after which sow in the spring of the third year, some kind of spring grain with herds grass and southern clover seed, and have as yet failed in no instance of obtaining a succession of good crops of from two to four tons of hay from seven to ten years afterwards, before it would become exhausted. Lot No. 1, upon which my buildings are standing, contains about two acres—is principally occupied for mowing, and being so situated as to receive the wash from the cow yard and road, is never otherwise manured to produce two good crops of hay. Lot No. 2 contains three acres, has been broken up three times in 30 years, manured and planted six years, and produced three crops of grain and twentyone of field hay grass, before which it had been used for pasturing only. Lot No. 3 contains three acres; has been broken up three times in the last thirty years, manured and planted six years, three years grain and twentyone years hay—previously used for pasturing only. Lot No. 4 contains eight acres; has been subject to the same rotation of crops as before mentioned, except in the year 1816, it being then sward land, planted with corn, and losing the crop that year by frost, I planted but one year before sowing with grain and grass seed, and the sod or turf not being perfectly rotted, it became necessary to plough and plant again after having taken off only two crops of hay. This lot had been, a small part of it, used for the raising of rye only occasionally, previous to my occupying, thirty years since. Lots Nos. 5, 6 and 7 contain four and a half acres; purchased in 1813; it was then ploughed for the first time, and being new land it produced, after having been planted and manured for two years, and thoroughly rotted, more than four tons to the acre; lots Nos. 5 and 6 have produced one crop of wheat and six crops of hay, without any further manure from 1816 to 1823, then planted and manured again as above for two years, and in 1825 sown again with wheat, producing about 25 bushels to the acre, and grass seed producing hay, not equal in quantity to the first time sowing, but rather more than two tons to the acre: in 1833 again ploughed, planted and manured two years, sown with wheat in 1836, which up to near the time of ripening promised to be the best I have ever seen, when it suddenly blasted or mildewed, and produced almost a worthless crop, while lot No. 6 adjoining, sown with barley at the same time, produced over 50 bushels to the acre; both lots were then likewise sown with herds grass and clover, and producing ever since two tons per acre.

Lot No. 7 (about one acre) was sown with grain and grass seed in 1816, after having been planted and manured two years, and mowed every year for twenty years, till 1836, without any manure, at which time it had become so exhausted as to produce not exceeding half a ton to the acre, yet by two years planting and manuring, it has this present year produced two good crops of southern clover of more than three tons per acre.

Lot No. 8, containing three acres, (purchased in 1816, being then pasturing,) was planted and manured two years, and in 1819 sown with grain and grass seed, and continued in mowing till 1825, producing one crop of grain and five crops of hay; in 1825 ploughed, planted and manured two years, and in 1828 sowed with grain and grass seed, and

had one crop of grain and six of hay; in 1834 ploughed, planted and manured for two years; in 1837 sowed with grain and grass seed, and that year one crop of grain and three crops of hay since.

Lot No. 9 I obtained in 1824: it contains six acres; was ploughed and planted two years, sown with grain and grass seed in 1826, and produced one crop of grain and five crops of hay; in 1831 ploughed, planted and manured for two years, and in 1834 sowed with grain and grass seed, and produced one crop of grain and five crops of hay, except about two acres, which is planted this year, and the residue will soon need it, being land very much reduced before I had it, by sowing with rye and planting with corn alternately, without manure and yielding but little.

Lot No. 10 came into my possession in 1831, and contains 18 acres, all of which has since been planted and manured two years, at different times; three acres first ploughed produced two crops of corn, one crop of spring grain and six crops of hay; ten more acres produced two crops of corn, one of grain and four crops of hay; the remaining five acres two crops of corn, one crop of oats, and three crops of hay.

To recapitulate: from 1810 to the present time, 1840, I have ploughed, planted and manured, with corn and potatoes, 203 acres; 101 1-2 acres sowed with grain, and mowed and made into hay the grass of 594 1-2 acres. From the 47 acres of the 66 acres of pasturage named above, in 1817 fourteen acres was woodland newly cleared, burnt, harrowed and sown with rye and grass seed, and with one application of plaster of Paris has produced an abundance of feed ever since, but I have fed it closer than I would desire; for pasture land if designed to be kept exclusively for pasturing, ought never to have consumed more than half of what it produces in one year; but should be suffered to remain and grow up in bunches, which bunches will be the first grass to grow in the next ensuing season, which causes the cattle to commence feeding upon them, and they will continue alternately to feed one half the land in each year, if not driven to consume the whole by over stocking. The objection to consuming the whole in one year is, that where the whole is consumed annually, the deterioration is so great, that in a very few years less than one half the stock which the whole feed did keep, would be more than could be kept, and the fertility will be constantly diminishing, until the land becomes unproductive and worthless, if it is such land that it cannot be restored by the plough. Twenty other acres of land purchased in 1816, being hilly land, and two thirds of it covered with white birch, by clearing and burning and then sowing plaster upon it, the white honey suckle in every part of it exceeded my greatest anticipation and enabled me at once to increase my stock of cows from one to eight. It will be inquired, that if I kept but one cow from 1810 to 1817, from whence did I get manure? It was from the consumption of the hay and grain by travellers' horses, I keeping a public house; but as I believe I never bought a ton of hay in my life and seldom ever any grain, and having a better taste and faculty for farming than tavern keeping, I was not desirous of notoriety for the latter, any further than it assisted me in the former. The residue of the pasture land which I have possessed since 1831, has been ploughed, but not with the great effect before described.

4, 5 and 6. I have tilled from 4 to 10 acres in a

year—spread and harrowed in about 20 loads of heap manure, and 10 loads of well rotted manure in the hill.

7. I prefer ploughing green sward late in the spring rather than in the fall, for planting; but the difference between spring and fall is not more than the inconvenience of doing all the work in the spring; the best prepared green sward land for planting that I ever had, was by the use of Prouty & Mears's green sward plough, laying a furrow of 12 inches or more wide perfectly flat, and of the depth of inches, then rolling with a heavy roller, after which passed over with a heavy harrow once, with one or more yoke of oxen, and then passed over both ways with a cultivator and horse.

8. I mowed 74 loads of herds grass and clover this year from 37 acres, averaging from 1 1-2 to 2 tons per acre.

9. I have no land that is situated for irrigation that could be benefited by it.

10. Never manure any land I mow; consider the loss of the manure more than the worth of the hay; and choose not to have the droppings of my cattle beat to pieces to become dry and raked in among the hay, but let it remain untouched, and it will produce more grass, or else cart it off to the field, which I frequently do.

11. About 11 acres not suitable for ploughing, of meadow and swail hay, produced 19 loads, making 12 or more tons.

12. Three acres of a dead, worthless swamp, from which there was no outlet for the water until I sunk a drain for about 25 rods to the depth of from two to four feet, through loam and gravel land, which being done enabled me to plough, plant and sow with grass seed, which from present appearances is likely to produce as much as any land whatever.

13. Planted this season about four acres of corn; the kind of manure such as is made by the consumption of the produce raised, by neat stock, horses and hogs, applied after ploughing; spread and harrowed in about 20 loads in the green state, and 10 loads of fine rotted manure in the hill to the acre; planted about three feet apart every way, and hoed so as to make as little hill as possible; the product, 65 bushels to the acre.

14. Planted three acres with potatoes, on two of which I spread 20 loads to the acre of a compost made of about one tenth barn yard manure and the residue meadow mud upon sward land, producing 150 bushels to the acre.

15. Raised no other vegetables than potatoes; do not think that our climate is adapted to the profitable use of the root culture; believe that raw vegetables, in severe winter climates, given to cattle, produce a relax and weakness, which in a warmer climate no doubt is beneficial.

16. Sowed four acres with oats, about 2 1-2 bushels of seed per acre, upon land that I had the year previous planted with corn one year only, without grass seed, and only harrowed them in: produce 30 bushels to the acre; and one acre of barley producing 40 bushels.

17. This year sowed no grass seed; every other year I sow all the land I have in tillage with grain and grass seed.

18. The only means of making manure is by raising and consuming produce of hay, corn or vegetables by neat stock, horses and hogs, and the usual means of preserving it, by the free use of straw, worthless hay, loam or meadow mud, and

keeping cattle, horses and hogs well littered both in the stable and yard.

19. Five oxen, 13 cows, 3 two-year old heifers, 1 bull and 2 horses: one barn 62 feet long and 30 wide, cellar under the whole; a linter upon the south side of 10 feet in the barn, and a linter in the cellar of 10 feet, for the tying of the cattle under the bay in front of those above, and the manure of the two linters are thrown together underneath the cattle above. At the north-easterly corner of the cellar there is constant running water, which all the cattle when in the yard may have free access to. One other barn of 40 feet by 24, one barn of 30 feet by 60, and a third part of one barn holding 10 tons of hay, and one other barn I occupy, of 21 feet by 20.

20. My cows and bull are of my own raising, being mostly a mixture of native and foreign breed.

21. Calves raised by drinking milk, until I can get them to live upon grass, which will be in the course of 6 or 8 weeks.

22. Made only one seventh part of the milk into butter, and have no account of it; the residue of milk was sold, 3975 gallons, for \$396 76.

23. Never kept any sheep.

24 and 25. Formerly, before selling milk, I used to keep through the summer from 8 to 10 hogs upon the skimmed milk, and with a little additional expense in the fall, would make them weigh from 400 to 500 lbs. each: this year kept 1 sow and her 10 pigs, which are not yet fattened.

26. Hogs have free access to the cow yard, and lodge in a part of the barn cellar.

27. I have employed one man by the year and a boy for eight months, from the first of last April, paying them \$200; the residue is occasional help, for all which I have paid by the day, \$76 02.

28. My apple trees, were from three to seven years since, all natural fruit, during which time there may have been 200 or more engrafted with various kinds of fruit, but mostly Baldwins, so that year before last, for the first, I sold about 60 bbls. of apples and this year over 100 barrels. The residue of apples, amounting to about 100 bushels, grew upon trees not worth engrafting, and will be soon cut down. I have likewise set out 200 or more apple trees, some of which are flourishing and others are not.

29. Of peaches, pears and plums a comfortable supply.

30. Have never been troubled with canker worms since grafting the trees, and from observation am induced to believe that rotten, decaying apple trees are better suited to raise canker worms and caterpillars than apples.

31. No ardent spirit is used by any person while in my employ, to my knowledge and belief, nor have I found it necessary to make any contract for seven years past, that none should be used, other than what would arise from implication that I should find all the food and drink necessary to perform my labor; and if what I find does not suit, they must seek employ elsewhere.

In the year 1834 I left off keeping a public house, and in the winter of 1835 I kept 6 oxen, 2 horses, and 20 cows, and paid that year for labor about \$500, and sold, according to accounts then kept, as follows:

Cash rec'd for hay and straw,	\$437 39
‘ ‘ Potatoes, oats, barley and corn,	331 40
‘ ‘ Butter, cheese and calves,	474 11

‘ ‘ 3437 lbs. pork, not gain over cost of hog,	207 61
‘ ‘ Net gain upon beef cattle,	84 85

\$1535 36

In 1836 sold for cash and paid for labor, \$455 48.

Hay, potatoes, corn,	\$317 78
1347 lbs. butter,	317 84
14 calves,	125 79
Fat cattle,	218 30
2805 lbs. pork, at 12 cts.	336 60
83 lbs. do. at 11 cts.	9 13
1 pig,	12 00

\$1337 44

In 1837 sold for cash and paid for labor, \$349 88.

17 calves,	\$51 72
455 lbs. butter,	113 55
3309 gallons of milk,	579 39
Potatoes, corn, rye and hay,	392 93
Pork,	158 63
Beef cattle,	197 64

\$1493 86

For the three last years I have been unable to sell hay at such price as I consider advantageous; it has accumulated and remains undisposed of; and I have therefore no separate account of the three last years.

All which is respectfully submitted to the committee of the Trustees of the Massachusetts Agricultural Society for their consideration.

FITCH WINCHESTER.

Southboro', Dec. 21st, 1840.

For the New-England Farmer.

#### ENGRAFTING.

MR EDITOR—A small experiment in engrafting which I tried the last year, proved so satisfactory that I am disposed to communicate it to the public through your paper, hoping that others may try it the ensuing spring more extensively.

I had occasion to engraft a middling sized apple tree upon six branches, setting two scions in each branch. I cut down the scions to two buds each, and covered the upper ends of one half with engrafting wax, putting it on warm. They were set about the middle of April, and in all other respects their chances for growing were equal. About the middle of May leaves were entirely developed upon all those which were covered with wax, and not a bud had burst open at that time on those which were not covered, although they afterwards all leaved out and grew well.

It has seemed to me that the loss by evaporation from the upper end of a scion, might frequently turn the scale between living and dying, where it was so set as to receive but little nourishment from the stock, and in all cases the stopping of the evaporation may occasion an earlier and more vigorous growth.

Yours, &c.

R. NEWTON.

Worcester, Jan. 12, 1841.

The dog is the only friend in adversity who never forsakes his master when all the world have forsaken him.

Wear thy old coat till thou canst pay for a new one.

## NEW ENGLAND FARMER, AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, FEB. 24, 1841.

### HOWARD'S PLOUGH.

We furnish today a cut of this valuable implement. We believe there is none better than this. A premium was awarded to the manufacturer last autumn at Worcester, by the Massachusetts Society for the Promotion of Agriculture. Our name is appended to the report of the committee which made the award; and though we then most unhesitatingly joined in the awarding of the larger premium to Messrs Prouty & Mears, for the best plough for laying the *furrow flat*, (that quality being the one for which the premium was offered,) yet we believed then that for *strength*, ease of draft, excellence of work, combining (according to the setting of the cutter) both the flat and the lapping furrow, and for its adaptation to *all the different soils upon a farm*, this plough has no superior.

### SIXTH AGRICULTURAL MEETING AT THE STATE HOUSE.

Live Stock being again up for consideration, Mr Colman remarked, that as oxen and cows had been the subject of the principal remarks on former occasions, he would draw attention to horses, sheep and swine.

The improvements in the breeds of swine within the last forty years, he said, had been immense. A packer of pork, twenty years ago, said that the introduction of the small-boned breed had been worth hundreds of thousands of dollars to Massachusetts. He knows the history of the Byfield breed. An uncle of his residing in Byfield, was accustomed to do marketing in Newburyport, where, about the year 1790, he found an old woman with two small pigs for sale; these he bought—took them home; and from these the breed was formed. They may have been from the China hog, for the ships of the place were often bringing pigs from foreign ports. We have the Bedford breed, from the Duke of Bedford who sent out some as a present to Gen. Washington, but which were kept back for his own use; by the agent employed to make the present.

Capt. Mackay, of Boston, made selection of some good swine in England, which he brought to this vicinity, where they or a cross of them with our swine, bear his name.—There is the Moco breed of which he knows not the history, nor the import of the name.

Berkshires were brought to the neighborhood of Albany about eight years ago. There has been a more recent importation to New Bedford. Mr Cushing, of Wattertown, now has a fine boar of this last importation.—Some doubts are entertained as to the superior worth of the pure breed. As to their beauty of form and their thrift no doubts can exist. The hogs in the streets of Albany all look well. Some maintain that the pure bloods do not cut up well; that the pork is not as thick as would be expected from the appearance of the living animal. Mr Phinney, of Lexington, has crossed the Berkshire and Mackay, the Berkshire and Moco, and also the three kinds; his hogs are admirable, and so are Mr Cushing's. In the neighborhood of Boston, summer feed is so costly, that we cannot afford to raise pigs; but we can make *pork*. When pork is 6 cents per lb., it will pay 70 cents per bushel for corn, if turned into pork—so his experience teaches. Each hog if well supplied with material, will make ten loads of manure per year.

Gen. Low, of Boxford, keeps a few sheep. Though we cannot profitably keep many in Essex county, yet

he thinks it good economy to have a few on the farm; his are natives; they lamb early, and the lambs at four months old will bring from \$3 50 to \$4 per head. If well littered, sheep will make much and good manure. Sheep will kill out white weed from the pasture. Well fettered, they give him no trouble.

Col. Jaques gave us the points of a good horse. We were unable to follow him with accuracy, and shall ask of him the favor to pen his own remarks for us. They are too important to be lost, and too important to be mutilated by an imperfect report.

Cousin Tim, when in the neighborly routine he must raise a bull, retains the calf which the butcher would not take as a gift; raises him; and Jonathan's, Tom's and Tim's cows are all served by this miserable runt, and he becomes the sire of the next generation of cows in the neighborhood. Thus too many of our farmers breed.

So far as relates to the Berkshire swine, he has been merely a looker-on. Has received intimations that they do not open well. (Here Mr French, of Braintree, inquired whether any pure Berkshire had ever been slaughtered in this neighborhood?) Col. J. did not know; he had nothing on the subject but hearsay.

No writer on the subject of breeding *in and in* had ever taken ground that was precisely in accordance with his experience. He has put the father on the daughter, and also has bred from brother and sister. His progeny has been vigorous and fine. In 1816 or '17, the Fill pail breed was put on Breed's Island, and there they have been breeding for more than twenty years, without a drop of blood from any other race, and yet the calves are healthy and vigorous, and the whole stock is improving. He is not prepared to discuss this subject thoroughly. By breeding *pigs* from brother and sister, you are very liable to get in the same litter every variety of form. The practice is to be avoided. Swine should be crossed; you may as well talk of a breed of earthen jugs as a breed of swine: they may be moulded to your taste.

The Saxony sheep are well suited to the warmer climate of the south and west; but for New England, the South Downs are to be preferred. He has a flock, very fine; they give him no trouble; are very easy to take on flesh; and yield about four lbs. of wool each.

Mr French inquired if he could tell the average yearly quantity of milk from a cow of his Cream Pot breed?

Col. J. replied that his calves usually take the milk for 3 or 4 months, and that he has not data from which he can fully answer the inquiry. The greatest quantity from a cow in one day was 21 quarts. His good cows when on grass, will not average more than 16 or 17 qts. At this season of the year, those that calved in December and are fed on hay and one half bushel of sugar beets, give 12 quarts.

Mr Cole, Editor of the Yankee Farmer, wished to notice two principles of breeding. One, that like produces like, both with animals and vegetables. Where two kinds mix, it takes a considerable time for their peculiar properties to become thoroughly blended and fixed. Longer with animals perhaps than vegetables; for imagination may in the latter case have an influence. He cited an instance in which it is supposed that the looking upon an ox of peculiar color, by a cow, gave the same color to her calf.—Which sex has most power in giving character to the offspring? It is often said that the male has, but he believes that it is the parent which has the purest blood; our bulls are often more thorough bred than the cows, and when this is the case, the qualities of the bull will predominate in the calf. But in Arabia, where they pay much attention to the blood of the *mare*, the colt is like the mother.

Which sex fashions the sex of the offspring? Experi-

ments in France have shown that the most vigorous parent gives the sex. Where the ewes are young and weak, while the ram is vigorous, the lambs will be mostly males. But where the ewes are strong and vigorous, while the ram is young or feeble, the majority of the lambs will be females. Parents produce their peculiarities in the opposite sex. Sons are like the mother—daughters resemble more the father. He thinks this is seen in the human race.

In crosses, the male should be smaller than the female. If the male be larger, the female will suffer, and the offspring is likely to be large, and to lack nourishment. Mr Collins, in producing the improved Durham, reduced the large Teeswater by taking a smaller bull.

Mr Weld, of Sturbridge, stated that when a farmer asks what stock is best, he should take into account the character of his farm. If the pasturing be poor, sheep will be good stock. He keeps a flock of mixed breed, 3-4 or 7-8 Merino; winters on low land hay, if the ground is covered with snow; but if the winter is open, gives either better hay or some grain. Gets from each 3 to 3 1-2 lbs. of wool, and loses very few lambs. Merinos or mixed are the best where wool is the principal object.

Let a man think of the quality of his farm when he would judge what breed of cattle is best. Our native stock is as good as any for most farms; though this stock should be improved. Select the *best* calves for raising. The best have much activity. If one is dumpyish he is not fit to raise. You may not be able at first to judge what a calf will be, but let it suck a month, and you can tell something about it. He gives his calves new milk, and thinks it best to have them get a good growth the first year.

Col. Jaques has tried various experiments for ascertaining whether the inferences from the experiments in France, stated by Mr Cole, are correct; but has never been able to find any thing that enables him to anticipate that the offspring is in any given case more likely to be of one sex than the other.

### LARGE HOGS.

Weight of 15 Berkshire and Mackay hogs, sent to market 22d February, 1841:—738 lbs.; 655, 579, 574, 556, 528, 523, 517, 503, 501, 487, 480, 476, 441, 400—aggregate weight, 7958 lbs.; average weight, 530 1-2 lbs.

MR PUTNAM—Dear Sir—Above you have the weight of a sample of my Berkshire and Mackay pigs. Some of those weighing over 500 lbs. are but 15 months old.

Yours, very truly,  
22d Feb. 1841.

E. PHINNEY.

[We are reluctant to add a bristle's weight to the burden of labors that rests upon the shoulders of the clerk of the courts in Middlesex; but if Mr Phinney can favor us with a statement of the breed, cross, age and keep of the several *pigs* in this sample, he may lead us and the public to some valuable inferences.—Ed.]

*Large Ear of Corn.*—There has been sent us, by Dr. Blanden, of Columbia, S. C., an ear of corn, (the Horse Tooth, we believe,) which, though *very dry*, weighs 1 lb. and 4 oz.; is 10 inches long, 2 3-4 in thickness, has 26 rows, and 55 kernels in a row—1430 kernels.

We will thank "A Plain Farmer," to make himself known to us. We want to show him some *silken* chains of argument that have been spun and sent us, for his and our entanglement.

Dr. C. T. Jackson is expected to address the farmers at the State House tomorrow evening, on "Soils and Manure."

[*Erratum.*—On the first page of this day's paper, (article "Agricultural Chemistry,") third column, 12th line from bottom, after the word "vegetation," the paragraph should read as follows:—thus it is thought that

seeds have the power of decomposing water and converting it for their use into its component parts, oxygen and hydrogen; and that the nitrates are made to surrender a portion of their nitrogen, &c. the same with ammonia.

### THERMOMETRICAL.

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northern exposure, week ending Feb. 21.

Feb. 1841.	7A.M.	12, M.	5, P.M.	Wind.	
Monday,	15	8	16	12	N.
Tuesday,	16	14	29	26	S. W.
Wednesday,	17	23	32	20	E.
Thursday,	18	8	23	18	N. E.
Friday,	19	26	40	34	W.
Saturday,	20	14	30	26	S. W.
Sunday,	21	32	46	42	S. W.

### BRIGHTON MARKET. — MONDAY, FEB. 22, 1841.

Reported for the New England Farmer.

At Market 205 Beef Cattle, 615 Sheep, and 90 swine. About 30 Beef Cattle and all the swine have been before reported.

**Prices.**—Beef Cattle—We advance our quotations to correspond with sales. We noticed a beautiful large Cow from Worcester County, sold for about \$100. We quote a few extra \$6 75 a 7 00. First quality \$6 25 a \$6 50. Third quality, \$4 75 a \$5 75.

**Sheep.**—Lots were sold at 2 50, \$3 50, 4 25, 4 75 and \$5 00.

**Swine.**—No lots were sold to peddle, and a very few only were retained from 4 to 5 1-2c.

### WHOLESALE PRICES CURRENT.

Corrected with great care, weekly.

**SEEDS.** Herds Grass, very little in market. Red Top, by the bag 60 to 70 c. Clover—Northern, very little in Market.—Southern, plenty, 9 to 10 c. Flax Seed, \$1 37 to 1 50 bu. Lucerne, 25 c. per lb.

**FLOUR.** Howard Street \$5 37—Genesco \$5 31—Ohio \$5 12.

**GRAIN.** Corn—Northern Yellow 50 to 61 c—Round Yellow 57 to 58—Southern Flat Yellow 55—White 53. Rye—Northern 60 to 65—Southern 50 to 55. Oats—Southern 23 to 32—Northern 35 to 40.

**PROVISIONS.** Beef—Mess \$10 50 to 11 00—Prime \$6 50—No. 1 \$9 00. Pork—Extra—15 00—Clear 14 50—Mess \$13 00. Hams—Northern 9 c. per lb.—Southern, none. Lard—Boston 9 c per lb.—Southern, 8 to 8 1-2. Butter—Lump 18 to 22—Firm 12 to 18—Shipping 8 to 14. Whole Hogs 5 1-2 to 6 c.—Pigs 5 c.

**HAY,** per ton, \$17 to 17 50—Eastern Screwed \$13 to 14

**CHEESE**—Old 11 c.—New 8.

**EGGS,** 16.

**POULTRY**—Chickens 10 to 12 1-2 c. per lb.—Turkeys 10 to 11—Geese 7.

**WOOL**—The market for this article has not experienced any change of late. Pulled Wool is rather scarce, and there is but a limited supply of low Fleeces and of fine Fleeces the stock is also moderate. Prime or Saxony Fleeces, washed, lb. 50 to 55 c.—American full blood, washed, 47 to 50—Do 3 4 blood, washed, 44 to 46—Do. 1-2 blood, washed, 36 to 40—1-4 and common do, 35 to 37—Smyrna Sheep, washed, 20 to 23—Do. unwashed, 10 to 14—Bengasi Sheep, 8 to 10—Buenos Ayres unpicked, 7 to 10—Superfine Northern pulled lamb 43 to 46—No. 1 do. do. 37 to 42—No 2 do do 26 to 30—No 3 do do 18 to 20.

### A SMALL FARM FOR SALE,

Situated in Braintree, ten miles from Boston, with a Dwelling House and large Cider mill thereon. The farm contains about 20 acres. Inquire of

NATHANIEL FAXON,  
No. 53 North Market Street.

Feb. 24.

### AN OX WAGON AND OX CART

Nearly new, for sale by JOSEPH BRECK & CO., Inquire at No. 62 North Market Street, or at their Farm in Brighton. Feb. 24.

### BERKSHIRE BOAR AND SOW.

The subscribers offer for sale a full blood Berkshire Boar and Sow, 18 months old, which they purchased a year since from N. C. Bement, which he warranted to be pure. Feb. 24. JOSEPH BRECK & CO.

### WANTED,

An experienced Gardener, to whom liberal pay and constant employment will be given. Inquire in this office. Feb. 24.

### HOWARD'S IMPROVED EASY DRAUGHT PLOUGH.

Great improvements have been made the past year in the form and workmanship of these Ploughs; the mould board has been so formed as to lay the furrow completely over, turning in every particle of gross or stubble, and leaving the ground in the best possible manner. The length of the mould board has been very much increased, so that the Plough works with the greatest ease, both with respect to the holding and the team. The Committee at the late trial of Ploughs at Worcester, say,

"Should our opinion be asked as to which of the Ploughs we should prefer for use on a farm, we might perhaps say to the inquirer, if your land is mostly light and easy to work, try Prouty & Mears, but if your land is heavy, hard or rocky, begin with Mr. Howard's."

At the above mentioned trial the Howard Plough done more work, with the least power of team, of any plough exhibited—no Plough doing over twentyseven and one half inches, to the 112 lbs. draught, while the Howard Plough done twenty-nine and one half inches, to the same power of team! All acknowledge that Howard's Ploughs are much the strongest and most substantial made.

There has been quite no improvement made on the shoe, or land side of this Plough, which can be renewed without having to furnish a new landside; this shoe likewise secures the mould board and landside together, and strengthens the Plough very much.

The price of the Ploughs is from \$6 to \$15. A Plough, sufficient for breaking up with four cattle, will cost about \$10 50, and with cutter \$1, with wheel and cutter, \$2 50 extra.

The above Ploughs are for sale, wholesale and retail, at the New England Agricultural Warehouse and Seed Store, Nos. 51 & 52 North Market Street, by JOSEPH BRECK & CO.

Feb. 24.

### PEAR, PLUM, GRAPE VINES, & C.

3000 Pear Trees, of the most approved kinds.  
2000 Plum Trees, of the most approved kinds and extra size—many of them have borne this season.  
Apple, Cherry and Peach Trees, of different kinds.

500 Quince Trees.  
4000 Isabella and Catawba Grape Vines, from 6 to 15 feet high; most of them have borne fruit. Black Hamburg, Sweetwater, Pond's.

30,000 Grant Asparagus Roots.  
Gooseberry, Currants, Raspberries, of good kinds.  
5000 Wilmot's Early Rhubarb or Pie Plants, lately introduced.

2000 Cherry and Pear Stalks; 1000 Plums; Roses, &c. of all kinds.

All orders sent to the subscriber at Cambridgeport, will meet with immediate attention.

SAMUEL POND.

Cambridgeport, Mass., Feb. 24.

### GARDEN SEEDS,

For sale by JOSEPH BRECK & Co. at the NEW ENGLAND FARMER OFFICE, No. 51 and 52 North Market St. Boston. The subscribers would inform the public that they have now on hand the largest collection of seeds ever before offered by sale in this city, embracing every variety of Field, Kitchen, Garden, and Ornamental Flower Seeds desirable for this or any other Climate.

Our seeds are either raised under our own inspection or imported from responsible houses in Europe, and having taken extraordinary pains to obtain such as are pure and genuine, we can confidently recommend them to our customers and friends, and feel assured they will prove satisfactory to all who try them.

Dealers in seeds are requested to forward their orders in season. Boxes for retailing from 8 dolls. and upwards will be sent out on commission allowing a liberal discount and take back what remain unsold.

Letters and orders with good reference will meet with prompt attention.

### FIELD SEEDS.

Sugar Beet.	Ruta Baga.
Mangel Wurtzel.	Ballatine's New Royal do.
New Red Globe do. } superior	White Tankard Turai.
Yellow do. } varieties.	Red do.
Carrot Long Orange.	Red Round do.
" Altringham.	White do.
" New White, extra fine.	White Globe do.
Pumpkin, sorts.	Green Round do.
Wheat—various sorts.	Purple Top Hybrid do.
Barley, do.	Buckwheat.
Rye, do.	Broom Corn.
Potatoes, do.	Millet.
Indian Corn, do.	Buckthorn. } for Hedges.
Oats, do.	Locust.

### GARDEN SEEDS.

Artichoke, Asparagus, Beans of every description, Beets of sorts, Borecole, Broccoli, Brussels Sprouts, Cauliflower, Caraway, Celery, of the most improved sorts, Cabbage 20 sorts, Carrot, all the varieties, Cucumber do, Cress, Egg Plant, Endive, Indian Corn, Kale, Leek, Lettuce in great variety, Melons, do. Martynea, Mustard, Nasturtium, Okra, Onion of sorts, Pepper do. Pumpkin do. Parsnip, Parsley, Peas, a very great variety, Rhubarb for tarts, Radish of sorts, Salsify, Squash of sorts, Tomato, Turai 20 varieties.

### SWEET AND POT HERBS.

Thyme	Sweet Basil.
Sweet Marjorum.	Lavender.
Sage.	Lemon Balm.
Summersavory.	Anise.
Medicinal Herbs, &c.	

### ORNAMENTAL FLOWER SEEDS.

Three hundred varieties, embracing all the finest sorts. Packages of 20 fine sorts for one dollar.

Those who prefer to have their Seeds put up to papers ready for retail, can be accommodated—each packet neatly closed and labeled with printed directions. Price 50 cents, per dozen papers, which are retailed here at 6 1-4 cents each.

Fruit and ornamental trees, of the greatest variety, supplied at nurseryman's prices, and orders solicited. These will be packed, when required, to go to any part of the U. States.

JOSEPH BRECK & CO.

Boston, Jan 27, 1841.

### WHITE CARROT.

A quantity of this new and valuable root is offered for sale at the New England Agricultural Warehouse, No. 52 North Market street.

Also—New Red and Yellow Globe MANGEL WURTZEL—considered a superior variety.

Feb. 10.

JOS. BRECK & CO.

### GRINDSTONES.

An extensive assortment of Water and Hand Grindstones constantly on hand and for sale by AMMI C. LOMBAKID & CO. 13 Lewis's Wharf. Feb. 10. Nov. 17.

## MISCELLANEOUS.

## GOING TO ———

Yes, there are some men, and farmers too, that are always *going to*—but never do it. In the circle of my acquaintance, I know of one farmer that has not a single edged tool on his premises, except axes and scythes, and yet he has been *going to* get a set of carpenter's tools for more than ten years. Another, and a large farmer too, that does not own a roller, but for five years past has borrowed one of his neighbor four or five days in each year—probably to satisfy himself as regards its utility as a farming implement. Another has not, but is always *going to* get a cart rope, and a set of pulley blocks. Another is *going to* get him a set of dry measures, though he sells more than a hundred bushels of fruit and grains annually. Another, and this man has *always been going to* burn dry wood after this year, but he never has done it. And singular as it may appear, one man that has been *going to* build him a better hog-pen than the one in which he now keeps his swine, and he has been *going to* for fifteen years. And there are many farmers that have been *going to* have better fences, better gates, better crops, and better stock, until I think they are now either really *going to* do it, or that they are sadly deficient of that energy and decision of character that should characterize every American farmer. And finally, I know of one man, who is almost deficient of every article and farming implement above named; and if I was *going to* tell you the reason, I should say, this man has been *going to* stop drinking ardent spirits for a long time. But judging from the looks of his farm and from his own most wretched personal appearance, I should say that this man, with rapid strides, was fast *going to* ——— [Farmers Gaz.]

From the same.

## THEY DON'T WORK IT RIGHT.

When I see a farmer in health, who sleeps after sunrise in the morning, I am fearful *he don't* work it right. And if he does not get an early breakfast then *she don't* work it right. And immediately after, if every tool is not ready for the workmen, and the work cut out for the day, then *he don't* work it right. And if the old horse must be got up before noon to haul the old wagon with the good lady, five eggs and a pound of butter, to market five days out of seven, then *she don't* work it right. If all hands, including the farmer's sons, are allowed to stop work at eleven, to *drink rum* and tell *long yarns* for half an hour or more, *he don't* work it right! Or if the daughters are allowed to *spin street yarn* through the day, then surely *she don't* work it right! And if the farmer is not adding, year after year, to the value of his farm, to the weight of his purse, and greatly to his stock of general information, it must be because *he don't work it right* in neglecting to take and *pay* for one or more agricultural papers. LEXOS.

*Excellent hints to Mechanics.* "Avoid giving long credits, even to your best customers. A man who can pay easily will not thank you for the delay, and a slack, doubtful paymaster is not too valuable as a customer to dun sharply and seasonably. A fish may as well attempt to live without water, or a man without air, as a mechanic without punctu-

ality and promptness in collecting and paying his debts. It is a mistaken and ruinous policy to attempt to keep on and get business by delaying collections. When you lose a slack paymaster from books, you only lose the chance of losing your money—and there is no man who pays more money to lawyers than he who is least prompt in collecting for himself.

*WE DID NOT SAY SO.*—Upon taking up our last number, the eye hit upon this paragraph:

"He who borrows from a friend generally has to pay a dollar's worth of acknowledgements and friendly acts for every cent he lends you."

This is not ours—neither its sentiment nor its grammar is ours,—it is not ours either by birth or adoption. How it came where it stands we know not. There is in every printing office a fellow whose name is *prima facie* evidence that *he* might be guilty of the deed. We put it upon him; and for his instruction we will tell him, that he who borrows of a *friend*, generally can pay all demands against him, by simply *returning, agreeable to promise*, what he has borrowed, and saying *I thank you*. And for the further instruction of said culprit, we will add, that he who borrows of an *enemy*, does much towards making that enemy his *friend*.—Ed.

"*WE DID NOT SAY SO.*"—To the Editor: The compositor, though not now filling the situation in the printing office of the "fellow" to whom you allude, is perfectly willing to assume his mantle and "take the responsibility" which you would impose upon him, in regard to the obnoxious paragraph. He owns himself "the culprit," so far as this: he put the paragraph where it is—so far only is he culpable: the sentiment is none of his conception, nor is the grammar of his manufacture. Being in want of a few lines to fill out a column—(no small pieces being furnished by the editor for this purpose)—and withal in a great hurry at the time, he found, in a newspaper, the paragraph in question, and without stopping to consider the correctness of its sentiment or the propriety of its grammar, used it for the purpose mentioned. He trusts this statement of the circumstances will induce you to believe that "the culprit" was not influenced in the transaction by any of those motives which you seem to think *the character he assumes* might warrant; and also, that he is not so much of an ignoramus in grammar, as to be unable to detect so flagrant a violation of its rules as the one to which you allude. With the utmost deference to your erudition, he would assure you, that though editors may be presumed to know *everything*, there are *many cases* in which that much abused "fellow" of the printing office you refer to, *can correct THEIR grammar*.—Sincerely thanking you for the excellent advice contained in your reprimand, (and likewise for that copy of "Lacon," from which to obtain small paragraphs in future,) permit me, respected sir, to subscribe myself

Your humble co-worker

In the dissemination of knowledge,  
THE "D——L."

The following toast was lately given at a celebration in Milwaukee, Wisconsin Territory:

"The Banks of Wisconsin—(the Mother Earth)—The more they are broken, the better dividends they pay."

## POUDRETTE.

This valuable manure may be had on application to the subscriber, at the office of the "New York Poudrette Company," No. 120 Nassau street, New York. It is *in-odoriferous*, and may be transported in barrels, on board of any vessel or steamboat, without offence—and it will be found an exceedingly valuable article as a *fertilizer on any soil*, and for *any crops*; but more especially for gardens and flowers, as there are no foul seeds in it. Poudrette has been used for three seasons with entire success on Long Island, by many practical farmers, as may be ascertained from letters and statements made by them, and published at this office in a pamphlet containing also the "act of incorporation," granted to the Company by the Legislature of the State of New York; and other facts in relation to the subject. Price 35 cents per bushel. Barrels cost 25 cents each, and hold 4 bushels. Persons wishing to make an experiment on a small scale can obtain one barrel by enclosing a two dollar current bank bill—or three barrels by enclosing five dollars, free of postage. On receipt of the money the article will be put up and forwarded as directed.

\* Price of shares, one hundred dollars—which entitles the holder to one hundred bushels of poudrette annually, during the term of the charter; fifty bushels in time for spring use, and fifty bushels in time for fall use. Shares taken soon, will be entitled to the spring dividend—and, if desired for experiment, a few bushels may be had this fall.

All orders, or applications in relation to the business, must be made to the subscriber, 120 Nassau street, New York.

D. K. MINOR.

I wish it distinctly understood that the "New York Poudrette Company" is in no way connected with the "Lodi Manufacturing Company," of which Anthony Dey and Peter Barthelmy are, or were, the managers.

Dec. 9, 1840.

D. K. M.

## POUDRETTE.

The subscribers reside in the state of New Jersey, many of us in the vicinity of the works erected by Anthony Dey, of the city of New York, on the Hackensack river, in New Jersey, for the manufactory of Urate and Poudrette, called "The Lodi Manufacturing Company." We have used the poudrette on the Spring Crops this year, 1840. We find it a valuable manure, superior to any other kind that we have ever used, and considering the facility of its transportation to the field, the small quantity required in the application to the crops, the quickness of its operation on vegetable matter, and the ease with which it can be applied,—all tend to recommend its use to the farmer and gardener as the cheapest and best manure, and we recommend it accordingly.

Those of us who have applied it to corn and potatoes think that it ripens those vegetables quicker than any other manure by several weeks.

Dated New Jersey, October, 1840.

Shares in the above company are \$100 each, and may be had by applying to Anthony Dey No. 73 Cedar St. New York.—The owner will receive 20 per cent. per annum, payable in money, or 50 bushels of Poudrette. The price to those who buy Poudrette is 40 cents a bushel. It costs the Stockholders 12 cents a bushel. One cents worth, that is, 20 Gills, will manure 20 hills of corn, and the like quantity 15 hills of Potatoes.

Newspapers friendly to agriculture will confer a favor on the Farmers and Gardeners by publishing the above.

Dec. 22.

## NEW FLOWER SEEDS.

The subscribers have received from London a choice collection of Flower Seeds, which, with those raised by themselves, constitute all worthy of cultivation. Price from 6 1-4 to 25 cents per paper. Assortment of these marked 6 1-4 cents, 20 papers for one dollar, and others in the same proportion. JOS. BRECK & CO.

Feh. 10.

## NEW ENGLAND FARMER.

A WEEKLY PAPER.

The Editorial department of this paper having come into the hands of the subscriber, he is now authorized by the publishers to inform the public that the price of the paper is reduced. In future the terms will be \$2 per year in advance, or \$2 50 if not paid within thirty days.

ALLEN PUTNAM.

N. B.—Postmasters are required by law to frank all subscriptions and remittances for newspapers, without expense to subscribers.

Mr Geo. Tappan is our agent at New Bedford, Mass.

### THE POTATO.

*Quere.* Is the potato a root? The dictionary to which we were wont in our childhood to be referred for information, insinuates that it is; nay more, gives us to understand that it may be eaten; but whether raw, after the manner of the groundnut, or seethed, or baked, or roasted, it saith not. Yet as man is omnivorous—meaning, we suppose, eating all things (if he can,) a most consolatory doctrine to the anti-Grahamists—it is for him to decide how and when this root-fruit shall enter into his viands. Botanists have heretofore supposed that the potato was a species of *Solanum* producing a small tuber, and which, under cultivation, has been improved into the varied kinds and sorts of the present day. Bot botanists, like all other philosophers, may be wrong at best, as has been verified in one kind of potato, the gilliflower, which originates on the stem of a garden posy.

Once we (who have an inkling for the curiosities of nature,) did actually see with our own eyes, little potatoes growing on the stems of a small trailing plant in a greenhouse collection. After looking all about the fine lot of geraniums and roses, and such flowers, the proprietor showed us, in a deep flower-pot, filled with light, rich earth, the above mentioned plant. Both he and we considered it not only a great curiosity, but exceedingly interesting. We did not perceive any blossoms on the plant; but perhaps the production of so useful a root (?) was considered by dame nature more than a compensation for mere posies—a thing by no means without some support, for we believe (and we live in the country and near farms,) that there are varieties of potatoes even, which never have any blossoms; and good potatoes they be too, at bottom.

From these and similar observations, we have come to the conclusion that the dictionary-men were wrong in attributing to potato the signification of root; and we here hold up our protest against book farmers, while talking about the root culture, to include the potato. We think, and we entertain some doubts whether it be our own discovery, (for every one should be modest in these days of science,) that the said vexed potato is not a root, but a mere swelling of the stem. We know that the sap in descending accumulates into the woody parts of plants. Now in going down, it may accumulate into potatoes. Why not? And perhaps nature did not mean that the potato should be eaten, but only intended it as seed; for we know that farmers do actually call a part of the crop *seed potatoes*, and cutting them into little pieces, raise others from them. Herein they do just as gardeners and the ladies do when they cut up a stem of a rose bush or geranium to have a greater number. Now it does not matter a whit, whether this stem grow under the ground or above it, because we find that other plants sometimes have stems under ground. And we also think that the potato is

a swelling or knot of the returning sap on the stem, as every one has seen that those potatoes which grow out of the hill, are green and bitter, and taste so like the stem itself that even pigs will scarcely touch them. Besides, we have seen on such potatoes little green leaves growing out of the eyes, which can therefore be nothing more than the buds of that part of the stem.

Things are not always called by right names. Can potatoes be roots? We opine they are not. If they be warts on stems, on what stems? We do not decide. Facts are stubborn things. 'Tis enough that we admire nature as she is: to peep into her ladyship's mysterious operations, belongs rather to those nature-men, who are always studying about grasses and mosses and creeping things, than to people who are contented to eat a good potato when they can get it, caring not whether it grow on trees or in the cold ground. At any rate, in such a case they can ask the farmer who raises it and brings it to market, and our word for it, he knows more about the matter than the whole of us.

VERB. SAT.

For the New England Farmer.

### ABSORPTION OF WATER.

A beet, carrot and flat turnip are growing in bulb glasses on our mantel, sustained only by pure water. They are nearly of equal size and weight. The difference in the quantity of water they each consume is, however, striking. Thus the beet, whose foliage is not expanded to a sixteenth part of its proper size, is a great water toper, and its *blood red* root and fibres exhibit its intemperate habits, "after the manner of men." The turnip next sucks away to such a purpose as to give one a tolerable mess of greens; and young turnip tops are good in that way. The carrot, the prettiest by far, drinks the least. Its foliage is long, rich and green, and its fibres of snowy whiteness. Does this experiment explain any fact in culture? The beet is a gross feeder and succeeds best in moist land; the flat turnip is generally sown and takes advantage of the autumnal rains; but the carrot, will it do well in comparatively dry summers?

GLENER.

For the N. E. Farmer.

### THE PROPER CONSTRUCTION OF BARNES.

There is no building of more importance to the farmer than a good, well-constructed barn; yet many do not seem to realize the advantage they would have by possessing one built on the most improved and convenient plan. I did not myself, until I pulled down my old barns and built anew. But I am now confident that I save at least fifty dollars a year by keeping the manure which is made in the cellar, directly under the cattle's stall, besides many other conveniences which the too common mode of constructing barns does not admit of. I will give you as good an idea of the construction of my own as I can, and then leave it

with your readers to judge whether it be worth any thing for a pattern or not. The ground on which I set my barn was nearly level, but with the aid of a plough and scraper I soon took out a place large enough for a cellar by digging down four feet and then setting my barn three feet above the level of the ground around it, which gives me a cellar seven feet in depth; the bottom of the cattle yard should be sunk nearly or quite as low as the bottom of the cellar; it is very desirable therefore to have the ground, on which to set a barn, slope a little, that the bottom of the yard may not be much lower than the land surrounding it; and, where it is possible, the yard and cellar should always be on the south side of the barn: it is not very essential to have a cellar under the whole width of a barn, unless the back side of it is wanted for carrots, &c., in which case it may be walled off and made secure from frost. My cellar is under only 23 feet of the width of the barn.

My barn is 55 feet in length and 38 feet in width and 15 feet posts. I divide the width by taking off 12 feet for the cattle stalls and 11 feet for floor room, which leaves 15 feet for hay; and having the floor pass through lengthwise makes it very handy unloading hay, and in winter it is likewise very handy to feed out: for a very large barn it might be well enough to have the floor 12 feet in width, but the narrower the floor is the better, providing it be wide enough for the loads you wish to draw in. I would not on any consideration build a barn more than 38 feet in width; first, because it is not so convenient; second, because it requires the rafters to be too long in order to give the roof a right pitch, which should be one quarter at least, even a little more is better; and third, because a barn does not look so well proportioned, unless it be an hundred feet long or upwards. Neither would I have a barn higher on any account than 15 or 16 feet posts, though many are built 18 and some 20; but it is strange that any one should build so high, if they did but calculate how much it costs to get their hay and grain up so high, and then to get it down when wanted: why I have seen six men employed at the same time in unloading and stowing away one load of hay, pitching it up from one mow to another; but it is much more convenient to have the room in the length than to build so high.

It is a very great and beneficial improvement in building barns to have them shingled down the sides as well as the roof; the extra expense is not so much as many people are ready to imagine, as there is a very considerable saving to be made in the quality of boards and nails where shingling is practiced: besides it keeps a barn warm and the frame dry, and the boarding is not warped by the sun and rain; therefore I think there is no loss but considerable gain in the end by shingling the sides.

Another exceedingly convenient improvement is, having a number of glass windows (about six lights of 6 by 8 glass in each) in the side of the barn directly behind the cattle, which will admit the light without admitting the cold winds and storms: there is not so much danger of their get-

ting broken as some might think, by the cattle going out and in. I have used nine two years nearly, and not a single light has been even cracked. (The manure made by the cattle in their stalls is not thrown out of the windows, but is let down through the floor into the cellar.) There should likewise be two rows of lights over the great doors and a window in each end near the ridgepole, that is if your barn is to be 50 or an 100 feet in length.

### BERKSHIRE AND CHINA SWINE.

Ma EDITOR—Under this head I noticed in the 32d No. of the Farmer, some remarks on the Berkshire swine in your vicinity, as being a cross between the black hog and alligator; being "miserable feeders, and gaining less than half a pound a day on good feed." Now, Mr Editor, if the Berkshire hogs in the vicinity of Boston are of the kind described by "A Beginner," they do not "begin" to be like what we call Berkshire here. Mine are from Bement's stock at Albany. They do not resemble the alligator, unless he be a very quiet animal. In form they resemble the very best of the "pig-ships," and as to "moonshine," they only resemble that when the hair is off, which leaves a fine white skin, which resembles somewhat the moon's light rays. As to gaining on good food half a pound a day, I tried one in the summer of '39, which weighed 74 lbs. to commence with; and at the end of 14 days it weighed 100 lbs., being 26 lbs. gained in 14 days—the food not the best. A pig which I thought not fit to breed from, I fattened for experiment the same season: whole cost of keeping \$14, (corn being only \$1 per bushel at that time);—weight at ten months old, 270 lbs.; price 7 cts. per lb. Last fall I fattened a full blood Berkshire at the usual age of fattening here, (about 18 months.) I fed him on corn meal alone for near two months; he consumed one bushel in nine days; weighed when dressed 474 lbs. I also fed several three fourths Berkshire, one fourth white China, all were good feeders, put on flesh well, and when killed were fatter than any hogs I have ever fattened destitute of Berkshire blood, although I have tried the razor back, Byfield and many of the improved breeds. If, however, I wanted a hardy hog, a good feeder, and one that would put on the most flesh, on a given portion of food, and was satisfied with a hog of 300 or 350 lbs. weight, I would prefer three quarters Berkshire, one quarter White China, to any other breed with which I am acquainted; but if I wanted a good feeder, a hardy hog, and one that would weigh from 4 to 500, I would take the full blood Berkshire. As "A Beginner" would be satisfied with a three hundred hog, I would recommend the cross named, and think by commencing with it, and selecting his whitish pigs to breed from, obtaining occasionally one from another family to prevent breeding in and in, I think he would soon have "white hogs to his mark." But why does "A Beginner" abominate black? If he is an anti-abolitionist, be it known unto him that the Berkshire has not a black skin. Many of our best men have black hair, and wear black coats: why may not a hog do the same without committing an abomination? especially since men do not eat bristles, and if they did, it is not likely there is a difference between the taste of a black and a white one.

ONE WHO PREFERS Form to Color.

West Thompson, Ct., Feb. 14, 1841.

From the Albany Cultivator.

### COMPARATIVE VALUE OF PIGS FOR CUTTING UP.

That there is a very great difference in the value of pigs of equal weight, when fattened and killed, is known to every buyer and packer of pork, and should be well understood by every farmer. There are certain parts of a hog, such as the hams, lard and mess, much more valuable than other parts, such as the head and feet, and those hogs which give the greatest weight where it is of the most value, other things being equal, are the best animals for both seller and buyer. Weight, however, without reference to the place where it is found, is generally the standard of value, and a hog that will weigh three or four hundred, even if one third of it is in the head and legs, is by many considered first rate. A breed of hogs then, having large hams, thick sides that lard well, with short necks, small heads, and slender legs and feet, is the one which is to be preferred, if there is sufficient weight of carcass and aptitude to fatten. Perhaps with an exception in a single point, (that of weight,) the Chinese hog comes nearer the standard of perfection than any other; and this defect in size, while the other valuable points have been retained, has been best corrected, we think, by the cross with the Berkshires. The great thickness of these hogs gives a weight of ham unequalled in any other, and their round, capacious carcass furnishes ample room for lard, which experience shows is usually fully occupied. Many have been disappointed in killing Berkshire pigs, because they looked smooth and round when compared with the Alligators, and it seems to have been supposed that they should weigh without feeding, as much as the latter after months of stuffing. No one has a right to expect this: the true point at issue is—which pig, with the same food, will make the most meat, and of the most valuable kind?—and, tried by this rule, we have no fears for the Berkshires.

Our pen of hogs this year consisted of five hogs of one of the best common breeds, and one Berkshire. The lot was from 18 to 24 months old, the Berkshire the oldest. They were none of them in high order when put up, and were fed wholly on steamed apples and potatoes, with the exception of about twenty bushels of screenings, refuse wheat and oats mixed together and ground. The average weight of the whole was 375 lbs. each; that of the Berkshire alone was 430 lbs. Several of the common pigs were longer than the Berkshire, but the weight in the latter was on the most valuable parts, and we have never seen a hog that exceeded him in the hams and lard, while the weight of the less valuable parts was proportionably less. They were fed little more than two months.

Since writing the above, we have been favored with a copy of the Report of the Committee on Swine, made to the Tompkins Co. Agricultural Society, in which are some very just remarks on the subject discussed above, and on the relative value of the several varieties of pigs now generally grown and fed in the country. From this report we make the following extract, as illustrating more fully the opinions we have expressed.

"The following experiment, made by the chairman of this committee last December, in cutting up his pork, will show that the Berkshire pig cuts up well, and has less offal than other breeds, in proportion to the valuable parts. The first exam-

ple is a sow, common breed, 2 1-2 years old; had raised one litter of pigs in July and August, 1839. She weighed as follows in parcels—whole weight 235 pounds. The second is a half blood Berkshire sow, 18 months old; had raised two litters of pigs; one in March and April, and the other in September and October, 1839—slaughtered in December.—Whole weight 204 pounds, in parcels as below. The third example that we will give is a half blood Berkshire barrow, 18 months old, killed at the same time, and all fattened in the ordinary way—whole weight 336 pounds, in parcels as follows:

	No. 1.	No. 2.	No. 3.
Lard,	26	16	31
Hams,	32 1-2	31	52
Tenderloin,	5 1-2	3 1-4	5
Feet,	8 3-4	6 3-4	9
Mess pork,	96	103	176
Prime,	28 1-4	16	26
Head,	18	16	21
Sparerib,	20	12	16
	235 lbs.	204 lbs.	336 lbs.

The following from the same report, is commendation strongly expressed, but we think facts will fully bear out the writer in his remarks:

"The Berkshire is a hardy hog, and a good feeder, and is as well adapted to consume the coarse food of the farm, as any other breed; and it is believed they will make a greater return in flesh for the food they consume than any other breed, except perhaps the China, and as large a return as they will. They are also remarkable quiet hogs, which is a very desirable quality with the farmer. They keep out of mischief, and save their flesh by their gentleness. Their skin is white when dressed and very thin.—Their pork is firm and solid, and of the very best quality. Their hams are unrivalled; and possess a higher character where known, than the ham of any other breed of hogs in existence."

From the same.

### USEFUL RECIPES.

*To cure poisoned Lambs.*—I send you a recipe to cure lambs when poisoned with *Withey*, so called here. It grows on low lands, about one foot high, and is green the year round. To half a pound of black tea, put one quart of water—boil it until you get the strength of the tea, sweeten with molasses and give two table spoonfuls at a time. One dose is in most cases sufficient.

ISAAC CHANDLER.

Great Falls, N. H.

*For Bots in Horses.*—A junk bottle full of strong sage tea, made very sweet with molasses. Two or three doses is generally sufficient for a cure.

J. PARKER, JR.

Trenton, N. J.

*Hiccough or Hiccup.*—We have been sometimes racked for an hour or two by this uncomfortable affection; but we think we have found a simple remedy: about a table spoonful of good vinegar with as much sugar as the vinegar will dissolve, has given us instant and effective relief.—ED.

Happy is he who in regretting his past indiscretions, can say, I never led a companion into evil.

## REPORTS OF THE MASSACHUSETTS AGRICULTURAL SOCIETY.

WM. SALISBURY'S STATEMENT.

1. My farm consists of 130 acres, exclusive of woodland, and embraces loam, clay and some peat, or as we call it, meadow.

To reclaim my meadow lands, I find it necessary to drain them, and invert the sod by the plough or some other implement, in such a manner as to completely kill out all the wild grass: when that is accomplished, I carry on a compost made of fine loam as I can obtain—say from 12 to 25 loads to the acre. My meadows are generally so soft before I get them brought into grass, that I cannot go on to them with a team, except there is frost in the ground. I therefore prepare my compost in summer or fall and heap it up pretty well, so that I can take it when the meadow is sufficiently frozen, and carry and spread it on the meadow; and when the frost gets out 2 or 3 inches, I go on with a good pair of horses and sharp harrow, and harrow till I make the surface as smooth as I can get it. I then sow on oats or some other grain, and give another harrowing. I then sow on about one peck of herds grass, half a bushel of red top, and as I commonly raise my own clover seed and sow it in the chaff, I do not know how much seed I put on; do not think we often hurt land by sowing clover seed on it. My upland I prefer to stock down in the fall, as I can then turn the stubble under, which I think is of service to the ground: I sowed two pieces on my meadow last spring; the one I harrowed after sowing the grass seed—the other I did not; and the piece that was not harrowed took the best. I sow southern clover seed on my land in the spring; the next season it will be ready to cut early, which I do, and lay it up for my milch cows. The second crop will usually start up very soon, and with me, as it will commonly fill with seed, I let as much of this crop stand till it gets ripe, as I think I shall want to sow the next spring. I do not think it good policy to sow clover seed in the fall, as the frost would probably kill it out. On the lands I laid down this fall, I intend to sow clover chaff next spring. After cutting clover intended for seed, I let it lay on the ground about a week, to take the dews and rains, which will render it much more easily threshed. I have been thus particular, thinking that the method of saving clover seed might not be understood by all my brother farmers in this section of the country.

I have tilled this season about 18 acres; I usually put on about 20 loads of manure to the acre, where I spread it, which I generally prefer to do. I usually mix meadow mud with all my stable manure: my straw manure I usually cover up in potato hills. I have usually carted my manure on to my grass land that I intended to plant to corn, and as I plough my land with what is commonly called a side-hill plough, and turn the furrows all one way, I have but one row of heaps spread at a time, preferring to cover it before it dries. The land that I intend to plant to potatoes I plough before I cart the manure on; then spread and harrow well, and cover the manure nearly all up when I plant.

There was so much said last year by a gentleman at the south, about its being the best way to put the manure on the top of the land, which has always been contrary to my theory, that I this year caused three loads to be spread upon the top of the land and well harrowed in, and three loads ploughed under as usual, and staked the land out (equal

quantities) and planted it to corn; the result this year is in favor of turning the manure under; but it remains to see which piece will produce the most grass and hold out longest; which it will take several years to determine.

I mow about 25 acres of upland. I think I cut from 1 to 1 1-2 tons per acre. I have no land that I can irrigate, except some low meadow, which I flow by means of dams that I cause to be made by ditching and laying the sods and mud above the ditch. I put down my gates in the fall before the swamps get full, and keep them down till April. The last year was the first of my experiment in this way. I therefore cannot so well tell what the result may be, but I think it will be favorable, as there appears to be considerable sediment settle. I do not manure the land that I irrigate. I put compost manure on meadow land that has been reclaimed, say from 12 to 20 loads per acre. I mow about 20 or 25 acres of low land that is not suitable for the plough; on that part which I have properly reclaimed I cut from 2 to 3 tons per acre of a good quality; on about 10 acres that I have not improved, I should think that I did not cut more than half a ton per acre; and that not worth half as much per ton as that that grew on the reclaimed meadow. (My method of reclaiming low bog is given in the previous part of my statement.)

I have planted 3 1-2 acres of corn this season. Some part of the ground was prepared by spreading manure on the grass and turning it under; on about one acre of which we also put a small quantity into the hill; on some we ploughed the land and spread manure on the top and harrowed it well. When I plough the manure under, I put about a gill of ashes round the corn after it is up: on the two pieces where I planted for experiment, I put ashes equally alike on both parts. I plant my corn without soaking. From 3 1-2 acres of corn we husked 300 bushels of ears, which we think will yield 150 bushels of shelled corn. The principal part of my corn this year was planted on low moist land. On one fourth of an acre of good corn land containing 680 hills, we spread 8 loads of stable manure and ploughed it in, and put about 3 loads in the hill: the corn was planted near the house and the fowls injured it some, but we husked 1368 pounds in the ear, which would be but a fraction short of 19 bushels, allowing 75 pounds to the bushel, on about one quarter of an acre.

We planted about 4 acres with potatoes, they are not all dug, and of course I am not able to state how much they will yield to the acre. My manner of planting I have heretofore in this report stated: I plant Calico, Orange, Pink-eyes, Lady-fingers, Blues and Long Reds.

I planted this season to ruta бага, English turnips, cabbages and carrots, about 1 1-2 acre: they are not all gathered yet—of course I am not able to say how many bushels I shall have. I do not think I have made it profitable to raise turnips this year; my carrots look better. I also sowed nearly an acre of corn for the purpose of feeding to cows when the pasture grew short: I this year found it very convenient. I expect also to feed out my turnips and carrots principally to my milch cows.

I sowed about 14 acres of ground this season. I sowed rye, peas, rye and oats mixed together for feed for hogs; rye and oats also, and barley. The peas, rye and oats sowed very early: rye I also sowed the first part of April; the barley I did not sow till some time in May: I sowed about one

bushel of rye to the acre; about two of peas, rye and oats, and about two and a half of barley. I last fall ploughed up about 2 1-2 acres of grass land, that was too wet to hoe; I rolled the land down and in the winter and spring I carried on from 15 to 20 loads of compost made by my hogs and spread it, and sowed on about two bushels per acre of peat, rye and oats mixed together, and harrowed it in and sowed on my grass seed, and it now bids fair to produce a crop of good hay another year; the land that I sowed my rye on I did not plough in the spring, as I did not wish to disturb the sod that was turned under last year; I went over it with the cultivator. The land that I sowed barley on I ploughed this spring. Did not raise wheat this year.

I have laid down 14 acres to grass this season, on 8 of which I sowed the grass seed in the spring at the time of sowing the grain, and on 6 acres I sowed it by itself this fall about the first week in September, (quantity of seed stated before.)

My means for making manure are meadow mud, loam from the road side, leaves, &c. Method of making manure: first my barns stand a little elevated; the yards form a gentle declivity. I have ploughed and taken out the earth near the lower side, also raised the lower part so that the hole would probably contain about 20 loads of muck or loam; I fill that with meadow mud or loam, as best suits my convenience: when taken out, which I do about twice a year, if filled with mud, carry it on to upland; if with loam, carry it on to the meadow. Below the yard I have excavated another hole, which I fill also; and when there is enough water to run out of the yard, I conduct it with spouts over any part of the place that I wish. I used to be in the habit of cleaning up my yard every morning and putting the droppings from the cows into a pile and throwing mud or loam over them; but have for two years past adopted a different method, which I think augments my manure very much; every morning, Sunday excepted, I throw about two shovelful of mud or loam over every dropping of a cow, and by this means I not only save the droppings, but also a great part of the urine. I have also dug under my stables and carried the dirt on to my meadow, and now fill under them with meadow mud; also lay as much mud as is convenient under the barn windows where I throw out my manure. I have also dug into the side-hill and placed my hog pen in such a way that my hogs lie almost under ground: have dug the yard down so as to make it level; laid a bank wall 6 or 8 feet high on the north side of my yard, and made a road round so that I can drive and tip as many loads of any thing that I wish into the yard as I please; I do not, however, at this season of the year put more than one or two into the same yard at a time. I also deposit back of the hog yards large quantities of mud, and as soon as it begins to thaw in the spring I begin to shovel into my hog yard and cover up the droppings of my hogs. I have also dug a hole a short distance from my house that will contain 12 or 15 loads of meadow muck, and with spouts from my sink spout and back door, I conduct all the waste water and suds over the deposit.

I have kept this summer and through the last winter 4 oxen, 12 cows, 6 two years old, 9 yearlings, 2 horses, 1 colt, no sheep.

I have one barn 82 by 30, one 52 by 30 feet: one barn built by my predecessor, for sheep, which I have converted into a hay and stock barn, 60 by 20 feet: have no cellar under them, except as sta-

ted above; have a shed between two barns, under which I put meadow mud and throw the manure from two stables.

I have been for a considerable time trying to improve my breed of cattle by mixing English and French with the best natives I could get.

Those calves which I intend to raise I let suck two or three days and then take them off and learn them to drink. I have this year raised six calves, which I have pastured. I have also kept for my neighbors seven cows nearly all the season. We have this year milked two old cows, seven 3 years old, and one 2 years old that calved in July. My family are pretty numerous, and of course make use of considerable milk. We have made up to this date 165 lbs. of butter and 40 cheeses—a small proportion of them new milk; nearly all of them better than four-meal cheese.

I have kept no sheep for some years. I usually keep one breeding sow, and have her produce one litter of pigs, say in March or early in April, which I usually kill the next winter for my own use; she will commonly have another litter by August or September; these I keep over winter and fatten the next winter to sell. I killed ten last winter; the oldest weighed I think from 225 to 300; the snouts weighed from 200 to 225. I have also endeavored to improve my swine by mixing with the best breed that we can get in our section of the country. We have had in this neighborhood a boar from Mr Phinney, of Lexington, so noted for keeping good hogs: the probability is if we had his corn chamber too, it would improve our pork very much. I have fenced off with boards about 2 1-2 acres of the thickest part of my orchard, and let my hogs have access to that from spring till about September, which I think helps the hogs and orchard too, very much: my hogs have been in but two or three years, and many of my apples have nearly doubled their size in that time, and are less wormy. My hogs, with the wash from the house, get their living in my orchards in number six old ones and four pigs that came the first of March. After shutting them up I feed them with raw pumpkins and apples as long as these last; I then boil or steam potatoes a while; I then mix some provender with them; at last make a pudding of corn and peas, rye and oats ground together; also occasionally give them a little corn in the ear.

I make from 60 to 75 loads of manure per year: in the season for it, I cut what brakes I can find on my farm and cart into the hog yard; get turf and loam from beside my walls; and use meadow mud; I suppose I have now from 3 to 500 loads of meadow mud thrown out, ready to cart or sled, if I want it, all the coming season.

I have employed this season one man for four months, for which I paid \$12 50 per month; one other youngster, 18 years old, for 8 months, for which I paid \$10 per month; I also have a grandson about the same age that lives with me all the year, and a small boy 10 years old. I am not able myself to do hard work; do not mow, chop or shovel; but can put up the bars and spread hay.

Have about 400 apple trees, most of them grafted; my winter fruit goes to market, except what we want for family use. The ordinary apples are principally given to my hogs in a raw state, but are sometimes ground in my cider mill, when a little provender is put with them and they are suffered to ferment; which mixture the swine eat very greedily. The last year we made but about two

barrels of cider, which more than supplied us for the year.

I have about 20 pear trees, as many peach trees, some plums, and some cherries.

My trees have not been attacked by canker worm. I think I have lost a few peach trees by the borer. I sometimes dig round my peach trees in the spring and put ashes about them.

We do not use ardent spirit at all as a drink on my farm.

In conclusion, the subscriber would say that he came on to the farm eleven years ago; found it very much run down; the pasture all run over to alders and bushes, some of them 6 or 8 feet high; the meadow very much run over with hassocks; from one half acre we took off 25 heaping cartloads. For several of the first years I could not raise my bread nor fodder enough to keep my cattle, summer or winter. I have now pretty much subdued the bushes; fenced off ten acres of the pasture; tore up the alders and bushes; manured the land and converted it into productive mowing fields; have eradicated the principal part of the hassocks on the farm, and reclaimed a considerable portion of my unproductive meadow, as your agent will see. I have had to work my passage, as the saying is, almost against wind and tide: I had to run in debt for a considerable part of the farm, and without means to buy much manure, I have had to make it principally from the materials which a wise providence has so amply provided. On a farm so large as mine, I do not think it so much an object to raise a large crop on a small piece of land, as to make a large piece of land productive.

All which is respectfully submitted by your  
Ob't servant,

WM. SALISBURY.

Groton, Oct. 21st, 1840.

MR READ'S STATEMENT.

1. My farm consists of 85 acres.
2. Nature of soil, rocky loam and peat.
3. Method of improving: I plough in September on my rocky land and cross plough in spring; when free from stone I plough in May; my peat land (8 acres) I have graveled 4 inches thick; put 20 loads of compost manure to the acre and seed to grass in August.
4. I till 7 acres; put 25 cartloads of manure to the acre.
5. My manure is applied in a compost.
6. I spread and plough in my manure.
7. I plough green sward in May, roll it, spread my manure and harrow it in.
8. I mow thirty acres of upland; average quantity of hay per acre two tons.
9. I do not irrigate any land.
10. I manure my low lands that I mow; 20 loads of compost to the acre.
11. I mow twelve acres not suitable for the plough; cut twentyfive tons of hay of a good quality.
12. I drain my low lands and gravel; spread on compost manure and raise two tons of hay to the acre, with good success.
13. I planted five acres of corn the present season. I ploughed my ground in September, cross ploughed in spring, spread 25 loads of compost manure to the acre, and had 36 bushels of corn to the acre.
14. I planted two acres of potatoes the present season: 1 1-2 acre I ploughed in September, rolled

in spring, and spread the manure and harrowed; the other half acre I ploughed the 20th of May; rolled it, spread the manure and harrowed it. I planted Long Reds—raised 350 bushels to the acre.

15. I planted 1-16 of an acre of vegetables to use in my family.

16. I sowed seven acres of grain the present year, where I had my corn and potatoes last year: 3 acres of oats about the 20th of April, 4 acres of barley the 10th of May: I sowed 2 1-5 bushels to the acre. I ploughed my ground and harrowed it, sowed my seed, harrowed and rolled it.

17. I have laid down seven acres of grass the present season; I sowed my seed with my spring grain; one peck of herds grass, one do. of red top, and eight pounds of clover seed to the acre.

18. I cart peat mud and loam into my barn yards and hog pens.

19. I keep 8 oxen, 8 cows, 12 young cattle, 2 horses, 25 sheep, through the year. I have one barn 60 by 50 feet; one 36 by 33 feet; one 36 by 26 feet. I have a long shed to cover my manure.

20. My cows are of a native and Durham breed.

21. I do not raise any calves.

22. I made ten hundred pounds of butter this year, six hundred pounds of cheese—one third new milk.

23. I keep 25 sheep of the native breed which average 95 pounds of wool yearly. I keep my sheep in a yard, have a shed for them to go under, feed them in racks in winter. My sheep lamb in February; one to ten of their young die from cold weather: I sell my lambs in May, at from four to five dollars per head.

24. I keep 14 swine; make thirty hundred lbs. of pork. They are of a mixed breed.

25. I feed my swine through the summer months with potatoes, apples, and slops from the dairy; fatten them on boiled pumpkins, potatoes and meal.

26. I take 80 cartloads of manure from my hog styes in a year: it is made of peat mud and loam.

27. I employ three hands and a boy on my farm, and pay \$300 a year for labor.

28. I have 700 grafted apple trees. I carry the fruit to Boston and Lowell markets; (600 of the trees grafted since 1828.)

29. I have 250 fruit trees of different kinds, exclusive of apple trees.

30. My trees have not been attacked by canker worms or borers, except two apple trees, which were attacked by borers. I cut a hole in the tree with a sharp pointed knife and run in a small wire, which destroyed them. I keep the ground around the roots of the trees free from grass or weeds.

31. I do not allow the use of ardent spirits on my farm.

Respectfully,

ZACCHEUS READ.

Westford, Oct. 26, 1840.

MR CONVERSE'S STATEMENT.

1. My farm consists of about 200 acres of improved land.

2. The soil is mostly loamy; some swails. I consider the best way to ditch and cart on loam or gravel.

3. I till from 12 to 15 acres; plant about one half of that, and sow the other part. I put about 20 loads on the acre of my planting ground; 10 loads green, spread and ploughed in, and 10 loads compost in the hill.

4. I cart some manure on to my fields for planting in a green state, and make 200 or 300 loads a year of compost.

5. I spread my manure for potatoes, and spread for corn and put in the hill too.

6. My way of managing green sward is, to turn it over and harrow it, and plant on the furrow. I think it will produce the best thus managed.

7. I mow about 55 acres, and cut very near two tons to the acre: I have 100 tons of good hay at least.

8. I have no land that I flow.

9. I make as much manure as I can, and manure my upland once in a year with compost manure, 10 or 15 loads to the acre.

10. I mow about 10 acres of lowish swail land. I cut about one ton to the acre of a mixture of blue-joint, fowl meadow and fresh meadow grass.

11. I have none.

12. I have planted 5 acres: my ground was sowed the last year soon after haying; the stubble was turned in; and it was ploughed once in the spring: the seed was small eight rowed yellow corn. The kind of manure; 10 loads of green was spread and 10 loads of compost was put in the hill: the quantity of corn on the acre was 60 or 65 bushels.

13. I planted two acres of potatoes; spread my manure; planted them in rows, one way 3 feet apart, and 1 1-2 foot the other way. I hoe my potatoes twice. I had about 300 bushels to the acre, Blues and Pink-eyes mixed together.

14. I planted a small piece with ruta бага and a few of the sugar beet; had about 100 bushels.

15. I sowed 5 acres of oats, 1 of wheat, 3 of rye. I ploughed my ground once and harrowed the seed in; I sowed 3 bushels of oats, 2 of wheat, 1 of rye to the acre; my wheat was the Bald wheat; the soil loamy; I soaked the seed in brine and rolled it in lime.

16. I have not laid down any.

17. I draw loam into my yards from my fields, that which gathers around the edges; and when I build wall, I dig a ditch to set my foundation in, and draw the dirt into my yards.

18. I keep 4 oxen, 24 cows, 16 head of young stock and dry cows, 70 sheep and 2 horses. I have one barn 110 feet long, one 50 feet, and a small barn for my sheep. I have no cellar.

19. My cows are a part native and a part mixture with the English.

20. If I raise early calves, I take them off at about a week old; and learn them to drink milk and eat meal or oats; if late calves, I learn them to drink whey and feed them about ten weeks.

21. I did not make any butter for sale; I have and shall make about ten thousand weight of cheese. I make 30 pounds per day now, new milk.

22. I keep 70 sheep, mixed Merino and Saxony; I sheared 212 lbs. of wool from 70 last spring. I house my sheep in stormy weather and feed out of doors in pleasant weather to air the pens. I do not have my lambs come till May. I lose but few.

23. I keep 9 swine; I have killed 7 of them—weight 2074 lbs.; have two old ones and one pig which I mean to kill when they will weigh ten hundred. My hogs are the common breed; I feed through the summer on whey with some meal; I fat with apples and potatoes boiled, put with whey and meal stirred in.

24. I make 30 or 40 loads, by using loam.

25. I work myself, and one son 18 years old, one 12 years, and hire one man all the time; pay him \$160 by the year; and in haying I hire 3 or 4 men, whom I pay \$1 per day. I have no help in

doors beside my wife. I pay about \$300 per year for labor.

26. About 120; some of them young; as many as one half grafted. I sell a good many winter apples; make a few barrels of cider: boil apples for my hogs.

27. I have 25 or 30—young English cherries, plums, peaches and pears—all young; some just beginning to bear.

28. I have a few grafted trees close to my house, that have been injured some by the canker worm. I once used tar.

29. Do not use ardent spirit on my farm, and have not for 12 years past. I have seen trouble enough with it. I was one of the first that put that out of the way with us.

Respectfully,

ROSWELL CONVERSE.

New Braintree, Oct. 26, 1840.

For the N. E. Farmer.

### POINTS OF A GOOD HORSE.

COL. S. JAKES' remarks at the Sixth Agricultural Meeting, on the prominent points to be observed in the selection of a useful horse, more particularly for a roadster.

I prefer a lightish head, neatly set to the neck; the neck rising promptly and strong from the shoulders and withers; neck somewhat crowning or curving at the top, tapering to the head, with a strong crest. Shoulders well laid in, spreading well back, something like a shoulder of mutton.—Chest deep, and a little projecting. Withers rising moderately high, and inclining well into the back. If the withers are low and flat on the top, the horse will be inclined to plunge to the ground, and when fatigued will stumble or fall. Neither must the withers rise too high, as he will then appear as though on stilts: both extremes are serious impediments to fine and safe action. Ribs should be well rounded out. Back straight and short, well copped, that is, the hips well thrown forward, forming a strong loin, and giving a long lever from the point of the hip to the hock joint of the hind leg. The horse should be a good length from point of shoulder to the extreme point of buttock.—Dock strong, and well covered with hair. Close and snug immediately under the dock. The muscles on the inner part of the thighs should be full and well shut together. If there is a large cavity under the dock, the horse will be inclined to scour, and probably only a door-yard horse.

The head, neck and body forms a lever, resting on the fore legs as a fulcrum, the head being at the end of the lever. If the neck be very long and the head heavy, or if the neck be quite short, and the head short and light, either of these extremes very much affects the regular clips and action. The whole machine should be of good proportion.

The fore arm is a very important lever, as regards the safety as a roadster. The legs should be clean and free from bleuish, and when in motion move true, and free from cutting or wabbling. The feet should be round and steep; heels broad, coronet, and posterns of medium length. Shank or canon short, broad and flat, showing the tendons or sinews. The knee large and well dropped down; the arm above the knee long, and the muscles large and full. The top of the shoulder, where matched to the withers, should not be so heavy loaded with muscle as to impede their action. No

objections to have the fore feet move pretty close, but not so as to cut.

Much depends on the form of the hind leg and the power of that lever, as regards strength and speed. The shank, hock and thigh should be broad and flat, something like that of an ox; and if so, when in motion will operate like a plank sprung edgewise, and then let fly. If the hind legs when at good speed open and spread a little, no objection, providing there is a good free action in the hock joint.

### PEAT MEADOWS—AN INQUIRY.

Can any one inform us whether the kinds of trees which have grown upon a meadow in antecedent ages, have any effect upon the quality of the muck as a manure, or upon the productiveness of the land when brought into a state of cultivation? We have heard the opinion expressed, that where hard wood grew, the quality is better than where the growth was pine. If this be true, it is of importance in these days, when the public eye is turned to these low lands in search of manure and productive soils. We suppose the resinous matter of the pine must be decomposed or greatly changed before the material in which it abounds can be fertilizing; but whether, when this change has taken place, the decomposed pine is not as good as the rotted oak, maple or alder, we have no grounds on which we have labored is good; that is the extent of our knowledge.—Ed.

From the Albany Cultivator.

### MANAGEMENT OF SALT MARSHES.

Messrs Gaylord & Tucker—Mr Fairbanks inquires through your paper, what kinds of grass seeds are best adapted to salt marshes. I have made some few experiments with salt marsh, without attempting to keep off the salt water, (I mean the heads of creeks that are frequently overflowed by salt water,) by scattering the seeds of herds grass, (known to some persons as red-top) over the marsh, and leave them to vegetate as they might. I have also sown wheat upon the meadow turf thrown out of a ditch, cut through the same kind of marsh, and it has flourished and produced well, and so did the herds grass; and I have no doubt that good crops of hay and wheat might be raised upon reclaimed salt marshes, if they were ditched and the tide kept off. I think the best way to prepare such marshes would be, to burn off the grass, cut narrow and deep ditches, and spread the mud over intervals, for the purpose of making a bed for the seed, although they could not be long cultivated in wheat, as by destroying the grass roots, (turf) the marsh would settle too much and perhaps become miry, but they would not become so if kept in grass. Marsh mud and turf, when dried and pulverized, make excellent manure for every kind of crops raised in this part of the country. No doubt it would vastly improve by lime. Herds grass seed can hardly be sown too thick; about two bushels to the acre is the usual quantity, but three would be better: it may be scattered upon the ground and covered by dragging a rough bush over it; or if the ground be not prepared, by permitting cattle to trample it in. Yours, respectfully,

HENRY WHITING.

Never do good to obtain praise. This is selling virtue at a price.

NEW ENGLAND FARMER,  
AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, MARCH 3, 1841.

SEVENTH AGRICULTURAL MEETING AT THE  
STATE HOUSE.

Dr. C. T. Jackson, who had been announced as our speaker for the evening, stated that he had had no leisure for writing out his views, and therefore must draw out, as he proceeded, from the stores which memory had laid up during the years he had devoted to Agricultural Chemistry. The earthy parts of all soils are formed by the disintegration or crumbling of rocks. A soil is in its nature (the earthy part of it,) like the rock from which it was originally formed. There are simple soils formed from a single kind of rock; and there are compound soils, the diluvial and alluvial, formed by a mixture of the crumbings of rocks that are different in their nature. The great current of waters that once swept over this portion of the earth, together with smaller and oft-repeated currents, have been great agents in producing these mixtures. These comminglings of different earths have contributed much to its fertility. Silix (i. e. sand) when found alone, is of too open or loose a texture; and so is carbonate of lime; while alumina (clay) is too adhesive. Any one of the earths, when alone, is barren. In every good soil there is a mixture of silix, carbonate of lime and alumina—(sand, lime and clay.) For the production of certain kinds of plants the soil must contain other earths; clover, for instance, requires gypsum. The grains require phosphates of lime and magnesia.

An acid soil is not good; neither is an alkaline one: it should be neutral. The earthy or mineral parts of a soil may vary much in their proportions, and yet the soil may be good; one in which sand predominates or one in which clay prevails may be good. But it is not so with the acids and alkalis; these must be neutralized, (made equal, or made to counteract each other.)—The acids result from the decaying of vegetable matter, as trees, leaves, grasses, &c., while alkalis come from the putrefaction and decay of animal matters, as flesh, dung, urine, &c.

The earthy matters, as sand, clay and the like, need to be mixed with either vegetable or animal matter or both, before there can be much fertility. This mixture has been going on through all the ages in which trees, leaves, grasses, plants have been decaying, and through which animals have been living and mouldering away. The original plants which grew before there was vegetable mould, were probably very hardy and of such a nature as to take much of their nourishment from the atmosphere and from water. The opinion has been advanced by Ad. Braconier, that originally the atmosphere contained more carbonic acid than at present, and thus was fitted to nourish plants which, in their decay, should fit the soil to nourish other and more valuable plants; and these plants in their growth by absorbing the carbonic acid, were fitting the atmosphere to support the higher orders of animal life.

Our usual plants require carbon and nitrogen to perfect their growth; and though they obtain a partial supply from the atmosphere, they cannot from that source alone derive a sufficiency for making them produce flowers and seeds. They must get some elsewhere. Consequently, the properties of the soil in which they take root are of importance. To the organic matter in the soil, the plant goes to obtain much of its food. Liebig has doubted this, because by applying guano (a manure from S. America,) to a soil that had neither vegetable nor animal matter in it, he has rendered that soil very fertile. He goes upon the presumption that guano con-

sists entirely of saline matters, as urate, phosphate and carbonate of ammonia. But Dr. J. has ascertained that this guano contains the usual ingredients of common fertile soils, besides a very large quantity of ammoniacal salts. (Therefore we may hold on yet to the common notion that it is important to have some organic matter, some vegetable or animal matter, something in addition to sand, clay, &c. in the soil of our fields.)

Where vegetables decay, a brown substance is formed, which is usually called vegetable mould. This substance contains much carbon, (food for plants,) but it likewise contains many acids. These acids, in their free state, are injurious to vegetation; where a tree is rotting nothing will grow: hence farmers have thought that rotten wood and muck are not good; that they make the soil sour. This is true of them in their acid state. But when these acids are neutralized, the rotten wood and muck become fertilizers. This neutralization can be produced slowly by exposing the substances to the action of the atmospheric and soil. But it can be more speedily and effectually accomplished by mixing them with, or exposing them to, the action of ammoniacal products produced by applying lime or ashes to putrid urine or dung. (But why putrid or partially decomposed? This we have asked since the meeting, and Dr. Jackson replies, because urine and dung when fresh, will give out, on the application of lime, only a small quantity of ammonia; but if somewhat putrid when the lime is applied, they give it out very freely.) The great object in the use of lime is, to make ammonia or ammoniacal products; and this should be done under such circumstances that the ammonia may be absorbed by vegetable matters; for then the acids in these matters will be neutralized and the matters themselves will become good manures. How shall we do this?

If you apply lime to dung or urine alone, the ammonia will pass off into the atmosphere and be lost. If you suffer dung to ferment alone, ammonia will be escaping from it and will be wasted. But mix your fresh dung and muck well together in a well formed heap; put a coating of muck on the outside of the heap; it is a good course to cover the whole with straw and boards. Let the heap lie in this state several weeks or months; Dr. J. recommends forming it in the autumn and letting it remain until spring. In this state the muck will absorb the ammonia given out by the dung in its first stages of decomposition. At the proper time, 10 or 15 days before you wish to apply the compost, take a bushel of unslaked lime to each cord in the heap, apply to it just water enough to reduce it to a powder, and then throw the heap over, mixing the lime in well. The heap may be again coated with muck, for this coating will absorb ammonia in sufficient quantity to make it good manure. Ashes will answer as a substitute for lime. (We did not learn the relative quantity of dung and muck, but we suppose that if the muck has been for some considerable time exposed to the atmosphere, or if from any other cause it does not contain a large quantity of free acids, that from two to three cords of muck may very safely be used to one cord of dung.) Muck when saturated with the urine of cattle, if thrown over and treated with lime, becomes as valuable as dung.

Farmers often make mistakes in the application of lime as a top dressing. If it is put on in its caustic state it does but little if any good the first year, because it is then imbibing carbonic acid from the atmosphere, and as this acid feeds the foliage of plants, the lime robs them of their food until it becomes saturated. Air-slaked lime as a top dressing answers well as a corrective on acid soils. Lime is most serviceable on soils containing a large quantity of partially decomposed organic matter

Mr Newton, President of the Berkshire Agricultural Society, had found caustic lime as a top dressing, fail the first year, though it produced good effects the following season. His experience in every respect confirmed Dr. Jackson's opinions. Soil and marsh mud may be used instead of muck, but are not equally valuable.

[We trust that farmers will preserve this paper, and that when the proper season arrives, some of them will follow strictly the rules here given for directing them in the use of lime.]

BOSTON CULTIVATOR'S REPORT OF DR. JACKSON'S REMARKS.

As Editor, we have nothing to say to our neighbor relating to his report; but as secretary of the farmers' meeting, and as the organ of their invitation to Dr. Jackson, we do complain of it; and for this reason: if those who are invited to address us are liable to be rendered ridiculous by great misrepresentation and disrespectful insinuations, we shall be unable to obtain speakers.

We certainly did not hear Dr. J. say that "he would endeavor to entertain the meeting by stating from recollection what he had formerly delivered at other meetings." But we did hear him say, in substance, this: that he should draw from the stores which memory had laid up during the years he had devoted to agricultural chemistry. Neither did we hear him say "that no plants would grow so as to mature their seeds, in any mixture of pure earths, without imbibing something from the atmosphere"—but we did hear him maintain (in opposition to Liebig's hypothesis,) that most plants cannot obtain from the atmosphere alone carbon enough to enable them to produce flowers and seeds. This was his point. When the Cultivator says that "the Doctor's remedy" for acidity in rotten wood "is lime," we must ask him if he remembers correctly the prescription. We thought Dr. J. named ammonia as the proper medicine; and for producing this he wished not for lime alone, but lime acting upon animal matter. "The wonder if he (Dr. J.) could make good manure from white pine, white pine leaves, or pine sawdust, if he had lime enough," we do not join in, both because we have found the muck from a pine swamp very good as an ingredient of compost manure; and also because we believe that boiling it in potash would very soon convert fine sawdust into very good manure, and believe further that all decayed vegetable matters may be made good manures, whenever by the use of lime and animal matter you cause them to imbibe ammonia enough to neutralize their acids. When the speaker "treated learnedly of *senic acid*," we did not hear him; but his remarks upon *crenic acid* we attended to. His remark that "rain water in this vicinity was charged with *erinite* of lime," escaped our notice; but we heard him say that *pond water* in this vicinity contains *crenate*, &c.

Where Dr. J. was understood "to think the subsoil was not worth much before it had been manured," we understood him to say that it would be improved by stirring it with the subsoil plough, and thus submitting it to increased action from the atmosphere. Another quotation—"As to gypsum, he supposed that some part of it might go into the plant and compose a part of it, as in case of clover, &c.; yet he confessed that gypsum produced no effect on some soils—(if plaster operates principally by forming a component part of the plant, then why should it not prove useful on all kinds of soil?)"—The statement of fact here may be correct, but as the question asked intimates an inconsistency in Dr. J.'s opinions, we will try to answer it. Gypsum is supposed to have much the same action as common salt; consequently we cannot expect to derive benefit from it where there is already salt enough to supply the plant with what it will incorporate into itself, as is the case along the sea coast. On calcareous soils, inland, it is serviceable.—Once more we quote—"The Doctor still seems to think lime the all important agent in agriculture, though he distinctly admits that the excrement of animals is useful." Dr. J. speaks of lime as a mere chemical agent to render compost soluble, and fit it for food to plants; and we distinctly ask if it was not a great object with him to teach farmers how they might make a compost that would be nearly or quite as good as dung? This was an object with him; and therefore the assertion that "he distinctly admits that the excrement of animals is useful," (implying that he sets but little value upon excrement as a manure,) is false in its import and an insult to his good common sense.

We intend to maintain our friendly relations with our

brother editor, but we must protect, as far as possible, from misrepresentation and slurs, the scientific friend of the farmers, whose services we were directed to solicit, and whose teachings were most highly valuable.

Mr Geo. B. Emerson is expected to speak at the agricultural meeting tomorrow evening, upon Forest Trees

We have the pleasure of inserting on our fifth page Col. Jaques' remarks upon the horse.

**THERMOMETRICAL.**

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northernly exposure, week ending Feb. 28.

Feb. 1841.	7 A.M.	12, M.	5, P.M.	Wind.	
Monday,	22	24	32	30	E.
Tuesday,	23	39	47	20	W.
Wednesday,	21	0	24	18	W.
Thursday,	25	6	29	26	S.

**BRIGHTON MARKET. — MONDAY, MARCH 1, 1841.**  
Reported for the New England Farmer.

At Market 410 Beef Cattle, 25 yoke of Working Oxen, 15 Cows and Calves, 500 Sheep, and 100 swine. 80 Beef Cattle unsold.

Prices.—Beef Cattle—We reduce our quotations to correspond with sales. We quote a few extra at \$6 50 a 6 75. First quality \$6 00 a \$6 25. Second quality \$5 50 a 5 75. Third quality, \$4 75 a \$5 25.

Working Oxen—A few sales only effected. Cows and Calves—Sales few and dull. Sheep.—Lots were sold at \$2 50, 2 75, 3 50, 4 50, 4 75 and \$5 00.

Swine.—4 1-2c. for sows and 5 1-2 for barrows. At retail 5 and 6.

**WHOLESALE PRICES CURRENT.**

Corrected with great care, weekly.

SEEDS Herds Grass, very little in market. Red Top, by the bag 60 to 70 c. Clover—Northern, very little in Market.—Southern, plenty, 9 to 10 c. Flax Seed, \$1 37 to 1 50 bu. Lucerne, 25 c. per lb.

FLOUR. Howard Street \$5 37—Genesee \$5 31—Ohio \$5 12.

GRAIN. Corn—Northern Yellow 60 to 61 c—Round Yellow 57 to 58—Southern Flat Yellow 55—White 53. Rye—Northern 60 to 65—Southern 50 to 55. Oats—Southern 23 to 32—Northern 25 to 40.

PROVISIONS Beef—Mess \$10 50 to 11 00—Prime \$6 50—No 1 \$9 00. Pork—Extra—15 00—Clear 14 50—Mess \$13 00. Hams—Northern, 9 c per lb.—Southern, none. Lard—Boston 9 c per lb.—Southern, 8 to 8 1-2. Butter—Lump 18 to 22—Firkin 12 to 18—Shipping 8 to 14. Whole Hogs 5 1-2 to 6 c.—Pigs 5 c.

HAY, per ton, \$17 to 17 50—Eastern Screwed \$13 to 14. CHEESE—Old 11 c.—New 8.

EGGS, 16.

POULTRY—Chickens 10 to 12 1-2 c. per lb.—Turkeys 10 to 11—Geese 7.

WOOL.—The market for this article has not experienced any change of late. Pulled Wool is rather scarce, and there is but a limited supply of low Fleeces and of fine Fleeces the stock is also moderate. Prime or Saxony Fleeces, washed, lb. 50 to 55 c.—American full blood, washed, 47 to 50—Do 3 4 blood, washed, 44 to 46—Do. 1-2 blood, washed, 36 to 40—1-4 and common do, 35 to 37—Smyrna Sheep, washed, 20 to 23—Do. unwashed, 10 to 14—Lienyasi Sheep, 8 to 10—Buenos Ayres unpicked, 7 to 10—Superfine Northern pulled lamb 43 to 46—No. 1 do. do. 37 to 42—No 2 do do 26 to 30—No 3 do do 18 to 20.

**FRUIT TREES AND SCIONS FOR SALE.**

The subscriber, at the Pomological Garden, Salem, offers for sale a very choice and extensive variety of Apple, Pear, Plum, Cherry, Peach and Apricot Trees, Grape Vines, Gooseberries, Red and White Dutch Currants, and Red and White Antwerp Raspberries.

Also, Scions of all the European and American Fruits which have been proved; all from fruit bearing Trees, packed in boxes with moss, and can be transported with safety in any part of this country or Europe.

ROBERT MANNING.  
(May)

**SITUATIONS WANTED**

As Gardeners and Farmers. Apply at N. E. Agricultural Warehouse and Seed Store. March 3.

**HOWARD'S IMPROVED EASY DRAUGHT PLOUGH.**

Great improvements have been made the past year in the form and workmanship of these Ploughs; the mould board has been so formed as to lay the furrow completely over, turning in every particle of grass or stubble, and leaving the ground in the best possible manner. The length of the mould board has been very much increased, so that the Plough works with the greatest ease, both with respect to the holding and the team. The Committee at the late trial of Ploughs at Worcester, say,

"Should our opinion be asked as to which of the Ploughs we should prefer for use on a farm, we might perhaps say to the inquirer, if your land is mostly light and easy to work, try Prouty & Mears, but if your land is heavy, hard or rocky, BEGIN WITH MR. HOWARD'S."

At the above mentioned trial the Howard Plough done more work, with the least power of team, of any plough exhibited—no Plough doing over twentyseven and one half inches, to the 112 lbs. draught, while the Howard Plough done twentyone and one half inches, to the same power of team! All acknowledge that Howard's Ploughs are much the strongest and most substantial made.

There has been quite an improvement made on the shoe, or land side of this Plough, which can be renewed without having to furnish a new landside—this shoe likewise secures the mould board and landside together, and strengthens the Plough very much.

The price of the Ploughs is from \$6 to \$15. A Plough, sufficient for breaking up with four cattle, will cost about \$10 50, and with cutter \$11, with wheel and cutter, \$2 50 extra.

The above Ploughs are for sale, wholesale and retail, at the New England Agricultural Warehouse and Seed Store, Nos. 51 & 52 North Market Street, by

JOSEPH BRECK & CO.

Feb. 24.

**PURE SPERM OIL.**

**EDMUND T. HASTINGS & CO.**

No. 101 State St. keep constantly for sale, Winter, Spring and Fall Sperm Oil, bleached and unbleached; which they warrant to be of the best quality and to burn without crusting.

Oil Canisters of various sizes.

Boston, Jan. 1, 1841.

1841

**FARM FOR SALE.**

The subscriber offers for sale that valuable Farm, situated about 3-4ths of a mile below the First Parish Meeting House, on the Stage road, and commonly known as the Judge Prescott farm, containing about 170 acres of superior land, in a good state of cultivation, with two dwelling houses, four barns, and other out buildings. The farm is remarkably well watered with soft water, conveniently fenced, has nearly forty acres of large, handsome wood and timber standing on it, with an orchard of grafted Apple, Pear, Peach, Plum, and Cherry trees, and might be easily divided into two Farms. The estate will be sold reasonably. If five thousand dollars be paid on receipt of the deed, the remainder may lay on mortgage to suit the convenience of the purchaser. For further particulars, apply to the subscriber, living on the premises.

WM. SALLSBURY.

Groton, Oct. 26, 1840.

ew.

**A SMALL FARM FOR SALE,**

Situated in Braintree, ten miles from Boston, with a Dwelling House and large Cider mill thereon. The farm contains about 20 acres. Inquire of

NATHANIEL FAXON,

Feb. 24.

No. 53 North Market Street.

**BERKSHIRE BOAR AND SOW.**

The subscribers offer for sale a full blood Berkshire Boar and Sow, 18 months old, which they purchased a year since from N. C. Cement, which he warranted to be pure.

Feb. 24.

JOSEPH BRECK & CO.

**PEAR, PLUM, GRAPE VINES, &C.**

3000 Pear Trees, of the most approved kinds. 2000 Plum Trees, of the most approved kinds and extra size—many of them have borne this season.

Apple, Cherry and Peach Trees, of different kinds.

500 Quince Trees. 4000 Isabella and Catawba Grape Vines, from 6 to 15 feet high; most of them have borne fruit. Black Hamburg, Sweetwater, Pond's.

30,000 Grant Asparagus Roots. Gooseberry, Currants, Raspberries, of good kinds. 5000 Wilmot's Early Rhubarb, or Pie Plants, lately introduced.

2000 Cherry and Pear Stalks; 1000 Plums; Roses, &c. of all kinds.

All orders sent to the subscriber at Cambridgeport, will meet with immediate attention.

SAMUEL POND.

Cambridgeport, Mass., Feb. 24.

**GARDEN SEEDS,**

For sale by JOSEPH BRECK & Co. at the NEW ENGLAND FARMER OFFICE, No. 51 and 52 North Market St. Boston. The subscribers would inform the public that they have now on hand the largest collection of seeds ever before offered by sale in this city, embracing every variety of Field, Kitchen, Garden, and Ornamental Flower Seeds desirable for this or any other Climate.

Our seeds are either raised under our own inspection or imported from responsible houses in Europe, and having taken extraordinary pains to obtain such as are pure and genuine, we can confidently recommend them to our customers and friends, and feel assured they will prove satisfactory to all who try them.

Dealers in seeds are requested to forward their orders in season Boxes for retailing from 8 dolls. and upwards will be sent out on commission allowing a liberal discount and take back what remains unsold.

Letters and orders with good reference will meet with prompt attention.

**FIELD SEEDS.**

- Sugar Beet.
- Mangel Wurtzel.
- New Red Globe do. } superior
- Yellow do. } varieties.
- Carrot Long Orange.
- " Altringham.
- " New White, extra fine.
- Pumpkin, sorts.
- Wheat—various sorts.
- Barley, do.

- Red Round do.
- White do.
- White Globe do.
- Green Round do.
- Purple Top Hybrid do.
- Buckwheat.
- Broom Corn.
- Millet.
- Buckthorn. } for Hedges.
- Locust.

**GARDEN SEEDS.**

Artichoke, Asparagus, Beans of every description, Beets of sorts, Borecole, Broccoli, Brussels Sprouts, Cauliflower, Caraway, Celery, of the most improved sorts, Cabbage 20 sorts, Carrot, all the varieties, Cucumber do, Cress, Egg Plant, Endive, Indian Corn, Kale, Leek, Lettuce in great variety, Melons, do. Martynia, Mustard, Nasturtium, Okra, Onion of sorts, Pepper do. Pumpkin do. Parsnip, Parsley, Peas, a very great variety, Rhubarb for tarts, Radish of sorts, Salsify, Squash of sorts, Tomato, Turnip 20 varieties.

**SWEET AND POT HERBS.**

- Thyme
- Sweet Marjoram.
- Sage.
- Summers-avory.
- Medicinal Herbs, &c.
- Sweet Basil.
- Lavender.
- Lemon Balm.
- Anise.

**ORNAMENTAL FLOWER SEEDS.**

Three hundred varieties, embracing all the finest sorts. Packages of 20 fine sorts for one dollar.

Those who prefer to have their Seeds put up in papers ready for retail, can be accommodated—each packet neatly closed and labelled with printed directions. Price 50 cents, per dozen papers, which are retailed here at 6 1-4 cents each. Fruit and ornamental trees, of the greatest variety, supplied at nurseryman's prices, and orders solicited. These will be packed, when required, to go in any part of the U. States.

JOSEPH BRECK & CO.

Boston, Jan 27, 1841.

**AN OX WAGON AND OX CART**

Nearly new, for sale by JOSEPH BRECK & CO., Inquire at No. 52 North Market Street, or at their Farm in Brighton. Feb. 24.

**WANTED,**

An experienced Gardener, to whom liberal pay and constant employment will be given. Inquire of this office. Feb. 24.

**GRINDSTONES.**

An extensive assortment of Water and Hand Grindstones constantly on hand and for sale by AMMI C. LOMBARO & CO. 13 Lewis's Wharf. 1841. Nov. 17.

## MISCELLANEOUS.

*The Ladies*—dear creatures—can do any thing they please with us. The Baltimore Clipper presents the following evidence, of the irresistible influence of "woman's winning way:"—

"A very beautiful young lady on the Point, not long since, signed her name to a temperance pledge, one article of which prohibited her receiving the affectionate attention of any young gentleman who was in any way given to intemperance. It happened that the tender hearted damsel had, at the very time she put her name to the paper, a beau with whom she was well pleased, but who, unfortunately, (according to report,) took occasionally a "leettle too much." The maiden was therefore under the painful necessity of addressing her, "fondly loved one" a polite note, stating her situation, the nature of the pledge she had taken, and the utter impossibility of her ever after receiving his attention as a lover. "I love you as purely as ever," was the language of the note, "but my word has gone forth, and honor bids me to respond to your kindness only in the light of a friend." The young man found himself completely subdued.—The words "I love you as purely as ever," were too potent. Determined not to forfeit such devoted affection, he sought the earliest opportunity to become a temperance advocate himself, signed the pledge, and is now a member of the Washington Temperance Society. Young love's dream with them has already brightened into engagement, and is, we understand, shortly to be consummated in matrimony. Powerful and beautiful is thy influence, oh woman."

*Weight of Military Men.*—The following memorandum was found a number of years ago in the pocket book of an officer of the Massachusetts line: August 19, 1783.

*Weighed at the Scale at West Point.*

General Washington,	209 lbs.
General Lincoln,	224 "
General Knox,	280 "
General Huntington,	132 "
General Groaton,	166 "
Colonel Swift,	219 "
Colonel Michael Jackson,	252 "
Colonel Henry Jackson,	238 "
Lt. Col. Huntington,	232 "
Lt. Col. Cobb,	186 "
Lt. Col. Humphreys,	221 "

It appears from the above, that the average weight of these eleven distinguished revolutionary officers, was 214 pounds. The heaviest weight having been General Knox, who weighed 280 pounds, and the lightest, General Huntington, who weighed 132 pounds. It is somewhat singular that the biographers of eminent men, never unless under circumstances of a peculiar character, record the weight or dimensions of the clay tenements which were the abode of their immortal spirits.

*Young farmers*, when you are looking out for a wife, ask the same question:

—A girl was presented to James I. as an English prodigy, because she was deeply learned. The person who introduced her, boasted of her proficiency in ancient languages. "I can assure your majesty," said he, "that she can both speak and write Latin, Greek and Hebrew." "These are rare attainments for a damsel," said James; "but pray tell me can she spin?"

*Excellent Sentiment.*—Governor Morehead, of North Carolina, in his inaugural address, introduces the following excellent sentiment, which cannot be too forcibly impressed on the minds of the citizens of this country:

"Nothing so surely indicates the happiness and prosperity of a people, as numerous school-houses well filled during the week, and churches well crowded on the sabbath—and the latter is sure to follow the former. If we desire to perpetuate our glorious political institutions, we must give to all our people moral and intellectual cultivation. That man who improves his intellect for six days in the week, and on the seventh endeavors to give it the proper direction, from the precepts of our holy religion—who learns to do unto others as he would they should do unto him—that man will never become a tyrant, and he can never be made a slave."

*The Cod-fish.*—A correspondent of the Exeter (N. H.) News Letter, speaking of the State House at Boston, says—"I did not particularly notice the ornaments of the Representatives' Hall, excepting a statue, which seems to attract even more attention than that of the Father of his country—I mean the likeness of a cod-fish, which has a conspicuous place, high and lifted up in front of the Chair. The Speaker looks up to the cod-fish, and calls the House to order. The gentlemen engaging in debate, as they wax warm and animated, throw up their hands and eyes to the cod-fish, and gather new force and zeal and eloquence. Even the chaplain of the House looks up to the cod fish, as he leads in the devotions of the morning. I do not by any means believe that the descendants of the pilgrims have become idolaters and actually worship the cod-fish, but it is certainly looked up to with great veneration, if not regarded as the presiding genius of the place."

*Titles.*—Several years ago there was a young English nobleman figuring away at Washington. He had not much brains, but a vast number of titles, which, notwithstanding our present dislike to them, have sometimes the effect of tickling the ear amazingly. Several young ladies were in debate, going over the list;—he is Lord Viscount so and so; Baron of such a country, &c. "My fair friends," exclaimed the gallant Lieut. N., "one of his titles you appear to have forgotten." "Ah," exclaimed she eagerly, "what is that?" "He is *Barren of Intellect*," was the reply.

*Definition of a Gentleman.*—Gentility is neither in birth, manner, nor fashion, but in the mind. A high sense of honor, a determination never to take a mean advantage of another, an adherence to truth, delicacy and politeness towards those with whom you may have dealings, are the essential and distinguishing characteristics of a gentleman.

*Solitude Sweetened.*—To shut a boy up in a cellar, and let him have free access to the molasses cask.

"How dreadful short the days are," as the woman said when she let her breakfast dishes stand till she had read a novel.

A man is said to be "over head and ears in debt," when he hasn't paid for his hat.

## POUDRETTE.

This valuable manure may be had on application to the subscriber, at the office of the "New York Poudrette Company," No 120 Nassau street, New York. It is in-odoriferous, and may be transported in barrels, on board of any vessel or steamboat, without offence—and it will be found an exceedingly valuable article as a fertilizer on any soil, and for any crops; but more especially for gardens and flowers, as there are no foul seeds in it. Poudrette has been used for three seasons with entire success on Long Island, by many practical farmers, as may be ascertained from letters and statements made by them, and published at this office in a pamphlet containing also the "act of incorporation," granted to the Company by the Legislature of the State of New York; and other facts in relation to the subject. Price 35 cents per bushel. Barrels cost 25 cents each, and hold 4 bushels. Persons wishing to make an experiment on a small scale can obtain one barrel by enclosing a two dollar current bank bill—or three barrels by enclosing five dollars, free of postage. On receipt of the money the article will be put up and forwarded as directed.

\* Price of shares, one hundred dollars—which entitles the holder to one hundred bushels of poudrette annually, during the term of the charter; fifty bushels in time for spring use, and fifty bushels in time for fall use. Shares taken soon, will be entitled to the spring dividend—and, if desired for experiment, a few bushels may be had this fall. All orders, or applications in relation to the business, must be made to the subscriber, t20 Nassau street, New York. D. K. MINOR.

I wish it distinctly understood that the "New York Poudrette Company" is in no way connected with the "Lodi Manufacturing Company," of which Anthony Dey and Peter Barthelemy are, or were, the managers. Dec. 9, 1840. 3m. D. K. M.

## POUDRETTE.

The subscribers reside in the state of New Jersey, many of us in the vicinity of the works erected by Anthony Dey, of the city of New York, on the Hackensack river, in New Jersey, for the manufactory of Urate and Poudrette, called "The Lodi Manufacturing Company." We have used the poudrette on the Spring Crops this year, 1840. We find it a valuable manure, superior to any other kind that we have ever used, and considering the facility of its transportation to the field, the small quantity required in the application to the crops, the quickness of its operation on vegetable matter, and the ease with which it can be applied,—all tend to recommend its use to the farmer and gardener as the cheapest and best manure, and we recommend it accordingly.

Those of us who have applied it to corn and potatoes think that it ripens those vegetables quicker than any other manure by several weeks.

Dated New Jersey, October, 1840.

Jacob D. Van Winkle.	P. F. Welsh.
John J. Newkirk.	G. C. Van Ripper.
John Tise.	George Tise.
Daniel Van Ripper.	William Wood.
George Demott.	John Duryee.
Henry Drayton.	George Newkirk.
Josiah Hornblower.	Garret Newkirk.
Corns. Van Winkle.	Daniel Vreeland.

Shares in the above company are \$100 each, and may be had by applying to Anthony Dey No. 73 Cedar St. New York.—The owner will receive 20 per cent. per annum, payable in money, or 50 bushels of Poudrette. The price to those who buy Poudrette is 40 cents a bushel. It costs the Stockholders 12 cents a bushel. One cent worth, that is, 20 Gills, will manure 20 hills of corn, and the like quantity 15 hills of Potatoes.

Newspapers friendly to agriculture will confer a favor on the Farmers and Gardeners by publishing the above. Dec. 22.

## NEW FLOWER SEEDS.

The subscribers have received from London a choice collection of Flower Seeds, which, with those raised by themselves, constitute all worthy of cultivation. Price from 6-14 to 25 cents per paper. Assortment of those marked 6-14 cents, 20 papers for one dollar, and others in the same proportion. JOS. BRECK & CO. Feb. 10.

## NEW ENGLAND FARMER.

## A WEEKLY PAPER.

The Editorial department of this paper having come into the hands of the subscriber, he is now authorized by the publishers to inform the public that the price of the paper is reduced. In future the terms will be \$2 per year in advance, or \$2 50 if not paid within thirty days.

ALLEN PUTNAM.

N. B.—Postmasters are required by law to frank all subscriptions and remittances for newspapers, without expense to subscribers.

Mr Geo. Tappan is our agent at New Bedford, Mass.

## SEVENTH AGRICULTURAL MEETING AT THE STATE HOUSE.

We had not space last week for inserting our notes of the sayings and doings of the meeting in full. We now supply the omission in part. Many of Dr. Jackson's remarks we do not retain. All that we shall add from him is contained in the following paragraph.

It has been maintained (originally by Berzellius) that there is in the soil a peculiar substance, which he called *geine*. But it is now ascertained that this *geine* contains several substances, varying in their proportions in different soils. Dr. Jackson, some time since ascertained this by his own analysis, (and if we are correct in our recollection, announced the discovery last year.) The last steamship from England brought a work in which Berzellius states that he has himself found in what he had called *geine*, the very substances which Dr. J. had discovered. One of these substances is called apocrenic acid, which forms with lime an almost insoluble salt. But there are five organic matters found in all soils, which form with lime soluble combinations, and thus furnish food for plants.

Mr Colman exhibited several specimens of corn received from New Haven, where, as he informed us, the exhibition of this product, at their show last autumn, was extensive and rich. We saw nothing in the specimens indicating any variety that is new to this section of the country. These corns were distributed among the gentlemen present.

Mr Teschemacher exhibited several geraniums which had been subjected to a new mode of treatment for promoting their growth. The foliage was luxuriant; the leaves were 6 1-2 inches in diameter, while those on a plant treated in the ordinary way were but 4 1-2 inches broad. The process he chose not to describe until the experiment had been extended far enough to determine its effects upon the flower. Since the commencement of this process, a work of Prof. Liebig has been received, which contains an hypothesis in relation to vegetable growth similar to that upon which Mr Teschemacher has been acting. The value of Liebig's work, time and experiments must determine.

[If we correctly understand the matter, Liebig's view is, that vegetation is mainly promoted by the absorption of carbonic acid and ammonia from the atmosphere; and that the great use of manures is to furnish carbonic acid and ammonia in the atmosphere, around the leaves.]

For the New England Farmer.

## ORIGIN OF THE IMPROVED SHORT HORNS.

ALLEN PUTNAM, Esq.—Sir—I noticed with surprise the remarks made at the 4th and 5th Agricultural Meetings, published in the two last numbers of your highly valuable paper, regarding the origin of the improved Durham Short-Horned race of cattle. Mr Charles Colling was the successful founder of that breed, by the introduction of the bull

"Hubback," into his herd of Teeswater cattle, about the year 1778. "It may be asserted that we have no superior Short-Horns which do not claim descent nearly or remotely from "Hubback."

My object more particularly at this time is to request your worthy Commissioner, Mr Colman, to publish a particular account of the "three pure bloods" which he once owned: by doing it he will confer a favor on all breeders of the improved Durham Short Horned cattle in this country. I wish the breeder's name of his "three pure bloods," the name of their sire, grand sire, &c., the sire of their dams, grand dams, &c., and as full and particular a pedigree as can be given, that all breeders may know what strain of blood to avoid.

For a history of this breed of cattle, I refer for a full account to Youatt's Treatise on Cattle, published in London, in 1834, under the superintendance of the Society for the diffusion of useful knowledge, and republished in this country.

HERD BOOK.

Connecticut, Feb. 21st, 1841.

For the New England Farmer.

## ERRORS CORRECTED.

ALLEN PUTNAM, Esq.—Dear Sir—When gentlemen of the legal profession file bills in equity, they are occasionally compelled to abandon them and file new bills; but it is more usual to beg leave to make the proper amendment. I am in the latter position, and desire to correct two errors which I committed in the few remarks I made at the Fifth Agricultural Meeting.

I stated that the improvement of the Short Horns by Mr Charles Colling commenced by a cross with a polled Galloway cow. Such I find is not the fact; yet according to Youatt, it seems quite certain that this cross was calculated to reduce the size and improve the symmetry of Mr Colling's herd. He also says of Colling's sale made in 1810, "In a sale of 48 lots realizing £7,115 17s., Lady and her descendants sold for a larger sum than any other family obtained." Lady was of the "alloy," and this fact clearly establishes the high estimate put upon this cross at that period.

It was with the bull Hubback that Mr Colling commenced his successful career as a breeder.—This bull, it seems, was smaller than the Teeswater, and that he first commenced his reduction of the size of the animal by the use of this bull, and that his herd were in high repute prior to his cross with the Galloway cow.

I stated that we have two cows whose dam was sired by Comet (155.) I should have said grand dam.

By giving this a place in the next number of the Farmer, you will confer a favor.

Yours, very respectfully,

WELLS LATHROP.

Springfield, Feb. 26th.

It is much more honorable to be noble than to be born so.

For the New England Farmer.

## LIEBIG'S AGRICULTURAL CHEMISTRY.

MR PUTNAM—I was much pleased to hear from the Agricultural Commissioner on Thursday evening, that a reprint of Liebig's new work on Agricultural Chemistry was being prepared here, and I trust it will be sold at such a price as will place it in the hands of all to whom the subject of the cultivation of the soil is interesting. This chiefly because it contains facts and their application, which, however known to the few, have not been hitherto widely disseminated. Thus those who have waded through the scientific periodicals of Europe for the last two years, cannot fail to have observed the clear indications of the discovery of the existence of large portions of nitrogen in seeds and plants; and I believe it has been known to some even in this country that ammonia, from which vegetation receives its chief supply of this substance (nitrogen,) exists in rain and snow water. The great practical discovery of Liebig unquestionably is, that plants derive a portion of the large quantity of nitrogen so necessary for their existence, from the ammonia which is carried down to the roots by the rain—which rain imbibes this ammonia from the atmosphere, in which it is disseminated by the putrefaction of various organic substances. Thus the old saying that the rain clears the air, is more true than has been usually supposed.

So also, the action of the decomposition of carbonic acid into solid carbon and oxygen by plants, has been long known, and the decomposition of water by seeds into oxygen and hydrogen, has been likewise considered as proved by later experiments.

In this work of Liebig, who has already earned well merited fame as an analyst of organic substances, these and many other facts are arranged and properly applied to agriculture. The consideration of them by the farmer must be of advantage to him, and will, no doubt, excite that attention to the subject which is so much desired both by the scientific and the practical man.

Some of the decompositions above alluded to, are operations of frequent occurrence in laboratories—the detail of the methods by which they are performed, is familiar to every chemist; and yet the vegetable physiologist wishes to refer them to a mysterious cause which he calls *vitality*—a cause which if once admitted and settled, places a bar to farther examination into the operations of nature. I had much rather consider the arrangement of the cells and vessels of a vegetable as a voltaic pile—the hairs, some of which are pointed, others tipped with knobs, called, for want of a better name, or more knowledge, *glands*, as collectors of the electric fluid. These decompositions then by which ammonia surrenders its nitrogen, carbonic acid its solid carbon and oxygen, and water its oxygen and hydrogen, would be perfectly simple and understood; as would also the cause why moisture or dampness often impedes the experiments of the electrical philosopher—the fluid being conveyed away for the use of vegetation.

Whatever may be my ideas on this subject, I am

far from offering them as facts, having neither sufficient proofs of them nor leisure to institute experiments on the subject. I only wish to enter my protest against the term *vitality*, as closing the door to examination, and of expressing my satisfaction at the chance that is offered by the publication of such a work as that of Liebig, for new discoveries in the science of agricultural and vegetable chemistry.

J. E. T.

### COMPOST.

Fearing that we may not have done justice to Dr. Jackson or to his subject, in our condensed report of his remarks at the 7th Agricultural Meeting, we are about to make him speak for himself, by quoting from his valuable report on the geological and agricultural survey of Rhode Island.

"Peat and swamp muck occur in almost every town in the State, and farms are so situated that they may be abundantly supplied with them.

I am confidently of opinion that when the value of these substances is fully known, they will be eagerly sought for, as the basis of compost manures. They are extensively employed in Europe for this purpose, and are highly esteemed.

Lord Meadowbank, who first called the attention of British agriculturists to this valuable substance, states, "that after long and watchful experience he is satisfied with the powers and duration of this species of compost. In every diversity of soil, it has given returns in no wise inferior to the best barn-yard dung, applied in the same quantity, and that it is equal if not preferable in its effects for the first three years, and decidedly superior afterwards."

"The carcase of a dead horse, which is often suffered to pollute the air by its noxious effluvia, has been happily employed in decomposing twenty tons of peat earth, and transforming it into the most enriching manure."—(See Young's Letters of Agricola, letter 25, p. 238.)

In this country experience has also demonstrated the value of peat composts. Elias Phinney, Esq., of Lexington, and Mr Haggerston, of Watertown, who are excellent practical farmers, both declare that a composted manure made of three parts of peat and one of stable manure, is equal in value to its bulk of clear stable dung, and is more permanent in its effects. Mr Phinney has also been remarkably successful in reclaiming peat bogs, and values such land for tillage more than his uplands.

I have seen the various methods of managing peat composts fully carried into effect, in every form described, and am satisfied that when its use is fully understood, and it shall be generally applied in Rhode Island, that a new and prosperous era will dawn upon the agriculture of the State.

In composting peat, the farmer should be attentive to the principles on which the art is founded, otherwise by deviating he may commit important errors.

It is essential that animal matters of some kind should be mixed with the peat, for the purpose of effecting its decomposition, and to produce the requisite gases. Lime is employed to decompose the peat, neutralize acids, and to disengage ammoniacal gas from the animal substances.

The peat greedily absorbs every particle of ammonia, and becomes in part soluble in water. The soluble matter produced is principally the apocrenate of ammonia. Crenate of ammonia and crenate of lime are also dissolved.

Where an excess of animal matter and lime are employed, free carbonate of ammonia is formed. If the compost is mixed with earth and allowed to remain for a long time, nitre is produced, the operation taking place more rapidly in the summer months.

Potash, soda, soapers' waste liquors and ashes, may also be advantageously mixed with peat, and will serve to render it soluble and fertilizing.

Peat may likewise be used to absorb the liquid manures, which ought to be collected for that purpose, in every barn-yard, the dry peat absorbing like a sponge. It afterwards undergoes fermentation, in consequence of the animal liquids absorbed. It is stated by Mr John Young, in his letters of Agricola, that the liquid manures are of the same value as the solid, and "that one ton of the solid dung will make four tons of compost, and four tons more may be made from the urine discharged by the cattle in the same given time."

Night soil is a very powerful manure, and may be composted with peat to great advantage, provided it is thoroughly limed, in order to effect its decomposition. It is thus deprived of its peculiar odor, and gives off ammonia in great quantities, so as to saturate the peat.

After considering the numerous methods of preparing peat composts, I ought to urge the farmers throughout the State, to begin forthwith to collect and prepare large quantities of this manure for the improvement of their farms, and I have no doubt but the produce of the land will soon be more than doubled. Every farmer who has a bog or swamp, whenever his business will allow him time, and the peat can be dug, ought to obtain large quantities and throw it up on the uplands to drain, by which its weight will be very much diminished, and by atmospheric influences its quality is improved, especially if it is exposed to the action of frost. It may then be transported to the barn-yard or hog styes, and there be converted into compost by mixture with animal excrements. Or it may be made into heaps in the corners of the fields, where it is to be used, fish dung or some other animal matters being mixed with it. Lime may be put in at the same time with the animal matters, or it may be introduced early in the spring, when the compost is dug over, in case it has remained through the winter."

### CULTIVATION OF THE PINE ON THE SHORES OF GASCONY.

We take the following interesting article from a London literary and theological periodical, entitled the Christian Teacher:

Economy is the welfare of states as of individuals. By economy, in its best and widest sense, is meant, that just and wise distribution of means and efforts, which out of the given conditions produces the largest sum of good and happiness.

To spend little, is but one and a very meagre branch of economy—in many instances no economy at all. In states especially, to gather much is at all events equally important. When we look around upon the world, survey the numbers in want almost of their daily bread, while the earth given to man to be subdued and rendered productive by the labor of his hands, is still, in an infinite number of cases, totally without culture, and never, with a few rare exceptions, producing what it is capable by skill and industry of being made to produce, it is impossible not to believe that our knowledge of

the science of political economy is in its very infancy—its true principles little practiced or understood. Man is seen on all sides in that most affecting of all situations, willing to labor, crying for the privilege of being allowed to work, starving in want of the merest necessities of life, while the bounteous earth lies spread around him, offering her liberal rewards for labor, and not finding hands.

What inexhaustible mines of wealth yet unexplored does the surface even of our own well-peopled and well-cultivated British islands present; what sources of riches, strength and happiness lie buried in the bogs of Ireland alone!

Soils far more ungrateful have, by a judicious and economical culture, been made the fruitful source of wealth and felicity, and perhaps there is no contemplation more useful and agreeable, than that of such a picture.

The manner in which sand hills, such as those which, covered with wiry grass, line many of our shores, have on the southwestern coast of France been rendered useful and productive in a high degree, is a striking example of well-directed and successful efforts of this nature.

In the departments of the *Gironde* and of the *Landes*, on the shores of that stormy ocean which raves between the mouth of the Gironde and Bayonne, the most magnificent pine forests are at this day waving, where not many years ago was nothing but a dreary and threatening desert of sand.

These forests cover an immense extent of land round Teste and the basin of Arcachon, and might be extended so as to cover the whole of the above mentioned coast, an extent of sixty French leagues, or about one hundred and fifty English miles.

Teste and the basin of Arcachon will be found, on consulting the map, to lie on the shores of the ocean, in the southern part of the department of the Gironde, from which the department of the Landes extends southwards. Every one in the least acquainted with French geography has heard of the Landes; of those immense level plains,—and has pictured to himself their dreary monotony—their shepherds elevated on stilts and wrapped in grey sheep-skins, leaning upon their staves, and watching, motionless, the flocks scattered over the measureless pasture.

The force of the western wind has raised upon this coast, as upon many others, hills of sand, from thirty to sixty metres in height, (a metre is something more than an English yard.) The French give these sand hills the name of *Dunes*: they are composed entirely of the dry sea sand, driven inwards in various places, as upon some of our own coasts.

These sand hills having attained a certain elevation, fall—are driven forward by the wind, and invading the plains behind them, menace the Landes with inevitable destruction.

Populous towns have fallen victims to the advance of this slow, but as it was long thought, irresistible enemy. The Dunes advanced annually, and the gradual destruction of the productive plains might be predicted with mathematical certainty.—Even the city of Bourdeaux itself seemed doomed, sooner or later, to perish under this deluge of sand.

This state of things at last excited public attention, and towards the end of the last century, the means of arresting this fatal progression were sought for, and, as is the usual consequence of being sought for, found.

A man of the name of Bremontier, we do not know whether he is yet living or not, imagined a

method of staying the plague, and of rendering this element of desolation and despair a source of wealth and population. He fanned and executed the project of covering these moving hills with forests of pine (*le Pin maritime*), the roots of which, by conglomeration together these light particles, and forming them into heaps of solid earth, might fix them permanently in their place, and arrest their further progress.

Fifteen thousand *hectares* are now covered with the pine: those plantations which date from the time when Bremonnier began his operations, now present to the eye, in place of the desolate sand hills, magnificent forests, waving majestic above the restless ocean.

The *Dunes* extend sixty leagues, being in breadth from three quarters of a league to three leagues: the hills are intersected by valleys, called in the country *Ledes*.

The trees are raised from seeds, cast on the spot on which they are intended to grow—they are not transplanted: when the seed is sown, the moving of the light sand is prevented by covering the ground with brambles or young pine branches, fifteen hundred faggots of these being necessary to cover one hectare: the seeds are sown thick, and when the young plants are of seven or eight years, the first thinning is made. If there were any means of cheap transport, these thinnings, sold at Bordeaux, would be extremely profitable. After this thinning, the remaining plants grow with increased vigor, and in ten years reach the height of fifteen to twenty feet; at the end of twentyfive years they produce turpentine. A hectare of pines produces this article to the value of from 25 to 60 francs, (that is from £1 to £2 8s. sterling,) according to the age of the plants,—a pretty considerable profit from what was once an unprofitable, and worse than unprofitable desert.

The infinite teeming earth seems, even now, but to be beginning to open her riches; man is yet only guessing at the powers of the mighty mother—only gathering the first scanty fruits of the wealth lying hidden in her bosom, as the reward of science, exertion, enlightened benevolence and peace.”

#### AGRICULTURAL READING.

It may easily be shown that there is no single occupation or business in life, where extensive knowledge is more necessary than it is to a full understanding and proper practice of agriculture. There is none so intimately blended with all the important branches of the natural sciences as this; none to which geology, chemistry, botany and entomology, are such important contributors and invaluable auxiliaries. The earth, the air, are full of instruction to the farmer; the pebble, leaf, insect; the composition and decomposition of matter and its causes, are all before him, all constantly going on around him, all inviting attention as part of the processes he must produce if he is a successful cultivator of the soil. He must read: and if he feels the value of knowledge himself, he will be proportionably anxious that those around him, his neighboring farmers, his friends, should read also. A community of knowledge constitutes one of the strongest ties that can bind society together; whatever may be the topic, it is a bond of feeling and interest not easily broken or destroyed. An intelligent practical man may change the whole course of agriculture in a neighborhood, and give an im-

pulse to its prosperity, which may endure long after the cause is forgotten. We have seen a man go into a neighborhood of farmers, respectable men, but who did not read, and felt the old fashion contempt and aversion for those who did. This man was a reader of agricultural papers, and when an improvement was pointed out that his good judgment showed was adapted to his means, his farm, or his circumstances, he adopted it at once. He improved his farm by draining his lands, and nearly doubling the ordinary crops, by skilful cropping and rotation. He improved his stock by purchasing at great cost, superior animals to breed from. His neighbors at first called him a “book farmer,” and sneered at his management. They soon found the laugh was on the wrong side, and began to inquire the causes. If he could get a neighbor to read, his periodicals were always at their service; and if he met a brother farmer, some proposition was made or some inquiry started which he was sure would lead to useful results. Soon they found agricultural papers necessary, and became subscribers themselves; an agricultural paper has become as indispensable as a political one, and its arrival is always looked for with interest and pleasure. The prominent farmers of that neighborhood are now *readers*—several different publications are received; and when they meet, the comparative merits of the different modes of husbandry are freely and intelligently discussed. We would wish to see such examples as this more frequently imitated. When they become common, it will be a proud day for American agriculture. In such instances, we trace the true secret of improvement, for although the looker-on may at first sneer at the reader, he is sure eventually to imitate first the improvements he makes, and lastly his course of reading. We ask it then as a favor, of every friend to agricultural improvement, to bring a knowledge of farming periodicals to the notice of his neighbors—let them be induced to become subscribers—to read, to reflect on the means of improving their cultivation—and a point will be gained, which will afford a rational hope of rapidly increasing and permanent prosperity.—*Albany Cult.*

*Examine your Implements.*—It is well in this month to make a careful examination of your farming implements; ascertain what are wanting, what new repairs, what new ones are to be introduced, &c., that all may be ready when required for use. It is not good policy when the seed is sown, to find you must wait until a harrow can be constructed or your neighbor has done using his, before you can cover it; or when you are ready to plant or mow, to find that you have hoes without handles and broken snaths to your scythes. All are more or less dependent, but the practice of borrowing agricultural implements should be discountenanced as much as possible, since they are all so cheap that where they are wanted frequently, the old adage, that it is better to borrow than to buy, is fully reversed.—*ib.*

Slander is a leprosy that cleaves to all mankind. Where you can find one who would willingly arrest the progress of an evil report, there are five hundred who would more willingly spread it.—*Anon.*

He who exchanges his own good opinion for that of another, makes a miserable bargain.

The strongest armor is worn inside the bosom.

*STEEL ORE.—Important Discovery.*—In the town of Duane, Franklin co., New York, is a vein of magnetic oxide, distinguished from the other minerals of that region by its capacity of yielding, directly from the process of smelting, a substance possessing all the physical and chemical properties of manufactured steel. From the analysis it appears that the properties of the substance resulting from the smelting of this mineral are inherent, and not the result of any new or peculiar process of assay. However little the world may be prepared to give credence to the existence of such a mineral in the state of an oxide, the fact is now too well established to admit of skepticism, and no one who will examine the edge tools and cutlery of all kinds that have, during the past season, been cast from this mineral and sent out into most of the cities for samples, can do so great violence to his own senses, as to doubt any longer the existence of a *natural steel*, from which, by the simple mode of moulding and casting, razor blades, penknives, shears, plane irons, gouges, axes of all sizes and descriptions, and every variety of tools of the machinist and carpenter's shop, are at once produced, having all the properties and best qualities of the purest steel.

We have actually seen some samples of articles cast out of this newly discovered ore which have been brought to this city, and are intended, we believe, to be presented to the “National Institution.”—*National Intel.*

*Churning Milk in Mexico.*—We find the following in the *Albany Cultivator*: it may be true.

“Many patents have been granted for various kinds of churns in our Yankee land, which probably in most cases originated from those who were accustomed to the “good old way,” but it strikes me that the Mexican churn beats all your Yankee inventions for ease, pleasure and saving of time. The method, as communicated to me by Joseph Greenham, a merchant of Vera Cruz, is: to enclose two tin cans in a green cow-hide, the size of them to correspond to the quantity of milk: the hide will shrink on drying and adhere tight to the cans, and being placed one on each side of a trotting horse, it has the appearance of saddle-bags. When filled nearly full with milk, the Mexican has only to mount the steed and ride into town from Mediling to Vera Cruz, the distance eight miles: the motion of the horse effects the separation of the butter from the milk, and the rider has only to pocket the cash for his buttermilk and butter, and at his leisure wend his way home.

Yours,  
S. W. JEWETT.

Weybridge, Vt., Jan. 1841.

[The milk of Col. Jaques' celebrated Cream Pot cows has been converted into butter during its conveyance from his farm in Charlestown to this city.]

*To destroy Rats and Mice.*—The following has been recommended for this purpose, and is worth the trial:

Take equal quantities of powdered oatmeal and unslacked lime; mix them by stirring, without adding any liquid, and put a small quantity in a place infested by rats or mice; they will swallow this preparation, become thirsty, and the water which they will drink will slack the lime and destroy them.

Despise no one; for every one knows something which thou knowest not.

For the N. E. Farmer.

### KEEPING CATTLE WARM IN WINTER.

MR ALLEN PUTNAM—Dear Sir—I observe by the papers that the subject for discussion at your agricultural meeting this evening, is Live Stock. If I were present, I would say something on the importance of keeping neat cattle and sheep warm in the winter season; but as I cannot be there, I will address a few words to you on the subject; and if you shall regard what I write as calculated to make the farmer's stock more comfortable and more profitable to its owner, you may publish this letter in the New England Farmer.

When I commenced farming, I prepared a good barn-yard, enclosed with a close fence, and a well of water therein, covered with a shed. I used to turn out my cattle in the morning, and suffer them to remain out all day, unless there was a severe storm. The cattle were fed at noon with some coarse fodder spread on the snow in the barn-yard, or in racks under the shed. A plentiful supply of water was kept constantly in a trough in the yard. Now, sir, for years I thought that this was the best way I could manage. I have since adopted a different course. My cattle are fed several times in the morning, and carefully carded; and at about 9 of the clock are turned out to water. While the cattle are drinking, the stalls are cleaned out and littered, and in about one hour the cattle are again tied up. If the weather is stormy or very cold, they are permitted to return to their stalls as soon as possible; but if the weather is mild, they are suffered to remain out longer, but not more than two hours. They are fed in their stalls several times during the day, always giving them little at a time. In the afternoon they are again turned out and watered, and suffered to remain out as long as in the morning. The stalls having been again cleaned out and littered, the cattle are again tied up for night. Great care is taken to make the barn warm. When the weather is cold, the doors and windows are closely shut. In this way, the cattle being more comfortable, are kept at much less expense and thrive better. A cow will give more milk when kept warm than when exposed to the cold. Every farmer knows that cattle eat more in severely cold weather; and, notwithstanding, then cows give less milk; still few farmers take sufficient care to protect their stock from the severity of the weather. Hogs, also, gain more on the same food, when kept warm.

My business calls me often to ride through the county of York, and it is distressing to see seven eighths of the stock (working oxen excepted,) exposed to the severity of the weather in cold winter days, from morning till night, without shelter. Cattle so situated will take little exercise, but stand shivering with the cold, not being able to lie down comfortably on the cold, melting snow. It is a mistaken notion that cattle and sheep should be much exposed to severe cold weather to render them hardy. Some farmers say that they leave their cattle out, because their business calls them from home. This is a poor excuse. It would be much better to turn their cattle out for water only once each day, and tie them up immediately after drinking, than to leave them all day exposed to the open air. Then the humane farmer, when gone from home and exposed to the storms of our inclement winter, may feel some satisfaction in the re-

fection that he has discharged his duty to his live stock, by placing them in a dry and warm shelter. Respectfully, yours, &c.

WM. A. HAYES.

S. Berwick, Me., Feb. 18, 1841.

For the New England Farmer.

### ROT IN TURNIPS.

I have noticed several articles recently in the various agricultural papers, relative to the destruction of the ruta бага in the field by rot.

The disease alluded to is not confined exclusively to the ruta бага, but is not unfrequently the cause of serious and fatal injury to every species and variety of turnips now known. In the autumn of 1839, I had a yard containing no less than six distinct varieties, all of which, with the exception of a few that had been sown very late, in order to supply a vacancy occasioned by the ravages of the fly, were destroyed.

A field of ruta bagas, the same season, was also greatly injured by the same cause; and indeed I have never been very successful in raising this root, where I have manured with green or unfermented dung, unmixed, with a liberal quantity of ashes or unslaked lime. The best and most valuable crop I ever harvested, was a crop of ruta bagas sown in drills, 18 inches asunder, on green sward turned in in June, and manured with ashes and gypsum, in the proportion of half and half.

The roots were perfectly smooth and symmetrical—of an excellent flavor, and kept longer without depreciating than any I have ever raised.

There have been many curious speculations offered in order to account for this evil; but as yet we have had nothing but speculations, and no one can congratulate himself upon having discovered either the cause or a remedy for its effects. Whether the rot is occasioned by a radical or tropical affection, or whether it is confined exclusively to crops grown on soils that have been manured with unfermented dung, is a question I am unable to decide.

Windham, Me., Feb. 4th, 1841.

H. D. W.

### BERKSHIRE SWINE.

We last week inserted a communication from "One who prefers Form to Color"—and also copied from the Albany Cultivator an article, each highly approving of the Berkshire. Our readers must not infer that we coincide in opinion with all who furnish matter for our pages, or that we adopt the views contained in every article which we copy. Our purpose is, within proper limits, to furnish our readers with what may be said on each side of a question. The Berkshire swine have recently obtained great notoriety. Farmers from east, west, north and south are inquiring into their merits and defects. It is important that the true value of this breed should be determined. If any one can give us facts or opinions from sources which entitle them to any considerable weight, that tend to show that these swine are less valuable than some other kinds, or that crosses with them are better than the pure bloods, we shall be happy to lay their remarks before the public. We have apprehensions that Berkshires deceive the eye; that their roundness on the rib makes them promise thicker pork than the farmer finds when they are slaughtered. We learn from good authority, that on the belly and sides they are thin, compared with the cross of Berkshire and Mackay. Report says that butchers

and meat sellers dislike the pure bloods. If this breed possesses a peculiar aptness to fatten, and if at the same time the pork is worth less in the market, then the farmer must settle the question whether what he saves in keep is not to be accompanied by a diminished price for the pork, such as will prevent his being the gainer by changing his stock. Information upon the subject is solicited.—Ed.

### THE POUUREITE COMPANIES.

In December last, there was inserted in this paper a notice of affidavits forwarded by Mr Anthony Dey, relating to the relative value of poudrette, as manufactured by the New York Poudrette Co. and by the Lodi Manufacturing Co. The object of the affidavits was to show that chemical analysis proved the article prepared by Mr Dey to be much superior to that prepared by Mr Minor. Last week we inserted what Mr Minor called the farmers' analysis of his article. Accompanying that statement was a note intimating that the analyses made for Mr Dey might not have been conducted with entire fairness. We suspect there may be facts which would naturally prompt an honest man to conjecture that Mr Dey, or rather his agents, may have given too great a relative excellence to his article. Our object now is, to place Mr Minor, or the New York Co. on as good footing in our columns, as was formerly given to Mr Dey or the Lodi Co. Here we must stop: the private rivalries or differences of the parties we must refuse to make public. We may add our own conviction that those who order the article from Mr Minor, are more likely to obtain it, than those who apply to Mr Dey. We have ordered from him a small quantity for our own use, and Messrs Breck & Co. are expecting to receive in a few weeks, several casks for sale.—Ed.

*Utility of Select Seeds.*—Mr Gaylord, in the Albany Cultivator, very justly remarks, that "the seed that ripens first in the ear, and is separated with the greatest ease, is the most proper for seed, as these circumstances show it is the most mature. A farmer in one of the northern States a few years since, was in the habit of selling large quantities of seed wheat annually and at high prices, as his wheat was of a superior quality, very heavy and productive, and supposed to be a new variety. It appeared, however, that he had brought his wheat to that degree of perfection, by selecting some of the finest heads from a field in the first place, and then instead of threshing the whole crop, and using the seed promiscuously, he generally beat the sheaves over a barrel, by which only the best and most perfect grains were separated, and by repeated sowings had rendered the qualities so desirable, permanent."

It is reasonable to believe that every kind of seed may be improved by a similar process of selection.

It is too often the case that a family of sons and daughters are seen spending their time in idleness and extravagance, while their parents are laboring like slaves for their support.

The mind of a thinking man resembles the earth, beneath whose surface lie many precious seeds. Every rain calls forth buds, and every beam of the sun produces flowers.

For the N. E. Farmer.

### LIME—"ONE FIRE MORE."

MR PUTNAM—Permit me to second your recommendation in regard to the application of lime the ensuing spring, on the plan proposed by Dr. Jackson, as set forth in your report of his instructive remarks at the Seventh Agricultural Meeting.

It yet appears to be a mooted question with many of our practical agriculturists, whether this great chemical agent is capable of affording any important aid in improving the common methods of cultivation; and it would appear to be the surest way to settle its merits as a fertilizer, to adopt, *strictly*, as you observe, the recommendations of its distinguished advocate, Dr. Jackson, which are not only supported by science, but by the experience of many intelligent and persevering cultivators in various parts of our country.

Considerable disappointment has been produced heretofore in its application as a top-dressing, which the scientific reasons assigned by Dr. Jackson in his remarks, will prevent in future.

Upon the whole, with so much evidence in support of its utility, and with the satisfactory explanations afforded by science of the causes of its failure in certain cases heretofore, I think instead of abandoning its use, there are new inducements for farmers to proceed in their experiments with it. Let it have a *fair* trial, upon *scientific* principles, as proposed by Dr. Jackson, and I for one have no fears for the result. At any rate, let it not be condemned as worthless, before it has been put to the test its friends solicit. An article of so much general importance and of so high pretensions as an aid to agriculture, should not be spurned upon the mere unsupported suggestions of *any* man, more particularly of one so manifestly destitute of chemical knowledge as—[The severe personal allusions of our correspondent which follow here, though just, we have thought best to omit, as they might give rise to a warfare of an unpleasant character.] Such men, however, can do but little to impede the march of agricultural improvement or dampen the spirit of scientific inquiry which is now awakened. In their veneration for ancient error, they may despise the truths which modern science is revealing—but they cannot circumscribe the influence or prevent the effects of those truths, no more than they can

"Pluck his brightness from the sun,  
Or with polluted finger tarnish it!"

But I am digressing. Mr Editor, I would again urge upon farmers the propriety of testing the value of lime in the exact manner proposed by Dr. Jackson, and if success does not attend the trial, there will then be *reason* for dispensing with its use: In the encouraging words of our caption, give *One Fire More!*" and another will be unnecessary.

Before I close this, permit me, sir, to congratulate you on your success in your new capacity.—Under your charge, I consider the usefulness of the Farmer, as an *agricultural* paper, greatly enhanced; and am confident that the New England Farmer—the lord of an acre, alike with him who tills his hundred—could adopt no better means to increase his store of "this world's goods" and reap richer recompense for his toil, than by becoming subscriber to, (and a *payer for*.) your valuable weekly. I would not detract a hair's-breadth from the well-earned merit of your eminent predecessor in the editorial chair, but in justice to you must say, that if he was fortunate in being able to

please a *select* class of readers, you must be deemed *peculiarly* fortunate in being suited to please *the mass*; and the course which you marked out for yourself upon assuming the editorial duties, and which you have thus far so ably and faithfully maintained, is the course, depend upon it, sir, which will regain the Farmer its wonted popularity, and meet the unqualified approbation of the great majority of its subscribers. I am pleased to see that in your efforts to make a good agricultural paper, you are so well seconded by the aid of correspondents—and, wishing that their number may be augmented, and that the Farmer may grow in public favor as you advance in editorial experience,

I remain truly yours,

J. H. D.

P. S.—In one of the farm reports lately published in the Farmer, I noticed the opinion advanced as fact, that manuring corn in the hill has the effect to produce an extra quantity of stalks to the detriment of the grain. As I do not recollect having seen this question discussed in your columns, I would ask if this opinion is sustainable as fact? The stimulus given to corn in its early stages by the manure in the hill, lessens the chance of the crop being injured by frost, by hastening its maturity; and I submit whether, in the long run, this advantage does not counterbalance the evil of a disproportionate quantity of stalks. I should like the views of your correspondents, *pro and con*, in regard to the matter.

From the Farmer's Cabinet.

### ON BREEDING BACK.

SIR—Conversing lately with two very intelligent friends and practical agriculturists on the tendency of all animals to "breed back," I was struck with the instances they related as having happened within their knowledge, and which carry back that tendency to a date far more remote than what I had contemplated as probable, or even possible.

The first said, "When I was a lad at my father's house, we had amongst our poultry a small rooster, of the bantam or feather-legged breed, with the feathers extending outside his legs like two small wings; he was kept until it was suspected that the breed of the other fowls might be injured by his cross, when he was killed; but, from that day to this, not a year passes without a feather-legged chicken amongst the poultry!"

The other said, "I once kept the variety of fowls called rumps: that is, fowls naturally without tails; but at length, determining to get rid of them, they were all killed right away: this was seventeen years ago, and during that time I have never had one of that sort upon my farm, but this year there has come a rump fowl amongst the chickens!"

And it is in this way, I presume, that the very frequent admixture of black, or spotted-faced sheep, are to be found in flocks where there have never been either ewe or buck of that variety for an age; but it must have been observed by every one, at all conversant with the rearing of sheep, that these mongrels, which have black, or dark-colored spots, are always the best sheep in the flock. And I know at this time, a remarkably fine pen of spring pigs, a cross between the Chester county and Berkshire black and white, each of which has the requisite number of white feet, &c., according to Albany statute; but two amongst them, and by far the best pigs, have a tinge of red mixed with the white—a proof that they are "breeding back" to their old

Berkshire blood. To this cause may also be attributed, I have no doubt, the varieties we so often find in corn, which, although selected with the greatest care, and planted far away from every other variety, will still be found to "sport" in a most surprising manner.

P. W.

### WHY DON'T HE DO IT.

When a farmer *knows* that a gate is better, and as a time and labor-saving fixture cheaper, than a set of bars and posts, and without calling on a carpenter he can himself make one—why don't he do it?

When he has no other fastening to his gates and barn doors than a rock rolled against them, and in a single evening after supper is able to make a better one—why don't he do it?

Or when he sees the boards dropping from his barns and out buildings, and like heaps of rubbish lying in piles about his premises, and need only nailing on again—why don't he do it?

Or if he is afraid of the expense of nails, and is always crying up the maxim of Dr. Franklin, to "save the pennies and the pounds will take care of themselves," and he knows that the same Dr. Franklin also said that "many men are penny wise and pound foolish," and he is not careful to think of the precept contained in the latter—why don't he do it?

If it is a saying of nearly half the manure of a farmer's stock by keeping them shut up in yards, instead of running at large through most of the winter—why don't he do it?

If he knows that many of his fields would be greatly improved by ditching, and by the removal of large stumps and stones—why don't he do it?

And when he knows that his pastures yield nearly double the feed, and of a better quality, if the bushes were all cut and subdued—why don't he do it?

And if he can add fifty per cent. to the product of his clover fields, and even his pastures, by the use of gypsum—why don't he do it?

And if it is cheaper, actually cheaper, to burn dry wood than green, and to use a stove instead of an open fire-place—why don't he do it?—*Farmer's Gaz.*

From the Albany Cultivator.

### CULTURE OF THE SUGAR BEET.

Messrs Gaylord & Tucker—I have tried during the four years past, various modes of cultivating the sugar beet. On our soils, which we call red land, but which I suppose you would call alluvial, the following plan I find the best. I work my ground until it is well pulverized, with a good supply of manure if it is poor. I then draw furrows about two feet apart, into which I put a reasonable quantity of manure. I then run my plough round both sides of the furrow, which will cover the manure and raise it on a ridge. I plant the seed from ten to twelve inches apart on the ridge. In this way I have been tolerably successful. Last year I had an extraordinary crop, but I did not take time to ascertain the number of bushels or tons to the acre. This year I had two acres, and got twentysix tons, though I do not call it more than half a crop, it having been a very dry season.

PETER DIEHL.

Poverty wants some, luxury many, and avarice all things.—*Cowley.*

NEW ENGLAND FARMER,  
AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, MARCH 10, 1841.

EIGHTH AGRICULTURAL MEETING AT THE  
STATE HOUSE.

The President, Hon. Daniel P. King, informed the meeting that he had received a communication from Dr. Andrew Nichols, of Danvers, with a request that it might be laid before the body over which he presided. A portion of the communication, embracing the outlines of a plan for forming an association among the farmers of the Commonwealth for the purpose of employing one or more agricultural chemists, who should analyze soils, manures, &c. for each member of the association, and prepare a popular treatise upon the science of agriculture, having been read, the matter was referred to a committee, consisting of Messrs Denny, of Leicester, Dr. Jackson, of Boston, and Collamore, of Pembroke, with instructions to report at the next meeting.

The House of Representatives having prolonged its session until 7 o'clock, and the community in part being engaged in the celebration of the Fourth, the attendance at the Hall in the early part of the evening was so small, that the meeting preferred to receive the remarks of Mr Emerson on Forest Trees at some other time, and voted a meeting on the following Monday evening for that purpose.

A gentleman from New Bedford being present, Mr Randall, who has imported for his own use both Ayreshire cattle and Berkshire swine, he was invited to favor us with some account of them. He judges the Ayreshire to be second to none as dairy stock. We understood him to say that one of his cows from the first to the seventh of April, besides feeding her calf, made 7 lbs. of butter and furnished 3 pts. of milk daily for other uses. This cow never gave more than 20 qts. of milk per day. This breed do well on short feed; will thrive where the Durhams would dwindle. They are more easily kept than our native stock; and one, with the same keep, will get more milk and more flesh from the Ayreshires than from natives. He has a fine bull, Ro's Roy, out of a cow that has obtained the first premiums in Scotland, which he deems superior to any other animal he has seen. This breed are not larger than our New England cows. Feeds his stock mostly upon straw and 1 1-2 peck of roots per day to each animal. The bull thus kept, was thought by many, from his fine condition, to have been stall-fed. When asked by Mr Buckminster whether his Ayreshires resembled the stock owned by Mr Cushing, he replied that they do resemble Mr Cushing's, but yet differ from them. Would not volunteer to express any apprehension that Mr Cushing's are not pure Ayreshire, but as he has been questioned, gives the opinion that there may be in them some Clydesdale blood.

Mr Randall has imported two Berkshire sows and a boar. The writers for the Albany Cultivator would lead one to suppose that the real Simon Pures have 18 white hairs in the tail, three white feet and a little white in the face, and that all other parts are black. But his are of a red or brick dust color, mixed with black. They have done remarkably well; his boar is now at Mr Cushing's, (Watertown) where he trusts he will establish a good character.

The question was raised whether the Berkshires will cut up as well as other hogs. (Our article in another column was sent to the printer before the meeting.) Mr Colman had recently heard reports unfavorable to them, at which he was somewhat surprised. He said that Mr

Cushman, Representative from Bernardstown, had had consigned to him for sale by one of his neighbors recently, a very large hog, and a request was made that he should not let it be known that the hog was of Berkshire breed, because that would injure the sale. The report is abroad that the meat sellers in the market house were unwilling to purchase the large hogs recently sent to market by Mr Phinney. (We are not certain whether the last statement was made by Mr C. or by some other speaker.)

Mr Putnam deemed the question an important one, and stated that he had heard objections to this breed from sources which entitled them to much consideration.

Mr Dodge, of Hamilton, apprehended that our farmers might miss it, by running after new breeds and omitting the improvement of those that have long been in the country.

Mr Sheldon, of Wilmington, said he was the first man to drive swine from New York State to this vicinity. Got then the Grass breed; they resembled the Berkshires, but were not as good; did not cut up well. He cares little for the breed—he wants to see the animal—to see the make of him—and if he likes that, he'll buy him, asking no questions about his family name.

From a bushel of *cooked* meal he can get sometimes 12 lbs. of pork; but from raw meal he seldom gets more than eight. It is important to be very regular as to the hour of feeding; after you have fixed your hour, do not depart from it so much as five minutes. A man accustomed to his breakfast at precisely seven o'clock, can tell without a watch very nearly when that time comes; and the pig can tell as accurately. By this regularity you keep them from squealing. A hog that eats every thing—that is, one that gets a variety in his food—will do better than one that is confined to a single article of food, however nutritious that may be. In reply to the question whether the state of the tide at the time of slaughtering the hog has any effect upon the pork, Mr S. said that he had made extensive observations and was satisfied that the point could not be settled until we could discover some process by which we could kill one half of the same hog on the flood, and the other half on the ebb of the tide.

Col. Adams, of Newbury, said that he continues to keep the Byfield breed, but has crossed slightly with the Mackay. Likes the looks of a white hog with lopped ears and a clipped tail. Recently slaughtered two sows 20 months old, that had brought 15 pigs, and their weight was 825 lbs. His butcher, Mr Colman, of Newburyport, tells him that no Berkshire of equal weight will cut so thick pure fat pork, on the back, by one inch as his breed. An intelligent farmer in his vicinity who recently slaughtered Berkshires, finds the pork so indifferent that he will not eat it. Col. A. coincides with Mr Sheldon in regard to feeding at a particular hour.—In winter he feeds twice a day; in summer three times.

Mr Sheldon thinks that pork can be obtained cheaply by giving hogs as much as they will eat; he generally feeds three times a day; but one season an Irishman fed his swine five times a day; and they did better, slightly better, than in any other season. The worst course one can take is to give an animal *just enough* to keep him where he is: up to that point there is *no profit*—but the next kernel of corn, the first that adds to size or fat, you may get pay for. The troughs should be covered, excepting while the hogs are eating.

Mr Colman corrected a statement made by him on a former evening, when he informed us that Capt. Mackay brought from England the original of the breed that bears his name. They were brought by Capt. Tracy.

Mr Randall had tried, much to his satisfaction, a process of curing hams, described last season in the Albany

Cultivator. (We think it has been published in our columns before we had charge of the paper, but if not, we will soon give it an insertion.)

The Berkshires found more disparagers than praisers. Their comparative merits and defects are not yet fully known. Those who have them already and like them, will of course continue to keep them;—those who have fair hogs of a different breed, may do well not to incur much expense to obtain this famous kind, until their relative worth is better understood. The color of Mr Randall's hogs, taken in connection with a few facts observed by us the last season, creates a presumption in our mind that there may be a better variety of improved Berkshires than that obtained from the vicinity of Albany. We noticed in each of three litters of pigs last year, *one* pig of the red or reddish color, and in each instance that was apparently the best pig in the litter. Red with black spots is said to be the color of the genuine old English Berkshire; the *black* comes mostly from the Chinese black hog. And as those pigs were best in which the color of the old Berkshire shows itself, the inquiry is legitimate, whether the fashionable Berkshire of the day has not too much of the Chinese blood in him; whether one with less of that blood would not be better.

AGRICULTURE IN MAINE.

We are happy to learn that our brethren in the east have commenced holding meetings at the capitol. Judging from the reports given in the Maine Farmer and Maine Cultivator, the first meeting must have been highly interesting. There are intelligence and enterprize enough in that State, when they shall be brought to bear more directly and generally upon agriculture and upon the inducements there offered to its prosecution, to make Maine prominent among the agricultural States of the Union. More extensive cultivation of the soil, in connection with the lumber trade and operations would, we imagine, contribute essentially to the prosperity and comfort of her people. Our hearty good wishes attend those who have commenced laboring to awaken there a deeper interest in this most natural and highly important occupation.

CORN.

We are indebted to Lovett Peters, Esq., of Westboro for a truss of corn, which has the characteristics of a very good kind. We shall with pleasure comply with his request to use some of it on our own grounds.

Also, we have on hand a specimen of fine corn from Mr John Preston, of Danvers. Other varieties from various directions may be seen at the Agricultural Warehouse.

We are indebted to Mr Peters, also, for a communication relative to the slavers in horses, which will be attended to at the season when that disease usually prevails.

BRISTLES IN ENGRAFTING MORTAR.

We learned a few days since from E. Phinney, Esq. that bristles, somewhat chopped up, cut say into three pieces each, will make a much more durable mortar than hair, whether for engrafting or plastering.

On Monday evening Mr G. B. Emerson was prevented by ill health from delivering his address upon Forest Trees. A discussion was had upon the Root Culture. Tomorrow evening, *Trees* will be the subject for consideration. Mr Emerson will be present if his health permits.

The excesses of our youth are drafts upon our old age, payable with interest about thirty years after date.—*Lacon*.

## THERMOMETRICAL.

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northernly exposure, week ending March 7.

March 1841.	7 A. M.	12, M.	5, P. M.	Wind.
Monday,	1 37	50	33	S. W.
Tuesday,	2 31	33	31	S. E.
Wednesday,	3 23	40	34	S. E.
Thursday,	4 23	28	25	S.
Friday,	5 9	21	22	N.
Saturday,	6 17	35	30	S. E.
Sunday,	7 35	42	35	N. W.

## BRIGHTON MARKET. — MONDAY, MARCH 8, 1841.

Reported for the New England Farmer  
At Market 285 Beef Cattle, 880 Sheep, 12 yoke of Working Oxen, 15 Cows and Calves, and 480 swine.  
Prices.—Beef Cattle.—A small advance was effected. The premium cattle from Worcester county, which were exhibited in State street a few days since, were sold for a high price. We quote extra \$6 75 a 7 00. First quality \$6 25 a 6 50. Second quality \$5 75 a 6 00.—Third quality, \$5 00 a 5 50.

Working Oxen.—No sales noticed.

Cows and Calves.—No sales made public.

Sheep.—Dull Lots at \$2 50, 3 25, 4 00, 4 50 and 4 75.

Swine.—Lots to peddle at 4 1-2c. for sows and 5 1 1/2 for barrows. At retail from 5 to 6 1-2.

## WHOLESALE PRICES CURRENT.

Corrected with great care, weekly.

SEEDS Herbs Grass, very little in market. Red Top, by the bag 60 to 70 c. Clover—Northern, very little in Market.—Southern, plenty, 9 to 10 c. Flax Seed, \$1 37 to 1 50 bu. Lucerne, 25 c. per lb.

FLOUR. Howard Street \$5 37—Genesee \$5 31—Ohio \$5 12.

GRAIN. Corn—Northern Yellow none—Round Yellow 51 to 53—Southern Flat Yellow 50—White — Rye—Northern 60 to 65—Southern 50 to 55. Oats—Southern 23 to 32—Northern 35 to 40.

PROVISIONS Beef—Mess \$10 50 to 11 00—Prime \$6 50—No. 1 \$9 00 Pork—Extra—15 00—Clear 14 50—Mess \$13 00. Hams—Northern 9 c. per lb—Southern, none. Lard—Boston 9 c. per lb.—Southern, 8 to 8 1-2. Butter—Lump 18 to 22—Firm 12 to 18—Shipping 8 to 14. Whole Hogs 5 1-2 to 6 c.—Pigs 5 c.

HAY. per ton, \$17 to 17 50—Eastern Screwed \$13 to 14 CHEESE—Old 11 c.—New 8.

EGGS. 16.

POULTRY—Chickens 10 to 12 1-2 c. per lb.—Turkeys 2 1-2—Geese 8.

WOOL.—The market for this article has not experienced any change of late. Puled Wool is rather scarce, and there is but a limited supply of low Fleeces and of fine Fleeces the stock is also moderate. Prime or Saxony Fleeces, washed, 6 50 to 55 c.—American full blood, washed, 47 to 50—Do 3 4 blood, washed, 44 to 46—Do. 1-2 blood, washed, 35 to 10—1-4 and common do, 35 to 37—Smyrna Sheep, washed, 20 to 23—Do. unwashed, 10 to 14—Bengasi Sheep, 8 to 10—Buenos Ayres unpicked, 7 to 10—Superfine Northern pulled lamb 43 to 46—No. 1 do. do. 37 to 42—No 2 do do 26 to 30—No 3 do do 18 to 20.

## FRUIT TREES, MULBERRIES, &amp;c.

The subscriber offers to the public the usual very large assortment, comprising the choicest Fruit Trees, of every class, and embracing all the newest varieties. Also, an immense collection of Ornamental Trees, Shrubs and Flowering Plants, Green House Plants, Bulbous Roots, and the most extensive assortment of Splendid Dahlias, in the Union.

All these articles will be sold at a reduction to suit the times, and as cheap or cheaper than they can be elsewhere obtained. For the silk culture, are offered the finest varieties of Mulberries, which are the Circassian, Elata, Alpine, Multicaulis, and Broussa; all of which are very hardy except the Multicaulis and that withstands ordinary winters. The State of New York having now granted a bounty of 2 per lb. on Silk, and Massachusetts and Vermont having one the same, they will no doubt take the lead in this great national pursuit.  
WM. R. PRINCE.

Flushing, March 7th, 1841.

N. B. Priced Catalogues will be sent to every applicant. Any persons who wish to establish silk plantations will be supplied with trees payable by a share of the proceeds.

## FARM WANTED

Wanted to purchase on credit or hire on a lease of five or ten years, a small but good farm in the vicinity of Boston.—The advertiser is engaged in rearing swine and makes large quantities of manure and has it in his power to keep a farm in a high state of cultivation. Any person having a place to dispose of or rent at a reasonable price may hear of a tenant by addressing  
JOHN GREY,  
Neponset Village, Dorchester.

## HOWARD'S IMPROVED EASY DRAUGHT PLOUGH.

Great improvements have been made the past year in the form and workmanship of these Ploughs; the mould board has been so formed as to lay the furrow completely over, turning in every particle of grass or stubble, and leaving the ground in the best possible manner. The length of the mould board has been very much increased, so that the Plough works with the greatest ease, both with respect to the holding and the team. The Committee at the late trial of Ploughs at Worcester, say,

"Should our opinion be asked as to which of the Ploughs we should prefer for use on a farm, we might perhaps say to the inquirer, if your land is mostly light and easy to work, try Prouty & Mears, but if your land is heavy, hard or rocky, BEGIN WITH MR. HOWARD'S."

At the above mentioned trial the Howard Plough did more work, with the same power of team, than any other plough exhibited. No other turned more than twentyseven and one half inches, to the 112 lbs. draught, while the Howard Plough turned twenty-nine and one half inches, to the same power of team! All acknowledge that Howard's Ploughs are much the strongest and most substantially made.

There has been quite an improvement made on the shoe, or land side of this Plough, which can be renewed without having to furnish a new landside: this shoe likewise secures the mould board and landside together, and strengthens the Plough very much.

The price of the Ploughs is from \$6 to \$15. A Plough, sufficient for breaking up with four cattle, will cost about \$10 50, and with cutter \$1, with wheel and cutter, \$2 50 extra.

The above Ploughs are for sale, wholesale and retail, at the New England Agricultural Warehouse and Seed Store, Nos. 51 & 52 North Market Street, by

JOSEPH BRECK &amp; CO.

Feb. 24.

## PURE SPERM OIL.

## EDMUND T. HASTINGS &amp; CO.

No. 101 State St. keep constantly for sale, Winter, Spring and Fall Sperm Oil, bleached and unbleached; which they warrant to be of the best quality and to burn without crusting.

Oil Canisters of various sizes.

Boston, Jan. 1, 1841.

1stly

## FRUIT TREES AND SCIONS FOR SALE.

The subscriber, at the Pomological Garden, Salem, offers for sale a very choice and extensive variety of Apple, Pear, Plum, Cherry, Peach and Apricot Trees, Grape Vines, Gooseberries, Red and White Dutch Currants, and Red and White Antwerp Raspberries.

Also, Scions of all the European and American Fruits which have been proved; all from fruit bearing Trees, packed in boxes with moss, and can be transported with safety to any part of this country or Europe.

ROBERT MANNING.

Salem, March 2, 1841.

1st May 1

## SITUATIONS WANTED

As Gardeners and Farmers. Apply at N. E. Agricultural Warehouse and Seed Store. March 3

## A SMALL FARM FOR SALE,

Situated in Braintree, ten miles from Boston, with a Dwelling House and large Cider mill thereon. The farm contains about 20 acres. Inquire of

Feb. 24.

NATHANIEL FAXON,

No. 53 North Market Street

## BERKSHIRE BOAR AND SOW.

The subscribers offer for sale a full blood Berkshire Boar and Sow, 18 months old, which they purchased a year since from N. C. Bement, which he warranted to be pure.

Feb. 24.

JOSEPH BRECK &amp; CO.

## PEAR, PLUM, GRAPE VINES, &amp;c.

3000 Pear Trees, of the most approved kinds. 2000 Plum Trees, of the most approved kinds and extra size—many of them have borne this season.

Apple, Cherry and Peach Trees, of different kinds.

500 Quince Trees

4000 Isabella and Catawba Grape Vines, from 6 to 15 feet high; most of them have borne fruit. Black Hamburg, Sweetwater, Pond's.

30,000 Grant Asparagus Roots.

Gooseberry, Currants, Raspberries, of good kinds.

5000 Whitmot's Early Rhubarb or Pie Plants, lately introduced.

2000 Cherry and Pear Stocks; 1000 Plums; Roses, &amp;c. of all kinds.

All orders sent to the subscriber at Cambridgeport, will meet with immediate attention.

SAMUEL POND.

Cambridgeport, Mass., Feb. 24.

## GARDEN SEEDS,

For sale by JOSEPH BRECK & Co. at the NEW ENGLAND FARMER OFFICE, No. 51 and 52 North Market St. Boston. The subscribers would inform the public that they have now on hand the largest collection of seeds ever before offered by sale in this city, embracing every variety of Field, Kitchen, Garden, and Ornamental Flower Seeds desirable for this or any other Climate.

Our seeds are either raised under our own inspection or imported from responsible houses in Europe, and having taken extraordinary pains to obtain such as are pure and genuine, we can confidently recommend them to our customers and friends, and feel assured they will prove satisfactory to all who try them.

Dealers in seeds are requested to forward their orders in season. Boxes for retailing from 8 dolls. and upwards will be sent out on commission allowing a liberal discount and take back what remain unsold.

Letters and orders with good reference will meet with prompt attention.

## FIELD SEEDS.

Sugar Beet.

Mangel Wurtzel.

New Red Globe do } superior

Yellow do. } varieties.

Carrot Long Orange.

" Altringham.

" New White, extra fine.

Pumpkin, sorts.

Wheat—various sorts.

## GARDEN SEEDS.

Artichoke, Asparagus, Beans of every description, Beets of sorts. Borecole, Broccoli, Brussels Sprouts, Culliflower, Caraway, Celery, of the most improved sorts, Cabbage 20 sorts, Carrot, all the varieties, Cucumber do, Cress, Egg Plant, Endive, Indian Corn, Kale, Leek, Lettuce in great variety, Melons, do. Martynca, Mustard, Nasturtium, Okra, Onion of sorts, Pepper do. Pumpkin do. Parsnip, Parsley, Peas, a very great variety, Rhubarb for tarts, Radish of sorts, Salsify, Squash of sorts, Tomato, Turnip 20 varieties.

## SWEET AND POT HERBS.

Thyme

Sweet Marjoram.

Sage.

Summersavory.

Medicinal Herbs, &amp;c.

Sweet Basil.

Lavender.

Lemon Balm.

Anise.

## ORNAMENTAL FLOWER SEEDS

Three hundred varieties, embracing all the finest sorts. Packages of 20 fine sorts for one dollar.

Those who prefer to have their Seeds put up in papers ready for retail, can be accommodated—each packet neatly closed and labelled, with printed directions. Price 50 cents, per dozen papers, which are re-tailed here at 6 1-4 cents each.

Fruit and ornamental trees, of the greatest variety, supplied at nurseryman's prices, and orders solicited. These will be packed, when required, to go to any part of the U. States.  
JOSEPH BRECK & CO.

Boston, Jan 27, 1841.

## AN OX WAGON AND OX CART

Nearly new, for sale by JOSEPH BRECK & CO., Inquire at No. 52 North Market Street, or at their Farm in Brighton. Feb. 24.

## WANTED,

An experienced Gardener, to whom liberal pay and constant employment will be given. Inquire of this office. Feb. 24. if.

## GRINDSTONES.

An extensive assortment of Water and Hand Grindstones constantly on hand and for sale by AMMI C. LOMBA (1) & CO. 13 Lewis's Wharf. 1stly. Nov. 17.

## MISCELLANEOUS.

## INTEMPERANCE.

O! that men should put an enemy into their mouths to steal away their brains.—*Shakspeare*.

The following extracts of a letter from a father to his only son, in which he portrays the detestable crime of drunkenness and its shocking consequences, in striking colors, are taken from an old book :

"DEAR TOM—It is with the greatest concern I hear you have lately (more than once) been guilty of getting fuddled in company with some of your youthful companions; you can scarce think what a shock this account gave me. I know, my dear boy, you have a great flow of spirits, a lively imagination, and great good nature; but those qualities, instead of guarding you against that odious fault, are, I am afraid, most likely to hurry you into it. Other vices generally have their rise and take deep root in the meanest dispositions: drunkenness, on the contrary, is often, too often observed to flourish in the richest and most promising soils: this, Tom, is a principal reason why I feel for you. A social, good-natured youth, is drawn in by degrees: if he is lively, smart, and witty, his company is sought for by others: if wit in another captivates him, the company he doats on draws him to the tavern, and though he steps cautiously at first, he soon, from habit and example, loses all sense of what he is doing; the sense of danger daily wears off; fondness of company by degrees draws on fondness for liquor; he becomes more sottish, and consequently more stupid, till at last his understanding, (an understanding that might have done honor to his country, and benefited his fellow creatures,) becomes clouded and muddled, and instead of the promising expectations that his youth afforded, he becomes a burden to himself, and despicable to all the world.

Drunkenness, Tom, stupifies the senses, destroys the memory, blunts the understanding, fills men with diseases, and makes them incapable of business of any kind. That this is the consequence of habitual drunkenness, too many instances will evidence. What a despicable character that of a sot is, I need not describe to you; and depend upon it, every person who is fond of the company of toppers, is in a fair way of becoming a sot. If your inclination tends that way, check it immediately, nor deceive yourself with the hopes of having the power to conquer it whenever you please; in such a case habit daily adds new strength to the vicious bent: the brute part of us (appetite) soon possesses the whole man, and reason, which may be called the angelic part, becomes quite smothered and destroyed. You know, Tom, it is a common expression to say, He is as drunk as a beast. We do not suppose that beasts get drunk: we mean by it that man by inebriation drowns his understanding; and when his reason is gone, he is upon a level with, nay, really far beneath the brute, irrational creation. Brutes are certainly equally rational with such a wretch, if not more so, with the superior advantage of a sound body and an instinct to guide them.

I know the world is apt to laugh at the apprehension of any danger accruing from getting fuddled now and then; they think the consequence innocent and trifling—but they soon find themselves woefully mistaken. Getting fuddled is the high road to habitual drunkenness—the oftener you are guilty of it, the more you prejudice your

health and understanding, and the less capable you are to guard against that abominable vice: it steals upon you insensibly, and you are seldom conscious of the danger till you are incapable of resisting it.

Consider, my dear lad, the first deviation from the level paths of virtue, is the gradual, imperceptible descent: the entrance is bewitching, as it lies through the flowery regions of pleasure; but as you advance, the way soon becomes rougher and less pleasing; the prospect by degrees grows dreary, gloomy and frightful: each step you advance grows steeper and steeper; your power of resistance grows fainter and fainter, and you are hurried down, in spite of the feeble efforts you are then capable of making, into the gulph of shame and everlasting destruction.

A drunkard is the worst of suicides: he is a deliberate, determined self-murderer; he hurries himself out of the world; and for the short time he crawls on the earth, he makes himself miserable by loading himself with racking distempers. Company, which he was so fond of, avoid and despise him, when he can no longer contribute to their irrational mirth; (for you must never trust to friendship commenced over a bottle,) and the only faint glimmering of pleasure he then enjoys, is when he is pouring down that liquid poison which first occasioned, and still increases his disorder.

As to the ridiculous custom of drinking healths, nothing certainly can be a greater enemy to health than it is.

I am far, Tom, from being one of that rigid class of mortals, who decry cheerfulness and mirth: I love mirth, you know I do; and cheerfulness (as the Spectator says,) is the very health of the soul; to preserve which, is one great reason why I would have you avoid drinking; for drinking is in reality an enemy to cheerfulness, good nature and mirth. In drinking, it is hard, nay it is almost impossible, to stop at a certain mark; and when you once go beyond it, you are hurried you know not whither; quarrelling, gaming, debauchery of all kinds, nay often murder, are the dreadful fruits of drinking; and in regard to conversation, Tom, I would appeal to yourself, whether, from the little you have seen of drinking, (I sincerely hope it is but little,) whether in your cool moments you would not have been ashamed of the words and actions which you applauded when warm with liquor. In a word, unless you most carefully guard against drunkenness in your youth, it will insensibly steal on you; it will make you miserable both in body and mind; it will prove an insuperable bar to your becoming eminent in any profession; it will make you odious to yourself, and despicable to others; and indeed, and in truth, I would rather hear of your being no more, than your becoming a drunkard. I shall conclude my letter with a little story I have somewhere read, and which I think much to the purpose.

A certain young fellow had been drawn into a contract with the devil, that in consideration of some important services from his diabolical majesty, the young fellow was to comply with one of three requests the devil should think proper to make him. It is to be observed, the devil had before tempted him in vain to commit several crimes; but the young fellow had hitherto withstood his temptations, and was still determined to refuse him in every thing but the one request he was obliged by his contract to comply with. When it came to Beelzebub's turn to command, he left it to the youth's choice either to murder his father, debauch his own sister, or get drunk. The young

man chose the last, as by far the least shocking; but when he had got drunk, the devil took that opportunity of tempting him (which till he was drunk he never could effectually do) to commit both the other crimes. Thus he was drawn in to commit all the devil wanted; whereas if either of the other had been his choice, he would probably have escaped so complicated a guilt."

## GREEN'S PATENT STRAW CUTTER.

JOSEPH BRECK & CO. at the New England Agricultural Warehouse and Seed Store Nos. 51 and 52 North Market Street, have for sale, Green's Patent Straw, Hay and Stalk Cutter, operating on a mechanical principle not before applied to any implement for this purpose. The most prominent effects of this application, and some of the consequent peculiarities of the machine are:

1. So great a reduction of the quantum of power requisite to use it, that the strength of a half grown boy is sufficient to work it efficiently.
2. With even this moderate power, it easily cuts two bushels a minute, which is full twice as fast as has been claimed by any other machine even when worked by horse or steam power.
3. The knives, owing to the peculiar manner in which they cut, require sharpening less often than those of any other straw cutter.
4. The machine is simple in its construction, made and put together very strongly. It is therefore not so liable as the complicated machines in general use to get out of order.

## BONE MANURE.

The subscriber informs his friends and the public, that after ten years experience, he is fully convinced that ground hones form the most powerful stimulant that can be applied to the earth as a manure.

Orders for Bone Manure or Oyster Shell Lime, left at the Bone Mill, near Tremont road, in Roxbury, at the New England Agricultural Warehouse and Seed Store, No 52 North Market Street, or through the Post Office will meet with prompt attention.

March 4, 1840.

NAHUM WARD

## BONE MILLS.

The subscriber offers for sale Bone Mills on a new and improved plan, which will grind 200 bushels per day, and make it of the proper fineness. They can be put up with small expense, and require but little room. They can be easily kept in repair and are not liable to break with the roughest usage.

They may be used for grinding Barilla, and will do the work in the best manner. Oyster shells, plaster, soap stone, bricks, bark, &c. may be ground by them.

Price \$20. They require about as much power as a small run of mill stones, to be used to advantage, and can, if necessary, be driven by horse power.

Those who wish to purchase can direct to William Aplin, No. 14 1-2 Westminster street, Providence, R. I., or to the subscriber.

Ground hones constantly on hand for sale.

WILLIAM CHASE.

Providence, R. I., Feb. 9, 1841.

## NEW FLOWER SEEDS.

The subscribers have received from London a choice collection of Flower Seeds, which, with those raised by themselves, constitute all worthy of cultivation. Price from 6 1-4 to 25 cents per paper. Assortment of those marked 6 1-4 cents, 20 papers for one dollar, and others in the same proportion.

JOS. BRECK & CO.

## NEW ENGLAND FARMER.

A WEEKLY PAPER.

The Editorial department of this paper having come into the hands of the subscriber, he is now authorized by the publishers to inform the public that the price of the paper is reduced. In future the terms will be \$2 per year in advance, or \$2 50 if not paid within thirty days.

ALLEN PUTNAM.

N. B.—Postmasters are required by law to frank all subscriptions and remittances for newspapers, without expense to subscribers.

# NEW ENGLAND FARMER, AND HORTICULTURAL REGISTER.

PUBLISHED BY JOSEPH BRECK & CO., NO 52 NORTH MARKET STREET, (AGRICULTURAL WAREHOUSE.)—ALLEN PUTNAM, EDITOR.

## BERKSHIRES NO LONGER BERKSHIRES.

MR EDITOR—I am an old hog-breeder, and have always supposed that I knew a thing or two—but I confess that I am now all ashore on that subject.—The time was when a good hog was not measured by the number of white feet which he possessed, or the quantity of white hair that he sported in his tail, but by something of much more importance. I find, however, that we were all wrong—no Berkshire can be a Berkshire with less than three white feet and a white top to his tail—"so says the book, and therefore it is true."

Now, I have observed, through a long life, the truth of an old aphorism, which I used to write as a copy, when a boy at school—"what is violent is seldom permanent"—and the Merino, the Morus, and now the Berkshire mania, all are proofs of the truth of the old adage; they have all been too violent to be permanent, and should be held in remembrance, as a warning against future speculations.

Well, then, Berkshires are no longer Berkshires, but *improved* Berkshires! So they can now be black, red, tawny, white, spotted, and speckled, and yet be quite pure and perfect blood—in short, *improved* Berkshires—leaving the old breed quite out of the question—then I would say that Benjamin Cooper, of Camden, N. J., has about the best hogs in this country, and they deserve the character which I. G. has given them in page 382, vol. iv. of the Cabinet, the perusal of which account induced me to go and view them for myself.

It is a pity the game is likely so soon to be brought to a close, for I have half a dozen young friends, who were just ready to dash into the speculation, each prepared with his *Bement* or *Lossing*, and a pedigree as long as my arm, and all of the right color too, to a hair; but Mr Samuel D. Martin's letter, in the Franklin Farmer, has, or I am much mistaken, blown up the Berko-mania, and will quite spoil the trade. He admits that the genuine Berkshires were red, with black spots—indeed, that is undeniable—but he contends—which is as *deniable*—that they were a coarse hog, with large ears and curly hair, a great consumer, but that they would attain a large size, (now what on earth was there in such a hog desirable to breed from?) and, therefore, he would make it appear, that every good quality of the present improved breed, was obtained from the Eastern or Chinese hog, of which there were two varieties of colors, the white and the black. Professor Low, however, contends that the color of the *modern* Berkshire is still a reddish brown, with dark spots; many of them, he says, are nearly black, manifesting their near approach to the Siamese character, and sometimes they are black, broken with white, but not a word does he say of their being quite white; although he admits that from this intermixture it becomes, in many cases, difficult to recognize, in the present race, the characters of the true Berkshire—and yet Mr Mar-

tin has a white imported boar, of the *improved* Berkshire breed, although he does not claim for him that he is an original Berkshire, but that he is an *improvement* upon that breed, by the eastern crosses. But all this while Messrs Lossing and Wait attach great importance to their pigs' coming direct from Berkshire, and of being the *only* pure blood, although they have never imported, by any chance, any of the original red and black color; and they brand all those with contempt that are not black and white, with the given number of white feet and white hairs in the tail.

But Mr Martin says, although red and black was the original, and has always been the prevailing color of the real Berkshire hog, yet, *thirty years ago*, there were white and black ones amongst them, (he must then mean, I presume, amongst the original breed,) and that he considers it therefore perfectly idle to say, that in an animal that is white and black, a few hairs of the one or the other color, in this or that place, constitute a genuine or a counterfeit—and so say I—but this is robbing the milk of all the cream, for, as I have often seen, much more importance has been attached to their color than to any other qualification.

So then it appears that every one has been breeding his own *improved* Berkshires! And that, in short, Berkshires are no longer Berkshires! I shall, therefore, *no longer* expect to see people shelling out their dollars for very inferior pigs, merely because they have been bred by such and such gentlemen, without regard to much besides the color of the feet and tail! And it comes at last to this—a good hog, any more than a good cow, cannot be of a bad color.

Let it not, however, for a moment be supposed that I wish to detract an iota from the value of the Berkshires—they are most excellent as a cross with our own swine stock, and have done, and will do, infinite good; but, really, the nonsense which is bandied about in all sorts of ways and all about things of the most trifling importance, is perfectly surfeiting, and reminds one of the old couplet—

"Strange that such difference there should be,  
'Twi'x tweedle-dum and tweedle dee!"

JOHN DILLON.

## PORTRAITS OF ANIMALS.

To the Editor of the Farmer's Cabinet:

SIR—I wish to call your attention to the portrait of a Cotswold buck, as drawn from the life, and given in the number of the Albany Cultivator for the last month. This animal has been imported by that spirited breeder and improver, W. H. Sotham, whose perseverance and industry in the cause are above all praise. But, is it really intended we should suppose that the sheep is there faithfully represented? Then he is a nondescript, and reminds one of the build of a road-wagon as much as a sheep; for if the hind legs had been brought a little further forward, they would then have stood under the centre of the carcass, and have rendered the fore legs quite unnecessary; or, it might have been as easy to add a couple, to support the enor-

mous rump! As he now stands, he appears, as some one says, "a creature packed up in two parcels." And yet, Mr Editor, the "portrait" as it is called, is nothing more nor less than what we were led to expect, from the importer's notes of preparation, first from the other side of the Atlantic, saying that he was coming, and, on landing, that he had come, and had brought with him the pride of all England! having, as it would seem, contrived to bribe the English breeders to dispose of their best stock for the consideration of a few extra dollars, reserving to themselves their "fair to middling" only, to breed from hereafter! Now, I must say, I have never found that our English friends were so much like some of ourselves—such penny-wise and pound-foolish folks—as to sell their best stock; and, judging by some that I have seen imported, I am not inclined to believe that they have so far forgotten themselves as to dispose of their *best*, even to friend Sotham, either for love or money.

While reading the importer's account of his magnificent purchase, in the late numbers of the Cultivator, I could not but think that he wrote with a large quill, and was reminded of the boy whose father had always counselled him to "talk large," and who, on being asked what fish he had dined upon, replied, "a whale." And I have heard of an honest Hibernian, who, on going to England to work at the hay harvest, and receiving thirtyfive shillings for his labor, hurried back to Ireland, and meeting a friend, on landing, who was just going for the same purpose, told him he might just stay where he was, for he had brought away all the money with him! Now it would really seem as if our Albany friends were determined to keep all the finest and fattest things to themselves, and swallow us and our lean kine at a gulp! Assuredly they do talk very large, and make wonderful animals upon paper; but *our* stock will grow in proportions in spite of us, and a very large body will fit itself with legs sufficient to support the weight which they are destined to carry; nor have we been able to obtain them with a natural piazza at the rump, all ours requiring artificial shelter in stormy weather. But let not our friend Sotham suppose for a moment, that I wish to detract an iota from the praise that is due to him for introducing amongst us improved stock; he richly deserves all the credit and profit that he can possibly receive; but if he would draw with a more faithful pencil the delineations of his animals, and write with a *teetle* smaller pen, he would not be serving himself or the cause which he has so nobly espoused, with less efficiency, truth, or fairness.

But I am bound to do him justice in one very essential particular—he has disenchanting the spell which has been thrown around the profession of hog-breeding in the Eastern States, and worked the very mischief with the magicians themselves, with all their tomfoolery about three white hairs and feet! He says, "color, in Berkshires, is not hereditary; they vary in many instances, and I have seen the pure breed of all colors, amongst the best prize herds in England. To discard good animals for their color only, are quibbles that seem

to me profitless discussions, and too much like quackery to deserve notice." \* \* We may therefore set to work and breed good animals, without being compelled to go to Albany for chapter and verse, for it would seem, after all, that a good animal cannot be of a bad color! Friend Sotham, we thank thee for our cure. J. WESTLAKE.

#### PROJECT FOR PROCURING EXTENSIVE ANALYSES OF SOILS.

At the Agricultural Meeting on Thursday evening last, the committee to whom was referred the communication of Dr. Andrew Nichols, of Danvers, submitted a report, which report was accepted; and the secretary was instructed to cause the communication and report to be laid before the public in some public print. He here inserts them with much pleasure, in the pages which are under his control.

*Danvers, March 4th, 1841.*

DEAR SIR—I have lately been preparing a brief essay on the Science of Agriculture, for the Transactions of the Essex Agricultural Society, now in the press. This has caused me to think much on the practicability of reducing, or rather elevating, this first of arts to an exact science, and on the means by which so desirable an object may be soonest accomplished; and I have been desirous of attending a meeting of the convention of agriculturists in which you preside, for the purpose of laying my views on this subject before them; but have hitherto been prevented by professional engagements, and perhaps shall be until the close of the session. I therefore address you by letter. Make such use of it as you may think proper.

How shall Agriculture be made a science? Undoubtedly in the same manner that all other sciences have been perfected—by systematizing all that is known of the chemical composition of soils, manures, and the philosophy of vegetation. And this must be done by some of the best chemists and naturalists amongst us—by philosophers in the closet and laboratory, and not by practical farmers in the field. These have, to be sure, to act an important part in this business. It is for farmers to collect facts for scientific men to generalize and work into the system, and to prove the correctness of, or overthrow every such system by experiments in the field. This may appear to the practical farmer all idle speculation. But is it so? Are not the laws of nature unchangeable, and when once known do they not conduct the operator unerringly to the accomplishment of his object, wherever natural forces are made to perform the work? Now chemists know, or can by judicious analytical experiments discover, the constituents of soils and the constituents of vegetables, and therefrom infer the wants of growing plants and point out the means of supplying them. The learned in vegetable physiology will be able to shew how far the laws of chemistry are modified or annulled by the principle of life in the vegetable. And the correctness of theories can be tested by growing plants in artificial soils in pots, and in natural soils whose composition is known, in the field. And the man of science, possessed of all this knowledge, can tell the operative farmer how to manure and cultivate his crops so as to obtain the largest product possible under the circumstances of the season beyond human control, such as temperature, showers, sun shine, winds, &c.; can point out the crops to which his soil is best adapted, with such manuring as he

is able to give it, and at the same time show him why and wherefore under such treatment his crops will not equal those of some neighbor, whose soil is different, or who can supply its deficiencies at a cheaper rate. From these considerations there seems to me no doubt but that to be the most successful agriculturist, a man must conduct his operations on scientific principles. And to do this, he must have his soils analyzed—his peat swamps and other depots of decomposed vegetable, or calcareous, or mineral matter analyzed—the adaptedness, or the contrary, of his soils to certain crops—taking into consideration the subsoil, exposure to sun, winds, &c. pointed out: and, always remembering that gold may be bought too dear, ascertain at what cost the deficiencies of his soil, be it of lime or any other constituent, can be supplied; and whether good economy warrants such an expenditure. All experiments in agriculture not based upon, and conducted according to, such knowledge, must be of but little value. And most of the statements of management of crops, &c. for which our Agricultural Societies pay liberal premiums, are worth little or nothing to other farmers, because the "sandy soil," the "clayey loam," the "manure" and the "compost manure" of the statement, are vague terms, conveying no definite idea of their constituents to any one who may wish to cultivate a similar crop on his own soil, with his own manure, which may be very different from those named in the pattern experiment. Hence the little confidence placed by practical men in "book farming." Because farming books are usually either deficient in essential particulars, or they are so technical that those unacquainted with the elements of chemical or natural science, cannot understand them.—Now there is but one way to remedy these difficulties. Books must be written in scientific language, which has always the same meaning. And those who would profit by them, must acquaint themselves with the elements of such science, which may be by men of ordinary education and capacity, easily accomplished.

It is to the head-work of scientific men that the world is indebted for nearly all great improvements in art. We may instance Navigation. Had it not been for the labors of mathematicians and astronomers in their closets, the science of navigation would have remained like the science of agriculture to this time, to be invented: and our mariners, like those of olden time, however skilful in managing their craft, would have been creeping along the shores of continents and islands, instead of traversing boldly the wide oceans and exploring unknown seas. The skill and knowledge of individuals, acquired by experience, must have died with them, they having no system by which they could communicate it to others. And every generation of seamen could become as wise and no wiser than their predecessors in their employment by the same means—by experience. So it is in agriculture. There are many worthy old farmers who have acquired a valuable fund of information in regard to the best means of cultivating their own acres, which they cannot communicate to others, at least so that others can apply the same practices to other soils with any thing like the same success. But all scientific knowledge can be conveyed from one mind to another with the utmost precision, so as to put into the possession of the pupil all that is known on the subject by his tutor.

But the question recurs, what can we do towards reducing agriculture to a science? Or how can

the agricultural community avail themselves of the knowledge which scientific men now possess in regard to the principles which should regulate the operations of husbandry? Can farmers, following such rules for analyzing soils and manures as have been published, analyze their own soils with sufficient accuracy to direct them to a scientific application of manures, &c.? Let the following plan of operations be considered as my attempt to answer these questions.

Let our first effort be to obtain the services of one or more of our best chemists, who shall devote all his powers and time to the analyzing of soils, manures, &c., to perfecting the science of agriculture, and preparing for publication a popular treatise on the subject.

As no appropriation is to be expected from our Legislature the present session to defray the expenses, let a subscription be opened and papers sent by members of your convention, when they separate, into all parts of the Commonwealth, with the understanding that all persons who will subscribe and pay in advance one dollar annually, or more, shall enjoy the privilege of having specimens of his soils, &c. analyzed by said chemist, and to have a statement of the constituents of said soils returned to him with the opinion of said chemist as to what is needed to render such soils most fertile; the value of specimens of peat muck, muck sand, marls, &c., and the treatment they need to make valuable manures for certain soils, describing such as would be most benefited by them, &c.

As soon as — dollars are known to be subscribed, let a meeting of the subscribers be holden at Boston or Worcester, to choose trustees to take charge of the funds, appoint the professor of Agricultural Chemistry, fix his salary, and prescribe his duties, and regulate and manage all the prudential concerns of the association.

All monies over and above the expenses of the professorship and incidental expenses, to be expended in printing the treatise above mentioned, to be distributed among the subscribers.

Agricultural societies might be admitted as subscribers, and be allowed the privilege of having all the soils and manures used by claimants for premium crops, &c. analyzed, on such conditions as the trustees might prescribe.

Into the laboratory of the professor, perhaps, students of chemistry might be admitted on terms prescribed by the trustees, mutually beneficial to the association, the professor and pupils.

It would seem that a plan which promises such a large return of the most valuable information for the small investment of money required, would meet with the approbation of the agricultural community and success. It certainly would be carried into effect immediately, should those who attend your agricultural meetings look upon its importance as I do.

The few thousand dollars expended by the Commonwealth in agricultural and geological surveys, will, in my opinion, be repaid with a thousand fold interest to the people of this Commonwealth, in the increased productions of agriculture. Take, for example, only one item of information, brought out and spread before the public in these reports, from Dr. Samuel L. Dana, of Lowell, concerning the food of plants and its abundance in peat muck, and the cheap means of converting such muck into a most valuable manure. And how shall we estimate the amount of benefit which will result to mankind from this source, when it shall be appre-

ciated by farmers generally as it deserves. On this subject I speak feelingly, and I think understandingly; for by following Dr. Dana's directions for making the geine of peat soluble, the produce of my farm has been doubled, at an expense which leaves the nett profits at least one third greater than before; and there are thousands of farms in this State equally well provided with this muck and equally well conditioned to be benefited by it as my own. And it is my firm belief that if all the farmers in the State would skilfully and understandingly regulate their operations by Dr. Dana's principles and rules, the agricultural products of the State, without any increase of labor, would be increased thirty per cent. the ensuing year. Now, if such benefits have been conferred on farmers, and through them on the world, by a man of science, who probably never turned a furrow in the field, it proves, I think, conclusively, the position with which I started, that it is scientific men whose aid agriculturists should now seek to systematize facts, and to invent, establish and perfect a science of agriculture, which shall guide and direct the operations of husbandry as safely and directly to their object, as the science of navigation does guide and direct the mariner to his distant port.

Yours, respectfully,

ANDREW NICHOLS.

Hon. DANIEL P. KING.

#### REPORT

*Of the Committee on the Communication of Dr. Andrew Nichols.*

Your Committee have read, with great interest, the able communication of Dr. Andrew Nichols, of Danvers, which was referred to them at a former meeting of this association, and are fully impressed with the importance of the subject therein considered.

Any feasible plan, having for its object the elevation of the art of agriculture to the rank of a comparatively exact science, will meet with their approbation and active co-operation.

That better methods may be devised for agricultural improvement than those which are now generally pursued, admits not of a doubt. A correct knowledge of the nature of soils and of manures of various kinds, and their adaptation to particular crops, is very desirable, and such knowledge would most certainly serve to advance the art of agriculture.

Experience is often fallacious; and when unaided by the light of science, important principles are sometimes overlooked by the experimenter. Hence we have frequent occasion to remark, that farmers from *experience* arrive at directly opposite results. This may be owing to some imperfection in the experimenter and sometimes to causes unknown or not appreciated by the experimenter, such as differences in the composition of the soils operated upon, variations in the seasons, &c. There is hardly an article used for manure respecting which there is not a difference of opinion among good practical farmers. This may be owing to errors of observation in some cases, but more frequently is due to an essential difference in the nature of the soil, compost or manures.

Your committee are of opinion that there is no subject of human knowledge more recondite than the science of agriculture. No other branch of art requires a more thorough knowledge of the sister sciences than this. It has not suffered from any

excess of book learning, but on the contrary stands greatly in need of more. Inaccuracies which would not be tolerated in any other branch of human learning, are allowed in this. Rude experiments and cruder essays, have unfortunately been considered sufficiently profound for this art.

Although many farmers are unacquainted with technical phrases, they are generally blessed with a sound understanding, and are able to overcome the trifling obstacles which a scientific nomenclature presents, and will value most highly such terms when they have become familiar with them, and discover their importance and use as means of conveying distinct and definite ideas from one mind to another. No branch of science or art has yet been able to exist without technical terms. The carpenter, mason, watchmaker, or blacksmith, like the astronomer, geologist or chemist, require a peculiar language in order to communicate their ideas to each other and to the world. "There is no *Royal* road to learning." The student of agricultural chemistry must labor like others before he can acquire a thorough knowledge of the science.

In order to comprehend the meaning of chemical terms, the farmer must pay some attention to the *elements* of the science, and then by the aid of such glossaries as should be contained in treatises of agricultural chemistry, he will be enabled to hold intercourse with the elements and know them by name and nature.

Your committee concur with Dr. Nichols in his suggestion as to the propriety of publishing a good practical treatise on agricultural chemistry and the physiology of plants. Such a work would have a valuable purpose in explaining the principles of the science and would prove very convenient to the farmer for reference, serving to refresh his memory on the subjects treated of in scientific works.

We are of opinion that farmers cannot make any trustworthy analyses of soils or manures without learning the principles of chemistry and serving a regular apprenticeship to the business. As soon should we think of advising the navigator to make his own sextant and chronometer, as to advise the farmer to attempt an analysis of his soils. The short-hand methods that have been published, will not shew the difference between barren and fertile soils. Nothing short of a most minute and rigid analysis will serve any useful purpose in agriculture, for the difference between an utterly barren soil and one in the highest state of fertility, does not often exceed four, and is more frequently limited to two per cent.; and the slight difference of composition cannot be detected by any rough experiments.

Now the farmer, even if he understood the art, has not the time, the books, nor the apparatus required for such delicate work; and he would find it very poor economy, and would soon abandon his researches as unsatisfactory and useless. The time required by an exact chemist for the thorough analysis of a soil, is not less than 14 days: more frequently a still longer period is required where the soil is complex in its nature. Single analyses, therefore, will rarely repay the chemist for his time and labor. In a well-regulated laboratory, where there is a sufficiency of apparatus, from 5 to 10 analyses may be carried forward together, so as to keep the operator constantly employed, and this is the only way in which the work can be economically performed.

Decided advantages then, will result from an association for the purpose mentioned in the letter of

Dr. Nichols, for the chemist would be supplied with a number of specimens at once, so that he could operate on them at once, and thus could afford to do the work at the lowest price.

It is suggested by your committee, that agricultural societies might pay their premiums on remarkable crops or on farms, in whole or in part, at the option of the successful applicant, by causing accurate analyses of the soils to be made at the expense of the society. Many distinguished agriculturists would prefer such information above any cash payment, for they would obtain a knowledge which would prove ultimately far more valuable.

It has been suggested that it would be useful to make known the usual cost of chemical analysis of soils. Your committee, therefore, append the following scale for the information of the association.

#### *Estimate for 100 specimens.*

1. The cost of merely separating the soluble and insoluble organic matters and determining their proportions in a gross way, \$1 per specimen.

2. For the proportional analysis of a soil containing six ingredients, the vegetable matters being destroyed by burning them off in a platina crucible, and the mineral ingredients and salts being accurately separated in proportions, according to the most recent methods employed by analytical chemists, \$10 per specimen.

3. To ascertain the precise nature and proportions of the organic matters in a soil, \$20.

4. A thorough analysis of a soil containing 12 ingredients, after the latest and best methods described by Berzelius, \$30 per specimen.

No chemist would desire to undertake such researches unless he received a number of specimens of soil at the same time, in order that he might work on as many as could be managed at once. Single analyses would cost double the amount above stated.

Your committee would suggest the propriety of instituting a regular course of lectures on the principles of Agricultural Chemistry, illustrated by experiments. Such a course might be delivered in Boston during the winter months, while the Legislature should be in session, and would afford to those who felt desirous of learning the facts and principles of the science, the opportunity for obtaining a knowledge of the subject at a very reasonable cost of time and money. If a class of 300 subscribers could be obtained, the tickets of admission would not cost more than \$1 each—the course consisting of a dozen lectures. Since it would be necessary to explain the general principles of the science, the course would present attractions to persons who are not especially devoted to agriculture, and there would be no difficulty in obtaining a sufficient number of subscribers.

In addition to such a course, it would be desirable to employ a lecturer familiar with the principles of Botany, to give a number of lectures on that science, for the sciences being connected, one serves to illustrate the other.

The time may arrive when Boston will become the seat of a college devoted to the advancement of agriculture and the arts. Such an institution will, when once established, prove one of the most useful and popular schools in the country.

C. T. JACKSON, of Boston,  
NATH'L P. DENNY, of Leicester,  
HORACE COLLAMORE, of Pembroke,  
Boston, March, 1841. Committee.

From the Sussex (Eng.) Express.

### WHITE CARROTS.

We beg to draw the particular attention of our readers to an excellent letter from Sir C. M. Burrell, Bart., on the subject of growing the White Carrot, the value of which we can fully confirm, having this year (although the season has been very unfavorable) obtained highly satisfactory results respecting it. We were induced to experimentize on this root at the recommendation of the Hon. baronet, given last year.

*Knapp Castle, Nov. 3.*

SIR—Perceiving, on perusal of your last Express, your notice respecting the premiums offered for specimens of turnips and mangel wurtzel, with accompanying statements of their culture, I trouble you with the following practical statement in support of my last year's published opinion on the preference of the culture of the white cattle carrot over that of the parsnip for agricultural purposes, and which was made in consequence of a letter from a correspondent in the Lewes Advertiser, advocating the growth of the parsnip, in which 500 bushels per acre was stated as the produce. Conceiving that from my then crop of white carrots, grown on a very indifferent field, the yield of which was 100 bushels per acre without the green tops, that their culture would be more advantageous on stiff soils than that of the parsnip, with a return of about a moiety of the produce only, I laid a comparative statement of my crop before the public, that agriculturists of intelligence and spirit might try the results by sowing both sorts on similar quality of land. But satisfied as I am myself of the preference of the white cattle carrot on my farm over all roots fit for cattle, I again sowed four acres broadcast on land of better quality this year, and so far as experience shows in the raising and housing of about half my crop, there will be, as near as we can determine, 1300 bushels per acre, after separation from the green tops; and considering the depth wheace their nourishment is obtained, (in one instance no less than 3 feet 5 1-2 inches, and in several others nearly as deep,) I do not view it as a very scourging crop, especially considering the vast increase of nutritious winter fodder, with consequent economy of hay, for both fattening and lean stock, and especially milch cows, their cream and butter being as good and free from any ill flavor as when feeding on the pastures; and likewise looking to the great increase of farm-yard manure resulting from its consumption, to which may be justly added the clean, friable, and finely pulverized state in which the ground is left after the removal of the crop, particularly well adapted for ridging up during winter and sowing with barley and seeds in the ensuing spring, I do not hesitate to bring the results of my experience to your attention and consideration.

My first inducement to try the white carrot was the representation of Mr Eaton, M. P., whose father, I understood, obtained the seed from Holland; with a result on sowing it on indifferent land in Cambridgeshire, of 1000 bushels per acre, with which my crop in 1839 tallied very accurately; I led myself to believe (but from the dryness which prevailed after sowing my seed last spring, and the consequence of a fresh growth on rain falling after hoeing in summer,) that the carrots would have been of more equal size, and the amount of the produce possibly greater in weight and value. For

the cultivation of the white carrot, free-working deep soils, well and deeply drained and subsoiled are to be preferred; and the better heart the ground is in, and the cleaner the tilth, the greater will of course be the chance of a remunerative and beneficial crop. Mine were sown broadcast, 6 lbs. to the acre, costing, last spring, 1s. per lb.; but whether being sown in drills at proper distances, and ridged up, would improve the crop, I leave to the discriminate judgment of practical and more scientific farmers. I shall only add, that those who at my recommendation have sown the white cattle carrot, express their satisfaction at their adoption, and my neighbor, the Rev. William Woodward, of West Grinstead, having sown them on a small breadth of land, has had cause to be satisfied with the result equally with myself. You are welcome to make what use of my observations you think proper, accepting my excuse for sending them hastily, and I fear, rather incoherently written, my time being too much occupied to make a fair copy.

I am, sir, your humble servant,

CHARLES MERRICK BURRELL.

From the Journal of the English Agricultural Society.

### ON THE WHITE OR BELGIAN CARROT

*To Ph. Pusey, Esq., M. P.*—Sir—I am desired by my father to send to you the particulars of the crop of white or Belgian carrots on Lord Ducie's farm at Whitfield. The extent of the piece is 1 acre 36 perches, from which 64 cartloads of roots were taken. The average weight of a cartload was found to be 10 cwt. This gives 32 tons as the total weight of the crop, which is at the rate of 26 tons 3 cwt. per acre. The soil is a deep, sandy loam, belonging to the new red sandstone formation.

This is a heavier crop than any other on the farm. The seed was sown in the second week in April, on land which had been ploughed 10 inches deep. It was sown on the flat, in rows 18 inches apart, by the common Suffolk drill. The seed had been mingled with damp sand for several days previous, as well to sprout it partially, as to render it capable of being drilled, as carrot seed elings so much together. They are singled out when a fortnight old to intervals of 6 inches in the row, and two horse-hoeings, with a hand-hoeing whenever the weeds made their appearance, was all the cultivation they received.

The result is a crop not only much more valuable per ton than any other green crop we have, but also heavier per acre, and raised at an expense less by at least one half than that attending the cultivation of the turnip.

The crop on the land the year before was Swedes, which were carried off the land and sold. No dong of any kind was put to the carrots.

I am, sir,

Your most ob't serv't,

JOHN C. MORTON.

*Chester Hill, Nov. 18, 1840.*

*Note by Mr Pusey.*—This carrot, though it has been long grown as a field-root in Flanders, has been but very lately introduced into England; it is, however, much liked by those who have tried it in my own neighborhood. A farmer, Mr W. B. Harris, who has grown it for two years on a good free loam, gives me the following account of it—“On taking up my carrots and weighing them, I find they fall short of the quantity I grew last year.

Instead of the white carrots weighing nearly 32 tons per acre, they will only weigh 20 tons this year; and instead of the red ones weighing about 16 tons, they only weigh 12 tons this year. I have generally found the difference between the red and white carrot to be as follows (in all cases where I have weighed them and in all cases of inquiry):—The white generally exceed the red ones in weight from 8 to 9 tons per acre, when you take the average of the field, as I have done now. I attribute the failure in my crop this year to two or three things. In the first place, the land was not subsoiled; in the second, they were planted late, and the weather too dry; and in the third place, they were hoed too thin—they were hoed the last time with a bean hoe.” Even the diminished crop of Mr Harris, however, is very considerable, as it is equal in weight to an excellent crop of Swedes, and is twice as valuable. On some lighter land 16 tons of the white carrot were grown last year, where the red field-carrot gave a very poor crop. I ought to add that I have not succeeded in raising more than eight or nine tons myself; but this new root has in its favor the high practical authority of the Yoxford Fanning Club, who “recommend strongly the cultivation of the long white carrot, as it produces a heavy crop of good quality, and adapted to strong as well as mixed soil lands, will keep well, and is excellent food for cart-horses.” It has been stated to me that there are two varieties, and that the best of the two is that which makes a large portion of its root above ground. Sir C. Burrell has grown it in Sussex, and has found it very productive. Col. Le Conteur informs me “that in Jersey the prize crop of parsnips this year afforded 318 lbs. to the perch, or 23 tons to the acre, while the white carrot, a prize crop also, which he had cultivated experimentally, gave him 524 lbs. to the perch, or nearly 38 tons to the acre—an enormous crop,” he adds, “which, if equally valuable for butter as the parsnip, will of course supersede it, as his parsnip crop in the same field, cultivated alike, only produced 16 1-2 tons, which, nevertheless, was a very fair crop.”

PH. PUSEY.

From the Yankee Farmer of Dec. 12, 1840.

### WHITE CARROT.

Last year (1839) I imported 50 lbs. White Altringham or Flanders carrot seed, and sold it to farmers in different parts of the country, who have returned favorable accounts of it.

The carrot is only recently introduced from France, where it was first brought into notice by M. Vilmorin, and is now pretty extensively cultivated. One great advantage which it possesses is, that from the comparative shortness of its roots, and their above-ground habits of growth, it is well adapted for shallow soil which has not depth sufficient to grow the large-rooted varieties. A friend in New Bedford who had some of the seed, thus writes: “I have exhibited some of the carrots in our market and our farmers are much pleased with them. I consider them a valuable acquisition to our list of roots and a most fortunate cross—I say cross, for my impression is, most decidedly, that the work of amalgamation has been secretly going on between the parsnip and the carrot, and no act of the legislature can prevent it.—The same number of men that harvested 82 1-2 bushels of the Orange carrot in one day last year, have this year harvested 184 bushels of the White, and from this

reason: the white grows out of the ground from 2 1-2 to 6 inches, so that they can easily be drawn from the ground. You may send me 15 lbs. of fresh seed next year." C. P. BOSSON.

*Remarks by the Editor of the Yankee Farmer.*—We were requested by Mr Bosson to make an experiment on the White carrot and compare it with the Orange and Yellow Altringham. We sowed a few drills of each kind, side by side, in a light sandy soil, without manure, on the 26th of May. After sowing these drills we mixed the different varieties of seeds together, and sowed a few drills more.

It was evident from observation, after the carrots had attained any size of consequence, that the white carrots were the most productive; and when they had attained a full growth the difference was still more apparent. We should have measured the product of each kind and learned the difference with precision, but owing to extremely dry weather, some of the seed failed and the plants came irregularly, so that this method could not have been a fair test.

On digging the carrots where the mixture of seeds was sown, we were astonished to see so great a difference between the white and other varieties, as we supposed that the white being partially out of the ground, exhibited on a superficial view, more difference than there really was.

We have just examined this mixed lot, and we find that the largest yellow or orange carrots are only 15 inches in length, and 7 inches in circumference, and only a small part are this size, and these are as large as could be expected in a soil rather poor in condition and without manure, and in a season extremely dry.

But with all these disadvantages the white carrots are of a noble size; about two thirds in number are quite large. The longest are two feet in length and a good number 18 inches long. The largest are over 8 inches in circumference, and the greater part are from 7 to 8 in circumference.—These are but very small ones. Take the lot together, the white carrots are more than twice as large as the others.

The white carrot grows partly above the ground like the mangel wurtzel, so that they may be pulled with much more convenience than the other varieties. Some of them were six inches above the ground.

We have been particular in our remarks on the white carrot, as we consider it a superior root—one that will yield a large and profitable crop from a rather poor soil, and one that is sufficiently hardy to bear up against unfavorable circumstances.—Though we have given the facts in the case that show on inspection double the amount from the white carrot, we would not recommend its culture with a view that there will, under all circumstances, be so great a difference.

We made an experiment six or eight years ago, with two varieties of the white carrot—the better the same as this—and the produce was great. We sowed the 20th of June, which was late, and on that account the produce was probably 25 or 30 per cent. less, but the yield was at the rate of 600 bushels to the acre. The land was in good condition, but not extremely rich.

Farmers, try this carrot: we can assure you that it is superior in its yield, and if a crop of roots can be increased 10 per cent. by a new variety of seed, it is well worth while to try it. This excess

will pay far more than all expenses for seed, and the trouble of an experiment.

According to European authorities, the white carrot, as Mr Bosson has stated, is suited to shallow soils, as it grows partly out of the ground; but we think that it is also well adapted to deep soils, as it penetrates as deep or deeper than other carrots.—In the lot which we have named, allowing that the longest was six inches above the surface, then it extended 19 below, which is more than the length of the other kinds; so besides the extension above the surface, the white carrot penetrated deeper than the other varieties.

For the N. E. Farmer.

#### NEW WHITE FIELD CARROT.

ALLEN PUTNAM, ESQ.—Dear Sir—We last year received a small quantity of the seed of a new variety of carrot—the White—which I am inclined to think will prove a valuable acquisition to the country, although I am not prepared to state confidently the comparative value of this with the Long Orange, either in regard to the quantity that may be raised per acre, or to quality; for no trial between the two has been conducted by me with proper accuracy. But I should judge from growing a few on our place at Brighton, the last year, that the new White will prove more productive than the Long Orange. We received the seed quite late—about the middle of June—it was sowed upon a piece of ground that had not been very deeply pulverized nor highly manured, and of which the subsoil is very hard. The plants when young suffered severely from drought, so that I did not anticipate much of a crop; but in this I was disappointed. In August the plants began to make a vigorous growth, and by October had grown very large. The crown of the root projected several inches above ground and was greenish, while the part below ground was pure white.

If any are disposed to make trial of this variety, seed can be obtained at our store, No. 52 North Market street. JOSEPH BRECK.

[We have given in the foregoing articles, nearly all the information we possess relating to the white carrot. Our readers will judge for themselves whether enough is here given to make it desirable to procure seed of this variety. Our object is simply to give publicity to what those who have raised this root think of its productiveness. In regard to this, as well as most other new things, the desirable course is, that numbers should try it, but the common farmer should do it at first on a limited scale.—ED.]

#### THE MASSACHUSETTS CHARITABLE MECHANIC ASSOCIATION

Announce to the public, that their *Third Exhibition* for the encouragement of manufactures and the mechanic arts, will be opened at Quiney Hall, in the city of Boston, commencing on Monday, Sept. 20, of the present year.

One of the most important objects of the Association, as stated in their charter, and embodied in their constitution, is the encouragement of Manufactures and the Mechanic Arts; and it is generally conceded that this can in no way be so well accomplished as by public exhibitions, held at stated periods, thus placing in one view the aggregate talent, skill and inventive genius of the country, especially in this prolific age of improvement.

The exhibitions of 1837 and 1839, were eminently successful, and the trustees believe, gave very general satisfaction to the vast number of contributors who availed themselves of the facilities offered for an exhibition of their several productions. Many new, useful, and important articles were thus, for the first time, made generally known to the community; at the same time were obtained the opinions of skilful judges on their intrinsic merits, and those opinions were communicated to the public, in the official reports of the judges. The success attending the two former exhibitions, and the beneficial results to the several contributors, encourage the hope that the third will surpass them, in the number, variety and excellence of the articles offered.

The officers and trustees for the year 1841, having been vested by the Association with full powers to make the necessary arrangements, respectfully invite manufacturers, mechanics and artists, the ingenious and scientific, to offer for exhibition and premium, articles in every department of art, science and taste; choice specimens of native skill and ingenuity, useful labor-saving machines, implements of husbandry, and new models of machinery in all their variety; in fine, every species of article for any useful or ornamental purpose, made of wood, stone, metal, or other material. The products of the loom in silk, cotton, wool, hemp, flax or hair, and all articles devised by female ingenuity, or wrought by their industry, will have a proper place in the exhibition.

Medals (of gold or silver,) or diplomas, will be awarded for all articles of merit, deemed worthy of such distinction; and the officers pledge themselves that strict impartiality will be observed in their distribution, and that competent judges shall be appointed, who in no case will be competitors for premiums on articles exhibited.

In the fullest confidence that this notice will meet the early attention of the manufacturers and mechanics of Massachusetts, as well as of our sister states, (whom we shall be proud to meet in this glorious field of competition,) the managers will make such arrangements as shall insure a fair and full opportunity for a display of every article which may be entered on or before the 15th of September; and although they will not exclude such articles as may be afterwards offered, yet they cannot promise them so conspicuous a place in the exhibition, as those will have which are earlier entered.

WM. WASHBURN,  
Superintendent.

*To Color Madder Red.*—For 10 lbs. flannel or yarn, take 3-4ths lb. cream tartar and 3-4ths lb. alum; pound them fine and boil 15 minutes in sufficient rain water; then add a little cold water and put in your cloth and boil it 3 hours, stirring it often; take it out and air it well, throw away your alum water, put in a sufficient quantity of water so as not to crowd your cloth; then put in 3 lbs. madder, and heat it over a moderate fire as hot as you can bear your hand in: then put in your cloth and keep it stirring 3 hours at the same heat. Then take out your cloth and add 2 quarts of soap and stir it up well, put in your cloth for 20 minutes, and then it is ready for scouring. The cloth or yarn should be well washed and put in the alum water while wet. The cost will be but 6 cents per yard.—*Cor. Alb. Cult.*

## NEW ENGLAND FARMER, AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, MARCH 17, 1841.

### ANALYSIS OF SOILS AND MANURES.

We insert today a communication from Dr. Andrew Nichols, of Danvers, to the farmers' meeting, and the report of a committee upon the same. Whatever may be thought of the practicability of Dr. Nichols' plan, he deserves high praise for the effort to accomplish a great good. Such an effort will not be labor thrown away. It has brought an important matter directly before the agricultural community. It has elicited a report containing valuable facts and suggestions. The subject will be widely considered. Many minds will strive to mature a practicable plan for procuring the desired analyses. We invite attention to the subject, not doubting that means can be found to extend the benefits of science to practical husbandry, more widely than they have hitherto been enjoyed.

Let it not be imagined that our wish to extend the lights of science, implies a belief that the light which experience gives to the practical farmer, ought to be shorn of a single beam, or that the paths which it discloses are to be hastily abandoned. We value most highly the teachings of experience, and we respect a strong attachment to old ways and old opinions. But we dislike that *blind* attachment which will perceive no proof, however clear, that a new may be better. We like observant eyes, candid reasoning, and openness to conviction, accompanied with that caution or prudence which will require *proof* that change would be improvement, before it will make changes to any great extent. We like much that habit of mind which inclines the farmer to ask *why* the courses he pursues are good. We would encourage it; and when that habit is formed, the chemist will be consulted for many answers; his replies will give light that may render the teachings of experience more intelligible and beneficial. Let science come as far as possible to the aid of art.

### NINTH AGRICULTURAL MEETING AT THE STATE HOUSE.

On the evening of Monday, last week, the President being absent, Mr Dodge, of Hamilton, was chosen President pro tem. Mr Emerson being prevented by ill health from addressing us upon Forest Trees, the meeting proceeded to discuss the subject of "Roots and Fruits as food for Live Stock."

Mr Colman commenced by remarking that the cultivation of vegetables for stock, had not been very much attended to generally in this country. Some farmers, however, had practiced it to a considerable extent. Potatoes he judged to be an excellent article for swine, while carrots are good for horses and cows. The ruta baga was introduced or at least brought to general notice in this country, by Wm. Cobbett, about 1812. This notorious man, whatever might be his merits as a cultivator, could make a good story. This root has been much cultivated in New York. From 7 to 900 bushels to the acre are large crops here. In New York the crop has been larger.

Mr Putnam, of Danvers, stated that the farmer would desire to know the cost of raising roots and their worth. He comes from a town where onions and carrots are raised somewhat extensively, and had made some observations as to the cost of cultivating an acre. Thought that people not acquainted with the business may over-estimate the labor. After the manure has been put on and ploughed in, three men with a horse or a yoke of

oxen to the plough, will rake and fit for the reception of the seed, an acre per day. Let the ploughing go on, and let the stones, lumps, stalks, &c. be raked into the furrow, and when the plough comes round again it will bury them all. One man will sow the acre, with rows from 15 to 18 inches apart, in about one half a day.—About 18 days work, on an average, will be required to hoe, weed and thin the acre. This is on the supposition that the surface is flat and that the rows are about 15 inches apart. He knows not whether it is best to sow on a flat surface or in ridges. More labor is required on the flat surface. An ordinary crop is about 500 bushels. Let the manure cost \$40, and the labor \$22 50, and let the improvement of the land offset the interest on the land, and this root can be raised for about 12 1-2 cents per bushel. It is valuable to the farmer as a means of working off his coarse fodder, while he keeps his cows in milk, and keeps them also in good condition. Whether it makes much saving in the quantity of hay, is questionable. By its contributions to both quantity and quality of the manure heap, it is highly valuable. In the neighborhood of cities, and wherever there is a market for milk in the winter, he thinks the root culture good economy for the farmer.

Mr Burckminster, Ed. of the Cultivator, stated that we have much to learn. There are some points on which we want light. It has been a common statement that plants with the broad flat leaf, extracting much nourishment from the atmosphere, do not exhaust the soil. This opinion prevails not so much among common farmers, as others. Many of his correspondents doubt its correctness. Capt. Moore, who obtained the first premium on farms from the State Society, obtained 800 bushels of ruta baga from an acre one year, and only 200 from the same land the next year. This seemed like great exhaustion. He has seen it stated that two bushels of ruta baga are as good as a bushel of grain, but he doubts its correctness.

Mr Stanley, of Attleboro', has a kind of turnip which he has not seen, excepting in his own neighborhood. It is called the Peruvian, the seed having been obtained from Peru. It does well on poorish soil—grows quite large: he plants 15 or 18 inches apart. This turnip will keep well in his cellar far into the summer. It is white—grows large—is excellent in quality, and keeps remarkably well.

Mr Putnam, of Danvers, stated in reference to the ruta baga as an exhauster of the soil, that he had seen its effects compared with those of carrots, beets, &c. upon a crop of corn the following year. In the early part of the season, the effects were quite unfavorable, but they lessened somewhat as the corn was maturing. The second year the grass was best on the part of the piece where the corn was lightest, and where the turnips had grown. Barley, in the only instance in which he had seen it following turnips, did well. In England it is thought that their soils have been much improved by the turnip husbandry. There, Indian corn is not cultivated. This crop suffers—but grass and barley, as far as his limited observations extend, do not suffer from the previous action of turnips upon the soil.

Mr Dodge, of Hamilton, inquired whether the improvement of the soil in England referred to, was not owing mainly to the fact that the soil is manured and trodden by the sheep while consuming the crop of turnips on the field; and asked also, whether the manure is in fact *any better* when cattle feed upon roots in part, than when they feed upon hay?

Mr Stanley inquired whether it would be a good way to renovate a light soil, to plough in a crop of turnips?

Mr Colman remarked, in reference to the worth of carrots, that an experienced man in Berkshire county,

who kept a large number of horses, has said, that as food for horses, he would rather have 100 bushels of carrots and 100 of oats, than to have 200 of oats. Mr C. values them highly for horses; has raised them for ten cents per bushel, getting 600 bushels to the acre. He would plant in ridges and plough between them. To avoid weeds, he would have the manure old and fine; would plough in the first crop of weeds—would sprout his seed—sow rather late, and thus save labor in tending the crop. His ridges he would make 27 to 30 inches apart, and put either one or two rows on a ridge.

Mr C. thinks ruta bagas and cabbages great exhausters of the soil. Would sow in beds and transplant.—Roots may be kept for winter by making a long heap in the field and covering it with earth; leave one end open, a first, and make vent holes through the top with a crow bar: you must give them ventilation at first, or they will spoil; afterwards close all up; take out at the south end as they are wanted for use.

(To be continued.)

### TENTH AGRICULTURAL MEETING.

On the evening of Thursday, last week, Hon. B. V. French, of Braintree, was in the Chair at the agricultural meeting. After the committee to whom was referred the communication of Dr. Nichols had reported, and their report had been referred to the secretary for publication, George B. Emerson, Esq. occupied the floor during the remainder of the evening, in remarks upon forest trees. His communications were rich in facts, interesting in manner, and highly instructive. We have no space for reporting them at present.

### LIEBIG'S AGRICULTURAL CHEMISTRY.

We understand that Mr John Owen, Cambridge, has in press an American edition of Liebig's Agricultural Chemistry, with copious notes and an introduction explaining the first principles of chemistry, technical terms, &c., by Professor Webster.

### DURHAM CATTLE.

On Saturday last there was exhibited in front of the State House, a pair of Durham steers, coming five years old, belonging to Hon. John Wellea. Their weight is 3400 lbs. They are small bodied, but fat and well formed.

### TO CORRESPONDENTS.

The insertion of the articles relating to the analysis of soils, obliges us to defer the communications relating respectively to "The Proper Quantity of Grass Seed," "The Wheat Insects," "Berkshires" and "Lucerne."

### MORE LEXINGTON HOGS.

We learn from the Daily Advertiser, that Mr Phinney sent into the city last week another lot of twelve fine hogs, from 6 to 11 months old, weighing in the aggregate 4086 lbs.; average weight 340 1-2 lbs. They were purchased by Mr Geo. Munroe, corner of Ann and Flee streets.

### Massachusetts Horticultural Society.

EXHIBITION OF FRUITS.

Saturday, March 6, 1841.

J. L. F. Warren, Esq., of Brighton, exhibited the following Apples—Monstrous Pippin, Old Fall Peat main? Wellington, and one sort unknown. Also, Isabella Grapes, in a fine state of preservation. Specimens of an apple supposed to be Pennock's Re Winter, were exhibited by Chief Justice Parker, of New Hampshire.

For the Committee,

ROBERT MANNING.

**THERMOMETRICAL.**

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northerly exposure, week ending March 14.

March, 1841.	7 A.M.	12 M.	5 P.M.	Wind.

**BRIGHTON MARKET.—MONDAY, MARCH 15, 1841.**  
Reported for the New England Farmer.

At Market 225 Beef Cattle, 320 Sheep, 10 yoke of Working Oxen, 12 Cows and Calves, and 690 swine. Prices.—Beef Cattle—Sales quick at last week's prices, viz. extra \$6 75 a 7 00 First quality \$6 25 a 6 50. Second quality \$5 75 a 6 00.—Third quality, \$5 00 a 5 50.

Working Oxen—Sales \$65, \$72 and \$85. Cows and Calves, \$20, \$23, and \$28.

Sheep.—Lots at \$3 00, 3 75, 4 50, and 5 00.

Swine.—Lots to peddle were sold from 4 1-16 to 4 1-4 for sows and 5 1-16 to 5 1-4 for barrows. At retail from 5 to 6.

**WHOLESALE PRICES CURRENT.**

Corrected with great care, weekly.

SEEDS. Herds Grass, very little in market. Red Top, new seed — by the bag 60 to 65 c. Clover—Northern, very little in market.—Southern, plenty, 9 to 10 c. Flax Seed, \$1, 37 to 1 50 bu. Lucerne, 25 c. per lb.

FLOUR. Howard Street \$5 37—Genesee \$5 31—Ohio \$5 12.

GRAIN. Corn—Northern Yellow none—Round Yellow 51 to 59—Southern Flat Yellow 50—White 48.—Rye—Northern 60 to 65—Southern 50 to 55. Oats—Southern 23 to 32—Northern 35 to 40.

PROVISIONS. Beef—Mess \$10 50 to 11 00—Prime \$6 50—No. 1 \$9 00. Pork—Extra—15 00—Clear 14 50—Mess \$13 00. Hams—Northern 9 c. per lb.—Southern, none. Lard—Boston 9 c. per lb.—Southern, 8 to 8 1-2. Butter—Lump 18 to 22—Firklin 12 to 18—Shipping 8 to 14. Whole Hogs 5 1-2 to 6 c.—Pigs 5 c.

HAY, per ton, \$17 to 17 50—Eastern Screwed \$13 to 14 CHEESE—Old 11 c.—New 8.

EGGS, 16.  
WOOL—The market for this article has not experienced any change of late. Pulled Wool is rather scarce, and there is but a limited supply of low Fleeces, and of fine Fleeces the stock is also moderate. Prime or Saxony Fleeces, washed, lb. 50 to 55 c.—American full blood, washed, 47 to 50—Do 3 4 blood, washed, 44 to 46—Do. 1-2 blood, washed, 36 to 40—1-4 and common do, 35 to 37—Smyrna Sheep, washed, 20 to 23—Do. unwashed, 10 to 14—Bengasi Sheep, 8 to 10—Buenos Ayres unpicked, 7 to 10—Superfine Northern pulled lamb 43 to 46—No. 1 do. do. 37 to 42—No 2 do do 26 to 30—No 3 do do 18 to 20.

**PEAR, PLUM, GRAPE VINES, &c.**

3000 Pear Trees, of the most approved kinds.  
2000 Plum Trees, of the most approved kinds and extra size—many of them have borne this season.

Apple, Cherry and Peach Trees, of different kinds.

500 Quince Trees.  
4000 Isabella and Catawba Grape Vines, from 6 to 15 feet high; most of them have borne fruit. Black Hamburg, Sweetwater, Pound's.

30,000 Grant Asparagus Roots.  
Gooseberry, Currants, Raspberries, of good kinds.  
5000 Wilmot's Early Rhubarb or Pie Plants, lately introduced.

2000 Cherry and Pear Stocks; 1000 Plums; Roses, &c. of all kinds.

All orders sent to the subscriber at Cambridgeport, will meet with immediate attention.

SAMUEL POND.

Cambridgeport, Mass., Feb. 24.

**AN OX WAGON AND OX CART**

Nearly new, for sale by JOSEPH BRECK & CO, Inquire at No. 52 North Market Street, or at their Farm in Brighton. Feb. 24.

**WANTED,**

An experienced Gardener, to whom liberal pay and constant employment will be given. Inquire of this office. Feb. 24. tf.

**CORN SHELLER.**

CAUTION, the public are hereby informed that the subscriber has letters Patent for his improved CORN SHELLER, and all infringements on the same will be prosecuted to the extent of the law. The above machines are for sale at J. Breck & Co. No. 51 and 52 North Market street, Boston. C. WILLIS.

March 14th.

**AGRICULTURAL IMPLEMENTS, &c.**

The Proprietors of the New England Agricultural Warehouse and Seed Store No. 51 and 52 North Market street, would inform their customers and the public generally that they have on hand the most extensive assortment of Agricultural and Horticultural Tools to be found in the United States. Part of which are the following:

- 1000 Howard's Patent Cast Iron Ploughs.
- 300 Common do. do.
- 200 Cultivators.
- 100 Greene's Straw Cutters.
- 50 Willis' do. do.
- 100 Common do. do.
- 100 Willis' Patent Corn Shellers.
- 50 Common do do.
- 200 Willis' Seed Sowers.
- 50 " Vegetable Cutters.
- 50 Common do. do.
- 200 Hand Corn Mills.
- 200 Grain Cradles.
- 100 Ox Yokes.
- 1500 Doz. Scythe Stones.
- 3000 " Austin's Rifles.
- 100 " Cast Steel Shovels.
- 150 " Common do.
- 100 " Spades.
- 500 " Grass Scythes.
- 300 " Patent Snaiths.
- 200 " Common do.
- 500 " Hay Rakes.
- 200 " Garden do.
- 200 " Manure Forks.
- 300 " Hay do.
- 500 Pair Trace Chains.
- 100 " Truck do.
- 100 " Draft do.
- 500 " Tie up do.
- 50 doz. Halter do.
- 1000 yards Fence do.
- 25 Grind Stones on rollers.

March 17.

**FRUIT TREES AND SCIONS FOR SALE.**

The subscriber, at the Pomological Garden, Salem, offers for sale a very choice and extensive variety of Apple, Pear, Plum, Cherry, Peach and Apricot Trees, Grape Vines, Gooseberries, Red and White Dutch Currants, and Red and White Antwerp Raspberries.

Also, Scions of all the European and American Fruits which have been proved; all from fruit bearing Trees, packed in boxes with moss, and can be transported with safety to any part of this country or Europe.

ROBERT MANNING.

Salem, March 2, 1841.

1May1

**FRUIT AND ORNAMENTAL TREES, &c.**

NURSERY OF WILLIAM KENRICK.

12,000 Pear and Plum Trees.—Large and new additions of Pear and Plum Trees have lately been received, many kinds of which are alike new to our country, and very extraordinary. Such have been the selections which have been made by the subscriber in Europe, and in person, during the last Autumn, where all have been proved; those kinds already well known amongst us being identified by him by the wood and the leaf.

A new Descriptive Catalogue of all these fruits will soon be ready, and will be sent to all who apply.

Of the few following fine kinds extra large numbers have been provided for sale; all being very productive kinds, and most of them prodigious bearers, and are therefore calculated for cultivation to great profit on a great and extensive scale. These ripen in succession in the order named:

Jargonelle,	Aug.	Duchesse D'Angouleme,	Oct. Nov.
Summer Franereal,	Aug.	Gloux Moreau or the	Oct. Nov.
Bartlett or Williams' B.	Sept.	D'Aremberg of the	
Chret,	Aug. Sept.	French,	Nov. to Feb.
Beurre D'Amalis,	Sept.	Easter Beurre,	Dec. to Apr.
	Oct.	Clion, or LeCure, very	
Napoleon,	Oct.	large, for cooking	
Louise Bonne		only; a prodigious	
D'Avranches,	Oct.	bearer, Bourgimestre	
Marie Louise,	Oct. Nov.	of Boston.	Winter.
Passé Colmar,	Nov. to Feb.		

All orders addressed to the subscriber, or left with Joseph Breck & Co., New England Farmer Office, will be promptly attended to, and Trees, when so ordered, will be securely packed for safe transportation to distant places.

N. B. A few trees of "Van Mons' Leon le Clerc Pears," supposed to be the best in the world; also, "Pitt's prolific Marie," or "Surpasse Marie Louise." These cost high—these Pears alone must, therefore be charged at extra prices, or \$2,50 for the former, and \$2,00 for the latter.

WILLIAM KENRICK.

Nonantum Hill, Newton, near Boston, March 2.

**FRUIT TREES, MULBERRIES, &c.**

The subscriber offers to the public the usual very large assortment, comprising the choicest Fruit Trees, of every class, and embracing all the newest varieties. Also, an immense collection of Ornamental Trees, Shrubs and Flowering Plants, Green House Plants, Bulbous Roots, and the most extensive assortment of Splendid Dahlias, in the Union.

All these articles will be sold at a reduction to suit the times, and as cheap or cheaper than they can be elsewhere obtained. For the silk culture, are offered the finest varieties of Mulberries, which are the Circassian, Elata, Alpine, Multicaulis, and Broussa; all of which are very hardy except the Multicaulis and that withstands ordinary winters.

The State of New York having now granted a bounty of \$2 per lb. on Silk, and Massachusetts and Vermont having done the same, they will no doubt take the lead in this great national pursuit.

WM. R. PRINCE.

Flushing, March 7th, 1841.

N. B. Priced Catalogues will be sent to every applicant. Any persons who wish to establish silk plantations will be supplied with trees payable by a share of the proceeds.

**FARM WANTED**

Wanted to purchase on credit or hire on a lease of five or ten years, a small but good farm in the vicinity of Boston.—The advertiser is engaged in rearing swine and makes large quantities of manure and has it in his power to keep a farm in a high state of cultivation. Any person having a place to dispose of or rent at a reasonable price may hear of a tenant by addressing JOHN GREY, Neponset Village, Dorchester. March 10.

**SITUATIONS WANTED**

As Gardeners and Farmers. Apply at N. E. Agricultural Warehouse and Seed Store. March 3.

**A SMALL FARM FOR SALE,**

Situated in Braintree, ten miles from Boston, with a Dwelling House and large Cider mill thereon. The farm contains about 20 acres, Inquire of NATHANIEL FAXON, No. 53 North Market Street. Feb. 24.

**BERKSHIRE BOAR AND SOW.**

The subscribers offer for sale a full blood Berkshire Boar and Sow 18 months old, which they purchased a year since from N. C. Bement, which be warranted to be pure. Feb. 24. JOSEPH BRECK & CO

**FOR SALE.**

A small House in Medford containing nine rooms, with a barn, &c., and near the depot of the Boston and Lowell Railroad. For terms, apply to JONATHAN BROOKS, near the premises. 3w\* March 16.

## MISCELLANEOUS.

## REMEMBER THE POOR.

Remember the Poor!

It fearfully snoweth,  
And bitterly bloweth;

Thou couldst not endure

The tempest's wild power  
Through night's dreary hour,  
Then pity the poor!

Remember the Poor!

The father is lying  
In that hovel dying  
With sickness of heart.  
No voice cheers his dwelling,  
Of Jesus' love telling,  
Ere life shall depart.

Remember the Poor!

The widow is sighing,  
The orphans are crying,  
Half starving for bread;  
With eagerness speed ye  
To succour the needy,  
Their helper is dead!

Remember the Poor!

The baby is sleeping,  
Its cheeks wet with weeping,  
On its mother's breast,  
Whose cough deep and hollow  
Foretells she'll soon follow  
Her husband to rest!

Remember the Poor!

To him who aid lendeth,  
Whatever he spendeth  
The Lord will repay;  
And sweet thoughts shall cheer him,  
And God's love be near him,  
In his dying day!

**TO YOUNG MEN.**—There is no moral object so beautiful to me as a conscientious young man. I watch him as I do a star in the heavens; clouds may be before him, but we know that his light is behind them, and will beam again; the blaze of other's prosperity may outshine him, but we know, that though unseen, he illumines his own sphere. He resists temptation not without a struggle, for that is not a virtue—but he does resist and conquer. He hears the sarcasm of the profligate and it stings him, for that is the trial of virtue, and he heals the wound with his own pure touch. He heeds not the watchword of fashion, if it lead to sin: the atheist who says not only in his heart but with his lips, "there is no God," controls not him, for he sees the hand of a creating God and reverences it, of a preserving God and rejoices in it. Woman is sheltered by fond arms and guided by loving counsel; old age is protected by its experience—manhood by its strength; but the young man stands amid the temptations of the world like a self-balanced tower. Happy is he who seeks and gains the prop and shelter of christianity.

Onward, then conscientious youth! raise thy standard and nerve thyself for goodness. If God has given thee intellectual power, awake it in that cause; never let it be said of thee, he helped to swell the tide of sin, by pouring his influence into its channels. If thou art feeble in mental strength, throw not a small drop into a polluted current.—Awake, arise young man! assume the beautiful

garments of virtue. It is easy, fearfully easy, to sin; it is difficult to be pure and holy. Put on thy strength, then; let thy chivalry be aroused against error: let truth be the lady of thy love—defend her.—*Southern Rose.*

**PATRIOTISM.**—The British had taken possession of a beautiful and very valuable house, belonging to Mrs Jacob Motte. Lieut. Col. Lee waited upon her, and informed her that in order to dislodge the enemy, he was afraid it would become necessary to burn the building. She instantly replied, "The sacrifice of my property is nothing, and I shall view its destruction with delight, if it shall in any degree contribute to the good of my country." This was not a mere boast: Mrs Motte with her own hands furnished the arrows that were to convey the combustible materials to the roof.

This was one of the many acts of female patriotism exhibited during the American revolution.

**STEALING UPON CREDIT.**—A farmer in Connecticut, having lost several of his sheep, discovered after a while that they had been "hooked" by a neighbor; and without taking any other means of redress, sent him a bill to the amount deficit, which was paid without amurmur. The next year his flock was thinned in the same way, and on a much larger scale; and, with good reason, suspecting his kind neighbor of being the pilferer, he sent him a bill as before for the amount lost, at which the neighbor demurred, alleging that he had not stolen one half the number, and that some *unprincipled villain* had been *stealing upon his credit!*

**USE OF FALSEHOOD.**—A jury who were directed to bring in a prisoner guilty, upon his own confession and plea, returned a verdict of not guilty, and offered as a reason, that they knew the fellow to be so great a liar that they did not believe him!

**READY WIT.**—A boy having been praised for his quickness of reply, a gentleman observed, when children are so keen in youth, they are generally stupid when they advance in years. "What a very keen boy you must have been, sir?" replied the child.

An itinerating dentist lately called at a house and applied for business. "Don't you want your teeth drawn?" said he to the owner. "No." "Don't your wife?" "No." "None of the children?" "No." "Can't you give me some sort of a job?" says the dentist. "Why," says the gentleman, "I have got an old *cross cut saw*, the teeth of which are out of order. You can have *that* job, if you'll fix 'em."

"Why is the letter D like a ring?" said a young lady to her accepted one day. The gentleman, like the generality of his sex in such a situation, was as dull as a hammer. "Because," added the lady, with a *very* modest look, "*we* can't be *wed* without it."

A young lady having borrowed a dictionary, was asked upon returning it how she liked it. She replied, "The words are truly beautiful—but I don't think much of the *story.*"

"John, you dog, are you into *them* sweetmeats again?" "No ma 'n—the sweetmeats *is* into me."

## GARDEN SEEDS,

For sale by JOSEPH BRECK & CO. at the NEW ENGLAND FARMER OFFICE, No. 51 and 52 North Market St. Boston. The subscribers would inform the public that they have now on hand the largest collection of seeds ever before offered by sale in this city, embracing every variety of *Field, Kitchen, Garden, and Ornamental Flower* Seeds desirable for this or any other Climate.

Our seeds are either raised under our own inspection or imported from responsible houses in Europe, and having taken extraordinary pains to obtain such as are pure and genuine, we can confidently recommend them to our customers and friends, and feel assured they will prove satisfactory to all who try them.

Dealers in seeds are requested to forward their orders in season. Boxes for retailing from 3 dolls. and upwards will be sent out on commission allowing a liberal discount and take back what remain unsold.

Letters and orders with good reference will meet with prompt attention.

## FIELD SEEDS

Sugar Beet.	Ruta Baga.
Mangel Wurtzel.	Ballantine's New Royal do.
New Red Globe do. } superior	White Tankard Turrip.
Yellow do. } varieties.	Red do.
Carrot Long Orange.	Red Round do.
" Altringham.	White do.
" New White, extra fine.	White Globe do.
Pumpkin, sorts.	Green Round do.
Wheat—various sorts.	Purple Top Hybrid do.
Barley, do.	Buckwheat.
Rye, do.	Broom Corn.
Potatoes, do.	Millet.
Indian Corn, do.	Buckthorn. } for Hedges.
Oats, do.	Locust. }

## GARDEN SEEDS.

Artichoke, Asparagus, Beans of every description, Beets of sorts, Borecole, Broccoli, Brussels Sprouts, Cauliflower, Caraway, Celery, of the most improved sorts, Cabbage 20 sorts Carrot, all the varieties, Cucumber do, Cress, Egg Plant, Eodive, Indian Corn, Kale, Leek, Lettuce in great variety, Melons, do. Martynia, Mustard, Nasturtium, Okra, Onion of sorts, Pepper do. Pumpkin do. Parsnip, Parsley, Peas, a very great variety, Rhubarb for tarts, Radish of sorts, Salsify, Squash of sorts, Tomato, Turnip 20 varieties.

## SWEET AND POT HERBS.

Thyme	Sweet Basil.
Sweet Marjoram.	Lavender.
Sage.	Lemon Balm.
Summersavory.	Anise.
Medicinal Herbs, &c.	

## ORNAMENTAL FLOWER SEEDS.

Three hundred varieties, embracing all the finest sorts. Packages of 20 fine sorts for one dollar.

Those who prefer to have their Seeds put up in papers ready for retail, can be accommodated—each packet neatly closed and labelled with printed directions. Price #0 cents, per dozen papers, which are retailed here at 6 1-4 cents each.

Fruit and ornamental trees, of the greatest variety, supplied at nurseryman's prices, and orders solicited. These will be packed, when required, to go to any part of the U. States.

JOSEPH BRECK &amp; CO.

Boston, Jan 27, 1841.

## GRINDSTONES.

An extensive assortment of Water and Hand Grindstones constantly on hand and for sale by AMMI C. LOMBA (L) & CO. 13 Lewis's Wharf. 1stly. Nov. 17.

## NEW FLOWER SEEDS.

The subscribers have received from London a choice collection of Flower Seeds, which, with those raised by themselves, constitute all worthy of cultivation. Price from 6 1-4 to 25 cents per paper. Assortment of those marked 6 1-4 cents, 20 papers for one dollar, and others in the same proportion. JOS. BRECK & CO.

## WHITE CARROT.

A quantity of this new and valuable root is offered for sale at the New England Agricultural Warehouse, No 52 North Market street.

Also—New Red and Yellow Globe MANGEL WURTZEL—considered a superior variety.

Feb. 10.

JOS. BRECK &amp; CO.

## NEW ENGLAND FARMER.

## A WEEKLY PAPER.

The Editorial department of this paper having come into the hands of the subscriber, he is now authorized by the publishers to inform the public that the price of the paper is reduced. In future the terms will be \$2 per year *in advance*, or \$2 50 if not paid within thirty days.

ALLEN PUTNAM.

N. B.—Postmasters are required by law to frank all subscriptions and remittances for newspapers, without expense to subscribers.

N. E. FARMER.

### NINTH AGRICULTURAL MEETING.

We continue our report of the discussion on the subject of "Roots and Fruits as food for Live Stock."

Mr Colman has done but little with the sugar beet; but the mangel wurtzel he has had experience with: his cows suffered from the use of them. More milk was obtained in consequence of their use, but the cows were thin. Some farmers have found no harm result from using them freely. One practical farmer on a milk farm, had found the blood beet as good as any root for making milk. He thinks an animal that gets roots does not require so much hay as one that gets no roots, though it is possible that the roots would increase the appetite and that as much hay, if furnished, would be eaten. Feed sheep upon turnips and the secretions of urine become great; the manure from them is good and large in quantity, if they are properly littered. He would not sow for root crops until the season is well advanced; as late as near the middle of June is a good time for many of them.

Mr Buckminster thought the suggestion in regard to late sowing valuable. He prefers the parsnip to the carrot. The sheep, he said, is a great gourmandizer; and the manure from them is miserable, wretched stuff. Is not increasing the quantity of urine by roots, like increasing the cider by putting in water? Is there any more strength or goodness in it?

Mr Colman thought the passage of food through the system changes its nature. The Deerfield farmers consider four bushels of potatoes equal to one of grain. All food for swine should be cooked—for sheep the cooking will not repay the expense. For cattle generally, the cooking is not profitable.

Mr Sheldon, of Wilmington, thinks that ruta bagas and roots generally exhaust the land too much. He would rather have a cord of manure from the sheep than from any other animal. He had found it a good course to plant potatoes after corn: the land is not to be ploughed; put your manure and seed between the hills; then split the hills, and thus cover the potatoes; this will give a better crop than to plough the land thoroughly. Four bushels of potatoes for making beef are equal to one bushel of grain, and they make the animal heavier and better than any other food; that is, when fed on these they are better than good judges suppose they will prove to be when slaughtered. They should always be washed—dirt is no benefit as food for cattle. Pumpkin seeds should not be given to cattle.

Mr Lathrop, of South Hadley, said that he tops his ruta bagas in the field and lets them lie there two or three weeks, until they are dry and a little wilted; and then they will not heat in the cellar. Frost will not hurt them, if it comes out from them where they lie in the field.

Mr Mosley, of Westfield, said that he has never planted a turnip or a Rohan. Potatoes he raises for his stock, and gets from 3 to 500 bushels per acre. Watches his neighbors in the root culture,

and is ready to adopt their course as soon as it shall appear to him better than his own.

Col. Jaques, of Charlestown, stated that the manure from sheep is very good. Carrots for stock he values highly. Ruta baga is very good food for dry stock. Half a bushel of mangel wurtzel per day to a milch cow will produce daily from two to three quarts of milk. Give a cow four quarts of meal per day for two or three years, and it will destroy her milking properties. The Oakes cow and two others in Charlestown, were ruined as milkers in this way. A bushel of meal and a bushel of shorts are better than two bushels of meal for permanent feeding. Potatoes, when steamed, are very good feed. The finest mutton he ever saw was fattened upon this article. Swine will do well, fed upon pumpkins. Ruta bagas, though good for stock, are great exhausters of the soil.

### LETTER TO THE EDITOR.

N. Bridgewater, March, 1841.

To the Editor of the New England Farmer:

SIR—In April last, as you may recollect, I obtained of you four quarts of seed corn, of the kind exhibited by you at one of the farmers' meetings in the State House, in February, 1840, and promised to communicate to you the result. On the 12th of May, the corn was planted on a gravelly loam, which had been planted with potatoes the year before; ploughed twice and harrowed; manured at the rate of 31 horse cart loads to the acre; two thirds ploughed in—the residue put in the hills, which were about 3 1-2 feet apart each way—on 106 rods of ground. The seed was steeped in a solution of saltpetre, which was probably too strong, as not more than two thirds of the corn sprouted; by which means the crop was much lessened. The corn was hoed three times, but not hilled—harvested the latter part of September, when it was well ripened. The produce was at the rate of 65 bushels to the acre, 75 pounds of ears reckoned a bushel. This crop, though not a remarkable one, was better than is usually obtained by me or my neighbors, with the same amount of manure and labor.

This corn (which I shall call the Putnam corn,) so far as I can judge from one year's trial, is, in my opinion, preferable to the Dutton, or any other variety with which I am acquainted, for a strong, warm soil. Part of the same field was planted with the Parker corn, manured and cultivated in the same manner, but fell considerably below the other in the produce.

The seed of the Putnam corn will be furnished to others in this vicinity who are desirous to try it the approaching season; and further trial will better develop its qualities. J. PERKINS.

[Our correspondent and friend need not apply our name to the corn above described; for neither we nor any other Putnam, to our knowledge, is entitled to any credit for forming or improving it.—We presume that it is the same essentially as the corn known in many places as the "Red Blaze." We think, also, that one variety of the Brown corn,

(for we have seen two, each purporting to be the genuine Brown,) may be the same. It is an eight rowed corn, with very large kernel—the color varying somewhat, but always inclining to red. We have been well acquainted with it for many years. It is rather late, and its stalk is large; but we know of no other corn equally productive on soils not cold and which are in a good condition as to fertility. We have raised it by the side of the Phinney, the Dutton, the Parker, and various others. When tried by the half bushel, this has invariably given a crop that exceeded any other by 10 to 20 per cent. The last season we had two thirds of an acre planted with Parker corn, having the same treatment and as good a chance in every known respect as the Red Blaze, and the latter yielded about 80 bushels to the acre, while the former gave only about 65. There was no perceptible difference in the size of the stalk or in the time of ripening. Before harvesting, the difference was apparently but little. When the husking commenced, a much larger number of the ears of the Parker corn were small, than of the other kind. The corn was thick on the ground—about 20,000 stalks to the acre.

We have a conjecture, founded upon a hasty observation of different fields, that if not more than 13 or 14,000 stalks are put upon the acre, that the Parker may be as productive as the other. That is, we presume that the Red Blaze will bear planting thick better than the Parker. This is an opinion founded on such limited observation, that we wish it to have no other effect than merely to induce farmers to ascertain by experiment, whether there is not a difference in the effect of close planting upon different varieties of corn, even when those varieties are alike as to the size of the stalk and the time of ripening. We think there is, and the fact, if it be a fact, is worth establishing.

Notwithstanding our good opinion of the Red Blaze, we do not recommend it excepting to those who have warm lands and manure well.—Ed.]

For the New England Farmer,

### THE BERKSHIRES.

MR EDITOR—I perceive that a writer in your paper of the 3d inst., has made me a victim of his "grey goose quill," having come down at me with his hammer of facts, in such a "neck-or-no-joint" way, that I apparently soon shall be among the things that were; the more especially, as I am ready to admit that facts are stubborn things, and also will cheerfully accede to him the credit of truth and accuracy in the experiments that he specifies; but there are always two sides to a story, and I am not altogether without experience in Berkshire hogs, having in May last bought of Messrs Breck & Co. a boar, then a weanling, of fine form, but in my estimation, bad color. He has had from that time to this present date, what I call good food for store hogs, viz: in summer, squashes boiled with meal, four times a day; in the shorter days of autumn and winter, beets, carrots and turnips, boiled with meal, three times a day—and

now he weighs—what think ye?—why 135 lbs.; which, calling his weight when purchased 25 lbs., gives a gain of 110 lbs. in about 275 days!! Now your correspondent may be satisfied with such growth, but I am not, nor should I be even though it was a white hog. But I have other objections to Berkshire hogs: it is eighteen months before they mature, and should you attempt to fat them sooner, you make but a waste of provender, for although they appear round, plump and fat, they cut up but miserably, as a neighbor of mine can testify, who tried the experiment. It appears to me that to raise pork with the greatest profit in our vicinity, it should be pigged the first of April and slaughtered the first of February, and it should at that time weigh from 200 to 250 lbs.; and if it is nice, handsome, white pork, it will readily bring the one half of a cent per pound more than overgrown hogs of twice the size; and you escape feeding in the spring months, when your help is wanted for other purposes, when roots are often scarce, and there is no green food.

A BEGINNER.

Boston, March 4, 1841.

### GRAFTING.

Grafting is usually performed in spring. Professor Thouin has described forty modes, but the following will answer all general purposes.

*Whip grafting or splice grafting.* This mode is practised principally on small stocks; and it succeeds best when the scion and stock are of an equal size.

The scion, which consists of the young wood of the former year's growth, is cut to the length of about four inches. This and the stock are each to be cut sloping for an inch or more, and tongued. Tonguing consists in cutting a slit in the middle of the slope of the stock in the scion downwards, and a corresponding slit upwards; both are now to be nicely joined, so that one of the sides at least, if not both shall perfectly coincide, and to be securely bound with a wet bass matting string, and covered with composition, or with grafting clay. As soon as the scion and stock are completely united, the string is to be removed.

*Cleft grafting.* This mode of grafting is usually practised on stocks from one to two inches in diameter. It is thus performed. The head of the stock is carefully sawed off at a part free from knots, and the top pared smooth; with a thin knife split the stock through the centre, to the depth of about two inches, and insert a wedge to keep it open for the reception of the scion. The scion is to be prepared in the form of a wedge; with an eye if possible in the upper part of the portion thus formed; perfect success is the more certain when this is the case. The scion is now to be carefully inserted, so that the inner bark of the scion and of the stock may exactly meet. Large stocks require two scions, one on each side; sometimes four are inserted. The whole is now to be carefully covered with composition, or grafting clay, except two or three eyes of each scion. This mode of grafting is equally applicable to very small stocks, but being weak must be bound with a cord of bass matting.

*Saddle Grafting.* This mode of grafting is performed chiefly on very small stocks—it is much practised by Mr Knight. The upper part of the stock is prepared in the form of a wedge, by two sloping cuts, one on each side. The scion is prepared by slitting it upwards, and paring out the middle part of each side to a point. When the stock and scion are of an equal size, the adjust-

ment may be perfect; but if unequal, one at least must exactly meet. The whole is secured by a string of matting and covered with the composition, or clay. The string however is to be removed when a perfect union has taken place.

*Root grafting.* This operation is often performed on grape vines, just below the level of the surface, by the usual mode of cleft grafting. It is also performed on pieces of root, where suitable stocks are scarce.

*Side grafting.* This mode is sometimes practiced on those parts of a tree where a limb is wanting.—There are two ways in which it is performed,

1st. The scion is prepared in the same manner as for splice grafting, and the bark and wood on the side of the stock is cut sloping and the scion being adjusted as carefully as possible, it is bound and covered with clay.

2d. The scion being cut sloping as in whip grafting, a cross cut is made in the side of the tree on the top of a perpendicular slit; the bark of the tree above the cross cut is pared down slanting to the wood. The bark is now raised as in inoculating, and the scion inserted, and bound fast, and covered with clay.

*Grafting by approach.* This is often practised on trees and shrubs which succeed with difficulty by other modes. The tree to be grafted must be growing very near the tree which is to furnish the grafts. The limb or limbs of each tree which is to be thus united, must be pared with a long sloping cut of several inches, nearly to its centre; and the parts of each tree thus prepared, are to be brought together, and firmly secured by a bandage of matting, so that the bark shall exactly meet at least on one side and covered with clay or composition. When a complete union has taken place, the trees are separated with a knife, by cutting off the stock below the junction.

*Grafting Clay* is made of one third part of fresh horse manure free from litter, one third of cow manure, and one third of good clay, with a small mixture of hair well beaten and incorporated several days before using.

*Grafting Composition* is made of three parts of resin, three parts of bees wax, and one part tallow, melted together; when well mixed, it is poured into water and worked up like shoemaker's wax by hand. This composition may be spread while in a melted state pretty thickly with a brush on very strong brown paper. This paper is to be cut into small strips of suitable size, and is very thickly applied. In cool weather, may be instantly warmed with the breath, so as to become adhesive.

From the Farmer's Cabinet.

### CULTIVATING ORCHARDS.

Considerable difference of opinion exists among farmers respecting the best method of cultivating orchards; but the practice may be divided into the following three methods; 1st, leaving them unploughed, but pasturing them more or less, either with all kinds of stock, or with hogs only; 2d, ploughing every year, and raising crops of annual grain, or pasturing them in the green state; or, 3d, subjecting them to the usual rotation of crops, in all respects as other uplands. I propose to give my views briefly, of the advantages and disadvantages resulting from each of these modes, as applicable to orchards in clay soils, from which my experience has been principally derived: in such soils the roots of the trees generally extend farther

around the stem than the branches do, and are found nearer or farther from the surface, as the plough has been more or less frequently used, but, generally, the larger roots are in the subsoil, below the depth to which the plough penetrates. In the first, or non ploughing mode, we find the ground covered with fibrous-rooted perennial, or annual grasses, the roots of which require, for their full support, all the rain that falls and can be retained a sufficient time in the soils in common seasons; but the roots of the tree also require, for luxuriant, or full growth, probably the whole of the rain that falls, and that can be rendered available; and being lower in the ground, and thus deprived of a portion of the moisture by the grass, they are obliged to contend with the grass-roots for the moisture in the soil proper; thus there are two sets of roots in the upper soil, each requiring, in dry seasons, all the available moisture present; the consequence is, that the fruit, not having sufficient nourishment, grows slowly, and much of it drops prematurely, neither acquiring the proper size nor sufficient ripeness; and the grass (if of the fibrous-rooted perennials) not seeding, on account of being closely pastured, extends itself by its creeping roots, and though its necessities, multiplies them indefinitely, making little growth above ground, and that suitable for pasturage only.

In the second mode, that of ploughing every year, and raising and ripening annual crops of grain, it must be obvious, that for a part of the time we escape the disadvantages of the first method, the crop sown not requiring the whole moisture and strength of the ground, until considerable growth has been made, during which time the moisture will have full, free, and easy access to the roots of the trees, the soil, or surface, being loose from recent ploughing—but after the crop sown has attained half its growth, and from that time till it is entirely ripened, the struggle will be in some measure as before, but, I think, generally more favourable for the fruit; nay, I believe that both the grain and the fruit will suffer less, and that neither will be so imperfectly supported as in the first method; for owing to the loose and open state of the ground, the moisture will penetrate deeper to the roots of the trees, passing first through the soil in which the roots of the grain are foraging; and much more will be absorbed by the ground, and less will run off, in heavy rains, than when the ground is covered by a close-cropped, short covering of grass; in addition to which we are entitled to presume that grounds annually cropped will require and receive frequent manuring. Of these methods, when no crop is taken but the fruit, I shall take notice hereafter.

The other, and most common method, that of subjecting orchards to the usual rotation of crops, seems to combine the disadvantages of both the preceding methods, and to preclude the possibility of the tree accommodating itself to its circumstances, which, in ordinary cases, it does in some degree.

Among the many provisions which Divine Wisdom has made for the continuation of vegetable (and, I believe, animal) species, there is one that is, in some measure, connected with this question. It has been observed that vegetables that have suffered great injuries, frequently produce fruit or seeds in large quantities; thus, fruit trees that have been blown down, and have had part of their roots torn out of the ground, frequently bear more fruit than before they suffered injury; yet it must be remem-

bered that this fertility, so evidently designed for the continuation of the species, is commonly the last effort of the vital energy of the plant, and the exhaustion produced by the perfecting of the fruit, usually terminates in death. Now I believe that when orchards are ploughed, after having remained in sod many years, it frequently happens that some of the trees, and sometimes many of them, after being thus mutilated by the plough, produce large quantities of fruit and then dwindle away, leading the owners to the conclusion that the ploughing was productive of the best effects to the orchard, but that afterward, some cause, with which they were not acquainted, destroyed or injured it. The foregoing remarks apply principally to clay soils, or those in which the roots of trees penetrate downward with difficulty, and which are, in general, not the best situations for orchards; there are loose soils, of various kinds, in which not only the roots of trees pass down freely, to the utmost limit of their natural growth, but, owing to the openness of soil and subsoil, the water that falls sinks so as to leave the *grass roots* without sufficient moisture, but furnishes it to the *roots of trees* during a long time, in which it percolates slowly till it reaches the remotest limit they have attained. These are hungry and poor soils for farming, but valuable for growing timber; and, in some of the best varieties of these soils, orchards produce fine fruits in great abundance.

To close: I believe the only crop that should be taken from the orchard should be *the fruit*, and that it should not be cultivated with grain or grass, with a view to obtain crops, and consequently not subjected to the rotation system. The question then remains, Should the orchard be ploughed, or not? I believe trees may live to the natural extent of life and produce well, under either mode of treatment. If the non-ploughing system is adopted, the grass that grows should not be mown or pastured, but be permitted to fall upon the ground; and it would thus retain the moisture nearly in the same way that fallen leaves retain it in forests, which seems to be nature's method of storing and furnishing moisture gradually to the roots of trees. Hogs should be permitted to range through the orchard at times during the period that the unripe fruit falls, as they destroy injurious insects, and prevent their increase. If the method of ploughing every year is adopted, I would prefer to do it in the spring, as soon as the ground was in good order, and then sow with oats and clover seed; when the oats were about half grown, or rather less, pasture them close, with cattle, and then take out the cattle, permitting the hogs to range occasionally, as before. The clover will cover the ground so as to afford some protection from the summer's sun and winter's cold, and when ploughed in the succeeding spring, will aid in enriching the ground; and this in some soils will (with the lime that should occasionally be spread upon the surface, after harvest) be sufficient to keep it fertile. In other soils it will be necessary to add manure periodically; but whether the ploughing or non-ploughing system shall be adopted, the fertility of the soil must be kept up by lime and manure, when necessary. A. W. C.

#### WORKING BUTTER.

It has been a custom in our family, time out of mind, not to use any water in working butter, under the impression that the latter would be injured by such contact, and disposed to become rancid. Instead therefore of washing out the buttermilk, it

is carefully worked out with a wooden ladle. The following extract from the account of the Holstein dairy system, will explain the whole affair:

"The churning being completed, the butter is taken off by means of a large wooden ladle, and carried in a tub directly to the butter cellar, where, in a large trough, very smoothly polished off inside and provided with a plug hole at the lower extremity, the butter is slightly worked, and salted with the purest salt; then moulded with a wooden ladle into a mass at the upper end of the trough, and left for some hours to drain. In the evening it is thoroughly beat, or rather slapped.

"The butter in Holstein is seldom if ever washed, as water is believed not only to rob it of its richness and flavor, but as being itself susceptible of putrefaction, and inimical to the preservation of the butter."—*New Genesee Far.*

From the Albany Cultivator.

#### EXTRAORDINARY SECRETION OF MILK.

MESSRS EDITORS—Having seen an article in the Cultivator of November last, with the caption, "Extraordinary Secretion of Milk," and having been personally knowing to a circumstance somewhat similar to some of those mentioned in that article, I have thought best to give a brief sketch of the facts. Many years since, I was directed by an uncle, with whom I was then living, to turn a two-year old colt into a back pasture, by which means she would be not only out of sight, but alone and apart from any other domestic animal. At this time the grass had begun to show quite a green appearance, it being about the middle of May. In about six weeks from this time, I discovered quite an enlargement of the udder; supposing the cause to proceed from some injury, I hastened to inform my uncle, who with myself and a third person, repaired to the lot without delay, and after a thorough examination, could find not the slightest injury whatever, but on the contrary, free from every appearance of having had an application of means being used calculated to produce milk; and which was proved more fully by the exertions on the present occasion of stripping, which was continued for some time before the milk came; from this time until late in the fall after, she was milked daily, giving a quart at a time by actual measurement, when with some care she was dried off.

D. P. S.

#### GOOD SENTIMENTS.

Agriculture is the nursery of patriotism and virtue.

Agriculture, aided by science, will make a little nation a great one.

Science must combine with practice to make a good farmer.

A wise government will not be slow in fostering the agricultural interest.

All the energy of the hero and all the science of the philosopher, may find scope in the cultivation of one farm.

If you separate science from agriculture, you rob a nation of its principal jewel.

Whatever may be the nature of your soil, and situation of your farm, remember that there is no soil so good, but it may be exhausted and ruined by bad tillage, and that there is none so bad that cannot be rendered fertile by good tillage.

#### DOMESTIC ECONOMY.

Few persons consider the importance of *small savings*. The trifling sum of ten cents a day saved or wasted for thirty years amounts to ten thousand and ninety-five dollars without interest.

The journeyman mechanic, who saves two hundred dollars a year, and keeps it at compound interest, may at the end of nine years set up for himself, with a thorough knowledge of his trade, and of men and business in general, and with a clear capital of nearly twenty three hundred dollars.

A man who saves one hundred dollars each year, from twenty one, and in like manner keeps it at interest, will have at fifty-five, *over ten thousand dollars* to support him in old age, dispose of by will or otherwise leave to his heirs.

Let me not be supposed to advocate unnecessary parsimony or avaricious hoarding. I envy not the sordid miser—whose god is gold—the selfish oppressor of the poor—the friend of none, respected by none. His heirs wish him dead, and will soon quarrel over and scatter his accumulated hoards. He knows it, and is really more wretched than the well fed pauper.

On the other hand, extravagance—a waste of property—is unjustifiable even in the rich. They are accountable to God for their conduct and the use they make of money; they have no moral right to annihilate it. They need not give it away to support the idle, this would be worse than wasted, it would be criminal; but they can give employment to the industrious and remunerate them fully for their labor. Parents that waste a thousand dollars a year in extravagance, probably to ruin their own children, would do well to consider how much good that sum might do in supporting and educating twenty orphan, neglected, or morally exposed, children.

#### LEGISLATIVE AID TO AGRICULTURE.

We are gratified to learn that the Agricultural Committee of the House of Assembly have reported a bill for the benefit of agriculture. Its provisions are such as will, we are inclined to believe, meet the approbation of the great mass of our farmers. It appropriates the sum of seven thousand dollars, to be distributed to the County Agricultural Societies in the ratio of \$50 to each member of Assembly, and the balance of the appropriation, \$600, to the State Agricultural Society—the money not to be paid to the several societies until they have raised an equal sum. If this bill shall be passed, and we cannot doubt but what it will be, it will give a new and powerful impetus to agricultural improvement. Small as the sum appropriated is, it will have the effect to bring into existence associations for the advancement of agriculture in all our counties, and their action will be extended to every town, so that, more or less, every individual may participate in the benefits to be derived from these associations.—*Albany Cult.*

*An excellent Potato Pudding.*—Take eight ounces of boiled potatoes, two ounces of butter, the yolks and whites of two eggs, a quarter of a pint of cream, one spoonful of white wine, a little salt, the juice and rind of a lemon; beat all to froth, and sugar to taste.

Be indulgent to other's faults, but implacable to your own.

For the New England Farmer.

### WHEAT INSECTS.

Wheat, barley, corn, and other grains, are subject to the attacks of many different kinds of insects, the history of which does not seem to be so well known as it ought to be, to enable us to provide effectually against the ravages of these insects. Although much has been written on this subject by naturalists in foreign countries, their writings are not generally accessible here, and we are obliged to depend for information mostly on our own observations and resources. Naturalists seldom have sufficient opportunities for making the necessary investigations and experiments; for these they must look to the farmer, who will be able to furnish valuable materials, if he prepares himself for the task, by previously obtaining such a general knowledge of the habits and transformations of insects, as will qualify him to become a careful and accurate observer. It is with a view to excite further attention to the history of these insects, and with the hope of procuring, thereby, more full and correct details respecting the habits of those which are injurious to wheat and other grains, that I propose to make a few remarks upon some of them.

Wheat is exposed to injury from insects in three ways: by those that devour it after it is stored in barns and granaries; by those that attack the ears while growing; and by those which prey upon the roots, the stems, and the leaves of the plant.

Several kinds of insects are found to be very destructive to stored grain in Europe, and some of them have also been observed in this country. One of these is the grain-weevil (*Calandra granaria*), properly so called. This, in its perfected state, is a little hard-shelled beetle, of a pitchy red color, about one eighth of an inch long, with a slender snout bent downwards, and a rather narrow and slightly flattened body, apparently consisting of two nearly equal portions, the anterior of which is the thorax or chest, and the hinder one the abdomen, on the top of which are the short wing-covers. This little beetle lays its eggs in wheat after the latter is housed, putting only one egg into a single grain. The young, hatched from the egg, is a little white grub, without legs. It burrows immediately into the grain, devours the substance within, leaving the hull only untouched, and remains concealed till it has finished its work of destruction, when it turns to a chrysalis, and soon afterwards to a beetle like its parents, and then comes out of the hull, and, after pairing, provides for another generation of weevil-grubs. So prolific are these insects, that a single pair may produce above six thousand descendants in one year. It is said that our stored wheat and corn are infested by these destructive weevils, or by some insects closely resembling them; but to what extent I have not yet been able to ascertain. If persons who have noticed these weevils will send me specimens of them in the beetle state, it will enable me to determine whether they are the same as the grain weevils of Europe.

Another beetle (*Trogosita mauritanica*), about one quarter of an inch long, of a chestnut-brown color with a flattened body, a short thorax and large head, is found among grain in Europe, where it is called *cadelle*. The young of this beetle are long, somewhat flattened, whitish grubs, narrowed towards the head, which is brown and horny, and armed with powerful nippers. They have six legs under the fore part of the body. When fully grown they measure about three eighths of an inch

in length. These grubs devour stored grain in Europe, and often do much damage to it; but I am not aware that they have been found in our own granaries.

The most destructive insects to stored grain are the young of a small moth (*Tinea granella*), the depredations of which are often carried to an alarming extent. The grain moth has a tuft of white hairs on its head; its wings cover its back like a sloping roof, but they are a little turned up behind, and are edged with a deep fringe. The upper wings are marked with grey, brown, and black, and have the lustre of satin; the lower or hinder wings are blackish. Its length, when the wings are closed, is between three and four tenths of an inch, and the wings expand six tenths of an inch. It lays its eggs on the grain in May, June, or July, sometimes early and sometimes late, according to the season, and the young are hatched in a few days afterwards. These young insects gnaw into the grain, covering the hole with a little web, and afterwards fasten together several grains with silken threads, so as to form a larger cavity, lined within with silk, in which they live. Thus wheat, barley, rye and oats, all of which they attack, will be found full of lumps of grains cemented together by these corn-worms, as they are called; and sometimes the whole surface of the grain in the bin will be covered with their webs. These worm-like destroyers are really caterpillars, of a cylindrical form, tapering a little at each extremity, and provided with sixteen legs, the first three pairs of which are conical and jointed, and the others fleshy and wart-like. When fully grown they measure from three to four tenths of an inch in length, and are of a light ochre or buff color, with a reddish head. In August or September, they get into cracks, or around the sides of corn-bins; and each one makes itself a little pod or cocoon, within which it remains through the winter. In March or April following, they take the chrysalis form; and three weeks afterwards the shining brown chrysalis forces itself part way out of the cocoon, and bursts open at one end, so as to allow the little moth therein confined to come forth.

The foregoing account will probably enable the readers of this paper to determine whether these destructive insects are found in our own country.—From various statements, deficient however in exactness, which have appeared in some of our agricultural journals, I am led to suspect that this corn-moth, or an insect exactly like it in its habits, prevails in all parts of the country, and that it has generally been mistaken for the grain-weevil, which it very far surpasses in its devastations. Many years ago I remember to have seen oats and shelled corn (maize,) affected in the way above described, and have observed seed-corn, hanging in the ears, to have been attacked by insects of this kind, the empty chrysalids of which remained sticking out between the kernels; but for some time past no opportunity for making further investigations has offered itself.

There is another grain-moth, which, at various times, has been found to be more destructive in granaries, in some provinces of France, than the preceding kind. It is the *Angoumois moth*, (*Alucita cerealella*, of Olivier,) apparently identical with the *Ceophora granella*, of Latreille.\* From an interesting little book of this insect, by Duhaenel du Monceau, and from Reaumur's "Memoires," I gath-

\*Also named *Tinea Hordei* and *Ypsolophus granellus*, by Kirby and Spence.

er the following particulars. The Angoumois moth, so named from a part of France where it was first noticed, is, in its perfected state, a four-winged insect, about three eighths of an inch long, when its wings are closed. It has a pair of curved feelers turned over its head. Its upper wings are narrow, of a light brown color, with the lustre of satin; they are folded over the body lengthwise, and horizontally above, but droop a little at the sides: the rest of the body is ash-colored. This moth lays its eggs, which vary in number from sixty to ninety, on the ears of wheat, rye and barley, most often while these plants are growing in the fields, but sometimes also on the stored grain. The little worm-like caterpillars, as soon as they are hatched from these eggs, disperse, and each one selects a single grain into which it burrows immediately at the most tender part, and remains concealed therein after the grain is harvested. It devours the mealy substance within the hull, and this destruction goes on so secretly, that it can only be detected by the loss of weight in the grain. When fully grown, this kind of caterpillar is not more than one fifth of an inch long. It is of a white color, and has sixteen legs, resembling those of the corn-worm already described. It has also, just behind the head, two little horns, and two short bristles at the end of the body. It turns to a chrysalis within the hull of the grain, having previously gnawed away the inside of one end, so as to provide for its future escape; and, in due time, it changes to a moth, and comes out of the empty hull.

It forms no part of my present purpose to state what are the means to be employed for checking the ravages of insects in stored wheat and other grain. I apprehend that this subject is well understood by our farmers and millers. My object will be answered if the foregoing plain descriptions will enable other persons, who enjoy opportunities which I do not possess, to ascertain by careful observation whether any of these destructive insects are found here; and I trust they may be induced to make known the result of their observations. It will be perceived that, of the four insects herein described, only one has any claim to the name of grain-weevil or wheat-weevil. It is to be hoped, therefore, that hereafter this name will be confined to the true culprit.

T. W. HARRIS.

(To be continued.)

For the New England Farmer.

### PROPER QUANTITY OF GRASS SEED.

MR A. PUTNAM—Dear Sir—In the report of the Committee on Farms, in which it became my duty to express their opinion and decision, as published in your paper of the 17th February, it was therein expressed that in the statements of the eleven applicants for premium, there was a deficiency in the quantity of seed applied to the land, when laid down to grass. There was, in every instance, less, and in most cases much less, than there should have been.

This was doubtless to the disadvantage of each cultivator; for had the quantity of seed been enlarged, the crop of hay would have been greater, as the condition and culture of the land was such as to make this evident to the committee. In fact, the sufficient use of grass seed has been a matter of long neglect with farmers. It is little over half a century since many farmers thought and expressed an opinion that nature would do this herself, and

without aid. The failure from dry seasons and the injury often done the smaller grass seeds by fermentation and bad preservation, tended to keep alive this unfortunate opinion.

Experience has, however, given us better instruction, and we find that when blessed in the season, he that sows abundantly shall reap in full proportion.

I was led to think that my individual suggestions would be in more proper place if separately made, rather than if otherwise connected. More especially as I had another object in view.

A few years since, when in England, I applied to a well accustomed and intelligent seedsman in London, and requested him to give me in writing an account of the quantity of seed used by farmers in laying down their lands to grass. The original paper he handed me, you have herewith. The notice he takes of tares and beans is immaterial; so also the account he gives of the quantity of St. Foine and Lucerne seed used where the quantity is lessened one half by being sown in drill. These two latter grasses have not succeeded, in my efforts of culture. It cannot indeed be expected that we should be able to procure any better substitutes for the grasses long familiar to our farmers.

The prevailing spear grass (if I may so call it,) which the English use with clover in laying down their grounds, is denominated rye grass; the quantity used is one bushel thereof with 14 lbs. of clover for an acre.

It may not be amiss to add, that in England the use of clover for turning in as a benefit to the soil, is of very extensive practice.

In the most inquisitive research after the herds grass in many parts of England and Scotland, I found but one spire which resembled the herds grass; this I brought home with me; but its resemblance was faint and diminutive—not distinct.

I have thus given you the information in detail which you requested of me, for such use as you may see fit to make thereof, and am, with much respect and regard,

Yours, truly,

JOHN WELLES.

*Boston, March 10, 1841.*

The following is a copy of the original paper furnished by the London seedsman, alluded to in the foregoing:

"Tares, 4 bushels; St. Foine, 4 or 5 bushels; Lucerne, 10 lbs. per acre, if broadcast—if drill, half the quantity; clover, 14 lbs., and rye grass 1 bushel; beans, 6 1-2 bushels, in drills."

From the Albany Cultivator.

#### A REMEDY FOR THE GRAIN WORM.

*Messrs Gaylord & Tucker*—Western Vermont was very noted for raising grain, especially wheat, from its first settlement until about the year 1820, when the grain worm was first discovered in rye, barley, summer and winter wheat; its ravages were more confined to the wheat crop of the winter variety. This formidable enemy came more and more numerous, until after repeated trials we were obliged entirely to abandon wheat raising. No remedy appeared to present itself whereby we could gain any success. It is but a few years since those who have cast their wheat upon the ground in the fall have been successful. The spring varieties are now more generally sown; which happens about the 15th of May, to carry the

ripening process beyond the reach of the fly, and summer fallows are going out of date.

In 1837, I tried an experiment which proved successful in avoiding the depredations of the grain worm; since then I have not cultivated the winter grain, and therefore have not again tried the remedy. As soon as the calyx or envelope of the kernel was formed and while the wheat was in blossom, I prepared some boys with traps and hired them to catch an animal well known in these parts by the name of skunk. They caught two of these noxious animals, which I hung up in two different parts of my wheat field about the height of the grain heads; and the result proved on strict examination that within a circle of several rods around these animals, no larvæ or grain worms could be found, and at the same time in other parts of the field, some considerable intrusions of the worm were noticed; but they did not infest this field of three acres to that extent that they did others in the neighborhood. The contrast as I suppose was occasioned by the strong effluvia that spread in all directions over it. I have also noticed that flies never prey upon the carcass of this animal as they are well known to do upon other dead flesh; and I should suppose that all animals that were endowed with but a small share of instinctive common sense, and were blest with but small olfactory organs, would shun the powerful weapons of this animal without one salutation.

The skunk is an animal which we frequently find in the fields, probably the same species and about the size of the pole cat; its hair is long and shining with one or two stripes from the head along the back and tail, clouded with white, the remainder black; it has a long bushy tail; lives and burrows in the woods and hedges, and often under barns and out-houses. When undisturbed, this animal is without any ill scent or disagreeable effluvia; but when attacked, the skunk discovers his singular but effectual method of defence. It emits a fluid of the most nauseous and intolerable scent that has ever been known: so odious, subtle, penetrating is the ill-scented matter, that there is no animal that can long endure it, or will venture to approach him when he is throwing it out; it infects the air all round; with the wind it may float a mile or more. No method has ever been found to extract the scent on which the fluid has been thrown; time, earth and air, after a long period afford the only complete remedy. This ill-scented fluid is an unctuous yellow matter contained in two tumors or bags attached to the abdomen, at the termination of the back bone, and surrounded in such a manner by circular muscles that on contraction the fluid is forced out with great velocity and force.

I have taken out these bags, and have no doubt they may be preserved any length of time by drying, or put them in glass jars in which any quantity of twine might be enclosed; by pressing the sack, the cord would become incorporated with the matter; then at, or just previous to the appearance of the wheat fly, which is about the last of June, while the grain is in the blossom, or milk, string this scented cord around and across the grain fields in different directions, and it would thoroughly incorporate the whole field, and I have no doubt form a safe and effectual barrier in preventing the encroachments of the wheat fly, and many other winged insects.

The above I cheerfully present for your consideration, with liberty to publish, hoping it may be of

some use to the public directly or indirectly, by leading the way to a more pleasant if not efficacious remedy to prevent the ravages of so formidable an enemy.

Yours, SOLOMON W. JEWETT.  
*Middlebury, Vt. Jan., 1841.*

From the New Genesee Farmer.

#### SPROUTING GARDEN SEEDS—RAISING ONIONS.

*Messrs Editors*—The approaching season will soon resume the interest in the field and garden, and it may not be unprofitable at this time to consider what will be the best course to pursue. The following statements are advanced as proof of the very great advantage derived from the simple process of sprouting garden seeds before planting. The positive knowledge of its benefits is derived from six years practice. There is no difficulty to be apprehended if the same judgment be exercised that is required in the common operations of the garden.

First, soak the seeds in water from six to twenty-four hours—some seeds being slower to admit moisture than others, is the difference in the time required. After soaking, drain off the water, and mix the seeds with a sufficient quantity of earth to absorb the moisture remaining on the seeds; stir them often, that they may vegetate evenly, and keep them in a moderate degree of warmth and moisture until they are sprouted, when they are ready to be put into the ground. If the weather should be unfavorable, put the seeds in a cool place, which will check their growth.

The advantages of this practice cannot be better shown, than by relating the management and improvement of the onion crop in our own garden.—The culture of the crop in 1840, was as follows:—Just before the approach of the preceding winter, there was a light dressing of fine manure put on a piece of land designed for onions, containing 2 1-2 acres, and the same ploughed. It remained until a thaw in the winter; it was then ploughed again; the frost was not all out of the ground; it was consequently left very rough, and more of the soil was exposed to the frost, which was beneficial. It was left in that situation until the time of sowing. In April, as soon as the soil was sufficiently dry, the ploughing was commenced, and the second day at night the sowing was finished, with seed prepared as before stated. In one week the onions were up, rows were soon visible nearly twenty rods, and no weeds yet appeared. The operation of stirring the soil with rakes and hoes was then commenced, and the weeds were not suffered to grow during the summer. (It is a mistaken notion that it is not time to hoe a garden until it is green with weeds.) The first of September the onions were harvested, and the product was over two thousand bushels of fine onions from two and a half acres.

W. RISLEY.

**WET FEET.**—How often do we see people tramping about in the mud, with leather soaked through, and how often do such people when they return home, sit down by the fireside and permit their feet to dry, without changing either their stockings or shoes. Can we then wonder at the coughing and barking, and rheumatism and inflammation, which enable the doctors to ride in their carriages. We entreat our readers, no matter how healthy, to guard against wet feet.—*Medical Adv.*

## NEW ENGLAND FARMER, AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, MARCH 24, 1841.

### TENTH AND LAST AGRICULTURAL MEETING AT THE STATE HOUSE.

Mr Geo. B. Emerson, of this city, who has been employed by the Commonwealth to collect and disseminate information relative to the Forest Trees of the State, informed the meeting that he had long been interested in the subject; for more than twenty years he has been accustomed to take his recreations, in roaming the forests and studying their constituents. These forests have been his benefactors in point of health and enjoyment. Once our domain was almost an unbroken forest. He laments to see it so rapidly wasting away, and would rejoice to see new forests rising up in our midst. Compared with the *native* trees of old England, Massachusetts is rich in what her soil produces. We have given to the mother land more than 500 varieties of trees and shrubs. A long table was here given by Mr E. of the number of oaks, maples, &c. of Mass. and those of England. We omit the table, but give the footing of the columns, which shows that our *tall timber trees* amount to 56. While those that are *natives* in old England number only 27.

He has no belief that our 360,000 acres of unimprovable lands, are in fact unimprovable. Some of our trees would grow on every soil. The most unpromising sands in France have been made to grow the pine. There is no such thing as absolutely barren sands; the rains and snows will deposit something favorable to vegetable growth wherever they fall. The pitch pine is best suited to the sandy plains. Our bare and rocky hills would bear the larch. The Duke of Athol has covered 10,000 acres of such land with the larch. Our wet marshes or meadows are the most difficult to operate upon, but these will bear the white cedar, which may be introduced by simply sowing the seed.

*General uses of the Forests.* Climate is affected by them. As the forests are stripped away the climate becomes drier. Our streams dry up as the woods—great reservoirs of water—are removed. These woods prevent the escape of water by evaporation; they soften the climate. They are conductors of electricity from the clouds, and thus are contributors to the fertility of the soil. Over a bare country the winds have nothing to break their force, and consequently sweep with violence. A bare hill gives no protection, while one covered with trees breaks the force of the wind. By their annual deposits of leaves and wood for decomposition, the forests contribute steadily to the fertility of the soil. As fuel, our forests are worth to the Commonwealth \$5,000,000 annually. Their worth as timber, and as furnishing materials for furniture, &c., are well known.

We desire that the briefness of our report may not lead to the inference that the address was not deemed worthy of more extended notice. We were much fatigued by the labors of the day, and feel unable to make our notes as full as usual. And so many days have elapsed since the meeting, that we fear our memory may not serve us faithfully if we attempt to draw from that alone. The remarks of Mr E. were both interesting and instructive.

Dr. C. T. Jackson remarked, that he had very recently learned a curious fact, which might be appropriately stated. Chemists in France have found that by cutting down a tree when the sap flows freely, coating the end where it has been cut with pitch or some other similar substance, boring with an auger to the heart of the tree

near the butt, and pouring into the hole a colored liquid, that the liquid will be carried up by the sap vessels, and will color the wood and the leaves. In this way you give any color you choose. Linseed oil was thus diffused through the wood in one instance, and it was found to add much to the durability of the timber.

### EDUCATION OF SHEEP.

We were highly pleased a day or two since, by hearing an intelligent farmer from New Salem state, that the dispositions of sheep in regard to leaping fences and rambling, are *the results of education*. On his farm, sheep have fed quietly for thirty years, in a pasture enclosed by a common stone wall, and have never shown any disposition to get out. One of his neighbors thought he must have exercised the powers of a witch over the flock, to make it so contented. And what, reader, think you was the process by which he charmed them? It was simply confining them to a yard in the winter. His flock are of his own raising. They have *never* been allowed to leave their pen in the *winter*. Where permission to do this is granted, especially when snow is on a part of the ground, and is deep and solid under the walls, the sheep pass from place to place with ease, and find the rich spots in the fields; as the snow wastes away gradually, they learn from day to day to leap higher, and when the snow has entirely disappeared, they have so practiced and learned the arts of climbing and jumping, that a common stone fence is no barrier against their reaching the spots where the best feed is to be found. After this it is exceedingly difficult to keep them where you would have them feed. A young flock, with no badly educated old ones to lead them astray, will never give you trouble, if you do not shamefully neglect your fences, or suffer the sheep to roam when the snow-banks reduce the height of the fences.—Is there not good sense in this farmer's advice to his brother farmers, that they *give their sheep a good education*?

### COMPARATIVE WORTH OF POTATO AND ROOT CROPS.

An intelligent farmer from beyond the Connecticut river, with whom we have had a pleasant acquaintance as an associate in legislation, has left with us the following questions, which we should be happy to have any one of our correspondents answer.

Can there be raised more *weight* of roots, such as turnips, ruta bagas, sugar beets, &c., than of Merino or other prolific potatoes on the same quantity of ground? If so, how much more.

Which will fatten the most, make the most beef or pork, pound for pound?

Allowing the fact that you can raise more weight of roots than of potatoes, is not the additional expense of cultivating the roots, and of cutting them up so that the stock can eat them, more than the extra profit, to say nothing of the injury done to the land by the roots?

### MASSACHUSETTS LEGISLATURE.

Being released from any farther duties at the House, we hope to do better for our readers in future than we have been able to thus far. To those who have been associated with us in legislation, we give an invitation to call upon us at our office whenever they may be in the city; to furnish us with any matters that may be useful and interesting to the farming community; to say among their neighbors and friends whatever they may honestly think of us and of our paper, in connexion with the farming interests; and if any of them find it convenient and agreeable to say a word in favor of our

paper, and to obtain subscribers for it, we shall esteem their good word and their labour in our behalf a personal favor.

### OBJECTS OF AN AGRICULTURAL SOCIETY.

(From Mr Huntington's Address before the Essex Agricultural Society.)

The direct and main object of our union, under the form of a society, is to improve, and extend, as far as may be, the agricultural resources and wealth of the county. This object cannot be fully accomplished, until all its members, and especially the practical farmers, consider it a personal and imperative *duty* to bring out and place upon record in our annual publication, all the valuable results of their experience. \* \* The wisdom of the world is founded on the experience of the world. This is emphatically true of the art which it is our design to promote. Every farmer, who pursues his calling with that zeal, enterprize and intelligence, which all men should endeavor to bring to the prosecution of their lawful business, will learn *something* every year, which it is important that others should know. That something should be communicated for the common benefit. The lights of experience and true knowledge should not be suffered to expire in one's own breast, but should shine forth on our published records for the illumination of the general mind. To this end, let every farmer who has good reason to believe that in any one thing he is wiser this year than he was the last, bring up here a brief narrative of the matter, to whatever branch of husbandry it may relate; and if this duty should be fully discharged by our intelligent yeomanry, abstracts might be prepared for publication, from such narratives, which would be of invaluable service in advancing the agricultural interests of the county. \* \* If our farmers will bring out to the public view, from time to time, the results of their own experience, the boundaries of knowledge will be enlarged, and an actual progress will be made in the promotion of this great and paramount interest of society. \* \* I cannot press this subject too earnestly on your attention. I believe this to be the great sphere of our usefulness as a society. Not looking to premiums or gratuities, as the objects of our labors, but to a greater recompense of reward, the consciousness of having discharged our whole duty, let us press forward, in the anxious endeavor to extend the boundaries of a just and true agricultural knowledge, to be applied in making our own ancient and honored county the garden and ornament of the State—rich in its various and useful productions, and the home of a contented, moral, intelligent and thrifty yeomanry.

*Sowing Grass Seeds.*—If there is one point of husbandry more than another in which farmers are generally defective, it is the niggardly way in which they use grass seeds in their tillage. If any seeds are sown, not more than half the quantity required is often used, the fields are left bare, and the unoccupied ground becomes a fit place for the vile weeds that are ever ready to spring up, where the husbandman does not anticipate them, by giving the earth something more valuable.—*Alb. Cult.*

Times of general calamity and confusion, have ever been productive of the greatest minds. The purest ore is produced from the hottest furnace, and the brightest thunderbolt is elicited from the darkest storm.—*Lacoin.*

None are so fond of secrets as those who do not mean to keep them;—such persons covet secrets as a spendthrift covets money—for the purpose of circulation.—*Id.*

THERMOMETRICAL.

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Masa. in a shaded North-ealy exposure, week ending March 21.

Table with columns for date (March 1841), time (7 A.M., 12 M., 5 P.M.), wind, and temperature readings for Monday through Sunday.

FARM FOR SALE.

The estate owned and occupied by the late NATHAN HAGAR, situated in Weston, about 13 miles from Boston. The buildings consist of a large two story dwelling house, two barns with sheds adjoining, a carriage house and wood-house, with a cider mill under the same, and other necessary out buildings, and two wells of good water, with about 60 acres of excellent land well watered and under a good state of cultivation; suitably divided into mowing, tillage, pasturing and woodland, with a large orchard of grafted fruit trees in bearing condition, enclosed by substantial stone walls. Also, if desired, a wood lot adjoining, containing about 25 acres, part of which is covered with heavy timber, and a part with a thrifty growth of young wood. For particulars, please apply to E. W. & J. B. HAGAR, Philadelphia Packet Pier, Commercial street Boston, or to NATHAN HAGAR, March 24, 1841. eop31\* Weston.

SITUATIONS WANTED

As Gardeners and Farmers. Apply at N. E. Agricultural Warehouse and Seed Store. March 3.

A SMALL FARM FOR SALE,

Situated in Braintree, ten miles from Boston, with a Dwelling House and large Cider mill thereon. The farm contains about 20 acres. Inquire of NATHANIEL FAXON, No. 63 North Market Street. Feb. 24.

STRAWBERRIES! STRAWBERRIES!

The subscriber would offer to the public, the present season, his Selected Collection, consisting of seven varieties; they are such as have stood the test of a fair trial for seven years, and all grown by the subscriber.

Warren's Seedling Melthea, a new and valuable kind, a free bearer, fruit very large and juicy; fruit measuring 5 1-2 inches have been exhibited the present season. This variety can be warranted to be one of the finest varieties grown, and will produce as fine fruit and as large quantity, with the same cultivation, as any other ever offered. The price of this Seedling is \$5 00 per hundred plants.

Melthea Castle.—Fruit extremely large, high flavored and showy; specimens of this fruit have been shown this season six inches in circumference. Price three dollars per hundred plants. Keen's Seedling.—A very superior variety, fruit very large, rich dark color, and uncommonly high flavored. Price three dollars per hundred.

Royal Scarlet.—Fruit long oval shaped and juicy, very free bearer, and very hardy. Price two dollars.

Hautbois.—Fruit larger than English Wood, exceedingly numerous, sometimes yielding 100 berries to the plant.—Price two dollars.

Early Virginia.—This is known to be the earliest and best fruit for market, a free bearer and very hardy. Price two dollars.

English Wood.—Fruit well known for years. Price one dollar.

Every plant sent from this garden will be warranted to be free from mixtures, and shall also be young and healthy, worth the price paid for them.

All orders directed to the subscriber, inclosing the amount for the order, or with a good reference, shall be promptly attended to, and the plants carefully forwarded agreeably to directions. JAMES L. L. F. WARREN. Nonantum Vale, Brighton. March, 24.

WINSHIP'S NURSERY,

BRIGHTON, NEAR BOSTON,

Situated on the line of the Boston and Worcester Rail Road,—5 miles from the city.

The Proprietors of this extensive nursery beg leave to inform their friends and the public, that they are ready to furnish orders to any amount, for Forest Trees, indigenous and exotic. Fruit Trees, including all the varieties of Pears, Peaches, Plums, Nectarines, Cherries, &c. &c. Vines—Shrubs, Green House Plants, &c. Catalogues may be obtained by applying at the Nursery. Trees carefully packed, to ensure safety in long voyages. Orders left at the New England Seed Store of J. BRECK & Co. Nos. 51 and 52; North Market street, will be delivered the day following, and left at any part of the city, free of expense.

Letters containing orders, addressed to the subscribers, J. & F. WINSHIP. Brighton Nurseries, March 24, 1841.

WANTED,

A farmer, who is qualified to carry on a small farm in the vicinity of Boston, and who has, also, a knowledge of gardening,—he must be a man without family. Apply at No. 6 West street. 2w March 24, 1841.

CLOVER & RED TOP.

50 tierces and 100 bbls. Prime Clover. 200 Bags Redtop, new seed. 50 hbls. Herds Grass prime quality, for sale by J. BRECK & Co. March 24

FARM WANTED.

Wanted to purchase on credit or hire on a lease of five or ten years, a small but good farm in the vicinity of Boston.—The advertiser is engaged in rearing swine and makes large quantities of manure and has it in his power to keep a farm in a high state of cultivation. Any person having a place to dispose of or rent at a reasonable price may hear of a tenant by addressing JOHN GREY, Neponset Villoge, Dorchester. March 10.

FRUIT TREES AND SCIONS FOR SALE.

The subscriber, at the Pomological Garden, Salem, offers for sale a very choice and extensive variety of Apple, Pear, Plum, Cherry, Peach and Apricot Trees, Grape Vines, Goosecherries, Red and White Dutch Currants, and Red and White Antwerp Raspberries. Also, Scions of all the European and American Fruits which have been proved; all from fruit bearing Trees, packed in boxes with moss, and can be transported with safety to any part of this country or Europe. ROBERT MANNING. tMayt Salem, March 2, 1841.

AGRICULTURAL IMPLEMENTS, &c.

The Proprietors of the New England Agricultural Warehouse and Seed Store No. 51 and 52 North Market street, would inform their customers and the public generally that they have on hand the most extensive assortment of Agricultural and Horticultural Tools to be found in the United States. Part of which are the following:

Table listing various agricultural implements such as Howard's Patent Cast Iron Ploughs, Common do., Cultivators, Greene's Straw Cutters, Willis' do., Common do., Willis' Patent Corn Shellers, Common do., Willis' Seed Sowers, Vegetable Cutters, Common do., Hand Corn Mills, Grain Cradles, Ox Yokes, Doz. Scythe Stones, Austin's Rifles, Cast Steel Shovels, Common do., Spades, Grass Scythes, Patent Snaths, Common do., Hay Rakes, Garden do., Manure Forks, Hay do., Pair Trace Chains, Truck do., Drail do., Tie up do., 50 doz. Halter do., 1000 yards Fence do., 25 Grind Stones an rollers.

FRUIT AND ORNAMENTAL TREES, &c.

NURSERY OF WILLIAM KENRICK.

12,000 Pear and Plum Trees.—Large and new additions of Pear and Plum Trees have lately been received, many kinds of which are alike new to our country, and very extraordinary. Such have been the selections which have been made by the subscriber in Europe, and in person, during the last Autumn, where all have been proved; those kinds already well known amongst us being identified by him by the wood and the leaf.

A new Descriptive Catalogue of all these fruits will soon be ready, and will be sent to all who apply.

Of the few following fine kinds extra large numbers have been provided for sale; all being very productive kinds, and most of them prodigious bearers, and are therefore calculated for cultivation to great profit on a great and extensive scale. These ripen in succession in the order named:

Table listing fruit varieties and their ripening times: Jargonelle, Summer Franceal, Aug. Oct. Nov.; Bartlett or Williams' B. Chret, Aug. Sept. Gloux Moreau or the D'Aremerg of the French, Nov. to Feb.; Beurre D'Amaulis, Sept. Easter Beurre, Dec. to Apr.; Napoleon, Louise Bonne, D'Avranches, Marie Louise, Passe Colmar, Oct. Oct. Oct. Oct. Oct. Oct. Duchesse D'Angouleme, Oct. Nov.; Gloux Moreau or the D'Aremerg of the French, Nov. to Feb.; Easter Beurre, Dec. to Apr.; Clion, or LeCure, very large, for cooking only, a prodigious bearer, Bourgmeestre of Boston, Winter.

All orders addressed to the subscriber, or left with Joseph Breck & Co., New England Farmer Office, will be promptly attended to, and Trees, when so ordered, will be securely packed for safe transportation to distant places.

N. B. A few trees of "Van Mons' Leon le Clerc Pears," supposed to be the best in the world; also, "Pat's prolific Marie" or "Surpasse Marie Louise." These cost high—these Pears alone must, therefore be charged at extra prices, or \$2,50 for the former, and \$2,00 for the latter.

WILLIAM KENRICK. Nonantum Hill, Newton, near Boston, March 2.

PEAR, PLUM, GRAPE VINES, &c.

3000 Pear Trees, of the most approved kinds. 2000 Plum Trees, of the most approved kinds and extra size—many of them have borne this season. Apple, Cherry and Peach Trees, of different kinds.

500 Quince Trees. 4000 Isabella and Catawba Grape Vines, from 6 to 15 feet high; most of them have borne fruit. Black Hamburg, Sweetwater, Pond's. 30,000 Grant Asparagus Roots. Gooseberry, Currants, Raspberries, of good kinds. 5000 Wilnot's Early Rhubarb or Pie Plants, lately introduced. 2000 Cherry and Pear Stocks; 1000 Plums; Roses, &c. of all kinds.

All orders sent to the subscriber at Cambridgeport, will meet with immediate attention. SAMUEL POND. Cambridgeport, Mass., Feb. 24.

CORN SHELLER.

CAUTION, the public are hereby informed that the subscriber has letters Patent for his improved CORN SHELLER, and all infringements on the same will be prosecuted to the extent of the law. The above machines are for sale at J. Breck & Co. No. 51 and 52 North Market street, Boston. C. WILLIS. March 14th.

## MISCELLANEOUS.

## THE PRESS.

BY MRS. ARDY.

Oh! the wondrous Press has a magic sway  
In its great and giant force,  
To the east and west it bends its way,  
And it takes o'er the seas its course;  
Gay dazzling stores may the good ship fill,  
In the pride of vain excess,  
But it boasts a treasure more precious still,  
In the wealth of the mighty Press.

The son of genius, unsought, unknown,  
May his heaven-born themes pursue,  
Their brightness gladdens himself alone,  
For his friends are far and few.  
But see, in the ranks of fame he stands,  
Lo! thousands his lays possess,  
And his name is blazoned in distant lands,  
Through the aid of the mighty Press.

The poet's numbers, the scholar's lore,  
Cast their radiant spell o'er all;  
Those strains are couched in the cottage poor  
That enchant the lordly hall:  
And the Book more holy than all besides,  
Which alone can truly bless,  
To the heathen shines as a lamp and guide,  
By the power of the mighty Press.

Alas! that a scene so bright, so dear,  
Should a dark reverse disclose;  
Alas! that a boon so great, so dear,  
Should be ever linked with woes;  
But the lawless doctrines of men profane  
To the world their guile address,  
Proving to thousands a snare and bane,  
Through the sway of the mighty Press.

Yet the summer-sky has its wintry doom,  
And the rose reveals a thorn,  
And evil must ever mix with good  
In a race to evil born;  
We must bear the pangs of a thwarted will  
Where we fondly hoped success,  
We must sigh o'er the mass of social ill,  
Diffused by the mighty Press.

Yet the light of Faith let us humbly seek  
To illumine our dangerous road,  
Let us deem all knowledge poor and weak  
That would lead our hearts from God;  
Then may we welcome instruction's tide,  
As it flows our land to bless,  
And greet with unmingled joy and pride  
The gift of our glorious Press.

## FARM FOR SALE.

The subscriber offers for sale that valuable Farm, situated about 3-4ths of a mile below the First Parish Meeting House, on the Stage road, and commonly known as the Judge Prescott farm, containing about 170 acres of superior land, in a good state of cultivation, with two dwelling houses, four barns, and other out buildings. The farm is remarkably well watered with soft water, conveniently fenced, has nearly forty acres of large, handsome wood and timber standing on it, with an orchard of grafted Apple, Pear, Peach, Plum, and Cherry trees, and might be easily divided into two Farms. The estate will be sold reasonably. If five thousand dollars be paid on receipt of the deed, the remainder may lay on mortgage to suit the convenience of the purchaser. For further particulars, apply to the subscriber, living on the premises. WM. SALISBURY.

Groton, Oct. 26, 1840.

eow.

## GRINDSTONES.

An extensive assortment of Water and Hand Grindstones constantly on hand and for sale by AMMI C. LOMBARDO & CO. 13 Lewis's Wharf. 1stly. Nov. 17.

## NEW FLOWER SEEDS.

The subscribers have received from London a choice collection of Flower Seeds, which, with those raised by themselves, constitute all worthy of cultivation. Price from 6 1-4 to 25 cents per paper. Assortment of those marked 6 1-4 cents, 20 papers for one dollar, and others in the same proportion. JOS. BRECK & CO.

## WHITE CARROT.

A quantity of this new and valuable root is offered for sale at the New England Agricultural Warehouse, No. 52 North Market street.

Also—New Red and Yellow Globe MANGEL WURTZEL—considered a superior variety. Feb. 10. JOS. BRECK & CO.

## GARDEN SEEDS.

For sale by JOSEPH BRECK & Co. at the NEW ENGLAND FARMER OFFICE, No. 51 and 52 North Market St. Boston. The subscribers would inform the public that they have now on hand the largest collection of seeds ever before offered by sale in this city, embracing every variety of Field, Kitchen, Garden, and Ornamental Flower Seeds desirable for this or any other Climate.

Our seeds are either raised under our own inspection or imported from respectable houses in Europe, and having taken extraordinary pains to obtain such as are pure and genuine, we can confidently recommend them to our customers and friends, and feel assured they will prove satisfactory to all who try them.

Dealers in seeds are requested to forward their orders in season. Boxes for retailing from 8 dolls. and upwards will be sent out on commission allowing a liberal discount and take back what remain unsold.

Letters and orders with good reference will meet with prompt attention.

## FIELD SEEDS

Those who prefer to have their Seeds put up in papers ready for retail, can be accommodated—each packet neatly closed and labelled with printed directions. Price 50 cents, per dozen papers, which are retailed here at 6 1-4 cents each.

Fruit and ornamental trees, of the greatest variety, supplied at nurseryman's prices, and orders solicited. These will be packed, when required, to go to any part of the U. States. JOSEPH BRECK & CO.

Boston, Jan 27, 1841.

## WILLIS'S LATEST IMPROVED VEGETABLE CUTTER.

For sale at the New England Agricultural Warehouse, No. 51 and 52 North Market Street, Boston, Willis's Latest Improved Vegetable Cutter. This machine surpasses all others for the purpose of cutting Ruta Baga, Mangel Wurtzel, and other roots. The great objection to other machines, is their cutting the roots into slices, which makes it almost impossible for the cattle to get hold of them: this machine with a little alteration, cuts them into large or small pieces, of such shape as is most convenient for the cattle to eat. It will cut with ease from one to two bushels of roots per minute. JOSEPH BRECK & CO.

## HOWARD'S IMPROVED EASY DRAUGHT PLOUGH.

Great improvements have been made the past year in the form and workmanship of these Ploughs; the mould board has been so formed as to lay the furrow completely over, turning in every particle of grass or stubble, and leaving the ground in the best possible manner. The length of the mould board has been very much increased, so that the Plough works with the greatest ease, both with respect to the holding and the team. The Committee at the late trial of Ploughs at Worcester, say,

"Should our opinion be asked as to which of the Ploughs we should prefer for use on a farm, we might perhaps say to the inquirer, if your land is mostly light and easy to work, try Prouty & Mears, but if your land is heavy, hard or rocky, BEGIN WITH MR. HOWARD'S."

At the above mentioned trial the Howard Plough did more work, with the same power of team, than any other plough exhibited. No other turned more than twentyseven and one half inches, to the 112 lbs. draught, while the Howard Plough turned twenty-nine and one half inches, to the same power of team! All acknowledge that Howard's Ploughs are much the strongest and most substantially made.

There has been quite an improvement made on the shoe, or land side of this Plough, which can be renewed without having to furnish a new landside: this shoe likewise secures the mould board and landside together, and strengthens the Plough very much.

The price of the Ploughs is from \$6 to \$15. A Plough, sufficient for breaking up with four cattle, will cost about \$10 50, and with cutter \$1, with wheel and cutter, \$2 50 extra.

The above Ploughs are for sale, wholesale and retail, at the New England Agricultural Warehouse and Seed Store, Nos. 51 & 52 North Market Street, by

JOSEPH BRECK &amp; CO.

Feb. 24.

## PURE SPERM OIL.

## EDMUND T. HASTINGS &amp; CO.

No. 101 State St. keep constantly for sale, Winter, Spring and Fall Sperm Oil, bleached and unbleached; which they warrant to be of the best quality and to burn without crusting.

Oil Canisters of various sizes.

Boston, Jan. 1, 1841.

1stly

## AN OX WAGON AND OX CART

Nearly new, for sale by JOSEPH BRECK & CO., Inquire at No. 52 North Market Street, or at their Farm in Brighton. Feb. 24.

## FOR SALE.

A small House in Medford containing nine rooms, with a barn, &c., and near the depot of the Boston and Lowell Railroad. For terms, apply to JONATHAN BROOKS, near the premises 3w\* March 16.

## NEW ENGLAND FARMER.

A WEEKLY PAPER.

The Editorial department of this paper having come into the hands of the subscriber, he is now authorized by the publishers to inform the public that the price of the paper is reduced. In future the terms will be \$2 per year in advance, or \$2 50 if not paid within thirty days.

ALLEN PUTNAM.

N. B.—Postmasters are required by law to frank all subscriptions and remittances for newspapers, without expense to subscribers.

## FARM BUILDINGS.

MR EDITOR—Sir—I have often seen the remark in your valuable paper, that every man had a right, and was called upon to exercise that right, of giving information and making inquiries about the different and better modes of cultivating the soil, erecting buildings, raising animals, &c. Feeling, sir, that you are ready and willing to bestow any information in relation to the great principles of farming, and are happy in so doing, I take the liberty to ask you a very few questions.

I have, sir, been looking around among my buildings and the buildings of my neighbors, in my own town and vicinity, and I see much extravagance in buildings, even in those for our animals. I see good and costly barns for our cattle, warm stables for our horses, and good, tight and comfortable shelters for all our animals except swine. And where do I find our swine? Some in a miserable mud-hole under a building open to the north winds; some in the corner of walls or fences with a few loose boards thrown over them, with flat rocks for a floor, and a few loose, round or sharp rocks for a bed, cemented together with frozen earth; and some in the open fields, with no shelter at all, except the blue sky over their heads—and finally a great proportion of them in a most miserable condition, in comparison with the condition of our other animals. This state of things ought not to exist. These beautiful, noble and most profitable of all the farmer's animals ought not to be so treated, because they occasionally, in doing their whole duty, happen to get their noses a little dirty. And, sir, for my own part, so far as I shall have further care of these fine animals, I am resolved to give them better treatment, and build one of the most comfortable buildings for them that I can put together; and this not only for their own comfort but my interest; for I am satisfied, from experience, that half a bushel of corn will make nearly as much pork when given to a comfortable pig in a warm pen, as a bushel when fed to an uncomfortable one, in the frozen mud. And now, sir, the questions which I propose to ask, are these, viz:—Do you believe with me, or do you imagine even for a moment, that it makes any difference what kind of a building swine are kept in, as it regards their growth and expense of keeping? and if so, what shall be the shape, size and situation of the best constructed building? shall it be so situated and constructed that the swine shall always be kept in the shade, even if kept warm, or shall they have an opportunity to lie where, during the winter, they can feel occasionally the warm rays of the sun? and any other information in relation to a place for keeping swine, taking into consideration the growth and keeping of the same, without regard to the expense of the building, will greatly oblige one, and I presume benefit many of the subscribers for your paper.

Grafton, March 15th, 1841. A FARMER.

These questions of "A Farmer," and the implied opinions are very acceptable to us. He has touched upon a subject of no small practical moment.—If warmth and comfort contribute materially to the growth of swine, there can be little doubt that it is good economy to furnish them with this kind of nourishment.

We have seen something of the benefits of keeping shoats or store pigs warm in the winter. Formerly, at our home, the swine were kept in cold pens, but for several years past they have fed and slept on the floor of a very warm barn, and at their pleasure have gone down into the cellar beneath to work over the manure from the cattle. This cellar is closed, and comparatively little frost is ever found in it. Here the pigs exercise in comfort as much of the time as they choose. When a night is severely cold, they remain below and sleep upon the horse manure at one end of the cellar. And now you will ask what is the effect of such a place upon the growth of the swine? We answer, that it has been the settled belief in our family for years, that the increased growth of five swine in the winter months, will pay the annual interest on \$100. Here the swine never can see the sun. But we believe it is desirable that they should. Were one constructing the pen, which should be the most favorable to the comfort and the consequent growth of his hogs, he would probably mistake, if he furnished them no opportunity to enjoy the pleasure which they obviously take, when basking in the rays of a bright winter's sun. We should say, generally, to each farmer, contrive in the cheapest way which your buildings and the grounds around them permit, to keep your hogs comfortable, and to let them work in manure or muck which is not frozen. A warm nest, good air and exercise are all desirable. But our correspondent has asked how we would build, setting aside all regard to the expense of the building. We are not sorry that the question has been put; for there is an original plan in our brain, which we are ready to make public, though it will be thought too costly by most farmers. It is difficult to describe a building in words so as to make one's self understood; should we fail in this attempt, we shall be happy to be questioned upon points which we do not render intelligible.

On a spot of ground, *sloping to the south*, dig in upon a level until you get a face 8 or 10 feet high. Build a good stone wall at this face; also at each end build such a wall twenty feet in length. On these three walls lay the sills of your building. The posts on the north side are *not* to come back to the face of the north wall by three feet: your building will be seventeen feet wide. Let the posts be four feet high. The roof is to be filled in the summer or autumn with the materials to be used in winter for litter. This litter is to be dropped down through a hole directly over each nest; this hole must be kept covered to prevent the cold air from descending; and for the convenience of covering, it might be well to make a curb four or five feet high around each hole. The litter, when you fill the chamber, will be placed immediately around these curbs or

board funnels. When you have put down litter enough for the day, throw a fork full over the hole and let it remain as a cover until more is wanted. These same chimnies uncovered in summer, will serve as good ventilators.

You have thirteen or fourteen feet from the bottom of the cellar to the beam. At about the centre of this space run timbers from one end of the cellar to the other. The north or innermost timber must be three feet from the wall. Another timber running the whole length and being ten feet in front of the first timber, will give the foundation of the floor on which your hogs are to feed and sleep. Let the four northern feet of this floor be a passage way in front of the pens. The remaining six feet may be divided into pens of twelve feet in length; six feet for a nest and six for the eating pen. From this eating pen, let stairs or steps (planks with cleats spiked across them) lead down to the bottom of the cellar, landing near the south side. The cellar must be divided into pens of twelve feet width; to each pen let there be a door in front sufficiently large to admit the cart; above this door have large glass windows to admit the sun. These cellar pens are now 20 feet deep; but I would have them partitioned off by movable planks, leaving 12 feet in front and eight in the rear.

Now let us look at the three feet of cellar along the north side, which are not covered: here fix a row of bulk heads, or sloping doors, through which you may tip down in the autumn, loads of muck and soil, and whatever else you may wish your hogs to work over during the winter. This will be retained in the smaller or inner division of each pen, lying partly under the floor on which the hogs eat and sleep, and may be thrown over for them to work upon from day to day. This is for winter work. But when your pens have been cleared in the spring, remove the partition across the pen, let the hogs run back to the north wall out of the reach of the sun. Give them materials for manure through your slanting doors on the north side. Here let them do their summer's work. These bulk-heads should be well covered in winter with hay, sea-weed, or some other suitable material for the prevention of cold. The windows in front might require blinds in summer. At one end of the building should be a cellar for keeping roots and cooking the food; and perhaps a steam pipe running immediately under the sleeping pens might be advisable. The whole building should be nearly frost proof.

We have here given a description of our fancy hog pen. We fear the description may not be intelligible; but if a pen be built in accordance with our idea, it will be warm in winter, cool in summer, and will let the process of manure making go on at all seasons. Whether it would be worth its cost, we have not fully considered.—Ed.

It is much easier to ruin a man of principle, than a man of none; for he may be ruined through his scruples. Knavery is supple, and can bend; honesty is firm, upright and yields not.—Lacon.

## WHAT! BERKSHIRES AGAIN?

Yes, reader, Berkshires again. It is a *fat* subject. Some lover of "good pork" who hails from "Down East," has sent us not only a *well formed* communication in "black and white," (genuine Berkshire colors,) but he has enclosed and franked the veritable white hairs from the tip of a genuine Berkshire's tail, (and, by the way, these white hairs are not exactly white, but are in color like the light streaks in the bird's-eye maple table on which we are writing, excepting two of them, which are *black*.) and thus has he furnished us an unerring standard by which we may test the right of every specimen of swine that comes within our ken, to take the name of genuine *improved Berkshire*.—It is an invaluable present. We heartily thank the donor; his favor will help us to many a hearty shake of the sides, as we go from sty to sty to determine which of the solar rays are reflected by the natural ornament of the posterior excrescence of every hogship and pigship in our whereabouts. With the greatest good will and glee imaginable will we devote ourself to that healing of our diseased correspondents, which a sight of these *real Simon Purcs* will at once effect.

Should this "Lover of Justice and Good Pork," (an acquaintance of ours in the winters which we spent at the capitol of Maine, if we *guess right*.) find it convenient to favor us with communications from time to time, he will not merely confer a favor upon us personally, but will help us to make this paper deserve the high compliment which he has paid to it in his closing sentence.

Berkshires have attained such notoriety, that their comparative excellencies and defects should be fairly and fully stated to the public. We willingly admit articles either for or against them, which purport to contain instructive facts or observations. We find much amusement in the conflicts of opinion, and are disposed to indulge our correspondents to the greatest extent, which justice to other topics will allow.—Ed.

*Down East, March 19th, 1841.*

ALLEN PUTNAM, Esq.—Sir—Having been born in Boston, I cannot divest myself of some regard for that city and its inhabitants, and even for those of the whole State of Massachusetts. It is therefore with alarm that I perceive such strong symptoms of rabidness exhibited by some of your correspondents in the columns of the *New England Farmer*. To read the last number of your paper, one would almost suppose the salvation of the world depended upon the stock, and more particularly the pigs, of Massachusetts being equal to those of New York,—that the good people of your State were afflicted with monomania, and his Satanic Majesty had appeared to them in the shape of a Berkshire hog. It may be, Mr Editor, caused by the color; for some animals, you know, have a natural antipathy to particular rays—the cock turkey, for instance, cannot abide the sight of red, and evinces it by his great gobbling; and possibly those gentlemen are such thorough-going anti abolitionists, that they cannot endure black, when exhibited to their eyes even in the hair of a hog. I am rather inclined to this last opinion, as the rage of their fever has evidently been much greater since the cut given to the abolitionists in the address of the President.

The white hairs in the tails of Mr Lossing's pigs, are the principal spectres that haunt their minds or flit before their visions, and as we farmers place great faith in old saws or proverbs, and there

is a well known one, that "a hair from the same dog will cure," I have taken the liberty to procure for and enclose to you some of the real Simon Pure hairs from the tail of a full-blood, to be by you administered to those unfortunate persons, trusting that your sense of humanity will prevent your delaying even for a moment (after their reception,) so important a prescription.

The uncharitable might think that those good citizens of Massachusetts were influenced a little—a *very little*—by fear they should not be able to make quite so much out of their Mackay and their Berkshire pigs, if the public were led to doubt the purity of their blood, and believe that a better breed could be found in Albany.

As I am a Massachusetts man by birth and a Maine farmer by adoption, I cannot be suspected of any prejudice in favor of New York. Having Massachusetts Berkshire and Mackay pigs, as well as some from Mr Lossing, (with the white feet and white hairs in the tail,) I have had, and still have, a good opportunity to judge of the value of the different breeds, from their aptitude to fat and their shape; and in justice to Mr Lossing and from regard to the interests of the farmers generally, (without caring a pin for those of a few breeders of pigs *for sale*.) I must confess that, although the Massachusetts Berkshire, Mackay and Bedford breeds of hogs are fine, the Lossing Berkshire is evidently a very different and much superior animal. The points I should point out in which they excel are, a rounder barrel, a rounder, fuller ham and shoulder, broader back, thinner head, less cheek, and smaller feet, legs, tail and ears—I say nothing about color, for whether blacks or Essex greys is to my mind of no importance, as long as it is, as in the case of the Berkshires, confined to the hair, and has not given any taint that cannot be scraped off. As to the white hairs, a few more or less may be of consequence on the head or beard of a bachelor, but I think of not the slightest on the body or tail of a hog.

That you may not suppose I have been imposed upon in the pigs I have mentioned as Massachusetts Berkshire and Mackay, I would remark that they are from the stock of Mr Phinney, of Lexington, a gentleman whose character is too well known to admit of such a suspicion.

In short, sir, no person who has ever examined one of Mr Lossing's pigs, can believe that these who have berated them in your paper ever saw one of the pure blood. The Berkshire they speak of, must be of a very different kind, and if any of the pure blood "did not cut up well," the owner slaughtered them when not half fatted, deceived into the belief that they were fit for the knife by their very superior shape.

Not being a breeder for sale, but only having a very few for my own use, my object is to obtain the most profitable hog—one that will give the greatest weight of clear pork, lard and ham, from the least quantity of food; this I am confident I now have in the Lossing Berkshire; but if any of your subscribers or correspondents have a kind superior to the Lossing, not the Massachusetts Berkshire, I should be very desirous to obtain a pair, and should consider him or them as having conferred an incalculable benefit upon their country by its introduction.

I cannot close this letter without returning you my thanks for the goodly proportion of valuable matter contained in your paper, and expressing my opinion that it is now fully equal to what it was in

its most palmy days, under the editorship of Mr Fessenden.

A LOVER OF JUSTICE AND GOOD PORK.

For the *New England Farmer*.

## WHEAT INSECTS.

(Continued.)

Since my former communication was written, I have found some interesting "Observations concerning the Fly-Weevil that destroys wheat, by Col. Landon Carter, of Sabine Hall, Virginia," in the first volume of the "Transactions of the American Philosophical Society at Philadelphia." The description, given by Col. Carter, of this insect, and of its habits, corresponds very nearly to that of the Angoumois moth, or *Ceophora cerealella*\*; but his history is deficient in some particulars, which are necessary to prove the identity of the American and European insects.

Of the insects that are injurious to wheat in the ear, or while it is in a growing state, the best known is the *wheat-midge*, or *wheat-gnat* (*Cecidomyia tritici*), of Europe, an account of which has been given by Mr Kirby, in the "Transactions of the Linnean Society of London." This midge or gnat resembles a mosquito in form, but is exceedingly minute, being only about one tenth of an inch long. Its body is orange-colored; its two wings are transparent like glass, and are fringed with short hairs around the edges; and the long antennæ, or horns, consist of little bead-like joints. This insect appears in swarms in the fields, when the wheat is in blossom; and, by means of the long retractile piercer at the end of its body, it thrusts its eggs within the chaffy scales of the flower. The young insects hatched from these eggs are little orange-colored maggots, tapering towards the head, and blunt at the hinder extremity, with the rings of the body somewhat bulging at the sides. They have no feet, but move in a wriggling manner, and by sudden jerks of the body, like some other maggots. Mr Kirby does not seem to have known with certainty in what way these maggots injure the wheat, and suggests that perhaps by eating the pollen they prevent the impregnation of the grain. It would seem, however, from recent observations, that somehow they abstract the nourishment from the grain, so that the latter does not fill; but whether by sucking it immediately from the grain, or from the base of the germ, (the latter seems most probable,) is not yet satisfactorily ascertained. In consequence of their depredations the grain becomes shriveled and abortive, and in some seasons a twentieth part of the crop is thereby lost. By the first of August they come to their full size, descend to the ground, and go into the earth to the depth of half an inch; here they probably remain inactive through the following winter, and turn to flies or gnats in the spring, when the wheat is about to blossom.

An insect much like the foregoing, and known in its maggot state by the name of "the grain worm," has been observed for some time past in the northern and eastern parts the United States, and in Canada, and its ravages have gradually extended in various directions from year to year. The *maggots* (which I have seen) agree exactly with the description given of those of the wheat-fly of Europe, and they attack and destroy the grain precisely in the same way. The *fly* has not yet fallen under my notice. Several essays on

\*See *New England Farmer*, March 24, 1841, page 300.

the history of these insects have been published in the 17th volume of the "New England Farmer," and I have received from a lady in Hopkinton, N. H., some additional and interesting information respecting them. A more extensive series of observations, conducted with care, and with a due regard to dates, is still wanted to complete the history of these depredators. They are said to attack wheat, rye, barley, clover, and timothy-grass. The lady above referred to, states that none of the insects could be found in a field of bald wheat, growing side by side with fields of rye and bearded wheat, where the orange-colored maggots abounded, though all these plants blossomed at the same time. It appears also, by various statements, that very early and very late wheat escape, and hence that the fly is limited in the period for depositing its eggs. It is therefore important to ascertain at what time the flies begin to appear, and at what date they generally disappear, and whether, during the whole of this period, they are engaged in laying their eggs. These dates may vary somewhat in different years and places; but a course of observations, in successive years, will afford the means for fixing upon the average dates. The next point to be determined is, the length of time required by the wheat-maggots to come to their full growth, and the size that they attain. After the feeding state is over, do they drop out of the ears to the ground, or do they let themselves down by threads after the manner of canker-worms? Some persons have stated that they undergo their changes and are transformed to flies in the ears of the grain, where their empty shells have been observed. Is not this an accidental exception to their usual habits, and do they not generally go into the ground about the time that the wheat is ready to be harvested? Do the maggots undergo a change of form immediately after this time, or do they remain torpid, motionless, and without change, till the approach of spring? What is the form of the insect in its chrysalis state, or just before it turns to a fly? The writer will be very glad to see specimens of the insects, taken while they are in the torpid and chrysalis state, and preserved in spirit.

It is said that these maggots or grain-worms are found in the heads of clover and of Timothy-grass as well as in wheat-ears: and some persons have supposed them to be the same as the "clover worms," which have been seen spinning down from lofts or mows where clover has been stowed away. This point might be easily settled, if any person would take the trouble to keep some of these clover-worms in a covered vessel, partly filled with earth and clover-heads, till they go through their transformations. I am inclined to think that these spinning clover-worms will turn out to be distinct from the wheat-insects.

Two kinds of flies have been noticed in wheat-fields by some of our farmers; one, the true wheat-fly, with an orange-colored body and without a projecting piercer; the other, "a changeable reddish or green fly," with a piercer folded under its belly. The latter uses its piercer for conveying its eggs within the chaffy scales of the wheat-ear; it is said also to lay its eggs in some kinds of berries. A complete history and description of this second kind of fly, and of its young in all their states, might throw some light on that of the true wheat fly; and it is to be hoped that some careful person will turn his attention to it, and favor the public with the result.

T. W. HARRIS.

Cambridge, March 24, 1841.

#### EXTRACT

From Robert Henderson's *Treatise on Swine*.

(Published by request)

"Of all the sorts of hogs I have seen, and that is not a few, I would give the preference to the Cheshire, or rather the Berkshire hog. This kind will grow to a good size, is easily fed, small boned, and of a handsome make. Some of them are brown, spotted with black; but many of them are of a singular reddish color, and I have seen droves of them that, when the sun shone on them, appeared of the color of gold. Their ears are not large, and bend slightly forward. I wish very much to see them introduced into Scotland; and am certain they would be more profitable than any other species. Until that can be accomplished, I can recommend the second or third cross from the white Cumberland boar with the black Guinea, Siamese or China sow. They are spotted black and white. Mr Culley speaks well of the Berkshires."

Broomhill, near Annan, Scotland, 1814.

From the Albaay Cultivator.

#### DISEASES OF SWINE.

MESSRS EDITORS—Is there no remedy for diseases in swine? I have lost twenty valuable pigs in the course of the last six months, by blind staggers, consumption, (sometimes with and sometimes without cough,) protruding of the rectum, and many without apparent cause. I have looked to books in vain for information. Last week three beautiful, healthy Berkshire pigs, as handsome as I ever saw, and two emaciated, unhealthy animals, in three different pens, were attacked on the same morning, and all the remedies known, which I considered as mere quackeries, were resorted to, and in a few hours some, and in 24 hours all, fell victims to it. I wish every man that takes the Cultivator, would send all his pig and cattle remedies for general condensation and arrangement, and see if we can learn any thing by it. I conceive the appointment of scientific men by the State to note the different diseases and experiments for cures, would be of more service to us than the bestowal of the same amount of legislative aid in any shape whatever.

R. L.

We have found charcoal one of the best preventives of disease in swine. They will eat it freely, if placed within their reach, and we have never known hogs attacked with disease when occasionally fed with it.—*Eds. Cult.*

#### DECAYED TURNIPS.

To the Editor of the Farmer's Cabinet:

SIR,—Seeing many inquiries as to the cause of the rotting of a turnip crop, without the least appearance of the disease externally, and having had much experience in the raising root-crops of various kinds, I would say, the evil arises from a wet and retentive subsoil. Four years ago, I sowed a fresh broken up piece of land with ruta бага; it had been in wood, and this was the first cultivated crop that had been raised upon it. The plants came well, and flourished for a season, when some of them began to turn blue, and they were then soon full of the animal, called familiarly, the plant-louse; others, however, retained their healthy appearance, while their internal parts were one mass of corruption; and it was curious to observe, on

putting one's foot on a large healthy-looking turnip, and full of foliage, how suddenly the whole superstructure would crush down into complete rottenness, the shell not being more than half an inch in thickness. On examining the tap-roots of many of them, they were found rotten, although the disease had not extended, in some cases, to within several inches of the bulb, while the effluvia which arose, from many, even of the comparatively sound-looking roots, was convincing proof of incipient decay. Many of the roots, to appearance perfectly sound, were packed away for winter provender, but I believe I may say, that not one of them proved in reality so, and no cattle would touch them.

The winter following revealed the truth, for, on examining the land, it was found to be full of stagnant water to within a few inches of the surface; since then, it has been drained and well cultivated, and I have no idea that the crop of turnips which I intend to grow upon it the present season, will decay on the land. Should they, however, deceive me, I will tell the truth, and inform you of the result, "right or wrong."

JOHN STURGES.

P. S. A writer in the Yankee Farmer complains that many of his diseased turnips were injured by grubs. I beg to say this would not have been the case, had not the turnips been first diseased.

#### FACTS.

"Facts are stubborn things."

1. A poor farmer will be a poor man.
2. A large manure-heap makes a full granary.
3. Intelligence to plan, industry to execute, and economy to preserve—prosperity follows.
4. Ignorance, idleness and waste are followed close in the rear by distress, poverty and want.
5. The interest and happiness of the owner of all domestic animals are promoted by kind treatment, full feeding and cleanliness. Try it.
6. Poor tillage, poor crops.
7. To raise an abundance of grass is the foundation of all good husbandry, and should be the first and last effort of every person who desires to be a successful and prosperous farmer.
8. Plants derive their nutriment from the soil, and every crop removed takes away part of its productive power, which an honest farmer will take pleasure and derive profit from restoring as soon as possible.
9. Those who trespass on the kindly disposition of the soil to produce crops, without making adequate returns to it, are soon brought to judgment.
10. A wise man will spread neither his manure nor his labor over more ground than will enable him to attain a maximum result.
11. Postponing doing right, is doing wrong.
12. A well-cultivated garden is the most profitable part of a farmer's domain.—*Farmer's Cab.*

What majesty there is in the christian's death! What a glory in his hope! As the rivers roll the smoothest the nearer they approach the ocean; as the rose smells the sweetest when dying; as the sun appears most glorious when setting, so it is with the christian.—*Buck.*

Pride is the first thing that overcomes man, and the last thing that man overcomes.—*St. Augustine.*

[The following communication has been sent us by the author, for publication in our columns: it appeared originally in the Albany Cultivator.]

### REMARKS ON ORNAMENTAL GARDENING,

*With a Plan of a Fruit, Flower and Vegetable Garden.*

Horticulture, after all that has been said and written, deservedly, in its commendation, is but an embraced department of the more enlarged science of Agriculture. It is the *great*, on a *reduced* scale: to a certain extent, it is the practical cyclopaedia, as well as the model-farm of the agriculturist.

Alas! how few properly study, how few in our country through want of merited reflection, duly appreciate the value of the kitchen garden. It has not been so in all places or times; though necessarily imperfect, because, like mathematics, its utmost point of excellence seems forbidden to human attainment. Our great proto-father enjoyed in his first garden, a satisfaction denied to the most fortunate of his descendants, a happiness unattainable by his children; for the garden of Eden was made, not by human hands,—it was the work of God.—When Adam was driven from his first home of indescribable bliss, he, by the labor of his hands and the sweat of his brow, made his little garden in other and less fruitful soil. In all times, and by all generations since, the hardy husbandman has had his garden. It is a matter of surprise, that while sciences of later birth have advanced almost to perfection, horticulture, perhaps the most necessary to man, has been comparatively so neglected and unimproved, and to our shame, so especially in this land of freedom. "Sat prata biberant," said the Mantuan bard, in allusion to the practice of irrigating land, which prevailed in Italy, near two thousand years ago, as a means of fertilizing the soil; yet how little is it at this day pursued, even in the land of Cincinnatus.

The inhabitants of Holland, proverbially industrious, have indeed almost made their country a garden; and to the application of irrigation, above all other causes, they owe that great abundance which is the almost invariable reward of great assiduity. The Hollanders have brought their industry to the land of their adoption, but they have left much of their skill at home.

In Britain, the attention of the people is, by the peculiarity of the general policy of that nation, much diverted from the cultivation of the soil, yet agriculture has not been much neglected there; and, so far as attended to, it has been honorable to the nation. Industry has been greatly aided by the application of scientific principles. In the application of these principles to horticulture, the Englishman has, in very many instances, approached a perfection worthy of the imitation, and still more of the rivalry of the American.

How happens it that so little attention is given to Horticulture in the United States? The people are industrious; they are intelligent: and much is done for the promotion of science in its various departments; but it must be confessed, although it may cause a blush, that horticulture is shamefully neglected. True, every farm-house has as its adjunct, a kitchen-garden; but what a garden! Would you walk through it—there is no walk there; or if there be, it is hidden by the crops, perhaps of vegetables, perhaps of weeds, or more probably, an unseemly commixture of both. Would you partake of some desired portion of its fruits,

the chance is you cannot reach it without trampling on some other fruit which you do not need. Over beds of earth carelessly piled up, seeds of various kinds are frequently thrown, as if the entire crop, like that of the field, were to be reaped during a single gathering time. Neither ornament nor convenience, nor even actual profit, seems to enter into this garden without a plan. The farmer acts as if he would not waste on the "little patch," the labor which would be more profitably employed in the wide extended meadow, or the large cornfield. Here rests the error. There is no other acre on the farm, which produces so large a return as that of the kitchen garden, nor is there any other acre on the farm, which will produce so large a return of profit in proportion to the labor and capital expended. The farmer instead of saying, "I am expending too much on this spot," might better say, "I am expending too little." The kitchen garden in truth, is the proper school of the agriculturist. There he will learn the great value of properly prepared compost, without which his garden will produce a scanty crop; he will there learn that manure, in order to secure its utmost benefit, must be buried beneath the surface, and not thrown loosely on the surface; he will there learn the great value of irrigation. The principles of the kitchen garden are in many instances applicable to the farm generally, and may often be adopted with great advantage.

A well furnished garden embraces the choice specimens of both nature and art, carefully selected and judiciously and harmoniously blended together—assisting nature to improve her own productions.

The amateur will not only collect from every quarter the beauties of nature, and arrange them to the best advantage; but calling to his aid the ornamental arts, he will heighten their effect by suitable displays of rural architecture; he will embellish his garden with jets and fountains, and with appropriate specimens of sculpture; and the pencil of the artist will give delight to his evening walks with pleasing transparencies. He will also avail himself of the treasures of Conchology—"perhaps none but the department of Flora, can vie with this in variety, symmetry of form, and in richness of coloring."

The head of a family, if he cherishes the social virtues, will prefer his home to any other place. It is like a centre of gravity to all his pleasures and attachments to life. If you see a good vegetable, flower and fruit garden attached even to an otherwise humble cottage, there can scarcely be a doubt but that that cottage is the abode of happiness—that home is the most pleasing place to its occupant.

The God of nature paints the flowers of the field most exquisitely, and gives us powers to discover and admire their inimitable beauty. "Do you know," said the amiable Wilberforce, as he was sinking under the infirmities of old age, opening on some flowers shut up in a book—"Do you know that I am very fond of flowers?—the corn, and things of that kind, I look upon as the bounties of Providence—the flowers I look upon as his smile."

"Your voiceless lips, oh flowers! are living preachers,  
Each cup a pulpit, and each leaf a book,  
Supplying to my fancy numerous teachers  
From loneliest nook!"

To conclude:—In gardening, as in all other subjects, a plan is necessary to success; and having been frequently solicited by Messrs Cultivator, and

by other friends in this and the adjacent counties for something of the kind, and considering this the proper season to commence preparatory operations, I herewith present a diagram and description of a garden, which, if it answers no other good purpose, may be the means of procuring a better from some other source.

Little has been published in our country on the subject of gardening as an art of design and taste; and the publications of Europe not being suitable to our wants, it is proper to make a beginning and devise that which may suit ourselves, our country, and our climate. ALEXANDER WALSH.

Lansingburg, Feb. 1, 1841.

(Plan of a Garden—Fig. 1.)

DESCRIPTION.

The garden and pleasure ground I would describe, is of an oblong form, 165 feet by 120 feet, with one end next the north side of the house, (fig. 1.) A walk 5 feet in width, A A, of a semi-elliptical form, passes from the north hall door to the principal rear building on the west, extending in its course to the north 60 ft.; a walk of 5 ft. in width extends through the centre from south to north, 159 ft. A A, and is crossed at right angles by another of the same width 47 feet from the north edge of the ellipsis; walks of 4 ft. width C C C, surround the four squares. The walks graveled; formed rising at the centre to the height of the beds, with a descent each side, of an inch and a half to the border, which border is composed of bricks laid edgewise, the outer side flush with the soil, the inner side an inch and a half above the lowest part of the walk. H and I two mounds 12 inches diameter, 3 feet 6 inches high, enclosed by octagons, leaving a walk 4 feet in the narrowest part, with openings of 6 feet to the centre walk and ellipsis; the mounds enclosed with brick, placed endwise, inclining to the centre, and sunk 3 inches in the ground; the enclosure filled with soil; each mound has growing in its centre an evergreen tree. H covered with evergreen periwinkle, *Vicia minor*, and I covered with variegated periwinkle, *Vicia minor fl. alba*.

At the proper season, green-house plants and also shells, will be prettily accommodated around

the mounds; of the latter, I would recommend *Strombus gigans*, *Triton variegatus*, and *Haliotis asisna*. The more rare and beautiful shells may be appropriately assigned to the summer-house.

(Fig. 2)

(Fig. 3)

XX two seats, each occupying 2 ft.—J and K passages leading to summer-house and green-house—L summer-house—M green-house—N N N N four Grecian pedestals for urns, statues, and heavy mineral specimens—R R R R four small columns, 9 feet high, connected in the centre at the top, with a hook under the centre (fig. 2), for suspending a lamp or bird-cage—grapes trained over the frame—S S two fixtures for transparencies—T T two seats (fig. 4), surrounded by an arched arbor 10 ft. high, thrown over the walk, ornamented on one side with honeysuckle, on the other by climbing Boursaut rose—U U two ornamental frames, 4 ft. 6 in. square, (fig. 3), may be covered with a variety of our native clematis—V V two structures 9 ft. high and 3 ft. 6 in. wide, (fig. 4), 4 feet from east fence, covered with American Bitter-sweet, *Celastrus scandens*.

(Fig. 4)

(Fig. 5)

The ground on the outside of the elliptical walk, east, a grass lawn, diversified with fruit and ornamental trees, commencing next the walk with the lowest shrub, and rising to the east in gradation to the largest tree. Many of our beautiful native flowers and shrubs are found to thrive under the shade and drip of lofty trees, and may here be planted in occasional groups.

The ground on the west side of the elliptical walk, grass lawn, shrubbery and filbert bushes, to the extreme west of the green-house.—O and P fruit and ornamental trees and native shrubs—R native flowers—Q tulips and late flowering exotic plants—O O diminutive rustic alcoves, from thrifty growing plants of upright privet, *Ligustrum stricum*, formed by placing a platform of light boards 2 ft. 6 in. from the ground, and 3 ft. long, and 1 ft. 6 in. wide, on the twigs of the privet; those in the centre of the platform to be trimmed off close to the under side, and those on the back and sides to be led up round the platform, entwined and arched;

the door to be constructed from the twigs in front, and an opening left 2 ft. 6 in. high, which is the height of the dome.

This described ornamental pleasure ground, containing some hundreds of trees and shrubs, possessing the color of green in common, yet differing in both the shape and shade of the leaf, add much to adorn this spot by their variegated moving foliage, light and shade.

D E F and G four principal compartments, each 43 ft. 6 in. by 43 ft.—D has a circle in the centre 26 feet in diameter, a parterre for annual flowers; in the centre a sun-dial; a walk 4 feet wide surrounds the circle, and from it north and south; the residue of the ground D allotted to Dahlias, &c.—E, F G, compartments for culinary vegetables, strawberries, and an occasional plum tree—B B B outside borders 6 ft. wide, for currants, gooseberries, raspberries, &c.; in the centre of the north border a small board suspended, labelled, "Waste not, want not;" near which bee-hives.—..... borders for small flowers on the south and north side of D and F.—..... borders south side of E and G for foreign grape vines and herbaceous perennial flowering plants. On each side of centre walk, trellis for native grape vines; posts 7 feet high with 5 rods of wire crossed at equal distance; at the southern extremity of trellis, a light arch, on the back or north side of which, may be inscribed, "With clustered grapes He crowns the vine." At the northern extremity of trellis, an arbor thrown over the walk 12 feet long, more for ornament than use; grapes in our northern latitudes ripen better on the open trellis.

Candytuft, *Iris umbellata*, a good annual border flower: Dwarf Iris, *Iris pumila*, and yellow flowering stone crop, *Sedum aizoon*, pretty biennial bordering.

On a subject embracing such variety, it is not best to be more minute on border or other plants, as the collection and selection of plants, and the invention of other ornamental decorations, will afford amusement to the man of taste, and to him this pleasing occupation must be left.

"Oh sages! think on joy like this,  
And where's your boast of apathy."

From the New Genesee Farmer.

HOOF AIL—ITS CAUSES AND CURE.

MESSRS EDITORS—I observed in one of your papers, an inquiry respecting the cause of the disease called hoof-ail in cattle; and having paid some attention to the subject, I will cheerfully give you the result of my observation and the prevailing opinions here, which you are at liberty to publish, if you think they will be of service to any of your readers.

In the winter of 1836-7, this disease made great ravages among the cattle in this vicinity. Freezing of the feet was at first assigned as the cause; but many proofs to the contrary soon led to the abandonment of this opinion, and ergot was substituted as the mischievous agent.

I believe it is an opinion well established that ergot of rye, or *Secale cornutum*, has given rise to gangrene in the human species. This circumstance and the similarity which exists between it and the disease under consideration, afford good reason for the belief that the causes may be similar.

Ergot may sometimes be found in large quantities in June or spear grass—whether it differs in its chemical properties from ergot of rye, I am not

able to say—presume it does not materially. This grass, as is well known, is apt to run out timothy and clover, consequently it grows in excess in old meadows, and to the ergot growing on it, the disease is attributable. I have made many inquiries, but never found a case occurring where the animal had not been fed on hay containing it.

I will mention a few facts in confirmation of this opinion. Mr W. had 50 head of cattle fed upon hay mown from old meadows—the greater part of which was June grass. Only one of the 50 escaped the disease. A tenant upon the same farm, kept his cattle within 20 or 30 rods of the preceding, but fed them upon hay of marsh grass, and they escaped the disease. Mr C., on the adjoining farm, had some June grass among his hay, but not so much as W. Only two or three of his cattle were affected, till the latter part of April, when, being out of hay, he procured some of W.; and in a few days five of them had the disease. Another neighbor, Mr B., had wintered his cows well, but in spring, being out of hay, he also procured some of Mr W.; and before long, all that had eaten it became affected with hoof-ail. Mr K., on an adjoining farm, fed his cattle on straw, and none of the disease appeared amongst them. Dr. Stimson says he fed his cattle on hay containing a large proportion of June grass. Good attention was given them, but many became affected with the disease; and it continued to increase until he stopped feeding the hay, and gave them turnips and other food, after which no more hoof-ail appeared.

I could mention numerous other cases, affording conclusive evidence that this disease is caused by ergot on June grass—but I fear it will make this communication too long to enumerate them. I will remark, that in this section of country, (Upper Canada,) this grass had an abundance of ergot growing upon it last season; and consequently we may expect to see cattle affected with hoof-ail again this winter. Indeed it has already made its appearance amongst my father's stock. He commenced feeding a lot of hay found to contain ergot, to some calves, on the 2d or 3d of December; and on the 12th, nine of them had the disease. We immediately changed their food and cut off the points of their hoofs, so that they bled freely. They are now doing well.

This treatment generally effects a cure, unless the disease has been of long standing. The disease rarely affects the fore feet. I have never seen an instance, but have heard it asserted that it will sometimes occur.

Respectfully, yours,  
St. George, U. C., Jan., 1841.

N.

Oftentimes, extravagant praise is bestowed on a light, loamy land farmer, who has not a stone or other obstruction on his land, and which has been well tilled by his predecessor for the last generation—while the stony-land farmer, with equal skill and who exercises ten times the laborious exertion, is passed unnoticed by superficial observers.

It is not known where he who invented the plough was born, nor where he died; yet he has effected more for the happiness of the world than the whole race of heroes and conquerors who have drenched it with tears and manured it with blood, and whose birth, parentage and education, have been handed down to us with a precision precisely proportionate to the mischief they have done.

**NEW ENGLAND FARMER,**  
AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, MARCH 31, 1841.

**LUCERNE.**

In answer to our correspondent who recently inquired whether it would do to sow lucerne broadcast, we reply that we have been consulting authorities upon the subject, and have inferred from our reading that it may be well to sow in drills and weed the crop, yet that this method is not essential. Several writers distinctly recommend sowing broadcast; and we trust that our correspondent will not abandon his purpose to try this grass. We have never cultivated it, and cannot therefore say any thing in reference to it excepting in the words of others:—the following is from the editor of the *New England Farmer*, (Mr Fessenden,) May 1, 1833:

"**LUCERNE.** Columella estimated this plant as the choicest of all fodder because it lasted many years, and bore being cut down four, five or six times a year. It enriches, he says, the land on which it grows, fattens the cattle fed with it, and is often a remedy for sick cattle. Columella's observations were adapted to the climate of Italy, and lucerne is not so productive in colder countries. Loudon says, though lucerne was so much esteemed by the ancients, and has been long cultivated to advantage in France and Switzerland, it has yet found no great reception in England. If any good reason can be given for this, it is, that lucerne is a less hardy plant than red clover, requires three or four years before it comes to its full growth, and it is for these and other reasons, ill adapted to enter into general rotations.

"The soil for lucerne must be dry, and inclining to sand with a subsoil not inferior to the surface; unless the subsoil be good and deep it is not fit for lucerne. The ploughing should be deep, and thorough, and English writers advise to bury a coat of manure a foot below the surface. Such is the practice in Guernsey, where lucerne is highly estimated.

"Capt J. Swett, of Roxbury, has cultivated this grass to good advantage. In September, 1831, this gentleman sent a sample to the Mass. Hor. Soc. and observed, 'This grass is of the fourth crop this season, and according to my estimate has produced at the rate of about 3000 lbs per acre, each crop, when cut and dried. I have raised this grass the last three years, and find that my horses and cows like it much. I prepare my land in the following manner: have it ploughed twice, harrowed well, and all the weeds and rubbish taken from the land, then sow about 30 lbs. of seeds to the acre.'

"The quantity of seed made use of in Europe is from 15 to 20 lbs. to an acre, though Mr Swett thinks more would be better. The Hon. Robert R. Livingstone has cultivated lucerne with much success. He advises, as the result of his experiments, 1. Never to sow on ground which is not perfectly pulverized; 2. Not to sow till the ground has acquired a degree of warmth friendly to vegetation, viz. in May; 3. To sow with no crop that will probably lodge; 4. If sown with buckwheat, to apply no gypsum or other manure till the wheat is off; 5. If the quantity sown is small and the farmer can afford to lose a crop to give the ground one turn in the autumn, another in April, harrowing fine, and a third the beginning of May, and then if the weather be mild and warm, sow, if the ground be in perfect tilth; otherwise give it another ploughing

"When lucerne turns yellow it should be mowed, and the plants will come up free from disease."

**SPRING WORK.**

We believe that the fertility of most of our soils is very materially affected by faithfully preparing them for the reception of the crop. The more we stir and pulverize them in the spring, the more productive they will prove. This is the general rule. There may be exceptions. But the rule and not the exceptions, must be made the basis of reasoning and advice. Some hints as to the way in which the working of the soil may add to its fertility, will, perhaps, be acceptable to our readers.

Particles of earth, or particles of earth and manure, that have been in close contact with each other for a year, have exerted nearly all the chemical action upon each other that they are capable of furnishing. So long as they remain together they will change but slowly. But if you break-up the soil thoroughly, crush the lumps, and stir the whole mass well, then new particles are brought together, to exert new chemical actions upon each other; and to change each other into food for plants. Furthermore, such treatment of the soil, prepares it to receive in all parts the action of water, air and warmth. If spots are left unploughed, the rains will work off from these sidewise through the softer spots that have been ploughed; and in the hard places neither air nor warmth can work freely. These important agents in carrying on the processes of vegetation are therefore less available in a hard and lumpy field, than in one that is mellow and well pulverized.

From these positions, it must be inferred that we recommend, faithful ploughing, rolling and harrowing. We request farmers to ask themselves, whether in their haste to dispatch their spring work, they do not often suffer themselves to put in a crop before they have prepared the soil as well as good and profitable husbandry requires. When ploughing the land for spring grains, if you take so wide a furrow as to leave a part of the soil unturned, or if when the plough is thrown out by cornstalks or a stone, you fail to "back up" and go over the unploughed space again, then we believe that you do not take the *most profitable* course. Let the ground be well ploughed. Then, if our advice be taken, the roller will be applied on all soils that have tenacity enough to be at all lumpy. Break down the lumps or confine them by using the roller, and then a well loaded harrow will do its work of pulverising to very great advantage. It is well to harrow both ways. A double harrowing and a subsequent rolling will ordinarily cover the seed sufficiently. The roller is apparently a very important implement, which should come into more general use. It gives to the lands a very smooth surface, it facilitates the germination of seed by bringing them into close contact with the soil, and in the heat of summer it is believed to be very serviceable to the young grass that had been sown among the grains. A farmer in Wenham, where most of the stubbles were killed the last summer, informed us a few days since, that he *apparently* saved his by having rolled his ground in the spring.

We believe it to be good economy in this vicinity, to sow hay seed with grain in all cases, whether one intends to lay the land down or not. The growth of clover is worth for feed in the autumn and for manure to the land the following season, more than the cost of seed.

Our original remarks in most cases are suggested by our observations upon a particular farm, and in this neighborhood. Of course they must not be understood as designed for universal application. Each reader must look at the peculiarities of his own climate and soil, before he can properly judge whether our advice is suited to his wants.

There is at present considerable difference of opinion

as to the comparative worth of northern and southern clover. We doubt not that a larger crop of northern than of southern can be obtained the first year; but we have as little doubt that where the southern has been sown with other grasses, that the second and third crops of hay will be larger than where the northern was raised. We have not facts enough within our own observation to enable us to give a preference to the one over the other in point of eventual profit.—There may be difficulty the present season in obtaining northern seed, for much of that which comes from the North, is supposed to have been carried there from the South. If the farmers should find themselves furnished with southern when they have asked for northern, we trust that they will not forget this suspicion, and will not be hasty in blaming the seedsmen of this vicinity, who do the best they can to obtain northern, and yet are fearful that they may be imposed upon.

**TOWN AGRICULTURAL SOCIETIES.**

On Wednesday of last week we had the pleasure of visiting a few farmers in Attleboro', who have formed an association for the purpose of increasing their knowledge of agriculture. They hold monthly meetings for discussion, and are collecting a library. Such associations will necessarily tend to make this important pursuit more intellectual and interesting. They have commenced a good work, and we trust that the inhabitants of other towns will copy their example. On the day above mentioned we, at their request, addressed the people of the place upon a few of the common, everyday matters of husbandry, and were sorry to be obliged to quit them abruptly; at another time we will gladly tell them what the cars would not wait for us to say then.

The light soils of that region would be vastly improved by copious dressings from their abundant bog holes and wet meadows. These meadows, many of them, may be very easily rendered vastly more productive than the surrounding uplands. When the farmers there turn their attention more to the draining and cultivating of their wet lands, they will find the labor more productive than that which is bestowed upon such soil as they are accustomed to cultivate.

**OUR CONFESSION.**

Conscience has been troubling us for some weeks in relation to inquiries proposed by a correspondent near Fall River, who was confined to his bed by a fractured limb. When his letter was received, we felt it a duty to reply soon. But his inquiry whether the waste from a calico printing establishment might be rendered serviceable as a manure, we were unable to answer at once; we hoped by taking time to learn something upon the subject that might enable us to give a definite answer; but we have gained nothing by the delay. Our *conjecture* is that too much copperas and other substances injurious to vegetation are contained in this waste, and that it will be expensive fitting it for manure. A small quantity might be tried by using lime freely with it.—Our confession must go still farther. We are sorry to say, but must say, that we have lost the communication and do not distinctly recollect the other inquiries proposed. If our correspondent will favor us again, we will endeavor so to use him that he shall have less cause of complaint than he has at present.

We have received the Premium List of the Rhode Island Society for the Encouragement of Domestic Industry, for 1841, and will give it an early insertion. The Society's annual Cattle Show, &c. will take place at Pawtucket, on the 6th of October next.

**THERMOMETRICAL.**

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northernly exposure, week ending March 28.

March, 1841.	7 A.M.	12 M.	5 P.M.	Wind.	
Monday,	22	25	41	35	S. E.
Tuesday,	23	35	55	60	S. E.
Wednesday,	24	31	60	47	N. W.
Thursday,	25	36	58	46	S.
Friday,	26	36	66	50	W.
Saturday,	27	50	57	46	E.
Sunday,	28	42	49	48	E.

**BRIGHTON MARKET.—MONDAY, MARCH 29, 1841.**

Reported for the New England Farmer.

At Market 400 Beef Cattle, 30 yoke of Working Oxen, 35 Cows and Calves, 560 Sheep, and 3100 swine. About 75 Beef Cattle and 600 Swine unsold.

**Prices.—Beef Cattle**—Former prices were not sustained and we reduce our quotations, viz extra \$6 50 a 6 75. First quality \$6 00 a 6 25. Second quality \$5 50 a 5 75.—Third quality, \$5 00 a 5 25.

**Working Oxen**—Sales were noticed at \$70, \$75 \$85, \$95, \$100 and \$120.

**Cows and Calves**—Sales \$20, \$25, \$28, \$33, \$40 and \$60.

**Sheep**—Lots at \$2 50, 3 50, 4 25 and a few extra 6 00 each.

**Swine**—More than two thousand were sold. Lots to peddle were sold mostly at 4 for sows, and 5 for barrows. A few lots at 4 1-8 and 4 1-4 and 5 1-8 and 5 1-4. At retail from 4 1-4 to 6.

**WHOLESALE PRICES CURRENT.**

Corrected with great care, weekly.

**SEEDS.** Herds Grass, very little in market. Red Top, new seed by the bag 60—old 55 c. Clover—Northern, very little in market.—Southern, plenty, 9 to 10 c. Flax Seed, \$1, 37 to 1 50 bu. Lucerne, 25 c. per lb.

**FLOUR.** Howard Street \$5 37—Genesee \$5 31—Ohio \$5 12.

**GRAIN.** Corn—Northern Yellow none—Round Yellow 51 to 53—Southern Flat Yellow 50—White 48.—Rye—Northern 60 to 65—Southern 50 to 55. Oats—Southern 30 to 31—Northern 35 to 40.

**PROVISIONS.** Beef—Mess \$10 50 to 11 00—Prime \$6 50—No. 1 \$9 00. Pork—Extra—15 00—Clear 14 50—Mess \$13 00. Hams—Northern 9 c. per lb.—Southern, none. Lard—Boston 9 c. per lb.—Southern, 8 to 8 1-2. Butter—Lump 18 to 22—Firkin 12 to 18—Shipping 8 to 14. Whole Hogs 5 1-2 to 6 c.—Pigs 5 c.

**HAY**, per ton, \$17 to 17 50—Eastern Screwed \$13 to 14. **CHEESE**—Old 11 c.—New 8.

**EGGS**, 16.

**WOOL**—The market for this article has not experienced any change of late. Pulled Wool is rather scarce, and there is but a limited supply of low Fleeces, and of fine Fleeces the stock is also moderate. Prime or Saxony Fleeces, washed, lb. 50 to 55 c.—American full blood, washed, 47 to 50—Do. 3 4 blood, washed, 44 to 46—Do. 1-2 blood, washed, 36 to 40—1-4 and common do, 35 to 37—Smayna Sheep, washed, 20 to 23—Do. unwashed, 10 to 14—Bengasi Sheep, 8 to 10—Buenos Ayres unpicked, 7 to 10—Superfine Northern pulled lamb 43 to 46—No. 1 do. do. 37 to 42—No 2 do do 26 to 30—No 3 do do 18 to 20.

**SITUATION WANTED.**

A practical Gardener, of whom good references can be given, with a wife and one child, wishes a situation. March 31. 2wis

**BEDFORD OATS.**

Just received 10 bushels of superior Bedford Oats. This variety is highly recommended, it not being liable to blast, and very productive. For sale by March 31. JOS. BRECK & CO.

**SUPERIOR SEED BARLEY.**

100 bushels of extra heavy and clean Seed Barley. Also 10 bushels CHEVALIER BARLEY, a new and superior variety, for sale by March 31. JOS. BRECK & CO.

**BLACK SEA WHEAT.**

Received from Vermont, 30 bushels Black Sea Wheat. Also, 20 bushels Italian Spring Wheat, raised in Warren, V. H. For sale by March 31. JOS. BRECK & CO.

**AN OX WAGON**

Nearly new, for sale by JOSEPH BRECK & CO., Inquire at No. 62 North Market Street, or at their Farm in Brighton. Feb. 24.

**WILLIS'S LATEST IMPROVED SEED SOWER.**

Willis's latest Improved Seed Sower, invented the last season; one of the most perfect machines ever introduced for the purpose. In using this machine, the farmer may be certain that his seed is put into the ground, and at the same time in the best possible manner. There has been a great difficulty in machines for sowing garden seeds; they are very apt to clog up, and the farmer might go over an acre of land and not sow a single seed; but not so with this; it is so constructed that it cannot possibly clog. In using this sower, the farmer can save one half of his seed, and do the work at less than one quarter the expense of the common way of sowing seeds and have it done in a much better manner; it opens the furrow, drops the seed, and covers it over and rolls them down. It will sow almost any kind of Garden Seeds; say Ruta Baga, Mangel Wurtzel, Turnips, Carrots, Beets, Parsnips, Onions. It is highly recommended by a great number of persons who used it the past season. For sale at the N. E. Agricultural Warehouse and Seed Store by JOSEPH BRECK & CO. March 31.

**WINSHIP'S NURSERY,**

BRIGHTON, NEAR BOSTON, Situated on the line of the Boston and Worcester Rail Road,—5 miles from the city.

The Proprietors of this extensive nursery beg leave to inform their friends and the public, that they are ready to furnish orders to any amount, for Forest Trees, indigenous and exotic. Fruit Trees, including all the varieties of Pears, Peaches, Plums, Nectarines, Cherries, &c. &c. Vines—Shrubs, Green House Plants, &c. Catalogues may be obtained by applying at the Nursery. Trees carefully packed, to ensure safety in long voyages. Orders left at the New England Seed Store of J. Breck & Co. Nos. 51 and 52, North Market street, will be delivered the day following, and left at any part of the city, free of expense.

Letters containing orders, addressed to the subscribers, J. & F. WINSHIP, Brighton Nurseries, March 24, 1841.

**AGRICULTURAL IMPLEMENTS, &c.**

The Proprietors of the New England Agricultural Warehouse and Seed Store No. 51 and 52 North Market street, would inform their customers and the public generally that they have on hand the most extensive assortment of Agricultural and Horticultural Tools to be found in the United States. Part of which are the following:

1000 Howard's Patent Cast Iron Ploughs	100 doz. Cast Steel Shovels.
300 Common do. do.	150 " Common do.
200 Cultivators.	100 " Spades.
100 Greene's Straw Cutters.	500 " Grass Scythes.
50 Willis' do. do.	300 " Patent Snaiths.
100 Common do. do.	200 " Common do.
100 Willis' Patent Corn Shellers.	500 " Hay Rakes.
50 Common do do.	200 " Garden do.
200 Willis' Seed Sowers.	200 " Manure Forks.
50 " Vegetable Cutters.	300 " Hay do.
60 Common do. do.	500 Pair Trace Chains.
200 Hand Corn Mills.	100 " Truck do.
200 Grain Cradles.	100 Draft do.
100 Ox Yokes.	500 Tie up do.
1500 Doz. Scythe Stones.	50 doz. Halter do.
3000 " Austin's Rifles.	1000 yards Fence do.
	25 Grind Stones on rollers.

**FRUIT TREES AND SCIONS FOR SALE.**

The subscriber, at the Pomological Garden, Salem, offers for sale a very choice and extensive variety of Apple, Pear, Plum, Cherry, Peach and Apricot Trees, Grape Vines, Gooseberries, Red and White Dutch Currants, and Red and White Antwerp Raspberries.

Also, Scions of all the European and American Fruits which have been proved; all from fruit bearing Trees, packed in boxes with moss, and can be transported with safety to any part of this country or Europe.

ROBERT MANNING, tMay Salem, March 2, 1841.

**CLOVER & RED TOP.**

50 tierces and 120 bbls. Prime Clover. 200 Bags Redtop, new seed. 50 bbls Herds Grass prime quality, for sale by March 24 J. BRECK & Co.

**FARM WANTED.**

Wanted to purchase on credit or hire on a lease of five or ten years, a small but good farm in the vicinity of Boston.—The advertiser is engaged in rearing swine and makes large quantities of manure and has it in his power to keep a farm in a high state of cultivation. Any person having a place to dispose of or rent at a reasonable price may hear of a tenant by addressing JOHN GREY, Neponset Village, Dorchester. March 10.

**FRUIT AND ORNAMENTAL TREES, &c.**

NURSERY OF WILLIAM KENRICK.

12 000 Pear and Plum Trees.—Large and new additions of Pear and Plum Trees have lately been received, many kinds of which are alike new to our country, and very extraordinary. Such have been the selections which have been made by the subscriber in Europe, and in person, during the last Autumn, where all have been proved; those kinds already well known amongst us being identified by him by the wood and the leaf.

A new Descriptive Catalogue of all these fruits will soon be ready, and will be sent to all who apply.

Of the few following fine kinds extra large numbers have been provided for sale; all being very productive kinds, and most of them prodigious bearers, and are therefore calculated for cultivation to great profit on a great and extensive scale. These ripen in succession in the order named:

Jargonelle,	Aug.	Duchesse D'Angouleme,	Oct. Nov.
Summer Francreal,	Aug.	Gloux Morceau or the D'Arenberg of the French,	Nov. to Feb.
Bartlett or Williams' B. Chrt,	Aug. Sept.	Easter Beurre, Dec. to Apr.	
Beurre D'Amaulis,	Sept.	Clion, or LeCure, very large, for cooking only, a prodigious bearer, Bourginestre of Boston.	Winter.
Napoleon,	Oct.		
Louise Bonne D'Avranches,	Oct.		
Marie Louise,	Oct. Nov.		
Passe Colmar,	Nov. to Feb.		

All orders addressed to the subscriber, or left with Joseph Breck & Co., New England Farmer Office, will be promptly attended to, and Trees, when so ordered, will be securely packed for safe transportation to distant places.

N. B. A few trees of "Van Mons' Leon le Clerc Pears," supposed to be the best in the world; also, "Pitt's prolific Marie," or "Surpasse Marie Louise." These cost high—these Pears alone must, therefore be charged at extra prices, or \$2,50 for the former; and \$2,00 for the latter.

WILLIAM KENRICK. Nonantum Hill, Newton, near Boston, March 2.

**PEAR, PLUM, GRAPE VINES, &c.**

3000 Pear Trees, of the most approved kinds. 2000 Plum Trees, of the most approved kinds and extra size—many of them have borne this season.

Apple, Cherry and Peach Trees, of different kinds. 500 Quince Trees. 4000 Isabella and Catawba Grape Vines, from 6 to 15 feet high; most of them have borne fruit. Black Hamburg, Sweetwater, Pond's. 30,000 Grant Asparagus Roots. Gooseberry, Currants, Raspberries, of good kinds. 5000 Wilmot's Early Rhubarb or Pie Plants, lately introduced. 2000 Cherry and Pear Stocks; 1000 Plums; Roses, &c. of all kinds.

All orders sent to the subscriber at Cambridgeport, will meet with immediate attention. SAMUEL POND. Cambridgeport, Mass., Feb. 24.

**CORN SHELLER.**

CAUTION, the public are hereby informed that the subscriber has letters Patent for his improved CORN SHELLER, and all infringements on the same will be prosecuted to the extent of the law. The above machines are for sale at J. Breck & Co. No. 51 and 52 North Market street, Boston. C. WILLIS. March 14th.

**A SMALL FARM FOR SALE,**

Situated in Braintree, ten miles from Boston, with a Dwelling House and large Cider mill thereon. The farm contains about 20 acres. Inquire of NATHANIEL FAXON, No. 53 North Market Street. Feb. 24.

## MISCELLANEOUS.

**WOMEN IN FRANCE.**—"Shame upon France, falsely styled by its inhabitants "The Paradise of Woman," where the female race is degraded to occupations which England never imposed on her most worthless daughters. Only the young and hardy of the stronger sex are employed in the *paria* trade of scavenger in England, none others being fit to cope with the discomfort of stifling dust in summer, and continual mud in winter. The streets of Paris, however, at this moment offer the distressing spectacle of aged and decrepid women, toiling by dozens in the wet, heavy mud, with which their miserable clothing is also saturated; a dripping broom or shovel is alternately placed in the girdle on their back, and their wrinkled features are scarcely discernible through the splashing of crowds of carriages, which whirling rapidly among these feeble old creatures, seem continually to threaten the miserable remnant of their days. There can scarcely be imagined a more deplorable spectacle than these aged women toiling at such heavy work without the assistance of men, and held so low in the consideration of the volatile crowd that they are not unfrequently thrown down by heedless drivers.

"Another class of work which frequently falls to the lot of aged woman is the fatiguing and chilly labor of carrying water, during the severe weather, to houses where the fountains and pumps are frozen. As some of the families supplied live on the fourth or fifth floors of the tall houses, the tread-mill task of the infirm poor creatures is hardly paid by the two sous charged per bucket.

"A third class of severe labor, often imposed on women here is the sawing and cutting up of wood for fuel, which they do in all weathers in the exposed and windy court yards. At the wood stores purchasers can only procure wood in large pieces as it comes from the forest; it is therefore, a trade to cut up the blocks into convenient lengths for the fire places, and near the woodstores is generally seen a collection of men and women, waiting to be engaged for that purpose. The women are singularly expert with their sharp little saws, which glide rapidly through the logs placed on a cross-legged stand like a portable garden chair; they then, unassisted, carry heavy loads of the cut wood to its destination in the cellars or up the eternal stairs, and finally with a few sous, and the mighty perquisite of the saw-dust, they set off happy and singing to seek a similar toil."—*Eng. paper.*

**FATHER MATHEW'S TEMPERANCE ROLL.**—A gentleman who lately visited Cork says: "I was disappointed in my wish to meet Father Mathew, who was in Dublin, where he had enrolled great numbers. I looked over the books at his home. They are very neatly kept, and resemble large ledgers. The number registered was above one million and a half, and there are immense numbers taken in the country and registered. I believe the total may be fairly stated at two millions and a half."

**WHITE CARROT.**

A quantity of this new and valuable root is offered for sale at the New England Agricultural Warehouse, No 52 North Market street.

Also—New Red and Yellow Globe MANGEL WURTZEL—considered a superior variety  
Feb. 10. JOS. BRECK & CO.

**GARDEN SEEDS.**

For sale by JOSEPH BRECK & Co. at the NEW ENGLAND FARMER OFFICE, No. 51 and 52 North Market St. Boston. The subscribers would inform the public that they have now on hand the largest collection of seeds ever before offered by sale in this city, embracing every variety of *Field, Kitchen, Garden, and Ornamental Flower Seeds* desirable for this or any other Climate.

Our seeds are either raised under our own inspection or imported from responsible houses in Europe, and having taken extraordinary pains to obtain such as are pure and genuine, we can confidently recommend them to our customers and friends, and feel assured they will prove satisfactory to all who try them.

Dealers in seeds are requested to forward their orders in season. Boxes for retailing from 8 dolls. and upwards will be sent out on commission allowing a liberal discount and take back what remain unsold.

Letters and orders with good reference will meet with prompt attention.

**FIELD SEEDS**

Indian Corn, do.	Buckthorn. } for Hedges.
Oats, do.	Locust.

**GARDEN SEEDS.**

Artichoke, Asparagus, Beans of every description, Beets of sorts, Borecole, Broccoli, Brussels Sprouts, Cauliflower, Caraway, Celery, of the most improved sorts, Cabbage 20 sorts, Carrot, all the varieties, Cucumber do, Cress, Egg Plant, Endive, Indian Corn, Kale, Leek, Lettuce in great variety, Melons, do. Martynia, Mustard, Nasturtium, Okra, Onion of sorts, Pepper do. Pumpkin do. Parsnip, Parsley, Peas, a very great variety, Rhubarb for tarts, Radish of sorts, Salsify, Squash of sorts, Tomato, Turnip 20 varieties.

**SWEET AND POT HERBS.**

Thyme	Sweet Basil.
Sweet Marjoram.	Lavender.
Sage.	Lemon Balm.
Summersavory.	Anise.
Medical Herbs, &c.	

**ORNAMENTAL FLOWER SEEDS.**

Three hundred varieties, embracing all the finest sorts. Packages of 20 fine sorts for one dollar.

Those who prefer to have their Seeds put up in papers ready for retail, can be accommodated—each packet neatly closed and labelled with printed directions. Price 50 cents, per dozen papers, which are retailed here at 6 t-4 cents each.

Fruit and ornamental trees, of the greatest variety, supplied at nurseryman's prices, and orders solicited. These will be packed, when required, to go to any part of the U. States.

JOSEPH BRECK & CO.

**STRAWBERRIES: STRAWBERRIES!**

The subscriber would offer to the public, the present season, his *Selected Collection*, consisting of seven varieties; they are such as have stood the test of a fair trial for seven years, and all grown by the subscriber.

*Warren's Seedling Methven*, a new and valuable kind, a free bearer, fruit very large and juicy; fruit measuring 5 1-2 inches have been exhibited the present season. This variety can be warranted to be one of the finest varieties grown, and will produce as fine fruit and as large quantity, with the same cultivation, as any other ever offered. The price of this Seedling is \$5 00 per hundred plants.

*Methven Castle*.—Fruit extremely large, high flavored and showy; specimens of this fruit have been shown this season six inches in circumference. Price three dollars per hundred plants

*Keen's Seedling*.—A very superior variety, fruit very large, rich dark color, and uncommonly high flavored. Price three dollars per hundred.

*Royal Scarlet*.—Fruit long oval shaped and juicy, very free bearer, and very hardy. Price two dollars.

*Hautbois*.—Fruit larger than English Wood, exceedingly numerous, sometimes yielding 100 berries to the plant.—Price two dollars.

*Early Virginia*.—This is known to be the earliest and best fruit for market, a free bearer and very hardy. Price two dollars

*English Wood*.—Fruit well known for years. Price one dollar.

Every plant sent from this garden will be warranted to be free from mixtures, and shall also be young and healthy, worth the price paid for them.

All orders directed to the subscriber, inclosing the amount for the order, or with a good reference, shall be promptly attended to, and the plants carefully forwarded agreeably to directions.

JAMES L. L. F. WARREN.  
Nonantum Vale, Brighton.  
March, 24.

HOWARD'S IMPROVED EASY DRAUGHT PLOUGH.

Great improvements have been made the past year in the form and workmanship of these Ploughs; the mould board has been so formed as to lay the furrow completely over, turning in every particle of grass or stubble, and leaving the ground in the best possible manner. The length of the mould board has been very much increased, so that the Plough works with the greatest ease, both with respect to the holding and the team. The Committee at the late trial of Ploughs at Worcester, say,

"Should our opinion be asked as to which of the Ploughs we should prefer for use on a farm, we might perhaps say to the inquirer, if your land is mostly light and easy to work, try Prouty & Mears, but if your land is heavy, hard or rocky, BEGIN WITH MR. HOWARD'S."

At the above mentioned trial the Howard Plough did more work, with the same power of team, than any other plough exhibited. No other turned more than twentyseven and one half inches, to the 112 lbs. draught, while the Howard Plough turned twenty-nine and one half inches, to the same power of team! All acknowledge that Howard's Ploughs are much the strongest and most substantially made.

There has been quite an improvement made on the shoe, or land side of this Plough, which can be renewed without having to furnish a new landside; this shoe likewise secures the mould board and landside together, and strengthens the Plough very much.

The price of the Ploughs is from \$6 to \$15. A Plough, sufficient for breaking up with four cattle, will cost about \$10 50, and with cutter \$1, with wheel and cutter, \$2 50 extra.

The above Ploughs are for sale, wholesale and retail, at the New England Agricultural Warehouse and Seed Store, Nos. 51 & 52 North Market Street, by

## KINDNESS TO ANIMALS—SHELTER FOR SWINE IN WINTER.

*"Blessed are the merciful, for they shall obtain mercy."*

There are few things more revolting to the feelings of a good man, than unkind treatment to animals. Such an absence of mercy as some men [?] evince towards the guileless creatures over which, by the unmerited goodness of God, they have dominion, betokens, in my estimation, a lack of all the qualities which comprise the character of a good man—it indicates, indeed, a depraved heart. This may be thought strong language, but my observation justifies it.

Regard for the wants and feelings of the speechless brute, is a jewel trait in the human character—and to me it is indicative of a virtuous disposition and a feeling heart. It is an incumbent duty, prompted by the spirit of goodness, by the dependent relation in which we stand to the brute, and enjoined by Him who gave man his authority over the beasts.

Entertaining these sentiments, Mr Editor, it was with no ordinary degree of pleasure that I read in your last the communication of "A Farmer," in which he broaches the subject of providing a more comfortable shelter for swine in winter. It is high time that public attention was excited upon this matter. The practice which prevails to so great an extent among farmers, of taking care for the comfort of their other animals and leaving their swine to comfort themselves as best they can, is an error of no small magnitude, and as detrimental to the true interests of the farmer as it is repugnant to the dictates of humanity. I am heartily glad your correspondent has brought the subject to public attention; for, in the light I view it, it is one of equal moment with "the comparative value of Berkshires," or any other topic which at present employs the pens of your correspondents.

The neglect (*cruelty*, in reality,) manifested by some farmers towards their swine, is reprehensible in the extreme. I have seen hog-pens, in the middle of winter, with crevices in the most exposed points half an inch in width, through which the cold wind and the storm had free access to the poor animals within when they sought their nest, and the entrance to that wretched apartment entirely open and destitute of the means of being closed. Such pens frequently meet the eye of the traveller, and the spectacle always excites in my mind a suspicion, that the owner is no better citizen than he should be—most likely, is a man destitute of kind feelings, or one who has benumbed his sensibilities by the poison liquid of the dram shop. As *Dow, jr.* says, "I have an antipathy to such men."

Though I cannot join with your correspondent in pronouncing the sufferers in question either "beautiful" or "noble," as general characteristics of the genus swine, yet I certainly would not have them excluded from the pale of humanity simply

because they are hogs. They are peculiarly entitled to the farmer's care, as they constitute, or may be made to constitute, one of the chief sources of his pecuniary income: this consideration alone should ensure them kind treatment—at least common kindness, which they cannot now, in too many instances, be said to receive. Their claims to this are just and indisputable:—they are not, like too many of the bipeds who feed upon them, *consumers* merely—they are in an eminent degree *producers*: if permitted, they cheerfully remunerate their owner for all the care bestowed upon them while living, and having accomplished the chief object of their life—to die—by their death they increase his profits. Why then, in the name of justice I ask, are they so generally slighted? Upon what principle of right, reason, or humanity, is the practice founded, of leaving *them* in a great measure unprotected from the "peltings of the pitiless storm" and the pinchings of cold, while other animals, less useful even, are provided with comfortable and adequate shelter? The partiality cannot be justified: it is an evil—a crying evil, that calls for immediate remedy. And if our farmers who are culpable in this respect \* still manifest any apathy or reluctance to move in the desired reform, I would suggest, Mr Editor, as a means of effecting the consummation so devoutly to be wished, that an association of humane persons be formed in each town, entitled "*the Society for ameliorating the condition of Swine in winter.*" The age is prolific in projects for benevolent purposes, and I can conceive of but few better calculated to subserve the cause of humanity than the one I have suggested, although its novelty may excite a smile. At any rate, let something be done, by some means—by the voice of the potent press or by private influence—through the agency of association or by individual example—to open the eyes and soften the hearts of those, whose unjust, ungenerous, and unmerited treatment of their swine, indicates blindness to their own interests and hardness of heart. Your correspondent has contributed his mite towards this end, and is entitled to much praise for his active benevolence in coming forward as an advocate in behalf of those who, though in *some* respects *resembling their master*, are destitute of his faculty of pleading their own case.

J. H. D.

### PREMIUM LIST

*Of the Massachusetts Society for Promoting Agriculture—1841.*

The Trustees of the Massachusetts Society for the Promotion of Agriculture, announce to the public their intention to offer in premiums not only the sum granted by the government, but the whole amount of the income of their own funds; and as they again omit for the ensuing year their Cattle Show at Brighton, they propose in addition to their

\*I may safely presume that few such are to be found among your subscribers, Mr Editor; for those who are in the habit of reading a paper devoted to their occupation, are generally better economists and better men.

usual premiums on agricultural experiments, the following premiums:

#### *For Stock.*

From any county of the Commonwealth, to be exhibited at the annual Shows of the Essex County Agricultural Society, the Plymouth County Agricultural Society, and the Hampshire, Franklin and Hampden Agricultural Society, respectively, in the autumn of 1841. Among other objects,

For the best full blooded bull, of an imported breed, not less than one year old, on satisfactory assurance being given that he shall be kept for use, in some county of the State, at least nine months from the day of exhibition.

For the second best ditto.

For the best milch cow, full blood, of an imported breed, not less than three, nor more than ten years old, with satisfactory evidence as to the quantity and quality of her milk and the manner in which she has been fed.

For the second best ditto.

For the best full blooded heifer, of imported breed, that has been milked not less than three months, with satisfactory evidence of the quantity and quality of her milk.

For the second best ditto.

For the best yearling full blooded heifer, of imported breed.

For the best pair of working oxen, taking into view their size, power and training.

For the second best ditto.

For the best pair of three year old steers, taking into view their size, power, &c.

The amounts of the premiums for the foregoing, will be particularly specified in the premium lists of said Societies; and no premium will be awarded to any animal which has heretofore had a premium of the State Society.

Competitors will be required to comply with the rules and regulations of said Societies respectively, and also to give notice in writing of their intention to offer animals for the foregoing premiums, to Benjamin Guild, Esq., Boston, Recording Secretary of the Massachusetts Society for Promoting Agriculture, on or before Monday preceding the days of exhibition respectively.

#### *For the Best Cultivated Farms.*

For the best cultivated farm, on which no premium has before been given, of not less than 70 acres, exclusive of wood land, regard being had to the quantity of produce, the manner and expense of cultivation, and the general appearance of the farm,

For the next best,	\$200
For the next best,	150
For the next best,	100
For the next best,	75
For the next best,	50
For the next best,	25

To obviate the objections which some claimants for premiums may have to making a written statement of the condition, products and management of their respective farms, as heretofore required, the Trustees propose to relieve them of this trouble by

an inspection, either personally or by an agent, of the farms which may be offered for premium.

The person or persons making the inspection, will require of the respective owners or occupants of farms, answers to the following inquiries:

Of how much land does your farm consist, exclusive of wood land?

What is the nature of your soil; does it consist of sand, gravel, clay, loam or peat?

If of a part or all of the above kinds, what do you consider the best method of improving them?

How many acres do you till, and how many cartloads of manure, (meaning by cartloads 30 bushels at least,) do you generally put on an acre?

Is your manure applied in its long, or green state, or in compost?

Do you spread and plough in your manure, put upon fields to be planted with corn or potatoes, or put it into the hills?

What is your method of ploughing and cultivating green sward?

How many acres of upland do you mow, and what is the average quantity of hay upon an acre?

How many acres of grass land do you irrigate; at what season and how long do you allow the water to flow your land, and what is the effect?

Do you manure the land irrigated, or any other land you mow, how much to an acre, and what kind of manure do you put on?

How many acres of low land, not suitable for the plough, do you mow, and what is the quality and quantity of the hay cut the present year?

What is your method of reclaiming low, bog or peat lands, and what has been your success?

How many acres of corn have you planted the present season; what was your mode of preparing the ground and the seed, the kind and quantity of manure used to an acre, the manner of applying it, and the quantity of corn raised to an acre?

How many acres did you plant with potatoes the present year; what was your method of planting, your manner of cultivating, and what the average quantity raised on an acre, and what kinds did you plant.

What number of acres of other vegetables did you plant, what kinds, and how many bushels of produce had you to the acre, and to what use shall you apply them?

How many acres of grain did you sow the present year; what kind of grain and at what times; how was the ground prepared; what quantity of seed did you sow on an acre? If you have raised wheat, of what kind; the nature of the soil, and was it sown with or without using lime?

How many acres have you laid down to grass the present season; at what time in the year did you sow it; how much seed to the acre; and was it sowed alone or with a grain crop?

What are your means and what your manner of collecting and making manure?

How many oxen, cows, young cattle, horses and sheep do you keep through the year? What is the size of your barn or barns, and have you a cellar under them? Is your manure covered?

Are your cows of native, foreign, or mixed breed? What is your management of calves intended to be raised?

How much butter did you make this year, and how many cheese, and what proportion of it new milk?

How many sheep do you keep, and of what breed? How many pounds of wool do you get from your sheep? What is your manner of housing, penning,

rearing and feeding them, especially in winter and at the time of lambing? At what time do your sheep lamb; and what proportion of their young die, and from what causes?

How many swine did you keep, what quantity of pork did you make, and of what breed were your swine?

What do you feed them upon through the summer months, and on what do you fatten them?

How many cartloads of manure do you take from your hog-styes in a year, and of what materials is it made?

What number of hands is employed on your farm, and what do you pay for labor?

What is the number of your apple trees? Are they of natural or grafted fruit? What use do you make of the fruit?

What number of fruit trees have you exclusive of apple trees?

Have your trees been attacked by canker worms or borers, and what is your method of destroying them?

In the cultivation of your farm, do you allow the use of ardent spirits?

The trustees are desirous that these questions should be answered with as much particularity as possible. The applicant will not, however, be required to answer them under oath, but according to the best of his knowledge and belief.

The Trustees hope and believe that by the method proposed, many important facts may be elicited, and the farming community enabled to derive much useful information from the skill and experience of practical farmers.

N. B. Claims to be addressed to Benjamin Guild, Esq., in Boston, before the first day of October next.

#### (Form of the Application.)

TO BENJ. GUILD, Esq., Boston.

Sir,—The subscriber, living in the town of hereby makes known his intention of applying for a premium for the best farm, and offers the same for inspection.

#### Rotation of Crops.

For the best rotation of crops on the same land, not less than two acres, for three or four years in succession, commencing when it is in grass, \$75 Premium to be claimed in December, 1841 or 1842.

It is expected the applicant will state the quality and condition of the land, when he first ploughs or breaks it up; the manner of preparing it each year, specifying the times of ploughing, the quantity and kind of manure used, the seed, whether potatoes, Indian corn or other grain, planted or sown, and the kind and quantity of grass seed, the time when sown, and whether with grain or alone, and the quantity or produce each year, including the last. The applicant's own statement, signed, but not sworn to, is all that will be required.

#### Vegetable and Grain Crops.

For the greatest quantity on an acre—  
Of potatoes, not less than 500 bushels, \$30  
‘ earrots, 30  
‘ ditto on half an acre, 15  
‘ mangel-wurtzel, 30  
‘ ditto on half an acre, 15  
‘ sugar beet, 30  
‘ ditto on half an acre, 15  
‘ ruta бага, 30  
‘ ditto on half an acre, 15

‘ cabbages, free from earth when weighed, 20  
‘ ditto on half an acre, 10

For the greatest quantity of vegetables (grain, peas, beans excepted) for home consumption and not for sale: raised for the keeping of stock, regard being had to the size of the farm in proportion to the crop, and to the number of the stock kept; and also to the respective value of the vegetables as food, and the expense of raising the same, \$30

For the greatest quantity on an acre—

Of Indian corn, (not less than 80 bushels, 75 lbs. in the ear to be considered a bushel,) \$30  
‘ wheat, not less than 25 bushels, 20  
‘ barley, not less than 45 bushels, 20  
‘ rye, not less than 30 bushels, 20  
‘ dry peas, either broadcast or in drills, 25  
‘ dry beans, not less than 10 bushels, 25  
‘ mustard seed, 20

It is to be understood that the quantity of land specified above, is in each case to be in one piece. And the claimant of any of the above premiums, shall, with one other person, make a statement according to the best of their knowledge and belief, to the following particulars, and shall obtain a certificate of the measurement of the land by some sworn surveyor.

The particulars are—

1. The condition of the land in the spring of 1841.
2. The product and general state of cultivation and quality of manure used upon it the preceding year.
3. The quantity of manure the present season.
4. The quantity of seed used.
5. The time and manner of sowing, weeding, and harvesting the crop, and the amount of the product ascertained by actual measurement, after the whole produce for which a premium is claimed, is harvested, and the entire expense of cultivation.
6. At least forty bushels of the vegetable, for which a premium is claimed, (except onions and common turnips,) are to be weighed, and 50 pounds free from dirt, will be considered as a bushel.

#### Experiments, Discoveries and Inventions.

For an effectual and satisfactory mode of extirpating the worm that attacks the locust tree, \$100

For a new, effectual, and satisfactory mode of extirpating the borer which attacks the apple tree, \$50

For the experiment of turning in green crops as a manure, on a tract not less than one acre, and proving its utility, giving an account in writing, of the process and the result; and particularly describing the condition of the ground before turning in the crop—the kind of crop—when sowed and when ploughed in, \$50

For any newly invented agricultural implement or machine, superior to any designed for the same use, a reward not exceeding 50 nor less than 10 dollars, according to the importance of the invention.

To the person who shall prove to the satisfaction of the Trustees that his mode of rearing, feeding and fattening neat cattle is best, \$20

#### Manures.

For the best dissertation on different manures, and on their practical application to the various soils in this Commonwealth, \$100

#### Apple Orchards.

For the best apple orchard, in any county of the Commonwealth, planted out not less than two, nor more than ten years before April, 1841—regard be-

ing had to the number and condition of the trees, the kind of fruit, and the mode of treatment, which must be described,

\$50

30

For the second best,

Claims to be addressed to Benjamin Guild, Esq., in Boston, free of expense, on or before the first day of September next.

Claims for the premiums on vegetable and grain crops, manures, experiments and inventions, together with the evidences required, are to be in writing, and sent free of expense to Benj. Guild, Esq., in Boston, Assistant Recording Secretary, on or before the first day of December next, and they will be examined by the committee, previous to the 5th day of December.

It is understood that, whenever merely from want of competition, any of the claimants may be considered entitled to the premium, under a literal construction, yet, if in the opinion of the judges, the object so offered is not deserving of any reward, the judges shall have a right to reject such claims. Persons to whom premiums shall be awarded, may, at their option, have an article of plate with suitable inscriptions, in lieu of the money.

In cases where pecuniary premiums are offered, the Trustees may, having regard to the circumstances of the competitors, award either the Society's gold or silver medals, in lieu of the pecuniary premium annexed to the several articles.

If any competitor for any of the Society's premiums shall be discovered to have used any disingenuous measures, by which the objects of the Society have been defeated, such person shall not only forfeit the premiums which may have been awarded to him, but be rendered incapable of being ever after a competitor for any of the Society's premiums.

The Treasurer will pay all premiums awarded, on demand.

All premiums not demanded within six months after they shall have been awarded, shall be deemed to have been generously given to aid the funds of the Society.

By order of the Trustees,

PETER C. BROOKS,

ELIAS PHINNEY,

JOHN C. WARREN,

HENRY CODMAN,

March, 1841.

Committee.

From the Farmer's Gazette.

#### CANKER WORMS—CHICKENS.

MR STORER—I wish through the medium of your Gazette, to call the attention of our citizens to a fact which occurred within my own personal knowledge; and if like causes produce like effects, (and I see no reason in this case why they will not,) a fact of importance to all who are sufferers from the ravages of the canker worm. The fact is this:

In the spring of 1840, I purchased three hens, which raised a brood of chickens each. When my fruit trees in my garden became literally covered with the canker worm, I thrashed them with a pole to the ground, where they were picked up by the chickens as greedily as they would pick up corn or grain. Several times a day I fed them in this manner, until I had entirely cleared my trees of the worms. Now, as to the result: in the month of November last, in some very warm days, when the moths were crowding up the clms in front of my residence by hundreds, I made repeated ex-

aminations of my fruit trees in the garden, for the purpose of preventing the moths from ascending; but to my surprise, I found (nor could I discover) but a single moth on a tree in my garden, where there had been for several successive years before, as many millions of worms as there were locusts in Egypt.

This method I believe, will be found altogether the most simple and economical, of ridding effectually our gardens of this troublesome insect, for it will be found that the chickens while young, are of immense advantage in other respects than merely to clear off the canker worms. The millions of insects of every description, which are revelling in luxury on our cucumbers, our cabbages, and in fact every vegetable in the garden, at a heavy tax upon our labor and patience, are entirely eradicated by these industrious birds. As soon as it is light in the morning, and before the cut worm has finished his depredations upon our beans and cucumbers and retreated in safety to his bed in the ground, they have found and stopped his mischief. Then again, in the winter you have the pleasure of picking their bones in a fricassee, or a pie, or any other method you prefer.

But their value as a complete annihilator of the canker worm, is beyond praise. Let a farmer but set four or five coops in his orchard of a hundred trees, and by a little attention for a few days in cleaning the trees, his work is done for years—the race is destroyed. It is, in my opinion, better than all the lead pipe in the country, and no expense.

Yours, &c.,

G. F. H. R.

New Haven, March 10, 1841.

#### THE DAHLIA.

The Dahlia certainly deserves to rank amongst the finest flowers of the garden. Its size, texture, and almost endless variety makes it a favorite wherever it is introduced. A few observations on its cultivation may not be altogether uninteresting to the lovers of flowers. It has been but a few years since it was cultivated in this neighborhood; for several years at first the roots generally were destroyed during the succeeding winter, and we had to receive an annual supply from the east. Experience taught us that we had killed them with kindness, like many fond mothers do their children. We put them up, and were so very careful of them that the warmth, I suspect, rotted them. Raising some plants from the seed, most of them produced single flowers, and were not thought worth any care to preserve them. They were taken up and laid in a heap in the garden, and covered up with earth, taking care to cover them deep enough to prevent the frosts of winter from reaching them: next spring they were found to be in perfect preservation. Since that I have left them in the garden during winter where they grew, and if a little earth or trash of any kind is piled over them, to prevent the frost from touching them, they are uniformly found in fine health in the spring. No root can be more hardy which is so easily destroyed by frost; they can resist frost little better if any than the sweet potato, but they will lie in the ground for two years and remain sound if not touched by frost. I would advise those who prefer letting them remain where they grew, to raise them in the spring and again return them to the ground after dividing the bunch of roots. In taking them up, the ground is made loose and better prepared to give a fine plant than if the root remains, and it

is beneficial to divide the clump of roots, independent of multiplying your stock. But one stock should be allowed to grow, even if the whole root is left in the ground. No root will throw out a shoot that has not a part of the old stock where it enters the clump of roots; in dividing them that must be well attended to, for the largest root, broken off below this juncture, may be cast aside—it is useless to plant it.

Nothing grows better from the slips than the dahlia—the hardest, best limbs should be chosen and cut off immediately below the joint when planted;—water them well and keep the sun off of them for a week. I have had them to bloom finely the same season, and they furnish a supply of roots for the next spring. Since the difficulty of preserving the roots through winter is obviated, I have no doubt the dahlia will soon be cultivated in every flower-garden in the country; I know no flower which is a greater ornament. They bloom from the seed the first season, if planted very early.—*Nashville Agriculturist.*

INTEMPERANCE.—It is this that fills the dockets of our courts with cases of dishonesty and fraud; that furnishes the loathsome dens of our jails with inhabitants, and supplies our gibbets with victims. It lays the axe to the root of all happiness: destroys all order, peace and quiet in communities, and is the death of all friendship, esteem, and love in families. It is the poison of friendship, the bane of society, the ruin of governments, and the grave of religion;—it enfeebles health, destroys wealth, overthrows happiness, and blights the moral feeling! No human imagination has ever yet conceived one half the horrors of this giant vice; in its ferocity it regards neither age, sex, or condition; the crowned head is not too high for the fiend to drag to the gulf of ruin, nor the beggar too low for it to plunge into the vortex of woe. This vice alone costs our country annually one hundred millions of dollars, and gives us in return, nothing but poverty, blasphemy, infidelity and crime; and while it opens up the flood-gates of misery upon us, it is, vampire-like, sucking away our strength and exhausting our energies—weakening the means of our existence and paralyzing the arm of our might! "In a single year," says an eloquent writer, "could all the effects of this vice be collected into one group it would present to the eye an army of three hundred thousand drunkards—not made up of the old, the feeble and decrepit, but of the middle-aged, the stout and the hearty, enlisted from all professions, and the shop, the counter, the bar, the bench, and the pulpit—seventyfive thousand criminals, and two hundred thousand paupers: and in the group would be seen thirty thousand of our countrymen annually dragged to the grave! With such an army Bonaparte might have overrun all Europe, and decked his brow with the garland of universal triumph!"—*Nash.*

*Cause of Decay of Ruta Bagas.*—A Roxbury, (Mass.) correspondent of the New Genesee Farmer, thinks the rot in ruta bagas is caused by too early sowing. He says: "I have, the last fourteen years, cultivated both the sugar beet and ruta baga, raising from 2000 to 3000 bushels for my cows. I have almost invariably found that when I sowed early, my roots were more or less rotted. The last season I sowed from the 15th to the 20th of June, and I had scarcely a defective one."

For the N. E. Farmer.

### BERKSHIRES YET AGAIN!

Cambridge, Pine Grove, March 25.

MR EDITOR—I have just left my plough, taken my supper, and read the N. E. Farmer. My attention was drawn to an article headed "The Berkshires," in which the writer complains that his Berkshire pig gained only "110 lbs. in 275 days." I have read and re-read the controversies about the Berkshires, and had determined to stand aloof from the contest—but as this is so hard a story to digest, and as "A Beginner," admits that "facts are stubborn things," and that "there are always two sides to a story," I will merely give him the facts relating to some pigs from my stock. On the 13th of November, 1840, I sold to a neighbor two Berkshire sow pigs—they were at that time five weeks old—one weighed 15 1-2 lbs., the other 20 3-4. They were fed on house swill, and not like those of "Beginner," "with squashes boiled with meal four times a day;" they never had a particle of meal. In 90 days they were weighed, and their weight was, one 126 lbs.—the other 119 lbs., being a gain of one pound and nearly one fifth per diem.

### RHODE ISLAND AGRICULTURAL SOCIETY.

Report of the Committee on Butter.

The Committee on Butter beg leave on this occasion, respectfully to present both their general and particular views to the Society on the subject of their appointment.

They are of opinion that the effect of altering the time first fixed by the standing committee for the inspection of butter, rendered it impossible for the owners of small dairies to be prepared on so short a notice, and thereby surrendering the whole field of competition to the owners of large dairies, who could avail themselves of this advantage by bringing their butter sweet and fresh from the churn, which circumstance might exert such an influence over the minds of the examining committee as to make them overlook defects in the paramount points in its manufacture. Its further effect was, to arrest the progress of many who had purposed entering their butter for a premium.

When it was again made known that the original plan was still to be carried out, the season had so far advanced, that very severe frosts had destroyed the sweetness of the grass, without which delicious butter cannot be made. Of this the applicants (who were in consequence but few,) very justly complained, as no skill of theirs could remedy such an evil.

None of the butter that passed under our inspection, either at the last annual meeting or since, was considered of that high order of excellence, which should entitle it to the first premium of \$20. So long as we aim at perfection, let us make no compromise by rewarding comparative merit.

The use of a thermometer is strongly recommended to those who attend to or direct the labor of a dairy.

Having carefully examined the subject, we, with great respect to public opinion, give the following outline, in our estimation as indispensable in making good butter, viz: Good cows, sweet feed, good water and air, and cleanliness in every depart-

ment. The temperature of the milk room, if possible, should never rise above 66° or sink below 50°. It is therefore necessary that the milk be kept in a cellar from ten to twelve feet deep. A room above ground is too warm in summer and too cold in autumn. Flat stones are better than clay, and clay better than brick for a cellar bottom. Brick absorbs impurities and cannot be easily cleansed. The cream should not be allowed to rise more than thirty-six hours; it should be sweet when taken off, and sweet when churned. (Butter will come quickly at all seasons of the year, if the cream be churned at a temperature between 60° and 66°.) Ice, or warm water put into it, will give the desired temperature. The milk cellar should be frequently whitewashed, and the air kept perfectly pure.

External causes often have a prejudicial effect on the flavor of butter; such as sink drains, hog pens, hen roosts, stables, barn yards, and the growth of cucumbers, tomatoes, and other plants which give out an odor in the immediate vicinity of the windows of the milk apartment. For this reason spring-houses, after the fashion of the farmers in the Middle States, are the most perfect repositories for milk. As it is well known that butter put into strong, tight kegs, will acquire an unpleasant taste from an impure atmosphere in which it may have been kept, how much more exposed is the extended surface of cream while rising; therefore nothing should be permitted to taint the air of the milk room. As the air smells, so will the butter taste; hence the taste of onions, turnips, cabbage, &c., and of cheese, when butter is made from cream raised on milk set in a cheese room.

*Salt.* The Liverpool bag or blown salt is frequently so impure as to render it unsuitable for the purposes of the dairy. Syracuse dairy salt will answer well when made very fine, but Rock salt or the lumps of Turks Island salt, washed, dried and thoroughly pulverized to a perfect powder, is best. Less than an ounce to a pound of butter is sufficient to make it keep, provided the buttermilk is perfectly worked out. Butter firkins should be made of white oak; it would be convenient to have them contain from 25 to 30 pounds only. Before they are used, let them be soaked a day or two in strong, pure brine; then emptied and wiped dry; this will keep them cool, tight and sweet, and prevent injustice in the tare. In putting down butter no salt should be put on the bottom, on the sides or between the layers. It is well, if it be expected that it will stand sometime before it is used, to cover the top with a cloth and this cloth with fine salt, to keep out the air more perfectly. The practice of washing butter, as it is termed, is disapproved of both in Europe and in this country, by the best judges. The Dutch wash in strong, lumped brine, only the butter that is designed for shipment to warm climates. It aids in getting out the buttermilk, but a portion of the fine flavor goes out with it. The brine should be cooled down to 50°. Fresh water is by far more injurious than brine. We are of opinion that all the buttermilk should be extracted without washing. The sweet flavor of new butter is often lost by permitting a piece of ice to melt upon it while on the table.

When all is right in butter it will yield to the pressure of a knife like wax without adhering to it.

There were a number of applicants for premiums, some of whom presented butter very well made in many respects, but all had some marked defect; such as being oversalted, or the grains of salt were perceptible, like grit between the teeth;

others appeared to have been made from cream that had been exposed to a bad atmosphere, or it was slightly rancid; and in one instance there was a distinct taste of cheese. Generally the butter-milk was well extracted, but it was nearly all deficient in fragrance and sweetness.

The butter presented by George Smith, of Smithfield, appeared in all respects well manufactured, but it was deficient in flavor. He keeps his milk in a cellar ten feet deep; used rock salt, at the rate of two thirds of an ounce to a pound of butter. To him we award a premium of four dollars.

The butter presented by John A. Mowry, of Smithfield, was salted with Syracuse dairy salt, at the rate of one ounce to the pound: it was deficient in flavor, and the particles of salt were perceptible; in other respects it was well made. He keeps his milk in a cellar eleven feet deep. He also presented an inclined table and butter-worker, by the aid of which, with less labor, the buttermilk is taken out, and the salt incorporated, without touching the butter with the hands. For this very useful invention (a model of which may be seen at Wm. Bradford's seed-store,) we recommend a premium of four dollars.

All of which is very respectfully submitted.

STEPHEN H. SMITH,  
MOSES B. IVES,  
WILBUR KELLY,  
GEO. W. COMSTOCK,  
Committee.

For the New England Farmer.

### DECOMPOSITION OF BONES.

MR PUTNAM—Sir—On reading in your Farmer of 17th February last a Mr Jones's very valuable experiments on bone manure, I was reminded of an idea I have often thought of, viz: If some easy plan of decomposing bones without grinding, could be adapted so that every farmer could have the advantage of using all the bones he may collect about his own house and neighborhood, a great many bones that are now useless might be collected and become a very valuable source for manure.

Now, Mr Editor, in hopes some of your intelligent correspondents will give what information they can on the subject, I will give you what I know accidentally. My wife puts all her refuse bones into her ashes, thinking they may be of some use to her soap: she makes her soap every spring, and sometimes let her leach stand six or eight months. On removing the ashes I have found nearly all the bones decomposed, or become, in appearance, like a white jelly.

In a report of the agriculture of the House of Industry at S. Boston, published in the Farmer of May 20th, 1840, it is stated, that mixing bone manure with earth as follows, one part bone and two parts earth, laid in a heap and moistened with cow-yard wash or water and turned over often, the bones will become completely decomposed in about two months.

A MECHANIC.

It is not the nursling of wealth or fortune, who has been dandled into manhood on the lap of prosperity, that carries away the world's honors or wins its mightiest influence; but it is rather the man whose earlier years were scarcely cheered by a single proffer of aid or smile of approbation, and who has drawn from adversity the elements of greatness.

For the N. E. Farmer.

### RULES FOR YOUNG MEN IN THE EMPLOY OF GENTLEMEN.

MR EDITOR—Sir—The author of the following rules has now labored for several years in the families of gentlemen, and has found by carefully adopting them, that they have been the means of procuring for him good places, constant employment, and of filling his pockets with money. For the benefit of those young men who are continually coming from the country to seek employment with the genteel in this vicinity, you may, if you please, insert them in your very valuable paper.

Yours, &c.

Medford, Mass.

1. Rise early and make good fires, with as little noise as possible.
2. Keep your barn neat and your horses and cows well fed and well cleaned. Have your horses ready to use at all times and see that your harness is clean, well oiled and in every respect perfect.
3. Always be good natured to the hired girls and your employers, doing whatsoever they ask you to do without murmuring, and that too as soon as it is possible after they call upon you.
4. Always move quickly, and as though it was not a hard task to obey orders.
5. Always finish the piece of work you begin as soon as practicable, and be sure not to have many unfinished jobs upon your hands at once.
6. Always be manly. Say no more than is necessary. Never act out the boy by telling comical stories, or by much and loud laughter.
7. Never drink ardent spirits. Never smoke about the premises. If you chew tobacco, (which no man ought to do,) do not spit about the house, carriages, or any other place where it will make dirt or be offensive.
8. When sent on an errand, never stop to tell long stories. Do not forget half, or do your errands imperfectly.
9. If you have an errand of your own to do, do not sneak away to do it unbeknown to your employer, but be open and honest with respect to the time which you take to yourself.
10. Always dress according to your work, that you may make no unnecessary labor for any one.
11. Always do all your work as well as you know how to do it, thoroughly and in its season.
12. Be perfectly honest in all things relating to your employer's work or property.
13. Keep your tools all in order. Have a place for every thing, and keep every thing in its place.
14. Be careful to put your employer to no unnecessary expense for any thing.
15. Keep your room and clothes neat at all times.
16. Never manifest too much affection for the hired girls where you live, or spend too much time with them or any others.
17. Ask not for your pay oftener than is necessary. Take good care of your money and spend but little for amusements.
18. If you have any leisure moments at any time, spend them in such a manner as will benefit you and also your employer.
19. Do not take your employer's time to read books or newspapers, unless by his own request.
20. Never use deception in any case, but always let the truth and the whole truth govern your actions and words.

21. Use not profane or vulgar language about the house or your work.

22. If any thing takes place contrary to your wishes, do not fly into a passion, but try to quell and bring your temper under due subjection.

23. Never undertake a job until you understand fully how your employer wishes to have it done.

24. Make it a rule to always attend religious worship somewhere all the sabbath.

25. Try to take as much care upon you as possible, and always see that all doors are locked and every place well secured, which it is your duty to see to.

26. Always try to be at home as much as possible evenings, and do not go out to stay late without your employer's knowledge.

27. Do not lounge about grog shops and taverns on any account whatever.

28. The best manner in which you can spend your evenings is at home, in reading, writing and study.

29. Always be careful with lights and fire, at all times.

30. Never have but few visitors, and especially go not out yourself among the "multitude who do evil."

These rules might be extended, but I forbear, hoping that these few may be regarded by all young men who wish to gain a good character, wealth and honor.

From the Farmer's Gazette.

### TOWN ROLLER.

I say a town roller, because there is but one in our town for all the farmers to use. And I might almost say a town horse-rake, were it not for the fact that the individual who owns it, has use for it in the haying season, and consequently cannot lend it to all his neighbors at once. However, within the last year, another horse-rake that had been for a long time thrown by in a dilapidated state, has again been put in operation, so that we have two in a population of about 1200. But the roller for aught I can see, must continue to roll its "solitary rounds."

As a farming implement, the roller should be deemed indispensably necessary. Next to the harrow, it is the best, and in fact the only effectual leveler of ploughed lands. There is scarcely a field sown with the small grains, that would not be benefited by rolling. It brings the earth into more immediate contact with the seed, causing it to vegetate much sooner, and with greater regularity; at the same time it does not have the effect to consolidate the earth to that depth which many have supposed. It is an implement hardly to be dispensed with in the laying down of lands to grass. However smooth the general surface may have been left by the harrow or the bush, (as many still prefer,) there are still tufts of grass or grass roots not entirely decomposed, the butts of corn stalks and the like that are left upon the surface, and which no harrow can cover, but which the roller will reduce to their proper level, with greater ease and with less expense than by any other method.

It has been found of great service in rolling wheat lands in the spring, where the plants have been partially thrown out by the action of frost. Newly seeded grass lands for the same reasons, are also much benefited by rolling, and particularly where the preceding crop of grain has left a rank stubble, or where the ground is more or less cov-

ered with loose, small stones, obstacles of no small moment to him that swings the scythe, or handles the revolving horse-rake. Where turf lands are ploughed plain for a corn crop, it is of incalculable benefit, and can hardly be dispensed with, by any one who values his reputation as a scientific cultivator of the soil. And any one who has wit or ingenuity enough to cut a saw log, can make a roller. Will those farmers who have always borrowed, make one, and if you find no use for it, your neighbors will, and that too in less than one month, so now is the time to make a roller.

LEXOS.

From the Farmer's Cabinet.

### SUBSOIL GARDENING.

The period has arrived when gardening must commence, and those whose garden plots are underlaid with a stiff, tenacious subsoil, would do well by considering whether some measures might not be taken with it that would render it more certainly productive. It has been demonstrated beyond cavil, that when a tenacious subsoil is dug and loosened up, without bringing it to the surface, or mixing it with the vegetable mould of the surface soil; if the season is very wet, the water descends into it readily, and the plants are protected from the injury of their food being too much diluted with water; and if a drought comes on, the roots penetrate deeper, and are benefited by the reservoir of moisture which lies below; and the capillary attraction in the earth brings the moisture upwards to the surface, and feeds and refreshes the vegetables. Any way you may fix it, it does much good, like all those good, honest old rules that work well either end foremost.

The way to work it is, to dig a little gutter a spit deep and the width of the spade, along the side of a bed, and throw the surface earth which comes out of it to the other end of the bed which is to be dug, where it will be required for the purpose of filling the trench which will be left at the conclusion of the work. Then begin at one end of this gutter and dig it up, and turn it over in the bottom, from end to end; when this is done, begin and dig in the usual way, turning down the surface soil on to the subsoil, which has just been dug; doing this from end to end properly, will leave another gutter, which dig and overturn as before; and so proceed till the bed is all dug two spits deep; the subsoil being turned topsyturvy, but none of it being brought up or mixed with the surface mould.

Now what is the objection to putting a garden through this salutary process? None at all, excepting that it will require twice the amount of labor; and this may appear to some a serious objection, but its adoption once in four or five years may be sufficient. The foregoing plan has no novelty in it, for it has been often done, with the greatest advantage resulting from it. Should it be too serious an undertaking to overturn a whole garden in this way in one season, try a single bed this spring, and become convinced of the importance of doing every thing you undertake in the best way you are capable of.

H.

It has been wisely ordered by a beneficent Providence, that the necessities of man properly administered, should become sources of physical and mental enjoyment.

## NEW ENGLAND FARMER,

AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, APRIL 7, 1841.

## MUCK—MUCK.

Almost every agricultural writer is inclined to ride some hobby. We find ourselves inclined to bridle and saddle "muck"—to buckle on spurs and drive ahead. The way before us is *miry*, and we may get bespattered; but a little mud has had no terrors for us in days of yore, and we have no fears that we shall prove a coward in leading as many farmers as will follow us, to an attack upon swamps and muck holes.

These bog meadows are among the best lands in the eastern part of Massachusetts, and they contain in abundance, materials by which we may, and by which we shall, in a few years greatly enrich our uplands. These bogs are the most valuable part of our farms. This assertion is made deliberately. We are aware of its extent and its import. We have made it seriously, and we predict that not many years will pass away before its truth will be generally admitted.

Leaving at present all consideration of their worth for cultivation, we wish to draw attention to them as sources from which manure can be obtained. Muck, properly prepared, and spread over our uplands, will greatly enhance their fertility. "Stop, young man"—methinks I hear the aged farmer saying—"Stop, young man. I have used this muck, and experience tells me that it is sour stuff, doing often more harm than good to the uplands. Such is the lesson which *experience has often taught*." We do not deny it—we do not doubt it; we know that it is true. Muck, as it comes from its bed, is often, is almost always, sour; it will impart of its sourness to the soil on which it is applied. This sourness is the natural product of the decomposition which the vegetable matters composing the muck have undergone. And until that sourness is removed, this meadow mud is not a manure; it does not furnish food for plants; but as soon as the sourness is removed—as soon as the acid is neutralized—this muck is nourishing to the crops that we cultivate.

How then can we remove the acid or counteract it? Exposure to the action of frosts and winds, rains and suns, will do much towards effecting the desired change. Farmers might do well to have three or four years' supply always on hand, and then not use that which has not had three or four years' exposure to the weather. But it is not necessary to wait thus long in all cases before we avail ourselves of the use of this article. We can, by the use of animal manure and lime, neutralize the acid of the muck in a few months or weeks, and thus more speedily enlarge our manure heaps.

The principles of making composts from muck, dung and lime or ashes, as recommended by Dr. C. T. Jackson, of this city, we gave in our report of his remarks at the State House; but deeming them most highly important, we make no apology for repeating them in our own words. Take one cord of dung and mix it thoroughly with two cords of muck, that has been for several months at least, exposed to the action of the atmosphere. Then apply one half of a cord of muck to the outside of the heap, as a coating; pat this coating hard and smooth as you can with the shovel. If the whole be covered with straw or hay, this will be an improvement. Let the mass lie in this state for several months; to mix in the autumn and suffer to remain until spring, is a good course. Then, about 10 or 15 days before the manure is to be applied to the land, take one bushel of unslaked lime to a cord of compost. Slake this lime,

but do it with so little water that it shall be a fine, dry powder. Now throw over the heap, mixing this lime well into the mass. Again coat the whole heap with another half cord of muck. The whole four cords in the course of two weeks will become good manure. The ammonia given out by the dung, will have neutralized the acid of the muck.

Heaps formed at this season may answer for use after the middle of May; though it would be better to allow a longer time. We make an earnest appeal to such farmers as have the materials in readiness to try this process and *adhere closely* to the rule. We wish to know distinctly whether science here is furnishing a valuable rule to guide us in our art.

Imagination carries us, reader, to your fireside, and hears you saying, "I'll try that, but I'll save some of the labor; I'll put my lime in when I first mix up the heap." It is our turn now to say "Stop, sir, stop."—We want before you go to work, to tell you that the great object is to neutralize (or counteract, or fix or destroy) *the acid in the muck*. The more ammonia you can extract or set free from the dung *at once*, the more effectually you will do your work. Now lime applied to dung *in its green state*, will not help to throw out ammonia half as fast as if the dung be *considerably decomposed* before the lime is used. If, then, you save the labor in the way proposed, you fail to get that large quantity of ammonia, at one time, which, if produced, would work like leaven through every lump and particle of muck in the heap and neutralize the acid.

"Well, then, Mr Editor," you say, "I'll save labor by letting the dung get *considerably decomposed* before I go to work upon it, and then will put in both muck and lime at once." Do so, sir, if you please; but if you do, the winds will have carried much of your ammonia to Maine or to Georgia, before you begin to use it; and therefore the quantity of muck which your dung will change into manure is very materially lessened.

Let the dung, while green, be mixed with muck, because the ammonia which passes off in its first stages of decomposition, will then be saved and used. But do not put your lime in for several weeks, because its action upon dung that has undergone considerable change, throws off ammonia much faster than from fresh dung. The faster the ammonia is generated or set free at any one time, the more thoroughly it will penetrate the muck.

The *principal* use of the lime in this process is, to generate ammonia rapidly from the dung. This ammonia is the strong smelling effluvia or gas, that goes off from the fermented dung heap. The same substance is sometimes called *hartshorn*, and is used in ladies' smelling bottles. The great object is to generate or liberate *this* under such circumstances that it shall pass into muck and counteract its acid.

But does not lime itself, when put into the muck heap without dung, neutralize the acid? It does, as far as it comes in contact with the muck. Why not then use muck and lime alone, or muck and ashes alone, without putting in dung? Because in such cases, the lime and ashes act but little on any other parts of the muck than those which *touch* the lime or ashes. There is no steam—no gas—to penetrate the lumps and do the work thoroughly. But put in the dung—raise the *steam*—and the steam, if properly confined by the outside coating of the heap, will penetrate every lump and particle, and make the whole good for nourishing plants.

Urine will answer the same purposes of dung in this process of neutralizing acid. Ashes will answer in the place of lime. Loam may be substituted for muck, but is far less valuable.

Again we urge it upon farmers to consider this sub-

ject well; for we are satisfied that *the best manner of preparing muck* for use on our lands, is one of the most important practical questions now agitated by our agriculturists.

We will dismount now; but it will not probably be long before we shall bestride our hobby again.

## SPRING WORK.

MR PUTNAM—I noticed an article in your paper of last week, under the head of "Spring Work." I wish to know how far you wish your remarks in regard to ploughing to extend. If green sward was last spring turned in, was planted and hoed, and is this season intended for grain, is it best to plough it, or use a cultivator or harrow without ploughing? If it is best to plough, how deep? Is it best to turn up the old sward or plough light and let the sward remain undisturbed. Also, whether land that is highly manured requires as much ploughing (as it remains lighter) as land that is not manured. A SUBSCRIBER.

Our opinion is against disturbing the sod. If the land was ploughed sufficiently deep last year to enable "A Subscriber" to plough without bringing up the sod, it may be well to plough. Though this is not essential if either the cultivator or the harrow is faithfully used. If the last year's ploughing of sward land was shallow, it will be better *not to plough*. Still the surface should be well pulverized and *remixed*. The land that was highly manured will doubtless produce a good crop without stirring it very thoroughly; but we believe that a faithful *remixing* of manure and soil—that the bringing of new particles in contact—would be of as much service—would be labor as profitably employed—as the labor bestowed upon ground not so well manured. The object would be, not so much to make the land light, as to *remix* the manure in the soil.

## ANALYSIS OF SOILS.

Our friend from Providence who says, "I should be glad to learn if there is any one in this vicinity who receives samples of soils for the purpose of analyzing them," is referred to the report of the Committee to whom was referred the communication of Dr. Nichols. That report was published in our paper of March 17th. Dr. C. T. Jackson, of this city, whose name is attached to the report, is the only individual with whom we are acquainted, who would be likely to undertake such labor. We have no knowledge of his disposition in relation to this matter; but we will hazard the conjecture that if specimens are sent him immediately, before the season invites him to the field, in the prosecution of his survey of New Hampshire, that he may be willing to analyze them. His terms, we presume, may be learned from that report.

That cut which, through some inadvertence, was placed at the head of the advertisement of "Willis' Latest Improved Seed Sower," in our last paper, was not exactly a correct likeness of the implement advertised, but a faithful representation of "Bachelder's Planting Machine"—an article of very dissimilar construction. Blunders will occur sometimes—even in printing offices!

## MASS. HORTICULTURAL SOCIETY.

The Committee on Fruits of the Mass. Horticultural Society, are requested to meet at their rooms on Saturday next at 10, A. M., on business of importance.

The members of the Society are informed that the seeds recently received from Paris, will be distributed on Saturday next, the 10th inst., at 11 o'clock.

Henry Colman, Esq., of this city, has accepted an invitation of the American Institute, New York, to deliver an address before its members and the public, or Wednesday next. Subject—"The Agriculture of the United States."

## THE PRESIDENT OF THE UNITED STATES

WILLIAM HENRY HARRISON, is no more! He died in Washington, the 4th of April, A. D. 1841, at thirty minutes before one o'clock in the morning. We may give further notice of the melancholy event in our next.

**THERMOMETRICAL.**

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass: in a shaded North-ealy exposure, week ending April 4.

	April, 1841.	7 A.M.	12, M.	5, P.M.	Wind.
Monday,	29	36	36	33	E.
Tuesday,	30	30	31	25	E.
Wednesday,	31	16	40	30	E.
Thursday,	1	33	44	45	S. W.
Friday,	2	33	62	54	S.
Saturday,	3	34	41	33	N. W.
Sunday,	4	33	50	45	S. W.

**BRIGHTON MARKET.—MONDAY, APRIL 5, 1841.**  
Reported for the New England Farmer.

At Market 300 Beef Cattle, 25 yoke of Working Oxen, 35 Cows and Calves, — Sheep, and 2000 swine.

PRICES.—Beef Cattle—Sales quick, and last weeks prices were fully sustained, viz. extra \$6 50 a 6 75. First quality, \$6 00 a 6 25 Second quality, \$5 50 a 5 75. Third quality, \$5 00 a 5 50.

Working Oxen—Sales \$62, \$70, \$80, \$85, \$100 and \$110.

Cows and Calves.—Sales \$20, \$25, \$28, \$30, and one at \$40.

Sheep.—None at Market.

Swine.—Lots to peddle were sold for 4 1-8 and 4 1-4 for sows, and 5 5-8 and 5 1-4 for barrows.

**WHOLESALE PRICES CURRENT.**

Corrected with great care, weekly

SEEDS. Herds Grass, very little in market. Red Top, new seed by the bag 60—old 55 c. Clover—Northern, very little in Market.—Southern, plenty, 9 to 10 c. Flax Seed, \$1.37 to 1 50 bu. Lucerne, 25 c. per lb.

FLOUR. Howard Street \$5 37—Genesee \$5 31—Ohio \$5 12.

GRAIN. Corn—Northern Yellow none—Round Yellow 54 to 56—Southern Flat Yellow 50—White 43.—Rye—Northern 60 to 65—Southern 50 to 55. Oats—Southern 30 to 31—Northern 35 to 40.

PROVISIONS. Beef—Mess \$10 50 to 11 00—Prime \$6 50—No. 1 \$9 00. Pork—Extra—15 00—Clear 14 50—Mess \$13 00. Hams—Northern 9 c. per lb.—Southern, none. Lard—Boston 9 c per lb.—Southern, 8 to 8 1-2. Butter—Lump 18 to 22—Firkia 12 to 18—Shipping 8 to 14. Whole Hogs 5 1-2 to 6 c.—Pigs 5 c.

HAY, per ton, \$17 to 17 50—Eastern Screwed \$13 to 14. CHEESE—Old 11 c.—New 8.

EGGS, 14 a 16.

WOOL.—The market for this article has not experienced any change of late. Pulled Wool is rather scarce, and there is but a limited supply of low Fleeces and of fine Fleeces the stock is also moderate. Prime or Saxony Fleeces, washed, lb. 50 to 55 c.—American full blood, washed, 47 to 50—Do 3 4 blood, washed, 44 to 46—Do. 1-2 blood, washed, 36 to 40—1-4 and common do, 35 to 37—Smyrna Sheep, washed, 20 to 23—Do. unwashed, 10 to 14—Bengasi Sheep, 8 to 10—Buenos Ayres unpicked, 7 to 10—Superfine Northern pulled lamb 43 to 46—No. 1 do. do. 37 to 42—No 2 do do 26 to 30—No 3 do do 18 to 20.

**PLUMS, PEARS, GOOSBERRIES, &c.**

Just received by JOSEPH BRECK & CO., from London, a fine assortment of Plum and Pear Trees, which are offered at reduced prices, including the following

**PEARS.**

Belle Lucrative,	Catillac,
Moufle Bouche,	Williams' Bon Chretien or
Josephine,	Bartlett,
Beurre Spence,	Jargouell d'Epague,
" Capiamoot,	Echasserie,
" Base,	Urbaniste,
" Diel,	Duchess d'Angouleme,
" d'Aremburgh,	St. Chislain,
Easter Beurre,	Madame d'Carne.

**PLUMS.**

Green Gage,	New Orleans,
Purple Gage,	Imperatrice,
Diamond,	Reine Claude,
Washington,	Royal d'Tours.
Golden drop,	

Gooseberries, White and Red Currants, Raspberries and every article in the Nursery line furnished at short notice. JOS. BRECK & CO., No. 52 North Market Boston. April 7, 1841.

**GOOD OPPORTUNITY FOR A FARMER.**

The owner of a farm in a healthy situation about two miles from the city of Washington, is desirous of obtaining a Superintendent of the farm. He wishes for a regularly bred farmer; and to such an one he would offer such favorable terms in money, house rent, fuel, provisions, &c., as to make it an inducement for a temperate and industrious man to enter into an agreement to take the management of the farm for a term of years.

For farther particulars, *personal* application may be made to JOSEPH WILLARD, No. 20 Court Street. Boston, April 7th. 3wis.

**BONE MANURE.**

The subscriber informs his friends and the public, that after ten years experience, he is fully convinced that ground bones form the most powerful stimulant that can be applied to the earth as a manure.

Price at the Mill 30 cents per bushel, put up in casks or hds. containing from 4 1-4 to 17 bushels each as the purchaser may desire or order, and delivered at any part of the city at 35 cents per bushel, and no charge for casks or carting.

Also, Oyster Shell Lime, price 8 cents per bushel at the kiln, put up in casks, 4 bushels each, at 50 cents per cask delivered at any part of the city.

Orders for Bone Manure or Oyster Shell Lime, left at the Bone Mill, near Tremont road, in Roxbury, at the New England Agricultural Warehouse and Seed Store, No 52 North Market Street, or through the Post Office will meet with prompt attention.

NAHUM WARD

**WILLIS'S LATEST IMPROVED SEED SOWER.**

Willis's latest Improved Seed Sower, invented the last season; one of the most perfect machines ever introduced for the purpose. In using this machine, the farmer may be certain that his seed is put into the ground, and at the same time in the best possible manner. There has been a great difficulty in machines for sowing garden seeds; they are very apt to clog up, and the farmer might go over an acre of land and not sow a single seed; but not so with this; it is so constructed that it cannot possibly clog. In using this sower, the farmer can save one half of his seed, and do the work at less than one quarter the expense of the common way of sowing seeds, and have it done in a much better manner; it opens the furrow, drops the seed, and covers it over and rolls them down. It will sow almost any kind of Garden Seeds; say Ruta Baga, Mangel Wurtzel, Turnips, Carrots, Beets, Parsnips, Onions. It is highly recommended by a great number of persons who used it the past season. For sale at the N. E. Agricultural Warehouse and Seed Store by JOSEPH BRECK & CO. March 31.

**WINSHIP'S NURSERY,**

BRIGHTON, NEAR BOSTON,

Situated on the line of the Boston and Worcester Rail Road, — 5 miles from the city.

The Proprietors of this extensive nursery beg leave to inform their friends and the public, that they are ready to furnish orders to any amount, for Forest Trees, indigenous and exotic

Fruit Trees, including all the varieties of Pears, Peaches, Plums, Nectarines, Cherries, &c. &c. Vines—Strubs, Green House Plants, &c. Catalogues may be obtained by applying at the Nursery. Trees carefully packed, to ensure safety in long voyages. Orders left at the New England Seed Store of J. Breck & Co. Nos. 51 and 52, North Market street, will be delivered the day following, and left at any part of the city, free of expense.

Letters containing orders, addressed to the subscribers, J. & F. WINSHIP. Brighton Nurseries, March 24, 1841.

**CLOVER & RED TOP.**

50 tierces and 100 bbls. Prime Clover. 200 Bags Redtop, new seed. 50 hbls. Herds Grass prime quality, for sale by J. BRECK & CO. March 24.

**AGRICULTURAL IMPLEMENTS, &c**

The Proprietors of the New England Agricultural Warehouse and Seed Store No. 51 and 52 North Market street, would inform their customers and the public generally that they have on hand the most extensive assortment of Agricultural and Horticultural Tools to be found in the United States. Part of which are the following:

1000 Howard's Patent Cast Iron Ploughs	100 doz. Cast Steel Shovels.
300 Common do. do.	150 " Common do.
200 Cultivators.	100 " Spades.
160 Greene's Straw Cutters.	500 " Grass Scythes.
50 Willis' do. do	300 " Patent Snaths.
100 Common do. do.	200 " Common do.
100 Willis' Patent Corn Shellers.	500 " Hay Rakes.
50 Common do do.	200 " Garden do.
200 Willis' Seed Sowers.	200 " Manure Forks.
50 " Vegetable Cutters.	300 " Hay do.
50 Common do. do.	500 Pair Trace Chains.
200 Hand Corn Mills.	100 " Truck do.
200 Grain Cradles.	100 " Draft do.
100 Ox Yokes.	500 " Tie up do.
1500 Doz. Seythe Stones.	50 doz. Halter do.
3000 " Austin's Rifles.	1000 yards Fence do.
	25 Grind Stones on rollers.

March 17.

**SITUATION WANTED.**

A practical Gardener, of whom good references can be given, with a wife and one child, wishes a situation. March 31. 2wis

**BEDFORD OATS.**

Just received 50 bushels of superior Bedford Oats. This variety is highly recommended, it not being liable to blast, and very productive. For sale by JOSEPH BRECK & CO. March 31.

**SUPERIOR SEED BARLEY.**

100 bushels of extra heavy and clean Seed Barley. Also 30 bushels CHEVALIER BARLEY, a new and superior variety, for sale by JOSEPH BRECK & CO. March 31.

**BLACK SEA WHEAT.**

Received from Vermont, 30 bushels Black Sea Wheat. Also, 20 bushels Italian Spring Wheat, raised in Warren, N. H. For sale by JOSEPH BRECK & CO. March 31.

**FARM WANTED.**

Wanted to purchase on credit or hire on a lease of five or ten years, a small but good farm in the vicinity of Boston.—The advertiser is engaged in rearing swine and makes large quantities of manure and has it in his power to keep a farm in a high state of cultivation. Any person having a place to dispose of or rent at a reasonable price may hear of a tenant by addressing JOHN GREY, Neponset Village, Dorchester. March 10.

**FRUIT AND ORNAMENTAL TREES, &c.**

NURSERY OF WILLIAM KENRICK.

12 000 Pear and Plum Trees.—Large and new additions of Pear and Plum Trees have lately been received, many kinds of which are alike new to our country, and very extraordinary. Such have been the selections which have been made by the subscriber in Europe, and in person, during the last Autumn, where all have been proved; those kinds already well known amongst us being identified by him by the wood and the leaf.

All orders addressed to the subscriber, or left with Joseph Breck & Co., New England Farmer Office, will be promptly attended to, and Trees, when so ordered, will be securely packed for safe transportation to distant places.

WILLIAM KENRICK.

Nonantum Hill, Newton, near Boston, March 2.

**PEAR, PLUM, GRAPE VINES, &c.**

3000 Pear Trees, of the most approved kinds. 2000 Plum Trees, of the most approved kinds and extra size—many of them have borne this season. Apple, Cherry and Peach Trees, of different kinds.

500 Quince Trees. 4000 Isabella and Catawba Grape Vines, from 6 to 15 feet high; most of them have borne fruit. Black Hamburg, Sweetwater, Pond's.

30,000 Grant Asparagus Roots. Gooseberry, Currants, Raspberries, of good kinds. 5000 Wilmot's Early Rhubarb or Pie Plants, lately introduced.

2000 Cherry and Pear Stocks; 1000 Plums; Roses, &c. of all kinds. All orders sent to the subscriber at Cambridgeport with JOSEPH BRECK & CO., will meet with immediate attention.

SAMUEL POND.

Cambridgeport, Mass., Feb. 24.

## MISCELLANEOUS.

**A HAPPY BLUNDER.**—The following humorous story, in which Mr Bulkey, the first minister of the town of Colchester, (Conn.) was concerned, is from an old publication:

"The Rev. Mr Bulkey, of Colchester, Conn., was famous in his day as a casuist and sage counsellor. A church in his neighborhood had fallen into unhappy divisions and contentions, which they were unable to adjust among themselves. They deputed one of their number to the venerable Bulkey for his advice, with a request that he would send it to them in writing. The matters were taken into serious consideration, and the advice with much deliberation committed to writing. It so happened, that Mr Bulkey had a farm in an extreme part of the town, upon which he entrusted a tenant; and to whom he must have been about transmitting a letter at the same time: in superscribing the two letters, the one for the church was directed to the tenant, and the one for the tenant to the church.

The church was convened to hear the advice which was to settle all their disputes. The moderator read as follows: "You will see to the repair of the fences, that they be built high and strong, and you will take special care of the old black bull."—This mystical advice puzzled the church at first, but an interpreter among the more discerning ones was found, who said—Brethren, this is the very advice we most need: the direction to repair the fences, is to admonish us to take good heed in the admission and government of our members;—we must guard the church by our Master's laws, and keep out strange cattle from the fold. And we must, in a particular manner, set a watchful guard over the Devil, "the old black bull," who has done so much hurt of late.

All perceived the wisdom and fitness of Mr Bulkey's advice, and resolved to be governed by it. The consequence was, all the animosities subsided, and harmony was restored to the long afflicted church. What the subject of the letter sent to the tenant was, and what good effect it had on him, the story does not tell."

It has been observed that horses have much taste for music. Among the sounds of all instruments, the sweet melody of the flute is to them the most pleasing. The following fact is from Arioste.—The Sybarytes, a luxurious and effeminate people, used to train their horses to dance to the sound and cadence of the flute, instead of breaking them to military evolutions. The Chrotoniates, their enemies, being aware of this circumstance, used the following stratagem at the moment of entering into battle. Instead of giving the usual signal for a charge of cavalry by sounding the trumpet, they began suddenly to play the flute. The horses of the Sybarytes immediately began to dance and jump, and in the height of their joy crossed over to the side of the Chrotoniates, carrying their astonished riders with them. The Sybarytes by this trick fell into the power of their enemies, and were completely defeated.—*Musical Reporter.*

It is a splendid remark of Bacon, that "envy, like the sun, always beats hottest on the highest ground."

Duty has pleasure which knows no satiety.

## GARDEN SEEDS,

For sale by JOSEPH BRECK & Co. at the NEW ENGLAND FARMER OFFICE, No. 51 and 52 North Market St. Boston. The subscribers would inform the public that they have now on hand the largest collection of seeds ever before offered by sale in this city, embracing every variety of *Field, Kitchen, Garden, and Ornamental Flower Seeds* desirable for this or any other Climate.

Our seeds are either raised under our own inspection or imported from responsible houses in Europe, and having taken extraordinary pains to obtain such as are pure and genuine, we can confidently recommend them to our customers and friends, and feel assured they will prove satisfactory to all who try them.

Dealers in seeds are requested to forward their orders in season. Boxes for retailing from 8 dolls. and upwards will be sent out on commission allowing a liberal discount and take back what remain unsold.

Letters and orders with good reference will meet with prompt attention.

## FIELD SEEDS

Sugar Beet.	Ruta Baga.
Mangel Wurtzel.	Ballantine's New Royal do.
New Red Globe do. } superior	White Tunkard Turrip.
Yellow do. } varieties.	Red do.
Carrot Long Orange.	Red Round do.
" Altringham.	White do.
" New White, extra fine.	White Globe do.
Pumpkin, sorts.	Green Round do.
Wheat—various sorts.	Purple Top Hybrid do.
Barley, do.	Buckwheat.
Rye, do.	Broom Corn.
Potatoes, do.	Millet.
Indian Corn, do.	Buckthorn. } for Hedges.
Oats, do.	Locust. }

## GARDEN SEEDS.

Artichoke, Asparagus, Beans of every description, Beets of sorts, Borecole, Broccoli, Brussels Sprouts, Culliflower, Caraway, Celery, of the most improved sorts, Cabbage 20 sorts, Carrot, all the varieties, Cucumber do, Cress, Egg Plant, Endive, Indian Corn, Kale, Leek, Lettuce in great variety, Melons, do. Martynia, Mustard, Nasturtium, Okra, Onion of sorts, Pepper do. Pumpkin do. Parsnip, Parsley, Peas, a very great variety, Rhubarb for tarts, Radish of sorts, Salsify, Squash of sorts, Tomato, Turrip 20 varieties.

## SWEET AND POT HERBS.

Thyme	Sweet Basil.
Sweet Marjoram.	Lavender.
Sage.	Lemon Balm.
Summersavory.	Anise.
Medicinal Herbs, &c.	

## ORNAMENTAL FLOWER SEEDS.

Three hundred varieties, embracing all the finest sorts. Packages of 20 fine sorts for one dollar.

Those who prefer to have their Seeds put up in papers ready for retail, can be accommodated—each packet neatly closed and labelled with printed directions. Price 40 cents, per dozen papers, which are retailed here at 6 1-4 cents each.

Fruit and ornamental trees, of the greatest variety, supplied at nurseryman's prices, and orders solicited. These will be packed, when required, to go to any part of the U. States. JOSEPH BRECK & CO

## STRAWBERRIES! STRAWBERRIES!

The subscriber would offer to the public, the present season, his *Selected Collection*, consisting of seven varieties; they are such as have stood the test of a fair trial for seven years, and all grown by the subscriber.

*Warren's Seeding Methven*, a new and valuable kind, a free bearer, fruit very large and juicy; fruit measuring 5 1-2 inches have been exhibited the present season. This variety can be warranted to be one of the finest varieties grown, and will produce as fine fruit and as large quantity, with the same cultivation, as any other ever offered. The price of this Seedling is \$5 00 per hundred plants.

*Methven Castle*.—Fruit extremely large, high flavored and showy; specimens of this fruit have been shown this season six inches in circumference. Price three dollars per hundred plants.

*Keen's Seedling*.—A very superior variety, fruit very large, rich dark color, and uncommonly high flavored. Price three dollars per hundred.

*Royal Scarlet*.—Fruit long oval shaped and juicy, very free bearer, and very hardy. Price two dollars.

*Hautbois*.—Fruit larger than English Wood, exceedingly numerous, sometimes yielding 100 berries to the plant.—Price two dollars.

*Early Virginia*.—This is known to be the earliest and best fruit for market, a free bearer and very hardy. Price two dollars.

*English Wood*.—Fruit well known for years. Price one dollar.

Every plant sent from this garden will be warranted to be free from mixtures, and shall also be young and healthy, worth the price paid for them.

All orders directed to the subscriber, inclosing the amount for the order, or with a good reference, shall be promptly attended to, and the plants carefully forwarded agreeably to directions.

JAMES L. L. WARREN.  
Nonantum Vale, Brighton.  
March, 24.

## HOWARD'S IMPROVED EASY DRAUGHT PLOUGH.

Great improvements have been made the past year in the form and workmanship of these Ploughs; the mould board has been so formed as to lay the furrow completely over turning in every particle of grass or stubble, and tearing the ground in the best possible manner. The length of the mould board has been very much increased, so that the Plough works with the greatest ease, both with respect to the holding and the team. The Committee at the late trial of Ploughs at Worcester, say,

"Should our opinion be asked as to which of the Ploughs we should prefer for use on a farm, we might perhaps say to the inquirer, if your land is mostly light and easy to work, try Prouty & Mears, but if your land is heavy, hard or rocky, BEGIN WITH MR. HOWARD'S."

At the above mentioned trial the Howard Plough did more work, with the same power of team, than any other plough exhibited. No other turned more than twentyseven and one half inches, to the 112 lbs. draught, while the Howard Plough turned twenty-nine and one half inches, to the same power of team! All acknowledge that Howard's Ploughs are much the strongest and most substantially made.

There has been quite an improvement made on the shoe, or land side of this Plough, which can be renewed without having to furnish a new landside: this shoe likewise secures the mould board and landside together, and strengthens the Plough very much.

The price of the Ploughs is from \$6 to \$15. A Plough, sufficient for breaking up with four cattle, will cost about \$10 50, and with cutter \$11, with wheel and cutter, \$2 50 extra.

The above Ploughs are for sale, wholesale and retail, at the New England Agricultural Warehouse and Seed Store, Nos. 51 & 62 North Market Street, by

JOSEPH BRECK & CO.

Feb. 24.

## FRUIT TREES AND SCIONS FOR SALE.

The subscriber, at the Pomological Garden, Salem, offers for sale a very choice and extensive variety of Apple, Pear, Plum, Cherry, Peach and Apricot Trees, Grape Vines, Gooseberries, Red and White Dutch Currants, and Red and White Autumn Raspberries.

Also, Scions of all the European and American Fruits which have been proved; all from fruit bearing Trees, packed in boxes with moss, and can be transported with safety to any part of this country or Europe.

ROBERT MANNING.

Salem, March 2, 1841.

(May)

## PURE SPERM OIL.

EDMUND T. HASTINGS & CO., No. 101 State St. keep constantly for sale, Winter, Spring and Fall Sperm Oil, bleached and unbleached; which they warrant to be of the best quality and to burn without crosting.

Oil Canisters of various sizes.

Boston, Jan. 1, 1841.

1841

## GRINDSTONES.

An extensive assortment of Water and Hand Grindstones constantly on hand and for sale by AMM C. LOMBARDO & CO. 13 Lewis's Wharf.

1841.

## TRACE CHAINS.

Just received, direct from the English manufacturer 8 casts of Trace Chains, from 6 to 11 feet long, suitable for ploughing or draft chains. JOSEPH BRECK & CO.

## NEW ENGLAND FARMER.

## A WEEKLY PAPER.

The Editorial department of this paper having come into the hands of the subscriber, he is now authorized by the publishers to inform the public that the price of the paper is reduced. In future the terms will be \$2 per year in advance, or \$2 50 if not paid within thirty days.

ALLEN PUTNAM.

N. B.—Postmasters are required by law to frank all subscriptions and remittances for newspapers, without expense to subscribers.

## NITRATE OF SODA AS A MANURE.

This article has recently been applied to the soil in England. In some instances its effects upon vegetation have been highly favorable. In other cases it has failed. The last No. of the Journal of the Royal Agricultural Society of England, contains the statements of sixteen different individuals in relation to the use and effects of this article. Several farmers in this vicinity have been recently obtaining it, and its effects in this State will be ascertained in part the coming season. We have obtained a small quantity for our own use, and intend to watch its operations upon different soils and different crops. Its cost is about \$4 per cwt. We give below extracts from the English journal.

Mr Pusey, President of the Society, says :

"With all proper abatements, the nitrate appears to be a very promising manure; and fortunately we need not apprehend that, as with bones and with some other artificial manures, the increase of its use should so raise its price as almost to absorb the profit of its employment; for the supply of it from the extensive beds which lie near the surface in Peru must be as inexhaustible, for centuries at least, as that of coals. This ample supply, as well as its easy carriage, increase its importance, and render it the more desirable that we should ascertain the causes of its success and its failure. At present the nitrate appears most capricious in its operation; but it is not, of course, Nature who is variable, but we who are ignorant."

"An objection has been made to the use of the nitrate, that its effect lasts for one year only. If it brings back its own cost, however, in the year, the objection is not just, at least when it is applied to grass; for we must not forget that an increase of food for stock once raised on grass land by any fresh means, is a new capital created, which circulates between the stock and the land, giving more dung to the soil, and, again, more food to the additional animals which are maintained on that soil, for as many years as the farm continues to be well managed. Whether it exhaust a soil by increasing the crop of grain, is a more difficult question, which cannot be answered without further observation. But the investigation of its effects is, I think, as likely to advance scientific as practical farming. Hitherto manures have been classed rather loosely as real or nutritious manures, such as dung, and stimulating manures, such as lime and other minerals; which last are supposed not to support the plant directly by affording it food, but indirectly, by exciting other substances, that are thus rendered capable of giving nourishment to it.—German writers, however, now maintain that dung itself acts not by any power which it possesses as having formerly been a part of living bodies, animal or vegetable, but as uniting those chemical elements, some of them mineral, which constitute the food of plants; and that a compound of these elements, artificially brought together, would act precisely in the same manner as dung. Dr. Liebig,

who is regarded as the first living authority on organic chemistry, maintains this view in the important work he has just published on "Chemistry in its application to Agriculture," and goes far to prove it. This is, in fact, the great question, if it still be a question, in agricultural chemistry. But the substance we are considering throws, I think, some light on this point and on the operation of other manures. It is now admitted that the most active principle of farm-yard dung, is the urine that is mixed in it. When this urine, which is the liquid manure of the Flemings, is applied to growing crops as a top-dressing, it gives a dark color to the grasses (including those grasses which bear grain, that is, common corn;) it has a tendency to lengthen, but weaken the straw—to increase the bulk, but diminish the weight, of the grain. I need not remind you that this liquid, when putrified, contains much ammonia: soot, I believe, acts in the same manner, and also contains much ammonia. The refuse liquor of gas works was mentioned in the first No. of our Journal as producing the same dark color and active growth in barley. I have tried it this year in consequence, and found it to act in the same manner on carrots. The chief ingredient of this liquor is also ammonia, as may be perceived by its pungent smell. It appears clear, therefore, that one active principle of those three very different manures is that substance in which they agree, namely, ammonia. But the nitrate of soda enables us, I think, to go a step further. Ammonia is a combination of nitrogen with hydrogen: either of these might be the source of its power over vegetation; but we have seen that saltpetre, or nitrate of potash, and cubic saltpetre, or nitrate of soda, act upon crops in the same peculiar manner with fermented urine, with soot, and with gas liquor. These last, however, do not contain hydrogen, and so differ from the other three, but they agree with them in containing nitrogen in the form of nitric acid. Nitrogen appears, then, to be the active principle of the five substances.—Dr. Liebig, in proving the efficacy of ammonia as a manure, has shown the necessity of nitrogen for forming the most nutritious part of our vegetable food, such as gluten, which nitrogen again appears as a most essential element of all animal frames. It is possible, however, that where a large portion of nitrogen is applied to wheat crops as manure, gluten may be produced in excess; and that the wheat may be deficient on the other hand, in some essential element, such as lime. According to Dr. Liebig's principles, we should be able to remedy this defect by applying lime at the same time in such a state as would be readily absorbed by the plant. I mention this, however, rather as an exemplification of those principles than as a practical suggestion. But having been led almost too far into this subject, I will only express the hope, that men of science who are competent to do it justice, may be disposed to assist us by investigating the operation of manures and the food of plants. I cannot but think that we are on the eve of important discoveries in this department of theoretical agriculture. With regard to the practical use of

the manure to which you have called our attention, its effects in this neighborhood have certainly borne out the doubts which you expressed. It seems to me that we should all try it, since it is of undoubted efficacy in many cases, but not on a large scale at first, unless we know that it has acted well on the particular soil and crop we wish to benefit, because its cost is considerable, and it sometimes fails altogether."

Mr John Alderson, Bailiff of the Earl of Zetland, says:

"Nine ridges in a meadow belonging to the Earl of Zetland, were sown with nitrate on or about the 1st of August, 1839. Two of the same ridges, with the remaining part of the meadow, were sown with nitrate of soda on the 13th of May, 1840. The best grass this year was on the two ridges sown with nitrate of soda twice, that is in August and again in May, the second-best that part which was sown in May, and the worst was that part which was sown in August, 1839. This shows that nitrate of soda has a little effect the second year, but not much.

"The Earl of Zetland's farming-man at Marske Farm, in returning home from sowing nitrate of soda on wheat, grass, &c., found in one of the sacks a small quantity left, and, being desirous not to waste it, took the trouble of going into a poor man's cottage-ground, where was growing a small ridge of wheat. This small quantity of nitrate of soda was sown on one end of the ridge. In a few days, to the great astonishment of the poor man, he saw so great a change, both in color and size, that he called together his neighbors to see if they could find out the cause; but as neither he nor his neighbors could make it out, they returned home satisfied to wait till the secret was revealed.

"A respectable farmer in the neighborhood of Marske, who had used a little nitrate of soda last summer, gives his opinion that he had not reaped or seen the benefit reported. On making inquiry it appeared that only 1 cwt. per acre had been applied: this agrees with my opinion, that not less than 1 1/2 cwt. should be sown, and I am rather inclined to say more.

"Nitrate of soda may be sown on pasture to a good effect, particularly on pasture that does not eat off regularly; but the farmer will not see the good effect without minute observation, as the cattle eat the grass as it grows.

"Two fields belonging to the Earl of Zetland, at Upleatham, were sown with clover in 1839; in 1840, one of the said fields was sown with nitrate of soda, and had a good effect. After the clover was cut, in the course of the week, the nitrate evidently showed itself in the fog or after-grass.—During the months of August and September, the two fields of clover-fog were depastured with cattle and sheep. The field sown with nitrate of soda was eaten by the cattle and sheep regularly away. The field not sown with nitrate of soda was left by the cattle in tufts or hots, not eaten regularly off. This evidently shows that nitrate of soda has the effect of sweetening the grass."

Messrs Drewitt & Son say :

"We are in doubt whether you did not misunderstand what we said as to its effect, or rather its non-effect, on our chalk soils for the turnip crop. The chalk we cultivate is a very dry rubbly chalk, without any admixture of loam, and but little other mould; and on this soil it had no effect on *turnips*, though for every other crop it was admirable. And what is a curious circumstance, and rather gratifying, where it had no effect on the turnips last season, and where of course they were inferior, its effect on the succeeding crop of barley was very great: it was superior to any other part of the field.

Its effect on the growth of corn, on land of every description we cultivate, chalk as well as other soils, is quite sufficient to induce us to continue the use of it. When we sowed it over our crops last spring, the land and the weather were very dry, and until rain fell, it had no effect; but afterwards it showed as usual, and produced an increase in the wheat crop of nearly one third."

Mr George Dewdney says :

"Nitrate of soda has been used with various success; in most instances amply repaying the farmer, by yielding a much larger proportion of grain and straw; in others, barely paying the cost and expenses attending the use; and in some a complete failure, I may say positive loss, though I am glad to add the latter instances are rare.

"The benefit of nitrate on green crops I still find to be great; for where sown this last spring on clover, pasture, and meadow ground, the crop has been very superior, far surpassing the adjacent lands. I have also a very high opinion of this kind of manure, as a top-dressing on the Swede and turnip crop, particularly on light land; but recommend it to be sown broadcast, at the usual rate of 1 1-4 cwt. per acre, a few days after the seed is deposited. Where it has been drilled with the seed mixed with ashes, I find the crop not so good as where sown by hand. In two instances which have come immediately under my notice, where a strip of ground had been dressed with nitrate only, I observed the plants throughout to be free from mildew, whilst the adjoining pieces suffered much, during the late dry weather. I am not at present prepared to give an opinion as to its after effects, except on grass; that there is a better after-math where nitrate has been used, is beyond doubt."

David Barclay, Esq. says :

"The experiments with nitrate of soda on my own farm, during the present year, were made with varying results, upon clover seeds, tares, sainfoin, peas, beans, grass, Swedes, turnips, oats, barley, and wheat.

"On the clover the effect was equal to the rest of the field dressed with farm-yard dung, at the rate of 9 cartloads to the acre.

"On the tares the effect was visible, but not sufficient to pay for the cost of the nitrate.

"On the sainfoin, the effect was perceptible, but the improvement would not more than repay half the cost of the nitrate. The same may be said of the results of the experiments as applied to beans and peas.

"My farm is situated on the confines of the clay and chalk formations; the soil of the western part is mostly of a heavy description, with a subsoil of stiff clay; the experiments made on this portion, whether upon corn or grasses, have been unsuccessful, while those which have been made on the

light land with the chalk subsoil have, with few exceptions, been attended with beneficial results—thus tending to confirm the opinion of the Harleston Club: but, on the other hand, Mr Pusey's experiments in Berkshire, and Mr Calvert's on the stiff clay of the Weald of Surrey, furnish evidence of a directly contrary tendency. Similar contradictions are worthy of remark in the letters and experiments which I have transcribed. Lord Zetland, in Yorkshire, and Mr Dewdney, in Surrey, have experienced great benefit from the application of nitrate of soda to meadow and pasture land; whereas on my grass land it has been almost a failure; and Messrs Drewitt, it will be observed, doubt if either upland or meadow grass will repay the cost of this dressing. My experiments on Swedes in 1839, and this year on turnips, have been strikingly successful; while those made in Yorkshire by Lord Zetland and Mr Vansittart, have altogether failed: how are we to account for such remarkable discrepancies?—are they to be attributed to some peculiar properties in the different soils?—has climate any influence in these cases? or are these discrepancies to be attributed to variations in the mode of applying this manure, or to accidental circumstances, such as the state of the weather at the time of its application? Science may throw much light on this inquiry; and all must unite in the hope expressed by our President, "that men of science who are competent to do it justice, may be disposed to assist us by investigating the operation of manures and the food of plants."

"The singular variations in the results of many actual experiments with nitrate of soda, by parties seeking to advance the cause of agricultural improvement, are calculated to discourage the use of it as a manure. It cannot, however, be doubted that it has a very powerful action on vegetable life; and by persevering in our experiments we may hope, with the aid of science, to understand the laws which govern it, and eventually arrive at practical conclusions of great national importance."

John Burgess, Esq. says :

"I beg to communicate to you a few experiments I have made upon my farm, which is stony thin land with a substratum of chalk. I found the saltpetre, which I only used on my wheat, gave an increase of about five bushels to the acre, with a considerable increase of straw. But I gave up the saltpetre for the nitrate of soda; and I believe I am the first individual who has tried it as a manure, and have found it answer beyond my most sanguine expectations. The quantity I have used has been an hundred weight to the acre, both of the saltpetre and the nitrate, as a top-dressing. The first trial was in a field of eight acres of oats, using the nitrate upon alternate lands, and where the corn was thinnest, the increase was rather more than two quarters to the acre, with abundance of straw, and the sample the best, according to the opinion of several farmers who came to see the field. I tried it upon my barleys, and I think I had better success with them than with the oats, and also upon a meadow. The mowers, with others who came to see the effect of the application, gave it as their opinion, that the increase was about three quarters of a load to the acre. I used it last year upon a field of six acres, four acres of which had been dunged with the yard dung, (about eight or ten loads to the acre, worth five shillings a load,) for turnips, but to the other two acres I applied the nitrate without any dung. To my great satisfac-

tion I found that the turnips grew so fast that they soon got out of the way of the fly, which had been very destructive to the other parts of the field, and indeed this was the only good piece in the field: in this case the nitre was used soon after the turnips were up.

This year I applied the nitre to my wheat, when from the wet season and the wire-worm, the plant was nearly destroyed, and I found it particularly beneficial, the wire-worm either being killed by the application or forsaking the roots; and, consequently, I think I have above an average crop of wheat. I have now growing a field of six acres of turnips, remarkably fine, and without any other manure than that of the nitre, and very superior to my other turnips where I have used the yard-dung in the quantity before stated; in this case the nitre was sowed a few days after the turnips, and before they were up.

"I think from the numerous correspondents I have had, in consequence of my recommendation, that the application of the nitre as a manure is giving general satisfaction, and coming very much into use. The best season for the application is as soon as vegetation begins to feel the influence of the spring, taking care to avoid frosty nights as much as possible. Several farmers have informed me they have found it better to apply the quantity at two different times, one half when the corn first begins to feel the influence of the spring, and the other half about six weeks afterwards. I shall offer no apology for my long detail, knowing your object and that of your council is to obtain information."

John Grey, Esq. says :

"I applied nitrate of soda to a row of potatoes, at an early period of their growth. The tops soon showed the effect, and far outstripped the adjoining rows in growth; but when the potatoes were taken up, the produce of that row was found to be less than that of the others, both in weight and measure.

"The first action of the potato plant is to throw out its top. The roots make their growth at a later period. It seems, in this instance, that the stimulus of the nitrate had expended itself in the earlier process; and that, instead of being benefited, the roots had suffered by the application—probably from the greater shades and weight of top."

*Introduction of Gardening.*—A knowledge of gardening was first introduced into England from the Netherlands, and, until 1509, our vegetables were imported from thence. Currants (or Corinthian grapes) were brought from the Isle of Zante, then belonging to Venice, and planted in England in 1535; about thirty years afterwards the Flemings planted a number of flowers, unknown in England, at Norwich and its vicinity, including gilly-flowers, carnations, the Provenco rose, &c. In 1552, grapes were brought into England, and planted in Bloxhall, in Suffolk; and in 1587, tulip roots were brought from Vienna. Hops were sent over from Artois in 1720, but five years elapsed before they were in general use for malt liquors.—*English paper.*

Hurry and Cunning are the two apprentices of Despatch and Skill; but neither of them ever learn their master's trade.—*Lacon.*

Men will wrangle for religion, write for it, fight for it, die for it, any thing but—*live for it.*—*lb.*

For the N. E. Farmer.

### LABOR-SAVING IMPLEMENTS, &c.

All innovation is not improvement. "Striving to better, oft we mar what's well."—These are axioms than which few are better attested by men's experience. But from the deep-rooted prejudice which some persons evince for whatever is ancient, it would seem to be *their* opinion that *no* innovation can be an improvement. This remark is in a peculiar degree applicable to a certain class of farmers. It is certainly a commendable practice (and in none more so than in the common farmer,) to distrust whatever is new, until its claims to utility are rendered indisputable by the unerring test of experience. Such prudence is no less a dictate of common sagacity than of true wisdom. But when the utility and value of a new invention intended to supersede an old one, have been tried in the crucible of experience and established beyond cavil, then to reject or scorn its aid, is to exhibit either a silly prejudice in favor of what is old, merely because it is old, or a parsimony unwarranted alike by true economy and self-interest.

In no particular in rural economy, with us, is it more desirable to *save*, than in the article of *labor*. This, generally, constitutes the heaviest item in the farmer's outsets. It is, therefore, plainly apparent, that if by any new process the amount of this can be abridged one third or one half, such diminution will, in a corresponding ratio, augment the farmer's profits. These are self-evident conclusions, from which I conceive none will dissent. The soundness of these positions being conceded, let us consider for a moment the common plea urged by farmers (and those in easy circumstances too,) when asked why they do not furnish themselves with an approved labor-saving implement, that they *can't afford it*. Now in respect to many labor-saving machines, such, for instance, as the horse-rake, thrashing machine, seed sower, &c., this objection appears to me to be dictated by a sort of penny-wise pound-foolish economy—or it springs from an obstinate blindness, self-imposed, which will not let the farmer realize the fact, though it be sustained by "proof as strong as holy writ," that the *cost* of the article is nothing compared with its value, and will be early returned (perhaps in one season,) by the saving of labor effected by its use. Take, for example, (as of new labor-saving inventions it comes first in use on the farm,) that valuable implement, "Willis's Improved Seed Sower." The character of this machine is fully established. Many practical farmers of high standing in community, (among whom I recollect particularly Judge Hayes, of Maine,) who would not, and could have no motive, in deceiving their brother farmers, have attested the worth of this seed sower as an aid in the economy of the farm. Now, if by the use of this single article, as the inventor asserts, a saving of *one half* the seed and *three quarters* of the expense of the common method of sowing can be effected, and the seeds—ruta бага, mangel wurtzel, turnips, carrots, or whatever it may be—put into the ground as faithfully, even better, than by the common mode, would it not appear to be the part of true wisdom and sound economy in the farmer to secure its aid, and not to urge the poor, unfounded objection that he *can't afford it*, or treat it with contempt because it is an innovation?

I had designed, Mr Editor, to have enlarged upon this subject, and to have demonstrated by figures that will not lie, how much advantage would

accrue to the farmer, who tills any considerable quantity of land, by his availing himself of the aid of this and other labor-saving inventions of modern date; but as I am unable at present, from lack of satisfactory data, to carry out my intention, I will close with the wish, that those farmers who have heretofore regarded ancient practices as *perfect* because they were adopted by their fathers, may speedily be convinced of their error; and that those who imagine they *can't afford* to adopt an improvement in their husbandry because it will *cost something*, may soon attain a sufficiency of this world's goods to enable them to say they *can afford* a few dollars for an article which, perhaps, in one season will more than pay its original cost. J. H. D.

For the New England Farmer.

### DECAYED TURNIPS.

I observed in the last number of the Farmer, an article from the Farmer's Cabinet, in which it is stated that this disease is the consequence of a wet or too retentive subsoil. That a soil of this description is not suitable to the cultivation of turnips, is generally admitted; but how does Mr John Sturges account for the rotting of crops on land where there is no such cause existing? The "*rot*," popularly so called, is often found to prevail on free and light soils as well as on those of a more heavy texture, and indeed in situations where there is no substratum for yards, and even rods below the surface. The farm which I cultivate is a free sandy loam, and so open that in order to obtain water it is necessary to dig from eighty to ninety feet. No water can be obtained in the village short of that distance, but we have often had rotten turnips in great abundance, even in this soil, as well as on the slopes of our eminences, where the soil is so light, that in order to prevent the surface mould from being washed away by heavy rains and showers, we have found it necessary to haul on clay and muck. If Mr Sturges' theory be correct, the tap-roots of *our* ruta bagas, like those of the Ohio parsnips, must be "rather long." Again—Mr Sturges assures us that the grub never attacks the turnips, unless when previously diseased. But until he proves that the tap-root of the ruta бага is capable of permeating a light sandy soil, or earth, to the depth of 80 or 90 feet from the surface, and of tipping upon the *stagnant* (?) waters of the earth's interior, I shall reject the latter theory, as no less unsatisfactory than the first. H. D. W.

Windham, Me., April 5, 1841.

The article from the "Farmer's Cabinet," referred to by our correspondent, was as far from being satisfactory to us as to him. But it was an attempt to exhibit the cause of frequent losses of a crop which many of our farmers wish to raise. The attempt was praise-worthy. This matter of rot in the ruta бага is a serious evil. If its cause can be ascertained, and rules given by which the action of the cause can be avoided, a great good will be conferred upon our community. It will give us pleasure to receive information, or even hints and conjectures, upon the subject, from any of our readers.

We have seen this rot where it was impossible that superabundant moisture in the subsoil could produce it: in one season it prevailed more among that part of the crop which was sowed (about the first of June) upon unfermented dung, than upon the part manured with a mixture of ground bones

and ashes. And more in each of these lots than in those sowed about the first of July. This was in 1838; and the crop that year was not by any means a failure. In 1839, we sowed upon fresh manure from the barn cellar on the last Wednesday of May. Land, a light loam—subsoil *dry*. This crop was very badly injured. We conjectured that the failure was owing either to the early sowing, or the fresh state of the manure. In 1840, we sowed where the manure had been applied the preceding autumn, and the same evil was experienced.

The season of sowing and the condition and nature of manure or soil, it is not improbable, have influences in increasing or diminishing this rot.—But what the proper season for sowing is? what the safest soil and subsoil? what the best kind of manure? what stage of decomposition should the manure be in?—these questions our experience and observations cannot answer. We are in the dark. And we put the question distinctly to *any man* who can, or to any one who *thinks* he can answer it—What is the cause of *rot* in the ruta бага? —Ed. N. E. FAR.

*Bring Flowers.*—The following is an extract from Mr Colman's Address before the Agricultural Society at New Haven:

"The taste for flowers, every where increasing among us, is an omen for good. Let us adorn our parlors, doorways, and roadsides, with trees and shrubs, and flowers. What a delight do they give to the passer-by? What favorable impressions do they at once excite towards those who cultivate for their own gratification, and find, after all, their chief pleasure in the gratification which they afford to others? What an affecting charm, associated as it is with some of the best sentiments of our nature, do they give to the sad dwelling places of the departed and beloved?"

The moral influences of such embellishments deserve our consideration. I do not mean simply the substitution of such refined tastes and pursuits in place of the gratification of the lower appetites. This is no small matter. But another influence should not be overlooked.

Every one familiar with human life, must be sensible that mere personal neatness and order are themselves securities of virtue. As we cultivate these habits, and in respect to our residences and the things and objects around us, make a study of rendering them orderly and beautiful, and adding to them the highest embellishments of art, our own self-respect is greatly increased. Next to religious principle nothing operates more than self-respect, as a safe-guard of virtue and a stimulant to excellence."

The only things in which we can be said to have any property, are our *actions*. Our thoughts may be bad, yet produce no poison; they may be good, yet produce no fruit. Our riches may be taken from us by misfortune, our reputation by malice, our spirits by calamity, our health by disease, our friends by death: but our *actions* must follow us beyond the grave. These are the only title-deeds of which we cannot be disinherited.—Lacón.

Of all the passions, jealousy is that which exacts the hardest service, and pays the bitterest wages. Its service is—to watch the *success* of our enemy; its wages—to be *sure* of it.—*ib.*

## CATTLE SHOW,

*Exhibition of Manufactures, Ploughing Match, and Public Sale of Animals and Manufactures, at Pawtuxet, R. I., on Wednesday, October 6th, 1841.*

The Standing Committee of the Rhode Island Society for the Encouragement of Domestic Industry, offer the following premiums:

*For Grain, Vegetable Crops and Agricultural Experiments.*

For a satisfactory, and the most satisfactory, statement in writing of the expense of raising any kind of grain crop, showing the least cost per bushel: the soil and subsoil on which the crop is raised must be named, and the cost stated as follows:

Rent of land for one year;	
Quantity and kind of manure—loads at;	
Ploughing, harrowing and rolling—days at;	
Planting or sowing—days at;	
Tillage—days at;	
Harvesting—days at;	
First premium,	\$12
Second,	8
Third,	6
	—
	\$26

For a satisfactory, and the most satisfactory, statement showing the value of apples, or any kind of root, compared with Indian corn per bushel, as food for cattle, horses, sheep, or swine,

Next best,	6
Next best,	4
	—
	\$20

To the person who shall raise or introduce into the State, potatoes of a quality superior to any heretofore raised or introduced,

For the cultivation of root crops at the least expense per bushel, the cost to be estimated on the same plan as for grain,

For the most satisfactory statement of the comparative cost of keeping stock on roots and hay, or on dry fodder alone,

For the most approved statement of the comparative profit of fattening sheep or swine upon the produce of a farm, the lean sheep to be valued after shearing,

For the best specimen of beet sugar, stating the process of making and the cost per lb.

For reclaiming bogs, requiring a statement of the process and expense, with the increased value of the land,

For under draining land with covered stone drains, so that the plough may pass over them without injury, stating the cost per rod after the stones are delivered,

For spreading clay or marsh mud on light soil at the rate of 160 loads to the acre, stating the distance carted, the cost of the same, and the effect produced on succeeding crops,

For the best statement on turning in green crops and manure, on a tract of land not less than one acre,

For plantations and nurseries of white ash trees raised from the seed,

For plantations of yellow or honey locust trees, set either in cleared land or on land from which the native growth of timber has recently been taken, the number set on each acre, at equal distance, not to be less than 80, and no premium to be allowed if set near cultivated land,

To the person who shall introduce any

grass, not before cultivated in this State, and prove by actual experiment, tested by satisfactory evidence, its superiority to any other grass now cultivated,

To the person who shall, by actual experiment, prove the best season and mode of laying down land to grass, whether spring, summer, or fall seeding be preferable, and whether with or without grain on different soils,

To the person who shall take up in the season, on his own farm, the greatest quantity of good honey, and shall at the same time exhibit superior skill in the management of bees,

*For Stock.*

For the best bull, not less than one year old, to be kept in the State one year after the fair,

For the next best,

For the next best,

For the best bull calf from four to twelve months old,

For the next best,

For the next best,

For the best milch cow not less than four years old,

For the next best,

For the next best,

For the best one year old heifer,

For the next best,

For the next best,

For the best two year old heifer,

For the next best,

For the next best,

For the best three years old heifer, with or without a calf,

For the next best,

For the next best,

For the next best heifer calf, from four to twelve months old,

For the next best,

For the next best,

For the best pair of working oxen, not less than four years old, regard being had to the strength, equality of match, and docility of the cattle, as well as to their size and appearance,

For the next best,

For the next best,

For the next best,

For the best pair of three years old steers, broken to the yoke,

For the next best do.

For the next best do.

For the best pair of two years old steers,

For the next best,

For the next best,

For the best pair of yearling steers,

For the next best,

For the best boar, not less than five months old, nor more than two years and six months old, with an assurance that he shall be kept six months for further service,

For the next best,

For the next best,

For the best breeding sow, not less than one year old, which shall have had at least one litter of pigs, and must be kept for breeding another year,

For the next best,

For the next best,

For the best weaned pigs, not less than four in number,

For the next best,

For the best weaned pigs, not less than four in number, 5

For the next best, 3

The premiums for the bulls and boars will be paid when evidence is produced that they have been kept in the State the time required.

For each yoke of oxen exhibited at the fair, (which shall appear in a team of fifty or more yoke, and to which no premium for any peculiar excellence is awarded,) if driven less than five miles, 25 cts.

For each yoke, five and over, 50 do.

For each yoke, ten and over, 75 do.

For each yoke, twenty and over, \$1

The unsatisfactory mode of determining the relative excellencies of milch cows, by mere inspection of them in the pens, or from recollection of verbal representations made to the committee at the moment of examination, has determined the Standing Committee, in offering the above liberal premiums, to require of the claimants, at the time of entry, to file their certificate in writing, of the product of milk and butter made from the cow, from the 17th to the 27th of June, and from the 10th to the 20th of September—ascertained in such a manner as may be entirely satisfactory; also, stating the time of the cow's calving, the quality of the calf, and if the cow has had any other keeping than by pasture, of what kind, and in what quantity it has been. And no person shall be considered by the committee of judges, a competitor for either of the above premiums for cows, who has not strictly complied with this rule. It is desirable, also, although it is not made requisite to obtain a premium, that if the cow is from a dairy stock, the certificate should contain a statement of the number and breed of the cows kept together, and of the produce in veal, butter and cheese, and of the number of swine kept as connected with the dairy, through the season, to the time of the Show.

None of the animals will be entitled to premium unless they are wholly the product of the State, excepting that with a view to encourage the introduction of improved stock, the Standing Committee will pay the premiums which may be awarded for bulls, rams and boars, brought into the State, upon receiving security that they shall be kept for use within the State at least one year next after.

In awarding the premiums upon stock, regard will be had to the manner and expense of raising and keeping. And the owner will be required to give a satisfactory account thereof to the appropriate committee, on the day of exhibition, as it is the intention of the Standing Committee to encourage that stock which not only may appear best at the Show, but which, in reference to the cost, is most profitable to the farmer.

The Standing Committee, with a view to the most liberal encouragement of the citizens of the State, who live remote from the place of exhibition, propose to pay at the rate of eight cents per mile for travel, to the owners of such animals as obtain premiums and which are brought or driven more than five miles, computing from the place from which the animals come to the place of the Show. Also, to unsuccessful competitors and owners of cattle, offered for exhibition, the like sum, when from the report it shall appear, that the animals exhibited were of such excellence as to claim the special notice of the committee; and that in their opinion, the owners merit such an indemnity for an expense which has given credit to the Show.

No animal for which to any owner one premium shall have been awarded, shall be considered a subject for any further premium of the Society, except it be for qualities different from those for which the former premium was awarded.

Persons intending to offer any species of stock for a premium, must give notice thereof, either by letter, post paid, or by personal application, to the Secretary, on or before the 5th of October next, the day preceding the Show, at 9 o'clock in the evening, requesting him to enter his application, so that tickets for the pens may be ready by 8 o'clock the next morning. The difficulty of making arrangements for the proper accommodation of the different species of stock, without such previous notice, renders a strict enforcement of this rule indispensable; and no person will be considered as a competitor, who shall not have made such application for entry on or before the time above specified. The owners of working oxen or cattle exhibited in the yoke, are requested to bring a chain to each yoke to secure them to posts.

In all cases where the age of animals is mentioned, the applicant must file his own certificate, or that of some other respectable individual, who personally knows the fact, that they are of the age for which they are entered, and also that they are the product of the State.

#### Butter and Cheese.

For the best cheese, all from the same dairy, not less in quantity than 100 lbs.,	\$8
For the next do. not of the same dairy	6
For the next do do	4
For the best butter, not less than 25 lbs.	15
Next best do do	12
Next best do do	10
Next best do do	7
Next best do do	6
Next best do do	5
Next best do do	2

The butter to be exhibited in kegs with covers, and without ornament or any mark whatever;—method of making to be given, stating the kind of salt used and quantity per pound.

#### Household Manufactures.

For the best piece of carpeting, 4-4 wide, and not less than fifteen yards	\$6
Next best do	4
Next best do	3
For the best lot of woollen knit hese, at least three pair	2
For the best flax or hemp knit hose	2
For the best cotton do	2
For the best worsted do	2
For the best silk do	3
For the best piece of woollen flannel, 7-8 wide, thirty yards at least	5
Next do	3
For the best bed made from peat-bag moss	4
For the best linen or tow diaper, 4 quarters wide and not less than 20 yards in length	4
For the best linen or tow diaper, 3-4 wide, and not less than 20 yards in length	3
For the best cow-hide boots, not less than two pairs	4
For the best calf-skin boots, not less than two pairs	4
For the best brogans, not less than two pairs	2

All to have been manufactured in this State, within the last year, and a certificate thereof required.

#### Shop Manufactures.

For the best plough	\$3
For the best dozen scythes	3
For the best dozen axes	3
For the best dozen hoes	3
For the best cast steel shovels	3
For the best dozen rakes	3
For any newly invented agricultural implements, superior to any designed for the same uses, a reward (not exceeding twenty dollars in all) according to the importance of the invention	20

Every article of manufacture, offered for premium, must be entered and delivered to the person appointed to receive them, before 9 o'clock, A. M., on the day of the fair. The goods must not be removed until 5 o'clock of the day of exhibition, unless by permission of the Committee of Arrangements.

#### Ploughing Match.

(No Drivers allowed.)

First plough	\$9
Second do	8
Third do	7
Fourth do	6
Fifth do	5
Sixth do	4
Seventh do	3
Eighth do	2

The depth to be ploughed will not be less than five inches, and the breadth of the furrow not more than ten inches.

The strictest regulations will be adopted, to insure the proper management of the cattle. They will not be permitted to be driven faster than their natural pace; and these premiums will be adjudged for the best work with the least expense of labor.

It must be understood, that in all cases where there be any competition or not, it is at the discretion of the committees to withhold a premium, if, in their opinion, the object so offered is not deserving of it.

Any attempts to obtain premiums by unfair practices, will be punished by a forfeiture of the premium, should it have been awarded before a discovery, and will also preclude the offender from being permitted to apply for premiums in future. Premiums to be demanded within six months after they are awarded.

Competitors for premiums of every description will be held to a rigid compliance with the foregoing rules, as well as such other rules and regulations as shall be adopted by the respective Committees on Premiums, hereafter to be appointed, and the Committee of Arrangements for the occasion.

In cases where, for want of competition, the claimants upon a literal construction of these proposals might be entitled to premiums, the Trustees shall be at liberty to reject the claim, unless the animal or manufactured article is of a superior quality and value.

No owner of any number of premium animals will be entitled to more than one allowance for travel.

The sum of fifty dollars is reserved, and will be distributed in gratuities to persons who shall exhibit articles of skill and utility deserving encouragement, and for which no particular premium is offered.

JAMES RHODES, *President.*

WM. W. HOPPIN, *Sec'ry.*

#### ENGRAFTING.

In conversation, a few days since, with a gentleman who has much practical acquaintance with setting scions, we learned from him that in cleft grafting it is very important to make your split or cleft in the stock before you shape the wedge on the scion, which should be *nicey fitted* to the cleft, and the inner bark of the scion and stock should be made to come together from top to bottom of the split. If they touch a short distance only, the scion may *live*, but it will not *grow well*. The *growth* is nearly in proportion to the extent of space over which the two inner barks are brought together. This gentleman objects to the use of rosin or any other similar substance in his engrafting wax; such substances burn or heat too much: two parts of bees' wax and one of tallow make his wax. While this is in a melted state, he dips cheap tape into it, and then winds in balls. With this tape thus greased he binds in his scions; with his composition he fills the cleft in the centre of the stock, and all places where the air or water could gain admission. When a stock is large, he binds around it a wide strip of woollen cloth, so that it shall extend about an inch above the stock and form a dish or cup, which he fills with earth. He never puts his scions in water. When a scion has been cut off at the top, he puts wax upon the top.—Ed.

#### EWES AND LAMBS.

Farmers sometimes experience a difficulty in making ewes own their lambs; and oftener perhaps when cases of twin lambs occur than at other times. When sheep are as valuable as at present, those who desire to rear all their lambs, may find a benefit in sprinkling a little fine salt over the disowned lamb. This will usually attract the mother, and when once the operation of licking has been performed, there is usually but little danger of desertion. A friend assures us he has practiced this method with decided success; and no injury to the lambs need be apprehended from the application. Sheep, when about to lamb, should be moved and disturbed as little as possible, as all such disturbances, especially with young or wild ewes, greatly increases the probability of their forsaking their young. Ewes in the spring of the year should be kept by themselves, and fed with grain or roots in such a manner as to make them less fearful, as well as to keep them in good heart.—*Selected.*

*Hydrangea.*—It may not be generally known to many of our readers that this flower, which is usually of a pink color, may be made to come out a beautiful rich blue, by the simple means of filling the pot or box with the swamp or bog earth. Common garden loam produces the pink. The discovery of producing the blue was accidentally made by a friend of ours, by whom it was sometime since communicated to us. We have repeated the experiment this season with good success, and now name the fact, that the lovers of variety may take advantage of it. The plant should be shifted very early in the spring.—*Watchtower.*

Success seems to be that which forms the distinction between confidence and conceit. Nelson, when young, was piqued at not being noticed in a newspaper which detailed an action wherein he had assisted: "But never mind," said he, "I will one day have a gazette of my own."—*Lacon.*

**NEW ENGLAND FARMER,**  
AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, APRIL 14, 1841.

**DEATH OF THE PRESIDENT.**

CITY OF WASHINGTON, }  
April 4, 1841. }

An all-wise Providence having suddenly removed from this life WILLIAM HENRY HARRISON, late President of the United States, we have thought it our duty, in the recess of Congress, and in the absence of the Vice President from the seat of Government, to make this afflicting bereavement known to the country, by this declaration, under our hands.

He died at the President's House, in this city, this fourth day of April, Anno Domini, 1841, at thirty minutes before one o'clock in the morning.

The People of the United States, overwhelmed, like ourselves, by an event so unexpected and so melancholy, will derive consolation from knowing that his death was calm and resigned, as his life has been patriotic, useful, and distinguished; and that the last utterance of his lips expressed a fervent desire for the perpetuity of the Constitution, and the preservation of its true principles. In death, as in life, the happiness of his country was uppermost in his thoughts.

DANIEL WEBSTER,  
*Secretary of State.*  
THOMAS EWING,  
*Secretary of the Treasury.*  
JOHN BELL,  
*Secretary of War.*  
J. J. CRITTENDEN,  
*Attorney General.*  
FRANCIS GRANGER,  
*Postmaster General.*

President HARRISON is no more! The Nation's chosen Head sleeps in dust! The object of the nation's confidence and trust has gone down to the grave! Millions in the land are made mourners! The hopes and fond anticipations of millions are disappointed! Never before, from our Presidential Chair, did one's "spirit return to God who gave it." The event in its circumstances is singularly solemn and impressive. In the annals of the world it has no parallel. No other man has been taken at that hour of intense and wide-spread solicitude, when a nation's eyes were anxiously watching his first exercise of the highest powers in that nation's gift—powers conferred voluntarily, peaceably, and yet by the intensest party strife. No other has been taken when millions were expecting from him such extensive changes in the policy and administration of a free nation's government. The bereavement reaches over our whole land and goes deep as the well-springs of patriotic hopes and fears in the human soul. But He who both gave and has taken, says to the sorrowing, "Be still, and know that I am God."

The reflecting and devout of all parties must sit awhile in calm and solemn meditation. With such men, now the rashness and indiscretion of party judgment will be silent. Indiscriminate praise and gratuitous detraction will stop *tacere*, "where the wicked cease from troubling and the weary are at rest."

While he was living, we made no allusions to the character of General Harrison in our columns. Now that he is gone, we wish to say that we most heartily joined in the efforts to promote his election, and that we sincerely lament his death. We believed him to be an honest and true man; one who feared God; was kind

and just; was a lover of his country—of his whole country. We believed, that as President, his ruling aim would be to preserve the integrity of the Constitution and laws, and to promote the prosperity and permanent welfare of the Union. Without belief that he was the ablest among our statesmen, we had undoubting confidence that he was highly capable and eminently trustworthy. Without imagining him perfect, we trusted that he was good. His acts, his writings, and the concurrent testimony of his fellow-citizens, taught us that he was brave and skilful in war—a good classical scholar of the old school—a philanthropist—and a man of most exemplary character in private life. Such continues to be our estimate of the man, now when his ear is deaf to the voice of human censure or praise. We mourn his fall as a national calamity. But "we sorrow, not without hope"—not without hope, that he who was taken from the most honorable civil station in our world, has entered upon the performance of higher duties, and the enjoyment of richer honors than any earthly station can afford,—not without hope, that He who presides over the destinies of nations, will be the guardian and the strength of those on whom the burthen of governing us is now placed.

Let the gathering of the the Farmer of North Bend into the garner of the Lord of the harvest, speak out in solemn and impressive tones, telling the husbandmen of our land, that each of them must soon give in an account of the crop upon that moral field, which is confided to his cultivation. Let them be influenced to sow abundantly to the spirit, trusting that they shall reap therefrom immeasurable stores of delicious fruit, under the cloudless skies and on the lovely fields which lie beyond the dark valley through which they all must pass.

**ANSWERS TO A CORRESPONDENT.**

We were pleased upon opening a communication, to find it from the pen of the correspondent to whom we made a "confession." He is correct in supposing that we are, or at least wish to be, without ceremony, "acquainted with all who have a wish to obtain information from our labors as editor." His remark, that agricultural papers have done much to excite our farmers to commence and pursue a course of *improvement*, is well founded; and we wish that every farmer would take some one of the many agricultural papers of the day, for there is not one among them that would not give hints, suggestions, facts and opinions that would be found profitable on every farm. Our correspondent's encouragement and good wishes for ourself, are contained in the following sentence: "Go on, I say, unto the end, and I trust and hope, that a handsome reward will be found for you at the end of the chapter."

**Roots.** The question, "What kind of roots do you consider the best to give to cows that give milk in the winter?" we will answer. Sugar beets first; carrots next; (we are not acquainted with the parsnip for this purpose;) the mangel wurtzel, ruta baga, and flat turnip, are all serviceable in moderate quantities to the stock in winter. But turnips of all varieties give an unpleasant taste to the milk. This evil, however, may be mainly, if not entirely, remedied by pouring two or three gills of boiling water into each gallon of milk, immediately after it is taken from the cow.

The sugar beet will make as much milk as any one of the roots, and the milk will be rich and sweet. The carrot is believed not to increase the quantity so much as the beet, but its effect upon the quality is probably equally favorable. Our own experience makes the carrot a more certain crop than the beet, and taking several seasons in succession, the carrot, on good, rich, but rather

dry upland, has been raised at less expense than the beet. On the moister soils the beet may do better. We have raised them quite profitably for the last two seasons, on peat-meadow or bog lands. Grown there, they are large and coarse, but yet answer a good purpose. We, however, would not advise any one to go into the cultivation of them to the exclusion of carrots. It is good husbandry to try several kinds. The season in which one fails may be favorable to others. The carrot will keep longer than the beet, and is better for spring use.

Our correspondent adds—"I planted sugar beet seed in May, on strong and well manured land; hoed in June and July, and soon after hoeing the last time, I discovered that my beets were dying, and on examination I found nearly one half of them wilted down and nearly dead. If you can assign any cause for such a change in my beets—which ended in a failure of the crop—I shall feel myself much indebted to you." In 1838 our crop was injured, as was *supposed*, by drought, in a manner similar to this. In 1839, but earlier in the season, while the plants were small, some bug or worm apparently cut them off just below the surface of the ground. We can say no more, excepting to ask a question of our correspondent in return, viz: whether he can ascribe his failure to either of these causes? and if so, to which of them? The beet, it must be remembered, is a great "*topper*."

**Cream-Pot Stock.** Another inquiry in these words, "Can I obtain some of the Cream Pot breed of cattle from Col. Jaques or any other person in your vicinity? If so, at what price can three or four year old heifers be had?"—we must request Col. Jaques to answer.

**Seed Sower.** The remaining inquiry, "which is the best seed sower?" we cannot answer in absolute terms. Willis' seed sower has been extensively used, and we learned from him a few days since, that he had never heard a word of complaint relative to it from any source. The price is \$14. Cheaper implements can be had, so far as the original cost is concerned, but whether cheaper in the end, our information does not enable us to determine. But we believe that if an instrument is so constructed as to drop the seeds regularly and *without any failures*, and this whether there be much seed or little in the hopper, that it will be cheap compared with one doing the work less faithfully, even though the latter can be had for the asking, while the former is held so high as to remind one that he "may buy gold too dear." Willis' is the only implement for the purpose kept for sale at Breck & Co.'s Agricultural Warehouse, though there are several others there for exhibition.

**LITERARY AND SCIENTIFIC NOTICES.**

We have been favored by Mr Jordan, with a copy of the April No. of Silliman's Journal, and also of the New York Review. Mr Jerdan, 121 Washington street, is the Boston publisher of these valuable periodicals. The publisher of Tales of the Ocean (S. N. Dickinson, 52 Washington street,) has laid on our table a copy of that work. These and other works of a similar character, are very acceptable to us, and we are willing to name them in our columns; but critical notices of works not specially adapted to the wants of the agricultural community, however favorable our private opinion of them may be, are not consistent with our design to adhere rather closely to our appropriate field of labor.

☞ We are indebted to the editors of the New Gene-see Farmer, for a paper of "wild rice," for which they have our thanks. We give them, also, our good wishes for their success in efforts to give to their paper a well merited and firm hold upon the esteem and support of the farmers of western New York.

## THERMOMETRICAL.

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northernly exposure, week ending April 11.

April, 1841.	7 A.M.	12 M.	5 P.M.	Wind.	
Monday,	5	33	52	43	N. W.
Tuesday,	6	37	45	41	N. W.
Wednesday,	7	31	53	42	S. W.
Thursday,	8	34	54	50	E.
Friday,	9	36	40	38	E.
Saturday,	10	33	40	32	E.
Sunday,	11	27	35	32	E.

## BRIGHTON MARKET.—MONDAY, APRIL 12, 1841.

Reported for the New England Farmer

At Market 300 Beef Cattle, 20 yoke of Working Oxen, 25 Cows and Calves, 725 Sheep, and 1125 swine.

Prices.—*Beef Cattle*—A small advance was effected, we quote a few extra \$6 75 a 7 00. First quality, 6 25 a \$6 50. Second quality, \$5 75 a 6 00. Third quality, \$5 00 a 5 75.

*Working Oxen*—Sales were noticed at \$62, \$70, \$85, \$92, \$110 and \$115.

*Cows and Calves*—Dull, \$20, \$25, \$27, \$31, and \$35.

*Sheep*—A lot of ordinary were sold for \$1 50 each. Lots of stall fed, \$3 75, \$4 25, \$4 75 and \$5 00.

*Swine*—Sales quick at a small advance, lots to peddle were generally sold at 4 1-4 for sows, and 5 1-4 for barrows. Large selected barrows at 5 and 5 1-4. At retail from 4 1-2 to 6.

## WHOLESALE PRICES CURRENT.

Corrected with great care, weekly.

SEEDS. Herds Grass, very little in market. Red Top, new seed by the bag 60—old 55 c. Clover—Northern, very little in market.—Southern, plenty, 9 to 10 c. Flax Seed, \$1, 37 to 1 50 bu. Lucerne, 25 c. per lb.

FLOUR. Howard Street \$5 37—Genesee \$5 31—Ohio \$5 12.

GRAIN. Corn—Northern Yellow none—Round Yellow 54 to 56—Southern Flat Yellow 50—White 43.—Rye—Northern 60 to 65—Southern 50 to 55. Oats—Southern 30 to 31—Northern 35 to 40.

PROVISIONS. Beef—Mess \$10 50 to 11 00—Prime \$5 50—No. 1 \$9 00. Pork—Extra—15 00—Clear 14 50—Mess \$13 00. Hams—Northern 9 c. per lb.—Southern, none. Lard—Boston 9 c. per lb.—Southern, 8 to 8 1-2. Butter—Lump 18 to 22—Firkin 12 to 18—Shipping 8 to 14. Whole Hogs 5 1-2 to 6 c.—Pigs 5 c.

HAY, per ton, \$17 to 17 50—Eastern Screwed \$13 to 14. CHEESE—Old 11 c.—New 8.

EGGS, 14 a 16.

WOOL—The market for this article has not experienced any change of late. Pulled Wool is rather scarce, and there is but a limited supply of low Fleeces and of fine Fleeces the stock is also moderate. Prime or Saxony Fleeces, washed, lb. 50 to 55 c.—American full blood, washed, 47 to 50—Do. 3-4 blood, washed, 44 to 45—Do. 1-2 blood, washed, 36 to 40—1-4 and common do, 35 to 37—Smyrna Sheep, washed, 20 to 23—Do. unwashed, 10 to 14—Bengasi Sheep, 8 to 10—Buenos Ayres unpicked, 7 to 10—Superfine Northern pulled lamb 43 to 46—No. 1 do. do. 37 to 42—No 2 do do 26 to 30—No 3 do do 18 to 20.

## MASSACHUSETTS HORTICULTURAL SOCIETY.

At a meeting, held April 10th, 1841, the Executive Committee were instructed not to receive any reports of Committees, awarding premiums, for the past year, after Saturday the 24th instant. E. M. RICHARDS, Recording Secretary.

## ASPARAGUS AND RHUBARB ROOTS.

For sale by J. BRECK & CO., a few large Asparagus and Rhubarb Roots. April 14

## HERBACEOUS PLANTS,

In great variety, for sale by J. BRECK & CO., No. 51 North Market St. April 14

## GOOD OPPORTUNITY FOR A FARMER.

The owner of a farm in a healthy situation about two miles from the city of Washington, is desirous of obtaining a superintendant of the farm. He wishes for a regularly bred farmer; and to such an one he would offer such favorable terms in money, house rent, fuel, provisions, &c., as to make it an inducement for a temperate and industrious man to enter into an agreement to take the management of the farm or a term of years.

For farther particulars, *personal* application may be made to JOSEPH WILLARD, No. 20 Court Street. Boston, April 7th. 3wis.

## WILLIS'S LATEST IMPROVED SEED SOWER.

Willis's latest Improved Seed Sower, invented the last season; one of the most perfect machines ever introduced for the purpose. In using this machine, the farmer may be certain that his seed is put into the ground, and at the same time in the best possible manner. There has been a great difficulty in machines for sowing garden seeds; they are very apt to clog up, and the farmer might go over an acre of land and not sow a single seed; but not so with this; it is so constructed that it cannot possibly clog. In using this sower, the farmer can save one half of his seed, and do the work at less than one quarter the expense of the common way of sowing seeds, and have it done in a much better manner; it opens the furrow, drops the seed, and covers it over and rolls them down. It will sow almost any kind of Garden Seeds; say Ruta Baga, Mangel Wurtzel, Turnips, Carrots, Beets, Parsnips, Onions. It is highly recommended by a great number of persons who used it the past season. For sale at the N. E. Agricultural Warehouse and Seed Store by JOSEPH BRECK & CO. March 31.

## WINSHIP'S NURSERY,

BRIGHTON, NEAR BOSTON,

Situated on the line of the Boston and Worcester Rail Road,—5 miles from the city.

The Proprietors of this extensive nursery beg leave to inform their friends and the public, that they are ready to furnish orders to any amount, for Forest Trees, indigenous and exotic.

Fruit Trees, including all the varieties of Pears, Peaches, Plums, Nectarines, Cherries, &c. &c.

Vines—Shrubs, Green House Plants, &c. Catalogues may be obtained by applying at the Nursery. Trees carefully packed, to ensure safety in long voyages. Orders left at the New England Seed Store of J. BRECK & Co. Nos. 51 and 52, North Market street, will be delivered the day following, and left at any part of the city, free of expense.

Letters containing orders, addressed to the subscribers, J. & F. WINSHIP, Brighton Nurseries, March 24, 1841.

## BONE MANURE.

The subscriber informs his friends and the public, that after ten years experience, he is fully convinced that ground bones form the most powerful stimulant that can be applied to the earth as a manure.

Price at the Mill 30 cents per bushel, put up in casks or hhd. containing from 4 1-4 to 17 bushels each as the purchaser may desire or order, and delivered at any part of the city at 35 cents per bushel, and no charge for casks or carting.

Also, Oyster Shell Lime, price 8 cents per bushel at the kiln, put up in casks, 4 bushels each, at 50 cents per cask delivered at any part of the city.

Orders for Bone Manure or Oyster Shell Lime, left at the Bone Mill, near Tremont road, in Roxbury, at the New England Agricultural Warehouse and Seed Store, No 52 North Market Street, or through the Post Office will meet with prompt attention. NAHUM WARD April 7, 1841.

## BEDFORD OATS.

Just received 50 bushels of superior Bedford Oats. This variety is highly recommended, it not being liable to blast, and very productive. For sale by JOS. BRECK & CO. March 31.

## SUPERIOR SEED BARLEY.

100 bushels of extra heavy and clean Seed Barley. Also 30 bushels CHEVALIER BARLEY, a new and superior variety, for sale by JOS. BRECK & CO. March 31.

## BLACK SEA WHEAT.

Received from Vermont, 30 bushels Black Sea Wheat. Also, 20 bushels Italian Spring Wheat, raised in Warren, N. H. For sale by JOS. BRECK & CO. March 31.

## AGRICULTURAL IMPLEMENTS, &amp;c.

The Proprietors of the New England Agricultural Warehouse and Seed Store No. 51 and 52 North Market street, would inform their customers and the public generally that they have on hand the most extensive assortment of Agricultural and Horticultural Tools to be found in the United States. Part of which are the following:

1000 Howard's Patent Cast Iron Ploughs	100 doz. Cast Steel Shovels.
300 Common do. do.	150 " Common do.
200 Cultivators.	100 " Spades.
100 Green's Suaw Cutters.	500 " Grass Scythes.
50 Willis' do. do.	300 " Patent Snaths.
100 Common do. do.	200 " Common do.
100 Willis' Patent Corn Shellers.	500 " Hay Rakes.
50 Common do do.	200 " Garden do.
200 Willis' Seed Sowers.	200 " Manure Forks.
50 " Vegetable Cutters.	300 " Hay do.
50 Common do. do.	500 Pair Trace Chains.
200 Hand Corn Mills.	100 " Truck do.
200 Grain Cradles.	100 " Draft do.
100 Ox Yokes.	500 " Tie up do.
1500 Doz. Scythe Stones.	50 doz. Halter do.
3000 " Austin's Rifles.	1000 yards Fence do.
	25 Grind Stones on rollers.

## FRUIT AND ORNAMENTAL TREES, &amp;c.

NURSERY OF WILLIAM KENRICK.

12,000 Pear and Plum Trees.—Large and new additions of Pear and Plum Trees have lately been received, many kinds of which are alike new to our country, and very extraordinary. Such have been the selections which have been made by the subscriber in Europe, and in person, during the last Autumn, where all have been proved; those kinds already well known amongst us being identified by him by the wood and the leaf.

All orders addressed to the subscriber, or left with Joseph Breck & Co., New England Farmer Office, will be promptly attended to, and Trees, when so ordered, will be securely packed for safe transportation to distant places.

WILLIAM KENRICK.

Nonantum Hill, Newton, near Boston, March 2.

## PEAR, PLUM, GRAPE VINES, &amp;c.

3000 Pear Trees, of the most approved kinds. 2000 Plum Trees, of the most approved kinds and extra size—many of them have borne this season.

Apple, Cherry and Peach Trees, of different kinds.

500 Quince Trees. 4000 Isabella and Catawba Grape Vines, from 6 to 15 feet high; most of them have borne fruit. Black Hamburg, Sweetwater, Pond's.

30,000 Grant Asparagus Roots. Gooseberry, Currants, Raspberries, of good kinds. 5000 Wilmot's Early Rhubarb or Pie Plants, lately introduced.

2000 Cherry and Pear Stocks; 1000 Plums; Roses, &c. of all kinds.

All orders sent to the subscriber at Cambridge port or with JOSEPH BRECK & CO., will meet with immediate attention.

Cambridgeport, Mass., Feb. 23.

SAMUEL POND.

## PLUMS, PEARS, GOOSEBERRIES, &amp;c.

Just received by JOSEPH BRECK & CO., from London, a fine assortment of Plum and Pear Trees, which are offered at reduced prices, including the following

## PEARS.

Belle Lucrative,	Cattillac,
Mouille Bouche,	Williams' Ben Chretien or } Bartlett,
Josephine,	Jargonell d'Epagne,
Beurre Spence,	Echasserie,
" Capiamoot,	Urbaniste,
" Bosc,	Duchess d'Angouleme,
" d'Arenburgh,	St. Chislain,
Easter Beurre,	Madalioe d'Carne.

## PLUMS.

Green Gage,	New Orleans,
Purple Gage,	Imperatrice,
Diamond,	Reine Claude,
Washington,	Royal d'Tours.
Golden drop,	

Gooseberries, White and Red Currants, Raspberries and every article in the Nursery line furnished at short notice. JOS. BRECK & CO., No. 52 North Market Boston. April 7, 1841.

## GRINDSTONES.

An extensive assortment of Water and Hand Grindstones constantly on hand and for sale by AMMI C. LOMBARO & CO. 13 Lewis's Wharf. 15ly. Nov. 17.

## MISCELLANEOUS.

## A GOOD STORY.

PLEASANT AND INSTRUCTIVE.

Mrs. W., consort and help-mate of Mr. W., merchant of New York, was a very economical woman, and, if the eulogist was not mistaken, had a very strong apron. The circumstances narrated by the friend of Mrs W. were as follows: Mr W. was a merchant in affluent circumstances, did a heavy business, and conducted all his affairs with the utmost regularity. Every department of business was completely systematised; every family expenditure was restricted to regular daily appropriations, and no surer is the sailing master of a ship to make his observation, work his traverse, and ascertain his exact latitude and longitude every noon, than was Mr W. to have his accounts nicely balanced, and ascertain his exact whereabouts in business every night. But wise, prudent, and punctilious as he was, he could not withstand the temptation to overtrading during one of the great paper expansions; and when the revulsion came, he found himself embarrassed beyond all his efforts to extricate himself. He had stood firm as a rock while many of the most reputable houses tumbled to ruins around him, but he could not collect money due him from his best customers, and there was one remaining note of ten thousand dollars, that would fall due in a few days, and he could devise no way to meet it. The notice came from the bank, but three days remained, and every resource failed. The first of these three days was spent in fruitless attempts to borrow. The second was as fruitlessly spent in trying to force a sale of goods. Nobody had any money to lend—nobody had any money to purchase goods at any price. Failure presented itself before him with all its frightfulness.

The day of grace arrived, and horror was depicted in his countenance. Mrs W. knew nothing of his troubles, and on perceiving him evidently in great distress of mind, she insisted on knowing what was the cause of his trouble. It was folly to conceal his ruin from her, and he condescended to make her acquainted with the cause of his misery.—How much she inquired, will save you from failure? Ten thousand dollars, he replied, will pay my last note in bank; but for want of this I must suffer the disgrace of having my note protested, assign my property for the benefit of my creditors, and suffer my name to go the world as a bankrupt. Is this all? said she. Why bless me, my dear Mr W., I can supply you with that sum without going out of the house. Not waiting to hear the question he was prepared to ask, she tripped up stairs, and in less time than I have occupied in telling the story, she returned with seventeen thousand dollars all in change, which she had saved within a few years from her daily allowance of market money.

All who heard the recital of this circumstance by the friend of Mrs W. were highly delighted with it, save one sharp-nosed slab-sided yankee, who would not believe, though an angel had told it, till he had applied the test of figures to it, to ascertain its probability. As he finished his calculations and was in the act of returning his pencil to his pocket, he burst into a roar of laughter. All eyes were turned upon him, and the narrator demanded what he meant by such uncivil deportment. 'Nothin' at all stranger,' said the calculator, "only I was thinkin' what a tarnal strong apron

that are woman must a had on to bring seventeen thousand dollars worth of change down stairs. I've ciphered it out on this here paper, and it will weigh jist half a ton if there aint a single copper among the whole on't."—*Saturday Courier.*

## GARDEN SEEDS,

For sale by JOSEPH BRECK & Co. at the NEW ENGLAND FARMER OFFICE, No. 51 and 52 North Market St. Boston. The subscribers would inform the public that they have now on hand the largest collection of seeds ever before offered by sale in this city, embracing every variety of *Field, Kitchen, Garden, and Ornamental Flower Seeds* desirable for this or any other Climate.

Our seeds are either raised under our own inspection or imported from responsible houses in Europe, and having taken extraordinary pains to obtain such as are pure and genuine, we can confidently recommend them to our customers and friends, and feel assured they will prove satisfactory to all who try them.

Dealers in seeds are requested to forward their orders in season. Boxes for retailing from 8 dolls. and upwards will be sent out on commission allowing a liberal discount and take back what remain unsold.

Letters and orders with good reference will meet with prompt attention.

## FIELD SEEDS.

Sugar Beet.	Ruta Baga.
Mangel Wurtzel.	Ballantine's New Royal do.
New Red Globe do. } superior	White Tankard Turnip.
Yellow do. } varieties.	Red do.
Carrot Long Orange.	Red Round do.
" Altringham.	White do.
" New White, extra fine.	White Globe do.
Pumpkin, sorts.	Green Round do.
Wheat—various sorts.	Purple Top Hybrid do.
Barley, do.	Buckwheat.
Rye, do.	Broom Corn.
Potatoes, do.	Millet.
Indian Corn, do.	Buckthorn. } for Hedges.
Oats, do.	Locust.

## GARDEN SEEDS.

Artichoke, Asparagus, Beans of every description, Beets of sorts, Borecole, Broccoli, Brussels Sprouts, Cauliflower, Caraway, Celery, of the most improved sorts, Cabbage 20 sorts, Carrot, all the varieties, Cucumber do, Cress, Egg Plant, Endive, Indian Corn, Kale, Leek, Lettuce in great variety, Melons, do. Martynia, Mustard, Nasturtium, Okra, Onion of sorts, Pepper do. Pumpkin do. Parsnip, Parsley, Peas, a very great variety, Rhubarb for tarts, Radish of sorts, Salsify, Squash of sorts, Tomato, Turnip 20 varieties.

## SWEET AND POT HERBS.

Thyme	Sweet Basil.
Sweet Marjorum.	Lavender.
Sage.	Lemon Balm.
Summersavory.	Anise.
Medicinal Herbs, &c.	

## ORNAMENTAL FLOWER SEEDS.

Three hundred varieties, embracing all the finest sorts. Packages of 20 fine sorts for one dollar.

Those who prefer to have their Seeds put up in papers ready for retail, can be accommodated—each packet neatly closed and labelled with printed directions. Price 50 cents, per dozen papers, which are retailed here at 6 1/4 cents each.

Fruit and ornamental trees, of the greatest variety, supplied at nurseryman's prices, and orders solicited. These will be packed, when required, to go to any part of the U. States.

JOSEPH BRECK &amp; CO.

## FRUIT TREES AND SCIONS FOR SALE.

The subscriber, at the Pomological Garden, Salem, offers for sale a very choice and extensive variety of Apple, Pear, Plum, Cherry, Peach and Apricot Trees, Grape Vines, Gooseberries, Red and White Dutch Currants, and Red and White Antwerp Raspberries.

Also, Scions of all the European and American Fruits which have been proved; all from fruit-bearing Trees, packed in boxes with moss, and can be transported with safety to any part of this country or Europe.

ROBERT MANNING.

Salem, March 2, 1841.

1 May

## PURE SPERM OIL.

EDMUND T. HASTINGS & CO., No. 101 State St. keep constantly for sale, Winter, Spring and Fall Sperm Oil, bleached and unbleached; which they warrant to be of the best quality and to burn without crusting.

Oil Canisters of various sizes.

Boston, Jan. 1, 1841.

1841

## TRACE CHAINS.

Just received, direct from the English manufacturer, 8 casks of Trace Chains, from 6 to 11 feet long, suitable for ploughing or draft chains. JOSEPH BRECK & CO.

## HOWARD'S IMPROVED EASY DRAUGHT PLOUGH.

Great improvements have been made the past year in the form and workmanship of these Ploughs; the mould board has been so formed as to lay the furrow completely over, turning in every particle of grass or stubble, and leaving the ground in the best possible manner. The length of the mould board has been very much increased, so that the Plough works with the greatest ease, both with respect to the holding and the team. The Committee at the late trial of Ploughs at Worcester, say,

"Should our opinion be asked as to which of the Ploughs we should prefer for use on a farm, we might perhaps say to the inquirer, if your land is mostly light and easy to work, try Prouty & Mears, but if your land is heavy, hard or rocky, BEGIN WITH MR. HOWARD'S."

At the above mentioned trial the Howard Plough did more work, with the same power of team, than any other plough exhibited. No other turned more than twentyseven and one half inches, to the 112 lbs. draught, while the Howard Plough turned twenty-nine and one half inches, to the same power of team! All acknowledge that Howard's Ploughs are much the strongest and most substantially made.

There has been quite an improvement made on the shoe, or land side of this Plough, which can be renewed without having to furnish a new landside: this shoe likewise secures the mould board and landside together, and strengthens the Plough very much.

The price of the Ploughs is from \$6 to \$15. A Plough, sufficient for breaking up with four cattle, will cost about \$10 50, and with cutter \$1, with wheel and cutter, \$2 50 extra.

The above Ploughs are for sale, wholesale and retail, at the New England Agricultural Warehouse and Seed Store, Nos. 51 & 52 North Market Street, by

JOSEPH BRECK &amp; CO.

## STRAWBERRIES! STRAWBERRIES!

The subscriber would offer to the public, the present season, his *Selected Collection*, consisting of seven varieties; they are such as have stood the test of a fair trial for seven years, and all grown by the subscriber.

Warren's *Seedling Methven*, a new and valuable kind, a free bearer, fruit very large and juicy; fruit measuring 5 1/2 inches have been exhibited the present season. This variety can be warranted to be one of the finest varieties grown, and will produce as fine fruit and as large quantity, with the same cultivation, as any other ever offered. The price of this Seedling is \$5 00 per hundred plants.

Methven *Castle*.—Fruit extremely large, high flavored and showy; specimens of this fruit have been shown this season six inches in circumference. Price three dollars per hundred plants.

Keen's *Seedling*.—A very superior variety, fruit very large, rich dark color, and uncommonly high flavored. Price three dollars per hundred.

Royal *Scarlet*.—Fruit long oval shaped and juicy, very free bearer, and very hardy. Price two dollars.

Hautbois.—Fruit larger than English Wood, exceedingly numerous, sometimes yielding 100 berries to the plant.—Price two dollars.

Early *Virginia*.—This is known to be the earliest and best fruit for market, a free bearer and very hardy. Price two dollars.

English *Wood*.—Fruit well known for years. Price one dollar.

Every plant sent from this garden will be warranted to be free from mixtures, and shall also be young and healthy, worth the price paid for them.

All orders directed to the subscriber, inclosing the amount for the order, or with a good reference, shall be promptly attended to, and the plants carefully forwarded agreeably to directions.

JAMES L. L. F. WARREN.

March, 21.

Nonantum Vale, Brighton.

## NEW ENGLAND FARMER.

A WEEKLY PAPER.

The Editorial department of this paper having come into the hands of the subscriber, he is now authorized by the publishers to inform the public that the price of the paper is reduced. In future the terms will be \$2 per year in advance, or \$2 50 if not paid within thirty days.

ALLEN PUTNAM.

N. B.—Postmasters are required by law to frank all subscriptions and remittances for newspapers, without expense to subscribers.

## OPINIONS OF A CORRESPONDENT.

MR EDITOR—There are a few thoughts floating in my mind, which I feel disposed to divulge for your consideration (not edification.) If they coincide with your views, I shall consider them sound; if otherwise, I shall regret, perhaps, having committed them to paper. They are submitted in the following queries:—

Would it not tend more certainly to promote the prosperity of the *great mass* of our farmers, if the intelligent gentlemen who control the agricultural press, instead of recommending to their favor costly foreign minerals as fertilizers of the soil, would devote their entire abilities to teaching them the means they have in abundance *at home* of enriching their land, and the method by which they can derive the most benefit from those means?

Will not the recommendation or favorable notice by editors, of nitrate of soda, saltpetre, &c., as manures, have the effect, in some cases, to divert the farmer's attention from his peat beds and bogs—those prolific mines of wealth—the true value of which is but just beginning to be generally appreciated?

Will not the New England cultivator, of moderate means, best promote his true interest by seeking the means of enriching his land in the substances which abound on his own premises, or which, as lime, can be had in most cases easily and in abundance?

Had not the great mass of our New England agriculturists—the *common farmers*—much rather be instructed in regard to the means they have within their reach of improving their land, than bored with long, dry essays and statements respecting the scarce and costly substances experimented with by the wealthy nobility and gentry across the water, and which, for the best of reasons, it is plainly evident can never be introduced among us, except, perhaps, by a few “fancy farmers,” whose opulence enables them to amuse themselves with any toy they please?

I trust, sir, you will not regard the above suggestions as the dictates of a captious disposition: they are submitted merely as the views of one who lays no claim to more than common sagacity, and for the purpose, mainly, of learning whether in your superior judgment they are well founded. As they are propositions in demonstration of which I offer only a simple *I think so*, they are not entitled to any great consideration.

In my humble opinion, Mr Editor, (and I say it with all becoming deference to the opinions of others,) the class of farmers which it should be the prime object of the agricultural press to benefit, are those who compose a vast majority of our cultivators,—the men who of necessity till the soil with their own hands, to earn their subsistence and provide for their offspring. These are the *real far-*

*mers*—the hard-handed, honest-hearted yeomanry of our land—the conservators of the public morals and the public liberty—and these are they whom I conceive it should be the chief aim of the gentlemen of your high profession to aid,—not by bringing to their attention or urging for their adoption every new-fangled project which may be originated abroad, and which neither their means nor their inclinations encourage any probability of their adopting—but by instructing them how to make the most of the ample resources of thrift they have *at home*—and teaching them how they may overcome by art the obstructions of nature.

You will not, sir, infer from what I have said, that I would withhold from our farmers the account of any *valuable* discovery pertaining to their art, which may be made abroad;—by no means: but I do think I speak the feelings of two thirds the readers of your exceedingly useful journal when I say, they had rather have such discoveries only brought to their attention through your pages, as are not of doubtful utility, and which, unlike the nitrate of soda, do not “*cost considerable*” and “*sometimes fail altogether*” of good effect.

All which is respectfully submitted—by

Yours to serve,

JONATHAN HOMESPUN.

*Somewhere, Mass., 1841.*

Farmer Homespun's *floating thoughts* bear the appearance of having come up from the clear and cool springs of reflection. They gently hint, that our extended extracts, last week, relating to nitrate of soda, might draw off his thoughts from the rich and pleasant *bag hole* into which we led him the week before. But we have no fears that his own good sense will not prompt him to “hold fast that which is good.” If on his premises, peat, muck, rich vegetable mould and the like abound, his remembrance that nitrate of soda “costs considerable,” will protect him from the attacks of any fatal fever for experiments. We had no intention or wish to lead the Jonathan Homespuns—the common, hard-handed farmers—into expensive outlays, where the chances of profit are not decidedly favorable. But we thought that some of them might wish for a little salt to season their fresh mud with, and that we would show them the little that is known of a kind of seasoning yet scarcely tried at all in this vicinity, and then leave them unadvised as to trying or rejecting it. But while we write and select mainly for those who are earning a living from the soil, we yet have a very high regard for those whose tastes lead, and whose fortunes enable them, to try many experiments in husbandry, and whose course gives many valuable hints and lessons to the less wealthy farmer. The experimenter's projects, whether resulting in success or failure, are serviceable to the community. They teach the prudent farmer what to adopt and what to avoid. “Book farmers” though they be, they are yet great public benefactors. And if our common farmers will but become so far book farmers as to learn what others have done and are doing in the various departments of agriculture, and at the

same time will exercise a sound discretion in applying the lessons which may be learned, they will find that these experimentors are their benefactors. For these inquirers—these experimentors—we must occasionally write and select. We did so in our last: we shall do so occasionally in future. And yet, in the main, we hope to direct attention to the abundant and the cheap, rather than the “scarce and costly,” and thus gratify friend Homespun and his kindred spirits, for whom we have a high respect and whose suggestions we highly value.—ED. N. E. FAR.

For the N. E. Farmer.

## THE POTATO.

“Is the potato a root?” is a query put in the N. E. Farmer of the 3d of March. If it be intended to ask if the part which we eat, the tuber as it is called, be a root, the answer must be *no*. “*VERB. SAR.*” is correct in supposing it not to be.

The living covering of almost all parts of plants, except the roots, parts under water, and some fruits, is pierced with small holes called *Stomata*, or pores, which facilitate evaporation. When there is an unusual degree of development of cellular substance, as in fruits, the part is said to be in a state of *anamorphosis*. Fruits and stems in this state have very few or no stomata or perspiring pores. Many people have noticed on potato stems a shining, dark purple tuber at the base or rather in the axilla of each leaf. In some seasons, and on some varieties of the potato, these tubers are common, sometimes exceeding a filbert in size. Now these tubers are situated in the very places from which, by the laws of vegetation, branches would be produced; whence there can be no doubt, but that they are the rudiments of branches, or branches themselves in a state of *anamorphosis*. They are destitute of exhaling pores, and the materials which would have possessed other properties, had these germs become branches, acquire a character rendering them fit for food. The tuber of a potato is a *stem* destitute of pores in the skin, and appearing in a state of unnatural development. The mystery seems to consist in this—that the great amount of starch it contains appears to have been accumulated rather from the want of some of the vessels proper to the plant, than by additional organs by which it might have been elaborated and secreted.

Among dicotyledonous plants, a common, native species of Loose-strife, (*Lysimachia racemosa*,) bears bulbs at the axillæ of the leaves; and among the monocotyledonous plants, we have familiar examples of similar character in the cloves of the garlic, in the top or Canada onion, as well as in the dark purple bulbs at the bases of the leaves of the Leopard Lily, (*Lilium bulbiferum*.) Such plants are sometimes called *viviparous*. G.

*Fairport, Ohio.*

This world cannot explain its own difficulties without the assistance of another.—*Lacon*.

**COWS NOTICED IN THE TRANSACTIONS OF THE ESSEX AGRICUL. SOCIETY.**

The committee to award the premiums offered by the State Society, awarded, for the best cow of native breed, to Albert Johnson, of Lynn, the first premium of \$15. The committee of the County Society on Milch Cows and Heifers, awarded the first premium of \$10 to Charles F. Putnam, of Salem, and the second of \$6, to Albert Johnson, of Lynn. We believe that Mr Putnam's cow was not entered with the committee for awarding the premiums offered by the State Society. The third county premium was given to Hobart Clark, Esq., of Andover. The committee say: "The exhibition of cows was unusually large, and several of these animals possessed remarkable excellence.—Your committee were embarrassed in relation to the best cows, by the fact that Mr Putnam's calved in October, and Mr Johnson's in March; thus bringing the best milking time of Mr Putnam's cow in winter—a season less favorable for a large yield of milk than the summer. Mr Johnson's cow gave more milk per day during some months of the year, than Mr Putnam's; but in the seventh month of the milking of Mr Putnam's cow, she gave 24 quarts more than Mr Johnson's in the sixth month of her milking—rendering it probable that Mr Putnam's cow would yield the larger quantity in a year.—Another fact was embarrassing: the statements of Messrs Putnam and Johnson give us the yield in milk, while Mr Clark gives his in butter; consequently it was difficult, if not impossible, to make a satisfactory comparison. Two other cows, one owned by George Spofford, of Georgetown, the other by Josiah Crosby, of Andover, were very good."

To exhibit with some distinctness the difficulty which this committee may be supposed to have met with, we copy the statements of Messrs Johnson, Putnam and Clark, and shall add our comments.

**ALBERT JOHNSON'S STATEMENT.**

*To the Committee on Milch Cows:*

GENTLEMEN—I present you a milch cow which I bought of Mr Draper, of Danvers, April 22, 1839. He said she was then five years old. She had a calf with her, which I sold when twentyone days old, for eight dollars. We used all we wanted in a family of eight persons, and sold one hundred and twentyfive dollars' worth of milk, at five cents per quart, from the 22d of April, 1839, to February 12, 1840.

The present season she calved the 27th day of March. I then commenced keeping an account of her milk, and the result is as follows: the calf was taken from her when nineteen days old, and weighed twentyfive pounds per quarter—sold for six dollars.

	Lbs.	Qts.
From March 27 to May 1, 33 days,	1102½	or 441
‘ May 1 to June 1, 31 ‘	1397	‘ 569
‘ June 1 to July 1, 30 ‘	1337½	‘ 535
‘ July 1 to Aug. 1, 31 ‘	1145	‘ 458
‘ Aug. 1 to Sept. 1, 31 ‘	998½	‘ 399
‘ Sept. 1 to ‘ 28, 28 ‘	859½	‘ 344
<b>Total,</b>	<b>184</b>	<b>6,840</b>

or, 3 tons, 840 lbs.; averaging, within a fraction, 15 quarts per day, without any estimate of the quantity that the calf took, which was all that he wanted.

The milk sold for five cents per quart, making an income from the milk for six months, of \$136 80  
From sale of calf, 6 00

\$142 80

The largest quantity any one day, fiftytwo lbs., or twenty qts. one and a half pint. Her pasture, until the drought came on, was good, after that I gave her some hay and one bag of shorts. Her milk makes the very first rate of butter, as also a large quantity: the milk is rich and good.

ALBERT JOHNSON.

September 30, 1840.

This may certify, that I milked the above described cow this whole season, and that the amount is correct and truly stated.

NEHEMIAH JOHNSON.

**CHARLES F. PUTNAM'S STATEMENT.**

*To the Committee on Milch Cows:*

GENTLEMEN—The cow offered by me for premium this day, was raised in Vermont, and is six years old. She calved the 25th of October, 1839, and the calf was taken away November 14th. Her feed, from the 15th November to May 15th, has been English hay and one and a half peck of sugar beets per day. From May 15th to this date, she has been in a very poor pasture, and has had two quarts of Indian meal, or three quarts ground oats per day, with hay at night. I have kept an exact account of the milk taken from her at each milking, since November 15th, and shall furnish you with a copy; I shall also furnish the expense of keeping, with the amount of sale of milk. I should be pleased to continue the account to complete the year, if it meets the views of the committee.

The cow is remarkably gentle, and her milk is of very superior quality. Mr James Holt, of Danvers, sold me the cow; she was considered superior for butter, having made in one week 10 lbs. 3 oz., with her second calf. She has had three calves, and will calve again in March.

I am, very respectfully, yours,

CHS. F. PUTNAM.

Salem, Sept. 28th, 1840.

GENTLEMEN—Having kept an accurate account of the milk obtained from my cow, for which a premium was awarded at Georgetown, I submit it to be used as you may think proper.

	Qts.	pts.	gills.
From 1839, Nov. 15 to Dec. 14,	433	0	1
‘ ‘ Dec. 15 to Jan. 13, 1840,	525	1	2
‘ 1840, Jan. 14 to Feb. 12,	405	0	0
‘ ‘ Feb. 13 to Mar. 13,	375	1	0
‘ ‘ Mar. 14 to Apr. 12,	370	1	3
‘ ‘ Apr. 13 to May 12,	342	1	3
‘ ‘ May 13 to June 11,	368	1	1
‘ ‘ June 12 to July 11,	376	0	0
‘ ‘ July 12 to Aug. 10,	302	1	0

‘ ‘ Sept. 10 to Oct. 9,	205	1	0
‘ ‘ Oct. 10 to Nov. 13,	273	0	1

\$4214 0 0

being nearly an average of 12 quarts per day for the year.

This milk I value as follows:

3333 quarts at 6 cents, \$199 98  
881 “ “ 5 “ 44 05

Gross amount of produce, \$244 03

Costs of keeping:  
2 1-2 tons of hay at \$15, 37 50  
68 1-4 bushels sugar beets, 13 05  
6 bushels ground oats, 2 88  
8 bushels Indian meal, 5 20  
Pasturage and driving, 11 00  
Milking, estimated 6 cts. per day, 21 90—91 53

Net produce for the year, \$152 50  
CHS. F. PUTNAM.

Salem, December, 1840.

NOTE.—I have compared the foregoing with Mr Putnam's book of original entries, made daily, and find it to be correct. It forcibly illustrates the importance of selecting animals of the best quality. The difference between keeping good animals and poor ones is, that one are profitable and the other are not. J. W. P.

[NOTE.—J. W. P. is Secretary of the Essex Agricultural Society.—Ed. N. E. FAR.]

**MR CLARK'S STATEMENT.**

*To the Committee on Milch Cows:*

GENTLEMEN—The cow which I offer this day for exhibition, is ten years old. I purchased her from a drove when a yearling. She calved the present season on the 28th of May, and her calf was taken from her when three weeks old. The milk of this cow, the first week, produced fourteen pounds of butter; the second, twelve and three fourths. Her first week's produce is present for your inspection. She has had nothing during most of the season but common grass feed. The average weight of her milk now is twenty pounds. Her calf is present with her. Her age is four months and three days.

I am, with respect,

Your obedient servant,

HOBART CLARK.

Andover, Sept. 30, 1840.

The above statements show that the cows are uncommonly good. We notice that Mr Johnson presumes that 2 lbs. 8 oz. of milk make a quart. But we believe that milk is seldom found to weigh less than 2 lbs. 9 oz. per quart. Milk must be extraordinarily rich that weighs only 2 lbs. 8 oz. We presume that Mr J. was entirely honest in acting upon his presumption, and we intend distinctly not to make the slightest imputation of any thing wrong. But if our belief is well founded, that it takes 41 oz. instead of 40, to make a quart, then the statement is too high by 66 qts. We should therefore subtract \$3 30 from the \$142 80, which the milk and calf were stated to be worth—then there will remain \$139 50. This is a very great income to obtain from one cow in 184 days. The cow we have been informed, would calve again in April.

Mr Putnam's statement contains a very valuable account of the expenses of keeping a cow. His cows are kept in the city, and every thing that they consume is weighed and measured. We presume from our knowledge of his habits, that every thing in the statement is accurate. His measure of the milk, we understand, is that by which he sold to his friends and neighbors. Every reader will perceive that his cow was more profitable during the

twelve months of which he gives the account, than she could be in either the twelve months preceding or following. Having calved in the autumn of '39, and not again until April, '41, the year embraced in the statement is not one from which an unqualified inference is to be made as to her annual produce for years in succession. Our rough guess, at the proper abatement, is, that one half should be deducted from the last half of the year. This will take from the account about 900 quarts or 54 dollars; and the presumed net profits of such a cow, where hay is only \$15 per ton, and where the milk can be disposed of for 6 cents per quart, is the handsome sum of about \$100. Mr P., from the circumstances of his situation, can buy hay cheaper, and can sell his milk to better advantage than most keepers of cows in the eastern part of the Commonwealth. His estimate of the worth of milk must be reduced nearly one sixth in making a comparison of the excellence of his cow and that of Mr Johnson.

There is no difficulty in finding reasons why the committee were embarrassed. It is no easy task to decide which of the two animals is best. We are satisfied with the judgment of the committee, and could have found no fault with them had they awarded differently.

But why should Mr Clark's cow be third, when she made 14 lbs. of butter in a week? Supposing 10 qts. of milk are required for a pound of butter, Mr Johnson's cow in her best month (May) would average about 12 lbs. 5 oz. per week, and Mr Putnam's in her best month (Nov. 15 to Dec. 14) would average only 10 lbs. 8 oz. Mr C.'s cow fell off in the 2d week 1 1-4 lb. and in three months from that time gave milk enough (at 10 qts. to the lb. of butter) for no more than 5 1-2 lbs. per week. We should infer that this too may be an excellent cow, and that a committee might desire to obtain more information concerning her than is conveyed by the statement. The few facts there exhibited indicate a falling off greater than is common, and perhaps greater than actually existed in this particular case.

The statements of Messrs Johnson and Putnam exhibit with great clearness and force, the profits of good cows. Such animals are cheaper, even at the high prices at which they are often purchased, than ordinary cows at the common market price. But the number possessing such excellencies is comparatively small, and may never be large. It however may be augmented by proper care, and our stock growers should spare no pains to make our herds as excellent in milking properties as possible.—ED. N. E. FAR.

### IMPROVEMENT OF STOCK.

Doubtless the best mode of improving the stock of the farm is, by obtaining some of the improved breeds; but is this the only way? Most of our farmers have a good cow or two, with which little if any fault can be found. So with their pigs. Among their sheep also, some have good wool and good carcass, and all may be improved by proper care, either by selecting good animals of their own or a neighbor's to breed from, if the improved breeds cannot conveniently be come at. If this course had been steadily pursued, we should have little need of importing stock; and if this course is not adopted and perseveringly followed, the benefits resulting from imported breeds will be of short duration. On the contrary, how often is the reverse

taken. Some miserable fall calf is left to run and starve his way up to about the size of a buck sheep, is still neglected and runs with the cows; the consequence is that the calves are after this miserable "runt," (to use a significant Yankee phrase,) and show the marks of their sire in every point. To be sure the cow will give milk after bringing forth such a worse than an abortion, which is the only advantage the farmer can derive from his cow, for the calf might better be knocked on the head—it will not pay for raising.

Every farmer can finish the picture for himself with the pigs, sheep, &c.

### Do not sell the best Stock.

Another great reason why some farmers have no better stock is, that they sell or slaughter themselves, their best breeders of the cows, ewes and sows, thus destroying all prospect of improvement.

Does a heifer show a disposition to fatten easy, she is encouraged by feed until fat, and sold or eaten, while her fellows, which appear to be of the breed of Pharaoh's lean kine, are kept for milk and raising calves. Has a farmer a sow pig that becomes fat with the same feed on which the rest of his swine are starving, he gives her the knife and propagates the *frames* and covers them at great expense with corn. Has he a fine, round, bright-eyed ewe, she will be fat about the time that his half-filled pork barrels are empty, and she is stripped of her jacket, the wethers having been sold long before. Thus many farmers go on perpetuating their miserable stock.

### Farmer Pennywise and Farmer Poundwise.

There is farmer Pennywise, with whom I am acquainted, will occasionally raise a good heifer, steer or colt, for his neighbors keep good breeds, and he by accident will be occasionally benefited thereby. When he has such an animal in his flock, he is apparently uneasy until it is disposed of; and after selling such an animal, a heifer, for instance, if you follow him into the house you may hear something like the following: "Well, my dear, I have sold the big heifer for fifteen dollars: is not that a good price for a heifer of her age?" "Good price, indeed," his wife would reply, "you had better have sold two of them little cat-ham'd, crooked-legged, acrawny things that you always keep for cows.—The reason that our cattle look so bad, and that we sell so little butter and cheese is, that you will sell the best heifers." Poor woman! I pity her; her pride and ambition are injured, and her children and self in rags, because her native industry and economy are cramped by the foolish and niggardly policy of her husband.

The picture is reversed in farmer Poundwise, who always keeps his best animals until full grown; then selecting the best breeders for his own use and selling the rest. If he has a good young horse, he will say, that will make me a fine team horse; a mare, she will make a good brood mare. "And what will you do with that?" says his neighbor, pointing to an ordinary animal. "Between you and I," says he, "I shall sell that colt the first chance. Such animals spoil the looks of the rest, and do not pay for keeping." Thus he will sell his poor steers, heifers, sheep and pigs at the first offer. If not sold, he would fatten those that would pay the expense, and give away those that would not. Not pay the expense of fattening! Are there any cattle, sheep, or hogs, that will not pay the expense of fattening? Reader, take some of

each, of the real Pharaoh breed, feed them until fat, keep an exact account of the expense, and you can answer the question yourself. In this way farmer Poundwise always has valuable stock; his steers are ready sale and command a good price; his horses are the best in the neighborhood, and the first to be looked at by purchasers. So with all the animals that he raises. Pennywise, on the contrary, is thronged with an ill-shaped, worthless stock that none will buy and pay the expense of raising; which are continually eating out his substance and making no return. Thus Pennywise drags on a miserable life in the road to ruin, while Poundwise moves easily and happily along in the road to wealth.

This is not all fiction: look about you, reader, and you will see plenty to sit for the picture of Pennywise; and if you have the least suspicion that I mean you, take the opposite course at once. *Chicago Agriculturist.*

### LONG CONTINUED ACTION OF CALCAREOUS MANURES.

To the Editor of the Farmer's Register:

The following facts, communicated to me a short time since by a farmer of Augusta county, may prove interesting to the readers of the Register, especially those of the marl and limestone regions of the State. The facts are these—that in a field of wheat (the last harvest) which was very much injured by the rust, two small spaces escaped entirely, the straw being bright and clean and the grain plump. On one of these spaces a lime-kiln was burned in the year 1810; since which time the field had been frequently cropped. On the other, the ashes from a distillery had been deposited for several years; the distillery, however, had not been in operation for 7 or 8 years. These spaces were, in all respects, treated as the other parts of the field, and their being surrounded on all sides by wheat very badly rusted, shows conclusively that the lime and ashes were the sole causes of the difference.

I hope the foregoing facts will be sufficient to induce some trials of the efficacy of lime and ashes in preventing rust, by those who have the means of doing so; the end in view is of sufficient importance to justify the labor and expense of many experiments. The quantity of lime and ashes, in the example related above, is much greater than can, or perhaps ought, to be applied in ordinary cases, but the lime operated effectively after 30 years, and the ashes after 7 or 8. A much smaller quantity applied annually might produce the same effect.

As lime is an essential ingredient of good wheat soils, may not the many failures of the wheat crop be owing, in some degree, to the absence of lime from most of the land cultivated in that crop?

The efficacy of lime, on what is called limestone land, is strikingly illustrated by the accidental experiment I have detailed above. WM. TATE.

*Lexington, Va.*

The truly great, consider first, how they may gain the approbation of God; and secondly, that of their own conscience; having done this, they would then willingly conciliate the good opinion of their fellow-men. But the truly little, reverse the thing; the primary object with them is to secure the applause of their fellow-men, and having effected this, the approbation of God and their own conscience may follow on as they can.—*Lacon.*

## HOW CAN FARMING BE MADE PROFITABLE?—SUBSOIL PLOUGHING.

Letter of E. Phinney, Esq. to A. Huntington, Esq., published in the Transactions of the Essex Agricultural Society, 1840:

Lexington, Dec. 1, 1840.

A. HUNTINGTON, Esq.—Dear Sir—The question is often asked, How can farming be made profitable? I answer, by liberal manuring, deep and thorough ploughing, and clean culture. I will venture to affirm, without fear of contradiction, that no instance can be cited, where a farmer who has manured his grounds highly, made a judicious use of the plough, and cultivated with care, has failed to receive an ample remuneration for the amount invested—nay more, that has not received a greater advance upon his outlay than the average profit derived from any other business. One great difficulty is, that most farmers seem not to be aware of the fact, that the greater the outlay, to a reasonable extent, when skilfully applied, the greater will be the profit; they therefore manure sparingly, plough shallow, and the consequence is, get poorly paid for their labor. This has raised a prejudice and given a disrelish to the business of farming, especially among those who are in the habit and are desirous of realizing something more from their occupation than a naked return of the amount expended.

The farmer who is so sparing of his manure that he can get but thirty bushels of corn from an acre, gets barely enough to pay him for the expense of cultivation; and in addition to this, by the ordinary method of ploughing, his field, at each successive rotation, is deteriorating, his crops becoming less, and in a few years he finds he must abandon his exhausted and worn out fields, to seek a subsistence for himself and family in some other business, or in some other region, where the hand of man has been less wasteful of the bounties of nature.

Instead then of his scanty manuring of ten cart-loads to the acre, which will give him but thirty bushels of corn, let him apply thirty loads. This additional twenty loads, at the usual price of manure in this part of the country, will cost him thirty dollars. But he now, instead of thirty bushels of corn, gets sixty bushels, and the increased quantity of stover will more than pay for the excess of labor required in cultivating and harvesting the large crop over that of the small one. He has then added thirty bushels of corn to his crop by means of the twenty loads of manure, which at the usual price of one dollar per bushel, pays him in the first crop for his extra outlay. His acre of land is laid to grass after taking off the corn, and the effect of his twenty loads of additional manuring, will be to give him, at the lowest estimate, three additional tons of hay in the first three years of mowing it, worth fifteen dollars a ton standing in the field. Now look at the result. His thirty dollars expended for extra manuring was paid for in the first year's crop, and at the end of three years more he will have received forty-five dollars profit on his outlay of thirty dollars; and in addition to this, his land is improved, and in much better condition for a second rotation. There is no delusion in this. It is a practical result, of the reality of which any farmer may satisfy himself, who will take the trouble to make the experiment.

From no item of outlays can the farmer derive so ample, or so certain a profit, as from his expen-

ditures for manure to a certain extent. This has been most strikingly verified by some of our West Cambridge farmers. It is not uncommon among some of the farmers in that town, to put on their grounds one hundred dollars' worth of manure to the acre, and in more instances than one, the gross sales of produce from ten acres under the plough, have amounted to five thousand dollars in one season. This is the result of high manuring and judicious cultivation of a soil too which is exceedingly poor and sandy.

The subject of subsoil ploughing is one upon which there has been little said, and less done in this part of the country. In all our grounds except those which are very loose and sandy, there is no doubt that great benefit would be derived from the use of the subsoil plough. In England, the effect of subsoil ploughing in increasing their crops, as stated by some agricultural writers, would seem almost incredible. By this means, the crops in that country have been doubled, and in many instances trebled. The expense, however, is stated to be very great—so great, as to be beyond the means of most of our farmers. In one case the expense of subsoil ploughing on a farm of over five hundred acres, was estimated by the owner to cost the enormous sum of thirteen hundred pounds sterling. This calculation took into consideration the use of the heavy Deanston plough, which always required four, and in some stiff clays, six horses to work it. I am aware that an implement might be constructed, which though it might not do the business quite so well, could, nevertheless, be made highly beneficial in the hands of our farmers, and obtained at a far less cost. I am informed that Mr Bosson, of the Yankee Farmer, has, with a highly praise-worthy zeal in the interest of agriculture, imported from England a subsoil plough, which may be worked with a less powerful team than the one commonly in use in that country.

In a climate like our own, which at that season of the year when our crops, particularly our root crops, most need the benefit of moisture that may be derived from deep ploughing, and are most likely to suffer from drought, the use of the subsoil plough would be attended with unquestionable benefit. On a field of my own, which had been set to an orchard, and therefore kept under the plough for some years, in attempting to underdrain a part of it that was usually flooded by water in the spring of the year, I noticed what the English call the "upper crust." This lay some inches below the surface, at the depth to which the land had been usually ploughed, formed by the treading of the oxen and the movements of the plough over it. This I found to be so hard as to be apparently as impenetrable by the roots of plants as a piece of marble, and discovered to me at once the cause of the failure, in a great measure, of my crop of potatoes the year before. Having discovered what I supposed to be the cause of the failure, I set about devising measures to remedy it.

I had never seen a subsoil plough, there never having been one seen or made in this part of the country. I consulted my ingenious friends, Messrs Prouty & Mears, and, at my request, they made an instrument of very cheap and simple construction, consisting of a wooden beam, about three inches square, and three feet long, with three tines or teeth of the common cultivator, placed in a direct line in the beam, extending about eight inches below the beam; to this handles were attached

similar to the handles of a plough. On trying this by running after the drill plough, I found, in my hard, stony subsoil, it was quite inadequate to the business, being too light and of insufficient strength. I then had one constructed of similar plan, but much heavier and stronger. The beam five feet long, six inches square, of white oak, well ironed, with three tines in nearly a right line, made of the best Swedes iron, one and a half inches square, extending twelve inches below the beam, with a spur at the foot, some less than that of the tine of the cultivator, with strong handles and an iron beam extending from each handle to the centre of the beam, by which the balance is easily preserved. This implement, drawn by two yoke of oxen, followed the drill plough in getting in carrots, and performed the work better than I had anticipated. The "upper crust" gave way, the resistance made by the hard, gravelly bottom and smaller stones was readily overcome. The earth was loosened in most places twelve or fourteen inches from the surface, and though not so thoroughly pulverized as it probably would have been by a perfect subsoil plough, yet, in my very hard stony subsoil, I am inclined to believe, that for simple drill husbandry, this will be found to be a valuable substitute for the English subsoil plough. And considering the small price of the implement, and the greater ease with which it is worked, the friction being much lessened by dispensing with the sole, I shall continue to use this until I can find a better. A part of my crop of carrots was sowed upon the same land appropriated to that crop last year; no more manure was applied than in the previous year, and notwithstanding the very severe drought which greatly injured most of our root crops, my crop on this piece of land was nearly double to that of last year. There is no known cause to which I can attribute this great increase of the produce, but the use of my new constructed substitute for a subsoil plough. The soil was stirred to the depth of fourteen inches; by this means the roots of the carrots were enabled to strike deep and thereby not only to find more nourishment, but to overcome, in a great measure, the effects of a very pinching drought.

With great respect,

Your ob't servant,

E. PHINNEY.

### TO THE PUBLIC.

#### *The Operation of Bronchotomy Successfully Performed on the Horse.*

On the 26th of January last, the undersigned was requested to examine a horse, the property of Messrs Charles and F. A. Heath, Esqrs., on Front street. His disease was strangles, or an abscess in the throat, of an unusual character—a consequence of fever or general indisposition. I prescribed for him and continued my visits from day to day till the morning of February the first, when all my efforts having so far proved ineffectual, the swelling and inflammation of the throat were such as to prevent swallowing; respiration had become very laborious, and immediate suffocation inevitable. I proposed an operation on the *trachea*, or wind-pipe. With this my employer was unacquainted, but on my explaining the *modus operandi*, he requested me to do as I thought fit. I immediately commenced operation, excising a portion of the wind-pipe sufficient to admit a small tube; this done,

relief was instantaneous. I continued my former treatment till the seventh, when the swelling, at first hard and painful to the touch, had become soft and elastic. I then made an opening four inches in length, and let off about five quarts of unhealthy matter. On examining the tumor, I found a number of small sinuses or tubes, which I at first thought would protract the cure and increase the difficulty of the case; but on the morning of the 8th, I found my patient looking well;—9th, 10th and 11th, fast improving: on the 12th, I withdrew the tube through which respiration had been performed for twelve days, cleansed the parts, brought the divided edges of the orifice together, and left nature to complete the cure. The horse is now fully recovered, in health, spirits and condition, and is able to perform the ordinary duties assigned him.

CHARLES M. WOOD,

*Veterinary Surgeon, 7 Sudbury st., Boston.*

WE, the undersigned, do hereby certify that Charles M. Wood, Veterinary Surgeon, of this city, attended the above mentioned horse in manner and form as described, and has been very successful; and we cordially recommend him to the public as an attentive and skilful practitioner of veterinary science.

(Signed) CHAS. & F. A. HEATH.

*Boston, March 12th, 1841.*

For the New England Farmer.

#### COL. JAQUES' REMARKS ON THE HORSE.

MR EDITOR—Fastidious must be that reader interesting himself in the welfare of horses, who is not amused by the late remarks of Col. Jaques on the prominent points of this most useful animal, or those points to be observed in the selection of a roadster. Now his description, I must confess, I cannot understand; particularly where he says the shoulder should be something like a shoulder of mutton. Now the shoulder of the sheep is generally upright and the withers are broad and flat on the top. Such shoulders in the horse are called by horsemen, muttony; and such horse, the gentleman states, would be likely to plunge to the ground, and when fatigued would stumble and fall; this is one of the extremes of which Col. I. speaks. Again he says, if the withers are too high, he will appear as if on stilts; and that both extremes are serious impediments to safe and fine action. The gentleman here prefers the medium of the two, but gives you no reason why his hobby should not plunge and fall to the ground. Those two extremes, the gentleman tells you, affect the regular clips and action; and then, to make a long story short, says the whole machine should be of good proportion: the feet, he observes, should be round and steep; heels broad and flat; now steep feet are generally predisposed to contraction, whilst those hoofs which come nearest the standard of excellence in youth, viz: an angle of about 45 degrees, retain the same form, as nearly as the injuries of shoeing will admit of, to an extreme old age. The gentleman here says, the shank or cannon should be short, broad and flat. Now the cannon, or *os metacarpi magnum*, is in form cylindrical, and flattened, posteriorly, into body and two divisions. The coronets and posterns the gentleman prefers of medium length. Now the posterns are divided into long and short, and the coronet, or coronary ring, is nothing short of the bond of union of the short posterior and the hoof—round and not long, as described.

Much, the gentleman says, also depends on the hind leg, as regards strength and speed; the form he likes when in motion, he says, will operate like "a plank sprung edgewise and then let fly." I am pretty conversant with the structure of the horse, but not with the springing of a plank as described. Now in Col. J.'s description of the fore extremity, he has omitted the most essential point, viz: the fetlock; for on this point depends the elasticity of the horse and the safety of the rider. Again—the gentleman has said something about a large cavity under the dock: such a horse, he observes, would be likely to scour, and is, probably, only a door-yard horse. Now suppose there is such a cavity as the gentleman mentions, it does not follow that the horse should scour—nature having made provision against such inconvenience. But it does follow, that if the horse is perfect in this particular point, that improper feeding, labor, or want of care would so disorganize the whole intestinal canal, as to render the animal permanently unsound, loose-bodied, and what Col. Jaques calls a scouring horse.—Again, the gentleman observes, "the dock should be strong and well covered with hair."—I suppose he intended the whole surface should be so protected. But horses intended for the road, should not have too much, as an inordinate growth of hair must be of considerable expense to the economy of itself and have a debilitating effect.

I am compelled, through urgent business, abruptly to desert my subject, but hope to be able to resume it again at no very distant day.

CHARLES M. WOOD,

*Veterinary Surgeon, 7 Sudbury st., Boston.*

These communications from Mr Wood, we received through the hands of the Agricultural Commissioner, for whose use they were written. For this attention we thank Mr Colman; and add, that our invitation privately given to him, when we assumed the charge of the paper, to furnish us, at his convenience, with matter for our columns, was uttered in good faith.

The case of surgical operation is interesting, and the report of it may be serviceable to the public.

The strictures upon Col. Jaques' description of a good horse, are less clear and instructive than is desirable, where one claiming to be "pretty conversant with the structure of the horse," undertakes to guard the public against errors into which he apprehends that people may be led by perusing the statements of another whose skill and judgment upon the subject in question have been both long and widely acknowledged. If Mr Wood will inform us as to his opinions upon the desirable points in a horse, we can better understand wherein he differs from Col. Jaques. We willingly insert the communication, and invite a friendly discussion in our columns. Our request to Mr Wood is, that he shall tell us *what the points are which he himself prefers in the horse*, as well as what he objects to, in the preferences of other writers.—Ed. N. E. FAR.

If hypocrites go to hell by the road to heaven, we may carry on the metaphor, and add, that as all the virtues demand their respective tolls, the hypocrite has a by way to avoid them, and to get into the main road again. And all would be well, if he could escape the *last* turnpike in the journey of life, where all must pay, where there is no by-path, and where the toll is death.—Lacon.

#### MODE OF GUARDING PEACH TREES FROM THE WORM.

To the Editor of the Farmer's Register:

Although my name is not on the list of your subscribers, I have had the satisfaction of reading some of the valuable articles which appear in your journal. Though unacquainted with you personally, as I feel some interest in your periodical, I will take the liberty of introducing myself, by giving a brief sketch of an experiment I have made, with success, on the peach tree; and if you deem it of any importance, or worthy the notice of your readers, you can give publicity to it.

As I consider the peach the most delicious fruit of our latitude, I have long since thought it a desideratum that it should be made independent of the destructive worm which kills the tree. I thought it practicable; and it occurred to me that there was in reach an antidote for the enemy to that luxurious growth. Having observed, in the practice of medicine, that the cedar berry was a powerful vermifuge, I transplanted cedar scions and peach scions together, six years since, in the following manner: I set one of each in a hole, with the roots entangled, and set close together, believing that the strong odor peculiar to the cedar, would prove offensive and sickening to the worm, and thereby prevent its approach to the peach tree.—Every circumstance seemed to conspire in favor of the experiment; there was no danger of the peach tree being choked by the cedar, because the former is a rapid, whilst the latter is of very slow growth. The peach scions bore the second year, and have put forth their leaves as black as a cloud every season, and bore most luxuriantly every season, until the last, which was the sixth year. I have set out a number since, in the same way, which are all flourishing. I think a soil should be selected much mixed with sand, in order to prove successful.

WM. N. ANDERSON.

*Newcastle, Va.*

*Economy in Candles.*—If you are without a rush-light, and would burn a candle all night, unless you use the following precaution, it is ten to one an ordinary candle will gutter away in an hour or two, sometimes to the endangering the safety of the house. This may be avoided by placing as much common salt, finely powdered, as will reach from the tallow to the bottom of the black part of the wick of a partly burnt candle, when, if the same be lit, it will burn very slowly, yielding sufficient light for a bedchamber; the salt will gradually sink as the tallow is consumed, the melted tallow being drawn through the salt, and consumed in the wick.—*Economist.*

Many a man may justly thank his talent for his rank, but no man has ever yet been able to return the compliment, by thanking his rank for his talent. \* \* Those who value themselves merely on their ancestry, have been compared to potatoes—all that is good of them is *under ground*.—Lacon.

The triumphs of truth are the most glorious, because they are the most bloodless of all victories, deriving their highest lustre from the number of the *saved*, not of the *slain*.—*Id.*

Did universal charity prevail, earth would be a heaven, and hell a fable.—*Id.*

**NEW ENGLAND FARMER,**  
AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, APRIL 21, 1841.

**NATIONAL AGRICULTURAL SOCIETY.**

Several able and spirited communications upon this subject, have recently appeared in the columns of the Albany Cultivator. They breathe the spirit of hearts most deeply interested in the agriculture of the country, and indicate a praiseworthy desire to act for the good of this great branch of national industry. The authors deserve the thanks of the public for their intentions, whatever may be the general opinion as to the seasonableness or wisdom of their recommendations. The editors of the Cultivator think that the time has not yet come for the formation of such a society.

The National Intelligencer, of April 17, contains a communication, which states that an attempt "will probably be made during the extra session of Congress to get up a National Society of Agriculture." The further information is given, that "there are hopes of establishing an agricultural school and experimental farm," and that the Smithsonian legacy may be appropriated to this object. This communication indicates the city of Washington as the proper place for the intended operations.

Our sympathies are with those who wish to extend knowledge of the science of agriculture, and who would be glad to render the art more intellectual and attractive. We are ready to lend whatever power we possess, to any association or institution, which shall seem to us fitted to give dignity and new charms to the cultivation of the soil. Should the wisdom which resides in a multitude of counsellors, and which dwells in riper heads than ours, deem the formation of a national society more wise and useful than any other measure that may be suggested, then we shall proffer to such an institution our good wishes and our aid. Many agriculturists in this vicinity, think favorably of the propositions contained in the Cultivator, and some of them will gladly meet their brother farmers of other States in convention, to deliberate upon the matter.

There do not occur to us any objections to immediate action. The present is as favorable as any future day that is likely to arrive. But after much reflection upon the subject, we cannot reason away some weighty objections to a national society, or to the having an experimental farm in or near the city of Washington.

It is presumed that no one can wish it to be in any measure the creature or the tool of the National Government; that no one would be willing to expose it to the disturbing and blighting influences of party strifes and favoritism. It should be the child of agriculturists; and these parents should support and control it at their own expense. Now we have no faith that a sufficient number of competent men exist, who can and will command the time and means necessary for procuring a representation from each of our many States for any length of time. The immense territory over which the officers and members must be scattered, (if it be national in any thing but name,) will render it unwieldy and inefficient. Another difficulty we find in the great dissimilarity of climate, soil and productions of the several sections of the Union. For we cannot anticipate harmonious action, where it would be natural for northern members to occupy time and appropriate funds for gaining information upon the subjects most important to their interests, while southern members would as naturally seek for that which would be peculiarly serviceable where rice, and

cotton, and cane are grown. More limited associations will answer our purposes better.

The suggestion that a national school and pattern farm should be in the District of Columbia, does not strike us favorably. For the North, a school is wanted, where its members can work—where the expenses of living will be moderate—where temptations to immorality will be few, and where the crops of our northern latitude can be cultivated. In the District, custom requires that manual labor shall be performed mostly by the colored population, and this, in connection with the warmth of the climate, would deter the sons of New England men from labor; the cost of living there would be too great for the sons of northern farmers; the habits of the city in winter (we say it with sorrow,) would be too dissipated for us to be willing that our sons should be exposed to its allurements; and the productions of that climate and soil, would fail to afford all the experimental lessons, which would be highly essential to one, who intended to devote himself to husbandry in Yankee land. The inhabitants of the extreme South and West, would make similar objections. The country would be more highly benefited by several schools in different sections.

Nothing can be farther from our design than to throw obstacles in the way of those, who would arouse the public to action upon the subject in question. Our remarks are only an avowal of the results of our reflection upon the subject. All that we ask for them is, a candid consideration. If they are approved and regarded, we shall deem the public wise and prudent; if they are rejected, we shall not call in question the soundness of that discretion which sets them at naught, but shall favor what we judge to be a lesser good, if we cannot obtain the greater.

**NORTHERN AND SOUTHERN CLOVER.**

One of our oldest and most respectable merchants, after reading a paragraph which we copied from the Maine Cultivator, respecting the comparative value of Northern and Southern Clover Seed, wishes us to say, that when he was in trade he bought and sold large quantities of the various kinds of grass seeds, and that it was well known then that the Southern Clover Seed was not suited for use in this climate. All that he could sell to New-England farmers was brought from the states of New-Hampshire and Maine. The Southern seed was considered worse than none.

The above from the Boston Courier is in accordance with the opinion of many of our farmers. Our private opinion accorded with the above until within two or three years. Within that period we have noticed, that though the Northern gives a larger produce the first season, it does it at the expense of the herds-grass and red-top in years following. We believe now, that where land is to continue in grass for three years, the produce will be as abundant, and the first year's growth will be finer and better, to use the Southern than the Northern. It is the opinion of some of the very best farmers in the vicinity of the city, that the Southern is the "only kind the farmer should ever sow." This opinion is extending: whether correct or not, is yet perhaps undetermined.

Our object in noticing the remarks in the Courier, is to say to the Editor and to his respectable informant, that an opinion, once universal, may not be sound; and that the opinion in question is losing its hold in the minds of many observing agriculturists. After listening to the discussions upon this subject at the State House, and making inquiries of many whose experience is valuable, we have come to the conclusion that the one may be as profitable as the other, and therefore, for our own use the present season, have procured the Southern seed because it comes much cheaper.

[Communicated.]

**LIEBIG'S AGRICULTURAL CHEMISTRY.**

This day published, by J. Owen, Cambridge, and for sale at the principal bookstores, "Organic Chemistry, in its applications to Agriculture and Physiology—by Justus Liebig, F. R. S., Professor of Chemistry in the University of Giessen. With an Introduction, Notes and Appendix, by J. W. Webster, M. D., Professor of Chemistry in Harvard University."

"This work is written with a rare degree of sagacity, and is full of immediate practical applications of incalculable importance. From its appearance we may date a new era in Agriculture, and the imagination cannot conceive the amount of improvement which may be expected from the application of the principles here developed."—*Dr. W. Gregory's Remarks to the British Association for the Advancement of Science, Glasgow, Sept. 1840.*

April 19th, 1841.

¶ This communication gives us desirable information. We are happy in the opportunity now afforded for obtaining a work which we have for many weeks been anxious to peruse. We expect to find in the volume much valuable matter; but we must withhold all expression of our own opinion until we shall have examined the work.—ED. N. E. FAR.

**TRANSPLANTING TREES.**

Many trees are lost by setting them too deep in their new bed. There is a natural anxiety to do all that can be done to make a young fruit or ornamental tree live and flourish. By this anxiety many people are influenced to place the roots deep, and to make a hollow or cup of earth around the trunk, thinking thus to give roots greater protection and abundant moisture. Perhaps the particular objects they have in view are thus accomplished. But they, by this course, place the roots where they are too cold, and cannot perform their proper offices. The most experienced nursery-men in this vicinity inform us that the lateral or horizontal roots should be placed about on a level with the surface of the ground; and that the other roots should be allowed to take the same relative position in the ground that they occupied before the tree was taken up. After the tree has been properly placed, earth up over the roots letting the ground slope from the trunk. It is a good course to dig a large and deep hole, and to fill it up by replacing the earth, or putting in other earths more fertile. Small stones, in the bottom of the holes, have been found eminently serviceable to the growth and health of trees. Orchards have flourished well where the trees have been placed upon the surface of the ground without digging, and then a load of soil put upon the roots of each tree. Avoid getting them much below the surface of the surrounding soil.

**TRANSACTIONS OF THE ESSEX AGRICULTURAL SOCIETY.**

We are indebted to J. W. Proctor, Esq., the attentive and efficient Secretary of the Society, for a copy of the Transactions for 1840. It contains the able and sound Address of A. Huntington, Esq., which we noticed and copied in part several weeks since. Then follows the instructive letter of E. Phinney, Esq., which we insert today. The reports of committees and the valuable communication of Dr. A. Nichols, we intend to notice in subsequent numbers.

[Want of space compels us to omit the remainder of the editor's remarks.—Print.]

The publication of our paper is delayed this week on account of the funeral solemnities in the city yesterday.

**THERMOMETRICAL.**

**BRIGHTON MARKET.—MONDAY, APRIL 19, 1841.**

Reported for the New England Farmer.

At Market 200 Beef Cattle, 15 pair of Working Oxen, 25 Cows and Calves, 310 Sheep, and 970 swine.

**PRICES.—Beef Cattle**—In consequence of the limited number at market an advance was effected. We quote extra \$7 00 a 7 25. First quality, 6 75 a \$7 00. Second quality, \$6 25 a 6 50. Third quality, \$5 50 a 6 00.  
**Working Oxen**—Sales were effected at \$72, \$80, \$90, \$95 and \$105.  
**Cows and Calves**—Sales, \$20, \$22, \$28, \$33, \$35 \$37.

**Sheep**—Lots \$3 75, \$4 25, \$4 75 and \$5 00.  
**Swine**—A small advance was effected. A large proportion at market were sold at 4 1-2 for sows, and 5 1-2 for barrows. A few lots at 4 1-4 and 5 1-4. At retail from 5 to 6 1-2.

**WHOLESALE PRICES CURRENT.**

Corrected with great care, weekly.

**SEEDS.** Herd Grass, very little in market. Red Top, new seed by the bag 50 to 55 c. Clover—Northern, 13c.—Southern, 8 to 9 c. Flax Seed, \$1, 37 to 1 50 bu. Lucerne, 25 c. per lb.

**FLOUR.** Howard Street \$5 37—Genesee \$5 31—Ohio \$5 12.

**GRAIN.** Corn—Northern Yellow none—Round Yellow 54 to 56—Southern Flat Yellow none—White 48.—Rye—Northern 60 to 65—Southern 50 to 55. Oats—Southern 30 to 31—Northern 35 to 40.

**PROVISIONS.** Beef—Mess \$10 50 to 11 00—Prime \$6 50—No. 1 \$9 00. Pork—Extra—15 00—Clear 14 50—Mess \$13 00. Hams—Northern 9 c. per lb.—Southern, none. Lard—Boston 9 c. per lb.—Southern, 8 to 8 1-2. Butter—Lump 18 to 22—Firkin 12 to 18—Shipping 8 to 14. Whole Hogs 5 1-2 to 6 c.—Pigs 5 c.

**HAY**, per ton, \$18 to 19—Eastern Screwed \$14 50.

**CHEESE**—Old 11 c.—New 8.

**EGGS**, 14 a 16.

**WOOL**—The market for this article has not experienced any change of late. Pulled Wool is rather scarce, and there is but a limited supply of low Fleeces, and of fine Fleeces the stock is also moderate. Prime or Saxony Fleeces, washed, lb. 50 to 55 c.—American full blood, washed, 47 to 50—Do 3-4 blood, washed, 44 to 46—Do. 1-2 blood, washed, 36 to 40—1-4 and common do, 35 to 37—Smyrna Sheep, washed, 20 to 23—Do. unwashed, 10 to 14—Bengasi Sheep, 8 to 10—Buenos Ayres unpicked, 7 to 10—Superfine Northern pulled lamb 43 to 46—No. 1 do. do. 37 to 42—No 2 do do 26 to 30—No 3 do do 18 to 20.

**DRAFT AND TRACE CHAINS.**

Just received by Packet Coromanda, 400 pair Trace Chains, suitable for Ploughing. 200 " Truck and leading Chains. 200 " Draft Chains. For sale by J. BRECK & CO., No. 52 North Market st. April 21

**FENCE CHAINS.**

Just received from England, 10,000 feet Chains, suitable for Fences or other purposes. For sale by J. BRECK & CO., No. 52 North Market st. April 21

**TYE UP CHAINS.**

Just received by Packet Coromanda, 500 Chains for tyeing up Cattle. These chains, introduced by E. H. DEAY, Esq. of Salem, and Col. JACQUES, for the purpose of securing cattle to the stall, are found to be the safest and most convenient mode of fastening cows and oxen to the stanchion. For sale by J. BRECK & CO., No. 52 North Market st. April 21.

**MASSACHUSETTS HORTICULTURAL SOCIETY.**

At a meeting, held April 10th, 1841, the Executive Committee were instructed not to receive any reports of Committees, awarding premiums, for the past year, after Saturday the 24th instant. E. M. RICHARDS, Recording Secretary. April 14. 2w

**WILLIS'S LATEST IMPROVED SEED SOWER.**

Willis's latest Improved Seed Sower, invented the last season; one of the most perfect machines ever introduced for the purpose. In using this machine, the farmer may be certain that his seed is put into the ground, and at the same time in the best possible manner. There has been a great difficulty in machines for sowing garden seeds; they are very apt to clog up, and the farmer might go over an acre of land and not sow a single seed; but not so with this; it is so constructed that it cannot possibly clog. In using this sower, the farmer can save one half of his seed, and do the work at less than one quarter the expense of the common way of sowing seeds, and have it done in a much better manner; it opens the furrow, drops the seed, and covers it over and rolls them down. It will sow almost any kind of Garden Seeds; say Ruta Baga, Mangel Wurtzel, Turnips, Carrots, Beets, Parsnips, Onions. It is highly recommended by a great number of persons who used it the past season. For sale at the N. E. Agricultural Warehouse and Seed Store by JOSEPH BRECK & CO. March 31.

**WINSHIP'S NURSERY,**

BRIGHTON, NEAR BOSTON,

Situated on the line of the Boston and Worcester Railroad, —5 miles from the city.

The Proprietors of this extensive nursery beg leave to inform their friends and the public, that they are ready to furnish orders to any amount, for Forest Trees, indigenous and exotic. Fruit Trees, including all the varieties of Pears, Peaches, Plums, Nectarines, Cherries, &c. &c.

Vines—Shrubs, Green House Plants, &c. Catalogues may be obtained by applying at the Nursery. Trees carefully packed, to ensure safety in long voyages. Orders left at the New England Seed Store of J. BRECK & CO. Nos. 51 and 52, North Market street, will be delivered the day following, and left at any part of the city, free of expense.

Letters containing orders, addressed to the subscribers, J. & F. WINSHIP. Brighton Nurseries, March 24, 1841.

**BONE MANURE.**

The subscriber informs his friends and the public, that after ten years experience, he is fully convinced that ground bones form the most powerful stimulant that can be applied to the earth as a manure.

Price at the Mill 30 cents per bushel, put up in casks or hds. containing from 4 1-4 to 17 bushels each as the purchaser may desire or order, and delivered at any part of the city at 35 cents per bushel, and no charge for casks or carting.

Also, Oyster Shell Lime, price 8 cents per bushel at the kiln, put up in casks, 4 bushels each, at 50 cents per cask delivered at any part of the city.

Orders for Bone Manure or Oyster Shell Lime, left at the Bone Mill, near Tremont road, in Roxbury, at the New England Agricultural Warehouse and Seed Store, No 52 North Market Street, or through the Post Office will meet with prompt attention. April 7, 1841. NAHUM WARD

**BEDFORD OATS.**

Just received 60 bushels of superior Bedford Oats. This variety is highly recommended, it not being liable to blast, and very productive. For sale by JOS. BRECK & CO. March 31.

**SUPERIOR SEED BARLEY.**

100 bushels of extra heavy and clean Seed Barley. Also 30 bushels CHEVALIER BARLEY, a new and superior variety, for sale by JOS. BRECK & CO. March 31.

**BLACK SEA WHEAT.**

Received from Vermont, 30 bushels Black Sea Wheat. Also, 20 bushels Italian Spring Wheat, raised in Warren, N. H. For sale by JOS. BRECK & CO. March 31.

**AGRICULTURAL IMPLEMENTS, &c.**

The Proprietors of the New England Agricultural Warehouse and Seed Store No. 51 and 52 North Market street, would inform their customers and the public generally that they have on hand the most extensive assortment of Agricultural and Horticultural Tools to be found in the United States. Part of which are the following:

1000 Howard's Patent Cast Iron Ploughs	100 doz. Cast Steel Shovels.
300 Common do. do.	150 " Common do.
200 Cultivators.	100 " Spades.
160 Greene's Straw Cutters.	500 " Grass Scythes.
50 Willis' do. do.	300 " Patent Snaths.
100 Common do. do.	200 " Common do.
100 Willis' Patent Corn Shellers.	500 " Hay Rakes.
50 Common do do.	200 " Garden do.
200 Willis' Seed Sowers.	200 " Manure Forks.
50 " Vegetable Cutters.	300 " Hay do.
50 Common do. do.	500 Pair Trace Chains.
200 Hand Corn Mills.	100 " Truck do.
200 Grain Cradles.	100 " Draft do.
100 Ox Yokes.	500 " Tie up do.
1500 Doz. Scythe Stones.	50 doz. Halter do.
3000 " Austin's Rifles.	1000 yards Fence do.
	25 Grind Stones on rollers.

**FRUIT AND ORNAMENTAL TREES, &c.**

NURSERY OF WILLIAM KENRICK.

12,000 Pear and Plum Trees.—Large and new additions of Pear and Plum Trees have lately been received, many kinds of which are alike new to our country, and very extraordinary. Such have been the selections which have been made by the subscriber in Europe, and in person, during the last Autumn, where all have been proved; those kinds already well known amongst us being identified by him by the wood and the leaf.

All orders addressed to the subscriber, or left with Joseph Breck & Co., New England Farmer Office, will be promptly attended to, and Trees, when so ordered, will be securely packed for safe transportation to distant places.

WILLIAM KENRICK.

Nonantum Hill, Newton, near Boston, March 2.

**PEAR, PLUM, GRAPE VINES, &c.**

3000 Pear Trees, of the most approved kinds. 2000 Plum Trees, of the most approved kinds and extra size—many of them have borne this season. Apple, Cherry and Peach Trees, of different kinds.

500 Quince Trees. 4000 Isabella and Catawba Grape Vines, from 6 to 15 feet high; most of them have borne fruit. Black Hamburg, Sweetwater, Pond's.

30,000 Grant Asparagus Roots. Gooseberry, Currants, Raspberries, of good kinds. 5000 Wilmot's Early Rhubarb or Pie Plants, lately introduced.

2000 Cherry and Pear Stocks; 1000 Plums; Roses, &c. of all kinds.

All orders sent to the subscriber at Cambridge port or with JOSEPH BRECK & CO., will meet with immediate attention.

SAMUEL POND.

Cambridgeport, Mass., Feb. 24.

**PLUMS, PEARS, GOOSEBERRIES, &c.**

Just received by JOSEPH BRECK & CO., from London, a fine assortment of Plum and Pear Trees, which are offered at reduced prices, including the following

**PEARS.**

Belle Lucrative,	Catillac,
Mouille Bouche,	Williams' Bon Chretien or Bartlett,
Josephine,	Jargonell d'Espagne,
Beurre Spence,	Echasserie,
" Capiamont,	Urbaniste,
" Bosc,	Duchess d'Angouleme,
" Diel,	St. Chislain,
" d'Aremhurgh,	Madaline d'Carne.
Easter Beurre,	

**PLUMS.**

Green Gage,	New Orleans,
Purple Gage,	Imperatrice,
Diamond,	Reine Claude,
Washington,	Royal d'Tours.
Golden drop,	

Gooseberries, White and Red Currants, Raspberries and every article in the Nursery line furnished at short notice. JOS. BRECK & CO., No. 52 North Market Boston. April 7, 1841.

**GRINDSTONES.**

An extensive assortment of Water and Hand Grindstones constantly on hand and for sale by AMMI C. LOMBARDI & CO. 13 Lewis's Wharf. 15ly. Nov. 17.

## MISCELLANEOUS.

[From the Christian Journal.]

## A FATHER TO HIS MOTHERLESS CHILDREN.

Come gather close to my side,  
My little smitten flock—  
And I will tell of him who brought  
Pure water from the Rock;  
Who boldly led God's people forth  
From Egypt's wraith a guide—  
Once a cradled babe did float  
All helpless on the Nile.

You're weary, precious ones, your eyes  
Are wandering far and wide,—  
Think ye of her who knew so well  
Your tender thoughts to guide?  
Who could to Wisdom's sacred lore  
Your fixed attention claim—  
Oh never from your heart's erase  
That blessed mother's name.

'Tis time to sing your evening hymn—  
My youngest infant dove;  
Come press thy velvet cheek to mine  
And learn the lay of love.  
My sheltering arms can clasp you all,  
My poor deserted throng;  
Cling as you used to cling to her,  
Who sings the Angel's song.

Begin sweet birds the accustomed strain  
Come, warble loud and clear—  
Alas! alas! you're weeping all,  
You're sobbing in my ear.  
Good night—go say the prayer she taught,  
Beside your little bed;  
The lips that used to bless you there  
Are silent with the dead.

A Father's hand your course may guide  
Amid the thorns of life—  
His care protect these shrinking plants  
That dread the storms of strife:  
But who upon your infant hearts  
Shall like that mother write?  
Who touch the springs that rule the soul?  
Dear mourning babes, good night.

*Bed Warming by an Irishman.* A gentleman from Danvers being at the Franklin House, in Providence, one night last winter, before retiring gave directions to the Irish servant to warm his bed. After waiting below a sufficient time, as he thought, to enable the servant to accomplish his purpose, the gentleman betook himself to his chamber, where he found Patrick very industriously employed in circulating the warming-pan to and fro under the bed, between the bedstead and the floor. Restraining his laughter as well as he was able, the gentleman told the servant he could never warm the bed in that way. "But beggin' your honor's pardon, sir," interrupted Pat, flourishing his fire-arms more briskly than ever, "beggin' your honor's pardon, sir, it's me that'll give it a good warmin'"—and round and round went the warming pan through the thin air, poor Patrick meantime puffing and blowing with the intensity of his exertions, to the great amusement of our friend, the traveller. Pat resisted for some time the directions of the gentleman, insisting that the bed would be burned up if he brought the pan of coals in contact with the clothes, and his scruples were not overcome, nor could he be induced to proceed in the usual manner, until he had turned down all the bed clothes, drawn the pan over the surface of the bed, and seen with his own eyes that the operation might be performed with safety.—*Salem Reg.*

There are no two things so much talked of, and so seldom seen, as virtue and the funds.—*Lacon.*

The following is related in the February number of the *Kniekerbocker*:

"Dr. Aspen's episode of tooth-drawing, reminds us of a country patient somewhat akin to his, who called on one of our most eminent dentists, being 'troubled with a raging tooth,' which he wished extracted. Seating himself, the polished instrument was displayed before his eyes, and the next moment the tormenter was placed in his hand.—'Well, doctor,' said he, 'how much do you ax for the job? Guy! but you did it quick, though.'—'My terms,' replied the dentist, 'are one dollar.'—'A dollar—for half a minute's work!! One dollar!!! THUNDER! Why, a doctor down't our place drew a tooth for me, two years ago, and it took him two hours. He dragged me all round the room, and lost his grip half a dozen times. I never see such hard work: and he only charged me twenty-five cents. A dollar for a minute's work! O git about!—you must be jokin'!" This economical victim was but following out the popular utilitarian doctrine, that the labor necessary to produce a result, should form its standard of value."

## GARDEN SEEDS,

For sale by JOSEPH BRECK & Co. at the New England Farmer Office, No. 51 and 52 North Market St. Boston. The subscribers would inform the public that they have now on hand the largest collection of seeds ever before offered by sale in this city, embracing every variety of *Field, Kitchen, Garden, and Ornamental Flower Seeds* desirable for this or any other Climate.

Our seeds are either raised under our own inspection or imported from responsible houses in Europe, and having taken extraordinary pains to obtain such as are pure and genuine, we can confidently recommend them to our customers and friends, and feel assured they will prove satisfactory to all who try them.

Dealers in seeds are requested to forward their orders in season. Boxes for retailing from 8 dollars, and upwards will be sent out on commission allowing a liberal discount and take back what remain unsold.

Letters and orders with good reference will meet with prompt attention.

## FIELD SEEDS

Sugar Beet.	Ruta Baga.
Mangel Wurtzel.	Ballatine's New Royal do.
New Red Globe do. } superior	White Tankard Turnip.
Yellow do. } varieties.	Red do.
Carrot Long Orange.	Red Round do.
" Altringham.	White do.
" New White, extra fine.	White Globe do.
Pumpkin, sorts.	Green Round do.
Wheat—various sorts.	Purple Top Hybrid do.
Barley, do.	Buckwheat.
Rye, do.	Broom Corn.
Potatoes, do.	Millet.
Indian Corn, do.	Buckthorn. } for Hedges.
Oats, do.	Locust.

## GARDEN SEEDS.

Artichoke, Asparagus, Beans of every description, Beets of sorts, Borecole, Broccoli, Brussels Sprouts, Culliflower, Caraway, Celery, of the most improved sorts, Cabbage 20 sorts, Carrot, all the varieties, Cucumber do, Cress, Egg Plant, Endive, Indian Corn, Kale, Leek, Lettuce in great variety, Melons, do. Martynia, Mustard, Nasturtium, Okra, Onion of sorts, Pepper do. Pumpkin do. Parsnip, Parsley, Peas, a very great variety, Rhubarb for tarts, Radish of sorts, Salsify, Squash of sorts, Tomato, Turnip 20 varieties.

## SWEET AND POT HERBS.

Thyme	Sweet Basil.
Sweet Marjorum.	Lavender.
Sage.	Lemon Balm.
Summersavory.	Anise.
Medicinal Herbs, &c.	

## ORNAMENTAL FLOWER SEEDS.

Three hundred varieties, embracing all the finest sorts. Packages of 20 fine sorts for one dollar.

Those who prefer to have their Seeds put up in papers ready for retail, can be accommodated—each packet neatly closed and labelled with printed directions. Price 50 cents, per dozen papers, which are retailed here at 6 1-4 cents each.

Fruit and ornamental trees, of the greatest variety, supplied at nurseryman's prices, and orders solicited. These will be packed, when required, to go to any part of the U. States. JOSEPH BRECK & CO.

## HOWARD'S IMPROVED EASY DRAUGHT PLOUGH.

Great improvements have been made the past year in the form and workmanship of these Ploughs; the mould board has been so formed as to lay the furrow completely overturning in every particle of grass or stubble, and leaving the ground in the best possible manner. The length of the mould board has been very much increased, so that the Plough works with the greatest ease, both with respect to the holding and the tenn. The Committee at the late trial of Ploughs at Worcester, say,

"Should our opinion be asked as to which of the Ploughs we should prefer for use on a farm, we might perhaps say to the inquirer, if your land is mostly light and easy to work, try Prouty & Mears. but if your land is heavy, hard or rocky, BEGIN WITH MR. HOWARD'S."

At the above mentioned trial the Howard Plough did more work, with the same power of team, than any other plough exhibited. No other turned more than twenty-seven and one half inches, to the 112 lbs. draught, while the Howard Plough turned twenty-nine and one half inches, to the same power of team! All acknowledge that Howard's Ploughs are much the strongest and most substantially made.

There has been quite an improvement made on the shoe, or land side of this Plough, which can be renewed without having to furnish a new landside: this shoe likewise secures the mould board and landside together, and strengthens the Plough very much.

The price of the Ploughs is from \$6 to \$15. A Plough, sufficient for breaking up with four cattle, will cost about \$10 50, and with cutter \$1, with wheel and cutter, \$2 50 extra.

The above Ploughs are for sale, wholesale and retail, at the New England Agricultural Warehouse and Seed Store, Nos. 51 & 52 North Market Street, by

JOSEPH BRECK &amp; CO.

## STRAWBERRIES! STRAWBERRIES!

The subscriber would offer to the public, the present season, his *Selected Collection*, consisting of seven varieties; they are such as have stood the test of a fair trial for seven years, and all grown by the subscriber.

*Warren's Seedling Methven*, a new and valuable kind, a free bearer, fruit very large and juicy; fruit measuring 5 1-2 inches have been exhibited the present season. This variety can be warranted to be one of the finest varieties grown, and will produce as fine fruit and as large quantity, with the same cultivation, as any other ever offered. The price of this Seedling is \$5 00 per hundred plants.

*Methven Castle*.—Fruit extremely large, high flavored and showy; specimens of this fruit have been shown this season six inches in circumference. Price three dollars per hundred plants.

*Keen's Seedling*.—A very superior variety, fruit very large, rich dark color, and uncommonly high flavored. Price three dollars per hundred.

*Royal Scarlet*.—Fruit long oval shaped and juicy, very free bearer, and very hardy. Price two dollars.

*Hautbois*.—Fruit larger than English Wood, exceedingly numerous, sometimes yielding 100 berries to the plant.—Price two dollars.

*Early Virginia*.—This is known to be the earliest and best fruit for market, a free bearer and very hardy. Price two dollars.

*English Wood*.—Fruit well known for years. Price one dollar.

Every plant sent from this garden will be warranted to be free from mixtures, and shall also be young and healthy, worth the price paid for them.

All orders directed to the subscriber, including the amount for the order, or with a good reference, shall be promptly attended to, and the plants carefully forwarded agreeably to directions. JAMES L. L. F. WARREN.

March, 24.

Nonantum Vale, Brighton.

## NEW ENGLAND FARMER.

A WEEKLY PAPER.

The Editorial department of this paper having come into the hands of the subscriber, he is now authorized by the publishers to inform the public that the price of the paper is reduced. In future the terms will be \$2 per year in advance, or \$2 50 if not paid within thirty days. ALLEN PUTNAM.

N. B.—Postmasters are required by law to frank all subscriptions and remittances for newspapers, without expense to subscribers.

## ON EXPERIMENTS ON MANURES.

To the Trustees of the Essex Agricultural Society:

GENTLEMEN—The committee to whom was referred the communication of Dr. Andrew Nichols, on the subject of compost manures, have at several times visited his farm in Middleton, where he has made experiments. The soil is naturally light, and for many years has been severely cropped without receiving much manure. The number of live stock kept upon the farm is small, and but little manure has been purchased. The distance from any place where animal manure can be purchased at a reasonable rate, seems almost to preclude his means of obtaining it. Under such difficulties Dr. Nichols has been very successful in the manufacture and application of a compost, the ingredients of which are meadow mud, ashes and a small proportion of animal manure. His success has been extraordinary, as will be evident to any one who knows the exhausted condition of the soil, and who has witnessed the heavy crops it is made to yield.

In the application of liquid manure made from meadow mud and potash, Dr. Nichols has been less successful this year than in his last year's experiment. A farther trial may establish or overthrow his theory on this subject. We hope he will continue his experiment, for it is of as much consequence that farmers should know what applications are useless or hurtful, as what will produce abundant harvests.

The committee recommend that the communication of Dr. Nichols be published; they also desire him to furnish for publication, the analysis of the mud, and an essay on the subject of peat mud, muck, sand, &c., as promised in said communication, and they recommend that the Society pay Dr. Nichols for his successful experiments, and valuable communications, a gratuity of ten dollars.

For the Committee,

DANIEL P. KING.

Danvers, Dec. 1840.

## ANDREW NICHOLS' STATEMENT.

To the Committee to whom was referred the communication of Andrew Nichols, on the subject of Compost Manures, &c.

GENTLEMEN—Having invited the attention of the Trustees of the Essex Agricultural Society to our continued use of, and experiments on, fresh meadow or peat mud, as a manure, it is, of course, expected that the result of these experiments should be laid before them. The compost with which we planted most of our corn and potatoes the present year, was composed of the same materials, and managed in the same manner as that which we used last year for the same purpose. (See Essex Agricultural Transactions for 1839, p. 35.)

[Although Dr. Nichols' statement for '39 was

inserted in this paper last year, we have thought it best to republish, because the subject is one of the most important to the farming interests that at present engages the attention of agriculturists. The great desideratum is, a cheap and expeditious method of rendering peat and muck food for plants. Dr. Nichols brings science, many years' careful observation, and a good stock of experience to bear upon the laws by which the growth of plants is carried on and increased. We saw his fields in '39, and were satisfied that he then obtained good crops, at much less than the ordinary expense for manure.—ED.]

### Dr. Nichols' Statement of 1839.

Persuaded of the importance of the discoveries made by Dr. Samuel L. Dana, of Lowell, and given to the world through the medium of the reports of Professor Hitchcock and Rev. H. Colman, to the Legislature of Massachusetts, concerning the food of vegetables, geine, and the abundance of it in peat mud, in an insoluble state to be sure, and in that state not readily absorbed and digested by the roots of cultivated vegetables, but rendered soluble and very easily digestible by such plants by potash, wood ashes, or other alkalies, among which is ammonia, one of the products of fermenting animal manures, I resolved last year to subject his theories to the test of experiment the present season. Accordingly I directed a quantity of black peat mud, procured by ditching for the purpose of draining and reclaiming an alder swamp, a part of which I had some years since brought into a state highly productive of the cultivated grasses, to be thrown in heaps. During the winter I also had collected in Salem, 282 bushels of unleached wood ashes, at the cost of 12 1-2 cents per bushel. These were sent up to my farm, a part to be spread on my black soil grass lands, and a part to be mixed with mud for my tillage land. Two hundred bushels of these were spread on about six acres of such grass land, while it was covered with ice and frozen hard enough to be carted over without cutting it into ruts. These lands produced from one to two tons of good merchantable hay to the acre, nearly double the crop produced by the same lands last year. And one fact induces me to think, that being spread on the ice, as above mentioned, a portion of these ashes was washed away by the spring freshet. The fact from which I infer this, is, that a run below, over which the water coming from the meadow on which the largest part of these ashes were spread flows, produced more than double the quantity of hay, and that of a very superior quality to what had been ever known to grow on the same land before.

Seventy bushels of these ashes, together with a quantity not exceeding thirty bushels of mixed coal and wood ashes made by my kitchen and parlor fires, were mixed with my barn manure, derived from one horse kept in stable the whole year, one other horse kept in stable during the winter months, one cow kept through the winter, and one pair of oxen employed almost daily on the road and in the woods, but fed in the barn one hundred days. This

manure was never measured, but knowing how it was made, by the droppings and litter or bedding of these cattle, farmers can estimate the quantity with a good degree of correctness. These ashes and this manure were mixed with a sufficient quantity of the mud above mentioned by forking it over three times, to manure three acres of corn and potatoes, in hills four feet by about three feet apart, giving a good shovel full to the hill. More than two thirds of this was grass land, which produced last year about half a ton of hay to the acre, broken up by the plough in April. The remainder was cropped last year without being well manured, with corn and potatoes. Gentlemen, you have seen the crop growing and matured, and I leave it to you to say whether or not the crop on this land would have been better had it been dressed with an equal quantity of pure, well rotted barn manure. For my own part, I believe it would not, but that this experiment proves that peat mud thus managed, is equal if not superior to the same quantity of any other substance in common use as a manure among us; which, if it be a fact, is a fact of immense value to the farmers of New England. By the knowledge and use of it, our comparatively barren soils may be made to equal or excel in productiveness the virgin prairies of the west. There were many hills in which the corn first planted was destroyed by worms. A part of these were supplied with the small Canada corn, a part with beans. The whole was several times cut down by frost. The produce was three hundred bushels of ears of sound corn, two tons of pumpkins and squashes, and some potatoes and beans. Dr. Dana, in his letter to Mr Colman, dated Lowell, March 6, 1839, suggests the trial of a solution of geine as a manure. His directions for preparing it are as follows: "Boil one hundred pounds of dry pulverized peat with two and a half pounds of white ash, (an article imported from England,) containing 36 to 55 per cent. of pure soda, or its equivalent in pearlash or potash, in a potash kettle, with 130 gallons of water; boil for a few hours, let it settle, and dip off the clear liquor for use. Add the same quantity of alkali and water, boil and dip off as before. The dark colored brown solution contains about half an ounce per gallon of vegetable matter. It is to be applied by watering grain crops, grass lands, or any other way the farmer's quick wit will point out."

In the month of June I prepared a solution of geine, obtained not by boiling, but by steeping the mud as taken from the meadow, in a weak lye in tubs. I did not weigh the materials, being careful only to use no more mud than the potash would render soluble. The proportion was something like this: peat 100 lbs., potash 1 lb., water 50 gallons; stirred occasionally for about a week, when the dark brown solution, described by Dr. Dana, was dipped off and applied to some rows of corn, a portion of a piece of starved barley, and a bed of onions sown on land not well prepared for that crop. The corn was a portion of the piece manured as above mentioned. On this the benefit was not so obvious. The crop of barley on the portion watered, was more than double the quantity both

in straw and grain to that on other portions of field, the soil and treatment of which was otherwise precisely similar.

The bed of onions which had been prepared by dressing it with a mixture of mud and ashes previous to the sowing of the seed, but which had not by harrowing been so completely pulverized, mixed and kneaded with the soil as the cultivators of this crop deem essential to success, consisted of three and a half square rods. The onions came up well, were well weeded, and about two bushels of fresh horse manure spread between the rows. In June, four rows were first watered with the solution of geine above described. In ten days the onions in these rows were nearly double the size of the others. All but six rows of the remainder were then watered. The growth of these soon outstripped the unwatered remainder.

Mr Henry Gould, who manages my farm on shares, and who conducted all the foregoing experiments, without thinking of the importance of leaving at least one row unwatered that we might better ascertain the true effect of this management, seeing the benefit to the parts thus watered, in about a week after, treated the remainder in the same manner. The ends of some of the rows, however, which did not receive the watering, produced only very small onions, such as are usually thrown away as worthless by cultivators of this crop. This fact leads me to believe that if the onions had not been watered with the solution of geine, not a single bushel of a good size would have been produced on the whole piece. At any rate, it was peat or geine rendered soluble by alkali, that produced this large crop.

The crop proved greater than our most sanguine expectations. The onions were measured in the presence of the chairman of your committee, and making ample allowance for the tops which had not been stripped off, were adjudged equal to four bushels to the square rod, or at the rate of 640 bushels to the acre. In these experiments, 7 lbs. of potash which cost 7 cts. a pound, bought at the retail price, were used. Potash, although dearer than wood ashes at 12 1-2 cts. per bushel, is I think, cheaper than the whiteash mentioned by Dr. Dana, and sufficiently cheap to make with meadow mud, a far cheaper manure than such as is in general used among our farmers. The experiment satisfies me that nothing better than potash and peat can be used for most if not all our cultivated vegetables, and the economy of watering with a solution of geine, such as are cultivated in rows, I think cannot be doubted. The reason why the corn was not very obviously benefited, I think, must have been, that the portion of the roots to which it was applied, was already fully supplied with nutriment out of the same kind from the peat ashes and manure put in the hill at planting. For watering rows of onions or other vegetables, I should recommend that a cask be mounted on light wheels, so set that like the *drill* they may run each side of the row and drop the liquid manure through a small tap hole or tube from the cask, directly upon the young plants. For preparing the liquor, I should recommend a cistern about three feet deep and as large as the object may require, formed of plank and laid on a bed of clay and surrounded by the same, in the manner that tan vats are constructed; this should occupy a warm place, exposed to the sun, near water, and as near as these requisites permit to the tillage lands of the farm. In such a cistern, in warm weather, a solution of geine

may be made in large quantities with little labor and without the expense of fuel, as the heat of the sun is, I think, amply sufficient for the purpose. If from further experiments it should be found economical to water grass lands and grain crops, a large cask or casks placed on wheels and drawn by oxen or horse power, the liquor from the casks being at pleasure let into a long narrow box perforated with numerous small holes, which would spread the same over a strip of ground, some 6, 8, or 10 feet in breadth, as it is drawn over the field in the same manner as the streets in cities are watered in summer.

ANDREW NICHOLS.

I certify that I measured the piece of land mentioned in the foregoing statement, as planted with corn, on the 21st of September, 1839, and found the same to contain two acres, three quarters, thirty-one rods.

JOHN W. PROCTOR,  
Surveyor.

#### Continuation of Dr. Nichols' Statement for 1840.

Four acres of corn, on the same kind of soil, was manured in the hill with this compost, and one acre of corn on a more meagre portion of the same field, was manured in the same manner, with a compost consisting of the same kind of mud, half a cord of manure taken from the pigsty, and forty pounds of potash, second quality, dissolved in water, sprinkled over and worked into the heap, with the fork, in the same manner that the dry ashes were into the other compost. Of both kinds the same quantity, a common iron or steel shovel full to the hill, was used, and no difference in the crop which could be ascribed to the different manures, could be perceived. The hills were four by three feet apart on an average. In the borders and adjoining this piece of corn, one acre was planted with potatoes. The compost used on some portions of this consisted of rather a larger portion of coarse barn manure composed of meadow hay, corn fodder waste, &c., wet with the urine and mixed with the droppings of cattle, and less meadow mud. The whole six acres was hoed twice only after the use of the cultivator. The whole amount of labor after the ground was furrowed and the compost prepared in heaps on the field, is stated by the tiller of the ground, H. L. Gould, to have been forty-nine days' work, of one man, previous to the cutting of the stalks. Pumpkins, squashes, and some beans were planted among the corn. The produce was four hundred and sixty bushel baskets of sound corn, eighty bushels of potatoes, three cords of pumpkins, one and a half bushels of white beans. On one acre of the better part of the soil, harvested separately, there were one hundred and twenty baskets of corn ears, and a full proportion of the pumpkins. On one eighth of an acre of Thorburn's tree corn treated in the same manner as the rest, the produce was nineteen baskets. A basket of this corn shells out seventeen quarts, one quart more than a basket of the ordinary kinds of corn. The meal for bread and puddings is of a superior quality. Could we depend upon its ripening, for, Thorburn's assertions to the contrary notwithstanding, it is a late variety of corn, (though it ripened perfectly with us last season, a rather unusually warm and long one,) farmers would do well to cultivate it more extensively than any other kind.

The use of dry ashes on our black soil grass lands, showed an increased benefit from last year. But our experiments with liquid manure disappointed us. Either from its not being of the requisite

strength, or from the dryness of the season, or from our mistaking the effects of it last year, or from all these causes combined, the results confidently anticipated, were not realized; and from our experiments this year we have nothing to say in favor of its use, although we think it worthy of further experiments. On the first view of the subject, a dry season or a dry time might seem more favorable to the manifestations of benefit from watering plants with liquid manure, than wet seasons or times. But when we consider that when the surface of the earth is dry, the small quantity of liquid used would be arrested by the absorbing earth ere it reached the roots, and perhaps its fertilizing qualities changed, evaporated, or otherwise destroyed, by the greater heat to which at such times it must be exposed—it is not, I think, improbable that the different effects noticed in our experiments with this substance, the two past years, might be owing to this cause. It is my intention, should sufficient leisure permit, to analyse the soil cultivated and the mud used, and prepare a short essay on the subject of peat mud, muck, sand, &c., as manure, for publication in the next volume of the transactions of the society.

Yours, respectfully,

ANDREW NICHOLS.

Danvers, December 26, 1840.

#### NOTICES

*Of Liebig's Organic Chemistry of Agriculture and Physiology.*—Just published by J. Owen, Cambridge, Mass.

This work has already acquired great reputation in Great Britain, and several notices and reviews of it have appeared in the foreign journals, all of which unite in expressing their high estimation of its contents. Three lectures have been recently delivered on Agriculture, at Oxford, by Dr. Daubeny, the distinguished Professor of Chemistry and Botany, in which he has illustrated and adopted Professor Liebig's views.

"Every page contains a mass of information. I would earnestly advise all practical men, and all interested in cultivation, to have recourse to the book itself. The subject is vastly important, and we cannot estimate how much may be added to the produce of our fields by proceeding on correct principles."—*Loudon's Gardener's Magazine for March, 1841.*

In alluding to this work before the British Association for the Advancement of Science, Dr Gregory remarked;—

"Every thing was simple and clearly explained. It was the first attempt to apply the newly created science of Organic Chemistry to Agriculture. In his opinion, from this day might be dated a new era in the art, from the principles established by Professor Liebig. He was of opinion, that the British Association had just reason to be proud of such a work, as originating in their recommendation."

The following is from the address at the Anniversary Meeting of the Royal Society, November 30, 1840, when one of the Copley medals was awarded to Professor Liebig, in presenting which, the President, the Marquis of Northampton, thus addressed Professor Daniell, who, in the absence of Professor Liebig, received from him the medal:—

"I hold in my hand and deliver to you one of the Copley medals, which has been awarded by us to Professor Liebig. My principal difficulty, in

the present exercise of this, the most agreeable part of my official duty, is to know, whether to consider M. Liebig's inquiries as most important in a chemical or in a physiological light; however that may be, he has a double claim on the scientific world, enhanced by the practical and useful ends to which he has turned his discoveries."

"It is the best book," writes Mr. Nuttall, "ever published on Vegetable Chemistry as applied to Agriculture, and calculated undoubtedly to produce a new era in the science."

Extract from a letter from Rev. H. Colman, Commissioner for the Agricultural Survey of Massachusetts, dated February 15th, 1841;—

"It is the most valuable contribution to Agricultural science, which has come within my knowledge. It takes new views on many subjects, which have been long discussed without any progress towards determinate conclusions; and reveals principles, which are of the highest importance. Some of these principles require farther elucidation and proof; but, in general, they are so well established by facts within my own observation, that in my opinion the truth, if not already reached, is not far distant."

From Silliman's Journal, January, 1841:—

"It is not too much to say, that the publication of Professor Liebig's Organic Chemistry of Agriculture, constitutes an era of great importance in the history of Agricultural science. *Its acceptance as a standard is unavoidable, for, following closely in the straight path of inductive philosophy, the conclusions which are drawn from its data are incontrovertible.*"—"To some, the style of this work may seem somewhat obscure; but it will be found, on a re-perusal, that great condensation, brevity, and terseness, have been mistaken for obscurity."—"We can truly say, that we have never risen from the perusal of a book with a more thorough conviction of the profound knowledge, extensive reading, and practical research of its author, and of the invincible power and importance of its reasonings and conclusions, than we have gained from the present volume."

In the notice from which the foregoing is extracted, the learned editors enumerate among the most important chapters, those on manure, the composition of animal manure, the essential elements of manure, bone manure, the supply of nitrogen by animal matter, mode of applying urine, value of human excrements, &c.

The Second Part of the work is a masterpiece of condensed reasoning on chemical transformations, fermentation, decay, and putrefaction, and on contagion, poisons, and miasms.

#### DISCOURSE,

*On the objects and importance of the National Institution for the Promotion of Science, established at Washington, 1840, delivered at the first Anniversary.* By JOEL R. POINSETT, Secretary of War and Senior Director of the Institution. Washington: 1841.

This discourse states the spheres and objects of several of the sciences, and their connection with the useful arts. We read it with much satisfaction, deeming it worthy of an occasion which required the services of a discriminating and well furnished mind. The following passages we offer to our readers.

"This Institution has allotted one entire division

to Agriculture. This must be considered the most important, as it is the most necessary of the useful arts, as well as the most essential to our existence in a state of civilization. The hunter or the shepherd can do no more than supply himself and his children with food. Such a people have no surplus for those who follow other pursuits; whereas in an agricultural community a portion of the people only are engaged in raising grain and cattle to supply the remainder with food, who, in their turn, are employed in the useful or fine arts, or in the pursuits of literature and science; and it may be safely asserted that the degree of civilization in any country will be in proportion to the perfection of its agriculture. Cicero says, "there is no better pursuit in life, none more full of enjoyment, or more worthy a freeman," and surely there is none which contributes more largely to the wealth and independence of a country. Like all the useful arts, it is dependent upon science for its perfection. Sir Humphrey Davy's work upon agricultural chemistry shows its intimate connection with that science, and we have already remarked the application of geology to its uses. One of the greatest improvements of farming in modern times, so fruitful in improvements of every kind, is the free use of mineral manures. Lime, in some form or other, must enter into the composition of every soil, to render it fertile; and where the chemist fails to detect it in the land, he supplies it artificially. A knowledge of the analysis of soils is therefore necessary to every good farmer. The use of mineral manures is beginning to be well understood, and to be generally practiced in our country; but there are two things that appear either not to be fully comprehended, or not to be sufficiently brought into successful operation; the one is to make a given quantity of land yield for a series of years, the maximum amount of produce it is capable of by high culture and a judicious rotation of crops, and the other is the art of irrigation. The great economy of making a small portion of land yield as much as a large one, must be too obvious to require explanation, and the manner of effecting this important object is to be learned by the application of scientific principles to husbandry. The wonderfully fertilizing effect of water has been understood for ages, and the art of irrigation has been practised from time immemorial. The scriptures are filled with beautiful poetical allusions to this art, which proves its antiquity, and it is still practised in every part of Asia, throughout the south of Europe, and in that portion of America settled by the Spaniards. In those countries are seen extensive works of irrigation, and where the depth of the bank of the river and the low level will not allow canals being taken out for the purpose, the Persian wheel, an instrument of great power and antiquity, is used. Often, indeed, water is drawn by this means from deep wells, to irrigate the fields, while in our finely watered country this great advantage is neglected. I have traversed, in a period of drought, the rich and fertile valleys of Virginia, and seen the corn and grass perishing for want of moisture, while a bountiful stream ran gurgling along the side of the hill, wanting only to be tapped to restore the withering plants and scorched grass to new life and vigor. In the South, irrigation is practised in the cultivation of rice, but only in the low country, by means of the ebb and flow of the tide, and for that plant alone. With this exception, there, as elsewhere throughout our country, the farmers do not avail them-

selves of the great natural advantages they enjoy in having the means of irrigation within their reach, but trust altogether to the uncertain seasons. As a thorough knowledge of this art would more than double our agricultural products with the same labor, this Institution will confer a benefit on their fellow citizens, by instructing them in the best methods of watering and draining their fields. In the south of Europe, canals of irrigation have been constructed by the ablest engineers of the age, and I cannot but think that our own civil engineers would find their account in becoming acquainted with this art, while at the same time they might render an invaluable service to their country.

"Entomology, which teaches the nature and habits of insects, is an important branch of natural history to the planter and farmer. It will enable him to protect his fruit trees, his grain and cotton fields, from their ravages; and an acquaintance with ornithology will aid him to distinguish what birds serve as auxiliaries for this purpose.

"It will be the duty of this Institution, likewise, to use its best endeavors to introduce into our country new varieties of wholesome, nutritious, and pleasant articles of food. With our extended commerce, this duty may be readily performed; and here let me remark, that agriculture has attained a high degree of perfection only among great commercial nations. The two arts depend mutually upon each other, and the cultivation of the one leads to the extension and advancement of the other."

\* \* \* \* \*

"My colleagues have already exhibited so much zeal and industry, that they require no exhortation from me to persevere in their efforts to promote the objects of our Institution, and in their contributions to the union and progress of the arts and sciences. Constituted as this Society is, few of its members can bestow their whole time to the purposes of the Institution; but all may devote some portion of it to this object. The mind requires relaxation from the labors of a trade, or profession, or the cares of state; but, like the soil we cultivate, it need not be left for that period to grow up in noxious weeds. Relaxation from intense application to our important duties may be found in the pursuits of literature and science. It is an error to suppose that letters cannot be cultivated without neglecting the fulfilment of the obligations we owe to our families or to our country. On the contrary, the man who devotes his leisure to the acquisition of knowledge will invigorate his mind, and better fit himself to fulfil his more important duties, than if he had passed those moments in frivolous amusements; and the pursuit itself, by leading us to an intimate acquaintance with the works of nature, cannot fail to elevate our minds to the contemplation of that Being who 'in wisdom has made them all,' and to inspire us with devout gratitude to Him who has endued us with intelligence to comprehend his marvellous works."

It has been said, that men carry on a kind of coasting trade with religion. In the voyage of life, they profess to be in search of heaven, but take care not to venture so far into their approximations to it, as entirely to lose sight of the earth; and should their frail vessel be in danger of shipwreck, they will gladly throw their darling vices aboard, as other mariners their treasures, only to fish them up again when the storm is over.—Lacon.

## EXTRACTS FROM A LETTER TO THE EDITOR.

MR PUTNAM—\* \*—My experience in feeding roots in the winter to milch cows, has been this.—Arranging according to their value, I place them as follows: Potatoes, sugar beet, carrots and then turnips. The difference I have found between the same quantity of feed has been from four to six quarts of milk daily in favor of potatoes, given to nine cows, which I have milked this winter: from one week's feeding carrots to nine cows, they fell off in milk on the seventh day six quarts; and on return to potatoes, the milk made its return in the same ratio as the decrease on carrots, or nearly the same.

I consider it was the drought that injured my sugar beets, which I made mention of in my last. And further, I believe they or some of them were injured by thinning them out too much at the last hoeing in July.

Seed Sower—once more. Is Willis' Seed Sower drawn by horse or by hand? Is it adapted to planting corn in the field? If so, I think I shall order one in a few weeks.

[It is wheeled by hand. It is intended soon to have some fitted for planting corn, beans, &c. as well as smaller seeds.—Ed.]

The muck I spoke of in my first, made from the waste of a calico factory, is now frozen in places to the depth of four or five inches, after having been drawn out on to a piece of high-dry land. What do you think of such materials as these for manure? Where some of the same stuff was drawn out and spread on meadow land last fall, it has a green and fresh appearance of forward grass. And while I am on the subject of manures, let me say a few words on the importance of manure.—You, Mr Putnam, cannot say too much through the columns of the Farmer on this subject. The vast importance of this article has not been sufficiently attended to by farmers in general, although it is the principal source of their riches. Without it, after all their care and labor, they can have but miserable crops. Therefore every farmer who wishes to reap the fruits of his labor, should carefully attend to the increase of his manure. The true farmer will endeavor to thrive by increasing the quantity and quality of his manure;—he never allows heaps of manure to remain under the windows of his stables, exposed to the wash of rain and other injuries that may befall it in such a situation: where it is practicable, he will have a suitable cellar under his barn for the reception of his manures, to be there well mixed with other and different materials, by his Berkshire or other kinds of swine. And here I would observe that the hog sty, properly attended, will be found to be one of the best and richest sources for the increase of this important article. Almost any quantity may be made in connection with a well regulated piggery, provided the owner will be as careful to feed his hog sty as the swine confined in it. I firmly believe more can be done under this head, than has yet been accomplished, if we make the best use of the means within our reach:—all the waste, pro and con, should be daily collected, from all the places where it may be found, and deposited in the best bank of discount, which every true farmer has within his own premises, viz: *Hog Sty Bank*. This bank should have a suitable situation, for fear that the various enemies might come within its walls, and injure, if not finally purloin and carry off, a

large share of the precious metals that should be deposited within its vaults for the furtherance and maintenance of the solidity of the character of the institution in the public mind. Mr Putnam, make a long and strong appeal to my brother farmers of New England, to rebuild and maintain within their own possession such a bank as I have been speaking of, and then be careful to attend daily to the payment of all demands in favor of the institution: success will be certain to follow in the dividends of this institution. I believe there is no other branch of husbandry that is more valuable on the whole than this. For if it be true that sometimes, and even often, the proceeds of pork in the market do not much if any exceed what might have been taken for the grain and other things which have been consumed in the various operations of the different functions of the institution, still the manure is an ample dividend for all services rendered the establishment; and it is what the farmer must have, and what he could not procure in sufficient quantity in any other way. Economy must be used in this as in all things else:—true economy consists in supplying the officers of this institution with food to eat, mud and other materials to keep the precious metals in constant employment—not with a parsimonious hand to deal out the food and other materials necessary for the full operation of the bank.

I for one say, friend Putnam, call often upon the farmers of New England to make the most on this subject of manure, for it is the main-spring of all the operations of the farmer. And I shall ever remain your well-wisher and friend.

O. CHACE, JR.

Tiverton, R. I., April 15th, 1841.

We heartily join in the call of friend Chace upon the farmers, to invest in the bank which he recommends, and shall reiterate the call in the loudest possible tones. And we advise them forthwith, as soon as they have drawn out their spring dividends, to supply the officers of the bank with means for profitable operations in the favorable business months of April and May. Farmers, do not wait until after planting for a leisure time for picking up something to put into the hog sty, but go and get materials for the pigs to work upon the very day that you finish cleaning out the sty.—Ed. N. E. Far.

For the New England Farmer.

## MANAGEMENT OF COWS AFTER CALVING.

MR EDITOR—I lately attended a meeting of an agricultural society, where remarks were made on the management of cows after calving. The questions presented for consideration were the following:

1st. Is it advantageous to let cows drink the biestings or the first milk after calving?

2d. Is it beneficial or detrimental to have cows eat the afterbirth?

3d. When the secundine adheres, and nature is obstructed in her operations, can any thing be given to the cow to remove it?

On the above questions the members of the society differed in opinion, as people do on all questions and subjects. As the questions I believe are important, I wish, Mr Editor, you would give your opinion, or any of your correspondents.

Westboro.'

A HERDSMAN.

In reply to the first of these questions we find nothing to communicate. One fact, however, is obvious. Nature having designed the milk for the offspring, it is unnatural food for the mother.

In reply to the other inquiries, we extract the following from Youatt's Treatise on Cattle—pages 544 and 5:

*Attention after Calving.*—Parturition having been accomplished, the cow should be left quietly with the calf; the licking and cleaning of which, and the eating of the placenta, if it is soon discharged, will employ and amuse her. It is a cruel thing to separate the mother from the young so soon; the cow will pine, and will be deprived of that medicine which nature designed for her in the moisture which hangs about the calf, and even in the placenta itself; and the calf will lose that gentle friction and motion which helps to give it the immediate use of all its limbs, and which, in the language of Mr Berry, "increases the languid circulation of the blood, and produces a genial warmth in the half exhausted and chilled little animal." A warm mash should be put before her, and warm gruel, or water from which some of the coldness had been taken off. Two or three hours afterwards, it will be prudent to give an aperient drink consisting of a pound of Epsom salts and two drachms of ginger. This may tend to prevent milk fever and garget in the udder. Attention should likewise be paid to the state of the udder. If the teats are sore, and the bag generally hard and tender, she should be gently but carefully milked three or four times every day. The natural and the effectual preventive of this, however, is to let the calf suck her at least three times in the day if it is tied up in the cow-house, or to run with her in the pasture, and take the teat when it pleases. The tendency to inflammation of the udder is much diminished by the calf frequently sucking; or should the cow be feverish, nothing soothes or quiets her so much as the presence of the little one.

*The Cleansing.*—The placenta, or *after-birth*, or cleansing, should be discharged soon after the calving. It soon begins to act upon the uterus as a foreign body, producing irritation and fever; it likewise rapidly becomes putrid and noisome, and if it is then retained long, it is either an indication of a weakly state of the cow, or it may produce a certain degree of low fever that will interfere with her condition. Every cowleech therefore, has his cleansing drink ready to administer; but it is too often composed of stimulating and injurious drugs, and which lay the foundation for after disease. The aperient drink recommended to be given after calving, with the addition of half a pint of good ale to it, will be the best assistant in this case and the only thing that should be allowed.

"Should the cleansing continue to be retained, some have recommended that a weight of six or eight ounces should be tied to the cord, the gentle and continual action of which will usually separate the placenta from its adhesions, without any risk of hemorrhage; but if the after-birth should still remain in the womb, and decomposition should evidently commence, the hand must be introduced into the passage, and the separation accomplished as gently as possible.

"There is, however, a great deal more fear about this retention of the after-birth than there needs to be, and it is only the actual appearance of inconvenience or disease resulting from it, that would justify a mechanical attempt to extract it."

From the Farmer's Monthly Visitor.

### ON RAISING OF WHEAT.

#### *Preparation of Seed to prevent Smut.*

The preparation of the seed I take from an English account published some years since, which practice I have adopted for five or six years past with success, and I do think much of it.

Make a brine of common salt strong enough to bare up a hen's egg: then put in your wheat, not more than the brine will cover. Stir it and skim as long as any thing will rise. It will float off all the light kernels of wheat, oats, light kernels of cockle, smut, or anything that is injurious to the seed. Then take the wheat out, and put into the same brine another lot, and so on till you have cleaned all you wish. After washing put the wheat into a heap—let it lay six hours—then mix a sufficient quantity of dry ashes, plaister of Paris or lime; then immediately sow your wheat. I am very particular as to time.

The result is, I have not found but two smut heads since I adopted this method, and I think it beneficial in preventing worms from destroying the seed, as well as adding to the growth of the wheat. The English account says, (as well as individuals with whom I conversed from England) that it has been tried on a farm for forty years, and was always successful. More proofs from the same account I might offer; but I am satisfied from my own experience of the beneficial results.

#### *Weeding of Wheat.*

I weed my wheat always twice. The first time when the wheat is three or four inches high; then again just before it begins to head out. I use an instrument called a grub. It is like a cabinet maker's gouge, about one and one-fourth of an inch in diameter, with a socket into which I insert a handle, say four or five feet long. With this instrument one man may go over a large piece of ground in a day. The method is to take the grub and cut off a thistle, dock, or any thing that is injurious to the wheat at the surface of the ground, and leave it on the spot where it is cut off. A field that has had this dressing will look much better: weeds always take the start of the wheat and retard the growth. This practice always pays the farmer a great price for his labor.

#### *Harvesting Wheat.*

I commence cutting my wheat when it is very green, when I find the kernel is out of the milk and about as hard as flour dough, which you may know by squeezing the kernel between your fingers. I then cut it as fast as I can, either in fair weather or not. I do not let it lay in the gravel on the ground exposed either to the sun or rain, but bind it up in single bands near the butt, set it up in stooks of eight bundles on the ground in the form of a pair of rafters, the butts as far apart as possible with two sheafs put on the top for protection. In this way it will dry very quick, and the sap in the straw will afford nourishment to the kernels sufficient to prevent it from shrinking too much. By this method I find the kernel retains all its goodness, and the straw makes excellent fodder for neat stock, because it retains all the sap that the wheat does not absorb. Wheat cured in this way thrashes very easy, and will not shell out by carting to the barn.

I think farmers are not aware how green they

may cut their wheat, and what a saving they may have in the quality of wheat and straw. They have only to try this method, and I feel assured they will find it to their interest.

In the summer of 1838, I sowed one and three-fourths of an acre of wheat in one lot. When harvested and threshed, I had seventy bushels. One full acre was stouter than the three-fourths; therefore I calculate the one acre produced forty-two bushels, and the three-fourths at the rate of thirtyeight bushels to the acre. The kind of wheat sowed was Siberian and red chaff. I generally sow to the acre one bushel and a half of seed. I have had the most wheat to the acre when sown from the 15th to the 20th of May. My usual crop of wheat is from 25 to 30 bushels to the acre, with common tillage.

#### *Preparation of Land.*

I plough and harrow my wheat land three or more times, and harrow between ploughings till I think it sufficiently mellow before sowing. I like the practice, after sowing the last time, of going over the ground to have it done with a light bush. It leaves the surface of the ground smoother and covers all the bare kernels. I seldom can make my wheat ground too rich or rich enough. I apply barn yard manure with about an equal quantity of leached ashes from my potash, ashes that I have used for the last twelve or fourteen years on tillage and mowing land in lots in different years from three to eight thousand bushels. After they have been thrown out from the ashery, I find leached ashes are valuable on all tillage land in preventing worms from destroying the seed.

A few years since a neighbor of mine planted a piece of corn on his land adjoining mine: soil naturally about the same. The worms destroyed his corn before weeding, so that he did not hoe it and had no crop, while I had from fifty to sixty bushels to the acre. Leached ashes are good on mowing land if spread on the surface. They will prevent a large white worm which often cuts off the roots of the grass under the surface of the ground. The reason is obvious. They do but little injury on ground where leached ashes are used. The quantity I apply generally to the acre, is about twelve ox cart loads, with as much more barn yard manure. The farm which I occupy is an upland farm, strong and retentive soil. Leached ashes are good on dry mowing lands, and I find from experience, have a good effect on quite a moist soil.

#### *General Remarks.*

I sometimes hear farmers say they do not believe in the idea of book farming. In answer, I would say, if my neighbor raises 40 bushels of wheat to the acre, and another 75 bushels of corn to the acre, another raises from 400 to 600 bushels of potatoes to the acre, and another cuts from three to four tons of hay to the acre, which I have done for years past, and the land is not impoverished, is this book farming or an experiment worth publishing? Will it be known unless it is communicated to the public in the Farmer's Monthly Visitor, or some other publication? I am persuaded it is of importance to Farmers to know how this is done, the kind of soil on which it is done, and the method of cultivation.

I think much of the improvements that are now making in our country in farming, and I do think every farmer ought to take or read an agricultural

publication for his own benefit and that of his sons—"to teach the young idea how to shoot."—I am persuaded that the farmer who can raise as much bread on five acres of land as he used to do on ten, or make two bushels of wheat grow where he formerly did but one, ought to communicate his experience to the public. We complain of hard times, and that the banks do not discount. The best remedy for a farmer is to know that he has a bank on his farm, and that he is the only director. If he so manages to raise more than he wants for his own consumption and many kinds of produce to sell, we shall not hear so much about hard times.

TH. FULLER.

Enosburgh, Vt., March 12, 1841.

From the Western Farmer and Gardener.

### SOIL FOR APPLE TREES.

The successful cultivation of the apple depends very much on the suitability of the ground they are planted in. The size and flavor of the fruit, the general health and duration of trees, are most commonly the result of good or bad soil. Climate and situation also affect both trees and fruit, but not in the degree in which the same are affected by the qualities predominant in the land. Of all the different descriptions of soil to be met with, that of a soft hazel loam, containing a small portion of sand, seems to be most congenial to the apple generally. In such soil the tree is seen to flourish longest, is most productive, and remains freest from disease or attack of insects. A great depth is not requisite; eighteen or twenty inches deep being quite enough, provided it be on a dry subsoil of gravel or loose rock. If the bottom be wet, the trees should be planted high, and every means taken to drain the ground. A wet bottom of gravelly clay should be avoided if possible.

Deep, rich soils in sheltered situations are not the most proper for the apple, for it is often seen that apple trees succeed well in any kind of loam, though it be not more than one foot in depth, so as the bottom is sound and dry, the roots take an extensive horizontal range, the young wood is always of more moderate growth, and better ripened, than when roots strike deep into the ground.

Although local circumstances often control the works of the planter, compelling him to fix on a site where the soil may not be exactly what is recommended above, he must, in this case, endeavor to make the soil by trenching, draining, and by addition of the qualities wanting, bring it as near to the standard as possible.

*Situation and Aspect for Planting Trees.*—The situation of an orchard should neither be in the bottom of a narrow valley, nor on the top of a hill: in the first, the young wood is never so well ripened, the buds are often too early excited in the spring, and there frosts are always more intensely felt: in the second, fruit-bearing trees are always too much exposed to winds. The most desirable site is the side of a hill which slopes gently to the southeast, that being the most sheltered situation in this western country. But when the violence of a west wind is broken by an intervening rise of ground, a southwest aspect has been found equal to any.

True contentment depends not upon what we have;—a tub was large enough for Diogenes, but a world was too little for Alexander.—Lacon.

## NEW ENGLAND FARMER, AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, APRIL 28, 1841.

### PLANTING CORN.

*Preparation of the Ground.* Where the land will admit of deep ploughing, such is to be preferred. Seven or eight inches of soil, at least, should be turned up. If more than this can be moved, let it be done. As soon as the ground is ploughed, let the roller be applied; thus put all the furrows down in their proper places, and break all lumps. Next, harrow well lengthwise the furrow; then harrow crosswise the furrows. This is for new or sward land, which we have found to be better than any other for corn.

*Manure.* It is not good husbandry in this vicinity, to apply less than seven or eight cords of good manure to the acre for this crop. Let one half of this quantity be spread upon the grass and turned under the sod. The other half having been previously formed into a heap in the field, and thrown over two or three times, should be spread upon the surface of the furrows, immediately after the rolling of the land, and then be harrowed in.—Plant in *hills*, from 3 ft. 3 in. to 3 ft. 6 in. each way. A greater distance will give larger ears, but not so much corn to the acre.

*Seed.* Put from 8 to 10 kernels in the hill. Thus furnish a good supply for worms, birds, &c. Subsequently, thin down to four or five stalks. No preparation of the seed is of any service where the land is in proper condition, where no enemy is to be repelled, and where you plant between the first and middle of May.

These directions are for lands well suited to corn.—On moist lands, it may be well to put manure in the hill and to earth up the corn. But on all others the manure should be spread; for though in June and July, the corn will not be as forward as if manured in the hill, yet careful experiment has shown that *in the half bushel*, in autumn, it will be more productive. The stalks never become quite as large. On lands not moist, avoid hilling.

These remarks are the results of several years' observations and experiments, where this crop has been cultivated with much more than ordinary success.

### TREATMENT OF HIRED MEN.

*Entreat not evil the hireling that bestoweth himself wholly for thee.—ECCLESIASTICUS.*

Art thou a man employing others to till thy grounds? Then remember that thou hast a Master who commands thee not to over-task or to abuse them. They are free men—the rights of free men are theirs. Often they are your equals in intelligence, character and respectability. Both duty and interest require you to regard their rights. They may demand, at reasonable times, as much palatable and wholesome food as is needed to preserve unimpaired their health and strength. They may demand as many hours for rest and sleep as the human constitution ordinarily requires. They may demand comfortable beds, in rooms not unhealthy. They may refuse such excessive efforts or great exposures as would prematurely break down the constitution. They may claim kindness and civility in all your language towards them, and in all your treatment of them. It is no part of their contract that they shall listen to oaths and curses, should such things pass your lips. It is no part of the contract that they shall bear such mental suffering, as unreasonable reproaches, unprovoked fault-finders, or ungoverned passions on your part, may produce.—

Until they forfeit it by misconduct, they may claim your confidence that they will be faithful to you and to your interests. When found unfaithful, let the fault be stated, and a full mutual understanding be obtained. But it is bad, very bad for both employer and employed to be suspicious of each other. Mutual confidence is for the comfort and good of both.—“Every body knows every thing;” and if you undertake to thrive by keeping laborers on a short allowance, by working them an excessive number of hours, by dint of scolding and fretting, by any secret artifices, they will read your heart's secret purposes, and will find ways and means to thwart you in the accomplishment of your designs. Imprudence and injustice on the part of employers, create in part the untrustworthiness complained of in the employed. We may preach next to the employed—the hired.

### THE WEATHER.

You would not see the darkest side,

You would not be complaining—

But, farmer, can your temper stand

This raining, raining, raining?

The weather cock is rusted east,

Unscour'd the plough's remaining,

The wash is soaking in the tub—

'T is raining, raining, raining.

The harness oiled, the corn shelled out,

Done, all the sawing, planing—

The winds still give an ague fit,—

'T is raining, raining, raining.

The door-post by his shoulder held,

His hands in pockets playing,

The farmer gazes east and west—

'T is raining, raining, raining.

Mud thickens on the kitchen floor,

The good wife's patience straining;

Restless the men go in and out—

'T is raining, raining, raining.

It's dismal dull for man and beast,

But let's have no complaining—

We'll hope, we'll trust all's well, e'en when

'T is raining, raining, raining.

It is needless for us to say that we are no poet. We were never charged with any poetical propensities. But the long—long cold storm of a week past, brought to mind a song once heard, and failing to remember it in full, we have stolen such parts as recollection could gather up, and spliced and added to them till they assumed the form in which they are here presented.

The great quantity of rain which has fallen within the week past, together with the degree of cold accompanying it, will render the ground unfit for the reception of seed for several days to come. Sowing and planting must be performed at a later period of the year than is usual in this vicinity. But in this fact there is no cause for discouragement. The forward seasons are not usually more productive than others. Our observation teaches, that even Indian corn is more productive in those seasons when it makes but slow progress in June, than in those in which its early growth is rapid. We do not say that its chances for escaping autumnal frosts are as great, but merely that it is more productive in case the latter part of the season favors it in maturing. Our grass, potatoes and grains, as well as most of our fruits, are ordinarily as abundant in the cooler seasons as in the hot ones—often they are more so.

The weather which comes, is the best for us. There is a promise that “seed time and harvest shall not fail;” and though a degree of adaptation to the *apparent* promises of the season may be proper, when we are deter-

mining what kind of seed to plant, and in what way to apply our manures and treat the growing crop, yet we deem it true wisdom, early in the year, to confide in the above promise, and make but slight deviations from the course which would be found best in the average years.

### LIEBIG'S AGRICULTURAL CHEMISTRY.

This work, an American edition of which is now for sale at the principal bookstores and Agricultural Warehouses of this city, comes out with high recommendations from able and discreet judges on both sides the Atlantic. The price of the work is \$1 25 per copy. So small a part of it has yet been examined by us, that we are unprepared to express any opinion as to its intrinsic value; but we are satisfied that all cultivators whose habits of reading and reflection are such as will enable them to comprehend a concise scientific work, will find it highly interesting. Many of the views expressed are to us new and entertaining, but we have yet found but little if any thing which calls for any departure from the commonly approved methods of manuring and treating our soils. The work deserves to be studied.

### PLANTS DESTROYED BY FIRE.

The green-house of M. P. Wilder, Esq., Hawthorn Grove, Dorchester, President of the Mass. Horticultural Society, was damaged by fire on the morning of the 16th inst. We regret to state that many of his choicest plants were destroyed, including his new importations of fine and rare things within the last year, and over five hundred seedling Camellias, in various stages of growth: also his splendid seedling Camellia Wilderii, described a few months since in the N. E. Farmer, and his whole collection of Caeti. The fire broke out in the western section, which contained the above named plants, but was discovered in season to save the eastern section and most of the plants, though in a damaged state. It has been necessary to head down his tall magnificent Camellias in the back row, as the only hope of saving them. The house was fully insured, but not so with the plants: there was only \$1000 upon them, which pays but a small portion of the loss. The loss is not only great to the enterprising proprietor, but to the horticultural community generally. Some of the plants cannot be replaced, and the destruction of his seedling C. Wilderii, will be lamented by every florist. He had already received orders for it from a number of the most distinguished foreign cultivators, and no doubt it would have proved a source of profit as well as pleasure, in adding a choice gem to this interesting family of plants.

J. B.

### FIRST CUCUMBER IN THE MARKET.

Mr F. W. R. Emery, of Bedford, exhibited to us on the 9th inst., a fine specimen of the long spined cucumber, which we believe was the first in Quincy market this year. It was sold for 50 cents, in the stall of Whiting, Norcross & Dana. Yesterday we received another specimen from the same gentleman, that measured 13 3-4 inches in length, which, considering the state of the weather for the last eight days—the sun not having made his appearance—is good testimony of his skill in horticulture: thus in opposition to all unfavorable influences without, producing with the assistance of the heat from a bed of oak leaves, a vegetable so perfect in shape. What we are to do with so much cucumber at this season of the year, we can hardly divine. Should there be a change in the weather soon, we shall probably begin upon one end of it: but as cool as it is at present, we must keep it in all its length, for the gratification of our customers and friends.

J. B.

*Errata.*—In Dr. Wood's communication on page 333 of our last number, the word “posterns,” in the fourth and fifth lines from the bottom of the first column, should have been *pasterns*; and “post-rrior,” in the second line from the bottom, should have been *pastern*.

Philosophy may teach us to *hear* of the calamities of others with magnanimity; but it is religion alone that can teach us to bear our own with resignation.—Lacon.

## THERMOMETRICAL.

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northerly exposure, week ending April 28.

April, 1841.	7 A.M.	12, M.	5, P.M.	Wind.
Monday,	19	28	42	W.
Tuesday,	20	33	53	E.
Wednesday,	21	41	46	E.
Thursday,	22	39	42	E.
Friday,	23	39	43	E.
Saturday,	24	40	61	E.
Sunday,	25	40	41	E.

A Northeast storm commenced on Tuesday afternoon, and has continued through the week; considerable rain has fallen each day. Farmers and Gardeners are very backward with their spring work.

BRIGHTON MARKET.—MONDAY, APRIL 26, 1841.  
Reported for the New England Farmer.

At Market 230 Beef Cattle, 15 pair of Working Oxen, 18 Cows and Calves, 200 Sheep, and 710 swine.

Prices.—Beef Cattle—Prices have further advanced. We noticed one or two yoke extra for \$7 75. First quality, \$7 25 a 7 50. Second quality, \$6 50 a 7 00. Third quality, \$5 75 a 6 50.

Working Oxen—Sales, \$80, \$95, and \$100.

Cows and Calves.—Sales, \$20, \$24, \$25, \$29, \$33, and \$35.

Sheep.—We noticed one lot sold for 4 3-4 cents the pound, alive.

Swine.—Lots to peddle were sold for 4 1-2 for sows, and 5 1-2 for barrows, and two lots for a fraction more. At retail from 5 to 6 1-2.

## WHOLESALE PRICES CURRENT.

Corrected with great care, weekly.

SEEDS. Herds Grass, very little in market. Red Top, new seed by the bag 50 to 55 c. Clover—Northern, 13c.—Southern, 8 to 9 c. Flax Seed, \$1, 37 to 1 50 bu. Lucerne, 25 c. per lb.

FLOUR. Howard Street \$5 37—Genesee \$5 31—Ohio \$6 12.

GRAIN. Corn—Northern Yellow none—Round Yellow 54 to 56—Southern Flat Yellow 50—White 43.—Rye—Northern 60 to 65—Southern 60 to 55. Oats—Southern 30 to 31—Northern 35 to 40.

PROVISIONS. Beef—Mess \$10 50 to 11 00—Prime \$6 50—No. 1 \$9 00. Pork—Extra—15 00—Clear 14 50—Mess \$13 00. Hams—Northern 9 c. per lb.—Southern, none. Lard—Boston 9 c. per lb.—Southern, 8 to 8 1-2. Butter—Lump 18 to 22—Firkin 12 to 18—Shipping 8 to 14. Whole Hogs 5 1-2 to 6 c.—Pigs 5 c.

HAY, per ton, \$13 to 19—Eastern Screwed \$14 50.

CHEESE—Old 11 c.—New 8.

EGGS, 14 a 16.

WOOL.—The market for this article has not experienced any change of late. Pulled Wool is rather scarce, and there is but a limited supply of low Fleeces and of fine Fleeces the stock is also moderate. Prime or Saxony Fleeces, washed, b. 50 to 55 c.—American full blood, washed, 47 to 50—Do. 1-4 blood, washed, 44 to 46—Do. 1-2 blood, washed, 36 to 40—1-4 and common do, 35 to 37—Smyrna Sheep, washed, 0 to 23—Do. unwashed, 10 to 14—Bengali Sheep, 8 to 10—Wenon Ayres unpicked, 7 to 10—Superfine Northern pulled lamb 43 to 46—No. 1 do. do. 37 to 42—No 2 do do 26 to 30—No 3 do do 18 to 20.

## HERBACEOUS PLANTS.

J. BRECK & CO., offer for sale a great variety of beautiful Herbaceous Plants, including 20 varieties Phlox, Penzance Coreopsis of sorts, Delphinium, Campanulas in recent variety, Double Pinks, Dracocephalums, Double Scarlet Lynchies, Double Ragged Robin, Spireas of sorts, Iris do. with a great variety of others. Also, Honeysuckles, Roses, and other ornamental Shrubs.

## GRAPE VINES.

Extra large Isabella Grape Vines for sale as above. Also, Giant and Early Wilmot Rhubarb Plants, and Asparagus Roots  
J. BRECK & CO.  
April 28

## DOUBLE DAHLIAS.

We have for sale a very large collection of the finest double Dahlias, of the most esteemed sorts. J. BRECK & CO., No. 62, North Market St. April 28

## SWEET POTATO SLIPS.

Just received and for sale by J. BRECK & CO., a supply Sweet Potato Slips. No 52, North Market st. April 28.

## WILLIS'S LATEST IMPROVED SEED SOWER.

Willis's latest Improved Seed Sower, invented the last season; one of the most perfect machines ever introduced for the purpose. In using this machine, the farmer may be certain that his seed is put into the ground, and at the same time in the best possible manner. There has been a great difficulty in machines for sowing garden seeds; they are very apt to clog up, and the farmer might go over an acre of land and not sow a single seed; but not so with this; it is so constructed that it cannot possibly clog. In using this sower, the farmer can save one half of his seed, and do the work at less than one quarter the expense of the common way of sowing seeds, and have it done in a much better manner; it opens the furrow, drops the seed, and covers it over and rolls them down. It will sow almost any kind of Garden Seeds; say Ruta Baga, Mangel Wurtzel, Turnips, Carrots, Beets, Parsnips, Onions. It is highly recommended by a great number of persons who used it the past season. For sale at the N. E. Agricultural Warehouse and Seed Store by  
JOSEPH BRECK & CO.  
March 31.

## WINSHIP'S NURSERY,

BRIGHTON, NEAR BOSTON,

Situated on the line of the Boston and Worcester Rail Road,—5 miles from the city.

The Proprietors of this extensive nursery beg leave to inform their friends and the public, that they are ready to furnish orders to any amount, for Forest Trees, indigenous and exotic. Fruit Trees, including all the varieties of Pears, Peaches, Plums, Nectarines, Cherries, &c. &c.

Vines—Shrubs, Green House Plants, &c. Catalogues may be obtained by applying at the Nursery. Trees carefully packed, to ensure safety in long voyages. Orders left at the New England Seed Store of J. BRECK & Co. Nos. 51 and 52, North Market street, will be delivered the day following, and left at any part of the city, free of expense.

Letters containing orders, addressed to the subscribers, J. & F. WINSHIP, Brighton Nurseries, March 24, 1841.

## BEDFORD OATS.

Just received 60 bushels of superior Bedford Oats. This variety is highly recommended, it not being liable to blast, and very productive. For sale by  
JOS. BRECK & CO.  
March 31.

## SUPERIOR SEED BARLEY.

100 bushels of extra heavy and clean Seed Barley. Also 30 bushels CHEVALIER BARLEY, a new and superior variety, for sale by  
JOS. BRECK & CO.  
March 31.

## BLACK SEA WHEAT.

Received from Vermont, 30 bushels Black Sea Wheat. Also, 20 bushels Italian Spring Wheat, raised in Warren, N. H. For sale by  
JOS. BRECK & CO.  
March 31.

## TO THE PUBLIC.

DR. CHARLES M. WOOD, Veterinary Surgeon, respectfully informs his friends and the public, that he has removed from Blossom St., to 69 Carver St. All orders left at his house, or at the stable of Wm. Forbes, No. 7 Sudbury St., will be promptly attended to, and gratefully acknowledged. All diseases of Horses, Cattle or Swine, are attended to. Also, castrating and spaying.

For the information of those who may have occasion for his services, and are unacquainted with his practice, he is politely permitted to refer to the following gentlemen who have employed him for a number of years past.

Wm. Forbes,  
Wm. J. Niles,  
Joshua Seward,  
J. B. Read,  
James F. Fullham,  
Wm. P. Loring,  
Joseph C. Pray,  
Boston, April 28.

Williams & Pearson,  
Geo. Meacham,  
S. K. Bayley,  
L. Maynard,  
Isaac Foster,  
Artemas White,  
Brown & Sevrenee.

## AGRICULTURAL IMPLEMENTS, &amp;c.

The Proprietors of the New England Agricultural Warehouse and Seed Store No. 51 and 52 North Market street, would inform their customers and the public generally that they have on hand the most extensive assortment of Agricultural and Horticultural Tools to be found in the United States. Part of which are the following:

1000 Howard's Patent Cast Iron Ploughs	100 doz. Cast Steel Shovels.
300 Common do. do.	150 " Common do.
200 Cultivators.	100 " Spades.
100 Greene's Straw Cutters.	500 " Grass Scythes.
50 Willis' do. do.	300 " Patent Snaiths.
100 Common do. do.	200 " Common do.
100 Willis' Patent Corn Shellers.	500 " Hay Rakes.
50 Common do do.	200 " Garden do.
200 Willis' Seed Sowers.	200 " Manure Forks.
50 " Vegetable Cutters.	300 " Hay do.
50 Common do. do.	500 Pair Trace Chains.
200 Hand Corn Mills.	100 " Truck do.
200 Grain Cradles.	100 " Draft do.
100 Ox Yokes.	500 " Tie up do.
1500 Doz. Scythe Stones.	50 doz. Halter do.
3000 " Austin's Rifles.	1000 yards Fence do.
	25 Grid Stones on rollers.

## FRUIT AND ORNAMENTAL TREES, &amp;c.

NURSERY OF WILLIAM KENRICK.

12,000 Pear and Plum Trees.—Large and new additions of Pear and Plum Trees have lately been received, many kinds of which are alike new to our country, and very extraordinary. Such have been the selections which have been made by the subscriber in Europe, and in person, during the last Autumn, where all have been proved; those kinds already well known amongst us being identified by him by the wood and the leaf.

All orders addressed to the subscriber, or left with Joseph Breck & Co., New England Farmer Office, will be promptly attended to, and Trees, when so ordered, will be securely packed for safe transportation to distant places.

WILLIAM KENRICK.

Nonantum Hill, Newton, near Boston, March 2.

## PEAR, PLUM, GRAPE VINES, &amp;c.

3000 Pear Trees, of the most approved kinds, 2000 Plum Trees, of the most approved kinds and extra size—many of them have borne this season.

Apple, Cherry and Peach Trees, of different kinds.  
500 Quince Trees.  
4000 Isabella and Catawba Grape Vines, from 6 to 15 feet high; most of them have borne fruit. Black Hamburg, Sweetwater, Pond's.  
30,000 Grant Asparagus Roots.  
Gonsherry, Currants, Raspberries, of good kinds.  
5000 Wilmot's Early Rhubarb or Pie Plants, lately introduced.

2000 Cherry and Pear Stocks; 1000 Plums; Roses, &c. of all kinds.  
All orders sent to the subscriber at Cambridge port or with JOSEPH BRECK & CO., will meet with immediate attention.

SAMUEL POND.

Cambridgeport, Mass., Feb. 24.

## PLUMS, PEARS, GOOSEBERRIES, &amp;c.

Just received by JOSEPH BRECK & CO., from London, a fine assortment of Plum and Pear Trees, which are offered at reduced prices, including the following

## PEARS.

Belle Lucrative,  
Mouille Bouche,  
Josephine,  
Beurre Spence,  
" Capiamont,  
" Bosc,  
" Diel  
" d'Aremburgh,  
Easter Beurre,

Catillac,  
Williams' Bon Chretien or }  
Bartlett, }  
Jargonell d'Espagne,  
Echasserie,  
Urbaniste,  
Duchess d'Angouleme,  
St. Chislain,  
Madaline d'Carne.

## PLUMS.

Green Gage,  
Purple Gage,  
Diamond,  
Washington,  
Golden drop,

New Orleans,  
Imperatrice,  
Reine Claude,  
Royal d'Tours.

Gooseberries, White and Red Currants, Raspberries and every article in the Nursery line furnished at short notice.  
JOS. BRECK & CO., No. 62 North Market Boston.  
April 7, 1841.

## GRINDSTONES.

An extensive assortment of Water and Hand Grindstones constantly on hand and for sale by AMMI C. LOMBARDO & CO. 13 Lewis's Wharf. N. Y. Nov. 17.

## MISCELLANEOUS.

## THE DEPARTED.

BY PARK DENJAMIN.

The departed! the departed!  
They visit us in dreams,  
And they glide above our memories  
Like shadows over streams—  
But where the cheerful lights of home  
In constant lustre burn—  
The departed—the departed!  
Can never more return!

The good, the brave, the beautiful,  
How dreamless is their sleep?  
Where rolls the dirge-like music  
Of the ever-tossing deep,  
Or where the hurrying night winds  
Pale winter's robes have spread  
Above their narrow palaces  
In the cities of the dead.

I look around and feel the awe  
Of one who walks alone—  
Among the wrecks of former days,  
In mournful ruin strown;  
I start to hear the stirring sounds  
Among the eypress trees,  
For the voice of the departed  
Is borne upon the breeze.

That solemn voice!—it mingles with  
Each free and careless strain;  
I scarce can think earth's minstrelsy  
Will cheer my heart again.  
The melody of summer-waves,  
The thrilling notes of birds,  
Can never be so dear to me  
As their remembered words.

I sometimes dream their pleasant smiles  
Still on me sweetly fall,  
Their tones of love I faintly hear  
My name in sadness call.  
I know that they are happy,  
With their angel plumage on,  
But my heart is very desolate,  
To think that they are gone.

The departed! the departed!  
They visit us in dreams,  
And they glide above our memories  
Like shadows over streams—  
But where the cheerful lights of home  
In constant lustre burn—  
The departed, the departed!  
Can never more return!

**Legal Pleasantries.**—They originate more than half the currant wit of the day in the Great West. There is a racy freshness, moreover, about the pleasantries of that region that is quite delightful. From a late Missouri Journal we have clipped the following anecdote of an eminent legal gentleman of that State. If it be as new to the readers as it is to us, we will guarantee his favorite suffrage. Being once opposed to Mr S——, late member to Congress, he remarked as follows to the jury upon a point of disagreement between them: "Here my brother S——, and I differ. Now this is very natural. Men seldom see things in the same light, and they may disagree in opinion upon the simplest principles of the law, and that very honestly; while, at the same time, neither can see any earthly reason why they should, and this merely because they look at different sides of the subject, and do not view it in all its bearings. Suppose for illustration, a man should come in here,

and boldly assert my brother S——'s head (here he laid his hand very familiarly on the large chucklehead of his opponent) is a *squash!* I, on the other hand, should maintain, and perhaps with equal confidence, that it is a head. Now, here would be a difference, undoubtedly, an honest difference of opinion. We might argue about it till dooms day, and never agree. You often see men arguing upon subjects as empty and trifling as this! But a third person coming in, and looking at the neck and shoulders that support it, would say at once that I had reason on my side; for if it was not a head, it at least occupied the place of one, and stood where a head ought to be."

All this was uttered in the gravest and most solemn manner imaginable, and the effect was irresistibly ludicrous.—*Spirit of the Age.*

## GARDEN SEEDS.

For sale by JOSEPH BRECK & CO. at the NEW ENGLAND FARMER OFFICE, No. 51 and 52 North Market St. Boston. The subscribers would inform the public that they have now on hand the largest collection of seeds ever before offered by sale in this city, embracing every variety of *Field, Kitchen, Garden, and Ornamental Flower* Seeds desirable for this or any other Climate.

Our seeds are either raised under our own inspection or imported from responsible houses in Europe, and having taken extraordinary pains to obtain such as are pure and genuine, we can confidently recommend them to our customers and friends, and feel assured they will prove satisfactory to all who try them.

Dealers in seeds are requested to forward their orders in season. Boxes for retailing from 8 dolls. and upwards will be sent out on commission allowing a liberal discount and take back what remain unsold.

Letters and orders with good reference will meet with prompt attention.

## FIELD SEEDS.

Sugar Beet.	Ruta Baga.
Mangel Wurtzel.	Ballatine's New Royal do.
New Red Globe do. } superior	White Tankard Turnip.
Yellow do. } varieties.	Red do.
Carrot Long Orange.	Red Round do.
" Altringham.	White do.
" New White, extra fine.	White Globe do.
Pumpkin, sorts.	Green Round do.
Wheat—various sorts.	Purple Top Hybrid do.
Barley, do.	Buckwheat.
Rye, do.	Broom Corn.
Potatoes, do.	Millet.
Indian Corn, do.	Buckthorn. } for Hedges.
Oats, do.	Loenst. }

## GARDEN SEEDS.

Artichoke, Asparagus, Beans of every description, Beets of sorts, Borecole, Broccoli, Brussels Sprouts, Cauliflower, Caraway, Celery, of the most improved sorts, Cabbage 20 sorts, Carrot, all the varieties, Cucumber do, Cress, Egg Plant, Endive, Indian Corn, Kale, Leek, Lettuce in great variety, Melons, do. Marjynea, Mustard, Nasturtium, Okra, Onion of sorts, Pepper do, Pumpkin do, Parsnip, Parsley, Peas, a very great variety, Rhubarb for tarts, Radish of sorts, Salsify, Squash of sorts, Tomato, Turnip 20 varieties.

## SWEET AND POT HERBS.

Thyme	Sweet Basil.
Sweet Marjorum.	Lavender.
Sage.	Lemon Balm.
Summersavory.	Anise.
Medicinal Herbs, &c.	

## ORNAMENTAL FLOWER SEEDS.

Three hundred varieties, embracing all the finest sorts. Packages of 20 fine sorts for one dollar. Those who prefer to have their Seeds put up in papers ready for retail, can be accommodated—each packet neatly closed and labelled with printed directions. Price 50 cents, per dozen papers, which are retailed here at 6 1-4 cents each.

Fruit and ornamental trees, of the greatest variety, supplied at nurseryman's prices, and orders solicited. These will be packed, when required, to go to any part of the U. States.

JOSEPH BRECK &amp; CO.

## TYE UP CHAINS.

Just received by Packet Coromanda, 500 Chains for tying up Cattle.

These chains, introduced by E. H. DENAY, Esq. of Salem, and Col. JACQUES, for the purpose of securing cattle to the stall, are found to be the safest and most convenient mode of fastening cows and oxen to the stanchion.

For sale by J. BRECK & CO., No. 52 North Market st. April 21.

## HOWARD'S IMPROVED EASY DRAUGHT PLOUGH.

Great improvements have been made the past year in the form and workmanship of these Ploughs; the mould board has been so formed as to lay the furrow completely over, turning in every particle of grass or stubble, and leaving the ground in the best possible manner. The length of the mould board has been very much increased, so that the Plough works with the greatest ease, both with respect to the holding and the team. The Committee at the late trial of Ploughs at Worcester, say,

"Should our opinion be asked as to which of the Ploughs we should prefer for use on a farm, we might perhaps say to the inquirer, if your land is mostly light and easy to work, try Prouty & Mears, but if your land is heavy, hard or rocky, BEGIN WITH MR. HOWARD'S."

At the above mentioned trial the Howard Plough did more work, with the same power of team, than any other plough exhibited. No other turned more than twentyseven and one half inches, to the 112 lbs. draught, while the Howard Plough turned twenty-nine and one half inches, to the same power of team! All acknowledge that Howard's Ploughs are much the strongest and most substantially made.

There has been quite an improvement made on the shoe, or land side of this Plough, which can be renewed without having to furnish a new landside; this shoe likewise secures the mould board and landside together, and strengthens the Plough very much.

The price of the Ploughs is from \$6 to \$15. A Plough, sufficient for breaking up with four cattle, will cost about \$10 50, and with cutter \$1, with wheel and cutter, \$2 50 extra.

The above Ploughs are for sale, wholesale and retail, at the New England Agricultural Warehouse and Seed Store, Nos. 51 & 52 North Market Street, by

JOSEPH BRECK &amp; CO.

## STRAWBERRIES! STRAWBERRIES!

The subscriber would offer to the public, the present season, his *Selected Collection*, consisting of seven varieties; they are such as have stood the test of a fair trial for seven years, and all grown by the subscriber.

**Warren's Seeding Methven**, a new and valuable kind, a free bearer, fruit very large and juicy; fruit measuring 5 1-2 inches have been exhibited the present season. This variety can be warranted to be one of the finest varieties grown, and will produce as fine fruit and as large quantity, with the same cultivation, as any other ever offered. The price of this Seedling is \$5 00 per hundred plants.

**Methven Castle**.—Fruit extremely large, high flavored and showy; specimens of this fruit have been shown this season six inches in circumference. Price three dollars per hundred plants.

**Keen's Seedling**.—A very superior variety, fruit very large, rich dark color, and uncommonly high flavored. Price three dollars per hundred.

**Royal Scarlet**.—Fruit long oval shaped and juicy, very free bearer, and very hardy. Price two dollars.

**Hautbois**.—Fruit larger than English Wood, exceedingly numerous, sometimes yielding 100 berries to the plant.—Price two dollars.

**Early Virginia**.—This is known to be the earliest and best fruit for market, a free bearer and very hardy. Price two dollars.

**English Wood**.—Fruit well known for years. Price one dollar.

Every plant sent from this garden will be warranted to be free from mixtures, and shall also be young and healthy, without the price paid for them.

All orders directed to the subscriber, inclosing the amount for the order, or with a good reference, shall be promptly attended to, and the plants carefully forwarded agreeably to directions.

JAMES L. L. F. WARREN.

March, 24. Nonantum Vale, Brighton.

## NEW ENGLAND FARMER.

A WEEKLY PAPER.

The Editorial department of this paper having come into the hands of the subscriber, he is now authorized by the publishers to inform the public that the price of the paper is reduced. In future the terms will be \$2 per year in advance, or \$2 50 if not paid within thirty days.

ALLEN PUTNAM.

N. B.—Postmasters are required by law to frank all subscriptions and remittances for newspapers, without expense to subscribers.

## LIGHTNING CONDUCTORS.

*Is there any effectual method upon which we may rely with confidence of protecting buildings from the disastrous effects of Lightning?*

This question is an important one, and involves the most momentous consequences, inasmuch as life and property are concerned. It is a question upon which many doubts have arisen as objections to the use of Lightning Conductors, from the fact that a great number of buildings have been struck with lightning with the common round rods attached to them. But these doubts would be removed if those who possess them could become fully acquainted with the principle of *Strong's Patent Lightning Conductors*, which are constructed after the manner of Dr. King's well known method, with some, though very important, improvements.

It is for the purpose of showing, in some degree, the utility of these conductors, and the advantages they possess over any others now in use, that the following facts are presented for your consideration.

It is not necessary to go into any detail of *causes*, but is sufficient to know that clouds are formed in the atmosphere and become charged with electricity, and whenever two bodies, such as two clouds, or a cloud and the earth, become charged to a certain intensity, according to the resistance opposed to its passage through the atmosphere, it will overcome that resistance and break through the intervening space; and it is while thus restoring its equilibrium, that it so frequently passes through buildings and other objects in its course, and causes such terrific effects.

Probably every person is aware that lightning does not always go in one direction. This is obvious to the eye. Its course is as variable as the wind. It darts from the earth to the clouds, from the clouds to the earth, and from one cloud to another through the atmosphere, going horizontally, obliquely, and vertically, and sometimes taking the earth in its course as a conductor, alike regardless of life, property and vegetation. Dr. Franklin was the first who proposed the use of metallic conductors for the purpose of controlling the discharges of lightning in such a manner as to prevent their passage through buildings. With the knowledge he then possessed of the science of electricity, he supposed that a single round rod of iron would, in every respect, answer the purpose intended. But after having made a fair trial, he found that buildings were sometimes struck, notwithstanding this precaution. He then sought for a remedy; and, reasoning from the fact that a sharp pointed or rough piece of metal would restore the equilibrium of electricity without explosion, and with much greater facility than a round smooth piece, he was led to the conclusion that a square slit nail rod would be preferable on account of its sharp corners, and accordingly, towards the close of his life, he affixed them to a number of buildings in Phila-

delphia, and recommended them for that purpose in preference to any other form.

But improvement did not stop here. The following is one of the circumstances which led Dr. King to study into the subject, which resulted in the application of a system of protecting buildings which has thus far proved his theory to be correct:

As a company of U. S. Infantry was returning from the funeral of an officer, in the town of Baton Rouge, La., they were overtaken by a thunder storm, and while passing the residence of Dr. King, who stood at the door with his attention directed towards them, he saw a flash of lightning which appeared to descend like a sheet of fire on to their bayonets. He immediately made inquiries as to the effect it produced, and was informed "that they all received a severe shock." If there had been no more than three or four persons, they would, in all probability, have been killed; for as their gun barrels did not extend to the ground, the charge was obliged to pass through their bodies, which served as a part of the conductors. But as there were a great number of points presented to the charge, it was divided, and each person receiving a proportion, almost entirely destroyed its effects. He inferred from these facts, that if a great number of points were erected on a building, it would, in the same manner, disperse and weaken the charge.

The principal feature of the Improved Conductors consists in their presenting metallic points to the atmosphere in all directions, in descending into the ground at two or more exposed corners of the building, and in being so connected that no one portion of the rods shall be detached from another; and their usefulness depends chiefly upon their being properly arranged and secured on the building, so that they may be able to receive the various discharges of lightning, and each rod connected with the ground receiving a proportion, conduct it off in a divided state; or *silently* to effect its equilibrium, which is by far the most frequent. A demonstration of the dispersing power of these conductors occurred a few weeks after they were affixed to the Hollis Street Church, Boston, which was previously struck by lightning four times, notwithstanding it had a round rod attached to it, and twice it was set on fire. The circumstance was related to the subscriber by persons who were eye witnesses. As a thunder-storm was passing over the city, their attention was directed towards the church by a vivid flash of lightning, which appeared to descend obliquely, in the form of a ball, to within a short distance of the building, when it burst into innumerable fragments, and disappeared on the points of the rods. Another of a similar character was observed on a building in the Navy Yard, Portsmouth, N. H.

Ever since Dr. King first applied his conductors to buildings, (which was about twenty years ago,) they have been constructed in the following manner, viz:—Iron nail-rods three eighths of an inch square, and from five to nine feet in length, or copper of proper dimensions, cut from sheets about the same length, and twisted, are made to connect to-

gether by means of a point about two inches and a half in length, turned at right angles with the rod on one end, to fit into an eye turned on one end of the next rod in series, and the whole secured to the building by a staple.

Now there is a very serious objection to this mode of connecting the rods. Not but that the use of the staple is well enough, for a charge of electricity will never leave a good conductor to follow a bad one, (such as wood,) providing that conductor be sufficient to contain and carry it off. But the objection lies in the fact that the connection depends almost entirely on the staple; which, if by any means, either by the action of the wind, the decay or shrinking of the wood, or its being improperly driven, it should work loose and come out, (a very common occurrence,) the rod having the eye is liable to hang away or spring from the point, in which case their power as conductors of electricity would be entirely cut off, and would serve only to lead the charge into the building and even render it more liable to damage than if there were no conductors attached to it.

The subscriber is happy to inform the public, that in order to remedy this defect, he has made an essential improvement, the importance of which must be obvious to every one.

Instead of making an eye and a point on the ends of the rods, the ends are flattened and screwed together by means of the points, which are made separate from the rods. In this way a *close* and *permanent* contact is made, independent of the staple, and although the staple may come out, still the *connection* will always remain perfect. Besides it affords a free and uninterrupted passage for the electric fluid, which is necessary for the safety of the building; whereas in the other case, it is very much obstructed in passing through so many *imperfect* connections. This we know from experiment. But, notwithstanding this, no building to which Dr. King's conductors have been affixed, has as yet been reported as having been struck by lightning, except in a few instances where the rods were disordered in the manner above mentioned.

Again: there are many persons who would like to have lightning conductors affixed to their buildings, but consider copper too expensive,\* and object to iron because it is so subject to oxydation, or corrosion. Rust does not essentially impair the conductive power of metals, but, like paint,† it almost entirely destroys their receiving and discharging power, because it is a *non-conductor* of electricity. The points being the most important part of the rods, it is necessary that they be preserved from rust as much as possible. For this purpose the subscriber uses iron points coated with zinc,‡

\*Copper is much less liable to corrosion than iron, and for this reason it is used, in preference to the latter, for that part of the rod which is placed in the ground. It is also a better conductor.

†Lightning conductors should in no case whatever be painted.

‡It is well known that the electro-chemical action between zinc and iron, when in contact with each other, effectually preserves the latter from the least degree of oxydation.

and made to screw into the iron rods in the same manner as described above.

In order to make the Patent Conductors still more preferable, they are offered to the public at the same price of the former rods.

Considering the comparatively trifling expense of these conductors and their utility, and the risk of property and life while unprotected, it would seem that no person owning buildings would for a moment hesitate to avail themselves of their protection. Accounts have come to the notice of the subscriber, of *sixtyfive* buildings being struck by lightning in Massachusetts and vicinity, during the season of 1840, notwithstanding a considerable number had round rods attached to them;—twenty-eight houses, five of which were burned to the ground; thirtyseven barns, twenty of which were destroyed; and *twentythree persons killed!*

The subscriber is authorized to say that Professor Silliman has expressed his decided approbation of the principle of Dr. King's Lightning Conductors, but is fully convinced that the improved method of connecting the joints is safer and much to be preferred.

In further testimony of the utility of these Conductors, the following certificates are presented by gentlemen upon whose knowledge and judgment in this matter, the public may rely with ac-  
ety.

The subscriber is aware of the great responsibility devolving upon a person engaged in this kind of business, and the necessity of a thorough knowledge of the subject in order to arrange the Conductors on the building in a manner to ensure its safety; for a person ignorant of the science of electricity, would be liable to put them on in such a manner that, instead of protecting the building, they would only serve to augment its danger. But having been a pupil of Dr. King's for above four years, and since Dr. K.'s death been engaged in the business for himself, and given his whole attention to the subject, he feels that he is able to execute any branch of the business in a proper manner.

Orders sent by mail from any distance in the country, will receive immediate attention. Those wishing for information with regard to the expense, &c., can obtain it by sending a small draft of the floor of the buildings, stating their length, breadth and height from the ground to the eaves, the direction of the ridge, number of chimneys and where situated, and how the building stands with regard to the points of the compass. Those who can make it convenient, are invited to call at his office, where he will be happy to explain the principle of his Conductors by experiments.

N. B.—If any person in possession of facts in cases of damage by lightning, will transmit to the subscriber, as soon after the occurrence as convenient, a description of some of the most important effects produced, they will confer a favor.

JUSTIN E. STRONG, *Electrician.*

Office, No. 12 Washington st., Boston.

#### CERTIFICATES.

This certifies, that Dr. King's Improved Lightning Conductors, have been affixed to several of the public buildings in the Navy Yard, Charlestown, and are considered much superior to the rods of the old construction, as a protection against injury from lightning.

Mr Strong has shown me a model of his method

of connecting the joints of the rods, by which a more perfect and firmer contact is made than by the method used by the late Dr. King. Mr Strong's rods would seem less liable to derangement, and are, therefore, preferable.

JNO. DOWNS, *Capt. Commanding.*

Navy Yard, Boston, April, 1841.

*To whom it may concern*:—The Standing Committee of the Society worshipping at the corner of Federal and Berry streets, desirous of availing themselves of the advantage of Dr. King's improved lightning conductors, as constructed by Mr Justin E. Strong, employed that gentleman the last year, to furnish their church with them; which he did to their satisfaction. And they have reason to congratulate themselves on the expedient; for, in the tempest of Friday evening, the 2d inst., the electric fluid, attracted by the points, fell upon them, and was conducted harmlessly off by the rods, leaving the house unscathed; whereas, probably, if the old round rod, (which to these had given place,) oxydized and imperfect as it was, had been the only protection, the house would have been destroyed or seriously injured.

Mr Strong has invented a new mode of connecting his rods at the joints, whereby the contact is rendered more perfect, greater facility in conducting electricity produced, and consequently the security to buildings still further increased. His method of preserving the points from oxydation is also valuable, and quite important in its results.

Under these considerations, and believing that the improved conductors are greatly superior to the single round one formerly in use, he is cheerfully recommended to the patronage of the public.

G. F. THAYER,

*One of the Committee of the Federal St. Society.*  
Boston, April, 1841.

Cambridge, 24th Oct., 1840.

MY DEAR SIR—In reply to your inquiries, I very willingly state that I adopted, some years ago, Mr King's Improved Lightning Conductors at my farm house, stable, and mansion house, at Quincy, and have every reason to be satisfied with them.

Without pretending to much knowledge of the subject, it appeared to me that Mr King's Conductors were more conformed to the theory on which the usefulness of lightning rods is maintained, than the common round lightning rods; that they presented more points to the atmosphere, and spread their action more equally over the surface to be protected; and that they were well adapted to the end, whether that end were safe attraction, easy and general distribution of electric fluid, or silently to effect the equilibrium of the atmosphere in respect to that fluid.

But I made no particular examination of the subject. My own opinion was decisive in their favor. I adopted them, and see no reason to regret or change my opinion.

JOSIAH QUINCY,

*President Harvard University.*

MR J. E. STRONG.

This will certify that Mr Justin E. Strong has succeeded to the business formerly done in Boston by Dr. King. He has testimonials from Dr. King which satisfy me that he enjoyed his confidence and was considered by him competent to construct and put up lightning rods according to his own plan. And Dr. King has accordingly recommend-

ed him to the patronage of the public as one fitted to give satisfaction in this branch of business.

The construction and arrangement of Dr. King's lightning rods have been considered so far an improvement upon the old ones, that they have been preferred whenever lightning rods were to be furnished to buildings. They appear to me to have, theoretically, advantages above any others, and I believe that experience has confirmed, in all cases where they have been adopted, the good opinion which has been formed of them from a scientific examination. I think they would prove more efficient than any other kind in protecting buildings from lightning. If I were to furnish these rods, I should not hesitate to employ Mr Strong, and gladly recommend him to others.

JOSEPH LOVERING,

*Prof. Nat. Philos. Harv. University.*

Cambridge, Oct. 3, 1840.

Mr Strong has shown me his mode of confining lightning rods to buildings, and securing the perfect contact of the joints, and I consider it superior to the old method, and less liable to derangement than any others which I have ever seen. I have no doubt that he would put these rods up in a satisfactory manner in every respect.

March 25, 1841.

J. LOVERING.

Boston, Aug. 22, 1840.

I have great confidence in the skill and science with which Dr. King's lightning rods were constructed, and have caused them to be placed on several important buildings. The bearer, Mr Strong, has certificates from Dr. King of his competency in the business; there is no reason to doubt, therefore, that his work will give satisfaction to his employer.

SAMUEL A. ELIOT,  
*Late Mayor of Boston.*

From the Farmer's Cabinet.

#### TAKE OFF YOUR POTATO BLOSSOMS.

*A little labor well paid for.*

It has long been known that crops of any kind, which perfect and ripen their seeds before they are removed, take up and appropriate a vast deal more nutriment (which they derive from the soil,) than those crops which are removed before the seeds are perfected. This conclusion looks reasonable at first sight; for the seeds, which are the most nutritious part of the plant, can't be formed without much food being forwarded from the earth for that purpose. Hence the exhaustion of the soil by the ripening of the crop. When a crop of grass is cut before the seeds are fully developed, the ground will be found to have parted with a much less portion of its fertility; and this is the reason of a grain crop exhausting the soil so much more than a grass crop. The following curious and important extract from a foreign journal, is a practical illustration of the above principle. "M. Zeller director of the Agricultural Society of Darmstadt in 1839 planted two plats of ground, of the same size, with potatoe. When the plants had flowered, the blossoms were removed from those in one field, while those in the other were left untouched to perfect their seed. The former produced 470 pounds—the latter 437 pounds." C.

Command your temper, or it will command you

### THE EDITOR'S DAYS OF ATTENDANCE AT HIS OFFICE.

We are the possessor of a small farm about 20 miles from the city, on the Eastern Rail Road. On this farm we expect, ordinarily, to spend our time from Tuesday evening until Saturday morning. On Saturday, Monday and Tuesday, we shall usually be at the office, where we shall ever be happy to see our friends, and any persons who may wish to impart agricultural information, or to receive such as we are able to give. The farm above alluded to has been purchased since we made our engagements with the publishers, to become editor. It is in an exhausted state, and is not naturally very fertile. We shall have no wonderful accounts to give of large crops. Having the buildings to remove and repair; and being almost without manure, our debtor side of the account book will contain a heavy column of figures, while the creditor will be blank, or nearly so, for some time to come. But we must labor with our own hands, for the preservation of health; and we wish to preserve and increase our practical acquaintance with the art of husbandry. This arrangement renders it necessary for us to make up the greater part of our paper one week before it is issued; and communications of much length, cannot often be inserted until one week after their reception.—ED. N. E. FAR.

### BERKSHIRES AND DURHAMS.

What bold sceptics those Boston boys are. In days of yore, they dared to raise a doubt as to the *jure divino* of kings, and now they do not hesitate to sneer at the pretensions of Berkshires and Durhams. It seems they hold certain weekly meetings, (in *Old Faneuil*, probably,) where a Mr Colman had the temerity to more than insinuate, that Durham cattle, for the pail, were not equal to the native stock; and other free spirits, not having the fear of speculators before their eyes, declared that Berkshires are selling for more than they are worth. These insinuations have not been without their effect upon the excellent editor of the *New England Farmer*, who says, that the report is that butchers and meat-sellers dislike the pure Berkshires, and he concludes with the following pretty broad hint as to his own opinion: "Those," he says, "who have them already and like them, will of course continue to keep them: those who have fair hogs of a different breed, may do well not to incur much expense to obtain this famous kind, until their relative worth is better understood."

An intelligent farmer, it was stated, in the neighborhood of Boston, who recently slaughtered Berkshires, found his pork so indifferent that he would not eat it; and several concurred in the statement, that, notwithstanding their roundness of appearance, they do not measure so much in the rib as some less valued breeds, thereby verifying the old maxim, that "all is not gold that glitters."

It would be strange, indeed, if, after all the discussion upon the merits of the true breed, we should discover that they were not worth talking about.—We see no reason why the Berkshires should not make as good bacon as any other hog, and care should be taken that an unfounded report does not retard the progress of a stock, that, judging by the eye alone, certainly promises a great improvement. We design to give fairly the views of both sides in the contest, which we see is about to rise on this subject, as well as our own conclusions, so soon as we collect facts on which to found an opinion.—*Southern Planter*.

From the *Maine Farmer*.

### VALUE OF THE SKUNK.

MR EDITOR—I have noticed a communication from the Albany Cultivator, respecting the advantages that might be derived from the skunk, by Solomon W. Jewett, of Middlebury, Vt., and likewise your remarks upon the profit of the animal, as a remedy to keep the weevils or grain fly from depositing their eggs in the heads of our wheat. Sir, I am aware that the usefulness or profit of the skunk is not fully appreciated. If the farmer could but know the amount of the beetle and other insects one of those animals will destroy in the season of them, he would never think of trapping them to string up in his field, or of caging them for the purpose of feeding and occasionally "stirring him up" to renew his perfume. Sir, I have been very destructive to these animals myself, before I knew the value of them. About three years since I discovered a woodchuck in my mowing, and knowing him to be mischievous in grass and vegetables, I killed him. Soon after a skunk took possession of his domicile, and kept it through the summer; in the fall after, I ploughed up the field, and in so doing, broke into a part of the den that he had used for convenience as a necessary, while he secreted himself from his destroyers; and I found there, I should judge, from 1-4 to 1-2 of a bushel of excrementitious matter that was mostly shells of the wings of the beetle. Since then I have endeavored to cultivate their friendship, and sir, if we let them run, they will destroy more insects than many of our two-legged animals would, that are trampling our vines and destroying the fruit which the skunk has protected. Sir, if I had a wish to cage an animal to keep up a nauseous effluvia for the purpose of driving the fly from my grain, I would catch some of the smoking loafers which infest our villages, that the industrious part of the community have to support, say four of them, and furnish them with "long-nine" cigars, and cage one on each side of the field, so that they cannot do one another mischief, and my word for it, I would rid society of a useless animal, and raise an effluvia that will be more disgusting to the flies and a surer protection to the wheat, than the scent of the quadruped named above. As to the flies not preying upon the carcase of the skunk, I think it is a mistake. I know that the flies use the carcase to deposit their eggs on. The best remedy that I know of at present for the weevil, is the Black Sea wheat, sowed not earlier than the 20th of May. T. P.

NOTE.—His skunkship is beginning to be duly appreciated. The substitute which our friend recommends is a good one—but won't it drive all the skunks from the farm too, as well as the weevils?—ED. ME. FAR.

☞ If it can be demonstrated that the skunk is a useful animal, we would move, as an act of justice, that a little more euphonious cognomen be applied to him than the one which he at present bears in the nomenclature of quadrupeds. Can't Dr. Holmes, of the *Maine Farmer*, suggest a name for the creature which will be more expressive of his character and less repulsive to the ear than that of skunk?—N. E. F.'s PR. DEV.

There are two modes of establishing our reputation—to be praised by honest men, and to be abused by rogues.—*Lacon*.

### MANURING GROUND.

If you would have sound and large crops, put on the manure liberally. Don't think to cheat mother earth with the appearance of granting her an ample allowance of the food of plants, for she will tell the truth and the whole story in the proper season.

There is not, generally, care enough taken when applying manure to the earth, to mix it well with the soil. All the lumps both of manure and of earth, should be broken finely up, and the soil stirred till the whole is mixed intimately together. Roots do not want to find a large lump of hard manure of the size of a man's head, in one place—a lump which they can hardly penetrate, and which may be strong enough to kill the roots as they approach it, and then have to travel over a square yard of poor unmanured soil, getting no nutriment by the way, before it finds another indigestible lump of rank food. The food of plants should be as well broken up and mixed before it can go into the bodies of vegetables, as the food of animals is after mastication. We repeat, therefore, mix the manure well and equally with the soil, if you would give your plants the best chance.

We said "put on the manure liberally;" but we did not say, put it on extravagantly or prodigally.

There is such a thing as giving the earth too much, and creating a surfeit for the plants. By this means vegetation is as much injured as is the friend whom you would treat hospitably when you force him to eat too hearty food or too much of it. The best plan is to give the soil just as much as the crop you put on it can and will eat up in the course of the season, leaving the earth in autumn, in about the same state for richness that it was when you began upon it in spring. When manure beyond what the plants can take up in one season, is applied to and left on the ground, that portion becomes inert and dead, doing more hurt than good, because it produces a gangrenous state of soil, which will greatly injure the crop the next year. It is for this reason that old gardens that have been long and extravagantly enriched, will not produce good potatoes and beets. They will be warty and wormy, from this cause. Keep the ground just lively and healthy, by applying as much manure, as the plants, which work hard all summer growing, can eat up and convert into seed; but be careful to apply no more. At least we have always found this to be the best system.—*Maine Cult.*

*Expeditious Threshing.*—Mr Everly, of Northwicks, made a bet of £5, with Mr R. Leach, of Blackfordington, that he would, within the short space of one hour, in his threshing machine, thresh one hundred bushels of oats and bind the straw into bundles. The performance was witnessed by almost all the farmers in the neighborhood, and, extraordinary to relate, within 47 minutes, Mr Everly threshed 133 1-2 bushels, and bound the straw into 240 bundles—a fact unparalleled in the annals of agricultural labor.—*English pap.*

Gold is an idol that can boast of two peculiarities; it is worshipped in all climes without a single temple, and by all classes without a single hypocrite.—*Lacon*.

True friendship is like sound health—its value is seldom known until it be lost.—*Ib.*

For the N. E. Farmer.

## EFFECTS OF GRAIN CROPS UPON ORCHARDS.

New Bedford, 22d April, 1841.

DEAR SIR—I have a young orchard of 3 1/2 acres, that is very promising, and looking uncommonly well. It has been planted to roots for four years successively, and I had determined to change the crop this year, and put in barley with clover, let the young clover die and remain on the ground through the winter: take a crop of clover from it in 1842, and break it up in the autumn of '42, turning in the after-math, and again grow roots.

I am told by a nursery-man, who is a good farmer, that if I sow barley, or any kind of grain, that when the grain is cut, the foliage will immediately change on the trees, and they will be checked in growth, nearly or quite three years, by one grain crop.

Will you be so kind as to give me your experience and opinion in this matter, and any information you may possess on the subject. Also, what you think of a crop of field peas with clover, by way of a change; or what course will be best to pursue.

I look more to the future good of the orchard, than to the profit of the crop, and yet I like to keep that in view.

Please give me the name of the best pea for field culture, the quantity required for one acre, and say if Messrs Breck & Co. have them for sale, and the price.

Your answer as soon as convenient, will much oblige  
Your ob't serv't,

GEO. RANDALL.

To ALLEN PUTNAM, Esq., Boston.

We can give our correspondent no information to be relied upon. Inquiring of an intelligent agriculturist as to the proper reply to be given in this case, he answered—"A few years since, I procured trees of a nursery-man, which failed to do well. Mentioning the disappointment to the man of whom I purchased, he asked what crop was grown on the ground where they were set out? I told him—barley. 'Why,' said he, 'why did you not put them in the fire?' That is all that I know about the matter." We saw the yellow leaf on parts of our orchard in the summer of '37, when oats were grown on the greater part of the land; while two small patches were planted to ruta bage. The trees in the vicinity of the ruta bage generally suffered, and also some that were rather remote from them. We asked at the time, whether the ruta bage caused the harm? but the fact that some of the suffering trees were quite distant from them, caused us to doubt whether it were so. The oats were not thought of as the possible cause. But they may have produced the injury. This subject deserves attention; and we respectfully solicit information upon it.

The inquiry relative to peas, we are not able to answer, any farther than to say, that the Early Frames are often used for the field, and can be obtained at the N. E. Agricultural Warehouse, at \$5 per bushel.

Were we asked for advice by our correspondent, we would hint to him a belief that he might find it a good course to plant corn on his land, cultivate without hill, sow his clover seed about the middle of July, at the last time of hoeing. He will thus get a good crop of clover in '42.—ED. N. E. FAR.

For the N. E. Farmer.

## ENGRAFTED SCIONS.

MR PUTNAM—In none of the essays either in the N. E. Farmer or elsewhere, on the vexed question "whether an engrafted scion affects the stock below the point of insertion," does any reference appear to have been made to treatises on vegetable physiology. If the propositions laid down by Professor Lindley, in "An Outline of the first principles of Botany," are correct, the question must be answered affirmatively. Examine some of them:

"67. The stem is produced by the successive development of leaf buds, which elongate in opposite directions.

"68. If an annular incision be made below a branch of an exogenous plant, the upper lip of the wound heals rapidly—the lower lip does not: the part above the incision increases sensibly in diameter—the part below does not.

"69. If a ligature be made round the bark, below a branch, the part above the ligature swells—that below it does not swell.

"70. Therefore the matter which causes the increase of exogenous plants in diameter, descends.

"74. In the spring, the newly formed wood is to be traced to the form of fibres descending from the leaf-buds; that which is most newly formed lying on the outside, and proceeding from the most newly developed buds.

"142. Leaf-buds consist of rudimentary leaves surrounding a vital point, the tissue of which is capable of elongation upwards in the form of stem, and downwards in the form of wood or root." &c.

The above propositions are selected for examination, to save space in your sheet and time to the reader, should you consider these remarks worthy of notice; though the conclusions aimed at would, perhaps, be more obvious from the examination of all the propositions from No. 52 to No. 112 inclusive.

The truth or falsity of these propositions may be ascertained by inspection at the proper seasons.—If they are true, it follows of course that every scion must affect the stock upon which it is engrafted; and if the diameter of the stock and of the scion were equal, and the engrafting be made near the ground, and the buds of the stock rubbed off, the wood from the scion should soon envelope the stock and furnish roots similar to those of the tree from which it had been taken.

But a scion from a tree of vigorous growth, engrafted upon a stock of slow growth, indicates its character by the increased size of the tree above the point of insertion, which is visible for many years, if the stock was engrafted free from the ground. This would seem to favor the notion that the scion does not affect the stock. On the other hand, examine a Siberian Crab, which has been engrafted on a small stock. The young leaf-buds of the crab are scarlet, when just opening, and the roots are much more slender than those of the thorn or of the common apple, and of a different color, by which its influence and progress can be traced. If the crab had been engrafted near the ground, in a few years all the roots which support the tree will be found to be those of the crab only; and scarlet buds may be found below the point of insertion, where the latter is at a distance from the earth.

The question being one of mere fact, yet of

much interest, should have been settled long since, as it might have been by mere inspection. Any one having access to a nursery which has been engrafted a few years, can end all doubts merely by making a vertical section through the centre of a young Siberian Crab, which had been engrafted on a thorn, or on wood of another color, carrying the section through the root. It is desirable that some one having the means should make the examination, that we may have fact as well as theory.

The question is as interesting in an economical as in a scientific point of view. Many a stock which has been grafted two or three years, has been thrown away, merely because the scion has been broken off or otherwise destroyed; yet it may have produced a bud below; and in cases of very rare varieties, it would be desirable to preserve the stock if any chance of obtaining the desired fruit remained.

It must not be concealed, that although Professor Lindley has the highest reputation for accuracy and profound learning in vegetable physiology, he may, like all mortals, be fallible. His propositions in the "Outline of the first principles of Botany," though laid down with the most imposing precision and confidence, are contradictory. Moderate and candid criticism need not step out of the work itself to destroy its credit for infallibility; yet this consideration furnishes no apology for not ascertaining the fact disputed. G.

Fairport, Ohio.

For the N. E. Farmer.

## DESTRUCTION OF CANKER WORMS.

MR PUTNAM—Year after year, the horticulturists of many parts of New England, have had their apple orchards ravaged by that severe scourge, the canker worm; and many and various have been the remedies which have from time to time been proposed for the destruction of that fatal enemy to fruit trees: but I cannot learn that any of the many remedies suggested have proved entirely efficacious.

Within a few days, I have seen the public attention drawn to the consideration of this, as yet, remediless evil. I have, I confess, not paid much attention to the origin and habits of the canker worm; but I conclude that late in autumn, before the frost sets in, the worms descend from the branches to the earth and bury themselves in the ground among the roots of the trees and below the reach of the frost, where they lie securely until warmed into active life by the invigorating influence of the sun's heat, when they ascend by the body of the trees into the branches, to prey upon the tender leaves and multiply their species, &c.

Reflecting upon this deplorable evil, it has occurred to me that the worms may be effectually destroyed by adopting the following remedy:—In the autumn and spring—in the former, just before the earth is frozen, and in the latter, as soon as possible after the frost is out of the ground—dig up the earth around the trees in a few places, to the depth to which the worms penetrate, and place in each hole small quantities of Indian corn, and also throw corn under the trees, to the extent of the diameter of the branches; this done under every tree, turn into the orchard a few hogs, and they, in rooting to find the corn, will turn up and kill many of the worms, and expose those not killed to the heavy night frosts, which will destroy them. In order

that the work of destruction may be thoroughly accomplished, the same operation may be repeated two or three times. If this act is performed properly, I feel confident that the canker worm will be effectually destroyed; and as the operation will not be attended with much loss of time, labor or expense, it will be well worth the trouble of the lovers of delicious fruit and good cider, to try the experiment. Yours, VIATOR.

#### Hogs Treading Clay.

P. S.—Some years ago, I had occasion to use a large quantity of clay mortar. I was so circumstanced that I had not, and could not hire oxen to perform the labor of treading the clay; but it occurred to me, that my own and my neighbors' hogs might be induced to perform that labor. I accordingly prepared the bed with clay, and threw over it the necessary quantity of water to render the clay plastic, and then strewed over the mass a peck of shelled corn and drove the hogs on to the bed. In pursuit of the corn, they commenced with avidity the labor of rooting up and treading out the clay, and in the course of a very little time, the entire bed of clay was thoroughly reduced into the most uniform and plastic mortar. When the hogs flagged a little, a few more handfuls of corn were strewed upon the clay bed, and they resumed their labor with renewed vigor. This hint may prove useful to brick-makers and others who may have occasion to prepare large quantities of clay for making bricks or other purposes, and who have not oxen to perform the labor.

“Viator” is mistaken if he supposes that the canker worm does not descend to the earth until the cold of autumn drives him down. These worms bury themselves as early as the first of August, and undergo their transformations from worms to grubs and moths, before the arrival of winter. Many of them ascend the trees in the warm nights which sometimes occur late in Nov. and Dec. If resorted to in Aug. and Sept., the plan proposed by our correspondent might be of some service in lessening the number of these destroyers of our trees.—This communication leads us to allude to a process employed by Samuel P. Fowler, Esq., of Danvers, for the destruction of this worm, which we hope to lay before the public in his own words, in the course of a few months. He removes all the earth that is within the distance of four or five feet of the trunk of the tree, and to the depth of five or six inches. This earth is carted away in August. Other earth mixed with some manure, is substituted in its place. This process has protected his trees from the worm and been highly conducive to their growth.—Ed. N. E. FAR.

For the New England Farmer.

#### CURE FOR BLIND STAGGERS, &c. IN HOGS.

MR PUTNAM—Sir—I noticed in No. 39 of your paper, a communication under the signature of “R. L.,” taken from the Albany Cultivator, in which the writer says he has “lost twenty valuable pigs by blind staggers, consumption, and many without any apparent cause, within the last six months;” and asks, “is there no remedy?” The writer says he has “looked to books in vain for information;” and, as he still asks for “pig and cattle remedies,” (as he calls them,) I thought I would try to give him some information through the medium of your valuable paper.

As to blind staggers, I consider the disease easily cured. How the disease originates, I cannot positively state; but I think from what I have seen, it may originate from a filthy sty, where there is not a free circulation of air; or in keeping hogs always shut up in a pen, without giving them fresh dirt, or letting them out where they can get it themselves. I have come to this conclusion, as more than three fourths of those I have seen affected, were those who were not permitted free access to the air and earth. Again: this disease may originate by the issues upon the inside of the legs getting stopped up.

The editor of the Cultivator recommends giving hogs charcoal as a preventive of disease. This may do, I think, much good; but as there are but few who have fully learned the truth of the old adage, “Prevention is better than cure,” I will now give a remedy. When it is found that one of your hogs has the blind staggers, no time should be lost; but you should proceed to give your hog, as soon as possible, something that is warming within. The first remedy I ever tried was a mixture of sulphur, hen manure and Cayenne pepper, with milk enough to make it about as thick as porridge—given to the hog as warm as he can bear it. Late years, I have used nothing but new rum and pepper, giving as much as I could make them take with a spoon. Before you give them any thing, it would be well to take some soft oil and pour upon the issues on their legs and give them a smart rubbing with a cob. With these medicines I have cured those who seemed to be almost dead, and if I were near, I would agree to cure all entirely of the blind staggers for 25 cents apiece. In case after taking this medicine the hog should remain blind, his head should be cut open with a sharp knife, between the ears, to the skull bone, and the wound filled with fine salt, taking care not to bring the knife so far back as to have it slip off the skull bone into the back of the neck. I once cured a shoat for a Mr K., in Hillsboro', N. H., in the manner I have described above, who thought I was very cruel to cut such a large place in his pig's head, and more cruel because I charged him a *shilling* for my services.

“R. L.” says many of his pigs died without any apparent cause. It is impossible to tell him what to do in this last case; but a thought suggested itself that they might have died of the “black tooth.” This disease may be easily known by examining the tusks, which will be very black; and to cure the hog so affected, they should be immediately drawn out with a pair of pincers.

Yours, &c. J. M. HARTWELL.

Medford, Mass.

For the New England Farmer.

#### THE WEST.

The valley of the Fox river and the country around Lake Winnebago, have from the earliest times been justly celebrated for the beauty of their scenery, the fertility of their soil, and great natural resources. All travellers, from Father Margrette down to those of this day, have been enraptured with its beauty of forest and river, prairie and lake; its forests where the bears and deer are still numerous; its prairie, where the buffalo once roamed in vast herds, now gone hundreds of miles west of the Mississippi; the rivers and lakes, abounding in fish; the tall wild rice stalks shooting up from the

pebbly bottom through the clear and bright waters, waving their richly loaded heads in embattled ranks—the resort of vast numbers of the feathered tribes, who feed and fatten on the rich spoil;—the beautiful shores, the long slopes of prairie and openings, or the forest rising like an amphitheatre alternately on either hand, the richness of the soil, abounding in wild fruits. Almost all kinds of fruit trees and limestone are found every where in the Territory (Wisconsin.) All these advantages combined, make it a paradise for the poor and unfortunate of this chosen people whom God has appointed to build up the waste places of the new world, and make “the wilderness to blossom like a rose.”

'Tis here in the midst of this beautiful region, I have located myself. My “log cabin” was built last season, a few acres of land broke up and enclosed, in western parlance. Connected with my farming establishment I keep a small stock of such articles as find ready sale in so new a country.—If the plough and any articles that I may order, should meet with favor, a market for other things from your house may be found. In the meantime,

Yours, respectfully,

J. J. R. PEASE.

Though well pleased with our native New England as a home, and persuaded that our young farmers may do well in Yankee land, yet we find pleasure in well written descriptions of the beauties and riches of the far west, and willingly indulge our readers with a perusal of the above appendage to a business letter to Messrs J. Breck & Co.—Ed.

For the New England Farmer.

#### CANADA THISTLES.

MR EDITOR—Sir—If you think this worth a place in your paper, insert it if you please.

To Extricate Canada Thistles.—Pasture your land with neat cattle, horses, or sheep, and mow the thistles three times in a season;—the first time as soon as the first blossom appears; also the second and third times, and in most cases you will have very few to mow the third year.

A SUBSCRIBER.

The Two Farmers.—Two farmers, who were neighbors, had their crops of early peas killed by the frost. One of them came to condole with the other on their misfortune.

“Ah!” cried he, “how unfortunate we have been, neighbor! Do you know that I have done nothing but fret ever since. But, bless me! you seem to have a fine, healthy crop coming up just now. What are these?”

“These?” cried the other, “why these are what I sowed immediately after my loss.”

“What! come up already!” exclaimed the fretter.

“Yes—while you were fretting, I was working.”

“What, and don't you fret when you have a loss?”

“Not until I have repaired the mischief.”

“Why then you have no need to fret at all.”

“True,” replied the industrious gardener, “and that's the very reason: in truth, it is very pleasant to have no longer reason to think of misfortune, and it is astonishing how many might be repaired by alacrity and energy.”

## NEW ENGLAND FARMER, AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, MAY 5, 1841.

### POTATOES.

Can any one give us valuable information regarding the cultivation of this root? (we call it *root* for convenience sake.) Our own experience with it has not been attended with such success as to give us any confidence that our mode of treatment has merits enough to entitle it to public mention. And yet in the hope of drawing information from other sources, our process will be given. On half the land, perhaps, used for this crop, good manure, fresh from the barn cellar, has been ploughed in at the rate of three cords to the acre—as much more has been put in the hill. Sometimes—often indeed—no part of the manure is ploughed in, but all is put in the hill—that is, from 3 to 5 cords are thus used per acre. The ground is generally *new*—i. e. *newly broken up*. The hills are 3 1-2 feet apart each way.—Nearly 20 bushels of seed is put upon the acre. The larger potatoes are cut into two, and two or three pieces are put in each hill, directly upon or into the dung. The varieties are the *Long Red* and the *Richardson*. These are but local names, and may not be extensively understood. The *Long Red* is an old variety, once famous for its productiveness, and still we find it more prolific than *Kidneys*, *Chenangoes*, *Blues*, *Whites*, or any other kind (not excepting even *Rohans*) which we cultivate. Its name is descriptive of its appearance; the vine of it grows large, and continues green until late in autumn. The *Richardson* resembles the *Chenango* in form, and is by many considered identical with it. We think it differs, being in color more blue, both internally and externally—being also larger and coarser—more productive, but less mealy and palatable. These two kinds have succeeded better with us than any others; and yet these best have not probably averaged us more than 200 bushels per acre for the last five years. In the cultivation of these it has been customary to plough between the hills both ways, and to hoe twice or three times. We have many doubts about the wisdom of our course: any reprehension will give us no annoyance.

We presume that it is better to cultivate in drills than in hills; better to spread at least half of the manure than to put a large quantity in the hill only. Coarse manure is better than fine; sward land is better than that which has been rendered fine and compact by recent cultivation. Such is the common opinion.

We have some conjectures in relation to the wants of this crop, which have never, as far as we know, been publicly expressed by any one. It is our belief that the sward lands and coarse manures are peculiarly serviceable, not because they, of themselves, furnish this crop with its appropriate nourishment more freely and fully than finer and richer soils and manures, but because they admit a freer circulation of air. For instance, should one bury in the potato hill, in a rich garden soil, a peck of brush, bushes, cornstalks, straw or any other substance which would furnish a sufficient ventilation, we should expect a good crop both in quantity and quality. This opinion has grown out of the observations of several seasons, in which we have noticed, while harvesting the crop, that those hills in which the air had the freest passages, gave the greatest yield. We give this as an opinion merely, but have much confidence in its correctness.

In relation to this crop, we do not assume to give instruction; for our own success with it, or rather our failure with it, has been such that we have ever thing

to learn upon the subject, and should be gratified to receive communications relating to this crop.

### PUMPKINS.

A custom, not uncommon, of raising these among corn, is injudicious, especially so where the land is in good till, and where the corn stands thick upon the ground. Under such circumstances, the injury to the corn outweighs the value of the pumpkins. But this crop is worth cultivating. A good course of procedure is to mark or furrow out a field with rows four feet or more apart each way. Plant each hill in every other row with corn. Then in the remaining rows plant every other hill with pumpkins. This will make the hills of vines eight feet apart; it will give a half crop of corn and a good crop of pumpkins. We prefer for cattle the variety which grows large and has a soft shell.

Squashes may be very profitably planted in the same way.

### LIGHTNING RODS.

We publish today a lengthy communication upon this subject. The tone of the article indicates an entire confidence on the part of Mr Strong that his rods have power in all cases to scatter the thunderbolt and render it harmless. It can hardly be expected that community will possess the same confidence:—we do not.

It is generally known, we suppose, that the electric fluid can be taken from a body highly charged with it, without any explosion, provided sharp points are used as conductors. This well established fact is kept in view by Mr S., and his rods are doubtless more effectual for protection against lightning, than any others known among us. Of the prudence of using conductors of electricity upon our dwellings, there can be little doubt. The laws which govern the lightning's course are probably as fixed and unvarying as those which compel water to run along the surface of the lowest ground. And if the laws of the movements of the electric fluid are known, it is as much in the power of man to make for the lightning a path which it will follow, as it is to dig out a channel in which the water will flow. But there is not the same confidence in community that the laws which direct the lightning's course are well understood, as there is that we know how water will move. We cannot have the same confidence that one can make a path in which the lightning will run invisibly down or away from the sides of our dwellings, as we have that the water falling upon the roof will go down the waterspouts. And yet the electric fluid has been so frequently experimented with and used from the days of Franklin to the present hour, and its laws are so well learned, that the probability is great that rods may be so constructed and so fixed upon our buildings that the lightning will almost certainly be led away from us.

Undoubtedly Mr Strong's rods will serve as a desirable and important protection in most instances. As far as our advice may have influence, we would use it in favor of the use of conductors; but at the same time we repeat our doubt whether any ordinary apparatus for the purpose will be found adequate to full protection in some rare instances in which a cloud or the earth is charged most highly with the electric fluid.

A model of the rods in question has been examined in our own office, and the principles of their construction are obviously sound. If our information is correct, the expense of the iron rods is 10, and that of the copper 15 cents per foot, when fixed upon the building.

The Western Farmer and Gardener states that tansey and wormwood planted nearly in contact with peach trees, will protect them from the moth-like worm.

The following remarks of B. are much to the point on a debatable question; and it will give us pleasure to hear from him upon other topics.

### COMPARATIVE WORTH OF NORTHERN AND SOUTHERN CLOVER.

MR EDITOR—Having lately seen some discussion in the papers respecting the comparative merits of Northern and Southern clover, I take the liberty of sending you the result of my own experience on the subject. Eight years since, necessity obliged me to use Southern seed. Since that time I have sowed more or less of it every year, and though contrary to the common opinion in this vicinity, give it the preference for the reasons that follow. It starts earlier and thus gets better rooted the first year; it is much less liable to lodge, consequently gives the other grasses sown with it a better chance; it will also stay in the ground longer than the Northern clover; and lastly, the quality of the hay is very superior. If it is an object for farmers to crowd their barns with clover hay as coarse as raspberry bushes, or if bulk makes amends for every thing else, then sow Northern seed; but if fine, sweet and heavy hay that cattle will eat clean, is desired, then get seed from the south. It is impossible to make very coarse clover without losing many of the heads and leaves, but the smaller stalks of the Southern present no such difficulty. If any one will take the trouble of stripping the heads and leaves from a given number of stalks of each kind, the Southern will be found the heavier of the two, leaving all the extra weight and bulk of the Northern in stalks that no animal will eat. Southern clover is something earlier than Northern, and will in common seasons head out a second time, thus presenting a good after-crop for the scythe; but as the second mowing kills many of the roots, I prefer letting it stand till ripe, when the heads can be gathered for seed with a rake or comb, and leave the crop to be slightly fed afterwards.

Let any one who doubts the correctness of the above statements, try the experiment for himself, and I doubt not but his prejudices would vanish. My soil is a rich clay loam of two feet, on a hard gravel pan. This is mentioned, as perhaps different soils would give different results. With Northern seed, my first year's mowing has not been worth half price per ton, having invariably lodged—consequently the lower leaves were turned yellow and fell off in making, while the mould adhered to the stalks, making the hay smoky when fed out in the winter;—in fact, I could never make any creature do more than pick off the heads, rejecting all the rest.

Kennebec Co., Me.

B.

### LINDLEY'S HORTICULTURE.

We have just received a copy of "The Theory of Horticulture, by John Lindley," first American edition, with notes. New York, Wiley & Putnam; Boston, C. C. Little & Co.

### THAT CUCUMBER.

MR BAECK—Sir—The credit of raising "the first Cucumber in the market" this year, belongs to *Thomas Crawford*, a very ingenious and industrious Irishman in my employ. Having served an apprenticeship of ten years in the business of gardening, in the father-land, he has attained a skill in horticultural pursuits seldom equalled. This statement is due Mr Crawford, who promises to send you, very soon, some of his seeds, which are of the first quality, as well as a second cucumber, measuring not less than 20 inches, when you shall have succeeded, in warmer weather, and with a better appetite, in diminishing the length of the first.

Yours, with esteem,  
Bedford, May 1st, 1841.

New potatoes have appeared at Richmond, Va. The Star, of that place, says it takes six for a mouthful!

**THERMOMETRICAL.**

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northley exposure, week ending May 2.

May, 1841.	7 A.M.	12 M.	5 P.M.	Wind.	
Monday,	26	40	56	43	E.
Tuesday,	27	48	52	46	N. W.
Wednesday,	28	35	54	54	N. W.

Saturday,	1	41	51	45	N. W.
Sunday,	2	41	61	42	E.

Cloudy with some rain every day this week except Wednesday and Thursday. Season continues very backward, 5 o'clock Monday, May 3, ground white with snow and falling very fast.

**BRIGHTON MARKET. — MONDAY, MAY 3, 1841.**

Reported for the New England Farmer.

At Market 280 Beef Cattle, 10 pair of Working Oxen, 12 Cows and Calves, 140 Sheep, and 830 swine. About 45 Beef Cattle unsold.

PRICES.—Beef Cattle.—We reduce our quotations to conform to sales. First quality, \$7 00 a 7 25. Second quality, \$6 50 a 6 75. Third quality, \$5 75 a 6 25. One or two yoke extra were sold for \$7 50.

Working Oxen.—Sales \$70, and \$85.

Cows and Calves.—Sales, \$20, \$23, and \$35.

Sheep.—Prices not obtained.

Swine.—A small advance effected. Lots to peddle 4 3-4 and 5 for sows, and 5 3-4 and 6 for barrows.

Large selected barrows, 5 3-4 and 6. At retail from 5 1-2 to 7.

**WHOLESALE PRICES CURRENT.**

Corrected with great care, weekly.

SEEDS. Herds Grass, very little in market. Red Top, new seed by the bag 58 to 55 c. Clover—Northern, 13c.—Southern, 8 to 9 c. Flax Seed, \$1, 37 to 1 50 bu. Lucerne, 25 c. per lb.

FLOUR. Howard Street \$5 37—Genesee \$5 31—Ohio \$5 12.

GRAIN. Corn—Northern Yellow none—Round Yellow 52—Southern Flat Yellow 57—White 54.—Rye—Northern 60 to 65—Southern 50 to 55. Oats—Southern 30 to 31—Northern 35 to 40.

PROVISIONS. Beef—Mess \$10 50 to 11 00—Prime \$5 50—No. 1 \$9 00. Pork—Extra—15 00—Clear 14 50—Mess \$13 00. Hams—Northern 9 c. per lb.—Southern, none. Lard—Boston 9 c. per lb.—Southern, 8 to 8 1-2. Butter—Lump 18 to 22—Firk 12 to 18—Shipping 8 to 14. Whole Hogs 5 1-2 to 6 c.—Pigs 5 c.

HAY, per ton, \$22 50 to 25—Eastern Screwed \$14 50.

CHEESE—Old 11 c.—New 8.

EGGS, 12 a 14.

WOOL—The market for this article has not experienced any change of late. Pulled Wool is rather scarce, and there is but a limited supply of low Fleeces, and of fine Fleeces the stock is also moderate. Prime or Saxony Fleeces, washed, 50 to 55 c.—American full blood, washed, 47 to 50.—Do. 3 4 blood, washed, 44 to 46.—Do. 1-2 blood, washed, 36 to 40.—1-4 and common do, 35 to 37.—Smyrna Sheep, washed, 20 to 23.—Do. unwashed, 10 to 14.—Bengasi Sheep, 8 to 10.—Buenos Ayres unpicked, 7 to 10.—Superfine Northern pulled lamb 43 to 46.—No. 1 do. do. 37 to 42.—No 2 do do 26 to 30.—No 3 do do 18 to 20.

HOVEY'S NEW SEEDLING STRAWBERRY.

This splendid variety of the Strawberry (originated in 1834) is now offered for sale. The fruit is of the largest size, often measuring 5 to 6 inches in circumference, handsomely formed—of a deep red color—exceedingly high flavored—and one of the most productive varieties, 12 quarts having been gathered from a bed 3 feet by 12. The vines are vigorous and hardy. Standing our severe winters without protection.

The fruit has been exhibited at the Massachusetts Horticultural Society in 1838, '39, and '40, where it attracted more attention than any other variety; and each season obtained a premium. It has every good quality to recommend a Strawberry to cultivation. The Spring is the most favorable time for planting in this climate. Plants \$5 per dozen.

Also, all the old established varieties of Strawberries, from \$1 to 2, per hundred plants.

Orders addressed to us, will be immediately attended to, and the plants packed and forwarded with dispatch.

HOVEY & CO., SEEDSMEN,

7 Merchants' Row, near State st.

May 5 4w

**DURHAM COW FOR SALE.**

A young full blooded Durham Cow and her calf—a very desirable animal in every particular. Apply to EDWARD TITCOMB, Jr., Newburyport.

May 6

**WILLIS'S LATEST IMPROVED SEED SOWER.**

Willis's latest Improved Seed Sower, invented the last season; and one of the most perfect machines ever introduced for the purpose. In using this machine, the farmer may be certain that his seed is put into the ground, and at the same time in the best possible manner. There has been a great difficulty in machines for sowing garden seeds; they are very apt to clog up, and the farmer might go over an acre of land and not sow a single seed; but not so with this; it is so constructed that it cannot possibly clog. In using this sower, the farmer can save one half of his seed, and do the work at less than one quarter the expense of the common way of sowing seeds, and have it done in a much better manner; it opens the furrow, drops the seed, and covers it over and rolls them down. It will sow almost any kind of Garden Seeds; say Ruta Baga, Mangel Wurtzel, Turnips, Carrots, Beets, Parsnips, Onions. It is highly recommended by a great number of persons who used it the past season. For sale at the N. E. Agricultural Warehouse and Seed Store by JOSEPH BRECK & CO. March 31.

**WINSHIP'S NURSERY,**

BRIGHTON, NEAR BOSTON,

Situated on the line of the Boston and Worcester Rail Road,—5 miles from the city.

The Proprietors of this extensive nursery beg leave to inform their friends and the public, that they are ready to furnish orders to any amount, for Forest Trees, indigenous and exotic.

Fruit Trees, including all the varieties of Pears, Peaches, Plums, Nectarines, Cherries, &c. &c.

Vines—Shrubs, Green House Plants, &c.

Catalogues may be obtained by applying at the Nursery.

Trees carefully packed, to ensure safety in long voyages.

Orders left at the New England Seed Store of J. BRECK & CO. Nos. 51 and 52, North Market street, will be delivered the day following, and left at any part of the city, free of expense.

Letters containing orders, addressed to the subscribers, J. & F. WINSHIP.

Brighton Nurseries, March 24, 1841.

**BEDFORD OATS.**

Just received 50 bushels of superior Bedford Oats. This variety is highly recommended, it not being liable to blast, and very productive. For sale by JOSEPH BRECK & CO. March 21.

**SUPERIOR SEED BARLEY.**

100 bushels of extra heavy and clean Seed Barley. Also 30 bushels CHEVALIER BARLEY, a new and superior variety, for sale by JOSEPH BRECK & CO. March 31.

**BLACK SEA WHEAT.**

Received from Vermont, 30 bushels Black Sea Wheat. Also, 20 bushels Italian Spring Wheat, raised in Warren, N. H. For sale by JOSEPH BRECK & CO. March 31.

**TO THE PUBLIC.**

DR. CHARLES M. WOOD, *Veterinary Surgeon*, respectfully informs his friends and the public, that he has removed from Blossom St., to 69 Carver St. All orders left at his house, or at the stable of Wm. Forbes, No. 7 Sudbury St., will be promptly attended to, and gratefully acknowledged. All diseases of Horses, Cattle or Swine, are attended to. Also, castrating and spaying.

For the information of those who may have occasion for his services, and are unacquainted with his practice, he is politely permitted to refer to the following gentlemen who have employed him for a number of years past.

- March 17.

**HERBACEOUS PLANTS.**

J. BRECK & CO., offer for sale a great variety of beautiful Herbaceous Plants, including 20 varieties Phlox, Perennial Coreopsis of sorts, Delphinium, Campanulas in great variety, Double Pinks, Dracocephalums, Double Scarlet Lychnes, Double Ragged Robin, Spiraeas of sorts, Iris do. with a great variety of others. Also, Honeysuckles, Roses, and other ornamental Shrubs.

**GRAPE VINES.**

Extra large Isabella Grape Vines for sale as above. Also, Giant and Early Wilmot Rhubarb Plants, and Asparagus Roots J. BRECK & CO. April 28

**SWEET POTATO SLIPS.**

Just received and for sale by J. BRECK & CO, a supply of Sweet Potato Slips. No 52, North Market st. April 23.

**BONE MILLS.**

The subscriber offers for sale Bone Mills on a new and improved plan, which will grind 200 bushels per day, and make it of the proper fineness. They can be put up with small expense, and require but little room. They can be easily kept in repair and are not liable to break with the roughest usage.

They may be used for grinding Barilla, and will do the work in the best manner. Oyster shells, plaster, soap stone, bricks, bark, &c. may be ground by them.

Price \$260. They require about as much power as a small run of mill stones, to be used to advantage, and can, if necessary, be driven by horse power.

Those who wish to purchase can direct to William Aplin, No. 14 1-2 Westminster street, Providence, R. I., or to the subscriber.

Ground bones constantly on hand for sale.

Providence, R. I., Feb. 9, 1841.

**DOUBLE DAHLIAS.**

We have for sale a very large collection of the finest Double Dahlias, of the most esteemed sorts. J. BRECK & CO., No. 52, North Market St. April 23

## MISCELLANEOUS.

## JURIES.

In this country, thanks to the free character of our noble institutions, it is not often necessary to vindicate the independence of jurors. But even here, judges have sometimes forgotten the dignity and courtesy due to this humble, but favorite tribunal. Such an one was eloquently reprov'd in the following address, reported *verbatim* by the late Rev. Edmund Butcher. The whole circumstance proves that true eloquence is the child of nature.—A judge on the Northwest Circuit in Ireland, tried an action for assault, brought by a neighboring land-owner against a poor tenant. The jury found the defendant *not guilty* :

"The judge was enraged, and told the jury they must go back and reconsider the matter; adding, he was astonished at their giving such an *infamous* verdict. The jury bowed, went back, and in a quarter of an hour returned, when the foreman, a venerable old man, thus addressed the bench: 'My Lord,—In compliance with your desire, we went back to our room; but as we there found no reason to alter our opinions or our verdict, we return it to you in the same words as before—*not guilty*. We heard your lordship's reproof; but we do not accept it as properly applying to us. Individually and in our private capacities, we are insignificant men; we claim nothing out of this box, above the common regard due to our humble, yet honest stations; but, my lord, assembled here as a jury, we cannot be insensible of the great importance of the office we now sustain. We feel glad that we are appointed, as you are, by the law and the constitution, not only to act impartially between the king and his subjects, the offended and the offender, but to form the barrier of the people against the possible influence, prejudice, or corruption of the bench; to which we do not wish to offer the smallest degree of disrespect, much less of insult; we pay it the respect which one tribunal should pay to another, for the common honor of both. This jury did not accuse the bench of partiality or oppression—no, we looked upon it as the sanctuary of truth and justice; still, my lord, we cannot erase from our minds the records of our school books. By them we were taught that kings and judges are but fallible mortals; and that the seat of justice has been polluted by a Tressilian, a Scroggs, and a Jeffreys.' The judge frowned at these words, but the intrepid juror thus proceeded: 'My lord, I am but a poor man, yet I am a freeborn subject and a member of the constitution—nay, I am now higher, for I am one of its representatives; I therefore claim for myself and fellow-jurors, liberty of speech.'

"The judge here resumed his complacency, and the orator continued his address: 'We have nothing to do, my lord, with your private character in this place—it is veiled by your official one: we know you here only in that of a judge, and, as such, we would respect you:—you know nothing of us but as a jury; and in that situation, we look to you for reciprocal respect, because we know of no man, however high his titles or his rank, in whom the law or the constitution would warrant an unprovoked insult towards that tribunal, in which they have vested the dearest privileges they possess. We sit here, my lord, sworn to give a verdict according to our consciences, and the best of our judgments, on the evidence before us. We have, in our minds, discharged our duty as honest men. If we have

erred, we are accountable, not to your lordship, nor to the king who appointed you—but to a higher power, the King of kings!"

"The bench was dumb, the bar silent; astonishment and applause murmured through the crowd, and the poor man was discharged."

**Employment.**—Men when driven and perplexed by the labors and cares of a busy life, often long for non-employment and ease—and think if they could only attain to such a state, they should certainly find happiness. But this is a great mistake in any man who indulges the idea. "I have lived," said the indefatigable Dr. Clark, "to know that the great secret of human happiness is this: never suffer your energies to stagnate. The old adage of 'too many irons in the fire,' conveys an abominable falsehood. You cannot have too many—poker, tongs, and all—keep them all going, and you will be the happier."

## DRAFT AND TRACE CHAINS.

Just received by Packet Coromanda,  
400 pair Trace Chains, suitable for Ploughing.  
200 " Truck and leading Chains.  
200 " Draft Chains. For sale by J. BRECK & CO.,  
No. 52 North Market st. April 21

## CLOVER &amp; RED TOP.

50 tierces and 100 bbls. Prime Clover.  
200 Bags Redtop, new seed.  
50 bbls. Herds Grass prime quality, for sale by  
March 24 J. BRECK & Co.

## HOWARD'S IMPROVED EASY DRAUGHT PLOUGH.

Great improvements have been made the past year in the form and workmanship of these Ploughs; the mould board has been so formed as to lay the furrow completely over turning in every particle of grass or stubble, and leaving the ground in the best possible manner. The length of the mould board has been very much increased, so that the Plough works with the greatest ease, both with respect to the holding and the team. The Committee at the late trial of Ploughs at Worcester, say,

"Should our opinion be asked as to which of the Ploughs we should prefer for use on a farm, we might perhaps say to the inquirer, if your land is mostly light and easy to work, try Prouty & Mears, but if your land is heavy, hard or rocky, begin with Mr. Howard's."

At the above mentioned trial the Howard Plough did more work, with the same power of team, than any other plough exhibited. No other turned more than twentyseven and one half inches, to the 112 lbs. draught, while the Howard Plough turned twenty-nine and one half inches, to the same power of team! All acknowledge that Howard's Ploughs are much the strongest and most substantially made.

There has been quite an improvement made on the shoe, or land side of this Plough, which can be renewed without having to furnish a new landside. This shoe likewise secures the mould board and landside together, and strengthens the Plough very much.

The price of the Ploughs is from \$6 to \$15. A Plough, sufficient for breaking up with four cattle, will cost about \$10 50, and with cutter \$11, with wheel and cutter, \$2 50 extra.

The above Ploughs are for sale, wholesale and retail, at the New England Agricultural Warehouse and Seed Store, Nos. 51 & 52 North Market Street, by

JOSEPH BRECK & CO.

## TYING UP CHAINS.

Just received by Packet Coromanda, 500 Chains for tying up Cattle.

These chains, introduced by E. H. Deary, Esq. of Salem, and Col. Jacques, for the purpose of securing cattle to the stall, are found to be the safest and most convenient mode of fastening cows and oxen to the stallion.

For sale by J. BRECK & CO., No. 52 North Market st. April 21.

## GARDEN SEEDS.

For sale by JOSEPH BRECK & Co. at the NEW ENGLAND FARMER OFFICE, No. 51 and 52 North Market St. Boston. The subscribers would inform the public that they have now on hand the largest collection of seeds ever before offered by sale in this city, embracing every variety of Field, Kitchen, Garden, and Ornamental Flower Seeds, desirable for this or any other Climate.

Our seeds are either raised under our own inspection or imported from responsible houses in Europe, and having taken extraordinary pains to obtain such as are pure and genuine, we can confidently recommend them to our customers and friends, and feel assured they will prove satisfactory to all who try them.

Dealers in seeds are requested to forward their orders in season. Boxes for retailing from 8 dolls. and upward will be sent out on commission allowing a liberal discount and take back what remain unsold.

Letters and orders with good reference will meet with prompt attention.

## FIELD SEEDS.

Sugar Beet.	Ruta Baga.
Mangel Wurtzel.	Callaine's New Royal do.
New Red Globe do. } superior	White Tankard Turnip.

Wheat—various sorts.	Purple Top Hybrid do.
Barley, do.	Buckwheat.
Rye, do.	Broom Corn.
Potatoes, do.	Millet.
Indian Corn, do.	Buckthorn. } for Hedges
Oats, do.	Locust.

## GARDEN SEEDS.

Artichoke, Asparagus, Beans of every description, Beet of sorts, Borecole, Broccoli, Brussels Sprouts, Cauliflower Caraway, Celery, of the most improved sorts, Cabbage 2 sorts, Carrot, all the varieties, Cucumber do, Cress, Egg Plant, Endive, Indian Corn, Kale, Leek, Lettuce in great variety, Melons, do, Martynia, Mustard, Nasturtium, Okra Onion of sorts, Pepper do, Pumpkin do, Parsnip, Parsley Peas, a very great variety, Rhubarb for tarts, Radish of sorts Salsify, Squash of sorts, Tomato, Turnip 20 varieties.

## SWEET AND POT HERBS.

Thyme	Sweet Basil.
Sweet Marjoram.	Lavender.
Sage.	Lemon Balm.
Summersavory.	Anise.
Medicinal Herbs, &c.	

## ORNAMENTAL FLOWER SEEDS.

Three hundred varieties, embracing all the finest sorts Packages of 20 fine sorts for one dollar.

Those who prefer to have their Seeds put up in paper ready for retail, can be accommodated—each packet neatly closed and labelled with printed directions. Price 50 cents per dozen papers, which are retailed here at 6 1-4 cents each.

Fruit and ornamental trees, of the greatest variety, supplied at nurseryman's prices, and orders solicited. These will be packed, when required, to go to any part of the U States. JOSEPH BRECK & CO.

## FRUIT AND ORNAMENTAL TREES, &amp;c.

## NURSERY OF WILLIAM KENRICK.

12 000 Pear and Plum Trees.—Large and new additions of Pear and Plum Trees have lately been received, many kinds of which are alike new to our country, and very extraordinary. Such have been the selections which have been made by the subscriber in Europe, and in person, during the last Autumn, where all have been proved; those kind already well known amongst us being identified by him by the wood and the leaf.

All orders addressed to the subscriber, or left with Joseph Breck & Co., New England Farmer Office, will be promptly attended to, and Trees, when so ordered, will be securely packed for safe transportation to distant places.

WILLIAM KENRICK.

## CAUSE OF ROT IN TURNIPS.

MR EDITOR—Much has been said of late about the cause of the rot in turnips. One attributes it to their being sowed on wet lands; another to early sowing; another to something else. Now I believe farmers often form their opinions too hastily. An opinion may be formed from one or two years' experience in a particular kind of management, or cultivating a particular kind of soil, in particular seasons, while the real cause of their success or failure may be attributed to some other cause, aside from what they suppose.

I have not been troubled with the rot in turnips until the last year, when I planted several pieces at different seasons, and had different management; but the result was such that I am not satisfied as to the cause of the disease.

The first piece was in 1839 well manured and planted with potatoes. Last spring it was again well dressed with compost manure, ploughed, and planted with ruta bagas the 4th of June. The crop was light and many of the roots were defective.

The second piece: the grass was turned in about the first of June—rolled and harrowed—manured in the hill with compost made of about one part stable manure and two parts meadow mud, with a small portion of wood ashes; planted the 11th of June. We had a tolerably fair crop and but few defective roots.

The third piece was managed as follows: a part of it was ploughed the 15th of June; rolled, dressed with about 30 loads of compost manure to the acre: harrowed and planted the 19th. On the other part the manure was spread on to the grass; it was ploughed the 16th; rolled, harrowed, manured lightly in the hill, and planted the 20th. The manure that was harrowed in and that put in the hill was of the same kind, and was made from loam carted into the cow yard and hog-pen, thence being removed to the field and being well pulverized by overhauling. The manure that was ploughed in was also compost, made of loam hauled into the barn cellar and mixed with the droppings of the cattle: this was applied in an unfermented state. Nearly the same quantity of manure was applied to both parts of the piece. After the turnips came up they were dressed with wood ashes. That part of the piece where the manure was ploughed in, produced a tolerably good crop, and but few defective plants: on the other part the crop was much lighter, and many of the roots were defective. A small portion of the piece extended into a dry knoll, where they were very free from rot.

In the second piece named, there was a small hollow extending across the piece, where there was a much better yield and where the plants were more free from rot.

There was a small patch in the first mentioned field where I had carted off the soil into my hog-

yard. It was a yellow loam. I ploughed it the 20th of June; manured it in the hill with hog manure, and planted it. The land was, to appearance, alike and the manure alike. On a small portion of the piece the plants were nearly all defective, and on the remainder there was a tolerable crop.

One of my neighbors had a piece which he highly manured and prepared with great care for an extra crop. It was almost an entire failure. Another neighbor planted a piece on a gravelly knoll, where the land to appearance was hardly worth cultivating: he had a very fair crop.

From what information I have gathered from the last year's crop in our vicinity, I think dry land has produced the best crop, although there are some exceptions.

Yours, with sincere respect,

JOSEPH HOW.

*Methuen, April 12, 1841.*

Though the facts given by our intelligent and observing correspondent from Methuen, do not solve the mystery of the rot, yet he has laid us under obligations by his statements. A collection of facts from various quarters, is the only process by which we can hope to learn the cause of the evil in question. A few men having given what light they can furnish, we trust that others will imitate their example, and help to detect the agent which ruins one of our valuable crops.—Ed. N. E. F.

For the N. E. Farmer.

## TREATMENT OF COWS JUST BEFORE AND AFTER CALVING.

MR EDITOR—Your paper of April 28th, contained some important questions relative to the management of cows after calving, answered in part by an extract from Youatt's Treatise on Cattle. I do not feel competent to give any answer to the questions, but wish to say a few words respecting the inflammation or garget in the udder, mentioned in the extract. This, I think, is caused by too great an accumulation of milk; for as far as my limited observation extends, I have never known a cow that calved before her bag was full to be troubled with it. Whether this is the true cause or not, we want a preventive. Youatt recommends a "drink consisting of a pound of Epsom salts and two drachms of ginger." From my experience in taking salts, I should think this a tough dose, and would much rather have one ounce of some milder preventative than a pound of such cure. The warm wash which he recommends, has a tendency to increase the quantity of milk, and if my opinion is correct, is injurious. My opinion (this I confess is a small affair, when compared with the opinion of older and more experienced farmers and herdsmen—but such as it is,) I will give you, with the reasons upon which it is founded, and then you may think as you please of it.

My father's practice, until last autumn—and it may be the practice of many others—was, to feed his cows for a short time before calving, higher

than they had been previously fed, in order, as he said, to have their bags well filled; and at the time of calving to give them warm water thickened with meal, (similar, I suppose, to the mash recommended.) The consequence was, that the extra feeding caused the bag to fill too soon, and the milk continuing to press in, caused inflammation. Our cows were much troubled with hard and swollen bags. Thinking what might be the cause, I last spring requested father to try an experiment on a cow that the year before was very troublesome, by reducing the quality of her food instead of increasing it. The result was that she calved before her bag was full. She gave but little milk at first, but in a few days gave a good mess; her bag milked down well, was soft and pliable. We have had no trouble since, excepting with a heifer, which calved about the first of July, when the grass feed was good. This would probably have been prevented, had she been taken to the barn and fed on hay eight or ten days before she calved; and we should thus have saved her much pain.

The treatment of milch cows is a subject upon which little, and I think too little, has been said in the agricultural papers of the day. Who can tell what effect one week of intense pain and suffering arising from an inflamed and swollen bag, has upon the health of the cow and the quantity of milk for the season? A FARMER'S BOY.

*Essex Co., Mass., April 30, 1841.*

The above communication coming, as we know it does, from a youth who has received none but a common school education, and whose days have thus far been spent in diligent labor upon the farm, we trust may have an influence in leading other boys to trace effects to their causes, and suggest remedies for existing evils. We shall have no fear that the interest or value of our paper will be diminished by inserting the opinions of boys, if they but give us as good reasons for the opinions as are furnished by this Farmer's Boy. We shall be happy to hear from him again.—Ed. N. E. F.

For the N. E. Farmer.

## SUBSOIL PLOUGHING.

Extract from a letter to Messrs J. Breck & Co. dated

*"Braintree, April 29, 1841.*

"I have just finished ploughing a piece of sod land of about an acre and a half, with Howard's subsoil plough, and deem it but justice to admit that the plough has done all that I expected from any subsoil plough, which is contrary to my expectations, as expressed to you and Mr Howard. The ground was unfavorable to a fair trial, it being stony, sideling, and occupied by a young orchard. I have ten acres more to plough this season, part old ground, and intend to make use of the subsoil plough for the whole of it. The plough got round the stones in the subsoil in a manner that I did not expect, ploughing to the depth of seventeen inches, moving and loosening the same in a tenacious soil, by the use of two yoke of oxen."

"Chevalier Barley.—I am often inquired of in regard to the Chevalier barley, purchased of you last year. I do not judge my soil suited to any of the small grains, but found the yield and kernel of this variety much greater and fuller than from the common barley on richer ground.

Yours, with respect, \_\_\_\_\_"

### POTATOES FROM THE SEED.

A Mr Merriam, of Chelmsford, recently called upon us and related an account of a wonderful growth of potatoes from the seed. He states that his account will seem incredible, and yet that it can be proved by competent witnesses. His statements are, that plants, apparently weeds when quite small, came up in his onion patch. A few of these escaped destruction at the first weeding and soon put on the appearance of potato vines. The land has been sowed with onions four or five years in succession. He can in no way account for the presence of the seed. Late in autumn these vines were of immense size: one of them measured 8 1-2 feet in length. From this one he obtained 15 3-4 pounds of good sized and handsome potatoes. The others yielded most abundantly: some of them furnishing fair potatoes, and others yielding these of irregular shape. Three roots furnished something resembling the old Spanish potato. From one root he obtained a very white potato—from another, the kidney—from a third, a round red. If we understood him correctly, the vines yielded from 97 to 127 potatoes each. Here was certainly an extraordinary produce. Unfortunately, the greater part of his crop has been frozen during the past winter.

The gentleman seemed to be at a loss to account for the appearance of these plants in that land, and also for the varieties of potato, all of which were different from any that he had ever cultivated. We can suppose that potato vines, with seed balls upon them, were worked into his manure and in that carried on to the field; and it is not uncommon for the seeds from potatoes of any one variety to yield fruit of various forms, colors and properties. There seems to us no mystery, unless it be in the great productiveness; and in relation to this it must be remembered that the land was in good tilth, and that the onion tops, being comparatively small, would offer but little obstruction to the freest and fullest growth of the potato.—Ed. N. E. F.

### COMMON SALT—ITS USES IN HORTICULTURE.

From Johnson's work on Fertilizers, we transcribe the chapter whereof the contents are indicated by the heading of this. When used by the gardener or florist, the quantity of salt needed is so small as to constitute no serious objection, and the scope of experiments necessary to ascertain its effects is so limited, as to admit of their being made with ease and exactness: and here let us say, that if young agriculturists were more given to such experiments, and to noting their results, they might fill up many an hour usefully that is now passed in listless ennui, or, to escape from that, in ruinous dissipation.

In transferring matter from foreign works to American periodicals, the most rigid and judicious excision of that which is inapplicable, will not always exclude some things which in our country will appear irrelevant, or prove to be impracticable.

The winnowing of the offal from the sound grain, must at last be left to the discriminating reader, who, if a liberal one, will be ready to make all allowance if the chaff be not out of all proportion to the wheat.

Salt, says our author, has been employed by the gardener for many purposes; most commonly on lawns, at the rate of ten bushels per acre, to prevent worm casts; and on gravel walks in a larger proportion, to kill weeds; it may be employed, however, as a fertilizer in gardens with decided advantage. I have witnessed the results of the following experiments made by my brother, George Johnson, at Great Totham, and I the more readily give them a place here, from knowing with what care they were made:

The soil was composed of stones and gravel 27 parts out of 100—vegetable fibre 1.5—soluble matter 3—carbonate of lime and magnesia 18—oxide of iron 4—animal and vegetable matter 1—alumina 4.5—silica 40—loss 1. Cultivated in Windsor beans. The soil treated with twenty bushels of salt per acre produced 217 bushels—the simple soil without salt, produced 135 1-2 bushels.

#### Onions.

	Tons.	cwt.	qrs.	lbs.
Salt 20 bushels—manure 20 tons per acre—produce,	3	13	3	12
Manure, 20 tons per acre,	2	10	2	19

#### Carrots.

1. Soil without manure,	13	4	0	0
2. ' with 20 tons of manure,	22	18	0	26
3. ' ' 20 bushels of salt,	18	2	0	0
4. ' ' 20 ' salt and 20 tons of manure,	23	6	1	18

#### Parsnips.

1. Soil with 20 tons manure and 20 bushels salt,	6	15	0	0
2. Soil with 20 tons manure,	6	11	1	1

#### Early Potatoes.

1. Soil simple, 308 bushels.
2. Soil with 20 bu. salt, 581 bushels.

#### Beets.

1. Soil simple,	4	10	1	0
2. Soil with 20 bushels of salt,	4	8	3	0
3. Soil with 20 bu. salt and 20 tons of manure,	7	0	0	0
4. Soil with 20 tons manure,	6	10	0	0

In preventing clubbing in the roots of some of the brassica (cabbage) tribe, my brother found salt highly useful: he states in some observations on this disease, read to the Horticultural Society of London, October 16, 1821, that "some cauliflowers were planted upon a light silicious soil, which had previously been manured with well putrified stable manure, and over one third of the allotted space was sown with salt at the rate of 20 bushels per acre, immediately before planting in July, 1821. The previous crop had been brocoli. Fiftyfour plants were set on the two thirds unsalted, and twentysix on the one third salted: the result has been, that of the fiftyfour unsalted, fifteen have been diseased and unproductive, but of the twentysix salted, only two."

A writer in the Farmer's Journal, October 23, 1820, says—I have employed salt with success, more especially to onions, and the whole of the cabbage tribe. Before the application of salt, they were generally clubbed at the roots and worm eaten; but since its application they have been

entirely free from this disease, and have grown well. Mr Archibald, gardener to Lord Sheffield, at Titcham, planted in March, 1829, two hundred Brighton coss lettuces, and sprinkled between the rows, quick lime. Two hundred more were planted out, and salt sprinkled between the rows. Those limed (the season proving dry,) ran to seed, and were of little value; but those on the salted ground cabbaged well, and were as productive as if the season had been wet.

The author proceeds to recommend the use of salt to florists by many examples of its effects. Dr. Priestley, by various experiments, found that the use of salt materially protracted the life of plants; and so well is this fact established, that it is a common custom with the importers of exotic plants to dip cuttings into salt water. "Before the adoption of this plan they almost invariably perished on the passage." Another writer of much observation, speaking of the use of salt in the culture of hyacinths in Holland, says—"This root, though not indigenous to the country, may be said to be completely naturalized in the neighborhood of Haerlem, where it grows luxuriantly in a deep, sandy, alluvial soil; yet one great cause of its free growth, I considered was owing to the saline atmosphere: this induced me to mix salt in compost and I am satisfied that no hyacinths will grow well at a distance from the sea without it."

We have said enough to set our fair readers who are fond of flowers, (the best sign of a good heart, to thinking—and we all know how it is with them when they take a thing in their head.—*Amer. Fam.*

### SILK CULTURE—IMPORTANT DISCOVERY—THE MUSCARDING IN AMERICA.

Probably the most important information it has ever fallen to the lot of the writer of this to communicate to the public, on the subject of silk culture in this country, will be found in the present article. It has long been known to every one who has read much on the subject of the silk culture, that, by the ravages of a disease called *Muscarding*, in Europe, the average loss of worms, taking one year with another, amounted to from fortyfive to fifty per cent. of all the worms hatched; and what was still worse, the disease generally made its appearance after the greater portion of the expense of the rearing had been incurred. The evil has continued, from time beyond the reach of history, to within a year or two past. In the United States, all of us have heretofore considered worms exempt from this fatal disease, it having generally been supposed not to exist here at all. This was a fatal delusion. I have just received from France a copy of the "Annales de la Societe Sericicole, fondee en 1837, pour la propagation l'amelioration de l'industrie de la soie en France" for 1837, 1838, and 1839, in one of the volumes which I find a plate representing silkworms in various stages of the muscarding; the first glance at which showed me that it was the identical disease of which a great portion of the silkworms in this country have perished. All who saw the disease last summer and have seen this plate, identified it instantly. I shall endeavor to have translations made for the next number of the Silk Journal, and if possible, shall accompany them with a copy of the plate, that all may read, see and judge for themselves. In the meantime, I have thought it advisable to take this hasty notice of the fact, that all silk growers may be enabled to apply preventive and remedy. Happily, the remedy will

do no harm, either to the healthy worms or those that may be affected with other diseases, and is cheap and easily applied. The remedy is a free application of *air-slacked lime* to the worms, and also to the floors of the cocoonery, and whitewashing all the wood-work of the fixtures. The lime should be sifted through a fine sieve on the worms, two or three times a week if healthy, and once a day if diseased, in the morning before first feeding, and after cleaning the hurdles. The quantity of lime to be sifted on the worms may be just sufficient to whiten the worms and leaves well; and it should be commenced when the worms are half grown, say twelve to fifteen days old. This remedy has, during the past two years, enabled those persons in France who used it to save and obtain cocoons from ninetyseven per cent. of all the worms hatched.

Now that we *know* we have this formidable disease amongst us, it becomes necessary that the remedy should be applied; and, as there are very few, if any, who know the disease by sight, I would most earnestly recommend that the remedy be applied in *all cases*, whether the worms are sickly or not; for it is even more effectual as a *preventive* than as a remedy, and, as before stated, will do no harm to either healthy or sickly worms.

GIDEON B. SMITH,

Editor of the *Silk Journal*, Baltimore, Md.

#### SMALL BIRDS GREAT BLESSINGS.

I wish our intelligent farmers could be awakened to the importance of preserving robins, and other small birds, as a means of aiding in their work. The inhumanity which suffers every lazy lubber of a boy, who can rest an old king's arm over a stone wall, to kill or frighten every poor linnnet that sings in the fields, and every robin-red-breast that dares eat an unripe cherry, and save a child from the dysentery, is a short-sighted piece of selfishness. These harmless birds *live upon* grubs and other worms, and insects, and the slight inroads they make upon the farmer's crops are repaid an hundred fold, by the protection they afford against a thousand destroyers. These birds, if not frightened, will become so tame as to perch on the hand, or light on the plough, as it turns over the furrow. No good farmer should fail to teach his boys to spare and cherish these harmless and often tuneful visitants to his fields and orchards. Like the good man in one of our western towns, who plead so earnestly for the poor crows, in our Legislature a few years since, I would enforce the legal penalties for trespass, against any one who shot them on my land. The crows, too—nature's living mouse-traps—instead of being a tame, almost domestic bird, as in some other countries, where farmers have been taught their value by long experience, have been frightened into mean pilferers of unweeded corn-hills! A good crow is worth a bushel of wheat or other grain, to the acre, and sometimes ten! A knowledge of ornithology, and not penal laws, is what our farmers and their sons need to induce them to regard their true interests in this matter.—*Farmer's Gaz.*

Poor ground deeply stirred, is preferable in many cases to rich ground with shallow tillage; and when the ground has been deeply moved once, it feels the benefit for ever after.

To preserve seeds in long voyages, mix them powdered sugar and roll them tight in paper.

From the Farmer's Cabinet.

#### ANTI-FRICTION.

*He who makes hard things go easy, deserves praise.*

If horses could speak, no doubt they would often complain of the excessive friction of cart and wagon wheels.

It should be the duty, as it is unquestionably the interest, of every farmer in the country, to see to the state of his wheels at frequent intervals, and lessen the friction of them to the lowest possible degree. The horse is an interesting and useful animal, and has but a dogged life of it under the most favorable circumstances, and therefore he ought to have his interest and comfort duly considered and attended to. Those who oppress beasts unnecessarily, always add to their own burdens by increasing their expenses; for all domestic animals pay well for kindness and care. A horse will be more useful, and last much longer under kind and Christian treatment, than when he is subjected to unnecessary hardship and extreme drudgery.

A horse always draws with the greatest effect when the line of draught is inclined upwards, so as to make an angle of about 15 degrees with the horizon; for at this inclination the line of traction is set at right angles to the shoulder, all parts of which are then equally pressed. When part of the weight presses on the back of the horse, he will draw a load which else he would be incompetent to move; hence, a horse can accomplish more in a cart properly loaded, than he could otherwise.

The question in regard to the material most proper to be applied to wheel-carriages to diminish friction, is one of great importance, and every well-wisher to the interests of farmers, ought to lend some aid in solving it. All the varieties of grease, tar, and their combinations have been resorted to; and there are other substances which have of latter years been adopted to lessen the friction of machinery; such as black lead and soap stone pulverized, and mixed with small quantities of fat of some kind. Yet I have seen no results of comparative experiments published to instruct and guide the public. Should any of the readers of the Cabinet possess practical knowledge on this useful and interesting subject, they would much oblige some of your readers by making it public through your columns. We have many *anti's* in our widely extended country, but we want one more, in the form of an *anti-friction composition*, for application to cart and wagon wheels, to make them revolve with less labor to our horses; and he who will discover and make it known through the Cabinet, will deserve well of the community at large.

Z.

#### CAPITAL.

There is no mistake more common nor more injurious, than that of supposing that the more land a man holds, the greater must be his profits, for the profit does not arise from the land itself, but from the manner of using it; for the best soil may be made unproductive by bad management, while the worst may be rendered profitable by the opposite course; but without sufficient capital no land can be properly cultivated; at the same time, there is nothing to which capital can be applied with greater certainty of a fair return for liberal expenditure, when correctly employed, than land. In fact, assuming always that the expenditure be directed

with judgment, it will be found that the profit upon the outlay increases in more than a proportionate degree to its amount; thus, supposing twenty-five dollars be the lowest, and fifty the highest sum that can be employed in the common culture of the same acre of land, it is more than probable that if twenty-five dollars return at the rate of ten per cent., the fifty dollars will yield twenty, or any intermediate sum, at the same progressive ratio. And admitting this to be true—and it is presumed no experienced agriculturist will doubt it—it follows, that a capital of 5000 dollars, expended in the cultivation of 200 acres, will only yield a profit of 500 dollars, while, if applied to no more than 100 acres, it would produce 1000 dollars; therefore, it is evident that his profit would be increased by diminishing the quantity of his land. Many a man has been ruined by a large farm, who might have acquired a competency with one of half the size. Most farmers are anxious for large occupations, and many are thus betrayed into the error of taking a greater quantity of ground than they have the means of managing to advantage; some, in the delusive hope of acquiring those means by future savings; others, from the vanity of holding more land than their neighbors. Hence arises deficiency of stock, imperfect tillage, and scanty crops, with all the consequent train of rent in arrear, wages ill paid, and debts unsatisfied—distress, duns, and final ruin! While he who prudently commences, with only such a number of acres as he has the power of cultivating with proper effect, is certain of obtaining the full return from the soil, and not being burdened with more land than he can profitably enjoy, his engagements are within his means; and thus, while enjoying present ease of mind, he lays the surest foundation for future prosperity. It therefore behoves a man to weigh well the charges with his means, and never allow himself to be seduced by any ideal prospect of gain, into the imprudence of entering upon a larger farm than his property will enable him to manage with the spirit necessary to insure success.—*British Husbandry.*

*Make your own Measures.* We give below a rule by which every one can easily make his own measures.

A barrel contains 10,752 cubic inches. A box 24 inches long, by 16 inches wide, and 28 inches deep, will hold just a barrel.

A half barrel. Make a box for this 24 inches by 16, and 14 inches deep. This will contain 5,376 cubic inches, or just half a barrel.

A bushel. This has 2,150 4-10 cubic inches. A bushel box will be 16 inches by 16 8-10 inches square, and 8 inches deep.

Half bushel. A box 12 inches long by 11 2-10 inches wide, and 8 deep, will hold just half a bushel.

Peck. A box 8 inches by 8 4-10 inches square, and 8 inches deep, is a peck.

Half a peck is 8 inches square and 4 2-10 inches deep, or 268 8-10 cubic inches.

A half gallon. This contains 134 4-10 cubic inches. A box 7 inches by 4 8-10 inches deep has just that quantity.

Quart. 4 inches by 4 inches 4 2-10 deep.—*Balt. Farmer.*

Although the devil is the father of lies, he seems, like other great inventors, to have lost much of his reputation by the improvements that have been made upon him.—*Swift.*

### FARMING IN GREAT BRITAIN.

*West Tisbury, Mass., March 20, 1841.*

GOV. HILL.—Dear Sir—I see by your paper that you have done me the honor to publish the remarks made by me at the Agricultural Meeting at the State House, Feb. 4th. The request made by the Chair that I should state my European reminiscences, took me entirely unprepared, for I had not so much as even thought that I should be called upon to address the meeting. One day of preparation would have enabled me to have said much, for the recollections of any man of common capacity, fond to a fault of agricultural life, and mixing most pleasantly in that society, cannot but interest, when they are of the best farming country under Heaven. For whatever opinion we may form of Britain—her pride, arrogance, insolence, presumption, vanity, faults, (mark my words,) that will have to be amended within ten years by the compulsory process of a general alliance of nations against her—yet we must all confess that her agriculture is the most stupendous thing under heaven. When it is remembered that the crop of turnips grown in Norfolk alone is greater than the value of her trade with China; that the market price of the geese brought from the Lincolnshire fens, is more than her trade with Denmark; that you shall see as a common thing, a hundred acres of turnips, or a hundred acres of beans, or thirty acres of cabbages in a single field—a farm of 300 acres all mowed—on a farm of the same size, 300 acres, all in crops; the live stock on a farm worth £10,000—twenty or more horses employed on one farm every working day in the year, and by means of thrice ploughing (heavy clays) turning 900 acres in a single year;—I say, when this is remembered, it will be seen that "Great" as Britain is in every thing, the superlative degree of greatness is in her agriculture—in her soil, naturally poor, but made rich by the application of capital and of unwearied assiduity, good sense and enterprise.

In this country we fail, most from want of capital, and from the circumstance that agriculture does not rank as an employment with others, especially with trade. It is not valued as it ought to be. The English contend that it never was so valued in a democratic country. Agriculture, they say, is substantially an aristocratic employment. This is certainly true of England, and I believe of Europe generally. In England, to be wanting in the dignity conferred by landed possessions, is to want that which conducts to the highest offices and most exclusive society. The term "country gentleman," is in England almost an actual patent of precedence. So far do they carry this, that no man in trade can marry into a family of landed descent and possessions, unless he add to large wealth an eminent character for talent. It is from the all-absorbing influence of men of landed property, that the agriculture of Great Britain has become an interest that has never had a parallel in the history of the world. For whilst the annual value of the exports from the United Kingdom is about two hundred and seventy millions of dollars, the annual value of the agricultural produce is reckoned at more than eleven hundred millions; and this when the valuation of the immense crops of vegetables is at the minimum price they are worth in feeding stock.

I am, dear sir, yours, respectfully,

JAMES ATHEARN JONES.

We copy the following from the Mark-lane Express, an English paper:

### THE TURNIP QUESTION.

SIR,—In consequence of a former letter that I wrote to you relative to the growth of Swedish turnips, and the weight per acre I had grown here, I have had several letters requesting me to state the method adopted by me in obtaining what the applicants call "enormous crops." I am always glad to give any information I am possessed of, for the benefit of agriculturists; and in reply, therefore, to the different queries put to me, I may state generally, that the field from which I had upwards of fortythree tons of Swedish turnips per statute acre, in 1840, is what I call a clayey loam, with a retentive subsoil. It was drained with tiles some years ago effectually, by cutting the drains, not more than from five to six yards apart. In 1839 it was broken up from pasture for oats; the crop was good, and so soon as the oats were cut and removed from the field, I had the stubble skim-ploughed, say from three to four inches deep, and in that state I allowed the field to remain a month or five weeks, and then I had it ploughed from sixteen to eighteen inches deep, with Smith's subsoil plough. After this operation, the field was not more disturbed until the spring of 1840, when I had it harrowed so soon as it was sufficiently dry. Between the end of March and the third week of May, I had it ploughed and harrowed three different times. From the subsoil ploughing in the autumn, the ground was very mellow in the spring; and after it was three different times ploughed and harrowed, the soil was very fine. The next operation was forming the drills, which were about thirty inches apart. While this was going on, I had the dung in a moist state carted out and spread in the hollow between the drills, with some bone-dust sown over it, and covered in immediately (to prevent evaporation) by having the drills split out over them. The quantity of dung per statute acre applied, was about from twenty-six to twenty-eight tons, and over this dung I had sown with the hand, about half a ton of the best raw-bone dust per statute acre.—After the dung and bone-dust were covered in, say about from two to three inches from the drills, I immediately, while the dung and ground were moist, had the seed sown by a machine, at the rate of about three pounds weight per statute acre, taking care that it was deposited in the dung; and thus by being so deposited, it vegetated immediately, and grew out of the way of the fly in course of eight or ten days. The moisture of the dung and soil, and the heat occasioned by their admixture with the bone dust, forced the plants for the first fortnight the same as if they had been in a hot-bed. At the end of this period the plants were almost ready for singling out, which as soon as they would bear the operation, I had done with the hand hoe, from fourteen to sixteen inches apart.

The above is the method that I have adopted at this place for these last eighteen years, and I have never once missed a crop; and I believe the lightest crop I have ever had during that period, has exceeded thirtysix tons per statute acre. I never sow later than the last week in May. If weight of crop is wanted, it is absolutely necessary to sow in May. As I stated in my former letter, I have always had the seed from Mr Skirving, of Liverpool; and I consider the turnip growers in England more indebted to that gentleman than to any other individual, for the improved species of Swe-

dish turnip which have for a number of years been known and successfully cultivated in this neighborhood. I am satisfied that I should not have had more than two thirds the weight of crop, had I trusted to the seed which is generally sold to the poor farmer as the improved Swede.

I ought to have stated that the turnips were twice hoed, and once hand-hoed after singling. I had last season all the crop removed from the ground by the latter end of October, and had the whole ground ploughed and sown with wheat during the first week in November.

ALEXANDER OGILVIE.

*Mere, near Knutsford, Feb. 6, 1841.*

From the Farmer's Gazette.

### DAIRY HOGS.

MA STORER.—Considering the arguments in a former communication sufficient, I shall pass on, in favor of old hogs, second, by *experiment*.

Sir, I will premise that I have no great experience in the dairy business, having kept but a small one, but I have made one or two little experiments on dairy pigs, which may pass for good witnesses on the occasion; for I contend the smaller the experiment, the greater the accuracy.

In the spring of 1839, I had four cows come in, had wintered four shoats, and bought four spring pigs. The latter I shut up in a little lot of grass, with a comfortable cot; and they soon took all the dairy slops, consisting of whey, loppered and butter milk, while the former ran in the streets, and received nothing but the wash of the house, the dish-water, potato skins, &c., and that very sparse, my family consisting only of four. What surprised me was, in the fall, when I put up my hogs to fatten, which I did altogether, I found my winter shoats were in as fine order, and had grown as well as the spring pigs. But mark the sequel—they all went on eating and fattening finely for a while, but presently the old grunners were conquered of their hoggish propensities, became lazy, lay down quiet, and lined themselves well inside; while the pigs, them eternal squealers! went on eating and squealing, squealing and eating, to the end of the chapter—having never been able to satiate their voracious jaws, nor consequently to put on inside fat. Now I know there is a great difference in the breeds of hogs; from the finest Berkshires down to the old Irish hogs, and even the *Alligators* and *Landpikes!* of more modern memory. I know too, that I bought these pigs of Mr Anson Gregory, and the race were then celebrated, and known by the name of the Gregory hogs.

The deduction I am compelled to bring from the premises is, that throwing away the balance due dairy slops, over house slops—in other words, milk over dish water—it took as much more to fatten the pigs than the old hogs, as the expense of wintering the latter! Consequently, we have an old hog, well fattened, to hitch on to the steelyards, in the one case, and a pig in the other!

My second experiment was this. Last spring, my little boy came home with a little pig under his arm, which one of the neighbors had given him. I finally consented he might nurse it. Well, he soon took most, and finally all the dairy of the four cows, through the latter part of the summer; leaving my three old hogs minus, as in the former case. Along in the fall, we butchered the pig,

and sent him on to New York market, weighing 140 lbs. He fell short 13 pounds, and with the loss of freight, brought 6 dollars a hundred—just what I afterwards obtained for my old hogs, at home, and home weight. Now it is estimated, I believe with agricultural accuracy, that a hog to a caw, may be kept in fine condition through the summer; and I am well persuaded, with the aid of a little clover feed, my three old hogs would have been in as fine condition and as ready for market as that pig. Why old hogs, under like advantages, may not be brought forward for an early market, as well as pigs, we are yet to be informed. To be sure, the pig took no corn in the fall, and that I set off against the dairy, which is enough in all conscience; and it must be recollected, that I had no old corn in either of the experiments.

Mr Editor, you or some one else have said, you are very fond of agricultural figures. The cost of the 4 pigs, in the first experiment, which was 10 dollars, I balance against the 4 shoats before wintering, and cast out of the account.

Average weight of the 4 pigs in the first experiment, 150 lbs., 600 lbs.

do do 4 old hogs, 300 lbs., 1200 lbs.

Average weight in the second experiment, 1 pig 127 lbs.

do 3 old hogs, 275 lbs., 825 lbs.

Average weight of the 3 shoats before wintering, 50 lbs., at 4 cts. per lb. \$6 00

The result of the two experiments, it will be perceived, is, that we have 2025 lbs. of old pork well fattened, for 727 lbs. pig pork, such as it is, at equal prices! No, this is it; we have 1300 lbs. lacking 2 lbs., well fattened old pork, for the whole sum of 6 dollars!—which would you take?

These two experiments have done me up on the subject of *Piggeries*, to adopt the language of the modern agricultural nomenclature. I have become a true convert and disciple to the science of *Hogology*!

To conclude: were I to form a perfect *Hogger*, and that most applicable to the dairy, it should be this. I would have a convenient home orchard, bearing all kinds of fruit, of double capacity to subserve the necessities of the hogger. This I would slit in two in the middle, in a direction from the house backwards, so as to bring the two ends of the lot, nearest to the house, in juxtaposition with the cot and swillery. To complete the picture, nature should cause a little rill or warbling brook to meander through it, transversely with the division fence. The former I intend to have, as I have already planted out the trees; the latter I cannot have, as I am situated on a hill, high and dry. One side of this division should be well laid down with clover, while the other should remain in tillage, ready to be laid down as the other ran out, and so on alternately, *ad infinitum*. That in tillage, I think should be in potatoes or some other root crop, and a crop fence, to recede by successive sections, that the hogs may be their own diggers, and save me the trouble of the back-ache. Then put on a hog, an *old hog*, or even double the number, to that of the dairy cows kept on the farm, and if you do not find fat *old hogs* in the fall, with little or no care, I will confess I do not know what a fat pig is!

Your subscriber,

D. BARNUM.

New Fairfield, April 11, 1841.

The first elements of wealth are obtained by labor from the earth and waters.—*Franklin*.

For the New England Farmer.

#### IN SEASON.

How few there are who fully understand the import of these words—that is, if we may judge from their actions. The man who in every department of life keeps these words before him, and acts up to the divine injunction, “Do ye to others as ye would that others would do unto you,” will be a happy man; while on the other hand, he who forgets that it is his imperious duty to be always in season, is dishonest, not only to himself, but also to his fellow men.

If we go to purchase of a tradesman at midday, and find his shutters and doors closed and bolted, we shall feel disappointed. We shall say that he is neglectful of his business, and that he does not deserve the custom of any one.

Again: should we employ a mechanic to labor for us, and he did not make his appearance until half of the forenoon had passed away, should we feel that he, at night, deserved the same amount of pay, that he would have been entitled to had he commenced work early in the morning? Certainly not. Indeed we should think hardly of a man who treated us thus, and that too with the greatest reason.

Should we employ a farmer, and he too, like the tradesman and mechanic, should be behind the time an hour or two, should we, at the time of settlement, like to give him the same we should those who came in season in the morning and wrought hard the day through? No, we should not. The truth is, man does not deal on the score on which Christ dealt when he gave to those who came at the eleventh hour a penny. Men are rigid in their dealings, and, as a general thing, do as they are done by, instead of doing as they *would be* done by. Thus each one, whether he be a man of business, a mechanic or farmer *must be* himself or through a faithful agent, attentive to his own business and interests.

It is an old saying that “if we do not look out for ourselves no one will look out for us;” but this saying is not true. Though we lounge in bed until the sun is risen high and shining bright; though we are inattentive to business; though we neglect to see that our accounts are kept square, that our bills are paid; still we shall not be forgotten. The merchant, the mechanic, and the farmer will all remember us, and will, in due time, bring in their bills against us—bills which we *must* pay, or our goods, our shops, and our farms will be mortgaged or appraised and sold. So you see it is plain that whether we look out for ourselves or not, others will look out for us. Yes, unless we rise in season, unless we are in season to our business, and finally in season to every avocation of our lives, our pockets will be lean of cash, and our children will be clothed in rags and grow up in ignorance. Yes, nothing will there be about us, but what will bear the mark of our slothfulness, and it is said by high authority, that “the slothful shall be under tribute;” “the way of the slothful is a hedge of thorns.” While on the other hand it is said, “Be instant in season, and ye shall reap if you faint not.” Yours, &c.

JIMMY IN THE COUNTRY.

Pity is a passion proceeding from the misfortune of another. Envy is a passion proceeding from another's success.—*Addison*.

THE SKUNK—AGAIN.—The merits of this hitherto much abused animal, are beginning to be developed and appreciated.—Subjoined is Gov. HILL's testimony of his worth, which we extract from the last Monthly Visitor. It would seem that the good which the skunk (out upon that name!) accomplishes in his way, fully atones for whatever is offensive in those *striking peculiarities* and mischief-working *eccentricities* of his character, for which, ever since mother Eve nibbled the pippen, he has been noted and persecuted. The testimony of so eminent an individual as Gov. HILL in favor of the skunk, we think is entitled to great weight, and we trust it will have its due influence in preventing a farther war of extermination upon the animal, whose *virtues* (which have too long been destined to “blush unseen and waste their *sweetness* on the desert air,”) should ensure him the protection of men, if they cannot secure him against the annoyance of dogs.—N. E. P's PR. DEV.

“The skunk is so mischievous and offensive that man always wars upon him, when he may do it with safety. But it has become evident that we have not done the animal justice. He works in the night, and therefore little of the good he does comes within our observation. He not only destroys in their season, in the warm nights of early summer and autumn, thousands of the beetles and other insects and worms that destroy vegetation and grain—but the moles and mice that infest the ploughed and grass grounds, find in him an enemy that hunts them to a good purpose for the farmer. Last year, there was in this region not over half a crop of potatoes; and of this half a crop, in some fields the moles and mice made sad havoc. We know that a pair of skunks whose burrows were near a potato and cornfield of six acres, saved us many bushels by hunting out of the ground and destroying the mice that in great numbers had found a place of retreat under the sward of the field, which had been turned down in the early spring. If the skunks shall not molest us, let them live and do good.”

To Cure a Burn.—“A Lady,” in the Knoxville Register, gives the following recipe for a burn:—“Scarce a month passes away but we read or hear of some accident caused by fire. I send you the following prescription for a burn, believing if it were generally known, that much suffering might be alleviated. Take a table spoonful of lard, half a table spoonful of spirits of turpentine, and a piece of rosin as large as a hickory nut, and simmer them together till melted. It makes a salve, which, when cold, may be applied to a linen cloth and laid over the burn. If immediately wanted, spread it on the cloth as soon as melted—it will very soon cool. I have seen its application after the corroding effects of chemical poisons, after a foot has been burned by boiling sugar, after severe scalds, and in every case the sufferer obtained perfect ease in ten or fifteen minutes after it was used. It may be applied two or three times a day, or as often as the cloth becomes dry.”

A sound economy is a sound understanding brought into action. It is calculation realized. It is the doctrine of proportion reduced to practice. It is the foreseeing contingencies and providing against them.—*Hannah More*.

Incredulity is the wit of fools.—*Raleigh*.

NEW ENGLAND FARMER,  
AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, MAY 12, 1841.

DIALOGUE.—WHICH IS THE BEST KIND OF  
CORN TO PLANT ?

A. Ar'n't you wrong, neighbor B., to plant, in a cold spring like this, that large and late corn of yours, which never ripens until October ?

B. Perhaps I am ; but is it not well to trust that the season may yet be warm and favorable to the corn crop ?

A. Yes, we may hope so ; but I am thinking it is best to go on the safe side, and plant only a small kind that ripens early. Is n't that the most profitable course ?

B. I shall plant some of an early kind, but shall not give up the more productive kind which has usually ripened on my farm.

A. How much of your corn land shall you put to the large kind ?

B. More than half.

A. More than half that seems to me foolish—you cannot expect it to ripen.

B. I will hope for its ripening. And judging from the past, I consider it best not to make a general sacrifice of productiveness to early maturity.

A. Will the past prove the wisdom of your course ?

B. You know, neighbor A., that I have passed all my days on this farm. My memory goes back for sixty years ; and I believe that no failures of this crop have occurred on the place during that period, excepting in the years 1812, '16, '36 and '37. In 1812, a considerable portion of the crop ripened, and the same in 1837. Perhaps three crops have failed to ripen in sixty years. The chances then are nineteen out of twenty that the large kind will mature. And if it should, I shall get one fifth more both of corn and stover, than the small kind will yield. If I fail to get sound corn, I shall get more stalks and more green corn. To be sure, I would rather have a small crop of corn well ripened, than a green and frozen large crop ;—but when my chances are nineteen out of twenty to get the large crop ripe, I think it better to take the risk. In other words, I prefer taking from my fields 60 dollars worth of corn and stalks per acre annually, for 19 years, and 25 dollars worth of green corn and stalks the 20th year, to taking 48 dollars' worth per year each year of the 20. In the one case I get \$1165 worth in twenty years,—in the other I get \$960 only. I think, therefore, neighbor A., that the past does justify me in holding on to the use of any highly productive kind of corn, which ripens well in ordinary seasons. Still, the convenience of having some corn ripe early in the autumn, and the inconvenience arising from losing a late corn are such, that I shall plant probably a third of my ground with the Brown corn, from N. Hampshire, or the Hartwell corn, from Southbridge, both of which ripen early, and have large kernel, small stalk and small cob, and are very productive for early varieties.

NOTE.—The facts here stated by B. in relation to the ripening of the corn crop, are the history of that crop on the editor's native farm. The land there is less subject to frosts than the average of land in the commonwealth. A few hills of this *Hortwell* corn were in our father's field last season, and it ripened a week earlier than the earliest of seven other varieties, and was the most productive of any excepting the latest, the Red Blaze. We think it combines to an uncommon extent, the two desirable properties of early maturity and productiveness. At our request, Messrs Breck & Co. have procured a few bushels of this variety from Dr. Hartwell, of Southbridge,

and it is for sale by them. Dr. H. obtained of this 130 bushels per acre in 1839, and in 1840, its husks were white in our field about the first of September. Our own opinion of this corn is such that we shall plant chiefly of this kind on our new farm, where the soil is in an exhausted state. This fact speaks our advice to our brother farmers.

Brother Holmes, of the Maine Farmer, has "burst into a" snow "song," having been set on fire by the current of our *raining* rhymes—and his lay pleases us so much that we withhold our own editorial for the purpose of showing his *snow* to our readers before the weather shall become warm enough to mar its freshness.—"Thank you, sir, for your company "down to posterity."

THE LAY OF THE MAY SNOW STORM.

Come cheer up, farmers, don't look pale,

Although the north wind 's blowing,

And all around, o'er hill and dale,

'Tis snowing, snowing, snowing.

'Tis true that sometimes long ere this,

You've done up all your sowing—

You may as well keep quiet now

'Tis snowing, snowing, snowing.

I know 'tis now the first of May,

And violets should be blowing ;

But girls can't have their holiday

Because 'tis snowing, snowing.

Good uncle Bill 's put on his coat,

And Pat his hands is blowing ;

And Sis is scolding round the stove

Because 'tis snowing, snowing.

But courage, farmers—do not fret—

Your crops will soon be growing ;

Dog-days will give you all a sweat

Though now 'tis snowing, snowing.

To fancy's eye, in yonder sky,

The star of hope is glowing ;

This blustering storm will soon pass by,

And stop this snowing, snowing.

Then cheer up, farmers, don't look pale,

Although the north wind 's blowing ;

"Seed time and harvest ne'er shall fail,"

Though now 'tis snowing, snowing.

Verily, if the editor of the New England Farmer and himself do not go down to posterity as a brace of storm poets, there is no virtue extant. He became so inspired with the rain storm during the last days of April, that his poetical cup ran over, and when it cleared up and snowed, we "burst into a song," and though it is rather a lugubrious one, it was the "best the house afforded," seeing as how we had to "make tracks" instead of making furrows, and seek a shelter from the snow instead of holding the plough.

In sober earnest, we have not had such a cold, dreary and backward spring for many a year. April has been remarkably cold and stormy, but it is no sign, because January "lingers in the lap of" May, that her sister June will be equally accommodating. It is true that our cattle have been at the barn nearly or quite six months, and there is a great scarcity of fodder ; but we will venture to turn prophet with the rest—for every one seems to have a spirit of *weather soothsaying*—and predict that the diligent and careful farmer will next fall have a good harvest of grass, potatoes, wheat, and perhaps corn—a fat Thanksgiving, and a merry Christmas.—*Maine Farmer.*

Let us not be too prodigal when we are young, nor too parsimonious when we are old ; otherwise we shall fall into the common error of those, who, when they had the power to enjoy, had not the prudence to acquire ; and when they had the prudence to acquire, had no longer the power to enjoy.—*Lacon.*

MASS. HORTICULTURAL SOCIETY.

At a meeting of the Mass. Horticultural Society, May 8th, 1841—Voted, That the following letter be published in the N. E. Farmer, with the thanks of the Society for the donation of scions.

Attest,

E. M. RICHARDS, Rec. Sec.

Bradford, April 30th, 1841.

Messrs BRECK & Co.—Gentlemen—I send accompanying this, some scions of the Wynkoop Harvest Apples, specimens of which I exhibited at the Horticultural Rooms last season. Will you be so kind as to hand them to the chairman or one of the committee on fruits, to be distributed by them as they judge well ; only I trust that you will be remembered in this ministration.

The tree is disposed to grow pretty large, to rise high—rather high than to cast out extended lateral branches. The bark is generally quite smooth and more easily raised from the wood than is common with apple trees. My trees have generally produced every year, exhibiting but a slight tendency to alternation. Of course the fruit is not very abundant any one year, yet I think them entitled to the credit of being good bearers. The fruit will need no praise where it is known. The description given by the committee is very accurate. It generally begins to ripen by the middle of July—frequently very good specimens are obtained earlier. I hope the scions—though owing to indisposition which has prevented my being out much, they were cut later than I could have wished—will prove good ; and that those who are disposed to try them, may not in the end be disappointed as to the merits of the fruit.

Some of the committee were so good as to say that they would hand me some scions of approved fruit in return. I surely do not wish or ask this as a condition upon which I send the parcel directed to them ; but still, to one who has but limited means of obtaining any of the more improved fruit, the offer is too inviting to suffer me to pass by it without saying, that if any one finds it perfectly convenient to hand you any scions, &c. of any kind of fruit, I should be truly very grateful, and I know you would very readily take charge of them and send by some opportunity. Since the loss I sustained in my trees a few winters since, I have a much more limited variety of the better fruits than I possessed before, though my good friend, G. Parsons, Esq., has done what in his infirm health he has been able to do. He had formerly, in a very generous manner, done much to help me to various kinds of choice fruit.

Will you make my best respects to the committee, and believe me, with sentiments of high esteem, gentlemen,  
Yours,  
G. B. PERRY.

P. S.—The woolly appearance which many of the grafts have, is very common to the young shoots in the spring :—upon vegetation coming, it is not retained.

CREAM-POT STOCK.

Inquiry was made in our columns a few weeks since, whether any of the Cream-pot stock could be purchased, and at what price. Col. Jaques immediately furnished a reply. It was sent to the printing office—but, by some process undiscoverable, it has effectually secreted itself. We looked for its appearance in the "proofs" last week, and again this week, but not meeting with it, we have inquired for the copy, and the answer is that it has not been seen. We can get no clue by which to discover its hiding place.

The highest of all characters, in my estimation, is his who is as ready to pardon the errors of mankind, as if he were every day guilty of some himself.—*Pliny.*

**THERMOMETRICAL.**

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northernly exposure, week ending May 9.

	May, 1841.	7 A.M.	12, M.	5, P.M.	Wind.
Monday,	3	34	37	40	N.
Tuesday,	4	32	48	45	N. W.
Wednesday,	5	47	59	46	E.
Thursday,	6	42	49	44	S.
Friday,	7	37	58	49	N.
Saturday,	8	44	50	43	E.
Sunday,	9	46	70	57	N. W.

About half the week was rainy. Vegetation still very backward.

**BRIGHTON MARKET. — MONDAY, MAY 10, 1841.**

Reported for the New England Farmer.

At Market 305 Beef Cattle, 20 pair of Working Oxen, 15 Cows and Calves, 210 Sheep, and 240 Swine.

Prices.—*Beef Cattle*.—The prices obtained last week were hardly sustained, and we reduce our quotations a trifle. First quality, \$7 00 a 7 25. Second quality, \$6 50 a 6 75. Third quality, \$5 50 a 6 00.

125 Beef Cattle unsold.  
*Working Oxen*.—Very few sales effected.  
*Cows and Calves*.—Sales, \$22, \$25, \$23, and \$35.  
*Sheep*.—Several lots sheared, at \$1 75 and \$1 80, and a lot not sheared \$1 75.

*Swine*.—Sales quick. Two lots, part Berkshire, at 5 1-4 and 5 1-2 for sows, and 6 1-4 and 6 1-2 for barrows. Also, a lot at 5 for sows, and 6 for barrowa. At retail from 5 3-4 to 7.

**WHOLESALE PRICES CURRENT.**

Corrected with great care, weekly.

**SEEDS.** Herds Grass, very little in market. Red Top, new seed by the bag 50 to 55 c. Clover—Northern, 13c.—Southern, 8 to 9 c. Flax Seed, \$1, 37 to 1 50 bu. Lucerne, 25 c. per lb.

**FLOUR.** Howard Street \$5 37—Genesee \$5 31—Ohio \$6 12.

**GRAIN.** Corn—Northern Yellow none—Round Yellow 62—Southern Flat Yellow 57—White 54.—Rye—Northern 60 to 65—Southern 50 to 55. Oats—Southern 36 to 33—Northern 33 to 40.

**PROVISIONS.** Beef—Mess \$10 50 to 11 00—Prime \$6 50—No. 1 \$9 00. Pork—Extra—15 00—Clear 14 50—Mess \$13 00. Hams—Northern 9 c. per lb.—Southern, none. Lard—Boston 9 c. per lb.—Southern, 8 to 8 1-2. Butter—Lump 18 to 22—Firkin 12 to 18—Shipping 8 to 14. Whole Hogs 5 1-2 to 6 c.—Pigs 5 c.

HAY, per ton, \$20 to 22 50—Eastern Screwed \$17 00. CHEESE—Old 11 c.—New 8.

EGGS, 11 a 12.

**WOOL.**—The market for this article has not experienced any change of late. Pulled Wool is rather scarce, and there is but a limited supply of low Fleeces, and of fine Fleeces the stock is also moderate. Prime or Saxony Fleeces, washed, lb. 50 to 55 c.—American full blood, washed, 47 to 50—Do. 3 4 blood, washed, 44 to 46—Do. 1-2 blood, washed, 36 to 40—1-4 and common do, 35 to 37—Smyrna Sheep, washed, 20 to 23—Do. unwashed, 10 to 14—Bengasi Sheep, 8 to 10—Buenos Ayres unwashed, 7 to 10—Superfine Northern pulled lamb 43 to 46—No. 1 do. do. 37 to 42—No 2 do do 26 to 30—No 3 do do 18 to 20.

**HOVEY'S NEW SEEDLING STRAWBERRY.**

This splendid variety of the Strawberry (originated in 1834) is now offered for sale. The fruit is of the largest size, often measuring 5 to 6 inches in circumference, handsomely formed—of a deep red color—exceedingly high flavored—and one of the most productive varieties, 12 quarts having been gathered from a bed 3 feet by 12. The vines are vigorous and bardy. Standing our severe winters without protection.

The fruit has been exhibited at the Massachusetts Horticultural Society in 1833, '39, and '40, where it attracted more attention than any other variety; and each season obtained a premium. It has every good quality to recommend a Strawberry to cultivation. The Spring is the most favorable time for planting in this climate. Plants \$5 per dozen.

Also, all the old established varieties of Strawberries, from \$1 to 2, per hundred plants.

Orders addressed to us, will be immediately attended to, and the plants packed and forwarded with dispatch.

HOVEY & CO., SEEDSMEN,  
May 5 4w 7 Merchants' Row, near State st.

**GRAPE VINES.**

Extra large Isabella Grape Vines for sale as above. Also, Giant and Early Wilmot Rhubarb Plants, and Asparagus Roots  
J. BRECK & CO.  
April 23

**WILLIS'S LATEST IMPROVED SEED SOWER.**

Willis's latest Improved Seed Sower, invented the last season; one of the most perfect machines ever introduced for the purpose. In using this machine, the farmer may be certain that his seed is put into the ground, and at the same time in the best possible manner. There has been a great difficulty in machines for sowing garden seeds; they are very apt to clog up and the farmer might go over an acre of land and not sow a single seed; but not so with this; it is so constructed that it cannot possibly clog. In using this sower, the farmer can save one half of his seed, and do the work at less than one quarter the expense of the common way of sowing seeds, and have it done in a much better manner; it opens the furrow, drops the seed, and covers it over and rolls them down. It will sow almost any kind of Garden Seeds; say Ruta Baga, Mangel Wurtzel, Turnips, Carrots, Beets, Parsnips, Onions. It is highly recommended by a great number of persons who used it the past season. For sale at the N. E. Agricultural Warehouse and Seed Store by  
JOSEPH BRECK & CO.  
March 31.

**WINSHIP'S NURSERY.**

BRIGHTON, NEAR BOSTON,

Situated on the line of the Boston and Worcester Rail Road,—5 miles from the city.

The Proprietors of this extensive nursery beg leave to inform their friends and the public, that they are ready to furnish orders to any amount, for Forest Trees, indigenous and exotic.

Fruit Trees, including all the varieties of Pears, Peaches, Plums, Nectarines, Cherries, &c. &c.

Vines—Shrubs, Green House Plants, &c. Catalogues may be obtained by applying at the Nursery. Trees carefully packed, to ensure safety in long voyages.

Orders left at the New England Seed Store of J. BRECK & Co. Nos. 51 and 52, North Market street, will be delivered the day following, and left at any part of the city, free of expense.

Letters containing orders, addressed to the subscribers, J. & F. WINSHIP, Brighton Nurseries, March 24, 1841.

**SUPERIOR SEED BARLEY.**

100 bushels of extra heavy and clean Seed Barley. Also 30 bushels CHEVALIER BARLEY, a new and superior variety, for sale by  
JOSEPH BRECK & CO.  
March 31.

**BLACK SEA WHEAT.**

Received from Vermont, 30 bushels Black Sea Wheat. Also, 20 bushels Italian Spring Wheat, raised in Warren, N. H. For sale by  
JOSEPH BRECK & CO.  
March 31.

**PEAR, PLUM, GRAPE VINES, &C.**

3000 Pear Trees, of the most approved kinds. 2000 Plum Trees, of the most approved kinds and extra size—many of them have borne this season.

Apple, Cherry and Peach Trees, of different kinds.

500 Quince Trees. 40 0 Isabella and Catawba Grape Vines, from 5 to 15 feet high; most of them have borne fruit. Black Hamburg, Sweetwater, Pond's.

30,000 Giant Asparagus Roots. Gooseberry, Currants, Raspberries, of good kinds. 5000 Wilmot's Early Rhubarb or Pie Plants, lately introduced.

2000 Cherry and Pear Stocks; 1000 Plums; Roses, &c. of all kinds.

All orders sent to the subscriber at Cambridgeport or left with JOSEPH BRECK & CO., will meet with immediate attention.

SAMUEL POND.

Cambridgeport, Mass., Feb. 24.

**PURE SPERM OIL.**

EDMUND T. HASTINGS & CO., No. 101 State St, keep constantly for sale, Winter, Spring and Fall Sperm Oil, bleached and unbleached; which they warrant to be of the best quality and to burn without crusty.

Oil Canisters of various sizes.

Boston, Jan. 1, 1841.

**FENCE CHAINS.**

Just received from England, 10,000 feet Chains, suitable for Fences or other purposes. For sale by J. BRECK & CO., No. 52 North Market st. April 21

**DURHAM COW FOR SALE.**

A young full blooded Durham Cow and her calf—a very desirable animal in every particular. Apply to EDWARD TITCOMB, Ja., Newburyport. May 5

**PLUMS, PEARS, GOOSEBERRIES, &c.**

Just received by JOSEPH BRECK & CO., from London, a fine assortment of Plum and Pear Trees, which are offered at reduced prices, including the following

PEARS.	
Belle Luerative,	Cattillac,
Mouille Bonche,	Williams' Bon Chretien or } Bartlett,
Josephine,	Jargonell d'Epagne,
Beurre Spence,	Echasserie,
" Capiamont,	Urbaustic,
" Bose,	Duchess d'Angouleme,
" Diel,	St. Chislain,
" d'Aremburgh,	Madaline d'Carne,
Easter Beurre,	

PLUMS.	
Green Gage,	New Orleans,
Purple Gage,	Imperatrice,
Diamond,	Reine Claude,
Washington,	Royal d'Tours.
Golden drop,	

Gooseberries, White and Red Currants, Raspberries and every article in the Nursery line furnished at short notice.  
JOSEPH BRECK & CO., No. 52 North Market Boston.  
April 7, 1841.

**GRINDSTONES.**

An extensive assortment of Water and Hand Grindstones constantly on hand and for sale by AMMI C. LOMBAKID & CO. 13 Lewis's Wharf. 15th. Nov. 17.

**AGRICULTURAL IMPLEMENTS, &c.**

The Proprietors of the New England Agricultural Warehouse and Seed Store No. 51 and 52 North Market street, would inform their customers and the public generally that they have on hand the most extensive assortment of Agricultural and Horticultural Tools to be found in the United States. Part of which are the following:

1000 Howard's Patent Cast Iron Ploughs	100 doz. Cast Steel Shovels.
300 Common do. do.	150 " Common do.
200 Cultivators.	100 " Spades.
100 Greene's Straw Cutters.	500 " Grass Scythes.
50 Willis' do. do.	300 " Patent Snaiths.
100 Common do. do.	200 " Common do.
100 Willis' Patent Corn Shellers.	500 " Hay Rakes.
50 Common do do.	200 " Garden do.
200 Willis' Seed Sowers.	200 " Manure Forks.
50 " Vegetable Cutters.	300 " Hay do.
50 Common do. do.	500 Pair Trace Chains.
200 Hand Corn Mills.	100 " Truck do.
200 Grain Cradles.	100 " Draft do.
100 Ox Yokes.	50 doz. Hay do.
1500 Doz. Sycle Stones.	1000 yards Fence do.
3000 " Austria's Rifles.	25 Grind Stones on rollers.

March 17.

**HERBACEOUS PLANTS.**

J. BRECK & CO., offer for sale a great variety of beautiful Herbaceous Plants, including 20 varieties Phlox, Perennial Coreopsis of sorts, Delphinium, Campanulas in great variety, Double Pinks, Dracocephalums, Double Scarlet Lychnes, Double Ragged Robin, Spiraeas of sorts, Iris do. with a great variety of others. Also, Honeysuckles, Roses, and other ornamental Shrubs.

**SWEET POTATO SLIPS.**

Just received and for sale by J. BRECK & CO., a supply of Sweet Potato Slips. No 52, North Market st. April 23.

**BONE MILLS.**

The subscriber offers for sale Bone Mills on a new and improved plan, which will grind 200 bushels per day, and make it of the proper fineness. They can be put up with small expense, and require but little room. They can be easily kept in repair and are not liable to break with the roughest usage.

They may be used for grinding Barilla, and will do the work in the best manner. Oyster shells, plaster, soap stone, bricks, bark, &c. may be ground by them.

Price \$200. They require about as much power as a small run of mill stones, to be used to advantage, and can, if necessary, be driven by horse power.

Those who wish to purchase can direct to William Apin, No. 14 1-2 Westminster street, Providence, R. I., or to the subscriber.

Ground bones constantly on hand for sale.  
WILLIAM CHASE.  
Providence, R. I., Feb. 9, 1841.

**DOUBLE DAHLIAS.**

We have for sale a very large collection of the finest Double Dahlias, of the most esteemed sorts. J. BRECK & CO., No. 52, North Market St. April 23

**CLOVER & RED TOP.**

50 tierces and 100 bbls. Prime Clover. 200 Bags Redtop, new seed. 50 bbls. Herds Grass prime quality, for sale by J. BRECK & Co. March 24.

## MISCELLANEOUS.

## THE GRANARY.

BY REV. ABEL C. THOMAS.

*"Whoso readeth, let him understand."*

"Jonathan Homespun, having purchased an extensive farm, and provided himself with every thing requisite to prosperous husbandry, proposes to furnish subscribers with one quart of wheat weekly, for one year, at the low price of one dollar and fifty cents, in advance; two dollars at the end of six months; or two dollars and fifty cents if not paid till the close of the year.

"The facilities afforded by the government for the transportation of wheat to every section of the Union and adjacent provinces, are such as must prove satisfactory to every subscriber; and the proprietor of the Granary assures all who may patronize him, that he will exert himself to supply an article of the best quality.

"N. B. Agents will be allowed a generous percentage. Address [post paid] Proprietor of the Granary, Hopeville."

Such was the prospectus issued by my friend, Mr Homespun. Feeling a lively interest in his welfare, I visited his farm, although it was a long journey from my home, and was pleased to find every thing in nice order. He informed me that he had contracted a large debt in the purchase of the premises, stock and implements of husbandry, but that he had no doubt of his ability to discharge every obligation in a few years. He also stated that he had already received many hundred subscribers, and that in four or five weeks he would commence the delivery of the wheat according to his proposals.

The scheme appeared plausible; and my friend was so confident of his success, that I had not the slightest doubt of his prosperity. I entered my name as a subscriber, and when I left him he was preparing many thousand quart sacks.

Every week for the space of two years, I received my quart of wheat, and concluded from its excellent quality and prompt delivery, that every thing was prosperous with Jonathan Homespun and his farm. So I gave myself no concern about my indebtedness to him—for said I, "to a farmer so extensively patronized as he is, the small pittance of two years' arrearages would be but as the drop of the bucket." It is true, there was occasionally printed on the sacks a general notice to delinquents, but I never suspected that this was intended for his friends.

The notice however became more frequent; and having leisure, I concluded I would visit my friend, the proprietor of the Granary. He greeted me cordially—but I saw that there had been trouble. He was evidently worn with toil and anxiety; and in the conversation of the evening, he entered into particulars.

"Here," said he, "I have been laboring day and almost night, for two years; and I am more in debt now than when I began. My creditors are pressing for payment: I am conscious of my inability to meet their demands, and can perceive no result but bankruptcy and ruin."

"But have you not a large list of subscribers?" said I.

"Yes, a very large list," was his reply; "but too many of them are like you!"

"Me?" I quickly rejoined in amazement, "too many like me?"

"Pardon me," said my friend, in a melancholy tone—"pardon me, for oppression will make even a wise man mad. You have had a quart of wheat weekly for two years—and I have not had a cent of payment: I have a large list of the same kind of patrons scattered here and there over thousands of miles. If they would pay me the trifles they severally owe me, I should be directly freed from embarrassment and go on my way rejoicing. But they reason as you reasoned—and among you, I am brought to the door of poverty and ruin."

I felt the full force of the rebuke, and promptly paying arrearages at the increased price named in the prospectus, and also a year in advance, I shortly bade adieu to the worthy and wronged farmer, resolving to do every thing in my power to repair the injury which had accrued from my delinquency.

O, ye patrons of Jonathan Homespun! wherever ye are or whoever ye are! ye who have received and eaten the wheat from his Granary, without making payment! Ye are guilty of a grievous sin of commission. Wherefore repent. Pay the farmer what you owe him. Uncle Sam's teamsters bring you the little sack of grain every week, and Uncle Sam's teamsters will carry the money safely to Jonathan Homespun.—*Star of Bethlehem.*

## HOWARD'S IMPROVED EASY DRAUGHT PLOUGH.

Great improvements have been made the past year in the form and workmanship of these Ploughs; the mould board has been so formed as to lay the furrow completely over turning in every particle of grass or stubble, and leaving the ground in the best possible manner. The length of the mould board has been very much increased, so that the Plough works with the greatest ease, both with respect to the holding and the team. The Committee at the late trial of Ploughs at Worcester, say,

"Should our opinion be asked as to which of the Ploughs we should prefer for use on a farm, we might perhaps say to the inquirer, if your land is mostly light and easy to work, try Prouty & Mears, but if your land is heavy, hard or rocky, BEGIN WITH MA. HOWARD'S."

At the above mentioned trial the Howard Plough did more work, with the same power of team, than any other plough exhibited. No other turned more than twenty-seven and one half inches, to the 112 lbs. draught, while the Howard Plough turned twenty-nine and one half inches, to the same power of team! All acknowledge that Howard's Ploughs are much the strongest and most substantially made.

There has been quite an improvement made on the shoe, or land side of this Plough, which can be renewed without having to furnish a new landside: this shoe likewise secures the mould board and landside together, and strengthens the Plough very much.

The price of the Ploughs is from \$6 to \$15. A Plough, sufficient for breaking up with four cattle, will cost about \$10 50, and with cutter \$1, with wheel and cutter, \$2 60 extra.

The above Ploughs are for sale, wholesale and retail, at the New England Agricultural Warehouse and Seed Store, Nos. 51 & 52 North Market Street, by

JOSEPH BRECK &amp; CO.

## DRAFT AND TRACE CHAINS.

Just received by Packet Coromanda, 400 pair Trace Chains, suitable for Ploughing.  
200 " Truck and leading Chains.  
200 " Draft Chains. For sale by J. BRECK & CO., No. 52 North Market st. April 21

## TYE UP CHAINS.

Just received by Packet Coromanda, 500 Chains for tying up Cattle.

These chains, introduced by E. H. DERAY, Esq. of Salem, and Col. JACQUES, for the purpose of securing cattle to the stall, are found to be the safest and most convenient mode of fastening cows and oxen to the stanchion.

For sale by J. BRECK & CO., No. 52 North Market st.

## GARDEN SEEDS.

For sale by JOSEPH BRECK & CO. at the NEW ENGLAND FARMER OFFICE, No. 51 and 52 North Market St. Boston. The subscribers would inform the public that they have now on hand the largest collection of seeds ever before offered by sale in this city, embracing every variety of Field, Kitchen, Garden, and Ornamental Flower Seeds desirable for this or any other Climate.

Our seeds are either raised under our own inspection or imported from responsible houses in Europe, and having taken extraordinary pains to obtain such as are pure and genuine, we can confidently recommend them to our customers and friends, and feel assured they will prove satisfactory to all who try them.

Dealers in seeds are requested to forward their orders in season. Boxes for retailing from 8 dolls, and upwards will be sent out on commission allowing a liberal discount and take back what remain unsold.

Letters and orders with good reference will meet with prompt attention.

## FIELD SEEDS.

Sugar Beet.	Ruta Paga.
Mangel Wurtzel.	Ballatine's New Royal do.
New Red Globe do. } superior	White Tankard Turnip.
Yellow do. } varieties.	Red do.
Carrot Long Orange.	Red Round do.
" Altringham.	White do.
" New White, extra fine.	White Globe do.
Pumpkin, sorts.	Green Round do.
Wheat—various sorts.	Purple Top Hybrid do.
Barley, do.	Buckwheat.
Rye, do.	Broom Corn.
Potatoes, do.	Millet.
Indian Corn, do.	Buckthorn. } for Hedges.
Oats, do.	Locust. }

## GARDEN SEEDS.

Artichoke, Asparagus, Beans of every description, Beets of sorts, Borecole, Broccoli, Brussels Sprouts, Cauliflower, Caraway, Celery, of the most improved sorts, Cabbage 20 sorts, Carrot, all the varieties, Cucumber do, Cress, Egg Plant, Endive, Indian Corn, Kale, Leek, Lettuce in great variety, Melons, do. Martynia, Mustard, Nasturtium, Okra, Onion of sorts, Pepper do. Pumpkin do. Parsnip, Parsley, Peas, a very great variety, Rhubarb for tarts, Radish of sorts, Salsify, Squash of sorts, Tomato, Turnip 20 varieties.

## SWEET AND POT HERBS.

yme	Sweet Basil.
Sweet Marjoram.	Lavender.
Sage.	Lemon Balm.
Summersavory.	Anise.
Medicinal Herbs, &c.	

## ORNAMENTAL FLOWER SEEDS.

Three hundred varieties, embracing all the finest sorts. Packages of 20 fine sorts for one dollar.

Those who prefer to have their Seeds put up in papers ready for retail, can be accommodated—each packet neatly closed and labelled with printed directions. Price 50 cents, per dozen papers, which are retailed here at 6 1-4 cents each.

Fruit and ornamental trees, of the greatest variety, supplied at nurseryman's prices, and orders solicited. These will be packed, when required, to go to any part of the U. States.

JOSEPH BRECK &amp; CO.

## FRUIT AND ORNAMENTAL TREES, &amp;c.

NUSSERY OF WILLIAM KENRICK.

12,000 Pear and Plum Trees.—Large and new additions of Pear and Plum Trees have lately been received, many kinds of which are alike new to our country, and very extraordinary. Such have been the selections which have been made by the subscriber in Europe, and in person, during the last Autumn, where all have been proved; those kinds already well known amongst us being identified by him by the wood and the leaf.

All orders addressed to the subscriber, or left with Joseph Breck & Co., New England Farmer Office, will be promptly attended to, and Trees, when so ordered, will be securely packed for safe transportation to distant places.

WILLIAM KENRICK.

Nonantum Hill, Newton, near Boston, March 2.

## NEW ENGLAND FARMER.

A WEEKLY PAPER.

The Editorial department of this paper having come into the hands of the subscriber, he is now authorized by the publishers to inform the public that the price of the paper is reduced. In future the terms will be \$2 per year in advance, or \$2 50 if not paid within thirty days.

ALLEN PUTNAM.

N. B.—Postmasters are required by law to frank all subscriptions and remittances for newspapers, without expense to subscribers.

## LIEBIG'S ORGANIC CHEMISTRY OF AGRICULTURE AND PHYSIOLOGY.

The British Association for the Advancement of Science, requested Dr. Justus Liebig, of Giessen, to prepare a report upon the state of Organic Chemistry; and his report furnished Sept. 1, 1840, constitutes the body of the work named at the head of this article. Prof. Webster, of Cambridge, under whose superintendance an American edition has just been issued, prefixes an introduction, comprising definitions of chemical terms, and appends some opinions held by Dr. S. L. Dana, of Lowell, and Dr. C. T. Jackson, of this city. Our Massachusetts chemists here named, both of whom possess and deserve the confidence of our community, as sagacious and expert analysts and reasoners, are not ready to endorse all the opinions of their transatlantic co-laborer; nor do they harmonize entirely with each other in opinion. This disagreement among doctors, while it shows their praiseworthy independence and freedom in scientific researches, tells us that there are important matters in agricultural chemistry yet undiscovered, or if discovered, yet unproved to the satisfaction of the scientific generally. This fact, while it properly renders the practical man cautious in adopting any new principles advocated in the laboratory, should not deter our intelligent farmers from making themselves acquainted with the opinions entertained by men of profound scientific research.

The work which has just made its appearance among us in such form as to be obtainable by all who may desire to know its contents, will receive much attention. The novelty and boldness of Liebig's views, give to the work an uncommon charm. But if we call it romance, it is the romance of science and logic. The book must be read with attention and study to be understood by common minds; and yet the greater portion of our reading and reflecting common farmers are capable of understanding the important portions of the work.

One leading view advanced with peculiar distinctness in the volume, exhibits a striking manifestation of the wonderful economy of Providence, in furnishing a supply of nourishment for the vegetable and animal creation. Plants are nourished, as Liebig maintains, mainly by carbonic acid; and their supply of carbon comes from the atmosphere. Animals by the process of breathing and by their decay, are constantly filling the air with this acid. The vegetable world uses up the impure gas which the animal is generating every moment. We and the animals feed the plants. They in turn give food to brutes and to men. And their contributions to our necessities are not made solely in the way of furnishing articles of food—but in their processes of taking up carbon from the atmosphere, they give out large quantities of pure oxygen for us to breathe. We unconsciously fit the air for their use, and they fit it for ours. This view is so beautiful and interesting that one is predisposed to hope that it may prove correct. To a very considerable

extent it is undoubtedly sound; but whether the author has not carried it too far, time and more extensive observation must determine.

In future numbers we shall extract from this treatise, probably appending our opinion of the correctness or inaccuracy of his leading positions. At present, we only quote the paragraphs containing the view above presented.—Ep.

"In attempting to explain the origin of carbon in plants, it has never been considered that the question is intimately connected with that of the origin of humus. It is universally admitted that humus arises from the decay of plants. No primitive humus, therefore, can have existed; for plants must have preceded the humus.

"Now, whence did the first vegetables derive their carbon? and in what form is the carbon contained in the atmosphere?

"These two questions involve the consideration of two most remarkable natural phenomena, which by their reciprocal and uninterrupted influence, maintain the life of the individual animals and vegetables, and the continued existence of both kingdoms of organic nature.

"One of these questions is connected with the invariable condition of the air with respect to oxygen. One hundred volumes of air have been found, at every period and in every climate, to contain twentyone volumes of oxygen, with such small deviations, that they must be ascribed to errors of observation.

"Although the absolute quantity of oxygen contained in the atmosphere appears very great when represented by numbers, yet it is not inexhaustible. One man consumes by respiration 45 Hessian cubic feet of oxygen in 24 hours; 10 centners of charcoal consume 58,112 cubic feet of oxygen during its combustion; and a small town like Giessen (with about 7000 inhabitants,) extracts yearly from the air, by the wood employed as fuel, more than 1000 millions of cubic feet of this gas.

"When we consider facts such as these, our former statement, that the quantity of oxygen in the atmosphere does not diminish in the course of ages—that the air at the present day, for example, does not contain less oxygen than that found in jars buried for 1800 years in Pompeii—appears quite incomprehensible, unless some source exists whence the oxygen extracted is replaced. How does it happen, then, that the proportion of oxygen in the atmosphere is thus invariable?

"The answer to this question depends upon another; namely, what becomes of the carbonic acid, which is produced during the respiration of animals, and by the process of combustion? A cubic foot of oxygen gas, by uniting with carbon so as to form carbonic acid, does not change its volume. The billions of cubic feet of oxygen extracted from the atmosphere, produce the same number of billions of cubic feet of carbonic acid, which immediately supply its place.

"The most exact and most recent experiments of *De Saussure*, made in every season, for a space of three years, have shown, that the air contains on

an average 0.000415 of its own volume of carbonic acid gas; so that, allowing for the inaccuracies of the experiments, which must diminish the quantity obtained, the proportion of carbonic acid in the atmosphere may be regarded as nearly equal to 1-1000 part or its weight. The quantity varies according to the seasons; but the yearly average remains continually the same.

"We have no reason to believe that this proportion was less in past ages; and nevertheless, the immense masses of carbonic acid, which annually flow into the atmosphere from so many causes, ought perceptibly to increase its quantity from year to year. But we find, that all earlier observers describe its volume as from one half to ten times greater than that which it has at the present time; so that we can hence at most conclude, that it has diminished.

It is quite evident that the quantities of carbonic acid and oxygen in the atmosphere, which remain unchanged by lapse of time, must stand in some fixed relation to one another; a cause must exist which prevents the increase of carbonic acid, by removing that which is constantly forming; and there must be some means of replacing the oxygen, which is removed from the air by the processes of combustion and putrefaction, as well as by the respiration of animals.

"Both these causes are united in the process of vegetable life.

"The facts which we have stated in the preceding pages prove, that the carbon of plants must be derived exclusively from the atmosphere. Now, carbon exists in the atmosphere only in the form of carbonic acid; and, therefore in a state of combination with oxygen."

[From "Transactions of the Essex Agricultural Society."]

## ON THE DAIRY.

The Committee on the Dairy are happy to report:

That the dairy women of the county have done more to enrich our show the present season than on former years. There were ten regular entries for premiums on butter, and several parcels were found not entered. The quality of the butter generally, was quite good; much of it was superior. The committee have had not an unpleasant, but a difficult labor to decide who are best entitled to premiums. Between the June butter offered by Dean Robinson, of Newbury, and that by Daniel Putnam, of Danvers, there was little if any difference; but the committee decided, after awarding the September premiums, to recommend that your first premium, of eight dollars, be awarded to Dean Robinson, of West Newbury; the second, of six dollars, to Daniel Putnam, of Danvers; the third, of four dollars, to Jesse Putnam, of Danvers. A firkin of June butter offered by William R. Putnam, of Wenham, was very good, and inferior by very little to that which is recommended for the third premium. There were also, specimens of

very fair butter, by John Preston, of Danvers, Mrs M. Wardwell, of Andover, and others.

For September butter, your committee recommend that the first premium of ten dollars be awarded to Daniel Putnam, of Danvers. They would, if guided solely by the quality of the butter, recommend the second premium to Peabody Hsley, of West Newbury; but as no statement of cows and process of making accompanied this butter, the committee recommend that the second premium of eight dollars be given to Mrs R. Buttrick, of Haverhill. Specimens of good September butter were offered also by Mrs M. Wardwell, of Andover; Mr John Preston, of Danvers; and very fair butter was offered by many others.

On cheese, your committee were not so heavily tasked. There were four entries. We recommend the first premium of ten dollars, to Isaac Carruth, of Andover. The second would be properly bestowed upon James Peabody, of Georgetown, had he given us the statements which the rules of the society require. This omission of Mr Peabody causes us to recommend the second premium, of eight dollars, to Mrs William Thorlow, of West Newbury. A sample of good cheese was exhibited also by Mrs R. Butterick, of Haverhill.

JOSEPH HOW,  
ALLEN PUTNAM,  
JOSHUA BALLARD,  
BENJAMIN SCOTT.

Georgetown, Sept. 30, 1840.

To J. W. Proctor, Esq.—Sir, having been unable to attend the meeting of the board of trustees in December, I submit the following considerations relating to the management of dairies.

The first and most essential point to be gained is to procure *good cows*. It costs no more to feed a good cow, than a poor one. And the comparative result of their produce at the close of the year, makes a most essential difference in the profits of the farmer. Suppose one cow to give one quart at a milking, or two quarts per day, more than another, the milk being of equal quality; and this milk to be estimated worth two and a half cents per quart, and this to continue 200 days—here would be a difference of *ten dollars* in the produce of the two cows. This rule applied to a dairy of fifteen cows, would be equal the sum of \$150—half as much as the net annual income of a majority of the farmers in the county.

The *quality of the milk* is a consideration not less important than the quantity. Those, who never have tried the experiment of setting different cows' milk separate, have very imperfect ideas of their comparative value. I have known some cows that five or six quarts of their milk would raise cream sufficient to make a pound of butter. I believe this was stated to be true of the Oakes cow, from the milk of which was made twenty pounds of butter a week for several successive weeks; and I have heard the same of others. But ordinarily, it takes ten quarts of milk to yield a pound of butter. It therefore become a point of great importance, in selecting cows for the making of butter, to obtain those whose milk is adapted to this purpose.

The *manner of feeding cows* is a point not to be neglected, in the management of a dairy. Good feed not only increases the quantity of the milk, but it improves the quality; and of consequence the butter and cheese produced therefrom are bet-

ter also. The *kind of food used* is also to be regarded. Every dairy-woman knows that the milk will indicate the kind of food used; therefore those kinds of food which leave the best flavor in the milk should be selected. When cows have been fed on cabbages or on turnips, who has not tasted the peculiarities of these vegetables? When they are fed on Indian meal, on carrots, or on beets,—it is fair to presume that these articles become incorporated with the milk also. I do not presume to say which of these articles is the most valuable to be cultivated for the feeding of cows; though I hope in this age of experiments, with so many inducements as are now held out for the trial, it will not be long before some of our farmers will give us satisfactory information on this subject.

The *manner of milking* also demands attention. Cows should be milked about the same time each day; and they should be milked *quick and clean*. If a portion of their milk is suffered to remain, this will soon diminish the quantity, and the cows will dry up. It is bad policy to trust milking to children, for they usually do it moderately and imperfectly, and more is lost thereby than would pay the best of laborers.

The *place for the setting of the milk*, is also worthy of attention. This should be cool, well ventilated, and exclusively appropriated to this purpose. For if it is permitted to be occupied in part for other purposes, some things will find their way there which will be injurious to the milk. It should also be properly lighted. Cream will rise more favorably in a light than in a dark room, and the quality of it will be better. Therefore a dairy room above ground is preferable to a cellar. The room should be carefully guarded, by the use of wire gauze, or some other substance at the windows, against the approach of insects or intruders of every kind. The milk should be set in pans uncovered; as the cream will not rise so freely when there is a cover over the pans. Care should be taken not to fill the pans full, especially in warm weather, as the cream will rise quicker and better when the milk is spread over a larger surface. The sooner it rises and is removed from the milk the better; and this should always be done before the milk begins to turn sour. When the cream is taken off, it should be kept in tight covered vessels, in cool places, until the churning process; and this should always be before any sourness or mould is discoverable.

Much care should be taken to separate the butter-milk thoroughly from the butter. More depends on this than any other part of the process in making good butter. Unless this is done, it will be impossible to preserve it sweet and good. If our dairy women would apply double the labor to half the quantity of their butter, and thereby thoroughly remove all particles of butter-milk, this one half would be worth more than the whole in the condition it is usually sent to the market. As this is a matter that interests every farmer, and every lover of good butter, (and who does not love it when it is fair and nice?) I have presumed to forward these remarks. You will use them as you think proper.

Respectfully, Yours,  
JOSEPH HOW.

Methuen, Jan. 6, 1841.

NOTE.—What I have said in relation to the working of butter, is to be understood, in relation

to such butter as had the proper previous management. For if the butter comes soft, it may be worked ever so long, and not become hard and good; although it may be improved by working. Butter that comes well will be fit for immediate use with very little working. But if it is to be kept, care should be taken that the buttermilk is thoroughly removed.

It was my intention to have said something on the feed of cows. But my remarks have already extended so far, I will simply say, that there is no feed on which cows can be kept, that will make better butter, than a first rate pasture; such as abounds with English grasses. When this supply fails, let the deficiency be made up by green corn-stalks. Farmers will do well to plant some corn extra, for this purpose.

The present winter, I have boiled roots for my cows, such as turnips and sugar beets, to which I add a little Indian meal. This food when properly prepared and seasoned with salt, is well received by the cows, and improves the flavor, and increases the quantity of their milk.

J. H.

Having been a member of the Committee on the dairy, and knowing nearly how the cows were fed on four out of the five farms from which our best butter was brought, we were at the time of the examination, satisfied that the quality of the food given to the cows, showed itself in the color and flavor of the butter. Being the son, brother, cousin, or near neighbor and friend of these claimants, we withheld the expression of our opinion—and when our associates had made up their judgment, we thought that it would give no indication of the comparative merits of the dairy-women, for the preference of the several parcels of butter was in exact accordance with what we supposed to be the richness of the food given to the cows. Since in the country "every body knows every thing" we of course knew that Daniel Putnam fed better than Jesse, Jesse better than William; and William better than John Preston—and the Committee placed their names in the same order when arranging, according to the excellence of the butter.—Ed. N. E. F.

From the Farmer's Cabinet.

#### ON PRUNING FRUIT TREES.

MR EDITOR—This is a subject which merits our deep regard: to the neglect of this necessary operation might be attributed many of the evils which infest our orchards in the shape of canker, blight and rottenness, proving in the end the destruction of thousands of our finest trees. I have lately made some extracts from a foreign work, which appear to contain much valuable instruction and many new ideas on this very important branch of rural affairs, and by giving them a place in the Cabinet, I think you would be serving a valuable cause.

"Some persons prune off all the fibres of the main roots of the trees before planting, supposing that they must perish and become mouldy; but this pruning is, to say the least, entirely useless; but if any large roots are bruised or lacerated, the injured parts must be removed, as they are too large to heal, although they might not wholly decay.

"To secure the proper direction of the roots, every tree must be deprived of those which tap,

leaving those only which extend nearly at right angles with the stem, the object being, to induce the roots to strike in a horizontal direction not more than six or eight inches below the surface of the earth; but the heading down of the trees before planting, with a view to give them figure in the first instance, is often carried too far by those who consider that by cutting them very low, they give strength to the tree: it is requisite, however—should the wish be to form an orchard of half-standard trees, which is strongly recommended in preference to those of very lofty growth—that a certain number of primary branches be found at a short distance from the ground, and they must therefore be procured by pruning. Suppose then, that only one erect shoot, about a yard in length, be produced from the graft; then it will be necessary to cut it back to the length of six inches above its origin, by which means three or four of the eyes remaining will be excited to send forth as many shoots; these might afterwards be shortened at discretion, according to their strength—the weaker to be cut closer than the stronger—and thus a true balance will be given to the members of the tree. Gardeners differ with respect to the proper seasons of heading down, some insisting that they ought not to undergo the operation until they have passed over one entire year after the planting; but after trying every method, the best appears to be, if a strong young tree be planted just before the leaves fall or have quite changed color, it ought not to be pruned during that autumn or winter, but in the following spring: just when the buds begin to swell, it may be cut back with safety and more certainly than at any season of the second year, and for this reason: if the pruning be performed at the time of planting, say October, the wounds remain exposed unhealed, to the fickleness and severity of the winter; but if the tree at the commencement of the following April, be sufficiently vigorous to *enlarge its buds*, it will be equally so, to effect the development of three or four of its lowest eyes, and thus to produce as many branches, at a season when the vital fluids of the glandular coat of the bark will produce healthy granulations over the wounded surfaces: but were the shoot or shoots left wholly unpruned, the leading buds alone might advance and leave a great length of wood or two different years' growths to be cut back to the proper distance above the graft.

“The object of pruning young trees is to produce a tree with a regular, open head, with radiating branches, as nearly as the habits of the tree will permit, from a central stem, obliquely ascending to a certain angle. Lindley's observations on the regularity of a well-pruned tree, are practically correct: he says, if this be effected at first, there will be no difficulty in keeping it so afterwards; but particular care must be taken in pruning, to cut to that bud immediately on the *inside* next to the centre of the tree, or to that immediately on the *outside*—by these means, on viewing the tree from the outside, the branches will appear in a perpendicular line from the eye; whereas, if pruned to a bud on the right or left side of the branch, the young shoot will be produced in that direction, and every branch will appear crooked, the regularity and beauty of the tree being thus destroyed in one year's pruning.

“As to the proper time for general pruning, there are two seasons of vigorous growth, the one in May, the other in July, and the critical period appears to be just after the July shooting has taken

place; then the wood will be firm, and the fluids of the tree, although not quite inactive, will be in a state of comparative quietude, yet producing granulation over the wounded surfaces; but if the branches be cut back at or before the season of the July shooting, the lower buds will be stimulated to produce in most cases a multitude of weak shoots, all of which must afterwards be cut out, or if one only be left, it has to undergo the same treatment, and with a similar result: thus, time is lost, the powers of the tree are taxed to no purpose, and no fruitful buds are obtained. The *winter* pruning may be understood as that period just preceding the enlargement of the buds in March or April, because the fluids excited by the spring influences, are ready at their first flow, to heal the wounds, and produce the depository of new vegetable matter: it is the torpid condition of a wound which causes disease under the action of cold, frosty winds, snow, or protracted wet during the winter. But some object that a tree will bleed, if the knife be used in the spring; facts, however, do not bear out the assertion that injury will arise from this circumstance, even in the case of the vine, although the watery sap from that tree will flow from the point of the wound for days. If care be taken to prune young trees properly for the first three or four years, they might then be left to themselves in a great measure, to form the figure which the nature of the variety inclines it to assume.”

J. F.

From the same.

#### WATER-PROOF DUBBING FOR LEATHER.

*Keep your feet dry and head cool.*

To render leather water-proof, and at the same time to preserve its elasticity, is a matter of great importance, as it increases its durability, and protects those who apply it to shoes or boots from the mischievous effects arising from damp or wet feet. The following receipt followed out carefully, it is believed, will effect this object.

Take a pint of linseed oil, two ounces of bees-wax, two ounces of spirits of turpentine, and half an ounce of Burgundy pitch, and slowly melt them together, continuing to stir them so as thoroughly to incorporate them, being careful not to set the mass on fire, as the ingredients are all combustible. When this compound cools, it will be found to be about as elastic as leather ought to be. If it were harder, it would cause the leather to crack or break when bent; and if it were softer, water would enter and wash it out. To apply it, re-melt it, warm the shoes or boots, and put it on with a small brush, or a sponge, or piece of cloth tied on the end of a stick; continue to warm it in till the leather is well saturated with it, and particularly the bottoms of the soles and heels. It should always be applied when the boots or shoes are new, and then lay them by to season for some time before wearing. Leather thus treated will be found impervious to water, and will wear twice as long as that to which it has not been applied. The writer has used this article for many years, and can testify to the great benefits derived from it; and he has no doubt but his shoemaker's bill has been reduced to one half by the use of this composition; and what has been saved in doctors' bills he is unable to estimate.

Common grease applied to leather tends to rot it, and it is soon washed out in wet weather. O.

#### CULTIVATION OF THE PEACH.

By T. Hancock, Nurseryman, Burlington, N. J.

The peach tree is very extensively cultivated throughout New Jersey, and large quantities of the fruit are annually sent to the New York and Philadelphia markets. Since the opening of the communication by railroad between these two cities, through the interior of the State, it has been the means of greatly increasing the number of peach orchards, and many large and extensive plantations have been made. Within a few years, from the increased facilities of rapid and safe transportation by railroad, between Boston, Providence and Stonington, the eastern cities have been supplied, to a very great extent, with New Jersey peaches, and the opening of such a market has induced cultivators to plant more extensively, in order to supply the demand. The crop proves a very profitable one for the light soils of a portion of the State, as the trees flourish very well where the land is not sufficiently good to produce but a very few bushels of corn to the acre.

If the few following remarks, in relation to our mode of cultivating the peach, will interest your readers, you can give them a place in your pages. I have an orchard of some extent, and have, in some seasons, gathered a very large crop.

When it is intended to plant out a good orchard of trees, we generally select an elevated position, entirely unprotected by any timber or shelter of any kind: if a situation can be selected near the bank of a river, the crop is more certain, as the trees better withstand the frosts, which occasionally do much damage.

Plough, and put the land in good condition for corn or vegetables, and plant the trees twenty feet apart each way. Continue to till the land, taking off a crop of peas, beans, potstotes, or something that does not grow too high; wheat, rye and oats are very injurious and should not be planted. The land must not remain without tillage, as the trees would soon be injured; indeed nothing will kill a fine peach orchard sooner than to let it lie in sward.

The trees should be two years old on the stock, (from seed,) and one year from the bud, (the year after budding.) This is considered as the best age for transplanting. If the water stands near the surface of the soil, or if the land has springs near the top of the ground, I should not deem it advisable to plant with the expectation of very certain crops. I have lost two orchards planted in this manner, while, in an adjoining field, where the land, or a part of it, was high, with a dry subsoil, the trees flourished and produced abundant crops.

Light sandy soil, or light loam, we consider the most preferable for planting out peach orchards, and I should judge that on many of the elevated knolls, in the vicinity of Boston, the peach might be cultivated to good advantage, particularly the earlier varieties. It is at least well worthy of trial.

Yours, respectfully,

—Mag. of Hort.

T. HANCOCK.

*Durable Whitewash.*—To make whitewash durable and prevent it from cracking, the water in which the lime is mixed should be fully saturated with salt before the lime is put in.

The average number of inhabitants to a square mile in Ireland is 275, in England 236, and in China 230.

## MASS. HORTICULTURAL SOCIETY.

At a meeting of the Massachusetts Horticultural Society, held April 24th, 1841—

*Voted*, That the several Reports of Committees awarding premiums for the year past, as approved of by the Executive Committee, be published in the New England Farmer.

Attest, E. M. RICHARDS,  
Rec. Sec'y.

*Report of the Committee on Fruit.*

The Fruit Committee of the Massachusetts Horticultural Society, for 1840-41, recommend for the approval of the Executive Committee the following premiums on Fruits, to be paid from an appropriation made for that purpose :

For the best Summer Apples, to John Hovey, Roxbury,	\$5
‘ ‘ best Autumn Apples, to George Lee, West Cambridge,	5
‘ ‘ best Winter Apples, to Benjamin V. French, Braintree,	5
‘ ‘ best Summer Pears, to Samuel Pond, Cambridgeport,	5
‘ ‘ best Autumn do. to do. do.	5
‘ ‘ best Winter do. to Marshal P. Wilder, Dorchester,	5
‘ ‘ best Cherries, to Elijah Vose, Dorchester,	5
‘ ‘ next best do. to John A. Kenrick, Newton,	4
‘ ‘ best Peaches, open culture, to J. L. L. F. Warren, Brighton,	5
‘ ‘ next best, (a seedling,) to E. M. Richards, Dedham,	4
‘ ‘ best under glass, to Mr Milne, Portland, Me.,	5
‘ ‘ best Plums, to Samuel Pond, Cambridgeport,	5
‘ ‘ best foreign grapes under glass, to David Haggerston, Watertown,	10
‘ ‘ best foreign grapes, open culture, to Samuel R. Johnson, Charlestown,	5
‘ ‘ best Nectarines, to Elias Phinney, Lexington,	5
‘ ‘ best Quinces, \$3 each to Elijah Vose, Dorchester, and Samuel Pond, Cambridgeport,	6
‘ ‘ best Gooseberries, to John Hovey, Roxbury,	5
‘ ‘ best Raspberries, to Aaron D. Weld, Roxbury,	5
‘ ‘ best Strawberries, to Messrs Hovey, Boston,	5
‘ ‘ next best do. to J. L. L. F. Warren, Brighton,	4
‘ ‘ best Currants, to Aaron D. Williams, Roxbury,	3
‘ ‘ best Muskmelons, to Elijah Vose, Dorchester,	3
‘ ‘ best Watermelons, to Clement Sharp, Roxbury,	3
For a great variety of Pears, a gratuity to R. Manning, Salem,	10
	\$122

The amount of premiums awarded is one hundred and twentytwo dollars, being within the amount appropriated for that purpose ; which is respectfully submitted for consideration and approval, by the Committee on Fruits.

BENJ. V. FRENCH, *Chairman.*

*Report of Committee on Vegetables.*

The Committee would report the following premiums for the year 1840 :

Asparagus—no premium.	
Beans, Large Lima, to E. Vose,	\$3 00
Early Dwarf—no premium.	
Broccoli,	
Beets, to A. D. Williams,	2 00
Cabbages—no premium.	
Carrots,	
Cauliflower,	
Celery,	
Corn, for boiling, to J. L. L. F. Warren,	2 00
Cucumbers, to do. do.	4 00
Lettuce—no premium.	
Peas, to J. L. L. F. Warren,	4 00
Potatoes—no premium.	
Rhubarb, to Samuel Walker,	3 00
Squashes, winter, to A. D. Williams,	3 00
do summer—no premium.	
Tomatoes, to John Hovey,	3 00
Egg Plant, to E. M. Richards,	2 00
Brussels Sprouts, to John Prince,	2 00
	\$27 00

The Committee recommend the following gratuities :

To Messrs Hovey & Co., for fine specimens of White Carrot, exhibited at the annual exhibition,	2 00
To E. Phinney, Esq., Lexington, for the very fine specimen of Squash, called "Harrison Squash," a gratuity of	4 00
	\$33 00

All of which is respectfully submitted.

SAMUEL POND.

April 24, 1841.

*Report of the Committee on Flowers, for 1840.*

The Committee on Flowers respectfully submit the following report of the premiums awarded for the year 1840 :

<i>Hyacinths</i> —For the best display, a premium to Jos. Breck & Co. of	\$5
<i>Tulips</i> —For the best 12 blooms, to Sam'l Walker a premium of	10
For the second best do do to S. R. Johnson a premium of	5
<i>Geraniums</i> —For the best 6 plants in bloom in pots, to A. Bowditch a premium of	5
For the next best 6 plants in bloom in pots, to W. Meller a premium of	3
<i>Pansies</i> —For the best 12 flowers, to S. Walker a premium of	5
For the best 6 different varieties, to W. Meller a premium of	3
For the best seedling, to S. Walker a premium of	2
<i>Roses</i> —For the best 50 blooms of hardy roses, to J. A. Kenrick a premium of	8
For the second best 50 blooms, to S. R. Johnson a premium of	6
For the best display of Chinese and other tender varieties, to S. R. Johnson a premium of	5
<i>Paeonies</i> —For the best display of flowers, to W. Kenrick a premium of	5
For the second best display of flowers, to J. A. Kenrick a premium of	3
<i>Pinks</i> —For the best display of flowers, to S. Walker a premium of	5

For the best seedling, to S. Walker a premium of	3
<i>Carnations</i> —For the best display of flowers, to W. Meller a premium of	5
For the second best display, to John Hovey a premium of	3
<i>German Asters</i> —For the best display of flowers, to Messrs Hovey & Co. a premium of	5
For the second best display of do., to J. J. Low a premium of	3
<i>Annals</i> —For the best display, to Joseph Breck & Co. a premium of	3
For the second best do., to Hovey & Co. a premium of	2
<i>Dahlias</i> —Premier Prize: Best 6 blooms, to M. P. Wilder a premium of	15
Specimen Bloom: The best flower, to M. P. Wilder a premium of	5
Discretionary premium for second best, to J. J. Low,	5
<i>Division A.</i> Class I.—Best 24 blooms, to M. P. Wilder,	8
Second best 24 do., to J. J. Low,	6
Class II.—Best 12 blooms, to J. Stickney,	6
Second best 12 do., to Hovey & Co.,	4
Class III.—Best 6 blooms, to D. Haggerston,	4
Second best 6 do., to J. A. Kenrick,	2
<i>Division B.</i> Class I.—Best 24 blooms, to D. McIntyre,	8
Second best 24 do., (no prize.)	
Class II.—Best 12 blooms, to S. Walker,	6
Second best 12 do., to S. Sweetser,	4
Class III.—Best 6 blooms, to W. Meller,	4
Second best 6 do., to N. E. Carter,	2
	\$173

The Committee have exceeded the amount voted to them by the Society \$48. It was their intention to ask for a larger sum last spring, but upon further consultation, they concluded to offer suitable premiums for the encouragement of the Dahlia, a plant which adds so much to the interest of our annual displays, and leave it for the Society to make up the deficit at the end of the season.

The committee are happy to have it in their power to state, that the shows have been much more interesting than usual; that the specimens of flowers exhibited, with the exception of Carnations, have been very beautiful, and the premiums have been worthily gained by the respective exhibitors. They only regret that it was not in their power to award a larger sum, and for a greater variety of objects, which are well deserving of encouragement.

In conclusion they would hope that the funds of the Society will enable them to devote a more liberal sum for premiums, believing that in no way can the interests of the science of Horticulture be so much advanced.

Respectfully submitted,

C. M. HOVEY, *Chairman.*

[The appropriation of money for the flower committee, having been but \$125, the executive committee could not approve of the report, without its being reduced to that amount, and it was then accepted, with the provision that the premiums should be paid *pro rata* on that sum.]

Many liberal men have become covetous, but I never knew a covetous man who became liberal.—*Langhorne.*

For the N. E. Farmer.

### THE YOUNG AGRICULTURISTS—PUBLICATION OF THEIR OPINIONS.

MR PUTNAM—I was much gratified upon perusing your last paper, to observe a communication from "A Farmer's Boy." With the practical matter of which he discourses, I am unacquainted; but I may say his conclusions appear plausible. It is not my intention to criticise his positions or the manner in which they are expressed: far from it: both are worthy a maturer head. I wish to express my approbation of the disposition which inclined him to observe, to commit his inferences to writing, and to send them for publication in your columns; and to say to him, in addition to the encouragement extended by yourself, *try again*—go on observing and communicating the results of your observations for publicity:—it is a proud distinction, young man, to have the thoughts of your own unaided conception, spread before the eyes of thousands, and a source of pleasure to reflect that those thoughts, though originating with your humble self, may become established as truths and prove a benefaction to community.

So far, Mr Editor, from there being any objection to your publishing the opinions of the young, I think the disposition to communicate them for your pages, is eminently worthy encouragement—especially as there is such a reluctance manifested by the older to furnish for this purpose whatever they may have learned in the progress of their pilgrimage here. You need entertain no fear, sir, that such communications as that of "A Farmer's Boy" will in the least diminish the interest of your paper—they will rather enhance it; and I hope the laudable example he has set, will induce others of his years to "follow copy."—By all means let the reflective young be stimulated and encouraged by the conductors of the press, in this disposition to communicate their thoughts for publication.

I have said, Mr Editor, all that I designed to say when I commenced; but if it will not encroach too much upon your space, I will add a few thoughts upon a subject which bears some affinity to the foregoing. If, in your more discerning and better-balanced mind, my anticipations should seem but as "the baseless fabrics of a vision," I must plead in excuse of the defect the phrenologist's decision, that "Ideality" and "Hope" are two of the ruling influences in my mental constitution; and if I shall betray ignorance in regard to the true state of things in the agricultural world, I sincerely solicit to be informed wherein I err.

I think I can see, sir, in the young farmers that now are, the "dawnings of beams and promises of day," which in due time will break forth in the undimmed and refulgent lustre of the sun upon the cause of agricultural improvement.—However much the discoveries of the closet and the laboratory may be calculated to benefit and perfect the art of husbandry, they will never—depend upon it, sir—they will never to any general extent be brought in to its aid, until the great mass of those who cultivate the earth shall be composed of men who can discern and are willing to admit, that the deductions of science and philosophy are more deserving their attention, than the erroneous opinions of those whose misfortune it was to live in an age when, compared with the present, the lights of knowledge were dim in their lustre and circumscribed in their extent. And here let us ask, is there any well

founded prospect that our yeomanry *will be composed of such men*—men who instead of sneering at book-learning, in compliance with the dictates of hereditary prejudice and self sufficient ignorance, will be disposed to court its enriching aid and practice upon its suggestions? I, for one, sincerely think there is. "Coming events cast their shadows before." I think I can see such a yeomanry in the "Farmer Boys" of the present day:—I think I can see in them the germs of that mighty agent which is destined—gradually it may be, but surely—to achieve that signal triumph in a change of our husbandry, which I am disposed to believe it has been reserved for modern light and modern truth to obtain over ancient ignorance and ancient error. My whole hope for whatever of great improvement our agriculture is to undergo in a half century to come, is centered in the young farmers of this generation as the chief agents through which it is to be accomplished. These expectations may be disappointed;—indeed, to the more sagacious they may appear as the mere illusions of fancy: to me they seem no less practicable than probable: I see much that is auspicious for the issue I predict,—much that warrants me in believing, that the day when the young farmers that now are shall take the places of their fathers to till the fields which they now till, will be a proud day for our agriculture—a proud one for our country. Coming into manhood, as they will, divested of prejudice, eager for knowledge, infused with the improving spirit of the age, and enlightened with the teachings of the common school,—do not *these* considerations go far in justifying the expectations I entertain, the hope I cherish? Mark me, sir: the "Farmer Boys" that now are, will make the men who will effect that stupendous revolution in our husbandry which will exalt the art among the highest in the industrious sisterhood, and contribute more than any bloodless revolution which has preceded it, to make us as a people pre-eminently prosperous, and as a nation pre-eminently independent. J. H. D.

It is pleasant to soar on the pinions of imagination, and those who describe the beauties of a world which she creates, peoples and instructs, help to improve and elevate the matter-of-fact and ignorant world of which we are a part. This prediction from the foreman on *Fancy Farm*, creates a smile—and smiles are good.—ED. N. E. FARM.

### CAUSE OF THE COLD, WET WEATHER.

We have been querying in our mind—what can be the natural cause of the cold, wet weather with which we have been so *steadily* afflicted this spring? For, really, we have hardly had a single pleasant day since the equinox in March; North Eastern storms, one after another, have prevailed to make the heavens black and the earth blue, for the last six weeks. Seldom has the sun been seen; it has been, decidedly, the most gloomy weather we have ever known for so long a time. What can be the cause of this sort of weather, and may we expect that the same cause will operate to produce a cold season?

A writer in the Eastern Argus, who appears to reason well from well known natural principles, has hit upon a conjecture that seems to us to offer a reasonable conclusion on this subject. He says he has noticed, that whenever large quantities of Polar ice have floated out upon our North Eastern coast, in the spring, we have invariably had a cold season. Such immense masses floating in the vi-

cinity of this part of the continent, must necessarily chill the atmosphere to a great extent, and that lower temperature condenses into rain the fogs and vapors which always hang over the Grand Banks, and creates a wind that naturally seeks its current in the direction of the continent where the air is more highly rarefied. This makes for us a N. E. wind, which brings on the protracted rains that usually accompany a storm from that direction.—The conjecture is a rational one, and we think is entitled to consideration. It is known, as reported by the English steam ships, that large islands of ice, mountains high, have floated out from the Polar regions into the Grand Banks on our North Eastern coast.

We have not much confidence that we are to have, the approaching summer, much corn-growing weather; and we advise farmers to plant the earliest varieties, so as to run as little risk as possible. Cold seasons, however, are generally more favorable to grain, grass and potatoes. One cold summer, it is to be hoped, will kill off the weevils. We have more confidence in the success of wheat this year than we have of corn. But do your *duty* and *trust to Providence*.

The following is the article in the Argus to which we have alluded.—*Maine Cult.*

### THE COLD WEATHER.

MR EDITOR—For many years past I have observed that our cold summers have uniformly been remarkable for the large quantities of Polar ice which have accumulated in the vicinity of the Grand Banks, and further south upon our coast. In conversation with a friend since, upon the backwardness of the present season, I remarked that we should doubtless soon learn of the existence of large quantities of ice upon the coast; being persuaded that the uncommonly cold weather which we have lately experienced, was owing principally to this cause. A paragraph in the papers has verified the prediction—a large quantity having been fallen in with by vessels lately returning from Europe. It is well known that sailors are generally admonished of their vicinity to icebergs by a fall in the temperature; and it is reasonable to suppose that the influence of large masses of ice upon our coast, would be extensively felt, and produce an important modification of our seasons. The British Provinces and New England feel this influence more than any other portions of our country: indeed they are almost the only portions which are materially affected by it. One result which may be expected from so unpleasant a neighborhood, is the frequent recurrence of easterly storms; for the atmosphere in the vicinity of the ice being much condensed, will have a strong tendency to rush to land, where it is more highly rarefied. This circumstance, too, has some effect in keeping the ice near our shores, and were it not for the counteracting influence of the Gulf Stream, which tends eastwardly, we might expect that the existence of large masses of ice upon our coast would produce almost a Greenland in summer. It may be worth while for men of science, and more particularly the farming portion of our community, to notice the connection which is here suggested. Should large quantities of ice continue to be seen in our vicinity through the month of May and into June, we shall unquestionably have a cold, unproductive season. M. S.

Teach the young to protect the birds.

## NEW ENGLAND FARMER,

AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, MAY 19, 1841.

## ROOT CULTURE.

The cultivation of roots as food for cattle and swine, has been strongly urged upon farmers by the agricultural press, for several years past. The columns of this paper have often spoken, and distinctly, upon the subject. "Line upon line, here a little and there a little," having been dealt out, the farmers of this vicinity have partially complied with the advice. But still farther compliance may be desirable. We, however, have not a belief that the root husbandry should be carried to the same extent in our climate as it is under the moister skies of England. "There the root crop is probably more certain than with us; while Indian corn, one of our most certain and best crops, cannot be grown in the fogs of the island. We do not suppose that it would be found profitable here to arival the mother land in the extent of root husbandry. And yet our faith is strong that it would be profitable in this region to grow roots more extensively than we yet do. Their aid in working off coarser kinds of fodder while the stock is kept in good condition; their effects in increasing the quantity of milk; their utility in making beef and pork, and their efficient agency in increasing the quantity and improving the quality of the manure heap, all commend them to the farmer's attention.

But he raises a question whether they do not cost more than they are worth. It is the great question; and it is not of easy solution, for the expenses of cultivation and the value of the roots for stock, are by far too much mere matters of conjecture. We are satisfied from several years' experience, that where eight cords of manure per acre are applied, that 400 bushels per acre of roots, taking one kind with another, may be raised. We have, taking a succession of years together, raised more carrots to the acre than ruta bagas or sugar beets. All the labor upon an acre may probably be performed for 25 dollars, and if it be allowed that the crop by its consumption will furnish as much manure as it exhausts in its growth, then the cost of the roots is but about 6 1/4 cents per bushel. Will not the bushel furnish the fourpence ha'penny's worth of milk, beef or pork? We have no doubt that it will; and we advise every farmer to raise at least 40 or 50 bushels for each beast in his barn. But he says, I have no land in a suitable condition for such crops. An experiment on a small scale the last season, satisfied us that sward land, newly turned, will answer well for the root crops. We incline to the opinion that they can be grown as economically on such land as on old ground. But the new ground must be well ploughed to the depth of eight inches or more, and must be thoroughly harrowed. The first of June is early enough for the sowing of any of these crops, and the ruta бага seed should be kept out of the land until the middle of the month.

Our custom has been to sow upon a level surface, and in rows not more than 15 or 16 inches apart; but we very much doubt whether it is not better to ridge and have the rows from 24 to 30 inches apart. This saves much labor. Many recommend soaking the seed; but when the ground is in good condition for the reception of seed, we have never found benefit from soaking. On the whole we think the carrot less subject to injury from worms, rot or drought than the other roots; it is as valuable as any one of them; and though the labor of its cultivation is somewhat greater, yet we prefer it for the main crop. It is well to try some of each kind.

Accounts are often published of crops much larger than we have named, as the probable produce. Without questioning the correctness of those accounts, we merely say that we have tried to conform to results obtained under our own eye in a series of four or five years; we wish to present the question of root culture fairly and not allure people into it by expectations which must probably be disappointed.

The cold and wet of the spring, though they certainly should not bring discouragement, will cause some hesitation about the planting of corn as extensively as is customary; but we see nothing in them to impair the hope that the root crop may do as well in this as in any other season. We trust that more attention will be given to it the present year than it has ordinarily received.

## LETTER FROM VIRGINIA.

Middle Town, Frederick Co., Virginia, }  
May 6th, 1841. }

THOMAS G. FESSENDEN, Esq.—Sir—The ball of agricultural improvement is silently and gradually wending its way southward. The public mind of this portion of the "Auld Dominion," is almost sufficiently advanced for inoculation. I desire a bud or cutting of Northern growth. Having no acquaintance in your Bay State, I am induced to refer to you for that information which the occasion requires. You will confer a lasting obligation on the writer, as well as all interested in the welfare of this most important branch of industry here, by communicating such statistical and general knowledge of agriculture and manufactures, as you can reach. Any and every document of your State and local societies from which we could glean the rise and progress of, a comparative view of the improvement in agriculture and manufactures, would be useful. I hope you will not consider this too great a tax upon your time. My apology for this intrusion is *stern necessity*, and the prominent position you occupy on the agricultural theatre. And judging from the laudable zeal you have evinced, I imagine my motives will not be misconstrued. Your earliest attention, compatible with your convenience, is most respectfully solicited.

Please, sir, accept my best wishes for your future welfare.

With great respect, I remain yours,

C. B. HITE.

Thomas G. Fessenden, Esq.

A memorial of beneficent labor not to be thrown away! Thus thought we upon reading the above letter directed to Thomas G. Fessenden, as the "Editor of the N. E. Farmer."

Subdued and hallowed sensations, like those which stir in us when viewing the portraits and other remembrancers of departed friends, moved the heart while the eye passed on from word to word and line to line. We were appropriating what was not meant for us. We were taking what belonged to the dead—innocently we were taking it, and yet not without misgivings, for fancy's ear heard the spirit which was wont to reveal itself in the columns of the Farmer, saying mildly, but firmly, that is mine, not yours. Yes, spirit of Fessenden, it is thine. It was addressed to thee. We claim it not. We hand it over to that portion of the world for whose instruction and improvement thou didst perseveringly, prudently and successfully labor. We give it as a witness that though the body thou didst inhabit is dead, yet thou still dost retain a place in our world. A mind in the "Old Dominion," which years ago drank in instruction from thee, now in its thirsting after knowledge, turns instinctively to the spot where, in days that are past, it found the refreshing draught. The fact is a monument to thine efficiency in the cause to which

thou wast devoted. It speaks of labors well performed, and of wide-spread confidence reposed in thee. Through many years, while a stranger to thee, we always heeded thy weekly messenger as a wise and prudent oracle. Thousands in the land doubtless did so too—so that the opinions and tastes of hundreds upon hundreds have been shaped by the quiet action of thy modest mind.—The good which thou hast done lives after thee. We fondly trust that it is yielding thee immortal fruit in the fair fields of the world above, while it is contributing to the enjoyments and comforts of those who are, and of those who in days yet far off in the future, will be, tillers of this world's soil.

At present it is impossible for us to prepare any thing for our columns which will meet the broad inquiry of the writer of the letter; but if he will inform us *how to send*, we shall be pleased to collect a few pamphlets for his use. Not that we can furnish any brighter light than is given to the Old Dominion by the pages of the Farmers' Register (as able and thorough as any other American agricultural journal)—but because it is pleasant to gratify the desires of all who seek for such light upon important subjects as we may be able to furnish. Mr H. will oblige us by describing the motions and progress of "the ball" in his region.

Some Southern journal has recently complained that the North takes no interest in the agricultural writings of the south. We doubt the justness of the complaint as a general one; and we deny its correctness as far as we are personally concerned. Though we select and write mainly for New England, we welcome instruction from the South, and send it there as cheerfully as elsewhere.

## RENOVATION OF THE PEACH TREE.

A gentleman, residing in Cambridge, informs us that he last summer heard that charcoal placed around the roots of the diseased peach stock, was serviceable. He immediately removed the soil from around the trunk of a sickly tree in his garden, supplied its place with charcoal, and was surprised at its sudden renovation, the subsequent rapidity of its growth, and the tenacity with which the fruit held on to the branches, and the unusual richness of its flavor when matured.

*Simple Cure for Rheumatism.*—Boil a small pot full of potatoes, and bathe the parts affected with the water in which the potatoes were boiled, as hot as it can be applied, immediately before getting into bed. The pains will be removed, or at least greatly alleviated, by the next morning. Some of the most obstinate rheumatic pains have been cured by one application of this novel and simple remedy.—*Selected.*

To ensure large crops, plough deep, fetch up the subsoil to be exposed to the sun and air, fill the land with good manure, and give the crops thorough tending at the proper season.

A British journal thinks that the introduction of the root culture in England, will effect as great a change in the prosperity of the landed interest, as the application of steam has produced in the results of mechanical ingenuity.

"All eloquence," said Dr. F., "is a lie."

"A very eloquent remark, that of yours," responded Dr. H.

Cheat your corn when you plant it, and it will cheat you when you harvest it.—*Me. Cult.*

The rate of wages in Ireland is from ten to twenty cents per day, without food.

## THERMOMETRICAL.

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northernly exposure, week ending May 16.

May, 1841.	5 A.M.	12 M.	7 P.M.	Wind.	
Monday,	10	45	50	47	E.
Tuesday,	11	43	50	52	N.
Wednesday,	12	39	61	51	N.
Thursday,	13	42	55	54	E.
Friday,	14	44	53	48	N.
Saturday,	15	38	53	56	E.
Sunday,	16	38	63	65	W.

## BRIGHTON MARKET. — MONDAY, MAY 17, 1841.

Reported for the New England Farmer.

At Market 122 Beef Cattle, (including 73 unsold last week) 20 Cows and Calves, 15 pair of Working Oxen, and 660 Swine. 30 Beef Cattle remain unsold.

Prices.—Beef Cattle—We quote a few extra \$7 75. First quality, \$7 25 a 7 50. Second quality, \$7 00 a 7 25. Third quality, \$6 00 a 6 75. We noticed a beautiful yoke of Cattle fed by Mr Sargeant of Springfield, sold for \$300.

Working Oxen—Very few sales effected.

Pulled Wool is rather scarce, and there is but a limited supply of low Fleeces, and of fine Fleeces the stock is also moderate. Prime or Saxony Fleeces, washed, lb. 50 to 55 c.—American full blood, washed, 47 to 50—Do 2 4 blood, washed, 44 to 46—Do. 1-2 blood, washed, 36 to 40—1-4 and common do, 35 to 37—Smyrna Sheep, washed, 20 to 23—Do. unwashed, 10 to 14—Bengasi Sheep, 8 to 10—Buenos Ayres unpicked, 7 to 10—Superfine Northern pulled lamb 43 to 46—No. 1 do. do. 37 to 42—No 2 do do 26 to 30—No 3 do do 18 to 20.

## HOVEY'S NEW SEEDLING STRAWBERRY.

This splendid variety of the Strawberry (originated in 1834) is now offered for sale. The fruit is of the largest size, often measuring 5 to 6 inches in circumference, handsomely formed—of a deep red color—exceedingly high flavored—and one of the most productive varieties, 12 quarts having been gathered from a bed 3 feet by 12. The vines are vigorous and hardy. Standing our severe winters without protection.

The fruit has been exhibited at the Massachusetts Horticultural Society in 1833, '39, and '40, where it attracted more attention than any other variety; and each season obtained a premium. It has every good quality to recommend a Strawberry to cultivation. The Spring is the most favorable time for planting in this climate. Plants \$5 per dozen.

Also, all the old established varieties of Strawberries, from \$1 to 2, per hundred plants.

Orders addressed to us, will be immediately attended to, and the plants packed and forwarded with dispatch.

HOVEY &amp; CO., SEEDSMEN,

7 Merchants' Row, near State st.

## RHUBARB PLANTS.

Giant and Early Wilmot Rhubarb Plants, and Asparagus Roots, for sale by J. BRECK & CO.

## GRINDSTONES.

An extensive assortment of Water and Hand Grindstones constantly on hand and for sale by AMMI C. LOMBARO & CO. 13 Lewis's Wharf. 1841. Nov. 17.

## WILLIS'S LATEST IMPROVED SEED SOWER.

Willis's latest Improved Seed Sower, invented the last season; one of the most perfect machines ever introduced for the purpose. In using this machine, the farmer may be certain that his seed is put into the ground, and at the same time in the best possible manner. There has been a great difficulty in machines for sowing garden seeds; they are very apt to clog up and the farmer might go over an acre of land and not sow a single seed; but not so with this; it is so constructed that it cannot possibly clog. In using this sower, the farmer can save one half of his seed, and do the work at less than one quarter the expense of the common way of sowing seeds, and have it done in a much better manner; it opens the furrow, drops the seed, and covers it over and rolls them down. It will sow almost any kind of Garden Seeds; say Ruta Baga, Mangel Wurtzel, Turnips, Carrots, Beets, Parsnips, Onions. It is highly recommended by a great number of persons who used it the past season. For sale at the N. E. Agricultural Warehouse and Seed Store by JOSEPH BRECK & CO. March 31.

## WINSHIP'S NURSERY.

BRIGHTON, NEAR BOSTON,

Situated on the line of the Boston and Worcester Rail Road,—5 miles from the city.

The Proprietors of this extensive nursery beg leave to inform their friends and the public, that they are ready to furnish orders to any amount, for Forest Trees, indigenous and exotic Fruit Trees, including all the varieties of Pears, Peaches, Plums, Nectarines, Cherries, &c. &c.

Vines—Shrubs, Green House Plants, &c. Catalogues may be obtained by applying at the Nursery. Trees carefully packed, to ensure safety in long voyages. Orders left at the New England Seed Store of J. BRECK & Co. Nos. 51 and 52, North Market street, will be delivered the day following, and left at any part of the city, free of expense.

Letters containing orders, addressed to the subscribers, J. & F. WINSHIP.

Brighton Nurseries, March 24, 1841.

## SUPERIOR SEED BARLEY.

100 bushels of extra heavy and clean Seed Barley. Also 30 bushels CHEVALIER BARLEY, a new and superior variety, for sale by JOS. BRECK & CO. March 31.

## BLACK SEA WHEAT.

Received from Vermont, 30 bushels Black Sea Wheat. Also, 20 bushels Italian Spring Wheat, raised in Warren, N. H. For sale by JOS. BRECK & CO. March 31.

## PEAR, PLUM, GRAPE VINES, &amp; C.

3000 Pear Trees, of the most approved kinds. 2000 Plum Trees, of the most approved kinds and extra size—many of them have borne this season.

Apple, Cherry and Peach Trees, of different kinds

500 Quince Trees. 40 0 Isabella and Catawba Grape Vines, from 6 to 15 feet high; most of them have borne fruit. Black Hamburg, Sweetwater, Pond's.

30,000 Giant Asparagus Roots. Gooseberry, Currants, Raspberries, of good kinds. 5000 Wilmot's Early Rhubarb or Pie Plants, lately introduced.

2000 Cherry and Pear Stocks; 1000 Plums; Roses, &c. of all kinds.

All orders sent to the subscriber at Cambridgeport or left with JOSEPH BRECK & CO., will meet with immediate attention.

SAMUEL POND.

Cambridgeport, Mass., Feb. 24.

## PURE SPERM OIL.

EDMUND T HASTINGS & CO., No. 101 State St, keep constantly for sale, Winter, Spring and Fall Sperm Oil, bleached and unbleached; which they warrant to be of the best quality and to burn without crusting.

Oil Canisters of various sizes.

Boston, Jan. 1, 1841. 1841

## FENCE CHAINS.

Just received from England, 10,000 feet Chains, suitable for Fences or other purposes. For sale by J. BRECK & CO., No. 52 North Market st. April 21

## DURHAM COW FOR SALE.

A young full blooded Durham Cow and her calf—a very desirable animal in every particular. Apply to EDWARD TITCOMB, Ja., Newburyport. May 8

## PLUMS, PEARS, GOOSEBERRIES, &amp; C.

Just received by JOSEPH BRECK & CO., from London, a fine assortment of Plum and Pear Trees, which are offered at reduced prices, including the following

## PEARS.

Belle Lucrative, Cattilac, Williams' Bon Chretien or Josephine, Mouille Bouche, Bartlett, Beurree Spence, Jargonell d'Espagne, Capannoot, Echasserie, Bosc, Urbaniste, Diel, Duchess d'Angouleme, d'Arenburgh, St. Chislain, Easter Beurree, Madaline d'Carne.

## PLUMS.

Green Gage, New Orleans, Purple Gage, Imperatrice, Diamond, Reine Claude, Washington, Royal d'Tours, Golden drop, Gooseberries, White and Red Currants, Raspberries and every article in the Nursery line furnished at short notice. JOS. BRECK & CO., No. 62 North Market Boston. April 7, 1841.

## AGRICULTURAL IMPLEMENTS, &amp; C.

The Proprietors of the New England Agricultural Warehouse and Seed Store No. 61 and 52 North Market street, would inform their customers and the public generally that they have on hand the most extensive assortment of Agricultural and Horticultural Tools to be found in the United States. Part of which are the following:

1000 Howard's Patent Cast Iron Ploughs	100 doz. Cast Steel Shovels.
300 Common do. do.	150 " Common do.
200 Cultivators.	100 " Spades.
100 Greene's Straw Cutters.	500 " Grass Scythes.
50 Willis' do. do.	300 " Patent Snaiths.
100 Common do. do.	200 " Common do.
100 Willis' Patent Corn Shellers.	500 " Hay Rakes.
50 Common do do.	200 " Garden do.
200 Willis' Seed Sowers.	200 " Manure Forks.
50 " Vegetable Cutters.	300 " Hay do.
50 Common do. do.	500 Pair Trace Chains.
200 Hand Corn Mills.	100 " Truck do.
200 Grain Cradles.	100 " Draft do.
100 Ox Yokes.	500 Tie up do.
1500 Doz. Scythe Stones.	50 doz. Halter do.
3000 " Austin's Rifles.	1000 yards Fence do.
	25 Grad Stones on rollers.

March 17.

## HERBACEOUS PLANTS.

J. BRECK & CO., offer for sale a great variety of beautiful Herbaceous Plants, including 20 varieties Plox, Perennial Coreopsis of sorts, Delphinium, Campanulas in great variety, Double Pinks, Dracocephalums, Double Scarlet Lychnes, Double Ragged Robin, Spiraeas of sorts, Iris do with a great variety of others. Also, Honeysuckles, Roses, and other ornamental Shrubs.

## SWEET POTATO SLIPS.

Just received and for sale by J. BRECK & CO., a supply of Sweet Potato Slips. No 52, North Market st. April 28.

## TO THE PUBLIC.

DR. CHARLES M. WOOD, Veterinary Surgeon, respectfully informs his friends and the public, that he has removed from Blossom St., to 69 Carver St. All orders left at his house, or at the stable of Wm. Forbes, No. 7 Sudbury St., will be promptly attended to, and gratefully acknowledged. All diseases of Horses, Cattle or Swine, are attended to. Also, castrating and spaying.

For the information of those who may have occasion for his services, and are unacquainted with his practice, he is politely permitted to refer to the following gentlemen who have employed him for a number of years past.

Wm. Forbes,	Williams & Pearson,
Wm. J. Niles,	Geo. Meacham,
Joshua Seward,	S. K. Bayley,
J. B. Read,	L. Maynard,
James F. Fullham,	Isaac Foster,
Wm P. Loring,	Artemas White,
Joseph C. Pray,	Brown & Sevence.
Boston, April 28.	

## DOUBLE DAHLIAS.

We have for sale a very large collection of the finest Double Dahlias, of the most esteemed sorts. J. BRECK & CO., No. 52, North Market St. April 28

## CLOVER &amp; RED TOP.

50 tierces and 100 hbls. Prime Clover. 200 Bags Redtop, new seed. 50 hbls Herds Grass prime quality, for sale by J. BRECK & Co. March 24.

## MISCELLANEOUS.

## DIRGE.

BY JAMES G. PERCIVAL.

*Handel's "Dead March in Saul."*

How soon the dawn, that shone so bright,  
Is deeply veiled in silent gloom!  
How soon a nation's hope and light  
Sinks in the darkness of the tomb!

[That hope has fled, and that light is gone,  
Shrouded beneath the funeral pall.  
The mourning train moves slowly on;  
Its steps in measured cadence fall.]

Earth yields to earth, and dust to dust;  
Low breathes the sigh, as sorrow flows:  
The grave receives its solemn trust;  
Our friend there takes his last repose.

Soon he awakes—a fairer morn  
Breaks on him, from the heavenly throne!  
Unsullied wreaths his brow adorn;  
He lives and moves in light alone.

But still we pause in silent grief;  
Still bend awhile beneath the rod;  
Still seek in tears a sad relief,  
And kneel before a chastening God.

[Yet not in vain—a softer heart,  
A purer spirit fills the breast:  
As tears of tender sorrow start,  
The angry waves of passion rest.]

We lay a brother in the tomb;  
We mourn a father and a friend.  
He sleeps not in eternal gloom;  
Not his the night that knows no end.

Soon he awakes—a fairer morn  
Breaks on him from the heavenly throne!  
Unsullied wreaths his brow adorn;  
He lives and moves in light alone.

**SINGULAR PROPERTIES OF THE FIGURE 9.**—Multiply 9 by itself, or by any other of the digits, and the figures of the product added together will amount to 9. The component figures of the amount of the multipliers, (viz. 45) when added together, make 9.

The amount of the several products or multiples of 9, (viz. 405) when divided by 9, gives a quotient of 45; and the component figures of either the dividend or quotient added together make 9.

Multiply any row of figures either by nine, or by any one of the products of nine multiplied by one of the digits, as by 18, 27, 36, 45, 54, 63, 72, or 81, and the sum of the figures of the product added together will be divisible by 9.

Multiply the 9 digits in the following order, 1 2 3 4 5 6 7 8 9, by nine, or by any one of the products of nine mentioned in the last paragraph, and the product will come out all in one figure, except the place of tens, which will be a 0, and that figure will be the one which multiplied by 9, supplies the multiplier; that is, if you select 9 as the multiplier, the product will be (except the place of tens) all ones; if you select 18, all twos; if 27, all threes, and so on. Omit the 8 in the multiplicand, and the 0 will also vanish from the product, leaving it all ones, twos, threes, &c., as the case may be.

Brutes never make themselves ridiculous; that is the peculiar prerogative of man.—*Tyneman.*

## HOWARD'S IMPROVED EASY DRAUGHT PLOUGH.

Great improvements have been made the past year in the form and workmanship of these Ploughs; the mould board has been so formed as to lay the furrow completely over turning in every particle of grass or stubble, and leaving the ground in the best possible manner. The length of the mould board has been very much increased, so that the Plough works with the greatest ease, both with respect to the holding and the team. The Committee at the late trial of Ploughs at Worcester, say,

"Should our opinion be asked as to which of the Ploughs we should prefer for use on a farm, we might perhaps say to the inquirer, if your land is mostly light and easy to work, try Prouty & Mears, but if your land is heavy, hard or rocky, BEGIN WITH MR. HOWARD'S."

At the above mentioned trial the Howard Plough did more work, with the same power of team, than any other plough exhibited. No other turned more than twenty-seven and one half inches, to the 112 lbs. draught, while the Howard Plough turned twenty-nine and one half inches, to the same power of team! All acknowledge that Howard's Ploughs are much the strongest and most substantially made.

There has been quite an improvement made on the shoe, or land side of this Plough, which can be renewed without having to furnish a new landside: this shoe likewise secures the mould board and landside together, and strengthens the Plough very much.

The price of the Ploughs is from \$6 to \$15. A Plough, sufficient for breaking up with four cattle, will cost about \$10 50, and with cutter \$1, with wheel and cutter, \$2 50 extra.

The above Ploughs are for sale, wholesale and retail, at the New England Agricultural Warehouse and Seed Store, Nos. 51 & 52 North Market Street, by

JOSEPH BRECK &amp; CO.

## STRAWBERRIES! STRAWBERRIES!

The subscriber would offer to the public, the present season, his *Selected Collection*, consisting of seven varieties; they are such as have stood the test of a fair trial for seven years, and all grown by the subscriber.

*Warren's Seedling Methven*, a new and valuable kind, a free bearer, fruit very large and juicy; fruit measuring 5 1-2 inches have been exhibited the present season. This variety can be warranted to be one of the finest varieties grown, and will produce as fine fruit and as large quantity, with the same cultivation, as any other ever offered. The price of this Seedling is \$5 00 per hundred plants.

*Methven Castle*.—Fruit extremely large, high flavored and showy; specimens of this fruit have been shown this season six inches in circumference. Price three dollars per hundred plants.

*Keen's Seedling*.—A very superior variety, fruit very large, rich dark color, and uncommonly high flavored. Price three dollars per hundred.

*Royal Scarlet*.—Fruit long oval shaped and juicy, very free bearer, and very hardy. Price two dollars.

*Haubois*.—Fruit larger than English Wood, exceedingly numerous, sometimes yielding 100 berries to the plant.—Price two dollars.

*Early Virginia*.—This is known to be the earliest and best fruit for market, a free bearer and very hardy. Price two dollars.

*English Wood*.—Fruit well known for years. Price one dollar.

Every plant sent from this garden will be warranted to be free from mixtures, and shall also be young and healthy, worth the price paid for them.

All orders directed to the subscriber, inclosing the amount for the order, or with a good reference, shall be promptly attended to, and the plants carefully forwarded agreeably to directions.

JAMES L. L. F. WARREN.  
March, 24. Nonantum Vale, Brighton.

## DRAFT AND TRACE CHAINS.

Just received by Packet Coromanda,  
400 pair Trace Chains, suitable for Ploughing.  
200 " Truck and leading Chains.  
200 " Draft Chains. For sale by J. BRECK & CO.,  
No. 52 North Market st. April 21

## TYE UP CHAINS.

Just received by Packet Coromanda, 500 Chains for tying up Cattle.

These chains, introduced by E. H. DERAY, Esq. of Salem, and Col. JACQUES, for the purpose of securing cattle to the stall, are found to be the safest and most convenient mode of fastening cows and oxen to the stanchion.

For sale by J. BRECK &amp; CO., No. 52 North Market st.

## GARDEN SEEDS,

For sale by JOSEPH BRECK & Co. at the NEW ENGLAND FARMER OFFICE, No. 51 and 52 North Market St. Boston. The subscribers would inform the public that they have now on hand the largest collection of seeds ever before offered by sale in this city, embracing every variety of Field, Kitchen, Garden, and Ornamental Flower Seeds desirable for this or any other Climate.

Our seeds are either raised under our own inspection or imported from responsible houses in Europe, and having taken extraordinary pains to obtain such as are pure and genuine, we can confidently recommend them to our customers and friends, and feel assured they will prove satisfactory to all who try them.

Dealers in seeds are requested to forward their orders to season. Boxes for retailing from 8 dolls. and upwards will be sent out on commission allowing a liberal discount and take back what remain unsold.

Letters and orders with good reference will meet with prompt attention.

## FIELD SEEDS.

Sugar Beet.	Ruta Baga.
Mangel Wurtzel.	Ballatine's New Royal do.
New Red Globe do. } superior	White Tankard Turnip.
Yellow do. } varieties.	Red do.
Carrot Long Orange.	Red Round do.
" Altringham.	White do.
" New White, extra fine.	White Globe do.
Pumpkin, sorts.	Green Round do.
Wheat—various sorts.	Purple Top Hybrid do.
Barley, do.	Buckwheat.
Rye, do.	Broom Corn.
Potatoes, do.	Millet.
Indian Corn, do.	Buckthorn. } for Hedges.
Oats, do.	Locust. }

## GARDEN SEEDS.

Artichoke, Asparagus, Beans of every description, Beets of sorts, Borecole, Broccoli, Brussels Sprouts, Cauliflower, Caraway, Celery, of the most improved sorts, Cabbage 20 sorts, Carrot, all the varieties, Cucumber do, Cress, Egg Plant, Endive, Indian Coro, Kale, Leek, Lettuce in great variety, Melons, do, Martynia, Mustard, Nasturtium, Okra, Onion of sorts, Pepper do, Pumpkin do, Parsnip, Parsley, Peas, a very great variety, Rhubarb for tarts, Radish of sorts, Salsify, Squash of sorts, Tomato, Turnip 20 varieties.

## SWEET AND POT HERBS.

Thyme.	Sweet Basil.
Sweet Marjorum.	Lavender.
Sage.	Lemon Balm.
Summersavory.	Anise.
Medicinal Herbs, &c.	

## ORNAMENTAL FLOWER SEEDS.

Three hundred varieties, embracing all the finest sorts. Packages of 20 fine sorts for one dollar.

Those who prefer to have their Seeds put up in papers ready for retail, can be accommodated—each packet neatly closed and labelled with printed directions. Price 50 cents, per dozen papers, which are retailed here at 6 1-4 cents each.

Fruit and ornamental trees, of the greatest variety, supplied at nurseryman's prices, and orders solicited. These will be packed, when required, to go to any part of the U. States.

JOSEPH BRECK &amp; CO.

## FRUIT AND ORNAMENTAL TREES, &amp;c.

NURSERY OF WILLIAM KENRICK.

12,000 Pear and Plum Trees.—Large and new additions of Pear and Plum Trees have lately been received, many kinds of which are alike new to our country, and very extraordinary. Such have been the selections which have been made by the subscriber in Europe, and in person, during the last Autumn, where all have been proved; those kinds already well known amongst us being identified by him by the wood and the leaf.

All orders addressed to the subscriber, or left with Joseph Breck & Co., New England Farmer Office, will be promptly attended to, and Trees, when so ordered, will be securely packed for safe transportation to distant places.

WILLIAM KENRICK.

Nonantum Hill, Newton, near Boston, March 2.

## NEW ENGLAND FARMER.

A WEEKLY PAPER.

The Editorial department of this paper having come into the hands of the subscriber, he is now authorized by the publishers to inform the public that the price of the paper is reduced. In future the terms will be \$2 per year in advance, or \$2 50 if not paid within thirty days.

ALLEN PUTNAM.

N. B.—Postmasters are required by law to frank all subscriptions and remittances for newspapers, without expense to subscribers.

N. E. FARMER.

### EXTRACTS FROM AN ADDRESS

*Before the Agricultural Society of Westboro', in Sept. 1840, by JOSEPH BRECK.*

"It is unpardonable in a man who, like most of our farmers, can, without detriment to his other arrangements of business, appropriate an acre or more for the cultivation of the more delicious fruits, not to do it. Even though he may not in dollars and cents find his account in it, yet in the health and happiness of his family, and in the pleasure of setting before his friends these cheap luxuries, he will. How often do we see children devouring unripe and unpalatable fruit, which too often brings on disease and premature death, when at a trifling expense, an abundant supply for the family may be raised, giving them a profusion of delicious, ripe and grateful fruit, which instead of an injury is a promoter of health.

"I have often heard objections made to raising fine fruit, some of which are the following: That it will be stolen should I succeed in raising it: it will therefore be of no use. I have no time to attend to such trifling matters, and even if I had, I have no taste for the pursuit. I cannot afford the expense. It will be a long time before the money I expend will be refunded, and I may not live to gather the fruit. In fact there is a lion in the way: the man has no disposition to attend to it; but is willing to lead his children into temptation, by neglecting his duty at home; for they, seeing their neighbor's fair fruit, cannot withstand the trial; trespass upon his ground and pilfer his fruit; irritate and outrage his feelings, and a neighborhood quarrel is the result.

"The most effectual remedy to prevent fruit from being stolen is, that the practice of planting orchards of select fruit, should become universal; for by so doing, all will either be in possession of the luxuries they afford, or enabled to purchase them at a moderate price, and thus the temptation to plunder is removed. Who thinks of robbing a cornfield or potato patch? Surely none but the most abandoned savage. Were cornfields and potato patches as uncommon as choice orchards of fruit, then it might be expected that for the sake of the green corn and potatoes, there are some men vile enough even to rob them. I have lately noticed an account of the Pawnee tribe of Indians, in which it was stated that some of the clan, tired of the toilsome and uncertain mode of living by hunting, were desirous of learning to cultivate the ground; and had, under the instruction of missionaries, raised an abundant crop; but, unluckily for them, their fields had been plundered by their more roving and less civilized neighbors, who were fond of the corn, but too lazy and improvident to raise it themselves. And thus it has been with us in relation to fruit. When the Pawnee tribe all cultivate corn, there will be no inducement for any to steal it. So if all will cultivate fruit among us, there will be none worse than savages to pilfer it. Should there be any, however, so vicious as to

trespass upon his neighbor's rights and rob him of his fruit, he should, if detected, be made a public example of at once, and his offence treated with that rigor which is due the crime. In times past, (and we hope these times are past forever,) it was considered quite a joke, a thing to be laughed at, to have a parcel of scapegoats club together, and in the darkness of night, rob their neighbor's fruit or melon yard. Thus children were early taught that it was a light offence. 'In point of criminality, where is the difference between stealing fruit or the fence which encloses it; an apple or a plough; cherries or silver spoons; melons or any other article belonging to the proprietor? If the law has not made it theft, it is an offence punishable with a heavy fine. Morality is as much outraged by taking a peach, as the spade at the door; and to treat such acts in children as unworthy of reproof, is a dereliction of duty which neither virtue nor religion can tolerate; for the doing wrong in the slightest manner, is most often the commencement of a career of depravity, which brings disgrace or ruin upon the heedless or deluded offender. A man's grounds should be considered as sacred as his house; and every article on his estate as secure against robbery as if it were protected by locks and bars.'—However, we may congratulate ourselves on the change in public opinion for the better on this subject, we have occasion still to regret the want of a higher standard of morality and good manners in this respect, which we hope parents and sabbath school teachers will elevate and set right. It ought to shame our youth, to have it said, that as a nation, we are far in the rear of many of the European; for there no one thinks of touching a fruit or flower, which does not belong to him. In confirmation of this, I might cite many facts, but will give only a few examples. The public road from Strasburg to Munich, in Germany, a distance of two hundred and fifty miles, is an avenue of fruit trees, unbroken except by towns and villages. There are but few fences in the country, and the grounds often unprotected, even on the highways; and although burdened by grape vines, and trees loaded with delicious fruits, no one thinks of taking the smallest quantity without the approbation of the proprietor. Lady Morton observes in her travels, "that property of this description is held sacred in proportion as it lies exposed. Having alighted from our carriage, to spare the springs on a rough road, which wound through a wilderness of fruit trees: I asked a boy who was lying reading under one of them, whether I might take an apple; he coolly replied, 'they are none of mine.' 'But you sometimes help yourself, I dare say.' He raised his head, and looking at me with an expression of humorous sarcasm, he replied: 'You mean that I steal, do you, madam? No, madam, it is better to ask for one, than to turn thief for an apple.'"

"Most towns of any size on the continent, boast of their promenades and public gardens, filled with trees, shrubs and plants of every description and of the choicest kinds; and although exposed and open to all, there is no fear as with us, of any inju-

ry in the smallest degree to any, however rare or valuable. I will take the town of Frankfort as an illustration. This town is surrounded, except on the side where the river Maine runs, with a pleasure ground at least two miles in length, commenced in 1809, and occupying the breadth of the former ditch and ramparts, and affording a great variety of shady walks and picturesque scenery. One particular feature of this pleasure ground is that it is not confined to trees and shrubs, but contains a profusion of the choicest flowers, such as Dahlias, Chrysanthemums, &c., together with most of the showy annuals, as asters, balsams, &c., and even geraniums, pinks and the like.

"Though merely separated from the public highway by a hedge which may be stridden across, and at all times accessible to every individual of a population of fifty thousand souls, and constantly frequented by servants and children of every description, not a flower nor even a leaf of any one of the plants, from the rarest and most showy even to the humblest, seems ever to be touched. A printed label is affixed on a board at each entrance, expressing that the public authorities, having originally formed, and annually keeping up the garden, for the gratification of the citizens—its trees, shrubs, and flowers are committed to the safeguard of their individual protection.

"This garden affords a striking proof of the improved state of German manners. No doubt the proprietors of our public and private gardens, would be glad to see this German spirit animating and pervading our citizens, of all ranks and conditions.

"I have dwelt long upon this point, feeling that the state of public opinion is not quite right upon this subject, and that the objection has been, and still is, an important one in many places.

"Want of time and taste is often a convenient excuse. But time is found for a thousand things of not half so much importance, and sometimes for that which is positively injurious. Time is often spent in meddling with other people's concerns, in discussing political questions, or in angry debates, which tend only to produce bad feelings, which would be better and much more profitably spent in setting out and taking care of trees at home. We suppose, at the present time, no respectable person is seen lounging about the tavern or grog-shop; but in times past, many who considered themselves so, were in the habit of doing it. The time that has been spent in this way in many of our towns, and the money worse than wasted for ardent spirits, would have been more than sufficient to have converted these places into gardens, blooming and fruitful, like the garden of Eden.

"The trees once set out, the time required for their care and preservation is but trifling. It is only the fragments of time that are needed. A few hours in the morning or at night, at some particular seasons of the year, is all that is necessary to insure to the farmer or mechanic, the comforts and pleasure of good fruit to his whole family.—The ignorant man has no time for the improvement of his mind: the objection is as good in one case as the other.

"Judge Buel observed, 'a taste for horticulture is acquired by a few practical lessons: and when once acquired not easily lost.'" It is moreover an employment that gives interesting pleasure through life, and when a love of it is once acquired, nothing would tempt the man to give it up. It is a fascinating occupation, and a good antidote against indolence and vice.

"As to the expense, it will be allowed, that the establishment of a fruit orchard, containing a succession of the best varieties for all seasons of the year, will be attended with some trouble and expense; but what then? will not the advantages arising from the occupation, the health and happiness it will insure, and the profits from the products greatly outweigh all this? And after all, it need not necessarily be attended with a heavy expense. Let there be an association of neighbors—say ten, if you please, who shall obtain a selection of the choicest varieties of fruit trees, to be used by the company as common stock, from which to take buds and scions. Suppose they purchase 200 trees, at the cost of 25 cents to one dollar each, averaging 50 cents each, or one hundred dollars for the whole. The trees divided among the members, would give 20 for each individual to cultivate and keep labelled, at the cost of ten dollars. The most difficult part of the business would be, to make the selection from the endless varieties which crowd our nurseries. It would be necessary to know the character of the fruit, the time of ripening, and adaptation of the variety for our climate. This knowledge may be obtained from any of our experienced horticulturists, who are ever ready to communicate knowledge of this sort, by an attendance upon the weekly exhibition of the Massachusetts Horticultural Society; from Kenrick's Orchardist; and from Manning's Book of Fruits—an excellent work, describing only such varieties of fruits as have been tested by the author.

"Every family should have a small patch of ground devoted to a nursery, where stocks should be set out, or raised from seed. Every boy should be early taught the art of budding and grafting in all the various ways. With this knowledge, so easily acquired, the vigorous nursery of stocks, and the buds and scions the company's trees would afford, would soon put in possession of every family, trees not only for themselves, but also for their more improvident neighbors, who are always glad enough to avail themselves of the improvements of their more enterprising neighbors, especially if they can get them without much trouble and cost. The time may seem long, to look ahead for the produce of the trees, and some may say, we shall not live long enough to gather the fruit, and we had rather invest our money where there will be a prospect of a more immediate profit. In speaking of the backwardness of many of our farmers to invest money in agricultural operations, where the profit is some years ahead, a friend of mine observed, that he believed the word *realize* was written on the brow of every Yankee farmer; for, as a general thing, there was an unwillingness to invest money, unless there was a chance of realizing an immediate harvest.

"The late lamented Judge Buel did not act upon this principle. At the age of 44, he commenced planting his orchards, decorating his grounds and improving his lands. He did not hesitate on account of his age, nor the distant prospect of a profitable return; but set about the business, as every good citizen should, feeling it to be a duty he owed posterity. And what were the results? Why, he

lived to see his most ardent hopes more than realized. He has left an example worthy the imitation of every farmer or landholder in the country. He did not begin and then leave off, but kept on planting and improving until the very last of life. It was my happiness to make this celebrated man a visit a few months before his death; and I assure you I was greatly surprised to see how much he had effected, by converting a barren tract of land into a fruitful garden, and surrounding himself with such a profusion of every thing delightful to the eye and pleasant to the taste. His house was embowered with ornamental trees and shrubs of every description; his orchards bending with fruit of the most delicious varieties; all the work of his own hands, and accomplished in the short space of 15 or 16 years. I have known an old man 80 years of age, industriously employed in setting out quince bushes; and who, though laughed at by his neighbors for his folly, as they called it, lived to the age of 95, and many years received a handsome sum for his quinces.

"We consider it the duty of every one to plant and improve, from the morning of life to its close, without considering for a moment whether he is to enjoy the fruits of it or not. It is a duty we owe posterity, and cannot be omitted by the patriot or christian."

#### EXTRACTS FROM AN ADDRESS

*Delivered before the Middlesex Horticultural Society, at Lowell, Oct 12th, 1840, by JOHN L. RUSSELL.*

"Although we may scarcely compete with the efforts of the State society, there yet can be no reason why ours should not be *proportionally* as great. The existence of many valuable varieties of fruits among the farms and gardens of the vicinity, presents a curious fact in horticultural science. Several of these, with which the books are hardly familiar, may be met with on our county farms, and the product of old trees. The venerable relic of the far-famed Chelmsford pear, is yet existent on one of the oldest farms of that town. It is a natural fruit, of excellent market qualities, and known as the Chelmsford, Tyngsboro', and Mogul Summer. A mere thin shell of the once extraordinary trunk, yet bears a few scraggy branches, and from its roots are four strong suckers, all of which are identical in fruit with the trunk. Before the great gale of September, 1816, it was a very large tree, but being much injured by that tornado, it rapidly declined to its present condition. The stem, however, bears an occasional crop, but was entirely barren the past season. Mr Manning, the great pomologist, of Salem, remarks, that it is a pear of the largest size, and extremely productive. For many years he searched in vain for its origin; sparing no expense in importing large pears from the French nurseries to identify it. Inquiry on my part enabled me to confer a trifling favor on my friend, and to establish the claim of old Chelmsford to a fine native fruit.

"The history of the valuable Baldwin apple is familiar to you, bearing in its cognomen a family name yet existent in our midst. A fine early apple has often been exhibited on your tables, originating also in Chelmsford, and known as the Spalding. The addition of these three natural fruits in our vicinity to pomology, is sufficient to encourage a research into natural varieties, which are as yet but little known. It should be our endeavor to find these out, and no pains should be spared in

the attempt. Useless, or next to futile, is it to import rare and costly fruits from Europe, which will survive our culture for a few years only, while our own country is the region and natural location of the finest sorts. We must artificially cultivate or raise from seed our own, that they may take the places of those which are becoming defective.—Horticulture should, in a great degree, be a *domestic* instead of a *foreign* subject of study and regard; and in your city where could it find greater examples of the benefit of such?

"The culture of the grape might be most successful in the vicinity of this city. Every south and western wall might cluster with valuable and delicious fruit. It is to be suspected that a prejudice against grapes has been raised from the former undue attention to those either of foreign growth, or of a more southern latitude. In fine warm summers and autumns, like the present, the famous Isabella would ripen finely, and give a most delicious crop; but, ordinarily, it is comparatively a doubtful variety, needing longer seasons to bring it to maturity. But our woods and river banks furnish very good varieties of the fox grape; by many considered little inferior to the Isabella. Choice sorts are occasionally to be met with among our farmers, and these equally productive, under proper management. The grape needs a rich and moist soil; the refuse of your factories furnish excellent materials for its culture. Little or no pruning is best for our native kinds, merely keeping the vines open and clear from dead wood. Better to have well ripened fruit of an inferior variety on our tables, and for domestic uses, than unripe and unwholesome of an uncertain crop. The value of the grape to the farmer has not been duly estimated. A little care regarding the kinds might cover his walls with beauty and profit. Mr Phinney, of Lexington, has already set a noble example in this way, and his broad, solid walls are exuberant in clustering vines and valuable fruit. A farmer might raise a ton or more per annum, which, at six cents per pound, would afford no inconsiderable revenue. Excellent wine can easily be made from these fruits as well as from the currant, and, without any greater trouble, a beverage far more salutary than that old fashioned product of the orchard, hard cider.

"Of the culture of the plum in this vicinity, I have no means of judging. Gradual experiment can only decide whether such a distance from the sea would be any objection. The plum is a native of maritime districts, and thrives best in alluvial soils in which are deposited marine substances. Its immense value to the horticulturist, as an article for market, is sufficient to induce whatever experiments may be necessary for its growth.

"Pears need a rich soil, and warm, moist exposures. Cities are particularly favorable to their growth. Small dwarf trees, of the finer sorts, might be introduced into the culture of confined areas. The superb St. Michael has been found to succeed best in some old gardens in Boston, and, amidst all the diseases now incident to the variety, to produce in such locations the finest specimens of fruit. How far this disease, the blight, may be overcome, remains to be proved. Could any measures be adopted to check its ravages on some of the finest kinds of pears, they would be of a most important bearing on the interests of horticulture. But, meanwhile, we have the productive and delicious Seckel, and the rich Bon Chretien, or Bartlett, and a host beside, too numerous for detail, and on-

ly to be known by an acquaintance with the *details* of our pursuits in this science.

"The peach, nectarine and apricot are all most favorably adapted to city culture. Trained to the wall, or planted as near as possible to the sides of the house, they are protected against frosts, and furnish an ornament, and at the same time a luxury of great attraction. One may realize a two-fold advantage in these trees. What more beautiful than the roseate flowers of the peach and nectarine, or the snowy inflorescence of the apricot? The warm sunny days of early April call the latter into life and elegance, to be soon succeeded with as fair fruit. The foliage of the peach and nectarine, too, is highly ornamental and slowly deciduous, while a certainty of a crop may be secured."

From the Maine Farmer.

#### SMUT IN WHEAT.

MR HOLMES—Sir—You will please to give the following a place in your paper for the benefit of the public. There has been much said by agriculturists respecting smut in wheat and the cause of it. Writers have disagreed on the subject.—Some have supposed that smut would produce smut, and even impregnate good wheat. Others have regarded the time of sowing, and have supposed the weather to produce the effect. But in my opinion the cause of the smut proceeds from a fly. In tracing the progress of the fly after the wheat is sowed to its harvesting, I am satisfied that the fly is capable of destroying the crop in several ways which may be noticed. The fly places the animalcule at the root, which may be found by pulling up some. When the blade turns a dark color, again about the time the wheat is heading you will observe the fly hovering about the head, which is the time the fly bore his bill into the kernel after the nourishment for its own body. The milk weeping out becomes smut. The fly then begins to nibble at the head and places the animalcule there called the weevil.

"The all-wise Creator, who has supplied us so bountifully with bread, and has so wisely caused the wheat to grow, has created these little insects for some particular purpose. Deity had a motive in creating them, and I have no doubt but they are endowed with sufficient knowledge to pass through several grades and to accomplish this great work which causes the smut, and it has this good effect, it employs the thoughts of men, as well as their hands, on the works of creation, and it convinces us that we are dependent on a being who has created all, and we are endowed with sufficient ability to try experiments, and to examine into the causes and effects of certain things: it therefore deserves our attention. Wheat culture ought to be encouraged, which is my motive in publishing this. Let us select suitable land to sow wheat on, and sow it in season, do our duty, and we may be rewarded a hundred fold.

I can recommend to wash wheat before you sow it. Put one peck of wood ashes and one half peck of lime to a bushel of wheat, and it may have a good effect as a quick spur in stirring it; also sow on ashes in a rainy day after the wheat is up, especially when you discover the fly to lurk in it, or on it, sow it on bountifully. The ashes being wet when it falls on the flies, it will either kill or scatter them. I also recommend to sow more clover near to the wheat, that the fly may take that in pre-

ference to the wheat. The fly will take some place in which to deposit the animalcule, no mistake.

SAMPL BRADLEY.

From the Farmer's Cabinet.

#### PRACTICE AND THEORY.

MR EDITOR—How strangely people will differ on the most familiar topics! It is seldom, indeed, that farmers can be brought to think exactly alike on many things relating to their business; the theory and practice will vary a little, and conclusions will be drawn from the same premises that will by no means harmonize to an exactitude, although to common observers there is no reason why there should not be the most perfect agreement.

To many, the very opposite accounts which are given—all resulting from experience, too—of the produce and value of peculiar crops, the various implements of husbandry, modes of management, the manner of preparing and applying the different kinds of manure, lime, plaster, &c., will appear a hopeless business to reconcile; and yet, with men who calculate and examine with a view to set at rest these discrepancies, it often happens, that they are enabled to discover much rhyme and reason for these prejudices, while common folks wonder that the same ostensible causes do not always produce the same effects.

At a late meeting of practical men, a strong preference was given to the use of Prouty & Mears' plough, its chief recommendation being that it takes up and lays over the furrow perfectly flat; and this peculiarity was declared to be the perfection of tillage: but I have since met with an excellent practical observer, who after using this plough for two years, has abandoned it, under the conviction that the injury arising to his crops from the use of it, has amounted to 100 dollars per annum! Now, how is this? Why, just thus: the free-working persons are cultivators of deep, dry, free-working soils, which, when turned over flat, are still sufficiently loose and friable to be operated upon very effectually by the harrow or drag; and then the advantage of casting every thing foul and weedy to the bottom of a deep, wide furrow, and covering it with a completely flat furrow-slice of fine light mould, the land showing like a well-pulverized fallow after the crop is sown, is, in their estimation, very great, insuring almost double crops, at a much smaller cost of management, the weeds having been smothered and completely destroyed in the operation of ploughing; while the person opposed to the use of this plough occupies a stiff, retentive soil, which, if turned flat, resists the operation of the drag, and becomes an almost impenetrable surface, lying dead, as he terms it, and into which the roots of the crops cannot make way: and thus he accounts for the loss of his acreable product to the amount above estimated. But all this evil he finds remedied by using a plough which lays its furrow to an angle of 45 degrees; it lies lighter and drier, affording plenty of mould by dragging down the aris or angular edges of the furrow to cover well the grain; and yet the furrow-slice is not set on edge, as the enemies of this plough contend, but lies sufficiently over to lap, so as effectually to prevent the herbage from springing up between the interstices; and in wet seasons, immediately after sowing the crop, such lands will remain dry and pulverized; while those turned completely flat, will in such circumstances become mere *hard pan*. Now this appears perfectly rational, and carries

conviction to the mind of every practical man, and every one can understand it.

It is just so with the roller; the use of it has been urged in the strongest manner, and it has no doubt been found to be a most valuable implement on many a light land farm, while the indiscriminate use of it on a clay land farm would, in many cases, be the most improper that could be imagined—and this is perfectly rational also. Then again, the question as to the propriety of feeding off wheat in the spring by stock; a plan which has been found at the same time of the greatest service and injury to the future crop, merely because it has been indiscriminately adopted on soils and under circumstances which were dissimilar in their nature and properties. And then, what a difference in soils with respect to their capacity to bear the liberal use of lime; for while some are benefited by the lavish expenditure of 500 bushels per acre, others are rendered sterile for years by the application of 60 or 80 bushels. And while with some the use of plaster is all-important, by others no good whatever has been experienced by the most careful application: the difference no doubt arising from the nature, situation, and circumstances of the soil. And even in the article of barnyard manure, how often do we hear persons contending for the most proper season and state in which to apply it; some considering, with Sir Humphrey Davy, that the best mode of using it is fresh as it falls; while others prefer to reserve it until it is dried to a pinch of snuff! A third party, however, and more rationally, it is believed, consider that until fermentation has taken place, no dung can properly be said to be a *manure* to the crop; that having passed, however, and the impure gases having had time to escape, the sooner it is then applied the better.—Then comes the question, whether it is best to turn it in by a *deep* furrow, as has been the practice for years, because "all animal manures have a tendency to rise in the soil, while calcareous manures sink in it," or whether it be not the best way to use it as a top dressing to the grass lands in spring and autumn, suffering it to be grown in by the crop, that it thus might yield its benefits by being gradually decomposed in light and heat; furnishing, in the state of water impregnated with the fructifying principle, the pabulum of plants—the only mode, it is contended, in which it can be taken into circulation by the plants.

These, and about a thousand other considerations, press upon the notice of the practical man, and demand his examination and serious regard, filling every instant of his time with matter for deep reflection, and calling for the most careful investigation. And yet farming has been considered merely a resource for the unfortunate; an employment which might be taken up by those whose natural abilities are not equal to the pursuits of trade or the learned professions! No wonder, then, that farmers are deemed to be the least enlightened class of society; and, as if to make the matter worse, they are the *only* class of men who themselves advocate *openly* the non-necessity—nay, worse than that—the inexpediency of reading and study in their operations—strange and unaccountable as the fact appears. V.

We ought not to be over anxious to encourage innovation in cases of *doubtful* improvement, for an old system must ever have two advantages over a new one; it is established, and it is understood.—Lacon.

For the N. E. Farmer.

### RENOVATION OF EXHAUSTED LAND, &c.

MR EDITOR—In your last you express a wish to hear from me again: you are a daring man to run the risk, for an old mechanic turned farmer, cannot be expected to do much with so small a tool as the pen. Ill health at this time compels me to be much within doors, and writing helps keep off a certain ugly *playmate*, who shall be nameless. If it ever clears off, I hope to find something to do out doors; but if it continues to rain, as it has for the *last six weeks*, I will write—whether my lucubrations get into the Farmer or into the fire.

You speak of having purchased a farm, in an *exhausted* state, and not naturally very fertile;—you have also told us a great deal about making compost, an article of vital importance on any farm, fertile or sterile; yet in my opinion there is a preliminary step to be taken before you are ready either to make or use it to the greatest advantage. Please to hear some of my experience, bearing in mind that the average result of *all* my trials is given as if there had been but *one*.

Ten years since, I began on a farm so completely run out that in the opinion of many it could not be renovated without an expense greater than the price of land here would warrant. Old farmers told me to plough no more than could be highly manured, and thus bring it to by degrees; but having only enough for one acre, and no means of buying, the years of a patriarch would be gone before the work could be accomplished. I therefore consulted nature and agricultural works, and formed my own plan of operations. I ploughed my old fields (which would not have exceeded half a ton per acre,) as deep as a breaking-up plough could run; this, my friends said, had sealed its ruin; so much cold stuff from the bottom had done the business. It was, however, harrowed and sown in the usual way with two bushels of wheat and ten lbs. of clover per acre, and after it appeared, was dressed with three bushels of ashes and plaster in equal quantities. The yield was ten bushels of good wheat worth \$15; the expense of ploughing, sowing seed, &c., \$11—leaving \$4, about the average price of half a ton of hay, as clear gain. The straw paid for reaping and threshing. An acre is now covered with a coat of clover and stubble, equal to 6 cords of good compost, which should be turned in from Oct. 1st to 15th. Next year you may plant all that can be manured; the third year, sow wheat with grass seed for a mowing crop. What cannot be planted may be gone through with as at first, substituting barley or oats for wheat, and the third year laid down also to wheat and grass. Each successive crop gains on the former, the land is gaining also, and the only outlay is two dollars in seed, &c. yearly. Every ploughing should be a little shaler than the previous one, and ashes used more plentifully if to be had; but so far as I can ascertain, a small quantity of plaster has the same good effect as more. I have made many experiments with it, generally to great advantage; but in what way it produces its effects, neither my reading nor experiments furnish very satisfactory information. I have also made repeated trials with lime, without any perceptible good; indeed, when used in any considerable quantity, its effects were decidedly bad, at least on the *first* crop. How this plan will work on sandy or gravelly soil, I know not; how it has worked on clay

loam, is demonstrated as plain as any problem of Euclid. An extra quantity of clover might be useful; any kind of foul seed which will not check the grain or ripen seeds, before ploughing may be thrown in. Two bushels of wheat is not too much for the first sowing, but is two or three pecks too much when the land is in first rate order. At the second breaking up, do not be afraid of deep ploughing or of cold stuff—let the plough run deep.

Kennebec Co. Me., May 12th, '41. B.

P. S. We have never had so much dark weather and rain as this spring: the dull days are to the fair as 10 to 1. Farming at a stand and roads impassable.

### POUDRETTE AS A FERTILIZER—THE N. Y. POUDRETTE CO., &c.

As considerable interest has been excited, and many inquiries made, in relation to *poudrette* as a fertilizer; and also in relation to the probability of the success of the New York *Poudrette* Company, I am induced to publish the annexed statements, and give the accompanying references, that those who desire to make inquiry can do so without direct application to me, presuming that some will prefer doing so.

The following statement made by gentlemen of intelligence, who have used *poudrette* as a manure for several years, may be satisfactory to those who desire to avail themselves of the advantages of the New York *Poudrette* Company, yet desire farther information in relation to its prospects. It is quite unnecessary, where these gentlemen are personally known, for me to say that they are practical farmers, of intelligence, character and caution; and that those who consult them personally, or by letter, (post paid,) may rely upon the information given by them in relation to the value of the article, or the prosperity of the company.

D. K. MINOR, *Agent*.

We the subscribers, stockholders in the "New York *Poudrette* Company," in answer to inquiries frequently made of us, would state that we have used the *poudrette* prepared by D. K. Minor, the agent of the company, on various crops for three years, and always with gratifying results. We believe it to be at least equal in value to any manufactured in this country; and considering its original cost, convenience of transportation, application, and its great efficacy as a fertilizer, decidedly preferable to any manure we have ever used.

The dividends, paid semi-annually, (50 bushels at a time,) have been received from 1837 to July, 1840; and from our opinion of the integrity of the agent, and our knowledge of his business qualifications, we confidently expect to continue to receive them with satisfactory punctuality.

The strenuous and persevering efforts of Mr. Minor to convert a common nuisance into a public benefit, and thereby to subserve the great interests of agriculture, certainly deserve, and when duly appreciated will, it is believed, receive the approbation and support of a discerning community.

Wm. Wickham Mills, Smithstown, L. I.; Timothy C. Smith, do.; Josiah Bowers, do.; Edwin A. Smith, do.; W. F. Blydenburgh, do.; Nathaniel Potter, Huntington, L. I.; Erastus H. Conklin, do.; John Wood, do.; Brewster H. Wood, do.; Nath'l Conklin, Patchogue, L. I.; Michael Le Foulon, New Jersey; Israel Foot, New York.

March, 1841.

New York, May 5th.

On account of the unusually stormy weather, I am not yet ready to deliver *poudrette* to shareholders as I intended. I made my calculation upon having an average of three and a half fair days in each week in April; but taking March and April, there was but about one and a half fair days in a week, and therefore it has been *impossible* to prepare it to deliver, either to shareholders or to answer several orders, for which the money has been received. I have the material on hand to make enough to supply the shareholders and the orders on book, and it will be prepared and delivered as soon as possible.

As the shareholders all desire to use it about the same time, but cannot *all* be supplied at *once*, I know of but one rule by which I may possibly do justice and avoid giving cause for dissatisfaction; which is, to deliver to the shareholders a *part* only of what is due, in the order of their subscription to the company, and then deliver the balance as fast as possible.

D. K. MINOR.

From the Albany Cultivator.

### MAXIMS AND PRECEPTS FOR YOUNG FARMERS.

I. Regard all persons whose time and labor are wholly at your command, as beings for whose health, comfort, and good conduct in this life, you will be held most fearfully responsible in the life to come.

II. Never forget that both moral and bodily health depend on the same thing; that is, temperance in food, drink, and all sensual indulgences; and temperance in the use of means to get rich.

III. To *wish well* is not enough; you must also *do well*, or your benevolence, like faith without good works, will be dead and utterly worthless.

IV. Ever bear in mind, that useful knowledge and a proper application of it, are to the health of the soul what wholesome food and appropriate exercise are to the health of the body.

V. Value as you ought the experience of others, and your own will cost you far less than without such aid; since to use theirs costs only an effort of memory, whereas the price paid for your own will often be the loss of health, fortune, and character.

VI. The more you strive to enrich your minds with every good thing which men and books can teach, the greater will be your power to gain wealth, honor, fame, and every rational enjoyment.

VII. Trust not others to do for you, what you can readily and as well do for yourselves.

VIII. The farmer who is ashamed of manual labor, will very soon find cause to be much more ashamed of himself.

IX. If you ever make a business of your pleasures, they will most assuredly soon make an end of your business.

X. Leave show to spendthrifts and fools, while you and your families consult only tasteful simplicity, comfort and usefulness, in all your arrangements and expenses.

XI. Love not money for its own sake; still less for the power it gives you to gratify selfish and sinful passions. But fail not to regard it as the most efficient means to accomplish all benevolent purposes. You will thus make it a blessing instead of a curse, both to yourselves and others.

XII. True economy consists not so much in *saving* money, as in *spending* it when made, solely and judiciously for purposes really useful. This

annually increases your profits, instead of diminishing or keeping them stationary.

XIII. Avoid debt as you would a pestilence, for it humbles, debases and degrades a man in his own eyes; subjects him to insults and persecutions from others; but still worse, it is a perpetual temptation, however anxiously resisted, to fraud, falsehood and theft—nay, not unfrequently, to despair and self-murder.

XIV. To take advantage in a bargain, is virtually to take money out of another's pocket, who is not aware of it. Worldlings call it "fair play," but all honest men call it cheating and swindling.

XV. The only just means of increasing wealth, are constant industry, true economy of time as well as money, well directed labor, and the regular application of a portion of our fair profits to increase our capital.

XVI. Never expect your lands to give you *much*, if you give them *little*, nor to make you *rich*, if you make them *poor*. Therefore, always manure them to the full extent of your means, and they will ever make you ample returns in rapidly increasing productions.

XVII. Economy, not less than humanity, requires you to keep all your farming stock in thriving condition; for a working animal in good order, will do much more work and eat less than a poor one; while the rest of your stock, well kept, will yield more of every thing, than double their number, if half starved, as such animals often are.

XVIII. To "save at the spigot, and let out at the bung," will soon empty the biggest hoghead; so will economy in small matters and waste in large ones, speedily squander the largest estate.

XIX. In all your farming operations, never forget that time, like money, if once lost or mis-spent, is forever past recovery.

XX. Constantly arrange beforehand, the daily work of your farms. Then none of your laborers need ever be idle in waiting to be told what he has to do.

XXI. Provide a place for every thing, and misplace nothing. No time will ever then be lost in searching for what you want.

XXII. Keep double sets of such plantation implements as are most used, and most exposed to wear and tear. The whole cost of extra sets will be amply repaid by saving the whole time lost in waiting for repairs, where only single sets are kept.

XXIII. Never resort to what are called "make shifts," when it is possible to avoid it; for they encourage carelessness and sloth, of which they are almost always sure signs.

XXIV. The very reverse of the lawyer's maxim, "*de minimis non curat Lex*"—the law regards not the smallest matters—must be the farmer's guide, or his largest concerns can never prosper as they might.

XXV. To keep good gates and fences, saves much time and labor in preventing trespasses; much loss of crops from depredations; and best of all, it saves much wrangling and ill will among neighbors, about mischievous stock.

XXVI. If you would excel in your profession, the diligent culture of your mind is as indispensable as that of your fields.

XXVII. Never commit the self-hurtful folly of looking upon any of the honest trades, professions and callings, as inimical to your own; for there is a natural bond of interest and amity between the whole, which cannot possibly be preserved without the cordial co-operation of all.

XXVIII. Encourage, both by precept and example, the true spirit of husbandry; for it promotes harmony, good will, and social intercourse among all with whom you deal; it tends to elevate your own class to its proper rank; and above all, it advances the welfare of your country, by promoting the most important of all her great interests.

XXIX. Never flatter yourselves, as some silly people do, that you know all which can be known, even of the most simple branch of your profession, or you will soon know much less than thousands of your modest, less assuming brethren. But always act under the firm belief that there is no ascertainable limit to our acquisitions in any art or science whatever; nor any difficulties which constant, diligent study cannot overcome. Your progress, then, towards the highest attainable point in whichever you prefer, will be as sure as fate itself. The accidents and vicissitudes of life may possibly interrupt your course; but only *persevere*, and you will finally conquer, with absolute certainty, all obstacles that are not insuperable.

And now, Messrs Editors, suffer me in conclusion, to address a few deprecatory remarks to the older class of your readers, lest they should possibly suppose I was vain enough to believe, that there was something new to them in what I have just written. My only purpose was to endeavor to render some service to my youthful brethren, upon whose characters and conduct so much of their country's good depends; by imparting for their special use, the results of many years experience and observation. In executing this purpose, it occurred to me that to give these results the form of detached maxims and precepts, would probably be more apt to engage their attention, than if I presented them in the more diffuse, connected style of an essay or lecture. With this explanation I leave them to their fate; but with the confident hope that all will approve the motive which prompted them, whatever some may think of the matter and manner of the author.

Yours, with regard,

JAMES M. GARNETT.

From the same.

#### EXPERIMENTS IN CULTURE OF CORN.

Messrs Editors—In the spring of 1839, I turned over a clover sod of two years standing, as early as it would admit of ploughing. The first week in May I planted one half the field to potatoes, and after planting my corn, I ploughed the other part of my potato patch three times more, dragging between each successive ploughing, and planted the potatoes the last week in May, the ground being in first rate order for any crop, as judged by the workmen. After this, each piece received like treatment. I would here observe, that I plant my potatoes a little below the level of the surface, and cover some deeper than is required for corn; while the potatoes show like rabbit's ears, I hoe for the first time, and second and last, before the vines fall. The result of the operation was decidedly in favor of the once ploughing. I would here remark that my corn was planted on once ploughing, rolled down, dragged fine, planted on a level surface, plaster and ashes, (two parts ashes and one plaster) put on before hoeing, hoed three times—not much hill made. The result was an extraordinary crop, to the astonishment of most who saw it.

In 1840, I had about thirty acres for corn—pre-

vious crop, wheat on summer fallow. I let neighbor P. have three acres, (not the choice of the field, but a grade the poorest.) that he fitted for himself by twice ploughing; planted about four feet apart, ploughed very deep between the corn, and hoed twice. The result was about thirty bushels per acre. Neighbor W. had five acres—ploughed once and ridged; planted four feet apart; hoed three times; a heavy hill made round the corn;—the result, about forty bushels per acre. The remainder of the field ploughed once; dragged fine, and planted on the surface. Six acres being planted from three and a half to four feet apart, yielded fifty bushels per acre. Nine acres, planted three feet apart; hoed twice and weeds cut down the third time; not much hill. The result, from sixty-five to seventy bushels per acre. The remainder of the field yielded from fifty to sixty-five bushels per acre.

A SUBSCRIBER.

#### TO PRESERVE HAMS FROM FLIES, &c.

For a score of hams, take about 3 quarts of salt, 1 pint of molasses, 1-4th of a pound of black pepper, and 2 ounces of salt petre pulverized; mix well together; lay the hams on a table with the rind downwards; rub the mixture over them with the hand, taking care to apply it to every part where there is no rind; let them lay a week, and rub them over with clear salt, which continue once a week for four or six weeks, according to the size of the hams, and they are ready to smoke; or if you choose after, the mixture is sufficiently struck in, put them into brine for two or three weeks and smoke; when smoked, hang them in a dry place. We hang ours in the garret, where they will keep all summer, secure from flies. When a ham is cut for use, hang it or lay it where you please, the flies will not touch it. We have practiced this method for several years, and have no reason to abandon it.

We have fed our milch cows about a peck of carrots per day each, through the winter; and the butter is as yellow as that made in summer, and equally as good.

Great improvements have been made in swine in this section by the introduction of the Berkshires. We fattened 12 pigs last fall, (about nine months old when killed;) average weight 200 lbs. Their food was one bushel of beets to two bushels of potatoes, cooked in a cauldron kettle and meal mixed in—the right kind of food for hogs, new-days.

D. G. MOSHER.

*Remedy for Kicking Cows.* A bed-cord drawn tightly over the loins of cows, in front of the udder, it is said, will cause them to give down their milk, and also prevent their kicking.

The desire to live without labor and in luxury, is one of our greatest sins: it fills our courts, the jails, and poor-houses; it demoralizes our youth, and brings the aged with sorrow to the grave.

You may talk about plaster of Paris, lime, marl, and stable manure, for an exhausted soil, but all in vain, if there is not energy and industry to apply them.

Half an ounce of alum in powder, will completely purify twelve gallons of corrupted water.

## NEW ENGLAND FARMER, AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, MAY 26, 1841.

### MANURES.

"Many a mickle makes a muckle."

Scrape up the droppings from your cows in your avenues and door yards. Get together the rotten chips and bark from the wood yard. Collect the rich soil which accumulates in the holes and corners around the house, the barn, the hog pen and all out buildings. If these materials are not wanted for immediate use, make them into a compact heap.

Have some expedient, also, for saving from the unfavorable action of rains and sun, what your cows drop in the barnyard during the summer nights. Covering the bottom of the yard with loam or muck, will preserve the greater part of the liquid secretions; but the solids will lose much of their worth if not daily covered with the soil or muck. Where the barn is airy and has a cellar under it, we recommend keeping the cows in the barn every night of the year. They suffer no discomfort, and we know of no other way in which so much and so good manure can be obtained from them.

Also, have materials at the side of the hog-yard constantly, so that something may be thrown in every two or three days for the swine to work upon. Throw in not too freely, however; there is a limit beyond which it is not profitable to fill up the yard. For it is not true that every thing which finds its way within the four walls that confine the pigs, is immediately converted into good manure. We believe that 2 or 2 1/2 cords is as much as one hog will ordinarily manufacture well in the space of 12 months. By occasionally putting in lime, ashes, or stable manure, the quantity may be rendered somewhat more than this. But while we caution farmers against reducing the quality too much, we earnestly call upon them to be careful to furnish the swine with enough of the raw material.

You have been so often told that *manure—manure—manure* is the one thing needful for successful farming, that it seems almost an insult to say it again—and yet it is so true and so important, that we do say it. We tell you to collect and save and make *manure—manure—manure*. We would write this word over the doors of your hog pens, your barns, your privies; near your ash holes, sink holes and every other spot where the article can be manufactured. We would send you to the road side, to the woods, to the sides of stone walls, to peat meadows and muck holes, for collecting matters to be converted into this essential article. We would send you now, as soon as the planting season is over, and would have you collect as much as possible. It were well to have years' supply always on hand in heaps. Thus placed it would be constantly improving; and if thrown over once or twice in a year, the fermentations and decompositions it would undergo, would greatly enhance its fertilizing properties, even before it was handed over to the cattle and swine. Make manure: little by little from day to day, will swell to a large pile in twelve months.

### SPELLING.

Which is right, *Plow-er* or *Plo-w*? Many of our agricultural papers have the prescription to set venerable usage at defiance, and spell *p-l-o-w*. We have but one objection: the change spoils a good anecdote. A barrister reading a document in an English court, pronounced the word *enough* as though it were spelt *e-n-o-w*—"Uff, uff," said the court; "all words in English end-

ing in *o-u-g h*, are pronounced *uff*." "I stand corrected," said the lawyer, and proceeded in his reading. Coming shortly to a sentence describing the operations of farmers, he raised his eye to the court and said, "they *pluff* the land, my lord." "And *we* stand corrected," said the court. Messrs Gaylord & Tucker, of the Albany Cultivator—yours be the sin of robbing posterity of this anecdote. For brevity's sake we shall copy your example, when we do not forget it, and spell *p-l-e-w*.

### SUBSOIL PLOW.

On Thursday last, we spent the afternoon in holding the plow. The work was on land which has been long pastured. The surface mossy, the sward tender, the soil light. The subsoil partly a loose and fine gravel and partly a yellow loam. With two yoke of oxen we plowed one half an acre with Howard's plow E. 2, to the depth of 7 inches, and subsoiled with Howard's subsoil plow about 7 inches. We found that 10 inches of subsoiling, with which we commenced, would worry the team. The stirring of the earth to the depth of 12 or 14 inches, we thought might be an improvement upon shallow plowing. And where it can be done as cheaply as in this instance, the experiment is not costly. But our case must not be taken as a fair instance of dispatch, for the furrows were 40 rods long upon a plain, and the plows were changed only 14 times in the half day. Ordinarily, where it is a day's work to break up an acre, it will take more than two days to break up and subsoil the same. In a few spots where the subsoil was slightly rocky, the subsoil plough appeared to be moved more easily by the team than any where else.

The extent to which the earth was stirred by this new implement, surprised us. The seven inch furrow was scarcely three inches deep after this plow had been passed under it.

We have strong faith that this instrument will come into extensive use. It is true that no great reliance should be placed upon theories until confirmed by experiment; and we are not inclined to devote much space to the praise of this implement the present season; but should our anticipations be fulfilled we hope to be permitted to urge its use another year.

### CATERPILLARS.

Take care of these foul consumers of the orchard foliage. Much injury to the trees is often done by them, but it is the owner's fault if they harm him to any great extent. A few hours labor will suffice for clearing the orchard of them. When they are on limbs that can be conveniently reached, it is well to tear off the nest and tread upon it. When the nests are above the arm's reach, a light pole with a swab upon the end, answers as a sufficient instrument for their destruction. The work is more effectually done if the swab is dipped in soap-suds, fish oil, or any liquid which will destroy the worm without injuring the tree. But the hour of the day at which this work is to be done, must be regarded. Take only those times when the whole family are in the nest. This is the case from early morning until 7 or 8 o'clock. From that time until near 11 o'clock, they are out upon the limbs and leaves taking their morning meal. Their nap at noon is usually from 11 o'clock until 2, P. M. At this time they are easily taken and effectually destroyed. In the afternoon they go out again to feed, but toward evening they may again be caught. This work of destruction should be commenced early in the season, while the leaves of the trees are so small as not to screen them from sight, and before they have perpetrated their ravages. And while protecting the orchard, it is well to look at the wild cherry and all the wild scrub apple trees upon the farm,

for these favorite abodes of the caterpillar, if undisturbed, will send out swarms of breeders to furnish a numerous progeny to people the neighborhood the next season. As a matter of taste too, we prefer the sight of green leaves on even the worthless bush, to the huge white house and its crawling inmates; and for appearance's sake we would lay a ruthless hand upon the rising colony.

### CANKER WORMS.

*A new fact in regard to Canker Worms*—Mr Breck, Monday morning, on his way into the city, saw a man tarring the trees on Mr S. S. Lewis' place, Roxbury, and stopt to inquire the cause. He was informed that the worms, which had been hatched out upon the shrubbery and fences, were making their way up the trees.—We have conversed with the man who applied the tar, and he informed us that *very small* worms, so small that it is difficult to see them without putting a white cloth around the tree for them to pass over, are going up in vast numbers, and he applies the tar to catch them.

### THE NEWEST BATHING AND WASHING APPARATUS.

We notice in the recent work of the tailors, a very economical style. The vest collar being below the cravat, and the collar of the coat below that of the vest, the wearer has only to walk out in the rain with his back to the storm, and his body and under cloths will find themselves in a current of water which will speedily do the work of bathing and washing. The inquiry suggests itself whether the same principle of economy might not be adopted in shingling the dandy's neck and shoulders. Should our house carpenters put the butts of the shingles upwards, and thus afford passages for rain water down within the walls, enough of it (provided the boarding was not too tight,) might run down the ceiling to keep it well washed, and thus save the labor of scouring. We see no reason why the principle would not work as well on the house, as on one's neck and shoulders.

¶ We would remind those who wish to set out Fir trees, that this is the season for transplanting them, and by leaving their orders at this office will have them promptly executed, or by visiting the Nurseries of the Messrs Winship, Brighton, can select the trees to suit themselves. Their Garden is only four miles from the city, and the ride to it, one of the most delightful in the vicinity of Boston. C. H. B. B.

A correspondant wishes us to inquire "what kind of trees will grow best on poor land by the sea shore, exposed to strong winds?" We solicit a reply from any one who has any experience upon the subject.

The Indian corn crop of southern Virginia was planted four or five weeks ago, and has been nearly destroyed by cold and rain. Much of the seed has rotted without coming up; and what has come up is sickly and good for nothing.

The Maryland farmers, despairing of their corn coming to any thing, have sown oats in its stead.

*Coffee.* The Pittsburg American says that they are planting coffee upon some of the western prairies—with what prospect of success, we do not know.

Mr Meller's exhibition of Geraniums at the Town Hall, Roxbury, will close today. His collection is said to be extensive and splendid.

**THERMOMETRICAL.**

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northernly exposure, week ending May 23.

May, 1841.	5, A.M.	12, M.	7, P.M.	Wind.	
Monday,	17	43	58	54	S. W.
Tuesday,	18	39	52	50	N. W.
Wednesday,	19	39	50	43	S. E.
Thursday,	20	33	65	66	N. W.
Friday,	21	56	78	63	N. E.
Saturday,	22	65	72	55	E.
Sunday,	23	68	77	75	S. W.

**BRIGHTON MARKET. — MONDAY, MAY 21, 1841.**

Reported for the New England Farmer.

At Market 285 Beef Cattle, 10 pair of Working Oxen, 25 Cows and Calves, 210 sheep, and 200 Swine. 90 Beef Cattle remain unsold.

**PRICES.**—*Beef Cattle*—Prices have again declined, and we quote to correspond, viz: First quality, \$7 00 a 7 25. Second quality, \$6 50 a 6 75. Third quality, \$5 50 a 6 25.

*Working Oxen*—Sales \$75, \$85, \$105.  
*Cows and Calves*—Sales, \$22, \$23, \$32, \$35, \$38, and \$40.

*Sheep*—Sales of lots sheared \$3 00 and \$4 00. Lots not sheared \$3 00 and \$5 00.

*Swine*.—A lot to peddle 5 1-2 for sows, and 6 1-2 for barrows, and a lot 5 3-4 and 6 3-4. At retail from 6 to 7 1-2.

**WHOLESALE PRICES CURRENT.**

Corrected with great care, weekly.

**SEEDS.** Herds Grass, very little in market. Red Top, new seed by the bag 50 to 55 c. Clover—Northern, 13c.—Southern, 8 to 9 c. Flax Seed, \$1, 37 to 1 50 bu. Lucerne, 25 c. per lb.

**FLOUR.** Howard Street \$5 37—Genesee \$5 25—Ohio \$5 12.

**GRAIN.** Corn—Northern Yellow none—Round Yellow 63—Southern Flat Yellow 60—White 64.—Rye—Northern 60 to 65—Southern 60 to 55. Oats—Southern 36 to 33—Northern 33 to 40.

**PROVISIONS.** Beef—Mess \$10 50 to 11 00—Prime \$6 50—No. 1 \$9 00. Pork—Extra—15 00—Clear 14 50—Mess \$13 00. Hams—Northern 9 c. per lb.—Southern, none. Lard—Boston 9 c. per lb.—Southern, 8 to 8 1-2. Butter—Lump 18 to 22—Firklin 12 to 18—Shipping 8 to 14. Whole Hogs 5 1-2 to 6 c.—Pigs 5 c.

**HAY,** per ton, \$20 to 22 50—Eastern Screwed \$17 00.

**CHEESE**—Old 11 c.—New 8.

**EGGS,** 11 a 12.

**WOOL**—The market for this article has not experienced any change of late. Pulled Wool is rather scarce, and there is but a limited supply of low Fleeces and of fine Fleeces the stock is also moderate. Prime or Saxony Fleeces, washed, lb. 50 to 55 c.—American full blood, washed, 47 to 50—Do 3 4 blood, washed, 44 to 46—Do. 1-2 blood, washed, 36 to 10—1-4 and common do, 35 to 37—Smyrna Sheep, washed, 20 to 23—Do. unwashed, 10 to 14—Bengasi Sheep, 8 to 10—Buenos Ayres unpicked, 7 to 10—Superfine Northern pulled and 43 to 46—No. 1 do. do. 37 to 42—No 2 do do 26 to 30—No 3 do do 18 to 20.

**MASSACHUSETTS HORTICULTURAL SOCIETY.**

A stated meeting will be held at the Rooms of said Society, on the first Saturday in June next, (the fifth of said month,) at 11 o'clock A. M. E. M. RICHARDS, Recording Secretary.

**PURE SPERM OIL.**

EDMUND T. HASTINGS & CO., No. 101 State St, keep constantly for sale, Winter, Spring and Fall Sperm Oil, bleached and unbleached; which they warrant to be of the best quality and to burn without crusting.

Oil Canisters of various sizes. Boston, Jan. 1, 1841. isty

**FENCE CHAINS.**

Just received from England, 10,000 feet Chains, suitable for Fences or other purposes. For sale by J. BRECK & CO., No. 62 North Market st. April 21

**DURHAM COW FOR SALE.**

A young full blooded Durham Cow and her calf—a very desirable animal in every particular. Apply to EDWARD WITCOMB, Jr., Newburyport. May 8

**RHUBARB PLANTS.**

Giant and Early Wilmot Rhubarb Plants, and Asparagus roots, for sale by J. BRECK & CO.

**WILLIS'S LATEST IMPROVED SEED SOWER.**

Willis's latest Improved Seed Sower, invented the last season; one of the most perfect machines ever introduced for the purpose. In using this machine, the farmer may be certain that his seed is put into the ground, and at the same time in the best possible manner. There has been a great difficulty in machines for sowing garden seeds; they are very apt to clog up and the farmer might go over an acre of land and not sow a single seed; but not so with this; it is so constructed that it cannot possibly clog. In using this sower, the farmer can save one half of his seed, and do the work at less than one quarter the expense of the common way of sowing seeds, and have it done in a much better manner; it opens the furrow, drops the seed, and covers it over and rolls them down. It will sow almost any kind of Garden Seeds; say Ruta Baga, Mangel Wurtzel, Turnips, Carrots, Beets, Parsnips, Onions. It is highly recommended by a great number of persons who used it the past season. For sale at the N. E. Agricultural Warehouse and Seed Store by JOSEPH BRECK & CO. March 31.

**HOVEY'S NEW SEEDLING STRAWBERRY.**

This splendid variety of the Strawberry (originated in 1834) is now offered for sale. The fruit is of the largest size, often measuring 5 to 6 inches in circumference, handsomely formed—of a deep red color—exceedingly high flavored—and one of the most productive varieties, 12 quarts having been gathered from a bed 3 feet by 12. The vines are vigorous and hardy. Standing our severe winters without protection.

The fruit has been exhibited at the Massachusetts Horticultural Society in 1838, '39, and '40, where it attracted more attention than any other variety; and each season obtained a premium. It has every good quality to recommend a Strawberry to cultivation. The Spring is the most favorable time for planting in this climate. Plants \$5 per dozen. Also, all the old established varieties of Strawberries, from \$1 to 2, per hundred plants.

Orders addressed to us, will be immediately attended to, and the plants packed and forwarded with dispatch.

HOVEY & CO., SEEDSMEN, 7 Merchants' Row, near State st. May 5 4w

**WINSHIP'S NURSERY,**

BRIGHTON, NEAR BOSTON,

Situated on the line of the Boston and Worcester Rail Road,—5 miles from the city.

The Proprietors of this extensive nursery beg leave to inform their friends and the public, that they are ready to furnish orders to any amount, for Forest Trees, indigenous and exotic.

Fruit Trees, including all the varieties of Pears, Peaches, Plums, Nectarines, Cherries, &c. &c.

Vines—Shrubs, Green House Plants, &c. Catalogues may be obtained by applying at the Nursery. Trees carefully packed, to ensure safety in long voyages. Orders left at the New England Seed Store of J. Breck & Co. Nos. 61 and 52, North Market street, will be delivered the day following, and left at any part of the city, free of expense. Letters containing orders, addressed to the subscribers, J. & F. WINSHIP, Brighton Nurseries, March 24, 1841.

**SUPERIOR SEED BARLEY.**

100 bushels of extra heavy and clean Seed Barley. Also 30 bushels CHEVALIER BARLEY, a new and superior variety, for sale by JOS. BRECK & CO. March 31.

**BLACK SEA WHEAT.**

Received from Vermont, 30 bushels Black Sea Wheat. Also, 20 bushels Italian Spring Wheat, raised in Warren, N. H. For sale by JOS. BRECK & CO. March 31.

**CLOVER & RED TOP.**

50 tierces and 100 bbls. Prime Clover. 200 Bags Redtop, new seed. 50 bbls. Herds Grass prime quality, for sale by J. BRECK & CO. March 24.

**PLUMS, PEARS, GOOSEBERRIES, &c.**

Just received by JOSEPH BRECK & CO., from London, a fine assortment of Plum and Pear Trees, which are offered at reduced prices, including the following

**PEARS.**

Belle Lucrative,	Cattillac,
Mouille Bouche,	Williams' Bon Chretien or )
Josephine,	Bartlett,
Beurre Spence,	Jargonell d'Espagne,
" Capiamont,	Echasserie,
" Bose,	Urhauste,
" Diel,	Duchess d'Angouleme,
" d'Aremburgh,	St. Chislain,
Easter Beurre,	Madaline d'Carne.

**PLUMS.**

Green Gage,	New Orleans,
Purple Gage,	Imperatrice,
Diamond,	Reine Claude,
Washington,	Royal d'Tours.
Golden drop,	

Gooseberries, White and Red Currants, Raspberries and every article in the Nursery line furnished at short notice. JOS. BRECK & CO., No. 62 North Market Boston. April 7, 1841.

**AGRICULTURAL IMPLEMENTS, &c.**

The Proprietors of the New England Agricultural Warehouse and Seed Store No. 51 and 52 North Market street, would inform their customers and the public generally that they have on hand the most extensive assortment of Agricultural and Horticultural Tools to be found in the United States. Part of which are the following:

1000 Howard's Patent Cast Iron Ploughs	100 doz. Cast Steel Shovels.
300 Common do. do.	150 " Common do.
200 Cultivators.	100 " Spades.
160 Greene's Straw Cutters.	500 " Grass Scythes.
50 Willis' do. do.	300 " Patent Snaths.
100 Common do. do.	200 " Common do.
100 Willis' Patent Corn Shellers.	500 " Hay Rakes.
50 Common do do.	200 " Garden do.
200 Willis' Seed Sowers.	200 " Maure Forks.
50 " Vegetable Cutters.	300 " Hay do.
50 Common do do.	500 Pair Trace Chains.
200 Hand Corn Mills.	100 " Truck do.
200 Grain Cradles.	100 " Draft do.
100 Ox Yokes.	50 doz. Halter do.
1500 Doz. Scythe Stones.	1000 yards Fence do.
3000 " Austin's Rifles.	25 Grind Stones on rollers.

March 17.

**PEAR, PLUM, GRAPE VINES, &c.**

3000 Pear Trees, of the most approved kinds. 2000 Plum Trees, of the most approved kinds and extra size—many of them have borne this season.

Apple, Cherry and Peach Trees, of different kinds. 500 Quince Trees. 40 0 Isabella and Catawba Grape Vines, from 6 to 15 feet high; and most of them have borne fruit. Black Hamburg, Sweetwater, Pond's.

30,000 Giant Asparagus Roots. Gooseberry, Currants, Raspberries, of good kinds. 5000 Wilmot's Early Rhubarb or Pie Plants, lately introduced.

2000 Cherry and Pear Stocks; 1000 Plums; Roses, &c. of all kinds. All orders sent to the subscriber at Cambridgeport or left with JOSEPH BRECK & CO., will meet with immediate attention.

Cambridgeport, Mass., Feb. 24.

SAMUEL POND.

**HERBACEOUS PLANTS.**

J. BRECK & CO., offer for sale a great variety of beautiful Herbaceous Plants, including 20 varieties Phlox, Perennial Coreopsis of sorts, Delphinium Campanulas in great variety, Double Pinks, Dracoccephalums, Double Lychnes, Double Ragged Robin, Spire of sorts, Iris do. with a great variety of others. Also, Honeysuckles, Roses, and other ornamental Shrubs.

**SWEET POTATO SLIPS.**

Just received and for sale by J. BRECK & CO., a supply of Sweet Potato Slips. No 52, North Market st. April 25.

**DOUBLE DAHLIAS.**

We have for sale a very large collection of the finest Double Dahlias, of the most esteemed sorts. J. BRECK & CO., No. 52, North Market St. April 25

**GRINDSTONES.**

An extensive assortment of Water and Hand Grindstones constantly on hand and for sale by AMMI C. LOMBAARD & CO. 13 Lewis's Wharf. Nov. 17.

## MISCELLANEOUS.

## A SINGULAR SERMON.

Four gentlemen and an old minister were assailed on the highway by three robbers, who demanded and took possession of all their funds. The old minister pleaded very hard to be allowed a little money, as he was on his way to pay a bill in London. The highwaymen, as our authority informs us, "being generous fellows, gave him all his money back again, on condition of his preaching them a sermon." Accordingly, they retired a little distance from the highway, and the minister addressed them as follows:—

"Gentlemen—You are the most like the apostles of any men in the world, for they were wanderers upon the earth, and so are you; they had neither lands nor tenements that they could call their own; neither, as I presume, have you. They were despised of all, but those of their own profession; and so, I believe are you. They were unalterably fixed in the principles they professed; and I dare swear so are you. They were often hurried into jails and prisons—were persecuted by the people, and endured great hardships; all of which sufferings, I presume, have been undergone by you. Their profession brought them all to untimely deaths; and, if you continue in your course, so will yours bring you! But in this point, beloved, you differ mightily; for the apostle ascended from the tree into heaven, where, I am afraid, you will never come; but as their deaths were compensated with eternal glory, yours will be rewarded with eternal shame and misery, unless you mend your manners."—*Methodist Magazine.*

**How to Choose a Wife.**—"The Patriarch," a magazine just published, offers the following recipe for the selection of a wife:

"A place for every thing and every thing in its place," said the patriarch to his daughter. "Select a wife, my son, who will never step over a broomstick." The son was obedient to the lesson. Now, said he, pleasantly, on a gay May-day, to one of his companions, I appoint this broomstick to choose me a wife. The young lady who will not step over it, shall have the offer of my hand. They passed from the splendid saloon to the grove.—Some stumbled over the broomstick, and others jumped it. At length a young lady stooped and put it in its place. The promise was fulfilled. She became the wife of an educated and wealthy young man, and he the husband of a prudent, industrious and lovely wife. He brought a fortune to her, and she knew how to save one.

**Mind your P's and Q's.**—The origin of this phrase is thus accounted for: It was formerly the custom in ale-houses, to keep the "day book" on the wall, or behind the door of the bar, and the landlord, to distinguish the *Pints* from the *Quarts*, put their initial letters at the head of every man's account. Hence the phrase "mind your P's and Q's!" At this day it has a more serious application, and tavern keepers are more chary of allowing their customers to run up scores, seeing that the law has put it out of his power to collect beyond a certain sum, a debt so contracted. This is a wise provision, and here we close this paragraph, with a friendly caution to all tapers to *mind their P's and Q's.*—*N. Y. Mercury.*

## HOWARD'S IMPROVED EASY DRAUGHT PLOUGH.

Great improvements have been made the past year in the form and workmanship of these Ploughs; the mould board has been so formed as to lay the furrow completely over turning in every particle of grass or stubble, and leaving the ground in the best possible manner. The length of the mould board has been very much increased, so that the Plough works with the greatest ease, both with respect to the holding and the team. The Committee at the late trial of Ploughs at Worcester, say,

"Should our opinion be asked as to which of the Ploughs we should prefer for use on a farm, we might perhaps say to the inquirer, if your land is mostly light and easy to work, try Prouty & Mears, but if your land is heavy, hard or rocky, BEGIN WITH MR. HOWARD'S."

At the above mentioned trial the Howard Plough did more work, with the same power of team, than any other plough exhibited. No other turned more than twenty-seven and one half inches, to the 112 lbs. draught, while the Howard Plough turned twenty-nine and one half inches, to the same power of team! All acknowledge that Howard's Ploughs are much the strongest and most substantially made.

There has been quite an improvement made on the shoe, or land side of this Plough, which can be renewed without having to furnish a new landside: this shoe likewise secures the mould board and landside together, and strengthens the Plough very much.

The price of the Ploughs is from \$6 to \$15. A Plough, sufficient for breaking up with four cattle, will cost about \$10 50, and with cutter \$1, with wheel and cutter, \$2 50 extra.

The above Ploughs are for sale, wholesale and retail, at the New England Agricultural Warehouse and Seed Store, Nos. 51 & 52 North Market Street, by

JOSEPH BRECK & CO.

## STRAWBERRIES! STRAWBERRIES!

The subscriber would offer to the public, the present season, his *Selected Collection*, consisting of seven varieties; they are such as have stood the test of a fair trial for seven years, and all grown by the subscriber.

**Warren's Seeding Methven**, a new and valuable kind, a free bearer, fruit very large and juicy; fruit measuring 5 1-2 inches have been exhibited the present season. This variety can be warranted to be one of the finest varieties grown, and will produce as fine fruit and as large quantity, with the same cultivation, as any other ever offered. The price of this Seeding is \$5 00 per hundred plants.

**Methven Castle**.—Fruit extremely large, high flavored and showy; specimens of this fruit have been shown this season six inches in circumference. Price three dollars per hundred plants.

**Keen's Seeding**.—A very superior variety, fruit very large, rich dark color, and uncommonly high flavored. Price three dollars per hundred.

**Royal Scarlet**.—Fruit long oval shaped and juicy, very free bearer, and very hardy. Price two dollars.

**Hautbois**.—Fruit larger than English Wood, exceedingly numerous, sometimes yielding 100 berries to the plant.—Price two dollars.

**Early Virginia**.—This is known to be the earliest and best fruit for market, a free bearer and very hardy. Price two dollars.

**English Wood**.—Fruit well known for years. Price one dollar.

Every plant sent from this garden will be warranted to be free from mixtures, and shall also be young and healthy, worth the price paid for them.

All orders directed to the subscriber, inclosing the amount for the order, or with a good reference, shall be promptly attended to, and the plants carefully forwarded agreeably to directions.

JAMES L. L. F. WARREN.

Nonantum Vale, Brighton.

## DRAFT AND TRACE CHAINS.

Just received by Packet Coromanda, 400 pair Trace Chains, suitable for Ploughing.

200 " Truck and leading Chains.  
200 " Draft Chains. For sale by J. BRECK & CO.,  
No. 52 North Market st. April 21

## TUG UP CHAINS.

Just received by Packet Coromanda, 500 Chains for tying up Cattle.

These chains, introduced by E. H. Deaay, Esq. of Salem, and Col. JACQUES, for the purpose of securing cattle to the stall, are found to be the safest and most convenient mode of fastening cows and oxen to the stanchion.

For sale by J. BRECK & CO., No. 52 North Market st.

## GARDEN SEEDS,

For sale by JOSEPH BRECK & Co. at the NEW ENGLAND FARMER OFFICE, No. 51 and 52 North Market St. Boston. The subscribers would inform the public that they have now on hand the largest collection of seeds ever before offered by sale in this city, embracing every variety of *Field, Kitchen, Garden, and Ornamental Flower Seeds* desirable for this or any other Climate.

Our seeds are either raised under our own inspection or imported from respectable houses in Europe, and having taken extraordinary pains to obtain such as are pure and genuine, we can confidently recommend them to our customers and friends, and feel assured they will prove satisfactory to all who try them.

Dealers in seeds are requested to forward their orders in season. Boxes for retailing from 8 dolls. and upwards will be sent out on commission allowing a liberal discount and take back what remain unsold.

Letters and orders with good reference will meet with prompt attention.

## FIELD SEEDS.

Sugar Beet.	Ruta Baga.
Mangel Wurtzel.	Ballatine's New Royal do.
New Red Globe do. } superior	White Tankard Turnip.
Yellow do. } varieties.	Red do.
Carrot Long Orange.	Red Round do.
" Altringham.	White do.
" New White, extra fine.	White Globe do.
Pumpkin, sorts.	Green Round do.
Wheat—various sorts.	Purple Top Hybrid do.
Barley, do.	Buckwheat.
Rye, do.	Broom Corn.
Potatoes, do.	Millet.
Indian Corn, do.	Buckthorn. } for Hedges.
Oats, do.	Locust. }

## GARDEN SEEDS.

Artichoke, Asparagus, Beans of every description, Beets of sorts, Borecole, Broccoli, Brussels Sprouts, Culliflower, Caraway, Celery, of the most improved sorts, Cabbage 20 sorts, Carrot, all the varieties, Cucumber do, Cress, Egg Plant, Endive, Indian Corn, Kale, Leek, Lettuce in great variety, Melons, do. Martynea, Mustard, Nasturtium, Okra, Onion of sorts, Pepper do. Pumpkin do. Parsnip, Parsley, Peas, a very great variety, Rhubarb for tarts, Radish of sorts, Salsify, Squash of sorts, Tomato, Turnip 20 varieties.

## SWEET AND POT HERBS.

Thyme.	Sweet Basil.
Sweet Marjoram.	Lavender.
Sage.	Lemon Balm.
Summersavory.	Anise.
Medicinal Herbs, &c.	

## ORNAMENTAL FLOWER SEEDS.

Three hundred varieties, embracing all the finest sorts. Packages of 20 fine sorts for one dollar.

Those who prefer to have their Seeds put up in papers ready for retail, can be accommodated—each packet neatly closed and labelled with printed directions. Price 50 cents per dozen papers, which are retailed here at 6 1-4 cents each.

Fruit and ornamental trees, of the greatest variety, supplied at nurseryman's prices, and orders solicited. These will be packed, when required, to go to any part of the U. States.

JOSEPH BRECK & CO.

## FRUIT AND ORNAMENTAL TREES, &amp;c.

NURSERY OF WILLIAM KENRICK.

12,000 Pear and Plum Trees.—Large and new additions of Pear and Plum Trees have lately been received, many kinds of which are alike new to our country, and very extraordinary. Such have been the selections which have been made by the subscriber in Europe, and in person, during the last Autumn, where all have been proved; those kinds already well known amongst us being identified by him by the wood and the leaf.

All orders addressed to the subscriber, or left with Joseph Breck & Co., New England Farmer Office, will be promptly attended to, and Trees, when so ordered, will be secured packed for safe transportation to distant places.

WILLIAM KENRICK.

Nonantum Hill, Newton, near Boston, March 2.

## NEW ENGLAND FARMER.

A WEEKLY PAPER.

The Editorial department of this paper having come into the hands of the subscriber, he is now authorized by the publishers to inform the public that the price of the paper is reduced. In future the terms will be \$ per year in advance, or \$2 50 if not paid within thirty days.

ALLEN PUTNAM.

N. B.—Postmasters are required by law to frank a subscriptions and remittances for newspapers, without expense to subscribers.

# NEW ENGLAND FARMER, AND HORTICULTURAL REGISTER.

### PRODUCTIVE FARM.

Through the politeness of Capt. Chandler, superintendent of the House of Industry at South Boston, we have received the Report of the Directors of that institution for the year ending May 31st, 1841, from which we copy the following statement, showing the

*Produce of the Farm in 1840.*

17 tons English hay,	\$289 00
5 ' Straw,	60 00
204 bush. Barley,	142 80
8 1-2 tons Mangel Wurtzel,	68 00
51 bush. Ruta Baga,	10 20
4000 lbs. Canada Squashes,	40 00
310 bush. Potatoes,	108 50
1620 ' English Turnips,	194 40
253 ' Blood Beets,	126 50
395 ' Sugar Beets,	110 60
73 ' Turnip Mangel Wurtzel,	18 25
568 ' Carrots,	170 40
50 ' Parsnips,	25 00
850 ' Onions,	425 00
4 ' Quinces,	12 00
104 bbls. Apples,	156 00
500 Cabbages,	20 00
22 tons green fodder,	132 00
Vegetables used before harvest,	210 00
Sales of vegetables and fruit before harvest, not included in the above,	845. 85
Garden seeds sold, avails not collected,	711 94
Garden seeds on hand,	63 00
	\$3,939 44
Produce of dairy and pigs,	1,775 46
Avails of oakum picking,	2,297 23
	\$8,012 13
Total,	
Being \$1313 19 more than last year.	

For the New England Farmer.

### A GOOD TEAM.

MR EDITOR—Some time since I noticed a communication in your paper upon the importance of good tools: I think that a good team is of equal importance for the advantageous working of the farm. For however good your plough may be, unless your team has strength enough to draw it steadily you will make but poor work.

Some farmers appear to act as though they thought it necessary for them to keep a long team to do their work; and then they act as though they thought that every straw of hay they could cheat their cattle out of and keep them on their legs, was so much clear gain. But let us look at such a farmer as he is doing his spring work:—if he has a piece of ground to plough, one pair of his oxen have not strength to do it, so he yokes up another; they cannot move off in a straight line, so he must hook on the old mare to keep them straight; and then with a boy to lead the mare, another to drive,

and one to hold, he may accomplish about as much as one man would do with one good pair of oxen well fed and trained. If he has a piece of hard breaking up to do, he must have four or five such yoke of oxen to do it. When he gets them all together, they look about as crooked, shriveled up and inefficient as a string of dried apples. Mr Editor, did you ever witness the work of such a team just commencing operations? Their principle of action appears to be, "one at a time last the longer":—some wishing to move in one direction, some in another; some deliberating whether it is best to move at all or not, moving so unsteadily and crookedly that it would be impossible for the best ploughman with a good plough, to make good work. So it is with all the operations of the farm. Twice the time is required to yoke and manage such a team, as is necessary to manage a good one.

I once knew a sort of farmer who prided himself much about his long team. Going to market one day with a cord of dry pine wood with four yoke of oxen and a horse, he was thus accosted by one of his neighbors: "A long team today, neighbor G." "Yes, yes: three yoke more at home, and none of them mortgaged neither." "Well, I should think the crows would soon have a bill of sale of them."

How can a farmer afford to keep such a poor team as this, when his success depends in a great measure upon the manner in which his work is done? A good team is the cheapest; but it is not enough to procure a good team; it needs constant care and attention to keep it good. The cattle must be well and regularly fed and carefully driven. Much depends upon the early training of the ox. If he is heavily loaded while young, he usually gets into a dull and slow gait, which it is difficult to break him of; but if he is moderately loaded and accustomed to walk quick, he will perform much more labor on the farm. The farmer gains nothing by loading his team heavily, for they acquire a habit of moving slowly while so loaded, which they will continue in when ploughing and doing the lighter work on the farm. It is necessary for farming work that oxen should be taught to back well. This may usually be done very easily by right management. Do not strike an ox hard upon the nose, for if you do, he soon learns to put his nose down so as to avoid the blow; and this brings the yoke in such a position that he cannot back. An ox should be taught to throw his head up and turn it a little out when he backs. This may be done by a good teamster in a short time.

AN ESSEX FARMER.

From the Yankee Farmer, of July 18, 1840.

### CANKER WORMS.

MR EDITOR—When I was in Boston last winter, I promised to give you some information respecting the habit of the canker worm; also some of the means to be used to prevent the ravages of this most destructive insect.

I shall commence with the insects in the egg,

and shall proceed with a number of occasional communications, which I shall send you from time to time.

The worms are usually hatched about the fifteenth of May, sometimes earlier and sometimes later, depending very much upon the season. When first hatched they are very small, but their presence can soon be discovered by a close observer. They are, in the early stage of their growth, very susceptible of cold, and a frost is fatal to them; although the insect in its perfect state is as hardy, and will endure cold or a pelting storm like a Polar bear; in fact, the grub in its ascent upon the trees in February, when overtaken by a cold snap, much resembles Bruin when placed in like circumstances, by drawing up its legs under the body, and sleeping in a torpid state until moderate weather. Last spring, in a cold Northeast storm, I observed the worms crawl into the closed petals of the apple blossom for shelter. They usually acquire their growth and leave the tree about the fifteenth of June, and during this period, change their skins several times.

They eat with astonishing voracity, particularly in their last stage, first devouring the leaf and then the fruit. After acquiring their full growth, which is usually in four or five weeks, they leave the tree by lowering themselves down to the ground by a silken thread, which they learned to spin from the earliest period of their existence, as they move about upon the branches, always careful to have the end of the cord fast, so that if the branch on which they are feeding is struck, they will always show themselves by spinning down a few feet, and if suffered to remain a short time, they will again ascend the tree by their cord, alternately grasping it with their feet and seizing it with their jaws.

Professor Peck is in some respects, incorrect in his description of the habit of this insect. He says "the worms descend by the trunk of the tree in June, and immerse themselves in the earth near the trunks, and rarely if ever more than three to four feet distant." Our observation has led us to a different opinion. They leave the tree from the branch on which they feed, and suddenly spin down by their thread to the ground, and enter it to the depth of from two to six inches, and immediately change into the chrysalis state. I have seen them leave the branch of an elm thirty feet from the trunk, and at once work their way into the ground. And the grubs and millers can be seen in the season of their running, soon after sunset struggling and fluttering through the grass for many feet around, usually to the extent of the branches of the tree, under which they are striving to reach the trunk. And if in their progress they meet with a fence, post, or house, they will ascend it, and the grub before leaving it, will deposit her eggs.

As we have now fairly disposed of the canker worm, for at least a few months, by burying it in the earth, let us now look around us and see what can be done to counteract the bad effects of its ravages. And what I shall here relate, came under my observation last year. In purchasing a piece of land, I came in possession of twenty large

apple trees, which had been eaten by the canker worm more or less for several years, but last year, particularly, the foliage and fruit were eaten entirely up. On some of the trees the worms were very numerous, and hardly found sufficient quantity of food to subsist upon.

After the worms had become quite large, I lessened their numbers by shaking the limbs and throwing coarse sand into the trees, thereby causing them to suspend themselves by their thread and striking them off with a stick to the ground, and then tarring the trees to prevent their ascending them. Dry coarse sand or ashes placed around the trunks will answer the purpose, to prevent the worms again ascending the trees. Small trees in this way may be wholly cleared of worms, but on large ones this method of exterminating the insect avails but little, for after destroying great numbers, enough will still remain to greatly injure the foliage and fruit, besides the injury the tree will be likely to sustain in shaking it, when the bark from the great flow of sap at this season of the year is very apt to peel, thereby causing canker. For this reason, I prefer coarse sand thrown into the tree, as it will generally destroy them without causing injury. But after the insect is on the tree, if a large one, little can be done to destroy it, and it should be our chief aim to devise some way to prevent its ascending the trunk.

Soon after the worms had entered the ground and passed into the chrysalis state, I removed the earth around the trees to the distance of five feet from the trunk, and to the depth of six inches, this I carted away and brought back, in return, some good manure mixed with earth, and placed it around the trees. In this way I got rid of a vast number of the worms by removing them with the dirt, besides increasing the growth and fruitfulness of the trees. I then covered the compost over with spent bark or tan, which I have found beneficial by preventing the growth of grass, and keeping the earth loose, and by the property it possesses of retaining frost, the earth around the trees is kept frozen, causing the grubs to remain still during the moderate weather in February, March, and beginning of April, thereby avoiding the necessity of tarring during this period. In the autumn and spring following the trees were tarred, and after the grubs were done running, they were scraped, and a wash composed of lime, soap-suds, clay, and cowdung applied with a whitewash brush to the trunk and branches. The trees were carefully pruned about the middle of May, by removing all the dead and diseased limbs, which, in consequence of repeated injury they had sustained by the worms, had become quite numerous.

There is nothing, perhaps, that will so soon cause decay in an apple tree as this insect. You will first notice the injury by observing the extremities of the branches, which will be dead, and unless they are removed in pruning, the disease will extend along to the trunk, and cause the death of the tree. Trees deprived of their foliage by the worm, generally puts forth again the same season, but this extra labor of furnishing new leaves is very exhausting to the vigor of the tree, and hence it becomes necessary to prune else, and apply manure, and in some bad cases of injury, the more stimulating the better.

When manure cannot be obtained, digging around the tree will answer a good purpose by crushing the chrysalis, exposing it to the action of

the sun and air, or to be devoured by birds, and the earth being loosened, will impart vigor to the tree. The question may be asked by some of your readers, when is the best time to dig around the tree? In reply, I would answer, I consider the first of July the best season, although it may be done at any time, from that period to the fall of the leaves in autumn. The reasons for my preferring the first of July are these. The worms having passed into the chrysalis state, the shells are soft and tender, and are more easily crushed by digging, and the tree will the sooner recover from its injury by receiving an immediate benefit from your assistance, but if delayed until autumn it will derive little benefit from your labors the present year. I have succeeded by the process above described, in completely restoring trees to the highest state of health and vigor, covering them with an abundance of fruit and foliage, and with but very little appearance of the Canker Worm.

Yours, with respect and esteem,

S. P. FOWLER.

[Having previously signified our intention to copy the above article, Mr Fowler, after requesting us to make a few corrections, adds—]

*The Method to be used to renovate and restore to health and vigor apple trees that have received injury from the Canker Worm.*—When trees have been suffered to be eaten for several years, as is sometimes done by some persons, under the mistaken notion that it is best to let them alone and eat themselves out, as they term it, it frequently becomes a subject of inquiry, what is best to do with them to restore them? I will relate to you the method a neighbor of mine pursued in regard to his trees, by my suggestion. He had suffered the canker worm to injure them most severely; many of the limbs were dead—others partially so; suckers were growing up from the middle of the tree; the limbs and trunk covered with moss, and with the appearance of canker—exhibiting decay and disease. Four different modes to pursue toward the trees presented themselves to our minds.—The first was to cut them down and set out new ones; but this was given up, when we considered that it was a well established fact, that new orchards do badly on the site of old ones. The second was, to head them down after the manner laid down by Forsyth and other writers, to restore old and decayed trees; but this mode was abandoned, for reasons which will hereafter appear. The third was, to trim out the suckers and cut off the dead limbs, shorten those half dead by cutting them down to the live wood, pruning close, ploughing or digging amongst the roots: how we should have succeeded in pursuing this method, I do not know: it has been practiced by Capt. Benj. Porter this spring upon his trees, which you will remember the canker worms and neglect have caused to be in a bad condition. We shall see the results in a few years, if we live. Had I have owned that large orchard, I would have given considerable for the opportunity which he had of entirely changing his trees, by grafting the suckers upon his old, and many of them, poor varieties of apples, and substituting the new and better kinds of fruit.

Our principal objection to this method was the difficulty of again imparting vigor in old and diseased tops, full of moss and canker, and likewise perceiving the tendency of the sap to flow into the suckers instead of the old limbs; and should these suckers be removed every year, or indeed twice a

year, as we have sometimes done, still there is a tendency in the tree to throw out new suckers, plainly indicating thereby that it is striving to obtain a new top, which in time it would acquire without assistance, (although much better with it,) by the growth of the suckers and the old limbs dying down to the trunk. Our fourth method, which we practiced with success and recommend to others, is as follows. First, to cut out all dead limbs close to the trunk, and when large, apply paint, with a brush, to the wounds. Red or yellow ochre is best; by the way we consider this the best application for wounds caused by removing large limbs, or by accidents, that can be made. I applied Forsyth's composition to the ends of limbs removed in pruning a few years since, and I found some of them rotten, caused by its retaining moisture, as I supposed. Cut off all partially dead limbs down to the live wood. Trim out the suckers, leaving a sufficient number of the most vigorous to form a good head to the trees, and apply the wash; dig around the trees and apply manure, if you have it. When the suckers have acquired a sufficient size, graft them, and as they grow and occasion may require, cut the old limbs out close to the grafts at the fork, prune the grafts and give them a proper direction, so as to form a good top. By this method, in a few years you can get rid of the old head, substituting for it a new one, healthy and vigorous. The advantages of this method over all others in restoring trees badly injured by the canker worm, are these: It gives us an opportunity by grafting, to obtain the new and better varieties of fruit; and in some old orchards this is very desirable. The reasons why we prefer it over Mr Forsyth's method of heading down, are these: the old limbs are bearing some fruit while your grafts are growing in your suckers, and you do not risk the life of the tree by depriving it at once of all its limbs, for there is some danger of losing large trees in this way.

There are many things connected with the habits of the canker worm and the means of its destruction, which it might be useful to publish. It has undoubtedly produced more injury to our apple trees than any thing else.

The next most destructive insect to our trees, or rather fruit, we have to trouble us, is the Curculio. They have increased very much with me in a few years, destroying or injuring, I should think, nearly half my fruit.

The canker is a disease well understood in England, but very little here. It is common with us, and when its effects are seen, it is ascribed by many people, ignorantly, to injury caused by severe winters, and nothing more thought of it. Much might be said on the subject of pruning. Very many people who prune trees, know but little about it. Much has been said and written on the proper time to prune, but after some considerable experience I think more of the manner of performing it than I do of the season in which it is done. All seasons have their advantages and disadvantages, and much might be said on both sides; I have pruned at all seasons of the year successfully and now do it when I have leisure and my saw is sharp. The attention of many people has been directed within a few years to the cultivation of fruit trees, and more have been set this year than I ever knew before.

A great deal more I have to write, had I space.

Your friend,

S. P. FOWLER.

N. B.—I wish to be understood in my remarks upon pruning, that I prune any time between the fall of the leaf in autumn and the middle of May following. I never pruned at any other season of the year, except to remove suckers in July or August, which I think advantageous. And now, as I am upon a fresh sheet, I will say more.

As I before remarked, many people are setting trees and selecting the kinds from the knowledge they obtain from books, regardless of their adaptation to particular soils and situations, which is a great mistake. Thus for instance, the Newton Phippen, Pennock's Red Winter, and many others raised south of New York are indifferent fruit with us, however excellent they may be at the South. And some of our common varieties of fruit, for instance the Pickman Phippen, a most valuable apple with me, I am informed by Mr Jno. M. Ives, is a poor tree in his soil. And the old Blue Pearmain, greatly extolled by some persons, in my soil the fruit is poor and the tree a shy bearer. S. P. F.

### SOAP.

I have always taken pleasure in superintending some of the chemical operations of the kitchen: by this means I have acquired some practical, in addition to my theoretical knowledge of the art of making common soap. I shall give below, the result of my experience in making this detergent article.

The bottom of the hopper or barrel intended for the ashes, should be covered with hay or straw: the ashes are then to be thrown in, and pressed down, as the hopper is filled. Leave room at the top for a bucket full of water. If quick lime can conveniently be had, put in a gallon or more with the ashes; it is not important where, whether at the bottom, in the middle, or at the top of the barrel; or whether intermixed throughout the ashes.

Boiling water is now to be poured on the ashes until the ley pass out at the bottom. Cold water may then be used. Rain water in both cases is preferable to hard water. Four buckets full of strong ley may thus be produced from a barrel of ashes. This quantity of ley, with the requisite proportion of fat will make half a barrel of prime soap.

When the ley is put into the kettle, throw in the fat without measure; the surplus is easily removed after the ley has "eaten" its share. If the process be rightly conducted, the combination will take place and soap will be formed within 1-2 an hour's boiling. Now skim off the supernatant fat; and if "brittle" soap be desired, add to the hot soap, 1-8 or more of its bulk of warm water, and stir the mass well.

Care should be taken to have both the fat and the ley as free as possible from any earthy matter and other dirt.

If these directions are pursued, and the precautions observed, soap will "come" in spite of all the witches that ever beset the soap kettle.

The above process is intended for soft soap, or soap of potash. If

**HARD SOAP.**—Or soap of soda be required, it is only necessary to add common salt, and a sufficient quantity, to the newly formed soft soap; and to boil the mass until it becomes hard on cooling: this may be easily ascertained by taking a little of it in a ladle, and setting it in cold water. When this change takes place, remove the contents of the kettle from the fire. It is sometimes necessary

for this preparation to stand several days, that the soap may become sufficiently solidified. If after a large quantity of salt is added, there appears to be no formation of hard soap, throw in some strong ley. Plenty of salt, and plenty of ley to decompose it, will ensure success.—*Albany Cultivator.*

### MANURES.

The Cardinal point to be observed in the management of manures, is to apply them in that state, and to those crops which are the most benefitted by their application. When manures are left in the yards over the summer, and exposed to the action of sun and rain, they are deprived of much of their value. The most efficient parts pass away and are lost to the farm. If manures are not applied to the spring crops of corn and roots, they should be heaped with layers of earth, vegetable mould, marsh mud, wash of roads and with some lime, that the salts and gasses produced, may be absorbed and retained. In this way, the value of yard manures is much increased, and the quantity augmented. The experiments of Chaptal and Liebig, prove that the more vegetable mould left by the decomposition of plants or manure in the open air, possesses little value compared with that in which all the salts and fertilizing ingredients are retained.

A short time since, a Committee of the French Institute was appointed to examine the nature and effects of a new manure, represented as of extraordinary power. It was found to be composed of gypsum, saturated with urine, the mass then dried and pulverized, and applied to plants in the form of a powder. It was pronounced the most effective of a large variety of the animalized manures, so much so indeed that the committee recommended great caution in its use. A small quantity applied to corn, garden plants, &c. gave a most rapid and vigorous growth. Would it not be well for our farmers to make some experiments with this material? It is certainly within the power of all. We hope that poudrette and bone manure will also be fairly tried; on these points we should be negligent no longer.—*Ibid.*

*The Team.*—It is enough to sicken the heart of a man of ordinary feeling, to witness the wretched skeleton animals that are compelled by dint of flagellation, to perform the labor of the farm in so many instances. Such treatment of animals is not only cruel but unprofitable. It is certain that one team well kept, will do more work than two half starved ones, and do it at the time and in the manner it should be done. It is a most injudicious practice to allow working cattle or horses to leave their stalls for the pasture, until the spring work is mainly over. They cannot derive sufficient nutriment from the young grasses, and a taste of the new makes them eat sparingly of the old, and the result is, they will fall away rapidly.—*Ibid.*

*Pruning.*—It is the custom among farmers to do the pruning of their orchards at such times as is most convenient, or as they have been taught to do, without reference to vegetable physiology, or the best methods pointed out by nature. Some prune in the winter, many in May, which is perhaps as good a time as any, the summer months excepted. We think that July, or rather the interval that takes place between the formation of the flower

and fruit shoots or buds, and that of the terminal shoots or buds, a period that lasts some three weeks, is the best time for pruning, and we advise those of our friends who have this work to do, to ascertain by experiment, what time gives the most healthy and vigorous wood for covering the wounds necessarily made in pruning.—*Ibid.*

### POPULATION OF THE UNITED STATES.

The Washington city Madisonian publishes the following statement of the population of the different States and Territories in the Union, agreeably to the census of 1840. The aggregate, it will be seen, exceeds 17,000,000.

States.	Population
Maine,	501,793
Massachusetts,	739,699
Rhode Island,	108,830
New York,	2,428,921
Pennsylvania,	1,724,022
Maryland,	469,233
South Carolina,	594,398
Tennessee,	829,210
District of Columbia,	43,712
Georgia,	667,194
Louisiana,	351,176
Ohio,	1,519,467
Illinois,	474,404
Arkansas,	95,642
Wisconsin,	30,752
New Hampshire,	284,574
Connecticut,	310,015
Vermont,	291,948
New Jersey,	373,306
Delaware,	78,085
Virginia,	1,239,797
Mississippi,	375,651
Florida,	54,207
North Carolina,	753,110
Alabama,	569,645
Kentucky,	777,397
Indiana,	683,314
Missouri,	381,102
Michigan,	211,705
Iowa,	43,068

Total 17,100,572

Returns from nine counties in Georgia wanting, seven of which contained in 1830, 55,881.

Returns from five counties in Alabama, not included. Four of the five counties contain, according to the Marshal's returns, 85,701.

Returns from Carter county, in Kentucky, wanting. The amount of population in 7 counties in Georgia in 1830, and that of four counties in Alabama, mentioned in this note, are included in the sum total.

The United States contain 2,300,000 square miles. One half only of this is settled. If the United States numbered as many inhabitants to the square mile as France, our population would be 363,000,000! The whole area of cultivated land in Great Britain and Ireland, is about fortyfive millions of acres.

It is computed that there are in England one million of horses used for labor—and two hundred thousand for pleasure—all of which are supposed to consume the produce of seven millions acres of land.

For the N. E. Farmer.

### MANAGEMENT OF COWS AFTER CALVING.

MR EDITOR—Your paper of April 28, contained some questions relating to the management of cows after calving. (The writer would have done well to have said *before* and after calving, for that was the question at the discussion which he mentions.) I will give you my poor opinion, founded on an experience—and critical experience—of many years.

And now to "A Herdsman's" first question:—"Is it advantageous to let cows drink the biestings or the first milk after calving?" I was a farmer's boy, and my father (who was called a very good farmer for that day,) always directed the boys to be sure and let the cow drink the first milk after calving. His cows, uniformly, I believe, without an exception, lost their appetite and lost flesh.—He attributed it to being over-fed. When I commenced farming for myself, I practiced in the same way, with the same result; my cows uniformly lost their appetite and flesh. I attended them wholly myself, so that I knew that they had not been over-fed: there must be some other cause. Then the question was, what is the cause? After much thought on the subject, I concluded it might be the drinking the first drawn milk after calving. I stopped giving the milk, and have not failed of having a cow eat all she was allowed to have, from that time to the present, which is more than thirty years. This to my mind is proof conclusive, that letting a cow drink her first drawn milk is not a good practice. I find others who let their cows drink the first milk; and those cows lose their appetite; but the owners had not thought it was caused by drinking their milk.

The second question—"Is it beneficial or detrimental to have cows eat the afterbirth?"—is answered by saying it is immaterial: it does neither good nor hurt, if the cow does not choke with it.

The third question is of more importance, and requires a more particular answer: "When the secundine adheres and nature is obstructed in her operations, can any thing be given to the cow to remove it?" It is doubtful whether any thing can be given that will effect the object. I have tried every thing that I ever heard of, and all to no purpose. It would seem that tying a weight to the cord, would not be recommended by any man, who well understood the connection of what should come away with what remains. My practice formerly was, to let the afterpart take its course: if it did not come away within twentyfour hours, it would generally remain eight or nine days. The stable would be scented so as to be disagreeable to go into; the cow would be losing flesh, and consequently shrinking in the quantity of milk.

After going on in this way several years, I got information of a man skilled in the business, how to take away what ought to be away, and have since always done it when necessary, and my cows have done as well as when it came away naturally.

LOVETT PETERS.

Westboro', May 17, 1841.

The above communication details the results of valuable experience, relating to one common practice. Without opportunity for testing satisfactorily the correctness of the opinion, we have believed for years that the food which nature prepares for the infant, is not suited to the nourishment of that animal in which the food is prepared: we called the milk *unnatural* food for the mother.

If Mr Peters can describe the process to which he alludes in his reply to the third question, the making of it public is very desirable.—Ed. N. E. F.

For the N. E. Farmer.

### BLIND STAGGERS IN SWINE.

ALLEN PUTNAM, Esq.—Dear Sir—In your paper of May 5th, I found an article signed J. M. Hartwell, entitled "Cure for Blind Staggers, &c. in Hogs." I was much pleased to find there was in the possession of any person, the knowledge of a remedy for that very fatal disease, and I felt very grateful to the gentleman for his promptness in communicating it to the public: I treasured it in my memory, resolved to avail myself of the advantage on the first occasion. On the 11th of this month, as I was passing the house of one of my neighbors, he called to me and requested I would look at one of his pigs. It was a fine one, of about seven weeks—had been taken from the sow at four weeks old and fed on scalded meal mixed with a few boiled potatoes and milk, with the dish-water of a small family:—it was kept with two others of the same age—the pen was divided into two parts, one for a bed room, the other for an eating room. It opened into a small yard of dry, gravelly bottom: the pen had a plank floor: both pen and yard were kept clean: the pigs were always well supplied in their bed-room with clean litter. The pigs were furnished with some clay in one corner of their yard, and twice every week with broken charcoal. The only objection I can think of to the pen is, that the air might not be pure enough, it being under the same cover with a privy, and the bed-room too low, not being more than four feet in height. I found the pig with all the symptoms of the blind staggers, turning round and round, with its snout to the floor and to the side of the pen, as if it was sucking the boards. I advised the new rum and pepper internally, with the oil and rubbing for the issues of its legs. The pig eat its food well at noon, was said by a little girl to have eat again well at about five in the afternoon, and was found at six or half after six, just before I saw it, affected as I have described. As this is a temperance town, it was difficult to procure new rum—it was, however, obtained and administered with the pepper in about half an hour, and in less than a quarter more, the pig was dead. I have frequently, in former years, had pigs with the blind staggers, and the only cure I have found has been, to bleed by cutting off a piece of the tail and ears, and then turning them out into a pasture, taking care to have it a small and close one, with no water in it, or they may run in and be drowned. The first I had attacked in this manner I lost; but since then, I have always effected a cure; but they have never afterward obtained so great a size as those that had not had the disease. I have never before known a pig less than four or five months old, attacked in that manner. My pigs have never had this disease in the winter, and never only when confined to a sty with or without a yard. If suffered to have a small pasture I do not think they will ever be so affected. I attribute it to costiveness, and believe a little brimstone occasionally, or green grass abundantly supplied to them every day, is the best preventive. The finest and most thrifty pigs are the most subject to this disorder.

I wish you would draw the attention of Mr Hartwell to this case. I am very far from condemning his course of treatment, although I wish he

had been a little more precise as to the quantity and proportions of his prescriptions, and I hope he will favor your readers with another communication on this subject. A DOWN EASTER.

We shall be happy to hear from J. M. Hartwell again, and also from "A Down Easter."—Ed.

For the N. E. Farmer.

### TO BOYS IN THE COUNTRY—SPARE THE BIRDS.

MR PUTNAM—As you condescended to permit a small space in the columns of your valuable paper, which is diffusing knowledge among scientific and practical farmers of age and experience, to be occupied by a production from the pen of one who is young and inexperienced, I will (thanking "J. H. D." for his compliment,) "try again." I send you a few lines addressed to my brother farmer boys, which you may dispose of as you think best.

Brother Farmer Boys:—The wet and cold of the present season have rendered much of the labor of the farm rather unpleasant and dreary. But notwithstanding all the snow, hail, rain and cold, which have made the farmer's frock and mittens comfortable garments, even to the middle of May, and which have prevented the ladies from coming out decked in the gay colors of spring, lest the storms should mar and soil the work of their fair hands,—notwithstanding the cold and wet, the birds have returned at their appointed time, with their equipages, like implements of husbandry, brightened by the rough usage and hard blows to which they have been subjected, to cheer and animate us in our labors with their lively songs, which form a delightful contrast with the pitiful moanings of the east wind, and to assist us in preparing our ground for the seed. Assist us? how can they assist us in preparing our ground? By destroying innumerable insects as they are brought to the surface by the operation of the plough and harrow, and which though silent and unseen in their work of devastation, are still the farmer's greatest enemy. My friends, let us receive the birds as welcome visitors to our fields, and not as soon as one makes his appearance, run to the house for a gun, and by creeping slyly behind some fence or bush, get near enough to pour upon him the leaden hail, and spoil his fine dress, wrought and colored by the hand of nature, so as to remain unfaded and uninjured through all the rain and hail which the clouds have poured upon him; stop forever the music of his throat, tuned by his Maker, and prevent him from ever more assisting the husbandman to free his premises of noxious insects. A certain man on being asked what the birds were made for, answered, to eat the worms and bugs. When asked what the worms and bugs were made for, he replied, for the birds to eat. This appears to be reasoning in a circle, in which we soon come round to the place from which we started. I think that the birds were intended for ornaments to adorn and beautify the works of nature, and with their beautiful plumage, graceful movements and sweet warblings, to please the eye and delight the ear of man:

"To make all the woods and valleys to ring,  
And bring the first news of the earliest spring,  
With their loud and silvery notes."

As the birds require food, it may be that the insects were made on purpose for them; these feed upon the same plants and vegetables which give

sustenance to man and beast. It is so ordered by an all-wise Providence, that if man wantonly and cruelly destroys the birds, judgment may come upon him, by having his crops destroyed by the very insects upon which the birds would feed. I beseech you, brother farmer boys, one and all, the next time you take your fowling piece and go forth in search of game, to remember that each bird you kill increases the number of insects—that you are committing an outrage upon humanity and society—and a sin in the sight of Him,

“Who sees with equal eye, as God of all,  
A hero perish or a sparrow fall.”

Think of this as you are about to poise your piece and pour its deadly contents upon the unfortunate victim, and if your finger does not refuse to do the horrid deed, or at least if your conscience does not upbraid you and agitate your nerves so as to suffer the bird to escape “more scared than hurt,” you must have a heart as hard as the savage, who when seeking for revenge, can bury his tomahawk in the heads of innocent women and children, and quench his thirst with the blood as it flows from their wounds.

A FARMER BOY.

Essex Co., May 20th, 1841.

### SKUNK, SKUNKED.

☞ If it can be demonstrated that the skunk is a *useful* animal, we would move, as an act of justice, that a little more euphonious cognomen be applied to him than the one which he at present bears in the nomenclature of quadrupeds. Can't Dr. Holmes, of the Maine Farmer, suggest a name for the creature which will be more expressive of his character and less repulsive to the ear than that of skunk?—N. E. F.'s PR. DEV.

Well, Mr N. E. F.'s PR. DEV. Esq., if you think a skunk “by any other name will *smell as sweet*,” suppose you call him *muskyferous puppy*? or if that cognomen is not sufficiently *euphonious* and *magniloquent*, suppose you call him *L'Eau de Cologne animal*?—Maine Farmer.

☞ WE thank you, Doctor, for your condescension in complying with our request. (“Nothing is beneath the attention of a *great* man.”) But we must frankly confess that neither of your titles suit us. They are all-sufficiently “*euphonious*,” “*magniloquent*” and *savory* withal. But we wished for a name which would indicate that the skunk had other claims to respectability and protection aside from his *aromatic* peculiarity. Your titles, Doctor, would not do the creature justice:—we shall therefore draw upon our own resources for one that in a measure will. In all coming time then, let the skunk be distinguished from other quadrupeds by the name of *Utilis et Fragrans*—by which we mean to be understood, that he is not only an *odoriferous* but a *useful* animal. WE think our Latin more significant, appropriate and *classical*, than either your French or *Yankee* titles—and if after a “sober, second thought,” you should come to the same opinion, Doctor, will you condescend to signify it?

[“Brother Holmes”—(excuse our familiarity, as it is prompted by “a fellow feeling”)—men have immortalized their names by the accomplishment of a *lesser* good than we are striving to effect.—When you and we! and Gov. HILL, shall have succeeded in “elevating” the skunk to his rightful place among useful animals, by demonstrating that instead of being the enemy of man he is the

destroyer of man's enemies—when we shall have accomplished this, (and our prospects of success grow brighter with the lapse of time,) shall we not merit the title of *public benefactors*? We shall,—and who shall say, that posterity, estimating aright the signal service we have rendered them by our disinterested and philanthropic exertions, may not enrol our names among

“The few, the immortal few,  
That were not born to die.”!!!

Does 'nt your pulse beat quicker, Doctor?—N. E. F.'s PR. DEV. “Esq.”]

P. S.—That title—very flattering—thank you—a man of very quick and just perception of merit, we take you for! “*Esquire!*” ahem!—WE shall pull up our dicky up, hereafter.

[Communicated.]

### ST. GEORGE CO.'S L'ETANG LIME.

A number of individuals have associated themselves for the purpose of manufacturing lime, at St. George, New Brunswick, and have received the sanction of the Provincial Assembly for that purpose; and as their article is as yet but little known, in the States, it never having been brought here in any considerable quantities, until the last year, the agent has thought it advisable to procure certificates from those who have used it during the past year, for the purpose of satisfying those who are unacquainted and who may wish to patronize.

It is, therefore, with this view that the following certificates from those who are actuated by no motives of interest in the success of the company, are hereto annexed:

[Certificates from many individuals we omit for want of room.]

Roxbury Laboratory, Jan. 1, 1841.

In reference to the excellent quality of the L'Etang Lime, I am prepared to state, that it is far superior to any American lime I have seen.

It has been analyzed in my laboratory, and used largely in the manufacture of chemical products here, and found to be of uncommon purity. For bleaching cotton goods, it would be economical to use it at a double price, over any lime sent to the Boston market. In soapmaking, tanning, and indeed all chemical operations requiring the use of lime, it is preferred to any other kind.

I have used it for mortar in building and repairing furnaces, where the strength of the cement is very soon known, and have never found so good lime for this use. The cement formed by mixing this lime with *fully one half more than the usual quantity of sand*, is very hard, close grained and strong after exposure, where ordinary mortar soon crumbles.

Respectfully,

A. A. HAYES,

Agent for Roxbury Coloring and Chemical Co.

The following is from Dr. Charles T. Jackson, Geologist:

Boston, Jan. 1, 1841.

MR DAVIS—Sir—I have been well acquainted with the qualities of the L'Etang lime for four years, having visited and examined the quarries, and used the lime in my laboratory. A specimen of the rock taken from the quarry was analyzed by me in 1836. It contained 98 per cent. of carbonate of lime, and trifling proportions of carbon, oxide of iron

and clay. A few weeks since, at your request, I examined a lot of the quick lime in your warehouse, and took fair average specimens for analysis. I found the lime to be of a very superior quality—well burnt, compact and white. On slaking several lumps of it, I found it good, to my entire satisfaction, since it formed a very bulky and very white and fine hydrate, or water-slaked lime. I have analyzed fair average pieces of this lime, and find it to be remarkably pure, there being but *six tenths* of a grain of siliceous and alumina, (or clay,) and *one tenth* of a grain of oxide of iron in one hundred grains of the quick lime. It contains, then, 99.3 per cent. of lime. There is no magnesia in any of the specimens that I have examined. This freedom from magnesia renders your lime preferable for chemical and agricultural use. It is an excellent article for the manufacture of bleaching powders or chloride of lime, the purest kinds being required for this purpose.

The following experiments were made to test its qualities for mortar:

1000 grains of the lime being exactly slaked with water, and dried at 212° F., increased in weight to 1410 grains, or 41 per cent. in weight from the solidification of water that combined with the lime in forming the hydrate.

One measure of the powdered quick lime, on being slaked, increased in bulk to four measures.

One measure of the powdered lime was slaked and made into a paste with water; four measures of pure white sand were then mixed with it, and the whole was worked into mortar, made into a cake, and allowed to harden. It was found that it would bear even a larger proportion of sand with advantage to the mortar. The ordinary limes of England will not bear more than three measures of sand.

In using the L'Etang lime, I should advise the workman to slake the lime thoroughly before mixing it with the sand, and the mortar will be much better if they even make it into a thin paste, like cream, before the sand is mixed with it. \* \*

Its great strength and purity strongly recommend it to masons for their nicest work, in building and plastering,—and since you furnish the lime at a very low price, it may even be used by the farmer in making his compost, or for spreading upon the soils which may require it.

Respectfully, your ob't serv't,

CHARLES T. JACKSON.

The L'Etang lime contains 99.3-10 per cent. of pure lime in each 100 lbs. of the quick lime.

About 300 lbs. in a cask: 2 1-10 only of impurities.

The Maine lime averages about 60 per cent. of pure lime, and 40 per cent. impurities.

Purchasers are requested to see that the Company's mark is on each cask.

DAVID DAVIS,

Agent, State street, Boston.

[The correctness of this statement we do not call in question; but in justice to the makers and venders of many of the Maine limes, we must add, on the authority of Dr. C. T. Jackson's “First Report on the Geology of Maine,” that J. Ulmer's quarry, *grey*, and E. Ulmer's quarry, *bluish and white*, Thomaston; also, Pierce quarry, *compact with grey stripes*, Hope; and Jordan's quarry, Brunswick, gave as much carbonate of lime as the L'Etang. Many of the quarries in Maine, however, fell far below this.—ED. N. E. F.]

## NEW ENGLAND FARMER, AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, JUNE 2, 1841.

### TILLING OF INDIAN CORN.

The seed is now mostly in the ground, and the attention of farmers must be turned at once to the hoeing of their growing crops. It was the custom of this vicinity only a few years since, to plow deep between the rows of corn, and make a very high hill. This process was deemed essential in good husbandry. The farmer who made but little hill, and left his corn to be supported and kept in an upright position by the helps which nature's Author furnishes, was ridiculed for his oddities, or abused for his slovenliness. We were educated in the belief that the high hill would give the largest corn. This opinion held its place in our mind until within seven years. We recollect distinctly defending that course seven years ago the present summer. And we did it in good faith. But at that time we were more familiar with theology, than with the processes of nature in the fields. Recently our studies have been more in the field than in the closet; and no plant has interested us more than Indian corn. In the summer of '34 we parted the ties, and left the cares of professional pursuits, and sought for health in the fields where our ancestors had long toiled. There the fashion which prevailed in our boyhood of hilling high, had lost much of its hold; in the corn field we found what seemed to us slovenly and insecure hoeing. Soon (in the latter part of July) there swept over our neighborhood a violent wind, accompanied by a most copious fall of rain. The corn yielded to the storm, and lay prostrate, or nearly so. We thought that the folly of omitting to hill was proved. But in four or five days from that time the corn was erect as ever, and we believe that scarcely a stalk was broken on the four acres; while some of our neighbors, whose corn was surrounded by more hill, and which was not laid so flat, were obliged to go through their fields and cut out broken stalks in large quantities. Our corn that year was the largest we ever had, giving 95 bushels to the acre. (The excess that year, is, perhaps, to be ascribed to the fact that the land on which it grew had been *pastured* for several preceding years.) But the rising of the corn, after it had been blown down, led us to inquire whether it could be satisfactorily accounted for. There is little doubt that it can.

Farmers all know that about the time when the ears begin to set, brace roots shoot out from the stalk just above the surface of the ground. These grow and strengthen as the ear increases in size. They fit themselves to sustain the burden they are to bear. Now if you earth up five or six inches around the bottom of the stalk, then the brace roots put out as many inches from the bottom, and the part of the stalk between the brace roots and the other roots, (those that form when the corn begins to grow, and which are the mouths through which it takes in its food) that part of the stalk being buried in the earth becomes brittle, so that if the brace roots loose their hold when the winds are high, the stalk will snap just at the surface of the ground. When this has happened, no process of nature or art will repair the harm. Now the brace roots are more liable to lose their hold when they fix and grow in the comparatively dry and loose earth on the top of a high corn-hill, than when they take hold of the moister and firmer earth on a level surface, where no hill has been made. The roots themselves will do more towards supporting the corn in the latter case than in the former. And though it may be true that the part of the stalk below these,

does, when surrounded by earth, help to prop the corn; yet though this help is afforded, the ability of the roots is lessened; and if the roots fail, the corn *breaks* and is ruined, or nearly so. But when there is no hill, if the corn be tipped over, it yields at the very bottom; there is no breaking; the effect is an *uprooting* on one side; the roots on the other side retain their place and continue to throw their nourishment into the stalk, which though "cast down is not destroyed"—not broken—and in this situation the loosened brace roots, nourished through those feeding roots that are unmoved, find a way to get back into their former position, and put the stalk erect, to an extent that has often excited our wonder, and which no evidence but that of actual observation, could have proved to us. Led by curiosity on this point, we strolled through the corn-fields, on as many as ten different farms, in the autumn of '39, subsequent to the blow which bore down all the corn, and we, noticing the effects in connection with every grade of hoeing, from the high hill to the flat surface, were satisfied that there was no advantage in *any raising* of the earth around the corn. Though where the surface was flat, the mass of the corn on the field was in a more horizontal position, yet none of it was broken, and much fewer of the ears and stalks rested *on the ground*. Though all the stalks went far towards the ground, and an observer at a distance would think them in a bad position; yet upon passing through the field he would find them held by the roots from going quite down, and that in their oblique position they were doing quite well. Our crop that year was more than 80 bushels to the acre. (See transactions of Essex Agricultural Society, 1839. Daniel Putnam's statement.) The result of all our observations is, that; excepting where you wish to hasten the maturity of the crop *at the expense of its size*, which is often desirable in cold lands, there is no advantage whatever in making any hill, if the manure, (as it should be) has all been spread. Where manure has been put in the hill, of course, earth enough must be hoed on to keep it from drying up. The foregoing remarks are in part the reasons for our advice to farmers that they avoid hilling their corn. Stir the surface of the ground with the hoe as many times as you please—the more the better—but do not make hills.

It has been the custom to plow between the rows and hoe *immediately* after ploughing. This custom facilitates the hoeing, where a hill is to be made; but where the surface is kept level, it matters not in regard to the hoeing when the plowing is done. Our opinion is in favor of the cultivator in preference to the plow; and we prefer the simple straight harrow teeth set in the cultivator frame, to the cultivator. Perhaps no evil results from stirring the earth deep between the rows at the first and second time of hoeing. We think it might *be well* to run the plow in the centre between the rows as deep as may be without disturbing the sod; but the earth thus turned up should not be put around the corn, but should be harrowed back into the place from which it was turned up. (This was done when our large crop was obtained in '34.) This would be stirring the earth well for the admission of light and air to the roots—an object very desirable. But neither the plow nor the cultivator should be brought *near* the corn after it is well started in its growth. These implements rend too many of the roots. A simple harrow, running lightly, and just breaking up the slight surface crust formed by the rains and dews, answers the one great purpose of letting in air and light, while it spares most of the roots. Our theory being, that one great object in the tillage of this crop is to keep passages always open for the admission of light and air, we have some objection to the use of the hoe *immediately* after the plow, cultivator or har-

row. Suppose that one intends to work his land on which this crop grows, three times in the course of six weeks. Is it better to do *all*, both plowing and hoeing, on the first and third weeks of June and the first one in July? or would you plow the first week, hoe the second, plow the third, hoe the fourth, plow the fifth and hoe the sixth? We recommend the latter; and for the reason that this course would keep *nearly all the time* a part of the surface crust so broken as to give free admission to air and light. Where ground is so farrowed or marked out as to admit of the horse's passing both ways, we prefer harrowing one way June 1st; the other way 5th; hoeing 10th; harrowing the same way as at first, 15th; the other way 20th; hoeing 25th; harrowing July 1st; harrowing 5th; hoeing 10th. This process which requires but little more labor than the common one, we have believed to be much more advantageous.

Our conjecture is that another routine, carrying us 15 days later, would be as serviceable as either of the preceding; but as we have no experience on this point, we call it only *conjecture*.

### L'ETANG LIME.

We have copied today parts of a statement of facts and opinions, which has been made public in relation to this lime. Its excellencies have repeatedly been mentioned to us within the last few months, by persons acquainted with its properties, and who had no interest in its sale. There can be no doubt that it is a better article for most purposes, than any other lime in our market.

We allude to it as an article deserving the attention of those persons who are accustomed to obtain lime in this city for agricultural purposes. In many instances where lime is applied to the land, we believe that the magnesia contained in it is sufficient to prevent or counteract all the desired influences of the lime itself, so that the application is rendered useless. Here is a lime entirely free from magnesia and every substance unfavorable to vegetation; and we ask those who are accustomed to apply lime to their soils, whether it may not be advisable for them to ascertain by experiment whether this would not be to them more profitable than the kinds they have been accustomed to use.

### "UTILIS ET FRAGRANS."

Such are the epithets which our good fellow who sticks the types for us, applies to the "puppy" which Pat thought must have "come from Wethersfield—for basides baing after baing all over black and all over white, he stunk so he could 'nt smell him."—"Frograns"!!! Fragrant is he? Yes. But the rose, the pink, and all the sweet flowers appear before us in blushing modesty, beseeching us not to permit a *foul odor* to become associated with the word which has long described their peculiar charm. We cannot withstand the eloquence of these daughters of Flora, and we say—*tetrum-fragrans*—foul smelling—His claim to be called *utilis*, we will let pass—trusting that that gentleman who last winter lounged to give us a communication upon a certain subject, but was deterred by fear that it would "*smell too loud*," will now come to the support of our *P. D.*, and prove that he has good reasons for his choice of the epithet *Utilis*.—Be it known that we, the Editor, have not before ventured to touch this subject, but have referred it to our *P. D.*, (i. e. Philologia Doctor—or Doctor of Language;) it is there in proper and competent hands, and with him we leave it.

\*We, the "*P. D.*" aforesaid, would like to know how our distinguished friend, the Editor, means for us to take that word "proper."—"P. D."

## CANKER WORMS.

Brighton, May 31, 1841.

GENTLEMEN—The Canker worms are going to be very destructive this season, as will be seen by inspecting the foliage of those kinds of trees that they deplete upon.

Last year after we observed the trees considerably seared, we set men to work upon one large Orchard of trees, in what we call the sheep pasture, back of the Cattle Fair Hotel. The good consequences resulting from it was, we preserved the remaining part of the foliage, and most if not all of the fruit. The worm readily falls to the ground, by giving the limb a sudden motion with the fist, or a club prepared with something soft at the end of it, to prevent injury to the bark.

The trees may at the same time be tarred and effectually prevent their (the worms) ascending again. If this precaution is taken, a considerable portion of them will be prevented, from various causes, finding their way to the stock of the trees, and much benefit will result from this simple operation, of merely starting them from the limbs, and breaking the web attached to them.

I will thank you to show this notice to our friend, Mr Putnam, that he may if he thinks it expedient give something in his next paper to influence the public to turn their attention to this, and the ensuing week, to destroy this pest to Horticulturists.

Very truly your Friend,  
JNO. WINSHIP.

MESSRS J. BRECK &amp; Co.

## THERMOMETRICAL.

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northerly exposure, week ending May 30.

May, 1841.	5 A.M.	12 M.	7 P.M.	Wind.
Monday,	24	59	83	70 N.
Tuesday,	25	53	82	63 S. W.
Wednesday,	26	61	82	63 S. W.
Thursday,	27	56	80	67 S. E.
Friday,	28	62	81	73 S. W.
Saturday,	29	61	72	52 N. E.
Sunday,	30	50	60	56 N. E.

The weather has been fine for ten days past, and vegetation has made very rapid growth. Apple Trees in blossom and quite full, considering the great crop we had last year.

## BRIGHTON MARKET.—MONDAY, MAY 31, 1841.

Reported for the New England Farmer.

At Market 295 Beef Cattle, 30 pair of Working Oxen, 20 Cows and Calves, 760 Swine. 30 Beef Cattle remain unsold.

PRICES.—Beef Cattle—Prices have further declined. We quote First quality, \$6 75 a 7 00. Second quality, \$6 25 a 6 50. Third quality, \$5 25 a 6 00.

Working Oxen.—Sales, \$50, \$58, \$62, \$75, \$88, \$90, \$100, and \$105.

Cows and Calves.—Sales, \$23, \$27, \$33, \$37, and \$40.

Swine.—Lots to peddle 5 1-8 and 5 1-4 for sows, and 6 1-8 and 6 1-4 for barrows. A lot large barrows at 5 1-2. At retail from 6 to 8.

## WHOLESALE PRICES CURRENT.

Corrected with great care, weekly

SEEDS. Herds Grass, very little in market. Red Top, new seed by the bag 50 to 55 c. Clover—Northern, 13c.—Southern, 8 to 9 c. Flax Seed, \$1, 37 to 1 50 bu. Lucerne, 25 c. per lb.

FLOUR. Howard Street \$5 37—Genesee \$5 25—Ohio \$5 12.

GRAIN. Corn—Northern Yellow none—Round Yellow 63—Southern Flat Yellow 60—White 64.—Rye—Northern 60 to 65—Southern 50 to 55. Oats—Southern 36 to 33—Northern 33 to 40.

PROVISIONS. Beef—Mess \$10 50 to 11 00—Prime \$6 50—No. 1 \$9 00. Pork—Extra—15 00—Clear 14 50—Mess \$13 00. Hams—Northern 9 c. per lb.—Southern, none. Lard—Boston 9 c. per lb.—Southern, 8 to 8 1-2. Butter—Lump 18 to 22—Firkin 12 to 18—Shipping 8 to 14. Whole Hogs 5 1-2 to 6 c.—Pigs 5 c.

HAY, per ton, \$20 to 22 50—Eastern Screwed \$17 00. CHEESE—Old 11 c.—New 8.

EGGS, 11 a 12.

WOOL—The market for this article has not experienced any change of late. Pulled Wool is rather scarce, and there is but a limited supply of low Fleeces, and of fine Fleeces the stock is also moderate. Prime or Saxony Fleeces, washed,

lb. 50 to 55 c.—American full blood, washed, 47 to 50—Do 3 4 blood, washed, 41 to 46—Do. 1-2 blood, washed, 36 to 40—1-4 and common do, 35 to 37—Smyrna Sheep, washed, 20 to 23—Do. unwashed, 10 to 14—Bengalia Sheep, 8 to 10—Buenos Ayres unpicked, 7 to 10—Superfine Northern pulled lamb 43 to 46—No. 1 do. do. 37 to 42—No 2 do do 26 to 30—No 3 do do 18 to 20.

## MASSACHUSETTS HORTICULTURAL SOCIETY

A stated meeting will be held at the Rooms of said Society, on Saturday next, June 5, at 11 o'clock, A. M.

E. M. RICHARDS,  
Recording Secretary.

June 2.

## DAHLIA POLES.

500 dozens of Dahlia and Bean Poles. Also, 2000 feet of Ladders, 16 to 40 feet in length, for sale by MOSES FRENCH, Jr., Maine wharf, Broad st. near the bottom of Summer st. 6w June 2

## FOR SALE.

GEORGE THE THIRD, who has been honored with the Second and First State premiums in 1839, at Worcester, and at Concord in 1840, by the Committees appointed by the State, for awarding such premiums, is of Durham Breed, was imported as most superior stock, and is thought by judges to possess more valuable points, than any to be found in any other animal of the kind.

Also, two young Bulls, Sired by the above, their Dams are imported and of the best possible blood.

For further information apply to CHARLES WIL-LARD 2d, Still River Village, Harvard. 4w June 2

## GRINDSTONES.

An extensive assortment of Water and Hand Grindstones constantly on hand and for sale by AMMI C. LOMBAARD & CO. 13 Lewis's Wharf. 1stly. Nov. 17.

## FENCE CHAINS.

Just received from England, 10,000 feet Chains, suitable for Fences or other purposes. For sale by J. BRECK & CO., No. 52 North Market st. April 21

## DURHAM COW FOR SALE.

A young full blooded Durham Cow and her calf—a very desirable animal in every particular. Apply to EDWARD TITCOMB, Jr., Newburyport. May 5

## SWEET POTATO SLIPS.

Just received and for sale by J. BRECK & CO., a supply of Sweet Potato Slips. No 52, North Market st. April 23.

## CLOVER &amp; RED TOP.

50 tierces and 100 lbs. Prime Clover.  
200 Bags Redtop, new seed.  
50 lbs. Herds Grass prime quality, for sale by  
March 24 J. BRECK & Co.

## AGRICULTURAL IMPLEMENTS, &amp;c.

The Proprietors of the New England Agricultural Warehouse and Seed Store No. 51 and 52 North Market street, would inform their customers and the public generally that they have on hand the most extensive assortment of Agricultural and Horticultural Tools to be found in the United States. Part of which are the following:

1000 Howard's Patent Cast Iron Ploughs	100 doz. Cast Steel Shovels.
300 Common do. do.	150 " Common do.
200 Cultivators.	100 " Spades.
100 Greene's Straw Cutters.	500 " Grass Scythes.
50 Willis' do. do.	300 " Patent Snath's.
100 Common do. do.	200 " Common do.
100 Willis' Patent Corn Shellers.	500 " Hay Rakes.
50 Common do do.	200 " Garden do.
200 Willis' Seed Sowers.	200 " Manure Forks.
50 " Vegetable Cutters.	300 " Hay do.
50 Common do. do.	500 Pair Trace Chains.
200 Hand Corn Mills.	100 " Truck do.
200 Grain Cradles.	100 Draft do.
100 Ox Yokes.	500 Tie up do.
1500 Doz. Scythe Stones.	50 doz. Halter do.
3000 " Austin's Rifles.	1000 yards Fence do.
	25 Grind Stones on rollers.

March 17.

## PLUMS, PEARS, GOOSEBERRIES, &amp;c.

Just received by JOSEPH BRECK & CO., from London, a fine assortment of Plum and Pear Trees, which are offered at reduced prices.

Gooseberries, White and Red Currants, Raspberries and every article in the Nursery line furnished at short notice.

JOS. BRECK & CO., No. 52 North Market Boston. April 7, 1841.

## WILLIS'S LATEST IMPROVED SEED SOWER.

Willis's latest Improved Seed Sower, invented the last season; one of the most perfect machines ever introduced for the purpose. In using this machine, the farmer may be certain that his seed is put into the ground, and at the same time in the best possible manner. There has been a great difficulty in machines for sowing garden seeds; they are very apt to clog up and the farmer might go over an acre of land and not sow a single seed; but not so with this; it is so constructed that it cannot possibly clog. In using this sower, the farmer can save one half of his seed, and do the work at less than one quarter the expense of the common way of sowing seeds, and have it done in a much better manner; it opens the furrow, drops the seed, and covers it over and rolls them down. It will sow almost any kind of Garden Seeds; say Ruta Baga, Mangel Wurtzel, Turnips, Carrots, Beets, Parsnips, Onions. It is highly recommended by a great number of persons who used it the past season. For sale at the N. E. Agricultural Warehouse and Seed Store by JOSEPH BRECK & CO. March 31.

## WINSHIP'S NURSERY.

BRIGHTON, NEAR BOSTON,

Situated on the line of the Boston and Worcester Rail Road,—5 miles from the city.

The Proprietors of this extensive nursery beg leave to inform their friends and the public, that they are ready to furnish orders to any amount, for Forest Trees, indigenous and exotic.

Fruit Trees, including all the varieties of Pears, Peaches, Plums, Nectarines, Cherries, &c. &c.

Vines—Shrubs. Green House Plants, &c. Catalogues may be obtained by applying at the Nursery. Trees carefully packed, to ensure safety in long voyages. Orders left at the New England Seed Store of J. BRECK & Co. Nos. 51 and 52, North Market street, will be delivered the day following.

Letters containing orders, addressed to the subscribers, J. & F. WINSHIP.

Brighton Nurseries, March 24, 1841.

## PEAR, PLUM, GRAPE VINES, &amp;c.

3000 Pear Trees, of the most approved kinds. 2000 Plum Trees, of the most approved kinds and extra size—many of them have borne this season.

Apple, Cherry and Peach Trees, of different kinds.

500 Quince Trees.

4000 Isabella and Catawba Grape Vines, from 6 to 15 feet high; most of them have borne fruit. Black Hamburg. Sweetwater, Pond's.

30,000 Giant Asparagus Roots.

Gooseberry, Currants, Raspberries, of good kinds.

5000 Wilmot's Early Rhubarb or Pie Plants, lately introduced.

2000 Cherry and Pear Stocks; 1000 Plums; Roses, &amp;c. of all kinds.

All orders sent to the subscriber at Cambridgeport or left with JOSEPH BRECK & CO., will meet with immediate attention.

Cambridgeport, Mass., Feb. 24. SAMUEL POND.

## FRUIT AND ORNAMENTAL TREES, &amp;c

NURSERY OF WILLIAM KENRICK.

12,000 Pear and Plum Trees.—Large and new additions of Pear and Plum Trees have lately been received, many kinds of which are alike new to our country, and very extraordinary.

Such have been the selections which have been made by the subscriber in Europe, and in person, during the last Autumn, where all have been proved; those kinds already well known amongst us being identified by him by the wood and the leaf.

All orders addressed to the subscriber, or left with Joseph Breck & Co., New England Farmer Office, will be promptly attended to, and Trees, when so ordered, will be securely packed for safe transportation to distant places.

WILLIAM KENRICK.

Nonantum Hill, Newton, near Boston, March 2.

## MISCELLANEOUS.

## WHAT SHOULD PARENTS DO WITH THEIR BOYS?

Many parents have sons, whom, when they arrive at years of discretion, they are uncertain what to do with. For instance a respectable mechanic has a good stout, hearty, well disposed son, whom he wishes to bring up respectably. If he is in easy circumstances, he, somehow or other seems to think that his son must be brought up to some higher business than a mechanic. He therefore concludes that he must send him to college, and make him a lawyer, a doctor, or a clergyman, and the honest well meaning parent labors hard to earn money to pay the expenses of a collegiate education, for the purpose of making him *respectable*, to make him take a higher rank in the world than that of a mechanic. Here is a great mistake. When the boy leaves college, what is he to do? He is then just qualified for nothing. He turns pedagogue for a while. He beats learning into the youthful progeny, but few, very few, think of pursuing the business of a school master as a permanent profession. After continuing it for a year or two, he quits it, and commences the study of one of the learned professions. Here are three or four years spent in preparing to become a professional man, and at much additional expence to his father. He at last is admitted to the bar, or receives a degree of M. D., or is licensed to preach. The next thing is to get a living by the profession he has chosen, and this is not so easy a matter. All the learned professions are full to overflowing, and there seems to be no room for new beginners. The consequence is, that the young aspirant for eminence, drags along, without getting business enough to pay the rent of an office. Year after year he toils, or would toil, if he had any thing to do, without making half enough to pay his own expenses. To be sure, there are some, whose superior intellect and commanding talents, will enable them to rise at once to eminence, and to command a business which will render them independent; but these cases are few and far between.

When such do occur, the superiority of mental power will shine out beforehand, and should be fostered. But the propensity which some mechanics have of bringing their sons up at college to make them more *respectable*, we think to be a great error. It is injuring a son more than it is benefiting him unless some extraordinary mental energy displays itself in the youth. He goes through college, and thence,

"Proceeding soon a graduated dunce,"

he is just fitted for—what? He has spent the best part of his youthful days, in qualifying himself for a profession from which he cannot gain a living, or at least but a very scanty one.

In our humble opinion, as the professions now are, we should say to mechanics, and indeed to professional men, in ninety-nine cases out of a hundred, give your sons a good education, and then put them as apprentices to some respectable mechanical business. They will then as soon as the time of their apprenticeship is expired be independent, capable of earning an honest living at once. The profession of a mechanic, is daily becoming more and more respectable, thanks to the good sense and good judgment of the present age, and it can no longer be thrown out as a mark of reproach, you are a mechanic, or the son of a mechanic. It is on the contrary an honor.

As the question has been recently discussed among a few mechanics, what they should do with their sons, we would repeat, give them a good education and then bring them up as mechanics or farmers, if you wish to ensure them a comfortable, honorable, and independent living and station in society.—*Boston Transcript.*

## GARDEN SEEDS.

For sale by JOSEPH BRECK & Co. at the NEW ENGLAND FARMER OFFICE, No. 51 and 52 North Market St. Boston. The subscribers would inform the public that they have now on hand the largest collection of seeds ever before offered by sale in this city, embracing every variety of Field, Kitchen, Garden, and Ornamental Flower Seeds desirable for this or any other Climate.

Our seeds are either raised under our own inspection or imported from respectable houses in Europe, and having taken extraordinary pains to obtain such as are pure and genuine, we can confidently recommend them to our customers and friends, and feel assured they will prove satisfactory to all who try them.

Dealers in seeds are requested to forward their orders in season. Boxes for retailing from 3 dollars, and upwards will be sent out on commission allowing a liberal discount and take back what remain unsold.

Letters and orders with good reference will meet with prompt attention.

## FIELD SEEDS.

Sugar Beet.	Rata Baga.
Mangel Wurtzel.	Ballantine's New Royal do.
New Red Globe do. } superior	White Tankard Turnip.
Yellow do. } varieties.	Red do.
Carrot Long Orange.	Red Round do.
" Altringham.	White do.
" New White, extra fine.	White Globe do.
Pumpkin, sorts.	Green Round do.
Wheat—various sorts.	Purple Top Hybrid do.
Burley, do.	Barley.
Rye, do.	Broom Corn.
Potatoes, do.	Millet.
Indian Corn, do.	Buckthorn. } for Hedges.
Oats, do.	Locust.

## GARDEN SEEDS.

Artichoke, Asparagus, Beans of every description, Beets of sorts, Borecole, Broccoli, Brussels Sprouts, Cauliflower, Caraway, Celery, of the most improved sorts, Cabbage 20 sorts, Carrot, all the varieties, Cucumber do, Cress, Egg Plant, Endive, Indian Corn, Kale, Leek, Lettuce in great variety, Melons, do. Martynca, Mustard, Nasturtium, Okra, Onion of sorts, Pepper do, Pumpkin do, Parsnip, Parsley, Peas, a very great variety, Rhubarb for tarts, Radish of sorts, Salsify, Squash of sorts, Tomato, Turnip 20 varieties.

## SWEET AND POT HERBS.

Thyme.	Sweet Basil.
Sweet Marjoram.	Lavender.
Sage.	Lemon Balm.
Summersavory.	Anise.
Medicinal Herbs, &c.	

## ORNAMENTAL FLOWER SEEDS.

Three hundred varieties, embracing all the finest sorts. Packages of 20 fine sorts for one dollar.

Those who prefer to have their Seeds put up in papers ready for retail, can be accommodated—each packet neatly closed and labelled with printed directions. Price 50 cents, per dozen papers, which are retailed here at 6-4 cents each.

Fruit and ornamental trees, of the greatest variety, supplied at nurseryman's prices, and orders solicited. These will be packed, when required, to go to any part of the U. States. JOSEPH BRECK & CO.

## DRAFT AND TRACE CHAINS.

Just received by Packet Coromanda, 400 pair Trace Chains, suitable for Ploughing.  
200 " Truck and leading Chains.  
200 " Draft Chains. For sale by J. BRECK & CO., No. 52 North Market st. April 21

## TYE UP CHAINS.

Just received by Packet Coromanda, 500 Chains for tying up Cattle.

These chains, introduced by E. H. DERRY, Esq. of Salem, and Col. JACQUES, for the purpose of securing cattle to the stall, are found to be the safest and most convenient mode of fastening cows and oxen to the stanchion.

For sale by J. BRECK & CO., No. 52 North Market st.

## PURE SPERM OIL.

EDMUND T. HASTINGS & CO., No. 101 State St, keep constantly for sale, Winter, Spring and Fall Sperm Oil, bleached and unbleached; which they warrant to be of the best quality and to burn without crusting.

Oil Canisters of various sizes.

Boston, Jan. 1, 1841.

1841

## HOWARD'S IMPROVED EASY DRAUGHT PLOUGH.

Great improvements have been made the past year in the form and workmanship of these Ploughs; the mould board has been so formed as to lay the furrow completely over, turning in every particle of grass or stubble, and leaving the ground in the best possible manner. The length of the mould board has been very much increased, so that the Plough works with the greatest ease, both with respect to the holding and the team. The Committee at the late trial of Ploughs at Worcester, say,

"Should our opinion be asked as to which of the Ploughs we should prefer for use on a farm, we might perhaps say to the inquirer, if your land is mostly light and easy to work, try Prouty & Mears, but if your land is heavy, hard or rocky, BEGIN WITH MR. HOWARD'S."

At the above mentioned trial the Howard Plough did more work, with the same power of team, than any other plough exhibited. No other turned more than twentyseven and one half inches, to the 112 lbs. draught, while the Howard Plough turned twenty-nine and one half inches, to the same power of team! All acknowledge that Howard's Ploughs are much the strongest and most substantially made.

There has been quite an improvement made on the shoe, or land side of this Plough, which can be renewed without having to furnish a new landside: this shoe likewise secures the mould board and landside together, and strengthens the Plough very much.

The price of the Ploughs is from \$6 to \$15. A Plough, sufficient for breaking up with four cattle, will cost about \$10 50, and with cutter \$1, with wheel and cutter, \$2 50 extra.

The above Ploughs are for sale, wholesale and retail, at the New England Agricultural Warehouse and Seed Store, Nos. 51 & 52 North Market Street, by JOSEPH BRECK & CO.

## TO THE PUBLIC.

DR. CHARLES M. WOOD, *Veterinary Surgeon*, respectfully informs his friends and the public, that he has removed from Blossom St., to 69 Carver St. All orders left at his house, or at the stable of Wm. Forbes, No. 7 Sudbury St., will be promptly attended to, and gratefully acknowledged. All diseases of Horses, Cattle or Swine, are attended to. Also, castrating and spaying.

For the information of those who may have occasion for his services, and are unacquainted with his practice, he is politely permitted to refer to the following gentlemen who have employed him for a number of years past.

Wm. Forbes,	Williams & Pearson,
Wm. J. Niles,	Geo. Meacham,
Joshua Seward,	S. K. Bayley,
J. E. Read,	L. Maynard,
James F. Fullham,	Isaac Foster,
Wm P. Loring,	Artemas White,
Joseph C. Pray.	Brown & Sevence.

Boston, April 23.

## DOUBLE DAHLIAS.

We have for sale a very large collection of the finest Double Dahlias, of the most esteemed sorts. J. BRECK & CO., No. 52, North Market St. April 23

## HERBACEOUS PLANTS.

J. BRECK & CO., offer for sale a great variety of beautiful Herbaceous Plants, including 20 varieties Phlox, Perennial Coreopsis of sorts, Delphinium, Campanulas in great variety, Double Pinks, Dracoecephalums, Double Scarlet Lychues, Double Ragged Robin, Spiraea of sorts, Iris do. with a great variety of others. Also, Honeysuckles, Roses, and other ornamental Shrubs.

## NEW ENGLAND FARMER.

## A WEEKLY PAPER.

The Editorial department of this paper having come into the hands of the subscriber, he is now authorized by the publishers to inform the public that the price of the paper is reduced. In future the terms will be \$2 per year in advance, or \$2 50 if not paid within thirty days. ALLEN PUTNAM.

N. B.—Postmasters are required by law to frank all subscriptions and remittances for newspapers, without expence to subscribers.

## ON THE ORIGIN AND ACTION OF HUMUS.

All plants and vegetable structures undergo two processes of decomposition after death. One of these is named *fermentation*, the other *decay*, *putrefaction*, or *eremacausis*.\*

(Eremacausis is the art of gradual combination of the combustible elements of a body with the oxygen of the air; a slow combustion or oxidation.—The conversion of wood into humus, the formation of acetic acid out of alcohol, nitrification, and numerous other processes, are of this nature. Vegetable juices of every kind, parts of animal and vegetable substances, moist sawdust, blood, &c., cannot be exposed to the air, without suffering immediately a progressive change of color and properties, during which oxygen is absorbed. The property of suffering this change is possessed in the highest degree by substances which contain nitrogen.)

Decay is a slow process of combustion, a process, therefore, in which the combustible parts of a plant unite with the oxygen of the atmosphere.

The decay of woody fibre (the principal constituent of all plants,) is accompanied by a phenomenon of a peculiar kind. This substance, in contact with air or oxygen gas, converts the latter into an equal volume of carbonic acid, and its decay ceases upon the disappearance of the oxygen. If the carbonic acid is removed, and oxygen replaced, its decay recommences, that is, it again converts oxygen into carbonic acid. Woody fibre consists of carbon and the elements of water; and if we judge only from the products formed during its decomposition, and from those formed by pure charcoal, burned at a high temperature, we might conclude that the causes were the same in both: the decay of woody fibre proceeds, therefore, as if no hydrogen or oxygen entered into its composition.

A very long time is required for the completion of this process of combustion, and the presence of water is necessary for its maintenance: alkalies promote it, but acids retard it; all antiseptic substances, such as sulphurous acid, the mercurial salts, empyreumatic oils, &c., cause its complete cessation.

Woody fibre, in a state of decay, is the substance called *humus*.

The conversion of woody fibre into the substances termed *humus* and *mould* is, on account of its influence on vegetation, one of the most remarkable processes of decomposition which occur in nature.

Decay is not less important in another point of view; for, by means of its influence on dead vegetable matter, the oxygen which plants retained during life, is again restored to the atmosphere.

The decomposition of woody fibre is effected in

three forms, the results of which are different, so that it is necessary to consider each separately.

The first takes place when it is in the moist condition, and subject to free, uninterrupted access of air; the second occurs when air is excluded; and the third when the wood is covered with water, and in contact with putrefying organic matter.

It is known that woody fibre may be kept under water or in dry air, for thousands of years without suffering any appreciable change; but that when brought into contact with air in the moist condition, it converts the oxygen surrounding it into the same volume of carbonic acid, and is itself gradually changed into a yellowish brown, or black matter, of a loose texture.

According to the experiments of De Saussure, 240 parts of dry sawdust of oak wood convert 10 cubic inches of oxygen into the same quantity of carbonic acid, which contains 3 parts, by weight, of carbon; while the weight of the sawdust is diminished by 15 parts. Hence 12 parts by weight, of water, are at the same time separated from the elements of the wood.

It has already been mentioned, that pure woody fibre contains carbon and the elements of water. Humus, however, is not produced by the decay of pure woody fibre, but by that of wood which contains foreign soluble and insoluble organic substances, besides its essential constituent.

Humus acts in the same manner in a soil permeable to air as in the air itself: it is a continued source of carbonic acid, which it emits very slowly. An atmosphere of carbonic acid, formed at the expense of the oxygen of the air, surrounds every particle of decaying humus. The cultivation of land, by tilling and loosening the soil, causes a free and unobstructed access of air. An atmosphere of carbonic acid is, therefore, contained in every fertile soil, and is the first and most important food for the young plants which grow in it.

In spring, when those organs of plants are absent, which nature has appointed for the assumption of nourishment from the atmosphere, the component substance of the seeds is exclusively employed in the formation of the roots. Each new radicle fibril which a plant acquires, may be regarded as constituting at the same time a mouth, a lung, and a stomach. The roots perform the functions of the leaves from the first moment of their formation; they extract from the soil their proper nutriment, namely, the carbonic acid generated by the humus.

By loosening the soil which surrounds young plants, we favor the access of air, and the formation of carbonic acid; and on the other hand the quantity of their food is diminished by every difficulty which opposes the renewal of air. A plant itself effects this change of air at a certain period of its growth. The carbonic acid, which protects the undecayed humus from further change, is absorbed and taken away by the fine fibres of the roots, and by the roots themselves; this is replaced by atmospheric air, by which process the decay is renewed, and a fresh portion of carbonic acid formed. A plant at this time receives its food both by

the roots and by the organs above ground, and advances rapidly to maturity.

When a plant is quite matured, and when the organs by which it obtains food from the atmosphere, are formed, the carbonic acid of the soil is no further required.

Deficiency of moisture in the soil, or its complete dryness, does not now check the growth of a plant, provided it receives from the dew and the atmosphere as much as is requisite for the process of assimilation. During the heat of summer it derives its carbon exclusively from the atmosphere.

We do not know what height and strength nature has allotted to plants; we are acquainted only with the size which they usually attain. Oaks are shown both in London and Amsterdam, as remarkable curiosities, which have been reared by Chinese gardeners, and are only one foot and a half in height, although their trunks, barks, leaves, branches, and whole habitus, evince a venerable age. The small turnip, grown at Teltow,\* when placed in a soil which yields as much nourishment as it can take up, increases to several pounds in weight.

*The size of a plant is proportional to the surface of the organs which are destined to convey food to it.* A plant gains another mouth and stomach with every new fibre of root and every new leaf.

The power which roots possess of taking up nourishment, does not cease as long as nutriment is present. When the food of a plant is in greater quantity than its organs require for their own perfect development, the superfluous nutriment is not returned to the soil, but is employed in the formation of new organs. At the side of a cell already formed, another cell arises; at the side of a twig and leaf, a new twig and leaf are developed. These new parts could not have been formed had there not been an excess of nourishment. The sugar and mucilage produced in the seeds, form the nutriment of the young plants, and disappear during the development of the buds, green sprouts, and leaves.

The power of absorbing nutriment from the atmosphere, with which the leaves of plants are endowed, being proportionate to the extent of their surface, every increase in the size and number of these parts is necessarily attended with an increase of nutritive power, and a consequent further development of new leaves and branches. Leaves, twigs, and branches, when completely matured, as they do not become larger, do not need food for their support. For their existence as organs, they require only the means necessary for the performance of the special functions to which they are destined by nature; they do not exist on their own account.

We know that the functions of the leaves and other parts of plants are to absorb carbonic acid, and with the aid of light and moisture, to appropriate its carbon. These processes are continually in operation; they commence with the first forma-

\*Teltow is a village near Berlin, where small turnips are cultivated in a sandy soil: they are much esteemed, and weigh rarely above one ounce.

\*The word *eremacausis* was proposed by the author some time since, in order to explain the true nature of putrefaction: it is compounded from two Greek words signifying *slow combustion*.—Tr.

tion of the leaves, and do not cease with their perfect development. But the new products arising from this continued assimilation, are no longer employed by the perfect leaves to their own increase: they serve for the formation of woody fibre, and are the solid matters of similar composition. The leaves now produce sugar, amylin or starch, and acids, which were previously formed by the roots when they were necessary for the development of the stem, buds, leaves and branches of the plant.

The organs of assimilation, at this period of their life, receive more nourishment from the atmosphere than they employ in their own sustenance, and when the formation of the woody substance has advanced to a certain extent, the expenditure of the nutriment, the supply of which still remains the same, takes a new direction, and blossoms are produced. The functions of the leaves of most plants cease upon the ripening of their fruit, because the products of their action are no longer needed. They now yield to the chemical influence of the oxygen of the air, generally suffer therefrom a change in color, and fall off.

A peculiar "transformation" of the matters contained in all plants takes place in the period between blossoming and the ripening of the fruit; new compounds are produced, which furnish constituents of the blossoms, fruit, and seed. An organic chemical "transformation" is the separation of the elements of one or several combinations, and their reunion into two or several others, which contain the same number of elements, either grouped in another manner, or in different proportions. Of two compounds formed in consequence of such a change, one remains as a component part of the blossom or fruit, while the other is separated by the roots in the form of excrementitious matter. No process of nutrition can be conceived to subsist in animals or vegetables, without a separation of effete matters. We know, indeed, that an organized body cannot generate substances, but can only change the mode of their combination, and that its sustenance and reproduction depend upon the chemical transformation of the matters which are employed as its nutriment, and which contain its own constituent elements.

Whatever we regard as the cause of these transformations, whether the *Vital Principle*, *Increase of Temperature*, *Light*, *Galvanism*, or any other influence, the act of transformation is a purely chemical process. *Combination* and *Decomposition* can take place only when the elements are disposed to these changes. That which chemists name *affinity* indicates only the degree in which they possess this disposition. It will be shown, when considering the processes of fermentation and putrefaction, that every disturbance of the mutual attraction subsisting between the elements of a body, gives rise to transformation. The elements arrange themselves according to the degrees of their reciprocal attraction into new combinations, which are incapable of further change, under the same conditions.

Plants thrive in powdered charcoal, and may be brought to blossom and bear fruit if exposed to the influence of the rain and the atmosphere; the charcoal may be previously heated to redness. Charcoal is the most "indifferent" and most unchangeable substance known; it may be kept for centuries without change, and is therefore not subject to decomposition. The only substances which it can yield to plants are some salts, which it contains, amongst which is silicate of potash. It

is known, however, to possess the power of condensing gases within its pores, and particularly carbonic acid. And it is by virtue of this power that the roots of plants are supplied in charcoal exactly as in humus, with an atmosphere of carbonic acid and air, which is renewed as quickly as it is abstracted.

In charcoal powder, which had been used for this purpose by *Lukas* for several years, *Buchner* found a brown substance soluble in alkalies. This substance was evidently due to the secretion from the roots of the plants which grew in it.

A plant placed in a closed vessel in which the air, and therefore the carbonic acid, cannot be renewed, dies exactly as it would do in the vacuum of an air-pump, or in an atmosphere of nitrogen or carbonic acid, even though its roots be fixed in the richest mould.

Plants do not, however, attain maturity, under ordinary circumstances, in charcoal powder, when they are moistened with pure distilled water instead of rain or river water. Rain water must, therefore, contain within it one of the essentials of vegetable life; and it will be shown, that this is the presence of a compound containing nitrogen, the exclusion of which entirely deprives humus and charcoal of their influence upon vegetation.

#### AGRICULTURAL SEMINARY, AT ANDOVER.

We have been requested to present the following notice of a course of study contemplated in the Teachers' Seminary, at the South Parish in Andover. It so fully harmonizes with the views expressed to meet what we consider the present wants of the community, that we cheerfully recommend the institution to those, who are desirous of educating their sons to be intelligent and independent farmers. At a time when the most distinguished men of our country feel it their highest honor, that they are *farmers*; and, when all the *learned professions*, so called, are *over stocked*, it becomes us, farmers, to consider what is the best manner of educating our sons.

"Arrangements have been made to introduce scientific agriculture as a regular branch of study; one of the teachers has been engaged, during the past winter, in investigating agricultural chemistry, with a view to give instruction on the subject, and to prepare a text book for the use of the students. Instruction will be given on the subject the coming term, which commences March 25th, in connection with the lectures and experiments in chemistry. The plan of adding scientific agriculture to the branches already pursued, originated from the belief that scientific agriculture must be made a regular branch of study in our literary institutions before we can make farmers scientific men, and produce a permanent improvement in our system of rural economy. It is our object to afford facilities to our young men for obtaining a thorough English education, especially to obtain a knowledge of the various branches of natural science, that they may be able to understand and apply the great principles of scientific agriculture which lay at the foundation of all successful practice. We propose to teach them botany and physiology, mineralogy, geology, and chemistry, with its application to agriculture, and to afford them the opportunity to

witness the operations of tillage under the direction of a teacher. No labor will be required, but the opportunity will be given for those who feel disposed, and a fair remuneration paid. The instruction in scientific agriculture will be connected with the process of analyzing soils. Fully believing that this plan will be of the highest practical advantage to the farming community, and the only one which will ultimately elevate the employment, and raise up a generation of scientific farmers, we confidently present it to the community for their cooperation and patronage."

Jan., 1841.

#### COWS AS BEASTS OF DRAUGHT.

It seems somewhat odd, that while we have compelled the horse, the ox, the mule, the ass, and even the dog, to work as beasts of draught, the cow should have been generally overlooked. Whether the experiment may have been tested, and found to fail, I know not; but certain it is, that instances are very rare in this country, where the cow may be seen toiling as the horse. Extraordinary, however, as it may be, a few years ago, a cow was to be seen on the banks of the Leeds and Liverpool Canal, pulling a boat along with comparative ease, and a proportionate degree of gravity; thus furnishing the boatman with both labor and milk.

The Flemings, too, are beginning to make use of the cow as a beast of draught, and that animal is made to cart, plough, and drill, for perhaps five or six hours per day. And it will be readily granted, I presume, that plenty of work of a suitable nature for the cow to execute, may mostly be found on any farm.

I know our farmers are slow to adopt any practice which is strange to them, hence the tardy progress of agriculture; others, again, will condemn untried whatever is recommended to them; which perhaps will be the case with the subject in question. Such, however, must not be heeded, for if they are so wilfully obtuse as to stand in their own light, the blame must lie in themselves. There is nothing particularly startling in a case of this sort. If a cow can be made to work a few hours a day, without lessening the quantity of her milk, why should not her labor be acceptable? But of course it is the small farmer who is most likely to profit by it, or the laborer who may have his acre or two of land, a cow or two, but no horse; and, as a matter of course, for such only is the hint intended.

In laying this subject before your readers, I anticipate the return of information which must be valuable; I have seen in your Magazine, at various times, papers on the disease of stock, evidently the productions of able veterinarians, and it is likely that those individuals could well ascertain the propriety or impropriety of sousing the cow. I earnestly hope that some of those gentlemen will take up the question, and give a definitive opinion on the matter at the outset; and if the cow can really be made more useful than she now is, I hope the practice will be introduced. These are the times for economy on the farm and elsewhere too, and a man is not to be blamed for using proper means to lessen his outlay; hoping, therefore, that the subject will meet the attention of reasonable men, "wh look before they leap," and who will not hesitate to express their opinions decidedly on it,

I remain, Sir, yours, &c.,  
Farnsworth, Lancashire, March 23, 1840. INQUIRER.

For the N. E. Farmer.

### TREATMENT OF COWS BEFORE AND AFTER CALVING.

MR EDITOR—In reply to questions of "A Herdsman," in the Farmer of the 28th of April, you have quoted from Youatt, some part of which deserves notice, as being wrong in practice.

He says it is "a cruel thing to separate the mother from the young so soon," but has not said how soon. Now, experience has taught me that the calf should be separated from the cow as soon as it has become dry, and taken what milk it needs for the time. The cow will bear the separation better than if it be permitted to remain with her longer: she will give down her milk better. It is the most effectual way that can be taken to make a cow hold up her milk, to let her calf remain with her day after day, as the manner of some is, she will give none, or little more milk than the calf can take, which will cause the bag to swell and get it in a bad state.

Giving "a pound of Epsom salts," as recommended by Youatt, is worse than useless, because every farmer, certainly every observing one, knows that the exertions of the cow in the act of bringing forth, causes her to scour, the same as any other violent exercise to which she is not accustomed.

Some—particularly modern "gentlemen"-farmers—suppose that a cow should be highly fed for some time before calving: this is their philosophy. Nothing can be more erroneous—or experience to me has been a poor teacher. My experience agrees exactly with that of "A Farmer's Boy," in the Farmer of the 12th instant. When I was a boy, my father kept some cows, and they were full fed on the best of hay, (roots then not being the fashion,) for some weeks before calving:—his cows, most of them, had swollen bags, and more or less of them had to be doctored every spring. My practice for many years has been different. For about two weeks before calving, they are kept on hay of a little better quality than what they have had through the winter: they will not give so much milk at first, as when they have been kept high; but no matter; feed sparingly for a few days, increase the quantity and quality of the food, gradually, and the milk will increase; they will be better in my opinion through the season, than if fed high before calving. It is on the same principle that cows wintered on meadow hay till near calving, (I do not mean bog grass nor pollypod, but good meadow hay,) will do better; that is, will give a greater quantity of milk through the summer, than when wintered on English hay. I can produce an instance where the experiment was tried on the same cows. At one of the agricultural meetings at the State House, last winter, Col. Jaques stated that he had known two instances of cows being spoiled for milk, by being fed highly with Indian meal. The fact I do not doubt; it is natural that it should be so. Indian meal is of a hot, drying quality and has a tendency to dry up the juices—the very thing to make milk. It is for the same reason, viz: its drying quality, that beef fattened wholly on Indian meal is not so juicy as that fattened on roots. This may be to some a new and strange idea, and cause them to say if the writer is ever drowned, they must look up stream for him; but believed or not, it is nevertheless true.

A FARMER.

May 26, 1841.

### DISEASES IN TURNIPS.

The extensive and repeated culture of the turnip, has fostered the rapid increase of its natural enemies; and after all the pains, labor and expense of the cultivator, he often sees his crop entirely destroyed or seriously injured. The remedies he can apply for many of these, can only be termed palliative; but still he has much in his power; and as the knowledge of natural history and field-entomology advances, he may expect more and more assistance.

The turnip flea, (*Haltica nemorum*.) is one of the worst enemies which attacks the turnip plant; which it does when in its seedling state, and often destroys a crop, and even the second and third sowings. It was once thought to be hatched from an egg deposited on the seed, but that opinion is now entirely exploded; and it is proved to deposit its ova on the leaves of the infant plant. It is of the order *coleoptera* and family *chrysomelida*. Various steps have been taken in order to prevent its attacks, and several steps for the seed used, but without success; top dressings of a saline and astringent character have been applied, but have failed; machines have even been invented, but none of these have succeeded. The only directions which can be given are—sow plenty of seed; use stimulating manure, to excite the plants to vigorous growth in their first stages; and secure a sufficiency of moisture in the soil at the time of sowing; especially keeping the fields clear of charcoal, which nurses the flea.

The black caterpillar—larva of the *Athalia centifolia*—also preys upon the leaves in a more advanced stage, appearing on the plants when they are about three weeks old. It is of the order *hymenoptera*, family *tenthredinida*. For an account of its natural history and methods of destroying it, the writer refers to the last year's report.

Another disease to which the turnip is liable, is vulgarly called "fingers and toes;" about a month after the plants have made their appearance, they begin to flag their leaves, and in a few sunny days literally die by acres together. On examination, the fibres of the roots are found enlarged, and the root covered with tumors and excrescences of every conceivable shape. It is a matter of dispute whether this is an organic disease in the plant, from some peculiarity in the soil, or the primary work of an insect. That an insect, in its maggot state, feeds upon these tumors, the writer has long known; but he has not been able satisfactorily to decide whether the insect is a cause or an effect of the disease. It is one of the *muicida*. A naked fallow is a remedy for it; but all applications to the soil and plant have been ineffectual.

The wire-worm is a sad enemy. It forms the subject of one of the Society's prize reports. To that I refer. The swarms of aphides, or plant lice, severely injured the turnips; and from the smallness of their size, are often unobserved. In 1836, they committed terrific ravages. They suck the juices of the plant, and appear in countless numbers. They are both oviparous and viviparous, and increase with amazing rapidity. Happily they are always followed by swarms of lady-cows, which feed on them, as well as insectivorous birds, which destroy vast numbers. No remedy can be applied with any probability of success. Every farmer should carefully protect swallows, red-breasts, &c., which are great destroyers of the aphides.

Slugs are, especially on newly ploughed soils, great devourers of the turnip plant in all its stages.

Ducks will devour them, but always injure the plants. Three bushels of quick lime per acre sown on the plants early in the morning, when the slugs are active, is a certain method of destroying them. Perhaps the very best preservation from all the above diseases may be stated to be—liberal manuring, adapted to the soil—thorough clearing of the land from weeds—and in short, pursuing the steps above detailed, for securing a full crop. The vigor of the plants in such cases, and their rapid vegetation, often enable them to overcome many serious attacks.—*British Farmer's Magazine*.

### TRANSPIRATION OF PLANTS.

Dr. Hales found that a sunflower, in twelve hours, transpired by its leaves, one pound fourteen ounces of water, all of which must have been imbibed from the soil by the roots. Water is the vehicle which conveys nourishment to plants. The food which it holds in solution is imparted to a plant in a manner analogous to the nourishment imparted to the animal system by the food which passes into the stomach. Hence the growth of the plant depends much on the presence of moisture, as well as of vegetable matter in the soil, and upon the sufficiency of roots to take it up and convey it to the trunk. Thus a tree divested of a great portion of its roots in transplanting, makes a new wood only in proportion as these are replaced by a new growth; and thus also a plant grows faster in a moist than in a dry soil, (the fertility of both alike,) and faster in a mellow soil where the roots can fully extend and multiply, than in a hard one.

These facts suggest to the farmer the impropriety of plowing deep between the rows of corn and other crops, whereby the roots are broken and wounded, and exposed to the drying influence of the sun and winds. 2. The importance of keeping his crops clear of weeds and all useless plants, which rob the soil of food and moisture. And 3, the propriety of transplanting his trees while young, when the system of roots can be preserved nearly entire, and of surrounding the roots with a bed of mellow, rich earth.—*Selected*.

*Mixture of Salt and Lime*.—This is an easy application: it is only for the farmer to buy 100 bushels of lime, and put 50 bushels of salt in a clamp, dug as if for potatoes or mangel wurtzel; lay it altogether, and mix it up with water till it comes to the consistency of mortar; cover it up cloae, and let it lay three months, and then apply it to the field, either by sowing or spreading it; 30 bushels an acre is the quantity for outside application on land for barley or wheat, or grass; and when the grass is subject to moss, it will be very beneficial. Where lime is applied to pasture, there you are sure to see what is called Dutch clover, and you will always find it to be so.—*Mr Mapletoft*.

It requires more magnanimity to give up what is wrong, than to maintain that which is right; for our pride is wounded by the one effort and flattered by the other.—*Lacon*.

The praise of the envions is far less creditable than their censure; they praise only that which they can surpass, but that which surpasses them, they censure.—*Ib*.

## GRASSES.

We copy the following extracts from "a Discourse before the Chester County (Penn.) Cabinet of Natural Science, by Wm. DARLINGTON, M. D.

"I propose to attempt a cursory notice of the character, properties, and importance to man, of a single tribe, or family, of the vegetable creation, known to the naturalists by the name of *Gramineæ*, or the true grasses; and while I calculate with some confidence, upon a fellow-feeling among the *Botanical* portion of the audience, I am not without a hope, that, in a district so distinguished for its agricultural advancement, the subject will also be found to possess a degree of *general* interest.

Before entering into particulars, however, it may be useful to make some preliminary explanations.—or, as the politicians say, to "to define our position." The term *grass*, in our vernacular tongue, is frequently used in a vague sense, to designate every kind of herbage found in our meadows and pastures. Hence, we often hear people speak of clover, lucerne, and other plants which have no botanical affinity with the *true* grasses, as though they really belonged to that remarkable tribe of vegetables. But such is not the language of naturalists; and ought not to be, of any well-informed person. An accurate knowledge of objects can neither be acquired nor communicated, without precision in the use of terms. The distinctive characters of that family of plants of which we propose to treat, are now well understood, and have been satisfactorily defined.

Whenever we meet with a plant having a cylindrical, jointed stem, with the joints solid, and the intervening portions hollow, or, in a few instances, filled with a pith-like substance,—the leaves alternate, one originating at each joint, embracing the stem with its base, and forming a sheath which is slit on one side down to its origin,—and the flowers protected by these peculiar envelopes, known by the name of chaff,—we may take it for granted that we have before us a *true* grass. Brief and simple as is this definition, it will be found to contain the most obvious characteristics of the tribe; sufficient, it is believed, to distinguish it from all others. While we are on the subject, however, a few additional traits may perhaps be adverted to, with propriety. The *cuticle*, or skin of the grasses, (for they have no bark, properly so called,) contains a considerable portion of *silex*, as is shown by its vitrification, when stacks or other dense masses of unthrashed grain are burnt. A sort of grass is produced from this *silex*, which preserves the form of the plant even to its minutest parts. The nerves or veins in the leaves of this family, are all nearly parallel—in consequence of which, these appendages (i. e. the leaves,) are entire, generally narrow, elongated, and more or less linear in their form. The flowers are mostly small, disposed in little clusters or spikelets, and these spikelets are variously arranged, in spikes, racemes, or loose panicles. Each spikelet—consisting sometimes of one, but more commonly of two, three, or many florets—is usually embraced or supported at base, by two chaffy pieces called *glumes*; and each floret is immediately protected by two somewhat similar chaffy coverings, which, for the sake of distinction, are denominated *palææ*. These chaffy coverings of the flowers and seeds of the grasses, are wholly unlike the delicate and showy floral envelopes of most other plants, and seem to be, in fact, the mere

stunted vestiges of abortive leaves, or rather of their sheaths, closely crowded together.

Having thus hastily glanced at some of the more striking features of the extensive tribe, technically denominated grasses, and the characters by which they are distinguished from other plants, I flatter myself we shall have no difficulty in recognizing any member of that family which may come in our way. It will be no news, indeed, to any of us to be told that "Red-top," "Timothy," and "Fox-tail," are grasses; and we all, perhaps, may be aware, that our cultivated Oats, Barley, Wheat and Rye, and even Rice, belong to the same category: but the fact may not be equally familiar to every one, that our Indian Corn and Broom Corn, the Sugar Cane and the Bamboo, are also true and genuine grasses. Much as these last mentioned plants seem to differ from the multitude of common grasses, the disciplined eye of the botanist perceives at a glance, that they all belong to the same family; and indeed, so eminently natural is the whole tribe, i. e. so strong is the general resemblance in the characters and habits of its members, that superficial observers, finding it so much easier to adopt them, than to verify the crude notions of the vulgar, have actually supposed several species to be continually and reciprocally changing into each other.

In an agricultural point of view, the superior value of the grasses as materials for pasture and hay, is owing to the large quantity of saccharine matter with which they abound, about the time of flowering; and which is the source of that rich, sweet odor, observable in well-preserved hay. This saccharine matter, which pervades the whole plant before flowering, and is most perfectly elaborated at that epoch, is designed to be ultimately concentrated and deposited in the seeds, chiefly in the form of farina; and hence we find the herbage of comparatively little value after the fruit is fully matured. The skilful agriculturist, therefore, when he wishes to have good hay, cuts his grass at the moment when the nutritious juices are most perfect, and while they are diffused throughout the plant. But when his main object is the seed, as in our cultivated grains, he of course postpones his harvest until the career of vegetation is finished. It is needless to enlarge on the importance of the herbage of the grasses, in supplying the food of our domestic animals, and, indirectly, the animal portion of our own food. I will, however, mention those species which are deemed of chief value in our meadows and pastures, naming them in what I consider the order of their excellence. 1. The meadow, or Green Grass, erroneously called "Blue Grass," in Kentucky, (*Poa pratensis*, L.) 2. Timothy, or the "Herd's Grass," of the Northern States (*Phleum pratense*, L.) 3. Orchard Grass (*Dactylis glomerata*, L.) 4. Meadow Fescue (*Festuca pratensis*, L.) 5. Blue Grass, (*Poa compressa*, L.) 6. Ray Grass, (*Lolium perenne*, L.) 7. Herd's Grass, of Penna., often called "Red-top;" the "Bent Grass," of the English, (*Agrostis vulgaris*, L.)—and 8. Sweet-scented Vernal Grass, (*Anthoxanthum odoratum*, L.) These generally cultivated here, are the Timothy and Orchard Grass; and occasionally we see the Ray and Herd's Grass, or Red-top, though these last are not so much esteemed. The others are completely naturalized; and when the soil is either originally fertile or adequately improved, the best of them, viz: the Meadow Grass and the Fescue, soon appear spon-

taneously in our pastures, and supersede the artificial ones.

The least valuable, perhaps, of *Cerealia*, or those grasses which are cultivated here for the sake of the seeds, is the common Oats, (*Avena sativa*, L.) This grain is lighter and less perfect with us, than it is in the north of Europe, and is almost entirely appropriated here, to the feeding of domestic animals; but in less favored climes, it contributes largely and directly to the sustenance of man. The better quality of this grain is sometimes malted, when the demand warrants or rewards the labor; and a small portion is manufactured into meal, as an article of diet for the sick; but both these operations are very limited in our country.

Ascending in the scale of value, we next find Barley (*Hordeum vulgare*, L.)—a grain which, in some regions, is extensively used for bread, and more or less as food for horses and other stock; but in our own country, it is almost exclusively employed in the manufacture of a rich potation, known to us all by the names of Beer, Ale and Porter. The immense crops produced in the middle and northern States, are nearly all destined for the breweries, a comparatively small portion being used in the distilleries. To prepare the grain for these establishments, it must undergo the process of malting, or incipient vegetation, in order to form the sugar, which is the source of the alcoholic strength of fermented and distilled liquors. It is found that when seeds begin to germinate, the farina or mealy portion is partly converted into sugar, by diminishing its carbon and augmenting the proportion of its hydrogen and oxygen; and this saccharine transmutation is precisely the operation of malting. The skill of the malster consists in arresting the germination, at the critical moment, when the formation of sugar is most complete and abundant. This he does by drying it in a kiln.

The grain next superior in importance—being used to a considerable extent in making bread, is Rye (*Secale cereale*, L.) In our own State, from the force of custom, or prejudice, and the greater abundance of wheat, we are in the habit of undervaluing the bread made of this grain. But in many districts, where the soil is better adapted to the plant, rye is very generally used, and highly esteemed. It is also employed to a most mischievous extent in the production of the ardent spirit called *whiskey*. In this case, the preliminary operation of malting, though sometimes practiced, is generally dispensed with, as being too costly. The grain is merely chopped, or coarsely ground, and, in conjunction with a small per centage of malt, is subjected to fermentation; by which process, also, the farina loses a portion of its carbon, and becomes sufficiently saccharine to yield large quantities of impure alcohol. So great is the amount of ardent spirit procured from this grain, and so tremendous the abuse resulting from the practice, that it may be doubted, on the whole, whether rye does not contribute more largely to the destruction than to the sustenance of human life. Certain it is, that by the conversion of its wholesome farina into an intoxicating draught, it is made a potent instrument of physical and moral evil—a most prolific source of disease, misery and crime. All these mischiefs, however, arise from the misapplication and abuse of a positive good; for which man, himself, must be held accountable, and must expect the penalties inseparable from folly and wickedness.

The next most valuable plant among the *Cerealia*

is, perhaps, our Indian Corn (*Zea Mays, L.*) And, indeed, in the districts most favorable to its culture, it may be said to rival wheat itself in importance. Those who are not in the habit of regarding the vegetable kingdom with a botanical eye, may possibly be surprised to hear this plant enumerated among the *Grasses*; yet, if they will advert to the definition already given, they will find the Indian Corn to be a genuine member of the Gramineous tribe. It presents, indeed, one of the few instances in which the stem is solid with pith, instead of being hollow or fistular between the nodes; but in every essential feature it will be found on examination to be a true and undoubted grass. The same remark applies to the Broom Corn, the Sugar Cane, and some others, in which the culm is filled with pith. In a district like this, where every occupant of a field or garden, cultivates his crop of Indian corn, it would be wholly superfluous to dwell on the excellence and manifold uses of this universal favorite. Suffice it to say, that while it is the most productive of our cultivated grains, every portion of the plant has its value in rural and domestic economy. The large pithy culm about the time of flowering, is replete with a rich saccharine juice—from which, no doubt, a considerable quantity of sugar might be extracted. The entire herbage is, therefore, highly esteemed as a nutritious food for cattle; the ears, or spikes of fruit, afford a choice treat to the epicure, even before they arrive at maturity; and when fully ripe, yield copious nourishment, in many forms, both for man and beast; while the very receptacles of the seeds—long considered as mere refuse—may be either ground with the grain as food for stock, or reserved as a convenient auxiliary fuel, in lighting up our anthracite fires. In Pennsylvania, and generally to the North, the farina of Indian corn is not extensively used by itself, in making bread, probably for want of skill and usage; but whoever has experienced the hospitality of our fellow-citizens on the southern side of "Mason and Dixon's Line," knows that corn bread is there admirably prepared and almost universally preferred to every other kind. The inhabitants of the West Indies, also, derive a large portion of their subsistence from our crops of Indian corn. It must be added, moreover, that a vast amount of this grain, in conjunction with rye, is converted by the distilleries into alcoholic poison—and its wholesome properties transmuted into the pestilent ministers to a depraved appetite. There are two other grain-bearing grasses yet to be noticed; each of which is so eminently valuable to the human race, that it is not easy to say which is entitled to the highest position in the scale of importance. It will of course be understood that I refer to Wheat (*Triticum sativum, L.*) and Rice (*Oryza sativa, L.*) In point of intrinsic value, I think there is no doubt that wheat may justly claim the precedence; but as rice is believed to afford sustenance to a larger portion of the human family than any other grain, we may allow it on this occasion to take rank as the first among the *Cerealia*—and therefore, according to our arrangement of the subject, the last to be treated of. Wheat, however, is clearly the most important of the grains, in the temperate zones, especially in the higher latitudes. I shall not trespass on your patience by enlarging on a subject so familiar to all, as is the value and importance of wheat. You are all aware that in the greater portion of our happy country, especially in the middle and western States, it is one of the

prominent objects of our agriculture. So long, therefore, as our people shall apply themselves to the tillage of the soil, we may reasonably hope to be exempted from that fearful calamity, a want of bread. In addition to the supply of food furnished by wheat, I may remark that our laundresses are chiefly indebted to its farina for that important article in their operations known by the name of starch; and in the olden time, when, whatever may have been the interior condition of the head, fashion required the exterior, at least, to be conspicuously decorated, the same starchy extract supplied the hair-dresser with his powder. As we have neglected the *external finish*, so elaborately bestowed on the pericranium, by our ancestors, it would seem to be but reasonable that we should give the more attention to the furniture *within*.—Although capable of yielding alcohol—like all the farinaceous seeds—Wheat is generally too valuable, as an article of food, to be desecrated by the process of distillation.

In our notice of the *Cerealia*, tho last in order, and, as is supposed, the first in importance, by reason of its extensive use, is the Rice plant. The beautiful grain which this grass affords, though considered by us here more as a delicacy than as a standing dish, is the principal sustenance of millions of the human race. Being a kind of semi-aquatic plant, Rice flourishes best in grounds that are low and marshy, or situated that they can be overflowed—though there is a variety called upland or Mountain Rice, which is much cultivated; and every where, within the tropical and adjacent regions, where circumstances are favorable to its culture, this admirable grass is to be found. In the southern parts of India—as I have had occasion to witness—the dense and squalid population is almost exclusively subsisted upon rice. This plant belongs to a small subdivision of the grass tribe, in which the flowers are often furnished with the extraordinary number of six stamens—or possibly they may each consist of two florets concentrated within the proper envelopes of a single flower—by which crowding process, all the parts of one of the florets, except the stamens, may be suppressed, or abortive; a phenomenon, of which it is believed there are many analogous instances in the economy of vegetation. The seeds are closely invested by the inner chaffy envelope, or paleæ, after the manner of oats and barley and while thus coated, are known in the East by the name of *Padda*. They are deprived of this covering by passing them between mill-stones properly adjusted for the purpose, and are thus prepared for the culinary department, much in the same way that hulled and pearl barley are manufactured. The albumen, or farinaceous portion of rice, is of a remarkably pure white—almost translucent—and of a very bland, nutritious quality. The gluten which it contains, enables the Chinese to manufacture from it various ornamental articles of great beauty and delicacy. This gluten is also said to be an important ingredient in the preparation of Japan paper. The art of extracting alcohol from the seeds, has been applied to rice as well as to the other *Cerealia*. The fiery liquor called Arrack—the generic name, in the East, for alcohol—is obtained by distillation from rice, in conjunction with sugar, or the juice of some species of palm; and in China, an amber-colored wine is also made from that grain.

From the sketch now presented—(which I fear has been tedious,) though extremely superficial

and imperfect—I think it may be perceived that the simple tribe of plants technically called *Grasses*, is not only one of the most abundant, but decidedly the most valuable and important to man, of all the many natural families in the vegetable creation. That while its peculiar characters cannot fail to interest the lover of natural science, its uses, abuses, and manifold relations to the welfare of society must ever give it a strong claim to the attention of the agriculturist, the philanthropist and the political economist."

#### NATIONAL AGRICULTURAL SOCIETY.

The editor of "The Agriculturist," (Nashville, Tenn.,) represents us as opposing the locating of the school to be connected with this Society, at Washington; and as "vehemently urging the propriety of the location being in Yankee land." In this passage our views are not correctly reported. We thought a national society and a national school would be unwieldy; and preferred sectional societies, and thought New England sufficiently large for one section; and of course desired the school for New England to be "in Yankee land." If there be a national school, we can adopt the language of the Agriculturist in relation to that, and say, "we do not think ourselves very strong sticklers for such a school, admitting there is one established, being in any particular section of the country."—En. N. E. F.

#### BENEFITS OF A CLAY MIXTURE ON SANDY LANDS.

A correspondent of the Western Farmer says: "Several years since, when a resident of New England, I purchased a piece of dry, sandy land, denominated there "pine plains," that had been very much worn. A portion of it, about 13.4 acre, was on the verge of a deep ravine, and a little more elevated than the remainder of the lot. This piece had been sown the fall previous to rye and stocked with clover. The rye was harvested—an inferior crop—and the ground, I found in the fall, was not to appearance more than half stocked.—Not having manure for a spring crop, and clay being handy, I carted on to the piece about thirty ox-cart loads of clay; this, however, was not pure, but supposed to contain about one third sand; the same was spread upon the surface of the ground in the fall. In the spring it had formed a complete coating over the whole surface; the result was, a heavy crop of clover. The next spring, about 20 loads of yard manure was spread upon it. It was then broken up, rolled, harrowed and planted to corn, about the 10th of May. The result was, about ninety bushels of sound corn. I had corn enough for my own use and sold about fifty bushels for fifty dollars. This was my first experiment in farming. It is nearly eight years since the clay was applied, and I am told the ground is still benefited by it. The application was continued on other portions of the lot with equally beneficial results as long as I occupied it."

Time gives wings of lightning to pleasure, but feet of lead to pain, and lends expectation a curb, but enjoyment a spur. It robs beauty of her charms to bestow them on her picture, and builds a monument to merit, but denies it a house; it is the transient and deceitful flatterer of falsehood, but the tried and final friend of truth.—Lacon.

**NEW ENGLAND FARMER,**  
AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, JUNE 9, 1841.

**PHYSICAL EDUCATION.**

*Hast thou daughters? Have a care of their body.*  
ECCLESIASTICUS.

The inhabitants along the shore in the old Bay State, are becoming less robust and hardy than their fathers were. The present generation has less vigor and health than the last possessed. The causes are doubtless many—and not a few of them are hidden. But a hasty glance at society will disclose some departures of the present generation from the habits of the past age, which obviously tend to debilitate. The closeness of our dwellings, rendered desirable by the high prices of fuel, causes us to breathe a less pure atmosphere than pervaded the dwellings of the yeomanry in the times when the chimney corner would hold half a score of children; the extensive substitution of coffee and tea for milk, bean porridge and the like, have brought on a degree of feebleness;—the general use of fine wheaten flour instead of the coarse rye and Indian of former days has over loaded and weakened the digestive organs in many cases;—the fashion which excludes the *thick* shoe and boot, and exposes the foot in cold and wet, has helped to bring on many maladies;—the abandonment of wrestling and other games requiring great muscular efforts, (though perhaps the abandonment is wise,) may be a cause of the increase of feebleness. In short, less of hardship and more luxury in modes of living, have exerted their enervating influences upon our community for the last quarter of a century. And though we are still a vigorous, energetic and enterprising people; yet, as these characteristics are becoming less prominent, it is proper for us to inquire into the causes and help to stay their operations. We feel the duty incumbent, because we think that the intellectual, moral and religious character of individuals and nations has a close and intimate connection with the health and strength of the body. The public good, (not its prosperity in money-making merely)—the public good—in the highest, broadest, deepest sense of the terms—is closely interwoven with the general health and strength of the people. Therefore necessity is laid upon those who would be faithful public teachers, to discountenance all customs which tend to bring on general feebleness.

We commenced with a quotation from a wise man of olden times—"Hast thou daughters? have a care of their body;" and it was our purpose to say distinctly, that the physical education of those who are to be the mothers of the next generation, is the first duty of parents; yes, we distinctly put this branch of education first; for while we would have habits of truth and obedience early formed, we are persuaded that these and other good habits are of much less worth to the world when found in one of feeble constitution, than when connected with a healthy frame, that has power to act out the promptings of the soul. *Make the child hardy*; and to do this, the food must be simple, the clothing loose and comfortable, and exposure to the weather in all its states, must be habitual. The dirt, and wet and cold into which the child will rush with delight, are all contributors to its health and energy of character. There is much *imprudent prudence* in keeping children within doors,—much *cruel kindness* in keeping them from exposure—much weakening *poison* in the *healthful delicacies* furnished for their feeble digestive organs. Let kindness to your offspring be far-sighted. Let it remember that health is promoted by vigorous exercise

and pure air. Let it not forget that winter's snows and summer's suns help to harden and strengthen the growing body.

Preserve the child from immoral habits and exercise little more restraint than is necessary for this, until the foundation of firm health is apparently well laid. There has been a tendency for a few years past to force the growth of the intellect in advance of physical growth; but this is a contravention of the course of nature, and must in many instances bring either death or debility. *He* who formed the mysterious connection between the body and soul, has obviously designed that the growth of the former shall precede that of the latter; and any course which shall prematurely develop the mind and call it into highly vigorous exercise in early childhood, is necessarily attended with danger of destroying the body.

But we designed to speak particularly of the physical education of daughters. Let them be accustomed to regular and vigorous exercise, and that too in the open air. It is becoming almost barbarous to send the girls to the milking stool and to the lighter work in the field. We are not without a share of the feeling on this subject which pervades this vicinity; and yet looking at the future and reasoning from well known facts, the conclusion is irresistible that it would be better—far better—better for *them* and better for the next generation, that our daughters should engage in the out-door labors which their grandmothers performed. Then a fresher bloom would spread over their cheeks, and more healthful blood would flow in all their veins. They would discharge their household duties with more despatch and less fatigue. Their spirits, graduated by their health, would diffuse more life into the family circle—and the mind, sympathizing with the body, would be clearer in its perceptions, more prompt in its decisions, more efficient in all its operations.

Looking forward to the future, we see not how it is possible for any other than a feeble race to be produced from the pale-faced girls, of compressed forms, that are growing up in both city and country. The subject is one of delicacy, but it is so closely connected with human welfare, that some obvious truths connected with it should not be suppressed. We say that the same laws by which, in brutes, the offspring partake of the characteristics of the parents, operate in the human species; and no female can reasonably expect to be the mother of a healthy family of children, who has not a firm and robust constitution. The weaknesses produced by stimulants, by unwholesome food, inactivity, impure air, tight lacing, thin shoes, or avoidance of vigorous exercise, will be transmitted to their children. The sins of the parents are visited upon the children for generations. These truths teach a lesson that should be heeded. Could the young of either sex, but be made acquainted with the facts which we have witnessed, they would learn that the marriage relation often—very often results in a family of feeble and inefficient children, and this too in consequence of such weaknesses in the parents as should have deterred them from entering into the married state. For we hold it to be wrong for any intelligent being to be voluntarily instrumental in bringing others into existence, when the probability is strong that the children will inherit such weaknesses as will render them unhappy or burthensome to society.

This subject of physical education is more closely connected with human welfare than almost any other that can be agitated. We have not discussed it; but the hints here given may cause some of our readers to make it matter of serious and useful reflection. Should we but feel it a duty to disclose all our convictions relative to this subject; and could our advice be taken, many of

the young of each sex would go down to their graves unwedded and childless, and this too, not oftener from any faults of their own, than from the faults of parents and of fashion, which have rendered them permanently feeble.

**THE L'ETANG AND MAINE LIMES.**

"The L'Etang lime contains 99 3-10 per cent. of pure limes in each 100 lbs. of the quick lime.  
"About 300 lbs. in a cask—2 1-10 only of impurities.  
"The Maine lime averages about 60 per cent. of pure lime and 40 per cent. impurities."

On seeing the above paragraphs appended to the statement respecting the L'Etang lime in our last paper, Mr Davis, the agent of the company, called upon us immediately to say, that he had not authorized any such assertions as they contain; and that he considered them highly improper and unjust, as the Maine limes which were manufactured for the market, were not only good, but *most* of them *very good*. The comparison was made without his knowledge, and never received his signature.

**LARGE CUCUMBER.**

Mr J. Crawford, of Bedford, who sent to us a fine cucumber when the weather was so cold that the thought of eating such a vegetable made one shiver, has now favored us with another, 17 inches long, which in these bright warm days is very tempting. This gentleman must be uncommonly successful in the growing of the cucumber, and if his process is peculiar, we invite him to make it public.

**BEEES IN A BARN CHAMBER.**

We have been informed that bees which Gov. Lincoln had put in a chamber in his barn, made an attack a few days since upon his oxen, when they came from the field, sweaty. The cattle were so annoyed that they broke down the fences in various places and became entirely unmanageable. We remember having seen, when a boy, the old horse similarly attacked, when taken from the plow and tied near the bee house. These facts may render it desirable to place bees remote from places where we must regularly bring our beasts of labor.

**Massachusetts Horticultural Society.**

Saturday, June 5, 1841.

Samuel Walker, of Roxbury, exhibited twelve stalks of Rhubarb, weighing 6 3-4 pounds—very fine.

AARON D. WILLIAMS.

**FRUIT COMMITTEE.**

The Committee on Fruits of the Massachusetts Horticultural Society, will please meet at their room on Saturday next at 10 o'clock, A. M., in relation to premiums for the ensuing year.

B. V. FRENCH, *Chairman.*

June 8.

The Maine Farmer states a method by which Twitch or Couch Grass (*Triticum repens*) was effectually destroyed. The experimenter plowed it under all of a *foot deep*, then harrowed and cultivated the ground as usual, and it never troubled him afterwards. He took good care to lay the furrows completely over, so that every part of this grass should be laid fairly and deeply under.

*Warm.* In this city, on Monday, the mercury rose to 88 in the shade.

**THERMOMETRICAL.**

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northerly exposure, week ending June 6.

June, 1841.	5 A.M.	12, M.	7, P.M.	Wind.	
Monday,	31	42	64	50	S. E.
Tuesday,	1	45	62	61	N. E.
Wednesday,	2	51	81	68	N.
Thursday,	3	52	68	63	N.
Friday,	4	47	71	70	N. W.
Saturday,	5	55	63	61	N.
Sunday,	6	54	76	58	S. E.

We have had no rain during the week, and but little for two weeks past, and the earth is getting dry; very dusty travelling indeed.

**BRIGHTON MARKET. — MONDAY, June 7, 1841.**

Reported for the New England Farmer.

At Market 240 Beef Cattle, 20 pair of Working Oxen, 15 Cows and Calves, 250 Sheep and 540 Swine. 75 Beef Cattle remain unsold.

**Prices.**—*Beef Cattle.*—We quote to correspond with last week, about the same prices were obtained for a like quality. First quality, \$6 75 a 7 00. Second quality, \$6 25 a 6 50. Third quality, \$5 25 a 6 00.  
*Working Oxen.*—Sales \$55, \$70, \$82, \$90, and \$95.  
*Cows and Calves.*—Sales, \$24, \$23, \$30, and \$38.  
*Sheep.*—Lots were sold at the following prices, viz: \$1 50, \$2 00, and \$3 25.  
*Swine.*—Lots to peddle 5 for sows, and 6 for barrows. At retail from 5 1-2 to 7.

**WHOLESALE PRICES CURRENT.**

Corrected with great care, weekly.

**SEEDS.** Herds Grass, very little in market. Red Top, new seed by the bag 50 to 55 c. Clover—Northern, 13c.—Southern, 8 to 9 c. Flax Seed, \$1, 37 to 1 50 bu. Lucerne, 25 c. per lb.

**FLOUR.** Howard Street \$5 37—Genesee \$5 25—Ohio \$5 12.

**GRAIN.** Corn—Northern Yellow none—Round Yellow 63—Southern Flat Yellow 50—White 64.—Rye—Northern 60 to 65—Southern 50 to 55. Oats—Southern 36 to 33—Northern 33 to 40.

**PROVISIONS.** Beef—Mess \$10 50 to 11 00—Prime \$6 50—No. 1 \$9 00. Pork—Extra—15 00—Clear 14 50—Mess \$13 00. Hams—Northern 9 c. per lb—Southern, none. Lard—Boston 9 c per lb.—Southern, 8 to 8 1-2. Butter—Lump 13 to 22—Firkin 12 to 18—Shipping 8 to 14. Whole Hogs 5 1-2 to 6 c.—Pigs 5 c.

HAY, per ton, \$20 to 22 50—Eastern Screwed \$17 00. CHEESE—Old 11 c.—New 3. EGGS, 11 a 12.

**WOOL.**—The market for this article has not experienced any change of late. Pulled Wool is rather scarce, and there is but a limited supply of low Fleeces, and of fine Fleeces the stock is also moderate. Prime or Saxony Fleeces, washed, lb. 50 to 55 c.—American full blood, washed, 47 to 50—Do. 3 4 blood, washed, 44 to 46—Do. 1-2 blood, washed, 36 to 40—1-4 and common do, 35 to 37—Smyrna Sheep, washed, 20 to 23—Do. unwashed, 10 to 14—Bengasi Sheep, 8 to 10—Buenos Ayres unpicked, 7 to 10—Superfine Northern pulled lamb 43 to 46—No. 1 do. do. 37 to 42—No 2 do do 26 to 30—No 3 do do 18 to 20.

**MASSACHUSETTS HORTICULTURAL SOCIETY.**

A stated meeting will be held at the Rooms of said Society, on Saturday next, June 5, at 11 o'clock, A. M.

E. M. RICHARDS,  
Recording Secretary.

June 2.

**MASSACHUSETTS HORTICULTURAL SOCIETY.**

NOTICE.

The exhibition of Pæonies, for premium, will take place at the Society's Room on Saturday, June 12th. The flowers to be ready for exhibition by 11 o'clock.

C. M. HOVEY,

Chairman of the Committee on Flowers.

**FULL BLOOD DURHAM CATTLE.**

The subscriber will sell at public auction, at his residence in Pleasant Valley, foot of Atwell's Avenue, in Providence, 1 1-2 miles from the Great Bridge, on Wednesday, the 30th of June instant, at 11 o'clock, A. M.

20 head of superior full and half blood Durham Cattle. Also, 20 full blood and half blood imported Southdown Sheep. A rare chance is offered in this stock to farmers and others to secure some of the finest Cattle ever offered for sale in this country, and as a whole there is seldom so choice a lot of herd book Cattle presented to the public. All interested are requested to call and examine this stock previous to the day of sale. Terms liberal. For further particulars see catalogue, which will be exhibited at the sale.  
 Providence, June 5, 1841. JOHN GILES.

**GOOD CULTIVATORS AT \$150**

Good Cultivators for sale at the New England Agricultural Warehouse, Nos. 51 & 52 North Market Street, Price \$3.50.  
 June 9. JOS. BRECK & CO.

**REVOLVING HORSE RAKE.**

The Revolving Horse Rake has been in general use in most parts of Pennsylvania and New Jersey, and is found to be one of the most useful labor saving machines now in use. One man and horse, with a boy to lead, will rake on an average from 25 to 30 acres per day with ease, and do the work well. There is a great advantage in this rake over all others, as the person using it does not have to stop the horse to unload the rake.

For sale at Nos. 51 & 52 North Market Street, by  
 June 9. JOS. BRECK & CO.

**DAHLIA POLES.**

500 dozens of Dahlia and Bean Poles. Also, 2000 feet of Ladders, 16 to 40 feet in length, for sale by MOSES FRENCH, Jr., Maine wharf, Broad st. near the bottom of Summer st. 6w June 2

**AGRICULTURAL IMPLEMENTS, &c.**

The Proprietors of the New England Agricultural Warehouse and Seed Store No. 51 and 52 North Market street, would inform their customers and the public generally that they have on hand the most extensive assortment of Agricultural and Horticultural Tools to be found in the United States. Part of which are the following:

- 1000 Howard's Patent Cast Iron Ploughs
- 300 Common do. do.
- 200 Cultivators.
- 100 Greene's Straw Cutters.
- 50 Willis' do. do.
- 100 Common do. do.
- 100 Willis' Patent Corn Shellers.
- 50 Common do do.
- 200 Willis' Seed Sowers.
- 50 " Vegetable Cutters.
- 50 Common do. do.
- 200 Hand Corn Mills.
- 200 Grain Cradles.
- 100 Ox Yokes.
- 1500 Doz. Scythe Stones.
- 3000 " Austin's Rifles.
- 100 doz. Cast Steel Shovels.
- 150 " Common do.
- 100 " Spades.
- 500 " Grass Scythes.
- 300 " Patent Snaiths.
- 200 " Common do.
- 500 " Hay Rakes.
- 200 " Garden do.
- 200 " Manure Forks.
- 300 " Hay do.
- 500 Pair Trace Chains.
- 100 " Truck do.
- 100 " Draft do.
- 500 " Tie up do.
- 50 doz. Halter do.
- 1000 yards Fence do.
- 25 Grind Stones on rollers.

**FENCE CHAINS.**

Just received from England, 10,000 feet Chains, suitable for Fences or other purposes. For sale by J. BRECK & CO., No. 52 North Market st. April 21

**DURHAM COW FOR SALE.**

A young full blooded Durham Cow and her calf—a very desirable animal in every particular. Apply to EDWARD TITCOMB, Ja., Newburyport. May 5

**HOWARD'S IMPROVED EASY DRAUGHT PLOUGH.**

Great improvements have been made the past year in the form and workmanship of these Ploughs; the mould board has been so formed as to lay the furrow completely over turning in every particle of grass or stubble, and leaving the ground in the best possible manner. The length of the mould board has been very much increased, so that the Plough works with the greatest ease, both with respect to the holding and the team. The Committee at the late trial of Ploughs at Worcester, say,

"Should our opinion be asked as to which of the Ploughs we should prefer for use on a farm, we might perhaps say to the inquirer, if your land is mostly light and easy to work, try Prouty & Mears, but if your land is heavy, hard or rocky, begin with Mr. Howard's."

At the above mentioned trial the Howard Plough did more work, with the same power of team, than any other plough exhibited. No other turned more than twenty-seven and one half inches, to the 112 lbs. draught, while the Howard Plough turned twenty-nine and one half inches, to the same power of team! All acknowledge that Howard's Ploughs are much the strongest and most substantially made.

There has been quite an improvement made on the shoe, or land side of this Plough, which can be renewed without having to furnish a new landside; this shoe likewise secures the mould board and landside together, and strengthens the Plough very much.

The price of the Ploughs is from \$6 to \$15. A Plough, sufficient for breaking up with four cattle, will cost about \$10 50, and with cutter \$1, with wheel and cutter, \$2 50 extra.

The above Ploughs are for sale, wholesale and retail, at the New England Agricultural Warehouse and Seed Store, Nos. 51 & 52 North Market Street, by  
 JOSEPH BRECK & CO.

**WILLIS'S LATEST IMPROVED SEED SOWER.**

Willis's latest Improved Seed Sower, invented the last season; one of the most perfect machines ever introduced for the purpose. In using this machine, the farmer may be certain that his seed is put into the ground, and at the same time in the best possible manner. There has been a great difficulty in machines for sowing garden seeds; they are very apt to clog up and the farmer might go over an acre of land and not sow a single seed; but not so with this; it is so constructed that it cannot possibly clog. In using this sower, the farmer can save one half of his seed, and do the work at less than one quarter the expense of the common way of sowing seeds, and have it done in a much better manner; it opens the furrow, drops the seed, and covers it over and rolls them down. It will sow almost any kind of Garden Seeds; say Ruta Baga, Mangel Wurtzel, Turnips, Carrots, Beets, Parsnips, Onions. It is highly recommended by a great number of persons who used it the past season. For sale at the N. E. Agricultural Warehouse and Seed Store by  
 JOSEPH BRECK & CO.  
 March 31.

**DRAFT AND TRACE CHAINS.**

Just received by Packet Coromanda, 400 pair Trace Chains, suitable for Ploughing. 200 " Truck and leading Chains. 200 " Draft Chains. For sale by J. BRECK & CO., No. 52 North Market st. April 21

**DOUBLE DAHLIAS.**

We have for sale a very large collection of the finest Double Dahlias, of the most esteemed sorts. J. BRECK & CO., No. 52, North Market St. April 23

**SWEET POTATO SLIPS.**

Just received and for sale by J. BRECK & CO, a supply of Sweet Putato Slips. No 52, North Market st. April 23.

## MISCELLANEOUS.

**Cultivate Flowers.**—A beautiful woman never looks so beautiful as when with her cheeks flushing with exercise, and her eyes sparkling with cheerfulness, with her "cape bonnet" on, and a hoe or a dibble in her hand, she is busily engaged in working in her garden. It is a healthy employment, and exhibits besides, evidences of refinement and taste. To those who are disposed to treat our opinion on this matter with contempt, we would recommend a perusal of the following extract from an exchange paper:—*Port. Jour.*

"What is the use of flowers?" exclaims a thrifty housekeeper, meanwhile busily polishing her fire-irons. What is the use of bright fire-irons? say we in reply: or of any fire-irons at all? Could not you make a fire on two stones, that would keep you quite as warm? What's the use of handsome table-cloths and bed-spreads? one might eat on a board, and not really starve either.

When you see a house standing all alone, bare of shrub or flower, except perhaps some volunteer bunches of thistle and pig-weed, what do you infer of its inmates? And when you have passed even a log-cabin, where the sweet brier was carefully trained around the door, while coils of morning glories and of scarlet beans, shaded the windows, did you not immediately think of the dwellers there, as neat, cheerful and agreeable? This is, more especially the case in regard to the homes of the poor. The credit of the rich man's grounds may belong to his gardener, but they who can keep no gardener, and whose simple flower garden springs out of moments stolen from necessary labor, possess a genuine and cordial love of the beautiful; to render even an humble dwelling so fragrant and fair.

**American Love of Occupation.**—There is probably no people on earth with whom business constitutes pleasure, and industry amusement, in an equal degree with the inhabitants of the United States of America. Active occupation is not only the principal source of their happiness and the foundation of their national greatness, but they are absolutely wretched without it, and instead of the "*dolce far niente*," know but horrors of idleness. Business is the very soul of an American: he pursues it not merely as a means of procuring for himself and his family the necessary comforts of life, but as the fountain of all human felicity. From the earliest hour in the morning until late at night, the streets are thronged by men of all trades and professions, each following his vocation like a *perpetuum mobile*, as if he never dreamed of a cessation from labor or the possibility of becoming fatigued. Neither is this hurry of business confined to the large cities; it communicates itself to every village and hamlet, and extends to and penetrates the western forests. It is as if all America were but one gigantic workshop, over the entrance of which there is the blazing inscription, "*No admittance here except on business.*"—*English writer.*

**An Alarm at Sea.**—The captain of one of our down-east schooners found himself one day becalmed in a fog off the Isle of Shoals, near Portsmouth, N. H. The vessel lay with a slight motion, when the captain, with the quick ear of a seaman, discovered, by the cracking sound of cordage, that there was another vessel close upon him.

He had neither gun nor trumpet to give his neighbor warning of their close approach; and the best thing he could think of was to set his men drumming on some empty casks; but to no purpose, as the sound increased, and the vessel was nearing him. As a last effort of ingenuity, he seized a handspike, and applying it to the ear of an old grunter that happened to be on board, gave it several turns, none of the easiest, which brought forth a squeal almost as loud as the big whistle of our locomotive engines. This signal was effectual; and just before coming in sight of his neighbor craft, bows on, he heard her captain exclaim to the man at the helm, in a voice of thunder, "Starboard your helm, blast your eyes—starboard your helm! we're close upon a hog-yard!"—*Anon.*

**Wellerisms** are getting out of fashion, but we occasionally meet with a good one. Here are a few that are not bad:

"Rather pointed, and I feel it deeply," as the hog said to the butcher-knife.

"This is *net* gain," as the lean spider said to the fat fly.

"Teeth inserted here," as the bull dog said when he bit.

"I'm a *crying evil*," as Wilson said when announcing that a horse had been stolen.

"If you have tears, prepare to shed them now," as the onion said to the cook.

"Let me *reflect*," as the mirror said to the Miss.

"I'm gaining *strength*," as the butter said to the housewife.

"I'm *cutting a swell*," as the steamboat said to the "Captling."

"O *solitude!* where are thy charms?" as the one *idea* in the "soaplock's" noddle said,

"We are kindred spirits," as the ass said to the dandy.

"*Sweet* are the uses of adversity," as the loafer said when he crawled into a newly-emptied *lasses* hogshead for "lodgings."

[Those eight last belong to us: if encouraged, we will try again. There's a good deal of inherent genius in us, which but for our excessive *modesty!* would make us a conspicuous character among the *literati* of the day!!—N. E. F.'s "P. D."]

## TO THE PUBLIC.

DR. CHARLES M. WOOD, *Veterinary Surgeon*, respectfully informs his friends and the public, that he has removed from Blossom St., to 69 Carver St. All orders left at his house, or at the stable of Wm. Forbes, No. 7 Sudbury St., will be promptly attended to, and gratefully acknowledged. All diseases of Horses, Cattle or Swine, are attended to. Also, castrating and spaying.

For the information of those who may have occasion for his services, and are unacquainted with his practice, he is politely permitted to refer to the following gentlemen who have employed him for a number of years past.

Wm. Forbes,  
Wm. J. Niles,  
Joshua Seward,

## TYE UP CHAINS.

Just received by Packet Coromanda, 500 Chains for tyeing up Cattle.

These chains, introduced by E. H. DERRY, Esq. of Salem, and Col. JACQUES, for the purpose of securing cattle to the stall, are found to be the safest and most convenient mode of fastening cows and oxen to the stanchion.

For sale by J. BRECK & CO., No. 52 North Market st.

## GARDEN SEEDS,

For sale by JOSEPH BRECK & Co. at the NEW ENGLAND FARMER OFFICE, No. 51 and 52 North Market St. Boston. The subscribers would inform the public that they have now on hand the largest collection of seeds ever before offered by sale in this city, embracing every variety of *Field, Kitchen, Garden, and Ornamental Flower Seeds* desirable for this or any other Climate.

Our seeds are either raised under our own inspection or imported from responsible houses in Europe, and having taken extraordinary pains to obtain such as are pure and genuine, we can confidently recommend them to our customers and friends, and feel assured they will prove satisfactory to all who try them.

Dealers in seeds are requested to forward their orders in season. Boxes for retailing from 8 dollars, and upwards will be sent out on commission allowing a liberal discount and take back what remain unsold.

Letters and orders with good reference will meet with prompt attention.

## FIELD SEEDS.

Sugar Beet.	Ruta Baga.
Mangel Wurtzel.	Ballatine's New Royal do.
New Red Globe do. } superior	White Tankard Turnip.
Yellow do. } varieties.	Red do.
Carrot Long Orange.	Red Round do.
" Altringham.	White do.
" New White, extra fine.	White Glohe do.
Pumpkin, sorts.	Green Round do.
Wheat—various sorts.	Purple Top Hybrid do.
Barley, do.	Buckwheat.
Rye, do.	Broom Corn.
Potatoes, do.	Millet.
Indian Corn, do.	Buckthorn. } for Hedges.
Oats, do.	Locust. }

## GARDEN SEEDS.

Artichoke, Asparagus, Beans of every description, Beta of sorts, Borecole, Broccoli, Brussels Sprouts, Cauliflower, Caraway, Celery, of the most improved sorts, Cabbage 20 sorts, Carrot, all the varieties, Cucumber do, Cress, Egg Plant, Endive, Indian Corn, Kale, Leek, Lettuce in great variety, Meions, do. Martynia, Mustard, Nasturtium, Okra, Onion of sorts, Pepper do. Pumpkin do. Parsnip, Parsley, Peas, a very great variety, Rhubarb for tarts, Radish of sorts, Salsify, Squash of sorts, Tomato, Turnip 20 varieties.

## SWEET AND POT HERBS.

Thyme.	Sweet Basil.
Sweet Marjoram.	Lavender.
Sage.	Lemon Balm.
Summersavory.	Anise.
Medicinal Herbs, &c.	

## ORNAMENTAL FLOWER SEEDS.

Three hundred varieties, embracing all the finest sorts. Packages of 20 fine sorts for one dollar.

Those who prefer to have their Seeds put up in papers ready for retail, can be accommodated—each packet neatly closed and labelled with printed directions. Price 50 cents, per dozen papers, which are retailed here at 6 1/4 cents each.

Fruit and ornamental trees, of the greatest variety, supplied at nurseryman's prices, and orders solicited. These will be packed, when required, to go to any part of the U. States.

JOSEPH BRECK & CO.

## FOR SALE.

GEORGE THE THIRD, who has been honored with the Second and First State premiums in 1839, at Worcester, and at Concord in 1840, by the Committees appointed by the State, for awarding such premiums, is of Durham Breed, was imported as most superior stock, and is thought by judges to possess more valuable points, than any to be found in any other animal of the kind.

Also, two young Bulls, Sired by the above, their Dams are imported and of the best possible blood.

For further information apply to CHARLES WIL-LARD 2d, Still River Village, Harvard. 4w June 2

## GRINDSTONES.

An extensive assortment of Water and Hand Grindstones constantly on hand and for sale by AMMI C. LOMBARO & CO. 13 Lewis's Wharf. 1stly. Nov. 17.

## NEW ENGLAND FARMER.

## A WEEKLY PAPER.

The Editorial department of this paper having come into the hands of the subscriber, he is now authorized by the publishers to inform the public that the price of the paper is reduced. In future the terms will be \$2 per year *in advance*, or \$2 50 if not paid within thirty days.

ALLEN PUTNAM.

N. B.—Postmasters are required by law to frank all subscriptions and remittances for newspapers, without expense to subscribers.

# NEW ENGLAND FARMER, AND HORTICULTURAL REGISTER.

PUBLISHED BY JOSEPH BRECK & CO., NO. 52 NORTH MARKET STREET, (AGRICULTURAL WAREHOUSE.)—ALLEN PUTNAM, EDITOR.

VOL. XIX.]

BOSTON, WEDNESDAY EVENING, JUNE 16, 1841.

[NO. 50.]

N. E. FARMER.

## INDUCEMENTS OF HORTICULTURE AS AN OCCUPATION.

(Extracted from J. Breck's Address before the Westboro' Agricultural Society.)

There are many inducements to pursue the art of Horticulture, some of which will be considered.

It is a source of profit. Good fruit, as an aliment, is conducive to health.

It is a source of much innocent pleasure. It has a good moral influence.

As to the profit—I think you must all acknowledge that this alone is a sufficient inducement for you to be up and doing. Your prospects are materially changed from what they were ten years ago. You are now within two hours of the best market in the United States, and can transport the most delicate fruit without the least injury. I would inquire how an acre of ground can be made to produce so much as when devoted to fruit? A neighbor of mine purchased a piece of ground—about an acre—for which he paid \$300; it was covered with apple trees in their full vigor, of the best varieties of fruit: he informed me that he sold in one year, enough to pay for it. I do not believe there is any crop that will pay so well as fruit. Fine fruit always commands the highest price in Boston; so high, indeed, that none but the affluent can afford it. I will give you the prices of a few varieties, the present season—[1840.]—Bartlett pears, 37 1-2 to 50 cents per dozen, and St. Michael at 50 cents to 1 dollar, according to size and fairness. Peaches, such as I used to raise bushels of, from 25 cents to 75 cents per dozen; and small, miserable things, not fit to eat, for 12 1-2 cents. Plums, 25 cents to 75 cents per box, of about one quart. Strawberries and Antwerp Raspberries, hardly ever less than 37 1-2 cents per box, unless they had begun to decay; and some magnificent varieties, 75 cents to \$1 per box. Isabella grapes, from 12 1-2 cents to 25 cents per lb. A few years since, Mr Samuel Johnson, of Charlestown, received the sum of \$49 29 for the produce of a single plum tree of the White Gage species, the growth of one season. It should be remembered, however, that these are the retail prices. But supposing the retailer makes 100 per cent., it will leave a generous price for the grower.—Good peaches have readily sold this season from 2 to 4 dollars per bushel. Porter apples 1 25 to \$1 50 per bushel, and all other fine eating varieties in proportion. The large Iron pear, for baking, is hardly ever less than \$4 per barrel, and I have known them as high as 6 or \$8, and nearly as easily raised as Baldwin apples. There are many varieties of winter pears now cultivated in the neighborhood of Boston, equal in flavor to any of the fall varieties, which will bring almost any price asked. An Isabella grape vine trained to an humble cottage that has fallen under my notice, yields bushels of fruit annually—not only supplying the family, but leaving a surplus for sale, or distribution among friends. This combines the

useful with the ornamental, as the vine loaded with its rich fruit is highly ornamental and grateful to the eye. There are individuals in Boston, with hardly a rod of land, whose income from grape vines trained to the house, yield sufficient to pay their taxes, amounting from 25 to \$40 per year, and still reserving enough for their table and friends.

I was on the farm of Elias Phinney, Esq., of Lexington, a few weeks since, and observed a fine orchard of peach trees of about one acre: the ground between the trees had been cultivated from the time they were planted, which accounted for the very fine, fair fruit, by which the trees were bending to the ground. I was informed that the crops raised between the trees had paid from year to year the cost of cultivation and other expenses, leaving the receipts from the fruit a net gain. I have been informed from good authority that the sales from this orchard in one week amounted to more than one hundred dollars, at wholesale prices; what the total amount of sales has been, I know not; but it must have been three times that sum. This farm is 12 miles, or two hours from Boston; so you will perceive it is the same distance, in one sense, as from Westboro' to Boston. I have already given a description of Mr Phinney's apple orchard, in the New England Farmer, which some of you take. It consists of about 4 or 500 trees on ten acres of land, planted 16 years ago; the ground has always been cultivated from the time the trees were planted. The fruit is mostly winter, a great majority of it the Baldwin. Two years ago he sold 700 barrels of good sound apples from it, and upon a rough guess, should say that this year it would exceed one thousand. Apples are now worth in the market at least \$1 50 per barrel: we bought some a few days since for a customer in St. Johns, and had to pay \$1 75.

There need be no fear of overstocking the market with good fruit. There is always had enough in all conscience. Our market has been crowded all summer with fruit prematurely picked, and transported by steam conveyance from New York, New Jersey, Pennsylvania, and even as far south as Norfolk, Va. By the time it reaches us, it is in a decaying state, and consequently unwholesome and not fit for a rational creature to eat: yet it has found a ready sale at high prices and in large quantities. By steam communication fruit is conveyed from Boston to Maine and the British Provinces, and even to England. For under the genial influences of our sun, our fruit is much superior to theirs, and brings a higher price. The facilities the steam ships now give, will greatly extend our market, and all the surplus fruit that will be raised for an age to come, will meet with a ready sale.

There can be no doubt in regard to the profit which may be derived from raising good fruit. Even the common cider apples are now generally allowed to be more profitable for feeding swine and other stock than for converting into cider. If they were not, I would advocate the plan which some have inconsiderately carried into effect, that is of cutting down their orchards. The cider busi-

ness, as formerly conducted, must have been a hard one, whether the cider was "hard" or not. The idea of picking apples and making them into cider, and then selling it at 75 cents per barrel, or laying up 20 or 30 barrels for family use, drinking as much more converted into cider brandy, as I have known a family do, is not so very agreeable. The best policy is to have none but the very finest varieties of fruit on the place, such as will find a ready sale at the best prices. The wind-falls and unsound fruit should be fed to the swine or converted into cider for vinegar. Orchards may be set out expressly for the use of swine and other stock. We know of a number of fine, thrifty young orchards of sweet apples, set out by men who have long used them to great advantage for feeding their swine, and who consider a bushel of them equal to a bushel of potatoes: they are valuable also for cows and horses; and if time permitted, could give accounts of many interesting experiments proving their value for this purpose; but must pass to the consideration of other inducements to pursue this pleasant occupation.

One great advantage arising from the cultivation of fine fruit is, that a free use of it is favorable to health. In the Annals of Horticulture, the advantages of it are set forth in the following language:

"One of the best aliments and the best appropriated, to the different ages of life, is that which our fruit affords. They present to man a light nourishment, of easy digestion, and produce a chyle admirably adapted to the functions of the human body. Thoroughly ripe fruit eaten with bread, is perhaps the most innocent of all aliments, and will even insure health and strength."

"There are fruits which, when perfectly ripe, can be eaten to excess, without inconvenience, such as grapes, cherries and currants; the other kinds never occasion ill consequences, if they are eaten only to satisfy the demands of nature."

As far as my own observation goes, I fully agree with the above writer. For, not having had the taste vitiated by tobacco or ardent spirits, I have always retained the high relish for fruits, which seems to be inherent to our natures, and have habitually used it freely when it has been in my power to obtain it. When toiling in the sun in our warm summer days, I have found there was nothing so grateful or refreshing as fruit. A plate of strawberries, currants, cherries or a melon, with a little bread and cheese, for a lunch, taken under a tree, fanned by the pure country air, is a luxury indeed; and will be found more effectual in recruiting the exhausted frame and quenching the parching thirst, than any thing else that can be named, even were the whole list of aliments or stimulating drinks called over. With fruit, a very little drink, even of cold water will be found necessary. Having had an abundance of cherries for a number of years past, I have eaten them in their season almost to excess, and found that health was improved by the use. I have eat them in the morning as soon as I have risen and could get to the trees, and at all times of the day. I

have frequently made my breakfast on bread and cherries, or strawberries, with a little milk or coffee, and found myself equally refreshed as if I had taken more substantial food; and it is my candid opinion that if fruits were more generally raised, and formed a part of every meal, it would be found by all to be beneficial to health and at the same time a saving to the purse. A writer in the Medical and Surgical Journal says, "that instead of standing in any fear of a generous consumption of ripe fruits, we regard them as positively conducive to health. The very maladies commonly assumed to have their origin in a free use of apples, cherries, melons and wild fruit, have been quite as prevalent, if not equally destructive in seasons of scarcity. All naturalists will testify to the importance of fruit seasons to the lower animals, particularly birds. When there is a failure or an insufficient supply, the feathered tribe are less musical, less numerous, and commence their migrations much earlier, than when amply supplied with the delicate nutrition designed for them at certain periods of the revolving year.

"There are so many erroneous notions entertained of the bad effect of fruit, that it is quite time a counteracting impression should be promulgated, having its foundation in common sense, and based on the common observation of the intelligent.

"We have no patience in reading the endless rules to be observed in this department of physical comfort. No one, we imagine, ever lived longer or freer from the paroxysms of disease, by discarding the delicious fruits of the land in which he finds a home. On the contrary, they are necessary to the preservation of health, and therefore caused to make their appearance at the very time when the condition of the body, operated upon by deteriorating causes, not always understood, requires their grateful, renovating influence. Tyssot, in his advice to people upon their health says: 'There is a pernicious prejudice with which all are too generally imbued. It is, that fruits are injurious in the dysentery, and increase and produce it. There is not perhaps a more false prejudice. Bad fruits and those which have been imperfectly ripened in unfavorable seasons, may occasion cholics and sometimes diarrhoeas, but never epidemic dysentery. Ripe fruits of all kinds, and especially those of summer, are the true preservatives against this malady.' He farther says, 'that whenever the dysentery has prevailed, I have eaten less animal food and more fruit, and I have never had the slightest attack. Several physicians have adopted the same regimen.

"I have seen eleven patients in the same house; nine were obedient and ate fruit; they recovered. The grandmother and a child which she was partial to, died. She prescribed to the child burnt wine, oil, powerful aromatics, and forbade the use of fruit: it died. She followed the same course and met the same fate."

The strawberry is considered by many medical men as a valuable medicine in many diseases; particularly for putrid fevers and pulmonary consumption. A free use of strawberries, it is said, will both prevent and cure the rheumatism. The celebrated Linnæus cured himself of the gout by persevering in a regimen of strawberries.

I could accumulate testimony on the utility of fruit, but I consider it unnecessary. Intelligent people no longer doubt upon the subject, and we hope the prejudices heretofore entertained against the free use of it, will be done away.

From the Albany Cultivator.

### THINGS NOT TO BE DONE.

Sowing spring wheat without soaking in brine, and rolling in lime, is a thing not to be done. According to C. W. Johnson, salt acts an important part in germination and promoting the growth of plants; and lime, every one is aware, seems to be necessary in some form to the perfection of plants and their seeds. Both, then, should be used in sowing wheat.

Attempting to keep cattle, sheep and horses, through our long winters on straw or even hay, without roots, is a thing not to be done. Every good farmer, will therefore make his arrangements so as to secure a plentiful supply of turnips, potatoes, or carrots, for winter and spring use. These fed with the hay, will improve the stock, promote health, and bring the animals through the most trying season of the year with safety and profit.

Making a yard of the highway, and allowing your cattle and sheep to be fed, and to drop their dung where it is lost to the farm, is not to be done. This practice, though a common, is a wretched one, and should be reformed altogether. Feed your animals in stalls, if you can; if not, in yards. To do otherwise, is wasteful in the extreme.

Allowing your cattle in the spring of the year to go roaming about, poaching your meadows and pastures with their feet, is a thing not to be done. The amount of food they can get in this way is a poor compensation for the damage they do, and besides it destroys their relish for hay, without offering any substitute.

Suffering animals to perish for want of attention, at any season of the year, is a thing not to be done. But if any do die accidentally, they should be converted to use by being covered with earth, to absorb the gasses of oxygen and ammonia that are the inevitable results of animal putrefaction, and which are indispensable to the growth of plants.

Having your pig sty in such a state, or place, that your pigs shall not work for a living, is a thing not to be done. They should have a yard into which weeds, swamp muck, straw, and the scrapings of roads and ditches should be thrown, to be converted into manure; and if they seem at any time reluctant to begin the task of mixing such materials, a few handfuls of corn scattered over the surface will set them to work most industriously.

Permitting the chips, pieces of bark, sawdust, &c., of your wood yard to accumulate for years, is a thing not to be done. Remember that all, which has once formed part of a plant can be converted into a plant again, and place all such matters where their decomposition will be most useful, and soonest effected.

Nearly every farm has some pond, marsh, or bog which receives a large portion of the wash of the cultivated land; and to allow this to remain without being returned to the soil, is a thing not to be done. There are some such places that may be considered as inexhaustible deposits of fertilizing matter, yet have never been drawn upon for a single load, by the neighboring farmers. Let those who have such deposits look to them.

Allowing your work to drive you, is a thing not to be done. The man who is half an hour behind his work, finds labor forever an uphill business. There is here a serious mistake committed by many farmers. They lay out more work than they can do well, or in season, and the consequence is,

nothing is done at the time, or as it should be. What you do, do in season, and be sure to do well.

Being content to allow a single year to pass without correcting some error, or making some improvement in husbandry, is a thing not to be done. In conversation with an intelligent farmer the other day, he remarked that the practice of all fell behind their knowledge, or in other words, none did as well as they knew how. To put the knowledge we acquire from our own or other's experience to use, should be the aim of every one, and would soon do away the reproach that farmers are a stationary race of men.

From the same.

### HAWTHORN HEDGES OF ENGLAND.

*Messrs Editors*—There appears to be a considerable desire to introduce into our meadows and fields, that most beautiful of all fences, the Hawthorn hedge. But the prevailing opinion, that it will not thrive here, seems to retard its introduction; the severity of the winter, and dryness of summer, are both urged as causes of its failure.

In England the thorn is considered to be one of their most hardy plants; and it makes a fence which endures for ages. It grows and preserves its beauty on hills which are almost bare of soil, and are, consequently, liable to be parched with the summer's sun, and are also exposed to the severities of winter; it bears the extremes of seasons, and difference of situations, much better than several other English plants which flourish here; hence it is, at least, reasonable to suppose that its failure must arise from some other cause than that of change of climate. Its proper cultivation may not be well enough understood; or, some little alteration may be required to adapt its cultivation to the difference of climate; such, for instance, as trenching *very deep* where the plants are to stand, which would have a greater tendency to preserve them from the injurious effects of the extreme heat and dryness in summer.

The mode of cultivation in England, is as follows: The plants are those of the white thorn. This thorn will, if left to grow singly, attain the bulk and height of an apple tree. It bears white flowers in great abundance, of a very fragrant smell, which are succeeded by a little egg-shaped berry, which, when it is ripe in the fall, is of a red color. Within the red pulp is a small stone; and this stone being put in the ground produces a plant or tree, in the same manner that a cherry-stone does. The red berries are called *haws*; whence this thorn is sometimes called the hawthorn. The leaf is precisely like a gooseberry leaf, only smaller; the branches are everywhere armed with *sharp thorns*, and the wood has a fine grain, and is very flexible and very tough.

The berries are ripe in November. They are beaten from the trees, and cleared from leaves and bits of wood; then they are mixed with sand or earth, four bushels of sand or earth to a bushel of haws, and kept in a cellar, or other cool place; and, soon as the frost is out of the ground in spring, they are sown as thick as peas, in drills one foot apart; here they come up and stand till the next year, when they are taken from that situation, assorted, the strong from the weak ones, and planted very thick in rows one foot apart in a nursery, where they stand another year; then they are ready to be planted to become a hedge. In England, there are two ways of planting a hedge as to

position of ground. One on a *bank*, with a ditch on the side; the other on the level ground.

The soil is prepared by plowing twelve or fourteen inches deep; or, which is better, by trenching two feet deep, and making the earth very fine. The plants are selected from the nursery, as near as possible of *equal size*, else some get the start of others, subdue them, and keep them down, and this makes an uneven hedge, with weak parts in it. If the plants be two years old, have been transplanted, and are at the bottom as big as a *large goose quill*, they are every thing that is required.

The roots of the plants are pruned to within four inches of the part that was at the top of the ground, or in other words, the root is left but four inches long, and all the fibres are cut clean away, or they would die and do harm if left.

The ground and the plants being thus prepared, a straight cut or drill is made about six inches deep, and the plants are put in, but not deeper than they stood before taken from the nursery. The distance between each plant is six or eight inches; some people prefer them twelve inches apart, and plant another line drawn six inches from the first, and put in the plants, not to stand opposite those in the first row, but opposite the middles of the intervals. When the plants are in, the soil between and around them is gently pressed down with the foot, then hoed a little and left neat.

This work is done early in October, or as soon as the ground is suitable in the spring. The first or second week in October would be the most proper time to plant here, even though the leaves should yet be on the plants, as the roots would strike, in this fine month, before the severe frosts commence, and the plants would be more vigorous and start earlier in the spring. If the planting could not be done in the fall, it should be done as soon as the ground is fit in the spring; or the heat and drought might come and retard the growth of the plants.

In both cases, the plants are out almost close to the ground. If planted in the fall, they are cut down as soon as the frost is out of the ground in the spring, and before the buds begin to swell; if planted in spring, they are cut down as soon as planted. This cutting down to within half an inch of the ground, is indispensably necessary, for without it there would be no hedge. The ground between and all about them is also kept clean and frequently hoed.

Some people cut down again the next spring, but it is much better to defer the second cutting until two years after the first one, and then to cut all close down to the ground as possible in the spring; the shoots then come out so thick and so strong that they never need to be cut down any more. But about the middle of the following July, the top, and sides near the top, are clipped off a little, and the bottom left still less clipped, so that the hedge may be wide at bottom and narrow at the top. In October, the new shoots are clipped again, but not quite down to the last cut, the sides being still left in a sloped form, wide at bottom and sharp at the top; when kept in that form the hedge grows close and bushy down to the ground, so as to form a completely close fence; but if left broad at the top, the bottom becomes open and the fence is not so good.

The clipping is performed twice in each of the first four or five years, with shears to be had for

that purpose; afterwards with a long handled bill-hook.

The ground is also hoed and kept clean near the roots of the plants for the first five or six years from the time of planting; the fence will then be about five feet high, and is usually allowed to attain the height of seven or eight feet in meadows and fields, and ten or twelve feet around gardens and orchards, and from two to five feet wide at the bottom.

Of the beauty of such a hedge it is impossible for any one who has not seen it, to form an idea. The leaf is beautiful in color and in shape; it is one of the very earliest in the spring, and preserves its bright hue during the summer heats. Its blossoms, which are white and fragrant, burst forth in the middle of May, and give the most gay and fruitful appearance to the meadows, fields and gardens which they encircle. Its usefulness in giving protection, shelter and shade, render it superior to any other sort of fence. The branches grow so thick and present thorns so numerous, and those so sharp, as to make the fence impenetrable. The shelter it gives in the spring and fall, and the shade it gives in the heat of summer, are so much more effectual than those given by wood or stone fences, that there is no comparison between them. This is important to the farmer whose profits depend much upon the good condition of his cattle, which improve more rapidly and are in every respect more profitable when thus protected from the chills of cold and wet weather, and also from the scorching rays of the summer's mid-day sun.

Another advantage which a quickset hedge possesses over any other sort of fence is, that it effectually protects gardens from the depredations of poultry. Fowls will alight on wooden, brick and stone fences; but never on a quickset hedge, which affords no steady lodgement for the feet, and which wounds their legs and thighs and bodies with its thorns. It not only gives protection against intruders, but also affords shelter in cold weather and shade in hot. On the south side of a high fence, peas, lettuces, radish, and many other things, can be had ten or twelve days earlier in the spring than in the unshaded ground; and during the heat of summer all these and many others thrive best in the shade, and continue to do so long after they will no longer produce in the sun.

The hawthorn is the favorite plant of England; it is seen as a flowering shrub in pleasure grounds; it is the constant ornament of paddocks and parks; the first appearance of its blossoms is hailed by old and young, as the sign of pleasant weather; the youth, of both sexes, adorn themselves with garlands made with flowers, and join in merry dance and rural sports around the hawthorn bush on the village green; whilst the more aged, seated beneath its shade, direct the joyous throng, and recount with pleasing recollections, all the pastimes and pleasures of their youth. In short, take away the hawthorn, and you take away the greatest beauty of the English fields and gardens.

And why should America not possess this most beautiful plant? She has some of the English follies and English vices; and why not English hedges, instead of post-and-rail and board fences? If, instead of these sterile-looking and cheerless enclosures, the gardens and meadows and fields in the neighborhood of cities and towns were divided by quickset hedges, what a difference would the alteration make in the look, and in the real value too, of those gardens, meadows, and fields?

N. B. If the white thorn plants cannot be procured here, they may be had from Liverpool or London in the spring; or the berries may be shipped from any port in Great Britain, in barrels, half sand and half berries, in November. Three barrels would fence a farm; and might be had for little more than two dollars a barrel, at any port in England.

With due regard, yours,  
Albany, March 22, 1841.

R. M.

#### CEDAR HEDGES.

Hugh Gaston, who makes some inquiries on this subject, is informed that the berries of the Cedar are to be gathered in December, thoroughly cleansed by rubbing off the resinous matter, put into unslaked ashes, and after two weeks, plant them in rows like peas. They may be transplanted in about two years, into a rich light soil, formed for the purpose, and in seven or eight years with proper trimming, make a beautiful hedge. If at the expiration of the two weeks' preparation in ashes, the ground should be frozen, they must be mixed up with earth in a box, and placed in an exposed situation, until the first thaw, or till the earth can be fitted for their reception. In trimming the cedar, or pruning, care must be taken not to disturb the centre or leading shoot, as in that case the tree frequently perishes.—*lb.*

#### PEACH WORM.

Messrs Editors—Has there been any preventive discovered to the ravages of the peach worm or grub, which threatens to destroy this most delicious of fruits? I have some fine trees which I find have been attacked. I am loth to lose them, and any information you may be able to give, will be thankfully received by one, at least, of your many  
SUBSCRIBERS.

If the trees are already infested by the grub, let them be carefully examined around the root, and every worm dissected out of the bark. Complete excision will alone save the tree; at least such is the opinion of some of the most successful peach growers. With this evil, prevention is better than cure, and fortunately since attention has been directed to this point, methods have been discovered which appear to be effectual in preventing the attacks of the parent moth or fly. Planting the red cedar with the peach tree in the same hole, and leaving the roots and stems in as near contact as possible, has been found by experience to preserve the peach, the odor of the cedar being offensive to the parent of the grub, and the slow growth of this shrub preventing any injury to the peach. Prof. Kirkland, of Ohio, says—"Tansy and wormwood contain large quantities of essential oil, which is peculiarly offensive to this insect; and it is found that if the body of the peach tree be surrounded by half a dozen sprouts of either of these vegetables, it will be perfectly secured against the approaches of the destructive enemy. They should be planted in the spring nearly in contact with the body of the tree, and so as to surround it. During the summer they should be cultivated, and kept free from grass. In this way they form a permanent and successful means of defence against the insect that has nearly exterminated the peach tree from many sections of our country."—*lb.*

Man is the master of his own destiny.—*Cousin.*

CATTLE SHOW AT BRIDGEWATER,

On Wednesday, Sept. 29, 1841.

List of Premiums proposed by the Plymouth County Agricultural Society:

State Premiums.

The Massachusetts Society for the Promotion of Agriculture, offer the following premiums for Stock, to be exhibited from any county of the Commonwealth, at Bridgewater, on Wednesday, the 29th of September next, at the annual Cattle Show of the Plymouth County Agricultural Society, viz:

For the best blooded bull of an imported breed, not less than one year old, assurance being given that he shall be kept for use in the Commonwealth at least nine months, \$20

For second best, (same requisitions,) 10

For the best milch cow, full blood, of an imported breed, not less than three nor more than ten years old, with satisfactory evidence as to the quantity of her milk and the manner in which she has been fed, 15

For second best, (same requisitions,) 7

For the best full blooded heifer of imported breed, that has been milked not less than three months, with satisfactory evidence of the quantity and quality of her milk, 10

For second best, (same requisitions,) 5

For the best full blooded heifer, of an imported breed, of any age, 5

For the best pair of working oxen, taking into view their size, power and training, 12

For second best do. do. 6

For the best pair of three years old steers, taking into view their size, power and training 6

For second best do. do. 4

Similar premiums may be expected to be offered for the same description of stock, at the Plymouth County Exhibition, in 1842.

Claims to the above premiums must be entered in writing, with Benj. Guild, Esq., Boston, Recording Secretary of the Massachusetts Society for Promoting Agriculture, on or before the 20th of September next; also in like manner, notice must be given to Abram Washburn, 2d, of Bridgewater, at least three days previous to the exhibition.

Improvements.

To the person who shall on the first day of September, 1841, have the largest quantity of land in the best state of preparation for English mowing, which was swamp land or fresh meadow, June 1st, 1840, \$25

Second premium for the same object, 15

Third do. do. 10

To the person who shall before the first day of October next, produce the greatest quantity of cocoons by feeding the worms on the leaves of the Chinese mulberry tree or shrub, 15

Second premium for the same object, 10

Third do. do. 5

Claimants of the above premiums will be required to feed successfully not less than 6000 worms, and to state in writing the manner of cultivating the trees or shrubs on which the worms were fed, the kind of soil, the quantity and kind of manure, if any used, &c. Also the manner in which the eggs were preserved, the time and manner of hatching the worms, and all the particulars relating to feeding, taking care of the worms and preserving the cocoons, with an account of the whole expense.

To every person in the county who shall build before September, 1841, one hundred rods of stone wall,

For every additional hundred rods, 9

And in the same proportion for fractional parts of a hundred rods, after two hundred have been built. 12

To the person who shall collect the greatest quantity of any kind of material, (excepting manure from stock,) which in the opinion of the committee shall more than pay the cost of collecting and spreading on his farm, between the first day of September last and the first day of September next, not less than 400 loads, 40 cubic feet considered a load, 20

A second premium for the same object, not less than 300 loads, 15

A third, not less than 250 loads, 12

A fourth, not less than 200 loads, 10

The committee are authorized to distribute 8 vols. of the N. E. Farmer and 8 vols. of the Yankee Farmer.

N. B. Claims to be made on or before the 1st day of August, 1841, to Isaac Alden, East Bridgewater.

Claimants, to entitle themselves to the above offered premiums, must make a particular statement in writing, of their several operations.

Produce.

For the greatest quantity of wheat, raised on not less than one acre of land, nor less than twenty bushels, \$12

For the next greatest quantity, do. 8

For do. do. do. do. 4

For the best crop of Indian corn, raised on one acre, not less than 60 bushels, (75 lbs. in the ear considered a bushel,) not to be harvested before the 15th of October, 1841, 12

Next best crop, 8

Next best do. 5

For the greatest quantity of barley on an acre, not less than thirty bushels, 8

Second premium, do. 5

For the best crop of Rohan potatoes, on not less than half an acre of land, nor less 400 bushels, 5

For the best crop of potatoes of any kind, on not less than one acre of land, and not less than 500 bushels to the acre, 10

For the next best do. not less than 400 bushels, (56 lbs. to be considered a bushel of every kind of root except onions,) 7

For the best crop of oats, on not less than two acres, and not less than 50 bushels to the acre, 7

For the next best on one acre, 4

For the greatest number of bushels of rye, raised on an acre, and not less than 30 bushels, 6

For the next best do. do. 5

For the greatest quantity of white beans raised on an acre, not less than 15 bushels, 6

For the next do. not less than 6 bushels on half an acre, 4

For the greatest quantity of carrots, raised on not less than one acre of land, and not less than three hundred bushels, 8

For the next greatest quantity on half an acre, 4

For the greatest quantity of onions, on not less than a quarter of an acre of land, and not less than 75 bushels, 5

For the greatest quantity of sugar beets,

raised on not less than a quarter of an acre of land, 5

If the sugar be extracted from the beets and a satisfactory account of the processes given, the premium will be trebled. 12

For the greatest quantity of common turnips on an acre, not less than 300 bushels, 5

For the best crop of ruta бага turnips, not less than 300 bushels, 5

The committee are authorized to distribute 8 vols. of the N. E. Farmer and 8 of the Yankee Farmer, as additions to the above offered premiums, or as gratuities to unsuccessful claimants, according to their judgment of merit.

P. S. It will be required of claimants of the above premiums, to state in writing, the condition of the land at the time the course of cultivation for the approaching season may commence, and the several operations in that cultivation; and the amount of produce must be attested by the owner and one laborer.

A certificate of the measurement of the land by some respectable surveyor, will be required. Claims to be made on or before September 29th, 1841, but the evidence of the amount of crops need not be produced until the first of November next. Communications to be made to Anthony Collamore, Penbrooke, Chairman of Committee on Produce.

N. B. Without a strict compliance with the above conditions, the committee have determined not to award premiums.

Stock.

For the best fat ox, \$10

For the next best do. 8

For the best fat cow, 6

Next best do. 3

For the best milch cow, 8

Next best do. 6

For the best heifer, not less than one nor more than three years old, 5

For the next best do. 3

For the best bull calf not less than five months old, 4

For the next best do. 3

For the best heifer calf, 4

For the next best do. 3

For the best pigs of the Berkshire or Mackay breed, not less than three months old, a male and female, assurance being given that they shall be kept in the county at least one year from the day of exhibition, 6

The committee are authorized to distribute 4 vols. of the N. E. Farmer and 4 vols. of the Yankee Farmer.

Cattle not to be removed from the pens before 1 o'clock, P. M. Claimants for premiums on stock, are required to exhibit to the committee, evidence of the mode of rearing and treating animals offered for premium. The committee will please strictly to enforce this requisition and award no premium for a milch cow, unless the quantity of milk and butter produced for at least ten days in each of the months, June and September, be accurately stated.

Animals must have been kept in the county six months to entitle them to premiums.

Claims for stock of every sort, and entries for the ploughing match, to be made on or before September 25th, 1841, to Abram Washburn, 2d, Bridgewater.

*Working Oxen and Steers.*

For the best pair of working oxen, raised and trained in the county, \$10  
 For the next best do. 6  
 For the best pair of steers, not less than two nor more than three years old, 6  
 For the next best do. 3  
 For the best pair of yearling steers, accustomed to the yoke, 5  
 For the next best do. 3  
 The committee are authorized to distribute 2 vols. of the N. E. Farmer and 2 vols. of the Yankee Farmer.

*Plowing Match.*

The Plowing Match will commence at 9 o'clock, A. M., on the day of exhibition.  
 1st premium, \$8  
 2d do. 6  
 3d do. 4  
 4th do. 3  
 5th do. 2

The work to be performed with one yoke of oxen.  
 The committee are authorized to distribute 3 vols. of the N. E. Farmer and 3 vols. of the Yankee Farmer.

*Articles of the Dairy.*

For the best butter, not less than 50 lbs., \$5  
 For next best do. not less than 25 lbs. 3  
 Next best do. do. do. 2  
 For the best cheese, not less than 700 lbs. 5  
 For next best do., not less than 100 lbs. 3  
 Next best do. do. do. 2

The committee are authorized to distribute 2 vols. of the N. E. Farmer and 2 vols. of the Yankee Farmer.

*Fruits and Vegetables.*

The committee on Fruits and Vegetables, are authorized to distribute twenty dollars for extraordinary fruits and vegetables that may be deposited for exhibition.

*Inventions.*

The committee are authorized to distribute for inventions and improvements in the structure of implements of agriculture, &c. as rewards of ingenuity, \$20  
 The committee are authorized to distribute 2 vols. of the N. E. Farmer and 2 vols. of the Yankee Farmer.

*Manufactures.*

The committee on cloths and the most useful articles of household manufacture, are authorized to award in premiums, according to their judgment of the comparative excellence and utility of the articles presented, \$75

*Bonnets and Fancy Articles.*

The committee on articles of usefulness and fancy, are authorized to award \$50

*Cocoons and Silk.*

To the person who shall raise and exhibit the largest quantity of cocoons, \$4  
 For the next greatest quantity, 3  
 For the next do. do. 2  
 For every ounce of wrought silk, raised and worked in the county, ten cents.

P. S. Cloths, fancy articles, products of the dairy, cocoons and silks, articles of invention, fruits, vegetables, &c. must be deposited in the Town

House before 9 o'clock, A. M. on the day of exhibition.

Articles manufactured out of Plymouth county, not admissable.

*Premiums Claimable in Future Years.*

1. To the person who shall on the first day of September, 1842, have the largest quantity of land in the best state of preparation for English mowing, which is now fresh meadow or swamp land, \$25  
 2. Second premium for the same object, 15  
 3. Third do. do. do. 10  
 4. For the most accurate and satisfactory experiment in the application of manure, premium payable in 1842, 25  
 5. To the person who shall make the most valuable and extensive general improvements on his farm, before September 1st, 1846, 50  
 6. To the person who shall make the next most valuable improvements, 30  
 7. For the most extensive forest, of any sort of trees suitable for timber, raised from the seed, not less than 1000 trees to the acre, which shall be in the most flourishing condition and more than five years old in September, 1845, 50  
 8. Second premium for the same object, 30  
 9. Third do. do. do. 20

Claims to these premiums numbered 1, 2, 3, 5 and 6, must be made to Isaac Alden, of East Bridgewater, on or before the first day of June, 1841, that the committee may acquaint themselves with the condition of the farms at that time, and become better qualified to judge of the actual improvements.

Premiums not demanded within one year will be considered as generously given to promote the objects of the Society.

On all premiums above five dollars, awarded to gentlemen not members of the Society, the Treasurer is directed to make a deduction of 25 per cent., to increase the funds.

The Trustees will not consider themselves obliged by the terms of the above offers, to give a premium in any case, when it shall be evident there has been no competition, nor more than ordinary exertion.

All entries for premiums may be made by letters, post paid. Letters not post paid, will not be considered.

By order of the Trustees,

MORRILL ALLEN.

Bridgewater, Jan. 1841.

From the British Farmer's Magazine.

ON PREPARING NIGHT-SOIL.

SIR—I observed a few days ago in one of your late periodicals, an inquiry, by a correspondent, for the best method of preparing night-soil, for manure. He said, "he had mixed it with lime, and a very strong smell of ammonia was evolved, whereby he feared the efficacy of the manure might be impaired. These conclusions are perfectly correct; its efficacy as organic manure, would be destroyed by the use of lime.

When an organic body containing nitrogen undergoes putrefaction, and moisture present, the nitrogen unites with the hydrogen of the water and forms ammonia; the oxygen, the other element of water, unites with the carbon of the putrifying body, and forms carbonic acid; both these trans-

formations, in their nascent state, combine and form carbonate of ammonia, a volatile salt, which is always evaporating with water, as long as the decomposition continues. Such invariably takes place in nitrogenous bodies.

When lime is added to a body holding carbonate of ammonia in solution, as in night-soil, the ammoniacal salt is decomposed; the lime robs it of its carbonic acid, and caustic ammonia, a still more volatile compound, flies off in gas: thus we have got rid of all the nitrogen the organic compound contained.

Organic manure, without nitrogen, is of very little value. It pervades every part of the vegetable structure, and no plant will attain maturity, even in the richest mould, without its presence.—The relative value of manure may be known by the relative quantity of nitrogen it contains. There does not appear to be any manure so rich in nitrogen as human excrement, (except bone manure, which contains upwards of 30 per cent. of gelatine in its interstices;) so much so, that according to the analyses of Macaire and Marcet, 100 parts of human urine are equal to 1300 parts of fresh dung of the horse, 600 parts of the cow, and 450 parts of the urine of the horse. Hence it is evident that it would be of much importance if none of the human excrements were lost, especially when we consider that with every pound of urine a pound of wheat might be produced. Now I would suggest to your correspondent the best and most economical method I know of preserving unimpaired the most valuable element in night-soil, which is as follows: To every 100 lbs. of night soil add 7 lbs. of sulphate of lime (gypsum) in powder; a double decomposition will ensue, and the result will be, instead of sulphate of lime and carbonate of ammonia, carbonate of lime and sulphate of ammonia—the latter, soluble salt which cannot be volatilized. It might now be mixed with other compost, or dried any way thought proper, and applied to the roots of the vegetable, to be again transformed into bread, butter, cheese, &c.

Chloride of calcium, sulphuric or muriatic acid, substances of low price, would completely neutralize the urine, converting its ammonia into salts which possess no volatility.

I would also suggest that if the floors of stables be strewed from time to time with a little sulphate of lime, they will lose all their offensive smell, and none of the ammonia which forms can be lost, but retained in a condition serviceable as manure. In close stables the horses' health would be better preserved and they would not be so liable to get blind as now. 13-4 lbs. of sulphate of lime will fix as much ammonia as is produced by 100 lbs. of horse's urine.

I am, sir, your obedient servant,

GREGORY BRABYN.

Wanebridge, Nov. 14.

*Soot as a manure.*—A writer in the Farmer's Journal says he has applied soot upon asparagus, peas, and a variety of other vegetables, with as much effect as if he had used solid dung; but to plants in pots, particularly pines, he found it admirably adapted; when watered with it, they assume a deep healthy green and grow strong and luxuriant.

Vice stings us even in our pleasures, but virtue consoles us even in our pains.—Lacon.

**NEW ENGLAND FARMER,**  
AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, JUNE 16, 1841.

**BOSTON POUURETTE.**

A Mr Rowell, of Lynn, asks the agricultural community to furnish means for manufacturing pourette in this city. We wish him success, and trust that he will meet with it.

If we understand his plan, the outlines are these:—that subscription papers be opened forthwith for taking up the stock; that as soon as \$10,000 shall be promised, in sums of not less, than \$50 each, a meeting of the subscribers shall be called, to choose their officers, determine whether it is best to go on, and if so, to authorize whom they please to collect the money that has been subscribed, and appropriate the same to the purpose for which it was designed.

We have asked Mr R. for proofs of his trustworthiness, and he has obtained a certificate signed by several highly respectable citizens of Lynn, which is satisfactory.

He possesses some practical acquaintance with the business; has spent some weeks at one of the establishments in New York, where a relative of his is superintendent.

We have questioned Mr R. very closely, and are unable to discover any reasons why the stock in such a company would not be profitable. Such subscribers as choose to take their dividends in the manufactured article, will apparently obtain manure at a low rate. Making very considerable allowances for unforeseen contingencies, the business certainly promises well to the stockholders. If, as Mr Rowell maintains, the outlay of \$10,000 will procure all necessary fixtures, tools, &c., and will also be sufficient for the manufacture of 30,000 bushels of pourette, then at the usual price of 40 cents per bushel, the whole expenses may be refunded the first year. This, however, is more than would be expected.

Mr R., should his plan succeed, will stand upon an equality with every other subscriber. He hopes, no doubt, to find employment as superintendent; but the company will be under no obligations to employ him; he asks not that any thing shall be paid in to him, but chooses that all funds should go into the hands of some other person as treasurer.

It is desirable that operations should be commenced forthwith; for this summer is the best time for preparing the article for use the next spring. All persons disposed to subscribe, will confer a favor by sending their intentions at once to the N. E. Farmer office. It is hoped by Mr R. that the farmers will be the subscribers.

We have no interest in this project apart from our general interest in agriculture; and in our remarks have endeavored to avoid holding out delusive expectations. We may be deceived; but we have given considerable attention to the subject, and have a strong persuasion that we are not imposed upon. We advise our friends who wish for more manure than they make, to invest 50 or 100 dollars (more if they choose,) in this concern, which we believe will go on and will do well. The question whether to go on or not, is to be submitted to those who subscribe; and no payment is asked for until they have decided that point.

We hope that our friends will at once inform us of their wishes. Should Mr R. meet with encouragement, he says that operations may be commenced next month.

**THE FLOWER GARDEN CULTIVATED BY THE LADIES.**

A neat flower garden in front of the farm house, is proof that the farmer's wife and daughters are industrious and refined. It is proof that the work within doors is well performed: for it is never the case that disorder and thriftlessness reside within, while the garden—tended by female hands—is neat and flourishing. This outdoor labor gives bloom to the cheeks, vigor to the whole frame, cheerfulness to the disposition, and general efficiency.

Fair and gentle woman is never in a better school than when busying her fingers and twining her affections around the fair daughters of Flora. There she mingles with beauties whose tongues never utter envy or malice, and whose ears are deaf to every idle or sinful word. There the lovely and innocent speak to her of the more lovely and holy One who delineates their graceful forms and paints their rich and varied colors. Purer, richer, better are the teachings of the shooting blades and opening flower, than come from the musings of a listless mind, the pages of romance, or the gossip of corrupted society. The seeds of health, and purity, and vigor are in the soil on which the pink and primrose grow, and those who labor to procure the fragrance of the latter, will taste the delicious fruit which the former bear.

Fear not, ye busy wives and daughters, that the care of a small flower garden will be a burthen, rendering more arduous the labors of the kitchen, the dairy room, and the needle. For the invigorating exhalations of the freshly turned soil, the draughts of pure oxygen which will be found around your plants when the warm sun is expanding their foliage, the variety of exercise which the garden gives to body and mind, together with the pleasure derived from the beauty and fragrance of your flowers, will furnish more strength than the labors of the garden will exhaust.

**LEISURE DAYS.**

By these we mean days in which the care of the crops does not require attention—days when the farmer can look about him and turn his hand to some odd job. Usually there are several such days in June, and the manner in which they are spent is of no small moment.

Of course it is not in our power to tell you what is to be done on your particular place—for on one farm a few rods of stone fence is to be built; on another an underdrain is to be completed; on a third the ditches require attention, &c. &c. But at these times keep a sharp look out for manure making. The swine must have frequent supplies of the raw material, and leaves, soil, muck, &c. must be deposited near the hog-yard now, so that in the busy days of haying, something may be thrown in, and your hogs not left without means of doing their proper work. These days for whitewashing, for cleaning up around the house and barn, for seasonal repairs, and the like, are among the most profitable of the season. We class them under the head of leisure days, but they should be far from days of idleness: more of the profits of husbandry is obtained from the good judgment and perseverance with which improvements are planned and executed; (we mean the gradual improvements, which the good farmer will have an eye to, and will carry forward at times when the cost will be but little)—more of the real profits of farming turns upon these than upon the ordinary crops of the farm. Where soil and manure are alike, one man can obtain as good a crop as another, or nearly so; the skill required is not so much that of planting and hoeing, as of increasing the manure heap, increasing the depth of the soil; protecting the dry lands from drought,

and draining those that are too wet; the mixing of soils and suiting the manures to the soils and crops to which they are applied. These are the important matters; and many of them deserve attention at this season of the year.

**THE SEASON.**

We have had more than two weeks of warm, windy weather, without rain: vegetation has advanced most rapidly; but now (Monday) the drought begins to pinch; rain is very desirable in this immediate vicinity: in the northern and eastern parts of Essex county, there have been recent showers, and nothing suffers there from lack of moisture.

**Massachusetts Horticultural Society.**

*Saturday, May 8th, 1841.*

Exhibited—Native Plants—10 species—from B. E. Cotting. 8 species of do. from E. Weston, jr. and F. Parker.

*May 15th.* Native Plants—10 species—from B. E. Cotting.

*May 22d.* Native Plants—14 species—from B. E. Cotting.

*May 29th.* Native Plants—22 species—from B. E. Cotting.

*June 5th.* Bouquets from J. Hovey, Hovey & Co., T. Mason and A. Bowditch.

Double White Camellia and Blush, Yellow and White Tea Roses, Lamarque do. and some others, from A. Bowditch.

Geraniums from T. Mason.

Native flowers from E. Weston, jr. and F. Parker.

Native plants, 30 species, from B. E. Cotting.

From J. Kenrick, *Pæonia Banksii* and *Papaveracea*; several varieties of fine hardy *Azaleas*; Double White and Scarlet *Hawthorn*; Flowering *Ash*; Scotch *Laburnum*; *Hallsia tetraptera*; *Magnolia cordata*; *Calycanthus*; *Tartarian Honeysuckle*; *Spiræa hypericifolia*; *Flesh col'd* and *White Horschestnut*; *Herbaceous Pæonies*, &c.

C. M. HOVEY, *Chairman.*

**EXHIBITION OF VEGETABLES.**

*Saturday, June 12.*

Hovey & Co. exhibited very fine specimens of Southgate Cucumber.

For the Committee.

S. POND.

**NOTICE.**

The exhibition of *Pæonies*, for premium, is postponed until Saturday, the 19th June. The following are the prizes offered:

For the best display of flowers—

‘ ‘ second best do. do.

C. M. HOVEY, *Chairman.*

**VARIEGATED HORSE CHESTNUT.**

William Kenrick, Esq., of Nonantum Hill, Newton, has exhibited to us the leaves of a Horse Chestnut tree, which are beautifully variegated, green and white. It has been raised from seed within a few years, and should it continue to exhibit the same propensity, will prove an interesting addition to our ornamental trees.

J. B.

*Sweet Flag.* A gentleman, whose word is valuable, informs us that by mowing the top of the sweet flag early in the season, and letting it fall and rot, and then mowing later and closer at the proper season both flag and the grass among it, you may kill out the flag.

**THERMOMETRICAL.**

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northerly exposure, week ending June 13.

June, 1841.	5, A. M.	12, M.	7, P. M.	Wind.
Monday,	7 56	85	76	W.
Tuesday,	8 70	88	82	N. W.
Wednesday,	9 66	67	68	S. E.
Thursday,	10 57	63	76	S. W.
Friday,	11 64	85	78	N. W.
Saturday,	12 53	75	68	N. W.
Sunday,	13 55	78	63	S. W.

There has not been rain enough during the week to wet the surface of the earth.

**BRIGHTON MARKET. — MONDAY, JUNE 14, 1841.**

Reported for the New England Farmer.

At Market 175 Beef Cattle, 12 pair of Working Oxen, 25 Cows and Calves, 650 Sheep and 630 Swine.

PRICES.—Beef Cattle.—We quote to correspond with last week. First quality, \$6 75 a 7 00. Second quality, \$6 25 a 6 50. Third quality, \$5 25 a 6 00.

Working Oxen.—No sales noticed.  
Cows and Calves.—Sales, \$22, \$25, \$30, \$32, \$35, and \$37.  
Sheep.—Lots \$2 25, \$2 42, \$2 50, \$2 67, and \$2 75.  
Swine.—Lots to peddle 5 for sows, and 6 for barrows. Large barrows 5 1-2. At retail from 5 1-2 to 7.

**REVOLVING HORSE RAKE.**

The Revolving Horse Rake has been in general use in most parts of Pennsylvania and New Jersey, and is found to be one of the most useful labor saving machines now in use. One man and horse, with a boy to lead, will rake on an average from 25 to 30 acres per day with ease, and do the work well. There is a great advantage in this rake over all others, as the person using it does not have to stop the horse to unload the rake.

For sale at Nos. 61 & 52 North Market Street, by June 9. **JOS. BRECK & CO.**

**NEW YORK POUURETTE COMPANY.**

This company has been in operation nearly four years. Present price of shares one hundred and five dollars; and each share is entitled to fifty bushels of Poudrette every six months, which is equal to fifty city cart loads of stable manure for 18 years from March, 1841.

Price of Poudrette 40 cents per bushel, or two dollars a barrel, of four bushels, delivered on board of vessels in this city. Those farmers who wish to obtain this manure regularly, will do well to take shares soon; and those who wish to purchase the article will do well not to wait another year, until they wish to use it.

Owing to the unusually wet season, orders received now cannot be filled under four or five weeks, but it is believed that there will be a supply in July, August and September.

To ensure a supply for early spring use, shares should be taken in time to receive a full Dividend, which will prevent disappointment or by a wet spring like the present; or

Those at a distance, who desire to make an experiment, can obtain one or more barrels, in turn, by remitting, at the rate of two dollars per barrel. A pamphlet will be sent to any person who desires one.

Shares will be sold for the present at \$105 each, but they will surely advance in price, notwithstanding the number of dividends will diminish every six months.

D. K. MINOY, Agent,  
120 Nassau street (up stairs.)

N. B. It is to be distinctly understood that this Company is in no way connected with the "Urate and Poudrette Company," or "Lodi Manufacturing Company" of Anthony Dey & Peter Barthelemy, on the New Jersey Meadows, which, it report be true, failed, after an expenditure of over \$50 000.

New York, May 10th, 1841. 6w j17

**WHOLESALE PRICES CURRENT.**

Corrected with great care, weekly.

SEEDS. Herds Grass, very little in market. Red Top, new seed by the bag 50 to 55 c. Clover—Northern, 13c.—Southern, 8 to 9 c. Flax Seed, \$1, 37 to 1 50 bu. Lucerne, 25 c. per lb.

FLOUR. Howard Street \$5 37—Genesee \$5 25—Ohio \$5 12.

GRAIN. Corn—Northern Yellow none—Round Yellow 68—Southern Flat Yellow 60—White 64.—Rye—Northern 60 to 65—Southern 50 to 55. Oats—Southern 36 to 33—Northern 33 to 40.

PROVISIONS. Beef—Mess \$10 50 to 11 00—Prime \$6 50—No. 1 \$9 00. Pork—Extra—15 00—Clear 14 50—Mess \$13 00. Hams—Northern 9 c. per lb.—Southern, none. Lard—Boston 9 c per lb.—Southern, 8 to 8 1-2. Butter—Lump 13 to 22—Firkin 12 to 18—Shipping 8 to 14.

HAY, per ton, \$18 to 20—Eastern Screwed \$14 to 15. CHEESE—Old 11 c.—New 8.

EGGS, 11 a 12.  
WOOL—The market for this article has not experienced any change of late. Pulled Wool is rather scarce, and there is but a limited supply of low Fleeces, and of fine Fleeces the stock is also moderate. Prime or Saxony Fleeces, washed, lb. 50 to 55 c.—American full blood, washed, 47 to 50—Do. 3-4 blood, washed, 44 to 46—Do. 1-2 blood, washed, 36 to 40—1-4 and common do, 35 to 37—Smyrna Sheep, washed, 20 to 28—Do, unwashed, 10 to 14—Bengasi Sheep, 8 to 10—Buenos Ayres unspiced, 7 to 10—Superfine Northern pulled lamb 43 to 46—No. 1 do. do. 37 to 42—No 2 do do 26 to 30—No 3 do do 18 to 20.

**GOOD CULTIVATORS AT \$3 50**

Good Cultivators for sale at the New England Agricultural Warehouse, Nos. 51 & 52 North Market Street, Price \$3.50. **JOS. BRECK & CO.**

**FENCE CHAINS.**

Just received from England, 10,000 feet Chains, suitable for Fences or other purposes. For sale by **J. BRECK & CO.,** No. 62 North Market st. April 21

**DAHLIA POLES.**

600 dozens of Dahlia and Bean Poles. Also, 2000 feet of Ladders, 16 to 40 feet in length, for sale by **MOSES FRENCH, Jr.,** Maine wharf, Broad st. near the bottom of Summer st. 6w June 2

**HOWARD'S IMPROVED EASY DRAUGHT PLOUGH.**

Great improvements have been made the past year in the form and workmanship of these Ploughs; the mould board has been so formed as to lay the furrow completely over turning in every particle of grass or stubble, and leaving the ground in the best possible manner. The length of the mould board has been very much increased, so that the Plough works with the greatest ease, both with respect to the holding and the team. The Committee at the late trial of Ploughs at Worcester, say,

"Should our opinion be asked as to which of the Ploughs we should prefer for use on a farm, we might perhaps say to the inquirer, if your land is mostly light and easy to work, try Prouty & Mears, but if your land is heavy, hard or rocky, BEGIN WITH MR. HOWARD'S."

At the above mentioned trial the Howard Plough did more work, with the same power of team, than any other plough exhibited. No other turned more than twenty-two and one half inches, to the 112 lbs. draught, while the Howard Plough turned twenty-nine and one half inches, to the same power of team! All acknowledge that Howard's Ploughs are much the strongest and most substantially made.

There has been quite an improvement made on the shoe, or land side of this Plough, which can be renewed without having to furnish a new landside: this shoe likewise secures the mould board and landside together, and strengthens the Plough very much.

The price of the Ploughs is from \$6 to \$15. A Plough, sufficient for breaking up with four cattle, will cost about \$10 50, and with cutter \$1, with wheel and cutter, \$2 50 extra.

The above Ploughs are for sale, wholesale and retail, at the New England Agricultural Warehouse and Seed Store, Nos. 51 & 52 North Market Street, by **JOS. BRECK & CO.**

**FULL BLOOD DURHAM CATTLE.**

The subscriber will sell at public auction, at his residence in Pleasant Valley, foot of Atwell's Avenue, in Providence, 1 1-2 miles from the Great Bridge, on Wednesday, the 23d of June instant, at 11 o'clock, A. M.

20 head of superior full and half blood Durham Cattle. Also, 20 full blood and half blood imported Southdown Sheep. A rare chance is offered in this stock to farmers and others to secure some of the finest Cattle ever offered for sale in this country, and as a whole there is seldom so choice a lot of herd book Cattle presented to the public. All interested are requested to call and examine this stock previous to the day of sale. Terms liberal. For further particulars see catalogue, which will be exhibited at the sale. Providence, June 5, 1841. **JOHN GILES.**

**WILLIS'S LATEST IMPROVED SEED SOWER.**

Willis's latest Improved Seed Sower, invented the last season; one of the most perfect machines ever introduced for the purpose. In using this machine, the farmer may be certain that his seed is put into the ground, and at the same time in the best possible manner. There has been a great difficulty in machines for sowing garden seeds; they are very apt to clog up and the farmer might go over an acre of land and not sow a single seed; but not so with this; it is so constructed that it cannot possibly clog. In using this sower, the farmer can save one half of his seed, and do the work at less than one quarter the expense of the common way of sowing seeds, and have it done in a much better manner; it opens the furrow, drops the seed, and covers it over and rolls them down. It will sow almost any kind of Garden Seeds; say Ruta Baga, Mangel Wurtzel, Turnips, Carrots, Beets, Parsnips, Onions. It is highly recommended by a great number of persons who used it the past season. For sale at the N. E. Agricultural Warehouse and Seed Store by **JOSEPH BRECK & CO.**

**AGRICULTURAL IMPLEMENTS, &c.**

The Proprietors of the New England Agricultural Warehouse and Seed Store No. 51 and 52 North Market street, would inform their customers and the public generally that they have on hand the most extensive assortment of Agricultural and Horticultural Tools to be found in the United States. Part of which are the following:

1000 Howard's Patent Cast Iron Ploughs	100 doz. Cast Steel Shovels.
300 Common do. do.	150 " Common do.
200 Cultivators.	100 " Spades.
100 Greene's Straw Cutters.	500 " Grass Scythes.
50 Willis' do. do.	300 " Patent Snaiths.
100 Common do. do.	200 " Common do.
100 Willis' Patent Corn Shellers.	500 " Hay Rakes.
50 Common do do.	200 " Garden do.
200 Willis' Seed Sowers.	200 " Manure Forks.
50 " Vegetable Cutters.	300 " Hay do.
50 Common do. do.	500 Pair Trace Chains.
200 Hand Corn Mills.	100 " Truck do.
200 Grain Cradles.	100 " Draft do.
100 Ox Yokes.	500 " Tie up do.
1500 Doz. Scythe Stones.	50 doz. Halter do.
3000 " Austin's Rifles.	1000 yards Fence do.
	25 Grind Stones on rollers.

March 17.  
**DURHAM COW FOR SALE.**  
A young full blooded Durham Cow and her calf—a very desirable animal in every particular. Apply to **EDWARD TITCOMB, Jr.,** Newburyport. May 5

## MISCELLANEOUS.

## HOME IN THE SKIES.

When up to nightly skies we gaze,  
Where stars pursue their endless ways,  
We think we see, from earth's low clod,  
The wide and shining home of God.

But could we rise to moon or sun,  
Or path where planets daily run,  
Still heaven would spread above us far,  
And earth remote would seem a star.

'T is vain to dream those tracks of space,  
With all their worlds approach his face;  
One glory fills each whirling ball—  
One love has shaped and moved them all.

This earth, with all its dust and tears,  
Is his no less than yonder spheres,  
And rain-drops weak, and grains of sand,  
Are stamped by his immediate hand.

The rock, the wave, the little flower,  
All fed by streams of living power,  
That spring from one Almighty will,  
Whate'er his thoughts conceived, fulfil.

And is this all that man can claim?  
Is this our longing's final aim,  
To be like all things round—no more  
Than pebbles cast on Time's gray shore?

Can man, no more than beast aspire  
To know his being's awful sire?  
And, born and lost on nature's breast,  
No blessing seek but there to rest?

Not this our doom, thou God benign!  
Whose rays on us unclouded shine;  
Thy breath sustains yon fiery dome,  
But man is most thy favored home.

We view those halls of painted air,  
And own thy presence makes them fair;  
But dearer still to thee, O Lord,  
Is he whose thoughts to thine accord.

[Blackwood.]

## MOUNTAIN SCENERY.

There is something in the wildness and sublimity of mountain scenery that tends to remind us rather of eternity than decay. The perishable works of man are no where to be seen. No city lies in gloomy ruins, to show the outline of faded greatness: no remnant of sanctuary here stands to show the worship that has passed away. We see no failing records of the glorious deeds of those whose names are learnt in history's page. We stand upon the mountain and we scarcely know that man exists upon the earth. This is not the land where arts have died, or science been forgot; those rocks never echoed the eloquence of orators, or the songs of poets; these waters never bore the proud ships of the merchant; the soil never yielded to man the fruit of his industry. It is not here that the finger of Time can be recognised. In vain would he set his mark on snows that never fail or disturb the fast bound form of adamant ice. In vain he stretches out his hand where the rushing torrent and the wavering water-fall, blest with an eternity of youth, dash on in their headlong course, regardless of the blighting power that withers strength, or lulls to rest the creation or the creature of mortality. Here may we pause and say that

Time has lost his power. Here may we view the faint efforts of Time overthrown in an instant. Changes they are; but the work of an hour has defeated the slow progress of decay. The lightning of the thunder-storm, the blowing tempest, the engulfing flood, the overspreading avalanche, have effaced from the surface of nature the impress of time, and left naught in the changes to remind us of age. Surely there are scenes in life which seem created to awaken in mankind the recollection, that even time can lose its power. Who will not feel the nothingness of the pleasures, the cares, nay, even the sorrows of our petty span, when for a moment he dwells with his heart and soul upon the thoughts of an eternity! Yes, it will sober the gay—it will comfort the grieved.—Edward Everett.

## MORE ECONOMIES.

*How to save Oil and Candles.*—Use sun-light two hours in the morning, and dispense with candles and lamps two hours after 9, P. M. The morning sun-light is much cheaper, and better than evening lamp-light.

*How to save expense in clothing.*—Purchase that which is at once decent and the most durable; and wear your garment despite the frequent changes of fashion, till it becomes too defaced to appear decent; then turn it and wear it henceforth as long as it protects the body. A blue coat is as warm after fashion requires a green one, as it ever was. A red shawl in fashion to-day, is as comfortable as a black one which fashion requires to-morrow. A few years hence your fame will not depend upon the style, color or quality of the broadcloth you wore in 1841.

*How to save time.*—Have a place for every thing, and when you have done using it, return it to its place. This will save much time in hunting after articles which are thrown carelessly aside, and lie you know not where.

*How to save expenses in travelling.*—Cultivate the bump of inhabitiveness; and if you want to go a mile or two, walk rather than hire an establishment at a livery stable. This will be for the health of your body as well as a security of your purse from languishment.

*How to save in little matters.*—Procure a book and keep an exact account of all your expenditures. At the expiration of three months, review the account and see how much you have expended in four, penny and nine penny items which you could have done without as well as not. Then see to it that each ensuing quarter shall be minus just those things. In many cases the aggregate will be found more considerable than you would be aware of, unless you keep such an account.

*How to save your property if your house should be consumed by fire.*—Get it insured. No one is entitled to much charity after he suffers loss, if he neglects so easy a method of securing himself.—Augusta Banner.

## DRAFT AND TRACE CHAINS.

Just received by Packet Coromanda,  
400 pair Trace Chains, suitable for Ploughing.  
200 " Truck and leading Chains.  
200 " Draft Chains. For sale by J. BRECK & CO.,  
No. 52 North Market st. April 21

## DOUBLE DAHLIAS.

We have for sale a very large collection of the finest Double Dahlias, of the most esteemed sorts. J. BRECK & CO., No. 52, North Market St. April 23

## GARDEN SEEDS,

For sale by JOSEPH BRECK & CO. at the NEW ENGLAND FARMER OFFICE, No. 51 and 52 North Market St. Boston. The subscribers would inform the public that they have now on hand the largest collection of seeds ever before offered by sale in this city, embracing every variety of Field, Kitchen, Garden, and Ornamental Flower Seeds desirable for this or any other Climate.

Our seeds are either raised under our own inspection or imported from responsible houses in Europe, and having taken extraordinary pains to obtain such as are pure and genuine, we can confidently recommend them to our customers and friends, and feel assured they will prove satisfactory to all who try them.

Dealers in seeds are requested to forward their orders in season. Boxes for retailing from 8 dolls. and upwards will be sent out on commission allowing a liberal discount and take back what remain unsold.

Letters and orders with good reference will meet with prompt attention.

## FIELD SEEDS.

Sugar Beet.	Ruta Baga.
Mangel Wurtzel.	Ballatine's New Royal do.
New Red Globe do. } superior	White Tankard Turnip.
Yellow do. } varieties.	Red do.
Carrot Long Orange.	Red Round do.
" Altringham.	White do.
" New White, extra fine.	White Globe do.
Pumpkin, sorts.	Green Round do.
Wheat—various sorts.	Purple Top Hybrid do.
Barley, do.	Buckwheat.
Rye, do.	Broom Corn.
Potatoes, do.	Millet.
Indian Corn, do.	Buckthorn. } for Hedges.
Oats, do.	Locust. }

## GARDEN SEEDS.

Artichoke, Asparagus, Beans of every description, Beets of sorts, Borecole, Broccoli, Brussels Sprouts, Culiflower, Caraway, Celery, of the most improved sorts, Cabbage 20 sorts, Carrot, all the varieties, Cucumber do, Cress, Egg Plant, Endive, Indian Corn, Kale, Leek, Lettuce in great variety, Melons, do. Martynca, Mustard, Nasturtium, Okra, Onion of sorts, Pepper do. Pumpkin do. Parsnips, Parsley, Peas, a very great variety, Rhubarb for tarts, Radish of sorts, Salsify, Squash of sorts, Tomato, Turnip 20 varieties.

## SWEET AND POT HERBS.

Thyme.	Sweet Basil.
Sweet Marjorum.	Lavender.
Sage.	Lemon Balm.
Summersavory.	Anise.
Medicinal Herbs, &c.	

## ORNAMENTAL FLOWER SEEDS.

Three hundred varieties, embracing all the finest sorts. Packages of 20 fine sorts for one dollar.

Those who prefer to have their Seeds put up in papers ready for retail, can be accommodated—each packet neatly closed and labelled with printed directions. Price 60 cents, per dozen papers, which are retailed here at 6 1-4 cents each.

Fruit and ornamental trees, of the greatest variety, supplied at nurseryman's prices, and orders solicited. These will be packed, when required, to go to any part of the U. States. JOSEPH BRECK & CO.

## FOR SALE.

GEORGE THE THIRD, who has been honored with the Second and First State premiums in 1839, at Worcester, and at Concord in 1840, by the Committees appointed by the State, for awarding such premiums, is of Durham Breed, was imported as most superior stock, and is thought by judges to possess more valuable points, than any to be found in any other animal of the kind.

Also, two young Bulls, Sired by the above, their Dams are imported and of the best possible blood.

For further information apply to CHARLES WIL-LARD 2d, Still River Village, Harvard. 4w June 2

## GRINDSTONES.

An extensive assortment of Water and Hand Grindstones constantly on hand and for sale by AMM C. LOMBAKI & CO. 13 Lewis's Wharf. isly. Nov. 17.

## NEW ENGLAND FARMER.

## A WEEKLY PAPER.

The Editorial department of this paper having come into the hands of the subscriber, he is now authorized by the publishers to inform the public that the price of the paper is reduced. In future the terms will be \$2 per year in advance, or \$2 50 if not paid within thirty days. ALLEN PUTNAM.

N. B.—Postmasters are required by law to frank all subscriptions and remittances for newspapers, without expense to subscribers.

N. E. FARMER.

## ON THE MEANS OF INCREASING THE FERTILITY OF LAND.

The productiveness of any soil, we think, depends entirely on its natural or artificial capability of retaining or transmitting its moisture, the vehicle at least by which nourishment is conveyed to plants. This productive power may therefore not only be continued in its greatest vigor, but greatly increased by proper management. When we by any means give to the soil a permanently increased vegetative power, we also increase the yearly produce which it yields.

Such a soil will give not only firmness to support the plants, but will facilitate the growth of their roots in search of moisture and nourishment to the greatest depth.

There is not an individual who cultivates a garden, and who exercises his judgment in its culture, but knows that the addition of clay gives cohesion to sandy or gravelly soils, and that sand and gravel when mixed with a clayey soil diminishes its tenacious property; and that these changes, thus effected, permanently increase the productive powers of both.

In our endeavor to improve barren soils, we should examine them in connection with fertile soils in their neighborhood, on the same geological formation; and the difference of their constituent parts may lead us to the means of their improvement. If the cause of sterility be owing to some defects in their composition, these defects should be supplied. An excess of silicious sand is improved by the application of clay, peat earth, or calcareous matter, cold well rotten manure, and rolling or trampling with sheep or other stock, to consolidate its texture.

When clay is in excess, it is remedied by the application of sand, chalk-marl, or burned clay, light unfermented manures, and perfect pulverization, to make the soil friable. An excess of vegetable matter in a dormant state, as in peaty soils, is corrected by burning, by the application of clay, sand, calcareous matter, gravel, rubble, or any thing heavy, to give firmness to the soil. Lime not only destroys the injurious effects produced by sulphate of iron, which abounds in some soils, particularly in those of a peaty and silicious gravelly nature, but is said to convert the sulphate of iron into a manure. None of these applications, however, will have the desired effect, unless there be first a perfect subsoil drainage of all superfluous moisture, conjoined with a perfect tillage.

Stagnant water, in any soil, melts down the particles of matter which composes it, and joins them together in close contact; it prevents the air and water from circulating amongst the roots of the plants, and they therefore die. When a clayey soil has been thus closed together by stagnant water, it requires to be perfectly drained, and it can only be recovered by repeated ploughings and harrowings, together with the pulverizing influence of frost to bring it into a fit state for vegeta-

tion, and if it has been long under water, it acquires a pernicious quality, which can only be got quit of with great difficulty,—fallowing, and the application of lime, has a great effect in reviving it.

The first principles of agriculture, which are shewn by the best practice, are few; they may be stated to be these:—make and keep the land perfectly dry, and clean, or free from weeds; make and keep the soil, which is too adhesive or too loose, of such a friable nature as will make it receive, retain, and transmit moisture, and thus fit it to produce the most luxuriant state of vegetation; restore to the soil, as a manure, in a state of decay, the greater part, if not the whole, of the produce after it has been consumed by sheep or other stock. Never manure any land till every weed is exterminated, for weeds grow most luxuriantly in the soil to which they are natural: if any of them are left, they will outgrow the plant you intend to cultivate, and take up the greatest quantity of the manure laid on the land.

The properties of the mineral matter of which soils are composed, are very various, this variety depending on the nature of the subsoil, as we have elsewhere shown; but as it is only where soils have the mineral ingredients in a certain proportion, that they are capable of imbibing moisture from the atmosphere, of holding the rain which falls on it, and transmitting it to plants as they require it. Of imbibing and retaining heat, and of readily decomposing vegetable matter, which makes up the most valuable soil. A knowledge of these particulars is of the greatest moment to the agriculturist; by it he will be able to improve the texture of the soil, by adding to it the mineral substance of which it is deficient, so as permanently to improve it.

To alter the nature and properties of the constituents of any soil, may be more expensive than to manure it; but the effect of the former will be lasting, while that of the latter is transitory; the one permanently improves the nature and quality of the soil, the other only imparts a temporary excitement to force a crop for a year or two.

The materials necessary for the permanent improvement of the soil are seldom far off, and the expense, though in some instances considerable, is soon repaid by the permanency of its increased fertility; the manure applied afterwards has a much greater effect, the expense of cultivation is greatly diminished, and the capital laid out is soon restored by its yearly increased produce. By these alterations we store the earth with hidden and inexhaustible treasures, which, invisible to the eye, put forth their strength and give us the evidence of their presence by the effects produced on vegetation.

In the process of vegetation, nature supplies soil, water, light and heat; but the matter composing the soil may not be in such a state as to receive and transmit these in such quantities as will produce a healthy vegetation.

Man may regulate the supply by cultivation, and by altering the texture of the soil.

When the materials of which the soil is compo-

sed are in proper proportion, the soil is most productive; when any one of the ingredients is in too great a proportion, the soil is unproductive.

Pure clay, silex, or lime, when alone, we have before stated, is barren; but if they are mixed together, having a due portion of water, the influence of the sun and a proper admission of air, (which are the prime movers in vegetable life,) a fermentation amongst the materials is created; and if vegetable and animal manure in a state of decomposition be combined with these, the soil, which was sterile when separate, will become productive when combined, and this mixture of materials and mechanical alteration will change the texture, and improve the quality of the soil.—*Morton on Soils.*

## PERFECT SUBSOIL DRAINAGE AND DEEP PLOWING.

Every variety of good soil has a naturally dry porous subsoil, being either a deep, friable, porous earth, sand, or gravel, or open rock; so that rain water will not rest on its surface, but readily pass through the stratum below.

The greatest injury which the land receives is from stagnant water on the surface, or between the soil and the subsoil.

Bad and worthless clay soil is generally that which is saturated by stagnant water.

If water be allowed to remain on good land, it will soon convert it into bad or worthless soil;—a retentive subsoil has generally a soft or clayey surface, and is universally a bad and unproductive soil.

When the subsoil is retentive, the rain finds its way through the cultivated portion of the surface to the subsoil, and passes on slips between them to the furrows, keeping the cultivated portions of the soil wet and unfit for vegetation; but if the subsoil be porous, either naturally or artificially, it then goes directly through the subsoil or porous passage to the drains that are formed to draw off the redundant water.

It is the constant practice of the most scientific gardeners, when about to pot any plants, to put some broken tiles or gravel in the bottom of the pots to drain off the superfluous moisture from the plants to the hole in the bottom of the flower pots; and when they use a strongish or clay soil, instead of passing the soil through a sieve, as formerly was the custom, they now chop it into small pieces, and thus give to strongish clay soils an artificial porosity which they naturally do not possess.

On examining the roots of plants growing in pots with soil thus prepared, we find the crevices between the broken pieces of earth full of roots because they have not only a more easy passage where the soil is friable, in consequence of the lumps keeping the earth loose and porous between them, but here the drainage is most rapid and complete.

Land is not perfectly drained which, during the wettest weather, has any spots on it which the water rests upon, and gets stagnant for a short period. The rain should have a free course to sink down through the subsoil below the roots of plants, and

then run off by the furrow-drains to the open ditches.

Complete subsoil drainage of the retentive soils can only be effected by having a drain in every furrow, or about one or at most two perches apart; and then by subsoil plowing across the drains, and making an artificial porous stratum under the cultivated surface, to within an inch or two of the stones in the drains, that the rain-water may fall through the surface and run in the subsoil to the drains. The effect produced on the crops of close retentive soils, after they have been perfectly drained and subsoil plowed, is most astonishing.

The produce is so much increased that it will in many instances, pay the expenses in a year or two; and wet soils, which seemed to be strong clay when wet, become friable and even light when completely subsoil-drained, are easily cultivated, and light enough for producing turnips to be fed off with sheep.

Perfect drainage and deep plowing is the true principle of giving to the soil an increased fertility. By this means the plants are enabled readily to push their roots farther and deeper in search of food, which they obtain of a more healthy kind, than when the soil is imperfectly drained and plowed shallow. All tenacious clay soils should be trenched or subsoil-plowed once in every course of crops, or when they are in fallow; this practice not only gives to the roots of plants a greater scope to go in search of food in dry weather, but also furnishes a depth of porous substratum under the soil to draw off the superabundant moisture during continued wet weather, and transmits moisture to the roots of plants in continual drought.—*Ibid.*

For the N. E. Farmer.

### IRRIGATION.

This important branch of agricultural business, has not received its merited attention. In America it is, as yet, a novel practice; but on the eastern continent, has been understood from the earliest times. The ancients highly commended this art, and attributed much to the great benefits received from it. The immortal Homer, in his *Iliad*, says—

"The peasant with his spade, a rill  
Conducts from some pure fountain through his grove  
Or garden, clearing the obstructed course."

Again, in his *Odyssey*, when describing the beauties of the garden of Alcinoüs—

"Amid  
The lovely scene, two fountains welling forth,  
One visits, into every part diffused,  
The garden round."

So, also, Virgil, in his *Georgics*, expresses himself in much the same terms—

[The quotation, untranslated, would be of no service to our readers generally, and we omit it.]

But not by the poets alone, has this improvement been spoken of as particularly beneficial to the soil. Strabo, and a multitude of historians, have recorded numerous instances of its adoption: in oriental countries, especially, often has been mentioned the fertility occasioned by canals led from the Tigris and Euphrates.

Among the Chinese, it has been in use up to the earliest dates of their records. They proceed on a magnificent scale, dividing their canals into frequent channels, whereby they secure immense

returns. In Asia and Africa, much is attributed to their aqueducts, and a bountiful harvest relied upon wherever they exist. In some portions of the former country, particularly at Mysore, this subject is under the express auspices and control of government.

In the Milanese territory, a greater expanse of irrigation is exhibited than upon any other portion of Europe. Canals are seen running in every direction, and the lands adjacent present a scene of uncommon fecundity. Centuries ago, canals were established there, and the continuance of water in them, is an object of general solicitude. There also, they are kept in operation by the authority and protection of government.

It seems to be a matter of surprise, that attempts to irrigate, are not more frequently made in America. Our country, as a general thing, is amply provided with water privileges, and our soil in most places can be greatly improved by them. Arid and apparently worthless land can be rendered arable, even without manure, in many instances, by appropriating water to this purpose. We daily observe situations, naturally offering this advantage, without the smallest attempt being made to retain or lead the water aside. Flowing not unfrequently from some considerable elevation, it glides with velocity through lower lands, in one direct course, while the soil, a little more remote, might be doubled or trebled in value, by the influence of this element. The stream is allowed to pass by unbedded and is lost in some marsh or eventually in the ocean.

Tillage in America has progressed rapidly, in point of improvement, for the last few years. Superior inventions in agricultural instruments, are of almost daily occurrence, and it seems rather astonishing that this particular branch of cultivation should be so generally overlooked. Irrefragable are the testimonies of its benefits wherever it has been adopted.

T. S. D.

For the New England Farmer.

### MANAGEMENT OF COWS AFTER CALVING.

MR EDITOR—In your paper of June 2d, I read a piece written by Mr Peters, of Westboro'. In that communication, he expressed his opinion on certain questions that I propounded, respecting the *management of cows after calving*, published in the N. E. Farmer, of April 28th. I was glad, Mr Editor, that you said something by way of answering the questions; likewise, that Mr Peters expressed his opinion, though I do not, altogether, agree with him. Free expression of honest opinion is a right that all ought to enjoy. I find no fault with what he has written, (except one thing,) and that is not very material. He says, "the writer would have done well to have said *before* and after calving, for that was the question at the discussion which he mentions." Now, Mr Editor, he has no authentic proof as to where this discussion was. I suppose, because my article was dated at Westboro', he thinks the discussion must have been there also. If he will have the goodness to turn to my communication, he cannot tell, neither does he know, whether the meeting that I attended was at Westboro', or in some other town. As Mr Peters has made a leap in the dark, I shall there leave him.

I proposed the questions, above named, without

expressing any opinion of my own. This I did, because I wished to have it done by abler pens. However, having had some experience in managing cows, I am induced to present my views on the subject.

Question 1st. Is it advantageous to let cows drink the biestings, or the first milk after calving?

For experiment, I have tried both ways, giving them the milk, and not giving, and am well satisfied that it makes no material difference. For thirty years I have, generally, been in the habit of giving my cows the first milk, and it has not had that effect named by Mr Peters. My cows, generally, have had good appetites. If the milk had an injurious effect, probably it would not last more than a day or two. If cows at this time require, something laxative, who knows but the milk is the best aperient drink they can have? Mr Peters states, that his *father's* cows and *his*, uniformly lost not only their *appetite* but their *flesh*. Has not Mr Peters, by his "*critical experience*," found out that it is *natural* for milky cows to lose their flesh after calving? What! can we expect a cow to give fifteen, and more quarts a day, and not have it cause emaciation? As a general thing, this cannot be prevented by the best of keeping and best attendance. Look at *all* females, that give milk, particularly the *sove*. How quick her flesh leaves her in consequence of giving milk; (not by drinking the biestings.)

Question 2d. Is it beneficial or detrimental to have cows eat the after-birth?

I say, without hesitation, it is beneficial. And no vigilance of man (in many cases) can prevent it. They often calve in the night, and in lots, and eat the placenta before any one has a chance to take it away from them. I believe with Youatt, that it is a medicine designed for the cow, by the God of nature. It is true, it seems to us it might be detrimental and unnatural; and we know that if given to any other cow, she would loathe it and would not touch it. But in the case of the mother, for the reason that what comes from her is "bone of her bone and flesh of her flesh," she licks her offspring with a good relish, and eats the after-birth with greediness, and, undoubtedly, it does her good. As to getting choked with it, it is possible, but not any *more probable* than that the *tobacco-chewer* will get choked with his *quid*.

Question 3d. When the secundine adheres, and nature is obstructed in her operations, can any thing be given to the cow to remove it?

On this question, Mr Peters and I very well agree. When there is a real adhesion of the secundine, not any thing can be given to remove it. Good nursing is all we can do for the cow; except what may be done by artificial means. In some cases, undoubtedly, it would be better to let things take their course, than to make use of violence.

A HERDSMAN.

Westboro', June 9th, 1841.

### CIRCULAR.

We publish with pleasure the following circular, addressed to us by the Hon. H. L. Ellsworth, Commissioner of Patents, and trust the commendable object he has in view, will receive from the public all the aid it is in their power to extend.

PATENT OFFICE,  
Washington, Dec. 18, 1840.

Sir—You are doubtless apprised, by the public papers, that a National Gallery in the Patent Of-

free, is open for the reception of unpatented models and specimens of manufactures. I confidently hope that the liberal views manifested by Congress will be promptly responded to by the manufacturers and all others engaged in the mechanic arts. They may be assured that preparation will be made to exhibit articles deposited to the best advantage, and every attention bestowed to protect them in glass cases, from injury or loss.

Few, very few, are aware of the progress of the arts in the United States, and hence the skepticism as to the ability we possess to supply our own wants. Our factories, scattered over a widely extended surface, are seen by travellers only, and they can visit but few, in traversing the leading routes. Unlike the concentrated establishments in Europe, where steam power is used, here factories and work-shops are found in retired spots, where streams (a valuable portion of national capital) give the most economical—the hydraulic power.

Annual fairs, in many places, have done much good and excited a laudable emulation; but these have been limited to a short duration, and designed for citizens in their immediate vicinity. It is now proposed to establish, at the seat of Government, a National Gallery, to remain a perpetual exhibition of the progress and improvement of the arts in the United States. Here the most beautiful specimens of the genius and industry of the nation will be found; and what American can visit the Gallery, and not be still prouder of his country, and feel that while we are free, we are also independent.

Permit me to say, that I am almost daily inquired of, where certain manufactures can be found, and I feel assured that an exhibition presenting so favorably, not only the articles manufactured, but the location and address of the manufacturer, will be reciprocally beneficial to all concerned.

The rooms, though spacious, will not admit of cumbersome articles; samples and specimens, similar to those exhibited at the principal fairs, will be thankfully received. I would observe, the Patent Office is fire-proof, and guarded by a careful watch. The largest hall is 273 feet long, 63 feet wide, and 30 feet high, and is susceptible of a gallery when needed. On the ground floor are rooms of less dimensions, but in the aggregate of equal area;—these are designed for the different kinds of agricultural implements, seeds, and other objects.

The collection and distribution of seeds seems to meet with much approbation; and it may be gratifying to know that the Diplomatic Corps and the Navy, are using much effort to transmit to the Patent Office the most valuable exotic, while from the agriculturists of this country is expected the best specimens of indigenous, seeds.

This National Gallery addresses itself to all classes; yet, however important or useful it may be, its success depends entirely upon the zeal manifested in its commencement; for it cannot be doubted, that, when once established, it will commend itself to the continued patronage of the public.

The names of agents are annexed, who will forward free of expense such articles as may be deposited with them.

May I solicit your kind influence and assistance in this undertaking.

With great respect,

Your obedient servant,

H. L. ELLSWORTH.

P. S. The Commissioner of Patents avails himself of this opportunity to request Patentees, and

the public in general, to aid the office in restoring the records of all patents and assignments granted before the fire in December, 1836. The same cannot be used in evidence unless so recorded anew. No expense is incurred. The papers are received and transmitted by mail.

Models and specimens, if deposited with any of the following agents, will be forwarded to the Patent Office free of expense:

Collector at Portsmouth, N. H.; do. at Portland, Me.; do. at Burlington, Vt.; do. at Providence, R. I.; Surveyor at Hartford, Conn.; Collector at Philadelphia, Penn.; do. at Baltimore, Md.; do. at Richmond, Va.; do. at Charleston, S. C.; do. at Savannah, Ga.; do. at New Orleans, La.; do. at Detroit, Mich.; do. at Buffalo, N. Y.; Surveyor at St. Louis, Mo.; Collector at Cleveland, Ohio; Surveyor at Pittsburg, Pa.; do. at Cincinnati, Ohio; do. at Louisville, Ky.—R. H. Eddy, agent, Boston, Mass.; David Gardener, agent, Custom House, New York.

#### NATIONAL AGRICULTURAL SOCIETY.

To the Editor of the New England Farmer:

Sir—The object of the annexed form of a subscription, is to ascertain whether there is a sufficient number of the friends of this great measure in the Union at this time, willing to lead their influence, to warrant a call of a primary meeting to organize the Society. Should the indications appear favorable, a committee of the friends of the cause will take upon themselves the responsibility of naming a time and place for the meeting, of which you will be duly notified.

I fondly hope you will promptly lend your own name, and procure a few names of other friends of agricultural improvement in your vicinity, and then forward the subscription by mail in time to reach Washington by the 10th of August, addressed to the "Hon. H. L. Ellsworth, Commissioner of the Patent Office, for Solon Robinson."

If you are averse to asking your friends to give pecuniary aid to this measure in its incipient state, please make use of the first part only of the paper.

I hope you will charge the liberty I take, to the zealous ardor I feel in promoting this great national object.

I have the honor to subscribe myself your agricultural friend, and humble servant,

SOLON ROBINSON.

Lake C. H., Ind., June 3d, 1841.

(Form of the Subscription Paper.)

NATIONAL AMERICAN SOCIETY OF AGRICULTURE,  
"To elevate the Character and Standing of the Cultivators of the American Soil."

The subject of forming such a Society, being now agitated in the United States, we do hereby pledge ourselves to the support of such a Society, according to our ability; and we earnestly hope that the active leading friends of the measure will take the necessary steps to organize the Society in the course of the year 1841.

Knowing that funds will be necessary to bring this great beneficial National Institution into active operation, particularly as we hope to see a National School of Agriculture connected with the Society, and also a scientific journal worthy the proposed name and character of such an institution—those of us who have added certain sums to our names, have freely contributed those sums, and

placed them in the hands of  
to be expended in aiding the formation of such a Society.

#### REMEDY FOR THE TURNIP FLY.

The following simple mode of guarding against the depredations of the Turnip Fly, if not new, is certainly not generally known, and may be of great benefit to some of our readers:

*Messrs Editors*—It is well known that the great enemy of the ruta бага and other turnip crops, is the small flea or fly that destroys the plants almost as soon as they appear above ground; and as this crop is becoming extensively cultivated, it is very important that some method be devised and made known for guarding against this insect. I have long been in the practice of raising ruta bagas, and for the past five years have not failed of obtaining a good crop. My mode is simply to soak the seed 24 or 48 hours in *Tanner's Oil*, and then roll it in plaster to facilitate the sowing. A very small quantity of oil is sufficient, as it is only necessary to moisten the seed thoroughly and allow it time to penetrate. The offensive odor of the oil is imparted to the seed, and the first leaves of the young plant are so impregnated with it that the flies will not eat them. I have frequently tried the experiment of sowing a small quantity of seed without any preparation, and have almost invariably found those plants nearly or quite destroyed, while those from the prepared seed escaped uninjured.

To the incredulous I would say, the trouble is but little, the expense nothing—therefore, try the experiment.

The oil does not seem in the least to injure the vitality of the seed. I have known it to vegetate well after soaking *ten days* in the oil; but I think two days is sufficient, and prefer it to a longer period.

L. B. PARSONS.

Perry, N. Y.

SPECULATION.—Alas! how many men, young and old, have within the last few years encountered the ruin which has resulted from a change of habits, or else gone down to an earlier grave from diseases contracted under a new climate! Looking round in our own neighborhoods, some of us can count up hundreds who have left the State with the expectation of bettering their condition: where one has realized his expectations, may we not count half a dozen who are disappointed. Removed far from us as they are, it is impossible we should ever see the misery of the dark side, while the isolated ease of one successful speculator stands out to the gaze of all in the light of the most effulgent sunbeams.—If the farmers of New England could realize the fact that their "lot has been cast in pleasant places"—if they can be made to believe that industry and perseverance will not fail of its reward at their own homes and near the graves of their ancestors—they will not abandon the friends and companions of their youth, in the by-no-means sure prospect of enjoying greater happiness in a more distant land.—*Farmer's Monthly Visitor*.

To handle eels securely, fishermen first cover them with dirt. In like manner does detraction strive to grasp at excellence.

For the N. E. Farmer.

### THE USEFUL CREATURE.

FRIEND PUTNAM—Presuming you had forgotten what I said to you last winter, about the merits of a certain quadruped, that has been too fragrant in your paper of late to need mentioning by name, (whose name, that is to be, in fact, seems as yet unsettled,) finding that abler, though I will not admit more friendly, advocates had come out in his defence, and moreover, seeing that I had not the moral courage long ago to take the lead in vindicating the character of this poor, despised, abused, slandered, persecuted, and most needlessly dreaded and execrated brute, I had pretty much concluded not to stir in the matter, but quietly relinquish any claim I might feel conscious of, to share in the *immortality* so eagerly contended for, in this new field of popular distinction. But as you gave me such a broad hint in your number of the 2d inst., though I may still be in *bad odor*, (as I before suggested to you the fear,) I shall now be sure of being in good company, and I have concluded to follow your bidding, and help to "brighten the prospects" of our mutual friends.

And, sir, if I were really ambitious of the distinction\* contended for, I could wield a wordy, weighty pen: I could discourse most lengthily and *odorously* withal, upon this heretofore *un-savory* theme.

I have the *presumption to presume* that I have more attentively watched the movements and studied the habits, or to speak more learnedly, have penetrated deeper into the *ology* of the beast, than any man living has thought it worth his while to do. Sir, I can boast of having completely *unskunked* the skunk in his most dreaded skunkishness, and made him as sweet and as harmless a creature as the prettiest kitten or puppy; so that the very finest fine lady might take him with the most perfect impunity to her caresses. And any farmer's boy may do the same, if he will take the animal at a tender age, and holding or tying him fast on his back, apply a sharp peckknife upon either side of the butt end of his tail, cutting cautiously through the fatty substance and muscular envelope, till he comes to a delicate membranous sac, containing the *fearful*: which sacks, one on either side, being removed, can never be reproduced, nor the *venom* be again secreted; and no danger, not the least, either to the operator or the operated upon.

To be serious, Mr Putnam, I do know, and affirm, from a careful observation of many years, that the skunk, in his proper line of business, is eminently entitled to a "rightful place among useful animals." He is signally the destroyer of the worst enemies to the tillers of the soil. And I do exceedingly rejoice, that with the innocent little birds, and the ill-favored toad, he has at length, though late, begun to be justly appreciated. He is in fact, worth his weight in toads, the capacity of his stomach is so much greater. His swine-like snout and sharp claws also give him peculiar facilities for taking all kinds of creeping things that are injurious to cultivated vegetables. Crickets, grasshoppers, beetles, all sorts of bugs, grubs

and worms, field mice, &c. he eagerly captures at their plunder, if, like him, they do their work in the night. Or he searches them out in their retreat, if they retire to rest by night. These are his natural food; and if he finds them in plenty, he will not plunder your eggs or young poultry, unless their manifest exposure offers a very strong temptation—though they are a great luxury to him. And at all times, a floor or a wall of the thickness of a shingle, and above the reach of his paws, is an impassable barrier against him. Like the odious rat, he cannot climb; nor can he, like the rat, with untiring perseverance, day and night, gnaw at the hardest wood, to do us mischief. It is the easiest thing in the world, therefore, to protect our poultry from him. And what harm besides does any one fear, from this always "more sinned against than sinning" creature. Perhaps it is, that he will wantonly assail him, and stench him out of house and home, or spoil a suit of clothes for him. No, never! unless we violently assault, and actually wound, or greatly terrify him, he will not discharge his ammunition upon us. And if we will let him alone, and permit our dogs to let him alone, (and they are always glad to be excused from molesting him,) he will most certainly let us alone. Let him play about your door-yard, in the evening, if he chooses, and pick the bones he may find there. He will be likely to keep off some worse visitants. And if he chance to enter your cellar, your kitchen, or your parlor even, as in summer his curiosity may lead him to do, let him alone, and he will go out without doing any harm. Or if he seem disposed to act too leisurely about it, you have only to approach him gently, yet fearlessly, and take him up by his tail, doing no violence to him, and you may carry him where you please, without the least danger to your best attire. You cannot possibly kill him so instantaneously, with gun, or club, or stone, or rudely force him out, as not fully to realize your worst fears of him. For the most part, as if conscious of the repute in which he is held, he shuns the presence of man. In winter he seldom ventures abroad, except in mild weather. During the season in which insect life is active, he is busy every night, coming forth in the twilight, or early in the evening, and rambling through gardens and fields with a somewhat nimble movement, he diligently searches for his prey. By the very earliest dawn, if not before, he returns to his abode, which is quite as likely to be under your barn as any where else, and there quietly sleeps all day. Nor will the continuous cackle of your fowls, or the chirping of their young, tempt him to the light of day.

The skunk is, probably, much more common in the immediate vicinity of this city, and elsewhere, than he is usually thought to be. Returning home at daylight down, in summer, I have occasionally seen him scud along the road and enter premises, there to pass the night most usefully to the proprietor, who, if he were conscious of the fact, most likely would summon all the dogs within whistle-call, to take vengeance on the vile intruder among his delicate flowers and plants. I was myself brought up to hate the skunk, and to destroy him whenever I could. Many a time, when a boy, after a day's work at harvesting, and an evening at husking, or at the cider-mill, have I tramped the region round, hour after hour, with a gang of farm laborers, on the sole intent to kill unoffending skunks, at their useful labors—because, forsooth, one of the race, once in about six or eight years,

on an average, I should say, in some situation peculiarly exposed, by the merest chance found, and of course took, a few young goslings or chickens, or helped himself to an egg or two, and did not think to hide the shells, as the two-legged skunks used often to do.

I have since learned a very different lesson.—Some eight or ten years ago, one evening about midsummer, I accidentally discovered a litter of young ones in my barn-yard, scrambling to get under the shed floor. New-comers I doubted not they were, and led there on purpose to feed upon my chickens, which occupied the floor immediately above, with only a single plank between them and death; and their passage-way into the barn-yard, where they were confined during the day, usually open all night. I should have had the floor up, the next morning, and killed the whole pack, but being obliged to start on a journey of a few days, I most unwillingly smothered my revenge. On my return, however, I lost no time. Every plank was removed; but it was too late: the boys had been upon the watch, in my absence, had killed some of the young, and the rest had taken the alarm and decamped. But I found, to my entire satisfaction, as well as astonishment, that the old ones had wintered there, and probably year after year; and that those young had been born there, and bred thus far; and yet, however incredible to skunk-haters, never a chick nor an egg had I missed.

They soon returned to their quarters, and afterwards I used to amuse myself in studying their habits. I have often gone, after tea, and looked over the fence, to see the old ones take peep after peep, at the receding day, impatient for the twilight. And then they would away to their known passage into the garden, and to their nightly work. Then the young, like kittens and puppies, would come out and gambol where the chickens had just left. I have not since had a heart to kill a skunk or suffer one to be killed, if I could prevent it. I bade them welcome to my shed, and my welcome they have freely used.

An old barn, too, upon the other side of us, within a stone's cast of where I am now writing, has long been their favorite abode, and still is, I presume, though as my curiosity is satisfied, I do not look for them; and they mind their own business and do not come in my way. In July, 1837, the old barn aforesaid was moved across the street. Presuming that some of my favorites were there, I apprised the workmen thereof, begging them not to harm the creatures, and promising to stand between themselves and harm. To our astonishment, upon removing the floor, we found no less than fourteen or fifteen of them, all of which, save one that escaped to an oat field near by, I caught in my hands, and with impunity removed them to a place of safety, much to the amusement of the spectators. Still, though there were so many and so near us, none of my family, nor any of our neighbors, to our knowledge, had ever seen one of them, or been disturbed in any way by them.

By the help of these animals, we suffer but little from insects in the garden. The large black squash bug, that loathsome thing, that has sometimes spoiled my tender vine plants, has almost wholly disappeared. These bugs, I fancy, they use to manufacture their strongest essence withal.

A gentleman of undoubted veracity, who assured me he was a witness to the fact, informed me that in the country where he used to reside, a fe-

\*That is, the *immortality* which we suggested to Dr. Holmes might accrue to him, OURSELF! and Gov. Hill—"WE THREE"—were we successful in elevating, &c. &c. But all the laurels we may have gained in this "new field of popular distinction," are most cheerfully surrendered to the gentleman who has in this article so ably defended the skunk.—"P. D."

male skunk was one day observed to creep from the wood-pile, and bask in the sun. A litter of half-starved kittens soon approached her, which she actually suckled, although, as was afterwards discovered, she had a numerous family of her own. This was day after day repeated. In the issue, however, the brutal recompense of such maternal kindness was, that the wood-pile was overthrown, and the skunk family, one and all, destroyed.

A word, Mr Editor, about the name of this animal. I am decidedly opposed to a change. Though not obstinately conservative, where change is likely to be improvement, I would not change even the name of the skunk, without very good reason. A new name, I fear, and especially a *classical* one, might work a change for the worse in the character of the animal;—might cause an elation, a sort of *transcendental* aim, above his proper place and calling. And who can tell—who can imagine the mischief that would most surely result, if with the immense odds of seeing, where all is darkness to us, he should commence offensive operations, and go peddling his commodity all abroad? No, sir! let us leave him in his humility;—let him remain, as ever, the poor, harmless, unambitious, but most useful SKUNK.\*

You see, my friend, I have given you enough to *spice* several papers, if it will too *highly season* a single number. Or, if you shall choose not to use my *seasoning* at all, I shall still remain, truly your friend, and the friend of "*The Farmer*."

LEMUEL CAPEN.

South Boston, June 5th, 1841.

For the N. E. Farmer.

#### PLUM-TREE GRUB.

MR PUTNAM—Sir—During the past year, I have found on examination of the excrescences, or warts on my plum trees, that they frequently contained a small grub, which I supposed must be the production of the Curculio.

From the circumstance of there having been but little fruit the last year, and my trees being more than ordinarily affected in this way, I inferred that the insect had taken to the trees and punctured them as a dernier resort.

It will be perceived by the inclosed communication of that zealous entomologist, Professor Harris, that I was entirely mistaken; and I hope by the publication of this article, to elicit some further information on the subject.

Yours, respectfully,

MARSHALL P. WILDER.

Hawthorn Grove, Dorchester, }  
June 9, 1841.

Cambridge, Mass., Dec. 18, 1840.

DEAR SIR—The box, containing a small grub-like insect from the warts of the plum tree, was safely received a few days since.

Much to my surprise, this insect appeared to be very different from that which is found in the fruit of the plum tree. The latter, (which, however, I have not seen for many years,) unless my memory

\*We moved a change of name, Sir, in the supposition that it might, to some degree, effect a change in public sentiment favorable to the skunk. But since you have so completely and satisfactorily established his claims to protection, the object we had in view will doubtless be attained without the proposed alteration, and we, therefore, as the legislators say, ask leave to withdraw our motion.—"P. D."

greatly fails me, is a short, plump, maggot-like creature, *without legs*, and not very different from the little weevil grubs that are found in chestnuts. The insect received from you measures three eighths of an inch in length, is rather thick and fleshy, and of a yellowish white color, except the head and the top of the first ring behind the head, which are light brown, and hard. The body consists of twelve rings, (besides the head,) the last one of which is smaller than the rest, and rounded behind. There are a few short hairs scattered over the surface, particularly on the hind part; but these are not visible to the naked eye. It has six small and short brownish legs, under the fore part of the body; and on the under side of the sixth, seventh, eighth, and ninth rings, there are two little warts, provided with minute brown hooks, arrayed in two curved rows; beneath the tail are also two sets of the same sort of hooks. This contrivance, you will readily understand, serves instead of five pairs of legs, in addition to the six tapering and jointed legs near the head. I have added *enlarged* sketches of the insect, which will the better enable you to understand my description.

[1, upper side.

2, under side.]

Will you do me the favor to examine, through a pocket magnifying glass, all the grubs that you find in the black warts of the plum tree, in order to ascertain whether all agree with the foregoing description? If you find any difference in them, particularly if you find some with legs and others without legs, please to keep them for me in separate boxes, with a little moist earth, and, marking the difference on the top of the boxes, send them to me when convenient.

Unfortunately, my duties as librarian in the University, prevent me from making search myself for destructive insects; but I am very desirous of interesting others in the subject; and if they will furnish me with the means of pursuing this important branch of natural history, it will give me great pleasure to contribute all in my power towards enlightening my countrymen respecting the history of insects, their great influence upon vegetation, and the intimate connection between them, ourselves, and all our possessions.

In Germany and France, the study of insects is provided for at the public expense; professors are maintained, and schools established, by means of which this may be pursued without difficulty. But in this country, no establishments of the kind now exist, although some years ago, the founders of the Massachusetts Professorship of Natural History required, by their statutes, instruction particularly in this branch, on account of its close connection with botany. Hence, it is not at all surprising that the most profound ignorance respecting the

economy of insects prevails throughout our country. I could give you many examples; but will only remind you of a statement in a late number of the *New England Farmer*, from which we are led to infer that the ball-rolling or tumble-dung beetle, is the mother of the cut-worm; although the only mischief done by it is, the robbing us of a small quantity of manure for the food of its young; while, at the same time, it acts its appointed part as one of nature's scavengers. There are not less than a thousand different kinds of caterpillars in Massachusetts, of which the so-called cut-worm is one; and yet only one of these many kinds retains, in common language, the name of caterpillar. Of the insects here called weevils, there are a dozen or more kinds, the transformations and habits of which differ greatly, and not more than two or three of them are true weevils. I never saw a weevil in an apple or a pear. It is true that in Europe they are attacked by weevils, as well as by the common insects found also in these fruits in this country, and frequently called weevil and apple worms here. Our apple-worms are true caterpillars, and like other caterpillars are transformed to mealy-winged insects or moths. (See the history of them, by Joseph Tufts, Esq., in the *Journal of the Mass. Agricultural Society*, vol. iv., p. 364; and in Kollar's *Treatise*, p. 230.) The maggot of the Hessain fly is not a weevil, neither is the orange-colored maggot that lives in the heads of growing wheat and barley. Stored grain is sometimes attacked by minute caterpillars, miscalled weevils, as well as by true weevils. The grub found in the fruit of the plum-tree is a weevil; that one which you have sent me from the cankered warts of this tree, does not appear to be a weevil. I hope to keep it alive, and see it go through its transformations, which will enable me to determine what it is, and consequently throw more light upon its history, and lead thereby to the means of arresting its devastations. A single specimen may die, and therefore I shall be glad to obtain more, in order to ensure success.

Hoping to interest you in my behalf, I remain,  
Respectfully, your friend and serv't,

THADDEUS WM. HARRIS.

M. P. WILDER, Esq.

From the Farmer's Gazette.

#### SAVE YOUR SALT HAY.

MR EDITOR—Having a quantity of salt hay remaining in my barn, the last spring, of such a quality that my stock would not eat it, I concluded that I should have to throw it into the yard for litter. Not liking to do this, the thought struck me to mix it with green clover. Accordingly, when I cut my clover, letting it lie but one day only in the sun to wilt, I put it in the barn, laying alternately a layer of clover, and a layer of salt hay. The consequence was, my clover was well cured, and I had the satisfaction of saving my salt hay, for my cattle eat the compound as well as if it had been the best English fodder.

Yours, &c.,

AUGUSTUS FOOT.

Branford, May 3, 1841.

He that knows himself, knows others; and he that is ignorant of himself, could not write a very profound lecture on other men's heads.—*Lacon*.

**NEW ENGLAND FARMER,**  
AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, JUNE 22, 1841.

**HAYMAKING.**

*Scythes.* Procure a good scythe for every man and boy on the farm who is to do any thing at mowing. This work of cutting the grass is hard enough, with the best implement that can be made. And where the tool is poor, the work must be done either poorly or slowly—and in either case the farmer is losing more than the cost of furnishing a better instrument. We know not—(by the way, this term *we*, I am tired of, and shall, when it so pleases me, use the more proper representative of my single self, *I*)—I know not that any one of the manufacturers of this article excels all others: some scythes from each factory are good, and others are not so;—if you are unfortunate enough to get a poor one, there is no economy in trying to worry through the season with it; gnawing off your grass; whetting every five minutes; fretting your own body or that of your hired man; going to the grindstone every two hours;—these attendants upon a poor scythe are such consumers of time that it is better to throw the soft or the brittle thing aside at once and purchase another. As a general rule the scythe that crooks towards the point works better than the straight one—at least it is so in my hands. The east-off scythe should not be put into the hands of the boy who is learning to mow—he wants in his feeble and unpractised hand, a sharper edge than is required by the man. Give him a good and a light tool; or else excuse him from this work.

*Horse Rake.* The value of this implement for use on a farm of common inequalities of surface, and of common size is often over-stated in the advertisements and puff. But the actual worth of it justifies its purchase. We have used the revolving horse-rake for four or five seasons, on a farm where two acres is perhaps the amount mowed per day: the raking up of the thick green morning's mowing in the latter part of the afternoon, is a fatiguing appendage to the previous hard work of the day. The old horse who has been in the pasture all day, and has nothing to do at present but kick flies, can greatly lighten and considerably shorten this labor: we generally save in time probably from 45 to 60 minutes, and in strength more than half. This saving toward the close of the day, comes in very opportunely, and we would not part with the rake for twice its cost.

To manage this instrument skilfully, requires some practice—but as soon as one gets a little accustomed to it, he can lay the winnow very well. On large farms its use must be more valuable than on small ones.—Where grain is mowed and raked up, this rake is very convenient and comfortable; it takes all clean, and saves from hard hand raking.

This instrument deserves more extensive use than it has found hitherto.

*Time of Cutting.* Where grasses are not lodged, it is well to cut when they are fairly and fully in blossom; but to avoid having some of them get far past this state before time can be found for securing, it is prudent to begin upon the more luxuriant fields before they reach full blossom.

*Curing.* In the early part of the haying season, while the grass is quite green, and much time is required for curing, it is well to be busy in turning it up to wind and sun; help it along as fast as you can—but later in the season, if the weather be good, it will be sufficiently cured the day after mowing without much assistance.

Some little matters amount to considerable in the

course of the season;—in turning up hay, take the help of the wind; do this too in raking;—in raking after the cart, regard the course of the wind and the direction in which the team will next move, and so arrange as not to be obliged to rake the ground over twice. In this simple labor of raking after the cart, I have found “head work” as profitable as in any of the operations upon the farm.

*Salt.* Hay that would be liable to heat and sour because not quite cured, may often be mowed away with safety, if six to ten quarts of salt to the ton are applied. The use of salt upon nearly all the hay as it goes into the barn may be wise. I am inclined to the belief that a farm in my neighborhood on which salt has been very freely used in that way, had been greatly improved by it; that is, I think the manure has been much more efficacious in consequence of the salt applied to the hay. At home we find no hay so palatable to the stock as that which is cut young, three-fourths dried and well salted.

*Clover.* This should be cured without much exposure to the sun. I can tell a story that goes to show that clover need not be so thoroughly dried as many suppose. Last year, about the middle of June we mowed some very coarse clover, scarcely beginning to blossom, and as full of sap as clover ever was. The weather was cloudy and foggy for several days, so that but little progress was made in curing it; it continued heavy and green; after four or five days, and while the cocks were damp with fog we loaded it because the indications of rain were strong. It was taken to the barn, stowed away and very thoroughly salted. In four or five days it was dripping wet and burning hot: in 15 days it was mouldy; in December, it was the hay preferred above all others in the barn, by “old Bug Horn,” a dainty cow that was destined to the shambles; every animal in the barn would devour it greedily—and this too, when most of the hay, and all the corn stalks in the barn had been salted;—the salt taste was no rarity.

*Drinks.* The hay-maker must have a full supply of drink; perspiration will be free, and he must have something to support it. There is no danger from frequent drinking in the hottest weather. Take cold water as often and as freely as you please; there is no danger from it, if you have not been too long without drink. Cold water is the best of all drinks for slacking thirst—it may be sweetened with molasses or with sugar; and if milk is taken with them, the drink is the most servicable we have ever found—furnishing nourishment, while it allakes thirst. Rum and Cider and their kindred spirits are not to be admitted to the field of the prudent and worthy farmer. I know they are not needed; I know they are not useful there. The hay will be cut and cured with more despatch and comfort when true temperance practices prevail, than where alcohol intrudes.

None but the intemperate are injured by drinking cold water. If told that I know not the hardship of swinging the scythe, and the need a man then has for the stimulus, I reply that I do know what it is to swing the scythe, and that on the very hottest day of 1840, I was mowing from half past four in the morning until three in the afternoon, with the exception of time enough to eat, drink and grind the scythe; and neither then nor on any other day of the season, did I require the use of any drinks stronger than milk and water. And no man, after one month of temperance, will ever require any thing stronger.

By the politeness of Mr Ellaworth, of the Patent Office, we have been favored with parcels of “Kentucky Pumpkin seed,” and “Kentucky Cushaw seed.”

**NATIONAL AGRICULTURAL SOCIETY.**

We publish today the invitation of Solon Robinson to the farmers of the country. Our views are not different from what they were when we spoke upon the subject several weeks since; but we honor the zeal of Mr Robinson, and will most cheerfully help to bring his great project to a fair and deliberate consideration in an assembly of the friends of agriculture. If any gentlemen in this vicinity desire us to act as agent in receiving contributions towards defraying the expenses of a preliminary meeting, or in sending information to Mr Robinson, we will do it with pleasure.

**MILK—EXTRAORDINARY.**

Mr Denny, of Westboro', has made us a present of two or three pounds of very good butter; its color is fine and its flavor good. The milk from which it was produced, was taken from a two year old heifer, that never had a calf, and will not have one until four or five months from this time. If we understand the case, calves were in the pasture with the heifer, and by their sucking caused the flow of milk. The flow has been so great that it has been necessary to milk her regularly.

**Massachusetts Horticultural Society.**

Saturday, June 19.

**EXHIBITION OF FLOWERS.**

From John Kenrick—Pæony Whittleji, Humei, fragrans and Reevesii. Several varieties of Roses—Hemerocallis lutea, Magnolia glauca and macrophylla, Valerian, Rose acacia, Glycene frutescens, Phloxes, Larkspurs, &c.

From W. Kenrick—Pæonia Whittleji, Humei, fragrans, earnea? Rosen and Reevesii. Also, Honeysuckles, including Douglassii; Iris, various kinds; Hemerocallis flora; Red and White Fraxinella, Guelder rose Spiræa, Scotch Laburnum, and a variety of Roses. Some of the bouquets and baskets of Pæonies were very tastily arranged.

From Messrs Winship—a great display of flowers, including Pæonies Whittleji, Humei and fragrans. The bouquets were very large and showy.

From the President—Pæonies Whittleji, Humei and Reevesii, Lonicera grata and Canadense, Saxifraga arborea, Clematis azurea grandiflora, Gillenia trifoliata, Double Rockets, (the latter very fine specimens,) and Roses.

From W. Meller—a great variety of fine Geraniums. From S. K. Johnson—Hardy and tender Roses—a fine collection.

From W. E. Carter—Pæonies Whittleji, Humei and Fragrans—all fine. Also, bouquets and other flowers. From J. L. L. F. Warren—bouquets.

New Geraniums and Seeding Verbenas, from Mr Wales, Dorchester.

Bouquets from A. Bowditch.

Hardy Roses, from C. Newhall.

From S. Walker—fine large bouquets.

Native plants, upwards of 25 species, from B. E. Cotting.

Sarracenia purpurea and other native plants, from Wm. Lincoln, Esq., Worcester.

Bouquets and Pæonies, from Hovey & Co.

The exhibition today was for Pæonies for premium, agreeably to notice. The following is the award of the Committee:

The subscribers, appointed to award the premium on Pæonies, have attended to the duty assigned to them, and award the Society's premiums for the best specimens and display of the Pæony, and give the

First premium to W. E. Carter;

Second do. to Wm. Kenrick.

S. WALKER, }  
D HAGGERSTON, } Committee.

Boston, June 19, 1841.

C. M. HOVEY, Chairman.

**NOTICE.**

The Society's Premiums for Roses, (both hardy and

tender,) and Pinks, will be awarded on Saturday, the 26th inst., as follows:

**Roses**—For the best 50 dissimilar blooms of *hardy* varieties;  
 For the 2d best 50 do. do. do.  
 For the 3d best 50 do do. do.  
 For the best display of Chinese and other tender Roses;  
 For the 2d best do. do. do.

**Pinks**—For the best display of flowers;  
 For the best 6 dissimilar blooms;  
 For the best seedling.  
 Per order, C. M. HOVEY, Chairman.

**NOTE.**—Exhibitors of flowers are respectfully requested to hand in to the Chairman a list of the flowers exhibited, if they wish them reported.

**EXHIBITION OF FRUITS.**

Saturday June 12, 1841.

(First exhibition of the season.)

Sweetwater Grapes, from Charles Goldermann, Chelsea.

Early Virginia Strawberries, from J. L. L. F. Warren, Brighton.

Hamburg, Miller's Burgundy, and Sweetwater Grapes, from J. S. Ellery, Brookline.

A fine specimen of Coolidge's Favorite Peaches, from George Lee, West Cambridge.

For the Committee, BENJ. V. FRENCH.

Saturday, June 19.

Messrs Hovey & Co. exhibited Hovey's Seedling Strawberry.

J. L. L. F. Warren exhibited Warren's Seedling Strawberry.

May Bigarreau Cherries, from M. P. Wilder, Esq.

Iron or Rock Apples, in fine preservation, from Levi Thaxter, Esq., Watertown.

JNO. A. KENRICK.

**THERMOMETRICAL.**

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northerly exposure, week ending June 20.

June, 1841.	5 A.M.	12 M.	7 P.M.	Wind.	
Monday,	14	53	80	65	W.
Tuesday,	15	61	74	70	W.
Wednesday,	16	56	74	72	N.
Thursday,	17	54	83	70	S. E.
Friday,	18	61	72	62	E.
Saturday,	19	57	74	62	E.
Sunday,	20	54	76	53	E.

We have had considerable rain since Friday noon, which has given freshness and vigor to vegetable creation, which is not only delightful, but encouraging to those who till the earth, that their labor will be crowned with an abundant harvest.

**BRIGHTON MARKET. — MONDAY, June 21, 1841.**

Reported for the New England Farmer.

At Market 200 Beef Cattle, 15 pair of Working Oxen, 20 Cows and Calves, 2800 Sheep and 320 Swine.

**PRICES.**—Beef Cattle.—We continue last weeks quotations, viz: First quality, \$6 75 a 7 00. Second quality, \$6 25 a 6 50. Third quality, \$5 25 a 6 00.

Cows and Calves.—Sales, \$23, \$25, \$31, \$34, \$38, \$40, and \$45.

Sheep.—Dull. Many lots were sold for considerable less than they cost in the country. Lots were sold for \$1 00, \$1 12, \$1 42, \$1 62, \$1 88, \$2 00, \$2 12, \$2 25, and \$2 33.

Swine.—Several lots of large barrows 5 1-2, and one lot at 5 3-8. A lot to peddle, some of which were pigs, at 5 1-8 and 6 1-8. At retail from 5 to 7 1-2.

**WHOLESALE PRICES CURRENT.**

Corrected with great care, weekly.

**SEEDS.** Herds Grass, very little in market. Red Top, new seed by the bag 50 to 55 c. Clover—Northern, 13c.—Southern, 8 to 9 c. Flax Seed, \$1, 37 to 1 50 bu. Lucerne, 25 c. per lb.

**FLOUR.** Howard Street \$5 37—Genesee \$5 25—Ohio \$5 12.

**GRAIN.** Corn—Northern Yellow none.—Round Yellow

low 63—Southern Flat Yellow 60—White 64.—Rye—Northern 60 to 65—Southern 50 to 55. Oats—Southern 36 to 33—Northern 33 to 40.

**PROVISIONS.** Beef—Mess \$10 50 to 11 00—Prime \$6 50—No. 1 \$9 00. Pork—Extra—15 00—Clear 14 50—Mess \$13 00. Hams—Northern 9 c. per lb.—Southern, none. Lard—Boston 9 c. per lb.—Southern, 8 to 8 1-2. Butter—Lump 18 to 22—Firkin 12 to 18—Shipping 8 to 14. HAY, per ton, \$18 to 20—Eastern Screwed \$14 to 15. CHEESE—Old 11 c.—New 8. EGGS, 11 a 12.

**WOOL.**—The market for this article has not experienced any change of late. Pulled Wool is rather scarce, and there is but a limited supply of low Fleeces, and of fine Fleeces the stock is also moderate. Prime or Saxony Fleeces, washed, lb. 50 to 55 c.—American full blood, washed, 47 to 50—Do 3 4 blood, washed, 44 to 46—Do. 1-2 blood, washed, 36 to 40—1-4 and common do, 35 to 37—Smyrna Sheep, washed, 20 to 28—Do. unwashed, 10 to 14—Bengasi Sheep, 8 to 10—Buenas Ayres unpicked, 7 to 10—Superfine Northern pulled lamb 43 to 46—No. 1 do. do, 37 to 42—No 2 do do 26 to 30—No 3 do do 18 to 20.

**PURE SPERM OIL.**

**EDMUND T. HASTINGS & CO.**

No. 101 State St, keep constantly for sale, Winter, Spring and Fall Sperm Oil, bleached and unbleached; which they warrant to be of the best quality, and to burn without crusting.

Oil Canisters of various sizes.  
 Boston, Jan. 1, 1841. 1841

**GOOD CULTIVATORS AT \$150.**

Good Cultivators for sale at the New England Agricultural Warehouse, Nos. 51 & 52 North Market Street, Price \$250.  
 JOS. BRECK & CO.

**REVOLVING HORSE RAKE.**

The Revolving Horse Rake has been in general use in most parts of Pennsylvania and New Jersey, and is found to be one of the most useful labor saving machines now in use. One man and horse, with a hoy to lead, will rake on an average from 25 to 30 acres per day with ease, and do the work well. There is a great advantage in this rake over all others, as the person using it does not have to stop the horse to unload the rake.

For sale at Nos. 51 & 52 North Market Street, by June 9. JOS. BRECK & CO.

**LACTOMETERS.**

Just received at the New England Agricultural Warehouse, No. 51 and 52, North Market st., a few sets of Lactometers, for testing the quality of milk.  
 June 23 JOSEPH BRECK & CO.

**WILLIS'S LATEST IMPROVED SEED SOWER.**

Willis's latest Improved Seed Sower, invented the last season; one of the most perfect machines ever introduced for the purpose. In using this machine, the farmer may be certain that his seed is put into the ground, and at the same time in the best possible manner. There has been a great difficulty in machines for sowing garden seeds; they are very apt to clog up and the farmer might go over an acre of land and not sow a single seed; but not so with this; it is so constructed that it cannot possibly clog. In using this sower, the farmer can save one half of his seed, and do the work at less than one quarter the expense of the common way of sowing seeds, and have it done in a much better manner; it opens the furrow, drops the seed, and covers it over and rolls them down. It will sow almost any kind of Garden Seeds; say Ruta Baga, Mangel Wurtzel, Turnips, Carrots, Beets, Parsnips, Onions. It is highly recommended by a great number of persons who used it the past season. For sale at the N. E. Agricultural Warehouse and Seed Store by JOSEPH BRECK & CO.

**AGRICULTURAL IMPLEMENTS, &c.**

The Proprietors of the New England Agricultural Warehouse and Seed Store No. 51 and 52 North Market street, would inform their customers and the public generally that they have on hand the most extensive assortment of Agricultural and Horticultural Tools to be found in the United States. Part of which are the following:

1000 Howard's Patent Cast Iron Ploughs	100 doz. Cast Steel Shovels.
300 Common do. do.	150 " Common do.
200 Cultivators.	100 " Spades.
100 Greene's Straw Cutters.	500 " Grass Scythes.
50 Willis' do. do.	300 " Patent Snaths.
100 Common do. do.	200 " Common do.
100 Willis' Patent Corn Shellers.	500 " Hay Rakes.
50 Common do do.	200 " Garden do.
200 Willis' Seed Sowers.	200 " Manure Forks.
50 " Vegetable Cutters.	300 " Hay do.
50 Common do do.	500 Pair Trace Chains.
200 Hand Corn Mills.	100 " Truck do.
200 Grain Cradles.	100 " Draft do.
100 Ox Yokes.	500 Tie up do.
1500 Doz. Scythe Stones.	50 doz. Halter do.
3000 " Austin's Rifles.	1000 yards Fence do.
	25 Grid Stones on rollers.

March 17.

**FULL BLOOD DURHAM CATTLE.**

The subscriber will sell at public auction, at his residence in Pleasant Valley, foot of Atwell's Avenue, in Providence, 1 1/2 miles from the Great Bridge, on Wednesday, the 23d of June instant, at 11 o'clock, A. M.

20 head of superior full and half blood Durham Cattle. Also, 20 full blood and half blood imported Southdown Sheep. A rare chance is offered in this stock to farmers and others to secure some of the finest Cattle ever offered for sale in this country, and as a whole there is seldom so choice a lot of herd book Cattle presented to the public. All interested are requested to call and examine this stock previous to the day of sale. Terms liberal. For further particulars see catalogue, which will be exhibited at the sale.  
 Providence, June 5, 1841. JOHN GILES.

## MISCELLANEOUS.

## SOW THY SEED.

BY T. RAFFLES.

"In the morning sow thy seed, and in the evening withhold not thy hand; for thou knowest not whether shall prosper either this or that, or whether they both shall be alike good" ECCLESIASTES, XI. 6.

In the morning sow thy seed,  
Nor at eve withhold thy hand,  
Who can tell which may succeed,  
Or if both alike shall stand,  
And a glorious harvest hear  
To reward the sower's care.

In the morning sow thy seed;—  
In the morning of thy youth;  
Prompt to every generous deed,  
Scatter wide the seeds of truth:  
He whose sun may set at noon  
Never can begin too soon!

Nor withhold thy willing hand  
In the eventide of age,  
E'en to life's last lingering sand,  
In thy closing pilgrimage,  
Seed may yet be sown by thee,—  
Sown for immortality!

"By all waters," be it known—  
Every where enrich the ground,  
Till the soil, with thorns o'er grown,  
Shall with fruits and flowers abound.  
Pregnant with a sweet perfume,  
Decked in Eden's loveliest bloom!

Sow it in the youthful mind:  
Can you have a fairer field?  
Be it but in faith consigned,  
Harvest, doubtless, it shall yield,  
Fruits of early piety,  
All that God delights to see.

Sow it on the waters wide,  
Where the seaman ploughs the deep;  
Then, with every flowing tide,  
You the blessed fruit shall reap,  
And the thoughtless sailors prove  
Trophy to the cause you love.

Sow it 'mid the crowded street—  
Lanes and alleys, dark and foul,  
Where the teeming masses meet—  
Each with an immortal soul,  
Sunk in deepest moral gloom,  
Reckless of the coming doom.

Sow it 'mid the haunts of vice—  
Scenes of infamy and crime;  
Suddenly, may paradise  
Burst, as in the northern clime.  
Spring, with all its verdant race,  
Starts from Winter's cold embrace.

Sow it with unsparing hand,  
'T is the Kingdom's precious seed;  
'T is the Master's great command,  
And his grace shall crown the deed;  
He hath said, the precious grain  
Never shall be sown in vain!

Long, indeed, beneath the clod,  
It may lie, forgot, unseen—  
Noxious weeds may clothe the sod;  
Changing seasons intervene,  
Summer's heat and Winter's frost—  
Yet that seed shall ne'er be lost.

But, at length, it shall appear,  
Rising up o'er all the plain—  
"First the blade and then the ear,"  
Then the ripe, the golden grain;  
Joyous reapers gladly come,  
Angels shoot the harvest home.

Many who find the day too long, think life too short; but short as life is, some find it long enough to outlive their characters, their constitutions, and their estates.

## POPULAR FOLLY.

Mechanics get tinged somewhat with the idea that it is not quite genteel enough for a darling child to be put to a trade, and that it would be a little more reputable for him to tend in a store!—Now no one will contend that all boys should be apprenticed to a trade, any more than that they should all be merchants, physicians or lawyers. But few will doubt, that many lads are crowded into what are called the learned professions who are as unqualified by nature for these eminent professions, as some of the members of those professions, are incompetent to make good mechanics. It is not any dullard that will make a mechanic, as is too often thought. If there is a bright boy in the family, he must be classically educated—if a very stupid one, "why (say the fond parents,) we must apprentice him to some hard-working mechanic, and he will probably be able to plod through the world!" With all proper deference to parents so mistaken as these, we, as mechanics, must say that a stupid boy will make as competent a professional man as mechanic. It requires good parts and a ready active mind, to master the principles of a mechanical business. We can easily account for the unworkmanlike manner in which mechanism is often executed, when we reflect how general the opinion has been—"the dullard to the trade, if we cannot do any thing else with him." It is a disgrace to us as mechanics, to have it obtain credence, that a mechanic can be formed of any "crooked stick of a boy." We should show a proper pride, by rejecting those boys whose only recommendation is stupidity—and whose parents think they are good for nothing but mechanics! We should return the compliment they pay our pursuits, by saying to them, "your sons are too poor stock for mechanics!"—Holden.

## TIME

It is a truism that time passes rapidly away. The wheel is constantly revolving, and carries with it our griefs and our joys—and finally life itself.—The ancients represented Time with a forelock, to show that it should be seized without delay, and that if once lost it cannot be secured. The duration of a man's life should not be estimated by his years, but by what he has accomplished—by the uses which he has made of time and opportunity. The industrious man lives longer than the drone; and by inuring our body to exercise and activity, we shall more than double the years of our existence.—Anon.

The hundreds of idle young men scattered throughout the country, and lounging about in our large towns, furnish indisputable evidence that many of the rising generation are contracting habits which in after life must cause a large amount of sorrow and wretchedness. Labor is not respected as it should be, and the consequence is, that idleness takes the place of industry, and poverty, ghastly and wretched, that of cheerfulness and content.—Anon.

## DRAFT AND TRACE CHAINS.

Just received by Packet Coromanda,  
400 pair Trace Chains, suitable for Ploughing.  
200 " Truck and leading Chains.  
200 " Draft Chains. For sale by J. BRECK & CO.,  
No. 52 North Market st. April 21

## GARDEN SEEDS,

For sale by JOSEPH BRECK & Co. at the NEW ENGLAND FARMER OFFICE, No. 51 and 52 North Market St. Boston. The subscribers would inform the public that they have now on hand the largest collection of seeds ever before offered by sale in this city, embracing every variety of Field, Kitchen, Garden, and Ornamental Flower Seeds desirable for this or any other Climate.

Our seeds are either raised under our own inspection or imported from respectable houses in Europe, and having taken extraordinary pains to obtain such as are pure and genuine, we can confidently recommend them to our customers and friends, and feel assured they will prove satisfactory to all who try them.

Dealers in seeds are requested to forward their orders in season. Boxes for retailing from 8 dolls. and upwards will be sent out on commission allowing a liberal discount and take back what remain unsold.

Letters and orders with good reference will meet with prompt attention.

## FIELD SEEDS.

Sugar Beet.	Ruta Baga.
Mangel Wurtzel.	Ballatine's New Royal do.
New Red Globe do. } superior	White Tankard Turup.
Yellow do. } varietal.	Red do.
Carrot Long Orange.	Red Round do.
" Altringham.	White do.
" New White, extra fine.	White Globe do.
Pumpkin, sorts.	Green Round do.
Wheat—various sorts.	Purple Top Hybrid do.
Barley, do.	Buckwheat.
Rye, do.	Broom Corn.
Potatoes, do.	Millet.
Indian Corn, do.	Buckthorn. } for Hedges.
Oats, do.	Locust. }

## GARDEN SEEDS.

Artichoke, Asparagus, Beans of every description, Beets of sorts, Borecole, Broccoli, Brussels Sprouts, Cauliflower, Caraway, Celery, of the most improved sorts, Cabbage 20 sorts, Carrot, all the varieties, Cucumber do, Cress, Egg Plant, Endive, Indian Cora, Kale, Leek, Lettuce in great variety, Melons, do. Marjoram, Mustard, Nasturtium, Okra, Onion of sorts, Pepper do. Pumpkin do. Parsnip, Parsley, Peas, a very great variety, Rhubarb for tarts, Radish of sorts, Salsify, Squash of sorts, Tomato, Turap 20 varieties.

## SWEET AND POT HERBS.

Thyme.	Sweet Basil.
Sweet Marjoram.	Lavender.
Sage.	Lemon Balm.
Summersavory.	Anise.
Medicinal Herbs, &c.	

## ORNAMENTAL FLOWER SEEDS.

Three hundred varieties, embracing all the finest sorts. Packages of 20 fine sorts for one dollar.

Those who prefer to have their Seeds put up in papers ready for retail, can be accommodated—each packet neatly closed and labelled with printed directions. Price 50 cents, per dozen papers, which are retailed here at 6 1-4 cents each.

Fruit and ornamental trees, of the greatest variety, supplied at nurseryman's prices, and orders solicited. These will be packed, when required, to go to any part of the U. States.

JOSEPH BRECK &amp; CO.

## FOR SALE.

GEORGE THE THIRD, who has been honored with the Second and First State premiums in 1839, at Worcester, and at Concord in 1840, by the Committees appointed by the State, for awarding such premiums, is of Durham Breed, was imported as most superior stock, and is thought by judges to possess more valuable points, than any to be found in any other animal of the kind.

Also, two young Bulls, Sired by the above, their Dams are imported and of the best possible blood.

For further information apply to CHARLES WIL-LARD 2d, Still River Village, Harvard. 4w June 2

## GRINDSTONES.

An extensive assortment of Water and Hand Grindstones constantly on hand and for sale by AMMI C. LOMBARD & CO. 13 Lewis's Wharf. 1stly. Nov. 17.

## NEW ENGLAND FARMER.

## A WEEKLY PAPER.

The Editorial department of this paper having come into the hands of the subscriber, he is now authorized by the publishers to inform the public that the price of the paper is reduced. In future the terms will be \$2 per year in advance, or \$2 50 if not paid within thirty days.

ALLEN PUTNAM.

N. B.—Postmasters are required by law to frank all subscriptions and remittances for newspapers, without expense to subscribers.

N. E. FARMER.

HAY AND FODDER.

Great losses are annually sustained in some parts of the United States in making hay, and in others, in curing corn blades, commonly called fodder. Mine, in a course of many years, have I think amounted to a moiety of the crops; and most of the expedients I have resorted to for avoiding these losses, have been but partially beneficial. Grass loses much both in quantity and substance, by an exposure to the sun in curing it, and fodder more, being thus exposed in small bundles. Both, and particularly the last, suffer greatly by dews and rains. This year I have made the most promising experiment for remedying these evils. A large meadow in bottom land, of a grass called red top or herd's grass, was cut in dry weather, and shocked in large shocks quite green, but dry—that is, not wet with either dew or rain—in the following mode. Four sticks, of five feet long, of the thickness of a man's wrist or more, were set up in a square of two feet wide at bottom, and meeting at top in a pyramidal form, where the shock was to stand. One at least of these sticks should be forked at top, to keep them steady while the hay is putting round them. A round log, about six feet long and six inches in diameter, was laid upon the ground, with one end reaching to the centre of the two feet square, between the sticks, and the other raised upon a fork about eighteen inches, for the purposes of enlarging the flue presently mentioned, lest it should be closed by the pressure of the hay, and that the log may be more easily drawn out when the shock is finished. Around and over the sticks the shock was made, its top reaching two or three feet above the top of the sticks. The purpose of the log was to make a flue for the admission of fresh air into the centre of the shock, and the expulsion of the air heated by the fermentation of the grass in curing. The flues were made to face the point from which the wind usually blows at the time of haymaking. If any flues happened to be closed by the pressure of the grass, they were easily opened by a smaller and pointed log; or when the largeness of a shock threatened this inconvenience, it was effectually prevented by inserting into the flue a short, forked stick as soon as the log was removed, to hold up the hay. As the logs are removed as soon as the shock is finished, two or three are sufficient for following a dozen mowers. The hay thus made is the best I ever saw, and the efficacy of the mode of curing it was strongly supported, by the growing grass under the shocks having been uninjured, whereas I never left shocks so long in one spot before, without its having been killed by the undissipated fermentation of the hay in curing. Corn blades or fodder, sustain an immense loss, even in dry weather, by two or three days' exposure to the sun and dews; and in wet they are nearly ruined. For an experiment, I shocked them in the mode just explained, quite green and dry; but I chiefly allowed them from four to eight hours' sun, before they were

shocked. Thus was made the best fodder I have seen. But the weather was favorable. The ends of the blades were laid outwards, and the shocks bound at top by a rope made of the blades.—*Arrator*, 1812.

MR COLMAN'S ADDRESS BEFORE THE AMERICAN INSTITUTE, IN N. Y.

This is an interesting performance. Few men in the country are better acquainted with his subject—"the Condition of Agriculture in the United States"—than the Agricultural Commissioner.—His remarks (very properly general,) are spirited, and mainly correct. We copy the following extracts:

"In a country like ours, as yet comparatively new, and with a vast extent of land just rescued from the wild beasts and wild men, that roamed over it with undisputed sovereignty, it cannot be expected that much improvement in agriculture should have been made. The great object has necessarily been, in most cases, production and immediate returns. Where immense tracts of land lay untilled, men have used up the soil without regard to its improvement or the continuance of its fertility. Excepting in those soils which are annually overflowed and enriched from the contributions of other fields, no soil under perpetual cultivation can retain its fertility. This has already been demonstrated in some of the oldest States, where cultivation has been highly stimulated, the products carried from the land, and no portion of them returned for its restoration and nourishment. In the new States likewise, the fertility of whose soils to the confident and reckless seems inexhaustible, this must ultimately be the case, unless the principles of modern husbandry, the principles of a rotation of crops and seasonable manuring, be understood and adopted. The laws of nature can neither be transcended nor violated with impunity. Avarice and selfishness in every department of life are sure of a just retribution. The laboring horse must have his full manger and his comfortable bed, or he will cease to labor. To exhaust the soil by cropping, and to be continually taking away without any replenishing, is a husbandry the fatal consequences of which are certain. In some parts of the country the soil is exhausted with perfect recklessness, and with a determination on the part of the cultivator, that when it ceases to yield abundantly he will emigrate; but there are few cases in which emigration is not a serious evil. If the account were fairly made up and the disadvantages of removal contrasted with the advantages of a fixed location, having all those multiplied conveniences, comforts and improvements which are found associated only with a long established residence, the policy of such calculations would be as strongly condemned by interest as by considerations of comfort and moral good. The evils of removal and emigration in our country—its physical sufferings, its social privations, and its moral trials, in a majority of cases, are necessarily great; and can be compensated only by extraordinary advantages.

It is happy for us that, under a faithful and enlightened agriculture, the fertility of a soil may not only be kept up, but continually increased. It is a truth, in which the old States have the deepest interest, that their impoverished lands may in many cases be restored and their waste and irreclaimed lands redeemed and made productive with greater ultimate advantages and pecuniary profit than a farm can be taken up and managed on the richest prairies of the far west. Let me state a case within my own knowledge. In the neighborhood of two or three populous villages, an observing man purchased seventy acres of wet meadow, the product of which was comparatively worthless. The land was estimated at not more than twenty dollars per acre. At an additional expense not exceeding twenty dollars per acre, he drained and manured it; and obtains from it at the rate of three tons of good hay to an acre, worth at the average price which hay has maintained in the vicinity for twenty years past, fifteen dollars per ton. From one measured acre he sold the product of one cutting for one hundred dollars, at twentyfive dollars per ton. We are yet, even in the old States, little acquainted with our own resources. I have no prejudice against the new States. Far from it. I admire their unrivalled magnificence, their superlative beauty, and their exuberant fertility. They are for the young and enterprising; for those who have no means of planting themselves in the old States; or for those of foreign countries, who fleeing from the yoke of oppression and degradation which has for centuries galled their necks under the despotisms of the old world, come with their wives and children to our shores, where they may breathe the air of freedom and enjoy the rights of men. Heaven prosper the virtuous, patriotic and industrious among them, as He prospered our pilgrim fathers. But at the same time, I am for the improvement of the old States. I am for doing well here, before I go farther under the expectation of doing better, with all the uncertainties attending a removal and the sacrifices and the privations which, under the best circumstances it must involve. We have not yet begun a systematic and liberal course of improvement. With respect to the small experiments which have been made, and many have come under my observation, I have not found a single instance conducted with judgment, skill, perseverance and liberality, which has not been amply compensatory and successful.—Your own county of Columbia presents many examples of such productive improvement. Lands in this county, which twenty years ago were scarcely worth twenty dollars, under a course of permanent improvement, are now readily sold at an hundred dollars per acre in whole farms, and pay a large profit at that."

Speaking of speculation and its disastrous results, Mr Colman says—

"It is but recently that conventions were assembled, the press teemed with encouraging publications, and every where men's mouths were full of the culture of silk. It was gravely calculated

that trees would not grow fast enough for the wants of the community, and that even our common farmers would be able to change their tow frocks for silken robes, made perhaps after the fashion of the Roman toga. But it was soon found that all this had its origin and its end in the price of mulcaulis and the sale of mulberry trees. The actual production of silk, destined, I confidently believe, to become a most important and profitable branch of American husbandry, did not enter into the calculations of most of these persons. Their eloquent eulogiums upon its culture were for another end. The reasonable gains of wholesome industry united with systematic frugality, were disdained under the dazzling expectations of sudden accumulation. Men crowded around the mountain, struggling up its ascent, and heedlessly thrusting down, if necessary to their own success, all who stood in their way, as if its glittering summits and its brilliant glaciers were of solid silver. The terrible avalanche which has rolled down, tumbling many from its giddy heights and crushing thousands upon whom it fell, has taught the country a lesson of rebuke and wisdom necessary to their pride, and which, at least for a while, must calm the insanity of an unbridled avarice and ambition. The season of mental and moral disease through which the country has passed, and from the dreadful effects of which it is now suffering, will prove a signal blessing if it shall be instrumental in giving, especially to the rising generation, more just views of duty, happiness, and good; if, in withdrawing them from their hazardous and too often dishonest and corrupting pursuits of gambling and speculation, it shall reconcile and attach them to the pursuits of honest toil in cultivating the earth. Such a pursuit is sure to bring with it a reasonable competence and the satisfactions of conscience, and at the same time present the widest room for the cultivation of the domestic affections, and the quiet and delicious pleasures of this true philosophy of life. I certainly would not encourage any extravagant expectations, or represent agriculture as likely, under the best circumstances, to yield enormous profits. Expectations of that character are vain and baseless, when applied to any of the business of life. Large fortunes are sometimes suddenly and unexpectedly made; but we must not be deluded by extraordinary examples. In the lottery of life we are sure to hear of the few who draw the highest prizes; but nothing is said of the multitudes, who draw only blanks. I do not mean to compare agriculture to the operations of chance. Trade partakes much more of chance than agriculture. But I mean to say that the capital may often be invested in agricultural improvements so as to meet all reasonable expectations of profit; and when the security of such investments is considered, they will be justified by the soundest discretion."

*Ticks on Sheep.*—An ointment made of gunpowder and sulphur, equal parts, mixed with lard and applied behind the necks of lambs and sheep newly shorn, will tend to rid them of all kinds of vermin. Ten cents worth may be sufficient for a hundred sheep.—*New Haven Farmer.*

The three great apostles of practical atheism, that make converts without persecution, and retain them without preaching, are wealth, health, and power.

### IMPORTANT DISCOVERY.

We embrace the earliest moment, after the receipt of the following letter, to lay it before our readers. The season is not yet so far advanced that the process may not be beneficial to those who put it in operation:—

M. P. WILDER, Esq., *President of the Massachusetts Horticultural Society:*

Sir,—Having discovered a cheap and effectual mode of destroying the *Rose Slug*, I wish to become a competitor for the premium offered by the Massachusetts Horticultural Society. After very many satisfactory experiments with the following substance, I am convinced it will destroy the above insect, in either of the states in which it appears on the plant, as the fly, when it is laying its eggs, or as the slug, when it is committing its depredations on the foliage.

*WHALE OIL SOAP*, dissolved at the rate of two pounds to fifteen gallons of water. I have used it stronger without injury to the plants, but find the above mixture effectual in the destruction of the insect. As I find, from experiments, there is a difference in the strength of the soap, it will be better for persons using it to try it diluted as above, and if it does not kill the insect, add a little more soap, with caution. In corresponding with Messrs. Downer, Austin & Co., on the difference in its appearance, they say—"Whale Oil Soap varies much in its relative strength, the article not being made as soap, but being formed in our process of bleaching oil. When it is of very sharp taste, and dark appearance, the alkali predominates, and when light colored and flat taste, the grease predominates." The former I have generally used, but have tried the light colored, and find it equally effectual, but requiring a little more soap—say two pounds to thirteen gallons of water.

*Mode of preparation.* Take whatever quantity of soap you wish to prepare, and dissolve it in boiling water, about one quart to a pound; in this way strain it through a fine wire or hair sieve, which takes out the dirt, and prevents its stopping the valves of the engine, or the nose of the syringe; then add cold water, to make it the proper strength; apply it to the rose-bush with a hand engine or syringe, with as much force as practicable, and be sure that every part of the leaves is well saturated with the liquid. What falls to the ground in application, will do good in destroying the worms and enriching the soil, and from its trifling cost, it can be used with profusion. A hogshead of 136 gallons costs forty-five cents—not quite four mills per gallon. Early in the morning, or in the evening, is the proper time to apply it to the plants.

As there are many other troublesome and destructive insects the above preparation will destroy, as effectually as the rose slug, it may be of benefit to the community to know the different kinds upon which I have tried it with success.

*The Thrips*, often called the Vine Fretter, a small, light-colored or spotted fly, quick in motion, which in some places are making the rose bush nearly as bad in appearance as the effects of the slug. *Aphis*, or Plant Louse, under the name of green or brown fly, an insect not quick in motion, very abundant on, and destructive to, the young shoots of the Rose, the Peach tree, and many other plants. *The Black Fly*, a very troublesome and destructive insect, that infests the young shoots of the Cherry and the Snow-Ball tree. I have never known any positive cure for the effects of this in-

sect until this time. Two varieties of insects that are destructive to, and very much disfigure Evergreens, the Balsam or Balm of Gilead Fir in particular, one an *Aphis*, the other very much like the rose slug. *The Acarus*, or red spider, that well known pest to gardeners.

*The Disease Mildew* on the Gooseberry, Peach, Grape Vine, &c. &c., is checked and entirely destroyed by a weak dressing of the solution.

The above insects are generally all destroyed by one application, if properly applied to all parts of the foliage. The eggs of most insects continue to hatch in rotation, during their season. To keep the plants perfectly clean, it will be necessary to dress them two or three times.

*The Canker Worm.* As the trees on this place are not troubled with this worm, I have not had an opportunity of trying experiments by dressing the trees, but have collected the worms, which are killed by being touched with the liquid. The expense of labor and engines for dressing large trees, to be effectual, may be more than the application of it will warrant; but I think by saturating the ground under the trees with the liquid, about the time the insect changes from the chrysalis state and ascends the trees, will destroy them; or, when the moth is on the tree, before laying its eggs, they may be destroyed without much labor; in either case, the mixture may be applied much stronger than when it comes in contact with the foliage. Laying it on the trunk and branches of the tree, at the consistency of thick paint, destroys the brown, acaly insect on the bark, and gives the tree a smooth, glossy, and healthy appearance.

I remain, sir,

Your most obedient servant,  
DAVID HAGGERSTON.

Watertown, June 19th, 1841.

### RYE AND BARLEY.

Both of these articles are used as food for hogs; and their meal, like that of oats, may be frequently combined with other food advantageously. The meal of the former is said to be particularly beneficial to young pigs, and calculated to preserve a healthy tone and action of the bowels. Barley has long constituted one of the principal articles resorted to, for feeding hogs in Europe, and is used for the same to a considerable extent in this country. We learn that the sole food employed by Mr Pattison, while fattening hogs in stall pens, was barley meal and water. One of the successful modes of preparing swine for market in England is, to commence with a mixture of two thirds of boiled or steamed potatoes, and one third of peas and barley, ground in equal quantities into meal; and as the process continues to diminish the former article, and add more to the latter. Malted barley given whole, has been found extremely beneficial in fattening hogs, as the quantity of sweet nutritious matter is greatly augmented. It is a food, however, generally best adapted to the elder class of pigs. The produce of barley in flour, is 12 to 14 pounds of grain, and 1000 parts of barley meal are found by chemical analysis to contain 920 parts of soluble and nutritious matter, i. e. 790 of mucilage or starch, 70 of sugar, and 60 of gluten.—*American Swine Breeder.*

Every fool knows how often he has been a rogue, but every rogue does not know how often he has been a fool.

From the New Genesee Farmer.

### CHEESE MAKING.

Messrs Editors—Communications are occasionally made through your paper, giving the best method of making cheese from practical experiments. As your Journal is designed for a medium through which farmers can exchange their views upon the various subjects connected with their high calling, I submit the following, if you think it worthy of occupying a corner of your Farmer.

The plan generally proposed by your correspondents, is to strain the milk in the tub over night, and warm it in the morning, carefully stirring in the cream. Mr A. F. Bill, in the October number of the New Genesee Farmer, says,—“In the morning take off the cream with a skimmer, and put it in a vessel by itself; then warm the milk, or a part of it, over a slow fire till about blood heat; then pour in the cream, and stir it moderately till there are no particles to be seen floating upon the surface.”

It seems to me evident, that when the cream is once separated from the milk, it can never be so thoroughly incorporated with it again, as to set the milk as soon as taken from the cow.

Our method is this:—Immediately after the cows are milked at night, (and the quicker the operation is performed the better,) we strain it into the cheese tub and put in the rennet—as the milk when it first comes from the cow is in precisely the right temperature to set. If the rennet is good, and properly prepared, a large table spoonful is sufficient for a pailful of milk. The tub should then be covered with a cloth, and allowed to stand undisturbed: in about forty minutes it will coagulate. It is then carefully cut, the tub again covered and left to stand till morning. When the tub is wanted for the morning's milk, the night's curd is dipped into the cheese basket, or cheese sink, to drain, and the morning's milk strained into the same tub. The rennet is then put on, going through the same process as with the night's milk. When sufficiently drained, the two curds are ready to be put together, scalded and salted according to the discretion of the maker.

Those who have had the least experience in the management of milk, must know that warming it after it has once cooled, gives it a tendency to sour the quicker. Any person who will take the trouble to try the experiment, will find that curd made from milk warm from the cow, will keep *sweet* much longer than that which has been warmed over the fire; and, besides this, it saves the time and trouble of *skimming* and warming. Nothing will make a good cheese maker assume a belligerent attitude so quick, as to see the skimmer flourished over the cheese tub.

From a long experience in a modern sized dairy, I am persuaded that in no way can so much, or cheese of so good quality be made, as to set the milk while warm from the cow.

Yours, E. BISHOP.

Allica, Genesee Co. April, 1841.

P. S.—While upon a subject connected with cows, let me suggest to your correspondents who occasionally send you the quantity of milk given by a particular cow, to give it in *pounds*, and not in *quarts*. It can be done much easier, and with greater accuracy; and not only so, but in the latter case it is too often *guessed at*, or measured, froth and all, in bruised and battered quart measures.

### GOOD CULTIVATION.

In nothing does the reward correspond more exactly with the deserts, than the amount and perfection of crops do with the labors of the cultivator. Men you may cheat, by obtaining advantages of them in trade; but old mother Earth you cannot cheat. She will reward you according to your works. And if you would obtain large and sound crops, you must deserve them by skill and labor—otherwise you will fail in calculations.

Good husbandry is as much a science, as any thing else—a science which, emphatically, “practice makes perfect.” Not only are the great things, but the little things to be attended to, and at proper times. For good crops, first, the land must be enriched—it should have as much manure, annually, as it can digest and convert into the fruits which you propose to gather from it. We say “as much,” but it should not have *more*. A superabundance will over-stimulate the soil, and leave a mass of inert matter, that will do more harm than good next year. The soil should be fed *annually*, as a man is fed daily. The idea of giving the earth manure enough to last several years, on cultivated ground, is like making a man eat in one day enough to last him a week. When the soil is well manured, the next thing is to pulverize it with the plow or spade. It is not enough to turn it over, but it must be *pulverized*. All the lumps should be broken up till they are crumbled into powder.

In planting, care should be taken to procure good seed of the best sort. Unhealthy and vitiated parents, in the vegetable, as well as the animal world, are pretty sure to produce inferior offspring. The seed should be dropped or sowed *suantly*.—Every hill, and if possible, every kernel, should have an equal space of ground allotted for its growth. Then there will be no soil wanted, and no plants pinched for want of room. Machines for planting are valuable, not only as saving labor, but also because they divide the land equally and give each hill or plant an equal chance. This is real economy.

The seed being planted at the right season—neither too early or too late—and earliness and lateness relate to the condition of the earth and skies, rather than to the day of the month—the next thing is to hoe the ground well as soon as the plants are high enough to work amongst. The sooner this is done the better, as it will not only kill the tender weeds before they get much root, but will prevent the coming up of many other weeds, the seeds of which are deeper in the earth, or slower of vegetation. Many a weed is killed by hoeing before it is out of the ground. But in hoeing corn, potatoes or beds of vegetables the first time, be *careful* and be *faithful*. Once well done is worth all of four times half done. Let the fingers be used about the plants, to pull up the weeds by the roots—not to break them off—and to loosen the soil about the plants. Let not an inch of the ground be untouched by the hoe, and stir it as deeply as you can with that instrument. A soft soil, that will admit the air and light, is indispensable to the young roots of the plants, which wish to run down and along the surface.

Be sure and kill all the weeds. Every one that grows exhausts the soil just so much as is necessary for its support, and robs your crop of its food, besides shading and crowding it to its injury.—Weeds are poor things in a garden or cultivated field. If the first weeding and hoeing are done thoroughly, the great effort of the season is over.

There will be but few weeds after that. But it is best to hoe in a dry time.

Some gardeners and cultivators with whom we are acquainted, think that as soon as a shower of rain is over, they must seize the hoe and run out to kill the weeds. This is bad husbandry in two respects. First, if the ground is stirred when it is wet, the earth is adhesive and it will dry in hard lumps and make a bad matter worse; secondly, hoeing at such a time will inevitably but *transplant* the weeds, and they will soon shoot up again.—Let the top of the soil be dry when you hoe. This is important, not only to destroy the weeds, but the crop will suffer less from dry weather, if hoed in such a time, than if stirred at a different time. One of the best ways in the world to prevent the effects of a drought, is to stir the land when it is dry. It is a mistake to suppose that the porous condition of the surface which is left by hoeing, allows the moisture to escape more rapidly. It will not escape so fast, as if it was not hoed. There is a greater circulation between the earth and the air, and in a dry time a greater amount of dew falls upon the plants in the night, when the earth is loose at the surface, than when it is compact and hard. The oftener you hoe the ground, when it is properly dry, the surer and larger will be the crop. If this could be done every day, without cutting the lateral roots, your plants would be thankful for it.

Some of our neighbors, who have visited our garden—it is a large one—marvel how it is that there never appear to be any weeds in it. For themselves, when the plants in their beds are up and large enough to be hoed, they are immersed and overtopped in weeds, and it is a dreadful job to pick them all out and leave the plants to the sole occupancy of the soil. But before ours are hoed, they see but a very few weeds in the beds; the rows of plants are all distinct and free, and appear as if they had already been hoed clean. We will tell them how this is done. In the first place, we never allow a single weed to go to seed in the garden. Of course then, there will be no seeds from this cause to come up the next spring—only such as have been borne upon the premises by the winds from adjacent grounds. We take as much care to kill the infant weeds, all summer and in autumn, as we do in spring. Then again, we never put on land weedy manure. They who make their beds of new stable manure, which is filled with the seeds of grass, clover, sorrel, pig weeds, &c., must expect that those seeds will come up as soon as their beets, onions, carrots, &c., and being more numerous, they will cover the ground very early. We are careful to dress the soil only with manure that has undergone the fermentation of at least one season, which has killed the wheat seeds. Then we plant and sow as soon as the land is manured and pulverized, so as to give the seed we sow as fair a chance in time, as the seeds of weeds that *may* chance to be in the manure. As soon as weeds do appear, and we can distinguish our plants, we go at them in earnest—not allowing them to get the mastery. By such timely care, we are troubled with weeds but little through the whole season.

Rich soil, kept soft by frequent hoeing, and free from weeds, will in ordinary seasons, produce perfect crops. A carelessness in either of these respects is fatal to a large harvest.—*Maine Cult.*

The proudest man on earth is but a pauper, fed and clothed by the bounty of Heaven.

## DOCKING HORSES.

To the Editor of the New England Farmer:

I believe it to be the duty of every one who is engaged in farming, to use every laudable exertion to promote and improve the art of agriculture; and in no other way can this be done successfully, but by mutually communicating our researches and disseminating them in agricultural journals, for the consideration of those that take an interest in it.

I have been highly gratified with the course you have pursued in conducting the Farmer; and I sincerely hope that you will continue the track you have marked out for yourself.

I saw in your paper dated January 20, 1841, a piece headed "Docking Horses," which I perceived was taken from the Maine Cultivator, and which has called forth these remarks.

The subject was a proper one, but was couched with ungenerous and severe language. It goes on thus: "We are sorry to perceive that the barbarous, cruel, and injurious practice of docking horses, is again beginning to be looked upon with favor, after some years of merited disuse. None but a narrow-minded, ignorant man would have ventured on this violation of vested rights, and none but blockheads, or jockeys, destitute of the better feelings of mankind, would have perpetrated the deed. An English gentleman had a hunting horse which carried his rider over a five-barred gate: he had him nicked, and he could scarcely carry him over a two-barred gate. A man that uses the knife to improve nature, may be justly deemed insane." The writer here quoted, mentions too, that "he was not in the habit of indulging in unkind feelings towards his fellow-men." I should not have thought this, had he not mentioned it. I have a different opinion from this writer: being confident that decking does not weaken the horse if properly done. The tendons, arteries, muscles and nerves, are only shortened by it: when the wound is healed, the tail must be as well as though it was longer. Those tendons cut in the nicking are always cut in docking, and never to the injury or weakening of the horse. I could quote the authority of many experimenters; but I will let pass by noticing his remarks. But I would ask if the method taken by this writer is a right one to convince a man that he has done wrong, by calling him a barbarous, inhuman wretch. It ever has been and is now the custom to dock and nick horses that do not carry upright; and it has been tolerated by a very large portion of the community. It has been done for convenience. Who wants to drive a horse that sits his tail so close to his quarter that you have to lift the hind end of the animal from the ground to clear the rein. The cutting or shortening the tail cannot affect his strength any more than it can his digestion. I do not like to indulge in unkind feelings, but when I see that the practice has been tolerated such a length of time, and by our most useful citizens, I do feel hurt at such language as the writer alluded to employs. I make bold to affirm that there is no class but that have or have had horses docked, and whoever they are, in the opinion of this writer, they are barbarians and blockheads. What he tells of the English hunter, I declare to be the most barefaced statement I ever saw in any man's writing. Mahomet would have been banished for such silly reasoning as this. That the nicking should make the difference he tells of, it must have diminished the strength of the horse at least three

fifths. People that have had horses nicked ought to know whether it diminishes their strength in this proportion; but out of hundreds that have been nicked in this State for a few years past, not one of their owners has discovered it. But this is as true as any thing he has stated, I believe. What arguments are these to bring before an enlightened community? Any man that thought the practice in question was injurious, would be disgusted with such barefaced, inconsistent and ridiculous statements! But the writer supposed he was addressing those barbarous, ignorant, inhuman, narrow-minded and insane blockheads and jockeys who are amply adequate to improve those principles which have been instilled into his mind. I advise him to lay by his pen and repair to Gloucester, R. I., although he considers himself, *materia prima*, and get his mind purged of that intolerance, bigotry and dogmatism, which appears so fully developed in his writings.

He says that race horses are not docked: very true—neither are they gelded. You must intrude upon the vested rights of nature in gelding as well as docking; but if docking is a barbarous custom, he cannot find language to express the cruelty and pain that is suffered in gelding. Thus I perceive that he "strains at a gnat and swallows a camel," for no one thinks of using a horse for a carriage without gelding. To wind up, he says—"Let those that will, prefer jockey horses; he prefers one that the knife has never touched." Undoubtedly he would make the best appearance behind such a horse; for if I was to judge of his appearance by his writing, I should think he had very long ears, and would look like a jackass driving a docked horse in a genteel carriage.

Yours, respectfully,

R. BURLINGAM, JR.

Gloucester, R. I., Feb. 18, 1841.

The above has but just come to hand. We admit it, because of our wish to let both sides of all practical questions be presented; but our own judgment is in favor of leaving animals in the form which nature gives, when we wish mainly health and strength.—Ed.

For the New England Farmer.

## CARRION.

How few there are who fully appreciate the value of carrion; and, instead of making a suitable and profitable use of it, carry it out into their pastures, or perhaps leave it uncovered near their buildings, where it will pollute the air and raise an offensive stench, until the action of the atmosphere has destroyed its life, or the fowls of the air or some animal has eaten it up or carried it away.

Now a wise man, if he has a horse, a cow, a hog, or sheep die, will not leave them to rot where the stench will be offensive or draw them off and let them lie uncovered, where there is no prospect of their carcass enriching the ground: no—but he will dig about his fruit trees and there bury them. The body of any small animal will do more good placed at the roots of an apple tree than they were worth when alive, as will be seen by the growth of the tree so favored, when the body of the animal has become putrefied.

Those who have been in the habit of wasting carrion may not believe this statement; but I can assure them that they will find it true; and if they will but once try the experiment, they will be con-

vinced of the fact at once. Let the unbelieving try it.

JIMMY IN THE COUNTRY.

Medford, May 15.

## PHYSICAL DEGENERACY.

We copy an article in this number on this subject from the New England Farmer. It is a subject which we have often brought forward, and one which rises in importance the more we reflect upon it. We cannot disguise the fact that the great bulk of the younger part of the community are far, very far from being as athletic, hardy and robust as were the older part when young. We see it every time we look around upon a group of young persons. It appears in every assembly, and it speaks a loud and a warning voice every time we compare the effeminate and sickly forms of the delicate lilly cheeked and lilly fingered youth, with the hardy and strong sinewy forms of that generation who are passing away from us like old oaks that have withstood the winds and the storms of a long life time, and are bowing to the effects of old age rather than to any disease.

We think that this, though observable in both sexes, is more so among the females than among the males. A pernicious belief that it is disgraceful to work, and that a young lady is elevated in the scale of respectability and dignity in proportion to her ignorance of domestic duties and her neglect of labor, has led to this. Among the farmers' daughters you will find something of the old system of hard labor at home, and a corresponding degree of health and strength. In the little villages you will perceive less of it, and a predominance of effeminacy: in the large villages we see more of it, and in the cities you will find a wide, very wide difference between the forms, shape, color, health, strength, and physical powers of the girls and those of the country.

We know that there is a false pride among certain individuals of the community which prompts to this—which leads the young miss to value herself more highly, the more delicate she can make herself appear, and the more she can "whiten out," even at the expense of health and the physical powers which God has given her. We agree with the editor of the N. E. Farmer in the sentiment that such should go down to the grave unmarried, childless, "solitary and alone." They may toss their head and curl their lip with as much scorn as they please; the laws of nature will not be infringed with impunity, and however delicate may be the subject, truth will not change, and the truth is, that puny and feeble parents can raise none other than a puny offspring. That farmer would be called a fool indeed, who culled out the poorest and most blighted and unripe seed to plant again, or saved the weakest and most feeble of his flocks to propagate for the future; and yet this is the very error which is blindly pursued in the continuance of the human species. We say blindly, for it must be owing to a blind impulse that rational beings should so conduct, rather than to any reasoning upon the subject.

It is a subject which should engage the attention of every philanthropist. Shall we become a nation of invalids? or shall we rise above the silly pride that seems now to direct public opinion, and by manly and useful labor, coarse but nutritious diet neat but comfortable clothing—reform so as to become again something as our fathers were? They were not afraid of the air. They were not ashamed

ed of labor. They were not too proud to be seen eating coarse but substantial food, and they were rewarded with health and strength accordingly.—*Maine Farmer.*

From the Albany Cultivator.

#### SALMAGUNDI, OR ODDS AND ENDS—No 1.

MESSRS EDITORS—It is my intention to present to your readers from time to time, as convenience permits, my views on divers and sundry subjects connected with my profession, in a fragmentary way, under the above caption. The adoption of this plan will enable me to condense, with due regard to fullness, however, when required, and thereby often avoid the prolixity of formal essays. It will, for the most part, be merely a discharge of small arms, but if a bomb-shell should now and then burst and break some shins, why—let them be mended again as soon as possible, together with the ways of those to whom the aforesaid shins belong. Peradventure the war should not come up to this brief manifesto, it will not, most certainly, be the first time in the history of nations or of individuals.

The first thing which will claim my attention, is to supply some deficiencies which were, not inadvertently, but for want of space, omitted in my last chapter, and somewhat connected by common usage, with shearing of sheep. And first,

##### Castration of Lambs.

Inasmuch as this is usually attended to at shearing time, it would be wholly unnecessary to advert to it, were it uniformly performed, as it should be, with reference to humanity and individual interest. The time I have chosen, as well as method, have been sanctioned and approved by some years of personal experience, and therefore I hope will be acceptable, as well as followed. The ewes of my flock, by the 20th of May, are through folding; and soon after, provided the weather is suitably warm, they are washed; and some cool day between this and shearing, the flocks are got up, and the lambs docked and castrated. Provided this is not done when the weather is cool, it should be attended to early in the morning, for the reason that when the temperature is low, there is less flow of blood, and consequently less exhaustion: a contrary course will endanger the lives of many lambs, especially if the breed be of the finer grade of Saxony. The *modus operandi* is thus:—one strides a scantling or narrow plank, which is placed in an inclined position, and on this the lambs are rested; this is a good way, because they can be more firmly held. Another, with a sharp knife, cuts about two thirds of the testicle bag off: if left too long it will bother the tagger and shearer: if cut too short, it will prolong the process of healing, and often jeopardize life, especially if no use is made of an ointment similar to the one which I shall prescribe and recommend. The testicles are then drawn out sufficiently far to reach the connecting cords, and instead of then giving a violent jerk, as is usual, the cords are divided by friction of the thumb nail. This is certainly more gentle and humane, because, apparently, attended with less suffering. After this the tail is docked, and if you wish to save yourselves the trouble of tagging often during the year, let it be cut as short as possible; besides, what looks more ungenteel, and absolutely vulgar, than a sheep with a long dock, or indeed without any dock at all. The ointment above alluded to, is composed of, say one pound of lard,

half a gill of tar, and a small portion of spirits turpentine, or in these proportions, warmed to a liquid and applied by means of a swab, about the mutilations. This not only possesses healing virtues, but keeps at a distance the maggot fly. The great majority of farmers use none, and the loss in consequence is always more or less, yearly, by neglect of it. Year before last, by using this ointment, I did not lose a lamb. Last year I docked and castrated 540, and but two or three died of this large number. After the whole process is through with, which with the skilful is momentary, they are placed in a separate pound, for the sake of quietness, and there remain until the blood ceases to flow, to prevent the wool of the ewes from being stained. Allied to this subject, is the

##### Destruction of Ticks,

a most disgusting kind of vermin, which impoverish and injure materially the health of sheep, as well as the appearance of the wool. A mode was recommended by one of you, Messrs Editors, in a late number of your paper, which was stated to be the result of actual experiment, and proved an effectual remedy. As near as my memory serves—and if I am wrong you can correct me—the process was performed at washing time, and the material was a liberal use of soft soap, which was rubbed upon the fleece before the sheep was immersed in water; and after a few were washed, being in a vat, the soap would so combine with the water as to produce strong suds; and the lambs were served in a similar way. This mode is not uncommon in England and Scotland, and the philosophy of it is very obvious; for, independent of the deadly ingredients of the soap, it produces thorough cleanliness, this being the greatest of all foes to the generation of vermin of similar description. The method is feasible—and I have no doubt efficient—where soft water abounds; but the stream which runs through my farm is strongly impregnated with lime; consequently the water is hard; otherwise I would be disposed to adopt it, for, aside from accomplishing so desirable an object, it must make the wool beautifully white and clean, a sight always good for sore eyes. Please remember this prescription, my brother wool-growers, when you are troubled in this way, it being more efficacious far than half the nostrums invented; and moreover will “put more money in thy pockets,” when the wool is thrown into market. In common with many others, I have used most successfully for the destruction of ticks, a decoction of tobacco water, and the process is as follows: buy at the stores, say for 100 lambs, four pounds of poor plug tobacco, or of stems ten pounds, and boil the same about two hours in order to extract fully the strength; and then pour the liquid into a half barrel or washing tub. In about a week after shearing, all the ticks will have left the ewes and fastened upon the lambs; then immerse them in this decoction up to the ears, care being taken not to remove them from over the vessel until the liquor has been rubbed or squeezed from the wool. There are other objects attained besides this in the use of tobacco water, namely, curing irritation or eruptions caused by johnswort; and if a little tar is dissolved in the water, it will serve as a guard for a while at least, against the attacks of flies, for we are all well aware how abhorrent the effluvia of tar is to insects of all kinds. If this plan is adopted, every wool-grower may rest assured that in two years scarcely a tick will be found in his flock.

##### Humanity to Brutes.

There is yet another small matter which should have been noticed in my last chapter, and which I deem of sufficient importance to mention here, viz: the practice of kicking and cuffing sheep, with a view to make them lay still when shearing them. Nothing of this kind is allowed in my shearing house, and on a repetition of the offence with my shearer, he receives due notice to quit, accompanied with an Uncle Toby's blessing. What! maltreat an animal when it is yielding its harvest which the God of nature has provided for our use and benefit! Let man keep in view that wise and humane proverb, “a merciful man is merciful to his beast,” for its observance will confer a two-fold benefit—to the mind pleasure, the invariable concomitant of the discharge of duty, and to the pocket an increased reward. L. A. MORRELL.

“SKUNKIANA.”—Dr. Holmes, of the Maine Farmer, (who, *en passant*, appears to be a true philosopher of the Uncle Toby stamp,) replies to our remarks upon his proposed titles for the skunk, after this wise:

“Marry! Mr N. E. F. Pr. D. Esq., thou art a facetious imp. Not only “a wit yourself, but the cause of wit in others”—and very *classical* withal. You shall be knighted, and have a *skunk fragrant* on the field of your coat of arms, and “*utilis et fragrans et amicus skunkorum*,” the motto.—ED. ME. FAR.”

WE are witty, that's a fact! and it affords us no little gratification to be told so!! especially by one who combines in so eminent a degree as docs Dr. Holmes, the rare attainments which make the *finished gentleman* and the *accomplished scholar*. (You perceive, Doctor, that your “puff” is met in that spirit of reciprocity peculiar to *great minds*.)

The honor of knighthood with which you would invest us, we must decline: It is a round in ambition's ladder to which we do not aspire. The age of chivalry, Doctor, is past: and the hazard of life and limb to win a “ladye love” in the desperate encounters of the tourney, is now regarded as a barbarism. If the honor you propose could be made an available means in winning us the affections of *one* of the gentler sex—then we would be *proud* to don the knightly armor and “break a lance” with any he who might be disposed to enter the lists as our rival. But tournaments are no more;—and the fair must now be won, if won at all, through the bloodless encounter between bright eyes and congenial hearts. [Dr., what should you prescribe for a patient who was afflicted with a *plethora* of “the tender passion”? Advice, to us, “*gratis*,” we suppose.]

While we decline the honor you would confer, we appreciate the generous motive which prompted it, and would *gently hint* that if you really think us entitled to *some* distinction in consideration of our services in *that* cause which few exhibited the “moral courage” to advocate, you may just give us to understand, in as plain a way as possible, that in your opinion we are *something* of a *genius* and a *considerably good sort of a fellow*—a promising young man, and one who would doubtless make a *first rate husband*. There, Doctor, say *only* so much, and believe us, our *best* feelings will be most delightfully tickled! nor could all the “star-and-garter” distinctions in christendom increase our ecstasy!!—N. E. F.'s “P. D.”

## NEW ENGLAND FARMER,

AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, JUNE 30, 1841.

## DRINKING IN HOT WEATHER.

MR EDITOR—In your number for June 23d, is an excellent article on Haymaking. I rejoice to see so many of these plain, practical articles in your paper; and hope they will be read extensively, and be as extensively useful.

There are one or two thoughts, however, in the concluding paragraphs of the article to which I allude, which do not seem to me so much in accordance with general experience as I wish they were. You say—and I know others have also said it—"None but the intemperate are injured by drinking cold water."

Now, unless you mean that the excessive drinking of cold water is itself intemperance, I am confident this statement cannot be true. That intemperate men are injured most readily by cold water, I have no doubt;—but that any man, who is at once over-heated and over-fatigued, may be injured by drinking cold water in large quantities, is at least equally certain. Indeed, it is certain that he who is either over-heated or over-fatigued, may be injured in this way. Cases of injury from the former cause are of almost every day occurrence.

I know what is the main thing intended by the writer of the article in question, in the remarks to which I have here alluded; and I rejoice at the effort. To put down the use of bad or even doubtful drinks, and put up cold water, is noble—and may God speed him who does it, or assists in doing it. Nevertheless, we must avoid doing evil, if we can, in our efforts to do good. And instead of saying, "There is no danger from frequent drinking in the hottest weather:—take cold water as often and as freely as you please—there is no danger from it, if you have not been too long without drink," &c.; instead of this advice, I wish with all my heart you had said something like the following—that is, had you believed it:—"There is no special danger from frequent drinking, in the hottest weather, provided you use the following cautions:—1. To drink very slowly. 2. To drink but little at a time. 3. To have your drink, though cool, not excessively cold. 4. To use but little drink with or near your meals. 5. To drink but little, very little, when over fatigued and over-heated.

With these restrictions, you might have said, as you have—"Cold water is the best of all drinks for slaking thirst; there is no danger from it (with the restrictions above,) if you have not been too long without drink," &c.

You say, "The haymaker must have a full supply of drink; perspiration will be free, and he must have something to support it." Yet I can point you to a laborer now over 80, and healthy and strong, who has drunk almost nothing at all between his meals all his life long, though he has perspired very freely, and no man has enjoyed his life more. Yet, observe, his meals are better than those of the average of men. I can tell you of another individual, whose employments are partly agricultural, and whose labors are very severe—calculated to elicit thirst, in the common way of thinking—who can labor through the summer and drink nothing at all, and who, for nearly ten months, beginning with August 6, 1840, did so. And not only so, but he suffered less from thirst during the time, than he ever did before in any of the months of his life. But then he lived right otherwise.

These facts are not mentioned, Mr Editor, to induce your readers to go without drinking at all, for I cannot advise a person in the world to do that—at least as long as he retains his present habits in other respects. My object was simply to show that we need far less drink than is usually supposed, if we only exercise, eat, sleep and think as we ought.

But I am extending these remarks too far perhaps. Excuse the freedom—well meant, I am sure—which I have taken. I was brought up a farmer—and, thank God, an intelligent one for the time—and I still love farming and the farming interests, and the welfare and happiness of the farmer. Would that I had the means of being a New England farmer now, on a small, but truly rational scale and system.

Yours, &amp;c. WM. A. ALCOTT.

Dedham, June 25, 1841.

[ ] We thank Dr. Alcott for his strictures upon the remarks we made last week. His long continued attention to matters pertaining to health, entitles his opinions to much weight. We most cheerfully make them public. But at the same time we are far from receding an inch from the ground we took last week. Will the *over-heat* and *over-fatigue* occur, if cold water is taken with sufficient frequency? It is possible that the *over-fatigue* may; but if it should, we question whether cold water, to any extent which the appetite craved, would be *instantly* and *excessively* injurious; (for the injury dreaded in these cases is the violent pain which often proves fatal in a short time.) Our belief is, that if cold water is taken so frequently as to prevent the *over-heat*, there is no danger from its freest use. We refer, of course, to danger of severe attacks of pain. Whether it would not be *permanently* better for our laboring people generally to use less drink, is a question to which we had no reference.

## MILKING.

The opinion is doubtless well founded that the quantity of milk given by a cow is determined *in part* by the mode of milking. Some persons will obtain a larger quantity than others. The rule is, that the more *gently* and *quickly* one does the work, the greater will be the quantity obtained. And from this rule we are authorized to make the inference that generally, *women* can perform this labor *better than men*. There is scarcely room for doubt that a dozen cows would give more milk in the course of the season if milked by women than if milked by men. But whether the greater economy of appropriating female labor to this business, will be sufficient to stay that current of fashion which calls upon the farmer's wife and daughters to cut all acquaintance with the cows and other animals, is exceedingly doubtful. We wish that it might.

Some evidence of the effects of different milking was obtained a year or two since on the farm of one of my neighbors. As Jonathan was rather old and stiff, he was set to do the milking. This continued for weeks; but the quantity of milk obtained being less than the owner thought his cows ought to yield, he was induced to seek for the cause; and upon setting the other younger men to do the milking, he very soon obtained a quart per day more from each cow than before. I am not aware that there was any accurate measurement in this instance; and I intend only to say that the difference in the quantity of milk obtained was such that the milking was taken out of the stiff fingers of Jonathan and assigned to some that were more nimble.

This subject seems to relate to a trifling matter; but it being one of those labors which come round twice in a day, the trifle added to the trifle each night and morn-

ing, may amount to an important item in the course of a year.

## J. E. TESCHMACHER'S ADDRESS,

Delivered at the Annual Meeting of the Boston Natural History Society, May 5.—This is a rich and chaste production; indicating an uncommon acquaintance with the numerous departments of Natural History and science.

## WORK ON THE HIGHWAYS.

We never knew a *good farmer* and a *worthy man*, who would not cheerfully do a good day's work on the road when squaring off his tax account. A man's character is seen in the dispositions with which he pays the public. If he is not faithful in working out his highway taxes, he deserves neither confidence nor respect. *His own ways need mending.*

## Massachusetts Horticultural Society.

## EXHIBITION OF FLOWERS.

Saturday, June 26.

From the President of the Society—a splendid display of beautiful Roses.

From John A. Kenrick—75 varieties of Roses, 4 varieties of Pæonies and several bouquets.

From Messrs Winship—a great display of Roses, Pæonies and other flowers, and a fine specimen of *Dentzia scabra*.

From A. Bowditch—fine Roses and other flowers.

From O. Johnson—a fine specimen of *Antirrhinum speciosum*.

From S. Walker—an elegant lot of Pinks, including some fine seedlings.

From S. R. Johnson—a great variety of hardy Roses, and a rich display of Chinese roses.

From W. Meller—a good show of Pinks, Geraniums and Roses.

From W. E. Carter—bouquets and other flowers.

From John Hovey—bouquets and roses.

From W. Kenrick—roses and bouquets.

From J. L. F. Warren—bouquets of roses, dahlias, &c.

From Hovey & Co., a few fine roses and bouquets.

From B. E. Cotting—native plants.

The exhibition of Roses and Pinks for premium took place today, and the following is the report of the judges:

## ROSES.

The committee appointed to award the Society's premiums on the best specimens and display of Roses, assign the prizes for the best dissimilar blooms, viz:

The first prize to John A. Kenrick;

The second prize to Messrs Winship;

The third prize to S. R. Johnson.

For the best display of Chinese and other tender roses, to S. R. Johnson.

The committee would make mention that the President of the Society exhibited many fine specimens of roses.

Boston, June 26th, 1841.

S. WALKER,  
P. B. HOVEY, JR.

## PINKS.

The committee for awarding the premiums for Pinks, report that they award the prize for

The best display of flowers to W. Meller;

The best six dissimilar flowers to S. Walker;

The best seedling to S. Walker.

Mr Walker's pinks were mostly seedlings, and gave him much credit for his successful cultivation.

June 26, 1841.

C. M. HOVEY,  
W. McLENNAN.

## EXHIBITION OF FRUITS.

Saturday June 26, 1841.

By Messrs Hovey & Co.—Hovey's Seedling Strawberries—(very splendid.)

By John C. Gray, Esq.—Strawberries—Pine Apple and Royal Scarlet.

By J. L. F. Warren—Warren's Seedling, Hautbois, Methven Scarlet and Early Virginia Strawberries.

By Otis Johnson, Esq.—Early Virginia Strawberries—very fine.

By John A. Kenrick—Wood Strawberries.

By Mrs Eustis, Dorchester—Methven Scarlet Strawberries.  
JNO. A. KENRICK.

☞ We would call the attention of the reader to the letter of Mr Haggerston, on another page, which we copy from the Boston Courier. If the remedies he suggests shall prove effectual for the evils he mentions, he will have conferred a great benefit upon the community.

#### MASSACHUSETTS HORTICULTURAL SOCIETY.

A stated meeting will be held at the Rooms of said Society, on Saturday next, July 3, at 11 o'clock, A. M.  
June 30. E. M. RICHARDS, Rec. Sec.

#### THERMOMETRICAL.

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northerly exposure, week ending June 27.

June, 1841.	5 A.M.	12 M.	7 P.M.	Wind.
Monday,	21 48	74	63	E.
Tuesday,	22 52	81	74	S. W.
Wednesday,	23 63	84	79	S.
Thursday,	24 69	79	64	S. E.
Friday,	25 60	69	62	E.
Saturday,	26 65	87	77	S. W.
Sunday,	27 70	90	79	S. W.

#### BRIGHTON MARKET. — MONDAY, JUNE 23, 1841.

Reported for the New England Farmer.

At Market 245 Beef Cattle, 10 pair of Working Oxen, 15 Cows and Calves, 950 Sheep and 250 Swine. 100 Beef Cattle unsold. 50 Beef Cattle were from Ohio.

Prices.—Beef Cattle.—We reduce our quotations to conform to sales. First quality, \$6 50 a 6 75. Second quality, \$6 00 a 6 25. Third quality, \$5 00 a 5 75.

Cows and Calves.—Sales, \$25, \$29, \$33, and \$40. Sheep.—Lots were sold at \$1 25, \$1 33, \$1 62, \$1 92, \$2 00, \$2 25, and \$2 42.

Swine.—A lot of large barrows 5 1-8. A lot to peddle, 4 1-2 for sows and 5 1-2 for barrows, some of which were small pigs. At retail from 5 to 7.

#### WHOLESALE PRICES CURRENT.

Corrected with great care, weekly.

SEEDS. Herds Grass, very little in market. Red Top, new seed by the bag 50 to 55 c. Clover—Northern, 13c.—Southern, 8 to 9 c. Flax Seed, \$1, 37 to 1 50 bu. Lucerne, 25 c. per lb.

FLOUR. Howard Street \$5 37—Genesee \$5 25—Ohio \$5 12.

GRAIN. Corn—Northern Yellow none—Round Yellow 65—Southern Flat Yellow 60—White 64.—Rye—Northern 60 to 65—Southern 50 to 55. Oats—Southern 36 to 38—Northern 33 to 40.

PROVISIONS. Beef—Mess \$10 50 to 11 00—Prime \$6 50—No. 1 \$9 00. Pork—Extra—15 00—Clear 14 50—Mess \$13 00. Hams—Northern 9 c. per lb.—Southern, none. Lard—Boston 9 c. per lb.—Southern, 8 to 8 1-2. Butter—Lump 18 to 22—Furkin 12 to 18—Shipping 8 to 14.

HAY, per ton, \$13 to 20—Eastern Screwed \$14 to 15. CHEESE—Old 11 c.—New 8.

EGGS, 11 a 12.

WOOL.—The market for this article has not experienced any change of late. Puled Wool is rather scarce, and there is but a limited supply of low Fleeces and of fine Fleeces the stock is also moderate. Prime or Saxony Fleeces, washed, lb. 50 to 55 c.—American full blood, washed, 47 to 50—Do 3 4 blood, washed, 44 to 46—Do. 1-2 blood, washed, 36 to 40—1-4 and common do, 35 to 37—Smyrna Sheep, washed, 20 to 23—Do. unwashed, 10 to 14—Bengasi Sheep, 8 to 10—Buenos Ayres unpicked, 7 to 10—Superfine Northern pulled lamb 43 to 46—No. 1 do. do. 37 to 42—No 2 do do 26 to 30—No 3 do do 18 to 20.

#### FOR SALE

Two pair of Pigs, Berkshire and China. JOSEPH BRECK & CO. June 30.

#### EYE UP CHAINS.

Just received by Packet Coromanda, 500 Chains for tying up Cattle.

These chains, introduced by E. H. DERBY, Esq. of Salem, and Col. JACQUES, for the purpose of securing cattle to the stall, are found to be the safest and most convenient mode of fastening cows and oxen to the stanchion.

For sale by J. BRECK & CO., No. 52 North Market st.

#### GRAIN CRADLES.

The Grain Cradle is an article which is coming into very general use in the New England States, where they were till of late but little known, although they have been in very general use in the Southern and Western States, for many years, and which is found to be decidedly the best mode of harvesting grain, as it is supposed one man will cradle five acres in a day, when he cannot reap more than one. The difference in gathering a crop is so much in favor of cradling, that we must suppose that it will be the only mode adopted hereafter, and the grain cradle will become of as much use, as an implement of husbandry, as the plow now is.

There has been a very great improvement in the manufacturing of this article, they are now made on the most improved plan; the scythe is well secured and finished in a superior manner and made of the best cast steel.

For sale at the N. E. Agricultural Warehouse and Seed Store, Nos. 51 and 52 North Market street. JOSEPH BRECK & CO. June 30

#### AGRICULTURAL IMPLEMENTS, &c

The Proprietors of the New England Agricultural Warehouse and Seed Store No. 51 and 52 North Market street, would inform their customers and the public generally that they have on hand the most extensive assortment of Agricultural and Horticultural Tools to be found in the United States. Part of which are the following:

1000 Howard's Patent Cast Iron Ploughs	100 doz. Cast Steel Shovels.
300 Common do. do.	150 " Common do.
200 Cultivators.	100 " Spades.
100 Greene's Straw Cutters.	500 " Scythes.
50 Willis' do. do.	300 " Patent Snaths.
100 Common do. do.	200 " Common do.
100 Willis' Patent Corn Shellers.	500 " Hay Rakes.
50 Common do do.	200 " Garden do.
200 Willis' Seed Sowers.	200 " Manure Forks.
50 " Vegetable Cutters.	300 " Hay do.
50 Common do. do.	500 Pair Trace Chains.
200 Hand Corn Mills.	100 " Truck do.
100 Ox Yokes.	100 Draft do.
1500 Doz. Scythe Stiles.	500 Tie up do.
3000 " Austin's Rifles.	50 doz. Halter do.
	1000 yards Fence do.
	25 Grind Stones on rollers.

March 17.

#### LACTOMETERS.

Just received at the New England Agricultural Warehouse, No. 51 and 52, North Market st., a few sets of Lactometers, for testing the quality of milk.

June 23

JOSEPH BRECK & CO.

#### DAHLIA POLES.

500 dozens of Dahlia and Bean Poles. Also, 2000 feet of Ladders, 16 to 40 feet in length, for sale by MOSES FRENCH, Jr., Maine wharf, Broad st. near the bottom of Summer st.

6w

June 2

#### DURHAM COW FOR SALE.

A young full blooded Durham Cow and her calf—a very desirable animal in every particular. Apply to EDWARD TITCOMB, Jr., Newburyport. May 6

#### PURE SPERM OIL.

#### EDMUND T. HASTINGS & CO.

No. 101 State St, keep constantly for sale, Winter, Spring and Fall Sperm Oil, bleached and unbleached; which they warrant to be of the best quality and to burn without crusting.

Oil Canisters of various sizes.

Boston, Jan. 1, 1841.

181y

#### GOOD CULTIVATORS AT \$3 50

Good Cultivators for sale at the New England Agricultural Warehouse, Nos. 51 & 52 North Market Street, Price \$3.50. JOS. BRECK & CO.

#### REVOLVING HORSE RAKE.

The Revolving Horse Rake has been in general use in most parts of Pennsylvania and New Jersey, and is found to be one of the most useful labor saving machines now in use. One man and horse, with a boy to lead, will rake on an average from 25 to 30 acres per day with ease, and do the work well. There is a great advantage in this rake over all others, as the person using it does not have to stop the horse to unload the rake.

For sale at Nos. 51 & 52 North Market Street, by

June 9.

JOS. BRECK & CO.

#### TO THE PUBLIC.

DR. CHARLES M. WOOD, Veterinary Surgeon, respectfully informs his friends and the public, that he has removed from Blossom St., to 69 Carver St. All orders left at his house, or at the stable of Wm. Forbes, No. 7 Sudbury St., will be promptly attended to, and gratefully acknowledged. All diseases of Horses, Cattle or Swine, are attended to. Also, castrating and spaying.

For the information of those who may have occasion for his services, and are unacquainted with his practice, he is politely permitted to refer to the following gentlemen who have employed him for a number of years past.

Wm. Forbes,  
Wm. J. Niles,  
Joshua Seward,  
J. B. Read,  
James F. Fullham,  
Wm P. Loring,  
Joseph C. Pray,  
Boston, April 23.

Isaac Foster,  
Artemas White,  
Brown & Sevence.

## MISCELLANEOUS.

## A MOTHER'S EVENING THOUGHTS.

BY MRS SIGOURNEY.

O HOMEFELT joys,—so dear and sweet,  
My clear, wood fire beside,—  
My baby creeping at my feet,  
Who oft with glance of pride,  
Looks back, elate and pleased to show  
How fast his tiny limbs can go.

And closely seated by my side,  
My little daughter fair,—  
Whose doll upon her knee doth ride,  
Essays a matron's care—  
While many a lesson, half severe,  
With kisses mix'd, must Dolly hear.

There lie my volumes closed and still,  
Those chosen friends of old,—  
My pen, regardless of my will,  
Lurks in its bronzed hold,—  
High joys they gave,—but not so dear  
As those that gild my fireside here.

Where harp and viol carol sweet,  
'Mid youth's unfolding hours,  
And gladness wings the dancer's feet  
That seem to tread on flowers,  
I've shared the cup,—it sparkled clear,—  
'T WAS FOAM, the precious draught is here.

I've trod the lofty halls,—where dwell  
The noblest of our land—  
And met,—tho' humble was my cell,—  
Warm smile, and greeting hand,—  
Yet she doth feel a thrill more blest,  
Who lulls her infant on her breast.

Strong words of praise,—such words as gird  
To high ambition's deed,  
'The impulse of my mind have stirr'd,—  
Though still unlearn'd their meed,—  
But what of these?—they fleet away,  
Like mist, before affection's ray.

Tho' many a priceless gem of bliss,  
Hath made my pathway fair,—  
Yet have I known no joy like this,  
A mother's nursing care,  
To mark, when stars of midnight shine,  
My infant's bright eye fix'd on mine.

Might woman win earth's richest rose,  
Yet miss that wild-flower zest,  
Which by the lowliest cradle grows,  
'T were but a loss at best!  
Pass on, O world, in all thy pride,  
I've made my choice,—and here abide.

Even she, who shines with beauty's ray—  
By fashion's throng career,—  
If from that pomp she turn away,  
And build her shelter'd nest,—  
And heard the jewels of the heart,  
Like Mary finds the better part.

From the Salem Observer.

## CLIFT OR EAVE SWALLOWS.

MESSRS EDITORS,—Knowing by several articles which have appeared in your paper, that you feel friendly towards birds, and take an interest in their welfare, I send you the following lines, hoping that they may not be uninteresting to you. If you consider them worthy a place in your paper you are at liberty to insert them.

The clift, or eave swallows, as they are com-

monly called, were first found in the vicinity of the Rocky Mountains. It appears that the cultivated hills and valleys of New England, teeming with insect population, were to these birds, like the rich valleys and beautiful prairies of the West to the white man—long unknown, it being I believe less than half a century since they first appeared east of the Hudson river.

The manner in which they settle in this, to them new country, reminds one of the manner in which settlements are formed by man in the far West. A bold and adventurous pair go forth in search of a new home: they fix upon a spot congenial to their tastes, and substituting the eaves of a barn for the shelter which the cliffs of the Rocky Mountains afforded them, build their nest; and if they are civilly treated by the owner of the premises, upon which they have taken up their abode, rear their offspring; and the next season return with them, and as many of their friends and connections as they can induce to emigrate with them, to extend their settlement, which in a few years has the appearance of a crowded and busy city.

The architecture of these birds resembles that of man, more than most birds;—not so much in form as in variety,—each pair building as their fancy dictates; some prefer a large door at which both can enter at once; others, choose a small entrance just large enough to admit one at a time; some who appear wealthy, that is, have plenty of mud, build large and commodious palaces, while others more frugal and economical, are contented with the small but neat cottage; some of them (I am sorry to say) resemble man in his low and base traits of character, such as indolence, and a disposition to take that which belongs to others; one was seen in the absence of his neighbor to go to his nest, take some of the materials and appropriate them to his own use.

As I cannot understand their language sufficiently well to interpret it, I cannot tell whether they have enacted laws to punish such gross transgressions upon the rights of others, or not: but as might be supposed, this pair was among the least prosperous of the settlement, being three times as long completing their nest, as some of the more honest and industrious ones were.

By visiting the farm, which was the birth place of Gen. Israel Putnam, now owned by Daniel Putnam, of North Danvers, may be seen over forty of these nests with the occupants. The best time to visit them is between four and half past five o'clock in the morning, as they are then chatting their morning song, and dressing their plumage to prepare for the labor of the day. But visitors may inquire for them at any hour, and be sure that they will not receive from them, the cold and repulsive answer, not at home, or not prepared to see company.

This settlement was commenced two years since by one solitary pair. Last year seven nests were built. They now number forty-three. This is increasing with a rapidity that will compare with the rapid increase of population in the fertile valley of the Mississippi. A. W. P.

North Danvers, June 2, 1831.

*Pride of Birth.*—"My uncle was one of the framers of the Constitution," said a youth the other day of patrician blood, to another of a more plebeian origin. "Who cares for that?" quoth the latter, "my father was one of the framers of our new meeting house."

## GARDEN SEEDS,

For sale by JOSEPH BRECK & Co. at the NEW ENGLAND FARMER OFFICE, No. 51 and 52 North Market St. Boston. The subscribers would inform the public that they have now on hand the largest collection of seeds ever before offered by sale in this city, embracing every variety of *Field, Kitchen, Garden, and Ornamental Flower Seeds* desirable for this or any other Climate.
