TREES AND SHRUBS OF MEXICO.

ADVERTISEMENT.

The United States National Herbarium, which was founded by the Smithsonian Institution, was transferred in the year 1868 to the Department of Agriculture and continued to be maintained by that department until July 1, 1896, when it was returned to the official custody of the Smithsonian Institution. The Department of Agriculture, however, continued to publish the series of botanical reports entitled "Contributions from the United States National Herbarium," which it had begun in the year 1890, until on July 1, 1902, the National Museum, in pursuance of an act of Congress, assumed responsibility for the publication. The first seven volumes of the series were issued by the Department of Agriculture.

VOLUME 23

TREES AND SHRUBS OF MEXICO

By PAUL C. STANDLEY

WASHINGTON
GOVERNMENT PRINTING OFFICE
1920-1926

NOTE.

The 5 parts of volume 23 of the Contributions were issued as follows:
Part 1, pages 1 to 170, October 11, 1920.
Part 2, pages 171 to 515, July 14, 1922.
Part 3, pages 517 to 848, July 18, 1923.
Part 4, pages 849 to 1312, December 31, 1924.
Part 5, pages 1313 to 1721, November 15, 1926.

☞ The indexes for parts 1 to 4 should be bound with the complete volume, since in the index of part 5 there are reprinted only the generic names of the earlier parts.

PREFACE.

The present volume consists of an account of the trees and shrubs of Mexico, by Mr. Paul C. Standley, Associate Curator of the United States National Herbarium. The work is based wholly upon the extensive series of Mexican plants in the National Herbarium, a large proportion of which have been obtained by special investigators sent out by the United States National Museum and the United States Department of Agriculture. The flora of Mexico, especially the arborescent flora, includes many species of great economic value. They furnish many products of commercial importance, such as henequen and ixtle fiber, palm oil, lumber, cacao, rubber, drugs, alcohol, and many fruits.

Heretofore no descriptive flora of any portion of tropical continental North America has been published, and the identification of the species of plants yielding important products has often been very difficult. Identification of material has been possible only by comparison with extensive series of herbarium specimens, such as are to be found only in the larger botanical institutions, or by reference to isolated descriptions, many of them available only in the largest libraries. The present work brings together all the published species of woody Mexican plants and furnishes keys for their identification as well as brief descriptive notes. Much information is presented also concerning commercial and local uses of the plants. The vernacular names of the trees and shrubs are given, and since these are fairly well standardized by local usage they will be found helpful as guides to the identity of fragmentary or otherwise difficult material.

Several collaborators have aided in the preparation of this volume by contributing the accounts of certain groups in which they are particularly interested, as follows: Dr. William R. Maxon, *Gleicheniaceae* and *Cyatheaceae*; Dr. A. S. Hitchcock, *Poaceae*; Dr. William Trelease, *Agave* and *Quercus*; Dr. S. F. Blake, *Meliaceae*, *Polygalaceae*, *Violaceae*, and *Asteraceae*; Mr. Ellsworth P. Killip, *Passifloraceae*; Dr. N. L. Britton and Dr. J. N. Rose, *Cactaceae*; Dr. B. L. Robinson, *Eupatorium* and *Ophryosporus*; Dr. J. M. Greenman, *Senecio*.

FREDERICK V. COVILLE,
Curator of the United States National Herbarium.

BULLETIN OF THE UNITED STATES NATIONAL MUSEUM.

II

PREFACE.

The present paper consists of the first installment of an account of the trees and shrubs of Mexico, by Mr. Paul C. Standley, Assistant Curator of the United States National Herbarium. The work is based wholly upon the extensive series of Mexican plants in the National Herbarium, a large proportion of which have been secured by special investigators sent out by the United States National Museum and the United States Department of Agriculture. The flora of Mexico, especially the arborescent flora, includes many species of great economic value. They furnish many products of commercial importance, such as henequen and ixtle fiber, palm oil, lumber, cacao, rubber, drugs, alcohol, and various kinds of fruits.

Heretofore no descriptive flora of any portion of tropical continental North America has been published, and the identification of the species of plants yielding important products has often been very difficult. Identification of material has been possible only by comparison with extensive series of herbarium specimens, such as are to be found only in the larger botanical institutions, or by reference to isolated descriptions, many of these available only in the largest libraries. The work of which the present paper is the first installment brings together all the published species of woody Mexican plants, and furnishes keys for their identification, as well as brief descriptive notes. Much information is presented also concerning commercial and local uses of the plants. The vernacular names of the trees and shrubs are given, and since these are fairly well standardized by local usage, they will be found helpful as guides to the identity of fragmentary or otherwise difficult material.

The account of the ferns of the families Gleicheniaceae and Cyatheaceae has been furnished by Mr. William R. Maxon, Associate Curator of the National Herbarium; that of the Poaceae, or grasses, by Prof. A. S. Hitchcock, Systematic Agrostologist of the Department of Agriculture; and that of the Amaryllidaceae, which includes the difficult genus *Agave*, or century plants, by Dr. William Trelease, Professor of Botany, University of Illinois.

FREDERICK V. COVILLE,
Curator of the United States National Herbarium.

TREES AND SHRUBS OF MEXICO.

By PAUL C. STANDLEY.

INTRODUCTION.

The most interesting regions of the earth from a botanical standpoint are those which possess a tropical climate. There physical conditions are most favorable for the growth of plants, and not only is vegetation much more luxuriant than in temperate countries, but the number of species, especially of trees and shrubs, is vastly greater. West Virginia and Costa Rica, for instance, are temperate and tropical areas of approximately equal size; but only 1,600 species of ferns and flowering plants are known from West Virginia, while the flora of Costa Rica includes more than three times and probably four times that number. Large areas in Mexico are neither tropical nor even subtropical, but no region of the globe, probably, possesses a richer or more interesting flora. Mexico has an area of 767,000 square miles, which, although only about one-fifth that of the United States, exhibits a greater range of climatic conditions. The extremes of elevation much exceed those of the United States, ranging from sea level to over 5,200 meters. Almost every conceivable plant formation is represented—the wet tropical forests of the southern lowlands, the temperate deciduous and coniferous forests of the central plateau and of the ranges of the Sierra Madre, the alpine zones of the high peaks like Orizaba, Popocatepetl, and Ixtaccihuatl, and the great barren or cactus deserts which reach their best development in the northern states.

The botanical features of Mexico have attracted attention from the days of the earliest explorers. Many botanists have visited the country in the last hundred years, yet the flora is still but imperfectly known. Almost every collector at the present day makes discoveries of remarkable species previously unknown to science, and some plants are still unknown botanically although their supposed medicinal properties, or their products, such as fruit, lumber, fiber, and gum, are well known locally and are frequently even of com-

mercial importance. In the immense mountain ranges there are hundreds of difficult peaks and almost inaccessible canyons whose exploration is extremely tedious; in the south the tropical forests are penetrated with difficulty, and the lofty branches of their trees are almost inaccessible to the collector; away from the Sierra Madre are innumerable isolated masses of mountains and hills, still unvisited by a botanist, which must yield a host of localized species. Consider, in addition, the fact that Mexico is still very imperfectly supplied with transportation facilities and it becomes evident that many years must elapse before a comprehensive knowledge of the flora is possible.

It is unfortunate, and at the same time remarkable, that no flora of any part of tropical continental North America has ever been prepared. Indeed, in this respect all of North America has made little progress as compared with Europe, some parts of Asia, Australia, and Africa, or even South America. The flora of tropical Africa, the most recent of all the great regions of the earth to be explored by European peoples, has been adequately treated in botanical literature; and the flora of Brazil has been described in a monumental series of volumes, of which any country might well be proud, but whose equal no other country possesses. For no political unit of North America has a modern descriptive or even a synoptical flora ever been published.

The only publication approaching a flora of Mexico which has ever been completed is the *Botany of the Biologia Centrali-Americana*, compiled by Hemsley and issued from 1879 to 1888. This, though including no descriptive notes (except incidentally) nor any means of identifying the species, is a comprehensive work, listing all the species of the higher plants known at that time from Mexico (excluding Baja California) and Central America. Ranges and definite localities are given for all the species, together with the more important synonymy. It is superfluous to state that after almost 40 years this work has lost much of its former usefulness, as a result of recent botanical discoveries. Nevertheless the five volumes of the *Biologia* will always remain an invaluable and classic work upon tropical American plants.

Botanical exploration in Mexico has now progressed to the point where a descriptive flora of the region is practicable, and such a compilation is urgently needed. The work here offered is intended to include a complete list of the woody plants known from Mexico, with keys for their determination. This arbitrary and artificial division of the Mexican flora was chosen for treatment because it contains those species which are the most conspicuous elements of the vegetation, as well as those which are of most importance from an economic standpoint. It includes, moreover, the larger portion of the Mexican

species. Later, it is to be hoped, someone else may have an opportunity to treat at length the herbaceous species or the flora as a whole. While it is only too evident that the available collections of Mexican plants are inadequate to furnish a complete illustration of the flora of the country, the offering of such a work as can be prepared with the material at hand needs no apology, for it is certain that the larger part of the woody plants, and especially those of economic importance, have already been collected.

It is not deemed advisable to include in the present publication an account of the general features of the flora. These have already been dealt with at length by other authors, particularly Hemsley¹ and Ramírez.²

PLAN OF THE WORK.

COLLECTIONS STUDIED.

In this list of Mexican plants it is intended, of course, to account for all the trees and shrubs which have been collected in Mexico or reported from that country. The account is based wholly upon the collections in the United States National Herbarium, although the published species not represented there have been included in the keys when possible. The National Herbarium contains the largest and most complete representation of Mexican plants that has been assembled, a large proportion of the material having been obtained by special collectors sent into the field by the United States National Museum and the United States Department of Agriculture. In addition, the herbarium contains many collections received from other institutions and individuals, the more important of which were obtained by the following collectors: F. Altamirano, F. W. Anthony, Brother G. Arsène, J. L. Berlandier, M. Botteri, M. Bourgeau, T. S. Brandegee, G. N. Collins, C. Conzatti, O. F. Cook, F. V. Coville, C. K. Dodge, C. B. Doyle, H. Galeotti, G. F. Gaumer, E. A. Goldman, J. M. Greenman, C. V. Hartman, A. S. Hitchcock, E. W. D. Holway, M. E. Jones, E. Kerber, E. Langlassé, F. M. Liebmann, F. E. Lloyd, D. T. MacDougal, F. S. Maltby, E. A. Mearns, C. F. Mills-paugh, Charles Mohr,³ E. W. Nelson, Brother Nicolas, C. R. Orcutt.

¹ Biol. Centr. Amer. Bot. 4: 138-315. 1887.

² La vegetación de México, pp. 1-271, with 2 maps. Mexico, 1899.

³ Charles Mohr (1824-1901) was a native of Germany, who came to the United States in 1848. He visited Mexico in 1857 and was a guest of Sartorius at his home in Mirador. He made botanical collections in the region of Orizaba. Here he was associated with Botteri, and his collection numbers, in some cases at least, are the same as Botteri's. His collections are in the United States National Herbarium. Dr. Mohr is best known for his "Plant Life of Alabama," published as volume 6 of the Contributions from the United States National Herbarium.

Edward Palmer, C. C. Parry, Henry Pittier, C. G. Pringle, C. A. Purpus, B. P. Reko, J. N. Rose, J. N. Roviroso, H. H. Rusby, W. E. Safford, H. C. Seaton, J. G. Schaffner, Arthur Schott, C. L. Smith, L. C. Smith, C. H. T. Townsend and C. M. Barber, Charles Wright, W. G. Wright, L. J. Xantus.

SPECIES INCLUDED.

It is manifest that the group here chosen for treatment is an artificial one. It is impossible to draw a sharp line between the woody and herbaceous plants, although in the vast majority of cases such a classification is easily made. Many truly woody plants are so small that they are not looked upon commonly as shrubs, and many herbaceous plants become so large as to remind one of small trees. Plants which are essentially annuals, and which in regions where freezing temperatures occur never live more than one season, may in tropical regions develop more or less woody stems. Moreover, in herbarium specimens, which as a rule consist merely of terminal portions of branches, it is often impossible to conclude that a plant is a shrub except from analogy or from information furnished by collectors. The writer would have preferred to treat only of the trees of Mexico, which are far less numerous than the shrubs and would have required less space for their elaboration: but the separation in the herbarium of trees and shrubs involves still greater difficulties than the separation of woody and herbaceous plants. We have so little published information regarding the size of Mexican plants, and most collectors show such an aversion to furnishing notes concerning their collections, that the classification of woody plants as trees and shrubs is evidently quite impracticable with our present knowledge. The writer's policy as to the species to be included has been a liberal one, and although it is possible that some species have been omitted which should have been included, it is certain that their number is small. On the other hand, many species have probably been included which should have been omitted, but this fact will increase rather than detract from the usefulness of the work. Some species have been listed as shrubs, rather against the judgment of the writer, because of data reported by collectors.

The statements given here concerning size are the best that can be compiled from published notes and from information furnished by collectors' labels. The information available is not so complete as is desirable and in some cases may be misleading. It has not been the intention to publish a descriptive manual, and the brief descriptive notes given under most of the species are intended merely to supplement the keys and to indicate the most striking features of each species. Keys are given for the determination of genera and

species and one for the determination of families. The last is adapted from a key to the families of tropical American plants published recently by Mr. Henry Pittier.¹ It is very difficult, if not impossible, to prepare a key to the families of tropical plants which will enable one always to refer a plant to its family, because many of the plants are still imperfectly known, and because there are in some families many exceptions to the typical plan of organization of the group. With complete material of a given plant, however it is hoped that the present key will usually be adequate for indicating its family position.

It has been intended to give references to the names of all woody plants published or reported from Mexico, disregarding, however, certain obviously incorrect names which have not received notice in more recent or important works. Casual references are made in addition to the more common cultivated exotic species. Published names not illustrated by material examined by the writer or not identifiable from the descriptions accompanying them have been listed as "doubtful species" at the end of their respective genera. The plan has been to list as a valid species or as a synonym each specific name based upon Mexican material, but it has not been deemed necessary to list all the combinations under various genera, unless their citation seemed to serve some useful purpose. The writer has not attempted to classify all the names of Mociño and Sessé, which occur in their *Plantae Novae Hispaniae* and *Flora Mexicana*, for these names have justly received little attention from taxonomists, and their determination would require an amount of labor quite inconsistent with any advantage that would result. Some of these names, however, have been referred to in their proper places. A very few of Mociño and Sessé's names are valid, but it is only by accident that such is the case.

RANGES OF THE SPECIES.

The range in Mexico ascribed to each species is based chiefly upon material in the National Herbarium, but reliable published reports have been taken into account when they indicated noteworthy extensions of range. It is probable that in many cases the species have wider ranges than is indicated, but the limits of distribution can not be determined definitely until more extensive explorations have been carried out. Much more comprehensive collections are needed from all parts of Mexico, but especially from the states of Tabasco, Michoacán, Guerrero, Oaxaca, and Chiapas. Those available from

¹ Clave analítica de las familias de plantas fanerógamas de Venezuela y partes adyacentes de la América Tropical. Pp. 1-108. Caracas, 1917.

Tabasco and Chiapas are particularly inadequate, and doubtless many of the listed species occur there, even if the ranges as here stated do not indicate the fact. If a species occurs in Oaxaca and also in Guatemala, it may safely be assumed that it is found in Chiapas, although the writer has not felt at liberty to report its occurrence there unless he has actually seen specimens from that State. The range outside Mexico is given for those species which extend into other countries, and when no such range is indicated it is to be assumed that the species is endemic.

TYPE LOCALITIES.

For the majority of the species there has been included a statement concerning the type or the type locality. The nomenclatorial type of a species is the specimen which served as the basis of the original description of the species, and the type locality is the one at which the specimen was collected. A knowledge of type localities is of great importance in taxonomic work, especially when it becomes necessary to divide into two or more species material which has been referred previously to a single one. It is of interest also to collectors who may visit these places and who may take an interest in recollecting such plants at their original stations. It is to be expected, generally, that the form of a species occurring in the region of the type locality is the typical one. In the case of many species described from Mexico, particularly the earlier ones, the source of the specimens on which they were based was given merely as "Mexico," without indication of any precise locality. In such instances the writer has made no reference to the type locality, which is, of course, practically unknown. Neither has it seemed worth while to refer to the type locality in the case of species described from "tropical America," "West Indies," or other similarly vague regions.

VERNACULAR NAMES.

The vernacular names listed have been gathered from various sources. Many have been taken from the labels accompanying herbarium specimens. All those found in literature which has come to the writer's attention have been listed if there was reason to suppose them accurate. The most extensive work dealing with Mexican vernacular plant names is the "*Sinonimia vulgar y científica de las plantas Mexicanas*," compiled by Dr. José Ramírez, with the assistance of Señor Gabriel V. Aleocer, published in the City of Mexico in 1902. This is a very extensive list and a valuable one, based partly upon the investigations of the authors, and also upon many previously published lists. It is unfortunate that many of the Latin

names are obviously erroneous and others doubtful, but the same statements are likely to be true of most lists of similar nature. The present writer is under particular obligations to Dr. Blas P. Reko, who has kindly permitted the use of a very extensive list of the vernacular names current in Oaxaca, which he has compiled. Valued assistance has been rendered likewise by Dr. Alfonso Herrera, Director de Estudios Biológicos, of the Mexican Government.

The names applied to plants vary greatly in different parts of Mexico, largely because of the diverse languages which preceded Spanish in different parts of the country, and which are still spoken in many regions, notwithstanding that Spanish is the language used by the great majority of the inhabitants. The Spanish names are the most generally used, as a rule. Many of them date back to the time of the Conquest, and are the same as names in common use for Spanish plants of more or less similar aspect, although often of no close relationship. In many instances the Carib names of West Indian plants were brought to Mexico by the early explorers and applied to the same or similar plants growing in the latter region. In the case of plants first discovered in Mexico, and quite unlike anything previously known to them, the Spaniards often adopted the native Mexican names, especially those of Nahuatl origin. It is interesting to observe how generally some of the Nahuatl names—often greatly modified in spelling and pronunciation, it is true—are now used among the Spanish-speaking people of North America, often in regions far remote from those where the Nahuatl language was ever spoken. Many of them are in common use among the Spanish-speaking people of Arizona and New Mexico, and some, like “mesquite,” have become recognized English words.

A large number of Nahuatl plant names are known, and many are listed here. Many more have been reported—particularly by Hernández—whose application is obscure or unknown. The Nahuatl language was the one spoken at the time of the Conquest by the inhabitants of the Valley of Mexico. The people of this prosperous region possessed a great love for flowers as objects of admiration and adornment, and were familiar with the properties and uses of many plants, consequently their botanical vocabulary was a remarkably large one. Less is known of the plant names of other parts of Mexico. Many names are known, however, from the Maya, which is the original and more or less current language of the Yucatán Peninsula and adjacent regions. Some names are available, also, from the Tarascan language of Michoacán; the Otomí, of north-central Mexico; and the Mixtec and Zapotec, of Oaxaca and Chiapas. Besides the vernacular names employed in Mexico, the writer has listed those from Central America, Colombia, and Venezuela, and from those islands of the West Indies in which Spanish is spoken, excluding, so

far as possible, those of local native dialects. The importance of recording native names can not be urged too strongly upon collectors. These names are often used very uniformly over wide areas and are, on the whole, probably better standardized than the English names employed in the United States. This is perhaps not remarkable, in view of the fact that many of the Spanish names have been in use for four centuries, and the native names much longer.

The vernacular names here cited are followed by parentheses in which are listed the states or countries in which they are known or reported to be used. If there is no further comment or indication, it may be assumed that the names are correctly applied. In many cases the vernacular names have been reported by a single authority, and in some cases the propriety of their application is doubtful; in such instances the vernacular name is followed by the name of the authority (in italics) to whom the writer is indebted for it.

ECONOMIC NOTES.

The economic notes also have been gathered from a wide variety of sources. A large amount of information concerning the uses of plants has been published in Mexico, and these data have been used freely. References have been given to the uses made of the plants in other regions, particularly Central America and the West Indies. Some of the information here presented is taken from the published and unpublished notes of Dr. Edward Palmer, who was engaged for many years in the botanical exploration of Mexico and made extensive observations on the local uses of plants. The Mexican flora contains a very large number of species of economic value, some of which, like the cacao and Mexican rubber tree, are of great commercial importance. The number of plants which yield edible fruit is very large. It would seem, also, that almost every species is employed locally for medicinal purposes, but too much importance should not be attached to the data reported regarding such uses, for, although many of the plants do possess therapeutic properties, in the far greater majority of cases the properties attributed are chiefly or wholly fictitious.

The Republic of Mexico, the region which is covered by the present work, is not a natural phytogeographic area, its boundaries being nowhere coincident with those of any limit of vegetation. It would be very difficult to draw a natural boundary along the northern frontier, and equally so on the south. There is no sharp break in the continuity of specific distribution on the south until the Isthmus of Panama is reached, and even here the break is not too pronounced, for a large number of species of woody plants are known to range from the arid regions of Colombia and Venezuela

to the similar arid areas of western Mexico. It would have been desirable to extend the scope of the present work to include Central America, but such an extension would have doubled, probably, the number of species treated. As the work now stands, it will be found useful for determination of a large proportion of the species native to Central America, as well as of those occurring in the United States in the region of the Mexican border.

To facilitate more thorough taxonomic study of the groups here treated, there have been listed, when practicable, references to monographic accounts of each family or genus, in which there will generally be found complete descriptions of the species. In most cases only the most recent monograph has been listed, but in some instances earlier systematic accounts have been mentioned if they seemed to furnish useful information or to be more easily accessible.

HISTORY OF BOTANICAL EXPLORATION IN MEXICO.

Botanical history in Mexico may be considered to have begun with the landing of the Conquistadores, for the earliest letters of Cortés to the King contain references to the curious vegetable products of the country. The true history of botanical activity in Mexico begins at a much earlier date, for the native inhabitants, who had already reached a high degree of civilization, may be said to have begun scientific researches. No other primitive people, probably, ever took so great an interest in botanical matters, and at the time of the Conquest none of the nations of Europe were much superior to the Mexicans in botanical knowledge. In one respect, at least, the latter had made greater progress in botanical activity, for they had established a botanical garden, on an elaborate scale, something that was not attempted in Europe until a still later date. Not only had the Aztec people acquired an intimate knowledge of the economic qualities of the plants with which they came in contact, a knowledge possessed by all primitive peoples, but they had developed an esthetic appreciation of plants for their beauty alone, a fact which indicates a rather high state of moral development. Flowers were cultivated extensively in the Valley of Mexico, and were brought in great quantities to the markets, where they were purchased for personal adornment and for the decoration of residences and temples. This love of flowers has persisted to the present time among the Mexican people, and cut flowers still occupy much space in the markets everywhere in the Republic.

Beginning with Hernández, a large number of botanical explorers from Europe and from the United States have visited Mexico, and many native Mexicans have contributed to our knowledge of the

vegetable productions of the country. It is not the writer's purpose to enumerate the men who have assembled the collections upon which the scientific knowledge of the Mexican flora is based, but references to most of them will be found in footnotes scattered through the systematic account of the flora. The earlier collectors have been discussed by Hemsley,¹ and the most complete information upon the subject has been published by León.² Several of the earliest enterprises for the botanical exploration of Mexico are so remarkable, and must be referred to so frequently in the text, that it seems essential to describe them in some detail. These are discussed below.

FRANCISCO HERNÁNDEZ.

His interest in the North American colonies having been awakened, perhaps by the reports made by the civil and religious authorities of the region, Philip II of Spain gave orders to his physician, Francisco Hernández, to prepare an account of the natural history, antiquities, and political conditions of New Spain.³ In order to give him a rank suitable to the importance of the work he was to undertake, Hernández was honored with the title of Protomédico of the Indies. He sailed from Spain in 1570, accompanied by his son. Although Philip II was very liberal in his appropriations for the expenses of the expedition, he appears to have underestimated the magnitude of the task, and it seems that Hernández was often embarrassed by his lack of financial resources. Hernández, however, compensated for this by his intense application to his work. He visited almost all parts of New Spain, observing all matters of natural history and collecting a vast amount of information. His enthusiasm led him to risk his health and life with experiments made upon his own person to determine the medicinal properties of plants discovered in the course of his travels. While upon a journey to Michoacán, he narrowly escaped death as a result of an experiment with the latex of "chupire." His health was finally undermined by his excessive labors, the worry caused by his financial embarrassment, and the hostility shown by some of those in authority. Five years had been the period assigned for the completion of his task, and at the end of that time, in 1575, he had 16 folio volumes ready for publication. Two years longer, however, he remained in Mexico, continually engaged

¹ Biol. Centr. Amer. Bot. 4: 117-137. 1887.

² Nicolás León, Biblioteca Botánico-Mexicana, catálogo bibliográfico y crítico de autores y escritos referentes a vegetales de México y sus aplicaciones, desde la Conquista hasta el presente. México, 1895. This work contains a remarkably complete and very valuable bibliography of Mexican botany. It is unfortunate that so many of the publications listed are inaccessible in even the largest libraries of the United States.

³ The name formerly applied to Mexico.

with the objects of his commission, and refusing to practice his profession for lack of leisure from his researches, although he states that he thus lost the opportunity of gaining more than 20,000 pesos. Taking advantage of his title of Protomédico, he assembled many of the Mexican physicians and directed them to test the native drugs and to inform him of the results obtained. He himself carried on experiments in the hospitals with drug plants whose properties he wished to determine.

In September, 1577, Hernández returned to Spain. He left in Mexico three or four copies of his manuscripts and sketches. Besides his manuscripts and herbarium, he carried to Spain many seeds and living plants to adorn the royal gardens. His execution of his Mexican commission must have satisfied the Spanish authorities, for he was offered a similar mission to Peru and other parts of the Indies, which he refused because of a desire to attend to the printing of his reports. His expectations in this direction, however, were destined to be sadly disappointed, for instead of being sent to the printer the manuscripts were buried in the library of the Escorial, although, as a Mexican writer remarks, "*with every honor,*" for they "were beautifully bound, in blue leather covered and worked with gold, with clasps, corners, and ornaments of silver, all very heavy and of excellent workmanship and design." Notwithstanding this unfortunate and ironical conclusion of Hernández's expectations, Colmeiro asserts that he had seen "a sample impression of the colored plates which were projected for his natural history, with an estimate of the cost, to judge from which the edition would have been of uncommon beauty, and perhaps the first of its kind for that time."

Wearied by his disappointments, Hernández survived only a short time, and died January 28, 1578. Neither the exact date of his birth nor his birthplace is known, nor the place where his remains rest. He left 16 folio volumes, six of text, describing the animals, plants, and minerals of Mexico, and 10 of drawings representing these objects; also various miscellaneous manuscripts dealing with medicine, Mexican antiquities, and moral and religious philosophy. He had prepared a translation of Pliny's National History, and had written at least two philosophical works in verse. Except for a few fragments, all these works were destroyed by the fire which consumed the Royal Monastery of the Escorial in June 1671. Of the manuscripts left in Mexico nothing is known, and it is probable that all were lost within a few years after their preparation.

Soon after Hernández's death the King moved to remedy the delay in the publication of his works by commissioning another of his physicians, Dr. Nardo Antonio Recchi, a native of Naples, to take

charge of them. The latter apparently extracted from the manuscripts the portion which he believed would be most useful to the medical profession, for it is evident that most of the matter he selected was of this sort. Some doubts have been raised regarding Recchi's competency to perform the task assigned him: nevertheless except for his connection with the matter it is improbable that any portion of Hernández's work would ever have been published. Recchi's manuscript, however, met with no better treatment than the original one, for it too remained unpublished, and was taken later by its compiler to Naples. After Recchi's death it came into the possession of his nephew, from whom it was purchased by Prince Federico Cesi, a devoted student of natural history. By him it was turned over to the Accademia dei Lyncei, whose members undertook the arrangement and annotation of the manuscript and finally prepared it for publication. Through the Spanish ambassador at Rome funds for printing were secured, and the work of Hernández, thus modified, was at last given to the public. There is considerable uncertainty regarding the actual date of publication, but the date of completion is believed to have been 1651.¹ An abridged edition appeared as early as 1628, and extracts had been published by various authors at still earlier dates. An edition of the work prepared by Ortega was issued at Madrid in 1780.

Hernández's work is of great historic interest because of the fact that it is the first extensive publication dealing with the botanical features of Mexico. It contains a great mass of information regarding the plants of that country, some of which, relating to practices of the early inhabitants, had been forgotten before other botanists visited the region. A large part of the observations relate to medicinal properties of plants, and these are interesting even if not of much practical importance. It is unfortunate that the identity of many of Hernández's plants must remain a matter of conjecture, because his descriptions are usually drawn in such general terms, and the illustrations accompanying them are often equally vague. The book, however, will always possess an attraction for those interested in herb lore if not for the taxonomist. It must be remembered that the work, as we have it, is not that of Hernández himself, but only a compilation or an extract, and that the original manuscript if it

¹ *Rerum medicarum Novae Hispaniae thesaurus, seu plantarum animalium, mineralium mexicanorum historia ex Francisco Hernández, novi orbis medici primarii, relationibus in ipsa mexicana urbe conscriptis a Nardo Antonio Recchio collecta ac in ordinem digesta: a Joanne Terrentio, Joanne Fabro et Fabio Columna Lynceis notis et additionibus illustrata. Cui accessere aliquot ex Principis Federici Caesii frontispiciis theatri naturalis phytosophicae tabulae una cum quam plurimis iconibus.* Pp. 1-950+1-90, ill. Rome, 1651.

could have been published as prepared would doubtless have been of much greater value.

In recent years Mr. W. E. Safford, of the U. S. Department of Agriculture, has spent much time in identifying the plants treated by Hernández. He has published numerous papers upon the subject, and references to some of these will be found in the body of the present paper.

EXPEDITION OF CHARLES III.

The most elaborate botanical undertaking in the history of Mexico was undoubtedly the famous expedition of Charles III of Spain. That ruler decided to institute a survey of the natural resources of his extensive dominions beyond the sea, and for the execution of the project explorers were chosen from among the most learned scientists of Spain, parties of whom were sent to several of the Spanish possessions. One of these expeditions was dispatched to the Philippines and another, headed by Ruiz and Pavón, to Peru. Since Mexico was one of the two most important of the Spanish possessions, the party sent to that country, New Spain, as it was then known, was chosen with particular care.

It was headed by Dr. Martín Sessé y Lacasta, who^o was to have charge of a proposed botanical garden. The other members of the commission were D. Juan Diego del Castillo; D. José Longinos; D. Juan Cerda, a draftsman; and Dr. Vicente Cervantes, who was to establish a chair of botany in the City of Mexico. The members were chosen by D. Casimiro Gómez Ortega, the director of the botanical garden of Madrid.

The commission arrived in Mexico in 1788, and on the 1st of May at 5 in the evening there was inaugurated with great solemnity a department of botany in the University. Sessé delivered an inaugural dissertation which was preceded by the installation of the men chosen for the various professorships, conducted by the rector of the University. There were present the royal audience, the doctors, all of the religious societies, the regidores, military officials, and many members of society. The viceroy was unable to be present, but he was represented by D. Francisco Xavier Gamboa.

The University was illuminated at night and after a brilliant concert, according to a contemporaneous newspaper account, "there were lighted magnificent fireworks, ingeniously executed by that pyrotechnic artist, D. Joaquín Gavilán. Three trees, known in this kingdom under the name of papayo, closely imitating nature in the delineation of their leaves, flowers, and fruits, gave a clear picture of the sex of plants, which, being separated in this genus, was represented in the following manner: Two female trees, clothed with their respective flowers, and fruits of different stages of devel-

opment, indicated the method by which the latter take their development from the flowers of the male plant, which, as such, was without fruits and occupied the center, sending out sparks of fire, which, directed to the female plants, represented perfectly the pollen transported through the air to fertilize the female flowers.

“At the foot of the male tree were placed various decorations alluding to the features of a garden, which illuminated the Plaza with brilliant, spectacular, and fascinating lights of different colors and changed gradually into others no less entertaining. As the three trees disappeared there appeared an inscription in letters of fire which said, AMOR URIT PLANTAS, which is what the illustrious Carolus Linnaeus holds in his ingenious dissertation, *Sponsalia Plantarum*.”

At the same hour on the following day the botanical course was opened under the direction of Cervantes in the residence of the chief engineer of the city, D. Ignacio Castera, who also offered his garden as a laboratory. The botanical lectures were attended not only by the young students of the University but by numerous professional men, one of whom was D. José Mariano Mociño. The city government lent assistance to the new undertaking by setting apart for a botanical garden a parcel of land, a portion of which is now occupied by the home of the Instituto Médico Nacional.

Mociño was a young physician, native of Mexico, who so distinguished himself in his botanical studies that only seven months after the establishment of the botanical course he was appointed member of the scientific commission. A fellow student, Maldonado, was given a like appointment. that he might engage in the work of dissections. These two, besides Castillo and Longinos, were directed to explore the more remote parts of New Spain, while Sessé reserved for himself the exploration of the central regions of Mexico, and Cervantes confined his attention to his professorial duties.

Mociño's explorations extended on the south to the coast of Tabasco, which he visited in December, 1794, continuing his course into Guatemala. In company with Castillo he went north to the Tarahumare country, into what is now Chihuahua, and later he traveled in California, and as far as Nootka Sound, and still later in Jalisco, Michoacán, and other regions. Mociño survived the peril and fatigue of his travels, but not so Castillo, who died in the City of Mexico, July 26, 1793.

Besides Cerda, the official artist of the expedition, D. Atanasio Echeverría,¹ a native of Mexico, was employed in making drawings of botanical and other objects. A pharmacist, D. Jaime Senseve, also was appointed to the commission, and likewise D. José Antonio

¹ The genus *Echeveria*, of the family Crassulaceae, was named in his honor.

Alzate y Ramírez, the latter a distinguished scientist, born in Mexico, who published numerous articles dealing with Mexican plants.

Longinos engaged in the formation of collections of various objects and explored many parts of New Spain, his route extending even to the Californias. He visited also Guatemala and Yucatán, and died in the port of Campeche in 1803. Some of his collections were sent to Madrid and part remained in Mexico.

Mociño was the most enthusiastic and diligent of all the members of the commission. He was likewise the most adventurous, and in the ascent of the Volcán de Tuxtla, in 1793, he came near losing his life. He ended his field work in 1801, and in the Hospital de San Andrés he conducted experiments with the medicinal plants he had collected. He was able to communicate to others some of his enthusiasm for natural history, and many people began to take an interest in the subject, one of the results of which was the formation of an extensive museum. His chief interest, however, was the task, in association with Sessé, of arranging and describing his botanical collections, with the view of publishing a work entitled *Plantae Novae Hispaniae*. He had already prepared a *Flora Mexicana*, and specimens from his collections had been sent to Lagasca and Cavanilles, who described some of them as new species. In addition, living plants and seeds were forwarded to the Botanical Garden of Madrid.

Finally, in 1804, Sessé and Mociño made an end of their explorations and set sail for Madrid, with a rich herbarium and a series of 1,400 colored drawings, as well as their precious manuscripts. Cervantes remained in Mexico as director of the botanical garden and professor of botany.

Sessé and Mociño were filled with hope of the immediate publication of the results of their labors, but the bitter disappointment experienced by Hernández was to be the share of these two botanists also. They were given a cool reception and no facilities whatever for printing their reports. Hope of soon meeting with success in his ambitions induced Mociño to accept a meager pension from the Government, and he lived as a member of Sessé's family until the death of the latter in 1809. He manifested a deep interest in all scientific matters; he was appointed director of the cabinet of natural history of Madrid, gave courses in zoology, and with the assistance of another Mexican, D. Pablo de La Llave, arranged the zoological collections of the museum.

Mociño seems to have been on good terms with the French, who invaded Spain about this time, but he became involved in difficulties because of his refusal to recognize one Barrois as president of the Academy of Medicine, of which he was a member. When the French Army withdrew from Madrid, Mociño remained, presuming that he had not compromised himself by acting as a teacher of nat-

ural history during the occupation, but in this he was mistaken, for soon after he was seized, thrown into prison, and placed in chains, and thus he remained until the French Army returned. Thereupon he was released and permitted to return to the museum. Again the French retreated, and Mociño, who was now far advanced in years (the date of his birth is not known), resolved not to risk his fortunes again with the Spanish authorities, and took his departure, bearing with him in a cart his manuscripts and drawings. By night he slept in the cart, and by day he walked beside it, until it was taken from him by a French officer. He managed, however, to save his possessions and to escape from Spain, and as it was evidently unsafe for him to return to Madrid he took refuge at Montpellier. He was nearly blind and was reduced to beggary, from which he was rescued by certain French scientists.

In Montpellier he became acquainted with De Candolle and Dunal, who joined with him in assigning names to the new species of plants he had discovered. To De Candolle he turned over his manuscripts and drawings, and that famous Swiss botanist seems to have been the first of those who had seen them to have formed an adequate idea of their value. Mociño often visited De Candolle's lecture room, and one day the latter had occasion to deliver a eulogy of the Mexican botanist, unaware that the subject of his praise was present. When the latter's presence was pointed out to him, De Candolle embraced Mociño effusively and pressed him to take the chair and elucidate the subject that had suggested his name. Overcome by the occasion, Mociño burst into tears and was unable to speak a word.

After passing a few years at Montpellier, the adoption of the constitution in Spain gave Mociño hope that he might be permitted to return to Madrid. He besought such permission of the government, and it was finally granted. In April, 1817, consequently, he asked of De Candolle, who was now in Geneva, the return of his papers. The request was evidently made in urgent terms, but De Candolle was determined to keep copies of the drawings and descriptions, and hastened to have these made. De Candolle says that "About 120 persons came voluntarily to offer me their time and brushes; most of them were ladies of society; but there were also professional artists and a multitude of persons who were strangers to me. The young people united in the common task. The whole city was busy for 10 days, and the diligence of all those who knew how to use a brush or pencil was really affecting. * * * As a result of this diligence the collection of Mociño was almost wholly copied in the time fixed." "De Candolle never recounted this affectionate demonstration of his fellow citizens," says Dunal, "but his eyes filled with tender tears." The number of drawings thus copied

was 1,100, and from them 274 new species were published in the *Prodromus*. Tracings of the sketches were distributed to many of the herbaria of Europe.

Mociño returned to Spain, where he received a warm welcome from the Minister of Marine, D. Juan Sabat, who gave him lodging in his home and assisted him in other ways. Mociño later started upon a voyage, but had proceeded only as far as Barcelona when he was overcome by illness, and he died in that city in 1819. Thus he failed to realize any of his hopes for the publication of the results of his long years of exploration and study, nor were the fruits of his labors destined to reach the public until still many more years had passed.

His drawings passed into the possession of the physician who attended him in his final illness, and it is not known what finally became of them. His manuscripts and other papers, including a "Flora de Guatemala," are in the Botanical Garden of Madrid, where the herbarium of the expedition is said to have been deposited in 1820. Some of the specimens reached the Lambert Herbarium, and it is believed that Mexican specimens at Kew and at the British Museum, labeled as having been collected by Pavón, are from the Sessé and Mociño collections. Presumably they were distributed by Pavón, and his name was affixed to the labels through some error. Pavón is not known to have visited Mexico.

The Sociedad Mexicana de Historia Natural learned that the manuscript of the *Flora Mexicana* existed at Madrid, and as early as 1870 made an attempt to secure a copy of it, but it was 15 years before the attempt was successful. It was desired also to secure the illustrations for publication, but this was found impracticable. The *Flora Mexicana* was finally published in the City of Mexico in 1888 by the Sociedad Mexicana de Historia Natural, and a second edition, with numerous corrections, was printed by the Instituto Médico Nacional in 1894. The *Plantae Novae Hispaniae* was printed by the former society in 1886, and was reprinted by the Secretaría de Fomento for the Chicago Exposition of 1893.

It was thus more than a hundred years after the organization of the expedition that the results of its investigations were finally made public. Perhaps no other botanical project has ever had so interesting a history, and none, it may safely be said, has ever been attended with so many dramatic incidents. If they had been published when first written, the two floras would have become historic. They were better prepared than most of the botanical works of their day, although their authors had a very broad conception of specific limits and referred many of the Mexican plants to species of the Old World tropics with which they were not even congeneric. When the works were actually printed they had long been obsolete, and most

of the plants dealt with had been described years before by other authors, sometimes under the same names but usually not. Aside from the sentimental interest that was gratified by the publication of the manuscripts, it is a matter of regret that botanical nomenclature was further taxed with so many useless synonyms. Indeed, but little attention has ever been paid by botanists to the numerous new names recorded in these two works.

ALEXANDER VON HUMBOLDT.

Alexander, Baron von Humboldt, one of the most illustrious men of his period, was born in Berlin in 1769. He was granted permission by the court of Spain to explore the Spanish possessions in America, and in 1799, in company with Aimée Bonpland, he sailed from Coruna. He landed at Cumaná, Venezuela, and starting from that point he explored New Andalusia (Venezuela) and Spanish Guiana. Thence he went to Cuba, and later to other parts of South America. In March, 1803, he landed at Acapulco, and followed the usual route of that day to the capital, where he made the acquaintance of Cervantes, Cal, Alzate, and many other scientists. He explored thoroughly the Valley of Mexico, and made collections also in Hidalgo, Querétaro, Guanajuato, Puebla, Jalisco, Michoacán, Guerrero, and other regions. Altogether, ten months were spent in Mexico, and in 1804 Humboldt and Bonpland returned to Paris, where the former remained for many years. He died in Berlin in 1850.

The rich material obtained by the expedition was sufficient to occupy the many years which Humboldt devoted to scientific study. The botanical collections were gathered chiefly by Bonpland, but the senior member of the expedition made extensive observations upon vegetation which served as the basis for classic works upon phytogeography. The Mexican collections included about 950 species, a large proportion of which were described as new. Along with the material from other regions they were turned over to Kunth, who published seven volumes describing them.¹ Humboldt and Bonpland also published jointly two large volumes dealing with some of the most interesting of their discoveries.² So far as modern botanical

¹ Nova genera et species plantarum quas in peregrinatione ad plagam æquinoctialem orbis novi collegerunt, descripserunt, partim adumbraverunt Amat. Bonpland et Alex. de Humboldt. Ex schedis autographis Amati Bonpland in ordinem digessit Carolus Siegesmund Kunth. Accedunt Alexandri de Humboldt notationes ad geographiam plantarum spectantes. Vols. 1-7. *pl. 1-700*. Paris, 1815-1825.

² Plantae æquinoctiales, per regnum Mexici in provinciis Caracarum et Novae Andalusiae, in Peruvianorum, Quitensium, Novae Granatae Andibus, ad Orenoci, Fluvii nigri, fluminis Amazonum ripas nascentes. In ordinem digessit Amatus Boupland. Vols. 1, 2. *pl. 1-143*. Paris, 1808-1809.

work is concerned, the *Nova Genera et Species* is the first important work treating of Mexican plants. The collections obtained in South America were much more extensive than those from Mexico, and for Venezuela, Colombia, Ecuador, and Peru the work is of even greater importance than for Mexico. Humboldt and Bonpland were the first to make known to science many of the most common and characteristic Mexican plants.

Besides these and other systematic works, Humboldt published accounts of his voyages, which are replete with original observations upon matters of natural history. He was the father of the science of plant geography, and published several classic works upon the subject, the best known of which is his *Essai sur la Géographie des Plantes*.¹

Bonpland was born in 1773 in the French city of Rochelle. Some time after his return to Europe, in 1816, he decided to establish himself in America, and went to Buenos Aires, where he gave courses in natural history. He traveled in the more remote parts of Argentina, Paraguay, and Bolivia, and finally settled in Paraguay where he established a factory for the preparation of maté. This act seems to have aroused the jealousy of the dictator Francia, and in 1821 a band of his agents attacked the finca, killed some of the employees, and wounded Bonpland himself. The latter was put in chains and kept nine years in captivity, but later was released and devoted his attention to agricultural pursuits. He died in 1858.

SYSTEMATIC TREATMENT.

KEY TO THE FAMILIES.

Subkingdom Pteridophyta.

Plants without flowers or seeds, but producing spores. Ferns.

Rhizomes creeping, very slender, producing mostly ascending or reclining vinelike leaves of indeterminate growth; sporangia relatively few, subglobose to pyriform, dehiscing vertically; sori flattened.

GLEICHENIACEAE.

Rhizomes erect or ascending, mostly arborescent, bearing a terminal crown of large leaves; sporangia numerous, ovoid, dehiscing horizontally; sori essentially globose.-----CYATHEACEAE.

¹Friederich Alexander von Humboldt et Aimé Bonpland. *Essai sur la géographie des plantes; accompagné d'un tableau physique des régions équinoxiales, fondé sur des mesures exécutées depuis le dixième degré de latitude boréale jusqu'au dixième degré de latitude australe pendant les années 1799-1803.* Pp. 1-155. Paris, 1805.

Also, Friederich Alexander von Humboldt. *De distributione geographica plantarum secundum coeli temperiem et altitudinem montium, prolegomena.* Pp. 1-249. *pl.* Paris, 1817.

Subkingdom Spermatophyta.

Plants with flowers which produce seeds. Flowering plants.

KEY TO THE CLASSES.

Ovules and seeds borne on the face of a bract or scale; stigmas wanting.

1. GYMNOSPERMAE.

Ovules and seeds borne in a closed cavity; stigmas present.

2. ANGIOSPERMAE.

CLASS 1. GYMNOSPERMAE.

Leaves pinnate, broad; cotyledons united.....CYCADACEAE.

Leaves entire or denticulate, narrow, usually needle-like or scalelike; cotyledons distinct.

Stems jointed. Leaves reduced to whorled scales.....GNETACEAE.

Stems not jointed.

Ovulate flowers solitary; fruit baccate, small. Leaves short, linear.

TAXACEAE.

Ovulate flowers few or numerous; fruit a dry or fleshy cone, often large.

PINACEAE.

CLASS 2. ANGIOSPERMAE.

KEY TO THE SUBCLASSES.

Cotyledon 1; stems endogenous; leaves parallel-veined.

1. MONOCOTYLEDONEAE.

Cotyledons normally 2; stems exogenous; leaves not parallel-veined.

2. DICOTYLEDONEAE

Subclass 1. Monocotyledones.

Ovary inferior. Leaves mostly basal, often spine-toothed.

AMARYLLIDACEAE.

Ovary superior.

Perianth rudimentary, of scales, green or greenish, never corolla-like.

Grasses.....POACEAE.

Perianth of 2 distinct series, the inner series usually corolla-like.

Ovules solitary in each cell of the ovary. Palms: leaves usually compound or deeply lobed.....PHOENICACEAE.

Ovules 2 to many in each cell.

Inflorescence a fleshy spadix surrounded by a spathe; leaves succulent.

Plants usually epiphytic and scandent.....ARACEAE.

Inflorescence not a spadix.

Styles present; stems not scandent, unarmed; leaves linear or dagger-shaped.....LILIACEAE.

Styles none; stems scandent, armed with spines; leaves broad.

SMILACACEAE.

Subclass 2. Dicotyledones.

KEY TO THE SERIES.

Perianth segments wanting or all similar (especially in texture and color).

rarely somewhat unequal, 5 or fewer.....1. APETALAE.

Perianth segments in 2 series, calyx and corolla, rarely similar but then more than 5.

Petals distinct, rarely coherent above but distinct below.

2. POLYPETALAE.

Petals united below (at least at the base) or throughout.

3. GAMOPETALAE.

Series 1. APETALAE.

Ovary superior, almost superior, or naked.

Perfect and pistillate flowers without a perianth.

Ovary with 2 or more cells.

Ovary 2-celled, with 1 ovule in each cell; styles 2. Leaves alternate, simple; flowers in catkins.....BETULACEAE.

Ovary 3 or 4-celled.

Ovary 3-celled; styles 3, or 1 but with 3 or 6 stigmas; fruit a 3-celled capsule.....EUPHORBIACEAE.

Ovary 4-celled; styles 2 or 4, or a 2-lobed sessile stigma; fruit 4-celled, indehiscent. Leaves fleshy, terete.....BATIDACEAE.

Ovary 1-celled.

Leaves reduced to whorled scales. Fruit conelike...CASUARINACEAE.

Leaves not reduced to whorled scales.

Ovule 1 in each cell.

Leaves opposite, stipulate; stamen 1; ovule pendulous.

CHLORANTHACEAE.

Leaves alternate, or opposite and estipulate; stamens 2 to 16; ovule erect.

Fruit a drupe, covered with pale wax; seeds without endosperm; leaves estipulate, dentate.....MYRICACEAE.

Fruit a small berry; seeds with endosperm; leaves stipulate, entire. Flowers in long slender dense spikes...PIPERACEAE.

Ovules more than 1 in each cell. Seeds with a tuft of hairs; leaves stipulate.....SALICACEAE.

Perfect and pistillate flows with a perianth.

A. Ovary 1, 1-celled.

B. Ovule 1.

Leaves stipulate.

Leaves deeply lobed, alternate.....ROSACEAE.

Leaves simple.

Styles 3, distinct or connate at the base. Stipules often sheath-like.....POLYGONACEAE.

Style 1 and undivided, or bipartite, or of 1 or 2 sessile stigmas.

Flowers perfect, racemose. Leaves alternate.

PHYTOLACCACEAE.

Flowers unisexual.

Stamens more numerous than the perianth segments; staminate flowers with a perianth.....EUPHORBIACEAE.

Stamens as many as the perianth segments or fewer; staminate flowers sometimes without a perianth. Leaves alternate.

Flowers solitary or clustered; juice not milky...ULMACEAE.

Flowers spicate, racemose, or capitate; juice milky.

MORACEAE.

Leaves estipulate.

Perianth imbricate in bud. Leaves entire or dentate, simple.

Perianth segments 6, rarely fewer, the stamens then more numerous than the segments but not twice as many.

Anthers dehiscent by recurved valves; style 1; seeds without endosperm. Leaves alternate, aromatic.---**LAURACEAE.**

Anthers dehiscent by longitudinal slits; styles 2 or 3; seeds with endosperm. Leaves usually alternate.---**POLYGONACEAE.**

Perianth segments 2 to 5; stamens as many as the segments or fewer. Leaves alternate or opposite.

Flowers with thin chaffy bracts; filaments united, at least at the base.-----**AMARANTHACEAE.**

Flowers with herbaceous bracts; filaments distinct. Leaves often succulent.-----**CHENOPODIACEAE.**

Perianth valvate or open in bud. Style 1 or none; stigma 1.

Stamens inserted on the perianth. Leaves deeply lobed, alternate. **PROTEACEAE.**

Stamens free from the perianth.

Filaments wholly connate; anthers dehiscent extrorsely. Leaves alternate, entire.-----**MYRISTICACEAE.**

Filaments free or connate only at the base; anthers dehiscent introrsely or laterally.

Stamens 3 or 4, equal in number to the perianth segments and opposite them. Leaves alternate; plants often with stinging hairs.-----**URTICACEAE.**

Stamens more numerous or fewer than the perianth segments, rarely of the same number, but the plants then with opposite leaves, and the stamens 5 or alternate with the perianth lobes. Leaves alternate or opposite, entire.

ALLIONIACEAE.

BB. Ovules 2 or more in each cell.

Ovules 2 in each cell.

Flowers dioecious; styles 3, or the stigma sessile.

EUPHORBIACEAE.

Flowers perfect or polygamous; style 1.

Stamens 3 or 4; style terminal; leaves estipulate, alternate.

PROTEACEAE.

Stamens 8 or more, rarely fewer, but the style then basal; leaves usually stipulate, alternate.

Style basal, or if terminal the stamens numerous; leaves simple.

ROSACEAE.

Style terminal; stamens 8 or 10; leaves pinnate.

MIMOSACEAE.

Ovules 3 or more in each cell. Leaves alternate.

Ovules attached to the ventral suture of the ovary.

Stamens 4, without filaments; leaves simple, estipulate.

PROTEACEAE.

Stamens 5 or more, with filaments; leaves compound, stipulate.

MIMOSACEAE.

Ovules attached to several parietal placentae or to a basal or central placenta.

Stamen 1. Leaves entire, estipulate; flowers spicate.

LACISTEMACEAE.

Stamens numerous.

Ovary borne on a long gynophore; seeds without endosperm.

CAPPARIDACEAE.

Ovary sessile or nearly so; seeds with endosperm.

FLACOURTIACEAE.

AA. Ovary 1, several-celled, or the carpels several and distinct.

Ovaries several, distinct.

Stamens with connate filaments, hypogynous. Leaves alternate, stipulate.....STERCULIACEAE.

Stamens with distinct filaments, or the filaments wanting, the stamens in the latter case perigynous.

Perianth segments distinct; leaves opposite, compound; plants scandentRANUNCULACEAE.

Perianth segments of the perfect and pistillate flowers more or less united, those of the staminate flowers sometimes distinct but the plants then with alternate leaves; plants erect.

Ovules 2; leaves stipulate, pinnate.....SIMAROUBACEAE.

Ovule 1; leaves estipulate, simple.....MONIMIACEAE.

Ovary 1.

Ovule 1 in each cell.

Flowers perfect.....RHAMNACEAE.

Flowers polygamous or dioecious.

Leaves compound, estipulate; stamens 8.....SAPINDACEAE.

Leaves simple, stipulate; stamens 4 or 5, or 10 to 20.

Stamens 4 or 5.....RHAMNACEAE.

Stamens 10 to 20.....BUXACEAE.

Ovules 2 or more in each cell.

Ovules 2 in each cell.

Leaves stipulate.

Style 1, undivided; ovary 5-lobate. Leaves alternate.

STERCULIACEAE.

Styles several; ovary usually 3-lobate.....EUPHORBIACEAE.

Leaves estipulate.

Flowers perfect; seeds without endosperm.....ACERACEAE.

Flowers unisexual; seeds with endosperm.....BUXACEAE.

Ovules 3 or more in each cell.

Stamens 15 or fewer.....TILIACEAE.

Stamens very numerous.....ELAEOCARPACEAE.

Ovary inferior, almost inferior, or half inferior.

Ovary 1-celled, or sometimes incompletely several-celled.

Ovule 1.

Stamens as many as the perianth segments and alternate with them; perianth corolla-like. Flowers in involucre heads.

ASTERACEAE.

Stamens as many as the perianth segments and opposite them, or fewer or more numerous; perianth calyx-like or wanting.

Leaves stipulate.

Leaves opposite.....CHLORANTHACEAE.

Leaves alternate.....MORACEAE.

Leaves estipulate.

Leaves pinnate. Plants trees or shrubs; flowers in catkins.

JUGLANDACEAE.

Leaves simple, sometimes reduced to scales.

Plants trees; fruit winged.....HERNANDIACEAE.

Plants small shrubs, often parasitic; fruit not winged.

Leaves opposite or verticillate, sometimes reduced to scales;
plants parasitic.....LORANTHACEAE.

Leaves mostly alternate; plants not parasitic.

CHENOPODIACEAE.

Ovules 2 or more.

Ovules 2 to 4. Leaves alternate, simple.....COMBRETACEAE.

Ovules 6 or more.

Plants erect trees; fruit an acorn; flowers in catkins....FAGACEAE.

Plants scandent shrubs; fruit not an acorn; flowers not in catkins.

ARISTOLOCHACEAE.

Ovary completely several-celled.

Ovule 1 in each cell; leaves simple, stipulate.

Ovary cells and styles or stigmas 3 or 4. Leaves opposite or alternate,
entire or dentate.....RHAMNACEAE.

Ovary cells and styles or stigmas 2. Leaves entire, opposite.

RUBIACEAE.

Ovules 2 or more in each cell; leaves simple, estipulate.

Plants scandent; perianth 3-lobed or 1 or 2-lipped; leaves alternate.

ARISTOLOCHACEAE.

Plants erect; perianth 4 to 8-lobed or parted; leaves opposite or alternate.

MYRTACEAE.

Series 2. POLYPETALAE.

A. Ovary wholly or half inferior.

B. Perfect stamens 10 or fewer.

Ovule 1 in each cell of the ovary.

Stamens as many as the petals and opposite them.

Ovary 1-celled; plants parasitic. Leaves opposite or verticillate, entire.

LORANTHACEAE.

Ovary 2 to 4-celled; plants not parasitic. Leaves opposite or alternate,
entire or dentate.....RHAMNACEAE.

Stamens as many as the petals and alternate with them, or fewer or
more numerous.

Style 1, simple or cleft only at the apex, or the stigma 1 and sessile.

Fruit an achene. Flowers in dense globose heads; leaves alternate,
usually lobate.....PLATANACEAE.

Fruit not an achene. Leaves alternate or opposite.

Petals contorted in bud. Leaves simple, entire or dentate.

ONAGRACEAE.

Petals valvate in bud.

Leaves entire; flowers not in umbels.....CORNACEAE.

Leaves lobed or compound; flowers in umbels....ARALIACEAE.

Styles 2 or more, free or connected only at the base, or the stigmas 2
or more and sessile. Leaves alternate.

Ovary half inferior; fruit capsular; flowers in globose heads.

Leaves palmately lobed.....HAMAMELIDACEAE.

Ovary wholly inferior; fruit baccate; flowers in umbels.

ARALIACEAE.

Ovules 2 or more in each cell of the ovary.

Styles 2 or more, united only at the base.

Leaves alternate.....FLACOURTIACEAE.

Leaves opposite.....HYDRANGEACEAE.

Style 1, simple or cleft only at the apex, or stigma 1 and sessile.

Petals valvate in bud.

Stamens 8 to 10, twice as many as the petals; calyx lobes valvate in bud; leaves alternate or opposite-----**COMBRETACEAE.**

Stamens 2 to 6, as many as the petals or fewer; calyx lobes open or imbricate in bud; leaves alternate-----**OLACACEAE.**

Petals imbricate or contorted in bud.

Ovary 1-celled, the ovules suspended from the apex of the cell.

COMBRETACEAE.

Ovary 1-celled, with basal, central, or parietal ovules, or several-celled.

Ovary 4 or 5-celled.

Perfect stamens 10; leaves opposite-----**MYRTACEAE.**

Perfect stamens 5; leaves alternate--**PTEROSTEMONACEAE.**

Ovary 1-celled, or incompletely several-celled.

Anthers dehiscent by terminal pores; leaves usually with longitudinal ribs, opposite-----**MELASTOMATACEAE.**

Anthers dehiscent by longitudinal slits; leaves without longitudinal ribs.

Seeds with endosperm; petals imbricate or open in bud; fruit baccate; leaves alternate---**GROSSULARIACEAE.**

Seeds without endosperm; petals contorted; fruit capsular; leaves alternate or opposite-----**ONAGRACEAE.**

BB. Perfect stamens more than 10.

Style 1, simple or cleft only at the apex, or stigma 1 and sessile.

Leaves stipulate. Leaves opposite, entire-----**RHIZOPHORACEAE.**

Leaves estipulate.

Plants very succulent and spiny, the leaves usually absent.

CACTACEAE.

Plants neither succulent nor spiny; leaves well developed.

Stamens usually twice as many as the petals; leaves usually with longitudinal ribs-----**MELASTOMATACEAE.**

Stamens more than twice as many as the petals; leaves without longitudinal ribs.

Sepals 2 to 4, or more and imbricate; leaves usually punctate.

MYRTACEAE.

Sepals 5 to 8, valvate; leaves not punctate-----**PUNICACEAE.**

Styles 2 or more, free or united only at the base, or the stigmas 2 or more and sessile.

Leaves estipulate, opposite.

Flowers borne upon the leaves; petals valvate in bud.

ESCALLONIACEAE.

Flowers not borne upon the leaves; petals valvate or imbricate.

HYDRANGEACEAE.

Leaves stipulate, alternate. Petals imbricate in bud.

Ovary 1-celled; petals usually 6 to 8-----**FLACOURTIACEAE.**

Ovary several-celled; petals 5-----**MALACEAE.**

AA. Ovary superior or nearly so.

C. Ovary 1, 1-celled or incompletely several-celled.

Sepals 2, distinct or rarely connate and forming a cap. Leaves estipulate.

Leaves entire; plants with colorless juice-----**PORTULACACEAE.**

Leaves dentate or lobate; plants with colored juice--**PAPAVERACEAE.**

Sepals 3 or more.

D. Perfect stamens 1 to 10.

E. Style 1, simple, with 1 stigma or with several connected stigmas, or stigma 1 and sessile.

F. Ovules 1 or 2 in each cell.

Leaves stipulate, alternate.

Style basal.....**ROSACEAE.**

Style terminal or nearly so.

Flowers papilionaceous (like that of the bean or pea), the upper petal outside.....**FABACEAE.**

Flower not papilionaceous, the upper petal innermost.

CAESALPINIACEAE.

Leaves estipulate.

Leaves simple.

Flowers regular.

Sepals and petals 3; anthers dehiscent by valves. Leaves alternate, aromatic.....**LAURACEAE.**

Sepals and petals 4 to 6; anthers dehiscent by longitudinal slits.

Petals valvate in bud; endosperm copious.....**OLACACEAE.**

Petals imbricate in bud; endosperm scant or none.

Ovule 1; leaves usually compound.

ANACARDIACEAE.

Ovules 2; leaves simple.....**ICACINACEAE.**

Flowers distinctly irregular.

Fruit covered with barbed spines. Leaves entire.

KRAMERIACEAE.

Fruit without barbed spines.

Stamens 4 to 8, hypogynous; anthers dehiscent by pores.

Leaves entire; flowers racemose.....**POLYGALACEAE.**

Stamens 9 or 10, usually perigynous; anthers dehiscent by longitudinal slits.....**FABACEAE.**

Leaves compound.

Ovule 1.....**ANACARDIACEAE.**

Ovules 2.

Ovules ascending; stamens 10, perigynous, 5 of them often sterile.....**CONNARACEAE.**

Ovules descending; stamens 3 to 8, hypogynous, all perfect.

Stamens 3 to 5; seeds with endosperm; leaves with transparent glands.....**RUTACEAE.**

Stamens 8; seeds without endosperm; leaves without transparent glands.....**BURSERACEAE.**

FF. Ovules more than 2 in each cell.

Ovules attached to a basal or free central placenta. Leaves alternate.

Stamens alternate with the petals. Leaves simple.

OLACACEAE.

Stamens opposite the petals.

Petals valvate in bud; plants climbing, with tendrils.

VITACEAE.

Petals imbricate; plants erect.

Sepals and petals 4 or 5; leaves simple; fruit 1-seeded.

MYRSINACEAE.

Sepals 9; petals 6; leaves compound; fruit 3-seeded.

BERBERIDACEAE.

Ovules attached to a sutural placenta or to 2 or more parietal placentae.

Ovules attached to the ventral suture of the ovary. Leaves usually compound, alternate; fruit a legume.

Corolla regular or nearly so.....**CAESALPINIACEAE.**

Corolla very irregular, papilionaceous.....**FABACEAE.**

Ovules attached to 2 or more parietal placentae.

Calyx segments united. Leaves entire, small.

FRANKENIACEAE.

Calyx segments distinct.

Petals 4. Ovary stipitate.....**CAPPARIDACEAE.**

Petals 5.

Leaves pinnate.....**MORINGACEAE.**

Leaves simple.....**VIOLACEAE.**

EE. Styles 2 or more, free or partially united, with separate stigmas, or stigmas 2 or more and sessile.

Ovule 1.

Sepals and petals each 3. Leaves entire, stipulate, the stipules sheathing.....**POLYGONACEAE.**

Sepals and petals each 4 to 6.

Stamens opposite the petals and of the same number; style 5-parted. Leaves simple.....**PLUMBAGINACEAE.**

Stamens alternate with the petals, or more numerous; styles usually 3. Leaves usually compound.....**ANACARDIACEAE.**

Ovules 2 or more. Leaves alternate.

Plants with tendrils; ovary stipitate.....**PASSIFLORACEAE.**

Plants without tendrils; ovary sessile.

Leaves not scalelike.....**TURNERACEAE.**

Leaves scalelike.....**TAMARICACEAE.**

DD. Perfect stamens more than 10

Ovule 1.

Leaves opposite.....**CLUSIACEAE.**

Leaves alternate.....**AMYGDALACEAE.**

Ovules 2 or more.

Ovules basal, apical, central, or sutural.

Petals and stamens hypogynous; sepals imbricate in bud. Leaves simple, alternate.....**DILLENIACEAE.**

Petals and stamens perigynous, rarely almost hypogynous but the sepals then valvate.

Leaves estipulate, entire.....**LYTHRACEAE.**

Leaves usually stipulate, dentate to pinnate.

Ovules 2; leaves simple.....**ROSACEAE.**

Ovules usually more than 2; leaves pinnate.

CAESALPINIACEAE.

Ovules on several parietal placentae.

Filaments wholly connate. Leaves alternate, estipulate, transparent-dotted; fruit berry-like.....**CANELLACEAE.**

Filaments free or connate only at the base.

Leaves, at least the lowest, opposite, simple. Fruit a capsule; low shrubs.

Plants not gland-dotted.....**CISTACEAE.**

Plants gland-dotted.....**HYPERICACEAE.**

Leaves alternate.

Style usually wanting; endosperm scant or none. Petals 4;
ovary stipitate.....**CAPPARIDACEAE.**

Style evident; endosperm copious. Leaves simple.

Petals similar to the sepals, perigynous; stamens perigynous.

FLACOURTIACEAE.

Petals unlike the sepals, hypogynous; stamens hypogynous.

Ovary 1-celled; fruit spiny; seeds glabrous, arillate;
flowers pinkish white.....**BIXACEAE.**

Ovary incompletely 3 to 5-celled, smooth; seeds woolly;
flowers yellow.....**COCHLOSPERMACEAE.**

CC. Ovary 1, completely or almost completely several-celled, or the ovaries
several and distinct.

D. Ovaries several, distinct or connate only at the base, with wholly dis-
tinct styles and stigmas.

Petals and stamens perigynous.

Leaves stipulate, alternate.

Seeds not arillate.....**ROSACEAE.**

Seeds arillate. Leaves entire.....**CROSSOSOMATACEAE.**

Leaves estipulate.

Leaves compound, not fleshy; ovules 2.....**CONNARACEAE.**

Leaves simple, fleshy; ovules numerous.....**CRASSULACEAE.**

Petals and stamens hypogynous. Leaves estipulate.

Stamens twice as many as the sepals or fewer.

Ovule 1 in each carpel. Leaves simple.

Leaves opposite or verticillate; flowers perfect or polygamous;
petals 5; carpels 5 to 10; plants not scandent.

CORIARIACEAE.

Leaves alternate; flowers dioecious; petals 6 or rarely 3; plants
scandent.....**MENISPERMACEAE.**

Ovules 2 or more in each carpel.

Petals 6, twice as many as the sepals. Leaves entire.

ANNONACEAE.

Petals as many as the sepals, 3 or more, usually 5.

Plants leafless or nearly so.....**KOEBERLINIACEAE.**

Plants with well-developed leaves. Leaves compound.

Stamens and staminodia together 3 to 8; ovules descending;
leaves with translucent glands.....**RUTACEAE.**

Stamens and staminodia together 10; ovules ascending; leaves
without glands.....**CONNARACEAE.**

Stamens more than twice as many as the petals.

Perianth usually composed of 4 or more sepals and an equal or lesser
number of petals. Seeds arillate; leaves entire, alternate.

DILLENACEAE.

Perianth composed of 3 sepals and 6 or more (rarely 3) petals.

Leaves entire.

Sepals valvate in bud; leaves estipulate.....**ANNONACEAE.**

Sepals imbricate in bud; leaves usually stipulate.

MAGNOLIACEAE.

DD. Ovaries several, with connate styles or stigmas, or ovary 1.

E. Ovule 1 in each cell.

Stamens distinctly perigynous.

Stamens 10 or more. Leaves alternate, stipulate.....**ROSACEAE.**

Stamens 4 or 5. Leaves simple, entire or dentate.

Calyx valvate in bud; stamens opposite the petals and often adnate to them.....**RHAMNACEAE.**

Calyx imbricate; stamens alternate or opposite, but very rarely adnate to the petals.....**CELASTRACEAE.**

Stamens hypogynous.

Flowers unisexual.

Ovary 4 to 6-parted; leaves usually pinnate, alternate, estipulate.
SIMAROUBACEAE.

Ovary entire or slightly lobed; leaves simple or digitate.

Ovules pendulous or descending; ovary usually 3-celled.

Cells of the ovary 3; fruit usually a capsule.

EUPHORBIACEAE.

Cells of the ovary 4 or more; fruit a drupe.

AQUIFOLIACEAE.

Ovules ascending; ovary usually 4 or 5-celled. Fruit drupaceous.

CLUSIACEAE.

Flowers perfect or polygamous.

Flowers polygamous.

Leaves opposite or verticillate, entire. Stamens numerous.

CLUSIACEAE.

Leaves alternate, usually compound.

Stamens inserted within a disk; ovules ascending or horizontal; radicle inferior.....**SAPINDACEAE.**

Stamens inserted outside a disk; ovules pendulous or horizontal; radicle superior. Leaves pinnate.

Ovary entire or slightly lobed; styles several and distinct, or stigma 1 and sessile.....**ANACARDIACEAE.**

Ovary deeply divided; styles connate...**SIMAROUBACEAE.**

Flowers perfect.

Stamens more than 10. Leaves stipulate, simple.

Sepals valvate or open in bud, more or less united; anthers 1-celled.....**MALVACEAE.**

Sepals imbricate, free or nearly so; anthers 2-celled. Flowers yellow.....**OCHNACEAE.**

Stamens 10 or fewer.

Leaves simple and entire, toothed, or lobed.

Stamens 8; ovary 2-celled. Leaves entire; flowers racemose.

POLYGALACEAE.

Stamens 2 to 6, or 10; ovary 3 to 6-celled.

Ovary 5 or 6-celled. Leaves alternate, stipulate; petals imbricate, yellow.....**OCHNACEAE.**

Ovary 2 to 4-celled. Leaves entire; plants often scandent.

MALPIGHIACEAE.

Leaves compound.

Filaments united. Leaves pinnate; ovary entire.

MELIACEAE.

Filaments free.

Leaves gland-dotted; filaments without scales; ovary entire.....**RUTACEAE.**

Leaves not gland-dotted; filaments usually with a basal scale; ovary usually divided...**SIMAROUBACEAE.**

EE. Ovules 2 or more in each cell.

F. Stamens hypogynous; disk none, but separate glands or a gynophore sometimes present.

Leaves opposite or verticillate, entire.

Flowers unisexual, regular.....**CLUSIACEAE.**

Flowers perfect, irregular.....**VOCHYSIACEAE.**

Leaves alternate.

Leaves stipulate.

Calyx segments imbricate in bud.

Stamens more than 10. Petals 4; ovary borne on a long gynophore; stigma sessile.....**CAPPARIDACEAE.**

Stamens 10. Leaves entire.....**ERYTHROXYLACEAE.**

Calyx segments valvate or open in bud.

Petals valvate in bud. Stamens 4 or 5, free; ovary sessile, 2 or rarely 3 or 4-celled; vines with tendrils...**VITACEAE.**

Petals imbricate or convolute.

Ovary stipitate; petals (4) imbricate...**CAPPARIDACEAE.**

Ovary sessile or nearly so; petals usually convolute in bud.

Anthers 1-celled, dehiscent by a pore or a longitudinal slit.

Filaments adnate; petals 5; seeds sometimes covered with long hairs.

Leaves simple; flowers usually calyculate; filaments united to the apex or nearly so...**MALVACEAE.**

Leaves digitate or simple; flowers not calyculate; filaments united only at the base or in the lower half.
BOMBACACEAE.

Anthers 2-celled, dehiscent by 2 pores or longitudinal slits.

Filaments more or less united; staminodia present.

STERCULIACEAE.

Filaments free, or slightly united at the base, but staminodia then absent.....**TILIACEAE.**

Leaves estipulate.

Stamens more than twice as many as the petals.

Ovary long-stipitate; ovules numerous...**CAPPARIDACEAE.**

Ovary sessile; ovules 3 or few.

Style distinct; petals free or nearly so.....**THEACEAE.**

Style none; petals united at the apex.

MARCGRAVIACEAE.

Stamens as many or twice as many as the petals.

Leaves compound.

Filaments free; leaves gland-dotted.....**RUTACEAE.**

Filaments united; leaves not gland-dotted.

Leaflets 3, entire.....**OXALIDACEAE.**

Leaflets 5 or more.....**MELIACEAE.**

Leaves simple.

Ovary 1-celled. Leaves entire...**ERYTHROXYLACEAE.**

Ovary 2 to 7-celled.

Calyx lobes valvate in bud.....**STERCULIACEAE.**

Calyx lobes imbricate in bud.

Stamens 5.....**MARCGRAVIACEAE.**

Stamens 10 to 14.....**CLETHRACEAE.**

FF. Stamens hypogynous, but inserted at the base or on the surface of a disk, or perigynous.

G. Leaves stipulate.

Stamens twice as many as the petals or more.

Styles 2 to 5.

Styles 2; stamens 8 to 12; leaves compound, usually opposite.

CUNONIACEAE.

Styles 5; stamens usually numerous; leaves simple or compound, alternate.....ROSACEAE.

Style 1, simple or bilobulate.

Leaves compound; stamens 8 to 10....ZYGOPHYLLACEAE.

Leaves simple; stamens usually numerous.

Stamens inserted on a disk; ovules numerous; leaves opposite or alternate.....ELAEOCARPACEAE.

Stamens inserted on the calyx tube; ovules 2 in each cell; leaves opposite, entire.....RHIZOPHORACEAE.

Stamens as many as the petals or fewer.

Stamens as many as the petals and opposite them. Vines with tendrils; leaves alternate.....VITACEAE.

Stamens as many as the petals and alternate with them, or fewer.

Leaves compound. Flowers perfect.

Ovary 2 to 4-lobate; seeds without endosperm.

SAPINDACEAE.

Ovary 3-celled; seeds with endosperm...STAPHYLEACEAE.

Leaves simple.

Style 1, simple; ovules erect or ascending; flowers usually perfect.....CELASTRACEAE.

Style 1 and divided, or styles 3; ovules pendulous or inverted; flowers unisexual.....EUPHORBIACEAE.

G. Leaves estipulate.

Leaves simple; disk present or absent.

Leaves alternate. Stamens 2 to 10, twice as many as the petals or fewer.

Stamens 5, opposite the petals, only 2 of them fertile. Ovary 2-celled, each cell with 2 ovules.....SABIACEAE.

Stamens 3 to 10, alternate with the petals, or less or more numerous.

Leaves with translucent glands.....RUTACEAE.

Leaves without glands.....CELASTRACEAE.

Leaves opposite or whorled.

Stamens 3, less numerous than the petals. Leaves entire.

HIPPOCRATEACEAE.

Stamens as many as the petals or more numerous.

Ovules 2 in each cell.

Ovary 2-celled; leaves without translucent glands. Fruit a double samara.....ACERACEAE.

Ovary 3 to 5-celled; leaves with translucent glands.

RUTACEAE.

Ovules more than 2 in each cell.

Styles or stigmas 5 to 10; leaves entire...CLUSIACEAE.

Style 1, simple.

Calyx lobes imbricate or open in bud; leaves with longitudinal ribs.....MELASTOMATACEAE.

Calyx lobes valvate; leaves not ribbed...LYTHRACEAE.

Leaves compound; disk always present.

Stamens inserted within the disk. Flowers usually polygamous.

Petals usually 5; plants often scandent.....**SAPINDACEAE.**

Petals 4; plants erect. Leaves digitate.....**AESCULACEAE.**

Stamens inserted outside the disk.

Fertile stamens 2; petals 5, 1 or 2 of them much reduced.

SABIACEAE.

Fertile stamens as many as the petals, rarely fewer, but the

4 or 5 petals then subequal.

Stamens as many as the petals and opposite them; flowers dioecious. Leaves alternate -----**SIMAROUBACEAE.**

Stamens as many as the petals and alternate with them, or more or less numerous; flowers usually perfect or polygamous.

Filaments united -----**MELIACEAE.**

Filaments free.

Leaves with translucent glands-----**RUTACEAE.**

Leaves without glands-----**BURSERACEAE.**

Series 3. GAMOPETALAE.

Ovary inferior or semi-inferior.

Stamens numerous.

Ovary 1-celled; plants succulent, usually armed with spines; leaves usually absent -----**CACTACEAE.**

Ovary several-celled; plants not succulent, unarmed; leaves well developed.

SYMPLOCACEAE.

Stamens 10 or fewer.

Stamens twice as many as the corolla lobes. Fruit fleshy; anthers opening by terminal pores; leaves alternate, simple-----**VACCINIACEAE.**

Stamens as many as the corolla lobes or fewer.

Stamens as many as the corolla lobes and opposite them. Corolla lobes valvate in bud.

Plants parasitic; stigma entire; leaves opposite or verticillate, entire.

LORANTHACEAE.

Plants not parasitic; stigma bilobate; leaves alternate, estipulate.

OLACACEAE.

Stamens as many as the corolla lobes and alternate with them, or less numerous.

Ovary 1-ovulate.

Anthers coherent; flowers in an involucre head. Fruit an achene.

ASTERACEAE.

Anthers not coherent; flowers not in an involucre head. Leaves opposite.

Stipules present, free from the petiole. Leaves always entire.

RUBIACEAE.

Stipules none, or if present united with the petiole.

CAPRIFOLIACEAE.

Ovary containing 2 or more ovules.

Perfect stamens fewer than the corolla lobes. Leaves simple.

GESNERIACEAE.

Perfect stamens as many as the corolla lobes.

Ovaries 2, distinct. Leaves simple, entire-----**APOCYNACEAE.**

Ovary 1, entire.

Leaves alternate, often lobed or compound.....**ARALIACEAE.**

Leaves opposite or verticillate.

Leaves estipulate.....**CAPRIFOLIACEAE.**

Leaves stipulate, entire.....**RUBIACEAE.**

Ovary superior or nearly superior.

A. Perfect stamens as many as the corolla lobes and opposite them, or more numerous.

Ovary 1-celled.

Ovule 1. Leaves simple.

Styles 3, or style 1 but with 3 stigmas; flowers dioecious. Plants scandent.....**MENISPERMACEAE.**

Style 1, with 5 stigmas; flowers perfect.....**PLUMBAGINACEAE.**

Ovules 2 or more.

Fruit a legume; leaves compound, alternate.....**MIMOSACEAE.**

Fruit a drupe or capsule; leaves simple.

Plants armed with spines.....**FOUQUIERIACEAE.**

Plants unarmed.

Staminodia none in the staminate flowers; seeds small, black or dark brown.....**MYRSINACEAE.**

Staminodia always present; seeds large, yellow or orange.

THEOPHRASTACEAE.

Ovary perfectly, or sometimes imperfectly, 2 or more-celled.

Leaves stipulate (stipules sometimes minute or deciduous).

Flowers unisexual. Ovary 3-celled.....**EUPHORBIACEAE.**

Flowers perfect. Leaves alternate.

Anthers 2-celled; staminodia present.....**STERCULIACEAE.**

Anthers 1-celled; staminodia absent.

Leaves simple; flowers calyculate; filaments united almost throughout.....**MALVACEAE.**

Leaves digitate or simple; flowers not calyculate; filaments united only at the base or in the lower half.....**BOMBACACEAE.**

Leaves estipulate.

Flowers unisexual, rarely polygamous. Styles several, free or partially united.

Ovules 1 or 2 in each cell. Leaves entire.....**DIOSPYRACEAE.**

Ovules more than 2 in each cell.

Stamens 10; ovules parietal; juice milky; leaves compound or lobed.....**CARICACEAE.**

Stamens more than 10; ovules axial; juice not milky; leaves simple.....**THEACEAE.**

Flowers perfect.

Calyx segments free or united only at the base. Leaves simple.

Stamens more than twice as many as the corolla lobes, 9 or more.
THEACEAE.

Stamens as many or twice as many as the corolla lobes, 8 or fewer,

Flowers irregular. Leaves entire.....**POLYGALACEAE.**

Flowers irregular.

Stamens as many as the corolla lobes; juice milky.

SAPOTACEAE.

Stamens more numerous than the corolla lobes; juice not milky.....**ERICACEAE.**

Calyx segments united to the middle or higher.

Leaves with translucent glands; ovary deeply lobate, the cells
2-ovulate.....**RUTACEAE.**

Leaves without translucent glands; ovary entire or scarcely lobate.

Leaves pinnate.....**MELIACEAE.**

Leaves simple.

Ovary 3-celled; anthers longitudinally dehiscent. Flowers
white, showy; pubescence of branched hairs.

STYRACACEAE.

Ovary with 4 or more cells; anthers dehiscent by apical pores.

ERICACEAE.

AA. Perfect stamens as many as the corolla lobes and alternate with them,
or less numerous.

B. Perfect stamens 3 or more, as many as the corolla lobes; corolla usually
regular.

C. Ovary simple and of 1 or 2 cells, or the ovaries 2 and distinct.

D. Ovules 2 to 4 in the whole ovary.

Leaves opposite or verticillate.

Style stigmatose only below the apex; corolla lobes contorted in
bud. Ovary 2-celled or the ovaries 2 and distinct; leaves
entire; juice usually milky.....**APOCYNACEAE.**

Style stigmatose at the apex or between the lobes; corolla lobes
imbricate or valvate.

Leaves stipulate; style simple.....**LOGANIACEAE.**

Leaves estipulate; style with 1 or 2 stigmas.....**VERBENACEAE.**

Leaves alternate.

Corolla valvate or plicate in bud.

Ovules erect; stigmas usually 2. Fruit a capsule.

CONVOLVULACEAE.

Ovules pendent; stigma 1.

Leaves compound; fruit a legume; plants often armed with
spines.....**MIMOSACEAE.**

Leaves simple; fruit not a legume; plants unarmed.

ICACINACEAE.

Corolla imbricate in bud.

Style stigmatose only below the apex; stigma 1. Leaves entire;
juice usually milky.....**APOCYNACEAE.**

Style stigmatose at the apex; stigmas 2. Leaves simple.

Ovary 1-celled.....**HYDROPHYLLACEAE.**

Ovary 2-celled.....**BORAGINACEAE.**

DD. Ovules more than 4 in the whole ovary.

Fruit a legume; leaves compound. Plants often armed with spines.

MIMOSACEAE.

Fruit not a legume; leaves simple.

Ovaries usually 2 and distinct; juice milky. Plants often
scandent; leaves entire.

Styles separate almost to the apex.....**ASCLEPIADACEAE.**

Styles separate only at the base, or completely united.

APOCYNACEAE.

Ovary 1, entire or slightly lobate; juice not milky. Leaves simple.

Leaves all opposite.....**LOGANIACEAE.**

Leaves alternate, or only the lowest opposite.

Style bifid.....**HYDROPHYLLACEAE.**

Style undivided.

Ovary 1-celled-----GESNERIACEAE.

Ovary 2-celled.

Corolla valvate or plicate in bud; fruit often baccate;
plants often armed with spines-----SOLANACEAE.

Corolla imbricate in bud; fruit a capsule with longitudinal
dehiscence; plants unarmed.

SCROPHULARIACEAE.

CC. Ovary simple and of 3 or more cells, or the ovaries 3 or more and
distinct.

Ovules 1 or 2 in each cell.

Leaves opposite or verticillate.

Cells of the ovary 3; stigmas 3; fruit a capsule.

POLEMONIACEAE.

Cells of the ovary 4 or 5; stigmas 1, 2, 4, or 5; fruit indehiscent
or divided into nutlets. Leaves simple.

Ovary entire. Stigmas 3, rarely 5-----VERBENACEAE.

Ovary 4-parted.

Stamens 4; stigmas 2 or rarely 1; corolla bilabiate.

MENTHACEAE.

Stamens 5; stigma 1; corolla regular-----BORAGINACEAE.

Leaves alternate.

Anthers basifixed, opening laterally or apically. Leaves entire.

DIOSPYRACEAE.

Anthers dorsifixed, or basifixed and opening internally.

Corolla united only at the base-----AQUIFOLIACEAE.

Corolla with a conspicuous tube.

Flowers mostly in 1-sided cymes; fruit not a capsule.

BORAGINACEAE.

Flowers not in 1-sided cymes; fruit a capsule.

CONVOLVULACEAE.

Ovules 3 or more in each cell.

Corolla valvate or plicate in bud; stamens inserted on the corolla;
calyx more or less united; plants often armed with spines.

SOLANACEAE.

Corolla imbricate or contorted; stamens often free from the corolla;
calyx segments often distinct or nearly so; plants unarmed.

Anthers dehiscent by longitudinal slits; ovary 3-celled.

POLEMONIACEAE.

Anthers dehiscent by terminal pores; ovary with 2 or 4 or more
cells-----ERICACEAE.

BB. Perfect stamens 2 to 4, fewer than the corolla lobes, or if of the same
number the stamens and lobes each 2; corolla nearly always irregular.

Ovules 1 or 2, rarely 3 or 4, in each cell.

Ovules 1 in each cell.

Ovary entire or obscurely 4-lobate-----VERBENACEAE.

Ovary 4-parted or deeply 4-lobate-----MENTHACEAE.

Ovules 2 to 4 in each cell.

Ovary 4 or 5-celled; leaves with translucent glands-----RUTACEAE.

Ovary 2-celled; leaves without translucent glands.

Stamens 2, regularly alternate with the cells of the ovary. Flowers
regular; leaves opposite -----OLEACEAE.

Stamens 4, or if 2 not alternate with the cells of the ovary.

Ovules 2 and collateral; fruit indehiscent or septicidal.

VERBENACEAE

Ovules 4, or 2 and superimposed; fruit loculicidal.

Seeds with endosperm, sessile or nearly so; stigma 1.

SCROPHULARIACEAE.

Seeds without endosperm, on conspicuous thick funicles; stigmas usually 2-----**ACANTHACEAE.**

Ovules more than 4 in each cell.

Ovary 1-celled; placentae central.

Seeds large; stamens 4; leaves compound. Plants often scandent.

BIGNONIACEAE.

Seeds small; fertile stamens 2; leaves simple----**GESNERIACEAE.**

Ovary 2-celled; placentae axillary.

Leaves compound-----**BIGNONIACEAE.**

Leaves simple.

Corolla induplicate-valvate or plicate-imbricate---**SOLANACEAE.**

Corolla plicate (but not imbricate) in bud.

Seeds inserted on large thick funicles-----**ACANTHACEAE.**

Seeds sessile or nearly so-----**SCROPHULARIACEAE.**

ANNOTATED CATALOGUE.

1. GLEICHENIACEAE. Vine-fern Family.

(Contributed by Mr. William R. Maxon.)

REFERENCES: Sturm, Gleicheniaceae, in Mart. Fl. Bras. 1²: 217-238. pl. 17. 1859; Underwood. A preliminary review of the North American Gleicheniaceae, Bull. Torrey Club 34: 243-262. f. 1, 2. 1907; Maxon, Gleicheniaceae, N. Amer. Fl. 16: 53-63. 1909.

Xerophilous ferns, mostly with branched creeping rhizomes; fronds usually ascending or reclining, numerous, somewhat vinelike, of indefinite growth, entangled, often forming dense impenetrable low thickets; primary axis naked; primary branches 1 to many pairs, opposite, determinate or (in most species) once to several times dichotomous, the included bud dormant or producing secondary and tertiary axes like the primary one; ultimate branches (pinnae) usually in pairs, bipinnate, pinnate, or deeply pinnatifid, the segments mostly elongate in our species (minute and rounded in the Old World *Gleichenia*); veins free, forked; sori dorsal or (in *Gleichenia*) terminal upon the veinlets, nonindusiate; sporangia sessile, short, 2 to many, opening by a vertical fissure.

1. DICRANOPTERIS Bernh. Neues Journ. Bot.

Schrad. 1²: 38. 1806.

Widely distributed in tropical and subtropical regions of both hemispheres. In tropical America many of the species grow rankly in the greatest profusion, often occupying wide areas of open or thinly shaded mountain slopes to the exclusion of other vegetation. A mass of the wiry interlacing fronds, with a blanket thrown over it, makes an excellent bed for the collector.

Primary branches bipinnate, the rachis not forked-----1. *D. bancroftii*.
Primary branches once or several times forked.

Internodes of primary branches normally naked; veins 2 to 5-forked; sori multisporangiate; rhizomes with spreading articulate hairs.

Accessory pinnae (a pair) borne at all but the ultimate nodes.

2. *D. flexuosa*.

Accessory pinnae wanting-----3. *D. pectinata*.

Internodes of primary branches at least partially pectinate; veins once forked; sori 3 to 5-sporangiate; rhizomes with ciliate scales.

Segments closely tomentose beneath, rarely glabrate with age—4. *D. bifida*.
Segments not tomentose beneath.

Pinnæ 2.5 to 3.2 cm. broad; segments narrowly oblong; veins 12 to 15 pairs, fibrillose with rusty scales; leaf tissues glabrous.

5. *D. underwoodiana*.

Pinnæ 3 to 5.5 cm. broad; segments linear; veins 20 to 28 pairs, these and the leaf tissues sparsely pilose with whitish stellate hairs.

6. *D. palmata*.

1. *Dicranopteris bancroftii* (Hook.) Underw. Bull. Torrey Club 34: 252. 1907.

Gleichenia bancroftii Hook. Sp. Fil. 1: 5. 1844.

Mertensia bancroftii Kunze, Linnaea 18: 307. 1844.

Gleichenia brunei Christ, Bull. Herb. Boiss. II. 5: 13. 1905.

Dicranopteris brunei Underw. Bull. Torrey Club 34: 253. 1907.

Mountains of Veracruz and Chiapas, southward to the Andes of South America; also in the Lesser Antilles and Jamaica (the type locality), mainly at 1,000 to 1,800 meters elevation.

Primary pinnæ 1 to 3 pairs, oblong, 1 to 1.5 meters long, 30 to 50 cm. broad, bipinnate; pinnules very numerous; segments narrowly linear, 1.5 to 2.2 cm. long, herbaceous, glabrous or nearly so, glaucous beneath; sori 3 to 5-sporangiate.

2. *Dicranopteris flexuosa* (Schrad.) Underw. Bull. Torrey Club 34: 254. 1907.

Mertensia flexuosa Schrad. Gött. Anz. Ges. Wiss. 1824: 863. 1824.

Mertensia rigida Kunze, Linnaea 9: 16. 1834.

Gleichenia flexuosa Mett. Ann. Lugd. Bat. 1: 50. 1863.

Gleichenia rigida Bomm. & Christ, Bull. Soc. Bot. Belg. 35: 174. 1896. Not

G. rigida J. Smith, 1841.

Mountains of Veracruz, at about 1,300 meters altitude. Guatemala to Brazil; widely distributed in the West Indies, mainly at low elevations; near Mobile, Alabama; type from Brazil.

Leaf axis 2 to 4 mm. in diameter; primary branches several pairs, repeatedly dichotomous, never developing a secondary axis, the internodes unequal, naked; pinnæ glabrous; segments glaucous beneath, linear, retuse, narrowly connected at the dilatate base, revolute.

3. *Dicranopteris pectinata* (Willd.) Underw. Bull. Torrey Club 34: 260. 1907.

Mertensia pectinata Willd. Svensk. Vet. Akad. Handl. II. 25: 168. 1804.

Gleichenia nitida Presl, Rel. Haenk. 1: 70. 1825.

Mertensia elata Desv. Mém. Soc. Linn. Paris 6: 201. 1827.

Mertensia nitida Presl, Tent. Pter. 51. 1836.

Mountains of Veracruz. General throughout tropical America, the type from near Caracas, Venezuela.

Leaf axis 3 to 6 mm. in diameter; primary branches several pairs, stipulate, repeatedly and unequally dichotomous, a false flexuous secondary axis formed by the alternate production of the unequal secondary branches, the included bud of each dichotomy always abortive; segments oblong to linear-oblong, pruinose beneath, glabrous, or the costa and veins sparsely rusty-paleaceous.

A variable species.

4. *Dicranopteris bifida* (Willd.) Maxon, N. Amer. Fl. 16: 60. 1909.

Mertensia bifida Willd. Svensk. Vet. Akad. Handl. II. 25: 168. 1804.

Gleichenia bifida Spreng. Syst. Veg. 4: 27. 1827.

Mertensia fulva Desv. Mém. Soc. Linn. Paris 6: 201. 1827.

Dicranopteris fulva Underw. Bull. Torrey Club 34: 255. 1907.

Mountains of Veracruz. Common and generally distributed throughout the

West Indies and Central America, southward into South America; type from Caracas, Venezuela.

Leaf axis stout, light greenish brown; primary branches 2 or several pairs, these once or twice dichotomous (rarely developing a secondary axis), the internodes at least partially naked; segments mostly linear, dilatate (the sinuses obtuse), entire, revolute.

5. *Dicranopteris underwoodiana* Maxon, *N. Amer. Fl.* 16: 59. 1909.

Temperate region of Chiapas, the type locality. Also in the high mountains of Quiché, Guatemala.

Leaf axis reddish brown, 2 to 3 mm. in diameter; primary branches usually 2 pairs, twice dichotomous (not developing a secondary axis), the primary internode nearly naked, the secondary ones fully pectinate; pinnae linear, 18 to 30 cm. long, the rachises closely invested with short rusty scales.

6. *Dicranopteris palmata* (Schaffn.) Underw. *Bull. Torrey Club* 34: 259. 1907.

Mertensia palmata Schaffn.; Fée, *Mém. Foug.* 9: 40 (32). 1857, name only.

Gleichenia palmata Moore, *Ind. Fil.* 380. 1862, name only.

Mountains of Veracruz, the type from Orizaba. Also in Guatemala (Alta Verapaz), eastern Cuba, and the Blue Mountains of Jamaica, at altitudes of 900 to 1,650 meters.

Leaf axis olivaceous, opaque; primary branches 2 or 3 pairs, divergent, usually 2 to 4 times dichotomous (rarely developing a secondary axis), the first and second internodes usually naked; pinnae 20 to 25 cm. long.

2. CYATHEACEAE. Tree-fern Family.

(Contributed by Mr. William R. Maxon.)

REFERENCES: Cyatheaceae, Diels in *Engl. & Prantl. Pflanzenfam.* 1⁴: 113-139. 1899; Maxon, *The tree ferns of North America*, *Ann. Rep. Smiths. Inst.* 1911: 463-491. *pl.* 1-15. 1912.

Mainly tree-like plants of moist tropical regions, the rhizome stout and woody, decumbent, oblique, or usually erect, and 1 to 15 meters high or more, naked, with smoothish, usually tessellate leaf scars, or rough and partially sheathed by the imperfectly deciduous stipe bases of the fronds of previous years; fronds borne in a terminal scaly crown, several or many, ascending to recurved, the blades 1 to 4-pinnate, up to 4 meters long, usually broad; sori indusiate or nonindusiate, nearly globose, borne dorsally upon the veins on the under surface of the blade or at the margin, the receptacle elongate, of various form and vestiture; sporangia numerous, crowded radially in several ranks, opening horizontally, the annulus oblique, with or without a stomium of thin-walled cells; spores triplanate.

The Cyatheaceae, or tree-fern family—the latter name given because, in contradistinction to all other families of ferns, the species are nearly all arborescent in habit of growth—are practically confined to tropical and subtropical regions and attain their best development, both as to luxuriant growth and as to number of species and individuals, in mountainous regions which have a nearly uniform, moist climate. Except in a very few cases they apparently can not endure extremes of either drought or cold. Thus in Mexico, as in Central America, they are practically confined to the Atlantic slopes and to the higher mountain regions that are constantly swept by the moisture-laden trade winds from the Gulf of Mexico. This territory embraces Veracruz and Tabasco and most of Oaxaca and Chiapas. From the arid interior plateau regions they are altogether lacking. Comparatively little material having been collected in extreme southeastern Mexico in recent years, our knowl-

edge, both of the species actually occurring there and of their geographic distribution, is very incomplete. Tree ferns are, as a rule, of restricted range, yet many of the Mexican species are known from Alta Verapaz, Guatemala, and of the remainder most, at least, may be expected to occur there. With a very few exceptions, the Mexican species are exclusively continental, and only a few extend as far south as Panama.

Aside from the attention attracted by their beauty and stately habit of growth, tree ferns are decidedly interesting because of their marked diversity in structural characters and, unfortunately, their difficult classification. Locally, at least, they serve varied economic uses also, the most important being the use of the trunks as building timbers. These are composed largely of a branched network of hard fibrovascular elements, resistant to decay and the attacks of termites alike, permitting the use of the trunks over and over again in the supporting framework of native houses. Occasionally they are made to serve as telegraph poles. Small pieces of the fibrovascular elements are employed in inlay work. In Costa Rica the succulent unrolling young fronds or "crossiers" of a *Cyathea* called "rabo de mico" are eaten as a salad. The scales of a related species (probably *Cyathea mexicana*), known in Veracruz as "ocopetate" or "cola de mono," are applied topically as a hemostatic. A like use of the matted capillary scales or "pulu" of Hawaiian species of *Cibotium* is, of course, well known. Several species of *Hemitelia* and *Alsophila* are known as "tatahueso" in Oaxaca, according to Reko.

Sori borne upon the back of the veins, commonly near the costule or at least not marginal; indusium (if present) not formed in part of the modified leaf margin.

Sori distinctly indusiate, the indusium attached at the base of the receptacle.

Indusia either (1) cup-shaped or saucer-shaped, never wholly inclosing the sporangia, persistent, or (2) globose, at first wholly containing the sporangia, rupturing at maturity, the divisions persistent to fugacious.

1. CYATHEA.

Indusia inferior, more or less semicircular in outline, often lobed and scale-like or sometimes cleft or lacerate, never inclosing all the sporangia.

2. HEMITELIA.

Sori usually nonindusiate, a very minute basal scale present in a few species.

3. ALSOPHILA.

Sori terminal upon the veins at or near the margin; indusium bilobate or bivalvate, the outer portion a more or less modified, concave lobule of the leaf margin.

Outer lip of the indusium formed of slightly modified leaf tissue, unlike the rigid brownish inner one.....4. DICKSONIA.

Outer lip of the indusium formed of highly differentiated cartilaginous tissue, similar to the inner one.....5. CIBOTIUM.

1. CYATHEA J. E. Smith, Mem. Accad. Sci. Torino 5: 416. 1793.

Caudex erect in most species, arboreous, bearing numerous adventitious roots in the basal part, in mature individuals usually smoothish above, with close-set to distant scars; fronds borne in a terminal crown, oblique, spreading, or rarely drooping, the stout stipes strongly aculeate to muricate, tuberculate, or nearly smooth, paleaceous toward the base; blades 2 or 3-pinnate, usually 1 to 3 meters long, lanceolate to oblong or ovate, the rachises variously pubescent, furfuraceous, or minutely paleaceous, glabrescent with age; pinnules subentire to pinnate, sessile to long-petiolate, deciduous or not; veins free, usually branched; sori dorsal, apart from the margin; indusium either (1) inferior and saucer-shaped, never wholly inclosing the sporangia, persistent,

with even margins, or (2) globose, at first wholly inclosing the sporangia, bursting irregularly at maturity, the divisions persistent or often disappearing. *Indusia* saucer-shaped, never inclosing the sporangia, with low even margins.

1. *C. arborea*.

Indusia at first globose and inclosing the sporangia, at length rupturing, the divisions persistent to fugacious.

Pinnules (secondary pinnae) distinctly petiolate, the lower ones with stalks 4 to 9 mm. long; leaf tissue coriaceous.....2. *C. tuerckheimii*

Pinnules mostly sessile or nearly so, membranous or herbaceous.

Rachises of the pinnae densely clothed with spreading or retrorse, linear, spinulose scales, sharply muricate from their persistent bases; pinnules cut to the costa nearly throughout.....3. *C. princeps*.

Rachises of the pinnae bearing a few deciduous scales, smooth or nearly so; pinnae very deeply pinnatifid, but the segments distinctly though narrowly joined.

Costae of the pinnules glabrous beneath; leaf tissue bright green beneath; sori large, apart from the costule.....4. *C. jurgensenii*.

Costae pilose or minutely squamulose beneath; leaf tissue much paler beneath than above; sori small, borne near or against the costule.

Pinnae long-petiolate (4 cm. or more); pinnules about 20 pairs; segments obtuse; veins 6 to 8 pairs, glabrous.....5. *C. trejoi*.

Pinnae subsessile or short-petiolate; pinnules 30 to 40 pairs; segments acute or acuminate; veins 8 to 12 pairs, usually minutely glandular-pubescent.....6. *C. mexicana*

1. *Cyathea arborea* (L.) J. E. Smith. Mem. Accad. Sci. Torino 5: 417. 1793.

Polypodium arboreum L. Sp. Pl. 1092. 1753.

Disphenia arborca Presl, Tent. Pter. 56. 1836.

Hemitelia arborca Fée, Mém. Foug. 5: 350. 1852.

Lowlands of eastern Mexico; rare. Generally distributed and common in the West Indies, the type from Martinique; variously reported from Central America and northern South America, probably in error.

Caudex erect, 4 to 12 meters high, usually with close-set, oval to broadly subhexagonal scars in 8 to 10 ranks, the apex clothed with large, lance-attenuate, dirty white scales; fronds 2.5 to 4 meters long; stipes stout, pale, low-tuberculate; blades 2 to 3 meters long, ovate, tripinnate, the rachises pale, glabrate; pinnae oblong, 40 to 80 cm. long, petiolate, or the shorter basal ones ovate and long-petiolate; pinnules numerous, mostly sessile, spreading, oblong-lanceolate, long-attenuate; segments linear-oblong, dilatate, sharply serrate, often revolute, the costule invariably with 1 or 2 white bullate scales at the base beneath; veins 1 to 3-forked.

This is one of the few species of Cyatheaceae which grow naturally in open sunny situations. It occurs often in colonies.

2. *Cyathea tuerckheimii* Maxon, Contr. U. S. Nat. Herb. 13: 4. 1909.

Region of Orizaba, Veracruz, at an altitude of about 1,300 meters. Also near Cobán, Alta Verapaz, Guatemala (the type locality), at 1,350 to 2,000 meters elevation.

Caudex erect, 3 to 4 meters high; fronds ample, at least 130 cm. broad, bipinnate-pinnatifid, the stout primary rachis deciduously furfuraceous, minutely spiny; pinnae oblong-lanceolate, acuminate, up to 65 cm. long, the rachis strongly muricate; pinnules 28 to 30 pairs, contiguous, short-petiolate, oblong-lanceolate, attenuate, up to 13 cm. long, pinnately cut nearly to the minutely and deciduously scaly costa; segments about 22 pairs, 10 to 12 mm. long, oblong, falcate, subacute, coriaceous, the crenate-serrate margins revo-

lute; sori large, 6 to 9 pairs, seated at the fork of the once-branched veins, the irregular divisions of the membranous indusium subsistent.

3. *Cyathea princeps* (Linden) E. Mayer, *Gartenflora* 17: 10. 1868.

Cibotium princeps Linden; E. Mayer, *Gartenflora* 17: 10. 1868, as synonym.

Cyathea bourgaei Fourn. Mex. Pl. Crypt. 135. 1872.

Cyathea munchii Christ, Bull. Herb. Boiss. II. 7: 413. 1907.

Veracruz and Chiapas, the type from the Volcano Tuxtla, Veracruz. Also in the mountains of Alta Verapaz, Guatemala; ascribed also to Costa Rica, but probably erroneously.

Caudex erect, stout, said to reach a height of nearly 20 meters; fronds at least 4 meters long; stipes 1 to 1.5 meters long, together with the yellowish primary and secondary rachises densely clothed with narrow, yellowish, spinulose, spreading or retrorse scales; blades broadly ovate, 2 to 2.5 meters long, tripinnate; pinnae oblong-lanceolate, acuminate, up to 1 meter long and 35 cm. broad, long-stalked; pinnules very numerous, approximate, linear-oblong, up to 18 cm. long, narrowly long-acuminate, the costa minutely and deciduously scaly beneath; segments 25 to 32 pairs, linear-oblong, dilatate, falcate, subentire, acutish, pruinose beneath, the costa with a few minute, simple or cleft scales; sori large, 6 to 9 pairs, the coriaceous indusium splitting into 2 to 4 persistent saccate lobes.

4. *Cyathea jurgensenii* Fourn. Mex. Pl. Crypt. 135. 1872.

Mountains of Oaxaca and Veracruz, the type from Oaxaca; rare.

Caudex presumably erect and several meters high; fronds ample, the blades bipinnate-pinnatifid, 1 meter broad or more, the primary rachis pale, minutely spinose; pinnae oblong, abruptly acuminate, mostly petiolate, up to 65 cm. long, the rachis smooth or nearly so, glabrate beneath; pinnules about 25 pairs, articulate, petiolate, deltoid-lanceolate, long-acuminate, 10 to 12 cm. long, very deeply pinnatifid, the costa nearly or quite glabrous beneath; segments 18 to 20 pairs, close, oblong, falcate, acute, obscurely crenate-serrate, bright green and nearly or quite glabrous on both surfaces; sori 4 to 8 pairs, apart from the costule, only the flat lobate basal portion of the pale yellowish membranous indusium persistent.

5. *Cyathea trejoi* Christ, Bull. Herb. Boiss. II. 5: 733. 1905.

Known only from San Pablo, Chiapas, altitude 1,500 meters, the type locality.

Caudex erect, long and slender, very spiny; fronds rather small, the primary rachis stout, smooth, stramineous or reddish, shining; pinnae articulate, easily deciduous, narrowly ovate, acuminate, 30 cm. long or more, long-petiolate; pinnules about 20 pairs, approximate, readily separable, lanceolate, 5 to 6 cm. long, cut nearly to the scantily pilose costa; segments about 15 pairs, oblong, subfalcate, obtuse, slightly dilatate, crowded, light green beneath, lightly crenate; sori 2 or 3 pairs, very small, basal, close to the costule, the delicate indusium grayish.

6. *Cyathea mexicana* Schlecht. & Cham. *Linnaea* 5: 616. 1830.

Cyathea hexagona Fée & Schaffn.; Fée, *Mém. Foug.* 8: 111. 1857.

Cyathea articulata Fée, *Mém. Foug.* 8: 111. 1857.

Cyathea glauca Fourn. Mex. Pl. Crypt. 135. 1872. Not *C. glauca* Bory, 1804.

Alsophila mucronata Christ, Bull. Soc. Bot. Belg. 35: 178. 1896.

Cyathea arida Christ, Bull. Herb. Boiss. II. 6: 180. 1906.

Veracruz to Chiapas, the type from Jalapa. Also in Guatemala (Alta Verapaz), Costa Rica, and western Panama, at 120 to 1,300 meters.

Caudex 3 to 10 meters high, unarmed; fronds 2 to 3 meters long, the stipe clothed at the base with brown acicular scales about 1 cm. long and armed with a few sharp conical shining black spines; blade 1.5 to 2.5 meters long.

oblong, bipinnate-pinnatifid; primary rachis stout, usually castaneous, deciduously puberulo-furfuraceous; pinnae oblong-lanceolate, acuminate, up to 85 cm. long, short-petiolate, deciduous; pinnules articulate, readily separable, 30 to 40 pairs, often distant, oblong-lanceolate, up to 10 cm. long (usually smaller), sessile or short-stalked, the costa beneath bearing a few antrorse hairs and deciduously squamulose toward the base; segments narrowly oblong, oblique, subfalcate, obscurely serrulate, connected by a wing 1 to 1.5 mm. broad on each side of the costa; sori 4 to 7 pairs, close to the costule, the divisions of the pale membranous indusium mostly fugacious.

A variable species.

2. *HEMITELIA* R. Br. Prodr. Fl. Nov. Holl. 158. 1810.

REFERENCES: Maxon, The North American species of *Hemitelia*, subgenus *Cnemidaria*, Contr. U. S. Nat. Herb. 16: 25-49. pl. 18-26. 1912; Maxon, The North American species of *Hemitelia*, section *Euhemitelia*, Contr. U. S. Nat. Herb. 17: 414-420. pl. 17-22. 1914.

Similar in general to *Cyathea*, but having the indusium inferior, more or less hemispherical, and varying from lobed to lacerate; or, in the American subgenus *Cnemidaria*, the plants mostly with short ascending trunks, coarse, succulent, pinnate or rarely bipinnate fronds, free-veined or not, the indusium hemispheric, concave, often lobed.

Blades fully bipinnate, the pinnules sessile and very deeply pinnatifid; indusium deeply lacerate, the divisions with long filamentous apices.

1. *H. costaricensis*.

Blades pinnate, the pinnae lightly crenate to pinnatifid; indusia entire or merely lobed.

Veins all free; pinnae pinnatifid at least two-thirds the distance to the costa, the segments oblong, acuminate, aristate-----2. *H. apiculata*.

Veins (basal) united by a transverse veinlet, a single row of costal areoles thus formed; lobes or crenations low or short, not acuminate.

Pinnae lightly crenate-serrate, decurrent-----3. *H. decurrens*.

Pinnae deeply crenate to crenately lobed, not decurrent.

Larger crenations 5 to 7 mm. broad, acute distally; pinnae 2.5 to 3 cm. broad-----4. *H. mexicana*.

Larger crenations 9 to 12 mm. broad, rounded; pinnae 3.5 to 4.2 mm. broad-----5. *H. lucida*.

1. *Hemitelia costaricensis* (Klotzsch) Mett.; Kuhn, *Linnaea* 36: 159. 1869.

Cyathea costaricensis Klotzsch; Kuhn, *Linnaea* 36: 159. 1869, as synonym.

Mountains of Veracruz and Chiapas. Also in western Guatemala and in Costa Rica (the type locality), ascending to 1,000 meters.

Caudex erect, 1 to 2 meters high, or more; pinnae narrowly oblong, acuminate, mostly 50 to 70 cm. long; pinnules 23 to 27 pairs, mostly sessile, linear-oblong, long-acuminate or attenuate; segments 20 to 23 pairs, narrowly oblong, subfalcate, acute, connected by a narrow costal wing.

2. *Hemitelia apiculata* Hook. in Hook. & Baker, Syn. Fil. 29. 1868.

Mountains of Oaxaca, the type locality.

Blades 35 to 50 cm. broad; pinnae narrowly oblong-lanceolate, 18 to 30 cm. long, 2.5 to 4.5 cm. broad below the narrowly long-acuminate apex, pinnatifid at least two-thirds the distance to the costa, the sinuses linear and very acute.

3. *Hemitelia decurrens* Liebm. Dansk. Vid. Selsk. Skrivt. V. 1: 285. 1849.

Hemistegia decurrens Fourn. Mex. Pl. Crypt. 135. 1872.

Mountain forests near Lobani, District of Chinantla, Oaxaca, at 900 to 1,050 meters; known only from the type collection.

Caudex about 30 cm. high; blades ovate-lanceolate, about 75 cm. long; pinnae narrowly oblong-lanceolate, 12 to 15 cm. long, 2.5 to 3 cm. broad, the upper ones adnate and confluent, those below semiadnate, constricted, narrowly long-decurrent.

4. *Hemitelia mexicana* Liebm. Dansk. Vid. Selsk. Skrivt. V. 1: 287. 1849.

Hemistegia mexicana Fourn. Mex. Pl. Crypt. 135. 1872.

Oaxaca, in mountain forests near Cacolá, District of Chinantla, at 750 to 900 meters altitude; known only from the original collection.

Caudex about 30 cm. high; blades broadly lanceolate, 1.5 to 1.8 meters long; pinnae linear, about 30 cm. long; main veins 50 pairs, spreading, 4 to 7 mm. apart.

5. *Hemitelia lucida* (Fée) Maxon, Contr. U. S. Nat. Herb. 16: 39. 1912.

Hemistegia lucida Fée, Gen. Fil. 351. 1852.

District of Chinantla, Oaxaca, at 2,000 meters altitude; known only from the type collection.

Blades ovate-oblong, 2 meters long or less; pinnae numerous, linear-lanceolate, up to 45 cm. long; main crenations or lobes 28 to 34 pairs.

3. *ALSOPHILA* R. Br. Prodr. Fl. Nov. Holl. 158. 1810.

Similar to *Cyathea*, but having the indusia wholly lacking or, in a few species, represented by a very minute, concealed, vestigial, basal scale; receptacles often copiously long-paraphysate.

Two subgenera, *Lophosoria* and *Amphidesmium*, are unique in their silky capillary scales, which are similar to those of *Cibotium* and *Dicksonia*. They differ notably from typical *Alsophila* in other morphological characters also and possibly should be regarded as distinct genera. *Amphidesmium* is not known to occur in Mexico, though it occupies a wide range southward. *Lophosoria* is represented by the variable and widely distributed *A. quadripinnata*, the first-mentioned species below.

Blades waxy-pruinose beneath, the rachises, costae, and veins lanate with lax, tortuous, pale rusty, septate hairs; sori with low hemispheric receptacles; caudex and stipe bases densely clothed with silky capillary scales 1 cell broad.....1. *A. quadripinnata*.

Blades not waxy-pruinose beneath, the rachises and costae paleaceous or furfureaceous, with or without spreading hairs; sori with capitate or spheric receptacles; caudex and stipe bases bearing flat scales many cells broad. Primary and secondary rachises blackish; blades fully tripinnate, the segments stalked.....2. *A. salvinii*.

Primary and secondary rachises stramineous to yellowish or light brown; blades simply bipinnate or bipinnate-pinnatifid.

Blades bipinnate only, the pinnules sinuate to crenate...3. *A. marginalis*.

Blades bipinnate-pinnatifid, the segments connected by a narrow wing.

Segments rounded-obtuse, shallowly and broadly crenate.

4. *A. schiedeana*.

Segments acute or acutish, sharply incised to pinnatifid.

Costae of pinnules thinly squamulose, nearly devoid of long spreading septate hairs beneath; primary rachis with pungent, spreading or retrorse, scattered spines throughout, the secondary rachises similarly armed.....5. *A. microdonta*.

Costae with numerous spreading hairs beneath, these extending to the costules and often to the veins; primary rachis unarmed, or plainly aculeate only toward the base, the secondary rachises merely muricate.

Pinnae and pinnules petiolate; costae and costules devoid of bullate scales_____6. *A. myosuroides*.

Pinnae and pinnules sessile; costules bearing small, subsistent, white or yellowish, bullate scales beneath.

Segments pinnatifid; primary and secondary rachises with occasional large flat persistent white scales_____7. *A. mexicana*.

Segments deeply incised to deeply crenate-serrate; rachises devoid of large whitish scales.

Bullate scales deciduous, few, confined to the base of the costules; segments sparsely hirsute above along the costules and veins_____8. *A. scabriuscula*.

Bullate scales persistent, numerous; segments glabrous above.
9. *A. bicrenata*.

1. *Alsophila quadripinnata* (Gmel.) C. Chr. Ind. Fil. 47. 1905.

Polypodium quadripinnatum Gmel. Syst. Nat. 2²: 1314. 1791.

Polypodium pruinatum Swartz. Journ. Bot. Schrad. 1800²: 29. 1801.

Alsophila pruinata Kaulf.; Kunze, Linnæa 9: 99. 1834.

Lophosoria pruinata Presl, Abh. Böhm. Ges. V. 5: 345. 1848.

Trichosorus glaucescens Liebm. Dansk. Vid. Selsk. Skrivt. V. 1: 283. 1849.

Trichosorus densus Liebm. Dansk. Vid. Selsk. Skrivt. V. 1: 284. 1849.

Trichosorus frigidus Liebm. Dansk. Vid. Selsk. Skrivt. V. 1: 284. 1849.

?*Alsophila schaffneriana* Fée, Mém. Foug. 8: 109. 1857.

Mountains of Veracruz, Puebla, Oaxaca, and Chiapas, ascending to 3,000 meters. Central America to Chile and Argentina; Greater Antilles, the type from Jamaica.

Rhizomes stout, up to 3 meters high (usually less than 1 meter), often multicapital, densely lanate with lax, tortuous, pale rusty, capillary scales; fronds 2 to 4.5 meters long, long-stalked, the blades subtriangular, tripinnate-pinnatifid.

2. *Alsophila salvinii* Hook. in Hook. & Baker. Syn. Fil. 36. 1866.

Alsophila munchii Christ, Bull. Herb. Boiss. II. 5: 734. 1905.

Region of San Pablo, Chiapas, at 2,200 meters altitude. Also in the mountains of Alta Verapaz, Guatemala, at 1,400 to 1,600 meters elevation, the type from Chilasco.

Trunk 1 to 1.5 meters high; blades very ample, at least 1.5 meters broad, the primary and secondary rachises blackish, polished, woody, nearly or quite smooth; pinnae 60 to 80 cm. long, 20 to 30 cm. broad; pinnules 22 to 25 pairs, close, spreading; segments 1 to 2 cm. long, 3 to 4 mm. broad, obtusely pinnatifid or crenately lobed; costae and costules deciduously paleaceous beneath, the scales minute, many of them stellate, with blackish spinous processes.

3. *Alsophila marginalis* Klotzsch, Linnæa 18: 542. 1844.

Hemitelia marginalis Jenman, Ferns Brit. W. Ind. Guian. 43. 1898.

Sierra San Nolasco, Oaxaca. Also in British Guiana, the type locality. Very rare.

Stipe sparsely short-aculeate, paleaceous above; blades 1.5 to 1.8 meters long, deciduously paleaceous; pinnae alternate, elongate-oblong, 20 to 38 cm. long, gibbose-articulate; pinnules sessile or short-petiolate, spreading, hastate-lanceolate, or ligulate from a cordate base, 2 to 8 cm. long, 8 to 15 mm. broad, sinuate to deeply crenate; sori in a continuous line 1 to 1.5 mm. from the margin.

4. *Alsophila schiedeana* Presl; Kunze, *Linnaea* 13: 149. 1839.

Mountains of Veracruz and Chiapas, the type from Veracruz. Also in eastern Guatemala, apparently common, at 275 to 1,000 meters altitude.

Arborescent; stipe dull brown, angulate, freely armed with stout straight spines up to 5 mm. long; blades ample, the rachis pale brown, aculeolate; pinnae spreading, linear-oblong to oblong, acuminate, up to 70 cm. long and 25 cm. broad, the secondary rachis decidedly squamulose-puberulous beneath; pinnules linear-oblong, acute or acuminate, spreading, with minute hairs and brown bullate scales beneath, the latter extending to the costules; veins simple or once forked, glabrous; sori nearly medial. "Malque" (Chiapas).

5. *Alsophila microdonta* Desv. *Mém. Soc. Linn. Paris* 6: 319. 1827.

Polypodium microdonton Desv. *Ges. Naturf. Freund. Berlin Mag.* 5: 319. 1811.

Polypodium aculeatum Raddi, *Opusc. Sci. Bologna* 3: 288. 1819. Not *P. aculeatum* L. 1753.

Alsophila armata Mart. *Icon. Pl. Crypt.* 72. *pl.* 28, 48. 1834. Not *A. armata* Presl, 1836.

Veracruz and Tabasco. Guatemala to Brazil, mainly at low elevations near the coast; known in the West Indies only from the Isle of Pines; type doubtfully South American.

Caudex 1 to 5 meters high; fronds arcuate-spreading, 2 to 2.5 meters long, the long brown stipes freely armed with very short, narrowly conical spines up to 1 cm. long, similar but smaller ones occurring sparsely on the primary and secondary rachises throughout; pinnae narrowly oblong, abruptly acuminate, 30 to 60 cm. long, 10 to 25 cm. broad; pinnules spreading, linear-oblong, attenuate; segments linear, falcate, obliquely incised except at the dilatate base, membranous, the costule bearing a few long septate hairs beneath and, with the veins, also thinly and laxly puberulous with minute tortuous hairs; sori numerous, nearly medial, often confluent.

6. *Alsophila myosuroides* Liebm. *Dansk. Vid. Selsk. Skrivt. V.* 1: 236. 1849.

Veracruz to Chiapas, at low elevations, the type from the region of Chinantla. British Honduras, eastern Guatemala, and Honduras, at 180 meters altitude or less; abundant in the province of Pinar del Río, Cuba, and the Isle of Pines, herbarium material having been widely distributed under the manuscript name *Alsophila wrightii* Underw.

Caudex $\frac{3}{5}$ to 5 meters high; fronds ample, the stout brown stipes thickly aculeolate and clothed with copious stiff, acicular, bright brown scales at the base, muricate above; pinnae petiolate, narrowly oblong, long-acuminate, 40 to 65 cm. long, 15 to 22 cm. broad; pinnules stalked, linear-attenuate or oblong-linear and abruptly long-caudate, the costae sparsely hirsute beneath; segments linear, falcate, acutish, serrate, herbaceous, dull green; costules sparsely hirsute beneath; sori very numerous, usually confluent.

7. *Alsophila mexicana* Mart. *Icon. Pl. Crypt.* 70. *pl.* 45. 1834.

Alsophila godmani Hook. in Hook. & Baker, *Syn. Fil.* 36. 1866.

Mountains of Oaxaca and Chiapas, the type from San Pablo de Teoxomulco, Oaxaca. Also in Alta Verapaz, Guatemala, at 900 to 1,550 meters altitude.

Caudex arborescent, presumably several meters high; blades ample; primary rachis stout, apparently unarmed, subpersistently furfuraceous, bearing scattered large whitish scales, and hirsute with long inflated tawny septate hairs, their bases persistent, the rachis thus invariably scabrous in age; pinnae narrowly oblong, acuminate, 50 to 60 cm. long, 16 to 22 cm. broad, the rachis similar to the primary one; pinnules close or subimbricate, sessile, linear-oblong, rather abruptly long-acuminate; segments herbaceous, pinnatifid, sparsely hirsute along the costules and veins on both surfaces.

8. *Alsophila scabriuscula* Maxon, Proc. Biol. Soc. Washington 32: 125. 1919.

Region of Córdoba, Veracruz. Also in Alta Verapaz, Guatemala, the type from Cubilquitz, altitude 350 meters.

Caudex arborescent, presumably stout and several meters high; fronds very ample, the stout stipe bearing numerous slender conical spines about 4 mm. long; blades ample, the primary rachis sparsely aculeate toward the base, hirsute, scabrous from the persistent bases of the pale spreading septate hairs; pinnae narrowly oblong, acuminate, 50 to 75 cm. long, 18 to 30 cm. broad, the secondary rachis hirsute, scabrous with age; pinnules approximate, spreading, sessile, oblong-linear, long-acuminate; segments herbaceous, deeply incised, the lobes usually bidentate; costules and veins sparsely hirsute beneath and with a thin covering of minute, closely appressed, septate hairs.

9. *Alsophila bicrenata* (Liebm.) Fourn. Mex. Pl. Crypt. 134. 1872.

Cyathea bicrenata Liebm. Dansk. Vid. Selsk. Skrift. V. 1: 289. 1849.

Mountains of Veracruz, Puebla, Oaxaca, and Chiapas, at 1,200 to 2,100 meters elevation, the type from Puebla.

Caudex 5 to 10 meters high, up to 15 cm. thick; stipe short, yellowish brown, short-aculeate; blades 2 to 4 meters long, elongate-lanceolate, the primary rachis sparingly hirsute with gland-tipped, laxly unciform, septate hairs, scabrous from their persistent inflated bases; pinnae oblong-lanceolate, acuminate, 45 to 60 cm. long, 14 to 20 cm. broad; pinnules 25 to 30 pairs, linear, attenuate, 10 to 15 mm. broad, sessile; segments narrowly oblong, subfalcate, herbaceous, deeply crenate-serrate, the teeth bidentate.

4. *DICKSONIA* L'Hér. Sert. Angl. 30. 1788.

REFERENCE: Maxon, The North American tree ferns of the genus *Dicksonia*, Contr. U. S. Nat. Herb. 17: 153-156. 1913.

Caudex erect, 1 to 10 meters high or more, stout, often with a thick growth of adventitious roots toward the base, greatly thickened above by the long-persistent stipe bases of old fronds; fronds numerous, rigidly ascending in a terminal crown, the short stout stipes and the summit of the caudex with a copious covering of bright brown to ferruginous silky capillary scales, these straight or matted, several cm. long, one cell broad; lamina ovate to oblanceolate, 2 to 3-pinnate; pinnae mostly equilateral, the pinnules elongate; segments coriaceous or rigidly herbaceous, dimorphous or (in our species) uniform; veins simple or several times forked; sori terminal; indusium bivalvate, the outer lip consisting of a deeply concave, rounded, greenish, scarcely modified lobule of the leaf margin, the inner lip dark or yellowish brown, deeply concave, usually coriaceous and equaling the outer lip.

1. *Dicksonia ghiesbreghtii* Maxon, Contr. U. S. Nat. Herb. 17: 155. 1913.

Temperate mountain region of Chiapas, the type collected by Ghiesbreght.

Caudex 4 to 5 meters high; blades essentially tripinnate; primary pinnae linear-oblong, acuminate, 60 to 70 cm. long, about 20 cm. broad, the rachis slightly rough from the abrasion of the articulate, turgid, dirty yellow, capillary scales; pinnules numerous, contiguous, alternate, sessile, linear-oblong, long-acuminate, the costa with a few capillary scales beneath; segments 20 pairs or more, linear-oblong, straight or subfalcate, 10 to 15 mm. long, the sterile ones serrate to obliquely incised, the fertile ones pinnatifid two-thirds the distance to the elevated costule; veins 7 or 8 pairs, those of the fertile segments usually once forked; sori mostly 4 or 5 pairs, 1 mm. broad.

5. **CIBOTIUM** Kaulf. Berlin, Jahrb. Pharm. 21: 53. 1820.

REFERENCE: Maxon, The American species of *Cibotium*, Contr. U. S. Nat. Herb. 16: 54-58. *pl.* 30-32. 1912.

Caudex stout, 1 to 8 meters high, sometimes from its covering of adventitious roots and old stipe bases attaining a diameter of nearly one meter; fronds erect-arching, the stout stipes and upper caudex clothed with capillary scales as in *Dicksonia*; blades ample, of an ovate-deltoid type, bipinnate to tripinnate-pinnatifid, the rachises smooth or nearly so, glabrescent; pinnae mostly inequilateral, the distal pinnules much longer than the proximal ones; pinnules similarly inequilateral, deltoid-oblong to linear. asymmetrical; under surfaces pruinose to ceraceo-papillate, glabrous, hairy, or rarely subfurfuraceous; veins oblique, the fertile ones usually simple; sori terminal, essentially marginal; indusium deeply bivalvate, the outer lip consisting of a highly differentiated saccate portion of the leaf margin, the inner of an orbicular to linguiform cartilaginous operculum affixed at its base, somewhat reflexed at maturity.

Larger pinnae 40 to 50 cm. long; sori mostly distant, usually extending outward in the plane of the segment, the inner lip of the indusium as large as the outer one; leaf tissue chartaceous-membranous-----1. **C. schiedei**.

Larger pinnae 60 to 80 cm. long; sori contiguous, erect, or the narrower and slightly longer inner lip strongly reflexed at maturity and overlying the costule; leaf tissue rigidly herbaceous-----2. **C. regale**.

1. **Cibotium schiedei** Schlecht. & Cham. Linnaea 5: 616. 1830.

Dicksonia schiedei Baker in Hook. & Baker, Syn. Fil. 50. 1868.

Humid mountain forests of Oaxaca and Veracruz, at 600 to 1,200 meters altitude, the type from Hacienda de la Laguna, Veracruz.

Caudex 1 meter high or less or (according to Galeotti) attaining a height of 4.5 meters; fronds 1.2 to 1.8 meters long, the blade at least 80 cm. broad, pinnae ascending, deltoid-oblong to deltoid-lanceolate, abruptly acuminate; pinnules 28 to 30 pairs, pinnatifid nearly to the costa, the larger distal ones 11 to 16 cm. long; segments 25 to 30 pairs, conspicuously pruinose and ceraceo-papillate beneath.

2. **Cibotium regale**-Versch. & Lem. Ill. Hort. 15: under *pl.* 548. 1868.

Dicksonia regalis Baker in Hook. & Baker, Syn. Fil. ed. 2. 461. 1874.

Mountains of Chiapas, whence it was introduced into cultivation by Ghiesbreght.

Caudex erect, up to 10 meters high, 40 to 50 cm. in diameter, fronds 10 to 12, widely recurved-spreading, up to 4 meters long; blades about 3 meters long, up to 1.5 meters broad; pinnae mostly spreading, deltoid-lanceolate acuminate; pinnules about 35 pairs, pinnatifid nearly to the costa; segments 30 to 35 pairs, conspicuously ceraceo-pruinose beneath.

3. **CYCADACEAE.** Cycad Family.

REFERENCE: A. De Candolle in DC. Prodr. 16²: 522-547. 1864.

Palmlike plants, the leaves pinnate, basal or clustered at the end of a trunk; flowers dioecious, in large thick cones; seeds nutlike.

Flowers of the species are important as food plants because of their edible fruits or of the starch obtained from the stems. They are often grown for ornament.

Cone scales imbricate in alternate series. Trunk covered by the persistent petioles-----1. **DIOON**.

Cone scales in vertical series.

Cone scales with 2 transverse appendages at the apex; caudex covered with persistent petioles.....2. **CERATUZAMIA**.

Cone scales naked; caudex naked.....3. **ZAMIA**.

1. **DIOON** Lindl. Bot. Reg. 1843: Misc. 59. 1843.

Pinnae entire.....1. **D. edule**.

Pinnae spinulose-denticulate.

Pinnae with numerous teeth on both margins; trunk 2 to 15 meters high.

2. **D. spinulosum**.

Pinnae entire on the lower margin, with few teeth on the upper margin; trunk short.....3. **D. purpusii**.

1. **Dioon edule** Lindl. Bot. Reg. 1843: Misc. 59. 1843.

Zamia macleni Miquel, Linnaea 18: 97. 1844.

Platyzamia rigida Zucc. Abh. Wiss. Akad. München 4: 23. 1845.

Dioon imbricatum Miquel, Wiss. Tijdschr. 1: 86. 1848.

Dioon angustifolium Miquel, Wiss. Tijdschr. 1: 37. 1848.

Dioon aculeatum Lem. Ill. Hort. Lem. 2: Misc. 91. 1855.

Dioon edule latipinna Dyer in Hemsl. Biol. Centr. Amer. Bot. 3: 191. 1883.

Nuevo León, Tamaulipas, San Luis Potosí, and Veracruz; described from cultivated plants.

Plants with a trunk 1 to 2 meters high; leaves 1 to 1.5 meters long, woolly when young, with about 200 pinnae, these linear-lanceolate, sharp-pointed; staminate cones cylindric, 20 to 30 cm. long; pistillate cones ovoid, 20 to 30 cm. long. "Chamal" (Nuevo León, Tamaulipas, San Luis Potosí); "sotol" (Tamaulipas); "palma de la virgen" (Sinaloa; in market); "palma de macetas" (Durango; cultivated).

The large chestnut-like seeds contain much starch, and are roasted or boiled and eaten. They are a favorite food of bears, peccaries, and domestic swine. A decoction of the seeds is said to be used for neuralgia. The staminate inflorescences are claimed to be poisonous to cattle, causing emaciation and partial paralysis. The plant is often seen in cultivation.

2. **Dioon spinulosum** Dyer; Eichl. Gart. Zeit. 1883: 411. 1883.

Reported from Veracruz and Yucatán.

Said to attain a height of 15 meters, although often much lower; leaves numerous, spreading, 1 to 2 meters long, with very numerous pinnae.

3. **Dioon purpusii**¹ Rose, Contr. U. S. Nat. Herb. 12: 260. 1909.

In shaded canyons. Puebla and Oaxaca; type from Tomellín Canyon, Oaxaca.

Trunk short; leaves numerous, a meter long or larger, stiff, ascending; pinnae 5 to 9 cm. long; staminate cones 15 to 20 cm. long; fertile cones about 45 cm. long and 20 cm. thick. "Chamal" (Oaxaca).

A plant with similar leaves, probably of the same species, has been collected in Tepic. Another similar plant, with glaucous leaves, is in cultivation in Sonora.

¹Named for C. A. Purpus, who has made extensive collections in Mexico in recent years, especially in Baja California, San Luis Potosí, Veracruz, Puebla, and Chiapas. His collections have included many plants previously unknown, most of which have been described by Brandegee. Sets of his collections are in the U. S. National Herbarium.

2. CERATOZAMIA Brongn. Ann. Sci. Nat. III. 5: 7. 1846.

The plants of this genus are very imperfectly known and are rarely collected. Some of them are seen occasionally in cultivation.

Petioles unarmed; pinnae about 1.3 cm. wide-----1. *C. kusteriana*.

Petioles aculeate; pinnae 1.8 to 7.5 cm. wide.

Pinnae few (about 5 pairs), semiobovate-----2. *C. miqueliana*.

Pinnae numerous (15 to 20 pairs), narrowly lanceolate.

Pinnae 10 to 12.5 cm. long. 1.8 to 3.5 cm. wide-----3. *C. latifolia*.

Pinnae 30 to 32 cm. long, about 2.5 cm. wide-----4. *C. mexicana*.

1. *Ceratozamia kusteriana* Regel, Bull. Soc. Nat. Moscou 1857: 187. 1857.

Introduced into cultivation from Mexico, the locality not stated.

Trunk short; leaves about 1.5 meters long, tomentose at first, with about 40 pinnae; staminate cones about 8 cm. long, short-pedunculate.

2. *Ceratozamia miqueliana* Wendl. Ind. Palm. 68. 1854.

Mexico, the locality not stated.

Leaves about a meter long, glaucous when young; pinnae 20 to 22.5 cm. long, about 7 cm. wide.

3. *Ceratozamia latifolia* Miquel, Wiss. Tijdschr. 1: 206. 1848.

Described from Mirador, Veracruz.

4. *Ceratozamia mexicana* Brongn. Ann. Sci. Nat. III. 5: 7. 1846.

?*Zamia galeottii* Vriese, Tijdschr. Nat. Gesch. 1845: 23. 1845.

Ceratozamia longifolia Miquel, Wiss. Tijdschr. 1: 40. 1848.

Ceratozamia intermedia Miquel, Wiss. Tijdschr. 1: 40. 1848.

Ceratozamia robusta Miquel, Wiss. Tijdschr. 1: 42. 1848.

Veracruz.

Trunk short, ovoid; leaves about a meter long; staminate cones about 10 cm. long and 4 cm. thick. "Palma" (*Ramirez*).

3. ZAMIA L., Sp. Pl. 165. 1753.

Several other species besides those listed here have been reported from Mexico, but their status is altogether doubtful. The species of the genus are known very imperfectly. The Indians of Florida used the starch extracted from the stems of the species of that region as a food known as coontie.

Pinnae oblanceolate or obovate-oblong-----1. *Z. furfuracea*.

Pinnae linear to lanceolate.

Nerves of the pinnae few (7 to 10)-----2. *Z. spartea*.

Nerves of the pinnae numerous (18 to 30 or more).

Pinnae few (about 16), usually entire-----3. *Z. cycadifolia*.

Pinnae numerous (28 to 50 or more), more or less serrulate.

Pinnae obtuse or truncate at the apex-----4. *Z. leiboldii*.

Pinnae acute or attenuate.

Pinnae about 0.8 cm. wide-----5. *Z. lawsoniana*.

Pinnae 1.5 to 3 cm. wide-----6. *Z. loddigesii*.

1. *Zamia furfuracea* L. f.; Ait. Hort. Kew. 3: 477. 1789.

Veracruz; introduced into cultivation in England as early as 1691.

Trunk 30 to 60 cm. long or obsolete; pinnae 20 to 26; pistillate cones 5 to 10 cm. long, yellow.

2. *Zamia spartea* A. DC. in DC. Prodr. 16²: 539. 1864.

Type from Acayucan, Veracruz. Guatemala.

Leaves about 30 cm. long, the petioles aculeolate; pinnae about 40, 25 to 30 cm. long, 4 to 5 mm. wide.

Reported (A. DC., loc. cit.) to be used as a remedy for snake bites.

3. *Zamia cycadifolia* Dyer in Hemsl. Biol. Centr. Amer. Bot. 3: 195. 1883.

Described from Mexico, probably from Veracruz.

Leaves bright green; pinnae linear, 12.5 to 20 cm. long, 6 to 12 mm. wide.

4. *Zamia leiboldii* Miquel, Linnaea 19: 427. 1845.

Described from Colipa, Veracruz.

Trunk very short; petioles 20 to 30 cm. long, the pinnae 28 to 44, 15 to 28 cm. long, 10 to 12 mm. wide; pistillate cone 5.5 cm. long.

5. *Zamia lawsoniana* Dyer in Hemsl. Biol. Centr. Amer. Bot. 3: 195. 1883.

Oaxaca.

Pinnae 50 or more, 22 cm. long or shorter, 8 mm. wide; staminate cone 6.5 cm. long, 2.5 cm. thick.

6. *Zamia loddigesii* Miquel, Tijdsch. Nat. Gesch. 10: 73. 1843.

Zamia mexicana Miquel, Prodr. Cycad. 13. 1861.

Southern Mexico, the locality not indicated. Guatemala.

Pinnae about 19 cm. long.

4. TAXACEAE. Yew Family.

1. TAXUS L. Sp. Pl. 1040. 1753.

1. *Taxus globosa* Schlecht. Linnaea 12: 496. 1838.

Forests of Veracruz, Hidalgo, Mexico, and Oaxaca; type from Real del Monte, Hidalgo.

Tree, 6 meters high or probably larger; leaves linear, cuspidate, 2 to 3.5 cm. long; seed nutlike, seated in a fleshy red cup-shaped disk.

The other North American species of yew have hard strong elastic close-grained reddish wood, with a specific gravity of about 0.64. The leaves and seeds of the various species contain a poisonous alkaloid, taxine; the bark is rich in tannin.

5. PINACEAE. Pine Family.

Trees or shrubs; leaves usually evergreen, alternate, opposite, verticillate, or fasciculate; flowers monoecious or dioecious; fruit a dry or somewhat fleshy cone, composed of few or numerous scales.

Leaves fasciculate (rarely solitary), with a sheath at the base.....1. **PINUS**.
Leaves solitary, without a sheath.

Leaves linear, 1 cm. long or larger.

Cones globose, with few thick scales; leaves deciduous.....4. **TAXODIUM**.

Cones elongate, with numerous thin scales; leaves persistent.

Cones pendulous, the scales persistent.....2. **PSEUDOTSUGA**.

Cones erect, the scales deciduous.....3. **ABIES**.

Leaves scalelike, mostly 3 mm. long or shorter.

Fruit baccate, indehiscent.....5. **JUNIPERUS**.

Fruit a dry cone, dehiscent.

Leaves opposite; cone scales peltate.....6. **CUPRESSUS**.

Leaves in whorls of 4; cone scales oblong, not peltate.

7. **LIBOCEDRUS**.

1. PINUS L. Sp. Pl. 1000. 1753.

REFERENCE: G. R. Shaw, The pines of Mexico, pp. 1-29. pl. 1-22. 1909.

The pines are perhaps the most important genus of North American trees. They are certainly the most important group of lumber trees, the wood, varying

in quality in different species, being used for almost every purpose for which wood is commonly employed. In the mountains of Mexico large quantities of pine lumber are sawed and much is exported.

The resinous juice is of great economic importance, being the source of turpentine, resin, tar, and other products. When the juice, which is obtained by tapping the trees, is distilled, oil or spirits of turpentine is produced. This has many well-known uses in the arts and in medicine. The residue left from the distillation is the resin of commerce. By crude distillation of the wood, pine tar is obtained, with a residue of charcoal. Tar subjected to distillation yields oil of tar and a thick residue known as naval pitch.

Pine wood is used extensively in Mexico for fuel. Bundles of splinters of pitch pine to be used in starting fires are seen commonly in the markets. Some of the North American Indians in times of famine have used the sapwood and inner bark for food, and they have also employed strips of the inner bark for making baskets. Some tribes still use resin to waterproof baskets and jars of wickerwork.

Pine leaves are sometimes mixed in adobe bricks in place of straw. The leaves are very tough, and the longer ones occasionally serve as a substitute for twine. The branches are employed in some localities for thatching. A volatile oil obtained from the leaves is used in medicine, and pine tar also is employed medicinally. The cones are used in place of combs by some of the Indian tribes.

The pines are often planted for ornamental purposes, and some of the Mexican species have been cultivated in Europe, although few of them thrive there. *Pinus halepensis* Mill. and *P. pinea* L., European species, are said to be cultivated in Mexican parks.

In Mexico pines are most generally known under the names "pino" (Spanish) and "ocote," the latter a corruption of the Nahuatl "ocotl." Besides the vernacular names listed under the various species, the following names are applied to Mexican pines, although it is uncertain to which species they belong: "Pino barbón" (Durango); "pino triste" (Durango); "pino de azúcar" (Durango; "perhaps *P. ayacahuite*"); "pino prieto" (Durango, Sinaloa); "guiri-biche" (Oaxaca, Zapotec, *Reko*).

In 1857 there was published in the City of Mexico a "Catalogue de Graines de Conifères Méxicains" by B. Roezl & Cia. In this 82 new species of Mexican pines were described, nearly all from the Valley of Mexico. The most competent students of the genus have concluded that all these new names are properly referable to earlier published species. It does not seem necessary to list the numerous names in synonymy here, but those who wish to refer to them will find them tabulated in Shaw's monograph referred to above.

Leaves 1 or 2 in a fascicle.

Leaves solitary.....1. *P. monophylla*.

Leaves 2 in a fascicle.

Leaf sheaths deciduous; leaves 2 to 4 cm. long.....2. *P. edulis*.

Leaf sheaths persistent; leaves 3 to 8 cm. long.....26. *P. contorta*.

Leaves 3 or more in a fascicle.

Leaves 4 to 5 cm. long or shorter.

Leaves 3 in a fascicle.....3. *P. cembroides*.

Leaves 4 in a fascicle.....4. *P. quadrifolia*.

Leaves 6 cm. long or longer.

Leaves 15 to 40 cm. long.

Sheaths of the leaves deciduous.

Leaves in fascicles of 5; cones 20 to 45 cm. long.....7. *P. ayacahuite*.

Leaves in fascicles 3; cones 5 to 7 cm. long.....13. *P. lumholtzii*.

Sheaths of the leaves persistent.

Cones usually deciduous, dull or sublustrous.

Cones 4 to 5 cm. long.

Leaves bright green.....14. *P. teocote*.
Leaves glaucous.....15. *P. lawsoni*.

Cones mostly 8 to 30 cm. long.

Leaves in fascicles of 3 or 4; cones 6 to 12 cm. long.

Sheaths deciduous.....12. *P. chihuahuana*.
Sheaths persistent.

Cones deciduous, dull.

Cones 7 cm. long or shorter..... 14. *P. teocote*.
Cones 6 to 12 cm. long.....18. *P. hartwegii*.

Cones persistent, sublustrous.

Leaves 8 to 13 cm. long; cones 4 to 8 cm. long; resin ducts
uniting hypoderm and endoderm of the leaves.
23. *P. oocarpa*.

Leaves 7 to 10 cm. long; cones 6 to 12 cm. long; resin ducts
medial.....24. *P. greggii*.

Leaves in fascicles of 5.

Cones 4 to 12 cm. long.

Sheaths deciduous.....11. *P. leiophylla*.
Sheaths persistent.

Leaves 18 to 28 cm. long. Cones persistent, lustrous.

23. *P. oocarpa*.

Leaves 7 to 18 cm. long.

Cones deciduous, dull.....18. *P. hartwegii*.
Cones persistent, lustrous.....20. *P. arizonica*.

Cones 10 to 45 cm. long.

Leaves 10 to 20 cm. long.....7. *P. ayacahuite*.

Leaves less than 10 cm. long.

Leaves entire. Seed wings rudimentary.....8. *P. flexilis*.
Leaves serrulate.

Prickles of the cone scales weak and deciduous.

Bark of young trees smooth.....16. *P. pseudostrobus*.

Bark of young trees rough.....17. *P. montezumae*.

Prickles of the cone scales stout and persistent.

19. *P. ponderosa*.

Cones persistent, very lustrous.

Resin ducts of the leaves uniting the hypoderm and endoderm.

23. *P. oocarpa*.

Resin ducts of the leaves internal or medial.

Resin ducts of the leaves internal.

Cone scales without upcurved spines.....21. *P. pringlei*.

Cone scales with strongly upcurved spines.....22. *P. coulteri*.

Resin ducts medial.....25. *P. patula*.

Leaves up to 15 cm. long, usually shorter.

Seeds not winged. Leaves in fascicles of 3.

Sheaths of the leaves deciduous; leaves entire.....5. *P. pinceana*.

Sheaths persistent; leaves serrulate.....6. *P. nelsoni*.

Seeds winged.

Seed wing well developed; cones 25 to 45 cm. long.

9. *P. lambertiana*.

Seed wing rudimentary; cones 10 to 25 cm. long.....10. *P. reflexa*.

1. *Pinus monophylla* Torr. in Frém. Rep. Exped. Rocky Mount. 319. *pl. 4*. 1845.
Pinus cembroides monophylla Voss, Mitt. Deutsch. Dendr. Ges. 16: 95. 1907.
 Mountains of Northern Baja California. Southern California (type locality) to Utah.

Tree, usually 7 meters high or less, but sometimes attaining a height of 15 meters and a trunk diameter of 30 cm.; trunk short, often branched near the base, the bark deeply and irregularly fissured, dark reddish brown; leaves about 4 cm. long, pale green; cones 4 to 6.5 cm. long, light reddish brown, shining, the scales few, thick; seeds about 1.5 cm. long; wood soft, brittle, weak, close-grained, yellow to light brown, its specific gravity about 0.56. "Piñón" (California, Arizona).

The wood is used for fuel and for charcoal for smelters. The seeds are edible, either raw or roasted, and they are sometimes ground into meal.

2. *Pinus edulis* Engelm. in Wisliz. Mem. North. Mex. 88. 1848.

Pinus cembroides edulis Voss, Mitt. Deutsch. Dendr. Ges. 16: 95. 1907.

Dry mountain sides, Baja California, at an altitude of about 1,800 meters; perhaps also in northern Chihuahua. Western Texas to Arizona and Wyoming; type from New Mexico.

Sometimes reaching a height of 12 meters and a trunk diameter of 75 cm., but usually smaller; trunk short, often divided to the base, the bark brown, irregular fissured; leaves 1.8 to 4 cm. long, green; cones about 4 cm. long, the few scales very thick; seeds brown, about 1.2 cm. long; wood soft, weak, brittle, close-grained, pale brown, the specific gravity about 0.64. "Piñón" (New Mexico, Arizona, etc.).

In the United States the wood is used for fencing, fuel, and charcoal, and is sometimes sawed into boards, although it is only rarely suitable for lumber. Pinyon seeds are an important article of food in New Mexico and Arizona, largely taking the place filled by peanuts in other parts of the United States. They were a staple food, also, of the Indians. In New Mexico they are sometimes gathered in such large quantities as to be used for horse feed. The nuts are sometimes exported to other regions, and have been used in making confectionery.

3. *Pinus cembroides* Zucc. Abh. Akad. Wiss. Muenchen 1: 392. 1832.

Pinus llaveana Schiede, Linnaea 12: 488. 1838.

Pinus osteosperma Engelm. in Wisliz. Mem. North. Mex. 89. 1848.

Low mountains, Chihuahua to Baja California, southward to Hidalgo. Southern Arizona and New Mexico.

Bushy tree, usually about 6 meters high, with a trunk diameter of 30 cm., but sometimes much larger; bark reddish brown, irregularly fissured; leaves 2.5 to 5 cm. long, dark green; cones 3 to 5 cm. in diameter, reddish brown; seeds 8 to 10 mm. long; wood soft, close-grained, yellow, its specific gravity about 0.65. Known generally as "piñón" or "pino piñón," the seeds as "piñones."

The seeds are eaten in all regions where the nut pine grows, and are highly esteemed. They are very palatable raw, but are improved by roasting, after which they possess a flavor unexcelled, perhaps, by that of any kind of nut. The seeds are placed in the mouth and the thin shells are cracked with the teeth and ejected without being touched by the fingers, an operation in which one may become very proficient by a little practice. The nuts are often added to candies.

4. *Pinus quadrifolia* Parry; Parl. in DC. Prodr. 16²: 402. 1868.

Pinus parryana Engelm. Amer. Journ. Sci. II. 34: 332. 1862. Not *P. parryana* Gord. 1858.

Mountains of Baja California, at low elevations. Southern California; type from mountains east of San Diego.

Tree, sometimes 12 meters high, with a trunk 45 cm. in diameter, the lower branches often touching the ground; bark dark reddish brown, shallowly fissured; leaves 3.5 to 4.5 cm. long, pale green; cones 4 to 6 cm. long, brown and shining; seeds about 1.5 cm. long; wood soft, close-grained, yellow or pale brown, its specific gravity about 0.57. "Piñón" (California).

The seeds are eaten like those of the other nut pines.

5. *Pinus pinceana* Gord.; Gord. & Glend. Pinet. 204. 1858.

Pinus latisquama Engelm. Gard. Chron II. 18: 712. 1882.

Coahuila to Hidalgo; type said to have come from Cuernavaca, but if so it was probably taken from a cultivated tree.

Low tree with short trunk, the branchlets long, slender, pendent; leaves 12 to 16 cm. long, grayish green; cones 6 to 9 cm. long, pendent, early deciduous.

In the original description the tree is said to reach a height of 18 meters, but it is usually much lower.

6. *Pinus nelsoni*¹ Shaw, Gard. Chron. III. 36: 122. f. 49. 1904.

Nuevo León, on lower slopes of the mountains; type from Miquihuana.

Low tree, 8 to 10 meters high, with long slender branches, these clothing the trunk to the ground; leaves 6 to 9 cm. long, grayish green.

Shaw reports that the nuts are eaten greedily by macaws, and are sometimes found in the markets for human food.

7. *Pinus ayacahuite* K. Ehrenb. Linnaea 12: 492. 1838.

Pinus strobiformis Engelm. in Wisliz. Mem. North. Mex. 102. 1848.

Pinus veitchii Roehl, Cat. Conif. Mex. 32. 1857.

Pinus bonapartei Roehl, Gard. Chron. 1858: 358. 1858.

Pinus loudoniana Gord.; Gord. & Glend. Pinet. 230. 1858.

Chihuahua to Mexico, Guerrero, and Chiapas; type from Omitlán, Hidalgo. Guatemala.

Large tree; leaves 10 to 20 cm. long; cones 20 to 45 cm. long, pendent, pale yellowish or reddish brown, usually dull; seeds with a large wing, or this rarely almost obsolete. "Acanita" (Coahuila); "acalocahuite" (Veracruz, *Ramírez*); "ayacahuite" (Valley of Mexico, Oaxaca, etc.); "ocote blanco" (Oaxaca); "ayacahuite colorado" (Hidalgo, Mexico, *Ramírez*); "sacalacahuite" (various localities, *Ramírez*); "pino real" (Oaxaca, *Reko*); "pino acahuite" or "pino cahuite" (Durango, *Patoni*).

8. *Pinus flexilis* James in Long, Exped. 2: 34. 1823.

Mountains of Coahuila. Northward along the Rocky Mountains to Alberta; type from the Rocky Mountains.

Tree, sometimes 15 meters high, with a trunk 1.5 meters thick, the crown conic or in age rounded; bark dark brown or nearly black, deeply fissured into broad ridges and scaly plates; leaves about 5 cm. long (rarely 9 cm.); cones 7.5 to 25 cm. long, light brown, with thin scales; seeds 8 to 12 mm. long, winged; wood soft, close-grained, pale yellow or reddish. Its specific gravity about 0.43.

The wood of the limber pine is used to some extent in the United States for construction purposes. The seeds are edible.

¹ Named for E. W. Nelson (1855-), Chief of the Bureau of Biological Survey, U. S. Department of Agriculture. Mr. Nelson has traveled very extensively in Mexico, while engaged in investigations of the biological features of the country. He has obtained a very large series of botanical specimens, which are in the U. S. National Herbarium.

9. *Pinus lambertiana* Dougl. Trans. Linn. Soc. Bot. 15: 500. 1827.

San Pedro Mártir Mountains of Baja California, at elevations of 2,250 meters or more. Northward to Oregon; type from the Umpqua River.

The largest of North American pines (probably of all pines), in the northern part of its range sometimes attaining a height of 70 meters and a trunk diameter of 4 meters, trees of still larger dimensions having been reported; bark brown or red-brown, fissured into long plates, on young trees smooth; cones pendulous; seeds broadly winged; wood light brown, soft, its specific gravity about 0.37.

In the United States (where the tree is known as sugar pine) the wood is used for shingles, barrels, general construction, etc.

10. *Pinus reflexa* Engelm. Bot. Gaz. 7: 4. 1882.

Pinus flexilis reflexa Engelm.; Rothr. in Wheeler, Rep. U. S. Surv. 100th Merid. 6: 258. 1878.

Mountains of northern Chihuahua. Arizona (type from Santa Rita Mountains) and New Mexico.

Tree, sometimes 30 meters high and with a trunk diameter of 60 cm., the branches slender and somewhat drooping; bark brown or reddish brown, deeply fissured; leaves light green; wood hard, strong, reddish white, its specific gravity about 0.49.

11. *Pinus leiophylla* Schlecht. & Cham. Linnaea 6: 354. 1831.

Zacatecas to Veracruz and Oaxaca; type from Michoacán.

Tree, 15 to 27 meters high; bark thin, at first, red, soon becoming very coarse and rough; leaves 10 to 14 cm. long, grayish green; cones maturing the third year, 7 cm. long or shorter, persistent. The names "ocote blanco" and "ocote chino" are said to be applied to this species.

12. *Pinus chihuahuana* Engelm. in Wisliz. Mem. North. Mex. 103. 1848.

Chihuahua to Zacatecas and Tepic; type from mountains of Chihuahua. Southern Arizona and New Mexico.

Tree, sometimes 20 meters high, with a trunk 90 cm. in diameter; bark thick, dark reddish or nearly black, deeply fissured into broad flat ridges; leaves 6 to 10 cm. long, pale green; cones 4 to 6 cm. long, ripening the third year, brown and shining; wood soft and brittle but durable, close-grained, orange, its specific gravity about 0.54.

13. *Pinus lumholtzii*¹ Robins. & Fern. Proc. Amer. Acad. 30: 122. 1894.

In the mountains, Chihuahua to Zacatecas and Tepic; type from Coloradas, Chihuahua.

Tree with broad rounded crown and slender, somewhat pendent branches; bark at first thin, separating into deciduous scales, in age coarse and thick; leaves 20 to 30 cm. long, bright green, pendent; cones pendent, dull pale brown. "Pino triste."

A decoction of the leaves is employed by the Indians for stomach troubles. The wood is used for musical instruments, and for other purposes.

14. *Pinus teocote* Schlecht. & Cham. Linnaea 5: 76. 1830.

Pinus teocote macrocarpa Shaw, Pines Mex. 17. 1909.

Nuevo León to Tepic and Chiapas; type from Mount Orizaba.

Tree, 20 to 35 meters high; bark at first thin, red, deciduous, in age thick and rough; leaves 10 to 20 cm. long; cones spreading or reflexed, brown or

¹Named for Carl Lumbholtz (1851-), a native of Norway, who has conducted extensive investigations of the ethnological features of Mexico, especially in the northern ranges of the Sierra Madre. Upon some of his expeditions botanical collections were obtained.

sublustrous. The following names are said to be applied to the tree in various localities: "Jalocote," "xalócotl" (Nahuatl). "ocote," "ocotl," "pino real."

The tree produces turpentine ("ocotzol," "trementina de pino," "trementina de ocote") which is used in medicine as a balsamic stimulant, and for other purposes for which turpentine is generally employed. The tar ("brea") remaining after the distillation of turpentine is used for making torches, in soap, etc.

15. *Pinus lawsoni* Roetzl; Gord. & Glend. Pinet. App. 64. 1862.

Pinus altamirani Shaw; Sarg. Trees & Shrubs 1: 209. 1905.

Michoacán and Morelos to Oaxaca, growing at subtropical levels.

Tree, 20 to 25 meters high, the branchlets with a white bloom; leaves 24 cm. long or shorter, glaucous; cones usually 5 to 6 cm. long, reflexed, deciduous, dull yellowish brown. "Ocote" (Oaxaca).

16. *Pinus pseudostrobus* Lindl. Bot. Reg. 25: Misc. 63. 1839.

Pinus apulcensis Lindl. Bot. Reg. 25: Misc. 63. 1839.

Pinus tenuifolia Benth. Pl. Hartw. 92. 1842.

Pinus orizabae Gord. Journ. Hort. Soc. Lond. 1: 237. 1846.

Durango and Sinaloa to Veracruz and Chiapas, chiefly at subtropical levels; type from Orizaba. Guatemala and Nicaragua.

Large tree, the trunk sometimes nearly 2 meters in diameter; bark smooth at first, becoming very rough in old age, the branches slender, verticillate; leaves 15 to 30 cm. long, pendent; cones 7 to 14 cm. long, early deciduous. "Pino real" (Durango, *Patonii*).

17. *Pinus montezumae* Lambert, Descr. Pinus ed. 3. 1: 39. 1839.

Pinus devoniana Lindl. Bot. Reg. 25: Misc. 62. 1839.

Pinus russelliana Lindl. Bot. Reg. 25: Misc. 63. 1839.

Pinus macrophylla Lindl. Bot. Reg. 25: Misc. 63. 1839.

Pinus filifolia Lindl. Bot. Reg. 26: Misc. 61. 1840.

Pinus grenvilleae Gord. Journ. Hort. Soc. Lond. 2: 77. 1847.

Pinus gordoniana Hartw. Journ. Hort. Soc. Lond. 2: 79. 1847.

Pinus winchesteriana Gord. Journ. Hort. Soc. Lond. 2: 158. 1847.

Pinus lindleyana Gord.; Gord. & Glend. Pinet. 229. 1858.

In the mountains, Durango and Zacatecas to Chiapas. Guatemala.

Tree, 15 to 20 or even 30 meters high; leaves 10 to 45 cm. long; cones sub-cylindric, 6 to 25 cm. long, deciduous, brown or nearly black, dull. Reko states that the following names are applied in Oaxaca: "Ocote blanco," "pino de Montezuma," "yutnusatnu" (Mixtec). The following names are said to be applied in various regions: "Ocote," "ocotl," "pino real," "pino blanco," "ocote hembro," "ocote macho."

18. *Pinus hartwegii*¹ Lindl. Bot. Reg. 25: Misc. 62. 1839.

Pinus rudis Endl. Syn. Conif. 151. 1847.

Pinus chrenbergii Endl. Syn. Conif. 151. 1847.

¹Karl Theodor Hartweg (1812-1871) was born at Karlsruhe, Germany. In 1836 he was sent by the Horticultural Society of London to Mexico to collect living plants and seeds for introduction into England. He reached Veracruz in December, 1836, and made collections about Santa Fé and Zacuapan. Later he visited Guanajuato, Aguascalientes, Jalisco, Hidalgo, and San Luis Potosí. In 1838 he spent two months at Morelia, and in 1839 he botanized in Oaxaca. Later he visited California, Guatemala, and the Andes of South America. His collections, which included many new species, were described by Bentham in a work entitled "Plantae Hartwegianae" (1839-42).

Durango to Nuevo León and Chiapas, growing on the mountains up to timber line; type from mountains of Campanario, at 2,700 meters.

Tree, 13 to 45 meters high; leaves 7 to 15 cm. long, glaucous; young cones blue or sooty black, the mature ones 6 to 12 cm. long, brown or nearly black, dull or lustrous. "Ocote" (Chiapas).

19. *Pinus ponderosa* Dougl.; P. Laws. Agr. Man. 354. 1836.

Pinus macrophylla Engelm. in Wisliz. Mem. North. Mex. 103. 1848.

Pinus jeffreyi Murray, Bot. Exped. Oreg. 2. pl. 1. 1853.

Pinus engelmanni Carr. Rev. Hort. 227. 1854.

In the mountains at middle elevations, Chihuahua to Durango and Baja California. Widely distributed in the western United States and Canada; type from Washington.

Large tree, sometimes 70 meters high, with a trunk diameter of 2.4 meters, but usually smaller. The trunk tall and naked, the bark pale reddish brown, broken into large plates; leaves 7.5 to 40 cm. long, yellowish green; cones 6 to 19 cm. long, early deciduous, reddish brown, lustrous; wood hard and strong but brittle, close-grained, pale and reddish brown or yellow, very resinous, its specific gravity 0.48 to 0.52. "Pino real" (Durango); "pinabete" (New Mexico).

The western yellow pine is an important source of lumber in northern Mexico and the southern Rocky Mountains. The wood is used for railroad ties, fencing, and all kinds of construction purposes.

20. *Pinus arizonica* Engelm.; Rothr. in Wheeler, Rep. U. S. Surv. 100th Merid. 6: 260. 1878.

Mountains of Chihuahua and Nuevo León. Southern Arizona (type from the Santa Rita Mountains) and New Mexico.

Tree, sometimes 30 meters high, with a trunk 1.2 meters in diameter; branches stout, spreading; bark reddish brown, broken into large irregular plates; leaves dark green; wood soft, weak, rather brittle, close-grained, light red or yellowish, very resinous, its specific gravity about 0.50.

An important source of lumber in the mountains of northern Mexico.

21. *Pinus pringlei* Shaw; Sarg. Trees & Shrubs 1: 211. 1905.

Michoacán, Guerrero, and Morelos, at subtropical levels; type from Uruapan, Michoacán.

Large tree with long sinuous branches; leaves 15 to 25 cm. long, bright green; cones 5 to 10 cm. long, pendent or spreading, ochre-yellow, lustrous.

22. *Pinus coulteri*¹ Lambert; Don, Trans. Linn. Soc. Bot. 17: 440. 1837.

On mountain tops, Baja California. California; type from Santa Lucia Mountains.

Tree, sometimes 21 meters high, with a trunk 1.2 meters in diameter; bark dark brown or nearly black, deeply fissured; leaves 15 to 35 cm. long, dark bluish green; cones 25 to 35 cm. long, 10 to 13 cm. thick, pendent, light yellowish brown; wood soft, weak, brittle, coarse-grained, light red, resinous, its specific gravity about 0.41.

¹Thomas Coulter (1793-1843) came to Mexico in 1825 as physician for a mining company in Hidalgo. He remained there for a number of years and made collections of plants. From 1831 to 1833 he explored Alta California (now chiefly included in the State of California) and later Sonora, being the first collector who forwarded to Europe collections from the latter region. His collections were sent to Trinity College, Dublin, from which institution they were distributed to various herbaria. A few of his plants are in the U. S. National Herbarium.

23. *Pinus oocarpa* Schiede, *Linnaea* 12: 491. 1838.

Sinaloa to Zacatecas and Chiapas; type collected between Ario and Volcán de Jorullo, Michoacán. Guatemala.

Tree, 12 to 15 meters high, with round compact head and stout branches; leaves 18 to 28 cm. long, bright green; cones 4 to 8 or sometimes 10 cm. long, persistent, pendent or spreading, ocher-yellow, often tinged with gray or green. "Ocote" (Oaxaca); "pino real" (Tepec); said to be known also as "ocote macho."

Pinus oocarpa microphylla Shaw¹ is a form from Sinaloa and Tepec with leaves only 8 to 13 cm. long.

24. *Pinus greggii*² Engelm.; Parl. in DC. Prodr. 16²: 396. 1868.

Mountains of Coahuila; type collected near Saltillo.

Tree, 10 to 15 meters high, with smooth gray bark when young; leaves bright green, erect; cones reflexed, ocher-yellow, lustrous.

25. *Pinus patula* Schlecht. & Cham. *Linnaea* 6: 354. 1831.

Querétaro to Veracruz and Puebla; type collected between Lerma and Toluca, Mexico.

Tree, 12 to 25 meters high, with long slender branches, the upper part of the trunk red; leaves 15 to 30 cm. long, slender, drooping; cones 6 to 9 cm. long, reflexed, persistent, dark brown.

26. *Pinus contorta* Dougl.; Loud. Arb. Frut. 4: 2292. 1830.

San Pedro Mártir Mountains of Baja California, at an altitude of about 2,400 meters. Northward to Alaska.

In the Mexican locality 22 to 30 meters high or larger, with straight trunk and narrow tapering crown; bark very thin, smooth, orange-brown; leaves 3 to 8 cm. long, stiff, yellowish green; cones 5 to 6 cm. long, ocher-brown, lustrous; wood soft, weak, close-grained, light yellow or whitish, with little resin, its specific gravity about 0.41.

2. PSEUDOTSUGA Carr. Trait. Conif. ed. 2. 256. 1867.

REFERENCES: Britton, N. Amer. Trees 69-73. f. 55, 56. 1908; Sudworth, For. Trees Pacif. Slope 99-106. f. 36, 37. 1908.

Trees with linear leaves 2 to 3 cm. long; cones ovoid-oblong, drooping, the bracts lobed, exserted beyond the rounded cone scales.

Cones 5 to 10 cm. long; bracts of the cones much exserted----1. *P. mucronata*.

Cones 10 to 17 cm. long; bracts only slightly exserted-----2. *P. macrocarpa*.

1. *Pseudotsuga mucronata* (Raf.) Sudw. Contr. U. S. Nat. Herb. 3: 266. 1895.

Abies mucronata Raf. Atl. Journ. 120. 1832.

Abies douglasii Lindl. Penny Cycl. 1: 32. 1833.

Pseudotsuga douglasii Carr. Trait. Conif. ed. 2. 256. 1867.

Mountains, at high altitudes, Chihuahua and Sonora to Hidalgo. Northward to southern Canada; type from the mouth of the Columbia River.

¹ Pines Mex. 27. 1909.

² Little is known concerning Josiah Gregg, who was a trader under the patronage of Thomas G. Rockhill, a Philadelphia merchant. He published in 1844 "The Commerce of the Prairies," in which he tells of his travels in the West, and of his residence of nearly nine years in northern Mexico. He made botanical collections in Mexico, and his specimens are chiefly in the herbarium of the Missouri Botanical Garden. He is believed to have died in California in 1850. The genus *Greggia*, of the family Brassicaceae, was named in his honor by Gray.

Tree, in Oregon and Washington sometimes reaching a height of 90 meters, with a trunk diameter of 4.5 meters, but usually smaller; bark thick, deeply fissured; cones purplish at first, yellowish brown when mature; wood hard, light red and coarse-grained or yellowish brown and fine-grained, the specific gravity about 0.51. "Hallarín" (Coahuila); "abeto," "pino de corcho" (Hidalgo); "pinabete," "cahuite," or "acahuite" (Durango); "pino real" (New Mexico).

This tree (known in the United States as Douglas fir) is of the greatest commercial importance in the United States, especially on the Pacific coast, as well as in those portions of Mexico where it is abundant. It furnishes the largest saw timber of any of the North American trees, if not of any trees in the world. The wood is used for all kinds of construction purposes, especially those which require large timbers, such as shipbuilding. It is used also for railroad ties. Large quantities of the lumber are exported from the United States. The bark is sometimes employed for tanning leather. The smaller roots are very uniform in diameter for a length of 2 to 3 meters and have been a favorite material of the California Indians for the manufacture of baskets. It is said that in the same State a decoction of the green leaves has been used by both Indians and white people as a beverage in place of coffee; and a decoction of the spring buds has been employed as a remedy for venereal diseases.

2. *Pseudotsuga macrocarpa* (Torr.) Mayr, Wald. Nordam. 278. 1890.

Abies douglasii macrocarpa Torr. in Ives, Rep. Colo. Riv. 28. 1861.

San Pedro Mártir Mountains, Baja California, at altitudes of 1,500 to 2,100 meters. Southern California, the type from San Diego County.

Similar to preceding species except for the larger cones; tree, sometimes 30 meters high, with a trunk diameter of 1.2 meters; wood hard, strong, close-grained, brown, durable, the specific gravity about 0.45.

3. ABIES Hill, Brit. Herb. 509. 1756.

Large conical trees with linear sessile leaves 2 to 6 cm. long; flowers monoecious; cones cylindric or ovoid, the thin scales falling away from the axis at maturity.

Leaves green and sulcate on the upper surface, slender-----1. *A. religiosa*.
Leaves glaucous and carinate on the upper surface, stout-----2. *A. concolor*.

1. *Abies religiosa* (H. B. K.) Schlecht. & Cham. Linnaea 5: 77. 1830.

Pinus religiosa H. B. K. Nov. Gen. & Sp. 2: 5. 1817.

Abies hirtella Lindl. Penny Cycl. 1: 31. 1833.

In the mountains, up to 3,600 meters, San Luis Potosí to Jalisco and southward; type collected between Mazatlán and Chilpancingo, Guerrero. Guatemala.

Large tree, sometimes 45 meters high (on Orizaba said to be as much as 60 meters high and 6 meters in circumference), occurring mostly at altitudes of 1,200 to 3,450 meters; branchlets hirtellous or glabrate; leaves mostly 2 to 3 cm. long; cones 6 to 15 cm. long. "Abeto" (Valley of Mexico, Oaxaca); "acoyatl" (Valley of Mexico, Nahuatl); "bansú" (Otomí); "jalocote" (Valley of Mexico); "oyamel" or "oyametl" (Valley of Mexico, Durango, Oaxaca, Nahuatl); "huallame" (Coahuila); "pinabete" (Durango and elsewhere); "guayame" (Nuevo León, *González*); "cipreso" (Guatemala); known also in various localities as "pino," "pino oyamel," or "xalócotl" (Nahuatl).

This fir tree furnishes considerable lumber which is used for various construction purposes, as well as for making paper. The trees are tapped in winter

for the oleoresin which they yield abundantly. This, known as "aceite de palo" or "aceite de abeto," is used in medicine for its balsamic properties, and as an ingredient of paints. The specific name "*religiosa*" was applied to the tree because of the fact that its branches are often used as decorations in churches.

2. *Abies concolor* Lindl. Journ. Hort. Soc. Lond. 5: 210. 1850.

San Pedro Mártir Mountains of Baja California, at altitudes of 2,250 meters or more. New Mexico (type locality) to California and Oregon.

Large tree, sometimes attaining a height of 75 meters and a trunk diameter of 2 meters, but usually smaller; bark very thick, reddish brown or light gray, deeply furrowed; leaves 3 to 6 cm. long; cones 7 to 15 cm. long, green or purplish; wood very soft, of medium strength, coarse-grained, inodorous, its specific gravity about 0.36.

The balsam fir is valuable for lumber when it occurs in sufficient abundance.

4. **TAXODIUM** L. Rich. Ann. Mus. Hist. Nat. 16: 298. 1810.

Only 2 other species are known, natives of the southeastern United States.

1. *Taxodium mucronatum* Ten. Ann. Sci. Nat. III. 19: 355. 1853.

Taxodium montezumae Decaisne, Bull. Soc. Bot. France 1: 71. 1854.

Taxodium mexicanum Carr. Trait. Conif. 147. 1855.

Sinaloa to Coahuila and southward, chiefly in wet soil; often planted as a shade tree. Guatemala.

Large tree, 20 to 30 meters high; trunk straight, enlarged near the base, covered with brownish red, rather smooth but shredded bark; roots of trees growing in water often sending up conical projections or "knees;" leaves (and many of the young branches) deciduous, 6 to 12 mm. long; staminate flowers in long slender spikes; cones subglobose, 1.5 to 2.5 cm. in diameter. The Nahuatl name is "ahuehuetl," in modern Mexican "ahuehuete"; the Tarascan name is "pentamu" or "pentamón;" "ciprés" (Tamaulipas); "cipreso" (Chiapas); "sabino" (Durango, San Luis Potosí, Oaxaca, and in other states); "ciprés de Montezuma" (Oaxaca, Valley of Mexico); "tnuyucu" or "yucu-ndatura" (Oaxaca, Mixtec, *Reko*); "yaga-chichicino" or "yaga-guichi xiña" (Oaxaca, Zapotec, *Reko*).

This bald cypress is one of the best-known trees of Mexico, being noted especially for its size. The largest individual reported is the famous tree at Santa María del Tule, Oaxaca, near the city of Oaxaca, which has a height of 38.6 meters and a trunk circumference of 51.8 meters;¹ the greatest diameter of its trunk is 12 meters, and the spread of its branches about 42 meters. The Cypress of Montezuma, in the gardens of Chapultepec, has a height of 51 meters and a trunk circumference of 15 meters. It was a noted tree four centuries ago, and has been estimated to be about 700 years old. Other trees have been estimated to have attained a much greater age. A third famous tree is the "Árbol de la Noche Triste," in the village of Popatela, near the City of Mexico, which is noted for its association with Cortés.

The wood is soft and rather weak, light or dark brown or yellowish, and is often obtained in very large planks. It is susceptible of a good polish and is used in Mexico for fine furniture, as well as for general construction. The tree furnishes an acrid resin which was used in pre-Conquest times for the cure of wounds, ulcers, cutaneous diseases, toothache, gout, etc., and which is still used extensively in popular practice. The bark is employed as an emmena-

¹M. O. Reyes. El gigante de la flora Mexicana ó sea el sabino de Santa María del Tule del Estado de Oaxaca. Naturaleza 6: 110-114. pl. 6. 1884.

gogue and diuretic, and the leaves are applied as a resolutive and as a cure for itch. Chips of the wood are placed in an excavation in the ground, covered with earth, and fired, and as a result there is obtained a kind of pitch which is used commonly as a cure for bronchitis and other chest affections.¹

5. JUNIPERUS L. Sp. Pl. 1038. 1753.

Trees or shrubs with small scalelike leaves, these opposite or verticillate; fruit a small globose cone, often berry-like.

Cedar wood is of much economic importance, being useful for many purposes, one of the most common of which is the manufacture of lead pencils. The bark is rich in tannin and is used for tanning leather. The volatile oil obtained from the fruit of some species is aromatic, stimulant, and diuretic. Spirits distilled with the berries of common juniper (*J. communis* L., of North America, Europe, and Asia) constitutes the gin of commerce. The leaves, or their decoction, of *J. sabina* L. (of Europe) and *J. virginiana* L. (of the United States) have been used as a teniafuge and abortifacient, although their use is dangerous. The trees are very commonly planted for ornamental purposes.

Reko gives the Mixtec name (in Oaxaca) as "yutnu-itne."

Leaves of the branchlets ternate, obtuse. Fruit 1.2 to 1.8 cm. in diameter, 1 or 2-seeded.....1. *J. californica*.

Leaves of the branchlets opposite.

Bark checkered. Leaves obtuse; fruit dry, usually 4-seeded.

2. *J. pachyphloea*.

Bark shredded.

Fruit brownish, dry, fibrous, with 4 or more seeds; leaves very acute.

3. *J. flaccida*.

Fruit blue, fleshy, resinous, with 1 or sometimes 2 seeds; leaves obtuse.

4. *J. mexicana*.

1. *Juniperus californica* Carr. Rev. Hort. 1854: 352. 1854.

Juniperus cerrosianus Kellogg. Proc. Calif. Acad. 2: 37. 1863.

Baja California, at altitudes of 150 to 1,000 meters. California (type locality).

Usually a shrub but sometimes a tree 12 meters high, with a trunk diameter of 60 cm.; bark thin, peeling off in long gray shreds, the inner bark reddish brown; fruit reddish brown, maturing the second year; wood soft, close-grained, light reddish brown, its specific gravity about 0.63. "Cedro" (Baja California).

The wood is very durable and is used for fencing and for fuel. The Indians employed the fruit, either fresh or dried, ground and made into cakes, for food.

2. *Juniperus pachyphloea* Torr. U. S. Rep. Expl. Miss. Pacif. 4: 142. 1857.

Low dry hillsides, Chihuahua and Sonora to Zacatecas and Puebla. Arizona to western Texas; type from New Mexico.

Shrub or tree, sometimes 18 meters high, with a trunk diameter of 1.8 meters; trunk usually short, covered with thick, reddish brown bark, this divided into coarse 4-sided plates; fruit about 1.2 cm. in diameter, with dry sweet flesh; wood soft, weak, brittle, close-grained, light red, with a specific gravity of about 0.58. "Tascate" (Chihuahua, Durango).

The bark is very different from that of any other species. The fruit is often used as food. Palmer reports that in Chihuahua the plant (presumably the leaves) is used as a remedy for rheumatism and neuralgia. Because of its

¹ Tomás Noriega. El Ahuehuete. Naturaleza 4: 35-40. 1877.

rough checkered bark, this species is known in the United States as alligator juniper.

3. *Juniperus flaccida* Schlecht. *Linnaea* 12: 495. 1838.

Chihuahua and Sonora, southward; type from Atotonilco El Chico. Guatemala; western Texas.

Shrub or tree, sometimes 12 meters high, with slender, spreading or drooping branches; fruit subglobose, reddish brown, 1.2 to 1.6 cm. in diameter, with dry flesh. "Cedro colorado" (Veracruz); "cedro" (Durango).

4. *Juniperus mexicana* Spreng. *Syst. Veg.* 3: 909. 1826.

Cupressus sabinoides H. B. K. *Nov. Gen. & Sp.* 2: 3. 1817. Not *Juniperus sabinoides* Griseb. 1844.

Juniperus tetragona Schlecht. *Linnaea* 12: 495. 1838.

Juniperus deppeana Steud. *Nom. Bot.* ed. 2. 835. 1840.

Nearly throughout Mexico, except along the northern part of the Pacific coast. Guatemala; western Texas.

Shrub or tree, sometimes 30 meters high, with a trunk diameter of a meter or more; in Mexico sometimes ascending to an altitude of 4,500 meters, and then a low shrub; trunk short or tall, the thin bark separating into fibrous, reddish brown scales; twigs 4-sided; fruit 6 to 8 mm. in diameter, dark blue, glaucous, with thin sweet resinous flesh; wood hard, weak, close-grained, brown, its specific gravity about 0.59. "Sabino" (Chihuahua, Hidalgo, Mexico, etc.); "enebro" (Oaxaca, *Reko*); "tascate" or "taxate" (Durango, Chihuahua).

The wood is used for general construction, fence posts, telegraph poles, railroad ties, etc., and for fuel. Palmer states that the ashes of the bark are used in the preparation of corn for tortillas.

Some of the specimens placed here may be referable to *J. monosperma* (Engelm.) Sarg., but in the herbarium material examined it is impossible to distinguish more than a single species.

6. **CUPRESSUS** L. *Sp. Pl.* 1002. 1753.

Tree or shrubs, closely resembling the species of *Juniperus*, but with larger cones, these opening when ripe and shedding the seeds; leaves opposite, small and scalelike.

The species of cypress are often cultivated for ornament. *C. sempervirens* L., of the Old World, is said to be cultivated in Mexico.

Seeds not winged, 2 or 3 to each scale; leaves not appressed. Cones about 2.5 cm. in diameter.....1. *C. thurifera*.

Seeds narrowly winged, 5 to 8 to each scale; leaves appressed. Cones 2.5 to 3.5 cm. in diameter.....2. *C. guadalupensis*.

Cones 1.2 to 2.5 cm. in diameter. Branchlets stout, stiff; leaves glaucous.....3. *C. arizonica*.

Branchlets slender; leaves green.....4. *C. benthamii*.

1. *Cupressus thurifera* H. B. K. *Nov. Gen. & Sp.* 2: 3. 1817.

Veracruz and Oaxaca; type from Tasco and Tehuilotepic, at 1,750 meters.

Shrub or large tree. "Cedro" (Veracruz); "cedro de la sierra" (Durango, Veracruz, etc.); "ciprés" (Veracruz); "cedro amarillo," "gretado amarillo" (Oaxaca, *Reko*); "tlatzcán" (*Herrera*).

2. *Cupressus guadalupensis* S. Wats. *Proc. Amer. Acad.* 14: 300. 1879.

Guadalupe Island, Baja California.

Widely spreading tree, averaging about 12 meters in height, but sometimes larger and with a trunk 7.5 meters in circumference; bark brown, curling into thin plates; wood whitish.

One tree measured by Palmer had a trunk 2 meters in circumference, with 236 annual rings.

3. *Cupressus arizonica* Greene, Bull. Torrey Club 9: 64. 1882.

Coahuila to San Luis Potosí, Zacatecas, and Baja California. Arizona (type locality) and New Mexico.

Shrub or tree, sometimes 21 meters high, with a trunk diameter of 1.2 meters; old bark thin, dark red or brown, separating into long shreds; cones reddish brown, glaucous; wood soft, close-grained, grayish, streaked with yellow, its specific gravity about 0.48. "Cedro," "cedro de la sierra," "pinabete" (Durango).

The wood is used for fuel and for general construction purposes.

4. *Cupressus benthamii*¹ Endl. Syn. Conif. 59. 1847.

? *Cupressus coulteri* J. Forbes, Pinet. Woburn. 190. 1839.

Cupressus lindleyi Klotzsch; Endl. Syn. Conif. 59. 1847.

Cupressus chrenbergii Künze, Linnaea 20: 16. 1847.

Cupressus karwinskiana Regel, Gartenflora 1857: 346. 1857.

Cupressus knightiana Perry; Gord. & Glend. Pinet. 61. 1858.

Topic to Veracruz and southward; ascending to 3,000 meters; type from Banco. Guatemala to Costa Rica.

Tree, often 18 to 30 meters high. "Cedro blanco" (Oaxaca, etc.); "ciprés" (Veracruz); "cedro" (Jalisco); "ciprés de México" (Veracruz, etc.); "gredado galán" (Oaxaca, *Reko*); "tlascal," "tlascalle" (Veracruz Michoacán, Mexico, etc.); "tlazcán" (Guerrero, Hidalgo, Veracruz); "teatlale" (various localities, *Ramírez*).

The wood is undoubtedly of importance for lumber, although no details concerning it are available. The bark is said to be used in medicine as an astringent.

7. **LIBOCEDRUS** Endl. Syn. Conif. 42. 1847.

1. *Libocedrus decurrens* Torr. in Frém. Rep. Exped. Rocky Mount. 7. pl. 3. 1854.

Mountains of Baja California, at altitudes of 2,100 to 2,400 meters. California and Oregon; type from the Sacramento River.

Tree, sometimes 45 meters high, with irregularly furrowed, reddish brown bark; leaves in whorls of 4, scalelike, decurrent; cones oblong, 1.8 to 2.5 cm. long, reddish brown; wood soft, weak, close-grained, light reddish brown, the specific gravity about 0.40.

Known in the United States as incense cedar, a name applied because of the fact that all parts of the tree contain a volatile oil with a characteristic incense-like odor. The wood is very durable and is used for general construction, laths, shingles, interior finish, etc. The bark is rich in tannin.

6. **GNETACEAE.** Joint-fir Family.

1. **EPHEDRA** L. Sp. Pl. 1040. 1753.

Shrubs, erect or rarely subsucculent or trailing over other shrubs; stems slender, jointed; leaves reduced to opposite or verticillate scales; flowers dioecious, the staminate in short aments, the fertile inflorescence conelike; fruit nutlike, angled, sometimes fleshy.

¹Named in honor of George Bentham (1800-1884), one of the most noted of British botanists. He was the author of many important botanical works, one of which was a report upon the Mexican collections obtained by Hartweg.

In their general appearance these leafless plants are very unlike any others found in North America. The stems have an astringent taste and contain tannin, but they are much eaten by stock. A decoction of the stems is used widely as a cure for venereal and renal diseases. *E. distachya* L., of the Mediterranean Region, contains an alkaloid, ephedrine, which produces paralysis of the heart.

Leaf scales ternate.

Leaf scales 8 to 10 mm. long, the apex aristate.....1. *E. trifurca*.

Leaf scales 5 mm. long or shorter, acute.....2. *E. californica*.

Leaf scales opposite.

Stems very scabrous3. *E. aspera*.

Stems smooth.

Fruit not fleshy; stems yellowish green, stiff, erect....4. *E. antisiphilitica*.

Fruit fleshy; stems glaucous or glaucescent.

Stems erect, with short stiff branches; fruit sessile or nearly so.

5. *E. compacta*.

Stems reclining, slender, flexuous; fruit conspicuously pedunculate.

6. *E. pedunculata*.

1. *Ephedra trifurca* Torr. in Emory, Mil. Recon. 152. 1848.

Dry mesas and hillsides, Chihuahua, Sonora, and Baja California. Western Texas to Utah; type from New Mexico.

About a meter high, with numerous erect branches. "Popotillo" (Chihuahua, Texas, New Mexico); "tepopote" (Chihuahua, Texas).

2. *Ephedra californica* S. Wats. Proc. Amer. Acad. 14: 300. 1879.

Dry plains and low mountain slopes, Baja California. Southern California; type from San Diego County.

Erect shrub.

3. *Ephedra aspera* Engelm.; S. Wats. Proc. Amer. Acad. 18: 157. 1883.

Dry plains and hillsides, Chihuahua to Zacatecas and Baja California; type from mountains near Saltillo, Coahuila.

Erect shrub, 0.3 to 1 meter high. "Pitamoreal" (Coahuila); "tepopote," "cañatilla," "popotillo" (Durango); "itamo real" (Coahuila); "hintimoreal" (Coahuila, *Palmer*).

Used for the same purposes as the other species. *Palmer* states, also, that the plant is sometimes sold in the markets as a remedy for pneumonia.

4. *Ephedra antisiphilitica* Meyer, Monogr. Ephedra 101. 1846.

In dry soil at low altitudes, Coahuila (type locality); doubtless also in Chihuahua. Western Texas to Colorado.

Shrub, a meter high or lower. "Cañatilla" (Chihuahua, Texas, New Mexico); "tepopote" (Chihuahua, Texas); "popotillo" (New Mexico).

5. *Ephedra compacta* Rose, Contr. U. S. Nat. Herb. 12: 261. 1909.

Dry plains and hillsides, Puebla and Oaxaca; type from Tehuacán, Puebla.

Shrub, 30 to 50 cm. high, very densely branched, pale green; fruit red and fleshy.

6. *Ephedra pedunculata* Engelm.; S. Wats. Proc. Amer. Acad. 18: 157. 1883.

Dry plains and hillsides, Chihuahua to San Luis Potosí and Zacatecas. Western Texas, the type from Uvalde.

Slender shrub with long reclining stems; fruit fleshy, red or salmon-colored. "Cañatilla," "tepopote," "popotillo" (Durango); "itamo real" (Zacatecas, San Luis Potosí); "retama real" (Durango, *Palmer*); "sanguinaria" (the stems, San Luis Potosí, *Safford*).

Besides its other uses, *Palmer* states that in Zacatecas the plant is esteemed as a remedy for pleurisy and pneumonia.

7. POACEAE. Grass Family.

(Contributed by Prof. A. S. Hitchcock.)

REFERENCE: Hitchcock, Mexican grasses in the U. S. National Herbarium, Contr. U. S. Nat. Herb. 17: 181-389. 1913.

Herbs or rarely shrubs or trees; leaves usually long and narrow, but in the woody species usually lanceolate or elliptic, often petiolate; flowers small, greenish, or purplish, arranged in small spikelets, the spikelets in narrow or open panicles; fruit a caryopsis or grain.

Most of the woody grasses belong to the tribe Bambosae, usually known in English-speaking countries as bamboos. In tropical America there are few grasses, aside from bamboos, that have woody stems, and nearly all of these belong to the genus *Lasiacis* of the tribe Paniceae.

It is impracticable to draw a sharp distinction between woody and herbaceous grasses. In the following account only those species have been included which possess culms that persist from year to year. Some excluded species have woody crowns or have the base of the culms woody; others, such as the sugar cane and reed (*Phragmites communis* Trin.), have large firm culms that appear woody during the season of growth, but do not persist.

Leaves many times longer than broad; panicle a large terminal plume; spikelets 2 to several-flowered, more or less silky.

Spikelets unisexual, the pistillate long-silky, the staminate glabrous; plants dioecious.....1. **GYNERIUM.**

Spikelets perfect, the lemmas silky.....2. **ARUNDO.**

Leaves lanceolate or elliptic, usually not more than 20 cm. long; panicles narrow or open but scarcely a large plume; spikelets 1 to several-flowered.

Spikelets unisexual; pistillate spikelets borne on the upper branches and on the ends of the lower branches of a loose terminal panicle, the smaller staminate spikelets pedicellate along the lower branches; leaves asymmetrically lanceolate-oblong, the larger 20 cm. long and 5 cm. wide.

3. **OLYRA.**

Spikelets perfect (often with sterile florets above or below); leaves usually less than 5 cm. wide.

Spikelets globose or ovoid, obtuse, with one perfect terminal floret and a sterile floret below; blades sessile.....4. **LASIACIS.**

Spikelets 1 to several-flowered, the florets acute or acuminate; blades usually contracted into a short petiole and jointed with the sheath. (BAMBOOS.)

Stamens 6. Spikelets several-flowered.....5. **BAMBOS.**
Stamens 3.

Spikelets 1-flowered.....6. **CHUSQUEA.**

Spikelets 2 to many-flowered.

Glumes 1 or 2; sterile lemmas none; spikelets loose, many-flowered, elongate, paniculate or racemose.....7. **ARUNDINARIA.**

Glumes 2; sterile lemmas 1 or 2; spikelets in racemes or 1-sided spikes, these arranged in tufts at the culm nodes.

8. **ARTHROSTYLIDIUM.**

1. **GYNERIUM** Humb. & Bonpl. Pl. Aequin. 2: 112. pl. 115. 1809.

1. **Gynerium sagittatum** (Aubl.) Beauv. Ess. Agrost. 138. pl. 24. f. 6. 1812.

Saccharum sagittatum Aubl. Pl. Guian. 1: 50. 1775.

Gynerium saccharoides Humb. & Bonpl. Pl. Aequin. 2: 112. pl. 115. 1809.

River banks and low ground, forming dense colonies, Veracruz and Oaxaca. West Indies to South America, the type from French Guiana.

Stout reed, often 10 meters tall, with culms clothed below with old sheaths (the blades having fallen), sharply serrulate blades, commonly 2 meters long and 4 to 6 cm. wide (forming a great fan-shaped summit to the sterile culms), and pale, plummy, densely flowered panicles 1 meter long or more, the main axis erect, the branches drooping. "Caña brava" (Tabasco, *Roviroso*); "caña de casa" (Guatemala); "caña boba," "suza" (Colombia); "caña de Castilla" (El Salvador, Cuba).

2. ARUNDO L. Sp. Pl. 81. 1753.

1. *Arundo donax* L. Sp. Pl. 81. 1753.

Along rivers and ditches throughout Mexico. Warmer parts of the Old World; cultivated in America for ornament and occurring from Texas to California and southward to South America as an escape.

A tall reed with strong, sparingly branching culms, elongate scabrous-margined flat blades, and densely flowered, slightly drooping panicles 30 to 60 cm. long, the spikelets about 1 cm. long. "Carrizo" (Durango, etc.); "caña hueca," "cañaveral" (*Ramírez*); "carricillo" (Tamaulipas); "güfn" (Cuba).

Tender stems eaten by animals; canes used for fishing rods, arrows, and flutes.

3. OLYRA L. Syst. Nat. ed. 10. 2: 1261. 1759.

1. *Olyra latifolia* L. Syst. Nat. ed. 10. 2: 1261. 1759.

Copses and shady banks, San Luis Potosí to Michoacán and southward. Mexico and West Indies to South America, the type from Jamaica.

Glabrous perennial, bamboo-like in aspect, commonly 5 meters tall, the strong hollow culms sometimes 1 cm. thick, erect and unsupported, the summit only arching (or weaker culms leaning among brush), the lower half to two-thirds simple and naked, the short sheaths bladeless or nearly so, the elongate internodes blotched with dull purple, branching from the upper nodes, the branches commonly fascicled, divaricate, often 1 meter long, sometimes again branching; blades convolute in the bud, spreading, flat, firm, asymmetrically lanceolate-oblong, abruptly acuminate, commonly 20 cm. long and 5 cm. wide, those of the ultimate branches smaller, the lowermost on both primary culm and branches rudimentary; panicles 10 to 15 cm. long, about two-thirds as wide, those of the secondary branches reduced, the branches stiffly ascending or spreading, each bearing a single large long-acuminate pistillate spikelet at the thickened summit and several small slender-pedicelled staminate spikelets along the rachis. "Tibisi" (Cuba).

4. LASIACIS (Griseb.) Hitchc. Contr. U. S. Nat. Herb. 15: 16. 1910.

The clambering species are known in Cuba as "tibisi."

Main stem prostrate, the fertile shoots prostrate, ascending, or erect.

Blades lanceolate, mostly less than 5 cm. long; fertile shoots strongly dorsiventral, mostly prostrate-----1. *L. rugelii*.

Blades linear-lanceolate, about 10 to 12 cm. long; fertile shoots ascending or erect from a decumbent base, not dorsiventral-----2. *L. grisebachii*.

Main stem clambering, or much branched and forming a tangled mass.

Ligule noticeable, brownish, about 2 mm. long. Blades scabrous on both surfaces, elongate, more than 10 times as long as wide; plants not forming a strong central clambering cane-----3. *L. oaxacensis*.

Ligule inconspicuous, hidden within the mouth of the sheath, rarely as much as 1 mm. long.

Culms not high-climbing, decumbent and rooting at base, forming a tangled mass, with no strong central cane; spikelets clustered toward the ends of the branches.....4. *L. rhizophora*.

Culms high-climbing, forming a strong central cane; spikelets not clustered toward the ends of the branches.

Blades glabrous on both surfaces, often more or less scabrous (see *L. ruscifolia*, rarely with glabrous ovate-lanceolate blades).

Panicle few-flowered, 5 to 10 cm. long; branches strongly zigzag, the branchlets strongly divaricate or reflexed; blades narrowly lanceolate, firm, mostly less than 1 cm. wide (sometimes wider on vigorous shoots)5. *L. divaricata*.

Panicle many-flowered, usually 15 to 25 cm. long or more on the primary branches; branches straight or arcuate, not zigzag; blades mostly over 1.5 cm. wide.

Spikelets globose, about 3 mm. long.....6. *L. globosa*.

Spikelets lanceolate-ellipsoidal, 3.5 to 5 mm. long.....7. *L. sloanei*.

Blades pubescent on one or both surfaces (sometimes glabrous in *L. ruscifolia*).

Blades narrowly lanceolate, averaging 8 to 10 times as long as wide; panicle large and open; spikelets 4 to 5 mm. long.

8. *L. sorghoidea*.

Blades ovate-lanceolate or elliptic, sometimes lanceolate, often more or less cordate-clasping; panicle often compact or at least the branches commonly compactly flowered; spikelets 3 to 4 mm. long.

9. *L. ruscifolia*.

1. *Lasiacis rugelii* (Griseb.) Hitchc. Bot. Gaz. 51: 302. 1911.

Panicum rugelii Griseb. Cat. Pl. Cub. 233. 1866.

Rich woods, San Luis Potosí and Yucatán. Cuba (the type locality).

Prostrate, the main canes slender; branches commonly fascicled, very leafy, the pubescent sheaths overlapping, the small, lanceolate, firm, puberulent, somewhat cinereous blades oblique at base; panicles short-exserted, few-flowered.

2. *Lasiacis grisebachii*¹ (Nash) Hitchc. Bot. Gaz. 51: 302. 1911.

Panicum grisebachii Nash, Bull. Torrey Club 35: 301. 1908.

Rich woods and shady banks, carpeting the floor of dark thickets, Veracruz. Honduras; Cuba (type locality).

Stems more slender, freely producing rootlets, the long narrow blades not crowded; panicle branches ascending.

3. *Lasiacis oaxacensis* (Steud.) Hitchc. Proc. Biol. Soc. Washington 24: 145. 1911.

Panicum oaxacense Steud. Syn. Pl. Glum. 1: 73. 1854.

Edges of woods, Veracruz, Michoacán, and Oaxaca (type locality). Guatemala and Jamaica to South America.

Slender, straggling, decumbent and geniculate at base, with numerous aerial rootlets, the long branches ascending and arcuate, with narrow scabrous blades commonly 20 cm. long, and large open few-flowered panicles, the spikelets borne at the ends of the branchlets.

¹Heinrich Rudolph August Grisebach (1814-1879), a native of Hanover, published in 1864 a "Flora of the British West Indies," one of the most important works upon the plants of tropical North America. He is known, too, for his "Vegetation der Erde," published in 1872, a classic work upon plant geography, and for numerous other botanical publications.

4. *Lasiacis rhizophora* (Fourn.) Hitchc. Proc. Biol. Soc. Washington **24**: 145. 1911.

Panicum rhizophorum Fourn. Mex. Pl. **2**: 31. 1886.

Copses and edges of woods, Veracruz, the type from Orizaba. Guatemala to Costa Rica.

Culms branching and straggling, not forming a strong central cane, decumbent at base and rooting at the lower nodes, the fertile culms ascending, 30 to 100 cm. long; blades 7 to 14 cm. long, 1.5 to 3 cm. wide; panicles 8 to 15 cm. long.

5. *Lasiacis divaricata* (L.) Hitchc. Contr. U. S. Nat. Herb. **15**: 16. 1910.

Panicum divaricatum L. Syst. Nat. ed. 10. **2**: 871. 1759.

Copses and edges of woods, chiefly at low altitudes and especially in the vicinity of the seacoast, Baja California to Veracruz and southward. Southern Florida and the West Indies to South America, the type from Jamaica.

Shrubby, with strong central canes, clambering to a height of 3 or 4 meters, the main branches often fascicled, the vigorous secondary foliage shoots mostly strongly divaricate or zigzag, usually glabrous throughout except on the margin of the sheaths; blades commonly less than 1 cm. wide, only on vigorous shoots as much as 1.5 cm. wide; panicles usually less than 10 cm. long, the branches deflexed at maturity. "Pito de bejuco" (Cuba).

6. *Lasiacis globosa* Hitchc. Contr. U. S. Nat. Herb. **17**: 251. 1913.

Copses near the sea, Guerrero; type from Acapulco. Panama.

Blades smooth, elliptic-lanceolate; panicle loosely flowered, 8 to 12 cm. long, the spikelets globose, 3 mm. long.

7. *Lasiacis sloanei* (Griseb.) Hitchc. Bot. Gaz. **57**: 302. 1911.

Panicum sloanei Griseb. Fl. Brit. W. Ind. 551. 1864.

Climbing among bushes and small trees, San Luis Potosí and Veracruz. West Indies and Mexico, south to Colombia, the type from Jamaica.

Climbing to the height of 3 to 4 meters, forming a strong central cane; branches solitary or 2 or 3 together, elongate; blades parchment-like in texture at maturity, commonly 12 to 15 cm. long and 2 to 3 cm. wide, narrowed into a very short pubescent petiole; panicles commonly as much as 20 cm. long, nearly as wide, the branches rather rigid.

The spikelets are larger in this species than in any other of the genus in the region.

8. *Lasiacis sorghoidea* (Desv.) Hitchc. & Chase, Contr. U. S. Nat. Herb. **18**: 338. 1917.

Panicum lanatum Swartz, Prodr. Veg. Ind. Occ. **24**. 1788. Not *P. lanatum* Rottb. 1776.

Panicum sorghoideum Desv.; Hamilt. Prodr. Pl. Ind. Occ. **10**. 1825.

Ravines, wood borders, and hedges, San Luis Potosí and Jalisco, southward. West Indies and Mexico to Argentina, the type from Hispaniola.

Erect or clambering to a height of 5 to 7 meters, with a strong central cane as much as 1 cm. thick, the main branches 1 meter long or more, arcuate, bearing slender branchlets toward the pendent ends; sheaths and both surfaces of the blades velvety, or the sheaths glabrescent, the blades of the main branches commonly 20 cm. long and 2.5 cm. wide, those of the branchlets much smaller, often less velvety; panicles usually about 10 to 20 cm. long, at maturity as wide or wider, the spikelets more or less clustered on the long distant branches.

9. *Lasiacis ruscifolia* (H. B. K.) Hitchc. Proc. Biol. Soc. Washington **24**: 145. 1911.

Panicum ruscifolium H. B. K. Nov. Gen. & Sp. **1**: 101. 1816.

Panicum compactum Swartz, Adnot. Bot. 14. 1829. Not *P. compactum* Kit. 1814.

Panicum liebmannianum Fourn. Mex. Pl. 2: 33. 1886.

Climbing over bushes, Sonora to Veracruz and southward; type from the Volcán Jorullo. Mexico and the West Indies to Venezuela.

More robust than any other species, freely branching, with numerous leafy dorsiventral shoots with broad blades, these velvety or glabrous beneath, glabrous or scabrous above, the sheaths glabrous or nearly so, the scarcely exerted, oblong or club-shaped panicles usually compactly flowered.

5. BAMBOS Retz. Obs. Bot. 5: 24. 1789.

Robust arboreous grasses with culms several centimeters in diameter and rising to the height of 10 to 20 meters.

Branches spiny ----- 1. *B. aculeata*.
Branches unarmed ----- 2. *B. vulgaris*.

1. *Bambos aculeata* (Rupr.) Hitchc. Contr. U. S. Nat. Herb. 17: 387. 1913.
Guadua aculeata Rupr.; Fourn. Mex. Pl. 2: 130. 1886.

Veracruz, the type from Colipa.

2. *Bambos vulgaris* Schrad.; Wendl. Coll. Pl. 2: 26. pl. 47. 1810.

Commonly cultivated in tropical America; native of the Old World.

Arboreous, freely branching; flowering branches fascicled, elongate, leafless, the sessile spikelets radiate in clusters. "Caña brava" (Cuba).

The common bamboo of cultivation.

6. CHUSQUEA Kunth, Syn. Pl. Aequin. 1: 254. 1822.

Branchlets pubescent; base of sheath tumid ----- 1. *C. nelsoni*.
Branchlets glabrous; base of sheath not tumid ----- 2. *C. bilimeki*.

1. *Chusquea nelsoni* Scribn. & Smith, U. S. Dept. Agr. Div. Agrost. Bull. 4: 16. 1897.

Only known from the type, which was collected between Chilapa and Tuxtla, Guerrero.

2. *Chusquea bilimeki*¹ Fourn. Mex. Pl. 2: 132. 1886.

Only known from the type locality, in the Valley of Mexico.

Described as having a culm a centimeter in diameter.

7. ARUNDINARIA Michx. Fl. Bor. Amer. 1: 73. 1803.

Blades 2 mm. wide; lemmas 1 to 1.5 mm. wide ----- 1. *A. acuminata*.

Blades 5 to 8 mm. wide; lemmas 2 mm. wide ----- 2. *A. longifolia*.

1. *Arundinaria acuminata* Munro, Trans. Linn. Soc. Bot. 26: 25. 1868.

Veracruz, the type locality.

Panicles diffuse, the spikelets narrow, acuminate, the lemmas awned.

2. *Arundinaria longifolia* Fourn. Mex. Pl. 2: 131. 1886.

Durango, Tepic, San Luis Potosí, Veracruz, and Oaxaca; type from Jicaltepec, Veracruz.

Panicles less diffuse than in the preceding, the spikelets wider; blades long and narrow, 15 to 20 cm. long, 5 to 8 mm. wide; culms as much as 4 cm. thick.

¹Named for Bilimek, who was chief gardener of the Emperor Maximilian. He made a small collection of plants, some of which are in the U. S. National Herbarium.

8. *ARTHROSTYLIDIUM* Rupr. Mém. Acad. St. Pétersb. VI. Sci. Nat. 3^e: 117. 1839.

1. *Arthrostylidium racemiflorum* Steud. Syn. Pl. Glum. 1: 336. 1854.

Veracruz; the type from Mexico, but the definite locality unknown. Costa Rica.

Several other species of bamboos have been described from Mexico, but their validity and identity are uncertain.

8. PHOENICACEAE. Palm Family.

REFERENCE: Oersted, Nat. For. Kjöbenhavn Vid. Medd. 1858: 1-54. 1859.

The palms are one of the most interesting and important groups of Mexican plants. Although the number of species represented is not nearly as large as in Central America, or farther southward in South America, those which are found in Mexico are of great economic importance. The plants attract attention because of their curious and beautiful forms, and they are favorite ornamental plants in Mexican parks and gardens. Besides the native species, some exotic ones are cultivated. The species are widely distributed in Mexico and often form extensive forests.

The trunks are used for making the walls and roofs of houses, and the leaves are the usual material employed for thatch. The juice of the stems usually contains sugar, and may be fermented to obtain intoxicating drinks. The tough leaves are made into hats, mats, raincoats, and other articles, and their fiber furnishes cordage. The fruits of many of the species are edible, and the seeds contain large quantities of oil.

The writer is under special obligations to Mr. O. F. Cook for assistance in the preparation of the account of this family.

Leaves flabellate.

Calyx and corolla united and forming a 6-dentate cup; ovary of a single 1-ovulate carpel. Petioles unarmed.....1. **THRINAX.**

Calyx and corolla distinct; ovary of 3 distinct or more or less united carpels. Style or stigma basilar in fruit. Petioles unarmed.....2. **INODES.**
Style or stigma terminal in fruit.

Trunk armed with long spines.....4. **ACANTHORRIZA.**
Trunk unarmed.

Petioles smooth. Fruit globose, about 12 mm. in diameter.

5. **CRYOSOPHILA.**

Petioles with dentate or denticulate margins.

Branches of the inflorescence, at least the primary ones, subtended by spathes.

Leaf sheaths split at base.....3. **WASHINGTONIA.**

Leaf sheaths not split at base.....6. **ERYTHEA.**

Branches of the inflorescence not subtended by spathes.

7. **BRAHEA.**

Leaves pinnate or pinnatifid, or sometimes simple and bifid at the apex.

Ovary of 3 distinct carpels, only one normally developed.....8. **PHOENIX.**

Ovary of united carpels.

Fruit baccate, without a bony endocarp.

Flowers sunk in the fleshy rachis of the inflorescence.

Style lateral, beside the one fertile cell of the ovary....9. **GEONOMA.**

Style rising from between the 3 fertile cells of the ovary.

10. **CALYPTROGYNE.**

Flowers not sunk in the rachis of the inflorescence.

- Spathes 2 ----- 11. **REINHARDTIA**.
 Spathes 3 or more ----- 12. **CHAMAEDOREA**.

Fruit nutlike, with a bony endocarp.

Trunk and leaf bases unarmed.

- Stamens 6; fruit 1-seeded ----- 13. **COCOS**.
 Stamens 10 to 24; fruit 2 to 6-seeded ----- 14. **ATTALEA**.

Trunk or leaf bases armed with spines, these sometimes black and needle-like.

Petals of the pistillate flowers connate only at the base.

15. **ACROCOMIA**.

Petals of the pistillate flowers united.

Staminate flowers immersed in the rachis of the inflorescence; fruit spiny ----- 16. **ASTROCARYUM**.

Staminate flowers not immersed in the rachis; fruit not spiny.

Trunk erect; seeds with large subapical foramina.

17. **BACTRIS**.

Trunk trailing or scandent; seeds with small peripheral foramina.

18. **DESMONCUS**.

1. **THRINAX** L. f.; Swartz, Prodr. Veg. Ind. Occ. 57. 1788.

1. *Thrinax wendlandiana* Becc. Webbia 2: 265. 1907.

Yucatán. Cuba (type locality); Honduras.

Leaves flabellate, about a meter long, green above, slightly paler beneath; spadix paniculate-branched; fruit globose, 5 mm. or more in diameter. Known in Cuba as "miraguano de lana," "guano de lana," or "guano de costa."

2. **INODES** Cook, Bull. Torrey Club 28: 529. 1901.

REFERENCE: Beccari, Webbia 2: 10-86. 1907 (as *Sabal*).

Plants with tall trunks; leaves flabelliform, the margins of the segments with numerous long threads; fruit small, globose, usually black.

Seeds small, 5 to 8 mm. broad. Branches of the inflorescence slender.

Fruit globose, not at all asymmetric ----- 1. *I. mexicana*.

Fruit more or less asymmetric at the base ----- 2. *I. japa*.

Seeds large, 10 to 13 mm. broad.

Branches of the pistillate inflorescence strongly thickened, fusiform. Embryo lateral ----- 3. *I. uresana*.

Branches of the pistillate inflorescence slender.

Embryo lateral ----- 4. *I. rosei*.

Embryo subdorsal ----- 5. *I. texana*.

1. *Inodes mexicana* (Mart.) Standl.

Sabal mexicana Mart. Hist. Nat. Palm. 3: 246. pl. 8, f. 1-7, pl. V, f. 4. 1836-50.

Tepic to Zacatecas and Oaxaca (type locality), and perhaps farther eastward. Guatemala.

Trunk 10 to 20 meters high, when young clothed with the persistent petioles, but in age naked; leaf blades somewhat recurved; inflorescence short and dense, recurved; fruit depressed-globose, about 8 mm. in diameter. "Palma real" (Oaxaca); "palma redonda" (Michoacán, Guerrero).

2. *Inodes japa* (Wright) Standl.

Sabal japa Wright; Sauv. Anal. Acad. Ci. Habana 7: 562. 1870.

Yucatán. Cuba (type locality).

Trunk tall, sometimes 24 meters high; leaves large, the blades about 1.2 to 1.3 meters long; inflorescence 30 to 70 cm. long, composed of several short panicles; fruit globose, 8 to 10 mm. in diameter. "Huano," "xaan" (Yucatán). Known in Cuba as "palma de guano," "cana," "japa," or "miraguano."

3. *Inodes uresana* (Trel.) Cook, Bull. Torrey Club 28: 534. 1901.

Sabal uresana Trel. Rep. Mo. Bot. Gard. 12: 79. pl. 35-37. 1901.

Vicinity of Ures, Sonora.

Trunk 5 to 10 meters high, about 30 cm. in diameter, naked; leaves very glaucous, on long unarmed petioles, the blades about 1 meter long; fruit depressed-globose, 15 to 20 mm. in diameter, green or dirty brown and somewhat lustrous.

4. *Inodes rosei*¹ Cook, Bull. Torrey Club 28: 534. 1901.

Sabal rosei Becc. Webbia 2: 83. 1907.

In the coastal plain, Tepic and southern Sinaloa; type from Acaponeta, Tepic.

Six to 12 or even 18 meters high, the trunk slender, naked, 15 to 20 cm. thick; leaves numerous, the blades pale green, 80 cm. wide or larger; inflorescence 60 cm. long or longer; fruit globose, about 1.8 cm. in diameter, blackish or dark blue.

5. *Inodes texana* Cook, Bull. Torrey Club 28: 534. 1901.

Sabal texana Becc. Webbia 2: 78. 1907.

Tamaulipas. Southwestern Texas (type locality).

Trunk tall, naked; spadices about 75 cm. long, copiously branched; flowers white, with a honey-like odor; fruit globose, 1.5 to 2 cm. in diameter. "Palma real," "palma de micheros" (Tamaulipas).

The leaves are used for thatching and for chair seats. The flowers are much frequented by bees. The fruits, known as "micheros," are said to be edible.

3. WASHINGTONIA Wendl. Bot. Zeit. 37: 68. 1879.

REFERENCES: Parish, Bot. Gaz. 44: 408-434. f. 1-12. 1907; Goldman, Contr. U. S. Nat. Herb. 16: 316. 1916; Parish, Bot. Gaz. 46: 144-147. f. 1-5. 1908; Parish, Bot. Gaz. 48: 462-463. 1909.

Plants usually with tall trunks; leaves flabelliform, deeply divided, the margins of the leaves usually separating into drooping fibers; fruit drupaceous.

Petiole obtuse at the junction with the blade..... 1. *W. sonorae*.

Petiole acuminate prolonged into the blade.

Leaf blades nearly or quite without filaments..... 2. *W. gracilis*.

Leaf blades copiously filiferous..... 3. *W. filifera*.

1. *Washingtonia sonorae* S. Wats. Proc. Amer. Acad. 24: 79. 1889.

Dry plains and canyons, Sonora and southern Baja California; type from canyons near Guaymas, Sonora.

Trunk reaching a height of 7.5 meters or more; leaves about a meter broad, somewhat glaucous, copiously filiferous; petioles armed with stout curved spines; inflorescence 1.5 to 1.8 meters long; fruit about 6 mm. in diameter, said to be used for food. In Baja California three distinct forms, known as "palma blanca," "palma colorada," and "palma negra," are recognized by the natives.

¹ Named for Dr. J. N. Rose (1862-), Associate Curator of the U. S. National Herbarium. Dr. Rose has collected extensively in nearly all parts of Mexico, and has obtained a very large series of specimens, which are in the National Herbarium. He has published many papers dealing with Mexican plants.

2. *Washingtonia gracilis* Parish, Bot. Gaz. 44: 420. f. 8-10. 1907.

Described from trees cultivated in southern California; believed to be a native of Baja California.

Trunk slender, at least 20 meters high; blades 80 to 100 cm. broad; petioles armed throughout with short curved yellow spines; fruit 6 to 7 mm. in diameter.

3. *Washingtonia filifera* (Linden) Wendl. Bot. Zeit. 37: 68. 1879.

Pritchardia filifera Linden, Ill. Hort. Lem. 24. 1877.

Neowashingtonia filamentosa Sudw. U. S. Dept. Agr. Div. For. Bull. 14: 105. 1897.

Neowashingtonia filifera Sudw. For. Trees Pac. Slope 199. 1908.

Dry plains, Baja California. Southern California.

Trunk up to 27 meters high, often a meter in diameter; leaves a meter broad or larger; inflorescence 2.5 to 3 meters long; fruit about 8 mm. long, black, with thin sweet flesh. In the typical form the petioles are unarmed near the blade; in *W. filifera robusta* (Wendl.) Parish¹ they are armed throughout; in *W. filifera microsperma* Becc.² they are armed only near the base.

This species is one of the commonest palms cultivated in hothouses. It is grown in parks in Sonora, where it is known as "palma de Castilla." The desert Indians of southern California utilized the leaves for building huts and strands from the leaves for tying and in basketry. The fruit was eaten fresh or dried, the seeds were ground into meal, and the terminal bud or "cabbage" was roasted and eaten.

4. *ACANTHORRHIZA* Wendl. in Kerchove, Palmiers 230. 1878.

REFERENCE: Beccari, Webbia 2: 230-243. 1907.

1. *Acanthorrhiza mocinni* (H. B. K.) Benth. & Hook.; Hemsl. Biol. Centr. Amer. Bot. 3: 411. 1885.

Chamaerops mocinni H. B. K. Nov. Gen. & Sp. 1: 300. 1815.

Trithrinax aculeata Liebm.; Mart. Hist. Nat. Palm. 3: 320. 1836-50.

Acanthorrhiza aculeata Wendl. in Kerchove, Palmiers 230. 1878.

Sinaloa to Oaxaca and Campeche; type from Acapulco, Guerrero. Guatemala.

Trunk of medium height, tapering upward, covered above with long spines; leaves flabelliform, green, slightly paler beneath, the petioles smooth; inflorescence short, recurved; fruit whitish, about 1.2 cm. in diameter. "Palma de escoba" (Campeche); "zoyamiche," "zoyaviche" (Oaxaca); "soyamiche" (Michoacán, Guerrero).

5. *CRYOSOPHILA* Blume, Rumphia 2: 53. 1836.1. *Cryosophila nana* (H. B. K.) Blume, Rumphia 2: 53. 1836.

Corypha nana H. B. K. Nov. Gen. & Sp. 1: 299. 1815.

Copernicia nana Liebm.; Hemsl. Biol. Centr. Amer. Bot. 3: 411. 1885.

Known only from the type locality, summit of Cuesta de los Pozuelos, between Acapulco and Mazatlán, Guerrero.

Trunk 2 to 4 meters high, slender, unarmed; leaves flabellate, green above, whitish beneath; flowers densely spicate; fruit globose, about 12 mm. in diameter, green. "Palmillo."

¹ Bot. Gaz. 44: 420. 1907. *Washingtonia robusta* Wendl. Gart. Zeit. 2: 198. 1883.

² Parish, Bot. Gaz. 44: 420. 1907.

6. *ERYTHEA* S. Wats. Bot. Calif. 2: 211. 1880.

REFERENCE: Beccari, Webbia 2: 118-140. 1907.

Plants with tall trunks; leaves flabelliform, deeply divided, the divisions lacerate at the apex; flowers perfect; fruit baccate.

Fruit obpyriform, distinctly attenuate to the base; petioles unarmed.

1. *E. elegans*.

Fruit globose, rounded at the base; petioles usually armed with spinelike teeth.

Leaves glaucous ----- 2. *E. armata*.

Leaves green.

Fruit 1.5 to 2 cm. in diameter; trunk sometimes 30 meters high.

3. *E. brandegeei*.

Fruit 2.5 to 3 cm. in diameter; trunk usually 6 to 9 meters high.

Petioles armed with short hooked spines ----- 4. *E. aculeata*.

Petioles unarmed or nearly so ----- 5. *E. edulis*.

1. *Erythea elegans* Franceschi; Becc. Webbia 2: 138. 1907.

Sonora, in the region about Hermosillo.

Leaves glaucescent; fruit 18 to 20 mm. long, 15 to 17 mm. thick.

2. *Erythea armata* S. Wats. Bot. Calif. 2: 212. 1880.

Brahea armata S. Wats. Proc. Amer. Acad. 11: 146. 1876.

Glaucosphaera armata Cook, Journ. Washington Acad. Sci. 5: 237. 1915.

Along canyons and arroyos, northern Baja California; type from Tantillas Mountains.

Trunk sometimes 12 meters high and a meter in diameter, but usually about 6 meters high; leaves very numerous, the blades glaucous, the petioles armed with curved teeth; inflorescence slender, exceeding the leaves, the flowers dull purplish. "Palma blanca" (Sonora).

This species is cultivated in southern California and in Sonora. It has been made the type of a new genus, *Glaucosphaera*, by Cook. While this genus is apparently well founded, it seems impracticable to recognize it in the present work, since the position of some of the other species, especially *E. elegans*, is doubtful.

3. *Erythea brandegeei*¹ Purpus, Gartenflora 1903: 12. f. 1, 2. 1903.

Mountains of the Cape Region of Baja California.

Trunk 30 meters high or higher, about 60 cm. in diameter or less, smooth; leaves 10 to 12, the blades subtomentose, sparsely filiferous, green above, pale beneath, about 1 meter long; petioles glabrous, 1 to 1.5 meters long, spine-toothed; inflorescence tomentose; fruit 10 to 15 mm. in diameter. "Palmilla," "palma negra," "palma de Tlaco."

The tender buds are eaten.

4. *Erythea aculeata* T. S. Brandeg. Zoe 5: 196. 1905.

Sinaloa; type from Cofradía.

Trunk 6 to 7 meters high; leaf blades 40 to 60 cm. long, with about 40 segments, slightly filiferous; petioles slender, 50 cm. long or longer, the margins armed with short teeth; fruit globose, 2.5 cm. in diameter.

¹Named for T. S. Brandege (1843-) who has made large collections of Mexican plants, chiefly in Baja California, but also in Sinaloa. He has published several papers upon the plants of Baja California, which are our most important sources of information upon the botanical features of that region. He has published, also, papers dealing with plants from other parts of Mexico, especially the recent collections obtained by C. A. Purpus. The Brandege Herbarium is at the University of California, but large numbers of the plants of Mr. Brandege's collections are in the U. S. National Herbarium.

5. *Erythea edulis* (Wendl.) S. Wats. Bot. Calif. 2: 212. 1880.

Brahea edulis Wendl.; S. Wats. Proc. Amer. Acad. 11: 146. 1876.

Known only from Guadalupe Island, Baja California. Cultivated in southern California.

Trunk sometimes 9 meters high and 37 cm. in diameter, covered with thick corky cracked bark; petioles stout, unarmed; leaf blades about a meter long, with 70 to 80 folds, tomentose at first; inflorescence 1.2 meters long, tomentose; fruit about 2.5 cm. in diameter, with thick pulp.

The fruit clusters are said to weigh 40 to 50 pounds. The pulp of the fruit is sweet and edible. The buds also are eaten.

7. **BRAHEA** Mart. Hist. Nat. Palm. 3: 243. 1836-50.

REFERENCE: Beccari, Webbia 2: 92-107. 1907.

Plants with tall unarmed trunks; leaves flabelliform, cleft into numerous segments; fruit of 1 to 3 1-seeded carpels.

Flowers glomerate-ternate.....1. *B. pimo*.

Flowers solitary.

Branches of the inflorescence terete, stout, densely tomentose-velutinous, the flowers partly immersed; leaves filiferous.....2. *B. calcarea*.

Branches of the inflorescence filiform, puberulent, the flowers sessile; leaves not filiferous.....3. *B. dulcis*.

1. *Brahea pimo* Becc. Webbia 2: 103. 1907.

Type from Monte de la Ventana, Michoacán or Guerrero.

Trunk 3 to 4 meters high; spadices about 40 cm. long, thrice branched. "Pimo."

2. *Brahea calcarea* Liebm.; Mart. Hist. Nat. Palm. 3: 319. 1836-50.

Described from mountains near Jalcomulco, Veracruz, altitude about 600 meters.

Trunk about 6 meters high, naked; petioles smooth; inflorescence about 25 cm. long, the branches flexuous, pendulous.

3. *Brahea dulcis* (H. B. K.) Mart. Nat. Hist. Palm. 3: 244. *pl. 137, 162*. 1836-50.

Corypha dulcis H. B. K. Nov. Gen. & Sp. 1: 300. 1815.

Nuevo León to Sinaloa and Oaxaca; type from "La Moxonera et Alto de las Caxas."

Trunk 2.5 to 6 meters high, or sometimes nearly obsolete, 15 to 20 cm. thick, unarmed; leaves green or pale green, sparsely filiferous, the margins of the petioles coarsely spine-toothed; inflorescence 1.5 to 2.5 meters long, pendulous, the branchlets very thick, tomentose; fruit globose, yellow, succulent; seed white, ovate, very hard. "Palmito" (Durango, Nuevo León); "cocaiste" (Michoacán, Guerrero); "palma apache" (Hidalgo, Puebla, *Urbina*); "palma dulce" (Puebla, Guerrero, *Ramírez*); "palma de sombrero," "palma soyal" (Guerrero, Hidalgo); "soyale" (various localities, *Ramírez*); "zoyate," "soyate" (Hidalgo, Jalisco, Oaxaca); "palma de abanico" (Oaxaca); "yagaxiña" (Oaxaca, Zapotec, *Reko*); "yucu-teyeye," "yutnu-ñun" (Oaxaca, Mixtec, *Reko*).

Wood very hard and heavy, used for frames of houses. Leaves used for thatching. The fruit (known in Durango as "michire" or "miche") is sweet and edible.

8. PHOENIX L. Sp. Pl. 1188. 1753.

1. *Phoenix dactylifera* L. Sp. Pl. 1188. 1753.

Widely cultivated in Mexico and in some places, as in Baja California, growing without cultivation, perhaps on the sites of abandoned ranches. Native of the Old World.

Trunk often 15 meters high or taller; leaves large, pinnate; fruit borne in large panicles. Commonly known as "datil;" the name "zoyacapulín" is said to be applied also.

One of the best-known palms, grown for its fruit in most tropical regions. The date palm was introduced into Mexico at an early period and is now cultivated in many localities, chiefly in the more arid regions. Dates were exported from Baja California in the early part of the nineteenth century, but the amount now produced in Mexico is not very large. They could doubtless be grown on a large scale in Sonora and Sinaloa, for the trees thrive in that part of Mexico.

9. *GEONOMA* Willd. Mém. Acad. Sci. Berlin 1804: 37. 1807.

Trunk very short, covered by the sheaths of the petioles-----1. *G. mexicana*.
Trunk 4 to 8 meters high, naked-----2. *G. magnifica*.

1. *Geonoma mexicana* Liebm.; Mart. Hist. Nat. Palm. 3: 316. 1836-50.

Oaxaca, at about 900 meters; material from Veracruz perhaps belongs here.

Trunk very short; leaves interrupted-pinnatifid, bifid at the apex, the pinnae subopposite, broadly lanceolate, long-acuminate; spadix pubescent, with cernuous branches; fruit oblique-ellipsoid.

2. *Geonoma magnifica* Lind. & Wendl. Linnaea 28: 335. 1856.

Described from material collected between San Carlos and Macuspana, Tabasco.

Trunk 4 to 8 meters high and 5 to 6 cm. thick, annulate; leaves pinnatisect, the blade 2.5 meters long, 70 to 80 cm. wide, with 7 or 8 pairs of pinnae, these broadly lanceolate, long-acuminate. "Pujai."

Hemsley reports¹ a third species from Oaxaca as *Geonoma galeottiana* Wendl., but this name is unpublished.

10. *CALYPTROGYNE* Wendl. Bot. Zeit. 17: 72. 1859.1. *Calyptrogyne ghiesbreghtiana*² (Lind. & Wendl.) Wendl. Bot. Zeit. 17: 72. 1859.

Geonoma ghiesbreghtiana Lind. & Wendl. Linnaea 28: 343. 1856.

Chiapas.

¹ Biol. Centr. Amer. Bot. 3: 408. 1885.

² August Ghiesbreght was born in Brussels in 1810. In 1836 he and Linden were appointed by Leopold I to explore Brazil. In 1837, together with Linden and Funck, he started for Mexico and reached Veracruz in January, 1838. He accompanied Galeotti in his ascent of Orizaba, and also collected elsewhere. He went to Europe in 1839, but returned to Mexico in the same year, and with Linden visited Tabasco. In March, 1840, he accompanied his collections to Europe, but returned soon after, and botanized in various states, ascending the volcanoes of Colima, Jorullo, and Zempoaltepec. He took up his residence in Tabasco, and explored that State as well as Chiapas. In 1857 he again accompanied his collections to Europe, to return once more, however, and establish himself in the city of Chiapas. His collections are found in many of the herbaria of Europe and America.

Trunk short or almost none; rachis of the leaf 80 to 85 cm. long, with 6 pairs of pinnae, these 50 to 65 cm. long; inflorescence 1.2 to 1.5 meters long. "Guanito talis."

Leaves used for covering huts.

11. **REINHARDTIA** Liebm.; Mart. Hist. Nat. Palm. 3: 311. 1836-50.

1. **Reinhardtia elegans** Liebm.; Mart. Hist. Nat. Palm. 3: 311. 1836-50.

Oaxaca; type collected between Chuapan and Tiutalcingo.

Trunk slender, 6 meters high; leaves 1.5 to 1.8 meters long, horizontal, the pinnae 30 to 45 cm. long, 1.2 cm. wide; inflorescence erect, a meter long, branched; fruit oval, about 1.5 cm. long.

12. **CHAMAEDOREA** Willd. Sp. Pl. 4²: 638. 1806.

Plants unarmed, erect or procumbent, with stout or very slender stems; leaves pinnatisect, or simple and bifid at the apex; fruit small, of 1 to 3 carpels, dry or fleshy.

The Mexican species of this genus, as of most others of the family, are very imperfectly known. Some of them were described from cultivated plants, and all are poorly represented in herbaria. The following key, consequently, is very imperfect.

The unopened flower spathes of various species are often cooked and eaten. The following vernacular names are reported for some of the species: "Tepejilote" or "tepejilote" (Nahuatl; Oaxaca, Morelos, Guerrero); "bon cabalsáh" (Oaxaca, Veracruz, *Ramírez*); "guaya de bajo," "guaya de cerro," "guayita" (Tabasco).

Interior perianth of the staminate flowers usually not stipitate; anthers obliquely incumbent.

Caudex repent, short, dichotomous; pinnae linear-----1. *C. martiana*.

Caudex erect, elongate, simple; pinnae lanceolate.

Pinnae few, about 8 on each side-----2. *C. alternans*.

Pinnae numerous, 18 or more on each side.

Segments of the inner perianth acutish; branches of the staminate inflorescence few-----3. *C. tepejilote*.

Segments of the inner perianth very obtuse; branches of the staminate inflorescence numerous-----4. *C. wendlandiana*.

Interior perianth of the staminate flowers connate at the base with the filaments and rudimentary ovary to form a short stipe; anthers erect.

Perianth segments of both staminate and pistillate flowers valvate.

Interior perianth of the pistillate flowers of 3 distinct segments.

Leaves simple, bilobate or irregularly pinnatifid; pistillate spadix simple.-----5. *C. ernesti-augusti*.

Leaves pinnate; pistillate spadix branched-----6. *C. sartorii*.

Interior perianth of both staminate and pistillate flowers gamophyllous, tridentate.

Leaves simple, bifid-----7. *C. stolonifera*.

Leaves pinnate.

Caudex very short or obsolete-----8. *C. humilis*.

Caudex 2 to 3.5 meters high.

Pinnae 1 to 1.5 cm. wide, about 15 cm. long-----9. *C. elegans*.

Pinnae about 2.5 cm. wide and 30 cm. long-----10. *C. liebmanni*.

Perianth segments of the staminate flowers valvate, those of the pistillate flowers imbricate.

Fruit 3-celled. Pistillate spadices simple.

Caudex procumbent; leaves about 40 cm. long----11. *C. pygmaea*.

Caudex erect; leaves more than 40 cm. long.

Pinnae 12.5 to 17 cm. long, 6 to 8 mm. wide.

12. *C. cataractarum*.

Pinnae 30 cm. long, 2.5 to 3.3 cm. wide-----13. *C. oreophila*.

Fruit 1-celled.

Leaves simple, bifid; spadices simple-----14. *C. tenella*.

Leaves pinnate; spadices usually branched.

Caudex very long, flexuous, subcaudent.

Pinnae partly hooked at the apex, some of them opposite.

15. *C. elatior*.

Pinnae not hooked at the apex, all alternate----16. *C. affinis*.

Caudex erect.

Pinnae few (5 to 12 on each side), trapezoid or oblong.

Staminate flowers oblong; segments of the inner perianth free at the apex-----17. *C. lunata*

Staminate flowers subglobose; segments of the inner perianth adnate at the apex.

Pinnae about 5 on each side-----18. *C. lindeniana*.

Pinnae 10 to 12 on each side-----19. *C. schiedeana*.

Pinnae numerous, elongate-lanceolate or linear-lanceolate.

Pinnae approximate in clusters along the rachis.

20. *C. klotzschiana*.

Pinnae evenly distributed along the rachis.

Leaf blades short, 45 to 60 cm. long----21. *C. radicalis*.

Leaf blades large, 1 to 2 meters long.

Pinnae 45 to 50 cm. long, about 2.5 cm. wide; caudex very short-----22. *C. montana*.

Pinnae about 30 cm. long, 2 to 3.5 cm. wide; caudex elongate.

Pinnae 3 to 3.7 wide-----23. *C. karwinskiana*.

Pinnae 0.8 to 2 cm. wide.

Pinnae about 2 cm. wide-----24. *C. pochutlensis*.

Pinnae about 1 cm. wide-----25. *C. graminifolia*.

1. *Chamaedorea martiana* Wendl. Allg. Gartenz. 21: 137. 1853.

Native of Mexico, the locality not known.

Caudex short, repent, dichotomous; leaves long-petiolate, pinnate, the pinnae numerous, small, linear; spadices short-pedunculate, simply branched.

2. *Chamaedorea alternans* Wendl. Gartenflora 29: 104. 1880.

Chiapas.

Caudex up to 3 meters high, 3 cm. thick, the nodes 4 to 8 cm. apart; leaves 4 or 5, 1.75 meters long, the petiole 35 cm. long, the blades pinnate, the pinnae about 8 on each side, elliptic-lanceolate, acuminate, the middle ones 40 to 50 cm. long, 11 to 14 cm. wide; pistillate spadix 40 to 50 cm. long, with 9 to 13 branches.

3. *Chamaedorea tepejilote* Liebm.; Mart. Hist. Nat. Palm. 3: 308. 1836-50.

Described from "Matlaluca, S. Maria, Orizaba."

Caudex 1.2 to 1.8 meters high, thick, closely annulate; leaf blades 1.2 meters long, the pinnae 32 to 37 cm. long, 3.5 cm. wide, numerous, alternate, narrowly lanceolate, subfalcate, acute; spadices simply branched, borne among the younger leaves; fruit oblong-ovoid, 16 mm. long, 6 mm. thick, black. "Tepejilote."

The unopened spathes are cooked and eaten like asparagus.

4. *Chamaedorea wendlandiana* (Oerst.) Hemsl. Biol. Centr. Amer. Bot. 3: 407. 1885.

Stephanostachys wendlandiana Oerst. Nat. For. Kjöbenhavn Vid. Medd. 1858: 28. 1859.

Oaxaca.

Leaves 1.2 meters long, the petiole 30 cm. long, the pinnae 18 to 20 on each side, narrowly lanceolate, slightly falcate, long-acuminate, the middle ones 50 cm. long, 3.7 cm. wide or more; staminate spadix 45 cm. long, the peduncle 30 cm. long, the spathes 7, chartaceous, greenish, the branches numerous, 15 cm. long; pistillate spadix 25 cm. long, the few branches erect or ascending, 7.5 cm. long.

5. *Chamaedorea ernesti-augusti* Wendl. Allg. Gartenz. 20: 73. 1852.

Eleutheropetalum ernesti-augusti Oerst. Nat. For. Kjöbenhavn Vid. Medd. 1858: 7. 1859.

Tabasco (type locality). Guatemala and Honduras.

Caudex elongate, erect, remotely annulate; leaves simple, ovate-oblong, bifid or irregularly pinnatifid, coarsely serrate; pistillate spadix simple, strict, equaling or longer than the leaves, the rachis thick and fleshy.

6. *Chamaedorea sartorii*¹ Liebm.; Mart. Hist. Nat. Palm. 3: 308. 1836-50.

Veracruz; type from Barranca de San Francisco, near Mirador, altitude 600 to 750 meters.

Caudex 2.5 to 4.2 meters high, annulate, covered above by the petiole bases; leaf blades 90 to 105 cm. long, the pinnae 30 cm. long, 4 to 5 cm. wide, alternate, elongate-lanceolate, acuminate, falcate; spathes soon deciduous; spadices borne between and below the fronds, simply branched, the branches of the staminate inflorescence very long and pendulous; fruit oval, black, 12 mm. long, 8 mm. thick.

7. *Chamaedorea stolonifera* Wendl.; Hook. f. in Curtis's Bot. Mag. 118: *pl.* 7265. 1892.

Described from southern Mexico, the locality not known.

Caudices very slender, a meter high, very stoloniferous, forming dense tufts, closely annulate; leaves terminal, 25 cm. long, short-petiolate, the blades cleft to below the middle into 2 oblong acute segments; spadices borne below the leaves, the staminate with 5 or 6 spreading flexuous branches, these 7.5 to 12.5 cm. long.

8. *Chamaedorea humilis* (Liebm.) Mart. Hist. Nat. Palm. 3: 308. 1836-50.

Collinia humilis Liebm. Overs. Dansk. Vid. Selsk. Forh. 1846: 8. 1846.

Veracruz and Oaxaca; type from Colipa, Veracruz.

Dwarf, the caudex very short or obsolete, covered by the petiole sheaths; leaves about 45 cm. long, the pinnae 15 cm. long, 1 cm. wide, linear-lanceolate; spadices 20 to 30 cm. long, borne between and below the leaves simply branched; fruit globose, black.

9. *Chamaedorea elegans* Mart. Linnaea 5: 204. 1830.

Veracruz and Oaxaca; type from Barranca de Tioselo.

Caudex erect, 1.8 meters high, with numerous nodes; pinnae narrowly lanceolate, acuminate, straight; spadix paniculate-branched; fruit globose.

¹ Carl Sartorius, a native of Darmstadt, Germany, was obliged by political conditions to leave his native country in 1826, and in 1830 he took refuge in Mexico. He purchased land at Mirador, at the base of Mount Orizaba, and engaged in agricultural pursuits. He made large collections of plants which are deposited in various herbaria of Europe and the United States. His death occurred in 1872.

10. *Chamaedorea liebmanni*¹ Mart. Hist. Nat. Palm. 3: 308. 1836-50.

Type from Chinantla, Oaxaca.

Caudex 3 to 3.5 meters high, erect, annulate; leaf blades 1 to 1.2 meters long, the petioles 22 cm. long, the pinnae elongate-lanceolate, 30 cm. long, 2.5 cm. wide, acuminate; spadices 45 cm. long, twice-branched; fruit globose, minute, black.

11. *Chamaedorea pygmaea* Wendl. Allg. Gartenz. 20: 217. 1852.

Chiapas.

Caudex very short, procumbent; leaves short-petiolate, 40 to 42.5 cm. long, the pinnae 9 to 12 on each side, elongate-lanceolate; pistillate spadices 25 to 30 cm. long.

12. *Chamaedorea cataractarum* (Liebm.) Mart. Hist. Nat. Palm. 3: 309. 1836-50.

Stachyphorb cataractarum Liebm. Overs. Dansk. Vid. Selsk. Forh. 1846: 8. 1846.

Oaxaca; type from Chinantla.

Thirty to 60 cm. high, the caudex very short, included in the sheaths; terminal leaves erect, the pinnae linear-lanceolate, acute, straight, alternate, 12.5 to 17 cm. long, 6 to 8 mm. wide; spadices basal, shorter than the leaves; fruit oval, black, the size of a pea.

13. *Chamaedorea oreophila* Mart. Hist. Nat. Palm. 3: 309. 1836-50.

Type from mountains of Tepitonga, Oaxaca.

Caudex 7.5 to 10 cm. long, densely annulate; leaves erect-patent; 75 cm. long, the pinnae 30 cm. long, 2.5 to 3.3 cm. wide, alternate, elongate-lanceolate, acute, straight; spadix 8 cm. long, erect, borne among the leaves; fruit olive-like, orange.

14. *Chamaedorea tenella* Wendl. Gartenflora 29: 102. 1880.

Nunnezharia tenella Hook. f. in Curtis's Bot. Mag. 107: pl. 6584. 1881.

Described from cultivated plants of Mexican origin.

Plants very small, flowering when 17 to 23 cm. high but sometimes 1 meter high, the caudex slender, rooting from the lower nodes; leaves short-petiolate, 10 to 20 cm. long, 6 to 10 cm. wide, obovate-oblong, bifid for a third their length, the lobes acute; spadices about as long as the whole plant, slender, drooping, simple; fruit globose, 8 mm. in diameter, dark green or bluish black.

Hooker (loc. cit.) remarks that this is perhaps the smallest palm known.

15. *Chamaedorea elatior* Mart. Linnaea 5: 205. 1830.

Chamaedorea scandens Liebm.; Mart. Hist. Nat. Palm. 3: 308. 1836-50.

San Luis Potosí, Veracruz, and Oaxaca; type from Barranca de Tioselo.

Stem sometimes 3.5 meters high, 2.5 cm. thick, flexuous and subscaudent, covered with petiole sheaths; basal leaves 2, persistent, flabellate-bifid, the

¹ Frederick Michael Liebmann (1813-1856), a Dane, was sent by the Danish Government to Mexico in 1840, in company with a gardener, Rath sack, to make scientific collections, especially of living plants and seeds for the botanical garden of Copenhagen. He landed at Veracruz in February, and with Karwinsky he explored that State, making his headquarters at Mirador. Later he visited Puebla and Oaxaca, and in 1843 he returned to Copenhagen with his collections, which consisted of 40,000 botanical specimens. He was appointed professor of botany at Copenhagen in 1845 and director of the botanical garden in 1849. He published numerous papers based upon his collections, and after his death Oersted also published descriptions of some of the new species discovered. His plants were distributed to many of the herbaria of Europe and the United States.

cauline ones remote, 1.8 to 2.5 meters long, the pinnae numerous, 45 cm. long, 2.5 cm. wide, alternate, elongate-lanceolate, long-acuminate; spadices lateral, subappressed, pedunculate, simply branched; fruit globose, black.

16. *Chamaedorea affinis* Liebm.; Mart. Hist. Nat. Palm. 3: 308. 1836-50.

Oaxaca; type from Chinantla.

Pinnae all alternate, the uppermost confluent; spathes 4, persistent.

17. *Chamaedorea lunata* Liebm.; Mart. Hist. Nat. Palm. 3: 307. 1836-50.

Type from Jicaltepec, Veracruz. Guatemala.

Caudex erect, 1.8 to 3.5 meters high, annulate, covered above with the leaf sheaths; leaves 75 to 100 cm. long, the pinnae 30 cm. long and 7.5 cm. wide or smaller, alternate, remote, broadly lanceolate, falcate, acuminate; spadices simply branched, borne below the leaves, the branches very long, flexuous; fruit elongate, curved, attenuate at each end, 12 to 14 mm. long.

18. *Chamaedorea lindeniana* Wendl. Allg. Gartenz. 21: 139. 1853.

Native of Mexico, the locality not known; specimens from Veracruz are perhaps referable here.

Pinnae 5 on each side, oblong-trapezoid, the middle ones 25 to 28 cm. long, 10 to 11.5 cm. wide, the lowest ones approximate, reflexed-patent, the upper confluent; peduncle of the pistillate inflorescence 35 to 38 cm. long, the rachis 7.5 to 10 cm. long, the branches slender, subflexuous.

19. *Chamaedorea schiedeana*¹ Mart. Linnaea 5: 204. 1830.

Veracruz; type from Jalapa. Guatemala.

Caudex about 1.8 meters high; petioles half as long as the blades, the pinnae broadly lanceolate, falcate-cuspidate; spadices simply branched; fruit globose, bluish black.

20. *Chamaedorea klotzschiana* Wendl. Ind. Palm. 63. 1854.

Native of Mexico, the locality not known.

Pinnae 15 to 18 on each side, elongate-lanceolate, acuminate, the middle ones 30 cm. long, 3.7 cm. wide.

21. *Chamaedorea radicalis* Mart. Hist. Nat. Palm. 3: 308. 1836-50.

Type from the Sierra Madre, lat. 21° to 22° (Tepic or Jalisco).

Plant small, the caudex short, stoloniferous, covered with the petiole sheaths; petioles shorter than the pinnae, the blades 45 to 60 cm. long, the pinnae thickish, linear-acuminate; spathes 6; spadices subbasal, erect, few-branched; fruit globose, black, the size of a pea.

22. *Chamaedorea montana* Liebm.; Mart. Hist. Nat. Palm. 3: 308. 1836-50.

Type from Trapiche de la Concepción, Oaxaca.

Caudex 30 cm. high or less, erect, closely annulate; petioles 45 to 60 cm. long, the blades 1.5 to 2 meters long, the pinnae 45 to 50 cm. long, 2.5 cm. wide or

¹ Christian Julius Wilhelm Schiede (1798-1836), a German, studied natural science, especially botany, at Berlin and Göttingen, and, as a means of assistance in his proposed botanical explorations, medicine. Accompanied by another botanist, Deppe, he reached Mexico in 1828. The two spent about a year in exploring the State of Veracruz, and obtained large collections of plants and other objects. Schiede then took up the practice of medicine, which gave him means to explore other regions of Mexico. His collections were studied chiefly by Schlechtendal and Chamisso, who published numerous papers dealing with them in Linnaea. Schiede himself published descriptions of some of the new plants he discovered, as well as letters dealing with the general aspects of Mexican vegetation. He died in the City of Mexico in 1836. His plants were widely distributed, the most complete series being at Berlin; a few are in the U. S. National Herbarium.

more, numerous, alternate or subopposite, rigid, narrowly lanceolate, acute, cuspidate; spadices simply branched, erect, borne among the leaves, the branches flexuous; fruit globose, small, thin-fleshed, black.

23. *Chamaedorea karwinskiana* Wendl. Allg. Gartenz. 21: 179. 1853.

Native of Mexico, the locality not known.

Caudex 50 cm. high or more, stoloniferous; leaves pinnate, the pinnae 27 to 33 on each side, linear-lanceolate, 30 cm. long, 3 to 3.7 cm. wide; staminate spadix 35 to 50 cm. long, the branches pendulous, the pistillate spadix 40 to 50 cm. long, branched; fruit oblong, black.

24. *Chamaedorea pochutlensis* Liebm.; Mart. Hist. Nat. Palm. 3: 308. 1836-50.

Type from Pochutla, Oaxaca.

Caudex 3 to 3.5 meters high, slender, closely annulate; fronds 1 to 1.2 meters long, the pinnae 20 to 28 cm. long, scarcely 2.5 cm. wide, elongate-lanceolate, straight, acute, spadices 45 cm. long, erect between the leaves, simply branched, the branches very long, slender, pendulous.

25. *Chamaedorea graminifolia* Wendl. Ind. Palm. 62. 1854.

Specimens from Yucatán are referred here with doubt, Guatemala.

Pinnae 36 to 42 on each side, linear, about 25 to 30 cm. long and 1 cm. wide, straight; staminate spadix 30 cm. long or more, the branches very long, flexuous, pendulous. "Xiat" (Yucatán).

13. *COCOS* L. Sp. Pl. 1188. 1753.

REFERENCES: Cook, The origin and distribution of the cocoa palm, Contr. U. S. Nat. Herb. 7: 257-293. 1901; Cook, History of the coconut palm in America, Contr. U. S. Nat. Herb. 14: 271-342. 1910; Beccari, The origin and dispersal of *Cocos nucifera*, Philippine Journ. Sci. Bot. 12: 27-43. 1911.

1. *Cocos nucifera* L. Sp. Pl. 1188. 1753.

Common along both coasts of Mexico, often cultivated. Widely distributed in tropical regions.

Trunk slender, sometimes 30 meters high with a diameter of 60 to 70 cm., usually enlarged at the base, normally erect but often bent over by wind; leaves pinnate, 3 to 6 meters long; flowers white, borne in large panicles. Known commonly in Mexico as "coco," "cocotero," "palma de coco," and "coco de agua;" also as "coco de castillo."

The best known and most important of all palms, of frequent occurrence along the coasts of Mexico, growing normally in the immediate vicinity of salt water. The trunks are used for building dwellings and for rafts and the leaves for thatching. The meat of the nut is a favorite article of food and large amounts are used for making "dulces" or sweetmeats. The milk of the fresh fruits is a refreshing drink and is said to have diuretic properties. The fruit has the reputation, in Cuba and Yucatán, of expelling intestinal parasites.

On the west coast of Mexico, particularly in Colima, an intoxicating drink called "tuba" is made from the sap obtained from the trunk or from the inflorescences. This is sometimes flavored with pineapple, lemon, onion, chile, or cinnamon, when it is known as "tuba compostura." The "tuba" is distilled to obtain alcohol, and also furnishes vinegar.

The shells of the nuts are made into cups and other articles. Oil is expressed from the meat, and small quantities of it have been exported from Mexico.

In other regions of the world the different parts of the coco palm are employed for an infinite variety of purposes which it seems unnecessary to enumerate here.¹

¹ See Safford, Contr. U. S. Nat. Herb. 9: 233-243. 1905.

14. *ATTALEA* H. B. K. Nov. Gen. & Sp. 1: 309. 1815.1. *Attalea cohune* Mart. Hist. Nat. Palm. 3: 300. *pl.* 167. 1836-50.

Jalisco to Oaxaca and Yucatán, chiefly in the littoral regions. Central America; type from Honduras.

Trunk often 50 to 60 meters high, when short usually covered with persistent leaf bases; leaves very large, sometimes 7.5 meters long (said to be even 18 meters long and 2.5 meters wide), gracefully recurved, pinnate, with very numerous segments; inflorescence 1.5 to 2 meters long; fruit resembling a small coconut, about 7 cm. long, mamillate at the apex, subtended by the accrescent perianth; seeds large, very oily. "Corozo" (Yucatán, Oaxaca, Guatemala, Costa Rica); "palma de coquito de aceite," "coquino," "coco de aceite," "coquito" (Colima); "palma real," "corozo gallinazo" (Panama); "cohune" (Honduras, Guatemala); "monaco," "manaca" (Guatemala); "coco de Guadalajara" (Chihuahua, in market).

The tallest and most showy of Mexican palms and one of the most important ones economically. The trunks are used for building purposes and the leaves for thatching. From the trunk a liquor similar to that of the coco palm is obtained. The flowers have a heavy, unpleasant odor, and attract bees and wasps. The young bud or "cabbage" is cooked and eaten, and in Costa Rica, at least, the young leaves are used for making hats. The fruits, however, are the most important part of the plant. They are much eaten by cattle, and the seeds are used for human food, especially for the preparation of sweetmeats. The seeds contain about 50 per cent of oil, which is extracted by pressure, and is used chiefly for making soap, but also for candles, machine oil, etc. One soap factory at Guaymas is said to have used 100,000 pounds of the oil a year.

Two species of *Cocos* described from Mexico by Liebmann probably belong to this genus. They may be synonyms of *Attalea cohune*, or they may represent distinct species, for there is reason to believe that more than one species of *Attalea* occurs in Mexico. *Cocos regia* Liebm. (Mart. Hist. Nat. Palm. 3: 323. 1836-50) was based upon material from the mountains of eastern Mexico. *C. guacuyule* Liebm. (Mart. loc. cit.) was collected near Guatemala, at an altitude of 360 meters. The latter name has been much used in Mexican literature for the plant here listed as *Attalea cohune*. The following vernacular names have been reported: "Coyol," "coyole," "guacoyul," "huiscoyul," "quacoyul."

15. *ACROCOMIA* Mart. Hist. Nat. Palm. 2: 66. 1823 (?).1. *Acrocomia mexicana* Karw.; Mart. Hist. Nat. Palm. 3: 285. *pl.* 138. 1836-50.

Sinaloa and southward along the Pacific coast; Yucatán; type from Teoxmulco. Guatemala.

Trunk of medium height, very spiny; leaves pinnate, with numerous thin narrow segments, these pale and more or less hispid beneath; rachis and petiole of the leaf armed with very numerous long compressed blackish lustrous spines; fruit globose, about 4 cm. in diameter: "Coyol" (Guerrero); "cocoyol" (Yucatán); "cocoyul" (Sinaloa, Guerrero); "guacoyul" (Oaxaca; from the Nahuatl, "cuaucoyotli"); "coquito baboso" (Oaxaca).

The fruit is edible and is often found in the markets. It is said that an intoxicating liquor is made from it.

16. *ASTROCARYUM* Meyer, Prim. Fl. Esseq. 265. 1818.1. *Astrocaryum mexicanum* Liebm.; Mart. Hist. Nat. Palm. 3: 323. 1836-50. Veracruz and Oaxaca (type locality).

Trunk 1.2 to 1.8 meters high, densely covered with black spines; petiole and rachis densely spiny, the blades pinnate, the pinnae broadly linear; spathes densely spiny; inflorescence spicate; fruit fusiform, beaked, densely spiny. "Chocón" (Veracruz).

17. **BACTRIS** Jacq. Stirp. Amer. 271. 1763.

Plants usually low, the stems unarmed or often covered with long spines; leaves pinnatisect, the petioles usually spiny; flowers monoecious; fruit 1-celled, 1-seeded, the pericarp fleshy.

Petiole and rachis of the leaf unarmed.....1. **B. acuminata**.

Petiole and rachis armed with long spines.

Fruit globose, unarmed.....2. **B. baculifera**.

Fruit obovoid, ovoid, or turbinate.

Fruit densely prickly.....3. **B. cohune**.

Fruit unarmed.....4. **B. mexicana**.

1. **Bactris acuminata** Liebm.; Mart. Hist. Nat. Palm. 3: 321. 1836-50.

Described from Chinantla, Oaxaca.

Petiole and rachis unarmed, the pinnae elongate-lanceolate or the upper ones elongate-obovate, linear-acuminate, black-aculeate beneath.

2. **Bactris baculifera** Karw.; Mart. Hist. Nat. Palm. 3: 322. 1836-50.

Type from Jicaltepec, Veracruz.

Cespitose; trunk 2.5 to 2.7 meters high, the internodes about 20 cm. long, armed with numerous compressed spines 7 to 13 cm. long; petiole and rachis spiny; fruit globose, unarmed.

Wood very hard; said to be used for canes, etc.

3. **Bactris cohune** S. Wats. Proc. Amer. Acad. 21: 467. 1886.

Material from Tabasco probably belongs to this species. Originally described from Guatemala.

Trunk 1.8 to 4.5 meters high, straight, slender, densely spiny, covered with the persistent sheaths of old leaves; leaves pale beneath, the petiole and rachis very spiny, the pinnae linear, often a meter long, aculeolate on the margin; spathes tomentose and spiny; fruit obovoid, nearly 5 cm. long, prickly. "Cocoyol de jauacte" (Tabasco).

Fruit edible.

4. **Bactris mexicana** Mart. Palm. Orbig. 65. 1847.

Veracruz and Oaxaca; type from Jicaltepec, Veracruz.

Trunk of medium height, very spiny; petiole and rachis armed with numerous long slender black spines, the pinnae lance-linear, aculeate-ciliate, paler beneath; spathe very prickly; fruit shaped like an acorn, about 2.5 cm. long, surrounded at the base by the cuplike perianth. "Palma de garroche" (Oaxaca); the "quauhcoyolli" of Hernández, according to Martius.

18. **DESMONCUS** Mart. Hist. Nat. Palm. 2: 84. 1824(?).

1. **Desmoncus chinantlensis** Mart. Hist. Nat. Palm. 3: 321. 1836-50.

Forests of Chinantla, Oaxaca.

Trunk stout, flexuous, subscandent, very densely setose-aculeate; leaves remote, the petioles sheathing, spiny, the blades pinnate, with elliptic pinnae; peduncles densely retrose-spiny; fruit obovoid-globose.

Plants of this genus are said to be known in Tabasco as "ballí" and "matambilla," but perhaps these names apply rather to species of *Bactris*.

9. ARACEAE. Arum Family.

REFERENCES: Engler in DC. Monogr. Phan. 2. 1879; Engler, Pflanzenreich IV. 23. 1905-1913.

Plants glabrous; leaves alternate, distichous, or spirally arranged, entire or lobate; flowers small, perfect or monoecious, crowded on a simple spadix, this usually surrounded by a spathe, the whole inflorescence resembling a single flower; fruit baccate.

A large family, with numerous species in Mexico. Most of the plants, however, are wholly herbaceous, and often acaulescent. The species taken up here scarcely deserve to rank as shrubs, but they have long, coarse, epiphytic, scandent stems, which give them the general appearance, at least, of shrubs. The leaves in this family usually contain crystals of calcium oxalate, which penetrate the tongue when a piece is chewed, causing pain and swelling.

Flowers all fertile, or a few at the base of the spike unisexual; leaves often perforated or pinnatifid.....1. **MONSTERA**.

Flowers monoecious, the upper ones staminate, the lower pistillate; leaves not perforated.

Ovaries distinct, 2 to 10-celled; seeds with endosperm...2. **PHILODENDRON**.

Ovaries coherent, 1 or 2-celled; seeds without endosperm...3. **SYNGONIUM**.

1. **MONSTERA** Adans. Fam. Pl. 2: 470. 1763.

Scandent branched shrubs, the branches rooting; leaves distichous, entire or pinnatifid, often with large perforations; flowers perfect.

Leaf blades regularly pinnatifid.....1. **M. deliciosa**.

Leaf blades never regularly pinnatifid, with large openings.

Openings biseriate or triseriate along the costa.....2. **M. punctulata**.

Openings irregularly scattered or uniseriate.

Spadix oblong, about half as long as the spathe...3. **M. pertusa jacquini**.

Spadix broadly ovoid, only slightly shorter than the spathe.

4. **M. karwinskyi**.

1. **Monstera deliciosa** Liebm. Nat. For. Kjöbenhavn Vid. Medd. 1849: 19. 1849.

Monstera lennae C. Koch, Bot. Zeit. 1852: 277. 1852.

Forests of Oaxaca (type locality) and Veracruz. Guatemala.

Stems terete, 6 meters long and 6 cm. thick or larger, sending out long roots from the nodes; leaf blades 40 to 60 cm. broad, with numerous narrow lobes; spadix 17 to 20 cm. long; berries pale yellow, spotted with violet. "Piñanona" (Oaxaca).

The fruiting spadices are edible.

2. **Monstera punctulata** Schott; Engl. in DC. Monogr. Phan. 2: 259. 1879.

Anadendron punctulatum Schott, Prodr. Syst. Aroid. 393. 1860.

Reported from Mexico, the locality not stated. Type locality uncertain but probably somewhere in Central America.

Leaf blades ovate, 60 to 70 cm. long, with numerous perforations.

3. **Monstera pertusa jacquini** (Schott) Engl. in Mart. Fl. Bras. 3^o: 113. 1878.

Monstera jacquini Schott, Oesterr. Bot. Wochenbl. 1854: 66. 1854.

Forests of Veracruz. West Indies, Central America, and northern South America.

Stems high-climbing, 1 to 3 cm. thick; leaf blades ovate, 30 to 40 cm. long, with few large perforations.

4. *Monstera karwinskyi* Schott, Oesterr. Bot. Zeitschr. 9: 99. 1859.
Monstera egregia Schott; Engl. in DC. Monogr. Phan. 2: 260. 1879.
 Forests of Veracruz; type collected between Colipa and Papantla.
 Stems high-climbing, 2 to 3 cm. thick; leaf blades obliquely oblong, 40 to 50 cm. long.

2. **PHILODENDRON** Schott; Schott & Endl. Melet. Bot. 1: 19. 1832.

Plants scandent, the leafy stems rooting at the nodes; leaves entire or lobate, thick, with persistent sheaths; flowers monoecious.

Leaves acute at the base, entire.

Leaf sheath arising slightly below the blade, long-produced---1. *P. seguine*.

Leaf sheath arising far below the blade-----2. *P. inaequilaterum*.

Leaves either sagittate or cordate or lobate.

Leaves parted or lobed.

Leaves 3-parted.

Ovules several in each cell-----9. *P. anisotomum*.

Ovules solitary-----10. *P. fenzlii*.

Leaves incised or pinnatifid.

Leaves ovate in outline-----11. *P. radiatum*.

Leaves rounded-----12. *P. polytomum*.

Leaves neither parted nor lobed.

Ovules solitary.

Petiole terete-----7. *P. subovatum*.

Petiole flattened above-----8. *P. advena*.

Ovules 2 to 5 in each cell.

Leaves thin, usually pellucid-striolate-----6. *P. mexicanum*.

Leaves subcoriaceous, not pellucid-striolate.

Petioles terete-----5. *P. sanguineum*.

Petioles flattened or sulcate on the anterior side.

Petioles flattened on the anterior side-----3. *P. sagittifolium*.

Petioles sulcate on the anterior side-----4. *P. daemonum*.

1. *Philodendron seguine* Schott, Bouplandia 1859: 164. 1859.

Forests of Oaxaca.

Branches 6 to 8 mm. thick; leaf blades narrowly oblong, 15 to 20 cm. long, 4 to 4.5 cm. wide.

2. *Philodendron inaequilaterum* Liebm. Nat. For. Kjöbenhavn Vid. Medd. 1850: 16. 1850.

Pital, Veracruz, the type locality.

Leaf blades oblong-ovate, 20 to 32 cm. long, 10 to 13 cm. wide.

3. *Philodendron sagittifolium* Liebm. Nat. For. Kjöbenhavn Vid. Medd. 1850: 17. 1850.

Philodendron tanyphyllum Schott, Prodr. Syst. Aroid. 273. 1860.

Veracruz to Morelos.

Stems high-climbing, 2.5 to 3 cm. thick; leaf blades sagittate, 30 to 50 cm. long; spathe green outside, purplish within; berries dull yellow.

4. *Philodendron daemonum* Liebm. Nat. For. Kjöbenhavn Vid. Medd. 1850: 17. 1850.

Veracruz, the type from Colipa.

Leaf blades cordate-hastate, 28 to 35 cm. long.

5. *Philodendron sanguineum* Regel, Gartenflora 1869: 197. pl. 621. 1869.

Forests of Veracruz, the type from the Valley of Córdoba.

Leaf blades elongate-sagittate, 20 to 30 cm. long; spathes green, 13 to 15 cm. long.

6. *Philodendron mexicanum* Engl. in Mart. Fl. Bras. 3²: 143. 1878.
Valley of Córdoba, Veracruz.
Leaf blades elongate-hastate, 30 to 36 cm. long.
7. *Philodendron subovatum* Schott, Oesterr. Bot. Wochenbl. 1855: 289. 1855.
Southern Mexico, the locality not indicated.
Stems scandent; leaf blades cordate-ovate, 25 to 35 cm. long, 24 to 30 cm. wide.
8. *Philodendron advena* Schott, Oesterr. Bot. Wochenbl. 1855: 289. 1855.
Southern Mexico, the locality not indicated.
Stems scandent; leaf blades broadly cordate-ovate, 35 cm. long, 20 to 26 cm. wide; spathes green outside, purple within; berries stramineous.
9. *Philodendron anisotomum* Schott, Oesterr. Bot. Zeitschr. 1858: 179. 1858.
Philodendron affine Hemsl. Diag. Pl. Mex. 37. 1878.
Morelos to Chiapas. Guatemala.
Stems repent or scandent, rooting at the nodes; leaf blades 3-parted.
10. *Philodendron fenzlii* Engl. in Mart. Fl. Bras. 3²: 144. 1878.
Morelos and probably elsewhere in Mexico.
Caudex scandent, 1 to 1.2 cm. thick; leaves 3-parted.
11. *Philodendron radiatum* Schott, Oesterr. Bot. Wochenbl. 3: 378. 1853.
Forests of Veracruz and Oaxaca. Guatemala.
Stems stout, scandent; leaf blades deeply pinnatifid; spathes green or purplish outside, pale purple within.
12. *Philodendron polytomum* Schott, Bonplandia 7: 164. 1859.
Forests of Veracruz; type from Cólipa.
Leaf blades deeply pinnatifid, 60 to 70 cm. long, 60 to 65 cm. wide.

3. SYNGONIUM Schott, Wien. Zeitschr. 3: 780. 1829.

Scandent shrubs, the stems rooting at the nodes; leaves petiolate, the primary ones sagittate, the adult ones 3 to 9-lobate, the petiole elongate, with an accrescent persistent sheath; flowers monoecious, the peduncles short, solitary or fasciculate, the spadix much shorter than the spathe.

Tube of the spathe narrowly cylindric; lateral nerves of the leaves ascending at an angle of about 60°-----1. *S. auritum*.

Tube of the spathe oblong-ovoid; lateral nerves ascending at an angle of 30 to 45°-----2. *S. podophyllum*.

1. *Syngonium auritum* (L.) Schott; Schott & Endl. Melet. Bot. 1: 19. 1832.

Arum auritum L. Sp. Pl. ed. 2. 1371. 1763.

Syngonium neglectum Schott, Bonplandia 1859: 163. 1859.

Veracruz to Morelos. Jamaica.

2. *Syngonium podophyllum* Schott, Prodr. Syst. Aroid. 68. 1856.

Veracruz. El Salvador.

10. LILIACEAE. Lily Family.¹

The Mexican species treated here are trees or shrubs, sometimes acaulescent but often with thick, simple or branched trunks; the leaves are either linear or dagger-shaped, usually stiff and rigid, sometimes with spiny margins; the flowers are either small or large and showy.

¹The writer is under obligations to Dr. William Trelease for generous assistance in the preparation of the account of this family.

Ovules numerous in each cell; flowers large, perfect.

Flowers scarcely 1.5 cm. wide, greenish; anthers oblong...1. **HESPERALOE**.

Flowers 5 to 10 cm. wide, white or yellow; anthers short-sagittate.

Style filiform; stigma papillate.....2. **HESPEROYUCCA**.

Style stout; stigma not papillate.

Perianth gamophyllous, tubular below, the stamens inserted in the throat.

.....3. **SAMUELA**.

Perianth polyphyllous or nearly so, campanulate, the stamens inserted at the base.....4. **YUCCA**.

Ovules 2 or 3 in each cell; flowers small, unisexual.

Ovary 3-celled; fruit exalate.

Fruit deeply 3-lobate, often inflated.....5. **NOLINA**.

Fruit not lobed or inflated.....6. **CALIBANUS**.

Ovary 1-celled; fruit 3-winged.

Perianth segments entire; leaves somewhat ribbed, the margins not prickly.

.....7. **BEAUCARNEA**.

Perianth segments denticulate; leaves not ribbed, the margins usually prickly.....8. **DASYLIRION**.

1. **HESPERALOE** Engelm.; S. Wats. in King, Geol. Expl. 40th Par. 5: 497. 1871.

REFERENCE: Trelease, Rep. Mo. Bot. Gard. 13: 29-38. pl. 1-4. 1902.

Plants acaulescent or nearly so; leaves linear, with filiferous margins; inflorescence paniculate, with few branches.

Flowers green, tinged with purple.....1. **H. funifera**.

Flowers rosy red or salmon-colored.....2. **H. parviflora**.

1. **Hesperaloe funifera** (Koch) Trel. Rep. Mo. Bot. Gard. 14: 36. 1902.

Yucca funifera Koch, Belg. Hort. 12: 132. 1862.

Hesperaloe davyi Baker, Kew Bull. 1898: 226. 1898.

Coahuila, Nuevo León, and San Luis Potosí; described from cultivated plants.

Leaves sometimes nearly 2 meters long and 4 cm. wide; inflorescence 2 to 2.5 meters high, the flowers campanulate, about 2.5 cm. long; capsule 2.5 to 5 cm. long, with large flat black seeds. "Samandoque."

The plant is said to be planted in Nuevo León for the fiber obtained from the leaves. The fiber is long and of excellent quality. It is exported as "ixtli" or "Tampico fiber."

2. **Hesperaloe parviflora** (Torr.) Coulter, Contr. U. S. Nat. Herb. 2: 436. 1894.

Yucca parviflora Torr. U. S. & Mex. Bound. Bot. 221. 1859.

Aloe yuccaefolia A. Gray, Proc. Amer. Acad. 7: 390. 1867.

Hesperaloe yuccaefolia Engelm.; S. Wats. in King, Geol. Expl. 40th Par. 5: 497. 1871.

Southwestern Texas, the type collected between the mouth of the Pecos and the Nueces. There is little doubt that the species occurs also on the Mexican side of the Río Grande, in Coahuila.

Leaves 1 to 1.25 meters long, about 2.5 cm. wide; inflorescence 1 to 1.25 meters high; flowers about 3.5 cm. long; capsule 2.5 cm. long or larger.

2. **HESPEROYUCCA** (Engelm.) Baker, Kew Bull. 1892: 8. 1892.

REFERENCE: Trelease, Rep. Mo. Bot. Gard. 13: 38-41. pl. 4, 5. 1902.

1. **Hesperoyucca whipplei** (Torr.) Baker, Kew Bull. 1892: 8. 1892.

Yucca whipplei Torr. U. S. & Mex. Bound. Bot. 222. 1859.

Mountain slopes, Baja California. California; type from Pasqual.

Plants acaulescent or nearly so; leaves linear, stiff, 0.3 to 1 meter long, 1.5 cm. wide, sharp-pointed, glaucous; inflorescence 2 to 5 meters high, dense, the flowers white, pendent, fragrant; capsule about 5 cm. long.

The leaves are said to give a fine, strong fiber. The flowers were eaten formerly by the California Indians, and Palmer states that the seeds, also, were ground and eaten, either raw or in the form of porridge.

3. SAMUELA Trel. Rep. Mo. Bot. Gard. **13**: 116. 1902.

Trees with thick, simple or branched trunks; leaves dagger-shaped, sharp-pointed, coarsely filiferous; flowers white, in large dense panicles.

Perianth tube conic, less than 1 cm. long-----1. *S. faxoniana*.
Perianth tube cylindric, 1.2 to 1.5 cm. long-----2. *S. carnerosana*.

1. *Samuela faxoniana* Trel. Rep. Mo. Bot. Gard. **13**: 117. 1902.

Western Texas (type from Sierra Blanca), and doubtless extending into Chihuahua.

Trunk 1.5 to 5 meters high, 30 to 60 cm. thick, simple or with a few branches at the top; leaves 1 to 1.25 meters long, 5 to 7.5 cm. wide; fruit baccate, 2.5 to 7.5 cm. long.

2. *Samuela carnerosana* Trel. Rep. Mo. Bot. Gard. **13**: 118. 1902.

Dry plains and mountain sides, Coahuila, Nuevo León, San Luis Potosí, and Zacatecas; type from Carneros Pass.

Trunk 1.5 to 6 meters high, simple or rarely branched, 70 cm. or less in diameter; fruit 5 to 7.5 cm. long, 4 cm. thick. "Palma samandoca" (Coahuila, Zacatecas).

The large trunks are used for fences or for the walls of houses, and sometimes they are split open so that the soft interior may be eaten by stock. The large flower panicles are eaten greedily by cattle and are sometimes gathered for this purpose. The immature inflorescences are used also for human food, boiled or roasted. The leaves yield a fiber (known in Zacatecas as "palma ixtle" fiber) useful for cordage. The pulpy, sweet but somewhat bitter fruits are eaten by people as well as by wild and domestic animals.

4. YUCCA L. Sp. Pl. 319. 1753.

REFERENCES: Trelease, Rep. Mo. Bot. Gard. **13**: 27-133. *pl. 1-99*. 1902; *op. cit.* **18**: 225-230. *pl. 12-17*. 1907.

The plants of this genus are distributed nearly throughout Mexico, but are most abundant in the more arid regions east of the western Sierra Madre, where they are often the dominant feature of the landscape. Yuccas are of importance from an economic standpoint, although much less so than the genus *Agave*.

The most important product is the fiber obtained from the leaves, which, however, is usually coarse and shorter than is desirable in commercial fiber. It is extracted usually in a crude fashion, and is an article of export. It may be that in time its extraction will be of considerable importance commercially. During the war-shortage of raw materials this fiber has acquired considerable value in the southwestern United States, especially that of *Yucca elata*. The fiber is much used locally for cordage, and it has been woven into mats and cloth by the Indians of Mexico and the United States. It is said that the cloth ("ayate") bearing the famous likeness of Our Lady of Guadalupe is made of *Yucca* fiber, but this may be incorrect.

The trunks of the arborescent species are often used for stockades and for walls of houses, and the leaves are used for thatching. Paper can be made from the fiber of the trunks and leaves.

The plants possess the saponifying properties of the genus *Agave*. The roots (under the name "amole") are used widely for washing clothing, the hair, etc., and they have been used in the United States in the manufacture of fine

toilet soap. An extract of the roots has been employed to produce foam in beverages.

The plants are of some importance as forage, chiefly in times of severe drought, when cattle often eat the stiff leaves. The flower panicles are much eaten by cattle. The flowers, either in bud or just after they have opened, have long been an article of human food in Mexico and they are frequently found in the markets at the present time. They are eaten raw as a salad, or are cooked in various ways, and are sometimes made into a conserve. They are slightly bitter and are reputed to have tonic properties.

The fruits of those species with baccate fruit, usually known as "datiles," are eaten by birds and mammals and by man. They contain much sugar but are more or less bitter. They are eaten either raw or cooked, and some of the Indians, of the United States at least, dried them for use in winter. The fruits are also fermented and sometimes distilled to produce an alcoholic beverage.

Various statements are made concerning the seeds. Palmer reports that the Indians used them for food. Others state that they are purgative, while Cervantes says that they are useful for the treatment of dysentery.

Many of the species of *Yucca* are used as ornamental plants, especially in arid regions. They are admirably suited for this purpose because of their showy flowers and striking palmlike appearance.

Fruit dehiscent, erect.

Leaves filiferous along the white margins. Plants with a tall trunk.

1. *Y. elata*.

Leaves minutely denticulate on the margins, not filiferous.

Capsule beaked, the valves rounded on the back.

Leaves about 60 cm. long; trunk about 3 meters tall.....4. *Y. rostrata*.

Leaves 20 to rarely 35 cm. long; trunk 1 meter high or less.

5. *Y. thompsoniana*.

Capsule mucronate, the valves flat on the back.

Plants with a tall trunk.....2. *Y. rigida*.

Plants acaulescent.....3. *Y. rupicola*.

Fruit indehiscent, baccate, pendent.

Fruit without a core, the pulp purple; ovary stalked. Leaves sharply denticulate but not filiferous.....6. *Y. aloifolia*.

Fruit with a papery core, the pulp greenish or whitish; ovary sessile.

Leaves not filiferous.....7. *Y. elephantipes*.

Leaves filiferous.

Margins of the leaves denticulate at first. Leaves thick and firm, often rough.....8. *Y. treculeana*.

Margins of the leaves not denticulate.

Leaves thin, flexible, smooth, the filaments slender.

Leaves 2 to 4 cm. wide; trunk nearly simple.....9. *Y. schottii*.

Leaves 7.5 cm. wide; trunk much branched.....10. *Y. jaliscensis*.

Leaves thick, rigid, the filaments usually coarse.

Leaves usually less than 2.5 cm. wide, smooth; trunk usually less than 2 meters high.....11. *Y. treleasei*.

Leaves 2.5 cm. wide or wider, often rough; trunk usually more than 2 meters high.

Leaves usually 2 to 4 cm. wide, smooth.

Plants acaulescent.....12. *Y. endlichiana*.

Plants with an elongate trunk.

Panicles narrow, pendent.....13. *Y. australis*.

Panicles broad, not pendent.

Leaves 15 to 23 cm. long-----14. *Y. valida*.

Leaves 30 to 60 cm. long.

Panicles glabrous or the pedicels puberulent.

15. *Y. decipiens*.

Panicles tomentose-----16. *Y. periculosa*.

Leaves 4 to 5 cm. wide, rough.

Style elongate-----17. *Y. macrocarpa*.

Style very short -----18. *Y. mohavensis*.

1. *Yucca elata* Engelm. Bot. Gaz. 7: 17. 1882.

Yucca angustifolia radiosa Engelm. in King, Geol. Expl. 40th Par. 5: 496. 1871.

Yucca radiosa Trel. Rep. Mo. Bot. Gard. 3: 163. 1892.

Dry plains, Chihuahua. Western Texas to Arizona.

Trunk simple or branched, sometimes 7 meters high; leaves very numerous, usually 3 to 10 mm. wide, long and very slender, with white margins; inflorescence glabrous; flowers white, campanulate. "Palmilla" (New Mexico).

2. *Yucca rigida* (Engelm.) Trel. Rep. Mo. Bot. Gard. 13: 65. 1902.

Yucca rupicola rigida Engelm. Trans. Acad. St. Louis 3: 49. 1873.

Chihuahua, Durango, and Zacatecas; perhaps also in Coahuila; type from between Mapimi and Guajuquilla.

Trunk simple or branched, sometimes 5 meters high; leaves thin, flat, glaucous, 30 to 60 cm. long, 2 to 3 cm. wide, rather stiff, sharp-pointed, with yellow margins; inflorescence glabrous; capsule about 5 cm. long. "Palma San José (Zacatecas); "palmita" (Durango); "palmilla."

A form with smooth, entire-margined leaves is var. *inermis* Trel. (Rep. Mo. Bot. Gard. 22: 102. 1911).

3. *Yucca rupicola* Scheele, Linnaea 23: 143. 1850.

Western Texas and doubtless in adjacent Mexico.

Plants acaulescent; leaves 30 to 50 cm. long, 2.5 to 3 cm. wide, glaucous, with brown or yellowish margins; inflorescence glabrous; flowers white or greenish.

A form with smooth-edged leaves is var. *edentata* Trel. (Rep. Mo. Bot. Gard. 22: 102. 1911).

4. *Yucca rostrata* Engelm.; Trel. Rep. Mo. Bot. Gard. 13: 68. 1902.

Chihuahua and Coahuila; type from Monclova, Coahuila.

Trunk simple or branched 3 meters high or less, 15 to 20 cm. in diameter, the wood very soft and spongy; leaves about 1 cm. wide, somewhat glaucous, striate, rather stiff, very pungent, with yellow margins; inflorescence glabrous, 0.5 to 1 meter long, the flowers large, pendent, white, rarely tinged with purple; capsule about 5 cm. long. "Soyate" (Coahuila); "palmita."

5. *Yucca thompsoniana* Trel. Rep. Mo. Bot. Gard. 22: 101. pl. 104-107. 1911.

Coahuila; type from Bufatello. Western Texas.

Flowering while stemless, but in age with a trunk a meter high; leaves 35 cm. long and 1 cm. wide or smaller, nearly flat, rigid, bluish or somewhat glaucous, pungent, usually roughened on the back; flowers about 4 cm. long; fruit 4 cm. long.

6. *Yucca aloifolia* L. Sp. Pl. 319. 1753.

Yucca serrulata Haw. Suppl. Pl. Succ. 32. 1819.

Veracruz, Morelos, and Yucatán; sometimes cultivated for ornament. West Indies; Gulf coast of the United States.

Trunk slender, branched or nearly simple, short; leaves distributed along the stem, flat, rigid, brown-pointed; flowers creamy white, tinged with green or purple near the base; fruit baccate, nearly black, with purplish black pulp. Ramirez gives the common names as "ic Zotli" and "izote."

A form with clustered trunks sometimes 7 meters high, and with tomentose inflorescence, is var. *yucatanica* (Engelm.) Trel. (Rep. Mo. Bot. Gard. 13: 93. 1902; *Y. yucatanica* Engelm. Trans. Acad. St. Louis 3: 37. 1873). It is known only from Yucatán.

7. *Yucca elephantipes* Regel, Gartenflora 8: 35. 1859.

Yucca guatemalensis Baker, Ref. Bot. 5: pl. 313. 1872.

Veracruz, Morelos, etc., the type apparently from Veracruz. Extensively cultivated in Guatemala.

Often 8 to 10 meters high, compactly branched above, the trunk from a swollen base, the bark rough; leaves 50 to 100 cm. long, 5 to 7 cm. wide, green, lustrous, not at all pungent, with very slightly scabrid margin; flowers white or creamy white. "Palmita," "datiles" (fruits), "palma" (Veracruz); "itabo" (Costa Rica); "izote" (Veracruz, Guatemala, Honduras).

Extensively cultivated, especially in Central America, as a hedge plant. The flowers are prized as an article of food, and are often found in the markets. They are usually fried with eggs.

8. *Yucca treculeana* Carr. Rev. Hort. 1858: 580. 1858.

Yucca aspera Regel, Ind. Sem. Hort. Petrop. 1858: 24. 1858.

Coahuila and Durango to Tamaulipas. Texas.

Trunk usually less than 5 meters high, simple or sparsely branched; leaves 0.9 to 1.25 meters long, 2.5 to 5 cm. wide, bluish green, thick, rough, concave, pungent, brown-margined; flowers white, sometimes tinged with purple. "Palma pita" or "palma de datiles" (Tamaulipas); "palma loca" (Nuevo León and elsewhere).

The leaves yield a coarse fiber which is used extensively. Palmer reports that the seeds are reputed purgative. The broader-leaved, larger-flowered form is var. *canaliculata* Trel. (*Y. canaliculata* Hook. in Curtis's Bot. Mag. III. 16: pl. 5201. 1860).

9. *Yucca schottii*¹ Engelm. Trans. Acad. St. Louis 3: 46. 1873.

Dry plains and hillsides, northern Chihuahua and Sonora. Southern Arizona and Sonora; type from Santa Cruz River, Arizona.

Trunk 2 meters high or rarely larger, simple or nearly so; leaves 2 to 4 cm. wide, bluish green, smooth, thin, concave, pungent, very finely filiferous; inflorescence usually tomentose; fruit sometimes 10 cm. long.

10. *Yucca jaliscensis* Trel., sp. nov.

Yucca schottii jaliscensis Trel. Rep. Mo. Bot. Gard. 13: 99. 1902.

Jalisco; type from Zapotlán.

¹Arthur Carl Victor Schott (1814-1875), a native of Germany, came to the United States in 1850. He was appointed a member of the scientific corps of the commission to establish the boundary between the United States and Mexico, and in the course of his work made large botanical collections. In 1864 he was commissioned by the governor of Yucatán to make a geological survey of that State, and here, also, he secured botanical collections. The most complete representation of his Yucatán plants is in the herbarium of the Field Museum of Natural History, but many of his specimens are in the U. S. National Herbarium.

About 8 meters high, freely branched; leaves about 75 cm. long and 7.5 cm. wide, thin, blue-green. "Isote."

The fiber extracted from the leaves is fine and of good quality.

11. *Yucca treleasei* Macbride, Contr. Gray Herb. n. ser. 56: 15. 1918.

Yucca brevifolia Schott; Torr. U. S. & Mex. Bound. Bot. 221. 1859, as synonym. Not *Y. brevifolia* Engelm. 1871.

Region of Nogales, Arizona (the type locality), and doubtless in adjacent Sonora.

Trunk 2.5 meters high or less, or often wanting; leaves about 75 cm. long, usually 2 to 3 cm. wide, green, smooth, thick and stiff, falcate, the margins freely filiferous.

12. *Yucca endlichiana* Trel. Rep. Mo. Bot. Gard. 18: 229. 1907.

Coahuila; type from Marte.

Acaulescent; leaves about 50 cm. long and 1.5 cm. wide, erect, fleshy, V-shaped, smooth, pungent, bluish green, finely filiferous; flowers creamy white or purplish, about 1.5 cm. long; fruit pendent, 2.5 to 3 cm. long, with thin flesh. "Pitilla."

The leaves furnish fiber of excellent quality; it is considered superior to that of "lechuguilla."

13. *Yucca australis* (Engelm.) Trel. Rep. Mo. Bot. Gard. 3: 162. 1892.

Yucca baccata australis Engelm. Trans. Acad. St. Louis 3: 44. 1873.

Coahuila (type locality) to Tamaulipas and Querétaro, perhaps extending to the Distrito Federal; often forming forests.

Large, much branched tree, sometimes 10 meters high or more; leaves about 30 cm. long and 2.5 cm. wide, or sometimes larger, green, stiff, coarsely filiferous; inflorescence pendent, glabrous; flowers creamy white. "Palma" (San Luis Potosí and elsewhere); "palma corriente" (Querétaro); "izote" (Valley of Mexico, perhaps only cultivated there). Known also in various localities as "palma de San Pedro" and "palma samandoca" or "palma samondoca."

The hollowed trunks are used sometimes for beehives. The leaves give a fiber useful for cordage, and the fiber is sometimes dipped in pitch to make torches for use in mines. The young stems and leaves have been distilled to obtain alcohol. The spongy interior of the trunk is cut into long strips, beaten flat, washed in running water, and made into mats which are used as pads ("sudaderos") for pack animals. The fiber forms a part of the exported "ixtle" or "Tampico fiber."

14. *Yucca valida* T. S. Brandeg. Proc. Calif. Acad. II. 2: 208. pl. 11. 1889.

Southern Baja California.

Usually 4.5 to 6 meters high, branched, the trunks 20 to 60 cm. or more in diameter; leaves distributed along the stem, 15 to 23 cm. long, 1 to 2 cm. wide, thin, smooth, with whitish threads; panicle somewhat pubescent, not pendent; flowers creamy white.

15. *Yucca decipiens* Trel. Rep. Mo. Bot. Gard. 18: 228. 1907.

Durango to San Luis Potosí; type from Gutiérrez, Zacatecas.

Arborescent, 8 to 10 meters high, much branched above, the trunk sometimes 2 meters thick, covered with very rough bark; leaves 30 to 60 cm. long, 1 to 4 cm. wide, heavily pointed, finely or coarsely filiferous; panicles about 1.5 meters long, not pendent, glabrous or puberulent; flowers creamy white, 3 to 4 cm. long; fruit pendent, 6 to 8 cm. long. "Palma" (Durango); "palma china" (Zacatecas, etc.).

16. *Yucca periculosa* Baker, Gard. Chron. 1870: 1088. 1870.

Yucca circinata Baker, Gard. Chron. 1870: 1088. 1870.

Puebla and probably in Oaxaca and Veracruz; described from cultivated plants, from Tehuacán, Puebla.

Sometimes 6 meters high, with few branches, slender, with rather smooth bark; leaves 35 to 50 cm. long, 2 to 3.5 cm. wide, short-pointed, finely and abundantly filiferous, with brown threads; panicle about a meter long, tomentose, the flowers creamy white.

17. *Yucca macrocarpa* (Torr.) Coville, Contr. U. S. Nat. Herb. 4: 202. 1893.

Yucca baccata macrocarpa Torr. U. S. & Mex. Bound. Bot. 221. 1859.

Dry plains and hillsides, Chihuahua. Western Texas to southern Arizona; type from plains near the Limpio, Texas.

Usually 3 to 5 meters high, but often lower, simple, or with few short branches; leaves 50 to 100 cm. long, 4 to 5 cm. wide, usually rough, pungent, yellowish green, coarsely filiferous; panicle glabrous or somewhat pubescent, the flowers creamy white, 4 cm. long; fruit 7.5 to 10 cm. long. "Palma criolla" (Chihuahua, Texas); "palma" (New Mexico).

The leaves are used extensively by the Indians of southern New Mexico for making baskets.

18. *Yucca mohavensis* Sarg. Gard. & For. 9: 104. 1896.

? *Yucca schidigera* Roetz, Belg. Hort. 1880: 51. 1880.

Dry plains, Baja California. California to Arizona; type from the Mohave Desert.

Sometimes 4.5 meters high but usually lower, simple or with few short branches, the trunk 20 cm. or less in diameter; leaves 45 to 80 cm. long, about 4 cm. wide, smooth; panicles 30 to 45 cm. long, the flowers 2.5 to 4 cm. long, white, often tinged with purple; fruit 7.5 to 10 cm. long, yellowish, becoming purplish or black; wood porous, light brown, the specific gravity about 0.27.

5. *NOLINA* Michx. Fl. Bor. Amer. 1: 208. 1803.

REFERENCE: Trelease, Proc. Amer. Phil. Soc. 50: 412-426. 1911.

Plants acaulescent or with well-developed trunks; leaves linear, often rough on the margins; flowers very small, whitish, paniculate; fruit papery, containing 3 globose seeds.

It is said that the trunks are sometimes roasted and the interior portion eaten. The leaves are very tough and useful for thatching, brooms, baskets, coarse hats, mats, etc. Their fiber is used locally for cordage and enters somewhat into the cordage materials of the United States.

In Durango (and probably elsewhere) the various species are known as "zacate cortador," "zacate de armazón," "zacate de aparejo," and "palmilla." In the United States the name "bear-grass" is applied.

Leaves 15 to 40 mm. wide, usually not brushlike at the tip; bracts usually papery, often showy. Plants treelike.

Pedicels scarcely half as long as the fruit; leaves rather thick.

13. *N. bigelovii*.

Pedicels nearly or quite as long as the fruit; leaves rather thin.

Leaves 3 to 4 cm. wide.....14. *N. nelsoni*.

Leaves 1.5 to 3 cm. wide.

Primary divisions of the inflorescence about 50 cm. long; leaves glaucescent.....15. *N. beldingi*.

Primary division of the inflorescence 25 to 30 cm. long; leaves green.

Leaves spreading or erect.....16. *N. parviflora*.

Leaves drooping.....17. *N. longifolia*.

Leaves 2 to 12 mm. wide, frequently brushlike at the tip; bracts not very showy.
Leaves thin and grasslike, usually 3 to 5 mm. wide, rather flat, usually not brushlike at the tip.

Pedicels slender, equaling or exceeding the fruit; bracts not imbricate.

Inflorescence 30 cm. long, the branches short-----1. *N. pumila*.

Inflorescence 25 to 30 cm. long, the branches stout, stiff---2. *N. juncea*.

Pedicels stout, about half as long as the fruit; bracts imbricate.

Leaves 2 to 3 mm. wide; inflorescence 15 cm. long-----3. *N. humilis*.

Leaves 5 mm. wide; inflorescence 25 to 30 cm. long-----4. *N. watsoni*.

Leaves thick, 2 to 12 mm. wide, concave, keeled on one or both surfaces, often brushlike at the tip.

Fruit somewhat inflated, the seed not protruding.

Leaves 4 to 5 mm. wide; lower branches of the panicle much longer than the bracts-----12. *N. rigida*.

Leaves 6 to 12 mm. wide; lower branches of the panicle about as long as the bracts.

Fruit shorter than the pedicels, 6 to 7 mm. wide--10. *N. durangensis*.

Fruit about as long as the pedicels, 7 to 10 mm. wide.

Divisions of the inflorescence 15 to 45 cm. long; leaves 6 to 12 mm. wide-----9. *N. microcarpa*.

Divisions of the inflorescence 10 to 15 cm. long; leaves 12 mm. wide.

11. *N. elegans*.

Fruit not inflated, the seed early protruding.

Inflorescence essentially smooth; pedicels slender-----8. *N. palmeri*.

Inflorescence roughened in lines; pedicels stout in fruit.

Lower panicle divisions as long as the bracts-----6. *N. erumpens*.

Lower panicle divisions shorter than the bracts.

Branchlets of the lower panicle divisions short, stiff, spreading.

7. *N. cespitifera*.

Branchlets of the lower panicle divisions weak, finally ascending.

5. *N. affinis*.

1. *Nolina pumila* Rose, Contr. U. S. Nat. Herb. 10: 92. 1906.

Known only from the type locality, in the Sierra Madre near Santa Teresa, Tepic.

Plants acaulescent; leaves 20 to 30 cm. long, 2 to 4 mm. wide, with serrulate margins; inflorescence about 30 cm. long.

2. *Nolina juncea* (Zucc.) Macbride, Contr. Gray Herb. n. ser. 56: 16. 1918.

Dasytirion junceum Zucc. Denkschr. Akad. Wiss. Muenchen 19: 19. 1845.

Dasytirion hartwegianum Zucc. Denkschr. Akad. Wiss. Muenchen 19: 21. 1845, nomen nudum.

Nolina hartwegiana Hemsl. Biol. Centr. Amer. Bot. 3: 371. 1884.

Known only from Zacatecas, the type locality.

Leaves 3 to 4 mm. wide; inflorescence 25 to 50 cm. long.

3. *Nolina humilis* S. Wats. Proc. Amer. Acad. 14: 248. 1879.

Known only from the original collection, from the region of San Luis Potosí.

Acaulescent; leaves 60 cm. long, 2 to 3 mm. wide, with very rough margins; inflorescence 15 cm. long.

4. *Nolina watsoni* (Baker) Hemsl. Biol. Centr. Amer. Bot. 3: 372. 1884.

Beaucarnea watsoni Baker, Journ. Linn. Soc. Bot. 18: 236. 1880.

San Luis Potosí.

Leaves 5 mm. wide, with very rough margins; inflorescence 25 to 30 cm. long.

5. *Nolina affinis* Trel. Proc. Amer. Phil. Soc. 50: 417. 1911.

Nolina caudata Trel. Proc. Amer. Phil. Soc. 50: 417. 1911.

Chihuahua and Sonora, on mesas and stony hills; type from near the city of Chihuahua. Southern Arizona.

Leaves 3 to 4 mm. wide, sometimes with smooth margins. "Palmilla" (Chihuahua).

Leaves used in Chihuahua for making hats. The young leaves are eaten by goats.

6. *Nolina erumpens* (Torr.) S. Wats. Proc. Amer. Acad. 14: 248. 1879.

Dasyllirion erumpens Torr. U. S. & Mex. Bound. Bot. 216. 1859.

Chihuahua. Western Texas (type locality).

Leaves usually 6 to 10 mm. wide, with rough or rarely smooth edges.

7. *Nolina cespitifera* Trel. Proc. Amer. Phil. Soc. 50: 419. 1911.

Coahuila; type from Buena Vista.

Leaves 6 to 10 mm. wide, rough-edged.

8. *Nolina palmeri* S. Wats. Proc. Amer. Acad. 14: 248. 1879.

In canyons, Baja California; type from Tantillas Mountains.

Acaulescent; leaves 8 to 10 mm. wide, rough-edged.

The roots ("amole") are said to be used as a substitute for soap.

Nolina palmeri brandegeei Trel. (Proc. Amer. Phil. Soc. 50: 420. 1911) is a form with the trunk up to 5 meters high.

9. *Nolina microcarpa* S. Wats. Proc. Amer. Acad. 14: 247. 1879.

Dry plains and hillsides, Chihuahua and Sonora. Arizona (type from Rock Canyon) and New Mexico.

Leaves 6 to 12 mm. wide, rough-edged.

10. *Nolina durangensis* Trel. Proc. Amer. Phil. Soc. 50: 421. 1911.

Chihuahua and Durango; type from the city of Durango.

About 2 meters high; leaves 7 to 11 or even 20 mm. wide, rough-margined. "Soyate" (Durango).

11. *Nolina elegans* Rose, Contr. U. S. Nat. Herb. 10: 91. 1906.

Known only from the Sierra Madre of Zacatecas.

Leaves 50 to 60 cm. long, 12 mm. wide, rough-margined.

12. *Nolina rigida* (Brongn.) Trel. Proc. Amer. Phil. Soc. 50: 422. 1906.

Anatis rigida Brongn. Ann. Sci. Nat. II. 14: 320. 1840.

Known only from a drawing of Sessé and Mocifio,¹ believed to represent a Mexican plant.

Leaves about 10 cm. long, 4 to 5 mm. wide.

13. *Nolina bigelovii* (Torr.) S. Wats. Proc. Amer. Acad. 14: 247. 1879.

Dasyllirion bigelovii Torr. U. S. Rep. Expl. Miss. Pacif. 4: 151. 1857.

Dry mesas and hillsides, Sonora and Baja California. California and Arizona; type from Bill Williams Fork, Arizona.

Trunk 1 to 2 meters high; leaves 1.5 to 2.5 cm. wide, the margin shredding into brown fibers.

14. *Nolina nelsoni* Rose, Contr. U. S. Nat. Herb. 10: 92. 1906.

Known only from the type locality, mountains near Miquihuana, Tamaulipas.

Trunk 1 to 3 meters high; leaves 50 to 70 cm. long, 3 to 4 cm. wide, rough-margined; inflorescence 2 to 3.5 meters high.

15. *Nolina beldingi* T. S. Brandeg. Zoe 1: 305. 1890.

Baja California; type from mountains of the Cape Region.

Trunk 3 to 7.5 meters high, branched; leaves 1.5 to 2 cm. wide.

Nolina beldingi deserticola Trel. (Proc. Amer. Phil. Soc. 50: 424. 1911) is a nearly acaulescent form.

¹ Proc. Amer. Phil. Soc. 50: pl. 17. 1911.

16. *Nolina parviflora* (H. B. K.) Hemsl. Biol. Centr. Amer. Bot. 3: 372. 1884.
Cordylina parviflora H. B. K. Nov. Gen. & Sp. 1: 268. 1815.
Roulinia humboldtiana Brongn. Ann. Sci. Nat. II. 14: 320. 1840.
Nolina altamiranoa Rose, Proc. U. S. Nat. Mus. 29: 438. 1905.
 Veracruz, Puebla, and Mexico; type from between Hauhtitlán and Tane-
 pantla.

Trunk 2 to 4 meters high; leaves 1.5 to 2.5 cm. wide.

17. *Nolina longifolia* (Schult.) Hemsl. Biol. Centr. Amer. Bot. 3: 372. 1884.

Yucca longifolia Schult. Syst. Veg. 7: 1715. 1830.

Roulinia karwinskiana Brongn. Ann. Sci. Nat. II. 14: 320. 1840.

Oaxaca and Puebla; type from San José del Oro.

- Trunk 2 to 3 meters high, swollen at the base, sparsely branched at the top;
 leaves very long, recurved over the trunk, 2 to 3 cm. wide.

6. CALIBANUS Rose, Contr. U. S. Nat. Herb. 10: 90. 1906.

1. *Calibanus hookerii* (Lem.) Trel. Proc. Amer. Phil. Soc. 50: 426. 1911.

Dasyllirion hookerii Lem. Ill. Hort. Lem. 6: Misc. 24. 1859.

Dasyllirion caespitosum Scheidw. Wochenschr. Ver. Beförd. Gartenb. 4: 286.
 1861.

Calibanus caespitosus Rose, Contr. U. S. Nat. Herb. 10: 90. 1906.

Hidalgo and San Luis Potosí; type from Real del Monte, Hidalgo.

- A very curious and remarkable plant, the trunk subglobose, 30 to 100 cm. in
 diameter, resembling a puffball, attached to the soil by small roots, the interior
 loosely spongy, the exterior covered with dark corky bark like that of some
 oaks; leaves 30 to 90 cm. long, 2 to 2.5 mm. wide, appearing in clusters here and
 there over the trunk, pale green, serrulate; flowers dioecious, purplish, very
 small, arranged in panicles 10 to 20 cm. long and 10 cm. broad.

7. BEAUCARNEA Lem. Ill. Hort. Lem. 8: Misc. 57. 1861.

- REFERENCE: Trelease, Proc. Amer. Phil. Soc. 50: 427-431. 1911; Rose, Contr.
 U. S. Nat. Herb. 10: 87-89. *pl.* 23. 1906.

Treelike plants, the trunks sometimes 10 meters high, more or less swollen at
 the base; leaves long, linear; flowers small, whitish, paniced.

The leaves are used for the same purposes as those of *Dasyllirion* and
Nolina.

Leaves with papillose grooves and rough margins, firm, more or less concave,
 keeled, pale or glaucous; fruit short-pedicellate.

Leaves 8 to 15 mm. wide; seeds 4 to 5 mm. long-----5. *B. stricta*.

Leaves 4 to 7 mm. wide; seeds 3 mm. long-----6. *B. gracilis*.

Leaves with smooth grooves and nearly smooth margins, thin, nearly flat,
 green; fruit long-pedicellate.

Leaves 1.5 to 2 meters long-----1. *B. recurvata*.

Leaves 1 meter long or shorter.

Fruit 18 to 20 mm. long-----4. *B. goldmanii*.

Fruit 10 to 15 mm. long.

Perianth segments scarcely 2 mm. long-----2. *B. inermis*.

Perianth segments 3 mm. long-----3. *B. plibilis*.

1. *Beaucarnea recurvata* Lem. Ill. Hort. Lem. 8: Misc. 61. 1861.

Beaucarnea tuberculata Roehl, Belg. Hort. 33: 138. 1883.

Nolina recurvata Hemsl. Biol. Centr. Amer. Bot. 3: 372. 1884.

Dasyllirion recurvatum Macbride, Contr. Gray Herb. n. ser. 56: 17. 1918.

Veracruz.

Trunk openly branched; leaves 1.5 to 2 meters long, 1.5 to 2 cm. wide.

2. *Beaucarnea inermis* (S. Wats.) Rose, Contr. U. S. Nat. Herb. 10: 88. 1906.
Dasyllirion inerme S. Wats. Proc. Amer. Acad. 26: 157. 1891.
 San Luis Potosí and Veracruz; type from Las Palmas, San Luis Potosí.
 Tree, openly branched, sometimes 13 meters high, with a trunk 1.5 meters in diameter, this covered with hard scaly black bark; leaves 1.2 to 1.5 cm. wide. "Soyate" or "zoyate" (San Luis Potosí); "palma culona" (San Luis Potosí, Ramírez).
 The soft spongy wood is used for corks.
3. *Beaucarnea pliabilis* (Baker) Rose, Contr. U. S. Nat. Herb. 10: 89. 1906.
Dasyllirion pliabile Baker, Journ. Linn. Soc. Bot. 18: 240. 1880.
 Yucatán; type from Sisal.
 Leaves 1.5 cm. wide.
4. *Beaucarnea goldmanii*¹ Rose, Contr. U. S. Nat. Herb. 12: 261. 1909.
 Known only from the type locality, San Vicente, Chiapas.
 Tall slender tree with swollen base, the trunk covered with thick, deeply furrowed bark; leaves 80 to 90 cm. long, 1 to 1.5 cm. wide, erect or reflexed; panicles 30 to 50 cm. long.
5. *Beaucarnea stricta* Lem. Ill. Hort. Lem. 8: Misc. 61. 1861.
Beaucarnea glauca Roezl, Belg. Hort. 33: 138. 1883.
Beaucarnea purpusi Rose, Contr. U. S. Nat. Herb. 10: 89. 1906.
Dasyllirion strictum Macbride, Contr. Gray Herb. n. ser. 56: 17. 1918.
 Puebla and Oaxaca; described from cultivated plants.
 Tree, 6 to 8 meters high, the trunk moderately swollen at the base, covered with the old leaves; leaves about 60 cm. long, 8 to 15 mm. wide, with yellowish margins. "Izote" (Oaxaca).
6. *Beaucarnea gracilis* Lem. Ill. Hort. Lem. 8: Misc. 61. 1861.
Beaucarnea oedipus Rose, Contr. U. S. Nat. Herb. 10: 88. pl. 23. 1906.
Dasyllirion gracile Macbride, Contr. Gray Herb. n. ser. 56: 17. 1918.
 Puebla; described from cultivated plants.
 Tree, 6 to 12 meters high, with stout branches, the trunk enormously swollen at the base and 2 to 7 meters in circumference; leaves 25 to 50 cm. long, 4 to 7 mm. wide, glaucous.

8. DASYLLIRION Zucc. Allg. Gartenz. 6: 258. 1838.

REFERENCE: Trelease, Proc. Amer. Phil. Soc. 50: 431-441. 1911.

Acaulescent or arborescent plants; leaves linear, usually with very spiny margins, the bases much broadened; flowers small, whitish, paniculate.

The plants grow mostly on dry, rocky mesas or hillsides and are often very abundant and conspicuous. The trunks are used frequently for building houses and for fuel. When one of the plants, covered with the dead leaves, is set on fire it will burn for some time, and the burned stumps are a familiar sight in regions where the plants occur. The leaf bases remaining on such burned plants, when removed from the trunk, make very satisfactory beds upon camping expeditions, for they are elastic and not uncomfortably hard. The trunks are often split open to permit cattle to eat the spongy interior, for this, as well as the leaf bases, contains much sugar and has been found to be an excellent

¹ Named for E. A. Goldman (1873-), of the Bureau of Biological Survey, U. S. Department of Agriculture, who has engaged in biological exploration of nearly all parts of Mexico. He has obtained a large collection of botanical material, which is deposited in the U. S. National Herbarium. Mr. Goldman has published a valuable paper dealing with the plants of Baja California (Contr. U. S. Nat. Herb. 16: 309-371. pl. 104-133. 1916).

food for cattle, especially in time of drought. In New Mexico and western Texas the plants have been used on a large scale for this purpose, often after having been transported by railroad. The plants were formerly much used for food by the natives of the arid regions, and are still so used to some extent. The leaves are trimmed off and the remaining head is roasted or boiled and the sweet pith and leaf bases then eaten. The heads are often baked for about 24 hours in pits dug in the ground. The roasted trunks are also allowed to ferment and then distilled to obtain a highly esteemed intoxicating drink known as "sotol," which is a colorless liquor of penetrating odor and peculiar taste. Alcohol has been extracted from sotol plants upon a commercial scale.

The leaves are much used for thatching, baskets, rough hats, mats, etc., and their fiber for rough cordage. The fiber seems to be suitable for the manufacture of paper.

Most of the species are known generally under the name "sotol."

Leaves 4-sided, unarmed.....16. *D. longissimum*.

Leaves 2-edged, flattened or concave, with prickly margins.

Fruit large (8 to 9 mm. wide), the style longer than the wings.

15. *D. berlandieri*.

Fruit small or, if large, the style not exceeding the wings.

Fruit 3 to 5 mm. wide.

Fruit with a very shallow notch at the apex, broadly elliptic, the style equaling or slightly exceeding the wings. Prickles of the leaves antrorse.

Leaves 10 to 15 mm. wide. Inflorescence much branched.

6. *D. texanum*.

Leaves 5 to 10 mm. wide.

Leaves about 1 meter long.....7. *D. simplex*.

Leaves 40 to 50 cm. long.....8. *D. longistylum*.

Fruit with a rather deep notch, narrowly elliptic to obovate, the style not surpassing the wings. Leaves usually 15 to 20 cm. wide.

Prickles of the leaves mostly retrorse.....5. *D. leiophyllum*.

Prickles of the leaves mostly antrorse.

Leaves 25 mm. wide or more.....3. *D. palmeri*.

Leaves 10 to 20 mm. wide.

Leaves about 0.5 meters long, dull; style nearly equaling the wings.

4. *D. parryanum*.

Leaves about 1 meter long; style half as long as the wings.

Leaves dull, glaucous.....1. *D. cedrosanum*.

Leaves lustrous, not glaucous.....2. *D. lucidum*.

Fruit 6 to 8 mm. wide, the style not exceeding the wings. Prickles all or mostly antrorse.

Leaves not with brushy tips, glaucous.....9. *D. glaucophyllum*,

Leaves with more or less brushy tips.

Leaves 1 cm. wide or narrower.....10. *D. acrotriche*.

Leaves mostly 1.5 cm. wide or wider, rarely only 1.2 cm. wide.

Wings of the fruit truncate at the apex, with a very narrow notch; leaves rough.....13. *D. serratifolium*.

Wings of the fruit rounded or obtuse at the apex, with a broad notch; leaves smooth or nearly so.

Leaves about 1.2 cm. wide.....11. *D. graminifolium*.

Leaves 1.5 to 2 cm. wide.

Style scarcely half as long as the wings.....12. *D. durangense*.

Style about as long as the wings.....14. *D. wheeleri*.

1. *Dasyilirion cedrosanum* Trel. Proc. Amer. Phil. Soc. 50: 431. 1911.
Coahuila and Zacatecas; type from Cedros, Zacatecas.
Trunk 1 to 1.5 meters high; leaves 2 cm. wide, glaucous; inflorescence 5 meters high.
2. *Dasyilirion lucidum* Rose, Contr. U. S. Nat. Herb. 10: 90. 1906.
Puebla; type from Tehuacán.
Trunk 1 to 2 meters high; leaves 1 to 1.7 cm. wide, smooth and lustrous; inflorescence 2 to 3 meters high.
3. *Dasyilirion palmeri* Trel. Proc. Amer. Phil. Soc. 50: 432. 1911.
Known only from the type locality, San Lorenzo Canyon, Coahuila.
Plants 2.5 to 3 meters high; leaves about 1 meter long, green or slightly glaucous, smooth, dull. "Sotol."
The leaves, deprived of the spines, are used for making brooms.
4. *Dasyilirion parryanum*¹ Trel. Proc. Amer. Phil. Soc. 50: 432. 1911.
San Luis Potosí, the type from the vicinity of San Luis Potosí.
Leaves dull, minutely roughened.
5. *Dasyilirion leiophyllum* Engelm.; Trel. Proc. Amer. Phil. Soc. 50: 433. 1911.
Chihuahua. New Mexico and western Texas; type from Presidio, Texas.
Stem short; leaves about 1 meter long, green or glaucescent, smooth, rather lustrous.
6. *Dasyilirion texanum* Scheele, Linnaea 23: 140. 1850.
Dasyilirion texanum aberrans Trel. Proc. Amer. Phil. Soc. 50: 434. 1911.
Coahuila and Nuevo León. Texas; type from New Braunfels.
Trunk very short or subterranean; leaves 1 meter long or shorter, green, lustrous; inflorescence 3 to 5 meters high. "Sotol" (Texas).
7. *Dasyilirion simplex* Trel. Proc. Amer. Phil. Soc. 50: 434. 1911.
Durango; type from Tepehuanes.
Plants 1.5 meters high; leaves about a meter long, green, smooth, lustrous. "Sotol."
The leaves are employed for making baskets, and for the "sopladores" used to fan charcoal fires.
8. *Dasyilirion longistylum* Macbride, Contr. Gray Herb. n. ser. 56: 16. 1918.
Known only from the type locality, Minas de San Rafael, San Luis Potosí.
Leaves 5 to 7 mm. wide, glaucous-green, smooth, the margin with large remote teeth; fruit 5 mm. wide.
9. *Dasyilirion glaucophyllum* Hook. in Curtis's Bot. Mag. II. 14: pl. 5041. 1858.
Dasyilirion glaucum Carr. Rev. Hort. 44: 435. 1872.
Known in Mexico only from the type locality, Real del Monte, Hidalgo; also in cultivation in Europe.
Trunk short; leaves 1 meter long or longer, about 1.2 cm. wide, dull; inflorescence 4 to 6 meters high.
10. *Dasyilirion acrotriche* (Schiede) Zucc. Denkschr. Akad. Wiss. München 16: 226. 1840.

¹Named for C. C. Parry (1823-1890), at one time botanist of the U. S. Department of Agriculture, who made extensive collections of plants in the United States, especially in the Rocky Mountains. In 1878, in company with Edward Palmer, he collected a large series of Mexican plants, chiefly in the State of San Luis Potosí.

- Yucca acrotricha* Schiede, *Linnaea* 4: 230. 1829.
Roulinia gracilis Brongn. *Ann. Sci. Nat.* II. 14: 320. 1840.
 San Luis Potosí, Veracruz, Hidalgo, and Querétaro; type from Mount Orizaba.
 Trunk 1 meter high or more; leaves less than 1 meter long, 6 to 10 or rarely 15 mm. wide, green or glaucescent; inflorescence 3 to 5 meters high or larger. "Cucharilla" (San Luis Potosí, *Urbina*).
11. *Dasyllirion graminifolium* Zucc. *Allg. Gartenz.* 6: 259. 1833.
 San Luis Potosí; described from cultivated plants.
 Leaves about 1 meter long, green, smooth, lustrous.
12. *Dasyllirion durangense* Trel. *Proc. Amer. Phil. Soc.* 50: 438. 1911.
 Known only from Durango, the type locality.
 Leaves 1 meter long or shorter, glaucescent.
13. *Dasyllirion serratifolium* (Schult.) Zucc. *Allg. Gartenz.* 6: 258. 1838.
Yucca serratifolia Schult. *Syst. Veg.* 7: 1716. 1830.
Dasyllirion laxiflorum Baker, *Journ. Bot. Brit. & For.* 10: 299. 1872.
 Oaxaca; described from cultivated plants.
 Plants subcaulescent; leaves 1 meter long or shorter, 1.5 to 3.5 cm. wide, whitish.
14. *Dasyllirion wheeleri* S. Wats.; *Rothr.* in Wheeler, *Rep. U. S. Surv.* 100th Merid. 6: 378. 1878.
Dasyllirion wheeleri wislizeni Trel. *Proc. Amer. Phil. Soc.* 50: 439. 1911.
 Chihuahua. Western Texas to Arizona (type from Ash Creek).
 Trunk 1 meter high or less; leaves 1 meter long or shorter, glaucous or green, nearly smooth; inflorescence 3 to 5 meters high.
15. *Dasyllirion berlandieri*¹ S. Wats. *Proc. Amer. Acad.* 14: 249. 1879.
 Known only from the type locality, La Silla, Monterrey, Nuevo León.
 The leaves of this species have not been collected.
16. *Dasyllirion longissimum* Lem. *Ill. Hort. Lem.* 3: Misc. 91. 1856.
Dasyllirion quadrangulatum S. Wats. *Proc. Amer. Acad.* 14: 250. 1879.
Dasyllirion juncifolium Rehnelt, *Gartenwelt* 11: 77. 1906.
 Tamaulipas to Hidalgo; described from cultivated plants.
 Trunk 1 to 2 meters high; leaves sometimes 2 meters long, 3 to 8 mm. wide, green, dull; inflorescence 2 to 6 meters high. "Junquillo" (Querétaro, Hidalgo).

11. SMILACACEAE. Smilax Family.

1. SMILAX L. Sp. Pl. 1028. 1753.

REFERENCE: A. De Candolle in DC. *Mónogr. Phan.* 1: 1-213. 1878.

Scandent shrubs; rhizomes often tuberiferous; stems often armed with spines; leaves alternate, usually persistent, palmately nerved, the petiole often tendril-bearing; flowers small, dioecious, umbellate, the umbels axillary; fruit a small globose berry.

The species of catbrier, greenbrier, or horsebrier, because of their spiny stems, often form almost impenetrable thickets.

¹ In honor of Jean Luis Berlandier, a Belgian, who made extensive collections between 1827 and 1830 in northeastern Mexico, especially in Tamaulipas, San Luis Potosí, Nuevo León, and Coahuila. The larger portion of his botanical collections was obtained in Texas. He died at Matamoros in 1851. His plants were widely distributed, and some of them are in the U. S. National Herbarium.

Leaves and branches copiously pilose; flowers usually tomentose.

Peduncles longer than the petioles.

Leaves copiously pilose, oval to ovate, deeply cordate at the base, obtuse or rounded and apiculate at the apex.....1. *S. mollis*.

Leaves glabrate, deltoid, subcordate at the base, long-acuminate at the apex.
2. *S. purpusii*.

Peduncles equaling or usually shorter than the petioles.

Sheaths about one-fifth as long as the petioles or shorter.

3. *S. tomentosa*.

Sheaths one-fourth to half as long as the petioles.....4. *S. subpubescens*.

Leaves and branches glabrous or nearly so; flowers glabrous.

Staminate flowers small, 1.5 to 2 or rarely 3 mm. long; anthers equaling or longer than the filaments.....5. *S. mexicana*.

Staminate flowers large, 2.5 to 8 mm. long; anthers usually shorter than the filaments.

Peduncles at anthesis shorter than the petioles.....6. *S. domingensis*.

Peduncles at anthesis longer than or equaling the petioles.

Leaves glaucous beneath.....7. *S. glauca*.

Leaves green beneath.

Peduncles about 5.5 cm. long, 5 to 6 times as long as the petiole: Fruit red.....8. *S. erythrocarpa*.

Peduncles rarely over 2 cm. long.

Pedicels half as long as the flowers.....9. *S. densiflora*.

Pedicels equaling or much longer than the flowers.

Leaves denticulate.....10. *S. moranensis*.

Leaves entire.

Fruit red.....11. *S. medica*.

Fruit black.

Younger branches with numerous stout spines; leaf blades more or less triangular, nearly or quite as broad as long.

12. *S. bona-nox*.

Younger branches unarmed or with few slender spines; leaf blades not triangular, usually twice as broad as long.

13. *S. cordifolia*.

1. *Smilax mollis* Willd. Sp. Pl. 4: 785. 1806.

Smilax pringlei Greenm. Proc. Amer. Acad. 34: 567. 1899.

Morelos to Veracruz, Tabasco, and Chiapas; type from Jalapa, Veracruz. West Indies, Central America, and northern South America.

Leaves lanceolate to broadly cordate-oval, 8 to 15 cm. long, acute or abruptly short-pointed, 5 or 7-nerved; umbels long-pedunculate. "Bejuco de chiquihuite" (Tabasco); "zarzaparrilla" (Veracruz, Ramirez).

2. *Smilax purpusii* T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 117. 1915.

Known only from the type locality, Cerro del Boquerón, Chiapas.

Leaves coriaceous, 5 to 10 cm. long, reticulate-veined, usually 7-nerved; umbels often racemose.

3. *Smilax tomentosa* H. B. K. Nov. Gen. & Sp. 1: 272. 1815.

Oaxaca. Central America and northern South America; type from Santa Fé, Colombia.

Leaves broadly ovate-cordate to lanceolate, sometimes as much as 25 cm. long and 20 cm. wide, acute or acuminate; umbels densely many-flowered.

4. *Smilax subpubescens* A. DC. in DC. Monogr. Phan. 1: 69. 1878.

Tamaulipas and Veracruz; type from Orizaba, Veracruz.

Scandent over shrubs and trees in woods; leaves ovate or ovate-oval, 7 to 13 cm. long, cordate at the base, short-pointed, lustrous. "Zarzón" (Tamaulipas). Specimens referred by De Candolle to *S. candelariae* A. DC.¹ belong here perhaps.

5. *Smilax mexicana* Griseb.; Kunth, Enum. Pl. 5: 167. 1850.

?*Smilax obtusa* Benth. Bot. Voy. Sulph. 175. 1844.

Smilax costaricae Vatke, Linnaea 40: 223. 1876.

Smilax gaumerii Millsp. Field Mus. Bot. 1: 357. 1898.

Sinaloa to Guerrero, Yucatán, and Tamaulipas. Central America.

Scandent shrub with angulate branches; leaves lanceolate to broadly ovate-oval, 5 to 17 cm. long, lustrous; umbels on long or short peduncles; fruit black. "Bejuco de chiquihuite" (Tabasco); "bejuco diente-de-perro," "zarza" (Guerrero); "xoché" (Yucatán, Maya); "zarzón" (Costa Rica).

The species has been reported from Mexico as *S. cumanensis* Willd. The leaves are very variable in shape, as in most species of the genus.

6. *Smilax domingensis* Willd. Sp. Pl. 4: 783. 1806.

Smilax schlechtendalii Kunth, Enum. Pl. 5: 224. 1850.

Smilax domingensis microscola Robinson, Proc. Amer. Acad. 35: 323. 1900.

Veracruz, Puebla, Tabasco, and Chiapas. West Indies; type from Santo Domingo.

Leaves lanceolate or ovate, 7 to 15 cm. long, thick, lustrous, acute to long-acuminate. "Alcacatzá" (Puebla); "chiquihuite" (Tabasco); "bejuco de membrillo," "dunguey," "dunguez blanco" (Porto Rico).

7. *Smilax glauca* Walt. Fl. Carol. 245. 1788.

?*Smilax jalapensis* Schlecht. Linnaea 18: 451. 1844.

Smilax discolor Schlecht. Linnaea 18: 454. 1844.

Veracruz. Eastern United States; type from the Carolinas.

Stems terete, armed with stout scattered prickles; leaves broadly ovate, 6 to 10 cm. long, acute or rounded at the apex, usually truncate at the base; fruit bluish black.

8. *Smilax erythrocarpa* Kunth, Enum. Pl. 5: 234. 1850.

Described from Mexico; reported from the Valley of Mexico.

Branches terete, armed with short straight prickles or unarmed; leaves ovate-oblong, 8 to 10 cm. long, acutish at the apex, rounded or subcordate at the base.

9. *Smilax densiflora* A. DC. in DC. Monogr. Phan. 1: 88. 1878.

Described from Toluca, Mexico; reported also from "San Miguel."

Stems terete, unarmed; leaves ovate, 3 to 5 cm. long, 5 or 7-nerved, acuminate at the apex, obtuse or subcordate at the base.

10. *Smilax moranensis* Mart. & Gal. Bull. Acad. Brux. 9²: 389. 1842.

Veracruz and Hidalgo, and probably elsewhere; type from Morán, Hidalgo.

Stems terete, aculeate; leaves lanceolate or ovate, 5 to 9 cm. long, 5 or 7-nerved, acuminate; fruit 6 to 7 mm. in diameter.

According to De Candolle, this is the "mecapatli" of Hernández.

11. *Smilax medica* Schlecht. & Cham. Linnaea 6: 47. 1831.

Veracruz and San Luis Potosí; type from Papantla, Veracruz; reported from Tamaulipas.

Stems angulate, unarmed or sparsely prickly; rhizome slender, striate, covered with whitish or purplish bark; leaves ovate or oblong, 10 to 20 cm. long, often lobate, 7 or 9-nerved, entire, sometimes prickly beneath; fruit 8 to 10 mm. in diameter. "Zarzaparrilla," "nanahuapatle," "quauhmecapatli," "quaumeca-

¹ In DC. Monogr. Phan. 1: 70. 1878.

patli," "zarza," "zarzaparrilla de Tulancingo," "zarzaparrilla de la sierra," "mecapatli" (*Ramírez*).

The species of *Smilax* which furnish the sarsaparilla of commerce are very imperfectly known, but this species is believed to be one of the chief sources of the drug. The Nueva Farmacopea Mexicana states that this is the only species of Eastern Mexico whose rhizomes are employed medicinally, and *Smilax medica* is one of the official sources of sarsaparilla according to the U. S. Pharmacopoea. Not much dependence can be placed upon either of these statements, however, because the species are poorly known, and the rhizomes have not been associated with botanical specimens of the plants which produce them.

The rhizomes are dug at any time of the year and dried in the sun. They contain a crystalline principle, parillin, upon which their virtues depend. This has sudorific and stimulant properties. Sarsaparilla was introduced into Spain about 1540, and was widely used as a remedy for venereal diseases. It is still employed for the same purpose, and for rheumatism, scrofulous diseases, and some cutaneous affections. It is widely employed also for flavoring beverages. Large amounts of sarsaparilla have been and still are exported from Mexico. It is said that the rhizome of a fern, known as "zarzaparrilla de Tierra Caliente," is sometimes used as an adulterant.

12. *Smilax bona-nox* L. Sp. Pl. 1030. 1753.

Veracruz. Eastern United States; West Indies.

Stems angulate, prickly or unarmed; leaves lanceolate to broadly deltoid-ovate, 3 to 10 cm. long, sometimes lobate, 5 to 9-nerved, acute, often denticulate. "Mecapatli, zarzaparrilla" (*Ramírez*).

13. *Smilax cordifolia* Humb. & Bonpl.; Willd. Sp. Pl. 4: 778. 1806.

? *Smilax acutifolia* Schlecht. Linnaea 18: 449. 1844.

? *Smilax invenusta* Kunth, Enum. Pl. 5: 234. 1850.

Smilax schiedeana Kunth, Enum. Pl. 5: 236. 1850.

Veracruz and Tabasco to Oaxaca and Colima; type from Jalapa, Veracruz.

Stems subterete or angulate, unarmed or sparsely prickly; leaves ovate or rounded-ovate, 6 to 12 cm. long, acute or acuminate, 5 to 9-nerved, usually more or less cordate at the base. "Cocolmegan," "cozolmécatl," "olcaczin" (Veracruz, *Ramírez*); "pacas" (Tarascan, *Herrera*); "cocolmea," "raíz de china" (*Ramírez*); "móoga" (Otomí, *Ramírez*).

This species has been reported from Mexico as *S. pseudochina* L. It is said to be used in medicine like *S. medica*.

DOUBTFUL SPECIES.

SMILAX ARISTOLOCHIAEFOLIA Mill. Gard. Diet. ed. 8. *Smilax* no. 7. 1768. *Smilax milleri* Steud. Nom. Bot. ed. 2. 2: 599. 1841. Described from Veracruz.

SMILAX BOTTERI A. DC. in DC. Monogr. Phan. 1: 89. 1878. Described from Veracruz. Perhaps the same as *S. cordifolia*.

SMILAX COGNATA Kunth, Enum. Pl. 5: 175. 1850. Described from Mexico, but probably rather a native of Brazil.

SMILAX GLAUCOCARPOS Schlecht. Linnaea 18: 450. 1844. Described from Hacienda del Carmen and Mineral del Monte. Related, according to De Candolle, to *S. mexicana* or *S. moranensis*.

SMILAX HAVANENSIS Jacq. Enum. Pl. Carib. 33. 1760. Native of the West Indies; reported from Mexico by De Candolle, perhaps erroneously.

SMILAX MULTIFLORA Mart. & Gal. Bull. Acad. Brux. 9²: 390. 1842. Described from Chinantla, Oaxaca.

SMILAX SPINOSA Mill. Gard. Diet. ed. 8. *Smilax* no. 8. 1768. Described from Veracruz.

12. AMARYLLIDACEAE. Amaryllis Family.¹

(Contributed by Dr. William Trelease.)

Plants usually herbs, often from bulbs as in the Liliaceae, from which they differ chiefly in their inferior ovary; in the warmer parts of America represented by the following monocarpic genera, some species of which produce a trunk, while the flower clusters of all are borne on more or less woody stalks that are sometimes tall and much branched.

Perianth segments distinct; filaments swollen at base; style base dilated and 3-angled; seed not lifted from the soil in germination.....1. **FURCRAEA**.
Perianth more or less tubular at base; filaments and style not swollen; seed raised on the cotyledon in germination.....2. **AGAVE**.

1. **FURCRAEA** Vent. Bull. Soc. Philom. 1: 65. 1793.

REFERENCES: J. G. Baker, Handbook of the Amaryllideae 198-203. 1888; Trelease, Observations on *Furcraea*, Ann. Jard. Bot. Buitenzorg II. Suppl. 3: 905-916. pl. 35-48. 1910; Drummond, Rep. Mo. Bot. Gard. 18: 25-75. pl. 1-4. 1907. The name is often written *Fourcroya* (Spreng. 1817) or *Furcroea* (Haw. 1819).

The leaves contain an excellent fiber resembling Sisal hemp, and variously called "pita" or "cabulla," but this is little exploited except for the Mauritius hemp, derived from the Brazilian *F. gigantea*.

Leaves denticulate but never toothed, finely striate-ridged. Leaves over 1 meter long; panicle very large. **SERRULATAE**.

Trunk tall (15 meters). Leaves concave and rather stiff....1. **F. longaeava**.
Trunk moderate (1 to 2 meters tall).

Leaves rather concave, long (2 meters), often recurved.....2. **F. roezlii**.
Leaves rather flat, short and stiff, very glaucous.

Leaves short, 50 to 60 cm. long; flowers 4 cm. long...3. **F. bedinghausi**.

Leaves twice as long; flowers 5 to 6 cm. long.....4. **F. quicheensis**.

Leaves neither denticulate nor striate, often horny-toothed. **EUFURCRAEA**.

Leaves 5 to 8 cm. wide.

Leaves narrow (5 to 6 cm. wide), straight between the short teeth.

5. **F. cahum**.

Leaves moderate (7 to 8 cm. wide), the margin concave between the teeth.

6. **F. melanodonta**.

Leaves broad (10 to 20 cm.).

Leaves with numerous marginal red-brown teeth.

Plants with a trunk sometimes 2 meters tall; leaves mostly entire above the middle.....7. **F. selloa**.

Plants mostly acaulescent; leaves usually toothed throughout.

Teeth rather short (3 mm. long) and close together (10 to 30 mm. apart); bulbils round-ovoid.....8. **F. guatemalensis**.

Teeth longer (5 to 7 mm. long) and more separated (30 to 60 mm. apart); bulbils elongate.....9. **F. cabuya**.

Leaves unarmed, otherwise as in no 9.....9a. **F. cabuya integra**.

¹ Fifteen Mexican species of *Agave*, not considered in this account, are characterized by Mr. Alwin Berger in "Die Agaven," published in 1915 but through the exigencies of the war not received until after the present account was in page proof.—WM. TRELEASE.

1. *Furcraea longaeva* Zucc. Act. Acad. Caes. Leop. Carol. 16²: 665. 1833.
Oaxaca; type from Mount Tanga. Also in adjacent Guatemala.
A tall unbranched monocarpic tree, finally surmounted by a gigantic panicle 5 meters long or more. "Yahuindayasi" (Oaxaca, Mixtec, *Reko*).
2. *Furcraea roezlii* Baker, Amaryll. 203. 1888.
Fourcroya roezlii André, Rev. Hort. 59: 353. 1887.
Furcraea longa Smith, Teysmannia. 7: 131. 1897.
Pachuca, Hidalgo; described from plants cultivated in Europe; type locality sometimes said to be near Juquila, Oaxaca, but this report probably refers to the preceding species.
A short-trunked plant, finally with panicle of equal length, the leaves characteristically sweeping the ground.
Much cultivated in warm regions under the garden names of *Agave argyrophylla*, *A. toneliana*, *Beschorneria floribunda*, *Lilia regia*, *Lilium regium*, *Roezlia bulbifera*, *R. regina*, *Yucca argyraea*, *Y. argyrophylla*, *Y. bulbifera*, *Y. parmentieri* and *Y. toneliana*.
3. *Furcraea bedinghausi* Koch, Wochenschr. Ver. Beförd. Gartenb. 6: 234. 1863.
Distrito Federal; described from plants cultivated in Europe, the type locality unrecorded.
A short-trunked smaller plant with shorter, stiffer, and flatter leaves.
Sometimes cultivated as *Beschorneria multiflora*. Specimens have been distributed as *Yucca pringlei* Greenm.
4. *Furcraea quicheensis* Trel. Trans. Acad. St. Louis 23: 148. 1915.
Guatemala; type collected near Quiché.
In size and habit intermediate between *F. longaeva* and *F. bedinghausi*. "Cheech."
5. *Furcraea cahum* Trel. Ann. Jard. Bot. Buitenzorg II. Suppl. 3: 908. pl. 39. 1910.
Yucatán; type collected near Sisal.
Subcaulescent, with narrow green flat leaves, these straight-margined between the finally blackish teeth. "Cajum" or "cajum-ci"; also "catana" (?).
6. *Furcraea melanodonta* Trel. Trans. Acad. St. Louis 23: 150. 1915.
Eastern Guatemala; type from Cruz.
Somewhat caulescent, with gray or bluish concave leaves, the margins hollowed between the black-chestnut teeth. "Maguey."
7. *Furcraea selloa* Koch, Wochenschr. Ver. Beförd. Gartenb. 3: 22. 1860.
Furcraea samalana Trel. Trans. Acad. St. Louis 23: 149. 1915.
Western Guatemala; type from the Samalá Valley.
Somewhat caulescent, with green broad long-channeled leaves, these usually toothed only below the middle, the margins hollowed between the red-brown teeth; bulbils elongate. "Maguey."
8. *Furcraea guatemalensis* Trel. Trans. Acad. St. Louis 23: 149. 1915.
Eastern Guatemala; type collected about Guatemala City.
Nearly acaulescent, the broad and long-channeled leaves grayish beneath and toothed throughout, the margin somewhat hollowed between the red-brown or chestnut teeth; bulbils ovoid. "Maguey."
9. *Furcraea cabuya* Trel. Ann. Jard. Bot. Buitenzorg II. Suppl. 3: 906. 1910.
Furcraea tuberosa Seem. Bot. Voy. Herald 216. 1854. Not *F. tuberosa* Ait. 1811.

Costa Rica (type from San Ramón) and Panama.

Nearly acaulescent, the leaves transiently somewhat glaucous, broad, long and openly concave, straight-margined between the rather long and distant yellowish teeth, these with brown or chestnut tips. "Cabuya," "cabuya con espina," or "Central American sisal."

9a. *Furcraea cabuya integra* Trel. Ann. Jard. Bot. Buitenzorg II. Suppl. 3: 907. 1910.

Furcraea gigantea Seem. Bot. Voy. Herald 216. 1854.

Costa Rica (type from San Ramón) and Panama; also (?) in Honduras and El Salvador.

Differs from the type only in having its leaves unarmed or with merely minute rudiments of teeth. "Cabuya Olancho," transmuted into "cabuya blanca."

2. AGAVE L. Sp. Pl. 323. 1753.

REFERENCES: J. G. Baker, Handbook of the Amaryllideae 163-198. 1888; Mulford, A study of the agaves of the United States, Rep. Mo. Bot. Gard. 7: 48-100. pl. 26-63. 1896; Trelease, *Agave macroacantha* and related euagaves, Rep. Mo. Bot. Gard. 18: 231-256. pl. 18-34. 1907; Trelease, The Mexican fiber agaves known as zapupe, Trans. Acad. St. Louis 18: 29-37. pl. 1-6. 1909; Trelease, The agaves of Lower California, Rep. Mo. Bot. Gard. 22: 37-65. pl. 18-72. 1912; Trelease, Revision of the agaves of the group *Applanatae*, Rep. Mo. Bot. Gard. 22: 85-97. pl. 73-99. 1912; Trelease & Ludwig, El Zapupe, pp. 1-29. ill. 1909; Trelease, Agave, in Bailey, Stand. Cycl. Hort. 1: 230-239. 1914.

The leaves contain an excellent fiber. That of *A. americana*, which is much planted and has escaped around the Mediterranean, is used in the dainty pita lacework of the Azores, etc. Much of the fiber of the *lechuguilla* type of plants is used for coarse sacking or enters into the complex of ixtle or Tampico fiber or Matamoros fiber. *Agave cantala* is grown extensively in tropical Asia for its fiber. Of recent years the zapupes have been exploited as equally worthy with the henequen or Sisal hemp, which forms the chief basis of Yucatecan commerce and is being extensively planted through tropical regions. The national drink of the Mexican Indians is fermented from the exuded sap of the large fleshy-leaved or maguey species when they are ready to bloom, and great plantations are maintained for this purpose on the table-land; and a great deal of distilled liquor, called mezcal, like the smaller-leaved species used for the purpose, is distilled from a fermented mash made from the roasted stems of many species, especially those of the group *Tequilanae*, which are grown in large numbers for this purpose, particularly about Tequila in the State of Jalisco. The glucoside saponin occurs in many species and is very abundant in the rootstocks of a few agaves and particularly in those of the related herbaceous genus *Manfreda*, and these are used for washing under the name "amole." The fiber of the leaves was used in pre-conquest days for making a kind of paper, upon which manuscripts were written.

The species of *Agave* are known in the United States as century plants. This name was given because of a belief that the plants flowered only when they had attained an age of a hundred years. This belief is, of course, incorrect. It is probably due to the fact that in cultivation the plants rarely bloom. In Europe the plants are often known as American aloes, because of a slight resemblance to Old World plants of the genus *Aloe*, of the family Liliaceae.

I. EUAGAVE. Flowers in a panicle.

- A. Leaves without a horny border, the spine at most decurrent for little more than its length.
- B. Leaves hard-fibrous, swordlike or dagger-like or else under 10 cm. wide.
- C. Marginal teeth numerous and strong.
- Teeth close together (5 to 10 mm. apart) and very slender.
- Leaves green.....1. *A. panamana*.
- Leaves gray-green, purple-green, or very glaucous.
- Leaves gray-green or purple-green.....2. *A. rubescens*.
- Leaves very glaucous.....3. *A. stringens*.
- Teeth more separated or heavier.
- D. Spine elongate, biconvex.....4. *A. angustifolia*.
- DD. Spine elongate, half-round or very openly grooved.
- Leaves rough-granular.....5. *A. bergeri*.
- Leaves smooth.
- Teeth slender.....6. *A. lespinassei*.
- Teeth heavy.
- Teeth scarcely raised.....7. *A. endlichiana*.
- Teeth on fleshy bases.....36. *A. sicaefolia*.
- DDD. Spine needle-shaped, round-grooved.
- Teeth heavy or raised.....8. *A. aboriginum*.
- Teeth slender.....9. *A. deweyana*.
- DDDD. Spine short and thick or subulately tapered, biconvex or shallow-grooved at base.
- E. Spine subulately slender.
- Spine chestnut. Teeth small.....10. *A. zapupe*.
- Spine red-brown or graying.
- Spine red-brown; teeth small.....20. *A. donnell-smithii*.
- Spine graying; teeth larger.....11. *A. subtilis*.
- EE. Spine similar but larger and stouter.
- Teeth separated (30 mm. apart or more).
- Teeth heavy-based.....12. *A. longisepala*.
- Teeth very slender.....13. *A. pedrosana*.
- Teeth closer (scarcely 20 mm. apart), slender.
- Leaves green.....14. *A. gutierreziana*.
- Leaves gray or white.
- Leaves gray.....15. *A. elongata*.
- Leaves white.....16. *A. collina*.
- EEEE. Spine not subulate, or else short.
- Spine graying. Teeth large.....17. *A. palmaris*.
- Spine red-brown.
- Teeth large.....18. *A. rhodacantha*.
- Teeth rather small.
- Teeth close (10 mm. apart).....19. *A. pes-mulae*.
- Teeth distant.....20. *A. donnell-smithii*.
- DDDDD. Spine conical, often round-grooved at base.
- F. Leaves green.
- Plants arborescent.
- Teeth heavy.....21. *A. karwinskii*.
- Teeth very slender-cusped.....22. *A. decipiens*.
- Plants short-stemmed or acaulescent.
- Teeth few or slender.....23. *A. sisalana*.
- Teeth numerous, tapered.....24. *A. candelabrum*.

FF. Leaves gray or lightly blue-glaucous.

Leaves numerous.

Leaves somewhat rough.....25. *A. kirchneriana*.

Leaves smooth.

Plant subacaulescent.

Teeth gradually tapered.

Teeth short.

Leaves lax.....26. *A. pacifica*.

Leaves more rigidly ascending.

Teeth distant (2 to 3 cm. apart).....27. *A. cantala*.

Teeth closer (1 to 1.5 cm. apart).....28. *A. tequilana*.

Teeth long and strong.

Teeth sharply flexed.....29. *A. pseudotequilana*.

Teeth gently curved.....30. *A. sullivanii*.

Teeth abruptly slender-cusped.....31. *A. ixtli*.

Plant distinctly caulescent.....32. *A. fourcroydes*.

Leaves few.

Spine grooved only at base.....33. *A. datylio*.

Spine grooved to middle.....34. *A. vexans*.

FFF. Leaves very white-glaucous.

Leaves very long and concave.....35. *A. nivea*.

Leaves shorter, rather dagger-like.

Leaves not falcate.

Teeth gradually pointed.....16. *A. collina*.

Teeth deltoid at base.....37. *A. macroacantha*.

Leaves falcate.....38. *A. yaquiiana*.

CC. Marginal teeth few or minute.

Leaves oblong, green, transiently glaucous.....23. *A. sisalana*.

Leaves oblanceolate, pale.....39. *A. desmetiana*.

BB. Leaves hard-fibrous, oblanceolate-oblong.

Teeth small and slender. Spine needle-shaped.....40. *A. thomasae*.

Teeth conspicuous and strong.

Leaves relatively long (nearly 1 meter).

Spine needle-shaped.

Spine involute.....41. *A. deamiana*.

Spine round-grooved.....45. *A. kellermaniana*.

Spine conical, flat-grooved.....42. *A. hurteri*.

Leaves short (scarcely 0.5 meter long).

G. Spine conical, flat-grooved or shallow-grooved.

Spine brown, much twisted.....43. *A. tortispina*.

Spine gray, straight.....44. *A. pachycentra*.

GG. Spine round-grooved.

Teeth close together (10 to 15 mm. apart) chestnut.

Teeth slender-cusped.....45. *A. kellermaniana*.

Teeth heavily triangular.....46. *A. samalana*.

Teeth more separated, red-brown.....47. *A. lagunae*.

GGG. Spine involute at base.

Teeth easily detachable.....48. *A. minarum*.

Teeth firmly attached.

Teeth small.....49. *A. seemanniana*.

Teeth large, brown.

Spine needle-shaped; teeth almost hooked.....50. *A. tenuispina*.

Spine conical; teeth nearly straight.....51. *A. opacidsens*.

- BBB. Leaves rather fibrous, oblong, over 1 mm. long.
 Leaves rather thin and straight-margined.....52. *A. lurida*.
 Leaves fleshier.
 Margin nearly straight.....53. *A. rasconensis*.
 Margin concave between the teeth.....54. *A. vera-cruz*.
- BBBB. Leaves fleshy, obovate, deeply repand, short.
 Spine flexuous; leaves scarcely 25 cm. long.
 Spine and teeth dull rusty brown.....55. *A. verchaffeltii*.
 Spine and teeth gray, gray-brown, or red-chestnut.
 Spine and teeth gray-brown or gray.....56. *A. megalacantha*.
 Spine and teeth red-chestnut.....57. *A. guadalajarana*.
 Spine straight; leaves twice as long.....58. *A. potatorum*.
- BBBBB. Leaves rather fleshy and long, oblanceolate, repand; teeth very unequal.
 Spine and teeth red-brown.
 Leaves green.....59. *A. mescal*.
 Leaves grayish.....60. *A. fenziiana*.
 Spine and teeth copper-colored.....61. *A. cupreata*.
- BBBBBB. Leaves fleshy, large, the teeth mostly subequal.
 Leaves green-and-gray-banded, rough.....111. *A. marmorata*.
 Leaves not markedly zoned.
 Spine conical, somewhat recurved.
 Leaves not sharply reflexed.
 Leaves abruptly acute, plicate.....112. *A. abrupta*.
 Leaves not plicate.
 Spine gradually tapered.....113. *A. wercklei*.
 Spine rapidly very acute.....114. *A. expansa*.
 Leaves reflexed toward the end.....115. *A. americana*.
 Spine needle-shaped.
 Leaves reflexed.....116. *A. picta*.
 Leaves not sharply reflexed.
 Leaves rough.....117. *A. asperrima*.
 Leaves smooth.
 Spine nearly straight.....118. *A. palmeri*.
 Spine flexuous.....119. *A. flexispina*.
- AA. Leaves with the teeth usually joined by a firmly attached horny border.
 Spine sinuous, rather slender.
 Filaments inserted in middle of tube.....62. *A. shawii*.
 Filaments inserted above the middle.....63. *A. orcuttiana*.
 Spine straight.
 Teeth gradually tapered.....64. *A. sebastiana*.
 Teeth abrupt from a broad base.
 Leaves abruptly acuminate.....65. *A. pachyacantha*.
 Leaves gradually acute.....66. *A. goldmaniana*.
- AAA. Leaves mostly with long-decurrent spine, but scarcely horny-margined between the teeth.
- H. Leaves oblong, long (over 1 meter).
 Leaves green or subglaucous; perianth segments long (3 cm.)
 12. *A. longisepala*.
 Leaves white-glaucous; segments much shorter.....67. *A. applanata*.
- HH. Leaves ovate or obovate, scarcely half as long.
 Leaves rather thin; spine slender.
 Leaves acute, dull gray.....68. *A. scabra*.
 Leaves acuminate, glaucous.....70. *A. parrasana*.

- Leaves thick and fleshier; spine rather stout.
 Spine flat-grooved.....71. *A. chihuahuana*.
 Spine round-grooved, sharp-edged.
 Leaves elongate; capsule about 4 cm. long.....72. *A. parryi*.
 Leaves broad; capsule 5.5 to 7.5 cm. long.
 Leaves acute.....69. *A. huachucensis*.
 Leaves acuminate.....73. *A. patonii*.
- HHH. Leaves triangular or lance-oblong, ascending.
 Leaves elongate (fully 1 meter long).
 Perianth segments twice as long as tube.....74. *A. aurea*.
 Perianth segments shorter than tube.....75. *A. promontorii*.
 Leaves scarcely half as long.
 Teeth close together (5 to 10 mm. apart), small.
 Teeth friable, almost cusplless.....76. *A. dentiens*.
 Teeth firm, with short sharp cusps.....77. *A. disjuncta*.
 Teeth more separated, sometimes very large.
 Spine nearly straight.
 Spine strong and rather stout.
 Leaf margin repand.
 Ovary flask-shaped.....78. *A. deserti*.
 Ovary fusiform.....79. *A. consociata*.
 Leaf margin nearly straight.....80. *A. pringlei*.
 Spine very slender.
 Leaves roughened.....81. *A. cerulata*.
 Leaves smooth.
 Perianth segments 15 mm. long.....82. *A. carminis*.
 Perianth segments 20 mm. long.....83. *A. sobria*.
 Spine somewhat tortuous. Leaves roughened.....84. *A. affinis*.
- HHHH. Leaves broadly lanceolate or oblanceolate.
 Teeth small, close together (10 mm.).....85. *A. brandegeei*.
 Teeth larger and more separated.
 Teeth gradually tapered.
 Teeth comparatively short and straight.....86. *A. margaritae*.
 Teeth long and often hooked.....87. *A. connochaetodon*.
 Teeth abruptly contracted from the base.
 Spine undulate; margin repand.....88. *A. roseana*.
 Spine and margin straight.....89. *A. avellanidens*.
- HHHHH. Leaves oblong or ovate-oblong; spine straight.
 Teeth long and firm.....90. *A. subsimplex*.
 Teeth short, detachable.....91. *A. nelsoni*.
- AAAA. Leaves horny-margined for the upper third or more, fleshy, large.
 Leaves broad (3 times, or rarely 4 or 5 times, as long as wide).
 Margin with few and rudimentary teeth or none.....92. *A. weberi*.
 Margin with numerous strong teeth.
 Teeth confluent on much of the margin.....93. *A. latissima*.
 Teeth joined by a horny margin only toward the end.
 Leaves undulate, very crenate, green.....94. *A. ferox*.
 Leaves not very crenate if green.
 Leaves deeply gutter-shaped.....96. *A. compluviata*.
 Leaves not gutter-like.
 Leaves scarcely twice as long as broad.....95. *A. mitraeformis*.

Leaves three or four times as long as broad.

Leaves gray or glaucous, scarcely 1.5 meters long.

Teeth close (1.5 to 2 cm. apart) ; margin incised_97. *A. felina*.

Teeth more separated or margin not incised.

Leaves gray-and-green-banded, often rough.

Teeth on fleshy hummocks.....98. *A. subzonata*.

Teeth without such hummocks.....99. *A. zonata*.

Leaves not conspicuously zoned.

Spine needle-shaped.....100. *A. gracilispina*.

Spine stout-conical.

Leaves acuminate.....101. *A. melliflua*.

Leaves acute.

Teeth on fleshy hummocks.....102. *A. quotifera*.

Teeth without such hummocks...103. *A. crassispina*.

Leaves green or slightly gray, plicate, 2 meters long.

104. *A. tecta*.

Leaves elongate (10 times as long as wide or longer).

Leaves smooth.

Leaves green (or relatively broad if gray), extremely large.

105. *A. atrovirens*.

Leaves gray.

Leaves very long (over 2 meters) and narrow. Teeth small.

106. *A. mapisaga*.

Leaves moderate.

Leaves scarcely repand (Pacific).....107. *A. schlechtendalii*.

Leaves more repand (central).....108. *A. bourgaei*.

Leaves white and very large.....109. *A. mirabilis*.

Leaves rough. Plants very glaucous except the green scape.

110. *A. franzosini*.

II. LITTAEA. Flowers in a spike or spikelike cluster.

A. Leaves not striate-ridged.

B. Leaves neither filiferous nor with a detachable margin.

C. Leaves elongate, at most minutely denticulate.

Leaves rather fleshy, tapered from the base.

Leaves with slender spine; flowers withering.

Margin denticulate.

Pedicels distinct.....123. *A. yuccaefolia*.

Pedicels on a peduncle.....124. *A. eduardi*.

Margin smooth.....125. *A. houghii*.

Leaves without spine; flowers drying rotate.....122. *A. bracteosa*.

Leaves rather stiff, oblong.

Leaves light green, narrow (scarcely 1 cm. wide)

120. *A. dasyliroides*.

Leaves gray, broader (2 cm. wide).....121. *A. intrepida*.

CC. Leaves relatively broad, at most minutely denticulate.

Leaves without spine.

Leaves without spine or denticles.

Plants with elongate trunk.....126. *A. attenuata*.

Plants nearly or quite acaulescent.....127. *A. ellemeetiana*.

Leaves without spine but denticulate.....128. *A. pruinosa*.

- Leaves with pungent short spine.
 Leaves not denticulate.....129. *A. vilmoriniana*.
 Leaves minutely denticulate.....130. *A. pedunculifera*.
- CCC. Leaves with evident spine and teeth.
 Spine and teeth soft and weak or small.
 Leaves glaucous or green. Teeth more or less irregularly connate.
 131. *A. celsii*.
 Leaves gray-green. Teeth mostly distinct.....132. *A. micracantha*.
 Leaves green, with pale median stripe.....133. *A. pendula*.
- Spine and teeth firm and relatively large.
 Teeth close together; leaves green.....134. *A. polyacantha*.
 Teeth more separated (10 mm. apart); leaves commonly glaucous.
 Flowers yellowish white, moderate.....135. *A. xalapensis*.
 Flowers deep yellow, large (75 mm. long)....136. *A. macrantha*.
- BB. Leaves with soft dry border, spine, and teeth.....137. *A. pumila*.
- BBB. Leaves with detachable horny border and with pungent spine.
 D. Leaves falcately ascending, thin, not repand.
 Leaves green or bluish.....138. *A. lecheguilla*.
 Leaves gray-green, somewhat glaucous.....139. *A. funkiana*.
- DD. Leaves spreading, rather narrow and thin, repand.
 140. *A. lophantha*.
- DDD. Leaves spreading, rather broad and usually thick.
 Leaves relatively thin, without pale ventral stripe....141. *A. horrida*.
 Leaves thicker.
 Leaves usually with pale ventral stripe.....142. *A. roezliana*.
 Leaves without pale ventral stripe.
 Leaves fleshy, incurved.....143. *A. ghiesbreghtii*.
 Leaves fibrous, straight.....144. *A. obscura*.
- DDDD. Leaves often falcate, ascending, thick and stiff.
 Spine short (25 mm. long).
 Teeth long (5 to 15 mm.) if widely separated....145. *A. triangularis*.
 Teeth scarcely 5 mm. long, distant.....146. *A. potrerana*.
 Spine long (over 50 mm. long). Spike very dense....147. *A. kerchovei*.
- DDDDD. Leaves spreading, oblong, thin, or else fleshy rather than hard.
 Horny margin of the leaf continuous.
 Teeth not on green hummocks.
 Leaves gray-green or blue-green, rather few ..148. *A. inopinabilis*.
 Leaves light green or glaucous.
 Leaves light green, scarcely glaucous.
 Spike very compact.....149. *A. convallis*.
 Spike rather loose.....150. *A. expatriata*.
- Leaves glaucous.
 Leaves flaccidly recurved.....151. *A. dissimulans*.
 Leaves not recurved.....152. *A. angustiarum*.
- Teeth saddling fleshy hummocks.
 Leaves rough. Teeth very broad.....153. *A. xylonacantha*.
 Leaves smooth.
 Teeth mammaeform.....154. *A. washingtonensis*.
 Teeth triangular.....155. *A. splendens*.
- Horny margin interrupted in the middle.....156. *A. vittata*.
- DDDDDD. Leaves straight, 3-edged, very hard...157. *A. victoriae-reginae*.
- BBBB. Leaves with (characteristically) detachable marginal threads, and
 with pungent spine.

Leaves small (scarcely 1 cm. wide and 10 cm. long), denticulate at base.

Spine flat.

 Marginal threads coarse.....158. *A. parviflora*.

 Marginal threads fine.....159. *A. toumeyana*.

Spine and leaf tip involute.....160. *A. hartmani*.

Leaves elongate, or broader in dwarf forms.

Leaves not recurving.

 E. Leaves narrow (scarcely 1 cm. wide).

 Leaves denticulate at base.....161. *A. mulfordiana*.

 Leaves not denticulate.....162. *A. schottii*.

 EE. Leaves moderately broad (1 to 2 cm.), not denticulate.

 Threads coarse, shaving-like.....163. *A. schidigera*.

 Threads fine, coiling.....164. *A. angustissima*.

 EEE. Leaves relatively broad (2.5-4 cm.), denticulate on suckers.

 165. *A. filifera*.

 Leaves recurving, very long and narrow.....166. *A. geminiflora*.

AA. Leaves striate-ridged, linear, without coarse teeth or marginal threads or horny margin.

 Leaves long and narrow (0.5 cm. wide, 60 to 90 cm. long); spine very slender.

 167. *A. striata*.

 Leaves shorter and broader (1 cm. wide, 25 to 50 cm. long); spine stouter.

 Leaves densely clustered, rhombic in section.....168. *A. echinoides*.

 Leaves fewer or laxer, often 3-sided.

 Leaves nearly smooth on the margin.....169. *A. stricta*.

 Leaves scabrid on the margin.....170. *A. falcata*.

1. *Agave panamana* Trel., sp. nov.

Leaves thin, 5 cm. wide and 65 cm. long, with a blackish needle-shaped spine scarcely 2 mm. wide and 10 mm. long, and small upcurved teeth 15 mm. apart and 1 to 2 mm. long; inflorescence 1 to 3 meters tall; flowers 60 mm. long, with segments equaling the tube, the filaments inserted about the upper third; freely bulbiferous.

Panama (type, in the herbarium of the New York Botanical Garden, from Urava Island, *Howe*, in 1909).

Known as "vara de San José."

2. *Agave rubescens* Salm-Dyck, Hort. Dyck. 8, 306. 1834.

Agave flaccida Salm-Dyck, Hort. Dyck. 306. 1834.

Agave punctata Salm-Dyck, Hort. Dyck. 8, 306. 1834.

Agave densispina Cels, Cat. 1865.

? *Agave erubescens* Ellemeet, Belg. Hort. 1871: 119. 1871.

Puebla and Oaxaca; type cultivated in Europe from an unspecified locality.

Nearly acaulescent; leaves gray, tinged with purple, 5 cm. wide, 75 cm. long, with a brown spine 4 mm. wide and 25 mm. long, and very slender, upcurved, orange or brown teeth 10 to 20 mm. apart and 3 to 4 mm. long, the translucent margin straight between them.

3. *Agave stringens* Trel., sp. nov.

Leaves concave, thin and recurving, very glaucous, 1 to 2 cm. wide and 60 cm. long or more, with a dark brown conical spine about 2 mm. wide and 8 mm. long, and very sharp and slender, red or brown, curved teeth scarcely 5 mm. apart and 1 to 2 mm. long, the intervening cartilaginous margin nearly straight.

Jalisco; type, in the herbarium of the Missouri Botanical Garden, from Rio Blanco barranca, *Trelease*, in 1904.

4. *Agave angustifolia* Haw. Syn. Pl. Succ. 72. 1812.

Agave wrightii Drummond, Rep. Mo. Bot. Gard. 18: 27. 1907.

Yucatán or Honduras ?; what appears to be this, also, from Campeche (v. *Christman*), in the Berlin herbarium; type cultivated in Europe from the island of St. Helena, where, as everywhere in warm countries, it is planted.

Subcaulescent; leaves gray-green, 8 cm. wide, 40 to 65 cm. long, with red-brown ungrooved spine 4 mm. wide and 25 to 40 mm. long, and dark, variously bent, very slender teeth 20 to 25 mm. apart and 3 to 5 mm. long.

5. *Agave bergeri* Trel.; Berger, *Agaven* 250. 1915.

Leaves gray-green, granular-roughened, about 8 cm. wide and 100 cm. long, with red-chestnut or graying, half-round, rough spine 5 to 6 mm. wide and 20 to 25 mm. long, and red or black, hooked, very slender teeth 15 to 25 mm. apart and 5 mm. long; inflorescence 5 meters tall; flowers 60 mm. long, green-yellow, with segments twice as long as the tube; capsules 30 mm. broad and 60 mm. long, somewhat stipitate and beaked; seeds 8 mm. wide and 12 mm. long; bulbiferous.

Region ?; type, in the herbarium of the Missouri Botanical Garden, cultivated in Europe as *A. rigida*, Berger, in 1908.

6. *Agave lespinassei* Trel. Trans. Acad. St. Louis 18: 33. 1909.

Veracruz; type from Tuxpan.

Acaulescent; leaves yellow-green, 6 to 7 cm. wide, 150 cm. long, with red-brown spine 5 to 6 mm. wide and 30 to 35 mm. long, and very slender, mostly upcurved, red-brown teeth 15 to 20 mm. apart and 1 to 2 mm. long, the intervening cartilaginous margin somewhat hollowed. "Zapupe de Tepezintla," "zapupe de Vincent."

7. *Agave endlichiana* Trel. Trans. Acad. St. Louis 18: 34. 1909.

Veracruz; type from Huatusco.

Acaulescent; leaves green, transiently glaucous, 5 to 9 cm. wide, 80 to 125 cm. long, with a garnet or chestnut spine 4 to 5 mm. wide and 15 to 30 mm. long, and heavy, upcurved, garnet or chestnut teeth 10 to 30 mm. apart and 3 mm. long, the intervening translucent margin nearly straight. "Ixtle," "ixtle manso."

8. *Agave aboriginum* Trel. Trans. Acad. St. Louis 18: 34. 1909.

Veracruz; type from Tuxpan.

Acaulescent; leaves yellow-green, somewhat gray, 5 to 11 cm. wide, 70 to 150 cm. long, with brown, somewhat decurrent spine 4 mm. wide and 35 to 50 mm. long, and heavy upcurved teeth 20 to 35 mm. apart and 5 to 8 mm. long sometimes with intercalated smaller ones, the intervening margin nearly straight. "Zapupe silvestre," "zapupe cimarrón," "zapupe de Sierra Chontla"; "wild zapupe."

9. *Agave deweyana*¹ Trel. Trans. Acad. St. Louis 18: 35. 1909.

Tamaulipas and Veracruz; type from Victoria, Tamaulipas.

Acaulescent; leaves yellow-green, somewhat transiently glaucous, 5 to 10 cm. wide, 150 cm. long, with brown or purplish spine 3 to 4 mm. wide and 15 to 40 mm. long, and slender upcurved teeth 15 to 45 mm. apart and 2 to 3 mm. long. "Zapupe de Tantoyuca," "zapupe de Huatusco," "zapupe verde"; "green zapupe."

10. *Agave zapupe* Trel. Trans. Acad. St. Louis 18: 32. 1909.

Veracruz; type from Tuxpan.

Acaulescent; leaves dark green but glaucous, 8 to 10 cm. wide, 150 to 200 cm. long, with red-brown or blackening spine 4 mm. wide and 15 to 25 mm.

¹Named for L. H. Dewey (1865-), of the U. S. Department of Agriculture, well known for his work upon the fiber plants of Mexico and other regions.

long, and slender upcurved teeth 15 to 30 mm. apart and 2 to 3 mm. long. "Zapupe azul," "zapupe de Estopier," "zapupe de San Bernardo"; "blue zapupe."

11. *Agave subtilis* Trel., sp. nov.

Leaves ascending, glaucous, 10 to 15 cm. wide, 150 cm. long, with an acuminate gray spine 5 mm. wide and 25 mm. long, this flattened to the middle, and with rather slender-cusped, mostly upcurved teeth 20 to 50 mm. apart and 4 to 5 mm. long.

Jalisco; type, in the herbarium of the Missouri Botanical Garden, from Tequila, *Griffiths* H, in 1909.

"Chato"; a good mezcal species.

12. *Agave longisepala* Tod. Hort. Panorm. 2: 34. 1891.

Jalisco(?); type cultivated in Europe; cultivated for mezcal at Tequila as "mezcal grande."

Leaves spreading, gray-green, 15 to 20 cm. wide, 200 cm. long, with a large conical or acuminate, flat-based, chestnut spine often 10 mm. wide and 25 mm. long, and with deltoid teeth 30 to 50 mm. apart and 5 to 10 mm. long, the prevailingly upcurved cusps often suppressed; flowers 70 mm. long, with short tube, the segments 30 mm. long.

13. *Agave pedrosana* Trel., sp. nov.

Leaves green, lightly glaucous, 10 to 15 cm. wide, 100 to 150 cm. long, with flexuous heavy flat-based chestnut spine about 10 mm. wide and 30 mm. long, and with slender upcurved teeth 30 to 60 mm. apart and 2 to 4 mm. long.

Jalisco; type, in the herbarium of the Missouri Botanical Garden, collected at San Pedro, near Guadalajara, *Trelease*, in 1903.

14. *Agave gutierreziana* Trel., sp. nov.

Leaves green, about 15 cm. wide and 200 cm. long, with a rather small subulate ungrooved graying spine scarcely 5 mm. wide and 20 mm. long, and with slender, sharply upcurved teeth 10 to 25 mm. apart and 5 to 6 mm. long.

Chiapas; type, in the herbarium of the Missouri Botanical Garden, from Tuxtla Gutiérrez, *Gutiérrez*, in 1908.

"Magueyón."

15. *Agave elongata* Jacobi, Hamb. Gart. Zeit. 20: 501. 1864.

Agave spectabilis Tod. Hort. Panorm. 2: 4. 1879.

Region ?; type cultivated in Europe.

Leaves spreading, gray-glaucous, 10 to 13 cm. wide, 200 cm. long, with rather attenuate, chestnut or graying, flat-based spine 5 to 6 mm. wide and 20 to 30 mm. long, and slender, mostly upcurved teeth 10 to 15 mm. apart and 5 mm. long.

16. *Agave collina* Greenm. Proc. Amer. Acad. 32: 296. 1897.

Morelos; type collected above Cuernavaca.

Acaulescent; leaves glaucous, somewhat green-banded across the back, 5 to 8 cm. wide, 75 cm. long, with red-brown or purplish brown spine 3 to 5 mm. wide and 20 to 30 mm. long, and rather heavy, upcurved, blackish teeth 10 to 25 mm. apart and 3 to 5 mm. long, the yellowish margin nearly straight between them.

17. *Agave palmaris* Trel., sp. nov.

Leaves ascending, gray, more or less glaucous, 10 to 15 cm. wide, 150 cm. long, with recurved, red or graying spine 4 mm. wide and 15 mm. long, and mostly upcurved, slender teeth 20 to 30 mm. apart and 5 mm. long.

Jalisco; type, in the herbarium of the Missouri Botanical Garden, from Mazatepec, *Dewey* 657.

"Mano larga," "chino bermejo." A good mezcal species; apparently cultivated for fiber in Sinaloa. A form with open spoon-shaped blunt spine fully 10 mm. wide (var. *monstrosa*) is cultivated as "zapalote."

18. *Agave rhodacantha* Trel., sp. nov.

Leaves green, lightly glaucous, 15 to 20 cm. wide, 250 cm. long or more, with black-chestnut flat-based spine 5 mm. wide and 20 mm. long, and large heavy upcurved teeth 20 to 60 or 70 mm. apart and 10 mm. long, from large lenticular bases.

Sinaloa; type, in the herbarium of the Missouri Botanical Garden, from Mocorito, *Lundstrom*, in 1909.

"Espinoza."

19. *Agave pes-mulae* Trel., sp. nov.

Leaves ascending, blue-green, glaucous, 6 to 8 cm. wide, 100 to 150 cm. long, with red-brown spine about 3 mm. wide and 15 mm. long, and sharply upcurved slender triangular teeth about 10 mm. apart and 3 mm. long.

Jalisco; type, in the herbarium of the Missouri Botanical Garden, from Tequila, *Griffiths* B, in 1909.

"Pato de mula," "pié de mula." A good mezcal species.

20. *Agave donnell-smithii*¹ Trel. Trans. Acad. St. Louis 23: 144. 1915.

Guatemala; type from Escuintla.

Acaulescent; leaves light green, glaucous beneath, 8 cm. wide, 75 to 100 cm. long or more, with garnet or chestnut spine 4 mm. wide and 12 to 15 mm. long, and rather slender upcurved teeth 15 to 25 mm. apart and 2 to 3 mm. long.

21. *Agave karwinskii* Zucc. Act. Acad. Caes. Leop. Carol. 16²: 677. 1833.

? *Agave laxa* Salm-Dyck, Hort. Dyck. 8. 1834.

? *Agave viridissima* Baker, Gard. Chron. n. ser. 8: 137. 1877.

Agave corderoyi Baker, Gard. Chron. n. ser. 8: 398. 1877.

Agave bakeri Ross, Boll. Soc. Sci. Nat. ed. Econom. Palermo. 1894².

Puebla and Oaxaca; type cultivated in Europe, presumably from Tehuacán.

Trunk becoming 4 meters tall; leaves green or very transiently glaucous, concave, 2 to 4 cm. wide, 35 to 70 cm. long, with dark brown spine 3 to 6 mm. wide and 25 to 50 mm. long, and strong, upcurved, nearly black teeth 25 to 45 mm. apart and 3 to 5 mm. long, the margin nearly straight between them. "Candelillo."

22. *Agave decipiens* Baker, Kew Bull. Misc. Inf. 1892: 183. 1892.

Agave laxifolia Baker in Curtis's Bot. Mag. 122: pl. 7477. 1896.

Southern Florida, around the coast (type cultivated in Europe without recorded locality); presumably native in Yucatán.

Trunk 2 to 3 meters tall; leaves green, outcurved, rather fleshy and concave, 4 to 10 cm. wide, 70 to 125 cm. long, with dark chestnut spine 3 to 5 mm. wide and 10 to 25 mm. long, and very slender flexuous teeth 10 to 25 mm. apart and 2 mm. long, these on fleshy prominences of the margin.

Cultivated (from a plant of Baja California) as *A. spiralis*. "False sisal."

¹ Named for Capt. John Donnell Smith (1829-), of Baltimore, Maryland, well known for his extensive publications upon the botany of Central America. Capt. Smith has made collections in Central America, and has directed botanical explorations in many parts of that region. His large herbarium, which contains a wide representation of Mexican plants, and his library, have been presented to the Smithsonian Institution, and are incorporated in the U. S. National Herbarium.

23. *Agave sisalana* Perrine, U. S. Sen. 25th Congr. Sess. 2, Doc. 300. *pl.* 1, 2, 4. 1838.

Agave rigida sisalana Baker, Kew Bull. Misc. Inf. 1889: 254. 1889.

Yucatán; type cultivated in Florida from introduced plants.

Acaulescent; leaves at length bright glossy green, at first lightly glaucous, nearly flat, 10 cm. wide, 150 cm. long, with a chestnut spine 4 to 5 mm. wide and 20 to 25 mm. long, the straight margin typically unarmed or with a few very rudimentary teeth. "Yaxci," "yax-qui," "green agave," "Sisal hemp," or "Bahama hemp."

The species most extensively planted, as a source of fiber, outside of Yucatán. Called "maguey tuxtleco" in Chiapas.

Sometimes occurring in a form as prickly as the preceding species (*f. armata* Trel. Mem. Nat. Acad. Sci. 11: 49. 1913); and exceptionally with a trunk about 1 meter tall.

24. *Agave candelabrum* Tod. Hort. Panorm. 1: 66. 1876.

Agave rumphii and *Agave laxa* Hort.

Region ?; type cultivated in Europe.

Leaves uniformly spreading, green, 7 cm. wide, 100 to 150 cm. long, with conical brown spine 3 mm. wide and 15 to 20 mm. long, and sharply upcurved teeth 10 to 25 or 30 mm. apart and 4 mm. long, the intervening margin straight.

Perhaps a green extreme of *A. cantala*.

25. *Agave kirchneriana* Berger, *Agaven* 252. 1915.

Acaulescent; leaves dull gray-green, slightly roughened, 7 cm. wide, 125 cm. long, with polished chestnut spine 5 mm. wide and 20 mm. long, and slender-upcurved blackish teeth 15 to 20 mm. apart and 3 to 5 mm. long; flowers green, 50 to 55 mm. long, the openly conical tube half as long as the segments.

Guerrero; type from Xochipila or Zumpango.

"Maguey delgado"; yielding superior fiber and mezcal.

26. *Agave pacifica* Trel., sp. nov.

Acaulescent; leaves yellow-green, very lightly glaucous and zoned, 3.5 to 5 cm. wide, 50 to 75 cm. long, the purplish red-brown spine 15 to 25 mm. long, often abruptly contracted and slender above the decurrent base, the teeth usually upcurved-triangular, 15 to 25 mm. apart and 3 to 5 mm. long, the intervening cartilaginous margin straight; flowers greenish yellow, 50 mm. long, the openly conical tube half as long as the segments; capsules shortly stipitate and beaked, 25 mm. broad and 45 mm. long.

Sonora, Sinaloa, and Tepic; type, in the herbarium of the Missouri Botanical Garden, from Creston Island, Mazatlán, Sinaloa, *Trelease*, in 1904.

27. *Agave cantala* Roxb. Hort. Beng. 25. 1814.

Agave vivipara of authors, not L.

Agave flaccida Haw. Syn. Pl. Succ. 72. 1812.

Furcraea cantala Haw. Suppl. Pl. Succ. 42. 1819.

Furcraea madagascariensis Haw. Suppl. Pl. Succ. 42. 1819.

Agave madagascariensis Spreng. Syst. Veg. 2: 79. 1825.

Agave cantala Roxb. Fl. Ind. 2: 167. 1832.

Region ?; type cultivated in India.

Acaulescent; leaves glaucous, slightly green-lined longitudinally, falcate or straight, ascending, 6 to 10 cm. wide, 150 cm. long, with slender-pointed conical brown spine 3 to 4 mm. wide and 15 to 20 mm. long, and red-chestnut, upcurved, gradually very sharp-pointed teeth 20 to 30 mm. apart and 5 to 6 mm. long.

A close ally of the "zapupe" and especially the "Tequila mezcal" species; cultivated for its fiber in the Philippines as "maguay" or "Manila aloe," and in India where it is the source of "Bombay hemp" or "Bombay aloe fiber."

Apparently one of the west-Mexican allies of *A. tequilana*, perhaps early taken for its fiber to the Philippines and thence to India, from the Acapulco region.

28. *Agave tequilana* Weber, Bull. Mus. Hist. Nat. 8: 220. 1902.

Jalisco; type from about Tequila.

Shortly caulescent; leaves rather light bluish green and persistently glaucous, thin and nearly flat, 8 to 10 cm. wide, 125 cm. long or more, with red-brown or purple-brown spine 3 to 4 mm. wide and 15 to 20 mm. long, and triangular upcurved reddish teeth 10 to 15 mm. apart and 3 to 4 mm. long, the intervening whitish margin slightly hollowed. "Mezcal azul" or "chino azul."

The common source of the distilled liquor, "mezcal de Tequila." A number of related forms are found in cultivation with this typical "azul." These, probably all specifically separable as with the "zapupe" complex, to which they are related, are known as "mano larga," "bermejo," "chato," "chino bermejo," "zapalote," "pié de mula" or "pato de mula," and "segufn" or "zigufn."

29. *Agave pseudotequilana* Trel., sp. nov.

Shortly caulescent; leaves yellow-green, glaucous, rather thick, openly concave, 15 cm. wide, 175 to 200 cm. long, with dark red-brown, conical or acuminately tapered spine 4 to 7 mm. wide and 10 to 15 or 20 mm. long, and sharply upcurved or flexed, triangular teeth on broad bases, 15 to 20 or 35 mm. apart and 5 to 10 mm. long, the intervening margin nearly straight; inflorescence ample, paniced; flowers unknown; capsules broadly oblong, 25 mm. broad and 45 mm. long, accompanied by bulbils.

Jalisco; type, in the herbarium of the Missouri Botanical Garden, from Tuxpan.

"Mezcal blanco" or "mezcal cucharo."

30. *Agave sullivanii* Trel., sp. nov.

Leaves green, about 10 cm. wide and 100 cm. long, with a chestnut, very short-conical spine, this abruptly pointed, or less commonly conical, and round-grooved at base, 5 mm. wide and 10 to 15 mm. long, the teeth triangular, upcurved, 20 mm. apart and 4 to 6 mm. long.

Region ?; type, in the herbarium of the Missouri Botanical Garden, cultivated for mezcal at La Paz, Baja California, *Sullivan*, in 1910.

31. *Agave ixtli* Karw. in Salm-Dyck, Hort. Dyck. 8, 304. 1834.

Yucatán; type cultivated in Europe, from Yucatán.

Acaulescent; leaves grayish, somewhat concave, scarcely 50 cm. long, with spine and prickles much as in *A. fourcroydes*.

"Ixtle"; apparently including the plants known as "bab-ci," "chelem" (which is *A. silvestris* D'Utra, Bol. Agr. S. Paulo, 1909: 169. 1909, and *A. proliфера* Schott, in sched.), "chucum-ci," "citam-ci" (which is *A. minima* D'Utra, loc. cit.), "pita-ci," "xix-ci," and "xtuc-ci." The specific name is variously and often erroneously spelled.

32. *Agave fourcroydes* Lem. Ill. Hort. 11: Misc. 65. 1864.

Agave rigida elongata Baker, Kew Bull. Misc. Inf. 1892: 33. 1892.

Yucatán; type cultivated in Europe from an unrecorded locality.

Trunk becoming 2 meters tall; leaves gray, rather flat, 8 to 10 cm. wide, 150 to 250 cm. long, with black-brown spine 4 to 6 mm. wide and 20 to 30 mm. long, and moderately slender, somewhat upcurved, blackish teeth 10 to 20 mm.

apart and 1 to 4 mm. long, the margin nearly straight between their somewhat raised bases. "Sacqui," "sac-ci," "gray agave," or "henequén."

The source of the larger part of the "Sisal hemp" exported from Yucatán.

33. *Agave datylio* Weber, Bull. Mus. Hist. Nat. 8: 223. 1902.

Baja California; type from La Paz.

Acaulescent; leaves yellow-green or gray-green, 3 to 4 cm. wide, 30 to 75 cm. long, with purplish or blackish spine 4 to 6 mm. wide and 20 to 30 mm. long, and glossy, chestnut, heavily triangular or slender-cusped teeth 20 to 30 or 50 mm. apart and 3 to 5 mm. long, the intervening margin nearly straight.

34. *Agave vexans* Trel. Rep. Mo. Bot. Gard. 22: 62. 1911.

Baja California; type from Mulegé.

Acaulescent; leaves gray-green, 2 cm. wide, 20 to 45 cm. long, with gray-brown spine 3 to 5 mm. wide and 25 to 35 mm. long, and triangular or slender-cusped, detachable teeth 15 to 20 mm. apart and 3 to 4 mm. long.

35. *Agave nivea* Trel. Trans. Acad. St. Louis 23: 143. 1915.

Guatemala; type from El Rancho.

Acaulescent; leaves very glaucous, very concave, 15 cm. wide, 200 cm. long, with black-chestnut spine 3 mm. wide and 15 to 20 mm. long, and triangular slender-cusped teeth 30 to 50 mm. apart and 3 mm. long, their bases often fleshy, the intervening margin nearly straight.

36. *Agave sicaefolia* Trel. Trans. Acad. St. Louis 23: 141. 1915.

Guatemala; type from El Rancho.

Acaulescent; leaves gray, flat or concave, 7 to 8 cm. wide, 60 to 75 cm. long, with purplish chestnut spine 4 mm. wide and 30 to 40 mm. long, and mostly upcurved, slender teeth 15 to 35 mm. apart and 3 to 5 mm. long, the intervening margin sometimes with smaller straight teeth.

37. *Agave macroacantha* Zucc. Act. Acad. Caes. Leop. Carol. 16²: 676. 1833.

Agave pugioniformis Zucc. Act. Acad. Caes. Leop. Carol. 16²: 676. 1833.

Agave flavescens Salm-Dyck, Hort. Dyck. 8, 305. 1834.

Agave flavescens macroacantha Jacobi, Hamb. Gart. Zeit. 1864: 500. 1864.

Agave bessereriana Van Houtte, Cat. 1868: 32. 1868.

Agave subfalcata Jacobi, Wochenschr. Ver. Beförd. Gartenb. 1869: 179. 1869.

Agave linearis Jacobi, Wochenschr. Ver. Beförd. Gartenb. 1869: 179. 1869.

Agave concinna Baker, Gard. Chron. n. ser. 8: 137. 1877.

Agave subburyensis Baker, Gard. Chron. n. ser. 8: 137. 1877.

Agave paucifolia Baker, Gard. Chron. n. ser. 9: 266. 1878.

Agave oligophylla Baker, Gard. Chron. n. ser. 10: 492. 1878.

? *Agave wiesenburgensis* Wittm. Gart. Zeit. 4: 13. 1885.

Agave barteri Baker, Amaryll. 178. 1888.

? *Agave integrifolia* Baker, Amaryll. 185. 1888.

Puebla; type cultivated in Europe, probably from Tehuacán.

Acaulescent; leaves glaucous, 2 to 4 (or 7) cm. wide, 20 to 55 cm. long, with dark brown or blackish spine 4 to 6 mm. wide and 15 to 25 mm. long or more, and heavy-based, rather upcurved teeth 15 to 20 mm. apart and 2 to 3 mm. long. "Espadilla."

38. *Agave yaquiana* Trel., sp. nov.

Acaulescent; leaves falcately erect, glaucous and green-zoned, 5 cm. wide, 75 cm. long, with brown decurrent spine 4 mm. wide and 25 mm. long, and rather heavy, mostly upcurved, triangular teeth 15 to 20 or even 50 mm. apart and 36 mm. long, the intervening cartilaginous margin very slightly hollowed.

Sonora; type, in the herbarium of the Missouri Botanical Garden, from rocky hillsides between Hermosillo and Ures, *Trelease* 391.

"Mezcal."

39. *Agave desmettiana* Jacobi, Hamb. Gart. Zeit. 22: 217. 1866.

? *Agave pallida* Jacobi, Hamb. Gart. Zeit. 22: 112. 1866.

? *Agave regeliana* Jacobi, Hamb. Gart. Zeit. 22: 214. 1866.

? *Agave ananassoides* de Jonge & Jacobi, Abh. Schles. Ges. Vaterl. Cult. 1868: 147. 1868.

Agave miradorensis Jacobi, Abh. Schles. Ges. Vaterl. Cult. 1868: 156. 1868.

Veracruz; type cultivated in Europe, presumably from El Mirador, Huatusco, though said to be from Brazil.

Leaves glaucous, nearly straight, 3 to 7 or 10 cm. wide, 75 to 100 cm. long, with slender spine 4 to 5 mm. wide and 20 to 25 mm. long, entire above but with minute, nearly colorless teeth some 5 mm. apart toward the base.

40. *Agave thomasaе* Trel. Trans. Acad. St. Louis 23: 138. 1915.

Guatemala; type cultivated at Quezaltenango.

Leaves green, glaucous, 15 cm. wide, 60 cm. long, with chestnut needle-shaped spine 2 mm. wide and 25 mm. long, and minute, nearly straight teeth 5 to 10 mm. apart and 1 to 2 mm. long, the margin straight between them.

41. *Agave deamiana*¹ Trel. Trans. Acad. St. Louis 23: 139. 1915.

Guatemala; type from Fiscal.

Leaves grayish, 10 cm. wide and 100 cm. long, with purplish brown, needle-shaped spine 3 to 4 mm. wide and 40 mm. long, and slender teeth 10 to 20 mm. apart and 2 to 4 mm. long, the margin straight between them.

42. *Agave hurteri* Trel. Trans. Acad. St. Louis 23: 136. 1915.

Guatemala; type from Zunil.

Leaves somewhat glaucous, 10 cm. wide, 75 to 100 cm. long, with straight chestnut spine 8 mm. wide and 40 mm. long, and more or less hooked, relatively slender teeth 10 to 20 mm. apart and 5 to 10 mm. long, the intervening margin straight.

43. *Agave tortispina* Trel. Trans. Acad. St. Louis 23: 135. 1915.

Guatemala; type from Cruz.

Leaves yellow-green, white-glaucous, 10 cm. wide, 25 to 30 cm. long, with red or smoky brown, very flexuous spine 4 mm. wide and 30 mm. long, and heavy, nearly straight teeth 15 to 25 mm. apart and 3 to 5 mm. long on prominent fleshy hummocks.

44. *Agave pachycentra* Trel. Trans. Acad. St. Louis 23: 135. 1915.

Guatemala; type from Cruz.

Leaves green, blue-glaucous, 15 to 20 cm. wide, 35 to 60 cm. long, with large gray spine 8 mm. wide and 50 to 60 mm. long, and heavy recurved teeth 25 to 50 mm. apart and 5 to 10 mm. long, these on prominent fleshy hummocks.

45. *Agave kellermaniana*² Trel. Trans. Acad. St. Louis 23: 142. 1915.

Guatemala; type from Fiscal.

Leaves very glaucous, 8 to 10 cm. wide and 100 cm. long or larger, with purple-chestnut spine 4 to 5 mm. wide and 30 to 35 mm. long, and upcurved slender teeth 10 to 25 mm. apart and 3 to 5 mm. long, these sometimes on fleshy prominences.

¹ Named for Charles C. Deam, of Bluffton, Indiana, well known for his investigations of the flora of Indiana. Mr. Deam has also obtained an extensive collection of plants in Guatemala.

² Named for W. A. Kellerman (1850-1908), of Ohio, known especially for his investigations of parasitic fungi. He made large collections of plants in Guatemala.

46. *Agave samalana* Trel. Trans. Acad. St. Louis 23: 142. 1915.

Guatemala; type from Esperanza.

Leaves glaucous, 15 cm. wide, 60 cm. long, with reddish or chestnut needle-shaped spine 3 to 4 mm. wide and 35 to 55 mm. long, and rather straight triangular teeth 5 to 20 mm. apart and 1 to 3 or 5 mm. long, the nearly straight intervening margin denticulate.

47. *Agave lagunae* Trel. Trans. Acad. St. Louis 23: 143. 1915.

Guatemala; type from Amatitlán.

Leaves very glaucous, 8 to 10 cm. wide, 40 cm. long, with garnet spine 3 to 5 mm. wide and 20 to 30 mm. long, and variously curved teeth 20 to 40 mm. apart and 3 to 5 mm. long, these on rather prominent fleshy hummocks between which the margin is straight.

48. *Agave minarum* Trel. Trans. Acad. St. Louis 23: 139. 1915.

Guatemala; type collected near El Rancho.

Leaves yellow-green, 6 cm. wide, 60 cm. long, with brown spine 5 mm. wide and 45 mm. long, and detachable teeth 5 to 10 mm. apart, the intervening margin straight.

49. *Agave seemanniana*¹ Jacobi, Abh. Schles. Ges. Vaterl. Cult. 1868: 154. 1868.

Nicaragua (type from Segovia) and Guatemala.

Leaves glaucous, 8 cm. wide, 35 cm. long, with purplish brown spine 2 to 4 mm. wide and 20 to 30 mm. long, and triangular teeth 10 to 20 mm. apart and 2 to 3 mm. long, the margin hollowed between them.

50. *Agave tenuispina* Trel. Trans. Acad. St. Louis 23: 140. 1915.

Guatemala; type from Cruz.

Leaves glaucous, 20 cm. wide, 70 cm. long, with dull brown needle-like spine 3 mm. wide and 60 to 70 mm. long, and rather heavy curved teeth 20 to 40 mm. apart and 5 to 10 mm. long, the margin hollowed between them.

51. *Agave opacidens* Trel. Trans. Acad. St. Louis 23: 140. 1915.

Guatemala; type from Cruz.

Leaves glaucous, 8 to 10 cm. wide, 75 cm. long, with dull brown spine 6 mm. wide and 50 to 60 mm. long, and heavy, nearly straight teeth 20 to 50 mm. apart and 5 to 8 mm. long, these on rather fleshy prominences.

52. *Agave lurida* Ait. Hort. Kew. 1: 472. 1789.

Veracruz; type cultivated in Europe; scarcely known except in cultivation.

Leaves glaucous, rather thin and curved, with a slender spine 3 to 4 mm. wide and 25 to 30 mm. long, and small teeth about 10 mm. apart and 3 mm. long, these usually not on fleshy bases.

53. *Agave rasconensis* Trel., sp. nov.

Leaves rather thin and more or less outcurved, about 10 cm. wide and 75 cm. long, gradually acute, glaucous, with needle-shaped, somewhat round-grooved, glossy red-brown spine about 4 mm. wide and 30 mm. long, and broadly triangular teeth 20 to 50 mm. apart and 6 mm. long, these on somewhat raised prominences between which the margin is nearly straight; inflorescence about 8 meters tall, paniculate; flowers 90 to 95 mm. long, short-pedicelcd, somewhat stipitate, the tube 12 to 15 mm. deep, scarcely half as long as the segments,

¹Berthold Seemann (1825-1871) was a native of Hanover, who from 1847 to 1851 was naturalist of H. M. S. *Herald*. In Mexico he collected in the states of Sinaloa and Durango, and probably elsewhere. He collected also in Panama, and published an extended account of his botanical discoveries.

the filaments inserted in its throat; capsules 25 mm. broad and 50 mm. long, stipitate but scarcely beaked; seeds 7 mm. wide and 10 mm. long.

San Luis Potosí; type, in the herbarium of the Missouri Botanical Garden, from Rascón, *Trelease* 75.

54. *Agave vera-cruz* Mill. Gard. Dict. ed. 8. *Agave* no. 7. 1768.

Agave mexicana and *Agave theometel* of authors.

Veracruz (?); type cultivated in Europe, nominally from that region; also established in Peru. Extensively planted about the Mediterranean, and cultivated as "blue aloe" in Mauritius, Amoy, and India.

Leaves glaucous, rather fleshy and straight, 15 to 17 cm. wide, 150 cm. long, with short stout gray spine 5 to 6 mm. wide and 20 to 25 mm. long, and deltoid teeth on low fleshy prominences.

55. *Agave verschaaffeltii* Lem. in Verschaaffelt, Cat. 1866-7, *f.*; Ill. Hort. 15: *pl.* 564. 1868.

Puebla; type cultivated in Europe, pretty clearly from about Tehuacán.

Leaves glaucous, 7 cm. wide, 15 to 17 cm. long, obovate-oblong, acuminate, with twisted light brown spine and long rust-brown teeth on very high fleshy prominences. "Papalometl."

A beautiful polymorphic small species, at one time popular in European gardens under distinctive varietal names, of which over 30 have been listed—one of the introducers advertising as many varieties as there are plants. Among the names preoccupied by these as specific are *A. albida*, *A. amoena*, *A. auricantha*, *A. bcdinghausii*, *A. bonneti*, *A. cochleata*, *A. crenata*, *A. croucheri*, *A. cucullata*, *A. elegans*, *A. imbricata*, *A. leopoldi*, *A. prolifera*, *A. pulverulenta*, *A. quadreta*, *A. rotundifolia*, *A. saundersii*, *A. serrata*, *A. scrullata*, *A. simsii*, *A. streptacantha*, and *A. tehuacanensis*.

56. *Agave megalacantha* Hemsl. Diag. Pl. Mex. 55. 1880.

Valley of Mexico; type from the lava fields.

Leaves gray, short-obovate, acuminate, 10 cm. wide, 15 to 20 cm. long, with brown or gray spine 5 mm. wide and 40 mm. long, and rather stout, mostly upcurved teeth about 20 mm. apart and 5 mm. long, these from very high fleshy prominences.

57. *Agave guadalajarana* Trel., sp. nov.

Leaves dull and pale but scarcely glaucous, cuneate-obovate, rather obtuse, 8 cm. wide and 12 cm. long, with red-chestnut curved spine 3 mm. wide and 25 mm. long, and triangular teeth, the upper ones 7 mm. long and from high fleshy prominences; inflorescence paniced, with short, more or less connate pedicels; flowers 60 mm. long, the perianth segments equaling or shorter than the tube; capsules stipitate and beaked, 15 to 20 mm. wide, 35 mm. long.

Jalisco; type, in the herbarium of the Missouri Botanical Garden, from Guadalajara, *Pringle* 4473.

58. *Agave potatorum* Zucc. Act. Acad. Caes. Leop. Carol. 16²: 675. 1833.

Puebla; type cultivated in Europe (from about Tehuacán?).

Leaves oblanceolate, acute, 8 to 10 cm. wide, 30 to 40 cm. long, with straight, dull brown spine, and rather small teeth on low fleshy prominences, gray in the typical form, and green in that which has been called *A. scolymus* Karw. (in Salm-Dyck, Hort. Dyck. 307. 1834).

59. *Agave mescal* Koch, Wochenschr. Ver. Beförd. Gartenb. 8: 94. 1865.

Agave hookeri Jacobi, Hamb. Gart. Zeit. 22: 168. 1866.

Michoacán (type locality about Tejuipico on the Balsas River?), Sinaloa, and Sonora.

Leaves dark green, oblong-obovate, acute, 15 to 25 cm. wide, 100 to 150 cm. long, rather thin, with slender brown spine and rather long teeth from the tops of fleshy prominences between which other teeth occur on the hollowed margin. "Mezcal," "lechuguilla."

60. *Agave fenzliana* Jacobi, Hamb. Gart. Zeit. 22: 170. 1866.

Agave inaequidens Koch, Wochenschr. Ver. Beförd. Gartenb. 3: 28. 1860.

Michoacán (?); type cultivated in Europe.

Leaves dull light green, 15 to 20 cm. wide and 150 cm. long or more, with long brown spine and unequal, rather small teeth more or less raised on prominences.

61. *Agave cupreata* Trel. & Berger; Berger, Agaven 197. 1915.

Leaves gray, oblanceolate, acute, 20 cm. wide, 75 cm. long, with copper-colored, somewhat twisted spine 5 mm. wide and 45 mm. long, and large, variously curved, unequal, similarly colored, flat teeth 30 to 60 mm. apart and 10 to 15 mm. long, these clasping the tops of large fleshy prominences; panicle 10 meters tall; flowers yellow, 55 to 60 mm. long, the tube about 10 mm. long.

Michoacán and Guerrero; type from the Sierra Madre.

"Maguey de mezcal."

62. *Agave shawii* Engelm. Trans. Acad. St. Louis 3: 314. 1875.

Northwestern Baja California, near the coast. Southern California; type from Point Loma.

Trunk 1 meter tall; leaves green, glossy, acuminate, 6 to 12 cm. wide, 25 to 50 cm. long, with flexuous needle-shaped red spine 3 to 6 mm. wide and 20 to 40 mm. long, and large, garnet, variously curved teeth 10 to 25 mm. apart and 10 to 15 mm. long, connected by a horny band; filaments inserted about the middle of the perianth tube.

63. *Agave orcuttiana*¹ Trel. Rep. Mo. Bot. Gard. 22: 47. 1912.

Northwestern Baja California, near the coast; type from San Quintín.

Trunk reaching a height of 3 meters; leaves green, with gray spine 4 mm. wide and 20 to 25 mm. long, and large curved gray teeth with-horny connection; filaments inserted above the middle of the tube.

64. *Agave sebastiana* Greene, Bull. Calif. Acad. 1: 214. 1885.

Western coast region and islands of middle Baja California; type from Cedros Island.

Leaves glaucous, rather acute, 6 to 10 cm. wide, 15 to 30 cm. long, with red-brown or gray spine 5 to 6 cm. wide and 20 to 50 mm. long, and nearly straight teeth 15 mm. apart and 3 to 5 or even 10 to 15 mm. long, with horny connection; filaments inserted above the middle of the tube.

65. *Agave pachyacantha* Trel. Rep. Mo. Bot. Gard. 22: 48. 1912.

Northwestern coast region of Baja California; type from Todos Santos Bay.

Leaves rather gray, acuminate, 10 to 12 cm. wide, 25 to 40 or 75 cm. long, with straight heavy chestnut spine 6 to 9 mm. wide and 25 to 40 mm. long, and mostly recurved, heavy teeth 15 mm. apart and 10 mm. long (or sometimes almost suppressed), with connecting horny line; filaments inserted toward the top of the tube.

¹ Named for C. R. Orcutt (1864-), for many years a resident of California, who has collected plants in various parts of Mexico, but especially in Baja California. Many specimens of his collection are in the U. S. National Herbarium.

66. *Agave goldmaniana* Trel. Rep. Mo. Bot. Gard. 22: 49. 1911.

Eastern Baja California; type from Yubai.

Trunk short; leaves grayish, 10 cm. wide, 50 cm. long, with nearly straight blackish spine 7 mm. wide and 40 mm. long, and teeth 15 to 30 mm. apart and up to 10 mm. long, these very nearly triangular, often connected by a horny band, the intervening margin nearly straight.

67. *Agave applanata* Koch, Wochenschr. Ver. Beförd. Gartenb. 1862: 83. 1862.

Veracruz; on the lava fields about Limón; type cultivated in Europe, without recorded locality.

Leaves glaucous, 10 to 15 cm. wide, 100 to 150 cm. long, with purplish or gray, somewhat flexuous, long-decurrent spine 6 to 7 mm. wide and 35 to 45 mm. long, and more or less recurved, triangular teeth 25 to 50 mm. apart and 5 to 8 mm. long, the upper ones connected by a horny line.

68. *Agave scabra* Salm-Dyck, Bonplandia 7: 86. 1859.

Agave wislizeni Engelm. Trans. Acad. St. Louis 3: 320. 1875.

Agave noah Nickels, Cat. 26: 20.

Coahuila; type from San Sebastián, Sierra de Noa.

Leaves dull gray, smooth, acute, 10 to 15 cm. wide, 20 to 25 cm. long, with somewhat curved and decurrent, chestnut or gray spine 3 to 4 mm. wide and 15 to 20 mm. long, and more or less curved, narrowly triangular teeth 15 to 20 mm. apart and 3 to 8 mm. long, the margin between them slightly hollowed.

69. *Agave huachucensis* Baker, Amaryll. 172. 1888.

Southern Arizona (type locality, Huachuca Mountains), and perhaps adjacent Mexico.

Leaves in a globose cluster, dull gray, essentially smooth, acute, 10 to 15 cm. wide, 16 to 30 cm. long, with more or less flexuous and decurrent, red-chestnut or gray spine 5 to 6 mm. wide and 25 mm. long, and usually recurved, narrowly triangular teeth 15 mm. apart and 4 to 7 mm. long, the margin between these usually concave.

70. *Agave parrasana* Berger, Notizbl. Bot. Gart. Berlin 4: 250. 1906.

Coahuila; type from Sierra de Parrás.

Leaves green, lightly glaucous, obovate, long-acuminate, 6 to 8 cm. wide, 10 cm. long or more, with slender-tipped spine 3 to 4 mm. wide and 50 mm. long, and more or less recurved triangular teeth about 10 mm. apart and 5 mm. long, on fleshy prominences.

71. *Agave chihuahuana* Trel. Rep. Mo. Bot. Gard. 22: 90. 1911.

Chihuahua; type locality near Chihuahua.

Leaves grayish, somewhat acuminate, 10 to 15 cm. wide, 15 to 25 cm. long, with purplish chestnut spine 4 to 7 mm. wide and 25 to 35 mm. long, and triangular teeth 15 to 25 mm. apart and 6 mm. long, the margin between them nearly straight; filaments inserted far above the middle of the tube.

72. *Agave parryi* Engelm. Trans. Acad. St. Louis 3: 311. 1875.

Mountains of northern Chihuahua. Southern Arizona and New Mexico; type from Santa Rita, New Mexico.

Leaves gray, acute or somewhat acuminate, 6 to 10 cm. wide, 25 to 30 cm. long (exceptionally 15 cm. wide and 40 cm. long), the spines nearly straight, from chestnut becoming gray, 5 to 6 mm. broad and 20 to 25 mm. long, the teeth straightish or gently recurved, 15 to 20 mm. apart, 3 to 5 mm. long; filaments inserted nearly in the throat of the perianth tube.

73. *Agave patonii* Trel. Rep. Mo. Bot. Gard. 22: 92. 1911.

Durango; type locality, Chinacates.

Leaves grayish, more or less acuminate, 20 cm. wide, 30 cm. long, with nearly straight purplish spine 6 mm. wide and 30 to 35 mm. long, and relatively

slender recurved teeth 20 to 25 mm. apart and 6 to 7 mm. long, the intervening margin nearly straight; filaments inserted in the throat of the perianth tube.

74. *Agave aurea* T. S. Brandeg. Proc. Calif. Acad. II. 2: 207. 1889.

Eastern Baja California; type locality, Purisima.

Leaves gray-green, acuminate, 10 to 15 cm. wide, 75 to 100 cm. long, with conical or acuminate chestnut spine 3 to 5 mm. wide and 20 to 30 mm. long, and very unequal, triangular, often upcurved teeth 10 to 20 mm. apart and 4 to 8 mm. long, from fleshy prominences.

75. *Agave promontorii* Trel. Rep. Mo. Bot. Gard. 22: 50. 1911.

Cape region of Baja California; type locality, Sierra de la Laguna.

Leaves rather glaucous; spine more acuminate and curved.

76. *Agave dentiens* Trel. Rep. Mo. Bot. Gard. 22: 51. 1911.

Islands off the Sonora coast; type from San Esteban Island.

Leaves glaucous gray-green, 3 to 5 cm. wide, 30 to 50 cm. long, with ash-colored or brown-tipped spine 3 to 4 mm. wide and 20 to 30 mm. long, and minute whitish friable teeth 5 to 10 mm. apart and scarcely 1 mm. long, the margin nearly straight.

77. *Agave disjuncta* Trel. Rep. Mo. Bot. Gard. 22: 51. 1911.

Islands of Baja California; type locality, San Benito Island.

Differs from the preceding in its firmer browner teeth.

78. *Agave deserti* Engelm. Trans. Acad. St. Louis 3: 310, 370. 1875.

Colorado Desert of southern California (type locality east of San Felipe), and possibly adjacent Baja California.

Leaves gray, slightly granular, 5 cm. wide, 15 to 30 cm. long, with brown or fading, needle-shaped spine 3 mm. wide and 30 mm. long, and rather friable teeth 5 to 10 mm. apart and 3 to 4 mm. long, from rather prominent fleshy hummocks; ovary flask-shaped, 15 to 20 mm. long, equaling the perianth.

79. *Agave consociata* Trel. Rep. Mo. Bot. Gard. 22: 53. 1911.

Southern California and adjacent Baja California; type locality, San Felipe, California.

Leaves gray, 6 cm. wide, 20 to 30 cm. long, with brown spine 3 to 4 mm. wide and 25 to 30 mm. long, and triangular teeth 10 to 30 mm. apart and 4 to 8 mm. long, the intervening margin somewhat hollowed; ovary fusiform, 25 to 30 mm. long, exceeding the perianth.

80. *Agave pringlei* Engelm.; Trel. Rep. Mo. Bot. Gard. 22: 54. 1911.

Baja California; type from the central plateau.

Leaves gray, 5 cm. wide, 15 to 40 cm. long, with drab or brown-tipped spine 3 to 5 mm. wide and 25 to 35 mm. long, and easily detachable triangular teeth 15 to 25 mm. apart and 3 to 5 mm. long, the intervening margin nearly straight.

81. *Agave cerulata* Trel. Rep. Mo. Bot. Gard. 22: 55. 1911.

Central Baja California; type locality, Calmalli.

Leaves gray or glaucous, somewhat rough, 2 to 4 cm. wide, 30 cm. long, with gray-brown spine 2 to 4 mm. wide and 30 mm. long, and friable teeth 10 to 15 or 25 mm. apart and 3 mm. long, from fleshy marginal hummocks.

82. *Agave carminis* Trel. Rep. Mo. Bot. Gard. 22: 55. 1911.

Islands of eastern Baja California; type locality, Carmen Island.

Leaves grayish, smooth, 5 cm. wide, 30 to 40 cm. long, with needle-shaped, light brown spine 2 mm. wide and 35 mm. long, and firm, variously curved, narrowly triangular teeth 20 to 30 mm. apart and 5 mm. long, from low fleshy prominences between which the margin is nearly straight.

83. *Agave sobria* T. S. Brandeg. Proc. Calif. Acad. II. 2: 207. 1899.

East-central Baja California; type locality, mesas about Comondú.

Leaves glaucous, about 60 cm. long, with chestnut or glaucous, narrowly triangular, variously curved teeth 20 to 30 mm. apart and 8 to 10 mm. long, the intervening margin more or less hollowed.

84. *Agave affinis* Trel. Rep. Mo. Bot. Gard. 22: 56. 1911.

Eastern Baja California; type locality, Concepción Bay.

Leaves glaucous gray-green, rough, 5 cm. wide, 50 cm. long, with somewhat wavy, light brown or faded, nearly straight, narrowly triangular teeth 10 to 20 or 40 mm. apart and 5 to 7 mm. long, from low prominences between which the margin is somewhat concave.

85. *Agave brandegeei* Trel. Rep. Mo. Bot. Gard. 22: 57. 1911.

Cape region of Baja California; type from the mountains.

Leaves grayish yellow-green, 10 cm. wide, 60 cm. long, with stout, conical or acuminate, recurved, red-brown spine 4 mm. wide and 20 mm. long, and gently upcurved, broadly triangular teeth 10 mm. apart and 2 mm. long, the intervening margin straight.

86. *Agave margaritae* T. S. Brandeg. Proc. Calif. Acad. II. 2: 206. 1889.

Islands of southwestern Baja California; type locality, Magdalena Island.

Leaves green or transiently glaucous, acuminate, 6 to 10 cm. wide, 12 to 20 cm. long, with somewhat undulate, needle-shaped, chestnut or fading spine 3 mm. wide and 25 mm. long, and narrowly triangular, curved teeth 10 mm. apart and 6 to 8 mm. long, on low fleshy prominences.

87. *Agave connochaetodon* Trel. Rep. Mo. Bot. Gard. 22: 58. 1911.

Southwestern Baja California; type locality, Santa María Bay.

Leaves somewhat glaucous light green, 6 cm. wide, 25 cm. long, with red or drab, flexuous, needle-shaped spine 3 to 4 mm. wide and 40 to 50 mm. long, and triangular, often much hooked teeth 15 to 20 mm. apart and 10 to 15 mm. long, the intervening margin hollowed.

Perhaps a form of the preceding with larger and peculiarly curved marginal teeth.

88. *Agave roseana* Trel. Rep. Mo. Bot. Gard. 22: 59. 1911.

Southeastern Baja California; type locality, Espíritu Santo.

Leaves glaucous gray-green, 15 cm. wide, 50 cm. long, with glaucous, purplish brown or fading, tortuous, needle-shaped spine 3 to 4 mm. wide and 50 to 70 mm. long, and large, flat, broadly triangular, often much and diversely curved teeth 30 mm. apart and 10 to 25 mm. long, on large fleshy prominences.

89. *Agave avellanidens* Trel. Rep. Mo. Bot. Gard. 22: 60. 1911.

East-central Baja California; type locality, Paraíso.

Leaves long-acuminate, 11 cm. wide and 60 cm. long or more, with conical wavy drab spine 5 mm. wide and 50 mm. long, and similarly colored, variously curved, very broadly triangular teeth 25 to 50 mm. apart (sometimes with an intermediate smaller one) and 10 mm. long, the intervening margin slightly hollowed.

90. *Agave subsimplex* Trel. Rep. Mo. Bot. Gard. 22: 60. 1911.

Islands of Sonora; type locality, Seal Island, near Tiburón.

Leaves very glaucous, 5 cm. wide, 15 cm. long, with nearly straight, light gray, needle-shaped spine 3 mm. wide and 20 mm. long, and purplish black or red or fading, narrow triangular, variously curved teeth 10 to 20 mm. apart and 5 to 10 mm. long, on fleshy prominences between which the margin is nearly straight.

91. *Agave nelsoni* Trel. Rep. Mo. Bot. Gard. 22: 61. 1911.

North-central Baja California; type locality, San Fernando.

Leaves glaucous, 7 cm. wide, 18 to 35 cm. long, with blackish or fading spine 5 mm. wide and 30 cm. long, and fragile, brown or whitish, broadly triangular teeth 10 to 20 mm. apart and 5 mm. long, the intervening margin nearly straight.

92. *Agave weberi* Cels; Poisson, Bull. Mus. Hist. Nat. 7: 231. 1901.

Coahuila, Nuevo León, Durango, and San Luis Potosí; type cultivated in Europe, from Moctezuma, San Luis Potosí.

Leaves nearly straight, 15 cm. wide, 120 to 200 cm. long, green, somewhat glaucous, with straight brown spine 5 mm. wide and 40 to 50 mm. long, the margin typically without teeth but sometimes bearing a very few small rudimentary teeth; capsules 30 mm. broad and 55 mm. long, stipitate but scarcely beaked; bulbiferous.

"Magüey liso"; yielding aguamiel and containing a usable fiber.

93. *Agave latissima* Jacobi, Hamb. Gart. Zeit. 20: 499, 551. 1864.

Agave gracilis Jacobi, Abh. Schles. Ges. Vaterl. Cult. 1870: 150. 1870.

Agave macroculmis Tod. Hort. Panorm. 2: 51. 1891.

Michoacán; type cultivated in Europe.

Leaves bright green or slightly glaucous, 20 to 30 cm. wide, 100 to 150 cm. long, with a stout conical spine as much as 25 mm. long, or a very heavy compressed spine base 20 mm. wide and 10 to 20 mm. long bearing a somewhat refracted tip 3 mm. wide and 5 mm. long, and short triangular teeth 20 to 30 mm. apart and 1 to 2 mm. long, or these commonly closer together or almost or quite confluent and from half-round grayish horny bases.

Yielding "aguamiel" and fiber. Sometimes grown in gardens as *A. coccinea*.

94. *Agave ferox* Koch, Wochenschr. Ver. Beförd. Gartenb. 3: 23. 1860.

Valley of Mexico; type cultivated in Europe under a name suggesting confusion with the next.

Leaves acuminate, rather abruptly outcurved above the middle, undulate and very deeply crenate, green, 30 cm. wide, 120 cm. long, with long, sometimes flexed, gray spine 8 to 10 mm. wide and 60 mm. long, and rather recurved teeth 15 mm. long and 30 to 60 mm. apart on very high fleshy prominences.

95. *Agave mitraeformis* Jacobi, Abh. Schles. Ges. Vaterl. Cult. 1868: 145. 1868.

Agave coarctata Jacobi, Abh. Schles. Ges. Vaterl. Cult. 1868: 147. 1868.

Puebla and adjacent Veracruz; type cultivated in Europe; the name taken for the common "magüey cimarrón" of the vicinity of Tehuacán.

Leaves long-acuminate, concave, slightly gray-and-green-zoned, 30 cm. wide, 75 cm. long, with long, relatively slender spine and large triangular teeth between which the margin is concave.

Cultivated sometimes as *A. bonnettiana* and *A. selloum*.

96. *Agave compluviata* Trel. in Bailey, Stand. Cycl. Hort. 1: 234. 1914.

Durango; type locality, Pueblito.

Leaves gray, zoned with green, acute, deeply gutter-shaped, with upcurved sides, the back somewhat ridged, 40 cm. wide and 120 cm. long or more, with rather long conical gray spine and triangular, more or less recurved, rather large teeth between which the margin is somewhat hollowed. "Magüey verde."

Cultivated for aguamiel and a sort of pulque.

97. *Agave felina* Trel., sp. nov.

Leaves dull, glaucous, 20 cm. wide, 150 cm. long, with slightly flexuous spine 7 mm. wide and 45 mm. long, and clawlike teeth 15 to 20 mm. apart and 5 to 10 mm. long, the intervening margin repand or often incised.

Durango; type, in the herbarium of the Missouri Botanical Garden, from Puebla, *Trelease*.

"Maguey chino."

98. *Agave subzonata* Trel., sp. nov.

Leaves gray, somewhat zoned with green, smooth or slightly rough, acute, 30 cm. wide, 120 cm. long, with stout gray spine 5 to 10 mm. wide and 30 mm. long, and rather heavy curved triangular teeth 40 to 50 mm. apart on very high fleshy prominences; panicle 5 meters tall, sparingly branched at top; filaments inserted about the middle of the rather long perianth tube; capsules stipitate and beaked, 2 cm. broad, 4.5 cm. long; seeds 5 mm. wide, 6 to 7 mm. long.

Nuevo León; type, in the herbarium of the Missouri Botanical Garden, collected at Monterrey, *Trelease*; common in hedges.

99. *Agave zonata* Trel. in Bailey, Stand. Cycl. Hort. 1: 234. 1914.

Nuevo León; type locality, Monterrey; common in hedges.

Leaves broadly and distinctly green-and-gray-banded, rough, acuminate, 25 cm. wide and 100 cm. long or more, with long, rather slender spine and rather distant triangular teeth between which the margin is very concave; capsules stipitate but scarcely beaked, 2.5 cm. broad, 4 to 4.5 cm. long; seeds about 5 mm. wide and 8 mm. long. "Maguey verde."

100. *Agave gracilispina* Engelm.; Leichtlin, Cat. 1882; Trel. in Bailey, Stand. Cycl. Hort. 1: 234. 1914.

Agave salmiana gracilispina Rol.-Goss. Rev. Hort. 68: 11. 1896.

San Luis Potosí; type locality, San Luis Potosí.

Aspect of the next, but the spine very long and needle-like. "Maguey blanco."

Planted for pulque. The leaf fiber of this and some of the following, as well as of the marginate species, is known as "ixtle."

101. *Agave melliflua* Trel. in Bailey, Stand. Cycl. Hort. 1: 234. 1914.

Nuevo León; type locality, Monterrey.

Leaves light gray, slightly roughened, long-acuminate, 30 cm. wide, 120 to 200 cm. long, with long, relatively slender, gray spine 4 to 6 mm. wide and 35 to 45 mm. long, and heavy-based, abruptly rather triangular-cusped teeth 20 to 50 mm. apart and 10 mm. long, on fleshy prominences; panicle 5 to 6 meters tall, rather narrow, sometimes bulbiferous; capsules stipitate and somewhat beaked, 2.5 cm. wide and 5 cm. long.

"Maguey serrano," "maguey manso," "maguey chino"; cultivated for aguamiel and the so-called pulque fermented from it there.

102. *Agave quotifera* Trel.; Ochoterena, Mem. Soc. Alzate 33: 102. 1913.

Durango; type locality, Puebla.

Leaves light gray, acute, moderately concave, about 30 cm. wide and 120 cm. long or more, with conical gray spine 8 mm. wide and 150 mm. long, and triangularly recurved teeth 25 to 40 mm. apart and about 4 mm. long, on low fleshy or horny bases between which the margin is nearly straight; inflorescence 6 meters tall; flowers 70 to 80 mm. long, yellow, the tube and segments equal.

"Maguey ceniso"; cultivated in hedges; sometimes used for aguamiel, or the flower stalk allowed to develop and cut for "quite," which is sold on the streets and chewed like sugar cane.

103. *Agave crassispina* Trel. in Bailey, Stand. Cycl. Hort. 1: 234. 1914.

San Luis Potosí and Durango; type locality, about San Luis Potosí.

Aspect of the preceding, but the leaves 25 cm. wide and 100 cm. long, only slightly gray, the spine very stout, 15 to 18 mm. wide, 50 to 80 mm. long, and

the large teeth 25 to 50 or 70 mm. apart and 10 to 15 mm. long, from abruptly dilated bases, sometimes on very prominent fleshy hummocks. "Maguey cimarrón."

Agave crassispina culta Trel., var. nov., differs from the type in its smaller spine and marginal teeth. San Luis Potosí; type locality, San Luis Potosí. "Maguey manso"; planted for pulque.

104. *Agave tecta* Trel. Trans. Acad. St. Louis 23: 145. 1915.

Guatemala; type cultivated in hedges at Quezaltenango.

Leaves gray-green, very thick and broad, spreading, plicate above the middle, 50 cm. wide, 200 cm. long, with purple-chestnut or gray spine 5 to 7 mm. wide and 45 to 65 mm. long, and recurved triangular teeth 40 to 70 mm. apart and 8 mm. long; scape densely covered by broad appressed imbricate bracts. "Maguey."

105. *Agave atrovirens* Karw. in Salm-Dyck, Hort. Dyck. 7, 302. 1834.

Oaxaca and Puebla; type locality, Mount Tanga, near Cajonos, Oaxaca.

Leaves dark green, very thick, ascending at the end, contracted at base, 30 to 40 cm. wide, 200 to 250 or even 400 cm. long, with elongate conical gray spine, and triangular teeth about 10 mm. long from low widened bases between which the margin is nearly straight. "Maguey verde grande."

Very extensively planted on the plains of Apam, in many forms, and the principal source of the pulque industry of Mexico, amounting to something like five million pesos annually. The most prized of the many forms planted are "maguey manso" and "maguey manso fino." Some mezcal called "mezcal de pulque" is distilled from pulque.

No fewer than 32 forms from about Apam are enumerated and their spines and marginal teeth pictured by P. and I. Blasquez in a "Tratado del Maguey," published at Puebla; and half as many more are listed for the District of Cholula. These lists contain the following Latin names—hardly employed according to botanical usage: *Agave acerva*, *A. aspera*, *A. blanda*, *A. cercus*, *A. cervus*, *A. cholulensis*, *A. cinerea*, *A. citrulacea*, *A. crispa*, *A. echidne*, *A. elegans*, *A. flava*, *A. foliosa*, *A. funis*, *A. glauca*, *A. insulsa*, *A. lutea*, *A. lutea mayor*, *A. maculata*, *A. maximiliana*, *A. miniata*, *A. nigra*, *A. pallida*, *A. procera*, *A. procera*, *A. profusa*, *A. rubra*, *A. silvestris*, *A. smaragdina*, *A. spinaceum*, *A. spinosa*, *A. spinosissima*, *A. superba*, *A. torosa*, *A. variegata*, *A. vesca*, *A. violacea*, and *A. viridis*. Aztec names, based on the word metl and not maguey, are given frequently to the forms recognized by planters.

Quite as disconcerting as to differentiate these, is any effort to recognize a number of the nominal species of this group based on young plants cultivated in European gardens a generation ago. A gray-leaved form closely allied to the green *atrovirens* but with leaves less narrowed at base is var. *salmiana* (*A. salmiana* Otto in Salm-Dyck, Bonplandia 7: 88. 1859), the scape of which is densely covered by long, somewhat spreading bracts, and of which the most glaucous extreme is *A. salmiana glauca* Becker (Monatsschr. Kakteenk. 8: 150). An exceptionally broad-leaved form is var. *cochlearis* (*A. cochlearis* Jacobi, Abh. Schles. Ges. Vaterl. Cult. 1871: 151. 1871), known in Sicilian gardens as *A. whitakeri*.

106. *Agave mapisaga* Trel., sp. nov.

Leaves green, slightly glaucous, narrow, rather straight but outcurving in age, 15 cm. wide, 175 to 250 cm. long, with rather short and recurved, chestnut or gray spine 4 to 8 mm. wide and 30 to 35 mm. long, and small but broad-based teeth 15 to 30 mm. apart and 1 to 2 mm. long, the intervening margin

nearly straight; inflorescence 8 meters tall or more; flowers green-yellow, 70 mm. long, the perianth segments equaling the tube.

Distrito Federal; type, in the herbarium of the Missouri Botanical Garden, from Tacubaya, *Trelease*.

"Maguey mapisaga"; planted for pulque.

107. *Agave schlechtendalii* Jacobi, Hamb. Gart. Zeit. 20: 555. 1864.

Region ?; type cultivated in Europe from seed said to have come from Sonora.

Known only from young plants rather closely comparable with those of *atrovirens*, but the gray leaves thinner and more outcurving.

108. *Agave bourgaei*¹ Trel., sp. nov.

Leaves gray, as much as 10 to 15 cm. wide and 150 cm. long, with conical gray spine 3 mm. wide and 30 mm. long, and triangular teeth some 10 mm. apart, the intervening margin more or less hollowed; panicle 3 meters tall or more; flowers 70 to 75 mm. long, the perianth segments nearly twice as long as the tube, the filaments inserted above the upper third of the tube.

Valley of Mexico; type, in the herbarium of the Museum of Natural History, Paris, collected on the lava fields, *Bourgeau* 1020; also *Bourgeau* 1399 and *Pringle* 6677.

109. *Agave mirabilis* Trel., sp. nov.

Leaves smooth, bright dark green when abraded, but densely white-pruinose, 40 cm. wide, 200 to 250 cm. long, often reflexed above the middle, with long gray spine 6 mm. wide and 80 mm. long, and triangular, more or less recurved teeth mostly 30 to 60 mm. apart and 10 to 15 mm. long, these abruptly dilated at base; inflorescence 8 to 10 meters tall, the thick (25 cm.) scape with very narrow reflexed bracts; flowers 70 to 80 mm. long, the tube and segments equal; capsules 25 mm. broad, 40 mm. long, not stipitate but shortly apiculate; seeds 6 to 7 mm. wide, 8 to 10 mm. long.

Puebla ?; type, in the herbarium of the Missouri Botanical Garden, from Las Vigas, *Trelease*.

"Maguey blanco"; planted in hedges.

110. *Agave franzosini* Baker, Kew Bull. Misc. Inf. 1892: 3. 1892.

Locality ?; type cultivated on the Riviera.

Leaves very rough, glaucous, often recurving, 20 to 30 cm. wide, 200 to 300 cm. long, with stout decurrent conical smoky-gray grooved spine 10 mm. wide and 55 mm. long, and abruptly broadly triangular teeth 30 to 70 mm. apart and 5 to 10 mm. long, these often from fleshy prominences; scape green.

111. *Agave marmorata* Roetzl, Belg. Hort. 33: 238. 1883.

Agave todaroi Baker, Amaryll. 195. 1888.

Puebla; type locality unquestionably the Cerro Colorado near Tehuacán.

Leaves very rough, gray, green-zoned, 25 to 40 cm. wide, 100 to 150 cm. long, with short, stout, curved, dull red spine 5 to 15 mm. wide and 20 mm. long, and large, rough, rusty brown teeth 15 to 40 mm. apart and 5 to 10 mm. long, sometimes in pairs, from fleshy prominences. "Maguey curandero." or "pitsomel."

¹ E. Bourgeau was a member of the French Scientific Commission of 1865-66. He had had previously wide experience as a botanical collector in the Old World, and his Mexican collection was an extensive one. It was gathered chiefly in the Valley of Mexico and in Veracruz. A large number of his specimens are in the U. S. National Herbarium. He died at Paris in 1877.

112. *Agave abrupta* Trel., sp. nov.

Leaves straight or somewhat upcurved, 15 to 30 cm. wide, 150 to 175 cm. long, very glaucous, very concave and deeply plicate toward the abrupt end, with heavy, conical, somewhat recurved spine 8 mm. wide and 25 mm. long, and small, variously curved, triangular teeth 15 to 30 or 40 mm. apart and only about 2 mm. long, but from conspicuous fleshy or horny prominences; inflorescence 7 to 8 meters tall.

Jalisco; type, in the herbarium of the Missouri Botanical Garden, from La Barca, *Trelcase*, in 1901; cultivated in hedges.

113. *Agave wercklei* Weber, sp. nov.

Acaulescent; leaves glaucous, bluish or white, abruptly upcurved above the base, 15 cm. wide, 125 to 200 cm. long, with somewhat recurved, grooved, conical, brown or gray spine 4 to 6 mm. wide and 25 to 35 mm. long, and triangular straight brown teeth 15 to 25 mm. apart and 3 mm. long, these sometimes on fleshy prominences or with the intervening margin hollowed; inflorescence 8 meters tall; flowers chrome-yellow, pumpkin-scented, 60 mm. long, the perianth segments twice as long as the tube; capsules 15 mm. broad and 45 mm. long; seeds 4 mm. wide and 6 mm. long; bulbiferous.

Costa Rica; type, in the herbarium of the Missouri Botanical Garden, cultivated at San José, *Alfaro & Tonduz* 17553.

Sometimes cultivated under the name of *A. costaricensis*.

114. *Agave expansa* Jacobi, Abh. Schles. Ges. Vaterl. Cult. 1868: 151. 1868.

Region ?; type cultivated in Europe.

Leaves gray, oblong, uniformly spreading, straight, acute, concave, about 20 cm. wide and 200 cm. long, with brown or gray, straight or slightly recurved, grooved spine 8 to 10 mm. wide and 25 to 30 mm. long, this acutely pointed from the very base, and with heavily triangular teeth 30 to 60 mm. apart and 5 to 8 mm. long, these with dilated bases, often from fleshy hummocks.

Extensively planted in southern Arizona (Tucson) and California (Los Angeles) as *A. americana*, from which its unreflexed leaves and more acutely pointed, somewhat prismatic spine distinguish it.

115. *Agave americana* L. Sp. Pl. 323. 1753.

Native ?; type cultivated in Europe, probably originally from a Mexican hedge-row; established freely about the Mediterranean.

Leaves gray, acute, outcurved or reflexed at end, 15 to 20 cm. wide, 200 to 250 cm. long, with brown, somewhat curved, conical spine 5 mm. wide and 25 mm. long, and triangular, more or less recurved teeth 15 to 50 mm. apart and about 5 mm. long, on fleshy prominences.

It is this plant, cultivated in the Azores, etc., from which the "pita" used in the drawn work of those islands is procured. Early records of the economic uses of "*Agave americana*" and "*A. mexicana*" commonly refer to other species, such as *A. fourcroydes* and *A. atrovirens*.

116. *Agave picta* Salm-Dyck, Bonplandia 7: 88. 1859.

Native ?; type cultivated in Europe.

Equally large and very similar, the darker and clearer green leaves 17 to 18 cm. wide, 225 cm. long, with a marginal band of yellow (as in one form, var. *marginata*, of the preceding), the spine straight and needle-shaped. "Maguey pinto," "maguey listado."

Much planted. On the Mediterranean coast seedlings are said to be invariably green (var. *viridis* Trel. in Bailey, Stand. Cycl. Hort. 1: 235. 1914; *A. ingens* Berger, Hort. Mortolensis, 12, 360. 1912), and no doubt correspond to the normal type of foliage.

117. *Agave asperima* Jacobi, Hamb. Gart. Zeit. 20: 561. 1864.

Texas, on the lower Rio Grande; and adjacent Coahuila, Zacatecas, and Durango; type cultivated in Europe, supposedly from Texas.

Leaves dull glaucous green, rough, 15 to 20 cm. wide, 120 cm. long, with decurrent brown spine 3 to 4 or 6 mm. wide and 30 to 55 mm. long, and variously curved triangular teeth 20 to 30 mm. apart and 7 to 10 mm. long, these saddling and sometimes confluent over high fleshy hummocks.

Seeds were distributed to gardens by Engelmann as *A. longispina*.

118. *Agave palmeri*¹ Engelm. Trans. Acad. St. Louis 3: 319. 1875.

New Mexico, Arizona, and adjacent Sonora; type locality, mountains of southern Arizona.

Leaves blue-green, smooth, varying much in shape and attenuation, ascending or outcurved or spreading, about 8 to 10 cm. wide and 45 to 70 cm. long, with nearly straight, needle-shaped, somewhat decurrent, garnet or purplish, finally fading spine 2 to 4 mm. wide and 20 to 40 mm. long, and variously straight or curved, very unequal, triangular teeth commonly 10 to 20 mm. apart and 3 to 5 mm. long, the intervening margin straight or much hollowed.

119. *Agave flexispina* Trel., sp. nov.

Leaves green or bluish, smooth, regularly spreading, deeply concave, 6 cm. wide and 12 cm. long (or much more?), with flexuous spine 5 mm. wide and 30 mm. long, this very openly flat-grooved, with acute margin at base, the slender unequal teeth scarcely 10 mm. apart and often nearly 10 mm. long, the margin between them sharply incised; flowers nearly sessile, agreeing with those of the last preceding species.

Durango; type, in the herbarium of the Missouri Botanical Garden, from Tepehuanes, *Palmer* 330, in 1906.

120. *Agave dasylirioides* Jacobi & Bouché, Hamb. Gart. Zeit. 21: 344. 1865.

Guatemala?; type cultivated in Europe; Berlin Herbarium material referring the collection to the igneous mountains near Quezaltenango, ^W*Warscewicz*, or southern Mexico.

Leaves outcurved and then ascending, thin and flat, light green, 10 to 15 mm. wide, 25 to 30 cm. long, unarmed except for the small flattened brown spine; spike 1.5 to 2 meters tall, recurving.

121. *Agave intrepida* Greenm. Proc. Amer. Acad. 34: 567. 1899.

Morelos; type locality, El Parque, above Cuernavaca.

Leaves gray, spreading, 2 cm. wide, 50 cm. long, with somewhat flexuous needle-like brown spine 1 to 2 mm. wide and 10 mm. long, the margin almost microscopically denticulate; spike 1 to 1.5 meters tall, commonly recurving.

122. *Agave bracteosa* S. Wats. Gard. Chron. n. ser. 18: 776. 1882.

Nuevo León; type locality, near Monterrey.

Leaves gray, rather soft, openly ascending with recurved tips, 4 cm. wide, 45 cm. long, without spine, the margin minutely denticulate; inflorescence 1 to 2 meters tall, the scape densely covered with outcurved narrow bracts; flowers 30

¹The species is named in honor of Edward Palmer (1831-1911), an Englishman by birth, who was for most of his life a resident of the United States. He spent many years in Mexico in botanical exploration, and his collections are surpassed in extent, probably, by those of no other collector. His work in Mexico began about 1870 and was continued until 1910. He collected chiefly in the northern states, but some of his plants were obtained as far south as Guerrero and Veracruz. His earlier collections were the basis of special reports by Gray and Watson, and many new species have been based upon his specimens.

mm. long, the marcescent perianth segments about equaling the tube. "Amole de Castilla."

123. *Agave yuccaefolia* DC. in Red. Liliac. 6. *pl.* 328, 329. 1812.

Region ?; type cultivated in Europe; said to be from Real del Monte, Hidalgo.

Trunk short; leaves glaucous, rather soft, recurved, 2.5 cm. wide, 60 cm. long, long-tapering, with minute slender spine, the margin minutely denticulate; inflorescence 3 meters tall; flowers 35 mm. long, the perianth segments almost distinct.

124. *Agave eduardi* Trel., sp. nov.

Habit ?; leaves glaucous, 6 cm. wide, 100 cm. long, long-attenuate, with slender brown spine about 1 mm. wide and 10 mm. long, and entire margin; scape covered by long narrow bracts; pedicels connate into a peduncle some 15 mm. long; flowers yellow, 40 mm. long; ovary flask-shaped, 20 mm. long, the tube narrow, about one-third as long as the segments, the filaments inserted in its throat; capsules scarcely glaucous, 8 mm. broad, 20 mm. long.

Durango; type, in the herbarium of the Missouri Botanical Garden, from San Ramón, *Palmer* 135, in 1906.

125. *Agave houghii* Hort.

A similar, if separable, plant, of the barranca of the Río Blanco, near Guadalajara, Jalisco, with stronger spine and smooth margin.

126. *Agave attenuata* Salm-Dyck. Hort. Dyck. 7, 303. 1834.

Agave glaucescens Hook. in Curtis's Bot. Mag. III. 18: *pl.* 5333. 1862.

Hidalgo; type cultivated in Europe (from about Real del Monte ?).

Trunk 1 to 1.5 meters tall, sometimes prostrate; leaves 15 to 20 cm. wide, 60 to 100 cm. long, glaucous, without either spine or prickles; spike 1.5 to 3 meters tall, often recurving, sometimes very bulbiferous in age.

127. *Agave ellemetiana* Jacobi, Hamb. Gart. Zeit. 21: 457. 1864.

Veracruz ?; type cultivated in Europe (from about Jalapa ?).

Nearly acaulescent; leaves 15 cm. wide and 60 cm. long or more, glaucous, without either spine or prickles; spike 1.5 to 3 meters tall, straight.

128. *Agave pruinosa* Lem. in Jacobi, Hamb. Gart. Zeit. 21: 449. 1864.

Agave debaryana Jacobi, Abh. Schles. Ges. Vaterl. Cult. 1869: 164. 1869.

Agave kellockii Jacobi, Abh. Schles. Ges. Vaterl. Cult. 1869: 165. 1869.

Michoacán ?; cultivated in Europe; the Volcán Jorullo is given as the source of *A. debaryana*.

Nearly acaulescent; very similar to the preceding, but the leaves with close-set minute denticles.

129. *Agave vilmoriniana* Berger. Repert. Nov. Sp. Fedde 12: 503. 1913.

Jalisco ?; cultivated in Europe, introduced by Diguët.

Leaves green or bluish or glaucous, softly fleshy, narrowly linear-lanceolate, acuminate, with slender, subulate, shortly decurrent spine 3 to 4 mm. long, the margin without teeth.

130. *Agave pedunculifera* Trel., sp. nov.

Habit ?; leaves 12 to 15 cm. wide, 65 cm. long, thin, glaucous, oblanceolate, acuminate, with dull red-brown needle-shaped spine 2 mm. wide and 15 mm. long, the margin with minute denticles about 2 mm. apart; inflorescence small, the pedicels aggregated on short slender forking peduncles 15 to 20 mm. long; capsules fusiform, 5 to 8 mm. broad, 20 mm. long; seeds dull, very small, 2 mm. wide, 2.5 mm. long.

Sinaloa; type, in the U. S. National Herbarium, from Colomas, *Rose* 1713.

131. *Agave celsii* Hook. in Curtis's Bot. Mag. III. 12: pl. 4934. 1856.

? *Agave brauniana* Jacobi, Hamb. Gart. Zeit. 22: 216. 1866.

? *Agave thompsoniana* Jacobi, Hamb. Gart. Zeit. 22: 262. 1866.

? *Agave smithiana* Jacobi, Hamb. Gart. Zeit. 22: 263. 1866.

? *Agave humboldtiana* Jacobi, Hamb. Gart. Zeit. 22: 264. 1866.

San Luis Potosí; type cultivated in Europe from an unrecorded locality.

Leaves glaucous, 10 cm. wide, 30 to 45 cm. long, with slender weak spine scarcely 1 mm. wide and 5 to 10 mm. long, and very irregular, close-set or confluent, green teeth 5 to 10 mm. apart and 2 to 3 mm. long, a little horny at the tip only.

The four synonyms, based on specimens cultivated from about San Luis Potosí, seem to refer to forms of this species with greener foliage; and *A. rupicola* Regel, *A. lamprochlora* Jacobi, and *A. perlucida* Jacobi differ little.

132. *Agave micracantha* Salm-Dyck, Bonplandia 7: 93. 1859.

Hidalgo or Veracruz?; type cultivated in Europe from an unrecorded locality.

Leaves gray-green, 8 to 12 cm. wide, 40 to 60 cm. long, with slender weak spine and small close-set dark teeth, these sometimes almost suppressed.

Nominal but closely related species cultivated in gardens from unrecorded localities and evidently of this alliance, are *A. albicans* Jacobi, *A. chloracantha* Salm-Dyck, *A. bernhardii* Jacobi, *A. bouchei* Jacobi, *A. haseloffii* Jacobi, ? *A. martiana* Koch, *A. mitis* Salm, *A. muilmanni* Jacobi, *A. oblongata* Jacobi; and *A. wallisii* Jacobi, said to be from Colombia.

133. *Agave pendula* Schnitts. Zeitschr. Gartenb. Ver. Darmstadt 6: 7. 1857.

Agave aloina Koch, Wochenschr. Ver. Beförd. Gartenb. 3: 37. 1860.

Agave sartorii Koch, Wochenschr. Ver. Beförd. Gartenb. 3: 37. 1860.

Agave noackii Jacobi, Hamb. Gart. Zeit. 22: 261. 1866.

Agave rubrocincta Jacobi, Abh. Schles. Ges. Vaterl. Cult. 1868: 153. 1868.

Agave caespitosa Tod. Hort. Panorm. 1: 32. 1876.

Veracruz; type cultivated in Europe, but collected at El Mirador, Huatusco.

More or less caulescent, the trunk sometimes 60 cm. tall; leaves deep green with paler median stripe above, about 8 cm. wide and 100 cm. long, with scarcely pungent end and minute brown teeth 5 mm. apart and 1 mm. long; inflorescence nodding.

134. *Agave polyacantha* Haw. Rev. Pl. Succ. 35. 1821.

Agave densiflora Hook. in Curtis's Bot. Mag. III. 13: pl. 5006. 1857.

? *Agave chiapensis* Jacobi, Hamb. Gart. Zeit. 22: 213. 1865.

Agave ottonis Jacobi, Hamb. Gart. Zeit. 22: 320. 1865.

Agave salmdyckii Baker, Gard. Chron. n. ser. 8: 490. 1877.

Veracruz (type cultivated in Europe, from an unspecified source, about 1800) and Chiapas?.

Leaves green though transiently glaucous, 5 to 15 cm. wide, 25 to 60 or 100 cm. long, with dark firm spine 2 to 3 mm. wide and 15 mm. long, and rather small close-set brown teeth 3 to 5 or 10 mm. apart and 2 to 3 mm. long; spike sometimes budding at tip and base.

Species evidently of this group, but of unrecorded habitat, are *A. botterii* Baker, *A. decaisneana* Jacobi, *A. engelmanni* Trel., *A. galeottei* Baker, *A. guedeneyri* Houll., and *A. varelliana* Baker.

Other less closely placed garden aloid species, supposedly from Mexico, are *A. ehrenbergii* Jacobi, *A. goeppertiana* Jacobi, *A. horizontalis* Jacobi, *A. kewensis* Jacobi, *A. lindleyi* Jacobi, *A. melanacantha* Lem., *A. regia* Baker, *A. rudis* Lem., and *A. rupicola* Regel.

135. *Agave xalapensis* Roez. in Jacobi, Hamb. Gart. Zeit. 21: 61. 1864.

Agave uncinata Jacobi, Hamb. Gart. Zeit. 21: 104. 1864.

Veracruz above Cruz Verde, Las Vigas; type cultivated in Europe, from unrecorded locality.

Leaves green or glaucous, 5 to 12 cm. wide, 25 to 75 cm. long, with dark firm brown spine 3 to 5 mm. wide and 5 to 30 mm. long, and red or blackish strong flat teeth 5 to 7 mm. apart and 5 mm. long; spike often budding at tip.

136. *Agave macrantha* Tod. Hort. Panorm. 2: 11. 1879.

Region ?; type cultivated in Europe.

Leaves spatulate-obovate, uncurved, glaucous, as much as 12 cm. wide and 30 to 50 cm. long, with chestnut spine 8 mm. wide and 20 to 30 mm. long, and firm brown teeth 6 to 15 mm. apart and 2 to 3 mm. long; flowers large for the group, about 80 mm. long, the yellow or bronzed perianth segments nearly 15 mm. wide and twice as long as the tube.

137. *Agave pumila* Baker, Amaryll. 172. 1888.

Region ?; type cultivated in Europe.

Very small (scarcely 5 cm. in diameter), with few round fleshy concave leaves, these dark-lined on the back and with soft whitish spine, and teeth somewhat connected by a similar margin.

The smallest of all agaves. Sometimes cultivated under the name *A. simoni* or *A. simonis*.

138. *Agave lecheguilla* Torr. U. S. & Mex. Bound. Bot. 213. 1859.

Agave poselgeri Salm-Dyck, Bonplandia 7: 92. 1859.

Agave multineata Baker, Amaryll. 168. 1888.

? *Agave nissoni* Baker, Gard. Chron. 1874: 529. 1874.

Texas and Chihuahua to Tamaulipas and Zacatecas, in a variety of forms; type locality, western Texas.

Leaves falcately ascending, green or bluish, the upper face often with a paler stripe and the back with narrow green lines, 2 to 3 cm. wide, 40 to 60 cm. long, with brown or graying spine 4 mm. wide and 30 to 50 mm. long, and mostly gently recurved triangular teeth 20 to 40 mm. apart and 3 to 7 mm. long, joined by a nearly straight detachable horny border scarcely 1 mm. wide. With flowers in short compact glomerules it is f. *glomeruliflora* Engelm. (*A. glomeruliflora* Berger, Hort. Mortol. 12. 1911).

"Lechuguilla"; much used for cordage, brushes, bagging, etc., and exported as "ixtle."

139. *Agave funkiana* Koch & Bouché, Wochenschr. Ver. Beförd. Gartenb. 3: 47. 1860.

Nuevo León and Tamaulipas; type cultivated in Europe, without recorded locality.

Leaves scarcely falcate, ascending, light green or gray-green, slightly glaucous, with pale ventral stripe and dark-lined back, 3 to 5 cm. wide, 50 to 75 cm. long, with brown-tipped gray spine 3 mm. wide and 15 to 25 mm. long, and mostly gently recurved triangular teeth 20 to 50 mm. apart and 5 mm. long, joined by a nearly straight or slightly concave detachable border about 1 mm. wide.

"Ixtle de Jaumave"; of better quality than the last preceding species.

140. *Agave lophantha* Schiede, Linnæa 4: 581. 1829.

Agave heteroantha Zucc. Act. Acad. Caes. Leop. Carol. 16²: 675. 1833.

Veracruz; type locality, Malpais de Nanlingo.

Leaves uniformly spreading, apple-green or dark blue-green, sometimes with pale ventral stripe and dark dorsal lines, 3 to 5 cm. wide, 30 to 60 cm. long,

with gray-brown spine 3 mm. wide and 20 mm. long, and conspicuously unequal and variously curved, narrowly triangular teeth 20 to 30 mm. apart and 3 to 7 mm. long.

When the median stripe is most pronounced it is var. *univittata* (*A. univittata* Haw. Phil. Mag. 10: 415. 1831); but the marking is not confined to this species.

141. *Agave horrida* Jacobi, Hamb. Gart. Zeit. 20: 546. 1864.

Morelos, abundant above Cuernavaca on the lava fields; type cultivated in Europe without indication of locality.

Leaves uniformly spreading, rather thin, green, without ventral stripe or dorsal lines, 6 to 7 cm. wide, 30 cm. long, with red-brown graying spine 3 mm. wide and 20 to 40 mm. long, and large flat hooked teeth 15 to 30 mm. apart and 5 to 15 mm. long, the connecting undulate horny border 2 to 3 mm. wide.

142. *Agave roezliana* Baker, Gard. Chron. n. ser. 7: 528. 1877.

Agave horrida lacvior Jacobi, Wochenschr. Ver. Beförd. Gartenb. 1869: 178. 1869.

Puebla; type cultivated in Europe, but now known to have come from Tehuacán.

Leaves uniformly spreading, thick, green, sometimes with paler ventral stripe but not dark-lined on the back, 5 to 10 cm. wide, 30 to 40 cm. long, with brown or fading spine 3 mm. wide and 20 to 25 mm. long, and heavily triangular teeth 10 to 15 mm. apart and 6 to 20 mm. long, the nearly straight horny intervening margin 1 to 3 mm. wide.

Plants with very short and broad leaves and exceptionally large teeth constitute var. *nana* (*A. horrida nana* Laurentius, Cat. 1869: 12. 1869; *A. gilbeyi horrida* Baker, Gard. Chron. 1873: 1305. 1873); and a form with elongate, narrowly oblong leaves and often reduced teeth is var. *peacockii* (*A. peacockii* Croucher, Gard. Chron. 1873: 1400. 1873).

143. *Agave ghiesbrechtii* Koch, Wochenschr. Ver. Beförd. Gartenb. 5: 83. 1862.

Region ?; type cultivated in Europe.

Leaves upcurving, concave, fleshy, grayish green or bluish green, without distinct ventral stripe or dorsal lines, 5 to 7 cm. wide, 18 to 20 cm. long, with spine scarcely 15 mm. long, and gray, triangular, nearly straight teeth scarcely 10 mm. apart and 5 mm. long, the connecting horny border under 2 mm. wide.

The form with shorter, more heavily bordered leaves is *A. rohanii* Jacobi (Hamb. Gart. Zeit. 20: 545. 1864); and that with elongate, narrowly bordered leaves is *A. leguayiana* J. Verschaffelt (Pr. Cour. 1868: 2. 1868).

144. *Agave obscura* Schiede, Linnaea 18: 413. 1844.

Agave grandidentata Jacobi, Hamb. Gart. Zeit. 22: 114. 1866.

Agave horrida micracantha Baker, Gard. Chron. n. ser. 7: 621. 1877.

Veracruz; common on the lava beds about Limón; type locality, lava fields of La Joya.

Densely subglobose; leaves uniformly spreading, gray, 10 cm. wide, 30 cm. long, with gray spine 3 to 8 mm. wide and 25 to 30 mm. long, and triangular, straight or variously curved teeth 5 to 10 mm. apart and 3 to 5 mm. long, the intervening margin 1 to 2 mm. wide. "Lechuguilla."

145. *Agave triangularis* Jacobi, Wochenschr. Ver. Beförd. Gartenb. 1869: 178. 1869.

Puebla; type cultivated in Europe from near Tehuacán.

Leaves ascending, thick and very rigid, dull gray-green, without ventral stripe or dorsal lines, about 5 cm. wide and 25 cm. long, with gray spine 3 mm. wide and 20 to 25 mm. long, and large, gently curved teeth 15 to 25 mm. apart and 5 to 15 mm. long, the nearly straight intervening margin 1 to 2 mm. wide.

With numerous but small teeth it is var. *rigidissima* (*A. rigidissima* Jacobi, Wochenschr. Ver. Beförd. Gartenb. 1869: 179. 1869); and with few and

minute or no teeth it is var. *subintegra* (*A. kerchovi inermis* Baker, Gard Chron. n. ser. 7: 527. 1877).

146. *Agave potrerana* Trel., sp. nov.

Leaves falcately ascending, triangular, rigid, transiently glaucous, without ventral stripe or dorsal lines, 5 to 6 cm. wide, 30 cm. long, with gray spine 3 mm. wide and 25 mm. long, and narrowly triangular, rather straight teeth commonly 10 to 15 mm. apart and 3 to 4 mm. long, the nearly straight connecting horny margin about 1 mm. wide; flowers about 50 mm. long, the perianth segments and tube about equal; capsules oblong-pyriform, 10 to 12 mm. broad, 30 to 35 mm. long; seeds 3 mm. wide, 4 mm. long.

Chihuahua; type, in herbarium of the Missouri Botanical Garden, from Potrero Peak, *Pringle* 302.

147. *Agave kerchovi* Lem. Ill. Hort. 11: 64. 1864.

Puebla ?; type cultivated in Europe.

Leaves uniformly spreading or ascending, triangular, rigid, gray-green, 7 to 10 cm. wide, 40 to 50 cm. long, with gray spine about 5 mm. wide and 50 to 70 mm. long, and triangular teeth 30 to 50 or even 100 mm. apart and 10 to 20 mm. long, each sometimes with an adjoining denticle, the straight connecting margin 2 to 3 mm. wide; spike extremely compact.

148. *Agave inopinabilis* Trel., sp. nov.

Leaves falcately spreading or ascending, oblong or gradually narrowed from base to point, gray-green or bluish-green, somewhat glaucous when young, 4 to 6 cm. wide, 100 cm. long, with dull brown or fading spine 5 mm. wide and 50 mm. long, and large, flat, brown, hazel-colored, or dead-gray, triangular, often doubled teeth commonly 50 to 100 mm. apart and 10 to 30 mm. long, the connecting margin 2 to 4 mm. wide; capsules oblong, 8 to 12 mm. wide, 12 to 30 mm. long; inflorescence rather lax; flowers claret-colored, 35 mm. long, the perianth segments almost distinct; seeds 2 mm. wide, 4 mm. long.

Puebla; type, in the herbarium of the Missouri Botanical Garden, from Tehuacán, *Trelcase*, in 1903.

149. *Agave convallis* Trel., sp. nov.

Leaves uniformly spreading, light green, 6 cm. wide, 50 cm. long, with gray spine 4 mm. wide and 25 mm. long, and heavily triangular, brown-tipped, somewhat recurved teeth 50 to 60 mm. apart and 6 to 10 mm. long, the nearly straight intervening border about 1 or 2 mm. wide but lenticularly widened beneath each tooth; inflorescence 3 to 4 meters tall; flowers creamy or bronzed, 35 to 40 mm. long, with very short tube.

Oaxaca; type, in herbarium of the Missouri Botanical Garden, from El Parián, *Trelcase* 4, in 1905.

150. *Agave expatriata* Rose, Rep. Mo. Bot. Gard. 11: 82. 1900.

Region ?; type cultivated at Washington.

Leaves uniformly spreading, light green, 6 to 9 cm. wide, 75 cm. long, with slender spine 15 to 25 mm. long, and triangular, unequal, variously curved teeth 10 to 20 mm. apart and 5 to 10 mm. long, the intervening straight border about 1 mm. wide.

151. *Agave dissimulans* Trel., sp. nov.

Leaves widely and flaccidly spreading or recurved, glaucous, more or less tinged with red, 7 cm. wide, 80 to 100 cm. long, with gray spine about 5 mm. wide and 50 mm. long, and heavily triangular, somewhat curved teeth 15 to 30 mm. apart and 6 to 15 mm. long, the intervening straight border 1 or 2 mm. wide; inflorescence 2 to 3 meters tall; flowers whitish, glaucous, 30 mm. long, with very short tube; capsules 12 mm. broad, 20 to 25 mm. long.

Oaxaca; type, in the herbarium of the Missouri Botanical Garden, from Mexia, *Trelease*.

152. *Agave angustiarum* Trel., sp. nov.

Leaves openly spreading, rather thin, glaucous, 5 to 13 cm. wide, 80 to 100 cm. long, with very slender spine 25 to 35 mm. long, and rather slender and curved teeth 15 to 40 mm. apart and 2 to 6 mm. long, the nearly straight intervening border scarcely over 1 mm. wide; inflorescence 1.5 to 4 meters tall; flowers glaucous greenish white, 35 to 40 mm. long, with very short tube; capsules 12 to 15 mm. broad, 25 mm. long; seeds 2 to 3 mm. wide, 3 to 5 mm. long.

Guerrero; type, in the herbarium of the Missouri Botanical Garden, from the canyon between Naranjo and Los Amates, *Trelease*.

153. *Agave xylonacantha* Salm-Dyck, Bonplandia 7: 92. 1859.

Agave amurensis Jacobi, Hamb. Gart. Zeit. 20: 548. 1864.

Agave kochii Jacobi, Hamb. Gart. Zeit. 22: 117. 1866.

Hidalgo and San Luis Potosí; type cultivated in Europe, said to be from San Luis Potosí, but later records include Ixmiquilpan and Real del Monte.

Leaves loosely spreading, rather thin, undulate or contorted, dull, mostly grayish green, rough, the back with darker lines, 5 to 12 cm. wide, 30 to 60 cm. long, with flexuous gray spine about 5 mm. wide and 40 to 50 mm. long, and large, triangular or confluent broad and very irregular teeth 15 to 40 mm. apart, these 10 to 15 mm. long, and nearly as broad over green prominences between which the nearly straight connecting horny margin is 1 to 2 mm. wide.

154. *Agave washingtonensis* Baker & Rose, Rep. Mo. Bot. Gard. 9: 121. 1898.

Region ?; type cultivated at Washington.

Leaves spreading, dark green, smooth, 7 to 10 cm. wide, 75 cm. long, with very short slender spine and small mammaeform teeth scarcely 10 mm. apart and 2 mm. long, these concave at base and connected by a very narrow horny border.

155. *Agave splendens* Jacobi, Abh. Schles. Ges. Vaterl. Cult. 1870: 147. 1870.

Region ?; type cultivated in Europe.

Leaves uniformly spreading, often with axillary branches, dark blue-green, glaucous when young, smooth, somewhat pale-banded above and dark-lined beneath, 4 to 5 cm. wide, 35 to 60 cm. long or more, with slender, more or less flexuous, gray spine 30 mm. long, and unequal, often doubled, variously curved, triangular teeth 20 to 40 mm. apart and 6 to 12 mm. long, these concave at base and connected by a moderately heavy border.

156. *Agave vittata* Regel, Gartenflora 7: 313. 1858.

Agave haymaldi Tod. Hort. Panorm. 1: 88. 1876.

Agave toneliana Baker, Gard. Chron. 1881: 362. 1881.

Nuevo León; type cultivated in Europe, probably from the mountains about Monterrey.

Leaves spreading along a distinct short trunk, dark green, often with pale ventral stripe, 6 to 7 cm. wide, 70 cm. long, with slender brown-tipped spine 20 mm. long, and variously curved triangular teeth 25 to 50 mm. apart and 4 to 7 mm. long, these on more or less oblique fleshy prominences, the very narrow connecting horny border frequently absent from the middle of the leaf.

157. *Agave victoriae-reginae* Moore, Gard. Chron. n. ser. 4: 484. 1875.

Agave consideranti Carr. Rev. Hort. 1875: 429. 1875.

Nuevo León, Coahuila, and Durango; type locality near Monterrey, Nuevo León.

Leaves very many, very hard and crowded in a round cluster, dark green, 4 to 6 cm. wide, 15 to 20 cm. long, acutely 3-sided, with 1 or 3 black apical

spines 5 to 10 mm. long, these decurrent into marginal and usually dorsal detachable horny borders.

"Noa"; the short but strong fiber used for bundles.

With fewer leaves, and consequently forming a less compact plant, it is f. *nickelsi* (*A. nickelsi* Rol. Goss. Rev. Hort. 1895: 579. 1895). "Pintillo."

158. *Agave parviflora* Torr. U. S. & Mex. Bound. Bot. 214. 1859.

Sonora; type locality, Sierra del Pajarito. Also in adjacent Arizona.

Small and globose; leaves ascending, numerous, green, dotted with gray, scarcely 1 cm. wide and 4 to 6 cm. long, denticulate at the base, elsewhere bearing a few coarse outcurved marginal threads, the straight flattened spine 1 mm. wide and 5 mm. long.

159. *Agave toumeyana* Trel., sp. nov.

Rather larger, laxer, and fewer-leaved than the preceding; leaves 1 cm. wide, 5 to 10 cm. long, with flat brown spine scarcely 1 mm. wide and 5 mm. long, the margin minutely hyaline-denticulate below the middle, at length bearing numerous long slender white marginal threads; flowers 15 mm. long, with short tube; capsules 7 mm. broad, 12 mm. long; seeds 2 mm. wide, 3 mm. long.

Southern Arizona; type, in herbarium of the Missouri Botanical Garden, from Pinal Mountains, *Toumey* in 1892; also in adjacent Sonora?

160. *Agave hartmani*¹ S. Wats. Proc. Amer. Acad. 26: 156. 1891.

Eastern Sonora (type cultivated at Cambridge, Massachusetts) and adjacent Chihuahua.

Resembling *A. parviflora*; leaves falcate, with concave-based spine and finer marginal threads.

161. *Agave mulfordiana* Trel., sp. nov.

Agave schottii serrulata Mulford, Rep. Mo. Bot. Gard. 7: 73. 1896.

Dimensions and aspect of the following and with similar marginal threads, but the base denticulate.

Southern Arizona; type, in the herbarium of the Missouri Botanical Garden, from Rincon Mountains, *Toumey* in 1894; also adjacent Sonora?

162. *Agave schottii* Engelm. Trans. Acad. St. Louis 3: 305. 1875.

Agave geminiflora sonorae Torr. U. S. & Mex. Bound. Bot. 214. 1859.

Arizona (type locality, Sierra del Pajarito) and adjacent Sonora.

Leaves falcately ascending, rather few, green, scarcely 1 cm. wide and 15 to 30 cm. long, untoothed, with brown or golden spine 1 mm. wide and 5 mm. long, and a few very thin outcurving marginal threads.

"Amole"; the crown used as a substitute for soap.

Without marginal threads it is var. *atricha*, the type cultivated at St. Louis, without record.

163. *Agave schidigera* Lem. Ill. Hort. 9: pl. 330. 1860.

Agave filifera adornata Scheidw. Wochenschr. Ver. Beförd. Gartenb. 4: 287. 1861.

Littaea roezlii Fonville, Rev. Hort. 1862: 39. 1862.

Agave vestita S. Wats. Proc. Amer. Acad. 25: 163. 1890.

Michoacán (type cultivated, from about the Volcán Jorullo), Zacatecas, Mexico, and Jalisco (the type of *A. vestita*, with more prismatic threads, from about Guadalajara).

¹C. V. Hartman and F. E. Lloyd made an extensive collection of plants in Chihuahua and Sonora from 1890 to 1893, while accompanying Carl Lumholtz in his archaeological explorations. The collection was reported upon by Robinson and Fernald (Proc. Amer. Acad. 30: 114-123. 1894). A set of the plants is in the U. S. National Herbarium.

Leaves green or purplish, uniformly spreading, 1.5 to 2 cm. wide, mostly 30 cm. long, not toothed, with rather numerous coarse and shaving-like marginal threads sometimes 2 mm. wide, the spine 5 to 10 mm. long or almost suppressed.

164. *Agave angustissima* Engelm. Trans. Acad. St. Louis 3: 306. 1875.

Tepic (the type from "Ocotillo, direction of Tepic") and Sinaloa.

Leaves green or almost red, numerous, uniformly spreading or falcate, 1 to 1.5 cm. wide, 30 to 60 cm. long, not toothed, with numerous long, slender, mostly loosely coiled marginal threads and flattened spine 5 mm. long. "Palmilla."

With leaves scarcely 30 cm. long it is var. *ortgiesiana* (*A. schidigera ortgiesiana* Baker, Gard. Chron. n. ser. 7: 303. 1877; *A. ortgiesiana* Roetzl, Belg. Hort. 1880: 52. 1880; *A. maritima* Hort.); common on the seaside rocks about Manzanillo, Colima.

165. *Agave filifera* Salm-Dyck, Hort. Dyck. 309. 1834.

Hidalgo and San Luis Potosí; type cultivated in Europe without locality.

Leaves clear green to dark green or purplish, rather numerous, uniformly spreading or somewhat upcurved, 2.5 to 4 cm. wide, 20 to 25 cm. long, not toothed, with numerous slender, recurved or coiled marginal threads, the openly grooved spine 15 to 20 mm. long. "Amole," "lechuguilla mansa."

With leaves twice as long, without increase in width, those of suckers commonly denticulate, it is var. *filamentosa* Baker (Gard. Chron. n. ser. 7: 303. 1877; *A. filamentosa* Salm-Dyck, Bonplandia 7: 94. 1859). A very compact form somewhat resembling *A. parviflora*, with leaves scarcely 10 cm. long, is var. *compacta* J. Verschaffelt (Cat. 9: 41. 1865-6; *A. perplexans* Trel. in Bailey, Stand. Cycl. Hort. 1: 238. 1914).

166. *Agave geminiflora* Gawl. Journ. Sci. 2: 88. 1817.

Bonapartea juncea Haw. Syn. Pl. Succ. 68. 1812.

Yucca boscii Desf. Tabl. Écol. Bot. Mus. ed. 2. 28, 274. 1815, name only.

Littaea geminiflora Tagliabue, Bibl. Ital. 1: 100. 1816.

Bonapartea flagelliformis Henckel, Flora 3: 45. 1820.

Dracaena filamentosa Scanagatta in Schult. Syst. Veg. 729. 1829.

Dracaena boscii Steud. Nom. Bot. ed. 2. 1: 528. 1840.

Agave geminiflora filamentosa Hook. in Curtis's Bot. Mag. 82: under *pl. 4950*. 1856.

Region ?; type cultivated in Europe; sometimes, but doubtless erroneously, thought to be South American.

Leaves of various shades of green, very numerous, gracefully spreading, recurved in age, 5 mm. wide, 60 to 90 cm. long, biconvex, entire, with flattened spine scarcely 5 mm. long and long, usually very slender marginal threads.

When the margin bears no threads it is var. *atricha* Trel. (in Bailey, Stand. Cycl. Hort. 1: 238. 1914; *A. geminiflora* Hook. in Curtis's Bot. Mag. 82: under *pl. 4959*; Lindl. Bot. Reg. *pl. 1145*; *A. knightiana* Drummond in Curtis's Bot. Mag. IV. 5: under *pl. 8271*. 1909).

167. *Agave striata* Zucc. Act. Acad. Caes. Leop. Carol. 16²: 678. 1833.

Hidalgo; type cultivated in Europe from Real del Monte.

Leaves numerous, uniformly spreading, grayish, rhombically biconvex, 4 to 6 mm. wide, 60 to 90 cm. long, somewhat scabrid on the margin, the surface with close round ribs separated by narrow whitened grooves, the needle-shaped spine 1 to 2 mm. wide and 15 to 20 mm. long; ovary stout, protruding into the perianth.

With fewer more laxly spreading or recurving leaves it is var. *recurva* Baker (Gard. Chron. n. ser. 8: 556. 1877; *A. recurva* Zucc. Abh. Akad. Wiss. Muenchen 4: 22. 1845). "Estoquillo," "espadín."

Agave paucifolia Tod. (Hort. Bot. Panorm. 1: 77. pl. 19. 1877) differs scarcely more than in its fewer leaves, these as wide as in the next species.

168. *Agave echinoides* Jacobi, Abh. Schles. Ges. Vaterl. Cult. 1868: 163. 1868.

Agave striata echinoides Baker, Gard. Chron. n. ser. 8: 556. 1877.

Region ?; type cultivated in Europe.

Leaves numerous, straight or slightly falcate, gray-green, rhombically biconvex, 1 cm. wide, 25 to 30 cm. long, slightly scabrid on the margin. the surface with close narrow ribs, the triangular spine 3 mm. wide and 25. mm. long; ovary slender, not protruding into the tube.

169. *Agave stricta* Salm-Dyck, Bonplandia 7: 94. 1859.

Agave hystrix Cels, Cat. 1861: 19. 1861.

Agave striata stricta Baker, Gard. Chron. n. ser. 8: 556. 1877.

Puebla, common about Tehuacán; type cultivated in Europe.

Often densely cespitose; leaves numerous, falcately upcurved, often in a globose cluster, gray-green or purplish to nearly white, triquetrously biconvex, 6 to 10 mm. wide, 25 to 35 cm. long, at most slightly scabrid. the surface with distinctly separated ribs, the red-brown or fading spine 3 to 4 mm. wide and 25 mm. long; ovary slender, scarcely protruding into the tube.

The purplish form is known in gardens as f. *purpurca*; the rosy form, as f. *rosea*; and the most glaucous form as var. *glauca* (or *Agave* or *Littaca dealbata*), of which there is a dwarfer form, f. *nana*.

170. *Agave falcata* Engelm. Trans. Acad. St. Louis 3: 304, 370. 1875.

Agave californica Baker, Gard. Chron. n. ser. 8: 556. 1877.

Coahuila (type locality, Buenavista), Durango, Zacatecas, and Nuevo León.

Leaves rather numerous spreading, often falcate, gray or purplish, evanescently glaucous, from biconvex or half-round becoming 3-sided, 7 to 15 mm. wide, 15 or commonly 30 to 50 cm. long, finely striate-ridged, the margin minutely denticulate, the triquetrously needle-shaped spine 2 to 3 mm. wide, 15 or 35 to 40 mm. long.

"Guapilla," "palmita," "espadín," "soyate," "sotolito"; furnishing "ixtle" or "Tampico fiber."

13. DIOSCOREACEAE. Yam Family.

1. DIOSCOREA L. Sp. Pl. 1032. 1753.

REFERENCE: Uline, Bot. Jahrb. Engler 22: 421-431. 1896.

Scandent plants, usually with large fleshy roots; leaves mostly broad and cordate, palmately 3 to many-nerved and reticulate-veined, entire or lobed; flowers small, usually dioecious, racemose or spicate; fruit a 3-valved capsule.

It is difficult to determine which, if any, of the species should be included in the present treatment. Some of them certainly have large, more or less persistent stems, but this character is rarely shown in herbarium specimens. The writer has included most of the larger plants, although probably most of them should have been omitted. There have been excluded a number of species which are evidently wholly herbaceous.

Stems winged..... 1. *D. alata*.

Stems not winged.

Leaves conspicuously lobed.

Uppermost leaves conspicuously lobate..... 2. *D. lobata*.

Uppermost leaves entire..... 5. *D. convolvulacea*.

Leaves entire.

Staminate flowers solitary along the rachis of the raceme.

Staminate flowers 3 mm. long or larger.

Stamens 6; flowers green.

Stamens all antheriferous.....3. *D. pallens*.

Stamens partly (3) reduced to staminodia.....4. *D. densiflora*.

Stamens 3; flowers purplish.....5. *D. convolvulacea*.

Staminate flowers about 2 mm. long. Stamens 3.

Leaves large, mostly 12 to 18 cm. wide, the basal sinus often closed.

6. *D. grandifolia*.

Leaves mostly 6 cm. wide or narrower, the basal sinus open.

7. *D. capillaris*.

Staminate flowers fasciculate or spicate in the racemes.

Staminate flowers pubescent. Stamens 6.

Flowers greenish white.....8. *D. laxiflora*.

Flowers purplish.....9. *D. dugesii*.

Staminate flowers glabrous.

Flowers in short dense spikes, these arranged in racemes.

10. *D. spiculiflora*.

Flowers fasciculate or in short loose racemes.

Stamens 3. Flowers 2 to 3 mm. long, greenish white.

Staminate flowers 3 mm. long.....11. *D. platycolpota*.

Staminate flowers scarcely more than 2 mm. long...12. *D. pringlei*.

Stamens 6.

Stamens subequal.....13. *D. macrostachya*.

Stamens unequal.

Flowers purplish, the racemes mostly solitary.

14. *D. composita*.

Flowers green, the racemes in loose panicles...15. *D. floribunda*.

1. *Dioscorea alata* L. Sp. Pl. 1033. 1753.

Cultivated in Mexico and in some places, as in Oaxaca, apparently naturalized. Native probably of Asia, but widely cultivated.

Leaves mostly orbicular-cordate, taper-pointed, glabrous, sometimes very large; flowers greenish. Known in Mexico as "igname," "iñame," or "ñame;" "ñangate" (Oaxaca).

The large roots of the yam are valuable for human food.

2. *Dioscorea lobata* Uline, Bot. Jahrb. Engler 22: 427. 1896.

Dioscorea lobata morcosana Uline, Proc. Amer. Acad. 35: 323. 1900.

Morelos, Mexico, and Veracruz; type collected near the City of Mexico.

Leaves puberulent, shallowly or deeply lobed.

3. *Dioscorea pallens* Schlecht. Linnaea 17: 610. 1843.

Veracruz, the type from Jalapa.

Plants glabrous; capsule 1.2 to 1.4 cm. long.

4. *Dioscorea densiflora* Hemsl, Biol. Centr. Amer. Bot. 3: 356. 1884.

Veracruz to Chiapas; type from Valley of Córdoba. Guatemala and Honduras.

Glabrous except upon the racemes; flowers in very long slender spikes.

5. *Dioscorea convolvulacea* Schlecht. & Cham. Linnaea 6: 49. 1831.

Dioscorea galeottiana Kunth, Enum. Pl. 5: 409. 1850.

Dioscorea convolvulacea viridis Uline, Bot. Jahrb. Engler 22: 427. 1896.

Mexico to Michoacán and Oaxaca.

Leaves usually puberulent; flowers long-pedicellate, purplish; capsules 1.5 to 2.5 cm. long.

D. convolvulacea viridis is a form with 3-lobed leaves.

6. *Dioscorea grandifolia* Schlecht. Linnaea 17: 602. 1843.

Jalisco to Morelos and Puebla; type from Acatlán, Puebla.

7. *Dioscorea capillaris* Hemsl. Biol. Centr. Amer. Bot. 3: 354. 1884.
Dioscorea hirsuta Mart. & Gal. Bull. Acad. Brux. 9²: 391. 1842. Not *D.*
hirsuta Blume, 1827-28.
 Guerrero to Veracruz, Tabasco, and Oaxaca; type from Mirador, Veracruz.
 Central America.
 Glabrous or pubescent; leaves often very large.
8. *Dioscorea laxiflora* Schlecht. Linnaea 17: 606. 1843.
Dioscorea remotiflora Kunth, Enum. Pl. 5: 409. 1850.
Dioscorea sparsiflora Hemsl. Biol. Centr. Amer. Bot. 3: 360. 1884.
 Sinaloa to San Luis Potosí and Oaxaca; type from Atotonilco el Grande,
 Hidalgo.
 Glabrous or pubescent; leaves often very large; capsules about 2 cm. long.
 "Bejuco de visnaga," "falsa cocolmea" (Oaxaca).
 Roots often very large, covered with irregular plates.
9. *Dioscorea dugesii*¹ Robinson, Proc. Amer. Acad. 29: 330. 1894.
Dioscorea violacea Uline, Bot. Jahrb. Engler 22: 423. 1896.
 Guanajuato (type locality) to Oaxaca.
 Plants puberulent.
10. *Dioscorea spiculiflora* Hemsl. Biol. Centr. Amer. Bot. 3: 361. pl. 92. 1884.
 Yucatán (type locality). Guatemala.
 Plants glabrous.
11. *Dioscorea platycolpota* Uline; Robinson, Proc. Amer. Acad. 36: 471. 1901.
 Known only from the type locality, near Iguala, Guerrero.
 Plants glabrous; leaves orbicular-cordate.
12. *Dioscorea pringlei* Robinson, Proc. Amer. Acad. 29: 323. 1894.
 Jalisco, the type from Guadalajara.
 Plants glabrous.
13. *Dioscorea macrostachya* Benth. Pl. Hartw. 73. 1841.
Dioscorea macrophylla Mart. & Gal. Bull. Acad. Brux. 9²: 392. 1842.
Dioscorea leiboldiana Kunth, Enum. Pl. 5: 355. 1850.
 ? *Testudinaria cocolmea* Procop, Bot. Centralbl. 49: 201. 1892.
 Veracruz and probably elsewhere; type from Panistlahuaca and Tepinistlahuaca.
 Central America.
 Plants glabrous; capsules 2 to 3 cm. long.
Testudinaria cocolmea is referred here with doubt by Uline; it may be referable rather to *D. remotiflora*, or perhaps it is a distinct species. The plant so named is very imperfectly known.
14. *Dioscorea composita* Hemsl. Biol. Centr. Amer. Bot. 3: 354. 1884.
 Veracruz, Oaxaca, and Chiapas; type from Orizaba, Veracruz. Central America.
 Glabrous or nearly so; capsules about 3 cm. long.
15. *Dioscorea floribunda* Mart. & Gal. Bull. Acad. Brux. 9²: 391. 1842.
 Veracruz, Oaxaca, and Tabasco; type from Jalapa, Veracruz. Central America.

¹ Alfredo Duges, a native of France, came to Mexico in 1853. For many years he held the chair of natural history in the college of the State of Guanajuato. He was a diligent student of the plants and animals of Mexico, and published many papers upon natural history. He obtained extensive collections of plants, many of which are in the Gray Herbarium, and a few in the U. S. National Herbarium. He died in 1910. The genus *Dugesia*, of the family Asteraceae, was named in his honor by Gray.

Glabrous; leaves thick and firm, with prominent venation. "Corrimiento" (Tabasco).

14. CASUARINACEAE. Beefwood Family.

1. CASUARINA L. Amoen. Acad. 4: 143. 1759.

1. *Casuarina equisetifolia* L. Amoen. Acad. 4: 143. 1759.

Commonly cultivated in Mexico and often growing without cultivation. Native of tropical Asia and Australia; naturalized also in southern Florida.

Large pinelike tree, sometimes 20 meters high, with a trunk 1 meter in diameter, with slender verticillate spreading branches; bark gray; young branchlets drooping, pale, resembling the stems of *Equisetum*, the leaves reduced to whorled scales; staminate flowers in slender terminal spikes; fruit conelike, 1 to 2 cm. in diameter; wood very hard, strong, close-grained, flesh-colored or in age brown, its specific gravity about 0.93. "Pino" (Yucatán, Cuba); "ciprés" (Yucatán); "pino de Australia" (Cuba); "sauce" (Nicaragua). Known in English-speaking regions as beefwood.

A common and handsome tree in parks in Mexico. In regions where the tree is native the bark is used for tanning and dyeing, yielding a reddish or blue-black dye. The bark is used in medicine for its tonic and astringent properties.

15. PIPERACEAE. Pepper Family.

The genus *Peperomia* is the only other Mexican representative of the family. Its species are mostly low herbs. Some of them may be shrubs, but there is no satisfactory evidence that they are.

1. PIPER L. Sp. Pl. 28. 1753.

REFERENCE: C. De Candolle in DC. Prodr. 16¹: 240-388. 1869.

Shrubs or small trees; leaves alternate, entire, stipulate; flowers perfect or unisexual, small, greenish, sessile in very dense terete spikes, or sometimes racemose; fruit a small berry.

The species are widely distributed in the moist and tropical regions of Mexico, but they are more abundant farther south. They are separated by rather small differences, and, as so limited, most of them are of very limited distribution. In some localities the plants are used medicinally, for various purposes. The plants are more or less aromatic. The leaves are used for seasoning, and the fruit of some species is edible. *Piper nigrum* L., of the East Indies, furnishes the black pepper of commerce, which is widely used as a condiment. It is cultivated in the East Indies, Asia, Philippines, West Indies, and elsewhere. *P. cubeba* L., also of the East Indies, furnishes the cubeb berries of commerce, which are used in medicine for various catarrhal affections. *Piper betle* L. is the betel pepper, whose leaves are chewed by the natives of the Pacific Islands.¹ In South America some of the species have a wide reputation for the cure of snake bites.

The species of *Piper* are most commonly known in Mexico by the name of "cordoncillo."

Spikes of flowers congested at the ends of axillary branchlets.

Subgenus 1. *Heckeria*.

¹ See Safford, Contr. U. S. Nat. Herb. 9: 353-354. 1905.

Spikes solitary, opposite the leaves.

Flowers pedicellate-----Subgenus 2. *Otonia*.

Flowers sessile.

Stamens 2 or 3.

Stamens 2-----Subgenus 3. *Cocobryon*.

Stamens 3-----Subgenus 4. *Carpunya*.

Stamens 4 to 6.

Stamens 4-----Subgenus 5. *Steffensia*.

Stamens 5 or 6-----Subgenus 6. *Enckea*.

Subgenus 1. *HECKERIA*.

Leaves peltate-----1. *P. cuernavacanum*.

Leaves not peltate.

Petioles as long as the blades or longer-----2. *P. cordillerianum*.

Petioles scarcely more than half as long as the blades--3. *P. umbellatum*.

Subgenus 2. *OTTONIA*.

Leaves pubescent beneath on the nerves-----4. *P. muelleri*.

Leaves glabrous.

Leaves 7-nerved, about 6.5 cm. wide-----5. *P. yucatanense*.

Leaves 5-nerved, 2.5 to 4 cm. wide.

Stamens 4-----6. *P. neesianum*.

Stamens 5 or 6-----7. *P. disjunctum*.

Subgenus 3. *COCOBRYON*.

Leaves acuminate, the lower ones cordate at the base, 7 or 9-nerved.

8. *P. diandrum*.

Leaves long-acuminate, the lower ones rounded at the base, 5 or 7-nerved.

9. *P. papantlense*.

Subgenus 4. *CARPUNYA*.

Anthers articulate-----10. *P. karwinskianum*.

Anthers not articulate.

Leaves subcoriaceous-----11. *P. caladiifolium*.

Leaves membranaceous.

Leaves puberulent beneath along the nerves-----12. *P. sanctum*.

Leaves glabrous.

Peduncles as long as the petioles-----13. *P. commutatum*.

Peduncles much shorter than the petioles-----14. *P. zacuapanum*.

Subgenus 5. *STEFFENSIA*.

Stigmas 2-----15. *P. bourgeaui*.

Stigma 3.

Style present-----16. *P. teapense*.

Style none.

Fruit trigonous or obovoid.

Bracts cucullate with inflexed apex or obovate.

Leaves pinnate-nerved-----17. *P. lapathifolium*.

Leaves palmate-nerved-----18. *P. schlechtendalii*.

Bracts peltate or truncate-peltate at the apex.

Leaves palmate-nerved.

Leaves glabrous, equal at the base.

Leaves 2.5 to 3 cm. wide.....19. *P. lepturum*.

Leaves 14 to 21 cm. wide.....20. *P. megalophyllum*.

Leaves pubescent, very unequal at the base, about 9 cm. wide.

21. *P. auritum*.

Leaves pinnate-nerved.

Leaves glabrous, 11 to 12 cm. long, 5.5 cm. wide...22. *P. oblongum*.

Leaves pubescent.

Leaves conspicuously bullate.....25. *P. palmeri*.

Leaves not bullate.

Leaf blades 16 to 25 cm. long, 6 to 12 cm. wide.

23. *P. dilatatum*.

Leaf blades about 11 cm. long and 5 cm. wide.

24. *P. pseudoasperifolium*.

Fruit tetragonus.

Bracts cucullate, the apex inflexed.

Leaves pinnate-nerved.

Leaf blades broadly elliptic, 21 to 23 cm. long, 11 cm. wide.

26. *P. rohrii*.

Leaf blades oblong, about 16.5 cm. long and 7 cm. wide.

27. *P. cordovanum*.

Leaves palmate-nerved.

Leaves puberulent beneath along the nerves, 20 to 24 cm. long, 14 to

19 cm. wide, ovate-rounded.....28. *P. potomorphe*.

Leaves glabrous, 5.5 to 7.5 cm. long, 2.5 cm. wide, lanceolate to ovate.

29. *P. variifolium*.

Bracts peltate, truncate-peltate, or truncate at the apex.

Leaves palmate-nerved, acutish at the base.....30. *P. berlandieri*.

Leaves pinnate-nerved.

Central nerve emitting lateral nerves along its whole length.

Leaves pubescent beneath, ovate or ovate-oblong.

31. *P. tuberculatum*.

Leaves glabrous, lance-ovate or lance-oblong.

32. *P. geniculatum*.

Central nerve emitting lateral nerves for only part its length.

Leaves glabrous.

Petioles about 30 mm. long.....33. *P. melanostictum*.

Petioles 8 to 10 mm. long.....34. *P. oaxacanum*.

Leaves pubescent, at least beneath.

Petioles mostly 10 to 15 mm. long.

Leaf blades rounded or cordate at the base.

Leaves glabrous on the upper surface...35. *P. macrophyllum*.

Leaves pilosulous and scabrous on the upper surface.

36. *P. aduncum*.

Leaf blades acute or acutish at the base.

Leaves glabrous on the upper surface.

37. *P. chamissonis*.

Leaves scabrous on the upper surface.

Peduncles hirtellous; leaves 4 to 7 cm. wide.

38. *P. jalapense*.

Peduncles glabrous; leaves about 8 cm. wide.

39. *P. fischerianum*.

Petioles short, usually 4 to 6 mm. long.

Leaf blades acute at the base.

Leaves 7 to 8 cm. wide, not bullate, thin.

Fruit hirsute; leaves acute-acuminate.

40. *P. descourtilsianum*.

Fruit glabrous; leaves subobtusely-acuminate.

41. *P. colipanum*.

Leaves about 4 cm. wide, somewhat bullate, rigid.

42. *P. misantlense*.

Leaf blades cordate to obtuse at the base.

Leaves glabrous and smooth on the upper surface.

Leaf blades obtuse at the base-----43. *P. citrifolium*.

Leaf blades cordate or semicordate at the base.

Leaves about 14 cm. long and 6.5 cm. wide.

44. *P. decipiens*.

Leaves about 23 cm. long and 14 cm. wide.

45. *P. liebmannii*.

Leaves scabrous on the upper surface.

Leaves conspicuously bullate, the pubescence of the lower surface appressed.

Leaf blades elliptic-lanceolate, 6 to 11 cm. wide.

46. *P. hispidum*.

Leaf blades oblong-lanceolate, about 4.5 cm. wide.

47. *P. mexicanum*.

Leaves not bullate, the pubescence not appressed.

Leaf blades tomentose beneath, about 4 cm. wide.

48. *P. leucophyllum*.

Leaf blades hirtellous beneath, 5.5 to 6 cm. wide.

49. *P. angustifolium*.

Subgenus 6. ENCKEA.

Ultimate nerves of the leaves conspicuously transverse-parallel.

Leaves hirtellous beneath, linear-acuminate at the apex.

50. *P. melastomoides*.

Leaves glabrous beneath, acuminate or short-acuminate at the apex.

Leaves rigid, the upper ones obtuse or acutish at the base; petioles about 1.5 cm. long-----51. *P. smilacifolium*.

Leaves membranaceous, cordate at the base; petioles 2 to 4 cm. long.

52. *P. marginatum*.

Ultimate nerves not conspicuously transverse-parallel.

Leaves pubescent on both surfaces.

Petioles 15 to 30 mm. long; leaves deeply cordate at the base.

53. *P. decrescens*.

Petioles 2 to 6 mm. long; leaves rounded or shallowly cordate at the base.

54. *P. kunthii*.

Leaves glabrous on the upper surface, glabrous or pubescent beneath.

Leaf blades broadly rounded-ovate, glabrous-----55. *P. jaliscanum*.

Leaf blades ovate or narrower.

Leaves 6 to 10 cm. long, 2.5 to 4 cm. wide.

Petioles 5 mm. long; leaves puberulent beneath along the nerves.

56. *P. lindenii*.

Petioles 8 mm. long; leaves glabrous-----57. *P. unguiculatum*.

Leaves 11 to 12 cm. long, 4.5 to 6 cm. wide.

Leaves puberulent beneath, 7-nerved, rounded or cordate at the base.

58. *P. medium*.

Leaves glabrous, 5-nerved, acute at the base-----59. *P. uhdei*.

1. *Piper cuernavacanam*¹ C. DC. *Linnaea* 37: 363. 1873.

Known only from the type locality, Cuernavaca, Morelos.

Branchlets velutinous-puberulent; leaves long-petiolate, the blades ovate-rounded, peltate, 18 cm. long, 21 cm. wide, acute at the apex, deeply cordate at the apex.

2. *Piper cordillerianum* C. DC. in DC. *Prodr.* 16¹: 332. 1869.

Cordillera of Veracruz, at 1,050 meters. Guatemala.

Leaves long-petiolate, the blades reniform-orbicular, 21 cm. long, 30 cm. wide, short-acuminate at the apex, deeply cordate at the base.

3. *Piper umbellatum* L. *Sp. Pl.* 30. 1753.

Heckeria umbellata Kunth, *Linnaea* 13: 569. 1839.

Veracruz to Colima and southward. Central America, West Indies, and South America; type from Santo Domingo.

Shrub, 1 to 2.5 meters high; leaves long-petiolate, the blades round-reniform, 17 to 18 cm. long, 22 to 23 cm. wide, attenuate-acute at the apex, deeply cordate at the base. "Mano de zopilote" (Tabasco); "santilla de culebra" (Oaxaca, *Reko*); "baquifña," or "basquifña" (Porto Rico).

4. *Piper muelleri*² C. DC. in DC. *Prodr.* 16¹: 243. 1869.

Veracruz; type from Orizaba. Honduras.

Branches glabrous, or when young densely hirtellous; leaves short-petiolate, the blades ovate-acuminate, 12.5 cm. long, 4.5 cm. wide, 7-nerved, rounded at the base.

5. *Piper yucatanense* C. DC. *Linnaea* 37: 334. 1873.

Forests of Yucatán.

Branchlets glabrous; leaves nearly sessile, the petioles about 3 mm. long, the blades ovate-acuminate, 12 cm. long, 6.5 cm. wide, rounded at the base, 7-nerved.

6. *Piper neesianum* C. DC. in DC. *Prodr.* 16¹: 256. 1869.

Veracruz. Nicaragua.

Branchlets glabrous; petioles 5 to 10 mm. long; leaf blades lanceolate or elliptic-lanceolate, 6 to 8.5 cm. long, 2 to 4 cm. wide, acuminate, acute at the base.

7. *Piper disjunctum* C. DC. *Linnaea* 37: 334. 1873.

Oaxaca and Veracruz; type collected between Huatusco and Jalapa, Veracruz.

Branchlets glabrous; petioles 6 mm. long; leaf blades ovate-lanceolate, 8 to 10 cm. long, 2.5 to 3 cm. wide, long-acuminate, acute or obtuse at the base.

8. *Piper diandrum* C. DC. *Linnaea* 37: 364. 1873.

Veracruz to Michoacán; type from Pital, Veracruz. Guatemala.

Shrub, 3 to 3.5 meters high; branchlets glabrous; petioles 1.5 to 2.5 cm. long; leaf blades ovate, 11 to 15 cm. long, 5.2 to 11 cm. wide, rounded, truncate, or cordate at the base.

¹ Misspelled "*Cuernavacanam*" in the original description.

² Frederick Mueller was an Alsatian, who was sent to Mexico in 1853 by Schlumberger of Mulhouse. He collected chiefly between Veracruz and Orizaba. He disappeared suddenly and was never heard of afterwards, and it is presumed that he was murdered.

9. *Piper papantlense* C. DC. in DC. Prodr. 16¹: 338. 1869.

Veracruz; type from Papantla. Central America.

Branchlets glabrous; petioles 1.2 cm. long; leaf blades ovate or ovate-lanceolate, 10.5 cm. long, 5 cm. wide.

10. *Piper karwinskianum* Kunth; C. DC. in DC. Prodr. 16¹: 327. 1869.

Schilleria karwinskiana Kunth, Linnaea 13: 700. 1839.

Known only from the type locality, near the City of Mexico.

Branchlets short-villous; petioles about 1 cm. long; leaf blades obliquely elliptic, acuminate, rounded at the base, soft-puberulent on both surfaces.

11. *Piper caladiifolium* (Miquel) C. DC. in DC. Prodr. 16¹: 330. 1869.

Artanthe caladiifolia Miquel, Syst. Piper. 387. 1844.

Mexico, the locality not known. Central America.

Branchlets glabrous; leaves long-petiolate, the blades ovate-cordate, short-acuminate, 13 to 21 cm. long, 10 to 14 cm. wide.

12. *Piper sanctum* (Miquel) Schlecht.; C. DC. in DC. Prodr. 16¹: 330. 1869.

Artanthe sancta Miquel, Syst. Piper. 389. 1844.

Veracruz and probably elsewhere; type from Atlacomulco.

Leaf blades rounded-cordate, about 21 cm. long and 18 cm. wide, short-acuminate, puberulent. The following names are reported for this species, although some probably belong to other species, and doubtless most of them are applied to various species indiscriminately: "Santa María" (Tabasco); "acufo," "hoja de aján" (Veracruz); "hierba santa" (Veracruz, Oaxaca); "santilla de comer" (Oaxaca, *Reko*); "tlamapaquelite," "tianepaquelite," "tlanepaquilitl" (Veracruz, Oaxaca; Nahuatl); "hoja santa;" "hoja de anís."

The leaves have been used by the early and present inhabitants of Mexico as a condiment. In popular medicine the plant is used as a stimulant and as a local anesthetic, and for toothache, stomach affections, and venereal diseases.

13. *Piper commutatum* Steud. (Nom. Bot. ed. 2. 2: 340. 1841, nomen nudum).

Piper plantagineum Lam. err. det. Cham. & Schlecht. Linnaea 6: 353. 1831.

Piper plantagineum Cham. & Schlecht.; C. DC. in DC. Prodr. 16¹: 330. 1869.

Not *P. plantagineum* Lam. 1791.

Described from Mexico, the locality not known.

Branchlets glabrous; petioles 2 cm. long; leaf blades ovate, 9 cm. long, 5 cm. wide, acuminate, rounded or subcordate at the base, glabrous.

14. *Piper zacuapanum* C. DC. in DC. Prodr. 16¹: 330. 1869.

Piper tiliacfolium Schlecht. & Cham. Linnaea 6: 352. 1831. Not *P. tiliacfolium* Desv. 1825.

Veracruz; type from Zacuapan.

Branchlets glabrous; petioles about 6 cm. long; leaf blades ovate, 14 cm. long, 12 cm. wide, acuminate, cordate at the base.

15. *Piper bourgeauii* C. DC. Linnaea 37: 358. 1873.

Known only from the type locality, Cuernavaca, Morelos.

Branchlets densely canescent-villous; petioles 1.2 cm. long; leaf blades oblong-lanceolate, 21 cm. long, 8 cm. wide, acuminate, subcordate at the base, soft-pubescent on both surfaces.

16. *Piper teapense* C. DC. in DC. Prodr. 16¹: 260. 1869.

Known only from the type locality, Teapa, Tabasco.

Branchlets pubescent; petioles 5 mm. long; leaf blades ovate-oblong, 13 cm. long, 5.8 cm. wide, acuminate, cordate at the base, glabrous on the upper surface, pubescent beneath.

17. *Piper lapathifolium* (Kunth) Steud. Nom. Bot. ed. 2. 2: 341. 1841.

Schilleria lapathifolia Kunth, Linnaea 13: 714. 1839.

Veracruz; type from Jalapa. Central America and northern South America.

Shrub, 3.5 to 4.5 meters high; branchlets glabrous; petioles 4 cm. long; leaf blades oblong-ovate, about 24 cm. long and 11 cm. wide, short-acuminate, cordate at the base, glabrous above, hirtellous beneath along the nerves.

18. *Piper schlechtendalii*¹ Steud. Nom. Bot. ed. 2. 2: 343. 1841.

Enkeia schlechtendalii Miquel, Syst. Piper. 362. 1844.

Piper schlechtendalianum C. DC. in DC. Prodr. 16¹: 324. 1869.

Known only from the type locality, Misantla, Veracruz.

Branchlets glabrous; petioles 6 mm. long; leaf blades elliptic-lanceolate or lanceolate, 6 to 10 cm. long, 2.5 to 3.5 cm. wide, long-acuminate, obtuse or acute at the base, glabrous.

19. *Piper lepturum* Kunth; C. DC. in DC. Prodr. 16¹: 320. 1869.

Schilleria leptura Kunth, Linnaea 13: 679. 1839.

Oaxaca. Brazil; type from Rio Janeiro.

Branchlets glabrous; petioles 1 cm. long; leaf blades lanceolate or oblong-lanceolate, 11 to 14 cm. long, 2.5 to 3 cm. wide, acuminate, cordate to acutish at the base, glabrous.

20. *Piper megalophyllum* C. DC. Linnaea 37: 357. 1873.

Pital and Mirador, Veracruz, the type localities.

Branchlets glabrous; petioles 6 to 9 cm. long; leaf blades rounded-ovate, 16 to 25 cm. long, 14 to 21 cm. wide, acuminate, cordate at the base, glabrous.

21. *Piper auritum* H. B. K. Nov. Gen. & Sp. 1: 54. 1815.

San Luis Potosí to Oaxaca and Yucatán; type from somewhere in Mexico. Central America; Colombia.

Shrub 1 to 4.5 meters high; branchlets glabrous; petioles 1.5 cm. long; leaf blades ovate-oblong, about 16 cm. long and 9 cm. wide, attenuate to the apex, cordate at the base. "Momo" (Tabasco); "xmacolan" (Yucatán, Maya); "acojo" (Veracruz); "hoja de la estrella" (Costa Rica); "Santa María," "cordoncillo" (Nicaragua); "anisillo," "monca blanca" (Costa Rica); "hoja de jute," "juniapra" (Guatemala, *Pittier*).

In Veracruz the leaves are used for seasoning tamales. In Costa Rica the fresh leaves are applied to relieve headache.

22. *Piper oblongum* H. B. K. Nov. Gen. & Sp. 1: 52. 1815.

Reported (by C. De Candolle) from Veracruz. Central America and northern South America; type from Venezuela.

Branchlets glabrous; leaves short-petiolate, the blades elliptic, acuminate, acutish at the base; spikes about 8 cm. long.

23. *Piper dilatatum* L. Rich. Act. Soc. Hist. Nat. Paris 1: 105. 1792.

Veracruz. Central America, West Indies, and South America.

Shrub 2 to 3 meters high; branchlets nearly glabrous; petioles 5 to 15 mm. long; leaf blades ovate-elliptic or obovate-elliptic, acuminate.

24. *Piper pseudoasperifolium* C. DC. in DC. Prodr. 16¹: 318. 1869.

Known only from Oaxaca, the type locality.

Branchlets hirsute; petioles 1 cm. long; leaf blades lance-elliptic, 11 cm. long, 5 cm. wide, acuminate, obtuse at the base.

25. *Piper palmeri* C. DC.; Rose, Contr. U. S. Nat. Herb. 1: 354. 1895.

Piper palmeri manzanilloanum C. DC.; Rose, Contr. U. S. Nat. Herb. 1: 354. 1895.

Colima; type from the city of Colima.

¹Named for Diedrich Franz Leonhard von Schlechtendal (1794-1866), professor of botany at Halle. He published several important papers describing early collections of Mexican plants.

Shrub 1.8 meters high; branchlets retrorse-pubescent; petioles 1 cm. long or shorter; leaf blades ovate-lanceolate, about 15 cm. long and 5.5 cm. wide, acuminate, unequal at the base. "Matico" (Colima); "hachogue" (Colima, *Rose*).

The plant is said to be used for washing clothes. A decoction is employed as a remedy for colic in man and horses, and for cutaneous diseases.

26. *Piper rohrii* C. DC. in DC. Prodr. 16¹: 296. 1869.

Oaxaca. Central America and South America; type from French Guiana.

Branchlets glabrous; petioles 2.5 cm. long; leaf blades short-acuminate, sub-attenuate at the base, glabrous.

27. *Piper cordovanum* C. DC. *Linnaea* 37: 352. 1873.

Known only from the type locality, Valley of Córdoba, Veracruz.

Branchlets glabrous; petioles 3.5 cm. long; leaf blades acuminate, unequal and obtuse at the base, glabrous.

28. *Piper potomorphe* (Miquel) C. DC. in DC. Prodr. 16¹: 308. 1869.

Artanthe potomorphe Miquel, Syst. Piper. 403. 1844.

Known only from the type locality, Cordillera of Veracruz.

Petioles 7 to 8 cm. long; leaf blades short-acuminate, deeply cordate at the base.

29. *Piper variifolium* (Miquel) C. DC. in DC. Prodr. 16¹: 308. 1869.

Enckea variifolia Miquel, Syst. Piper. 355. 1844.

Veracruz.

Branchlets glabrous; petioles 6 to 8 mm. long; leaf blades acute or acuminate, rounded at the base.

30. *Piper berlandieri* C. DC. in DC. Prodr. 16¹: 295. 1869.

Tamaulipas to Veracruz and Oaxaca; type collected between Tampico and Real del Monte.

Shrub or small tree, 2 to 6 meters high; petioles about 1.5 cm. long; leaf blades obovate-oblong, about 9.5 cm. long and 4.5 cm. wide, short-acuminate, acutish at the base, glabrous.

31. *Piper tuberculatum* Jacq. *Icon. Pl. Rar.* 2: 2. pl. 210. 1786.

Veracruz to Tepic, Oaxaca, and Tabasco. Central America, West Indies, and South America.

Shrub or small tree, 2 to 6 meters high; branchlets puberulent; leaf blades obliquely ovate or ovate-oblong, 7 to 14 cm. long, 4 to 6 cm. wide, subacuminate, very unequal at the base. "Cordoncillo" (Tabasco, Chiapas).

32. *Piper geniculatum* Swartz, Prodr. Veg. Ind. Occ. 15. 1788.

Veracruz to Tabasco and Chiapas. Central America, West Indies, and South America; type from Jamaica.

Shrub or small tree, up to 6 meters high; leaves short-petiolate, the blades lance-ovate or lance-oblong, sometimes 25 cm. long and 12 cm. wide, acuminate, very unequal at the base. "Cordoncillo" (Tabasco).

33. *Piper melanostictum* (Miquel) C. DC. in DC. Prodr. 16¹: 274. 1869.

Artanthe melanosticta Miquel, Syst. Piper. 404. 1844.

Known only from Tabasco, the type locality.

Branchlets glabrous; leaf blades ovate-oblong, 19 cm. long, 7.5 cm. wide, subobtuse, unequal at the base.

34. *Piper oaxacanum* C. DC. in DC. Prodr. 16¹: 274. 1869.

Known only from the type locality, Oaxaca.

Branchlets glabrous; leaf blades oblong-elliptic or ovate-elliptic, 16.5 cm. long, 6.5 cm. wide, acuminate, unequal and acute at the base.

35. *Piper macrophyllum* H. B. K. Nov. Gen. & Sp. 1: 46. 1815.
Veracruz. Central America, West Indies, and South America; type from Venezuela.
Shrub, about 3 meters high; branchlets glabrous; leaf blades elliptic-oblong, 17 to 24 cm. long, 8 to 12 cm. wide, acuminate; spikes 4 to 5 cm. long.
36. *Piper aduncum* L. Sp. Pl. 29. 1753.
San Luis Potosí to Tepic and Chiapas. Central America, West Indies, and South America; type from Jamaica.
Shrub, 2 to 4.5 meters high; branchlets hirsute or glabrate; leaf blades oblong-elliptic, 17 to 20 cm. long, 7 to 8 cm. wide, acuminate. "Cordoncillo" (Hidalgo, Veracruz); "cordoncillo blanco" (Hidalgo, Veracruz, Nicaragua); "platanillo" (Cuba); "higuillo," "higuillo oloroso" (Porto Rico).
The plant is said to have astringent, stimulant, and diuretic properties. In Brazil it is used to treat ulcers.
37. *Piper chamissonis* (Miquel) Steud. (Nom. Bot. ed. 2. 2: 340. 1841, nomen nudum); C. DC. in DC. Prodr. 16¹: 283. 1869.
Artanthe chamissonis Miquel, Syst. Piper. 457. 1844.
Veracruz and Oaxaca; type from Hacienda de la Laguna, Veracruz.
Petioles 1 cm. long; leaf blades oblong, 15 cm. long, 7 cm. wide, short-acuminate.
38. *Piper jalapense* (Miquel) C. DC. in DC. Prodr. 16¹: 277. 1869.
Artanthe jalapensis Miquel, Syst. Piper. 444. 1844.
Veracruz to Oaxaca; type from Jalapa, Veracruz. Guatemala.
Shrub, up to 4.5 meters high; branchlets densely hirtellous; petioles 1 to 1.5 cm. long; leaf blades ovate-oblong or elliptic-oblong, 13 to 19 cm. long, acuminate; spikes 10 cm. long.
39. *Piper fischerianum* C. DC. in DC. Prodr. 16¹: 277. 1869.
Mexico, the locality not known.
Branchlets glabrous; petioles 1 cm. long; leaf blades lance-elliptic, 19.5 cm. long, acuminate, appressed-hirtellous beneath along the nerves.
40. *Piper descourtilsianum*¹ C. DC. in DC. Prodr. 16¹: 277. 1869.
Veracruz; type from Mirador.
Branchlets glabrous; leaf blades oblong-elliptic, 15.5 cm. long, long-acuminate, glabrous above, puberulent beneath along the nerves.
41. *Piper colipanum* C. DC. Linnaea 37: 348. 1873.
Veracruz; type from Colipa.
Branchlets glabrous; leaf blades oblong-elliptic, 19 cm. long, glabrous above, puberulent beneath.
42. *Piper misantlense* C. DC. in DC. Prodr. 16¹: 286. 1869.
Known only from the type locality, Misantla, Veracruz.
Branchlets glabrous; leaf blades oblong, 14 cm. long, acuminate, glabrous above, puberulent beneath.
43. *Piper citrifolium* Lam. Tabl. Encycl. 1: 80. 1791.
Veracruz and probably Yucatán. Central America, West Indies, and northern South America.
Branchlets hirtellous; leaf blades elliptic-lanceolate or ovate-lanceolate, 12 to 21 cm. long, 5 to 7.5 cm. wide, long-acuminate; spikes 4 to 5 cm. long.

¹Named for Michael Étienne Descourtilz, a French physician, who spent many years in the West Indies, North America, etc. He published a "Flore médicale des Antilles," in 8 volumes, illustrated by 600 colored plates.

44. *Piper decipiens* (Miquel) C. DC. in DC. Prodr. 16¹: 273. 1869.
Artanthe dccipiens Miquel, Syst. Piper. 462. 1844.
 Known only from the type locality, Cordillera of Veracruz.
 Branchlets pubescent; leaf blades ovate-oblong, 14 cm. long, acuminate, puberulent or hirtellous beneath.
45. *Piper liebmannii* C. DC. Linnaea 37: 344. 1873.
 Veracruz; type from Mirador.
 Branchlets glabrous; leaf blades oblong-elliptic, acute, hirtellous or hirsute beneath; spikes 7.5 cm. long.
46. *Piper hispidum* Swartz, Prodr. Veg. Ind. Occ. 15. 1788.
Piper hirsutum Swartz, Fl. Ind. Occ. 1: 60. 1797.
 Veracruz to Tepic and Oaxaca. Central America, West Indies, and South America; type from Jamaica.
 Shrub, 2 to 5 meters high; branchlets hirsute; leaf blades 12 to 19 cm. long; spikes 10 to 11 cm. long. "Higuillo," "higuillo oloroso" (Porto Rico).
47. *Piper mexicanum* (Miquel) C. DC. in DC. Prodr. 16¹: 276. 1869.
Artanthe mexicana Miquel, Syst. Piper. 458. 1844.
 Tepic to Oaxaca; type from Cordillera of Oaxaca. Guatemala.
 Branchlets hirtellous; leaf blades oblong-lanceolate, 14 cm. long, acuminate, unequal at the base.
48. *Piper leucophyllum* (Miquel) C. DC. in DC. Prodr. 16¹: 278. 1869.
Artanthe leucophylla Miquel, Syst. Piper. 460. 1844.
 Jalisco to Morelos, Puebla, and Guerrero.
 Shrub, 1 to 4 meters high; branchlets tomentose; leaf blades oblong-lanceolate, about 14 cm. long, subacuminate. "Cordoncillo" (Guerrero).
 A decoction of the plant is used in Guerrero for fevers and as a wash to kill parasites upon the human scalp.
49. *Piper angustifolium* Ruiz & Pav. Fl. Peruv. Chil. 1: 38. pl. 57. 1798.
 Veracruz to Tepic. Central America, West Indies, and South America; type from Peru.
 Branchlets densely villous; leaf blades elliptic-lanceolate, 16 cm. long or shorter, acuminate. The following names are said to apply to the plant, although they are probably not confined to this species: "Achiotlín," "soldadillo" (Veracruz); "achotlín" (Colima); "cordoncillo" (Jalisco, Veracruz, Oaxaca, Hidalgo, Nicaragua); "mático" (Oaxaca, Nicaragua); "rabo de zorra," "santilla montés" (Oaxaca); "platanillo," "platanillo de monte" (Cuba).
 The leaves, known in commerce as "matico," are an article of export from some parts of tropical America. They are used in medicine to stop the flow of blood and for venereal diseases. It is probable that many different species furnish the "matico" of commerce. In Mexico this plant is used as an astringent and a balsamic stimulant.
50. *Piper melastomoides* Schlecht. & Cham. Linnaea 5: 74. 1830.
 Veracruz; type from Jalapa.
 Shrub, 3 to 4.5 meters high; branchlets villous; petioles 1 cm. long; leaf blades oblong-ovate or lance-elliptic, about 17 cm. long and 7.5 cm. wide, rounded or acute at the base; spikes 3 cm. long.
51. *Piper smilacifolium* H. B. K. Nov. Gen. & Sp. 1: 56. 1815.
 Veracruz. Central America and Venezuela (type locality).
 Shrub, 3 to 4.5 meters high; branchlets glabrous; petioles 1.5 cm. long; leaf blades ovate, 14 to 19 cm. long, 11 to 16 cm. wide, cordate to acutish at the base; spikes 11 cm. long.

52. *Piper marginatum* Jacq. Icon. Pl. Rar. 2: 2. pl. 215. 1786.

Michoacán and Guerrero. Central America, West Indies, and South America.

Shrub, up to 5 meters high; branchlets glabrous; leaf blades ovate-rounded, 12 to 16 cm. long and wide, acuminate at the apex. "Anisillo" (Santo Domingo, Nicaragua); "higuillo oloroso" (Porto Rico).

53. *Piper decrescens* (Miquel) C. DC. in DC. Prodr. 16¹: 251. 1869.

Enckea decrescens Miquel, Lond. Journ. Bot. 4: 440. 1845.

Hacienda de los Naranjos. Central America.

Branchlets glabrous; leaf blades ovate or broadly ovate, 8 cm. long, 5 cm. wide, short-acuminate; spikes 8 cm. long.

54. *Piper kunthii* (Miquel) C. DC. in DC. Prodr. 16¹: 250. 1869.

Enckea kunthii Miquel, Syst. Piper. 363. 1844.

Veracruz to Oaxaca and Chiapas; type from Cordillera of Oaxaca.

Branchlets pubescent; leaf blades elliptic-lanceolate, 5 to 7.5 cm. long, 1.5 to 4 cm. wide, long-acuminate.

55. *Piper jaliscanum* S. Wats. Proc. Amer. Acad. 26: 145. 1891.

Jalisco, Sinaloa, and Tepic; type from Guadalajara, Jalisco.

Shrub, 2.5 to 4.5 meters high, glabrous; petioles 6 to 14 mm. long; leaf blades 3.5 to 7.5 cm. long, acute or short-acuminate; spikes 6 cm. long.

56. *Piper lindenbergii* (Miquel) C. DC. in DC. Prodr. 16¹: 248. 1869.

Enckea lindenbergii Miquel, Syst. Piper. 368. 1844.

Known only from the type locality, Teapa, Tabasco.

Branchlets puberulent; leaf blades elliptic-lanceolate, 7 to 10 cm. long, 2 to 4 cm. wide, acuminate.

57. *Piper unguiculatum* Ruiz & Pav. Fl. Peruv. Chil. 1: 34. 1798.

Piper terminale H. B. K. Nov. Gen. & Sp. 1: 57. 1815.

Veracruz and probably elsewhere. Central America, West Indies, and South America; type from Peru.

Shrub, 2 to 5 meters high; branchlets glabrous; leaf blades oblong-ovate, 6 to 9 cm. long, 2.5 to 4 cm. wide, attenuate-acuminate.

58. *Piper medium* Jacq. Icon. Pl. Rar. 1: 2. pl. 8. 1781.

Piper ceanothifolium H. B. K. Nov. Gen. & Sp. 1: 26. 1815.

Veracruz to Yucatán and Oaxaca. Central America, West Indies, and South America.

Shrub, 1 to 4.5 meters high; branchlets puberulent; leaf blades elliptic or ovate-elliptic, acuminate; spikes about 6 cm. long. "Cordoncillo" (Veracruz); "yaxtehc-ché" (Yucatán, Maya); "alcotán" (Costa Rica); "higuillo de limón" (Porto Rico).

In Costa Rica the plant is reputed to be a cure for snake bites.

59. *Piper uhdei*¹ C. DC. in DC. Prodr. 16¹: 248. 1869.

Mexico, the locality not known.

Branchlets glabrous; petioles 7 mm. long; leaf blades elliptic-lanceolate or lanceolate, acuminate.

DOUBTFUL SPECIES.

PIPER ACUTIUSCULUM C. DC. Ann. Cons. Jard. Genève 2: 259. 1898. Type from Valley of Córdoba, Veracruz.

¹Named for C. A. Uhde, who was Prussian consul at Matamoros about 1845. He made large collections of fruits, seeds, and living orchids, as well as of herbarium specimens, which were sent to the Botanical Garden at Berlin.

PIPER BEGONIAEFOLIUM Hook. & Arn. Bot. Beechey Voy. 310. 1839-40. Described from somewhere in Mexico.

PIPER BREDEMEYERI Jacq. Eclog. Pl. Rar. 1: 125. pl. 84. 1811-16. Reported from Jalisco.

PIPER CARDIOPHYLLUM C. DC. in DC. Prodr. 16¹: 374. 1869. *Piper populifolium* Opiz in Presl, Rel. Haenk. 1: 160. 1830. Described from some unknown locality in Mexico.

PIPER CHINANTLENSE Mart. & Gal. Bull. Acad. Brux. 10²: 1843. Type from Chinantla, Oaxaca.

PIPER KERBERI C. DC. Ann. Cons. Jard. Genève 2: 258. 1898. Type from Córdoba, Veracruz.

PIPER LEBEBOURII C. DC. in DC. Prodr. 16¹: 281. 1869. Native of Brazil; reported from Mexico by De Candolle.

PIPER MIRADORENSE C. DC. in DC. Prodr. 16¹: 380. 1869. *Piper patulum* Mart. & Gal. Bull. Acad. Brux. 10²: 128. 1843. Type from Mirador, Veracruz.

PIPER MULTINERVIUM Mart. & Gal. Bull. Acad. Brux. 10²: 130. 1843. Type from Jalapa and Mirador, Veracruz.

PIPER NEVOSUM C. DC. in DC. Prodr. 16¹: 374. 1869. *Piper patens* Hook. & Arn. Bot. Beechey Voy. 310. 1839-40. Described from somewhere in Mexico.

PIPER NITIDULUM Opiz in Presl, Rel. Haenk. 1: 154. 1830. Type from somewhere in Mexico.

PIPER ORIZABANUM C. DC. Ann. Cons. Jard. Genève 2: 258. 1898. Type from the region of Orizaba.

PIPER PLATYPHYLLUM (Benth.) C. DC. in DC. Prodr. 16¹: 375. 1869. *Enckea platyphylla* Benth. Bot. Voy. Sulph. 167. 1844. Type from Manzanillo, Colima.

PIPER RETICULOSUM Opiz in Presl, Rel. Haenk. 1: 155. 1830. Type said to be from Mexico.

PIPER TRIQUETRUM Opiz in Presl, Rel. Haenk. 1: 160. 1830. Described from somewhere in Mexico.

PIPER TRICHOPHYLLUM C. DC. Ann. Cons. Jard. Genève 2: 261. 1898. Type from Mexico.

16. LACISTEMACEAE.

1. LACISTEMA Swartz, Prodr. Veg. Ind. Occ. 12. 1788.

1. *Lacistema myricoides* Swartz, Prodr. Veg. Ind. Occ. 12. 1788.

Veracruz. Central America, West Indies, and tropical America; type from Jamaica.

Shrub or small tree; leaves elliptic-oblong, 10 to 15 cm. long, entire, glabrous; flowers in axillary spikes, apetalous; fruit baccate, ovoid, about 8 mm. long.

17. CHLORANTHACEAE.

1. HEDYOSMUM Swartz, Prodr. Fl. Ind. Occ. 847. 1788.

1. *Hedyosmum artocarpus* Solms in DC. Prodr. 16¹: 485. 1869.

Veracruz, Morelos, and Oaxaca; type from Jalapa, Veracruz.

Shrub, 3 to 4.5 meters high, aromatic and resinous; leaves mostly 12 to 20 cm. long, ovate or oblong-ovate, serrate; flowers dioecious, the staminate spicate, the pistillate capitate; pistillate inflorescence at maturity fleshy, composed of numerous 3-angled drupes, 2 to 3 cm. in diameter.

18. SALICACEAE. Willow Family.

Trees or shrubs; leaves alternate, stipulate, entire, dentate, or lobate, deciduous; flowers dioecious, in catkins; fruit a small capsule, the seeds bearing long white hairs.

The following genera are the only ones of the family:

- Stamens numerous; bracts incised; disk cup-shaped; winter buds with several scales.....1. **POPULUS**.
 Stamens usually less than 5; bracts entire; disk represented by one or two small glands; winter buds with a single scale.....2. **SALIX**.

1. **POPULUS** L. Sp. Pl. 1034. 1753.

The species of *Populus* are generally distinguished from those of *Salix* by their broad leaves, but one Mexican representative, *P. angustifolia*, has leaves as narrow as those of some willows.

The native species are widely used in Mexico as shade trees, for which purpose they are very satisfactory, since they start readily from cuttings or from large branches placed in the ground, and grow rapidly. They are not very long-lived and the trees are frequently killed by mistletoe (*Phoradendron*). The pistillate trees are not desirable as shade trees, for in the spring when the fruit is ripe the seeds fly everywhere through the air, filling people's eyes and nostrils and becoming a general nuisance. This trouble may be avoided by planting only cuttings taken from staminate trees.

Besides the native species, the white poplar, *P. alba* L., of the Old World, and its various forms ("álamo blanco") is cultivated in central and southern Mexico. It is distinguished by having the lower surface of the leaves covered with a dense white tomentum. *P. nigra* L., the black poplar, another Old World species, is said to be cultivated in Mexico.¹

The most common name for the species of the genus is "álamo."

Petioles rounded, not flattened laterally; leaves with very minute teeth.

Leaf blades ovate, dark green above, very pale beneath, rounded at the base.

1. **P. trichocarpa**.

Leaf blades lanceolate, pale green on both sides, obtuse or acute at the base.

2. **P. angustifolia**.

Petioles laterally compressed; leaves usually with large teeth.

Leaf blades not deltoid in outline, orbicular, oval, oblong, or broadly ovate, pale beneath.

Petioles densely tomentose; leaf blades tomentose beneath when young, the teeth large.....3. **P. monticola**.

Petioles and leaves glabrous; leaf blades with small teeth.

4. **P. tremuloides**.

Leaf blades more or less deltoid, not pale beneath.

Pedicels as long as the capsules or longer.

Leaf blades mostly broader than long, the tip short, entire; capsules 10 to 13 mm. long.....5. **P. wislizeni**.

Leaf blades much longer than broad, the tip very long, crenate-serrulate; capsules 7 to 8 mm. long.....6. **P. dimorpha**.

¹Apparently this name has been applied by some Mexican writers to the native *P. mexicana*.

Pedicels much shorter than the capsules.

Capsules 5 mm. long or shorter.....7. *P. arizonica*.

Capsules 6 to 10 mm. long.

Leaf blades usually broadly cuneate or rounded at the base, long-pointed, glabrous or nearly so.....8. *P. mexicana*.

Leaf blades mostly truncate or subcordate at the base. short-pointed.

Petioles and leaves glabrous or nearly so.....9. *P. fremontii*.

Petioles and lower surface of the leaves densely short-pilose or tomentose.....10. *P. macdougalii*.

1. *Populus trichocarpa* Torr. & Gray; Hook. Icon. Pl. 9: pl. 878. 1852.

San Pedro Mártir Mountains of Baja California at an altitude of about 1,350 meters. Northward to Alaska; type from Santa Clara River, California.

Tree, sometimes 60 meters high, but in Baja California much smaller, with a narrow crown; bark light gray, deeply fissured in age; wood soft, weak, brown, its specific gravity about 0.38.

In the United States the wood is used for barrel staves, tubs, bowls, etc. Among the Indians it was a favorite tree for making canoes, and the roots were used in basketry. The sterile Mexican specimens seen by the writer have very small leaves. This species is known in the United States as black cotton-wood.

2. *Populus angustifolia* James in Long, Exped. 1: 497. 1823.

Along streams, mountains of northern Chihuahua. Northward to Canada; type from the Rocky Mountains.

In Chihuahua said to be a tree 4.5 to 7.5 meters high, but farther north often much larger, sometimes attaining a height of 20 meters and a trunk diameter of 40 to 50 cm.; bark rough or fissured; leaves 5 to 12 cm. long; catkins 2 to 6 cm. long; wood weak, soft, light brown, its specific gravity about 0.39.

3. *Populus monticola* T. S. Brandeg. Zoe 1: 274. 1890.

Sierra de la Laguna of Baja California at altitudes of 660 to 1,550 meters.

Tree, 15 to 22 meters high, the trunk 60 to 90 cm. in diameter, the bark often smooth and white; branchlets at first densely tomentose; leaf blades coarsely dentate; wood light reddish. "Huirigo."

The wood is used locally for making furniture and other objects. It has been stated by Bailey¹ that this is a form of the Old World *P. alba* which has become naturalized in Baja California, but the writer is convinced from study of specimens that this is not the case.

4. *Populus tremuloides* Michx. Fl. Bor. Amer. 2: 243. 1803.

Mountains of Chihuahua, Sonora, San Luis Potosí, and Durango. Widely distributed in the United States and in Canada (type locality).

Usually a small slender graceful tree, but sometimes 12 meters high or even up to 18 meters, the trunk sometimes 60 cm. in diameter; bark thin, smooth, pale green or grayish; wood soft, weak, light brown, its specific gravity about 0.40. "Alamillo" (Durango, *Patoni*).

Large amounts of aspen wood are used in the United States for paper pulp. The tree is one of the first to spring up in lumbered or burned-over regions, and it often covers large areas. The Mexican specimens seen are all sterile. Probably they should be referred to *P. aurea* Tidestrom,² but the status of that species is still uncertain.

¹ Stand. Cycl. Hort. 2756. 1916.

² Amer. Mid. Nat. 2: 35. 1911.

5. *Populus wislizeni*¹ (S. Wats.) Sarg. Man. Trees N. Amer. 165. 1905.

Populus fremontii wislizeni S. Wats. Amer. Journ. Sci. III. 15: 3. 1878.

Along streams at low altitudes, northern Chihuahua and Sonora. Western Texas to Colorado.

Often 15 meters high, with a very thick trunk and large crown; bark pale gray, fissured; leaves 5 to 10 cm. long; wood soft, brownish, its specific gravity about 0.46. Commonly known as "álamo"; "güérigo" (Chihuahua).

In the Rio Grande Valley the wood is much used for firewood, fence posts, and rafters of houses. It is not very good for fuel, since it burns almost like paper. The fallen leaves are eaten by cattle. This cottonwood is the most common shade tree of New Mexico. It was reported from Mexico by Hemsley as *Populus balsamifera* L., a species of more eastern and northern distribution.

6. *Populus dimorpha* T. S. Brandeg. Zoe 5: 197. 1905.

Along arroyos and streams at low altitudes, Sonora and Sinaloa; type from Culiacán.

A large tree, often planted in parks; remarkable for the dimorphism of its leaves, those on the older branches ovate-deltoid, very long-acuminate, those on young shoots linear-lanceolate to ovate-lanceolate.

7. *Populus arizonica* Sarg. Bot. Gaz. 57: 210. 1919.

Populus arizonica jonesii Sarg. Bot. Gaz. 57: 211. 1919.

Baja California to Chihuahua, Tamaulipas, and Puebla, chiefly in river bottoms; Chiapas (?). Southern California to New Mexico; type from Arizona.

Large tree, sometimes 25 meters high, with a trunk diameter of 1.5 meters; crown rounded, with spreading branches; bark light gray, ridged, or on young trees smooth. Generally known as "álamo," but also as "chopo" (Chihuahua, San Luis Potosí) and "olmo" (Tamaulipas).

The wood is used for fuel, carts and cart wheels, fence posts, water troughs, etc. *P. arizonica jonesii* (type from Valley of Palms, Baja California), to which most of the Mexican material belongs, is a form with longer pubescence than the type.

8. *Populus mexicana* Wesm. in DC. Prodr. 16²: 328. 1864.

Type collected between Tampico, Tamaulipas, and Real del Monte, Hidalgo.

Leaves broadly ovate, 4.5 to 7 cm. long, long-petiolate, abruptly long-acuminate at the apex.

The writer has seen no material agreeing satisfactorily with the type collection.

9. *Populus fremontii* S. Wats. Proc. Amer. Acad. 10: 350. 1875.

Baja California; Sonora (?). California and Nevada; type from Deer Creek, California.

Large tree, sometimes 35 meters high, with a trunk 2 meters in diameter, the branches spreading and drooping; bark light gray and smooth on young trees, brown and ridged in old trees; wood soft, light brown, weak, its specific gravity about 0.48. "Alamo" (Baja California).

¹The species was named for Adolf Wislizenus (1810-1889), who came to the United States from Germany in 1835. He was one of the first of United States botanists to visit Mexico, having gone, by way of the Santa Fe trail, to Chihuahua in 1846. He obtained in that State a large collection of plants, which were reported upon by Dr. George Engelmann in a book published by Wislizenus detailing his travels.

10. *Populus macdougalii*¹ Rose, Smiths. Misc. Coll. 61¹²: 1. 1913.

Northern Sonora and Baja California; type from the delta region of the Colorado River.

Large tree; differing from *P. fremontii* only in the more copious pubescence, and probably not specifically distinct.

2. *SALIX* L. Sp. Pl. 1015. 1753.

REFERENCE: C. Schneider, Bot. Gaz. 65: 1-41. 1918.

The various species of willows are found in nearly all parts of Mexico, usually growing at the edge of water. They are often planted as shade trees. *Salix babylonica* L. ("sauz llorón," the weeping willow), an Old World species, with very long, slender, drooping branches, is sometimes cultivated also.

The wood is used chiefly for firewood, but also for construction to a limited extent. In the United States it is burned for charcoal, which is of excellent quality, being used in medicine and as black crayon by artists. The bark is sometimes used for tanning, and the leaves as forage for stock. The flexible tough branches are employed for making baskets, and they were so used by many tribes of North American Indians. They are used also in Mexico as well as elsewhere in the manufacture of wicker furniture. The bark and leaves contain tannin and salicin. The latter principle is a useful febrifuge, and was widely used before quinine came into general use. A willow decoction is still employed for treating fevers in Mexico in domestic practice, and other medicinal properties are attributed to the plants.

The usual names for species of *Salix* are "sauz" and "sauce." The following ones are said to be applied to species which have not been determined by the writer: "Ahuejote" (Jalisco, Valley of Mexico); "huejocote," "huexotl" (Nahuatl); "tepehuexote" (Valley of Mexico); "yaga-gueza" (Zapotec); "yutnu-nuu" (Oaxaca, Mixtec, *Reko*).

Stamens 3 or more.

Leaves glaucous or glaucescent beneath.

Branchlets yellow or yellowish, glabrous.....4. *S. wrightii*.

Branchlets reddish or purplish or tomentulose.

Branchlets densely tomentose; leaves densely villous-tomentulose beneath when young; petioles 8 mm. long or less; staminate aments 0.5 to 3 cm. long.....5. *S. jaliscana*.

Branchlets glabrous or sparsely pilose; leaves glabrous beneath or nearly so; petioles mostly over 10 mm. long; staminate aments 4 to 6 cm. long.....6. *S. bonplandiana*.

Leaves green beneath.

Branchlets yellowish or yellowish cinereous; ovary often pilose.

3. *S. gooddingii*.

Branchlets reddish or purplish; ovary glabrous.

Capsule ovoid to elliptic, scarcely attenuate or short-attenuate at the apex; leaf blades linear or linear-lanceolate; stipules eglandular.

1. *S. humboldtiana*.

Capsule ovoid-lanceolate, attenuate at the apex; leaf blades linear-lanceolate to broadly lanceolate; stipules glandular on the inner surface.

2. *S. nigra*.

¹ Named in honor of Dr. D. T. MacDougal (1865-), director of the department of botanical research of the Carnegie Institution, distinguished for his contributions to the knowledge of plant physiology. Dr. MacDougal has made limited collections of plants in Mexico, some of which are in the U. S. National Herbarium.

Stamens 2.

Leaves small or very small, linear or lanceolate, with stomata equally distributed on both surfaces.

Aments short, the staminate ones 5 to 13 mm. long, the pistillate ones in fruit 1.2 to 2 cm. long; anthers globose or short-elliptic, about as broad as long-----7. *S. taxifolia*.

Aments longer, or the anthers elliptic and much longer than broad.

Ovary glabrous or sparsely pilose; staminate flowers with 2 glands.

8. *S. exigua*.

Ovary densely sericeous-villous; staminate flowers with a single gland.

9. *S. thurberi*.

Leaves large or broad, without stomata on the upper surface; leaves rarely small, the ovary then long-stipitate.

Aments appearing in the axils of full-grown leaves, 2 cm. long or shorter.

Ovary glabrous or sparsely pilose.

Branchlets glabrous; leaves glabrous-----11. *S. mexicana*.

Branchlets tomentose; leaves more or less tomentulose beneath.

Leaf buds rostrate, glabrous or sparsely pilose at the apex; pedicels not longer than the bracts-----10. *S. hartwegii*.

Leaf buds merely acute, villous-tomentulose; pedicels longer than the bracts-----12. *S. schaffnerii*.

Aments appearing before or with the leaves.

Aments scarcely 1 cm. long; leaves usually 2 cm. long or less.

17. *S. cana*.

Aments more than 2.5 cm. long; leaves mostly much more than 2.5 cm. long.

Ovary glabrous; stigmas short; filaments glabrous.

Leaf blades lanceolate, oblanceolate, or narrowly elliptic; staminate aments about 12 mm. thick; bracts obovate, very obtuse or truncate-----13. *S. lasiolepis*.

Leaf blades elliptic or elliptic-lanceolate; staminate aments 15 to 20 mm. thick; bracts oblong, acute-----14. *S. rowleei*.

Ovary villous; stigmas lanceolate; filaments pilose at the base.

Bracts narrowly lanceolate, acute or short-acuminate.

15. *S. oxylepis*.

Bracts oblong, obtuse or subtruncate, rarely acutish.

16. *S. paradoxa*.

1. *Salix humboldtiana* Willd. Sp. Pl. 4: 657. 1805.

? *Salix oxyphylla* H. B. K. Nov. Gen. & Sp. 2: 19. 1817.

Salix stipulacea Mart. & Gal. Bull. Acad. Brux. 10¹: 343. 1843.

Salix humboldtiana stipulacea C. Schneid. Bot. Gaz. 65: 7. 1918.

Veracruz to Colima, Chiapas, and Tabasco. Central America and South America; type from Peru.

Large or small tree, sometimes 10 meters high, with a trunk 15 to 30 cm. in diameter. "Sauce," "sauz," "sauz blanco" (Tabasco).

The Mexican specimens, as well as those from Central America, belong to *S. humboldtiana stipulacea*. This differs only slightly from the typical form, which ranges from Colombia to Argentina. A form which is possibly a hybrid between this and *S. bonplandiana* is reported from Oaxaca.

2. *Salix nigra* Marsh. Arb. Amer. 139. 1875.

Salix nigra lindheimeri C. Schneid. Bot. Gaz. 65: 9. 1918.

Coahuila to Tamaulipas, Sinaloa, and Tepic. Widely distributed in eastern North America.

Tree, sometimes 20 or even 40 meters high, with a trunk diameter of a meter, but usually smaller; branches slender, spreading or somewhat drooping; bark rough, blackish, coming off in narrow strips; leaves 6 to 15 cm. long; wood light reddish brown, soft, weak, its specific gravity about 0.44. "Sauz" (Tamaulipas).

The bark is sometimes used in domestic medicine for its reputed tonic, febrifuge, anaphrodisiac, carminative, and stimulant properties. Palmer states that in Tamaulipas a decoction of the bark is used as a lotion for erysipelas. All the Mexican material is referred by Schneider to *S. nigra lindheimerii*, which occurs also in western Texas.

3. *Salix gooddingii* Ball, Bot. Gaz. 40: 376. 1905.

Chihuahua to Baja California and Sinaloa. California to New Mexico; type from Clark County, Nevada.

Shrub or tree, sometimes 12 meters high; bark rough, dark; leaves narrowly lanceolate, 5 to 12 cm. long; capsules glabrous. "Sauz" (Chihuahua).

Palmer reports that a decoction is used in Chihuahua for fevers. A form which may represent a hybrid between this and *S. bonplandiana* is reported from Baja California by Schneider.

4. *Salix wrightii*¹ Anderss. Öfv. Svensk. Vet. Akad. Förh. 15: 115. 1858.

Northern Chihuahua. Western Texas and New Mexico. Type from Texas or Chihuahua.

Shrub or small tree.

5. *Salix jaliscana* Jones, Contr. West. Bot. 12: 77. 1908.

Jalisco, the type from Ferreria; Michoacán (?).

Shrub or small tree; leaves elliptic or elliptic-lanceolate.

6. *Salix bonplandiana* H. B. K. Nov. Gen. & Sp. 2: 20. pl. 101, 102. 1817.

Salix pallida H. B. K. Nov. Gen. & Sp. 2: 20. 1817.

Nearly throughout Mexico; type from Hidalgo. Guatemala; southern New Mexico and Arizona.

Small or large tree, sometimes 12 meters high or more, with a trunk 40 cm. in diameter, the branches slender, somewhat drooping; bark brown, thick, irregularly fissured; leaves lanceolate or linear-lanceolate, 12 cm. long or shorter, 1 to 2 cm. wide. "Sauz" (Jalisco, Baja California); "sauce" (*Urbina*).

7. *Salix taxifolia* H. B. K. Nov. Gen. & Sp. 2: 18. 1817.

Salix microphylla Schlecht. & Cham. Linnaea 6: 354. 1831.

Nearly throughout Mexico; type from Querétaro. Western Texas to Arizona; Guatemala; Porto Rico (?).

Shrub or tree, sometimes 18 meters high, with a trunk 50 cm. in diameter; leaves linear or lanceolate, 3 cm. long or shorter, silvery-silky; capsules pubescent. "Taray," "taray de río" (Durango, *Patoni*); "tarais" (Chihuahua).

8. *Salix exigua* Nutt. N. Amer. Sylv. 1: 75. 1842.

Chihuahua to Baja California. Northward to Canada; type from Oregon.

Shrub, 2 to 4 meters high, or sometimes a tree 7 meters high.

¹ Named for Charles Wright (1811-1885), one of the most famous of American botanical collectors. From 1847 to 1851 he made very large collections in western Texas, southern New Mexico and Arizona, and Chihuahua and Sonora. These were studied by Gray, and many species of northeastern Mexico were first described from Wright's collections. Later Wright obtained an extensive series of plants in Cuba, and also in Nicaragua and other regions. Sets of his plants are in the U. S. National Herbarium.

9. *Salix thurberi*¹ Rowlee, Bull. Torrey Club 27: 252. 1900.
Salix longifolia angustissima Anderss. Öfv. Svensk. Vet. Akad. Förh. 15: 116. 1858.
 Coahuila and Nuevo León; Durango (?). Western Texas (type locality) and southern New Mexico.
 Medium-sized tree.
10. *Salix hartwegii* Benth. Pl. Hartw. 52. 1840.
 Mexico and Michoacán; type from Aganguio, Michoacán.
 Leaves elongate-lanceolate or narrowly elliptic-lanceolate, 3.5 to 9.5 cm. long.
11. *Salix mexicana* Seemen, Bot. Jahrb. Engler 21: Beibl. 52: 9. 1895.
 Hidalgo, Mexico, and Puebla; type from Zacualtipán, Hidalgo.
 Shrub, 3 to 4.5 meters high.
12. *Salix schaffnerii* C. Schneid. Bot. Gaz. 65: 30. 1918.
 San Luis Potosí and Veracruz; type from San Luis Potosí.
 Leaves elliptic-lanceolate, 6 to 9 cm. long.
13. *Salix lasiolepis* Benth. Pl. Hartw. 335. 1857.
 Chihuahua and Coahuila to Baja California. California, the type from Monterey.
 Tree or shrub, 3.5 to 9 or sometimes 16 meters high; bark brown, rather thin, fissured; leaves 6 to 10 cm. long; wood soft, weak, light brown, its specific gravity about 0.56. "Ahuejote" (Baja California).
14. *Salix rowleei* C. Schneid. Bot. Gaz. 65: 31. 1918.
Salix rowleei cana C. Schneid. Bot. Gaz. 65: 34. 1918.
 Mexico (State); type from Eslava.
 Shrub or tree, sometimes 6 meters high, the branchlets villosulous, the branches blackish; leaves elliptic or elliptic-lanceolate, about 7.5 cm. long.
15. *Salix oxylepis* C. Schneid. Bot. Gaz. 65: 34. 1918.
Salix latifolia Mart. & Gal. Bull. Acad. Brux. 10¹: 344. 1843. Not *S. latifolia* Forbes, 1828.
 Puebla and Veracruz; type from Mount Orizaba.
 Leaves ovate-elliptic or obovate-oblong, 3.5 to 4.5 cm. long.
16. *Salix paradoxa* H. B. K. Nov. Gen. & Sp. 2: 20. 1817.
 ? *Salix pringlei* Rowlee, Bot. Gaz. 27: 136. 1899.
Salix paradoxa ajuscana C. Schneid. Bot. Gaz. 65: 37. 1918.
 Hidalgo to Oaxaca; type from Morán, Hidalgo.
 Shrub or small tree, up to 6.5 meters high; leaves oblong-elliptic, elliptic-lanceolate, or elliptic, 5 to 13 cm. long.
17. *Salix cana* Mart. & Gal. Bull. Acad. Bruz. 10¹: 344. 1843.
 Mount Orizaba, the type locality, and perhaps elsewhere.
 Leaves narrowly oblanceolate.

DOUBTFUL SPECIES.

SALIX ENDLICHII Seemen, Repert. Sp. Nov. Fedde 5: 19. 1908. Described from the Sierra Madre of Chihuahua. Closely related, according to Schneider, to *S. cana*.

¹George Thurber (1821-1890), a native of Rhode Island, was appointed in 1850 botanist to the United States commission to establish the boundary between the United States and Mexico. He spent five years in making botanical collections, from the Gulf of Mexico to the Pacific Ocean, and discovered many interesting plants, which were described by Gray. He is well known also for his publications upon horticultural subjects.

19. MYRICACEAE. Bayberry Family.

1. MYRICA L. Sp. Pl. 1024. 1753.

REFERENCE: Chevalier, Mém. Soc. Sci. Nat. Cherbourg 32: 85-340. 1901.

Shrubs or small trees; leaves alternate, stipulate, covered with small glands; flowers very small, dioecious, in axillary spikes; fruit small, globose, covered with whitish wax.

Chevalier reports a specimen of *M. hartwegi* S. Wats., collected by Pavón, from Mexico. It is probable that the collection is incorrectly labeled, for that species is confined to California and Oregon, and its known area of distribution is far removed from the Mexican border. Several species of bayberry occur in the United States.

Leaf blades narrowly oblanceolate or oblong-oblanceolate, 5 to 9 cm. long, acute to attenuate-----1. *M. mexicana*.

Leaf blades obovate, 1.5 to 4 cm. long, rounded to acutish at the apex.

2. *M. pringlei*.

1. *Myrica mexicana* Willd. Enum. Pl. 2: 1011. 1809.

Myrica xalapensis H. B. K. Nov. Gen. & Sp. 2: 10. 1817.

Myrica lindeniana C. DC. in DC. Prodr. 16²: 150. 1864.

Jalisco to Tamaulipas, Veracruz, Yucatán, and Chiapas. Guatemala.

Shrub or small tree, 2 to 6 meters high; leaves entire or with a few coarse teeth. "Arbol de la cera" (Hidalgo, Oaxaca, Veracruz, etc.); "huancanalá" (Veracruz, Oaxaca, etc.); "chac olol" (Chiapas, *Seler*).

Myrica lindeniana is considered a distinct species by Chevalier. It is said to differ in having the leaves dentate above the middle, those of *M. mexicana* being entire or dentate only at the apex. The writer has seen no specimens that are certainly referable to *M. lindeniana*, but in view of the fact that the leaves of *M. mexicana* are sometimes coarsely dentate, it does not seem probable that the former is a valid species.

This is a well-known plant in Mexico because of the wax that is obtained from the fruit. The shrub often occurs in great abundance, forming extensive thickets, and the fruit can be gathered in quantity. It is boiled in water, whereupon the wax rises to the surface and is skimmed off. The crude wax is greenish, or often very dark from impurities, but it may be bleached or purified until it is nearly white. It is not uncommon in the markets of Mexico City. It is used for candles, which burn slowly, with very little smoke, emitting a pleasant balsamic odor. It is used also as a substitute for or adulterant of beeswax, and has been tested for making phonograph records. Small quantities have been exported. The aromatic leaves also contain wax, but only in small quantities.

The wax is a popular remedy, taken internally, for jaundice and diarrhœa. A decoction of the root bark is said to be acrid, astringent, and in large doses emetic.

2. *Myrica pringlei* Greenm. Proc. Amer. Acad. 41: 236. 1905.

Myrica parvifolia confusa Chevalier, Mém. Soc. Sci. Nat. Cherbourg 32: 285. 1901.

Hidalgo, Puebla, and Oaxaca; type from "Honey Station," Puebla, in pine forest, altitude 1,740 meters.

Shrub 0.3 to 1 meter high, similar to the preceding species. "Chilpanxohuilt" (Puebla, *Herrera*).

This species also produces wax.

20. JUGLANDACEAE. Walnut Family.

Large shrubs or usually trees, commonly strong-scented; leaves alternate, pinnate; flowers monoecious, small, greenish, arranged in long drooping catkins; fruit a very hard nut, inclosed in a thick dry husk; seeds deeply lobed, usually edible.

Husk of the fruit indehiscent; fruit very rough; staminate catkins solitary, sessile or nearly so.....1. **JUGLANS.**
 Husk of the fruit splitting into valves; fruit smooth or nearly so; staminate catkins in 3's, long-pedunculate.....2. **HICORIA.**

1. **JUGLANS** L. Sp. Pl. 997. 1753.

The wood of the larger species of *Juglans* is highly valued because of its hardness, toughness, and durability. That of *J. nigra* L., the black walnut of the United States, is much used for furniture and gunstocks. The bark and fruit are sometimes used for tanning and dyeing. The seeds are edible and are often used in sweetmeats. *Juglans regia* L. ("nogal," "nuez grande," "nuez de Castilla"), the English walnut, native of Europe, is cultivated in Mexico.

Nuts large, 3 to 4 cm. broad.

Leaflets sparsely pilose beneath or glabrate, glabrate on the upper surface.

1. **J. pyriformis.**

Leaflets densely velvety-pilose beneath, stellate-pubescent on the upper surface.....2. **J. mollis.**

Nuts small, 1 to 2.5 cm. broad.

Nuts 1 to 1.5 cm. broad; leaflets narrow, minutely and obscurely serrulate, strongly falcate; shrub or small tree.....3. **J. rupestris.**

Nuts 2 to 2.5 cm. broad; leaflets broad, conspicuously serrate, scarcely falcate; large tree.....4. **J. major.**

1. **Juglans pyriformis** Liebm. Nat. For. Kjöbenhavn Vid. Medd. 1850: 79. 1850. Veracruz and Hidalgo to Jalisco; type from Veracruz.

Doubtless a large tree; leaflets 9 to 15, acute to attenuate. "Nogal."

The material at hand is not very satisfactory and it may be that more than one species is involved. A specimen from Durango (*Palmer* 104) has a conspicuously pyriform nut, but the leaflets are almost completely glabrous beneath. Possibly it represents an undescribed species, but it is referred here for the present. Of this collection *Palmer* gives the following note: "'Nogal'; 15 to 18 meters high, the trunk 0.6 to 1.2 meters in diameter, the crown wide-spreading; the leaves are thrown in water to stupefy fish."

2. **Juglans mollis** Engelm.; Hemsl. Biol. Centr. Amer. Bot. 3: 163. 1883.

Juglans mexicana S. Wats. Proc. Amer. Acad. 26: 152. 1891.

Nuevo León and San Luis Potosí; type from mountains east of San Luis Potosí.

Small or medium-sized tree, or sometimes 15 to 18 meters high, with a trunk diameter of a meter; bark thick, blackish, deeply furrowed; leaflets usually 9 to 15, acutish to attenuate; catkins 7 to 12.5 cm. long; nut reddish brown, with rounded ridges. "Nogal," "nuez meca" (San Luis Potosí).

The tree is said to be valued highly for its wood, which is sawed and is used for bowls, tubs, and other articles. The husks of the fruit are used to procure a coffee-colored dye. The leaves are heated and applied locally for rheumatism. It may be that *J. mexicana* is a distinct species, but no definite characters are observable in the material at hand.

3. *Juglans rupestris* Engelm. in Sitgreaves, Rep. Zuñi & Colo. 171. pl. 15. 1854. Coahuila and probably in Chihuahua. Western Texas and southern New Mexico (type locality).

Shrub, usually less than 5 meters high, growing in clumps and branched almost to the base, or said to be sometimes a tree 9 meters high; bark smooth and yellowish on young stems, in age thick, furrowed, and broken into plates; leaflets 13 to 23; catkins 5 to 10 cm. long; nuts dark brown; wood hard, weak, close-grained, dark brown, its specific gravity about 0.70. "Nogal."

4. *Juglans major* (Torr.) Heller, *Muhlenbergia* 1: 50. 1900.

Juglans rupestris major Torr. in Sitgreaves, Rep. Zuñi & Colo. 171. pl. 16. 1854.

Chihuahua and Durango. Arizona (type locality) and New Mexico.

Tree, sometimes 15 meters high, with a trunk diameter of 1.5 meters, the trunk short, the branches spreading, the bark dark gray, rough; leaflets 9 to 19, 6 to 12 cm. long; wood hard, rather weak, coarse-grained, dark brown, its specific gravity about 0.67. "Nogal silvestre" (Chihuahua).

A decoction of the leaves is said to be taken as a tonic.

2. HICORIA Raf. Med. Repos. N. Y. II. 5: 352. 1808.

About a dozen other species of the genus (the hickory trees) occur in the United States. Their wood is very tough and is much used for articles in which strength and elasticity is needed, such as ax handles, wagon wheels, etc. The seeds of most species have an agreeable flavor and large quantities are eaten.

Leaflets 5; bud scales imbricate-----1. *H. mexicana*.
Leaflets 7 to 15; bud scales valvate.

Leaflets 7 or 9, not falcate; shell of the nut thick--2. *H. myristicaeformis*.
Leaflets usually 11 to 15, conspicuously falcate, shell of the nut thin.

3. *H. pecan*.

1. *Hicoria mexicana* (Engelm.) Britton, Bull. Torrey Club 15: 283. 1888.
Carya mexicana Engelm.; Hems. Biol. Centr. Amer. Bot. 3: 162. 1883.

San Luis Potosí and Querétaro; type from mountains near Álvarez, San Luis Potosí, at an altitude of 2,400 meters.

Tree, 15 to 18 meters high; leaflets obovate, sessile, about 15 cm. long, acuminate, with a pleasant odor; fruit with a thick husk, the nut somewhat angled. "Nogalillo" (San Luis Potosí).

The leaves are used for wrapping tamales. The wood is used locally.

2. *Hicoria myristicaeformis* (Michx. f.) Britton, Bull. Torrey Club 15: 284. 1888.

Juglans myristicaeformis Michx. f. Hist. Arb. Amér. Sept. 211. 1810.

Carya myristicaeformis Nutt. Gen. Pl. 2: 222. 1818.

Nuevo León. Southeastern United States; type from Charleston, South Carolina.

Large tree, sometimes 35 meters high, with a trunk diameter of a meter; bark dark reddish brown, shallowly fissured into close scales; leaflets 5 to 12 cm. long, acute or acuminate; fruit with a thin husk, the nut rounded, smooth, brown; wood hard, tough, strong, close-grained, light brown, its specific gravity about 0.80.

3. *Hicoria pecan* (Marsh.) Britton, Bull. Torrey Club 15: 282. 1888.

Juglans pecan Marsh. Arb. Amér. 69. 1785.

Carya olivaeformis Nutt. Gen. Pl. 2: 221. 1818.

Nuevo León, San Luis Potosí, and Hidalgo; reported from Oaxaca and probably in some other states. Eastern United States.

Large tree, sometimes reaching a height of 50 meters and a trunk diameter of 2 meters; bark light reddish brown, furrowed into narrow ridges; leaflets ovate or oblong-lanceolate, 8 to 15 cm. long; fruit with a thin husk, the nut rounded, reddish brown, thin-shelled; wood hard, rather brittle and weak, close-grained, light reddish brown, its specific gravity about 0.72. The following names are reported from various parts of Mexico: "Nuez encarcelada," "nuez chiquita," "nogal morado," "pacanero," "nogal de nuez chica," "nuez lisa."

The bark is said to have been used in Mexico in the treatment of intermittent fevers and for dyspepsia. The pecan is grown extensively in the southern United States, and the nuts are an important article of commerce. The kernels have a very agreeable flavor and are eaten alone or in candies and other sweetmeats. Most of the cultivated forms have much larger nuts, with thinner shells, than the wild trees.

21 BETULACEAE. Birch Family.

Shrubs or trees; leaves alternate, deciduous, dentate, the stipules usually deciduous; flowers small, dioecious, in catkins.

Pistillate catkins conelike in fruit, the scales woody; staminate flowers 2 or 3 to each bract; perianth none in the pistillate flowers.....1. **ALNUS**.

Pistillate catkins not conelike, the scales thin; staminate flowers solitary above the bract; perianth present in the pistillate flowers.

Fruit inclosed in a bladder-like closed sac.....2. **OSTRYA**.

Fruit merely subtended by a flat leaflike 3-lobed bract.....3. **CARPINUS**.

1. **ALNUS** Hill, Herb. Brit. 510. 1756.

REFERENCES: Fernald, Proc. Amer. Acad. 40: 24-28. 1904; Bartlett, Proc. Amer. Acad. 44: 609-612. 1909.

Numerous species of *Alnus* occur in the United States. The Mexican alders have often been determined as *A. acuminata* H. B. K., and there are many references in literature to the name, but that species, described from the Andes of Peru, does not occur in Mexico.

The bark of the alders is astringent and rich in tannin. It is used in Mexico for tanning skins, giving them a red color, and it is employed also for dyeing skins, blankets, etc., furnishing various colors according to the substances combined with it. The Nueva Farmacopea Mexicana states that the leaves are used as poultices for wounds, an infusion of the bark as a lotion in cutaneous diseases, a decoction of the bark internally for scrofula and venereal diseases, and a decoction of the fruit as an astringent lotion for inflammation of the throat.

The following vernacular names are reported, but it is impossible to determine the species to which they are applied: "Aile" or "ayle" (Jalisco, Morelos, Oaxaca; from the Nahuatl, "ailitl"); "abedul" (Veracruz, Oaxaca); "olmo del país" (Veracruz, Hidalgo, *Ramírez*); "palo de águila" (Oaxaca, *Reko*); "yaga-bizie" (Oaxaca, Zapotec, *Reko*); "palo de lama" (Guatemala, *Pittier*). The Spanish name "aliso" is used in New Mexico and in some parts of Mexico.

Leaves densely covered beneath with yellow wax glands...1. **A. jorullensis**.

Leaves without glands beneath or the glands remote and inconspicuous.

Mature strobiles 7 to 14 mm. long. Veins very coarse and prominent on the lower surface of the leaves.....2. **A. firmifolia**.

Mature strobiles 20 mm. long or longer.

Petioles pubescent.

Leaf blades broadly rounded at the base, broadly elliptic-ovate.

3. *A. pringlei*.

Leaf blades acute or acutish at the base, ovate or oblong-ovate.

4. *A. oblongifolia*.

Petioles glabrous.

Leaves conspicuously pilose beneath, at least on the nerves.

5. *A. arguta*.

Leaves glabrous beneath or nearly so-----6. *A. glabrata*.

1. *Alnus jorullensis* H. B. K. Nov. Gen. & Sp. 2: 27. 1817.

Along streams, Jalisco to Veracruz and Oaxaca; type from Volcán de Jorullo, Michoacán, Guatemala.

Shrub or tree, 3 to 6 meters high or larger, with smooth, reddish brown branches; leaves oblong or obovate, 7 to 13 cm. long; strobiles 1 to 2 cm. long.

2. *Alnus firmifolia* Fernald, Proc. Amer. Acad. 43: 61. 1907.

State of Mexico; type from Cima Station, at an altitude of 3,000 meters.

Tree, 6 to 12 meters high.

3. *Alnus pringlei* Fernald, Proc. Amer. Acad. 43: 62. 1907.

Type from Uruapam, Michoacán; perhaps also in Durango and Jalisco.

Small tree. "Aliso" (Durango).

Certain doubtful forms are intermediate between this and *A. oblongifolia*, but the type collection appears distinct from the latter species.

4. *Alnus oblongifolia* Torr. U. S. & Mex. Bound. Bot. 204. 1859.

Sonora; perhaps also in Durango and Tepic. Southern New Mexico (type locality) to southern California.

Small or medium-sized tree, sometimes 10 meters high, with a trunk 25 cm. in diameter, the branches reddish brown; bark thin, light brown; leaves 5 to 10 cm. long; catkins 9 cm. long or shorter; strobiles 1 to 1.5 cm. long.

5. *Alnus arguta* (Schlecht.) Spach, Ann. Sci. Nat. II. 15: 205. 1841.

Betula arguta Schlecht. Linnaea 7: 139. 1832.

Alnus arguta cuprea Bartlett, Proc. Amer. Acad. 44: 610. 1909.

Alnus arguta subsericea Bartlett, Proc. Amer. Acad. 44: 610. 1909.

Tamaulipas to Veracruz (type locality), Oaxaca, and Chiapas; apparently also in Chihuahua.

Tree, 6 to 7.5 meters high, the branches brown; leaves ovate or obovate, 4 to 10 cm. long; strobiles 2 to 3 cm. long.

The Chihuahua specimens were referred doubtfully to *A. glabrata* by Bartlett, but seem essentially the same as *A. arguta*. This species has been referred to *A. acuminata* H. B. K., *A. ferruginea* H. B. K., and *A. jorullensis castaneae-folia* (Mirb.) Regel, none of which is known to occur in Mexico.

6. *Alnus glabrata* Fernald, Proc. Amer. Acad. 40: 26. 1904.

Alnus glabrata durangensis Bartlett, Proc. Amer. Acad. 44: 611. 1909.

Hidalgo to Oaxaca; Durango; type from Monte San Nicolás, Guanajuato.

Large or medium-sized tree; leaves oblong-lanceolate or elliptic, coarsely dentate, acuminate. "Aliso" (Durango).

A. glabrata durangensis Bartlett is a form in which the lower surface of the leaves is glaucescent; it may be specifically distinct. Specimens of *A. glabrata* have been reported from Mexico as *A. rhombifolia* Nutt.

2. *OSTRYA* Scop. Fl. Carn. 414. 1760.

1. *Ostrya guatemalensis* (Winkl.) Rose, Contr. U. S. Nat. Herb. 8: 292. 1905.
Ostrya italica virginiana guatemalensis Winkl. in Engl. Pflanzenreich IV. 61:
 22. 1904.

Ostrya mexicana Rose, Contr. U. S. Nat. Herb. 8: 292. 1905.

Veracruz to Tabasco and Chiapas. Guatemala (type locality) to Costa Rica.

Tree, 12 to 15 meters high or smaller, with thin, light brown bark; leaves ovate, doubly serrate; staminate flowers in slender catkins; fruits surrounded by bladder-like bracts, arranged in strobiles like those of common hops (*Humulus lupulus* L.). Commonly known as "guapaque."

This is very closely related to *O. virginiana* (Mill.) Koch, but seems fairly distinct. In the Guatemalan form the pubescence is slightly more copious than in the plants of Veracruz, but there appears to be no essential difference between the two.

The wood of the ironwood is very strong, tough, and durable. It is used for railroad ties and other purposes. The bark is used for dyeing and tanning.

3. *CARPINUS* L. Sp. Pl. 998. 1753.

1. *Carpinus caroliniana* Walt. Fl. Carol. 236. 1788.

Carpinus caroliniana tropicalis Donn. Smith, Bot. Gaz. 15: 28. 1890.

Veracruz to Jalisco and Chiapas. Guatemala; eastern United States and Canada, the type from Carolina.

Tree, sometimes 12 meters high, the trunk up to 60 cm. in diameter, usually compressed or fluted, the bark thin, smooth, grayish; leaves oblong-ovate, acuminate; staminate catkins 2 to 3 cm. long; wood hard, light brown, very difficult to work, its specific gravity about 0.73. "Lechillo," "palo silo," "palo barranco" (Michoacán, *Altamirano*).

Carpinus caroliniana tropicalis is a form with more copious pubescence than the type. Both forms of the American hornbeam occur in Mexico.

VOLUME 23, PART 2

TREES AND SHRUBS OF MEXICO (FAGACEAE-FABACEAE)

By PAUL C. STANDLEY

WASHINGTON
GOVERNMENT PRINTING OFFICE

1922

BULLETIN OF THE UNITED STATES NATIONAL MUSEUM,

II

PREFACE.

The present part of volume 23 of the Contributions is a second installment of the Trees and Shrubs of Mexico, by Mr. Paul C. Standley, assistant curator of the United States National Herbarium. This portion of the work extends from the oak family to the bean family, both inclusive. Some of the largest and most important groups of Mexican plants are included in the families here treated, which contain many species of economic value. The account of the Oaks has been prepared by Dr. William Trelease, of the University of Illinois.

FREDERICK V. COVILLE,
Curator of the United States National Herbarium.

TREES AND SHRUBS OF MEXICO.¹

By PAUL C. STANDLEY.

22. FAGACEAE. Beech Family.

The only representatives of this group native in Mexico are the oaks, which belong to the largest genus of the family. The Old World chestnut ("castaño," the tree; "castaña," the nut), *Castanea sativa* Mill., is said to be cultivated occasionally in Mexico, Oaxaca, and other states.

1. QUERCUS L. Sp. Pl. 994. 1753.

(Contributed by Dr. William Trelease.)

REFERENCE: A. De Candolle in DC. Prodr. 16²: 2-109. 1864.

Trees or shrubs; leaves alternate, deciduous or persistent, entire, toothed, or lobed, the teeth and lobes often bristle-tipped; flowers monoecious, the staminate ones in slender catkins; stamens 6 to 12; pistillate flowers solitary or in small clusters; ovules 6, but only one maturing; fruit an acorn, subtended by an enlarged cup (involucre).

The genus *Quercus* is very abundantly represented in Mexico; indeed, no other country has so large a number of species. In this region the oaks are found chiefly in the mountains. In northern Mexico the species grow at comparatively low altitudes, in the arid mountains, but they occur also at high altitudes in the larger ranges, such as the Sierra Madre. In southern Mexico oaks are almost confined to the high mountains, but a few species occur near sea level.

From an economic standpoint oaks are very important. The wood is of the highest quality, being very strong and durable, although these characters vary in different species. It is used for an infinite variety of purposes, especially where strength is desirable. It is highly valued for furniture and for the interior finish of buildings, for ship building, wagons, railroad ties, and many other purposes. As fuel, also, it is unsurpassed. No other group of hardwood trees furnishes wood which is so widely used, in Mexico as well as elsewhere. The bark, too, is important economically, being one of the most widely used tanbarks. Several species of southern Europe have very thick, corky bark, which furnishes the cork of commerce.

The leaves of oak trees are often punctured by insects, and as a result galls ("manzanitas de encina") are formed. These are frequently of the most beautiful and bizarre forms, and often brilliantly colored. They sometimes contain as much as 60 or 70 per cent of tannic acid, and consequently they are excellent for use in tanning leather. They are widely employed also for making ink.

Oaks are almost unsurpassed as shade trees in temperate regions. Because of their tough wood they are seldom broken by wind. Their broad tops give them a handsome appearance, and they are very long-lived.

The acorns ("bellotas"), too, are of considerable economic importance, although less so now than formerly.² In early times they were an important

¹ The first installment of the Trees and Shrubs of Mexico, comprising the families Gleicheniaceae to Betulaceae, was published as Part 1 of Volume 23, Contributions from the U. S. National Herbarium, pp. 1-170, October 11, 1920.

² See V. Havard, Bull. Torrey Club 22: 118-119. 1895.

food of the American Indians, especially those of California and certain parts of Mexico, and they are still employed to some extent. Acorns contain starch, fixed oil, citric acid, sugar, and astringent and bitter principles. Sometimes they are sweet enough to be eaten raw without preparation, but usually it is necessary to rid them of the bitter principle. This is done by shelling and skinning the seeds, then pounding them into meal. The meal is washed repeatedly in water and then boiled as a mush or baked as cake or bread. White oaks (subgenus *Leucobalanus*) have the sweetest and most palatable acorns and have been the most generally used. All the live oaks (such as *Quercus virginiana*, *Q. pungens*, and *Q. oblongifolia*) are said to have edible acorns, but the black oaks (subgenus *Erythrobalanus*) were not extensively employed. The Indians of the southeastern United States obtained from the acorns of *Q. virginiana* a sweet oil much used in cooking. In more recent times acorns have often been roasted and employed as a substitute for coffee, or as an adulterant of it.

Oaks are of little importance in medicine. In Mexico the staminate catkins are reputed anodine and antispasmodic, being used as remedies for vertigo and epilepsy. The bark and acorns are sometimes used as astringents.

One of the most interesting products of these trees is the lac, widely known in Mexico, which is produced by certain scale insects, or Coccidae. This, presumably, is produced on various species of oaks, and also upon trees and shrubs of other families. The following account, by Urbina,¹ of its production upon *Quercus reticulata*, may be quoted here:

"It seems worth while to mention here the manna which forms on *Quercus acuminata* H. B., an oak which grows at Medina, on the boundary between the States of Michoacán and Mexico, which was studied by Sr. D. Melchor Ocampo, who gave the tree the name of *Quercus mellifera*, its vernacular name being *encina de miel*. According to Dr. Oliva (Lecc. Farm. 2: 84), in May it produces an abundance of a globular rough substance, which turns black and resembles manna. Sr. Dr. D. Manuel M. Villada brought back from an excursion which he made to Medina a branch of this tree, black as if the bark were covered with rubber, due to a fungus which had formed in such quantity that it gave rise to a thick layer, in whose midst appeared very fine threads, long and transparent, like caramel, and which, in my opinion, are produced by a *Coccus* or aphid which feeds on this sugary substance. The excess is emitted in threads whose peculiar form is due to the abdominal tubes of the aphid. The explanation of this seems to me to be the following: In the month of May there is an abundant secretion of glucose produced by the bark of the oak, which is taken advantage of not only by the aphid which make these caramel-like threads, but also by the fungus which attacks the bark.

"Under the circumstances, I believe it desirable that a study be made of this product, which, in the opinion of Sr. Oliva, may be a manna, a presumption apparently justified by the existence of two organisms; the fungus and the *Coccus*, which develop simultaneously, using the same food—the glucose. And as this principle is the dominant one in manna, I believe with Sr. Oliva that this oak under favorable conditions produces this substance, which should be analyzed carefully, after visiting the place where the oak grows, and studying the manner of its formation, in order to confirm or correct this view."

The vernacular names applied to the species of oaks can be given in only a few instances. Many names are found in literature, but the species have been so confused that no confidence can be placed in the determinations. The usual Spanish names are "encina" (live oak) and "roble" (deciduous oak),

¹ *Naturaleza* 7: 105-106. 1900.

with various modifying adjectives. The following names also are reported for species not identified: "Alcornoque" (Oaxaca, Michoacán; this is properly the name for the Spanish cork oak); "eucharitas," "peinecillo" (Oaxaca, Reko); "encina memelita"; "charrasquillo" (Durango, Patoni; shrubby species); "encinilla" (Durango, Patoni; shrub. 40 cm. high or less).

The usual Nahuatl word for oak is written "ahuatl," "ahoatl," and "aoatl"; the following variants are reported: "Ahoaquahuitl," "ahuaquahuitl," or "auaquahuitl" (oak-tree); "ahuatetz," "auatetz," "ahuatetzmolli," "auatetzmulli" (live oak); "ahuacoztic" (yellow-oak); "ahuatzin pitzahuac" (narrow-leaf oak); "texmole" (Michoacán); "ahuatezon" (Morelos, Mexico); "ahuatomatl" (acorn, literally "oak-tomato"; sometimes corrupted as "aguatomate") Geographic names relating to oak trees are: Ahuatepec, "oak-hill"; Ahuachilpa, "in the red oaks"; Ahuatlán, "near the oaks."

Reko gives the following Zapotec names used in Oaxaca: "Yaga-yoo." "yaga-reche." "yaga-xoo," "yaga-cino," "yaga-zache." Belmar lists the following Mixe names: "Kook" (acorn); "sho"; "shokiup"; "shotiönit" (acorn). Otomí names, according to Buelna, are "mëttza" and "ndežã" (acorn). González gives the Zoque name as "camay-cuy." A name reported by Ramírez from Michoacán, probably Tarascan, is "tarecuen."

I. Fruit (not known in nos. 6, 7, 11, 15, 21, 26, 28, 34, 39) maturing the first season; shell of acorn not woolly within, the abortive ovules at or near its base: stigmas short and broad, nearly sessile; leaves not aristate, but sometimes with tip and teeth pungently mucronate. LEUCOBALANUS.

A. Leaves, or many of them, serrate, never very small.

B. Acorn (so far as known) large or very large (20 to 70 mm. in diameter).

Leaves large.

Acorn depressed-globose-----1. *Q. insignis*.

Acorn short-conical-----2. *Q. strombocarpa*.

Acorn elongate. Teeth of leaf mostly larger.

Acorn very large (40 mm. broad and 60 mm. long). Scales short, in rings-----3. *Q. cyclobalanoides*.

Acorn distinctly smaller (30 mm. broad and 50 mm. long).

4. *Q. excelsa*.

Acorn ovoid-----5. *Q. galeottii*.

Acorn unknown. Leaves rather blunt-toothed.

Leaves distinctly short-petioled-----6. *Q. pinalensis*.

Leaves nearly sessile-----7. *Q. chinantlensis*.

Leaves moderate (scarcely 3 cm. wide and 10 cm. long), sharply serrate.

8. *Q. leiophylla*.

BB. Acorn unknown. Leaves polymorphous on the same twig.

41. *Q. diversifolia*.

BBB. Acorn moderate (scarcely 15 mm. in diameter). Leaves moderate, nearly all toothed.

Leaves finely venulose-reticulate on both faces-----9. *Q. lancifolia*.

Leaves heavily reticulate beneath, rugulose above. 10. *Q. glabrescens*.

AA. Leaves, or many of them, crenate or shallowly round-lobed, never very small. Fruit never very large.

Leaves blue-green, glabrous, somewhat glaucous, coriaceous, not rugose.

Leaves elliptic or oblong, low-crenate-----11. *Q. glaucoides*.

Leaves obovate, more deeply crenate-----12. *Q. glaucophylla*.

Leaves green, or else rugose or not coriaceous.

C. Leaves glabrate or somewhat thinly puberulent.

D. Leaves oblanceolate-ovate. Fruit unknown----15. *Q. nudinervis*.

- DD. Leaves elliptic-obovate or obovate.
 Leaves subacute, scarcely rugose-----14. *Q. idonea*.
 Leaves very obtuse.
 Leaves somewhat rugose and puberulent-----38. *Q. arizonica*.
 Leaves not rugose, glabrate.
 Leaves finely low-venulose beneath-----15. *Q. nudinervis*.
 Leaves heavily veiny beneath-----16. *Q. standleyi*.
- DDD. Leaves elliptic-oblong, characteristically crenate only above.
 Fruit sessile; acorn exserted-----19. *Q. sororia*.
 Fruit stout-peduncled; acorn nearly included-----20. *Q. germana*.
- DDDD. Leaves oblanceolate. Cup scales thickened.
 13. *Q. tuberculata*.
 Acorn oblong, rather slender (10 to 15 mm. in diameter, 15 to 25 mm. long.)
 Leaves slender-petioled, round-based-----17. *Q. polymorpha*.
 Leaves short-petioled, subcuneate at base-----18. *Q. juergensenii*.
 Acorn round-ovoid, thicker-----19. *Q. sororia*.
- CC. Leaves transiently silvery beneath, elliptic-oblong or obovate.
 52. *Q. breviloba*.
- CCC. Leaves pale-tomentulose beneath, broadly oblanceolate.
 21. *Q. glaucescens*.
- CCCC. Leaves dingy-puberulent or tomentulose beneath. Peduncle moderate or rather long.
 Leaves not extremely large, distinctly or slenderly petioled.
 Leaves scarcely more than undulate-----30. *Q. peduncularis*.
 Leaves crenate throughout, not very rugose.
 Leaves elliptic-oblanceolate-----22. *Q. martensiana*.
 Leaves subpandurate, becoming glabrate-----23. *Q. liebmannii*.
 Leaves crenate only toward the apex, rugose, pandurate.
 24. *Q. pandurata*.
 Leaves large (20 cm. long or more), very short-petioled or very thick-petioled, rugose.
 Leaves round-obovate, very obtuse. Peduncle thick.
 25. *Q. macrophylla*.
 Leaves more elliptic-obovate and pointed-----26. *Q. resinosa*.
 Leaves oblanceolate-elliptic. Peduncle relatively slender.
 Leaves not pandurate.
 Leaves rather acuminate, crisped-----27. *Q. circinata*.
 Leaves blunt or subacute-----28. *Q. magnoliaefolia*.
 Leaves subpandurately narrowed-----29. *Q. lutea*.
- CCCCC. Leaves tomentulose beneath, rugose. Peduncle long.
 Leaves often very large (15 cm. wide and 25 cm. long), obovate.
 37. *Q. decipiens*.
 Leaves never extremely large.
 Leaves elliptic-oblong.
 Leaves rather large (5 cm. wide and 10 cm. long); peduncle moderate-----30. *Q. peduncularis*.
 Leaves smaller (scarcely 3 cm. wide and 8 cm. long); peduncle filiform-----33. *Q. laeta*.
- Leaves obovate to broadly elliptic.
 Scales of the rather large (20 to 25 mm. broad) cup lax.
 31. *Q. hartwegi*.
 Scales of the smaller cup mostly appressed.
 Leaves broadly pandurate-obovate-----32. *Q. laxa*.

Leaves elongate-obovate, subglabrescent...34. *Q. bonplandiana*.

Leaves round-obovate or subelliptic.

Leaves crenate.....35. *Q. rugosa*.

Leaves repandly mucronate, whitened beneath.

36. *Q. reticulata*.

AAA. Leaves, or most of them, entire; fruit nearly sessile.

E. Leaves tomentose beneath and rugose above, or else blue-green or very small.

Leaves relatively large (fully 2 cm. wide and 4 cm. long), very rugose and revolute.

Leaves obovate-elliptic, subcordate.....39. *Q. greggii*.

Leaves broadly elliptic, round-based.....40. *Q. aculcingensis*.

Leaves usually very small (scarcely 2 cm. wide and 3 cm. long).

Leaves rugulose and revolute, rather blunt.

Leaves deciduous.....42. *Q. microphylla*.

Leaves evergreen or nearly so.....43. *Q. repanda*.

Leaves not rugose, commonly acute.....44. *Q. intricata*.

EE. Leaves glabrate (scurfy-puberulent in *Q. grisea*), deciduous.

Leaves neither rugose nor coarsely veiny.

Leaves elliptic or oblong, very obtuse, blue-green.

Leaves relatively narrow (1.5 cm. wide, 4 cm. long). Acorn striate.

45. *Q. engelmanni*.

Leaves characteristically broader (3 cm. wide, 4.5 cm. long).

46. *Q. oblongifolia*.

Leaves very broadly elliptic, more or less puberulent...47. *Q. grisea*.

Leaves lanceolate, acute, very small.....49. *Q. pringlei*.

Leaves not rugose, veiny beneath. Acorn short.....19. *Q. sororia*.

Leaves rugose, undulate, veiny beneath. Acorn elongate.

17. *Q. polymorpha*.

EEE. Leaves canescent beneath, evergreen.

Leaves broadly elliptic, relatively large and usually obtuse.

53. *Q. oleoides*.

Leaves lance-oblong, or elliptic-oblong and pungently acute.

Cup turbinate or rounded; acorn oblong-fusiform...54. *Q. fusiformis*.

Cup umbonate; acorn conical.....55. *Q. brandegei*.

AAAA. Leaves, or many of them, pungently dentate or low-serrate.

Leaves canescent beneath.

Cup turbinate or rounded; acorn subfusiform.....54. *Q. fusiformis*.

Cup umbonate; acorn conical.....55. *Q. brandegei*.

Leaves not canescent.

Leaves moderate, elliptic-obovate.

Peduncle elongate; leaves rugose.

Margin of leaves with crenate tothing.....35. *Q. rugosa*

Margin of leaves with repand tothing.....36. *Q. reticulata*.

Margin variously entire to crenate-dentate.....41. *Q. diversifolia*.

Peduncle short; leaves only slightly rugose, puberulent.

38. *Q. arizonica*.

Leaves commonly very small; peduncle never very long.

Leaves ovate, the minute teeth near the apex, glabrous. 50. *Q. toumeyii*.

Leaves polymorphous in outline and margin.....51. *Q. dumosa*.

Leaves elliptic-ovate, toothed throughout, pubescent.

Teeth of leaves very short (1 mm.); pubescence rather woolly.

44. *Q. intricata*.

Teeth long (3 to 4 mm.); pubescence rather velvety. 48. *Q. pungens*.

- II. Fruit maturing the second season; shell of acorn woolly within, the abortive ovules lateral; stigmas short and rounded, nearly sessile; leaves entire to pungently but not aristately toothed. **PROTOBALANUS.**
 Leaves for a time tomentose, rather large; a tree-----56. *Q. tomentella.*
 Leaves glabrate, rather small; a shrub-----57. *Q. palmeri.*
- III. Fruit (not known in nos. 66, 70, 72, 75, 89, 92, 94, 95, 102, 103, 109, 112) often maturing the second season; shell of acorn woolly within, the abortive ovules characteristically apical; stigmas spatulate, on elongate styles; leaves entire or toothed or often incised, the tip and teeth often aristate. **ERYTHROBALANUS.**
- A. Leaves small, coriaceous, not rugose, usually rather pungently few-toothed. Leaves elliptic-ovate, more or less scurfy.
 Tothing of leaves repand-----58. *Q. emoryi.*
 Tothing of leaves serrate-----60. *Q. eduardi.*
 Leaves lanceolate.
 Leaves tomentulose beneath-----59. *Q. durifolia.*
 Leaves glabrous, or in the first subtomentose.
 Leaves veiny, rather elongate-----61. *Q. devia.*
 Leaves not veiny-----91. *Q. depressa.*
 Leaves broadly oblong or obovate-oblong-----93. *Q. sideroxylla.*
- AA. Leaves usually moderately large, scarcely coriaceous, all, or most of them, entire.
- B. Leaves firmly tomentulose beneath, rugose, lanceolate. 62. *Q. hypoleuca.*
- BB. Leaves firmly woolly beneath, rugose, broad.
 Leaves obovate.
 Leaves not aristate. Tomentum rather straight-----68. *Q. fulva.*
 Leaves aristate from the veins-----70. *Q. chicamolensis.*
 Leaves ovate to oblong, not aristate from the veins---71. *Q. dysophylla.*
- BBB. Leaves somewhat loosely fleecy beneath, rather large.
 Leaves rugose-----66. *Q. floccosa.*
 Leaves not rugose-----92. *Q. orizabae.*
- BBBB. Leaves detachably woolly beneath, granular when denuded, rugose, narrow.
 Cup rounded, not inrolled at margin-----96. *Q. mexicana.*
 Cup turbinate, inrolled at margin-----97. *Q. crassipes.*
- BBBBB. Leaves sparsely stellate-hairy beneath, moderate. 80. *Q. oajacana.*
- BBBBBB. Leaves sparsely scurfy, rather small.
 Leaves rugose, subcordate.
 Leaves elliptic-ovate-----99. *Q. castanea.*
 Leaves oblong-----100. *Q. rugulosa.*
 Leaves coarsely bullate rather than rugose-----80. *Q. oajacana.*
- BBBBBBB. Leaves glabrate, but sometimes with axillary tufts of hairs beneath.
 Leaves very rugose, large, acute, cordate-----75. *Q. rysophylla.*
 Leaves neither very rugose nor very large.
 Leaves characteristically very blunt and rather broad.
 Acorn thick-walled; leaves slightly rugose.
 Leaves granular and glabrous beneath---76. *Q. nectandraefolia.*
 Leaves not granular, somewhat persistently floccose. 77. *Q. lingvaefolia.*
- Acorn thin-walled; leaves not rugose.
 Leaves broadly elliptic or oblong.

Leaves not aristate from the veins, round-based. Cup turbinate.

Twigs glabrescent.....78. *Q. perseaeifolia*.

Twigs tomentose.....79. *Q. pubinervis*.

Leaves sometimes aristate, cordate.....73. *Q. aristata*.

Leaves narrowly oblong.....81. *Q. totutlensis*.

Leaves characteristically acute.

C. Leaves narrowly lanceolate (five times as long as broad).

82. *Q. salicifolia*.

CC. Leaves broadly lanceolate (scarcely four times as long as broad).

Leaves rather large (fully 6 cm. wide and 10 cm. long).

74. *Q. uruapanensis*.

Leaves moderately small.

Cup turbinate saucer-shaped.....83. *Q. ghiesbreghtii*.

Cup half-round, deeper.

Cup rather large (15 mm. broad).....84. *Q. tlapuxahuensis*.

Cup smaller (scarcely 12 mm. broad).

Petiole relatively long (10 mm.).....85. *Q. lanceolata*.

Petiole short (5 mm.).....90. *Q. ocoteaeifolia*.

CCC. Leaves ovate-elliptic.

Leaves somewhat revolute.....77. *Q. linguaeifolia*.

Leaves not revolute.....92. *Q. orizabae*.

CCCC. Leaves lanceolate-ob lanceolate.....86. *Q. laurina*.

AAA. Leaves rather large, undulate or pungently dentate, rugose, tomentose.

67. *Q. crassifolia*.

AAAA. Leaves, or many of them, serrate, scarcely coriaceous.

D. Leaves very rugose, or else densely tomentulose beneath.

E. Leaves tomentulose beneath.

Leaves very rugose.

Leaves large, obovate, toothed above.....63. *Q. scytophylla*.

Leaves rather small (scarcely 4 cm. wide and 6 cm. long), subcordate.

Leaves obovate.....64. *Q. omissa*.

Leaves oblong.....65. *Q. pulchella*.

Leaves only slightly rugose, large.

Leaves oblong-ob lanceolate.....111. *Q. calophylla*.

Leaves obovate.....112. *Q. candicans*.

EE. Leaves sparingly fleecy beneath, rather large. Teeth few.

66. *Q. floccosa*.

EEE. Leaves tomentose beneath.

Leaves rather large.

Leaves obovate-elliptic, the teeth few, toward the end...68. *Q. fulva*.

Leaves ovate-elliptic, the teeth usually numerous and coarse.

69. *Q. stipularis*.

Leaves small (scarcely 3 cm. wide and 6 cm. long).

Leaves rather ovate.....71. *Q. dysophylla*.

Leaves elliptic-oblong.....72. *Q. splendens*.

DD. Leaves only slightly rugose, scurfy or fleecy beneath.

Leaves oblanceolate-elliptic, the teeth toward the end, scurfy.

Petiole moderate (often 10 mm. long).....94. *Q. chrysophylla*.

Petiole short (5 mm.). Leaves often lanceolate and entire.

95. *Q. tridens*.

Leaves lanceolate or oblong.

Teeth toward the apex of the blade.....98. *Q. lanigera*.

Teeth along the side of the blade.....99. *Q. castanea*.

DDD. Leaves not rugose.

Leaves furfuraceous beneath. Teeth small-----107. *Q. furfuracea*.

Leaves glabrate, but sometimes with axillary tufts beneath.

Leaves thick and small, scarcely venulose-----91. *Q. depressa*.

Leaves thin, or else veiny.

Leaves moderate in size (scarcely 4 cm. wide and 12 cm. long).

F. Leaves lanceolate or lance-oblong; teeth small.

Leaves rather broad, or rounded at base.

Leaves evergreen, subcoriaceous-----61. *Q. devia*.

Leaves deciduous.

Leaves not very veiny-----106. *Q. sartorii*.

Leaves very venulose-----108. *Q. grahami*.

Leaves narrower (four times as long as broad), and subacute at base.

Leaves neither revolute nor very prominently veiny.

89. *Q. affinis*.

Leaves somewhat revolute and more venulose.

102. *Q. cortesii*.

FF. Leaves ovate-lanceolate, venulose-----108. *Q. grahami*.

FFF. Leaves oblanceolate, with coarse teeth.

Twigs and petioles glabrous-----87. *Q. major*.

Twigs and petioles pubescent-----88. *Q. barbinervis*.

FFFF. Leaves oblong, rather pungently tooted, 93. *Q. sideroxylla*.

Leaves large, with rather coarse teeth.

Leaves lanceolate or oblanceolate.

Leaves elongate (four times as long as broad), much crisped.

103. *Q. huitamalcana*.

Leaves broader (three times as long as broad), scarcely crisped.

Acorn moderately small.

Acorn depressed, nearly included-----101. *Q. grandis*.

Acorn ovoid, scarcely half included.

Leaves evergreen-----109. *Q. acutifolia*.

Leaves deciduous-----110. *Q. xalapensis*.

Acorn very large (40 mm. long)-----104. *Q. chiapasensis*.

Leaves ovate. Acorn very large-----105. *Q. skinneri*.

1. *Quercus insignis* Mart. & Gal. Bull. Acad. Brux. 10²: 219, 1843.

Veracruz; type locality, on the flanks of Mount Orizaba.

Large deciduous tree with stout villous twigs; buds glabrous, 5 to 7 mm. in diameter, 10 to 15 mm. long; leaves large (4 to 7 cm. wide, 9 to 16 cm. long), rugose, somewhat hairy beneath, oblanceolate-obovate, obtuse or submucronate, short-petioled, usually short-serrate above; acorn depressed, blunt, 50 to 70 mm. in diameter, half-included, the saucer-shaped cup with thick squarrose scales. "Encina," "aoatl," "ahoquahuil" (*Ramírez*).

2. *Quercus strombocarpa* Liebm. Overs. Dansk. Vid. Selsk. Forh. 1854: 176. 1854.

Veracruz; type locality, San Bartolomé.

Resembling the preceding; leaves large (6 to 9 cm. wide, 14 to 17 cm. long), elliptic-obovate; acorn conical, pointed, 50 mm. in diameter, the lower third included in the very turbinate cup. "Encina," "aoatl," "ahoquahuil" (*Ramírez*.)

3. *Quercus cylobalanoides* Trel. Proc. Amer. Phil. Soc. 54: 11. 1915.

Chiapas; type locality, Finca Irlanda.

Large deciduous tree with stout glabrous twigs; leaves large (6 to 9 cm. wide, 15 to 25 cm. long), glabrous, oblanceolate, acute, short-petioled, coarsely and acutely mucronate-serrate; acorn elongate-ovoid, 40 to 50 mm. in diameter, 50 to 60 mm. long, one-third included, the turbinate goblet-shaped cup with abortive scales connate in rings.

4. *Quercus excelsa* Liebm. Overs. Dansk. Vid. Selsk. Forh. 1854: 174. 1854.

Veracruz; type locality, Matlaluga.

Twigs rather slender, glabrous; buds glabrous, small; leaves deciduous, large (5 to 11 cm. wide; 15 to 25 cm. long), glabrous, oblanceolate, acute or subacuminate, subsessile or short-petioled, mostly cuneate, subentire or typically coarsely but acutely serrate to below the middle; acorn ovoid or elongate-ovoid, characteristically 25 to 30 mm. in diameter, 40 to 50 mm. long, the very shallow saucer-shaped cup closely covered by rather small and blunt scales.

5. *Quercus galeottii*¹ Mart. Bull. Acad. Brux. 10²: 220. 1843.

Veracruz; type locality, Santiago de Huatusco.

Rather large (subevergreen?) tree with stout glabrescent twigs and small glabrous buds; leaves large (5 to 7 cm. wide, 12 to 17 cm. long), glabrous, oblanceolate, acute, subcuneately short-petioled, acutely low crenate-serrate; acorn broadly ovoid, 25 to 40 mm. in diameter, 30 to 40 mm. long, one-third included, the more or less flaring, rounded cup with subappressed pointed scales.

6. *Quercus pinalensis* Trel.

Quercus cuneifolia Liebm. Overs. Dansk. Vid. Selsk. Forh. 1854: 189. 1854.

Not *Q. cuneifolia* Raf. 1838.

Type from Cerro de Pinal.

Twigs rather slender, glabrous; leaves (deciduous?) large (6 to 10 cm. wide, 15 to 25 cm. long), glabrous, broadly oblanceolate, acute, more or less cuneate, short-petioled, coarsely and bluntly serrate-lobed; fruit unknown.

7. *Quercus chinantlensis* Liebm. Overs. Dansk. Vid. Selsk. Forh. 1854: 179. 1854.

Veracruz; type locality, Lacoba.

Twigs rather slender, glabrous; leaves (deciduous?) large (5 to 6 cm. wide, 14 cm. long), glabrous, oblanceolate, long-acute or subacuminate, subsessile, cuneate and entire below, very coarsely and rather bluntly repand-serrate above; fruit unknown.

¹ Henri Galeotti was born in France in 1814. He sailed from Hamburg for Mexico in 1835, reaching Veracruz in December. He spent six months at Jalapa, collecting living plants, especially orchids. He passed on to Vigas and Perote, and finally Puebla and Mexico. He botanized at various times in the state of Mexico, part of the time in company with Ehrenberg. In 1835 he spent two or three months in Hidalgo. At the end of that year he visited Querétaro and later Jalisco and Tepic, and in 1837 Guanajuato. He ascended Popocatepetl in June, 1837; in July he visited Michoacán, and in December Aguascalientes and San Luis Potosí. In April, 1838, he returned to Veracruz and made his headquarters at the German colony at Mirador. In August of that year, in company with Funck, Linden, and Ghiesbreght, he ascended the Pico de Orizaba, remaining with his companions for 11 days in a cavern on the mountain. In 1839 he visited Puebla and Oaxaca. In 1840 he returned to Europe, where he became director of the Botanical Garden of Brussels. He died in 1858. Descriptions of some of the new species discovered were published by himself and Martens in the Bulletin de l'Académie Royale de Belgique.

8. *Quercus leiophylla* A. DC. in DC. Prodr. 16²: 71. 1864.

Veracruz; type locality, San Bartolomé.

Deciduous tree with rather slender glabrous twigs and small rounded glabrous buds; leaves rather small (2 to 3 cm. wide, 7 to 12 cm. long), glabrous, lanceolate or oblanceolate, acute at both ends, short-petioled, subentire to typically coarsely serrate above the middle; acorn ovoid, 20 mm. in diameter, 30 mm. long, one-third included, the half-round cup with acute appressed scales.

9. *Quercus lancifolia* Cham. & Schlecht. Linnaea 5: 78. 1830.

Veracruz; type locality, Jalapa.

Deciduous tree with slender glabrous twigs and small glabrous buds; leaves rather small (2 to 3 cm. wide, 8 to 12 cm. long), glabrous, venulose, flat, slightly paler beneath, lanceolate, acute at both ends, subentire or coarsely, serrate above; acorn elongate-ovoid, scarcely 15 mm. in diameter and 25 mm. long, the saucer-shaped cup with blunt appressed scales.

10. *Quercus glabrescens* Benth. Pl. Hartw. 56, 348. 1840.

Hidalgo and Veracruz; type from Real del Monte, Hidalgo.

Deciduous tree with slender, stellate-villous or glabrate twigs and small glabrous buds; leaves rather small (3 cm. wide, 6 to 10 cm. long), rugulose and glabrate above, often stellate-pubescent beneath, elliptic-oblong or lanceolate, acute, mostly rounded at base, short-petioled, coarsely serrate above with revolute notches; acorn ovoid, 10 mm. in diameter, 15 mm. long, less than one-third included, the shallow cup with acute, rather lax scales.

An entire-leaved form is f. *integrifolia* Liebm. in DC. Prodr. 16²: 35. 1864.

11. *Quercus glaucoides* Mart. & Gal. Bull. Acad. Brux. 10²: 209. 1843.

Quercus cordata Mart. & Gal. Bull. Acad. Brux. 10²: 211. 1843.

Oaxaca; type locality, in the Mixteca Alta.

Medium-sized deciduous tree with slender, glabrescent, and often lightly glaucous twigs, and small, at first hairy buds; leaves moderate (4 cm. wide, 8 cm. long), blue-green, glabrescent, slightly glaucous beneath, subelliptic, obtuse, cordate, short-petioled, rather crenately repand above; acorn unknown, the small half-round cup with acute appressed scales.

12. *Quercus glaucophylla* Seemen, Bot. Jahrb. Engler 29: 95. 1900.

Oaxaca; type locality, San Felipe.

Differing from the preceding in its obovate crenate leaves; acorn ovoid, half-included, 10 mm. in diameter and 15 mm. long.

13. *Quercus tuberculata* Liebm. Overs. Dansk. Vid. Selsk. Forh. 1854: 181. 1854.

Sinaloa (?); type locality somewhere in the western Sierra Madre.

Deciduous glabrous tree with rather slender twigs and small buds; leaves moderate (3 to 5 cm. wide, 8 to 10 cm. long), elliptic-oblanceolate, rather obtuse at both ends or the base very acute, short-petioled, crenate and often crisped; acorn round-ovoid, 12 mm. in diameter, 15 mm. long, scarcely one-third included, the suburceolate cup with keeled or tuberculate, acute, appressed scales.

14. *Quercus idonea* Goldman, Contr. U. S. Nat. Herb. 16: 321. 1916.

Baja California; type locality, Sierra de la Laguna.

Small deciduous tree with rather slender twigs and small buds; leaves moderate or rather large (4 to 6 cm. wide, 10 to 12 cm. long), puberulent or glabrate, elliptic to ovate or oblong, rather acute at both ends or the base subtruncate, short-petioled, crisped, somewhat coarsely subrenate, especially above; acorn oblong-ovoid, 10 to 15 mm. in diameter, 20 to 25 mm. long, the deeply saucer-shaped cup with acute subappressed scales. "Encina roble."

15. *Quercus nudinervis* Liebm. Overs. Dansk. Vid. Selsk. Forh. 1854: 182. 1854.
Type locality, in the Cerro de Pinal.
Twigs moderate, glabrous; leaves large (5 to 9 cm. wide, 13 to 17 cm. long), glabrescent, obovate or oblanceolate, obtuse or bluntly acuminate, rather decurrent on the short moderate petiole, low-crenate; fruit unknown.
16. *Quercus standleyi* Trel., sp. nov.
Sonora; type in the U. S. National Herbarium, no. 635607, collected in the Sierra de Alamos, in 1910, by Rose, Standley, and Russell (no. 12789).
Deciduous glabrous tree with rather slender orange-brown twigs and small round buds with tomentulose-ciliate scales; leaves rather large (6 to 12 cm. wide, 15 to 24 cm. long), elliptic-obovate, obtuse at both ends, short-petioled, coarsely crenate, paler beneath, with white veins and margin; fruit unknown.
17. *Quercus polymorpha* Cham. & Schlecht. Linnaea 5: 78. 1830.
Quercus petiolaris Benth. Pl. Hartw. 55, 348. 1840.
Quercus varians Mart. & Gal. Bull. Acad. Brux. 10²: 214. 1843.
Veracruz, Nuevo León, and San Luis Potosí; type locality, near Jalapa, Veracruz. Said to be the chief component of the forest on the Uxaxc Canal, Guatemala.
Medium-sized deciduous tree with rather slender glabrous twigs and somewhat hairy buds 4 mm. in diameter and 6 mm. long; leaves rather large (3 to 6 cm. wide, 7 to 13 cm. long), lightly glaucous and sometimes rusty-woolly beneath, ovate-lanceolate or elliptic, obtuse, often subcordate, slender-petioled, entire or crenately few-toothed at end; acorn oblong, about 10 mm. in diameter and 20 mm. long, half included, the rounded cup with acute appressed scales. "Encina" (Ramírez).
18. *Quercus juergensenii*¹ Liebm. Overs. Dansk. Vid. Selsk. Forh. 1854: 188. 1854.
Quercus jurgensii A. DC. in DC. Prodr. 16²: 78. 1864.
Oaxaca; type locality, Chinantla.
Apparently closely related to the preceding, with short-petioled, cuneate, rather large leaves (4 cm. wide, 7 to 10 cm. long), and oblong acorns 15 mm. in diameter and 20 to 25 mm. long.
Not recently recognized.
19. *Quercus sororia* Liebm. Overs. Dansk. Vid. Selsk. Forh. 1854: 175. 1854.
Oaxaca; type locality, Chinantla.
Twigs rather slender, glabrescent; buds small, glabrous; leaves deciduous, moderate (4 cm. wide, 10 cm. long), slightly glaucous and exceptionally fleecy beneath, elliptic-oblong, obtuse, rounded at base or subcordate, short-petioled, entire; acorn round-ovoid, 15 mm. in diameter and 20 mm. long, one-third included, the rounded cup with thin, acute, rather loose scales.
20. *Quercus germana* Cham. & Schlecht. Linnaea 5: 78. 1830.
Veracruz and adjacent San Luis Potosí; type locality, Jalapa, Veracruz.
Deciduous tree with rather slender glabrous twigs; leaves oblong, medium-sized (4 cm. wide, 10 cm. long), rather obtuse, round-based, glabrous, slightly glaucous beneath, short-petioled, crenately few-toothed at end; acorn subglobose, 15 mm. in diameter, nearly included, the round cup with rather coarse keeled acute appressed scales.

¹ Little is known of Jürgensen, who collected in Mexico for Galeotti, after the latter left that country. His collections were obtained chiefly in the state of Oaxaca.

21. *Quercus glaucescens* Humb. & Bonpl. Pl. Aequin 2: 29. 1809.

Sinaloa; type locality, Caieguala.

Large deciduous tree with rather slender glabrous twigs and small glabrous buds; leaves large (5 to 8 cm. wide, 12 to 16 cm. long), densely pale-tomentulose beneath, broadly oblanceolate, obtuse or bluntly subacuminate, cuneate at base, short-petioled, repand or bluntly few-toothed toward the end; fruit unknown. "Encina memelito" (*Ramírez*).

22. *Quercus martensiana* Trel.

Quercus affinis Mart. & Gal. Bull. Acad. Brux. 10²: 222. 1843. Not *Q. affinis* Scheidw. 1837.

Veracruz; type locality, Zacuapam.

Deciduous tree with rather slender glabrescent twigs and small hairy buds; leaves rather large (3 to 5 cm. wide, 12 cm. long), glabrescent above, somewhat tomentulose and hairy beneath, elliptic-oblanceolate to ovate, obtuse at both ends or mucronate and somewhat cordate, short-petioled, subentire or undulate or repandly few-toothed; acorn subglobose, 10 to 15 mm. in diameter, half included, the rounded cup with thin blunt appressed scales.

23. *Quercus liebmannii* Oerst. in Liebm. Chênes Amér. Trop. 16. 1869, name only.

Oaxaca; type locality, Cuesta de San Juan del Estado.

Twigs rather slender, reddish, glabrescent; buds small, glabrescent; leaves (deciduous?) large (5 to 7 cm. wide, 13 to 17 cm. long), subpersistently pale-tomentulose beneath, oblanceolate-obovate, bluntly subacuminate, the narrowed base subcordate, short-petioled, crenate-sinuate; fruit unknown.

24. *Quercus pandurata* Humb. & Bonpl. Pl. Aequin. 2: 28. 1809.

Quercus obtusata pandurata A. DC. in DC. Prodr. 16²: 27. 1864.

Michoacán; type locality, Ario.

Small (deciduous?) tree with rather slender glabrescent twigs and small, transiently fleecy buds; leaves rather large (6 cm. wide, 14 cm. long), finely stellate-scurfy beneath, pandurately oblanceolate-oblong, rather acute, rounded or subtruncate at base, moderately petioled, crenate or somewhat shallowly and bluntly toothed above; mature fruit unknown, the young cups with acute, somewhat keeled, appressed scales.

With very obtuse, more elongate, and entire leaves it is *Q. obtusata* Humb. & Bonpl. (op. cit. 26. 1809).

25. *Quercus macrophylla* Née, Anal. Cienc. Nat. 3: 274. 1801.

Quercus magnoliaefolia macrophylla A. DC. in DC. Prodr. 16²: 27. 1864.

Coahuila to Jalisco, Guerrero, and San Luis Potosí; type locality, between Tixtla and Chilpancingo, Guerrero.

Rather small deciduous tree with stout, yellow-tomentulose but glabrescent twigs, and glabrescent buds 6 mm. in diameter and 10 mm. long; leaves very large (13 to 30 cm. wide and 25 cm. long or more), subglabrescent above, usually persistently tomentulose beneath, round-obovate, very obtuse, rounded or slightly auriculate-cordate at base, sessile, crisped, undulate to coarsely crenate-toothed; acorn elongate-ovoid, 20 mm. in diameter, 35 mm. long, scarcely half included, the broad cup with subappressed acute scales.

26. *Quercus resinosa* Liebm. Overs. Dansk. Vid. Selsk. Forh. 1854: 182. 1854.

Sonora ?; type locality somewhere in the western Sierra Madre.

Deciduous tree with stout tomentulose twigs; leaves large (10 to 15 cm. wide, 20 to 30 cm. long), glabrescent above, gray-puberulent beneath and resinous-punctate along the veins, oblanceolate-obovate, obtuse or subacute, slightly cordate, crisped repand, on short thick petioles; fruit unknown.

27. *Quercus circinata* Née, Anal. Cienc. Nat. 3:272. 1801.

Type locality, between Tixtla and Chilpancingo, Guerrero.

Small deciduous tree, 8 to 10 meters high, with stout, tomentulose or glabrescent twigs and small canescent buds; leaves large (6 to 10 cm. wide, 15 to 25 cm. long), glabrate above, velvety beneath, oblanceolate, blunt-acuminate, rounded at base, short-petioled, crisped, crenate-toothed; acorn elongate-ovoid, 15 mm. in diameter, 20 to 30 mm. long, one-third included, the half-round cup with acute appressed scales. "Encina roble." (Michoacán, Guerrero).

28. *Quercus magnoliaefolia* Née, Anal. Cienc. Nat. 3:268. 1801.

Type locality, between Tixtla and Chilpancingo, Guerrero.

Like the preceding; differing little except in its more oblanceolate-obovate, less acuminate, and less crenate leaves.

29. *Quercus lutea* Née, Anal. Cienc. Nat. 3:268. 1801.

Type locality, between Tixtla and Chilpancingo, Guerrero.

Like the preceding; differing little except in its somewhat pandurate leaves.

30. *Quercus peduncularis* Née, Anal. Cienc. Nat. 3:270. 1801.

Quercus tomentosa Willd. Sp. Pl. 4:437. 1805.

Type locality, in the western Sierra Madre, above the Río Mescal, between Acapulco and Mexico City.

Small (deciduous?) tree, with moderate glabrescent twigs and small hairy buds; leaves rather large (5 cm. wide, 12 cm. long), scurfy along the midrib above and rather thinly woolly beneath, elongate-elliptic, subacute, somewhat cordate, short-petioled, sinuate; fruit stalked; acorn ovoid, 10 mm. in diameter, 15 mm. long, less than half included, the rather shallow cup with acute appressed scales. "Encina" (Ramírez).

31. *Quercus hartwegi* Benth. Pl. Hartw. 432. 1840.

Quercus obtusata hartwegi A. DC. in DC. Prodr. 16²:27. 1864, in part.

Quercus pandurata hartwegi Wenzig, Jahrb. Bot. Gart. Berlin 3:197. 1884.

Type locality, Tuxpan, near Angangueo, Michoacán.

Deciduous tree with moderate glabrescent twigs and small hairy buds; leaves moderate (4 to 5 cm. wide, 7 to 8 cm. long), characteristically velvety beneath and along the midrib above, broadly elliptic or sometimes pandurately obovate, obtuse, slightly cordate, short-petioled, repand to coarsely crenate or toothed; fruit often long-stalked; acorn round-ovoid, 15 mm. in diameter, half included, the flaring saucer-shaped cup 20 to 25 mm. in diameter, with acute, rather loose scales.

32. *Quercus laxa* Liebm. Overs. Dansk. Vid. Selsk. Forh. 1854:181. 1854.

Quercus xyliina Scheidw. Hort. Belg. 1837:321. 1837.

Quercus reticulata laxa Wenzig, Jahrb. Bot. Gart. Berlin 3:195. 1884.

Jalisco, Tepic, Colima, and Michoacán; type locality, somewhere in the western Sierra Madre.

Very like the preceding; fruiting cup smaller (15 mm. broad), with more keeled and appressed scales.

33. *Quercus laeta* Liebm. Overs. Dansk. Vid. Selsk. Forh. 1854:179. 1854.

Quercus pandurata laeta Wenzig, Jahrb. Bot. Gart. Berlin 3:197. 1884.

San Luis Potosí, Mexico, and Puebla; type locality, Grande.

Twigs rather slender, somewhat scurfy or glabrescent; buds small, glabrescent; leaves rather small (2 to 3 cm. wide, 7 to 8 cm. long), short-tomentose beneath and on the midrib above, lanceolate or oblong-elliptic, obtuse, rounded at base, very short-petioled, entire or crenate; fruit slender-peduncled; acorn ovoid, 10 mm. in diameter, 15 mm. long, the thin half-round cup with small subacute appressed scales.

34. *Quercus bonplandiana* Sweet, Hort. Brit. 370. 1826.

Quercus ambigua Humb. & Bonpl. Pl. Aequin. 2: 51. 1809. Not *Q. ambigua* Michx. 1901.

Hidalgo; type locality, Morán.

Very like the preceding; differing in its more narrowly obovate, low-crenate, longer-petioled leaves; fruit unknown.

35. *Quercus rugosa* Née, Anal. Cienc. Nat. 3: 275. 1801.

Quercus spicata Humb. & Bonpl. Pl. Aequin. 2: 46. 1809.

Quercus macrophylla rugosa Wenzig, Jahrb. Bot. Gart. Berlin 3: 198. 1884. Hidalgo; type locality, in the Cerro de las Navajas, near Morán.

Twigs rather stout and tomentose; buds small, subpubescent; leaves deciduous, moderate (3 to 5 cm. wide, 8 to 10 cm. long), glabrate above, dingy-tomentose and reticulate-veiny beneath, elliptic-obovate, obtuse, cordate, rather short-petioled, callously crenate or coarsely and subpungently low-serrate above; fruit long-peduncled; acorn unknown, the rather small shallow cup with acute appressed scales.

36. *Quercus reticulata* Humb. & Bonpl. Pl. Aequin. 2: 40. 1809.

Chihuahua to Mexico and Oaxaca; type locality, Santa Rosa to Guajuato.

Rather large deciduous tree with moderate, somewhat tomentose twigs and small glabrescent buds; leaves rather small (3 to 4 cm. wide, 6 to 7 cm. long), rugose, stellate or brown-tomentose beneath, the midrib scurfy above, obovate, very obtuse, rounded at base or subcordate, short-petioled, repandly callous-dentate above; fruit peduncled; acorn ovoid, 10 mm. in diameter, 15 to 20 mm. long, scarcely half included, the rounded cup with acute, appressed or loose scales; wood hard, close-grained, brown, its specific gravity about 0.95. "Palo colorado" (San Luis Potosí, Palmer); "encina de miel" (San Luis Potosí, Mexico); "encina" (San Luis Potosí); "encina quiebra-hacha" (Hidalgo Villada); "aoatl," "ahoquahuitl" (Nahuatl, Ramírez); "chaparro," "encina prieta" (Oaxaca, Scler); "tnu-yaha," "tnu-yáa" (Oaxaca, Mixtec, Scler).

Palmer reports the use of the acorns as a substitute for coffee in San Luis Potosí.

37. *Quercus decipiens* Mart. & Gal. Bull. Acad. Brux. 10²: 214. 1843.

Veracruz; type locality, Mirador.

Moderately large deciduous tree with rather stout glabrescent twigs and medium-sized rusty-hairy buds; leaves unusually large (12 to 16 cm. wide, 18 to 25 cm. long), glabrate above, more or less puberulent and whitened beneath, obovate, bullate, short-petioled, very obtuse, repand or low-toothed above; fruit very long-peduncled (peduncle up to 25 cm. long); acorn oblong, 12 mm. in diameter, 20 mm. long, scarcely one-third included, the half-round cup with acute, rather loose scales.

38. *Quercus arizonica* Sarg. Gard. & For. 8: 92. 1895.

Sonora and Chihuahua. Arizona; type locality, Huachuca Mountains.

Deciduous shrub or small tree with slender tomentose twigs and glossy glabrate small buds; leaves small (scarcely 3 cm. wide and 6 cm. long), blue-green, somewhat crisped and revolute, glabrate above, more or less stellate and reticulate beneath, broadly elliptic or subovate, obtuse or acute, subcordate, short-petioled, entire or repand or distantly denticulate or serrulate; acorn ovoid, 10 mm. in diameter, 15 to 20 mm. long, nearly half included, the rounded cup with thickened acute appressed scales; wood hard and strong, close-grained, dark brown to nearly black, the specific gravity slightly over 1.00.

39. *Quercus greggii* (A. DC.) Trel.

Quercus reticulata greggii A. DC. in DC. Prodr. 16²: 34. 1864.

Coahuila; type locality, San Antonio, near Saltillo.

Rather small evergreen trees with moderate, tomentose or more or less glabrescent twigs and small hairy buds; leaves rather small (3 to 5 cm. wide, 4 to 7 cm. long), rugose, revolute, granular or puberulent on the midrib above, rusty stellate-fleecy beneath, shortly elliptic-obovate, mucronately very obtuse, cordate, short-petioled, entire or slightly repand above; acorn conic-ovoid, about 10 mm. in diameter and 20 mm. long, the shallow cup with acute appressed scales.

40. *Quercus aculcingensis* Trel.

Quercus reticulata crassifolia Oerst. in Liebm. Chênes Amér. Trop. 20. 1869.

Oaxaca; type locality, Puente Colorado on the Cuesta de Aculcingo.

Twigs moderate, dingy-woolly; buds small, glabrate; leaves deciduous, small (2 cm. wide, 4 cm. long), rugose, revolute, densely tomentose beneath, the midrib granular above, elliptic, rather obtuse at both ends, short-petioled, entire; fruit unknown.

41. *Quercus diversifolia* Née, Anal. Cienc. Nat. 3: 270. 1801.

Quercus tomentosa diversifolia A. DC. in DC. Prodr. 16²: 33. 1864.

Type locality, between Chalma and Santa Rosa, Veracruz.

A scarcely placeable shrub, said to be 3 to 5 meters high, with rather small leaves (2 cm. wide, 2.5 to 7 cm. long) tomentose beneath, ovate, oblong, or elliptic in outline, and subentire to crenate-dentate on the same branch; fruit on a peduncle 5 cm. long.

42. *Quercus microphylla* Née, Anal. Cienc. Nat. 3: 264. 1801.

Guanajuato, Hidalgo, and Mexico; type from Guanajuato.

Intricately branched deciduous low shrub with slender tomentose twigs and glabrescent ovoid buds 2 mm. in diameter and 4 to 5 mm. long; leaves small (1 to 2 cm. wide, 2 to 4 cm. long), rugose, revolute, and concave, scurfy above, woolly beneath, elliptic-oblong, mostly obtuse at both ends, very short-petioled, entire or undulate or crenately toothed above; acorn ovoid, 10 mm. in diameter, 15 mm. long, one-third or more included, the half-round cup with acute appressed scales. "Encina capulincillo" (Mexico, Ramírez).

43. *Quercus repanda* Humb. & Bonpl. Pl. Aequin. 2: 31. 1809.

Hidalgo and adjacent San Luis Potosí; type locality, El Jacal, between Real del Monte and Morán, Hidalgo.

Intricately branched subevergreen shrub with slender tomentose twigs and small glabrescent buds; leaves small (1 to 2 cm. wide, 3 to 4 cm. long), rugose, undulately revolute, sparingly scurfy above, woolly beneath, elliptic to ovate or obovate, commonly obtuse at both ends, very short-petioled, entire or sparingly low-toothed above; acorn round-ovoid, 10 mm. in diameter, 12 to 15 mm. long, nearly half included, the rounded cup with acute appressed scales. "Encina," "encina negra," "encina chaparro" (Hidalgo).

44. *Quercus intricata* Trel.

Quercus microphylla crispata A. DC. in DC. Prodr. 16²: 36. 1864. Not *Q. crispata* Steven. 1857.

Coahuila and adjoining Zacatecas; type locality, Buena Vista, near Saltillo, Coahuila.

Intricately branched deciduous shrub with slender tomentose twigs and small glabrescent buds; leaves small (scarcely 1 to 2 cm. wide and 3 to 5 cm. long), crisp and revolute, stellate-scurfy above, closely tomentose beneath, subellip-

tic, typically acute, subcordate and typically entire, very short-petioled; acorn round, subincluded, scarcely 10 mm. in diameter, the rounded cup with acute appressed scales.

45. *Quercus engelmanni*¹ Greene in Greene & Kellogg, Ill. West Amer. Oaks 32. 1889.

Southeastern California; type locality, between San Diego and Los Angeles; said to reach adjoining Baja California.

A moderate-sized tree very like the following, except in its broader leaves, but of distinct geographic range; wood hard, strong but brittle, close-grained, brown, its specific gravity about 0.94.

The wood is said to check badly in drying and to be useful only for fuel.

46. *Quercus oblongifolia* Torr. in Sitgreaves, Rep. Zuñi & Col. 173. 1853. Chihuahua and Sonora. Arizona; type from "western New Mexico."

Moderate-sized tree with slender, glabrescent, often pruinose twigs and small red buds with ciliate scales; leaves (deciduous?) small (usually 1 to 2 cm. wide and 3 to 4 cm. long), glabrous, paler beneath, elliptic or oblong, rounded at both ends or subcordate, entire or coarsely and crenately few-toothed, the usually pruinose petiole short; acorn elongate-ovoid, 10 to 15 mm. in diameter, one-third included, the half-round cup with rather broad and blunt, keeled, appressed scales; wood hard and strong but brittle, very dark brown, heavy.

47. *Quercus grisea* Liebm. Overs. Dansk. Vid. Selsk. Forh. 1854: 171. 1854.

Chihuahua, and apparently to Zacatecas. Western Texas, the type locality not specified.

Shrub or small tree with slender tomentose twigs and small round red buds with puberulent outer scales; leaves deciduous, small (scarcely 2 cm. wide and 4 cm. long), thin, blue-green, minutely puberulent above and dull, though glossy when abraded, stellate-scurfy beneath, elliptic or ovate, mucronately subacute, often cordate, short-petioled, entire; acorns paired on a short slender peduncle, ellipsoid, 8 mm. in diameter, 12 mm. long, scarcely one-third included, the half-round cup with rather acute appressed scales. "Encina prieta," "encina blanca" (Durango, *Palmer*).

The wood is useful only for fuel.

48. *Quercus pungens* Liebm. Overs. Dansk. Vid. Selsk. Forh. 1854: 171. 1854.

Quercus undulata pungens Engelm. Trans. Acad. Sci. St. Louis 3: 392. 1876. Chihuahua. New Mexico.

Shrub or small tree with slender tomentulose twigs; leaves deciduous, small (scarcely 2 cm. wide and 3 cm. long), from scurfy glabrescent, crisped, elliptic, pungently acute, rounded at base, very short-petioled, with about 4 large pungent deltoid teeth on each side; acorn ovoid, scarcely 8 mm. in diameter and 12 mm. long, half included, the rounded cup with small appressed scales.

49. *Quercus pringlei* Seemen, Bot. Jahrb. Engler 29: 96. 1900.

Coahuila; type locality, in the Carneros Pass below Saltillo.

Shrub with slender subglabrescent twigs and minute round glabrous buds; leaves (deciduous?) very small (scarcely 1 cm. wide and 2.5 cm. long), glabrous, lance-elliptic, subaristately acute, rounded at base, mostly entire, the

¹ George Engelmann (1809-1884), a native of Germany, lived most of his life at St. Louis, Missouri, where he was engaged in the practice of medicine. An enthusiastic botanist, Engelmann devoted most of his botanical labors to the study of the more difficult groups of plants, such as the *Cactaceae*, *Yucca*, *Agave*, *Quercus*, etc. He described many Mexican species of these and other groups.

very short petiole somewhat tomentose; acorn round-ovoid, scarcely 10 mm. in diameter, fully half included, the rounded cup with somewhat thickened and blunt appressed scales.

50. *Quercus toumeyii* Sarg. Gard. & For. 8: 92. 1895.

Sonora. Arizona; type locality, Bisbee.

Shrub or small tree with slender tomentulose twigs and small pubescent buds; leaves deciduous, very small (scarcely 1 cm. wide and 2 cm. long), smooth or papillate above, sparingly velvety beneath, elliptic, mucronately acute, subcordate, entire or pungently few-toothed above, with very short hairy petiole; acorn oblong, scarcely 8 mm. in diameter and 12 mm. long, less than half included, the rounded cup with rather blunt appressed scales; wood hard, close-grained, brown.

51. *Quercus dumosa* Nutt. N. Amer. Sylv. 1: 7. 1842.

California; type locality, Santa Barbara. Extending into Baja California, in several foliage forms, of which one, with very small, ovate-elliptic, pungently dentate leaves scarcely 15 mm. wide and 25 mm. long, is var. *turbinella* Jepson (Silva Calif. 218. 1910; *Q. turbinella* Greene in Greene & Kellogg, Ill. West. Amer. Oaks 37. 1889).

Deciduous shrub with slender, usually glabrescent twigs; leaves small (commonly less than 2 cm. wide and 5 cm. long), polymorphous, more or less persistently tomentulose beneath, short-petioled; fruit typically slender-peduncled, the moderate-sized or small oblong acorn scarcely half included in the finely scaly, half-round cup.

This species is said to be the one whose acorns were most used as food by the Indians of southern California.

52. *Quercus breviloba* (Torr.) Sarg. Gard. & For. 8: 93. 1895.

Quercus obtusifolia breviloba Torr. U. S. & Mex. Bound. Bot. 266. 1859.

Quercus annulata Buckl. Proc. Acad. Phila. 1860: 445. 1860. Not *Q. annulata* Smith, 1819.

Nuevo León. Texas; type locality in Howard County.

Large deciduous shrub or small tree with rather slender glabrous buff twigs; leaves rather small (3 to 6 cm. wide, 6 to 12 cm. long), glabrous and glossy green above, glabrate but pale or microscopically silvery-tomentulose beneath, elliptic-obovate, obtuse, mostly acute at base, short-petioled, usually undulate or with a few short round lobes; acorn ovoid, scarcely 8 mm. in diameter and 12 mm. long, half included, the rounded cup with acute, rather close scales; wood hard and strong, brittle, brown, close-grained.

53. *Quercus oleoides* Cham. & Schlecht. Linnaea 5: 79. 1830.

Veracruz, Chiapas, and Tabasco; type locality, Hacienda de la Laguna, near Jalapa, Veracruz. British Honduras, Guatemala, Honduras, and Costa Rica.

Rather large broad-topped evergreen tree with slender gray-tomentulose twigs and small reddish glabrate buds; leaves mostly rather small (3 to 6 cm. wide, 6 to 8 cm. long, but exceptionally twice as large), glabrous and green above, minutely pale-tomentulose beneath, revolute, obovate-elliptic, rather obtuse, subcuneate, rather short-petioled, typically entire; fruit mostly peduncled; acorn ovoid, 10 mm. in diameter, 15 to 20 mm. long, about half included, the turbinate cup with keeled acute appressed scales in vertical rows. "Roblecito" (Guatemala, Honduras).

A juvenile form with obovate toothed leaves is *Q. lutescens* Mart. & Gal. Bull. Acad. Brux. 10²: 219. 1843.

54. *Quercus fusiformis* Small, Bull. Torrey Club 28: 357. 1901.

Quercus virginiana fusiformis Sarg. Bot. Gaz. 65: 448. 1918.

Coahuila and Nuevo León. Texas; type locality, Kerrville.

Small evergreen tree with slender tomentulose twigs and minute round red velvety buds; leaves small (1 cm. wide, 3 to 5 cm. long), minutely canescent beneath, narrowly oblong-lanceolate, mucronately acute, rounded at base, entire or with 1 or 2 asymmetric teeth, the short petiole tomentulose; fruit long-peduncled; acorn fusiform-oblong, 10 mm. in diameter, 20 to 25 mm. long, less than one-third included, the turbinate cup with acute appressed scales in somewhat evident vertical rows.

This and *Q. oleoides* are probably the species which have been reported from Mexico as *Q. virginiana* Mill. (*Q. virens* Ait.). The following are some of the vernacular names reported: "Maculi" (Nuevo León, Veracruz); "maquili-huatl" (Veracruz); "texmole"; "roble"; "roble serrano"; "palo duro"; "tezmolli"; "encina."

55. *Quercus brandegei* Goldman, Contr. U. S. Nat. Herb. 16:321. 1916.

Baja California; type locality, Rancho El Paraíso, near El Triunfo.

Moderately large evergreen tree with slender tomentulose twigs and minute round brown velvety buds; leaves small (scarcely 2 cm. wide and 3 to 6 cm. long), densely hoary beneath, elliptic-oblong, mucronately acute, rounded or acute at base, entire or with a few irregular low pungent teeth, the short petiole canescent; fruit rather long-peduncled; acorn conical, about 8 mm. in diameter and 15 mm. long, fully half included, the goblet-shaped cup with acute appressed scales.

56. *Quercus tomentella* Engelm. Trans. Acad. St. Louis 3: 393. 1877.

Guadalupe Island, Baja California.

Moderate-sized evergreen tree with rather stout short-pilose twigs and tomentulose buds as much as 7 mm. in diameter and 12 mm. long; leaves moderate (4 to 7 cm. wide, 7 to 12 cm. long), coriaceous, granular on the midrib above, the whitened lower surface more or less persistently fleecy, elliptic-ovate, acute or subacuminate, subcordate, toothed, with short villous petiole; acorn ovoid or elongate, sometimes 30 mm. in diameter and 35 mm. long, scarcely ever half included, the thick half-round cup with its scales embedded in tomentum; wood hard, close-grained, yellowish brown, its specific gravity about 0.72.

57. *Quercus palmeri* Engelm. Trans. Acad. St. Louis 3: 393. 1877.

Quercus dunnii Kellogg, Pacif. Rural Press, June 7, 1879.

Quercus chrysolepis palmeri Engelm. in S. Wats. Bot. Calif. 2: 97. 1880.

Northern Baja California. Also in San Diego County, California, the type locality.

Evergreen shrub with slender, minutely scurfy twigs; leaves small (2 cm. wide, 3 cm. long), coriaceous, glabrate, rounded, acute, cordate, crisped or folded, typically coarsely and pungently dentate; acorn conic-oblong, 15 mm. in diameter, 25 to 30 mm. long, the subturbinate undulate-margined cup very fulvous-woolly.

58. *Quercus emoryi*¹ Torr. in Emory, Notes Mil. Recon. 151. 1848.

Quercus hastata Liebm. Overs. Dansk. Vid. Selsk. Forh. 1854: 171. 1854.

Chihuahua and Sonora. Texas to Arizona; type from Texas.

Small deciduous tree with slender glabrescent red twigs and glossy brown glabrate buds sometimes 3 mm. in diameter and 8 mm. long; leaves small (1 to

¹ William H. Emory (1811-1887), was a member of the commission for establishing the boundary between the United States and Mexico. He was the author of "Notes of a military reconnoissance from Fort Leavenworth in Missouri to San Diego in California" (1848), and of the "Report of the United States and Mexican Boundary Commission" (1857).

2 cm. wide, 3 to 6 cm. long), thick and hard, from minutely scurfy glabrescent, elliptic or oblong to ovate, mucronately acute, truncate at base or subcordate, short-petioled, characteristically repandly few-toothed; acorn narrowly ellipsoid, 8 mm. in diameter, 15 to 20 mm. long, one-third included, the rounded cup with blunt appressed scales; wood rather soft, strong but brittle, close-grained, dark brown, its specific gravity about 0.93.

The acorns are said to be of good quality as food.

59. *Quercus durifolia* Seemen, Bot. Jahrb. Engler 29: 95. 1900.

Durango; type locality, Durango.

Twigs slender, subglabrescent; buds glossy light brown, small; leaves (deciduous?) very small (1 cm. wide, 3 to 4 cm. long), firm, canescent beneath, short-lanceolate, mucronately acute, obliquely subtruncate at base, short-petioled, mostly with a few short teeth; acorn round-ovoid, under 10 mm. in diameter, fully half included, the rounded cup with blunt appressed scales.

60. *Quercus eduardi* Trel.

Quercus oligodonta Seemen, Bot. Jahrb. Engler 29: 96. 1900. Not *Q. oligodonta* Saporta, 1879.

Durango, Jalisco, and Tepic; type from Durango.

Small deciduous tree with slender glabrescent twigs and glossy, light brown, small buds; leaves small (2 to 4 cm. wide, 3 to 6 cm. long), firm, rather persistently stellate-scurfy beneath, oblong-elliptic, mucronately subacute, slightly cordate, with short glabrescent petiole, entire or with several aristate teeth; acorn ovoid or oblong, scarcely 8 mm. in diameter and 10 mm. long, half included, the turbinate cup with rounded appressed scales.

"Encina colorada"; the dark red wood valuable.

61. *Quercus devia* Goldman, Contr. U. S. Nat. Herb. 16: 322. 1916.

Baja California; type locality, between El Sauz and Chuparosa.

Moderately large evergreen tree, about 20 meters high, with slender glabrescent twigs and small, acutely ovoid, glabrescent buds; leaves rather small (1 to 3 cm. wide, 5 to 10 cm. long), often somewhat dingy-tomentose beneath, broadly lanceolate or oblong, very acute, subcordate, rather short-petioled, aristately toothed; acorn oblong, 8 mm. in diameter, 15 to 20 mm. long, the shallow cup with blunt appressed scales. "Encina negra."

62. *Quercus hypoleuca* Engelm. Trans. Acad. Sci. St. Louis 3: 384. 1877.

Chihuahua and Sonora. New Mexico (type locality, Santa Rita) and Arizona.

Shrub or small to moderately large subevergreen tree with rather slender gray-tomentose twigs and small red buds with ciliate scales; leaves rather small (2 to 3 cm. wide, 5 to 10 cm. long), rugose, revolute, blue-green above, densely pale-tomentulose beneath, lanceolate, aristately very acute, rounded at base, moderately petioled, typically entire; acorn narrowly conic-oblong, 8 mm. in diameter, 10 to 15 mm. long, scarcely one-third included, the turbinate cup with blunt, appressed, at first very tomentose scales; wood hard and strong, close-grained, dark brown, the specific gravity about 0.80.

63. *Quercus scytophylla* Liebm. Overs. Dansk. Vid. Selsk. Forh. 1854: 180. 1854.

Oaxaca and Michoacán; type locality, Yalala to Yabochi, Oaxaca.

Twigs rather slender, glabrescent; buds small, glossy brown, glabrescent; leaves (deciduous?) large (7 to 8 cm. wide, 13 to 15 cm. long), rugose, densely creamy-tomentulose beneath, typically obovate and acute, obliquely acute or rounded at base, moderately petioled, characteristically with several short aristate teeth above; acorn ovoid, 10 mm. in diameter, 15 to 20 mm. long, the rounded or saucer-shaped cup with blunt appressed scales. "Encina" (Michoacán).

64. *Quercus omissa* A. DC. in DC. Prodr. 16²: 28. 1864.

Type locality, somewhere in the western Sierra Madre.

Twigs moderate, somewhat puberulent; buds elongate, dull brown, hairy at tip, scarcely 3 mm. in diameter and 6 mm. long; leaves (deciduous?) rather small (3 to 4 cm. wide, 5 to 6 cm. long), rugose, slightly revolute, creamy-tomentulose beneath, typically obovate, obtuse, cordate, short-petioled, aristately somewhat coarsely stiff-serrate above; acorn subglobose, 8 mm. in diameter, the rather deep cup with very blunt appressed scales.

65. *Quercus pulchella* Humb. & Bonpl. Pl. Aequin. 2: 44. 1809.

Type locality, between Guanajuato and Santa Rosa.

Twigs slender, glabrescent; buds small, dark brown, glabrate; leaves deciduous, small (2 to 3 cm. wide, 4 to 6 cm. long), rugose, yellow-tomentulose beneath, oblong-obovate, obtuse, often subtruncately cordate, slender-petioled, aristately low-serrate; fruit annual (?), the rounded cup with glabrous blunt appressed scales.

66. *Quercus floccosa* Liebm. Overs. Dansk. Vid. Selsk. Forh. 1854: 178. 1854.

Veracruz?; type from the Pico de Orizaba, at 2,600 to 3,200 meters.

Twigs moderate, at first rusty-scurfy; leaves (deciduous?) rather large (6 to 9 cm. wide, 9 to 16 cm. long), rugose, typically fleecy beneath, elliptic-obovate, aristately subacute, rounded at base, entire or with a few short teeth above, the moderate petiole fleecy; fruit unknown.

67. *Quercus crassifolia* Humb. & Bonpl. Pl. Aequin. 2: 49. 1809.

Quercus spinulosa Mart. & Gal. Bull. Acad. Brux. 10²: 218. 1843.

Guerrero to Veracruz and San Luis Potosí; type locality, Chilpancingo, Guerrero.

Rather large deciduous tree with somewhat stout, more or less scurfy twigs and glossy glabrate buds 3 mm. in diameter and 5 mm. long; leaves large (6 to 9 cm. wide, 12 to 14 cm. long), rugose, scurfy on the nerve above, tawny-fleecy beneath with the denudable surface granular, elliptic, obovate, or rounded, variously obtuse or subacuminate, cordate, short-petioled, aristate-undulate or stiffly low-toothed; fruit annual; acorn ellipsoid, 12 mm. in diameter, 15 to 20 mm. long, one-third or more included, the deep saucer-shaped cup with rounded appressed scales.

68. *Quercus fulva* Liebm. Overs. Dansk. Vid. Selsk. Forh. 1854: 183. 1854.

Chihuahua, Durango, and Michoacán; the type from an unrecorded locality in the western Sierra Madre.

Twigs stout, densely tomentose; buds brownish, tomentose; leaves 4 to 9 cm. wide, 8 to 14 cm. long, densely tomentose beneath, petioled, aristately serrate. "Roble" (Durango).

69. *Quercus stipularis* Humb. & Bonpl. Pl. Aequin. 2: 47. 1809.

Type locality, near Actopan (Veracruz?).

Twigs rather stout, fleecy; buds brownish, somewhat pubescent, 3 mm. in diameter, 5 mm. long; leaves deciduous, moderate (4 to 5 cm. wide, 7 to 10 cm. long), rugose, puberulent above on the midrib, rusty-fleecy beneath, elliptic-ovate to obovate, subacuminate, cordate, moderately petioled, aristately serrate; fruit annual; acorn ovoid, 12 mm. in diameter, 15 mm. long, scarcely one-third included, the rounded cup with blunt, rather loose scales.

70. *Quercus chicamolensis* Trel.

Quercus mollis Mart. & Gal. Bull. Acad. Brux. 10²: 216. 1843. Not *Q. mollis* Raf. 1838.

Oaxaca; type locality, in the Mixteca Alta.

Rather small (deciduous?) tree with moderate, at first densely tomentose twigs; leaves rather small (4 cm. wide, 5 to 6 cm. long), rugose, yellow-tomentose beneath, rather obovate and acute, cordate, short-petioled, entire but ciliate aristate above; acorn unknown, the rounded cup with blunt appressed scales.

71. *Quercus dysophylla* Benth. Pl. Hartw. 55. 1840.

San Luis Potosí, Veracruz, and Hidalgo; type locality, mountains near Huasca, Hidalgo.

Twigs moderate, subglabrescent; buds glossy red-brown, canescent, 3 mm. in diameter, 5 mm. long; leaves deciduous, rather small (2 to 3 cm. wide, 5 to 8 cm. long), revolute, subglabrescent above, rusty-tomentose beneath, oblong, ovate, or elliptic, subacute, cordate, moderately petioled, entire or less characteristically coarsely mucronate-toothed; acorn ovoid or elongate, 10 mm. in diameter, 15 to 18 mm. long, the shallow turbinate cup with obtuse appressed scales. "Manzanilla" (Hidalgo).

To be compared with no. 40, *Quercus diversifolia*, and with the following.

72. *Quercus splendens* Née, Anal. Cienc. Nat. 3: 275. 1801.

Type locality, Tixtla, Guerrero.

Small open-topped tree with moderate yellow-tomentose twigs; leaves (deciduous?) rather small (3 to 4 cm. wide, 8 cm. long), puberulent above, yellow-tomentose beneath, subelliptic, ranging to ovate or obovate, acute, rounded at base or subcordate, subsessile, irregularly and unequally toothed, but not aristate; fruit unknown.

Not known from recent collections.

73. *Quercus aristata* Hook. & Arn. Bot. Beechey Voy. 444. 1841.

Tepic and Sinaloa; type locality, between San Blas and Tepic.

Twigs rather slender, transiently fleecy; buds glabrate, small; leaves deciduous, moderate (3 to 4 cm. wide, 7 to 15 cm. long), glabrescent, somewhat crisped and narrowly revolute, elliptic-oblong, aristately obtuse or subacute, rounded to cordate at base, moderately petioled, entire or undulate, sometimes aristate from the veins; fruit annual; acorn round-ovoid, 10 mm. in diameter, the deep rounded cup with blunt appressed scales.

74. *Quercus uruapanensis* Trel.

Quercus nitida Mart. & Gal. Bull. Acad. Brux. 10²: 210. 1843. Not *Q. nitida* Raf. 1838.

Michoacán and Oaxaca (?); type locality, Uruapan, Michoacán.

Thick-trunked, moderately large, deciduous tree with rather slender, glabrous, dark red twigs and small, puberulent, glossy, deep brown buds; leaves rather large (4 to 7 cm. wide, 9 to 16 cm. long), glabrous, or with axillary tufts beneath, subelliptic, acuminate, acute to truncate at base, moderately petioled, entire or exceptionally somewhat aristate-toothed above; acorn ovoid, 12 mm. in diameter, 20 mm. long, one-third included, the rounded cup with blunt appressed scales. "Encina colorada."

Yielding excellent timber.

75. *Quercus rysophylla* Weatherby, Proc. Amer. Acad. 45: 423. 1910.

Nuevo León; type locality, in the Sierra Madre above Monterrey.

Rather small tree with stout glabrate twigs and glabrescent, glossy brown, acute buds 3 mm. in diameter and 6 mm. long; leaves supersistent, large (4 to 7 cm. wide, 14 to 20 cm. long), rugose and veiny, revolute, glabrous, lanceolate, aristately long-acute, auriculate or deeply cordate at base, short-petioled, undulate; acorn unknown, the young cup with obtuse appressed golden scales.

76. *Quercus nectandraefolia* Liebm. Overs. Dansk. Vid. Selsk. Forh. 1854: 175. 1854.

Veraacruz; type locality, Totutla.

Twigs rather slender, dingy-tomentose; buds brown, glabrescent, small; leaves (deciduous?) moderate (3 to 5 cm. wide, 9 to 12 cm. long), revolute, glabrous, somewhat paler and granular beneath, elliptic, obtuse, acute to subcordate at base, subsessile, crisped but entire; fruit annual; acorn ovoid, 20 mm. in diameter, 25 mm. long, thick-walled, half included, the rounded cup with blunt thickened appressed scales.

77. *Quercus lingvaefolia* Liebm. Overs. Dansk. Vid. Selsk. Forh. 1854: 180. 1854.

Oaxaca; type locality, Cuesta de Lachopa.

Twigs moderate, glabrescent; leaves (deciduous?) moderate (3 to 4 cm. wide, 6 to 11 cm. long), slightly revolute, somewhat floccose or glabrate, elliptic, obtuse or acute, cordate, short-petioled, entire; acorn ovoid, 10 mm. in diameter, 15 mm. long, the saucer-shaped cup with blunt appressed scales.

78. *Quercus perseaeifolia* Liebm. Overs. Dansk. Vid. Selsk. Forh. 1854: 188. 1854.

Veraacruz; type locality, Hacienda de Jovo.

Twigs rather slender, glabrescent; buds small, glabrate; leaves deciduous, moderate (3 to 5 cm. wide, 6 to 12 cm. long), slightly revolute, glabrate, oblanceolate-elliptic, obtuse at both ends, very short-petioled, entire; fruit annual; acorn oblong, 10 mm. in diameter, 15 mm. long, one-third included, the turbinate cup with blunt appressed scales.

79. *Quercus pubinervis* Mart. & Gal. Bull. Acad. Brux. 10²: 211. 1843.

Veraacruz; type locality, about Huatusco.

Rather large deciduous tree with slender tomentose twigs and small red-brown glabrate buds; leaves moderate (4 to 5 cm. wide, 8 to 12 cm. long), somewhat revolute, the midrib puberulent above and the lower surface somewhat persistently fleecy, lance-ovate to elliptic-oblanceolate, rounded at both ends, very short-petioled, entire or low-undulate; fruit annual; acorn oblong, 10 mm. in diameter, 15 mm. long, one-third included, the turbinate cup with blunt appressed scales.

80. *Quercus oajacana* Liebm. Overs. Dansk. Vid. Selsk. Forh. 1854: 178. 1854.

Quercus salicifolia oajacana Wenzig, Jahrb. Bot. Gart. Berlin 3: 207. 1884.

Oaxaca; type locality, between Tanetze and Talea.

Twigs moderate, yellow-scurfy; buds red-brown, somewhat hairy, small; leaves evergreen, moderate (3 to 4 cm. wide, 8 to 10 cm. long), with puberulent midrib above, loosely stellate beneath, lance-elliptic to subovate, acute, rounded at base, short-petioled, entire or somewhat undulate; fruit annual; acorn ovoid, 12 mm. in diameter, 15 mm. long, the shallow cup with blunt appressed scales.

81. *Quercus totulensis* A. DC. in DC. Prodr. 16²: 62. 1864.

Veraacruz; type locality, Totutla.

Twigs slender, quickly glabrous; buds glabrous, glossy light brown, 2 mm. in diameter, 5 mm. long; leaves deciduous, rather small (2 cm. wide, 6 to 8 cm. long), paler and sometimes with axillary tufts beneath, oblong, rounded at both ends or a little narrowed below, slender-petioled, entire; acorn rounded, fully half included, the rounded cup with rather acute appressed scales.

82. *Quercus salicifolia* Née, Anal. Cienc. Nat. 3: 265. 1801.

Quercus mexicana glabrata Seem. Bot. Voy. Herald 332. 1852-7.

Quercus castanca glabrata A. DC. in DC. Prodr. 16²: 72. 1864.

Guerrero; type locality apparently Acapulco.

Twigs slender, glabrous; buds small; leaves deciduous, moderate (2 to 4 cm. wide, 10 to 15 cm. long), glabrous, lanceolate, aristately long-acute, typically rounded at base, short-petioled, entire; fruit annual (?); acorn subglobose, 12 mm. in diameter, half included, the subturbinate cup with appressed scales. "Encina saucillo" (Durango).

83. *Quercus ghiesbreghtii* Mart. & Gal. Bull. Acad. Brux. 10²: 212. 1843.

Veracruz; type locality, on Mount Orizaba, at 3,300 meters.

Moderate-sized evergreen tree with rather slender, at first dingy-tomentose twigs and small, glabrate, glossy brown buds; leaves moderate (3 cm. wide, 8 to 10 cm. long), somewhat pubescent on the veins beneath, lanceolate, long-acute, very round-based, moderately petioled, entire; fruit annual; acorn short-ovoid, 10 mm. in diameter, 12 mm. long, the turbinate saucer-shaped cup with blunt appressed scales.

84. *Quercus tlapuxahuensis* A. DC. in DC. Prodr. 16²: 29. 1864.

Quercus salicifolia tlapuxahuensis Wenzig, Jahrb. Bot. Gart. Berlin 3: 207. 1884.

Michoacán; type locality, Tlapuxahua.

Twigs moderate, glabrous; buds small, dull brown, loosely hairy above; leaves (deciduous?) moderate (3 cm. wide, 7 to 10 cm. long), glabrous or the midrib slightly puberulent above and the lower surface with axillary tufts, lanceolate, aristately acute, rounded at base, slender-petioled, entire; fruit annual; acorn short-ovoid, 12 cm. in diameter, 15 mm. long, fully half included, the rounded cup with obtuse, appressed, somewhat revolutely thickened scales.

85. *Quercus lanceolata* Humb. & Bonpl. Pl. Aequin. 2: 34. 1809.

Hidalgo; type locality, between Morán and Santa Rosa.

Rather small (subevergreen?) tree with slender, transiently scurfy twigs and small glabrescent brown buds; leaves rather small (3 cm. wide, 7 to 10 cm. long), glabrous, or slightly scurfy above or fleecy in the axils beneath, lanceolate, acute at both ends or rounded at base, slender-petioled, entire or occasionally with a few low aristate teeth; acorn ovoid, 10 mm. in diameter, 12 mm. long, scarcely half included, the rounded cup with glabrous blunt appressed scales somewhat thickened toward the base.

86. *Quercus laurina* Humb. & Bonpl. Pl. Aequin. 2: 32. 1809.

Hidalgo; type locality, Cerro de las Navajas, near Morán.

Very like the preceding, the deciduous leaves rather more broadly oblanceolate, the fruit apparently annual, and the cupule scales less commonly thickened.

87. *Quercus major* (A. DC.) Trel.

Quercus nitens major A. DC. in DC. Prodr. 16²: 69. 1864.

Quercus laurina major Wenzig, Jahrb. Bot. Gart. Berlin 3: 205. 1884.

Veracruz; type locality, Alpatlahua.

Twigs rather slender, glabrate; buds small, acute, glabrescent; leaves deciduous, moderate (2 to 4 cm. wide, 6 to 9 cm. long), glabrous, or puberulent along the midrib above and with axillary tufts beneath, lanceolate to oblanceolate-ovate, acute at both ends or rounded at base, slender-petioled, characteristically serrately incised with aristate teeth; acorn ovoid, 10 mm. in diameter, 15 mm. long, half included, the rounded cup with blunt appressed scales.

88. *Quercus barbinervis* Benth. Pl. Hartw. 56. 1840.

Quercus laurina barbinervis Wenzig, Jahrb. Bot. Gart. Berlin 3: 205. 1884.

Hidalgo; type locality, Real del Monte.

Twigs rather slender, sparsely tomentose; buds small, glabrescent; leaves deciduous, small (scarcely 3 cm. wide and 5 cm. long) or on shoots larger

(as much as 5 cm. wide and 13 cm. long), glabrate, or with fleecy axils beneath, slightly revolute, elliptic-obovate, acute, mostly rounded at base, the moderate petiole pubescent, coarsely few-toothed above; fruit annual (?); acorn ovoid, 10 to 12 mm. in diameter, 15 to 18 mm. long, half included, the rounded cup with blunt appressed scales.

89. *Quercus affinis* Scheidw. Hort. Belg. 4: 321. 1837.

Type locality, between Regla and Istula, Hidalgo.

Twigs slender, at first scurfy; buds small, glabrous, glossy brown; leaves evergreen, small (2 cm. wide, 7 to 9 cm. long), glossy, glabrous, oblong-lanceolate, acute at both ends, moderately petioled, sharply setaceous-serrate with short teeth; fruit biennial (?); acorn unknown, the immature cup with rather acute appressed scales.

90. *Quercus ocoteaefolia* Liebm. Overs. Dansk. Vid. Selsk. Forh. 1854: 176. 1854.

Quercus laurina ocoteaefolia Wenzig, Jahrb. Bot. Gart. Berlin 3: 205. 1884.

Oaxaca and Puebla; also in Michoacán (?); type locality, Talea and Laguna, Oaxaca.

Small deciduous tree with slender glabrescent twigs and small, glossy brown, glabrescent buds; leaves moderate (3 cm. wide, 8 to 10 cm. long), glossy, glabrous, or with axillary tufts beneath, lanceolate, acute at both ends or somewhat rounded at base, shortly slender-petioled, entire or less commonly with a few teeth; acorn ovoid, 8 mm. in diameter, 10 mm. long, half included, the rounded cup with blunt appressed scales.

91. *Quercus depressa* Humb. & Bonpl. Pl. Aequin. 2: 50. 1809.

Hidalgo; type locality, El Jacal, Morán.

Low evergreen shrub with slender stellate-scurfy twigs and small, dull brown, glabrate buds; leaves small (1 to 2 cm. wide, 3 to 4 cm. long), rather thick, slightly revolute, glabrate or the midrib puberulent above, lance-elliptic, acute or acuminate, rounded at base, short-petioled, usually with a few coarse teeth; acorn ovoid, acute, 8 mm. in diameter, 12 mm. long, half included, the rounded cup with blunt appressed scales.

92. *Quercus orizabae* Liebm. Overs. Dansk. Vid. Selsk. Forh. 1854: 189. 1854.

Veracruz (?); type locality, Pico de Orizaba, at 2,600 to 3,300 meters, with *Q. floccosa*.

Twigs moderate, at first rusty-fleecy; buds small, red-brown, somewhat hairy; leaves (deciduous?) rather large (3 to 7 cm. wide, 8 to 14 cm. long), glabrescent above, somewhat fleecy beneath, slightly revolute, elliptic-ovate, acute, obliquely rounded at base, slender-petioled, entire or artistately about 3-toothed at end; fruit unknown.

93. *Quercus sideroxylla* Humb. & Bonpl. Pl. Aequin. 2: 39. 1809.

Guanajuato; type locality, Santa Rosa.

Large evergreen tree with slender lanose twigs and small brown glabrescent buds; leaves small (2 cm. wide, 4 to 6 cm. long), the lower surface sometimes hairy-tufted, broadly oblong, subacute, cordate at base, short-petioled, sharply and rather incisely toothed; acorn ovoid, 10 mm. in diameter, 12 mm. long, half included, the rounded cup with blunt appressed scales.

94. *Quercus chrysophylla* Humb. & Bonpl. Pl. Aequin. 2: 42. 1809.

Hidalgo; type locality, between Pachuca and Morán.

Moderate-sized deciduous tree with slender glabrescent twigs and small reddish glabrous buds; leaves small (2 cm. wide, 4 to 6 cm. long), from scurfy glabrescent, oblanceolate-oblong, with straight margin, subacute, rounded at base, moderately petioled, setaceous several-toothed at end; fruit unknown.

95. *Quercus tridens* Humb. & Bonpl. Pl. Aequin. 2: 35. pl. 82. 1809.

Hidalgo; type locality, Morán.

Very like the preceding, the short-petioled leaves entire or aristately about 3-toothed at the end; mature foliage characters, even, unknown for both species.

96. *Quercus mexicana* Humb. & Bonpl. Pl. Aequin. 2: 35. 1809.

Quercus castanea mexicana A. DC. in DC. Prodr. 16²: 72. 1864.

Quercus castanea integra Oerst. Bidr. Kundsk. Egefam. 362. 1871.

Veracruz and Guanajuato; type locality, Santa Rosa, Guanajuato.

Small or moderately large deciduous tree with slender glabrescent twigs and small brown glabrescent buds; leaves small or narrow (2 to 5 cm. wide, 10 cm. long), rugose, revolute, the midrib puberulent above and the granular lower surface detachably tomentose, elliptic-oblong, subacute, rounded at base or slightly cordate, short-petioled, entire; acorn ovoid, 10 mm. in diameter, 12 mm. long, half included, the thick-stalked rounded cup with glabrate blunt appressed scales, these sometimes thickened at base or with outcurved margin.

With still narrower leaves (1.5 cm. wide and 7 cm. long) it is *Q. crassipes angustifolia* Humb. & Bonpl. (op. cit. 37. 1809); and a form of this with crowded leaves is *Q. confertifolia* Humb. & Bonpl. (op. cit. 53. 1809).

97. *Quercus crassipes* Humb. & Bonpl. Pl. Aequin. 2: 37. 1809.

Mexico, Guanajuato, and Hidalgo; type locality, Santa Rosa, Guanajuato.

Similar to the preceding, but the turbinate cup inrolled at the margin.

98. *Quercus lanigera* Mart. & Gal. Bull. Acad. Brux. 10²: 215. 1843.

Oaxaca; type locality in the Mixteca Alta.

Twigs slender, glabrescent; buds small, brown, glabrescent; leaves deciduous, small (2 to 3 cm. wide, 5 to 6 cm. long), detachably fleecy beneath, elliptic-oblong, aristately obtuse or acute, rounded at base, moderately petioled, entire or with a few awned teeth above; fruit annual; acorn subglobose, scarcely 10 mm. in diameter, the somewhat turbinate cup with blunt appressed scales.

99. *Quercus castanea* Née, Anal. Cienc. Nat. 3: 276. 1801.

Quercus mucronata Willd. Sp. Pl. 4: 436. 1805.

Hidalgo; type locality, between Ixmiquilpan and Zimapan and Acámbaro.

Small (deciduous?) tree with rather slender glabrescent twigs and glabrous brown buds 2 mm. in diameter and 4 mm. long; leaves rather small (3 to 4 cm. wide, 7 to 9 cm. long), rugulose, minutely stellate beneath, lance-oblong, aristately acute, rounded at base or subcordate, short-petioled, typically aristately low-serrate above; fruit annual; acorn round-ovoid, 8 mm. in diameter, 10 mm. long, the rounded cup with blunt appressed scales.

A form with slightly obovate-elliptic, typically entire leaves, from the same region, is *Q. elliptica* Née (op. cit. 278. 1801).

100. *Quercus rugulosa* Mart. & Gal. Bull. Acad. Brux. 10²: 209. 1843.

Hidalgo; type locality, San Pedro y San Pablo, near Real del Monte.

Moderate-sized deciduous tree with rather slender glabrescent twigs and small, brown, at first fleecy buds; leaves rather small (2 to 4 cm. wide, 6 to 9 cm. long), minutely revolute, reticulately venulose, somewhat stellate, especially on the granular lower surface, elliptic-oblong, mucronately obtuse or subacute, rounded at base or somewhat cordate, moderately petioled, entire; acorn short, the somewhat turbinate small cup with blunt thin scales.

101. *Quercus grandis* Liebm. Overs. Dansk. Vid. Selsk. Forh. 1854: 183. 1854.

Oaxaca. Northern Guatemala, the type locality.

Large deciduous tree with rather slender glabrate twigs and small brown glabrescent buds; leaves large (5 to 10 cm. wide, 14 to 23 cm. long), glabrous,

somewhat paler beneath, oblanceolate, acute, commonly narrowed at base, slender-petioled, with rather distant aristate teeth; acorn depressed, 20 to 25 mm. in diameter, two-thirds or more included, the urceolate, slightly umbonate cup with thin blunt scales somewhat outcurved at margin.

102. *Quercus cortesii* Liebm. Overs. Dansk. Vid. Selsk. Forh. 1854: 175. 1854.

Veracruz; type locality, between Hacienda de Jovo and Huitamalco.

Twigs slender, glabrous; buds small, straw-colored, glabrescent; leaves (deciduous?) moderate (3 cm. wide, 12 cm. long), glabrous, or with axillary tufts beneath, narrowly lanceolate, acute at both ends, moderately petioled, rather distantly aristate-serrate; fruit unknown.

103. *Quercus huitamalcana* Trel.

Quercus serra Liebm. Overs. Dansk. Vid. Selsk. Forh. 1854: 174. 1854. Not *Q. serra* Unger, 1845.

Veracruz and Puebla; type locality, between Huitamalco and Teziutlán, altitude 2,000 meters.

Twigs rather slender, glabrate; buds light brown, glabrescent, 2 mm. in diameter, 3 to 4 mm. long; leaves (deciduous?) large (4 to 7 cm. wide, 16 to 20 cm. long), glabrous and glossy, crisped, lanceolate, the base various, moderately petioled, coarsely deltoid-serrate; fruit unknown.

104. *Quercus chiapasensis* Trel. Proc. Amer. Phil. Soc. 54: 9. 1915.

Chiapas; type locality, Finca Irlanda.

Large evergreen tree with moderate glabrescent twigs and hairy buds; leaves large (4 to 8 cm. wide, 12 to 15 cm. long), glabrous, lanceolate, long-acute, the base various, the petiole moderate or long, coarsely serrate or incised with aristate teeth; acorn broadly ovoid, 30 to 40 mm. in diameter, the large saucer-shaped cup with thickened appressed scales.

Polymorphic in foliage details.

105. *Quercus skinneri* Benth. Pl. Hartw. 90. 1842.

Guatemala (type locality, in the mountains about Quezaltenango); possibly also in Chiapas.

Large (deciduous?) tree, similar to the preceding, but the equally long round-based leaves ovate, with longer slender petiole, and fruit even larger.

106. *Quercus sartorii* Liebm. Overs. Dansk. Vid. Selsk. Forh. 1854: 177. 1854.

Veracruz; type locality, Totutla.

Deciduous tree with rather slender glabrescent twigs and brown glabrescent buds 3 mm. in diameter and 6 mm. long; leaves moderate (3 to 5 cm. wide, 9 to 13 cm. long), glabrescent, or with axillary tufts beneath, lance-elliptic, acute, typically rounded at base, slender and often long-petioled, entire with aristate veins or very low-serrate; fruit annual; acorn round-ovoid, 10 mm. in diameter, 12 mm. long, the sometimes turbinate cup with obtuse appressed scales.

107. *Quercus furfuracea* Liebm. Overs. Dansk. Vid. Selsk. Forh. 1854: 189. 1854.

Oaxaca; type locality, Chinantla.

Twigs rather slender, scurfy or glabrescent; buds small, light brown, glabrescent; leaves deciduous, moderate (3 to 5 cm. wide, 8 to 12 cm. long), gray-stellate and tufted beneath, ovate to lanceolate, acute, mostly rounded at base, moderately petioled, entire or aristately low-crenate-serrate; acorn round-ovoid, 8 mm. in diameter, 10 mm. long, the somewhat turbinate deep cup with blunt appressed scales.

108. *Quercus grahami*¹ Benth. Pl. Hartw. 57. 1840.

Oaxaca; type locality not recorded.

Rather large deciduous tree with slender glabrous twigs and small, light brown, glabrescent buds; leaves moderate (2 to 4 cm. wide, 7 to 12 cm. long), glabrous, or sparsely scurfy and tufted in the axils beneath, very venulose, lanceolate, rather taper-pointed, typically rounded at base, slender-petioled, setaceously serrate or incised; acorn ovoid, 12 mm. in diameter, 15 to 20 mm. long, half included, the rounded cup with blunt appressed scales.

109. *Quercus acutifolia* Née, Anal. Cienc. Nat. 3: 267. 1801.

Type locality above the Río Mescala, on the road from Acapulco to the City of Mexico.

Rather small evergreen tree with rather slender glabrate twigs and brown glabrate buds 3 mm. in diameter and 6 mm. long; leaves large (5 to 7 cm. wide, 15 to 20 cm. long), glabrous, or the midrib puberulent above and the axils tufted beneath, lance-ovate, acute or attenuate, the base mostly rounded, rather long-petioled, aristately serrate or almost lobed, with rounded sinuses; fruit unknown. "Aguatle."

110. *Quercus xalapensis* Humb. & Bonpl. Pl. Aequin. 2: 24. 1809.

Veracruz; type locality, Jalapa.

Rather large deciduous tree with moderate glabrate twigs and brown glabrate acute buds 2 to 3 mm. in diameter and 5 mm. long; leaves large (4 to 8 cm. wide, 10 to 15 cm. long), glabrous, or with some axillary tufts beneath, broadly or ovately lanceolate, acute, typically acute at base or decurrent on the slender petiole, setaceously serrate with the margin little indented; acorn round-ovoid, 18 mm. in diameter, 20 mm. long, half included, the rounded cup with blunt, rather loose scales. "Roble de duela," "encina roble" (Veracruz, Ramírez).

111. *Quercus calophylla* Cham. & Schlecht. Linnaea 5: 79. 1830.

Veracruz; type locality, Jalapa.

Large (deciduous?) tree with moderate fleecy or glabrate twigs and dull brown glabrescent buds as much as 12 mm. long; leaves large (4 to 7 cm. wide, 11 to 13 cm. long), densely creamy-tomentulose beneath, ovate to obovate or elliptic, acute or acuminate, rounded or obliquely truncate at base, moderately petioled, somewhat bristly-serrate at the end; acorn ovoid, 18 mm. in diameter, 20 to 25 mm. long, one-third included, the half-round cup with blunt, rather loose scales.

With long-acuminate low-denticulate leaves as much as 12 cm. wide and 22 cm. long it is *Q. acuminata* Mart. & Gal. (Bull. Acad. Brux. 10²: 217. 1843). With blunt-pointed, rather deeply serrate and acute-based leaves 5 cm. wide and 13 cm. long, it is *Q. intermedia* Mart. & Gal. (op. cit. 223. 1843). A form with acute, sharply toothed leaves 5 cm. wide and 10 cm. long, or exceptionally 11 cm. wide and 18 cm. long. *Q. alamo* Benth. (Pl. Hartw. 55. 1842), is called "álamo" because of its soft poplar-like wood.

112. *Quercus candicans* Née, Anal. Cienc. Nat. 3: 277. 1801.

Type locality, Tixtla, Guerrero.

Moderate-sized deciduous tree with moderate, rather persistently tomentose twigs and ovoid glabrate buds 3 mm. in diameter and 5 to 7 mm. long; leaves typically large (10 to 15 cm. wide, 15 to 25 cm. long), densely creamy-tomentu-

¹G. J. Graham collected a series of about 400 specimens of plants about the City of Mexico, Talpuxahua, and Real del Monte. These were reported upon by Bentham in his "Plantae Hartwegianae."

lose beneath, elliptic-obovate, subacute, variously narrowed or rounded or truncate at base, moderately petioled, aristately repand to rather deeply lobed; fruit unknown. "Encina de asta."

Sapwood red, the heart dark, with still darker stripes.

23. ULMACEAE. Elm Family.

Trees or shrubs; leaves deciduous or persistent, alternate, entire or dentate, usually rough; flowers small, greenish, perfect or unisexual; fruit 1-seeded.

Fruit dry.

Fruit not winged.....1. **CHAETOPTELEA**.

Fruit winged.....2. **ULMUS**.

Fruit a drupe.

Leaves opposite.....3. **LOZANELLA**.

Leaves alternate.

Pistillate flowers in lax many-flowered cymes; plants unarmed.

4. **TREMA**.

Pistillate flowers solitary or few; plants often armed with spines.

5. **CELTIS**.

1. **CHAETOPTELEA** Liebm. Nat. For. Kjöbenhavn Vid. Medd. 1850: 54. 1850.

1. *Chaetoptelea mexicana* Liebm. Nat. For. Kjöbenhavn Vid. Medd. 1850: 76. 1850.

Ulmus mexicana Planch. in DC. Prodr. 17: 156. 1873.

Veracruz, the type from Mirador; reported from Oaxaca. Costa Rica and Panama.

Large tree, 15 to 40 meters high, with open crown, the branches ascending; bark gray, somewhat scaly; leaves deciduous, oblong-ovate, acuminate, serrate; flowers yellow; wood hard, heavy, strong, very tough, rather fine-grained, light or dark brown, sometimes with darker lines. "Olmo" (Oaxaca, Veracruz); "papalote," "cempoalehuatl" (Veracruz); "ira" (Costa Rica); "ceniza," "cenizo" (Panama).

The wood is used in Mexico for lumber. The bark is astringent and is used for treating coughs.

Planchon¹ has stated that this plant differs in no way from *Ulmus*. All the species of the latter genus, however, have a broadly winged fruit, while in *Chaetoptelea* there is no vestige of a wing, and this is a probably a sufficient basis for the maintenance of Liebmann's genus.

2. ULMUS L. Sp. Pl. 225. 1753.

Sessé and Mociño reported² *Ulmus americana* from Mexico. The plant so named (if the report is based on an actual plant) probably belongs to some other genus.

The members of this genus (the elms) are perhaps the finest shade trees for temperate regions, although they are of slow growth. The wood of most species is extremely tough.

1. *Ulmus crassifolia* Nutt. Trans. Amer. Phil. Soc. 5: 169. 1837.

No Mexican specimens seen by the writer, but the species is common along the Rio Grande in Texas, and doubtless occurs in Nuevo León and Tamaulipas. Texas to Mississippi.

Tree, sometimes 30 meters high, with a trunk diameter of 1 meter, the branches drooping; bark thick, brown, deeply fissured; leaves oblong or ovate,

¹ In DC. Prodr. 17: 156. 1873.

² Pl. Hisp. 45. 1887.

5 cm. long or smaller, short-petiolate, finely serrate; flowers small, clustered, appearing in autumn; fruit 8 to 10 mm. long, hairy; wood reddish brown, rather weak, its specific gravity about 0.70.

The wood is used locally for furniture and wheel hubs.

3. LOZANELLA Greenm. Proc. Amer. Acad. 41: 236. 1905.

The following is the only species of the genus, which was named in honor of Señor Don Filemón L. Lozano, who assisted Pringle in his Mexican collections.

1. *Lozanella trematoides* Greenm. Proc. Amer. Acad. 31: 236. 1905.

Known only from the type locality, "Honey Station," near Trinidad, Hidalgo.

Shrub or small tree, 2 to 6 meters high; leaves slender-petioled, ovate, 5 to 9 cm. long, acuminate, serrate, 3-nerved, thinly hairy beneath; flowers dioecious, small and green, the pistillate in axillary cymes; perianth 5 or 6-parted; fruit a sessile ovoid greenish drupe.

4. TREMA Lour. Fl. Cochinch. 562. 1790.

1. *Trema micrantha* (L.) Blume, Ann. Mus. Bot. Lugd. Bat. 2: 58. 1853.

Rhamnus micranthus L. Syst. Nat. ed. 10. 2: 937. 1759.

Celtis canescens H. B. K. Nov. Gen. & Sp. 2: 28. 1817.

Celtis schiedeana Schlecht. Linnaea 7: 140. 1832.

Sponia micrantha Decaisne, Nouv. Ann. Mus. Paris 3: 498. 1834.

Sinaloa to Veracruz and southward. Florida, West Indies, Central America, and tropical South America.

Shrub or small tree, 2 to 6 meters high or in some parts of its range still larger, the trunk occasionally 10 to 15 cm. in diameter; leaves ovate, finely serrate, 3-nerved, acute or acuminate, 5 to 12 cm. long, their pubescence variable in amount; flowers very small, greenish white, cymose; fruit small (about 1.5 mm. in diameter), globose, green or reddish; wood light, soft, close-grained, light brown. "Ixpepe" (Veracruz); "equipal" (Michoacán); "yaco de cuero" (Oaxaca, *Reko*); "jucó," "capulfn," "vara blanca" (Costa Rica); "capulí" (Guatemala); "masaquila" (Venezuela); "memiso" (Santo Domingo); "palo de cabra," "guacimilla" (Porto Rico).

The bark contains very strong fiber. The species of this genus seem to be of little economic importance. *T. commersonii* Blume, of Madagascar, is highly esteemed for medicinal purposes by the natives, and stomachic, astringent, febrifuge, diuretic, and antisiphilitic properties are attributed to it.

5. CELTIS L. Sp. Pl. 1043. 1753.

Large or small trees or shrubs, sometimes scandent, armed or unarmed; leaves deciduous or somewhat persistent, entire or dentate, often unequal at base; flowers small, the pistillate usually solitary and long-pedicellate; fruit globose, with thin flesh and a large seed.

The fruit of all the species is sweet and edible, especially in the spineless species (hackberries or sugarberries), but the pulp is very scant. The Indians of some parts of the United States seem to have been very fond of it. They pounded the fruit fine, seeds and all, and ate it with fat or mixed with parched corn.¹

¹ See M. R. Gilmore, Uses of plants by the Indians of the Missouri River region. Ann. Rept. Bur. Amer. Ethnol. 33: 45-154. pl. 1-30. 1919.

Plants armed with spines.

- Leaves mostly 3 to 5.5 cm. wide, with numerous small teeth, or sometimes entire; fruit short-pilose.....1. *C. iguanaea*.
 Leaves mostly 1 to 2 cm. wide, with few coarse teeth; fruit glabrous or nearly so.....2. *C. pallida*.

Plants unarmed.

- Leaves pinnately nerved, not at all 3-nerved, the lateral nerves very numerous.....3. *C. monoica*.
 Leaves conspicuously 3-nerved at the base, the lateral nerves few, distant.
 Leaves finely pilose beneath, usually dentate near the apex. Leaves usually scabrous on the upper surface.....4. *C. caudata*.
 Leaves glabrate or sparsely puberulent beneath, entire.
 Leaves very thick, scabrous on the upper surface and grayish green, the venation very prominently reticulate beneath.....5. *C. reticulata*.
 Leaves thin, smooth on the upper surface and deep green, the venation not very prominently reticulate beneath.....6. *C. mississippiensis*.

1. *Celtis iguanaea* (Jacq.) Sarg. *Silv. N. Amer.* 7: 64. 1895.

Rhamnus iguanaeus Jacq. *Enum. Pl. Carib.* 16. 1760.

Mertensia lucvigata H. B. K. *Nov. Gen. & Sp.* 2: 31. 1817.

Momisia chrenbergiana Klotzsch, *Linnaea* 20: 538. 1847.

Celtis anfractuosa Liebm. *Dansk. Vid. Selsk. Skrivt. V.* 2: 338. 1851.

Celtis platycaulis Greenm. *Proc. Amer. Acad.* 39: 78. 1903.

Momisia iguanaea Rose & Standl. *Contr. U. S. Nat. Herb.* 16: 8. 1912.

Chihuahua to Baja California and southward. Central America, West Indies, and South America; southern Florida and western Texas.

Shrub or small tree, 3 to 12 meters high, the trunk often 25 to 30 cm. in diameter, the branches armed with stout, usually recurved spines, long and spreading or clambering; branchlets often compressed; leaves ovate or oval; flowers greenish yellow; fruit 8 to 12 mm. long, yellow, somewhat angled. "Granjeno" (Veracruz and elsewhere); "garabato blanco" (Sinaloa); "ña de gato," "zarza" (Cuba); "cagalera comestible" (Nicaragua); "gallito" (Santo Domingo).

The leaves are very variable in shape and toothing, but their variations seem to offer no basis for specific segregation. The leaves of this and the following species are conspicuously domatiate beneath—furnished with cuplike shelters (for parasites?) in the axils of the veins. The fruit is edible. The specific name is derived from the fact that the fruit is eaten by iguanas, the common and characteristic lizards of the tropics.

2. *Celtis pallida* Torr. *U. S. & Mex. Bound. Bot.* 203. 1859.

Momisia pallida Planch. in *DC. Prodr.* 17: 191. 1873.

Chihuahua to Baja California and Oaxaca. Arizona to western Texas (type locality).

Densely branched spiny shrub, 1 to 6 meters high, the branches often long and recurved; leaves oval to oblong, obtuse or acutish; cymes few-flowered; fruit 5 to 8 mm. long, yellow, orange, or red. "Granjeno" (Chihuahua, Durango, Nuevo León, Texas; often written "grangeno"); "granjeno huasteco" (Tamaulipas); "capul" (Durango, Texas); "garabato" (Sinaloa).

This shrub often forms dense impenetrable thickets of considerable extent. The wood is good for fuel and fence posts. The fruit is edible, but somewhat astringent. The flowers are said to furnish a good quality of honey.

The pubescence of the branchlets is usually appressed but sometimes spreading. The leaves are variable in outline, usually with a few large teeth, but

sometimes entire. The species has been reported from Mexico as *Celtis tala* Gill., a plant of South America. This is presumably the plant described from Mexico by Sessé and Mociño¹ as *Rhamnus grangenos*, although it is doubtful whether that name is not referable rather to *Celtis iguanaea*.

3. *Celtis monoica* Hemsl. Biol. Centr. Amer. Bot. 3: 139. pl. 77. 1883.

Veracruz and Oaxaca; María Madre Island; type from Tantoyuca, Veracruz.

Leaves oblong-ovate, 6 to 9 cm. long, acuminate, lustrous, shallowly serrate, strigose beneath. "Palo de águila" (Oaxaca).

Very different in appearance from the other species of the genus, especially because of the pinnate-veined leaves. The fruit bears scattered sharp tubercles.

4. *Celtis caudata* Planch. Ann. Sci. Nat. III. 10: 294. 1848.

Celtis littoralis Liebm. Dansk. Vid. Selsk. Skrivt. V. 2: 337. 1851.

Querétaro and Hidalgo to Michoacán and Oaxaca; type from Zimapán, Hidalgo.

Tree, usually of small size; leaves ovate, asymmetric, long-acuminate, at least part of them usually dentate, rarely all entire.

This is doubtless the species reported from Cuernavaca by Sessé and Mociño² as *Celtis occidentalis* L.

5. *Celtis reticulata* Torr. Ann. Lyc. N. Y. 2: 247. 1824.

Coahuila to Baja California. Texas to Colorado and Arizona; type from the Rocky Mountains.

Small or large tree, sometimes 15 meters high, with a trunk 50 to 60 cm. in diameter, but in arid places frequently only a shrub 3 meters high, the crown dense, broad, the branches often very crooked; bark white or gray, smooth on young trees, very rough in age; leaves often rounded-ovate, obtuse or acute, 3 to 7 cm. long; fruit red or orange, about 8 mm. in diameter; wood with a specific gravity of about 0.72. "Palo blanco" (Durango, Tamaulipas, Texas); "palo mulato" (Durango); "acibuche" (Chihuahua); "cumbro" (Sinaloa); "palo duro" (New Mexico).

The tree is usually too small and crooked to be of economic importance, but the wood is used for posts and for axe and hoe handles, and for other similar purposes. The leaves are frequently covered with curious insect galls.

6. *Celtis mississippiensis* Bosc, Dict. Agr. 10: 541. 1847.

Celtis berlandieri Klotzsch, Linnaea 20: 541. 1847.

Coahuila to Tamaulipas and San Luis Potosí. Northeastward to Illinois and Florida.

Tree, in some parts of its range 39 meters high, with a trunk 1 meter in diameter; bark white and smooth on young trees, gray and rough in age, with corky projections; leaves ovate, 5 to 12 cm. long, acute to long-acuminate; fruit orange or red; wood yellow, soft, its specific gravity about 0.50. "Palo blanco" (Coahuila, Tamaulipas).

Often planted or left as a shade tree about dwellings; wood used in Mexico for carts and other objects, and in the United States, occasionally, for furniture and flooring; fruit edible, as in the other species, the pulp sweet but very scant.

The Mexican specimens always have entire leaves. They do not seem specifically separable from the eastern form, although the leaves are often broader.

¹ Pl. Nov. Hisp. 38. 1887.

² Pl. Nov. Hisp. 174. 1887.

24. MORACEAE. Mulberry Family.

Usually trees, with milky sap; leaves alternate, entire, dentate, or lobate; the stipules deciduous; flowers very small, monoecious or dioecious.

The only other Mexican genus is *Dorstenia*, whose species are low herbs. *Toxylon pomiferum* Raf., the Osage orange or bois d'arc (known in Chihuahua as "naranjo chino"), native of the southern United States, is sometimes cultivated. It is a very spiny tree or shrub, with globose yellowish fruits sometimes 15 cm. in diameter. *Artocarpus communis* Forst., the breadfruit tree of the Pacific islands ("árbol del pan"), with large, pinnately lobed leaves and large rough fruit, is in cultivation in tropical Mexico.

Leaves peltate, the blades radiately lobed. Flowers in dense spikes.

9. CECROPIA.

Leaves not peltate, the blades not radiately lobed.

Flowers borne on the inside of a globose receptacle, this fleshy, with a small opening at the top.....4. FICUS.

Flowers not borne inside a receptacle.

Flowers of one or both sexes in aments, spikes, or racemes.

Pistillate flowers in spikes or aments.

Pistillate perianth of distinct segments; fruit very juicy, with a small seed, naked.....2. MORUS.

Pistillate perianth tubular; fruit with only thin flesh, with a large seed, covered by the accrescent perianth.....3. TROPHIS.

Pistillate flowers in heads.

Staminate flowers with a 4-parted perianth.....1. CHLOROPHORA.

Staminate flowers without a perianth.....8. SAHAGUNIA.

Flowers of one or both sexes capitate, borne on a flat or rounded receptacle, or solitary.

Leaves very densely long-hairy; flowers borne on a flat receptacle.

7. CASTILLA.

Leaves never densely long-hairy; flowers not borne on a flat receptacle.

Pistillate flowers sessile and usually solitary in the axils.

6. PSEUDOLMEDIA.

Pistillate flowers in heads or on a receptacle.

Pistillate flowers one on each receptacle.....5. BROSIMUM.

Pistillate flowers more than one to each head or receptacle.

Inflorescence wholly of heads; leaves entire...10. COUSSAPOA.

Inflorescence partly of spikes (staminate); leaves usually toothed.

Staminate flowers with a 4-parted perianth.

1. CHLOROPHORA.

Staminate flowers without a perianth.....8. SAHAGUNIA.

1. *CHLOROPHORA* Gaud. in Freyc. Voy. Bot. 508. 1826.

Leaves glabrous or nearly so.....1. *C. tinctoria*.

Leaves densely pubescent on both surfaces.....2. *C. mollis*.

1. *Chlorophora tinctoria* (L.) Gaud. in Freyc. Voy. Bot. 508. 1826.

Morus tinctoria L. Sp. Pl. 986. 1753.

Chiefly on stream banks and seashores, San Luis Potosí to Yucatán and Tabasco; reported from Tamaulipas, Oaxaca, Michoacán, and Guerrero. Central America, West Indies, and tropical South America; type from Jamaica.

Shrub or tree, sometimes 20 meters high, with a trunk 10 to 80 cm. in diameter, the bark brownish gray or light brown, with few shallow furrows, the branches spreading, often armed with sharp axillary spines; leaves deciduous, ovate or oval, caudate-acuminate, bright dark green, entire or ser-

rate (both kinds often on the same branches); flowers dioecious, the staminate in slender dense catkins, the pistillate in globose heads. the receptacle fleshy in fruit; seeds brown; wood light yellow, becoming darker on exposure, hard, heavy, close-grained, strong, tough, taking an excellent polish, its specific gravity about 0.71 (reported as high as 0.98). "Moral liso," "moral de clavo" (Tabasco); "palo mora" (Colombia, Isthmus of Tehuantepec); "moral amarillo," "moradilla" (Veracruz); "yaga-huil" (Oaxaca, Zapotec, *Reko*); "moral" (Tabasco, Oaxaca, etc., Colombia); "palo moral" (Oaxaca); "palo amarillo" (Tabasco, etc., El Salvador); "mora" (Sinaloa, El Salvador, Guatemala, Honduras, Costa Rica, Santo Domingo, Porto Rico, Nicaragua); "palo de mora" (Costa Rica, Porto Rico); "dinde" (Colombia); "moral del país," "mora blanca," "mora deloma," "fustete," "mora de piedra" (Cuba); "brasil" (Costa Rica); "mora macho," "palo amarillo" (Santo Domingo).

The wood is very durable and is used for furniture, interior finish, wheels, etc. Its most important use, however, is as a dye-wood; it furnishes a yellow, brown, or green dye, the coloring properties being due to two principles, morin or morindon, and moritannic acid. It is the fustic of commerce,¹ long an important article of export to Europe and the United States from tropical America. Large quantities have been exported from Mexico, especially from Tabasco. It is usually prepared in the form of sticks 60 to 120 cm. long and 7.5 to 20 cm. in diameter. The bark is used sometimes for tanning.

Various medicinal properties are reported for this tree, in Central America and the West Indies. The bitter bark, with a disagreeable odor, is said to be astringent, tonic, and in large doses purgative; it has been used for venereal diseases. The ashes of the wood have been used in Jamaica for gout and rheumatism. The fruit is astringent and useful in the form of a gargle for sore throat and mouth. The root is reputed diuretic. In Nicaragua an infusion of the flowers is used for colds. When ripe the fruit is sweet and full of milky juice, and it is sometimes eaten.

2. *Chlorophora mollis* Fernald, Proc. Amer. Acad. 40: 52. 1904.

Known only from the type locality, Tomellín Canyon, Oaxaca.

Similar to the preceding species except for the copious pubescence on all parts.

2. *MORUS* L. Sp. Pl. 986. 1753.

REFERENCE: Bureau in DC. Prodr. 17: 237-249. 1873.

Trees; leaves thin, deciduous, 3-nerved, dentate or often lobed, especially on young branches; flowers green, monoecious, the two kinds of flowers in separate catkins; fruit a syncarp, composed of numerous small juicy 1-seeded drupes.

One other species, *M. rubra* L., the red mulberry, is native in the United States. With regard to it, Havard says,² "There is some ground for belief that our native Red Mulberry was cultivated [by the Indians], the fine quality and great quantity of the fruit being mentioned by De Soto and others." *Morus alba* L., native of Asia, the white mulberry ("moral blanco"), with sweet and insipid, white or violet fruit is cultivated in Mexico. It has become naturalized in the United States, where it was introduced at an early date as food for silkworms. It is said to have been introduced into Mexico for the same purpose about 1522. Mulberries of other species also have been used for feeding silkworms. *Morus nigra* L., the black mulberry ("moral negro"), of Asiatic origin, is cultivated in Mexico for its large, juicy, well-flavored, red or black fruit.

¹ *Rhus cotinus* L., of Europe, also is known as fustic.

² Bull. Torrey Club 22: 104. 1895.

The Spanish name for the mulberry fruit is "mora"; for the tree, "moral"; the name "morera" is applied to the white mulberry tree. Asiain gives the Huastec name for mulberry tree as "tzitzi." According to Belmar, the Mixe names are "hamdek" (fruit) and "hamdek-kiup" (tree).

Pistillate spikes elongate, lax, many-flowered; leaves thin, scarcely or not at all scabrous on the upper surface, glabrate beneath—1. *M. celtidifolia*.

Pistillate spikes short, dense, few-flowered; leaves thick, very scabrous on the upper surface, copiously pubescent beneath-----2. *M. microphylla*.

1. *Morus celtidifolia* H. B. K. Nov. Gen. & Sp. 2: 33. 1817.

Morus mexicana Benth. Pl. Hartw. 71. 1840.

Morus mollis Rusby, Bull. Torrey Club 38: 145. 1911.

Coahuila to Veracruz and Oaxaca; reported from Yucatán. Guatemala and Costa Rica; Colombia to Peru; type from Ecuador.

Tree, 5.5 to 9 meters high; leaves oval-ovate, 5 to 15 cm. long, bright green, cuspidate-acuminate; fruit at first red but finally black. The fruit is known generally as "mora," the tree as "moral"; "palo moral" (Oaxaca); "yaga-biyozaa" (Oaxaca, Zapotec, *Reko*); "brasil" (Costa Rica).

The species is somewhat variable in leaf form and in size of fruit, but with the material available it does not seem necessary to recognize either of the segregates. This is perhaps the species to which Sessé and Mociño¹ apply the name "*Morus tartarica*," although it is not certain that they do not refer to one of the introduced species. It is probably to this tree that Sahagún refers: "In this country [New Spain] there are mulberry trees. They are called *amacapulin* [paper cherry]. This tree is smooth and branched. The branches are very numerous, and the leaves are crowded and green, a little paler beneath. It produces mulberries a little smaller than those of Castile." In Ecuador the wood of this species is said to be valued for building purposes.

2. *Morus microphylla* Buckl. Proc. Acad. Phila. 1862: 8. 1863.

Morus microphilyra Greene, Leaflets 2: 120. 1910.

Chihuahua to Durango. Southern Arizona to western Texas (type locality).

Small tree, 4.5 to 7.5 meters high, with a trunk 30 cm. in diameter, the crown dense and compact, or often a shrub in Mexico; bark gray, furrowed, covered with small scales; fruit 1 to 1.5 cm. long, red or finally black; wood hard, close-grained, elastic, light brown, its specific gravity about 0.77. "Mora," "moral."

The wood is used to a small extent in Mexico by carpenters, and was employed by the Indians of Texas for bows. The fruit is rather sour and varies in size according to the amount of water the tree receives. It is sometimes found in markets.

This species may not be distinct from the preceding one. The leaves are very variable and often deeply lobed, especially on young shoots.

3. *TROPHIS* L. Syst. Nat. ed. 10. 2: 1289. 1759.

REFERENCE: Bureau in DC. Prodr. 17: 251-254. 1873.

Trees, unarmed; leaves deciduous or persistent, entire or dentate; flowers dioecious, green, spicate, racemose, or paniculate; fruit small, subglobose, with thin flesh and a large seed.

Fruit smooth, sessile or short-pedicellate; leaves usually more than 3 cm. wide.

1. *T. racemosa*.

Fruit tuberculate, long-pedicellate; leaves 3 cm. wide or less---2. *T. mexicana*.

1. *Trophis racemosa* (L.) Urban, Symb. Antill. 4: 195. 1903.

Bucephalon racemosum L. Sp. Pl. 1190. 1753.

Trophis americana L. Syst. Nat. ed. 10. 2: 1289. 1759.

¹ Pl. Nov. Hisp. 160. 1887.

Trophis ramon Schlecht. *Linnaea* 6: 357. 1831.

Tamaulipas to Sinaloa, Oaxaca, Veracruz, and Tabasco. Central America, Colombia, and the West Indies.

Tree, 15 meters high or less, with brown bark, the trunk usually 35 to 40 cm. in diameter; leaves short-petiolate, oblong to oval, 8 to 15 cm. long, short-acuminate, coriaceous, often very rough, entire or inconspicuously dentate. "Ramón" (Veracruz, Tabasco, Cuba, Santo Domingo; a corruption of this name, "ramoon," used also in Jamaica); "confitura" (Oaxaca, *Reko*); "huanchal" (Oaxaca); "leche María" (Oaxaca); "ramoncillo" (Tabasco); "ramón de Castilla" (Veracruz, *Villada*); "cafecillo" (Nicaragua); "ramón de caballos" (Cuba).

The tree is much used in Mexico, as well as elsewhere, as fodder for domestic animals, the cut branches being often transported to some distance for the purpose. The fruit is said to be edible, although the flesh is certainly very scant. The bark contains tannin and has been used in medicine as an astringent.

It may be that more than one species is included in the material referred here. The leaves are somewhat variable in shape and texture. The pistillate inflorescence is usually simply spicate, but it is sometimes branched. *T. glabrata* Liebm.¹, from the description, does not seem to differ essentially.

2. *Trophis mexicana* (Liebm.) Bureau in DC. Prodr. 17: 253. 1873.

Sorocea mexicana Liebm. Dansk. Vid. Selsk. Skrivt. V. 2: 335. 1851.

Trophis chiapensis T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 178. 1915.

Veracruz, Oaxaca, and Chiapas; type from Tlapacoyan, Veracruz.

Medium-sized tree; leaves narrowly elliptic-oblong, with a long, narrow, often curved tip, conspicuously serrate, smooth, bright green.

4. *FICUS* L. Sp. Pl. 10. 59. 1753.

REFERENCE: Standley, The Mexican and Central American species of *Ficus*, Contr. U. S. Nat. Herb. 20: 1-35. 1917; Urbina, Los Amates de Hernández, *Naturaleza* 7: 93-114. 1900; M. Urbina, Los Amates de Hernández ó higueras Mexicanas, *Naturaleza* III. 1: 32-53. 1912.

Large or small trees; leaves entire (in the native Mexican species); flowers minute, borne on the inner surface of a more or less globose receptacle, this succulent in age, with a very small opening at the apex, this closed by small scales, the receptacle subtended at the base by a lobed involucre.

Many if not most of the Mexican figs are of very peculiar growth. They are hemiparasites; that is, they often begin their growth upon other plants, usually palms, germinating and developing a stem from which aerial roots descend to the ground and take root.² In this way the plants in their young stages are often vinelike. With age, the aerial roots increase in size and form a trunk which gradually envelops completely the host plant. The stems at first are flat, broad, and thin, and as they increase in size several will unite, assuming irregular and fantastic forms. Ultimately the host plant dies but often it persists for a long time, and it is not unusual to see the fronds of a palm rising from the crown of a large fig tree. Figs of this habit of growth are known generally as "matapalo." Sometimes the plants begin their growth upon cliffs, developing their thin trunks against the rocks.

¹ Dansk. Vid. Selsk. Skrivt. V. 2: 314. 1851.

² See Trelease, Illustrations of a "strangling" fig tree. Rept. Mo. Bot. Gard. 16: 161-165. pl. 39-45. 1905.

Large fig trees, too, often send down from their branches aerial roots which take hold of the soil and finally develop into trunks. In this way trees of the banyan type are formed, some of them of enormous size.

Because of their broad, dense crowns and handsome foliage many of the Mexican figs make attractive shade trees. Some exotic species are cultivated for the same purpose. *F. nitida* Thunb., an Asiatic plant with small lustrous obovate leaves is seen frequently in parks, being known as "laurel de la India," "laurel," and "álamo extranjero." A specimen of *F. crassinervia* Willd., from Puebla, was probably taken from a cultivated tree; the species is a West Indian one. *F. religiosa* L., of the East Indies ("laurel de India," "álamo cubano"), with very long-acuminate leaves, also is cultivated. *F. elastica* Roxb., another Old World species, is frequent in parks and gardens, being one of the finest shade trees grown in the tropics. It is one of the sources of India rubber, and is the well-known rubber plant which is cultivated for ornament in the United States and elsewhere. Its leaves are larger than those of most Mexican species, and the fruit is of distinct shape, oblong rather than globose, as in most figs. The common edible fig, *F. carica* L. ("higuera," "higo"), is extensively cultivated in Mexico for its fruit, which under favorable conditions is produced at all times of the year. It differs from all the American species in having lobed leaves. It was doubtless brought to Mexico at a very early date by the Spaniards. The Jesuits introduced the fig tree into Baja California in the eighteenth century, and it is said to have been the only fruit, except grapes, which was thoroughly successful there.

The fruit of all the species is edible, but often the receptacles are so small and dry that they are not very palatable. They are a favorite food of many kinds of birds and of domestic animals.

The milky juice of the Mexican species yields a kind of rubber which might become of some commercial importance. This is said to have been used locally for treating fractured bones and for similar purposes. Some of the South American species are said to produce commercial rubber.

Few medicinal uses are reported for this genus in Mexico. The early inhabitants are said to have used the root, to which purgative properties are ascribed, in the treatment of fevers and chest affections, and the milky juice for ulcers. The juice is often applied to warts, but with what success is not stated. The juice of some of the South American species is reported to be extremely poisonous.

The wood of the fig trees is soft and light and of little value. The large trunks, however, are often made into canoes. In preconquest days the bark was of great importance, for it was one of the sources of the bark paper used by the Aztecs for their records and correspondence. Some of this paper is still preserved in the ancient manuscripts. It is generally stated that the species used for the purpose was *F. petiolaris*. This is, it is true, the species described by Hernández, but it is probable that other species were used indiscriminately. Plants of other families were used likewise for the same purpose, and it is now uncertain what one was most commonly employed.

It was believed that the manufacture of bark paper in Mexico had become obsolete, but Professor Starr, of the University of Chicago, found a few years ago that the method of preparation was still known to some of the Otomí Indians of Hidalgo. He secured specimens of the paper and has published an account of its manufacture.¹ He states that the trees used are "xalama" (*Ficus* sp.), "jonote" (*Heliocarpus*), "moral," and "dragón." The name

¹ Starr, In Indian Mexico, pp. 245-246, 259, 268.

"moral" probably refers to some plant of the family Moraceae, and "dragón" perhaps to a *Jatropha*. After being stripped from the trees, the bark is washed with lye water taken from the corn soaked for *tortillas*, washed in fresh water, thoroughly boiled, and split into thin strips. These the women arrange carefully upon a wooden plank and then beat with a stone until a sheet of paper results. The side of the sheet next to the board is smooth, the other somewhat rough. The paper is dried in the sun. The paper obtained from the "moral" is white; that from "xalama" purplish. It is said that the bark of the "ule" (*Castilla*) also is used.

Because of the purposes for which the paper is employed, its preparation is generally conducted with great secrecy. It is used for decorations in various ceremonies, especially those of pagan origin. More commonly, however, it is used for "brujería" (witchcraft), and for this it is cut into "muñecos," representing human beings, horses, and other animals, and these are employed to work injury to people and domestic animals, being buried in front of a house or in a corral. The *muñecos* are employed also for curing disease, applied directly to the affected part.

This ceremonial use of the bark paper is the last remnant of a common practice of ancient times. Before the conquest paper banners were employed as offerings to the gods at certain feasts, and crowns of paper also were offered, and were worn by those who took part in the ceremonies.

The vernacular names applied to the species of *Ficus* are very numerous, and many of them are listed under the species enumerated below. In Jalisco, according to Urbina, they are usually known as "camichín" or "zalate." The former name, which is used elsewhere also, is applied to the species having smaller fruits than those known by the name "zalate." The word *camichín*, he states, is written more properly *coamichin* (= *coatl*, snake + *michin*, fish = fish-snake = eel). This name was probably given because of the adventitious roots, which might be taken to resemble eels. A name widely used in Mexico for fig trees is *amate*; this is a modification of the Nahuatl word *amatl*, "paper," applied to the tree. It is interesting to note that the Tarascan word for paper, *siranda*, also is used as a name for the fig tree. The name "macahuite" (Nahuatl, *ama-cuahuitl* = fig-tree) is said to be used in central Mexico. The word *amatl* is preserved in such place names as Amatitlán, "among the fig trees"; Amatepec, "the hill of the figs"; Amecameca, "place where they wear fig shirts."

Peduncles solitary; involucre trilobate; stamens 2. (Subgenus PHARMACOSYCE.)

Leaves hirtellous or short-pilose beneath; receptacles pilose or hirtellous.....1. *F. glaucescens*.

Leaves glabrous or merely scabrous beneath; receptacles glabrate or scabrous.

Branchlets densely pilose-sericeous.....2. *F. radulina*.

Branchlets glabrous or puberulent.

Leaves rounded and apiculate at the apex.....5. *F. radula*.

Leaves gradually acute or acuminate at the apex.

Leaf blades about 4 times as long as broad, acute at the base, glabrous.....3. *F. segoviae*.

Leaf blades not more than two and a half times as long as broad, usually very obtuse or rounded at the base, commonly scabrous.

4. *F. mexicana*.

Peduncles geminate; involucre bilobate; stamen 1. (Subgenus UROSTIGMA.)

Involucre very asymmetric, attached excentrically to the peduncle.

6. *F. tecolotensis*.

Involucre symmetric, attached centrally to the peduncle.

Receptacles all or partly sessile.

Receptacles partly sessile and partly pedunculate on the same plant.

7. *F. cookii*.

Receptacles all sessile.

Leaves cuspidate at the apex, with a long acute acumen.

8. *F. panamensis*.

Leaves not cuspidate at the apex.

Involucre small, about 5 mm. in greatest diameter, inconspicuous; receptacles glabrous.....9. *F. kellermannii*.

Involucre large, conspicuous, inclosing the receptacle for half its length or more; receptacles finely pubescent or in age glabrate.

10. *F. cotinifolia*.

Receptacles all pedunculate.

Leaves conspicuously pubescent beneath.

Leaf blades suborbicular, as broad as long, deeply cordate at the base, white-barbate beneath along the costa.....11. *F. petiolaris*.

Leaf blades usually conspicuously longer than broad, the pubescence of short hairs scattered over the lower surface.

Stipules glabrous or nearly so; receptacles pyriform. Leaves cordate-ovate or ovate-deltoid.....12. *F. palmeri*.

Stipules densely sericeous; receptacles globose.

Receptacles 13 to 17 mm. in diameter; leaf blades 6 to 19 cm. long, broadest at or near the middle.....16. *F. lapathifolia*.

Receptacles 10 to 13 mm. in diameter; leaf blades 4.5 to 12 cm. long, usually broadest at or near the base.

Involucre 10 to 15 mm. in greatest diameter; receptacles with fine appressed pubescence or glabrate; peduncles 2 to 4 mm. long.....14. *F. pringlei*.

Involucre 4 to 6 mm. in diameter; receptacles short-villous; peduncles 5 to 7 mm. long.....15. *F. microchlamys*.

Leaves glabrous beneath or nearly so.

Receptacles 4 to 12 mm. in diameter.

Ostiole of the receptacle depressed; leaf blades 1.5 to 4.7 cm. wide.....17. *F. padifolia*.

Ostiole plane or elevated; leaf blades 5 to 9.5 cm. wide.

18. *F. lentiginosa*.

Receptacles 15 to 25 mm. in diameter.

Stipules ferruginous-sericeous.....19. *F. glyxicarpa*.

Stipules glabrous or minutely puberulent.

Leaf blades cuneate-obovate, rounded at the apex.

20. *F. involuta*.

Leaf blades oblong to oval or ovate-oval, broadest at or below the middle.

Leaf blades cordate or subcordate at the base, with 5 to 9 lateral veins on each side.

Petioles 3.5 to 7 cm. long; leaves bright green; receptacles pubescent.....21. *F. jonesii*.

Petioles 1.5 to 3.5 cm. long; leaves glaucescent beneath; receptacles glabrous.....13. *F. brandegei*.

Leaf blades rounded or emarginate at the base, with usually 8 to 13 lateral veins on each side.

Leaf blades emarginate at the base; receptacles densely puberulent_____22. *F. goldmanii*.

Leaf blades rounded at the base; receptacles glabrous or nearly so_____23. *F. yucatanensis*.

1. *Ficus glaucescens* (Liebm.) Miquel, Ann. Mus. Bot. Lugd. Bat. 3: 300. 1867.
Pharmacosycea glaucescens Liebm. Dansk. Vid. Selsk. Skrivt. V. 2: 332. 1851.
Pharmacosycea hernandezii Liebm. Dansk. Vid. Selsk. Skrivt. V. 2: 332. 1851.
Ficus hernandezii Miquel, Ann. Mus. Bot. Lugd. Bat. 3: 300. 1867.
Ficus guadalajarana S. Wats. Proc. Amer. Acad. 26: 151. 1891.
Veracruz to Sinaloa and Oaxaca; type from Mecapalco, Veracruz. Central America.
Large or small tree; stipules 1 to 2 cm. long; leaves oval-oblong or obovate-oval, 8 to 23 cm. long, very obtuse or apiculate at the apex; receptacles 1.5 to 2.5 cm. in diameter. "Higo loxe grande" (Oaxaca).
2. *Ficus radulina* S. Wats. Proc. Amer. Acad. 26: 151. 1891.
Chihuahua and Sonora; type collected near Batopilas, Chihuahua.
Large tree with whitish or yellowish branches; stipules 6 to 8 cm. long; leaves oblong to oval-elliptic, 9 to 18 cm. long; receptacles 1.5 to 2 cm. in diameter, spotted with light and dark green. "Nacapuli," "higuera" (Sonora); "salate" (Chihuahua).
3. *Ficus segoviae* Miquel, Ann. Mus. Bot. Lugd. Bat. 3: 300. 1867.
Pharmacosycea angustifolia Liebm. Dansk. Vid. Selsk. Skrivt. V. 3: 333. 1851.
Not *Ficus angustifolia* Roxb. 1814.
Veracruz to Guerrero and Oaxaca. Guatemala and Nicaragua (type locality).
Stipules 2 to 5.5 cm. long; leaf blades narrowly elliptic, 10 to 20 cm. long; receptacles 1.5 to 3 cm. in diameter. "Macahuite" (Oaxaca).
4. *Ficus mexicana* Miquel, Ann. Mus. Bot. Lugd. Bat. 3: 299. 1867.
Pharmacosycea mexicana Miquel, Versl. Med. Kon. Akad. Amsterdam 13: 416. 1862.
San Luis Potosí to Sinaloa, Oaxaca, and Yucatán.
Large tree, sometimes 20 meters high, with a trunk nearly 2 meters in diameter, the bark pale brownish or yellowish; stipules 3.5 to 10 cm. long; leaves oval or elliptic-oblong, 8 to 20 cm. long; receptacles about 2 cm. in diameter, light green. "Copoy" (San Luis Potosí, Palmer); "sabali" (Sinaloa).
5. *Ficus radula* Willd. Sp. Pl. 4: 1144. 1806.
Veracruz to Yucatán and Oaxaca. Central America, Colombia, and Venezuela (type locality).
Large or small tree, with brownish gray branches; stipules 1 to 1.5 cm. long; leaves oblong to oval, 8 to 16 cm. long; receptacles 1.5 to 3 cm. in diameter. "Macahuite" (Oaxaca; from the Nahuatl, "ama-cuahuitl").
6. *Ficus tecolutensis* (Liebm.) Miquel, Ann. Mus. Bot. Lugd. Bat. 3: 299. 1867.
Urostigma tecolutense Liebm. Dansk. Vid. Selsk. Skrivt. V. 2: 324. 1851.
Veracruz to Yucatán and Oaxaca; type from Tecolutla, Veracruz. Guatemala.
Stipules 1 to 1.5 cm. long; leaves oblong, oval, or oval-obovate, 6 to 10 cm. long, obtuse or acutish at the apex, obtuse or emarginate at the base, glabrous; receptacles 5 to 8 mm. in diameter. "Matapalo" "amate," "matapalo liso," "macahuite" (Oaxaca).
7. *Ficus cookii* Standl. Contr. U. S. Nat. Herb. 20: 15. 1917.
Chiapas; type from San Vicente. Guatemala.
Large tree; stipules 1 to 1.5 cm. long; leaves oval or orbicular-ovate, 6 to 11 cm. long, rounded at the apex, shallowly cordate at the base; receptacles about 1 cm. in diameter.

A very remarkable species because of the presence of both sessile and pedunculate receptacles upon the same tree.

8. *Ficus panamensis* Standl. Contr. U. S. Nat. Herb. 20: 15. 1917.

Tabasco. Central America and Colombia; type from Panama.

Stipules 2 cm. long; leaves oblong or obovate-oblong, 9 to 16 cm. long, glabrous; receptacles 1 cm. in diameter. "Amatillo" (Tabasco).

9. *Ficus kellermannii* Standl. Contr. U. S. Nat. Herb. 20: 18. 1917.

Oaxaca. Guatemala; type from El Rancho.

Stipules 1 to 2 cm. long; leaves oval-oblong, obovate-oval, or oval, 5 to 14 cm. long, short-hirtellous beneath, emarginate or subcordate at base; receptacles 8 to 10 mm. in diameter. "Higo loxe chico" (Oaxaca).

10. *Ficus cotinifolia* H. B. K. Nov. Gen. & Sp. 2: 49. 1817.

Ficus myxaefolia Kunth & Bouché, Ind. Sem. Hort. Berol. 18. 1846.

Urostigma longipes Liebm. Dansk. Vid. Selsk. Skrivt. V. 2: 321. 1851.

Urostigma glaucum Liebm. Dansk. Vid. Selsk. Skrivt. V. 2: 322. 1851.

Ficus subrotundifolia Greenm. Proc. Amer. Acad. 41: 237. 1905.

Chihuahua to Baja California, Oaxaca, and Yucatán; type collected on the Acapulco road near La Venta del Egido. Costa Rica.

Large or small tree, sometimes 15 meters high, with a trunk a meter in diameter, the branches few, large, spreading; stipules 5 to 13 mm. long; leaves oblong to orbicular, 5 to 13 cm. long, very variable; receptacles 6 to 11 mm. in diameter, whitish, often spotted. "Copó," "coobó," "álamo" (Yucatán); "higuerón" (Tamaulipas, San Luis Potosí); "amate prieto" (Morelos).

The milky juice mixed with the powdered bark is applied to wounds and bruises. This may be the "tilamatl" ("black-fig") described by Hernández.

11. *Ficus petiolaris* H. B. K. Nov. Gen. & Sp. 2: 49. 1817.

Ficus jaliscana S. Wats. Proc. Amer. Acad. 26: 150. 1891.

Sonora to Guerrero and Morelos; reported from Oaxaca; type collected near Mazatlán, Guerrero.

Large or small tree with white trunk; leaves 6.5 to 15 cm. wide; receptacles 1 to 1.5 cm. in diameter. The following names are reported for this species, although it is probable that most of them are applied to others also: "Tepeamatl" or "tepeamate" (Guerrero; the former the Nahuatl term, meaning "hill-fig"); "tescalama," "tescalamate," or "texcalamate" (Morelos, Durango, Guanajuato, etc.; in Nahuatl, *texcalamatl*="lava-fig," this name, according to Robelo, given because the tree sometimes grows on lava rock); "palo chilamate" (Oaxaca, *Reko*; from the Nahuatl, *chil-amatl*); "higuera" (Durango, Sinaloa); "palo Marfa," "higuerón" (Sinaloa, Mexico); "higuerote," "texcalama lechosa" (Sinaloa); "amate" (Oaxaca); "amacostic" (Morelos); "amate amarillo" (Morelos, Guerrero).

This species has frequently been reported¹ from Mexico as *F. nymphacifolia* L. That is a South American species, which is somewhat similar but nevertheless quite distinct.

This species is discussed by Hernández² in a chapter entitled, "De Amacoztic, seu Papyro lutea, seu Tepematl, Sycomoro Saxatili Mexicana." His remarks are as follows: "The *Amacoztic*, which some call *Texcalamatl*, or rock-paper, and others *Tepeamatl*, is a large tree which has the leaves broad, almost round, thick and purplish like ivy, and nearly heart-shaped; the bark is on one side yellow inclining to green, and on the other red; it has the fruits on the same trunks, which are smooth like that of a fig tree; the fruit resembles small

¹ As by Sessé & Mocino, Pl. Nov. Hisp. 180. 1887.

² Thesaurus 81. 1651.

figs; it is purple and full of small red seeds; the tree is fastened to the rocks, and is a wonderful thing. The leaves have no perceptible odor or flavor; their temperament is moist and cold. The decoction of the roots allays the thirst of those who suffer from fever, alleviates pains of the chest, is purgative and vomitive, and it is prepared by boiling three ounces of the roots with three pounds of water until the half is consumed; its milk cures sores of the lips and chronic ulcers. The tree grows in mountainous and rough places about Chietla, embracing the rocks, as I have said, and as the name itself indicates. There is another kind that has the same name and temperament, which, they say, serves only for furnishing straight, smooth poles." Hernández also gives two easily recognizable figures of the plant (pp. 82, 409).

Dr. Fernando Altamirano, quoted by Urbina,¹ describes the gum or rubber obtained from this (and probably also from other) species of *Ficus* as follows: "The commercial *Texcalama* appears as rounded masses of variable dimensions. This substance is elastic and adhesive and very ductile, gray in color, and capable of being formed into membranes as delicate as soap bubbles, being in this state white and transparent; exposed to the air it hardens and assumes a yellow tint, for which reason it should be kept in vessels full of water. In boiling water it softens and becomes more sticky.

"Its density is greater than that of water; its odor is urine-like, and it has scarcely any taste.

"In its analysis I found 15 per cent of caoutchouc, 55 per cent of a resin soluble in alcohol, and 5 per cent of a resin soluble in ether."

This gum is used by surgeons and others in Mexico for treating broken bones, hernia, etc.

12. *Ficus palmeri* S. Wats. Proc. Amer. Acad. 24: 77. 1889.

Baja California, on rocky hillsides; type from San Martín Island.

Tree, 4.5 to 10 meters high, with white trunk; stipules 1.5 to 2 cm. long; leaves 6 to 14 cm. long; receptacles 12 to 15 mm. in diameter. "Salate."

This is presumably the tree described by Clavigero² as "anabá," in the following words: "Anabá is the name of a fruit similar to the fig, and of the tree on which it is borne. The latter is large, the bark of its trunk and branches whitish like that of the fig tree, and the fruit similar in color and shape to the early figs but smaller, less juicy, and without the sweet flavor of our figs. Nevertheless the Californians esteem it so highly that when they hear of an *anabá* with ripe fruit they go to hunt for it and gather a supply of the fruit, even though it may be four or five leagues distant. The wood of the *anabá* is absolutely useless, and the roots are usually broader than thick, for since the tree grows among rocks, it introduces its roots into the clefts, or, in default of these, extends them over the rocks themselves. In Mexico, where it is known by the name of *salate*, it fruits better and attains a larger size."

13. *Ficus brandegei* Standl. Contr. U. S. Nat. Herb. 20: 22. 1917.

Known only from the type locality, San José del Cabo, Baja California.

Similar to the last species except for the complete absence of pubescence upon the leaves.

14. *Ficus pringlei* S. Wats. Proc. Amer. Acad. 26: 150. 1891.

Jalisco; type from the barranca near Guadalajara.

¹ *Naturaleza* 7: 98. 1900.

² *Historia de la California*, 1789. This is the first work in which Baja California plants were described. Clavigero's information was furnished by a brother of the Jesuit order, whose descriptions are remarkably vivid and accurate.

Small or medium-sized tree; stipules 1.5 cm. long; leaves ovate-oval or deltoid-ovate, 4.5 to 8 cm. long, very obtuse or rounded at the apex, subcordate or emarginate at the base.

15. *Ficus microchlamys* Standl. Contr. U. S. Nat. Herb. 20: 23. 1917.

Sinaloa, Tepic, Jalisco, and Veracruz; type from Guadalajara.

Large tree; stipules 7 mm. long; leaves oblong to rounded-ovate, 6 to 12 cm. long, rounded or obtuse at the apex, subcordate or emarginate at the base. "Salate bronco" (Sinaloa).

16. *Ficus lapathifolia* (Liebm.) Miquel, Ann. Mus. Bot. Lugd. Bat. 3: 297. 1867.

Urostigma lapathifolium Liebm. Dansk. Vid. Selsk. Skrivt. V. 2: 319. 1851.

Tamaulipas to Veracruz, Chiapas, and Guerrero; type from Yecoatla and Colipa, Veracruz. Guatemala.

Stipules 1.5 to 1.8 cm. long; leaves oval to broadly oblong.

17. *Ficus padifolia* H. B. K. Nov. Gen. & Sp. 2: 47. 1817.

Ficus complicata H. B. K. Nov. Gen. & Sp. 2: 48. 1817.

Urostigma schiedeanum Miquel, Lond. Journ. Bot. 6: 539. 1847.

Urostigma complicatum Liebm. Dansk. Vid. Selsk. Skrivt. V. 2: 325. 1851.

Urostigma baccatum Liebm. Dansk. Vid. Selsk. Skrivt. V. 2: 327. 1851.

Urostigma turbinatum Liebm. Dansk. Vid. Selsk. Skrivt. V. 2: 328. 1851.

Urostigma sulcipes Miquel, Versl. Med. Kon. Akad. Amsterdam 13: 413. 1862.

Ficus fasciculata S. Wats. Proc. Amer. Acad. 24: 78. 1889.

Ficus sonorae S. Wats. Proc. Amer. Acad. 24: 78. 1889.

Tamaulipas to Sonora, Oaxaca, and Tabasco; type from Acapulco, Guerrero. Central America.

Small or often a very large tree, as much as 30 meters high, with broad, dense crown and numerous trunks and aerial roots; stipules 5 to 15 mm. long; leaves mostly ovate or elliptic, 4 to 12 cm. long, acute or acuminate. "Nacapuli" (Sonora); "camichfn" (Colima, Sinaloa, Jalisco); "comuchfn" (Michoacán, Guerrero); "palo de coco" (Oaxaca, *Liebmann*); "amatillo." "capulfn grande" (Tabasco); "samatito" (Guerrero, Oaxaca, Morelos); "amesquite" (Morelos); "matapalo" (Oaxaca); "higuino" (Costa Rica); "cozahuique" (Oaxaca, *Villada*); "jalamate," "cabra-higo" (Morelos, *Urbina*).

One of the handsomest of Mexican trees, often with an immense crown of dark green leaves. It has been reported from Mexico as *F. ligustrina* Kunth & Bouché, a South American species. The fruit is usually tinged or spotted with red or purple; it is sweet and much eaten by children and birds, and sometimes it is sold in the markets.

*Urbina*¹ considers that this is the "amazquitl" of Hernández, who speaks of the value of the tree for shade, and states that a decoction of the root bark was given to fever patients. The "hoeiamatl" of Hernández is perhaps the same species; this was employed as a remedy for various skin diseases and for pains and sourness of the stomach. Another wild fig described by Hernández under the name "itzamatl" may also be *Ficus padifolia*. This, Hernández states, was called "higo de Indias" by the Spaniards.

18. *Ficus lentiginosa* Vahl, Enum. Pl. 2: 183. 1806.

Guerrero to Oaxaca and Yucatán. West Indies; type from Montserrat.

Stipules 1 to 1.5 cm. long; leaves oval or ovate-oval, 7.5 to 16 cm. long, obtuse or rounded and often short-pointed at the apex, bright green; receptacles 8 to 9 mm. in diameter. "Jaguey" (Porto Rico).

For an illustration of a flowering branch see Contr. U. S. Nat. Herb. 8: pl. 35.

¹ *Naturaleza* 7: 99. 1900.

19. *Ficus glydicarpa* Miquel, Ann. Mus. Bot. Lugd. Bat. 3: 297. 1867.
Urostigma glydicarpum Miquel, Versl. Med. Kon. Akad. Amsterdam 13: 409. 1862.
 Veracruz; type from Hacienda de la Laguna.
 Stipules 1 cm. long; leaves elliptic-oblong or obovate, 7 to 20 cm. long, obtuse or rounded and short-pointed at the apex; receptacles 1.5 to 2 cm. in diameter.
20. *Ficus involuta* (Liebm.) Miquel, Ann. Mus. Bot. Lugd. Bat. 3: 298. 1867.
Ficus obtusifolia H. B. K. Nov. Gen. & Sp. 2: 49. 1817. Not *F. obtusifolia* Roxb. 1814.
Urostigma involutum Liebm. Dansk. Vid. Selsk. Skrivt. V. 2: 323. 1851.
Urostigma bonplandianum Liebm. Dansk. Vid. Selsk. Skrivt. V. 2: 323. 1851.
Ficus bonplandiana Miquel, Ann. Mus. Bot. Lugd. Bat. 3: 298. 1867.
 Sinaloa to San Luis Potosí, Yucatán, and Oaxaca. Central America; type from Nicaragua.
 Large tree, sometimes with a trunk 1.8 meters in diameter and a crown 19 meters broad; stipules 1.5 to 3 cm. long; leaves 11 to 21 cm. long; receptacles 1.5 to 2 cm. in diameter. "Amate" (Guererro); "amate blanco" (San Luis Potosí, Morelos); "matapalo" (Oaxaca); "palo de sal" (Costa Rica).
 The fruit is edible. The milky juice of the branches is applied externally for pain in the stomach.
21. *Ficus jonesii* Standl. Contr. U. S. Nat. Herb. 20: 31. 1917.
 Sinaloa and Jalisco; type from La Palma, Jalisco.
 Large tree; leaves oval-oblong to broadly ovate-oblong; receptacles 2.5 cm. in diameter.
 The writer is inclined to believe that the receptacles described for this may belong to a different tree from the one which furnished the leaves, and that the latter may be referable to *F. lentiginosa*.
22. *Ficus goldmanii* Standl. Contr. U. S. Nat. Herb. 20: 32. 1917.
 Sonora and Sinaloa to Puebla and Oaxaca; type from Alamos, Sonora.
 Large tree, with a short, very thick trunk supported by buttresses; leaves oblong or elliptic-oblong, 8 to 20 cm. long; receptacles 2 to 2.5 cm. in diameter. "Chalate" (Durango).
23. *Ficus yucatanensis* Standl. Contr. U. S. Nat. Herb. 20: 33. 1917.
 Yucatán; type from Chichen Itzá.
 Stipules 1 to 1.5 cm. long; leaves oval or oval-oblong, 8 to 20 cm. long; receptacles 2 cm. in diameter.

DOUBTFUL SPECIES.

- FICUS CALYCVLATA* Mill. Gard. Diet. ed. 8. *Ficus* no. 11. 1768. Described from Veracruz. The description does not agree with any species known from Mexico.
FICUS FUSCESCENS (Liebm.) Miquel, Ann. Mus. Bot. Lugd. Bat. 3: 298. 1867.
Urostigma fuscescens Liebm. Dansk. Vid. Selsk. Skrivt. V. 2: 329. 1851. Described from Veracruz; perhaps not of this genus.

5. *BROSIMUM* Swartz, Prodr. Veg. Ind. Occ. 12. 1788.

Leaves oval or oblong-oval, 4.5 to 8.5 cm. wide, acute or acuminate.

1. *B. alicastrum*.

Leaves oblong or lance-oblong, 2 to 3 cm. wide, obtuse or acutish.

2. *B. conzattii*.1. *Brosimum alicastrum* Swartz, Prodr. Veg. Ind. Occ. 12. 1788.

Tamaulipas to Yucatán, Tabasco, Oaxaca, and Tepic. West Indies and Central America; type from Jamaica.

Tree, sometimes 30 meters high, with a trunk a meter in diameter, the crown broad and dense; bark gray; leaves bright green, glabrous, entire; flowers unisexual, in dense globose pedunculate heads; fruit subglobose, yellow or orange, containing a single large seed about 12 mm. broad. "Ramón" (Yucatán, Oaxaca); "ox" (Yucatán, Tabasco, Maya); "ojite" (Veracruz, Tamaulipas, Oaxaca; from the Nahuatl, "oxitl"); "nazareno" (Oaxaca, *Reko*); "oxotzin" (Veracruz, *Finck*); "capomo" (Tepic, Jalisco, Veracruz, Oaxaca); "apomo" (Sinaloa); "Juandiego" (Oaxaca, *Reko*); "ojoche" (Nicaragua); "maseco" (Guatemala, Honduras).

The wood is said to be white, or sometimes grayish or tinged with flesh color, compact, hard, and fine-grained; it is used in carpenter work. The tree is valued highly for forage, the branches being cut and fed to different kinds of stock, and the fallen leaves are eaten greedily by cattle. The tree is often planted for this purpose, and in some parts of Mexico it is a very important forage plant. The milky juice is reported to yield a kind of rubber, and is used as a calmant in asthma. It is reputed also to increase the flow of human milk, this probably a relic of the old medical theory of signatures. The seeds are said to be fattening for cattle, which are fond of them, and they are used also as human food. For the latter purpose they are boiled or roasted, and eaten alone or mixed with sugar, honey, or corn meal. They have a flavor resembling that of chestnuts and are very nutritious. The seeds are sometimes roasted and used as a substitute for coffee.

2. *Brosimum conzattii* Standl. Contr. U. S. Nat. Herb. 20: 211. 1919.

Known only from the type locality, Cafetal San Rafael, Distrito de Pochutla, Oaxaca.

Similar to the preceding, of which it may be only a form, but with much smaller, relatively narrower leaves, the embryo with an obtuse, rather than acute, radicle.

6. *PSEUDOLMEDIA* Trécul, Ann. Sci. Nat. III. 8: 129. 1847.

1. *Pseudolmedia oxyphyllaria* Donn. Smith, Bot. Gaz. 20: 294. 1895.

Veracruz. Guatemala; type from Volcán de Tecuamburro.

A tree; leaves elliptic-oblong, 11 to 23 cm. long, acuminate, entire, glabrous; flowers dioecious, the staminate ones in sessile heads, the pistillate solitary, sessile, axillary, surrounded by silky bracts.

Perhaps not sufficiently distinct from *P. spuria* (Swartz) Griseb., of the Greater Antilles and Panama.

7. *CASTILLA*¹ Cervantes, Gaceta de Literatura de México, Suppl. July 2, 1794.

REFERENCES: Pittier, Contr. U. S. Nat. Herb. 13: 247-279. 1910; Cook, The culture of the Central American rubber tree, U. S. Dept. Agr. Bur. Pl. Ind. Bull. 49. 1903; Villada, El árbol del hule, Naturaleza 3: 316-330. 1876.

1. *Castilla elastica* Cervantes, Gac. Lit. Méx. Suppl. 1794.

Castilla lactiflua Cook, Science n. ser. 18: 438. 1903.

Veracruz to Sinaloa, Chiapas, and Yucatán; type from Veracruz.

¹ Sometimes written *Castilloa*. The genus was named in honor of Juan Diego del Castillo (1744-1793), pharmacist and economic explorer, who came to Mexico in 1787 as a member of the famous naturalists' expedition sent out by Charles III. As a result of the labors occasioned by his work, he fell ill and died in the City of Mexico. He left a legacy of \$4,000 to be used in publishing the Flora Mexicana. A manuscript by his hand, entitled "Plantas descritas en el viaje de Acapulco," is said to be preserved in the Botanical Garden at Madrid.

Tree, attaining a height of 20 meters or more, the trunk grayish, nearly smooth; leaves distichous, deciduous, short-petiolate, oblong or oval-oblong, 25 to 40 cm. long, cordate at the base, acuminate at the apex, copiously pubescent; flowers monoecious, the 2 kinds on separate receptacles, the staminate receptacles 2 to 2.5 cm. broad, bearing numerous flowers; fruiting receptacles 4 cm. or more in diameter, contorted, the fruits becoming fleshy and brick-red. "Arbol del hule"; "tarantaqua" (Michoacán, *Leon*); "hule" (the rubber; sometimes written "ule"; derived from the Nahuatl *ollī* or *ollin*); "cuauchile." Robelo gives the Nahuatl names for the tree as "olcagiite," "ulcuagüil," "olcuahuil," and "ulcuahuil."

This is one of the best-known trees of Mexico, being the principal source of commercial rubber in Mexico and Central America. The rubber is obtained from either wild or cultivated trees. The *Castilla* grows wild chiefly in the states of Chiapas, Tabasco, Yucatán, and Veracruz, usually at altitudes of 700 meters or less. It is reported also from Campeche, Oaxaca, Guerrero, Michoacán, Colima, Jalisco, Hidalgo, Sinaloa, and Tamaulipas. Cultivation of the rubber tree was begun in the State of Chiapas about 50 years ago, but only in an experimental way, and it is only in recent years that cultivation has been carried on upon an extensive scale. The details of rubber production are so numerous that they can not be treated here, but those interested in the subject should consult the paper by Cook, listed above.

Like other plants of the family Moraceae, the rubber tree has milky juice, and this is the source of the rubber. The juice is obtained by tapping the trees. It coagulates upon exposure to the air, but various substances are sometimes added to hasten coagulation. In British Honduras the pounded stems of morning-glory (*Calonyction*) are said to be used for this purpose. The early inhabitants of Mexico were well acquainted with the crude rubber, using it to make balls for games, for bottles, and for waterproofing coats, hats, shoes, and other objects.

The wood is white and moderately heavy. The bark is beaten out by some of the Indians of tropical America, and the fabric thus obtained is used for clothing and blankets. In Mexico the bark is said to have been one of the sources of paper.

Hernández was probably the first to give an account of the Mexican rubber tree. He gives a fairly accurate figure,¹ and the following account, in a chapter entitled "De Holquahuil, seu Arbore Chilli²": "*Holquahuil* is a tree of which there are two sorts. The one produces a large, smooth, yellow stem, full of soft pith; whitish flowers; very large leaves; and star-shaped disks, pale but becoming red, clinging to a stalk and crowded with fruits like Pontic nuts, which are covered with a whitish and yellow skin and have a bitter flavor. The other sort has leaves like *Malus Medicus*, but larger; the bark of both trees is bitter. The latter grows in Michoacán, where it is called *tarantaquam*. The first is called *Mecatani* and *yhulapae*. The bark is warm in the third order and slightly lubricous; its infused decoction is good for dysentery. When cut it yields a gum, called *Holli* by the Indians, which is at first milky, but soon yellow, and finally black, if it is smeared on the bodies of those who gather it. It is so resilient that balls fashioned from it bounce like hand-balls, and it is useful for many other purposes. For it evokes the urine uncommonly, cleanses the womb, and corrects sterility. * * * Added to food it fattens, and compounded with those creatures which are called *Axin*, it is said to engender a certain agility to the body, and to soften the bones so that men are able to

¹ Thesaurus 50. 1651.

² The word "chilli" is probably a typographical error for "holli" or "hule."

turn and twist this way and that, and to handle the body like contortionists; and it excites venery, it allays colics, applied as a plaster it relieves the bowels, appeases thirst, and, burnt, it dissipates ulcers. This is that noble gum with which the Indians once were wont to play the game called *Bathei*, wonderful to see, which, by the agency of Cortés, the people of Spain also were enabled to witness years ago. The leaves of the tree, dried and bruised, are said to destroy lions and other animals."

According to Sahagún, "hoarseness is cured by rubbing the throat with *ulli*, drinking honey, and sniffing a few drops of honey up the nose. * * * The gum is very medicinal and is used for almost all diseases. It is a remedy for the eyes, for abscesses, and for suppuration. It is taken with cacao. It is useful for the stomach and intestines, internal putrefaction, and constipation." The rubber was employed also for holding broken bones in place, and for similar purposes.

Several other species of *Castilla* are found in Central America. Some Mexican specimens have been reported as *C. guatemalensis* Pittier,¹ but the present writer has no reason for believing that more than one species occurs in Mexico.

8. SAHAGUNIA² Liebm. Dansk. Vid. Selsk. Skrivt. V. 2: 316. 1851.

1. *Sahagunia mexicana* Liebm. Dansk. Vid. Selsk. Skrivt. V. 2: 316. 1851.

Mirador and Barranca de Santa María, Veracruz.

Tree; leaves oblong, acuminate, entire or nearly so; flowers dioecious, the staminate spicate, the pistillate capitate. "Arbol del pan" (Veracruz, *Vilada*).

9. CECROPIA L. Amoen. Acad. 5: 410. 1760.

REFERENCE: Miquel in Mart. Fl. Bras. 4¹: 139-154. 1853.

Trees or shrubs, the stems simple or branched, the trunk whitish, hollow; leaves long-petiolate, the blades deeply lobed, usually white-tomentose beneath, the lobes 7 to 13, entire; stipules large, inclosing the young inflorescences; flowers dioecious, in very dense cylindric spikes, these clustered at the end of a stout peduncle.

All the species are much alike in general appearance, and they are not easily separated upon examination of herbarium material. The specimens available are

¹ Contr. U. S. Nat. Herb. 13: 272. 1910. The proper name for this species is *Castilla gummifera* (Bertol.) Pittier; see Contr. U. S. Nat. Herb. 20: 34. 1917.

² The genus is named in honor of Bernardo de Sahagún, a Franciscan friar of Spanish birth who came to Mexico as a missionary in 1529. Here, as Prescott states, "he distinguished himself by his zeal, the purity of his life, and his unwearied exertions to spread the great truths of religion among the natives." He wrote a "Historia Universal de Nueva España," the material for which he obtained directly from the native people with whom he was continually associated. This work he composed in the Nahuatl language, which he could both write and speak with great fluency. It was feared by the other members of the order that the publication of the work would keep alive in the natives too vivid an impression of the superstitions which it was the duty of the Christian church to eradicate, and consequently the permission to print the manuscript was refused. It was not until 1830 that Sahagún's history was actually printed. Besides the other matters of which it treats, the book contains much information regarding the plants of Mexico. Sahagún's work is one of the most important of those dealing with Mexican antiquities, and is unique in the method of its preparation. The author lived to an advanced age, and died in the capital in 1590.

not numerous or very satisfactory, and it is doubtful how many species occur in Mexico.

The trees grow very rapidly. Their hollow trunks are generally inhabited by pugnacious ants. The trunks are often cut in two and used as troughs to conduct water. Many of the native inhabitants of tropical America used them also for making a kind of trumpet, and the soft spongy wood was employed as tinder. In Brazil the wood has been used for making paper. The bark contains a tough, coarse fiber used for cordage and for mats and for a kind of coarse cloth by the Indians of Central and South America. The sap yields rubber, but the quantity obtained by tapping is too small to be of commercial importance. It is said that the Indians sometimes ate the pith and that cattle eat the leaves and fruit. The fruit is eaten also by birds.

Various medicinal properties are ascribed to the plants. In Mexico the juice is used as a caustic for the treatment of ulcers and the removal of warts. In South America and the West Indies it is used for dysentery and venereal diseases, and a decoction of the young leaves for dropsy, liver affections, and asthma. The ashes, according to Barham, were employed as a remedy for dropsy. It is said, in addition, that the plant possesses the properties of digitalis, although its toxicity is relatively low.

According to Cook¹ *Cecropia peltata* is known in Porto Rico as "yagrumo hembra," because of the fact that it is popularly believed to be the female plant of *Didymopanax morototoni*, which is known as "yagrumo macho."

The trees of the genus *Cecropia* are first described by Oviedo² (Lib. VIII, Cap. X), under the name "yaruma." He states that the Indians valued them highly as a remedy for wounds.

The following vernacular names are reported for the species: "Guarumbo" (Valley of Mexico, Oaxaca, Tabasco, Chiapas); "guarumo" (Tabasco, Chiapas, Veracruz, Costa Rica; the word, according to Pittier, is probably of Cuban or Haitian origin); "chancarro" (Veracruz, Oaxaca); "coilotópalo," "coilotá-palo" (Valley of Mexico); "saruma" (Michoacán, Valley of Mexico); "guarina" (Tabasco, Chiapas).

Pistillate spikes sessile-----1. *C. mexicana*.

Pistillate spikes pedunculate.

Staminate spikes few, 10 to 15 cm. long-----2. *C. schiedeana*.

Staminate spikes numerous (12 to 15), 3 to 6 cm. long-----3. *C. obtusa*.

1. *Cecropia mexicana* Hemsl. Biol. Centr. Amer. Bot. 3: 151. pl. 80. 1883.

Veracruz to Sinaloa and Oaxaca; type from Córdoba, Veracruz. Central America.

Sometimes as much as 12 to 15 meters high. "Guarumbo" (Oaxaca); "trompeta" (Sinaloa); "guarumo" (Costa Rica, El Salvador).

This is probably the species reported from Jorullo by Sessé and Mociño³ as *C. peltata* L. It has often been reported from Mexico under that name by other writers. One collection from Oaxaca, with leaves glabrate beneath, perhaps represents an undescribed species.

2. *Cecropia schiedeana* Klotzsch, Linnaea 20: 531. 1847.

Veracruz: type from Papantla.

¹ Contr. U. S. Nat. Herb. 8: 110. 1903.

² Primera parte de la historia natural y general de las Indias, yslas y tierra firme del mar oceano. Sevilla, 1535. An enlarged and improved edition was published in Madrid, 1851-55.

³ Pl. Nov. Hisp. 170. 1887.

3. *Cecropia obtusa* Trécul, Ann. Sci. Nat. III. 8: 79. 1849.

Veracruz and Yucatán. Cuba; South America.

"Xcoochlé" (Yucatán, Maya); "yagrumo hembra" (Cuba).

DOUBTFUL SPECIES.

CECROPIA COMMUTATA Schott; Miquel in Mart. Fl. Bras. 4¹: 148. 1843. Described from a sterile cultivated plant said to be of Mexican origin.

CECROPIA PROPINQUA Miquel in Mart. Fl. Bras. 4¹: 149. 1843. Described from sterile cultivated plants.

10. *COUSSAPOA* Aubl. Pl. Guian. 2: 891. 1775.1. *Coussapoa rekoii* Standl. Contr. U. S. Nat. Herb. 20: 211. 1919.

Veracruz and Oaxaca; type locality, Cafetal Concordia, Cerro Espino, Oaxaca, at an altitude of 600 meters.

Large tree with spreading crown, the branchlets, stipules, and nerves prickly; leaves ovate-rounded, sometimes half a meter long, entire, short-pointed; flowers in globose pedunculate heads, the head becoming succulent and edible at maturity. "Chirimoya," "carnero" (Oaxaca); "ababábite" (Veracruz).

The ripe heads are edible; they are about 2.5 cm. in diameter and resemble miniature chirimoyas (*Annona cherimola*). Mr. Wilson Popenoe has found them recently offered for sale in markets of Veracruz.

25. *URTICACEAE*. Nettle Family.

Large or small shrubs or small trees, sometimes covered with stinging hairs. Many herbaceous representatives of the family occur in Mexico. Most of the species of the *Urticaceae* have very tough stems, from which coarse, tough fiber may be obtained.

Plants with stinging hairs.

Stigma penicillate-capitate; perianth lobes fleshy in fruit.....1. *URERA*.

Stigma filiform; perianth lobes unchanged in fruit.....2. *URTICASTRUM*.

Plants never with stinging hairs.

Perianth membranaceous in fruit, inclosing the achene.

Stigma persistent; leaves toothed.....3. *BOEHMERIA*.

Stigma deciduous; leaves entire.....4. *POUZOLZIA*.

Perianth none.

Flowers in long slender spikes.....5. *MYRIOCARPA*.

Flowers in axillary glomerules.....6. *PHENAX*.

1. *URERA* Gaud. in Freyc. Voy. Bot. 496. 1826.

REFERENCE: Weddell in DC. Prodr. 16¹: 88-98. 1869.

Trees or shrubs, covered with stinging hairs; leaves alternate, stipulate, petioled; flowers small, green, in axillary panicles, usually dioecious; fruit a small achene, surrounded by the fleshy calyx and resembling a berry.

Inflorescence not dichotomous; leaves entire or sinuate. Achene exceeding the calyx.....1. *U. microcarpa*.

Inflorescence dichotomous or trichotomous; leaves crenate-dentate or coarsely dentate.

Achene exceeding the calyx; leaves coarsely dentate.....2. *U. baccifera*.

Achene not exceeding the calyx; leaves closely crenate-dentate.

3. *U. caracasana*.

1. *Urera microcarpa* Wedd. Arch. Mus. Paris 9: 156. 1856.

Yucatán and Tabasco. Panama; Jamaica (type locality).

Shrub or small tree; leaves elliptic-oblong, 7 to 10 cm. long. "Laol" (Yucatán, Maya).

2. *Urera baccifera* (L.) Gaud. in Freyc. Voy. Bot. 497. 1826.

Urtica baccifera L. Sp. Pl. ed. 2. 1398. 1763.

Oaxaca; reported from Yucatán, and probably also in Tabasco or Chiapas. Central America, West Indies, and South America.

Shrub or small tree, 2 to 7 meters high, covered with stout stinging hairs; leaves oval or rounded-cordate, 10 to 30 cm. long or larger; flowers small, in cymes, whitish, the branches of the cymes red or purplish; fruit small, juicy, white. "Ortiga de caballo" (Yucatán); "chichicaste" (Oaxaca); "chichicazte" (Guatemala); "chichicazte nigua" (El Salvador); "ortiga" (Panama, Porto Rico); "ortiga brava" (Porto Rico); "pringamosa" or "pringamoza" (Colombia, Santo Domingo, Venezuela); "guaina" (Colombia); "chichicate," "chichicastre" (Cuba).

The fruit is said to be edible. In Yucatán the shrub is planted for hedges. The hairs sting the flesh severely and sometimes cause painful sores. The branches are said to be used sometimes in Colombia as a rubefacient, and the fiber separated from them is employed in Cuba and elsewhere for making rope and twine. According to Grosourdy,¹ the root has been used in Porto Rico as a popular remedy for gonorrhoea, and the juice of the leaves for chills in intermittent fevers, while diuretic properties are ascribed to the plant.

3. *Urera caracasana* (Jacq.) Griseb. Fl. Brit. W. Ind. 154. 1859.

Urtica caracasana Jacq. Pl. Hort. Schönbr. 3: 71. pl. 986. 1798.

Urera caracasana tomentosa Wedd. in DC. Prodr. 16¹: 90. 1869.

Urtica chichicaxtli Sessé & Moc. Pl. Nov. Hisp. 160. 1887.

Veracruz to Sinaloa, Chiapas, and Tabasco. Central America, West Indies, and tropical South America; type from Caracas, Venezuela.

Shrub or small tree, 2 to 4 meters high, usually armed with slender stinging hairs; leaves very variable in shape, rounded-ovate to rhombic-elliptic, cordate to obtuse at base, acute or acuminate at apex, sparsely or densely pubescent; flowers very small, greenish; fruit bright red at maturity. "Ortiga" (Veracruz, Tabasco); "mal hombre" (Veracruz); "quemador" (Sinaloa); "chichicaxtli" (Oaxaca); "chichicaxtli." "mala mujer" (Morelos, Sessé & Mociño); "tachinole" (Durango); "chichicaste" (Guatemala); "ortiga colorada" (Porto Rico).

According to Reko, the Nahuatl name is "xio-patli" (*xioitl*, syphilis; *patli*, remedy, medicine). He states that the plant is still used by the Indians of the Sierra de Juárez as a remedy for syphilis. Sessé and Mociño state that the shrub was sometimes planted for hedges. Palmer reports that in Durango it is employed to cure the effects of poison ivy (*Rhus toxicodendron* and related species).

2. **URTICASTRUM** Fabr. Pl. Hort. Helmst. 204. 1759.1. *Urticastrum mexicanum* (Liebm.) Kuntze. Rev. Gen. Pl. 1: 635. 1891.

Discocarpus mexicanus Liebm. Dansk. Vid. Selsk. Skrivt. V. 2: 309. 1851.

Urera platycarpa Wedd. Ann. Sci. Nat. III. 18: 202. 1852.

Laportea mexicana Wedd. in DC. Prodr. 16¹: 84. 1879.

Veracruz and Oaxaca (type locality). Guatemala.

¹ René de Grosourdy, El médico botánico criollo. 1864.

Shrub, 1 to 3 meters high, covered with slender stinging hairs, the trunk thick, succulent, sparsely branched; leaves broadly ovate, crenate; flowers dioecious; fruit a small thin orbicular achene.

3. BOEHMERIA Jacq. Enum. Pl. Carib. 9. 1760.

REFERENCE: Weddell in DC. Prodr. 16¹: 195-218. 1869.

Shrubs or more commonly herbs; leaves opposite or alternate, 3-nerved; flowers green, unisexual, paniced, glomerate, or spicate in the leaf axils; fruit a small achene.

A few herbaceous species occur in Mexico besides those listed below. The best-known species of the genus is the ramie plant ("ramié," "seda vegetal"), *Boehmeria nivea* (L.) Gaud., a large herb or small shrub which has been cultivated in Mexico as well as elsewhere for its fiber. It differs from the native Mexican species in having the leaves densely white-tomentose beneath. The original home of the plant was probably China, but the species is now widely dispersed in tropical regions.

Flowers in dense axillary glomerules-----1. *B. ulmifolia*.

Flowers in long dense spikes.

Stipules lance-ovate; leaves copiously pubescent on the upper surface.

2. *B. caudata*.

Stipules lance-linear; leaves glabrate on the upper surface-----3. *B. palmeri*.

1. *Boehmeria ulmifolia* Wedd. Arch. Mus. Paris 9: 347. 1856.

Boehmeria fallax ulmifolia Wedd. in DC. Prodr. 16¹: 198. 1869.

Veracruz; type from Jalapa. Guatemala.

Shrub, 1.5 to 2.5 meters high; leaves broadly ovate, crenate.

2. *Boehmeria caudata* Swartz, Prodr. Veg. Ind. Occ. 34. 1788.

Boehmeria flagelliformis Liebm. Dansk. Vid. Selsk. Skrivt. V. 2: 310. 1851.

Veracruz to Oaxaca. Central America, West Indies, and tropical South America.

Shrub or small tree, 2 to 5 meters high; leaves ovate or lance-elliptic, closely crenate, densely pubescent beneath.

The plant is said to give a very strong fiber. This is probably the plant described by Sessé and Mociño¹ as *Urtica spicata*. That name belongs properly to an Old World species of *Boehmeria*.

3. *Boehmeria palmeri* S. Wats. Proc. Amer. Acad. 22: 453. 1887.

Known only from the type locality, Tequila, Jalisco.

Shrub, 2.5 meters high; leaves ovate, 7 to 13 cm. long; flower spikes often leafy at the apex.

4. POUZOLZIA Gaud. in Freyc. Voy. Bot. 503. 1826.

Shrubs; leaves usually alternate, 3-nerved, stipulate; flowers monoecious, clustered in the leaf axils, the glomerules unisexual; fruit a small achene.

Leaves densely short-pilose beneath, not tomentose-----1. *P. palmeri*.

Leaves densely white-tomentose beneath.

Leaves mostly 4 to 7 cm. long, abruptly acuminate-----2. *P. nivea*.

Leaves mostly 1.5 to 4 cm. long, rounded to acute at the apex...3. *P. pringlei*.

1. *Pouzolzia palmeri* S. Wats. Proc. Amer. Acad. 22: 453. 1887.

Rocky slopes of barrancas, Jalisco and Sinaloa to Morelos; type from Guadalajara.

Shrub, 1 to 1.5 meters high, with slender reddish brown branches; leaves bright green, ovate or oval, acuminate; flowers very small, in dense axillary clusters.

¹ Fl. Mex. 235. 1896.

2. Pouzolzia nivea S. Wats. Proc. Amer. Acad. **22**: 453. 1887.

Rocky slopes, Jalisco and Sinaloa to Veracruz; type from Guadalajara.

Shrub, 1 to 1.5 meters high; leaves ovate or oval, 3-nerved, very white beneath.

P. latifolia Wedd.¹ was based on specimens said to have come from Mexico. Its description suggests *P. nivea*.

3. Pouzolzia pringlei Greenm. Proc. Amer. Acad. **33**: 476. 1908.

Puebla and Oaxaca; type from Tomellín Canyon, Oaxaca.

Shrub similar to the last species but with much smaller leaves.

5. MYRIOCARPA Benth. Bot. Voy. Sulph. 168. 1844.

REFERENCE: Weddell in DC. Prodr. **16**¹: 235³³-235³⁶. 1869.

Trees or shrubs; leaves large, alternate, dentate, pinnately veined and somewhat 3-nerved; stipules connate; flowers green, dioecious, the long stalks axillary, solitary or clustered; fruit a small achene.

Leaf blades ovate-orbicular, cordate at the base-----**1. M. cordifolia**.
Leaf blades ovate or broadly ovate, obtuse or rounded or rarely subcordate at the base.

Leaves serrate; pistillate peduncles slender, glabrate-----**2. M. longipes**.

Leaves crenate; pistillate peduncles stout, densely pilose.**3. M. brachystachys**.

1. Myriocarpa cordifolia Liebm. Dansk. Vid. Selsk. Skrivt. V. **2**: 306. 1851.

Veracruz and Puebla; type from forests near Colipa, Veracruz.

Tree, 4 to 5 meters high; leaves mostly 20 to 25 cm. long and nearly as wide; fruit a small achene. "Mal hombre" (Puebla).

2. Myriocarpa longipes Liebm. Dansk. Vid. Selsk. Skrivt. V. **2**: 306. 1851.

Myriocarpa colipensis Liebm. Dansk. Vid. Selsk. Skrivt. V. **2**: 306. 1851.

Veracruz to Colima and Chiapas. Central America; type from Costa Rica.

Shrub, 2.5 to 6 meters high; flowers in very long slender spikes. "Cholagogue Indio" (Oaxaca).

The plant is sometimes used for hedges. In Oaxaca it is employed as a remedy for malaria.

3. Myriocarpa brachystachys S. Wats. Proc. Amer. Acad. **26**: 152. 1891.

Jalisco; type from barranca near Guadalajara.

Shrub or small tree; leaves 7 to 17 cm. long, densely pubescent beneath.

Myriocarpa stipitata ambigua Wedd.,² described from Veracruz, is perhaps the same as *M. longipes*.

6. PHENAX Wedd. Ann. Sci. Nat. IV. **1**: 191. 1854.

Shrubs; leaves alternate, petiolate, toothed, 3 or 5-nerved; stipules free; flowers green, monoecious, in dense axillary clusters, the bracts brown, scarious; fruit a compressed achene.

Leaf blades broadly ovate, thin, coarsely crenate-----**1. P. hirtus**.

Leaf blades ovate to lance-oblong, thick, finely and closely crenate.

2. P. mexicanus.

1. Phenax hirtus (Swartz) Wedd. in DC. Prodr. **16**¹: 235³³. 1869.

Urtica hirta Swartz, Fl. Ind. Occ. **1**: 285. 1797.

Veracruz to Oaxaca. Central America, West Indies, and tropical South America.

Shrub, 1 to 2 meters high; leaves mostly 5 to 11 cm. long, green, glabrate, long-petiolate, coarsely crenate.

¹ In DC. Prodr. **16**¹: 234. 1869.

² In DC. Prodr. **16**¹: 235³⁴. 1879.

Specimens reported from Jalapa by Hemsley¹ as *P. sonneratii* Wedd. probably belong here.

2. *Phenax mexicanus* Wedd. Arch. Mus. Paris 9: 500. 1856.

Phenax gaudichaudianus Wedd. Ann. Sci. Nat. IV. 1: 193. 1854.

Phenax galeottianus Blume, Mus. Bot. Lugd. Bat. 2: 227. 1866.

Veracruz, Oaxaca, and Chiapas. Central America.

Shrub, 1 to 2.5 meters high; leaves bright green, 3-nerved; flowers small, in dense axillary clusters; fruit a small achene.

26. PROTEACEAE. Protea Family.

1. **ROUPALA** Aubl. Pl. Guian. 1: 83. 1775.

1. *Roupala borealis* Hemsl. Biol. Centr. Amer. Bot. 3: 78. pl. 76. 1882.

Veracruz and Oaxaca; type from San Cristóbal, Veracruz. Guatemala.

Shrub or small tree, nearly glabrous; leaves dimorphous, part of them pinnate, with coarsely serrate leaflets, part of them simple, long-petiolate, ovate or elliptic, long-acuminate, shallowly serrate; flowers small, in long slender spikes. "Palo de zorrillo" (Oaxaca).

27. LORANTHACEAE. Mistletoe Family.

Shrubs, sometimes very small, parasitic upon the branches of trees or shrubs, usually green but often red, brown, or yellowish and without chlorophyll; leaves mostly opposite, entire, thick and leathery, frequently reduced to scales, estipulate; flowers large or small, perfect or unisexual; fruit a 1-seeded berry.

The pulp of the fruit is extremely viscid, and if it comes in contact with any object it can not be separated from it without great difficulty. The fruit is eaten by birds and it is largely by their agency that the seeds are transported from one host to another. It is said that in Brazil a kind of rubber has been extracted from the fruit, and that the leaves are used for tanning.

When one of the plants of this family is removed from its host there is exposed upon the latter a curious structure which often assumes a flower-like form. These "wood flowers" or "flores de madera" are well known in some parts of tropical America, and various superstitions are associated with them. Flowers not calyculate, very small.

Flowers in one rank on the joints of the inflorescence. Leaves developed.

1. **DENDROPTHORA.**

Flowers in 2 or more ranks.

Flowers solitary in the axils of the bracts; leaves reduced to scales.

2. **RAZOUMOFSKYA.**

Flowers borne above the bracts on the axis of the spike; leaves often well developed.....

3. **PHORADENDRON.**

Flowers calyculate, often large and showy.

Flowers sunk in the axis of the inflorescence.....

4. **ORYCTANTHUS.**

Flowers not sunk in the axis of the inflorescence, sessile or pedicellate.

Flowers small, less than 1 cm. long.....

5. **STRUTHANTHUS.**

Flowers large, 2 cm. long or larger.

Seeds with endosperm.....

6. **PHRYGILANTHUS.**

Seeds without endosperm.....

7. **PSITTACANTHUS.**

¹ Biol. Centr. Amer. Bot. 3: 161. 1883.

1. **DENDROPTHORA** Eichl. in Mart. Fl. Bras. 5²: 102. 1868.

1. *Dendrophthora pedicellata* Van Tiegh. Bull. Soc. Bot. France 43: 182. 1896.
Type from "Mesa Chica."

Stems terete; leaves oblong or oblong-lanceolate, 3.5 to 5 cm. long, obtuse or rounded at apex, glabrous; spikes 1 cm. long, 2 or 3-jointed, the flowers pedicellate.

2. **RAZOUMOFSKYA** Hoffm. Hort. Mosq. 1808.

1. *Razoumofskyia vaginata* (H. B. K.) Kuntze, Rev. Gen. Pl. 1: 587. 1891.

Viscum vaginatum H. B. K. Nov. Gen. & Sp. 3: 445. 1817.

Arceuthobium cryptopodum Engelm. Bost. Journ. Nat. Hist. 6: 214. 1850.

Arceuthobium vaginatum Eichl. in Mart. Fl. Bras. 5²: 105. 1868.

Sonora to Coahuila, Mexico, and Oaxaca; type from Cofre de Perote. Western United States. On pines; reported also on *Abies religiosa*.

Plants 6 to 20 cm. high, often forming dense tufts, much branched, brownish; leaves reduced to small scales; flowers spicate. "Ingerto" (Durango).

Hemsley¹ reports *A. campylopodum* Engelm. from Orizaba and *A. oxycedri* Bieb. from Veracruz and Oaxaca. It may be that more than one species is represented in the material examined by the writer, but there are no readily apparent characters for their separation.

3. **PHORADENDRON** Nutt. Journ. Acad. Phila. II. 1: 185. 1847.

REFERENCE: Trelease, The genus *Phoradendron*, pp. 1-124, pl. 1-245. 1916.

Branches terete, angulate, or compressed; leaves opposite, sometimes reduced to scales; flowers usually dioecious, sessile or immersed in the rachis of a spike.

Mistletoe plants are much used in the United States for Christmas decorations, and on this account are of some commercial importance. The American mistletoes are different from the true mistletoe of Europe, *Viscum album* L., but some of them are similar to it in general appearance. The Spanish names applied to the European mistletoe are "muérdago," "liga," and "visco," words adopted in Spanish America for the native plants of the same family. The species of *Phoradendron* often occur upon trees in such abundance as ultimately to kill them. The fruit of some species has been reported as poisonous, but that of other species is said to be edible. The species apparently are little used in domestic medicine. The Coahuila Indians of southern California are said to use the dried and powdered stems of one species (growing on *Juniperus*) as a remedy for saddle sores on horses. Ramírez gives the names applied to various species of doubtful identification as "cabellera," "liga," "visco cuerchino," and "chachahua."

Stems with scales near the base of the branches; leaves always developed.

Scales present on all the joints-----1. *P. piperoides*.

Scales present only on the basal joints of the branches.

Leaves pinnately nerved, oval or oblong-oval-----2. *P. oliverianum*.

Leaves palmately nerved.

Flowers mostly 2-ranked on each joint.

Stems quadrangular.

Fruit not tuberculate; leaves twice as long as broad--3. *P. townsendi*.

Fruit tuberculate; leaves nearly as broad as long--4. *P. yucatanum*.

Stems not quadrangular.

Spikes filiform; branchlets compressed-----5. *P. wawrae*.

Spikes stout; branchlets subterete-----6. *P. vernicosum*.

¹ Biol. Centr. Amer. Bot. 3: 83-4. 1882.

Flowers 4 to 6-ranked.

Fruit tuberculate.

Leaves 15 to 30 mm. wide.....7. *P. amplifolium*.

Leaves 4 to 8 mm. wide.....8. *P. carneum*.

Fruit not tuberculate.

Branches sharply quadrangular.

Sepals closely meeting in fruit.

Spikes pedunculate.....9. *P. tamaulipense*.

Spikes sessile.....10. *P. gaumeri*.

Sepals not meeting in fruit.

Leaves subsessile.....11. *P. guazumae*.

Leaves petiolate.....12. *P. commutatum*.

Branches terete or compressed.

Leaves small, 10 to 12 mm. long.....13. *P. brevifolium*.

Leaves large, 3 cm. long or usually much larger.

Leaves thin, sharply nerved.

Leaf blades ovate-oval.....14. *P. pachyarthron*.

Leaf blades ovate-lanceolate to lance-linear.

Branchlets subterete.....15. *P. schumanni*.

Branchlets compressed.

Bracts usually 2 pairs.....16. *P. purpusi*.

Bracts a single pair.....17. *P. nervosum*.

Leaves very thick and coriaceous.

Leaf blades oval-ovate.....18. *P. reichenbachianum*.

Leaf blades lanceolate to linear.

Fruit ovoid.

Branchlets compressed; nerves coarse.

19. *P. lanceolatum*.

Branchlets not compressed; nerves slender.

20. *P. falcatum*.

Fruit globose.....21. *P. forestierae*.

Stems without scales on the branches; leaves sometimes reduced to scales.

Branches broadly winged.....22. *P. calyculatum*.

Branches not winged.

Pistillate flowers 2 to each joint. Plants parasitic chiefly on Pinaceae.

Leaves reduced to small scales, not disarticulating.

Plants puberulent; spikes several-jointed.....23. *P. californicum*.

Plants glabrous; spikes 1-jointed.

Scales strongly constricted at the base. On *Juniperus*.

24. *P. ligatum*.

Scales obscurely or not at all constricted.

Scales not constricted; plants stout, on *Juniperus*.

25. *P. juniperinum*.

Scales obscurely constricted; plants slender, pendent, on *Libocedrus*.....26. *P. libocedri*.

Leaves well developed or sometimes scalelike but disarticulating.

Leaves scalelike.....27. *P. minutifolium*.

Leaves well developed.

Leaves linear or linear-oblong.

Plants tomentose; spikes often with 2 or 3 joints.

28. *P. capitellatum*.

Plants papillose or hirtellous; spikes usually with one joint.

Staminate spikes about 12-flowered.....29. *P. tequilense*.

Staminate spikes about 6-flowered.....30. *P. saltillense*.

Leaves more or less spatulate.

Leaves spatulate-linear.....31. *P. bolleanum*.

Leaves oblanceolate-spatulate.

Spikes usually 2-jointed; staminate spikes mostly 6-flowered.

32. *P. guadalupense*.

Spikes usually 1-jointed; staminate spikes 8 to 12-flowered.

Staminate spikes about 12-flowered; on *Juniperus*.

33. *P. densum*.

Staminate spikes about 8-flowered; on *Abies* and *Cupressus*.

34. *P. pauciflorum*.

Pistillate flowers 6 or more on each joint.

Branches compressed at the joints.

Leaves 10 to 25 mm. wide.....35. *P. scaberrimum*.

Leaves 5 to 7 mm. wide.....36. *P. longifolium*.

Branches not compressed.

Leaves mostly acute or attenuate, large (mostly 7 to 10 cm. long), pubescent.....37. *P. velutinum*.

Leaves rounded or very obtuse at the apex, or if acute very small.

Leaves small, usually 1 cm. wide or less, if larger very long in proportion to their breadth.

Plants persistently tomentose.....38. *P. lanatum*.

Plants not persistently tomentose, the pubescence sparse or soon deciduous.

Fruit villous or hispid.

Leaves oval or elliptic.....39. *P. eduardi*.

Leaves linear-oblanceolate to narrowly oblong.

Fruit retrorsely hispid. Sepals closed.....40. *P. galeottii*.

Fruit sparsely villous.

Sepals closed.....41. *P. peninsulare*.

Sepals open.....42. *P. palmeri*.

Fruit glabrous or puberulent.

Leaves subacute, sessile.....43. *P. mazatlanum*.

Leaves very obtuse, usually petiolate.

Plants large, stout.

Leaves sessile.....44. *P. globuliferum*.

Leaves petiolate.

Plants glabrate.....45. *P. brachystachyum*.

Plants densely pubescent throughout.

46. *P. tlacolulense*.

Plants small (of Baja California).

Leaves oval or rounded.....47. *P. aureum*.

Leaves oblong or obovate-oblong.....48. *P. diguetii*.

Leaves large, most of them 2 cm. wide or larger, never much elongate.

Fruit pubescent.

Leaf blades mostly 5 to 8 cm. long.....49. *P. robinsoni*.

Leaf blades usually less than 4 cm. long.

Leaves orbicular or nearly so.....50. *P. coryae*.

Leaves elliptic or obovate.....51. *P. tomentosum*.

Fruit glabrous.

Spikes yellow-hispid.....52. *P. colipense*.

Spikes glabrous, tomentose, or sparsely villous.

Spikes glabrous or sparsely villous.

Leaves suborbicular.....53. *P. macrophyllum*.

Leaves rounded-obovate.....54. *P. cockerellii*.

Spikes canescent-tomentose.

Staminate spikes 4 to 6 cm. long-----55. *P. greggii*.

Staminate spikes 2 cm. long or shorter.

Staminate spikes (in flower) 1.5 to 2 cm. long.

56. *P. engelmanni*.

Staminate spikes 1 cm. long-----57. *P. thyrsoides*.

1. *Phoradendron piperoides* (H. B. K.) Trel. Gen. Phorad. 145. 1916.

Viscum latifolium Swartz, Fl. Ind. Occ. 1: 268. 1797. Not *V. latifolium* Lam. 1789.

Loranthus piperoides H. B. K. Nov. Gen. & Sp. 3: 443. 1818.

Viscum cornifolium Presl, Epim. Bot. 254. 1849.

Viscum ellipticum Presl, Epim. Bot. 254. 1849.

Viscum laurifolium Presl, Epim. Bot. 255. 1849.

Veracruz. Central America, West Indies, and South America; type from Popayán, Colombia. On various dicotyledonous hosts.

Leaves lanceolate to broadly ovate, 6 to 10 cm. long, acute or acuminate; fruit yellow or orange.

2. *Phoradendron oliverianum* Trel. Gen. Phorad. 136. pl. 201. 1916.

Veracruz; type from Mirador.

Leaves oval or elliptic, 4.5 to 6 cm. long, obtuse or rounded at the apex; spikes 2 to 3.5 cm. long.

3. *Phoradendron townsendi* Trel. Gen. Phorad. 112. pl. 162. 1916.

Known only from Socorro Island.

Leaves oblanceolate-oblong, 4 to 6 cm. long, very obtuse; spikes 1 cm. long.

4. *Phoradendron yucatanum* Trel. Gen. Phorad. 118. pl. 173. 1916.

Yucatán.

Leaves cuneately obovate or suborbicular, 1.5 to 2.5 cm. long, rounded or emarginate at the apex; spikes 5 to 10 mm. long.

5. *Phoradendron wawrae* Trel. Gen. Phorad. 94. pl. 128. 1916.

Veracruz; type from Tuxpan.

Leaves lanceolate or oblanceolate, 5 to 10 cm. long, very obtuse; spikes 1 to 1.5 cm. long.

6. *Phoradendron vernicosum* Greenm. Field Mus. Bot. 2: 250, 1897.

Yucatán, the type from Izamal; parasitic on *Bumelia buxifolia* and perhaps on other plants.

Leaves elliptic, obovate, or lanceolate, 2.5 to 4 cm. long, very obtuse; spikes 1 to 2 cm. long.

7. *Phoradendron amplifolium* Trel. Gen. Phorad. 59. pl. 68. 1916.

Veracruz, Puebla, and Oaxaca; type collected between Piaxtla and Amolac, Puebla.

Leaves oblanceolate-oblong to obovate-elliptic, very obtuse, 8 to 12 cm. long; spikes 3 cm. long; fruit reddish, 6 to 7 mm. in diameter.

8. *Phoradendron carneum* Urban, Bot. Jahrb. Engler 23: Beibl. 5: 1. 1897.

Jalisco to Querétaro and Oaxaca; type from Guadalajara; on *Ipomoea* and *Populus*.

Leaves linear-lanceolate, obtuse or acute, 5 to 15 cm. long; spikes 2 to 3 cm. long; fruit reddish orange, 4 to 5 mm. in diameter.

9. *Phoradendron tamaulipense* Trel. Gen. Phorad. 115. pl. 167. 1916.

Tamaulipas, Veracruz, and Oaxaca; type from Alvarado, Veracruz; on *Salix*, *Populus*, *Mimosa*, and *Parmentiera*.

Leaves elliptic-obovate, obtuse, 3.5 to 5 cm. long, subsessile; spikes 1.5 to 5 cm. long; fruit coral-red or deep orange. "Ingerto,"¹ "seca-palo" (Tamaulipas).

In Tamaulipas the plant is used with "chile color" (*Capsicum*) to make an ointment applied for the relief of pain.

10. *Phoradendron gaumeri* Trel. Gen. Phorad. 114. *pl.* 167. 1916.

Known only from the type locality, Izamal, Yucatán.

Leaves elliptic-obovate, obtuse, 2.5 to 3 cm. long; spikes 2 to 4 cm. long.

11. *Phoradendron guazumae* Trel. Gen. Phorad. 104. *pl.* 148. 1916.

Sinaloa; type from Mazatlán; on *Guazuma*.

Leaves oblanceolate or obovate, 4 to 5.5 cm. long, very obtuse; spikes 1 to 2 cm. long.

12. *Phoradendron commutatum* Trel. Gen. Phorad. 106. *pl.* 150, 151. 1916.

Sinaloa to San Luis Potosí and Tabasco; type collected between Guadalajara and Tepic. Honduras and Nicaragua.

Leaves obovate, 3.5 to 5 cm. long, obtuse or acute; spikes 1.5 to 3 cm. long; fruit red. "Cabellera" (Tabasco).

13. *Phoradendron brevifolium* Oliver, Nat. For. Kjöbenhavn Vid. Medd. 1864: 176. 1864.

Puebla and Oaxaca; type from Tehuacán, Puebla.

Leaves narrowly elliptic or oblong, 3 mm. wide, very obtuse, sessile; spikes 5 cm. long or shorter.

14. *Phoradendron pachyarthron* Eichl. in Mart. Fl. Bras. 5²: 122. 1868.

Known only from Baños, Hidalgo, the type locality.

Leaves 5 to 9 cm. long, obtuse, petiolate; spikes 2 cm. long.

15. *Phoradendron schumanni* Trel. Gen. Phorad. 62. *pl.* 71, 72. 1916.

Chihuahua, Durango, and Guanajuato; type from Jaral, Guanajuato; on *Quercus*.

Leaves oblong-elliptic or elliptic-lanceolate, obtuse, 6 to 8 cm. long, petiolate; spikes 2 to 7 cm. long.

16. *Phoradendron purpusi* Trel. Gen. Phorad. 62. *pl.* 73. 1916.

Veracruz; type from Zacuapan; on *Quercus*.

Leaves falcate-lanceolate, acute or obtuse, 8 to 15 cm. long, petiolate; spikes 5 cm. long or shorter.

17. *Phoradendron nervosum* Oliver, Nat. For. Kjöbenhavn Vid. Medd. 1864: 175. 1864.

Phoradendron konzattii Trel. Gen. Phorad. 63. *pl.* 15. 1916.

Veracruz to Oaxaca; type from Colipa, Veracruz; reported on *Annona*, *Liquidambar styraciflua*, *Pyrus*, and *Quercus*.

Leaves lanceolate, obtuse to attenuate, 9 to 30 cm. long, petiolate; spikes 2 to 6 cm. long; fruit reddish.

18. *Phoradendron reichenbachianum* (Seem.) Oliver, Nat. For. Kjöbenhavn Vid. Medd. 1864: 175. 1864.

Viscum reichenbachianum Seem. Bot. Voy. Herald 296. *pl.* 62. 1856.

Jalisco to Mexico; type from the Sierra Madre; on *Quercus*.

Leaves obtuse, 8 to 10 cm. long; spikes 3 to 5 cm. long.

19. *Phoradendron lanceolatum* Engelm. Mem. Amer. Acad. n. ser. 4: 59. 1849.

Nuevo León; type from Rinconada; on *Quercus*.

Leaves 6 to 8 cm. long, 1 to 1.5 cm. wide, obtuse, subpetiolate; spikes 3 to 4 cm. long.

¹ "Ingerto" (often written "injerto") is the Spanish word for "graft," a term not inappropriate for mistletoe.

20. *Phoradendron falcatum* (Schlecht. & Cham.) Trel. Gen. Phorad. 65. 1916.
Viscum falcatum Schlecht. & Cham. Linnaea 5: 172. 1830.
Viscum schiedeannum DC. Prodr. 4: 671. 1830.
 San Luis Potosí and Veracruz; type from Jalapa; on *Quercus*.
 Leaves 8 to 15 cm. long, 1.5 cm. wide, obtuse; spikes 1.5 to 2.5 cm. long.
21. *Phoradendron forestierae* Robins. & Greenm. Proc. Amer. Acad. 32: 36. 1896.
Phoradendron pringlei Trel. Gen. Phorad. 60. pl. 70. 1916.
 Hidalgo and Puebla; type collected between Tehuacán and Esperanza Puebla; on *Forestiera* and *Fraxinus*.
 Leaves linear-lanceolate, 5 to 16 cm. long, obtuse or acute; spikes 1 to 4 cm. long.
22. *Phoradendron calyculatum* Trel. Gen. Phorad. 54. pl. 62, 63. 1916.
Viscum falcatum Hook. Icon. Pl. 4: pl. 368. 1841. Not *V. falcatum* Schlecht. & Cham. 1830.
 Veracruz and Oaxaca; type from Jalapa; on *Quercus*.
 Leaves narrowly falcate-lanceolate, obtuse, 15 to 25 cm. long; spikes 3 to 4 cm. long.
23. *Phoradendron californicum* Nutt. Journ. Acad. Phila. II. 1: 185. 1848.
 Baja California, Sonora, and Sinaloa. California (type locality) to Utah. Reported on *Acacia*, *Prosopis*, *Zizyphus*, *Parkinsonia*, *Olneya*, *Covillea*, and *Microrhamnus*.
 Spikes 5 to 10 mm. long; fruit red, 3 mm. in diameter.
 Russell¹ reports that this plant is eaten by the Pima Indians of Arizona. The stems bearing the fruit are boiled, and the fruit is then stripped off into the mouth and eaten.
24. *Phoradendron ligatum* Trel. Gen. Phorad. 24. pl. 15. 1916.
 Chihuahua and Durango; probably in Baja California. California, Oregon (type locality), and Nevada. On *Juniperus* and *Cupressus*.
 Spikes about 2 mm. long.
25. *Phoradendron juniperinum* Engelm. Mem. Amer. Acad. n. ser. 4: 58. 1849.
 Chihuahua. Western Texas to Colorado, Utah, and Arizona; type from Santa Fe, New Mexico. On *Juniperus*.
 Spikes 3 mm. long; fruit yellowish or wine-colored.
 According to Hough, the Hopi Indians of Arizona use the plant as a substitute for coffee.
26. *Phoradendron libocedri* (Engelm.) Howell, Fl. Northw. Amer. 1: 608. 1902.
Phoradendron juniperinum libocedri Engelm.; S. Wats. Bot. Calif. 2: 105. 1880.
 Baja California. California (type from Lassens Peak) and Oregon. On *Libocedrus decurrens*.
 Spikes 3 mm. long; fruit straw-colored.
27. *Phoradendron minutifolium* Urban, Bot. Jahrb. Engler 23: Beibl. 5: 2. 1897.
 Veracruz; type from Llanos de Perote; on *Juniperus*.
 Leaves acute, 2 to 3 mm. long; spikes 3 mm. long.
28. *Phoradendron capitellatum* Torr.; Trel. Gen. Phorad. 25. pl. 17. 1916.
 Sonora. Western Texas to Arizona; type from New Mexico. On *Juniperus*.
 Leaves 1 to 1.5 cm. long, acute; spikes 5 mm. long; fruit straw-colored.
29. *Phoradendron tequilense* Trel. Gen. Phorad. 26. pl. 18. 1916.
 Known only from the type locality, Sierra de Tequila, Jalisco. Reported on "*Thuja*" (*Cupressus* or *Juniperus*?).

¹ Frank Russell, The Pima Indians, Ann. Rept. Bur. Amer. Ethnol. 26. 1908.

- Leaves 1 to 1.5 cm. long, acute, sessile; spikes 4 to 7 mm. long; fruit straw-colored.
30. *Phoradendron saltillense* Trel. Gen. Phorad. 27. *pl.* 16. 1916.
Known only from the type locality, San Antonio de las Alazanes, near Saltillo, Coahuila; on *Juniperus*.
Leaves 2 to 3 cm. long, acute, sessile; spikes 5 to 6 mm. long.
31. *Phoradendron bolleanum* (Seem.) Eichl. in Mart. Fl. Bras. 5²: 134. 1868.
Viscum bolleanum Seem. Bot. Voy. Herald 295. *pl.* 63. 1856.
Chihuahua and Durango; type from the Sierra Madre; on *Juniperus*; one collection reported, perhaps erroneously, as on *Arbutus*.
Leaves 1 to 1.5 cm. long, acute, sessile; spikes 3 mm. long; fruit straw-colored.
"Ingerto" (Durango).
32. *Phoradendron guadalupense* Trel. Gen. Phorad. 29. *pl.* 22, 23. 1916.
Known only from Guadalupe Island, Baja California.
Leaves 1.5 to 3 cm. long, very obtuse, sessile; spikes about 1 cm. long.
33. *Phoradendron densum* Torr.; Trel. Gen. Phorad. 27. *pl.* 20. 1916.
Sonora. California and Oregon; type from Mount Shasta. On *Juniperus*.
Leaves 1.2 to 2 cm. long very obtuse, sessile; spikes 3 mm. long; fruit straw-colored.
34. *Phoradendron pauciflorum* Torr. U. S. Rep. Expl. Miss. Pacif. 4⁴: 134. 1857.
Baja California. California (type locality) and Arizona. On *Abies* and perhaps on *Cupressus*.
Leaves 2 to 3 cm. long, obtuse, sessile; spikes 5 mm. long; fruit straw-colored.
35. *Phoradendron scaberrimum* Trel. Gen. Phorad. 52. *pl.* 59. 1916.
Sinaloa and Tepic; type from Santa Teresa, Tepic.
Leaves narrowly lanceolate, acutish to emarginate, 10 to 16 cm. long; spikes 2.5 cm. long.
36. *Phoradendron longifolium* Eichl. (in Mart. Fl. Bras. 5²: 107. 1868, nomen nudum); Trel. Gen. Phorad. 53. *pl.* 60. 1916.
Known only from the type locality, San Pedro Nolasco, Oaxaca.
Leaves linear-oblong, acutish, 10 to 14 cm. long; spikes 2.5 cm. long.
37. *Phoradendron velutinum* (DC.) Nutt. Journ. Acad. Phila. II. 1: 185. 1847.
Viscum velutinum DC. Prodr. 4: 281. 1830.
Querétaro to Oaxaca; type from Toluca, Mexico. Guatemala. On *Cornus*, *Crataegus*, *Quercus*, etc.
Leaves falcate-lanceolate, acute or acuminate, 1 to 2.5 cm. wide; spikes 1.5 to 2 cm. long.
38. *Phoradendron lanatum* Trel. Gen. Phorad. 45. *pl.* 46. 1916.
Querétaro to Oaxaca; type from Hacienda Ciervo y Cadereyta, Querétaro.
Leaves narrowly elliptic or obovate, 2 to 3 cm. long, acute or obtuse; spikes 1 cm. long.
39. *Phoradendron eduardi* Trel. Gen. Phorad. 46. *pl.* 47. 1916.
Baja California; type from Carmen Island.
Leaves 1.5 to 2 cm. long, sessile, very obtuse; spikes 2.5 to 4 cm. long; fruit creamy white, 4 mm. in diameter.
40. *Phoradendron galeottii* Trel. Gen. Phorad. 46, *pl.* 46. 1916.
Veracruz; type from Mirador; on *Quercus*.
Leaves 2 to 5 cm. long, obtuse; spikes 1.5 cm. long or shorter.

41. *Phoradendron peninsulare* Trel. Gen. Phorad. 50. *pl.* 55. 1916.
Baja California; type from Cape San Lucas.
Leaves 1.5 to 3 cm. long, very obtuse; spikes 1 to 2 cm. long.
According to Trelease, this may be the pistillate form of *P. diguetii*.
42. *Phoradendron palmeri* Greenm. Proc. Amer. Acad. 40: 28. 1904.
Known only from the type locality, Alvérez, San Luis Potosí; on *Quercus*.
Leaves 2 to 3.5 cm. long, obtuse; spikes 0.5 to 2 cm. long. "Ingerto de encina."
43. *Phoradendron mazatlanum* Trel. Gen. Phorad. 47. *pl.* 48. 1916.
Known only from the type locality, Mazatlán, Sinaloa.
Leaves spatulate-oblong, 3.5 to 4.5 cm. long; spikes 2 cm. long.
44. *Phoradendron globuliferum* Trel. Gen. Phorad. 48. *pl.* 51. 1916.
Vicinity of Guaymas, Sonora.
Leaves elliptic-obovate, very obtuse, 2 cm. long; spikes 0.5 to 2 cm. long.
Perhaps not distinct from the next species.
45. *Phoradendron brachystachyum* (DC.) Nutt. Journ. Acad. Phila. II. 1: 185. 1847.
Viscum brachystachyum DC. Prodr. 4: 280. 1830.
Sonora to Tamaulipas, Veracruz, and Oaxaca; type collected between Tampico and Real del Monte; on *Arbutus*, *Quercus*, *Jacquinia*, *Guaiacum*, etc.
Leaves oblong-lanceolate to orbicular, very variable, 1.5 to 5 cm. long; spikes 1 to 1.5 cm. long.
46. *Phoradendron tlacolulense* Loes. Bull. Herb. Boiss. 2: 536. *pl.* 20. 1894.
Oaxaca; type from Mitla.
Leaves orbicular or obovate, 1 to 2 cm. long; spikes 5 mm. long.
47. *Phoradendron aureum* Trel. Gen. Phorad. 49. *pl.* 52. 1916.
Known only from the type locality, Santa Cruz, Baja California.
Leaves 1 to 2 cm. long, short-petiolate; spikes 1 to 1.5 cm. long.
48. *Phoradendron diguetii* Van Tiegh. Bull. Mus. Hist. Nat. 1: 31. 1895.
Phoradendron brachyphyllum Trel. Gen. Phorad. 49. *pl.* 53. 1916.
Phoradendron tumidum Trel. Gen. Phorad. 49. *pl.* 53. 1916.
Phoradendron saccatum Trel. Gen. Phorad. 50. *pl.* 55. 1916.
Baja California; on *Quercus*, *Veatchia*, *Jatropha*, etc.
Leaves 3 cm. long, short-petiolate; spikes 1.5 cm. long.
49. *Phoradendron robinsoni* Urban, Bot. Jahrb. Engler 23: Beibl. 5: 4. 1897.
Puebla and Guerrero; type from Tehuacán, Puebla; on *Celtis*.
Leaves oblanceolate or obovate, very obtuse, petiolate; spikes 2 to 8.5 cm. long.
50. *Phoradendron coryae* Trel. Gen. Phorad. 43. *pl.* 44. 1916.
Phoradendron wilkinsoni Trel. Gen. Phorad. 44. *pl.* 45. 1916.
Chihuahua to Baja California. Western Texas to Arizona; type from Chiricahua Mountains, Arizona. On *Quercus*.
Leaves 1.5 to 3.5 cm. long, short-petiolate; spikes 1.5 to 2 cm. long; fruit white.
51. *Phoradendron tomentosum* (DC.) Oliver, Nat. For. Kjöbenhavn Vid. Medd. 1864: 176. 1864.
Viscum tomentosum DC. Prodr. 4: 670. 1830.
Viscum villosum Nutt.; Torr. & Gray, Fl. N. Amer. 1: 654. 1840.
Phoradendron villosum Nutt. Journ. Acad. Phila. II. 1: 185. 1848.
Phoradendron puberulum Trel. Gen. Phorad. 42. *pl.* 43. 1916.
Chihuahua to Baja California and Hidalgo; type from "Real de Catone." California and Oregon. On *Celtis*, *Prosopis*, *Quercus*, *Platanus*, *Acacia*, *Aesculus*, *Arctostaphylos*, *Populus*, *Rhus*, *Robinia*, *Salix*, etc.

Leaves 2 to 3.5 cm. long, very obtuse, short-petiolate; spikes 1 to 3.5 cm. long; fruit white. The following names are reported, but they may apply to other species: "Visco cuercino," "liga" (Mexico); "ingerto" (Durango); "silmo" (Sinaloa).

52. *Phoradendron colipense* Trel. Gen. Phorad. 37. pl. 33. 1916.

Known only from the type locality, Colipa, Veracruz.

Leaves oblanceolate-elliptic, very obtuse, 5 to 8 cm. long; spikes 3.5 cm. long.

It is doubtful whether this and the following species are sufficiently distinct from each other or from *P. flavescens* (Pursh) Nutt., of the eastern United States.

53. *Phoradendron macrophyllum* (Engelm.) Cockerell, Amer. Nat. 34: 293. 1900.

Phoradendron flavescens macrophyllum Engelm.; Rothr. in Wheeler, Rep. U. S. Surv. 100th Merid. 6: 252. 1878.

Sonora. Arizona, the type from Camp Grant. On *Alnus*, *Celtis*, *Fraxinus*, *Juglans*, *Platanus*, *Populus*, *Salix*, etc.

Leaves 2.5 to 6 cm. long, short-petiolate; spikes 1.5 to 5 cm. long; fruit white, 4 to 5 mm. in diameter.

54. *Phoradendron cockerellii* Trel. Gen. Phorad. 38. pl. 36. 1916.

Chihuahua. New Mexico and western Texas; type from Silver City, New Mexico. On *Populus*, *Salix*, and *Fraxinus*.

Leaves 3.5 to 5.5 cm. long, petiolate; spikes 1.5 to 5 cm. long; fruit white.

55. *Phoradendron greggii* Trel. Gen. Phorad. 36. pl. 22. 1916.

Coahuila and Nuevo León; type from Rinconada, Nuevo León; on *Acacia* and *Prosopis*.

Leaves elliptic or broader, 2.5 to 4.5 cm. long, petiolate; fruit white.

56. *Phoradendron engelmanni* Trel. Gen. Phorad. 35 pl. 29-31. 1916.

Chihuahua. Western Texas; type from New Braunfels. On *Celtis*, *Quercus*, *Prosopis*, etc.

Leaves obovate, 3 to 5 cm. long, short-petiolate; fruit white.

57. *Phoradendron thyrsoideum* Trel. Gen. Phorad. 36. pl. 33. 1916.

Tamaulipas and San Luis Potosí; type from Victoria, Tamaulipas; on *Prosopis juliflora* and *Acacia farnesiana*.

Leaves obovate-spatulate, 3 to 5 cm. long, short-petiolate; fruit waxy white. "Ingerito blanco" (Tamaulipas).

4. **ORYCTANTHUS** Eichl. in Mart. Fl. Bras. 5²: 87. 1868.

1. *Oryctanthus glaberrimus* (Oliver) Eichl. in Mart. Fl. Bras. 5²: 89. 1868.

Loranthus glaberrimus Oliver, Nat. For. Kjöbenhavn Vid. Medd. 1864: 170. 1864.

Known only from Guatulco, the type locality.

Plants glabrous, the branches compressed; flowers very small, sunk in the axis of the spike.

5. **STRUTHANTHUS** Mart. Flora 13: 102. 1830.

Plants green, usually glabrous, parasitic upon dicotyledonous plants, the branches terete or compressed; leaves well developed, opposite; flowers small, spicate, racemose, or corymbose.

Leaves small, 16 mm. long or shorter.

Branches densely pubescent; flowers cymose-capitate—1. *S. microphyllus*.

Branches glabrous; flowers mostly solitary.

Branchlets compressed; leaves very obtuse.....2. *S. inconspicuus*.

Branchlets terete; leaves acutish.....3. *S. inornus*.

Leaves large, 3 cm. long or often much longer.

Leaves abruptly acuminate at apex.

Flowers pedicellate; perianth 4.5 to 6 mm. long.....4. *S. deppeanus*.

Flowers sessile; perianth less than 4 mm. long.

Flower clusters sessile.....5. *S. densiflorus*.

Flower clusters pedunculate, the peduncles swollen and reflexed in fruit.

6. *S. quercicola*.

Leaves rounded to acute at apex, never abruptly acuminate.

Leaf blades orbicular to elliptic, glaucescent; inflorescence loose, elongate, interrupted.

Style contorted; inflorescence usually shorter than the leaves.

7. *S. venetus*.

Style straight; inflorescence longer than the leaves.....8. *S. hartwegi*.

Leaf blades oblong, lanceolate, linear, or oblong-obovate.

Inflorescence pedunculate, usually 3-flowered; leaves mostly obovate-oblong.....9. *S. diversifolius*.

Inflorescence sessile or nearly so; leaves mostly lanceolate to linear.

Leaves mostly 2.5 to 3.5 cm. wide.....10. *S. grahami*.

Leaves mostly 0.4 to 1.2 cm. wide.....11. *S. haenkeanus*.

1. *Struthanthus microphyllus* (H. B. K.) Don, Hist. Dichl. Pl. 3: 413. 1834.

Loranthus microphyllus H. B. K. Nov. Gen. & Sp. 3: 439. pl. 300. 1818.

Jalisco to Morelos; type from Cuernavaca; on *Quercus*, *Solanum*, etc.

Leaves lanceolate to ovate or almost linear, acute or acutish; flowers about 4 mm. long.

2. *Struthanthus inconspicuus* (Benth.) Standl. Contr. U. S. Nat. Herb. 20: 212. 1919.

Loranthus inconspicuus Benth. Bot. Voy. Sulph. 102. 1844.

Sinaloa to Guerrero; type from San Blas, Tepic; on *Randia*, etc.

Leaves oblanceolate or obovate; branches greenish; flowers minute.

3. *Struthanthus inornus* (Robins. & Greenm.) Standl. Contr. U. S. Nat. Herb. 20: 212. 1919.

Loranthus inornus Robins. & Greenm. Amer. Journ. Sci. 50: 163. 1895.

Known only from the type locality, Cuicatlán, Oaxaca.

Leaves oblanceolate or subulate.

4. *Struthanthus deppeanus* (Cham. & Schlecht.) Blume; Schult. Syst. Veg. 7: 1731. 1830.

Loranthus deppeanus Cham. & Schlecht. Linnaea 5: 172. 1830.

Loranthus liebmanni Oliver, Nat. For. Kjöbenhavn Vid. Medd. 1864: 172. 1864.

Veracruz; type from Jalapa.

Leaves ovate-lanceolate, about 7 cm. long, petiolate.

Loranthus liebmanni was described from Chinantla, Oaxaca, and may be different.

5. *Struthanthus densiflorus* (Benth.) Standl. Contr. U. S. Nat. Herb. 20: 212. 1919.

Loranthus densiflorus Benth. Pl. Hartw. 62. 1840.

Veracruz to Oaxaca; type from Hacienda del Carmen. Central America. On *Citrus*, etc.

Leaves lanceolate or ovate, 6 to 10 cm. long; flowers verticillate along the axis of a short spike.

6. *Struthanthus quercicola* (Cham. & Schlecht.) Blume; Schult. Syst. Veg. 7: 1731. 1830.
Loranthus quercicola Cham. & Schlecht. Linnæa 5: 173. 1830.
Loranthus crassipes Oliver, Nat. For. Kjöbenhavn Vid. Medd. 1864: 173. 1864.
 San Luis Potosí and Veracruz; type from Jalapa; on *Quercus*, *Acacia farnesiana*, etc.
 Leaves ovate or oval-ovate, 4 to 7.5 cm. long.
7. *Struthanthus venetus* (H. B. K.) Blume; Schult. Syst. Veg. 7: 1731. 1830.
Loranthus venetus H. B. K. Nov. Gen. & Sp. 3: 434. 1818.
 Sinaloa to Guerrero and Tabasco; type from Cuernavaca, Morelos. Central America.
 Stems elongate, trailing or scandent, brownish; leaves 3 to 11 cm. long, pale; flowers about 6 mm. long; fruit glaucous. "Cabellera" (Tabasco).
 It is probable that this is the plant described by Sessé and Mociño¹ as *Loranthus volubilis*. This is based on plants from Cuernavaca, and the Nahuatl name is given as "teapizmicianiquauhiti."
8. *Struthanthus hartwegi* (Benth.) Standl. Contr. U. S. Nat. Herb. 20: 212. 1919.
Loranthus hartwegi Benth. Pl. Hartw. 62. 1840.
 Described from Talea, Oaxaca; parasitic on *Annona*. Reported from Costa Rica.
 Leaves ovate-orbicular, 4 to 6.5 cm. long; flowers 6 mm. long.
9. *Struthanthus diversifolius* (Benth.) Standl. Contr. U. S. Nat. Herb. 20: 212. 1919.
Loranthus diversifolius Benth. Pl. Hartw. 63. 1840.
 Described from Mexico, the locality not known; specimens from Jalisco and Colima seem to be closely related, and perhaps belong to this species.
 Flowers about 1 cm. long.
10. *Struthanthus grahami* (Benth.) Standl. Contr. U. S. Nat. Herb. 20: 212. 1919.
Loranthus grahami Benth. Pl. Hartw. 62. 1840.
 Morelos; perhaps also in Sonora and Sinaloa; reported from Veracruz and Oaxaca; on *Quercus*, etc.
 Leaves 15 cm. long or smaller, short-petiolate, narrowed to an obtuse apex.
11. *Struthanthus haenkeanus*² (Presl) Standl. Contr. U. S. Nat. Herb. 20: 212. 1919.
Spirostylis haenkeana Presl; Schult. Syst. Veg. 7: 163. 1829.
Loranthus spirostylis DC. Prodr. 4: 315. 1830.
 Sonora to Oaxaca; type from Acapulco. On *Celtis*, *Quercus*, *Nerium*, etc.
 Branches long and slender, drooping or sometimes twining; leaves linear to lanceolate; fruit red or orange. "Toji" (Sonora).

¹ Pl. Nov. Hisp. 51. 1887.

² Named in honor of Thaddeus Haenke (1761-1817), a Bohemian. He was to have accompanied the Malaspina expedition executed during the reign of Charles III, but he reached Cádiz the day after that organization had set sail. He took another ship and sailed for Buenos Aires, proceeding to Chile, where he joined Néé, and with him journeyed to Mexico. Haenke's Mexican collections were made along the road from Acapulco to the City of Mexico. He died in Bolivia. His specimens are chiefly at Prague and Vienna. Presl published two volumes under the title "Reliquiae Haenkeanae," based upon his collections.

DOUBTFUL SPECIES.

LOBANTHUS INTERRUPTUS H. B. K. Nov. Gen. & Sp. 3: 440. 1817. Type from Ario, Michoacán.

LOBANTHUS TEHUACANENSIS Oliver, Nat. For. Kjöbenhavn Vid. Medd. 1864: 171. 1864. Described from Tehuacán, Puebla; reported from Oaxaca, Tabasco, and Guatemala. Perhaps of the genus *Oryctanthus*.

STRUTHANTHUS SELERORUM Loes. Bull. Herb. Boiss. 2: 536. 1894. Type from Matlatengo, Hidalgo.

6. *PHRYGILANTHUS* Eichl. in Mart. Fl. Bras. 5²: 45. 1868.

Plants glabrous, parasitic on dicotyledonous hosts, the branches terete; flowers large and showy, solitary or cymose.

Leaf blades linear or terete..... 1. *P. sonorae*.
 Leaf blades broadly spatulate-obovate..... 2. *P. palmeri*.

1. *Phrygilanthus sonorae* (S. Wats.) Standl. Contr. U. S. Nat. Herb. 20: 212. 1919.

Loranthus sonorae S. Wats. Proc. Amer. Acad. 24: 73. 1889.

Baja California and Sonora; parasitic on *Elaphrium microphyllum*; type from Guaymas.

Plants glaucous, much branched; leaves slender, 4 to 6 mm. long; flowers bright red, 4 cm. long. "Ingerto" (Baja California).

2. *Phrygilanthus palmeri* (S. Wats.) Engl. in Engl. & Prantl, Pflanzenfam. Nachtr. 1: 134. 1897.

Loranthus palmeri S. Wats. Proc. Amer. Acad. 21: 438. 1886.

Chihuahua to Jalisco and Puebla, on species of *Elaphrium*; type from Hacienda San Miguel, Chihuahua.

Plants green, with stout reddish brown branches; leaves 2 to 2.5 cm. long, petiolate, rounded at apex; flowers red, almost 4 cm. long.

7. *PSITTACANTHUS* Mart. Flora 13: 106. 1830.

Parasites, usually upon dicotyledonous plants, with green leaves; flowers large, cymose or corymbose.

A plant of the family Loranthaceae and probably of this genus, growing on the Pico de Orizaba, is said to be known locally as "planta quebradora." The species of *Psittacanthus* (Greek for "parrot-flower") have more showy flowers than the Mexican representatives of other genera of the family.

Perianth velutinous..... 1. *P. mexicanus*.
 Perianth glabrous.

Branches all terete, or nearly so.

Anthers 5 to 6 mm. long; leaves cordate-clasping, glaucous.

2. *P. auriculatus*.

Anthers about 18 mm. long; leaves obovate-elliptic..... 3. *P. macrantherus*.

Branches usually quadrangular, at least more or less angulate.

Flowers 6.5 to 8 cm. long; leaves attenuate..... 4. *P. schiedeanus*.

Flowers 3 to 5 cm. long.

Buds terete; perianth lobes dilated; leaves ovate or broadly cordate, obtuse..... 5. *P. karwinskyanus*.

Buds clavate; perianth lobes linear; leaves never cordate.

Leaves usually falcate or very oblique, attenuate to the apex.

6. *P. calyculatus*.

Leaves not falcate, rounded or very obtuse at the apex.

7. *P. americanus*.

1. *Psittacanthus mexicanus* (Presl) Blume; Schult. Syst. Veg. 7: 1730. 1830.
Loranthus mexicanus Presl; Schult. Syst. Veg. 7: 129. 1829.
Described from Mexico, the locality not indicated.
2. *Psittacanthus auriculatus* (Oliver) Eichl. in Mart. Fl. Bras. 5²: 25. 1868.
Loranthus auriculatus Oliver, Nat. For. Kjöbenhavn Vid. Medd. 1864: 174.
1864.
Oaxaca; type from Pochutla.
Plants glaucous throughout, glabrous; leaves 3 to 4.5 cm. long, rounded at apex; flowers about 4 cm. long.
3. *Psittacanthus macrantherus* Eichl. in Mart. Fl. Bras. 5²: 26. 1868.
Sierra San Pedro Nolasco; said to be parasitic on pines.
Leaves 6 to 7.5 cm. long; flowers 5.5 to 6.5 cm. long.
4. *Psittacanthus schiedeianus* (Cham. & Schlecht.) Blume; Schult. Syst. Veg. 7: 1730. 1830.
Loranthus schiedeianus Cham. & Schlecht. Linnaea 5: 172. 1830.
Loranthus kerberi Fourn. Bull. Soc. Bot. France 30: 185. 1883.
Veracruz to Michoacán and Oaxaca; type from Jalapa; on *Salix*, etc. Central America.
Leaves lanceolate or ovate, 6 to 16 cm. long, asymmetric, short-petiolate, green; flowers numerous, corymbose. "Lirio," "muérdago," "sileno" (Oaxaca).
5. *Psittacanthus karwinskyanus* (Schult.) Eichl. in Mart. Fl. Bras. 5²: 26. 1868.
Loranthus karwinskyanus Schult. Syst. Veg. 7: 1641. 1830.
Described from Sultepec, Mexico; parasitic on *Annona reticulata*.
Leaves about 12.5 cm. long, 7.5 to 10 cm. wide; flowers almost 5 cm. long.
6. *Psittacanthus calyculatus* (DC.) Don, Hist. Diehl. Pl. 3: 415. 1834.
Loranthus calyculatus DC. Mém. Lorant. pl. 10. 1830.
Tamaulipas to Jalisco, Chiapas, and Yucatán; type from "Cuarcavara" (Cuernavaca?). Central America. Parasitic on *Persea*, *Acacia*, *Prosopis*, *Quercus*, *Pithecollobium*, *Prunus persica*, *Citrus*, *Olea*, *Nerium*, *Salix*, etc.
Plants often a meter high; leaves mostly lanceolate, green; flowers red or yellow, showy. "Chac-xciu" (Yucatán, Maya); "ingerto" (Jalisco, Guanaajuato); "batuu-chá" (Oaxaca, *Seler*); "visco," "visco cuercino," "quauh-zitli," "mal de ojo," "muérdago" (Morelos, *Ramírez*); "malojo" (Jalisco); "ingerto de aguacate" (Tamaulipas); "liga" (Valley of Mexico, *Ramírez*); "quauhtzictli" (Mexico, Morelos, *Ramírez*); "yecapixtla" (*Cervantes*).
A decoction of the leaves and flowers is said to be used for treating wounds, and the distilled water as a cosmetic.
7. *Psittacanthus americanus* (Jacq.) Mart. Flora 13: 108. 1830.
Loranthus americanus Jacq. Stirp. Amer. 97. pl. 67. 1763.
Tepic to Chiapas and Veracruz; reported from Yucatán. Central America; West Indies.
Leaves 6 to 10 cm. long, green, short-petiolate; flowers corymbose, bright red. "Ingerto" (Guerrero, Michoacán); "xken" (Yucatán, Maya, *Dondé*).

28. OPILIACEAE. *Opilia* Family.

This family is omitted in the key to families. In that, pistillate specimens would run to the family Urticaceae (p. 22), with which the present group would scarcely be confused; and staminate specimens would run to the family Olacaceae (p. 26). The only Mexican genus of the latter family with distinct petals

is *Ximenia*, in which they are densely hairy within, while in *Agonandra* the petals are glabrous within.

1. **AGONANDRA** Miers (Ann. Nat. Hist. II. 8: 172. 1851, nomen nudum); Benth. & Hook. Gen. Pl. 1: 349. 1862.

REFERENCE: Standley, The North American species of *Agonandra*, Journ. Washington Acad. Sci. 10: 505-508. 1920.

Shrubs or small trees, glabrous or nearly so, with slender, often pendulous branches; leaves alternate, entire, petiolate, stipulate; flowers small, in bracteate axillary racemes, usually dioecious; calyx minute, 4 or 5-lobate; staminate flowers with 4 or 5 narrow petals, the stamens 4 or 5, exerted, 4 small scales present below the stamens; pistillate flowers apetalous, the disk urceolate, surrounding the ovary; fruit fleshy, drupaceous.

Only one other species of the genus is known, a native of Brazil and Colombia.

Leaves acute or acuminate; young branches glabrous_____1. **A. racemosa**.
Leaves rounded or obtuse at apex; young branches puberulent.

Fruit 8 mm. long_____2. **A. obtusifolia**.

Fruit 15 mm. long_____3. **A. conzattii**.

1. **Agonandra racemosa** (DC.) Standl. Journ. Washington Acad. Sci. 10: 506. 1920.

Schaefferia racemosa DC. Prodr. 2: 41. 1825.

Sonora to Guerrero; originally described from one of Sessé and Mociño's plates.

Shrub or small tree, 4 to 5 meters high, glabrous throughout; leaves lanceolate to broadly ovate-elliptic, 3 to 7.5 cm. long, acute to broadly rounded at base, acute or acuminate at apex or sometimes obtuse and abruptly short-pointed; staminate flowers 2.5 mm. long, greenish; fruit subglobose, about 8 mm. long. "Palo del golpe" (Michoacán, Guerrero).

2. **Agonandra obtusifolia** Standl. Journ. Washington Acad. Sci. 10: 507. 1920.
Tamaulipas and Veracruz; type from Victoria, Tamaulipas.

Shrub, 1 to 3 meters high, with spreading branches; leaves short-petiolate, narrowly oblong to ovate, 2 to 5 cm. long, cuneate at base, somewhat succulent; staminate flowers 2.5 mm. long; fruit yellow, not edible. "Granadillo," "revienta cabra" (Tamaulipas).

3. **Agonandra conzattii** Standl. Journ. Washington Acad. Sci. 10: 508. 1920.

Oaxaca and Puebla; type from Portillo de Coyula, Distrito de Cuicatlán, Oaxaca.

Leaves short-petiolate, oblong, lanceolate, or oblong-ovate, 2 to 2.5 cm. long, cuneate at base, succulent, the petioles minutely puberulent. "Maromero" (Oaxaca).

29. OLACACEAE. Olax Family.

Shrubs or small trees; leaves alternate, estipulate, entire; flowers small, perfect, in cymes or racemes; calyx 4 or 5-dentate; corolla 4 to 6-lobed; stamens inserted with the perianth; fruit a drupe.

Stamens twice as many as the perianth lobes; perianth cleft nearly to the base, the lobes densely barbate within_____1. **XIMENIA**.

Stamens as many as the perianth lobes; perianth lobed to the middle or less deeply, the lobes sparsely or not at all barbate_____2. **SCHOEPFIA**.

1. *XIMENIA*¹ L. Sp. Pl. 1193. 1793.

Shrubs or small trees, sometimes with spinose branchlets; leaves subcoriaceous; flowers whitish, solitary or in small axillary cymes; calyx 4 or 5-dentate; corolla 4 or 5-lobed.

Leaves and outer surface of the petals densely pubescent-----1. *X. pubescens*.
Leaves and outer surface of the petals glabrous.

Petioles 4 to 10 mm. long; leaves mostly 1.5 to 3.5 cm. wide; petals 7 to 10 mm. long, densely long-barbate within-----2. *X. americana*.

Petioles 3 mm. long or shorter; leaves 0.6 to 1.5 cm. wide; petals 5 to 6 mm. long, short barbate-----3. *X. parviflora*.

1. *Ximenia pubescens* Standl. Contr. U. S. Nat. Herb. 20: 212. 1919.

Known only from the type locality, between Mixtepec and Colotepec, Oaxaca. Spiny shrub, the leaves small, mostly orbicular.

2. *Ximenia americana* L. Sp. Pl. 1193. 1753.

Veracruz to Colima, Chiapas, and Yucatán. Florida, West Indies. Central America, South America, and in the tropics of the Old World.

Spiny shrub or small tree, in some parts of its range 6 meters high; bark smooth, reddish, very astringent; leaves oblong or elliptic, 3 to 7 cm. long, pale beneath, rounded at apex; flowers yellowish white, fragrant; fruit yellow, subglobose, 1.5 to 2 cm. in diameter, with peculiar odor and acid flavor; wood hard, tough, close-grained, yellow, its specific gravity about 0.92. "Xkuk-ché" (Yucatán, Maya); "pepe nance" (El Salvador); "chocomico" (Nicaragua); "limoncillo" (Colombia); "yaná," "jía manzanilla," "ciruelo cimarrón," "ciruelillo" (Cuba); "manzanilla" (Guatemala, Honduras); "albarillo del campo" (Argentina).

The fruit, which resembles a plum in appearance, is edible, either raw or cooked. It is stated that oil has been extracted from the seeds in Brazil. The fruit is said to have purgative properties, and Grosourdy states that a sirup made from it is used in the West Indies for dropsy, rheumatism, etc. The plant is seldom large enough to furnish wood of importance, but the wood has sometimes been employed as a substitute for sandalwood (*Santalum*), which it somewhat resembles. In Florida and the British West Indies this species is known under various names, such as "hog plum," "tallow-wood," "mountain plum," "false sandalwood," and "wild olive."

3. *Ximenia parviflora* Benth. Pl. Hartw. 7. 1839.

San Luis Potosí to Sinaloa and Oaxaca; type from León, Guanajuato.

Spiny shrub, 1 to 2 meters high, with angled branches, the lower ones long and slender; leaves oblong or obovate; fruit globose, yellow. "Ciruelillo" (Guanajuato).

The fruit is edible.

¹ The genus was named in honor of Francisco Ximénez, a native of Luna in the Kingdom of Aragón. In the early years of his life he was a soldier, and in 1605 he came to New Spain. He became a lay brother of the Convento de Santo Domingo de México February 25, 1612. The date of his death is not known. In 1615 there was published in the City of Mexico under his authorship a volume entitled "Quatro libros de la naturaleza y virtudes de las plantas, y animales que están receuidos en el uso de medicina en la Nueva España, y la método, y corrección, y preparación, que para administrarlas se requiere con lo que el Doctos Francisco Hernández escriuió en lengua Latina." This was reprinted at Morelia in 1888. Ximénez's work is not a mere translation of Hernández, but contains much original information upon Mexican plants.

2. **SCHOEPFIA** Schreb. Gen. Pl. 129. 1789.

Glabrous shrubs or small trees; leaves coriaceous; flowers in short axillary racemes, or solitary or fasciculate in the leaf axils; calyx small, cuplike, obscurely denticulate; corolla 4 to 6-lobed.

Leaf blades narrowly oblanceolate or rarely obovate-----1. *S. californica*.

Leaf blades lanceolate to broadly ovate.

Perianth about 3 mm. long, the lobes nearly as long as the tube.

2. *S. angulata*.

Perianth 4 to 6 mm. long, the lobes much shorter than the tube.

Perianth 5-parted-----3. *S. mexicana*.

Perianth 4-parted.

Perianth 4 to 5 mm. long, the lobes half as long as the tube or longer; leaves mostly 1.8 to 3.5 cm. wide-----4. *S. schreberi*.

Perianth 6 to 7 mm. long, the lobes one-third as long as the tube or shorter; leaves scarcely more than 1 cm. wide-----5. *S. parvifolia*.

1. *Schoepfia californica* T. S. Brandeg. Proc. Calif. Acad. II. 2: 139. 1889.

Southern Baja California; type from San Gregorio.

Shrub or small tree, 2 to 6 meters high, with stiff divaricate branches, the older branches whitish; leaves glaucous, puberulent; flowers reddish yellow; fruit oval, 6 mm. long.

2. *Schoepfia angulata* Planch.; Hemsf. Diag. Pl. Mex. 5. 1878.

Veracruz; type from Zacuapan.

Shrub, nearly glabrous; leaves lanceolate or ovate, 2.5 to 5 cm. long, bright green; flowers small, yellow.

3. *Schoepfia mexicana* A. DC. in DC. Prodr. 14: 622. 1856.

Known only from the type locality. Tlacolula, Oaxaca.

Leaves ovate or ovate-elliptic, 2.5 to 3 cm. long, obtuse.

4. *Schoepfia schreberi* Gmel. Syst. Veg. 2: 376. 1791.

San Luis Potosí and Veracruz to Colima and Yucatán. Central America, West Indies, and northern South America.

Shrub or tree, 1.3 to 6.5 meters high; leaves broadly ovate, obtuse or acute, bright green; flowers yellow or greenish.

5. *Schoepfia parvifolia* Planch.; Hemsf. Diag. Pl. Mex. 5. 1878.

Sinaloa to Oaxaca.

Glabrous shrub or tree, sometimes 7 meters high, with a trunk 40 cm. in diameter, the branches stiff, gray; leaves ovate or oval, 2 to 3 cm. long, obtuse, bright green. "Palo fierro," "tecolotillo" (Sinaloa).

The wood is said to be heavy and blackish, and to be valued for carpenter work.

30. **ARISTOLOCHACEAE.** Birthwort Family.1. **ARISTOLOCHIA** L. Sp. Pl. 960. 1753.

REFERENCE: Duchartre in DC. Prodr. 15¹: 432-498. 1864.

Erect or usually scandent plants; leaves alternate, entire or lobate; inflorescence axillary (sometimes borne at the base of the plant), the peduncles 1-flowered and solitary, fasciculate, or racemose, the perianth very variable in form; fruit a capsule.

It is difficult to determine from herbarium specimens or descriptions which species are fruticose and which herbaceous; perhaps other species should be included and some of those in the present list excluded. A number of herbaceous species occur in Mexico.

The species are highly valued in tropical America as a remedy for snake bites. Whether they have any real value for this purpose is uncertain. The Nahuatl

name is "tlacopatli" (trumpet-medicine). In modern usage this has been modified to "tacopate," "tacopatlle," "tacopaxtle," "tacopaste," etc.

Calyx limb with 3 long linear lobes.

Leaves glabrous on the upper surface; calyx lip about 10 cm. long.

1. *A. tricaudata*.

Leaves pubescent on the upper surface; lip about 5 cm. long.

2. *A. malacophylla*.

Calyx limb not 3-lobate.

Leaf blades rounded at the base; plants erect.....3. *A. arborea*.

Leaf blades cordate at the base; plants scandent or trailing.

Stems and margins of the leaves pilose with long brown hairs.

4. *A. pilosa*.

Stems and margins of the leaves without long brown hairs, often glabrous.

Leaves sessile, densely soft-pilose beneath.....5. *A. asclepiadifolia*.

Leaves long-petiolate, puberulent or glabrous beneath.

Calyx very large, the limb 18 to 35 cm. broad. Leaves deltoid-cordate, puberulent beneath.....6. *A. grandiflora*.

Calyx smaller, the limb less than 8 cm. broad, often much less.

Leaves puberulent beneath.

Leaf blades deltoid-cordate, deeply cordate at base.

7. *A. pavoniana*.

Leaf blades oval or oblong, shallowly cordate at base.

Leaf blades ovate, glabrous on the upper surface, subcordate at base; flowers solitary.....8. *A. ovalifolia*.

Leaf blades oblong, puberulent on the upper surface, cordate at base; flowers racemose.....9. *A. maxima*.

Leaves glabrous beneath.

Leaves acute or acutish, subcordate at base, green beneath; calyx limb 5 to 8 cm. wide.....10. *A. odoratissima*.

Leaves rounded or very obtuse at apex, deeply cordate at base, pale or glaucous beneath; calyx limb less than 2.5 cm. wide.

Calyx limb somewhat bilobate, the large lobe acute or acuminate.....11. *A. pardina*.

Calyx limb not bilobate, obtuse.....12. *A. taliscana*.

1. *Aristolochia tricaudata* Duchartre. Ill. Hort. Lem. 12: pl. 523. 1865.

Chiapas; the plant has been cultivated in European greenhouses.

Arborescent, with gray fissured bark; leaves oblong, 12.5 to 20 cm. long, acute or acuminate, pubescent beneath; flowers axillary, solitary, odorless, the calyx limb with 3 long narrow lobes, maroon outside, dark purple-brown within.

2. *Aristolochia malacophylla* Standl. Proc. Biol. Soc. Washington 33: 65. 1920.

Known only from the type locality, Salto de Zaráracua, Uruapam, Michoacán. Leaves oval, 12.5 cm. long, cordate at the base.

3. *Aristolochia arborea* Linden; Hook. in Curtis's Bot. Mag. pl. 5295. 1862.

Chiapas, the type locality. Guatemala.

Erect shrub, 2 meters high, the trunk with corky bark; leaves narrowly oblong, about 30 cm. long; flowers clustered near the base of the stem.

4. *Aristolochia pilosa* H. B. K. Nov. Gen. & Sp. 2: 116. pl. 113. 1817.

Aristolochia ferruginea T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 51. 1914.

Oaxaca and Chiapas. Central America to Ecuador (the type locality).

Stems slender, scandent; leaves cordate, obtuse or acutish; calyx limb 4 to 5 cm. long. "Sombbrero," "hediondilla" (Guatemala).

5. *Aristolochia asclepiadifolia* T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 178. 1915.

Known only from the type locality, Consoquintla, Veracruz.

Leaves oval, 8 to 18 cm. long, deeply cordate at base, rounded and short-pointed at apex.

6. *Aristolochia grandiflora* Swartz, Fl. Ind. Occ. 3: 1566. 1806.

Chiapas and Yucatán; reported from Veracruz. Central America and the West Indies; type from Jamaica.

High-climbing vine; leaves large, cordate, acute, nearly glabrous; calyx very large, the limb sometimes 45 cm. long, with a linear tip a meter long, yellowish and purple-spotted inside, the flowers with a disagreeable odor. "Guaco" (Veracruz, Ramírez); "flor de pato" (Yucatán); "güegüecho," "chompipe" (Nicaragua); "moco de güegüecho" (El Salvador).

The roots are reputed to be an antidote for the bites of snakes and other poisonous animals, and to have sudorific, abortive, and emmenagogue properties. Descourtilz states that the plant is poisonous to pigs, and that it was sometimes employed in the West Indies to poison human beings. The young shoots are reported to be eaten as a vegetable in some localities.

7. *Aristolochia pavoniana* Duchartre, Ann. Sci. Nat. IV. 2: 55. 1854.

Described from Mexico, the locality not known.

Leaves about 6 cm. long, acute; flowers axillary, solitary, the calyx limb 1.4 cm. long.

8. *Aristolochia ovalifolia* Duchartre, Ann. Sci. Nat. IV. 2: 50. 1854.

Known only from Oaxaca, the type locality, at an altitude of 660 meters.

Leaves 15 cm. long, subacuminate; calyx limb 2.3 cm. long. "Flor de guaco."

9. *Aristolochia maxima* L. Sp. Pl. ed. 2. 1361. 1763.

Reported from Yucatán, Central America, Colombia, and Venezuela.

Leaves 9 to 15 cm. long, rounded or obtuse at apex and often short-pointed; flowers large, racemose; capsule about 9 cm. long. "Guaco del sur" (Yucatán); "guaco" (Guatemala, Colombia, Venezuela); "contracapitana" (Venezuela); "cuajilote" (Costa Rica).

This, like many of the other species, is considered an antidote for snake bites. A closely related plant, possibly the same species, occurs in Tabasco, where it is known as "canastilla" and "farolito." It is reported that the young fruits are eaten in Costa Rica.

10. *Aristolochia odoratissima* L. Sp. Pl. ed. 2. 1362. 1763.

Tabasco and perhaps elsewhere. Central America and northern South America.

Leaves deltoid-cordate, acute or acutish, sometimes 3-lobate; calyx limb broad, about 10 cm. long. "Cocobá," "cococoba" (Tabasco).

11. *Aristolochia pardina* Duchartre, Ann. Sci. Nat. IV. 2: 47. 1854.

Colima and Guerrero; type from Colima.

Stems scandent, with corky bark; flowers greenish yellow, with black markings. "Guaco" or "huaco" (Colima); "bejuco amargo" (Guerrero).

The stems are used as a substitute for cordage, and an infusion of the leaves for fevers.

12. *Aristolochia taliscana*¹ Hook. & Arn. Bot. Beechey Voy. 309. 1839-40.

Aristolochia galeottii Duchartre, Ann. Sci. Nat. IV. 2: 44. 1854.

Sinaloa, Tepic, and Jalisco (type locality).

¹The specific name is more properly, perhaps, written as "*jaliscana*," but "*taliscana*" is the original spelling.

Similar in general appearance to the last species; a slender vine with stems 2 to 3 meters long; capsules about 3 cm. long. "Huaco," "zapatito," "palito," "matanene del mar" (Sinaloa).

In Sinaloa the plant is highly esteemed as a remedy for the bites of snakes and other poisonous animals.

31. POLYGONACEAE. Buckwheat Family.

Shrubs or trees, sometimes scandent; leaves alternate or rarely opposite or verticillate, entire, stipulate, the stipules often united into a sheath; flowers mostly small, perfect or unisexual; corolla none; fruit a lenticular or 3-angled achene, usually surrounded by the persistent calyx.

Several other genera, all of whose species are herbaceous, occur in Mexico.

Plants with tendrils in the inflorescence, scandent.....7. **ANTIGONON**.
Plants without tendrils.

Flowers one or more inside an involucre.

Leaves alternate; involucre not accrescent in fruit, not colored; flowers perfect.....1. **ERIOGONUM**.

Leaves opposite; involucre accrescent in fruit, red or purplish; flowers unisexual.....2. **HARFORDIA**.

Flowers not involucreate.

Flowers normally 5-parted.

Perianth lobes not winged.

Flowers unisexual.....3. **MUHLENBECKIA**.

Flowers perfect.....4. **COCCOLOBA**.

Perianth lobes winged.

Leaves orbicular; pedicels not winged; filaments pubescent.

5. **NEOMILLSPAUGHIA**.

Leaves not orbicular; pedicels winged; filaments glabrous.

6. **PODOPTERUS**.

Flowers 6-parted or rarely 3-parted.

Flowers perfect; perianth segments broadly ovate...8. **GYMNOPODIUM**.

Flowers dioecious; perianth segments of the fertile flowers long and narrow.

Stamens numerous; fruit acutely trigonous.....9. **TRIPLARIS**.

Stamens 9; fruit 3 to 6-sulcate, the angles obtuse.

10. **RUPRECHTIA**.

1. **ERIOGONUM** Michx. Fl. Bor. Amer. 1: 246. 1803.

Low shrubs, often tomentose; flowers surrounded by an involucre, the involucres spicate, umbellate, capitate, or cymose, the flowers small but often rather showy.

Numerous herbaceous species occur in northern Mexico. Most of the species of the genus grow in arid places.

Leaves not at all tomentose.....1. **E. orcuttianum**.

Leaves tomentose on one or both surfaces.

Perianth densely pubescent.

Perianth narrowed to a stipelike base; plants low, with depressed stems.

2. **E. undulatum**.

Perianth without a stipelike base; plants tall, much branched...3. **E. molle**.

Perianth glabrous or nearly so.

Involucres in heads or cymes.

Leaf blades spatulate or rounded-rhombic, densely tomentose on both sides, the margins not revolute.....4. *E. pondii*.

Leaf blades linear, oblong, or oblanceolate, glabrate on the upper surface, the margins strongly revolute.....5. *E. fasciculatum*.

Involucres racemose or spicate.

Involucres 1-flowered.....6. *E. taxifolium*.

Involucres several-flowered.

Branches erect, slender.....7. *E. wrightii*.

Branches divaricate, very stout.....8. *E. nodosum*.

1. *Eriogonum oreuttianum* S. Wats. Proc. Amer. Acad. 20: 371. 1885.

Baja California; type from Cantillas Mountains.

Shrub, about a meter high, with tortuous branches, the bark brownish and fissured; leaves rounded-obovate; branches of the inflorescence divaricate, the flowers whitish.

2. *Eriogonum undulatum* Benth. in DC. Prodr. 14: 7. 1856.

Chihuahua to San Luis Potosí and Hidalgo.

Low depressed shrub; leaves oval to oblanceolate, white-tomentose beneath, long-petiolate; involucres umbellate or solitary; flowers white, showy.

This has been reported from Mexico as *E. jamesii* Benth., a name probably synonymous with *E. undulatum*.

3. *Eriogonum molle* Greene, Pittonia 1: 207. 1888.

Known only from the type locality, Cedros Island, Baja California.

Erect shrub, 30 to 60 cm. high; leaves oval or ovate, thick, white beneath; involucres in a dense long-pedunculate cyme.

4. *Eriogonum pondii* Greene, Pittonia 1: 267. 1889.

Baja California; type from Cedros Island.

Low depressed shrub; leaves about 1 cm. long; flowers white or pink.

5. *Eriogonum fasciculatum* Benth. Trans. Linn. Soc. Bot. 17: 411. 1837.

Baja California. California (type locality), Nevada, and Arizona.

Shrub, 0.6 to 1 meter high; leaves short, often fascicled, white-tomentose or glabrate; flowers white.

The Coahuilla Indians of southern California use a decoction of the leaves for pains in the head or stomach, and a decoction of the flowers as an eye wash.

6. *Eriogonum taxifolium* Greene, Pittonia 1: 267. 1889.

Known only from Cedros Island, Baja California.

Low, slender, much branched shrub; leaves linear; flowers white, the involucres in long interrupted spikes.

7. *Eriogonum wrightii* Torr.; Benth. in DC. Prodr. 14: 15. 1856.

Chihuahua and Sonora to San Luis Potosí; Baja California (?). Western Texas (type locality) to southern California.

Cespitose shrub, 30 to 60 cm. high, white-tomentose throughout; leaves oval to oblong; flowers white.

8. *Eriogonum nodosum* Small, Bull. Torrey Club 25: 49. 1898.

Northern Baja California. Southern California; type from Dos Cabezas.

Densely tomentose shrub, 0.3 to 1 meter high.

2. **HARFORDIA** Greene & Parry, Proc. Davenport Acad. 5: 27. 1888.

Low, densely branched shrubs, with stiff gray branches; leaves very small, fleshy, spatulate; flowers axillary, the sepals in fruit large, reddish, conspicuously veined.

- Plants fruticose only at the base, the branches slender; leaves linear to spatulate-----1. *H. macroptera*.
 Plants woody almost throughout, the branches very stout; leaves broadly spatulate-----2. *H. fruticosa*.

1. *Harfordia macroptera* (Benth.) Greene & Parry, Proc. Davenport Acad. 5: 28. 1888.

Pterostegia macroptera Benth. Bot. Voy. Sulph. 44. 1844.

Pterostegia galioides Greene, Bull. Calif. Acad. 4: 213. 1885.

Baja California.

2. *Harfordia fruticosa* Greene; Parry, Proc. Davenport Acad. 5: 28. 1888.

Pterostegia fruticosa Greene, Bull. Calif. Acad. Sci. 4: 212. 1885.

Known only from Cedros Island, Baja California.

Densely branched shrub, 0.6 to 1 meter high.

Perhaps not specifically different from the preceding.

3. MUHLENBECKIA Meisn. Gen. Pl. 1: 316. 1840.

Muhlenbeckia platyclada Meisn., a curious plant with long flat ribbon-like leafless stems, a native of the Solomon Islands, is sometimes cultivated. Seler reports that it grows upon trees in Veracruz, where it is perhaps naturalized.

1. *Muhlenbeckia tamnifolia* (H. B. K.) Meisn. Gen. Pl. 2: 227. 1840.

Polygonum tamnifolium H. B. K. Nov. Gen. & Sp. 2: 180. 1817.

Polygonum quadrangulatum Mart. & Gal. Bull. Acad. Brux. 10²: 353. 1843.

Veracruz to Morelos. Central America to Chile; type from Colombia.

Scandent or trailing shrub with brown stems; leaves oblong or ovate, cordate at base, acuminate; flowers very small, greenish, glomerate-spicate.

4. COCCOLOBA L. Syst. Nat. ed. 10. 1007. 1759.

REFERENCE: Lindau, Bot. Jahrb. Engler 13: 106-229. 1890.

Trees or shrubs; flowers small and inconspicuous, perfect, fascicled within small bracts, the fascicles spicate; perianth often very fleshy in fruit.

Ramírez reports the vernacular name "totó" for a Tabasco species of doubtful determination.

Perianth lobes accrescent and inclosing the fruit. Leaf blades obovate or oval, glabrous-----1. *C. floribunda*.

Perianth tube accrescent and inclosing the fruit.

Leaves more or less pubescent beneath, sometimes pubescent also on the upper surface.

Leaf blades mostly orbicular or nearly so, about as broad as long.

Leaves minutely puberulent beneath-----2. *C. uvifera*.

Leaves short-pilose beneath.

Leaf blades 12 to 50 cm. long, pilose on the upper surface.

3. *C. grandifolia*.

Leaf blades 5 to 8 cm. long, glabrous on the upper surface.

7. *C. goldmanii*.

Leaf blades about twice as long as broad or longer.

Rachis of the inflorescence glabrous or very minutely puberulent.

4. *C. lapathifolia*.

Rachis of the inflorescence densely short-pilose.

Leaf blades obtuse-acuminate, 12 to 18 cm. long, 5 to 7 cm. wide.

5. *C. lindeniana*.

Leaf blades rounded at the apex, 6 to 13 cm. long, 2.5 to 7 cm. wide.

6. *C. liebmanni*.

Leaves glabrous, or sometimes sparsely pilose beneath along the costa.

Leaves peltate-----14. *C. acapulcensis*.

Leaves not peltate.

Rachis of the inflorescence pubescent.

Pedicels as long as the ocreolae. Leaf blades 8 to 22 cm. long, 9 to 13 cm. wide-----8. *C. schiedeana*.

Pedicels twice as long as the ocreolae or longer.

Leaf blades rounded or cordate at base-----9. *C. cozumelensis*.

Leaf blades narrowed to the base-----10. *C. chiapensis*.

Rachis of the inflorescence glabrous.

Leaf blades narrowed at base; nodes 1-flowered-----11. *C. orizabae*.

Leaf blades rounded or cordate at base; nodes 1 to 3-flowered.

Pedicels 1 to 2 mm. long, much exceeding the ocreolae.

12. *C. humboldti*.

Pedicels 1 mm. long or shorter, about equaling the ocreolae.

13. *C. jurgenseni*.

1. *Coccoloba floribunda* (Benth.) Lindau, Bot. Jahrb. Engler 13: 217. 1890.

Campderia floribunda Benth. Bot. Voy. Sulph. 159. pl. 52. 1844.

Campderia mexicana Meisn. in DC. Prodr. 14: 171. 1856.

Oaxaca. Central America to Brazil; type from Honduras.

Tree; leaves 5 to 11 cm. long, 3 to 5 cm. wide, rounded or subcordate at base.

2. *Coccoloba uvifera* (L.) Jacq. Enum. Pl. Carib. 19. 1760.

Polygonum uvifera L. Sp. Pl. 365. 1753.

In coastal thickets, Tamaulipas to Yucatán and Sinaloa. Florida, West Indies, Central America, and northern South America.

Shrub or tree, sometimes as much as 15 meters high, with a trunk a meter in diameter, but usually much smaller, densely branched; bark thin, smooth, brown; leaves about 20 cm. wide, very thick, the veins often red; flowers white; fruit purple, 1 to 2 cm. in diameter, in long dense heavy racemes; wood hard, dark brown, taking a good polish, its specific gravity about 0.96. "Uva de la playa" (Tamaulipas, Veraacruz, Venezuela); "uva de la mar" (Tamaulipas, Yucatán, Oaxaca, Porto Rico); "uvero" (Tamaulipas, Cuba); "uva" (Yucatán, Veraacruz, Santo Domingo); "manzano" (Sinaloa); "uva caleta" (Cuba); "papatnrro" (Costa Rica); "uvero de playa" (Panama, Costa Rica); "uvilla" (Santo Domingo).

In Florida and the British West Indies the plant is known as "sea-grape." "pigeon-wood," "horsewood," and "hopwood." The wood is highly esteemed in tropical America for cabinet work, and is used also for fuel. It is said to yield a red dye. The roots are astringent and have been employed as a remedy for dysentery. The fruit is edible, with an acidulous, somewhat astringent flavor, and in the West Indies it has been fermented, with sugar, to produce an alcoholic drink. Febrifuge properties are attributed to the bark. The shrub is often planted (as in Florida) for ornamental purposes, for the large thick leaves are of striking and handsome appearance. It grows readily from cuttings.

The first account of the plant, probably, is that given by Oviedo (Lib. VIII, Cap. XIII), who says: "The Christians give the name *uvero* to the tree the Indians call *quibara*. This is a fine tree, with good wood, especially for making charcoal for blacksmiths and silversmiths; as they are trees with spreading tops, and not straight, although the branches are thick and the wood strong, they are useless for construction of houses, but may be employed for butchers' blocks and shoe lasts. The wood resembles that of *madroño*, for it is red, but it is stronger. The fruit consists of thin racemes of grapes, sepa-

rated from each other, rose or purple in color, and good to eat, although the stone is very large in proportion to the size of the fruit and the amount of flesh; the largest are the size of a filbert. The leaves are like those illustrated; they are so different from other leaves that I have shown them here. The largest of these leaves are a palm broad or larger, and some are smaller. At the time that wars were going on in Hispaniola and the other islands and on Tierra-Firma, as the Christians did not carry with them paper and ink, they used these leaves like paper. The leaves are green and thick as those of ivy; the veins are red or purple and fine, and with a pin or sharp point one can write anything on them, from one end to the other, while they are green and freshly cut; the letters resemble white scratches and stand out so well from the face of the leaf that they are easily legible. Thus written upon, the leaves were sent by an Indian wherever the Spaniards wished them to go. Although the midvein of the leaf is rather large, the other veins are so small that they do not interfere with the writing."

3. *Coccoloba grandifolia* Jacq. Enum. Pl. Carib. 19. 1760.

Coccoloba pubescens L. Sp. Pl. ed. 2. 523. 1762.

Reported from Mexico, the locality not stated. West Indies and the Guianas.

Tree, 12 to 25 meters high, with erect trunk; leaves orbicular or broadly cordate, 8 to 60 cm. wide, coriaceous. "Moralón" (Porto Rico).

4. *Coccoloba lapathifolia* Standl., sp. nov.

Type from Acapulco, Guerrero (*Palmer* 206; U. S. Nat. Herb. no. 1,016,048).

Petioles 5 mm. long, finely puberulent; leaf blades narrowly oblong or lance-oblong, 14.5 to 18.5 cm. long, 5 to 5.5 cm. wide, deeply cordate at base, rounded or very obtuse at apex, coriaceous, finely puberulent or glabrate on the upper surface, the venation inconspicuous, pilose or short-villous beneath along the costa and lateral veins or finally glabrate, the venation prominent, the lateral veins about 15 on each side; racemes terminal, 9 to 18 cm. long, slender, glabrous or nearly so, rather densely flowered, the pedicels 3 times as long as the ocreolae, glabrous; perianth glabrous; filaments exserted.

5. *Coccoloba lindeniana*¹ (Benth.) Lindau, Bot. Jahrb. Engler 13: 182. 1890.

Campderia lindeniana Benth.; Benth. & Hook. Gen. Pl. 3: 103. 1880.

Known only from the type locality, Teapa, Tabasco.

Shrub; leaves oblong or lance-oblong, cordate at base.

6. *Coccoloba liebmanni* Lindau, Bot. Jahrb. Engler 13: 189. 1890.

Colima to Oaxaca; type from Pochutla, Oaxaca.

Leaves oblong-obovate or oblong, coriaceous, cordate at base.

7. *Coccoloba goldmanii* Standl., sp. nov.

Type from the valley of the Río Fuerte, Sinaloa (*Goldman* 245; U. S. Nat. Herb. no. 335744).

Branches puberulent at first; ocreae 4 to 5 mm. long; petioles 12 to 15 mm. long, densely puberulent; leaf blades orbicular or nearly so, 5 to 8 cm. long, rounded at apex, rounded or emarginate at base, thick-coriaceous, green on the upper surface, puberulent on the veins, the costa and lateral veins slender, prominent, the other venation inconspicuous, slightly paler beneath, short-pilose, especially on the veins, the venation very prominent, reticulate; racemes

¹ Named in honor of Jean Jules Linden, who was associated with Ghiesbreght in botanical exploration of Mexico. He collected (about 1837-1839) in Yucatán, Chiapas, and Tabasco, and perhaps elsewhere. He afterwards became the proprietor of the famous nurseries at Ghent, once the property of Verschaffelt.

12 to 25 cm. long, slender, the rachis short-pilose, the pedicels mostly solitary, puberulent, stout, twice as long as the ocreolae; fruiting calyx glabrous, 8 mm. long; achene ellipsoid, brown, lustrous.

8. *Coccoloba schiedeana* Lindau, Bot. Jahrb. Engler 13: 187. 1890.

Coccoloba barbadensis mexicana Meisn. in DC. Prodr. 14: 153. 1856.

?*Coccoloba oaxacensis* Gross, Repert. Nov. Sp. Fedde 12: 219. 1913.

Veracruz to Guerrero, Chiapas, and Yucatán; type from Papantla, Veracruz. Guatemala.

Small or large tree; leaves mostly oval, obtuse to cordate at base; flowers white. "Carnero de la costa" (Oaxaca); "tepalcahuite" (Veracruz); "tamulero" (Michoacán, Guerrero); "carnero" (Chiapas, Oaxaca); "uvero" (Veracruz); "palo de carnero" (Oaxaca).

The wood is used for cart wheels and other purposes. The fruit is edible.

The writer has seen no material of *C. oaxacensis*, and it may be a distinct species.

9. *Coccoloba cozumelensis* Hemsl. Biol. Centr. Amer. Bot. 4: 108. 1887.

Coccoloba yucatanica Lindau, Bot. Jahrb. Engler 13: 190. 1890.

Yucatán; type from Cozumel Island.

Leaves ovate or oblong-ovate, obtuse or acute, 3 to 10 cm. long.

10. *Coccoloba chiapensis* Standl. Proc. Biol. Soc. Washington 33: 67. 1920.

Known only from the type locality, Finca Irlanda, Chiapas.

Large tree; leaves elliptic, 15 to 20 cm. long, acuminate.

11. *Coccoloba orizabae* Lindau, Bot. Jahrb. Engler 13: 189. 1890.

Known only from Orizaba, the type locality.

Leaves lance-ovate, obtuse-acuminate, 4.5 to 10 cm. long; fruit 1 cm. long.

12. *Coccoloba humboldti* Meisn. in DC. Prodr. 14: 163. 1856.

Tamaulipas to Oaxaca and Tabasco.

Shrub or small tree; leaves oval or ovate, about 8 cm. long; flowers white. "Tocó prieto" (Tabasco).

13. *Coccoloba jurgenseni* Lindau, Bot. Jahrb. Engler 13: 188. 1890.

Colima to Oaxaca (type locality).

Leaves oblong or oval, 8 to 20 cm. long.

14. *Coccoloba acapulcensis* Standl. Proc. Soc. Washington 33: 66. 1920.

Known only from the type locality, Acapulco, Guerrero.

Easily distinguished from the other Mexican species by its peltate suborbicular leaves, these 5.5 to 8 cm. wide.

5. **NEOMILLSPAUGHIA** Blake, Bull. Torrey Club 48: 84. 1921.

1. *Neomillspaughia emarginata* (Gross) Blake, Bull. Torrey Club 48: 85. 1921.

Podopterus emarginatus Gross, Repert. Sp. Nov. Fedde 12: 218. 1913.

Yucatán; type from Kabah.

Glabrous shrub or tree; leaves orbicular, 7 to 10 cm. wide, coriaceous, emarginate at base and apex; flowers in long racemes; perianth segments 5, the outer ones winged, the inner ones small.

In general appearance the plant resembles some species of *Coccoloba*.

6. **PODOPTERUS** Humb. & Bonpl. Pl. Aequin. 2: 89. 1809.

Shrubs or small trees; leaves thin, early deciduous; flowers fasciculate or racemose, perfect; outer perianth segments with broad scarious wings; stamens 5.

One other species is known, a native of Guatemala.

Leaf blades broadly obovate or rhombic-obovate, acute to acuminate at base.

1. *P. mexicanus*.

Leaf blades oval-ovate, cordate at base.....2. *P. cordifolius*.

1. *Podopterus mexicanus* Humb. & Bonpl. Pl. Aequin. 2: pl. 107. 1809.

Tamaulipas to Colima, Oaxaca, and Yucatán; type from Veracruz. Guatemala.

Shrub or small tree, sometimes 6 meters high, with stout spinose branchlets; leaves deciduous, glabrous; flowers in dense fascicles, appearing when the plant is leafless, greenish tinged with brown.

2. *Podopterus cordifolius* Rose & Standl. Proc. Biol. Soc. Washington 33: 66. 1920.

Colima to Oaxaca; type locality, on the seashore at Manzanillo, Colima.

Small tree with very straggling, pendent branches.

7. ANTIGONON Endl. Gen. Pl. 310. 1837.

Plants fruticose or chiefly herbaceous, scandent; leaves cordate or deltoid; flowers fasciculate, the fascicles racemose.

Exterior sepals ovate in anthesis.....1. *A. guatimalense*.

Exterior sepals cordate in anthesis.

Leaf blades decurrent on the petiole.

Sepals reddish, in fruit nearly as broad as long, obtuse or rounded at apex, usually apiculate; plants usually copiously pubescent.

2. *A. cinerascens*.

Sepals yellowish, longer than broad in fruit, acute or acutish; plants nearly glabrous.....3. *A. flavescens*.

Leaf blades not decurrent.....4. *A. leptopus*.

1. *Antigonon guatimalense* Meisn. in DC. Prodr. 14: 184. 1856.

Polygonum grandiflorum Bertol. Nov. Comm. Acad. Bonon. 4: 412. 1840. Not *P. grandiflorum* Willd. 1799.

Antigonon grandiflorum Robinson, Proc. Amer. Acad. 44: 613. 1909.

Guerrero and Oaxaca. Central America and Colombia; type from Guatemala.

Leaves broadly cordate; inflorescence copiously pubescent, the flowers rose-colored; sepals in fruit about 3 cm. long.

2. *Antigonon cinerascens* Mart. & Gal. Bull. Acad. Brux. 10¹: 14. 1843.

Veracruz, Oaxaca, and Chiapas; type from Jalapa. Central America.

Leaves broadly ovate-cordate, abruptly short-acuminate; flowers purplish red. "Bejuco de colación" (El Salvador); "bellísima" (Nicaragua).

3. *Antigonon flavescens* S. Wats. Proc. Amer. Acad. 22: 446. 1887.

Jalisco to Oaxaca; type from Chapala, Jalisco.

Leaves deltoid, often very large, glabrous, acute or acuminate; flowers greenish white or yellowish. "Coamecate," "coamecatl" (Jalisco, *Urbina*).

4. *Antigonon leptopus* Hook. & Arn. Bot. Beechey Voy. 308. pl. 69. 1839-40.

Antigonon cordatum Mart. & Gal. Bull. Acad. Brux. 10¹: 14. 1843.

Chihuahua to Beja California, southward to Oaxaca; often cultivated elsewhere; type from the west coast.

Large vine, often climbing to the tops of the highest trees, sometimes running over low shrubs; leaves deltoid or cordate, acuminate; sepals at first small and inconspicuous but becoming large, purplish red, and very showy, the racemes (as in the other species) furnished with tendrils. "Flor de San Diego" (Veracruz, Oaxaca, Yucatán); "enredadera de San Diego" (Nuevo León, Oaxaca); "rosa de mayo" (Sinaloa); "corona de la reina" (Tamaulipas); "hierba de

Santa Rosa" (Morelos); "San Miguelito" (Sonora, Sinaloa); "fulmina" (Guerrero, Morelos); "bellísima" (Oaxaca, Colombia); "corona" (Sinaloa, Tamaulipas); "flor de San Miguel" (Sonora, Guatemala); "coronilla" (Sinaloa); "coamecate" (Morelos, Sinaloa); "coamecatl" (Guanajuato, Texas); "cuamecate" (Durango, Jalisco; from the Nahuatl, *cuau-mecatl*=tree+cord); "bejuco de colación" (El Salvador); "coralillo," "coralillo rosado" (Cuba); "cadena de amor" (Philippine Islands).

A very showy and handsome plant, and cultivated for this reason not only in Mexico but in many other regions. In general appearance it suggests *Bougainvillea*, and is equally handsome. It is a rapid grower and remains in bloom a long time. In Florida it is known as "Confederate vine." The flower clusters serve as tendrils for the support of the plant, and shorten themselves by bending at the joints in a zigzag form. The roots bear tubers which are usually small, although they are said sometimes to weigh as much as 15 pounds. They are edible and have a nutlike flavor. For an illustration of this species see *Contr. U. S. Nat. Herb.* 8: *pl.* 18.

8. GYMNOPODIUM Rolfe in Hook. Icon. Pl. IV. 7: *pl.* 2699. 1901.

Shrubs or trees; leaves alternate, subsessile; flowers fascicled in racemes, slender-pedicel; inner perianth segments small and inconspicuous; stamens 9; fruit a small 3-angled achene.

One other species is known, a native of British Honduras.

Sepals cordate at base.....1. *G. antigonoides*.
 Sepals cuneate or decurrent at base.....2. *G. ovatifolium*.

1. *Gymnopodium antigonoides* (Robinson) Blake, *Bull. Torrey Club* 48: 84. 1921.

Millspaughia antigonoides Robinson; Millsp. & Loes. *Bot. Jahrb. Engler* 36: Beibl. 80: 14. 1905.

Yucatán and Chiapas; type from Progreso, Yucatán.

Shrub or tree, sometimes 12 meters high; leaves obovate to oval, 2 to 5.5 cm. long, rounded at apex, puberulent when young; flowers fasciculate, racemose, greenish, the sepals in age 7 mm. long.

The Chiapas specimens have slightly broader and larger leaves than those from Yucatán.

2. *Gymnopodium ovatifolium* (Robinson) Blake, *Bull. Torrey Club* 48: 84. 1921.

Millspaughia ovatifolia Robinson; Millsp. & Loes. *Bot. Jahrb. Engler* 36: Beibl. 80: 14. 1905.

Known only from the type locality, Progreso, Yucatán.

Leaves broadly ovate, 5 cm. long, acutish.

9. TRIPLARIS L. Syst. Nat. ed. 10. 881. 1759.

1. *Triplaris auriculata* Meisn. in DC. *Prodr.* 14: 174. 1856.

Chiapas and perhaps elsewhere in Mexico, the type from some unknown locality.

Shrub or tree, more or less pubescent; leaves large, oval, short-petiolate; flowers dioecious, racemose, the pistillate calyx accrescent and in fruit about 5 cm. long.

The Mexican material seen appears to be the same as *T. macombii* Donn. Smith, and is perhaps not different from *T. surinamensis* Cham. *T. auriculata* is probably the plant reported from Chiapas as *Triplaris* sp. with the vernacular

name "palo mulato." A related species, *T. tomentosa* Wedd., is a small tree with hollow stems infested by ants, known in Costa Rica as "hormigo" and "tabaco."

10. **RUPRECHTIA** C. A. Meyer, Mém. Acad. St. Pétersb. VI. 6: 148. 1840.

Trees or shrubs with rather small leaves; flowers dioecious, fasciculate in short spikes; pistillate calyx accrescent in fruit.

Venation of the lower surface of the leaves very prominent and finely reticulate.

Fruiting sepals 3.5 to 4 cm. long.....1. *R. macrosepala*.

Fruiting sepals 1.3 to 2.7 cm. long.

Leaf blades narrowly elliptic-oblong or lanceolate, 0.8 to 2.5 cm. wide, nearly glabrous beneath; fruiting sepals 1.3 to 1.8 cm. long.

2. *R. occidentalis*.

Leaf blades elliptic, 1.8 to 3.5 cm. wide, densely short-pilose beneath; fruiting sepals about 2.5 cm. long.....3. *R. fusca*.

Venation of the lower surface of the leaves neither prominent nor reticulate.

Leaves densely short-pilose beneath.....4. *R. pringlei*.

Leaves glabrous beneath or nearly so.

Leaves ovate or broadly ovate, widest at or below the middle, acute or acuminate.....5. *R. cumingii*.

Leaves mostly oblanceolate-oblong, widest above the middle, obtuse or acutish.....6. *R. pallida*.

1. *Ruprechtia macrosepala* Standl., sp. nov.

Sinaloa; type from Varal, Municipalidad de Mazatlán (*Dehesa* 1508; U. S. Nat. Herb. no. 1,012,464).

Branchlets slender, brownish; ocreae 2.5 to 3 mm. long; petioles stout, 3 to 5 mm. long; leaf blades elliptic-ovate, 6.5 to 11.5 cm. long, 3 to 4.5 cm. wide, obtuse or rounded at base, acute or acuminate at apex, green and glabrous on the upper surface, slightly paler beneath, sparsely strigose along the veins, the venation very prominent and finely reticulate; pistillate racemes numerous, laxly flowered, the flowers slender-pedicellate; calyx 3.5 to 4 cm. long, densely appressed-pilose below, glabrate above; inner calyx lobes linear-attenuate, 4 to 5 mm. long, the outer lobes ligulate-spatulate, reticulate-veined, rounded at apex, tinged with red at first; achene 8 to 9 mm. long, glabrous.

2. *Ruprechtia occidentalis* Standl. Proc. Biol. Soc. Washington 33: 66. 1920.

Sinaloa; type from San Blas.

Shrub, about 3 meters high; leaves 3 to 8 cm. long, 1 to 2.5 cm. wide, acuminate to acutish.

3. *Ruprechtia fusca* Fernald, Proc. Amer. Acad. 33: 86. 1897.

Puebla and Guerrero; type from Acapulco.

Shrub or small tree, 4.5 meters high, the trunk 20 cm. in diameter; leaves very thick, acute, with fulvous pubescence.

4. *Ruprechtia pringlei* Greenm. Proc. Amer. Acad. 33: 476. 1898.

Oaxaca; type from Tomellín Canyon.

Shrub or small tree, 4 to 6 meters high, with gray bark; leaves oblong-ovate, 4 to 7 cm. long; fruiting calyx 2 to 2.5 cm. long.

5. *Ruprechtia cumingii* Meisn. in DC. Prodr. 14: 179. 1856.

Veracruz. Central America and Colombia (type locality).

Large or small tree with rounded crown; leaves ovate, acuminate, comparatively thin, 4 to 7.5 cm. long, 1.8 to 3.5 cm. wide; fruiting calyx about 2 cm. long.

6. *Ruprechtia pallida* Standl., sp. nov.

Michoacán and Guerrero; type from Cayaco, Michoacán (Nelson 6964; U. S. Nat. Herb. no. 399283).

Branches blackish brown, rugose; ocreae 1.5 mm. long; petioles 3 to 5 mm. long; leaf blades oblanceolate-oblong or elliptic-oblong, 4.5 to 7 cm. long, 1.5 to 2 cm. wide, usually cuneate at base, obtuse to subacute at apex, subcoriaceous, pale on both surfaces, glabrous above, the venation inconspicuous, glabrous beneath except for a few scattered hairs along the costa, the lateral veins about 9 on each side, prominent, the other venation inconspicuous; pistillate racemes (very immature) about 2 cm. long, densely flowered; calyx densely pilose with short subappressed hairs.

32. CHENOPODIACEAE. Goosefoot Family.

REFERENCE: Standley, Chenopodiaceae, N. Amer. Fl. 21: 3-93, 1916.

Shrubs, usually low, often succulent; leaves opposite or alternate, estipulate, sometimes reduced to scales; flowers small, perfect or unisexual; fruit a utricle, 1-seeded.

A large number of herbaceous species of various genera are found in Mexico. Leaves reduced to scales; stems jointed; flowers in fleshy spikes or sunk in the joints of the stems.

Branches alternate-----3. ALLENROLFEA.

Branches opposite-----4. ARTHROCNUM.

Leaves well developed; stems not jointed; flowers solitary or clustered in the axils of the leaves.

Embryo spirally coiled; leaves very fleshy, terete or semiterete--5. DONDIA.

Embryo not coiled; leaves usually flat.

Pubescence of inflated hairs or wanting, never of slender hairs.

1. ATRIPLEX.

Pubescence of silky hairs-----2. EUROTIA.

1. ATRIPLEX L. Sp. Pl. 1052. 1753.

Shrubs with scurfy whitish pubescence; leaves alternate or opposite, entire or dentate; flowers unisexual; fruit inclosed by bracts.

Several herbaceous representatives of the genus are found in Mexico. The plants are of considerable value as forage for stock.

Fruiting bracts with 4 longitudinal wings.

Bracts 7 to 25 mm. long, the free portion equaling or usually shorter than the wings-----1. A. canescens.

Bracts 4 to 10 mm. long, the free portion much longer than the wings.

Pedicels of the fertile flowers 2 mm. long or less; bracts 4 to 6 mm. long.

2. A. linearis.

Pedicels 4 to 7 mm. long; bracts 6 to 10 mm. long-----3. A. macropoda.

Fruiting bracts not winged.

Leaves all or nearly all opposite. Leaves sessile, 2 to 5 mm. long.

4. A. matamorensis.

Leaves alternate, or the lowest opposite.

Leaves dentate-----5. A. acanthocarpa.

Leaves entire:

Leaves sagittate, clasping, 2 to 4 mm. long-----6. A. julacea.

Leaves never sagittate, usually much larger.

Bracts entire, 5 to 12 mm. long-----7. A. confertifolia.

Bracts dentate or crenulate, usually smaller.

Plants tall shrubs, usually a meter high or more; leaves neither obovate nor orbicular.

Bracts crenulate; leaves petiolate, the blades 1.5 to 5 cm. long.

8. *A. lentiformis*.

Bracts laciniate-dentate; leaves sessile, usually less than 1 cm. long.

9. *A. polycarpa*.

Plants low shrubs, rarely 60 cm. high or, if larger, the leaves obovate or orbicular.

Bracts 2 to 3 mm. long-----10. *A. insularis*.

Bracts 4 to 10 mm. long.

Bracts 4 to 8 mm. long, broader than long-----11. *A. obovata*.

Bracts 8 to 10 mm. long, longer than broad----12. *A. pringlei*.

1. *Atriplex canescens* (Pursh) Nutt. Gen. Pl. 1: 197. 1818.

Calligonum canescens Pursh, Fl. Amer. Sept. 370. 1814.

Obione tetraptera Benth. Bot. Voy. Sulph. 48. 1844.

Obione berlandieri Moq. in DC. Prodr. 13²: 114. 1849.

Baja California to Coahuila, San Luis Potosí, and Zacatecas. Northward in the United States to Oregon and South Dakota; and from South Dakota.

Densely branched, grayish shrub, usually 1 to 1.5 meters high, often forming broad clumps; leaves mostly linear, obtuse; flowers dioecious. "Costillas de vaca" (Zacatecas); "chamiso" (Baja California, Chihuahua, New Mexico); "cenizo" (Chihuahua, Sonora).

In some parts of its range this plant, like others of the genus, is of some importance as a forage plant. The leaves have a salty flavor. The seeds of this and other species have been used as food by the Gosiute Indians of Utah.

2. *Atriplex linearis* S. Wats. Proc. Amer. Acad. 24: 72. 1889.

Dry plains and hillsides, Sonora and Baja California; type from Guaymas. Southern Arizona and California.

Dense shrub, 1 to 2.5 meters high; leaves linear. 1 to 5 cm. long, whitish. "Chamiso" (Baja California).

3. *Atriplex macropoda* Rose & Standl. N. Amer. Fl. 21: 72. 1916.

Known only from the type locality, Pichilingue Island, Baja California.

Shrub with slender branches; leaves linear. 1 to 1.8 cm. long.

4. *Atriplex matamorensis* A. Nels. Proc. Biol. Soc. Washington 17: 99. 1904.

Atriplex oppositifolia S. Wats. Proc. Amer. Acad. 9: 118. 1874. Not *A. oppositifolia* Vill. 1779.

Tamaulipas; type from the Rio Grande Valley, near Matamoros, Southwestern Texas.

Small shrub, 20 to 40 cm. high, with slender, very leafy branches; leaves sessile, lance-oblong, 2 to 5 mm. long, entire, obtuse or acutish; bracts sub-orbicular, 3 mm. long, dentate.

5. *Atriplex acanthocarpa* (Torr.) S. Wats. Proc. Amer. Acad. 9: 117. 1874.

Obione acanthocarpa Torr. U. S. & Mex. Bound. Bot. 183. 1859.

Chihuahua to Nuevo León. Western Texas and southern New Mexico; type from plains near the Burro Mountains, New Mexico.

Shrub. 1 meter high or less; leaves oblong to broadly obovate, 1.5 to 5 cm. long, coarsely dentate; flowers monoecious; bracts 7 to 15 mm. long, the margins laciniate, the sides with numerous long flattened appendages.

6. *Atriplex julacea* S. Wats. Proc. Amer. Acad. 20: 370. 1885.

Baja California; type from Bahía de Todos Santos.

Procumbent or erect shrub, the slender branches densely leafy; leaves scale-like; flowers dioecious; bracts 4 to 5 mm. long, with corky appendages on the sides.

7. *Atriplex confertifolia* (Torr.) S. Wats. Proc. Amer. Acad. 9: 119. 1874.
Obione confertifolia Torr. in Frém. Rep. Exped. Rocky Mount. 318. 1845.
 Chihuahua. Northward in the United States to Oregon and South Dakota; type from Utah.
 Shrub, rarely over 50 cm. high, often forming broad clumps; leaves mostly oval, entire, 1 to 2 cm. long; flowers dioecious; bracts oval or suborbicular.
8. *Atriplex lentiformis* (Torr.) S. Wats. Proc. Amer. Acad. 9: 118. 1874.
Obione lentiformis Torr. in Sitgreaves, Rep. Zuñi & Colo. 169. 1853.
 Northern Sonora. Southern California to southwestern Utah; type from Arizona.
 Dense shrub, 1 to 4 meters high; leaves ovate to ovate-deltoid or oblong, obtuse or rounded at apex; bracts smooth on the sides.
 The Coahuilla Indians of southern California grind the seeds and boil the meal in salted water. The various species of *Atriplex* were rather important food plants among many of the Indians of the arid portions of North America. Among the Pimas of Arizona the young shoots, which have a salty flavor, were boiled and eaten. The same tribe made use of the seeds (presumably including also the bracts), cooking them in pits over night, then drying and parching them and storing for winter use. Seeds so preserved were eaten as *pinole*—a mixture of the ground seeds with water. The Pimas used the powdered root as a dressing for sores.
9. *Atriplex polycarpa* (Torr.) S. Wats. Proc. Amer. Acad. 9: 117. 1874.
Obione polycarpa Torr. U. S. Rep. Expl. Miss. Pacif. 4: 130. 1857.
Atriplex curvidens T. S. Brandeg. Proc. Calif. Acad. II. 2: 201. 1889.
 Sonora and Baja California. California to Arizona; type from the Gila River, Arizona.
 Dense shrub, 1 to 2 meters high; leaves rhombic or deltoid, 2 to 5 cm. long, grayish; flowers dioecious; bracts with a few subulate appendages on the sides.
10. *Atriplex insularis* Rose, Contr. U. S. Nat. Herb. 1: 80. 1890.
 Islands off the west coast of Baja California; type from Raza Island.
 Erect shrub, 1.5 to 2 meters high; leaves obovate or orbicular, 1 to 1.5 cm. long, short-petiolate or sessile, rounded at apex; bracts coarsely and irregularly dentate, short-tuberculate on the sides.
11. *Atriplex obovata* Moq. Chenop. 61. 1840.
Atriplex greggii S. Wats. Proc. Amer. Acad. 9: 118. 1874.
 Chihuahua to Zacatecas; type from San Luis Potosí. Western Texas and southern New Mexico.
 Shrub, 15 to 40 cm. high; leaves oblong to oval, 1 to 3 cm. long; flowers dioecious; bracts denticulate, the sides sparsely tuberculate or crested near the base, rarely smooth.
12. *Atriplex pringlei* Standl. N. Amer. Fl. 21: 68. 1916.
 Known only from the type locality, alkaline plains, Hacienda de Angostura, San Luis Potosí.
 Shrub, 20 to 30 cm. high; leaves obovate, 1.5 to 3 cm. oblong, rounded at apex; bracts not compressed, irregularly dentate, the sides with few or numerous appendages.
2. **EUROTIA** Adans. Fam. Pl. 2: 260. 1763.
1. *Eurotia subspinosa* Rydb. Bull. Torrey Club 39: 312. 1912.
 Chihuahua and Coahuila. Southern California to Utah; type from Utah.
 Much-branched shrub a meter high or less, copiously pubescent; leaves linear, alternate, 1 to 3 cm. long, stellate-pubescent; flowers dioecious, clustered in the leaf axils; fruit covered with long white or brownish hairs.

The plant is of some importance for forage. The closely related *E. lanata* (Pursh) Moq., of the western United States, is often known as "winter-fat."

3. **ALLENROLFEA** Kuntze, Rev. Gen. Pl. 545. 1891.

1. *Allenrolfea occidentalis* (S. Wats.) Kuntze, Rev. Gen. Pl. 1: 546. 1891.

Halostachys occidentalis S. Wats. in King, Geol. Expl. 40th Par. 5: 293. 1871.

Spirostachys occidentalis S. Wats. Proc. Amer. Acad. 9: 125. 1874.

In alkaline soil, Sonora and Baja California; probably also in Chihuahua. Northward in the United States to Oregon; type from Utah.

Shrub, 1.5 meters high or less, much branched, green, with very succulent, fragile, jointed branches; flowers arranged spirally by 3's or 5's in the axils of fleshy peltate bracts. "Hierba del burro" (New Mexico).

Eaten sparingly by stock. Known in New Mexico as "burroweed."

4. **ARTHROCNUM** Moq. Chenop. 111. 1840.

1. *Arthrocnemum subterminale* (Parish) Standl. Journ. Washington Acad. Sci. 4: 399. 1914.

Salicornia subterminalis Parish, Erythraea 6: 87. 1898.

In alkaline soil, Baja California and Sinaloa. California; type from Riverside County.

Low leafless shrub with succulent jointed branches; flowers in groups of 3 on the opposite sides of the joints, the flowering joints forming terminal spikes.

The seeds were ground into meal and eaten by the Coahuilla Indians of southern California.¹

5. **DONDIA** Adans. Fam. Pl. 2: 261. 1763.

Low shrubs or herbs, glabrous or pubescent, often glaucous; leaves short, terete or semiterete, very succulent; flowers small, perfect, axillary.

The plants perhaps scarcely deserve to be classed as shrubs. They are sometimes burned to secure ashes from which lye for soap making is made. The Coahuilla Indians of California are said to use the plants for dyeing baskets black. The salty-flavored leaves were cooked and eaten by the Pimas and other Indians of the arid regions. The following names are said to be applied to various species of doubtful identification: "Romerito"; "romerillo"; "jauja" (Durango, Tamaulipas); "sosa" (Sonora); "quelite salado" (Chihuahua).

Stems and leaves glabrous or nearly so.

Seed 1.5 to 2 mm. broad.....1. *D. californica*.

Seed 0.8 mm. broad.....2. *D. fruticosa*.

Stems and leaves densely villous or tomentulose, at least when young.

Branches of the inflorescence very slender, spreading or divaricate, flexuous, elongate; leaves flattened.....3. *D. ramosissima*.

Branches of the inflorescence stout, ascending or erect, not flexuous, short; leaves terete.

Calyx densely pubescent.....4. *D. brevifolia*.

Calyx nearly or quite glabrous.

Leaves glaucous, 3 to 7 mm. long, rounded at apex; seed 1.5 mm. broad.

5. *D. palmeri*.

Leaves green, 7 to 15 mm. long, acute; seed 1 mm. broad.

6. *D. tampicensis*.

¹ See D. P. Barrows, The ethno-botany of the Coahuilla Indians of southern California, pp. 1-82, 1900. Doctorate thesis of the University of Chicago.

1. *Dondia californica* (S. Wats.) Heller, Cat. N. Amer. Pl. 3. 1898.
Suaeda californica S. Wats. Proc. Amer. Acad. 9: 89. 1874.
Salt marshes, coast of Baja California. California; type from San Francisco Bay.
Shrub, 20 to 80 cm. high; leaves 1.5 to 3.5 cm. long.
2. *Dondia fruticosa* (L.) Druce, List. Brit. Pl. 60. 1908.
Chenopodium fruticosum L. Sp. Pl. 221. 1753.
Suaeda fruticosa Forsk. Fl. Aegypt. Arab. 70. 1775.
Coahuila and probably elsewhere. Northward to Alberta; Bahamas and Cuba; Europe, Asia, and Africa.
Shrub, 20 to 80 cm. high; leaves 1 to 1.5 cm. long.
3. *Dondia ramosissima* Standl. N. Amer. Fl. 21: 91. 1916.
Baja California. Southern California and Arizona; type from Lees Ferry, Arizona.
Shrub, 1 meter high; leaves 0.5 to 2 cm. long.
4. *Dondia brevifolia* Standl. N. Amer. Fl. 21: 92. 1916.
Baja California. Southern California; type from Newport.
5. *Dondia palmeri* Standl. N. Amer. Fl. 21: 91. 1916.
Coahuila and Zacatecas; type from Parrás, Coahuila.
Low shrub. "Saladillo" (Zacatecas).
6. *Dondia tampicensis* Standl. N. Amer. Fl. 21: 91. 1916.
Known only from the type locality, along the coast near La Barra, Tamaulipas, near Tampico.

33. AMARANTHACEAE. Amaranth Family.

REFERENCE: Standley, Amaranthaceae, N. Amer. Fl. 21: 95-169. 1917.

Shrubs or small trees; leaves opposite or alternate, estipulate, entire; flowers small, perfect or unisexual, usually whitish, mostly spicate; fruit very small, dry.

Many herbaceous representatives of the family occur in Mexico.

Leaves opposite. Fruit 1-seeded.

Stigma capitate or shallowly bilobate. Plants scandent.....5. PFAFFIA.

Stigma with 2 or 3 subulate or filiform lobes.....6. IRESINE.

Leaves alternate.

Fruit with 2 or more seeds. Flowers perfect.

Fruit 1-seeded.....1. CELOSIA.

Sepals glabrous; anthers 4-celled.

Seeds with an aril; stems usually scandent or reclining.....2. CHAMISSOA.

Seeds without an aril; stems erect.....3. LAGREZIA.

Sepals villous; anthers 2-celled.....4. DICRAURUS.

1. CELOSIA L. Sp. Pl. 205. 1753.

Low shrubs or herbs; leaves alternate, entire or lobed, petiolate; flowers perfect, spicate.

The best-known representative of the genus is the cockscomb, *Celosia argentea* L., various forms of which are cultivated for ornament. It is known in Mexico as "cresta de gallo," "abanico," "Cinco de Mayo," and "mano de león." The cultivated plants are the form with fasciated inflorescence, described by Linnaeus as *Celosia cristata*. This is the only species besides those enumerated below which occurs in Mexico.

Sepals 5 to 6 mm. long, prominently nerved.

Leaf blades hastately lobed; stigmas 2-----1. *C. palmeri*.

Leaf blades not lobed; stigmas 3.

Seeds 5 to 8; leaf blades ovate to lanceolate, decurrent nearly to the base of the petiole-----2. *C. virgata*.

Seeds about 20; leaf blades deltoid to triangular-lanceolate, short-decurrent.
3. *C. nitida*.

Sepals 3 mm. long or less, obscurely nerved.

Leaf blades, at least most of them, hastately lobed, puberulent beneath.

4. *C. floribunda*.

Leaf blades entire, glabrous.

Flowers pedicellate-----7. *C. chiapensis*.

Flowers sessile.

Fruit stipitate; sepals dark brown-----5. *C. moquini*.

Fruit sessile; sepals stramineous-----6. *C. orcuttii*.

1. *Celosia palmeri* S. Wats. Proc. Amer. Acad. 18: 163. 1883.

Coahuila, Nuevo León, and San Luis Potosí; type from Monclova, Coahuila, Western Texas.

Low shrub, much branched, glabrous except about the inflorescence; leaves lanceolate or lance-triangular, 1.5 to 5 cm. long; spikes 1 to 2 cm. long; seeds 3 or 4.

2. *Celosia virgata* Jacq. Coll. Bot. 2: 279. 1788.

Veracruz and Yucatán. Cuba and Porto Rico; northern South America.

Plants suffrutescent, 0.5 to 1 meter high; leaves ovate or lanceolate; flower spikes 1 to 5 cm. long.

3. *Celosia nitida* Vahl, Symb. Bot. 3: 44. 1794.

San Luis Potosí to Yucatán. West Indies, western Texas, and northern South America.

Plants fruticose below, the slender stems erect or clambering over other plants, glabrous; leaves 2 to 7 cm. long. "Abanico" (Colombia).

Used in Martinique as a remedy for dysentery.

4. *Celosia floribunda* A. Gray, Proc. Amer. Acad. 5: 167. 1861.

Southern Baja California; type from the vicinity of Cape San Lucas.

Shrub, 4 meters high or less; leaves 3 to 18 cm. long; spikes 2 to 15 cm. long.

5. *Celosia moquini* Guillem.; Moq. in DC. Prodr. 13²: 239. 1849.

Southern Mexico, the localities not definitely known.

Leaves 15 to 30 cm. long; flower spikes arranged in large panicles.

6. *Celosia orcuttii* Greenm. Field Mus. Bot. 2: 330. 1912.

Colima, the type from the city of Colima.

Leaves 6 to 17 cm. long, acute.

Rather doubtfully distinct from the last species.

7. *Celosia chiapensis* T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 363. 1917.

Chiapas; type from Finca Irlanda.

Glabrous shrub; leaves slender-petiolate, lanceolate or elliptic-lanceolate, 9 to 14 cm. long, acuminate.

2. CHAMISSOA H. B. K. Nov. Gen. & Sp. 2: 196. 1817.

1. *Chamissoa altissima* (Jacq.) H. B. K. Nov. Gen. & Sp. 2: 197. 1817.

Achyranthes altissima Jacq. Enum. Pl. Carib. 17. 1762.

Sinaloa to Tamaulipas, Tlaxasco and Oaxaca. Central America, West Indies, and northern South America; type from Jamaica.

Shrub, the stems 2 meters long or more, scandent or reclining, glabrous or nearly so; leaves ovate or lanceolate, 6 to 18 cm. long, acute; flowers spicate, in large panicles. "Pate" (Nicaragua); "guaniquique" (Cuba); "pabellón del rey" (Santo Domingo).

This is probably the plant described by Sessé and Mociño¹ as *Celosia atomiceis*.

3. LAGREZIA Moq. in DC. Prodr. 13²: 252. 1849.

1. *Lagrezia monosperma* (Rose) Standl. Journ. Washington Acad. Sci. 5: 393. 1915.

Celosia monosperma Rose, Contr. U. S. Nat. Herb. 1: 352. 1895.

Colima and Guerrero; type from Manzanillo, Colima.

Shrub, 2 to 5 meters high, glabrous or nearly so; leaves ovate to lanceolate, 5 to 12 cm. long; flowers perfect, small, in slender paniculate spikes.

4. DICRAURUS Hook. f. in Benth. & Hook. Gen. Pl. 3: 42. 1880.

Erect shrubs, copiously pubescent; leaves chiefly alternate, but some of them frequently opposite; flowers unisexual, small, spicate, the spikes paniculate.

Leaves ovate to ovate-lanceolate, acute, 3 to 9 mm. wide; petioles 1 to 2 mm. long-----1. *D. leptocladus*.

Leaves rounded-ovate or rounded-deltoid, usually rounded at the apex, 13 to 35 mm. wide; petioles 5 to 10 mm. long-----2. *D. alternifolius*.

1. *Dicraurus leptocladus* Hook. f. in Benth. & Hook. Gen. Pl. 3: 43. 1880.

Dicraurus diffusus Baill. Hist. Pl. 9: 214. 1888.

Chihuahua to San Luis Potosí. Western Texas (type locality).

Shrub, 0.2 to 1 meter high, with numerous stems.

2. *Dicraurus alternifolius* (S. Wats.) Uline & Bray, Bot. Gaz. 21: 355. 1896.

Iresine alternifolia S. Wats. Proc. Amer. Acad. 24: 72. 1889.

Shrub, 1 to 3.5 meters high, with grayish or brownish branches.

5. PFAFFIA Mart. Nov. Gen. & Sp. 2: 20. 1826.

1. *Pfaffia hookeriana* (Hemsl.) Greenm. Field Mus. Bot. 2: 330. 1912.

Hebanthe hookeriana Hemsl. Biol. Centr. Amer. Bot. 3: 19. 1882.

Veracruz, the type from Córdoba. Central America.

Scandent shrub, more or less pubescent; leaves ovate, acute, short-petiolate; flowers mostly perfect, yellowish white, spicate, the sepals covered with long white hairs.

6. IRESINE P. Br. Civ. Nat. Hist. Jam. 358. 1756.

Shrubs or small trees, erect or sometimes scandent; leaves opposite, petiolate; flowers perfect or unisexual, usually spicate, the sepals variously hairy.

A number of herbaceous species occur in Mexico. A plant described by Sessé and Mociño² as *Celosia dioica* belong, apparently, to this genus, but its identification is doubtful.

Flowers perfect or polygamous.

Branches of the inflorescence glabrous or nearly so.

Bracts and bractlets rounded or obtuse at the apex.

Inflorescence naked; bracts stramineous or whitish; pubescence of the sepals bright white; leaf blades broadest at the middle---1. *I. nigra*.

Inflorescence leafy; bracts fuscous; pubescence of the sepals brownish; leaf blades broadest near the base-----2. *I. pacifica*.

¹ Pl. Nov. Hisp. 41, 1887. The specific name is written "*Atomiris*" in Fl. Mex. 74. 1894.

² Pl. Nov. Hisp. 38. 1893.

Bracts and bractlets acute or acuminate, cuspidate.

Staminodia minute; sepals acute or acutish; bracts sparsely villous.

3. *I. angustifolia*.

Staminodia one-third as long as the filaments; sepals obtuse or rounded at apex; bracts densely villous.....4. *I. arenaria*.

Branches of the inflorescence densely canescent or tomentose.

Leaf blades elliptic to oblanceolate-oblong, 12 to 20 cm. long, soon glabrate; spikelets sessile; sepals sparsely lanate at base.....5. *I. tomentella*.

Leaf blades ovate to lanceolate, 8 cm. long or less, permanently pubescent; spikelets mostly pedicellate; sepals densely lanate.....6. *I. hartmanii*.

Flowers dioecious.

Branches of the inflorescence glabrous or nearly so.

Leaves 25 to 33 cm. long.....7. *I. herrerae*.

Leaves 2 to 15 cm. long.

Bracts subcoriaceous, rounded at apex; lateral veins of the leaves nearly obsolete.....8. *I. palmeri*.

Bracts scarious, mucronulate; lateral veins of the leaves coarse and prominent.....9. *I. interrupta*.

Branches of the inflorescence densely pubescent.

Staminate spikelets glomerate at the ends of branches; leaf blades about as broad as long, mostly suborbicular.....10. *I. rotundifolia*.

Staminate spikelets paniculate; leaf blades much longer than broad.

Sepals of the pistillate flowers rigid, green, the tips slightly spreading.

11. *I. pringlei*.

Sepals of the pistillate flowers thin, whitish, the tips erect or incurved.

Pubescence of branched hairs.....12. *I. stricta*.

Pubescence of simple hairs.

Panicles on long naked peduncles, narrow, the branches usually short.

Leaves soon glabrate; pubescence of the stems lustrous.

13. *I. nitens*.

Leaves permanently pubescent, at least beneath; pubescence dull.

14. *I. schaffneri*.

Panicles short-pedunculate or usually sessile, broad, the branches commonly elongate.

Leaves white beneath with a usually dense tomentum.

Spikes usually sessile, short; leaves thick, subrugose; branches of the panicle stout.....15. *I. cassiniaeformis*.

Spikes nearly all pedunculate, elongate; leaves thin; branches of the panicle slender, flexuous.....16. *I. discolor*.

Leaves not white beneath, the pubescence of yellowish, straight or loosely matted hairs.

Panicles very dense; bracts and sepals villous only at base; sepals of the staminate flowers 2.5 to 3 mm. long.

17. *I. grandis*.

Panicles loose and open; bracts and sepals copiously villous; sepals of the staminate flowers 2 mm. long or shorter.

18. *I. calea*.

1. *Iresine nigra* Uline & Bray, Bot. Gaz. 21: 350. 1896.

Veracruz and Chiapas. Central America; type from San Pedro Sula, Honduras.

Shrub with slender branches; leaves mostly ovate, 4.5 to 14 cm. long, acute to long-acuminate, glabrous.

2. *Iresine pacifica* Standl. Contr. U. S. Nat. Herb. 18: 96. 1916.
Sinaloa to Colima; type from Manzanillo.
Slender erect shrub, or often herbaceous, nearly glabrous; leaves ovate or lanceolate, 4 to 10 cm. long.
3. *Iresine angustifolia* Euphrasén, Beskr. St. Barthel. 165. 1795.
Iresine elatior Rich.; Willd. Sp. Pl. 4: 766. 1805.
Veracruz; Baja California. West Indies; Costa Rica to Brazil and Ecuador; type from St. Bartholomew Island, West Indies.
Much-branched shrub, a meter high, or often herbaceous, nearly glabrous; leaves mostly lanceolate, 5 to 10 cm. long.
4. *Iresine arenaria* Standl. Contr. U. S. Nat. Herb. 18: 93. 1916.
Sinaloa, on sandy hillsides, the type from Topolobampo.
Plants erect, fruticose at base, nearly glabrous; leaves mostly lanceolate, 2.5 to 4.5 cm. long.
5. *Iresine tomentella* Standl. Contr. U. S. Nat. Herb. 18: 97. 1916.
Known only from the type locality, Gómez Farías, Tamaulipas.
Erect shrub, 1.5 to 2 meters high, with white flowers. "Tepezán."
6. *Iresine hartmanii* Uline, Field Mus. Bot. 1: 422. 1899.
Sonora and Durango; type from Granados, Sonora.
Shrub, 1.5 to 2.5 meters high.
7. *Iresine herrerae* Blake, Contr. Gray Herb. n. ser. 53: 55. 1918.
Known only from the type locality, Río Concordia, Oaxaca.
Erect shrub, 3 meters high, glabrous.
8. *Iresine palmeri* (S. Wats.) Standl. Journ. Washington Acad. Sci. 5: 395. 1915.
Hebanthe palmeri S. Wats. Proc. Amer. Acad. 18: 144. 1883.
Nuevo León to Veracruz; type from Guajuco, Nuevo León.
Scandent or decumbent shrub, nearly glabrous; leaves mostly ovate-oblong, 2 to 6 cm. long.
9. *Iresine interrupta* Benth. Bot. Voy. Sulph. 156. 1844.
Alternanthera richardii Moq. in D. C. Prodr. 13²: 353. 1849.
Hebanthe subnuda Hemsl. Biol. Centr. Amer. Bot. 3: 20. 1882.
Sonora to San Luis Potosí, Veracruz, and Puebla; type from Tepic. Guatemala.
Scandent or reclining shrub, 4 to 6 meters long, nearly glabrous, with pale stems; leaves broadly ovate or lanceolate, acute or attenuate. "Barba del viejo" (Sinaloa).
10. *Iresine rotundifolia* Standl. Contr. U. S. Nat. Herb. 18: 96. 1916.
Puebla; type from San Luis Tultitlanapa.
Leaves 3.5 to 17 mm. long, tomentose beneath.
11. *Iresine pringlei* S. Wats. Proc. Amer. Acad. 25: 161. 1890.
On rocky slopes, Jalisco to Puebla and Oaxaca; type from Guadalajara.
Erect shrub, 1.5 to 3 meters high; leaves ovate, 4 to 8 cm. long, acuminate; flowers in large panicles.
12. *Iresine stricta* Standl. Contr. U. S. Nat. Herb. 18: 97. 1916.
Puebla and Oaxaca; type from Tehuacán, Puebla.
Erect shrub, 30 to 80 cm. high; leaves oval to ovate, 1.3 to 3.5 cm. long.
13. *Iresine nitens* Standl. Contr. U. S. Nat. Herb. 18: 95. 1916.
Known only from the type locality, Tehuacán, Puebla.
Low erect shrub; leaves lanceolate, 2 to 6 cm. long, acute.

14. *Iresine schaffneri* S. Wats. Proc. Amer. Acad. 21: 437. 1886.

Dry rocky hillsides, Chihuahua to San Luis Potosí, and Hidalgo; type from San Luis Potosí.

Erect shrub, 1 meter high or less; leaves ovate or lanceolate, 2 to 9 cm. long. "Tlatlón" (Querétaro).

15. *Iresine cassiniaeformis* Schauer, Linnaea 19: 708. 1847.

Tamaulipas and San Luis Potosí.

Erect shrub, 1 to 1.5 meters high; leaves mostly ovate, acute or obtuse.

16. *Iresine discolor* Greenm. Proc. Amer. Acad. 33: 477. 1898.

Puebla and Oaxaca; type from Santa Catarina Canyon, Oaxaca.

Erect shrub with slender branches; leaves oval, ovate, or oblong, 2 to 7 cm. long.

17. *Iresine grandis* Standl. N. Amer. Fl. 21: 163. 1917.

Jalisco to San Luis Potosí, Veracruz, Mexico, and Michoacán; type from Las Canoas, San Luis Potosí. Guatemala.

Shrub, 1.5 to 3 meters high; leaves ovate, 6 to 13 cm. long.

18. *Iresine calea* (Ibáñez) Standl. Contr. U. S. Nat. Herb. 18: 94. 1916.

Gomphrena latifolia Mart. & Gal. Bull. Acad. Brux. 10¹: 349. 1843.

Achyranthes calca Ibáñez. Naturaleza 4: 79. 1879.

Iresine latifolia Benth. & Hook. Gen. Pl. 3: 42. 1880. Not *I. latifolia* D. Dietr. 1839.

Hecbanthe mollis Hemsl. Biol. Centr. Amer. Bot. 3: 20. 1882.

Iresine laxa S. Wats. Proc. Amer. Acad. 21: 454. 1886.

Baja California to Coahuila, Tamaulipas, and Chiapas; type from Puebla. Central America.

Erect shrub, 1.5 to 6.5 meters high; leaves ovate, 4 to 10 cm. long. "Tepozán" (Tamaulipas); "amargosillo" (Michoacán, Guerrero); "pié de palma" (Valley of Mexico, Ramírez); "tlatlanenaya," "hierba del tabardillo," "hierba de la calentura" (Puebla); "mosquitero" (El Salvador). Robelo gives one of the Mexican names as "clacancauayo" derived from the Nahuatl *tlatiancua-ye*, "which has knees," referring to the jointed stems.

Reputed to have diuretic and diaphoretic properties; decoction of the plant used in Puebla in the treatment of fevers.

34. ALLIONIACEAE. Four-o'clock Family.

REFERENCE: Standley, Allioniaceae, N. Amer. Fl. 21: 171-254. 1918.

Shrubs or trees, sometimes scandent; leaves opposite (in the genera listed here), entire; flowers small and usually inconspicuous; corolla none.

Many herbaceous representatives of the family occur in Mexico. *Bougainvillea spectabilis* Willd., a native of Brazil, is a favorite ornamental plant in Mexico. It is a tall spiny climber with alternate leaves, the small flowers being borne on large, showy, purplish red bracts. It is known in Mexico by the following names: "Azalea de guía," "bugambilla," "bugevilla," "bombilla," "bugavilea," "hernandiazéa," "camelina." Another well-known cultivated plant of the family is the four-o'clock, *Mirabilis jalapa* L., known in Mexico as "arbolera," "maravilla," "Don Diego de noche," and "trompetilla."

Fruit bearing short-stalked glands.

Plants armed with spines; flowers in cymes-----3. PISONIA.

Plants unarmed; flowers in umbels.

Plants erect; stamens 6 to 11-----4. PISONIELLA.

Plants scandent or trailing; stamens 2 to 5-----5. COMMICARPUS.

Fruit without glands.

Fruit with longitudinal wings; low shrubs.....6. **SELINOCARPUS**.

Fruit not winged; trees or large shrubs.

Stamens included.....1. **NEEA**.

Stamens exerted.....2. **TORRUBIA**.

1. **NEEA**¹ Ruiz & Pav. Fl. Peruv. Chil. Prodr. 52. 1794.

Leaves sometimes verticillate; flowers dioecious; staminate perianth urceolate, 4 or 5-dentate; stamens 5 to 10; fruit ellipsoid.

Leaves coriaceous, opposite.....1. **N. choriophylla**.

Leaves membranaceous.

Leaves mostly 2 to 6 cm. wide; stamens 5.....2. **N. psychotrioides**.

Leaves less than 2 cm. wide; stamens 6.

Leaves partly verticillate, acuminate at apex.....3. **N. tenuis**.

Leaves opposite, obtuse or acutish.....4. **N. sphaerantha**.

1. **Neea choriophylla** Standl. Contr. U. S. Nat. Herb. 13: 384. 1911.

Yucatán.

Leaf blades oval to obovate-oval, 4.5 to 7 cm. long, abruptly acuminate; perianth 3 mm. long.

2. **Neea psychotrioides** Donn. Smith, Bot. Gaz. 16: 199. 1891.

Tabasco and Oaxaca. Guatemala (type from Escuintla) to Costa Rica.

Slender shrub, 2 to 3 meters high; leaves opposite or verticillate, oblong to elliptic, 8 to 15 cm. long, glabrous; perianth 4 to 8 mm. long.

3. **Neea tenuis** Standl. Contr. U. S. Nat. Herb. 13: 384, pl. 74. 1911.

Known only from the type locality, Orizaba, Veracruz.

Leaf blades elliptic-oblong or lance-elliptic, 4.4 to 5 cm. long; perianth 3 to 4 mm. long.

4. **Neea sphaerantha** Standl. Contr. U. S. Nat. Herb. 13: 384. 1911.

Known only from the type locality, Izamal, Yucatán.

Leaves oblong or oval, 1 to 2 cm. wide, glabrous; perianth 4 to 5 mm. long.

2. **TORRUBIA** Vell. Fl. Flum. 139. 1827.

Shrubs or small trees; flowers small, dioecious; fruit small, drupaceous.

Inflorescence lax, few-flowered; leaf blades oval or oblong-oval...1. **T. potosina**.

Inflorescence dense, many-flowered; leaf blades elliptic...2. **T. linearibracteata**.

1. **Torrubia potosina** Standl. Contr. U. S. Nat. Herb. 18: 99. 1916.

Known only from the type locality, Raseón, San Luis Potosí.

Leaves 5 to 10.5 cm. long, acute or acuminate.

2. **Torrubia linearibracteata** (Heimerl) Standl. Contr. U. S. Nat. Herb. 18: 100. 1916.

Pisonia linearibracteata Heimerl, Repert. Sp. Nov. Fedde 12: 221. 1913.

Yucatán; type from Chichen Itzá.

Leaves 7.5 cm. long and 4.3 cm. wide or smaller.

3. **PISONIA**² L. Sp. Pl. 1026. 1753.

Flowers small, dioecious, cymose; fruit 5-sided, puberulent, with stalked glands along the angles.

¹The genus was named in honor of Luis Née, a Frenchman by birth but a Spaniard by naturalization, who was an associate of Malaspina on his voyage around the world (1789-1794). He collected chiefly in South America, but also visited Mexico, landing at Acapulco and journeying to the capital, in company with Haenke. His collections are at Madrid.

²Named in honor of Willem Piso, a Dutch physician and naturalist, who visited Brazil in 1637.

Mature fruit 7 to 10 mm. thick-----1. *P. macranthocarpa*.

Mature fruit 3 to 4 mm. thick.

Staminate flowers yellowish green, in loose open cymes 2.5 to 6 cm. broad.

2. *P. aculeata*.

Staminate flowers dark red, in compact headlike cymes 1 to 2.2 cm. broad.

Leaf blades acute or acutish, obovate or oblong-obovate, nearly glabrous; spines straight-----3. *P. flavescens*.

Leaf blades rounded or obtuse at apex, orbicular or rounded-obovate, densely pubescent; spines usually recurved-----4. *P. capitata*.

1. *Pisonia macranthocarpa* Donn. Smith, Bot. Gaz. 20: 293. 1895.

Pisonia aculeata macranthocarpa Donn. Smith, Bot. Gaz. 16: 198. 1891.

Chiapas. Central America, Venezuela, and Cuba; type from Escuintla, Guatemala.

Shrub or small tree with reddish brown branches, armed with few, usually straight spines; leaves elliptic to broadly oval; flowers greenish yellow; fruit 1 to 2 cm. long.

2. *Pisonia aculeata* L. Sp. Pl. 1026. 1753.

Tamaulipas to Sinaloa and southward, chiefly along sea beaches. Southern Florida, West Indies, Central America, tropical South America, and southern Asia.

Densely branched shrub, often with a thick trunk, the branches long and drooping or subsacandent, very spiny; leaves mostly 3 to 10 cm. long, variable in shape; flowers sweet-scented; fruit 9 to 12 cm. long. "Reeb" or "hbeeb" (Yucatán, Maya) "garabato" (Durango); "garabato prieto," "uña del diablo" (Michoacán, Guerrero); "coma de uña" (Tamaulipas); "uña de gato" (Tabasco, Cuba, Santo Domingo, Porto Rico); "huele de noche" (Oaxaca, Guatemala); "espino y camote" (Oaxaca or Chiapas, *Scler*); "gu-ichi-gu" (Oaxaca, *Scler*); "zarza" (Cuba); "escambrón" (Porto Rico); "espino negro" (Nicaragua).

The branches are said to be used in Jamaica for barrel hoops. A decoction of the leaves and bark is used in Yucatán, Jamaica, and elsewhere for rheumatism and venereal diseases. The glands of the fruit are extremely viscid, and in herbarium specimens they retain their viscosity indefinitely. The fruits adhere easily to the feathers of birds, sometimes in such abundance as to prevent their flying.

3. *Pisonia flavescens* Standl. Contr. U. S. Nat. Herb. 13: 389. 1911.

Extreme southern Baja California; type from San José del Cabo.

Branches slender, gray; leaves 4 to 6.5 cm. long; fruit about 1 cm. long.

4. *Pisonia capitata* (S. Wats.) Standl. Contr. U. S. Nat. Herb. 13: 388. 1911.

Cryptocarpus capitatus S. Wats. Proc. Amer. Acad. 24: 71. 1889.

In sandy soil, Sonora to Tepic; type from Guaymas, Sonora.

Densely branched shrub or small tree, sometimes 5 meters high, branched to the ground or often with a distinct trunk; leaves 2 to 6 cm. long; fruit 7 to 10 mm. long. "Bainoro prieto," "vainoro prieto," "garabato prieto" (Sinaloa); "garambullo" (Sonora, Sinaloa).

A decoction of the fruit is said to be used for fevers.

4. **PISONIELLA** (Heimerl) Standl. Contr. U. S. Nat. Herb. 13: 385. 1911.

1. *Pisoniella arborescens* (Lag. & Rodr.) Standl. Contr. U. S. Nat. Herb. 13: 385. 1911.

Boerhaavia arborescens Lag. & Rodr. Anal. Cienc. Nat. 4: 257. 1801.

Pisonia hirtella H. B. K. Nov. Gen. & Sp. 2: 217. 1818.

Pisonia mexicana Willd.; Link, Enum. Pl. 1: 354. 1821.

Boerhaavia octandra S. Wats. Proc. Amer. Acad. 26: 145. 1891.

Pisonia arborescens Kuntze, Rev. Gen. Pl. 3²: 265. 1898.

Jalisco to Veracruz and Oaxaca; type from Salvatierra, Guanajuato.

Shrub, 2 meters high or less; leaves broadly ovate or ovate-orbicular, 2.5 to 7 cm. long, obtuse or acute; flowers perfect, greenish white, 5 to 7 mm. long; fruit dry, about 1 cm. long. "Jazmincillo" (Valley of Mexico, etc.)

5. **COMMICARPUS** Standl. Contr. U. S. Nat. Herb. 12: 373. 1909.

Plants fruticose or suffrutescent, more or less scandent; flowers perfect, umbellate or verticillate, small; fruit dry, cylindric, with very viscid glands.

Perianth 3 mm. long and broad, glabrous or obscurely puberulent; glands of the fruit irregularly scattered.....1. **C. scandens**.

Perianth 7 to 8 mm. long, 10 mm. broad, short-villous or hirtellous; glands of the fruit grouped in transverse bands.....2. **C. brandegei**.

1. **Commicarpus scandens** (L.) Standl. Contr. U. S. Nat. Herb. 12: 373. 1909.

Boerhaavia scandens L. Sp. Pl. 3. 1753.

Nearly throughout Mexico, in fencerows and waste ground. Western Texas and southern Arizona; West Indies; South America; type from Jamaica.

Leaves cordate-ovate or ovate-deltoid, 1.5 to 6.5 cm. long, acute; flowers greenish yellow; fruit about 1 cm. long. "Bejuco de purgación" (Porto Rico); "sonorita" (Sinaloa).

A decoction of the roots is said to be used in Porto Rico for venereal diseases.

2. **Commicarpus brandegei** Standl. Contr. U. S. Nat. Herb. 12: 374. 1909.

Boerhaavia elongata T. S. Brandeg. Proc. Calif. Acad. II. 2: 199. 1889. Not *B. elongata* Salisb. 1796.

Southern Baja California; type from San Pablo.

Plants 2 meters long or more, with whitish stems; flowers white.

6. **SELINOCARPUS** A. Gray, Amer. Journ. Sci. II. 15: 262. 1853.

Low shrubs, more or less pubescent; flowers perfect, solitary in the leaf axils.

Several herbaceous species also occur in Mexico.

Perianth 1 cm. long. Leaves linear or linear-oblong.....1. **S. angustifolius**.

Perianth 2.5 to 3.5 cm. long.

Leaves linear, 1 to 4 cm. long, obscurely glandular-puberulent or glabrous.

2. **S. palmeri**.

Leaves narrowly spatulate-oblong, 0.4 to 1.1 cm. long, densely glandular-hirtellous.....3. **S. purpusianus**.

1. **Selinocarpus angustifolius** Torr. U. S. & Mex. Bound. Bot. 170. 1859.

Coahuila. Western Texas, the type from Presidio del Norte.

Plants fruticose below, 10 to 40 cm. high; flowers often cleistogamous; fruit 5.5 to 7.5 mm. long, with 5 thin wings.

2. **Selinocarpus palmeri** Hemsl. Biol. Centr. Amer. Bot. 3: 6. 1882.

Known only from the type locality, San Lorenzo de Laguna, Coahuila.

Flowers 3.5 cm. long, the stamens long-exserted.

3. **Selinocarpus purpusianus** Heimerl, Oesterr. Bot. Zeitschr. 63: 353. 1913.

Known only from the type locality, Sierra del Rey, Coahuila.

Shrub, 10 to 20 cm. high; flowers 2.5 to 3 cm. long.

35. BATIDACEAE.1. **BATIS** L. Syst. Nat. ed. 10. 1380. 1759.1. **Batis maritima** L. Syst. Nat. ed. 10. 1380. 1759.

On seacoasts, Tamaulipas to Yucatán; Baja California and Sonora to Colima and probably to Chiapas. Widely distributed in tropical America; Hawaii.

Erect or prostrate shrub, sometimes a meter high; leaves opposite, fleshy, semiterete, 1 to 2.5 cm. long; flowers small, dioecious, in short axillary spikes. "Lechuga de mar" (Nicaragua); "barrilla" (Porto Rico).

The leaves have a salty flavor and have been eaten as a salad. In the West Indies ashes of the plant have been used in the manufacture of soap and glass. Descourtilz reports that the leaves were used in the treatment of ulcers, and that they have aperitive and diuretic properties.

36. PHYTOLACCACEAE. Pokeweed Family.

REFERENCE: Walter in Engl. Pflanzenreich IV. 83. 1909.

Shrubs or small trees; leaves alternate, entire; flowers small, perfect or unisexual; corolla usually none.

A number of herbaceous species of other genera occur in Mexico. It may be that some of the Mexican species of *Phytolacca* become shrubs, but the writer has seen no conclusive evidence to this effect.

Petals 5; aril of the seed large. Fruit a capsule, 1 to 5-seeded.

1. STEGNOSPERMA.

Petals none; aril small or none.

Ovary semi-inferior; leaves cordate. Plants scandent; fruit dry, 1-seeded.

2. AGDESTIS.

Ovary superior; leaves not cordate.

Perianth 5-parted. Fruit baccate-----**3. ACHATOCARPUS.**

Perianth 4-parted.

Pedicels ebracteolate; branches spinose-----**4. PHAULOTHAMNUS.**

Pedicels bracteolate; branches not spinose.

Fruit dry; flowers subsessile, appressed to the rachis.

5. PETIVERIA.

Fruit baccate; flowers pedicellate, not appressed.

Plants erect; stamens 4-----**6. RIVINA.**

Plants scandent; stamens 8 to many-----**7. TRICHOSTIGMA.**

1. STEGNOSPERMA Benth. Bot. Voy. Sulph. 17. 1844.

1. Stegnosperma halimifolium Benth. Bot. Voy. Sulph. 17. 1844.

Baja California and Sonora to Oaxaca and Veracruz; type from Baja California. Guatemala and Nicaragua; Cuba, Jamaica, and Hispaniola.

Glabrous shrub, 1 to 3.5 meters high; leaves obovate or elliptic; flowers perfect, racemose, green tinged with red. "Amole" (Baja California); "bledo carbonero" (Cuba).

The powdered root is used in Baja California as a substitute for soap. The plant has the reputation of being a cure for hydrophobia. It grows at low elevations, usually near the seacoast. The flowers are borne at nearly all times of the year.

2. AGDESTIS Moc. & Sessé; DC. Reg. Veg. Syst. 1: 543. 1818.

1. Agdestis clematidea Moc. & Sessé; DC. Reg. Veg. Syst. 1: 543. 1818.

Nuevo León to Veracruz and Oaxaca. Western Texas; Guatemala; reported from the West Indies and Brazil, but probably cultivated there.

Plants scandent, the stems mostly herbaceous; root large, turnip-shaped; leaves rounded-cordate; flowers white, showy, with a slight fetid odor, arranged in paniculate racemes. "Hierba del indio" (Tamaulipas); "tripas de Judas" (Oaxaca, *Reko*). Walter reports the name "thusch" from Mexico. Palmer states the roots weigh as much as six pounds.

3. *ACHATOCARPUS* Triana, Ann. Sci. Nat. IV. 9: 45. 1858.

Trees or shrubs; flowers small, dioecious; perianth 5-lobed; stamens 10 to 20; fruit baccate.

Leaves densely pubescent beneath-----1. *A. oaxacanus*.

Leaves glabrous.

Branchlets aculeate-----2. *A. gracilis*.

Branchlets unarmed-----3. *A. mexicanus*.

1. *Achatocarpus oaxacanus* Standl., sp. nov.

Type collected between Jamiltepec and Río Verde, Oaxaca (*Nelson* 2358; U. S. Nat. Herb. no. 569298).

Branches puberulent, armed with slender spines 6 mm. long or less; leaves short-petiolate, obovate-oblong or elliptic-oblong, 5.5 to 6.5 cm. long, 2.5 to 3.5 cm. wide, obtuse or rounded at apex, acute to attenuate at base, glabrate above, densely pubescent beneath along the costa; racemes numerous, few-flowered, 2.5 cm. long, or less, the rachis puberulent, the pedicels 1 to 2 mm. long; sepals 2 mm. long, obovate to suborbicular, rounded at apex, minutely puberulent or glabrate; fruit 3 mm. in diameter, glabrous.

2. *Achatocarpus gracilis* H. Walt. in Engl. Pflanzenreich IV. 83:137. f. 41. 1909.

Known only from the type locality, Petatlán, Guerrero, altitude 50 meters.

Glabrous tree with slender brown branches, armed with straight spines; leaves obovate-lanceolate, 6 cm. long, obtuse; flowers small, paniculate.

3. *Achatocarpus mexicanus* H. Walt. in Engl. Pflanzenreich IV. 83:139. 1909.

Veracruz and Chiapas; type collected between Tapana and La Junta, Chiapas.

Shrub or tree, glabrous, unarmed; leaves elliptic, 8.5 cm. long; flowers racemose.

4. *PHAULOTHAMNUS* A. Gray, Proc. Amer. Acad. 20:294. 1885.

1. *Phaulothamnus spinescens* A. Gray, Proc. Amer. Acad. 20:294. 1885.

Baja California, Sonora (type locality), and Sinaloa.

Erect glabrous shrub, 1 to 2.5 meters high, with gray branches; leaves oblanceolate, about 1.5 cm. long; flowers small, in short racemes.

5. *PETIVERIA* L. Sp. Pl. 342. 1753.

1. *Petiveria alliacea* L. Sp. Pl. 342. 1753.

Petiveria octandra L. Sp. Pl. ed. 2. 486. 1762.

Petiveria hexandria Sessé & Moc. Fl. Mex. 98. 1894.

Baja California to Jalisco, Chiapas, Yucatán, and Veracruz. Widely distributed in tropical America; type from Jamaica.

Suffrutescent, about a meter high, or often wholly herbaceous, with a strong odor of garlic; leaves ovate or elliptic, with minute stipules; flowers small, pink, white, or green, in long slender interrupted spikelike racemes. "Zorrillo" (Tabasco, Yucatán, Sinaloa, Nicaragua, Michoacán, Guerrero); "hierba de las gallinitas" (Oaxaca, Yucatán); "pay-ché," "xpay-ché" (Yucatán, Maya: "skunk-plant"); "anamú" (Cuba, Porto Rico, Panama, Colombia, Santo Domingo); "apazote de zorro" (Guatemala); "hispasina" (Guatemala); "ipacina" (Nicaragua).

Known in Jamaica as "guinea-hen weed." Probably as a result of its strong and characteristic odor, the plant has been much used in domestic medicine. It is reputed to have diuretic, sudorific, expectorant, antispasmodic, and depurative properties, and has been used as a vermifuge, emmenagogue, and abortifacient, and for toothache (the roots inserted in cavities in the teeth), fevers, rheumatism, paralysis, venereal diseases, hysteria and other nervous diseases, hydrophobia, and scorpion stings. Palmer's notes indicate that in Sinaloa the leaves are bound upon the forehead to relieve headache, and that the powdered roots are used as a snuff for nasal catarrh. It is stated that when cows eat the plant an alliaceous flavor is imparted to their milk. Descourtiz reports that in the West Indies the roots were placed among woolen goods to protect them from insects.

6. RIVINA L. Sp. Pl. 121. 1753.

1. *Rivina humilis* L. Sp. Pl. 121. 1753.

Rivina laevis L. Mant. Pl. 1: 41. 1767.

Nearly throughout Mexico. Widely distributed in tropical America.

Suffrutescent, up to 1 meter high, sometimes wholly herbaceous; leaves petiolate, ovate, acute or acuminate, bright green; flowers small, white or greenish, racemose; fruit a small, 1-seeded, red or orange berry. "Coral" (various localities); "coralito," "coralillo" (Durango); "hierba mora," "saca-tinta," "coralillo," "coralillo carmín" (Nicaragua); "carmín" (Colombia, Porto Rico); "ojo de ratón," "coralitos" (Cuba); "pimpín," "pinta-pinta" (Colombia); "sangre de toro" (Argentina, Uruguay); "caimancillo" (Santo Domingo).

The fruit is full of blood-red juice, which yields a red dye. The leaves are said to be used for catarrh and for treating wounds. The fruit is reported to be edible. Sometimes known as "rouge-plant."

R. portulacoides Nutt., with slightly larger flowers, and *R. purpurascens* Schrad., with purplish flowers in long stiff racemes, are recognized by Walter as distinct species, but they do not appear to differ essentially from the common form.

7. TRICHOSTIGMA A. Rich. Pl. Vasc. Cub. 1: 627. 1845.

1. *Trichostigma octandrum* (L.) H. Walt. in Engl. Pflanzenreich IV. 83: 109. 1909.

Rivina octandra L. Cent. Pl. 2: 1756.

Villamilla octandra Benth. & Hook. Gen. Pl. 3: 81. 1880.

Sinaloa to Tamaulipas, Tabasco, and Chiapas. Widely distributed in tropical America.

Scandent shrub, sometimes 5 meters long; leaves elliptic or ovate, acute, petiolate; flowers small, whitish or purplish, racemose; fruit a small black 1-seeded berry. "Bejuco de paloma" (Porto Rico); "guacamayo" (Colombia); "sotacaballo" (Costa Rica); "bejuco canasta," "guaniquí" (Cuba); "pabelón del rey" (Santa Domingo).

The leaves have been used in Colombia for the treatment of wounds, and the stems in Jamaica for barrel hoops.

37. PORTULACACEAE. Portulaca Family.

Some of the species of *Talinum* should perhaps be classed as shrubs.

1. TALINOPSIS A. Gray, Pl. Wright. 1: 14. 1852.

1. *Talinopsis frutescens* A. Gray, Pl. Wright. 1: 15. pl. 3. 1852.

Chihuahua to San Luis Potosí and Puebla. Western Texas (type locality) and southern New Mexico.

Brittle erect shrub, 60 cm. high or less; leaves opposite, linear, fleshy; flowers in terminal cymes; fruit a capsule.

38. RANUNCULACEAE. Buttercup Family.

Many herbaceous representatives of the family occur in Mexico.

1. CLEMATIS L. Sp. Pl. 543. 1753.

Scandent shrubs; leaves opposite, pinnate; flowers often showy; fruit of achenes, each with a long hairy tail.

Several Asiatic species of *Clematis* are frequent in cultivation as ornamental vines, and some of them are grown in Mexico. Ramírez reports the name "sacamecate" as used in Hidalgo for some unidentified native species.

Flowers solitary; sepals erect, purplish.....1. *C. pitcheri*.

Flowers paniculate; sepals spreading, white.

Flowers polygamo-dioecious, the staminate and pistillate borne upon the same plant.

Leaflets 3, mostly 4.5 to 9 cm. long, long-acuminate.....2. *C. pubescens*.

Leaflets normally 5 or 7, usually less than 3.5 cm. long, obtuse or acutish.

3. *C. pauciflora*.

Flowers dioecious.

Leaflets all or partly 3-lobed or parted.....4. *C. drummondii*.

Leaflets entire or dentate or very shallowly-lobed.

Leaflets entire, very densely yellow-sericeous.....5. *C. rufa*.

Leaflets entire or dentate, if entire, never densely sericeous.

Leaflets entire or with a few narrow acute teeth, glabrous or thinly sericeous beneath, usually rounded at base.....6. *C. dioica*.

Leaflets with few or numerous broad, obtuse or rounded teeth, often densely sericeous or pilose beneath, frequently cordate at base.

Leaflets large, mostly 6 to 10 cm. long, usually densely pilose or sericeous beneath.....7. *C. grossa*.

Leaflets mostly less than 4 cm. long, thinly sericeous or glabrate beneath.....8. *C. ligusticifolia*.

1. *Clematis pitcheri* Torr. & Gray, Fl. N. Amer. 1: 10. 1839.

Clematis filifera Benth. Pl. Hartw. 285. 1848.

Clematis filifera incisa Hemsl. Biol. Centr. Amer. Bot. 1: 2. 1879.

Clematis pitcheri filifera Robinson in A. Gray, Syn. Fl. 1¹: 6. 1895.

Viorna pitcheri Britton in Britt. & Brown, Illustr. Fl. ed. 2. 2: 123. 1913.

Coahuila to Sinaloa and Hidalgo. Texas to Nebraska and Indiana.

Shrub with reddish stems, sparsely pubescent; leaflets ovate, with prominent veins, acute or acutish; flowers about 2.5 cm. long, with thick leathery sepals. "Barba de viejo" (Sinaloa).

The specimens are somewhat variable, but apparently they represent a single species. This plant is reported by Sessé and Mociño¹ as *Clematis viorna*, a species native of the eastern United States.

2. *Clematis pubescens* Benth. Pl. Hartw. 5. 1839.

Guanajuato (type locality) to Oaxaca.

Leaflets 5 to 9 cm. long, long-acuminate, sparsely dentate or entire; sepals about 8 mm. long.

3. *Clematis pauciflora* Nutt.; Torr. & Gray, Fl. N. Amer. 1: 9. 1838.

Baja California; reported from Sonora. California.

Plants nearly glabrous; sepals about 2 cm. long; achenes glabrous.

A specimen from western Chihuahua probably belongs here also.

¹ Pl. Nov. Hisp. ed. 2. 85. 1893.

4. *Clematis drummondii* Torr. & Gray, Fl. N. Amer. 1: 9. 1838.

Clematis nervata Benth, Pl. Hartw. 5. 1839.

Tamaulipas and San Luis Potosí to Baja California and Sinaloa. Texas (type locality) to Arizona.

Plants copiously pubescent, scandent over other shrubs; leaflets usually small and narrow, rarely over 3 cm. long, attenuate, usually deeply lobed; sepals 8 to 14 mm. long, white. "Barba de chivo" (Chihuahua, Coahuila, Zacatecas, Tamaulipas, etc.); "hierba de los avaros" (San Luis Potosí, *Safford*).

Very variable in pubescence and leaf form, but none of the forms seem specifically distinct.

5. *Clematis rufa* Rose, Contr. U. S. Nat. Herb. 10: 95. 1906.

Known only from the type locality, between Tenejapa and Yatalón, Chiapas.

The plant differs from *C. grossa* only in its entire leaflets, and additional material is necessary to determine its claim to specific rank. This and the following species are very closely related, and it is probable that they are all forms of a single one, *C. dioica*.

6. *Clematis dioica* L. Syst. Nat. ed. 10. 1084. 1759.

Clematis americana Mill. Gard. Dict. ed. 8. *Clematis* no. 14. 1768.

Clematis acapulcensis Hook. & Arn. Bot. Beechey Voy. 410. 1841.

Clematis grahami Benth. Pl. Hartw. 5. 1839.

San Luis Potosí to Sinaloa, Chiapas, and Yucatán. West Indies, Central America, and South America.

Very variable in pubescence and shape of the leaflets; flowers often in large showy panicles; fruit conspicuous because of the feathery tails, these 3 to 6 cm. long. "Cabeza de vieja" (Chiapas); "barba de viejo" (Tabasco, Michoacán, Valley of Mexico, Costa Rica, Guatemala, Nicaragua); "barbas de chivo" (Michoacán, etc.); "barba de chivato" (Nuevo León); "barbas de gato" (Mexico); "chilillo" (Michoacán); "chilillo de cerro" (Hidalgo); "cabellos de ángel" (Guatemala, Costa Rica, Cuba, Porto Rico); "crespillo" (Nicaragua).

Known in Jamaica as "virgin's-bower" and "traveler's joy." The stems contain a coarse fiber and are used occasionally as a substitute for twine. The leaves of this and other species have an acrid flavor; crushed and applied to the skin they are rubefacient and finally vesicant, and because of this property they are used in domestic medicine. The dried leaves lose their acrid properties. An ointment made with the leaves is used for cutaneous diseases. An infusion of the flowers and leaves is employed as a cosmetic, for removing freckles and other blemishes from the skin. The plant is said to be poisonous to cattle, and the root to have purgative properties.

In spite of the variability exhibited, it seems impossible to divide the ample material at hand into groups characterized by any constant or important character. Specimens referred by Hemsley to *C. flammulastrum* Griseb. belong here, as well as material referred to *C. caripensis* H. B. K. and *C. sericea* H. B. K.

Clematis dioica or a closely related species is figured and described by Hernández¹ under the heading. "De *Cocostamatl*, seu luteo *tamalli*, Urinaria mirabili." His account, in part, is as follows:

"*Cocostamatl*, which some call *Cocostie*, *Cocostin*, or *Cocostli*, is a climbing shrub, having a thick pale root, whence the name. The stems are smooth, slender, and round; the leaves sinuous and divided into three points. The flowers are white, of moderate size, very like those of *Izquixochitl*, and from them there spring berries, not unlike cherries, but white in color. The root is pale and

¹Thesaurus 118. 1651.

inodorous, its taste slimy, of moderate temper or slightly inclined to coldness and humidity. It is a wonderful diuretic, expels phlegm, and removes all urinary obstructions."

The name "cocoztamatl" ("yellow tomato," of no application to the plant) is doubtless incorrect, and should be rather "cocotemecatli" ("pungent-vine"), as is indicated by Hernández's second account¹ of the plant, which also is accompanied by a figure. The description of the fruit, of course, is erroneous. The second account is headed "De Cocotemecatli, seu fune volubili acri," and is as follows:

"*Cocotemecatli*, which some call *Cocotemecaxihuitl*, is an herb with leaves like those of basil [*Ocimum*], but much larger, angled, and crenate. The stem is purplish and climbing; the flowers are small, borne on the ends of hairy branchlets, and they change into purplish white pappus; the roots are fibrous. It grows at Yacapichtlan and Quauhquechollan, in hot and rocky places. The leaves, which are glutinous, if crushed and taken in the quantity of a handful, cure dysentery. The root and stems are hot and dry in the fourth degree; they are a remedy for ringworm and, if taken in a dose of two drachms, calm pains in the stomach and colic; they are diuretic, aid parturition, cure those affections which arise from cold, and allay pains caused by wind."

7. *Clematis grossa* Benth. Pl. Hartw. 33. 1840.

Clematis rhodocarpa Rose, Contr. U. S. Nat. Herb. 10: 95. 1906.

Tamaulipas to Tepic and Chiapas; type from San Bartolo. Central America.

Closely related to *C. dioica*, but apparently distinct, but perhaps not essentially different from *C. sericca* H. B. K., to which specimens have been referred; leaflets usually with numerous large coarse teeth. "Chilillo" (Mexico, Veracruz); "barba de vejo" (Oaxaca, Guatemala); "barba de chivo" (Oaxaca, Veracruz).

Roots said to be used as a remedy for distemper in horses.

8. *Clematis ligusticifolia* Nutt.; Torr. & Gray, Fl. N. Amer. 1: 9. 1838.

Northern Chihuahua and Sonora. Western United States; type from the Rocky Mountains.

Leaflets usually 5 or 7; achenes densely sericeous.

C. neomexicana Woot. & Standl.,² described from the San Luis Mountains, on the border between Sonora and New Mexico, is probably not essentially different.

39. BERBERIDACEAE. Barberry Family.

1. ODOSTEMON Raf. Amer. Month. Mag. 192. 1817.

REFERENCE: Fedde, Bot. Jahrb. Engler 31: 30-133. 1901.

Shrubs or small trees with yellow wood; leaves alternate, estipulate, pinnate, the leaflets 3 to many, usually dentate, the teeth often spine-tipped; flowers yellow, perfect, racemose; fruit a berry, with few seeds.

The wood is used in Mexico to give a yellow dye. The roots of *O. aquifolium* (Pursh) Rydb. (*Berberis aquifolium* Pursh), a species native of the western United States, but closely related to some of the Mexican ones, are official in the U. S. Pharmacopoeia. They are bitter and contain the alkaloids berberine, oxyacanthine, and berbamine. Both the fruit and roots have been recommended as possessing alterative, laxative, tonic, and diuretic properties. They are employed in syphilitic and scrofulous affections, chronic cutaneous diseases, convalescence from fevers, etc. This plant is known in the United States as Oregon grape; it is the state flower of Oregon.

¹Thesaurus 141. 1651.

²Contr. U. S. Nat. Herb. 16: 122. 1913.

Leaflets 3, the terminal one sessile.

Leaflets green, merely coriaceous, dentate.....18. *O. eutriphyllus*.

Leaflets pale, rigid-coriaceous, deeply lobed.....13. *O. trifoliolatus*.

Leaflets usually more than 3, if 3 the terminal leaflet petiolulate.

Flowers paniculate or in elongate long-pedunculate racemes.

Leaflets entire.

Inflorescence paniculate.....1. *O. ehrenbergii*.

Inflorescence racemose.

Leaflets acute.....4. *O. tenuifolius*.

Leaflets rounded or very obtuse at the apex.

Pedicels 3 to 5 mm. long; leaflets green.....2. *O. chochoco*.

Pedicels 15 to 20 mm. long; leaflets very pale, especially beneath.

3. *O. longipes*.

Leaflets dentate.

Leaflets narrowly lanceolate, mostly 8 to 12 cm. long...5. *O. lanceolatus*.

Leaflets ovate or oval, usually much less than 8 cm. long.

Lateral leaflets 2 pairs.....6. *O. quinquefolius*.

Lateral leaflets 3 to 6 pairs.

Leaflets acute or acutish.

Teeth of the leaflets small, appressed; leaflets subcoriaceous.

7. *O. hartwegii*.

Teeth of the leaflets large, spreading; leaflets coriaceous.

8. *O. ilicinus*.

Leaflets rounded or very obtuse at the apex.

Flowers racemose.....9. *O. andrieuxii*.

Flowers paniculate.

Leaflets subsessile, remote.....10. *O. pallidus*.

Leaflets evidently petiolulate, the margins overlapping.

Leaflets 4 to 5 cm. long, 2 to 3 cm. wide...11. *O. zimapanus*.

Leaflets 5 to 11 cm. long, 3 to 9 cm. wide...12. *O. paxii*.

Flowers in short, sessile or short-pedunculate racemes.

Leaflets very rigid, pale on both surfaces, with large stiff teeth.

14. *O. fremontii*.

Leaflets merely coriaceous, deep green on one or both surfaces.

Leaflets entire or with few appressed teeth.....15. *O. gracilis*.

Leaflets with numerous spreading teeth.

Leaflets 1 to 2 cm. long, 0.7 to 1 cm. wide...16. *O. angustifolius*.

Leaflets 3 to 8 cm. long, 1 to 4 cm. wide.

Leaflets ovate-lanceolate or lanceolate.....17. *O. incertus*.

Leaflets ovate to broadly oval.

Leaflets usually 5.....19. *O. trifolius*.

Leaflets 7 to 11 in all or most of the leaves.

Leaflets much longer than broad, mostly 1 to 1.5 cm. wide, with numerous small teeth.....20. *O. fascicularis*.

Leaflets little longer than broad, 2.5 to 4 cm. wide, with few large teeth21. *O. wilcoxii*.

1. *O. ehrenbergii*¹ (Kunze) Standl.

Berberis ehrenbergii Kunze, *Linnaea* 20: 45. 1847.

Mahonia ehrenbergii Fedde, *Bot. Jahrb. Engler* 31: 106. 1901.

¹ Carl August Ehrenberg (1801-1849) spent 10 years (1831-1840) in Mexico in Oaxaca, Puebla, Mexico, Hidalgo, San Luis Potosí, and other states. He was especially interested in Cactaceae, many species of which he introduced into cultivation in Europe. His collections consisted of about 2,000 numbers.

Grown from seeds from southern Mexico, probably from Veracruz; not known in the wild state.

Leaflets 7 to 15, ovate, obtuse, entire; flowers whitish, in lax racemes.

2. *Odostemon chochoco* (Schlecht.) Standl. Proc. Biol. Soc. Washington 31: 133. 1918.

Berberis chochoco Schlecht. Bot. Zeit. 12: 652. 1854.

Mahonia chochoco Fedde, Bot. Jahrb. Engler 31: 103. 1901.

Nuevo León, San Luis Potosí, and Veracruz; type from Chococala.

Tree, 6 to 9 meters high; leaflets oval or oblong, 3.5 to 5.5 cm. long, lustrous, with conspicuous venation; fruit blue. "Chochoco," "palo amarillo."

Wood used for tanning and dyeing.

3. *Odostemon longipes* Standl. Proc. Biol. Soc. Washington 31: 133. 1918.

Known only from the type locality, San Ramón, Durango.

Tree, 7.5 to 9 meters high, with a trunk 60 cm. or less in diameter, and a large crown; leaflets 11 or 13, oblong, 3.5 to 5.5 cm. long; fruit blue, edible. "Palo amarillo."

4. *Odostemon tenuifolius* (Lindl.) Standl.

Berberis tenuifolia Lindl. Bot. Reg. Misc. 24. 1838.

Mahonia tenuifolia Loud.; Steud. Nom. Bot. ed. 2. 1: 197. 1840.

Berberis fraxinifolia Hook. Icon. Pl. pl. 329, 330. 1841.

Veracruz; type from Zacuapan.

Shrub, 3 meters high; leaflets oblong-lanceolate, 4.5 to 10 cm. long, bright green; flowers in very long racemes.

5. *Odostemon lanceolatus* (Benth.) Standl.

Berberis lanceolata Benth. Pl. Hartw. 34. 1840.

Mahonia lanceolata Fedde, Bot. Jahrb. Engler 31: 92. 1901.

Hidalgo; type from Apulco; perhaps also in Oaxaca.

Shrub, 1 to 2 meters high; leaflets 11 to 17, spine-toothed; fruit blue.

6. *Odostemon quinquefolius* Standl. Proc. Biol. Soc. Washington 31: 133. 1918.

Puebla; type from Cerro Matzize, near San Luis Tultitlanapa.

Large glabrous shrub; leaflets 5, oblong-ovate or ovate-oval, 3 to 5.3 cm. long; racemes 7 to 11 cm. long.

7. *Odostemon hartwegii* (Benth.) Standl.

Berberis hartwegii Benth. Pl. Hartw. 34. 1840.

Mahonia hartwegii Fedde, Bot. Jahrb. Engler 31: 109. 1901.

Known only from the type locality, Contadero, Hidalgo.

Leaflets 11 to 15, ovate-lanceolate, acuminate; racemes 30 cm. long.

8. *Odostemon ilicinus* (Schlecht.) Standl.

Mahonia ilicina Schlecht. Linnaea 10: 236. 1835.

Berberis ilicina Hemsl. Biol. Centr. Amer. Bot. 1: 23. 1879.

Veracruz and Hidalgo; type from plains between Guantololalpa and Tlachichilco, Veracruz.

Shrub, 0.5 to 3 meters high; leaflets 11 to 15.

9. *Odostemon andrieuxii*¹ (Hook. & Arn.) Standl.

Berberis andrieuxii Hook. & Arn. Bot. Beechey Voy. 318. 1841.

Mahonia andrieuxii Fedde, Bot. Jahrb. Engler 31: 103. 1901.

Known only from the original collection, from somewhere in southern Mexico.

¹G. Andrieux, concerning whom no accurate data are available, collected in the states of Oaxaca, Puebla, and Mexico about 1834. His collections were distributed to various European herbaria.

10. *Odostemon pallidus* (Hartw.) Standl.

Berberis pallida Hartw.; Benth. Pl. Hartw. 34. 1840.

Mahonia pallida Fedde, Bot. Jahrb. Engler 31: 109. 1901.

Hidalgo to Oaxaca; type from Cardonal, Hidalgo.

Shrub or small tree, 2 to 6 meters high; leaflets 9 to 13, oval, 3 to 6.5 cm. long, rounded or obtuse at the apex, pale beneath; panicles 15 to 25 cm. long. "Palo amarillo."

11. *Odostemon zimapanus* (Fedde) Standl.

Mahonia zimapana Fedde, Bot. Jahrb. Engler 31: 111. 1901.

Hidalgo and Mexico; type from Las Verdosas, near Zimapan, Hidalgo.

12. *Odostemon paxii* (Fedde) Standl.

Mahonia paxii Fedde, Bot. Jahrb. Engler 31: 113. 1901.

Known only from the type locality, between Zimapan and Encarnación, Hidalgo.

13. *Odostemon trifoliolatus* (Moric.) Heller, *Muhlenbergia* 7: 139. 1912.

Berberis trifoliolata Moric. Pl. Amer. Rar. 113. pl. 69. 1841.

Berberis ilicifolia Scheele, *Linnaea* 21: 591. 1848.

Mahonia trifoliolata Fedde, Bot. Jahrb. Engler 31: 96. 1901.

Chihuahua and Coahuila to San Luis Potosí. Western Texas (type locality) and southern New Mexico.

Shrub, 1 to 4.5 meters high; leaflets mostly 3 to 5 cm. long, very thick and rigid, pale, especially beneath, with large spiny lobes or teeth; fruit red. "Agritos" (Coahuila, Nuevo León, Texas); "agrillo" (San Luis Potosí, Safford); "palo amarillo" (Chihuahua, Nuevo León, Durango).

In Texas and New Mexico the name "agrito" is corrupted into "agarita" or even "algerita."

The wood is sometimes used for tanning and for making ink. Like that of other species, it yields a yellow dye. The acid fruit is utilized for jelly, preserves, and tarts, and wine has been made from it. The roasted seeds are said to have been used as a coffee substitute. A decoction of the root is reported to be employed in Texas as a remedy for toothache. The flowers are said to supply bees with a good quality of honey.

This is presumably the species to which Berlandier¹ gives the name *Chryso-dendron tinctoria*, a new genus which, however, is not technically described. He states that the plant is known in Tamaulipas as "palo amarillo," and is used by the Indians to dye deerskins and cotton goods.

14. *Odostemon fremontii* (Torr.) Rydb. Bull. Torrey Club 33: 141. 1906.

Berberis fremontii Torr. U. S. & Mex. Bound. Bot. 30. 1859.

Mahonia fremontii Fedde, Bot. Jahrb. Engler 31: 98. 1901.

Sonora and Baja California. New Mexico to southern Utah (type locality) and California.

Shrub, 2 to 4 meters high, often forming dense rounded clumps; leaflets usually 5, about 2 cm. long, very spiny; fruit reddish, nearly dry.

A specimen collected by Pringle in Sonora is referred by Fedde to *O. haematocarpus* (Wooton) Heller.² This and *O. fremontii* are not very sharply differentiated. It seems better to the present writer to refer all the Mexican

¹ In Diario de viaje de la Comisión de Límites que puso el Gobierno de la República bajo la dirección del Exmo. Sr. general de división D. Manuel de Mier y Teran. Mexico, 1850. The name appears on p. 170.

² *Muhlenbergia* 7: 129. 1912. *Berberis haematocarpa* Wooton, Bull. Torrey Club 25: 304. 1898; type from New Mexico.

material to the latter species. One of the Baja California specimens seems to be intermediate between the two species.

15. *Odostemon gracilis* (Hartw.) Standl.

Berberis gracilis Hartw.; Benth. Pl. Hartw. 34. 1840.

Mahonia subintegrifolia Fedde, Bot. Jahrb. Engler 31: 94. 1901.

Mahonia gracilis Fedde, Bot. Jahrb. Engler 31: 95. 1901.

Nuevo León to Oaxaca; type from Zimapán, Hidalgo.

Shrub, 1 to 1.5 meters high; leaflets 5 or 7, ovate, 3 to 5 cm. long, acute; fruit blue. "Palo amarillo" (Mexico).

16. *Odostemon angustifolius* (Hartw.) Standl.

Berberis angustifolia Hartw.; Benth. Pl. Hartw. 34. 1840.

Mahonia angustifolia Fedde, Bot. Jahrb. Engler 31: 91. 1901.

Known only from the type locality, between Actopan and Pachuca, Hidalgo.

Shrub, about 4 meters high; leaflets 5 to 9, oblong-lanceolate; fruit purple, sweet.

17. *Odostemon incertus* (Fedde) Standl.

Mahonia incerta Fedde, Bot. Jahrb. Engler 31: 93. 1901.

Known only from the type locality, between Real del Monte and Atotonilco El Chico, Hidalgo.

18. *Odostemon eutriphyllus* (Fedde) Standl.

Mahonia eutriphylla Fedde, Bot. Jahrb. Engler 31: 91. 1901.

Coahuila to Mexico; type from La Encarnación.

Low shrub; leaflets oval or broader, 2 to 3 cm. long, very spiny.

A specimen from Ixtacihuatl was collected on rocks above timber line at an altitude of 3,900 meters. It is possible that the material referred here represents more than a single species. Palmer's no. 14, from Coahuila, is referred to *O. schiedeana* by Fedde, but the specimen of this collection in the National Herbarium is certainly not that species. Probably two different plants were distributed under the same number.

19. *Odostemon trifolius* (Cham. & Schlecht.) Standl.

Berberis trifolia Cham. & Schlecht. Linnaea 5: 211. 1830.

Mahonia trifolia Roem. & Schult. Syst. Veg. 7: 1616. 1830.

Berberis schiedeana Schlecht. Bot. Zeit. 12: 654. 1854.

Mahonia schiedeana Fedde, Bot. Jahrb. Engler 31: 90. 1901.

Hidalgo and Mexico; type from the plains between Guantotalapa and Tlachichilco (Veracruz?).

Low shrub, sometimes prostrate; ascending in the Sierra de las Cruces to 3,600 meters; leaflets oval, 2 to 3 cm. long, very spiny; fruit blue.

20. *Odostemon fascicularis* (DC.) Abrams, Bull. N. Y. Bot. Gard. 6: 360. 1910.

Berberis pinnata Lag. Elench. Hort. Madr. 6. 1803, nomen nudum.

Mahonia fascicularis DC. Reg. Veg. Syst. 2: 19. 1821.

Berberis moranensis Roem. & Schult. Syst. Veg. 7: 17. 1829.

Mahonia pinnata Fedde, Bot. Jahrb. Engler 31: 86. 1901.

Mahonia pinnata cachira Fedde, Bot. Jahrb. Engler 31: 88. 1901.

Veracruz to Guanajuato, Michoacán, and Oaxaca. Guatemala; California, the type from Monterey.

Shrub, 1 to 3.5 meters high; leaflets with small spiny teeth. The following names are reported, but probably at least some of them apply to other species: "Retamilla," "xoxoco" (Mexico); "palo jarilla" (Valley of Mexico); "cachisdá" (Hidalgo, Mexico, Guanajuato); "canisdá" (Hidalgo, Veracruz); "quisquirindin," "quisquiringuin" (Hidalgo, Distrito Federal); "palo amarillo"; "leña amarilla"; "palo de teñir"; "yagabuxe" (Oaxaca).

The fruit is rather sweet and edible; it and the bark are used in domestic medicine.

21. *Odostemon wilcoxii* (Kearney) Heller, *Muhlenbergia* 7: 139. 1912.

Berberis wilcoxii Kearney, *Trans. N. Y. Acad.* 14: 29. 1894.

Northern Sonora. Southern Arizona and New Mexico; type from Fort Huachuca, Arizona.

Low shrub; leaflets 3 to 5 cm. long, lustrous; fruit blue.

This is referred by Fedde to *O. dictyotus* (Jepson) Abrams,¹ and may not be specifically distant from that California plant.

40. MENISPERMACEAE. Moonseed Family.

Shrubs, usually scandent; leaves alternate, estipulate, petiolate, entire or lobate; flowers small, dioecious, cymose, the cymes racemose or paniculate; petals and sepals usually 6 each; stamens as many as the petals and opposite them.

Endosperm none; leaves thick-coriaceous, glabrous.....1. **HYPERBAENA**.

Endosperm present; leaves never thick-coriaceous.

Carpel 1; bracts of the inflorescence large, leaflike; stamens connate. Leaves usually peltate.....2. **CISSAMPELOS**.

Carpels usually 3; bracts of the inflorescence small; stamens free.

Leaves not peltate; sepals and petals subequal.....3. **CEBATHA**.

Leaves peltate; sepals and petals unequal.....4. **MENISPERMUM**.

1. **HYPERBAENA** Miers, *Ann. Sci. Nat.* II. 7: 44. 1851.

REFERENCE: Diels in *Engl. Pflanzenreich* IV. 94: 198-203. 1910.

1. **Hyperbaena mexicana** Miers, *Ann. Sci. Nat.* III. 19: 94. 1867.

Known only from the original collection from somewhere in Mexico.

Scandent shrub, nearly glabrous; leaves oblanceolate-oblong, 10 to 12 cm. long, acuminate, entire.

2. **CISSAMPELOS** L. *Sp. Pl.* 1031. 1753.

REFERENCE: Diels in *Engl. Pflanzenreich* IV. 94: 283-306. 1910.

1. **Cissampelos pareira** L. *Sp. Pl.* 1031. 1753.

Cissampelos caepeba L. *Sp. Pl.* 1032. 1753.

Cissampelos tomentosa DC. *Reg. Veg. Syst.* 1: 535. 1818.

Cissampelos acuminata Benth. *Pl. Hartw.* 445. 1840. Not *C. acuminata* DC. 1818.

Cissampelos benthamiana Miers, *Ann. Nat. Hist.* III. 17: 144. 1866.

Tamaulipas to Sonora, Chiapas, and Yucatán. Distributed almost throughout the tropics of the world.

Scandent shrub, usually densely pubescent, the hairs somewhat stinging; leaves orbicular, reniform, or cordate; bracts of the pistillate inflorescence similar to the leaves but smaller; flowers very small, greenish white; fruit a red or orange drupe. "Oreja de ratón" (Michoacán, Guerrero); "butua" (Colima, Guerrero, Veracruz); "pareira brava" (Veracruz, Oaxaca); "iztac-coanenepilli" (*Nueva Farmacopea Mexicana*); "bejuco azul," "venadero" (Costa Rica); "picamano" (Nicaragua); "bejuco de mono" (Porto Rico); "alcotán" (Guatemala, El Salvador); "bejuco de alcotán" (El Salvador);

¹ *Bull. N. Y. Bot. Gard.* 6: 360. 1910. *Berberis dictyota* Jepson, *Bull. Torrey Club* 18: 319. 1891.

"cotán" (Guatemala); "hierba ratón" (Venezuela); "tomatillo de sabana" (Cuba).

The roots are hard, tortuous, brown, and rugose, with a bitter flavor. They are said to have diuretic, emmenagogue, febrifuge, and expectorant properties, and are used in treating urinary and venereal diseases. The plant also has a great reputation throughout tropical America as a remedy for the bites of venomous snakes. It has been confused with the "pareira brava" of commerce, which is furnished by a South American plant (*Chondodendron tomentosum* Ruiz & Pavón) of the same family, and is used sometimes as an adulterant of that drug. The leaves are said to be employed as a poultice for treating wounds. The name "velvet-leaf" is applied to the plant in Jamaica. The leaves have been suspected to be poisonous to cattle.

3. CEBATHA Forsk. Fl. Aegypt. Arab. 172. 1775.

REFERENCE: Diels in Engl. Pflanzenreich IV. 94: 227-241. 1910.

Slender scandent shrubs; leaves thin, entire or shallowly lobate; petals 6; stamens 6 to 9; fruit a drupe.

Leaves densely pilose beneath, those of the flowering branches broadly ovate or ovate-deltoid-----1. *C. carolina*.

Leaves glabrous or glabrate beneath, those of the flowering branches usually lance-linear to elliptic-oblong-----2. *C. diversifolia*.

1. *Cebatha carolina* (L.) Britton, Mem. Torrey Club 5: 162. 1894.

Menispermum carolinum L. Sp. Pl. 340. 1753.

Cocculus carolinus DC. Reg. Veg. Syst. 1: 524. 1818.

Tamaulipas. Eastern United States; type from Carolina.

Plants copiously pubescent; leaves 3.5 to 6.5 cm. wide, obtuse or rounded at apex, pale beneath; flowers cream-colored; fruit red, edible. "Hierba del ojo" (Tamaulipas).

2. *Cebatha diversifolia* (DC.) Kuntze, Rev. Gen. Pl. 1: 9. 1891.

Cocculus diversifolius DC. Reg. Veg. Syst. 1: 523. 1818.

Cocculus oblongifolius DC. Reg. Veg. Syst. 1: 529. 1818.

Tamaulipas to Sonora and Oaxaca; described from one of Mociño and Sessé's drawings. Western Texas and southern Arizona.

Climbing over shrubs and fences; leaves extremely variable, ranging from linear to broadly ovate, entire or lobate; fruit dark purple.

4. MENISPERMUM L. Sp. Pl. 340. 1753.

1. *Menispermum canadense* L. Sp. Pl. 340. 1753.

Menispermum mexicanum Rose, Contr. U. S. Nat. Herb. 13: 302. 1911.

Mountains of Nuevo León. Eastern and southern United States.

Slender pubescent vine; leaves long-petiolate, the blades nearly orbicular, 5 to 20 cm. wide, angulate or shallowly lobed, sometimes entire, pale beneath; stamens 10 to 20; fruit dark blue, about 1 cm. wide.

The roots of moonseed have been used in the United States in domestic medicine as a tonic and for venereal diseases. They contain an alkaloid, menispermine, and were formerly official as a substitute for sarsaparilla.

41. MAGNOLIACEAE. Magnolia Family.

Trees or shrubs; leaves alternate, stipulate or estipulate, entire; flowers perfect, often large and showy, solitary or fasciculate; sepals 2 to 6; petals 6 to many; stamens numerous; fruit of few or numerous carpels.

Stipules large, deciduous; flowers large, 5 to 10 cm. long; carpels of the fruit imbricate in numerous series.

- Carpels bivalvate at maturity; petals comparatively thin---1. **MAGNOLIA**.
 Carpels indehiscent; petals thick and leathery-----2. **TALAUMA**.
 Stipules none; flowers less than 3 cm. long; carpels verticillate in a single series.
 Leaves glaucous beneath; carpels indehiscent; sepals valvate---3. **DRIMYS**.
 Leaves green beneath; carpels dehiscent; sepals imbricate----4. **ILLICIUM**.

1. **MAGNOLIA** L. Sp. Pl. 535. 1753.

Large trees; leaves petiolate, persistent or deciduous; flowers large, white, solitary; sepals 3; petals 6 to 12; fruit conelike.

Most of the species of magnolias have very showy flowers, and many are in cultivation. *Magnolia grandiflora* L., the bull bay of the southeastern United States, with handsome evergreen leaves, is said to be cultivated in Mexico and to be known as "magnolia" and "Semframis."

Leaves persistent, the blades rounded to acute at base, green beneath.

1. **M. schiedeana**.

Leaves deciduous, the blades cordate at base, white beneath----2 **M. dealbata**.

1. **Magnolia schiedeana** Schlecht. Bot. Zeit. 1864: 144. 1864.

Veracruz to Tepic and Sinaloa.

Large tree; leaves oval or elliptic, 12 to 17 cm. long, acute, glabrous, with very prominent, finely reticulate venation; flowers creamy white, the petals about 6 cm. long. "Corpus" (Tepic, *Rose*).

Rose reports that a decoction of the flowers is used in Tepic as a remedy for scorpion stings.

2. **Magnolia dealbata** Zucc. Abh. Bayer. Akad. 2: 373. pl. 3, 4. 1836.

Veracruz and Oaxaca; type collected in forests near Rincón, at an altitude of 600 to 900 meters.

Tree, 4.5 to 5.5 meters high (according to Zuccarini); leaves obovate-oval, 30 to 50 cm. long or larger, green on the upper surface, white beneath, obtuse or acutish at apex; flowers yellowish white, fragrant, 30 to 40 cm. broad; seeds covered with a fleshy orange aril. "Elosúchil" (Oaxaca; from the Nahuatl, *elotl*, a green ear of corn with husk, and *xochitl*, flower).

A relative of *M. macrophylla* Michx., of the southeastern United States, and perhaps not distinct from it. Reported from Mexico by Sessé and Mociño¹ as *M. tripetala*, a species confined to the southeastern United States.

2. **TALAUMA** Juss. Gen. Pl. 281. 1789.

1. **Talauma mexicana** (DC.) Don, Hist. Dichl. Pl. 1: 851. 1831.

Magnolia mexicana DC. Reg. Veg. Syst. 1: 451. 1818.

Talauma macrocarpa Zucc. Abh. Bayer. Akad. 2: 369. pl. 1, 2. 1836.

Mountains of Veracruz, Oaxaca, Mexico, and Morelos.

A large tree, sometimes 30 meters high, with a trunk 1.2 to 1.5 meters in diameter; leaves persistent, oval or elliptic, 12 to 25 cm. long or larger, acute, lustrous, reticulate-veined; flowers large, white, sweet-scented, the petals and sepals very thick and leathery, often tinged with purple; sepals 3; seeds surrounded by a fleshy red aril, hanging by a white threadlike funicle. "Flor de corazón" (Oaxaca, Veracruz, Morelos); "hualhua" (Veracruz, Morelos); "yoloxochitl" (Nahuatl); "hierba de las mataduras" (Morelos, Mexico, *Ramírez*); "laurel tulipán" (Morelos); "guilaclhi" (Oaxaca, Zapotec, *Reko*).

This is one of the best-known of Mexican trees. It was highly esteemed by the early inhabitants because of the sweet odor of the blossoms, a single flower being sufficient to perfume a whole house. The tree was cultivated in gardens, and the flowers were reserved for the exclusive use of the nobility. The plant

¹ Fl. Mex. 145. 1894.

was valued also for its reputed medicinal properties, and it still finds use in domestic medicine. The bark is employed for fevers, and is said also to have an effect upon the heart similar to that of digitalis. A decoction of the flowers is administered for epilepsy, paralysis, and various heart affections, and as a tonic. The plant, upon analysis, is said to yield a glucoside which dissolves the blood corpuscles.¹

The Nahuatl name, "yoloxochitl," signifies "heart-flower," an allusion to the shape of the unopened flower buds. Robelo gives "chupagua" as one of the vernacular names—a derivative of the Nahuatl *chipahuac*, "the beautiful." The species has been reported from Mexico² as *Magnolia glauca*, a name synonymous with *M. virginiana* L., which pertains to the sweet bay of the eastern and southern United States. It appears, also, that *Talauma mexicana* and *Magnolia schiedeana* have often been confused. The two species are much alike in leaf form and in the appearance of their flowers, but the fruits are very different.

Talauma macrocarpa is mentioned by Acosta (1590) under the name "yoloxuchil." It is illustrated and described by Hernández³ under the name "yoloxochitl." The latter author discusses its medical properties, stating that "it is an excellent remedy for sterility," and remarks that the flowers were sometimes used to flavor chocolate.

3. DRIMYS Forst. Char. Gen. 83. 1776.

1. *Drimys winteri* Forst. Char. Gen. 84. pl. 42. 1776.

Drimys granatensis L. f. Suppl. Pl. 269. 1781.

Drimys mexicana Moc. & Sessé; DC. Reg. Veg. Syst. 1: 444. 1818.

Veracruz and Oaxaca; reported from other states; sometimes cultivated. Central America and southward to the Straits of Magellan.

An evergreen shrub or tree, in some parts of its range 18 meters high, with grayish bark; leaves mostly oblong or oblong-obovate, 7 to 13 cm. long, coriaceous, persistent, green above, glaucous beneath, petiolate; flowers solitary or umbellate, white; sepals 2 or 3; petals 6 or more; fruit purplish black. "Chilillo," "chachaca," "palo picante" (various parts of Mexico); "palo de chile" (Oaxaca); "muelo," "quiebra-muelas" (Costa Rica); "canelo" (Chile).

This plant, which furnishes the Winter's bark of commerce, was first obtained by Winter, who was captain of one of the ships which accompanied Sir Francis Drake's expedition of 1577. The three vessels of the fleet were struck by a storm in the southern ocean and Winter's ship was driven to the Straits of Magellan, where three weeks were spent with the object of improving the health of the crew. *Drimys* was one of the plants which attracted Winter's attention, and he used the bark for treating scurvy. Specimens of the bark were presented to the famous botanist Clusius, who gave it the name of Cortex Winteranus. It became a favorite remedy in Europe, but as it was difficult to obtain the drug from South America the bark of *Canella alba*, a West Indian tree, was often substituted for it. Winter's bark is little used at the present time except in domestic medicine in the regions where it is native. It is aromatic and pungent and has tonic and antiscorbutic properties. In Brazil it is used for dysentery and for gastric disturbances. In Costa Rica the bark is chewed for toothache. The powdered bark is sometimes employed in Mexico as a condiment.

¹ For accounts of the plant see A. L. Herrera, *El yoloxochitl*, Estudio 4: 133; E. Armendáriz, *Analysis de las semillas del yoloxochitl*, Estudio 4: 248.

² Sessé & Moc. Pl. Nov. Hisp. 90. 1887.

³ Thesaurus 40. 1651.

It may be that the species as accepted here should be divided into two or more, but the general practice of recent writers has been to refer all the American forms to a single species.

4. **ILLICIUM** L. Syst. Nat. ed. 10. 1050. 1759.

1. **Illicium floridanum** Ellis, Phil. Trans. London 60: 524. *pl. 12.* 1770.

Veracruz and Puebla. Florida to Louisiana.

Aromatic evergreen shrub, 1.5 to 3 meters high; leaves elliptic or lance-elliptic, 7 to 14 cm. long, acuminate, petiolate, persistent, gland-dotted beneath; flowers long-pedicellate, with 20 to 30 narrow, dark crimson or purple petals. "Matacaballos" (Veracruz); "ixcapantl" (Puebla).

The shrub is reputed poisonous to stock. It is known in Florida as "poison bay" and "sweet laurel." The Mexican form has been illustrated recently (Bol. Dir. Estud. Biol. 1: 661. 1916).

A related species of China, *Illicium verum* Hook. f., is the star-anise, whose fruit is much used in oriental countries for flavoring food.

42. **ANNONACEAE.** Custard-apple Family.

Trees or shrubs, often aromatic; leaves alternate, estipulate, entire; flowers solitary or clustered, usually perfect, commonly with 3 sepals and 6 fleshy or leathery petals; stamens numerous; fruit of 1 or more carpels, these sessile or stipitate, usually fleshy, free or united to form a many-celled fruit.

Petals, at least the outer ones, imbricate.

Seeds solitary, attached at the base of the cell; flowers small.

1. **GUATTERIA.**

Seeds several, attached to the side of the cell; flowers usually very large.

2. **SAPRANTHUS.**

Petals valvate.

Outer petals separated, not connivent.

Carpel of the fruit one-----3. **TRIDIMERIS.**

Carpels numerous.

Inner petals clawed-----4. **CYMBOPETALUM.**

Inner petals not clawed-----5. **DESMOPSIS.**

Outer petals connivent.

Ovules 2 to many in each carpel; carpels distinct in fruit---6. **XYLOPIA.**

Ovules one in each carpel; carpels concrete in fruit.

Petals connate into a 3 or 6-lobed tube, the outer ones wing-appendaged.

7. **ROLLINIA.**

Petals not connate, the outer ones not appendaged-----8. **ANNONA.**

1. **GUATTERIA** Ruiz & Pav. Fl. Peruv. Chil. Prodr. 85. 1794.

Trees or shrubs; peduncles 1-flowered, axillary, solitary or fasciculate, pubescent; fruit composed of numerous stipitate berries.

Petals about 6 mm. long-----1. **G. bibracteata.**

Petals 1 cm. long or often much larger.

Leaves cordate at base-----2. **G. macrantha.**

Leaves rounded to acute at base.

Leaves short-acuminate at apex.

Petals 2 to 4.3 cm. long; leaves 5 to 15 cm. long.

Leaves 2 to 2.5 cm. long-----3. **G. gaumeri.**

Leaves 3 to 5 cm. wide-----7. **G. depressa.**

Petals 1 to 1.5 cm. long; leaves mostly 15 to 25 cm. long.

4. **G. diospyroides.**

Leaves long-acuminate at apex.

Flowers geminate ----- 5. *G. galeottiana*.

Flowers solitary ----- 6. *G. jurgensenii*.

1. *Guatteria bibracteata* (Hook.) Hemsl. *Diag. Pl. Mex.* 1. 1878.

Annona bibracteata Hook. *Icon. Pl.* 4: *pl.* 328. 1841.

Veracruz; type from Consoquintla.

Tree; leaves oblong-lanceolate, short-petiolate, sparsely pubescent or glabrous; flowers green.

2. *Guatteria macrantha* Presl, *Rel. Haenk.* 2: 78. 1835.

Described from somewhere in Mexico.

Perhaps not of this genus.

3. *Guatteria gaumeri* Greenm. *Field Mus. Bot.* 2: 251. 1907.

Vicinity of Izamal, Yucatán.

Tree, 10 to 15 meters high, with gray bark; leaves elliptic or elliptic-oval, with an aromatic odor when crushed. "Elemuy."

Used medicinally.

4. *Guatteria diospyroides* Baill. *Adansonia* 8: 269. 1868.

Oaxaca; type from Trapiche de la Concepción.

Leaves lance-elliptic, 10 to 25 cm. long, short-petioled, glabrous or nearly so; flowers green.

5. *Guatteria galeottiana* Baill. *Adansonia* 8: 268. 1868.

Oaxaca (type locality) and Campeche.

Leaves lanceolate, 10 to 25 cm. long.

6. *Guatteria jurgensenii* Hemsl. *Diag. Pl. Mex.* 1. 1878.

Oaxaca; type from Sierra San Pedro Nolasco.

Leaves lanceolate, 15 to 23 cm. long; flowers (as in the other species) sericeous, about 2.5 cm. broad.

7. *Guatteria depressa* (Baill.) Safford.

Annona depressa Baill. *Adansonia* 8: 267. 1868.

Veracruz and perhaps elsewhere; type from Tozamapa.

Similar to *G. gaumeri*, but with broader leaves, these very thick and lustrous; carpels of the fruit numerous, ellipsoid, long-stipitate.

2. **SAPRANTHUS** Seem. *Journ. Bot.* 4: 369. 1866.

Shrubs or trees; flowers very large, solitary, with an extremely disagreeable odor of carrion; fruit of few large sessile carpels.

Petals mostly 6 to 8 cm. long ----- 1. *S. foetidus*.

Petals 4 cm. long or shorter.

Leaf blades oblong-elliptic, acuminate; petals about 4 cm. long

2. *S. campechianus*.

Leaf blades oblong-obovate, obtuse or acutish; petals about 2 cm. long.

3. *S. microcarpus*.

1. *Sapranthus foetidus* (Rose) Safford.

Asimina foetida Rose, *Contr. U. S. Nat. Herb.* 5: 134. 1897.

Sinaloa to Oaxaca; type from Acapulco.

Shrub or small tree, 4 to 5 meters high, copiously pubescent; leaves oval to oblong, 7 to 14 cm. long or larger, short-petiolate, acute or obtuse; petals greenish yellow at first, maroon or dark purple at maturity, with conspicuous veins. "Madre de cacao" (Oaxaca); "murciélago" (Guerrero); "zopilotillo" (Sinaloa).

2. *Sapranthus campechianus* (H. B. K.) Standl.*Asimia campechiana* H. B. K. Nov. Gen. & Sp. 5: 61. 1821.*Asimina insularis* Hemsl. in Hook. Icon. Pl. 16: pl. 1514. 1886.

Campeche (type locality) and Yucatán.

Tree, 6 meters high; leaves elliptic-oblong, 6.5 to 8.5 cm. long, acuminate, pubescent.

Asimina insularis is perhaps distinct but, judging from the description, the species are very closely related.**3. *Sapranthus microcarpa* (Donn. Smith) Fries, Svensk. Vet. Akad. Handl. 34^o: 12. 1900.***Porcelia microcarpa* Donn. Smith, Bot. Gaz. 20: 1. 1895.*Asimina purpusii* T. S. Brandeg. Univ. Calif. Publ. Bot. 4: 375. 1913.

Veracruz and Oaxaca. Guatemala; type from Ocosito.

Shrub, 1.8 to 2.7 meters high; leaves obovate or oval-oblong, mostly 5 to 8 cm. long, obtuse or acute; carpels 2.5 to 4.5 cm. long.

DOUBTFUL SPECIES.

UNONA VIOLACEA Dunal, Monogr. Anon. 105. pl. 25. 1817. This plant, described from Mexico, is probably the same as one of the species listed above, perhaps *S. foetidus*.**3. TRIDIMERIS** Baill. Adansonia 9: 219. 1869.**1. *Tridimeris hahniana*¹ Baill. Adansonia 9: 219. 1869.**

Type from the forests of San Cristóbal (Oaxaca?).

A small tree.

4. CYMBOPETALUM Benth. Journ. Linn. Soc. Bot. 5: 69. 1861.**1. *Cymbopetalum penduliflorum* (Dunal) Baill. Adansonia 8: 268. 1868.***Unona penduliflora* Dunal, Monogr. Anon. 100. pl. 28. 1817.

Veracruz and Oaxaca. Guatemala.

Tree or large shrub with long narrow leaves; petals purplish within, greenish outside. "Guineillo," "guineillo prieto" (Oaxaca); "xochinacatzli" (Nahuatl).

The aromatic petals were used in preconquest days for flavoring chocolate and are still so used in some localities. The flowers were used also as a remedy for asthma and other diseases.² This plant was highly esteemed by the early inhabitants of Mexico, having been brought from the south to be grown in the gardens of the emperor. It is first mentioned by Sahagún (1509), under the name "teunacatzli," "the sacred ear." He states that the flowers were valued for their odor and for flavoring chocolate. Hernández describes and figures³ the plant in a chapter entitled "De *Xochinacatzli*, seu flore auriculæ." The Nahuatl term *xochinacatzli* signifies "ear-flower." Hernández states that the plant is a native of the *tierra caliente*, and that in the *tiangues* or markets of the Indians there is nothing more frequently found or more highly prized than this flower, "which is wont to give the greatest charm and taste, together with a very fragrant

¹Ludwig Hahn spent nearly 20 years in Mexico as a teacher of music, and made extensive collections of plants and animals, most of which were sent to Berlin. He was a member of the French Scientific Commission, and an associate of Bourgeau. He died in Mexico in 1873. Some of his plants are in the U. S. National Herbarium.

²See W. E. Safford, Science, n. ser. 33: 470. 1911; Smiths. Rept. 1910: 428. 1911; Journ. Washington Acad. Sci. 2: 234. 1912.

³Thesaurus 30. 1651.

odor and flavor to that celebrated drink cacao, which they call chocolate, and it imparts to it certain tonic properties and wholesomeness as well. It is said that when drunk in water this flower dispels flatulency, causes phlegm to become thin, warms and comforts the stomach which has been chilled or weakened, as well as the heart; and that it is efficacious in asthma, ground to a powder with addition of two pods of the red peppers called *texochilli*, with their seeds removed and toasted on a *comal*, which is a kind of griddle on which the natives toast and make their bread called by us *tortillas*, adding to the same three drops of balsam and taking it in some suitable liquor." It is of interest to note that the dried flowers are still offered for sale in the markets of Guatemala.

5. **DESMOPSIS** Safford, Bull. Torrey Club 43: 184. 1916.

1. *Desmopsis galeottiana* (Baill.) Safford, Bull. Torrey Club 43: 187. 1916.
Trigynia galeottiana Baill. Adansonia 8: 181. 1868.

Veracruz; type from Palanque.

Shrub or small tree with elliptic-lanceolate leaves; flowers green, on long slender pedicels; fruit of 7 to 11 carpels.

6. **XYLOPIA** L. Syst. Nat. ed. 10. 1250. 1750.

1. *Xylopia trunciflora* Schlecht. & Cham. Linnaea 6: 417. 1831.

Known only from the type locality, near Colipa, Veracruz.

Small tree; leaves lance-elliptic, 10 cm. long, obtuse, subsessile, pubescent beneath; flowers borne along the trunk; carpels 5 to 7, globose or ellipsoid, 1 to 3-seeded.

7. **ROLLINIA** St. Hil. Fl. Bras. Merid. 1: 28. 1825.

1. *Rollinia mucosa* (Jacq.) Baill. Adansonia 8: 268. 1868.

Annona mucosa Jacq. Obs. Bot. 16. 1764.

Veracruz. Trinidad and Lesser Antilles; type locality, Martinique.

Tree with brownish branches; leaves oblong or elliptic, 7 to 14 cm. long, acuminate; flowers solitary, long-pedunculate. "Anona" (*Ramirez*); "anón," "candongo" (Santo Domingo).

8. **ANNONA** L. Sp. Pl. 536. 1753.

REFERENCES: Safford, Classification of the genus *Annona*, with descriptions of new and imperfectly known species, Contr. U. S. Nat. Herb. 18: 1-68. pl. 1-41, f. 1-75. 1914; Safford, *Annona sericea* and its allies, Contr. U. S. Nat. Herb. 16: 263-275. pl. 85-99, f. 42-44. 1913; Safford, The genus *Annona*: The derivation of its name and its taxonomic subdivisions, Journ. Washington Acad. Sci. 1: 118. 1911; Safford, *Annona*, in Bailey, Stand. Cycl. Hort. 291-295. 1914.

Trees or shrubs; leaves deciduous or persistent; flowers usually solitary, lateral; fruit very variable, composed of numerous carpels crowded together into a fleshy mass.

The generic name (sometimes, but incorrectly, written *Anona*) is a modification of the Haitian name of some of the species, "anón." Belmar gives the Mixe equivalents of "anona" as "ai-dium," "ait-keip" (the tree), and "tzaptzaidium."

Flowers subglobose or broadly pyramidal in bud.

Petals 3 or, if 6, the inner ones rudimentary or much narrower than the outer ones.

Leaf blades 4 to 9 cm. long, thinly appressed-pilose beneath; flowers short-pedicellate-----1. **A. globiflora.**

Leaf blades 9 to 14 cm. long, densely soft-pilose beneath; flowers long-pedicellate-----2. **A. longipes.**

Petals 6, broad, in 2 series.

Inner petals valvate-----3. *A. glabra*.

Inner petals imbricate.

Leaves with minute pockets beneath in the axils of the lateral nerves.

4. *A. muricata*.

Leaves without pockets in the axils of the nerves-----5. *A. purpurea*.

Flowers elongate and more or less triquetrous in bud.

Peduncles with clasping leaflike bracts at base; testa of seeds thick and hard.

6. *A. diversifolia*.

Peduncles without clasping leaflike bracts at base; testa thin.

Outer petals about 8 mm. long. Fruit 2 to 2.5 cm. in diameter; leaves

lanceolate-----7. *A. palmeri*.

Outer petals 1.8 to 5 cm. long.

Leaves rounded or obtuse at apex, oval or rounded, soft-pilose or tomentose beneath.

Outer petals 1.8 to 2.5 cm. long-----8. *A. cherimola*.

Outer petals 4 to 5 cm. long-----9. *A. longiflora*.

Leaves acute or acuminate at apex, oblong-lanceolate to elliptic-oval, nearly glabrous beneath, at least in age. Flowers 2 to 3 cm. long.

Fruit composed of numerous rounded, loosely cohering carpels, the surface very rough, with a glaucous bloom. Leaves mostly lanceolate-----10. *A. squamosa*.

Fruit smooth or nearly so, the surface often divided into angular areoles by impressed lines.

Leaves mostly lanceolate; fruit with conspicuous areoles, turning red when ripe-----11. *A. reticulata*.

Leaves elliptic-oval; fruit smooth, yellow-----12. *A. lutescens*.

1. *Annona globiflora* Schlecht. *Linnaea* 10: 235. 1836.

Annona fruticosa Sessé & Moc. *Fl. Mex. ed. 2.* 134. 1894.

Tamaulipas, San Luis Potosí, and Veracruz; type from Hacienda de la Laguna, near Jalapa.

Shrub, 0.6 to 2 meters high; leaves oblong or lance-oblong, 4 to 9 cm. long, thin, acute or obtuse, pale beneath; fruit subglobose, 3 to 4 cm. in diameter, muricate, with scant edible pulp. "Anonilla" (Veracruz); "chirimoya" (Tamaulipas, San Luis Potosí); "anonita de papagayos" (Veracruz).

2. *Annona longipes* Safford, *Contr. U. S. Nat. Herb.* 16: 269. *pl. 89.* 1913.

Known only from the type locality, Lake Catemaco, Veracruz.

Tree, 10 meters high; leaves ovate-oval, 9 to 14 cm. long, acute or acuminate; fruit shaped like a strawberry, 2.5 cm. long, covered with gibbous areoles, tomentose, with scant pulp.

3. *Annona glabra* L. *Sp. Pl.* 537. 1753.

Annona palustris L. *Sp. Pl. ed. 2.* 757. 1762.

Veracruz and Guerrero, in wet soil; reported from Yucatán, Tabasco, and Oaxaca. Widely distributed in tropical America; type from the Bahamas.

Shrub or tree, sometimes 12 meters high, the trunk as much as 50 cm. in diameter, often swollen or with buttresses at the base, the bark thin, reddish brown; leaves oval, oblong, or ovate, 6 to 15 cm. long, deep green, acute or acuminate; outer petals yellowish, with a deep red spot near the base; fruit 5 to 12 cm. long, ovoid, smooth, yellowish at maturity, with cream-colored pulp; wood brown, soft, weak, its specific gravity about 0.50. "Corcho" (Guerrero, Tabasco, Yucatán, Porto Rico); "árbol de corcho" (Veracruz); "palo de corcho" (Yucatán); "mag" (Yucatán, Maya); "cayur," "corazón cimarrón," "guanábano cimarrón," "anón" (Porto Rico); "bagá," "palo

bobo" (Cuba); "anonillo" (Guatemala, Honduras); "guanábano de corcho" (Santo Domingo).

The tree often grows about salt water, associated with mangroves. Its English names are "pond-apple," "alligator-apple," and "monkey-apple." The fruit is insipid but is said to be eaten in some localities, while in others it is regarded as poisonous. It is said to be eaten by the alligators that frequent the banks where it grows, hence the name "alligator-apple." The very light wood is used to make bottle corks and floats for fish nets.

4. *Annona muricata* L. Sp. Pl. 536. 1753.

Widely cultivated in Mexico and elsewhere in tropical America, the native region not definitely known.

Small tree, usually 4 to 5 meters high; leaves ill-scented, lustrous, obovate, ovate, or elliptic, persistent; flowers yellow; fruit very large, sometimes weighing five pounds, ovoid or heart-shaped, the ill-smelling skin furnished with numerous recurved fleshy spines, the pulp white and juicy, with a pleasant subacid flavor; wood light-colored, soft, its specific gravity about 0.397. "Guanábano" or "guanábana" (Yucatán, Chiapas, Oaxaca, Nicaragua, Porto Rico, Colombia, Peru, Philippines, Santo Domingo); "anona amarilla" (Tlaxasco, Ramírez); "catuche" or "catucho" (Jalisco, Ramírez); "polvox" (Maya, Urbina); "zapote de viejas" (Urbina); "cabeza de negro" (Oaxaca, Jalisco); "huanaba" (Guatemala); "guanaba" (El Salvador).

The fruit of the soursop is highly esteemed in tropical regions. It is eaten fresh, used in preparing beverages, made into jelly, tarts, or preserves, and sometimes fermented to obtain an intoxicating drink. Stock also are fond of the fruit. It is reputed to have pectoral, antiscorbutic, and febrifuge properties. The seeds and green fruit are astringent and are employed as a remedy for dysentery. The leaves, too, are used medicinally, also the flowers. One of the earliest writers to describe the plant is Oviedo (Lib. VIII, Cap. XVII), who used the Haitian name "guanábano."

5. *Annona purpurea* Moc. & Sessé; Dunal, Monogr. Anon. 64. pl. 2. 1817.

Annona involucrata Baill. *Adansonia* 8: 265. 1868.

Veracruz, Oaxaca, and Yucatán. Central America and Venezuela.

Small or medium-sized tree, sometimes 7.5 meters high; leaves oval to oblong, 15 to 38 cm. long, short-petiolate, acuminate, thin; petals velvety outside, deep purple within; fruit 10 to 20 cm. in diameter, broadly ovoid or subglobose, bearing numerous rigid pyramidal protuberances covered with a feltlike tomentum, the pulp orange-colored, fragrant, fibrous. "Cabeza de negro" (Veracruz); "cabeza de ilama" (Veracruz, Oaxaca); "chincua," "ilama de Tehuantepec" (Oaxaca); "soncoya," "soncolla," or "sencuya" (Central America); "toreta" (Panama); "manirote" (Venezuela); "matacuy" (Guatemala).

The fruits are sold in the markets of Veracruz and elsewhere. They vary considerably in quality. There is a popular belief that they give rise to chills and fevers.

6. *Annona diversifolia* Safford,¹ Science n. ser. 33: 471. 1911.

Colima and Guerrero; type from Colima. El Salvador.

Small tree with brownish gray aromatic bark; leaves elliptic or oblong, 15 cm. long or less, rounded at apex; fruit ovoid-globose, about 15 cm. in diameter, covered with low rounded protuberances, the pulp fine-flavored, cream-colored or rose-tinted. "Ilama," "hilama," "ilamatzapotl" (Mexico); "anona blanca" (El Salvador).

¹ See also, Safford, *Annona diversifolia*, a custard-apple of the Aztecs, Journ. Washington Acad. Sci. 2: 118-125. f. 1-4. 1912.

7. *Annona palmeri* Safford, Contr. U. S. Nat. Herb. 18: 43. pl. 24. 1914.

Known only from the type locality, Acapulco, Guerrero.

Shrub, 1.5 to 3 meters high; leaves lanceolate or ovate, 5 to 10 cm. long, acute; flowers small, dull white; fruit subglobose, 2 to 2.5 cm. in diameter, with scant pulp. "Anonilla."

8. *Annona cherimola* Mill. Gard. Dict. ed. 8. *Annona* no. 5. 1768.

Widely cultivated in Mexico, and in tropical America generally. Native of the Andes of Peru, but naturalized in Mexico at a very early date.

Tree, 4.5 to 7.5 meters high; leaves mostly oval or rounded-oval, obtuse, pubescent; petals greenish yellow or rufous outside, pale yellow or whitish within; fruit globose or ovoid, the surface with rounded protuberances or marked with U-shaped areoles, sometimes smooth, the pulp white, pleasantly acidulous. "Chirimoyo" or "chirimoya" (Jalisco, Oaxaca, etc., Colombia, Peru; the name of Peruvian origin, said to signify "cold-seed"); "pox," "tzuli pox" (Yucatán, Maya); "quauhtzapotl," "matzapotl" (Nahuatl).

One of the most highly valued species because of its excellent fruit; much cultivated in the *tierra caliente*, in several forms of variable quality. The fruit is sometimes fermented to obtain an alcoholic beverage. Macfadyen states that in Jamaica the dried flowers were used to flavor snuff. The seeds are used in Mexico as an emetic-cathartic and as an insecticide. In the first case one or two seeds are swallowed; they are first roasted slightly, their shell removed, and the embryo crushed in water or milk. For the destruction of parasites upon the human body, the seeds are crushed, mixed with lard, and applied as an ointment to the parts affected. Cortina, who analyzed the seeds,¹ states that they contain sugar, gum, albumen, extractive matter, oil, and resin, the last probably being the emetic-cathartic agent.

9. *Annona longiflora* S. Wats. Proc. Amer. Acad. 22: 397. 1887.

Jalisco; type from Río Blanco.

Shrub, 1 to 3 meters high; leaves mostly oval or orbicular, copiously pubescent; outer petals whitish or cream-colored, with a dark purple spot at base; fruit ovoid-globose, the surface with flat areoles or bearing protuberances. "Chirimoya de la barranca," "chirimoya cimarrona."

The fruit is edible either raw or cooked. A sweetmeat is made by boiling it with sugar together with the fruit of the "tejocote" (*Crataegus mexicana*).

10. *Annona squamosa* L. Sp. Pl. 537. 1753.

Annona cinerea Dunal, Monogr. Anon. 72. pl. 8. 1817.

Widely cultivated in Mexico and elsewhere in tropical America.

Tree, 4.5 to 6 meters high, with grayish bark; leaves lanceolate or oblong, acute; petals greenish yellow or greenish white, usually with a purplish red spot at base; fruit the size of an orange, globose or heart-shaped, composed of loosely adherent carpels, these rounded at apex, forming a tuberculate surface, greenish yellow, the pulp yellowish white, creamy or custard-like, sweet and pleasantly flavored. "Texaltzapotl," "quauhtzapotl" (Nahuatl); "ahate" (Jalisco, Veracruz); "anona blanca" (Chiapas, Ramírez); "saramulla," "saramullo" (Yucatán); "tzalmuy" (Yucatán, Maya); "anón" (Colombia, Costa Rica, Porto Rico); "chirimoya" (Porto Rico); "ates" (Philippines); "anón" (Santo Domingo).

Fruit of excellent flavor and highly esteemed; it is produced at nearly all times of the year. It is eaten alone or made into sherbets and is not cooked like that of some other species. The leaves are sometimes rubbed over floors or placed in hens' nests to keep away vermin. The seeds likewise have in-

¹ See Urbina, *Naturaleza* 7: 222. 1901.

secticide properties. The crushed leaves are sometimes applied as poultices to ulcers and malignant sores. The root is a drastic purgative.

The tree is described by Oviedo (Lib. VIII, Cap. XVIII) under the name "hanon." Hernández describes and figures¹ it as "ahate de Panucho (Pánuco)"; he also illustrates it,² without description, as "ate vel abate de Panuco." The English names applied to this species are "sugar-apple" and "sweetsop."

11. *Annona reticulata* L. Sp. Pl. 37. 1753.

Annona longifolia Sessé & Moc. Fl. Mex. ed. 2. 134. 1894.

Cultivated in Mexico and in places doubtless native. Widely cultivated in the tropics.

Tree, 4.5 to 7.5 meters high; leaves deciduous, lanceolate or oblong, acute, nearly glabrous; petals olive or yellowish, usually stained with purple within and with a dark purple spot at base; fruit 7.5 to 12.5 cm. in diameter, the surface divided into angled areoles, usually reddish or reddish brown, the pulp sweetish, insipid, tallow-like. "Quauhtzapotl" (Nahuatl); "anona" (Oaxaca, etc., Nicaragua, Philippines, Guam); "anona colorada" (Chiapas, Ramírez); "chirimoya" (Oaxaca, Costa Rica); "op" (Yucatán, Maya); "ilama" (*Alcocer*); "corazón" (Porto Rico); "mamón" (Cuba); "riñón" (Venezuela).

The wood is light and soft. The bark is said to have astringent and tonic properties, and that of young branches to give a useful fiber. The leaves and branches are used for tanning and are said to give a blue or black dye. The English names are "custard-apple" and "bullock's-heart."

12. *Annona lutescens* Safford, Contr. U. S. Nat. Herb. 18: 41. pl. 23. 1914.

Chiapas. Guatemala; type from Cahabón, Alta Verapaz.

Small tree with spreading branches; fruit similar to that of *A. reticulata*, but yellow. "Anona amarilla" (Guatemala).

DOUBTFUL SPECIES.

ANNONA EXCELSA H. B. K. Nov. Gen. & Sp. 5: 59. 1821. Type from La Venta del Exido. Described from sterile branches.

ANNONA LIEBMANNIANA Baill. *Adansonia* 8: 266. 1868. Type from Comaltepec.

43. MYRISTICACEAE. Nutmeg Family.

1. *COMPSONEURA* Warb. Ber. Deutsch. Bot. Ges. 13: 94. 1895.

1. *Compsonaura sprucei* (A. DC.) Warb. Nov. Act. Acad. Caes. Leop. Carol. 68: 143. 1897.

Myristica sprucei A. DC. in DC. Prodr. 14: 199. 1856.

Myristica mexicana Hemsl. Biol. Centr. Amer. Bot. 3: 67. pl. 73. 1882.

Tabasco. Honduras and Brazil; type from Rio Negro, Brazil.

Glabrous shrub or tree; leaves alternate, estipulate, oblong or obovate-oblong, 12 to 25 cm. long, subacuminate, bright green; flowers very small, dioecious, paniculate or subracemose.

Myristica mexicana is considered synonymous with *Compsonaura sprucei* by Warburg, the monographer of the group, but it seems probable that further study will show that the Mexican plant is a distinct species. The type of *M. mexicana* is from the banks of the Rio Puyapatengo.

¹ Thesaurus 348. 1651.

² Thesaurus 454. 1651.

44. MONIMIACEAE. *Monimia* Family.

REFERENCE: Perkins in Engl. Pflanzanreich IV. 101. 1901.

Shrubs; leaves opposite, entire or irregularly serrate, estipulate; flowers small, perfect or unisexual, usually cymose or racemose; perianth 4 to 6-lobed; corolla none; stamens numerous; fruit of numerous small carpels.

Anthers dehiscent by longitudinal slits.....1. **MOLLINEDIA.**
Anthers dehiscent by valves.....2. **SIPARUNA.**

1. **MOLLINEDIA** Ruiz & Pav. Fl. Peruv. Chil. Prodr. 83. 1794.

Leaves entire or dentatè; flowers pedicellate, in axillary cymes; perianth 4-lobed; fruit of numerous small drupes.

Sepals subequal. Stamens 30 to 33.....1. *M. orizabae*.

Sepals unequal, the outer broader than the inner.

Leaves pilose when young. Stamens 23 or 24.....2. *M. viridiflora*.

Leaves glabrous.

Stamens 25.....3. *M. mexicana*.

Stamens 30 to 40.....4. *M. nigrescens*.

1. *Mollinedia orizabae* Perkins, Bot. Jahrb. Engler 27: 674. 1900.

Known only from the type locality, Orizaba, Veracruz.

Leaves oblong or obovate-oblong, 8 to 12 cm. long, short-acuminate, glabrous.

2. *Mollinedia viridiflora* Tulasne, Ann. Sci. Nat. IV. 3: 43. 1855.

Oaxaca; type locality, mountains of Oaxaca.

Leaves obovate or elliptic-oblong, 8 to 12 cm. long, petiolate, acuminate, glabrate in age.

3. *Mollinedia mexicana* Perkins, Bot. Jahrb. Engler 27: 674. 1900.

Known only from the type locality, Mirador, Veracruz.

Leaves narrowly oblong or obovate-oblong, 9 to 13.5 cm. long, long-acuminate.

4. *Mollinedia nigrescens* Tulasne, Ann. Sci. Nat. IV. 3: 41. 1855.

Known only from the type locality, Tenejapa, Oaxaca.

Leaves lanceolate or oblong-lanceolate, 8 to 12 cm. long, remotely serrate above the middle.

2. **SIPARUNA** Aubl. Pl. Guian. 2: 864. 1775.

Shrubs, usually with a pleasant odor; flowers in short axillary cymes, usually short-pediceled; fruit of numerous small drupes.

Leaves copiously stellate-pilose.....1. *S. riparia*.

Leaves glabrous or nearly so.

Leaf blades entire or sinuate-dentate.

Leaves coriaceous.....2. *S. andina*.

Leaves membranaceous.....3. *S. nicaraguensis*.

Leaf blades conspicuously serrate or dentate.

Inflorescence dense, short.....4. *S. colimensis*.

Inflorescence lax, conspicuously pedunculate.....5. *S. sumichrastii*.

1. *Siparuna riparia* (Tulasne) A. DC. in DC. Prodr. 16²: 647. 1868.

Citriosma riparia Tulasne, Ann. Sci. Nat. IV. 3: 36. 1855.

Veracruz and Oaxaca. Guatemala.

Tree or shrub; leaves obovate or oval-obovate, 10 to 17 cm. long, acute or acuminate, irregularly dentate; fruit globose, red. "Limoncillo" (Veracruz); "cerbatana" (Guatemala).

2. *Siparuna andina* (Tulasne) A. DC. in DC. Prodr. 16²: 648. 1868.

Citriosma andina Tulasne, Ann. Sci. Nat. IV. 3: 36. 1855.

Mountains of Oaxaca.

- Leaves ternate, obovate-oblong, 12 to 15 cm. long, petiolate, short-acuminate.
3. *Siparuna nicaraguensis* Hemsl. Biol. Centr. Amer. Bot. 3: 69. 1882.
Guerrero and Oaxaca to Tabasco. Guatemala and Nicaragua (type locality).
Shrub, 3 to 4 meters high, or sometimes a tree, with a strong odor; leaves oval to oblong, 7.5 to 15 cm. long; flowers small, yellowish white; fruit blood-red. "Hierba del talaje," "limoncillo," "hierba de la conchuda" (Oaxaca).
4. *Siparuna colimensis* Perkins, Bot. Jahrb. Engler 28: 682. 1901.
Known only from Colima, the type locality.
Leaves ovate or oblong, 9 to 18 cm. long, short-acuminate; fruit depressed-globose, reddish, acidulous.
5. *Siparuna sumichrastii* (A. DC.) Perkins, Bot. Jahrb. Engler 28: 682. 1901.
Siparuna riparia sumichrastii A. DC. in DC. Prodr. 16²: 648. 1868.
Veracruz; type from the city of Veracruz.
Shrub, 3 meters high; leaves obovate-oblong or elliptic, 10 to 16 cm. long; fruit 5 mm. in diameter.

45. LAURACEAE. Laurel Family.

REFERENCE: Mez, Jahrb. Bot. Gart. Mus. Berlin 5. 1869.

Aromatic evergreen trees or shrubs; leaves alternate, persistent, glandular-punctate, estipulate, entire; flowers perfect or unisexual, small, green or yellow, usually cymose, umbellate, or capitate; perianth limb usually 6-lobed; corolla none; stamens and staminodia normally twice as many as the segments and opposite them, arranged in 2 or 4 series; anthers erect, 2 or 4-celled; fruit baccate or drupaceous, 1-seeded.

In this family flowers are usually necessary for determination, and fruiting specimens are of little value unless accompanied by flowers.

The common European laurel, *Laurus nobilis* L. ("laurel") is cultivated in Mexico as a shade tree. The writer has seen no material of *Acrodielidium mexicanum* and *A. misanilae* recently described from Veracruz by Brandegee.¹ The genus is not otherwise known from Mexico, and it is probable that both these species belong to genera listed below.

The only Mexican representative of the family not listed here is *Cassytha filiformis* L., a yellowish leafless twining parasitic plant, in general appearance much like dodder (*Cuscuta* spp.).

Two well-known Old World trees of the family are *Cinnamomum camphora* (L.) Nees & Eberm., camphor ("alcáñfor"), and *C. zeylanicum* Nees, cinnamon ("canela").

Inflorescence racemose, subtended by an involucre of bracts.

Bracts of the involucre decussate-opposite.....1. LITSEA.

Bracts imbricate.....2. UMBELLULARIA.

Inflorescence usually paniculate, sometimes racemose or capitate, not involucrate.

Sepals very unequal, the outer ones shorter.....3. PERSEA.

Sepals equal or nearly so.

Anthers 2-celled.

Stamens all with introrse anthers.....4. SASSAFRIDIUM.

Stamens partly with extrorse anthers.

Staminodia of the innermost stamens large.....5. HUFELANDIA.

Staminodia of the innermost stamens minute or aborted.

6. MISANTECA.

Anthers 4-celled.

¹ Univ. Calif. Bot. 6: 497. 1919.

Staminodia of the inner series of stamens well developed, sagittate.

Sepals usually deciduous.....3. *PERSEA*.

Sepals persistent.....7. *PHOEBE*.

Staminodia of the inner stamens minute or none, stipelike.

Anther cells in pairs, one pair above the other.....8. *OCOTEA*.

Anther cells all inserted at nearly the same height...9. *NECTANDRA*.

1. *LITSEA* Lam. Encycl. 3: 574. 1789.

REFERENCE: Bartlett, Proc. Amer. Acad. 44: 597-602. 1909.

Shrubs or trees; leaves comparatively small; inflorescence short-racemose, few-flowered, axillary, in bud surrounded by an involucre of 4 to 6 broad bracts; perianth 6 or 4-lobed; stamens usually 9 or 12, those of the first and second ranks eglandular, those of the third and fourth ranks usually with a stipitate gland on each side at the base; anthers introrsely 4-celled.

The aromatic leaves of all the species are used extensively for flavoring food. Leaves copiously pubescent beneath.

Inflorescences corymbose.....1. *L. neesiana*.

Inflorescences solitary or fasciculate.....2. *L. orizabae*.

Leaves glabrous or nearly so.

Leaf blades rounded or subcordate at base.

Inflorescences corymbose or paniculate.

Pedicels much longer than the flowers.....3. *L. pedicellata*.

Pedicels shorter than the flowers.....4. *L. pringlei*.

Inflorescences solitary or fasciculate.

Leaf blades rounded-ovate, obtuse.....5. *L. parvifolia*.

Leaf blades ovate-lanceolate, acute.....6. *L. novoleontis*.

Leaf blades acute or obtuse at base.

Leaves usually glaucous beneath, more than 2 cm. wide; inflorescences corymbose.....7. *L. glaucescens*.

Leaves not glaucous beneath, 1.5 cm. wide or narrower; inflorescences solitary.....8. *L. schaffneri*.

1. *Litsea neesiana* (Schauer) Hemsl. Biol. Centr. Amer. Bot. 3: 76. 1882.

Tetranthera neesiana Schauer, Linnaea 19: 712. 1847.

? *Tetranthera villosa* Mart. & Gal. Bull. Acad. Brux. 10²: 359. 1843.

Veracruz to Sinaloa, Oaxaca, and Chiapas.

Tree or shrub, 2 to 9 meters high; leaves ovate, 2.5 to 5 cm. long, acute or acuminate, green and glabrous above, pale and pubescent beneath. "Laurel" (Chiapas); "laurel de la sierra" (Sinaloa).

One collection placed here by the writer was referred by Bartlett to *L. guatemalensis* Mez. The leaves are used in Sinaloa as a remedy for colic pains.

2. *Litsea orizabae* (Mart. & Gal.) Mez. Jahrb. Bot. Gart. Mus. Berlin 5: 479. 1889.

Persca orizabae Mart. & Gal. Bull. Acad. Brux. 10²: 358. 1843.

Known only from Mount Orizaba, at an altitude of about 4,000 meters.

Shrub; leaves ovate, about 7.5 cm. long, acute.

3. *Litsea pedicellata* Bartlett, Proc. Amer. Acad. 44: 598. 1909.

Known only from the type locality, mountains near Saltillo, Coahuila, at an altitude of 2,135 meters.

Shrub, 1 to 2 meters high; leaves orbicular-ovate, 2 to 3 cm. long, obtuse.

4. *Litsea pringlei* Bartlett, Proc. Amer. Acad. 44: 598. 1909.

Nuevo León and San Luis Potosí; type from limestone ledges of the Sierra Madre above Monterrey, Nuevo León, altitude 850 meters.

Shrub, 1 to 2 meters high; leaves ovate-lanceolate or ovate, 3 to 5 cm. long, acute or attenuate.

5. *Litsea parvifolia* (Hemsl.) Mez, Jahrb. Bot. Gart. Mus. Berlin 5: 481. 1889.
Umbellularia parvifolia Hemsl. Biol. Centr. Amer. Bot. 3: 77. 1882.
 Coahuila and perhaps elsewhere.
 Shrub; leaves 1.3 to 4 cm. long, green above, pale beneath.

6. *Litsea novoleontis* Bartlett, Proc. Amer. Acad. 44: 601. 1909.
 Nuevo León and San Luis Potosí; type from the Sierra Madre near Monterrey.
 Shrub, 1 to 5 meters high; leaves ovate or lance-ovate, 2.5 to 5.5 cm. long; fruit black. "Laurel" (San Luis Potosí).

Tea made from the leaves is used as a beverage, with the addition of sugar and milk. It is used also for asthma and to induce perspiration.

7. *Litsea glaucescens* H. B. K. Nov. Gen. & Sp. 2: 168. 1817.

Litsea cervantesii H. B. K. Nov. Gen. & Sp. 2: 168. 1817.

Tetranthera glaucescens subsolitaria Meissn. in DC. Prodr. 15¹: 193. 1864.

Litsea glaucescens subsolitaria Hemsl. Biol. Centr. Amer. Bot. 3: 76. 1882.

Tamaulipas to Veracruz, Chiapas, and Tepic; type from Acapulco. Central America.

Tree or shrub, sometimes 6 meters high; leaves ovate or lanceolate, 5 to 8 cm. long, acute or attenuate, petiolate, glaucous or green beneath. "Laurel" (Oaxaca, Veracruz, Chiapas, Guatemala, etc.); "sufricaya" or "sufricago" (Veracruz, etc.); "ziz-uch" (Chiapas, *Scler*).

A tea made from the leaves is used as a beverage, as in the other species, also for colic, etc. *L. glaucescens subsolitaria* is a form with solitary or fasciculate (rather than corymbose) inflorescences.

8. *Litsea schaffneri* Bartlett, Proc. Amer. Acad. 44: 601. 1909.

San Luis Potosí and Guanajuato; type from San Miguelito Mountains, San Luis Potosí.

Shrub 2 to 3 meters high; leaves narrowly lanceolate, 2 to 5 cm. long, acute. "Laurel" (San Luis Potosí).

2. UMBELLULARIA Nutt. N. Amer. Sylv. 1: 87. 1842.

1. *Umbellularia californica* (Hook. & Arn.) Nutt. N. Amer. Sylv. 1: 87. 1842.

Tetranthera californica Hook. & Arn. Bot. Beechey Voy. 159. 1833.

Probably in northern Baja California, although no specimens from the Mexican side of the Boundary have been seen. California.

Shrub or tree, sometimes 30 meters high, with a trunk 1.6 meters in diameter, the bark scaly, brown; leaves oblong-lanceolate, 5 to 14 cm. long, acute; flowers yellow; fruit yellowish, 2 to 3 cm. long; wood light brown, strong, hard, its specific gravity about 0.65.

The fruit was eaten by the California Indians, and the leaves are sometimes used for seasoning food. The wood is used for furniture, boats, etc.

3. PERSEA Gaertn. f. Fruct. & Sem. 3: 222. 1805.

REFERENCES: Blake, A preliminary revision of the North American and West Indian avocados, Journ. Washington Acad. Sci. 10: 9-21. 1920; Popenoe, in Bailey. Stand. Cycl. Hort. 436-438, 2555-2556. 1914-16; G. N. Collins, The avocado, a salad fruit from the tropics, U. S. Dept. Agr. Bur. Pl. Ind. Bull. 77. 1905.

Usually trees; flowers in axillary or subterminal, pedunculate panicles; perianth 6-lobed, the 3 outer lobes often smaller than the inner ones; perfect stamens 9, those of the first and second series eglandular, those of the third series with a gland on each side at the base; anthers extrorsely 4-celled; fruit small or often very large.

Species nos. 5 to 9 are referred by some authors to a separate genus, *Nothaphoebe*.

Perianth lobes equal or subequal; flowers comparatively large.

Ovary glabrous; staminal glands sessile-----1. *P. cinerascens*.
Ovary pubescent; staminal glands stipitate.

Pedicels 8 to 15 mm. long; stipe of staminode 2 to 3 times as long and essentially as broad as the elliptic head. Branchlets densely ferruginous-tomentose-----2. *P. schiedeana*.

Pedicels 1 to 6 mm. long; staminode with triangular head much broader than the stipe.

Branchlets fulvous-villous; leaves floccose-tomentose beneath; filaments only one-third longer than the anthers-----3. *P. floccosa*.

Branchlets glabrous to pilosulous; leaves glabrous to pilosulous beneath; filaments 2 to 3 times as long as the anthers.

Leaves not anise-scented; perianth deciduous-----4. *P. americana*.

Leaves anise-(or sassafras)-scented; perianth usually persistent.

4a. *P. americana drymifolia*.

Perianth lobes unequal, the outer ones shorter; flowers small.

Leaves glabrous-----5. *P. longipes*.

Leaves pubescent, at least beneath.

Leaf blades lanceolate or oblong, about 3 cm. wide.

Leaves minutely sericeous beneath, not glaucescent----6. *P. veraguensis*.

Leaves not sericeous beneath, glaucous or glaucescent--7. *P. podadenia*.

Leaf blades mostly ovate, obovate, or elliptic, 3 to 10 cm. wide.

Pubescence of the lower surface of the leaves coarse, loose; inflorescence fulvous-villous-----8. *P. chamissonis*.

Pubescence of the lower surface of the leaves fine, appressed; inflorescence sericeous-----9. *P. liebmanni*.

1. *Persea cinerascens* Blake, Journ. Washington Acad. Sci. 10: 18. f. 2. 1920.
Known only from the type locality, Zacuapan, Veracruz.

Tree; branchlets densely pilose-tomentose; leaf blades elliptic to oval-oblong or obovate, 10 to 20 cm. long, 5 to 8 cm. wide, acute or short-pointed, pilosulous beneath; pedicels 1 mm. long; perianth 7 to 8.5 mm. long; fruit subglobose, glaucous-blue, about 12 mm. in diameter.

2. *Persea schiedeana* Nees, Syst. Laurin. 130. 1836.

Persea gratissima schiedeana Meissn. in DC. Prodr. 15¹: 53. 1864.

Persea pittieri Mez, Bot. Jahrb. Engler 30: Beibl. 67: 15. 1901.

Veracruz and probably elsewhere; type from Misantla, Guatemala to Panama.

Tree, 15 to 20 or rarely even 50 meters high; leaf blades obovate to oval-obovate or oval, 12.5 to 30 cm. long, 7 to 15 cm. wide, obtuse or rounded and short-pointed at apex, beneath glaucous and pilosulous; perianth 6 to 8 mm. long. "Chinini" (Veracruz); "coyó," "coyoté," "kiyó," "kiyau," "chucte," "chaucte," "shucte," "kotyó," (Guatemala); "aguacatón" (Panama).

This species is cultivated in Veracruz and is probably also indigenous there. The flowers are pale greenish yellow, turning crimson at the base in age, or sometimes light rose. The stamens also turn crimson with age, and the glands are bright orange. The flowers of *P. americana* are said to be pale green, not changing color with age.

The fruit is much like that of the common avocado, and equally variable in form and quality. The skin is thick but leathery and pliable; the flesh brownish white, of fine oily texture. The flavor is similar to that of the common avocado but distinguishable, suggesting that of a ripe coconut. The cotyledons when cut are rose-pink; in *P. americana* they are whitish.

3. *Persea floccosa* Mez, Jahrb. Bot. Gart. Berlin 5: 148. 1889.

Known only from the type locality, Chinantla, Oaxaca.

Tree; leaf blades ovate, 11 to 17 cm. long, 5 to 7.5 cm. wide, acuminate, glaucescent beneath; perianth 5 mm. long.

4. *Persea americana* Mill. Gard. Dict. ed. 8. 1768.

Laurus persea L. Sp. Pl. 370. 1753.

Persea gratissima Gaertn. f. Fruct. & Sem. 3: 222. pl. 221. 1807.

Persea persea Cockerell, Bull. Torrey Club 19: 95. 1892.

Commonly cultivated in Mexico, and probably native in the southern part. Widely cultivated in tropical regions.

Tree, sometimes 20 meters high, with a trunk 60 cm. in diameter, the bark rather thin. light gray, fissured; leaves oval to elliptic, 10 to 30 cm. long, 3.5 to 20 cm. wide, acute or obtuse, copiously pubescent when young; flowers greenish; perianth 5.5 to 7 mm. long; fruit oval or pear-shaped, sometimes 18 cm. long, smooth, with thick oily pulp and a very large seed; wood rather soft, fine-grained, reddish brown or light brown, its specific gravity about 0.65.

The fruit is known in Mexico as "aguacate" or "ahuacate," from the Nahuatl "ahuacatl" ¹ or "ahuacuahuatl." The following additional names are used, some of them referring to horticultural varieties: "Aguacate oloroso" (Veracruz, Oaxaca); "on" (Yucatán, Maya); "aguacate xinene," "xinene" (Oaxaca, *Reko*); "tonalahuate" (Morelos, Veracruz, *Ramirez*); "cupanda" (Tarascan); "aguacatillo" (Michoacán, Jalisco); "pahuatl" (the name of a large variety, according to Starr ²); "pagua" (a large variety, *Robelo*); "koidium," "koitum," "kuitm" (Mixe, the fruit, *Belmar*; the tree is "kuitm-keip"); "ttatzán" (Otomí, *Buelna*); "palta" (Colombia, Ecuador, Peru; the Quechua name; *Ramirez* reports it as in use in Mexico, but this is doubtful); "cura" (Colombia). The best English name is "avocado," a derivative of "aguacate." This word has been variously modified, the extremes being perhaps "abogado," the Spanish word for "lawyer," and "watercats," employed by some English writers. The name "alligator-pear" is sometimes applied, but this is an objectionable name. In the various Maya dialects of Central America the names employed are "o," "oj," "ju," "un," "um," and "on."

The avocado is one of the best-known of Mexican trees, having been cultivated for many centuries. It has been introduced into most tropical regions of the world, and in recent years into southern Florida and California. It is of interest to note that the Trapp avocado, the form most commonly grown in Florida, belongs to a distinct species, of unknown origin, distinguished by having the perianth glabrous within. It has been described recently by Blake ³ as *Persea leiogyne*.

Two principal horticultural forms of *Persea americana* are recognized, the "West Indian type," with smooth fruit and leathery skin, and the "Guatemalan type," with rough or warty fruit and brittle skin. There is great variation in the size and shape of the fruit.

In tropical America the trees are grown from seeds, beginning to bear when four or five years old and continuing their production sometimes for 50 years or more. In modern practice the best forms are propagated by budding. A good-sized tree will produce as many as 500 fruits per year. The fruit has a pleasant flavor, and is usually eaten as a salad, with the addition of salt, pepper, vinegar,

¹This is also the Nahuatl term for testicle. It is uncertain which is the primitive meaning.

²Starr, In Indian Mexico, p. 245. 1908.

³Journ. Washington Acad. Sci. 10: 19. 1920.

and other condiments, but sometimes it is prepared with sugar or wine. It is eaten by all kinds of domestic animals.

A large number of therapeutic uses are reported for the plant. The pulp is credited with hastening the suppuration of wounds and is reputed to have aphrodisiac and emmenagogue properties. The rind is used to expel intestinal parasites. The seeds contain a milky juice which turns red on exposure, and which produces an indelible stain on linen. Ground and mixed with cheese, meal, etc., the seeds are used to poison rats and mice. An ointment of the pulverized seeds is sometimes employed as a rubefacient, and a decoction of them, or a piece of a seed placed in the cavity of a tooth, is believed to cure toothache. The leaves and bark are employed in domestic medicine because of the pectoral, stomachic, emmenagogue, resolutive, and antiperiodic properties ascribed to them. The seeds are used also for the manufacture of various trinkets.

The avocado is noted by all the early writers upon tropical American plants. Oviedo (Lib. IX, Cap. XXIII) gives a very full account of the tree and of the fruit, which he describes as superior to the pears of Castile. Acosta gives a brief account of the fruit, under the name "palta." Sahagún writes the name "auacatl," and states that there are also other kinds besides the common one: The "tlacaçlauacatl," which women nursing dare not eat, because the fruit causes diarrhoea in the children nursed; and the "quiluacatl," or "green aguacate," a form with green skin, "and very good to eat." He states that the powdered seeds were employed as a remedy for dandruff. Hernández also gives a long account¹ of the avocado, in a chapter entitled "De *Ahuaca Quauhiti*, seu Arbore Querciformi butiraceo fructu." He describes the leaves as fragrant, and consequently doubtless refers to the Mexican type, *Persea americana drymifolia*. He states that by pressure oil was obtained from the seeds and used to cure eruptions of the skin.

4a. *Persea americana drymifolia* (Schlecht. & Cham.) Blake, Journ. Washington Acad. Sci. 10: 15. 1920.

Persea drymifolia Schlecht. & Cham. Linnaea 6: 365. 1831.

Nuevo León to Sinaloa, Veracruz, and Puebla; type from Papantla, Veracruz. Guatemala; cultivated in Ecuador.

Leaves usually smaller than in *P. americana*, elliptic or oval, acute or acuminate; fruit thin-skinned. "Aguacate oloroso."

This is the common Mexican avocado, and the vernacular names reported above apply also, presumably, to the variety.

5. *Persea longipes* (Schlecht.) Meissn. in DC. Prodr. 15¹: 55. 1864.

Laurus longipes Schlecht. Linnaea 7: 390. 1832.

Veracruz; type from Hacienda de la Laguna; perhaps also in Guerrero.

Tree or shrub; leaves oblong or lanceolate, 8 to 15 cm. long, attenuate, green and lustrous above, paler beneath.

6. *Persea veraguensis* Seem. Bot. Voy. Herald 193. 1854.

Oaxaca and Chiapas. Type from Chiriquí, Panama.

Tree, sometimes 20 meters high; leaves 8 to 17 cm. long, acuminate, with conspicuous venation, the pubescence of the lower surface somewhat lustrous; flowers sericeous.

7. *Persea podadenia* Blake, Contr. Gray Herb. n. ser. 52: 62. 1917.

Sonora, Durango, and Jalisco; type from San Ramón, Durango.

Shrub or tree; leaves 9 to 16 cm. long, acute or acutish, pale beneath, petiolate. "Laurel" (Jalisco); "laurel de la sierra" (Sonora).

Leaves with a flavor similar to that of sassafras; used for seasoning food.

¹ Thesaurus 89. 1651.

8. *Persea chamissonis* Mez, Jahrb. Bot. Gart. Mus. Berlin 5: 168. 1889.
San Luis Potosí, Veracruz, and Oaxaca; type from Chiconquiaco, Veracruz.
Small tree; leaves lance-oblong to obovate-oval, 5.5 to 11 cm. long, obtuse or acute, copiously pubescent.
9. *Persea liebmanni* Mez, Jahrb. Bot. Gart. Mus. Berlin 5: 166. 1889.
Sinaloa to Oaxaca; type from Chinantla, Oaxaca.
Tree; leaves mostly oval or oval-ovate, 10 to 18 cm. long, acute or obtuse, very thick; fruit globose, 1 cm. in diameter.

4. **SASSAFRIDIUM** Meissn. in DC. Prodr. 15¹: 171. 1864.

1. *Sassafridium macrophyllum* Rose, Contr. U. S. Nat. Herb. 1: 355. 1895.
Sinaloa to Veracruz and Tabasco; type from Manzanillo.
Tree, sometimes 10 meters high, nearly glabrous; leaves lance-oblong to ovate or oval-oblong, 10 to 20 cm. long, petiolate, acute or acuminate, lustrous; flowers numerous, white, sweet-scented; perianth 6-lobed, the lobes subequal; perfect stamens 9, those of the first and second series eglandular, those of the third series with 2 glands at the base; anthers 4-celled, introrse; fruit about 1 cm. long. "Laurel," "laurel blanco" (Tabasco); "aguacatillo" (Michoacán, Guerrero); "laurelón" (Sinaloa).

5. **HUFELANDIA** Nees, Pl. Laur. Expos. 11. 1833.

1. *Hufelandia mexicana* Mez, Jahrb. Bot. Gart. Mus. Berlin 5: 20. 1889.
Veracruz and Oaxaca.
Shrub or tree; leaves elliptic or ovate, acute or acuminate, green, glabrous; perianth 6-lobed; perfect stamens 9, those of the first and second series eglandular, the anthers 2-celled, introrse, the anthers of the third series extrorse, the filaments each with 2 glands at the base.
Reported from Mexico as *H. pendula* Meisn. and *Beilschmiedia pendula* Hemsl.

6. **MISANTECA** Cham. & Schlecht. Linnaea 6: 367. 1831.

- Trees, nearly glabrous, with large leaves, these short-petiolate, acuminate; perianth 6-lobed; perfect stamens 3, connate into a fleshy column about the pistil, the anthers 2-celled; fruit large, partly inclosed in the cuplike accrescent calyx tube.

Flowers sessile, capitate.....1. *M. capitata*.
Flowers pedicellate, paniculate.....2. *M. jurgensenii*.

1. *Misanteca capitata* Cham. & Schlecht. Linnaea 6: 367. 1831.
Acrodiclidium glabrum T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 497. 1919.
Oaxaca and Veracruz; type from Misantla and Papantla, Veracruz. Guatemala.

Large tree; leaves oval to lance-oblong, 11 to 25 cm. long, thick and leathery; flower heads 1 to 1.5 cm. in diameter, very long-pedunculate; fruit 2.5 cm. long. "Laurel," "palo misanteco" (Veracruz); "laurel de la sierra" (Oaxaca).

The wood is said to be valuable for carpentry and cabinet work.

2. *Misanteca jurgensenii* Mez, Jahrb. Bot. Gart. Mus. Berlin 5: 102. 1889.
Oaxaca; type from Pinatopa.
Tree; leaves lance-oblong or oblong-oblongeolate, 14 to 20 cm. long, acute at the base, lustrous; fruit ellipsoid, 2.5 cm. long.
The fruit seated in the large calyx tube resembles an acorn and its cup.

7. **PHOEBE** Nees, Syst. Laurin. 98. 1836.

Trees or shrubs; leaves usually large, glabrous or pubescent, petiolate; flowers paniculate; perianth 6-lobed; perfect stamens 9, those of the first and second

- series eglandular, with introrsely 4-celled anthers, those of the third series each with 2 glands at the base, the anthers extrorsely 4-celled.
- Ovary pilose.....1. *P. pallescens*.
 Ovary glabrous.
- Leaves sessile, cordate.....2. *P. amplexicaulis*.
 Leaves petiolate.
- Mature leaves conspicuously soft-pilose or villous beneath, never 3-nerved.
 Filaments pilose.
- Leaves acute at base.....3. *P. psychotrioides*.
 Leaves obtuse or rounded at base.....4. *P. mollis*.
- Filaments of the outer series of stamens glabrous.
- Leaves obtuse or cordate at base.
 Filaments as long as the anthers or slightly shorter. 5. *P. betazensis*.
 Filaments very short or none.
- Anthers rectangular-quadrate.....6. *P. helicterifolia*.
 Anthers elliptic.....7. *P. nectandroides*.
- Leaves acute at base.
 Leaves lanceolate.....8. *P. bourgeauviana*.
 Leaves elliptic or subovate.....9. *P. pachypoda*.
- Mature leaves glabrous beneath or glabrate or short-tomentellous, never soft-pilose.
- Leaves pinninerved or very obscurely triplinerved, glabrous.
 Filaments less than one-third as long as the anthers.
10. *P. subtriplinervia*.
 Filaments about as long as the anthers.
 Flowers pubescent; leaves less than 3 cm. wide.
11. *P. tampicensis*.
 Flowers glabrous; leaves 4 to 6 cm. wide.....12. *P. ehrenbergii*.
- Leaves distinctly triplinerved.
 Flowers pilose.....13. *P. mexicana*.
 Flowers glabrous.
- Inflorescence equaling or longer than the leaves.....14. *P. effusa*.
 Inflorescence shorter than the leaves.
- Filaments partly pilose.....15. *P. salicifolia*.
 Filaments glabrous.....16. *P. barbeyana*.
1. *Phoebe pallescens* Mez, Jahrb. Bot. Gart. Mus. Berlin 5: 218. 1889.
 Known only from the type locality, Orizaba.
2. *Phoebe amplexicaulis* (Cham. & Schlecht.) Mez, Jahrb. Bot. Gart. Mus. Berlin 5: 216. 1889.
Persea amplexicaulis Cham. & Schlecht. Linnaea 5: 90. 1830.
 Known only from the type locality, Cerro Colorado, Veracruz.
 Leaves cordate-oblong, 11.5 cm. long, 3 cm. wide, coriaceous, glabrous, long-acuminate; inflorescence few-flowered.
3. *Phoebe psychotrioides* (H. B. K.) Mez, Jahrb. Bot. Gart. Mus. Berlin 5: 191. 1889.
Coclea psychotrioides H. B. K. Nov. Gen. & Sp. 2: 172. 1817.
 Forests of Veracruz and Oaxaca; type from Jalapa, Veracruz.
 Shrub; leaves elliptic to lance-oblong, 5 to 11 cm. long, acuminate, bright green and lustrous on the upper surface.
4. *Phoebe mollis* Mez, Jahrb. Bot. Gart. Mus. Berlin 5: 192. 1889.
 Described from Mexico, the locality not known.
 Leaves lanceolate, about 7.5 cm. long, acute, white-tomentose beneath.

5. *Phoebe betazensis* Mez, Jahrb. Bot. Gart. Mus. Berlin 5: 192. 1889.
Oaxaca; type from Betaza. Guatemala.
Shrub, or perhaps sometimes a tree; leaves elliptic, oblong, or obovate, 8 to 20 cm. long, acuminate, pilose on both surfaces; panicles large, long-pedunculate; fruit 1.5 to 2 cm. long.
6. *Phoebe helicterifolia* (Meissn.) Mez, Jahrb. Bot. Gart. Mus. Berlin 5: 193. 1889.
Oreodaphne helicterifolia Meissn. in DC. Prodr. 15¹: 123. 1864.
Described from San Bartolo, Chiapas. Guatemala to Costa Rica.
Shrub or tree; leaves oblong, lanceolate, or elliptic, 5 to 10 cm. long, copiously pubescent, acute or acuminate, short-petiolate. "Quizarrá amarilla" (Guatemala, Costa Rica).
7. *Phoebe nectandroides* Mez, Jahrb. Bot. Gart. Mus. Berlin 5: 194. 1889.
Veracruz, Oaxaca, and Chiapas; type from Orizaba. Central America.
Tree, about 12 meters high; leaves obovate or broadly elliptic, 15 to 25 cm. long, pilose; branches of the inflorescence glabrous.
Previously reported from Mexico as *Ocotea umbrosa* Mart.
8. *Phoebe bourgeauviana* Mez, Jahrb. Bot. Gart. Mus. Berlin 5: 194. 1889.
Known only from the type locality, Córdoba, Veracruz.
Leaves lanceolate, about 10 cm. long, soft-pubescent beneath, acuminate; fruit about 1 cm. long.
9. *Phoebe pachypoda* (Nees) Mez, Jahrb. Bot. Gart. Mus. Berlin 5: 196. 1889.
Persea pachypoda Nees, Linnaea 21: 490. 1847.
Oreodaphne benthamiana Nees, Linnaea 21: 521. 1847.
Phoebe hartwegii Meissn. in DC. Prodr. 15¹: 30. 1864.
Persea hartwegii Hemsl. Biol. Centr. Amer. Bot. 3: 72. 1882.
Phoebe benthamiana Mez, Jahrb. Bot. Gart. Mus. Berlin 5: 195. 1889.
San Luis Potosí, Veracruz, and Guanajuato; type from El Banco.
Shrub or tree, 3 to 7 meters high; leaves 7.5 to 12 cm. long, petiolate, acuminate, very thick, green above, pale and soft-pilose beneath; fruit 1 to 1.5 cm. long. "Aguacate cimarrón."
Fruit said to be edible.
10. *Phoebe subtriplinervia* (Meissn.) Standl.
Oreodaphne subtriplinervia Meissn. in DC. Prodr. 15¹: 125. 1864.
Ocotea subtriplinervia Hemsl. Biol. Centr. Amer. Bot. 3: 74. 1882.
Phoebe galeottiana Mez, Jahrb. Bot. Gart. Mus. Berlin 5: 200. 1889.
Veracruz; type from Jalapa.
Shrub or perhaps a tree, glabrous; leaves lanceolate, 4 to 6 cm. long, acuminate, coriaceous; flowers subracemose, white or yellowish, 2 mm. long.
11. *Phoebe tampicensis* (Meissn.) Mez, Jahrb. Bot. Gart. Mus. Berlin 5: 200. 1889.
Oreodaphne tampicensis Meissn. in DC. Prodr. 15¹: 136. 1861.
Ocotea tampicensis Hemsl. Biol. Centr. Amer. Bot. 3: 74. 1882.
Ocotea angustata Blake, Contr. Gray Herb. n. ser. 52: 63. 1917.
Tamaulipas and San Luis Potosí; type from Tampico.
Tree, 6 to 10 meters high; leaves linear-lanceolate, 6 to 11 cm. long, attenuate, dark green, lustrous; fruit 1.5 to 2 cm. long.
12. *Phoebe ehrenbergii* Mez, Jahrb. Bot. Gart. Mus. Berlin 5: 201. 1889.
Type from Temascaltepec, State of Mexico; perhaps also in Oaxaca.
Leaves elliptic or elliptic-lanceolate, 12 to 16.5 cm. long, acute, glabrous.
13. *Phoebe mexicana* Meissn. in DC. Prodr. 15¹: 31. 1864.
Persea mexicana Hemsl. Biol. Centr. Amer. Bot. 3: 72. 1882.

Veracruz; type from Jalapa. Reported from Costa Rica.

Large tree; leaves oblong-lanceolate or oblong, 5 to 12.5 cm. long, acuminate, coriaceous, glabrous. "Quechol aguacate."

14. *Phoebe effusa* Meissn. in DC. Prodr. 15¹: 33. 1864.

Persea effusa Hemsl. Biol. Centr. Amer. Bot. 3: 71. 1882.

Veracruz. Central America.

Tree, sometimes 30 meters high, with a trunk a meter in diameter, the bark grayish; leaves lanceolate to elliptic-oblong, 6 to 14 cm. long, acuminate or obtuse; flowers greenish, ill-scented; wood light brown, moderately soft, light, weak, fine-grained. "Sigua blanca" (Panama).

15. *Phoebe salicifolia* Nees, Linnaea 21: 488. 1847.

Persea salicifolia Hemsl. Biol. Centr. Amer. Bot. 3: 71. 1864.

Known only from the type locality, Regla, Hidalgo.

Tree, 6 meters high; leaves lanceolate or oblong-lanceolate, 6 to 10 cm. long, acuminate.

16. *Phoebe barbeyana* Mez, Jahrb. Bot. Gart. Mus. Berlin 5: 209. 1889.

Known only from the type locality, Orizaba, Veracruz.

Leaves elliptic, 8 to 11 cm. long, acuminate, glabrate; fruit about 1 cm. long.

8. *OCOTEA* Aubl. Pl. Guian. 2: 780. 1775.

Trees or shrubs with coriaceous leaves; flowers in axillary or subterminal panicles; perianth 6-lobed; perfect stamens 9, those of the first and second series eglandular, the anthers introrsely 4-celled, those of the third series minute or sometimes wanting; fruit at first inclosed in the indurate perianth tube, later exerted.

Flowers glabrous-----1. *O. cernua*.

Flowers pubescent.

Flowers dioecious-----2. *O. puberula*.

Flowers perfect.

Anthers of the two outer series sessile, foliose, not contracted at base.

Leaves mostly 3.5 to 5 cm. wide, obtuse or acutish---3. *O. veraguensis*.

Leaves 7 to 15 cm. wide, acuminate-----4. *O. perseifolia*.

Anthers of the two outer series borne on filaments, or sessile but contracted at the base, not foliose.

Leaves tomentellous beneath, broadly elliptic-----5. *O. rubriflora*.

Leaves barbate beneath in the axils of the veins, lanceolate or lance-elliptic.

Staminodia conspicuous, white-pilose-----6. *O. effusa*.

Staminodia none-----7. *O. klotzschiana*.

1. *Ocotea cernua* (Nees) Mez, Jahrb. Bot. Gart. Mus. Berlin 5: 377. 1889.

Oreodaphne cernua Nees, Syst. Laurin. 424. 1836.

Tabasco and Campeche. Lesser Antilles; Central America.

Tree, 6 to 8 meters high, glabrous; leaves elliptic or oval-elliptic, 8 to 17 cm. long, acuminate, petiolate. "Laurel de bajo" (Campeche).

2. *Ocotea puberula* Nees, Syst. Laurin. 472. 1836.

Strychnodaphne puberula Nees, Linnaea 8: 39. 1833.

Reported from Veracruz. Widely distributed in South America.

Leaves elliptic-oblong or lance-oblong, 7.5 to 20 cm. long, acute or acuminate.

3. *Ocotea veraguensis* (Meissn.) Mez, Jahrb. Bot. Gart. Mus. Berlin 5: 240. 1889.

Sassafridium veraguense Meissn. in DC. Prodr. 15¹: 171. 1864.

Chiapas. Central America; type from Panama.

Small or medium-sized tree, the bark grayish, smooth or slightly rugose, aromatic, with an odor like cinnamon; leaves oblong-elliptic, 7 to 12 cm. long, glabrous; flowers white, sweet-scented; fruit 1.5 cm. long; wood hard, moderately heavy, very close-grained, durable, taking a good polish. "Canelo," "canelillo" (Costa Rica); "sigua canelo" (Panama); "palo colorado" (Nicaragua).

4. *Ocotea perseifolia* Mez & Donn. Smith, Bot. Gaz. 20: 10. 1895.

Forests of Tabasco. Guatemala; type from Yzabal.

Tree; leaves ovate, oblong-ovate, or oval-ovate, 15 to 30 cm. long, acuminate; panicles large, many-flowered. "Laurel de chile" (Tabasco).

5. *Ocotea rubriflora* Mez, Jahrb. Bot. Gart. Mus. Berlin 5: 279. 1889.

Known only from the type locality, Teapa, Tabasco.

Tree; leaves broadly elliptic, about 23 cm. long, acuminate.

6. *Ocotea effusa* (Meissn.) Hemsl. Biol. Centr. Amer. Bot. 3: 73. 1882.

Oreodaphne effusa Meissn. in DC. Prodr. 15¹: 120. 1864.

Oaxaca; type from San Pedro Nolasco.

Leaves lanceolate, 5 to 10 cm. long, long-acuminate.

7. *Ocotea klotzschiana* (Nees) Hemsl. Biol. Centr. Amer. Bot. 3: 73. 1864.

Oreodaphne klotzschiana Nees, Linnaea 21: 523. 1847.

Veracruz and perhaps elsewhere.

Tree or shrub; leaves lanceolate or oblong, 5 to 8.5 cm. long, narrowly acuminate, lustrous.

9. **NECTANDRA** Roland; Rottb. Act. Litt. Univ. Hafn. 1: 279. 1778.

Trees or shrubs with coriaceous leaves; flowers in axillary or terminal, pedunculate cymes; perianth 6-lobed; perfect stamens 9, those of the first and second series eglandular, the anthers introrsely 4-celled, those of the third series with glands at base, the anthers extrorsely 4-celled.

Nectandra rodiaei Hook., of northern South America, is the greenheart, whose wood is valuable, especially because of its great durability in water. The bark contains the alkaloids bebeerine, sipirine, and nectrandrine. It is tonic, somewhat astringent, and febrifuge, somewhat resembling cinchona in properties although greatly inferior in quality. It has been used in the treatment of intermittent and remittent fevers. The Indians of British Guiana are said to make a kind of bitter bread from the seeds, which contain nearly 50 per cent of starch.

Anthers of the outer series sessile. Flowers pubescent.

Ovary densely tomentose.....1. *N. sinuata*.

Ovary glabrous or nearly so.

Style equaling or longer than the ovary.....2. *N. reticulata*.

Style shorter than the ovary.

Young leaves conspicuously yellowish-tomentellous on the upper surface.

3. *N. pallida*.

Young leaves glabrous or nearly so on the upper surface.

4. *N. glabrescens*.

Anthers of the outer series conspicuously stipitate.

Filaments of the first and second series of stamens pilose.

Leaves not reticulate, sericeous when young.....5. *N. nitida*.

Leaves reticulate, not sericeous.....6. *N. sanguinea*.

Filaments of the first and second series of stamens glabrous.

Style decidedly longer than the ovary; leaves glabrous...7. *N. rectinervia*.

Style equaling or longer than the ovary; leaves more or less pubescent beneath.

Flowers 6 to 9 mm. broad.....8. *N. concinna*.

Flowers 4 to 6 mm. broad.....9. *N. pichurim*.

1. *Nectandra sinuata* Mez, Jahrb. Bot. Gart. Mus. Berlin 5: 402. 1889.
Oaxaca. Central America; type from Guatemala.
Tree, 12 to 15 meters high; leaves oblong, obovate, or obovate-oval, 10 to 25 cm. long, petiolate, obtuse or acute, velvety-pilose; flowers large, white within, red outside; fruit about 3 cm. long. "Aguacatillo" (Oaxaca); "quizarra hedionda" (Costa Rica).
2. *Nectandra reticulata* (Ruiz & Pav.) Mez, Jahrb. Bot. Gart. Mus. Berlin 5: 404. 1889.
Laurus reticulata Ruiz & Pav. Fl. Peruv. Chil. 4: pl. 348. 1802.
Ocotea mollis H. B. K. Nov. Gen. & Sp. 2: 164. 1817.
Nectandra mollis Nees, Syst. Laurin. 287. 1836.
Oaxaca and Veracruz. Central America and South America; type from Peru.
Tree, sometimes 40 meters high; leaves elliptic-oblong, 15 to 25 cm. long, acute or acuminate, puberulent, with conspicuous venation; flowers white.
3. *Nectandra pallida* Nees, Linnaea 21: 510. 1847.
Michoacán; also reported from Mexico, the locality not indicated but probably in Veracruz. British Guiana.
Leaves lanceolate, about 11 cm. long, acuminate, tomentellous.
4. *Nectandra glabrescens* Benth. Bot. Voy. Sulph. 161. 1844.
Tepic to Guerrero, the type region. Reported from Central America and Colombia.
Tree, 8 to 14 meters high; leaves lance-oblong to elliptic, 10 to 18 cm. long, acuminate, lustrous; flowers white.
5. *Nectandra nitida* Mez. Jahrb. Bot. Gart. Mus. Berlin 5: 461. 1889.
Type from western Mexico, the locality not indicated. Panama.
Tree, 12 to 15 meters high; leaves ovate or elliptic, about 12.5 cm. long, acuminate, sericeous when young, glabrate in age; fruit subglobose, 6 mm. long.
6. *Nectandra sanguinea* Rottb. Act. Litt. Univ. Hafn. 1: 279. 1778.
Ocotea salicifolia H. B. K. Nov. Gen. & Sp. 2: 166. 1817.
Ocotea globosa Cham. & Schlecht. Linnaea 6: 366. 1831.
Tamaulipas to Tabasco. Central America and northern South America; type from Surinam.
Shrub or small tree, sometimes 8 meters high, with a trunk nearly a meter in diameter; leaves lanceolate to elliptic, 7 to 15 cm. long, obtuse to attenuate, petiolate, lustrous; flowers white or pinkish; fruit globose, 1 cm. in diameter, black. "Piesito de paloma" (Tabasco); "aguacatillo" (Tamaulipas).
Specimens from Yucatán, reported by Mez as *N. coriacea* (Swartz) Griseb., probably belong here. *N. loesenerii* Mez. (Bull. Herb. Boiss. II. 5: 243. 1905), from Veracruz, is closely related, judging from the description.
7. *Nectandra rectinervia* Meissn. in DC. Prodr. 15¹: 158. 1864.
Veracruz. Central America and northern South America; type from Cumaná, Venezuela.
Tree; leaves elongate-oblong, 10 to 20 cm. long, long-acuminate; flowers white or lilac.
8. *Nectandra concinna* Nees, Syst. Laurin. 322. 1836.
Veracruz and Oaxaca. Central and South America.
Tree; leaves elliptic or oblong, 9 to 16 cm. long, acute or acuminate; flowers white. "Angelino aceiteno" (Venezuela).

9. *Nectandra pichurim* (H. B. K.) Mez, Jahrb Bot. Gart. Mus. Berlin 5: 449. 1889.

Ocotca pichurim H. B. K. Nov. Gen. & Sp. 2: 266. 1817.

Reported from Mexico by Mez, the localities not stated. Panama and South America.

Shrub or tree, sometimes 20 meters high, with white bark; leaves lanceolate or ovate-lanceolate, 10 to 19 cm. long, long-acuminate; flowers white, fragrant; fruit globose, 6 mm. in diameter.

47. HERNANDIACEAE. *Hernandia* Family.

Trees or shrubs; leaves alternate, entire or lobed, estipulate, petiolate; flowers inconspicuous, cymose or paniculate, unisexual; perianth 4 to 10-lobed; corolla none; stamens as many as the perianth lobes, 2-celled; fruit 1-seeded.

Leaves entire; fruit surrounded by a fleshy involucre; flowers in clusters of 3 surrounded by an involucre-----1. **HERNANDIA**.

Leaves usually lobed; fruit nutlike, 2 of the calyx lobes persistent, developing into winglike appendages; flowers not involucre-----2. **GYROCARPUS**.

1. **HERNANDIA**¹ L. Sp. Pl. 981. 1753.

1. *Hernandia guianensis* Aubl. Pl. Guian. 2: 848. 1775.

Veraacruz. Costa Rica to the Guianas.

Tree, about 8 meters high; leaves ovate to rounded-oval, 10 to 18 cm. long, 6 to 12 cm. wide, rounded or subcordate at base, rounded and short-pointed at apex, glabrous or somewhat puberulent beneath, long-petiolate; flowers in long-stalked cymes, finely tomentulose, white. "Aguacatillo" (Costa Rica).

A single Mexican specimen has been seen by the writer, collected by Liebmann in dense forests near Pital. The specimen is in poor condition, and the specific determination consequently very doubtful.

2. **GYROCARPUS** Jacq. Stirp. Amer. 282. 1763.

1. *Gyrocarpus americanus* Jacq. Stirp. Amer. 282. pl. 178, f. 80. 1763.

Gyrocarpus jacquini Roxb. Pl. Corom. 1: 2. pl. 1. 1795.

Gyrocarpus jacquini schiedeii Schlecht. Linnaea 19: 399. 1842.

Veraacruz to Yucatán, Oaxaca, and Tepic. Central America, Colombia, and Venezuela; tropical Africa, Asia, and Australia.

Large or medium-sized tree, sometimes 20 meters high, with thick branches; leaves alternate, long-petiolate, often 30 cm. wide or larger, entire or palmately lobed; flowers small, unisexual, in broad cymes; calyx lobes accrescent in fruit and becoming 10 to 12 cm. long and about 1 cm. wide. "Palo hediondo" (Oaxaca, Guerrero, Morelos); "quitlacoctli," "quitlacotli" (Nahuatl); "xkis" or "ciis" (Yucatán, Maya); "babá" (Oaxaca, *Reko*); "palo del zopilote" (Oaxaca); "volador" (Yucatán, Venezuela, Colombia); "talalate," "gallito," "caballitos" (Nicaragua).

The wood is white and very soft and light, a cubic foot weighing about 23 pounds. It is said to take paint and varnish well, and in some places is used for making toys and light boxes. In India the seeds are strung as necklaces and rosaries.

¹ The genus was named for Francisco Hernández; see p. 10.

48. PAPAVERACEAE. Poppy Family.

Shrubs or small trees with colored juice; leaves alternate, entire, dentate, or lobate; flowers perfect; petals 4 or 6, sometimes none; stamens numerous; fruit a 1-celled capsule.

Herbaceous representatives of several other genera occur in Mexico.

Leaves very spiny; sepals 3. Petals large, yellow-----1. ARGEMONE.

Leaves not spiny; sepals 2.

Petals large, yellow; leaves entire, coriaceous-----2. DENDROMECON.

Petals none; leaves lobed or dentate, membranaceous-----3. BOCCONIA.

1. ARGEMONE L. Sp. Pl. 508. 1753.

1. *Argemone fruticosa* Thurb.; A. Gray, Mem. Amer. Acad. n. ser. 5: 306. 1855.

Coahuila; type from La Peña.

Shrub, 45 to 75 cm. high; leaves 2.5 to 4 cm. long, sessile, shallowly lobed, very glaucous, the lobes tipped with slender yellow spines; flowers pale yellow, 7 to 8 cm. broad.

Several other species of the genus are found in Mexico, but they are all herbs. They are known by the vernacular names "chicalote" and "cardo santo."

2. DENDROMECON Benth. Trans. Hort. Soc. Lond. II. 1: 407. 1834.

1. *Dendromecon rigidum* Benth. Trans. Hort. Soc. Lond. II. 1: 407. 1834.

Northern Baja California. California.

Shrub, 0.5 to 2.5 meters high; leaves lanceolate or lance-elliptic, 3.5 to 7 cm. long, acute, nearly sessile, very thick and conspicuously veined; flowers solitary, terminal, 4 to 5 cm. broad; capsule very slender, linear, about 6 cm. long.

3. BOCCONIA L. Sp. Pl. 505. 1753.

Shrubs or small trees with yellow or reddish juice, the stems simple or sparsely branched; leaves often very large; flowers small, in large panicles; capsule small, stipitate, dehiscent to the base; seeds solitary or few.

In Mexican literature the species are much confused, since all are similar in general appearance and have the same properties. The following references to the chemical properties of the plants may be cited: E. Armendáñez, Análisis de la *Bocconia*, Estudio 4: 471; Mariano Lozano y Castro, Estudio químico de la corteza de *Bocconia*, Estudio 4: 281, 344; Villada, Estudios relativos á la *Bocconia arborea* y los alcaloides de las Papaveráceas, Naturaleza II. 2: 207-212.

Leaves entire or dentate-----1. *B. integrifolia*.

Leaves pinnatifid.

Lobes of the leaves narrow, long-attenuate-----2. *B. arborea*.

Lobes broad, rounded or acute.

Lobes acute or acutish, conspicuously dentate-----3. *B. frutescens*.

Lobes rounded at apex, entire or sinuate-dentate-----4. *B. latisejala*.

1. *Bocconia integrifolia* Humb. & Bonpl. Pl. Aequin. 1: 119. pl. 35. 1808.

Bocconia integrifolia mexicana DC. Reg. Veg. Syst. 2: 91. 1821.

Veraacruz. Central America to Peru (type locality); Jamaica.

Branched shrub, 1 to 2 meters high; leaves oblong or oblanceolate, 15 to 25 cm. long, tomentose beneath or glabrous and glaucous.

2. *Bocconia arborea* S. Wats. Proc. Amer. Acad. 25: 141. 1890.

Durango and Sinaloa to Puebla and Oaxaca; type from Lake Chapala, Jalisco. Guatemala.

Tree, 4 to 8 meters high, the trunk sometimes 60 cm. in diameter, covered with corky bark; leaves clustered at the ends of the branches, 10 to 45 cm. long or larger, with few or numerous narrow lobes, glabrous above, beneath pale and tomentose or glabrous. "Chicalote," "chicalote de árbol" (Tepic); "lora-sangre" (Michoacán, Oaxaca, etc.); "palo amarillo" (Michoacán); "árbol de Judas," "palo de Judas" (Durango, *Patoni*); "sauco" (Durango, *Palmer*); "enguande," "inguande," "engüemba" (Michoacán, Tarascan, *Ramírez*); "mano de león" (Oaxaca); "cocoxihuitl" (Jalisco, *Ramírez*); "tlacoxihuitl" (Jalisco, Michoacán, *Ramírez*); "guachilli" (*Ramírez*); "ahuacachilli" (Morelos); "palo del diablo" (Durango, Sinaloa); "palmilla" (Sinaloa).

The bark yields a yellow dye which was used by the early inhabitants of Mexico for coloring plumes and other objects. The plant contains several alkaloids similar to those obtained from the poppy plant (*Papaver somniferum* L.). These, when injected beneath the skin, cause local anesthesia, and for this purpose they have been used by surgeons in the City of Mexico, while performing operations. The wood is useless for timber or fuel, but is sometimes employed in tanning.

The species is illustrated by Hernández,¹ and described in a chapter headed "De Enguamba." He states that the plant grows about Uruapam, and that an oil extracted from the fruit is employed for dissolving tumors and cleansing ulcers. On page 158 of the Thesaurus Hernández figures and describes another plant under the heading "De Cocoxihuitl, seu herba acri." The figure may represent either *Bocconia arborea* or *B. frutescens*. Hernández's description is based upon a plant in the gardens of the King of Texcoco, where, he says, he "studied the plant for some days." He gives the meaning of the Nahuatl name as "hot-herb," but it may be that it should be translated rather "yellow-herb," an allusion to the color of the juice. He gives the following account of the names and medicinal properties of the plant: "The plant is hot and dry in the fourth degree, and possesses a certain astringency. The shoots, deprived of the bark, dissipate films and ulcers of the eyes. The juice relieves wind on the stomach, cures eruptions (as does the fruit also), and alleviates pains of cold origin. The leaves, crushed and applied as a poultice, heal old wounds and dissolve warts. Some call this tree *Quauh chilli*, because of its acrid and burning flavor, like that of the peppers called *Chilli* by the Mexicans. It grows in temperate or hot regions, as well as in gardens. Some call it also *Totolinzyochtl*, or pigeon-flower, and some *Tlacoxihuitl*, [rod-herb]."

3. *Bocconia frutescens* L. Sp. Pl. 505. 1753.

Bocconia frutescens cernua Moc. & Sessé; DC. Reg. Veg. Syst. 2: 90. 1821.

Tamaulipas, San Luis Potosí, and Veracruz. Central America to Peru; West Indies.

Shrub or tree, 1 to 7.5 meters high, the stems with large white pith, covered with smooth pale bark; leaves 12 to 40 cm. long or larger, petiolate, usually with numerous lobes, tomentose or sometimes glaucous beneath; flowers purplish; fruit usually glaucous. "Gordolobo" (Veracruz); "cuatlataya" (*Ramírez*); "calderón" (Tamaulipas); "lora-sangre" (Veracruz); "guacamayo," "tabaquillo" (Costa Rica); "palo amarillo," "palo amargo" (Cuba); "palo de pan

¹ Thesaurus 97. 1651.

cimarrón," "pan cimarrón" (Porto Rico); "curarador," "trompeto," "sarno," "mata-chande," "sarcillejo" (Colombia); "sangre de toro" (Guatemala); "sancho amargo" (Argentina, Uruguay); "yagrumo macho" (Santo Domingo). Probably some of the other names listed for *B. arborea* are applied also to this species.

The plant contains an alkaloid, protopine. The yellow or orange juice is very bitter and acrid and has a disagreeable odor. It is used for treating ulcers, skin eruptions, chilblains, bronchitis, and chronic ophthalmia, and to remove warts, and is said to have vermifuge and purgative properties. The leaves, too, are sometimes heated and applied as a poultice to wounds. In Colombia an infusion of the roots is valued as a remedy for jaundice and dropsy. In Jamaica, it is stated, the leaves are rubbed on house floors to keep away insects, and in Colombia the oil extracted from the seeds is used to destroy vermin on the head and skin.

Robelo gives as vernacular names in Mexico "cocojegiite" (from *cocoxihuitl*), "clacojegiite" (from *tlacojihuitl*), and "guachichile" or "guachichil" (from *cuau-chilli*, "tree-chile"). He states that the plants were used in pre-conquest days to adorn the temples.

4. *Bocconia latispala* S. Wats. Proc. Amer. Acad. 25: 141. 1890.

Nuevo León; type from Guajuco.

Plants 1 to 2 meters high, with numerous stems; leaves 14 to 30 cm. long, with few broad lobes, pale beneath. "Mala mujer."

This plant is said to be a herbaceous annual, but it is so closely similar to the other species, all of which are fruticose, that it seems best to include it here.

49. CAPPARIDACEAE. Caper Family.

Shrubs or trees; leaves alternate, stipulate or estipulate, simple and entire or palmately compound; flowers mostly perfect, often large and showy; sepals 4 to 8, free or connate; petals 4 or rarely none; stamens 6 to many; fruit capsular or baccate.

Many herbaceous representatives of the family occur in Mexico.

Leaves compound.

Fruit an inflated capsule; leaves glaucous.....1. ISOMERIS.

Fruit baccate; leaves green.

Petals 4; fruit long-stipitate.....5. CRATAEVA.

Petals none; fruit sessile.....7. FORCHAMMERIA.

Leaves simple. Fruit baccate.

Petals none.....7. FORCHAMMERIA.

Petals present.

Petals blue; leaves 1 cm. long or shorter.....6. SETCHELLANTHUS.

Petals never blue; leaves much more than 1 cm. long.

Sepals connate. Fruit large, with hard pericarp, sessile.

2. MORISONIA.

Sepals distinct or nearly so.

Stamens numerous; sepals all similar in size.....3. CAPPARIS.

Stamens 9 to 12; inner sepals smaller than the outer.

4. ATAMISQUEA.

1. ISOMERIS Nutt.; Torr. & Gray, Fl. N. Amer. 1: 124. 1838.

1. *Isomeris arborea* Nutt.; Torr. & Gray, Fl. N. Amer. 1: 124. 1838.

Baja California and western Sonora. California, the type from San Diego.

Shrub, 1 to 2 meters high, or sometimes herbaceous, ill-scented, the wood hard and yellow, the young branches glaucous; leaflets 3, oblong, 2 to 3 cm.

long, obtuse or acutish; flowers racemose, 1.5 cm. long, yellow; calyx 4-lobed; stamens 6; fruit acute or attenuate, 4 to 6 cm. long.

The Coahuilla Indians of southern California eat the green pods after cooking them with hot stones in a hole in the ground.

2. MORISONIA L. Sp. Pl. 503. 1753.

1. *Morisonia americana* L. Sp. Pl. 503. 1753.

Sinaloa to Oaxaca. Lesser Antilles; northern South America.

Shrub or small tree, sometimes 7 meters high, with sparse stellate or lepidote pubescence; leaves long-petiolate, oblong or ovate-oblong, 12 to 25 cm. long, obtuse or acute, very thick, lustrous, nearly glabrous; flowers in lateral corymbs, rather large, white; petals 4; fruit baccate, many-seeded, globose, 3.5 to 6 cm. in diameter, brownish and rough outside. "Chicozapote" (Oaxaca); "árbol del diablo" (Colima, Colombia); "chico" (Sinaloa); "cacao cimarrón," "rabo de mico" (Colombia).

In the West Indies aperitive and antihysterical properties are attributed to the infusion of the flowers, which is used also as a remedy for intestinal parasites; and the pulp of the fruit is said to be used in reducing inflammation.

3. CAPPARIS L. Sp. Pl. 503. 1753.

REFERENCE: Eichler in Mart. Fl. Bras. 13¹: 267-288. *pl.* 60-65. 1865.

Shrubs or trees, glabrous or pubescent, the pubescence often stellate or lepidote; leaves simple, petiolate, usually thick and leathery; flowers usually large and white; sepals 4; petals 4; fruit baccate, variable in form.

The fruits of some Australian species are eaten by the natives. *Capparis spinosa* L., of the Mediterranean Region, produces the capers ("alcaparras") of commerce. These are the flower buds and young fruits preserved in vinegar with some salt. Capers are the basis of an important industry in some parts of southern Europe. It is stated that in Provence 1,760,000 pounds are harvested annually.

Indument none or of simple hairs.

Sepals rounded.

Leaf blades obtuse or rounded at base, usually emarginate at apex. Plants glabrous; fruit torulose, smooth.....1. *C. flexuosa*.

Leaf blades subcordate or emarginate at base, rounded or acute at apex.

Plants glabrous; leaves mostly 4 to 8.5 cm. wide; fruit smooth; stamens not longer than the petals.....2. *C. baducca*.

Plants usually more or less pubescent; leaves 1.5 to 4 cm. wide; fruit verrucose; stamens much longer than the petals....3. *C. verrucosa*.

Sepals acute.

Petioles 3 to 8 mm. long.....4. *C. oxysepala*.

Petioles 13 to 50 mm. long.....5. *C. longipes*.

Indument of scales or of branched hairs.

Sepals valvate in bud.

Leaves linear. Fruit stipitate.....6. *C. angustifolia*.

Leaves elliptic or oblong.

Fruit stipitate.....7. *C. cynophallophora*.

Fruit sessile.....8. *C. odoratissima*.

Sepals open in bud.

Indument of the leaves chiefly or wholly of stellate hairs.

Leaf blades oblanceolate, densely stellate-pubescent on the upper surface.

9. *C. asperifolia*.

Leaf blades elliptic or lanceolate, soon glabrous on the upper surface.

10. *C. incana*.

Indument of the leaves chiefly of scales.

Stipe of the fruit 2.5 cm. long, slender.....11. *C. indica*.

Stipe 1.5 cm. long or shorter, very stout.....12. *C. pringlei*.

1. *Capparis flexuosa* L. Sp. Pl. ed. 2. 722. 1762.

Morisonia flexuosa L. Amoen. Acad. 5: 398. 1760.

? *Capparis brevisiliqua* DC. Prodr. 1: 251. 1824.

Tamaulipas to Yucatán, Colima, and Sinaloa. Widely distributed in tropical America; type from Jamaica.

Shrub or tree, 2.5 to 8 meters high, glabrous; leaves oblong to obovate, 3 to 6.5 cm. long, short-petiolate, rounded or retuse at apex; flowers white or pale rose, fragrant, the stamens white, very long; fruit siliquiform, 7 to 15 cm. long, torulose, the seeds imbedded in scarlet pulp. "Xpayumak" or "xbayumak" (Yucatán, Maya); "pan y agua," "guayabo de loro" (Venezuela); "burro," "palo de burro" (Porto Rico); "mostaza" (Cuba, Santo Domingo).

This species has been known generally as *C. cytophallophora* L.¹ The root has a flavor resembling that of horse-radish. In the West Indies an infusion of it has been used for dropsy and as an emmenagogue and a decoction of the leaves for cutaneous diseases. Sedative and antispasmodic properties are attributed to the fruit, and diuretic and emmenagogue properties to the bark. For an illustration of a fruiting branch see Contr. U. S. Nat. Herb. 8: pl. 23.

2. *Capparis baduoca* L. Sp. Pl. 504. 1753.

Capparis frondosa Jacq. Enum. Pl. Carib. 25. 1760.

Tamaulipas and Veracruz. Central America, West Indies, and northern South America.

Shrub or small tree, 2 to 7.5 meters high; leaves long-petiolate, elliptic or ovate, 11 to 30 cm. long, very thick; flowers greenish white or purplish; fruit 3 to 5 cm. long, purple brown. "Tinto," "naranjuelo," "fruta de burro" (Colombia); "palo de burro," "sapo" (Porto Rico); "ajito" (Venezuela).

The fruit is reputed poisonous. Medical properties similar to those of *C. flexuosa* are attributed to the plant.

3. *Capparis verrucosa* Jacq. Stirp. Amer. 159. pl. 99. 1763.

Capparis palmeri Rose, Contr. U. S. Nat. Herb. 1: 301. 1895.

Sinaloa to Chiapas. Central America, West Indies, Colombia, and Venezuela.

Shrub or small tree, 1 to 6 meters high; leaves nearly sessile, oblong or obovate-oblong, 3.5 to 8.5 cm. long; flowers large, white, with long stamens; fruit oblong, 2.5 to 6 cm. long, densely tuberculate. "Limoncillo" (Guerrero); "coquito" (Oaxaca); "ajito" (Venezuela); "palo de burro" (Porto Rico).

4. *Capparis oxysepala* C. Wright; Radlk. Sitzungsber. Math. Phys. Acad. Wiss. München 14: 172. 1884.

Guerrero and Yucatán. Nicaragua (type locality).

Plants glabrous or nearly so; leaves short-petiolate, oval-oblong to oval-obovate, 7 to 15 cm. long, acutish to rounded at apex, bright green, lustrous; flowers large, racemose, long-pedicellate.

5. *Capparis longipes* Standl.

Capparis discolor Standl. Contr. U. S. Nat. Herb. 20: 182. 1919. Not *C. discolor* Donn. Smith, 1897.

Known only from the type locality, banks of the Río Petatlán, Guerrero.

Tree, 8 to 10 meters high; flowers white, with the odor of orange blossoms. "Naranjillo."

¹ See Fawcett and Rendle, Journ. Bot. Brit. & For. 52: 142-144. 1914.

6. *Capparis angustifolia* H. B. K. Nov. Gen. & Sp. 5: 96. pl. 438. 1821.

Type from Cañada de Zopilote, between Mexico and Acapulco.

Plants lepidote-pubescent; leaves short-petiolate, rounded or subcordate at base; flowers white.

7. *Capparis cynophallophora* L. Sp. Pl. 504. 1753.

Capparis jamaicensis Jacq. Enum. Pl. Carib. 23. 1760.

Yucatán. Southern Florida, West Indies, Central America, and Venezuela; type from Jamaica.

Slender shrub or tree, 1.8 to 15 meters high; leaves petiolate, elliptic, 5.5 to 9 cm. long, acute, thick, green and lustrous on the upper surface, scaly beneath; flowers white, changing to purplish, fragrant, the filaments purplish, the anthers yellow; fruit slender, sometimes 30 cm. long or longer. "Carbonero" (Cuba); "burro," "bejuco inglés," "palo de burro prieto" (Porto Rico); "olivo" (Santo Domingo).

Known in the Bahamas as "wild orange."

8. *Capparis odoratissima* Jacq. Pl. Hort. Schönbr. 1: pl. 110. 1797.

Oaxaca. Central America to Venezuela (type locality).

Shrub or small tree; leaves obovate, petiolate, 5 to 8 cm. long, rounded at the apex, green above, covered with brown or yellowish scales beneath; flowers corymbose. "Naranjillo" (Oaxaca).

9. *Capparis asperifolia* Presl, Reliq. Haenk. 2: 86. 1836.

?*Capparis cuneiformis* Sessé & Moc. Pl. Nov. Hisp. 87. 1887.

Capparis langlassei Briq. Ann. Cons. Jard. Genève 17: 392. 1914.

Michoacán and Guerrero; type from Acapulco.

Tree, 4 to 6 meters high; leaves short-petiolate, acute, about 9 cm. long, densely stellate-pubescent on both surfaces; flowers white, racemose.

10. *Capparis incana* H. B. K. Nov. Gen. & Sp. 5: 94. 1821.

Capparis pauciflora Presl, Reliq. Haenk 2: 86. 1836.

Capparis karwinskiana Schlecht. Linnaea 10: 237. 1836.

?*Capparis umbellata* Sessé & Moc. Pl. Nov. Hisp. 87. 1887.

Tamaulipas to Yucatán, Oaxaca, and Guerrero; type collected between Mescala and Estola.

Shrub or tree, the pubescence of grayish or rusty stellate hairs; leaves petiolate, 4.5 to 8 cm. long, acuminate or attenuate, thin; flowers white; fruit globose or oblong, 2.5 cm. long or shorter, densely pubescent. "Vara blanca" (Tamaulipas).

Perhaps not distinct from *C. ferruginea* L., of the West Indies.

11. *Capparis indica* (L.) Fawc. & Rendle, Journ. Bot. Brit. & For. 52: 144. 1914.

Breynia indica L. Sp. Pl. 503. 1753.

Capparis breynia L. Syst. Nat. ed. 10. 1071. 1759.

Capparis amygdalifolia Jacq. Enum. Pl. Carib. 24. 1760.

Capparis amygdalina Lam. Encycl. 1: 608. 1785.

Sinaloa to Oaxaca. Central America, West Indies, Colombia, and Venezuela.

Shrub or small tree, 2 to 7.5 meters high; leaves linear to obovate, 5 to 8 cm. long, petiolate, acute or obtuse; flowers white; fruit slender, torulose, 6 to 25 cm. long. "Colorín" (Michoacán, Guerrero); "mangle de la sierra" (Sinaloa); "escremento" (Nicaragua); "auso," "tinto" (Colombia).

Reputed to have medicinal properties similar to those of *C. flexuosa*.

12. *Capparis pringlei* Briq. Ann. Cons. Jard. Genève 17: 300. 1914.

Oaxaca; type from Tomellín Canyon.

Small tree.

DOUBTFUL SPECIES.

CAPPARIS FURFURACEA Ruiz & Pav.; DC. Prodr. 1: 252. 1824. Described from Mexico.

4. *ATAMISQUEA* Miers, Trav. Chile 2: 529. 1826.1. *Atamisquea emarginata* Miers, Trav. Chile 2: 529. 1826.

Dry plains and hillsides, Baja California and Sonora. Argentina.

Densely branched shrub, 1 to 6 meters high, ill-scented, with brittle branches; leaves linear or oblong-linear, 1 to 3.5 cm. long, short-petiolate, emarginate at the apex, green on the upper surface, scaly beneath; flowers small, solitary or fasciculate, sweet-scented; sepals and petals each 4; fertile stamens 6; fruit oval or subglobose, about 8 mm. long.

5. *CRATAEVA* L. Sp. Pl. 444. 1753.

Shrubs or trees; leaves deciduous, very long-petiolate, the leaflets 3; flowers racemose or corymbose, the stamens long-exserted; petals 4; stamens 8 to 20; fruit baccate, large, long-stipitate.

Leaflets glabrous-----1. *C. tapia*.
Leaflets puberulent beneath-----2. *C. palmeri*.

1. *Crataevia tapia* L. Sp. Pl. 444. 1753.

Tamaulipas to Sinaloa and southward nearly throughout the lower parts of Mexico. West Indies, Central America, and South America.

Glabrous tree, usually 6 to 9 meters high, but sometimes as much as 18 meters; bark grayish brown; leaflets ovate, elliptic, or oval, 5.5 to 15 cm. long, thin, acute or acuminate, paler beneath; flowers green or purplish; fruit subglobose, 2.5 to 5.5 cm. in diameter. "Zapotillo amarillo" (Colima); "Tres Marías" (Yucatán); "xkolocmax" (Yucatán, Maya); "cascarón" (Tabasco); "palo de guaco" (Panama); "manzana de playa" (Nicaragua); "zorrocloco" or "sorrocloco" (Colombia); "toco" (Trinidad, Venezuela).

The bark has a disagreeable odor; it is reputed to have tonic, stomachic, anti-dysenteric, and febrifuge properties. The roots are very acrid, and their juice applied to the skin produces blisters. The leaves are sometimes used as poultices.

It may be that *C. gymandra* L. (if that species is distinct from *C. tapia*) also occurs in Mexico, but the specimens seen afford no convincing evidence to that effect.

2. *Crataeva palmeri* Rose, Contr. U. S. Nat. Herb. 1: 301. 1895.

Sinaloa and Durango to Guerrero; type from Armeria, Colima.

Shrub or small tree, with purplish flowers, the stamens long-exserted; fruit 3.5 to 5 cm. long.

Very similar to *C. tapia* except for the presence of pubescence.

6. *SETCHELLANTHUS* T. S. Brandeg. Univ. Calif. Publ. Bot. 3: 378. 1909.1. *Setchellanthus caeruleus* T. S. Brandeg. Univ. Calif. Publ. Bot. 3: 378. 1909.

Known only from the type locality, Coscomate, Oaxaca.

Shrub; leaves ovate to suborbicular, 1 cm. long or shorter, subsessile, obtuse, silvery-strigose; flowers solitary, blue, about 2 cm. long; stamens shorter than the sepals.

7. *FORCHAMMERIA* Liebm. Nat. For. Kjöbenhavn Vid. Medd. 1853: 93. 1854.

Trees, glabrous or pubescent; leaves simple or compound, petiolate; flowers small, racemose or paniculate; stamens numerous.

Leaves trifoliolate-----1. *F. trifoliata*.

Leaves simple.

Leaves glabrous, lanceolate, ovate, or oblanceolate to oblong.

Leaves obtuse-----2. *F. pallida*.

Leaves acute or acuminate-----5. *F. lanceolata*.

Leaves hirtellous, especially beneath, linear.

Leaf blades emarginate at base; fruiting pedicels 3 to 5 mm. long; fruit
7 to 12 mm. broad-----3. *F. watsoni*.

Leaf blades usually attenuate at base; fruiting pedicels 10 to 15 mm. long;
fruit 12 to 15 mm. broad-----4. *F. macrocarpa*.

1. *Forchammeria trifoliata* Radlk. Field Mus. Bot. 1: 399. 1898.

Yucatán.

Tree, 6 to 9 meters high; leaves long-petiolate; leaflets obovate-oblong, 7 to 13 cm. long, thick, glabrous; flowers in rather large panicles. "Tres Marias."

2. *Forchammeria pallida* Liebm. Nat. For. Kjöbenhavn Vid. Medd. 1853: 94. 1854.

Forchammeria apiocarpa Radlk. Meth. Bot. Syst. 54. 1883.

Colima to Oaxaca; type collected between Tehuantepec and Mazatlán.

Tree, 4.5 to 6 meters high, the trunk 12 to 20 cm. in diameter; leaves narrowly oblong or oblanceolate, 6 to 11 cm. long, usually rounded at apex; flowers green, in short or long racemes; fruit subglobose, 1.5 to 2 cm. long, somewhat glaucous.

3. *Forchammeria watsoni* Rose, Contr. U. S. Nat. Herb. 1: 302. 1895.

Baja California, Sonora, and Sinaloa; type from Guayamas, Sonora.

Shrub or tree, 3 to 7.5 meters high, often with a broad spreading crown; leaves 6 to 12 cm. long, very thick, with conspicuous venation, the margins revolute; flowers racemose; fruit globose-obovoid. "Palo San Juan" (Baja California).

4. *Forchammeria macrocarpa* Standl. Contr. U. S. Nat. Herb. 20: 183. 1919.

Known only from the type locality, San Luis Tultitlanapa, Puebla.

Leaves 9 to 17 cm. long, acute or acutish.

5. *Forchammeria lanceolata* Standl. Contr. U. S. Nat. Herb. 20: 183. 1919.

Known only from the type collection, from somewhere in Mexico.

Shrub, 3 to 4.5 meters high; leaves mostly lanceolate, 6 to 8 cm. long, 1.5 to 3 cm. wide, obtuse at base; fruit about 12 mm. long.

50. MORINGACEAE. Horseradish Tree Family.

1. MORINGA Juss. Gen. Pl. 348. 1789.

1. *Moringa oleifera* Lam. Encycl. 1: 398. 1783.

Guilandina moringa L. Sp. Pl. 381. 1753.

Moringa pterygosperma Gaertn. Fruct. & Sem. 2: 314. 1791.

Moringa moringa Millsp. Field Mus. Bot. 1: 490. 1902.

Common in cultivation in Mexico and often growing without cultivation. Native of Africa and the East Indies; widely cultivated and naturalized in tropical America.

Tree, 3 to 6 meters high or larger, with whitish bark, the roots thick, soft; leaves alternate, twice or thrice pinnate; flowers paniculate, sweet-scented, the 5 petals white or yellowish white, tinged with crimson outside near the base; perfect stamens 5; fruit a long 3-angled capsule; seeds winged. "Paraíso blanco" (Yucatán); "paraíso de España" (Campeche); "perlas del Oriente" (Guerrero, Oaxaca); "árbol de las perlas," "chinto borrego" (Oaxaca); "acacia" (Tamaulipas); "paraíso francés," "palo jeringa" (Cuba); "marrango" (El Salvador, Nicaragua, Costa Rica); "angela" (Porto Rico); "narrango," "marenque," "paraíso extranjero," "teberinto" (El Salvador).

The usual English name is "horseradish tree." The roots have the odor and flavor of horseradish (*Armoracia rusticana* Gaertn. Mey. & Schreb.), for which they are sometimes substituted; a decoction of them is used in Nicaragua for dropsy, and their juice is applied as a rubefacient or counter-irritant. The wood is said to yield a blue dye. The leaves and young branches are relished by stock and are sometimes cut for fodder. In India the young leaves, pods, and flowers are cooked and eaten. The leaves are sometimes applied as a poultice to sores, and they are said to have purgative properties. The seeds yield the "ben" oil of commerce, which is used for lubricating watches and other delicate machinery. The oil is odorless and never becomes rancid, consequently it is useful in the manufacture of perfumes. It is very acrid and has purgative properties, but its use is somewhat dangerous if taken internally. It is sometimes applied externally for cutaneous diseases.

51. CRASSULACEAE. Orpine Family.

REFERENCE: Britton & Rose, N. Amer. Fl. 22: 7-74. 1905.

The species listed below are scarcely to be regarded as true shrubs, and other Mexican species probably have equal claims to a place here. Many herbaceous representatives of the family occur in Mexico.

1. *SEDUM* L. Sp. Pl. 430. 1753.

Very succulent erect plants; leaves alternate, entire; flowers small, perfect; calyx 4 or 5-lobed; petals 4 or 5; stamens 8 or 10; fruit of 4 or 5 follicles.

- Leaves terete-----1. *S. bourgaei*.
 Leaves flat, at least on the upper side.
 Petals yellow or purplish red.
 Petals purplish red-----2. *S. oxypetalum*.
 Petals yellow-----3. *S. dendroideum*.
 Petals white.
 Leaves linear-----4. *S. frutescens*.
 Leaves oblong to spatulate.
 Leaves very turgid, narrowly oblong-----5. *S. lenophylloides*.
 Leaves flat, obovate or spatulate.
 Flowers pedicellate-----6. *S. tortuosum*.
 Flowers sessile-----7. *S. retusum*.

1. *Sedum bourgaei* Hemsl. Diag. Pl. Mex. 11. 1878.

Mexico to Michoacán; type from San Nicolás, Valley of Mexico.

Low shrub, much branched; leaves 1 to 2 cm. long; flowers white or pink, cymose.

2. *Sedum oxypetalum* H. B. K. Nov. Gen. & Sp. 6: 45. 1823.

Mountains and lava beds of the State of Mexico.

Shrub, often a meter high, with very thick stems, the bark exfoliating in thin yellowish sheets; leaves spatulate, 1 to 1.5 cm. long, rounded at apex; flowers in leafy cymes.

3. *Sedum dendroideum* Moc. & Sessé; DC. Mém. Crass. 37. pl. 9. 1828.

Hidalgo, Veracruz, Mexico, and Puebla, on cliffs.

Branched shrub, a meter high or less, often forming dense masses; leaves 2 to 4 cm. long. "Siempreviva," "textiote," "textiolt" (Mexico).

The juice is astringent and is used for hardening the gums, and for hemorrhoids, chilblains, dysentery, etc. Applied to the forehead, it is believed to stop nosebleed.

4. *Sedum frutescens* Rose, Contr. U. S. Nat. Herb. 13: 298. 1911.

Morelos.

Low shrub; leaves 2 to 6 cm. long, acute, bright green.

5. *Sedum lenophylloides* Rose, Contr. U. S. Nat. Herb. 13: 298. 1911.
Tamaulipas and Nuevo León; type from Monterrey.
Low shrub, about 30 cm. high; leaves 1 to 1.5 cm. long, pale, often purplish.
6. *Sedum tortuosum* Hemsl. Diag. Pl. Mex. 10. 1878.
Described from Mexico, the locality not known.
Low glabrous shrub with thick branches; leaves 2.5 cm. long.
7. *Sedum retusum* Hemsl. Diag. Pl. Mex. 51. 1880.
San Luis Potosí.
Low glabrous shrub; leaves sessile, 1 to 1.5 cm. long.

52. HYDRANGEACEAE. Hydrangea Family.

REFERENCE: Small & Rydberg, N. Amer. Fl. 22: 159-178. 1905.

Trees or shrubs, rarely scandent; leaves opposite, estipulate, entire or dentate; flowers perfect, often large and showy; sepals and petals 4 or 5 each; stamens 8 to many; fruit a capsule.

Capsule ovoid, the beaks arising gradually from the body.

Filaments not appendaged; sepals and petals each 5; stamens 10.

4. FENDLERELLA.

Filaments appendaged under the anthers; sepals and petals each 4; stamens 8.....

5. FENDLERIA.

Capsule urceolate or obovoid, the beak or beaks rising abruptly from the body.
Petals valvate, very small; stamens 8; inflorescence involucrate.

1. HYDRANGAEA.

Petals convolute or imbricate, large; stamens 12 to 60; inflorescence not involucrate.....

2. DEUTZIA.

Capsule subglobose; petals imbricate.

Capsule obovoid or obconic; petals convolute.....

3. PHILADELPHUS.

1. HYDRANGAEA L. Sp. Pl. 397. 1753.

1. *Hydrangea oerstedii* Briq. Ann. Cons. Jard. Genève 20: 407. 1919.

Cornidia radiata Oerst. Nat. For. Kjöbenhavn Vid. Medd. 1856: 42. 1856. Not *Hydrangea radiata* Walt. 1788.

Reported from Veracruz and the Sierra Madre. Costa Rica and Panama.

Scandent shrub; leaves oblong or oblong-elliptic, about 12 cm. long and 6 cm. wide, leathery, petiolate, obtuse, entire or nearly so, almost glabrous; flowers small, pink, cymose, the inflorescence covered with large rounded bracts before expansion; petals 2.5 mm. long.

The identification of the Mexican specimens is doubtful, but they probably belong here. They have been reported as *Hydrangea peruviana* Moric. and as *Cornidia peruviana* (L.) Small.

Hydrangea opuloides Koch. (*H. hortensia* DC.), the common cultivated hydrangea, native of China and Japan, is grown in Mexico under the name "hortensia."

2. DEUTZIA Thunb. Nov. Gen. 1: 19. 1781.

Shrubs, the pubescence of stellate hairs; leaves deciduous, shallowly dentate, petiolate; flowers small, white, cymose.

Most of the species of the genus are natives of eastern Asia, and some are cultivated for their showy flowers. The Mexican species have been placed in a separate genus, *Neodeutzia*, by Small, but they differ in no important respect from the Old World forms.

Petals 5 to 6 mm. long.....

1. D. mexicana.

Petals 3 to 4 mm. long.

Tomentum of the lower surface of the leaves of similar, very closely appressed hairs.....2. *D. pringlei*.

Tomentum of unequal, loose, and spreading hairs.....3. *D. occidentalis*.

1. *Deutzia mexicana* Hemsl. *Diag. Pl. Mex.* 9. 1878.

Neodeutzia mexicana Small, *N. Amer. Fl.* 22: 162. 1905.

Veracruz; type from Orizaba.

Shrub, 2 to 5 meters high; leaves ovate, 2.5 to 5 cm. long, white-pubescent beneath.

2. *Deutzia pringlei* C. Schneid. *Mitt. Deutsch. Dendr. Ges.* 1904: 186. 1904.

Neodeutzia ovalis Small, *N. Amer. Fl.* 22: 162. 1905.

Neodeutzia pringlei Small & Rydb. *N. Amer. Fl.* 22: 555. 1918.

Known only from the type locality, San José Pass, San Luis Potosí.

Shrub, 3 meters high; leaves oval or oblong, 1.5 to 2.5 cm. long, rounded at apex, green on the upper surface, white beneath.

3. *Deutzia occidentalis* Standl. *Proc. Biol. Soc. Washington* 31: 134. 1918.

Neodeutzia occidentalis Rydb. *N. Amer. Fl.* 22: 555. 1918.

Puebla and Oaxaca; type from Barranca del Oro, Puebla.

Shrub, sometimes 4.5 meters high; leaves ovate-orbicular or ovate, 2.8 to 4.5 cm. long.

3. PHILADELPHUS L. *Sp. Pl.* 470. 1753.

Shrubs; leaves deciduous or somewhat persistent, entire or shallowly serrate; flowers white, large and showy.

Patoni gives the local name of one of the Durango species as "mirto." Many of the species which are natives of Asia and the United States are cultivated for their showy, often fragrant flowers. The native species, and perhaps some of the foreign ones, are grown in Mexican gardens. The usual English names for the plants are "syringa"¹ and "mock orange," the latter name probably given because of the sweet odor of the flowers in some species. *Philadelphus coronarius* L., an Old World species, has been reported from Mexican gardens, and may very likely be cultivated there. The name was applied by Sessé and Mociño² to a native species.

Petals acute; stamens about 15.....1. *P. mearnsii*.

Petals rounded or retuse at apex; stamens 25 to 60.

Styles and free portion of the ovary glabrous.

Leaves pilose on the upper surface with spreading hairs.

Style evident; bark of older stems yellowish.....2. *P. pumilus*.

Style nearly obsolete; bark of older stems dark gray.

3. *P. serpyllifolius*.

Leaves strigose on both surfaces.

Bark of the previous year's branches not exfoliating.

4. *P. asperifolius*.

Bark of the previous year's branches exfoliating.....5. *P. madrensis*.

Styles or free part of the ovary or both more or less hairy.

Inflorescence 1 to 3-flowered; petals more or less hairy.

Calyx strigose; petals without a reddish spot at base...6. *P. mexicanus*.

Calyx densely white-sericeous; petals sometimes with a reddish spot at base.....7. *P. coulteri*.

¹ This name is also the Latin generic name of the lilac, *Syringa vulgaris* L., of the family Oleaceae.

² *Pl. Nov. Hisp.* 82. 1887.

Inflorescence 5 to 13-flowered; petals glabrous or pubescent below along the costa.

Branchlets grayish-strigose; leaves more or less strigose on both sides.

8. *P. karwinskyanus*.

Branchlets and leaves glabrous, or the leaves hairy along the veins.

9. *P. affinis*.

1. *Philadelphus mearnsii* W. H. Evans; Small & Rydb. N. Amer. Fl. 22: 174. 1905.

Known only from the type locality, on the boundary between Chihuahua and New Mexico.

Low shrub with exfoliating bark; leaves oblong, 1 cm. long or shorter, entire, acutish, strigose; petals 1 cm. long.

2. *Philadelphus pumilus* Rydb. N. Amer. Fl. 22: 173. 1905.

Baja California. California; type from San Jacinto Mountains.

Shrub, 1.2 to 1.8 meters high; leaves oblong or elliptic, 6 to 10 mm. long, obtuse, white-sericeous beneath.

The species has been reported from Baja California as *P. serpyllifolius* A. Gray.

3. *Philadelphus serpyllifolius* A. Gray, Pl. Wright. 1: 77. 1852.

Northern Chihuahua and Sonora. Western Texas (type locality) and southern New Mexico.

Shrub, 1 meter high or less, with spreading branches; leaves oblong or oval, 1 cm. long or shorter, entire.

4. *Philadelphus asperifolius* Koern.; Regel, Gartenflora 16: 73. 1867.

Known only from the type locality, Hacienda Santiaguillo.

Shrub, 2 to 3 meters high; leaves oval or oval-ovate, 1 to 3 cm. long, obtuse or acutish.

5. *Philadelphus madrensis* Hemsl. Kew Bull. Misc. Inf. 1908: 251. 1908.

Philadelphus palmeri Rydb. N. Amer. Fl. 22: 173. 1905.

Philadelphus purpusii T. S. Brandeg. Univ. Calif. Publ. Bot. 4: 270. 1918.

In the mountains, Durango to Nuevo León and San Luis Potosí; type from the Sierra Madre of Durango.

Erect shrub with slender gray or brown branches; leaves lanceolate to oval-ovate, 1 to 3 cm. long, acute or obtuse.

6. *Philadelphus mexicanus* Schlecht. Linnaea 13: 418. 1839.

Veracruz to Morelos and Oaxaca; sometimes cultivated; type from Jalapa, Veracruz.

Shrub, sometimes scandent to a height of 6 meters; leaves lanceolate to broadly ovate, 3 to 7 cm. long, short-petiolate, acuminate, remotely denticulate; flowers showy, fragrant, cream-colored, 3 to 4 cm. broad. "Jazmín," "acuilotl" (Oaxaca); "jazmín del monte," "jeringuilla" (Valley of Mexico, *Cervantes*); "mosqueta."

This species has been introduced into cultivation in Europe. It or one of the related species is figured and described by Hernández¹ in a chapter entitled "De *Acuilotl*, seu Volubili Aquatica." His account is as follows: "*Acuilotl*, or water-vine, is so called by the Mexicans not without reason, for it grows in moist places, and spreads over the ground or climbs over near-by trees. There are two sorts, differing only in color of flowers, name, and size of leaves. The first has pure white flowers and slightly smaller leaves, and is called *Acuilotl*; in the second the flowers are pale and the leaves larger, and it is called *Corticacuilotl*,

¹Thesaurus 107. 1651.

because of the yellow color of the flowers. The stems of both are round, purplish, woody, brittle, and slender, with soft pith. In form and odor the flowers are not unlike the musk rose, a plant not wholly different from this one. The leaves are like those of the bramble, but less toothed, with nerves running lengthwise, and with almost the odor of cucumber. The flowering branches are employed for their perfume by the Indians, and for the garlands which they use so much; and a scented water of pleasant odor is distilled from them. The plant grows in temperate or rather cold places. The leaves are bitter and dry and hot in almost the third order, wherefore, if taken in wine in the quantity of a handful, they relieve colic, and if crushed and applied as a plaster, they ease strained members, and dissolve tumors beyond belief." Hernández also gives an illustration,¹ without description, of the "cozticacuilotl xochitl."

7. *Philadelphus coulteri* S. Wats. Proc. Amer. Acad. 22: 472. 1887.

Nuevo León to Hidalgo; type from Zimapán, Hidalgo.

Shrub, 1 to 3 meters high; leaves lanceolate or ovate, 3 to 5 cm. long, acute or acuminate, green above, white beneath, denticulate; flowers very fragrant, white, about 4.5 cm. broad, with a red or purple spot at the base of each petal.

8. *Philadelphus karwinskyanus* Koehne, Gartenflora 1896: 486. 1896.

Veracruz and Oaxaca; type from Totolapa, Oaxaca.

Tall shrub; leaves ovate, 2 to 6 cm. long, acute or acuminate, denticulate or entire; petals about 1 cm. long.

9. *Philadelphus affinis* Schlecht. Linnaea 13: 419. 1839.

Hidalgo, Veracruz, and Oaxaca; type from Hacienda del Carmen.

Shrub, sometimes 4 meters high; leaves lance-ovate to rounded-ovate, 3.5 to 7 cm. long, acuminate, green on both sides, remotely denticulate; flowers large and showy.

4. *FENDLERELLA* Heller, Bull. Torrey Club 25: 626. 1898.

Low, densely branched shrubs with exfoliating bark; leaves small, 3-nerved, entire, deciduous; flowers small, white, in small dense cymes.

Leaves green beneath, thinly strigose, not at all tomentose.....1. *F. utahensis*.

Leaves densely white-tomentose beneath.

Petals copiously pilose outside.....2. *F. lasiopetala*.

Petals glabrous.....3. *F. mexicana*.

1. *Fendlerella utahensis* (S. Wats.) Heller, Bull. Torrey Club 25: 626. 1898.

Whipplea utahensis S. Wats. Amer. Nat. 7: 300. 1873.

Fendlerella cymosa Greene; Woot. & Standl. Contr. U. S. Nat. Herb. 16: 129. 1913.

Mountains of Chihuahua and Coahuila. Nevada to New Mexico; type from Utah.

Densely branched shrub, 1 meter high or less; leaves linear-oblong to elliptic, 0.5 to 2.5 cm. long, acute or obtuse.

2. *Fendlerella lasiopetala* Standl. Proc. Biol. Soc. Washington 33: 67. 1920.

Known only from the type locality, San Lorenzo Canyon, southeast of Saltillo, Coahuila.

Leaves elliptic or oval-elliptic, 1.5 cm. long or shorter, acute or acutish.

3. *Fendlerella mexicana* T. S. Brandeg. Zoe 5: 246. 1908.

Known only from the type locality, Cerro de Paxtle, Puebla.

Leaves elliptic or ovate, about 1 cm. long, with revolute margins.

¹Thesaurus 374. 1651.

5. **FENDLERA**¹ Engelm. & Gray; A. Gray, Pl. Wright. 1: 77. 1852.

REFERENCE: Rehder, Journ. Arn. Arb. 1: 203-206. 1920.

Erect shrubs with striate branches; leaves small, deciduous, entire, 3-nerved, sessile or nearly so; flowers large, white, solitary or clustered.

Leaves linear, strongly revolute, glabrous or nearly so on the upper surface.

1. **F. linearis**.

Leaves narrowly lanceolate to ovate-oblong.

Leaves sparsely strigose or nearly glabrous beneath, glabrous above, not revolute.....2. **F. rupicola**.

Leaves tomentose and strigose beneath, scabrous above, revolute.

3. **F. wrightii**.1. **Fendlera linearis** Rehder, Journ. Arn. Arb. 1: 205. 1920.

Known only from the type locality, in the Sierra Madre near Monterrey, Nuevo León.

Leaves 1.5 to 2.5 cm. long, 1 to 1.5 mm. wide, strigose beneath; petals 7 to 8 mm. long; capsule about 8 mm. long.

2. **Fendlera rupicola** A. Gray, Pl. Wright. 1: 77. 1852.

Sonora. Western Texas and southern New Mexico; type from New Braunfels, Texas.

Shrub, 1 to 2 meters high; leaves oblong or elliptic, 1 to 4 cm. long; petals 1.5 to 2 cm. long.

3. **Fendlera wrightii** (A. Gray) Heller, Bull. Torrey Club 24: 537. 1897.*Fendlera rupicola wrightii* A. Gray, Pl. Wright. 1: 77. 1852.

Chihuahua. Western Texas to Colorado and Arizona; type from San Pedro River, Texas.

Shrub, very similar to the preceding species; leaves 1 to 2 cm. long; petals usually only 1.2 to 1.5 cm. long.

53. **PTEROSTEMONACEAE. Pterostemon Family.**1. **PTEROSTEMON** Schauer, Linnaea 20: 736. 1847.

Pubescent shrubs; leaves alternate, petiolate, dentate, the stipules minute or obsolete; flowers perfect, showy, white, cymose; fruit a capsule.

Calyx densely pilose with long stiff white hairs; leaf blades somewhat narrowed to the obtuse or broadly cuneate base.....1. **P. mexicanus**.Calyx puberulent or minutely pilose; leaf blades rounded or broadly rounded at base.....2. **P. rotundifolius**.1. **Pterostemon mexicanus** Schauer, Linnaea 20: 726. 1847.

Hidalgo; type from Zimapán.

Shrub with dark branches; leaves obovate-orbicular, 2 to 3 cm. long, densely pilose beneath; flowers about 1 cm. long.

2. **Pterostemon rotundifolius** Ramírez, Estudio 4: 453. pl. 18. 1893.

Puebla and Oaxaca; type from between Jaltepetongo and Guandulain, Oaxaca.

Shrub, 1.5 to 3 meters high; leaves suborbicular, 2 to 3 cm. long, soon glabrate beneath.

¹ August Fendler (1813-1883), a native of Prussia, came to the United States in 1834. Later he visited Prussia, but soon returned to North America and settled in St. Louis, where he made the acquaintance of Engelm. In 1847 he followed the Santa Fe Trail to New Mexico, where he made a large collection of plants, upon which a report was published by Gray. Later he botanized in Panama and Venezuela, where he obtained important collections, and finally settled in Trinidad, where he died.

54. ESCALLONIACEAE. Escallonia Family.

1. *Phyllonoma* Willd.; Roem. & Schult. Syst. Veg. 6: 210. 1820.

REFERENCE: Rusby, N. Amer. Fl. 22: 191. 1905.

1. *Phyllonoma laticuspis* (Turcz.) Engl. in Engl. & Prantl, Pflanzenfam. 3^{2a}: 87. 1890.*Dulongia laticuspis* Turcz. Bull. Soc. Nat. Moscou 31¹: 454. 1858.

Durango to Chiapas; type from Oaxaca.

Shrub or small tree with slender branches, glabrous; leaves alternate, stipulate, petiolate, lanceolate, 4 to 8 cm. long, long-acuminate, serrate; flowers very small, in small cymes borne upon the upper surface of the leaf; fruit small, baccate. "Hierba de la viruela" (Oaxaca).

The plant has a high reputation as a remedy for smallpox. This species has been reported from Mexico as *P. ruscifolia*.

55. GROSSULARIACEAE. Gooseberry Family.

REFERENCE: Coville & Britton, N. Amer. Fl. 22: 193-225. 1908.

Usually erect shrubs, spiny or unarmed; leaves alternate, petiolate, deciduous or persistent, lobed or toothed; flowers small, racemose, perfect; sepals and petals each 5; stamens 5, opposite the sepals; fruit a globose 1-celled berry, several or many-seeded.

The fruit of all the Mexican species is edible, but it varies greatly in quality.

Plants without spines; pedicels jointed below the ovary.....1. **RIBES**.Plants with spines; pedicels not jointed.....2. **GROSSULARIA**.1. **RIBES** L. Sp. Pl. 201. 1753.

Unarmed (in the Mexican species) shrubs; leaves palmately veined, usually lobed, commonly deciduous; racemes few to many-flowered; pedicel often bearing a pair of bractlets below the joint; fruit never spiny.

The best-known plant of the genus is *Ribes vulgare* Lam., the garden currant, which is cultivated for its sour red fruit. It is a native of Europe. The native American currants all have edible fruit which, however, is usually of sweetish and insipid flavor. The plants seem to be little used in medicine. A decoction of the roots of *R. americanum* Mill. is said to be employed by the Omaha and Winnebago Indians for renal and uterine affections.Ovary with sessile glands; leaves not lobed, evergreen....1. **R. viburnifolium**.

Ovary without glands or with stipitate glands; leaves lobed, deciduous.

Anthers without a cup-shaped apical gland.

Calyx tube glabrous, yellow, 3 or more times as long as thick.

Flowers sessile or nearly so.....10. **R. chihuahuense**.Flowers pedicellate.....11. **R. fontinale**.

Calyx tube pubescent, not yellow, or if so less than twice as long as thick.

Axis of the raceme straight and stiff, 1 cm. long or shorter; leaves without glands.....12. **R. tortuosum**.

Axis of the raceme flexuous, elongate; leaves usually with glands.

Leaves with sessile scattered amber-colored waxlike glands on both surfaces.....13. **R. nelsoni**.

Leaves with stipitate glands.

Ovary glabrous.....14. **R. brandegei**.

Ovary with gland-tipped hairs.

Flowers pink or purple, 8 to 10 mm. long; pedicels 2 to 5 mm. long.

15. **R. malvaceum**.

- Flowers usually white or greenish white, 5 to 7 mm. long; pedicels 1 to 2 mm. long-----16. *R. indecorum*.
 Anthers with a conspicuous cup-shaped apical gland.
 Ovary with at least a few gland-tipped hairs, or the calyx more than 1 cm. long.
 Leaves with sessile glands on both surfaces but without gland-tipped hairs; calyx and petals deep red-----2. *R. ceriferum*.
 Leaves with gland-tipped hairs on both surfaces; flowers white or greenish white, sometimes partly purplish.
 Sepals longer than the calyx tube, both together less than 7 mm. long. 3. *R. neglectum*.
 Sepals shorter than the tube, both together 10 to 13 mm. long. 4. *R. pringlei*.
 Ovary glabrous; calyx less than 1 cm. long.
 Bracts obovate, dentate at the broad apex-----5. *R. dugesii*.
 Bracts mostly linear-oblong to lanceolate, usually acute and entire.
 Lobes of the calyx longer than the tube.
 Leaves glabrous on the upper surface, the margin with gland-tipped hairs -----6. *R. orizabae*.
 Leaves sparsely pubescent on the upper surface, the margin without gland-tipped hairs -----7. *R. affine*.
 Lobes of the calyx equaling or shorter than the tube.
 Leaves rounded, truncate, or cordate at base, the sinus shallow and open; glands of the leaves usually sessile; calyx 5 to 6 mm. long-----8. *R. rugosum*.
 Leaves deeply cordate at base, the sinus usually closed, both surfaces, as well as the petioles, with stout gland-tipped hairs; calyx 8 to 10 mm. long-----9. *R. ciliatum*.
1. *Ribes viburnifolium* A. Gray, Proc. Amer. Acad. 17: 202. 1882.
 Baja California; type from Todos Santos Bay. Southern California.
 Shrub with straggling branches; leaves mostly oval or rounded-oval, 2 to 7 cm. long, bright green and lustrous on the upper surface, glabrous or nearly so; sepals pink, the petals greenish; racemes few-flowered, equaling or shorter than the leaves; fruit about 6 mm. in diameter.
2. *Ribes ceriferum* Coville & Rose, Contr. U. S. Nat. Herb. 8: 298. 1905.
 Chihuahua and Durango; type from Mount Mohinora, Chihuahua.
 Shrub, 1 to 4.5 meters high; leaves suborbicular, 2 to 5 cm. wide, 3-lobed, glabrous above or nearly so, puberulent beneath; flowers reddish; racemes 3 to 10-flowered, equaling or shorter than the leaves; pedicels 6 to 10 mm. long; fruit black, glabrous. "Capulincillo" (Durango).
3. *Ribes neglectum* Rose, Contr. U. S. Nat. Herb. 8: 298. 1905.
 San Luis Potosí; type from Álvarez.
 Shrub, 1.5 meters high or less; leaves 2 to 4 cm. wide, 3 or 5-lobed, glandular-pubescent; racemes 6 to 12-flowered, about as long as the leaves; pedicels 2 to 6 mm. long; fruit black, 8 to 10 mm. in diameter.
4. *Ribes pringlei* Rose, Contr. U. S. Nat. Herb. 8: 298. 1905.
 State of Mexico and San Luis Potosí; type from Sierra de Ajusco.
 Shrub, 1.8 to 3 meters high; leaves 3 to 7 cm. wide, 3 or 5-lobed, glandular-pubescent; flowers about 1.2 cm. long, pinkish; racemes drooping, 8 to 12-flowered, longer than the leaves; pedicels 6 to 8 mm. long; ovary glandular-pubescent.
5. *Ribes dugesii* Greenm. Proc. Amer. Acad. 39: 78. 1903.
 Known only from the type locality, mountains of Santa Rosa, near Guanajuato.

Leaves ovate-orbicular, 2 to 5 cm. wide, 3 or 5-lobed, sparsely glandular on both sides; sepals purplish, the petals white; fruit bluish black.

6. *Ribes orizabae* Rose, Contr. U. S. Nat. Herb. 8: 339. 1905.

Known only from the type locality, Orizaba, Veracruz.

Leaves broadly ovate or suborbicular, 3 or 5-lobed, glabrous above, glandular-pubescent beneath; racemes 8 to 12-flowered; pedicels 5 to 8 mm. long; ovary glabrous.

7. *Ribes affine* H. B. K. Nov. Gen. & Sp. 6: 60. 1823.

Ribes multiflorum H. B. K. Nov. Gen. & Sp. 6: 60. 1823. Not *R. multiflorum* Willd. 1813.

Ribes kunthii Berland. Mém. Soc. Phys. Hist. Nat. Genève 3²: 60. 1826.

Ribes mexicanum Spreng. Syst. Veg. 4: Cur. Post. 100. 1827.

Ribes altamirani Jancz. Bull. Acad. Cracovie 1906: 10. 1906.

Hidalgo and Querétaro; type from Morán, Hidalgo.

Shrub, 1 to 3 meters high; leaves 4.5 cm. wide or smaller, broadly ovate or orbicular, 3 or 5-lobed, pubescent; racemes pendulous, 6 to 12-flowered, shorter than the leaves; pedicels 5 to 8 mm. long; fruit bluish black, glabrous, 8 mm. in diameter.

8. *Ribes rugosum* Coville & Rose, Contr. U. S. Nat. Herb. 8: 300. 1905.

Ribes grande Rose, Contr. U. S. Nat. Herb. 8: 339. 1905.

Mexico and Puebla; type from Santa Fé, Valley of Mexico.

Shrub, 1.5 to 3.5 meters high; leaves 3 to 5 cm. wide, suborbicular, 3 or 5-lobed, glabrous above, pubescent beneath; flowers greenish or pinkish; racemes drooping, 7 to 12-flowered; pedicels 3 to 6 mm. long; fruit bluish black, glabrous. "Capulincillo," "ciruelillo" (Mexico, *Reiche*).

9. *Ribes ciliatum* Humb. & Bonpl.; Roem. & Schult. Syst. Veg. 5: 500. 1819.

Ribes jorullense H. B. K. Nov. Gen. & Sp. 6: 61. 1823.

High mountains, Colima to Oaxaca, and Veracruz.

Shrub, 3 to 5 meters high; leaves 3 to 9 cm. wide, suborbicular, 3 or 5-lobed, glabrous above, pubescent beneath; flowers greenish white, fragrant; racemes drooping, about 10-flowered; fruit glabrous, 8 mm. in diameter. "Capulincillo" (Valley of Mexico); "ciruelillo" (Mexico, Hidalgo); "saraacuacho" (Mexico).

Roots reputed to have emetic properties.

10. *Ribes chihuahuense* Britton, Torreya 7: 102. 1907.

Known only from the type locality, near the city of Chihuahua.

Leaves 2 to 2.5 cm. long, ovate or suborbicular, glabrous, the lobes few-toothed; racemes 3 to 5-flowered, slightly longer than the leaves, the flowers sessile or nearly so.

11. *Ribes fontinale* Britton; Coville & Britton, N. Amer. Fl. 32: 205. 1908.

Known only from the type locality, Samalayuca, Chihuahua.

Leaves 3 cm. wide or smaller, usually 3-lobed, the lobes entire or few-toothed; racemes 4 to 7-flowered, 3 to 4 cm. long.

12. *Ribes tortuosum* Benth. Bot. Voy. Sulph. 17. 1844.

Ribes palmeri Vasey & Rose, Proc. U. S. Nat. Mus. 11: 529. 1889.

Baja California; type from San Quintín.

Shrub, 1.2 meters high or less, with short stiff branches; leaves 1.5 to 3 cm. wide, very shallowly 5-lobed, finely puberulent on both sides; fruit red, 6 to 8 mm. in diameter, glabrous.

13. *Ribes nelsoni* Coville & Rose, Contr. U. S. Nat. Herb. 8: 297. 1905.

Chihuahua; type from Colonia García.

Shrub, 1 to 2 meters high; leaves 6 cm. wide or smaller, with 3 or 5 acute lobes, serrate-dentate; flowers pale yellow; racemes drooping, 6 to 10-flowered.

14. *Ribes brandegei* Eastw. Proc. Calif. Acad. III. 2: 242. 1902.

Mountain slopes, Baja California; type from Sierra de Laguna.

Erect shrub, 2.5 meters high; leaves $\frac{3}{4}$ to 5 cm. wide, 3-lobed, sparsely glandular-pubescent on both sides; sepals rose-purple, the petals white; racemes 3 to 10-flowered; fruit glabrous.

15. *Ribes malvaceum* Smith in Rees, Cycl. 30: *Ribes* no. 13. 1815.

Northern Baja California. California.

Erect shrub; leaves shallowly 3 or 5-lobed, 2.5 to 5 cm. wide, tomentose and glandular-pubescent beneath; flowers pink or purple, the racemes longer than the leaves; fruit viscid-pubescent, 1 cm. or less in diameter.

16. *Ribes indecorum* Eastw. Proc. Calif. Acad. III. 2: 243. 1902.

Mountains of Baja California, at an altitude of 840 to 900 meters. Southern California, the type collected near San Diego.

Shrub, 1.8 to 2.5 meters high, the young shoots glandular-pubescent; leaves reniform-orbicular, obtusely 3 or 5-lobed, 2 to 5 cm. wide, stipitate-glandular on the upper surface; ovary with simple and gland-tipped hairs; fruit about 7 mm. in diameter.

2. **GROSSULARIA** Mill. Gard. Diet. ed. 7. 1759.

Spiny erect shrubs; leaves deciduous, palmately veined; racemes few-flowered; bractlets, if present, minute, at the base of the pedicel; ovary sometimes spiny.

The cultivated gooseberry is *Grossularia reclinata* (L.) Mill., a native of northern Europe. The native American species have edible fruit, which is extremely sour until maturity, when it becomes sweet.

Lobes of the calyx twice as long as the tube or longer; petals red throughout.

1. *G. madrensis*.

Lobes of the calyx less than twice as long as the tube; petals yellow or greenish, sometimes with purple margins.

Calyx 10 to 12 mm. long-----2. *G. microphylla*.

Calyx 5 to 6 mm. long-----3. *G. quercetorum*.

1. *Grossularia madrensis* Coville & Rose; Coville & Britton, N. Amer. Fl. 22: 217. 1908.

Ribes madrense Coville & Rose, Smiths. Misc. Col. 50: 32. 1907.

Known only from the type locality, Quebrada Honda, Durango.

Erect shrub with slender spines; leaves 3 cm. wide or less, 3 or 5-lobed, glandular-pubescent; peduncles 1 or 2-flowered; petals dark red; fruit glabrous.

2. *Grossularia microphylla* (H. B. K.) Coville & Britton, N. Amer. Fl. 22: 219. 1908.

Ribes microphyllum H. B. K. Nov. Gen. & Sp. 6: 62. 1823.

Veraacruz to Michoacán; type from El Guarda.

Shrub, 1 to 3 meters high; leaves 2.5 cm. wide or smaller, 3 or 5-lobed, somewhat pubescent; flowers reddish yellow; fruit glabrous, 8 mm. in diameter.

3. *Grossularia quercetorum* (Greene) Coville & Britton, N. Amer. Fl. 22: 220. 1908.

Ribes quercetorum Greene, Bull. Calif. Acad. 1: 83. 1885.

Baja California. California; type from El Paso de Robles.

Shrub, 1 to 1.5 meters high; leaves 1 to 2 cm. wide, deeply lobed; fruit glabrous, 8 mm. in diameter.

56. **CUNONIACEAE.** *Cunonia* Family.1. **WEINMANNIA** L. Syst. Nat. ed. 10. 1005. 1759.

REFERENCE: Britton, N. Amer. Fl. 22: 179-180. 1905.

Weinmannia fagaroides H. B. K., of Ecuador, is said to furnish wood of good quality. Its bark is rich in tannin and is used for tanning leather. The species

of Madagascar are large trees with durable wood. Their bark contains much tannin and yields a black dye.

1. *Weinmannia pinnata* L. Syst. Nat. ed. 10. 1005. 1759.

Weinmannia glabra L. f. Suppl. Pl. 228. 1781.

Weinmannia intermedia Schlecht. & Cham. Linnaea 5: 555. 1830.

Mountains of Hidalgo, Veracruz, and Oaxaca. West Indies, Central America, and South America; type from Jamaica.

Shrub or small tree, copiously pubescent; leaves opposite, stipulate, pinnate, the rachis winged, the leaflets 9 to 25, oval or oblong, 1 to 2 cm. long, crenate; flowers small, in long racemes; sepals 4 or 5; petals 4 or 5; stamens 8 or 10; fruit a small capsule. "Lorito" (Costa Rica); "oreganillo" (Porto Rico); "encinillo" (Colombia).

The bark is astringent, and a gum often exudes from it. It is said that the bark has been used as an adulterant of quinine.

57. HAMAMELIDACEAE. Witch-hazel Family.

1. LIQUIDAMBAR L. Sp. Pl. 999. 1753.

REFERENCE: P. Wilson, N. Amer. Fl. 22: 189. 1905.

The balsam derived from *Liquidambar orientalis* Mill., of western Asia, is the official *Styrax* of the U. S. Pharmacopoeia; it is known also as storax. It is used in medicine as a stimulating expectorant and very feeble germicide.

1. *Liquidambar styraciflua* L. Sp. Pl. 999. 1753.

Liquidambar macrophylla Oerst. Amér. Centr. 16. 1863.

Liquidambar styraciflua mexicana Oerst. Amér. Centr. 16. 1863.

Mountains, Veracruz and Puebla to Chiapas. Guatemala; eastern United States; type from Virginia.

Large or small tree, sometimes 45 meters high, with a trunk 1.5 meters in diameter, the crown broad or narrow; bark thick, deeply furrowed, grayish, the young branches usually with corky wings; leaves about 15 cm. wide, with 5 deep acute lobes, bright green; flowers unisexual, the staminate racemose, the pistillate in globose heads, the heads becoming spiny and conelike in fruit; perianth none; fruit a capsule, opening at the apex, containing few winged seeds; wood hard, weak, light brown, its specific gravity about 0.59. "Xochiquahuitl," "xochiocotzoquahuitl," "xochiocotzotl" (the gum) (Nahuatl); "maripenda" (Michoacán, Tarascan); "nabá" (Chiapas, *Morelet*); "ocotzotl," "ocozotl," or "ocozol" (Veracruz); "ocozote" (Oaxaca, *Reko*); "estoraque" (Oaxaca, Guatemala); "liquidámbar" (Oaxaca, Guatemala, Honduras, Nicaragua); "yaga-bito," "yaga-bizigui" (Oaxaca, Zapotec).

The wood of the sweet-gum takes a good polish but warps badly. It is used in the United States for furniture, shingles, paving blocks, etc., and in Mexico for boxes, chests, and other articles. For interior finish of houses it is very popular, for it is of fine appearance when polished. The leaves (which are beautifully colored in autumn, before falling) contain tannin.

The resin or balsam obtained from the tree appears to be little known in the United States, but in Mexico and Central America it has been much used from the earliest times. It has been employed also in Europe in medicine, under the names "liquidambar" and "copalm balsam." The balsam is a transparent yellowish liquid with peculiar agreeable balsamic odor and bitter warm acrid taste; upon exposure to the air it hardens. The gum is sometimes chewed in the southern United States to sweeten the breath. A sirup prepared from the bark has been used as a remedy for diarrhoea and dysentery, especially in children.

The method of gathering the balsam in Honduras, and the uses made of it there, are detailed in the following account by W. V. Wells:¹ "The owners

¹ Explorations and adventures in Honduras, pp. 321-322. 1857.

of cattle estates send their mayordomos into the woods to collect the gum, which is found exuding from the pores of the tree, and often collecting, like that of the peach, in some knot or bruise along its smooth surface. The gum trickles from the incision in transparent tears down the conduits made by the natives, until, from a spout inserted in some convenient place, a pint or more is collected. By climbing to the lower branches a purer quality is said to be obtained.

"A rim of plantain leaves, bound tightly around the trunk and left for several days, is found filled with the precious distillation. I afterwards went with Julio, the mayordomo of Lepaguare, about two leagues to one of these trees, where he procured from the leafy troughs at least a pint. The trunk of the liquid amber-tree is clammy to the touch, so that numerous living bees, attracted by the sweet, glutinous substance sweating from the pores, are found sticking helplessly to the bark. The gum, when bottled, becomes of the consistency of sirup. In the *caballeria* of Don Francisco Zelaya there were at least two gallons used for no other purpose than to heal the wounds of horses, mules and cattle. * * * I was assured that it never failed to effect a speedy cure for flesh-wounds in horses, and that in the mountains, when the mahogany-cutters or hunters wounded themselves, they applied at once to this tree for *remedios*. It is sometimes mixed into a stiff gum with other substances, and chewed by the Indians as a preservative of the teeth."

One of the earliest references to the sweet-gum tree is that by Bernal Diaz del Castillo¹ who, describing the meals taken by the Mexican emperor, says: "After he had dined, they presented to him three little canes highly ornamented, containing liquid amber, mixed with an herb they call tobacco, and when he had sufficiently viewed and heard the singers, dancers, and buffoons, he took a little of the smoke of one of these canes." The balsam and gum were much used for flavoring tobacco and also as incense in houses and temples. As for medicinal uses, the tree was employed in catarrhal, stomachic, and other affections, and was reputed to have stimulant properties. The following account of the tree by Hernández,² accompanied by a figure, is given in a chapter entitled "*De Xochicotzo Quahuil, seu Arbore Liquidambari Indici*": "*Xochicotzo Quahuil* is a large tree, with leaves almost like those of a maple, divided into three points and two notches, toothed, on one side whitish and on the other darker. The bark of the trunk is partly yellow and partly green. It grows in plains and in hot, or sometimes in temperate places, like *Hoeyacocotla*, *Quahuchinac*, and *Xicotepec*. Its nature is hot and dry, and its odor pleasant. If the bark of this tree is cut, there flows from it what is called Indian Liquidambar by the Spaniards, and by the Mexicans *Xochicotzol*, in the sweetness of its odor very like *Styrax*. Its nature is hot in the third order, and dry, and added to tobacco it strengthens the head, belly, and heart, induces sleep, and alleviates pains in the head that are caused by colds. Alone, it dissipates humors, relieves pains, and cures eruptions of the skin. From the same tree, either spontaneously or from incisions, there is distilled an oil, no whit inferior to the famed liquor, either in sweetness of odor or in medicinal virtues, albeit some assert that the oil is distilled from the first liquor, put in a suitable place, or expressed, so that the thinner part of it may distil; and they assert that it is hot and moist, not accurately, however.

¹ True history of the conquest of Mexico, translation by Keatinge, p. 140. 1800.

² Thesaurus 56. 1651. See also M. G. Lozada, *El Liquidámbar*, *Naturaleza* 1: 70.

It relieves wind in the stomach and dissipates tumors beyond belief, it aids digestion, strengthens the belly, heals uterine affections, and others similar to those, either alone or mixed with other drugs. There are some who prepare a kind of balsam from the twigs steeped in water, but this is meaner and less suitable for the aforesaid remedies, and not fit for any except the meaner uses."

58. PLATANACEAE. Plane-tree Family.

REFERENCE: Gleason, N. Amer. Fl. 22: 227-229. 1908.

1. PLATANUS L. Sp. Pl. 999. 1753.

Large trees with thin peeling bark; pubescence of stellate hairs; leaves alternate, long-petiolate, palmately nerved, dentate or lobate, with large stipules; flowers small, green, unisexual, monoecious, in large dense globose heads; sepals 3 or 4; petals small, alternate with the sepals; stamens alternate with the petals; fruit of nutlets, each surrounded by stiff erect hairs.

The species of this genus are known by the English names of "buttonwood," "sycamore," and "plane-tree." They are excellent shade trees and especially to be recommended for street planting. They are little attacked by insects and usually have broad crowns, with tough branches not easily broken by the wind. The native species are planted as shade trees in Mexico.

Heads 1 or 2 or rarely 3 on each peduncle, sessile.

Leaves whitish-tomentose beneath.....1. *P. mexicana*.

Leaves green and glabrate beneath.....2. *P. glabrata*.

Heads 3 to 6 on each peduncle.

Leaves with 5 deep narrow lobes, truncate or often deeply cordate at the base.

Heads slender-stalked; leaves rather closely grayish-tomentose at first but soon glabrate.....3. *P. wrightii*.

Heads sessile or on very short stalks; leaves loosely yellow-tomentose.

4. *P. racemosa*.

Leaves not lobed, or with 3 lobes, or rarely with 2 very small additional lobes, these often very shallow.

Heads stalked.....5. *P. chiapensis*.

Heads sessile.

Leaves rounded and conspicuously decurrent at base, loosely white-tomentose beneath the lobes usually entire.....6. *P. lindeniana*.

Leaves truncate or subcordate at base, scarcely or not at all decurrent, with a very close sparse tomentum beneath, not whitish, the lobes coarsely dentate.....7. *P. oaxacana*.

1. *Platanus mexicana* Moric. Pl. Amer. Rar. 12. 1830.

Along watercourses, Tamaulipas, Nuevo León, San Luis Potosí, and Veracruz.

Large tree, 15 to 20 meters high, the trunk 1.5 meters in diameter, with broad crown; leaves long-petiolate, 7 to 20 cm. wide, with 5 or more-acuminate lobes; fruit heads brownish, about 3 cm. in diameter. "Aya" (Veracruz, *Schiede*); "álamo" (Tamaulipas, Veracruz); "álamo blanco" (San Luis Potosí, Nuevo León, Tamaulipas).

Sometimes planted as a shade tree. The wood is used for general carpenter work and for dishes and spoons.

2. *Platanus glabrata* Fernald, Proc. Amer. Acad. 36: 493. 1901.

Coahuila, Nuevo León, and San Luis Potosí; type from Monclova, Coahuila.

Leaves 5 to 20 cm. wide, usually green on both surfaces, acutely lobed and dentate. "Álamo" (San Luis Potosí).

3. *Platanus wrightii* S. Wats. Proc. Amer. Acad. 10: 349. 1875.

Northern Chihuahua and Sonora; sometimes planted as a shade tree. Southern Arizona (type locality) and New Mexico.

Tree with broad crown, sometimes 24 meters high, with a trunk diameter of 1.5 meters, the bark brownish, scaling off in thin sheets; leaves 15 to 20 cm. wide, with 3 to 7 long narrow lobes, these entire or sparsely dentate; wood light brown, its specific gravity about 0.47.

4. *Platanus racemosa* Nutt. N. Amer. Sylv. 1: 47. 1842.

Baja California. California (type locality).

Large tree, sometimes 38 meters high, with a trunk diameter of 2.7 meters; leaves deeply lobed, 15 to 25 cm. wide; wood hard, coarse-grained, light brown, weak and not durable, its specific gravity about 0.49.

5. *Platanus chiapensis* Standl. Contr. U. S. Nat. Herb. 20: 212. 1919.

Chiapas; type from Zinacantan.

Tree, 15 meters high; leaves with 3 short acute lobes, or merely coarsely and remotely dentate, 9 to 23 cm. long, fulvous-tomentose beneath.

6. *Platanus lindeniana* Mart. & Gal. Bull. Acad. Brux. 10¹: 342. 1843.

Veracruz and Puebla to Chiapas; type from Jalapa.

Tree, 30 to 40 meters high; leaves 9 to 20 cm. long or larger, with 3 long narrow lobes. "Álamo" (Veracruz).

This may be the species reported from Uruapam by Sessé and Mocino¹ as *P. orientalis*. That name belongs to an Old World species.

7. *Platanus oaxacana* Standl. Contr. U. S. Nat. Herb. 20: 213. 1919.

Known only from the type locality, San Miguel Alborrados, Oaxaca, altitude 1,950 meters.

Leaves 12 to 20 cm. wide.

59. CROSSOSOMATACEAE. Crossosoma Family.

REFERENCE: Small, N. Amer. Fl. 22: 231-232. 1908.

1. *CROSSOSOMA* Nutt. Journ. Acad. Phila. II. 1: 150. 1848.

Shrubs or small trees with rough astringent bark; leaves alternate, thick, small, entire; flowers perfect, solitary, white or purplish; sepals and petals 5 each; stamens usually 15 or more; fruit a cluster of 2 to 5 follicles.

Petals broadly obovate or orbicular-obovate; follicles many-seeded.

1. *C. californicum*.

Petals spatulate or oblong; follicles few-seeded.

Body of the follicle oblong-cylindric, rugose-----2. *C. bigelovii*.

Body of the follicle ovoid, reticulate-----3. *C. parviflorum*.

1. *Crossosoma californicum* Nutt. Journ. Acad. Phila. II. 1: 150. 1848.

Guadalupe Island, Baja California. Islands off the coast of southern California; type from Santa Catalina Island.

Shrub or small tree with rough scaly bark; leaves oblong, obovate, or spatulate, 2.5 to 9 cm. long, sessile or nearly so; petals white, 1.5 to 1.8 cm. long.

2. *Crossosoma bigelovii*² S. Wats. Proc. Amer. Acad. 11: 122. 1876.

¹ Pl. Nov. Hisp. 163. 1837.

² John Milton Bigelow (1804-1878) was appointed in 1850 surgeon of the Mexican Boundary Commission, and in 1853 surgeon and botanist of the expedition under Lieutenant Whipple, which explored the route for a railroad along the thirty-fifth parallel. He made large collections of plants, which were reported upon by Torrey and Gray.

Erect shrub, the branches sometimes spinelike; leaves 0.5 to 1.5 cm. long; petals white or purplish, 1 to 1.4 cm. long.

3. *Crossosoma parviflorum* Robins. & Fern. Proc. Amer. Acad. **30**:114. 1894.
Sonora. Arizona, the type from the Grand Canyon.

Shrub, 1 to 2.5 meters high; leaves elliptic-oblong, 8 to 13 mm. long, pale green; petals white, 6 mm. long.

60. ROSACEAE. Rose Family.

REFERENCE: Rydberg, N. Amer. Fl. **22**: 239-533. 1908-1918.

Shrubs or trees; leaves usually alternate, simple or compound, commonly stipulate; flowers usually perfect, often large and showy; sepals normally 5; petals as many as the sepals or wanting; stamens usually numerous; fruit of achenes, follicles, or small drupes.

Many herbaceous plants of the family are natives of Mexico.

Leaves compound or deeply lobed and with linear lobes.

Petals none; flowers in long spikelike racemes. Leaves pinnate, with 9 to 19 leaflets; very low shrub-----5. **ACAENA**.

Petals present; flowers never in spikelike racemes.

Leaves 2 or 3 times pinnate, with very numerous minute divisions. Plants unarmed; flowers small, white, corymbose-paniculate.

9. CHAMAEBATIA.

Leaves once pinnate or digitate or merely lobed.

Leaves merely pinnate-lobed; flowers mostly solitary; plants unarmed.

Bractlets present on the calyx; pistils numerous-----7. **FALLUGIA**.

Bractlets none; pistils few-----8. **COWANIA**.

Leaves pinnate or digitate; flowers often racemose, corymbose, or paniculate; plants usually armed with spines.

Fruit of numerous drupelets borne on a receptacle; leaves often palmate; petals usually white; stipules free from the petiole.

11. RUBUS.

Fruit globose or urceolate, with numerous achenes inside; leaves pinnate; petals pink or red; stipules united to the petiole.

12. ROSA.

Leaves simple, entire or dentate, or with short, broad lobes.

Leaves entire. Flowers white.

Fruit of usually 3 follicles; leaves flat; flowers racemose-----1. **SPIRAEA**.

Fruit an achene; leaves clavate or filiform; flowers paniculate.

6. ADENOSTOMA.

Leaves toothed or lobed.

Leaves digitately lobed; fruit of numerous fleshy drupelets. Flowers large, white-----11. **RUBUS**.

Leaves merely dentate or crenate or pinnately lobed; fruit dry.

Petals none; calyx tube long-tubular; fruit a single achene with a long plumose tail; flowers axillary, solitary or fasciculate.

10. CERCOCARPUS.

Petals present; calyx tube never tubular; fruit of follicles or of more than one achene; flowers terminal, often paniculate.

Fruit of achenes with long plumose tails; flowers ochroleucous or purple-----8. **COWANIA**.

Fruit of follicles without long plumose tails; flowers white.

Stipules none; seeds exalate; leaves deciduous--4. **SERICOTHECA**.

Stipules present, deciduous; seeds winged; leaves persistent.

- Carpels wholly united into a 5-celled capsule; flowers solitary or in small clusters.....2. **LINDLEYELLA**.
 Carpels free above, wholly distinct at maturity; flowers corymbose.
 3. **VAUQUELINIA**.

1. **SPIRAEA** L. Sp. Pl. 489. 1753.

Many of the species of this genus, especially those of Asiatic origin, are cultivated for ornament, and some are grown in Mexican gardens.

1. *Spiraea hartwegiana* Rydb. N. Amer. Fl. 22: 246. 1908.

Spiraea parvifolia Benth. Pl. Hartw. 36. 1840. Not *S. parvifolia* Raf. 1838. Puebla and Oaxaca; type from "Puerta del Dio."

Shrub with grayish or reddish brown branches; leaves spatulate, 7 to 15 mm. long, entire, glabrous; flowers small, white, racemose; petals 5, 2 mm. long; fruit of 5 follicles.

2. **LINDLEYELLA** Rydb. N. Amer. Fl. 22: 259. 1908.

1. *Lindleyella mespiloides* (H. B. K.) Rydb. N. Amer. Fl. 22: 259. 1908.

Lindleya mespiloides H. B. K. Nov. Gen. & Sp. 6: 240. 1823.

Lindleyella schiedcana Rydb. N. Amer. Fl. 22: 259. 1908.

Coahuila to Tamaulipas and Oaxaca; type from between La Puente de la Madre de Dios and Magdalena.

Shrub, 2 to 3 meters high; leaves oblanceolate to broadly obovate, 1 to 4 cm. long, short-petiolate, glabrous, crenulate; flowers solitary or clustered, white, 2 to 3 cm. broad; petals 5; stamens 15 to 25. "Barreta" (Zacatecas).

3. **VAUQUELINIA** Correa; Humb. & Bonpl. Pl. Aequin. 1: 140. 1808.

Shrubs or small trees; leaves coriaceous, serrate or dentate, the stipules small, deciduous; flowers small, white, corymbose; petals 5; stamens 15 to 25; fruit a woody capsule.

Leaves finely tomentose beneath.

Leaf blades lanceolate or narrowly lanceolate, tapering to the apex, white beneath..... 1. **V. californica**.

Leaf blades narrowly oblong, not tapering to the apex, obtuse, greenish beneath..... 2. **V. australis**.

Leaves glabrous beneath, at least when fully expanded.

Leaf blades linear or linear-lanceolate, coarsely salient-dentate, acute or attenuate at base..... 3. **V. corymbosa**.

Leaf blades lanceolate, oblong, broadly oblong, or ovate, truncate to acutish at base.

Leaf blades 3 to 5 cm. long, 0.6 to 1.1 cm. wide, finely serrulate; petioles 3 to 6 mm. long; inflorescence few-flowered..... 4. **V. pauciflora**.

Leaf blades 5.5 to 10.5 cm. long, 1.3 to 3 cm. wide, coarsely serrate; petioles 6 to 25 mm. long; inflorescence many-flowered.

Leaf blades 3 to 5 times as long as broad, obtuse or acutish at base.

5. **V. karwinskyi**.

Leaf blades about twice as long as broad, truncate or very obtuse at base.

6. **V. latifolia**.

1. *Vauquelinia californica* (Torr.) Sarg. Gard. & For. 2: 400. 1889.

Spiraea californica Torr. in Emory, Notes Mil. Recomm. 140. 1848.

Vauquelinia torreyi S. Wats. Proc. Amer. Acad. 11: 147. 1876.

Reported from Sonora and Baja California. Arizona; type from mountains near the Gila.

Shrub or small tree, up to 6 meters high, the trunk sometimes 18 cm. in diameter, the branches stiff and crooked; bark thin, reddish brown, scaly; leaves 4 to 8 cm. long; corymbs 5 to 8 cm. wide; wood hard, close-grained, dark brown, its specific gravity about 1.13.

2. *Vauquelinia australis* Standl. Proc. Biol. Soc. Washington 31: 132. 1918.

Known only from the type locality, Cerro de Paxtle, Puebla.

Leaves 3.5 to 6 cm. long, serrulate, lustrous on the upper surface; corymbs about 4 cm. broad; petals 3.5 mm. long.

3. *Vauquelinia corymbosa* Correa; Humb. & Bonpl. Pl. Aequin. 1: 140. 1808.

Vauquelinia angustifolia Rydb. N. Amer. Fl. 22: 260. 1908.

Chihuahua and Coahuila to Hidalgo; type from Actopan, Hidalgo. Western Texas.

Tree, up to 10 meters high; with brown bark; leaves 5 to 10 cm. long or larger, long-petiolate. "Guauyul," "guayule," "palo prieto," "árbol prieto," "palo verde" (Durango, *Patoni*).

The wood or bark is said to be used for dyeing goat skins yellow. *Patoni* states that the name "guayule" belongs properly to this plant rather than to *Parthenium argentatum*, to which it is now generally applied, and that it is doubtful how it came to be applied to the latter plant. *V. angustifolia* differs from the typical form in having less salient teeth, but the two forms are connected by specimens intermediate in character.

4. *Vauquelinia pauciflora* Standl. Proc. Biol. Soc. Washington 31: 132. 1918.

Known only from the type locality, Guadalupe Canyon, northeastern Sonora.

Tree; branches dark gray, leafy at the tips; leaves lustrous on the upper surface.

Rydberg has applied the name *V. torreyi* S. Wats. to this species, but that is evidently only a new name for *Spiraea californica* Torr. It may be that *V. pauciflora* is only a form of *V. californica*.

5. *Vauquelinia karwinskyi* Maxim. Act. Hort. Petrop. 6: 236. 1879.

Vauquelinia potosina Painter; Standl. Proc. Biol. Soc. Washington 31: 131. 1918.

San Luis Potosí and probably elsewhere; type from Santiaguillo.

Shrub or small tree with dark brown branches; leaves long-petiolate, lustrous on the upper surface.

6. *Vauquelinia latifolia* Rydb., sp. nov.

Coahuila and Tamaulipas; type from mountains near Miquihuana, Tamaulipas, altitude 2,100 to 2,700 meters. (*Nelson* 4481; U. S. Nat. Herb. no. 332669).

Shrub, 1 to 2.5 meters high; leaves petiolate, ovate to ovate-oblong, 5 to 6.5 cm. long, 2.5 to 3 cm. wide, obtuse or acute, rounded at base, coarsely serrate, thick-coriaceous, glabrous, lustrous, often glaucescent beneath; corymbs many-flowered, dense, glabrous, 4 to 5 cm. broad, the flowers about 6 mm. long.

4. **SERICOTHECA** Raf. Sylva Tell. 152. 1839.

Small or large shrubs; leaves estipulate, dentate; flowers small, white, paniculate, the panicles often large and showy; petals 5; stamens about 20; fruit of 5 small follicles.

Teeth of the leaves lanceolate or triangular-ovate, ending in a long mucro; stamens shorter than the calyx lobes.

Leaves glabrous on the upper surface.....4. *S. fissa*.

Leaves velvety-pubescent on the upper surface.....5. *S. velutina*.

Teeth of the leaves rounded or rounded-ovate, with a short mucro; stamens usually equaling the calyx lobes.

Leaves glandular-atomiferous and slightly hairy on the veins beneath, not at all tomentose-----3. *S. schaffneri*.

Leaves tomentose and villous beneath.

Leaf blades abruptly contracted at the base, scarcely decurrent.

1. *S. pachydisca*.

Leaf blades cuneate at the base and decurrent on the winged petioles.

2. *S. dumosa*.

1. *Sericotheca pachydisca* Rydb. N. Amer. Fl. 22: 263. 1908.

Known only from the type locality, Tacubaya, Valley of Mexico.

Shrub with brown branches; leaves 2 to 3 cm. long, short-petiolate, with few coarse teeth; panicles 10 to 15 cm. long.

2. *Sericotheca dumosa* (Nutt.) Rydb. N. Amer. Fl. 22: 263. 1908.

Spiraea dumosa Nutt.; Hook. Lond. Journ. Bot. 6: 217. 1847.

Holodiscus dumosus Heller, Cat. N. Amer. Pl. 4. 1898.

Chihuahua and Baja California. Northward to Wyoming; type from the Platte River.

Shrub, 1 to 2 meters high, often forming large clumps; leaves 2 to 5 cm. long, obtuse or acute; panicles 5 to 20 cm. long, very showy.

The fruit of this and other species is said to have been eaten by the Coahuilla Indians of California and the Tewa of New Mexico.

3. *Sericotheca schaffneri* Rydb. N. Amer. Fl. 22: 264. 1908.

Northern Mexico; type from San Luis Potosí. Arizona.

Low shrub; leaves 1 to 3 cm. long, ovate or rounded-oval, obtuse; panicles 5 to 7 cm. long.

4. *Sericotheca fissa* (Lindl.) Rydb. N. Amer. Fl. 22: 265. 1908.

Spiraea fissa Lindl. Bot. Reg. 26: Misc. 73. 1840.

Spiraea argentea Benth. Pl. Hartw. 82. 1841. Not *S. argentea* L. f. 1781.

? *Holodiscus loeseneri* Dammer, Repert. Sp. Nov. Fedde 15: 385. 1919.

Michoacán to Oaxaca and Veracruz. Guatemala to Costa Rica.

Shrub, 2.5 to 3.5 meters high; leaves 2 to 5 cm. long, acute; panicles 5 to 15 cm. long.

On the Pico de Orizaba the species ascends to 3,300 meters.

5. *Sericotheca velutina* Rydb. N. Amer. Fl. 22: 265. 1908.

Southern Mexico; type from Sierra de San Felipe, Oaxaca. Guatemala.

Shrub, 1 meter high or more; leaves 1.5 to 3 cm. long; panicles 5 to 10 cm. long.

DOUBTFUL SPECIES.

SPIRAEA MEXICANA Schiede; Regel, Ind. Sem. Hort. Petrop. 1857: 58. 1858.

Described from cultivated plants of Mexican origin.

5. *ACAENA* Mutis; L. Mant. Pl. 145. 1775.

Low shrubs, or often herbaceous almost throughout; leaves pinnate, stipulate; flowers small, spicate or racemose, the calyx covered with barbed prickles; petals none; stamens 3 to 5; fruit a solitary achene.

Upper leaflets 1.5 to 2 cm. long, the lower gradually reduced.

1. *A. agrimonioides*.

Upper leaflets 0.8 to 1.5 cm. long, the lower scarcely reduced--2. *A. elongata*.

1. *Acaena agrimonioides* H. B. K. Nov. Gen. & Sp. 6: 231. 1823.

Known only from the type locality, near Tianguillo.

Stems purplish; leaflets 9 to 13, sessile, acute, coarsely serrate.

2. *Acaena elongata* L. Mant. Pl. 200. 1771.

Mountains, Veracruz to Mexico and Colima. Southward to Colombia.

Low shrub with brownish or purplish bark; leaflets 9 to 19, oval or elliptic, serrate, glabrous and lustrous on the upper surface; stamens purple; fruit covered with barbed spines.

6. *ADENOSTOMA* Hook. & Arn. Bot. Beechey Voy. 129. 1832.

Erect shrubs; leaves often fasciculate, filiform or clavate; flowers very small, white, paniculate; petals 5; stamens 10 to 15; fruit a single achene.

Leaves clavate, fascicled; bracts not scarious; stamens usually 15.

1. *A. fasciculatum*.

Leaves filiform, scattered; bracts with scarious margins; stamens usually 10.

2. *A. sparsifolium*.**1. *Adenostoma fasciculatum* Hook. & Arn. Bot. Beechey Voy. 139. 1832.**

Adenostoma brevifolium Nutt.; Rydb. N. Amer. Fl. 22: 396. 1913.

Baja California, abundant in the mountains at 300 to 1,800 meters. California; type from Monterey Bay.

Shrub, 0.5 to 6 meters high, the branches brown or gray; leaves 4 to 10 mm. long, acute or obtuse, lustrous; petals about 1.5 mm. long. "Chamiso" (Baja California).

2. *Adenostoma sparsifolium* Torr. in Emory, Notes Mil. Recon. 140. 1848.

Baja California, on mountain slopes at 1,000 to 1,750 meters. California; type from Warner Pass.

Shrub or tree, 1 to 10 meters high, forming dense thickets, the branchlets green, the bark of old branches reddish brown, often peeling in thin sheets; leaves 5 to 12 mm. long, gland-dotted; flowers sometimes pinkish. "Palo amarillo" (Baja California); "hierba del pasmo," "chamiso" (California).

Often known in California as "greasewood." A decoction of the plant is used locally for chills and fevers and as a tonic. The Coahuilla Indians of California employed the wood for arrow points and rabbit sticks; a decoction of the twigs as a purgative and vomitive in the case of pains in the stomach and intestines; the powdered twigs mixed with grease as a salve; and a decoction of the plant as a remedy for sick cattle.

7. *FALLUGIA* Endl. Gen. Pl. 1246. 1840.**1. *Fallugia paradoxa* (D. Don) Endl.; Torr. in Emory, Notes Mil. Recon. 140. 1848.**

Sieversia paradoxa D. Don, Trans. Linn. Soc. Bot. 14: 576. 1825.

Geum cercocarpoides DC.; Seringe in DC. Prodr. 2: 554. 1825.

Fallugia mexicana Walp. Repert. Bot. 2: 46. 1843.

Chihuahua, Durango, and Coahuila. Western Texas to Utah and Arizona.

Shrub, 1 to 2 meters high, the bark whitish, shredded; leaves 1 to 2 cm. long, divided into 3 to 7 linear revolute lobes; flowers white, usually solitary, long-pedunculate, the 5 petals 1.5 to 2 cm. long; stamens numerous; achenes with feathery purplish tails 3 to 5 cm. long. "Pofil" (New Mexico).

A very handsome shrub when in either flower or fruit; of some value as a forage plant. It is sometimes known in the southwestern United States as "Apache-plume." The Tewa Indians of New Mexico employed the smaller branches, tied in bundles, as brooms, and the larger ones for arrow shafts. They also, like the Hopi of Arizona, employed an infusion of the leaves for washing the hair to promote its growth, probably, according to Hough, because of the hairy fruit.

8. *COWANIA* D. Don, Trans. Linn. Soc. Bot. 14: 574. 1825.

Erect shrubs or small trees; leaves dentate, pinnatifid, or entire, coriaceous, viscid, gland-dotted, the margins usually revolute; flower solitary; petals 5; stamens numerous; achenes 1 to 12, each with a long feathery tail.

Leaves entire.....1. *C. ericaefolia*.

Leaves dentate or pinnatifid.

Petals purple or rose; leaves 5 to 9-dentate; sepals cuspidate-acuminate.

2. *C. plicata*.

Petals white or yellowish; leaves 3 or 5-cleft; sepals rounded at apex.

Calyx tube campanulate, abruptly contracted at base; lobes of the leaves entire.....3. *C. mexicana*.

Calyx tube funnelform, gradually narrowed at base; lobes of the leaves cleft or dentate.....4. *C. stansburiana*.

1. *Cowania ericaefolia* Torr.; A. Gray, Pl. Wright. 2: 106. 1853.

Western Texas; type collected on rocks along the Rio Grande below Presidio del Norte; doubtless also in Chihuahua, although no Mexican specimens have been seen.

Shrub, 1 meter high or less, with dark brown bark; leaves linear-subulate, 4 to 6 mm. long; petals white or yellowish, 6 to 8 mm. long.

2. *Cowania plicata* D. Don; Sweet, Brit. Flower Gard. II. pl. 400. 1838.

Cowania purpurea Zucc. Abh. Akad. Wiss. München 4²: 7. 1845.

Greggia rupestris Engelm. in Wislitz. Mem. North. Mex. 114. 1848.

Rocky hillsides, Coahuila, San Luis Potosí, Zacatecas, and Guanajuato.

Shrub, 0.5 to 2 meters high, with shredded bark; leaves obovate, 6 to 20 mm. long, white-tomentose beneath; petals 10 to 12 mm. long.

3. *Cowania mexicana* D. Don, Trans. Linn. Soc. Bot. 14: 575. 1825.

Geum dryadoides DC.; Seringe in DC. Prodr. 2: 554. 1825.

Durango and Guanajuato; reported from Jalisco.

Shrub, 1 to 2 meters high, with brownish bark; leaves usually 3-cleft, 5 to 10 mm. long; petals cream-colored, about 8 mm. long. "Romero cedro" (Guanajuato, Jalisco); "chivatillo" (Durango, *Patoni*); "romerillo cimarrón" (*Seemann*).

4. *Cowania stansburiana* Torr. in Stansb. Expl. Great Salt Lake 386. 1852.

Dry hillsides, Chihuahua and Sonora. Colorado to southern California; type from Great Salt Lake, Utah.

Shrub, 1 to 3.5 meters high, with gray shredded bark; leaves 8 to 15 mm. long, viscid; petals white or pale yellow, 8 to 10 mm. long; tails of the fruit 4 to 5 cm. long.

Before the advent of European races the Indians of Utah and Nevada obtained material for clothing from this shrub. The thin, silky inner bark was removed in strips and woven or braided together. The bark was used also for sandals, ropes, and mats. The Gosiute Indians are said to have used the plant medicinally, but in what manner is not stated.

9. *CHAMAEBATIA* Benth. Pl. Hartw. 308. 1848.1. *Chamaebatia australis* (T. S. Brandeg.) Abrams, Bull. Torrey Club 34: 263. 1907.

Chamaebatia foliolosa australis T. S. Brandeg. Bot. Gaz. 27: 447. 1899.

Northern Baja California; type from La Grulla. Southern California.

Low shrub, glandular-pubescent, with blackish branches; leaves 3 to 6 cm. long, 2 or 3 times pinnatifid into very numerous minute segments; flowers white, cymose-paniculate, the 5 petals 4 to 5 mm. long; stamens numerous.

10. *CERCOCARPUS* H. B. K. Nov. Gen. & Sp. 6: 232. 1823.

Shrubs or small trees, leaves entire or dentate, thick; flowers axillary, solitary or fasciculate, inconspicuous; fruit with long feathery tails.

Patoni gives the vernacular name of a Durango species as "lentisco." Because of their very hard, tough wood the plants are commonly known in the United States by the name of "mountain mahogany." The wood of *C. ledifolius* Nutt. was used by the Gosiute Indians of Utah for bows. The Tewa of New Mexico drink an infusion of the leaves of *C. montanus* Raf. (known as "palo duro") with salt, as a laxative.

Leaves coriaceous, the veins very prominent beneath, impressed above.

Leaves crenate.....4. *C. pringlei*.

Leaves serrate or dentate.

Leaf blades oval or elliptic, acute or subobtuse at the apex, the lateral veins mostly 12 to 20 on each side.....1. *C. macrophyllus*.

Leaf blades obovate to orbicular, rounded at apex, the lateral veins 5 to 10 on each side.

Leaves not conspicuously white-tomentose beneath, the lateral veins 7 to 10 on each side.....2. *C. fothergilloides*.

Leaves conspicuously white-tomentose beneath, the lateral veins 5 to 8 on each side.....3. *C. mojadensis*.

Leaves not coriaceous, the veins neither very prominent nor impressed.

Leaf blades 2 to 6 cm. long, dentate at least at and above the middle.

Pubescence of the hypanthium and young leaves spreading.

5. *C. rotundifolius*.

Pubescence of the hypanthium and young leaves appressed.

6. *C. betuloides*.

Leaf blades usually less than 2 cm. long, dentate only at the apex or entire.

Pubescence of the hypanthium and young leaves appressed; hypanthium tube less than 6 mm. long.....9. *C. breviflorus*.

Pubescence of the hypanthium and young leaves spreading; hypanthium tube 6 to 7 mm. long.

Pubescence of short hairs.....7. *C. eximius*.

Pubescence of long, shaggy hairs.....8. *C. paucidentatus*.

1. *Cercocarpus macrophyllus* C. Schneid. Handb. Laubh. 1: 530. 1905.

In the mountains, Jalisco to Veracruz and Guerrero; type from Orizaba, Veracruz.

Shrub, 2 to 4 meters high; leaves 4 to 11 cm. long, very thick, green above, tomentose beneath, dentate; tails of the fruit 5 to 6 cm. long.

2. *Cercocarpus fothergilloides* H. B. K. Nov. Gen. & Sp. 6: 233. 1823.

Mexico and Puebla; probably extending to Oaxaca; type from near the City of Mexico.

Shrub or small tree, 1 to 5 meters high; leaves 2.5 to 4.5 cm. long, dentate, lustrous on the upper surface. "Ramón," "zunu-ña" (Oaxaca).

3. *Cercocarpus mojadensis* C. Schneid. Handb. Laubh. 1: 530. 1905.

Coahuila and Zacatecas; type from Sierra Mojada, Coahuila.

Shrub or small tree; leaves 2 to 4 cm. long, dentate, white-tomentose beneath; tails of the fruit 3 to 4 cm. long.

4. *Cercocarpus pringlei* (C. Schneid.) Rydb. N. Amer. Fl. 22: 420. 1913.

Cercocarpus mojadensis pringlei C. Schneid. Mitt. Deutsch. Dendr. Ges. 14: 126. 1905.

Oaxaca; type from La Hoya Canyon.

Tree, up to 8 meters high; leaves 3 to 6.5 cm. long, white-tomentose beneath.

5. *Cercocarpus rotundifolius* Rydb. N. Amer. Fl. 22: 421. 1913.

Baja California; common in canyons at 1,440 to 1,700 meters. Southern California; type from Los Angeles County.

Shrub, 3 to 5.5 meters high, with dark branches, sometimes forming dense thickets; leaves rounded-oval or suborbicular, 1 to 3 cm. long; tails of the fruit 6 to 7 cm. long.

6. *Cercocarpus betuloides* Nutt.; Torr. & Gray, Fl. N. Amer. 1: 427. 1840.

Northern Baja California. California; type from Santa Barbara.

Shrub or tree, 3 to 10 meters high, the trunk sometimes 25 cm. in diameter; bark thin, separating into irregular scales; leaves oval or obovate, 1.5 to 5 cm. long; wood close-grained, reddish brown, its specific gravity about 0.93.

The wood is sometimes used for tool handles, and is useful for fuel.

7. *Cercocarpus eximius* (C. Schneid.) Rydb. N. Amer. Fl. 22: 422. 1913.

Cercocarpus breviflorus eximius C. Schneid. Handb. Laubh. 1: 530. 1905.

Dry rocky hillsides, Chihuahua and Sonora. Arizona and New Mexico; type from Capitan Mountains, New Mexico.

Shrub or small tree, 1 to 7 meters high, the trunk sometimes 20 cm. in diameter, with very hard wood; bark thin, scaly; leaves obovate or elliptic, rounded at the apex; tails of the fruit 4 to 5 cm. long.

8. *Cercocarpus paucidentatus* (S. Wats.) Britton, Trans. N. Y. Acad. 14: 31. 1894.

Cercocarpus parvifolius paucidentatus S. Wats. Proc. Amer. Acad. 17: 353. 1882.

Cercocarpus treleasei C. Schneid. Handb. Laubh. 1: 530. 1905.

San Luis Potosí to Hidalgo; type from San Miguelito, San Luis Potosí.

Shrub with gray bark; leaves 5 to 10 mm. long; tails of the fruit about 3 cm. long.

9. *Cercocarpus breviflorus* A. Gray, Pl. Wright. 2: 54. 1853.

Chihuahua, Coahuila, and Sonora; type from Fronteras, Sonora. Arizona to western Texas.

Shrub, 1 to 2 meters high, with dark gray, fissured bark; leaves elliptic, acute, 8 to 15 mm. long.

11. **RUBUS** L. Sp. Pl. 492. 1753.

Erect, prostrate, or scandent shrubs, usually armed with prickles or bristles; leaves persistent or deciduous, petiolate, simple or palmately or pinnately compound; flowers usually racemose or paniculate, large and showy; fruit of numerous small juicy drupes, these united and falling off like a cap or sometimes united to the receptacle, rarely falling off separately.

The genus contains the cultivated blackberries ("zarzamoras"), dewberries, and raspberries ("frambuesas"), some of which are grown in Mexico, although not very extensively. The native species are known in Mexico as "zarzamora"; the Tarascan name is said to be "situni"; the name "coatlamitl"¹ is reported from the Valley of Mexico. The fruit of all the native species is edible, and is used extensively in Mexico.

The root bark of the wild blackberries is official in the U. S. Pharmacopoeia. The decoction has long been a favorite domestic astringent remedy for diarrhoea.

¹The name should probably be "coatlantli" ("serpent's tooth"). The Nahuatl name for the fruit is "coatlanxocotl."

Sessé and Mociño report¹ from Mexico *Rubus occidentalis* and *R. hispidus*, both United States species, *R. fruticosus*, a European species, and *R. pentaphyllus*. The descriptions given are too brief for identification.

The tropical American species of *Rubus* seem to have attracted little attention from the early writers, but they are mentioned by Oviedo (Lib. VIII, Cap. XXVI), who says of the "zarzadoras:" "Although these can not be counted as trees in Spain, they are so here, where they have thicker trunks and stems and are much taller than in Castile, and for their size must be termed trees."

Leaves simple. Plants unarmed.

Flowers paniculate; drupelets capped by a hard pubescent cushion.

26. *R. parviflorus*.

Flowers mostly solitary; drupelets without a cushion.

Leaves concolorous, the terminal lobe broadly ovate, usually broader than long.....27. *R. neomexicanus*.

Leaves dark green above, paler beneath, the terminal lobe triangular, usually longer than broad.....28. *R. trilobus*.

Leaves compound.

Stipules broad, free or nearly so. Stems creeping.....1. *R. pumilus*.

Stipules narrow, linear-lanceolate or subulate, more or less adnate to the petioles.

Fruit cup-shaped, falling off from the dry receptacle.

Inflorescence racemose; fruit red; leaves pinnate.....5. *R. strigosus*.

Inflorescence corymbose; fruit black or purple; leaves palmate.

Fruit hemispheric; sepals inclosing the fruit.....4. *R. pringlei*.

Fruit oblong; sepals reflexed in fruit.

Leaves glabrate on the upper surface; fruit 8 to 15 mm. thick.

2. *R. glaucus*.

Leaves puberulent on the upper surface; fruit 6 to 8 mm. thick.

3. *R. eriocarpus*.

Fruit not cup-shaped, the carpels remaining on the fleshy receptacle and falling with it or falling off separately.

Plants with prostrate biennial stems; leaflets coarsely toothed, deciduous.

Leaves glabrous beneath or nearly so, except on the veins.

25. *R. humistratus*.

Leaves copiously pubescent beneath.

Fruit sparsely pilose.....23. *R. cymosus*.

Fruit glabrous.....24. *R. oligospermus*.

Plants with usually erect or scandent perennial stems; leaflets finely and closely dentate, often evergreen.

Drupelets few, falling off separately.

Plants scandent; branches of the inflorescence unarmed; sepals obtuse.

Stems tomentose, unarmed; leaflets stellate-puberulent on the upper surface, velvety-tomentose beneath....21. *R. scandens*.

Stems inconspicuously pilose, prickly; leaflets glabrous above, puberulent beneath on the veins.....22. *R. fagifolius*.

Plants erect; branches of the inflorescence prickly; sepals acute or acuminate.....11. *R. corifolius*.

Drupelets united with the receptacle or, if falling separately, numerous.

Stems and petioles densely hispid with long eglandular bristles.

6. *R. trichomallus*.

¹ Pl. Nov. Hisp. 85. 1887.

- Stems and petioles not hispid or, if so, the bristles gland-tipped.
 Stems and petioles with gland-tipped hairs.
 Leaflets sparsely hairy beneath or glabrate---7. *R. verae-crucis*.
 Leaflets densely pubescent beneath-----8. *R. adenotrichos*.
 Stems and petioles without gland-tipped hairs, the inflorescence
 sometimes glandular-hairy.
 Stems climbing or trailing; inflorescence conspicuously prickly.
 Leaflets lance-ovate, long-acuminate-----17. *R. nelsonii*.
 Leaflets broadly ovate or oval.
 Leaflets oval, rounded or obtuse-----20. *R. alnifolius*.
 Leaflets ovate, short-acuminate or acute.
 Teeth of the leaflets broadly ovate; inflorescence with
 gland-tipped hairs-----18. *R. palmeri*.
 Teeth of the leaflets lanceolate, directed upward; in-
 florescence without gland-tipped hairs.
 19. *R. sapidus*.
 Stems not climbing or trailing; inflorescence usually not prickly.
 Drupelets pubescent; inflorescence prickly.
 Leaflets cordate at base, soft-pubescent.
 9. *R. philyrophyllus*.
 Leaflets not cordate at base, sparsely pubescent.
 10. *R. liebmannii*.
 Drupelets glabrous; inflorescence slightly or not at all prickly.
 Petals at least twice as long as the sepals.
 Leaflets closely serrate with numerous sharp lanceolate
 teeth; drupelets few-----11. *R. coriifolius*.
 Leaflets dentate with numerous small, rather distant
 teeth; drupelets numerous-----12. *R. schiedeanus*.
 Petals slightly if at all exceeding the sepals.
 Leaflets regularly dentate with rather short teeth, never
 cordate at base.
 Inflorescence glandular and tomentose; leaflets pilose
 on the upper surface----13. *R. macrogongylus*.
 Inflorescence not glandular; leaflets finely stellate-
 pubescent on the upper surface----14. *R. smithii*.
 Leaflets closely and irregularly or doubly serrate with
 lanceolate antrorse teeth.
 Inflorescence copiously glandular-pubescent; inflores-
 cence lax-----15. *R. uhdeanus*.
 Inflorescence very sparsely or not at all prickly; in-
 florescence dense-----16. *R. abundus*.

1. *Rubus pumilus* Focke, Abh. Nat. Ver. Bremen 4: 155. 1874.

Chihuahua to Mexico, in mountain woods; type from San Andrés.

Stems creeping and rooting, sparsely prickly, with shredded bark; leaves reni-
 form, simple, 3 to 4 cm. wide, often 3-lobed; flowers white; fruit red, 1 cm. broad.

2. *Rubus glaucus* Benth. Pl. Hartw. 173. 1845.

Morelos to Chiapas. Southward to Ecuador, the type locality.

Shrub, 1 to 3 meters high, the stems glaucous; leaves pinnate, the 3 leaflets
 ovate, 6 to 15 cm. long, white-tomentose beneath; flowers white; fruit dark
 purple, 1.2 to 2 cm. long.

3. *Rubus eriocarpus* Liebm. Nat. For. Kjöbenhavn Vid. Medd. 1852: 162. 1853.

Veracruz and Puebla; type from Chnantla, Oaxaca. Central America.

Shrub, 1 to 3 meters high, the stems glaucous, prickly; leaflets 3, 6 to 10 cm. long, finely serrate, long-acuminate, white-tomentose beneath; flowers white; fruit about 1 cm. long, the drupelets tomentose.

4. *Rubus pringlei* Rydb. N. Amer. Fl. 22: 443. 1913.

Mexico and Hidalgo to Oaxaca and Chiapas. Guatemala; type from Volcán de Agua.

Shrub, 1 to 2 meters high; leaflets 3, prickly, 4 to 6 cm. long; flowers white; fruit 2 cm. long, red or purple, with a bloom.

5. *Rubus strigosus* Michx. Fl. Bor. Amer. 1: 297. 1803.

Batidaca arizonica Greene, Leaflets 1: 241. 1906.

Rubus arizonicus Rydb. N. Amer. Fl. 22: 446. 1913.

Mountains of Chihuahua. Widely distributed in the United States, Canada, and Alaska.

Shrub, 0.3 to 1 meter high; leaflets 5 or 7, 3 to 6 cm. long, white-tomentose beneath; flowers white; fruit 1 cm. broad.

The fruit of this red raspberry is of good quality and is much used in regions where it is abundant. Some of the horticultural raspberries are forms of this species improved by cultivation.

6. *Rubus trichomallus* Schlecht. Linnaea 13: 268. 1839.

Rubus urticaefolius Focke, Abh. Nat. Ver. Bremen 4: 149. 1874. Not *R. urticaefolius* Poir. 1804.

Veracruz and Chiapas; type from Hacienda de la Laguna, Veracruz. Central America and Colombia.

Stems several meters high, pubescent; leaflets 3 or 5, ovate, 7 to 12 cm. long; flowers white; fruit reddish or almost black.

7. *Rubus verae-crucis* Rydb. N. Amer. Fl. 22: 450. 1913.

Veracruz; type from San Miguel del Soldado.

Erect shrub, 5 to 7 meters high; leaflets 3 or 5, lanceolate, 5 to 10 cm. long; petals white, 1 cm. long.

8. *Rubus adenotrichos* Schlecht. Linnaea 13: 267. 1839.

Veracruz, Morelos, Oaxaca, and Chiapas; type from Jalapa, Veracruz. Guatemala to Costa Rica.

Shrub, up to 9 meters high, the stems covered with reddish gland-tipped bristles; leaflets 3 or 5, 5 to 10 cm. long; petals white or pink, 1 cm. long; fruit red or black, 1 cm. thick.

9. *Rubus philyrophyllus* Rydb. N. Amer. Fl. 22: 451. 1913.

Rubus tiliaccus Liebm. Nat. For. Kjöbenhavn Vid. Medd. 1852: 161. 1853.

Not *R. tiliaccus* Smith, 1815.

Rubus tiliacifolius Focke, Abh. Nat. Ver. Bremen 4: 159. 1874. Not *R. tiliacifolius* Weine, 1825.

Known only from the type locality, Chinantla, Oaxaca.

Leaflets 3, 8 cm. long or shorter, short-acuminate.

10. *Rubus liebmannii* Focke, Abh. Nat. Ver. Bremen 4: 158. 1874.

Mexico and Oaxaca; described from cultivated plants grown from seed gathered on Mount Zempoaltepec, Oaxaca.

Shrub, 2 to 3 meters high; leaflets 3, 4 to 10 cm. long, green; flowers rose-colored; fruit black, 1 cm. long.

11. *Rubus coriifolius* Liebm. Nat. For. Kjöbenhavn Vid. Medd. 1852: 157. 1853.

Michoacán to Veracruz, Morelos, and Chiapas; type from Jalapa, Veracruz.

Shrub, 1.5 to 3.6 meters high; leaflets elongate-ovate, 5 to 10 cm. long, acuminate; flowers white or rose; fruit red or nearly black.

12. *Rubus schiedeanus* Steud. Nom. Bot. ed. 2. 2: 479. 1841.

Rubus dumetorum Schlecht. Linnaea 13: 267. 1839. Not *R. dumetorum* Weihe, 1824.

Veracruz and Oaxaca; type from Jalapa, Veracruz. Guatemala.

Shrub, 1.5 to 7.5 meters high; leaflets 3 or 5, 4 to 10 cm. long, glabrous above, puberulent beneath; flowers white; fruit black.

13. *Rubus macrogongylus* Focke, Repert. Sp. Nov. Fedde 9: 236. 1911. Veracruz. Guatemala.

Leaflets 3 or 5, oblong, acuminate; fruit black.

14. *Rubus smithii* Rydb. N. Amer. Fl. 22: 453. 1913.

Rubus poliophyllus Focke; Donn. Smith, Bot. Gaz. 18: 202. 1893. Not *R. poliophyllus* Kuntze, 1879.

Mexico. Guatemala; type from San Rafael.

Leaflets 3 or 5, oval or elliptic, 8 cm. long or shorter, abruptly acuminate; flowers white; fruit black.

15. *Rubus uhdeanus* Focke, Abh. Nat. Ver. Bremen 4: 159. 1874.

Mexico and Morelos.

Leaflets 3, pale beneath, 9 cm. long or shorter; petals white or pinkish, 8 mm. long; fruit black, about 1 cm. long.

16. *Rubus abundus* Rydb. N. Amer. Fl. 22: 454. 1913.

Rubus floribundus H. B. K. Nov. Gen. & Sp. 6: 219. 1823. Not *R. floribundus* Weihe, 1821.

Veracruz and Oaxaca. Central America to Bolivia; type from Andes of Loja, Ecuador.

Leaflets 3 or 5, 10 cm. long or shorter; flowers white or rose; fruit black, subglobose.

17. *Rubus nelsoni* Rydb. N. Amer. Fl. 22: 455. 1913.

Known only from the type locality, Mount Zempoaltepec, Oaxaca.

Stem reclining, 2 to 4 meters long; leaflets 3 or 5, 3 to 7 cm. long; flowers white; fruit dark purple, subglobose.

18. *Rubus palmeri* Rydb. N. Amer. Fl. 22: 456. 1913.

Durango, Sinaloa, Tepic, and Jalisco; type from San Ramón, Durango.

Stems reclining, 2 to 4 meters long; leaflets 3 or 5, 10 cm. long or shorter; flowers white; fruit black, of good flavor. "Guisnora," "huismora" (Durango); "mora" (Sinaloa).

19. *Rubus sapidus* Schlecht. Linnaea 13: 269. 1839.

Veracruz; type from Jalapa.

Leaflets 3 or 5, dark green, 7 cm. long or shorter, acuminate; petals white, 1 cm. long; fruit globose.

20. *Rubus alnifolius* Rydb. N. Amer. Fl. 22: 457. 1913.

Known only from the type locality, San Miguel, Veracruz.

Stems decumbent or reclining; leaflets 3, oval, coriaceous, 3 to 5 cm. long; fruit dark purple, 1.5 to 2 cm. long.

21. *Rubus scandens* Liebm. Nat. For. Kjöbenhavn Vid. Medd. 1852: 154. 1853.

Veracruz; type from Mirador.

Stems climbing, often 6 meters long; leaflets 3 or 5; flowers white or pinkish; fruit dark purple.

22. *Rubus fagifolius* Schlecht. & Cham. Linnaea 5: 571. 1830.

Veracruz; type from Papantla.

Stems climbing, sometimes 5 meters long; leaflets 3 or 5, 12 cm. long or shorter, coriaceous; flowers white; fruit red, of 4 to 6 large drupelets.

23. *Rubus cymosus* Rydb. N. Amer. Fl. 22: 470. 1913.

Known only from the type locality, Tlalpam, Valley of Mexico.

Stems decumbent, prickly; leaflets 5, ovate, 3 to 8 cm. long; flowers white; fruit dark purple, globose, 1 cm. long.

24. *Rubus oligospermus* Thornber; Rydb. N. Amer. Fl. 22: 470. 1913.
Rubus scolocaulon T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 498. 1919.
 Baja California and Sonora to San Luis Potosí and Jalisco. Southern Arizona; type from Santa Catalina Mountains.
 Stems trailing, glabrous, 1 to 6 meters long; leaflets 3 or 5, 5 cm. long or shorter; flowers white.
 This has been reported from Mexico as *R. trivialis* Michx.
25. *Rubus humistratus* Steud. Nom. Bot. ed. 2. 2: 478. 1841.
Rubus humifusus Schlecht. Linnaea 13: 270. 1839. Not *R. humifusus* Weihe & Nees, 1821.
 Southern Mexico; type from Jalapa, Veracruz.
 Stems prostrate, 1 to 2 meters long; leaflets 3, ovate, 3 to 6 cm. long; flowers white.
26. *Rubus parviflorus* Nutt. Gen. Pl. 1: 308. 1818.
Rubus parviflorum Rydb. Bull. Torrey Club 30: 274. 1903.
 Mountains of Chihuahua. Northward to Alaska and Ontario; type from Lake Huron.
 Shrub, a meter high or less, unarmed, glandular-pubescent; leaves petiolate, reniform, 5 to 10 cm. wide, 3 or 5-lobed; flowers paniculate, the petals white, 1.5 to 3 cm. long; fruit thimble-shaped, red, 1.5 to 2 cm. wide, juicy, edible.
 Known in the United States as "thimbleberry." The fruit is often gathered, but is of rather poor quality. It collapses when picked. The flowers are very showy and handsome.
27. *Rubus neomexicanus* A. Gray, Pl. Wright. 2: 55. 1853.
Oreobatus neomexicanus Rydb. Bull. Torrey Club 30: 275. 1903.
 Northern Sonora. Arizona and New Mexico; type from Santa Rita, New Mexico.
 Shrub, 1 to 3 meters high, with flaky bark; leaves cordate-reniform, 3 to 9 cm. wide, pubescent, long-petiolate; flowers white, the petals 2 to 2.5 cm. long; fruit 1.5 cm. broad, red.
28. *Rubus trilobus* Seringe in DC. Prodr. 2: 566. 1825.
Rubus mexicanus Kuntze, Meth. Sp. 102. 1879.
Oreobatus trilobus Rydb. N. Amer. Fl. 22: 428. 1913.
 Veracruz, Puebla, Oaxaca, and Chiapas. Guatemala.
 Shrub; leaves cordate, 3-lobed; petals white, 2 cm. long; fruit purple, 1.5 cm. broad.

DOUBTFUL SPECIES.

RUBUS MADRENSIS Jones, Contr. West. Bot. 12: 14. 1908. Described from Chihuahua.

12. *ROSA* L. Sp. Pl. 491. 1753.

Erect shrubs, armed with prickles; leaves pinnate; flowers solitary or corymbose, large and showy; hypanthium enlarged and fleshy in fruit, bearing numerous achenes on the inner surface.

Many species of roses ("rosas") of European or Asiatic origin are cultivated in Mexico for their beautiful flowers. The fruits of some of the North American species are sweet and palatable when frosted, and they were eaten by the Indians, especially in winter, when food was scarce. Among the Tewa Indians of New Mexico a salve made from the petals is used for sore mouth, and a decoction of the fruit was employed by the Omaha as a wash for sore eyes. Some of the tribes smoked the inner bark, either alone or mixed with tobacco.

Leaflets mostly 5 to 10 mm. long; fruit densely spiny-----1. *R. minutifolia*.

Leaflets mostly 1.5 cm. long or larger; fruit not spiny.

Leaflets glabrous beneath, without glands, thick-----2. *R. montezumae*.

Leaflets pubescent beneath, or with stalked glands, thin.

Rachis of the leaves, as well as the fruit, without large stalked glands.

3. *R. fendleri*.

Rachis of the leaves, and usually the fruit, with long-stalked glands.

Leaflets densely pubescent beneath, not glandular-ciliate.

4. *R. californica*.

Leaflets glabrous beneath but with numerous stalked glands, glandular-ciliate-----5. *R. serrulata*.

1. *Rosa minutifolia* Parry, Bull. Torrey Club 9: 97. 1882.

Baja California, abundant in places along arroyos and on mesas, up to an altitude of 300 meters; type from Bahía de Todos Santos.

Shrub, 0.5 to 1.5 meters high, the stems covered with stellate hairs; leaflets 3, 5 to 8 mm. long; petals deep rose purple to white, 1 to 1.5 cm. long.

2. *Rosa montezumae* Humb. & Bonpl.; Redouté, Roses 1: 55. 1817.

Rosa mexicana Willd. (Spreng. Syst. Veg. 2: 555. 1825, as synonym); Crép.

Bull. Soc. Bot. Belg. 11: 82. 1872.

Mountains of Mexico and Hidalgo; type from the mountains of the Valley of Mexico.

Shrub, 1 to 2 meters high; leaflets 3 to 7, oval, acute, 1 to 2 cm. long; petals pink, 1.5 to 1.8 cm. long; fruit red. "Garambullo," "uña de gato," "rosa de Moctezuma," "cinorrodón," "agabanzo," "escaramujo" (Valley of Mexico); "trompillo" (Hidalgo, *Villada*).

The fruit is used in domestic medicine.

3. *Rosa fendleri* Crép. Bull. Soc. Bot. Belg. 15: 91. 1876.

Mountains of northern Chihuahua. Northward to Montana and South Dakota; type from New Mexico.

Shrub, 1 meter high or less; leaflets 5 or 7, 1 to 3 cm. long; petals pink, 1.5 cm. long; fruit red.

4. *Rosa californica* Cham. & Schlecht. Linnaea 2: 35. 1827.

Baja California. California; type from San Francisco.

Shrub, 1 to 3 meters high; leaflets 5 or 7, 1 to 2 cm. long; petals pink, 1.5 to 2.5 cm. long.

5. *Rosa serrulata* Raf. Ann. Gén. Phys. 5: 218. 1820.

Rosa mexicana S. Wats. Proc. Amer. Acad. 15: 354. 1882. Not *R. mexicana* Willd. 1825.

Coahuila and Nuevo León. Eastern United States; type from New York.

Shrub, 1 meter high or less; leaflets usually 5, 1 to 4 cm. long; petals pink, 1.5 to 2.5 cm. long.

61. MALACEAE. Apple Family.

Trees or shrubs, sometimes armed with spines; leaves alternate, stipulate, dentate or lobate; flowers perfect, solitary, racemose, corymbose, or cymose, often large and showy; petals 5; stamens usually numerous; fruit a pome, this consisting of the much enlarged, fleshy calyx tube, inclosing the papery or leathery seedlike carpels.

Several important cultivated fruit trees belong to this family, chief of which are the following: The apple, *Malus sylvestris* Mill. ("manzano," the tree, "manzana," the fruit; "belehui," Oaxaca, Zapotec, *Reko*; "tnutinumi," Oaxaca, Mixtec, *Reko*); the pear, *Pyrus communis* L. ("peral"); the quince, *Cydonia oblonga* Mill. ("membrillo"); and the loquat, *Eriobotrya japonica* Lindl. ("ñspero"). All these are natives of the Old World. Bustamente states¹

¹ In his edition of Andrés Cavo's *Los Tres Siglos de México*, p. 6. 1852.

that the first apple trees were brought to Mexico by Gregorio López, and planted in Jalisco about 1522. Clavigero relates that the Jesuits planted apple trees in Baja California in the 18th century.

Carpels of the fruit hard and bonelike; plants usually armed with spines.

1. CRATAEGUS.

Carpels of the fruit thin and papery; plants without spines.

Fruit large, 2 cm. in diameter or larger.....2. PHOTINIA.

Fruit small, 1 cm. in diameter or smaller.

Leaves oblong or lanceolate, 8 to 10 cm. long, dentate...3. HETEROMELES.

Leaves rounded or oval, 5 cm. long or shorter, entire or obscurely dentate.

4. AMELANCHIER.

1. CRATAEGUS L. Sp. Pl. 475. 1753.

REFERENCE: Eggleston, Bull. Torrey Club 36: 501-514. 1909.

Shrubs or small trees with dark brown, scaly bark, nearly always armed with long stout spines; leaves dentate or lobate, petiolate, deciduous; flowers white, corymbose, strong-scented, the odor often very disagreeable; fruit usually globose or pyriform; wood hard and tough.

The species (in the United States called "hawthorn" and "red haw") are known in Mexico under the name "tejocote" or "texocotl." Buelna gives the Otomí names as "dopri," "dopini," and "vipeni." The fruit is highly valued and is a common article in the markets. It is eaten raw or more commonly made into jelly or preserves. The trees are often cultivated. The fruit is reputed to have pectoral properties, although, apparently without sufficient basis. The roots are used in domestic medicine because of their supposed diuretic and antidysenteric properties. The wood, which is hard and compact, is used for various purposes.

Mexican specimens of the genus are reported by Sessé and Mocino¹ as *Crataegus crus-galli* and *Mespilus pyracantha*.

Branchlets, corymbs, and lower surface of leaves glabrous. Fruit red.

1. C. baroussana.

Branchlets, corymbs, and lower surface of leaves tomentose.

Leaf blades broadly ovate, tomentose on both sides. Stamens about 10; styles 4 or 5; calyx lobes serrate; fruit red.....2. C. greggiana.

Leaf blades mostly elliptic, lanceolate, or obovate.

Stamens 5 to 10. Styles 3 or 4; calyx lobes serrate; fruit red, with 3 or 4 nutlets.....3. C. rosei.

Stamens about 20.

Calyx lobes serrate. Styles usually 2 or 3; fruit yellow, with 2 or 3 nutlets.....4. C. pubescens.

Calyx lobes entire.

Leaf blades oblanceolate or obovate.....5. C. stipulosa.

Leaf blades mostly lanceolate or elliptic.

Styles 2 or 3; leaves glabrous on the upper surface. Fruit yellow, with 2 or 3 nutlets.....6. C. parryana.

Styles 3 to 5; leaves tomentose on the upper surface.

Leaf blades 3 to 9 cm. long; styles usually 3 or 4. Fruit orange.....7. C. mexicana.

Leaf blades 1.5 to 5 cm. long; styles usually 4 or 5...8. C. nelsoni.

1. *Crataegus baroussana* Eggleston, Torreya 7: 35. 1906.

Coahuila; type from mountains near Saltillo.

¹ Pl. Nov. Hisp. 84, 85. 1887.

Tree, 3.5 to 5.5 meters high; leaves elliptic-oval, 3 to 7 cm. long, serrate and shallowly lobed, bright green; fruit about 1 cm. in diameter.

2. *Crataegus greggiana* Eggleston, Bull. Torrey Club 36: 511. 1909.
Coahuila; type from Saltillo.

Tree, 4.5 to 6 meters high, the trunk 15 to 30 cm. thick; spines 7 cm. long or shorter; leaves 4 to 7 cm. long, coarsely serrate.

3. *Crataegus rosei* Eggleston, Bull. Torrey Club 36: 509. 1909.

Chihuahua to San Luis Potosí and Durango; type from Álvarez, San Luis Potosí.

Shrub or small tree, 3 to 9 meters high, the trunk up to 37 cm. in diameter; leaves 2.5 to 4 cm. long, serrate, lustrous; fruit often 1.5 cm. in diameter.

Wood white, tough, and durable; used for tool handles.

4. *Crataegus pubescens* (H. B. K.) Steud. Nom. Bot. ed. 2. 433. 1841.

Mespilus pubescens H. B. K. Nov. Gen. & Sp. 6: 213. pl. 565. 1824.

Crataegus pubescens botteri Eggleston, Bull. Torrey Club 26: 506. 1909.

Veracruz, Hidalgo, and Oaxaca; type from Morán, Hidalgo.

Tree, sometimes 10 meters high; leaves 3 to 8 cm. long, finely serrate or on young branches deeply lobate; fruit about 12 mm. long.

5. *Crataegus stipulosa* (H. B. K.) Steud. Nom. Bot. ed. 2. 433. 1841.

Mespilus stipulosa H. B. K. Nov. Gen. & Sp. 6: 213. 1824.

Chiapas, Guatemala to Ecuador (type locality).

Tree; leaves 4 to 8 cm. long, acute or obtuse, tomentose beneath, finely serrate; fruit sometimes 2.5 cm. in diameter.

6. *Crataegus parryana* Eggleston, Bull. Torrey Club 36: 510. 1909.

Known only from the type locality, Álvarez, San Luis Potosí.

Shrub or small tree, up to 4.5 meters high. "Tejocote ameco."

7. *Crataegus mexicana* Moc. & Sessé; DC. Prodr. 2: 629. 1825.

Crataegus subserrata Benth. Pl. Hartw. 10. 1839.

Crataegus hypolasia Koch, Hort. Dendr. 167. 1853.

Crataegus mexicana microsperma Eggleston, Bull. Torrey Club 36: 508. 1909.
San Luis Potosí to Jalisco, Oaxaca, and Veracruz.

Tree about 6 meters high; spines often very large and stout; leaves thick, lustrous, serrate or shallowly lobate; fruit 1 to 2 cm. in diameter. "Manzanita tejocotera" (Oaxaca).

8. *Crataegus nelsoni* Eggleston, Bull. Torrey Club 36: 512. 1909.

Known only from the type locality near San Cristóbal, Chiapas, altitude 2,100 to 2,640 meters.

Spines stout, 4 to 6 cm. long; leaves lustrous, serrate and shallowly lobate.

2. PHOTINIA Lindl. Trans. Linn. Soc. Bot. 13: 103. 1821.

1. *Photinia mexicana* (Baill.) Hemsl. Biol. Centr. Amer. Bot. 1: 380. 1880.

Chamaemeles mexicana Baill. Adansonia 9: 148. 1869.

In forests, mountains of Veracruz and Oaxaca; type from Veracruz.

Tree, about 9 meters high; leaves oblong, elliptic, or oval, 5 to 12 cm. long, petiolate, rounded to acutish at apex, shallowly crenate, thick, bright green, lustrous; flowers cymose-paniculate, brown-tomentose; fruit subglobose, usually 3 to 4 cm. in diameter, rough, tomentose when young; seeds dark reddish brown, 1.5 cm. long. "Peral silvestre" (Oaxaca).

The fruit somewhat resembles a small pear. It is said to be of good flavor. This plant is probably the one reported by Sessé and Mociño¹ as *Crataegus indica*.

¹ Pl. Nov. Hisp. 84. 1887.

3. **HETEROMELES** M. Roemer, Fam. Nat. Syn. 3: 105. 1837.

1. *Heteromeles salicifolia* (Presl) Abrams, Bull. N. Y. Bot. Gard. 6: 381. 1910.
Crataegus arbutifolia Ait. Hort. Kew. 3: 202. 1811. Not *C. arbutifolia*
 Lam. 1783.

Photinia arbutifolia Lindl. Trans. Linn. Soc. Bot. 13: 103. 1821.

Heteromeles arbutifolia M. Roemer, Fam. Nat. Syn. 3: 105. 1847.

Photinia salicifolia Presl, Epim. Bot. 204. 1849.

Baja California, ranging from sea level up to 1,680 meters. California;
 type from Monterey.

Shrub or tree, 2 to 9 meters high, sometimes with a trunk 45 cm. in diameter; bark thick, light gray, shallowly fissured; leaves persistent, oblong, acute, 8 to 10 cm. long, dentate; flowers small, white, in large panicles; fruit red or yellow, about 1 cm. long, astringent; wood hard, close-grained, reddish brown, its specific gravity about 0.93.

The tree is known in California as "tollon," "Christmas-berry," and "California holly." It is often used for Christmas decorations. The fruit is edible.

4. **AMELANCHIER** Medic. Phil. Bot. 1: 155. 1789.

Shrubs or small trees; leaves petiolate, persistent or deciduous, entire or denticulate; flowers racemose, solitary, or clustered, white, rather showy; fruit a small, juicy pome.

Leaves small, 0.7 to 1.8 cm. wide, the lateral nerves not very conspicuous beneath; calyx usually glabrous outside; inflorescence commonly short and umbelliform.-----1. *A. denticulata*.

Leaves large, usually 2.3 cm. wide, the lateral nerves coarse and very conspicuous beneath; calyx densely white-tomentose outside; inflorescence elongate, racemose -----2. *A. nervosa*.

1. *Amelanchier denticulata* (H. B. K.) Koch, Dendrol. 1: 183. 1869.

Cotoneaster denticulata H. B. K. Nov. Gen. & Sp. 6: 169. pl. 556. 1823.

Nagelia denticulata Lindl. Bot. Reg. 31: Misc. 40. 1845.

Crataegus minor Sessé & Moc. Pl. Nov. Hisp. 84. 1887.

Chihuahua and Coahuila to Mexico and Oaxaca; type from Actopan, Hidalgo.

Erect shrub, 1 to 3.5 meters high, densely branched, the branches gray or brown; leaves 1 to 2.5 cm. long, entire or denticulate; flowers about 1 cm. broad; fruit red, dark purple, or black, 8 to 10 mm. long. "Membrillito" (Veracruz); "membrillo cimarrón," "tlaxisqui," "tlaxistle" (Valley of Mexico); "membrillo" (Oaxaca); "madronillo" (Coahuila).

The fruit is edible. The stems, according to Herrera, are made into canes, known as "varitas de Apizaco," which are notable for their flexibility. In the typical form of the species the calyx is tomentose outside, but in most of the specimens the calyx is glabrous. The northern (glabrous) form may be a distinct species, but there seem to be some intermediate specimens. *Crataegus inermis* Sessé & Moc.¹ is perhaps another synonym of this species.

2. *Amelanchier nervosa* (Decaisne) Standl.

Cotoneaster nervosa Decaisne, Nouv. Arch. Mus. Paris 10: 177. 1874.

Chiapas and Oaxaca.

Leaves 3 to 4.5 cm. long, very thick, bright green on the upper surface, white or gray-tomentose beneath, usually entire.

¹ Pl. Nov. Hisp. 84. 1887.

62. AMYGDALACEAE. Almond Family.

Trees or shrubs; leaves alternate, entire or serrate, persistent or deciduous, stipulate; flowers perfect, often showy, usually solitary, cymose, corymbose, or racemose; petals 5; stamens numerous; fruit a drupe.

Style subterminal; leaves often serrate-----1. PRUNUS.

Style basilar; leaves entire.

Stamens 3 to 10.

Petals none or minute-----2. LICANIA.

Petals 5-----3. HIRTELLA.

Stamens 15 to many.

Anthers linear, elongate-----4. LECOSTEMON.

Anthers short, didymous or rounded.

Calyx tube elongate; inflorescence racemose or paniculate; ovary adnate to the throat of the calyx-----5. COUEPIA.

Calyx tube campanulate; inflorescence cymose; ovary sessile in the bottom of the calyx-----6. CHRYSOBALANUS.

1. PRUNUS L. Sp. Pl. 473. 1753.

REFERENCE: Koehne, Bot. Jahrb. Engler 52: 279-333. 1915.

Trees or shrubs; leaves serrate or entire, the teeth often gland-tipped; flowers solitary, corymbose, umbellate, or racemose; fruit glabrous or pubescent.

Several important fruit trees of this genus are cultivated in Mexico, chief of which are the following: The peach, *Prunus persica* (L.) Sieb. & Zucc., "durazno," "melocotón," "prisco," "albérrchigo," "pahsh" (Mixe, *Belmar*), "ñhcanzà," "ixi" (Otomí, *Buelna*); the apricot, *P. armeniaca* L., "chabacano," "albaricoque," "damasco"; the almond, *P. communis* (L.) Fritsch, "almendro" (the tree), "almendra" (the fruit); various plums, *P. domestica* L., *P. insititia* L., etc., "ciruelo," "ciruelo de España"; and cherries, *P. cerasus* L., "cerezo," (the tree), "cereza" (the fruit), "guindo." All these were doubtless introduced into Mexico by the Spaniards at an early date. It is of interest to note that peaches were probably introduced into the United States directly from Mexico. Havard remarks¹ upon the subject as follows:

"The Indians certainly exhibited commendable promptness and industry, after the advent of the whites, in introducing such fruits as were shown to be desirable. Thus the Peach brought to Mexico soon after the conquest was, according to the testimony of Du Pratz, found in general cultivation among the Indians of Louisiana when the French settled that province in 1698, and had become abundant in Georgia at the time of the settlement of the English in 1732. Wm. Bartram describes the carefully planted Orange groves of the Indians which he noticed in 1773. The early introduction and propagation of these two plants by the Indians led to the erroneous impression that they were of American origin."

Flowers solitary, fascicled, or umbellate; ovary often pubescent.

Flowers umbellate; fruit large, 1.8 to 2.5 cm. long, glabrous-----1. *P. mexicana*.

Flowers solitary or fasciculate; fruit usually less than 1 cm. long.

Ovary glabrous-----2. *P. apodantha*.

Ovary pubescent.

Leaves entire or nearly so.

Leaves oval or obovate-----3. *P. minutiflora*.

Leaves linear-oblongate-----4. *P. fasciculata*.

¹ V. Havard, Food plants of the North American Indians, Bull. Torrey Club 22: 98-123. 1895.

Leaves serrate or serrulate.

Leaf blades orbicular or broadly ovate, finely serrate; flowers pedicellate.....5. *P. fremontii*.

Leaf blades oblong or obovate, serrate; flowers subsessile.

6. *P. microphylla*.

Flowers racemose; ovary glabrous.

Racemes terminating short leafy branches; leaves finely serrulate.

Leaf blades mostly 4 to 6 cm. long, obtuse or acute; racemes 4 to 6 cm. long.....7. *P. virens*.

Leaf blades mostly 6.5 to 10 cm. long, abruptly acuminate or long-acuminate; racemes usually 7 to 15 cm. long.....8. *P. capuli*.

Racemes axillary, naked; leaves entire or coarsely serrate or dentate.

Leaves serrate or dentate, or rarely entire, the fruit then 1.5 to 2 cm. long.

Leaves entire.....9. *P. lyoni*.

Leaves serrate or dentate.

Leaf blades suborbicular or rounded-ovate; racemes equaling or longer than the leaves.....10. *P. ilicifolia*.

Leaf blades lance-oblong; racemes much shorter than the leaves.

11. *P. prionophylla*.

Leaves entire.

Calyx persistent beneath the fruit. Leaves barbate beneath.

12. *P. rhamnoides*.

Calyx deciduous.

Calyx villous within at the base; petals barbate above the base.

13. *P. cortapico*.

Calyx glabrous within; petals glabrous.

Racemes all or mostly in clusters of 2 to 4.....14. *P. samyroides*.

Racemes solitary.

Leaf blades without glands beneath; branches tuberculate by the elevated lenticels.....15. *P. tuberculata*.

Leaf blades with 2 or more glands beneath near the base; branches smooth or nearly so.

Glands 3 or 4 beneath, 2 of them near the base close to the costa, the others near the lateral veins.....16. *P. tetradenia*.

Glands 2, at the base of the blade near the costa.

Petioles 5 to 10 mm. long; petals 2.3 to 2.7 mm. long; anthers 1 to 1.2 mm. long; stigma 1.3 to 1.5 mm. broad.

17. *P. erythroxyton*.

Petioles 12 to 22 mm. long; petals 1.5 to 2 mm. long; anthers 0.6 to 0.8 mm. long; stigma 0.4 to 1 mm. broad.

18. *P. brachybotrya*.

1. *Prunus mexicana* S. Wats. Proc. Amer. Acad. 17: 353. 1882.

Coahuila and Nuevo León; type from Lerios, Coahuila. Southern United States.

Small tree; leaves lanceolate or ovate, 5 to 12 cm. long; flowers white, 2 cm. broad; fruit purplish red, with a bluish bloom, sometimes 2.5 cm. in diameter.

This species has often been confused with *P. americana* Marsh. and *P. nigra* Ait., both natives of the United States. Those two species are the source of many of the cultivated plums. In the wild state the fruit is of fair quality, but it is greatly improved by cultivation. There is reason to believe that these wild plums were cultivated by the Indians, although, as Havard remarks, the Indian orchards were perhaps only the result of seeds accidentally dropped about villages and camping grounds.

2. *Prunus apodantha* Blake, Contr. Gray Herb. n. ser. 52: 68. 1917.
Known only from the type locality, Río Hondo, State of Mexico.
Shrub, 60 cm. high; leaves oval, 1.5 to 3 cm. long, 1 to 1.5 cm. wide, obtuse, crenate-serrate, pilose beneath; petals 3.3 mm. long.
3. *Prunus minutiflora* Engelm. Bost. Journ. Nat. Hist. 6: 185. 1850.
Reported from Chihuahua. Western Texas; type collected between San Antonio and New Braunfels.
Shrub 30 to 60 cm. high, densely branched; leaves 1 to 2 cm. long, pubescent beneath or glabrate; fruit 8 to 12 mm. long.
4. *Prunus fasciculata* (Torr.) A. Gray, Proc. Amer. Acad. 10: 70. 1874.
Emplectocladus fasciculatus Torr. in Frém. Rep. Exped. Rocky Mount. 10. pl. 5. 1850.
Amygdalus fasciculata Greene, Fl. Franc. 49. 1891.
Baja California, on dry slopes. Southern California (type locality) to Utah and Arizona.
Densely branched shrub, 1 to 2.5 meters high, with gray bark; leaves 1 to 1.5 cm. long; flowers very small, the petals white, linear; fruit 10 to 12 mm. long, densely pubescent, with very thin flesh.
5. *Prunus fremontii* S. Wats. Bot. Calif. 2: 442. 1880.
Amygdalus fremontii Abrams, Bull. N. Y. Bot. Gard. 6: 385. 1910.
Northern Baja California. Southern California, the type from San Diego County.
Shrub, sometimes 4.5 meters high, with stiff spinescent branches; leaves about 1 cm. long, thin, deciduous; flowers white, about 1 cm. broad.
6. *Prunus microphylla* (H. B. K.) Hemsl. Biol. Centr. Amer. Bot. 1: 368. 1888.
Amygdalus microphylla H. B. K. Nov. Gen. & Sp. 6: 243., pl. 564. 1823.
San Luis Potosí to Hidalgo; type collected between Pachuca and Morán, at an altitude of 2,340 meters.
Shrub, about a meter high, densely branched; leaves 1 to 1.5 cm. long; flowers small, white.
7. *Prunus virens* (Woot. & Standl.) Standl.
Prunus salicifolia acutifolia S. Wats. Proc. Amer. Acad. 22: 411. 1887.
Padus virens Woot. & Standl. Contr. U. S. Nat. Herb. 16: 132. 1913.
In mountain canyons, Chihuahua and Sonora to Durango and San Luis Potosí. Southern Arizona to western Texas; type from Organ Mountains, New Mexico.
Tree, usually about 7 meters high, with smooth, thin, reddish brown bark, the top broad and spreading, dense; leaves ovate or ovate-oblong, bright green; flowers small, white; fruit black, about 1 cm. in diameter, sweet, edible.
Perhaps not sufficiently distinct from *P. capuli*.
8. *Prunus capuli* Cav. Anal. Hist. Nat. (Madrid) 2: 110. 1800.
Prunus salicifolia H. B. K. Nov. Gen. & Sp. 6: 190. pl. 563. 1823.
Cerasus capollin DC.; Seringe in DC. Prodr. 2: 539. 1825.
Sonora to Chiapas and Veracruz. Guatemala to Peru; type from Ecuador.
Shrub or usually a tree, sometimes 15 meters high, with a trunk nearly a meter in diameter, the bark reddish brown or grayish, nearly smooth, the crown broad; leaves lanceolate to ovate, lustrous, nearly glabrous; flowers small, white; fruit red or black, 1 cm. in diameter or smaller. Generally known as "capulfn," "capulfi," or "capollfn" (the name doubtless applied to other species also, and applied to this species in Peru and Ecuador); "tnun-

daya" (Oaxaca, Mixtec, *Reko*); "xengua" (Michoacán, *León*); "cerezo" (Guatemala); "pa kshumuk" (Mixe, *Belmar*); "detze," "ghohto" (Otomí *Buelna*).

The wood is of good quality and is much used for general carpentry and cabinet work. The large juicy fruit is highly esteemed, and for this reason the trees are sometimes planted about houses. In early times, at least, an intoxicating drink was made from the fruit. The juice or the fruits are sometimes mixed with cornmeal to make a kind of cake known as "capultamal" or "capoltamalli." The bark, leaves, or seeds, when crushed in contact with water, develop hydrocyanic acid, and under proper conditions they may poison animals which eat them; the same is true of other members of the genus. The distilled water of the leaves is substituted in Mexico for cherry laurel water, and has the same antispasmodic properties. A decoction of the bark is employed for dysentery and is reputed also, without sufficient basis apparently, to have febrifuge properties. The bark of *Prunus serotina* Ehrh. of the United States, a closely similar species, is official in the U. S. Pharmacopoeia. It has tonic properties and the power of calming irritation and diminishing nervous excitability. It has been employed extensively for the hectic fever which accompanies scrofula and tuberculosis. The fruit of the same species has been much used for flavoring spirituous liquors and various nonintoxicating beverages.

The fruit of *Prunus capuli* is mentioned by the earliest Spanish visitors to Mexico. Bernal Diaz del Castillo, in relating the hardships of the siege of Mexico in 1521, when the Spaniards and their allies were often in the direst straits for want of food, says, "Corn we had sufficiency of, but we wanted refreshments for the wounded. What preserved us was the plant called *quilitas*, cherries while in season, and tunas or Indian figs." Sahagún treats of the tree under the name "capulfn." The juice of the leaves and young shoots, he states, was dropped into the eyes to heal inflammation, and the kernels of the seeds were roasted and eaten. Hernández also treats of the plant in a chapter,¹ accompanied by a figure, entitled "De *Capolin*, seu *Ceraso dulci indica*." "The fruits," he says, "are slightly acid and astringent, although when fully ripe they are sweet and lose a great part of their harshness; and by some persons they are considered in no wise inferior to our cherries. In nature they are hot, dry, and somewhat astringent. They are made into bread and wine in times of scarcity. They furnish a sad food, and one which is hurtful in a way to the heart; and they impart a black color to the teeth if they are eaten for a long time, but this can be removed easily with attention and dentifrices; and there are not lacking persons who prefer these to all the other spring fruits, even those of the Old World. The tree flowers in spring and bears fruit nearly all summer long. It thrives in temperate regions, such as Mexico, where these trees grow in the gardens and plains, cultivated or wild. The decoction of the bark, put in the sun for fifteen days, and drunk in a dose of a drachm, cures dysentery; and the powdered bark removes ulcers from the eyes, clears the vision, and relieves inflammation of the eyes; and it moistens the tongue if it be dry from burning fever, as does also the liquor or juice from the young shoots."

9. *Prunus lyoni* (Eastw.) Sarg. Pl. Wilson. 74. 1911.

Cerasus lyoni Eastw. Handb. Trees Calif. 54. 1905.

Prunus ilicifolia integrifolia Sudw. Gard. & For. 4: 51. 1891.

Prunus integrifolia Sarg. Man. Trees N. Amer. 531. 1905.

¹ Thesaurus 95. 1651.

Reported from northern Baja California. Southern California.

Tree, sometimes 12 meters high, with a trunk 45 cm. in diameter; bark thick, gray; leaves ovate or ovate-lanceolate, 5 to 8 cm. long, acute, leathery; fruit purple, rounded, 1.5 to 2 cm. in diameter.

10. *Prunus ilicifolia* (Nutt.) Walp. Repert. Bot. 2: 10. 1843.

Cerasus ilicifolia Nutt.; Hook. & Arn. Bot. Beechey Voy. 340. 1832.

Laurocerasus ilicifolia Roem. Syn. Rosifl. 92. 1847.

Baja California, on mesas and in canyons. California; type from Santa Barbara.

Shrub or, northward, a tree 10 meters high; bark thick, reddish brown, fissured; leaves 6 cm. long or shorter, with spiny teeth; fruit subglobose, purple or reddish yellow, about 1.5 cm. in diameter; wood hard, strong, its specific gravity about 0.98. "Isláy" (Baja California, California; sometimes written "yslay").

The fruit of the holly-leaf cherry is edible, but the flesh, although of good flavor, is very scant. It is gathered by the people of Baja California. The Coahuilla Indians of California made use of the seeds for food. These were gathered in large quantities and spread in the sun to dry. They were then cracked and the kernels extracted and crushed in a mortar, then leached in a sand basket through which water was poured. The meal thus obtained was made into atole.

11. *Prunus prionophylla* Standl. Contr. U. S. Nat. Herb. 20: 213. 1919.

Known only from the type locality, Ixtaccihuatl, at an altitude of 2,100 to 2,400 meters.

Leaves about 10 cm. long, persistent, acute, serrate.

12. *Prunus rhamnoides* Koehne, Bot. Jahrb. Engler 52: 283. 1915.

Jalisco and Durango. Guatemala; type from San Miguel Uspantán.

Tree, 7.5 to 15 meters high; leaves ovate or lanceolate, 5.5 to 9 cm. long, attenuate, bright green; flowers about 5 mm. broad. "Iza" (Durango).

The Mexican specimens are variable but do not seem essentially different from the type. Reputed poisonous to cattle.

13. *Prunus cortapico* Kerber; Koehne, Bot. Jahrb. Engler 52: 307. 1915.

Known only from Colima, the type locality.

Tree with lance-oblong leaves; racemes much shorter than the leaves. "Cortapico," "carretero."

14. *Prunus samydoides* Schlecht. Linnaea 13: 92. 1839.

Laurocerasus samydoides Roem. Syn. Rosifl. 3: 92. 1847.

Veracruz to Hidalgo; type from Hacienda de la Laguna, Veracruz.

Small tree; leaves oval-lanceolate, 9 cm. long or smaller, persistent, glabrous.

15. *Prunus tuberculata* Koehne, Bot. Jahrb. Engler 52: 308. 1915.

Known only from the type locality, Monte Pelado, Oaxaca.

Tree; leaves lance-oblong; racemes much shorter than the leaves.

16. *Prunus tetradenia* Koehne, Bot. Jahrb. Engler 52: 309. 1915.

Veracruz and Oaxaca; type collected between Misantla and Naolinco, Veracruz.

Shrub; leaves oblong-lanceolate to oval, 6 to 15 cm. long, acute, bright green.

17. *Prunus erythroxyton* Koehne, Bot. Jahrb. Engler 52: 309. 1915.

Colima and Michoacán; type from Mesa del Cerrero, near Colima.

Tree with hard wood; leaves oblong to oval, 14 cm. long or less, coriaceous; flowers about 8 mm. broad; fruit black.

Perhaps not sufficiently distinct from the next species.

18. *Prunus brachybotrya* Zucc. Abh. Akad. Wiss. München 2: 348. 1837.*Prunus laurifolia* Schlecht. Linnaea 13: 91. 1839.*Prunus schiedeana* Steud. Nom. Bot. ed. 2. 2: 404. 1841.*Laurocerasus mexicana* Roem. Syn. Rosifl. 3: 90. 1847.*Laurocerasus brachybotrya* Roem. Syn. Rosifl. 3: 91. 1847.

Veracruz to Oaxaca.

Tree, sometimes very large, with large, oblong to oval, bright green leaves.
"Cerezo" (Oaxaca).

DOUBTFUL OR EXCLUDED SPECIES.

Hemsley reported *Prunus demissa* (Nutt.) Walp. and *P. virginiana* L. from Mexico, but the reports are doubtless based on incorrect determinations.**PRUNUS FERRUGINEA** (Seringe) Steud. Nom. Bot. ed. 2. 2: 400. 1841. *Cerasus ferruginea* Seringe in DC. Prodr. 2: 540. 1825. Described from Mexico. Said to have obovate leaves. Probably not of this genus.**2. LICANIA** Aubl. Pl. Guian. 1: 119. 1775.

Trees, glabrous or pubescent; leaves small or large, short-petiolate; flowers small, paniculate; fruit often very large.

Leaves 2 to 3 cm. wide, glabrous. Ovary glabrous-----1. **L. retifolia.**

Leaves 5.5 to 12 cm. wide, often pubescent.

Leaves oval or rounded-oval, 8.5 to 13 cm. long, broadly rounded or subcordate at base, tomentulose beneath when young; ovary glabrous.

2. **L. arborea.**

Leaves oblong to oblong-oblongeolate, 16 to 35 cm. long or larger, rounded or acute at base, glabrous or nearly so beneath; ovary strigillose.

3. **L. platypus.****1. Licania retifolia** Blake, Contr. Gray Herb. 52: 66. 1917.

Known only from the type locality, Cerro de los Cajones, Michoacán or Guerrero, altitude 1,000 meters.

Tree, 5 to 8 meters high; leaves lanceolate or obovate, 4.3 to 10 cm. long, acute to rounded at apex, bright green; flowers small, greenish white.

2. Licania arborea Seem. Bot. Voy. Herald 118. pl. 25. 1853.*Licania seleriana* Loes. Verh. Bot. Ver. Brand. 53: 55. 1911.

Guerrero and Oaxaca; reported from Morelos and Michoacán. Central America; type from Panama.

Tree, 4.5 to 6 meters high or larger; leaves short-petiolate, thick, pale beneath, the venation very conspicuous; panicles 15 to 20 cm. long, the flowers yellowish; fruit 2.5 cm. long or larger, containing a single large oily seed. "Cacahuanché," "cacahuaté," "cacahoanantzín," "quirindol cacahuanché," "quirindal," "caña dulce," "cacahoananche" (Guerrero, Morelos, Oaxaca, etc.); "frailecillo," "palo de fraile," "totopostle" (Oaxaca); "alcornoque" (Costa Rica); "encina" (Guatemala, Honduras).

The seeds contain about 30 per cent of oil, and burn readily when ignited. They are often strung on sticks and used for illuminating purposes. The oil is extracted in large quantities and is used for making candles, soap, axle grease, etc. It has a peculiar odor and a disagreeable flavor, and a green color which it imparts to soap made from it.³³ See J. C. Segura & M. D. Cordero, Reseña sobre el cultivo de algunas plantas industriales, pp. 33-40. 1884.

The writer has seen no authentic material of *L. scleriana*, but from the description it does not appear essentially different.

3. *Licania platypus* (Hemsl.) Fritsch, Ann. Naturhist. Hofmus. Wien 4: 53. 1889.

Moquilea platypus Hemsl. Biol. Centr. Amer. Bot. 1: 366. 1880.

Oaxaca. Central America; type from Granada, Nicaragua.

Tree, 10 to 15 meters high; leaves short-petiolate, rounded to short-acuminate at the apex; panicles large, many-flowered; fruit obovoid, 13 cm. long or larger, rough, edible. "Mesonzapote" (from *mezontli*, the crown of leaves left after cutting the heart of the *maguay*, and *zapote*); "caca de niño," "zapote amarillo," "zapote borracho," "zapote cabello" (Oaxaca); "zapote" (Costa Rica).

3. *HIRTELLA* L. Sp. Pl. 32. 1753.

1. *Hirtella americana* Aubl. Pl. Guian. 247. pl. 98. 1775.

Hirtella oblongifolia DC. Prodr. 2: 529. 1825.

? *Hirtella acavacensis* DC. Prodr. 2: 529. 1825.

Guerrero to Chiapas and Tabasco. Central America and South America; type from French Guiana.

Shrub, 2 to 4.5 meters high, with hirsute stems; leaves oblong, elliptic, or oblong-ovate, 5 to 10 cm. long, acute or acuminate, with an obtuse tip, short-petiolate; flowers small, in long loose racemes, the petals pink or purplish, the stamens long-exserted; fruit about 1 cm. long. "Icaquillo" (Tabasco, Oaxaca); "cajetillo" (Guerrero); "icaco de aura," "teta de yegua" (Cuba).

The bark is said to be astringent, and that of some species is used in Brazil for tanning.

DOUBTFUL SPECIES.

HIRTELLA CASTANEA D. C. Prodr. 2: 528. 1825. Based upon a drawing by Mociño and Sessé, believed to represent a Mexican plant. Probably the same as *H. triandra* Swartz.

4. *LECOSTEMON* Moc. & Sessé; DC. Prodr. 2: 539. 1825.

1. *Lecostemon terniflorum* Moc. & Sessé; DC. Prodr. 2: 539. 1825.

Described from Mexico, but not known from specimens.

Shrub; leaves oval or obvate-oval, rounded to acutish at apex; peduncles 3-flowered.

The plant is altogether doubtful, and nothing which closely resembles it has been collected recently. Other species are known from South America.

5. *COUEPIA* Aubl. Pl. Guian. 1: 519. 1775.

Trees or shrubs; leaves short-petiolate, coriaceous; flowers paniculate, small, tomentulose; fruit often large.

Stamens 18 to 21.....1. *C. polyandra*.
Stamens 10 to 15.....2. *C. dodecandra*.

1. *Couepia polyandra* (H. B. K.) Rose, Contr. U. S. Nat. Herb. 5: 196. 1899.

Hirtella polyandra H. B. K. Nov. Gen. & Sp. 6: 246. pl. 565. 1821.

Couepia kunthiana Benth.; Hemsl. Biol. Centr. Amer. Bot. 1: 367. 1880. Sinaloa to Oaxaca; type from Acapulco, Guerrero.

Shrub or tree, 3 to 8 meters high; leaves oblong or oval, 5.5 to 13 cm. long, rounded or short-acuminate at apex, whitish-tomentulose beneath; flowers about 1 cm. long, cream-colored, in short dense panicles; fruit obovoid, yellow, sometimes 7.5 cm. long, edible. "Zapotillo" (Tepic, Guerrero); "zapote amarillo" (Guerrero); "guayabito de tinta" (Sinaloa).

2. *Couepia dodecandra* (DC.) Hemsl. in Hook. Icon. Pl. 27: pl. 2620, 2621. 1899.

Hirtella dodecandra DC. Prodr. 2: 529. 1825.

Type from somewhere in Mexico; cultivated in Tabasco and British Honduras.

Tree, 4.5 to 6 meters high, leaves oblong, 5 to 15 cm. long, tomentose beneath; fruit ellipsoid, 5 to 6.5 cm. long, 1 or 2-seeded. "Pfo," "uspío" (Tabasco).

Known in British Honduras as "baboon-cap." Fruit said to be edible.

6. **CHRYSOBALANUS** L. Sp. Pl. 513. 1753.

1. *Chrysobalanus icaco* L. Sp. Pl. 513. 1753.

Along the coast, Tamaulipas to Yucatán; Guerrero to Oaxaca. Widely distributed in tropical America and western Africa; type from Jamaica.

Low shrub, 1 to 1.5 meters high, or said sometimes to be a tree 9 meters high, with a trunk 30 cm. in diameter; bark thin, scaly, brownish gray; leaves persistent, broadly elliptic to orbicular, 5 to 7 cm. long, nearly sessile, leathery; flowers cymose, small, whitish; fruit globose or nearly so, 2 to 4 cm. in diameter, creamy white, pink, purple, or blue-black, the flesh white, sweet, juicy; wood hard, strong, close-grained, light brown, its specific gravity about 0.77. "Icaco," "hicaco," or "jicaco" (Chiapas, Veracruz, Yucatán, Oaxaca, Guerrero, Tamaulipas, Guatemala, Honduras, Porto Rico; the name of Antillean origin); "xicaco" (Oaxaca, *Seler*).

The English names are "cocoa-plum" and "pigeon-plum." The bark, leaves, and root are astringent and have been used for dysentery, etc. The leaves and fruit furnish a black dye. The seeds contain a large amount of oil, and by the Caribs they were strung on sticks and burnt like candles. The seeds are edible also. The fruit is highly valued in some parts of Mexico and elsewhere in tropical America and was a favorite food of the Caribs. It is astringent until perfectly ripe, when it is sweet and insipid. It is eaten raw but more often made into preserves, which are sold in Mexican markets. For an illustration of a fruiting branch see *Contr. U. S. Nat. Herb.* 8: pl. 26.

The "hicaco" is well described by Oviedo (*Lib. VIII, Cap. IX*). "The skin of the fruit," he writes, "has some resemblance to that on a monkey's face; for no matter how young a monkey is, it seems old because of its wrinkles, and likewise the *hicaco* fruit, no matter how fresh it may be, is always full of wrinkles."

63. **CONNARACEAE.** Connarus Family.

REFERENCE: Britton, *N. Amer. Fl.* 22: 233-236. 1908.

Shrubs or trees; leaves alternate, estipulate, odd-pinnate, the leaflets entire; flowers small, perfect, paniculate; fruit a 1-seeded follicle.

Calyx lobes imbricate, accrescent in age.....1. **ROUREA.**
Calyx lobes valvate, not accrescent.....2. **CNESTIDIUM.**

1. **ROUREA** Aubl. Pl. Guian. 1: 467. 1775.

1. *Rourea glabra* H. B. K. Nov. Gen. & Sp. 7: 41. 1824.

Rourea oblongifolia Hook. & Arn. Bot. Beechey Voy. 283. 1836.

Tamaulipas to Tepic and southward. Central America to Venezuela; West Indies; type from the Río Orinoco.

Scandent or erect shrub; leaflets 3 or 5, oblong to ovate-elliptic, 3 to 12 cm. long, acuminate, thick, lustrous, glabrous; panicles few or many-flowered, pubescent; petals white; fruit 1 to 1.7 cm. long, the seeds large, dark brown, with a large orange aril. "Chilillo" (Oaxaca, Tamaulipas, Veracruz); "chilillo de la Huasteca" (Guerrero, Tepic, Veracruz); "chilillo venenoso" (Tepic, Vera-

cruz); "palo de chilillo" (Puebla); "canjura" (El Salvador); "mata-negro" (Cuba); "bejuco de garrote," "Juan caliente" (Porto Rico).

The seeds, as well as other parts of the plant, are reported to be very poisonous, especially to carnivorous animals (they are even said to be harmless to other orders of animals), and they are used for poisoning coyotes. They are employed also as a remedy for cutaneous diseases. The roots contain long resistant fibers and are used as cordage. They are said also to dye skins a bright purple. The poisonous properties of Old World species of the genus are well known.

2. CNESTIDIUM Planch. Linnaea 24: 439. 1850.

1. *Cnestidium rufescens* Planch. Linnaea 23: 440. 1850.

Veracruz, Oaxaca, and Tabasco. Cuba; Central America, the type from Panama.

Subscandent shrub, 3 meters high or more; leaflets 5 to 9, ovate-oblong or oblong-obovate, 3 to 8 cm. long, obtuse or short-acuminate, velvety-pubescent beneath; fruit 1.5 cm. long, curved, brown-tomentose; seed lustrous, with a large fleshy aril.

64. KRAMERiaceae. Krameria Family.

1. *KRAMERIA* Loeffl. Iter Hisp. 195. 1758.

Low, erect or procumbent shrubs with usually sericeous or strigose pubescence; leaves alternate, estipulate, small, simple and entire or trifoliate; flowers showy, perfect, solitary and axillary or racemose; sepals 4 or 5; petals 5; stamens 4; fruit coriaceous, globose or nearly so, indehiscent, covered with numerous spines.

The dried roots of *Krameria triandra* Ruiz & Pavón, *K. ixina* L., and *K. argentea* Mart., all South American species, are official in the U. S. Pharmacopoeia. In commerce they are known as rhatany roots. They are used as a tonic and powerful astringent in the case of chronic diarrhoea, passive hemorrhages, etc. The Mexican species probably have the same properties, and their roots have been exported. The plants also yield a yellow or brownish red dye, and are employed locally in Mexico for coloring wool and skins. The roots of some species have been used in Europe for making ink, coloring wine, and manufacture of dentifrices. The names "encinilla" (Nuevo León) and "guachapurillo" (Sinaloa) are reported for species of doubtful determination. The name *Krameria ixina* has been applied to some of the Mexican species by Sessé and Mociño¹ and other writers.

Leaves 3-foliate..... 1. *K. cytisoides*.

Leaves simple.

Fruit glabrous..... 2. *K. palmeri*.

Fruit densely pilose or sericeous.

Leaves petiolate, 5 to 7 mm. wide..... 3. *K. cuspidata*.

Leaves sessile, usually much less than 5 mm. wide.

Pedicels densely glandular..... 4. *K. glandulosa*.

Pedicels not glandular.

Stems procumbent, chiefly herbaceous.

Flowers yellow; leaves sericeous..... 5. *K. secundiflora*.

Flowers purple; leaves glabrate..... 6. *K. prostrata*.

Stems erect, often woody throughout.

Spines of the fruit not barbed..... 7. *K. ramosissima*.

Spines of the fruit barbed.

¹ Pl. Nov. Hisp. 18. 1887.

- Barbs stout, all borne at the apex of the spine, in an umbrella-like whorl.
- Upper petals, at least the middle one, with broad rounded blades-----8. *K. bicolor*.
- Upper petals with narrow, linear or lanceolate blades.
- Plants densely leafy, the branches not conspicuously spinose; fruit closely sericeous-----9. *K. grayi*.
- Plants very sparsely leafy. the branches spinose; fruit with spreading or loosely ascending hairs---10. *K. paucifolia*.
- Barbs of the spines scattered along the upper part of the spine.
- Body of the fruit strongly compressed-----11. *K. parvifolia*.
- Body of the fruit very slightly or not at all compressed.
- Body of the fruit 4 to 5 mm. thick, the spines short and stout. 12. *K. revoluta*.
- Body of the fruit 6 to 7 mm. thick, the spines long and slender. 13. *K. interior*.

1. *Krameria cytisoides* Cav. Icon. Pl. 4: 61. *pl.* 390. 1797.
Krameria cinerea Schauer, Linnaea 20: 725. 1846.
Krameria chrenbergii Gaudog. Bull. Soc. Bot. France 60: 455. 1913.
Coahuila and Tamaulipas to Hidalgo and Puebla.
Erect shrub, 0.8 to 1.8 meters high; leaflets oblong-ob lanceolate or obovate, 2 cm. long or shorter, sericeous; flowers purplish, the sepals about 2 cm. long. "Donapé."
Roots used for dyeing wool.
2. *Krameria palmeri* Rose, Contr. U. S. Nat. Herb. 1: 304. *pl.* 27. 1895.
Sinaloa and southern Sonora; type from Agiabampo, Sonora.
Dense shrub, 60 to 90 cm. high; leaves linear, 1 to 2 cm. long; fruit yellowish or purplish, about 8 mm. in diameter.
3. *Krameria cuspidata* Presl, Reliq. Haenk. 2: 103. 1836.
Tepic to Oaxaca.
Low shrub; flowers purplish, about 8 mm. long. "Viuxita" (Oaxaca).
4. *Krameria glandulosa* Rose & Painter, Contr. U. S. Nat. Herb. 10: 108. 1906.
Dry mesas and hillsides, Chihuahua to Baja California. Western Texas to Utah and California; type from El Paso, Texas.
Low, densely branched shrub; leaves sericeous, 1 to 2 cm. long; flowers rather showy, purplish, 6 to 8 mm. long.
5. *Krameria secundiflora* DC. Prodr. 1: 341. 1824.
Krameria pauciflora DC. Prodr. 1: 341. 1824.
Chihuahua and Coahuila to Oaxaca.
Plants woody only near the base and scarcely to be classed as shrubs; leaves linear or linear-lanceolate, 6 to 15 mm. long, acute; flowers yellowish, about 1 cm. long. "Zarzaparrilla" (San Luis Potosí); "raíz de cuculillo" (Jalisco).
The long black roots somewhat resemble those of the commercial sarsaparilla.
6. *Krameria prostrata* T. S. Brandeg. Zoe 5: 200. 1905.
Krameria diffusa Rose & Painter, Contr. U. S. Nat. Herb. 10: 107. 1906.
Sinaloa to Zacatecas, Morelos, and Guerrero; type from Cofradía, Sinaloa.
Similar in habit to the preceding species, but with purplish flowers, these 1 to 1.5 cm. long; leaves linear, 1 to 2 cm. long, acute, green.
7. *Krameria ramosissima* (A. Gray) S. Wats. Proc. Amer. Acad. 17: 326. 1882.
Krameria parvifolia ramosissima A. Gray, Pl. Wright. 1: 41. 1852.
Tamaulipas, and reported from Coahuila and Nuevo León. Western Texas (type locality).

Densely branched shrub, 30 to 60 cm. high; leaves linear, 6 mm. long or shorter; flowers purplish. "Calderona" (Tamaulipas).

8. *Krameria bicolor* S. Wats. Proc. Amer. Acad. 21: 417. 1886.

Chihuahua to Sinaloa and Jalisco; type from Hacienda San José, Chihuahua.

Shrub, 0.9 to 1.5 meters high, with greenish stems; leaves lanceolate or linear, sericeous; flowers purplish; fruit about 1 cm. in diameter.

9. *Krameria grayi* Rose & Painter, Contr. U. S. Nat. Herb. 10: 108. 1906.

Krameria canescens A. Gray, Pl. Wright. 1: 42. 1852. Not *K. canescens* Willd. 1825.

Chihuahua and Coahuila. Western Texas (type locality) to southern California.

Densely branched shrub, 30 to 90 cm. high; leaves linear, densely sericeous; flowers purple. "Chacate" (Ramírez).

10. *Krameria paucifolia* Rose, Contr. U. S. Nat. Herb. 10: 108. 1906.

Krameria canescens paucifolia Rose, Contr. U. S. Nat. Herb. 1: 66. 1890.

Baja California and Sonora; type from La Paz, Baja California.

Low shrub, forming dense masses, the branches often spinose; leaves linear or lanceolate, 5 to 15 mm. long; flowers purplish, 6 to 8 mm. long. "Mezquitillo" (Baja California).

11. *Krameria parvifolia* Benth. Bot. Voy. Sulph. 6. pl. 2. 1844.

Baja California (type locality) and Sonora. Southern California and Arizona.

Low rigid shrub with gray or brownish branches; leaves linear, 1.5 cm. long or shorter; flowers purple.

The Pima Indians of Arizona use the powdered root in the treatment of sores.

12. *Krameria revoluta* Berg, Bot. Zeit. 1856: 751. 1856.

Krameria collina T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 182. 1915.

Oaxaca; type collected near Tehuantepec.

Low shrub; leaves linear, 1 to 2 cm. long. sericeous; flowers purple.

13. *Krameria interior* Rose & Painter, Contr. U. S. Nat. Herb. 10: 108. 1906.

Known only from the type locality, San Juan Capistrano, Zacatecas.

Low shrub with shredded bark and purple flowers.

65. MIMOSACEAE. Mimosa Family.

Trees or shrubs, often armed with spines; leaves usually bipinnate, rarely pinnate; flowers usually small but often showy, capitate, spicate, or racemose; calyx usually 5-lobed or 5-parted; petals usually 5, free or connate; fruit a legume, but very variable in form.

In many members of this family the leaves are "sensitive," that is, they respond when touched or struck by folding their leaflets together. They also often act in the same way upon the approach of darkness or during excessively dry weather. A few herbaceous representatives of the family occur in Mexico.

Leaves pinnate.....15. INGA.

Leaves bipinnate.

Anthers tipped with a small gland. Stamens usually twice as many as the corolla lobes; flowers spicate.

Fruit breaking up into 1-seeded joints. Plants scandent...1. ENTADA.

Fruit continuous, not breaking up into joints.

Fruit septate between the seeds, sometimes spirally coiled.

2. PROSOPIS.

Fruit not septate, never coiled.

Plants unarmed, low shrubs or herbs. Fruit broadly oblong.

3. **NEPTUNIA.**

Plants usually armed with spines, trees or large shrubs.

Fruit thin, bivalvate.....4. **PIPTADENIA.**

Fruit thick and hard, indehiscent.....5. **GOLDMANIA.**

Anthers without glands.

Stamens as many as the corolla lobes or twice as many.

Fruit with a persistent continuous margin, the valves separating from it; plants usually armed with spines; flowers capitate or spicate.

6. **MIMOSA.**

Fruit without a persistent margin; plants unarmed; flowers capitate.

Seeds longitudinal or oblique; low shrubs or herbs.....7. **ACUAN.**

Seeds transverse; trees or large shrubs.....8. **LEUCAENA.**

Stamens more than twice as many as the corolla lobes.

Stamens free. Flowers capitate or spicate; plants spiny or unarmed.

9. **ACACIA.**

Stamens united.

Fruit elastically bivalvate. Plants unarmed; flowers capitate.

10. **CALLIANDRA.**

Fruit not elastically dehiscent.

Valves of the fruit separating from the persistent margin. Plants unarmed; flowers spicate or capitate.....11. **LYSILOMA.**

Valves of the fruit not separating from the margin.

Valves of the fruit thin, very broad, straight. Flowers capitate.

12. **ALBIZZIA.**

Valves thickened, often curved, twisted, or coiled.

Fruit coiled, very broad, indehiscent; flowers capitate; plants unarmed.....13. **ENTEROLOBIUM.**

Fruit not coiled, usually narrow and indehiscent; flowers capitate or spicate; plants usually spiny.

14. **PITHECOLLOBIUM.**

1. **ENTADA** Adans. Fam. Pl. 2: 318. 1763.

Scandent shrubs, often armed with spines; leaves bipinnate, the leaflets few, large; flowers small, spicate; fruit large, breaking up into 1-seeded joints.

Plants armed with very numerous recurved spines; fruit about 2 cm. wide.

1. **E. patens.**

Plants unarmed; fruit 5 to 6 cm. wide.....2. **E. polystachia.**

1. **Entada patens** (Hook. & Arn.) Standl.

Inga patens Hook. & Arn. Bot. Beechey Voy. 419. 1841.

Piptadenia patens Benth. Bot. Voy. Sulph. 89. 1844.

Mimosa gualanensis Robins. & Bartl. Proc. Amer. Acad. 43: 53. 1907.

Guerrero. Guatemala and Nicaragua; type from Nicaragua.

Leaflets 3 to 6 pairs, 1.5 to 5 cm. long, oval or orbicular, nearly glabrous; flowers yellowish white; fruit about 13 cm. long, glabrous, often somewhat constricted between the seeds.

The Guerrero plant has more numerous pinnae and leaflets than the Central American one, and may be distinct.

2. **Entada polystachia** (L.) DC. Mém. Legum. 12. 1825.

Mimosa polystachia L. Sp. Pl. 520. 1753.

Sinaloa to Oaxaca and Tabasco. Central America, West Indies, and northern South America.

Large scandent shrub; leaflets mostly oblong and 2 to 4 cm. long; flowers small, greenish, in dense spikes; fruit 5 to 6 cm. wide. "Bejuco de amole" (Guerrero, Tabasco); "bejuco de mondongo" (Tabasco, *Roviroso*); "haba de la costa," "bejuco de panone," "bejuco de estribo" (Oaxaca, *Reko*); "bejuco de hierro" (Nicaragua); "guiamol" (El Salvador); "parra rosa" (Costa Rica); "bejuco de garza" (Colombia).

The tough stems are used as cordage. When macerated in water they are said to afford a substitute for soap. In Trinidad the roots are employed as a remedy for venereal diseases.

Entada scandens (L.) Benth. is reported from Tabasco, where it is said to be known as "haba," "haba de la costa," and "tacalote." The writer has seen no Mexican specimens, and it may be that the plant so referred to is really *E. polystachia*. *E. scandens* is distinguished by its much larger fruit and enormous seeds (these 5 to 6 cm. broad).

2. PROSOPIS L. Mant. Pl. 1: 10. 1767.

Spiny shrubs or trees; leaves bipinnate, the pinnae usually 1 or 2 pairs, the leaflets small and numerous; flowers small, spicate or capitate; fruit indehiscent, linear, sometimes constricted between the seeds, in some species spirally coiled.

The first two species, with spirally coiled fruit, are sometimes referred to a separate genus, *Strombocarpa*.

Fruit spirally coiled; flowers spicate or capitate.

Flowers capitate.....1. *P. cinerascens*.

Flowers spicate.....2. *P. pubescens*.

Fruit not coiled; flowers spicate.

Corolla dentate; fruit 7.5 cm. long or shorter.....3. *P. palmeri*.

Corolla deeply lobate; fruit usually much longer.

Leaflets commonly rounded at apex, broad in proportion to their length.

Leaflets glabrous, often ciliolate; fruit usually glabrous...4. *P. juliflora*.

Leaflets puberulent; fruit usually puberulent...4a. *P. juliflora velutina*.

Leaflets usually acutish at apex, linear, often very long.

4b. *P. juliflora glandulosa*.

1. *Prosopis cinerascens* A. Gray; Benth. Trans. Linn. Soc. Bot. 30: 381. 1875.

Strombocarpa cinerascens A. Gray, Pl. Wright. 1: 61. 1852.

Tamaulipas and Nuevo León; type from Azulfrora, Nuevo León. Southwestern Texas.

Shrub, about 30 cm. high, armed with long slender spines, pubescent; leaflets 8 to 12 pairs, oblong, 1.5 to 3 mm. long; fruit 1.5 to 4 cm. long.

2. *Prosopis pubescens* Benth. Lond. Journ. Bot. 5: 82. 1846.

Strombocarpa pubescens A. Gray, Pl. Wright. 1: 60. 1852.

Northern Baja California, Sonora, and Chihuahua, chiefly in alluvial soil of river valleys. Southern California to western Texas; type from California.

Shrub or tree, sometimes 10 meters high, with a trunk 30 cm. in diameter, the bark brownish, separating into thin flakes; spines stout, whitish; leaves deciduous, the leaflets 1 cm. long or shorter, pubescent; flowers greenish, the spikes 5 to 8 cm. long; fruit 3 to 5 cm. long, yellowish; wood very hard, brittle, close-grained, light brown, its specific gravity about 0.76. Known generally as "tornillo."

The screwpod mesquite is often abundant in river valleys, forming dense thickets of considerable extent. The wood is very durable and is used for fence posts, tool handles, etc., and in the Rio Grande Valley it is an important source of fuel. The fruits are edible like those of *P. juliflora*, and are used in

much the same way. They are so sweet that they can be eaten as picked, without any special preparation. The Indians of the Colorado River region obtained a fermented drink from the pods, and by boiling them they prepared a sirup. The Pimas of Arizona cooked the pods in a pit lined with the stems of *Tessaria borealis*, alternating them with layers of cocklebur (*Xanthium* sp.) leaves. The pit was covered with earth and left three or four days before being opened. The pods were then spread in the sun, dried, and stored. Later they were pounded into a fine flour, which was eaten in the form of pinole. The Pimas also used a decoction of the root bark as a dressing for wounds, and as the wound healed the dried and pulverized bark was substituted.

3. *Prosopis palmeri* S. Wats. Proc. Amer. Acad. 24: 48. 1889.

Baja California; type from Mulegé.

Shrub or tree, sometimes 7.5 meters high, with spreading crown; bark rough, splitting off in long strips; leaflets 4 to 7 mm. long; flowers bright yellow, fragrant; fruit almost terete at maturity, puberulent. "Palo de hierro."

4. *Prosopis juliflora* (Swartz) DC. Prodr. 2: 447. 1825.

Mimosa juliflora Swartz. Prodr. Veg. Ind. Occ. 85. 1788.

Mimosa rotundata Sessé & Moc. Pl. Nov. Hisp. 178. 1887.

Nearly throughout Mexico. West Indies, the type from Jamaica; Central America; widely distributed in South America; naturalized in Hawaii and the Philippine Islands.

Shrub or tree, sometimes 12 meters high with a trunk 1.2 meters in diameter, the bark thick, brown or blackish, shallowly fissured; leaflets mostly 5 to 10 mm. long, linear-oblong; flowers greenish yellow, sweet-scented; fruit mostly 10 to 20 cm. long, about 1 cm. wide, strongly compressed when young but thick at maturity, brown or yellowish; wood hard, close-grained, dark red or brown, with yellow sapwood, its specific gravity about 0.76. Known generally as "mezquite" (from the Nahuatl "m'zquitl"), but the following additional names are reported: "Guisache" (Michoacán, Guerrero); "chúcata" (Michoacán, Tarascan); "tziritzequa" (Michoacán, Ramírez); "algarroba" (Colima, and in many other regions); "mezquite blanco," "mezquite amarillo," "mezquite Colorado," "chachaca" (*Alcozer*); "mauca-caballo" (Panama); "acacia de Catarina" (Nicaragua); "aroma" (Philippines); "mezquite chino" (Tamaulipas); "mezquicopal" (the gum, *Robelo*, from the Nahuatl *mizqui-copalli*); "ttâhi" (Otomí, Buena).

One of the best-known plants of Mexico and of the arid regions of the United States; in Mexico often planted as a shade tree. In the more arid regions the mesquite is usually a shrub, and it is only when fairly well supplied with water that it becomes a tree. It thrives best in river valleys, where it attains the greatest size, but on plains and mesas it is often abundant, frequently, indeed, being the most characteristic plant for many miles, and forming thickets or forests. The smaller trees are strikingly suggestive of peach trees, for which they are often mistaken by inexperienced eastern travellers viewing them for the first time from the train as they cross the State of Texas. The larger individuals are much like apple trees in habit. The wood is valuable for many purposes, such as railroad ties, carts, fence posts, charcoal, fuel, etc. In Texas it has been used for paving blocks for streets. The wood and bark are employed for tanning. In the northern part of its range the shrubby form develops enormous underground stems (known in Chihuahua as "cepas") which, in many places are the most important source of fuel. They require a great amount of labor to remove them from the earth, but they form excellent firewood. The smaller roots penetrate the soil to a great depth, sometimes, it is said, for as much as 15

to 23 meters. The Seri Indians of Tiburón Island use the root fiber for cordage, wetting the roots in water, and sometimes they manufacture a coarse fabric from the fiber. The wood of the roots is very hard, and the Pima of Arizona employed it for their war clubs and for plows.

The gum which exudes from the trunk ("goma de mezquite," "goma del país," "mizquicopalli") is amber-colored and translucent, similar to gum arabic, for which it is often substituted in Mexico. Dissolved in water it makes excellent mucilage, and its infusion is used for dysentery and as a gargle for throat affections; by the Pimas a solution of it was used for treating sore eyes and open wounds. It is sometimes employed in making candy. The flowers are much frequented by bees, and yield a good grade of light-colored honey. The Pima Indians sometimes eat the flower spikes, stripping off the flowers between the teeth. The same tribe employs the inner bark of the mesquite as a substitute for rennet, and a decoction of it as an emetic and cathartic.

The pods are, perhaps, the most important part of the plant. When chewed they are sweet, for they contain much sugar, the pulp being composed of 25 to 30 per cent of grape sugar. They are eaten by stock of all kinds and where the plants are abundant are important for forage. In Hawaii, where the mesquite is naturalized, the fruits have become an article of some commercial importance because of their use for stock feed. They are gathered in large quantities and ground into meal. It is of interest to note that in the early days of the Spanish occupation, when ships traded regularly every year between Acapulco and Manila, the mesquite was introduced into the Philippines and has now become naturalized there. It was even described from that country as a new species, *Prosopis vidaliana* Naves. The pods have long been an article of human food in North America, and are still so used to some extent, especially by the Indians. Among some of the tribes, as with the Pimas, they were the chief food staple. They are ground into a meal from which the seeds and coarser parts of the pods are removed. The Apaches and other tribes often made use of holes or depressions in the rocks as a mortar for grinding the pods, and these holes are now of common occurrence in the mountains where mesquite plants are found. The meal is made into cakes (known in Mexico as "mezquitamales") which are baked, or it is mixed with water to form a beverage known as "mezquitatole." The meal is also mixed with water and fermented to make a kind of beer.

The mesquite is discussed by Sahagún under the name "mizquitl." "From the bark," he writes, "they prepare a drink which takes the place of *pulque*," a statement whose accuracy is questionable. He reports that the juice of the leaves and young shoots is dropped into the eyes to relieve affections of those organs. Hernández¹ also treats of the plant in a chapter entitled "De *Mizquitl*, seu *Siliqua Acatiae*." He states that the Chichimec Indians make cakes from the pods, and, incorrectly of course, that the tree "is the true *Acacia* of the ancients, which furnishes Gum Arabic." The tree is mentioned also by Clavigero (*Historia de California*, 1789), who says, but doubtless erroneously, that it is introduced in that region. He also mentions the use of the juice for the relief of eye affections (a practice still followed in Mexico to the present day), and he reports that the Cochimí name of the plant is "guatrá."

Prosopis juliflora is a variable species, but there seems to be no satisfactory basis for separation of the forms. Some of the Mexican material exactly matches that from Jamaica, but many specimens approach the two following forms. It may be mentioned, incidentally, that the early writers state that the mesquite of Jamaica is not a native plant, but was introduced in early days, very probably from Mexico.

¹ Thesaurus 59. 1651. A figure is given on page 455.

Berlandier¹ once applied (but without technical description) the name *Mimosa "pseudo-echinus"* to this species, because of the resemblance of the leaves to those of "*Echinus Molle*," the "árbol del Perú." The latter Latin name, of course, is a typographical (?) error for *Schinus molle*.

4a. *Prosopis juliflora velutina* (Wooton) Sarg. *Silv. N. Amer.* 13: 15. 1902.

Prosopis odorata Torr. in Frém. Rep. Exped. Rocky Mount. 313. 1843.

Prosopis articulata S. Wats. *Proc. Amer. Acad.* 24: 48. 1889.

Prosopis velutina Wooton, *Bull. Torrey Club* 25: 456. 1898.

Sonora and Baja California to Michoacán, Arizona (type locality).

Shrub or often a tree, 2 to 6 meters high or larger. "Mezquite."

This form is usually distinguishable from the typical *juliflora* by the small pubescent leaflets. There are so many intermediate specimens, however, especially in Mexico, that it is not possible to recognize the form as a species. In case the plant should receive such recognition, the proper name for it is *Prosopis odorata* Torr. That name was based upon a flowering specimen of the present plant and fruit of *P. pubescens*, and for that reason has been discarded by most writers. Taking into consideration the specific name, "*odorata*," it seems reasonable to typify the name by the flowering specimen.

Prosopis articulata was based upon a form in which the pods are strongly constricted between the seeds. Specimens examined show great variation in this respect, the prominence of the constrictions being dependent, apparently, upon the amount of fleshy matter developed in the valves.

4b. *Prosopis juliflora glandulosa* (Torr.) Cockerell, *N. Mex. Agr. Expt. Sta. Bull.* 15: 58. 1895.

Prosopis glandulosa Torr. *Ann. Lyc. N. Y.* 2: 192. 1828.

Baja California to Tamaulipas, Veracruz, and Yucatán. Louisiana to southern California; type from New Mexico.

Shrub or tree, either with a well developed trunk or without one. "Mezquite."

If the material from the West Indies and the United States were studied without reference to that from Mexico, as has been done, apparently, by recent writers, *Prosopis glandulosa* might well be considered a distinct species. In Mexico so many intergrading plants occur that it can not be regarded as more than a form of *P. juliflora*. The leaflets are usually glabrous, but often they are quite as pubescent as in *P. juliflora velutina*. Specimens from Peru and Argentina are so like the plant of the United States that if they were labeled as coming from the latter country no one would question their determination as *P. glandulosa*.

3. NEPTUNIA Lour. Fl. Cochinch. 653. 1790.

Low shrubs or herbs, unarmed; leaves bipinnate, the leaflets small, numerous, the stipules persistent; flowers small, capitate or in short oblong spikes; fruit short and broad, flat.

Neptunia oleracea Lour., an aquatic herbaceous species, has been collected in Tabasco.

Fruit about 15 mm. wide; plants pubescent-----1. *N. pubescens*.

Fruit 8 mm. wide or narrower; plants glabrous-----2. *N. plena*.

1. *Neptunia pubescens* Benth. in Hook. *Journ. Bot.* 4: 356. 1842.

Coahuila, Western Texas; South America, the type from Peru.

Low suffrutescent plant; pinnae 2 or 3 pairs, the leaflets 15 to 35 pairs, oblong, about 6 mm. long; fruit 2 to 2.5 cm. long.

¹ Diario de viage de la Comisión de Límites, p. 177. 1850.

2. *Neptunia plena* (L.) Benth. in Hook. Journ. Bot. 4: 355. 1842.

Mimosa plena L. Sp. Pl. 519. 1753.

Baja California and Sinaloa to Chiapas. Widely distributed in tropical America.

Low shrub or often herbaceous; pinnae 3 to 5 pairs, the leaflets 5 to 8 mm. long; flowers yellow, capitate, the heads long-pedunculate; fruit 3 to 4.5 cm. long.

4. **PIPTADENIA** Benth. in Hook. Journ. Bot. 4: 334. 1842.

Erect or scandent shrubs or trees, armed or unarmed; leaves bipinnate, the leaflets few or numerous; flowers small, spicate.

Piptadenia cebil Griseb. of Argentina is valued as a source of tanbark. *P. rigida* Benth. of Brazil furnishes Angico gum, which resembles gum arabic. From the seeds of *P. peregrina* (L.) Benth., a species occurring in the West Indies and South America, the natives prepared a narcotic snuff known in the West Indies as "cohoba."¹ That species is known in Porto Rico as "cojoba," "cojóbana," "cojobo," and "cojobillo."

Leaflets linear, about 1 mm. wide; fruit not constricted.....1. *P. flava*.

Leaflets oval or rhombic, 3 to 10 mm. wide; fruit constricted between the seeds.

2. *P. constricta*.

1. *Piptadenia flava* (Spreng.) Benth. Trans. Linn. Soc. Bot. 30: 371. 1875.

Acacia flava Spreng. Syst. Veg. 3: 141. 1826.

Piptadenia leptocarpa Rose, Contr. U. S. Nat. Herb. 1: 325. 1895.

Mimosa bucerogenia Robinson, Proc. Amer. Acad. 43: 23. 1907.

Jalisco to Guerrero. Central America and northern South America; type from Colombia.

Erect shrub, 3 to 5 meters high; leaflets 4 to 7 mm. long, glabrous; flowers yellowish green; fruit flat, 3 to 8 cm. long, about 1.5 cm. wide, glabrous.

2. *Piptadenia constricta* (Mich. & Rose) Macbride, Contr. Gray Herb. n. ser.

59: 18. 1919.

Goldmania constricta Mich. & Rose, Mém. Soc. Phys. Hist. Nat. Genève 34: 274. pl. 20. 1903.

Sinaloa to Guerrero; type from Acapulco, Guerrero.

Tree, 10 to 12 meters high, unarmed or with short stout spines; pinnae about 5 pairs, the leaflets rhombic, 6 to 17 mm. long; fruit 10 to 15 cm. long, about 6 mm. wide, very deeply constricted between the seeds.

5. **GOLDMANIA** Rose; Micheli, Mém. Soc. Phys. Hist. Nat.

Genève 34: 274. 1903.

1. *Goldmania foetida* (Jacq.) Standl.

Mimosa foetida Jacq. Pl. Hort. Schönbr. 3: 73. pl. 390. 1798.

Piptadenia foetida Benth. Trans. Linn. Soc. Bot. 30: 366. 1875.

Goldmania platycarpa Rose; Micheli, Mém. Soc. Phys. Hist. Nat. Genève 34: 274. 1903.

Piptadenia platycarpa Macbride, Contr. Gray Herb. n. ser. 59: 18. 1919.

Sinaloa to Puebla; described from cultivated plants whose origin was doubtful.

Tree, sometimes 12 meters high, or only a shrub, unarmed; leaflets suborbicular to cuneate-obovate, 1 to 3 cm. long, nearly glabrous; flowers yellowish green, spicate, ill-scented; fruit short, 1 to 1.5 cm. wide, curved, reddish brown, rough.

¹ See W. E. Safford, Narcotic plants and stimulants of the ancient Americans, Ann. Rep. Smiths. Inst. 1916: 387-424. pl. 1-17, f. 1-6. 1917.

"Pinzanguarimbo" (Guerrero); "coyacate" (Guerrero, *Boupland*); "hui-zache" (Guerrero, Jalisco, *Urbina*); "yóndiro" (Michoacán, *Ramírez*); "cusa" (Sinaloa).

This has been reported from Mexico as *Piptadenia quadrifolia* N. E. Brown, a South American species.

6. MIMOSA L. Sp. Pl. 516. 1753.

REFERENCE: Robinson, Proc. Amer. Acad. 33: 305-331. 1898.

Trees or shrubs, usually armed with stout spines, occasionally scandent; leaves bipinnate; petiolar glands commonly absent; flowers small but often bright-colored, capitate or spicate, sessile; stamens usually long-exserted; fruit very variable in form, usually compressed, the margin persistent, the valves often breaking into joints.

Several herbaceous species occur in Mexico. A large number of Mexican species are described by Sessé and Mocino,¹ but in most cases it is impossible to identify them.

A. Flowers spicate.

Leaflets 1 or 2 pairs.

Leaflets densely pubescent; fruit coiled-----1. *M. spirocarpa*.

Leaflets glabrous; fruit straight.

Leaflets 15 to 22 mm. long-----2. *M. rosei*.

Leaflets 4 to 9 mm. long-----3. *M. paucifoliolata*.

Leaflets more than 2 pairs, at least in most of the leaves, usually much more numerous.

Corolla glabrous or nearly so.

Leaflets few, 1 to 5 or rarely 7 pairs, elliptic to obovate, less than twice as long as broad.

Leaflets and fruit glabrous-----4. *M. laxiflora*.

Leaflets and fruit pubescent.

Fruit armed with spines-----5. *M. distachya*.

Fruit unarmed-----6. *M. purpurascens*.

Leaflets 4 to 20 pairs or more, linear or oblong, more than twice as long as broad.

Fruit sessile or nearly so-----7. *M. polyantha*.

Fruit long-stipitate.

Valves of the fruit hispid-----8. *M. polyanthoides*.

Valves of the fruit glabrous.

Joints of the fruit much broader than long; filaments yellowish.

9. *M. stipitata*.

Joints of the fruit about as long as broad; filaments purplish.

10. *M. ionema*.

Corolla densely sericeous or puberulent.

Leaflets 4 to 10 mm. wide-----11. *M. guatemalensis*.

Leaflets 2.5 mm. wide or narrower.

Stems unarmed-----12. *M. puberula*.

Stems armed with stout spines.

Leaflets usually 20 to 40 pairs-----13. *M. cabrera*.

Leaflets usually less than 20 pairs.

Spikes oblong, little longer than broad-----56. *M. monanctris*.

Spikes cylindric, much longer than broad.

Branches covered with minute, sessile or stipitate glands.

14. *M. adenanthroides*.

¹ Pl. Nov. Hisp. 175-179. 1887.

Branches not glandular.

Calyx distinctly dentate, 1 to 1.5 mm. long, a third to half as long as the corolla.

Fruit about 4 mm. wide, unarmed.....15. *M. coelocarpa*.

Fruit about 6 mm. wide, often spiny.

Spines dark-colored, not much broadened at the base; fruit unarmed.....16. *M. wrightii*.

Spines usually light-colored, very broad and flat at base; fruit armed with spines on the margins.

17. *M. dysocarpa*.

Calyx subtruncate, about 0.8 mm. long, about a fourth as long as the corolla.

Pinnae 3 or 4 pairs.....18. *M. luisana*.

Pinnae 9 to 20 pairs.

Leaflets glabrous on the upper surface.

19. *M. rhododactyla*.

Leaflets tomentulose-sericeous on both surfaces.

Fruit unarmed or nearly so.....20. *M. palmeri*.

Fruit densely armed with spines.....21. *M. benthami*.

AA. Flowers capitate.

B. Stamens of the same number as the corolla lobes.

Pinnae one pair; leaflets 1 or 2 pairs, usually large.

Stems copiously pubescent or setose.....22. *M. albida*.

Stems glabrous or nearly so.

Plants unarmed or nearly so; leaflets 1.7 cm. long or shorter.

23. *M. goldmanii*.

Plants armed with spines; leaflets mostly 2.5 to 8 cm. long.

Pods sessile or nearly so; leaflets setose beneath.

24. *M. manzanilloana*.

Pods stipitate; leaflets glabrous beneath.....25. *M. acapulcensis*.

Pinnae usually 2 to several pairs, sometimes one pair; leaflets 3 to many pairs, usually small.

Pinnae 3 to 5 pairs.....26. *M. leptocarpa*.

Pinnae 1 or 2 pairs. Fruit (so far as known) less than 1 cm. wide.

Leaflets 3 to 5 or rarely 6 pairs, 7 to 25 mm. wide.

Leaflets 2 cm. long or shorter, glabrous.....27. *M. lactiflua*.

Leaflets 2.3 to 3.6 cm. long, more or less pubescent.

Fruit strigose; leaflets strigose.....28. *M. deamii*.

Fruit glabrous; leaflets soft-pubescent when young.

29. *M. psilocarpa*.

Leaflets more than 5 pairs in most of the leaves, less than 7 mm. wide.

Peduncles glabrous or merely puberulent.

Fruit densely spiny.....30. *M. sicyocarpa*.

Fruit unarmed, except sometimes on the margin.

Plants unarmed; margin of the fruit spiny.....31. *M. caerulea*.

Plants armed with stout spines; fruit unarmed.

32. *M. mixtecana*.

Peduncles densely pilose, tomentose, scabrous, or hispid.

Fruit glabrous but spiny; plants chiefly herbaceous.

34. *M. pudica*.

Fruit puberulent or pilose as well as spiny; plants woody almost throughout.

Leaflets glabrous on the upper surface.....34. *M. nelsonii*.

Leaflets densely pubescent on both surfaces.....35. *M. xanti*.

BB. Stamens twice as many as the corolla lobes.

Branches more or less bristly-hispid, usually armed with spines also, in one species the pubescence only obscurely hispid, but the spines then tipped with flexuous bristles.

Stems bristly but without spines.....36. *M. camporum*.

Stems armed with spines.

Rachis of the leaf bristly but without spines; pinnae 20 to 25 pairs.

37. *M. galeottii*.

Rachis of the leaf armed with spines.

Bristles of the peduncles usually gland-tipped; corolla striate.

38. *M. somnians*.

Bristles of the peduncles eglandular; corolla not striate.

Pods obovate, 1 to 3-seeded; spines with slender flexuous tips.

39. *M. dormiens*.

Pods linear-oblong, 15 to 20-seeded; spines stiff, straight.

40. *M. pigra*.

Branches not bristly-hispid; spines never ending in flexuous bristles.

C. Corolla glabrous.

Fruit winged; peduncles rufous-tomentose. Leaflets 2 to 3 mm. wide.

41. *M. hemiendyta*.

Fruit not winged; peduncles not rufous-tomentose.

Leaflets 3 to 17 mm. wide or broader.

Plants unarmed; leaflets coriaceous, 6 to 17 mm. wide.

43. *M. leucaenoides*.

Plants armed with spines; leaflets thin, mostly 3 to 8 mm. wide.

Leaflets glabrous.

Pinnae one pair; leaflets about 8 pairs....44. *M. micheliana*.

Pinnae 3 or 4 pairs; leaflets 4 or 5 pairs...53. *M. wootonii*.

Leaflets pubescent. Pinnae 3 or more pairs.

Leaflets rhombic, acute or acutish, mostly 5 to 8 mm. wide, soft-pilose beneath when young; branches pilose.

45. *M. ervendbergii*.

Leaflets oblong, rounded at the apex, 3 to 4 mm. wide, minutely strigillose; branches puberulent or glabrate.

46. *M. argillotropha*.

Leaflets 2 mm. wide or narrower.

Pinnae 1 to 3 pairs; leaflets few, usually 5 pairs or fewer.

Spines geminate.....47. *M. tenuiflora*.

Spines solitary.....58. *M. lindheimeri*.

Pinnae 3 to many pairs; leaflets numerous.

Petioles equaling or longer than the rachis, densely armed with short recurved spines.....48. *M. invisia*.

Petioles much shorter than the rachis, unarmed or with a few scattered spines.

Leaflets 8 pairs or fewer; fruit about 6 mm. wide.

49. *M. grahami*.

Leaflets 20 to 32 pairs, thin; fruit often 2 cm. wide.

Pinnae 6 to 12 pairs.....50. *M. eurycarpa*.

Pinnae 15 to 18 pairs.....51. *M. colimensis*.

CC. Corolla pubescent, at least on the lobes.

Leaflets 4 to 6 mm. wide.....52. *M. malacophylla*.

Leaflets less than 3 mm. wide.

Fruit with 2 broad lacerate wings.....42. *M. lacerata*.

Fruit not winged.

- D. Pinnæ 1 to 4 pairs.
 Leaflets one pair-----54. *M. zygophylla*.
 Leaflets 2 or more pairs.
 Valves of the fruit armed with spines.
 Rachis of the leaf armed with numerous spines.
 55. *M. hystricosa*.
 Rachis of the leaf unarmed.
 Leaflets green, thinly sericeous-----56. *M. monancistra*.
 Leaflets white with a dense sericeous pubescence.
 57. *M. emoryana*.
 Valves of the fruit unarmed, the margins often spiny.
 Corolla nearly glabrous-----58. *M. lindheimeri*.
 Corolla densely pubescent.
 Spines straight; leaflets densely sericeous with long soft
 hairs-----59. *M. purpusii*.
 Spines recurved; leaflets strigillose or sericeous with very
 short hairs.
 Pinnæ 3 or 4 pairs-----65. *M. biuncifera*.
 Pinnæ 1 or 2 pairs.
 Fruit glabrate, acute at the base----60. *M. pringlei*.
 Fruit densely tomentose, rounded at the base.
 Fruit strongly constricted between the seeds, the
 margins with numerous long spines.
 61. *M. depauperata*.
 Fruit scarcely at all constricted, the margins un-
 armed or nearly so-----62. *M. calcicola*.
 DD. Pinnæ more than 4 pairs in all or most of the leaves.
 Leaflets about 1 mm. long. Valves of the fruit very spiny.
 63. *M. minutifolia*.
 Leaflets 2 mm. long or longer.
 Leaflets 2.5 to 3 mm. wide, densely pilose-sericeous on both
 surfaces-----64. *M. mollis*.
 Leaflets mostly less than 2 mm. wide.
 Fruit acute or acutish at base and usually also at apex,
 4 to 6 mm. wide-----65. *M. biuncifera*.
 Fruit rounded or very obtuse at base and apex, 7 to 10 mm.
 wide.
 Leaflets 5 to 7 mm. long-----66. *M. lemmoni*.
 Leaflets 4 to 5 mm. long-----67. *M. aculeaticarpa*.
1. *Mimosa spirocarpa* Rose, Contr. U. S. Nat. Herb. 3: 316. *pl. 11*. 1895.
 Sinaloa to Colima; type from Culiacán, Sinaloa.
 Shrub, 3 to 6 meters high; leaflets obliquely oval or suborbicular, 1 to 3 cm.
 long; flowers purplish at first, becoming white, the spikes 7 to 13 cm. long;
 fruit narrow, coiled like a snail shell.
 2. *Mimosa rosei* Robinson, Proc. Amer. Acad. 33: 317. 1898.
 Known only from the type locality, Bolaños, Jalisco.
 Plant unarmed, so far as specimens show; leaflets obliquely obovate or oval;
 fruit pale green, about 7 cm. long and 7 mm. wide, glabrous, unarmed, long-
 stipitate.
 3. *Mimosa paucifoliolata* Micheli, Mém. Soc. Phys. Hist. Nat. Genève 34: 278.
pl. 24. 1903.
Mimosa laxiflora zygophylloides Robinson, Proc. Amer. Acad. 33: 317. 1898.
 Colima and Michoacán or Guerrero; type from Las Minitas.

Shrub or small tree, 2 to 5 meters high, sparsely armed with flat straight spines; leaflets obovate-orbicular; flowers white, the spikes 3 to 4 cm. long, lax.

4. *Mimosa laxiflora* Benth. Lond. Journ. Bot. 5: 93. 1846.

? *Acacia prosopoides* DC. Prodr. 2: 460. 1825.

Chihuahua and Sonora (type locality).

Shrub with few short spines; leaflets 5 to 12 mm. long, pale green; flowers white, the spikes 2 to 4 cm. long; fruit unarmed.

5. *Mimosa distachya* Cav. Icon. Pl. 3: 48. pl. 295. 1794.

Mimosa brandegei Robinson, Proc. Amer. Acad. 33: 316. 1898.

Baja California and Sinaloa to Oaxaca and Puebla.

Shrub, copiously armed with short recurved spines; leaflets 4 to 18 mm. long, pale green; flowers white or pinkish, the spikes long and lax; fruit usually setose, 6 to 8 mm. wide. "Garabatillo" (Oaxaca).

It is possible that *M. brandegei* is a distinct species, but the material at hand can not be separated consistently into two forms.

6. *Mimosa purpurascens* Robinson, Proc. Amer. Acad. 33: 317. 1898.

Baja California, Sonora, and Sinaloa; type from La Paz, Baja California.

Shrub or small tree, 2 to 10 meters high; leaflets 3 to 8 mm. long; flowers pink; fruit puberulent, unarmed. "Cuca," "cuilón," "iguano" (Sinaloa).

In Sinaloa the bark is used for tanning skins, and it is sometimes chewed to harden the gums.

7. *Mimosa polyantha* Benth. in Hook. Journ. Bot. 4: 410. 1842.

Mimosa polyantha levior Robinson, Proc. Amer. Acad. 33: 318. 1898.

Sinaloa to Morelos and Oaxaca; type from Acatlán, Puebla. Guatemala.

Shrub, 1 to 3.5 meters high, copiously armed with spines; leaflets 2 to 4 mm. long; flowers pink or white, the spikes long and lax; fruit usually hispid, sometimes smooth, about 8 mm. wide. "Arrendador" (Sinaloa).

8. *Mimosa polyanthoides* Robinson, Proc. Bost. Soc. Nat. Hist. 31: 260. 1904.

Guerrero; type from mountains above Iguala, altitude 1,200 meters.

Shrub, 3 to 4.5 meters high; leaflets 5 to 7 mm. long.

9. *Mimosa stipitata* Robinson, Proc. Bost. Soc. Nat. Hist. 31: 261. 1904.

Guerrero, Oaxaca, Puebla, and Morelos; type from Iguala, Guerrero, altitude 1,200 meters.

Shrub or small tree, 1.5 to 4.5 meters high; leaflets 3 to 5 mm. long; flowers white, the spikes 2.5 to 4.5 cm. long, lax; fruit about 4.5 cm. long and 1 cm. wide, glabrous. "Timbin" (Michoacán, Guerrero).

Bark used for tanning.

10. *Mimosa ionema* Robinson, Proc. Amer. Acad. 36: 473. 1901.

Guerrero and Morelos; type from Cuernavaca.

Shrub, 3 to 4.5 meters high, armed with straight flat spines; leaflets 5 to 9 mm. long; flowers pinkish.

Doubtfully distinct from *M. stipitata*.

11. *Mimosa guatemalensis* (Hook. & Arn.) Benth. Bot. Voy. Sulph. 89. 1844.

Inga guatemalensis Hook. & Arn. Bot. Beechey Voy. 419. 1841.

Sinaloa and Tepic. Guatemala (type locality) and Nicaragua.

Shrub, about 2 meters high, densely pubescent, armed with numerous short straight spines; leaflets oval or obovate-oval, 7 to 20 mm. long; fruit densely pubescent, unarmed, about 6 mm. wide.

12. *Mimosa puberula* Benth. Lond. Journ. Bot. 5: 88. 1846.

Hidalgo and perhaps elsewhere; type from Zimapan.

Pinnae 5 to 10 pairs, the leaflets oblong, 4 to 5 mm. long; spikes 4 to 5 cm. long; fruit pubescent.

13. *Mimosa cabrera* Karst. Fl. Columb. 2: 63. pl. 132. 1869.

Chiapas. Central America and Colombia (type locality).

Small tree, armed with very stout flat spines; leaflets about 5 mm. long, linear-oblong; fruit pubescent. "Tepescahuite" (Chiapas, *Seler*); "carbón," "carbonal" (Honduras); "carbonal" (Colombia); "cabrero" (Venezuela).

14. *Mimosa adenantheroides* (Mart. & Gal.) Benth. Lond. Journ. Bot. 5: 88. 1846.

Acacia adenantheroides Mart. & Gal. Bull. Acad. Brux. 10²: 310. 1843.

Guerrero and Oaxaca; type from mountains of Sola and Yolotepeque, Oaxaca.

Erect shrub, armed with stout flat spines; leaflets oblong, 3 to 13 mm. long; spikes 1.5 to 2 cm. long; fruit 6 to 7 mm. wide, puberulent.

15. *Mimosa coelocarpa* Robinson, Proc. Amer. Acad. 33: 319. 1898.

Known only from the type locality, Topolobampo, Sinaloa.

Very spiny shrub; leaflets about 3 mm. long; spikes 3 to 4 cm. long; fruit densely pubescent.

16. *Mimosa wrightii* A. Gray, Pl. Wright. 2: 52. 1853.

Chihuahua and Sonora (type locality). Southern Arizona.

Shrub, armed with straight flat spines; leaflets 3 to 5 mm. long, obtuse or acute; flowers pink; fruit densely pubescent, unarmed.

17. *Mimosa dysocarpa* Benth.; A. Gray, Pl. Wright. 1: 62. 1852.

Chihuahua, Sonora, and Durango. Western Texas (type locality) to southern Arizona.

Densely armed shrub; leaflets 3 to 6 mm. long, pubescent; flowers pink, sweet-scented; fruit armed on the margins with short stout spines, densely pubescent. "Gatuño" (Chihuahua).

18. *Mimosa luisana* T. S. Brandeg. Zoe 5: 248. 1908.

Puebla and Oaxaca; type from San Luis Tultitlanapa, Puebla.

Shrub, armed with straight flat spines; leaflets 3 to 4 mm. long, pubescent; flowers pink, the spikes about 3.5 cm. long; fruit densely pubescent, unarmed, about 5 mm. wide.

19. *Mimosa rhododactyla* Robinson, Proc. Bost. Soc. Nat. Hist. 31: 260. 1904.

Known only from the type locality, Las Higueritas, near the boundary between Michoacán and Guerrero, altitude 500 meters.

Shrub, 3 meters high; leaflets 3 mm. long, pubescent; flowers pale pink.

20. *Mimosa palmeri* Rose, Contr. U. S. Nat. Herb. 1: 99. 1891.

Mimosa fasciculata malacocarpa Robinson, Proc. Amer. Acad. 33: 319. 1898.

Sonora, Sinaloa, and Jalisco; type from Alamos, Sonora.

Shrub, 1.8 to 3 meters high, armed with stout straight spines; leaflets 2 to 4 mm. long; flowers pink, fragrant, the spikes 4 to 6 cm. long; fruit long, narrow, unarmed, about 3 mm. wide.

21. *Mimosa benthami* Macbride, Contr. Gray Herb. n. ser. 59: 12. 1919.

Acacia fasciculata Kunth, Mimos. Pl. Légum. 75. pl. 23. 1819-24.

Mimosa fasciculata Benth. Lond. Journ. Bot. 5: 88. 1846. Not *M. fasciculata* Benth. 1842.

Durango to Jalisco, Oaxaca, and Morelos; type from Guanajuato.

Shrub, armed with stout straight spines; leaflets 2 to 6 mm. long; bark whitish; flowers pinkish, the spikes long and dense; fruit densely spiny, about 5 mm. wide. "Uña de gato" (Jalisco, Michoacán, Guerrero).

22. *Mimosa albida* Humb. & Bonpl.; Willd. Sp. Pl. 4: 1030. 1805.

Mimosa floribunda Willd. Sp. Pl. 4: 1031. 1805.

Mimosa albida floribunda Robinson, Proc. Amer. Acad. 33: 311. 1898.

Mimosa albida euryphylla Robinson, Proc. Amer. Acad. 33: 311. 1898.

Sinaloa to San Luis Potosí, Tabasco, and Chiapas. Central America and South America; type from Peru.

Shrub, 1 to 3 meters high, armed with short recurved spines; leaflets oblique, 3 to 8 cm. long, usually obtuse, densely pubescent; flowers pinkish; fruit 2 to 3 cm. long, 5 mm. wide, setose-hispid. "Sensitiva," "vergonzoso" (Oaxaca).

23. *Mimosa goldmanii* Robinson, Proc. Amer. Acad. 33: 308. 1898.

Known only from the type locality, between Juchitañ and Chivela, Oaxaca. Erect shrub with brownish branches; leaflets glabrous, aculeate-ciliate.

24. *Mimosa manzanilloana* Rose, Contr. U. S. Nat. Herb. 1: 326. 1895.

Sinaloa to Guerrero; type from Manzanillo, Colima.

Shrub, 1 to 1.5 meters high, armed with short stout recurved spines; leaflets 1 to 4 cm. long, obtuse or acute; flowers pink; fruit short, hispidulous, about 5 mm. wide.

25. *Mimosa acapulcensis* Robinson, Bot. Gaz. 28: 135. 1899.

Known only from Acapulco, Guerrero, the type locality.

Spiny shrub; leaflets oblique, 3 to 10 cm. long, acute or obtuse; flower heads racemose; fruit 5 to 6 mm. wide.

26. *Mimosa leptocarpa* Rose, Contr. U. S. Nat. Herb. 1: 326. 1895.

Colima to Guerrero; type from Manzanillo, Colima.

Straggling shrub, armed with very short recurved spines; leaflets oblong, obtuse, about 1 cm. long; flowers said to be yellowish white; fruit broad, very thin, glabrous, 7 to 11 cm. long, armed on the margin with short curved spines. "Sierilla" (Guerrero).

27. *Mimosa lactiflua* Delile; Benth. Trans. Linn. Soc. 30: 393. 1875.

Oaxaca; described from cultivated specimens of uncertain source; it is possible that the name does not apply properly to the Oaxaca plant.

Shrub, armed with short straight spines.

28. *Mimosa deamii* Robinson, Proc. Amer. Acad. 35: 324. 1900.

Known only from the type locality, Salina Cruz, Oaxaca.

Shrub, 3 meters high; flowers pinkish; fruit 3 to 3.4 cm. long, strigose.

29. *Mimosa psilocarpa* Robinson, Proc. Amer. Acad. 35: 325. 1900.

Known only from the type locality, in the mountains of Oaxaca.

Fruit glabrous, unarmed, 2 to 3 cm. long.

30. *Mimosa sicyocarpa* Robinson, Proc. Amer. Acad. 33: 313. 1898.

Known only from the type locality, between San Sebastián and Bufa de Mascota, Jalisco.

Shrub, 1 to 2 meters high, sparsely armed with short recurved spines; leaflets narrowly oblong, 1.5 to 2 cm. long; fruit 2.5 to 3 cm. long, densely spiny.

31. *Mimosa caerulea* Rose, Contr. U. S. Nat. Herb. 5: 141. 1897.

Morelos and Oaxaca; type from Cuernavaca.

Unarmed shrub, about a meter high; leaflets oblong, 1 to 1.5 cm. long, obtuse or acute, nearly glabrous; flowers purplish; fruit glabrous, the margins minutely aculeolate.

32. *Mimosa mixtecana* T. S. Brandeg. Univ. Calif. Publ. Bot. 3: 379. 1909.

Puebla and Oaxaca; type from the region of San Luis Tlutiltanapa, Puebla.

Shrub, armed with straight brown spines; leaflets 6 to 20 mm. long; flowers pink; fruit glabrous, unarmed, long-stipitate.

33. *Mimosa pudica* L. Sp. Pl. 518. 1753.

Veracruz and probably elsewhere. Widely distributed in tropical America; type from Brazil.

Plants decumbent or spreading, suffrutescent occasionally, but perhaps hardly to be considered a shrub; leaflets linear-oblong, about 1 cm. long; flowers white

or pink. "Dormilona," "pinahuihuixtle," "quecupatli," "sensitiva," "ten vergüenza," "vergonzosa," "xmutz" (Ranifrez); "cierra tus puertas" (Guatemala).

34. *Mimosa nelsonii* Robinson, Proc. Amer. Acad. 33: 314. 1898.

Mimosa lignosa Micheli, Mém. Soc. Phys. Hist. Nat. Genève 34: 278. pl. 23. 1903.

Michoacán to Oaxaca; type collected between San Gerónimo and La Venta, Oaxaca.

Shrub, 0.3 to 2 meters high, rather sparsely armed with straight spines; leaflets 5 to 10 mm. long, thick, obtuse; flowers pink; fruit short, densely bristly, about 5 mm. wide.

35. *Mimosa xanti* A. Gray, Proc. Amer. Acad. 5: 157. 1862.

Mimosa langlassei Micheli, Mém. Soc. Phys. Hist. Nat. Genève 34: 277. pl. 23. 1903.

Baja California (type locality) and Michoacán. Guatemala.

Erect shrub, 1 to 3.5 meters high, often forming dense thickets, armed with stout straight spines; leaflets oblong, about 1 cm. long, acute or obtuse; flowers pink; fruit short, hispid. "Celosa" (Baja California).

36. *Mimosa camporum* Benth. in Hook. Journ. Bot. 2: 130. 1840.

Tepic to Guerrero. Central America and South America.

Plants chiefly herbaceous but sometimes somewhat shrubby, nearly or quite without spines; leaflets about 8 mm. long; flowers pink; fruit short, hispid.

37. *Mimosa galeottii* Benth. Lond. Journ. Bot. 5: 92. 1846.

Acacia hirta Mart. & Gal. Bull. Acad. Brux. 10²: 318. 1843.

Morcos, Oaxaca, and Guerrero; type from mountains of Yolotepeque, Oaxaca, at an altitude of 2,460 meters.

Shrub or small tree, 3 to 4.5 meters high, armed with rather slender recurved spines; leaflets very numerous, 2 mm. long or shorter; flowers yellowish, turning pink; fruit usually very spiny, about 4 cm. long and 6 mm. wide. "Uña de gato" (Michoacán, Guerrero).

Specimens reported by Micheli¹ as *M. adenotricha* belong here.

38. *Mimosa somnians* Humb. & Bonpl.; Willd. Sp. Pl. 4: 1036. 1805.

Veracruz, Oaxaca, and Guerrero. Widely distributed in tropical America.

Plants chiefly herbaceous but often suffrutescent, armed with rather few short spines; leaflets mostly 4 to 5 mm. long; flowers white or pinkish; fruit glabrous or pilose, 3 to 4 mm. wide.

39. *Mimosa dormiens* Humb. & Bonpl.; Willd. Sp. Pl. 4: 1035. 1805.

Chiapas. Widely distributed in tropical America.

Ascending or erect shrub, densely armed with slender spines; leaflets about 8 mm. long, pubescent. "Dormidera" (Colombia).

40. *Mimosa pigra* L. Cent. Pl. 1: 13. 1755.

Mimosa asperata L. Syst. Nat. ed. 10. 1312. 1759.

Mimosa berlandieri A. Gray; Torr. U. S. & Mex. Bound Bot. 61. 1859.

Tamaulipas to Sinaloa, Chiapas, and Tabasco. Widely distributed in tropical America and Africa.

Erect or ascending shrub, 1 to 2 meters high, armed with numerous stout spines; leaflets linear, about 5 mm. long; flowers pink; fruit hispid, often very densely so, about 1 cm. wide. "Zarza" (Guerrero, Costa Rica); "choven" (Veracruz, San Luis Potosí, Scler); "espina de vaca" (Panama).

¹ Mém. Soc. Phys. Hist. Nat. Genève 34: 276. 1903.

41. *Mimosa hemiendyta* Rose & Robins. Contr. U. S. Nat. Herb. 8: 32. 1903.
Yucatán and Campeche; type from Apazote, Campeche.
Shrub, 1.5 to 6 meters high; leaflets 4 to 5 mm. long, glabrate; fruit with a broad, erose or shallowly lacerate wing.
42. *Mimosa lacerata* Rose, Contr. U. S. Nat. Herb. 5: 141. 1897.
Querétaro, Morelos, Puebla, and Oaxaca; type from Piaxtla, Puebla.
Shrub, 1.5 to 2.5 meters high, armed with stout spines; leaflets 2 to 3 mm. long; fruit with a broad, deeply lacerate wing.
43. *Mimosa leucaenoides* Benth. Lond. Journ. Bot. 5: 89. 1846.
San Luis Potosí and Hidalgo; type from Zimapán, Hidalgo.
Shrub or small tree, 3 to 4.5 meters high; leaflets 1.5 to 2.5 cm. long, lustrous; fruit unarmed, about 6 mm. wide.
44. *Mimosa micheliana*¹ Robinson, Proc. Bost. Soc. Nat. Hist. 31: 259. 1904.
Known only from the type locality, La Correa, Guerrero, altitude 250 meters.
Shrub, armed with small recurved spines; leaflets 9 to 13 mm. long; flowers pale pink.
45. *Mimosa ervendbergii*² A. Gray, Proc. Amer. Acad. 5: 178. 1862.
Veracruz, Oaxaca, and Chiapas; type from Tantoyuca, Veracruz. Central America.
Shrub, probably scandent, armed with very short recurved spines; leaflets 1 to 3 cm. long; flower heads in large naked panicles. "Zarza," "sierrilla" (Oaxaca).
46. *Mimosa argillotropha* Robinson, Proc. Bost. Soc. Nat. Hist. 31: 257. 1904.
Known only from the type locality, La Correa, Guerrero.
Shrub, armed with very small recurved spines; leaflets 1 cm. long or shorter; flowers white.
47. *Mimosa tenuiflora* Benth. Lond. Journ. Bot. 5: 92. 1846.
Type from Zimapán, Hidalgo.
Pinnae 1 to 3 pairs; branchlets glabrous.
48. *Mimosa invisá* Mart. Herb. Fl. Bras. 121. 1837-40.
Schrankia brachycarpa Benth. in Hook. Journ. Bot. 2: 130. 1840.
Sinaloa to Guerrero and Veracruz. Widely distributed in tropical America.
Procumbent or prostrate plant, chiefly herbaceous, armed with very numerous short recurved spines; leaflets 5 mm. long; flowers pink; fruit hispid, 4 mm. wide. "Dormilona" (Costa Rica).
The roots have a disagreeable odor and are said to have irritant properties. In Costa Rica the bitter infusion of the leaves is considered tonic, and the seeds are sometimes used as an emetic.
49. *Mimosa grahami* A. Gray, Pl. Wright. 2: 52. 1853.
Northern Sonora (type locality) and Chihuahua.
Shrub, armed with rather slender spines; leaflets 4 mm. long; flowers pink; margins of the fruit with a few short spines, about 6 mm. wide.
50. *Mimosa eurycarpa* Robinson, Proc. Amer. Acad. 33: 322. 1898.
Mimosa eurycarpoides Robinson, Proc. Amer. Acad. 36: 472. 1901.
Sinaloa to Oaxaca; type collected between Guichocovi and Lagunas, Oaxaca.

¹ Named for Marc Micheli, a botanist of Geneva, who published a paper describing the Leguminosae collected in Mexico by Eugène Langlássé.

² L. C. Ervendberg made a small collection of plants in the District of Huasteca, Veracruz, in 1858 and 1859. This was reported upon by Gray in 1861 (Proc. Amer. Acad. 5: 174-190).

Shrub or small tree, sometimes 6 meters high; leaflets 4 to 6 mm. long; flowers white; fruit broad, thin, sparsely hispid on the valves. "Rabo de iguana" (Guerrero); "uña de gato" (Oaxaca).

It is possible that *M. curycarpoides* is distinct, but it is known only from flowering branches, which show no essential differences from *M. eurycarpa*. The fruit originally described as belonging to *M. eurycarpoides* is probably that of *Acacia farnesiana*.

51. *Mimosa colimensis* Robinson, Proc. Bost. Soc. Nat. Hist. 31: 358. 1904.

Known only from Colima, the type locality.

Shrub, armed with short recurved spines; leaflets 5 to 7 mm. long; flower heads racemose-paniculate.

It is doubtful whether this is distinct from *M. eurycarpa*. The fruit is not known.

52. *Mimosa malacophylla* A. Gray, Journ. Bost. Soc. Nat. Hist. 6: 182. 1850.

Chihuahua and Coahuila to Tamaulipas. Western Texas; type collected on the Rio Grande.

Scandent or recumbent shrub, 3 to 4.5 meters high, armed with numerous small recurved spines; leaflets mostly oval, 7 to 14 mm. long, obtuse or acute; flowers white, sweet-scented; fruit 5 to 7.5 cm. long, 1 cm. wide, glabrous. "Raspa-huevos" (Nuevo León, Tamaulipas); "raspilla" (Tamaulipas).

53. *Mimosa wootonii*¹ Standl., sp. nov.

Type from Hacienda Buena Vista, Tamaulipas (Wooton, June 14, 1919; U. S. Nat. Herb. no. 989828).

Subscandent shrub, the branches angulate, glabrous, armed with very numerous short recurved prickles; leaf rachis 9 to 12 cm. long, with numerous recurved prickles, sparsely puberulent with short curled hairs; pinnae 3 or 4 pairs; leaflets usually 4 or 5 pairs, oval-elliptic, oval, or sometimes obovate-oval, 8 to 15 mm. long, 5 to 9 mm. wide, acute or obtuse at apex, mucronate, bright green, glabrous, with rather prominent venation; flowers capitate, racemose, the peduncles fasciculate, 1.2 to 2 cm. long, puberulent; calyx and corolla glabrous, the calyx one-third as long as the corolla; ovary glabrous. "Raspilla," "raspa-huevos."

Except in pubescence, this plant is almost exactly like *M. malacophylla* Gray, which was collected at the same locality. It may be only a form of that species, but in the latter the pubescence is very copious on all parts, consisting of short straight hairs. The quality and quantity of pubescence seem to be constant characters in the other Mexican species of the genus.

54. *Mimosa zygophylla* Benth.; A. Gray, Pl. Wright. 1: 61. 1852.

Coahuila, Nuevo León, San Luis Potosí, and Zacatecas; type from the region of Saltillo.

Densely branched shrub, 0.3 to 1 meter high or larger, armed with short stout recurved spines; leaflets about 3 mm. long; flowers pink; fruit short, glabrous, unarmed or nearly so, 7 cm. wide.

55. *Mimosa hystricosa* T. S. Brandeg. Univ. Calif. Publ. Bot. 4: 86. 1910.

Jalisco to Puebla; type from Cerro de Gavilán, Puebla.

Shrub, armed with numerous short spines; leaflets 5 to 8 mm. long; fruit very spiny.

56. *Mimosa monancistra* Benth. Pl. Hartw. 12. 1839.

?*Mimosa hircinquiana* Micheli, Mém. Soc. Phys. Genève 34: 276. pl. 21. 1903.

Coahuila to San Luis Potosí, Oaxaca, and Jalisco; type from Aguascalientes.

¹ Named for Elmer Ottis Wooton (1865-), now of the U. S. Department of Agriculture, who made a collection of plants in Tamaulipas in 1919.

Shrub, 0.6 to 1.5 meters high, sparsely or densely armed with short spines; leaflets 3 to 5 mm. long; flowers pink; fruit very spiny, 4 to 5 mm. wide. "Garabatlillo" (Aguascalientes); "uña de gato" (Guanajuato).

57. *Mimosa emoryana* Benth. Trans. Linn. Soc. Bot. 30: 426. 1875.

Chihuahua and Durango. Western Texas (type locality).

Shrub, densely pubescent, armed with numerous stout spines; leaflets 3 to 5 mm. long; flowers pink; fruit very spiny, about 5 mm. wide.

58. *Mimosa lindheimeri*¹ A. Gray, Proc. Bost. Soc. Nat. Hist. 6: 181. 1850.

Mimosa biuncifera lindheimeri Robinson, Proc. Amer. Acad. 33: 328. 1898.

Coahuila to San Luis Potosí, Puebla, and Michoacán. Western Texas (type locality).

Erect, very spiny shrub, nearly glabrous, with reddish purple or pink flowers; leaflets 2 to 3 mm. long; fruit armed with spines on the margins, 4 to 5 mm. wide.

59. *Mimosa purpusii* T. S. Brandeg. Univ. Calif. Publ. Bot. 3: 379. 1909.

Puebla and Oaxaca; type from Cerro de Matzize, Puebla.

Very spiny shrub, densely pubescent; leaflets 3 to 4 mm. long; flowers pink; fruit densely pubescent, 6 mm. wide, with a few short spines on the margins.

60. *Mimosa pringlei* S. Wats. Proc. Amer. Acad. 21: 452. 1886.

Chihuahua; type collected near the city of Chihuahua. Western Texas.

Densely branched shrub, armed with short slender recurved spines; leaflets 3 to 4 mm. long; fruit 2 cm. long, glabrous, unarmed or nearly so.

61. *Mimosa depauperata* Benth. Pl. Hartw. 13. 1839.

Acacia canescens Mart. & Gal. Bull. Brux. 10²: 312. 1843.

Querétaro to Mexico and Oaxaca; type from Actopan, Hidalgo.

Shrub, 0.3 to 1 meter high, very spiny; leaflets 2 to 3 mm. long; fruit densely pubescent, 5 mm. wide, the margins armed with stout straight spines.

62. *Mimosa calcicola* Robinson, Proc. Amer. Acad. 33: 325. 1898.

Hidalgo and Puebla; type from plains near Tehuacán, Puebla.

Shrub, 0.3 to 1 meter high, very spiny; leaflets 2 to 4 mm. long; flowers white or pinkish; fruit densely pubescent, unarmed or nearly so, about 4 mm. wide.

63. *Mimosa minutifolia* Robins. & Greenm. Amer. Journ. Sci. III. 50: 150. 1895.

Jalisco; type from Río Blanco.

Fruit very spiny, 7 to 8 mm. wide.

64. *Mimosa mollis* Benth. in Hook. Journ. Bot. 4: 408. 1842.

Puebla; type from Acatlán.

Shrub, armed with short flat spines, densely pubescent; leaflets 4 to 6 mm. long; fruit densely pubescent, unarmed.

65. *Mimosa biuncifera* Benth. Pl. Hartw. 12. 1839.

Mimosa prolifica S. Wats. Proc. Amer. Acad. 21: 452. 1886.

Chihuahua to San Luis Potosí, Mexico, Oaxaca, and Durango; type from León, Guanajuato. Southern Arizona and New Mexico.

Shrub 1 to 2 meters high, densely armed with stout recurved spines; leaflets mostly 2 to 3 mm. long; flowers pink or white; fruit very spiny on the margins. "Gatuño" (Zacatecas, Durango, Chihuahua); "uña de gato" (Chihuahua, Texas, etc.).

¹ Ferdinand Lindheimer (1801-1879), a native of Germany, resided for more than 30 years in Texas, where he made large collections of plants. These were reported upon by Gray and Engelmann. The genus *Lindheimera*, of the family Asteraceae, was named in his honor.

66. *Mimosa lemmoni* A. Gray, Proc. Amer. Acad. 19: 76. 1883.

Northern Chihuahua and Sonora. Southern New Mexico and Arizona; type from Huachuca Mountains, Arizona.

Shrub, about 1 meter high, very pubescent; fruit densely pubescent, unarmed or nearly so, about 6 mm. wide.

67. *Mimosa aculeaticarpa* Ortega, Hort. Matr. Dec. 134. 1800.

Mimosa acanthocarpa Benth. in Hook. Journ. Bot. 4: 409. 1842.

Mimosa acanthocarpa desmanthocarpa Robinson, Proc. Amer. Acad. 36: 472. 1901.

Mimosa aculeaticarpa imparilis Macbride, Contr. Gray Herb. n. ser. 59: 12. 1919.

San Luis Potosí to Tepic, Chiapas, and Hidalgo.

Shrub or small tree, armed with numerous spines; flowers white or pink; fruit usually spiny on the margins, about 6 mm. wide, reddish brown.

Mimosa acanthocarpa desmanthocarpa is a form with unarmed fruit. *M. aculeaticarpa imparilis* has glandular and hirsute branchlets.

DOUBTFUL SPECIES.

MIMOSA ARCUATA Mart. & Gal. Bull. Acad. Brux. 10²: 308. 1843. Type from Tehuacán, Puebla. According to Robinson, probably a synonym of *M. biuncifera* Benth.

MIMOSA GEMINATA DC. Prodr. 2: 427. 1825. Described from Mexico.

MIMOSA TRICEPHALA Cham. & Schlecht. Linnaea 5: 591. 1830. Type from Actopan, Hidalgo.

7. ACUAN Medic. Theod. Sp. 62. 1786.

Low suffrutescent or herbaceous plants, unarmed; leaves bipinnate, the leaflets numerous, small, the stipules setaceous, persistent; flowers in dense heads; fruit linear, compressed.

Several other species of the genus occur in Mexico, but they are herbaceous plants.

Fruit 3 to 5 mm. wide-----1. *A. virgatum*.

Fruit 5 to 6 mm. wide-----2. *A. fruticosum*.

1. *Acuan virgatum* (L.) Medic. Theod. Sp. 62. 1786.

Mimosa virgata L. Sp. Pl. 519. 1753.

Desmanthus virgatus Willd. Sp. Pl. 4: 1047. 1806.

Sonora to San Luis Potosí, Veracruz, and Oaxaca. Widely distributed in tropical America.

More commonly, perhaps, a herbaceous plant, but often a shrub 1 to 3 meters high; leaflets 2 to 4 mm. long, oblong, obtuse; flowers white; fruit 4.5 to 10 cm. long, glabrous.

2. *Acuan fruticosum* (Rose) Standl.

Desmanthus fruticosus Rose, Contr. U. S. Nat. Herb. 1: 131. pl. 13. 1892.

Baja California; type from Carmen Island.

Slender shrub, 1.5 to 3 meters high; leaflets oblong, 5 to 9 mm. long; fruit 4 to 8 cm. long.

8. LEUCAENA Benth. in Hook. Journ. Bot. 4: 416. 1842.

Unarmed trees or shrubs; leaves bipinnate, the leaflets few and large or numerous and small, the petiole usually glanduliferous; stipules small; flowers in dense globose heads, white; fruit flat, stipitate, bivalvate.

Some of the South American species are said to be employed to poison or stupefy fish.

Leaflets large, most of them 0.8 to 3 cm. wide, comparatively few.

Mature fruit 2.5 to 4.5 cm. wide.

Leaflets 6 to 8 pairs; pinnae 3 to 6 pairs.....1. *L. plurijuga*.

Leaflets 2 to 4 pairs; pinnae 2 or 3 pairs.

Leaflets lance-ovate, 1.5 to 2.3 cm. wide; fruit 2.5 to 3 cm. wide.

2. *L. macrophylla*.

Leaflets broadly ovate or oval, most of them 2.5 to 3.5 cm. wide; fruit

3.5 to 4.5 cm. wide.....3. *L. macrocarpa*.

Mature fruit less than 2 cm. wide.

Leaflets lance-oblong or oblong-ovate, 0.8 to 1.3 cm. wide...4. *L. lanceolata*.

Leaflets oval or rounded-oval, most of them 1.5 to 3.5 cm. wide or larger.

5. *L. microcarpa*.

Leaflets small, 1 to 8 mm. wide, numerous.

Young branches sharply angulate.....6. *L. esculenta*.

Young branches terete.

Corolla glabrous.

Leaflets 6 mm. long or shorter.

Leaflets thin, linear-oblong, the venation plane, rounded or obtuse at apex.....7. *L. diversifolia*.

Leaflets coriaceous, oval-oblong or broadly oblong, the venation prominent beneath, cuspidate at apex.....8. *L. cuspidata*.

Leaflets 10 mm. long or longer.

Leaflets oblong, obtuse or rounded at apex, 3 to 8 mm. wide; fruit puberulent.....9. *L. shannoni*.

Leaflets narrowly lance-oblong, acute, 2.5 to 4 mm. wide; fruit glabrous.

10. *L. glabrata*.

Corolla pubescent.

Limb of the corolla pilose with spreading yellow hairs; beak of the fruit 1.5 to 3.5 cm. long.....11. *L. greggii*.

Limb of the corolla pilose with minute appressed hairs; beak of the fruit less than 1 cm. long.

Corolla 3 to 4 times as long as the calyx.....12. *L. pulverulenta*.

Corolla about twice as long as the calyx.

Leaflets 7 to 15 mm. long.....13. *L. glauca*.

Leaflets 2 to 5 mm. long.

Leaflets glabrous on the faces, the costa impressed beneath.

14. *L. brachycarpa*.

Leaflets densely pilose on both surfaces with minute, mostly spreading hairs, the costa prominent beneath.....15. *L. stenocarpa*.

1. *Leucaena plurijuga* Standl. Contr. U. S. Nat. Herb. 20: 189. 1919.

Querétaro, Guanajuato, and Michoacán; type from Monte León, Michoacán.

Leaflets oblong or oval, 2 to 3 cm. long, rounded at apex, nearly glabrous; fruit about 24 cm. long.

2. *Leucaena macrophylla* Benth. Bot. Voy. Sulph. 90. 1844.

Colima to Guerrero; type from Acapulco, Guerrero. Reported from Panama.

Small tree, about 3.5 meters high; leaflets 5 to 6.5 cm. long, acute, pubescent beneath when young, glabrate in age; fruit about 20 cm. long.

3. *Leucaena macrocarpa* Rose, Contr. U. S. Nat. Herb. 1: 327. f. 6. 1895.

Tepic to Colima; type from Río Blanco, Jalisco.

Shrub or small tree, sometimes 7.5 meters high; leaflets 4 to 9 cm. long, acute or obtuse, bright green, nearly glabrous; flower heads 1 cm. in diameter, racemose.

4. *Leucaena lanceolata* S. Wats. Proc. Amer. Acad. 21: 427. 1886.

Sonora, Chihuahua, and Sinaloa; type from Hacienda San Miguel, Chihuahua. Shrub, 1.5 to 3 meters high; leaflets 2 to 4 cm. long, acute; flower heads 1.5 to 2 cm. in diameter; fruit 12 to 18 cm. long.

5. *Leucaena microcarpa* Rose, Contr. U. S. Nat. Herb. 5: 141. 1897.

Baja California and Sinaloa to Morelos and Guerrero; type from Miraflores, Baja California.

Shrub or tree, sometimes 6 meters high; leaflets 2 to 5.5 cm. long, rounded to acute at apex, thick, lustrous; flowers white, the heads 2 cm. in diameter. "Guajillo" (Michoacán, Guerrero).

It is possible that the southern plant, with larger leaflets, represents another species. All the material is very close to *L. trichodes* (Jacq.) Benth., of Hispaniola.

6. *Leucaena esculenta* (Moc. & Sessé) Benth. Trans. Linn. Soc. 30: 442. 1875.

Acacia esculenta Moc. & Sessé; DC. Prodr. 2: 470. 1825.

Mimosa esculenta Moc. & Sessé, Pl. Nov. Hisp. 178. 1887.

Jalisco to Puebla and Chiapas; type from "Nova-Hispania."

Tree, 6 to 15 meters high; leaves often 40 cm. long, the leaflets linear, 3 to 4 mm. long, glabrate; flowers white, odorless, the heads 2 cm. in diameter, arranged in large racemes or panicles; fruit 12 to 27 cm. long, 2 to 3 cm. wide, red or purplish. "Guaje" or "huaje" (Jalisco, Mexico, Morelos, Oaxaca; derived from the Nahuatl *huaxin*, *hoatzin*, or *hoaxin*); "uachi blanco" (Chiapas); "huassi," "guaxi" (Otomí, Peñafiel).

Sessé and Mociño state that the pods were an article of commerce and that the seeds, in spite of their unpleasant flavor, were eaten by the Indians, who believed that they possessed a prodisiac properties. The seeds are still eaten in Mexico, usually with salt.

This is probably the plant of which Sahagún writes: "There is a tree known as *uaxin*. It is of medium size; its trunk is smooth, likewise the leaves, which are almost like those of the árbol del Perú [*Schinus molle*]. It bears a fruit like that of the carob, which is good to eat and is offered for sale in the markets."

According to Robelo, the geographic name Oaxaca takes its derivation from the word *huaxin*, the Nahuatl form being Huaxyacac, or "place where the *huaxin* begins to grow." The word Huaxtl signifies "where the *huaxin* abounds," and Huajuapán "river of the *huaxin*."

7. *Leucaena diversifolia* (Schlecht.) Benth. in Hook. Journ. Bot. 4: 417. 1842.

Acacia diversifolia Schlecht. Linnaea 12: 570. 1838.

Jalisco to Oaxaca and Veracruz; type from Jalapa, Veracruz.

Shrub; leaves large, glabrate; flower heads 2 cm. in diameter; fruit 15 to 20 cm. long, about 1.5 cm. wide, lustrous.

8. *Leucaena cuspidata* Standl. Contr. U. S. Nat. Herb. 20: 189. 1919.

Known only from the type locality, Minas de San Rafael, San Luis Potosí. Leaflets pale beneath; flower heads less than 1 cm. in diameter.

9. *Leucaena shannoni* Donn. Smith, Bot. Gaz. 57: 419. 1914.

Chiapas. El Salvador (type locality).

Shrub or tree; leaflets oblong, 2.5 to 4 mm. wide, obtuse; flowers glabrous; fruit puberulent.

10. *Leucaena glabrata* Rose, Contr. U. S. Nat. Herb. 5: 140. 1897.

Guerrero and Puebla to Chiapas; type from Acapulco, Guerrero.

Tree, 9 to 12 meters high, with a trunk 30 cm. or more in diameter; leaflets glabrous or nearly so. "Guaje" (Guerrero).

The Chiapas plant (known as "uaxi" or "guacis") has very short fruit, and is perhaps distinct. The seeds are eaten raw when they are green.

11. *Leucaena greggii* S. Wats. Proc. Amer. Acad. 23: 272. 1888.

Coahuila and Nuevo León; type from Rinconada. Southwestern Texas.

Shrub or small tree, 3 to 4.5 meters high; leaflets 5 to 7 cm. long, acute, glaucous; flower heads 1.5 cm. in diameter; fruit 14 to 19 cm. long, 1 cm. wide; wood hard, close-grained, brown, its specific gravity about 0.92.

12. *Leucaena pulverulenta* (Schlecht.) Benth. in Hook. Journ. Bot. 4: 417. 1842.

Acacia pulverulenta Schlecht. Linnaea 12: 571. 1838.

Nuevo León, Tamaulipas, and Veracruz; type from San Antonio, Veracruz. Southwestern Texas.

Tree, sometimes 18 meters high, the tall straight trunk sometimes 50 cm. in diameter, covered with cinnamon-brown bark; leaflets 3 to 4 mm. long, glabrate; flowers white, sweet-scented; fruit 11 to 18 cm. long, about 1.5 cm. wide; wood hard, heavy, close-grained, of a rich, dark brown color, the sapwood bright clear yellow, the specific gravity about 0.67. "Tepeguaje," "quebra-hacha" (Tamaulipas).

The tree is a source of lumber, which is employed for general purposes.

13. *Leucaena glauca* (L.) Benth. in Hook. Journ. Bot. 4: 416. 1842.

Mimosa glauca L. Sp. Pl. 520. 1753.

Jalisco to Michoacán, Chiapas, and Yucatán. Widely distributed in tropical and subtropical America.

Shrub or tree, sometimes 10 meters high, with a trunk 10 cm. in diameter, the bark dark brown, somewhat scaly; leaves 10 to 30 cm. long; flowers whitish; fruit 10 to 15 cm. long, 1.5 cm. wide; wood hard, close-grained, light brown. "Xaxim" (Yucatán, Maya); "uaxi," "guacis" (Chiapas); "aroma blanca" (Cuba); "hediondilla" (Porto Rico); "granalino" (Santo Domingo).

There is a prevalent belief in tropical America that if horses, mules, or pigs eat any part of the plant their hair will fall out. Cattle are said not to be affected, and in Mauritius the plant is considered valuable as forage for goats. The seeds are sometimes used for making necklaces, bracelets, and other articles. Grosourdy reports that the roots have emmenagogue and abortive properties. The plant has been introduced into the tropics of the old World, where it is sometimes planted for hedges. It grows readily from cuttings. Its most common English name is "lead-tree," but in the Bahamas it is known as "jumby-bean."

14. *Leucaena brachycarpa* Urban, Symb. Antill. 2: 265. 1900.

Veracruz. Described from plants cultivated in Jamaica.

Tree, 7.5 meters high; flower heads 1 cm. in diameter; fruit 10 to 11 cm. long, 1.2 cm. wide.

15. *Leucaena stenocarpa* Urban, Symb. Antill. 2: 266. 1900.

Oaxaca; type from foothills of the Sierra de San Felipe.

Small tree, 4.5 meters high; fruit about 10 cm. long and 1.2 cm. wide.

DOUBTFUL SPECIES.

LEUCAENA LAXIFOLIA Urban, Symb. Antill. 2: 296, 1900. Described from Mexico. Closely related to *L. diversifolia* (Schlecht.) Benth.

LEUCAENA TRICHANDRA (Zucc.) Urban, Symb. Antill. 2: 267. 1900. *Acacia trichandra* Zucc. Abh. Akad. Wiss. München 2: 349. 1838. Described from cultivated specimens, probably of Mexican origin. Very closely related to *L. diversifolia*, and doubtfully distinct. Bentham considered it synonymous with that species.

9. ACACIA Willd. Sp. Pl. 4: 1049. 1806.

REFERENCE: Benth. Trans. Linn. Soc. Bot. 30: 444-533. 1875.

Trees or shrubs, rarely herbs, usually armed with spines; leaves bipinnate, the leaflets usually small and numerous, the petiole usually glanduliferous; flowers small but often showy, capitate or spicate, the stamens numerous (sometimes as many as 400), exserted; fruit very variable in form.

The species of *Acacia* are widely distributed in the tropics of both hemispheres, being particularly abundant in Australia. Many of them yield useful gums, gum arabic being furnished by *A. scorpioides* (L.) W. F. Wight [*A. arabica* (Lam.) Willd.] and other species. This gum is employed in medicine as a remulcent and has varied uses in different industries.

A. Spines very large, most of them 5 mm. wide at the base or often much broader, either inflated and then usually punctured by ants or flattened and sword-shaped, never abruptly recurved, sometimes boat-shaped.

Involucel borne at or above the middle of the peduncle; bractlets of the flower heads not peltate; spines often puberulent when young.

Flowers in globose heads.

Spines boat-shaped.....1. *A. cochliacantha*.

Spines sword-shaped, flat.....2. *A. macracantha*.

Flowers in cylindrical spikes.

Spines turgid and only slightly compressed.....3. *A. standleyi*.

Spines flat, strongly compressed.....4. *A. gladiata*.

Involucel borne near the base of the peduncle, or at least below the middle; bractlets peltate; spines glabrous.

Fruit indehiscent, terete, terminating in a spinose beak.

Flowers in globose or oblong-globose heads.....5. *A. sphaerocephala*.

Flowers in long cylindric spikes.....6. *A. cornigera*.

Fruit dehiscent.

Fruit opening by a single suture. Flowers spicate.....7. *A. hindsii*.

Fruit opening by 2 sutures.

Flowers in globose heads.....8. *A. globulifera*.

Flowers in cylindric spikes.

Spines much broadened and compressed at base; fruit somewhat compressed.....9. *A. nelsonii*.

Spines little broadened and scarcely at all compressed; fruit terete or nearly so.....10. *A. collinsii*.

AA. Spines often wanting, when present much smaller, usually much less than 5 mm. wide at base, never boat-shaped or large and sword-shaped, often abruptly recurved.

B. Flowers spicate.

Leaflets large, all or most of them more than 1 cm. wide.

Flowers pedicellate. Plant glabrous.....11. *A. reniformis*.

Flowers sessile.

Stipular spines mostly 1 to 3 cm. long.....13. *A. conzattii*.

Stipular spines 5 mm. long or shorter.

Leaves densely short-pilose at maturity.....15. *A. californica*.

Leaves glabrous or nearly so at maturity or puberulent.

Fruit 5 mm. wide or narrower.....14. *A. pringlei*.

Fruit 1 to 2.5 cm. wide.

Pinnae one pair; leaflets subchartaceous, longer than broad.

16. *A. unijuga*.

Pinnae 2 or 3 pairs; leaflets coriaceous, nearly as broad as long.

12. *A. sororia*.

Leaflets small, the largest 6 mm. wide.

Petioles flat, striate, usually 10 to 20 cm. long; leaflets soon deciduous.

17. *A. willardiana*.

Petioles not flat and striate, commonly less than 10 cm. long; leaflets persistent.

Stipules spinelike, usually 1 to 3 cm. long.

Leaflets glabrous.....18. *A. amentacea*.

Leaflets pubescent.

Fruit densely hirtellous.....19. *A. bilimekii*.

Fruit glabrous or minutely puberulent.....20. *A. sonorensis*.

Stipules not spinelike, the spines all less than 1 cm. long.

Leaflets 3 to 7 pairs.

Leaflets 2.5 to 4 mm. long; fruit about 1.5 cm. wide.

21. *A. greggii*.

Leaflets mostly 6 to 10 mm. long; fruit 2 cm. wide or wider.

22. *A. wrightii*.

Leaflets 10 to many pairs in all or most of the leaves.

Rachis of the leaves with recurved spines.....23. *A. iguana*.

Rachis of the leaves unarmed.

Pinnae much shorter than the rachis of the leaf, usually numerous (commonly 15 or more).

Fruit velvety-puberulent, about 2 cm. wide...24. *A. macilentia*.

Fruit glabrous or nearly so, about 1.5 cm. wide.

Rachis of the leaves glabrous.....25. *A. millefolia*.

Rachis of the leaves densely short-pilose...32. *A. acatlensis*.

Pinnae nearly or quite as long as the rachis or often longer, usually less than 10.

Leaflets 7 to 10 pairs.....26. *A. rotundata*.

Leaflets 10 to many pairs.

Pinnae 2 to 5 pairs.

Leaflets 8 to 11 mm. long.....27. *A. gaumeri*.

Leaflets 2 to 6 mm. long.

Surfaces of the leaflets glabrous, the margins ciliate.

28. *A. dolichostachya*.

Surfaces, at least the lower one, of the leaflets puberulent or sericeous.

Leaflets about 2 mm. long; fruit 16 mm. wide.

29. *A. compacta*.

Leaflets 6 mm. long; fruit 8 mm. wide.

30. *A. mammifera*.

Pinnae 6 to 10 pairs in all or most of the leaves.

Pinnae mostly 5 to 8 cm. long; fruit glabrous.

31. *A. coulteri*.

Pinnae mostly 1.5 to 3 cm. long; fruit pubescent.

32. *A. acatlensis*.

BB. Flowers capitate.

Stipules spinose, stout, straight, usually long.

Fruit covered with thick stalked glands.....33. *A. glandulifera*.

Fruit without glands, or the glands sessile.

Fruit flat, bivalvate; bracts borne near the middle of the peduncle.

Fruit 2 to 3 cm. long, strongly curved; spines very slender, yellowish.

34. *A. biaciculata*.

Fruit 5 to 12 cm. long, straight or nearly so; spines stout, brown, white, or grayish.

- Pinnae 4 to 9 (rarely 3) pairs; leaflets usually puberulent, slightly or not at all viscid.....35. *A. constricta*.
- Pinnae 1 or 2 (rarely 3) pairs; leaflets glabrous, very viscid.
36. *A. vernicosa*.
- Fruit turgid, tardily or not at all dehiscent; bracts borne at the summit of the peduncle.
- Pinnae 2 to 8 pairs.
Fruit glabrous, 5 to 7.5 cm. long.....37. *A. farnesiana*.
Fruit pubescent, 7.5 to 10 cm. long.....38. *A. tortuosa*.
- Pinnae 10 to 60 pairs.
Fruit 2 to 2.5 cm. wide.....39. *A. pennatula*.
Fruit 0.7 to 1 cm. wide.....1. *A. cochliacantha*.
- Stipules not spinose, the spines infrastipular.
- C. Leaflets large, more than 5 mm. wide, usually 1 to 2.5 cm.
Leaflets one pair, thick-coriaceous.....40. *A. crassifolia*.
Leaflets 2 to many pairs, usually thin.
Leaflets 2 or 3 pairs.....41. *A. rosei*.
Leaflets 4 to many pairs.
Stems densely setose-pilose.....42. *A. crinita*.
Stems glabrous.
Costa of the leaflets strongly excentric; fruit 3 cm. wide; plants armed with short spines.....43. *A. anisophylla*.
Costa of the leaflets nearly central; fruit about 1.2 cm. wide; plants unarmed.
Leaflets oblong or oval-oblong, chartaceous, the venation not prominent on the upper surface.....52. *A. penicillata*.
Leaflets broadly oval or suborbicular, nearly as broad as long, coriaceous, the venation prominent on the upper surface.
53. *A. tequilana*.
- CC. Leaflets small, less than 5 mm. wide.
- D. Petioles without glands; flowers pedicellate; plants unarmed.
- E. Stems hirsute or pilose with long or with short and dense, spreading hairs.
Margins of the leaflets revolute; leaflets usually pubescent on both surfaces with short curved hairs.....44. *A. polypodioides*.
Margins of the leaflets plane; leaflets glabrous on the faces or pilose with short straight hairs.
Pinnae 2 to 5 pairs; leaflets 10 to 13 pairs. Stems hirsute.
45. *A. leucothrix*.
Pinnae usually 5 to 10 pairs or more; leaflets numerous.
Venation of the lower surface of the leaflets not elevated.
Leaflets glabrous beneath.....46. *A. villosa*.
Venation of the lower surface of the leaflets elevated.
Leaflets glabrous beneath, ciliate; fruit hirsute; stems sparsely hirsute.....47. *A. filicioides*.
Leaflets pilose beneath; fruit glabrous or nearly so; stems densely short-pilose.....48. *A. elegans*.
- EE. Stems glabrous or puberulent, the pubescence of short, appressed or incurved hairs.
Leaflets 1.5 mm. wide or narrower, oblong-linear or narrowly oblong, the venation not reticulate, although sometimes prominent.
Venation of the lower surface of the leaflets elevated.
48. *A. elegans*.

Venation of the lower surface of the leaflets not elevated.

Pinnae usually 3 to 6 pairs; leaflets commonly 10 to 15 pairs; leaves rarely over 5 cm. long-----49. *A. cuspidata*.

Pinnae usually 6 to 10 or more pairs; leaflets numerous; leaves usually 8 to 10 cm. long or larger----50. *A. angustissima*.

Leaflets 2 to 7 mm. wide, oval or broadly oblong, the venation reticulate, prominent.

Pinnae 8 to 11 pairs-----51. *A. laevis*.

Pinnae 3 to 5 pairs.

Leaflets oval-oblong, about twice as long as broad.

52. *A. penicillata*.

Leaflets quadrangular-orbicular, nearly as broad as long.

53. *A. tequilana*.

11D. Petioles with glands; flowers sessile or nearly so; plants usually armed with spines.

Pinnae 6 to many pairs in all or most of the leaves.

Leaflets linear or oblong-linear, 1 mm. wide or narrower.

Fruit long-stipitate, glabrous or nearly so, very thin.

54. *A. paniculata*.

Fruit sessile, densely velvety-puberulent, thick.

55. *A. berlandieri*.

Leaflets oblong. or narrowly oblong, more than 1 mm. wide.

Costa of the leaflets close to the upper margin.

56. *A. glomerosa*.

Costa remote from the margin.

Leaflets thick, densely puberulent beneath; fruit subsessile, densely puberulent, the valves thick--57. *A. subangulata*.

Leaflets thin, glabrous or nearly so; fruit stipitate, glabrate, the valves thin-----58. *A. riparia*.

Pinnae 1 to 4 pairs.

Rachis of the leaves or pinnae armed with spines.

Leaflets glabrous, 4 or 5 pairs-----59. *A. palmeri*.

Leaflets pubescent, 6 to 14 pairs.

Leaflets 6 to 10 pairs; valves of the fruit thin.

60. *A. malacophylla*.

Leaflets 10 to 14 pairs; valves of the fruit thick.

61. *A. purpusii*.

Rachis of the leaves and pinnae unarmed.

Leaflets 1.5 mm. wide or narrower-----62. *A. occidentalis*.

Leaflets 2.5 to 5 mm. wide.

Leaflets oval-oblong, bright green-----63. *A. micrantha*.

Leaflets cuneate-oblong, glaucescent-----64. *A. roemeriana*.

1. *Acacia cochliacantha* Humb. & Bonpl.; Willd. Sp. Pl. 4: 1081. 1806.

Mimosa campechiana Mill. Gard. Dict. ed. 8. *Mimosa* no. 20. 1768.

Chihuahua to Baja California, Puebla, and Chiapas. South America; type from Guayaquil, Ecuador.

Shrub or small tree, 1.5 to 4.5 meters high; spines, especially those on sterile branches, very large, 1.5 to 5 cm. long, boat-shaped, brown or gray, those on fertile branches mostly subulate; leaflets very numerous, 2 to 3 mm. long, linear; flowers yellow; fruit compressed or nearly terete, usually 9 to 10 cm. long, blackish brown, tardily dehiscent or indehiscent. "Quisache corteño," "quisache tepamo" (Michoacán, Guerrero); "cucharitas," "palo de cucharitas" (Oaxaca).

The spines are very different from those of any other species. Palmer reports that a decoction of the plant is used in Sonora as a remedy for affections of the bladder.

2. *Acacia macracantha* Humb. & Bonpl.; Willd. Sp. Pl. 4: 1080. 1806.

Mimosa lutea Mill. Gard. Dict. ed. 8. *Mimosa* no. 17. 1768.

Acacia lutea Hitchc. Rep. Mo. Bot. Gard. 4: 83. 1893. Not *A. lutea* Leavenw. 1824.

Sinaloa to Puebla and Veracruz. Central America, West Indies, and South America.

Shrub or small tree; spines 2.5 to 5 cm. long, compressed, brown or gray; leaflets numerous, linear, about 2 mm. long; flowers yellow, the heads about 8 mm. in diameter; fruit 10 to 12 cm. long, somewhat compressed, dark brown, tardily if at all deliscent.

3. *Acacia standleyi* Safford, Journ. Washington Acad. Sci. 4: 367. 1914.

Known only from the type locality, Acaponeta, Tepic.

Shrub; spines 2.5 to 3.5 cm. long, castaneous or grayish, slightly compressed; leaflets about 3 mm. long; flowers yellow, the very dense spikes 2 cm. long.

4. *Acacia gladiata* Safford, Journ. Washington Acad. Sci. 5: 359. f. 2. 1915.

Sinaloa and Tepic; type from Rosario, Sinaloa.

Spines 3.5 to 5 cm. long, almost flat, brown or gray; leaflets 3 to 4 mm. long.

Probably only a form of *A. standleyi*.

5. *Acacia sphaerocephala* Schlecht. & Cham. Linnaea 5: 594. 1830.

Acacia veracruzensis Schenck, Repert. Sp. Nov. Fedde 12: 362. 1913.

Acacia dolichocephala Safford, Journ. Washington Acad. Sci. 5: 355. 1915.

Tamaulipas, San Luis Potosí, Veracruz, and Yucatán.

Shrub or small tree, sometimes 6 meters high; spines mostly 4 to 11 cm. long, terete or nearly so, whitish, pale brown, or yellowish; leaflets oblong-linear, 5 to 8 mm. long; flowers yellow; fruit about 5 cm. long, red or reddish brown, with a very long sharp beak. "Cornezuelo" (Tamaulipas); "zubin," "zubinché" (Yucatán, Maya).

The seeds are imbedded in abundant pulp. In this, as in the following species (nos. 6 to 10), the bull-horn acacias, the large spines are usually inhabited by ferocious ants, which enter the spines by a puncture near the apex. These ants subsist upon nectar of the large pale glands which are borne as appendages upon the tips of the leaflets.

6. *Acacia cornigera* (L.) Willd. Sp. Pl. 4: 1080. 1806.

Mimosa cornigera L. Sp. Pl. 520. 1753.

Acacia spadicigera Schlecht. & Cham. Linnaea 5: 595. 1830.

Acacia hernandezii Safford, Journ. Washington Acad. Sci. 4: 358. 1914.

Acacia furcella Safford, Journ. Washington Acad. Sci. 4: 359. 1914.

San Luis Potosí and Veracruz to Chiapas, and probably elsewhere; described from a cultivated plant of Mexican origin. Central America.

Shrub or small tree; spines 2.5 to 10 cm. long, terete or slightly compressed, varying in color from brownish yellow to almost black, often recurved or twisted; leaflets about 8 mm. long, glabrous, the nectar glands 1 to 2 mm. long; flowers yellow, the very dense thick spikes 2.5 to 4 cm. long; fruit 2.5 to 6 cm. long, red or brown at maturity. "Espino blanco" (Chiapas); "zubin," "zubinché" (Yucatán, Maya, *Seler*); "cornezuelo" (Tabasco, *Roviroso*, Nicaragua); "cuernos del toro" (Oaxaca); "árbol del cuerno" (Veracruz); "cuernitos" (Veracruz, Oaxaca); "huitzmamaxalli" of Hernández; "iscanal blanco" (El

Salvador). The name "tépame" is reported from Jalisco and Guerrero, but may refer to some other species.

The young shoots are said to be cooked and eaten, and the leaves to be used for the bites of insects, etc.

7. *Acacia hindsii*¹ Benth. Lond. Journ. Bot. 1: 504. 1842.

Acacia sinaloensis Safford, Journ. Washington Acad. Sci. 4: 365. 1914.

Acacia tepicana Safford, Journ. Washington Acad. Sci. 4: 366. 1914.

Sinaloa to Chiapas; type from Manzanillo, Colima.

Shrub or small tree; spines mostly 3 to 5 cm. long, brown, gray, or black, usually much compressed and often 2 cm. wide at base; leaflets 3 to 8 mm. long; flowers yellow, the spikes slender, 3 to 5 cm. long; fruit usually 4 to 6 cm. long, brown or blackish, beaked, more or less compressed. "Guisache corteño," "cornezuelo" (Michoacán, Guerrero); "carretadera" (Sinaloa).

The spines vary greatly in form and color in this and related species, so that it is doubtful whether they afford characters of any value for the separation of species. The bark is employed in Sinaloa as a remedy for scorpion stings.

8. *Acacia globulifera* Safford, Journ. Washington Acad. Sci. 4: 360. 1914.

Type from Tsilam, Yucatán.

Spines 3 to 4 cm. long, terete or slightly compressed, pale; leaflets 3 to 4 mm. long; flowers yellow, in small heads.

A. chiapensis Safford² is probably the same species, but since it was described from fruiting specimens and *A. globulifera* from specimens with flowers, it is impossible to be certain. *A. chiapensis* was based on specimens collected near San Fernandino, Chiapas. It is a shrub or small tree, 3 to 5 meters high.

9. *Acacia nelsonii* Safford, Journ. Washington Acad. Sci. 4: 363. 1914.

Vicinity of the type locality, Acapulco, Guerrero.

Spines 2.5 to 3.5 cm. long, grayish or brownish, polished; leaflets about 1 cm. long.

10. *Acacia collinsii* Safford, Science n. ser. 31: 677. 1910.

Acacia yucatanensis Schenck. Repert. Sp. Nov. Fedde 12: 361. 1913.

Chiapas and Yucatán; type collected between Chicoasen and San Fernandino, Chiapas.

Shrub, 3 to 4.5 meters high; spines 3 to 5 cm. long, brown or brownish, polished; leaflets about 1 cm. long; spikes very thick and dense, the flowers yellow; fruit short, slightly or not at all compressed.

11. *Acacia reniformis* Benth. in Hook. Icon. Pl. 12: 59. pl. 1165. 1875.

Known only from the type locality, banks of the Río Moctezuma, near Las Apuntas.

Glabrous shrub; pinnae 1 or 2 pairs, the leaflets one pair, orbicular-reniform, 2.5 to 3.5 cm. wide, coriaceous; stipules large, persistent; spikes 2.5 to 3.5 cm. long, lax.

¹Richard Brinsley Hinds was an officer of H. M. S. *Sulphur*, a British ship which was engaged from 1836 to 1842 in surveying the western coast of America, the field of operations extending from Peru to Alaska. The botanical collections were obtained by Hinds, Dr. Sinclair, an officer of the ship, and George Barclay, a gardener from Kew. Plants were collected in Mexico about San Blas and Tepic, and at Cape San Lucas and Magdalena Bay, Baja California. They were reported upon by Hinds, the new species being described by Bentham.

²Journ. Washington Acad. Sci. 5: 356. 1915.

12. *Acacia sororia* Standl. Contr. U. S. Nat. Herb. 20: 186. 1919.

Querétaro; type from Higuerillas.

Leaflets one pair, oval or orbicular, 1 to 2.5 cm. long, coriaceous, puberulent; fruit strongly compressed, bivalvate, 1.5 to 2.5 cm. wide, puberulent.

13. *Acacia konzattii* Standl. Contr. U. S. Nat. Herb. 20: 186. 1919.

Known only from the type locality, Estación Almaloyas, Oaxaca, altitude 800 meters.

Pinnæ one pair, the leaflets 2 pairs, 1.5 to 2.5 cm. long; spikes long and slender.

14. *Acacia pringlei* Rose, Contr. U. S. Nat. Herb. 3: 316. 1895.

Oaxaca and Guerrero; type from Tomellín Canyon, Oaxaca.

Tree, 6 to 9 meters high; leaflets 1.5 to 5 cm. long, bright green, glabrate; spikes sometimes 12 cm. long; fruit about 15 cm. long, glabrous.

15. *Acacia californica* T. S. Brandeg. Proc. Calif. Acad. II. 3: 221. 1892.

Southern Baja California; type from La Palma.

Tree, 5 to 8 meters high, with very short stout spines; pinnæ one pair, the leaflets 2 pairs, oval or rounded, 1 to 3 cm. long, thick; flowers cream-colored, the spikes 5 to 10 cm. long. "Guamuchillo."

16. *Acacia unijuga* Rose, Contr. U. S. Nat. Herb. 8: 32. f. 8. 1903.

Known only from the type locality, Las Palmas, San Luis Potosí.

Large tree, armed with very short spines; leaflets 2 to 3 cm. long; spikes very slender and interrupted; fruit flat, 1.7 to 2.5 cm. wide, puberulent.

17. *Acacia willardiana* Rose, Contr. U. S. Nat. Herb. 1: 88. 1890.

Prosopis heterophylla Benth. Lond. Journ. Bot. 5: 82. 1846. Not *Acacia heterophylla* Willd. 1805.

Sonora (type locality) and Baja California.

Slender unarmed tree, 3 to 5 meters high, the bark exfoliating in thin yellowish papery sheets; leaflets pale green, 2 to 6 mm. long, soon deciduous from the persistent petiole; flowers pale yellow, the spikes 3 to 6 cm. long; fruit flat, 0.8 to 1.5 cm. wide, glabrous. "Palo liso," "palo blanco" (Sonora).

18. *Acacia amentacea* DC. Prodr. 2: 455. 1825.

Acacia rigidula Benth. Lond. Journ. Bot. 1: 504. 1842.

Nuevo León, Tamaulipas, and San Luis Potosí. Southwestern Texas.

Shrub or small tree, 3 to 4.5 meters high; spines straight, sometimes 5 cm. long; pinnæ 1 pair, the leaflets few, oblong, about 1 cm. long, lustrous; spikes short, the flowers yellow, sweet-scented; fruit 3 to 4 mm. wide, compressed, brown, puberulent. "Gavia" (Tamaulipas); "chaparro prieto" (Nuevo León, Tamaulipas).

19. *Acacia bilimekii* Macbride, Contr. Gray. Herb. n. ser. 59: 6. 1919.

Acacia sericocarpa Rose, Contr. U. S. Nat. Herb. 8: 300. 1905. Not *A. sericocarpa* Fitzg. 1904.

Acacia ambigua Rose, Contr. U. S. Nat. Herb. 8: 31. f. 7. 1903. Not *A. ambigua* Hoffmg. 1826.

Morelos and Puebla; type from Matamoros, Puebla.

Low shrub, densely pubescent; spines 1 to 2 cm. long, whitish; leaflets oblong, about 1 cm. long; fruit 5 mm. wide.

20. *Acacia sonorensis* Rose, Contr. U. S. Nat. Herb. 8: 31. 1903.

Known only from the type locality, Guaymas, Sonora.

Shrub; pinnæ one pair, the leaflets 2 or 3 pairs, oblong, 6 to 12 mm. long.

21. *Acacia greggii* A. Gray, Pl. Wright. 1: 65. 1852.

Chihuahua and Coahuila; type from valley west of Patos. Western Texas to southern Arizona.

Shrub or tree, sometimes 9 meters high, with a trunk 30 cm. in diameter; pinnae 1 to 3 pairs; flowers yellowish, fragrant, the spikes 3 to 5 cm. long; fruit flat, 8 to 12 cm. long; wood hard, strong, durable, reddish brown, its specific gravity about 0.85. "Uña de gato" (Chihuahua, New Mexico, Texas, Arizona); "gatuño" (Chihuahua).

A gum similar to gum arabic, which exudes from the trunk, is used locally. The seeds were used for food by some of the Indians of Arizona and Mexico.

22. *Acacia wrightii* Benth.; A. Gray, Pl. Wright. 1: 64. 1852.

Tamaulipas to Sonora and Baja California. Western Texas (type locality) to southern California.

Shrub or tree, sometimes 9 meters high, with a trunk 30 cm. in diameter, the bark thin, broken into grayish brown scales; pinnae 2 or 3 pairs, the leaflets oblong or obovate; flowers light yellow, the spikes 3 to 5 cm. long; fruit flat, 8 to 11 cm. long, thin; wood hard, close-grained, light brown, its specific gravity about 0.94. "Uña de gato" (Nuevo León); "uña de gato negra" (Tamaulipas).

The wood is of little use except for fuel.

23. *Acacia iguana* Micheli. Mém. Soc. Phys. Hist. Nat. Genève 34: 281. pl. 25. 1903.

Michoacán and Guerrero; type from La Puerta.

Tree, 12 to 15 meters high, armed with short, recurved spines; leaflets oblong, 8 to 15 mm. long; flowers yellowish white, the spikes short or elongate. "Rabo de iguana."

24. *Acacia macilenta* Rose, Contr. U. S. Nat. Herb. 8: 31. 1903.

Type from Colima; a fruiting specimen from Jalisco also may belong here.

Tree, 6 meters high, the trunk 7.5 to 12.5 cm. in diameter; pinnae 25 pairs or fewer, the leaflets numerous, linear, 4 mm. long; flowers sweet-scented, the spikes 10 to 12 cm. long; fruit flat, about 11 cm. long and 2 cm. wide, very thin.

25. *Acacia millefolia* S. Wats, Proc. Amer. Acad. 21: 427. 1886.

Chihuahua to Sinaloa; type from Hacienda San José, southwestern Chihuahua. Southern Arizona.

Shrub, 3 meters high, with very short spines; leaflets numerous, linear, 3 to 7 mm. long; fruit 10 to 15 cm. long.

26. *Acacia rotundata* Benth. Trans. Linn. Soc. Bot. 30: 521. 1875.

Type from somewhere in Mexico; species not seen by the writer.

Pinnae 1 to 3 pairs; leaflets few, oblong-linear; spikes lax, about 2.5 cm. long.

27. *Acacia gaumeri* Blake, Proc. Biol. Soc. Washington 34: 44. 1921.

Known only from Yucatán, the type locality.

Tree, 8 meters high; pinnae 4 pairs; leaflets 9 to 16 pairs, oblong, appressed-pubescent beneath; spikes paniculate, 1 to 1.5 cm. long; ovary pilose.

28. *Acacia dolichostachya* Blake, Proc. Biol. Soc. Washington 34: 43. 1921.

Type from Yucatán.

Stems unarmed, glabrous; pinnae 5 pairs; leaflets 24 to 29 pairs, linear-oblong, about 3.5 mm. long; spikes 3 to 3.5 cm. long; ovary glabrous.

29. *Acacia compacta* Rose, Contr. U. S. Nat. Herb. 8: 31. 1903.

Known only from the type locality, Tomellín Canyon. Oaxaca.

Shrub, 2 to 3 meters high; pinnae 2 to 5 pairs; flowers yellow, the spikes dense, 2.5 to 3 cm. long; fruit flat, 10 cm. long, 1.5 cm. wide.

30. *Acacia mammifera* Schlecht. Linnaea 12: 563. 1838.

Known only from the type locality. Barranca de Acholoya.

Glabrate unarmed shrub; pinnae 2 to 4 pairs, the leaflets narrowly elliptic, puberulent; spikes 2.5 to 5 cm. long; fruit flat, 7.5 to 15 cm. long, 8 mm. wide.

31. *Acacia coulteri* Benth.; A. Gray, Pl. Wright. 1: 66. 1852.

Sonora to Tamaulipas and Hidalgo; type from Zimapán, Hidalgo.

Slender shrub or tree, 3 to 10 meters high, unarmed or nearly so, the trunk sometimes 60 cm. in diameter; leaflets 4 to 6 mm. long; flowers whitish, in long slender spikes; fruit about 15 cm. long and 2 cm. wide, flat. "Tepeguaje" (Durango); "palo de arco," "huajillo" (Tamaulipas).

Wood very hard; used for tool handles, general construction, and fuel.

32. *Acacia acatlensis* Benth. Lond. Journ. Bot. 1: 513. 1842.

Acacia sericea Mart. & Gal. Bull. Acad. Brux. 10²: 309. 1843.

Acacia pueblensis T. S. Brandeg. Univ. Calif. Publ. Bot. 4: 85. 1910.

Jalisco to Oaxaca, Veracruz, and Yucatán; type from Acatlán.

Tree, 3 to 8 meters high, armed with short stout spines, or sometimes unarmed; leaflets oblong-linear, 2 to 5 mm. long; flowers white, in long spikes. "Guayolote" (Michoacán).

33. *Acacia glandulifera* S. Wats. Proc. Amer. Acad. 25: 147. 1890.

Coahuila; type from Carneros Pass.

Shrub, about 60 cm. high; spines stout, about 1 cm. long; leaflets few, 2 to 3 mm. long; flower heads 5 to 7 mm. in diameter; fruit 6 to 8 cm. long, about 7 mm. wide, very rough.

34. *Acacia biaciculata* S. Wats. Proc. Amer. Acad. 21: 452. 1886.

Chihuahua; type from sandy plains near the city of Chihuahua.

Shrub, the prostrate branches a meter long or shorter; spines very slender, 1 to 1.5 cm. long; leaflets few, 3 to 4 mm. long; flowers orange, in small long-pedunculate heads; fruit 3 to 4 cm. long, 4 mm. wide, compressed, falcate, pubescent.

35. *Acacia constricta* Benth.; A. Gray, Pl. Wright. 1: 66. 1852.

Sonora to Tamaulipas, Puebla, and Zacatecas, on dry plains and hillsides, often forming extensive thickets. Western Texas (type locality) to southern Arizona.

Shrub, 1 to 6 meters high, with reddish brown branches; spines 1 to 2.5 cm. long; leaflets mostly 2 to 3 mm. long; flowers yellow, sweet-scented; fruit 6 to 12 cm. long, 3 to 4 mm. wide, constricted between the seeds. "Huisache" (Zacatecas, Coahuila, etc.); "gigantillo," "vara prieta," "chaparro prieto" (Durango, *Patoni*); "largoncillo" (Chihuahua).

36. *Acacia vernicosa* Standl. Contr. U. S. Nat. Herb. 20: 187. 1919.

Sonora and Chihuahua to Zacatecas and Querétaro; type from Santa Rosalia, Chihuahua. Western Texas to southern Arizona.

Shrub, 1 to 2 meters high, similar to the preceding species.

37. *Acacia farnesiana* (L.) Willd. Sp. Pl. 4: 1083. 1806.

Mimosa farnesiana L. Sp. Pl. 521. 1753.

Vachellia farnesiana Wight & Arn. Prodr. Fl. Ind. Orient. 272. 1834.

Nearly throughout Mexico. Widely distributed in tropical and subtropical regions of both hemispheres; probably adventive in the Old World; type from Santo Domingo.

Shrub or tree, 1 to 9 meters high, the short trunk sometimes 45 cm. in diameter, the branches spreading or drooping; bark thin, peeling off in long, reddish brown scales; spines 1 to 2.5 cm. long; leaflets 2 to 6 mm. long; flowers bright yellow, very sweet-scented; fruit dark brown or purplish; wood hard, close-grained, brownish red to yellow, its specific gravity about 0.83. "Binorama" or "vinorama" (Sonora, Baja California, Sinaloa); "huisache" or "huizache"

(Nuevo León, Tamaulipas, Jalisco, Querétaro, Durango, Coahuila, Texas, etc.; from the Nahuatl *huitz-axin*); "guisache yondiroy" (Michoacán, Guerrero); "quisache" (Chiapas); "huisache de la semilla," "huixachin," "uisatsin" (Morelos, Oaxaca, *Seler*); "xkantiriz" (Yucatán, Maya); "matitas" (*Ramírez*); "fiñisachi" (Guanajuato, *Dugès*); "bihi" (Oaxaca, Zapotec, *Reko*); "espino" (Oaxaca); "aroma" or "aromo" (Yucatán, Nicaragua, Costa Rica, Porto Rico, Colombia, Peru, Philippines, etc.); "zubin," "zubin-ché" (Yucatán, Maya, *Seler*); "gabia" or "gavia" (Durango, *Patoni*); "subin" (Honduras *Pittier*); "aroma amarilla" (Cuba); "espino blanco" (Guatemala, El Salvador); "cachito de aroma" (Nicaragua); "cuji" (Venezuela); "cuji cimarrón," "pelá," "ña de cabra" (Colombia); "espinillo" (Argentina, Uruguay). Known in the southern United States as "opoponax."

In many parts of Mexico the plant is found chiefly about dwellings and seems to be naturalized, but in other regions it appears to be native. The wood is used for many purposes. The bark and fruit contain tannin and are used for tanning and dyeing, and the fruit is often used for making ink. The viscous juice of the pods is employed in some places for mending broken china. The gum which exudes from the trunk is employed locally in making mucilage; it is very similar to gum arabic. The leaves are of value as forage for stock, especially in winter. In southern Europe the plant is cultivated extensively for the flowers (known in commerce as cassie flowers), from which perfume is manufactured. As much as 100,000 pounds of them are harvested annually about Grasse, France. In tropical America the flowers are often laid among linen to impart their perfume to it. An ointment made from the flowers is used in Mexico as a remedy for headache, and their infusion for dyspepsia. The green fruit is very astringent, and a decoction is employed for dysentery, inflammation of the skin and mucous membrane, etc. *Seler* reports even that in San Luis Potosí a decoction of the roots is employed as a supposed remedy for tuberculosis. The pulverized dried leaves are sometimes applied as a dressing to wounds.

This is probably the plant reported from Baja California by *Clavigero* as "huisache." The pods, he states, were used there for making ink. Cattle, he says, are fond of the tender branches, but these impart a bad flavor to their flesh.

38. *Acacia tortuosa* (L.) Willd. Sp. Pl. 4: 1083. 1806.

Mimosa tortuosa L. Syst. Nat. ed. 10. 1312. 1759.

Prosopis microphylla H. B. K. Nov. Gen. & Sp. 6: 308. 1823.

Acacia subtortuosa Shafer in Britton, N. Amer. Trees 524. f. 485. 1908.

Durango to Tamaulipas, Hidalgo, and Colima. Western Texas; West Indies.

Shrub or tree, 1 to 6 meters high, the trunk sometimes 15 cm. in diameter; bark deeply fissured, blackish brown; spines 1 to 2 cm. long, whitish; pinnae 3 or 4 pairs, the leaflets 2 to 4 mm. long; flowers yellow, sweet-scented, the heads about 1 cm. in diameter; fruit reddish brown. "Huisache" (Durango, Aguascalientes); "huisache chino" (Jalisco).

39. *Acacia pennatula* (Schlecht. & Cham.) Benth. Lond. Journ. Bot. 1: 390. 1842.

Inga pennatula Schlecht. & Cham. Linnaea 5: 593. 1830.

Sonora to Tamaulipas and Chiapas; type from Hacienda de la Laguna, Veracruz. Guatemala and Nicaragua.

Shrub or tree, 3 to 6 meters high, copiously pubescent; spines short and stout; pinnae very numerous, the leaflets crowded, 1 to 2 mm. long; flowers yellow or orange, very fragrant, in rather large heads; fruit 7 to 13 cm. long, compressed, dark brown, with very thick hard valves. "Tepame" (Jalisco);

"quisache tepano" (Michoacán, Guerrero); "algarroba" or "algarrobo" (Sonora, Oaxaca); "espino" (Sinaloa).

The bark is sometimes employed as a remedy for indigestion, and the wood for making charcoal.

40. *Acacia crassifolia* A. Gray, Mem. Amer. Acad. 5: 317. 1854.

Coahuila and San Luis Potosí; type from La Peña, Coahuila.

Branches reddish brown, glaucous when young, armed with few very small spines; leaflets rounded or subreniform, 2 to 5 cm. wide, glabrous, very thick, with prominent venation; heads racemose; fruit thick, about 7 cm. long and 2 cm. wide, slightly curved, glaucous.

41. *Acacia rosei* Standl. Contr. U. S. Nat. Herb. 20: 187. 1919.

Sinaloa; type locality, Mazatlán.

Pinnæ 2 pairs, the leaflets oval, 2 to 4.5 cm. long, thin, glabrate; flowers white; fruit flat, very thin, about 1 cm. wide. "Day."

42. *Acacia crinita* T. S. Brandeg. Zoe 5: 198. 1905.

Sonora and Sinaloa; type from Culiacán.

Low shrub, the stems covered with stiff yellowish hairs 5 mm. long; leaflets oval, 1.2 to 2 cm. long, glabrous, pale beneath; flowers white.

43. *Acacia anisophylla* S. Wats. Proc. Amer. Acad. 21: 452. 1886.

Known only from the type locality, mountain canyons near Jimulco, Coahuila.

Small tree, sparsely armed with short straight spines; pinnæ 1 to 3 pairs, the leaflets 4 to 7 pairs, oblong, 6 to 14 mm. long; fruit compressed but very thick, 10 to 12 cm. long, somewhat glaucous.

44. *Acacia polypodioides* Standl. Contr. U. S. Nat. Herb. 20: 184. 1919.

Oaxaca and Chiapas; type from Chiapa, Chiapas. Nicaragua.

Unarmed shrub, copiously pilose; leaflets numerous, 3 to 5 mm. long; flowers white; fruit flat, thin, 8 to 11 mm. wide, pubescent.

45. *Acacia leucothrix* Standl. Contr. U. S. Nat. Herb. 20: 185. 1919.

Tamaulipas and San Luis Potosí; type from San Dieguito, San Luis Potosí.

Shrub, copiously hirsute; leaflets few, about 3 mm. long; flowers white, the heads axillary, slender-pedunculate; fruit flat, thin, about 4.5 cm. long and 7 mm. wide, brown, glabrate.

46. *Acacia villosa* (Swartz) Willd. Sp. Pl. 4: 1067. 1806.

Mimosa villosa Swartz, Fl. Ind. Occ. 2: 982. 1800.

Acacia hirsuta Schlecht. Linnaea 12: 572. 1838.

? *Acacia stipellata* Schlecht. Linnaea 12: 574. 1838.

Coahuila and Nuevo León to Oaxaca and Chiapas. West Indies and Central America; southern United States; type from Jamaica.

Erect unarmed shrub, pubescent or glabrate; leaflets linear, 3 to 5 mm. long; flowers white; fruit flat, thin.

47. *Acacia filicioides* (Cav.) Trel. Rep. Ark. Geol. Surv. 1888⁴: 178. 1891.

Mimosa filicioides Cav. Icon. Pl. 1: 55. pl. 78. 1791.

Acacia filicina Willd. Sp. Pl. 4: 1072. 1806.

Acacia carbonaria Schlecht. Linnaea 12: 571. 1838.

Gerrero to Veracruz; type from somewhere in Mexico.

Shrub, more or less hirsute throughout; leaflets oblong-linear, 3 to 5 mm. long; flowers white; fruit flat, thin, about 5 cm. long and 1 cm. wide.

It is possible that the name *filicioides* really applies to the plant here listed as *A. villosa*, but Cavanilles's plate seems to agree better with the present plant.

48. *Acacia elegans* Schlecht. Linnaea 12: 569. 1838.

Tepec to Guerrero and Morelos; type from Regla, Hidalgo.

Shrub or small tree, 2.5 to 5 meters high, unarmed; leaflets linear, 3 to 5 mm. long; flowers white; fruit thin, flat, straight, about 1 cm. wide.

49. *Acacia cuspidata* Schlecht. Linnaea 12: 573. 1838.

Chihuahua to Zacatecas and Puebla; type collected near Mexico City. Texas to Arizona.

Low shrub, unarmed; leaflets oblong, 2 to 4 mm. long; flowers white; fruit thin, flat, about 6 mm. wide, brown.

It is not certain that the name *cuspidata* really belongs to the plant to which it is applied here.

50. *Acacia angustissima* (Mill.) Kuntze, Rev. Gen. Pl. 3²: 47. 1898.

Mimosa angustissima Mill. Gard. Dict. ed. 8. *Acacia* no. 19. 1768.

Acacia glabrata Schlecht. Linnaea 12: 569. 1839.

Acacia elegans Mart. & Gal. Bull. Acad. Brux. 10²: 312. 1843.

Acacia insignis Mart. & Gal. Bull. Acad. Brux. 10²: 315. 1843.

Distributed almost throughout Mexico; type from Campeche. Central America; southern United States.

Shrub or small tree, 2 to 4 meters high, unarmed, pubescent or glabrate; leaflets mostly 3 to 5 mm. long; flowers white, the heads axillary or racemose; fruit thin, flat, brown. The following names are reported for this and the closely related species (nos. 42-48): "Xaax" (Yucatán, Maya); "timbe" (Baja California, Oaxaca, San Luis Potosí); "cantemó" (Tabasco); "guajillo" (Sinaloa); "palo de pulque" (Oaxaca).

In Oaxaca the bark is used for tanning skins and for inducing fermentation in *tepache*.

51. *Acacia laevis* Standl. Contr. U. S. Nat. Herb. 20: 185. 1919.

Known only from the type locality, near Guadalajara, Jalisco.

Plants glabrous, unarmed; leaflets numerous, 4 to 5 mm. long, pale beneath; flower heads in long racemes.

52. *Acacia penicillata* Standl. Contr. U. S. Nat. Herb. 20: 185. 1919.

Jalisco and Oaxaca; type from Cerro de San Felipe, Oaxaca.

Pinnæ 3 to 5 pairs, the leaflets 8 to 13 mm. long; flower heads racemose, about 2 cm. in diameter; fruit flat, about 8 cm. long and 1.2 cm. wide, glabrous, glaucescent.

53. *Acacia tequilana* S. Wats. Proc. Amer. Acad. 22: 409. 1887.

Durango, Jalisco, and San Luis Potosí; type from Tequila, Jalisco.

Glabrous shrub, 1.5 to 3 meters high, unarmed; leaflets 0.8 to 2.5 cm. long; flowers white, the heads in long naked racemes; fruit 4.5 cm. long and nearly 1 cm. wide, flat, thin, glaucescent.

54. *Acacia paniculata* Willd. Sp. Pl. 4: 1074. 1806.

Acacia picachensis T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 179. 1915.

Michoacán to Oaxaca. West Indies and South America; type from Brazil.

Shrub or small tree, sometimes scandent, armed with short recurved spines; leaflets very numerous, 3 to 5 mm. long, glabrous; flowers white; fruit flat, 8 to 15 cm. long, 2 to 2.5 cm. wide, brown, glabrous. "Rabo de iguana" (Michoacán, Guerrero); "rabo de lagarto," "espino" (Oaxaca); "tocino" (Cuba).

55. *Acacia berlandieri* Benth. Lond. Journ. Bot. 1: 522. 1842.

Acacia tephroloba A. Gray, Pl. Wright. 1: 65. 1852.

Coahuila to Veracruz and Querétaro; type from Nuevo León. Western Texas.

Shrub, 1 to 4.5 meters high, pubescent, armed with short spines; leaflets numerous, 3 to 6 mm. long; flowers white, sweet-scented; fruit flat, 9 to 16 cm. long, 2 to 3 cm. wide, straight or curved, very densely velvety-puberulent.

"Huajillo" (Coahuila, Tamaulipas, Nuevo León, Texas; sometimes written "huajilla" or "guajilla"); "mimbre," "matorral" (Tamaulipas).

Wood sometimes used for tool handles and other small objects, also for fuel.

56. *Acacia glomerosa* Benth. Lond. Journ. Bot. 1: 521. 1842.

Veracruz. Central America and South America.

Shrub or small tree, often scandent, armed with numerous very short spines; leaflets numerous, about 1 cm. long; flower heads small, numerous, racemose-paniculate.

Acacia laccifera Villada (Naturaleza II. 2: 487. pl. 30. 1896) is probably a synonym of this species.

57. *Acacia subangulata* Rose, Contr. U. S. Nat. Herb. 5: 194. 1899.

Puebla and Oaxaca; type from limestone hills near Tehuacán, Puebla.

Tree, 4.5 to 6 meters high, armed with short stout straight spines; leaflets numerous, 7 to 13 mm. long; flower heads mostly racemose-paniculate; fruit about 10 cm. long and 2.5 cm. wide.

58. *Acacia riparia* H. B. K. Nov. Gen. & Sp. 6: 276. 1823.

Sinaloa to Guerrero, San Luis Potosí, and Yucatán. West Indies, Central America, and South America; type from Brazil.

Scandent shrub, armed with short recurved spines; leaflets 5 to 7 mm. long; flowers yellowish white; fruit about 9 cm. long and 2 cm. wide, flat, often glaucescent. "Tlahuitol" (San Luis Potosí, *Urbina*); "zarza" (Porto Rico); "rasga-rasga," "panelo," "toldillo" (Colombia); "yax-catzim" (Yucatán, Maya); "gatufño blanco" (Sinaloa).

59. *Acacia palmeri* S. Wats. Proc. Amer. Acad. 17: 350. 1882.

Known only from the type locality, in the Sierra Madre south of Saltillo, Coahuila.

Shrub, nearly glabrous, armed with short spines; pinnae 1 or 2 pairs, the leaflets 6 to 8 mm. long; flower heads axillary.

60. *Acacia malacophylla* Benth.; A. Gray, Pl. Wright. 1: 64. 1852.

Coahuila and Nuevo León. Western Texas (type locality).

Shrub, armed with short spines; leaflets about 7 mm. long; fruit flat, about 8 cm. long and nearly 2 cm. wide, glabrous.

61. *Acacia purpusii* T. S. Brandeg. Univ. Calif. Publ. Bot. 3: 380. 1909.

Known only from the type locality, San Luis Tultitlanapa, Puebla.

Shrub, armed with short stout recurved spines; leaflets about 8 mm. long, glabrate, with prominent venation; fruit about 8 cm. long and 2 cm. wide, falcate, stipitate, glabrate.

62. *Acacia occidentalis* Rose, Contr. U. S. Nat. Herb. 8: 32. 1903.

Sonora (type locality) and Sinaloa; perhaps also in Chihuahua.

Shrub or tree, 2 to 12 meters high, armed with short stout dark spines; leaflets 2 to 3 mm. long; flowers white or nearly so; fruit thin, flat, about 7 cm. long and 2 cm. wide. "Désota" (tésota ?) (Sonora).

63. *Acacia micrantha* Benth. Trans. Linn. Soc. Bot. 30: 526. 1875.

Tamaulipas and San Luis Potosí.

Shrub, armed with short spines; leaflets 7 to 11 mm. long; flower heads slender-pedunculate, axillary or racemose; fruit flat, thin, about 6 cm. long and 1.8 cm. wide, glabrous, rounded at apex.

64. *Acacia roemeriana* Schéele, Linnaea 21: 456. 1848.

Chihuahua and Coahuila; Baja California. Western Texas (type locality).

Shrub, 1 to 2 meters high, armed with short, mostly recurved spines; leaflets 7 to 15 mm. long; flower heads mostly axillary; fruit flat, thin, about 7 cm. long and 1.5 cm. wide, often falcate, glabrous.

This is considered a valuable honey plant in western Texas.

DOUBTFUL SPECIES.

ACACIA CYLINDRIFLORA Mart. & Gal. Bull. Acad. Brux. 10²: 313. 1843. Type from Oaxaca. Probably a *Mimosa*.

ACACIA FEROX Mart. & Gal. Bull. Acad. Brux. 10²: 314. 1843.

ACACIA LANATA Mart. & Gal. Bull. Acad. Brux. 10²: 315. 1843. Type from Mixteca Alta.

ACACIA MOLLICULA Mart. & Gal. Bull. Acad. Brux. 10²: 315. 1843. Type from Tehuacán, Puebla. Flowers said to be pink. Probably of some other genus.

10. CALLIANDRA Benth. in Hook. Journ. Bot. 2: 138. 1840.

Unarmed shrubs or small trees, or sometimes herbs; leaves bipinnate, the leaflets small or large; stipules usually persistent; flowers in dense heads, often rather large and showy, red or white, the stamens long-exserted; fruit flat, usually straight, the valves recurved after dehiscence.

The names "plumita" (Oaxaca) and "gavia" (Durango) are reported for undetermined species of the genus.

Leaflets 2 to 4 to each pinna, mostly 2 to 7 cm. long; pinnae usually 2 pairs.

Leaflets pinnately nerved, lanceolate or narrowly lanceolate.....1. *C. laevis*.

Leaflets palmately nerved, with 2 or more distinct nerves rising from the base.

Corolla pubescent.....2. *C. canescens*.

Corolla glabrous.....3. *C. emarginata*.

Leaflets 5 to many to each pinna, often very small; pinnae 1 to many pairs.

Heads of flowers in long terminal racemes; flowers pedicellate; filaments red or purple.

Leaflets not falcate, rounded or very obtuse at apex; pinnae usually 15 to 20 pairs.

Corolla appressed-pilose.....4. *C. anomala*.

Corolla glabrous.....5. *C. calothyrsus*.

Leaflets falcate, usually acute; pinnae usually 7 to 12 pairs.

Corolla about 16 mm. long, white outside with dense appressed hairs.

6. *C. palmeri*.

Corolla 5 to 11 mm. long, not white outside, the pubescence mostly of brownish hairs.....7. *C. houstoniana*.

Heads of flowers mostly axillary, never racemose; flowers sessile or nearly so.

Pinnae one pair, the leaflets large, 1 to 2.5 cm. wide.....9. *C. conzattii*.

Pinnae 2 or more pairs, or if a single pair the leaflets 5 mm. wide or narrower.

Leaflets variously pubescent beneath.

Leaflets large, most of them 0.8 to 2.5 cm. wide, membranaceous.

17. *C. penduliflora*.

Leaflets small, less than 5 mm. wide, often coriaceous.

Plants low, less than 20 cm., woody only at the base.

16. *C. humilis*.

Plants usually large, woody throughout.

Leaflets oval or obovate-oval.....18. *C. malacophylla*.

Leaflets oblong or narrowly oblong.

Pinnae usually 8 to 10 pairs; leaflets somewhat tomentose beneath with somewhat matted, curled hairs....8. *C. nitida*.

Pinnae 1 to 6 pairs; leaflets pilose beneath with mostly straight appressed hairs.

Corolla glabrous or nearly so, greenish.

Pinnae 1 or 2 pairs; leaflets 6 to 10 pairs...20. *C. angelica*.

Pinnae 4 to 6 pairs; leaflets 20 or more pairs...21. *C. laxa*.

Corolla copiously pubescent, usually purple.

Corolla 4 to 4.5 mm. long-----10. *C. eriophylla*.

Corolla 6 to 7 mm. long.

Leaflets usually 8 to 10 pairs, oblong--11. *C. californica*.

Leaflets usually 12 to 20 pairs, narrowly oblong.

Pods densely pubescent with spreading hairs; pinnae usually 3 or 4 pairs-----12. *C. cumingii*.

Pods sparsely pubescent with appressed hairs; pinnae 4 to 6 pairs-----13. *C. peninsularis*.

Leaflets glabrous beneath, but often ciliate.

Plants low, usually less than 20 cm. high, woody only at the base.

Pinnae 2 to 4 pairs; leaflets oval or broadly oblong, not conspicuously if at all ciliate-----15. *C. reticulata*.

Pinnae 5 to 9 pairs; leaflets oblong or narrowly oblong, often long-ciliate-----16. *C. humilis*.

Plants usually tall shrubs, often woody throughout.

Pinnae a single pair in all the leaves; leaflets very small, oval or obovate-oval-----19. *C. unijuga*.

Pinnae 2 or more pairs in all or most of the leaves (rarely a single pair, the leaflets then oblong).

Leaflets coriaceous; calyx shallowly dentate-----14. *C. bijuga*.

Leaflets membranaceous; calyx deeply lobate.

Branches quadrangular-----22. *C. tetragona*.

Branches terete.

Pinnae 2 pairs in most of the leaves.

Leaflets usually 10 to 13 pairs, oblong or narrowly oblong.

23. *C. oaxacana*.

Leaflets usually 5 to 7 pairs, oval to broadly oblong.

24. *C. formosa*.

Pinnae 3 or more pairs in most of the leaves.

Leaflets usually 8 to 15 pairs or more, 2 to 6 mm. wide.

25. *C. portoricensis*.

Leaflets 3 to 6 pairs, 10 to 20 mm. wide-----26. *C. capillata*.

1. *Calliandra laevis* Rose, Contr. U. S. Nat. Herb. 5: 194. 1899.

Sinaloa and Tepic; type from Colomas, Sinaloa.

Shrub; leaflets 4, lanceolate, 4.5 to 9 cm. long, bright green, glabrous.

2. *Calliandra canescens* (Schlecht. & Cham.) Benth. Lond. Journ. Bot. 3: 96. 1844.

Inga canescens Schlecht. & Cham. Linnaea 5: 592. 1830.

Calliandra purpusii T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 180. 1915.

Veracruz and Oaxaca; type collected near Puente del Rey. Guatemala.

Shrub, 1.5 to 2.5 meters high; leaflets 1 to 3.5 cm. long; flowers white.

3. *Calliandra emarginata* (Humb. & Bonpl.) Benth. Lond. Journ. Bot. 3: 95. 1844.

Inga emarginata Humb. & Bonpl.; Willd. Sp. Pl. 4: 1009. 1806.

Calliandra rupestris T. S. Brandeg. Zoe 5: 199. 1905.

- Tamaulipas and Sonora to Oaxaca and Veracruz; type from Acapulco, Guerrero.

Shrub; leaflets 2 to 8.5 cm. long, very variable in shape, acute to rounded at apex; flowers purplish red or greenish; fruit about 12 mm. wide.

The specimens seen exhibit a large amount of variation, and it may be that several species are represented. Without more ample material it seems unwise to make any segregates.

4. *Calliandra anomala* (Kunth) Macbride, Contr. Gray Herb, n. ser. 59: 4. 1919.

Inga anomala Kunth, Mimos. Pl. Légum. 70. pl. 22 1819-24.

Acacia callistemon Schlecht. Linnaea 12: 568. 1838.

Calliandra kunthii Benth. in Hook. Journ. Bot. 2: 139. 1840.

Chihuahua to Sinaloa, Mexico, and Chiapas. Guatemala.

Shrub, 1 to 4.5 meters high, with blackish bark; leaflets very numerous, linear-oblong, 2.5 to 5 mm. long; flowers purple, showy; fruit densely hirsute or hispid. "Cabeza de ángel" (Mexico); "cabellos de ángel" (Guanajuato, Costa Rica, Guatemala, Honduras); "pambetano" (Morelos, Valley of Mexico, Veracruz); "cabellitos de ángel" (Morelos); "cabellitos de una vara" (Morelos, Ramírez); "hierba del ángel," "lele" (various localities, Ramírez); "tepachera" "timbrillo" (Valley of Mexico, Ramírez); "tepexiloxochitl" or "tepejiloxochitl" (=mountain+corn silk+flower), "texoxochitl" "tlacoxiloxochitl" (=rod or bush+corn silk+flower), "tlamacazatzotl," "tzonxochitl," "xiloxochitl," "xiloxochicuahuitl" (the shrub) (Nahuatl); "canaleta," "hierba de canela" (Oaxaca, Reko); "coquito" Oaxaca, Selser; "carboncillo" (Costa Rica); "cabellito" (Sinaloa).

The plant is sometimes used for tanning. The root is used to retard fermentation in a drink, "tepaché," made from pulque and coarse sugar. The plant is said to contain a glucoside, calliandrine. In domestic medicine it is used for fevers, especially malaria, although experiments have indicated that its reputation for this purpose is not justified.

The plant is treated at length by Hernández¹ in a chapter entitled "De *Tlacoxiloxochitl* flore Barbato," which is accompanied by three good figures. His account is as follows: "*Tlacoxiloxochitl*, which some call *Tentzonxochitl* [=beard-flower], some *Tlamacazatacotl* [=priest-bush], and others *Tepexiloxochitl* or *Tlalxilochitl* [=dwarf hair-flower], is a shrub with leaves like mesquite. The flowers are like long red hair, and they come from round reddish berries. The root is fibrous, yellow outside, and red within when it is cut. The stalks are red and the pods yellow. It grows in level or mountainous places and sometimes along streams. The root bark is dry and astringent and somewhat glutinous; its nature is hot, in the third order, and its flavor sharp. The flowers, crushed, mixed with water, and used as drops, are a wonderful remedy for diseases of the eye, for they correct inflammation and remove morbid growths, and heal ulcers. If the decoction or infusion of the juice is drunk, it stops diarrhoea and dysentery, stimulates the appetite, and relieves indigestion. There be those who say also that it soothes the chest, relieves the belly, removes the bile by vomiting, and is also a remedy for coughs."

This species has usually been known as *Calliandra grandiflora* (L'Hér) Benth., but as pointed out recently by Macbride² that name can scarcely apply to the common Mexican species. Macbride states that "There is no reasonable doubt but that it is rather referable to *C. houstoni* (L'Hér.) Benth.," but the same objections that prevent its application to the common Mexican plant also prevent its reference to synonymy under the latter species.

5. *Calliandra calothyrsus* Meissn. Linnaea 21: 251. 1848.

Chiapas, Central America and northern South America; type from Surinam.

Erect shrub, nearly glabrous; leaflets very numerous, 3 to 7 mm. long, linear.

6. *Calliandra palmeri* S. Wats. Proc. Amer. Acad. 22: 410. 1887.

Known only from the type locality, Guadalajara, Jalisco.

¹ Thesaurus 104. 1651.

² Contr. Gray Herb. n. ser. 59: 5. 1919.

Shrub, 1 to 1.5 meters high, the stems densely white-pilose; leaflets 6 to 8 mm. long, coriaceous, lustrous on the upper surface, white-pilose beneath.

7. *Calliandra houstoniana* (Mill.) Standl.

Mimosa houstoniana Mill. Gard. Dict. ed. 8. *Mimosa* no. 16. 1768.

Mimosa houstoni L'Hér. Sert. Angl. 30. 1788.

Acacia houstoni Willd. Sp. Pl. 4: 1062. 1806.

Acacia metrosideriflora Schlecht. Linnaea 12: 567. 1838.

Calliandra houstoni Benth. in Hook. Journ. Bot. 2: 139. 1840.

Sonora to Tamaulipas and Chiapas; type from Veracruz. Guatemala and Honduras.

Shrub or small tree, 1 to 6 meters high, pubescent or glabrate; bark red-brown; leaflets 4 to 7 mm. long, the upper surface with a metallic luster; flowers purplish red, large and showy; fruit about 1.5 cm. wide, densely brown-hirsute. "Charamusco" (Tabasco); "hierba burro" (Chiapas); "pambotano" (southern Mexico); "day," "tabardillo" (Sinaloa). Probably the names reported for *C. anomala* apply also to this species.

The same properties are attributed to this as to *C. anomala*. The bark is chewed to harden the gums (in Sinaloa). According to the U. S. Dispensatory, the root bark, under the name of "pambotano bark" (sometimes written erroneously as "pandotano") has been highly recommended in Europe as an anti-periodic. It is said also to contain an alkaloid which produces death by systolic arrest of the heart.

8. *Calliandra nitida* S. Wats. Proc. Amer. Acad. 22: 410. 1887.

Zacatecas, Jalisco, and Tepic; type from Río Blanco, Jalisco.

Shrub, 1 meter high or less, copiously pubescent; leaflets 4 to 7 mm. long, with a metallic luster; flowers purplish red. "Potosina" (Jalisco).

9. *Calliandra konzattii* Standl. Contr. U. S. Nat. Herb. 20: 188. 1919.

Known only from the type locality, Río de Pilas, Oaxaca, altitude 300 meters.

Leaflets 5 to 7, obliquely ovate or elliptic, 2.5 to 6 cm. long, acute or obtuse, bright green, glabrate; flowers very small, greenish.

Perhaps not of this genus but rather a *Pithecollobium*.

10. *Calliandra eriophylla* Benth. Lond. Journ. Bot. 3: 105. 1844.

Calliandra chamaedrys Engelm.: A. Gray, Mem. Amer. Acad. II. 4: 39. 1849.

Calliandra conferta Benth.; A. Gray, Pl. Wright. 1: 63. 1852.

Sonora to Coahuila and Puebla; type from Chila, Puebla. Western Texas to southern Arizona.

Shrub, commonly about 30 cm. high, usually densely branched, the branches stiff, gray; leaflets few, 3 to 4 mm. long; heads few-flowered, the flowers purple; fruit 5 mm. wide, pubescent.

11. *Calliandra californica* Benth. Bot. Voy. Sulph. 14. pl. 11. 1844.

Baja California, on dry stony hillsides, often abundant; type from Magdalena Bay.

Stiff, densely branched shrub, 1 to 2 meters high; leaflets 4 to 13 mm. long, thick, pale; flowers purplish red; fruit about 7 mm. wide.

12. *Calliandra cumingii* Benth. in Hook. Journ. Bot. 2: 140. 1840.

Calliandra cumingii galeottii Benth. Lond. Journ. Bot. 3: 106. 1844.

Inga speciosa Mart. & Gal. Bull. Acad. Brux. 10²: 320. 1843.

Puebla and Oaxaca. Type from Colombia.

Shrub, 30 to 60 cm. high; leaflets 1 cm. long or shorter; flowers purplish red, the heads long-pedunculate.

The writer has seen no Colombian material, and it may be that the Mexican plant represents a different species. If so, the name published by Martens and Galeotti is available.

13. *Calliandra peninsularis* Rose, Contr. U. S. Nat. Herb. 5: 135. 1897.

Baja California; type from La Paz.

Densely branched shrub; leaflets 4 to 9 mm. long; flowers purple; fruit about 8 mm. wide. "Tabardillo," "zapotillo."

Roots used as a remedy for fevers.

14. *Calliandra bijuga* Rose, Contr. U. S. Nat. Herb. 5: 135. 1897.

Jalisco to Veracruz and Chiapas; type from Acapulco, Guerrero.

Shrub or tree, the trunk sometimes attaining a diameter of 20 cm.; pinnae 1 or 2 pairs, the leaflets numerous, 7 to 16 mm. long, bright green, lustrous; flowers purple; fruit about 1 cm. wide.

Closely related to *C. magdalenae* (Bert.) Benth., and doubtfully distinct.

15. *Calliandra reticulata* A. Gray, Pl. Wright. 2: 53. 1853.

Chihuahua to Jalisco and Puebla. Southern Arizona and New Mexico; type from Santa Rita, New Mexico.

Leaflets 4 to 10 mm. long, very thick, with prominent venation; flowers purple; fruit about 7 mm. wide, glabrous.

This and *C. humilis* are low plants, usually 10 to 20 cm. high, and scarcely deserve to be classed as shrubs, being herbaceous except at the base.

16. *Calliandra humilis* (Schlecht.) Benth. Lond. Journ. Bot. 5: 103. 1846.

Acacia humilis Schlecht. Linnaea 12: 567. 1838.

Calliandra herbacea Engelm.; A Gray, Mem. Amer. Acad. II. 4: 39. 1849.

Sonora to Zacatecas and Jalisco; type from Regla, Hidalgo. Southern Arizona and New Mexico.

Leaflets 6 mm. long or shorter; fruit about 6 mm. wide, pubescent or glabrate.

17. *Calliandra penduliflora* Rose, Contr. U. S. Nat. Herb. 5: 193. 1899.

Durango to Oaxaca and Veracruz; type from Bolaños, Jalisco.

Shrub, 1.5 to 4.5 meters high; leaflets mostly 1 to 3 cm. long, rounded at apex; flowers white, the heads slender-pedunculate, the stamens very long and slender; fruit 6 to 10 cm. long, about 7 mm. wide, glabrous.

18. *Calliandra malacophylla* Benth. Lond. Journ. Bot. 3: 100. 1844.

Calliandra unijuga pueblensis Macbride, Contr. Gray. Herb. n. ser. 59: 4. 1919.

Puebla and Oaxaca; type from Monte San Felipe.

Stiff, densely branched shrub with brownish bark; leaflets few, 5 to 7 mm. long, pubescent; flowers white.

19. *Calliandra unijuga* Rose, Contr. U. S. Nat. Herb. 50: 193. 1899.

Puebla and Oaxaca; type from Cuicatlán, Oaxaca.

Shrub, 1 to 2.5 meters high.

Very similar to the last species except in the lack of pubescence, and probably only a form of it. The two plants sometimes grow together, for on one sheet examined (*Rose* 9885, from Puebla) both are associated under the same number.

20. *Calliandra angelica* Benth. Lond. Journ. Bot. 3: 100. 1844.

Known only from the type locality, Regla, Hidalgo.

Not seen by the writer. Vernacular name given as "cabellito de ángel."

21. *Calliandra laxa* Benth. Trans. Linn. Soc. Bot. 30: 551. 1875.

Acacia laxa Willd. Sp. Pl. 4: 1069. 1806.

Acacia rubescens Mart. & Gal. Bull. Acad. Brux. 10²: 315. 1843.

Calliandra xalapensis Benth. Lond. Journ. Bot. 3: 106. 1844.

Veracruz to Guerrero and Oaxaca. Northern South America; type from Venezuela.

Erect shrub, pubescent or glabrate; leaflets 4 to 7 mm. long; flowers white.

22. *Calliandra tetragona* (Willd.) Benth. in Hook. Journ. Bot. 2: 139. 1840.
Acacia tetragona Willd. Sp. Pl. 4: 1069. 1806.
 Michoacán to Chiapas. Central America and northern South America; type from Caracas.
 Shrub or small tree, 1.5 to 4.5 meters high; leaflets numerous, 4 to 10 mm. long, bright green; flowers white; fruit about 1 cm. wide.
23. *Calliandra oaxacana* Rose, Contr. U. S. Nat. Herb. 5: 193. 1899.
 Zacatecas to Oaxaca; type from Tomellín Canyon, Oaxaca.
 Shrub 1 to 1.5 meters high; leaflets numerous, 4 to 11 mm. long; flowers white or pink.
24. *Calliandra formosa* (Kunth) Benth. Lond. Journ. Bot. 3: 98. 1844.
Acacia formosa Kunth, Mimos. Pl. Légum. 102. pl. 32. 1819-24.
Acacia gracilis Mart. & Gal. Bull. Acad. Brux. 10²: 311. 1843.
Calliandra coulteri S. Wats. Proc. Amer. Acad. 17: 352. 1882.
 Baja California to Chihuahua, Colima, and Yucatán.
 Shrub or small tree, nearly glabrous; leaflets 0.5 to 2.5 cm. long, bright green; flowers white. "Tepeguaje" (Guanajuato).
C. coulteri may be distinct, but probably is not. The name "ébanó" is reported as applied to this species, but the writer is doubtful whether the plant so referred to (said to be a large tree) is correctly identified.
25. *Calliandra portoricensis* (Jacq.) Benth. Lond. Journ. Bot. 3: 99. 1844.
Mimosa portoricensis Jacq. Icon. Pl. Rar. 3: 20. pl. 633. 1793.
 Sinaloa to San Luis Potosí, Yucatán, and Oaxaca. Widely distributed in tropical America; type from Porto Rico.
 Shrub or small tree, 1 to 4.5 meters high, nearly glabrous; leaflets 1.8 cm. long or shorter, thin, bright green; flowers pink or white; fruit about 8 mm. wide, glabrous. "Pich" (Yucatán, Maya); "moruro de costa," "soplillo" (Cuba); "cojibillo," "acacia," "zarza boba" (Porto Rico); "granolino" (Santo Domingo).
26. *Calliandra capillata* Benth. Lond. Journ. Bot. 3: 98. 1844.
 Guerrero and Puebla to Chiapas; type from Mount San Felipe, Oaxaca. Reported from Guatemala.
 Shrub, 1 to 2.5 meters high, glabrous; leaflets few, 1.2 to 4 cm. long, thin, bright green; flowers white or pink.

DOUBTFUL SPECIES.

- CALLIANDRA HIRSUTA* (Don) Benth. Trans. Linn. Soc. Bot. 30: 554. 1875.
Inga hirsuta Don, Hist. Dichl. Pl. 2: 395. 1832. Believed to have come from Mexico.
- CALLIANDRA LAMBERTIANA* (Don) Benth. Lond. Journ. Bot. 3: 100. 1844. *Acacia lambertiana* Don in Lindl. Bot. Reg. 9: pl. 721. 1823. Described from cultivated plants said to have come from Mexico. Perhaps the same as *C. laxa*.
- CALLIANDRA TETRAPHYLLA* (Don) Benth. Trans. Linn. Soc. Bot. 30: 544. 1875.
Inga tetraphylla Don, Hist. Dichl. Pl. 2: 392. 1832. Described from Mexico.
- CALLIANDRA FULGENS* Hook. f. in Curtis's Bot. Mag. 124: pl. 7626. 1898. Described from cultivated plants believed to have come from Mexico. Apparently related to *C. emarginata*, but with more numerous (6) leaflets.

11. *LYSILOMA* Benth. Lond. Journ. Bot. 3: 82. 1844.

Unarmed trees or shrubs; leaves bipinnate, with few and large or usually numerous and small leaflets; flowers small, capitate or spicate; fruit flat, broad, the valves thin, separating from the persistent margin.

- Flowers in spikes-----1. *L. acapulcensis*.
 Flowers in globose heads.
 Pinnae 1 or 2 pairs.
 Leaflets usually 3 to each pinna, 4 to 9 cm. long; stipules persistent, large.
 2. *L. tergemina*.
 Leaflets numerous, 2 cm. long or shorter; stipules minute, deciduous.
 3. *L. candida*.
 Pinnae 3 to many pairs.
 Pinnae 20 to 25 pairs-----4. *L. aurita*.
 Pinnae 3 to 13 pairs.
 Leaflets oval, 8 to 12 mm. wide-----9. *L. sabicu*.
 Leaflets oblong, less than 5 mm. wide.
 Leaflets pubescent beneath.
 Leaves pubescent with appressed hairs-----5. *L. microphylla*.
 Leaves hirtellous with spreading hairs-----6. *L. watsoni*.
 Leaflets glabrous beneath. *or juvenile*.
 Pinnae 6 to 13 pairs; leaflets 7 mm. long or shorter.
 7. *L. divaricata*.
 Pinnae usually 3 or 4 pairs; leaflets about 10 mm. long.
 8. *L. bahamensis*.

1. *Lysiloma acapulcensis* (Kunth) Benth. Lond. Journ. Bot. 3: 83. 1844.
Acacia acapulcensis Kunth, Mimos. Pl. Légum. 7S. pl. 24. 1819-24.
Acacia desmostachya Benth. Pl. Hartw. 13. 1839.
Lysiloma desmostachya Benth. Lond. Journ. Bot. 3: 84. 1844.
Lysiloma acapulcensis brevispicata Rose, Contr. U. S. Nat. Herb. 1: 100. 1891.
 Sonora to San Luis Potosí and Chiapas; type from Acapulco. Guerrero. Guatemala.
 Shrub or tree, sometimes 15 meters high, with very hard wood; leaves pubescent, at least when young, the leaflets very numerous, linear-oblong, 8 mm. long or shorter; stipules large, sometimes persistent; spikes 4 to 6 cm. long; fruit 2.5 to 4.8 cm. wide. "Tepeguaje" or "tepehuaje" (Michoacán, Guerrero, Oaxaca, Sinaloa, Veracruz, Sonora); "tepeoaxin" (*Ramírez*); "laaguia" (Oaxaca, Zapotec, *Reko*).

The bark is astringent and is used in domestic medicine. It is sometimes chewed to harden the gums. The gum which exudes from the bark is used like gum arabic.

L. acapulcensis brevispicata Rose, from Sonora, differs only in its short spikes.

2. *Lysiloma tergemina* Benth. Trans. Linn. Soc. Bot. 30: 534. 1875.
 Guerrero, Morelos, and Puebla; type from Acatlán, Puebla.
 Small tree, 3 to 4.5 meters high; leaflets obliquely oval, rounded or obtuse at apex, bright green, glabrous; stipules reniform; flowers white; fruit 10 to 15 cm. long, 3.5 to 4.5 cm. wide, glaucescent.

3. *Lysiloma candida* T. S. Brandeg. Proc. Calif. Acad. II. 2: 153. 1889.
 Southern Baja California, in canyons and on rocky slopes; type from Purísima.

Tree, sometimes 7.5 meters high, with a trunk 15 to 30 cm. in diameter (often with several trunks), the bark smooth, white; leaflets oblong or oval, obtuse or rounded at apex; stamens yellow; fruit 8 to 15 cm. long, 2.5 to 3 cm. wide, the valves thin and papery. "Palo blanco."

The bark is much used locally for tanning, and is an article of export. For an illustration of a grove of the trees see Contr. U. S. Nat. Herb. 16: pl. 113.

4. *Lysiloma aurita* (Schlecht.) Benth. Lond. Journ. Bot. 3: 83. 1844.
Acacia aurita Schlecht. Linnaea 12: 572. 1838.
 Veracruz and Chiapas; type from Malpais de Naulinco, Veracruz. Guatemala and Nicaragua.
 Leaves pubescent, the leaflets about 3 mm. long; fruit 10 to 12 cm. long, 2 to 2.5 cm. wide, dark reddish brown.
5. *Lysiloma microphylla* Benth. Lond. Journ. Bot. 3: 83. 1844.
 Guanajuato to Chiapas; type from León, Guanajuato.
 Tree, 9 meters high; leaflets 4 to 6 mm. long; fruit about 13 cm. long and 2.5 cm. wide.
 Most of the material recently referred to this species is rather *L. divaricata*, if Bentham's descriptions are reliable.
6. *Lysiloma watsoni* Rose, Contr. U. S. Nat. Herb. 1: 99. 1891.
 Known only from the vicinity of the type locality, Alamos, Sonora.
 Shrub or small tree, 3 meters high, the trunk 7.5 cm. in diameter; leaflets 5 mm. long; fruit 2.5 cm. wide.
7. *Lysiloma divaricata* (Jacq.) Macbride, Contr. Gray Herb. n. ser. 59: 6. 1919.
Mimosa divaricata Jacq. Pl. Hort. Schoenbr. 3: 76. pl. 395. 1798.
Lysiloma schiedeana Benth. Lond. Journ. Bot. 3: 83. 1844.
 Baja California and Sonora to Veracruz and Oaxaca. Reported from Nicaragua and Costa Rica.
 Shrub or tree, 3 to 18 meters high, the trunk sometimes almost a meter in diameter, the wood very hard; flowers white; fruit 9 to 15 cm. long, 1.5 to 3 cm. wide. "Quiebracha" (Michoacán, Guerrero); "tepeguaje" (Sinaloa).
 The wood is used for various purposes and the bark is employed for tanning.
8. *Lysiloma bahamensis* Benth. Lond. Journ. Bot. 3: 82. 1844.
 Yucatán. West Indies and southern Florida; type from the Bahamas.
 Tree, sometimes 16 meters high, with a trunk 1.2 meters in diameter, the crown broad, the bark smooth, gray or brownish; flowers white; fruits 8 to 15 cm. long, 2.5 cm. wide; wood hard, tough, close-grained, dark reddish brown, its specific gravity about 0.64.
 The wood is used in the West Indies for making boats. The species has been reported from Yucatán as *L. latisiliqua* (L.) Benth.
9. *Lysiloma sabicu* Benth. Kew Journ. Bot. 6: 236. 1854.
 Reported from Yucatán. Cuba (type locality) and the Bahamas.
 Tree 6 meters high; wood hard, heavy, compact, fine-grained, brown, its specific gravity said to be about 0.90. "Xiaxek" (Yucatán, Maya); "sabicú," "jigüe," "jigüe blanco," "moruro de costa" (Cuba).
 The wood is of good quality and very durable in water. Formerly it was much used in Cuba for shipbuilding, and was exported to England to be used for the same purpose, as well as for making bobbins and shuttles. It is employed also for cabinetwork.

12. ALBIZZIA Durazz. Mag. Tosc. 34: 11. 1772.

Some of the Old World species yield useful gums and others furnish tanbark.

1. *Albizzia occidentalis* T. S. Brandeg. Proc. Calif. Acad. II. 3: 222. 1892.
 Baja California and Sinaloa; Tres Marias Islands; type from San José del Cabo, Baja California.
 Tree 5 to 15 meters high, with a trunk sometimes 80 cm. in diameter, the bark smooth, gray; leaves bipinnate, the pinnae about 4 pairs, the leaflets few, obliquely oblong or oval, 2 to 4.5 cm. long, nearly glabrous; flowers yellowish white, capitate; fruit flat, 13 to 20 cm. long, 3 to 4 cm. wide. "Palo escopeta" (Baja California); "palo fierro," "bolillo," "arellano" (Sinaloa).

This tree is very common in some localities. The wood is used in carpentry.

Albizzia lophantha Benth., a native of Australia, with spicate flowers, narrow leaflets, and small pods, is cultivated in central Mexico.

13. ENTEROLOBIUM Mart. Flora 20²: Beibl. 117. 1837.

1. *Enterolobium cyclocarpum* (Jacq.) Griseb. Fl. Brit. W. Ind. 226. 1860.

Mimosa cyclocarpa Jacq. Fragm. Bot. pl. 34, f. 1. 1809.

Mimosa parota Sessé & Moc. Pl. Nov. Hisp. 177. 1837.

Sinaloa to Tamaulipas, Veracruz, and Chiapas. Central America, West Indies, and northern South America.

Large unarmed tree, 12 to 30 meters high or larger, with broad spreading crown, the trunk 0.6 to 2.5 meters in diameter; bark rough; leaves bipinnate, the leaflets very numerous, linear-oblong, 10 to 12 mm. long, acute or obtuse; flowers small, white, sessile in dense heads; fruit flat, coiled, 8 to 11 cm. in diameter, dark brown, lustrous; seeds dark brown or black, about 12 mm. long; wood hard, resistant, elastic, grayish tinged with yellow, sometimes livid and mottled. "Orejón" (Veracruz); "huinecaztle," "huanacastle" (Sinaloa); "parota" (Michoacán, Jalisco, Guerrero); "piche" (Tabasco); "cuanacastle," "nacaztle" (Oaxaca, from the Nahuatl *cuan-nacaztli*, "ear-tree"); "cascabel sonaja" (Tamaulipas); "guanacaste" (Guatemala, Nicaragua, Honduras, Costa Rica); "nacastle" (Veracruz); "conacaste" (Guatemala); "anjera," "carito," "carita" (Colombia); "caro hembra" (El Salvador, Venezuela); "oreja de judfo," "árbol de las orejas" (Cuba).

The tree grows rapidly and makes an excellent shade tree because of its broad top. The large trunks are used for canoes, water troughs, etc., and the wood is very durable in water. It is employed in carpentry and cabinetwork. The pods are said to be an excellent feed for cattle, and the seeds as well as the young pods are sometimes cooked to be used for human food. The fruit and bark are rich in tannin. Rose reports that in Sinaloa the bark and fruit are used as a substitute for soap in washing woolen goods and that a syrup made from the bark is used for colds. The fruit is used as a soap substitute in Venezuela also. The gum which exudes from the trunk is employed in Sinaloa as a remedy for bronchitis.

14. PITHECOLLOBIUM Marat. Flora 20²: Beibl. 114. 1837.

REFERENCE: Benth. Trans. Linn. Soc. Bot. 30: 570-598. 1875.

Shrubs or trees, spiny or unarmed; leaves bipinnate, the leaflets few or numerous, the petioles usually glanduliferous; peduncles mostly axillary and solitary or fasciculate, or sometimes terminal and racemose, the flowers capitate or spicate; fruit very variable.

Pithecollobium multiflorum Benth. has been reported from Mexico at various times, but apparently it is not found there.

Leaflets large, 0.7 to 2.5 cm. wide or larger, if less than 1 cm. wide the blades rounded and nearly as broad as long; leaflets always few (1 or 2 pairs).

Plants very spiny.

Flowers in long spikes.

Calyx less than one-fourth as long as the corolla. Stamen tube very long-exserted.....1. *P. macrosiphon*.

Calyx almost or fully half as long as the corolla.

Stamen tube included or short-exserted; bracts deltoid, minute, about as broad as long; valves of the fruit comparatively thin.

2. *P. lanceolatum*.

- Stamen tube long-exserted; bracts lanceolate, conspicuous, elongate; valves of the fruit very thick.....3. *P. calostachys*.
- Flowers capitate.
- Spines ascending; flowers densely pubescent; leaves pale green.
4. *P. dulce*.
- Spines divaricate; flowers glabrate; leaves usually bright green.
5. *P. unguis-cati*.
- Plants unarmed.
- Petiole winged.....6. *P. furcatum*.
- Petiole not winged.
- Leaflets acute or acuminate; flowers subspicate.....7. *P. cognatum*.
- Leaflets rounded at apex; flowers capitate.....8. *P. guadalupense*.
- Leaflets small, the largest 5 mm. wide, usually much longer than broad; leaflets numerous.
- Pinnae one pair.
- Valves of the fruit very hard and woody, 2.5 to 3 cm. wide...17. *P. confine*.
- Valves of the fruit not woody, less than 2 cm. wide.
- Leaflets revolute, oblong.....9. *P. revolutum*.
- Leaflets not revolute, oval or suborbicular.
- Leaflets pubescent.....10. *P. elastichophyllum*.
- Leaflets glabrous.....11. *P. compactum*.
- Pinnae 2 or more pairs.
- Corolla about 1.5 cm. long, densely white-sericeous.
- Calyx pilose; leaflets 2 to 2.5 mm. wide.....12. *P. acatlense*.
- Calyx glabrous; leaflets 4 to 7 mm. wide.....13. *P. leiocalyx*.
- Corolla less than 1 cm. long.
- Gland present on the rachis at the point of insertion of the lowest pair of pinnae.
- Plants unarmed; valves of the pod contorted after dehiscence. Flowers capitate.....14. *P. arboreum*.
- Plants armed with numerous spines; valves not contorted.
- Spines recurved; flowers capitate. Leaflets narrowly oblong.
15. *P. leptophyllum*.
- Spines straight; flowers capitate or spicate.
- Flowers spicate.....16. *P. flexicaule*.
- Flowers capitate.
- Leaflets 4 or 5 pairs, oval or rounded-obovate, rounded at apex.
17. *P. confine*.
- Leaflets 10 to 15 pairs, oblong, acute.....18. *P. schaffneri*.
- Gland borne on the petiole below the pinnae.
- Calyx glabrous or nearly so; pods constricted between the seeds.
19. *P. tortum*.
- Calyx densely pubescent; pods not constricted.
- Pinnae 4 to 6 pairs in most of the leaves.
- Leaflets mostly 5 to 7 mm. wide; plants unarmed.
20. *P. tomentosum*.
- Leaflets 1.5 to 2.5 mm. wide; plants usually armed with spines.
- Pods stipitate, 1.4 to 1.7 cm. wide.....21. *P. brevifolium*.
- Pods sessile or nearly so, 2.5 cm. wide.....22. *P. albicans*.
- Pinnae 2 or 3 pairs in most of the leaves.
- Corolla densely sericeous; pinnae and leaflets crowded; spines strongly recurved; pods pubescent.....23. *P. sonora*.
- Corolla glabrate; pinnae and leaflets not crowded; spines nearly straight; pods glabrous or nearly so.....24. *P. mexicanum*.

1. *Pithecollobium macrosiphon* Standl. Contr. U. S. Nat. Herb. 20: 191. 1919. Known only from the type locality, between Tumbala and El Salto, Chiapas. Spiny tree; leaflets 4 to 6 cm. long, obtuse.

2. *Pithecollobium lanceolatum* (Humb. & Bonpl.) Benth. Lond. Journ. Bot. 5: 105. 1846.

Mimosa ligustrina Jacq. Fragm. Bot. Illustr. 29. pl. 32, f. 6. 1809. Not *M. ligustrina* Vahl, 1807.

Inga lanceolata Humb. & Bonpl.; Willd. Sp. Pl. 4: 1005. 1806.

Pithecollobium ligustrinum Klotzsch; Benth. Trans. Linn. Soc. Bot. 30: 571. 1875.

Sinaloa to Chiapas, Veracruz, and Tabasco; reported from San Luis Potosí. Central America and northern South America; type from Cumaná, Venezuela.

Tree 3.5 to 5 meters high or larger, armed with short stout spines; pinnae one pair, the leaflets one pair, oblique, 3.5 to 8 cm. long, obtuse, bright green, thick, glabrate; flowers small, white; fruit terete, about 10 cm. long. "Timuche" (Michoacán, Guerrero); "tucuy" (Tabasco, San Luis Potosí); "pichejumo" (San Luis Potosí); "conchi" (Sinaloa); "espino," "chimnango" (Colombia); "bobo" (Venezuela); "abracade" (El Salvador).

3. *Pithecollobium calostachys* Standl. Contr. U. S. Nat. Herb. 20: 190. 1919.

Tamaulipas and San Luis Potosí to Tabasco and Chiapas; type from Tampico, Tamaulipas.

Tree 4.5 to 6 meters high or larger.

This has been referred commonly to the preceding species but seems specifically distinct by the characters given in the key.

4. *Pithecollobium dulce* (Roxb.) Benth. Lond. Journ. Bot. 3: 199. 1844.

Mimosa dulcis Roxb. Pl. Coromand. 1: 67. pl. 99. 1795.

Acacia obliquifolia Mart. & Gal. Bull. Acad. Brux. 10²: 317. 1843.

Baja California to Chihuahua, Tamaulipas, and Chiapas; often cultivated. Central America and Colombia; naturalized in the East Indies and elsewhere in the tropics of the Old World; type from Coromandel.

Tree. 4.5 to 20 meters high or larger, very spiny; trunk often 60 to 80 cm. in diameter, the bark grayish; pinnae one pair, the leaflets one pair, 2.5 to 5 cm. long or larger, obtuse, pale green, glabrate; flowers yellowish or greenish white; fruit long and narrow, reddish, pubescent, much coiled and twisted; seeds black, surrounded by a white or reddish aril; wood moderately heavy, flexible, strong, reddish brown. "Huamúchil," "cuamúchil," or "guamúchil" (used widely in Mexico; from the Nahuatl names, which are given variously as *cuamochtili*, *quahmochitl*, *coacamachalli*, or *quamochitl*); "guamúchitl," "guamucho," "humo" (Tamaulipas); "guaymachile" (Guerrero, Palmer); "guamachi" (Guerrero); "pinzan" (Guerrero, Oaxaca, Veracruz); "cuamóchil," "huamúchil costeño," "guamucho," "huamuche," "muchite" (Oaxaca); "yaga-bixihui," "yaga-biguichi" (Oaxaca, Zapotec, Reko); "guamuchil" (Durango, Patoni); "buamúchil" (Alcocer); "espino de playa" (Nicaragua); "mohigüiste" (Costa Rica); "guachimole," "mongollano" (El Salvador); "jaguay" (Guatemala); "inga" (Cuba); "camachile" (Guam, Philippines).

It is of interest to note that the Nahuatl name was introduced, along with the plant itself, into Guam and the Philippines by the Spaniards. The word has been modified there into such forms as "camanchil," "camonsil," "kamachiles," and "camachile." From the Philippines the tree was carried to India, where it is now much planted. The pods are known in India as "Manila tamarinds."

The tree is very resistant to drought. It is nearly evergreen, but loses its old leaves as the new ones appear. The wood is widely employed for general

construction purposes, for fence posts, and for fuel. The bark yields a yellow dye, and is much used for tanning skins; it is used in domestic medicine, also, because of its astringent properties. The gum exuding from the trunk is transparent and deep reddish brown; dissolved in water it makes good mucilage. The flowers are much frequented by bees and yield a good quality of honey. The fruit is highly esteemed in Mexico and is a common article in the markets. The acidulous aril surrounding the seeds is eaten and is used in the preparation of a beverage similar to lemonade. Stock of all kinds are fond of the pods, and in India monkeys are said to eat them greedily.

The tree is treated by Hernández¹ in a chapter entitled "*De Coaca machalli, seu Maxilla Colubri.*" This name ("snake-jaws"), he states, is given because the pair of leaflets somewhat resemble the jaws of a snake. "The leaves," he says, "applied as plasters, allay pain, even those of venereal sores, and relieve convulsions. In flavor they are astringent, sweet, and somewhat glutinous, and in temper to a certain extent cold, or moderately warm." The tree is treated on page 94 of the same work, in a chapter headed "*De Quamochitl, seu arbore fructus crepitanis.*" In this account he states that the root bark is good for dysentery; the leaves, with salt, cure indigestion, and also produce abortion; the juice of the seeds, sniffed into the nose, draws off humors from the head; and the pulverized seeds (especially if mixed with rue) cleanse internal ulcers.

5. *Pithecollobium unguis-cati* (L.) Mart. Hort. Monac. 188. 1829.

Mimosa unguis-cati L. Sp. Pl. 517. 1753.

Chiefly in coastal thickets, Tamaulipas to Yucatán; Sinaloa. West Indies; northern South America; type from Jamaica.

Shrub or small tree, sometimes 9 meters high, with a trunk 30 cm. in diameter, very spiny, the bark reddish brown or gray, shallowly fissured; leaves more or less persistent, the pinnae one pair, the leaflets one pair, obliquely obovate or oval, 2 to 4 cm. long; flowers greenish yellow, sweet-scented, the long stamens purplish; fruit 8 to 12 cm. long, 0.6 to 1.2 cm. wide, twisted, reddish brown; seeds dark brown or blackish, surrounded by a red aril; wood very hard, close-grained, red or purple, with yellow sapwood, its specific gravity about 0.90. "Tzim-ché," "tzin-ché." (Yucatán, Maya, *Seler*); "espino de playa" (Nicaragua); "espinuelo" (Venezuela); "dinde" (Colombia); "manca montero" (Cuba); "uña de gato" (Nicaragua, Cuba, Porto Rico); "rolon" (Porto Rico).

The English names applied to the plant are "cat's-claw," "black-bead," and "bread-and-cheeses."

The bark is astringent, and diuretic and tonic properties are ascribed to it; it has been used for fevers and kidney diseases as well as for treating sores. Barham reports that the plant was much used in Jamaica in domestic medicine, and that it was "a sovereign remedy for the stone and gravel," as well as for affections of the liver and spleen. The Spaniards, he relates, said that the black seeds resembled the kidneys and the white aril the fat surrounding those organs, hence, by the doctrine of signatures, the belief that the plant was a remedy for kidney affections. The fruit is said to be rich in tannin and to yield a yellow dye.

6. *Pithecollobium furcatum* Benth. Lond. Journ. Bot. 5: 106. 1846.

Known only from the type locality, on the banks of the Río Teapa, Tabasco.

Plants glabrate; pinnae one pair, the leaflets one pair, obliquely obovate-oblong, 7.5 to 10 cm. long, obtuse-acuminate.

7. *Pithecollobium cognatum* (Schlecht.) Benth. Lond. Journ. Bot. 5: 107. 1846.

Inga cognata Schlecht. Linnaea 12: 560. 1838.

¹Thesaurus 90. 1651.

Veracruz, the type from Colipa. Central America.

Tree, sometime 8 meters high; pinnae 1 pair, the leaflets 1 pair, lanceolate or narrowly oblong, usually 8 to 11 cm. long, thick, lustrous, glabrous. "Soto caballo" (Costa Rica).

8. *Pithecollobium guadalupense* (Pers.) Chapm. Fl. South. U. S. 116. 1860.

Mimosa guadalupeensis Pers. Syn. Pl. 2: 262. 1807.

Yucatán. West Indies and Florida Keys; type from Guadeloupe.

Unarmed shrub or tree, sometimes 6 meters high, with a trunk 15 cm. in diameter, the bark dark gray, slightly fissured; leaves persistent, the 4 leaflets obliquely obovate to suborbicular, 4 to 7 cm. long, lustrous; flowers pink; fruit compressed, 10 to 15 cm. long, dark brown, twisted; seeds black, with a red aril.

The writer has seen no material from the Lesser Antilles, and does not feel certain that the name here used really applies to the present plant. The Yucatán specimens, however, are of the same species as the Cuban plant to which the name is now applied.

9. *Pithecollobium revolutum* Rose, Contr. U. S. Nat. Herb. 10: 96. pl. 28. 1906.

Known only from the type locality, near Higuerrillas, Querétaro.

Low dense shrub; leaflets 6 to 10, about 3 mm. long; fruit flat, curved, 5 to 7 cm. long, pubescent.

10. *Pithecollobium elastichophyllum* A. Gray; S. Wats. Proc. Amer. Acad. 17: 352. 1882.

Coahuila, Nuevo León, and San Luis Potosí; type from Monterrey.

Low spiny shrub with very stiff interlaced branches; leaflets few, 3 to 4 mm. long, coriaceous; flowers reddish, the heads nearly sessile; fruit flat, 1.5 cm. wide, curved, puberulent.

11. *Pithecollobium compactum* Rose, Contr. U. S. Nat. Herb. 8: 33. 1903.

Pithecollobium purpusii T. S. Brandeg. Univ. Calif. Publ. Bot. 4: 85. 1919.

Puebla; type from Tehuacán.

Low shrub, usually 30 to 50 cm. high, compact, very spiny; leaflets 5 to 7 pairs, 3 to 4 mm. long, lustrous; flowers greenish, tinged with red, subcapitate; fruit curved, compressed, 1.2 cm. wide, puberulent; seeds brownish black.

12. *Pithecollobium acatlense* Benth. Trans. Linn. Soc. Bot. 30: 593. 1875.

Durango to Puebla and Oaxaca; type from Acatlán, Puebla.

Shrub or small tree, 3 to 4.5 meters high; pinnae 2 or 3 pairs, the leaflets rather numerous, 6 to 10 mm. long, obtuse or acute, pubescent or glabrate; flowers capitate, the heads nearly sessile; fruit flat, straight, about 14 cm. long and 2.5 cm. wide, densely pubescent.

13. *Pithecollobium leiocalyx* Standl. Contr. U. S. Nat. Herb. 20: 189. 1919.

Known only from the type locality, Salina Cruz, Oaxaca.

Leaflets 6 to 14 mm. long, obliquely oval or obovate, pubescent.

14. *Pithecollobium arboreum* (L.) Urban, Symb. Antill. 2: 259. 1900.

Mimosa arborea L. Sp. Pl. 519. 1753.

Pithecollobium filicifolium Benth. Lond. Journ. Bot. 3: 205. 1844.

Samanea arborea Ricker in Bailey. Stand. Cycl. Hort. 3066. 1917.

Veracruz and Oaxaca. West Indies and Central America; type from Jamaica.

Tree, sometimes 4 meters high, with a trunk a meter in diameter, the bark thick, gray, very rough; leaves large, often 40 cm. long, bright green, glabrate, with numerous pinnae and leaflets, the latter linear. 12 to 15 mm. long; flowers white; fruit subterete, constricted, bright red, puberulent, twisted after dehiscence, blood-red within; seeds black; wood hard, fine-grained, taking

a good polish. "Coralillo" (Oaxaca); "frijolillo" (Veracruz); "loro," "lorito," "conchido" (Costa Rica); "moruro," "moruro prieto," "tengue" (Cuba); "cojóbana," "cojoba" (Porto Rico); "cola de marano," "cola de mico," "quebracho" (Guatemala, Honduras, *Blake*).

The wood is said to be of excellent quality, and is much used in some parts of the West Indies and Central America for flooring, ceiling, posts, etc.

15. *Pithecollobium leptophyllum* (Cav.) Daveau, Bull. Soc. Bot. France 59: 635. 1912.

Mimosa leptophylla Cav.; Lag. Gen. & Sp. Nov. 16. 1803.

Pithecollobium palmeri Hemsl. Diag. Pl. Mex. 50. 1880.

Pithecollobium palmeri recurvatum S. Wats. Proc. Amer. Acad. 23: 272. 1888.

Durango to San Luis Potosí and Puebla; perhaps also in Sonora; type from somewhere in Mexico.

Shrub, 0.6 to 1.5 meters high, very spiny; leaves small, the pinnae few, the leaflets numerous, 3 to 4 mm. long; fruit flat, brown, puberulent, curved, 1 to 1.5 cm. wide.

16. *Pithecollobium flexicaule* (Benth.) Coulter, Bot. Gaz. 15: 270. 1890.

Acacia flexicaulis Benth. Lond. Journ. Bot. 1: 505. 1842.

Siderocarpos flexicaulis Small, Bull. N. Y. Bot. Gard. 2: 91. 1901.

Samanea flexicaulis Macbride, Contr. Gray Herb. n. ser. 59: 2. 1919.

Tamaulipas and Nuevo León. Southwestern Texas.

Spiny shrub or tree, sometimes 15 meters high, with a trunk 1.2 meters in diameter, the branches irregular and spreading; leaves persistent, the pinnae 2 or 3 pairs, the leaflets 3 to 5 pairs, oblong or obovate, 5 to 12 mm. long, thick, lustrous; flowers yellow, fragrant; fruit somewhat flattened, hard and woody, 10 to 15 cm. long, 2.5 cm. wide, brown or black; wood hard, close-grained, dark red or purplish brown, with yellowish sapwood, its specific gravity about 1.04. "Ebano" (Tamaulipas, Nuevo León).

The wood is very durable and is used for fence posts, wagons, cabinetwork, fuel, etc. The green seeds are cooked and eaten, and when ripe they are often roasted and eaten or used as a substitute for coffee.

17. *Pithecollobium confine* Standl. Contr. U. S. Nat. Herb. 20: 191. 1919.

Baja California; type from Cape San Lucas.

Shrub or small tree, 1.5 to 3 meters high, similar to the last species but with capitate flowers. "Palo fierro."

18. *Pithecollobium schaffneri* S. Wats. Proc. Amer. Acad. 17: 352. 1882.

Samanea schaffneri Macbride, Contr. Gray Herb. n. ser. 59: 2. 1919.

Known only from the mountains about San Luis Potosí.

Shrub, very spiny, pubescent; pinnae 2 to 4 pairs, the leaflets 2 to 3 mm. long, acute; fruit 7.5 to 12.5 cm. long, 1 cm. wide, straight or somewhat curved densely pubescent.

19. *Pithecollobium tortum* Mart. Herb. Fl. Bras. 114. 1837.

Baja California and Sonora to Oaxaca; Veracruz and Yucatán. Central America, West Indies, and South America; type from Brazil.

Slender shrub or tree, 3 to 9 meters high, armed with stout spines, the bark smooth, brown; leaflets oblong or obovate, 7 to 15 mm. long, pubescent or glabrous; fruit 7 to 10 mm. wide, often 20 cm. long or longer, glabrous. "Poralana" (Guerrero); "guayacán" (Honduras).

20. *Pithecollobium tomentosum* Micheli, Mém. Soc. Phys. Hist. Nat. Genève 34: 285. pl. 28. 1903.

Jalisco to Guerrero; Yucatán; type from banks of the Espíritu Santo, altitude 600 meters.

Tree, 6 to 8 meters high; leaflets 1 to 1.8 cm. long, oblong, puberulent; flowers white. "Parotillo" (Michoacán, Guerrero).

The writer has seen no fruit of this plant, which may belong to some other genus.

21. *Pithecollobium brevifolium* Benth.; A. Gray, Pl. Wright. 1: 67. 1852.

Havardia brevifolia Small, Bull. N. Y. Bot. Gard. 2: 92. 1901.

Coahuila, San Luis Potosí, and Tamaulipas; type collected between Cerralvo and Monterrey, Nuevo León. Southwestern Texas.

Tree, sometimes 9 meters high, with a trunk 15 cm. in diameter, the bark thin, smooth, gray; leaves persistent, the pinnae 2 to 5 pairs, the leaflets 10 to 20 pairs, 4 to 8 mm. long, pubescent or glabrate; flowers yellowish white; fruit flat, straight, 7 to 12 cm. long, about 1.5 cm. wide; wood hard, close-grained, dark reddish brown, very heavy. "Tenaza" (Nuevo León, Tamaulipas); "huajillo" (Texas); "guajilla" (Tamaulipas).

The tree is of some importance for forage, the leaves being eaten by goats and sheep in winter. The wood is used for various purposes. Specimens collected in Oaxaca probably belong to this species, and others from Sinaloa (where the plant is known as "carbonera") are probably conspecific.

22. *Pithecollobium albicans* (Kunth) Benth. Trans. Linn. Soc. Bot. 30: 592. 1875.

Acacia albicans Kunth, Mimos. Pl. Légum. 87. pl. 27. 1819-24.

Yucatán and Campeche; type from Campeche.

Tree, sometimes 20 meters high; leaflets numerous, 3 to 6 mm. long; fruit about 10 cm. long. "Chucum" (Yucatán); "hulsache" (Campeche, Ramírez).

The tree is said to produce a gum similar to that of mezquite. The fruit is reported to contain 18 per cent of tannin, and to yield a black dye.

It is probable that the present material is referred here correctly, although it does not quite agree with Bentham's description, especially in regard to the fruit. The type collection was without fruit, and Bentham's description of it was based, presumably, upon specimens from Hidalgo, which may have belonged to some other species.

23. *Pithecollobium sonorae* S. Wats. Proc. Amer. Acad. 24: 49. 1889.

Dry plains or hillsides, Sonora and Sinaloa; type from Guaymas, Sonora.

Shrub or small tree, 3 to 6 meters high, with very hard wood; leaflets numerous, 3 to 4 mm. long; fruit flat, straight, 7 to 9 cm. long, 1.5 to 2 cm. wide. "Uña de gato" (Sonora); "palo gato" (Sinaloa).

24. *Pithecollobium mexicanum* Rose, Contr. U. S. Nat. Herb. 1: 100. 1891.

Baja California, Sonora, and Sinaloa; type from Alamos, Sonora.

Tree, 4.5 to 9 meters high or larger, or often only a shrub, with smooth brownish bark, armed with short spines; leaflets few, oblong, about 5 mm. long, pale green; fruit flat, thin. "Chino" or "palo chino."

The wood is used for furniture, etc.

15. INGA Scop. Intr. Hist. Nat. 298. 1777.

REFERENCES: Bentham, Lond. Journ. Bot. 4: 577-622. 1845; Pittier, Contr. U. S. Nat. Herb. 18: 173-223. pl. 81-105. 1916.

Unarmed trees or shrubs; leaves even-pinnate, the leaflets few, large, the petiole often winged; stipules small; flowers large, spicate or capitate; fruit large, the seeds imbedded in a pulp.

The fleshy pulp surrounding the seeds is edible, and the pods are often seen in the markets. The wood is said to be weak and fibrous, with a specific gravity of 0.54 to 0.67, and to be of little value except for charcoal and firewood. Some of the species are often planted to shade coffee bushes and as windbreaks to

protect cacao plantations. The names "chalahuitl" (San Luis Potosí), "chelele" (Tabasco), "hulándini" (Michoacán), and "coyuacate" (Veracruz) are reported for unidentified species of the genus. Belmar gives the Mixe name as "tahk."

Rachis of the leaf not winged.

Flowers spicate.

Spikes long, slender, interrupted; flowers glabrous or nearly so.

1. *I. laurina*.

Spikes very short, headlike, dense; flowers densely sericeous.

2. *I. leptoloba*.

Flowers capitate.

Flowers sessile; stipules deciduous.....3. *I. jinicuil*.

Flowers pedicellate; stipules persistent.

Corolla 7.5 mm. long or shorter; fruit 9 to 12 cm. long....4. *I. paterno*.

Corolla 8 to 9 mm. long; fruit sometimes 40 cm. long.....5. *I. radians*.

Rachis of the leaves winged.

Corolla 10 to 16 mm. long.

Leaflets glabrate on the upper surface; corolla scarcely 10 mm. long.

6. *I. pringlei*.

Leaflets copiously pubescent on the upper surface; corolla about 15 mm. long.

Calyx 4 to 6 mm. long.....7. *I. edulis*.

Calyx about 10 mm. long.....8. *I. xalapensis*.

Corolla 20 to 25 mm. long.

Calyx very slender, the tube 2 to 3 mm. thick, thinly pubescent.

9. *I. purpusii*.

Calyx broad, the tube 3.5 to 5 mm. thick, densely sericeous.

Calyx lobes more than half as long as the tube; leaflets 6 pairs.

10. *I. fissicalyx*.

Calyx lobes less than half as long as the tube; leaflets usually 5 pairs.

Calyx 10 to 12 mm. long, covered with loose fulvous hairs; bracts ovate; leaflets obtuse or acutish.....11. *I. eriocarpa*.

Calyx about 15 mm. long, with a fine, close pubescence; bracts linear or nearly so; leaflets acuminate.....12. *I. spuria*.

1. *Inga laurina* (Swartz) Willd. Sp. Pl. 4: 1018. 1806.

Mimosa laurina Swartz, Fl. Ind. Occ. 2: 978. 1800.

Jalisco and Guerrero. Central America and the West Indies; type from St. Kitts.

Tree, 7.5 to 15 meters high, with large broad crown; leaflets 4 or 6, elliptic or obovate, 6 to 14 cm. long, acute or acuminate, bright green, glabrous; flowers white, sweet-scented; fruit flat, about 15 cm. long, 3 to 3.5 cm. wide. "Guamá" (Porto Rico).

2. *Inga leptoloba* Schlecht. Linnaea 12: 560. 1838.

Veracruz, Tabasco, and Oaxaca; type from Hacienda de la Laguna, Veracruz. Central America.

Tree, or often a shrub 2 to 3 meters high; leaflets usually 6, 8 to 18 cm. long, acute or acuminate, glabrous; spikes paniculate. "Vainillo" (Veracruz).

Planted in Costa Rica as shade for coffee.

3. *Inga jinicuil* Schlecht. Linnaea 12: 559. 1838.

Veracruz; type from Jalapa.

Large or small tree, often planted to shade coffee; leaflets 6, lanceolate to elliptic, glabrous, 8 to 11 cm. long, acute, lustrous; flowers white. "Jinicuil," "cuajinicuil."

4. *Inga paterno* Harms, Repert. Sp. Nov. Fedde 13: 419. 1914.
Oaxaca. Guatemala (type locality) to Costa Rica.
Medium-sized tree; leaflets 8 or 10, elliptic to lanceolate, 4 to 17 cm. long, obtuse or acute, glabrous; flowers white; fruit flat, 9 to 12 cm. long, 4 to 5 cm. wide, 2 or 3-seeded. "Paterno" (Guatemala); "cujinicuil" (Costa Rica).
Often planted, like the other species, for coffee shade.
5. *Inga radians* Pittier, Contr. U. S. Nat. Herb. 18: 178. 1916.
Oaxaca and Chiapas; type from Tapachula, Chiapas.
Tree; leaflets usually 6, elliptic or ovate, 7 to 18 cm. long, acuminate, glabrous; fruit sometimes 40 cm. long, 6.5 to 8.5 cm. wide, about 3 cm. thick. "Cujinicuil" (Chiapas).
6. *Inga pringlei* Harms, Repert. Sp. Nov. Fedde 13: 526. 1915.
Known only from the type locality, Jalapa, Veracruz.
Small tree; leaflets 10 or 12, lance-oblong, 4 to 7.5 cm. long, acuminate, thinly pilose beneath.
7. *Inga edulis* Mart. Flora 20: Beibl. 113. 1837.
Veracruz. Central America and South America; type from Brazil.
Small or large tree, sometimes 15 meters high, with broad spreading crown and gray bark; leaflets usually 6 or 8, very variable in form, mostly 10 to 20 cm. long; fruit short, angled, densely pubescent, with edible pulp. "Guayaniquil" (Costa Rica).
8. *Inga xalapensis* Benth. Lond. Journ. Bot. 4: 616. 1845.
Sinaloa and Jalisco to Veracruz; type from Jalapa, Veracruz. Central America.
Small tree, 6 to 8 meters high, the trunk 50 to 60 cm. in diameter, the bark ash brown; leaflets 10 to 16, oblong or lance-oblong, 6 to 17 cm. long, acute or obtuse; fruit 10 to 15 cm. long, about 1 cm. wide. "Cujiniquil" (Jalisco); "vainillo" (Sinaloa); "cuje" (Guatemala).
Wood used in Sinaloa for fence posts.
9. *Inga purpusii* Pittier, Contr. U. S. Nat. Herb. 18: 199. 1916.
Known only from the type locality, Finca Yolanda, Chiapas.
Tree; leaflets 4 or 6, ovate or oblong, 10 to 18 cm. long, acute, pubescent on both surfaces.
10. *Inga fissicalyx* Pittier, Contr. U. S. Nat. Herb. 18: 213. 1916.
Veracruz and Tabasco; type from Zacuapan, Veracruz. Guatemala.
Leaflets lance-oblong, 3 to 11 cm. long, acute, pubescent on both surfaces. "Bitze," "chelele," "guatope" (Tabasco).
11. *Inga eriocarpa* Benth. Lond. Journ. Bot. 4: 615. 1845.
Sinaloa and Jalisco to Michoacán, Oaxaca, and Veracruz; type collected between San Blas and Guadalajara.
Tree, often 12 meters high, with spreading crown and rough black bark; leaflets about 10, oblong to oval-obovate, 4 to 9 cm. long, very thick; flowers white; fruit subterete, tomentose. "Vainillo" (Michoacán, Sinaloa); "aguatope" (Oaxaca, from the Nahuatl *ahua-topochtlic*, "white stamens").
12. *Inga spuria* Humb. & Bonpl.; Willd. Sp. Pl. 4: 1011. 1806.
Tepic to Tamaulipas, Veracruz, and Chiapas. Central America and South America; type from Venezuela.
Large or small tree, sometimes 15 meters high, with wide-spreading crown; leaflets about 10, 5 to 13 cm. long, pubescent; flowers white; fruit subterete, short or elongate, tomentose. "Vainillo" (Veracruz); "jinicuil" (Guerrero); "timbre" (Veracruz); "cuje" (Guatemala); "guama" (Venezuela); "cujinicuil" (Jalisco, Costa Rica).

DOUBTFUL SPECIES.

INGA CORIACEA Don, Hist. Dichl. Pl. 2: 390. 1832. Described from somewhere in Mexico.

INGA FLEXUOSA Schlecht. Linnaea 12: 559. 1833. *I. schiedeana* Steud. Nom. Bot. ed. 2. 1: 810. 1840. Based upon leaf specimens from Jalapa; perhaps the same as *I. xalapensis* Benth.

66. CAESALPINIACEAE. Senna Family.

Trees or shrubs, often armed with spines: leaves simple, pinnate, or bipinnate; flowers usually large and showy, mostly racemose, regular or irregular; petals usually 5; stamens commonly 10; fruit a legume but very variable in form.

Leaves pinnate, bifoliolate, or simple, never bipinnate.

Anthers erect. Leaves pinnate-----1. **CASSIA**.

Anthers versatile.

Leaves with numerous leaflets.

Calyx lobes 4; fruit thick-----2. **TAMARINDUS**.

Calyx lobes 5; fruit very flat and thin-----3. **POEPPIGIA**.

Leaves simple or of 2 leaflets.

Petals very unequal; fruit winged on the upper suture; leaves simple.

4. **CERCIS**.

Petals subequal; fruit not winged; leaves simple or bifoliolate.

Flowers 7 mm. long or shorter. Fruit indehiscent; leaves bifoliolate.

5. **CYNOMETRA**.

Flowers more than 1 cm. long.

Calyx lobes 4; fruit indehiscent. Leaves bifoliolate.

6. **HYMENAEA**.

Calyx lobes 5; fruit dehiscent-----7. **BAUHINIA**.

Leaves bipinnate, at least some of them.

Calyx lobes strongly imbricate; seeds without endosperm.

Leaves partly pinnate. Trees or large shrubs----8. **HAEMATOKYLUM**.

Leaves all bipinnate.

Plants low shrubs, chiefly herbaceous, unarmed; fruit thin, elastically bivalvate-----9. **HOFFMANSEGGIA**.

Plants large shrubs or trees, often spiny; fruit thin and bivalvate or often very thick-----10. **CAESALPINIA**.

Calyx lobes valvate or slightly imbricate; seeds with endosperm.

Plants unarmed.

Flowers red; fruit very broad, thick, and hard-----11. **DELONIX**.

Flowers yellow; fruit narrow, thin-----12. **CONZATTIA**.

Plants armed with spines. Fruit narrow, thin.

Fruit linear, constricted between the seeds; rachis of the leaf spinose.

13. **PARKINSONIA**.

Fruit linear-oblong, not constricted; rachis of the leaf not spinose.

14. **CERCIDIUM**.

1. **CASSIA** L. Sp. Pl. 376. 1753.

REFERENCE: Bentham, Trans. Linn. Soc. Bot. 21: 503-591. pl. 60-63. 1871.

Unarmed trees or shrubs; leaves pinnate, the leaflets large or small; flowers usually yellow, commonly large and showy, racemose, paniculate, or solitary; fruit very variable in form, dehiscent or indehiscent.

Besides the species enumerated here, a large number of herbaceous ones also occur in Mexico.

Fruit elastically bivalvate. Anthers dehiscent by short terminal slits.

Flowers mostly in terminal racemes, sometimes also in the upper axils; plants hispid or viscid-pubescent, or both.

Petioles equaling or slightly longer than the rachis; leaflets oval to oblong or obovate.....1. *C. pauciflora*.

Petioles usually twice as long as the rachis or longer; leaflets rounded-obovate or suborbicular.

Fruit hispid with long spreading hairs; plants prostrate or procumbent.

2. *C. hispidula*.

Fruit pilose with short appressed hairs; plants erect...3. *C. enneandra*.

Flowers solitary or clustered in the axils; plants neither hispid nor viscid.

Leaflets 2 or 4.....4. *C. diphylla*.

Leaflets more than 2.

Leaflets 3 or 4 pairs.

Venations of the leaflets conspicuously reticulate.....5. *C. greggii*.

Venation of the leaflets not reticulate.....6. *C. macdougaliana*.

Leaflets numerous pairs.

Costa of the leaflet very close to the margin.....7. *C. cinerea*.

Costa of the leaflet remote from the margin.

Stems glabrate or puberulent.....8. *C. flexuosa*.

Stems pilose with spreading hairs.....9. *C. picachensis*.

Fruit indehiscent or dehiscent, never elastically bivalvate.

Gland of the petiole borne at the base of the petiole.

Fruit 15 to 25 cm. long, 2 to 3 mm. wide.....10. *C. leptocarpa*.

Fruit 7.5 to 12.5 cm. long, 5 to 8 mm. wide.....11. *C. occidentalis*.

Glands borne between the leaflets or none.

Anthers partly dehiscent by basal pores, pubescent.....12. *C. grandis*.

Anthers all dehiscent at or near the apex, usually glabrous.

A. Fruit turgid, terete, subterete, tetragonous, or articulate-compressed and strongly constricted between the seeds.

Seeds longitudinal.

Plants glabrous or nearly so; leaflets usually 3 pairs....13. *C. tora*.

Plants sericeous or stellate-tomentose; leaflets 3 to 5 pairs.

Plants sericeous.....14. *C. ornithopoides*.

Plants stellate-tomentose.....15. *C. villosa*.

Seeds transverse.

Leaflets 2 pairs.

Racemes axillary, much shorter than the leaves.

Leaflets glabrous.....16. *C. inaequilatera*.

Leaflets pubescent beneath.

Leaflets obtuse.....17. *C. berlandieri*.

Leaflets acute.....18. *C. densiflora*.

Racemes mostly arranged in a large terminal panicle.

Leaflets densely pubescent beneath.....19. *C. oxyphylla*.

Leaflets glabrous beneath or obscurely puberulent.

Gland present between the lowest pair of leaves; stipules setaceous.....20. *C. fruticosa*.

Glands present between both pairs of leaflets; stipules lanceolate.....21. *C. undulata*.

Leaflets 3 or more pairs.

Leaflets 6 to 18 pairs.

Leaflets 6 to 8 pairs, rounded at apex, tomentose beneath.

22. *C. tomentosa*.

Leaflets 8 to 15 pairs, acute, glabrous.....23. *C. spectabilis*.

Leaflets 3 to 5 pairs.

Leaflets acute, usually glabrous.....24. *C. laevigata*.

Leaflets obtuse or rounded at the apex, often pubescent.

Leaflets densely sericeous.....25. *C. argentea*.

Leaflets glabrous or nearly so.....26. *C. bicapsularis*.

AA. Fruit strongly compressed, flat, not articulate, or if articulate not much constricted between the seeds.

B. Gland present between the lowest pair of leaflets, large and conspicuous.

Fruit breaking into 1-seeded joints.....27. *C. skinneri*.

Fruit not jointed.

Leaflets 2 or 3 pairs.

Fruit linear-oblong, about 12 mm. wide.....28. *C. purpusi*.

Fruit linear, less than 8 mm. wide.

Anthers erostrate.....29. *C. botteriana*.

Anthers partly rostrate.

Interior sepals 12 mm. long; plants usually pubescent.

30. *C. leiophylla*.

Interior sepals 6 mm. long; plants glabrous.

31. *C. holwayana*.

Leaflets 4 to 40 pairs.

Leaflets 18 to 40 pairs, linear-oblong.....32. *C. multijuga*.

Leaflets 4 to 15 pairs, usually broader.

Leaflets small, 4 to 6 mm. long.....33. *C. polyphylla*.

Leaflets 7 to 20 mm. long or longer.

Petals about 7 mm. long; flowers in long racemes; leaflets densely pilose beneath.....34. *C. chiapensis*.

Petals 15 to 20 mm. long or larger; flowers clustered or in very short few-flowered racemes; leaflets usually glabrous or sparsely pubescent.

Leaflets acuminate.....35. *C. tonduzii*.

* Leaflets rounded or very obtuse at apex.

Leaflets oblong, 9 to 12 pairs.....36. *C. quiedondilla*.

Leaflets obovate to oval, usually 4 to 8 pairs.

37. *C. biflora*.

BB. Glands none or minute and inconspicuous.

Leaflets 1 pair.....38. *C. unijuga*.

Leaflets 3 to 15 pairs.

Leaflets small, 3 to 7 mm. wide or narrower.

Fruit winged on the margins.

Leaflets 4 to 7 pairs, obovate-oval.....39. *C. galeottiana*.

Leaflets 8 to 14 pairs, elliptic-oblong.....40. *C. polyantha*.

Fruit not winged.

Fruit 9 to 15 cm. long, the valves thin.....41. *C. wislizeni*.

Fruit 14 to 25 cm. long, the valves thick.....42. *C. pringlei*.

Leaflets large, 1 to 6 cm. wide or larger.

Valves of the fruit winged.....43. *C. alata*.

Valves of the fruit not winged.

Leaflets 3 to 5 pairs.

Leaflets acute or acutish, soft-pubescent beneath.

44. *C. atomaria*.

Leaflets rounded or very obtuse at the apex.

Leaflets oblong.....45. *C. peralteana*.

Leaflets oval, oval-ovate, or rounded.

Fruit and ovary glabrous or nearly so.

46. *C. emarginata*.

Fruit and ovary pubescent-----47. *C. andrieuxii*.

Leaflets 6 to 15 pairs.

Leaflets glabrous; stipules large, reniform.

48. *C. nicaraguensis*.

Leaflets pubescent; stipules lanceolate to linear.

Fruit glabrous; leaflets usually acute---49. *C. racemosa*.

Fruit pubescent, at least when young; leaflets very obtuse or rounded at the apex.

Leaflets 1.8 to 3 cm. long; bracts lanceolate.

50. *C. liebmanni*.

Leaflets mostly 5 to 12 cm. long; bracts rounded-oval.

51. *C. reticulata*.

1. *Cassia pauciflora* H. B. K. Nov. Gen. & Sp. 6: 360. 1823.

Cassia punctulata Hook. & Arn. Bot. Beechey Voy. 420. 1841.

Sinaloa to Guerrero; type from La Venta del Peregrino. Central America; Brazil.

Shrub 0.6 to 2.5 meters high, viscid-hirsute; leaflets 2 pairs, 1.5 to 4.5 cm. long, obtuse or rounded at apex; petals yellow, nearly 2 cm. long; fruit about 3 cm. long, nearly 1 cm. wide. "Bejuco" (Sinaloa).

2. *Cassia hispidula* Vahl. Eclog. Amer. 3: 10. 1807.

Durango to Veracruz and Chiapas. Central America and South America.

Plants procumbent, usually herbaceous, but sometimes fruticose, very viscid; leaflets 2 pairs, 1 to 2 cm. long; petals bright yellow, 1.5 to 2 cm. long; fruit flat, hirsute, 3 to 4.5 cm. long, 8 mm. wide. "Nahuapate" (Costa Rica).

The plant is used medicinally in Costa Rica. The seeds are reported to contain abrin, the principle found in the seeds of *Abrus precatorius*.

3. *Cassia enneandra* T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 179. 1915.

Oaxaca and Chiapas; type from Cerro de Picacho, Oaxaca. Guatemala.

Slender shrub, 1 to 2 meters high; leaflets 2 pairs, 1 to 1.8 cm. long, thinly pilose; flowers about 1.8 cm. long.

4. *Cassia diphylla* L. Sp. Pl. 376. 1753.

Veracruz to Guerrero and Oaxaca. Widely distributed in tropical America.

Plants essentially annual and usually herbaceous, but often frutescent, prostrate, glabrous; leaflets and large stipules finely parallel-veined.

5. *Cassia greggii* A. Gray, Pl. Wright. 1: 59. 1852.

Chamaecrista greggii Pollard; Heller, Cat. N. Amer. Pl. ed. 2. 5. 1900.

Nuevo León (type locality) and Tamaulipas.

Low shrub, nearly glabrous, with gray or brownish branches; leaflets oblong, about 1 cm. long; flowers 1.5 cm. long; fruit flat, 4 cm. long, 6 mm. wide, puberulent.

6. *Cassia macdougaliana* Rose, Contr. U. S. Nat. Herb. 12: 267. 1909.

San Luis Potosí to Puebla; type from Tehuacán, Puebla.

Densely branched shrub, 30 to 60 cm. high; leaflets 4 to 8 mm. long, bright green, thick; flowers large, deep yellow, long-pedicellate.

7. *Cassia cinerea* Cham. & Schlecht. Linnaea 5: 559. 1830.

Chamaecrista cinerea Pollard; Heller, Cat. N. Amer. Pl. ed. 2. 5. 1900.

Tamaulipas, Veracruz, and Oaxaca, often on seashores; type collected between Tecolutla and Villa Rica, Veracruz.

Ascending or prostrate shrub, the stem sometimes 2 meters long; leaflets small, pubescent.

8. *Cassia flexuosa* L. Sp. Pl. 379. 1753.

Chamacrista flexuosa Greene, Pittonia 4: 27. 1899.

Chamacrista amplistipulata Rose, Contr. U. S. Nat. Herb. 12: 267. 1909.

Yucatán to Guerrero and Oaxaca. Central America and northern South America; type from Brazil.

Low erect shrub, with small coriaceous leaflets and large stipules.

9. *Cassia picachensis* T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 180. 1915.

Guerrero to Oaxaca; type from Cerro de Picacho, Oaxaca.

Very closely related to the preceding species, and probably only a pubescent form of it.

10. *Cassia leptocarpa* Benth. Linnaea 22: 528. 1849.

Sinaloa to Chihuahua, Veracruz, and Oaxaca. Central America and South America.

More commonly, perhaps, herbaceous, but sometimes shrubby and 2.5 meters high, ill-scented, variable in pubescence, sometimes glabrous but often pilose; leaflets about 5 pairs, ovate, 3 to 10 cm. long, acute or acuminate; flowers large and showy, paniculate; fruit subterete, 15 to 25 cm. long. "Viche" (Sinaloa).

11. *Cassia occidentalis* L. Sp. Pl. 377. 1753.

Chihuahua to Sinaloa, Chiapas, and Yucatán. Widely distributed in tropical and subtropical America; type from Jamaica.

Herbaceous or shrubby, sometimes 2.5 meters high, ill-scented; leaflets 4 to 7 pairs, ovate, 2 to 8 cm. long, acute or acuminate, usually glabrous; flowers large and showy, mostly axillary; fruit flat, glabrous, with thick margins. "Habilla," "habilla prieta" (Michoacán, Guerrero); "bricho" (Jalisco, San Luis Potosí); "mezquitillo" (Jalisco, Oaxaca); "hediondillo" (Oaxaca); "vainillo" (Oaxaca); "ecapatli" or "ecapacle" (Nahuatl); "frijolillo" (El Salvador, Panama, Nicaragua); "pico de pájaro" (Costa Rica, Nicaragua); "hierba de la potra," "hierba de gallinazo," "aitera," "bicho," "furrusca," "comida de murciélago," "chilinchile" (Colombia); "brusca" (Colombia, Venezuela, Cuba); "hierba hedionda," "martinica" (Cuba).

The seeds are sometimes employed as a substitute for coffee. The plant is used in domestic medicine for its reputed tonic, diuretic, stomachic, and febrifuge properties. It is employed especially for dropsy, rheumatism, fevers, and venereal diseases. An infusion of the leaves has been employed by the regular physicians of the French colonies of western Africa in the treatment of yellow fever, with good results according to reports.¹ The plant is used also, in the form of an ointment, as a remedy for ringworm, eczema, and other cutaneous diseases.

This species is figured by Hernández,² and described in a chapter entitled "De *Ecapatli*, seu parva *Sambuco*." His account is as follows: "*Ecapatli*, which some call *Tlaloaxin*, some *Totoncaxihoitl*, or hot medicine, some *Xomotontli*, or little elder, and others *Xiopatli*, is a hairy shrub, with leaves like the almond, and smooth, purplish, slender, round stems. On the tips of the branches are borne the yellow flowers, from which spring the pods, which are slender, round, and long, filled with purplish seeds, like lentils but smaller, of heavy odor and bitter flavor. The shrub grows in fields of the hot and temperate regions, and is often cultivated about houses and gardens because of its medicinal virtues. Its nature is hot and dry and somewhat astringent. It cures tumors and ulcers and calms ear-ache. The leaves, crushed and applied as a plaster to the belly, benefit infants who vomit their milk; and

¹ See Heckel, Les plantes utiles de Madagascar, p. 266. 1910.

² Thesaurus 112. 1651.

applied likewise to the head they alleviate pain; and applied everywhere to the body, or taken in the quantity of a handful, they relieve fever chills. Some say that in this manner it cures indigestion also, that its application helps that form of leprosy which the Indians call *Xiottl*."

12. *Cassia grandis* L. f. Suppl. Pl. 230. 1791.

Collected at Acapulco, but perhaps only cultivated; reported from Tabasco, Central America, West Indies, and South America.

Tree, 4 to 10 meters high or larger; leaflets large, oblong, 10 to 20 pairs, pubescent; flowers large and showy, racemose, white or pink; fruit 45 to 60 cm. long, about 3.5 cm. in diameter. "Cañafistulá grande" (Tabasco); "cañafistula" (Guerrero); "carao" (Costa Rica, Nicaragua, El Salvador); "sandal" (Costa Rica); "cargo" (El Salvador, Honduras); "cañafistula gruesa," "cañandonga" (Colombia); "carámano" (Nicaragua); "cañafistula cimarrona" (Porto Rico).

The fruit is filled with a bitter pulp, which has laxative properties and is used in the treatment of fevers.

It is probably this species which has been reported frequently from Mexico as *C. fistula* L. The writer has seen no Mexican specimens of the latter, although it may occur in Mexico, at least in cultivation. The following Mexican names are reported for *C. fistula*: "Cañafistula," "quauhayo-huachtli," "quahuayo." It has been reported from Oaxaca, Campeche, Morelos, and Veracruz.

13. *Cassia tora* L. Sp. Pl. 376. 1753.

Baja California and Sonora to Chiapas and Veracruz. Widely distributed in the tropics of both hemispheres.

Plants ill-scented, glabrous or nearly so, usually herbaceous but sometimes fruticose and a meter high; leaflets obovate or rounded-obovate, 2 to 5 cm. long, rounded at apex; flowers large, yellow; fruit 15 to 20 cm. long, 3 to 4 mm. wide. "Dormilón" (Costa Rica); "biche manso" (Sinaloa); "ejotil" (Guatemala, Honduras, *Blake*).

The leaves are said to have the purgative properties of the senna of commerce. In the Old World tropics they are sometimes cooked and eaten. In India the plant bears a great reputation as a remedy for ringworm and other cutaneous diseases. It is sometimes cultivated there for the seeds, which are used as a mordant in dyeing cloth blue. The seeds are sometimes employed in Mexico as a substitute for coffee, and it is said that they have been imported into Europe from the tropics for use in adulterating that article. In India the leaves are fried in castor oil (oil of *Ricinus communis*) and applied to ulcers; they are also crushed and used to relieve the pain of insect stings, and employed as poultices to boils to hasten suppuration. In the same country the seeds, ground and mixed with buttermilk, are employed to relieve itching eruptions of the skin.

14. *Cassia ornithopoides* Lam. Encycl. 1: 466. 1783.

Cassia sericca Swartz, Fl. Ind. Occ. 724. 1797.

Tamaulipas to Sonora, Guerrero, and Yucatán. Central America, West Indies, and South America.

Plants usually herbaceous, but sometimes fruticose and a meter high, sericeous with rufous or fulvous hairs; flowers small, yellow; fruit short, tetragonous, constricted between the seeds. "Ovilla" (Michoacán, Guerrero); "xtuab" (*Ramírez*).

Seeds used in Brazil as a substitute for coffee, the leaves as poultices for wounds, and the roots as a remedy for dropsy.

15. *Cassia villosa* Mill. Gard. Dict. ed. 8. *Cassia* no. 4. 1768.

Cassia astroites Cham. & Schlecht. Linnaea 5: 597. 1830.

Cassia articulata Rose, Contr. U. S. Nat. Herb. 12: 266. 1909.

Baja California; Oaxaca; Yucatán.

Shrub 1 to 2 meters high, easily recognized by the stellate pubescence; leaflets 3 or 4 pairs, ovate, 2.5 to 6.5 cm. long, acute or acuminate; flowers yellow; fruit 4 to 5 mm. wide, densely pubescent, deeply constricted between the seeds.

16. *Cassia inaequilatera* Balb.; DC. Prodr. 2: 490. 1825.

Reported from Oaxaca by Bentham. Colombia and Venezuela; type from Santa Marta, Colombia.

Leaflets ovate, acuminate; flowers in axillary racemes.

17. *Cassia berlandieri* Benth. Trans. Linn. Soc. Bot. 27: 520. 1871.

Tamaulipas and Veracruz; type from Tampico.

The writer has seen no material of this species.

18. *Cassia densiflora* Mart. & Gal. Bull. Acad. Brux. 12: 304. 1843.

Durango to Veracruz, Oaxaca, and Chiapas; type from Guatulco, Oaxaca.

Leaflets obliquely ovate, 6 to 15 cm. long, obtuse or acute, thin, bright green; flowers yellow, in axillary racemes.

19. *Cassia oxyphylla* Kunth. Mimos. Pl. Légum. 129. pl. 39. 1819-24.

Cassia hartwegii Benth. Pl. Hartw. 117. 1843.

Sinaloa to Chiapas. Central America and northwestern South America; type from Venezuela.

Shrub, 2 to 4.5 meters high; leaflets oblique, oblong to obovate-oval, 6 to 18 cm. long, usually short-acuminate; flowers large, pale yellow; fruit subterete, about 14 cm. long and 1 to 1.5 cm. in diameter, the valves thin, smooth. "Candelillo" (Costa Rica); "frijol de monte" (Panama); "casia fistula" (Sinaloa).

The plant is used in Sinaloa as a vomitive.

20. *Cassia fruticosa* Mill. Gard. Dict. ed. 8. *Cassia* no. 10. 1768.

Cassia bacillaris L. f. Suppl. Pl. 231. 1781

Guerrero to Chiapas, Yucatán, and Veracruz. West Indies, Central America, and northern South America.

Slender, erect or scandent shrub; leaflets ovate, oblong, or obovate, oblique, 7 to 18 cm. long, usually acuminate; flowers yellow, large and showy; fruit terete, 14 to 35 cm. long, 1 cm. or less in diameter. "Quitigato" (Guerrero); "quelite" (Tabasco, *Rovirosa*); "vainillo" (Nicaragua); "sen de palillos" (Costa Rica).

This is probably the species reported by Sessé and Mociño¹ as *C. viminea*.

21. *Cassia undulata* Benth. in Hook. Journ. Bot. 2: 76. 1840.

Michoacán and Guerrero to Tabasco. Central America and northern South America.

Erect or scandent shrub, 2 to 4 meters high; leaflets obliquely lanceolate or ovate, 4.5 to 9 cm. long, long-acuminate, bright green, lustrous; flowers yellow, large and showy.

22. *Cassia tomentosa* L. f. Suppl. Pl. 231. 1781.

Querétaro to Hidalgo and Oaxaca; often cultivated. Central America and South America.

Shrub or small tree, 1 to 4.5 meters high, tomentose throughout; leaflets oblong, 2 to 6.5 cm long; flowers large and showy; fruit subterete, tomentose,

¹ Pl. Nov. Hisp. 63. 1887.

about 11 cm. long, with thin valves. "Retama" (Guerrero, *Ramírez*); "alcaparro" (Colombia).

23. *Cassia spectabilis* DC. Cat. Hort. Monsp. 90. 1813.

Reported from Veracruz. Central America, West Indies, and Colombia.

Tree, sometimes 9 meters high; leaflets lanceolate, 4.5 to 8 cm. long, attenuate; fruit 25 to 30 cm. long, terete, glabrous, transversely sulcate, with thick hard valves. "Canchín" (Veracruz, *Ramírez*).

It may be that this is one of the species which, in Mexico, have been confused with *C. fistula* L.

24. *Cassia laevigata* Willd. Enum. Pl. 441. 1809.

Sinaloa to Tamaulipas, Veracruz, and Chiapas. Widely distributed in the tropics of both hemispheres.

Plants herbaceous or fruticose, sometimes 2.5 meters high, or occasionally a small tree, glabrous or nearly so; leaflets usually ovate, 4 to 8 cm. long, acute or acuminate; flowers yellow; fruit subcompressed, 6 to 10 cm. long, 6 to 8 mm. in diameter. "Duerme de noche" (Durango); "retama" or "retamo" (Veracruz, Durango, Oaxaca); "café del país," (Veracruz, Oaxaca); "sen del país," "hierba hedionda macho" (Porto Rico); "frijolillo" (Guatemala, Honduras, *Blake*).

Seeds sometimes used as a substitute for coffee. The plant is said to have purgative properties, and is used in Mexico as an emmenagogue. Sornay states that the plant has been suspected to be poisonous.

This species is figured by *Hernández*¹ and discussed in a chapter entitled "De *Chatalhuic* *Cassia* *Silvestri*." The figure applies to this plant, but the description does not agree in all particulars. He speaks of it as "*chatalhuic*, which some call *Cacaotl* or *Casia fistula*." "The bark," he says, "which is hot and dry in the fourth degree, is light or dark in color; powdered and drunk in the quantity of two drachms in water in the morning it purges the bile and phlegm, and expels worms if there are any in the body. It is esteemed as an excellent drug by the natives. The same bark, mixed with *Axin* and supplied behind the ears, cures earache. The rind of the fruit, which is sweet and in flavor similar to that of *Cassia fistula*, drunk in the same manner and quantity, purges the bile and phlegm, soothes the belly, and acts as a gentle purgative. The same rind, pulverized and infused in water (a comb being wetted with it), restores the hair and makes it grow long. The seeds, ground and mixed with water and drunk, soothe fevers. All of which things have been proved by a thousand experiments." On page 376 of the same work there is figured, without description, "*Ecapatli altera*," which also is probably of this species.

25. *Cassia argentea* H. B. K. Nov. Gen. & Sp. 7: 358. 1823.

Known only from the type locality, banks of the Rio Mescal.

Said to be a shrub about a meter high, although the related species are much lower and herbaceous. No material seen by the writer.

26. *Cassia bicapsularis* L. Sp. Pl. 376. 1753.

Cassia ovalifolia Mart. & Gal. Bull. Acad. Brux. 12: 305. 1843.

Cassia manzanilloana Rose, Contr. U. S. Nat. Herb. 1: 325. 1895.

Sonora to Tamaulipas, Yucatán, and Chiapas. Widely distributed in tropical America; also adventive in the Old World.

Shrub, 1.5 to 3 meters high, or often herbaceous, glabrous or pubescent; leaflets oval or obovate, 1.5 to 4 cm. long; flowers pale yellow, very large and showy; fruit subterete, about 11 cm. long and 1 cm. in diameter, smooth. "Bricho" or "bicho" (Jalisco, San Luis Potosí); "alcaparrillo" (Oaxaca,

¹Thesaurus 70. 1651.

Guatemala, Peru); "cochimbo" (Oaxaca, Tabasco); "sen del país" (Cuba, Porto Rico); "hoja de sen" (Porto Rico); "hierba del burro" (Argentina).

Leaves reported to have purgative properties. The wood is said to have been used in Brazil for paper making.

27. *Cassia skinneri* Benth. Trans. Linn. Soc. Bot. 27: 542. 1871.

Cassia nelsoni Rose, Contr. U. S. Nat. Herb. 5: 135. f. 1. 1897.

Cassia trichoneura T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 179. 1915.

Guerrero to Morelos and Chiapas. Guatemala (type locality).

Shrub or tree, 2 to 6 meters high; leaflets usually 5 pairs, oval, oblong, or obovate, 2 to 4.5 cm. long, rounded at apex, pubescent beneath; flowers yellow, the petals about 3.5 cm. long, conspicuously veined; fruit flat, about 14 cm. long and 1 cm. wide, puberulent. "Parocata" (Guerrero).

28. *Cassia purpusi* T. S. Brandeg. Zoe 5: 234. 1906.

Baja California; type from Calmallí.

Low shrub with dark branches; leaflets oval, 1 to 2 cm. long, rounded at apex, glaucescent; flowers yellow; fruit 5 or 6 cm. long, glabrate.

29. *Cassia botteriana*¹ Benth. Trans. Linn. Soc. Bot. 27: 541. 1871.

Veracruz and Tepic; type from Orizaba, Veracruz.

No material seen by the writer.

30. *Cassia leiophylla* Vog. Gen. Cass. Syn. 25. 1837.

Veracruz; reported from Tabasco. Central America and South America; type from Brazil.

Low shrub, or sometimes wholly herbaceous; leaflets broadly obovate, 3 to 5 cm. long, rounded at apex; flowers yellow, the petals 3 cm. long; fruit about 10 cm. long and 5 mm. wide, falcate, glabrate. "Hormiguera" (Tabasco, *Rovirosa*).

31. *Cassia holwayana* Rose, Contr. U. S. Nat. Herb. 8: 301. 1905.

Cassia multiflora Mart. & Gal. Bull. Acad. Brux. 10²: 307. 1843. Not *C. multiflora* Vog. 1837.

Puebla, Oaxaca, and Chiapas; type from the city of Oaxaca.

Shrub, 1 to 3.5 meters high, glabrous; leaflets oval or oblong, 2 to 7.5 cm. long, rounded at the apex; flowers yellow, very large and showy; fruit flat, 7 to 11 cm. long, 5 to 7 mm. wide. "Retamo" (Oaxaca, *Villada*).

32. *Cassia multijuga* L. Rich. Act. Soc. Hist. Nat. Paris 108. 1792.

Puebla and Chiapas. South America; West Indies.

Tree, about 6 meters high; leaflets linear, 10 to 15 mm. long, glabrous; flowers large, yellow; fruit flat, 15 cm. long, 1.5 cm. wide, glabrous.

33. *Cassia polyphylla* Jacq. Coll. Bot. 4: 104. 1790.

Yucatán. West Indies; type from Porto Rico.

Shrub, 2 to 4 meters high, or sometimes a tree of 15 meters; leaflets few, oval or obovate; flowers yellow, mostly solitary; fruit flat, linear. "Hediondilla," "retama," "retama prieta" (Porto Rico).

34. *Cassia chiapensis* Standl. Contr. U. S. Nat. Herb. 19: 215. 1919.

Chiapas; type from Teopisca.

Probably a shrub, densely pilose throughout; leaflets oval, 2 to 4 cm. long, rounded at apex; flowers small, yellow, racemose; fruit short, flat, thin, glabrate.

¹Mateo Botteri, a Dalmatian, was sent to Mexico by the Horticultural Society of London about 1850. Later he collected on his own account, and made very extensive series of specimens, which were widely distributed. These came chiefly, if not entirely, from the region of Orizaba, where he settled and later died.

35. *Cassia tonduzii* Standl. Contr. U. S. Nat. Herb. 20:215. 1919.
Chiapas. Costa Rica (type locality).
Tree; leaflets elliptic or oblong, 3 to 8 cm. long; flowers yellow, about 3 cm. long; fruit flat, 15 to 18 cm. long, 6 mm. wide, glabrate.
36. *Cassia quiedondilla* Micheli, Mém. Soc. Phys. Hist. Nat. Genève 34:272. pl. 19. 1903.
Guerrero; type from Los Fresnos. Guatemala to Costa Rica.
Shrub; leaflets 1.2 to 3 cm. long, rounded at apex, pale beneath, glabrate; flowers yellow, the petals 3 to 3.5 cm. long. "Quiedondilla" (Guerrero).
Probably not essentially different from some of the forms of *C. biflora*.
37. *Cassia biflora* L. Sp. Pl. 378. 1753.
Cassia acapulcensis H. B. K. Nov. Gen. & Sp. 6:353. 1823.
Cassia geminiflora Moc. & Sessé; Collad. Hist. Nat. Méd. Cass. 103. pl. 3. 1816.
Baja California to Chihuahua, Yucatán, and Chiapas. Widely distributed in tropical America.
Slender shrub, 0.5 to 2.5 meters high; leaflets 1 to 3.5 cm. long, rounded or sometimes emarginate at apex, glabrous or nearly so; flowers yellow, 2 to 3 cm. long; fruit flat, 5 to 11 cm. long, 4 to 5 mm. wide, straight or curved. "Flor de San José" (Oaxaca); "ahumada," "montenegrito" (Nicaragua); "retama" (Porto Rico); "brucha" (Venezuela); "abejón," "biche silvestre" (Sinaloa).
Said to have been used in the Bahamas as a remedy for venereal diseases.
38. *Cassia unijuga* Rose, Contr. U. S. Nat. Herb. 5:195. 1899.
Puebla; type from Tehuacán.
Densely branched shrub, 30 to 90 cm. high; leaflets rounded, 6 to 11 mm. long, subretuse at apex, pubescent; flowers axillary, yellow, 2.5 cm. long; fruit flat, glabrous, about 10 cm. long and 7 mm. wide.
39. *Cassia galeottiana* Martens, Bull. Acad. Brux. 10²:305. 1843.
Puebla and Oaxaca (type locality).
Shrub or small tree, 2 to 4.5 meters high; leaflets 5 to 9 mm. long, rounded at the apex, glabrate in age; flowers yellow, 1 to 1.5 cm. long; fruit about 7 cm. long and 2 cm. wide, flat and thin, glabrous, narrowly winged, breaking into short joints.
40. *Cassia polyantha* Moc. & Sessé; Collad. Hist. Nat. Méd. Cass. 112. pl. 2. 1816.
Cassia browniana Kunth, Mimos. Pl. Légum. 135. pl. 41. 1819-24.
Cassia goldmani Rose, Contr. U. S. Nat. Herb. 10:98. 1906.
Baja California; Guanajuato to Oaxaca.
Shrub or small tree, 3 to 4.5 meters high; leaflets 1 to 2 cm. long, rounded at apex, glabrate in age; flowers yellow, about 1 cm. long; fruit similar to that of the preceding species.
41. *Cassia wislizeni* A. Gray, Pl. Wright. 1:60. 1852.
Chihuahua (type locality) to Tamaulipas, San Luis Potosí, and Querétaro. Southern New Mexico and Arizona.
Shrub, 1 to 3 meters high; leaflets obovate or rounded, 4 to 15 mm. long, rounded at apex, thinly and minutely sericeous; petals yellow, 2 cm. long; fruit flat, 6 to 8 mm. wide, glabrous, lustrous. "Pinacate" (Zacatecas).
42. *Cassia pringlei* Rose, Contr. U. S. Nat. Herb. 5:194. 1899.
Cassia morelensis Greenm. Proc. Amer. Acad. 39:79. 1903.
Colima to Morelos and Oaxaca; type from Tomellín, Oaxaca.
Shrub or small tree, 1 to 6 meters high; leaflets oblong, obovate, or oval, 5 to 8 mm. long; flowers 2 to 2.5 cm. long; fruit flat, 6 mm. wide.

43. *Cassia alata* L. Sp. Pl. 378. 1753.

Guerrero; reported from Yucatán, Oaxaca, and Tabasco, but chiefly cultivated, probably. Widely distributed in tropical America.

Shrub, 1 to 4 meters high; leaflets oval to oblong, 6 to 17 cm. long, rounded at apex, glabrate; flowers large, lemon-yellow, racemose; fruit about 15 cm. long, each valve with a broad thin wing. "Flor del secreto" (Yucatán, Oaxaca); "taratana" (Oaxaca, Tabasco); "soroncontil" (Nicaragua); "bagagua," "lucutema," "mocuteno," "majagüillo" (Colombia); "laureño" (Panama); "guacamaya francesa" (Cuba); "baraño" (Guatemala, Honduras, Blake); "talantola," "talantro" (Porto Rico); "guajavo" (Santo Domingo).

In Jamaica the plant is known as "ringworm shrub." It is a very handsome shrub when in flower. In Guam and the Philippines it is called "Acapulco," doubtless from the fact that it was introduced into those islands by the ships which sailed between Acapulco and Manila. In the Philippines this name has also been modified as "Capulco" and "Capurco." Reko refers the Nahuatl name "ecapatli" to this species, and states that the plant was employed by the Aztecs for syphilis. He refers here also the name "toncaxihuitl" ("fever-herb"), and states that the plant found use also as a remedy for fevers.

The leaves are said to have purgative, diuretic, and sudorific properties, and they are employed widely as a remedy for ringworm and other cutaneous diseases. The decoction of the plant has been used in the West Indies for venereal diseases, as a remedy for snake bites, and to destroy chiggers. Drury reports that it is widely used by Hindoo physicians for all sorts of poisonous bites. For an illustration of the plant see Contr. U. S. Nat. Herb. 8: pl. 39.

44. *Cassia atomaria* L. Mant. Pl. 68. 1767.

Sinaloa to Chiapas. Central America and South America.

Tree, 5 to 12 meters high; leaflets oblong, elliptic, or ovate, 4.5 to 12 cm. long, densely pubescent beneath; flowers large, yellow, racemose; fruit flat, 14 to 40 cm. long or more, 1 to 1.5 cm. wide. "Quediondillo" (Michoacán, Guerrero; doubtless a corruption of "hediondilla").

45. *Cassia peralteana* H. B. K. Nov. Gen. & Sp. 6: 356. 1823.

A very doubtful species; known only from the original collection obtained near Campeche.

Leaflets oblong, 1 to 3 cm. long, appressed-puberulent beneath; flowers in axillary racemes.

46. *Cassia emarginata* L. Sp. Pl. 376. 1753.

Cassia arborescens Mill. Gard. Dict. ed. 8. *Cassia* no. 15. 1768.

Nearly throughout Mexico. West Indies, Central America, and northern South America.

Tree, 3.5 to 7 meters high, or larger; trunk often 25 to 30 cm. in diameter; bark dark brown; leaflets oblong to rounded-oval, 2 to 13 cm. long, pubescent beneath; flowers large, pale yellow or orange, racemose; fruit like that of *C. atomaria*. "Flor de San José," "alcaparro," "vara de San José," "chile perro" (Oaxaca); "xtuab" (Yucatán); "palo de zorrillo" (Baja California); "palo hediondo" (Veracruz); "mora hedionda" (Sinaloa); "vainillo" (Nicaragua); "brucha macho" (Venezuela); "guacamaya amarilla," "Júpiter amarillo" (Cuba); "palo de chivo" (Santo Domingo).

Reported to have purgative properties and to be used in Jamaica as a dye-wood. In Sinaloa the leaves are applied to allay the pain of insect stings. The flowers are very abundant and showy.

47. *Cassia andrieuxii* Benth. Trans. Linn. Soc. Bot. 27: 548. 1871.

Cassia fulva T. S. Brandeg. Zoe 5: 233. 1906.

Puebla (type locality) and Oaxaca.

Shrub or small tree; leaflets oval or obovate-oval, 1 to 3.5 cm. long, densely pubescent on both surfaces; flowers yellow, racemose; fruit 15 cm. long, about 8 mm. wide.

48. *Cassia nicaraguensis* Benth. Trans. Linn. Soc. Bot. 27: 552. 1871.

Cassia seleriana Harms, Bull. Herb. Boiss. 7: 551. 1899.

Guerrero to Oaxaca. Central America; type from Nicaragua.

Tree, 4 to 6 meters high, glabrous; stipules very large, semireniform, persistent; leaflets numerous, oblong, 3 to 7 cm. long, obtuse or rounded at apex; flowers yellow, in long racemes; fruit 8 to 11 cm. long, nearly 1.5 cm. wide, lustrous, the valves prominently mamillate over the seeds. "Candelita" (Costa Rica); "sambrán" (El Salvador).

49. *Cassia racemosa* Mill. Gard. Dict. ed. 8. *Cassia* no. 19. 1768.

Yucatán. South America.

Tree, 6 to 18 meters high; leaflets oblong to oval-elliptic, 3 to 6 cm. long; flowers large, orange or yellow, in short dense racemes; fruit about 6.5 cm. long and 1 cm. wide, flat.

50. *Cassia liebmanni* Benth. Trans. Linn. Soc. Bot. 27: 549. 1871.

Known only from the type locality, Santiago Estola. Oaxaca.

51. *Cassia reticulata* Willd. Enum. Pl. 443. 1809.

Chiapas; reported from Yucatán and Tabasco. Central America and South America.

Tree, 3.5 to 8 meters high; leaflets oblong to obovate, rounded at apex; flowers large, yellow, in long racemes; fruit very flat, 12 to 18 cm. long, 1.3 to 2 cm. wide, the valves thin. "Sambrán," "sambrán de río" (El Salvador); "saragundín" (Costa Rica); "sorocontil" (Nicaragua); "tarantán" (Venezuela).

2. TAMARINDUS L. Sp. Pl. 34. 1753.

1. *Tamarindus indicus* L. Sp. Pl. 34. 1753.

Widely cultivated in Mexico, as well as elsewhere in tropical America, and often growing without cultivation. Native of the tropics of the Old World.

Large unarmed tree, sometimes 15 meters high or more, with widely spreading crown, the bark brown; leaves pinnate, the leaflets numerous, oblong, 1 to 2 cm. long; flowers large, yellow, striped with red, racemose; fruit large, brown, rough, thick, indehiscent, the 4 to 7 brown seeds surrounded by a juicy red pulp; wood fine-grained, dirty white or yellowish, its specific gravity said to be about 0.94. Known generally as "tamarindo;" the name "huaje" or "hoaxin" is said to be used in some localities.

The tamarind was introduced into Mexico soon after the Conquest, and is now a common tree in many regions. The wood is of some local importance. It is valuable for building purposes and furnishes excellent charcoal for the manufacture of gunpowder. In India the leaves are used to give a yellow dye and the seeds, young leaves, and flowers are eaten. The fruit is the most important product of the tree, the juicy, acidulous pulp being eaten and employed generally in tropical America in the preparation of cooling beverages. It is made also into various kinds of sweetmeats. In some parts of tropical America a fermented drink is made from the pulp.

In India the fruit is much used for flavoring curries, and the seeds are often cooked and eaten. The young seedlings also are boiled as a vegetable, likewise the leaves and flowers.

The pulp of the fruit is official in the U. S. Pharmacopoeia. It contains sugar and acetic, tartaric, and citric acids. Its fluid extract is laxative and

refrigerant, and an infusion is employed as a beverage in febrile diseases. The supply of the fruit for the United States comes chiefly from the West Indies; that for Europe from India, the West Indies, and Ecuador. For shipment the outer shell is stripped off and the pulp preserved with sugar or syrup. In Madagascar a decoction of the bark is employed for asthma and amenorrhoea, and a decoction of the leaves for intestinal worms and derangements of the stomach.

The tamarind is described at length by Hernández.¹ For an illustration of the leaves and fruit see Contr. U. S. Nat. Herb. 9: *pl.* 66.

Ceratonia siliqua L., the carob or St. John's-bread ("algarrobo"²), a native of the Old World, is cultivated at Guaymas, Sonora, and probably elsewhere. It has pinnate leaves with large oval leaflets, and large brown pods containing a thick edible pulp.

3. POEPPIGIA Presl, Symb. Bot. 1: 15. 1830.

1. *Poeppigia procera* Presl, Symb. Bot. 1: 16. *pl.* 8. 1830.

Guerrero and Oaxaca. Cuba, Central America, and South America.

Nearly glabrous tree, 4 to 5 meters high, unarmed; leaves pinnate, the leaflets numerous, linear-oblong, 1 to 2 cm. long, glabrate; flowers yellow, showy, paniculate; fruit flat and thin, narrowly winged on the upper suture, 4 to 9 cm. long, 1 to 1.5 cm. wide; wood hard, the sapwood white, the heartwood reddish, beautifully veined. "Quiebra-hacha," "bicho" (Oaxaca); "tengue," "abey hembra" (Cuba).

4. CERCIS L. Sp. Pl. 374. 1753.

1. *Cercis canadensis* L. Sp. Pl. 374. 1753.

Coahuila to San Luis Potosí. Eastern United States.

Large shrub or small tree, 3 to 12 meters high, the trunk sometimes 30 cm. thick; bark smooth, light brown; leaves deciduous, reniform or ovate-orbicular, 5 to 9 cm. wide, glabrous or pubescent beneath; flowers pink or purplish, clustered, appearing before the leaves; fruit flat, thin, 6 to 10 cm. long, 1 to 1.5 cm. wide, bronze, somewhat glaucous; wood hard, close-grained, yellowish brown, its specific gravity about 0.70. "Pata de vaca" (San Luis Potosí).

Palmer reports that in San Luis Potosí the flowers are fried and eaten, being considered a great delicacy. The bark has mild but very active astringent properties, and has been recommended for the treatment of chronic diarrhoea and dysentery.

C. reniformis Engelm. (*C. texensis* Sarg.) has been reported from Mexico. That species does not appear to be very clearly distinct from *C. canadensis*. The Mexican material at hand seems to represent a single species, and agrees better with *C. canadensis* than with the material that has been referred to *C. reniformis*.

5. CYNOMETRA L. Sp. Pl. 382. 1753.

1. *Cynometra oaxacana* T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 180. 1915.

Guerrero and Oaxaca; type from Cerro de Picacho, Oaxaca.

Unarmed tree, 8 to 10 meters high; leaves nearly sessile, bifoliate, the leaflets very oblique, 3 to 6.5 cm. long, obtuse, thick, lustrous, glabrous; flowers

¹ Thesaurus 83-84, with figure. 1651. For other accounts see Popenoe in Bailey, Stand. Cycl. Hort. 3306-3307. *f.* 3768. 1917; Safford, Contr. U. S. Nat. Herb. 9: 383. 1905; Cook, Contr. U. S. Nat. Herb. 8: 248. 1903.

² This is the tree to which the name "algarrobo" is applied in Spain. The Spaniards who came to Mexico in early days applied the name to various similar, more or less closely related plants.

small, white, in short racemes, long-pedicellate; fruit ellipsoid, compressed, 2.5 to 3 cm. long.

6. HYMENAEA L. Sp. Pl. 1192. 1753.

Some of the species occurring along the East African coast furnish valuable gums which are exported as "copal gum" for the manufacture of varnish. The gum is exuded chiefly about the roots, and in some localities deposits of "fossil" gum are found, where the trees themselves have disappeared. From 800,000 to 1,200,000 pounds of the gum are said to be exported annually from Zanzibar.

1. *Hymenaea courbaril* L. Sp. Pl. 1192. 1753.

Hymenaea candolleana H. B. K. Nov. Gen. & Sp. 6: 323. pl. 566. 1823.

Tepec to Chiapas, Veracruz, and Tabasco. Widely distributed in Central America, the West Indies, and South America.

Unarmed tree, 5 to 25 meters high, or even larger, the trunk sometimes 2 meters in diameter, sometimes furnished with buttresses, the bark thin, whitish; leaves bifoliolate, persistent, the leaflets obliquely ovate, oblong, or oval, 5 to 10 cm. long, obtuse to acuminate, thick and leathery, gland-dotted; flowers large, whitish or purplish, corymbose-paniculate; fruit large, brown, rough, usually 2-seeded, indehiscent, the valves very thick and hard. "Cuapinol," "cuapinole," "cuapinoli," "coapinol," "guapinol," "guapinole" (Tabasco, Oaxaca, Veracruz, Jalisco, Central America, etc.; from the Nahuatl *cuapinolli*, sometimes written *quauhpinoli*); "nere" (Oaxaca, Zapotec, *Reko*); "copinol" (Guatemala, El Salvador); "algarrobo" (El Salvador, Cuba, Porto Rico, Panama, Venezuela); "quiebra-hacha," "curbaril" (Cuba); "palito colorado" (Guatemala, Honduras, *Blake*).

The name "courbaril" is said to be employed in British Guiana and "jatoba" in Brazil. The wood is very hard, tough, and heavy (the specific gravity reported as 0.90 and 1.06), and is colored somewhat like mahogany; it is employed for general construction, ship building, furniture, sugar mills, etc., and is sometimes exported. The Indians of Brazil use both the trunks and the bark for making canoes. The seeds are surrounded by a sweet pulp, which becomes mealy when the fruit is ripe. This pulp is edible; it is mixed with water to prepare a kind of "atole," which is said to be very nutritious, and is sometimes fermented to produce an alcoholic beverage. A pale yellow or reddish gum ("resina de cuapinole," "goma animé de México," "ámbar del país," "ámbar de cuapinole," "succino del país," "succino criollo," "goma de la tierra," "incienso de la tierra," "incienso de Petapa") exudes from the trunk, and is found more abundantly on the roots. In Mexico this has been much used for incense in churches, and is employed in making varnish for furniture, patent leather, etc. It is sometimes collected in Mexico for export, and this tree is supposed to be the source of the "gum animé," of which large quantities are shipped from Brazil. This was formerly used in official medicine, especially in the preparation of ointments and plasters, but now it is employed only in the manufacture of varnish and incense. The fruit contains large resin pockets whose contents harden into gum. In the regions where the tree is native the gum is sometimes smoked to relieve asthma and is employed locally for rheumatism, catarrh, ulcers, and venereal diseases. The decoction of the bark is reputed to act as an arterial sedative and to have purgative vermifuge and carminative properties.¹ For an illustration of the fruit see *Contr. U. S. Nat. Herb.* 8: pl. 41.

7. BAUHINIA L. Sp. Pl. 374. 1753.

Trees or shrubs, often armed with spines, sometimes scandent, the stems often compressed; leaves simple and palmately nerved, entire or bilobate,

¹ See Noriega, *Bol. Dir. Estud. Biol. (Mexico)* 2: 357-363. f. 1-3. 1918.

or sometimes bifoliolate; flowers racemose, usually large and showy, the racemes often paniculate; fruit flat, indehiscent or bivalvate.

There are many species of the genus in the East Indies, some of which are cultivated in tropical America because of their very showy flowers. Some of the Old World representatives yield a gum which, however, is of little importance, and the bark of certain species is used for tanning. Others have bark which furnishes dyes or from which rope is made, some are said to be employed as fish poisons, and some have edible flowers and seeds. Vermifuge properties are ascribed to certain species, and others are employed as remedies for liver affections.

The following names are reported for Mexican species whose identification is uncertain: "Timbe" (Jalisco); "hierba de la vaca" (Durango); "papalocuahuite" (San Luis Potosí).

Stamens 10, all or 5 of them perfect.

Plants armed with spines.

- Lobes of the leaves acute.....1. *B. leptopetala*.
Lobes rounded.....2. *B. longiflora*.

Plants unarmed.

- Leaves bifoliolate.....3. *B. heterophylla*.
Leaves simple.
Fruit elliptic-oblong.....4. *B. glabra*.
Fruit linear.

Leaves 3.5 cm. long or shorter, the lobes broadly rounded.

5. *B. andrieuxii*.

Leaves 4 to 11 cm. long, the lobes acute or acutish.....6. *B. unguolata*.

Stamens, except one or two, sterile and reduced to staminodia.

Leaves all or mostly bifoliolate.

- Leaflets 2-nerved; flowers solitary.....7. *B. ramosissima*.
Leaflets 3-nerved; flowers racemose.
Leaflets less than 2.5 cm. long.....8. *B. unguicularis*.
Leaflets 2.5 to 5 cm. long.....9. *B. uniflora*.

Leaves simple.

- Petals 2, much shorter than the calyx lobes.....10. *B. dipetala*.
Petals 5, equaling or much longer than the calyx lobes.

- Leaves not bilobate.....11. *B. jenningsii*.
Leaves all or mostly bilobate.

Leaves lobed more than halfway to the base.

- Leaves coriaceous, reticulate-veined, deeply cordate at base.

14. *B. pes-caprae*.

Leaves membranaceous, not reticulate-veined, shallowly or not at all cordate at base.

- Pedicels less than 5 mm. long, stout; pubescence of the petals appressed.....15. *B. lunarioides*.

Pedicels 7 to 12 mm. long, slender; claws of the petals pilose with spreading white hairs.

- Leaves broader than long, about 3 cm. long.....16. *B. lunaria*.

Leaves as long as broad or longer, 7 to 15.5 cm. long.

17. *B. pringlei*.

Leaves lobed less than halfway to the base, or barely to the middle.

- Petals nearly sessile, the claw very short.....18. *B. coulteri*.

Petals borne on long slender claws.

Petals densely pilose or tomentose, at least on the claw and lower part of blade.

Blades of the petals 2.5 mm. wide or narrower.

19. *B. subrotundifolia*.

Blades of the petals nearly 1 cm. wide.

Leaves 9-nerved, lobed halfway to the base, 5 cm. wide or narrower ----- 12. *B. macranthera*.

Leaves 7-nerved, lobed less than halfway to the middle, 6 to 8 cm. wide ----- 13. *B. retifolia*.

Petals glabrous or nearly so.

Leaves glabrous.

Leaves 5 to 10 cm. long, all deeply bilobate.

20. *B. unilateralis*.

Leaves 10 to 22 cm. long, shallowly bilobate, or some of them often entire ----- 21. *B. pansamalana*.

Leaves pubescent.

Leaves green beneath, almost concolorous, with numerous small glands, the lobes usually acute or acuminate.

22. *B. mexicana*.

Leaves pale beneath, nearly or wholly without glands.

Pubescence of the lower surface of the leaves, between the veins, of closely appressed hairs.

Leaves large, usually 5 to 8 cm. long, deeply lobed, the lobes divaricate, usually pointed ----- 23. *B. divaricata*.

Leaves small, 1.5 to 5.5 cm. long, shallow lobed, the lobes not divaricate, rounded ----- 24. *B. spathacea*.

Pubescence of the lower surface of the leaves of soft spreading hairs.

Petals purplish ----- 25. *B. schlechtendaliana*.

Petals white ----- 26. *B. latifolia*.

1. *Bauhinia leptopetala* DC. Prodr. 2: 513. 1825.

Described from Mexico. Known to the writer only from Mociño and Sessé's plate.¹

Leaves cordate at base, glabrous; flowers greenish, the petals linear, acute.

2. *Bauhinia longiflora* Rose, Contr. U. S. Nat. Herb. 10: 97. 1906.

Bauhinia chlorantha T. S. Brandeg. Zoe 5: 200. 1905.

Sinaloa to Guerrero; type from Imala, Sinaloa.

Spreading shrub or tree, 3 to 9 meters high, armed with short stout spines; leaves 2.5 to 6 cm. wide, green, sparsely pubescent beneath; flowers large, greenish; fruit 15 to 20 cm. long, 1 to 1.5 cm. wide, borne on a very long slender stipe.

Perhaps not different from *B. pauletia* Pers. (*Pauletia aculeata* Cav.), a species described from Panama.

3. *Bauhinia heterophylla* Kunth, Mimos. Pl. Légum. 46. 1919-24.

Yucatán. West Indies and northern South America; type from Venezuela.

Scandent shrub, 3 to 4.5 meters high.

4. *Bauhinia glabra* Jacq. Stirp. Amer. 119. pl. 173, f. 3. 1763.

Yucatán; Colima; reported from Veracruz. Central America and northern South America; type from Cartagena, Colombia.

Scandent shrub; leaves 5 to 7.5 cm. long, long-petiolate, the lobes obtuse, thinly brown-sericeous beneath; fruit 5 to 7 cm. long, nearly 2 cm. wide, 1 or 2-seeded, very thin, brown-sericeous.

The Mexican plant may be specifically distinct.

¹DC. Calq. Dess. Fl. Mex. pl. 223.

5. *Bauhinia andrieuxii* Hemsl. *Diag. Pl. Mex.* 48. 1880.

Oaxaca; type from the city of Oaxaca.

Shrub with reddish brown branches; leaves mostly 2 to 3 cm. wide, pubescent beneath; flowers few.

6. *Bauhinia unguolata* L. *Sp. Pl.* 374. 1753.

Pauletia inermis Cav. *Icon. Pl.* 5: 6. *pl.* 409. 1799.

Bauhinia inermis Pers. *Syn. Pl.* 1: 455. 1805.

Bauhinia cavaniillei Millsp. *Field Mus. Bot.* 1: 364. 1898.

Tepec to Veracruz, Tabasco, and Chiapas. Central America.

Erect shrub or small tree, unarmed, the branches slender, reddish brown; leaves 3 to 10 cm. wide, brown-pubescent and gland-dotted beneath; flowers 4 to 5 cm. long, white or greenish; stamens white; fruit 15 to 20 cm. long, about 1 cm. wide, minutely puberulent or glabrate. "Pato de venado" (Oaxaca, Michoacán, Guerrero); "calzoncillo" (Tabasco); "casco de venado" (Costa Rica); "cocla" (Panama).

Leaves said to have sudorific properties.

7. *Bauhinia ramosissima* Benth.; Hemsl. *Biol. Centr. Amer. Bot.* 1: 339. 1880.

Coahuila to Hidalgo; type from Zimapán, Hidalgo.

Densely branched shrub; leaflets about 1.5 cm. long, rounded at apex, bright green, glabrous; flowers 2.5 cm. long; fruit 1 to 1.5 cm. wide, short-stipitate.

8. *Bauhinia unguicularis* Benth.; Hemsl. *Biol. Centr. Amer. Bot.* 1: 340. 1880.

Known only from the type locality, Zimapán, Hidalgo.

Densely branched shrub; leaflets rounded at apex, glabrate; petals 3 cm. long.

9. *Bauhinia uniflora* S. Wats. *Proc. Amer. Acad.* 21: 451. 1886.

Coahuila and San Luis Potosí; type from Jimulco, Coahuila.

Large, densely branched shrub; leaflets oval or rounded, glabrate, thick; flowers purplish, about 3 cm. long.

10. *Bauhinia dipetala* Hemsl. *Diag. Pl. Mex.* 48. 1880.

Veracruz, Puebla, and Oaxaca; type from Valley of Córdoba, Veracruz.

Shrub or small tree, 3 to 4.5 meters high; leaves 3.5 to 12 cm. long, puberulent or glabrate beneath, the lobes rounded or obtuse; flowers purplish, the stamens long-exserted; fruit about 15 cm. long and 1 to 1.5 cm. wide, long-stipitate.

11. *Bauhinia jenningsii* P. Wilson, *Bull. Torrey Club* 43: 463. 1916.

Yucatán. Isle of Pines, Cuba (type locality).

Leaves ovate-oblong or ovate, sometimes subhastate, 4.5 to 10 cm. long, acute or obtuse at apex, subcordate at base, pale beneath; flowers about 1.5 cm. long; fruit 8 cm. long and 1.2 cm. wide.

12. *Bauhinia macranthera* Benth.; Hemsl. *Biol. Centr. Amer. Bot.* 1: 338. 1880.

Known only from the type locality, Zimapán, Hidalgo.

Leaves pubescent beneath, the lobes rounded; flowers subsolitary, the petals 3 cm. long; fruit about 12 cm. long, glabrous.

13. *Bauhinia retifolia* Standl., *sp. nov.*

Type from Rascón, San Luis Potosí (*Purpus* 5268; U. S. Nat. Herb. no. 463835).

Young branches stout, ferruginous-tomentulose, unarmed; petioles 1.5 to 2.5 cm. long, sparsely tomentose at first but soon glabrate; leaf blades 5.5 to 9.5 cm. long, 6 to 8 cm. wide, openly cordate or subcordate at base, 7 or 9-nerved, bilobate at the apex for about one-third the total length, the lobes deltoid, obtuse or rounded at apex, coriaceous, bright green, concolorous, the venation very

prominent and closely reticulate on both surfaces, lustrous above, glabrous, obscurely puberulent beneath along the nerves but elsewhere glabrous; flowers racemose, the racemes axillary, short, dense, the pedicels short, stout, tomentulose; calyx spathaceous, 2 to 2.4 cm. long, thinly puberulent; the teeth short, subulate; petals 5, 3 to 4 cm. long, the blade oval, about 1.5 cm. long, thinly racemose, the racemes axillary, short, dense, the pedicels short, stout, thinly tomentose near the base but elsewhere glabrous, the claw slender, densely tomentose; ovary long-stipitate, densely tomentose.

Related to *B. macranthera* Benth. The writer has seen no material of that species, but according to the description it differs in having small, 9-nerved, deeply bilobate leaves, and much shorter petioles.

14. *Bauhinia pes-caprae* Cav. Icon. Pl. 5: 3. pl. 404. 1799.

Guerrero; type from Acapulco.

Small tree, 3.5 meters high or larger; leaves 3 to 8 cm. long, glabrous or nearly so, very thick, the lobes rounded at apex; flowers about 3 cm. long, the petals white-sericeous outside, pink within. "Pié de cabra."

15. *Bauhinia lunarioides* A. Gray; S. Wats. Bibl. Ind. N. Amer. Bot. 205. 1878.

Nuevo León and probably elsewhere.

Leaves 3.5 to 5.5 cm. long, more or less pubescent beneath, the lobes rounded at apex; flowers about 3 cm. long.

16. *Bauhinia lunaria* Cav. Icon. Pl. 5: 4. pl. 407. 1799.

Known only from the type locality, Acapulco, Guerrero.

Shrub, 1.8 to 2.5 meters high; petals purplish.

17. *Bauhinia pringlei* S. Wats. Proc. Amer. Acad. 25: 147. 1890.

Jalisco to Guerrero; type from Guadalajara.

Slender shrub, 4.5 to 6 meters high; leaves 7.5 to 18 cm. wide, thin, bright green above, pale and glabrate beneath, the lobes rounded to acute; petals 3 cm. long, white, with a purple stripe along the costa; fruit about 12 cm. long and 1.3 cm. wide.

18. *Bauhinia coulteri* Macbride, Contr. Gray Herb. n. ser. 59: 22. 1919.

Bauhinia platypetala Benth.; Hemsl. Biol. Centr. Amer. Bot. 1: 339. 1880.

Not *B. platypetala* Burch. 1878.

San Luis Potosí and Hidalgo; type from Zimapán, Hidalgo.

Shrub, 30 to 60 cm. high, or perhaps larger; leaves 2 to 5 cm. wide, very shallowly lobed, the lobes broadly rounded; flowers about 2.5 cm. long; fruit 12 cm. long or shorter, 1.5 cm. wide.

19. *Bauhinia subrotundifolia* Cav. Icon. Pl. 5: 4. pl. 406. 1799.

Colima and Guerrero; type from Acapulco, Guerrero.

Shrub or tree, 2.5 to 6 meters high; leaves 3 to 5 cm. wide, puberulent or glabrate beneath, the lobes broadly rounded; flowers 1.5 cm. long, white; fruit 1.5 cm. wide, short, puberulent.

20. *Bauhinia unilateralis* Britten, Journ. Bot. Brit. & For. 35: 233. 1897.

Veracruz.

Leaves mostly 7-nerved, pale beneath; fruit about 15 cm. long, 1.5 cm. wide. "Pata de cabra."

21. *Bauhinia pansamalana* Donn. Smith, Bot. Gaz. 13: 27. 1888.

Chiapas. Guatemala; type from Pansamalá.

Shrub or small tree, 3 to 4 meters high; leaves 6 to 15 cm. wide, thin, bright green, glabrous, 7-nerved, some of them often entire but most of them with 2 short attenuate lobes; flowers purplish; fruit often 30 cm. long, 2 to 2.5 cm. wide.

22. *Bauhinia mexicana* Vog. Linnaea 13:299. 1839.*Bauhinia confusa* Rose, Contr. U. S. Nat. Herb. 10: 97. 1906.

Tamaulipas to Veracruz and Puebla; type from Papantla, Veracruz.

Shrub or small tree, 2 to 4.5 meters high, the trunk sometimes 12 cm. in diameter, the bark gray, rough; leaves 3 to 6.5 cm. wide, puberulent or glabrate beneath; flowers 2 to 2.5 cm. long, white, often tinged with pink; fruit 1.2 to 1.5 cm. wide, straight or falcate. "Pata-vaca," "pata de vaca" (Tamaulipas).

Plant used in Tamaulipas as a remedy for jaundice.

23. *Bauhinia divaricata* L. Sp. Pl. 374. 1753.

San Luis Potosí to Tabasco and Yucatán. Central America and West Indies.

Shrub or tree, 1.8 to 9 meters high; leaves 3 to 9 cm. wide, subcordate at base, the lobes usually divaricate, obtuse or acutish; flowers white, about 2 cm. long; fruit 1 to 1.5 cm. wide. "Pata de vaca" (Yucatán, San Luis Potosí); "tzu luth" (Yucatán, Maya, *Seler*); "pata de res" (San Luis Potosí); "huamúchil" (San Luis Potosí, *Seler*); "pato de chivo" (Santo Domingo).Wood used by the Indians for making bows. The species has been reported from Mexico as *B. porrecta* Swartz.**24. *Bauhinia spathacea* DC. Prodr. 2:512. 1825.**

Oaxaca to Yucatán.

Shrub or small tree; leaves 2 to 5.5 cm. wide; flowers white. "Pata de vaca" (Yucatán).

The material referred here by the writer may not be correctly identified, and it is doubtful if it is specifically distinct from the preceding species. The plant has been reported from Yucatán as *B. porrecta* Swartz.**25. *Bauhinia schlechtendaliana* Mart. & Gal. Bull. Acad. Brux. 10²:308. 1843.***Bauhinia goldmani* Rose, Contr. U. S. Nat. Herb. 10:97. 1906.

Oaxaca and Chiapas; type from Río de las Vueltas, Oaxaca.

Tree, 6 to 8 meters high; leaves 4 to 5 cm. wide, the lobes obtuse or acute; flowers 2.5 cm. long; fruit about 12 cm. long and 1.2 cm. wide.

Doubtfully distinct from the next species.

26. *Bauhinia latifolia* Cav. Icon. Pl. 5:4. pl. 405. 1799.*Bauhinia amblyophylla* Harms, Bull. Herb. Boiss. 7:548. 1899.

Sinaloa to Oaxaca and Veracruz; type from Acapulco, Guerrero. Guatemala.

Shrub or tree, 2 to 6 meters high, the bark brownish gray, shallowly fissured; leaves 3.5 to 11 cm. wide, pubescent beneath, the lobes acute to rounded; fruit 1 to 1.5 cm. wide; wood nearly white. "Pata de venado" (Michoacán, Guerrero); "pié de venado" (Oaxaca); "pata de cabra," "pié de cabra," "guacinilla cimarróna" (Sinaloa).

8. HAEMATOTOXYLUM L. Sp. Pl. 384. 1753.

Trees or shrubs, glabrous or nearly so, armed with stout spines; leaves pinnate, the leaflets few, of medium size; flowers yellow, racemose, the racemes axillary; fruit flat, thin, dehiscent along the sides.

Petals 5 to 6 mm. long-----1. *H. campechianum*.Petals 7 to 9 mm. long-----2. *H. brasiletto*.**1. *Haematoxylum campechianum* L. Sp. Pl. 384. 1753.**

Tabasco, Campeche (type locality), and Yucatán. West Indies.

Tree, sometimes 15 meters high, the trunk and branches gnarled, flattened and irregularly fissured, covered with grayish or brownish, rough bark; leaflets broad, somewhat wedge-shaped, 1 to 3 cm. long, with numerous fine parallel veins, emarginate at apex; flowers ill-scented; wood hard, with characteristic odor, the sapwood yellowish, the heartwood reddish brown, becoming deep red on exposure, the specific gravity about 1.003. Known in Mexico as "palo de tinta," "tinto," "palo de Campeche."

The wood (logwood) is a well-known article of export and has been exported from Mexico, Central America, and the West Indies in vast quantities. Formerly its export was the chief industry of Yucatán and Tabasco, and it is still shipped in considerable amounts. It is stated that when Grandmont captured Campeche he burned more than a million logs stored there. The wood is used principally for dyeing, its properties being dependent upon the peculiar principle, haematoxylin or hematin, which it contains. Logwood is one of the few natural dyewoods which has not been replaced satisfactorily by synthetic dyes. Its properties were made known at an early date, and the wood was soon an important article of export to Spain from Mexico and the West Indies. Acosta relates that in 1587 130 quintals of it were shipped to Spain from Santo Domingo. The tree seems to be native in Hispaniola, but it was naturalized at an early date in Jamaica and the Bahamas, where it did not grow naturally.

The heartwood is official in the U. S. Pharmacopoeia, being used in medicine as a mild astringent, especially in diarrhoea and dysentery. The wood contains about 10 per cent of tannin. The seeds are sometimes employed to flavor food.

2. Haematoxylum brasiletto Karst. Fl. Columb. 2: 27. pl. 114. 1862-69.

Haematoxylum boreale S. Wats. Proc. Amer. Acad. 21: 426. 1886.

Chihuahua to Baja California, Oaxaca, and Morelos. Guatemala to Colombia (type locality); Haiti.

Tree, similar in habit to the last species, rarely more than 7 meters high, often only a shrub; bark dark brown; leaves persistent until the appearance of the new ones, the young leaflets usually tinged with bronze; leaflets oblong-oval to orbicular, often broadly cuneate, 0.5 to 2 cm. long, rounded or emarginate at apex; fruit 2.5 to 5.5 cm. long, 0.8 to 1.5 cm. wide, very thin, sessile, often red or purple. Known generally as "brasil" or "palo de brasil," but the names "palo de tinta" and "palo de Campeche" are applied in the south; "azulillo" (Oaxaca); "brasileto" (Colombia).

This species has often been confused with the preceding one, and in commerce no distinction is drawn between the two. The wood is equally valuable, and has been exported in large quantities from the west coast of Mexico. It is used locally for dyeing various objects and is employed as a remedy for jaundice and erysipelas. The plant is described by Hernández¹ in a chapter entitled "De *Curaqua*, seu *Brasilio Hispanorum*." The accompanying figure is a very poor one and may represent some other plant. He states that the plant was called "curaqua" in Michoacán, "quamochitl" or "vitzquahuitl" by the Mexicans, and "brasil" by the Spaniards. "Its wood dyes thread red, for it is much like sandalwood. The decoction of the juice is at first yellow, but it turns red, and if it is boiled longer, purple, and if mixed with alum, red or vermilion. This tree is refrigerant, febrifuge, astringent, and corroborative."

9. HOFFMANSEGGIA Cav. Icon. Pl. 4: 63. 1797.

Herbs or small shrubs, usually with glandular foliage; leaves bipinnate, the leaflets small; flowers yellow, racemose; fruit linear or oblong, flat, often falcate.

Several herbaceous species of this genus occur in Mexico.

Calyx without black glands; plants leafless or nearly so.

Stems and leaves puberulent or short-pilose.....1. *H. microphylla*.

Stems and leaves glabrous.....2. *H. intricata*.

Calyx with black sessile glands; plants usually copiously leafy.

¹Thesaurus 121. 1651.

- Leaflets reticulate-veined, glabrous, numerous, with few glands.
3. *H. caudata*.
- Leaflets with obsolete venation, pilose, few, densely black-glandular.
- Pubescence of spreading or reflexed hairs-----4. *H. melanosticta*.
- Pubescence of appressed or incurved hairs-----5. *H. fruticosa*.
1. *Hoffmanseggia microphylla* Torr. U. S. & Mex. Bound. Bot. 58. 1859.
Sonora and Baja California, common in low sandy places. Southern California; type from the Colorado Desert.
Low, usually leafless shrub, 1 to 1.5 meters high, with green branches; flowers 6 to 7 mm. long; fruit 1.5 cm. long.
2. *Hoffmanseggia intricata* T. S. Brandeg. Proc. Calif. Acad. II, 2: 151. 1889.
Hoffmanseggia glabra Fisher, Contr. U. S. Nat. Herb. 1: 147. 1892.
Baja California (type locality) and Sonora.
Shrub, nearly leafless, with rigid spinose branches, forming clumps 45 cm. high; leaflets 1 to 2 mm. long.
3. *Hoffmanseggia caudata* A. Gray, Bost. Journ. Nat. Hist. 6: 179. 1850.
Occurring in Texas at various places along the Rio Grande, and doubtless also on the Mexican side; type collected between the Nueces and the Rio Grande.
Plants low, suffrutescent; leaflets small, pale, coriaceous; racemes few-flowered.
4. *Hoffmanseggia melanosticta* (Schauer) A. Gray, Pl. Wright. 1: 54. 1852.
Pomaria melanosticta Schauer, Linnaea 20: 748. 1847.
Hoffmanseggia melanosticta greggii Fisher, Contr. U. S. Nat. Herb. 1: 149. 1892.
Coahuila to Querétaro. Western Texas (type locality).
Low shrub, densely pubescent, closely covered with viscid black glands; leaflets oval, about 6 mm. long; flowers yellow, in long racemes.
5. *Hoffmanseggia fruticosa* S. Wats. Proc. Amer. Acad. 21: 451. 1886.
Known only from the type locality, Jimulco, Coahuila.
Shrub, about 1.8 meters high.

10. CAESALPINIA L. Sp. Pl. 380. 1753.

Trees or shrubs, sometimes scandent, usually unarmed but sometimes aculeate; leaves bipinnate, the leaflets large or small; flowers yellow or red, racemose, large and showy; fruit very variable, dehiscent or indehiscent.

Several species of *Caesalpinia* and *Poinciana* are described by Sessé and Mociño,¹ but the identification of most of them is doubtful. The following vernacular names are reported for species of uncertain determination: "Tzuraqua" (Michoacán, *Ramírez*); "cahuinga" (Michoacán); "chalate" (Oaxaca).

Fruit covered with long prickles; rachises of the leaves very spiny.

Leaves with foliaceous stipules; seeds gray-----1. *C. crista*.

Leaves without stipules; seeds yellow-----2. *C. jayabo*.

Fruit not prickly; rachises of the leaves nearly always unarmed.

Fruit thick and hard or fleshy, indehiscent or tardily dehiscent, or in a few species thin and dehiscent but some of the calyx lobes then pectinate-dentate.

Leaflets linear-oblong, less than 2 mm. wide; fruit curved or coiled.

3. *C. coriaria*.

¹ Pl. Nov. Hisp. 65-67. 1887.

Leaflets ovate-oblong to orbicular, 4 to 25 mm. wide or larger.

Calyx lobes entire or nearly so. Plants unarmed.

Leaflets 11 to 20 mm. wide----- 4. *C. vesicaria*.

Leaflets 4 to 8 mm. wide----- 5. *C. sclerocarpa*.

Calyx lobes, at least the outer one, pectinate-dentate.

Plants armed with spines; fruit thick and somewhat fleshy, usually less than 1.5 cm. wide----- 6. *C. cacalaco*.

Plants unarmed; fruit thin, 1.5 to 4 cm. wide.

Leaflets suborbicular, glabrous; fruit 1 or 2-seeded, 1.5 to 2.2 cm. wide----- 7. *C. gracilis*.

Leaflets ovate-oblong to oval, pubescent; fruit several-seeded, 2 to 4 cm. wide----- 8. *C. platyloba*.

Fruit thin, elastically bivalvate; calyx lobes entire.

Inflorescence densely ferruginous-tomentose with stellate hairs.

9. *C. eriostachys*.

Inflorescence not stellate-tomentose.

Leaves sessile; pinnae one pair; plants armed with spines.

10. *C. sessilifolia*.

Leaves petiolate; pinnae more than one pair; plants usually unarmed.

Leaflets 6 to 10 pairs or more.

Pinnae 3 or 4 pairs; young branches pilosulous----- 11. *C. laxa*.

Pinnae 5 to 11 pairs or more; branches glabrous-- 12. *C. pulcherrima*.

Leaflets usually 3 to 5, sometimes 6 pairs.

Pedicels furnished with sessile or stipitate glands.

Leaflets with black glands along the margins.

13. *C. melanadenia*.

Leaflets without black glands.

Pedicels and calyx glabrous but furnished with stipitate glands.

14. *C. pannosa*.

Pedicels and calyx pubescent as well as glandular.

Leaflets 2 to 4.5 mm. wide.

Leaflets oblong, about 2 mm. wide, usually 4 or 5 pairs.

15. *C. placida*.

Leaflets oval or orbicular, about 4 mm. wide, usually 3 pairs.

16. *C. phyllanthoides*.

Leaflets 5 to 25 mm. wide.

Pedicels very sparsely glandular; leaflets rhombic.

17. *C. gaumeri*.

Pedicels densely glandular; leaflets obovate, ovate, or oval.

Fruit very glandular; leaflets 3 or 4 pairs, 5 to 14 mm. wide ----- 18. *C. caladenia*.

Fruit not glandular; leaflets 2 pairs, 10 to 23 mm. wide.

19. *C. acapulcensis*.

Pedicels without glands.

Pedicels jointed below the middle----- 20. *C. californica*.

Pedicels jointed above the middle, often at the base of the calyx.

Leaflets small, 2 to 5 mm. wide. Calyx densely pubescent.

21. *C. palmeri*.

Leaflets large, most of them 6 to 20 mm. wide or larger.

Calyx tube 6 mm. wide or less; stamens about as long as the petals----- 22. *C. mexicana*.

Calyx tube 8 to 11 mm. wide; stamens often long-exserted.

Stamens long-exserted----- 23. *C. exostemma*.

Stamens about equaling the petals---- 24. *C. yucatanensis*.

1. *Caesalpinia crista* L. Sp. Pl. 380. 1753.*Guilandina bonducella* L. Sp. Pl. ed. 2. 545. 1762.*Caesalpinia bonducella* Fleming, Asiat. Res. 11: 159. 1810.

Along beaches on both coasts of Mexico. Widely distributed on tropical and subtropical coasts of both hemispheres.

Straggling or sprawling, armed with very numerous straight or recurved prickles; leaflets ovate to orbicular, 1.5 to 4 cm. long, rounded or obtuse at apex, pubescent when young, glabrate in age; flowers small, greenish yellow; fruit 6 to 8 cm. long and nearly as broad, densely prickly; seeds usually 2, gray, nearly 2 cm. in diameter. "Cojones de gato" (Yucatán); "jabilla" (Veracruz); "haba de San Antonio" (Veracruz, *Dugès*); "taray" (Veracruz, *Ramírez*); "brasil" (Oaxaca); "guacolote" (*Nueva Farmacopea Mexicana*); "guacolote prieto," "brasilete colorado," "palo fernambuco," (Cuba); "mato de playa," "mato azul" (Porto Rico).

A characteristic strand plant, often forming impenetrable thickets of considerable extent. The large seeds (known as "nicker-nuts") are so hard that it requires a heavy blow of a hammer to break them. They retain their vitality for a long time, and are transported by ocean currents for great distances, having been carried occasionally from tropical America to European shores. They contain about 23 per cent of oil, which has been extracted in some regions. They are very bitter and contain a principle known as bondu-cine, which is believed to possess tonic and antiperiodic properties. The seeds have been used in domestic medicine (and even employed in Europe in times past) as a substitute for quinine, and also as a remedy for dropsy, snake bites, and venereal diseases. They are often carried by the natives of tropical America as talismans or amulets, and are used by children as marbles.

It is presumably this species which has been reported from Mexico as *C. echinata* Lam., a Brazilian species, and said to be known as "brasil" and "hoitzquahuitl" or "huitzquahuitl." The writer has seen no specimens of the plant, which may be some other species. It is said to be exported as a dye-wood. For an illustration of the seeds see *Contr. U. S. Nat. Herb.* 9: *pl.* 15.

2. *Caesalpinia jayabo* Maza, Anal. Soc. Esp. Hist. Nat. 19: 234. 1880.

Reported from Veracruz by Urban,¹ but the writer has seen no Mexican specimens. West Indies and East Indies.

Prickly shrub, similar to the preceding but with large yellow seeds. Known in Cuba as "guacolote amarillo" and in Porto Rico as "mato amarillo."

This is *C. bonduc* of most authors, but scarcely *Guilandina bonduc* L., which is synonymous with the preceding species.

3. *Caesalpinia coriaria* (Jacq.) Willd. Sp. Pl. 2: 532. 1799.*Poinciana coriaria* Jacq. Stirp. Amer. 123. *pl.* 75. *f.* 36. 1763.

Sinaloa to Oaxaca. West Indies, Central America, and northern South America.

Unarmed shrub or tree, 3 to 9 meters high, the trunk sometimes 40 cm. in diameter, the crown broad and spreading; bark rough, gray; leaflets numerous, 4 to 8 mm. long, glabrate, dotted with black glands; flowers small, white or yellowish, in short racemes; fruit short, 1.5 to 2 cm. wide, dark brown, lustrous, curved or coiled; sapwood light orange yellow, the heartwood dark, sometimes nearly black, very hard, heavy, tough, close-grained, taking a fine polish. "Cascolote" (Oaxaca, Michoacán, Guerrero, Chiapas, Colima); "nacascotl" (*Altamirano*); "nacascul" (Oaxaca, Guerrero); "nacascol" (Nicaragua, Costa Rica); "nacasolo" (Nicaragua); "nacasco-

¹Symb. Antill. 2: 273. 1900.

lote" (Guatemala); "agallo" (Panama); "dibidibi" or "dividivi" (Cuba, Santo Domingo, Colombia, Venezuela; also the commercial name); "guatapán," "guatapanare" (Venezuela); "guatapaná" (Cuba, Santo Domingo); "guastapaná" (Santo Domingo); "libidibi" (Colombia).

The pods contain 25 to 30 per cent of tannin. They are used locally for tanning and have been exported in large quantities from Mexico and other parts of tropical America for that purpose. They have been employed in Mexico for making ink and are said to have been so used by the early inhabitants. The pods yield a black dye and the wood is said to give a red one. The tree was introduced into India early in the nineteenth century and has been much planted there. One tree is said to yield as much as 100 pounds of the pods. These have been exported to England, under the name of "divi-divi" or "dibi-dibi," where they brought \$40 to \$65 per ton.

4. *Caesalpinia vesicaria* L. Sp. Pl. 381. 1753.

Yucatán. Cuba, Jamaica, and Curaçao.

Shrub or small tree, 3.5 to 4.5 meters high, unarmed; leaflets few, very broadly cuneate, 1 to 3 cm. long, usually emarginate, thick, lustrous, glabrous; flowers yellow; fruit 6 to 7 cm. long, about 1.5 cm. wide, thick and hard. Known in Cuba as "guacamaya de costa," "palo Campeche," or "palo negro."

5. *Caesalpinia sclerocarpa* Standl. Contr. U. S. Nat. Herb. 20: 214. 1919.

Sinaloa to Oaxaca; type collected between San Gerónimo and La Venta, Oaxaca.

Unarmed tree, 10 to 14 meters high, with a trunk 50 to 60 cm. in diameter; leaflets oblong or oval, 1 to 1.8 cm. long, glabrous; flowers yellow; fruit very hard, blackish, indehiscent, 5 to 8 cm. long, nearly 2 cm. wide. "Ébano" (Sinaloa).

The wood is valuable for carpenter work.

6. *Caesalpinia cacalaco* Humb. & Bonpl. Pl. Aequin. 2: 173. pl. 137. 1809.

Sinaloa to Puebla and Oaxaca; type collected between Chilpancingo and Zumpango, Guerrero.

Shrub or sometimes a large tree, often grown as a shade tree, usually very spiny; bark gray, very rough; leaflets few, oval or suborbicular, 1 to 2.5 cm. long, glabrous or nearly so; flowers large, in long racemes; fruit 10 to 15 cm. long, 1 to 1.5 cm. wide, red or reddish, somewhat succulent, somewhat constricted between the seeds. "Huisache" (Sinaloa; sometimes written "huizache"); "cascalote" (Michoacán, Oaxaca, Guerrero); "nacascul" (Guerrero, Oaxaca); "chalalá" (Oaxaca).

This tree is often confused in literature with *C. coriaria*, although the two species are very unlike in most of their characters. The fruit of *C. cacalaco* has the same properties as that of *C. coriaria*.

7. *Caesalpinia gracilis* Benth.; Hemsl. Diag. Pl. Mex. 9. 1878.

Sonora.

Slender unarmed shrub, 1 to 2 meters high, with reddish brown branches; leaflets few, 1 to 1.5 cm. long, glabrous; flowers few, yellow; fruit oval or rounded, about 3 cm. long, pale reddish brown, glabrous, usually with 2 large seeds. "Vara prieta."

The branches are sometimes used by the Indians for making baskets.

8. *Caesalpinia platyloba* S. Wats. Proc. Amer. Acad. 21: 425. 1886.

Chihuahua to San Luis Potosí, Oaxaca, and Sinaloa; type from Hacienda San Miguel, Chihuahua.

Shrub or small tree, 1.8 to 6 meters high, unarmed; leaflets 2 to 5.5 cm. long, pubescent; flowers yellow, the largest sepal pectinate-lobed; fruit 6 to 13 cm. long, flat, velvety-pubescent, thin but apparently indehiscent; seeds large, flat, brownish. "Palo colorado" (Chihuahua, Sinaloa).

A similar or perhaps the same species occurs in Yucatán, where it is known as "chacte." The writer has seen only flowering specimens, which matched those of *C. platyloba*; the fruit, however, may be different. One of the collections was determined by Greenman as *C. cubensis* Greenm., but that name is probably synonymous with *C. pectinata* Cav. (*Coulteria tinctoria* H. B. K.), a species in which the fruit is very different from that of *C. platyloba*.

9. *Caesalpinia eriostachys* Benth.; Seem. Bot. Voy. Herald 88. 1853.

Sinaloa to Guerrero. Central America; type from Costa Rica.

Shrub or small tree, sometimes 6 meters high, with an irregular trunk 20 cm. in diameter; leaflets numerous, oval or rhombic, 4 to 11 mm. long, dotted with black glands; flowers large, yellow, in long racemes; fruit 7 to 12 cm. long, 2 to 2.5 cm. wide, puberulent, flat, dehiscent. "Iguanero" (Michoacán, Guerrero); "iguano" (Sinaloa); "palo alejo" (Colima, Oaxaca); "zahino" or "zajino" (Costa Rica, Nicaragua).

It is reported that in Colima the crushed bark is thrown in water to stupefy fish.

10. *Caesalpinia sessilifolia* S. Wats. Proc. Amer. Acad. 21: 450. 1886.

Poinciana sessiliflora Rose, Contr. U. S. Nat. Herb. 13: 303. 1911.

Coahuila and Durango; type from Bolsón de Mapimi.

Spiny shrub, 1 to 2 meters high; leaflets suborbicular, 6 to 13 mm. long, pale, glabrous; flowers few, yellow; fruit short and broad, glabrate.

11. *Caesalpinia laxa* Benth. Pl. Hartw. 60. 1840.

Type from Tejomulco, Oaxaca; reported also from Nuevo León.

Shrub, 0.9 to 1.2 meters high, nearly glabrous; leaflets 6 to 9 pairs, oval-elliptic, 6 to 8 mm. long, glabrous.

12. *Caesalpinia pulcherrima* (L.) Swartz, Obs. Bot. 166. 1791.

Poinciana pulcherrima L. Sp. Pl. 380. 1753.

Cultivated nearly throughout Mexico and often escaped from cultivation. Widely cultivated and naturalized in the tropics of both hemispheres, its native habitat unknown.

Glabrous shrub or small tree, 1 to 6 meters high, unarmed or prickly, the trunk rarely more than 10 cm. in diameter; bark thin, nearly smooth, brown; leaflets oblong to obovate, 1.5 to 2.5 cm. long, pale beneath; flowers very large, red, more or less variegated with yellow, or sometimes wholly yellow; fruit flat, about 10 cm. long and 2 cm. wide; wood soft and weak, orange, fine-grained. "Flor de San Francisco" (Guerrero); "tabachfn." "tabachino." or "tabaqufn" (Nuevo León, Guerrero, Durango, Sinaloa, Baja California); "tabachfn amarillo" (Jalisco); "flor de guacamaya" (Oaxaca, Chiapas); "chacsickin," "kansickin" (yellow-flowered form) (Yucatán, Maya); "flor del camarón" (Veracruz, Guerrero); "chamolxochitl" (Nahuatl); "chaleasúchil" (from the Nahuatl *chacal-xochitl*, "shrimp-flower"); "sirundaniqua" (Michoacán, Tarascan, Ramírez); "xiloxóchitl" (Puebla, Nahuatl); "maravilla moreña" (Oaxaca); "tabachil" (Sinaloa); "guacamaya" or "guacamayo" (Nicaragua, Guatemala, Colombia, El Salvador); "clavellina" (Colombia, El Salvador, Costa Rica, Porto Rico); "hoja de sen" (Costa Rica); "flor barbona" (El Salvador, Guatemala); "flor de ángel," "florito," "flor de pavo" (Colombia); "hierba del espanto," "espanta-lobos," "gallito," "Santa Rosa," "flor de

chapa" (Guatemala); "cuacamaya" (Cuba); "malinche,"¹ "guacamaya pequeña" (Nicaragua); "barbón" (El Salvador); "caballero" (Philippines); "carzazo" (Santo Domingo).

The English names are "Barbados-flower," "Barbados-pride," "flower-fence," and "bird-of-paradise flower." The flowers are sweet-scented and are said to yield a good quality of honey. The fruit contains tannin and is sometimes used for tanning skins. It is said to give a yellow dye with alum and a black dye with iron salts, and the root is reported to yield a red dye. In India the charred wood is used to make ink. The large seeds are sometimes cooked and eaten when green. In Sinaloa it is reported that a kind of rubber is extracted from the seeds and made into balls or "pelotas." In domestic medicine the plant is employed in many ways. The leaves are sometimes used to adulterate senna. The early inhabitants of Mexico used a decoction of the leaves for liver affections and as a wash for ulcers of the mouth and throat. The flowers are reputed to have purgative, febrifuge, and emmenagogue properties, and a decoction is a popular remedy for erysipelas and for inflammation of the eyes. In Nicaragua the astringent infusion of the bark is used as a wash for the teeth and gums. Infusions of the leaves, roots, or bark are employed in various places for colds, fevers, cutaneous diseases, and as a purge, and are said even to induce abortion. It is reported that in Guatemala the leaves are thrown in water to stupefy fish.

A related species, *C. gilliesii* (Hook.) Wall., known as "bird-of-paradise flower," is sometimes cultivated in northern Mexico. It is distinguished by the copious pubescence and very viscid inflorescence.

13. *Caesalpinia melanadenia* (Rose) Standl.

Poinciana melanadenia Rose, Contr. U. S. Nat. Herb. 13: 303. 1911.

Puebla and Oaxaca; type from Tehuacán, Puebla.

Low shrub with reddish brown branches; leaflets oval or obovate, about 5 mm. long.

14. *Caesalpinia pannosa* T. S. Brandeg. Proc. Calif. Acad. II. 2: 150. 1889.

Poinciana pannosa Rose, Contr. U. S. Nat. Herb. 13: 303. 1911.

Baja California; type from San Jorge.

Unarmed shrub, 0.6 to 1.2 meters high; bark white, peeling in thin sheets; leaflets oval, 7 to 15 mm. long, glabrous; flowers pale yellow, in lax racemes; fruit flat, about 4 cm. long and 1.5 cm. wide, bearing numerous small black glands.

15. *Caesalpinia placida* T. S. Brandeg. Proc. Calif. Acad. II. 3: 131. 1891.

Poinciana placida Rose, Contr. U. S. Nat. Herb. 13: 303. 1911.

Baja California; type from La Paz.

Unarmed shrub, 1 to 3.5 meters high; bark dark brown; leaflets oblong, 4 to 6 mm. long, gland-dotted; inflorescence very glandular; flowers bright yellow, the calyx and pedicels dark red.

16. *Caesalpinia phyllanthoides* Standl., sp. nov.

Type from Hacienda Buena Vista, Tamaulipas (Wootton, June 18. 1919; U. S. Nat. Herb. no. 989730).

Low slender shrub with glabrous branchlets; leaves 5 to 9 cm. long, long-petioled, glabrous; pinnae 3 or 4 pairs, long-stalked; leaflets usually 3 pairs, 3 to 7 mm. long, 3 to 4.5 mm. wide, orbicular to oval, subcoriaceous, with rather

¹Derived from the Nahuatl, *malichtic*, a plume, especially one worn on the head (*panache*), referring to the long hairlike stamens. Malinche was also the name given to Cortés, because of his association with the Indian woman Malintzin or Marina, who during the Conquest acted as interpreter between the Mexicans and Spaniards.

prominent venation beneath, paler beneath, short-petiollulate, eglandular; racemes terminal, few-flowered; pedicels finely puberulent and furnished with scattered short-stipitate glands; sepals about 7 mm. long, puberulent and glandular, glandular-ciliate; petals only slightly exceeding the sepals; fruit flat, elastically dehiscent, 2.5 cm. long, 1.3 cm. wide, glabrous but with a few scattered dark glands.

17. *Caesalpinia gaumeri* Greenm. Field Mus. Bot. 2: 330. 1912.

Yucatán; type from Progreso.

Tree, 15 to 20 meters high, unarmed; leaflets 2 to 3 cm. long, glabrate; flowers yellow, in long racemes. "Xcitinche."

18. *Caesalpinia caladenia* Standl. Contr. U. S. Nat. Herb. 20: 214. 1919.

Sonora to Colima; type collected below Minas Nuevas, Sonora.

Unarmed shrub; leaflets oval, 1 to 3 cm. long, glabrous; flowers large, yellow; fruit flat, about 7 cm. long and 1.5 cm. wide, straight or falcate, bearing numerous small-reddish glands.

19. *Caesalpinia acapulcensis* Standl. Contr. U. S. Nat. Herb. 20: 213. 1919.

Known only from Acapulco, Guerrero, the type locality.

Unarmed shrub; leaflets 2.5 to 4 cm. long, rounded at apex, glabrous, pale beneath; fruit 7 cm. long, 1.7 cm. wide, puberulent.

20. *Caesalpinia californica* (A. Gray) Standl.

Caesalpinia mexicana californica A. Gray, Proc. Amer. Acad. 5: 157. 1862.

Poinciana californica Rose, Contr. U. S. Nat. Herb. 13: 303. 1911.

Baja California.

Unarmed shrub, 1 to 4.5 meters high; leaflets few, oval, 1 to 2 cm. long, glabrous; flowers yellow; fruit about 4.5 cm. long and 1.3 cm. wide, velvety-puberulent.

Perhaps not essentially different from *C. pannosa*.

21. *Caesalpinia palmeri* S. Wats. Proc. Amer. Acad. 24: 47. 1889.

Poinciana palmeri Rose, Contr. U. S. Nat. Herb. 13: 303. 1911.

Baja California, Sonora, and Sinaloa; type from Guaymas, Sonora.

Shrub or small tree, 1 to 4.5 meters high; leaflets 4 to 15 mm. long, usually glabrous but sometimes pubescent; calyx pubescent; flowers yellow, in very short racemes; fruit about 5.5 cm. long and 1.5 cm. wide, velvety-puberulent, tinged with purple.

22. *Caesalpinia mexicana* A. Gray, Proc. Amer. Acad. 5: 157. 1862.

Caesalpinia mexicana pubescens Robins. & Greenm. Proc. Amer. Acad. 29: 386. 1894.

Poinciana mexicana Rose, Contr. U. S. Nat. Herb. 13: 303. 1911.

Sinaloa to Tamaulipas and Guerrero; type from Nuevo León.

Unarmed shrub or small tree, 1.5 to 6 meters high; leaflets oblong to suborbicular, 1 to 2.5 cm. long; flowers rather large, yellow, in very long racemes; fruit flat, about 6 cm. long and 1.5 cm. wide. "Retamilla" (Nuevo León); "tabachín del monte" (Tamaulipas).

A rather variable species; calyx usually glabrous but sometimes pubescent. The form found on the Pacific Coast differs slightly from the more eastern one; intermediate forms occur also. Here probably belong sterile specimens of a Oaxaca tree known as "ébano" and "guayavillo."

23. *Caesalpinia exostemma* DC. Prodr. 2: 483. 1825.

Poinciana konzattii Rose, Contr. U. S. Nat. Herb. 13: 303. 1911.

Oaxaca; also reported to range from Jalisco to Chiapas. Guatemala to Nicaragua.

Small tree, 3 to 4.5 meters high, unarmed; leaflets oblong to oval, 1 to 3 cm. long, pubescent or glabrate; flowers large and showy, yellow; fruit 8 to

11 cm. long, 2 cm. wide, velvety-puberulent. "Hojasén," "hojasén del país," "sen," "sen del país," "yagati," "guete-rêgl" (Oaxaca, *Seler*).

24. *Caesalpinia yucatanensis* Greenm. Field Mus. Bot. 2: 252. 1907.

Veracruz and Yucatán; type from Izamal, Yucatán.

Shrub or tree; leaflets oblong to oval, 1.5 to 3.5 cm. long; flowers yellow, large and showy; fruit about 6.5 cm. long and 1.8 cm. wide, velvety-pubescent. "Xkanpocoleum" (Yucatán).

Doubtfully distinct from *C. exostemma*.

DOUBTFUL SPECIES.

ROBINIA PYRAMIDATA Mill. Gard. Dict. ed. 8. *Robinia* no. 7. 1708. Type from Campeche.

11. *DELONIX* Raf. Fl. Tellur. 2: 92. 1836.

1. *Delonix regia* (Boj.) Raf. Fl. Tellur. 2: 92. 1836.

Poinciana regia Boj.; Hook. in Curtis's Bot. Mag. pl. 2884. 1829.

Widely cultivated in Mexico as a shade tree and sometimes growing without cultivation. Native of Madagascar and tropical Africa, but planted commonly in all tropical regions.

Large tree, usually 10 to 20 meters high, with wide-spreading crown, the trunk sometimes a meter in diameter; bark thin, grayish brown, slightly furrowed; leaves bipinnate, deciduous, the leaflets numerous, oblong, 4 to 10 mm. long, pubescent; flowers racemose-corymbose, the petals 5 to 7 cm. long, orange-red or scarlet; fruit dark brown, flattened, often 60 cm. long; wood whitish or yellowish, close-grained but soft and weak, its specific gravity about 0.83. "Tabuchín" or "tabachín" (Oaxaca, Sinaloa); "framboyán" or "frambyano" (Veracruz; a corruption of the French "flamboyant"); "espuela de caballero," "flor del camarón" (Oaxaca, *Reko*); "árbol del fuego" (various parts of Mexico, Guam, Philippines); "pata león" (Tamaulipas); "caballero" (Philippines).

The English names are "flame-tree," "royal poinciana," and "peacock-flower." This is one of the most widely planted trees in the tropics, and when covered with its huge bunches of brilliant flowers it is extremely showy. When leafless the trees are rather unsightly, and their wood is so weak that they are often broken by wind. For an illustration of the tree see Contr. U. S. Nat. Herb. 8: pl. 54.

12. *CONZATTIA* Rose, Contr. U. S. Nat. Herb. 12: 407. 1909.

Shrubs or small trees, unarmed; leaves bipinnate, with numerous small leaflets; flowers showy, bright yellow, in long slender axillary racemes; fruit flat, few-seeded, very acute at both ends, narrowly winged along the edges.

The genus was named in honor of Dr. C. Conzatti, of Oaxaca, a botanist well known for his extensive collections and publications upon the Mexican flora.

Leaflets glabrous on the upper surface-----1. *C. multiflora*.

Leaflets sericeous on the upper surface-----2. *C. sericea*.

1. *Conzattia multiflora* (Robinson) Standl.

Caesalpinia multiflora Robinson, Proc. Amer. Acad. 27: 167. 1892.

Conzattia arborea Rose, Contr. U. S. Nat. Herb. 12: 408. 1909.

Michoacán to Puebla and Oaxaca; type from Monte León Pass, Michoacán.

Large shrub or small tree, nearly glabrous, 3 to 8 meters high, with broad spreading crown, the trunk 10 to 30 cm. in diameter; leaves large, with numerous small leaflets, these oblong, 1 to 1.8 cm. long, obtuse; flowers showy, yellow, in slender racemes; fruit 8 to 15 cm. long, 1 to 1.5 cm. wide, flat, very acute, with 3 or 4 seeds.

2. *Conzattia sericea* Standl., sp. nov.

Type from Río de Tamazula, Imala, Municipalidad de Culiacán, Sinaloa, altitude 80 meters (*J. G. Ortega* 4169; U. S. Nat. Herb. no. 1,081,254).

Tree, 10 to 15 meters high, the trunk 50 to 75 cm. in diameter, the young branchlets at first puberulent but soon glabrate; leaves long-petiolate, the pinnae few, the leaflets about 9 pairs, oblong, 10 to 12 mm. long, obtuse and apiculate, sericeous on both surfaces, more densely so beneath; racemes 8 to 25 cm. long, glabrous, the pedicels 6 to 9 mm. long; sepals 5 mm. long, very obtuse; petals bright yellow, 7mm. long. "Navío."

The pinnae and leaflets are less numerous than in *C. multiflora*.

13. *PARKINSONIA* L. Sp. Pl. 375. 1753.

Trees or shrubs, armed with spines; leaves pinnate, the leaflets numerous, small; flowers showy, yellow, in axillary racemes; fruit linear, nearly terete, constricted between the seeds.

Rachis of the leaves long, flat, winged; leaflets 20 to 30 pairs.—1. *P. aculeata*.

Rachis of the leaves short, not winged; leaflets 4 to 6 pairs.—2. *P. microphylla*.

1. *Parkinsonia aculeata* L. Sp. Pl. 375. 1753.

Common nearly throughout Mexico; often planted. Widely distributed in tropical America; western Texas.

Slender graceful shrub or tree, sometimes 12 meters high, the trunk 30 cm. or less in diameter; branches yellowish green, the bark brown in age, smooth; leaf rachis 20 to 40 cm. long, the leaflets 3 to 8 mm. long, pale green, deciduous, leaving the persistent naked rachis; flowers pale yellow, fragrant; pods 5 to 10 cm. long; wood hard, close-grained, light brown with yellowish sapwood, the specific gravity about 0.61. "Retama" (Nuevo León, Tamaulipas, Sinaloa, Texas, Costa Rica, Colombia); "retama de cerda" (Tamaulipas); "guacóporo" (Sonora, Tamaulipas, Guanajuato); "junco" (Guanajuato, San Luis Potosí); "palo verde" (Oaxaca, Tamaulipas); "mezquite extranjero" (Durango); "guichi-belle" (Oaxaca, Zapotec, *Reko*); "acacia de agüijote," "espino real de España" (Nicaragua); "calentano," "yabo" (Colombia); "flor de rayo," "palo de rayo" (Porto Rico); "junco marino," "espinillo" (Cuba); "espinillo de España" (Venezuela); "cambrón" (Santo Domingo).

The foliage and young branches are eaten by stock. The wood is used for fuel, and has been employed for making paper. The infusion of the leaves is employed locally as a febrifuge and sudorific, a remedy for epilepsy, and an abortifacient.

2. *Parkinsonia microphylla* Torr. U. S. Rept. Expl. Miss. Pacif. 4: 82. 1857.

Dry plains and hillsides, Sonora and Baja California. Southern California (type locality) and Arizona.

Spiny shrub or tree, 1 to 7.5 meters high, the trunk 30 cm. or less in diameter; bark smooth, yellowish green; leaflets 2 to 4 mm. long, pubescent; flowers pale yellow; fruit 5 to 8 cm. long; wood hard, close-grained, dark yellowish brown with yellow sapwood, with a specific gravity of about 0.74. "Retama," "lebón" (Baja California); "palo verde" (Sonora, California).

By the Pima Indians of Arizona the pods were eaten, either as gathered or after having been ground in a mortar. The coarse meal thus obtained was sometimes mixed with that of mesquite pods. The wood was used for making small articles, such as ladles.

14. *CERCIDIUM* Tulasne, Arch. Mus. Paris 4: 133. 1844.

Trees or shrubs, armed with axillary spines; leaves bipinnate, the leaflets few, small; flowers showy, yellow, few, in axillary racemes; fruit flat or swollen, finally dehiscent.

Pedicels glabrous or with few scattered appressed hairs-----1. *C. floridum*.
 Pedicels copiously pilose with very short spreading hairs.

Younger branches densely pilose with short whitish hairs.

2. *C. peninsulare*.

Younger branches glabrous or nearly so, sometimes finely puberulent.

Pods turgid when mature; seeds 5 to 7 mm. wide-----3. *C. torreyanum*.

Pods very flat; seeds about 3.5 mm. wide-----4. *C. plurifoliolatum*.

1. *Cercidium floridum* Benth.; A. Gray, Pl. Wright. 1: 58. 1852.

Coahuila to Tamaulipas. Southwestern Texas.

Spiny tree with crooked branches, sometimes 6 meters high, the trunk up to 25 cm. thick; bark thin, green or greenish brown; leaflets 2 to 4 pairs, 4 to 6 mm. long; flowers golden yellow, about 2 cm. broad, sweet-scented, in short racemes; fruit 4 to 6 cm. long, brownish yellow; wood soft, close-grained, greenish yellow, with a specific gravity of about 0.54. "Retama" (Tamaulipas); "palo verde" (Texas).

The wood is of little use except for fuel.

2. *Cercidium peninsulare* Rose, Contr. U. S. Nat. Herb. 8: 301. 1905.

Southern Baja California, common at low and middle elevations; type from La Paz.

Shrub or small tree, 1 to 7.5 meters high, closely resembling the next species and doubtfully distinct from it; spines short and stout; leaflets 5 to 10 mm. long, pubescent. "Palo verde," "palo de púa."

The young branches are sometimes cut and fed to horses and mules. For an illustration of a tree see Contr. U. S. Nat. Herb. 16: pl. 114.

3. *Cercidium torreyanum* (S. Wats.) Sarg. Gard. & For. 2: 388. 1889.

Parkinsonia torreyana S. Wats. Proc. Amer. Acad. 11: 135. 1876.

Sonora to Tepic. Southern Arizona (type from the Lower Colorado River) and California.

Small tree, sometimes 9 meters high, with a trunk 50 cm. in diameter; bark bright green; leaflets 2 or 3 pairs, 3 to 6 mm. long; fruit 8 to 10 cm. long, about 1 cm. wide; wood soft, weak, close-grained, light brown, with yellow sapwood, the specific gravity about 0.65. "Palo verde" (Sonora, California, Arizona).

The Indians of Arizona ground the fruit in a mortar and used it for food, especially in the form of atole. The wood was employed for various purposes.

4. *Cercidium plurifoliolatum* Micheli, Mém. Soc. Phys. Nat. Hist. Genève 34: 269. pl. 18. 1903.

Cercidium goldmani Rose, Contr. U. S. Nat. Herb. 8: 301. 1905.

Cercidium unijuga Rose, Contr. U. S. Nat. Herb. 8: 301. 1905.

Michoacán to Puebla and Oaxaca; type from San Luis (Guerrero?).

Tree, 4.5 to 12 meters high, the green branches armed with stout spines; leaflets mostly 5 to 8 pairs, 5 to 8 mm. long, pubescent; fruit thin, 4 to 7 cm. long, 8 mm. wide. "Palo de berria," "mantecoso," "palo mantecoso" (Oaxaca).

67. FABACEAE. Bean Family.

Trees or shrubs, often scandent; leaves alternate, stipulate, usually compound; flowers often large and showy, very irregular; fruit a legume, sometimes variously modified.

One of the largest and most important groups of Mexican plants. Many herbaceous species occur also. Perhaps some species of genera not included here, especially of *Phascolus*, deserve to be classed as shrubs. Two species of *Ormocarpum* have been reported from Mexico, but they are unknown to the

writer. *Copaifera*, also, has been reported, but there is no reason to believe that the genus belongs to the Mexican flora.

Coumarouna oleifera (Benth.) Taub.¹ was described, or rather mentioned, as the "Eboe-tree of the Mosquito shore." Hemsley gives the distribution as "Mexico; Honduras," but it is very doubtful whether the plant occurs in Mexico.

Stamens free.

Leaves digitately 3-foliolate..... III. Podalyrieae.

Leaves pinnate (rarely 1-foliolate).

Leaflets 1 to 3; petal 1..... I. Swartziaeae.

Leaflets 5 or more; petals 1 or 5..... II. Sophoreae.

Stamens monadelphous or diadelphous.

Fruit breaking up into joints..... VI. Hedysareae.

Fruit continuous, not jointed.

Leaves digitately 3-foliolate..... IV. Genisteeae.

Leaves pinnate or rarely simple.

Leaflets 3 (rarely 5); plants usually scandent; fruit bivalvate.

VIII. Phaseoleae.

Leaflets usually 7 or more, or the leaves simple; plants usually erect; fruit often indehiscent.

Leaves even-pinnate.

Plants scandent..... VII. Viciaeae.

Plants erect..... VI. Hedysareae.

Leaves odd-pinnate or simple.

Fruit large, indehiscent..... IX. Dalbergieae.

Fruit dehiscent, or very small and indehiscent..... V. Galegeae.

Tribe I. Swartziaeae.

A single genus..... 1. TOUNATEA.

Tribe II. Sophoreae.

Petal 1. Fruit short; ovules 2..... 2. ATELEIA.

Petals 5.

Ovule 1..... 3. TOLUIFERA.

Ovules 2 or more.

Stamens long-exserted..... 4. SWEETIA.

Stamens not exserted.

Calyx short-dentate..... 5. SOPHORA.

Calyx deeply lobate..... 6. ORMOSIA.

Tribe III. Podalyrieae.

A single genus..... 7. XYLOTHERMIA.

Tribe IV. Genisteeae.

A single genus in Mexico..... 8. CROTALARIA.

Tribe V. Galegeae.

Hairs of the pubescence usually attached by the middle; connective of the anther appendaged..... 9. INDIGOFERA. ✓

Hairs attached by the base; connective not appendaged.

Seeds usually 1 or 2; leaves gland-dotted.

Seed 1..... 10. APOPLANESIA.

¹ Taub. Bot. Centralbl. 47: 389. 1891. *Dipteryx oleifera* Benth. in Hook. Journ. Bot. 2: 235. 1850.

Seeds 2 or rarely more.

Corolla of a single petal.....11. *AMORPHA*.

Corolla of 5 petals.

Stamens diadelphous.....12. *EYSENHARDTIA*.

Stamens monadelphous.....13. *PAROSELA*.

Seeds several or numerous; leaves not gland-dotted.

Seeds with a small appendage (strophiole).

Stamens monadelphous.....14. *HARPALYCE*.

Stamens diadelphous.....15. *BRONGNIARTIA*.

Seeds not appendaged.

Inflorescence terminal or leaf-opposed.

Style bearded on the inner side.....16. *BARBIERIA*.

Style glabrous or bearded only at apex.....17. *CRACCA*.

Inflorescence axillary.

Fruit with 1 or 4 wings (the wings sometimes very narrow).

Fruit winged on the upper edge; plants usually spiny.

18. *ROBINIA*.

Fruit with 4 longitudinal wings; plants unarmed.

19. *DAUBENTONIA*.

Fruit not winged.

Fruit with inner cross-partitions.

Style glabrous.....20. *SESBAN*.

Style bearded.....21. *BENTHAMANTHA*.

Fruit 1-celled.

Fruit much inflated, bladder-like.....22. *DIPHYSA*.

Fruit not inflated.

Style coiled. Plants glabrous or nearly so.....23. *LENNEA*.

Style straight or slightly curved.

Style bearded.

Plants usually unarmed.....24. *COURSETIA*.

Plants very spiny.....25. *OLNEYA*.

Style glabrous or nearly so.

Stamens diadelphous.....26. *GLIRICIDIA*.

Stamens monadelphous.

Leaves estipellate.....27. *WILLARDIA*.

Leaves stipellate.....28. *HESPEROTHAMNUS*.

Tribe VI. *Hedysareae*.

Leaflets 1 or 3.....29. *MEIBOMIA*.

Leaflets 4 or more, often numerous.

Terminal joint of the fruit samara-like, with a large terminal wing. Plants scandent.....30. *NISSOLIA*.

Terminal joint not winged.

Leaflets 4 or 6, emarginate at apex. Flowers large, yellow.....31. *AMICIA*.

Leaflets 8 to many, rarely if ever emarginate.

Leaflets pungent-pointed, minute.....32. *PICTETIA*.

Leaflets never pungent.

Fruit jointed.....33. *AESCHYNOMENE*.

Fruit not jointed.....34. *CLIMACORACHIS*.

Tribe VII. *Vicieae*.

A single genus.....35. *ABRUS*.

Tribe VIII. Phaseoleae.

Style bearded.

Calyx teeth subequal.....36. **RAMIREZELLA.**Calyx teeth very unequal.....37. **CLITORIA.**

Style glabrous.

Vexillar stamen free at the base but united above with the other stamens.

Lower calyx lobe well developed.....38. **DIACLEA.**Lower calyx lobe minute.....39. **CANAVALIA.**

Vexillar stamen free, or united with the others at the base.

Plants erect.

Ovules 1 or 2. Flowers usually yellow.

Seeds transverse.....40. **ERIOSEMA.**Seeds longitudinal.....41. **DOLICHOLUS.**

Ovules usually numerous, at least more than 2.

Plants usually armed with spines; calyx very oblique, truncate, bilobate, or with very short teeth.....42. **ERYTHRINA.**

Plants unarmed; calyx deeply lobate or dentate.

Upper calyx lobe entire; leaflets not gland-dotted.

43. **GALACTIA.**

Upper calyx lobe bidentate; leaflets gland-dotted beneath.

44. **CAJANUS.**

Plants scandent or trailing.

Ovules 1 or 2.....40. **DOLICHOLUS.**

Ovules numerous.

Calyx bilobate, the lobes entire; fruit usually hispid with bristle-like hairs.....45. **MUCUNA.**

Calyx 4 or 5-lobate; fruit not hispid.

Upper 2 calyx lobes united into an entire lobe.....43. **GALACTIA.**

Upper 2 calyx lobes distinct or forming a bidentate lobe.

Bracts and bractlets striate, persistent.....46. **BRADBURYA.**

Bracts and bractlets not striate, caducous.

47. **CALOPOGONIUM.**

Tribe IX. Dalbergieae.

Fruit drupaceous, 1-seeded.....48. **ANDIRA.**

Fruit not drupaceous, usually with more than 1 seed.

Anther cells erect and dehiscent by a short terminal slit or divergent and dehiscent by longitudinal slits.....49. **AMERIMNON.**

Anther cells parallel, longitudinally dehiscent.

Leaflets alternate.

Calyx acute at base; fruit suborbicular or broadly oblong.

50. **PTEROCARPUS.**

Calyx obtuse at base; fruit circinate or samara-like.

Fruit circinate, not winged.....51. **DREPANOCARPUS.**Fruit winged, samara-like.....52. **MACHAERIUM.**

Leaflets opposite (rarely only 1).

Wing petals free from the keel. Ovule 1; fruit thin.

53. **PLATYMISCIUM.**

Wing petals adherent to the keel.

Fruit with 4 longitudinal wings.....54. **ICHTHYOMETHIA.**

Fruit not winged.

Fruit compressed.....55. **LONCHOCARPUS.**Fruit torulose, not compressed.....56. **MUELLERA.**

1. **TOUNATEA** Aubl. Pl. Guian. 1: 549. 1775.

Unarmed trees; leaves unifoliolate or 3 or 5-foliolate; flowers large, racemose; fruit coriaceous or fleshy, dehiscent or indehiscent.

Leaves unifoliolate.....1. **T. simplex**.
Leaves 3 or 5-foliolate.....2. **T. myrtifolia**.

1. **Tounatea simplex** (Swartz) Taub. Bot. Centralbl. 47: 391. 1891.

Possira simplex Swartz, Prodr. Veg. Ind. Occ. 82. 1788.

Rittera grandiflora Vahl, Eclog. Amer. 2: 37. pl. 9. 1798.

Swartzia grandiflora Willd. Sp. Pl. 2: 1220. 1800.

Swartzia simplex Spreng. Syst. Veg. 2: 567. 1825.

Tepec to Oaxaca. Central America, West Indies, and northern South America.

Glabrous tree, 3.5 to 5 meters high, resembling an orange tree; leaves oval or elliptic, 6 to 20 cm. long, acuminate, thick, lustrous; flowers large (the petal 3.5 cm. long), yellow; fruit 2.5 to 4.5 cm. long, rounded, long-stalked, with thick valves, containing one or two seeds. "Naranjillo" (Michoacán, Guerrero); "naranjito" (Oaxaca).

2. **Tounatea myrtifolia** (J. E. Smith) Taub. Bot. Centralbl. 47: 392. 1891.

Swartzia myrtifolia J. E. Smith in Rees, Cycl. 341. 1820.

Reported by Hemsley from Tabasco. Guatemala to Panama and northern South America; type from Venezuela.

2. **ATELEIA** Moc. & Sessé; DC. Mém. Légum. 394. pl. 57. 1825.

REFERENCE: Standley, The Mexican species of *Ateleia*, Contr. U. S. Nat. Herb. 20: 173-175. 1919.

Unarmed shrubs or trees; leaves pinnate, the leaflets large; flowers of medium size, white, racemose; fruit flat, stipitate, short and broad, indehiscent, more or less winged along the upper suture.

Wing of the fruit obsolete or nearly so; leaflets 1 to 1.6 cm. wide...1. **A. arsenii**.

Wing of the fruit well developed; leaflets 2.5 to 5.5 cm. wide.

Seeds 8 mm. long.....2. **A. insularis**.

Seeds 5 mm. long.....3. **A. pterocarpa**.

1. **Ateleia arsenii** Standl. Contr. U. S. Nat. Herb. 20: 174. 1919.

Known only from the type locality, Pico de Quinceo, near Morelia, Michoacán, altitude 2,800 meters.

Shrub; leaflets about 17, oblong, 2 to 5 cm. long, obtuse, puberulent beneath; petals about 1.3 cm. long; fruit 2.7 cm. long, 1.6 cm. wide.

2. **Ateleia insularis** Standl. Contr. U. S. Nat. Herb. 20: 175. 1919.

Known only from the type locality, María Madre Island, Tepec.

Leaflets ovate or oblong-ovate, 4.5 to 7 cm. long, obtuse, glabrate in age; fruit 3 cm. long and 2 cm. wide.

3. **Ateleia pterocarpa** DC. Prodr. 2: 419. 1825.

Pterocarpus ateleia Moc. & Sessé; DC. Prodr. 2: 419, 1825, as synonym.

Tepec; type from some unknown locality in Mexico.

Tree, about 6 meters high; leaflets oval or suborbicular, 3.5 to 8 cm. long, puberulent beneath, the venation finely reticulate; fruit 2 cm. long, 1.3 cm. wide.

3. **TOLUIFERA** L. Sp. Pl. 384. 1753.1. **Toluifera pereirae** (Klotzsch) Baill. Hist. Pl. 2: 383. 1870.

Myroxylon pereirae Klotzsch, Bonplandia 1857: 274. 1857.

Veracruz and Oaxaca to Yucatán and Chiapas; reported from Michoacán. Central America and northern South America.

Unarmed tree, sometimes 17 meters high, with gray bark; leaves pinnate, the leaflets 7 to 11, ovate or oval, 3 to 7.5 cm. long, obtuse to acuminate, lustrous, coriaceous at maturity, with numerous translucent dots and lines; flowers whitish, racemose; fruit about 7 cm. long, 2 to 3 cm. wide, indehiscent, the apex thick and 1-seeded, the basal portion long and broadly winged. "Nabá" (Yucatán, Tabasco, Maya); "chucte" (Veracruz); "bálsamo," "árbol de bálsamo," "palo de bálsamo" (Veracruz, Chiapas, Guatemala, etc.); "bálsamo de Perú," "semillas del obispo," "cedro chino" (Oaxaca); "yaga-guiente" (Oaxaca, Zapotec, *Reko*); "hoitziloxitl" (Nahuatl); "bálsamo negro"; "bálsamo de San Salvador."

This tree furnishes the balsam of Peru or "balsamum Peruvianum" of commerce. The commercial article comes chiefly, if not wholly, from El Salvador. The balsam, which is obtained from the trunk of the tree, is a viscid, dark reddish brown, fragrant liquid, with a warm, somewhat bitter taste; it burns readily. It is an official drug of the United States Pharmacopoeia, having stomachic and expectorant properties. It has been employed for chronic catarrh, asthma, phthisis, etc., and for rheumatism and venereal diseases, but at the present time it is little employed by American physicians. The balsam is much used in Europe in the manufacture of perfumery.

In the collection of the balsam, the first step is the beating of a band around the trunk of the tree until the bark is thoroughly crushed, then cuts are made in the bark and fire is applied to the openings, whereupon the sap takes fire, but this is soon extinguished. The tree is then left for 15 days until the balsam begins to run, when it is collected on pieces of cotton thrust into the incisions. The juice is squeezed from these into jars of boiling water, upon which the balsam floats. The trees will produce one to two kilograms per week, but they are tapped only in the spring before the rainy season. The balsam is at first amber-colored but soon turns brown. It is obtained also from the fruit, this kind being of better quality and known as "bálsamo blanco." By a papal bull issued by Pius IV in 1562, and by another by Pius V in 1571, the clergy were authorized to use the "bálsamo negro" in the preparation of the chrism, and it was declared a sacrilege to injure or destroy the trees. The balsam is still widely used for this purpose.

The tree was well known to the early inhabitants of Mexico, by whom it was much used in medicine. It was one of the trees cultivated in the royal garden of Mexico, having been brought from the *tierra caliente*. Jars of the balsam were a regular article of tribute to the emperor. The balsam attracted the attention of the early Spanish explorers and was forwarded by them to Europe. Here the most extravagant properties were ascribed to it, and it sold at prices ranging from twenty to two hundred dollars an ounce. In early days much of the balsam is said to have reached Spain by way of Peruvian ports, hence the derivation of the misleading name of "balsam of Peru." An infusion of the fruit in alcoholic liquors is employed locally as a stimulant, diuretic, and anthelmintic, and as a lotion to remove freckles.

The tree is described and figured by Hernández¹ in a chapter entitled "De *Hoitziloxitl*, seu Arbore Balsami Indici." He states that the Panucans called the tree "chucte." An inferior kind of balsam, he states, was obtained by boiling the twigs in water.

4. SWEETIA Spreng. Syst. Veg. 2: 171. 1825.

1. *Sweetia panamensis* Benth. Journ. Linn. Soc. Bot. 8: 263. 1865.

Michoacán and Guerrero. Costa Rica and Panama (type locality).

¹ Thesaurus 51. 1651.

Tree, 8 to 12 meters high, unarmed; leaves pinnate, the leaflets ovate, 5 to 7.5 cm. long, coriaceous, obtuse or acutish, bright green and lustrous above; flowers white, 6 mm. long, racemose-paniculate; fruit flat, oblong or elliptic, 5.5 to 9 cm. long, 2 cm. wide, thin, with one or two seeds. "Huesillo" (Michoacán, Guerrero).

5. SOPHORA L. Sp. Pl. 373. 1753.

Trees or shrubs, unarmed; leaves pinnate, the leaflets large, thick; flowers racemose; fruit linear, terete or slightly compressed, constricted between the seeds, indehiscent or tardily deliscent.

One herbaceous species, *S. sericea* Nutt., occurs in northern Mexico.

Leaflets 0.6 to 1 cm. long-----1. *S. purpusi*.

Leaflets 2 to 5 cm. long or longer.

Leaflets not reticulate-veined; racemes usually 20 cm. long or longer.

2. *S. tomentosa*.

Leaflets conspicuously reticulate-veined; racemes usually less than 10 cm. long.

Calyx conspicuously dentate; leaflets mostly oblong or elliptic-oblong, sericeous beneath, at least when young-----3. *S. secundiflora*.

Calyx subtruncate; leaflets oval or broadly oval, glabrous---4. *S. konzattii*.

1. *Sophora purpusi* T. S. Brandeg. Zoe 5: 235. 1906.

Coahuila and Zacatecas; type from Sierra de Parrás, Coahuila.

Shrub; leaflets about 17, oval or oblong, coriaceous, green and glabrate on the upper surface, sericeous beneath; racemes few-flowered, the flowers white, tinged or dotted with purple; fruit white-sericeous, 2 or 3-seeded.

2. *Sophora tomentosa* L. Sp. Pl. 373. 1753.

Known in Mexico only from Clarion Island, Baja California. Widely distributed on seashores in the tropics of both hemispheres.

Shrub, 1 to 3 meters high, leaves deciduous, the leaflets 15 to 21, oblong to orbicular, 2 to 4 cm. long, sericeous beneath, at least when young; flowers yellowish white, 2.5 cm. long; pods long and slender, strongly constricted between the seeds; seeds brown. "Tambalisa" (Cuba).

The plant is reputed to have diuretic, sudorific, and purgative properties, and is used in the West Indies as a remedy for venereal diseases. The seeds are commonly believed to be poisonous, and they, like other parts of the plant, contain a poisonous alkaloid. It is said, however, that in Madagascar the pods are fed to cattle.

3. *Sophora secundiflora* (Ortega) Lag.; DC. Cat. Hort. Monsp. 148. 1813.

Broussonetia secundiflora Ortega, Hort. Matr. Dec. 61. pl. 7. 1798.

Virgilia secundiflora Cav. Icon. Pl. 5: pl. 401. 1799.

Coahuila to San Luis Potosí. Western Texas and southern New Mexico.

Shrub or small tree, sometimes 12 meters high, with a trunk 20 cm. in diameter; leaves evergreen, the leaflets 7 to 11, 2.5 to 6 cm. long, lustrous on the upper surface, beneath sericeous, at least when young; flowers 2 to 3 cm. long, violet-blue, very fragrant; fruit hard and woody, sometimes 20 cm. long; seeds large, bright red; wood hard, close-grained, orange-red, with yellow sapwood, its specific gravity about 0.98. "Frijolillo" (Nuevo León, Texas); "colorín" (Coahuila, Nuevo León, Texas); "frijolito" (Texas).

The seeds contain a bitter poisonous alkaloid, sophorine, and one seed is said to be sufficient to cause death in a human being. The Indians of Texas and adjacent Mexico used small quantities of the powdered seeds to produce a sort of intoxication. Taken thus the seeds produce general excitement, delirium, and finally deep sleep lasting two or three days. Children have been poisoned fatally by eating the seeds. The wood is said to yield a yellow dye.

4. *Sophora conzattii* Standl., sp. nov.

Type from Cerro Espino, Distrito de Pochutla, Oaxaca, altitude 1,200 meters (*Conzattii*, Reko & Makrinius 3171; U. S. Nat. Herb. no. 763856).

Tree, the young branchlets puberulent; leaves persistent, the rachis 9.5 to 13 cm. long, puberulent at first but soon glabrate, the petiolules 2 mm. long; leaflets 7 or 9, oval or elliptic-oval, 3.5 to 5.5 cm. long, 2.2 to 3.5 cm. wide, rounded at base, rounded or very obtuse at apex, coriaceous, bright green, lustrous, glabrous, the venation prominent and reticulate on both surfaces; racemes about 5.5 cm. long, few-flowered, the rachis and pedicels minutely sericeous, the pedicels 6 to 8 mm. long; the flowers violet; calyx 6 mm. long and 8 mm. broad, minutely sericeous, the limb oblique, truncate or subundulate; petals glabrous, the standard 2.8 cm. long its claw 4 to 5 mm. long, the blades of the other petals about 18 mm. long; stamens glabrous; ovary densely sericeous. "Frijolillo."

6. *ORMOSIA* Jack, Trans. Linn. Soc. Bot. 10: 360. 1825.1. *Ormosia mexicana* Standl., sp. nov.

Type from Zacuapan, Veracruz (*Purpus* 6326; U. S. Nat. Herb. no. 566950).

Leaves large, brown-tomentose, finally glabrate, the petiolules stout, 7 mm. long; leaflets 13, oblong, oblanceolate-oblong, or ovate, 8 to 17 cm. long, 4.5 to 5.5 cm. wide, obtuse or rounded at the more or less unequal base, obtuse or acutish at apex, thin, green and glabrate on the upper surface, minutely pilose beneath with yellow hairs; racemes 10 to 17 cm. long, paniculate, the branches densely brown-tomentulose, the bracts and bractlets linear or lanceolate, 7 mm. long or shorter, subsistent; calyx 1 cm. long, brown-tomentulose, the lobes about as long as the tube, lance-oblong, acute or acuminate; petals tomentulose outside, the standard short-clawed, 13 mm. long, 10 mm. wide; ovary densely brown-pilose, 3 or 4-ovulate.

No species of this genus has been reported previously from Mexico, and only two are recorded from Central America, both from Panama. *O. mexicana* is clearly distinct from the Panaman species. It resembles somewhat *Dussia martinicensis* Krug & Urban, of the Lesser Antilles, but the leaflets are so different that it may scarcely be referred to that species. The flowers, too, are smaller than in the Martinique plant.

7. *XYLOTHERMIA* Greene, Pittonia 2: 188. 1891.1. *Xylothemia montana* (Nutt.) Greene, Pittonia 2: 188. 1891.

Pickeringia montana Nutt.; Torr. & Gray, Fl. N. Amer. 1: 389. 1840.

Xylothemia montana tomentosa Abrams, Bull. Torrey Club 34: 263. 1907.

California, the type from Santa Barbara; probably extending to northern Baja California.

Erect shrub with spinose branches; leaves sessile, digitately trifoliolate or unifoliolate, the leaflets elliptic or obovate, 1 to 2 cm. long; flowers reddish purple, nearly 2 cm. long, in short racemes; fruit linear, flat.

8. *CROTALARIA* L. Sp. Pl. 714. 1753.

Low erect shrubs, unarmed; leaves digitately trifoliolate or sometimes simple; flowers usually yellow, racemose; fruit short, inflated, bivalvate.

A number of herbaceous species occur in Mexico. Those listed here are more properly herbs than shrubs, but they are frequently suffrutescent. The seeds rattle about in the inflated fruit, giving the effect of a rattlebox, hence the generic name. The plants of the genus are of little economic importance, although some are of value for forage. Some species are cultivated in India for their fiber, which is of good quality.

Leaves simple-----1. *C. schiedeana*.

Leaves trifoliolate.

Leaflets densely pilose-sericeous on the upper surface.

Corolla copiously pilose.....2. *C. gloriosa*.

Corolla glabrous.....3. *C. mollicula*.

Leaflets glabrous or nearly so on the upper surface.

Pubescence of the fruit spreading.

Keel of the corolla about 8 mm. long.....4. *C. setifera*.

Keel 12 to 15 mm. long.....5. *C. eriocarpa*.

Pubescence of the fruit closely appressed.

Keel of the corolla with a long slender beak.....6. *C. longirostrata*.

Keel with a short stout beak.

Racemes mostly borne opposite the leaves.....7. *C. vitellina*.

Racemes mostly terminal.

Leaflets lanceolate to linear-oblong.....8. *C. maypurensis*.

Leaflets mostly ovate or elliptic.....9. *C. anargyroides*.

1. *Crotalaria schiedeana* Steud. Nom. Bot. 1: 445. 1840.

Crotalaria bracteata Cham. Linnaea 5: 575. 1830. Not *C. bracteata* Roxb. 1814.

Veracruz and Oaxaca; type from Zacuapan, Veracruz.

Low shrub or, as in most of the other species of the genus, chiefly or wholly herbaceous; leaves linear-oblong, 5 to 7 cm. long, subsessile, obtuse, sericeous; flowers 2 cm. long; fruit about 3 cm. long.

2. *Crotalaria gloriosa* Rose, Contr. U. S. Nat. Herb. 12: 273. 1909.

Known only from the type locality, mountains near Iguala, Guerrero.

Shrub, about 2 meters high, densely pilose; leaflets 4 to 6 cm. long, acute; corolla 1.5 cm. long; fruit densely sericeous.

3. *Crotalaria mollicula* H. B. K. Nov. Gen. & Sp. 6: 403. 1823.

Type from the vicinity of Guanajuato; reported also from Oaxaca.

Leaflets lanceolate, obtuse, 1.5 to 2 cm. long.

4. *Crotalaria setifera* DC. Prodr. 2: 131. 1825.

Jalisco to San Luis Potosí, Morelos, and Oaxaca.

Slender shrub, often a meter high; leaflets linear-oblong to elliptic, 1.5 to 4.5 cm. long, acute or obtuse; flowers 1.5 cm. long; fruit 1.5 to 2 cm. long.

5. *Crotalaria eriocarpa* Benth. Bot. Voy. Sulph. 80. 1844.

Crotalaria viminalis Rose, Contr. U. S. Nat. Herb. 8: 47. pl. 6. 1903.

Sinaloa to Morelos; type from Mazatlán, Sinaloa.

Shrub, 1.5 to 3 meters high, sometimes with long pendent branches; leaflets mostly elliptic, 2 to 5 cm. long, acute or obtuse; flowers yellow, 2.5 cm. long, in long racemes; fruit 2 to 3 cm. long. "Tronador," "cascabelito" (Sinaloa).

6. *Crotalaria longirostrata* Hook. & Arn. Bot. Beechey Voy. 285. 1836-39.

Jalisco (type locality) and Tepic to Chiapas. Guatemala and Nicaragua.

Slender shrub, about a meter high; leaflets oblong to elliptic-oval, 1 to 4.5 cm. long, obtuse or rounded at apex; flowers yellow, 1.5 to 2 cm. long. "Chapilín" or "chipilín" (Guatemala).

The young branches are used in Guatemala as a pot herb.

7. *Crotalaria vitellina* Ker, Bot. Reg. 6: pl. 447. 1820.

Sinaloa and Jalisco to Veracruz, Tabasco, and Chiapas. Central America and South America; type from Brazil.

Slender shrub, about a meter high; leaflets lanceolate to elliptic-oval, 2 to 8 cm. long, acute or obtuse; flowers 2 cm. long, yellow; fruit 2 to 3.5 cm. long. "Chipilín eimarrón" (Tabasco); "tronador" (Sinaloa); "cohetillo" (El Sal-

vador); "chipilín" (Guatemala); "quiebra-plato," "uña del diablo" (Costa Rica).

Said to be of some importance as a forage plant in Brazil.

8. *Crotalaria maypurensis* H. B. K. Nov. Gen. & Sp. 6: 403. 1823.

Crotalaria acapulcensis Hook. & Arn. Bot. Beechey Voy. 414. 1841.

Jalisco to Veracruz and Chiapas. Central America and South America.

Slender shrub, 1 to 1.5 meters high; leaflets 2.5 to 6 cm. long, obtuse or acute; flowers yellow, 1.5 to 2 cm. long; fruit about 3 cm. long.

9. *Crotalaria anargyroides* H. B. K. Nov. Gen. & Sp. 6: 404. 1823.

Veracruz to Michoacán and Guerrero. Central America and northern South America.

Leaflets 1 to 5 cm. long, obtuse or rounded at apex; flowers yellow, 1.5 cm. long.

C. cajanifolia H. B. K.,¹ described from the Volcán de Jorullo, is perhaps the same species.

9. INDIGOFERA L. Sp. Pl. 751. 1753.

Unarmed shrubs or sometimes herbs, the pubescence of appressed hairs, these attached by the middle; leaves pinnate; flowers small, in axillary racemes; fruit terete or compressed, small.

Fruit strongly compressed, 3.5 to 5 mm. wide-----1. *I. platycarpa*.

Fruit terete or tetragonous, usually narrower.

Leaflets oblanceolate or obovate, broadest above the middle; leaves sessile or nearly so.

Leaflets conspicuously punctate-----2. *I. sabulicola*.

Leaflets not punctate.

Plants prostrate or procumbent; leaflets usually less than 1.5 cm. long.

3. *I. ornithopodioides*.

Plants erect; leaflets mostly 1.7 to 3 cm. long-----4. *I. lespedezioides*.

Leaflets lanceolate to oval, broadest at or below the middle; leaves petiolate.

Fruit 1 to 3-seeded, 5 to 9 mm. long.

Leaflets glabrous on the upper surface.

Fruit subglobose, 1-seeded-----5. *I. sphaerocarpa*.

Fruit oblong, usually 2 or 3-seeded-----6. *I. densiflora*.

Leaflets strigose on the upper surface.

Fruit truncate or subtruncate at apex-----7. *I. sphinctosperma*.

Fruit rounded to acute at apex.

Fruit 1-seeded, subglobose-----8. *I. jaliscensis*.

Fruit 2 or 3-seeded, oblong.

Leaflets usually 15 or more-----9. *I. montana*.

Leaflets 3 to 7-----10. *I. tumidula*.

Fruit with several seeds, usually much more than 1 cm. long.

Lobes of the calyx subulate, twice as long as the tube or longer; leaflets usually 3 or 5-----11. *I. mucronata*.

Lobes of the calyx deltoid or lanceolate, little if at all longer than the tube; leaflets 7 or more

Fruit conspicuously curved-----12. *I. suffruticosa*.

Fruit straight or nearly so.

Leaflets glabrous on the upper surface-----13. *I. salmoniflora*.

Leaflets strigose on the upper surface.

Corolla 5 to 6 mm. long.

¹ Nov. Gen. & Sp. 6: 405. 1823.

Leaflets mostly 2 to 4 cm. long, green, sparsely strigose.

14. *I. cuernavacana*.

Leaflets mostly less than 1.5 cm. long, densely gray-strigose.

15. *I. conzattii*.

Corolla 7 to 10 mm. long.

Racemes 4 cm. long or shorter, few-flowered—16. *I. palmeri*.

Racemes 5 to 20 cm. long, many-flowered.

Leaflets 3 to 5 pairs; fruit 2.5 to 4 cm. long—17. *I. fruticosa*.

Leaflets 6 to 10 pairs; fruit 1.5 to 2.5 cm. long.

18. *I. thibaudiana*.

1. *Indigofera platycarpa* Rose, Contr. U. S. Nat. Herb. 8: 47. pl. 7. 1903.

Guerrero and Morelos; type from limestone mountains near Iguala, Guerrero.

Erect shrub, 1.5 to 4.5 meters high, with reddish brown branches; leaflets oval or oblong, 1 to 1.5 cm. long, obtuse; fruit 2 to 3 cm. long, 3 to 4 mm. wide.

2. *Indigofera sabulicola* Benth. in Mart. Fl. Bras. 15¹: 40. 1859.

Guerrero, Oaxaca, and Veraeruz. Central America, West Indies, and South America; type from Brazil.

Plants prostrate, fruticose or almost wholly herbaceous, densely sericeous; leaflets about 5 mm. long; flowers 7 mm. long.

3. *Indigofera ornithopodioides* Schlecht. & Cham. Linnaea 5: 577. 1830.

Indigofera leptosepala Nutt.; Torr. & Gray, Fl. N. Amer. 1: 298. 1838.

Indigofera acutifolia Schlecht. Linnaea 12: 282. 1838.

Indigofera mexicana Benth. Pl. Hartw. 286. 1848.

Chihuahua to Tamaulipas and Oaxaca; type from Veraeruz. Texas.

Plants prostrate or procumbent, chiefly herbaceous but sometimes shrubby; leaflets usually 5 or 7, rounded or retuse at apex; flowers 5 to 6 mm. long.

It is possible that the Mexican material includes more than one species, but there are no apparent lines of division. The description of *I. hippocrepoides* Schlecht.¹ suggests this species, but that plant may belong to some other genus. The same is true of *I. coronilloides* Mart. & Gal.²

4. *Indigofera lespedezioides* H. B. K. Nov. Gen. & Sp. 6: 457. 1823.

Michoacán to Oaxaca; reported, probably erroneously, from Chihuahua; type from Volcán de Jorullo. Central America, Cuba and Jamaica, and South America.

Shrub or herb, a meter high or less; leaflets 3 or 5 or often only 1, rounded or retuse at apex; flowers red or purplish, 6 to 7 mm. long. "Añil cimarrón" (Cuba); "cachecahua," "escorzonera de jiquilite" (Guatemala, Honduras, Blake).

Said to be of some value as a forage plant in Cuba. Used in Guatemala as a remedy for stomach troubles.

5. *Indigofera sphaerocarpa* A. Gray, Pl. Wright. 2: 37. 1853.

Northern Chihuahua and Sonora; type from Santa Cruz, Sonora. Southern Arizona.

Slender erect shrub; leaflets about 17, 1 to 1.5 cm. long; flowers 3 mm. long; fruit 3 to 4 mm. long.

6. *Indigofera densiflora* Mart. & Gal. Bull. Acad. Brux. 10²: 44. 1843.

Mexico. Morelos, Puebla, and Oaxaca (type locality).

Slender shrub, about 2 meters high; leaflets about 19, oblong to oval, 1.5 to 2 cm. long; fruit about 8 mm. long.

¹ Linnaea 12: 283. 1838.

² Bull. Acad. Brux. 10²: 45. 1843.

A specimen from Durango is very closely related, differing only in having the leaflets thinly strigose on the upper surface.

7. *Indigofera sphinctosperma* Standl. Contr. U. S. Nat. Herb. 20: 216. 1919. Veracruz; type from Zacuapan.

Slender shrub; leaflets about 17, oval or rounded-oval, 8 to 14 mm. long; fruit 3 to 4 mm. long.

8. *Indigofera jaliscensis* Rose, Contr. U. S. Nat. Herb. 8: 310. 1905.

Jalisco to Morelos; type from Río Blanco, Jalisco.

Shrub, a meter high or less; leaflets about 25, oblong or oval-oblong, 1 to 2.5 cm. long.

9. *Indigofera montana* Rose, Contr. U. S. Nat. Herb. 8: 311. 1905.

Durango, Zacatecas, and Jalisco; type collected between Mezquite and Monte Escobedo, Jalisco.

Slender shrub, about a meter high; leaflets oblong or narrowly oblong, 1 to 2.5 cm. long; flowers brown-sericeous.

Closely related to the preceding species, but usually with narrower leaflets.

10. *Indigofera tumidula* Rose. Contr. U. S. Nat. Herb. 12: 273. 1909.

Known only from the type locality, Iguala Canyon, Guerrero.

Shrub; leaflets oblong, 3 to 4 cm. long, rounded at apex; fruit 4 to 5 mm. long.

11. *Indigofera mucronata* Spreng.; DC. Prodr. 2: 227. 1825.

Galega frutescens Mill. Gard. Dict. ed. 8. *Galega* no. 3. 1768. Not *Indigofera frutescens* L. f. 1781.

Indigofera torulosa Hook. & Arn. Bot. Beechey Voy. 286. 1836-39.

Sinaloa to Veracruz and Chiapas. Widely distributed in tropical regions.

Plants herbaceous or suffruticose and procumbent, or sometimes shrubby and 2 meters high, sparsely strigose; leaflets oblong to broadly oval, 1 to 3 cm. long, bright green; flowers pinkish or brick-red; fruit 2.5 to 4 cm. long, tetragonous, slender. "Añilillo" (Tabasco, *Roviroso*).

12. *Indigofera suffruticosa* Mill. Gard. Dict. ed. 8. *Indigofera* no. 2. 1768.

Indigofera anil L. Mant. Pl. 2: 272. 1771.

Indigofera lindheimeriana Scheele, Linnaea 21: 464. 1848.

Occurring nearly throughout Mexico. Widely dispersed in tropical America, and adventive in the Old World.

Shrub, 1 to 2.5 meters high; leaflets mostly 11 or 13, oblong or oval, 1 to 3 cm. long; flowers small, greenish or yellowish; fruit 1.2 to 1.5 cm. long, falcate. Known generally in Spanish America as "añil"; "choh" (Yucatán, Maya); "jiquelite" or "xiquelite" (Oaxaca, Chiapas, Central America; from the Nahuatl *xiu-quilitl*, "turquoise-herb"); "huiquilitl" (*Ramírez*); "añil Colorado" (Tabasco, *Roviroso*); "añil jiquelite," "añil montés" (Oaxaca); "jiquilete," "jiguilete" (Guatemala); "azul," "azulejo" (Santo Domingo).

This species was formerly widely cultivated in the warmer parts of America for the extraction of indigo, although an Old World species, *I. tinctoria* L., was often used also. The latter is the chief source of the Old World indigo. In the southeastern United States indigo was an important crop in the early part of the nineteenth century. In 1794 about 1,500,000 pounds were exported to Europe. In southern Mexico, also, it was an important article of export, in Yucatán up to 1885 at least. The blue dye, for which indigo is chiefly valued, was finally largely replaced by coal-tar products, although much natural indigo is still used, having been found superior for some purposes to the artificial dyes. One of the chief reasons for the decline of indigo cultivation in America is the fact that the extraction and handling of the dye is very injurious to the health of those engaged in the work. The process of extraction of the coloring

matter is simple; the dried plants are soaked in water, and the infusion drawn off; the indigo soon settles to the bottom of the liquid and is rolled into balls and dried.

The use of this plant as a dye was known to the aboriginal inhabitants of Mexico. In Sonora the Indians use it for coloring palm leaves and other articles. In addition the plant has been much used in domestic medicine. The Aztecs used the seeds for urinary diseases and for ulcers, the leaves as a poultice applied to the head to reduce fever, and the plant as a remedy for syphilis. Febrifuge, vulnerary, purgative, antispasmodic, diuretic, and stomachic properties have been attributed to the plant, and it is a favorite local remedy for epilepsy. In Brazil it is one of the reputed remedies for snake bites, and in the United States indigo is often applied to the stings of bees and other insects. The powdered seeds or a decoction of the roots are said to be efficient in destroying vermin upon the human body.

13. *Indigofera salmoniflora* Rose, Contr. U. S. Nat. Herb. 5: 140. 1897.

Sinaloa; type from Imala.

Slender shrub, about a meter high; leaflets usually 7 or 9, oval, 1.5 to 4.5 cm. long; flowers pink; fruit 3 to 4 cm long.

14. *Indigofera cuernavacana* Rose, Contr. U. S. Nat. Herb. 5: 140. 1897.

Morelos to Michoacán and Oaxaca; type from Cuernavaca, Morelos.

Slender shrub, 2.5 meters high or less; leaflets about 9, oval, 2 to 4 cm. long.

15. *Indigofera konzattii* Rose, Contr. U. S. Nat. Herb. 8: 310. 1905.

Puebla and Oaxaca; type from Monte Albán, Oaxaca.

Low shrub; leaflets usually 7 or 9; fruit about 2 cm. long.

16. *Indigofera palmeri* S. Wats. Proc. Amer. Acad. 22: 404. 1887.

Durango and Jalisco; type from Tequila, Jalisco.

Slender shrub, 1.5 to 4.5 meters high; leaflets oblong or oval, 1 to 3 cm. long; fruit 1.5 to 3 cm. long.

17. *Indigofera fruticosa* Rose, Contr. U. S. Nat. Herb. 5: 140. 1897.

Baja California; type from San José del Cabo.

Shrub, 1 to 1.5 meters high.

18. *Indigofera thibaudiana* DC. Prodr. 2: 225. 1825.

Indigofera excelsa Mart. & Gal. Bull. Acad. Brux. 10^o: 45. 1843.

San Luis Potosí and Veracruz to Oaxaca. Guatemala.

Shrub, 1 to 3 meters high; leaflets oblong to rounded-oval, 1.5 to 4 cm. long. "Añil silvestre."

I. costaricensis Benth. has been treated as a synonym of this species, but it seems to differ in the glabrous upper surface of the leaflets.

DOUBTFUL SPECIES.

INDIGOFERA LOTOIDES Schlecht. Linnaea 12: 282. 1838. Type from Mineral del Monte. Apparently not of this genus.

INDIGOFERA PURPUSH T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 499. 1919. Type from Barranca de Tenampa, Veracruz.

10. *APOPLANESIA* Presl, Symb. Bot. 1: 63. pl. 41. 1831.

1. *Apoplanesia paniculata* Presl, Symb. Bot. 1: 63. pl. 41. 1831.

Microlobium glandulosum Liebm. Nat. For. Kjöbenhavn Vid. Medd. 1853: 104. 1854.

Eyscuhardtia olivana Safford, Journ. Washington Acad. Sci 6: 133. f. 1. 1916.

Colima to Oaxaca. Guatemala.

Tree, sometimes 10 meters high; leaves odd-pinnate, the leaflets oval or oblong, 1 to 7 cm. long, rounded or emarginate at apex, black-dotted, puberulent when young but soon glabrate; flowers small, in slender racemes, the calyx accrescent in fruit. "Palo de arco" (Guerrero, Oaxaca); "ébanó," "caca-naquasle" (Colima); "arco negro," "matagallina," "palo matagallina," "palo de arco negro," "palo de arco" (Oaxaca); "guie-biche" (Oaxaca, Zapotec, *Reko*); "cacanaguaste" (Colima).

The bark is said to yield a dye.

11. *AMORPHA* L. Sp. Pl. 713. 1753.

Erect unarmed shrubs; leaves pinnate, the leaflets numerous, gland-dotted; flowers small, violet, racemose, the corolla of a single petal; fruit short, 1 or 2-seeded, indehiscent.

Calyx lobes very short, obtuse; rachis of the leaf not aculeolate.

1. *A. fragrans*.

Calyx lobes elongate, acute; rachis of the leaf finely glandular-aculeolate.

2. *A. californica*.

1. *Amorpha fragrans* Sweet, Brit. Fl. Gard. pl. 241. 1828.

Amorpha occidentalis Abrams, Bull. N. Y. Bot. Gard. 6: 394. 1910.

Northern Chihuahua and Sonora. California to Texas, Illinois, and Montana.

Shrub, 1 to 3 meters high; leaflets 9 to 27, oblong to oval, 1.5 to 4 cm. long, minutely strigose; racemes 8 to 20 cm. long; calyx gland-dotted, 3 to 3.5 mm. long; banner 4.5 to 5 mm. long; fruit 5 mm. long.

From some of the related species, known in the United States as "false indigo," a kind of indigo was formerly extracted.

2. *Amorpha californica* Nutt.; Torr. & Gray, Fl. N. Amer. 1: 306. 1838.

Mountains of Baja California. Southern Arizona and California (type from Santa Barbara).

Shrub 1 to 3 meters high; leaflets 11 to 25, oval or elliptic, 1 to 3 cm. long, soft-pilose, rounded at apex; racemes 5 to 20 cm. long; calyx 5 to 6 mm. long; banner 5 mm. long; fruit curved, 5 mm. long.

DOUBTFUL SPECIES.

AMORPHA RABIAE Lex.; Llave & Lex. Nov. Veg. Descr. 1: 22. 1824. Described from Pico de Quinceo, near Morelia, Michoacán. Probably not of this genus.

12. *EYSENHARDTIA* H. B. K. Nov. Gen. & Sp. 6: 489. 1824.

REFERENCE: Pennell, N. Amer. Fl. 24: 34-40. 1919.

Shrubs or small trees; leaves pinnate, the leaflets glandular-punctate; flowers in lax spikelike racemes; corolla nearly regular, white; stamens 10; fruit indehiscent, 1-seeded.

Calyx irregular, in fruit flaring from the base, the slit between the posterior lobes extending nearly to the base, the anterior lobes decidedly longer than the posterior ones.

Leaflets 35 to 45, 8 to 12 mm. long; bracts deciduous before anthesis; fruit 14 to 16 mm. long, glabrous.....1. *E. punctata*.

Leaflets 9 to 25, 3 to 6 mm. long; bracts persistent until after anthesis; fruit 5 to 7 mm. long, pubescent.

Leaflets 21 to 25, densely pubescent on the upper surface; racemes 6 to 9 cm. long.....2. *E. schizocalyx*.

Leaflets 9 to 17, nearly glabrous on the upper surface; racemes 1 to 5 cm. long.

Leaflets 9 or 11, 4 to 5 mm. long; style with a minute gland.

3. *E. peninsularis*.

Leaflets 13 to 17, 3 to 4 mm. long; style glandless.....4. *E. spinosa*.

Calyx only slightly irregular, in fruit tubular-campanulate, the slit between the posterior lobes short, the anterior lobes only slightly longer than the posterior ones.

Style pubescent, glandless; fruit 5 to 8 mm. long; leaflets 9 to 13, 2 to 2.5 mm. long.....5. *E. parvifolia*.

Style glabrous, gland-bearing; fruit 7 to 20 mm. long; leaflets 21 to 51, 3 to 25 mm. long.

Fruit reflexed in age, punctate with inconspicuous glands; standard conspicuously notched.....6. *E. polystachya*.

Fruit ascending, punctate with conspicuous glands; standard petal only slightly notched.

Fruit 12 to 13 mm. long, 3.5 to 4 mm. wide, straight or nearly so; leaflets 41 to 49, 12 to 15 mm. long.....7. *E. platycarpa*.

Fruit 7 to 10 mm. long, 2 to 2.5 mm. wide, curved; leaflets 15 to 31, 5 to 11 mm. long.....8. *E. texana*.

1. *Eisenhardtia punctata* Pennell, N. Amer. Fl. 24: 39. 1920.

Aguascalientes and Jalisco; type collected between Bolaños and Guadalajara, Jalisco.

Shrub or small tree, 3 to 5 meters high, with fragrant foliage; leaflets oval-oblong, glabrate; racemes 4 to 9 cm. long; calyx 3 to 4 mm. long; fruit 4.5 to 5 mm. wide, straight. "Palo dulce" (Aguascalientes).

2. *Eisenhardtia schizocalyx* Pennell, N. Amer. Fl. 24: 39. 1920.

Known only from the type locality, Mapimí, Durango.

Branchlets cinereous-canescens; leaflets oval or broadly oblong, 4 to 6 mm. long, appressed-pubescent; petals 4 to 4.5 mm. long; fruit 2.5 to 3 mm. wide.

3. *Eisenhardtia peninsularis* T. S. Brandeg. Univ. Calif. Publ. Bot. 4: 180. 1911.

Baja California.

Densely branched shrub, the branchlets cinereous-canescens; leaflets oblong, puberulent beneath; racemes 2 to 5 cm. long; petals 4 to 5 mm. long.

4. *Eisenhardtia spinosa* Engelm.; A. Gray, Bost. Journ. Nat. Hist. 6: 174. 1850.

Chihuahua; type from Lake Encinillas.

Densely branched shrub, the branchlets cinereous-canescens; leaflets oblong or oval, puberulent beneath; racemes 1 to 3 cm. long; petals 4 to 4.5 mm. long; fruit 2 mm. wide.

5. *Eisenhardtia parvifolia* T. S. Brandeg. Univ. Calif. Publ. Bot. 4: 180. 1911.

Known only from the type locality, Sierra de Parrás, Coahuila.

Densely branched shrub, the branchlets canescens; leaflets elliptic-oval, glabrate; racemes 5 to 10 mm. long; fruit 1.7 to 2 mm. wide, glabrous.

6. *Eisenhardtia polystachya* (Ortega) Sarg. Silv. N. Amer. 3: 29. 1892.

Viborquia polystacha Ortega, Hort. Matr. Dec. 66. 1798.

Eisenhardtia amorphoides H. B. K. Nov. Gen. & Sp. 6: 491. 1824.

Varennea polystachya DC. Prodr. 2: 522. 1825.

Eisenhardtia amorphoides orthocarpa A. Gray, Pl. Wright. 2: 37. 1853.

Eisenhardtia orthocarpa S. Wats. Proc. Amer. Acad. 17: 339. 1882.

? *Psoralea stipularis* Sessé & Moc. Fl. Mex. ed. 2. 169. 1894.

Eisenhardtia reticulata Pennell, N. Amer. Fl. 24: 36. 1919.

Eysenhardtia subcoriacea Pennell, N. Amer. Fl. 24: 36. 1919.

Eysenhardtia cobriformis Pennell, N. Amer. Fl. 24: 36. 1919.

Chihuahua and Sonora to Oaxaca and Tamaulipas. Southern Arizona.

Shrub or tree, 3 to 8 meters high, the branchlets canescent; bark thin, light gray; leaflets 21 to 51, oblong or oval, 3 to 20 mm. long, pubescent or sometimes glabrate; racemes 4 to 15 cm. long; petals 5 to 7 mm. long; fruit 10 to 15 mm. long, 3 to 5 mm. wide, glabrous; wood hard, dense, reddish brown, the specific gravity about 0.87. "Rosilla," "palo cuate" (Sinaloa); "palo dulce" (Mexico, Hidalgo, Puebla, Sonora, Jalisco, Oaxaca); "coatl," "coate," "cuate" (from the Nahuatl *coatl*, "snake-water"); "palo dulce blanco" (Mexico); "taray" (Nuevo León, Durango); "vara dulce," "varaduz" (Durango, *Patoni*); "leña nefrítica"; "urza" (Otomí).

This plant has long been known in Mexico because of the peculiar properties of the wood.¹ An infusion of the heartwood in water has at first a golden-yellow color which soon deepens to orange. When held in a glass vial against a black background it exhibits a beautiful peacock-blue fluorescence. The wood was well known in Europe as early as the 16th century, where it was called "lignum nephriticum," because of its supposed diuretic properties. It was first mentioned by Monardes (1565), and is mentioned by Hernández under the name "coatl" or "coatli." He also states that the name "tlapalezpatli,"² or "blood-red medicine," was used for the plant. Sahagún writes of the plant as follows: "There is a wild tree called *coatl* from which they get the branches for making the baskets which they call *uacates*. It is a flexible wood, and if put in water the latter becomes blue. It is a remedy for urinary diseases."

The foliage of the tree is aromatic and the flowers are fragrant. In Mexico drinking troughs made from the wood are used for watering fowls, or a piece of the wood is put in their drinking water to ward off diseases. Palmer reports that in Sonora a decoction of the wood is given as a refreshing drink to fever patients. The wood is much used in some localities for kidney and bladder affections. It also gives a yellowish brown dye.

7. *Eysenhardtia platycarpa* Pennell & Safford, N. Amer. Fl. 24: 37. 1919.

Jalisco to Puebla and Guerrero; type from Barranca of Guadalajara, Jalisco.

Shrub or small tree, 3 to 5 meters high, the branchlets cinereous-puberulent; leaflets oblong, minutely puberulent; racemes 4 to 12 cm. long; petals 5 mm. long; fruit glabrous.

8. *Eysenhardtia texana* Scheele, Linnaea 21: 462. 1848.

Coahuila and Tamaulipas. Texas; type from New Braunfels.

Shrub, 2 to 3.5 meters high; leaflets oblong, finely puberulent; racemes 3 to 10 cm. long; petals 4 to 5 mm. long; fruit glabrous. "Vara dulce" (Tamaulipas).

The shrub is said to be a good honey plant.

13. *PAROSELA* Cav. Descr. Pl. 185. 1802.

REFERENCE: Rydberg, N. Amer. Fl. 24: 40-116. 1919-20.

Shrubs or rarely small trees, with gland-dotted branches, leaves, and calyx; leaves pinnate, rarely simple; flowers racemose or spicate; calyx 10-ribbed,

¹ See W. E. Safford, *Lignum nephriticum*—its history and an account of the remarkable fluorescence of its infusion, Smiths. Rep. 1915: 271-298. *pl.* 1-7. 1916; also Safford, *Eysenhardtia polystachya*, the source of the true *Lignum nephriticum mexicanum*, Journ. Washington Acad. Sci. 5: 503-517. *f.* 1, 2. 1915.

² Also written "tlapalezpatli" and "tlapahoaxpatli."

5-lobed; stamens 10 or 9; fruit indehiscent, 1 or few-seeded, usually included in the calyx.

Many herbaceous species of the genus occur in Mexico. The shrubby forms are of scarcely any economic importance, and very few vernacular names are recorded for them. An infusion of the leaves of some species is said to be employed in Ecuador as a remedy for indigestion.

A. Flowers pediceled, reflexed.

Calyx lobes longer than the tube.

Leaves and stem glabrous.

Leaflets 17 to 37, less than 2 mm. long-----1. *P. filiciformis*.

Leaflets 5 or 7, 3 to 4 mm. long-----2. *P. berlandieri*.

Leaves and stem pubescent.

Calyx lobes filiform, plumose; flowers subtended by 1 to 3 prominent glands -----3. *P. sericocalyx*.

Calyx lobes lance-subulate, not plumose; flowers not subtended by glands.

Flowers 8 to 10 mm. long; leaflets 15 to 29-----4. *P. calycosa*.

Flowers about 6 mm. long; leaflets 9 to 17-----5. *P. orcuttii*.

Calyx lobes shorter than the tube or barely equaling it.

Leaves simple.

Leaves, at least the lower ones, obovate or spatulate, toothed; ovules 4 to 6; calyx with a single gland in each interval-----6. *P. spinosa*.

Leaves narrowly linear; ovules 2; glands 2 or more in each interval.

Branches glabrate, bright green; leaves sparsely pubescent.

7. *P. schottii*.

Branches densely gray-strigose, becoming yellowish; leaves densely strigose -----8. *P. puberula*.

Leaves pinnate.

Calyx hairy outside.

Leaves conspicuously hairy.

Pubescence of the stem and peduncles spreading-----9. *P. goldmani*.

Pubescence of the stem and peduncles appressed.

Calyx canescent throughout-----10. *P. parryi*.

Calyx glabrous below, canescent-hirsute above---11. *P. maritima*.

Leaves glabrous or nearly so.

Stems decumbent, pilose-----12. *P. procumbens*.

Stems erect, glabrous or sparsely strigose.

Leaflets punctate above-----81. *P. hospes*.

Leaflets not punctate above.

Leaflets 2 mm. long, retuse; calyx 2.5 mm. long--13. *P. palmeri*.

Leaflets 7 to 10 mm. long, obtuse; calyx 3 to 3.5 mm. long.

14. *P. neglecta*.

Calyx glabrous outside.

Calyx hairy inside.

Calyx strongly angled, not conspicuously glandular.

Leaves pubescent.

Leaflets sparsely pilose; stem glabrous-----15. *P. anthonyi*.

Leaflets densely strigose; stem canescent----11. *P. maritima*.

Leaves glabrous.

Leaflets linear-----16. *P. radicans*.

Leaflets oblong or oval.

Branches strigose-----22. *P. oculata*.

Branches glabrous.

Upper 4 calyx lobes acute-----17. *P. variegata*.

Upper 4 calyx lobes obtuse-----18. *P. divaricata*.

- Calyx not strongly angled, conspicuously glandular.
- Leaflets pubescent on the upper surface; racemes lax. Petals
purplish.....19. *P. schaffneri*.
- Leaflets glabrous on both surfaces; racemes dense.
- Petals, except the banner, purplish.....20. *P. hegewischiana*.
- Petals all greenish yellow.....21. *P. viridiflora*.
- Calyx glabrous within.
- Calyx lobes equaling the tube.
- Branches strigose.....22. *P. oculata*.
- Branches glabrous.
- Racemes short, at the ends of short leafy branches.
.....23. *P. crenulata*.
- Racemes 8 to 12 cm. long, on naked peduncles opposite the
leaves.....24. *P. elongata*.
- Calyx lobes much shorter than the tube.
- Leaf rachis distinctly winged, constricted at the nodes.
.....25. *P. nutans*.
- Leaf rachis not winged but slightly margined.
- Racemes headlike or subumbellate.....26. *P. gracillima*.
- Racemes elongate, not headlike.
- Racemes 2 to 5-flowered, lax.....27. *P. diffusa*.
- Racemes many-flowered, dense.
- Racemes 1 to 2 cm. long; plants decumbent.
.....28. *P. dispansa*.
- Racemes 3 to 8 cm. long; plants erect...29. *P. submontana*.
- AA. Flowers sessile, ascending.
- B. Calyx lobes subulate-tipped, usually longer than the tube.
- Spikes subsessile at the ends of short axillary branches as well as at the
ends of the main branches.
- Leaves and branches glabrous or nearly so, except when very young.
- Spikes short but not capitate, mostly short-pedunculate or at the ends
of short leafy branches.....30. *P. scandens*.
- Spikes capitate, sessile in the leaf axils and at the ends of the branches.
- Leaflets 11 or 13, 3 to 4 mm. long.....31. *P. capitulata*.
- Leaflets 5 to 9, 4 to 11 mm. long.....32. *P. tehuacana*.
- Leaves and branches conspicuously villous.
- Calyx without conspicuous glands between the ribs....65. *P. sessilis*.
- Calyx with conspicuous glands between the ribs.
- Bracts ovate, acute, scarcely longer than the calyx tube.
- Spikes, at least in fruit, lax; leaf rachis evidently winged.
.....33. *P. domingensis*.
- Spikes short and dense; rachis scarcely winged....34. *P. humilis*.
- Bracts lance-ovate, long-acuminate, much exceeding the calyx tube.
.....35. *P. occidentalis*.
- Spikes terminating the stem and branches.
- C. Petals yellow, fading to rose or purplish.
- Calyx not conspicuously gland-dotted between the ribs; leaves glabrous.
- Calyx tube glabrous.....42. *P. argyrostachya*.
- Calyx tube pubescent.
- Leaflets 7 to 11, often emarginate, blackening in drying.
.....36. *P. melantha*.
- Leaflets 11 to 35, not emarginate, not blackening.
- Leaflets 2 to 6 mm. long; corolla less than 1 cm. long.
.....37. *P. zimapanica*.

Leaflets 7 to 9 mm. long; corolla more than 1 cm. long.

38. *P. diversicolor*.

Calyx with a row of conspicuous glands between the ribs; leaves usually more or less pubescent.

Calyx glabrous only at the base, more or less pilose between the ribs as well as on the margin.

Bracts caudate-acuminate, longer than the calyx...39. *P. caudata*.

Bracts acute or short-acuminate, shorter than the calyx.

Corolla 10 mm. long; bracts pubescent.....40. *P. lutea*.

Corolla 7 mm. long; bracts glabrous on the back...41. *P. wardii*.

Calyx wholly glabrous except on the margins.

Leaves glabrous.

Stems glabrous.....42. *P. argyrostachya*.

Stems puberulent.....43. *P. botterii*.

Leaves pubescent.

Bracts acute or gradually short-acuminate.

Leaflets elliptic-obovate, pubescent on both sides.

44. *P. plumosa*.

Leaflets oblong, glabrous on the upper surface.

45. *P. painteri*.

Bracts abruptly caudate-acuminate.

Petals dark blue.....46. *P. atrocyanea*.

Petals yellow.

Leaflets hairy on both sides; stem long-hairy.

47. *P. gigantea*.

Leaflets glabrate on the upper surface; stem short-hairy.

48. *P. macrostachya*.

CC. Petals purple or bluish to white, only the banner, if any of the petals, ochroleucous.

D. Leaves glabrous.

Leaflets 41 to 71.

Leaflets oblong, channeled. Calyx lobes longer than the tube.

49. *P. crassifolia*.

Leaflets oval, flat.

Bracts much longer than the calyx; calyx lobes equaling the tube.....50. *P. roseiflora*.

Bracts not exceeding the calyx; calyx lobes shorter than the tube.....51. *P. longifolia*.

Leaflets 7 to 31.

Spikes short and dense, subcapitate, subsessile.

Spikes many-flowered; calyx lobes about equaling the tube.

52. *P. saffordii*.

Spikes few-flowered; calyx lobes much longer than the tube.

Bracts glabrous; calyx lobes about 6 mm. long.

53. *P. formosa*.

Bracts silky-pilose; calyx lobes 3.5 to 4 mm. long.

54. *P. purpusi*.

Spikes elongate, distinctly pedunculate.

Calyx tube glabrous or nearly so.....43. *P. botterii*.

Calyx tube densely pubescent.

Branches conspicuously gland-dotted.....55. *P. brandegei*.

Branches not conspicuously gland-dotted.

Leaflets broadly oblong; calyx lobes shorter than the tube.

56. *P. smithii*.

Leaflets linear to narrowly oblong; calyx lobes equaling or exceeding the tube.

Calyx appressed-sericeous; leaves slightly pubescent when young-----57. *P. glabrescens*.

Calyx loosely pilose; leaves glabrous from the first.

Leaflets linear-oblong, slightly involute; petals rose-purple -----58. *P. lasiostachya*.

Leaflets linear, strongly involute; petals pink or whitish-----59. *P. involuta*.

DD. Leaves conspicuously pubescent.

Plants densely sericeous.

Leaves 3-foliolate-----60. *P. eriophylla*.

Leaves 5 to 11-foliolate-----61. *P. greggii*.

Plants not densely sericeous.

Petals (except sometimes the banner) dark purple.

Calyx lobes shorter than the tube-----62. *P. oaxacana*.

Calyx lobes equaling or longer than the tube.

Bracts deciduous-----83. *P. emoryi*.

Bracts persistent.

Leaflets narrowly oblong, 2 to 4 mm. long, pubescent on both sides -----63. *P. tsugoides*.

Leaflets broadly oblong, 4 to 7 mm. long, glabrous on the upper surface.

Corolla rose-purple; calyx not conspicuously glandular.

64. *P. versicolor*.

Corolla dark bluish purple; calyx with conspicuous glands between the ribs-----46. *P. atrocyanea*.

Petals rose-colored to white.

Spikes short, often subglobose, sessile at the ends of short leafy branches-----65. *P. sessilis*.

Spikes elongate, usually pedunculate at the ends of elongate branches.

Leaflets villous-sericeous; branches villous-canescens.

Branches glandular-tuberculate; petals usually without glands-----66. *P. megalostachys*.

Branches not conspicuously glandular; petals with a large gland near the apex-----67. *P. wislizeni*.

Leaflets and branches finely short-pubescent.

Leaflets obtuse, sparsely pilose or glabrate above; corolla rose-----68. *P. sanctae-crucis*.

Leaflets acute, finely short-pubescent above; corolla nearly white-----69. *P. leucantha*.

BB. Calyx lobes short, ovate or lanceolate, usually much shorter than the tube, rarely subulate-tipped.

Corolla yellow.

Fruit exerted from the calyx.

Stipular spines 3 to 9 mm. long; only the terminal leaflet retuse; banner about twice as broad as the other petals--70. *P. benthami*.

Stipular spines 1 to 2 mm. long; all leaflets retuse; banner 3 to 4 times as broad as the other petals-----71. *P. megacarpa*.

Fruit not exerted.

Spikes elongate; corolla fading to purple; bracts caducous.

72. *P. acutifolia*.

Spikes subcapitate; corolla fading yellow; bracts persistent.

Stems pubescent-----73. *P. capitata*.

Stems glabrous.

Bracts brown, not conspicuously glandular; pubescence of the calyx appressed-----74. *P. quinqueflora*.

Bracts yellow, with green tip, conspicuously glandular; pubescence of the calyx not appressed-----75. *P. lloydii*.

Corolla (except sometimes the banner) not yellow.

Petals white.

Calyx tube glabrous-----76. *P. mucronata*.

Calyx tube pubescent.

Leaflets 3 to 5 mm. long, linear; bracts persistent--77. *P. lumholtzii*.

Leaflets more than 10 mm. long, oval or oblong; bracts caducous.

Calyx lobes deltoid-acuminate, fully half as long as the tube; spikes paniculate, nodding-----78. *P. eysenhardtoides*.

Calyx lobes triangular, acute, one-third as long as the tube; spikes mostly axillary, erect-----79. *P. leucostachys*.

Petals wholly or partly purple, pink, or blue.

Calyx glabrous or sparsely silky-strigose outside, the lobes ciliolate, broader than long.

Calyx glabrous; flowers sessile-----80. *P. frutescens*.

Calyx sericeous-strigose; flowers short-pedicellate--81. *P. hospes*.

Calyx pubescent outside, at least on the lobes, these longer than broad.

Leaflets large, 1 to 2 cm. long, acute; corolla yellow at first.

72. *P. acutifolia*.

Leaflets mostly small, sometimes large, nearly always obtuse; wing and keel petals always purple, pink, or blue.

Petals dark blue.

Leaflets 2 to 4 mm. long, elliptic or oval----82. *P. pilosissima*.

Leaflets 5 to 20 mm. long, or sometimes larger.

Leaves simple-----84. *P. scoparia*.

Leaves pinnate.

Calyx lobes unequal, the lowest one distinctly longer; leaves glabrous -----85. *P. juncea*.

Calyx lobes subequal; leaves sparsely or densely canescent.

Leaflets entire or sinuate, oval to oblong--86. *P. tinctoria*.

Leaflets distinctly dentate.

Leaflets obovate to oblanceolate; stem and leaves decidedly canescent-----87. *P. dentata*.

Leaflets linear-lanceolate; stem and leaves somewhat pubescent but green-----88. *P. arenaria*.

Petals (except sometimes the banner) purple or pink.

Banner, as well as the other petals, purple.

Leaflets 13 to 31, oblong-----62. *P. oaxacana*.

Leaflets 31 to 65, linear.

Leaves glabrous-----89. *P. pectinata*.

Leaves canescent-----90. *P. abietifolia*.

Banner yellow or white.

Branches not conspicuously glandular-tuberculate.

Spikes solitary; leaflets glabrous, very numerous.

51. *P. longifolia*.

Spikes paniculate; leaflets few, canescent.

Petals purple-----91. *P. tomentosa*.

Petals pink, turning yellowish in age--92. *P. psoraleoides*.

Branches conspicuously glandular-tuberculate. Spikes single.

Stems and leaves glabrous. Spikes headlike.

Spikes long-pedunculate; bracts much shorter than the calyx. Leaflets 2 to 3 mm. long---93. *P. hemsleyana*.

Spikes short-pedunculate; bracts equaling the calyx.

Bracts broadly obovate; leaflets 3 to 5 mm. long.

94. *P. trochilina*.

Bracts lanceolate; leaflets 1 to 2 mm. long.

95. *P. minutifolia*.

Stems and leaves more or less pubescent.

Calyx merely puberulent, brown; leaflets 11 to 21, 2 to 3 mm. long. Spikes oblong-----96. *P. naviculifolia*.

Calyx canescent; leaflets 3 to 7, if more numerous more than 3 mm. long.

Spikes elongate and lax in fruit. Bracts soon deciduous.

Leaves long-sericeous on both sides---97. *P. argyrea*.

Leaves short-pubescent on the upper surface.

Calyx villous-canescens, the lobes equaling the tube.

Bracts ovate-acuminate, longer than the buds.

98. *P. seemanni*.

Calyx silky-canescens with appressed hairs, the lobes shorter than the tube.

Bracts ovate or ovate-lanceolate, shorter than the buds-----99. *P. tuberculata*.

Bracts lance-subulate, longer than the buds.

100. *P. canescens*.

Spikes dense and short, even in fruit.

Spikes (without the corollas) more than 1 cm. thick, acute at first; corolla more than 1 cm. long; leaflets 7 to 31.

Leaflets 7 to 13, sericeous-----97. *P. argyrea*.

Leaflets 13 to 31, short-pubescent with spreading hairs-----101. *P. conzattii*.

Spikes 7 to 8 mm. thick, obtuse; corolla less than 1 cm. long; leaflets 5 to 9.

Leaves glabrous above, minutely puberulent beneath-----102. *P. tuberculina*.

Leaves canescent on both sides.

Spikes oblong, 2 to 3 cm. long, distinctly pedunculate-----103. *P. fulvosericca*.

Spikes globose or short-oblong, 1 to 1.5 cm. long, subsessile or very short-pedunculate.

Pubescence appressed; leaflets 3 to 8 mm. long.

104. *P. dorycnoides*.

Pubescence spreading; leaflets less than 3 mm. long.

Leaves greenish, minutely canescent; calyx silky-villous with brown hairs.

105. *P. polycephala*.

Leaves and calyx villous-canescens with long whitish hairs-----106. *P. decora*.

1. *Parosela filiciformis* (Robins. & Greenm.) Rose, Contr. U. S. Nat. Herb. 8: 303. 1905.

Dalca filiciformis Robins. & Greenm. Proc. Amer. Acad. 29: 382. 1894.

In dry soil, San Luis Potosí and Aguascalientes to Oaxaca; type from Villar, San Luis Potosí.

Plants very slender, 20 to 60 cm. high; with a thick woody root; stems, glabrous; leaflets 17 to 37, oval or suborbicular, 1 to 2 mm. long, glabrous; racemes 5 to 10 cm. long, remotely flowered; calyx villous; petals yellowish below, purple above.

2. *Parosela berlandieri* (A. Gray) Rose, Contr. U. S. Nat. Herb. 10: 106. 1906.

Dalea berlandieri A. Gray, Proc. Amer. Acad. 5: 177. 1861.

San Luis Potosí and Tamaulipas; type from San Carlos, Tamaulipas.

Slender shrub, 0.5 to 1 meter high; branches glabrous; leaflets 5 or 7, cuneate or obovate-oblong, 3 to 4 mm. long, glabrous; racemes lax, 2 to 4 cm. long; calyx densely pilose; petals at first yellowish, becoming reddish; fruit pilose.

3. *Parosela sericocalyx* Rydb. N. Amer. Fl. 24: 63. 1919.

Known only from the type collection, from the Sierra Madre of Durango or Sinaloa.

Slender shrub, 50 cm. high or more; stems silky-villous when young; leaflets 9 to 21, oval, sericeous on both sides, 10 to 15 mm. long; racemes 2 to 4 cm. long; calyx sericeous; petals reddish purple; fruit sericeous.

4. *Parosela calycosa* (A. Gray) Heller, Cat. N. Amer. Pl. ed. 2. 5. 1900.

Dalea calycosa A. Gray, Pl. Wright. 2: 40. 1853.

Chihuahua, Sonora, and Nuevo León; type collected on the San Pedro, Sonora. New Mexico and Arizona.

Plants suffrutescent, 10 to 30 cm. high or more; stems slender, strigose-canescens; leaflets 15 to 29, oval or obovate, 3 to 5 mm. long, obtuse or retuse, glabrous above, strigose beneath; racemes 2 to 4 cm. long, dense; calyx densely pilose; petals white and purple; fruit pilose.

5. *Parosela orcuttii* (S. Wats.) Parish, Bot. Gaz. 55: 305. 1913.

Dalea orcuttii S. Wats. Proc. Amer. Acad. 20: 359. 1885.

Northern Baja California; type from Topo and Cantillas Canyon. Southern California.

Stems suffrutescent, ascending, 10 to 20 cm. long, strigose-canescens; leaflets 9 to 17, oblong-obovate, 2 to 4 mm. long, glabrous above, strigose beneath; racemes 1 to 2 cm. long, dense; calyx hirsute-pilose; petals purple and whitish.

6. *Parosela spinosa* (A. Gray) Heller, Cat. N. Amer. Pl. ed. 2. 7. 1900.

Dalea spinosa A. Gray, Mem. Amer. Acad. II. 5: 315. 1854.

Dalea spinescens Hemsl. Biol. Centr. Amer. Bot. 1: 247. 1880.

Psorodendron spinosum Rydb. N. Amer. Fl. 24: 45. 1919.

Sonora and Baja California. Arizona and southern California; type from the Gila River, Arizona.

Densely branched shrub or small tree, 4 to 7 meters high; leaves 2 to 5 cm. long, irregularly dentate, early deciduous; racemes 3 to 5 cm. long, the rachis spinose; calyx strigose; petals dark blue; fruit canescens; wood soft, coarse-grained, brown, its specific gravity about 0.55. "Mangle" (Sonora).

The English name is "indigo-bush" or "indigo-thorn." The plant is very showy when in flower.

7. *Parosela schottii* (Torr.) Heller, Cat. N. Amer. Pl. ed. 2. 6. 1900.

Dalea schottii Torr. U. S. & Mex. Bound. Bot. 53. 1859.

Psorodendron schottii Rydb. N. Amer. Fl. 24: 44. 1919.

Northern Baja California. Southern Arizona and California; type from the Colorado River.

Densely branched shrub, 1 to 3 meters high, with spinose branches; leaves 0.5 to 3 cm. long; racemes 4 to 8 cm. long, 6 to 20-flowered; calyx sparsely short-hirsute or glabrate; petals blue.

8. *Parosela puberula* (Parish) Standl.

Parosela schottii puberula Parish, Bot. Gaz. 55: 312. 1913.

Psorodendron puberulum Rydb. N. Amer. Fl. 24: 45. 1919.

Northern Baja California. Southern California, the type from the Colorado Desert.

Densely branched shrub with spinose branches; leaves 1 to 2.5 cm. long; racemes 3 to 5 cm. long; calyx densely canescent; petals bluish purple, 1 cm. long; fruit puberulent.

Perhaps only a form of *P. schottii*.

9. *Parosela goldmani* Rose, Contr. U. S. Nat. Herb. 8: 305. 1905.

Known only from the type locality, Sierra de Choix, Sinaloa.

Stems suffrutescens, 30 to 50 cm. high or more, short-hirsute, becoming glabrate, reddish; leaflets 15 to 35, oblong or elliptic, 3 to 4 mm. long, obtuse, white-hirsute; racemes 2 to 4 cm. long; calyx densely hirsute; petals bluish purple; fruit hirsutulous.

10. *Parosela parryi* (Torr. & Gray) Heller, Cat. N. Amer. Pl. ed. 2. 6. 1900.

Dalea divaricata cinerea A. Gray, Proc. Amer. Acad. 7: 336. 1868.

Dalea parryi Torr. & Gray; A. Gray, Proc. Amer. Acad. 7: 397. 1868.

Sonora and Baja California. Southern Arizona and California; type from Fort Mohave, California.

Stems slender, suffruticose, 30 to 60 cm. high, gray-strigose; leaflets 15 to 33, obovate or suborbicular, 2 to 5 mm. long, emarginate, strigose; racemes 3 to 8 cm. long; calyx strigose-canescens; petals violet; fruit minutely puberulent.

11. *Parosela maritima* (T. S. Brandeg.) Rose, Contr. U. S. Nat. Herb. 8: 304. 1905.

Dalea maritima T. S. Brandeg. Proc. Calif. Acad. II. 3: 125. 1891.

Southern Baja California; type from Todos Santos.

Stems suffruticose, decumbent, densely white-pubescent; leaflets 15 to 23, oblong-obovate, 3 to 4 mm. long, densely canescent; racemes 1 to 3 cm. long, dense; calyx glabrous below, hirsute above; petals purple; fruit glabrous.

12. *Parosela procumbens* (Moc. & Sessé) Rose, Contr. U. S. Nat. Herb. 8: 304. 1905.

Dalea procumbens Moc. & Sessé; DC. Prodr. 2: 246. 1825.

Dry hillsides, Jalisco to Chiapas (type locality).

Stems suffruticose, prostrate, 30 to 50 cm. long, reddish, pilose; leaflets 15 to 21, oval or obovate, 2 to 3 mm. long, glabrous, crenulate; racemes 1 to 2 cm. long, dense; calyx pilose on the ribs; petals bright purple; fruit puberulent.

13. *Parosela palmeri* Rose, Contr. U. S. Nat. Herb. 8: 304. 1905.

Dry hillsides, Sonora and Sinaloa; type from Alamos, Sonora.

Slender shrub, 0.5 to 1 meter high, glabrous or nearly so; leaflets 11 to 21, elliptic or obovate, 2 mm. long, retuse, glabrous; racemes 4 to 6 cm. long, lax; calyx puberulent; petals ochroleucous, tipped and margined with purple.

14. *Parosela neglecta* (Robinson) Rose, Contr. U. S. Nat. Herb. 8: 304. 1905.

Dalea neglecta Robinson, Proc. Amer. Acad. 29: 329. 1894.

Known only from Guanajuato, the type locality.

Stems woody below, 30 to 50 cm. high, glabrous; leaflets 11 to 15, elliptic or oblanceolate, 7 to 10 mm. long, rounded at apex, glabrous, glaucous beneath; racemes lax, 2 to 4 cm. long; calyx puberulent; petals deep purple.

15. *Parosela anthonyi* (T. S. Brandeg.) Rose, Contr. U. S. Nat. Herb. 12: 272. 1909.
Dalea anthonyi T. S. Brandeg. Erythea 7: 2. 1899.
 Southern Baja California; type from San José del Cabo.
 Shrub, about 1 meter high; branches glabrous or nearly so; leaflets 13 to 21, oblong, obtuse, 3 to 5 mm. long, sparsely pilose; racemes lax, 2 to 7 cm. long; calyx glabrous; petals bluish purple, variegated with yellow; fruit glabrous.
16. *Parosela radicans* (S. Wats.) Rose, Contr. U. S. Nat. Herb. 8: 305. 1905.
Dalea radicans S. Wats. Proc. Amer. Acad. 17: 341. 1882.
 Coahuila; type from the Sierra Madre, south of Saltillo.
 Stems suffruticose, erect or procumbent, 10 to 40 cm. long, glabrous; leaflets 13 to 19, linear, 2 to 4 mm. long, glabrous; racemes 1 to 2 cm. long, lax; calyx glabrous; petals purple.
17. *Parosela variegata* Rydb. N. Amer. Fl. 24: 55. 1919.
 Southern Baja California; type from San José del Cabo.
 Slender shrub, 50 cm. high or more; branches purplish, glabrous; leaflets 19 to 25, elliptic, 3 to 4 mm. long, retuse, glabrous; racemes 3 to 6 cm. long; calyx glabrous; petals blue, white, and yellowish; fruit glabrous.
18. *Parosela divaricata* (Benth.) Rose, Contr. U. S. Nat. Herb. 8: 305. 1905.
Dalea divaricata Benth. Bot. Voy. Sulph. 12. 1844.
 Baja California; type from Magdalena Bay.
 Stems suffruticose, diffusely branched, brownish, glabrous; leaflets 15 to 21, oblong or obovate, 2 to 4 mm. long, obtuse or emarginate, glabrous; racemes 2 to 3 cm. long; calyx glabrous; petals purplish; fruit glabrous.
19. *Parosela schaffneri* (Hemsl.) Rose, Contr. U. S. Nat. Herb. 12: 273. 1909.
Dalea schaffneri Hemsl. Diag. Pl. Mex. 7. 1878.
 Known only from the type locality, Chapultepec, Distrito Federal.
 Stems suffruticose, glabrous; leaflets 15 to 41, oblong or elliptic, 4 mm. long, pilose above; racemes lax; calyx glabrous; petals purple and yellowish.
20. *Parosela hegewischiana* (Steud.) Rydb. N. Amer. Fl. 24: 57. 1919.
Dalea laxiflora Schlecht. Linnaea 12: 293. 1838. Not *D. laxiflora* Pursh, 1814.
Dalea hegewischiana Steud. Nom. Bot. ed. 2. 1: 480. 1840.
 ? *Trichopodium glandulosum* Presl, Bot. Bemerk. 52. 1844.
Dalea rosca D. Dietr. Syn. Pl. 4: 1017. 1847.
Parosela lasiostoma Rose, Contr. U. S. Nat. Herb. 8: 305. 1905.
Parosela campylostachya Rose, Contr. U. S. Nat. Herb. 12: 272. 1909.
 Hidalgo to Oaxaca.
 Stems slender, suffruticose, decumbent, glabrous; leaflets 13 to 35, oval or obovate, 2 to 5 mm. long, glabrous; racemes dense, 2 to 4 cm. long; calyx glabrous; petals rose-purple, the banner yellowish; fruit glabrous.
21. *Parosela viridiflora* (S. Wats.) Rose, Contr. U. S. Nat. Herb. 8: 305. 1905.
Dalea viridiflora S. Wats. Proc. Amer. Acad. 21: 448. 1886.
 Chihuahua to Hidalgo; type from Santa Eulalia Mountains, Chihuahua.
 Stems slender, decumbent, suffrutescent, 20 to 30 cm. long, yellowish, glabrous; leaflets 9 to 17 oblong-obovate, 3 to 7 mm. long, obtuse or retuse, glabrous; racemes dense, 2 to 5 cm. long; petals greenish yellow; fruit glabrous.
22. *Parosela oculata* Rydb. N. Amer. Fl. 24: 60. 1919.
 Known only from the type locality, Cerralvo, Baja California.
 Low shrub; branches strigose; leaflets 25 to 37, oblong, 5 mm. long, glabrous; racemes 3 to 8 cm. long, dense; petals purplish blue, with a cream-colored spot on the banner.

23. *Parosela crenulata* (Hook. & Arn.) Rose, Contr. U. S. Nat. Herb. 8: 306. 1905.
Dalca crenulata Hook. & Arn. Bot. Beechey Voy. 285. 1836.
 Sonora to Guerrero; type from Jalisco.
 Slender shrub, sometimes 2 meters high; branches dark brown, glabrous; leaflets 7 to 13, elliptic, 2 to 4 mm. long, crenulate, glabrous; racemes dense, 1 to 3 cm. long; petals purple; fruit glabrous. "Malva prieta" (Sinaloa).
 The slender branches are used for brooms.
24. *Parosela elongata* Rose, Contr. U. S. Nat. Herb. 8: 306. 1905.
 Known only from the type locality, Jojutla, Morelos.
 Stems 0.5 to 1 meter high, glabrous; leaflets 7 to 15, oblong, 7 to 12 mm. long, glabrous; calyx glabrous; petals purple; fruit glabrous.
25. *Parosela nutans* (Cav.) Rose, Contr. U. S. Nat. Herb. 8: 306. 1905.
Psoralea nutans Cav. Icon. Pl. 3: 1. pl. 201. 1794.
Dalca nutans Willd. Sp. Pl. 3: 1339. 1803.
 Sonora to Yucatán and Chiapas. Central America.
 Stems slender, suffruticose, sometimes 3 meters high, purplish, glabrous; leaflets 11 to 41, oblong, 5 to 10 mm. long, glabrous; racemes lax; calyx glabrous; petals purple; fruit glabrous. "Canchalagua" (Guatemala).
 In Jalisco a yellow dye is obtained from the plant.
26. *Parosela gracillima* (S. Wats.) Rose, Contr. U. S. Nat. Herb. 8: 305. 1905.
Dalca gracillima S. Wats. Proc. Amer. Acad. 22: 404. 1887.
 Jalisco; type from Guadalajara.
 Stems very slender, suffruticose, procumbent, reddish, glabrous, 30 to 50 cm. long; leaflets 13 to 21, oblanceolate, 1 to 4 mm. long, glabrous; racemes 2 to 6-flowered; calyx glabrous; petals purple, the banner yellowish; fruit glabrous.
27. *Parosela diffusa* (Moric.) Rose, Contr. U. S. Nat. Herb. 8: 305. 1905.
Dalca diffusa Moric. Mém. Soc. Genève 6: 536. 1833.
Dalca gracilis Hook. & Arn. Bot. Beechey Voy. 286. 1836. Not *D. gracilis* Kunth, 1824.
Dalca ramosissima Mart. & Gal. Bull. Acad. Brux. 10²: 41. 1843.
 Chihuahua and Sonora to San Luis Potosí and Guerrero. Guatemala.
 Slender shrub, often a meter high; branches glabrous, purplish; leaflets 3 to 23, oblong or obovate, 2 to 5 mm. long, glabrous; racemes lax, 2 to 5-flowered; calyx glabrous; petals purple, the banner usually yellowish; fruit glabrous. "Escoba larga" (Morelos, *Seler*); "ratón." "xolteco" (*Ramírez*).
 As in the case of various other species, the branches are often tied together to form coarse brooms.
28. *Parosela dispansa* Rydb. N. Amer. Fl. 24: 59. 1919.
 Known only from the type locality, mountains near Talpa, Jalisco.
 Stems slender, suffruticose, glabrous, dark brown; leaflets 9 to 13, elliptic, 3 to 5 mm. long, retuse, glabrous; racemes 1 to 2 cm. long; calyx glabrous; petals violet or rose-purple; fruit glabrous.
29. *Parosela submontana* Rose, Contr. U. S. Nat. Herb. 8: 306. 1905.
 Chihuahua to Puebla and Oaxaca; type from Plateado, Zacatecas.
 Stems slender, suffruticose, 0.5 to 1.2 meters high, glabrous, purplish; leaflets 31 to 41, oblong, 5 to 10 mm. long, glabrous; racemes 3 to 8 cm. long, rather dense; calyx glabrous; petals purple; fruit glabrous.
30. *Parosela scandens* (Mill.) Rydb. N. Amer. Fl. 24: 114. 1920.
Psoralea scandens Mill. Gard. Dict. ed. 8. *Psoralea* no. 4. 1768.
 Veracruz.

Glabrous shrub with brown branches; leaflets 7 or 9, elliptic, 8 to 15 mm. long, glabrous; spikes short, globose or oblong; calyx tube nearly glabrous, the lobes plumose; petals yellow.

31. *Parosela capitulata* Rydb. N. Amer. Fl. 24: 113. 1920.

Known only from the type locality, in Oaxaca.

Glabrous shrub with purplish brown branches; leaflets 11 or 13, oblong, 3 to 4 mm. long, glabrous; spikes capitate; calyx tube sparsely hairy, the lobes plumose; petals brownish purple (when dry).

32. *Parosela tehucana* Rydb. N. Amer. Fl. 24: 113. 1920.

Known only from the type locality, Tehuacán, Puebla.

Low shrub with brown glabrous branches; leaflets obovate, 3 to 7 mm. long, sparsely short-villous when young but soon glabrous; spikes globose; calyx tube pilose, the lobes plumose; petals yellow, turning dark purple; fruit villous above.

33. *Parosela domingensis* (DC.) Millsp. Field Mus. Bot. 1: 21. 1895.

Dalea domingensis DC. Prodr. 2: 246. 1825.

Yucatán. Cuba and Hispaniola (type locality).

Shrub, 1 to 4 meters high, the branches villous; leaflets 5 to 9, oval or obovate, 6 to 15 mm. long, villous on both sides; spikes becoming 2 to 4 cm. long; calyx pubescent, the lobes plumose; petals ochroleucous, turning pink or purple; fruit villous.

34. *Parosela humilis* (Mill.) Rydb. N. Amer. Fl. 24: 114. 1920.

Psoralea humilis Mill. Gard. Dict. ed. 8. *Psoralea* no. 7. 1768.

Dalea thyrsoiflora A. Gray, Proc. Amer. Acad. 5: 177. 1861.

Parosela thyrsoiflora Vail, Bull. Torrey Club 24: 14. 1897.

Chihuahua to Yucatán and Oaxaca; type from Veracruz. Texas; Guatemala.

Slender shrub with brownish villous branches; leaflets 3 to 9, oval or obovate, 6 to 18 mm. long, retuse, short-villous; spikes short and dense; calyx pubescent, the lobes plumose; petals yellow, turning brownish purple.

35. *Parosela occidentalis* Rydb. N. Amer. Fl. 24: 115. 1920.

Parosela platyphylla Rydb. N. Amer. Fl. 24: 115. 1920.

Sonora and Sinaloa; type from Culiacán (?), Sinaloa.

Shrub, 1 to 1.5 meters high, the branches villous; leaflets 5 to 15, oval or obovate, 5 to 15 mm. long, villous; spikes 1 to 3 cm. long, dense; calyx villous, the lobes plumose; petals yellow, turning brown or purplish; fruit villous.

36. *Parosela melantha* (Schauer) Rydb. N. Amer. Fl. 24: 108. 1920.

Dalea melantha Schauer, Linnaea 20: 746. 1847.

Parosela fuscescens Rydb. N. Amer. Fl. 24: 109. 1919.

Coahuila to Veracruz and Oaxaca (type locality).

Shrub with glabrous branches; leaflets 5 to 13, cuneate, 2 to 6 mm. long, retuse, glabrous; spikes 1 to 4 cm. long, 1 cm. thick; petals yellow; fruit pilose.

37. *Parosela zimapanica* (Schauer) Rydb. N. Amer. Fl. 24: 109. 1920.

Dalea zimapanica Schauer, Linnaea 20: 746. 1857.

Mexico, Hidalgo, Puebla, and Oaxaca; type from Zimapán, Hidalgo.

Shrub, 1 to 3 meters high, with glabrous branches; leaflets 11 to 19, elliptic or oblong, 2 to 6 mm. long, glabrous; spikes 1.5 to 3 cm. long, 1.2 to 1.5 cm. thick; calyx silky-villous; petals yellow, turning purplish brown or brownish pink; fruit villous.

This has been reported from Mexico as *Dalea microphylla* H. B. K.

38. *Parosela diversicolor* Rydb. N. Amer. Fl. 24: 109. 1920.

Known only from the type locality, Sierra de Clavellinas, Oaxaca.

Shrub, 1 meter high or more, with glabrous branches; leaflets 13 to 35, oblong, 7 to 9 mm. long, glabrous; spikes dense, 1 to 2 cm. long; calyx silky-villous, the lobes plumose; petals yellow, turning rose and purple; fruit silky-villous.

39. *Parosela caudata* Rydb. N. Amer. Fl. 24: 112. 1920.

Known only from the type locality, Álvarez, San Luis Potosí.

Shrub, 1 meter high or more, the branches densely villous; leaflets 13 to 17, oblong or elliptic, 5 to 6 mm. long, villous; spikes dense, 2 to 6 cm. long, 1 cm. thick; calyx silky-pilose, the lobes plumose; petals yellow, turning brownish; fruit villous.

40. *Parosela lutea* Cav. Descr. Pl. 186. 1802.

Psoralea lutea Cav. Icon. Pl. 4: 12. pl. 325. 1797.

Dalea ovalifolia Ortega, Hort. Matr. Dec. 30. 1797.

Dalea lutea Willd. Sp. Pl. 3: 1341. 1803.

Nuevo León to Puebla. Guatemala.

Shrub, 30 to 50 cm. high, the branches densely pubescent; leaflets 15 to 21, elliptic or oval, 4 to 6 mm. long, often retuse, pilose, sometimes glabrate on the upper surface; spikes dense, 5 to 8 cm. long, 1 cm. thick; calyx pilose, the lobes pilose-ciliate; petals yellow; fruit villous.

41. *Parosela wardii* Rydb. N. Amer. Fl. 24: 112. 1920.

Tamaulipas and San Luis Potosí; type collected at San Luis Potosí.

Shrub, 30 to 60 cm. high, the branches pubescent; leaflets 9 to 15, oblong, 3 to 8 mm. long, villous-canescens, obtuse; spikes dense, 2 to 3 cm. long; calyx silky-pilose, the lobes plumose; petals yellow, fading brownish; fruit densely pubescent.

This has been reported as *Dalea leucostoma* var. and as *D. cinerea* Moric.

42. *Parosela argyrostachya* (Hook. & Arn.) Rydb. N. Amer. Fl. 24: 110. 1920.

Dalca argyrostachya Hook. & Arn. Bot. Beechey Voy. 285. 1836.

Chihuahua to Guerrero and Chiapas; type from Jalisco.

Shrub 50 cm. high or more, with glabrous branches; leaflets 15 to 21, oblong or obovate, glabrous; spikes dense, 3 to 6 cm. long, acute; calyx glabrous, the lobes plumose; petals yellow, turning brownish; fruit pubescent above, glabrous below.

43. *Parosela botterii* Rydb. N. Amer. Fl. 24: 110. 1920.

Known only from the type locality, Orizaba, Veracruz.

Stems glabrous or when young brownish-villous; leaflets 17 to 21, elliptic, 2 to 4 mm. long, glabrous; spikes dense, 3 to 5 cm. long, acute; calyx sparsely hirsute, the lobes plumose; petals rose-purple.

44. *Parosela plumosa* (S. Wats.) Rose, Contr. U. S. Nat. Herb. 10: 106. 1906.

Dalea plumosa S. Wats. Proc. Amer. Acad. 21: 448. 1886.

Chihuahua, the type collected near the city of Chihuahua.

Shrub 30 to 50 cm. high, the branches finely pubescent; leaflets 11 to 17, elliptic-obovate, 4 to 6 mm. long, minutely pilose; spikes dense, 2 to 4 cm. long, 1 cm. thick; calyx glabrous, the lobes long-pilose; petals yellow, turning brownish; fruit pubescent.

45. *Parosela painteri* Rose, Contr. U. S. Nat. Herb. 10: 105. 1906.

Querétaro; type from San Juan del Río.

Shrub 30 to 50 cm. high, the branches puberulent; leaflets 11 to 15, oblong, 5 mm. long, retuse, glabrous above, minutely pubescent beneath; spikes 2 to 3 cm. long; calyx glabrous, the lobes long-pilose; petals yellow, turning brownish purple; fruit densely pubescent.

46. *Parosela atrocyanea* Rydb. N. Amer. Fl. 24: 111. 1920.

Known only from the type locality, San Luis Tultitlanapa, Puebla.

Low shrub with strigose branches; leaflets 9 to 17, oblong or obovate, 4 to 7 mm. long, glabrous above, strigose beneath; spikes dense, 1.5 to 3.5 cm. long, 1 cm. thick; calyx tube nearly glabrous, the lobes ciliate; petals at first yellow (?), turning dark blue, the banner wholly or partly yellow; fruit pubescent above, glabrous below.

47. *Parosela gigantea* Rose; Rydb. N. Amer. Fl. 24: 110. 1920.

Michoacán and Puebla; type from Tarascón, Michoacán.

Shrub, 2 to 5 meters high, the branches villous; leaflets 11 to 17, oval or obovate, 6 to 10 mm. long, pilose; spikes 3 to 6 cm. long, 1 cm. thick, dense, acute; calyx tube glabrous, the lobes long-pilose; petals yellow, turning blackish; fruit sparsely pilose.

48. *Parosela macrostachya* (Moric.) Rose, Contr. U. S. Nat. Herb. 12: 273. 1909.

Dalea macrostachya Moric. Mém. Soc. Genève 6: 543. pl. 5. 1833.

Dalea leucostoma Schlecht. Linnaea 12: 294. 1838.

Hidalgo.

Shrub, 0.3 to 1 meter high, the branches at first pubescent, becoming glabrate; leaflets 17 to 25, oblong or elliptic, 5 to 7 mm. long, glabrous above, pilose beneath; spikes 2 to 4 cm. long; petals yellow; fruit sericeous.

49. *Parosela crassifolia* (Hemsl.) Rose, Contr. U. S. Nat. Herb. 12: 272. 1909.

Dalea crassifolia Hemsl. Biol. Centr. Amer. Bot. 1: 238. 1880.

Sinaloa and Jalisco; type from the Sierra Madre of Sinaloa or Durango.

Shrub, 50 cm. high or more, with long glabrous branches; leaflets oblong, 3 to 4 mm. long, fleshy, glabrous; spikes dense, 2 to 3 cm. long; calyx tube silky-pilose, the lobes plumose; petals pale pink or nearly white; fruit densely pilose above.

50. *Parosela roseiflora* Rydb. N. Amer. Fl. 24: 105. 1920.

Type from the Sierra Madre of Durango or Sinaloa.

Plants glabrous, 40 cm. high or more; leaflets 25 to 41, elliptic, 5 mm. long, obtuse; spikes dense, 2 cm. long; calyx tube sericeous, the lobes plumose; petals rose; fruit silky-villous.

51. *Parosela longifolia* Rose; Rydb. N. Amer. Fl. 24: 105. 1920.

Known only from the type locality, between Altenguilla and Jacala, Jalisco.

Stems glabrous, 1 meter high or more; leaflets 31 to 37, oval, 3 to 4 mm. long, glabrous; spikes dense, 2 to 3 cm. long, 1 cm. thick; calyx tube silky-pilose; banner yellowish, the other petals light rose; fruit sericeous.

52. *Parosela saffordii* Rose, Contr. U. S. Nat. Herb. 12: 273. 1909.

Coahuila (type locality) and Durango.

Low shrub with glabrous branches; leaflets 9 to 13, oblanceolate or obovate, 2 to 3 mm. long, glabrous; calyx tube pilose; petals rose-colored; pod pubescent.

53. *Parosela formosa* (Torr.) Vail, Trans. N. Y. Acad. Sci. 14: 34. 1894.

Dalea formosa Torr. Ann. Lyc. N. Y. 2: 177. 1827.

Chihuahua and Sonora. Colorado to Texas and Arizona; type from the Platte River, Colorado.

Crooked shrub, 0.3 to 1 meter high, with glabrous branches; leaflets 7 or 9, oblong-spatulate, 1.5 to 2 mm. long, glabrous; calyx tube pilose, the lobes plumose; petals purple-rose; fruit pilose.

A very handsome shrub when in flower.

54. *Parosela purpusi* (T. S. Brandeg.) Rose, Contr. U. S. Nat. Herb. 10: 106. 1906.

Dalea purpusi T. S. Brandeg. Erythea 7: 2. 1899.

Baja California; type from Calmallí.

Densely branched shrub, 30 to 40 cm. high, the branches glabrous or strigillose; leaflets 3 or 5, obovate, 4 to 6 mm. long, strigose; spikes 1.5 cm. long; calyx tube sericeous, the lobes plumose; petals pink; fruit sericeous.

55. *Parosela brandegei* Rose, Contr. U. S. Nat. Herb. 10: 106. 1906.

Dalea ramosissima Benth. Bot. Voy. Sulph. 11. 1844. Not *D. ramosissima* Mart. & Gal. 1843.

Parosela ramosissima Heller, Cat. N. Amer. Pl. ed. 2. 6. 1900.

Baja California; type from Magdalena Bay.

Shrub with reddish glabrous branches; leaflets 11 or 13, obovate, 2 to 5 mm. long, obtuse or retuse, glabrous; spikes dense, 3 to 5 cm. long, 1 cm. thick; calyx densely pilose; petals rose-colored; fruit sparsely pilose.

56. *Parosela smithii* Rydb. N. Amer. Fl. 24: 106. 1920.

Oaxaca to Hidalgo; type from Sierra de San Felipe, Oaxaca.

Slender shrub about 1 meter high, the stems glabrous; leaflets 13 to 21, oblong, 5 to 8 mm. long, obtuse, glabrous; spikes dense, 1.5 to 4 cm. long, 1 cm. thick; calyx densely sericeous; petals rose-purple; fruit densely sericeous above.

57. *Parosela glabrescens* Rydb. N. Amer. Fl. 24: 106. 1920.

San Luis Potosí.

Slender shrub 50 cm. high or taller, the stems glabrous or slightly pubescent; leaflets 15 to 21, elliptic, acute or obtuse, sparsely pilose at first; spikes dense, 1.5 to 3 cm. long, 1 cm. thick; calyx silky-pilose; petals pale rose or nearly white.

58. *Parosela lasiostachya* (Benth.) Rose, Contr. U. S. Nat. Herb. 10: 107. 1906.

Dalea lasiostachya Benth. Pl. Hartw. 11. 1839.

Dry hillsides, Mexico and Puebla.

Slender shrub, 1 meter high, with reddish glabrous branches; leaflets 13 to 17, oblong or linear-oblong, 3 to 6 mm. long, glabrous; spikes 2 to 4 cm. long, 1.5 cm. thick; calyx silky-villous; petals rose or purple; fruit densely villous.

59. *Parosela involuta* Rydb. N. Amer. Fl. 24: 107. 1920.

Jalisco; type from Río Blanco.

Slender shrub, 1 meter high or more, with glabrous branches; leaflets 11 to 15, linear, 3 to 5 mm. long, glabrous; spikes dense, 2 to 4 cm. long, 1 cm. thick; calyx densely silky-pilose; petals pale rose or pink, or at first whitish; fruit densely pubescent.

60. *Parosela eriophylla* (S. Wats.) Rose, Contr. U. S. Nat. Herb. 10: 106. 1906.

Dalea eriophylla S. Wats. Proc. Amer. Acad. 17: 340. 1822.

Coahuila; type from the Sierra Madre, 40 miles south of Saltillo.

Shrub, 10 to 20 cm. high, with tomentose branches; leaflets 3, oblong or obovate-oblong, 3 mm. long, densely white-villous; spikes sessile, headlike; calyx densely villous; petals rose-colored.

61. *Parosela greggii* (A. Gray) Heller, Cat. N. Amer. Pl. ed. 2. 6. 1900.

Dalea greggii A. Gray, Mem. Amer. Acad. II. 5: 314. 1854.

Parosela leucosericca Rydb. N. Amer. Fl. 24: 104. 1920.

Sonora to San Luis Potosí, Puebla, and Oaxaca; type from Buena Vista, Coahuila. Arizona.

Low shrub with tomentose-sericeous branches; leaflets 5 to 11, obovate or oval, 3 to 10 mm. long, densely sericeous-tomentose; spikes dense, 1 to 3 cm.

long, 1 cm. thick; calyx silky-villous; petals rose-colored, or the banner yellowish; fruit densely villous above.

62. *Parosela oaxacana* Rose, Contr. U. S. Nat. Herb. 10: 104. 1906.

Oaxaca; type from Sierra de San Felipe.

Shrub, 1 to 2 meters high, with finely soft-pubescent branches; leaflets 13 to 31, narrowly oblong, 6 to 9 mm. long, finely pubescent when young; spikes dense, 1 to 3 cm. long, 1 cm. thick; calyx silky-pubescent; petals rose-purple; fruit sparsely pubescent above.

63. *Parosela tsugoides* Rydb. N. Amer. Fl. 24: 102. 1920.

Oaxaca; type from the Valley of Oaxaca. Guatemala.

Shrub, 1 meter high, with finely villous reddish branches; leaflets 13 to 23, oblong, 2 to 3 mm. long, pubescent; spikes 2 to 3 cm. long, 1 cm. thick; calyx densely pilose; petals dark purple; fruit pubescent.

64. *Parosela versicolor* (Zucc.) Rydb. N. Amer. Fl. 24: 102. 1920.

Dalea versicolor Zucc. Flora 15²: Beibl. 1: 69. 1832.

Oaxaca and Chiapas.

Shrub, 1 meter high, with villous branches; leaflets 15 to 21, oblong, 4 to 7 mm. long, glabrous above, finely pubescent beneath; spikes 3 to 5 cm. long, 1.5 cm. thick; calyx pilose; banner white or ochroleucous, the other petals rose-purple; fruit densely pubescent.

65. *Parosela sessilis* (A. Gray) Rydb. N. Amer. Fl. 24: 104. 1920.

Dalea wislizeni sessilis A. Gray, Proc. Amer. Acad. 16: 105. 1880.

Sonora to Durango. New Mexico (type locality) and Arizona.

Shrub, 0.5 to 1 meter high, with finely puberulent branches; leaflets 13 to 21, oblong, 2 to 3 mm. long, densely pubescent beneath, sparsely pilose or glabrate above; spikes 1 to 2.5 cm. long; calyx densely pilose; banner white or yellowish, the other petals rose colored; fruit densely pubescent.

66. *Parosela megalostachys* Rose; Rydb. N. Amer. Fl. 24: 102. 1920.

Baja California; type from San Esteban.

Shrub, 1 meter high or more, with villous branches; leaflets 7 to 13, obovate, 8 to 10 mm. long, densely sericeous; spikes dense, 3 to 5 cm. long, 1.2 to 1.5 cm. thick; calyx densely silky-pilose; petals rose-colored; fruit villous.

67. *Parosela wislizeni* (A. Gray) Vail, Trans. N. Y. Acad. Sci. 14: 34. 1894.

Dalea wislizeni A. Gray, Mem. Amer. Acad. II. 4: 32. 1849.

Chihuahua to Durango and Guanajuato; type from the Sierra Madre west of Chihuahua.

Shrub, 0.5 to 1 meter high, with villous-canescens branches; leaflets 15 to 23, oblong, 3 to 6 mm. long, obtuse, densely villous-sericeous; spikes dense, 2 to 5 cm. long; calyx silky-villous; petals light rose or nearly white; fruit densely villous.

68. *Parosela sanctae-crucis* Rydb. N. Amer. Fl. 24: 103. 1920.

Sonora and Chihuahua; type from Santa Cruz, Sonora. Arizona.

Shrub, 0.5 to 1 meter high, with short-pubescent branches; leaflets 13 to 15, oblong, 3 to 5 mm. long, short-pubescent beneath, pilose or glabrate above; spikes dense, 1 to 2 cm. long; calyx densely pilose; petals rose colored; fruit pilose above.

69. *Parosela leucantha* Rydb. N. Amer. Fl. 24: 103. 1920.

Tepic and Jalisco; type collected in Tepic.

Shrub, 1 meter high, with finely short-pubescent branches; leaflets lance-oblong, 2 to 4 mm. long, acute, short-pubescent; spikes dense, 2 to 7 cm. long; calyx pilose; petals white; fruit densely pubescent above.

70. *Parosela benthami* (T. S. Brandeg.) Standl.

Dalea benthami T. S. Brandeg. Proc. Calif. Acad. II. 2: 148. 1889.

Dalea megacarpa biuncifera Greene; Vasey & Rose, Contr. U. S. Nat. Herb. 1: 15. 1890.

Psorobatus benthami Rydb. N. Amer. Fl. 24: 40. 1919.

Islands of the west coast of Baja California; type from Santa Margarita Island.

Shrub, 1 meter high or less, with white-tomentose branches covered with orange or brown glands; leaflets 7 to 11, suborbicular, 4 to 8 mm. long, white-tomentose; spikes 2 to 6 cm. long; calyx tomentose; petals pale yellow; fruit tomentose.

71. *Parosela megacarpa* (S. Wats.) Standl.

Dalea megacarpa S. Wats. Proc. Amer. Acad. 20: 359. 1885.

Psorobatus megacarpus Rydb. N. Amer. Fl. 24: 41. 1919.

Sonora (type locality) and Baja California.

Shrub, 1 meter high or less, with white-tomentose branches; leaflets 9 to 13, suborbicular, 5 to 8 mm. long, white-tomentose; spikes 5 to 15 cm. long, nearly 1 cm. thick; calyx tomentose; petals yellow, turning brown; fruit tomentose, 1 cm. long.

72. *Parosela acutifolia* (DC.) Rose, Bot. Gáz. 40: 144. 1905.

Dalea acutifolia DC. Prodr. 2: 245. 1825.

Morelos and Guerrero; type from Sierra Chilapa, Guerrero.

Shrub, 1 to 3 meters high, with glabrous branches; leaflets 7 to 11, elliptic or oval, 1 to 2.5 cm. long, cuspidate, glabrous; spikes rather lax, 5 to 15 cm. long; calyx silky-villous; petals at first greenish yellow, turning dark reddish purple; fruit silky-villous.

73. *Parosela capitata* (S. Wats.) Rose, Contr. U. S. Nat. Herb. 12: 272. 1909.

Dalea capitata S. Wats. Proc. Amer. Acad. 25: 146. 1890.

Chihuahua and Coahuila to San Luis Potosí; type from Carneros Pass, Coahuila.

Shrub, 30 to 50 cm. high, with finely puberulent branches; leaflets 5 to 9, obovate, 2 to 3 mm. long, emarginate; spikes dense, 1 to 3 cm. long; calyx sericeous; petals yellow; fruit finely pubescent.

74. *Parosela quinqueflora* (T. S. Brandeg.) Rydb. N. Amer. Fl. 24: 84. 1920.

Dalea quinqueflora T. S. Brandeg. Univ. Calif. Publ. Bot. 4: 180. 1911.

San Luis Potosí; type from Buena Vista.

Low shrub with glabrous branches; leaflets 5 or 7, cuneate-oblong, 3 mm. long; spikes headlike, 3 to 7-flowered; calyx sericeous; petals yellow.

75. *Parosela lloydii* Rydb. N. Amer. Fl. 24: 84. 1920.

Known only from the type locality, Cedros, Zacatecas.

Low shrub with glabrous branches; leaflets 7 or 9, cuneate-oblong, 3 mm. long, glabrous; spikes 2 to 7-flowered; petals yellow.

76. *Parosela mucronata* (DC.) Rose, Contr. U. S. Nat. Herb. 10: 103. 1906.

Dalea mucronata DC. Prodr. 2: 246. 1825.

Jalisco and elsewhere in central Mexico.

Stems suffruticose, 0.5 to 1 meter high, glabrous; leaflets 7 to 27, elliptic, glabrous, cuspidate; spikes dense, 1 to 2.5 cm. long, 1 cm. thick; calyx glabrous; petals white; fruit glabrous.

77. *Parosela lumholtzii* (Robins. & Fern.) Vail, Bull. Torrey Club 26: 117. 1899.

Dalea lumholtzii Robins. & Fern. Proc. Amer. Acad. 30: 115. 1894.

Parosela arizonica Vail, Bull. Torrey Club 24: 14. 1897.

Sonora; type from Los Pinitos. Arizona.

Stems suffruticose, puberulent; leaflets 17 to 27, linear, 4 to 6 mm. long, obtuse, glabrous or sparsely sericeous when young; spikes dense, 1 cm. long or less; calyx sparsely sericeous; petals white; fruit densely pubescent above.

78. *Parosela eysenhardtoides* (Hemsl.) Rose, Contr. U. S. Nat. Herb. 10: 104. 1906.

Dalea eysenhardtoides Hemsl. Diag. Pl. Mex. 6. 1878.

Michoacán to Oaxaca; type from Oaxaca.

Shrub, 2 to 4 meters high, with finely puberulent branches; leaflets 7 to 13, oblong-obovate or oblong-oblancheolate, 1 to 2 cm. long, mucronate; spikes dense, 1 to 3 cm. long, 6 to 7 mm. thick; petals white; fruit puberulent.

79. *Parosela leucostachys* (A. Gray) Rose, Contr. U. S. Nat. Herb. 10: 104. 1906.

Dalea leucostachys A. Gray, Mem. Amer. Acad. II. 4: 32. 1849.

Chihuahua, Durango, and Jalisco; type from Cosihuiriac, Chihuahua.

Shrub, 0.5 to 1 meter high, with puberulent or short-villous branches; leaflets 5 to 9, oblanceolate or obovate, obtuse or retuse; spikes 1 to 3 cm. long; calyx puberulent; petals white; fruit pubescent.

80. *Parosela frutescens* (A. Gray) Vail; Rose, Contr. U. S. Nat. Herb. 8: 303. 1905.

Dalea frutescens A. Gray, Bost. Journ. Nat. Hist. 6: 175. 1850.

Chihuahua, Coahuila, and Nuevo León. Texas (type from Guadalupe River) and New Mexico.

Slender shrub, 1 meter high or less, with glabrous branches; leaflets 13 to 17, obovate, 3 to 8 mm. long, retuse, glabrous; spikes dense, about 1 cm. long; calyx tube glabrous; petals purple; fruit glabrous.

81. *Parosela hospes* Rose, Contr. U. S. Nat. Herb. 12: 272. 1909.

Coahuila and Nuevo León; type collected near Monterrey, Nuevo León.

Slender shrub, 2 to 3 meters high, glabrous throughout, the branches purplish; leaflets 5 or 7, oblong or cuneate, 6 to 10 mm. long; spikes lax, 2 to 4 cm. long, 5 to 12-flowered; petals creamy white to pale purple; fruit sericeous.

82. *Parosela pilosissima* Rydb. N. Amer. Fl. 24: 91. 1920.

Known only from the type locality, near the city of Durango.

Shrub, 20 to 40 cm. high, the branches purplish, puberulent when young; leaflets 9 to 15, elliptic or oval, 2 to 4 mm. long, glabrous above, pilose beneath; spikes dense, 1 to 3 cm. long; calyx pubescent; petals blue; fruit slightly pubescent.

83. *Parosela emoryi* (A. Gray) Heller, Cat. N. Amer. Pl. ed. 2. 6. 1900.

Dalea emoryi A. Gray, Mem. Amer. Acad. II. 5: 315. 1854.

Psoralea emoryi Rydb. N. Amer. Fl. 24: 47. 1919.

Sonora and Baja California. Arizona (type from the Gila River) and southern California.

Shrub, 1 to 2 meters high, with white-velvety branches dotted with red or orange glands; leaflets 1 to 13, linear-oblong to obovate, 5 to 20 mm. long, white-velutinous; spikes dense, 1.2 to 1.5 cm. thick, 10 to 20-flowered; petals dark blue; fruit villous above.

This and related species were used by the Indians to dye baskets, giving a yellow or yellowish brown color.

84. *Parosela scoparia* (A. Gray) Heller, Cat. N. Amer. Pl. ed. 2. 7. 1900.

Dalea scoparia A. Gray, Mem. Amer. Acad. II. 4: 32. 1849.

Psoralea scoparius Rydb. N. Amer. Fl. 24: 48. 1919.

On sandhills, Chihuahua and Coahuila. New Mexico; type from the Jornada del Muerto.

Shrub, 0.5 to 1 meter high, with erect canescent branches; leaves 1 cm. long or less, linear or oblanceolate, canescent; spikes 1.2 to 1.5 cm. thick; calyx white-villous; petals dark blue; fruit pubescent.

85. *Parosela juncea* (Rydb.) Standl.

Psorothamnus junceus Rydb. N. Amer. Fl. 24: 48. 1919.

Known only from the type locality, Esperanza Canyon, San Pedro Mártir Mountains, Baja California.

Shrub with glabrous branches; leaflets 1 to 5, oblong or narrowly oblanceolate, 1 to 1.5 cm. long, glabrous; spikes subglobose, 1 cm. thick; petals dark blue.

86. *Parosela tinctoria* (T. S. Brandeg.) Standl.

Dalea tinctoria T. S. Brandeg. Proc. Calif. Acad. II. 2: 147. 1889.

Psorothamnus tinctorius Rydb. N. Amer. Fl. 24: 47. 1919.

Baja California; type from San Gregorio.

Shrub, 1 to 2 meters high, with gray branches; leaflets 3 or 5, 4 to 10 mm. long; spikes subglobose, 1 cm. thick; calyx villous; petals dark blue.

87. *Parosela dentata* (Rydb.) Standl.

Psorothamnus dentatus Rydb. N. Amer. Fl. 24: 47. 1919.

Known only from the type locality, Santo Domingo, Baja California.

Shrub with velutinous-canescenscent branches; leaflets 9 to 17, 1 to 2 cm. long, canescent; spikes subglobose, 1 cm. thick; petals dark blue.

88. *Parosela arenaria* (T. S. Brandeg.) Standl.

Dalea tinctoria arenaria T. S. Brandeg. Proc. Calif. Acad. II. 2: 147. 1889.

Psorothamnus arenarius Rydb. N. Amer. Fl. 24: 47. 1919.

Southern Baja California; type from Boca de Soledad.

Shrub, the branches glabrous or nearly so; leaflets 5 to 9, 1 to 3.5 cm. long, sparsely canescent; spikes short, 1 cm. thick; calyx silky-villous; petals blue; fruit pubescent.

89. *Parosela pectinata* (Kunth) Rose, Contr. U. S. Nat. Herb. 10: 104. 1906.

Dalea pectinata Kunth, Mimos. Pl. Légum. 169. pl. 49. 1819.

Durango, Jalisco, and San Luis Potosí; type from Villapando.

Stems suffruticose, 0.5 to 1 meter high, glabrous; leaflets 41 to 65, linear, 2 to 4 mm. long, glabrous; spikes dense, 2 to 3 cm. long, 1 cm. thick; calyx silky-villous; petals blue or bluish purple; fruit short-villous.

90. *Parosela abietifolia* Rose; Rydb. N. Amer. Fl. 24: 92. 1920.

Known only from the type locality, mountains above Etzatlán, Jalisco.

Stems suffruticose, 30 to 40 cm. high, villous-tomentose; leaflets 31 to 35, 5 to 8 mm. long, short-villous; spikes 1 to 3 cm. long; calyx densely silky-villous; petals rose-purple; fruit densely villous.

91. *Parosela tomentosa* (Cav.) Rose, Contr. U. S. Nat. Herb. 12: 273. 1909.

Psoralea tomentosa Cav. Icon. Pl. 3: 21. pl. 240. 1794.

Dalea tomentosa Willd. Sp. Pl. 3: 1341. 1803.

Dalea verbenacca Schlecht. & Cham. Linnaea 5: 579. 1830.

Dalea argentea Don, Hist. Dichl. Pl. 2: 225. 1832.

Tepec and Jalisco to Veraacruz and Guerrero.

Shrub, 1 meter high, with villous branches; leaflets 3 to 7, obovate, 8 to 12 mm. long, acute or mucronate, silky-villous; spikes dense, 1 to 3 cm. long, acute; calyx villous; petals purple or pink; fruit pubescent above.

92. *Parosela psoraleoides* (Moric.) Rose, Contr. U. S. Nat. Herb. 10: 104. 1906.

Dalea verbenacca sericea Schlecht. Linnaea 5: 579. 1830.

Dalea psoraleoides Moric. Mém. Soc. Genève 6: 533. pl. 4. 1833.

Jalisco to Veracruz and Guerrero; type from Cuernavaca, Morelos. Guatemala.

Shrub, 0.5 to 1.2 meters high, with villous branches; leaflets 5 to 9, oblong-obovate or elliptic, 5 to 10 mm. long, cuspidate, white-sericeous; spikes dense, 1 to 4 cm. long, 8 mm. thick; calyx villous; banner yellowish, the other petals pink, turning yellowish; fruit hairy at the summit.

93. *Parosela hemsleyana* Rose, Contr. U. S. Nat. Herb. 10: 104. 1906.

Dalea ramosissima Hemsl. Biol. Centr. Amer. Bot. 1: 245. 1880. Not *D. ramosissima* Mart. & Gal. 1843.

San Luis Potosí.

Shrub with glabrous branches; leaflets 9 to 15, oblong, 2 to 3 mm. long, obtuse, glabrous; spikes subcapitate; calyx sericeous; banner ochroleucous, the other petals purple; fruit densely pubescent.

94. *Parosela trochilina* (T. S. Brandeg.) Rose, Contr. U. S. Nat. Herb. 10: 104. 1906.

Dalea trochilina T. S. Brandeg. Proc. Calif. Acad. II. 3: 200. 1892.

Southern Baja California; type from La Chuparosa.

Shrub, 1 to 1.5 meters high, the branches glabrous; leaflets 7 to 15, obovate, 3 to 5 mm. long, glabrous; spikes dense, 1 to 2 cm. long; calyx sericeous; banner ochroleucous, the other petals purple; fruit pubescent.

95. *Parosela minutifolia* Rydb. N. Amer. Fl. 24: 87. 1920.

Zacatecas to Oaxaca and Veracruz; type from Pachuca, Hidalgo.

Shrub, 50 cm. high, with glabrous branches; leaflets 7 or 9, 1 to 2 mm. long, glabrous; spikes 1 to 1.5 cm. long; calyx densely silky-pilose; banner ochroleucous, the other petals purple; fruit silky-villous.

96. *Parosela naviculifolia* (Hemsl.) Rose, Contr. U. S. Nat. Herb. 10: 104. 1906.

Dalea naviculifolia Hemsl. Diag. Pl. Mex. 7. 1878.

Oaxaca.

Shrub, 30 to 50 cm. high, with puberulent branches; leaflets 11 to 21, oblong, 2 to 3 mm. long, obtuse, puberulent above; spikes dense, 1 to 3 cm. long, 8 mm. thick; calyx puberulent; banner white or ochroleucous, the other petals purple; fruit puberulent above.

97. *Parosela argyrea* (A. Gray) Heller, Cat. N. Amer. Pl. ed. 2. 5. 1900.

Dalea argyrea A. Gray, Pl. Wright. 1: 47. 1852.

Chihuahua and Nuevo León. Texas (type from San Pedro River) and New Mexico.

Shrub, 0.3 to 1 meter high, with tomentose branches; leaflets 7 to 13, obovate, 5 to 8 mm. long, sericeous; spikes dense, 1 to 2.5 cm. long; calyx silky-villous; banner yellowish, fading purplish, the other petals purple; fruit silky-villous.

98. *Parosela seemanni* (S. Wats.) Rose, Contr. U. S. Nat. Herb. 10: 106. 1906.

? *Dalea chrenbergii* Schlecht. Linnaea 12: 290. 1838.

Dalea seemanni S. Wats. Proc. Amer. Acad. 22: 470. 1887.

Baja California to Zacatecas, Mexico, and Hidalgo; type from the Sierra Madre (Durango?).

Shrub, 50 cm. high or more, the branches finely pubescent; leaflets 7 to 11, obovate or cuneate-oblong, sericeous; spikes rather dense, 2 to 5 cm. long; calyx long-villous; banner yellowish, the other petals purple.

99. *Parosela tuberculata* (Lag.) Rose, Contr. U. S. Nat. Herb. 10: 104. 1906.

Dalea tuberculata Lag. Gen. & Sp. Nov. 23. 1816.

Dalea thymoides Schlecht. Linnaea 5: 580. 1830.

Dalea verrucosa Don, Hist. Diehl. Pl. 2: 225. 1832.

? *Dalea comosa* Schlecht. Linnaea 12: 289. 1838.

Chihuahua and Coahuila to Mexico and Puebla.

Shrub, 50 cm. high or more, the branches densely short-pubescent; leaflets 5 to 11, oblong or obovate, 4 to 8 mm. long, short-pubescent, sometimes glabrate above; spikes 2 to 15 cm. long; calyx short-pubescent; banner yellowish, the other petals purple; fruit pubescent. "Engorda-cabras" (Durango, *Patoni*).

100. *Parosela canescens* (Mart. & Gal.) Rose, Contr. U. S. Nat. Herb. 10: 105. 1906.

Dalea canescens Mart. & Gal. Bull. Acad. Brux. 10²: 43. 1843.

Hidalgo, Puebla, and Oaxaca; type from Tehuacán, Puebla.

Shrub, 1 to 2 meters high, with finely canescent branches; leaflets 3 to 7, obovate, 4 to 10 mm. long, canescent, sometimes glabrate on the upper surface; spikes 2 to 10 cm. long; calyx short-pubescent; banner ochroleucous, the other petals purple; fruit pubescent.

101. *Parosela conzattii* Rydb. N. Amer. Fl. 24: 89. 1920.

Known only from the type locality, Cerro San Antonio, Oaxaca.

Low shrub with puberulent branches; leaflets 17 to 31, linear-oblong, 4 to 5 mm. long, glabrous above, puberulent beneath; spikes 2 cm. long; calyx pubescent; petals rose-purple.

102. *Parosela tuberculina* Rydb. N. Amer. Fl. 24: 89. 1920.

Known only from the type locality, San Luis Tultitlanapa, Puebla.

Low shrub with puberulent branches; leaflets 7 to 11, obovate, 4 to 5 mm. long, retuse, glabrous above, puberulent beneath; spikes dense, 1.5 to 3 cm. long; calyx short-pilose; banner yellowish, the other petals rose-purple; fruit densely pubescent.

103. *Parosela fulvosericca* Rydb. N. Amer. Fl. 24: 89. 1920.

Vicinity of San Luis Potosí.

Shrub, 50 cm. high, with villous branches; leaflets 7 or 9, obovate, 4 to 10 mm. long, retuse, sericeous; spikes dense, 2 to 3 cm. long; calyx sericeous; banner yellowish, the other petals rose-purple; fruit densely pubescent.

104. *Parosela dorycnoides* (DC.) Rydb. N. Amer. Fl. 24: 90. 1920.

Dalea dorycnoides DC. Prodr. 2: 245. 1825.

Dalea pulchella Moric. Mém. Soc. Genève 7: 249. pl. 7. 1836. Not *D. pulchella* Don, 1832.

? *Dalea argentea* Mart. Del. Sem. Hort. Monac. 1846. Not *D. argentea* Don, 1832.

Parosela pulchella Heller, Cat. N. Amer. Pl. ed. 2. 6. 1900.

San Luis Potosí and Hidalgo.

Shrub, 50 cm. high or more, with tomentose branches; leaflets 5 or 7, obovate, 3 to 8 mm. long, retuse, silky-canescens; spikes headlike, 1 to 2 cm. long; calyx villous; banner ochroleucous, the other petals purple; fruit pubescent.

105. *Parosela polycephala* (Benth.) Rydb. N. Amer. Fl. 24: 90. 1920.

Dalea polycephala Benth.; Hemsl. Biol. Centr. Amer. Bot. 1: 244, hyponym. 1880.

San Luis Potosí.

Low shrub with puberulent branches; leaflets 5 to 9, obovate, 2 mm. long or less, puberulent; spikes subglobose; calyx villous; banner yellowish, the other petals rose-purple; fruit pubescent.

106. *Parosela decora* (Schauer) Rydb. N. Amer. Fl. 24: 90. 1920.

Dalea decora Schauer, Linnaea 20: 743. 1847.

Oaxaca.

Shrub, 0.3 to 1 meter high, with tomentose branches; leaflets 3 to 7, oblong or obovate, 2 to 5 mm. long, obtuse or retuse, villous-tomentose; spikes dense, headlike, 1 to 1.5 cm. long; calyx villous; banner white or ochroleucous, the other petals purple; fruit pubescent.

For a list of doubtful species of the genus see Rydberg, N. Amer. Fl. 24: 116. 1920.

14. **HARPALYCE** DC. Prodr. 2: 523. 1825.

Shrubs or small trees; leaves odd-pinnate, the leaflets rather large, with numerous yellowish or reddish glands on the lower surface; flowers large, racemose; fruit short and broad, bivalvate.

The writer is skeptical concerning the validity of the species listed below. They are separated usually by characters which would be considered of little value in other genera of the family and are represented by very few specimens.

The name "balché-ceh" is said by Seler to be applied to some species of the genus in Yucatán.

Leaflets glabrous on the upper surface, even when young-----1. *H. goldmani*.

Leaflets sericeous or puberulent on the upper surface, at least when young.

Venation of the lower surface of the leaflets prominent and reticulate.

Leaflets acutish or obtuse; valves of the fruit very thick and hard.

2. *H. mexicana*.

Leaflets rounded and shallowly retuse at apex; valves of the fruit thin.

3. *H. pringlei*.

Venation of the leaflets neither prominent nor reticulate.

Leaflets oval or rounded-oval, finally glabrate beneath, retuse at apex.

4. *H. arborescens*.

Leaflets oblong, copiously sericeous beneath, scarcely or not at all retuse at apex.

Leaflets 7 or 9-----5. *H. loeseneriana*.

Leaflets 13 to 23-----6. *H. macrobotrya*.

1. *Harpalyce goldmani* Rose, Contr. U. S. Nat. Herb. 8: 313. 1905.

Known only from the type locality, Canjob, Chiapas.

Leaflets 17 to 21, oblong or oblong-ovate, obtuse; racemes mostly longer than the leaves, the flowers large.

2. *Harpalyce mexicana* Rose, Contr. U. S. Nat. Herb. 8: 42. 1903.

Known only from the type locality, near Bolaños, Jalisco.

Small tree; leaflets 11 or 13, 4 to 7.5 cm. long; fruit 5.5 cm. long, 2.5 cm. wide, glabrous; seeds 10 to 14 mm. long, brown, lustrous.

3. *Harpalyce pringlei* Rose, Contr. U. S. Nat. Herb. 8: 42. 1903.

Known only from the vicinity of the type locality, Cuernavaca, Morelos.

Shrub, 0.3 to 1.8 meters high; leaflets about 11, 1.8 to 4 cm. long; fruit about 8 cm. long and 2.5 cm. wide.

4. *Harpalyce arborescens* A. Gray, Proc. Amer. Acad. 5: 178. 1862.

Brongniartia retusa Benth.; Hemsl. Diag. Pl. Mex. 8. 1878.

Brongniartia hidalgensis Taub. Bull. Herb. Boiss. 3: 613. 1895.

Harpalyce retusa Rose, Contr. U. S. Nat. Herb. 8: 43. 1903.

San Luis Potosí, Veracruz, and Hidalgo; type collected near Tantoyuca, Veracruz.

Shrub or small tree; leaflets 7 to 11, 2 to 5 cm. long.

5. *Harpalyce loeseneriana* Taub. Bull. Herb. Bolss. 3: 612. 1895.

Harpalyce ferruginea T. S. Brandeg. Zoe 5: 234. 1906.

Puebla and Oaxaca; type from Mitla, Oaxaca.

Leaflets 2 to 4.5 cm. long; flowers 2.5 cm. long; fruit 8.5 cm. long, 3 cm. wide.

6. *Harpalyce macrobotrya* Harms, Verh. Bot. Ver. Brand. 51: 22. 1909.

Known only from the type locality, Distrito de Comitán, Chiapas.

Leaflets 2 cm. long or shorter; flowers 2 cm. long, red.

DOUBTFUL SPECIES.

HARPALYCE FORMOSA DC. Prodr. 2: 523. 1825. This, the type of the genus, was based upon one of Mociño and Sessé's drawings, but the tracing of the drawing seen by the writer is so imperfect that it is impossible to tell what species is represented. It may be the same as *H. pringlei* Rose.

15. BRONGNIARTIA H. B. K. Nov. Gen. & Sp. 6: 465. 1823.

Unarmed shrubs, usually small, with odd-pinnate leaves; flowers usually large, axillary, and long-pedunculate.

The plants vary greatly in pubescence at different stages of growth. Leaves that are densely sericeous at first may be almost glabrous when fully developed.

Stipules semireniform or semisagittate, much produced below the point of insertion.

Leaflets 3 or 5; bracts longer than peduncles.....1. *B. inconstans*.

Leaflets more than 5; bracts usually shorter than the peduncles.

Young branches pilose with soft spreading hairs.

Corolla about 2.5 cm. long.....2. *B. lunata*.

Corolla about 1.5 cm. long.....3. *B. nudiflora*.

Young branches glabrous or with appressed hairs.

Leaflets mostly 2.5 to 5 cm. long.....4. *B. podalyrioides*.

Leaflets mostly 1 to 2.5 cm. long.....5. *B. mollicula*.

Stipules oval to linear, not produced below the point of insertion.

Leaflets linear, less than 1 mm wide.....6. *B. minutifolia*.

Leaflets oblong or broader, much wider.

Young branches glabrous or practically so.

Flowers about 2 cm. long; leaflets 1 to 2 cm. long.....7. *B. diffusa*.

Flowers about 3 cm. long; leaflets 2 to 4 cm. long.....8. *B. glabrata*.

Young branches copiously pubescent.

Leaflets 3 or 5.

Leaflets 5, rounded or obtuse at apex, thin.....9. *B. suberea*.

Leaflets usually 3, emarginate, subcoriaceous.....10. *B. trifoliata*.

Leaflets 7 or more in all or most of the leaves.

Bractlets subtending the flowers glabrous.

Leaflets glabrous; bractlets cordate at base.....11. *B. foliolosa*.

Leaflets sericeous beneath when young; bractlets not cordate at base.....12. *B. magnibracteata*.

Bractlets pilose or sericeous.

Fruit densely pilose.....13. *B. lasiocarpa*.

Fruit glabrous.

Bracts at anthesis as long as the calyx.....14. *B. lupinoides*.

Bracts at anthesis much shorter than the calyx.

Calyx glabrous.

Leaflets acute, 2.5 to 5 mm. wide.....15. *B. parvifolia*.

Leaflets rounded or obtuse at apex, 5 to 17 mm. wide.

Leaflets reticulate-veined, subcordate at base.

16. *B. discolor*.

Leaflets not reticulate-veined, rounded or obtuse at base.

Leaflets 14 to 17 mm. wide, broadly rounded or retuse at apex-----17. *B. luisana*.

Leaflets 5 to 8 mm. wide, obtuse at apex.

18. *B. peninsularis*.

Calyx copiously pilose or sericeous.

Venation of the lower surface of the leaflets very prominent and closely reticulate-----19. *B. parryi*.

Venation of the leaflets neither very prominent nor closely reticulate.

Pubescence of the peduncles retrorse-----20. *B. goldmanii*.

Pubescence of the peduncles spreading, ascending, or appressed.

Corolla 2.7 to 3 cm. long-----21. *B. benthamiana*.

Corolla less than 2.5 cm. long.

Leaflets 6 to 11 mm. long-----22. *B. vicioides*.

Leaflets 14 to 50 mm. long-----23. *B. intermedia*.

1. *Brongniartia inconstans* S. Wats. Proc. Amer. Acad. 22: 404. 1887.

Jalisco and Michoacán; type from Tequila, Jalisco.

Glabrous shrub about a meter high; stipules very large, resembling the leaflets, these 1.2 to 5.5 cm. long, coriaceous, reticulate-veined, glaucescent beneath; flowers 3 cm. long, yellowish brown, turning purple.

2. *Brongniartia lunata* Rose, Contr. U. S. Nat. Herb. 5: 194. 1899.

Known only from the type locality, east of Huasemote, Durango.

Leaflets 7 to 11, oval, 4 to 6 cm. long.

3. *Brongniartia nudiflora* S. Wats. Proc. Amer. Acad. 25: 146. 1890.

Brongniartia palmeri Rose, Contr. U. S. Nat. Herb. 1: 97. 1891.

Sonora to Jalisco; type from hills near Guadalajara.

Shrub, 45 to 90 cm. high; leaflets 7 to 15, 2.5 to 6 cm. long, copiously pilose, reticulate-veined; flowers purplish. "Haba de barranca" (Jalisco).

4. *Brongniartia podalyrioides* H. B. K. Nov. Gen. & Sp. 6: 468. pl. 588. 1823.

? *Brongniartia bilabiata* Micheli. Mém. Soc. Phys. Hist. Nat. Genève 34: 248. pl. 1. 1903.

Sonora to Guerrero and Morelos; type collected near La Punta de Ixtla, between Tasco and Cuernavaca, Morelos, altitude 900 meters.

Shrub, 1 meter high or less; leaflets about 11, elliptic or oval, glabrate in age; flowers 2.5 cm. long; fruit 2.5 cm. wide or narrower, glabrous, glaucescent.

B. galegoides Presl,¹ probably a Mexican plant, is closely related to this species.

5. *Brongniartia mollicula* T. S. Brandeg. Univ. Calif. Publ. Bot. 3: 380. 1909.

Oaxaca and Puebla; type from San Luis Tultitlanapa, Puebla.

Leaflets 7 or 9, oval or suborbicular, bright green; flowers 2 to 2.5 cm. long.

6. *Brongniartia minutifolia* S. Wats. Proc. Amer. Acad. 20: 360. 1885.

Brongniartia minutifolia canescens S. Wats. Proc. Amer. Acad. 23: 271. 1888. Chihuahua. Western Texas; type from Chisos Mountains.

Shrub, 0.3 to 1 meter high; leaflets numerous, linear, 2 to 4 mm. long; flowers 1 cm. long; fruit 1.5 cm. long, 1 cm. wide.

The Chihuahua plant is *B. minutifolia canescens*.

¹ Symb. Bot. 2: 21. pl. 67. 1833.

7. *Brongniartia diffusa* Rose, Contr. U. S. Nat. Herb. 5: 194. 1899.

Known only from the type locality, between Pedro Paulo and San Blasito, Tepic.

Slender shrub, about a meter high; leaflets 7 to 19, oval or rounded-oval, bright green; flowers purplish, 2 cm. long; fruit glabrous.

8. *Brongniartia glabrata* Hook. & Arn. Bot. Beechey Voy. 238. 1836.

Brongniartia bracteolata Micheli, Mém. Soc. Phys. Hist. Nat. Genève 34: 249. pl. 2. 1903.

Sinaloa to Guerrero.

Slender shrub, 2 meters high or less, with green branches; leaflets 5 to 11, elliptic to suborbicular, bright green, glabrate; flowers 2.5 cm. long or larger; fruit 7 to 8 cm. long, 1.5 cm. wide. "Hierba de víbora" (Sinaloa).

Bark and leaves used in Sinaloa as a remedy for rattlesnake bites.

It is possible that *B. bracteolata* is a distinct species, but the material at hand does not show any important differences.

9. *Brongniartia suberea* Rose, Contr. U. S. Nat. Herb. 5: 134. pl. 13. 1897.

Known only from Acapulco, Guerrero, the type locality.

Shrub, 2.5 to 3.5 meters high, the young branches often with thick corky ridges; flowers brownish or purplish.

B. mollis H. B. K.,¹ the type from Quebrada de Zopilote, between Zumpango and Tasco, is closely related and may be the same species. The only difference is found in the larger number of leaflets (9 to 11) in the species earlier described.

10. *Brongniartia trifoliata* T. S. Brandeg. Zoe 5: 105. 1901.

Southern Baja California.

Spreading shrub, 2 to 4 meters high; leaflets 2.5 to 5.5 cm. long and nearly as wide, pale; fruit about 3.5 cm. long and 2 cm. wide.

11. *Brongniartia foliolosa* Benth.; Hemsl. Diag. Pl. Mex. 7. 1878.

Hidalgo and Puebla; type from Zimapán, Hidalgo.

Slender shrub, 1.5 to 2.5 meters high; leaflets about 25, oval, 4 to 10 mm. long, bright green, thick; fruit glabrous.

12. *Brongniartia magnibracteata* Schlecht. Linnaea 12: 338. 1838.

Veraacruz and probably elsewhere; type from San Bartolo.

Slender shrub, 1 to 2 meters high; leaflets about 33, oblong or oval, 1 to 2 cm. long, bright green; flowers purplish, nearly 2 cm. long; fruit glabrous, 4 cm. long, 1.8 cm. wide.

Judging from the description, *B. stipitata* Hemsl.² is closely related to this species, if not synonymous with it.

13. *Brongniartia lasiocarpa* Rose, Contr. U. S. Nat. Herb. 12: 268. 1909.

Puebla; type from Tehuacán.

Shrub, 30 to 40 cm. high or larger; leaflets 15 to 19, broadly oval, 4 to 7 mm. long, thick, bright green, pilose, reticulate-veined flowers 1.5 cm. long.

14. *Brongniartia lupinoides* (H. B. K.) Standl.

Peraltea lupinoides H. B. K. Nov. Gen. & Sp. 6: 471. pl. 589. 1823.

Peraltea oxyphylla DC. Mém. Légum. 463. 1825.

Brongniartia thermoides Spreng.; Steud. Nom. Bot. 1: 230. 1840.

Brongniartia oxyphylla Hemsl. Biol. Centr. Amer. Bot. 1: 254. 1880.

Guanajuato to Guerrero and Oaxaca; type collected between Chilpancingo and Zumpango, Guerrero.

¹ Nov. Gen. & Sp. 6: 467. pl. 587. 1823.

² Diag. Pl. Mex. 8. 1878.

Shrub, 1 to 2.5 meters high; leaflets about 17, oblong or oval, 2 to 4 cm. long, densely sericeous, at least when young; flowers purple, 2.5 cm. long, very showy; fruit 5 to 7 cm. long, 2 to 3 cm. wide. "Janacahuate" (Jalisco, *Urbina*); "jaboncillo" (Guanajuato).

The fruit is nearly sessile in this species. A specimen from Guerrero differs in having stipitate fruit, but it is doubtful whether this is a specific character.

15. *Brongniartia parvifolia* Rose, Contr. U. S. Nat. Herb. 12: 268. 1909.

Known only from the type locality, between San Gerónimo and La Venta, Oaxaca.

Low shrub, about 30 cm. high; leaflets about 35, oblong or elliptic, 5 to 10 mm. long, pilose; flowers small, dark red; fruit 3.5 cm. long, nearly 1.5 cm. wide.

16. *Brongniartia discolor* T. S. Brandeg, Univ. Calif. Publ. Bot. 4: 272. 1912.

San Luis Potosí and Veracruz to Puebla; type from Bagre, San Luis Potosí. Leaflets 11 to 27, 1 to 1.7 cm. long; flowers 1.5 cm. long.

17. *Brongniartia luisana* T. S. Brandeg, Univ. Calif. Publ. Bot. 3: 381. 1909.

Known only from the type locality, San Luis Tultitlanapa, Puebla.

Slender shrub; leaflets oval, 2 to 3 cm. long, thin, bright green, sericeous beneath.

18. *Brongniartia peninsularis* Rose, Contr. U. S. Nat. Herb. 12: 268. 1909.

Known only from the type locality, southwest of El Potrero, Baja California, altitude 450 meters.

Shrub, 2 to 3 meters high, with pale crooked branches; leaflets 11 to 15, ovate to oval, 1.5 to 2.2 cm. long; flowers 1.7 cm. long.

19. *Brongniartia parryi* Hemsl. Biol. Centr. Amer. Bot. 1: 254. 1880.

San Luis Potosí (type locality), Guanajuato, and Querétaro.

Shrub; leaflets about 15, oblong or ovate-oblong, 1.5 to 4.5 cm. long, pale green, pubescent; fruit 3.5 to 7 cm. long, 2 to 3 cm. wide. "Garbancillo" (Querétaro).

20. *Brongniartia goldmanii* Rose, Contr. U. S. Nat. Herb. 12: 269. 1909.

Known only from the type locality, between Las Flechas and La Rastra, Sinaloa.

Shrub, 2 to 3 meters high; leaflets about 7, oval, 1 to 2.5 cm. long, bright green; flowers 2 to 2.5 cm. long.

21. *Brongniartia benthamiana* Hemsl. Biol. Centr. Amer. Bot. 1: 252. 1880.

Guanajuato, Hidalgo, and Mexico; type from León, Guanajuato.

Shrub a meter high or less; leaflets about 19, oval or oblong, 1.5 to 2.5 cm. long; fruit 4 to 6 cm. long, 1.7 to 2.5 cm. wide.

22. *Brongniartia vicioides* Mart. & Gal. Bull. Acad. Brux. 10²: 49. 1843.

Puebla and Oaxaca; type from Misteca Alta and Cerro de San Felipe, Oaxaca.

Low shrub; leaflets 13 to 21, oval or broadly oblong, bright green on the upper surface, densely sericeous beneath.

23. *Brongniartia intermedia* Moric. Mém. Soc. Phys. Hist. Nat. Genève 7: 253. pl. 10. 1836.

Brongniartia sericea Schlecht. Linnaea 12: 337. 1838.

Brongniartia revoluta Rose, Contr. U. S. Nat. Herb. 12: 269. 1909.

San Luis Potosí to Jalisco and Oaxaca.

Shrub 1 meter high or less; leaflets 11 to 37, oblong or oval, densely sericeous when young; fruit 4 to 6 cm. long, 1.5 to 2.2 cm. wide, often glaucescent.

DOUBTFUL SPECIES.

BRONGNIARTIA GRACILIS Hemsl. Biol. Centr. Amer. Bot. 1: 253. 1880. Described from Mexico, the exact locality not known.

BRONGNIARTIA OLIGOSPERMOIDES Baill. Adansonia 9: 240. 1868-70. Type from Xochialco.

16. *BARBIERIA* DC. Mém. Légum. 241. 1825.

1. *Barbieria pinnata* (Pers.) Baill. Hist. Pl. 2: 263. 1870.

Galactia pinnata Pers. Syn. Pl. 2: 302. 1807.

Clitoria polyphylla Poir. in Lam. Encycl. Suppl. 2: 300. 1811.

Barbieria polyphylla DC. Mém. Légum. 242. 1825.

Southern Mexico, the exact localities not known, but probably in Veracruz or Oaxaca or both. Greater Antilles, Central America, and South America.

Shrub, 0.5 to 4 meters high, erect or scandent; leaves odd-pinnate, with numerous oblong leaflets; flowers red, about 5.5 cm. long, racemose; fruit linear, hirsute. "Enredadera" (Porto Rico).

17. *CRACCA* L. Sp. Pl. 752. 1753.

Low unarmed shrubs; leaves pinnate, the leaflets usually numerous but sometimes only 1 or 3, commonly with numerous close parallel lateral nerves; flowers small or large, racemose; fruit linear, flat, bivalvate.

Many of the Mexican plants of this genus are probably to be classed as herbs rather than shrubs, although most of them are inclined to be suffrutescent, at least at the base. All the Mexican species except one which, so far as known, is always a herbaceous annual, are included in the present treatment. Most of the species have very tough stems, which are broken with difficulty. *Cracca virginiana* L., of the United States, a herbaceous species, was used by the Indians of the Southeastern States to poison fish. It is said also to have diaphoretic and powerful anthelmintic properties.

Leaflets densely tomentose beneath, very obtuse at apex, large, 1 to 5 or rarely 7.

Leaflets 5 or 7-----1. *C. lanata*.

Leaflets usually 1 or 3, the lateral ones, when present, often much reduced.

Calyx long-pilose; leaflet one, oval or broadly oblong----2. *C. platyphylla*.

Calyx short-pilose; leaflets usually 3, oblong.

Calyx about 2 cm. long-----3. *C. diversifolia*.

Calyx about 1 cm. long-----4. *C. micheliana*.

Leaflets sericeous or glabrate beneath, or rarely short-pilose but then acute.

Leaflets nearly or quite as broad as long-----5. *C. potosina*.

Leaflets much longer than broad.

A. Leaflets rounded or very obtuse at base.

Leaflets 1 to 7, glabrous or densely white-sericeous beneath.

Leaflets densely white-sericeous beneath-----6. *C. watsoniana*.

Leaflets glabrous beneath-----7. *C. madrensis*.

Leaflets more than 7 in all or most of the leaves, or if fewer neither glabrous nor densely white-sericeous beneath.

Pubescence of the stems closely appressed.

Fruit pubescent.

Pubescence of the stems closely appressed; leaflets 3 to 4 cm. long.

8. *C. rhodantha*.

Pubescence of the stems often partly spreading; leaflets 1.5 to 2.6 cm. long-----17. *C. leucantha*.

Fruit glabrous, at least on the sides.

Fruit glabrous on the edges; leaflets 2.5 to 4 cm. long.

9. *C. leiocarpa*.

Fruit strigillose on the edges; leaflets 1.5 to 2.5 cm. long.

10. *C. cuernavacana*.

Pubescence of the stems spreading or reflexed.

Leaflets 5 to 9 or rarely 11, 1.4 to 2.5 cm. wide.

Leaflets obtuse, glabrate beneath.....11. *C. tepicana*.

Leaflets acute, densely pilose beneath.....12. *C. langlassei*.

Leaflets more than 9 in all or most of the leaves, usually much more numerous, commonly less than 1.4 cm. wide.

Keel of the corolla about 1 cm. long. Leaflets 0.8 to 1.5 cm. long, glabrous on the upper surface.....13. *C. seemanni*.

Keel of the corolla much more than 1 cm. long.

Leaflets 0.6 to 1.2 cm. long.....22. *C. pringlei*.

Leaflets 1.5 to 4 cm. long or longer.

Pubescence of the stems brown; leaflets acute, 3.5 cm. long.

14. *C. submontana*.

Pubescence of the stems white to yellow; leaflets obtuse, or if acute less than 3.5 cm. long.

Fruit 6 to 7 mm. wide, thick, densely long-pilose.

15. *C. talpa*.

Fruit 3 to 5 mm. wide, flat, short-pilose or sericeous.

Corolla 2.5 to 3 cm. long.....16. *C. macrantha*.

Corolla 2 cm. long or shorter.

Leaflets small, 1.5 to 2.6 cm. long.....17. *C. leucantha*.

Leaflets large, most of them 3 to 5 cm. long or longer.

Calyx lobes subulate-attenuate.....18. *C. toxicaria*.

Calyx lobes triangular or oblong, acute or subobtuse.

19. *C. schiedeana*.

AA. Leaflets acute or cuneate at base.

Pubescence of the stems spreading or ascending, never closely appressed.

Leaflets broadest near the apex.

Flowers about 2 cm. long; leaflets 3 to 8 cm. long, glabrous on the upper surface.....20. *C. nitens*.

Flowers 8 to 12 mm. long; leaflets 6 to 20 mm. long, usually sericeous on the upper surface.....21. *C. cinerea*.

Leaflets broadest at or near the middle.

Flowers 2 cm. long.....22. *C. pringlei*.

Flowers less than 1 cm. long.

Leaflets appressed-pilose on the upper surface...23. *C. brandegei*.

Leaflets glabrous on the upper surface.....24. *C. vicioides*.

Pubescence of the stems closely appressed.

Fruit glabrous.....9. *C. leiocarpa*.

Fruit sericeous or strigillose.

Leaflets oblanceolate or obovate, broadest near the apex.

21. *C. cinerea*.

Leaflets linear to linear-oblong, broadest at the middle.

Flowers 5 to 7 mm. long.....25. *C. purpurea*.

Flowers 11 to 18 mm. long.....26. *C. palmeri*.

1. *Cracca lanata* (Mart. & Gal.) Kuntze, Rev. Gen. Pl. 1: 175. 1891.

Tephrosia lanata Mart. & Gal. Bull. Acad. Brux. 10²: 48. 1843.

Tephrosia crassifolia Benth. Bot. Voy. Sulph. 80. 1844.

Cracca crassifolia Kuntze, Rev. Gen. Pl. 1: 174. 1891.

Veracruz to Tepic and Guerrero; type from Zacuapan, Veracruz.

Low shrub; leaflets oblong or oval, 4 to 8 cm. long, coriaceous; flowers 2 to 2.5 cm. long, purplish; fruit tomentose.

2. *Cracca platyphylla* Rose, Contr. U. S. Nat. Herb. 12: 270. f. 25. 1909.

Known only from the type locality, pine woods between Mascota and San Sebastián, Jalisco.

Low shrub; leaflet one, oval-oblong to broadly oval, 5 to 7 cm. wide, broadly rounded at apex, coriaceous, white-tomentose beneath; flowers large, rose-red.

3. *Cracca diversifolia* Rose, Contr. U. S. Nat. Herb. 12: 270. 1909.

Michoacán; type from Uruapam.

Shrub 0.5 to 1 meter high; leaflets 3, green on the upper surface, densely white-tomentose beneath, the lateral ones smaller than the terminal one; flowers violet, 2.5 cm. long; fruit very densely pilose.

4. *Cracca micheliana* Standl.

Tephrosia major Micheli. Mém. Soc. Phys. Hist. Nat. Genève 34: 251. pl. 4. 1903.

Cracca major Rose, Contr. U. S. Nat. Herb. 12: 270. 1909. Not *C. major* Alef. 1861.

Known only from the type locality, El Ocote, Michoacán or Guerrero.

Shrub about a meter high; leaflets sometimes 16 cm. long and 6 cm. wide; flowers white tinged with violet; fruit densely tomentose.

5. *Cracca potosina* (T. S. Brandeg.) Standl.

Tephrosia potosina T. S. Brandeg. Univ. Calif. Publ. Bot. 4: 272. 1912.

Nuevo León and San Luis Potosí; type from Rascón, San Luis Potosí.

Plants chiefly herbaceous, decumbent; leaflets usually 5, suborbicular, 2 to 4 cm. long, sericeous beneath; fruit densely pilose.

This plant has been reported from Mexico as *Tephrosia lindheimeri* A. Gray, but it seems quite distinct from that species.

6. *Cracca watsoniana* Standl.

Clitoria sericea S. Wats. Proc. Amer. Acad. 22: 407. 1887.

Cracca sericea Rose, Contr. U. S. Nat. Herb. 12: 271. 1909. Not *C. sericea* A. Gray, 1883.

Tepic to Guerrero; type from Río Blanco, Jalisco.

Plants 45 cm. high or less, woody at base; leaflets 1 or sometimes 5 or 7, linear-oblong to oval, 3 to 8 cm. long, densely white-sericeous beneath; flowers purple, 2 to 2.5 cm. long.

7. *Cracca madrensis* (Seem.) Kuntze, Rev. Gen. Pl. 1: 175. 1891.

Tephrosia madrensis Seem. Bot. Voy. Herald 280. pl. 61. 1856.

Known only from the type locality, somewhere in the Sierra Madre.

Leaves unifoliolate.

8. *Cracca rhodantha* (T. S. Brandeg.) Rose, Contr. U. S. Nat. Herb. 12: 270. 1909.

Tephrosia rhodantha T. S. Brandeg. Zoe 5: 201. 1905.

Sinaloa; type from Cofradía.

Slender shrub, 0.4 to 1.8 meters high, or often herbaceous nearly throughout; leaflets numerous, narrowly oblong; flowers brick-red or purplish white.

9. *Cracca leiocarpa* (A. Gray) Kuntze, Rev. Gen. Pl. 1: 175. 1891.

Tephrosia leiocarpa A. Gray, Pl. Wright. 2: 36. 1853.

Tephrosia affinis S. Wats. Proc. Amer. Acad. 21: 424. 1886.

Tephrosia viridis Jones, Contr. West. Bot. 12: 7. 1908.

Cracca affinis Rose, Contr. U. S. Nat. Herb. 12: 269. 1909.

Chihuahua and Sonora to Jalisco; type collected along the Sonora, in Sonora.

Slender shrub, 0.6 to 2 meters high; leaflets about 17, narrowly oblong; flowers pinkish.

10. *Cracca cuernavacana* Rose, Contr. U. S. Nat. Herb. 12: 269. 1909.

Known only from the type locality, wooded slopes of barranca above Cuernavaca, Morelos, altitude 1,800 meters.

Slender suffrutescent plant, 0.6 to 1 meter high; leaflets oblong, obtuse, bright green; flowers 1.5 cm. long.

11. *Cracca tepicana* Standl. Contr. U. S. Nat. Herb. 20: 217. 1919.

Known only from Tepic, the type locality.

Leaflets oblong or oval-oblong, obtuse, green; flowers 1.5 cm. long.

12. *Cracca langlassei* (Micheli) Rose, Contr. U. S. Nat. Herb. 12: 270. 1909.

Tephrosia langlassei Micheli, Mém. Soc. Phys. Hist. Nat. Genève 34: 250. pl. 3. 1903.

Jalisco to Oaxaca; type from the Sierra Madre of Michoacán or Guerrero.

Plants copiously pubescent; leaflets oblong-ovate, 3 to 6 cm. long; flowers 1.5 cm. long.

The specimens from Jalisco are slightly different from the more southern plant, and may represent a different species.

13. *Cracca seemanni* Britten & Baker, Journ. Bot. Brit. & For. 38: 17. 1900.

Sinaloa and perhaps elsewhere; type from somewhere in the Sierra Madre.

Plants suffrutescent, with purplish flowers. "Gallitos" (Sinaloa).

This has been reported from Mexico as *Tephrosia virginiana* (L.) Pers.

14. *Cracca submontana* Rose, Contr. U. S. Nat. Herb. 8: 46. 1903.

Sinaloa and Tepic; type collected between Pedro Paulo and San Blascito, Tepic.

Leaflets coriaceous, bright green on the upper surface and scaberulous; flowers about 2.5 cm. long.

15. *Cracca talpa* (S. Wats.) Rose, Bot. Gaz. 40: 143. 1905.

Tephrosia talpa S. Wats. Proc. Amer. Acad. 22: 405. 1887.

Sinaloa and Durango to Veraacruz and Oaxaca; type from Río Blanco, Jalisco.

Plants herbaceous or suffrutescent; leaflets oblong or oval, 2 to 6 cm. long, densely sericeous; flowers pink, 1.5 to 2 cm. long.

This species is closely related to *C. toxicaria*, but has much broader, thicker fruit, and the leaflets are usually proportionally broader.

16. *Cracca macrantha* (Robins. & Greenm.) Rose, Bot. Gaz. 40: 143. 1905.

Tephrosia macrantha Robins. & Greenm. Proc. Amer. Acad. 29: 383. 1894.

Jalisco to Guerrero; type from Tequila, Jalisco.

Slender shrub, 2.5 to 3.5 meters high; leaflets oblong, 2 to 4 cm. long; flowers large, white or pink, in long racemes.

17. *Cracca leucantha* (H. B. K.) Kuntze, Rev. Gen. Pl. 1: 175. 1891.

Tephrosia leucantha H. B. K. Nov. Gen. & Sp. 6: 460. pl. 577. 1823.

Tephrosia leucantha acuta Jones, Contr. West. Bot. 12: 7. 1908.

Chihuahua and Sonora to Guanajuato; type collected near Guanajuato.

Plants suffrutescent; leaflets numerous, oblong or narrowly oblong; flowers greenish white or pinkish; fruit 3 to 5.5 cm. long, 4 to 5 mm. wide.

18. *Cracca toxicaria* (Pers.) Kuntze, Rev. Gen. Pl. 1: 175. 1891.

Tephrosia toxicaria Pers. Syn. Pl. 2: 328. 1807.

Tephrosia multifolia Rose, Contr. U. S. Nat. Herb. 1: 320. 1895.

Cracca multifolia Rose, Contr. U. S. Nat. Herb. 12: 270. 1909.

Sinaloa to Zacatecas and Oaxaca. Central America, West Indies, and South America.

Shrub, 1 to 2 meters high, or often herbaceous; leaflets numerous, oblong or narrowly oblong; flowers white and pink, 1.5 to 2 cm. long. "Barbasco" (Jalisco, Oaxaca, Colombia); "chilapate" (El Salvador).

The roots have a disagreeable odor; in the West Indies they have been used in the treatment of cutaneous diseases. The plant is said also to have purgative properties and to affect the heart like digitalis. It is often crushed and thrown in water to poison fish. It is reported to furnish a fine blue dye.

19. *Cracca schiedeana* (Schlecht.) Standl.

Tephrosia schiedeana Schlecht. *Linnaea* 12: 299. 1838.

Jalisco to Oaxaca and Veracruz; type from Barranca de Tioselo, Veracruz. Guatemala.

Low shrub or herb; leaflets oblong or narrowly oblong, sericeous; flowers 2 greenish white or pinkish; fruit 3 to 5.5 cm. long, 4 to 5 mm. wide.

It is not certain that the specific name applies to the present plant, which seems distinct from *C. toxicaria*. It may be that *C. schiedeana* should be referred to the synonymy of that species.

20. *Cracca nitens* (Benth.) Kuntze, *Rev. Gen. Pl.* 1: 175. 1891.

Tephrosia nitens Benth.; *Seem. Bot. Voy. Herald* 107, pl. 19. 1853.

Michoacán to Chiapas. Central and South America; type from Panama.

Erect shrub 1 to 5 meters high; leaflets few, coriaceous, bright green above, densely sericeous beneath with lustrous hairs; flowers violet-red.

21. *Cracca cinerea* (L.) Morong, *Ann. N. Y. Acad.* 7: 79. 1892.

Galega cinerea L. *Syst. Nat.* ed. 10. 1172. 1759.

Tephrosia cinerea Pers. *Syn. Pl.* 2: 328. 1807.

Tephrosia decumbens Benth. *Nat. For. Kjöbenhavn Vid. Medd.* 1853: 7. 1854.

Tephrosia scopulorum T. S. Brandeg. *Univ. Calif. Publ. Bot.* 6: 181. 1915.

Guerrero to Veracruz, Yucatán, and Oaxaca. Widely distributed in tropical America.

Plants decumbent, herbaceous or suffrutescent; flowers small, purplish or pink. "Barbasco" (Colombia); "añil," "añil cenizo" (Porto Rico).

The plant is said to have narcotic properties, and has been used in Guiana to stupefy fish. In the West Indies it is reputed to have medicinal properties, and has been used in the treatment of fevers and in nervous, cutaneous, and venereal diseases.

22. *Cracca pringlei* Rose, *Bot. Gaz.* 40: 143. 1905.

Oaxaca; type from Las Sedas.

Plants decumbent, suffrutescent; leaflets about 1 cm. long; flowers few, purple, 2 cm. long.

23. *Cracca brandegei* Standl. *Contr. U. S. Nat. Herb.* 20: 217. 1919.

Sinaloa and Durango; type from Altata, Sinaloa.

Leaflets linear or oblong-linear, 1 to 4.5 cm. long.

24. *Cracca vicioides* (Schlecht.) Kuntze, *Rev. Gen. Pl.* 1: 175. 1891.

Tephrosia vicioides Schlecht. *Linnaea* 12: 297. 1838.

Veracruz to Michoacán and Guerrero; type from Hacienda de la Laguna, Veracruz.

Plants herbaceous or suffrutescent, green and nearly glabrous; leaflets 2 to 3 cm. long; flowers small, wine-red, in very slender racemes.

25. *Cracca purpurea* L. *Sp. Pl.* 752. 1753.

Tephrosia purpurea Pers. *Syn. Pl.* 2: 329. 1807.

Tephrosia tenella A. Gray, *Pl. Wright.* 2: 36. 1853.

Cracca tenella Rose, *Contr. U. S. Nat. Herb.* 12: 271. 1909.

Baja California to Chihuahua, Veracruz, and Oaxaca. Widely distributed in the tropics of both hemispheres.

Plants usually herbaceous but sometimes frutescent; flowers small, purple or purplish. "Añil" (Porto Rico).

Specimens of this species have been reported from Mexico as *Tephrosia leptostachya* DC. Maiden reports that the plant is harmful and even poisonous to stock. The plant is used in different countries for stupefying fish. Various medicinal properties are ascribed to it in India. An ointment made from the roots is applied for elephantiasis; the juice is applied to eruptions upon the skin, and a decoction of the roots is used for indigestion, coughs, liver and kidney affections, etc.

26. *Cracca palmeri* (S. Wats.) Rose, Contr. U. S. Nat. Herb. 12: 270. 1909.

Tephrosia palmeri S. Wats. Proc. Amer. Acad. 24: 46. 1889.

Tephrosia purisimae T. S. Brandeg. Proc. Calif. Acad. II. 2: 149. 1889.

Tephrosia cana T. S. Brandeg. Proc. Calif. Acad. II. 3: 126. 1891.

Baja California and Sonora; type from Guaymas, Sonora.

Plants slender, erect or decumbent, herbaceous or frutescent; leaflets 1.5 to 5.5 cm. long; flowers pink or purplish.

DOUBTFUL OR EXCLUDED SPECIES.

CRACCA OROBOIDES (H. B. K.) Kuntze, Rev. Gen. Pl. 1: 175. 1891. *Tephrosia oroboides* H. B. K. Nov. Gen. Sp. 6: 462. pl. 579. 1823. Apparently a species of *Lotus*.

CRACCA VENOSA (Mart. & Gal.) Kuntze, Rev. Gen. Pl. 1: 175. 1891. *Tephrosia venosa* Mart. & Gal. Bull. Acad. Brux. 10²: 47. 1843. Type from Oaxaca. The description suggests *C. pringlei* Rose, but the fruit is described as glabrous.

TEPHROSIA CHRYSOPHYLLA Mart. & Gal. Bull. Acad. Brux. 10²: 40. 1843. Not *T. chrysophylla* Pursh, 1814. Type from Veracruz.

18. ROBINIA L. Sp. 722. 1753.

Trees or shrubs, usually armed with spines; leaves deciduous, pinnate; flowers in axillary racemes; fruit flat, bivalvate, narrowly winged along the upper suture.

Robinia pseudacacia L., the black locust, a native of the eastern United States, with white flowers, is cultivated as a shade tree in some localities. It is known usually as "acacia," and the name "loco" is said to be applied in Chihuahua.

Inflorescence glandular-hispid-----1. *R. neomexicana*.

Inflorescence puberulent or pilose, without glands-----2. *R. pringlei*.

1. *Robinia neomexicana* A. Gray, Mem. Amer. Acad. n. ser. 5: 314. 1854.

Mountains of northern Sonora. Western Texas to Arizona and southern Colorado; type from the Mimbres River, New Mexico.

Very spiny tree or shrub, sometimes 7.5 meters high, with a trunk 35 cm. in diameter; bark thin, light brown, nearly smooth; leaflets 13 to 21, oval, about 4 cm. long; flowers large, showy, pale pink; fruit flat, densely hispid with gland-tipped hairs; wood very hard, strong, close-grained, yellow with brownish markings, the specific gravity about 0.80. "Uña de gato" (New Mexico).

2. *Robinia pringlei* Rose, Contr. U. S. Nat. Herb. 12: 274. 1909.

Known only from the type locality, near Tula, Hidalgo, altitude 2,040 meters.

Medium-sized tree; leaflets 13 or 15, oval, 3.5 to 5 cm. long, thin, nearly glabrous; flowers large, in lax axillary racemes; fruit flat, 6 cm. long, 1 cm. wide, smooth, with 2 narrow wings along one edge.

DOUBTFUL SPECIES.

ROBINIA EHRENBURGII Schlecht. *Linnaea* 12: 303. 1838. Type from 'Aguas-calientes, near Granada. Probably a species of *Lonchocarpus*.

ROBINIA MELANOCARPA Schlecht. *Linnaea* 12: 305. 1838. Type from Papantla, Veracruz. Probably a *Lonchocarpus*.

19. DAUBENTONIA DC. *Mém. Légum.* 285. 1825.

1. *Daubentonia cavanillesii* (S. Wats.) Standl.

? *Aeschynomene longifolia* Cav. *Icon. Pl.* 4: 8, *pl.* 316. 1797.

Sesban cavanillesii S. Wats. *Proc. Amer. Acad.* 17: 342. 1882.

San Luis Potosí. Southern United States.

Shrub 1 to 2 meters high; leaves odd-pinnate, the leaflets numerous, pale, narrowly oblong, 1 to 2.5 cm. long, obtuse; flowers yellow, 1.5 to 2 cm. long, racemose; fruit with 4 longitudinal wings.

The seeds are said to have been used in the southern United States as a substitute for coffee.

20. SESBAN Adans. *Fam. Pl.* 2: 327. 1763.

Unarmed shrubs or small trees or often herbs; leaves pinnate, the leaflets numerous, small; flowers racemose, large and showy; fruit linear, compressed, 4-angled, or subterete, often very long.

Corolla 6' to 7 cm. long. Leaflets oblong or oval.-----1. *S. grandiflora*.

Corolla 2.5 cm. long or shorter.

Leaflets lanceolate to elliptic, acute; fruit stipitate, 8 mm. wide.

2. *S. mexicana*.

Leaflets oblong or oval, rounded at the apex; fruit sessile, 3 to 4 mm. wide.

3. *S. macrocarpa*.

1. *Sesban grandiflora* (L.) Pers. *Syn. Pl.* 2: 316. 1807.

Aeschynomene grandiflora L. *Sp. Pl.* ed. 2. 1060. 1763.

Agati grandiflora Desv. *Journ. de Bot. Desv.* 1: 120. 1813.

Adventive in Yucatán and sometimes cultivated for ornament. Native probably of the East Indies; adventive in tropical America.

Nearly glabrous shrub or small tree, sometimes 4.5 meters high; leaflets about 3 cm. long; flowers very large, white or pink, pendulous; fruit 30 to 35 cm. long. "Pico de flamingo" (Yucatán); "cobrequé" (Nicaragua); "galito," "báculo," or "cresta de gallo" (Porto Rico).

The wood is soft, weak, and light. From incisions in the stem there runs a pinkish white juice, which dries into vitreous tears of a violet tint. From these is obtained a gum from which two coloring principles have been separated—a red one, agathinone, and a yellow one, xanthoagathine. The bitter bark is said to have tonic and febrifuge properties; in India it has been employed as a remedy for smallpox. Diuretic and laxative properties are ascribed to the leaves. In southern Asia the flowers and green pods are eaten as a salad or pot herb, and the leaves and young shoots are gathered and fed to cattle. For an illustration of the plant see *Contr. U. S. Nat. Herb.* 9: *pl.* 6.

2. *Sesban mexicana* Pollard, *Bull. Torrëy Club* 24: 154. 1897.

Aeschynomene longifolia Orteg. *Hort. Matr.* Dec. 9: 70. 1800. Not *A. longifolia* Cav. 1797.

Sesban longifolia DC. *Prodr.* 2: 265. 1826:

Jalisco.

Low shrub; leaflets 1.5 to 3.5 cm. long, bright green; fruit 6.5 to 12.5 cm. long, conspicuously torulose.

It is not at all certain that the name *Aeschynomene longifolia* Cav. does not apply to this plant. That species was based upon flowering specimens, and the leaves illustrated resemble those of *S. mexicana* quite as much as those of *Daubentonia cavanillesii*.

3. *Sesban macrocarpa* Muhl.; Ell. Bot. S. C. & Ga. 2: 221. 1788.

Aeschynomene picta Cav. Icon. Pl. 4: 7. pl. 314. 1797.

Sesban picta Pers. Syn. Pl. 2: 316. 1807.

Usually along streams or in wet soil, Baja California and Sonora to Guerrero and Veracruz. Southern United States; Central America.

Shrub, 1 to 4.5 meters high; leaflets numerous, 1 to 3.5 cm. long, pale green; flowers large, yellow, racemose; fruit slender, 10 to 30 cm. long. "Zacate de agua" (Jalisco); "bequilla" (Sonora, Palmer).

21. **BENTHAMANTHA** Alef. Bonplandia 1862: 264. 1862.

Unarmed herbs or low shrubs; leaves odd-pinnate, with 3 to many thin, rather small leaflets; flowers small, racemose; fruit linear, compressed, bivalvate.

Pedicels and rachis of the inflorescence glandular-pilose.

Leaflets sericeous on the upper surface-----1. *B. glandulifera*.

Leaflets glabrous on the upper surface-----2. *B. greenmanii*.

Pedicels and rachis without gland-tipped hairs.

Leaflets glabrous on the upper surface-----3. *B. glabrescens*.

Leaflets pilose or sericeous on the upper surface-----4. *B. mollis*.

1. *Benthamantha glandulifera* (Benth.) Alef. Bonplandia 1862: 264. 1862.

Tephrosia glandulifera Benth. Pl. Hartw. 115. 1843.

Cracca glandulifera Benth. Nat. For. Kjöbenhavn Vid. Medd. 1853: 8. 1853.

Benthamantha glandulosa Rose, Contr. U. S. Nat. Herb. 10: 99. 1906.

Chiapas. Central America and northwestern South America; type from Guayaquil, Ecuador.

Shrub, 60 cm. high, or sometimes herbaceous; leaflets about 13, oval, 1 to 2 cm. long, sericeous beneath; flowers purplish yellow, 1 cm. long.

2. *Benthamantha greenmanii* (Millsp.) Britt. & Baker; Millsp. Field Mus.

Bot. 2: 50. 1900.

Cracca greenmanii Millsp. Field Mus. Bot. 1: 299. pl. 13. 1896.

Yucatán and Campeche; type from Chichen Itzá, Yucatán.

Plants low, suffrutescent or herbaceous.

The roots bear numerous tubers as in *B. glabrescens*. Probably these tubers are borne by all the members of the genus.

3. *Benthamantha glabrescens* (Benth.) Alef. Bonplandia 1862: 264. 1862.

Tephrosia glabrescens Benth. Bot. Voy. Sulph. 81. 1844.

Cracca glabrescens Benth. Nat. For. Kjöbenhavn Vid. Medd. 1853: 9. 1853.

Benthamantha pumila Rose, Contr. U. S. Nat. Herb. 10: 99. pl. 30. 1906.

Benthamantha tuberosa T. S. Brandeg. Univ. Calif. Publ. Bot. 4: 376. 1913.

Chihuahua to Puebla and Veracruz; reported from Nuevo León. Type from Colombia.

Plants decumbent, herbaceous or suffrutescent, bright green and glabrate; leaflets oval or rounded-oval, 0.5 to 2 cm. long.

The roots bear numerous tubers 1 to 10 cm. long, resembling small sweet potatoes.

4. *Benthamantha mollis* (H. B. K.) Alef. Bonplandia 1862: 264. 1862.

Tephrosia mollis H. B. K. Nov. Gen. & Sp. 5: 463. 1821.

Cracca mollis Benth. Nat. For. Kjöbenhavn Vid. Medd. 1853: 4. 1853.

Cracca edwardsii A. Gray, Pl. Wright. 2: 35. 1853.

9

Cracca edwardsii sericea A. Gray, Proc. Amer. Acad. 17: 201. 1882.

Cracca sericea A. Gray, Proc. Amer. Acad. 19: 74. 1883.

Brittonamra sericea Kearney, Trans. N. Y. Acad. Sci. 14: 32. 1894.

Benthamantha sericea Britt. & Baker, Journ. Bot. Brit. & For. 38: 19. 1900.

Benthamantha fruticosa Rose, Contr. U. S. Nat. Herb. 8: 99. 1906.

Baja California to Chihuahua, Yucatán, and Chiapas. Southern Arizona; Central America and northern South America; type from Venezuela.

Slender shrub, 0.6 to 1.5 meters high, or often herbaceous; leaflets mostly oval, 1 to 3.5 cm. long; flowers small, yellow striped with brown or purple; fruit about 6 cm. long and 3.5 mm. wide.

A very variable species, with a wide range. It may be possible to divide it into two or more species, but no constant lines of separation are apparent. The pubescence of the stems is either appressed or spreading, in varying degrees. The earlier or larger leaves are often trifoliolate, while the upper leaves on the same plant are usually multifoliolate. The leaflets are often mottled with bronze and green. Specimens of this species have been reported from Yucatán as *Tephrosia cinerea* Pers. and as *Cracca cinerea* (Pers.) Morong.

The writer has seen no specimens of *B. caribaea* (Jacq.) Kuntze from Mexico, although it might be expected in Yucatán. It resembles *B. mollis*, but has much larger flowers.

22. DIPHYSA Jacq. Enum. Pl. Carib. 7. 1760.

Unarmed shrubs or small trees; leaves pinnate, the leaflets few, thin; flowers rather large, yellow, racemose; fruit inflated but compressed.

Some of the species—probably all of them—yield a yellow dye. The vernacular names "macano" and "cacique" are said to be applied in Panama to *D. carthaginensis* Jacq.

Inflorescence densely viscid-pubescent or covered with long, stout, spinelike hairs.

Inflorescence viscid-pubescent, without spinelike hairs.

Fruit 3 to 5 cm. long-----1. *D. racemosa*.

Fruit 6 to 11 cm. long-----2. *D. macrocarpa*.

Inflorescence scarcely or not at all viscid, covered with long spinelike hairs.

3. *D. thurberi*.

Inflorescence neither viscid-pubescent nor with spinelike hairs.

Racemes usually 1 or 2-flowered; leaflets 5 mm. long or shorter; branches puberulent.-----4. *D. minutifolia*.

Racemes with few or numerous flowers; leaflets usually much more than 5 mm. long, or if small the branches glabrous.

Stipe of the fruit much longer than the calyx-----5. *D. sennoides*.

Stipe equaling or shorter than the calyx.

Pedicels with at least a few short hairs in anthesis; leaflets mostly 1.5 to 3 cm. long, bright green on the upper surface-----6. *D. robinoides*.

Pedicels wholly glabrous; leaflets mostly less than 1.5 cm. long, commonly grayish green.

Fruit less than 1.5 cm. wide-----7. *D. suberosa*.

Fruit 2 to 3 cm. wide-----8. *D. occidentalis*.

1. *Diphysa racemosa* Rose, Contr. U. S. Nat. Herb. 1: 97. pl. 3. 1891.

Sonora to Guerrero and Morelos; type from Alamos, Sonora.

Shrub, 1.5 to 3 meters high, very viscid; leaflets usually 9 to 17, oval or oblong, 0.5 to 2.5 cm. long, pale beneath; racemes long, numerous, the flowers about 2 cm. long; fruit about 4 cm. long and 1.5 cm. wide.

The plant has a disagreeable odor. The wood is hard and yellow.

2. *Diphysa macrocarpa* Standl., sp. nov.

Type from Tecozantla, Hidalgo, collected by F. Salazar, May 22, 1914 (U. S. Nat. Herb. no. 1,039,091).

Branches, petioles, and inflorescence densely viscid-pubescent; leaflets 11 to 29, oval, 8 to 15 mm. long, glabrous, pale beneath; racemes lax, few-flowered; calyx glabrous, the lobes glandular-ciliate; fruit 6 to 11 cm. long, 1.2 to 1.5 cm. wide, obtuse or acute, short-rostrate, covered with sessile glands, the stipe about twice as long as the calyx, viscid-setulose. "Retama de cerro."

3. *Diphysa thurberi* (A. Gray) Rydb.

Daubentonia thurberi A. Gray, Mem. Amer. Acad. n. ser. 5: 313. 1855.

Diphysa echinata Rose, Contr. U. S. Nat. Herb. 12: 271. 1909.

Sonora and Sinaloa; type from Mabibi, Sonora. Southern Arizona.

Shrub; leaflets about 11, or more, oval or rounded-oval, 1 to 1.5 cm. long.

4. *Diphysa minutifolia* Rose, Contr. U. S. Nat. Herb. 12: 271. 1909.

Tamaulipas to Yucatán and Chiapas; type from Cuernavaca, Morelos.

Shrub, 1 to 2 meters high, rigidly branched, the branches gray or red; leaflets about 13, oval or oblong, bright green; flowers 1.5 cm. long. "Xsusuc" (Yucatán, Maya); "retama" (Tamaulipas).

5. *Diphysa sennoides* Benth. Nat. For. Kjöbenhavn Vid. Medd. 1853: 12. 1854.

Veracruz (type locality) and Hidalgo to Guerrero and Oaxaca. Reported from Guatemala and Venezuela.

Shrub 2 to 4 meters high; leaflets about 13; fruit very large, about 10 cm. long. "Cascabelillo" (Guerrero).

6. *Diphysa robinoides* Benth. Nat. For. Kjöbenhavn Vid. Medd. 1853: 11. 1854.

Diphysa floribunda Peyr. Linnaea 30: 78. 1859.

Veracruz to Yucatán, Chiapas, and Oaxaca. Central America; type from Nicaragua.

Shrub or small tree, sometimes 7.5 meters high; leaflets mostly 11 to 21, oval or oblong; flowers numerous, 1.5 cm. long; fruit about 6 cm. long and 1.5 to 2 cm. wide. "Cuachepil" (from the Nahuatl *cuau-chepilli*); "palo amarillo" (Guatemala); "guachipilín," "guachipeli," "huachipilín" (El Salvador, Costa Rica).

The wood is hard and durable; it yields a yellow dye. It is doubtful whether this species is distinct from *D. carthaginensis* Jacq., which was described from Cartagena, Colombia.

7. *Diphysa suberosa* S. Wats. Proc. Amer. Acad. 22: 405. 1887.

Sonora to Morelos and Oaxaca; type from Guadalajara.

Shrub 1 to 3 meters high; bark of the older branches forming thick, corky ridges; leaflets numerous, 5 to 15 mm. long. "Palo santo" (Jalisco).

The powdered bark is used in Jalisco as a remedy for catarrh. The flowers of this and the next species are smaller than in *D. robinoides*.

8. *Diphysa occidentalis* Rose, Contr. U. S. Nat. Herb. 12: 271. 1909.

Sonora to Guerrero; type from Guaymas, Sonora.

Shrub or tree, 1.5 to 8 meters high, the trunk sometimes 30 cm. in diameter.

DOUBTFUL SPECIES.

COLUTEA AMERICANA Mill. Gard. Dict. ed. 8. *Colutea* no. 5. 1768. Type from Veracruz.

23. *LENNEA* Klotzsch; Link, Klotzsch & Otto, Icon. Pl. Rar. 2: 65. 1842.

Unarmed shrubs or small trees; leaves pinnate, the leaflets large; flowers rather small, racemose; fruit flat, bivalvate, few-seeded.

Inflorescence glabrous; standard about 7 mm. long; fruit glabrous.

1. *L. robinoides*.

Inflorescence densely brown-pilose with short appressed hairs; fruit densely pubescent.....2. *L. brunnescens*.

1. *Lennea robinoides* Klotzsch; Link, Klotzsch & Otto, Icon. Pl. Rar. 2: 65. pl. 26. 1842.

Veracruz; described from cultivated plants.

Slender glabrous shrub; leaflets usually 9 or 11, oval, 2.5 to 4 cm. long, thin, bright green; flowers purplish, in very slender axillary racemes; fruit linear.

2. *Lennea brunnescens* Standl., sp. nov.

Veraeruz; type from Carrizal (*Goldman 701*; U. S. Nat. Herb. no. 397071).

Tree, 6 to 7.5 meters high, the branches grayish or brownish, when young densely pilose with short brownish ascending hairs; stipules subulate, 2 to 3 mm. long; leaf rachis 6 to 11 cm. long, the petiolules 1 to 2 mm. long; leaflets 13 or 15, oval, oval-oblong, or oval-obovate, 2 to 5.5 cm. long, 1 to 2.5 cm. wide, acutish to rounded at base, rounded or subretuse at apex, bright green and glabrous on the upper surface, with prominulous reticulate venation, beneath slightly paler, thinly sericeous with whitish or brownish hairs; racemes rather dense, 4 to 5 cm. long, the rachis and slender pedicels pilose with short brown hairs; calyx 3 mm. long, densely brown-pilose, the lower lobes triangular, acuminate; petals glabrous, the standard 8 to 9 mm. long; fruit flat, 5.5 to 7 cm. long, 1.2 to 1.4 cm. wide, obtuse at apex, gradually tapering to the base, densely pilose with minute appressed brown hairs.

Also collected at Baños del Carrizal, Veracruz, August, 1914, by C. A. Purpus (no. 6083). The Purpus collection is in fruit only and was distributed as "*Acacia?*" The only other Mexican species of the genus, *L. robinoides*, is represented in the National Herbarium by a single collection (*Purpus 5891*), from Misantla, Veracruz, which agrees well with the original description and plate. *L. robinoides* differs from the present plant in its lack of pubescence, less numerous leaflets, and smaller flowers. The flowers of *L. brunnescens* appear to have been greenish yellow, although of course their color may have changed in drying; those of *L. robinoides* are purplish.

24. COURSETIA DC. Ann. Sci. Nat. 4: 92. 1825.

Erect shrubs or trees, spiny or unarmed, pubescent; leaves pinnate, the leaflets small or large; flowers in axillary racemes; fruit linear, compressed, bivalvate.

In *C. glandulosa* as well as in other species the branches are often covered with a transparent, yellowish or brown gum or lac produced by insects. Palmer reports that in Sonora this is dissolved in water with sugar and used as a drink in colds and fevers, and that it is believed also to be a remedy for tuberculosis. It is sold in the drug shops as "goma Sonora" at about a peso per pound.

Inflorescence without glands or gland-tipped hairs.

Leaflets 1.5 to 4 cm. long.....1. *C. polyphylla*.

Leaflets less than 1 cm. long.....2. *C. axillaris*.

Inflorescence with numerous sessile glands or gland-tipped hairs.

Petioles flat and winged.....3. *C. planipetiolata*.

Petioles subterete, not winged.

Rachis of the leaves pilose with long soft spreading hairs....4. *C. mollis*.

Rachis of the leaves with short appressed hairs.

Corolla about 1 cm. long.....5. *C. glandulosa*.

Corolla about 2 cm. long.....6. *C. madrensis*.

1. *Coursetia polyphylla* T. S. Brandeg. Univ. Calif. Publ. Bot. 4: 376. 1913.
Known only from the type locality, Baños del Carrizal, Veracruz.
Slender shrub, apparently unarmed; leaflets about 11, oval-oblong or oval-ovovate; fruit 6 cm. long, 5 mm. wide, constricted between the seeds.
2. *Coursetia axillaris* Coult. & Rose, Bot. Gaz. 16: 180. 1891.
Tamaulipas. Southwestern Texas, the type from San Diego.
Densely branched shrub or small tree, unarmed; flowers white, 1 cm. long, solitary or in few-flowered racemes; fruit linear, 2 to 3.5 cm. long, slightly constricted between the seeds.
3. *Coursetia planipetiolata* Micheli, Mém. Soc. Phys. Hist. Nat. Genève 34: 253. pl. 5. 1903.
Guerrero and Oaxaca; type from Río San Luis.
Shrub, about 2 meters high; leaflets oval or ovate, 3 to 5.5 cm. long; flowers pinkish white; fruit 5 to 7 cm. long, 6 mm. wide, brown.
4. *Coursetia mollis* Robins. & Greenm. Proc. Amer. Acad. 29: 384. 1894.
Sinaloa to Guerrero; type from the Barranca of Beltrán, Jalisco.
Densely pubescent shrub, 1 to 4 meters high, armed with very stout short spines; leaflets often as many as 31, oblong or oval, 1 to 2 cm. long; flowers in short long-pedunculate racemes, the standard purplish, the other petals pale yellow; fruit 7 cm. long and 7 mm. wide, scarcely at all constricted. "Garbancillo de la costa," "cucablanca" (Sinaloa).
5. *Coursetia glandulosa* A. Gray, Proc. Amer. Acad. 5: 156. 1862.
Coursetia microphylla A. Gray, Proc. Amer. Acad. 17: 201. 1882.
Baja California and Sonora to Guerrero; type from the vicinity of Cape San Lucas, Baja California.
Shrub or small tree, 1.5 to 6 meters high, unarmed; leaflets mostly oval, 1 cm. long or shorter; flowers pink, with yellow center, or white and yellow; fruit constricted between the seeds. "Samo prieto" (Sonora).
6. *Coursetia madrensis* Micheli, Mém. Soc. Phys. Hist. Nat. Genève 34: 253. pl. 6. 1903.
Known only from the type locality, in the Sierra Madre of Michoacán or Guerrero.
Spiny shrub; leaflets oval, 1.5 cm. long, sericeous beneath; flowers blood-red with orange-yellow center.

DOUBTFUL SPECIES.

COURSETIA VIRGATA (Cav.) DC. Prodr. 2: 264. 1825. *Aeschynomene virgata* Cav. Icon. Pl. 3: 47. pl. 293. 1794. Type from New Spain. Scarcely of this genus.

25. *OLNEYA* A. Gray, Mem. Amer. Acad. n. ser. 5: 328. 1855.

1. *Olneya tesota* A. Gray, Mem. Amer. Acad. n. ser. 5: 328. 1855.

Dry plains and hillsides, Sonora and Baja California. Southern Arizona (type locality) and California.

Shrub or small tree, often only a meter high but sometimes attaining a height of 9 meters, with a trunk diameter of 45 cm.; branches armed with stiff sharp spines; bark thin, scaly, peeling off in long reddish brown strips; leaves odd-pinnate, the leaflets 11 to 15, 8 to 20 mm. long, grayish; flowers purplish white, showy, in short racemes; fruit glandular-hairy, with 1 to 5 or more seeds. "Palo fierro," "palo de hierro," "árbol de hierro," "tésota," "uña de gato."

The English name is "ironwood." Wood hard, strong but brittle, dark brown, the specific gravity about 1.15; difficult to work, but sometimes used, and valued for firewood. The Indians of Arizona and northwestern Sonora grind the

roasted beans and use them for making "pinole." The tree is mentioned by Clavigero (*Historia de la California*, 1789) as "palo hierro."

26. *GLIRICIDIA* H. B. K. *Nov. Gen. & Sp.* 6: 393. 1823.

Trees with pinnate leaves; leaflets estipellate, usually blotched beneath; flowers in axillary racemes, pink or purplish; fruit stipitate, broadly linear, exalate, bivalvate.

Leaflets rounded at apex, densely sericeous beneath when young with long hairs; flowers about 1.5 cm. long-----1. *G. guatemalensis*.

Leaflets mostly acute, glabrate beneath or sparsely strigose with very short hairs; flowers about 2.5 cm. long-----2. *G. sepium*.

1. *Gliricidia guatemalensis* Micheli, *Bull. Herb. Boiss.* 2: 442. *pl.* 10. 1894.

Oaxaca. Guatemala; type from Sacabajá.

Leaflets 11 to 17, oval, 1.5 to 3.5 cm. long, blotched beneath with bronze or purple; flowers long-pediceled, in lax racemes.

2. *Gliricidia sepium* (Jacq.) Steud. *Nom. Bot.* ed. 2. 1: 688. 1841.

Robinia sepium Jacq. *Enum. Pl. Carib.* 28. 1760.

Gliricidia maculata H. B. K. *Nov. Gen. & Sp.* 6: 393. 1823.

Robinia maculata H. B. K. *Nov. Gen. & Sp.* 6: 393. 1823.

Lonchocarpus maculatus DC. *Prodr.* 2: 260. 1825.

Robinia variegata Schlecht. *Linnaea* 12: 301. 1838.

Gliricidia lambii Fernald, *Bot. Gaz.* 20: 533. 1895.

Sinaloa to Veracruz, Yucatán, and Chiapas. Central America and northern South America; naturalized in the West Indies and Philippines; type from Cartagena, Colombia.

Tree, 3 to 9 meters high or larger, the trunk usually short and crooked; bark grayish, smooth or shallowly fissured; leaflets ovate or elliptic, 3.5 to 6.5 cm. long, acute, green above, pale beneath and usually blotched with bronze; flowers 2.5 cm. long, in clustered racemes, bright pink; fruit long, flat, 1.5 cm. wide; sapwood yellowish, turning reddish brown on exposure, the heartwood darker, tinged with red, hard and heavy, very tough, close-grained, taking a good polish. "Cacahuananche" (Michoacán, Guerrero, Sinaloa, Tepic); "cacahuanano" (Oaxaca; from the Nahuatl "cacahua-nantli," "cacao-mother"); "lengua de perico" (Veracruz); "madre de cacao" (Jalisco, Chiapas, Guatemala, Nicaragua, El Salvador, Panama, Philippines); "xak-yaab," "sacyab" (Yucatán, Maya); "iaiti" (Chiapas); "cansim" (Guatemala); "madera negra" (Costa Rica, Panama, Nicaragua); "sangre de drago" (Costa Rica); "bala" (Costa Rica, Panama); "madriado" (Nicaragua); "mataratón" (Panama, Colombia); "bien vestida," "piñón florido," "piñón amoroso" (Cuba); "cacaute" (Philippines).

Often planted for hedges, and a favorite shade tree for cacao and coffee plantations; grown from seeds or cuttings. The leaves are eaten by cattle but, like other parts of the plant, they are poisonous to rats, mice, and other rodents. The seeds or powdered bark mixed with rice, etc., are used in tropical America for poisoning rats and mice. The tree is said to have been introduced into the Philippines from Mexico at an early date.

This tree was first described by Oviedo (*Lib. VIII, Cap. XXX*), who says that in order to protect the cacao "they plant between the trees other trees which the Indians call *yaguaguyt* and the Christians *madera negra*, which grow almost twice as large as the cacao trees and protect them from the sun, and they prune the branches to make them grow straight. These trees are of such a nature that they live much longer than the cacao trees and never decay; it is one of the strongest woods known. The *madera negra* has very beautiful flowers, pink and white, in bunches, and they have a good odor; the fruit consists of pods

which contain lentils, somewhat smaller than lupine seeds and very hard; they never shed their leaves and are trees that the Indians value for making hedges about their lands, and for wood for their houses or huts, for they say that it never decays. I tore down a sacrificial building in Nicaragua a quarter of a league or less outside the city of León. in the square of the Cacique Mahomotompo, who served me; for to separate the people from the rites and sacrifices and diabolic ceremonies we took from them the temples which, in the language of Charotega, to which that town belongs, they call *teyopa*; that is to say, houses of prayer. And I had taken to León the wooden posts, all of which were *madera negra*, and made a stable for my horses. When I asked the cacique and the old men who had made that temple, they said it was built many years before; so far as I could understand, it was a hundred years or more; the wood that had been two yards deep in the ground was still as green and fresh as if just cut, and the axes rebounded and were nicked in cutting it. I am often reminded by this wood of the Ark of the Covenant of the Old Testament, made of shittim wood, which was incorruptible, and of the same wood was made the altar of the Lord. I do not know whether this *madera negra* of Nicaragua is shittim wood; but I do know that the Indians hold it for a fact that it is imperishable, unless burnt, and so they affirm." Oviedo treats the tree in another chapter (Lib. VIII, Cap. XXXVIII) under the name "yagaguyt."

27. **WILLARDIA** Rose, Contr. U. S. Nat. Herb. 1: 97. 1891.

Unarmed shrubs or trees; leaves pinnate, the leaflets numerous, small or large; flowers showy, in axillary racemes; fruit flat, dehiscent.

Flowers 6 to 8 mm. long; leaflets 0.8 to 1.5 cm. long; fruit glabrous.

1. *W. parviflora*.

Flowers 15 to 25 mm. long; leaflets 1.5 to 5 cm. long; fruit pubescent.

Flowers about 1.5 cm. long, the standard glabrous-----2. *W. mexicana*.

Flowers 2 to 2.5 cm. long, the standard sericeous-----3. *W. eriophylla*.

1. *Willardia parviflora* Rose, Contr. U. S. Nat. Herb. 8: 313. 1905.

Known only from the vicinity of the type locality, Yautepec, Morelos.

Shrub, 3 to 4 meters high, much branched; leaflets 11 to 21, subcordate, with revolute margins; fruit 4.5 to 7 cm. long, 1.2 cm. wide, acute at each end.

2. *Willardia mexicana* (S. Wats.) Rose, Contr. U. S. Nat. Herb. 1: 98. 1891.

Coursetia mexicana S. Wats. Proc. Amer. Acad. 21: 424. 1886.

Chihuahua, Sonora, and Sinaloa; type from Hacienda San Miguel, Chihuahua.

Shrub or tree, 3 to 12 meters high, the trunk sometimes 35 cm. or more in diameter; bark smooth; leaflets 9 to 15; flowers lilac; fruit flat, 5 to 12.5 cm. long. "Nesco," "palo piojo" (Chihuahua, Sinaloa, Sonora); "taliste" (Sinaloa).

Wood used for mining props, fuel, and for other purposes. A decoction of the bark is employed in Sinaloa to destroy parasites on cows and horses.

3. *Willardia eriophylla* (Benth.) Standl.

Lonchocarpus eriophyllus Benth. Journ. Proc. Linn. Soc. Bot. 4: Suppl. 94. 1860.

Michoacán, Guerrero, and Puebla; perhaps also in Morelos; type from Chilá, Puebla.

Tree, 4 to 5 meters high; leaflets about 13, oblong, obovate, or oval, densely pubescent; flowers reddish violet.

Specimens from Morelos have fruit 9 to 13 cm. long and 1.2 to 1.5 cm. wide. It is not certain that they are conspecific with the flowering specimens. The generic position of *Willardia eriophylla* can not be established with certainty until more material is collected.

28. HESPEROTHAMNUS T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 499. 1919.

Erect shrubs or trees; leaflets pinnately 5-foliolate; flowers purple or purplish, large, in terminal racemes; fruit broadly linear, bivalvate.

Fruit about 17 mm. wide.....1. *H. littoralis*.
Fruit 7 to 10 mm. wide.....2. *H. grandis*.

1. *Hesperothamnus littoralis* T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 499. 1919.

Lonchocarpus littoralis T. S. Brandeg. Zoe 5: 157. 1903.

Southern Baja California.

Shrub or small tree; leaflets 3 to 6 cm. long, acute, densely pubescent; fruit about 8 cm. long.

2. *Hesperothamnus grandis* Standl., sp. nov.

Puebla and Oaxaca; type from Tehuacán, Puebla (*Rose & Hay* 5869; U. S. Nat. Herb. no. 395657).

Shrub or small tree, sometimes 7.5 meters high, the branchlets brownish, when young densely pilose with short, fulvous, spreading or reflexed hairs; leaf rachis 4 to 10.5 cm. long, the petiolules 3 to 5 mm. long, the stipels filliform; leaflets elliptic-oblong, ovate-oval, elliptic, oval, or rounded-oval, the terminal one sometimes rounded-obovate, 3.5 to 7 cm. long, 1.5 to 5.3 cm. wide, rounded, obtuse, or subcordate at base, rounded to acute at apex, often abruptly short-acuminate, thick, pale green, densely velvety-puberulent on the upper surface when young, beneath densely velvety-pilose with very short pale hairs, or in age glabrate; flowers fasciculate-racemose, short-pedicellate, the racemes dense or interrupted, 4.5 to 11 cm. long, usually long-pedunculate and equaling or longer than the leaves, the rachis densely short-pilose; calyx 5 to 7 mm. long, densely sericeous or short-pilose, the 4 lobes triangular or lanceolate, usually subulate-acuminate, equaling or longer than the tube; petals purplish, the standard thinly pilose outside with short, appressed or somewhat spreading hairs, the blade about 1 cm. long and broad, the claw 3 mm. long, the wing and keel petals of about the same length; style glabrous; fruit sessile, 5 to 6 cm. long, 6 to 10 mm. wide, compressed, bivalvate, strigose-sericeous, the margins slightly thickened.

The following additional collections belong here:

PUEBLA: Near Tehuacán, 1905, *Rose, Painter & Rose* 9923; in 1906, *Rose & Rose* 11281; *Pringle* 6748.

OAXACA: Canyon above Dominguillo, *Pringle* 5649. Six miles above Dominguillo, altitude 1,350 to 1,650 meters, *Nelson* 1826a.

29. MEIBOMIA Heist.; Fabr. Pl. Hort. Helmst. 168. 1759.

Herbs or shrubs, sometimes scandent; leaves pinnate, the leaflets usually 3 but sometimes only 1; flowers commonly racemose, small, purple to white; fruit of 1 to several joints, often covered with hooked hairs, the joints thus readily adhering to clothing.

One of the largest genera of Mexican plants, but most of the species are herbaceous. Besides the species listed here there are doubtless others which sometimes become shrubs. The plants are often browsed by stock, and some species of the genus have been cultivated as fodder crops.

Joints of the fruit notched on the upper side; plants usually scandent.

Leaflets suborbicular.....1. *M. painteri*.

Leaflets ovate or nearly so.

Joints of the fruit less than 1 cm. wide, much longer than broad.

2. *M. angustata*.

Joints of the fruit about 2 cm. wide, nearly as broad as long.

3. *M. purpusii*.

Joints of the fruit not notched.

Leaves unifoliolate.

Fruit glabrous.....4. *M. pallida*.

Fruit puberulent.....5. *M. psilophylla*.

Leaves 3-foliolate.

Joints of the fruit closely folded together.

Leaflets oblong or ovate-oblong.....6. *M. plicata*.

Leaflets oval or suborbicular.....7. *M. plectocarpa*.

Joints of the fruit not folded together.

Joints twice as long as wide or longer.....8. *M. foliosa*.

Joints much less than twice as long as wide.

Pubescence of the stems of numerous closely appressed hairs.

Leaflets broadly rounded at apex; fruit sericeous.....9. *M. robinsonii*.

Leaflets acute or acutish; fruit glabrous or puberulent.

Bracts cuspidate-acuminate.....10. *M. conzattii*.

Bracts obtuse or acutish.....11. *M. jaliscana*.

Pubescence of the stems of spreading or recurved hairs, or wanting.

Fruit glabrous or nearly so.

Leaflets suborbicular or obovate-orbicular.

Joints of the fruit 4 mm. long; leaflets mostly obovate-orbicular.

12. *M. rubricaulis*.

Joints of the fruit 5 to 6 mm. long; leaflets suborbicular.

13. *M. orbicularis*.

Leaflets oval to narrowly oblong.

Joints of the fruit longer than broad.

14. *M. chartacea*.

Joints of the fruit suborbicular.....15. *M. nitida*.

Fruit copiously puberulent or pilose.

Leaflets mostly oval or suborbicular, rounded at apex.

16. *M. cinerea*.

Leaflets ovate to narrowly oblong or lanceolate, acute or acutish,
or at least narrowed to the apex.

Leaflets 5 cm. long or shorter; bracts small.

17. *M. ghiesbreghtii*.

Leaflets 6 to 17 cm. long; bracts large and conspicuous.

Leaflets linear-lanceolate, glabrate beneath.

18. *M. macrostachya*.

Leaflets ovate, sericeous beneath.....19. *M. amplifolia*.

1. *Meibomia painteri* Rose & Standl. Contr. U. S. Nat. Herb. 16: 214. 1913.

Known only from the type locality, Iguala Canyon, Guerrero.

Plants scandent, suffrutescent; leaflets orbicular. 3 to 8 cm. long; joints of
the fruit about 1 cm. long and broad.

2. *Meibomia angustata* Rose & Standl. Contr. U. S. Nat. Herb. 16: 215. 1913.

Known only from the type locality, between San Sebastián and Las Palmas,
Jalisco.

Leaflets ovate-lanceolate, 2.5 to 8 cm. long.

3. *Meibomia purpusii* (T. S. Brandeg.) Blake, Contr. U. S. Nat. Herb. 24: 6.
1921.

Desmodium lunatum T. S. Brandeg. Zoe 5: 246. 1908. Not *D. lunatum* Huber.
1906.

Desmodium purpusii T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 53. 1914.

Veracruz; type from Zaenapan.

Scandent shrub; leaflets 5.5 to 9.5 cm. long, acute.

4. *Meibomia pallida* Rose & Painter, Bot. Gaz. 40: 145. pl. 5. 1905.
Known only from the type locality, Huilotepec, Oaxaca.
Low shrub; leaflets oblong to orbicular, 1 to 2.5 cm. long, obtuse or acute, pale.
5. *Meibomia psilophylla* (Schlecht.) Kuntze, Rev. Gen. Pl. 1: 198. 1891.
Desmodium psilophyllum Schlecht. Linnaea 12: 310. 1838.
San Luis Potosí and Veracruz to Chiapas and Puebla; type from Chiconquiaco. Guatemala.
Slender glabrous shrub, a meter high or less; leaflets oblong to narrowly lance-oblong, 2 to 8 cm. long, obtuse.
6. *Meibomia plicata* (Schlecht. & Cham.) Kuntze, Rev. Gen. Pl. 1: 198. 1891.
Desmodium plicatum Schlecht. & Cham. Linnaea 5: 585. 1830.
Sonora to Veracruz and Chiapas; type collected between Misantla and Colipa, Veracruz.
Shrub, 1 to 3.5 meters high; leaflets 2 to 7 cm. long, densely tomentose beneath; flowers purple. "Escobilla" (Michoacán, Guerrero).
7. *Meibomia plectocarpa* (Hemsl.) Kuntze, Rev. Gen. Pl. 1: 198. 1891.
Desmodium plectocarpum Hemsl. Diag. Pl. Mex. 46. 1880.
San Luis Potosí and Veracruz; type from Orizaba.
Leaflets 2.5 to 6.5 cm. long, densely pubescent; flowers violet, in long dense racemes.
8. *Meibomia foliosa* (Hemsl.) Kuntze, Rev. Gen. Pl. 1: 198. 1891.
Desmodium foliosum Hemsl. Biol. Centr. Amer. Bot. 1: 278. 1880.
Veracruz and Oaxaca; type from Sierra San Pedro Nolasco.
Slender glabrous shrub; leaflets ovate or lanceolate, 2.5 to 7 cm. long, usually attenuate, thin, bright green.
9. *Meibomia robinsonii* Standl.
Desmodium jaliscanum obtusum Robinson, Proc. Amer. Acad. 26: 164. 1891.
San Luis Potosí and Jalisco; type from Tamasopo Canyon, San Luis Potosí, Guatemala.
Shrub, 1 to 3 meters high; leaflets oval, 3.5 to 7 cm. long, densely pubescent.
10. *Meibomia conzattii* (Greenm.) Standl.
Desmodium conzattii Greenm. Field Mus. Bot. 2: 331. 1912.
Guerrero to Veracruz and Oaxaca; type from San Bernardino, Oaxaca.
Shrub, 1 to 4.5 meters high; leaflets ovate or oblong, 3 to 8 cm. long; flowers purplish, rather large.
11. *Meibomia jaliscana* (S. Wats.) Standl.
Desmodium jaliscanum S. Wats. Proc. Amer. Acad. 22: 406. 1887.
Jalisco and Guanajuato; type from Río Blanco, Jalisco.
Shrub, 1 to 2.5 meters high; leaflets lance-oblong or ovate-oblong, 3 to 9 cm. long.
12. *Meibomia rubricaulis* Rose & Painter, Bot. Gaz. 40: 145. 1905.
Sinaloa and Durango to Guerrero; type from Etzatlán, Jalisco.
Slender shrub, 1 to 2 meters high, with purple flowers; leaflets 1 to 2 cm. long, glabrate.
13. *Meibomia orbicularis* (Schlecht.) Kuntze, Rev. Gen. Pl. 1: 198. 1891.
Desmodium orbicularis Schlecht. Linnaea 12: 311. 1838.
San Luis Potosí and Veracruz to Chiapas and Oaxaca; type from Regla, Hidalgo. Guatemala.
Slender shrub or herb; leaflets 1 to 2.5 cm. long, pale beneath, glabrate; flowers purplish. "Eugorda-cabra" (Guanajuato).

14. *Meibomia chartacea* (T. S. Brandeg.) Standl.
Desmodium chartaceum T. S. Brandeg. *Zoe* 5: 202. 1905.
 Known only from the type locality, near Culiacán, Sinaloa.
 Leaflets narrowly lance-oblong. 3.5 to 7.5 cm. long, pale.
15. *Meibomia nitida* (Mart. & Gal.) Kuntze, *Rev. Gen. Pl.* 1: 198. 1891.
Desmodium nitidum Mart. & Gal. *Bull. Acad. Brux.* 10²: 186. 1843.
 Veracruz, Oaxaca (type locality), and Guerrero.
 Slender shrub, 1 to 4 meters high, with purple flowers; leaflets mostly ovate, 3 to 6 cm. long, bright green.
16. *Meibomia cinerea* (H. B. K.) Standl.
Hedysarum cinereum H. B. K. *Nov. Gen. & Sp.* 6: 526. *pl.* 599. 1823.
Desmodium cinereum DC. *Prodr.* 2: 330. 1825.
Desmodium chiapense T. S. Brandeg. *Univ. Calif. Publ. Bot.* 6: 53. 1914.
 Tepic to Chiapas; type collected near Mexcala and Chilpancingo, Guerrero. Central America.
 Shrub, 1 to 2.5 meters high; leaflets 3 to 7 cm. long, densely pubescent or tomentose.
17. *Meibomia ghiesbreghtii* (Hemsl.) Kuntze, *Rev. Gen. Pl.* 1: 198. 1891.
Desmodium ghiesbreghtii Hemsl. *Biol. Centr. Amer. Bot.* 1: 279. 1880.
 Mexico and Oaxaca (type locality).
 Shrub, 1 to 2.5 meters high.
18. *Meibomia macrostachya* (Hemsl.) Kuntze, *Rev. Gen. Pl.* 1: 198. 1891.
Desmodium macrostachyum Hemsl. *Diag. Pl. Mex.* 44. 1880.
 Jalisco to Morelos and Oaxaca (type locality).
 Plants 1.5 to 2.5 meters high; leaflets 5.5 to 17 cm. long; flowers in very long, mostly simple racemes.
19. *Meibomia amplifolia* (Hemsl.) Kuntze, *Rev. Gen. Pl.* 1: 197. 1891.
Desmodium amplifolium Hemsl. *Biol. Centr. Amer. Bot.* 1: 274. 1880.
 Oaxaca (type locality) and Chiapas. Guatemala.
 Leaflets 5 to 12 cm. long, sericeous beneath.

30. NISSOLIA Jacq. *Enum. Pl. Carib.* 7. 1760.

REFERENCE: Rose, *Contr. U. S. Nat. Herb.* 5: 157-163. 1899.

Plants usually scandent, fruticose or herbaceous; leaves odd-pinnate, the leaflets usually 5; flowers small, yellow, racemose or verticillate in the leaf axils; fruit indehiscent, of few short broad joints, the terminal joint with a large thick terminal wing.

The species are very closely related, and it is doubtful whether all those listed here are really distinct.

Calyx or fruit or both with few or numerous yellow bristle-like hairs.

Fruit setose-hispid.

Leaflets densely pilose beneath; fruit rounded at the apex.....1. *N. dodgei*.

Leaflets glabrous beneath; fruit acute.....2. *N. setosa*.

Fruit not setose-hispid.

Plants scandent; fruit not constricted.....3. *N. schottii*.

Plants prostrate; fruit conspicuously constricted into joints.

4. *N. wislizeni*.

Calyx and fruit without yellow bristle-like hairs.

Flowers all or chiefly in naked racemes.

Calyx lobes long, filiform-subulate.....5. *N. guatemalensis*.

Calyx lobes very short, deltoid.....6. *N. nelsoni*.

Flowers verticillate in the axils of the leaves.

- Calyx tube about 5 mm. long-----7. *N. platycalyx*.
 Calyx tube 1.5 to 3.5 mm. long.
 Leaflets densely and persistently pilose beneath-----8. *N. hirsuta*.
 Leaflets glabrous beneath or nearly so.
 Leaflets large, most of them 2.5 to 4 cm. long, all much longer than broad.
 9. *N. laxior*.
 Leaflets small, most of them 1 to 2 cm. long, those of the lower leaves
 usually orbicular or nearly so-----10. *N. pringlei*.
1. *Nissolia dodgei* Rose, Contr. U. S. Nat. Herb. 5: 161. f. 23. 1899.
 Coahuila and Neuvo León; type from Monterrey, Nuevo León.
 Leaflets 1 to 2 cm. long; fruit 2 cm. long, 2 or 3-seeded.
 2. *Nissolia setosa* T. S. Brandeg. Proc. Calif. Acad. II. 3: 127. 1891.
 Southern Baja California; type from Triunfo.
 Vine, 3 to 4 meters long; leaflets 5, orbicular, 1 to 2 cm. long; flowers 4 mm.
 long, dark yellow.
 3. *Nissolia schottii* (Torr.) A. Gray, Journ. Linn. Soc. 5: 26. 1861.
Chaetocalyx schottii Torr. U. S. & Mex. Bound. Bot. 56. pl. 18. 1859.
 Chihuahua, Sonora, and Sinaloa; type from Sierra Verde, Sonora. Southern
 Arizona.
 Leaflets 5, oval or orbicular, 1 to 3.5 cm. long; flowers nearly 1 cm. long;
 fruit 2.5 to 3 cm. long.
 4. *Nissolia wislizeni* A. Gray, Journ. Linn. Soc. 5: 25. 1861.
Chaetocalyx wislizeni A. Gray, Pl. Wright. 1: 51. 1852.
 Chihuahua and Sonora to Zacatecas and Hidalgo; type collected near the
 city of Chihuahua. Southern Arizona.
 Leaflets orbicular or nearly so, 8 to 15 mm. long; flowers 1 cm. long or
 slightly larger.
 This species differs from the others in being prostrate rather than scandent.
 The plants are nearly or quite herbaceous.
 5. *Nissolia guatemalensis* Rose, Contr. U. S. Nat. Herb. 5: 162. 1890.
 Sinaloa. Guatemala (type locality).
 Leaflets oval, 3 to 7 cm. long, obtuse or acutish; flowers 6 mm. long, very
 numerous, in long racemes.
 Although known in Mexico from a single locality far distant from Guate-
 mala, the specimens can not be distinguished from those from the latter region.
 6. *Nissolia nelsoni* Rose, Contr. U. S. Nat. Herb. 5: 162. f. 26. 1899.
 Sinaloa and Jalisco to Veracruz and Chiapas; type from the Valley of
 Oaxaca.
 Plants climbing to a height of 3 to 4.5 meters; leaflets elliptic to orbicular,
 2 to 5.5 cm. long, acutish to broadly rounded at apex. "Riatilla" (Sinaloa).
 It is doubtful whether this is distinct from *N. fruticosa* Jacq., of Columbia.
 7. *Nissolia platycalyx* S. Wats. Proc. Amer. Acad. 17: 344. 1882.
 Known only from the type locality, in the mountains east of Saltillo, Coa-
 huila.
 8. *Nissolia hirsuta* DC. Prodr. 2: 257. 1825.
Nissolia confertiflora S. Wats. Proc. Amer. Acad. 21: 424. 1886.
 Chihuahua to Sinaloa, Oaxaca, and Morelos; type from Guanajuato.
 Leaflets 1 to 5.5 cm. long, thin, bright green; wing of the fruit 1 cm. wide
 or narrower.
 9. *Nissolia laxior* (Robinson) Rose, Contr. U. S. Nat. Herb. 5: 162. 1899.
Nissolia confertiflora laxior Robinson, Proc. Amer. Acad. 29: 315. 1894.

Nissolia montana Rose, Contr. U. S. Nat. Herb. 8: 48. 1903.

Jalisco and Guanajuato to Morelos and Puebla; type from Beltram, Jalisco. Leaflets elliptic or oval, thin, bright green; flowers 1 cm. long.

10. *Nissolia pringlei* Rose, Contr. U. S. Nat. Herb. 5: 159. f. 20. 1899.

Nissolia diversifolia Rose, Contr. U. S. Nat. Herb. 5: 160. f. 21. 1899.

Nissolia multiflora Rose, Contr. U. S. Nat. Herb. 5: 161. f. 24. 1899.

Chihuahua to Morelos and Oaxaca; type from Santa Eulalia Mountains, Chihuahua.

Flowers about 7 mm. long; fruit 3 cm. long, the wing about 7 mm. wide.

DOUBTFUL SPECIES.

NISSOLIA PLATYCARPA Benth. in Mart, Fl. Bras. 15¹: 77. 1859. Type from Zimapán, Hidalgo. This species has never been properly described, and it is impossible to place it definitely.

31. *AMICIA* H. B. K. Nov. Gen. & Sp. 6: 511. 1823.

1. *Amicia zygomeris* DC. Prodr. 2: 315. 1825.

Chihuahua to Tepic, Oaxaca, and Veracruz.

Slender unarmed shrub, or sometimes herbaceous, glabrous or pilose, leaflets 4 or 6, 2 to 6 cm. long and nearly as wide, truncate or emarginate at apex, conspicuously gland-dotted; flowers 3 to 3.5 cm. long, yellow, racemose, subtended by large, orbicular or reniform bracts.

32. *PICTETIA* DC. Ann. Sci. Nat. 9: 93. 1825.

1. *Pictetia microphylla* Benth.; Hemsf. Diag. Pl. Mex. 8. 1878.

Type collected in Sonora; plant known to the writer only from the description.

Glandular-pubescent shrub; leaves pinnate, the leaflets 4 or 5 pairs, lanceolate, 3 mm. long, pungent; flowers 1.8 cm. long, racemose; fruit stipitate, 3 or 4-seeded, constricted between the seeds.

33. *AESCHYNOMENE* L. Sp. Pl. 713. 1753.

Small shrubs or herbaceous plants; leaves odd-pinnate; flowers small, in axillary racemes or clusters; fruit flat, of 2 to several joints.

Several other species besides those enumerated here occur in Mexico, but they are all herbaceous forms.

Stipules conspicuously produced below the point of insertion.

Leaflets acute or acutish, the costa near the margin-----1. *A. americana*.

Leaflets very obtuse, the costa central.

Stems glabrous or nearly so-----2. *A. sensitiva*.

Stems hispid.

Fruit 5 to 6 mm. wide-----3. *A. hispida*.

Fruit 3 to 4 mm. wide-----4. *A. hispidula*.

Stipules not produced below the point of insertion.

Costa of the leaflets excentric, usually near the margin; leaflets 3.5 mm. wide or narrower, often acute.

Leaflets densely white-sericeous-----5. *A. nivea*.

Leaflets green, thinly sericeous or strigose or glabrate.

Leaflets obtuse, the costa not very close to the margin.

Corolla 10 to 12 mm. long; leaflets 2.5 to 3.5 mm. wide.

6. *A. fascicularis*.

Corolla 6 to 7 mm. long; leaflets 1 to 1.5 mm. wide--7. *A. oligantha*.

Leaflets acute, the costa very close to the margin.

Leaflets 6 to 10 pairs-----8. *A. purpusii*.

Leaflets mostly more than 10 pairs-----9. *A. compacta*.

Costa of the leaflets central; leaflets often more than 3.5 mm. wide, obtuse or rounded at apex.

Standard petal glabrous.

Leaflets numerous, 1.2 to 3 mm. wide.....10. *A. amorphoides*.

Leaflets 15 or fewer, 4 to 16 mm. wide.....11. *A. palmeri*.

Standard petal variously pubescent.

Venation of the leaflets reticulate.

Calyx glabrous; branches of the inflorescence glabrous or nearly so.

.....12. *A. simulans*.

Calyx pubescent; branches of the inflorescence densely pilose and often hispid.....13. *A. petraea*.

Venation of the leaflets not reticulate.

Leaflets 7 to 11.

Leaflets glabrous or nearly so.....14. *A. fruticosa*.

Leaflets densely sericeous or pilose.....15. *A. vigil*.

Leaflets 15 or more.

Leaflets 3.5 to 6 mm. wide.....16. *A. pringlei*.

Leaflets 2 mm. wide or narrower.....17. *A. paniculata*.

1. *Aeschynomene americana* L. Sp. Pl. 713. 1753.

Aeschynomene glandulosa Poir. in Lam. Encycl. Suppl. 4: 76. 1816.

Aeschynomene floribunda Mart. & Gal. Bull. Acad. Brux. 10²: 180. 1843.

Aeschynomene americana depila Millsp. Field Mus. Bot. 1: 363. 1898.

Chihuahua to Sinaloa, Chiapas, Yucatán, and Veracruz. Widely distributed in tropical America; type from Jamaica.

Plants suffrutescent and sometimes a meter high, or often herbaceous; leaflets numerous, oblong-linear, about 1 cm. long; flowers small, pale yellow to brownish yellow, sometimes striped with purple. "Huevo de rana" (Nicaragua); "hierba rosario" (Porto Rico); "pegapega" (Cuba).

Of some importance as a forage plant.

2. *Aeschynomene sensitiva* Swartz, Prodr. Veg. Ind. Occ. 107. 1788.

Sinaloa to Veracruz. Widely distributed in tropical America; also in Africa.

Plants suffrutescent or herbaceous, sometimes 4 meters high; leaflets oblong, 6 to 15 mm. long; flowers pale yellow with red veins, about 1 cm. long; fruit 4 to 8 cm. long, 3 to 6 mm. wide. "Hierba de ciénaga," "hierba rosario" (Porto Rico).

3. *Aeschynomene hispida* Willd. Sp. Pl. 3: 1163. 1800.

Sinaloa and Durango to Veracruz and Oaxaca. Widely distributed in tropical America.

Herbaceous or suffrutescent; flowers yellow, striped with red, 10 to 14 mm. long.

4. *Aeschynomene hispidula* H. B. K. Nov. Gen. & Sp. 6: 531. 1823.

Michoacán to Veracruz and Oaxaca. Central America and South America; type from Colombia.

Herbaceous or suffrutescent, sometimes 3.5 meters high; flowers scarcely 1 cm. long.

5. *Aeschynomene nivea* T. S. Brandeg. Proc. Calif. Acad. II. 2: 150. 1889.

Baja California; type from Purísima.

Silvery-sericeous shrub, 0.6 to 1 meter high; leaflets numerous, oblong-linear, 4 to 10 mm. long; flowers ochroleucous or sulphur-yellow, 1 cm. long; fruit usually of only 2 joints.

6. *Aeschynomene fascicularis* Schlecht. & Cham. *Linnaea* 5: 584. 1830.
Chihuahua and Sonora to Jalisco and Yucatán; type collected between Laguna Verde and Actopan (Veracruz?). Central America.
Shrub, 1 to 2.5 meters high, with yellow flowers.
7. *Aeschynomene oligantha* Micheli, *Mém. Soc. Phys. Hist. Nat. Genève* 34: 526. 1903.
Known only from the type locality, "Mata de Dios." Michoacán or Guerrero. Doubtfully distinct from *A. fascicularis*.
8. *Aeschynomene purpusii* T. S. Brandeg. *Zoe* 5: 247. 1908.
Known only from the type locality, Zacuapan, Veracruz.
9. *Aeschynomene compacta* Rose, *Contr. U. S. Nat. Herb.* 5: 191. 1899.
Aeschynomene oaxacana T. S. Brandeg. *Univ. Calif. Publ. Bot.* 6: 181. 1915.
Puebla and Oaxaca; type from Tomellín Cañón, Oaxaca.
Shrub, 1 to 1.5 meters high; leaflets 3 to 10 mm. long.
10. *Aeschynomene amorphoides* (S. Wats.) Rose; Robinson, *Proc. Amer. Acad.* 29: 315. 1894.
Brya amorphoides S. Wats. *Proc. Amer. Acad.* 22: 406. 1887.
Sinaloa to Colima; type from Tequila, Jalisco.
Shrub, about a meter high; flowers purplish, 6 mm. long; joints of the fruit 1 or 2.
11. *Aeschynomene palmeri* Rose, *Contr. U. S. Nat. Herb.* 5: 192. 1899.
Aeschynomene paucifoliolata Micheli, *Mém. Soc. Phys. Hist. Nat. Genève* 34: 256. *pl. 9.* 1903.
Guerrero; type from Acapulco.
Shrub, 1 to 3 meters high, with purplish flowers.
12. *Aeschynomene simulans* Rose, *Contr. U. S. Nat. Herb.* 5: 192. 1899.
Sinaloa and Tepic; type collected between Rosario and Colomas, Sinaloa.
Plants suffrutescent; flowers yellow, tinged with purple.
13. *Aeschynomene petraea* Robinson, *Proc. Amer. Acad.* 27: 166. 1892.
Aeschynomene madrensis Micheli, *Mém. Soc. Phys. Hist. Nat. Genève* 34: 255. *pl. 8.* 1903.
Durango to Guerrero; type from Guadalajara.
Plants suffrutescent, 1 to 1.5 meters high; flowers large, yellow, striped with brown or purple.
14. *Aeschynomene fruticosa* Rose, *Contr. U. S. Nat. Herb.* 5: 192. 1899.
Known only from the type locality, Topolobampo, Sinaloa.
Shrub, 1 to 1.5 meters high, with small yellow flowers.
15. *Aeschynomene vigil* T. S. Brandeg. *Proc. Calif. Acad. II.* 3: 128. 1891.
Southern Baja California; type from San José del Cabo.
Shrub, about a meter high, with white stems; flowers purple.
16. *Aeschynomene pringlei* Rose, *Contr. U. S. Nat. Herb.* 8: 312. 1905.
Known only from the type locality, limestone hills near Jojutla, Morelos.
Shrub, 3 to 4.5 meters high.
17. *Aeschynomene paniculata* Willd.; Vog. *Linnaea* 12: 95. 1838.
Guerrero to Veracruz. South America; type from Brazil.
34. **CLIMACORACHIS** Hemsl. & Rose, *Contr. U. S. Nat. Herb.* 8: 43. 1903.
Low erect shrubs or herbs; leaves pinnate, the leaflets small, numerous; flowers yellow, racemose, the racemes geniculate; fruit flat, 2 to 4-seeded.
Stems glabrous-----1. *C. mexicana*.
Stems glandular-pilose-----2. *C. fruticosa*.

1. *Climacorachis mexicana* Hemsl. & Rose, Contr. U. S. Nat. Herb. 8: 43. 1903.

Known only from the type locality, in the Sierra Madre west of Bolaños, Jalisco.

Leaflets 9 to 12 pairs, linear, 4 to 5 mm. long; fruit 5 to 10 mm. long.

2. *Climacorachis fruticosa* Hemsl. & Rose, Contr. U. S. Nat. Herb. 8: 44. 1903.

Known only from the type locality, mountains near Talpa, Jalisco, altitude 1,320 to 1,500 meters.

Leaflets sometimes 20 pairs, 7 mm. long.

35. **ABRUS** Adans. Fam. Pl. 2: 327. 1763.1. *Abrus precatorius* L. Syst. Nat. ed. 12. 2: 472. 1767.

Glycine abrus L. Sp. Pl. 753. 1753.

Veracruz; reported from Yucatán. West Indies, South America, Asia, and Africa.

Scandent shrub with pinnate leaves; leaflets numerous, oblong, 1 to 1.5 cm. long, bright green, very obtuse; flowers racemose, pink or purplish; fruit short, broad; seeds 4 to 6, scarlet, black about the hilum. "Xocoac," "xoxoag" (Yucatán, Maya); "peonía" (Cuba); "peronía," "peronilas" (Porto Rico); "brujitos," "chochitos de Indio," "pionías," "peronilla" (Colombia).

The English names are "bead-vine," "wild licorice," and "crab's-eyes." Stems strong and used as cordage. The leaves and root have the flavor of licorice, and the latter is sometimes employed as a substitute for that article. The root is said to contain glycyrrhizin, the principle found in true licorice (*Glycyrrhiza glabra* L.). The leaves are sensitive to changes in light intensity; they droop vertically during the night and rise to a horizontal position in the morning. Lunan states that the dried leaves were used in India as a substitute for tea.

The plant is reported to have poisoned cattle in India, and the seeds are certainly poisonous. They have been used in that country for criminal poisoning, but are said to be inert if swallowed whole. It is said that the poisonous properties are destroyed by heat and that the seeds have been used for food in some countries, but this is perhaps erroneous. They contain abric acid and two proteid poisons, to one of which the name abrine has been given. They are known in commerce as "jequirity seeds," and have been employed by European physicians in treating diseases of the eye and skin. The seeds are very handsome and are strung into bracelets and necklaces. Because of their uniformity in size they were formerly used as weights by jewel merchants. The leaves are applied externally to swellings in India and are chewed with sugar for coughs.

36. **RAMIREZELLA** Rose, Contr. U. S. Nat. Herb. 8: 44. 1903.

Scandent plants, fruticose, at least at the base; leaves pinnately trifoliate, the leaflets large; flowers racemose, at first covered with large striate bracts; fruit linear, compressed, bivalvate.

The species are very closely related, and more material is necessary to determine their validity.

Fruit densely pilose; calyx short-pilose-----1. *R. pubescens*.

Fruit and calyx glabrous or nearly so.

Peduncles and rachis glabrous or nearly so-----2. *R. buseri*.

Peduncles and rachis of the inflorescence copiously pilose.

Lower calyx lobes acute-----3. *R. pringlei*.

Lower calyx lobes rounded or obtuse-----4. *R. strobilophora*.

1. *Ramirezella pubescens* Rose, Contr. U. S. Nat. Herb. 8: 45. 1903.

Known only from the type locality, between Tlapa and Taliscatilla, Guerrero, altitude 1,170 to 1,350 meters.

Leaflets broadly ovate, about 8 cm. long, acuminate, densely pubescent beneath; fruit long-beaked.

2. *Ramirezella buseri* (Micheli) Rose, Contr. U. S. Nat. Herb. 12: 274. 1909.
Phaseolus buseri Micheli, Mém. Soc. Phys. Hist. Nat. Genève 34: 263. pl. 13. 1903.

Ramirezella occidentalis Rose, Contr. U. S. Nat. Herb. 8: 45. 1903.

Ramirezella glabrata Rose, Contr. U. S. Nat. Herb. 8: 45. 1903.

Jalisco to Guerrero; type from La Botella, altitude 350 meters.

Leaflets ovate or broadly ovate, 4 to 10 cm. long, acuminate, glabrate; flowers purplish white, large and showy.

With more ample material, it may be possible to recognize more than a single species here.

3. *Ramirezella pringlei* Rose, Contr. U. S. Nat. Herb. 12: 274. 1909.

Known only from the type locality, Iguala Canyon, Guerrero, altitude 900 meters.

Leaflets 6 to 10 cm. long, glabrate; corolla violet, 2 cm. long.

4. *Ramirezella strobilophora* (Robinson) Rose, Contr. U. S. Nat. Herb. 5: 44. 1903.

Vigna strobilophora Robinson, Proc. Amer. Acad. 27: 167. 1892.

Chihuahua to Jalisco; type collected near Guadalajara.

Scandent shrub, the stems sometimes 2.5 cm. thick; leaflets 6 to 8 cm. long, acuminate; flowers purple and white, in dense racemes; fruit 9 to 12 cm. long, about 1.5 cm. wide.

37. CLITORIA L. Sp. Pl. 753. 1753.

Shrubby or herbaceous plants, often scandent; leaves pinnate, with usually 3 leaflets; flowers large, showy, solitary or clustered in the axils of the leaves or short-racemose.

Besides the species listed here, *C. ternatea* L., a herbaceous vine, with 5 leaflets, also occurs in Mexico.

Leaves sessile or very short-petiolate.....1. *C. subsessilis*.

Leaves long-petiolate.

Flowers about 7 cm. long.....2. *C. javitensis*.

Flowers 2 to 4 cm. long.

Plants scandent. Leaflets acute or acuminate, pale beneath.

3. *C. mexicana*.

Plants erect.

Pubescence of the stems appressed.....4. *C. multiflora*.

Pubescence of the stems spreading.

Flowers about 2.5 cm. long.....5. *C. triflora*.

Flowers about 4 cm. long.....6. *C. humilis*.

1. *Clitoria subsessilis* Rose, Contr. U. S. Nat. Herb. 5: 169. 1899.

Oaxaca; type collected between Guichocovi and Lagunas.

Plants low, erect, herbaceous or suffrutescent; leaflets linear-oblong, obtuse; flowers 4.5 to 5.5 cm. long.

2. *Clitoria javitensis* (H. B. K.) Benth, Journ. Linn. Soc. 2: 42. 1858.

Neurocarpum javitense H. B. K. Nov. Gen. & Sp. 6: 409. 1823.

Reported from Veracruz and Mexico. Panama and northern South America; type from Javita.

Scandent or repent shrub; leaflets oval or elliptic, acuminate, 8 to 15 cm. long, pubescent beneath.

3. *Clitoria mexicana* Link, Enum. Pl. 2: 235. 1822.

Veracruz, Puebla, and Oaxaca. Guatemala.

Stems slender, scandent, herbaceous or suffruticose; leaflets ovate, 4 to 6 cm. long; flowers blue; fruit 3.5 to 5.5 cm. long, 6 mm. wide.

Closely related to *C. mariana* L., under which name it has been reported from Mexico.

4. *Clitoria multiflora* Mart. & Gal. Bull. Acad. Brux. 10²: 188. 1843.

Clitoria polystachya Benth. Pl. Hartw. 60. 1840.

Tepec to Oaxaca and Veracruz; type from Mirador, Veracruz.

Erect shrub, about a meter high; leaflets mostly ovate, acute or acuminate, 4 to 11 cm. long; flowers white, spotted with violet, 3 to 3.5 cm. long.

5. *Clitoria triflora* S. Wats. Proc. Amer. Acad. 2: 407. 1887.

Durango, Jalisco, and Michoacán; type from Río Blanco, Jalisco.

Plants erect, 30 to 60 cm. high, suffrutescent; leaflets oblong-lanceolate, 4 to 9.5 cm. long, obtuse or acute; flowers dark purple and lilac; fruit about 4 cm. long and 6 to 7 mm. wide.

Clitoria monticola T. S. Brandeg.,¹ described from Baja California, is closely related, judging from the description. The writer has seen no material of it.

6. *Clitoria humilis* Rose, Contr. U. S. Nat. Herb. 5: 169. 1899.

Known only from the type locality, Sierra Madre of Durango.

Plants herbaceous or suffrutescent, 10 to 20 cm. high or larger; leaflets oval or oblong; flowers apparently white.

38. **DIOCLEA** H. B. K. Nov. Gen. & Sp. 6: 437. 1823.1. *Dioclea guianensis* Benth. Ann. Wien. Mus. Naturg. 2: 134. 1838.

Tabasco. Central America and northern South America; type from British Guiana.

Scandent shrub with pinnately 3-foliolate leaves, the leaflets broad, 5 to 12 cm. long, short-acuminate, pubescent; flowers purple or blue, 3 cm. long, in long, spikelike racemes; fruit flat, about 9 cm. long and 1.5 cm. wide. "Haba de monte" (Panama).

39. **CANAVALIA** Adans. Fam. Pl. 2: 325. 1763.

Scandent or prostrate herbs or shrubs; leaves pinnately 3-foliolate; flowers large, racemose; fruit flat, bivalvate.

Several herbaceous species occur in Mexico. The generic name was originally written *Canavali*.

Valves of the fruit each with 2 central costae; leaflets glabrous beneath or nearly so.....1. *C. acuminata*.

Valves of the fruit each with one central costa; leaflets usually pilose beneath.

Lower calyx lobes minute, lance-ovate, very acute; calyx thinly sericeous or glabrate.....2. *C. villosa*.

Lower calyx lobes large, orbicular; calyx very densely sericeous.

3. *C. hirsuta*.

1. *Canavalia acuminata* Rose, Contr. U. S. Nat. Herb. 1: 322. 1895.

Known only from the type locality, Manzanillo, Colima.

Scandent shrub, nearly glabrous; flowers large, cream-colored; fruit 15 to 20 cm. long, flat; seeds brownish black.

2. *Canavalia villosa* Benth. Ann. Wien. Mus. Naturg. 2: 135. 1838.

Canavalia rostrata Benth. Ann. Wien. Mus. Naturg. 2: 135. 1838.

¹ Univ. Calif. Publ. Bot. 6: 500. 1919.

Wenderothia discolor Schlecht. *Linnaea* 12: 331. 1838.

Wenderothia pilosa Mart. & Gal. Bull. Acad. Brux. 10²: 191. 1843.

Wenderothia glabra Mart. & Gal. Bull. Acad. Brux. 10²: 193. 1843.

Sinaloa to Nuevo León, Tabasco, and Chiapas. Central America.

Scandent shrub or herb; leaflets 6 to 11 cm. long, usually oval, short-acuminate; flowers violet, showy, 3.5 cm. long; fruit about 15 cm. long and 2 cm. wide, densely pilose. "Patito" (Michoacán, Guerrero); "frijolillo" (Sinaloa, Puebla, Tabasco); "gallinitas" (*Urbina*).

3. *Canavalia hirsuta* (Mart. & Gal.) Standl.

Wenderothia hirsuta Mart. & Gal. Bull. Acad. Brux. 10²: 192. 1843.

Veracruz to Guerrero and Chiapas; type from Oaxaca. Guatemala.

Scandent shrub, similar to *C. villosa*.

The bractlets at the base of the calyx are much larger than in the preceding species.

40. *ERIOSEMA* Desv. Ann. Sci. Nat. 9: 421. 1826.

Low shrubs or herbs, unarmed; leaves pinnate, 3-foliolate or rarely unifoliolate, the leaflets gland-dotted beneath; flowers yellow, racemose, often large and showy; fruit compressed, bivalvate, short, usually 2-seeded.

Flowers in elongate racemes.

Flowers about 1.5 cm. long; lobes of the calyx scarcely longer than the tube.

1. *E. multiflorum*.

Flowers 2 cm. long; lobes of the calyx fully twice as long as the tube.

2. *E. grandiflorum*.

Flowers in very short headlike racemes.

Pubescence of the lower surface of the leaflets closely appressed.

3. *E. diffusum*.

Pubescence of the lower surface of the leaflets chiefly loose and spreading.

Corolla 12 to 14 mm. long; peduncles shorter than the racemes; leaflets of the lower leaves less than twice as long as wide-----4. *E. palmeri*.

Corolla less than 10 mm. long; peduncles usually longer than the racemes; leaflets more than twice as long as wide-----5. *E. pulchellum*.

1. *Eriosema multiflorum* Robinson, Proc. Amer. Acad. 29: 316. 1894.

Known only from the type locality, rocky hills near Tequila, Jalisco.

Shrub, 0.6 to 1 meter high; leaves subsessile, the 3 leaflets oblong, rounded at apex, rugose.

2. *Eriosema grandiflorum* (Schlecht. & Cham.) Seem. Bot. Voy. Herald 345. 1857.

Rhynchosia grandiflora Schlecht. & Cham. *Linnaea* 5: 588. 1830.

Sonora to Oaxaca and Veracruz; type from Hacienda de la Laguna, Veracruz.

Erect shrub, 1 to 2 meters high; leaflets mostly oblong, 4 to 9 cm. long, obtuse or acute, densely pubescent; flowers in long racemes, large and showy. "Jarilla de la sierra" (Sinaloa).

3. *Eriosema diffusum* (H. B. K.) Don, Hist. Diehl. Pl. 2: 347. 1832.

Glycine diffusa H. B. K. Nov. Gen. & Sp. 6: 420. pl. 572. 1823.

Sinaloa to Chiapas and Veracruz. Central America and Colombia (type locality).

Plants erect, herbaceous or suffrutescent, closely but sparsely sericeous; leaflets linear-oblong to oval, 2.5 to 7 cm. long; fruit short, densely pilose. "Guapo" (Guatemala); "guapillo" (Guatemala, Honduras, Blake); "hierba del duende" (Sinaloa).

An infusion of the plant is used in Guatemala for female diseases.

4. *Eriosema palmeri* S. Wats. Proc. Amer. Acad. 22: 403. 1887.

San Luis Potosí to Jalisco and Tepic; type from Tequila, Jalisco.

Plants low, herbaceous or suffrutescent, copiously hirsute with fulvous or brown hairs; roots tuberous-thickened.

Specimens reported from Veracruz as *E. crinitum* (H. B. K.) Don probably belong to this species.

Rhynchosia hirsuta Mart. & Gal.¹ is either this plant or a closely related one.

5. *Eriosema pulchellum* (H. B. K.) Don, Hist. Dichl. Pl. 2: 348. 1832.

Glycine pulchella H. B. K. Nov. Gen. & Sp. 6: 422. 1823.

Chihuahua to Veracruz and Oaxaca. Central America; Colombia (type locality).

Plants suffrutescent; leaflets mostly oblong, 2.5 to 7 cm. long, obtuse.

The leaves are sometimes unifoliolate on young plants.

41. **DOLICHOLUS** Medic. Vorles. Churpf. Phys. Ges. 2: 354. 1787.

Plants herbaceous or frutescent, scandent or prostrate or rarely erect; leaves usually pinnately 3-foliolate, rarely unifoliolate; flowers racemose; fruit bivalvate.

A few herbaceous species not enumerated here are found in Mexico.

Plants erect-----1. **D. pringlei**.

Plants scandent.

Flowers 1.5 to 2 cm. long or larger.

Leaflets acute; bracts broadly ovate, acute-----2. **D. macrocarpus**.

Leaflets long-acuminate; bracts lanceolate or lance-ovate, acuminate.

3. **D. discolor**.

Flowers 1 cm. long or shorter.

Calyx lobes subequal, the upper ones 3 times as long as the tube or longer.

4. **D. longeracemosus**.

Calyx lobes unequal, the upper ones about as long as the tube.

Fruit more or less hispid, not constricted between the seeds.

Leaflets longer than broad, not reticulate-veined; fruit long-hispid; stems scarcely at all viscid-pubescent-----5. **D. nigropunctatus**.

Leaflets about as broad as long, conspicuously reticulate-veined; fruit short-hispid; stems densely viscid-pilose-----6. **D. potosinus**.

Fruit velutinous-puberulent, often constricted between the seeds.

Fruit 4 to 5 mm. wide, not constricted between the seeds.

7. **D. minimus**.

Fruit 8 to 12 mm. wide, constricted between the seeds.

8. **D. phaseoloides**.

1. *Dolicholus pringlei* Rose, Contr. U. S. Nat. Herb. 10: 101. 1906.

Rhynchosia pringlei Rose, Contr. U. S. Nat. Herb. 3: 316. 1895.

Oaxaca; type from Las Sedas.

Erect shrub, 1 to 1.5 meters high; leaflets strongly reticulate-veined, 2.5 to 5 cm. long and nearly as wide, densely pubescent; flowers large, in long narrow panicles; fruit hirsute; seeds dark brown.

2. *Dolicholus macrocarpus* (Benth.) Rose, Contr. U. S. Nat. Herb. 10: 101. 1906.

Rhynchosia macrocarpa Benth. Pl. Hartw. 11. 1839.

Chihuahua and Durango to Hidalgo; type from Aguascalientes.

Plants scandent, herbaceous or suffrutescent; leaflets 3 to 11 cm. long, densely pubescent; flowers large, in long racemes; fruit about 4 cm. long and 1.2 cm. wide, densely pubescent; seeds dark brown.

¹ Bull. Acad. Brux. 10²: 198. 1843.

3. *Dolicholus discolor* (Mart. & Gal.) Rose, Contr. U. S. Nat. Herb. 10: 101. 1906.
Rhynchosia discolor Mart. & Gal. Bull. Acad. Brux. 10²: 198. 1843.
Rhynchosia australis Rose, Contr. U. S. Nat. Herb. 8: 48. 1903. Not *R. australis* Benth. 1864.
Rhynchosia cuernavacana Rose, Contr. U. S. Nat. Herb. 8: 313. 1905.
Dolicholus cuernavacanus Rose, Contr. U. S. Nat. Herb. 10: 101. 1906.
Durango to Morelos and Chiapas; perhaps also in Sonora; type from Oaxaca, Guatemala.
Leaflets mostly deltoid-ovate, 3.5 to 9 cm. long; flowers large and showy, in long racemes.
4. *Dolicholus longeracemosus* (Mart. & Gal.) Rose, Contr. U. S. Nat. Herb. 10: 101. 1906.
Rhynchosia longeracemosa Mart. & Gal. Bull. Acad. Brux. 10²: 198. 1843.
Tamaulipas and Nuevo León to Oaxaca and Guerrero; type from Veracruz. Central America.
Plants scandent, herbaceous or suffrutescent; flowers yellow, in long racemes; seeds mottled with light and dark brown.
Perhaps not distinct from *D. reticulatus* (Swartz) Millsp., of the West Indies.
5. *Dolicholus nigropunctatus* (S. Wats.) Rose, Contr. U. S. Nat. Herb. 10: 101. 1906.
Rhynchosia nigropunctata S. Wats. Proc. Amer. Acad. 22: 408. 1887.
Veracruz and Jalisco; type from Guadalajara.
Plants scandent; petals yellow within, brownish outside.
6. *Dolicholus potosinus* (T. S. Brandeg.) Standl.
Rhynchosia potosina T. S. Brandeg. Univ. Calif. Publ. Bot. 4: 181. 1911.
San Luis Potosí; type from Guascama.
Plants scandent, very viscid.
It is probable that this is not distinct from *D. nigropunctatus*.
7. *Dolicholus minimus* (L.) Medic. Vorles. Churpf. Phys. Ges. 2: 354. 1787.
Dolichos minimus L. Sp. Pl. 726. 1753.
Rhynchosia minima DC. Prodr. 2: 385. 1825.
Rhynchosia mexicana Hook. & Arn. Bot. Beechey Voy. 287. 1836-39.
Baja California and Sonora to Zacatecas, Yucatán, and Chiapas. Widely distributed in the tropics of both hemispheres.
Slender vine, herbaceous or suffrutescent; flowers small, yellow, often striped with red outside; seeds dark brown or black. "Frijolillo" (Cuba).
This has been reported from Yucatán as *Galactia multiflora* Robinson.
8. *Dolicholus phaseoloides* (Swartz) Kuntze, Rev. Gen. Pl. 3²: 62. 1898.
Glycine phaseoloides Swartz, Prodr. Fl. Ind. Occ. 105. 1788.
Glycine precatória Willd. Enum. Pl. 2: 755. 1809.
Rhynchosia phaseoloides DC. Prodr. 2: 385. 1825.
Rhynchosia precatória DC. Prodr. 2: 385. 1825.
Rhynchosia crythrinoides Schlecht. & Cham. Linnaea 5: 587. 1830.
Dolicholus vaiiiae Rose, Contr. U. S. Nat. Herb. 10: 101. 1906.
Sonora to San Luis Potosí, Veracruz, and Oaxaca. Widely distributed in tropical America.
Plants scandent, herbaceous or suffrutescent; flowers small, yellow, striped with brown; seeds particolored, half black and half scarlet. "Frijolillo" (Veracruz); "peonía" (Jalisco, San Luis Potosí); "negritos" (San Luis Potosí, Guerrero, Jalisco); "atecuixtli" (Nahuatl, "crab-eyes"); "colorín chiquito" (Guerrero, Morelos, Durango, Oaxaca); "ojo de cangrejo" (Guerrero, Morelos, etc.); "pulguitas" (Guerrero, Oaxaca); "ojo de zanate" (Sinaloa); "frijol

de chintlatuahua" (Oaxaca, *Reko*); "colorincito," "ojo de chanata" (Durango, *Patoni*); "ojitos de picho" (Tabasco, *Rovirosa*); "senecuilche," "xenecuilche," "pipilzintli" (*Nueva Farmacopea Mexicana*); "purensapichu" (Michoacán, Tarascan, *Lcón*); "peronilla" (Colombia); "bejuco de paloma," "peronfas" (Porto Rico); "fruta de pitillo" (Guatemala, Honduras, *Blake*).

The handsome seeds are sometimes used as beads. The seeds are believed popularly to be poisonous and to cause a kind of insanity.

42. *ERYTHRINA* L. Sp. Pl. 706. 1753.

REFERENCE: Standley, The Mexican and Central American species of *Erythrina*, Contr. U. S. Nat. Herb. 20: 175-182. 1919.

Trees or shrubs, rarely herbs, usually with spiny branches; leaves pinnately 3-foliolate; flowers in axillary or terminal racemes, showy, red or reddish; standard petal large or elongate, the other petals small, the wings sometimes wanting; fruit stipitate, linear, bivalvate.

The species are very common in many parts of Mexico, and their properties are well known there, but in literature there has been great confusion concerning the specific names. The larger forms are often planted as hedges because of their showy flowers and well-armed branches. Most of the species, unfortunately, flower when devoid of leaves. The plants were used for hedges by the early inhabitants of Mexico, and they are sometimes planted now for coffee shade. Branches take root readily when placed in the ground. The wood is very soft and light and is used for corks, for carving small figures and images, and for various other purposes. The bark is said to yield a yellow dye. The succulent flowers are often cooked and eaten as a vegetable or prepared as a salad.

The handsome seeds, usually of various shades of red, are strung as necklaces, and also used by children in games. They were employed by the early Mexicans in a game, somewhat like dice, known as "patol." It is of interest to find that this name is now employed by the Hopi and other Pueblo Indians for a stick-dice game.

The seeds of one of the Mexican species have been studied by Altamirano, who found in them erythroidine, a powerful paralyzant of the motor system, erythroresin, an emetic, coralin, and erythric acid. The extract has been suggested as a substitute for curare. The poisonous properties of the seeds are well known in Mexico, and they are used to destroy noxious animals. They have been employed also as a hypnotic agent. Species of *Erythrina* growing in other regions are known to have poisonous seeds, as in the case of the Javan *E. lithosperma* Blume, from whose seeds a tetanizing alkaloid, hypaphorine, has been extracted.

The bark and stems have similar poisonous properties, and they are employed in tropical America to stupefy fish. From the bark an alkaloid, erythrine, has been extracted, which has a powerful effect on the nervous system. In Brazil the bark is employed in small doses as a hypnotic, purgative, and diuretic. The roots are used in Mexico for their supposed sudorific properties. The leaves are reputed emmenagogue, and a decoction of the flowers is used in treating chest affections. The juice of the stems is applied to scorpion stings.

A large number of vernacular names are reported from Mexico, but in most cases the specific application is doubtful. The usual names for the seeds are "colorin" and "patol" (from the Nahuatl, *patolli*); for the flowers "pitos." The following names are listed in literature: "Zompantli," "zompantle," "zompantle," "zumpantle," "tzompantli," "tzompantle" (from the Nahuatl *tzon-pantli*, "hair-banner"; also *tzon-pan-cuahuitl*, "hair-banner-tree");

"cozquelite" (*Reko*); "purenchequa," "pureque" (Michoacán, Tarascan); "tzinacanquahuil"; "chijol" (from the Nahuatl *chi-xo-lli*, "swollen-pod," *Reko*); "chocolin" (seeds); "pichoco"; "jiquimite," "iquimite"; "peonía" (Jalisco, Chihuahua); "chilicote" (Chihuahua); "chottza," "demthy" (Otomí, *Buelna*).

One species of doubtful determination is figured, without description, by Hernández¹ under the name "macayxtli."

Standard petals very broad, oval. Calyx bilobate; seeds brown.

1. *E. breviflora*.

Standard narrow, linear or linear-oblong.

Fruit and ovary aculeate.

Calyx dentate.....2. *E. setosa*.

Calyx cleft on one side at the apex, not dentate.....3. *E. leptorhiza*.

Fruit and ovary not aculeate.

Calyx cleft on one side at the apex, or conspicuously bilobate.

Calyx cleft on one side at the apex.....4. *E. rubrinervia*.

Calyx bilobate.....5. *E. montana*.

Calyx truncate.

Standard densely lanate or tomentulose.

Seeds about 8 mm. long; standard 7 cm. long; fruit deeply constricted between the seeds.....6. *E. lanata*.

Seeds about 12 mm. long; standard 5 to 5.5 cm. long; fruit shallowly constricted between the seeds.....7. *E. occidentalis*.

Standard glabrous or nearly so.

Leaflets, at least the terminal ones, conspicuously sinuate-lobate.

8. *E. herbacea*.

Leaflets never lobate.

Seeds about 15 mm. long; leaflets usually rounded or very obtuse at apex.....9. *E. fiabelliformis*.

Seeds about 10 mm. long; leaflets usually acute or acuminate at apex.

Standard 8 cm. long; fruit deeply constricted between the seeds; leaflets aculeate beneath.....10. *E. goldmanii*.

Standard 6.5 cm. long or shorter; fruit only slightly constricted between the seeds; leaflets not aculeate.....11. *E. americana*.

1. *Erythrina breviflora* DC. Prodr. 2: 413. 1825.

Erythrina latiflora Sessé & Moc. Pl. Nov. Hisp. 55. 1887.

Erythrina petraea T. S. Brandeg. Zoe 5: 247. 1908.

Jalisco to Morelos and Puebla; type from Ayacapixtla.

Shrub, 3 to 5 meters high, usually with spiny stems; leaflets 8 to 19 cm. long, broadly rhombic, pubescent beneath and often aculeolate along the veins, short-pointed; racemes short, rather few-flowered; banner about 3 cm. long; seeds brown, about 17 mm. long.

Specimens from San Luis Tultitlanapa, Puebla, are remarkable in having leaflets only 2 to 3.5 cm. long, but the material appears to be properly referable to this species. The shrub flowers when in full leaf.

2. *Erythrina setosa* Mart. & Gal. Bull. Acad. Brux. 10²: 194. 1843.

Mountains of Oaxaca and perhaps elsewhere; type from Regla and the eastern cordillera of Oaxaca.

Stems probably always herbaceous, about 60 cm. high, prickly, nearly glabrous; leaflets 6 to 12 cm. long, acute or acutish, glabrous or nearly so, aculeolate

¹Thesaurus 382. 1651.

beneath along the veins; racemes short and dense. on very long peduncles; banner 4.5 to 6 cm. long, glabrous.

Erythrina horrida DC.¹ is probably the older name for the species. It was based upon one of Sessé and Mocino's plates which, however, is too poor for certain identification. It is possible that *E. horrida* is rather to be referred to *E. leptorhiza*.

3. *Erythrina leptorhiza* DC. Prodr. 2: 413. 1825.

Michoacán to Hidalgo and Mexico.

Stems probably always herbaceous, 30 to 60 cm. high, usually prickly; leaflets 4 to 13 cm. long, acute or obtuse, puberulent or glabrate, often aculeolate beneath along the veins, the venation usually prominent and reticulate; banner 7 to 8 cm. long; fruit 2 to 4-seeded, slightly constricted between the seeds, densely aculeate; seeds nearly black, about 1.5 cm. long. "Patol," "colorín negro" (Michoacán); "cochizquilitl" (*Urbina*).

The roots are thick and fleshy or somewhat woody. The name *Erythrina leptocalyx* Rose was applied to specimens of this species, and has appeared in print, but it has never been properly published.

4. *Erythrina rubrinervia* H. B. K. Nov. Gen. & Sp. 6: 434. 1823.

Oaxaca, Chiapas, and Veracruz. Guatemala to Colombia; Cuba; type from Fusagasugá, Colombia.

Shrub or tree, 2.5 to 9 meters high, with broad crown, the branches spiny or unarmed; leaflets 6 to 18 cm. long, usually acute or acuminate, glabrous or nearly so, paler beneath; banner 7 to 8.5 cm. long; fruit strongly constricted between the seeds; seeds 8 to 10 mm. long, scarlet. "Pito" (Guatemala).

5. *Erythrina montana* Rose & Standl. Contr. U. S. Nat. Herb. 20: 179. 1919.

Durango to Jalisco; type from the Sierra Madre near Santa Teresa, Tepic.

Stems probably always herbaceous, 60 cm. high, unarmed; leaflets 4 to 13 cm. long, rounded to acute at apex, glabrous or nearly so, conspicuously reticulate-veined, usually minutely aculeolate beneath along the veins; standard 5 to 7 cm. long, glabrous; fruit 1 to 4-seeded, slightly constricted between the seeds.

The flowers seem to vary considerably in color, being purplish green, or amber-colored tinted with salmon.

6. *Erythrina lanata* Rose, U. S. Dept. Agr. N. Amer. Fauna 14: 81. f. 1. 1899.

Guerrero and Oaxaca; type from Acapulco, Guerrero.

Shrub with spiny branches; leaflets 4 to 7 cm. long or larger, pointed, glabrous or nearly so, paler beneath; seeds scarlet, 7 to 8 mm. long.

7. *Erythrina occidentalis* Standl. Contr. U. S. Nat. Herb. 20: 180. 1919.

Sinaloa and Tepic; type from Mazatlán, Sinaloa.

Shrub or small tree, often 5 to 6 meters high, with gray spiny branches, leafless at anthesis; leaflets 5 to 17 cm. long, acute or acutish, tomentulose beneath when young but soon glabrate; racemes dense, elongate; flowers rose or red; fruit 5 to 10-seeded; seeds scarlet, about 12 mm. long. "Colorín" (Sinaloa).

The wood is used to some extent, and is said to be durable in dry places. Bottle stoppers are often made from it.

8. *Erythrina herbacea* L. Sp. Pl. 706. 1753.

Tamaulipas and San Luis Potosí. Southeastern United States.

Shrub or small tree, 1 to 3 meters high or larger, with few stiff branches, the trunk very spiny; leaflets 4 to 8 cm. long, usually acute or acutish, glabrous or nearly so, usually somewhat 3-lobed; banner 5 to 5.5 cm. long, red or reddish;

¹ Prodr. 2: 413. 1825.

seeds 5 to 10, scarlet, about 1 cm. long. "Colorín," "patol colorín" (Tamaulipas); "patol" (San Luis Potosí).

In San Luis Potosí the seeds are used to poison rats and dogs. The soft wood is used for making figures of saints, etc. In Mexico this species is apparently always a shrub or tree, but in Florida it is often herbaceous and sometimes a scandent shrub.

9. *Erythrina flabelliformis* Kearney, Trans. N. Y. Acad. 14: 32. 1894.

Erythrina purpusi T. S. Brandege. Zoe 5: 158. 1903.

Baja California to Sonora, San Luis Potosí, and Morelos. Southern Arizona (type from Fort Huachuca) and New Mexico.

Shrub or small tree with spiny branches; leaflets 4 to 8 cm. long, rarely acute, usually broader than long, tomentulose beneath at first but soon glabrate; racemes usually dense and many-flowered; banner red, 4 to 6 cm. long; fruit sometimes 30 cm. long, with 2 to many seeds, rather shallowly constricted between the seeds; seeds usually dark red. "Colorín," "chilicote" (Durango); "coralina" (Baja California).

This is no doubt one of the species to which the name *E. coralloides* has been frequently applied. Brandege¹ states that in Baja California the boys play with the large red seeds, for which they employ the name "chilacayote," a name used also for the seeds of species of *Marah* or *Megarrhiza*, of the family Cucurbitaceae. Palmer reports that in Durango the seeds are used as a remedy for toothache, and the wood for carving figures of saints, etc.

10. *Erythrina goldmanii* Standl. Contr. U. S. Nat. Herb. 20: 181. 1919.

Chiapas; type from San Vicente.

Branches spiny; leaflets 4 to 9 cm. long, pilose when young but soon glabrate, armed beneath with a few recurved prickles; fruit several-seeded; seeds about 1 cm. long, scarlet.

11. *Erythrina americana* Mill. Gard. Dict. ed. 8. *Erythrina* no. 5. 1768.

Erythrina carnea Ait. Hort. Kew. 3: 8. 1789.

Mexico and Veracruz to Chiapas and Yucatán; type from Veracruz.

Shrub or tree, sometimes 9 meters high, with spiny branches; leaflets 7 to 22 cm. long, glabrous or nearly so; flowers red; fruit few or many-seeded; seeds 10 to 12 mm. long, usually scarlet. "Colorín" (Puebla); "chacmolché" (Yucatán, Maya); "pito" (Veracruz).

This is probably the species for which the names "chontal," "madre chontal," "madre cacao," and "madre brava" are used in Tabasco. It is probable also that *E. coralloides* DC.² is a synonym of this species, although possibly that is rather the proper name for *E. flabelliformis*. De Candolle's name was based upon one of Sessé and Mociño's drawings, but the tracing of the latter seen by the writer is too imperfect for definite identification. *E. americana* has been reported from Mexico as *E. corallodendron* L., a West Indian species with red and black seeds which is not known to occur in Mexico.

DOUBTFUL SPECIES.

ERYTHRINA DIVARICATA DC. Prodr. 2: 414. 1825. Based upon one of Sessé and Mociño's plates, which is said to represent a Mexican plant.

ERYTHRINA LONGIPES DC. Prod. 2: 413. 1825. This also was based upon a plate of Sessé and Mociño.

¹ T. S. Brandege, Flora of the Cape Region of Baja California, Proc. Calif. Acad. II. 3: 108-227. 1891.

² Prodr. 2: 413. 1825.

ERYTHRINA PRINCEPS Dietr. in Otto & Dietr. Allg. Gartenz. 2: 305. 1834. Described from Mexico. Not identifiable from the description.

ERYTHRINA ROSEA Dietr. in Otto & Dietr. Allg. Gartenz. 2: 253. 1834. Described from Mexico. Identity doubtful.

43. *GALACTIA* Adans. Fam. Pl. 2: 322. 1763.

Scandent or erect herbs or shrubs; leaves pinnately 3 or 5-foliolate, the leaflets large or small; flowers small or large, usually racemose; fruit linear, bivalvate.

Leaflets 4 to 9 cm. wide. Plants scandent.....1. *G. viridiflora*.

Leaflets less than 3.5 cm. wide.

Flowers in axillary clusters.....2. *G. brachystachya*.

Flowers racemose.

Racemes stout, dense, sessile, mostly shorter than the leaves.

3. *G. multiflora*.

Racemes slender, interrupted, pedunculate, mostly longer than the leaves.

Plants erect; leaflets acute or acuminate.....4. *G. incana*.

Plants scandent or trailing; leaflets often obtuse.

Leaflets glabrous on the upper surface.....5. *G. acapulcensis*.

Leaflets variously pubescent on the upper surface.

Leaflets bright green on the upper surface, not closely sericeous on either surface.....6. *G. striata*.

Leaflets grayish, closely sericeous on both surfaces.

Leaflets white beneath with a soft silky pubescence, oval or ovate.

7. *G. argentea*.

Leaflets grayish beneath with rather stiff pubescence, usually oblong.....8. *G. wrightii*.

1. *Galactia viridiflora* (Rose) Standl.

Odonia viridiflora Rose, Contr. U. S. Nat. Herb. 10: 103. pl. 33. 1906.

Guerrero to Morelos; type from Iguala, Guerrero.

Scandent shrub; leaflets about as broad as long, pubescent; flowers greenish white, 1.2 cm. long, in very long racemes.

2. *Galactia brachystachya* Benth. Ann. Wien. Mus. Naturg. 2: 127. 1838.

Coahuila to Guerrero and Oaxaca; type from Zimapán, Hidalgo.

Slender scandent shrub; leaflets oblong or oval, 1 to 4 cm. long; flowers purplish, 1 cm. long; fruit about 2 cm. long and 6 mm. wide.

3. *Galactia multiflora* Robinson, Proc. Amer. Acad. 29: 315. 1894.

Jalisco to Oaxaca; type from Tequila, Jalisco.

Erect or scandent shrub, sometimes 1.5 meters high; leaflets oblong to orbicular, 2 to 5 cm. long; flowers purplish, about 1.2 cm. long; fruit 3 to 4 cm. long, 5 to 6 mm. wide.

4. *Galactia incana* (Rose) Standl.

Odonia incana Rose, Contr. U. S. Nat. Herb. 10: 102. pl. 32. 1906.

Sinaloa and Tepic; type collected between Aguacate and Dolores, Tepic.

Leaflets ovate or oblong, 3.5 to 7 cm. long; racemes often 25 cm. long.

5. *Galactia acapulcensis* Rose, Contr. U. S. Nat. Herb. 5: 137. 1897.

Baja California, Guerrero, and Morelos; type from Acapulco, Guerrero.

Leaflets oblong or oval, 3 to 7 cm. long, thin; flowers 1 cm. long.

Perhaps not distinct from *G. striata*.

6. *Galactia striata* (Jacq.) Urban, Symb. Antill. 2: 320. 1900.

Glycine striata Jacq. Hort. Vindob. 1: 32. pl. 76. 1770.

Galactia brevistyla Schlecht. Linnaea 12: 288. 1838.

Odonia retusa Rose, Contr. U. S. Nat. Herb. 10: 102. 1906.

Chihuahua to Jalisco, Chiapas, and Yucatán. Widely distributed in tropical America.

Plants slender, scandent, sometimes to a height of 3 meters, herbaceous or suffrutescent; flowers small, purple.

This has been reported from Mexico as *G. tenuiflora* Willd.

7. *Galactia argentea* T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 181. 1915.

Known only from the type locality, Cerro de Picacho, Oaxaca.

Scandent shrub, densely silvery-sericeous throughout; leaflets oval or oblong, 2 to 4 cm. long; flowers purple.

8. *Galactia wrightii* A. Gray, Pl. Wright. 1: 44. 1852.

Galactia tephrodes A. Gray, Pl. Wright. 2: 34. 1853.

Chihuahua and Sonora. Western Texas (type locality) to southern Arizona.

Plants slender, scandent, sericeous; leaflets oblong or elliptic, 2 to 5 cm. long; fruit about 4.5 cm. long, 4 to 5 mm. wide, pubescent.

44. CAJANUS DC. Cat. Hort. Monsp. 85. 1813.

1. *Cajanus indicus* Spreng. Syst. Veg. 3: 248. 1826.

Cytisus cajan L. Sp. Pl. 739. 1753.

Cajanus cajan Millsp. Field Mus. Bot. 2: 53. 1900.

Cultivated in Mexico and sometimes escaping. Native country not certainly known, but perhaps tropical Asia; widely cultivated and naturalized in tropical regions.

Erect shrub or herb, 1 to 3 meters high; leaves pinnately 3-foliolate, the leaflets ovate or oblong, 3 to 8 cm. long, acute, puberulent and gland-dotted beneath; flowers large, yellow, often striped or spotted with red, in short racemes; fruit oblong-linear, bivalvate, pilose; seeds small, gray or brownish. "Frijol de palo" (Nicaragua, Panama, Costa Rica); "frijolillo" (Costa Rica); "garbanzo falso" (Nicaragua); "guandú" (Costa Rica, Porto Rico); "gandul," "gandures" (Porto Rico); "timolillo," "quinbolillo" (Costa Rica); "chicharros," "quinconcho" (Venezuela); "frijol guandus" (Colombia).

The English name "pigeon-pea" is said to have been given because pigeons are fond of the seeds. The plant is extensively cultivated in some tropical regions for its edible seeds, and in India it is said to hold third rank among the leguminous plants cultivated for food. The seeds are eaten either ripe or green. When cultivated the plant is usually treated as an annual, but if not cut it becomes a truly woody shrub. It is often grown for forage, and in Madagascar the leaves have been utilized as food for silkworms. In Bengal the plant has been grown as a host plant for lac insects. The stems are used in Asia for roofs and baskets, and they have been burnt into charcoal for gunpowder. Diuretic, astringent, antidysenteric, detersive, laxative, and vulnerary properties are ascribed to the plant. With regard to the flowers there are two chief varieties, one with yellow petals, the other with the standard purplish outside.

45. MUCUNA Adans. Fam. Pl. 2: 325. 1763.

Scandent herbs or shrubs; leaves pinnate, 3-foliolate; flowers large, fasciculate or racemose; fruit thick and hard, usually covered with stinging hairs.

Some species of the genus are grown extensively as forage plants.

Fruit with transverse crests..... 1. *M. sloanei*.

Fruit without transverse crests.

Fruit 4.5 to 5 cm. wide, flat; leaflets densely lustrous-sericeous beneath.

2. *M. argyrophylla*.

Fruit less than 2 cm. wide, very thick; leaflets sparsely sericeous beneath.

3. *M. pruriens*.

1. *Mucuna sloanei* Fawe. & Rendle, Journ. Bot. Brit. & For. 55: 36. 1917.

Michoacán and Guerrero to Veracruz and Oaxaca. Tropical America and western Africa.

Scandent shrub or herb; leaflets about 9 cm. long, silvery-sericeous beneath; flowers large, yellow; fruit 4 to 5 cm. wide, densely covered with bristly hairs; seeds subglobose, dark brownish gray, 2.5 cm. in diameter. "Pica-pica" (Oaxaca, Veracruz); "ojo de venado" (Guerrero, Veracruz, Oaxaca, Panama); "ojo de borrico" (Veracruz); "ojo de buey" (Oaxaca, Porto Rico); "matos del monte," "matos" (Porto Rico).

The seeds were eaten by the Caribs of the West Indies, and were formerly used in Jamaica for the manufacture of buttons and snuff-boxes. In Mexico they are sometimes worn as amulets. They are said also to be purgative and diuretic. The leaves are reported to yield a black dye. The hairs of the pods cause intense irritation when in contact with the skin. Formerly these hairs, like those of *M. pruriens*, mixed with molasses, formed a mixture of wide usage, administered internally, for the destruction of intestinal parasites in man. The hairs are softened by soaking in molasses, and are said to have no injurious effect upon the lining of the alimentary canal.

This is probably the plant reported from Mexico by Sessé and Mociño¹ as *Dolichos altissimus*.

2. *Mucuna argyrophylla* Standl., sp. nov.

Chiapas and Oaxaca; type from Ocuilapa. Chiapas (Nelson 3060; U. S. Nat. Herb. no. 234283).

Young branches densely appressed-pilose; petioles slender, 6.5 to 10 cm. long, the petiolules 5 to 8 mm. long; leaflets 8.5 to 16 cm. long, 5.5 to 10 cm. wide, abruptly short-acuminate at apex, the terminal one broadly elliptic-oval or rounded-oval, rounded at the base, the lateral ones usually smaller, oblique, very unequal at base, the leaflets thin, hispidulous on the upper surface, beneath densely silvery-sericeous with lustrous hairs; peduncles often 50 cm. long or longer, slender, the racemes dense, 2.5 to 6.5 cm. long, the pedicels recurved, 4 to 5 cm. long; calyx about 12 mm. long and broad, densely sericeous, the teeth very short, obtuse; standard petal 2 cm. wide (when flattened out), the blade 2 cm. long, the claw 5 mm. long; wings about as long as the standard, 7 to 8 mm. wide; keel 4.5 cm. long, about 1 cm. wide, rounded at apex; fruit about 20 cm. long and 4.5 cm. wide, 2 to 4-seeded, densely hispid with short brown hairs, sessile, the valves thin, smooth.

3. *Mucuna pruriens* (L.) DC. Prodr. 2: 405. 1825.

Dolichos pruriens L. Syst. Nat. ed. 10. 2: 1162. 1750.

Veracruz. Widely distributed in the tropics of both hemispheres.

Scandent or procumbent shrub or herb; flowers dark purple, in pendent racemes; fruit 7 to 10 cm. long, very densely covered with stinging hairs; seeds small, blackish brown. "Pica-pica" (Veracruz, Costa Rica, Cuba); "guzano de pica-pica" (Nicaragua).

The English names are "cowage" and "cowitch." In India the powdered seeds are said to be used as an aphrodisiac, and the green seeds are cooked and eaten. The seeds are said to be used sometimes as a substitute for coffee.

46. BRADBURYA Raf. Fl. Ludov. 104. 1817.

Plants scandent, herbaceous or suffrutescent; leaves pinnate, 3-foliolate, or sometimes unifoliolate; flowers large, showy, the axillary peduncles with one or more flowers; fruit linear, bivalvate.

One or two herbaceous species also occur in Mexico.

¹ Pl. Nov. Hisp. 117. 1887.

- Leaves unifoliolate, the leaflets hastate.....1. *B. sagittata*.
 Leaves 3-foliolate.
 Leaflets hastate.....2. *B. schottii*.
 Leaflets not hastate.
 Fruit 8 to 10 mm. wide; upper calyx lobes nearly obsolete...3. *B. plumieri*.
 Fruit 4 to 6 mm. wide; upper calyx lobes equaling or longer than the tube.
 Upper calyx lobes about as long as the tube; bracts densely sericeous.
 4. *B. pubescens*.
 Upper calyx lobes much longer than the tube; bracts puberulent.
 5. *B. virginiana*.

1. *Bradburya sagittata* (Humb. & Bonpl.) Rose, Contr. U. S. Nat. Herb. 8: 46. 1903.

Glycine sagittata Humb. & Bonpl.; Willd. Enum. Pl. 757. 1809.

Centrosema hastatum Benth. Ann. Wien. Mus. Naturg. 2: 120. 1838.

Centrosema dubium Hemsl. Biol. Centr. Amer. Bot. 1: 294. 1880.

Veracruz to Colima and Oaxaca. Costa Rica; Colombia (type locality).

Plants herbaceous or suffrutescent; leaflets 6 to 11 cm. long, acuminate, glabrate; petiole winged; flowers about 4.5 cm. long; fruit 8 to 14 cm. long, 6 to 8 mm. wide, with a long slender beak.

2. *Bradburya schottii* Millsp. Field Mus. Bot. 1: 364. 1898.

Centrosema schottii K. Schum. in Just's Bot. Jahresb. 26¹: 353. 1900.

Yucatán; type from Nohpat.

Plants scandent to a height of 3 meters; flowers 3.5 cm. long; fruit 12.5 to 15 cm. long, 6 mm. wide.

3. *Bradburya plumieri* (Turp.) Kuntze, Rev. Gen. Pl. 1: 164. 1891.

Clitoria plumieri Turp.; Pers. Syn. Pl. 2: 303. 1807.

Centrosema plumieri Benth. Ann. Wien. Mus. Naturg. 2: 118. 1838.

Guerrero to Veracruz, Yucatán, and Chiapas. Widely distributed in tropical America.

Scandent shrub or herb; leaflets suborbicular to oval-oblong, 3.5 to 10 cm. long, apiculate or short-acuminate; flowers 4.5 to 5 cm. long, dark purple to pinkish white; fruit 10 to 18 cm. long. "Frijolillo," "patitos" (Tabasco); "mariposa" (Campeche).

4. *Bradburya pubescens* (Benth.) Kuntze, Rev. Gen. Pl. 1: 164. 1891.

Centrosema pubescens Benth. Ann. Wien. Mus. Naturg. 2: 119. 1838.

Clitoria schiedeana Schlecht. Linnaea 12: 284. 1838.

? *Clitoria grandiflora* Mart. & Gal. Bull. Acad. Brux 10²: 189. 1843.

Bradburya schiedeana Rose, Contr. U. S. Nat. Herb. 8: 46. 1903.

Guerrero to San Luis Potosí, Veracruz, and Chiapas. Widely distributed in tropical America.

Plants scandent, herbaceous or suffrutescent; leaflets elliptic or ovate. 4 to 10 cm. long, pubescent, short-acuminate; flowers 3 to 4 cm. long, yellowish or purple; fruit about 15 cm. long. "Flor de pito" (Porto Rico).

5. *Bradburya virginiana* (L.) Kuntze, Rev. Gen. Pl. 1: 164. 1891.

Clitoria virginiana L. Sp. Pl. 753. 1753.

Centrosema virginiana Benth. Ann. Wien. Mus. Naturg. 2: 120. 1838.

Tamaulipas to Yucatán, Chiapas, and Oaxaca. Widely distributed in tropical America; southern United States; western Africa.

Plants usually herbaceous but sometimes scandent to a height of 6 meters; leaflets ovate or oblong, 3 to 7.5 cm. long, bright green, acute; flowers 2 cm. long, blue or purplish; fruit 10 to 15 cm. long. "Sonajera azul," "hierba de bulla," "chochito," "crica de negra" (Porto Rico).

Various medicinal uses are reported from Porto Rico for the plant. Groussourdy states that the flowers yield a blue dye.

47. CALOPOGONIUM Desv. Ann. Sci. Nat. 9: 423. 1826.

Another species, *C. galactoides* Benth., a herbaceous plant, also occurs in Mexico.

1. *Calopogonium caeruleum* (Benth.) Hemsl. Biol. Centr. Amer. Bot. 1: 301. 1880.

Stenolobium caeruleum Benth. Ann. Wien. Mus. Naturg. 2: 125. 1838.

Tepec to Veracruz and Chiapas. Central America, West Indies, and South America; type from Brazil.

Scandent or trailing shrub or herb; leaves pinnately 3-foliolate, the leaflets rhombic, obtuse or acute; flowers small, violet, in long spikelike racemes; fruit flattened, 5 to 7 cm. long, 8 mm. wide.

48. ANDIRA Lam. Encyl. 1: 171. 1783.

Unarmed trees; leaves pinnate, the leaflets large or of medium size; flowers pink or violet, paniculate; fruit drupaceous, ovoid or obovoid, indehiscent.

The seeds of some South American species have anthelmintic properties.

Leaflets glabrous beneath, acute or abruptly acuminate; flowers about 1 cm. long-----1. *A. jamaicensis*.

Leaflets densely tomentose beneath, rounded or very obtuse at the apex; flowers about 1.8 cm. long-----2. *A. galeottiana*.

1. *Andira jamaicensis* (W. Wright) Urban, Symb. Antill. 4: 298. 1905.

Geoffraea jamaicensis W. Wright, Phil. Trans. Lond. 67: 512. 1777.

Geoffraea inermis Swartz, Prodr. Veg. Ind. Occ. 106. 1788.

Andira excelsa H. B. K. Nov. Gen. & Sp. 6: 385. 1823.

Andira inermis H. B. K. Nov. Gen. & Sp. 6: 385. 1823.

Michoacán to Chiapas; reported from Tabasco and Yucatán. West Indies, Central America, South America, and western Africa; type from Jamaica.

Tree, sometimes 30 meters high; leaflets usually 9 or 11, oblong or ovate, large, acuminate; flowers small, paniculate, purple or reddish violet, sometimes pink; fruit rounded, oval, or obovate, 2.5 to 4 cm. long or larger. "Cuillim-buca" (Mochoacán, Guerrero); "yabo," "yaba" (Yucatán, Cuba); "maca colorada," "pacay," "macallo," "moca" (Tabasco); "macayo" (Tabasco, Oaxaca); "pilón" (Guiana); "moca," "moca blanca" (Porto Rico); "guacamayo" (Guatemala, Honduras, Blake).

Wood hard and durable, varying from yellowish to dark brown or even black, susceptible of a high polish, the specific gravity reported as 0.748 and 0.880. In Tabasco it is valued for construction purposes. The tree has a disagreeable odor. In Porto Rico it is sometimes planted for coffee shade. The bark and seeds are used as a purgative, vermifuge, febrifuge, or anthelmintic, but large doses are said to be dangerous, producing delirium or even death. The seeds are said to contain a poisonous alkaloid.

2. *Andira galeottiana* Standl. Contr. U. S. Nat. Herb. 20: 217. 1919.

Veracruz and Puebla; type from Catemaco, Veracruz.

Leaflets 5 to 13, oblong to obovate-oblong, 3 to 13 cm. long, glabrate on the upper surface; racemes dense, 6 to 9 cm. long, forming a large panicle; ovary glabrous. "Macayo" (Puebla).

49. AMERIMNON Jacq. Enum. Pl. Carib. 27. 1760.

Trees or shrubs, unarmed, often scandent; leaves pinnate, with numerous leaflets, rarely unifoliate; flowers small, usually paniculate; fruit oblong or linear, flat, thin, indehiscent, 1 or few-seeded.

Some of the Asiatic and South American species yield part of the rosewood of commerce.

Leaflet 1.....1. *A. brownii*.

Leaflets 5 or more.

Leaflets glabrous beneath.....2. *A. granadillo*.

Leaflets thinly sericeous beneath.

Leaflets 1.5 to 3 cm. long.....3. *A. glabrum*.

Leaflets 3.5 to 5 cm. long.....4. *A. glomeratum*.

1. *Amerimnon brownii* Jacq. Enum. Pl. Carib. 27. 1760.

Dalbergia amerimnum Benth. Journ. Linn. Soc. Bot. 4: Suppl. 36. 1860.

Dalbergia brownii Urban, Symb. Antill. 4: 295. 1905.

Tamaulipas, Veracruz, and Oaxaca. Central America, West Indies, and South America.

Shrub, 3 to 4.5 meters high, often with long reclining branches; leaves ovate or oval, 3.5 to 7 cm. long, obtuse or acute, lustrous, glabrous; flowers white, in dense clusters. "Péndola" (Cuba).

2. *Amerimnon granadillo* Standl., sp. nov.

Oaxaca to Michoacán; type from El Tibor, Michoacán or Guerrero, altitude 100 meters (*Langlassé* 294; U. S. Nat. Herb. no. 385583).

Tree, the branchlets slender, glabrous; leaves glabrous, the rachis 9.5 to 18 cm. long, slender, glaucescent, the petiolules 2.5 to 3 mm. long; leaflets 7 to 11, elliptic-oval or ovate-oval, 3 to 7 cm. long, 1.7 to 4 cm. wide, rounded at base, obtuse or rounded-obtuse at apex, sometimes with a somewhat abrupt obtuse tip, thin, bright green and lustrous on the upper surface, paler beneath, the venation prominent and reticulate on both surfaces; cymes lax, few-flowered, the pedicels in fruit 4 to 5 mm. long, very stout; calyx persistent in fruit, thinly sericeous with short brown hairs, the lobes obtuse; fruit very flat and thin, 1 to 3-seeded, 8 to 15 cm. long, 1.7 to 2 cm. wide, sometimes slightly constricted in the middle, acuminate at apex, attenuate at base, lustrous, glabrous, reticulate-veined, the slender stipe 10 to 12 mm. long.

Collected also at Apango (Cerro Huatulco), Oaxaca, altitude 400 meters, October 10, 1917, by B. P. Reko (no. 3517).

Related to *Dalbergia retusa* Hemsl., a species of Panama, which is distinguished by the sericeous lower surface of the leaflets and broader, shorter fruit.

Amerimnon granadillo is a well-known forest tree of the west coast of Mexico, and there are several references to it in literature under the vernacular name of "granadillo." It is highly valued for use in cabinet work. A specimen of the wood has been forwarded by Dr. Reko. It is very heavy and hard, of a beautiful purple color, with broad stripes of purplish black; it takes a fine polish.

3. *Amerimnon glabrum* (Mill.) Standl.

Robinia glabra Mill. Gard. Dict. ed. 8. *Robinia* no. 5. 1768.

Dalbergia campechiana Benth. Journ. Linn. Soc. Bot. 4: Suppl. 37. 1860.

Amerimnon campechianum Kuntze, Rev. Gen. Pl. 1: 159. 1891.

Dalbergia purpusii T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 501. 1919.

Veracruz, Morelos, and Oaxaca to Yucatán; type from Campeche.

Scandent shrub; leaflets about 9, oval, rounded at the apex, paler beneath; flowers small, white, in loose clusters; fruit 4 to 6 cm. long, 1 to 1.5 cm. wide, thin. "Cibix" (Yucatán, Maya); "bejuco de panunc," "bejuco de estribo" (Oaxaca).

4. *Amerimnon glomeratum* (Hemsl.) Standl.

Dalbergia glomerata Hemsl. Diag. Pl. Mex. 8. 1878.

Known only from the type locality, Sierra Zongolica, Veracruz.

Leaflets 11 or 13, ovate-oblong, obtuse; flowers smaller than those of the last species, in dense cymes.

50. **PTEROCARPUS** L. Sp. Pl. ed. 2. 1662. 1763.

Unarmed trees; leaves pinnate, with few large leaflets; flowers large, racemose or paniculate; fruit short and broad, compressed, 1 or 2-seeded, indehiscent.

Some of the Asiatic species yield gums which are used medicinally for diarrhoea, and also for dyeing and tanning. Others yield valuable woods.

Fruit sessile or nearly so, densely cinereo-puberulent; calyx densely puberulent, the lobes acute-----1. *P. orbiculatus*.

Fruit long stipitate; calyx lobes very obtuse.

Calyx densely pubescent; leaflets acutish or obtuse at apex.

2. *P. acapulcensis*.

Calyx glabrate; leaflets cuspidate-acuminate-----3. *P. officinalis*.

1. *Pterocarpus orbiculatus* DC. Prodr. 2: 418. 1825.

Amphymenium pubescens H. B. K. Nov. Gen. & Sp. 6: 380. 1823.

Pterocarpus amphymenium DC. Prodr. 2: 418. 1825.

Pterocarpus pubescens Spreng. Syst. Veg. 4: Cur. Post. 268. 1827. Not *P. pubescens* Poir. 1804.

Pterocarpus aphyllus Micheli, Mém. Soc. Phys. Hist. Nat. Genève 34: 266. pl. 16. 1903.

Guerrero, Michoacán, Oaxaca, and Veracruz.

Tree, 6 to 8 meters high, with white bark; leaflets 3 to 7, large, variable in shape, nearly glabrous; flowers yellow, rather large, racemose; fruit sub-orbicular, 4 to 5 cm. broad, surrounded by a broad thin wing. "Llora-sangre" (Guerrero); "guayabillo" (Michoacán).

Pterocarpus crispatus DC.¹ may be the same species. Its fruit is not known.

2. *Pterocarpus acapulcensis* Rose, Contr. U. S. Nat. Herb. 5: 143. 1897.

Veracruz, Guerrero, and Oaxaca; type from Acapulco, Guerrero.

Tree, 7 meters high or larger, with yellow flowers; leaflets pale beneath; fruit 5 to 6.5 cm. long. "Drago" (Guerrero, Oaxaca); "sangre de drago," "sangredrago" (Oaxaca).

This may be the species reported by Ramírez from Michoacán as *P. draco*, with the vernacular name "huahuauchi."

3. *Pterocarpus officinalis* Jacq. Stirp. Amer. 283. pl. 183. f. 92. 1763.

Pterocarpus draco L. Sp. Pl. ed. 2. 1662, in part. 1763.

Yucatán. Central America, West Indies, and northern South America.

Tree, sometimes 24 meters high, with yellow or yellowish brown flowers; wood dirty white, with a specific gravity of about 0.554. "Sangre de drago" (Guatemala, Nicaragua); "sangregado" (Nicaragua); "palo de pollo" (Porto Rico).

As in other species, when the bark is cut it exudes a blood-red juice that soon solidifies and forms a red resin which is insipid and inodorous. It was formerly used in medicine under the name of "dragon's-blood," and large amounts were at one time sent to Spain from Cartagena, Colombia.

51. **DREPANOCARPUS** Meyer, Prim. Fl. Esseq. 236. 1818.

Trees or shrubs sometimes scandent; leaves unequally pinnate, estipellate, the leaflets alternate; flowers purple or white, in short axillary racemes or in terminal panicles; fruit falcate, compressed, indehiscent, 1-seeded.

¹ Prodr. 2: 418. 1825.

Leaflets usually 7; standard petal sericeous.

Leaflets acuminate.....1. *D. inundatus*.

Leaflets rounded at apex.....2. *D. lunatus*.

Leaflets 25 to 30; standard petal glabrous.....3. *D. mucronulatus*.

1. *Drepanocarpus inundatus* Mart.; Benth. Ann. Naturhist. Hofmus. Wien 2: 96. 1838.

Veracruz and Chiapas. Central America to Brazil.

Shrub, usually scandent; leaflets 5 to 9, ovate to lance-oblong, 4 to 8 cm. long, glabrous or nearly so; flowers sessile.

2. *Drepanocarpus lunatus* (L. f.) Meyer, Prim. Fl. Esseq. 233. 1818.

Pterocarpus lunatus L. f. Suppl. Pl. 317. 1781.

Reported from Veracruz. Central America, West Indies, South America, and western Africa.

Shrub, 2 to 5 meters high, armed with short recurved spines; leaflets oblong, 1.5 to 5 cm. long, with very numerous fine close nerves; flowers purple; fruit flat, short, strongly curved. Known in Porto Rico as "escambrón" or "palo de hoz."

3. *Drepanocarpus mucronulatus* Benth.; Hemsl. Diag. Pl. Mex. 8. 1878.

Known only from the type locality, Bolaños, Jalisco.

Leaflets oblong, 6 to 10 mm. long, mucronate, hirsute beneath; flowers short-pedicellate, 5 to 6 mm. long.

Of this Hemsley says, "A very distinct plant, perhaps the type of a new genus."

DOUBTFUL SPECIES.

DREPANOCARPUS ? *CYATHIFORMIS* DC. Prodr. 2: 420. 1825. Described from somewhere in Mexico. Probably a synonym of *Dalbergia monetaria* L. f., which is not known to occur in Mexico.

52. *MACHAERIUM* Pers. Syn. Pl. 2: 276. 1807.

Scandent shrubs or erect trees, usually armed with spines; leaves pinnate; flowers small or of medium size, racemose or paniculate; fruit compressed, samara-like, 1-seeded, indehiscent.

Some of the South American species yield valuable wood which forms part of the rosewood of commerce.

Leaflets acuminate, elliptic or ovate.....1. *M. latifolium*.

Leaflets rounded or retuse at the apex, oblong or obovate-oblong.

Leaflets 5 to 9.....4. *M. riparium*.

Leaflets more than 9 in most of the leaves.

Inflorescence puberulent or with minute appressed hairs; leaflets mostly 1.5 to 2 cm. wide.....2. *M. biovulatum*.

Inflorescence setulose-pilose with stiff yellowish hairs; leaflets 6 to 8 mm. wide.....3. *M. setulosum*.

1. *Machaerium latifolium* (Benth.) Pittier, Contr. U. S. Nat. Herb. 20: 470. 1921.

Machaerium acuminatum latifolium Benth. Journ. Linn. Soc. Bot. 4: Suppl. 65. 1860.

Veracruz. Nicaragua and Costa Rica.

Shrub, probably scandent; leaflets 5 or 7, elliptic, 5 to 12 cm. long, glabrate; fruit 7 to 8 cm. long, glabrous, the thin wing 2 cm. wide or wider.

2. *Machaerium biovulatum* Micheli, Mém. Soc. Phys. Hist. Nat. Genève 34: 265. pl. 15. 1903.

Michoacán to Oaxaca; type from El Ocote. Guatemala.

Large scandent shrub, armed with short recurved spines; leaflets 3 to 5 cm. long, bright green, pale beneath, with numerous fine close nerves; flowers violet; fruit 5 to 6 cm. long, the wing 1.2 to 1.5 cm. wide.

It may be that two species are represented by the material referred here.

3. *Machaerium setulosum* Pittier, Contr. U. S. Nat. Herb. 20: 477. 1921.

Veracruz; type from Zacuapan.

Subscandent shrub; leaflets numerous, 2 to 3.5 cm. long, with fine parallel nerves, pubescent beneath; flowers violet.

4. *Machaerium riparium* T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 500. 1919.

Known only from the type locality, Zacuapan, Veracruz.

Leaflets oblong or elliptic, about 3 cm. long, glabrous; panicles ferruginous-pubescent; fruit glabrous, 6 cm. long, the wing 1.8 cm. wide.

The writer has seen no material of this species.

53. **PLATYMISCIUM** Vog. Linnaea 11: 198. 1837.

Trees or shrubs; leaves glabrous, estipellate, the leaflets few, opposite; racemes borne on new or old branches, solitary or fasciculate; corolla yellow, glabrous; fruit oblong, flat, submembranaceous, indehiscent.

Leaflets 3; rachis of the racemes glabrous.....1. *P. trifoliolatum*.

Leaflets 5; rachis of the racemes finely puberulent.....2. *P. yucatanum*.

1. *Platymiscium trifoliolatum* Benth. Journ. Linn. Soc. Bot. 4: Suppl. 82. 1860.

Type collected between San Blas, Tepic, and Guadalajara, Jalisco.

Leaflets ovate-elliptic, acuminate, acute at base; racemes 7 to 13 cm. long, the flowers long-pedicellate, 10 to 12 mm. long; young fruit about 3.5 cm. long and 8 mm. wide.

2. *Platymiscium yucatanum* Standl., sp. nov.

Type from Izamal, Yucatán, flowering in February (*Gaumer* 377; U. S. Nat. Herb. no. 571629).

Tree, 24 meters high, the branchlets gray; leaves glabrous, the petiole about 3 cm. long; leaflets 5, ovate or ovate-oblong, 4 to 6 cm. long, 1.5 to 2.5 cm. wide, obtusely acuminate, rounded or obtuse at base, coriaceous, lustrous, the venation prominent and reticulate on both surfaces, the petiolules 5 to 6 mm. long; racemes fasciculate on old branchlets, 7.5 cm. long or less, lax, the rachis minutely puberulent; pedicels 1 to 2.5 mm. long; calyx 3 mm. long, minutely puberulent; standard petal about 7 mm. long.

The tree has been reported¹ from Yucatán as *Pterocarpus draco* L. The Maya name is given as "subinché."

54. **ICHTHYOMETHIA** P. Br. Civ. Nat. Hist. Jam. 296. 1756.

REFERENCE: Blake, Revision of *Ichthyomethia*, a genus of plants used for poisoning fish, Journ. Washington Acad. Sci. 9: 241-252. 1919.

Trees or shrubs; leaves pinnate, the leaflets opposite; flowers in lateral panicles, appearing before the leaves, pink or white and red; fruit indehiscent, broadly 2-winged on each suture. 1 to 6-seeded.

Leaflets very densely tomentose or soft-pilose beneath.

Leaflets tomentose beneath.....1. *I. grandifolia*.

Leaflets short-pilose beneath.....2. *I. mollis*.

Leaflets strigose or puberulent beneath.

Leaflets densely incurved-puberulent beneath, the hairs parallel with the veinlets; stipe of the fruit equaling or slightly exceeding the calyx.

3. *I. communis*.

Leaflets strigose beneath, the hairs crossing the veinlets transversely; stipe much exceeding the calyx.....4. *I. americana*.

¹ Field Mus. Bot. 1: 368. 1898.

1. *Ichthyomethia grandifolia* (Donn. Smith) Blake, Journ. Washington Acad. Sci. 9: 245. 1919.

Derris grandifolia Donn. Smith, Bot. Gaz. 56: 55. 1913.

Puebla and Oaxaca. Guatemala; type from Cerro Gordo.

Tree; leaflets 7 to 11, oval, 5.5 to 10 cm. long, crisped-pilosulous above, rounded at apex; calyx 7 to 8 mm. long; banner petal glabrous, 10 mm. long; fruit 4 to 9 cm. long, 3 to 5-seeded.

2. *Ichthyomethia mollis* (Rose) Blake, Journ. Washington Acad. Sci. 9: 246. 1919.

Piscidia mollis Rose, Contr. U. S. Nat. Herb. 1: 98. 1891.

Sonora and Sinaloa; type from Alamos, Sonora.

Shrub or tree, 3 to 16 meters high, the trunk sometimes 70 cm. in diameter; leaflets 7 to 13, oval, 3 to 8 cm. long, densely pilosulous on the upper surface; fruit 2.5 to 5 cm. long, 1 to 3-seeded. "Palo blanco" (Sonora, Sinaloa).

The wood is of some importance for building purposes. The flowers have not been collected.

3. *Ichthyomethia communis* Blake, Journ. Washington Acad. Sci. 9: 247. 1919.

Tamaulipas and San Luis Potosí to Yucatán. Honduras, Cuba, and Florida (type from Ramrod Key).

Tree, sometimes 25 meters high; leaflets 7 or 9, oblong or elliptic, 4 to 12 cm. long, acute or short-pointed; calyx 4.5 mm. long; banner cinereous-pubescent outside; fruit 2.5 to 7.5 mm. long, 1 to 6-seeded; wood weak, close-grained, yellowish brown, its specific gravity about 0.87. "Haabí," "habí," "haabín" (Yucatán, Maya); "chijol" (Tamaulipas, Veracruz); "flor de papagallo" (Ramírez); "cocuite," "javín" (Veracruz, Villada); "guaná hedionda" (Cuba).

This has been confused with *I. piscipula* (L.) Hitchc. (*Erythrina piscipula* L.; *Piscidia erythrina* L.; *Piscidia piscipula* Sarg.), a species confined apparently to Jamaica, where it is known as "dogwood." The properties discussed below are probably common to all or most of the species.

The wood is very durable, especially in water, and takes a fine polish. It has been used for boat building, fuel, and charcoal. Robelo states that in Mexico there is a popular belief that the wood petrifies after many years, beginning at the heart. The dry bark, especially that of the root, has a strong and disagreeable odor of opium; it produces a burning sensation in the mouth. It contains substances (one of which has been named piscidin) which are narcotic and analgesic, and has been used as an anodyne in neuralgia, nervous insomnia, whooping cough, etc. The extract of the bark is sometimes employed in tropical America for relieving toothache, applied locally, and that of the Jamaican species to cure mange in dogs. The best-known use of the tree, however, is its employment for poisoning or stupefying fish, the bark and leaves being crushed and thrown into the water. It is said that the Caribs used the juice for poisoning their arrows, but this appears doubtful.

4. *Ichthyomethia americana* (Sessé & Moc.) Blake, Journ. Washington Acad. Sci. 9: 248. 1919.

Piscidia americana Sessé & Moc. Pl. Nov. Hisp. 116. 1857.

Michoacán and Guerrero; type from Apatzingán, Michoacán. Guatemala.

Tree; leaflets 9 to 13, oval-oblong or elliptic-oblong, 4 to 8 cm. long, rounded to acute at the apex; calyx 6 to 7 mm. long; standard 15 mm. long, cinereous-puberulent outside; fruit 1.5 to 7.5 cm. long, 1 to 6-seeded. "Tatzungo," "zat-zumbo" (Michoacán, Tarascan); "cocuile," "colorín de peces," "matapez" (Guerrero).

55. *LONCHOCARPUS* H. B. K. Nov. Gen. & Sp. 6: 383. 1823.

REFERENCE: Pittier, Contr. U. S. Nat. Herb. 20: 37-93. pl. 1-6. f. 1-43. 1917.

Unarmed trees or shrubs; leaves pinnate; flowers often large and showy, racemose or paniculate; fruit compressed, thin or thick, indehiscent.

Same species are used in South America as fish poisons. The leaves of some are said to have irritant and vomitive properties.

Leaves unifoliolate.....1. *L. unifoliolatus*.

Leaves with 3 or more leaflets.

Leaflets glabrous beneath or when young sparsely pilose along the costa.

Pedicels mostly longer than the calyx; leaflets and calyx punctate.

Plants wholly glabrous.....2. *L. longistylus*.

Plants sparsely pubescent on the inflorescence and the costa of the leaflets.

3. *L. longipedicellatus*.

Pedicels shorter than the calyx; leaflets and calyx not punctate.

Fruit cochleate; leaflets 5 to 9.....4. *L. cochleatus*.

Fruit flat; leaflets 3 or 5, rarely 7.

Flowers about 1 cm. long.....5. *L. hondurensis*.

Flowers about 1.5 cm. long.

Leaflets 6 to 9 cm. long, acutish.....6. *L. megalanthus*.

Leaflets 9 to 11 cm. long, cuspidate-acuminate.....7. *L. mexicanus*.

Leaflets more or less pubescent beneath over the whole surface.

Leaflets acute or acutish at apex, or abruptly apiculate.

Leaflets small, most of them 3 to 5 cm. long, the upper ones acute at base.

Standard densely sericeous; keel petals auriculate.

8. *L. minimiflorus*.

Standard thinly sericeous; keel petals not auriculate.

Leaflets 9 to 15.....9. *L. lanceolatus*.

Leaflets 5 or 7.....10. *L. yucatanensis*.

Leaflets large, most of them 6 to 12 cm. long, usually rounded or very obtuse at base.

Leaflets 5 or 7.

Leaflets cuspidate-acuminate.....11. *L. caudatus*.

Leaflets very short-acuminate.

Lateral nerves of the leaves very conspicuous and prominent beneath; calyx conspicuously dentate.....12. *L. oaxacensis*.

Lateral nerves inconspicuous; calyx subtruncate.

Calyx densely sericeous.....13. *L. guatemalensis*.

Calyx glabrous or nearly so.....14. *L. purpusii*.

Leaflets 9 or more in most of the leaves.

Lateral nerves of the leaflets 10 to 12.....15. *L. affinis*.

Lateral nerves of the leaflets 5 to 8.

Standard petals 16 to 18 mm. long.....16. *L. palmeri*.

Standard 10 to 14 mm. long.

Leaflets finely sericeous beneath.....17. *L. robustus*.

Leaflets scabrous-puberulent beneath.....18. *L. sericeus*.

Leaflets rounded or very obtuse at apex, never apiculate, often emarginate.

Venation of the leaflets not impressed on the upper surface.

Pubescence of the calyx brown; leaflets 1.5-3 cm. long.

19. *L. comitensis*.

Pubescence of the calyx gray or whitish; leaflets mostly more than 3 cm. long.

Leaflets oval.....20. *L. constrictus*.

Leaflets oblong.....21. *L. emarginatus*.

Venation of the leaflets conspicuously impressed on the upper surface.
Upper margin of the fruit conspicuously thickened—18. *L. sericeus*.
Upper margin of the fruit not thickened.

Ovules 7 or 8; fruit thin-----22. *L. rugosus*.

Ovules 2 or 3; fruit coriaceous.

Fruit 7 to 11.5 cm. long-----23. *L. eriocarinalis*.

Fruit about 4 cm. long-----24. *L. jaliscensis*.

1. *Lonchocarpus unifoliolatus* Benth. Journ. Proc. Linn. Soc. Bot. 4: Suppl. 90. 1860.

Puebla and perhaps elsewhere in southern Mexico, the type from some uncertain locality.

Small tree; leaflets ovate, 10 to 12.5 cm. long, acuminate; flowers pink, racemose.

2. *Lonchocarpus longistylus* Pittier, Contr. U. S. Nat. Herb. 20: 62. f. 10. 1917.

Yucatán; type from Xbalché.

Tree with purplish flowers; leaflets 11 to 15, oblong or ovate, 3.5 to 8.5 cm. long; fruit 1 or 2-seeded, 8 to 8.5 cm. long, 3 cm. wide, with thin margins. "Bal-ché," "xbal-ché" (Maya).

3. *Lonchocarpus longipedicellatus* Pittier, Contr. U. S. Nat. Herb. 20: 61. f. 8. 1917.

Known only from the type locality, Jiquipilas, Chiapas.

Tree; leaflets 7 or 9, oblong or ovate, 3.5 to 10.5 cm. long, obtuse or acute; flowers purplish.

4. *Lonchocarpus cochleatus* Pittier, Contr. U. S. Nat. Herb. 20: 68. pl. 4, C. 1917.

Known only from the type locality, El Calabazal, Guerrero.

Tree, 4 to 5 meters high; leaflets 4 to 9.5 cm. long, obtuse or acuminate; fruit 4 to 9.5 cm. long, 2.5 to 4.5 cm. wide, with thin edges.

5. *Lonchocarpus hondurensis* Benth. Journ. Proc. Linn. Soc. Bot. 4: Suppl. 91. 1860.

Tabasco. Honduras (type locality) and British Honduras.

Tree, 6 to 8 meters high; leaflets usually 5, 3.5 to 10 cm. long; flowers purplish red. "Gusano" (Tabasco).

6. *Lonchocarpus megalanthus* Pittier, Contr. U. S. Nat. Herb. 20: 70. f. 19. 1917.

Sinaloa and Tepic; type from Tepic.

Tree, about 10 meters high, with low branches; leaves deciduous, the leaflets 3.5 to 9 cm. long.

7. *Lonchocarpus mexicanus* Pittier, Contr. U. S. Nat. Herb. 20: 71. f. 20. 1917.

Known only from the type locality, San Andrés Tuxtla, Veracruz, altitude 500 meters.

Tree with purplish flowers.

8. *Lonchocarpus minimiflorus* Donn. Smith, Bot. Gaz. 44: 110. 1907.

Chiapas. Guatemala; type from Santa Bárbara.

Tree, 8 to 10 meters high, with purple flowers; leaflets 7 to 13.

9. *Lonchocarpus lanceolatus* Benth. Journ. Proc. Linn. Soc. Bot. 4: Suppl. 92. 1860.

Sinaloa to Oaxaca.

Shrub or small tree with purple flowers; leaflets 9 to 15, 2 to 4 cm. long; fruit usually 1-seeded. "Cabo de hacha" (Sinaloa).

10. *Lonchocarpus yucatanensis* Pittier, Contr. U. S. Nat. Herb. 20: 74. *f.* 24. 1917.
Known only from the type locality, Progreso, Yucatán.
Leaflets 3 to 6 cm. long; flowers pink or purplish.
11. *Lonchocarpus caudatus* Pittier, Contr. U. S. Nat. Herb. 20: 68. *pl.* 4, A. 1917.
Known only from the type locality, Acatlán. Puebla.
Tree; leaflets 6.5 to 12.5 cm. long; fruit glabrous, 1 or 2-seeded, 6 to 10 cm. long, 3 cm. wide, with thin margins.
12. *Lonchocarpus oaxacensis* Pittier, Contr. U. S. Nat. Herb. 20: 66. *f.* 14. 1917.
Known only from the type locality, Jayacatlán, Oaxaca, altitude 1,500 meters.
Tree; leaflets 4.5 to 8.5 cm. long; flowers purplish.
13. *Lonchocarpus guatemalensis* Benth. Journ. Proc. Linn. Soc. Bot. 4: Suppl. 87. 1860.
Veracruz and perhaps elsewhere in southern Mexico. Central America; type from Guatemala.
Deciduous tree with pinkish or purplish flowers.
14. *Lonchocarpus purpusii* T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 500. 1919.
Known only from the type locality, Zacuapan, Veracruz.
Tree, 5 to 6 meters high; leaflets 5 or 7, oval or elliptic. 5 to 6 cm. long, glabrous above, strigillose beneath; flowers dark purple; ovules 2 or 3.
15. *Lonchocarpus affinis* Pittier, Contr. U. S. Nat. Herb. 20: 56. *pl.* 1, C. *f.* 3. 1917.
Veracruz; type from Orizaba.
Leaflets 13 or 15, 3 to 12.5 cm. long; flowers purplish; fruit 1 or 2-seeded, 5.5 to 9 cm. long, 1.6 to 1.8 cm. wide, the upper margin slightly thickened.
16. *Lonchocarpus palmeri* Rose, Contr. U. S. Nat. Herb. 1: 322. 1895.
Known only from the type locality, Manzanillo, Colima.
Tree, 6 to 10 meters high, with spreading crown, the trunk 15 to 30 cm. in diameter; flowers purplish; fruit 1 to 5-seeded, 3 to 8 cm. long, 2.8 cm. wide, the upper margin thickened.
17. *Lonchocarpus robustus* Pittier, Contr. U. S. Nat. Herb. 20: 83. *f.* 34. 1917.
Known only from the type locality, Yajalón, Chiapas.
Leaflets 9 to 13, 4 to 8 cm. long; flowers pinkish or purplish.
18. *Lonchocarpus sericeus* (Poir.) H. B. K. Nov. Gen. & Sp. 6: 383. 1823.
Robinia sericea Poir. in Lam. Encycl. 6: 226. 1804.
Sinaloa to Guerrero. West Indies and northern South America; reported from western Africa.
Small tree with pinkish or purplish flowers; leaflets 7 to 13, 3.5 to 9 cm. long; fruit 1 to 5-seeded, 5 to 12 cm. long, 2.3 cm. wide, the upper margin much thickened. "Cocorocho" (Guatemala).
19. *Lonchocarpus comitensis* Pittier, Contr. U. S. Nat. Herb. 20: 76. 1917.
Known only from the vicinity of the type locality, Comitán, Chiapas.
Shrub or small tree; leaflets 7 to 11, obovate, ovate, or oblong; flowers 1.5 cm. long.
20. *Lonchocarpus constrictus* Pittier, Contr. U. S. Nat. Herb. 20: 79. *pl.* 6, A. *f.* 28. 1917.
Colima and Guerrero; type from Manzanillo, Colima.
Shrub or small tree, 2 to 5 meters high; leaflets 5 to 11; flowers reddish purple; fruit 1 to 3-seeded, 5.5 to 10.5 cm. long, 6 to 7 mm. wide.

21. *Lonchocarpus emarginatus* Pittier, Contr. U. S. Nat. Herb. 20: 80. f. 30. 1917.
Oaxaca; type collected near San Gerónimo.
Leaflets 5 to 11, emarginate; flowers pink or purplish.
22. *Lonchocarpus rugosus* Benth. Journ. Proc. Linn. Soc. Bot. 4: Suppl. 92. 1860.
Guerrero and Yucatán, type from Campeche. Central America.
Tree with deep pink flowers; leaflets 9 to 17, 2.5 to 6.5 cm. long; fruit 1 to 6-seeded, 4 to 14 cm. long, 1.7 to 2 cm. wide. "Masicarón" (Honduras).
23. *Lonchocarpus eriocarinalis* Micheli, Mém. Soc. Phys. Hist. Nat. Genève 34: 267. 1903.
Colima and Guerrero; type from El Valle Grande, Guerrero.
Tree, 6 to 8 meters high; leaflets 7 to 11, ovate, 3 to 6.5 cm. long; flowers deep red; fruit 1 to 3-seeded. "Palo de oro" (Guerrero).
24. *Lonchocarpus jaliscensis* Pittier, Contr. U. S. Nat. Herb. 20: 60. 1917.
Known only from the type locality, Bolaños, Jalisco.
Leaflets 7 to 13, 1.5 to 5 cm. long.
Doubtfully distinct from *L. eriocarinalis*.

DOUBTFUL SPECIES.

- Lonchocarpus obovatus* Benth. Journ. Proc. Linn. Soc. Bot. 4: Suppl. 93. 1860. Type from Chilá, Puebla.
- Lonchocarpus parviflorus* Benth. Journ. Proc. Linn. Soc. Bot. 4: Suppl. 89. 1860. Type from Mexico.
- Lonchocarpus phaseolifolius* Benth. Journ. Proc. Linn. Soc. Bot. 4: 93. 1860. Type from Tehuantepec.
- Robinia acuminata* Schlecht. Linnaea 12: 306. 1838. Type from Mapilque. According to Schlechtendal, this plant belongs to the genus, like the following species.
- Robinia latifolia* Mill. Gard. Dict. ed. 8. *Robinia* no. 9. 1768. Type from Campeche.
- Robinia rosea* Mill. Gard. Dict. ed. 8. *Robinia* no. 4. 1768. Type from Campeche.
- Robinia schiedeana* Schlecht. Linnaea 12: 306. 1838. Type collected between Veracruz and Santa Fé.

56. *MUELLERA* L. f. Suppl. Pl. 52. 1781.

1. *Muellera mexicana* (Zucc.) Benth. Journ. Linn. Soc. Bot. 4: Suppl. 117. 1860.
Cyanobotrys mexicana Zucc. Abh. Akad. Wiss. München 4: 28. 1845.
Described from cultivated plants of Mexican origin.
Leaflets 5 to 11, ovate or oblong, acuminate, densely pellucid-punctate; pedicels 2-flowered; fruit subcompressed, subtorulose, 2.5 to 5 cm. long, 1 to 3-seeded, smooth, glabrate.
The plant is wholly doubtful, and the name may have been based upon a mixture.

TREES AND SHRUBS OF MEXICO (OXALIDACEAE-TURNERACEAE)

By PAUL C. STANDLEY

WASHINGTON
GOVERNMENT PRINTING OFFICE

1923

BULLETIN OF THE UNITED STATES NATIONAL MUSEUM.

II

PREFACE.

The third installment of the Trees and Shrubs of Mexico, by Mr. Paul C. Standley, Assistant Curator of the United States National Herbarium, treats the families Oxalidaceae to Turneraceae, both inclusive. Several of the largest and most important groups of Mexican trees are included, such as the Meliaceae, which contains the true mahoganies of the genus *Swietenia*; the Euphorbiaceae, or spurge family; the Malvaceae, or mallow family; and the Sterculiaceae, among whose representatives is the cacao, *Theobroma cacao*, perhaps the most important economically of all the native Mexican trees.

The accounts of the families Meliaceae and Polygalaceae have been furnished by Dr. S. F. Blake of the United States Department of Agriculture.

FREDERICK V. COVILLE,
Curator of the United States National Herbarium.

TREES AND SHRUBS OF MEXICO.¹

By PAUL C. STANDLEY.

65. OXALIDACEAE. Wood-sorrel Family.

One other genus, *Biophytum*, occurs in Mexico.

1. OXALIS L. Sp. Pl. 433. 1753.

Low shrubs or sometimes herbs, pubescent; leaves alternate, pinnately 3-foliate; flowers small, perfect, usually cymose; sepals 5, inferior; petals 5 (yellow in the species here listed), deciduous; stamens 10, the filaments united into a tube below; styles filiform or subulate; fruit a small oblong or columnar capsule, 5-celled.

Numerous herbaceous species are found in Mexico. The name "socojol" (from the Nahuatl *xocoyolli*, "sorrel") is applied to some species.

Longer filaments not appendaged.....1. *O. camporum*.

Longer filaments appendaged on the back.

Leaflets acute or acuminate.

Leaflets linear or linear-oblong.....2. *O. angustifolia*.

Leaflets ovate or lance-ovate.....3. *O. sepium*.

Leaflets, at least most of them, emarginate at the apex.

Capsule glabrous.....4. *O. yucatanensis*.

Capsule pubescent on the angles.....5. *O. neaei*.

1. *Oxalis camporum* T. S. Brandeg. Univ. Calif. Publ. Bot. 4: 377. 1913.

Veracruz; type from Baños del Carrizal.

Leaflets 2.5 cm. long and 1 cm. wide or smaller, pubescent.

2. *Oxalis angustifolia* H. B. K. Nov. Gen. & Sp. 5: 249. 1822.

Lotoxalis angustifolia Rose, Contr. U. S. Nat. Herb. 10: 115. 1906.

Known only from the type locality, near La Venta del Peregrino.

Plants about 20 cm. high; leaflets 1.5 to 2.5 cm. long, glabrous; petals twice as long as the sepals.

3. *Oxalis sepium* St. Hil. Fl. Bras. Merid. 1: 111. 1825.

Oxalis acuminata Schlecht. Linnaea 5: 224. 1830.

Oxalis lindenii Turcz. Bull. Soc. Nat. Moscou 31¹: 429. 1858.

Lotoxalis sepium Small, N. Amer. Fl. 25: 48. 1907.

Guerrero and Oaxaca to Veracruz. Central America, West Indies, and South America; type from Brazil.

¹The first installment of the Trees and Shrubs of Mexico, comprising the families Gleicheniaceae to Betulaceae, was published as Part 1 of Volume 23, Contributions from the U. S. National Herbarium, pp. 1-170, October 11, 1920; the second installment, comprising the families Fagaceae to Fabaceae, as Part 2, pp. 171-515, July 14, 1922.

Slender shrub, sometimes 2 meters high, with reddish brown branches; leaflets mostly 2 to 4 cm. long, pubescent; sepals 3 to 4 mm. long, the petals twice as long; capsule 5 to 7 mm. long.

4. *Oxalis yucatanensis* (Rose) Standl.

Lotoxalis occidentalis Rose, Contr. U. S. Nat. Herb. 10: 115. 1906. Not
Oxalis occidentalis Knuth, 1915.

Lotoxalis yucatanensis Rose, Contr. U. S. Nat. Herb. 10: 116. 1906.

Sinaloa to Guerrero and Yucatán; type from Yucatán. Central America.

Slender shrub, rarely more than 30 cm. high; leaflets 1 to 2.5 cm. long, glabrous or sparsely pubescent beneath; sepals 4 to 5 mm. long; capsule 6 to 8 mm. long.

5. *Oxalis neaei* DC. Prodr. 1: 691. 1824.

Oxalis tephrodes Turcz. Bull. Soc. Nat. Moscou 31¹: 427. 1858.

Oxalis psilotrichia Turcz. Bull. Soc. Nat. Moscou 31¹: 427. 1858.

Oxalis fasciculata Turcz. Bull. Soc. Nat. Moscou 32¹: 272. 1859.

Lotoxalis neaei Rose, Contr. U. S. Nat. Herb. 10: 115. 1906.

Guerrero to Veracruz and Chiapas; type from Acapulco, Guerrero. Central America and South America.

Slender shrub, a meter high or less, or often herbaceous; leaflets 1 to 3 cm. long, pubescent on both sides; sepals 3 to 4 mm. long; capsule 4 to 6 mm. long.

66. ERYTHROXYLACEAE. Coca Family.

1. ERYTHROXYLON L. Syst. Nat. ed. 10. 1035. 1759.

REFERENCE: Britton, N. Amer. Fl. 25: 59-66. 1907.

Glabrous trees or shrubs; leaves alternate, entire, thin, stipulate, petiolate; flowers small, solitary, or fasciculate in the leaf axils; fruit a small drupe.

Erythroxylon coca Lam., of South America, is the well-known coca plant, from which cocaine is obtained. It is cultivated extensively in Peru and Bolivia.

Stipules large, conspicuously striate; leaves acute.

Calyx lobes ovate.....1. *E. tabascense*.

Calyx lobes orbicular-ovate.....2. *E. lucidum*.

Stipules small, not striate; leaves rounded or very obtuse at apex.

Leaves large, usually 3.5 to 7 cm. long.

Pedicels filiform, 5 to 12 mm. long.....3. *E. havanense*.

Pedicels stout, 4 to 6 mm. long.....4. *E. mexicanum*.

Leaves small, all or most of them less than 3 cm. long.

Leaves broadly ovate.....5. *E. compactum*.

Leaves ovate to broadly oval, broadest at or below the middle.

Branchlets glaucescent; pedicels 5 to 7 mm. long.....6. *E. pringlei*.

Branchlets not glaucescent; pedicels 2 to 4 mm. long.....7. *E. pallidum*.

1. *Erythroxylon tabascense* Britton, N. Amer. Fl. 25: 66. 1907.

?*Erythroxylon ellipticum* Ramírez; Villada, Naturaleza 3: 53. pl. 4. 1898.

Not *E. ellipticum* R. Br. 1863.

Tabasco, and probably in Veracruz; type from San Sebastián, Tabasco.

Shrub with brown branches; leaves 8 to 14 cm. long; petals 1 to 3.5 mm. long. "Zapotillo" (Veracruz, Ramírez).

The infusion of the leaves is said to be used as a beverage.

2. *Erythroxylon lucidum* H. B. K. Nov. Gen. & Sp. 5: 179. 1822.

Reported from Mexico, but no specimens seen by the writer. Costa Rica to Colombia; type from Colombia.

Small tree; leaves 8 to 15 cm. long.

3. *Erythroxylon havanense* Jacq. Enum. Pl. Carib. 21. 1760.

Oaxaca and Veracruz. Cuba; type from Havana.

Shrub or small tree, 6 meters high or less; leaves 3 to 8 cm. long, pale beneath; flowers white; fruit 4 to 7 mm. long, orange or yellow.

4. *Erythroxylon mexicanum* H. B. K. Nov. Gen. & Sp. 5: 178. 1822.

Sonora to Tamaulipas, Veracruz, and Guerrero; perhaps also in Yucatán; type from Chilpancingo, Guerrero.

Shrub, 1.5 to 3 meters high; leaves 3 to 7 cm. long, pale beneath; fruit 6 to 10 mm. long. "Pata de pájaro" (Sinaloa).

5. *Erythroxylon compactum* Rose, Contr. U. S. Nat. Herb. 8: 313. 1905.

Puebla and Oaxaca; type from Tehuacán, Puebla.

Shrub, 3 meters high or less; leaves mostly 1 to 1.5 cm. long; flowers mostly solitary.

This and the next species are very closely related.

6. *Erythroxylon pringlei* Rose, Contr. U. S. Nat. Herb. 8: 314. 1905.

Known only from the type locality, near Iguala, Guerrero.

Shrub or small tree, 3.5 to 4.5 meters high; leaves 1.5 to 3 cm. long; fruit red, 7 to 8 mm. long.

7. *Erythroxylon pallidum* Rose, Contr. U. S. Nat. Herb. 8: 314. 1905.

Vicinity of the type locality, San Juan Capistrano, Zacatecas.

Shrub; leaves 2 to 3 cm. long.

67. ZYGOPHYLLACEAE. *Lignum-vitae* Family.

Shrubs or trees, unarmed, often strong-scented and resinous; leaves opposite or alternate, simple, digitate, or pinnate, the leaves or leaflets entire; flowers perfect, regular or nearly so; sepals 5, free, usually imbricate; petals 5; stamens twice as many as the petals; fruit a capsule, often splitting into several carpels.

Leaves mostly opposite, digitate or even-pinnate.

Leaves digitate, usually 3 or 5-foliolate; flowers pink or purplish.

1. FAGONIA.

Leaves even-pinnate; flowers yellow, blue, or violet.

Leaflets 2; petals yellow-----**2. COVILLEA.**

Leaflets more than 2; petals blue or violet.

Stamens with scalelike appendages at base; stipules persistent.

3. PORLIERIA.

Stamens not appendaged; stipules deciduous-----**4. GUAIIACUM.**

Leaves mostly alternate, odd-pinnate or simple.

Fruit covered with long straight hairs; leaves simple, linear or oblanceolate.

Flowers yellow-----**5. SERICODES.**

Fruit tomentose or puberulent; leaves pinnate or, if simple, oval.

Flowers purplish; petals 4; leaves pinnate-----**6. MORKILLIA.**

Flowers yellowish; petals 5; leaves usually simple-----**7. VISCAINOIA.**

1. **FAGONIA** L. Sp. Pl. 386. 1753.

REFERENCE: Standley, Proc. Biol. Soc. Washington 24: 243-250. 1911.

Small shrubs or herbs; leaves opposite, digitately 1 to 7-foliolate, the leaflets small, entire; flowers small, solitary, pink or purplish; fruit small, composed of 5 carpels.

Most of the species scarcely deserve to be classed as shrubs.

Leaves wanting; stipules triangular-subulate, 1 mm. long or shorter; sepals persistent.....1. **F. scoparia**.

Leaves present; stipules subulate, usually much more than 1 mm. long; sepals caducous.

Leaflets 5 or 7.....2. **F. palmeri**.

Leaflets 3.

Ovary glabrous.....3. **F. laevis**.

Ovary and mature fruit pubescent.

Leaflets glabrous.

Stems densely glandular.....4. **F. viscosa**.

Stems scaberulous, not at all glandular.....5. **F. californica**.

Leaflets pubescent, often glandular.

Pedicels shorter than the fruit.

Leaflets 8 to 13 mm. long; stems densely glandular.

6. **F. pachyacantha**.

Leaflets 3 to 10 mm. long; stems sparsely or often scarcely at all glandular.....7. **F. barclayana**.

Pedicels longer than fruit.

Leaflets linear; stipules 4 to 5 mm. long; stems sparsely pilose.

8. **F. insularis**.

Leaflets lanceolate or linear-oblong; stipules 2 mm. long; stems sparsely scaberulous.....9. **F. rosei**.

1. **Fagonia scoparia** T. S. Brandeg. Univ. Calif. Publ. Bot. 4: 181. 1911.

Known only from the type locality, Cerro del Macho, Coahuila.

Slender erect shrub, about 30 cm. high, leafless; petals purplish pink, 5 mm. long.

2. **Fagonia palmeri** Vasey & Rose, Contr. U. S. Nat. Herb. 1: 82. 1890.

Baja California; type from Santa Rosalia.

Densely branched undershrub, forming clumps about 45 cm. high; leaflets linear, 3 to 10 mm. long; petals pinkish.

3. **Fagonia laevis** Standl. Proc. Biol. Soc. Washington 24: 249. 1911.

Northern Baja California. Southern California and Arizona; type from Yuma, Arizona.

Plants suffrutescent, decumbent, densely branched, glabrous; leaflets 2 to 8 mm. long.

4. **Fagonia viscosa** Rydb. N. Amer. Fl. 25: 104. 1910.

Sonora (type locality) and Baja California. Southern California.

Leaflets 8 to 15 mm. long, 3 to 8 mm. wide; petals purple, 6 to 8 mm. long.

5. **Fagonia californica** Benth. Bot. Voy. Sulph. 10. 1844.

Baja California; type from Magdalena Bay. Southern California to Utah.

Densely branched, suffrutescent, about 30 cm. high; petals 5 to 8 mm. long.

6. **Fagonia pachyacantha** Rydb. N. Amer. Fl. 25: 105. 1910.

Known only from the type collection, from somewhere in Baja California.

Suffrutescent, 30 to 60 cm. high; leaflets linear, 8 to 15 mm. long; petals 6 to 8 mm. long.

7. *Fagonia barclayana*¹ (Benth.) Rydb. N. Amer. Fl. 25: 104. 1910.
Fagonia californica barclayana Benth. Bot. Voy. Sulph. 10. 1844.
 Baja California; type from Magdalena Bay.
 Leaflets 8 to 20 mm. long; petals 5 mm. long; fruit 4 to 5 mm. long.
8. *Fagonia insularis* Standl. Proc. Biol. Soc. Washington 24: 247. 1911.
 Known only from Carmen Island, Baja California.
 Leaflets 1 to 9 mm. long; petals 5 mm. long; fruit 3 to 4 mm. long.
9. *Fagonia rosei* Standl. Proc. Biol. Soc. Washington 24: 247. 1911.
 Known only from the type locality, Tiburón Island, Baja California.
 Leaflets 2 to 3 mm. long; petals purplish, 7 mm. long.

2. **COVILLEA**² Vail, Bull. Torrey Club 22: 229. 1895.

1. *Covillea tridentata* (DC.) Vail, Bull. Torrey Club 26: 302. 1899.
Zygophyllum tridentatum DC. Prodr. 1: 706. 1824.
Larrea mexicana Moric. Pl. Nouv. Amer. 71. 1839.
Larrea glutinosa Engelm. in Wisliz. Mem. North. Mex. 93. 1848.
Larrea tridentata Coville, Contr. U. S. Nat. Herb. 4: 75. 1893.
 Baja California and Sonora to Tamaulipas, Querétaro, and Durango. Western Texas to Utah and southern California.

Strong-scented shrub, 1 to 3.5 meters high; leaves opposite, persistent, composed of 2 oblong to obovate leaflets, these oblique, united at base, 5 to 10 mm. long; flowers solitary, the petals yellow, 8 to 10 mm. long; fruit of 5 carpels, densely pilose with long hairs. Mostly generally known as "gobernadora;" "hediondilla" (Sonora, New Mexico); "falsa alcaparra" (Sonora, San Luis Potosí, Ramírez); "guamis" or "huamis" (San Luis Potosí, Chihuahua); "hediondo" (California).

The creosote bush is one of the most characteristic shrubs of the dry plains of northern Mexico, often covering wide areas to the exclusion of most other woody plants. The flower buds, pickled in vinegar, are said to be eaten like capers. The plant is much used in domestic medicine, especially for rheumatism, a decoction of the leaves being employed for baths or fomentations. The decoction is said, also, to have remarkable antiseptic properties, and is applied to bruises and sores. It is taken internally for gastric disturbances and for venereal diseases. A reddish brown lac is often deposited upon the branches by a small scale insect. This lac is used in some parts of Mexico for dyeing leather red, and the Coahuilla Indians of California employ it as cement. The same Indians use a decoction of the plant for intestinal complaints and for tuberculosis. The Pima Indians of Arizona drink a decoction of the leaves as an emetic, and apply the boiled leaves as poultices to wounds and sores.

¹ George Barclay was a gardener at Kew, who accompanied H. M. S. *Sulphur* for the purpose of making botanical collections.

² Named for Frederick Vernon Coville (1867-), Curator of the U. S. National Herbarium. Mr. Coville was botanist of the U. S. Death Valley Expedition of 1891, and published a volume dealing with the botanical features of that region (Contr. U. S. Nat. Herb. 4), and he has published many other papers upon a wide range of botanical subjects. He made a collection of plants in Sonora in 1903.

3. **PORLIERIA** Ruiz & Pav. Fl. Peruv. Chil. Prodr. 55. 1794.1. *Porlieria angustifolia* (Engelm.) A. Gray, Pl. Wright. 1: 28. 1852.

Guaiacum angustifolium Engelm. in Wislitz. Mem. North Mex. 113. 1848.

Coahuila to Tamaulipas; type from Parras, Coahuila. Southwestern Texas.

Shrub or small tree, sometimes 7 meters high, with a trunk 25 cm. in diameter, the branches stout, crooked; leaves pinnate, persistent, the leaflets 8 to 12, linear, 1.5 cm. long or shorter; flowers 1 to 2 cm. broad, sweet-scented, purple; wood hard, compact, taking a fine polish, the heartwood dark brown, the sapwood yellow, the specific gravity about 1.10. "Guayacán" (Coahuila, Tamaulipas, Texas).

The bark of the roots is sometimes made into balls and sold in the markets as a kind of "amole"; it is valued for washing woolen goods, since it does not fade the colors, and is esteemed also as a disinfectant. A decoction of the wood or bark is employed in domestic medicine as a sudorific and vascular stimulant, especially in rheumatism and venereal diseases; it is reputed to be used as an emmenagogue. The durable wood is used for fence posts and other purposes. Known in Texas as "soap-bush."

4. **GUAIAECUM** L. Sp. Pl. 381. 1753.

Trees or shrubs; leaves opposite, abruptly pinnate, the leaflets few, thick, entire, unequal; flowers large and showy, blue or purple; fruit an angled capsule.

Guaiacum officinale L., the lignum-vitae, has been reported from Mexico, but probably incorrectly.

Leaflets broadly oblong or obovate, usually 8 to 15 mm. wide. 1. *G. sanctum*.
Leaflets linear or linear-oblong, usually 3 to 7 mm. wide.

Ovary pubescent.....2. *G. palmeri*.
Ovary glabrous.....3. *G. coulteri*.

1. *Guaiacum sanctum* L. Sp. Pl. 382. 1753.

Guaiacum verticale Orteg. Hort. Matr. Dec. 93. 1798.

Yucatán and probably in Tabasco; perhaps also in Veracruz. West Indies and southern Florida; type from Porto Rico.

Tree, sometimes 10 meters high, the trunk short, the bark thin, pale or white; leaflets 4 to 10, 2 to 3.5 cm. long, glabrous; petals 7 to 11 mm. long; fruit 1.4 to 1.7 cm. long; wood resinous, light yellow, becoming green on exposure, very hard, with a characteristic odor, the specific gravity about 1.15. "Guayacán."

This species has been reported from many other parts of Mexico, apparently because it has been confused with *G. coulteri*. The wood is used for railroad ties and other purposes.

Both *G. sanctum* and *G. officinale* L., the latter a West Indian species, are official in the U. S. Pharmacopoeia. The extract of the wood, which is known as "lignum-vitae," has stimulant and diaphoretic properties. It was introduced into Europe as early as 1508 by the Spaniards, who had learned that it was used by the Indians as a remedy for syphilis. It was long highly esteemed as a remedy for syphilitic affections, and for gout, rheumatism, scrofula, and cutaneous diseases, but it is now believed to have no distinct influence upon such diseases. The resin also is employed, being stimulant, alterative, diaphoretic, and in large doses purgative. The bark and wood contain saponin.

One of the species of *Guaiacum* is illustrated by Hernández and treated¹ at length in a chapter entitled "De Hoaxacan, seu Ligno Sancto."

¹ Thesaurus 62-65. 1651.

2. *Guaiacum palmeri* Vail, N. Amer. Fl. 25: 107. 1910.

Dry plains and hills, Sonora and Sinaloa; type from Guaymas, Sonora.

Shrub or small tree; leaflets 4 to 10, 0.8 to 2.2 cm. long; petals blue, about 1.5 cm. long; fruit 1 to 1.5 cm. long.

It is probable that this plant is only a form of *G. coulteri*.

3. *Guaiacum coulteri* A. Gray, Mem. Amer. Acad. II. 5: 312. 1855.

Guaiacum planchoni A. Gray; Vail & Rydb. N. Amer. Fl. 25: 107. 1910.

Sonora to Oaxaca; type collected between Rayón and Ures, Sonora.

Shrub or small tree, 1 to 12 meters high, with crooked branches; leaflets 6 to 10, 1 to 2.5 cm. long, glabrous or nearly so; flowers fragrant, the petals blue or violet, 1 to 1.5 cm. long; fruit about 1.5 cm. long. Known throughout its range as "guayacán;" "árbol santo" (Puebla, *Ramírez*); "palo santo" (Oaxaca, Jalisco); "matlaquahuitl" (Nahuatl, *Ramírez*); "yaga-na" (Oaxaca, Zapotec, *Reko*); "yutnu-tandaa" (Oaxaca, Mixtec, *Reko*).

The plant was reported from Mexico by Mocifio and Sessé as *G. afrum* L. The wood is hard and resinous, strong and durable, and is good for firewood, being used sometimes for fuel in railroad engines. It is employed also for making articles in which great strength is required. The tree is believed to have essentially the same properties as *G. sanctum*.

The writer has not seen type material of *G. planchoni*, which was described from Oaxaca, but other material from that state differs in no way from *G. coulteri*, and the characters supposed to separate the two species seem not to hold in the material examined.

5. SERICODES A. Gray, Pl. Wright. 1: 28. 1852.**1. *Sericodes greggii* A. Gray, Pl. Wright. 1: 28. 1852.**

Durango, Zacatecas, Coahuila, and Nuevo León; type from San Lorenzo (Coahuila?).

Low, densely branched shrub; leaves fascicled, linear or oblanceolate, 8 to 12 mm. long, strigose; flowers small, yellowish; fruit a small capsule, separating into 5 carpels, densely covered with long white hairs.

6. MORKILLIA Rose & Painter, Smiths. Misc. Coll. 50¹: 33. 1907.

Erect shrubs; leaves alternate, odd-pinnate, with large entire leaflets; flowers very large, deep rose-purple, solitary or geminate; fruit a large 4-winged capsule. Leaflets acute or obtuse; wings of the fruit produced at the apex, the sinus narrow-----1. *M. mexicana*.

Leaflets acuminate; wings of the fruit scarcely produced, the sinus broad and open-----2. *M. acuminata*.

1. *Morkillia mexicana* (Moc. & Sessé) Rose & Painter, Smiths. Misc. Coll. 50¹: 33. 1907.

Chitonia mexicana Moc. & Sessé; DC. Prodr. 1: 707. 1824.

Hidalgo, Puebla, and Oaxaca.

Shrub, 3 to 5 meters high, with grayish white bark; leaflets 7 to 15, 3 to 5 cm. long, densely pubescent; petals 3 to 4 cm. long; fruit 4 to 6 cm. long. "Guayacán" (Oaxaca).

2. *Morkillia acuminata* Rose & Painter, Smiths. Misc. Coll. 50¹: 34. 1907.

Known only from the type locality, mountains between Victoria and Jaumave Valley, Tamaulipas.

Shrub, 3 to 5 meters high, densely pubescent; leaflets 3 to 9, 1 to 3 cm. long; petals 2.5 to 3 cm. long; fruit 5 cm. long.

7. **VISCAINOA** Greene, *Pittonia* 1: 163. 1888.1. *Viscainoa geniculata* (Kellogg) Greene, *Pittonia* 1: 163. 1888.*Staphylea geniculata* Kellogg, *Proc. Calif. Acad.* 2: 22. 1859.

Baja California and western Sonora; type from San Sebastián Bay, Baja California.

Shrub, 1.5 to 3.5 meters high, cinereous-pubescent, with crooked branches; leaves alternate, simple or pinnate, with 3 or 5 leaflets, these mostly oval, 2 to 5 cm. long; flowers large, yellowish white; fruit a capsule, 2 to 3 cm. long, usually 4-lobed. "Guayacán" (Baja California).

68. **RUTACEAE.** Rue Family.REFERENCE: P. Wilson, *N. Amer. Fl.* 25: 173-224. 1911.

Aromatic trees or shrubs, often armed with spines, usually furnished with glands in bark, leaves, and fruit; leaves opposite or alternate, estipulate, simple or compound; flowers perfect or unisexual, large or small; calyx inferior, with 3 to 5 lobes or sepals; petals 3 to 5, usually imbricate, sometimes united; stamens as many or twice as many as the petals; ovary of 1 to 5 or more free or united carpels; styles free or connate; fruit a follicle, capsule, samara, drupe, or berry.

No herbaceous plants of the family are natives of Mexico. The rue family includes the important tropical citrus fruits, of which the following, and perhaps some others, are cultivated in Mexico. *Citrus medica* L., the citron ("cidra," "cedro limón," "cidrero"), with large fruits containing scant pulp, the rind of which is candied and used in confectionery; *C. limonia* Osbeck, the lemon ("limón," limón agrio," "limonero"; "nimû," Otomí; "tzapposh," Mixe); *C. aurantifolia* (Christm.) Swingle,¹ the lime ("lima," "lima chica," "limón dulce," "lima chicona"); *C. aurantium* L., the sour orange ("naranja agria"); *C. sinensis* Osbeck, the common or sweet orange ("naranja," "naranja dulce"; "yaga-naraxo," Zapotec; "tzaptzouk," "tzapkiuk," "tzaptzuik," Mixe; "nanxa," "xidni," Otomí); *C. grandis* Osbeck, the grapefruit, pomelo, or shaddock ("toronja"); *Triphasia trifolia* (Burm.) P. Wilson, the lime-berry ("limoncito"), a small tree, grown for ornament. Some of these trees have escaped from cultivation in the warmer parts of Mexico.The citrus fruits were introduced into Mexico by the Spaniards immediately after the Conquest. Bernal Díaz del Castillo² claims for himself the honor of introducing the orange into Mexico, in 1518, while he was with Grijalva's expedition. His account is as follows: "As this country [in Tabasco, at the mouth of the Tonalá River] is infested by mosquitos, in order to avoid them I went to sleep in a large temple, near which I at this time sowed seven or eight seeds of oranges, which I had brought from Cuba. They grew very well, for the priests of the temple took care of them when they saw that they were uncommon plants. This I mention, because they were the first trees of the kind that ever grew in New Spain. After the conquest of Mexico, this province being considered as offering the greatest advantages, was chosen by most of the principal persons amongst the conquerors, of which number I was one; and on my arrival there I went in search of, and found my young trees flourishing, and having transplanted them, they all did very well."¹ Often known incorrectly as *Citrus limetta*.² True history of the Conquest of Mexico, translation by Keating, p. 23. 1800.

Fruit a drupe.

Leaves digitately 3 to 7-foliolate.

Style lateral.....1. **SARGENTIA**.

Style terminal.....2. **CASIMIROA**.

Leaves simple, 1-foliolate, or pinnate.

Style lateral; leaves linear or nearly so, simple.....3. **CNEORIDIUM**.

Style terminal; leaves compound, or, if simple, much broader than linear.

Stamens as many as the petals.....4. **STAURANTHUS**.

Stamens twice as many as the petals.....5. **AMYRIS**.

Fruit a capsule or samara, or of follicles.

Corolla gamopetalous; filaments more or less united with the corolla tube.

Leaves 1-foliolate.....6. **ERYTHROCHITON**.

Corolla polypetalous; filaments free from the petals.

Ovules 5 or more in each carpel. Leaves simple.....7. **THAMNOSMA**.

Ovules 2 or 1 in each carpel.

Fruit a samara or samara-like. Leaves digitate, the leaflets 3.

Carpels of the fruit separating at maturity; flowers usually perfect.

8. **HELIETTA**.

Carpels not separating; flowers polygamous.

Samara woody, wingless or nearly so.....9. **TARAVALIA**.

Samara not woody, surrounded by a broad wing.....10. **PTELEA**.

Fruit a capsule or of 1 or more follicles.

Stamens as many as the petals.

Flowers unisexual; plants usually armed with spines. Leaves pinnate.....11. **ZANTHOXYLUM**.

Flowers perfect; plants unarmed.

Leaves pinnate; fruit of 1 or 3 follicles.....12. **PILOCARPUS**.

Leaves simple, 1-foliolate, or digitate; fruit a woody capsule.

13. **ESENBECKIA**.

Stamens twice as many as the petals or more.

Calyx deciduous; leaves digitate.

Leaves alternate; sepals very unequal.....14. **PELTOSIGMA**.

Leaves opposite; sepals subequal.....15. **CHOISYA**.

Calyx persistent; leaves pinnate.

Ovary 2-celled. Leaflets 5 or 7, 3 to 7 mm. long.

16. **MEGASTIGMA**.

Ovary 5-celled.

Calyx of 5 distinct or nearly distinct sepals; leaflets 11 to 25, 6 to 12 mm. long.....17. **POLYASTER**.

Calyx 5-dentate; leaflets 5 to 11, 2.5 to 10 cm. long.

18. **DECATROPIS**.

1. **SARGENTIA** S. Wats. Proc. Amer. Acad. 25:144. 1890.

1. *Sargentia greggii* S. Wats. Proc. Amer. Acad. 25: 144. 1890.

Nuevo León, Tamaulipas, and San Luis Potosí; type from Monterrey, Nuevo León.

Tree, sometimes 13 meters high; bark smooth, gray, peeling off in thin plates; leaves alternate, persistent, digitately 2 or 3-foliolate, 3 to 10 cm. long, obtuse or acutish, nearly glabrous, entire; flowers small, white; fruit fleshy, edible, 1.5 to 2 cm. long, yellow; seeds brown, 1.2 to 1.4 cm. long. "Limoncillo" (Tamaulipas, San Luis Potosí); "chapote amarillo" (Nuevo León); "naranjillo" (Tamaulipas).

The wood is said to be used for fuel, carts, and other purposes.

2. **CASIMIROA**¹ Llave & Lex. Nov. Veg. Descr. 2: 2. 1825.

Unarmed trees or shrubs; leaves persistent, alternate, digitate, the leaflets coriaceous, usually entire; flowers small, perfect; fruit a drupe, 2 to 5-celled, with a single seed in each cell.

Leaflets densely velvety-pubescent beneath.

Leaflets 3, obtuse; petioles 1.5 to 3 cm. long-----1. *C. pubescens*.

Leaflets usually 5, acuminate; petioles 3 to 12 cm. long-----2. *C. tetrameria*.
Leaflets glabrous beneath or nearly so, sometimes pilose along the costa.

Fruit 1.2 to 1.8 cm. in diameter-----3. *C. pringlei*.

Fruit 5 to 10 cm. in diameter.

Leaflets obtuse-----4. *C. watsonii*.

Leaflets acuminate.

Leaflets 5 or rarely 7, the lateral ones sessile or on short stout petiolules.

5. *C. edulis*.

Leaflets usually 3, the lateral ones on slender petiolules 1 to 3 cm. long.

6. *C. sapota*.

1. *Casimiroa pubescens* Ramírez, Anal. Inst. Med. Nac. Mex. 2: 19. pl. 5. 1896.

Querétaro and San Luis Potosí; type from El Madroño, Sierra Gorda, Querétaro, altitude 2,400 meters.

Shrub, about 2 meters high, much branched, densely pubescent; leaflets 3 or sometimes 1, oblong-obovate to elliptic, 4 to 6.5 cm. long; fruit depressed-globose, about 4 cm. broad, pubescent, the pulp white and scanty; seeds 5 or 6. "Zapote de rata" (Querétaro).

2. *Casimiroa tetrameria* Millsp. Field Mus. Bot. 1: 401. 1898.

Yucatán and Michoacán; type from Xcholac, Yucatán. Guatemala to Costa Rica.

Tree, 6 to 15 meters high, with rounded crown; leaflets oblong-ovate to elliptic, usually 7 to 16 cm. long, entire or obscurely crenate. "Matasano" (Costa Rica, Honduras).

The fruit of this species is not known to the writer, but it is probably similar to that of *C. edulis*. This species has been confused with *C. sapota*, but it is more closely related to *C. edulis*, of which it may be only a pubescent form.

3. *Casimiroa pringlei* (S. Wats.) Engl. in Engl. & Prantl, Pflanzenfam. 3⁴: 178, 1896.

Sargentia pringlei S. Wats. Proc. Amer. Acad. 26: 134. 1891.

Nuevo León, San Luis Potosí, and Durango; type from San José Pass. San Luis Potosí.

Shrub or small tree, 3 to 5 meters high, with grayish bark; leaflets 2 or 3, obovate or elliptic, 3 to 9 cm. long, obtuse or acutish, glabrous or nearly so, entire; flowers greenish yellow; fruit subglobose or oval, 1.2 to 1.8 cm. broad; seeds 10 to 12 mm. long.

¹The genus was dedicated to Casimiro Gómez, of whom the authors write as follows: "Casimiro Gómez, ad Cardonal ex tribu Ottemitarum edito, viro sobrio ac temperanti, in gerendo bello, prompto, sagaci animosissimo, ipsi, quod a luxu abhorrens, et se milites suos humili victu ac vestitu conservans ac ducens, exigua Ottemitarum manu, innumerabilia ac gloriosissima pro patriae bono gesserit."

4. *Casimiroa watsonii* Engler; P. Wilson, N. Amer. Fl. 25: 214. 1911.

Known only from the type locality, near Guadalajara, Jalisco.

Leaflets 3 or 4, elliptic to oblanceolate, 3 to 7.5 cm. long, entire or nearly so, glabrate; fruit sweet and edible, containing 1 or 2 seeds.

It seems rather doubtful whether this is distinct from *C. pringlei*.

5. *Casimiroa edulis* Llave & Lex. Nov. Veg. Descr. 2: 2. 1825.

Sonora to Jalisco; often cultivated; reported from many other parts of Mexico, but probably because of confusion with *C. sapota*. Guatemala.

Large or medium-sized tree, with broad dense crown; leaflets almost always 5, elliptic, oval, or broadly ovate, bright green, nearly or quite glabrous, often lustrous; flowers white; fruit 8 to 10 cm. broad, yellowish, with sweet pulp; seeds usually 5, 1.8 to 2.3 cm. long. The following names are reported, but most of them probably belong equally or exclusively to *C. sapota*: "Zapote blanco" (the most common name); "zapote;" "chapote;" "matasano (Oaxaca); "cochiztzapotl" (Nahuatl, "sleepy-zapote"); "iztactzapotl" (Nahuatl; "white-zapote"); "ceaxmutza" (Otomí, *Buelna*).

This species may have a wider range than is indicated, but all the Mexican specimens seen by the writer come from the Pacific coast. It is not absolutely certain that this species, rather than *C. sapota*, is the one described by Llave and Lexarza, but their description seems to agree better with it.

The white sapote (including also *Casimiroa sapota*) is a well-known tree in Mexico, but is little grown outside that country. It is cultivated in the West Indies and has been introduced into southern California. The fruit varies in size and quality. It somewhat resembles an apple, and the best varieties are as large as a good-sized orange. The tender yellowish skin is thin, like that of an apple; the pulp is soft and cream-colored, of delicate texture, with a pleasant sweet flavor. The fruit ripens in July and August. It is much eaten in Mexico and is commonly sold in the markets.

The fruits are popularly believed to induce sleep if eaten in quantity, and to calm rheumatic pains. The bark, leaves, and especially the seeds are said to contain a glucoside, casimiro sine, which has a hypnotic and sedative effect upon cerebral centers. A small dose, it is stated, produces, at the end of an hour, deep sleep which lasts four to six hours. This principle, obtained chiefly from the seeds, has been used by Mexican physicians.

The white sapote is described by Hernández,¹ who says:

"The *Cochitzapotl* is a large irregular tree, with thin foliage of ternate leaves like those of the orange; the trunk is spattered with white spots; the flowers are yellow and medium-sized; the fruit, of the shape and size of a quince, is called by the Spaniards *Zapote blanco*; it is edible and of agreeable flavor, but it is not to be counted a wholesome food; the stone which it contains is a deadly poison. The bark of the tree is dry and somewhat sweet, with a certain bitterness; the leaves, crushed and applied to the nipples of the nurse, cure diarrhea in infants; the seeds, crushed and roasted, cure putrid ulcers and proud flesh, and by exciting suppuration produce new flesh and hasten healing; if eaten, the fruits induce drowsiness, whence the name. The tree grows in hot and cold regions."

6. *Casimiroa sapota* Oerst. Nat. For. Kjöbenhavn Vid. Medd. 1857: 157. 1858.

San Luis Potosí and Querétaro to Jalisco and Oaxaca. Type from Nicaragua.

Tree, similar to the preceding species; leaflets nearly always 3, smaller and narrower, on very long petiolules. "Zapote" (Querétaro); "zapote blanco" (Jalisco); "matasano" (Nicaragua).

¹Thesaurus 89. 1651.

This species has been considered the same as *C. edulis*, but to the writer it seems amply distinct, the leaves of the two being very different. All the species of the genus are represented by inadequate herbarium material.

3. **CNEORIDIUM** Hook. f.; Benth. & Hook. Gen. Pl. 1: 312. 1862.

1. **Cneoridium dumosum** (Nutt.) Hook. f.; Baill. Hist. Pl. 4: 498. 1873.

Pitavia dumosa Nutt.; Torr. & Gray, Fl. N. Amer. 1: 215. 1838.

Baja California. Southern California; type from San Diego.

Densely branched shrub. 0.5 to 1.5 meters high; leaves opposite or fasciculate, linear or oblong-linear, 1.5 to 2.5 cm. long, green, entire or nearly so; flowers very small; fruit a capsule, 5 to 6 mm. broad.

4. **STAURANTHUS** Liebm. Nat. For. Kjöbenhavn Vid. Medd. 1853: 91. 1853.

Unarmed trees; leaves alternate, simple or unifoliolate, gland-dotted; flowers small, in terminal or axillary racemes or panicles; fruit a 1-seeded drupe.

Leaves 3.5 to 7 cm. wide, abruptly short-acuminate at apex; flowers racemose.

1. **S. perforatus**.

Leaves 1.5 to 2.5 cm. wide, gradually attenuate to apex; flowers mostly paniculate ----- 2. **S. konzattii**.

1. **Stauranthus perforatus** Liebm. Nat. For. Kjöbenhavn Vid. Medd. 1853: 92. 1854.

Zanthoxylum ghiesbreghtii Turcz. Bull. Soc. Nat. Moscou 32¹: 274. 1859.

Veracruz; type collected between Totutla and Huatusco.

Glabrous tree; leaves unifoliolate, the petioles 0.8 to 2.2 cm. long, the leaflets oblong-elliptic, 10 to 18 cm. long.

2. **Stauranthus konzattii** Rose & Standl., sp. nov.

Type from Cerro San Antonio, Oaxaca, altitude 1,700 meters (*Konzatti* 2445; U. S. Nat. Herb. no. 841056).

Glabrous tree or shrub, with reddish brown branches; leaves simple, the petioles stout, 5 to 8 mm. long, subterete, the blades lanceolate or oblong-lanceolate, 6 to 9.5 cm. long, 1.3 to 2.5 cm. wide, rounded or obtuse at the base, gradually attenuate from the middle or lower to the acute or subobtuse apex, coriaceous, bright green, sublustrous above, the venation plane or prominulous, scarcely paler beneath, the costa slender but prominent, the other venation prominulous, conspicuously gland-dotted; flowers few, in small terminal or axillary racemes or panicles, the pedicels stout, 2 mm. long or shorter; calyx 1.8 mm. broad, the lobes very obtuse; ovary smooth; fruit globose, about 8 mm. in diameter; seed globose, 7 mm. in diameter.

Only one other species of the genus is known, *S. perforatus* Liebm. It differs from the present plant in having unifoliolate leaves, the leaflet being much larger and broader than the leaf of *S. konzattii*, and abruptly short-acuminate at the apex. The Veracruz plant, moreover, has longer petioles and axillary racemes. The flowers of *S. konzattii* are not known, and until they have been studied, the generic position of the plant must remain in doubt. It may be that it should be referred rather to *Amyris*.

5. **AMYRIS** L. Syst. Nat. ed. 10. 996. 1759.

Unarmed trees or shrubs; leaves opposite or alternate, pinnate, sometimes unifoliolate, the leaflets entire or crenulate; flowers small, perfect, paniculate, white or yellowish white; fruit a drupe.

Leaflet 1.

Petioles 2 to 5 mm. long----- 1. **A. monophylla**.

Petioles 15 to 24 mm. long----- 2. **A. rekoii**.

Leaflets 3 or more.

Leaves opposite.

Leaflets usually 7 to 11, sometimes 5, densely puberulent beneath.

3. *A. madrensis*.

Leaflets 3 or 5, glabrous beneath or nearly so.

Lateral leaflets subcordate at base, rounded at apex, pale beneath.

4. *A. purpusi*.

Lateral leaflets obtuse at base, acuminate at apex, green beneath.

5. *A. balsamifera*.

Leaves alternate.

Leaflets 1 to 3 cm. long, 0.5 to 1.5 cm. wide, the terminal one short-stalked.

6. *A. texana*.

Leaflets 3 to 10 cm. long, 2 to 9 cm. wide, the terminal one long-stalked.

Petioles not winged; leaflets acute, ovate or rhombic-ovate.

7. *A. sylvatica*.

Petioles usually winged; leaflets acuminate, elliptic to rhombic-lanceolate.

8. *A. thyrsoiflora*.

1. *Amyris monophylla* T. S. Brandeg. Univ. Calif. Publ. Bot. 3: 381. 1909.

Oaxaca and Puebla; type from San Luis Tultitlanapa, Puebla.

Glabrous shrub; leaflet ovate to oval, 2.5 to 5 cm. long, rounded or obtuse at apex, coriaceous, entire or nearly so.

2. *Amyris rekoii* Blake, Contr. Gray Herb. n. ser. 53: 56. 1918.

Tepec and Oaxaca; type from Cafetal Nueva Esperanza, Department of Pochutla, Oaxaca, altitude 700 meters.

Glabrous tree or shrub; leaflet lance-ovate to oblong-ovate, 6.5 to 11.5 cm. long, acuminate; fruit bluish black, 5 mm. in diameter.

3. *Amyris madrensis* S. Wats. Proc. Amer. Acad. 25: 144. 1890.

Nuevo León and San Luis Potosí; type from mountains near Monterrey, Nuevo León. Southwestern Texas.

Very leafy shrub; leaflets rhombic, 1.5 to 3 cm. long, coriaceous, entire or crenate; fruit 10 to 12 mm. long.

4. *Amyris purpusi* P. Wilson, Bull. Torrey Club 37: 86. 1910.

Known only from the type locality, Zacuapan, Veracruz.

Small tree; leaflets 3, oval or ovate, 2 to 4 cm. long, entire or nearly so.

5. *Amyris balsamifera* L. Syst. Nat. ed. 10. 1000. 1759.

Sinaloa to Guerrero. West Indies, South America, and southern Florida; type from Jamaica.

Shrub or tree, sometimes 7 meters high, with a trunk 20 cm. in diameter; leaflets 3 or 5, 5 to 13 cm. long, entire or crenulate; flowers white; fruit obovoid or elliptic, 6 to 13 mm. long, bluish black, aromatic; wood hard, close-grained, orange, very resinous, its specific gravity about 1.04. "Limoncillo" (Sinaloa).

The Mexican material may represent a distinct species, but the material at hand is too incomplete to determine this point.

6. *Amyris texana* (Buckl.) P. Wilson, Torreya 8: 139. 1908.

Zanthoxylum texanum Buckl. Bull. Torrey Club 10: 90. 1883.

Amyris parvifolia A. Gray, Proc. Amer. Acad. 23: 226. 1888.

Nuevo León. Western Texas; type from Corpus Christi.

Glabrous aromatic shrub, 1 to 2 meters high, leaflets 3, ovate, obtuse. "Chapotillo" (Nuevo León).

7. *Amyris sylvatica* Jacq. Stirp. Amer. 107. 1763.

Veracruz and perhaps elsewhere. Central America, West Indies, and northern South America; type from Cartagena, Colombia.

Glabrous shrub or tree, 2 to 9 meters high; leaflets crenate, bright green; fruit 4.5 to 7 mm. long, black or reddish. "Tea" (Porto Rico).

8. *Amyris thyrsoflora* Turcz. Bull. Soc. Nat. Moscou 31¹: 475. 1858.

Veracruz.

Glabrous shrub or tree; leaflets crenate or entire, coriaceous, lustrous; flowers white, fragrant.

6. *ERYTHROCHITON* Nees & Mart. Nov. Act. Acad. Caës. Leop. Carol. 11: 151. 1823.1. *Erythrochiton lindeni* (Baill.) Hemsl. Biol. Centr. Amer. Bot. 1: 166. 1879.

Torosiphon lindeni Baill. Adansonia 10: 312. 1872.

Tabasco; type from Teapa. Central America.

Shrub, about 2 meters high; leaves long-petiolate, the leaflet 1, oval or elliptic, 10 to 35 cm. long, entire, glabrous; flowers white, in scorpioid cymes, the sepals 2 to 4 cm. long.

7. *THAMNOSMA* Torr. & Frém. in Frém. Rep. Exped. Rocky Mount. 313. 1845.

Erect shrubs or sometimes herbs; leaves alternate, linear or reduced to scales, entire; flowers small, racemose; fruit a 2-lobed capsule.

Petals 3 to 5 mm. long; leaves present; seeds 1.5 to 2 mm. long—1. *T. texana*.

Petals 8 to 14 mm. long; leaves usually absent; seeds 4 to 6 mm. long

2. *T. montana*.

1. *Thamnosma texana* (A. Gray) Torr. U. S. & Mex. Bound. Bot. 42. 1859.

Rutosma texana A. Gray, Gen. Fl. Amer. 2: 144. 1849.

Chihuahua to Nuevo León and San Luis Potosí. Western Texas (type locality) to Colorado and Arizona.

Slender shrub, 50 cm. high or less, or often herbaceous; leaves linear, 5 to 15 mm. long; flowers yellowish or purplish.

2. *Thamnosma montana* Torr. & Frém. Rep. Exped. Rocky Mount. 313. 1845.

Northern Baja California and probably northern Sonora. California to Arizona and Utah; type from Nevada.

Glandular shrub, 30 to 60 cm. high, the branches often spinose, yellowish green; leaves 5 to 10 mm. long but early deciduous; flowers purple. "Cordoncillo" (Arizona).

A decoction of the plant is used by the Pima and Apache Indians as a remedy for gonorrhoea, and in Arizona it is employed as a general tonic and blood purifier.

8. *HELIIETTA* Tulasne, Ann. Sci. Nat. III. 7: 280. 1847.1. *Helietta parvifolia* (A. Gray) Benth. in Hook. Icon. Pl. 14: 66. 1882.

Ptelea parvifolia A. Gray; Hemsl. Biol. Centr. Amer. Bot. 1: 170. 1879.

Coahuila to Tamaulipas and Querétaro; type from Carrizal, Nuevo León. Western Texas.

Shrub or tree, sometimes 8 meters high, with a slender trunk 15 cm. in diameter; bark thin, dark brown, scaly; leaves opposite, persistent, digitate, the leaflets 3, obovate, 1 to 5 cm. long, obtuse, usually entire, glabrous, flowers small, white, cymose; fruit 6 to 8 mm. long, with thin wings; wood hard, close-grained, orange-brown, the specific gravity about 0.88. "Barreta" (Nuevo León, Tamaulipas, Coahuila, Texas).

9. **TARAVALIA** Greene, Leaflets 1: 222. 1906.1. *Taravalia aptera* (Parry) Greene, Leaflets 1: 222. 1906.*Ptelea aptera* Parry, Proc. Davenport Acad. 4: 39. 1884.*Ptelea nucifera* Greene, Contr. U. S. Nat. Herb. 10: 75. 1906.*Ptelea obscura* Greene, Contr. U. S. Nat. Herb. 10: 76. 1906.

Baja California; type from Bahía de Todos Santos.

Shrub or small tree, sometimes 5 meters high; leaves alternate, digitate, the leaflets 3, gland-dotted, 1 to 3 cm. long, obtuse or acute; flowers few, small, white; fruit nutlike, indehiscent.

10. **PTELEA** L. Sp. Pl. 118. 1753.1. *Ptelea trifoliata* L. Sp. Pl. 118. 1753.*Ptelea pentandra* Moc. & Sessé; DC. Prodr. 2: 83. 1825.*Ptelea angustifolia* Benth. Pl. Hartw. 9. 1839.*Ptelea subintegra* Greene, Contr. U. S. Nat. Herb. 10: 61. 1906.*Ptelea coahuilensis* Greene, Contr. U. S. Nat. Herb. 10: 61. 1906.*Ptelea obtusata* Greene, Contr. U. S. Nat. Herb. 10: 61. 1906.*Ptelea pumila* Greene, Contr. U. S. Nat. Herb. 10: 61. 1906.*Ptelea scutellata* Greene, Contr. U. S. Nat. Herb. 10: 62. 1906.*Ptelea cuspidata* Greene, Contr. U. S. Nat. Sonora to Tamaulipas and Oaxaca. Widely distributed in the United States.

Shrub or small tree, sometimes 7 meters high, with a trunk 20 cm. in diameter, the whole plant with a disagreeable odor; bark thin, smooth or nearly so, dark gray, reddish brown on young branches; leaves alternate, digitately 3-foliolate, the leaflets very variable in shape and size, glabrous or pubescent; flowers greenish white, cymose; fruit a samara, 1 to 2.5 cm. long; wood hard, close-grained, yellowish brown, its specific gravity about 0.83. "Cola de zorrillo" (Chihuahua).

In the United States, where the plant is known as "hop-tree" and "wafer-ash," the fruit has been employed as a substitute for hops. The root has a bitter, pungent, and slightly acrid but not disagreeable taste and a somewhat aromatic odor. It contains the alkaloid berberine. It has been employed as a remedy for dyspepsia and as a mild tonic.

Many segregates from this species have been published besides the Mexican ones cited above. The species exhibits a large amount of variation, but it seems impossible to divide the specimens into groups by any constant character. Wilson, in the North American Flora, has recognized three species, but the key characters given for the species are obviously of little value. Of the Mexican segregates, *P. pumila* is the most distinct, because of its very small leaflets.11. **ZANTHOXYLUM** L. Sp. Pl. 270. 1753.

Shrubs or trees, often armed with spines; leaves alternate, even-pinnate, odd-pinnate, or rarely unifoliolate, deciduous or persistent, the leaflets entire or crenulate; flowers small, whitish or yellowish; fruit of 1 to 5 follicles.

The dried bark of two United States species, *Z. americanum* Mill. and *Z. clava-herculis* L., which are known as "prickly ash," is official in the U. S. Pharmacopoeia. It contains one or more alkaloids and is used as a stimulant

and, externally, as a counter irritant, especially in the treatment of chronic rheumatism. One of the Australian species is reported to be a violent convulsive poison, and is said to be used by the natives for poisoning fish.

Leaves even-pinnate.

Sepals and petals each 4 or 5-----19. *Z. microcarpum*.

Sepals and petals each 3.

Follicles 4 to 4.8 mm. long, blackish; marginal glands of the leaflets obsolete.

1. *Z. pringlei*.

Follicles 5 to 7 mm. long, brown; marginal glands of the young leaflets conspicuous-----2. *Z. procerum*.

Leaves odd-pinnate.

Leaflets rounded or very obtuse at apex, small, 1.5 cm. wide or narrower.

Leaflets 3-----3. *Z. liebmannianum*.

Leaflets 5 or more.

Leaflets 25 to 61-----4. *Z. elegantissimum*.

Leaflets 5 to 17.

Flowers in short, often lateral spikes or spikelike racemes.

Follicles 3.5 to 4 mm. broad, the stipe usually long and slender.

5. *Z. fagara*.

Follicles 4 to 5.5 mm. broad, the stipe short and stout-----6. *Z. affine*.

Flowers usually in terminal or lateral panicles or in long slender racemes.

Calyx of oblong or ovate, distinct sepals-----7. *Z. purpusii*.

Calyx of triangular or suborbicular lobes, persistent.

Leaflets 7 to 15; follicles 5 to 7 mm. long-----8. *Z. insulare*.

Leaflets 5 or 7; follicles 3.5 to 4 mm. long-----9. *Z. culantrillo*.

Leaflets acute or acuminate, or, if obtuse, 2.5 cm. wide or larger.

Sepals 4; leaflets 3 or rarely 5-----10. *Z. limoncello*.

Sepals 5; leaflets 5 or more in most of the leaves.

Branches of the inflorescence corky-thickened; plants glabrous or nearly so.

Seeds 4 to 5 mm. long; follicles 4.5 to 8 mm. long; leaflets abruptly short-pointed-----11. *Z. caribaeum*.

Seeds 6 to 8 mm. long; follicles 9 to 15 mm. long; leaflets usually tapering to an acuminate tip.

Follicles sessile-----12. *Z. nelsoni*.

Follicles with a slender stipelike base-----13. *Z. elephantiasis*.

Branches of the inflorescence not corky-thickened; plants glabrous or pubescent.

Sepals suborbicular, strongly imbricate in flower----14. *Z. bijugum*.

Sepals oblong or ovate, not strongly imbricate in flower.

Leaflets glabrous-----15. *Z. melanostictum*.

Leaflets more or less pubescent beneath.

Calyx of distinct sepals, deciduous-----16. *Z. mollissimum*.

Calyx of united sepals, persistent.

Follicles 6 to 8 mm. long; pedicels stout; leaflets 9 to 14 cm. long-----17. *Z. goldmani*.

Follicles 4.5 to 5.5 long; pedicels slender; leaflets 5 to 7.5 cm. long-----18. *Z. arborescens*.

1. *Zanthoxylum pringlei* S. Wats. Proc. Amer. Acad. 26: 134. 1891.

Known only from the type locality, Tamasopo Canyon, San Luis Potosí.

Tree, sometimes 13 meters high, the trunk 30 cm. in diameter, grayish, armed with short stout spines; leaflets 4 to 10, oblong, 3 to 7 cm. long, acute

or acuminate, glabrous, entire; flowers in large dense terminal panicles; fruit with an odor of camphor.

2. *Zanthoxylum procerum* Donn. Smith, Bot. Gaz. 23: 4. 1897.

Oaxaca. Costa Rica; type from Santa María de Dota.

Nearly glabrous tree, 10 to 15 meters high, armed with spines, even on the leaf rachis; leaflets 4 to 12, oblong to elliptic, 6.5 to 17 cm. long, abruptly acuminate, lustrous, nearly entire; flowers white, in large terminal corymbs. "Palo de ropa" (Oaxaca); "lagartillo" (Costa Rica).

3. *Zanthoxylum liebmannianum* (Engl.) P. Wilson, Bull. Torrey Club 37: 85. 1910.

Fagara liebmanniana Engl. Bot. Jahrb. Engler 21: Beibl. 54: 20. 1896.

Zanthoxylum longipes Rose, Contr. U. S. Nat. Herb. 5: 163. 1899.

Puebla and Oaxaca; type from San Juan del Estado, Oaxaca.

Shrub or small tree, 3 to 4.5 meters high, unarmed or sparsely prickly; leaflets 1 to 3 cm. long, yellowish green, crenulate; seeds black, lustrous.

4. *Zanthoxylum elegantissimum* (Engl.) P. Wilson, Bull. Torrey Club 37: 85. 1910.

Fagara elegantissima Engl. Bot. Jahrb. Engler 21: Beibl. 54: 25. 1896.

Veraacruz; type from Chiconquiaco.

Glabrate shrub with slender flexuous branches, armed with small prickles; leaflets oval-oblong, 4 to 10 mm. long, entire or nearly so; flowers in large terminal panicles.

5. *Zanthoxylum fagara* (L.) Sarg. Gard. & For. 3: 186. 1890.

Schinus fagara L. Sp. Pl. 389. 1753.

Fagara pterota L. Syst. Nat. ed. 10. 897. 1759.

Fagara lentiscifolia Humb. & Bonpl.; Willd. Enum. Pl. 165. 1809.

Zanthoxylum pterota H. B. K. Nov. Gen. & Sp. 6: 3. 1823.

?*Zanthoxylum marginatum* Sessé & Moc. Fl. Mex. ed. 2. 231. 1894.

Baja California and Sonora to Tamaulipas, Veraacruz, Yucatán, and Chiapas. Florida and Texas; Central America; West Indies; South America; type from Jamaica.

Shrub or tree, sometimes 10 meters high, with a strong odor; bark thin, gray, covered with thick corky projections, the branches armed with hooked prickles; leaf rachis broadly winged, the leaflets 5 to 13, 0.7 to 2.5 cm. long, crenulate; flowers yellowish green, dioecious; wood yellow, very hard, compact, reddish brown, the specific gravity about 0.74. "Colima" (Nuevo León, Tamaulipas, Chihuahua, Texas); "limoncillo" (Sinaloa, Cuba); "xic-ché" (Yucatán, Maya); "uña de gato" (Tamaulipas, Colombia); "palo mulato" (Jalisco, Ramírez); "tomeguín," "espino" (Cuba); "espino rubial" (Porto Rico); "correosa" (Texas); "uñagato" (Tamaulipas).

Known in the Bahamas as "wild lime." The young leaves are frequently tinged with bronze. A decoction of the leaves is used in domestic medicine; that of the bark is said to be sudorific and to act as an arterial and nervous stimulant. The leaves and bark have a pungent and acrid flavor, and have been used as a spice. The bark is said to give a yellow dye.

6. *Zanthoxylum affine* H. B. K. Nov. Gen. & Sp. 6: 3. 1823.

Michoacán to Hidalgo and Puebla; type from Lake Cuitzeo, Michoacán.

Shrub or small tree, 3 to 4.5 meters high, armed with slender prickles; leaf rachis winged, the leaflets 7 to 17, 0.5 to 1.5 cm. long, entire or crenulate. "Palo mulato" (Michoacán, Ramírez).

7. *Zanthoxylum purpusii* T. S. Brandeg. Univ. Calif. Publ. Bot. 3: 381. 1909.
Known only from the type locality, San Luis Tultitlanapa, Puebla.
Densely branched, spiny shrub, 1 to 2 meters high; leaflets 5 or 7, 5 to 15 mm. long, crenulate.
8. *Zanthoxylum insulare* Rose, U. S. Dept. Agr. N. Amer. Fauna 14: 79. 1899.
Tres Marias and Socorro islands; type from María Madre Island. Jamaica; northern South America.
Glabrous shrub or tree, 4 to 18 meters high, the trunk grayish, armed with corky spines 1.5 to 3 cm. long; branches usually unarmed; leaflets 1.5 to 7 cm. long, coarsely crenate.
9. *Zanthoxylum culantrillo* H. B. K. Nov. Gen. & Sp. 6: 2. 1823.
Morelos. Guatemala to Peru; type from Peru.
Shrub or small tree, pubescent; leaf rachis winged, the leaflets 0.7 to 3.5 cm. long, crenate or nearly entire; flowers yellowish green.
10. *Zanthoxylum limoncello* Planch. & Oerst.; Triana & Planch. Ann. Sci. Nat. V. 14: 312. 1872.
Zanthoxylum foetidum Rose, Contr. U. S. Nat. Herb. 5: 112. 1897.
Morelos. Central America; type from Volcán de Chiriquí, Panama.
Shrub or small tree, 2 to 6 meters high, armed with stout prickles; leaf rachis not winged, the leaflets 2 to 7.5 cm. long, nearly glabrous; flowers greenish, with unpleasant odor. "Limoncillo," "zorrillo" (Costa Rica).
11. *Zanthoxylum caribaeum* Lam. Encycl. 2: 39. 1786.
Zanthoxylum occidentale Rose, Contr. U. S. Nat. Herb. 5: 164. 1899.
Sinaloa and Tepic. West Indies and northern South America; type from Barbados.
Tree, 5 to 20 meters high, the trunk spiny; leaf rachis terete, the leaflets 7 to 13, 4.5 to 12 cm. long, glabrate, crenate. "Zorrillo" (Sinaloa); "espino rubial" (Porto Rico).
In the West Indies the bitter bark has been used for fevers and venereal diseases. The wood is said to be very durable.
12. *Zanthoxylum nelsoni* Rose, U. S. Dept. Agr. N. Amer. Fauna 14: 79. 1899.
Known only from the type locality, María Madre Island, Tepic.
Glabrous tree, 7.5 to 20 meters high; leaf rachis terete, the leaflets 11 to 15, 4.5 to 10 cm. long, crenulate, conspicuously gland-dotted.
13. *Zanthoxylum elephantiasis* Macfad. Fl. Jam. 1: 193. 1837.
Veracruz and perhaps elsewhere. Costa Rica and Panama; West Indies; type from Jamaica.
Tree, 5 to 18 meters high, the trunk sometimes 50 cm. in diameter; bark grayish, covered with large corky sharp-pointed cushions; branches prickly; leaf rachis terete, often prickly, the leaflets 5 to 17, 3.5 to 10.5 cm. long; flowers greenish yellow; sapwood thick, light brown, or nearly white, the heartwood darker, tinged with yellow, hard, light, fine-grained, taking a good polish, durable in the ground. "Ruda" (Panama); "pino macho" (Santo Domingo).
14. *Zanthoxylum bijugum* (Engl.) P. Wilson, Bull. Torrey Club 37: 86. 1910.
Fagara bijuga Engl. Bot. Jahrb. Engler 21: Beibl. 54: 23. 1896.
Known only from the type locality, Tlacolula, Oaxaca.
Pubescent tree; leaflets 5, coriaceous, 2.5 to 6 cm. long.
15. *Zanthoxylum melanostictum* Schlecht. & Cham. Linnaea 5: 231. 1830.
?Fagara crassifolia Engl. Bot. Jahrb. Engler 21: Beibl. 54: 21. 1896.
Veracruz and probably elsewhere.
Shrub or tree, unarmed or prickly; leaflets 3 to 7, coriaceous, 6 to 15 cm. long, entire or crenulate.

16. *Zanthoxylum mollissimum* (Engl.) P. Wilson, Bull. Torrey Club 37: 86. 1910.
Fagara mollissima Engl. Bot. Jahrb. Engler 21: Beibl. 54: 22. 1896.
 Known only from the type locality, Mina de Dolores.
 Leaflets 9 to 11, 4 to 8.5 cm. long, entire or nearly so, densely pubescent.
17. *Zanthoxylum goldmani* Rose; P. Wilson, N. Amer. Fl. 25: 195. 1911.
 Known only from the type locality, between Culiacán and Las Flechas, Sinaloa.
 Branches prickly; leaflets 7, coriaceous, crenate, pubescent beneath.
18. *Zanthoxylum arborescens* Rose, Contr. U. S. Nat. Herb. 5: 112. 1897.
Zanthoxylum peninsulare T. S. Brandeg. Zoe 5: 249. 1908.
 Southern Baja California and Sinaloa; type from Imala, Sinaloa.
 Small tree, 3 to 4 meters high, the branches unarmed or with few short prickles; leaflets 3 to 7, pubescent.
19. *Zanthoxylum microcarpum* Griseb. Fl. Brit. W. Ind. 138. 1859.
Fagara microcarpa Krug & Urb.; Urban, Bot. Jahrb. Engler 21: 570. 1896.
 Oaxaca. Costa Rica; Lesser Antilles; South America; type from Dominica.
 Tree, sometimes 13 meters high, the bark covered with stout compressed prickles; leaflets 10 to 30, oblong or oblong-lanceolate, 3 to 9 cm. long, acute, serrate-crenate, pubescent or glabrate; panicles terminal, 10 to 15 cm. long; follicles 1 or 2, 4 to 5 mm. in diameter.

DOUBTFUL SPECIES.

FAGARA FALCIFOLIA Engl. Bot. Jahrb. Engler 21: Beibl. 54: 24. 1896. Type from Mirador, Veracruz. Based upon sterile specimens.

ZANTHOXYLUM PENTANOME DC. Prodr. 1: 725. 1824. Described from Mexico. Referred doubtfully by Wilson to synonymy under *Z. monophyllum* (Lam.) P. Wilson. That, however, is not represented by herbarium specimens from Mexico. It is distinguished by 1-foliolate leaves. The name *Z. pentanome* has been much used in works relating to Mexican plants. Some species so named is reported to be a remedy for the "vómito negro" and for venereal diseases. It is said to be known as "palo mulato."

12. PILOCARPUS Vahl, Eclog. Amer. 1: 29. 1796.

The leaves of *P. jaborandi* Holmes and *P. microphyllus* Stapf, of Brazil, are official in the U. S. Pharmacopoeia, and leaves of other species also are used. They contain two alkaloids, pilocarpine and jaborine, which are the most reliable of diaphoretics. They are widely employed for the treatment of dropsy, pleurisy, rheumatism, Bright's disease, and similar affections.

1. *Pilocarpus longipes* Rose, Contr. U. S. Nat. Herb. 5: 112. 1897.

Pilocarpus insularis Rose, U. S. Dept. Agr. N. Amer. Fauna 14: 80. 1899.

Tepic to Guerrero; type from Acapulco, Guerrero.

Unarmed shrub or tree, 2 to 6 meters high; leaves alternate, pinnate, the leaflets usually 3 or 5, oblong to obovate, 3 to 10 cm. long, obtuse or retuse, entire, glabrous; flowers small, racemose; fruit of 1 or 3 carpels, these conspicuously ridged; seeds large, black.

Perhaps not essentially different from *P. racemosus* Vahl, of the West Indies.

13. ESENBECKIA H. B. K. Nov. Gen. & Sp. 7: 246. 1825.

Unarmed trees or shrubs; leaves alternate or rarely opposite, simple or 1 to 5-foliolate, the leaflets gland-dotted; flowers small, perfect, racemose or paniculate; fruit a hard woody capsule, very rough outside.

Leaves simple, the petioles not jointed.

Fruit about 2 cm. broad; petioles 1 to 12 mm. long-----1. *E. hartmanii*.

Fruit 3 to 4 cm. broad; petioles 10 to 35 mm. long-----2. *E. flava*.

Leaves compound, with 3 or 5 leaflets.

Leaflets densely pubescent beneath-----3. *E. macrantha*.

Leaflets glabrous beneath or nearly so.

Inflorescence racemose, few-flowered; leaves short-petiolate, the glands large and conspicuous-----4. *E. collina*.

Inflorescence paniculate; leaves long-petiolate, with small inconspicuous glands.

Sepals puberulent outside; flowers 6 to 8 mm. broad---5. *E. pentaphylla*.

Sepals glabrous outside; flowers 5 to 5.5 cm. broad---6. *E. berlandieri*.

1. *Esenbeckia hartmanii* Robins. & Fern. Proc. Amer. Acad. 30: 115. 1894.

Sonora and Sinaloa; type from La Tinaja, Sonora.

Shrub, 2 to 3 meters high, with thick stiff branches; leaves oblong to oval, entire, 2 to 8 cm. long, rounded or retuse at apex, pubescent beneath.

2. *Esenbeckia flava* T. S. Brandeg. Zoe 1: 378. 1891.

Southern Baja California; type from San José del Cabo.

Shrub or small tree, sometimes 9 meters high, with a trunk 20 cm. in diameter; leaves oblong or oval, 5 to 14 cm. long, pubescent beneath; flowers white, 1.4 cm. broad; fruit covered with spinelike projections; wood yellow. "Palo amarillo."

3. *Esenbeckia macrantha* Rose, Contr. U. S. Nat. Herb. 5: 111. 1897.

Oaxaca and Puebla; type collected near Dominguillo, Oaxaca.

Tree, 4 to 6 meters high; leaflets 3, 15 to 20 cm. long, obtuse or short-acuminate; flowers white, 8 to 10 mm. broad; fruit 3 cm. broad.

4. *Esenbeckia collina* T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 183. 1915.

Known only from the type locality, Cerro del Picacho, Oaxaca.

Leaflets 3, 3 to 5 cm. long, rounded or retuse at apex.

5. *Zanthoxylum fagara* (L.) Sarg. Gard. & For. 3: 186. 1890.

Galipea pentaphylla Macfad. Fl. Jam.: 1: 196. 1837.

Yucatán, Jamaica (type locality).

Tree, sometimes 15 meters high, with brownish or grayish bark; leaflets usually 5, 6 to 17 cm. long; flowers yellowish white. "Yax-hocob" (Yucatán, Maya).

The plant of Yucatán may not be distinct from *E. berlandieri*.

6. *Esenbeckia berlandieri* Baill. Adansonia 10: 151. 1871.

Esenbeckia acapulcensis Rose, Contr. U. S. Nat. Herb. 5: 111. 1897.

Esenbeckia ovata T. S. Brandeg. Univ. Calif. Publ. Bot. 7: 327. 1920.

Guerrero, Tamaulipas, San Luis Potosí, and Veracruz; type from Tampico, Tamaulipas.

Tree, 4.5 to 6 meters high, with a trunk 7 to 12 cm. in diameter; leaflets 3 or 5, dark green, 4 to 17 cm. long, rounded at apex. "Jopoy" (Tamaulipas, Palmer).

14. **PELTOSTIGMA** Walp. Repert. Bot. 5: 386. 1846.

1. *Peltostigma pteleoides* (Hook.) Walp. Repert. Bot. 5: 387. 1846.

Pachystigma pteleoides Hook. Icon. Pl. pl. 698, 699. 1844.

Hidalgo and probably elsewhere. Central America; Jamaica (type locality).

Tree, 5 to 8 meters high; leaves alternate, digitately 3 or 5-foliolate, the leaflets 5 to 20 cm. long, acute or acuminate, bright green, glabrate, entire or nearly so; flowers white, fragrant, 3 to 5.5 cm. broad; fruit of 6 to 10 large hard carpels.

15. **CHOISYA** H. B. K. Nov. Gen. & Sp. 6: 4. 1823.

REFERENCE: Standley, Proc. Biol. Soc. Washington 27: 221-224. 1914.

Unarmed shrubs; leaves opposite or subopposite, persistent, digitately 3 to 13-foliolate; flowers perfect, white, in axillary cymes; fruit of 3 or 5 carpels.

Leaflets 3, oblong to ovate, 5 to 30 mm. wide-----1. *C. ternata*.

Leaflets 5 to 13, linear, 1 to 4 mm. wide.

Pubescence of the pedicels of minute appressed hairs. Leaflets 8 to 13.

2. *C. dumosa*.

Pubescence of the pedicels of slender spreading hairs.

Leaflets 3 to 5, 2 to 4 mm. wide, broadest at or above the middle, the margins plane or nearly so, repand-denticulate-----3. *C. mollis*.

Leaflets usually 7 to 11, rarely 5, 1.3 mm. wide or narrower, of uniform width throughout, the margins strongly revolute, entire or nearly so.

4. *C. palmeri*.

1. *Choisya ternata* H. B. K. Nov. Gen. & Sp. 6: 6. 1823.

Juliania caryophyllata Llave & Lex. Nov. Veg. Descr. 2: 4. 1825.

Puebla and Oaxaca; reported from San Luis Potosí and the Valley of Mexico; often cultivated in gardens.

Aromatic shrub; leaflets 2 to 8 cm. long, rounded or emarginate at apex, entire, glabrate; petals white, 1 to 1.5 cm. long. "Hierba del clavo" (Oaxaca, San Luis Potosí, Valley of Mexico); "flor del clavo" (Valley of Mexico, Ramírez); "clavillo," "clavo de olor" (Conzatti).

The infusion of the plant is reputed to have antispasmodic properties.

2. *Choisya dumosa* (Torr.) A. Gray, Proc. Amer. Acad. 23: 224. 1888.

Astrophyllum dumosum Torr. U. S. Rep. Expl. Miss. Pacif. 2²: 161. 1854.

Chihuahua and Coahuila. Western Texas and southern New Mexico; type from New Mexico.

Shrub, 1 to 1.5 meters high, the branches and petioles roughened with large glands; leaflets 1 to 4 cm. long; petals about 8 mm. long. "Zorrillo" (New Mexico).

3. *Choisya mollis* Standl. Proc. Biol. Soc. Washington 27: 223. 1914.

Known only from the type locality, which is not definitely known but is probably in northern Sonora.

Leaflets 1.2 to 4 cm. long, rounded at apex.

4. *Choisya palmeri* Standl. Proc. Biol. Soc. Washington 27: 234. 1914.

Coahuila and Zacatecas; type from Chojo Grande, Coahuila.

Leaflets 0.6 to 1.7 cm. long; follicles 5 to 6 mm. long, glandular.

16. **MEGASTIGMA** Hook. f.; Benth. & Hook. Gen. Pl. 1: 299. 1862.1. *Megastigma galeottii* Baill. Adansonia 10: 331. 1872.

Fagara pumila Engl. Bot. Jahrb. Engler 21: Beibl. 54: 21. 1896.

Puebla and Oaxaca; type from cactus plains of Oaxaca.

Small straggling shrub with crooked branches; leaves alternate, pinnate, the leaflets 5 or 7, ovate to orbicular, 3 to 7 mm. long, entire; flowers white, short-racemose, the petals 2 to 2.5 mm. long; fruit a follicle, 2.5 to 3 mm. in diameter.

17. **POLYASTER** Hook. f.; Benth. & Hook. Gen. Pl. 1: 299. 1862.1. *Polyaster boronioides* Hook. f.; Benth. & Hook. Gen. Pl. 1: 299. 1862.

?*Zanthoxylum inerme* Sessé & Moc. Fl. Mex. ed. 2. 230. 1894.

Polyaster chrcnbergii Engl. Bot. Jahrb. Engler 21: Beibl. 54: 26. 1896.

Tamaulipas to Hidalgo; type from Zimapán, Hidalgo.

Shrub, 2 meters high, unarmed; leaves alternate, pinnate, the rachis narrowly winged, the leaflets 11 to 25, oblong, 6 to 12 mm. long, minutely crenulate; flowers small, paniculate; fruit of 2 to 5 small carpels.

Sessé and Mocifio give the vernacular name of *Zanthoxylum inerme* as "gobernadora."

18. **DECATROPIS** Hook. f.; Benth. & Hook. Gen. Pl. 1: 298. 1862.

1. *Decatropis bicolor* (Zucc.) Radlk. Sitzungsber. Math. Phys. Akad. Wiss. München 16: 306. 1886.

Simaba bicolor Zucc. Flora 15²: Beibl. 72. 1832.

Decatropis coulteri Hook. f.; Benth. & Hook. Gen. Pl. 1: 299. 1862.

Nuevo León, Tamaulipas, Veracruz, and Hidalgo.

Shrub or small tree, 2 to 7 meters high, unarmed; leaves alternate, pinnate, the leaflets 5 to 11, lanceolate, 2.5 to 10 cm. long, thick, acute, green above, tomentose beneath; flowers small, white, in large terminal panicles; fruit of 2 to 5 small carpels.

69. **KOEBERLINIACEAE. Junco Family.**

REFERENCE: Barnhart, N. Amer. Fl. 25: 101-102. 1910.

1. **KOEBERLINIA** Zucc. Flora 15²: Beibl. 73. 1832.

1. *Koerberlinia spinosa* Zucc. Flora 15²: Beibl. 73. 1832.

Northeastern Sonora to Tamaulipas and Hidalgo. Western Texas to southern Arizona.

Shrub or tree, sometimes 8 meters high, with a trunk 30 cm. in diameter, the branches short, stiff, green, spine-tipped; leaves alternate, minute, scale-like, soon deciduous; flowers small, greenish, short-racemose; fruit a small berry; wood hard, close-grained, dark brown or nearly black, its specific gravity about 1.12. Known generally in Mexico and Texas as "junco"; "abrojo" (*Ochoterena*); "corona de Cristo" (Arizona).

The wood is resinous and burns readily, giving off a disagreeable odor. The plant is little more than a great mass of spines, and often forms impenetrable thickets.

70. **SURIANACEAE. Bay-cedar Family.**

1. **SURIANA** L. Sp. Pl. 284. 1753.

1. *Suriana maritima* L. Sp. Pl. 284. 1853.

Yucatán. On coastal sands and rocks, Florida, West Indies, South America, and in the Old World; type from Bermuda.

Shrub or small tree, sometimes 8 meters high, with a trunk 30 cm. in diameter, but usually much smaller; bark rough, irregularly fissured, brown; leaves alternate, thick, linear-spatulate, 1.5 to 4 cm. long, entire, densely pubescent; flowers small, yellow, clustered; sepals 5, persistent; petals 5, imbricate, 7 to 9 mm. long, erose at apex; fruit of small carpels, 4.5 mm. long; wood very hard and heavy, reddish brown. "Cuabilla" (Cuba); "gitarón," "temporana" (Porto Rico).

Known in the Bahamas as "bay-cedar."

71. **SIMAROUBACEAE. Simaruba Family.**

REFERENCE: Small, N. Amer. Fl. 25: 227-239. 1911.

Shrubs or trees; leaves usually alternate, simple or pinnate; flowers perfect or unisexual, usually small; fruit a drupe, berry, capsule, or samara, the seeds usually solitary.

Besides the genera here listed, *Simaba cedron* Planch. has been reported from Mexico, but the writer has seen no specimens.

Leaves simple, sometimes reduced to scales.

Leaves reduced to scales; petals 7 or 8.....1. **HOLACANTHA**.
Leaves well developed; petals 4.....2. **CASTELA**.

Leaves pinnate.

Fruit samara-like.....3. **ALVARADOA**.
Fruit drupaceous or baccate.

Leaflets 3.....4. **PICRELLA**.

Leaflets 5 or more in all or most of the leaves.

Carpels of the fruit 1-ovulate.

Stigmas distinct; leaflets usually 11 to 21.....5. **SIMAROUBA**.

Stigmas united; leaflets usually 5.....6. **QUASSIA**.

Carpels 2-ovulate.

Carpels distinct.....7. **RECCHIA**.

Carpels united.....8. **PICRAMNIA**.

1. **HOLACANTHA** A. Gray, Mem. Amer. Acad. II. 5: 310. 1854.

1. **Holacantha emoryi** A. Gray, Mem. Amer. Acad. II. 5: 310. 1854.

Reported from northern Sonora. Southern Arizona; type collected between Tucson and the Gila River.

Shrub, 2 to 3 meters high, much branched, the branches spinose, green or brownish; leaves reduced to small scales; flowers dioecious, small, solitary or clustered; fruit of 6 to 10 small drupes. "Corona de Cristo" (Arizona).

2. **CASTELA** Turp. Ann. Mus. Hist. Nat. 7: 78. 1806.

Shrubs or small trees, the branchlets spinose or spurlike; leaves small, narrow, simple, entire or nearly so; flowers small, dioecious, solitary or clustered; sepals 4, distinct or nearly so; petals 4; stamens 8; fruit of 1 or more small drupes.

Leaves green beneath, the pubescence not white.....1. **C. peninsularis**.

Leaves covered beneath with a fine whitish pubescence.

Petals narrowly obovate; leaves narrowly obovate.....2. **C. texana**.

Petals broadly obovate; leaves obovate or ovate.

Leaves obtuse at apex.....3. **C. tortuosa**.

Leaves retuse.....4. **C. retusa**.

1. **Castela peninsularis** Rose, Contr. U. S. Nat. Herb. 12: 278. 1909.

Castelaria peninsularis Small, N. Amer. Fl. 25: 231. 1911.

Dry plains and hillsides, Baja California; type from San José del Cabo.

Densely branched, spiny shrub, 1 meter high or less; leaves oval or broadly obovate, 1 to 2 cm. long, coriaceous; flowers red; petals 3 mm. long; fruit about 8 mm. long.

2. **Castela texana** (Torr. & Gray) Rose, Contr. U. S. Nat. Herb. 12: 278. 1909.

Castela nicholsoni texana Torr. & Gray, Fl. N. Amer. 1: 680. 1840.

Castelaria texana Small, N. Amer. Fl. 25: 231. 1911.

Castela salubris Boas, Beitr. Anat. Syst. Simarub. 44. 1912.

Dry plains and hillsides, Coahuila, Tamaulipas, and San Louis Potosí. Southwestern Texas.

Densely branched shrub, 1 to 2.5 meters high, with stiff whitish spinose branches; leaves 0.5 to 1.5 cm. long, obtuse; flowers bright red or purplish, about 3 mm. long; fruit red, 6 to 8 mm. long. "Bisbirinda" (Tamaulipas); "amargoso" (Nuevo León, Texas); "chaparro amargoso" (Texas).

A decoction of the very bitter bark is employed in domestic medicine for fevers, intestinal disturbances, and eczema. It has astringent and perhaps tonic properties.

The type of *C. salubris* came from Tamaulipas, and the name is doubtless to be referred here. Collections from Oaxaca and Puebla also were cited; these are probably referable to *C. tortuosa*.

3. *Castela tortuosa* Liebm. Nat. For. Kjöbenhavn Vid. Medd. 1853: 108. 1854.

Castelaria tortuosa Small, N. Amer. Fl. 25: 231. 1911.

Puebla and Oaxaca; type from Tehuacán, Puebla.

Shrub, 1 to 2 meters high, with crooked spiny branches; leaves 0.8 to 1.5 cm. long; flowers reddish purple, 2.5 mm. long.

4. *Castela retusa* Liebm. Nat. For. Kjöbenhavn Vid. Medd. 1853: 110. 1854.

Oaxaca; type from San Carlos.

Very spiny shrub; leaves lustrous on the upper surface. "Amargoso," "palo amargoso" (*Reko.*).

The writer has seen no material of this or of *C. tortuosa*.

The species of the genus are closely related, and it is doubtful whether all those listed above are distinct.

DOUBTFUL SPECIES.

CASTELA LYCHNOPHOROIDES Liebm. Nat. For. Kjöbenhavn Vid. Medd. 1853: 111. 1854. Type from Tehuacán, Puebla. Referred doubtfully to the genus by Liebmann.

3. *ALVARADOA*¹ Liebm. Nat. For. Kjöbenhavn Vid. Medd. 1853: 100. 1854.

1. *Alvaradoa amorphoides* Liebm. Nat. For. Kjöbenhavn Vid. Medd. 1853: 100. 1854.

Alvaradoa mexicana Liebm.; Benth. Pl. Hartw. 344. 1857.

Southern Chihuahua to Jalisco and Chiapas; Yucatán and Campeche; type from Bolaños, Jalisco. Central America, West Indies, and southern Florida.

Tree, 3 to 8 meters high (reported to reach a height of 18 meters); leaves pinnate, the leaflets 19 to 51, oval or oblong, 1 to 2.5 cm. long, finely sericeous beneath; flowers small, dioecious, green or yellowish white, in long racemes; fruit a lanceolate samara 1 to 1.5 cm. long, pilose. "Bel-ciniché," "x̄besinic-ché" (Yucatán, Maya); "palo de hormigas" (Yucatán); "plumajillo" (Guatemala); "pié de gallo" (Sinaloa); "tamarindillo" (Cuba).

4. *PICRELLA* Baill. *Adansonia* 10: 150. 1871.

1. *Picrella trifoliata* Baill. *Adansonia* 10: 150. *pl.* 10. 1871.

Described from plants cultivated at Paris, believed to be of Mexican origin; the plant is not known otherwise.

Slender shrub; leaves palmately 3-foliolate, the leaflets ovate, oval, or obovate, 1 to 2.5 cm. long, entire; flowers small, perfect, in small axillary panicles.

5. *SIMAROUBA* Aubl. *Pl. Guian.* 2: 859. 1775.

1. *Simarouba glauca* DC. *Ann. Mus. Paris* 17: 424. 1811.

Yucatán. Florida, West Indies, and Central America; probably also in northern South America; type from Cuba.

Tree, sometimes 30 meters high; leaves persistent, pinnate, the leaflets usually 11 to 21, oblong, 5 to 10 cm. long, glabrate, pale beneath; flowers small, greenish, in rather large loose panicles; fruit drupaceous, oval, 1.5 to 2 cm. long, red or dark purple; wood soft, brownish. "Xpaxakil" (Yucatán, Maya); "simaruba" (Costa Rica); "aceituno" (Nicaragua, El Salvador, Panama);

¹The genus was named in honor of Pedro de Alvarado, one of the associates of Cortés.

“aceituno negro” (Nicaragua); “jucumico” (El Salvador); “palo blanco” (Cuba).

In Costa Rica an infusion of the bark is used as a remedy for intermittent fevers. The fruit is edible.

6. **QUASSIA** L. Sp. Pl. ed. 2. 553. 1762.

1. **Quassia amara** L. Sp. Pl. ed. 2. 553. 1762.

Native of northern South America; cultivated in Colima, Guerrero, and Oaxaca, and apparently naturalized in some localities.

Small tree; leaf rachis winged, the leaflets usually 5, about 10 cm. long, thin, acute or acuminate, entire; flowers perfect, 2.5 to 4.5 cm. long, racemose or paniculate; fruit of usually 5 drupes, these 1 to 1.5 cm. long. “Cuasia.”

7. **RECCHIA** Moc. & Sessé; DC. Reg. Veg. Syst. 1: 411. 1818.

REFERENCE: Loesener & Solenreder, Verh. Bot. Ver. Brand. 47: 35–62. 1905.

Trees; leaves pinnate, the leaflets large, alternate, entire; flowers small, in terminal panicles; fruit of 1 to 3 large drupes.

Leaflets 6 to 14 cm. long; petals 9 mm. long.....1. **R. connaroides**.

Leaflets 1 to 6 cm. long; petals 6.5 to 7.5 cm. long.....2. **R. mexicana**.

1. **Recchia connaroides** (Loes. & Solenr.) Standl.

Rigiostachys connaroides Loes. & Solenr. Verh. Bot. Ver. Brand. 47: 37. 1905. Oaxaca; type from Tlacolula.

Leaflets 5 or 7, puberulent beneath, 3 to 7 cm. wide, obtuse or rounded at apex; flowers about 2 cm. broad.

2. **Recchia mexicana** Moc. & Sessé; DC. Reg. Veg. Syst. 1: 411. 1818.

Rigiostachys bracteata Planch. Lond. Journ. Bot. 6: 30. 1847.

Rigiostachys rourcoides Loes. & Solenr. Verh. Bot. Ver. Brand. 47: 39. 1905.

Recchia bracteata Small, N. Amer. Fl. 25: 235. 1911.

Colima to Oaxaca.

Tree, 5 to 6 meters high; leaflets 5 to 11, obtuse or rounded at apex, sometimes acutish, puberulent beneath; panicles sometimes 45 cm. long; flowers yellow, fragrant; drupes 1 to 1.5 cm. long. “Corazón bonito” (Oaxaca).

The wood is hard and valuable.

It may be that more than one species is represented here, but the material examined by the writer appears to be conspecific. The characters which have been reported as distinguishing the species appear to be of little value.

8. **PICRAMNIA** Swartz, Prodr. Veg. Ind. Occ. 27. 1788.

Trees or shrubs; leaves persistent, pinnate, the leaflets entire, opposite or alternate, petiolulate; flowers very small, dioecious, in spikelike or branched panicles; fruit baccate.

Panicles branched; petals and sepals each 5.

Leaflets usually 3 to 9.....1. **P. polyantha**.

Leaflets 21 to 25.....2. **P. xalapensis**.

Panicles simple, spikelike; petals and sepals each 3 or 4.

Sepals and petals each 4.....3. **P. tetramera**.

Sepals and petals each 3.

Leaflets 2.5 cm. long or shorter.....4. **P. pistaciaefolia**.

Leaflets mostly 4 to 10 cm. long.

Leaflets copiously pubescent beneath at maturity.....5. **P. andicola**.

Leaflets nearly glabrous beneath at maturity.

Stamens included.....6. **P. lindeniana**.

Stamens exerted.....7. **P. antidesma**.

1. *Picramnia polyantha* (Benth.) Planch. Lond. Journ. Bot. 5: 577. 1846.
Rhus polyantha Benth. Pl. Hartw. 60. 1840.
Puebla and Oaxaca; type from Villa Alta, mountains of Chinantla, Oaxaca. Slender shrub; leaflets ovate to oblong-lanceolate, 5 to 10 cm. long, acuminate or long-acuminate, more or less pubescent beneath.
2. *Picramnia xalapensis* Planch. Lond. Journ. Bot. 5: 577. 1846.
Known only from the type locality, Jalapa, Veracruz.
Leaflets narrowly ovate or lanceolate, 1.5 to 3.5 cm. long, glabrate; petals 2 to 2.5 mm. long, linear or linear-lanceolate.
3. *Picramnia tetramera* Turcz. Bull. Soc. Nat. Moscou 36¹: 598. 1863.
Chiapas and probably elsewhere; described from southern Mexico.
Leaflets 5 to 13, lanceolate, obtuse-acuminate, densely pubescent beneath; panicles longer than the leaves; fruit pubescent when young.
4. *Picramnia pistaciaefolia* Blake & Standl. Contr. U. S. Nat. Herb. 20: 218. 1919.
Oaxaca; type from Cafetal San Rafael, Cerro Espino, altitude 800 meters. Slender shrub; leaflets about 17, obtuse or subacuminate, sparsely pubescent beneath; panicles 15 to 20 cm. long; fruit 1 cm. long. "Cáscara amarga." Used by the Indians as a remedy for syphilis.
5. *Picramnia andicola* Tulasne, Ann. Sci. Nat. III. 7: 265. 1847.
Veracruz; type from mountains of Veracruz, at an altitude of 750 meters. Slender shrub, copiously pubescent; leaflets 7 to 13, oblong, ovate-oblong, or obovate, 3 to 8.5 cm. long, obtuse-acuminate; flowers reddish green.
6. *Picramnia lindeniana* Tulasne, Ann. Sci. Nat. III. 7: 266. 1847.
Known only from the type locality, Rfo Puyatapengo, Teapa, Tabasco. Tree; leaflets 9 to 11, obliquely ovate or lanceolate, 5 to 8 cm. long; flowers white.
7. *Picramnia antidesma* Swartz, Prodr. Veg. Ind. Occ. 27. 1788.
?Picramnia teapensis Tulasne, Ann. Sci. Nat. III. 7: 265. 1847.
Tepic to Chiapas and Tabasco. West Indies and Central America; type from Jamaica.
Shrub or tree, sometimes 6 meters high, glabrate; leaflets usually 7 to 13, oval to ovate-oblong, usually acuminate, bright green; flowers greenish white; fruit 1.5 cm. long, orange or red. "Chilillo" (Chiapas, *Seler*); "cáscara amarga" (Panama).

The leaves and bark are bitter, with a flavor resembling that of licorice. The bark was formerly exported to Europe, where it was used as a remedy for erysipelas and venereal diseases. In the West Indies it has been employed in domestic medicine for intermittent fevers and for gastric and intestinal affections.

DOUBTFUL SPECIES.

PICRAMNIA BONPLANDIANA Tulasne, Ann. Sci. Nat. III. 7: 266. 1847. Type from Jalapa, Veracruz.

PICRAMNIA FESSONIA DC. Prodr. 2: 66. 1825. Described from Mexico.

72. BURSERACEAE. Torchwood Family.

REFERENCE: Rose, N. Amer. Fl. 25: 241-261. 1911.

Aromatic unarmed trees or shrubs; leaves alternate, estipulate, simple, pinnate, or bipinnate, the leaflets entire or crenate; flowers small, perfect or unisexual, usually paniculate; sepals 3 to 5, united below; petals as many as the

sepals and alternate with them, usually distinct; stamens twice as many as the petals, the filaments free; ovary 4 or 5-celled, the ovules usually 2 in each cell; fruit drupaceous, containing 1 to 5 stones.

Petals valvate in bud; leaves pinnately 5 or 7-foliolate, the leaflets large, entire.

1. ICICA.

Petals imbricate; leaves various-----2. ELAPHRIUM.

1. ICICA Aubl. Pl. Guian. 1: 337. 1775.

1. *Icica copal* Schlecht. & Cham. Linnaea 5: 601. 1830.

? *Icica leptostachya* Turcz. Bull. Soc. Nat. Moscou 31¹: 473. 1858.

Protium copal Engl. in DC. Monogr. Phan. 4: 83. 1883.

Icica palmeri Rose, N. Amer. Fl. 25: 260. 1911.

San Luis Potosí, Veracruz, and Oaxaca; type from Veracruz.

Tree; leaves pinnate, the leaflets 5 or 7, 10 to 18 cm. long, oblong, obtuse or rounded at apex, coriaceous, entire; flowers small, in axillary panicles. "Copal" (Veracruz).

Icica heptaphylla Aubl. has been reported from Yucatán, where it is said to be known as "copal" and "pom." The writer has seen no specimens of the genus from that State.

2. ELAPHRIUM Jacq. Enum. Pl. Carib. 3. 1760.

Shrubs or trees; leaves deciduous, simple, pinnate, or bipinnate, the leaflets entire or crenate, sometimes lobate; flowers small, solitary or in axillary panicles; fruit a small 3-angled drupe, containing a single large seed.

The species all have a strong and characteristic odor resulting from the oil contained in the plants. All or most of them yield a resin, known as "copal," which is used in various ways, especially in domestic medicine. It is employed particularly as a cement and for varnish, and is burned by the Indians as incense in the churches and during some of their pagan celebrations. The name copal, which is of Nahuatl origin, is now applied in commerce to resins which come from Africa, the East Indies, and South America, and, indeed, most of the commercial resins known as copal come from those regions. The following vernacular names are reported for plants of the genus whose specific determination is doubtful: "Tacamaca"; "papelillo" (Durango); "tecomaca"; "copalquahuitl" (Nahuatl; applied to various species); "suchicopal" (Colima, Veracruz, Jalisco); "sochicopal" (Colima, Veracruz); "copalxochitl" (Colima, Veracruz); "teponaxtle," "teponaxtli," "teponaztli;" "cirujano" (Morelos). The species are so closely related that many of the vernacular names are doubtless applied to more than a single one.

Petiole and rachis not winged.

Leaves simple or unifoliolate.

Leaves crenate.

Flowers solitary, nearly sessile; leaves glabrous---1. *E. subtrifoliatum*.

Flowers paniculate, on slender pedicels; leaves pubescent.

42. *E. rhoifolium*.

Leaves entire.

Leaves lance-oblong, more than twice as long as broad; pedicels long and slender-----2. *E. cerasifolium*.

Leaves ovate or oval, less than twice as long as broad; pedicels short and stout-----3. *E. simplicifolium*.

Leaves with 3 or more leaflets.

Leaflets crenate.

Leaflets 11 to 35.

Leaflets 2 to 4 cm. long, narrowly lanceolate.....4. *E. multijugum*.

Leaflets 1 to 1.5 cm. long, oblong.....5. *E. karwinskii*.

Leaflets 3 to 7.

Leaflets rounded or obtuse at apex.....1. *E. subtrifoliatum*.

Leaflets acute or acuminate.

Lateral nerves of the leaflets very numerous (about 20) and prominent.....6. *E. kerberi*.

Lateral nerves few, not conspicuous.

Leaflets acuminate.....7. *E. lancifolium*.

Leaflets merely acute.....8. *E. trijugum*.

Leaflets entire.

Leaflets small, about 1 cm. long.....9. *E. schaffneri*.

Leaflets large, 3 to 12 cm. long or larger.

Ovary and fruit pubescent.....10. *E. grandifolium*.

Ovary and fruit glabrous.

Leaflets densely tomentose at maturity.....11. *E. heterophyllum*.

Leaflets glabrous at maturity or thinly pilose or puberulent.

Leaflets glaucescent beneath, with very prominent, reticulate venation.....12. *E. longipes*.

Leaflets green beneath, the venation not prominent.

13. *E. simaruba*.

Petiole and rachis winged, sometimes very narrowly so.

Leaves bipinnate.

Leaflets large, usually 1 to 2.5 cm. long.

Leaflets rounded at base.....14. *E. diversifolium*.

Leaflets acute at base.....15. *E. collinum*.

Leaflets small, most of them much less than 1 cm. long.

Leaflets coriaceous, densely pilose beneath; calyx lobes shorter than the petals.....16. *E. gracile*.

Leaflets comparatively thin, glabrous or nearly so; calyx lobes equaling or longer than the petals.....17. *E. bipinnatum*.

Leaves once pinnate.

Leaflets entire, never tomentose.

Leaflets linear, oblong, or rarely oval, 3 mm. wide or narrower.

Leaflets 5 to 9. Young branches pubescent.....18. *E. aridum*.

Leaflets more than 9 in all or most of the leaves.

Leaflets linear-oblong to oval.....19. *E. microphyllum*.

Leaflets narrowly linear.....20. *E. galeottianum*.

Leaflets lanceolate to broadly ovate or oval-elliptic, most of them more than 5 mm. wide.....21. *E. odoratum*.

Leaflets crenate or serrate, or, if entire, densely tomentose.

Leaflets glabrous beneath when mature, or pubescent only along the costa.

Leaflets about 25, linear-lanceolate.....22. *E. pringlei*.

Leaflets 3 to 15.

Leaflets long-attenuate or long-acuminate at apex.

Teeth of the leaflets very large and coarse.....23. *E. penicillatum*.

Teeth of the leaves very small and appressed.

Leaflets 3 or 5.....25. *E. tecomaca*.

Leaflets usually 7 to 15.

Leaflets 7 or 9; inflorescence sessile or nearly so.

21. *E. odoratum*.

Leaflets 11 to 15; inflorescence slender-pedunculate.

26. *E. rubrum*.

Leaflets rounded to acute at apex.

Leaflets 3.....27. *E. biflorum*.

Leaflets 5 or more.

Leaflets crenate with large coarse teeth.

Base of the leaflets acute or cuneate.....28. *E. laxiflorum*.

Base of the leaflets rounded or obtuse.....37. *E. aloexylon*.

Leaflets with very small appressed teeth.

Leaflets entire or with few distant obscure teeth.

21. *E. odoratum*.

Leaflets finely crenate along almost the whole margin.

29. *E. fagaroides*.

Leaflets conspicuously pubescent beneath even at maturity, on the surface as well as on the costa.

Teeth of the leaflets small and appressed or none.

Leaflets green beneath, sparsely puberulent.....21. *E. odoratum*.

Leaflets white-tomentose beneath.

Leaflets glabrate on the upper surface, narrowly lanceolate.

30. *E. bicolor*.

Leaflets pilose on the upper surface, oblong.....31. *E. pannosum*.

Teeth large and coarse.

Leaves at maturity thick-coriaceous, strongly bullate on the upper surface, densely pubescent on both surfaces.

Leaflets 11 to 21 in all or most of the leaves.....32. *E. jorullense*.

Leaflets 5 to 9.

Leaflets 1 to 1.5 cm. long.....33. *E. schiedeanum*.

Leaflets mostly 3 to 6 cm. long.....34. *E. cuneatum*.

Leaves thin at maturity, or if thick never bullate.

Fruit densely pubescent.....35. *E. submoniliforme*.

Fruit glabrous.

Leaflets at maturity glabrous on the upper surface, often lustrous, rarely pubescent, but then 12 mm. long or shorter.

Leaflets 9 to 19, with a few irregular crenations.

36. *E. filicifolium*.

Leaflets 5 to 9, regularly crenate.

Inflorescence pubescent, short-pedunculate.....37. *E. aloexylon*.

Inflorescence glabrous, long-pedunculate.

38. *E. longipedunculatum*.

Leaflets densely pubescent on the upper surface at maturity, usually 2 cm. long or larger.

Leaflets 15 to 21.....39. *E. sessiliflorum*.

Leaflets 1 to 11.

Leaflets long-acuminate.....24. *E. pubescens*.

Leaflets obtuse.

Rachis conspicuously dentate.....40. *E. excelsum*.

Rachis entire.

Flowers nearly sessile.....41. *E. queretarense*.

Flowers slender-pedicellate.....42. *E. rhoifolium*.

1. *Elaphrium subtrifoliatum* Rose, N. Amer. Fl. 25: 244. 1911.

Terebinthus subtrifoliatus Rose, Contr. U. S. Nat. Herb. 10: 122. 1906.

Jalisco; type collected west of Bolaños.

Low glabrous shrub with dark reddish brown branchlets; leaflets 1 or 3, ovate-rhombic, 1 to 2.5 cm. long, rounded at apex.

2. *Elaphrium cerasifolium* (T. S. Brandeg.) Rose, N. Amer. Fl. 25: 244. 1911.
Bursera cerasifolia T. S. Brandeg. Proc. Calif. Acad. II. 3: 121. 1891.
 Southern Baja California; type from San José del Cabo.
 Small tree, 4 to 8 meters high, with reddish brown branchlets; leaves bright green, 3 to 6 cm. long, glabrous.
3. *Elaphrium simplicifolium* Schlecht. Linnaea 16: 532. 1842.
Bursera schlechtendalii Engl. in DC. Monogr. Phan. 4: 41. 1883.
Bursera jonesii Rose, Contr. U. S. Nat. Herb. 3: 314. 1895.
 Jalisco to Chiapas. Guatemala.
 Shrub or small tree, 2 to 3 meters high, glabrous, with grayish or brownish branches; leaves 1 to 3.5 cm. long, rounded to acutish at apex.
4. *Elaphrium multifugum* (Engl.) Rose, N. Amer. Fl. 25: 248. 1911.
Bursera multijuga Engl. in DC. Monogr. Phan. 4: 42. 1883.
 Colima (type locality) and perhaps elsewhere; not seen by the writer.
 Leaflets acute, glabrous; panicles 1.5 to 3.5 cm. long; flowers greenish yellow. "Cuajote amarillo" (Engler).
5. *Elaphrium karwinskii* (Engl.) Rose, N. Amer. Fl. 25: 248. 1911.
Bursera karwinskii Engl. in DC. Monogr. Phan. 4: 43. 1883.
 Known only from the type locality, Tolimán, Querétaro.
 Leaflets glabrous.
6. *Elaphrium kerberi* (Engl.) Rose, N. Amer. Fl. 25: 247. 1911.
Bursera kerberi Engl. in DC. Monogr. Phan. 4: 41. 1883.
 Jalisco and Colima; type from Colima.
 Shrub or small tree; bark peeling off in thin, reddish brown sheets; leaflets 3, sessile, oblong-lanceolate to oval-oblong, 4 to 9 cm. long, finely crenate-serrate, glabrous, usually cuspidate-acuminate.
7. *Elaphrium lancifolium* Schlecht. Linnaea 17: 247. 1843.
Bursera lancifolia Engl. in DC. Monogr. Phan. 4: 42. 1883.
 Known only from the type collection, perhaps from Veracruz.
 Leaflets 3 to 7, lanceolate, 5 to 6 cm. long, glabrous.
8. *Elaphrium trijugum* (Ramírez) Rose, N. Amer. Fl. 25: 248. 1911.
Bursera trijuga Ramírez, Anal. Inst. Méd. Nac. Méx. 2: 16. pl. 2. 1896.
 Morelos; type from Distrito de Ayala.
 Leaflets 7, 4 to 7.5 cm. long, glabrous. "Cuajote chino."
9. *Elaphrium schaffneri* (S. Wats.) Rose, N. Amer. Fl. 25: 245. 1911.
Bursera schaffneri S. Wats. Proc. Amer. Acad. 22: 469. 1887.
 San Luis Potosí; type from Morales Mountains.
 Leaflets 3 to 7, obovate or suborbicular, glabrous.
Elaphrium obovatum (Turcz.) Rose¹ is a closely related species, if not the same as *E. schaffneri*. The type is from Orizaba.
10. *Elaphrium grandifolium* Schlecht. Linnaea 17: 249. 1843.
Bursera cinerea Engl. in DC. Monogr. Phan. 4: 43. 1883.
Bursera grandifolia Engl. in DC. Monogr. Phan. 4: 45. 1883.
Elaphrium occidentale Rose, N. Amer. Fl. 25: 246. 1911.
 Sinaloa to Oaxaca and Veracruz.
 Tree, 3 to 9 meters high or larger, the trunk often 45 cm. in diameter, the bark purplish green, finally peeling off in papery brownish sheets; leaf-

¹ N. Amer. Fl. 25: 245. 1911. *Bursera obovata* Turcz. Bull. Soc. Nat. Moscou 36¹: 614. 1863.

lets 3 to 9 (usually 5), 4 to 13 cm. long, abruptly acuminate at apex, copiously pubescent, at least beneath. "Palo mulato" (Oaxaca); "chutama" (Sinaloa).

The gum which exudes from the trunk is employed for caulking boats and glueing furniture.

11. *Elaphrium heterophyllum* (Engl.) Rose, N. Amer. Fl. 25: 247. 1911.

Bursera heterophylla Engl. in DC. Monogr. Phan. 4: 46. 1883.

Known only from the type locality, Tlaquiltenango, Morelos; not seen by the writer.

Leaflets 3 or 5, elliptic, 1.5 to 2 cm. long; panicles 6 to 8 cm. long.

12. *Elaphrium longipes* Rose, N. Amer. Fl. 25: 246. 1911.

Terebinthus longipes Rose, Contr. U. S. Nat. Herb. 10: 120. 1906.

Type from Matamoros, Puebla; perhaps also in Morelos.

Small glabrous tree, 3 to 4 meters high, with broad flat crown; leaflets 7 to 13, long-petiolulate, 2.5 to 5 cm. long, abruptly acuminate.

13. *Elaphrium simaruba* (L.) Rose, N. Amer. Fl. 25: 246. 1911.

Pistacia simaruba L. Sp. Pl. 1026. 1753.

Bursera gummifera L. Sp. Pl. ed. 2. 471. 1762.

? *Elaphrium ovalifolium* Schlecht. Linnaea 17: 248. 1843.

Bursera simaruba Sarg. Gard. & For. 3: 260. 1890.

Terebinthus arborca Rose, Contr. U. S. Nat. Herb. 10: 118. 1906.

Terebinthus acuminata Rose, Contr. U. S. Nat. Herb. 12: 278. 1909.

Terebinthus attenuata Rose, Contr. U. S. Nat. Herb. 12: 278. 1909.

Elaphrium subpubescens Rose, N. Amer. Fl. 25: 247. 1911.

Sinaloa to Tamaulipas, Veracruz, Yucatán, and Chiapas. Southern Florida, West Indies, Central America, and northern South America; type from Jamaica.

Tree, sometimes 25 meters high, with a trunk a meter in diameter, but usually much smaller, the branches thick and spreading; bark reddish brown, smooth, peeling off in thin sheets; leaflets usually 5 or 7, 4 to 14 cm. long, variable in shape, usually acuminate or cuspidate-acuminate, commonly more or less pubescent; flowers greenish or yellowish, sweet-scented; wood light brown, soft, weak, its specific gravity about 0.30. "Palo mulato" (Tepic, Chiapas, Tabasco, Oaxaca, Veracruz); "quiote" (Sinaloa); "palo jiote" (Chiapas, Veracruz, Guatemala, Honduras, El Salvador); "chacah" or "chaca" (Yucatán, Tamaulipas, Veracruz); "piocha" (Tamaulipas); "zongolica" (Oaxaca); "palo colorado," "mulato" (Sinaloa); "archipín"; "almácigo" (Porto Rico, Costa Rica, Santo Domingo, Panama, Colombia); "jiñocuabo," "jiñicüite" (Nicaragua); "jiote" (Sinaloa, Honduras, Guatemala); "jiñocuave," "carana," "jiñocuavo," "jiñote" (Costa Rica); "almácigo encarnado" (Porto Rico); "jiote," "chino," "chinacahuite" (Guatemala); "copón" (Honduras); "almácigo blanco" (Cuba, Santo Domingo); "almácigo colorado," "almácigo amarillo," "cachibú" (Cuba); "indio desnudo," "pellejo de indio" (Guiana); "palo chino" (Guatemala, Honduras).

The branches take root easily when placed in the ground, and the tree is often planted for shade or to form hedges. The wood, which has a strong characteristic odor, is not very durable, but it is employed for fence posts and canoes, and is burned for charcoal. From the branches a brownish gum exudes, which is often used as a substitute for glue and as a cement for mending broken china and glass. The gum is known in Costa Rica as "elequeme" and "tacamahaca." The Caribs employed it for painting their canoes to preserve them from the attacks of worms. The tree is much used in domestic medicine, the gum and sometimes the leaves being the parts employed. Diaphoretic, purgative, diuretic, and expectorant properties are attributed to it, and it is

employed for dysentery, dropsy, venereal diseases, yellow fever, and other affections.

In Florida the tree is known as "gumbolimbo," a name used also by the Jamaican negroes, an apparent corruption of "goma elemí," the name sometimes given by the Spaniards to the gum.¹ The fruit is eaten by birds and pigs.

For an illustration of *Elaphrium simaruba* see Contr. U. S. Nat. Herb. 8: pl. 21.

14. *Elaphrium diversifolium* Rose, N. Amer. Fl. 25: 248. 1911.

Bursera diversifolia Rose, Contr. U. S. Nat. Herb. 5: 113. 1897.

Chiapas; type collected between Ocuilapa and Tuxtla.

Tree, 3.5 to 7.5 meters high, copiously pubescent; leaflets 9 to 13, the lower ones pinnate, or the leaves often simply pinnate.

15. *Elaphrium collinum* (T. S. Brandeg.) Rose, N. Amer. Fl. 25: 248. 1911.

Bursera collina T. S. Brandeg. Zoe 5: 204. 1905.

Known only from the type locality, Cofradfa, Sinaloa.

Leaves copiously pubescent.

16. *Elaphrium gracile* (Engl.) Rose, N. Amer. Fl. 25: 249. 1911.

Bursera gracilis Engl. in DC. Monogr. Phan. 4: 50. 1883.

Jalisco to Morelos and Chiapas; type from Xochiculco, Oaxaca. Guatemala. Tree, sometimes 9 meters high; flowers greenish white; fruit green or brownish red. "Copal santo," "copal chino colorado," "incienso del país" (Oaxaca, *Reko*); "copal" (Guatemala).

It is not certain that this is specifically distinct from the next species.

17. *Elaphrium bipinnatum* (DC.) Schlecht. Linnaea 17: 631. 1843.

Amyris bipinnata DC. Prodr. 2: 82. 1825.

Bursera bipinnata Engl. in DC. Monogr. Phan. 4: 49. 1883.

Sinaloa and southern Chihuahua to Guerrero and Morelos.

Shrub or small tree, sometimes 12 meters high, with a trunk 50 cm. in diameter; leaves fernlike, with very numerous small leaflets. "Jaboncillo" (Chihuahua); "copal chino," "copal amargo" (Michoacán); "copal amargoso" (Guerrero, *Ramírez*); "incienso del país," "tetlate," "tetlatfa" (Morelos, *Ramírez*); "tetlatián," "tetlatín" (*Ramírez*); "copal amargo" (*Conzatti*); "palo copal" (Sinaloa); "cuajote colorado" (*Villada*).

The resin is employed in Sinaloa for treating wounds.

18. *Elaphrium aridum* Rose, N. Amer. Fl. 25: 249. 1911.

Terebinthus arida Rose, Contr. U. S. Nat. Herb. 10: 118. 1906.

Known only from the vicinity of the type locality, dry hills about Tehuacán, Puebla.

Low shrub; leaflets green, 4 to 6 mm. long, rounded at apex, glabrous or nearly so.

19. *Elaphrium microphyllum* (A. Gray) Rose, N. Amer. Fl. 25: 250. 1911.

Bursera microphylla A. Gray, Proc. Amer. Acad. 5: 155. 1861.

Bursera morelensis Ramírez, Anal. Inst. Méd. Nac. Méx. 2: 17. 1896.

Terebinthus multifolia Rose, Contr. U. S. Nat. Herb. 10: 120. 1906.

Dry plains and hillsides, Sonora and Baja California to Zacatecas, Morelos, and Puebla; type from Baja California. Southern Arizona.

Shrub or tree, sometimes 9 meters high, with reddish branches; leaflets usually 11 to 35, obtuse, glabrous. "Torote" (Sonora, Baja California); "torote blanco" (Sonora); "copal" (Baja California); "cuajote colorado" (Morelos).

¹ See W. E. Safford, Natural history of Paradise Key and the near-by Everglades of Florida, Smithsonian. Rep. 1917: 377-434. pl. 1-64. 1920.

The bark is used for tanning and dyeing, and has been exported for that purpose from Baja California. The Indians of Sonora are said to use the branches for basketry. An infusion of the bark or gum is a popular remedy for venereal diseases.

It may be that more than one species should be recognized here, but the characters that have been cited as distinguishing the three species here combined do not hold for the material examined by the writer.

20. *Elaphrium galeottianum* (Engl.) Rose, N. Amer. Fl. 25: 249. 1911.

Bursera galeottiana Engl. in DC. Monogr. Phan. 4: 47. 1883.

Puebla and Oaxaca; type from Tehuacán, Puebla.

Small tree; leaflets 13 to 25, glabrous. "Cuajote colorado" (Oaxaca, Villada).

Very closely related to *E. microphyllum*, and perhaps only a form of it. The leaflets, however, are narrower, and the pubescence usually more abundant.

21. *Elaphrium odoratum* (T. S. Brandeg.) Rose, N. Amer. Fl. 25: 250. 1911.

Bursera odorata T. S. Brandeg. Proc. Calif. Acad. II. 2: 138. 1889.

Bursera tenuifolia Rose, Contr. U. S. Nat. Herb. 3: 314. 1895.

Bursera aptera Ramírez, Anal. Inst. Méd. Nac. Méx. 2: 16. 1896.

Bursera purpusii T. S. Brandeg. Zoe 5: 249. 1908.

Elaphrium covillei Rose, N. Amer. Fl. 25: 250. 1911.

Elaphrium confusum Rose, N. Amer. Fl. 25: 251. 1911.

Elaphrium brachypodum Rose, N. Amer. Fl. 25: 253. 1911.

Sonora and Baja California to Morelos and Puebla; type from San Gregorio, Baja California.

Shrub or small tree; bark yellow, peeling off in thin papery sheets; leaflets 5 to 11, 1 to 3.5 cm. long, acute to rounded at apex, entire or obscurely crenulate, usually glabrous but sometimes sparsely pubescent beneath. "Cuajote verde" (Morelos); "torote" (Baja California, Sinaloa); "chutama" (Sinaloa).

The gum is applied to cure scorpion stings, insect bites, and other wounds. It is yellowish, brown, or almost black, odorless, acrid, and bitter, and is reputed to have expectorant and drastic purgative properties. It is used also for mending broken dishes. The bark is employed for tanning hides.

The species is a variable one, the leaves varying greatly upon the same plant. All the names listed above refer to very closely related forms, which it seems impossible to separate by any constant character. For an illustration of a tree see Contr. U. S. Nat. Herb. 16: pl. 115.

This is probably the species figured by Hernández and described¹ in a chapter entitled "De Cuilacopalli seu Stercore Copallis, Copallifera VI."

22. *Elaphrium pringlei* (S. Wats.) Rose, N. Amer. Fl. 25: 252. 1911.

Bursera pringlei S. Wats. Proc. Amer. Acad. 25: 145. 1890.

Jalisco; type from bluffs of the Río Grande de Santiago, near Guadalajara.

Small tree; leaflets linear-lanceolate, 2 to 4 cm. long, dark green above, pale beneath; flowers purplish. "Cuajote colorado."

23. *Elaphrium penicillatum* DC. Prodr. 1: 724. 1824.

Bursera graveolens pilosa Engl. in DC. Monogr. Phan. 4: 49. 1883.

Bursera penicillata Engl. in DC. Monogr. Phan. 4: 52. 1883.

Elaphrium pilosum Rose, N. Amer. Fl. 25: 251. 1911.

Southern Chihuahua and Sinaloa to Jalisco.

Shrub, 1 to 3 meters high; leaflets 7 to 15, thin, 4 to 8 cm. long.

¹ Thesaurus 48. 1651.

24. *Elaphrium pubescens* Schlecht. *Linnaea* 16: 527. 1842.

Yucatán and Campeche; type from Campeche.

Tree, about 15 meters high; leaflets usually 7, 3 to 5 cm. long. "Nabanché" (Yucatán).

Said to be cultivated in Yucatán and possibly an introduced species; very closely related to *Elaphrium graveolens* H. B. K. (as which it has been reported from Yucatán) of South America.

25. *Elaphrium tecomaca* (DC) Standl.

Amyris tecomaca DC. Prodr. 2: 82. 1825.

Bursera fragilis S. Wats. Proc. Amer. Acad. 21: 422. 1886.

Amyris sylvatica Sessé & Moc. Fl. Mex. ed. 2. 93. 1894. Not *A. sylvatica* Jacq. 1763.

Sinaloa and southern Chihuahua. Type (according to Sessé and Mociño) from mountains near Mazatlán (Guerrero?).

Tree, 3 to 5 meters high, glabrous, the trunk 5 to 8 cm. in diameter; leaflets 3 or 5, lanceolate or narrowly lanceolate, 3 to 6 cm. long, finely crenate-serrate. "Torote" (Chihuahua).

Sessé and Mociño give the vernacular name as "tacamahaca," and state that the gum was used for healing wounds.

26. *Elaphrium rubrum* Rose, N. Amer. Fl. 25: 252. 1911.

Terebinthus rubra Rose, Contr. U. S. Nat. Herb. 10: 121. 1906.

Sonora and Sinaloa; type collected near Colomas, Sinaloa.

Shrub or small tree; leaflets 2 to 4 cm. long, bright green, glabrous.

27. *Elaphrium biflorum* Rose, N. Amer. Fl. 25: 253. 1911.

Terebinthus biflora Rose, Contr. U. S. Nat. Herb. 10: 119. 1906.

Puebla; type from Tehuacán.

Shrub or tree, 2 to 5 meters high, with short branches; leaflets 1 to 3 cm. long, glabrate, crenate.

28. *Elaphrium laxiflorum* (S. Wats.) Rose, N. Amer. Fl. 25: 253. 1911.

Bursera laxiflora S. Wats. Proc. Amer. Acad. 24: 44. 1889.

Dry hillsides, Sonora and Sinaloa; type from Guaymas, Sonora.

Shrub or small tree with reddish brown branches; leaflets 5 to 9, most of them less than 1 cm. long, very coarsely crenate or rarely entire. "Copal" (Sonora, Sinaloa); "torote prieto" (Sonora).

29. *Elaphrium fagaroides* H. B. K. Nov. Gen. & Sp. 7: 27. pl. 611. 1824.

Bursera fagaroides Engl. in DC. Monogr. Phan. 4: 48. 1883.

Durango to Puebla; type from Querétaro.

Tree with brown branches; leaflets usually 5 or 7 and 1 to 2 cm. long. "Cuajiote amarillo" (Morelos, *Urbina*); "cuajiote colorado" (San Luis Potosí, *Ramírez*).

30. *Elaphrium bicolor* Schlecht. *Linnaea* 17: 625. 1843.

Bursera bicolor Engl. in DC. Monogr. Phan. 4: 53. 1883.

Morelos; type from Real de Cuautla.

Small tree with rounded crown; leaflets 9 to 19, 3.5 to 8 cm. long, densely white-tomentose beneath; panicles lax, 10 to 20 cm. long.

31. *Elaphrium pannosum* (Engl.) Rose, N. Amer. Fl. 25: 254. 1911.

Bursera pannosa Engl. in DC. Monogr. Phan. 4: 54. 1883.

Known only from the type locality, Mirador, Veracruz; not seen by the writer.

Leaflets 9, acute, 1.5 to 2 cm. long.

32. *Elaphrium jorullense* H. B. K. Nov. Gen. & Sp. 7: 28. pl. 612. 1824.

Elaphrium lanuginosum H. B. K. Nov. Gen. & Sp. 7: 31. 1824.

Bursera jorullensis Engl. in DC. Monogr. Phan. 4: 57. 1883.

Bursera palmeri glabrescens S. Wats. Proc. Amer. Acad. 25: 145. 1890.

Bursera glabrescens Rose, Contr. U. S. Nat. Herb. 3: 313. 1895.

Durango to Puebla and Guerrero; type from Jorullo, Michoacán.

Shrub or tree, sometimes 7.5 meters high, with brown bark; leaflets 2 to 4 cm. long, densely pubescent, strongly rugose. "Copal" (Morelos, *Urbina*); "copal blanco," "copal de penca" (Morelos, *Ramírez*); "copal santo" (Morelos, Michoacán, *Ramírez*); "ngedni," "ngidi" (Otomí); "copalli," "goma de limón," "elemí de México" (*Nueva Farmacopea Mexicana*); copalquahuitl" (Nahuatl).

The copal or resin of this tree is reddish and burns readily. It is usually gathered in September and October from incisions in the trunk, the juice being collected on maguey leaves, hence the name of "copal de penca." Dissolved in turpentine the resin gives a transparent and very glossy varnish. The copal is used in Mexico as a substitute for gum elemi. It is employed in treating uterine diseases and in making ointments, and smoke from it is inhaled as a remedy for headache.

This may be the species figured by Hernández and described¹ in a chapter headed "De Copaliquahuitl Patlahoac, seu Arbore Copalli latifolia, Copalifera II."

33. *Elaphrium schiedeana* (Engl.) Rose, N. Amer. Fl. 25: 256. 1911.

Bursera schiedeana Engl. in DC. Monogr. Phan. 4: 57. 1885.

Known only from the type locality, Cuautla, Morelos; not seen by the writer.

Leaflets 7 or 9, pubescent on both surfaces.

34. *Elaphrium cuneatum* Schlecht. Linnaea 17: 629. 1843.

Bursera cuneata Engl. in DC. Monogr. Phan. 4: 56. 1883.

Guanajuato, Mexico, and Guerrero; type from Tlamixtlahuaca, Guerrero.

Leaflets 7 or 9, oblong or lance-oblong, very rugose, densely pubescent beneath.

35. *Elaphrium submoniliforme* (Engl.) Marchand; Rose, N. Amer. Fl. 25: 255. 1911.

Bursera submoniliformis Engl. in DC. Monogr. Phan. 4: 55. 1883.

Oaxaca; type from Río Vueltas.

Leaflets 7 to 13, oblong or oval, 1 to 3 cm. long, densely pubescent.

36. *Elaphrium filicifolium* (T. S. Brandeg.) Rose, N. Amer. Fl. 25: 254. 1911.

Bursera filicifolia T. S. Brandeg. Zoe 5: 248. 1908.

Sonora and Baja California; type from Rancho Colorado, Baja California.

Small tree with brownish branches; leaflets usually 1 cm. long or shorter, bright green.

37. *Elaphrium aloexylon* Schiede, Linnaea 17: 252. 1843.

Bursera aloexylon Engl. in DC. Monogr. Phan. 4: 52. 1883.

Bursera nelsoni Rose, Contr. U. S. Nat. Herb. 3: 314. 1895.

Morelos, Puebla and Oaxaca; type from Real de Cuautla, Morelos.

Shrub or small tree; leaflets usually 7 or 9, 1 to 2 cm. long or sometimes larger, pubescent when young but often glabrate in age. The following vernacular names are reported, but it is uncertain whether they belong exclusively, or at all, to this species: "Linaloé," "inanué," "linalué," "xochicopal"; "cua-jiote colorado" (Oaxaca, *Villada*).

By distillation there is obtained from the wood or fruit an oil which is used in the manufacture of perfumes. The wood, which is yellow and very fragrant, is said to have been exported to England.

¹ Thesaurus 46. 1651.

This is probably the species figured by Hernández and described¹ in a chapter entitled "De Copalli Qualuitl, seu Arbore Gummiifera Copallifera I."

E. glabrifolium H. B. K.² described from Michoacán, may be the same species.

38. *Elaphrium longipedunculatum* Rose, N. Amer. Fl. 25: 254. 1911.

Puebla and Oaxaca; type from Almoloyas, Oaxaca.

Tree with reddish branches; leaflets 5 or 7, densely pubescent or glabrate, 1.5 to 4 cm. long.

39. *Elaphrium sessiliflorum* (Engl.) Rose, N. Amer. Fl. 25: 254. 1911.

Bursera sessiliflora Engl. in DC. Monogr. Phan. 4: 55. 1883.

Bursera asplenifolia T. S. Brandeg. Univ. Calif. Publ. Bot. 3: 382. 1909.

Puebla and Oaxaca.

Leaflets 15 to 21, 3 to 7 cm. long, densely pubescent.

40. *Elaphrium excelsum* H. B. K. Nov. Gen. & Sp. 7: 30. 1824.

Bursera excelsa Engl. in DC. Monogr. Phan. 4: 57. 1883.

Bursera palmeri S. Wats. Proc. Amer. Acad. 22: 402. 1887.

Durango and Sinaloa to Chiapas; type collected between Acapulco and El Exido, Guerrero. Guatemala.

Shrub or tree, 3 to 6 meters high, with reddish bark; leaflets 5 to 9, 2.5 to 5 cm. long, coarsely crenate, densely pubescent. "Sisiote" (Guanajuato); "copalquín" (Durango); "copal" (Guerrero, Oaxaca, Guatemala).

41. *Elaphrium queretarensis* Rose, N. Amer. Fl. 25: 254. 1911.

Querétaro; type collected near the city of Querétaro.

Tree, 4 to 5 meters high; leaflets 7 to 9, 1 to 3 cm. long, densely pubescent.

Probably only a form of *E. excelsum*.

42. *Elaphrium rhoifolium* Benth. Bot. Voy. Sulph. 10. 1844.

Elaphrium hindsianum Benth. Bot. Voy. Sulph. 11. 1844.

Terebinthus macdougalii Rose, Torreya 6: 170. 1906.

Elaphrium epinnatum Rose, N. Amer. Fl. 25: 243. 1911.

Elaphrium goldmani Rose, N. Amer. Fl. 25: 256. 1911.

Baja California, the type from Magdalena Bay; a closely related plant, perhaps of the same species, occurs in Puebla.

Shrub or small tree, 7.5 meters high or less, with reddish brown branches; leaves simple or pinnately 3 or 5-foliolate, copiously pubescent. "Copal."

The bark is used locally for tanning.

DOUBTFUL SPECIES.

BURSERA DELPECHIANA Poisson; Engl. in DC. Monogr. Phan. 4: 53. 1883. Type from Mexico.

¹Thesaurus 45. 1651.

²Nov. Gen. & Sp. 7: 28. 1824.

73. MELIACEAE. Chinaberry Family.

(Contributed by S. F. Blake.)

Trees or shrubs; leaves alternate, estipulate, usually pinnate; flowers regular, hermaphrodite (in ours); calyx 4 or 5-lobed or parted; petals 4 or 5, free or adnate to the disk; stamens 5, 8, or 10, usually united into a tube (free in *Cedrela*); disk annular or stipitiform, sometimes elongate; ovary free, 2 to 5-celled; ovules usually 2, sometimes 1 or 12; style simple; stigma disk-shaped or pyramidal; fruit capsular, rarely drupaceous.

Filaments united at least to middle.

Leaves bipinnate; fruit drupaceous.....1. MELIA.

Leaves once pinnate; fruit a capsule.

Anthers borne on apex of the staminal tube or of its lobes.

2. TRICHILIA.

Anthers borne inside the apex of the staminal tube.

Ovules 1 or 2 in each cell; seeds not winged.....3. GUAREA.

Ovules 12 in each cell; seeds winged.....4. SWIETENIA.

Filaments free.....5. CEDRELA.

1. MELIA L. Sp. Pl. 384. 1753.

REFERENCE: C. De Candolle in DC. Monogr. Phan. 1: 450-459. 1878.

1. *Melia azedarach* L. Sp. Pl. 384. 1753.

Melia azedarach a glabrior C. DC. in DC. Monogr. Phan. 1: 452. 1878.

Escaped from cultivation throughout Mexico. Native of the Old World; escaped from cultivation from the southwestern United States southward.

Tree, up to 15 meters high; leaves bipinnate, the leaflets toothed; flowers paniced, pink or lilac, sweet-scented; sepals 5; petals 5; filaments united into a tube, this 20-toothed at apex; anthers 10, sessile inside the apex of the tube; fruit a 4-seeded translucent drupe. "Paraíso" (Michoacán, Yucatán, Veracruz, San Luis Potosí, Oaxaca, Costa Rica, Argentina, Uruguay, Philippines, Colombia, Cuba, Guatemala); "piocha" (Oaxaca); "canelo" (Nuevo León, San Luis Potosí); "paraíso morado" (*Herrera*); "lila" (Chihuahua, Santo Domingo); "paraguas chino" (Chihuahua); "lila de las Indias," "lila de China" (*Nuevo Farm. Mex.*); "jaeinto" (Panama); "lilaña," "pasilla" (Porto Rico); "árbol de quitasol" (Cuba).

The chinaberry (known also as china-tree, pride of India, and umbrella-tree) is much planted in Mexican parks and gardens. It grows very rapidly, but the trees do not last long and the branches are easily broken off. Both flowers and fruit are borne in great profusion, and the yellowish fruits hang on the tree a long time. The wood is soft and weak. The large seeds are sometimes used as beads, and oil has been extracted from them.

The bark contains a bitter principle, mangrovin. The roots have a bitter, nauseous taste; they have been widely used as an anthelmintic but their efficacy is doubtful. The leaves are reported to have emetic properties, and they have been employed as a febrifuge and as a remedy for hysteria. The fruit is eaten by cattle, but it is generally reputed to be poisonous to human beings. The bark is said to be used in some regions for stupefying fish. In the southern United States there is a belief that if horses eat the fruits they will be protected against attacks of bots. It is said also that the berries packed with dried fruit will prevent the attacks of insects and that if laid among clothes they will keep away moths. A decoction of the fruits sprinkled over growing plants is reported to guard them from injury by cutworms and other insects.

The specific name *azedarach* is of Arabic origin. For an illustration of the chinaberry see Contr. U. S. Nat. Herb. 8: pl. 45.

2. **TRICHILIA** L. Syst. Nat. ed. 10. 1020. 1759.

REFERENCE: C. De Candolle in DC. Monogr. Phan. 1: 646-713. 1878.

Leaves abruptly pinnate, rarely odd-pinnate; panicles axillary, rarely terminal; calyx 4 or 5-toothed or lobed, rarely 5-sepaled; petals 4 or 5, rarely 3; filaments connate below or to apex into a tube, the anthers borne at apex of the tube or of the lobes; ovary 2 to 4-celled, the ovules 1 or 2, superposed or collateral; capsule usually 3-valved and 3-seeded; seeds arillate.

Filaments connate nearly or quite to apex into a denticulate tube.

Ovary glabrous.....1. *T. havanensis*.

Ovary pubescent.....2. *T. oligantha*.

Filaments connate for two-thirds their length or less.

Leaflets 3.....3. *T. parvifolia*.

Leaflets more than 3.

Anthers pubescent.

Petals densely puberulous or tomentose outside; leaflets very densely and softly fulvescent-pilosulous beneath along nerves or over whole surface.....4. *T. cuneata*.

Petals sparsely puberulous or glabrous; leaflets sparsely puberulous to pilose chiefly along the veins beneath.

Leaflets 8, oval or obovate-oval, the larger 14 cm. long, 5.7 cm. wide; petals sparsely puberulous.....5. *T. oaxacana*.

Leaflets 11 to 21, lanceolate to elliptic, the larger 5 to 8 cm. long, 1 to 3 cm. wide; petals glabrous or sparsely pubescent above.

Disk about equaling the ovary.....6. *T. karwinskyana*.

Disk much shorter than ovary.....7. *T. hirta*.

Anthers glabrous.

Petals densely tomentose-puberulous outside; panicles terminal, corymbed.

8. *T. arborea*.

Petals glabrous outside; panicles axillary.

Petals 5 to 6 mm. long.

Panicle half to two-thirds as long as the leaves; free portion of filaments sparsely pilose within.....9. *T. pringlei*.

Panicle equaling the leaves; free portion of filaments densely hirsute within.....10. *T. pavoniana*.

Petals 4 mm. long.

Calyx teeth obtuse or rounded; ovules 2, superposed.....11. *T. colimana*.

Calyx teeth acute; ovules 2, collateral.....12. *T. wawrana*.

1. *Trichilia havanensis* Jacq. Enum. Pl. Carib. 20. 1760.

Trichilia havanensis β *lancoolata* C. DC. in DC. Monogr. Phan. 1: 677. 1878.

Trichilia havanensis var. *spathulata* Rose, Contr. U. S. Nat. Herb. 1: 314. 1895.

Tamaulipas to Sinaloa and Oaxaca. Central America and West Indies; type from Cuba.

Shrub or small tree; leaflets 3 to 9, obovate or cuneate-obovate, 3.5 to 15 cm. long, essentially glabrous, usually subcoriaceous; panicles umbelliform, dense, usually about 1.5 cm. long; petals glabrous, 3 mm. long; anthers, ovary, and style glabrous. "Limoncillo" (Oaxaca, Honduras); "cucharillo," "estribillo" (Tamaulipas); "uruca" (Costa Rica); "garrapatilla" (Colima); "cauache" (Sinaloa); "barre-horno" (El Salvador); "siguaraya" (Cuba).

The wood is used in Mexico for making spoons and other small articles. The cream-colored sweet-scented flowers are much visited by bees. In Costa Rica the branches are employed for decorating the interiors of houses and churches. The leaves and fruit are reputed to be poisonous.

2. *Trichilia oligantha* C. DC. in DC. Monogr. Phan. 1: 693. 1878.

Mexico, without locality.

Branchlets villosulous; leaflets 9, the blades lance-oblong, the larger 10 cm. long, 3 cm. wide, short-cuspidate, glabrous above except on costa, beneath softly pubescent; panicles branched, few-flowered, densely hirtellous; calyx teeth 4, acute; petals glabrous, 2 mm. long; anthers glabrous.

3. *Trichilia parvifolia* C. DC. Ann. Cons. Jard. Genève 10: 159. 1907.

Sinaloa to Guerrero and Veracruz; type from Mexico, without definite locality. Nicaragua.

Shrub, up to 4 meters high; leaflets obovate or cuneate-obovate, 2 to 4.5 cm. long, emarginate, usually thick, sparsely hairy on the veins and in the axils beneath, or subglabrous; panicles axillary, 1 cm. long or less; petals 5, glabrous, 3 mm. long; anthers glabrous; ovary and style hirsute; capsule about 6 mm. thick, pubescent, 3-seeded; seeds 4 mm. long.

This species is closely related to *T. trifolia* L., of Venezuela, and may not be distinct.

4. *Trichilia cuneata* Radlk. Sitzungsab. Math. Phys. Akad. München 9: 642. 1879.

Trichilia heydeana C. DC. Bot. Gaz. 19: 3. 1894.

Chiapas. Guatemala and El Salvador; type from Guatemala.

Middle-sized tree; leaflets 7 to 11, obovate or elliptic-oblong, 5 to 15 cm. long, obtuse to short-pointed; panicles dense, 7 to 20 cm. long, densely fulvescent-pilosulous; calyx deeply 5-toothed, the teeth acute; petals 3.2 mm. long.

5. *Trichilia oaxacana* Blake, Contr. Gray Herb. n. ser. 53: 58. 1918.

Known only from the type locality, Cafetal Concordia, Department Pochutla, Oaxaca.

Leaflets 8, oval or obovate-oval, the larger 14 cm. long, 5.7 cm. wide, obtusely acuminate, sparsely puberulous on the veins beneath; panicle 16 cm. long, on a peduncle 11 cm. long; calyx 1 mm. long, the 5 teeth acute; petals 3.5 mm. long; anthers pilose on margin; style sparsely pilose.

6. *Trichilia karwinskyana* C. DC. in DC. Monogr. Phan. 1: 663. 1878.

Known only from the type locality, Papantla, Veracruz.

Leaflets 13 to 15, the blades lanceolate, 7 cm. long, 2.5 cm. wide, membranaceous, long-cuspidate, appressed-pilosulous on costa above and on nerves beneath; panicles exceeding the petioles, densely hirtellous, the flowers crowded; petals glabrous, acute, 4 mm. long.

7. *Trichilia hirta* L. Syst. Nat. ed. 10. 1020. 1759.

Trichilia spondioides Jacq. Enum. Pl. Carib. 20. 1760.

Trichilia schiedeana var. *purpusii* T. S. Brandeg. Univ. Calif. Publ. Bot. 4: 274. 1912.

General nearly throughout Mexico. Central and South America; West Indies; type from Jamaica.

Shrub or small tree, 3 to 20 meters high; leaflets 11 to 21, the blades lance-ovate or elliptic, 2.5 to 8 cm. long, pilose along the veins, especially beneath, or glabrescent; panicles 3 to 13 cm. long; petals 4 mm. long, sparsely pubescent dorsally or subglabrous; capsules essentially glabrous, about 15 mm. thick; seeds 3, subglobose, 6 mm. thick. "Garbancillo" (Sonora); "xkulinsis" (Yucatán); "cabo de hacha" (Oaxaca, Cuba, Porto Rico); "mata-piojo" (Nicaragua); "jubabán," "guabán" (Cuba); "guaita," "jobillo," "molinillo," "palo de Anastasio," "retamo" (Porto Rico).

The compact, yellowish or brownish wood is used for carpentry and for making canoes, carts, and other articles. The root is said to have strong purgative properties.

8. *Trichilia arborea* C. DC. Bull. Herb. Boiss. II. 5: 426. 1905.

Yucatán. Costa Rica and Nicaragua; type from Nicoya, Costa Rica.

Tree, 15 to 20 meters high; leaflets 11, ovate to oblong, 3.5 to 6 cm. long, glabrate or puberulous above, short-pubescent on veins and surface beneath; panicles several, short, corymbed at apex of branches; petals 4.8 mm. long; style pubescent. "Choben-ché" (Yucatán, Maya).

This has been reported from Yucatán as *T. terminalis* Jacq. The bark is used there as a remedy for fevers.

9. *Trichilia pringlei* Rose, Contr. U. S. Nat. Herb. 8: 50. 1903.

Known only from the type locality, Cuernavaca, Morelos.

Shrub or tree, 4 to 9 meters high; leaflets 15, elliptic or elliptic-ovate, 5 to 7 cm. long, sparsely appressed-pubescent on both sides at maturity, obtusely acuminate; panicles (including peduncle) 15 to 20 cm. long, much shorter than leaves; petals glabrous, 5 to 5.8 mm. long; style glabrous; capsule densely fulvescent-pubescent, about 17 mm. thick.

10. *Trichilia pavoniana* C. DC. Ann. Cons. Jard. Genève 10: 154. 1907.

Mexico, without locality.

Leaflets 13, elliptic, 2 to 5 cm. long, obtusely short-acuminate, appressed-hirtellous above, densely so beneath; panicles about equaling the leaves; calyx teeth 5, rounded, ciliolate; petals glabrous, 6 mm. long; style glabrous.

11. *Trichilia colimana* C. DC. Bot. Gaz. 19: 40. 1894.

*Trichilia langlassei*¹ C. DC. Ann. Cons. Jard. Genève 10: 160. 1907.

Sinaloa to Guerrero; type from Colima.

Shrub or tree; leaflets 9 to 13, lanceolate to ovate or obovate-oval, the larger 5 to 12 cm. long, 2 to 4.5 cm. wide, sparsely or rather densely pilosulous or pilose on both sides, acuminate; panicles much shorter than leaves or equaling them, sparsely pilosulous; calyx ciliolate; petals 4 or 5; capsules 1 to 1.5 cm. thick, pubescent with short whitish hairs; seeds subglobose, 6 mm. thick.

12. *Trichilia wawrana* C. DC. in DC. Monogr. Phan. 1: 666. 1878.

Known only from the type locality, "Passo-Majo," Mexico.

Leaflets 13 to 15, lanceolate, the larger 3.5 cm. long, 1.5 cm. wide, obtusely cuspidate, appressed-pilose on both sides chiefly on the veins, ciliate; panicles half as long as the leaves; calyx puberulous; style glabrous above.

DOUBTFUL SPECIES.

TRICHILIA PALLIDA Swartz. Prodr. Veg. Ind. Occ. 67. 1788. This West Indian species is listed by Hemsley² from Mexico on the authority of Grisebach, but the record is very doubtful.

TRICHILIA PALMERI C. DC. Bot. Gaz. 19: 39. 1894.

Known only from the type locality, Armeria, Colima.

Petioles 1 to 2 cm. long; leaflets 3, narrowly obovate or elliptic, 2.8 to 6 cm. long, 1.5 to 2.5 cm. wide, petiolulate, obtusely acuminate or short-pointed,

¹ Named for Eugène Langlassé, who made a large collection of plants in 1898 and 1899 in the states of Michoacán and Guerrero. A set of the plants is in the U. S. National Herbarium.

² Biol. Centr. Amer. Bot. 1: 183. 1879.

glabrous above, densely spreading-pilosulous on the veins beneath and sparsely so on surface; flowers unknown; capsule glabrous, about 6 mm. thick; seeds 4 mm. long.

Distinguished from *Trichilia parvifolia* C. DC., the only other Mexican species with 3-foliolate leaves, by the shape and pubescence of the leaflets.

TRICHILIA SCHEDEANA C. DC. in DC. Monogr. Phan. 1: 664. 1878. Closely allied to *Trichilia karwinskyana* C. DC. and *T. hirta* L. No specimens have been examined, and the status of the species is uncertain. Type from Veracruz.

3. GUAREA Allem.; L. Mant. Pl. 2: 150. 1771.

REFERENCE: C. De Candolle in DC. Monogr. Phan. 1: 542-579. 1878.

Leaves abruptly pinnate; panicles axillary, sometimes borne on the older wood; calyx 4 or 5-toothed, rarely 5-sepaled; petals 4 or 5; filaments connate into a denticulate tube, the sessile anthers borne inside the tube at apex; ovary 4 or 5-celled; seeds usually large, pseudo-arillate by the separable inner pericarp.

Guarea trichilioides L., a West Indian species which has been reported incorrectly from Mexico, is said to have poisonous juice, which acts as a violent emetic and purgative. The following names have been reported from Mexico for plants of the genus whose specific identity is doubtful: "Guaraguao"; "cedrillo cimarrón" (Tabasco); "trementino" (Tabasco).

Ovary more or less pubescent.

Leaflets 1 to 3 pairs; petals 4, 6 mm. long or less; ovary 4-celled, the ovules solitary.

Panicles about equaling the leaves.....1. *G. rovirosae*.

Panicles much shorter than the leaves.

Ovary densely strigose throughout; style sparsely strigose, longer than ovary.....2. *G. chiapensis*.

Ovary sparsely strigose near apex; style glabrous, equaling ovary or shorter.....11a. *G. excelsa dubia*.

Leaflets 5 pairs or more; petals 5, 10 mm. long; ovary 5-celled, the cells 2-ovulate.....3. *G. chichon*.

Ovary glabrous.

Panicles about equaling the leaves or longer.

Panicles, calyx, and petals glabrous.....4. *G. filiformis*.

Panicles, calyx, and petals more or less densely strigillose.

Petals 6 mm. long; style about 2.5 mm. long, slender, distinctly longer than the ovary.....5. *G. tuerckheimi*.

Petals 3.8 to 4 mm. long; style 1 mm. long or less, equaling or shorter than the ovary.

Panicles nearly glabrous; leaflets of the larger leaves lance-elliptic, acuminate to an obtuse apex, 4 times as long as wide or more.

6. *G. polyantha*.

Panicles rather densely strigillose; leaflets of the larger leaves oblong-obovate, obtusely short-pointed, less than 3 times as long as wide.

7. *G. heterophylla*.

Panicles much shorter than the leaves.

Petals glabrous; petioles 6 cm. long.....8. *G. brachystachya*.

Petals puberulous or ciliolate; petioles 1.8 to 4.3 cm. long.

Petals 8.5 mm. long.....9. *G. obtusata*.

Petals 3 to 4.7 mm. long.

Petals merely ciliolate.....10. *G. makrinii*.

Petals strigillose or pilosulous outside.

Gynophore glabrous.....11. *G. excelsa*.

Gynophore puberulous.....12. *G. virescens*.

1. *Guarea rovirosae* C. DC. Ann. Cons. Jard. Genève 10: 145. 1907.
Known only from the type locality, near Atasta, Tabasco.
Leaflets lance-elliptic, 11 cm. long, acuminate; ovary sparsely pilosulous, 4-celled, the cells 1-ovulate; petals 4, pilosulous, 6 mm. long; style glabrous.
2. *Guarea chiapensis* Blake, Proc. Biol. Soc. Washington 34: 116. 1921.
Known only from the type locality, Finca Irlanda, Chiapas.
Leaflets 2 or 3 pairs, elliptic or obovate-elliptic, 10 to 16 cm. long, short-pointed, sparsely strigillose on the veins beneath, not tufted in the axils; panicles 5 cm. long; petals densely strigillose, 5.8 mm. long.
3. *Guarea chichon* C. DC. Ann. Cons. Jard. Genève 10: 147. 1907.
Known only from the type locality, near Atasta, Tabasco.
Leaflets oblong-elliptic, up to 23 cm. long, very short-attenuate; panicles about equaling the leaves; ovary and style densely hirsute. "Chichón de montaña."
4. *Guarea filiformis* C. DC. in DC. Monogr. Phan. 1: 566. 1878.
Guarea filiformis β *pallida* C. DC. in DC. Monogr. Phan. 1: 566. 1878.
Guarea filiformis γ *cinerascens* C. DC. in DC. Monogr. Phan. 1: 567. 1878.
Morelos and Oaxaca. Nicaragua and Peru; type from Peru.
Leaflets 3 pairs, oblong-elliptic or ovate-elliptic, 13.5 cm. long, 5 cm. wide, obtusely cuspidate, glabrous; calyx teeth obtuse; petals 4 mm. long.
5. *Guarea tuerckheimi* C. DC.; Donn. Smith, Bot. Gaz. 33: 250. 1902.
Veracruz. Guatemala; type from Cubilquitz.
Leaflets 2 to 8 pairs, obovate-oblong or oval-oblong, the larger 15 cm. long, short-acuminate with obtuse apex; panicles loose, broad, 9.5 to 25 cm. long; petals sparsely strigillose above.
6. *Guarea polyantha* Blake, Proc. Biol. Soc. Washington 34: 117. 1921.
Known only from the type locality, Acapulco, Guerrero.
Large shrub; leaflets 2 to 5 pairs, those of the larger leaves 12.5 to 19 cm. long, 3 to 4.7 cm. wide, acuminate to an obtuse apex; panicles much branched, 10 to 24 cm. long; petals nearly glabrous, 3.8 mm. long; flowers with odor of honey. "Cedrillo."
7. *Guarea heterophylla* Blake, Proc. Biol. Soc. Washington 34: 116. 1921.
Known only from the type locality, Pinotepa, Oaxaca.
Leaflets 1 to 5 pairs, those of the larger leaves 9 to 12.5 cm. long, 3.8 to 5 cm. wide, obscurely and obtusely short-pointed; panicles remotely branched, 7.5 to 14 cm. long; petals strigillose above, 4 mm. long.
8. *Guarea brachystachya* DC. Prodr. 1: 624. 1824.
Mexico (?).
Leaflets ovate, subacuminate, 9 cm. long or less; panicles spiciform, about 6 cm. long; calyx teeth 4, obtuse; petals 4.
9. *Guarea obtusata* Blake, Proc. Biol. Soc. Washington 33: 118. 1920.
Known only from the type locality, Cafetal Concordia, Cerro Espino, Oaxaca.
Leaflets 2 to 4 pairs, elliptic-oblong or obovate-oblong, 9 to 17 cm. long, broadly rounded at apex, barbate beneath in the axils; panicles about 4 cm. long; flowers very fragrant; petals 4 or 5, papillose-puberulous outside; ovary 4-celled, the ovules solitary; fruit subglobose, 2.7 cm. long; seeds 1.5 cm. long.
10. *Guarea makrinii* Blake, Contr. Gray Herb. n. ser. 53: 57. 1918.
Known only from the type locality, Cafetal Concordia, Cerro Espino, Oaxaca.
Leaflets 2 or 3 pairs, oval or obovate-oval, the larger 9 to 10.5 cm. long, obtuse, barbate in the axils beneath; panicles 2.5 to 3.5 cm. long; petals 4 mm. long. "Ocotillo blanco."

11. *Guarea excelsa* H. B. K. Nov. Gen. & Sp. 7: 227. 1825.

Tepic to Guerrero; type collected near La Venta de Acaguisotla, between Acapulco and Zumpango, Guerrero.

Tall tree; leaflets 2 to 4 pairs, elliptic-oblong to oblong, 8 to 16 cm. long, obtuse to short-pointed; panicles 6.5 cm. long or less, narrow; petals sparsely strigillose, 4 mm. long; capsules subglobose, 1.5 cm. thick, 4-seeded.

Wrongly referred by Casimir De Candolle to *Guarea humilis* Bert., a West Indian species.

11a. *Guarea excelsa dubia* Blake, Proc. Biol. Soc. Washington 34: 116. 1921.

Known only from the type locality, María Madre Island, Tepic.

Ovary sparsely strigose; capsule strigillose.

12. *Guarea virescens* C. DC. Ann. Cons. Jard. Genève 10: 140. 1907.

Known only from the type locality, banks of the Río Coyaquilla, Michoacán or Guerrero.

Tree, 15 meters high; leaflets 2 or 3 pairs, elliptic to obovate-oblong, short-acuminate, 11 to 21 cm. long, 6 to 8.5 cm. wide; petals 4, acute, appressed-pilosulous; staminal tube appressed-pilosulous above; gynophore puberulous; ovary 4-celled, the cells 1-ovulate.

DOUBTFUL AND EXCLUDED SPECIES.

GUAREA GLABRESCENS (Hook. & Arn.) Blake.

Sapindus glabrescens Hook. & Arn. Bot. Beechey Voy. 281. 1836-1840.

Guarea fulva β *mexicana* C. DC. in DC. Monogr. Phan. 1: 575. 1878.

Mexico.

Leaflets 2 to 4 pairs, oblong-lanceolate, about 11 cm. long, beneath subvillous over whole surface when young, in age only along the veins; inflorescence paniculate; capsule subtrigonal, scarcely lobed, about 1 cm. long, often by abortion 2-celled.

GUAREA HIRSUTA C. DC. in DC. Monogr. Phan. 1: 578. 1878.

Described by De Candolle from "New Spain" and listed by Hemsley, but a later collection shows it to be a South American species.¹

GUAREA PALMERI Rose; C. DC. Bot. Gaz. 19: 39. 1894.

Colima; type from Manzanillo. Guatemala; El Salvador.

Tree, 5 meters high; leaflets 2 to 6 pairs, oblong or obovate-lanceolate, 12 cm. long, 4 cm. wide, pilose in the axils beneath; panicles racemiform; sepals 4, obtuse; ovary glabrous; capsule subglobose, 4-celled, 2 cm. long.

4. SWIETENIA Jacq. Enum. Pl. Carib. 4. 1760.

REFERENCES: Rolfe, Kew Bull. 1919: 201-207. 1919; Blake, Journ. Washington Acad. Sci. 10: 286-297. f. 1, 2. 1920.

Trees with hard and heavy, red wood; leaves abruptly pinnate or rarely odd-pinnate; flowers paniculate; calyx 5-lobed, the lobes semicircular or deltoid; petals 5, oval; staminal tube 10-toothed, the anthers borne inside the tube at apex; disk crenulate; ovary 5-celled; fruit a capsule, the seeds about 12 in each cell, with a terminal wing.

The trees of this genus are well known under the name of mahogany, and they are highly valued for their handsome, hard, heavy wood, which is much used for making fine furniture and the interior finish of houses. It should be noted, however, that not all the mahogany of commerce is derived from species of *Swietenia*; indeed, some of it is obtained from trees which have no relationship with the family Meliaceae.

¹ See C. DC. Ann. Cons. Jard. Genève 10: 150. 1907.

The first species of the genus to be described was *Swietenia mahagoni* Jacq., a West Indian plant which is not known to occur in Mexico, although it has often been reported from the region. All the species are closely related and presumably have similar properties.

A large amount of mahogany wood is exported from Mexico, especially from Yucatán and other coastal states (that from Yucatán is probably *S. macrophylla*). The trees grow rapidly and sometimes form extensive pure stands. The wood is used locally for furniture, for canoes, and for various other purposes.

A gum frequently exudes from the trunk. The bark is said to be bitter and to have astringent, tonic, and febrifuge properties. The juice of the young shoots has been employed in Cuba to heal wounds and to stop hemorrhages. The oil from the seeds ("pepitos de zopilote") was used by the Aztecs as a cosmetic, and is now sometimes used in making toilet soaps.

The following names are or have been in use in Mexico for species of the genus: "Caoba," "caobo" (Guerrero, Tabasco, Yucatán, Oaxaca; the word probably of Carib origin); "cóbano" (Colima, Guerrero); "zopilo-zontecomacuahuitl" (Nahuatl, "buzzard-head-tree," in allusion to the fact that the fruits with their curved stalks, when hanging on the trees resemble buzzard heads, as viewed from a short distance); "zopilote"; "tzopilotl"; "zopilocuahuitl"; "zopilotl"; "rosadillo" (Guerrero, Tabasco, Yucatán); "palo zopilote" (Oaxaca, *Conzatti*).

One of the species of *Swietenia* is described by Hernández¹ in a chapter headed "De Tzopilotlizonte Comatl, seu Capite Auræ."

Leaflets subsessile; seeds light brown.

Leaflets 5 to 9 cm. long, 0.8 to 3 cm. wide.....1. *S. humilis*.

Leaflets 8.5 to 14 cm. long, 3 to 5 cm. wide.....2. *S. cirrhata*.

Leaflets distinctly petioluled; seeds dark chestnut-brown...3. *S. macrophylla*.

1. *Swietenia humilis* Zucc. Abh. Akad. Muench. 2: 355. pl. 7. 1835-36.

Michoacán to Chiapas; type collected near Tehuantepec, Oaxaca. Guatemala.

Tree, up to 10 meters high; leaflets 2 to 5 pairs, elliptic-lanceolate to elliptic-ovate, glabrous; petals white, 5 mm. long; capsule 15 to 20 cm. long, 10 to 12 cm. thick, umbonate at apex; seeds 6 to 9 cm. long. "Cóbano" (Guerrero, Michoacán, Oaxaca); "flor de venadillo" (Tepic); "caoba" (Chiapas); "gateado" (Oaxaca).

The seeds are said to be very poisonous. The seeds of a *Swietenia* supposed to belong to this species are sold by Indian peddlers in Tepic and used to make a tea which is taken for pains in the chest. The wood of this species is not known to be exported in any quantity.

2. *Swietenia cirrhata* Blake, Journ. Washington Acad. Sci. 10: 292. f. 2, b. 1920.

Sinaloa to Oaxaca, less coastal than the preceding species; type from La Salada, Michoacán. El Salvador.

Tree, up to 15 meters high; leaflets 3 to 6 pairs, usually with a long filiform twisted cusp at apex. "Venadillo," "caoba" (Sinaloa).

The wood is much used in carpentry (Sinaloa).

3. *Swietenia macrophylla* King in Hook. Icon. Pl. 16: pl. 1550. 1886.

Tabasco and Chiapas. Honduras and Guatemala, and perhaps farther south; type supposed to be from Honduras.

Tree; leaflets 3 to 5 pairs, on petiolules 1.5 to 7 mm. long, the blades elliptic to oblong, 6 to 18 cm. long, 2 to 7 cm. wide; petals 4 mm. long; capsule ovoid, 15 cm. long, 7.5 cm. thick, subacutely umbonate; seeds 7.5 to 10 cm. long. "Caoba" (Guatemala, Honduras).

¹Thesaurus 94. 1651.

This species, the "Honduras mahogany," is the most important in the genus commercially at the present time.

5. *CEDRELA* L. Syst. Nat. ed. 10. 940. 1759.

REFERENCES: C. De Candolle in DC. Monogr. Phan. 1: 735-747. 1878; Rose, Contr. U. S. Nat. Herb. 5: 189-191. 1899; C. De Candolle, Ann. Cons. Jard. Genève 10: 168. 1907.

Leaves abruptly pinnate, the leaflets entire; flowers paniced; calyx teeth 5; petals 5, connate below with the disk; ovary and stamens borne on a columnar disk longer than the ovary; stamens 5, the filaments free; ovary 5-celled, the cells 8 to 12-ovuled; fruit a 5-valved capsule; seeds with a terminal wing.

The species of Spanish cedar are widely distributed in Mexico. They are large trees with light coarse soft wood, which is widely employed for making cigar boxes. The wood is distinctive in appearance and has a characteristic odor. Large amounts of it are exported from Mexico, chiefly for making cigar boxes, and it has been employed locally for canoes, shingles, interior finish of houses, doors, sugar casks, rafters, and other purposes. The trees grow rapidly and sometimes form pure stands. The root bark is very bitter and has been employed for treating fevers and epilepsy. A decoction of the leaves is held in the mouth to relieve toothache. A resin which exudes from the trunk is used for affections of the chest. The seeds are reputed to have vermifuge properties.

The usual name for these trees in Mexico is "cedro." The following additional names are reported, but it is impossible to decide to what species they belong: "Kuché," "kulché" (Yucatán, Maya); "cedro colorado" (Oaxaca, Veracruz); "cedro chino"; "cedro liso"; "cedro macho" (Oaxaca); "cedro de la Habana"; "calicedra"; "cedro fino" (Veracruz, Oaxaca); "cedro oloroso" (Oaxaca); "cobano" (Oaxaca); "cedro hembra."

Cedrela odorata L., a West Indian species, has been reported frequently from Mexico, but is not known to occur in the region. It is to this species that Oviedo (Lib. IX, Cap. VII) refers, in what is probably the first account of Spanish cedar: "In Hispaniola and other islands and on the mainland there are certain trees which, because they have a pleasant odor, the Christians call *cedro*; in truth I do not believe they are cedars, but because the wood has a better odor than that of other trees, our carpenters have given it this name. It is an easily worked wood, good for making chests and door and window trimmings and for other purposes, and it is a wood not much attacked by worms; for this reason some say that it is never attacked by worms, but they are much mistaken, for it has often been proved that it does suffer in this respect like other woods; although to the tongue it seems more bitter than other woods, the taste of a worm and that of a man are not the same thing."

Leaflets broadly oval to suborbicular, broadly rounded or obtuse at apex, nearly as broad as long.....1. *C. rotunda*.

Leaflets lanceolate to oblong, acuminate or acute, much longer than broad.

Petioliules 4 mm. long or less.

Leaflets very densely and finely canescent-pilosulous beneath, glabrous above; corolla 8 to 9 mm. long; anthers not apiculate....2. *C. discolor*.

Leaflets sparsely or rather densely cinereous-pilosulous or green beneath, at least the costa puberulous above; corollas 5 to 6 mm. long; anthers minutely apiculate.

Leaves sparsely pilosulous beneath, chiefly on the primary and secondary veins; capsule 2.2 to 2.5 cm. long.....3. *C. saxatilis*.

Leaves rather densely pilosulous beneath, on the surface as well as the veins; capsule 3.5 to 4 cm. long.....4. *C. oaxacensis*.

Petioliules 5 to 15 mm. long.

Sepals obtuse; rachis and both sides of leaflets glabrous.

5. *C. angustifolia*.

Sepals acute or acutish; rachis and lower surface of leaflets usually puberulous or pilosulous.

Leaflets conspicuously ciliolate.

Capsule 2.5 cm. long; leaflets acute at base-----6. *C. dugesii*.

Capsule 4 to 4.8 cm. long; leaflets mostly broadly rounded or subcordate at base-----7. *C. ciliolata*.

Leaflets obscurely or not at all ciliolate.

Anthers apiculate. Petals 8 mm. long-----8. *C. mexicana*.

Anthers not apiculate.

Petals 6 mm. long; filaments glabrous-----9. *C. occidentalis*.

Petals 8 to 9 mm. long; filaments sparsely pilose--10. *C. yucatanana*.

1. *Cedrela rotunda* Blake, Proc. Biol. Soc. Washington 33: 109. 1920.

Known only from the type locality, vicinity of Villa Unión, Sinaloa.

Leaflets 2 to 4 pairs, 4 to 11 cm. long, 4.5 to 9 cm. wide, papery, glabrescent above, densely and softly griseous-pilosulous beneath; petiolules 3 to 4 mm. long; capsules 2.2 to 2.5 cm. long.

2. *Cedrela discolor* Blake, Proc. Biol. Soc. Washington 33: 108. 1920.

Known only from the type locality, San Ramón, Durango.

Leaflets 8 pairs, ovate to oblong or elliptic-oblong, the larger 13 to 17 cm. long, 3.5 to 4.3 cm. wide, shining above; panicles large, densely flowered, the flowers subsessile rufidulous-pilosulous.

3. *Cedrela saxatilis* Rose, Contr. U. S. Nat. Herb. 8: 314. 1905.

Morelos and Oaxaca; type collected near Cuernavaca, Morelos.

Tree, 7 meters high; leaflets 5 to 8 pairs, oblong or ovate-oblong, the larger 15 cm. long, 5 to 6.3 cm. wide; panicles large, with spreading or deflexed branches.

4. *Cedrela oaxacensis* C. DC. & Rose, Contr. U. S. Nat. Herb. 5: 190. 1899.

Cedrela montana var. *mexicana* C. DC. in DC. Monogr. Phan. 1: 741, 1878.

Oaxaca.

Small tree; leaflets 6 or 7 pairs, oblong, 5 to 11 cm. long, 3 to 4.3 cm. wide; panicles large, with spreading or deflexed branches; capsules 3.5 to 4 cm. long.

5. *Cedrela angustifolia* DC. Prodr. 1: 624. 1824.

Mexico, without definite locality. Reported also from Peru, but this record is very doubtful.

Leaflets 8 to 10 pairs, long-petioliolate, narrowly ovate-oblong, 11.5 cm. long, 2.8 cm. wide, glabrous on both sides, acute at base; panicles large; flowers subsessile; calyx teeth obtuse.

6. *Cedrela dugesii* S. Wats. Proc. Amer. Acad. 18: 190. 1883.

Guanajuato; type from Guanajuato.

Large tree; leaflets 3 to 5 pairs, ovate or lance-ovate, the larger 9 to 13.5 cm. long, 2.5 to 4.8 cm. wide, caudate-attenuate, sparsely pilosulous or glabrescent and gland-dotted beneath; petiolules 7 to 15 mm. long; panicles dense; corolla 7 mm. long. "Nogal cimarrón," "cedro."

7. *Cedrela ciliolata* Blake, Proc. Biol. Soc. Washington 34: 115. 1921.

Known only from the type locality, Rincón, near Morelia, Michoacán.

Leaflets 3 to 5 pairs, ovate or oblong-ovate, the larger 9 to 12.5 cm. long, 3.3 to 5 cm. wide, caudate-acuminate, pilosulous on the veins beneath or glabrescent; petiolules 9 to 15 mm. long. "Nogal corriente."

8. *Cedrela mexicana* M. Roemer, Fam. Nat. Syn. 1: 137. 1846.*Cedrela glaziovii* C. DC. in Mart. Fl. Bras. 11¹: 224. pl. 65. f. 1. 1878.

Puebla and Tepic; type from Papantla, Veracruz. Ranging southward to Brazil.

Tree; leaflets about 8 pairs, ovate-oblong or oblong, 8 to 11 cm. long, 3 to 3.5 cm. wide, somewhat puberulent beneath or glabrate; petiolules 5 to 11 mm. long; flowers 8 mm. long; capsules 2.5 to 4 cm. long. "Cedro" (Veracruz).

9. *Cedrela occidentalis* C. DC. & Rose, Contr. U. S. Nat. Herb 5: 190. 1899.

Sinaloa to Oaxaca; type from Acaponeta, Tepic.

Tree, up to 20 meters high; leaflets 6 to 20 pairs, oblong, the larger 9 to 17 cm. long, 4 to 5 cm. wide, densely puberulous or glabrate beneath; petioles mostly 7 to 10 mm. long; capsule 2.5 to 4 cm. long. "Cedro" (Sinaloa).

10. *Cedrela yucatanana* Blake, Proc. Biol. Soc. Washington 33: 110. 1920.

Veracruz to Yucatán; type from Mérida, Yucatán.

Tree, about 12 meters high; leaflets usually 6 to 8 pairs, ovate to lance-oblong, the larger 6.5 to 13 cm. long, 2 to 4 cm. wide, incurved-puberulous beneath on whole surface or only on the veins; petiolules 5 to 10 mm. long; capsule 3.5 cm. long.

DOUBTFUL SPECIES.

CEDRELA ALTERNIFOLIA (Mill.) Steud. Nom. Bot. ed. 1. 170. 1821. *Cedrus alternifolia* Mill. Gard. Diet. ed. 8. *Cedrus* no. 3. 1768. Said to have simple cordate leaves, and probably not a member of the family. Described from Campeche.

74. MALPIGHIACEAE. Malpighia Family.

REFERENCE: Small, N. Amer. Fl. 25: 117-171. 1910.

Shrubs or trees, often scandent; leaves usually opposite, stipulate, entire, dentate, or lobate, often with glands on the margin or lower surface; flowers usually perfect and showy, variously arranged, cleistogamous flowers often present; sepals 5, usually glanduliferous; petals 5, clawed; stamens 5 or 10; fruit drupaceous, nutlike, capsular, or of 1 to 3 samaras.

Fruit a capsule or drupe, never bristly; receptacle flat or depressed.

Fruit dry, separating into 3 carpels.....4. **THRYALLIS.**

Fruit a fleshy drupe, not separating.

Styles with slender acute tips.....1. **BYRSONIMA.**

Styles with thickened, obtuse or truncate tips.

Styles distinct.....2. **MALPIGHIA.**Styles united.....3. **BUNCHOSIA.**

Fruit of winged samaras or nutlike, or densely bristly; receptacle usually pyramidal.

Fruit densely bristly.

Filaments glabrous; stigma bilobate.....5. **LASIOCARPUS.**Filaments pubescent; stigma entire.....6. **ECHINOPTERYS.**

Fruit not bristly, usually of samaras, sometimes nutlike.

Samaras with lateral wings, these distinct or united.

Anther-bearing stamens 3 or 5.

Normal flowers with 5 fertile stamens and styles...7. **ROSANTHUS.**Normal flowers with 5 fertile stamens and 1 style, or with 3 fertile stamens and 2 or 3 styles.....8. **GAUDICHAUDIA.**

Anther-bearing stamens 10.

Lateral samara wings lobed to the base.....9. **TETRAPTERIS.**

Lateral wings not lobed.

Stipules borne on the petiole above the base.....10. **HIRAEA.**Stipules borne at the base of the petiole.....11. **MASCAGNIA.**

Samaras with a single dorsal wing, this sometimes reduced to a keel or beak.

Style 1; stamens 5 or 6.

Samaras winged.....12. JANUSIA.

Samaras merely keeled, nutlike.....13. ASPICARPA.

Styles 3; stamens 10.

Stigmas clavate or truncate.....14. BANISTERIOPSIS.

Stigmas borne on the dilated thin style tips.

Samara wings thickened along the dorsal (outer) edge

15. BANISTERIA.

Samara wings thickened along the ventral (inner) edge.

16. STIGMAPHYLLON.

1. **BYRSONIMA** L. Rich.; Juss. Ann. Mus. Paris 18: 481. 1811.

Byrsonima spicata (Cav.) DC. is reported from Mexico by Small, but the writer has seen no specimens referable to it.

1. *Byrsonima crassifolia* (L.) DC. Prodr. 1: 579. 1824.

Malpighia crassifolia L. Sp. Pl. 126. 1753.

Byrsonima cotinifolia H. B. K. Nov. Gen. & Sp. 5: 152. pl. 447. 1822.

Byrsonima oaxacana Juss. Ann. Sci. Nat. II. 13: 332. 1840.

Byrsonima karwinskiana Juss. Ann. Sci. Nat. II 13: 333. 1840.

Sinaloa to Chiapas and Veracruz. Central America, West Indies, and northern South America.

Erect shrub or tree, 2 to 9 meters high; leaves oblong to ovate or rounded-elliptic, mostly 4 to 15 cm. long, short-petiolate, acute to rounded at apex, densely tomentose when young with reddish or whitish hairs, often glabrate in age; flowers yellow or reddish; fruit a yellow drupe, about 1 cm. in diameter. Most generally known as "nance," "nanche," or "nanchi"; "chi" (Yucatán, Maya); "nananche" (*Alcocer*); "nanche de perro," "nanzinquahuitl" (*Ramírez*); "changuco" (Michoacán, Guerrero); "nantzinxocotl" (*Urbina*); "nance agrio" (Guerrero, Tabasco); "nancite" (Costa Rica, El Salvador, Nicaragua); "nance verde" (El Salvador); "yuco," "nanchi," "chaparro," "peralejo" (Columbia).

Small recognized *B. oaxacana* and *B. karwinskiana* as distinct species, but the characters by which they are supposed to be distinguishable seem not to hold in the material examined by the writer.

The plant is much cultivated in Mexico and Central America for its acid edible fruit. This is usually eaten raw, but is sometimes cooked, and is used also for preparing a beverage similar to lemonade. In some localities it has been fermented to produce an alcoholic drink. The wood, which is said to be reddish and to have a specific gravity of about 0.67, is employed in various ways. The bark is used for tanning and dyeing, and is said, in addition, to yield a strong fiber. The plant is astringent, and various parts have been used in domestic medicine for fevers, colds, and snake bites.

2. **MALPIGHIA** L. Sp. Pl. 425. 1753.

Erect shrubs or small trees; leaves opposite, entire in the Mexican species, flowers in short axillary cymes; calyx with 6 to 10 glands; petals variously dentate; fruit a drupe, usually red.

Malpighia urens L., a West Indian species, has been reported from Mexico, probably erroneously. The following vernacular names are reported for it, but it is not certain that they apply even to a plant of this genus: "Ahualt-zocotl," "ahualzocotlque," "palo bronco."

Leaves and branchlets tomentose, at least when young.

Leaves cordate at base.....1. *M. cordata*.

Leaves rounded to acute at base.

Cymes pedunculate; leaves conspicuously petiolate.....2. *M. mexicana*.

Cymes and leaves sessile or nearly so.....3. *M. subglabrata*.

Leaves and branchlets sericeous, strigose, or glabrous.

Styles unequal, the 2 posterior ones longer and thicker than the anterior one.

Leaves acute or acuminate; stamens opposite the lateral petals much stouter than the others and longer than those opposite the sepals.

4. *M. incana*.

Leaves rounded or obtuse at apex; stamens opposite the lateral petals not longer than those opposite the sepals.

Fruit 5 to 6 mm. wide.....5. *M. umbellata*.

Fruit 10 to 12 mm. wide.....6. *M. puniceifolia*.

Styles nearly equal, or the anterior one slightly longer than the posterior ones.

Leaves, at least most of them, obtuse or rounded at apex.

Styles unequal, the anterior one longer than the posterior one; anterior petals longer than the posterior one.....7. *M. heterophylla*.

Styles subequal; anterior petals smaller than the posterior one.

Larger petals 6 to 7 mm. long.....8. *M. galeottiana*.

Larger petals 9 to 10 mm. long.....9. *M. diversifolia*.

Leaves acute or acuminate.

Sepals barbate; calyx with 10 glands.....10. *M. ovata*.

Sepals not barbate; calyx with 6 to 8 glands.....11. *M. glabra*.

1. *Malpighia cordata* Small, N. Amer. Fl. 25: 154. 1910.

Jalisco and Morelos; type from Zacoalco, Jalisco.

Shrub, densely tomentose; leaves rounded-ovate, 3 to 6 cm. long, obtuse or acute; larger petals 9 to 11 mm. long; fruit about 1 cm. in diameter.

2. *Malpighia mexicana* Juss. Ann. Sci. Nat. II. 13: 337. 1840.

Bunchosia guadalajarensis S. Wats. Proc. Amer. Acad. 22: 401. 1887.

Malpighia oaxacana Niedenzu; Loesener, Bull. Herb. Boiss. 2: 544. 1894.

Durango to Oaxaca and Morelos.

Erect shrub, 2 to 4.5 meters high; leaves oval to ovate, 3 to 10 cm. long, obtuse or acute, usually densely tomentose beneath; flowers purple or purplish, 1.5 to 2 cm. wide; fruit red, about 1 cm. in diameter. "Nanche" (Oaxaca); "manzanito" (Jalisco).

3. *Malpighia subglabrata* (Niedenzu) Small, N. Amer. Fl. 25: 154. 1910.

Malpighia mexicana subglabrata Niedenzu, Gen. Malp. 4. 1889.

Known only from the type locality, San Agustín.

Leaves ovate, 2.5 to 7 cm. long, obtuse, glabrate; fruit red, 1 cm. long.

4. *Malpighia incana* Mill. Gard. Dict. ed. 8. *Malpighia* no. 3. 1768.

Malpighia campechiensis Lam. Encycl. 4: 333. 1797.

Yucatán and Campeche; type from Campeche. Cuba.

Leaves oblong or lanceolate, 3 to 6 cm. long, pubescent, especially beneath, short-petiolate; flowers purple, 1.5 cm. wide; fruit 8 mm. in diameter.

5. *Malpighia umbellata* Rose, Contr. U. S. Nat. Herb. 1: 310. 1895.

Sonora and Sinaloa; type from Agiabampo, Sonora.

Much-branched shrub, 2.5 meters high; leaves oblong or obovate, 1.5 to 3.5 cm. long, glabrate; fruit red, edible. "Mora de campo."

6. *Malpighia puniceifolia* L. Sp. Pl. ed. 2. 609. 1762.

Yucatán. West Indies and northern South America.

Leaves oblong to oval, 1.5 to 7 cm. long, glabrous in age, short-petiolate; flowers pink or violet, 1.5 to 2 cm. broad; fruit red. "Cerezo," "cerezero" (Cuba).

The fruit is edible and has an agreeable flavor. In the West Indies it is much eaten, and is used for jellies and tarts. The bark is reported to yield a red dye.

7. *Malpighia heterophylla* Griseb. *Linnaea* 22: 2. 1849.

Described from Mexico, the locality not known but probably in Veracruz.

Leaves ovate-lanceolate, 4 to 10 cm. long, glabrate; corolla 1.5 cm. wide.

8. *Malpighia galeottiana* Juss. Arch. Mus. Hist. Nat. (Paris) 3: 261. 1844.

Puebla and Oaxaca; reported from San Luis Potosí; type from mountains of Oaxaca.

Shrub or tree, 1 to 6 meters high; leaves oval, oblong, or ovate, 1 to 3 cm. long, short-petiolate, bright green, glabrate; flowers pink or white, 1.5 cm. wide; fruit red, 1 cm. in diameter.

9. *Malpighia diversifolia* T. S. Brandeg. *Zoe* 5: 104. 1901.

Southern Baja California; type from San José del Cabo.

Shrub, 2 to 2.5 meters high; leaves suborbicular to ovate or obovate, 2 to 4 cm. long, glabrate in age; flowers pink, 2 cm. wide; fruit red, 1 cm. in diameter, edible. "Manzana," "manzanita."

10. *Malpighia ovata* Rose, Contr. U. S. Nat. Herb. 1: 310. 1895.

Bunchosia parvifolia S. Wats. Proc. Amer. Acad. 24: 42. 1889. Not *Malpighia parvifolia* Juss. 1844.

Malpighia watsoni Rose, Contr. U. S. Nat. Herb. 1: 310. 1895.

Sonora to Oaxaca; type from Guaymas, Sonora.

Shrub, 2 to 4 meters high; leaves ovate or broadly ovate, 1 to 6 cm. long, glabrate; flowers pink, 1 to 1.3 cm. wide; fruit red, 8 to 9 mm. long.

11. *Malpighia glabra* L. Sp. Pl. 425. 1753.

Nuevo León and Tamaulipas to Tabasco and Yucatán. Southern Texas, Central America, West Indies, and northern South America; type from Jamaica.

Shrub, 1 to 3 meters high; leaves mostly ovate, 2.5 to 9 cm. long, glabrous or nearly so, bright green; flowers pink, 1.5 cm. wide; fruit red. "Escobillo" (Tabasco); "manzanita" (Tamaulipas); "cereza" (*Sessé & Mociño*); "chi" (Yucatán, *Dondé*); "cerezo," "cerezo de Jamaica," "palo de gallina" (Cuba); "Júpiter" (Costa Rica); "cerezo de Castilla" (Panama); "arrayancito" (Colombia); "xocot," "xochtotl" (Nicaragua).

The fruit is edible, and the plant is sometimes cultivated. The bark is said to be astringent and to have been used as a remedy for fevers.

3. **BUNCHOSIA** L. Rich.; Juss. Ann. Mus. Hist. Nat. 18: 481 1811.

Erect shrubs or trees; leaves opposite, entire, usually short-petiolate; flowers mostly yellow, in narrow panicles; calyx with 8 or 10 glands; petals undulate or dentate; fruit a drupe.

Ovary and young fruit glabrous or practically so.

Leaves acute at base, glabrous; fruit 9 to 13 mm. in diameter.

1. *B. glandulosa*.

Leaves rounded or obtuse at base, pubescent beneath, at least when young;

fruit 15 to 20 mm. in diameter-----2. *B. palmeri*.

Ovary and young fruit copiously pubescent.

Corolla large, 18 mm. broad or larger.

Inner petal cordate, similar to the other petals.....3. *B. strigosa*.

Inner petal spatulate.....4. *B. sonorensis*.

Corolla small, usually 12 to 15 mm. broad.

Anther connective purple or brown.....5. *B. lindeniana*.

Anther connective yellow.

Leaves densely pubescent beneath when mature.

Leaves soon glabrate on the upper surface.....6. *B. biocellata*.

Leaves permanently and densely pubescent on the upper surface.

7. *B. montana*.

Leaves nearly or quite glabrous when mature.

Innermost petal with a broad suborbicular blade....8. *B. lanceolata*.

Innermost petal with a spatulate blade.....9. *B. gracilis*.

1. *Bunchosia glandulosa* (Cav.) DC. Prodr. 581. 1824.

Malpighia glandulosa Cav. Monad. Diss. 411. 1789.

Yucatán. West Indies.

Shrub or small tree, 2 to 6 meters high; leaves oblong, elliptic, or ovate, 3 to 10 cm. long, usually acute, glabrous, bright green; flowers yellow; fruit bilobate, 9 to 13 mm. in diameter, red or orange. "Sipché" (Yucatán, Maya); "cabra hedionda" (Santo Domingo).

2. *Bunchosia palmeri* S. Wats. Proc. Amer. Acad. 22: 401. 1887.

Sinaloa to Guerrero and Morelos; type from Tequila, Jalisco.

Shrub or small tree; leaves mostly oval, 8 to 17 cm. long, obtuse or rounded and short-acuminate, pale green. "Garbancillo" (Sinaloa).

3. *Bunchosia strigosa* Schlecht. Linnaea 10: 242. 1836.

Type from Tehuantepec, Oaxaca; no material seen by the writer.

Leaves ovate-oblong or elliptic-oblong, 5 to 10 cm. long, obtuse or acute, glabrate beneath.

4. *Bunchosia sonorensis* Rose, Contr. U. S. Nat. Herb. 1: 94. 1891.

Dry hillsides, Sonora and Sinaloa; type from Alames, Sonora.

Shrub, 1 to 2.5 meters high; leaves oval to oblong, 2 to 7 cm. long, obtuse or rounded at apex, copiously pubescent; flowers yellow; fruit bilobate, red, 1.5 to 2 cm. broad.

5. *Bunchosia lindeniana* Juss. Arch. Mus. Hist. Nat. (Paris) 3: 335. 1844.

Veracruz.

Leaves oblong to ovate, 8 to 15 cm. long, short-acuminate, bright green, short-petiolate; fruit 2 or 3-lobate, 1 to 1.5 cm. in diameter.

6. *Bunchosia biocellata* Schlecht. Linnaea 10: 241. 1836.

Bunchosia discolor Turcz. Bull. Soc. Nat. Moscou 32¹: 266. 1859.

Tamaulipas and Veracruz; type from Jalapa, Veracruz. Guatemala.

Shrub or small tree, 2 to 3.5 meters high; leaves mostly oval or elliptic, 5 to 13 cm. long, obtuse or acute, thin, bright green; flowers yellow.

7. *Bunchosia montana* Juss. Arch. Mus. Hist. Nat. (Paris) 3: 340. 1844.

Oaxaca; type collected near the city of Oaxaca.

Shrub, 1.5 to 3 meters high; leaves mostly oblong or ovate, 3 to 7 cm. long, rounded or obtuse at apex, thick, densely pubescent; fruit bilobate, 1 to 1.5 cm. in diameter, yellow.

8. *Bunchosia lanceolata* Turcz. Bull. Soc. Nat. Moscou 36¹: 582. 1863.

Bunchosia pringlei S. Wats. Proc. Amer. Acad. 26: 133. 1891.

Colima (?) to Oaxaca, Veracruz, and San Luis Potosí; type from Orizaba.

Slender shrub, 2 to 3 meters high, with long, often subscandent branches; leaves mostly ovate to oblong, 5 to 15 cm. long, bright green, acute or acuminate, often lustrous; flowers yellow; fruit bilobate, 1.5 to 2 cm. broad. "Capulincillo," "ciruelillo," "zapotito de San Juan" (Veracruz, according to various authors); "zapotillo de San Juan" (Oaxaca, *Reko*).

Some of the specimens referred here have no flowers, and may belong elsewhere.

9. *Bunchosia gracilis* Niedenzu, *Bunchos.* 5. 1898.

Described from Mexico. Central America.

Leaves elliptic or oblong, 6 to 15 cm. long, bright green, acute or acuminate.

DOUBTFUL SPECIES.

BUNCHOSIA CANESCENS (Ait.) DC. *Prodr.* 1: 582. 1824. *Malpighia canescens* Ait. *Hort. Kew.* 2: 105. 1789. Described from cultivated plants. Reported from Mexico by Small.

BUNCHOSIA SESSILIFOLIA DC. *Prodr.* 1: 582. 1824. Described from Mexico. Probably not of this genus.

4. *THRYALLIS* L. *Sp. Pl. ed. 2.* 554. 1762.

Erect shrubs; leaves opposite, sessile or petiolate, entire; flowers usually yellow, racemose; calyx glandless or with very small glands; petals entire or dentate, persistent; fruit a small 3-lobate capsule.

Ovary glabrous.

Leaves sessile..... 1. *T. sessilifolia*.

Leaves petiolate..... 2. *T. glauca*.

Ovary pubescent.

Sepals and leaves densely silky-strigose..... 3. *T. vestita*.

Sepals and leaves glabrous or nearly so.

Anthers about as broad as long; corolla about 1 cm. wide.

4. *T. angustifolia*.

Anthers twice as long as broad or longer; corolla about 2 cm. wide.

Calyx with glands outside at base.

Glands at base of the leaf blade sessile..... 5. *T. palmeri*.

Glands of the leaf blade long-stipitate..... 6. *T. humilis*.

Calyx without glands.

Branches glabrous; leaf glands sessile..... 7. *T. dasycarpa*.

Branches pubescent; leaf glands stipitate..... 8. *T. tuberculata*.

1. *Thryallis sessilifolia* Rose, *Contr. U. S. Nat. Herb.* 12: 281. 1909.

Galphimia sessilifolia Rose, *Contr. U. S. Nat. Herb.* 3: 313. 1895.

Oaxaca; type from hills of Las Sedas, altitude 1,800 meters.

Shrub, 0.3 to 1 meter high; leaves ovate to rounded-ovate, 1.5 to 3.5 cm. long, glabrous, glaucescent; flowers yellow, tinged with red, petals about 1 cm. long.

2. *Thryallis glauca* (Cav.) Kuntze, *Rev. Gen. Pl.* 1: 89. 1891.

Galphimia glauca Cav. *Icon. Pl.* 5: *pl.* 489. 1799.

Galphimia gracilis Bartl. *Linnaea* 13: 552. 1839.

Galphimia latifolia Bartl. *Linnaea* 13: 553. 1839.

Galphimia grandiflora Bartl. *Linnaea* 13: 554. 1839.

Galphimia paniculata Bartl. *Linnaea* 13: 556. 1839.

Galphimia humboldtiana Bartl. *Linnaea* 13: 559. 1839.

? *Galphimia multicaulis* Juss. *Ann. Sci. Nat.* II. 13: 327. 1840.

Sonora to San Luis Potosí, Morelos, and Chiapas; type from Acámbaro, Guanajuato. Central America; naturalized in the West Indies.

Slender shrub, 0.5 to 4.5 meters high, glabrous or nearly so; leaves oblong, ovate, or oval, 1 to 6 cm. long, usually obtuse or rounded at apex, more or less glaucous; flowers yellow, large, in showy racemes. "Huachácata," "nachá-cata," "vachácata" (Michoacán); "calderona amarilla," "flor de diciembre" (Michoacán, Guerrero); "ramo de oro" (Jalisco); "palo del muerto" (Jalisco, Mexico, *Urbina*); "hierba del piojo" (San Luis Potosí); "consulita," "lluvia de oro" (Porto Rico); "hierba del venado," "palo de San Vicente" (Sinaloa); "consulitas" (Santo Domingo).

A handsome shrub, sometimes cultivated. Small recognized *T. multicaulis* (Juss.) Kuntze as a valid species, said to differ from *T. glauca* by its low habit and branched inflorescence. All the material examined by the writer appears to be conspecific. The leaves are used for healing wounds in Sinaloa.

3. *Thryallis vestita* (S. Wats.) Rose, Contr. U. S. Nat. Herb. 12: 281. 1909.

Galphimia vestita S. Wats. Proc. Amer. Acad. 21: 421. 1886.

Known only from the type locality, Hacienda San Miguel, southwestern Chihuahua.

Slender shrub, about 30 cm. high; leaves linear or linear-lanceolate, 1 to 3.5 cm. long; flowers yellow.

4. *Thryallis angustifolia* (Benth.) Kuntze, Rev. Gen. Pl. 1: 89. 1891.

Galphimia angustifolia Benth. Bot. Voy. Sulph. 9. 1844.

Galphimia unifolia A. Gray, Gen. Fl. Amer. 2: 196. 1849.

Baja California and Sonora to Tamaulipas; type from Cape San Lucas, Baja California. Western Texas.

Low slender shrub; leaves linear to oval, 1 to 4 cm. long, acute or obtuse; flowers yellow, becoming reddish.

5. *Thryallis palmeri* Rose, Contr. U. S. Nat. Herb. 12: 281. 1909.

Galphimia glandulosa Rose, Contr. U. S. Nat. Herb. 5: 137. 1897. Not *G. glandulosa* Cav. 1799.

Known only from the type locality, Acapulco, Guerrero.

Shrub; leaves oblong to ovate, 2.5 to 6 cm. long, obtuse or acute; flowers yellow.

6. *Thryallis humilis* Rose, Contr. U. S. Nat. Herb. 12: 280. 1909.

Typic; type collected between Concepción and Acaponeta.

Low shrub; leaves ovate or elliptic, 4 to 7 cm. long, obtuse or acute, glaucous beneath; flowers yellow.

7. *Thryallis dasycarpa* Small, N. Amer. Fl. 25: 151. 1910.

Dry hillsides, Sinaloa to Michoacán; type from Rosario, Sinaloa.

Shrub, sometimes 3 meters high; leaves oblong or ovate, 1 to 9.5 cm. long; flowers yellow, becoming reddish, in long racemes.

8. *Thryallis tuberculata* Rose, Contr. U. S. Nat. Herb. 12: 281. 1909.

Known only from the type locality, between Rosario and Colomas, Sinaloa.

Leaves oblong to lanceolate, 2.5 to 5 cm. long, obtuse or acute, short-petiolate; flowers yellow.

5. **LASIOCARPUS** Liebm. Nat. For. Kjöbenhavn Vid. Medd. 1853: 90. 1854.

1. *Lasiocarpus salicifolius* Liebm. Nat. For. Kjöbenhavn Vid. Medd. 1853: 91. 1854.

Puebla and Oaxaca; type from Río de las Vueltas, Oaxaca.

Shrub, 1 to 2 meters high; leaves opposite, linear-oblong to oval-oblong, 2 to 6 cm. long, sericeous, especially beneath; flowers small, white, short-racemose; fruit densely covered with very long slender purplish bristles.

6. **ECHINOPTERYYS** Juss. Arch. Mus. Hist. Nat. (Paris) 3: 342. 1844

Erect or scandent shrubs; leaves alternate, entire; flowers racemose, the petals dentate; fruit 3-lobate, densely birstly.

Leaves petiolate, mostly ovate, 1 to 3 cm. long; bristles of the fruit slender, densely pubescent.....1. *E. eglandulosa*.

Leaves sessile or subsessile, linear-oblong, mostly less than 1 cm. long; bristles stout, glabrate.....2. *E. setosa*.

1. *Echinopterys eglandulosa* (Juss.) Small, N. Amer. Fl. 25: 148. 1910.

Bunchosia eglandulosa Juss. Ann. Sci. Nat. II. 13: 325. 1840.

Echinopterys lappula Juss. Arch. Mus. Hist. Nat. (Paris) 3: 342. 1844.

Sonora to Zacatecas, Morelos, and Oaxaca.

Slender scandent shrub; leaves lanceolate to broadly ovate, 1 to 3 cm. long; flowers yellow, the petals 6 to 10 mm. long; fruit densely bristly, purplish.

2. *Echinopterys setosa* T. S. Brandeg. Univ. Calif. Publ. Bot. 4: 182. 1911.

Known only from the type locality, Sierra de la Paila, Coahuila.

Densely branched shrub with white-strigose branchlets; leaves linear-oblong, 1 cm. long or shorter.

7. **ROSANTHUS** Small, N. Amer. Fl. 25: 131. 1910.1. *Rosanthus subverticillatus* (Rose) Small, N. Amer. Fl. 25: 131. 1910.

? *Banisteria brevipes* Moc. & Sessé; DC. Prodr. 1: 591. 1824.

Gaudichaudia subverticillata Rose, Contr. U. S. Nat. Herb. 8: 49. 1903.

Durango and Jalisco; type collected between Huejuquilla and Mexquitic, Jalisco.

Erect shrub, 50 to 80 cm. high, copiously pubescent; leaves opposite or ternate, oblong, 4 to 10 cm. long, obtuse and mucronate, entire; flowers yellow, the petals 7 to 11 mm. long, denticulate; fruit of 3 samaras, these 11 to 13 mm. long.

8. **GAUDICHAUDIA** H. B. K. Nov. Gen. & Sp. 5: 156. 1822.

Scandent or trailing shrubs; leaves opposite, entire, petiolate; calyx with 8 or 10 glands; petals yellow, dentate; fruit of usually 3 samaras.

Samaras V-shaped, the wings distinct at apex.

Anther-bearing stamens 5.....1. *G. karwinskiana*.

Anther-bearing stamens 3.

Flower clusters loose; sepal glands oval.....2. *G. schiedeana*.

Flower clusters dense; sepal glands linear.....3. *G. confertiflora*.

Samaras orbicular or obovate, the wings extending all around the body.

Anther-bearing stamens 5.

Sepals less than 5 mm. long; corolla less than 2 cm. broad...4. *G. pentandra*.

Sepals over 5 mm. long; corolla more than 2 cm. broad...5. *G. arnottiana*.

Anther-bearing stamens 3.

Leaves sessile or nearly so, narrowed to the base.....6. *G. cynanchoides*.

Leaves conspicuously petiolate, more or less cordate at base.

Samaras mucronate at base.....7. *G. mucronata*.

Samaras long-caudate at base.....8. *G. webbiana*.

1. *Gaudichaudia karwinskiana* Juss. Ann. Sci. Nat. II. 13: 252. 1840.

Described from Mexico, the locality not known; specimens from Jalisco may belong here.

Leaves oblong-ovate or obovate, about 2.5 cm. long, pubescent on both surfaces.

2. *Gaudichaudia schiedeana* Juss. Arch. Mus. Hist. Nat. (Paris) 3: 591. 1844.
 ? *Gaudichaudia albida* Schlecht. & Cham. Linnaea 5: 217. 1830.
Triopteris sericca Schlecht. Linnaea 10: 243. 1836.
Gaudichaudia palmeri S. Wats. Proc. Amer. Acad. 21: 421. 1885.
Janusia mexicana T. S. Brandeg. Zoe 5: 203. 1905.
 Sonora to Oaxaca and Veracruz; type from Malpais de Naolinco, Veracruz, Central America.

Slender sericeous shrub; leaves oblong to ovate or oval, 2 to 5 cm. long, obtuse or rounded at base; petals 9 to 12 mm. long; samaras 1.5 to 2 cm. long.

3. *Gaudichaudia confertiflora* Juss. Ann. Sci. Nat. II. 13: 252. 1840.
Gaudichaudia congestiflora Juss. Arch. Mus. Hist. Nat. (Paris) 3: 590. 1844.
 Reported from Aguascalientes, and probably occurring elsewhere.
 Leaves 2 to 5 cm. long; petals 6 to 7 mm. long; samaras 1 to 1.4 cm. long.

4. *Gaudichaudia pentandra* Juss. Ann. Sci. Nat. II. 13: 252. 1840
 Jalisco to Hidalgo and Puebla; type from Sultepec, Mexico.
 Leaves lanceolate to ovate-oblong, 3 to 6 cm. long, densely pubescent; petals 6.5 to 7.5 mm. long; samaras 8 to 10 mm. long.

5. *Gaudichaudia arnottiana* Juss. Ann. Sci. Nat. II. 13: 252. 1840.
 Sinaloa to Jalisco and Morelos; type from Jalisco.
 Leaves oblong to oval, 2 to 7 cm. long; petals 1.5 to 1.8 cm. long; samaras 1.4 to 1.8 cm. long.

6. *Gaudichaudia cynanchoides* H. B. K. Nov. Gen. & Sp. 5: 158. pl. 445. 1822.
 Type from Morelia, Michoacán.
 Leaves oblong, 2 to 5 cm. long; petals 6 to 7 mm. long.
 The following vernacular names have been reported, but they probably refer to other species: "Hierba del zorro," "xunequiltzio," "xunequiltl."

7. *Gaudichaudia mucronata* (Moc. & Sessé) Juss. Ann. Sci. Nat. II. 13: 253. 1840.
Hiraea mucronata Moc. & Sessé; DC. Prodr. 1: 586. 1824.
 ? *Hiraea oxyota* Moc. & Sessé; DC. Prodr. 1: 586. 1824.
 ? *Hiraea podocarpa* Moc. & Sessé; DC. Prodr. 1: 586. 1824.
 ? *Hiraea acuminata* Moc. & Sessé; DC. Prodr. 1: 586. 1824.
Gaudichaudia filipendula Juss. Ann. Sci. Nat. II. 13: 252. 1840.

Sonora and Chihuahua to San Luis Potosí, Veracruz, and Oaxaca; reported from Yucatán. Central America.

Leaves oblong or ovate, 3 to 8 cm. long, often auriculate at base; petals 6 to 8 mm. long; samaras 8 to 10 mm. long. "Chilillo-ak" (Yucatán).

8. *Gaudichaudia webbiana* Juss. Ann. Sci. Nat. II. 13: 152. 1840.
 Described from Mexico, the locality not known.
 Leaves oblong-ovate, 2.5 to 4.5 cm. long; petals 6 to 8 mm. long; samaras 10 to 12 mm. long.

DOUBTFUL SPECIES.

GAUDICHAUDIA MOLLIS Benth. Pl. Hartw. 6. 1839. Type from Aguascalientes.

GAUDICHAUDIA ENRICO-MARTINEZII Bárcena, Méx. Minist. Fom. Anal. 3: 149. 1878.

9. TETRAPTERIS Cav. Monad. Diss. 433. 1790.

Scandent or reclining shrubs; leaves opposite, entire; calyx with 8 glands; petals yellow, entire or dentate; fruit of 3 samaras, each of these 4-winged.

Glands much shorter than the sepals, usually about half as long.

Leaves conspicuously petiolate, rounded to acute at base----1. *T. mexicana*.

Leaves mostly subsessile, cordate at base-----2. *T. nelsoni*.

Glands nearly or quite as long as the sepals.

Lower wings of the samara much smaller than the upper ones.

3. *T. acapulcensis*.

Lower wings almost as large as the upper ones-----4. *T. schiedeana*.

1. *Tetrapteris mexicana* Hook. & Arn. Bot. Beechey Voy. 281. 1836.

Sinaloa to Guerrero and Morelos; type from Jalisco.

Shrub, scandent to a height of 6 to 8 meters; leaves ovate or elliptic, 4 to 10 cm. long, acute or short-acuminate, glabrate; petals 9 to 11 mm. long.

2. *Tetrapteris nelsoni* Rose, Contr. U. S. Nat. Herb. 5: 143. 1897.

Known only from the type locally, between Nopala and Mixistepec, Oaxaca.

Leaves ovate or rounded-ovate, 1 to 3.5 cm. long, acute, glabrate.

3. *Tetrapteris acapulcensis* H. B. K. Nov. Gen. & Sp. 5: 168. 1822.

Type from Acapulco, Guerrero. Central America and Colombia.

Leaves oblong, ovate, or oval, 3 to 6 cm. long, obtuse or acutish; petals 7 to 8 mm. long.

4. *Tetrapteris schiedeana* Schlecht. & Cham. Linnaea 5: 218. 1830.

Heteropteris yucatanensis Millsp. Field Mus. Bot. 1: 369. 1898.

Tepec to Veracruz, Yucatán, and Chiapas; type from Jalapa, Veracruz. Central America.

Scandent to a height of 6 meters or more; leaves lanceolate to elliptic or ovate, 3 to 9 cm. long, acute or acuminate; petals 5 to 8 mm. long.

DOUBTFUL SPECIES.

TETRAPTERIS COTONEASTER (H. B. K.) Juss. Ann. Sci. Nat. II. 13: 264. 1840.

Galphimia mollis H. B. K. Nov. Gen. & Sp. 5: 173. 1822. Type from Tepecoacuilco, Guerrero.

10. *HIRAEA* Jacq. Enum. Pl. Carib. 4. 1760.

Erect or scandent shrubs or small trees; leaves opposite, entire, thick, short-petiolate; stipules very small, borne on the petioles; petals usually yellow, undulate or dentate; fruit of 3 samaras, with large wings.

Anthers oblong; leaves acute at base-----1. *H. dipholiphylla*.

Anthers subglobose; leaves truncate or subcordate at base.

Petals merely undulate; leaves nearly glabrous beneath-----2. *H. borealis*.

Petals denticulate; leaves usually copiously pubescent beneath. 3. *H. velutina*.

1. *Hiraea dipholiphylla* Small, N. Amer. Fl. 25: 122. 1910.

Morelos and Oaxaca; type from Cuernavaca, Morelos.

Leaves oblong to elliptic, 5 to 10 cm. long, acute or acuminate, bright green, sericeous when young but soon glabrate; petals yellow, 6 to 9 mm. long; samaras 2.5 to 3.5 cm. wide.

2. *Hiraea borealis* Niedenzu, *Hiraea* 5. 1906.

Cozumel Island, Yucatán. Type from Ruatán Island, Honduras.

Leaves oblong-obovate, oval, or oblong, 4 to 11 cm. long, rounded at apex; petals yellow, 8 to 9 mm. long.

3. *Hiraea velutina* Niedenzu, *Hiraea* 6. 1906.

Sinaloa to Veracruz and Oaxaca; type from Pinotepa, Oaxaca. Southward to Colombia.

Leaves mostly obovate, 5 to 11.5 cm. long, rounded or short-pointed at apex, coriaceous, sometimes glabrate in age; petals yellow, about 9 mm. long.

11. **MASCAGNIA** Bertero; Colla, Hort. Ripul. 86. 1824.

Scandent, trailing, or suberect shrubs; leaves opposite, entire; calyx with usually 8 glands; petals entire, denticulate, or rarely lobate; fruit of 3 samaras with large wings.

Styles pubescent; petals yellow.

Flowering peduncles 3 mm. long or longer; anthers ovoid—1. *M. macroptera*.

Flowering peduncles 1 mm. long or less; anthers subglobose—2. *M. mexicana*.

Styles glabrous; petals not yellow.

Filaments very unequal.

Leaves broadly ovate to lanceolate, usually acute—3. *M. lilacina*.

Leaves obovate or broadly obovate, usually rounded at apex.

4. *M. vacciniifolia*.

Filaments equal or nearly so.

Flowers mostly axillary, never in terminal panicles.

Leaves mostly oblong or ovate-oblong, 1.5 cm. long or shorter.

5. *M. cana*.

Leaves broadly ovate to suborbicular, mostly 2 to 6 cm. long.

6. *M. seleriana*.

Flowers in terminal panicles.

Petals undulate; glands much shorter than the sepals; leaves glabrous or nearly so—7. *M. gouania*.

Petals denticulate; glands nearly as long as the sepals; leaves soft-pubescent on both sides—8. *M. polybotrya*.

1. *Mascagnia macroptera* (Moc. & Sessé) Niedenzu, Mascagn. 27. 1908.

Hiraea macroptera Moc. & Sessé; DC. Prodr. 1: 586. 1824.

Hiraea septentrionalis Juss. Ann. Sci. Nat. II. 13: 259. 1840.

Hiraea greggii S. Wats. Proc. Amer. Acad. 17: 333. 1882.

Hiraea mexicana Rose, Contr. U. S. Nat. Herb. 1: 312. 1895.

Baja California and Sonora to Tamaulipas, Hidalgo, and Sinaloa.

Scandent or sometimes erect shrub; leaves lanceolate to oval, 3 to 8 cm. long, rounded to acute at apex, glabrate, short-petiolate; petals 6.5 to 12 mm. long; samaras 4.5 to 5.5 cm. wide, the wings erose-denticulate or undulate. "Gallinita" (Sonora, Baja California); "matanene" (Baja California, Sinaloa); "bejuco prieto" (Sinaloa).

Leaves sometimes used as poultices for bruises and sores.

2. *Mascagnia mexicana* Niedenzu, Mascagn. 29. 1908.

Veracruz; type collected near Orizaba.

Leaves ovate or oval, 10 cm. long or less, pubescent beneath; petals yellow, 10 to 12 mm. long; samaras 3.5 to 4.5 cm. wide.

3. *Mascagnia lilacina* (S. Wats.) Niedenzu in Engl. & Prantl, Pflanzenfam. 3: 56. 1890.

Hiraea lilacina S. Wats. Proc. Amer. Acad. 17: 333. 1882.

Coahuila; type from Caracol Mountains, south of Monclova.

Scandent to a height of 4.5 meters; leaves 2.5 to 4 cm. long, rounded or cordate at base; petals blue or lilac, 8 to 10 mm. long; samaras 2 to 2.5 cm. wide.

4. *Mascagnia vacciniifolia* Niedenzu, Mascagn. 11. 1908.

Mascagnia rupicola T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 501. 1919.

Veracruz and perhaps elsewhere.

Scandent on rocks to a height of 15 meters; leaves 2 to 3 cm. long, obtuse or acute at base; petals rose-colored, 5 to 6 mm. long; samaras 2.5 cm. wide.

5. *Mascagnia cana* Small, N. Amer. Fl. 25: 120. 1910.

Hiraca sericea Engelm.; A. Gray, Pl. Wright. 1: 37. 1852. Not *H. sericea* Juss. 1832.

Mascagnia sericea Niedenzu, Mascagn. 29. 1908.

Sonora to Durango and Coahuila; type from Cadena, Durango.

Apparently an erect shrub; leaves copiously sericeous, short-petiolate or sessile; petals purplish, 5 to 6 mm. long; samaras 1.5 to 1.8 cm. wide, often purplish.

6. *Mascagnia seleriana* Loes. Bull. Herb. Boiss. 2: 543. 1894.

Hiraca parviflora Rose, Contr. U. S. Nat. Herb. 5: 139. 1897.

Mascagnia pringlei Niedenzu, Mascagn. 9. 1908.

Veracruz, Puebla, and Oaxaca; type from Mitla, Oaxaca.

Erect or scandent shrub; leaves densely pubescent, rounded or subcordate at base, short-petiolate; petals violet, 5 to 8 mm. long; samaras 1.3 to 2 cm. wide. "Maxocotl," "maxoctl" (Oaxaca).

7. *Mascagnia gouania* Small, N. Amer. Fl. 25: 120. 1910.

Morelos; type from Jojutla.

Scandent shrub; leaves ovate to rounded-ovate, 4 to 7 cm. long, acute or abruptly acuminate, long-petiolate; petals purplish, 5 to 6.5 cm. long; samaras 2.5 to 3 cm. wide.

8. *Mascagnia polybotrya* (Juss.) Niedenzu in Engl. & Prantl, Pflanzenfam. 3⁴: 56. 1890.

Hiraca polybotrya Juss. Ann. Sci. Nat. II. 13: 260. 1840.

?*Hiraca spicigera* Turcz. Bull. Soc. Nat. Moscou 36¹: 584. 1863.

Puebla and Oaxaca.

Leaves 2.5 to 5 cm. long, rounded or subcordate at base, short-petiolate; petals blue.

No material seen by the writer; perhaps the same as *M. gouania*.

12. *JANUSIA* Juss. Ann. Sci. Nat. II. 13: 250. 1840.

Slender scandent shrubs; leaves small, opposite, short-petiolate, entire; flowers small, yellow, solitary or in axillary clusters, the petals undulate; fruit of 2 or 3 samaras.

Leaves linear or narrowly lanceolate..... 1. *J. gracilis*.
Leaves ovate or oval..... 2. *J. californica*.

1. *Janusia gracilis* A. Gray, Pl. Wright. 1: 37. 1852.

Dry hillsides, Baja California to Coahuila. Western Texas to southern Arizona; type collected near El Paso, Texas.

Leaves 1 to 3 cm. long, strigose, especially beneath; larger petals 4 to 5 mm. long; samaras 9 to 12 mm. long.

2. *Janusia californica* Benth. Bot. Voy. Sulph. 8. 1844.

Dry hillsides, Baja California, Sonora, and Sinaloa; type from Magdalena Bay, Baja California.

Leaves 1.5 to 4 cm. long, rounded or obtuse at apex, thinly strigose, often subcordate at base; samaras 9 to 12 mm. long, often tinged with red.

13. *ASPICARPA* Rich. Mém. Mus. Hist. Nat. 2: 396. 1815.

Slender shrubs with erect or reclining stems; leaves opposite, entire, sessile or short-petiolate; flowers of two kinds, the petaliferous in mostly terminal clusters, with fimbriate petals, the cleistogamous sessile in the lower axils or on long axillary peduncles; fruit of 2 crested nutlets.

- Pubescence of the stems of spreading hairs.....1. *A. hirtella*.
 Pubescence of the stems of appressed hairs.
 Cleistogamous flowers sessile in the axils.....2. *A. hyssopifolia*.
 Cleistogamous flowers pedunculate.
 Peduncles of the cleistogamous flowers nearly or quite as long as the leaves. 3. *A. longipes*.
 Peduncles of the cleistogamous flowers much shorter than the leaves.
 Leaves 4 to 8 mm. wide, thinly strigose or glabrate beneath. 4. *A. humilis*.
 Leaves 10 to 30 mm. wide, densely sericeous beneath.....5. *A. lanata*.

1. *Aspicarpa hirtella* Rich. Mém. Mus. Hist. Nat. 2: 399. 1815.

Aspicarpa urens Lag. Gen. & Sp. Nov. 1. 1816.

Acasmus pruriens Desv.; Desf. Cat. Pl. Paris. ed. 3. 233. 1829.

Zacatecas and Jalisco to Mexico.

Stems scandent or reclining, hirsute with stinging hairs; leaves oval-ovate, 1.5 to 3.5 cm. long, rounded to acutish at apex, cordate or subcordate at base; larger petals about 1 cm. long.

2. *Aspicarpa hyssopifolia* A. Gray, Bost. Journ. Nat. Hist. 6: 167. 1850.

Western Texas, along the Rio Grande, and doubtless also in Coahuila or Nuevo León.

Stems 10 to 30 cm. high; leaves mostly linear or lanceolate, 1 to 2.5 cm. long, acute; larger petals 5 to 7 mm. long.

3. *Aspicarpa longipes* A. Gray, Pl. Wright. 1: 37. 1852.

Sonora to San Luis Potosí and Querétaro. Western Texas and southern Arizona; type from Texas.

Stems 1 meter long or less, sometimes scandent; leaves ovate or oval, 1 to 4.5 cm. long, cordate or subcordate at base.

4. *Aspicarpa humilis* (Benth.) Juss. Arch. Mus. Hist. Nat. (Paris) 3: 597. 1844.

Gaudichaudia humilis Benth. Pl. Hartw. 6. 1839.

Aspicarpa hartwegiana Juss. Ann. Sci. Nat. II. 13: 253. 1840.

Chihuahua and Durango to San Luis Potosí; type from Aguascalientes.

Low ascending shrub; leaves ovate to oblong-lanceolate, 1 to 3 cm. long.

5. *Aspicarpa lanata* Rose, Contr. U. S. Nat. Herb. 8: 49. 1903.

Durango, Jalisco, and Zacatecas; type from Guadalajara, Jalisco.

Densely pubescent shrub, 20 to 70 cm. high; leaves often whorled, oblong to oval, 3 to 6.5 cm. long, acute to rounded at apex; petals yellow, 6 to 9 mm. long.

14. *BANISTERIOPSIS* C. B. Robinson; Small, N. Amer. Fl. 25: 131. 1910.

Scandent shrubs; leaves opposite, entire, petiolate; flowers large, paniculate, the calyx with 8 or 10 glands, or glandless; petals dentate or lacerate; fruit of 3 or fewer samaras.

Leaves lanceolate or oblong-lanceolate, glabrous.....1. *B. acapulcensis*.

Leaves oval or broadly ovate, sericeous.....2. *B. argentea*.

1. *Banisteriopsis acapulcensis* (Rose) Small, N. Amer. Fl. 25: 132. 1910.

Heteropteris acapulcensis Rose, Contr. U. S. Nat. Herb. 5: 139. 1897.

Known only from the type locality, Acapulco, Guerrero.

Leaves 7 to 15 cm. long; larger petals 5 to 5.5 mm. long; samaras 2.5 to 3 cm. long.

2. *Banisteriopsis argentea* (H. B. K.) C. B. Robinson; Small, N. Amer. Fl. 25: 133. 1910.

Heteropteris argentea H. B. K. Nov. Gen. & Sp. 5: 164. 1822.

Chiapas. Central America and northern South America; type from Colombia.

Leaves 3 to 12 cm. long, rounded to acute at apex; petals pink, the larger ones 7 to 8 mm. long; samaras 2.5 to 3 cm. long.

15. **BANISTERIA** L. Sp. Pl. 427. 1753.

Erect or scandent shrubs or trees; leaves opposite, entire; flowers large, in paniculate cymes; calyx glandless or with 8 glands; petals entire or denticulate; fruit of 2 or 3 samaras.

Sepal tips recurved. Inflorescence densely reddish-pubescent—1. *B. laurifolia*.
Sepal tips erect.

Leaves with 2 to 6 sessile glands near the base of the blade underneath.

2. *B. beecheyana*.

Leaves with 2 stipitate glands underneath.

Glands remote from the base of the blade.

Body of the samara with a thin crown on the side-----3. *B. cotinifolia*.

Body of the samara not crowned.

Leaves acute or acuminate-----4. *B. arborescens*.

Leaves rounded or obtuse at apex-----5. *B. pallida*.

Glands borne at the extreme base of the leaf blade.

Samaras 2 to 2.5 cm. long-----6. *B. palmeri*.

Samaras 3 to 4 cm. long.

Body with 2 or 3 crowns-----7. *B. gayana*.

Body with a single crown, or merely tuberculate-----8. *B. portillana*.

1. *Banisteria laurifolia* L. Sp. Pl. ed. 2. 611. 1762.

Malpighia dubia Cav. Monad. Diss. 413. 1789.

Heteropteris longifolia H. B. K. Nov. Gen. & Sp. 5: 166. 1822.

Heteropteris floribunda H. B. K. Nov. Gen. & Sp. 5: 166. 1822.

Byrsonima stigmatophora Schlecht. Linnaea 10: 241. 1836.

Sinaloa to Veracruz, Tabasco, and Oaxaca. Central America and West Indies; type from Jamaica.

Large scandent shrub, or sometimes a tree, up to 12 meters high; leaves lance-oblong to elliptic or ovate, 5 to 16 cm. long, obtuse to acuminate, coriaceous, lustrous, glabrous in age; flowers yellow, the petals 5 to 7 mm. long; samaras 3.5 to 4 cm. long. "Pinsanillo" (Michoacán, Guerrero); "escobillo" (Tabasco); "bejuco de caballo" (*Sessé & Mociño*); "coral" (Costa Rica); "cointura" (Panama); "bejuco de buey" (Porto Rico); "vergaño de toro" (Cuba).

2. *Banisteria beecheyana*¹ (Juss.) C. B. Robinson; Small, N. Amer. Fl. 25: 134. 1910.

¹With the hope of finding in Bering Strait the expeditions under Parry and Franklin, the British Government in 1825 dispatched H. M. S. *Blossom* under the command of Capt. F. W. Beechey. This ship anchored at San Blas in Tepic in December, 1827, and remained there until February, 1828. During this time the naturalist, Lay, explored Tepic and adjoining regions, and made a collection of plants. Some of these came from Jalisco, and on the labels that name was written "Talisco," a circumstance which has caused a derivative of the latter incorrect name to be used as a specific name for some of the new species described from the collections. Plants were collected also at Acapulco and Mazatlán. Some of the naval officers, particularly Alexander Collie, assisted Lay in making the collections. The plants were reported upon by Hooker and Arnott.

- Banisteria tomentosa* Schlecht. *Linnaea* 10: 244. 1833. Not *B. tomentosa* Desf. 1804
- Heteropteris beecheyana* Juss. *Ann. Sci. Nat.* II. 13: 278. 1840.
- Banisteria simulans* Small, *N. Amer. Fl.* 25: 136. 1910.
Tepic to Tamualipas, Yucatàn, and Chiapas. Central America and Colombia.
Erect or scandent shrub; leaves oblong to rounded-oval, 4 to 7 cm. long, copiously pubescent beneath; petals 4.5 to 6 mm. long; samaras 3 to 4 cm. long.
3. *Banisteria cotinifolia* (Juss.) C. B. Robinson; Small, *N. Amer. Fl.* 25: 134. 1910.
Heteropteris cotinifolia Juss. *Ann. Sci. Nat.* II. 13: 274. 1840.
Veracruz and Oaxaca.
Leaves broadly ovate or rounded, 4 to 7 cm. long, obtuse, glabrate; samaras 2.5 to 3 cm. long.
4. *Banisteria arborescens* (T. S. Brandeg.) Small, *N. Amer. Fl.* 25: 135. 1910.
Heteropteris arborescens T. S. Brandeg. *Zoe* 5: 203. 1905.
Known only from the type locality, Cerro Colorado, Sinaloa.
Leaves ovate to oblong-lanceolate, 4 to 8 cm. long, glabrate; samaras 2.5 to 3 cm. long.
5. *Banisteria pallida* (T. S. Brandeg.) Standl.
Heteropteris pallida T. S. Brandeg. *Univ. Calif. Publ. Bot.* 6: 182. 1915.
Guerrero and Oaxaca; type from San Gerónimo, Oaxaca.
Leaves ovate to broadly oval, 3 to 11 cm. long, in age glabrous; samaras 2.5 to 3 cm. long.
Perhaps not distinct from *B. arborescens*.
6. *Banisteria palmeri* (Rose) C. B. Robinson; Small, *N. Amer. Fl.* 25: 135. 1910.
Heteropteris palmeri Rose, *Contr. U. S. Nat. Herb.* 1: 311. 1895.
Sonora and Sinaloa; type from Alamos, Sonora.
Leaves ovate or lanceolate, 3 to 7 cm. long, glabrate; larger petals 5 to 6 mm. long. "Bejuco huesillo" (Sinaloa).
The stems are used as cordage. They are sometimes 20 to 25 meters long.
7. *Banisteria gayana* (Juss.) C. B. Robinson; Small, *N. Amer. Fl.* 25: 135. 1910.
Heteropteris gayana Juss. *Ann. Sci. Nat.* II. 13: 274. 1840.
Colima to Oaxaca.
Large scandent shrub; leaves 2.5 to 7 cm. long, glabrate; samaras often tinged with red.
8. *Banisteria portillana* (S. Wats.) C. B. Robinson; Small, *N. Amer. Fl.* 25: 135. 1910.
Heteropteris portillana S. Wats. *Proc. Amer. Acad.* 22: 402. 1887.
Jalisco; type collected near Guadalajara.
Scandent shrub; leaves 6 to 11 cm. long, glabrous in age; petals 7 to 8 mm. long, salmon-colored outside, red inside.
16. **STIGMAPHYLLON** Juss.; *St. Hil. Fl. Bras. Merid.* 3: 48. 1833.
Scandent shrubs; leaves opposite, entire, dentate, or lobate, petiolate; flowers large, yellow, in axillary pedunculate umbel-like corymbs, the petals dentate; fruit of 2 or 3 samaras.
Leaves copiously pubescent beneath, even in age-----1. **S. lindenianum.**

Leaves glabrous beneath or nearly so.

Leaves deltoid-cordate or ovate-cordate, deeply cordate at base.

2. *S. selertianum*.

Leaves oval, elliptic, or ovate, rounded or subcordate at base.

3. *S. mucronatum*.

1. *Stigmaphyllon lindenianum* Juss. Arch. Mus. Hist. Nat. (Paris) 3: 362. 1844.

Stigmaphyllon lupulus S. Wats. Proc. Amer. Acad. 21: 461. 1885.

San Luis Potosí to Yucatán and Chiapas; type from Teapa, Tabasco. Central America.

Coarse scandent shrub; leaves entire, undulate, or deeply lobate, rounded to acuminate at apex, truncate or cordate at base; larger petals 9 to 11 mm. long; samaras 2 to 2.5 cm. long. "Chinaca" (Veracruz).

2. *Stigmaphyllon selertianum* Niedenzu, Stigmatoph. 2: 7. 1900.

Oaxaca and Chiapas; type from Almoloyas, Oaxaca.

Leaves 2 to 9 cm. long, entire or undulate, deeply cordate, with rounded sinuses, long-petiolate; petals 1.3 to 1.5 cm. long.

3. *Stigmaphyllon mucronatum* (DC.) Juss. Arch. Mus. Hist. Nat. (Paris) 3: 377. 1844.

Banisteria mucronata DC. Prodr. 1: 589. 1824.

Banisteria ternata Moc. & Sessé; DC. Prodr. 1: 591. 1824.

Veraacruz and Oaxaca. Central America and northern South America; type from Ecuador.

Slender scandent shrub; leaves 3 to 9 cm. long, rounded to acute at apex, pale beneath; larger petals 1.3 to 1.8 cm. long; samaras 2 to 2.5 cm. long. "Bejuco de ratón" (Guatemala, Honduras).

75. POLYGALACEAE. Milkwort Family.

(Contributed by S. F. Blake.)

Herbs, shrubs, or trees, sometimes scandent, with alternate (in all the following species) or sometimes opposite or whorled, entire leaves, without stipules or with small stipular glands; flowers perfect, zygomorphic, racemed, the racemes sometimes paniculate; sepals 5, free or the two lower united, one dorsal, two ventral, two lateral and interior, the latter (wings) usually much larger than the others and petaloid; petals 3, rarely 5, hypogynous, the ventral one (keel) boat-shaped, often with a terminal beak or crest, the two upper usually ligulate or oblong, the two lateral rarely present, always very small; stamens 8 (in all the following species), the filaments united for most of their length into a sheath split on the upper side, united at base to the upper petals or the keel or both; anthers 1-celled, opening by terminal pores; disk usually represented by a gland at base of ovary; ovary 1 or 2-celled; style 1; stigma often 2-lobed; ovules solitary, pendulous; fruit a capsule, drupe, or samara; seeds usually pubescent and arillate.

Ovary and fruit 2-celled; fruit a dehiscent capsule-----1. **POLYGALA**.

Ovary and fruit 1-celled; fruit indehiscent.

Keel with a plicate crest; fruit a samara, with a large wing on the lower side-----2. **SECURIDACA**.

Keel not crested; fruit drupelike, not winged-----3. **MONNINA**.

1. **POLYGALA** L. Sp. Pl. 701. 1753.

Herbs, shrubs, or trees, with alternate estipulate leaves and racemose flowers; sepals free or the two lower united; wings petaloid; keel crested, beaked, or unappendaged; stamens 8 or rarely 6; fruit a 2-celled 2-seeded thin-walled capsule; seeds usually pubescent and arillate.

The species are of little economic importance but some are used in medicine, diaphoretic, expectorant, and emetic properties being ascribed to them. Others are used locally as remedies for snake bites, and some are said to have poisonous properties.

Keel blunt, without crest or beak.

Sepals all free.

Sepals and wings at least in part deciduous.

Sepals all herbaceous, deciduous like the wings, or with them rarely subsistent; aril pubescent at least at apex.

Capsule and leaves not obviously glandular.

Leaves small, mostly 6 to 20 mm. long, usually distinctly dimorphous, the lower shorter, oval or oblong-oval, the upper oblong to linear or rarely uniform, but then smaller than in the next group ----- **I. MICROTHRIX.**

Leaves comparatively large, mostly 2 to 6 cm. long, 1 to 3 cm. wide, ovate, gradually reduced upward, not noticeably dimorphous.

II. HEBANTHA.

Capsule and leaves bearing large glands ----- **III. ADENOPHORA.**

Sepals not all herbaceous, the lower ones petaloid, deciduous like the wings, the upper one herbaceous, persistent; aril glabrous.

IV. BILOBA.

Sepals and wings persistent, the sepals herbaceous ----- **V. HUATECA.**

Sepals not all free, the two lower ones connate. Wings and sepals persistent.

VI. HEBECLADA.

Keel with a beak or crest.

Keel with a conic or cylindric beak, not crested.

Sepals (except usually the upper) and wings deciduous.

VII. EURHINOTROPIS.

Sepals and wings persistent ----- **VIII. PANTOMONE.**

Keel with a fimbriate crest ----- **IX. MONNINOPSIS.**

I. MICROTHRIX.

Leaves nearly uniform, oval or ovate.

Plant densely pubescent with spreading hairs.

Capsule merely ciliate; wings shorter than keel ----- **1. P. ovatifolia.**

Capsule puberulous on the sides; wings longer than keel --- **2. P. buxifolia.**

Plant puberulous with incurved or appressed hairs.

Wings subsistent ----- **3. P. myrtilloides.**

Wings deciduous.

Leaves oval or elliptic, obtuse or rounded ----- **4. P. xanti.**

Leaves ovate, acuminate ----- **5. P. serpens.**

Leaves more or less dimorphous, the lower oval or oblong, the upper longer, linear to oblong, elliptic, or ovate.

Wings glabrous; capsule merely ciliate ----- **6. P. pavoni.**

Wings pubescent, at least at base, or if rarely glabrous, then capsule pubescent on the sides.

Aril small, the depth of the entire or merely denticulate-lobulate scarious margin less than the height of the corneous umbo.

- Hairs of stem all incurved or appressed.
 Capsule more or less pubescent on sides.
 Flowers 4 to 5 mm. long.....7. *P. magdalenae*.
 Flowers 6 to 7 mm. long.
 Stems hirsute-tomentose above.....8. *P. leptosperma*.
 Stems barely puberulous above.....27. *P. oaxacana*.
 Capsule merely ciliate at maturity.
 Middle and upper leaves strongly reduced, 5 to 14 mm. long, linear
 or lance-linear.
 Aril with more or less distinct dorsal lobe, subpedicellate by the
 pointed base of seed.....9. *P. barbeyana*.
 Aril without distinct dorsal lobe, subsessile.
 Aril with subglabrous umbo.....10. *P. zacatecana*.
 Aril with densely pilose umbo.....11. *P. intricata*.
 Middle and upper leaves not reduced, 15 to 31 mm. long.
 Middle and upper leaves obovate-oblong, 4.5 to 7 mm. wide.
 12. *P. palmeri*.
 Middle and upper leaves linear, 1.5 to 3 mm. wide.
 13. *P. racemosa*.
- Hairs of stem (at least in part) wide-spreading.
 Hairs of stem all short and wide-spreading; leaves not reticulate.
 14. *P. rectipilis*.
 Hairs of stem partly long and spreading, partly short and incurved;
 leaves reticulate.
 Middle and upper leaves linear or linear-lanceolate, 1.8 to 4 mm. wide.
 21. *P. retifolia*.
 Middle and upper leaves oblong-lanceolate or oval, 4.5 to 16 mm. wide.
 22. *P. amphothrix*.
- Aril larger, the depth of the lobed or lobulate scarious margin equaling or
 exceeding the height of the corneous umbo.
 Capsule merely ciliate at maturity; aril not veil-like.
 Upper leaves linear to narrowly lanceolate.
 Stems incurved-puberulous.
 Upper leaves strongly reduced, 5 to 14 (23) mm. long.
 15. *P. reducta*.
 Upper leaves not reduced, 17 to 36 mm. long.....16. *P. longa*.
 Stems sparsely spreading-pubescent, glabrate....17. *P. neurocarpa*.
 Upper leaves ovate to elliptic-oblong.
 Wings 6 to 6.5 mm. long.....18. *P. oophylla*.
 Wings 4 to 5 mm. long.
 Scarious border of aril barely as deep as height of umbo; keel
 purplish.....19. *P. brachyanthema*.
 Scarious border of aril distinctly deeper than height of umbo;
 keel yellowish green.....20. *P. brandegeana*.
- Capsule pubescent on sides at maturity or, if merely ciliate, then aril
 veil-like.
 Hairs of stem (at least in part) wide-spreading.
 Middle and upper leaves linear or linear-lanceolate, 1.8 to 4 mm.
 wide.....21. *P. retifolia*.
 Middle and upper leaves oblong-lanceolate or oval, 4.5 to 16 mm.
 wide.....22. *P. amphothrix*.

Hairs of stem all incurved or appressed.

Aril veil-like, with broad scarious lobulate margin, covering one-third to three-fifths of seed, the dorsal margin vertically descending, the lower margin nearly or quite horizontal.

Sepals and wings quickly deciduous.....23. *P. obscura*.

Sepals and wings subsistent.....24. *P. lozani*.

Aril not veil-like.

Upper leaves ovate to elliptic or lance-oblong.

Lobes of aril oblong to deltoid; wings 5 to 5.8 mm. long.

25. *P. parrasana*.

Lobes of aril linear or lance-linear; wings 3.5 to 5 mm. long.

26. *P. compacta*.

Upper leaves linear.....27. *P. oaxacana*.

II. HEBANTHA.

Capsule merely ciliate at maturity.

Hairs of stem all incurved or appressed.

Stem subterete; wings 5.5 to 6.6 mm. long.

Stem and leaves sparsely strigillose; leaves narrowly lanceolate.

28. *P. longipes*.

Stem and leaves densely strigillose or incurved-puberulous; leaves ovate to rhombic-lanceolate.....29. *P. velata*.

Stem strongly angled; wings 4.5 mm. long.....30. *P. polyedra*.

Hairs of stem (at least in part) wide-spreading.

Leaves lanceolate; wings ciliate.....31. *P. galeottii*.

Leaves ovate; wings not ciliate.....32. *P. rivinaefolia*.

Capsule pubescent on sides at maturity.

Keel 3.2 to 3.5 mm. long; wings 3.8 mm. long.....33. *P. brachytropis*.

Keel 4.2 to 6.8 mm. long; wings 4.5 to 7 mm. long.

Wings rather densely pubescent over whole outer surface.

Sepals 4 to 4.5 mm. long; capsule reticulate.....34. *P. americana*.

Sepals 2.5 to 3 mm. long; capsule scarcely reticulate...35. *P. pedicellata*.

Wings sparsely pubescent or puberulous chiefly at apex and base and along costa, or subglabrous.

Wings 6.5 to 9 mm. long.

Hairs of stem partly short and incurved, partly long and spreading.

41. *P. biformipilis*.

Hairs of stem all similar, appressed or incurved-spreading.

Capsule spreading-pilosulous; aril with minute umbo.

36. *P. cuspidulata*.

Capsule incurved-puberulous; umbo medium-sized.

37. *P. appressipilis*.

Wings 4.5 to 5.8 mm. long.

Wings suborbicular, glabrous except for the ciliolate margin and the finely puberulous costa; sepals 1 to 2 mm. long.

38. *P. brachysepala*.

Wings oval, pubescent at least along costa; sepals 2 to 3.8 mm. long.

Dorsal margin of aril strongly descending; umbo medium or large.

39. *P. microtricha*.

Dorsal margin of aril horizontal or erectish; umbo minute.

40. *P. chiapensis*.

III. ADENOPHORA.

Leaves obovate.

- Leaves incurved-pubescent.....42. *P. glandulosa*.
 Leaves nearly glabrous.....43. *P. phoenicistes*.
 Leaves linear to oblong-lanceolate.....44. *P. macradenia*.

IV. BILOBA.

Lower sepals glabrous; flowers purple; racemes many-flowered.

Bracts deciduous, equaling the pedicels; stems canescent-pilosulous.

45. *P. purpusii*.Bracts persistent, shorter than the pedicels; stems incurved-pubescent but green.....46. *P. conzattii*.Lower sepals ciliate; flowers greenish; racemes 1 to 4-flowered...47. *P. parryi*.

V. HUATECA.

A single species.....48. *P. tehuacana*.

VI. HEBECLADA.

Wings densely ciliate; seed pilose-tomentose; aril large....49. *P. floribunda*.

Wings very minutely glandular-ciliolate; seed pilosulous; aril minute.

50. *P. apopetala*.

VII. EURHINOTROPIS.

Flowers 8.5 mm. long, purplish and yellowish.....51. *P. fishiae*.

Flowers 4 to 5.5 mm. long, white or rosy.

Leaves oval, glabrous or sparsely incurved-puberulous.

Leaves 1 to 2 cm. long, 4 to 12.5 mm. wide.....52. *P. nitida*.Leaves 4 to 9 mm. long, 2 to 6.5 mm. wide.....53. *P. eucosma*.

Leaves squamiform to lanceolate or, when broader, densely pubescent.

Leaves not squamiform.

Leaves, at least the lower ones, oval to suborbicular, like the stem densely spreading or incurved-spreading-pubescent.

54. *P. lindheimeri*.Leaves mostly linear to lanceolate, merely incurved-puberulous like the stem.....55. *P. tweedyi*.Leaves squamiform, 1 to 4.5 mm. long.....56. *P. minutifolia*.

VIII. PANTOMONE.

A single species.....57. *P. desertorum*.

IX. MONNINOPSIS.

Capsule more than twice as long as wings.....58. *P. semialata*.

Capsule less than one and one-half times as long as wings.

Stem glabrous.....59. *P. hemipterocarpa*.

Stem strigillose or puberulous.

Wings 5 mm. long.....60. *P. watsoni*.

Wings 2.5 to 3.5 mm. long.

Leaves linear or acicular; stem strigillose or incurved-puberulous.

Capsule oblong, about twice as long as wide.

Leaves strongly 2-sulcate beneath.....61. *P. scoparioides*.

Leaves not 2-sulcate beneath.

Capsule 2 mm. long; aril 1 mm. long.....62. *P. dolichocarpa*.Capsule 2.7 to 3 mm. long; aril 1.5 mm. long.....63. *P. scoparia*.

Capsule suborbicular or oval, not twice as long as wide.

64. *P. michoacana*.Leaves obovate-spatulate; stems spreading-puberulous....65. *P. viridis*.

1. *Polygala ovatifolia* A. Gray, Pl. Wright. 1: 39. 1852.

Chihuahua to Nuevo León. Texas and New Mexico; type from western Texas.

Suffrutescent, erect, 30 cm. high or less, densely spreading-pilose; leaves ovate, 1.2 to 3 cm. long, 0.6 to 1.3 cm. wide, acutish, spreading-pilose on both sides; racemes 2 to 6.5 cm. long; flowers greenish yellow; wings 4 to 5 mm. long; aril with rather broad, lobed and lobulate, scarious margin.

2. *Polygala buxifolia* H. B. K. Nov. Gen. & Sp. 5: 407. 1821.

Polygala ovalifolia DC. Prodr. 1: 331. 1824.

San Luis Potosí and Querétaro; type from Santa Rosa, Querétaro.

Suffrutescent, ascending, about 28 cm. long, spreading-pubescent; leaves elliptic or ovate, about 2 cm. long, obtuse or rounded; wings 5.5 mm. long; aril with broad scarious margin and distinct short lateral and spreading dorsal lobes.

3. *Polygala myrtilloides* Willd. Sp. Pl. 3: 889. 1803.

San Luis Potosí and Hidalgo.

Fruticulose below, densely appressed-puberulous; leaves elliptic to oval-ovate, mostly obtuse, 1.5 to 2 cm. long, subcoriaceous, subappressed-pubescent; racemes 4 to 8-flowered; wings 5.5 to 6.5 mm. long; capsule puberulous and ciliate; aril broadly scarious-margined, 3-lobed, the dorsal lobe short and horizontal.

4. *Polygala xanti*¹ A. Gray, Proc. Amer. Acad. 5: 153. 1861.

Southern Baja California; type from Cape San Lucas.

Suffrutescent below, procumbent or erectish, densely incurved-pubescent; leaves oval, 6 to 16 mm. long, rounded at apex, densely incurved-pubescent; racemes short; flowers white, tinged with yellow and purple; wings 5.3 to 5.8 mm. long; capsule densely pubescent; scarious margin of aril narrow, equaling the umbo, shortly upturned at dorsal apex.

5. *Polygala serpens* Blake, Contr. Gray Herb. n. ser. 47: 21. 1916.

Known only from the type locality, Acapulco, Guerrero.

Suffruticulose, procumbent, incurved-puberulous, 30 cm. long or less; leaves ovate, 1.5 to 2.8 cm. long, acuminate, thin, incurved-spreading-pubescent; racemes loose, 2 cm. long; flowers apparently ochroleucous; wings 5.5 to 7 mm. long; aril minute, capitelliform, with obsolete scarious margin.

6. *Polygala pavoni*² Chod. Mém. Soc. Phys. Hist. Nat. Genève 31²: 14. 1893.

Mexico, without definite locality.

Undershrub, puberulous, about 20 cm. long; leaves elliptic or elliptic-ovate, varied, 2 cm. long, puberulous, obtuse; racemes few-flowered; flowers 5 to 6 mm. long; ovary ciliate; fruit unknown.

A species of doubtful relationship.

7. *Polygala magdalenae* T. S. Brandeg. Univ. Calif. Publ. Bot. 4: 182. 1911.

Southern Baja California; type from Magdalena Island.

Prostrate, 30 cm. long, incurved-griseous-puberulous; lowest leaves oval-oblong, 7 mm. long, the others oblong to linear, 1.2 to 2 cm. long, incurved-

¹L. J. Xantus, while employed by the U. S. Coast Survey, made a collection of about 120 species of plants in Baja California, chiefly about Cape San Lucas. Many new species were published by Gray in his report upon the collection (Proc. Amer. Acad. 5: 153-173. 1861). A set of the plants is in the U. S. National Herbarium.

²In honor of José Pavón, a member of the Spanish scientific commission sent to Peru and Chile in 1777. He was an associate of Ruiz, with whom he published several classic works dealing with South American plants.

puberulous; racemes loose, 4 to 10.5 cm. long; flowers apparently ochroleucous; wings narrowly obovate-oval, 4.5 mm. long; aril minute, 0.7 mm. high, with very narrow scarious margin.

8. *Polygala leptosperma* Chod. Mém. Soc. Phys. Hist. Nat. Genève 31²: 17. 1893.

Oaxaca.

Suffrutescent below, 12 cm. long, hirsute-tomentose above; leaves lanceolate to lance-linear, 1.5 to 2.2 cm. long, subtomentose-velutinous; flowers 6 to 7 mm. long; wings elliptic-lanceolate, long-ciliate; capsule ovate-cuneate, hispid; aril small, capitelliform, the very narrow scarious margin with very short upturned dorsal lobe and no lateral lobes.

9. *Polygala barbeyana* Chod. Mém. Soc. Phys. Hist. Nat. Genève 31²: 16. 1893.

Coahuila to San Luis Potosí; type from San Luis Potosí. Arizona.

Several-stemmed, suffruticulose below, up to 40 cm. high, densely incurved-pubescent or at length subglabrate; leaves reduced, the lowest oblong, the middle and upper subsquamiform, linear or linear-lanceolate, 5 to 10 mm. long; racemes 1.7 to 11 cm. long; wings obovate-oval or suborbicular-oval, 3.5 to 4.5 mm. long; aril small, 0.7 mm. high, cap-shaped, subpedicellate by the pointed base of seed, with narrow unlobed scarious margin and short upturned dorsal lobe.

10. *Polygala zacatecana* Blake, Contr. Gray Herb. n. ser. 47: 26. 1916.

Known only from the type locality, near Concepción del Oro, Zacatecas.

Several-stemmed, suffruticulose below, about 12 cm. high, incurved-puberulous; leaves reduced, the lower oblong or oval, 4 to 5 mm. long, the others linear-lanceolate, 4.5 to 10 mm. long, 1 mm. wide, involute; racemes 2 to 5 cm. long; wings oval-obovate, 4 mm. long; aril tiny, very sparsely pubescent, with subglabrous umbo, the scarious margin entire, very narrow.

11. *Polygala intricata* Blake, Contr. Gray Herb. n. ser. 47: 26. 1916.

Known only from the type locality, Saltillo, Coahuila.

Stems about 10 cm. long, flexuous, ascending, densely incurved-puberulous; lowest leaves oblong, 3 mm. long, the others linear or linear-lanceolate, 11 to 14 mm. long, 1.5 to 2.5 mm. wide; racemes flexuous; wings obovate, 3.5 to 4 mm. long; aril 0.8 mm. high, the umbo densely spreading-pilose, the narrower margin subentire.

12. *Polygala palmeri* S. Wats. Proc. Amer. Acad. 17: 325. 1882.

Coahuila; type from Juárez. Western Texas.

Several-stemmed, subcanescently pubescent, about 15 cm. high; lower leaves oval, the others oblong or ovate-oblong, the middle and upper 16 mm. long, 4.5 to 7 mm. wide, obtuse or truncate, thick; racemes 4.5 cm. long; flowers greenish yellow and purplish; wings obovate, 5.7 to 6 mm. long; aril 1.5 mm. high, with narrow subentire scarious margin extended into short subhorizontal anterior and dorsal lobes.

13. *Polygala racemosa* Blake, Contr. Gray Herb. n. ser. 47: 28. 1916.

Chihuahua; type from Santa Eulalia Mountains. Southern Arizona.

Several-stemmed, fruticulous below, about 30 cm. high, densely incurved-puberulous but green; lower leaves strongly reduced, the others linear, 15 to 31 mm. long, 1.5 to 3 mm. wide, acute; racemes 7 to 13 cm. long; flowers apparently greenish; wings oval-obovate, 4.5 to 4.8 mm. long; aril 0.7 to 1 mm. high, the scarious margin lobulate, narrower than the umbo, the dorsal lobe very short, the lateral obsolete.

14. *Polygala rectipilis* Blake, Contr. Gray Herb. n. ser. 47: 27. 1916.

Coahuila. Type from Hillsboro, Sierra County, New Mexico.

Several-stemmed, fruticulose below, about 20 cm. high, densely spreading-pilose with short hairs; lower leaves oblong or oval, 8 to 14 mm. long, the others linear, 12 to 22 mm. long, 1.7 to 2.5 mm. wide; racemes 4 to 10 cm. long; flowers purplish; wings obovate-oval, 4.5 mm. long; aril 1 mm. high, the scarious, scarcely lobed margin narrower than the umbo.

15. *Polygala reducta* Blake, Contr. Gray Herb. n. ser. 47: 25. 1916.

Polygala scopulorum T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 364. 1917.

Coahuila to San Luis Potosí; type from San Luis Potosí.

Several-stemmed, suffruticulose below, 17 cm. high or less, incurved-puberulous; lower leaves oval-oblong, 5 to 9 mm. long, the others linear-lanceolate or linear, 5 to 23 mm. long, 0.5 to 2 mm. wide, involute; racemes very loose, 6 to 9 cm. long; wings elliptic-obovate, 4.5 to 5 mm. long; aril 1 mm. high, the dorsal lobe spreading, 1.5 mm. long, the lateral lobes short, subentire, slightly deeper than the umbo.

16. *Polygala longa* Blake, Contr. Gray Herb. n. ser. 47: 29. 1916.

Chihuahua. Texas and Arizona; type from the Pecos River, Texas.

Several-stemmed, suffruticulose below, 13 to 45 cm. high, densely incurved-griseous-puberulous; lowest leaves oblong or oval-oblong, 8 to 17 mm. long, the others oblong-lanceolate or oblong-linear, 17 to 36 mm. long, 1.5 to 4 mm. wide, usually acute, griseous-puberulous; racemes 2 to 10.5 cm. long; flowers purplish; wings oval or suborbicular, 3.8 to 5.5 mm. long; aril 1 mm. high, the dorsal margin 1.5 mm. long, the umbo 0.4 mm. high, the broader scarious margin strongly lobulate, with distinct or subdistinct dorsal and shorter lateral lobes.

17. *Polygala neurocarpa* T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 364. 1917.

Known only from the type locality, Ixmiquilpan, Hidalgo.

Several-stemmed, suffruticose below, about 30 cm. long, at first sparsely spreading-pubescent with short straight hairs, in age glabrate except in the axils; leaves linear to linear-oblong, 9 to 25 mm. long, 1 to 4 mm. wide, thickish, soon glabrate; racemes 3.5 to 7.5 cm. long; peduncles and pedicels glabrous; wings oval, 5.2 mm. long; aril 1 to 1.2 mm. high, 1.4 mm. long dorsally, the scarious margin repand or lobulate, descending, slightly wider than the umbo.

18. *Polygala oophylla* Blake, Contr. Gray Herb. n. ser. 47: 33. 1916.

Known only from the type locality, Tlacuilotepec, Puebla.

Few-stemmed, suffruticulose below, about 20 cm. high, densely incurved-spreading-pubescent; lowest leaves elliptic, 4 mm. long, the others ovate, 11 to 22 mm. long, 3.5 to 10 mm. wide, acute or subacute; racemes 4 to 7 cm. long; flowers purplish; wings orbicular-oval, 6 to 6.5 mm. long; aril 1.6 mm. high, 2 mm. long, the broad scarious margin irregularly lobulate.

19. *Polygala brachyanthema* Blake, Contr. Gray Herb. n. ser. 47: 33. 1916.

Known only from the type locality, Minas de San Rafael, San Luis Potosí.

Several-stemmed, fruticulose below, 17 to 33 cm. high, green, incurved-pubescent; lowest leaves obovate, 3 to 7 mm. long, the others oblong-elliptic, 10 to 15 mm. long, 3 to 4.8 mm. wide, subobtuse, mucronate, sparsely incurved-pubescent; flowers purplish and greenish; wings oval, 4.5 to 5 mm. long; aril 1 mm. high, 1.6 mm. long dorsally, the scarious margin irregularly crenulate-lobulate, produced into a short horizontal lobe, deeper than the umbo.

20. *Polygala brandegeana* Chod. Bot. Jahrb. Engler 52: Beibl. 115: 72. 1914.

Hidalgo and Puebla; type from El Riego, Tehuacán, Puebla.

Many-stemmed, erectish, 7 to 9 cm. high, pubescent; lower leaves obovate, 3 mm. long, the others oblong to oval or oblong-linear, 6 to 10 mm. long, 1.5 to

4.5 mm. wide, thickish, sparsely pubescent beneath; racemes very short, 1 to 3-flowered; flowers greenish and purplish; wings oval, 5.5 mm. long; aril 1.5 mm. deep, 2.3 mm. long, the broad scarious margin irregularly lobulate, with indistinct lateral and distinct dorsal lobe descending at an angle of about 45°.

21. *Polygala retifolia* Blake, Contr. Gray Herb. n. ser. 47: 29. 1916.

Known only from the type locality, Rfo Blanco, Jalisco.

Stems few, fruticulose below, about 40 cm. high, densely pubescent with short incurved and long straight spreading hairs; lowest leaves 4 to 11 mm. long, the others linear or linear-lanceolate, 2.5 to 4 cm. long, 1.8 to 4 mm. wide, thick, acuminate, reticulate-venose; racemes 8 to 14 cm. long; wings obovate-oval, 5 to 6 mm. long; ovary densely pilose; fruit unknown.

22. *Polygala amphothrix* Blake, Contr. Gray Herb. n. ser. 47: 39. 1916.

Durango and Tepic; type from Otinapa, Durango.

Stems few, 10 to 15 cm. high, densely pubescent with short incurved and long straight wide-spreading hairs; lowest leaves oval, 3.5 to 11.5 mm. long, the others oblong-lanceolate or oval, 15 to 36 mm. long, 4.5 to 16 mm. wide, obtuse or subacute, reticulate; flowers purplish; wings oval, 5 to 5.5 mm. long; ovary densely pilosulous; fruit unknown.

23. *Polygala obscura* Benth. Pl. Hartw. 53. 1840.

Polygala puberula A. Gray, Pl. Wright. 1: 40. 1852.

Polygala laeta T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 365. 1917.

Polygala vagans T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 366. 1917.

Chihuahua to Oaxaca; type from Hacienda del Carmen, Oaxaca. Texas to Arizona.

Many-stemmed, suffruticulose below, 12 to 38 cm. high, grayish-puberulous; lower leaves oblong or oval-oblong, 12 to 28 mm. long, the middle and upper oblong to lanceolate or linear, 18 to 42 mm. long, 1.5 to 12 mm. wide, puberulous; racemes 3.3 to 9 cm. long; flowers purplish; wings oval-obovate or elliptic, 4.5 to 5.8 mm. long, 2 to 3.5 mm. wide; keel 4.8 to 5 mm. long; capsule puberulous or merely ciliate; aril 1.3 to 3 mm. high, veil-like, appressed, with very broad, irregularly lobulate, scarious margin.

23a. *Polygala obscura euryptera* Blake, Contr. Gray Herb. n. ser. 47: 31. 1916.

Oaxaca.

Wings 6 to 6.5 mm. long, 4 to 4.5 mm. wide; keel 6 to 6.5 mm. long.

24. *Polygala lozani* Rose, Contr. U. S. Nat. Herb. 13: 307. 1911.

Polygala calcicola Rose, Contr. U. S. Nat. Herb. 10: 122. pl. 37. 1906. Not

P. calcicola Chod. 1893.

Known only from the type locality, La Cañada, near Tehuacán, Puebla.

Several-stemmed, suffruticulose below, about 10 cm. high, subcanescent-pubescent; lower leaves oval, 11 mm. long, the others oblong or linear-oblong, 10 to 13 mm. long, 1.8 to 3.5 mm. wide, acutish, incurved-pubescent; flowers yellowish green; wings oval, 5 to 5.5 mm. long, subpersistent; aril 1.7 mm. high, the appressed scarious margin irregularly lobulate, deeper than the umbo, the dorsal lobe barely indicated.

25. *Polygala parrasana* T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 365. 1917.

Known only from the type locality, Sierra de Parrás, Coahuila.

Stems several, fruticulose below, procumbent, 4 to 10 cm. long, densely ascending-pubescent; leaves oval or elliptic-oblong, 3 to 9 mm. long, 2.5 to 4 mm. wide, apiculate to obtuse, thickish, pubescent both sides; racemes 1.3 cm. long, few-flowered; wings oval, 5.2 mm. long; keel 5.8 mm. long; aril 1.3 mm. high, 1.7 mm. long on the dorsal margin, the umbo 0.4 mm. high, the scarious mar-

gin 3-lobed, the lateral lobes ovate, vertical, appressed, the dorsal subequal, descending.

26. *Polygala compacta* Rose, Contr. U. S. Nat. Herb. 8: 315. 1905.

Polygala pubescens A. Gray; Chod. Mém. Soc. Phys. Hist. Nat. Genève 31¹: 21. 1893. Not. *P. pubescens* Mart. 1815.

Jalisco and San Luis Potosí to Puebla; type from the Valley of Mexico.

Many-stemmed, ascending or erect, 10 to 20 cm. high, incurved-griseous-puberulous, very leafy; lower leaves obovate or oval, 5 to 17 mm. long, the others oblong or lance-oblong, 11 to 19 mm. long, 3 to 5 mm. wide, obtuse to acutish, incurved-puberulous; racemes rather dense, 1.5 to 4 cm. long; flowers apparently ochroleucous; wings oval or obovate-oval, 3.5 to 5 mm. long; aril 1 to 2 mm. high, strongly 3-lobed, the lobes scarious, linear-lanceolate or linear, descending or the dorsal more or less spreading, subequal or the dorsal somewhat the longer.

27. *Polygala oaxacana* Chod. Bot. Jahrb. Engler 52: Beibl. 115: 73. 1914.

Known only from the type locality, San Juan del Estado, Etla, Oaxaca.

Stems few, suffruticulose below, barely puberulous above, about 20 cm. long; leaves linear, the larger 26 to 35 mm. long, 3 mm. wide, acute, glabrescent; racemes 3 to 5-flowered, 3 cm. long; flowers 6 to 7 mm. long; wings oval; ovary densely pilose; fruit unknown.

28. *Polygala longipes* Blake, Contr. Gray Herb. n. ser. 47: 40. 1916.

Oaxaca.

Stem slender, finely strigillose, 30 cm. high or more; leaves lanceolate, 5.5 to 6.5 cm. long, 9 to 14 mm. wide, thin, long-acuminate, sparsely and finely strigillose; racemes 14.5 cm. long or less; pedicels 5 to 8 mm. long; wings oblong-oval, 6.6 mm. long, 3.3 mm. wide; seed unknown.

29. *Polygala velata* Blake, Contr. Gray Herb. n. ser. 47: 41. 1916.

Chiapas.

Erect, 35 cm. high and more, rather densely incurved-puberulous; leaves ovate to rhombic-lanceolate, 3.7 to 5.2 cm. long, 1.2 to 2.2 cm. wide, acuminate, sparsely incurved-puberulous; racemes 6.5 to 10.5 cm. long; wings oval, 5.5 mm. long, 3.5 mm. wide; aril 3 mm. high, cloaklike, the broad scarious margin sparsely pilose, appressed, slightly lobulate, the umbo medium-sized.

30. *Polygala polyedra* T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 364. 1917.

Known only from the type locality, Mazatlán, Sinaloa.

Stem stoutish, strongly angled, 35 cm. long and more, grayish green, densely strigillose; leaves unknown; racemes 5 cm. long or less, rather dense; wings oval, 4.5 mm. long, 3.5 mm. wide; aril 1.8 to 2 mm. high, 1.6 to 1.8 mm. long dorsally, the umbo pilose, 0.4 mm. deep, the repand-lobulate scarious margin sparsely pilose, the dorsal margin horizontal or slightly upturned.

31. *Polygala galeottii* Chod. Mém. Soc. Phys. Hist. Nat. Genève 31¹: 28. 1893.

Known only from the type locality, Rancho de Haupa, between Jalapa and Córdoba, Veracruz.

Simple or sparsely branched, slightly hirsute; leaves lanceolate, 2.8 to 4 cm. long, 1 to 1.4 cm. wide, attenuate at each end, ciliate and slightly pubescent; racemes elongate, loose; flowers 6 mm. long; wings elliptic-obovate; capsule hirsute-ciliate; aril 2 mm. high, 2.8 mm. long on the dorsal margin, papery, crenate or undulate, scarcely lobed.

32. *Polygala rivinaefolia* H. B. K. Nov. Gen. & Sp. 5: 409. 1821.

Polygala albowiana Chod. Bull. Herb. Boiss. 3: 123. 1895.

Polygala jaliscana Blake, Contr. Gray Herb. n. ser. 47: 44. 1916.

Jalisco to Morelos; type collected near Ario, Michoacán.

Suffruticulose, several-stemmed, about 40 cm. high, rather densely pubescent with short incurved hairs and plentiful long spreading ones; leaves ovate or oblong-ovate, 2.5 to 5.5 cm. long, 1.5 to 3 cm. wide, acute to acuminate, thin, bright green above, rather densely pubescent on both sides; racemes 1.5 to 15 cm. long; flowers purplish; wings oval, 5 to 6 mm. long, 3 to 4 mm. wide; capsule suborbicular, pale, reticulate, about 1 cm. long; aril 1.5 to 2 mm. high, with lobulate or slightly lobed ventral margin, the umbo small, the dorsal margin subhorizontal or curved-ascending to nearly vertically descending.

33. *Polygala brachytropis* Blake, Contr. Gray Herb. n. ser. 47: 46. 1916.

Known only from the type locality, Zimapán, Hidalgo.

Suffruticulose below, 25 cm. high and more, densely pubescent with short incurved and long wide-spreading hairs; leaves ovate, 2.5 to 3.8 cm. long, 1.2 to 1.4 cm. wide, acute, firm, rather sparsely pubescent; racemes about 3 cm. long; wings elliptic, 3.8 mm. long, 2.5 mm. wide; seed unknown.

34. *Polygala americana* Mill. Gard. Dict. ed. 8. *Polygala* no. 7. 1768.

Veracruz.

Several-stemmed, erect, fruticulose, 12 cm. high, densely pubescent with incurved-spreading, rather short, equal hairs; leaves ovate to obovate, 1.4 to 2.3 cm. long, 8 to 11 mm. wide, acute, firm but rather thin, rather densely pubescent on both sides; flowers purplish; racemes 1.2 to 4 cm. long; wings oval, 5 to 7 mm. long, 3 to 4 mm. wide; capsule densely spreading-pubescent, reticulate; seed unknown.

35. *Polygala pedicellata* Blake, Contr. Gray Herb. n. ser. 47: 45. 1916.

Veracruz and Oaxaca; type from Zacuapan, Veracruz.

Stems few, fruticulose below, suberect, branched, about 40 cm. high, rather densely incurved-puberulous; leaves ovate, 2.3 to 3.4 cm. long, 9 to 16 mm. wide, subacuminate, incurved-pubescent; racemes 3.5 to 7 cm. long; flowers purplish; wings oval, 5 to 6.5 mm. long, 3.5 to 4.5 mm. wide; capsule spreading-pubescent; aril 1.5 to 1.8 mm. high, the umbo large, the subequal scarious margin with obscure lateral lobes and distinct, descending or upcurved dorsal lobe.

36. *Polygala cuspidulata* Blake, Contr. Gray Herb. n. ser. 47: 45. 1916.

Puebla and Oaxaca; type from Cerro de Santa Lucía, near San Luis Tultitlanapa, Puebla.

Stems few, erect, densely incurved or incurved-spreading-pubescent, 15 to 40 cm. high; leaves ovate, 2 to 3 cm. long, 1.1 to 1.6 cm. wide, cuspidulate, rather densely incurved-pubescent; racemes 5 to 11 cm. long; flowers purplish; wings oval, 7 to 8.3 mm. long, 5 to 5.5 mm. wide; capsule spreading-pilosulous and ciliolate; aril 2.2 to 2.5 mm. high, with tiny pilose umbo, the undulate scarious margin sparsely pilose, the dorsal margin horizontal or slightly curved-ascending or descending at an angle of about 45°.

37. *Polygala appressipilis* Blake, Contr. Gray Herb. n. ser. 47: 41. 1916.

Tepec to Puebla and Oaxaca; type from Cuernavaca, Morelos.

Stems several, erect, about 35 cm. high, griseous-puberulous; leaves ovate or oval, 1.5 to 3 cm. long, 8 to 13 mm. wide, acute or obtuse, appressed-puberulous; wings oval or broadly elliptic, 6.5 to 9 mm. long, 4.5 to 5.8 mm. wide; mature seed unknown.

38. *Polygala brachysepala* Blake, Contr. Gray Herb. n. ser. 47: 44. 1916.

San Luis Potosí, Guerrero, and Morelos; type from Las Canoas, San Luis Potosí.

Stems several, fruticulose below, rather densely incurved-puberulous with a few long spreading hairs intermixed, 20 to 35 cm. high; leaves ovate, 2.8 to 4.5 cm. long, 1.2 to 2 cm. wide, acuminate, sparsely pubescent; racemes 5 to 7 cm. long; wings suborbicular, 5.5 mm. long, 4.8 mm. wide; aril cloaklike, appressed, 3.5 mm. high, with deep subentire scarious margin.

39. *Polygala microtricha* Blake, Contr. Gray Herb. n. ser. 47: 46. 1916.

Hidalgo and Oaxaca; type from Zimapán, Hidalgo.

Suffruticulose below, branched, 25 cm. high and more, densely incurved-puberulous; leaves ovate, 2.7 to 3.8 cm. long, 1 to 1.2 cm. wide, acute to acuminate, firm, rather densely puberulous; racemes 3.5 to 7.5 cm. long; wings oval, 5.5 mm. long, 4 mm. wide; aril 3 mm. high, cloaklike, the large umbo pilose, the much broader scarious margin lobulate, the dorsal and lateral lobes barely indicated, subappressed.

40. *Polygala chiapensis* Blake, Contr. Gray Herb. n. ser. 47: 40. 1916.

Chiapas.

Stems erect, about 24 cm. high, pubescent with short incurved and sometimes a few longer incurved-spreading hairs; lower leaves oval or obovate, the middle and upper lanceolate, 2 to 4.2 cm. long, 5 to 8 mm. wide, acuminate, sparsely incurved-pubescent, reticulate; racemes 6 to 10 cm. long; wings oval, 5.5 mm. long, 3.5 mm. wide; aril 1.5 mm. high, papery, irregularly lobulate, the horizontal dorsal margin 2.2 mm. long.

41. *Polygala biformipilis* Blake, Contr. Gray Herb. n. ser. 47: 52. 1916.

Veracruz; type from Zacuapan.

Stems several, suffruticulose below, erect, 35 to 60 cm. high, densely and softly pubescent with short incurved and long straight spreading hairs; leaves ovate or oblong-ovate, 3 to 5 cm. long, 1 to 2 cm. wide, acuminate, pubescent like the stem; racemes dense, 3.5 to 7 cm. long; flowers purplish; wings oblong-oval, 8.7 mm. long, 4.7 mm. wide; aril 2.5 mm. high, the small umbo densely pilose, the broad scarious margin lobulate, the dorsal margin ascending, the anterior vertical.

42. *Polygala glandulosa* H. B. K. Nov. Gen. Sp. 5: 404. 1821.

Viola punctata Humb. & Bonpl.; Roem. & Schult. Syst. Veg. 5: 391. 1819.

Not *Polygala punctata* A. W. Benn. 1879.

Polygala greggii S. Wats. Proc. Amer. Acad. 17: 325. 1882.

Nuevo León and San Luis Potosí; type from Puente de la Madre de Dios.

Stems very numerous, suffruticulose, diffuse, 10 to 20 cm. long, densely leafy; leaves obovate to suborbicular-oval, 4.5 to 10 mm. long, 1.5 to 6 mm. wide, rounded, mucronate, cuneate at base, thick, incurved-puberulous or short-pilosulous, densely translucent-glandular-dotted; racemes axillary, 1 or 2-flowered; flowers purple; wings spatulate-obovate, 7.5 mm. long; capsule elliptic; aril galeiform, equitant.

43. *Polygala phoenicistes* Blake, Contr. Gray Herb. n. ser. 47: 55. 1916.

Known only from the type locality, Sierra de Guascama, Minas de San Rafael, San Luis Potosí.

Stems several, fruticulose, diffuse or suberect, 6 to 15 cm. long; leaves cuneate-obovate, 5.5 to 7 mm. long, 2.5 to 4.5 mm. wide, densely glandular-punctate, very sparsely incurved-puberulous along costa beneath; racemes 1-flowered; flowers purple; wings spatulate-obovate, 6 mm. long; capsule oblong-elliptic; aril corneous, 3-lobed.

44. *Polygala macradenia* A. Gray, Pl. Wright. 1: 39. 1852.

Coahuila. Texas to Arizona; type from hills at the head of the San Felipe, Texas.

Stems very numerous, 3.5 to 21 cm. long, fruticulose below, erectish or ascending, densely leafy, canescently puberulous; leaves linear-oblong or oblong-lanceolate, 2 to 6 mm. long, 0.6 to 1.3 mm. wide, thick, flattened above, gland-dotted, canescent-puberulous; racemes 1 or 2-flowered; flowers purple; wings obovate, 5 to 5.5 mm. long; capsule oblong; aril shortly 3-lobed.

44a. *Polygala macradenia glanduloso-pilosa* (Chod.) Blake, Contr. Gray Herb. n. ser. 47: 56. 1916.

Polygala glanduloso-pilosa Chod. Bot. Jahrb. Engler 52: Beibl. 115: 72. 1914. San Luis Potosí.

Less pubescent; leaves linear or linear-lanceolate, 1.2 to 3 mm. long, 0.3 to 0.5 mm. wide, concave or sulcate above, sparsely incurved-puberulous.

45. *Polygala purpusii* T. S. Brandeg. Univ. Calif. Publ. Bot. 4: 88. 1910.

Known only from the type locality, Acatitlán, Puebla.

Fruticulose, several-stemmed, erect, 25 cm. high, densely canescent-pilosulous on the younger parts; leaves oval to oblong-oval, rarely orbicular, 9 to 14 mm. long, 4 to 11 mm. wide; racemes terminal, 4.5 cm. long; wings obovate-oval, 4.7 mm. long; keel whitish with yellowish tip; capsule suborbicular, 3 mm. long; aril 1.2 mm. deep, the 2 lobes oval, appressed.

46. *Polygala konzattii* Rose, Contr. U. S. Nat. Herb. 13: 307. 1911.

Known only from the type locality, Cerro San Antonio, Oaxaca.

Stems 40 cm. long, slender, green, incurved-pubescent; leaves ovate-oval or obovate, 15 mm. long, cuspidate at the truncate-rounded apex or retuse; racemes very loose, 1.8 to 20 cm. long; wings obovate, 4.5 mm. long; capsule quadrate-orbicular, 3.5 mm. long; aril 1.4 mm. long, with large corneous umbo, the 2 lateral lobes oblong, appressed.

47. *Polygala parryi* A. W. Benn. Journ. Bot. Brit. & For. 17: 140. 1879.

San Luis Potosí.

Suffruticulose, procumbent below, 9 cm. long or less, several-stemmed, incurved-puberulous; leaves oval to orbicular, 6 to 11 mm. long, rounded to obtuse at each end; wings obovate, 3.5 mm. long; capsule orbicular, venose, plump, 3.5 mm. long; aril 1.5 mm. deep, with small corneous umbo and 2 oblong appressed lobes.

48. *Polygala tehuacana* T. S. Brandeg. Univ. Calif. Publ. Bot. 4: 273. 1912.

Known only from the vicinity of the type locality, mountains north of Tehuacán, Puebla.

Suffruticulose, many-stemmed, erect, about 15 cm. high, canescent-puberulent; leaves oblong, 5 to 10 mm. long, 1.5 to 2.5 mm. wide, obtusish, puberulous; racemes mostly 1-flowered; flowers purplish-yellowish; wings oval-obovate, 6 mm. long; capsule oval, ciliate, 4.8 mm. long; seed silky-pilose; aril with small umbo and 2 oblong lateral lobes.

49. *Polygala floribunda* Benth. Pl. Hartw. 58. 1840.

Polygala americana floribunda Kuntze, Rev. Gen. Pl. 1: 48. 1891.

Chiapas; type from Zonaguá. Guatemala.

Frutescent, erect, about 1.5 meters high, incurved-pubescent or strigillose; leaves ovate, 3.5 to 9 cm. long, 1.2 to 3.8 cm. wide, acute, finely reticulate, strigillose or glabrate; racemes loose, up to 23 cm. long, rarely branched; flowers violet-purple; wings suborbicular, 8 to 11 mm. long and wide, venose; capsule transversely broad oblong, obovate, 8 mm. long; seed globose, 3 mm. thick; aril 2 mm. high, fleshy-coriaceous, not lobed.

50. *Polygala apopetala* T. S. Brandeg. Proc. Calif. Acad. II. 2: 130. pl. 3. 1889.

Southern Baja California; type from Comondú.

Shrub or small tree, 5 meters high or less, the branches strigillose; leaves ovate, 2.5 to 5 cm. long, 1.7 to 2.2 cm. wide, sparsely strigillose; racemes terminal, loose, 5 to 19 cm. long; flowers pinkish purple; wings suborbicular, 12 to 15 mm. long and wide, reticulate; capsule quadrato-orbicular, emarginate, 1.5 to 1.9 cm. long; seed ellipsoid, 9 mm. long; aril corneous, 0.5 mm. long.

51. *Polygala fishiae* Parry, Proc. Davenport Acad. 4: 39. 1884.

Northern Baja California; type collected near Sauzal, Todos Santos Bay. Southern California.

Frutescent, about 1.5 meters high, glabrous or very sparsely strigillose; leaves oblong or oblong-lanceolate, 1.7 to 5 cm. long, 4 to 14 mm. wide, rounded or retuse, glabrous; racemes 2.5 to 20 cm. long; flowers purplish, whitish, and yellowish, 8.5 mm. long; wings obovate, ciliate; capsule suborbicular, 7.5 mm. long; seed pilose, 5 mm. long.

52. *Polygala nitida* T. S. Brandeg. Univ. Calif. Publ. Bot. 4: 272. 1912.

Known only from the type locality, Bagre, Minas de San Rafael, San Luis Potosí.

Frutescent, decumbent, finely incurved-puberulous, about 20 cm. long; lower leaves elliptic to oval, 1 to 2 cm. long, 7.5 to 12.5 mm. wide, rounded, cuspidate, reticulate, shining, glabrous or sparsely puberulous beneath along costa, the upper more oblong; racemes 3 to 9-flowered, 1.5 to 3.5 cm. long; flowers rose-colored; wings oblong-obovate, 5.5 mm. long; keel yellowish; capsule 4 mm. long, oval, subreticulate-striate.

53. *Polygala eucosma* Blake, Contr. Gray Herb. n. ser. 47: 72. 1916.

Coahuila to Hidalgo; type from the Sierra Madre south of Saltillo, Coahuila. Southern New Mexico.

Fruticulose, many-stemmed, procumbent, 4.5 to 20 cm. long or more, minutely incurved-puberulous; leaves oval or elliptic, 4 to 9 mm. long, 2 to 6.5 mm. wide, acute or obtuse, coriaceous, scarcely reticulate, glabrous or very sparsely incurved-puberulous; racemes 2 or 3-flowered; flowers rosy; wings obovate, 4 to 4.5 mm. long, 1.8 to 2.8 mm. wide.

54. *Polygala lindheimeri* A. Gray, Bost. Journ. Nat. Hist. 7: 150. 1850.

Polygala emoryi Blake, Contr. Gray Herb. n. ser. 47: 72. 1916.

Nuevo León. Texas and New Mexico; type from the upper Guadalupe and Pierdenales rivers, Texas.

Stems several, fruticulose below, erect to decumbent, densely spreading-pilose or pilosulous or rarely incurved-spreading-pubescent, about 18 cm. long; lower or all the leaves elliptic or oval, rarely orbicular, 5 to 13 mm. long, 3 to 12 mm. wide, coriaceous, spreading-pilosulous or incurved-spreading-puberulous, reticulate, the middle and upper usually oblong or lance-oblong and acute; racemes 2 to 8-flowered, geniculate; wings oblong-obovate, 4.5 to 5 mm. long; capsule oblong, striate.

55. *Polygala tweedyi* Britton; Wheelock, Mem. Torrey Club 2: 143. 1891.

Polygala lindheimeri parvifolia Wheelock, Mem. Torrey Club 2: 143. 1891.

Polygala arizonae Chod. Mém. Soc. Hist. Nat. Genève 31²: 108. 1893.

Polygala arizonae tenuifolia Chod. Mém. Soc. Phys. Hist. Nat. Genève 31²: 109. 1893.

Polygala texensis Robinson in A. Gray, Syn. Fl. 1¹: 451. 1897.

Polygala parvifolia Woot. & Standl. Contr. U. S. Nat. Herb. 19: 392. 1915.

Polygala blepharotropis Blake, Contr. Gray Herb. n. ser. 47: 73. 1916.

Polygala lithophila Blake, Contr. Gray Herb. n. ser. 47: 74. 1916.

Polygala pycnophylla T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 366. 1917.

Sonora, Coahuila, and San Luis Potosí. Oklahoma and western Texas to Arizona; type from Tom Green County, Texas.

Suffruticulose, many-stemmed, spreading to erect, incurved-puberulous, 7 to 28 cm. high; leaves dimorphous or uniform, linear to lanceolate, elliptic, or ovate-lanceolate, 4 to 26 mm. long, 1 to 6 mm. wide, the lowest broader than the others, coriaceous, reticulate, incurved-puberulous; racemes 3 to 22-flowered, geniculate; flowers rosy or whitish; wings obovate, 4 to 5.3 mm. long; capsule oval to oblong.

56. *Polygala minutifolia* Rose, Contr. U. S. Nat. Herb. 13: 307. 1911.

Polygala nudata T. S. Brandeg. Univ. Calif. Publ. Bot. 4: 183. 1911.

Coahuila and Nuevo León; type collected near Monterrey, Nuevo León.

Stems very numerous, fruticulose, erect, about 15 cm. high, strigillose or subglabrous; leaves squamiform, linear-lanceolate, 1 to 4.5 mm. long, 0.5 mm. wide, acuminate; racemes straight, 4 to 6-flowered; flowers white; wings oval-obovate, 4 mm. long; capsule oblong, 2.8 mm. long.

57. *Polygala desertorum* T. S. Brandeg. Proc. Calif. Acad. II. 2: 130. 1889.

Southern Baja California; type from Agua Dulce.

Frutescent, several or many-stemmed, erect, strigillose, 25 cm. high; leaves linear or linear-lanceolate, 9 to 18 mm. long, 1 to 1.5 mm. wide, acute, firm; racemes loose, 5 to 9 cm. long; flowers purple and yellow; wings oblong-obovate, glabrous, 8 mm. long, appearing apiculate; capsule oval-oblong, glabrous, 5.5 mm. long; seed subsericeous, 3.5 mm. long.

58. *Polygala semialata* S. Wats. Proc. Amer. Acad. 17: 326. 1882.

Coahuila, Nuevo León, and Zacatecas; type from Monterrey, Nuevo León.

Stems numerous from a fruticulose base, erect or lax, almost filiform, minutely puberulous, 8 to 21 cm. long; leaves linear, 5 to 8.5 mm. long, 0.5 to 1 mm. wide; racemes 3 to 12.5 cm. long; flowers whitish; wings oval-obovate, 1.4 mm. long; capsule narrowly oblong, curved, 3.6 mm. long, 1.3 mm. wide, the upper cell larger and distinctly winged; seeds cylindric, curved, 2.5 mm. long.

59. *Polygala hemipterocarpa* A. Gray, Pl. Wright. 2: 31. 1853.

Chihuahua to Hidalgo; type collected near "Deserted Rancho," on the border of Sonora. Texas to Arizona.

Stems several, erect, fruticulose below, glabrous, slightly glaucous, 12 to 56 cm. high; leaves linear, 6 to 23 mm. long, 0.6 to 1 mm. wide, acute; racemes 3 to 21 cm. long; flowers white; wings obovate, 3.5 to 4 mm. long; capsule oblong, 5 mm. long, the upper cell broadly scarious-winged; seed 2.7 mm. long.

60. *Polygala watsoni* Chod. Mém. Soc. Phys. Hist. Nat. Genève 31²: 285. 1893.

Polygala acicularis S. Wats. Proc. Acad. Amer. Acad. 21: 445. 1886. Not

P. acicularis Oliver, 1868.

Known only from the type locality, Santa Eulalia Mountains, Chihuahua.

Stems numerous, ascending from a woody base, 35 cm. long or less, finely incurved-puberulous; leaves linear-acicular, 4 to 11 mm. long, 0.4 to 0.6 mm. wide, acuminate, 2-sulcate beneath; racemes 6 to 11 mm. long, about 10-flowered; flowers white; wings obovate, 5 mm. long; capsule elliptic, narrow-margined on both cells, 3 mm. long; seed 2.6 mm. long.

61. *Polygala scoparioides* Chod. Mém. Soc. Phys. Hist. Nat. Genève 31¹: 284. 1893.

Polygala scoparia multicaulis A. Gray, Pl. Wright. 1: 38. 1852.

Polygala wrightii A. Gray; A. W. Benn. Journ. Bot. Brit. & For. 17: 205. 1879, as synonym.

Sonora to Coahuila and San Luis Potosí. Texas to Arizona.

Stems numerous, angled, finely incurved-puberulous, 9 to 30 cm. high; leaves linear-acicular, 7 to 14 mm. long, 0.6 to 1.3 mm. wide, acute to acuminate, strongly 2-sulcate beneath; racemes 1.5 to 7.8 cm. long; flowers white; wings spatulate-obovate, 2.6 to 3 mm. long, appearing acute by inflexion; capsule oblong-elliptic, 3 to 3.5 mm. long, 1.6 mm. wide; seed 2.5 to 3 mm. long; aril 1 to 1.9 mm. long.

62. *Polygala dolichocarpa* Blake. Contr. Gray Herb. n. ser. 47: 107. 1916.

Known only from the type locality, Minas de San Rafael, San Luis Potosí.

Stems several, suffruticulose below, 10 to 35 cm. high, sulcate, sparsely incurved-puberulous, soon becoming nearly leafless; leaves linear, 3 to 4.5 mm. long, 0.3 mm. wide, acuminate, thickish, convex and veinless beneath; racemes loose, 5 to 10 cm. long; flowers white; wings spatulate-obovate, 2.7 to 3.2 mm. long; capsule oblong, 2 mm. long, 1 mm. wide, the upper cell very narrowly margined; seed 1.5 mm. long, cylindric; aril 1 mm. long.

63. *Polygala scoparia* H. B. K. Nov. Gen. & Sp. 5: 399. 1821.

? *Polygala mexicana* Moc.; DC. Prodr. 1: 333. 1824.

Polygala flagellaria Pavón; Chod. Mém. Soc. Phys. Hist. Nat. Genève 31²: 282. 1893, as synonym.

Polygala filiformis Pavón; Chod. Mém. Soc. Phys. Hist. Nat. Genève 31²: 282. 1893, as synonym.

Mexico and Veracruz; type collected near the City of Mexico.

Stems numerous, fruticulose below, slender, striate, finely incurved-puberulous, 7.5 to 13 cm. long; leaves rather crowded, linear-acicular, 5 to 9 mm. long, 0.4 to 1 mm. wide, acuminate, cuspidate, thickish, 1-nerved but not sulcate beneath; racemes dense or loose below, 0.5 to 2.3 cm. long; flowers white; wings obovate, 2.9 mm. long; capsule oval-oblong, 2.7 to 3 mm. long, 1.5 mm. wide, the upper cell narrowly winged; seed cylindric, 2.2 to 2.5 mm. long; aril 1.5 mm. long.

64. *Polygala michoacana* Robins. & Seat. Proc. Amer. Acad. 28: 103. 1893.

San Luis Potosí to Puebla and Michoacán; type from Pátzcuaro, Michoacán.

Habit and general characters of *P. scoparia*; leaves up to 1.5 mm. wide; racemes 0.7 to 4.2 cm. long; wings cuneate-obovate, 2.5 mm. long, 1 mm. wide; capsule suborbicular, 2 to 2.5 mm. long, 1.5 to 1.8 mm. wide; seed 1.7 to 2 mm. long; aril 1.2 to 1.8 mm. long.

65. *Polygala viridis* S. Wats. Proc. Amer. Acad. 17: 325. 1882.

Known only from the type locally, Caracol Mountains, Coahuila.

Several-stemmed, suffruticulose, spreading, densely spreading-puberulous, 5.5 to 11 cm. long; leaves obovate-spatulate, 5 to 11 mm. long, 1.5 to 3.6 mm. wide, coriaceous, spreading-puberulous; racemes loose, 1 to 2.5 cm. long; flowers green with narrow white margin; wings obovate, 2.6 mm. long; capsule oval-oblong, narrowly winged above, 2.8 mm. long, 1.5 mm. wide; seed 2 mm. long; aril 1.2 mm. long.

2. SECURIDACA L. Sp. Pl. 707. 1753.

Shrubs or trees, usually scandent; leaves alternate, entire, with peziform stipular glands; flowers medium or large, in terminal and axillary, often paniced racemes; outer sepals free or the 2 lower united; wings large, petaloid; keel with a fimbriate crest; stamens 8; fruit a 1-celled samara, with a large wing on the lower side.

One species of the genus, known as "contraveneno" and "palomita morada," is said to be used in Nicaragua as a remedy for snake bites.

Leaves strigillose to sparsely pubescent beneath; pedicels strigillose or pubescent with incurved hairs.....1. *S. diversifolia*.

Leaves densely and softly pilosulous or pilose beneath; pedicels densely and softly spreading or ascending-puberulous.....2. *S. sylvestris*.

1. *Securidaca diversifolia* (L.) Blake.

Polygala diversifolia L. Sp. Pl. 703. 1753.

Securidaca acuminata Schlecht. Linnaea 14: 382. 1840. Not *S. acuminata* St. Hil. 1829.

Securidaca schlechtendaliana Walp. Repert. Bot. 1: 236. 1842.

Elsota schlechtendaliana Kuntze, Rev. Gen. Pl. 1: 46. 1891.

? *Securidaca myrtifolia* Chod. Bull. Herb. Boiss. 3: 546. 1895.

Tamaulipas to Michoacán (or Guerrero) and southward. Central America to Ecuador; West Indies.

Trailing or high-climbing shrub, strigillose or ascending-puberulous; leaves elliptic-oblong to ovate or oval, 3.8 to 12 cm. long, 2.2 to 5.7 cm. wide, thick, above somewhat shining, prominulous-reticulate and paler beneath; racemes usually 6 to 14 cm. long; flowers pink to purplish, the keel with yellow tip; wings suborbicular to oval-ovate, 8.5 to 11.8 mm. long, 6 to 8 mm. wide; samara puberulous, 4 to 6 cm. long; fruiting cell wing-margined on upper side, the margin prolonged beyond the cell and connate with the proper wing. "Flor de arrayán" (Oaxaca).

2. *Securidaca sylvestris* Schlecht. Linnaea 14: 381. 1840.

Elsota sylvestris Kuntze, Rev. Gen. Pl. 1: 46. 1891.

Veracruz to Tepic and southward; type from Jalapa, Veracruz. Central America.

Shrub, climbing to a height of 25 meters, the branchlets densely and softly puberulous; leaves ovate to elliptic or oblong-ovate, 2.7 to 7.5 cm. long, 1.2 to 3.3 cm. wide, dull both sides and softly pubescent; racemes 1.5 to 11 cm. long; flowers wine-red or rosy; wings suborbicular, 8 to 11 mm. long; samara spreading-puberulous, 3.8 to 4.7 cm. long; fruiting cell narrowly winged on upper side, the wing prolonged for 3 to 7 mm. beyond the fruiting cell and connate with proper wing.

3. **MONNINA** Ruiz & Pav. Syst. Veg. Peruv. Chil. 169. 1798.

Herbs or shrubs, very rarely scandent; leaves in ours estipulate; flowers racemed; outer sepals free or the 2 lower united; wings petaloid; keel not crested; stamens 8 or 6; fruit (in the following species) drupaceous, 1-celled, 1-seeded, with rugose endocarp surface and thin fleshy exocarp.

Racemes not at all comose; bracts ovate, obtuse to acute, 1.2 to 2.5 mm. long.

Peduncles and young branches densely pilose-tomentose.

1. *M. schlechtendaliana*.

Peduncles and young branches strigillose.....2. *M. xalapensis*.

Racemes comose toward apex; bracts lance-subulate to ovate, acuminate to attenuate, 2.5 to 7 mm. long.

Stem and leaves merely strigillose or incurved-puberulous...3. *M. sylvatica*.

Stem and leaves spreading-pilosulous or hirsutulous.

Branches and leaves softly spreading-pilosulous; leaves oval, cuneate to rounded at base.....4. *M. guatemalensis*.

Branches and leaves hirsutulous; leaves lanceolate, long-attenuate at base.

5. *M. subserrata*.

Monnina stenophylla Steud. Nom. Bot. ed. 2. 2: 157. 1841. Not *M. stenophylla* St. Hil. 1829.
Monnina erioclada Gandog. Bull. Soc. Bot. France 60: 455. 1913.
 Tepic to Morelos; type collected near the City of Mexico.
 Branching shrub, the branches in youth like the peduncles densely and usually griseously pilose-tomentose with spreading crisped hairs, in age subglabrate; leaves elliptic to lance-elliptic, 4.5 to 8 cm. long, 1 to 2.4 cm. wide, thin, beneath appressed-puberulous and along costa spreading-pilose; racemes solitary or few, dense, 6 cm. long or less; flowers purplish; wings suborbicular, 4 to 4.8 mm. long; drupe obliquely ellipsoid, 6 to 7 mm. long.
2. *Monnina xalapensis* H. B. K. Nov. Gen. & Sp. 5: 414. 1821.

Monnina evonymoides Schlecht. Linnaea 14: 380. 1840.
Monnina sylvicola Chod. Bull. Soc. Bot. Belg. 30¹: 303. 1891.
 Michoacán to Veracruz and Chiapas; type from Jalapa, Veracruz. Central America.
 Branching, apparently shrubby, incurved-puberulous; leaves lance-ovate to elliptic or oval, 7.3 to 12 cm. long, 2.5 to 6 cm. wide, sparsely strigillose; racemes 18 cm. long or less; bracts lance-subulate, 5 mm. long; wings suborbicular, 4 to 4.7 mm. long; drupe crested, 6 to 7 mm. long.
4. *Monnina guatemalensis* Chod. Bull. Herb. Boiss. 4: 249. 1896.
 Chiapas. Northern Guatemala; type from Cobán.
 Shrub with stout, yellow-green, spreading-pilosulous branches; leaves oval, 5.5 to 11 cm. long, 2.6 to 7 cm. wide, short-pointed, yellowish green; racemes several, 16 cm. long or less; bracts lance-ovate, acuminate, 4.8 to 7 mm. long; wings obovate-suborbicular, 4.3 to 4.8 mm. long; drupe 8 mm. long.
5. *Monnina subserrata* Chod. Bull. Herb. Boiss. 4: 250. 1896.
 Mexico, without definite locality.
 Branches stout, hirsutulous with very soft thick hairs; leaves lanceolate, 6.5 to 8 cm. long, 2.8 to 3.5 cm. wide or smaller, acute, cinerascens-hirsutulous both sides, the younger tomentose; racemes comose; wings obovate-cuneate.

76. EUPHORBIACEAE. Spurge Family.

Trees or shrubs; juice often milky; leaves usually alternate, sometimes opposite, entire, dentate, or lobate; stipules often present; flowers unisexual, monoecious.

cious or dioecious, variously arranged, usually regular; perianth commonly small, sometimes showy, often wanting; anthers 2-celled; fruit usually capsular, sometimes drupaceous, commonly 3-celled but often with fewer or more numerous cells; seeds frequently carunculate.

A large family of plants, represented in Mexico also by numerous herbaceous species. The sap usually has purgative and often poisonous properties.

Flowers surrounded by an involucre containing both pistillate and staminate flowers; perianth none or minute.

Involucre cuplike, regular.....1. **EUPHORBIA.**

Involucre very irregular, oblique.....2. **PEDILANTHUS.**

Flowers not involucre or, if so, the involucre containing only staminate or pistillate flowers; perianth present and usually well developed.

Ovules 2 in each cell; stamens, at least the outer ones, opposite the sepals.

Leaves all or mostly opposite.....3. **TETRACOCCLUS.**

Leaves alternate.

Fruit drupaceous; flowers racemose, dioecious.....4. **HIERONYMA.**

Fruit capsular, rarely fleshy; flowers never racemose.

Flowers monoecious.....5. **PHYLLANTHUS.**

Flowers dioecious.....6. **ASTROCASIA.**

Ovule 1 in each cell; stamens, at least the outer ones, alternate with the sepals.

Stamens in bud bent inward, the apex of the anther turned downward.

Staminate flowers usually with petals; flowers mostly in terminal racemes.....7. **CROTON.**

Stamens erect in bud.

A. Calyx lobes valvate.

Petals present in the staminate flowers.

Petals 8 to 12; stamens numerous.....8. **GARCIA.**

Petals 4 or 5; stamens 5 to 15.

Petals entire; stamens in 2 or 3 series.....9. **DITAXIS.**

Petals lobed; stamens in one series.....10. **CHIROPETALUM.**

Petals none.

Stamens numerous, the filaments repeatedly branched; leaves lobed.

11. **RICINUS.**

Stamens few or numerous, the filaments simple; leaves not lobed.

Styles united; plants usually with stinging hairs.

Inflorescence subtended by 2 large showy bracts; stamens usually 20 to 30.....12. **DALECHAMPIA.**

Inflorescence with small inconspicuous bracts; stamens 3 or fewer.....13. **TRAGIA.**

Styles distinct; plants without stinging hairs.

Anther cells elongate, often cylindric and curved, separated.

14. **ACALYPHA.**

Anther cells globose, or oblong and adnate.

Anther cells globose.....15. **BERNARDIA.**

Anther cells elongate.

Leaves entire; styles lacerate.....16. **ADELIA.**

Leaves dentate; styles entire.....17. **ALCHORNEA.**

AA. Calyx lobes imbricate.

Corolla present or, if absent, the plants with stinging hairs.

18. **JATROPHA.**

Corolla none; plants never with stinging hairs.

Leaves deeply lobed.....19. **MANIHOT.**

Leaves entire or toothed.

Capsule large, 5 to 20-celled, elastically dehiscent; bracts large, membranaceous, inclosing the buds, in anthesis irregularly cleft.....20. **HURA.**

Capsule small, usually 3-celled, or the fruit drupaceous and many-celled.

Stamens numerous.....21. **MABEA.**

Stamens 1 to 3.

Staminate calyx none or rudimentary.

Inflorescence terminal.....22. **DALEMBERTIA.**

Inflorescence axillary.....23. **GYMNANTHES.**

Staminate calyx well developed.

Calyx 3 to 6-parted.

Seeds carunculate; inflorescence usually terminal.

24. **SEBASTIANIA.**

Seeds ecarunculate; inflorescence axillary.

25. **CORYTHEA.**

Calyx shallowly lobate.

Stamens united; fruit drupaceous....26. **HIPPOMANE.**

Stamens distinct; fruit capsular.

Column of the capsule present, the seeds usually persistent upon it after dehiscence of the capsule.

27. **SAPIUM.**

Column none, but the receptacle usually persistent after the fall of the capsule cells, becoming indurate, 2 or 3-horned.....28. **STILLINGIA.**

1. **EUPHORBIA** L. Sp. Pl. 450. 1753.

REFERENCE: Boissier in DC. Prodr. 15²: 7-187. 1865.

Shrubs or small trees with milky juice; leaves alternate, opposite, or verticillate, on long or short petioles, usually entire; flowers involucre, the involucre cuplike, 4 or 5-lobed, with 4 or 5 glands within, the glands often with petal-like appendages; perianth none; flowers unisexual; stamen 1 in the staminate flowers; fruit a 3-lobed capsule.

One of the largest genera of plants, represented in Mexico also by many herbaceous species. The genus is divided by some authors into several, but the present writer has preferred to consider the species as belonging to a single genus.

Euphorbia splendens Bojer, the "crown-of-thorns," a native of Madagascar, is often cultivated in Mexico, where it is known as "corona de Cristo." It has somewhat climbing stems which are covered with long stout spines; the involucre is subtended by two large red bracts.

A. Leaves alternate, only those of the inflorescence, if any, opposite.

Glands of the involucre without petal-like appendages.

Leaves 1 cm. long or shorter.....1. **E. longecornuta.**

Leaves 2 to 15 cm. long or larger.

Leaves and stems pubescent.....2. **E. fulva.**

Leaves and stems glabrous or nearly so.

Bracts bright red; leaves long-petiolate, broadest at or below the middle, often lobed.....5. **E. pulcherrima.**

Bracts green, white, or yellowish, rarely pink; leaves sessile or short-petiolate, broadest above the middle, entire.

Leaves 2 to 4.5 cm. long; floral bracts acute.....6. **E. xylopoda.**

Leaves 6 to 30 cm. long or larger; bracts suborbicular.

Leaves mostly 6 to 15 cm. long, the blade decurrent to the base of the petiole.....3. *E. calyculata*.

Leaves about 30 cm. long, on naked petioles.....4. *E. elata*.

Glands of the involucre with petal-like appendages.

Plants normally leafless.....7. *E. antisiphilitica*.

Plants leafy, at least in the inflorescence.

Appendages bright red; leaves glabrous.....8. *E. fulgens*.

Appendages white or yellowish or, if reddish, the leaves pubescent.

Involucres glabrous.....9. *E. californica*.

Involucres pubescent.

Stems naked, the inflorescence leafy.....10. *E. consoquitlae*.

Stems leafy.

Stems very thick, gnarled and crooked, woody throughout.

11. *E. misera*.

Stems long and slender, suffrutescent.

Leaves glabrous or nearly so.....12. *E. tresmariae*.

Leaves densely pilose beneath, at least when young.

13. *E. oaxacana*.

AA. Leaves all opposite or verticillate.

Leaves opposite, more or less oblique at base, usually distichous, sometimes dentate; stipules deltoid to linear.

Leaves finely toothed.....14. *E. tomentulosa*.

Leaves entire.

Leaves acute.....15. *E. fruticulosa*.

Leaves rounded or obtuse at apex.

Capsule glabrous; leaves mostly 1 cm. long or shorter.

16. *E. magdalenae*.

Capsule puberulent; leaves mostly 1 to 2 cm. long.....17. *E. anthonyi*.

Leaves mostly verticillate, not oblique at base, entire; stipules glandlike.

Leaves linear.....18. *E. peganoides*.

Leaves lanceolate to orbicular.

Involucres glabrous, the appendages nearly obsolete.

19. *E. schlechtendalii*.

Involucres sparsely or densely pubescent, the appendages well developed.

Appendages of the glands linear to oblong, much longer than broad.

Appendages cleft into linear lobes.....20. *E. chiapensis*.

Appendages not cleft into linear lobes.

Bracts of the inflorescence inconspicuous, small, green.

21. *E. tricolor*.

Bracts conspicuous, large, white.....22. *E. leucocephala*.

Appendages broadly ovate to reniform, as broad as long or broader.

Bractlets of the inflorescence white or pink, conspicuous.

23. *E. lucii-smithii*.

Bracelets green, inconspicuous.

Leaves orbicular or nearly so, mostly 4 to 13 cm. wide.

24. *E. cotinifolia*.

Leaves oblong or oblanceolate to ovate, 3 cm. wide or less.

Appendages longer than the tube of the involucre.....25. *E. xanti*.

Appendages shorter than the tube of the involucre.

Leaves obovate or oblanceolate, broadest above the middle, usually pubescent beneath.....26. *E. plicata*.

Leaves mostly ovate or elliptic, broadest at or below the middle, glabrous or nearly so.....27. *E. colletioides*.

1. *Euphorbia longecornuta* S. Wats. Proc. Amer. Acad. 25: 161. 1890.

Nuevo León; type from Sierra de la Silla, near Monterrey.

Stems very thick and woody below, 20 cm. high, densely branched, minutely puberulent; leaves very numerous, oblong or elliptic, acute or acutish, very short-petiolate; glands with long-attenuate horns.

2. *Euphorbia fulva* Stapf, Kew Bull. 1907: 294. 1907.

Euphorbia elastica Alt. & Rose, El Palo Amarillo 1. pl. 1-4. 1905. Not *E. elastica* Jumelle, 1905.

Euphorbioidendron fulvum Millsp. Field Mus. Bot. 2: 305. 1909.

Jalisco and Guanajuato to Oaxaca.

Tree, 8 to 10 meters high, with smooth yellow bark; leaves 3 to 6 cm. long, 1 to 4 cm. wide, glabrous above or nearly so, densely pubescent beneath; flowering branches usually leafless, forming a 4 or 5-rayed umbel; involucre densely tomentose; capsule glabrous. Generally known as "palo amarillo"; "palo colorado," "palo de cucaracha" (Oaxaca, *Reko*).

This tree is of some importance as a source of rubber. The latex is thin and yellowish white and does not coagulate readily. When dried it is a doughlike, dark yellow substance. By tapping, about a liter of the latex may be obtained from a tree. The greatest difficulty in development of the tree as a source of rubber is found in the separation of the rubber from the resin, the amount of the former being 18 to 20 per cent and of the latter 40 per cent. The resin is said to make an excellent varnish. A good drying oil, suitable for varnish, has been extracted from the seeds.¹

3. *Euphorbia calyculata* H. B. K. Nov. Gen. & Sp. 2: 59. 1817.

Tithymalus calyculatus Klotzsch, Abh. Akad. Berlin 1860: 81. 1860.

Euphorbioidendron calyculatum Millsp. Field Mus. Bot. 2: 305. 1909.

Michoacán and Guanajuato; type from Lake Pátzcuaro, Michoacán.

Shrub of small tree, glabrous throughout, the branches densely leafy; leaves oblanceolate, often very narrowly so, acute or obtuse, pale green; involucre in broad leafy umbels, the bracts suborbicular, whitish or tinged with red, apiculate. "Chupire," "chupiri," "chupireni" (Michoacán, Tarascan, "that which burns"); "tencuanete" or "tenquanete" (*Ramírez*).

The seeds are said to contain 30 per cent of oil, which has purgative properties similar to those of croton oil. The milky juice of the stems causes blisters upon the skin and painful inflammation. This species is said to yield a kind of rubber much inferior to that obtained from *E. fulva*. The plant is discussed by Hernández² in a chapter entitled "De Chupiri, seu Charapeti, aquam rubeo colore tingenti Arcano Venerei morbi." He states that the inhabitants of Michoacán employed the plant as a remedy for venereal diseases and other affections.

4. *Euphorbia elata* T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 55. 1914.

Known only from the type locality, Finca Irlanda, Chiapas.

Glabrous tree, 7 meters high; leaves oblanceolate, about 8 cm. wide; obtuse or acutish; cymes naked, long-pedunculate; involucre about 9 mm. broad, the lobes lacerate; ovary glabrous.

¹See F. Altamirano, El Palo Amarillo, pp. 1-3. pl. 1-4, Mexico, 1905; Altamirano, El palo amarillo como productor de caucho, Mexico, 1905; Otto Stapf, A new rubber tree; palo amarillo, Kew Bull. 1907: 294-296. 1907.

²Thesaurus 120. 1651.

5. *Euphorbia pulcherrima* Willd.; Klotzsch, Allg. Gartenz. 2: 27. 1834.

Poinsettia pulcherrima Graham, Edinburgh New Phil. Journ. 20: 412. 1836.

Euphorbia fastuosa Sessé & Moc. Pl. Nov. Hisp. 80. 1887.

Jalisco to Oaxaca and Veracruz; cultivated in all the warmer parts of Mexico. Central America; cultivated generally in tropical regions.

Shrub or small tree, 1 to 8 meters high, the branches glabrous; leaves large, usually broadly ovate or panduriform, acuminate, long-petiolate, glabrous or sometimes pubescent beneath; bracts of the inflorescence large and leaflike, bright red; involucre yellow. "Flor de Pascua" (Michoacán, Guerrero, Veracruz, Hidalgo, etc., Central America, Cuba); "Santa Catarina," "flor de Santa Catarina" (Oaxaca); "Catalina" (Durango, Hidalgo); "pañó holandés" (Oaxaca); "cuitla-xochitl" (Nahuatl); "flor de Nochebuena," "pañó de Holanda," "flor de fuego," "Nochebuena"; "bandera" (Durango); "bebeta" (Veracruz); "pastora" (Costa Rica); "pastores" (Nicaragua); "Pascuas" (Philippines).

This plant, which is generally known as "poinsettia," is cultivated widely in tropical countries and also in hothouses in temperate regions. In the United States it is especially common in florists' shops about Christmas time. The bright red floral leaves make the plant extremely showy. It grows readily from cuttings.

The bark is said to contain a red coloring principle, and it is reported that the bracts yield a scarlet dye. In Mexico a decoction of the bracts is sometimes taken by nursing women to increase the flow of milk, but the practice is said to be dangerous. The leaves are applied as poultices for erysipelas and various cutaneous affectations, and Grosourdy states that the milky juice was employed by the Indians to remove hair from the skin.

6. *Euphorbia xylopoda* Greenm. Proc. Amer. Acad. 33: 480. 1898.

Known only from the type locality, hills of Las Sedas, Oaxaca, altitude 1,800 meters.

Slender glabrous shrub, 0.5 to 1 meter high; leaves elliptic or obovate, 5 to 12 mm. wide, rounded to acutish at apex, pale beneath; involucre terminal, solitary, the floral leaves green and white.

7. *Euphorbia antisiphilitica* Zucc. Abh. Akad. Wiss. München 1: 292. 1829-30.

Euphorbia occulta Klotzsch in Seem. Bot. Voy. Herald 277. 1856.

? *Euphorbia cerifera* Alcocer, Anal. Inst. Méd. Nac. Méx. 11: 155. 1911.

Coahuila to Hidalgo and Puebla.

Stems numerous, suffrutescent, 1 meter high or less, usually pale green, minutely puberulent or glabrous, leafless, simple or branched; leaves said to be linear; involucre puberulent, in small clusters along the stems; capsule glabrous. "Candelilla" (Zacatecas, San Luis Potosí, Coahuila, Durango, Nuevo León).

A kind of wax thickly covers the branches, and factories in Nuevo León and San Luis Potosí have engaged in the extraction of this substance. The plant frequently grows with the guayule (*Parthenium argentatum* A. Gray). To obtain the wax, the branches are boiled in water, whereupon it rises to the surface. It is grayish in the crude state but after refining becomes yellow and finally white. It is used (mixed with paraffin) for candles, which burn with a bright light and agreeable odor. It is said to be excellent for ointments and for soap making, and has been found suitable for phonograph records and as an insulating agent in electrical work. The wax has been used also in shoe polish, floor polish, and lubricants, and for waterproofing. The plant has purgative properties and is much used in Mexico as a remedy for venereal diseases.

8. *Euphorbia fulgens* Karw. Allg. Gartenz. 2: 26. 1834.

Euphorbia jacquiniæstora Hook. in Curtis's Bot. Mag. pl. 3673. 1839.

Trichosterigma fulgens Klotzsch, Abh. Akad. Berlin 1860: 42. 1860.

Oaxaca and probably elsewhere; type from Zacatepec.

Stems suffruticose, glabrous; leaves slender-petiolate, lanceolate or narrowly lanceolate, 6 to 10 cm. long, 1 to 2.5 cm. wide, acuminate; involucre few, axillary, solitary or cymose, the lobes petal-like, bright red; capsule glabrous.

A showy plant, sometimes cultivated in hothouses.

9. *Euphorbia californica* Benth. Bot. Voy. Sulph. 49. pl. 23B. 1844.

Euphorbia hindsiana Benth. Bot. Voy. Sulph. 51. pl. 24. 1844.

Euphorbia comonduana Millsp. Proc. Calif. Acad. II. 2: 229. 1889.

Trichosterigma californicum Klotzsch & Garcke, Abh. Akad. Berlin 1860: 42. 1860.

Trichosterigma hindsianum Klotzsch & Garcke, Abh. Akad. Berlin 1860: 42. 1860.

Baja California, Sonora, and Sinaloa; type from Magdalena Bay, Baja California.

Shrub, 0.5 to 2 meters high, glabrous throughout; leaves long-petiolate, usually orbicular or nearly so, 0.8 to 3 cm. long, rounded or emarginate at base, thin or somewhat fleshy; involucre solitary or clustered, with short whitish appendages.

10. *Euphorbia consoquitlae* T. S. Brandeg. Univ. Calif. Publ. Bot. 7: 327. 1920.

Type from Consoquitla, Veracruz.

Branched shrub with greenish branches; involucre in small leafy-bracted panicles, pubescent, long-pedunculate, the lobes about 2 mm. long, obtuse; capsules glabrous.

11. *Euphorbia misera* Benth. Bot. Voy. Sulph. 51. 1844.

Trichosterigma miserum Klotzsch & Garcke, Abh. Akad. Berlin 1860: 42. 1860.

Euphorbia benedicta Greene, Pittonia 1: 263. 1889.

Baja California; type from San Quentín. Southern California.

Shrub, 1 to 2 meters high, or a small tree with very thick trunk, the branches gray or brownish; leaves slender-petiolate, the blades orbicular or nearly so, mostly 1 cm. long or shorter, usually pubescent; involucre mostly terminal, solitary or cymose, with whitish appendages; capsule glabrous or pubescent.

12. *Euphorbia tresmariae* (Millsp.) Standl.

Euphorbia subcaerulea tresmariae Millsp. U. S. Dept. Agr. N. Amer. Fauna 14: 88. 1899.

Known only from the type locality, María Madre Island, Tepic.

Slender shrub; leaves slender-petiolate, the blades mostly rhombic-ovate or ovate-oval, 0.8 to 1.5 cm. long, thin, obtuse or rounded at the apex; involucre numerous, with whitish appendages; capsule glabrous.

13. *Euphorbia oaxacana* Robins. & Greenm. Proc. Amer. Acad. 32: 37. 1896.

Euphorbia latericolor T. S. Brandeg. Univ. Calif. Publ. Bot. 4: 377. 1913.

Aklema oaxacana Millsp. Field Mus. Bot. 2: 416. 1916.

Chiapas, Oaxaca, and Veracruz; type from Monte Albán, Oaxaca, altitude 1,740 meters.

Slender shrub, 0.5 to 1.5 meters high, the branches pubescent at first but soon glabrate; leaves slender-petiolate, the blades oval or ovate, 2 to 4 cm. long, obtuse, pubescent on both surfaces when young; involucre clustered or cymose, lateral or terminal.

14. *Euphorbia tomentulosa* S. Wats. Proc. Amer. Acad. 22: 476. 1887.
Chamaesyce tomentulosa Millsp. Field Mus. Bot. 2: 412. 1916.
 Baja California and Sonora; type from Rosario, Baja California.
 Low shrub, 60 cm. high or less, with dichotomous branches; leaves short-petiolate, oval or rounded-oval, 5 to 17 mm. long, finely pubescent; involucre pubescent, clustered at the ends of the branches, the glands purplish, with white appendages; capsule glabrous.
15. *Euphorbia fruticulosa* Engelm.; Boiss. in DC. Prodr. 15²: 38. 1865.
Chamaesyce fruticosa Millsp. Field Mus. Bot. 2: 409. 1916..
 Known only from the type locality, Saltillo, Coahuila.
 Glabrous erect shrub, 30 cm. high or less; leaves ovate, glaucescent, 4 to 6 mm. long.
16. *Euphorbia magdalenae* Benth. Bot. Voy. Sulph. 50. 1844.
Euphorbia blepharostipula Millsp. Contr. U. S. Nat. Herb. 1: 77. 1890.
Chamaesyce magdalenae Millsp. Field Mus. Bot. 2: 410. 1916.
 Baja California; type from Magdalena Bay.
 Low slender shrub with glabrous or minutely puberulent branches; leaves nearly sessile, oblong or oval, often emarginate; appendages of the glands white.
17. *Euphorbia anthonyi* T. S. Brandeg. Erythraea 7: 7. 1899.
Euphorbia clarionensis T. S. Brandeg. Erythraea 7: 7. 1899.
 Baja California; type from San Benito Island.
 Stout shrub, 40 cm. high or less, nearly glabrous; leaves nearly sessile, broadly oblong or oblong-obovate, rounded at apex, very unequal at base; glands of the involucre dark brown, the appendages well developed or nearly obsolete.
18. *Euphorbia peganoides* Boiss. Cent. Euphorb. 22. 1860.
Aklema peganoides Millsp. Field Mus. Bot. 2: 416. 1916.
 Colima; type from some unknown locality in Mexico.
 Shrub, glabrous or nearly so; leaves 2.5 to 8 cm. long, nearly sessile; involucre glabrous or sparsely puberulent, mostly in terminal cymes, the appendages white, semiorbicular.
19. *Euphorbia schlechtendalii* Boiss. Cent. Euphorb. 18. 1860.
Alectoroctonum ovatum Schlecht. Linnaea 19: 252. 1847.
Euphorbia mayana Millsp. Field Mus. Bot. 1: 304. pl. 16. 1896.
Euphorbia nelsonii Millsp. Bot. Gaz. 26: 268. 1898.
Aklema ovata Millsp. Field Mus. Bot. 2: 416. 1916.
 Tamaulipas to Sinaloa, Oaxaca, and Yucatán; type from Actopán and Papantla, Veracruz. Guatemala and Nicaragua.
 Shrub or small tree, 1 to 4.5 meters high, glabrous or nearly so; leaves slender-petioled, the blades variable in shape, orbicular, ovate, or broadly obovate, 1 to 5 cm. long, rounded to acutish at apex; involucre in terminal cymes, the appendages of the glands usually very narrow; capsule glabrous "Sae-chacah" (Yucatán, Maya); "mulatilla" (Oaxaca).
 The sap is said to yield a kind of rubber.
20. *Euphorbia chiapensis* T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 54. 1914.
Eumecanthus chiapensis Millsp. Field Mus. Bot. 2: 414. 1916.
 Oaxaca and Chiapas; type from Sierra de Tonalá, Chiapas.
 Slender glabrous shrub, 1 meter high; leaves slender-petiolate, ovate or lance-ovate, 3 to 6 cm. long, obtuse; involucre in terminal and axillary cymes; appendages of the glands each cleft into 2 linear lobes.

21. *Euphorbia tricolor* Greenm. Proc. Amer. Acad. 33: 479. 1898.

Aklcma tricolor Millsp. Field Mus. Bot. 2: 417. 1916.

Puebla and Oaxaca; type from Tehuacán, Puebla.

Slender shrub, 1 meter high or less, the branches puberulent at first; leaves slender-petiolate, oblong-ovate to ovate-orbicular, 1 to 2 cm. long, sparsely pubescent beneath; involucre in small terminal cymes, the appendages oblong-ovate, entire or nearly so, white or purplish.

22. *Euphorbia leucocephala* Lotsy, Bot. Gaz. 20: 350. pl. 24. 1895.

Chiapas. Guatemala and Honduras; type from Cuilco, Guatemala.

Shrub, 1 to 2 meters high; leaves slender-petiolate, lance-oblong to oblong-oval, 3 to 6.5 cm. long, obtuse or rounded at apex, sparsely pubescent beneath; inflorescence terminal, large, of numerous cymes, the white bracts very conspicuous; appendages of the glands oblong-ovate. "Puno-puno," "flor de niño," "flor de Pascua." (Chiapas).

23. *Euphorbia lucii-smithii* Robins. & Greenm. Proc. Amer. Acad. 32: 36. 1896.

Michoacán to Chiapas; type from Rancho de Calderón, Oaxaca. Guatemala.

Shrub, 3 to 4.5 meters high, the branches tomentulose; leaves slender-petiolate, usually elliptic, 2 to 5 cm. long, obtuse or acute, pubescent beneath; inflorescence terminal, leafy, the bracts white, pink, or red; appendages oblong or ovate, white; capsule glabrous.

Specimens from Chiapas are noteworthy because of their villous stems.

24. *Euphorbia cotinifolia* L. Amoen. Acad. 3: 112. 1756.

Alectoroctonum cotinifolium Schlecht. Linnaea 19: 252. 1845.

Alectoroctonum scotannum Schlecht. Linnaea 19: 252. 1845.

Alectoroctonum yavalquahuil Schlecht. Linnaea 19: 252. 1845.

Euphorbia scotana Boiss. in DC. Prodr. 15²: 60. 1865.

Aklema cotinifolia Millsp. Field Mus. Bot. 2: 416. 1916.

Oaxaca and Veracruz. Central America and northern South America; type from Curaçao.

Shrub or tree, 3 to 6 meters high; leaves long-petioled, rounded-ovate or orbicular, 5 to 14 cm. long, glabrous beneath or sparsely pubescent; involucre in dense terminal cymes; appendages of the glands broader than long, crenate. "Trompillo," "piñoncillo," "mala-mujer" (Oaxaca); "mata-gallina" (Veracruz); "barrabás" (Costa Rica); "sapo" (Nicaragua); "hierba mala" (Guatemala); "lechera" (Venezuela); "manzanillo" (Colombia).

The milky sap has violent emetic-cathartic properties, and in doses of even small quantity is poisonous. It has been employed by some of the Indians of Central America for criminal poisoning. The natives of certain parts of South America are said to make use of it as an arrow poison and for poisoning fish. The juice is sometimes used to cauterize ulcers. The seeds also are said to have drastic purgative properties.

25. *Euphorbia xanti* Engelm.; Boiss. in DC. Prodr. 15²: 62. 1865.

Euphorbia gymnoclada Engelm. Proc. Amer. Acad. 5: 171. 1861. Not *E. gymnoclada* Boiss. 1860.

Aklema xanti Millsp. Field Mus. Bot. 2: 417. 1916.

Baja California; type from Cabo de San Lucas.

Shrub, 1 to 3 meters high, with glabrous branches; leaves petiolate, linear-lanceolate to elliptic or broadly obovate, glabrous or nearly so; involucre few, axillary or in terminal cymes; appendages white or pink, rounded-obovate. "Liga."

The leaves are remarkably variable in form, and it may be that the material represents two species; but the involucre characters are uniform. The milky

juice of the plant sometimes gets upon the lips and faces of feeding animals and causes the hair to fall out. If it comes into contact with their eyes it produces severe inflammation and even blindness.

26. *Euphorbia plicata* S. Wats. Proc. Amer. Acad. 21: 438. 1886.

Aklema plicata Millsp. Field Mus. Bot. 2: 417. 1916.

Chihuahua and Sonora to Jalisco; type from Hacienda San Miguel, southwestern Chihuahua.

Shrub, 1.5 to 2.5 meters high, with glabrous branches; leaves petiolate, 2.5 to 10 cm. long, obtuse; involucre in terminal cymes or axillary clusters; appendages of the glands orbicular, entire or crenulate, white; capsule glabrous. "Candelilla china" (Sinaloa).

In Sinaloa the juice is said to be used in very small doses as a purgative.

27. *Euphorbia colletioides* Benth. Bot. Voy. Sulph. 163. 1844.

Euphorbia padifolia T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 54. 1914.

Aklema colletioides Millsp. Field Mus. Bot. 2: 416. 1916.

Sonora to Oaxaca; type from Acapulco, Guerrero.

Shrub, about a meter high, with glabrous stems; leaves slender-petiolate, 3 to 6 cm. long, obtuse or acute, pale beneath; involucre numerous, in broad terminal cymes; appendages of the glands white, semiorbicular; capsule glabrous.

It is probable that *E. ligustrina* Boiss.,¹ described from Mexico, is a synonym, but it is described as having ovate appendages.

DOUBTFUL SPECIES.

EUPHORBIA ROSSIANA Pax, Repert, Sp. Nov. Fedde 8: 162. 1910. Type from Zapotitlán, near Tehuacán, Puebla. The leaves are not described.

2. PEDILANTHUS Neck. Elem. Bot. 2: 354. 1790.

REFERENCE: Millspaugh, Field Mus. Bot. 2: 353-371. 1913.

Shrubs with fleshy branches, the juice milky; leaves alternate, deciduous; flowers monoecious, small, surrounded by an oblique involucre; fruit a 3-lobate capsule.

The following vernacular names are reported for plants of the genus whose specific determination is doubtful: "Perico" (Durango); "aymoz" (Chiapas); "tamaulipa" (Veracruz).

Involucre hood-shaped, the appendix larger than the tube.....1. *P. finkii*.

Involucre shoe-shaped, the appendix smaller than the tube.

Lobe of the appendix entire.

Staminate pedicels pubescent, the pistillate ones glabrous.

2. *P. tithymaloides*.

Staminate and pistillate pedicels glabrous.

Leaves glabrous3. *P. parasiticus*.

Leaves pubescent.

Glands of the appendix 4.....4. *P. pringlei*.

Glands 25. *P. campester*.

Lobe of the appendix bipartite or tripartite.

Lobe of the appendix tripartite.

Divisions of the appendix all on one plane.....6. *P. itzaeus*.

Divisions of the appendix on different planes, 2 of them superior and one inferior7. *P. peritropoides*.

¹Cent. Euphorb. 22. 1860.

Lobe of the appendix bipartite.

Colored floral bracts absent.

Peduncle centrally affixed to the involucre tube.....8. *P. macrocarpus*.

Peduncle affixed posteriorly to the tube.

Appendix projecting along the margin of the fissure...9. *P. aphyllus*.

Appendix not projecting along the margin of the fissure.

Tube of the appendix glabrous inside.....10. *P. nodiflorus*.

Tube pubescent inside.....11. *P. cymbiferus*.

Colored floral bracts present, conspicuous, exceeding the inflorescence.

Involucral tube glabrous.

Glands of the appendix 2.....12. *P. articulatus*.

Glands of the appendix 4.....13. *P. bracteatus*.

Involucral tube puberulent or pilose.

Capsule with hornlike projections.....14. *P. spectabilis*.

Capsule without hornlike projections.

Involucral tube pilose.....15. *P. pavonis*.

Involucral tube puberulent.

Pistillate pedicels pubescent, the staminate ones glabrous.

Stamens glabrous.....16. *P. palmeri*.

Stamens pubescent.....17. *P. tomentellus*.

Pistillate and staminate pedicels glabrous.

Lobes of the appendix all laterally compressed.

Lobes glabrous.....18. *P. greggii*.

Lobes puberulent.....19. *P. olsson-sefferi*.

Lobes partly linear or flabellate.

Lateral and fifth lobes of the tube flabellate.

20. *P. involucratius*.

Lateral and fifth lobes linear.....21. *P. rubescens*.

1. *Pedilanthus finkii* Boiss. in DC. Prodr. 15²: 1261. 1866.

Known only from the type locality, Córdoba, Veracruz.

Shrub with hollow stems; leaves oblong, 10 to 14 cm. long, acute.

2. *Pedilanthus tithymaloides* (L.) Poit. Ann. Mus. Hist. Nat. 19: 390. 1812.

Euphorbia tithymaloides L. Sp. Pl. 453. 1753.

Tamaulipas and perhaps elsewhere. Central America, West Indies, and northern South America.

Shrub, 1 to 2 meters high; leaves ovate or oblong, 3.5 to 7.5 cm. long, acute, cuneate at base, glabrous; involucre purple; capsule 9 mm. broad. "Candelilla" (Tamaulipas); "dictamno" (Nicaragua); "bitamo" (Costa Rica); "ftamo real," "gallito colorado" (Cuba); "dictamo real" (Cuba, Colombia); "pié de niño" (Guatemala); "ponopinito" (Venezuela).

The milky juice is caustic, irritant, and emetic, and is sometimes used in domestic medicine. It is employed in some regions for venereal diseases. The plant is sometimes cultivated under the names "slipper-plant," "bird-cactus," "redbird cactus," and "Jew-bush."

3. *Pedilanthus parasiticus* Klotzsch & Garcke, Monatsb. Akad. Berlin 253. 1859.

Pedilanthus ramosissimus Boiss. in DC. Prodr. 15²: 5. 1862.

Known only from the type collection, which is said to have come from Mexico.

Leaves 2.5 cm. long or shorter, rounded or subcordate at base.

4. *Pedilanthus pringlei* Robinson, Proc. Amer. Acad. 29: 322. 1894.

Oaxaca to San Luis Potosí; type from Las Palmas, San Luis Potosí. Guatemala.

Shrub, 1 to 1.5 meters high; leaves 4 to 5 cm. long, acuminate, pubescent; involucre dark purplish red; capsule 7 mm. long, long-stipitate.

5. *Pedilanthus campester* T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 56. 1914.

Known only from the type locality, dry rocky plains, "Picaco-San Gerónimo," Oaxaca.

Leaves ovate, acute, about 6 cm. long and 3 cm. wide, pubescent.

6. *Pedilanthus itzaeus* Millsp. Field Mus. Bot. 1: 305. 1896.

Yucatán; type from Silam. Cuba and Santo Domingo.

Glabrous shrub, 1.5 meters high; leaves ovate, acute, 5 to 7.5 cm. long, 4 to 6 cm. wide, fleshy; involucre light pink. "Yaxahalche" (Yucatán, Maya).

Sometimes cultivated as an ornamental plant. Dondé states that laundresses employ the leaves for bleaching clothes. Two or three drops of the milky juice in water are sometimes taken as a purgative, but its use is dangerous.

7. *Pedilanthus peritropoides* Millsp. Field Mus. Bot. 2: 369. 1913.

Known only from the type locality, Coahuayula, Michoacán.

Glabrous shrub; leaves oblong to ovate, 12 to 15 cm. long, 5 to 6 cm. wide, rounded at apex.

8. *Pedilanthus macrocarpus* Benth. Bot. Voy. Sulph 49. pl. 23. f. A. 1844.

Baja California and Sonora to Colima; type from Magdalena Bay, Baja California.

Shrub, about a meter high; capsule about 2 cm. broad. "Candelilla" (Baja California).

The juice is said to yield a kind of rubber.

9. *Pedilanthus aphyllus* Boiss.; Klotzsch & Garcke, Abh. Akad. Berlin 106. 1860.

Pedilanthus calcaratus Schlecht. Linnaea 19: 155. 1847.

Veracruz and Puebla.

Shrub, a meter high or less, with whitish branches, usually leafy; involucre red, 2 cm. long. "Periquito" (Oaxaca, *Reko*; perhaps relating to some other species); "gallitos" (Puebla, *Urbina*).

10. *Pedilanthus nodiflorus* Millsp. Field Mus. Bot. 1: 305. 1896.

Yucatán; type from Silam.

Shrub, sometimes 2 meters high, widely branched, leafless; involucre red, 8 mm. long.

11. *Pedilanthus cymbiferus* Schlecht. Linnaea 19: 253. 1847.

Type from somewhere in Mexico.

Branches pubescent, leafless; involucre 12 mm. long.

12. *Pedilanthus articulatus* (Klotzsch & Garcke) Boiss. in DC. Prodr. 15²: 6. 1862.

Diadenaria articulata Klotzsch & Garcke, Abh. Akad. Berlin 108. 1860.

Known only from the type, this said to have come from Mexico.

Leaves oblong, 4 to 5 cm. long, obtuse or retuse, cuneate at base, puberulent

13. *Pedilanthus bracteatus* (Jacq.) Boiss. in DC. Prodr. 15²: 6. 1866.

Euphorbia bracteata Jacq. Pl. Hort. Schönbr. 3: 14. pl. 276. 1798.

Based on specimens said to have come from Mexico.

Shrub, 1.2 meters high; leaves 10 cm. long, glabrous, oblong, obtuse.

14. *Pedilanthus spectabilis* Robinson, Proc. Amer. Acad. 43: 23. 1907.

Zacatecas and Jalisco to Guerrero; type from Iguala Canyon, Guerrero.

Shrub, about 1 meter high, with gray branches; leaves oblong to broadly ovate, 6 to 12 cm. long, rounded or obtuse at apex, pubescent beneath; involucre whitish, nearly 2 cm. long; capsule 1 cm. in diameter.

15. *Pedilanthus pavonis* (Klotzsch & Gareke) Boiss. in DC. Prodr. 15²: 6. 1866.
Diadenaria pavonis Klotzsch & Gareke, Abh. Akad. Berlin 108. 1860.
 Colima and perhaps elsewhere, the type from some unknown Mexican locality.
 Leaves 12 to 17.5 cm. long, 6.5 to 7.5 cm. wide, subsessile, acute, glabrous;
 involucre 1.6 to 1.8 cm. long.
 This is the name which has usually been applied to Mexican species of the
 genus by local writers. The following vernacular names have been reported,
 but they probably refer to other species: "Candelillo" or "candelilla" (Jalisco,
 Oaxaca); "jumete" (Jalisco, Oaxaca); "cordobán," "venenillo" (Oaxaca).
 The plant is reputed to have purgative, emetic, emmenagogue, and antisymphilitic
 properties.
16. *Pedilanthus palmeri* Millsp. Field Mus. Bot. 2: 364. 1913.
 Known only from Tepic, the type locality.
 Leaves acute or obtuse, cuneate at base, glabrous, sometimes 15 cm. long;
 involucre red, 1.5 cm. long.
17. *Pedilanthus tomentellus* Robins. & Greenm. Amer. Journ. Sci. 50: 164.
 1896.
 Oaxaca; type from the city of Oaxaca.
 Shrub, 1.5 to 2.5 meters high; leaves 4 to 5 cm. long, acute, pubescent; in-
 volucre 1.2 cm. long. "Cordobán," "cordobancillo."
18. *Pedilanthus greggii* Millsp. Field Mus. Bot. 2: 363. 1913.
 Known only from the type locality, somewhere in Mexico.
 Leaves oblong-lanceolate, about 9 cm. long and 3 cm. wide, acute, puberulent.
19. *Pedilanthus olsson-sefferi* Millsp. Field Mus. Bot. 2: 363. 1913.
 Known only from the type locality, Tomellín, Oaxaca.
 Leaves oblong to ovate, 3 to 6 cm. long, obtuse, puberulent beneath; involucre
 1 cm. long.
20. *Pedilanthus involucratus* (Klotzsch & Gareke) Boiss. in DC. Prodr. 15²:
 6. 1862.
Diadenaria involucrata Klotzsch & Gareke, Abh. Akad. Berlin 107. 1860.
 Described from cultivated plants which were believed to be of Mexican
 origin.
 Shrub, about a meter high; leaves petiolate, oblong, 7.5 cm. long, puberulent
 beneath.
21. *Pedilanthus rubescens* T. S. Brandeg. Zoe 5: 209. 1905.
 Sinaloa; type from Culiacán.
 Shrub, 1 to 2 meters high, with pale branches; leaves 9 cm. long or smaller,
 ovate-lanceolate, nearly glabrous; floral leaves purplish red; involucre 2 cm.
 long.

DOUBTFUL SPECIES.

PEDILANTHUS GHIESBREGHTIANUS Baill. *Adansonia* 1: 340. 1861. Described
 from Mexico.

PEDILANTHUS TEHUACANUS T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 55. 1914.
 Type from Tehuacán, Puebla. No material seen by the writer, the diagnosis
 too incomplete for determination of the position of the species.

3. *TETRACOCCLUS* Engelm.; Parry, West Amer. Sci. 1: 13. 1885.

1. *Tetracoccus dioicus* Parry, West Amer. Sci. 1: 13. 1885.
Tetracoccus engelmanni S. Wats. Proc. Amer. Acad. 20: 373. 1885.
 Northern Baja California; type from Santo Tomás.
 Much-branched glabrous shrub; leaves mostly opposite, linear, 1 to 2.5
 cm. long, entire; flowers small, dioecious, apetalous, mostly solitary in the
 axils; capsule 4-lobate, about 6 mm. in diameter.

4. **HIERONYMA** Allem. Pl. Nov. Bras. 1848.1. *Hieronyma oblonga* (Tulasne) Muell. Arg. *Linnaea* 34: 66. 1865.*Stilaginella oblonga* Tulasne, Ann. Sci. Nat. III. 15: 248. 1851.*Stilaginella benthami* Tulasne, Ann. Sci. Nat. III. 15: 248. 1851.

Puebla and Oaxaca. South America; type from British Guiana.

Tree or shrub; leaves alternate, obovate-lanceolate, 15 cm. long or smaller, subcuspidate, acute at base, lepidote-pubescent when young; flowers small, dioecious, racemose; fruit drupaceous.

5. **PHYLLANTHUS** L. Sp. Pl. 981. 1753.

Shrubs or small trees, usually glabrous; leaves commonly distichous, small or large, entire, stipulate; flowers small, racemose, paniculate, or fascicled in the axils; fruit a capsule, sometimes fleshy and succulent.

Several herbaceous species occur in Mexico. *P. grandifolius* L. has been reported from Mexico upon the basis of a specimen collected by Sessé and Mociño; this, however, came from Porto Rico. Some species of the genus are cultivated for ornament. Certain Old World species are employed for poisoning fish.

Petioles half as long as the blades or longer.....1. *P. neurocarpus*.

Petioles much less than half as long as the blades.

Staminate calyx 4-parted.

Fruit fleshy; stipules dentate.....2. *P. acidus*.

Fruit dry; stipules entire.....3. *P. nobilis*.

Staminate calyx 5- (or 6-) parted.

Anthers dehiscent by vertical slits.

Leaves rounded or very obtuse at apex, broadest above the middle.

4. *P. galeottianus*.

Leaves acute or acuminate, broadest near base.....5. *P. purpusii*.

Anthers dehiscent by horizontal or oblique slits.

Flowers in elongate racemes or panicles.

Flowers racemose.....6. *P. oaxacanus*.

Flowers paniculate.

Stipules oblanceolate.....7. *P. tequilensis*.

Stipules linear-lanceolate or ovate-lanceolate.....8. *P. chiapensis*.

Leaves obovate-oblong.

Leaves ovate to ovate-oval.

Pistillate calyx lobes pinnately nerved.....9. *P. glaucescens*.

Pistillate calyx lobes 1-nerved.....10. *P. adenodiscus*.

Flowers solitary or fasciculate in the leaf axils.

Leaves acute or acuminate.

Staminate calyx 1 to 1.5 mm. long.....11. *P. acuminatus*.

Staminate calyx 2.5 mm. long.....12. *P. mocinianus*.

Leaves rounded or very obtuse at apex.

Leaves small, 5 mm. wide or narrower, broadest near apex.

13. *P. subcuneatus*.

Leaves large, 1 to 3.5 cm. wide, broadest at or below the middle.

14. *P. micrandrus*.

1. *Phyllanthus neurocarpus* Muell. Arg. *Linnaea* 34: 69. 1865.

Tamaulipas and San Luis Potosí; type collected between Victoria and Tula, Tamaulipas.

Leaves orbicular-ovate, 1.2 to 3 cm. long, rounded-obtuse, glabrous.

2. *Phyllanthus acidus* (L.) Skeels, U. S. Dept. Agr. Bur. Pl. Ind. Bull. 148: 17. 1909.

Averrhoa acida L. Sp. Pl. 428. 1753.

Cicca disticha L. Mant. Pl. 1: 124. 1767.

Phyllanthus distichus Muell. Arg. in DC. Prodr. 15²: 413. 1866.

Specimens seen from Tamaulipas, Guerrero, and Oaxaca, but perhaps only cultivated in Mexico. Native of the East Indies but cultivated in most tropical regions, and sometimes naturalized.

Shrub or small tree; leaves orbicular to oval-ovate, mostly 5 to 6 cm. long, short-pointed, distichous upon slender branches, these resembling pinnate leaves; flowers pink, in lax panicles; fruit large and succulent, pale green; seed large, lobate. "Ciruela corteña" (Oaxaca); "manzana estrella" (Tamaulipas); "grosella" (Costa Rica, Nicaragua, Cuba); "cerezo común," "cerezo de la tierra" (Porto Rico); "cerezo occidental" (Cuba).

This plant is often cultivated in warm regions under the names "Otaheite gooseberry," "West Indian gooseberry," "star gooseberry," and "jimbling." The fruit is nearly 2 cm. in diameter, with firm, acid, and astringent flesh. It is usually pickled or made into preserves. The root and seeds are said to have purgative and cathartic properties. The wood is described as rather hard and fine-grained, with a specific gravity of 0.57.

3. *Phyllanthus nobilis* (L. f.) Muell. Arg. in DC. Prodr. 15²: 114. 1866.

Margaritaria nobilis L. f. Suppl. Pl. 428. 1781.

Cicca antillana Juss. Tent. Euphorb. 108. 1824.

Yucatán. West Indies and Central America.

Shrub or tree, 4 to 20 meters high; leaves short-petiolate, lance-oblong or elliptic-oblong, 5 to 12 cm. long, acute or acuminate, glabrous; fruit about 6 mm. in diameter. "Amortiguado," "avispillo," "higuerillo," "biguillo," "millo," "palo de millo," "yuquillo," "siete-cueros" (Porto Rico).

4. *Phyllanthus galeottianus* Baill. Adansonia 1: 32. 1860-61.

Phyllanthus peninsularis T. S. Brandeg. Erythea 7: 8. 1899.

Southern Baja California to Jalisco and Michoacán; type from Morelia, Michoacán.

Slender shrub, a meter high or less, or almost wholly herbaceous; leaves nearly sessile, rounded-obovate, 1 to 5 cm. long; flowers clustered in the axils.

5. *Phyllanthus purpusii* T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 55. 1914.

Known only from the type locality, Cerro del Boquerón, Chiapas.

Tree, 7 to 8 meters high, glabrous; leaves ovate or ovate-lanceolate, 2 to 3.5 cm. long, pale beneath.

6. *Phyllanthus oaxacanus* T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 185. 1915.

Known only from the type locality, San Gerónimo, Oaxaca.

Leaves short-petiolate, broadly ovate-oval, 4 to 5 cm. long, obtuse, glabrous.

7. *Phyllanthus tequilensis* Robins. & Greenm. Proc. Amer. Acad. 29: 392. 1894.

Known only from the type locality, Tequila, Jalisco.

Leaves ovate-elliptic, 4.5 to 10 cm. long, rounded to acute at apex, pale beneath; capsule 3.5 cm. broad.

8. *Phyllanthus chiapensis* Sprague, Kew Bull. 1909: 264. 1909.

Known only from the type locality, on dry hills, Cacate, Chiapas.

Shrub, 2 meters high; leaves 3.5 to 5 cm. long, 1.5 to 2.3 cm. wide, rounded at apex, subcuneate at base; flowers reddish; capsule 3 cm. broad or larger.

Reported by Hemsley as *P. laxiflorus* Benth.

9. *Phyllanthus glaucescens* H. B. K. Nov. Gen. & Sp. 2: 115. 1817.

Yucatán Peninsula; type from Campeche. Guatemala.

Shrub; leaves ovate-oval to orbicular-elliptic, 9 to 22 cm. long, acute or short-pointed, glabrous, pale beneath; capsule more than 2 cm. in diameter. "Xpbixdon" (Yucatán).

10. *Phyllanthus adenodiscus* Muell. Arg. Linnaea 32: 23. 1863.

Tamaulipas, San Luis Potosí, and Veracruz; type from Papantla, Veracruz.

Shrub, 1.5 to 3 meters high; leaves rounded-ovate to oblong-elliptic, 8 to 15 cm. long, acuminate, glabrous, pale beneath; capsule 4 cm. long or larger.

11. *Phyllanthus acuminatus* Vahl, Symb. Bot. 2: 95. 1791.

? *Phyllanthus sessei* Briq. Ann. Cons. Jard. Genève 4: 224. 1900.

Baja California to San Luis Potosí, Yucatán, and Oaxaca. West Indies, Central America, and South America.

Shrub or tree, 3 to 6 meters high, with slender green angulate branches; leaves ovate to oval, mostly 3 to 4 cm. long, green; capsule about 4 mm. long. "Ciruelillo" (Tabasco); "chilillo," "gallina" (Costa Rica).

12. *Phyllanthus mocinianus* Baill. Adansonia 1: 35. 1860.

Described from specimens believed to have come from Mexico.

Glabrous; leaves ovate or cordate-ovate, 1.5 to 3 cm. long.

13. *Phyllanthus subcuneatus* Greenm. Proc. Amer. Acad. 33: 478. 1898.

Puebla; type from limestone ledges near Tehuacán.

Slender shrub, 1 meter high or less; leaves cuneate-obovate, 4 to 7 mm. long, glabrous; capsule 4 mm. broad.

14. *Phyllanthus micrandrus* Muell. Arg. Linnaea 32: 27. 1863.

Phyllanthus pringlei S. Wats. Proc. Amer. Acad. 26: 147. 1891.

Sinaloa to San Luis Potosí and Guerrero. Guatemala; type from Venezuela.

Slender shrub or tree, 2 to 6 meters high; leaves orbicular or rounded-ovate, 1 to 3.5 cm. long, thin, glabrous; flowers greenish white.

6. *ASTROCASIA* Robins. & Millsp. Bot. Jahrb. Engler 36: Beibl. 80: 19. 1905.1. *Astrocasia phyllanthoides* Robins. & Millsp. Bot. Jahrb. Engler 36: Beibl. 80: 20. 1905.

Yucatán; type from Itzimna.

Shrub, 1 to 2 meters high; leaves deciduous, slender-petiolate, orbicular to ovate, 4 to 13 cm. long, rounded or obtuse at apex, entire, pale beneath; flowers dioecious, fasciculate on short lateral spurs, borne on long filiform pedicels; capsule 8 mm. long. "Xkahyuc," "xcaba-xpixolon" (Maya).

This has been reported from Yucatán as *Phyllanthus nutans* Swartz.

7. *CROTON* L. Sp. Pl. 1004. 1753.

Trees or shrubs; leaves alternate, petiolate, stipulate, entire or dentate, rarely lobate; pubescence of stellate hairs or of scales; flowers small, monoecious or dioecious, with or without petals, racemose; fruit a more or less 3-lobate capsule.

Several herbaceous species are found in Mexico. *Croton eluteria* (L.) Swartz, of the Bahamas, produces the cascarilla bark of commerce, which is employed in medicine as a tonic.

Petals well developed in both staminate and pistillate flowers. Pubescence lepidote.

Leaves pinnately nerved.....1. *C. glabellus*.

Leaves 3 or 5-nerved at base.

Ovary and fruit smooth, densely lepidote.....2. *C. niveus*.

Ovary and fruit tuberculate, hispid.....3. *C. reflexifolius*.

Petals rudimentary or absent in one or both kinds of flowers.

Petals rudimentary or absent in both kinds of flowers.

Flowers monoecious.....4. *C. tenuilobus*.

Flowers dioecious.

Staminate racemes long-pedunculate; capsule densely lepidote with short-rayed scales5. *C. neomexicanus*.

Staminate racemes sessile or short-pedunculate; capsule covered with long-rayed scales.

Staminate racemes very short, few-flowered; leaves long-petiolate.

6. *C. californicus*.

Staminate racemes elongate, many-flowered; leaves short-petiolate or subsessile7. *C. dioicus*.

Petals well developed in the staminate flowers, rudimentary or obsolete in the pistillate ones.

Racemes interrupted, the pistillate portion separated from the staminate by a long sterile portion. Leaves dentate.

Leaves obovate-oblong, acute at base.....8. *C. meissneri*.

Leaves broadly ovate, rounded or subcordate at base....9. *C. liebmanni*.

Racemes continuous.

Lowest bracts of the racemes subtending both staminate and pistillate flowers.

Glands none on the leaves.

Leaves acuminate, denticulate.....10. *C. stipulaceus*.

Leaves obtuse or abruptly short-pointed at apex, entire.

11. *C. suberosus*.

Glands present on the lower surface of the leaf near the base.

Styles divided to the base, the branches lacinate or bifid.

Leaves obscurely 5-nerved or often pinnate-nerved, rhombic-lanceolate12. *C. grewiaefolius*.

Leaves conspicuously palmate-nerved, broadly ovate.

13. *C. gossypiifolius*.

Styles divided to the base, the branches, however, entire.

Stipules subulate.....14. *C. panamensis*.

Stipules ovate or lance-ovate.....15. *C. draco*.

Lowest bracts subtending only pistillate flowers.

Pubescence of scalelike hairs.

Leaves densely lepidote on the upper surface...16. *C. amphileucus*.

Leaves glabrate on the upper surface.

Leaves obtuse or rounded at apex.....17. *C. hypoleucus*.

Leaves long-acuminate.....18. *C. watsonii*.

Pubescence of stellate hairs.

A. Stipules glandular-lacinate or glandular-denticulate.

Pubescence of closely appressed, depressed hairs.

Leaves glandular-ciliate.....19. *C. jucundus*.

Leaves not glandular-ciliate.

Styles once dichotomous.....20. *C. adpersus*.

Styles 2 or more times dichotomous.....21. *C. soliman*.

Pubescence of loose spreading hairs.

Styles once dichotomous, the branches entire.

Stipules pinnately lobate.....22. *C. incanus*.

Stipules palmately lobate.....23. *C. suaveolens*.

- Styles 2 or more times dichotomous or, if once dichotomous, the branches not entire:
 Leaves usually glandular-ciliate, entire or nearly so.
 Stipules very short and inconspicuous; ciliation of the leaves inconspicuous.....24. *C. humilis*.
 Stipules long and conspicuous; ciliation of the leaves very conspicuous.
 Stamens about 40; divisions of the stipules long and slender; style branches entire...25. *C. ciliato-glandulosus*.
 Stamens about 30; divisions of the stipules short and stout; style branches laciniate.....26. *C. pulcher*.
 Leaves not ciliate, dentate.
 Bracts laciniate.....27. *C. ovalifolius*.
 Bracts entire.
 Leaves denticulate.....28. *C. stylosus*.
 Leaves coarsely duplicate-dentate...29. *C. macrodontus*.
- AA. Stipules entire.
 Style branches 2 or more times dichotomous, often laciniate. Leaves coarsely dentate30. *C. repens*.
 Style branches once dichotomous.
 Stamens 20 to 50. Leaves with glands at base.
 Stamens 35 to 50; leaves serrulate.....31. *C. xalapensis*.
 Stamens 20 to 30; leaves entire.....32. *C. subfragilis*.
 Stamens 6 to 20.
 Leaves with large glands on the lower surface at the base.
 33. *C. mexicanus*.
 Leaves without glands, or these very obscure.
 Pistillate racemes very dense and congested in fruit, many-flowered; pistillate flowers sessile or nearly so.
 Leaves entire, long-petiolate.....34. *C. cladotrichus*.
 Leaves repand-dentate.....35. *C. francoanus*.
 Pistillate racemes lax, usually few-flowered, if dense the pistillate flowers long-pedicellate.
 Leaves rounded or very obtuse at apex.
 Leaves mostly palmate-nerved at base; pistillate sepals accrescent.....36. *C. corymbulosus*.
 Leaves pinnate-nerved; sepals not accrescent.
 Base of the leaf broadly rounded or subcordate; leaves mostly oval.....37. *C. ehrenbergii*.
 Base of the leaf cuneate or obtuse; leaves mostly oblong or ovate-oblong.....38. *C. torreyanus*.
 Leaves, at least most of them, acute or acuminate.
 Stipules large, semireniform, foliaceous, persistent.
 39. *C. alamosanus*.
 Stipules small, linear or subulate, early deciduous.
 Leaves pinnate-nerved, the basal nerves not conspicuous.
 Leaves perfectly glabrous on the upper surface.
 40. *C. cortesianus*.
 Leaves pubescent on the upper surface.
 Leaves thin, green on the upper surface, soon glabrate.....41. *C. miradorensis*.

Leaves thin, pale and densely and very finely stellate-pubescent on the upper surface.

42. *C. rhamnifolius*.

Leaves palmate-nerved, the basal nerves (usually 5) very conspicuous.

Lobes of the capsule compressed and acutish above.

43. *C. flavescens*.

Lobes of the capsule broadly rounded.

Upper leaf surface pale, nearly or quite as densely pubescent as the lower.

Leaves cordate at base, very short-petiolate; large shrub-----44. *C. magdalenae*.

Leaves not cordate at base, long-petiolate; very low shrub-----36. *C. corymbulosus*.

Upper leaf surface bright green, usually glabrate.

Leaves glabrous or nearly so beneath at maturity.

Leaves very scabrous on the upper surface, the hairs with enlarged bases.

45. *C. calvescens*.

Leaves not scabrous, the hairs without enlarged bases-----46. *C. sonorae*.

Leaves persistently and copiously pubescent beneath.

Pubescence of the lower leaf surface fine and appressed-----47. *C. fragilis*.

Pubescence of the lower leaf surface coarse and spreading.

Capsule finely stellate-puberulent.

48. *C. fruticosus*.

Capsule coarsely stellate-pillose.

49. *C. morifolius*.

1. *Croton glabellus* L. Amoen. Acad. 5: 409. 1760.

Croton schiedeanus Schlecht. Linnaea 19: 243. 1847.

Veracruz and Tabasco. Central America, West Indies, and northern South America.

Shrub or small tree, the pubescence of small brown scales; leaves oblong-elliptic or oblong-ovate, 5 to 20 cm. long, short-petiolate, abruptly short-acuminate, entire, glabrate; flowers in long slender racemes; capsule coarsely tuberculate. "Copalchi" (Tabasco, Costa Rica); "caobilla" (Veracruz *Kamírez*); "quizarrá copalchi" (Costa Rica).

The wood is said to be strong, fine-grained, and durable.

2. *Croton niveus* Jacq. Stirp. Amer. 255. pl. 162. f. 2. 1763.

Croton pseudo-china Schlecht. Linnaea 5: 84. 1830.

Croton arboreus Millsp. Field Mus. Bot. 1: 303. pl. 15. 1896.

Colima to Tamaulipas, Yucatán, and Chiapas. Central America, northern South America, and West Indies; type from Cartagena, Colombia.

Shrub or tree (said sometimes to attain a height of 18 meters), the pubescence of silvery scales; leaves ovate or broadly ovate, 5 to 12 cm. long or larger, acute or acuminate, usually somewhat cordate at base, entire; flowers in long or short racemes; capsule about 9 mm. long. "Quina" (Oaxaca); "quina blanca" (Veracruz); "copalchi" (Veracruz, Oaxaca, Costa Rica, El

Salvador, Nicaragua); "vara blanca" (Tamaulipas); "salvia de la playa" (Colombia).

The bark is said to be similar in odor and flavor to cascarilla bark, for which it is sometimes substituted. It contains a bitter principle, copalchin, which is found also in other species of *Croton*. In commerce the bark is known as "copalchi" and "quina blanca," and it is employed as a tonic, especially in intermittent fevers. It was formerly exported to Europe for medicinal purposes, but is no longer used abroad. The leaves are closely covered with silvery or brownish hairs, but they are sometimes also short-pilose.

3. *Croton reflexifolius* H. B. K. Nov. Gen. & Sp. 2: 68. 1817.

Croton sylvaticus Schlecht. Linnaea 19: 240. 1847. Not *C. sylvaticus* Hochst. 1845.

Guerrero to Tamaulipas and Veracruz; type from Acapulco. Central America; reported from Colombia.

Shrub or small tree; leaves ovate or ovate-cordate, 5 to 10 cm. long, acuminate or abruptly acuminate, entire, finely silvery-lepidote, at least beneath, but often glabrate in age; flowers in long slender racemes; capsule about 12 mm. long, conspicuously muricate. "Copalchi" (various parts of Mexico, *Ramírez*, Costa Rica); "Solimán prieto" (San Luis Potosí, *Scler*).

4. *Croton tenuilobus* S. Wats. Proc. Amer. Acad. 21: 439. 1886.

Southwestern Chihuahua to Tepic; type from Hacienda San José, Chihuahua. Slender shrub; leaves linear-lanceolate or linear-oblong, 2 to 6 cm. long, green above, pale beneath, finely stellate-pubescent; flowers short-racemose.

5. *Croton neomexicanus* Muell. Arg. Linnaea 34: 141. 1865.

Chihuahua to Nuevo León. Western Texas and southern New Mexico; type from western Texas.

Plants suffrutescent, 0.3 to 1.5 meters high, covered with close silvery radiate scales; leaves lanceolate to elliptic, 1 to 4 cm. long, petiolate, obtuse or rounded at apex, entire, usually green on the upper surface; staminate racemes slender, many-flowered, 4 to 8 cm. long.

Root bark said to be used as a purgative.

6. *Croton californicus* Muell. Arg. in DC. Prodr. 15²: 691. 1866.

Baja California, Sonora, and Sinaloa. Southern Arizona and California; type from San Francisco, California.

Slender shrub, sometimes 1.5 meters high, or often herbaceous, the pubescence mostly of appressed radiate scales; leaves slender-petiolate, oblong to elliptic, 2.5 to 5 cm. long, obtuse, often green on the upper surface.

7. *Croton dioicus* Cav. Icon. Pl. 1: 4. pl. 6. 1791.

Croton elacagnifolius Vahl; Geisel. Croton. Monogr. 9. 1807.

Croton gracilis H. B. K. Nov. Gen. & Sp. 2: 69. 1817.

Astogyne crotonoides Benth. Pl. Hartw. 14, 1839.

Nuevo León to Durango, Oaxaca, and Veracruz.

Plants low, shrubby or frequently herbaceous, densely covered with appressed silvery scales; leaves short-petiolate, oval to oblong, 1.5 to 4.5 cm. long, obtuse, entire; staminate flowers in short dense spikes. "Rosval" (Nuevo León); "hierba del gato," "rubaldo," "robaldo" (Coahuila); "encinilla" (Durango, *Patoni*); "hierba del zorrillo" (Valley of Mexico, *Ramírez*, Oaxaca, *Reko*); "yepaxihuitl" (*Ramírez*); "epaxihuitl" (Nahuatl, "skunk-herb").

The seeds and root are reported to have drastic purgative properties. The plant is said to be used also for hysteria, and in baths for rheumatism.

8. *Croton meissneri* Muell. Arg. in DC. Prodr. 15²: 665. 1866.

Known only from the type locality, near Orizaba, Veracruz.

Stems low, perhaps herbaceous; leaves oblong-obovate, 1.5 to 2.5 cm. long, obtuse, coarsely serrate, stellate-pubescent.

9. *Croton liebmanni* Muell. Arg. in DC. Prodr. 15²: 665. 1866.

Known only from the type locality, near Santiago, Amatlán, Oaxaca.

Leaves long-petiolate, 4 to 8 cm. long, long-acuminate, biglandular at base; racemes slender, 5 to 6 mm. long; capsule 6 mm. long.

10. *Croton stipulaceus* H. B. K. Nov. Gen. & Sp. 2: 85. 1817.

Valley of Mexico to Oaxaca; type collected near the City of Mexico.

Leaves long-petiolate, cordate-ovate, 6 to 10 cm. long, acuminate, denticulate, densely stellate-tomentose; racemes dense, many-flowered; capsule 9 mm. long. "Sangre de drago" (*Humboldt*).

The species is unknown to the writer.

11. *Croton suberosus* H. B. K. Nov. Gen. & Sp. 2: 86. 1817.

Known only from the type locality, Acapulco, Guerrero.

Branches with corky fissured bark; leaves short-petiolate, 3 to 8 cm. long and nearly as broad, stellate-tomentose, shallowly cordate at base; racemes dense, 3 to 3.5 cm. long.

Known to the writer only from the description, which is strongly suggestive of *C. cladotrichus* Muell. Arg.

12. *Croton grewiaefolius* Muell. Arg. Linnaea 34: 87. 1865.

Known only from the type locality, near the city of Oaxaca.

Leaves long-petiolate, rhombic-lanceolate, 5 to 8 cm. long, acuminate, acute at base, dentate, stellate-pubescent; racemes elongate.

13. *Croton gossypiifolius* Vahl, Symb. Bot. 2: 98. 1791.

Reported from Oaxaca. Central America, northern South America, and West Indies; type from Trinidad.

Shrub or tree, sometimes 15 meters high, copiously stellate-tomentose; leaves cordate-ovate, often 30 cm. long, acute or acuminate; flowers in very long stout racemes. "Targuá" (Costa Rica); "sangre de drago" (Venezuela).

It is rather doubtful whether this species actually occurs in Mexico.

14. *Croton panamensis* (Klotzch) Muell. Arg. in DC. Prodr. 15²: 546. 1866.

Cyclostigma panamense Klotzsch in Seem. Bot. Voy. Herald 105. 1853.

Veracruz, Puebla, Oaxaca, and Chiapas. Central America; type from Volcán de Chiriquí, Panama.

Tree, sometimes 35 meters high, with a trunk 60 cm. in diameter, the bark grayish white, nearly smooth, the crown flat; leaves long-petiolate, broadly ovate-cordate, usually 10 to 20 cm. long, acute or acuminate, densely stellate-pubescent, denticulate; racemes equaling or longer than the leaves. "Sangre de drago" (Chiapas); "targuá" (Costa Rica); "sangrillo" (Panama).

15. *Croton draco* Schlecht. Linnaea 6: 360. 1831.

San Luis Potosí and Veracruz to Chiapas; type from Papantla, Veracruz.

Tree, 4.5 to 15 meters high, copiously stellate-tomentose; leaves long-petiolate, broadly ovate-cordate, 10 to 25 cm. long, acuminate, entire or denticulate; racemes usually very long. "Sangre de drago" (Veracruz, Chiapas, Oaxaca, Guatemala); "tlachinole," "sangregado" (Veracruz); "ezquahuilit," "árbol de sangre" (*Nueva Farmacopea Mexicana*); "cuete," "palo muela" (Sinaloa).

Reputed to have astringent properties, and said to be used locally as a remedy for fevers and for hardening the gums. The blood-red sap is bitter, and gives a red dye; it is employed as a remedy for hoof diseases in burros and horses.

16. *Croton amphileucus* Briq. Ann. Cons. Jard. Genève 4: 227. 1900.

Known only from the type locality, near Real del Monte, Hidalgo, altitude 2,400 meters.

Shrub; leaves elliptic, 10 to 13 mm. long, obtuse, short-petiolate, densely lepidote on both surfaces, entire; racemes 5 to 10 mm. long.

Known to the writer only from the description.

17. *Croton hypoleucus* Schlecht. Linnaea 19: 246. 1847.

Croton shepherdiaefolius Schauer, Linnaea 20: 729. 1847.

Coahuila (?) to Hidalgo; type collected between Zimapán and San José del Oro, Hidalgo.

Shrub; leaves oblong-ovate, 3 to 4.5 cm. long, petiolate, entire, bright green on the upper surface, very densely silvery-lepidote beneath.

18. *Croton watsonii* Standl.

Croton elacagnoides S. Wats. Proc. Amer. Acad. 26: 147. 1891. Not *C. elacagnoides* Balf. 1884.

Known only from the type locality, Las Palmas, San Luis Potosí.

Shrub or small tree, 3 to 4.5 meters high; leaves ovate or lanceolate, 1.5 to 5 cm. long, entire, bright green on the upper surface, densely silvery-lepidote beneath; racemes slender, 10 to 15 cm. long; capsule depressed, 5 mm. broad.

19. *Croton jucundus* T. S. Brandeg. Zoe 5: 205. 1905.

Known only from the type locality, Yerba Buena, near Culiacán, Sinaloa.

Plant soon glabrate, green, very sparsely stellate-pubescent; leaves long-petiolate, ovate or lanceolate, 6 to 10 cm. long, attenuate, entire, ciliate with long slender gland-tipped hairs.

Perhaps only a form of *C. ciliato-glandulosus*.

20. *Croton adpersus* Benth. Pl. Hartw. 51. 1840.

Type from Morelia, Michoacán; reported from Oaxaca, Veracruz, and San Luis Potosí.

Leaves petiolate, ovate or ovate-lanceolate, 3.5 to 6 cm. long, acuminate, serrulate, stellate-puberulent. "Solimán" (*Scler*).

21. *Croton soliman* Schlecht. & Cham. Linnaea 6: 361. 1831.

Veracruz, Tabasco, and Oaxaca; type from Papantla, Veracruz.

Slender green shrub; leaves long-petiolate, ovate or rhombic, 5 to 9 cm. long, cuspidate-acuminate, appressed-stellate beneath, obscurely crenate; flowers whitish. "Solimán" (Veracruz).

22. *Croton incanus* H. B. K. Nov. Gen. & Sp. 2: 73. 1817.

San Luis Potosí to Hidalgo; type from Los Organos, Actopán.

Shrub, 2 meters high, densely stellate-pubescent; leaves ovate, 1.5 to 3.5 cm. long, obtuse, entire; racemes 2 to 3 cm. long.

Known to the writer only from the description.

23. *Croton suaveolens* Torr. U. S. & Mex. Bound. Bot. 194. 1859.

? *Croton virictianus* Muell. Arg. Linnaea 34: 133. 1865-66.

Chihuahua, Coahuila, and San Luis Potosí. Western Texas; type collected along the Rio Grande.

Low, densely branched shrub, densely stellate-tomentose, the pubescence usually yellowish; leaves broadly rhombic-ovate, 1 to 3.5 cm. long, obtuse or acutish, thick, entire; racemes short and stout. "Encinillo" (Chihuahua).

Plant fragrant, used in baths in convalescence from fevers.

24. *Croton humilis* L. Syst. Nat. ed. 2. 1276. 1759.

Croton berlandieri Torr. U. S. & Mex. Bound. Bot. 193. 1859.

Nuevo León to Yucatán. Southern Florida and West Indies.

Slender shrub, a meter high or less, stellate-pubescent (usually sparsely so) and viscid; leaves rounded-ovate to lanceolate, 2 to 6 cm. long, rounded or cordate at base, usually acute at apex, nearly entire; racemes 3 to 5 cm. long; capsule 4 to 5 mm. long. "Yecaban," "icaban" (Yucatán).

This has been reported from Yucatán as *C. albidus* Muell. Arg. It may be that two species are represented by the material referred here, but a satisfactory basis of division is not apparent.

25. *Croton ciliato-glandulosus* Ortega. Hort. Matr. Dec. 51. 1797.

Croton penicillatus Vent. Choix Pl. Cels. 12. pl. 12. 1803.

Baja California and Sonora to Tamaulipas, Veracruz, and Chiapas. Guatemala and Honduras; Cuba.

Shrub, 1 to 2 meters high, densely stellate-tomentose; leaves long-petiolate, broadly ovate-cordate, 3 to 12 cm. long, acute or acuminate; capsule about 7 mm. long. "Solimán" (Tamaulipas, etc.); "pícosa" (Querétaro); "canelilla" or "canelillo" (Oaxaca); "xunaxilase," "cuanaxonaxi," "xunalixase," "xonaxe" (Oaxaca); "enchiladora" (Oaxaca, Veracruz); "Solimán blanco" (*Seler*); "Dominguillo," "hierba de la cruz" (*Altamirano*); "palillo" (*Flores*); "chirca," "ciega-vista" (Guatemala, Honduras).

The plant has a strong aromatic odor. It is much used locally as a remedy for fevers, and is said to have purgative properties. It also is reputed to increase the flow of milk in goats which browse upon it. *Seler* states that (in Chiapas?) it is the food plant of a red caterpillar which is eaten by the natives. The hairs of the leaves adhere to the hands and injure the eyes when introduced into the latter.

26. *Croton pulcher* Muell. Arg. in DC. Prodr. 15²: 644. 1866.

Puebla; type from Tehuacán.

Low shrub with stout branches, densely stellate-tomentose; leaves short-petiolate, broadly ovate, 4 to 5.5 cm. long, acutish.

Perhaps only a form of *C. ciliato-glandulosus*.

27. *Croton ovalifolius* West, Bidr. Beskr. St. Croix 307. 1793.

Oaxaca. West Indies and South America.

Shrub, green, sparsely stellate-pilose; leaves long-petiolate, oblong to elliptic or obovate, 1 to 3 cm. long, rounded or obtuse at apex, finely denticulate; sepals of the pistillate flowers large, accrescent, glandular-ciliate.

28. *Croton stylosus* Muell. Arg. *Linnaea* 34: 128. 1865.

Type from Mexico, the locality not known.

Leaves short-petiolate, rhombic-ovate, 6 to 10 cm. long, cuspidate-acuminate.

29. *Croton macrodontus* Muell. Arg. *Linnaea* 34: 128. 1865.

Veracruz and Oaxaca.

Green, sparsely stellate-pubescent shrub; leaves long-petiolate, ovate, 5 to 13 cm. long, long-acuminate, thin.

30. *Croton repens* Schlecht. *Linnaea* 19: 237. 1847.

Sinaloa to Oaxaca and Veracruz; type from Hacienda de la Laguna, Veracruz. Central America.

Slender shrub, often decumbent, green, stellate-pubescent; leaves usually short-petiolate, suborbicular to ovate, 2 to 7 cm. long, rounded to acute at apex, often shallowly lobate, crenate-dentate. "Tostoncillo" (El Salvador); "chacotote" (Guatemala Honduras).

The root is used locally for stomach affections.

31. *Croton xalapensis* H. B. K. Nov. Gen. & Sp. 2: 85. 1817.

Veracruz to Chiapas; type from Jalapa, Veracruz. Central America.

Shrub or small tree, 2 to 9 meters high, copiously stellate-tomentose, at least when young; leaves long-petiolate, cordate-ovate, 8 to 20 cm. long or larger, acuminate or cuspidate-acuminate; racemes very long and slender. "Targuá," "terré," "targuacillo" (Costa Rica); "chirca" (Guatemala, Honduras).

The wood is white and weak. The gum which exudes from the trunk is used for cleaning the teeth.

32. *Croton subfragilis* Muell. Arg. Linnaea 34: 111. 1865.

Known only from the type locality, between Tuxtla and Chiapas.

Leaves oblong-ovate, 10 to 15 cm. long, cuspidate-acuminate, stellate-pubescent with ferruginous hairs. "Copalché."

33. *Croton mexicanus* Muell. Arg. Linnaea 34: 113. 1865.

Described from Mexico, the locality not known.

Leaves oblong-ovate, 12 cm. long or shorter, stellate-pubescent with depressed hairs or glabrate, acuminate, entire or denticulate.

34. *Croton cladotrichus* Muell. Arg. Linnaea 34: 124. 1865.

Croton purpusii T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 184. 1915.

Michoacán to Oaxaca.

Shrub, copiously stellate-pubescent or tomentose, the branches covered with thick corky bark; leaves mostly suborbicular, 6 to 15 cm. long, usually abruptly short-pointed, more or less cordate at base; spikes usually shorter than the leaves, very thick and dense. "Gordolobo" (Michoacán, Guerrero).

35. *Croton francoanus* Muell. Arg. Linnaea 34: 124. 1865.

Known only from the type locality, near Oaxaca.

Leaves nearly sessile, broadly triangular-ovate, 5 to 10 cm. long, acuminate, cordate at base, whitish-tomentose beneath.

36. *Croton corymbulosus* Engelm. in Wheeler, Rep. U. S. Surv. 100th Merid. 5: 242. 1878.

Chihuahua, Coahuila, and Sonora. Western Texas to southern Arizona; type from Camp Bowie, Arizona.

Plants low, woody at base, the stems clustered, densely silvery-pubescent throughout; leaves long-petiolate, orbicular to oblong, 2 to 4.5 cm. long; racemes 2 to 4 cm. long. "Encinilla" (Texas).

Tea made from the leaves is used in domestic medicine in western Texas, because of its sudorific and tonic properties.

37. *Croton ehrenbergii* Schlecht. Linnaea 19: 248. 1847.

Hidalgo.

Slender shrub, 0.6 to 1.2 meters high; leaves short-petiolate, 1 to 3 cm. long, entire, densely silvery-pubescent beneath; racemes short, few-flowered.

38. *Croton torreyanus* Muell. Arg. in DC. Prodr. 15²: 579. 1866.

Coahuila and Nuevo León to Veracruz. Western Texas (type locality).

Shrub, 1 to 2 meters high, stellate-tomentose; leaves short-petiolate, 3 to 6 cm. long, entire; racemes 1 to 4 cm. long. "Salvia" (Tamaulipas).

39. *Croton alamosanus* Rose, Contr. U. S. Nat. Herb. 1: 111. 1891.

Sonora to Oaxaca; type from Alamos, Sonora.

Shrub, 1 to 4 meters high; leaves nearly sessile, ovate or oblong-ovate, 5 to 14 cm. long, cordate at base, long-acuminate, green, thinly stellate-pubescent, entire or nearly so. "Ocotillo" (Sinaloa).

The resin is employed as a remedy for toothache.

40. *Croton cortesianus* H. B. K. Nov. Gen. & Sp. 2: 83. 1817.*Croton trichocarpus* Torr. U. S. & Mex. Bound. Bot. 196. 1859.

Sinaloa to Tamaulipas, Campeche, and Chiapas; type collected near Campeche. Western Texas.

Shrub, 1 to 3 meters high; leaves mostly oblong-ovate, 3 to 10 cm. long, short-petiolate, acute or acuminate, rounded or subcordate at base, stellate-pubescent beneath, bright green above; racemes often very long. "Palillo" (Tamaulipas, San Luis Potosí); "pozual," "puzual" (San Luis Potosí *Seler*); "ek-balam" (Maya, *Seler*); "pinolillo" (Tamaulipas).

The juice is applied as a caustic for the treatment of skin diseases.

41. *Croton miradorensis* Muell. Arg. in DC. Prodr. 15²: 627. 1866.

Veracruz; type from Mirador.

Shrub; leaves ovate or oblong-ovate, 6 to 12 cm. long, acute or acuminate, rounded or subcordate at base, stellate-tomentose beneath.

42. *Croton rhamnifolius* H. B. K. Nov. Gen. & Sp. 2: 75. 1817.

Yucatán to Oaxaca. West Indies and South America; type from Venezuela.

Shrub, 1 to 2 meters high; leaves oblong to ovate, 4 to 7 cm. long, short-petiolate, acute, densely stellate-tomentose beneath, entire, or near so. "Ecbalan," "xa-balam" (Yucatán).

This has been reported from Yucatán as *C. cortesianus*.**43. *Croton flavescens* Greenm. Proc. Amer. Acad. 39: 81. 1903.**

Southwestern Chihuahua to Guerrero; type from Monte León Station, Michoacán, altitude 1,500 meters.

Shrub, 1.5 to 2.5 meters high; leaves broadly ovate-cordate, 6 to 11 cm. long, usually long-acuminate, entire, densely stellate-pubescent beneath.

44. *Croton magdalenae* Millsp. Proc. Calif. Acad. II. 2: 220. 1889.

Baja California; type from Magdalena Island.

Shrub, 1 to 3.5 meters high, very densely and finely stellate-tomentose throughout; leaves broadly cordate-ovate or rounded-cordate, 4 to 10 cm. long, acutish, short-petiolate, entire; racemes longer than the leaves.

45. *Croton calvescens* S. Wats. Proc. Amer. Acad. 26: 147. 1891.

Jalisco and Michoacán; type from Chapala, Jalisco.

Shrub, green, pubescent at first but soon glabrate; leaves ovate or broadly ovate, acute or acuminate, rounded at base, 5 to 8 cm. long, serrulate; flowers in very long slender spikes.

46. *Croton sonorae* Torr. U. S. & Mex. Bound. Bot. 194. 1859.*Croton pringlei* S. Wats. Proc. Amer. Acad. 12: 373. 1885.*Croton gonzalezii* Greenm. Proc. Amer. Acad. 39: 81. 1903.

Sonora to Oaxaca; type from Sonora.

Slender shrub, 1 to 2 meters high, green and glabrate; leaves ovate or broadly ovate, 2 to 5 cm. long, long-acuminate, rounded at base, short-petiolate; racemes very slender and lax.

47. *Croton fragilis* H. B. K. Nov. Gen. & Sp. 2: 75. 1817.*Croton sericeus* Schlecht. Linnaea 5: 85. 1830. Not *C. sericcus* Lam. 1786.

Sinaloa to Veracruz, Yucatán, and Chiapas. Northern South America; type from Cumaná, Venezuela.

Slender shrub, 1 to 4.5 meters high; leaves long-petiolate, lanceolate to broadly cordate-ovate, acute to long-acuminate, bright green above, whitish beneath; racemes long and slender, the flowers brownish yellow. "Tanché" (Yucatán).

The material referred here is very variable, and probably represents two or more species.

48. *Croton fruticosus* Engelm.; Torr. U. S. & Mex. Bound. Bot. 194. 1859.

Chihuahua to Nuevo León. Western Texas and southern New Mexico; type from western Texas.

Aromatic shrub, about 1 meter high, densely stellate-tomentose; leaves long-petiolate, ovate or deltoid-ovate, 3 to 8 cm. long, acute to attenuate, rounded or subcordate at base, entire or nearly so. "Encinilla," "hierba loca" (Chihuahua, *Ramírez*.)

49. *Croton morifolius* Willd. Sp. Pl. 4: 535. 1805.

Croton sphaerocarpus H. B. K. Nov. Gen. & Sp. 2: 84. *pl.* 105. 1817.

Durango to Veracruz and Oaxaca.

Shrub, 1 to 3 meters high, copiously stellate-tomentose; leaves broadly ovate or cordate-ovate, 3 to 10 cm. long, acute to long-acuminate, entire or nearly so; racemes short or elongate. "Palillo" (Guanajuato, Querétaro, Oaxaca, Michoacán).

The plant is aromatic and contains an essential oil, which is applied externally for the relief of neuralgia. When inhaled, the oil is said to produce insensibility and paralysis. An infusion of the leaves is taken internally for pains in the stomach.

DOUBTFUL SPECIES.

CROTON GAUMERI Millsp. Field Mus. Bot. 2: 418. 1916. Type from Yucatán.

CROTON GLANDULOSEPALUS Millsp. Field Mus. Bot. 2: 419. 1916. Type from Yucatán.

CROTON MALVAVISCIFOLIUS Millsp. Field Mus. Bot. 2: 419. 1916. Type from Yucatán.

8. *GARCIA* Rohr, Skrivt. Naturh. Selsk. (Kjøbenhavn) 2: 217. 1792.1. *Garcia nutans* Rohr, Skrivt. Naturh. Selsk. (Kjøbenhavn) 2: 217. *pl.* 9. 1792.

Sinaloa and Tepic and probably elsewhere. Central America, Colombia, and West Indies; type from Santa Marta, Colombia.

Small or large tree; leaves alternate, oblong-obovate, 10 to 20 cm. long, long-petiolate, short-acuminate, entire; flowers monoecious, about 1 cm. long; capsule 2 or 3-seeded, about 2.5 cm. wide, fulvous-tomentulose.

9. *DITAXIS* Vahl; Juss. Euphorb. Gen. Tent. 27. 1824.

REFERENCE: Pax & Hoffm. in Engl. Pflanzenreich IV. 147^{v1}: 51-77. 1912.

Small shrubs, commonly pubescent; leaves alternate, usually petiolate, entire or dentate, 3-nerved at the base, with small stipules; flowers small, monoecious or dioecious.

Several herbaceous species occur in Mexico.

Ovary and capsule glabrous.

Plant densely sericeous, at least on the leaves-----1. *D. heterantha*.

Plant glabrous-----2. *D. brandegei*.

Ovary and capsule pubescent.

Flowers in long-pedunculate axillary racemes; leaves 2 to 6.5 cm. wide.

3. *D. pringlei*.

Flowers solitary or clustered in the axils, sessile or short-pedunculate; leaves mostly less than 2 cm. wide.

Staminodia none or very short-----4. *D. lanceolata*.

Staminodia well developed.

Flowers dioecious-----5. *D. palmeri*.

Flowers monoecious.

Petals of the pistillate flowers lance-linear-----6. *D. guatemalensis*.

Petals of the pistillate flowers ovate or rhombic-ovate.

Leaves linear to lanceolate-----7. *D. sericophylla*.

Leaves mostly ovate to oval.

Staminate petals longer than the calyx-----8. *D. manzanilloana*.

Staminate petals shorter than the calyx-----9. *D. tinctoria*.

1. *Ditaxis heterantha* Zucc. Abh. Akad. Wiss. München 15²: 735. 1829-30.

Argithamnia argentea T. S. Brandeg. Univ. Calif. Publ. Bot. 4: 273. 1912.

Sinaloa, Querétaro, Guanajuato, Hidalgo, and San Luis Potosí; type from Toluán, Querétaro.

Shrub with thick woody stems; leaves ovate or broadly ovate, 4 to 8 cm. long, acute or acuminate, entire or nearly so, short-petiolate, whitish-sericeous beneath, at least when young; inflorescence slender-pedunculate. "Azafrancillo" (Querétaro); "azafrán de bolita" (Jalisco).

The plant is employed as a dye; the seeds are said to be edible, with a flavor like that of walnuts.

2. *Ditaxis brandegei* (Millsp.) Rose & Standl. Contr. U. S. Nat. Herb. 16: 13. 1912.

Argithamnia brandegei Millsp. Proc. Calif. Acad. II. 2: 220. 1889.

Baja California and Sonora; type from San Gregorio, Baja California.

Shrub, 1 to 2 meters high, glabrous throughout, the stems usually purplish and glaucescent; leaves lanceolate or ovate, 2 to 7 cm. long, acute, finely serrate, long-petiolate; flowers in slender racemes.

3. *Ditaxis pringlei* (Greenm.) Pax & Hoffm. in Engl. Pflanzenreich IV. 147^{v1}: 66. 1912.

Argithamnia pringlei Greenm. Proc. Amer. Acad. 41: 239. 1905.

Known only from the vicinity of the type locality, Cuernavaca, Morelos.

Shrub, 1 to 1.5 meters high; leaves orbicular to ovate, 3 to 8 cm. long, rounded to acute at apex, short-petiolate, entire or denticulate, white-tomentose beneath.

4. *Ditaxis lanceolata* (Benth.) Pax & Hoffm. in Engl. Pflanzenreich IV. 147^{v1}: 71. 1912.

Serphyton lanceolatum Benth. Bot. Voy. Sulph. 52. 1844.

Argyrothamnia lanceolata Muell. Arg. Linnaea 34: 145. 1845.

Baja California and Sonora; type from Magdalena Bay, Baja California.

Slender, sparsely leafy shrub; leaves linear to lanceolate, 1.5 to 4 cm. long, entire, sericeous.

5. *Ditaxis palmeri* (S. Wats.) Pax & Hoffm. in Engl. Pflanzenreich IV. 147^{v1}: 64. 1912.

Argithamnia palmeri S. Wats. Proc. Amer. Acad. 24: 77. 1889.

Known only from the type locality, Guaymas, Sonora.

Slender shrub; leaves mostly lanceolate, 3 to 6 cm. long, long-acuminate, entire or nearly so, short-petiolate, green, nearly glabrous.

6. *Ditaxis guatemalensis* (Muell. Arg.) Pax & Hoffm. in Engl. Pflanzenreich IV. 147^{v1}: 59. 1912.

Argyrothamnia guatemalensis Muell. Arg. Linnaea 34: 145. 1865.

Jalisco to Guerrero and Puebla. Type from Guatemala.

Shrub, about a meter high; leaves ovate to ovate-oval, 1.5 to 7 cm. long, acute or acuminate, short-petiolate, sericeous, serrulate.

7. *Ditaxis sericophylla* (A. Gray) Heller, Cat. N. Amer. Pl. 5. 1900.
Argithamnia sericophylla A. Gray in S. Wats. Bot. Calif. 2: 70. 1880.
 Baja California and Sonora. Southern Arizona and California; type from Arizona.
 Low shrub, sparsely leafy; leaves 1 to 3.5 cm. long, entire, short-petiolate or sessile, sericeous.
8. *Ditaxis manzanilloana* (Rose) Pax & Hoffm. in Engl. Pflanzenreich IV 147^{v1}: 59. 1912.
Argithamnia manzanilloana Rose, Contr. U. S. Nat. Herb. 1: 357. 1895.
 Known only from the type locality, Manzanillo, Colima.
 Slender shrub; leaves ovate, 4 to 5 cm. long, acuminate, short-petiolate, green, thinly sericeous, entire or denticulate.
9. *Ditaxis tinctoria* (Millsp.) Pax & Hoffm. in Engl. Pflanzenreich IV. 147^{v1}: 59. 1918.
Argithamnia tinctoria Millsp. Field Mus. Bot. 1: 302. pl. 14. 1896.
 Type from Xcholac, Yucatán, Nicaragua.
 Shrub, 1.3 meters high; leaves ovate-lanceolate, 4 to 6 cm. long, acuminate, nearly entire, short-petiolate, densely pilose beneath. "Azafrán."
 The plant is employed as a dye.

10. **CHIROPETALUM** Juss. Ann. Sci. Nat. I. 25: 21. 1832.

1. *Chiropetalum schiedeana* (Muell. Arg.) Pax in Engl. & Prantl, Pflanzenfam. 3²: 45. 1890.
Argyrothamnia schiedana Muell. Arg. Linnaea 34: 150. 1865.
 Nuevo León to Veracruz and Hidalgo; type from Cerro Colorado.
 Slender shrub, 1 meter high or less, or more often, perhaps, herbaceous; leaves alternate, slender-petiolate, narrowly or broadly ovate, 1.5 to 6 cm. long, acute or acuminate, serrulate, stellate-pubescent, at least when young; flowers monoecious, in slender axillary racemes; capsule deeply 3-lobate.

11. **RICINUS** L. Sp. Pl. 1007. 1753.

1. *Ricinus communis* L. Sp. Pl. 1007. 1753.
 Common in cultivation in Mexico, and naturalized in some localities. Native probably of tropical Africa, but now widely dispersed in tropical regions.
 Essentially an annual plant, but often shrublike, and sometimes becoming treelike and 9 meters high or even larger, glabrous, glaucous; leaves alternate, large, palmately lobate, the lobes acuminate, dentate; flowers monoecious, apetalous, large, racemose; fruit a large, smooth or echinate capsule. Commonly known as "higuerilla"; "palma christi" (Oaxaca); "yaga-bilape," "yaga-higo" (Oaxaca, Zapotec, *Reko*); "yutnu-nduchidzaha" (Oaxaca, Mixtec, *Reko*); "degua" (Otomí); "koch" (Maya); "tlapatl," "higuera infernal" (*Nueva Farmacopea Mexicana*).

The castor-bean is cultivated to some extent in Mexico for its seeds, which are an important source of oil. This ("aceite de castor") is well known and much used in medicine because of its purgative properties. It is widely employed as a lubricant, and has been used for illuminating purposes, in the manufacture of soap, for the manufacture of the Turkey-red oil required in the dyeing and printing of cotton goods, and for dressing tanned hides. In India and China silkworms are fed on the leaves, and the stems have been used for making paper. The ground seeds from which the oil has been extracted afford a valuable fertilizer.

The Indians of Ecuador string the seeds on sticks and burn them like candles. The decoction of the root has been used in the West Indies as a remedy for colic, and that of the leaves for venereal diseases, while the leaves are applied to the head in cases of fever to alleviate pain. The value of the scalded leaves, applied externally, as a powerful galactagogue has long been known. The castor-bean has been in use since ancient times, being known to the Egyptians at least 4,000 years ago, and it is mentioned by the early Greek writers. Most of the seeds of commerce are grown in India. During the European war their production upon a large scale was attempted in the southern United States, but with most unsatisfactory results.

12. DALECHAMPIA L. Sp. Pl. 1054. 1753.

Shrubs, or sometimes almost wholly herbaceous, erect or scandent; leaves alternate, stipulate, petiolate, entire, parted, or lobate; flowers monoecious, apetalous, borne inside a large foliaceous involucre; fruit a small capsule.

Plants erect; leaves pinnately nerved.

Style column dilated at apex; leaves coriaceous_____1. *D. spathulata*.

Style column not dilated at apex; leaves membranaceous___2. *D. roezliana*.

Plants scandent; leaves palmately nerved.

Leaves mostly composed of 3 distinct leaflets_____3. *D. triphylla*.

Leaves merely lobed, or entire.

Leaves mostly lobed; bracts usually 1.5 to 2.5 cm. long____4. *D. scandens*.

Leaves entire; bracts 0.6 to 1.2 cm. long_____5. *D. schottii*.

1. *Dalechampia spathulata* (Scheidw.) Baill. Etud. Gén. Euphorb. 487. *pl. 3. f. 16-30*. 1858.

Cremophyllum spathulatum Scheidw. Bull. Acad. Sci. Brux. 9¹: 23. 1842.

Reported from Tabasco. Described from cultivated plants.

Leaves spatulate, entire, cuspidate-acuminate, glabrous.

2. *Dalechampia roezliana* Muell. Arg. in DC. Prodr. 15²: 1233. 1866.

Type from Zontecomapan, Veracruz. Guatemala.

Low shrub, usually unbranched; leaves oblanceolate, 15 to 30 cm. long, 4 to 8 cm. wide, acuminate, glabrous, entire or dentate.

3. *Dalechampia triphylla* Lam. Encycl. 2: 258. 1786.

Veracruz and Tabasco. Central America and South America.

Plants scandent, suffrutescent; leaves mostly 3-foliolate, but some of them usually simple, entire or dentate.

4. *Dalechampia scandens* L. Sp. Pl. 1054. 1753.

Chihuahua and Sonora to Guerrero, Veracruz, and Yucatán. Widely distributed in tropical America, with forms in Africa and the East Indies.

Scandent shrub, or sometimes herbaceous, usually with some stinging hairs; leaves mostly 3-lobate, pubescent, cordate at base; bracts large and whitish. "Xmool-coh" (Yucatán, Maya, *Seler*; "puma-foot," the calyx lobes closing like claws after the capsule opens); "ortiga" (Nicaragua); "ortiguilla" (Costa Rica).

In Costa Rica the leaves are rubbed upon the cheeks as a remedy for toothache.

Some of the Madagascar species of *Dalechampia* furnish a black dye, and are used by the natives to blacken their teeth.

5. *Dalechampia schottii* Greenm. Field Mus. Bot. 2: 255. 1907.

Yucatán; type from Mérida.

Leaves 2 to 7.5 cm. long, ovate or broadly ovate, rounded to acuminate at apex.

13. *TRAGIA* L. Sp. Pl. 980. 1753.

Plants scandent or erect, suffrutescent or herbaceous, the pubescence partly of stinging hairs; leaves alternate, more or less cordate at base, variously dentate; flowers small, apetalous, racemose; fruit a 3-lobate capsule.

Several herbaceous species occur in Mexico. The species listed below scarcely deserve to be classified as shrubs.

Racemes bifurcate.

Leaves about 16 cm. wide, deeply cordate at base; pistillate flowers on short stout pedicels.....1. *T. bailloniana*.

Leaves 3 to 7 cm. wide, truncate or shallowly cordate at base; pistillate flowers on very long, slender pedicels.....2. *T. volubilis*.

Racemes simple.

Leaves entire or shallowly crenate, with a broad shallow sinus at base.

3. *T. mexicana*.

Leaves conspicuously dentate, with a deep, narrow or closed sinus at base.

4. *T. affinis*.

1. *Tragia bailloniana* Muell. Arg. *Linnaea* 34: 178. 1865-66.

Known only from the type locality, Teapa, Tabasco.

Plants scandent, pilose; leaves 20 cm. long, acuminate.

2. *Tragia volubilis* L. Sp. Pl. 980. 1753.

Veracruz. Central America, West Indies, South America, and tropical Africa and Asia.

Suffrutescent, scandent, copiously pubescent; leaves conspicuously dentate or serrate. "Pringa-moza" (Nicaragua, Porto Rico).

Reputed to have diuretic and sudorific properties; used in the West Indies for venereal diseases. Grosourdy states that the juice, mixed with salt, was sometimes applied to ulcers.

3. *Tragia mexicana* Muell. Arg. *Linnaea* 34: 182. 1865-66.

Type from Hacienda de Jovo, in southern Mexico. Guatemala.

Scandent; leaves oblong-ovate, 6 to 17 cm. long, 3 to 7 cm. wide, acuminate; capsule densely hispid.

4. *Tragia affinis* Robins. & Greenm. *Proc. Amer. Acad.* 29: 393. 1894.

Jalisco to Morelos; type collected near Guadalajara, Jalisco.

Scandent, copiously pubescent; leaves 5 to 11 cm. long, acute.

14. *ACALYPHA* L. Sp. Pl. 1003. 1753.

REFERENCE: Mueller von Argau in DC. *Prodr.* 15²: 799-889. 1866.

Shrubs; leaves alternate, usually ovate, variously toothed, 3 or 5-nerved or pinnate-veined; staminate flowers glomerate, in slender spikes, the calyx 4-parted; pistillate flowers 1 or more subtended by a foliaceous bract, the bracts usually in ament-like spikes, the calyx of 3 or 4 sepals; fruit a 3-celled capsule.

A large number of herbaceous species occur in Mexico. *Acalypha wilkesiana* Muell. Arg., a shrub native of the islands of the Pacific, is sometimes grown in Mexico for ornament. It has large glossy green leaves, variously bordered or mottled with pink or red.

Pistillate flowers long-pedicellate.

Stipules ovate-lanceolate.....1. *A. flagellata*.

Stipules subulate.

Pistillate inflorescence 1 or 2-flowered.....2. *A. coryloides*.

Pistillate inflorescence many-flowered.

Leaves cuspidate-acuminate, long-petiolate-----3. *A. schlechtendaliana*.

Leaves acute or obtuse, short-petiolate-----4. *A. longipes*.

Pistillate flowers sessile.

Staminate spikes without pistillate flowers, terminal...5. *A. longestipularis*.

Staminate spikes with pistillate flowers at base or, if wholly staminate, axillary.

Pistillate spikes, at least the well-developed ones, with staminate flowers above or, if not so, the bracts divided into subulate lobes, these ciliate with long gland-tipped hairs.

Bracts shallowly lobate or dentate.

Bracts glandular-pubescent.

Teeth of the bracts 9 to 13-----32. *A. langiana*.

Teeth 17 to 21-----6. *A. cuspidata*.

Bracts without glandular pubescence.

Pistillate bracts minutely 1 to 4-dentate; leaves glabrate, mostly 6 to 18 cm. long-----7. *A. diversifolia*.

Pistillate bracts with about 9 short teeth; leaves densely pubescent, 2.5 to 3.5 cm. long-----8. *A. schlumbergeri*.

Bracts divided into long subulate lobes, these ciliate with long gland-tipped hairs.

Pistillate spikes elongate-----9. *A. glandulifera*.

Pistillate spikes subcapitate-----10. *A. arvensis*.

Pistillate spikes without staminate flowers above, the bracts never with subulate and glandular-ciliate lobes.

A. Pistillate spikes all axillary.

Pistillate bracts lobed or cleft to below the middle.

Bracts 3-lobed-----11. *A. seleriana*.

Bracts 9 to 17-lobed.

Lobes of the bracts subulate-linear-----12. *A. trachyloba*.

Lobes of the bracts lanceolate or broader.

Pistillate spikes subsessile-----13. *A. melochiaefolia*.

Pistillate spikes slender-pedunculate.

Bracts 9 to 11-lobed-----14. *A. unibracteata*.

Bracts 13 to 17-lobed-----15. *A. leptopoda*.

Pistillate bracts lobed to the middle or less deeply.

Fertile spikes all or mostly 8 to 15 cm. long, the bracts very numerous.

Stipules lanceolate-----16. *A. macrostachya*.

Stipules setaceous.

Leaves serrate with somewhat spreading teeth; bracts shallowly dentate-----17. *A. macrostachyoides*.

Leaves with appressed and incurved teeth; bracts deeply dentate-----18. *A. flavescens*.

Fertile spikes 1 to 5 cm. long, rarely longer, with comparatively few bracts.

Pistillate inflorescence consisting of a single subsessile bract.

19. *A. rafaensis*.

Pistillate inflorescence with several bracts or, if of a single bract, this long-pedunculate.

Bracts without glandular pubescence.

Teeth of the bracts acuminate-----20. *A. leptoclada*.

- Teeth of the bracts obtuse or acutish.
 Bracts glabrous or nearly so; leaves soon glabrate.
 Bracts about 5-dentate; leaves 7 to 10 cm. long.
 21. *A. oligantha*.
- Bracts 11 to 15-dentate; leaves mostly 3 to 5 cm. long.
 22. *A. acapulcensis*.
- Bracts densely pubescent; leaves finely pubescent beneath.
 23. *A. dioica*.
- Bracts glandular-pubescent.
 Bracts coarsely dentate, with 17 to 25 teeth.
 24. *A. comonduana*.
- Bracts minutely dentate.
 Leaves obtuse, 1 to 3 cm. long, densely pilose beneath.
 25. *A. californica*.
- Leaves acute or acuminate, mostly 3 to 7 mm. long, green
 beneath and short-pilose.....26. *A. umbrosa*.
- AA. Pistillate spikes terminal, some of them also axillary.
 Bracts lobed to the middle or more deeply.
 Bracts with a few short subappressed hairs, not ciliate.
 27. *A. papillosa*.
- Bracts densely pilose or at least pilose-ciliate.
 Bracts glandular-ciliate.....28. *A. ocymoides*.
- Bracts not glandular-ciliate.
 Lateral lobes of the bracts truncate.....29. *A. triloba*.
- Lateral lobes of the bracts acuminate.....30. *A. fournieri*.
- Bracts lobed one-fourth the distance to the base or less.
 Stems glandular-pubescent.
 Bracts 17 to 21-dentate.....31. *A. adenostachya*.
- Bracts 7 to 13-dentate.
 Leaves acute or acuminate.....32. *A. langiana*.
- Leaves rounded or very obtuse at apex.....33. *A. pringlei*.
- Stems without glandular pubescence.
 Leaf blades 1 cm. long or smaller.....34. *A. parvifolia*.
- Leaf blades more than 2 cm. long.
 Leaves glabrous or nearly so.
 Bracts glabrous except for the gland-tipped hairs on the margins; leaves long-petiolate.....35. *A. deppeana*.
- Bracts glandular-pubescent on the sides as well as on the margins; leaves short-petiolate.
 Bracts 7 or 9-dentate.....36. *A. lignosa*.
- Bracts 3 or 5-dentate.....37. *A. laxiflora*.
- Leaves copiously pubescent beneath.
 Bracts 17 to 21-dentate.
 Leaves lance-ovate, obtusely serrate.....38. *A. vagans*.
- Leaves broadly ovate, acutely serrate.....39. *A. lagascana*.
- Bracts 5 to 13-dentate.
 Ovary muricate.
 Leaves 2 to 4.5 cm. long; petioles less than half as long as the blades.....40. *A. liebmanni*.
- Leaves 8 to 17 cm. long; petioles usually more than half as long as the blades.
 Leaf blades with a pale distinct margin beneath.
 41. *A. cincta*.
- Leaf blades not marginate.....42. *A. schiedeana*.

Ovary smooth.

Bracts 5 to 7-dentate.....43. *A. oligodonta*.

Bracts 9 to 15-dentate.

Leaves cuspidate-acuminate.....44. *A. mollis*.

Leaves short-acuminate.

Teeth of the bracts acute; leaves serrate.

45. *A. lindeniana*.

Teeth of the bracts obtuse; leaves crenate.

46. *A. frederici*.

1. *Acalypha flagellata* Millsp. Field Mus. Bot. 2: 417. 1916.

Yucatán; type from Buenavista Xbac.

Dioecious shrub, 2 to 5 meters high, glabrous or nearly so; leaves ovate, about 12 cm. long and 7.5 cm wide, acuminate, crenate-dentate; spikes 15 to 35 cm. long; capsule tuberculate.

2. *Acalypha coryloides* Rose, Contr. U. S. Nat. Herb. 1: 357. 1895.

Colima; type from Manzanillo.

Shrub, 1 to 2 meters high, with grayish branches, leaves ovate or oblong-ovate, 2 cm. long or less, very short-petiolate, crenate; staminate spikes very dense, 6 to 12 mm. long; capsule muricate.

3. *Acalypha schlechtendaliana* Muell. Arg. Linnaea 34: 6. 1865.

Linostachys padifolia Schlecht. Linnaea 19: 235. 1845. Not *Acalypha padifolia* H. B. K. 1817.

Veracruz and Chiapas. Guatemala to Costa Rica.

Slender shrub, nearly glabrous; leaves oblong-ovate, obovate, or lance-elliptic, 8 to 18 cm. long, crenate-serrate; pistillate inflorescence loosely paniculate; staminate spikes long and slender; capsule muricate.

Mueller described¹ a var. *mollis* (from Veracruz), in which the leaves are thinly pilose beneath. It seems to differ from the typical form only in pubescence.

4. *Acalypha longipes* S. Wats. Proc. Amer. Acad. 26: 149. 1891.

San Luis Potosí; type from Tamasopo Canyon.

Slender shrub, glabrous or nearly so; leaves oblong-ovate or ovate-elliptic, 5 to 13 cm. long, serrate; pistillate inflorescence laxly paniculate; staminate spikes lax, 7 to 12 cm. long; ovary muricate.

5. *Acalypha longestipularis* Muell. Arg. Linnaea 34: 51. 1865.

Known only from the type locality, near Oaxaca.

Stipules setaceous, 10 to 12 mm. long; leaves lance-rhombic, 11 to 14 cm. long, 4.5 to 6 cm. wide, acuminate, tomentulose beneath, pubescent above, serrulate; ovary sericeous-hispid.

6. *Acalypha cuspidata* Jacq. Pl. Hort. Schönbr. 2: 63. pl. 243. 1797.

Oaxaca and perhaps elsewhere. West Indies and South America.

Slender shrub; leaves ovate, 6 to 14 cm. long, acuminate or long-acuminate, crenate or serrate, pubescent; spikes usually little longer than the petioles; ovary hirtellous.

7. *Acalypha diversifolia* Jacq. Pl. Hort. Schönbr. 2: 63. pl. 244. 1797.

Tamaulipas, Veracruz, and Oaxaca. Central America and South America.

Shrub, 1 to 3 meters high; leaves lance-ovate to broadly ovate, 5 to 18 cm. long, acuminate or cuspidate-acuminate, serrate or serrulate, glabrate or pubescent beneath; spikes mostly sessile, solitary or fasciculate, 3 to 10 cm. long, dense; ovary hispidulous, tuberculate.

¹ Linnaea 34: 159. 1865.

8. *Acalypha schlumbergeri* Muell. Arg. in DC. Prodr. 15²: 861. 1866.

Described from southern or central Mexico, the locality not known.

Shrub, densely soft-pubescent; leaves ovate or lance-ovate, acute, crenate-serrate; spikes longer than the leaves; ovary hispid.

9. *Acalypha glandulifera* Robins. & Greenm. Amer. Journ. Sci. 50: 164. 1895. Oaxaca; type from Sierra de San Felipe.

Shrub, 1.5 to 2.5 meters high; leaves ovate or broadly ovate, cordate at base, 5 to 12 cm. long, cuspidate-acuminate, crenate or serrate-dentate, pubescent, especially beneath, long-petiolate; staminate spikes, 5 to 10 cm. long; ovary hispid.

10. *Acalypha arvensis* Poepp. & Endl. Nov. Gen. & Sp. 3: 21. 1845.

Acalypha pavoniana Muell. Arg. Linnaea 34: 50. 1865.

Acalypha capitellata T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 183. 1915.

Veracruz and Oaxaca. Central America to Peru; type from Peru.

Slender shrub; leaves lanceolate to broadly ovate, 3 to 10 cm. long, acuminate, serrate or crenate, pubescent or glabrate; pistillate heads long-pedunculate; capsule hirsute.

11. *Acalypha seleriana* Greenm. Field Mus. Bot. 2: 254. 1907.

Yucatán; type from Xkombec.

Shrub, 1 to 2.5 meters high; leaves ovate to oblong-lanceolate, 2.5 to 5 cm. long, acute or obtuse, dentate or crenate-dentate, pubescent at first but soon glabrate; ovary muricate-hispid.

12. *Acalypha trachyloba* Muell. Arg. Flora 1872: 25. 1872.

Known only from the type locality, near Oaxaca.

Shrub; leaves broadly ovate, 5 to 7 cm. long, cuspidate-acuminate, serrate-dentate, pubescent, especially beneath; staminate spikes 6 to 9 cm. long; pistillate spikes pedunculate.

13. *Acalypha melochiaefolia* Muell. Arg. in DC. Prodr. 15²: 821. 1866.

Known only from the type locality, Hacienda Perado, near Orizaba.

Leaves triangular-ovate, 4 to 5 cm. long, crenate-serrate, velutinous; pistillate spikes 1.5 cm. long.

14. *Acalypha unibracteata* Muell. Arg. Linnaea 34: 160. 1865.

Veracruz to Yucatán and Chiapas; type collected between Mirador and Jalapa, Veracruz. Guatemala.

Shrub, 1.5 to 3 meters high, with reddish brown branches; leaves ovate or lance-ovate, 2 to 7 cm. long, acute to long-acuminate serrate-dentate, pubescent or glabrate; pistillate bracts 1 or 2; staminate spikes 1 to 2 cm. long. "Chilibtux" (Yucatán, Maya).

15. *Acalypha leptopoda* Muell. Arg. Linnaea 34: 39. 1865.

Veracruz. Guatemala to Costa Rica.

Slender shrub; leaves ovate, 4 to 12 cm. long, cuspidate-acuminate, serrate, densely pubescent or glabrate; pistillate bracts usually 1 or 2; staminate spikes 1.5 to 6 cm. long; ovary puberulent.

The typical form (*A. leptopoda glabrescens* Muell. Arg. in DC. Prodr. 15²: 824. 1866) has glabrate leaves. *A. leptopoda mollis* Muell. Arg. (loc. cit.) is a form with densely pubescent leaves.

16. *Acalypha macrostachya* Jacq. Pl. Hort. Schönbr. 2: 63. pl. 245. 1797.

Veracruz, Oaxaca, and Chiapas. Central America and South America.

Shrub, 1 to 3 meters high, leaves broadly ovate, 10 to 20 cm. long, cuspidate-acuminate, serrate, densely pubescent or glabrate; ovary hispidulous. "Chichicaste" (Guatemala).

17. *Acalypha macrostachyoides* Muell. Arg. in DC. Prodr. 15²: 809. 1866.

Veraacruz.
