TO HIS EXCELLENCY COUNT SAMATA SAKUMA,

GOVERNOR GENERAL OF FORMOSA.

SIR,

I have the honour to submit to your Excellency the first
Fasciculus of the "Icones Plantarum Formosanarum, nec non et
Contributiones ad Floram Formosanam" by B. HAYATA, D. Sc.

KAKICHI UCHIDA,

CIVIL GOVERNOR OF FORMOSA.

Icones Plantarum Formosanarum

nec non et

Contributiones ad Floram Formosanam

Icones of the Plants of Formosa, and Materials for a Flora of the Island, based on a Study of the Collections of the Botanical Survey of the Government of Formosa.

FASCICULUS I

By

B. Hayata, Rigaku-hakushi.

Introduction

The history of botanical study in the island of Formosa dates back as early as the middle of the last century. In 1858, WILFORD, the earliest collector in Formosa, made some collections near the coast of the island. Later, in 1864, OLDHAM visited the northern part of the coast. Then SWINHOE, WATTERS, HANCOCK, STEERE, and later, FORD, CAMPBELL, PLAYFAIR, and a few others made collections in different places, mostly in the lowlands. These collections were studied by many botanists such as HANCE, MAXIMOWICZ, HEMSLEY, and others. Later on, during 1893 and 1894, DR. A. HENRY made an extensive collection in the southern part of Formosa. He is perhaps the latest European botanist who has carefully studied the island.

It was not until the acquisition of Formosa by Japan, in 1897, that Japanese botanists began to pay attention to the botany of the island. After that time, many collectors among whom we may mention Messrs.

MAKINO, OWATARI, and MIYAKE, were sent there by the Imperial University. They all brought back to the Herbarium at Tōkyō good collections, which were studied by Prof. J. MATSUMURA.

But no great progress was made in the botanical study of the island, until in 1904 the Government of Formosa decided to carry out a botanical survey of the whole island. Mr. T. KAWAKAMI with several assistants was then engaged to collect plants, and I devoted myself to the investigation of the materials sent by the collectors to the Herbarium at Tōkyō. It was in these circumstances that, in 1905, I wrote "Enumeratio Plantarum Formosanarum"¹⁾ in conjunction with Prof. J. MATSUMURA. At that time, owing to the hostility of the savages, the botanical survey did not extend to regions having an elevation of more than 3000 ft. Fortunately, however, the Government of Formosa has gradually succeeded in getting control of the mountains. During 1905–1907, several excursions to the mountainous districts were carried out by the Government. In 1908, as a result of the study of the mountain-collections, I published "Flora Montana Formosae"²⁾, in which a considerable number of new species were described.

Since that publication, I have had many more collections from the island. These collections are, in greater part, from the mountainous regions, and contain a considerable number of novelties. As the flora of the island has a close affinity to the floras of Japan and China, it is very important, in working up the materials, to make an exhaustive comparison of the collections with specimens from those two countries. At the same time, as the flora of the island contains a considerable number of Indian elements including the Himalayas and the Malay peninsula and archipelago, it is equally desirable for the work that specimens of these regions should also be compared. For a comparison with the Japanese specimens, the Herbarium at Tōkyō will answer fairly well, as it includes nearly all Japanese plants though not exhaustively. Chinese plants, however, are here very poorly represented. I therefore found it very unsatisfactory to work up so big a

¹⁾ MATSUMURA, J. et HAYATA, B.—*Enumeratio Plantarum Formosanarum*. *Journ. Coll. Sci. Imp. Univ. Tōkyō* XXII. 702 pages, with 18 plates, 1906.

²⁾ HAYATA, B.—*Flora Montana Formosae*. *Journ. Coll. Sci. Imp. Univ. Tōkyō* XXV. Art.-19, 260 pages, with 41 plates, 1908.

collection only in the Herbarium at Tōkyō. Moreover, as a considerable number of Chinese plants are represented in the Herbarium at Kew and also in that at Dahlem, and as the type specimens of FRANCHET are especially preserved in the Herbarium at Paris, and those of MAXIMOWICZ at St. Petersburg, I thought it very necessary for my work to see all the plants represented in the principal herbaria of the West.

It was my great good fortune that I was given an opportunity of visiting these different herbaria, in order to make an exhaustive comparison of my materials with the collections preserved in them. With this intention, I first went to Kew taking all the materials with me. There I pursued my work with specimens of the floras to which the flora of Formosa is more or less related. The comparison made in most cases, was confined to the flora of Asiatic regions, especially of China, Korea, India, the Himalayas, and the Malay peninsula and archipelago; but in some cases it was extended to Australia, the Arctic and Antarctic regions, Europe, Africa, America, and even to Polynesia. I found that many of the species in my collections are represented in the Chinese herbarium at Kew, and also among the specimens from other regions. At the same time, I found also that the greater part of my materials are not yet represented at Kew, and that in all probability they are species not yet described. After finishing my work at Kew,¹⁾ I went to the Herbarium at Paris, in order to see the type specimens of Chinese plants mainly described by FRANCHET. Later my work took me to the Herbarium at Dahlem, where are preserved many collections of Asiatic flora. My purpose in going to Dahlem was to see especially the specimens mentioned in Prof. DIELS' "Die Flora von Central China."²⁾ In Dahlem, as in Paris, I devoted myself to making notes of the specimens preserved there, as I had not brought my materials with me. I especially devoted myself to

¹⁾ During my stay at Kew, I was away from my work for a little more than a week, when I went to Brussels to take part in the International Botanical Congress, then being held there, at which I presented a paper entitled "Botanical Survey of the Government of Formosa, with short Sketches on the Vegetation and Flora of the Island." This paper is now in press at Brussels.

²⁾ DIELS,—*Die Flora von Central China.* ENGL. Bot. Jahrb. XXIX. pp. 169-657.

making sketches, on tracing paper, of the specimens preserved only in Dahlem and nowhere else, so that I could make a close comparison with these sketches on my return to Tōkyō. After finishing my work, I went with the same purpose to the Herbarium at St. Petersburg, in order to see the type specimens of MAXIMOWICZ. During my work on the continent, I was successful in placing some species which I had not been able to determine at Kew. Still, many of the plants in my collections, which remained undetermined, are not represented in any of the herbaria on the continent. It is, therefore, highly probable that they are species not yet described. Shortly after my return to Tōkyō, I finished preparing my "Materials for a Flora of Formosa", which had been undertaken during my stay at Kew. The paper¹⁾ is now in press in Tōkyō.

To mention the number of species in the flora²⁾ of the island, known to us up to the present time, there are in the *Enumeratio*³⁾ 1999 species belonging to 701 genera and 153 families. In my *Flora Montana*⁴⁾ 392 species are mentioned, belonging to 266 genera and 70 families. In my "Materials for a Flora of Formosa", I have mentioned 735 species, belonging to 343 genera and 109 families, thus adding to our present knowledge of Formosan flora 567 species, 72 genera and 2 families. Excluding all those species which appear for a second or third time in the above three paper, the total number of the plants of the island is 2660 species, belonging to 836 genera and 156 families, thus adding 292 species to the number given in "List of Plants in Formosa," quite recently published by Mr. T. KAWAKAMI.⁵⁾ At present, the number of species has nearly doubled since the publication of Dr. A. HENRY's preliminary work.⁶⁾ Thanks to the encouragement and

assistance given to botanical research by the Government of Formosa, we now have a fair knowledge of the flora of this interesting island.

A few remarks about the publication of the present work, which is to be continued in a long series, may not be out of place. For a long time, I have had a desire to publish a flora of Formosa, accompanied by icones, to be issued yearly in separate numbers, with some fixed allowance for this special publication, which might be completed in fifteen years. In 1909, I asked Mr. K. OSHIMA, then the Civil Governor of Formosa, to consider the matter of publication. Owing to the gracious aid he extended to me, it has been possible to arrange that the publication shall be carried on for fifteen years, beginning this year. The icones will contain 600 plates, illustrating nearly all the plants to be found in Formosa, and accompanied by descriptions. This will be issued yearly for fifteen years in separate numbers, each containing 40 plates.

The present fasciculus contains all the plants belonging to Polypetalæ known to us from the island up to the present time, accompanied by 40 plates mainly illustrating the species newly described by myself in my "Materials for a Flora of Formosa." The plan of the present work was at first to give full descriptions of all plants so as to serve as a guide to students of the Formosan flora. The time, however, being very limited, I have found it difficult to carry out this plan, and therefore am obliged to be content with giving only descriptions of plants of special interest. I hope to be able to add full accounts in the next fasciculus, and to pursue the plan through the whole series.

In conclusion, I wish to tender my hearty thanks to all the officials of the Government of Formosa who have helped me in the publication of my work. My very cordial thanks are due especially to Mr. T. KAWAKAMI, who has assisted me in many ways.

B. HAYATA.

April, 1911.

*Key to the Orders of the Formosan Flowering Plants.***I. Dicotyledons.**

1. Polypetalous.

Series I. **Thalamiflora**. Ranunculaceæ to Tiliaceæ.,, II. **Disciflora**. Lineæ to Coriarieæ.,, III. **Calyciflora**. Leguminosæ to Cornaceæ.

2. Gamopetalous. Caprifoliaceæ to Plantagineæ.

3. Apetalous. Nyctagineæ to Ceratophylleæ.

II. Gymnosperms.**III. Monocotyledons.**

1. Microspermous. Hydrocharideæ to Orchideæ.

2. Epigynous. Scitamineæ to Dioscoreaceæ.

3. Coronarious. Roxburghiaceæ to Commelinaceæ.

4. Calycinous. Flagellarieæ to Palmae.

5. Nudiflora. Pandaneæ to Lemnaceæ.

6. Apocarpous. Alismaceæ to Najadaceæ.

7. Glumaceous. Eriocauleæ to Gramineæ.

Class I. Dicotyledons—Polypetalous.

Series I. **Thalamiflora**. Flowers usually bisexual and regular; calyx inferior, of distinct or connate sepals; corolla of distinct petals, sometimes united at the very base, (for examples, *Ternstroemiacæ*, *Malvaceæ*); stamens hypogynous, rarely inserted on a hypogynous disk or torus. Exceptions: Flowers unisexual in *Menispermaceæ*; irregular in *Viola*, *Impatiens*, *Polygala*, and some others; petals none in *Clematis* and some others.

Ovary apocarpous, of 2 or more free carpels, rarely carpel solitary.

Flowers bisexual.

Sepals 5 or fewer, petals 1-seriate.

Sepals deciduous.

Ranunculaceæ.

(*Ranunculus*).

Sepals and petals 2-3-seriate, or sepals 1-seriate and petals 2- or more-seriate.

Shrubs or trees.	
Leaves stipulate, sepals 5 or more.	Magnoliaceæ.
Leaves exstipulate, sepals 3.	Anonaceæ.
Aquatic herbs.	Nymphaeaceæ.
Flowers unisexual, diœcious.	Menispermaceæ.
Ovary syncarpous.	
Ovary 1-celled, spuriously 2-celled in Cruciferæ.	
Placentas parietal.	
Endosperm 0.	
Ovary spuriously 2-celled.	Cruciferæ.
Ovary one-celled, usually on a gynophore.	
Endosperm copious.	Capparideæ.
Flowers irregular.	
Plant with milky juice.	Papaveraceæ.
Plant without milky juice.	(Corydalis).
Stamens 5, anthers spurred.	
Stamens 8, anthers not spurred.	Violaceæ.
Flowers regular.	
Plant with milky juice.	Papaveraceæ.
Plant without milky juice.	
Herbs with glandular hairs.	
Trees on shrubs.	Droseraceæ.
Stamens many, in 1 or 5-bundles.	
Stamens, 5 or more, not in bundles.	Hypericineæ.
Fruits capsular placentas 2.	
Fruits berried, placentas 3 or more.	Pittosporæ.

Bixineæ.

Placentas free, central or basal.

Sepals, petals and stamens 6 each.

Berberideæ.

Sepals 5 or calyx 5-fid.

Herbs, leaves opposite.

Caryophylleæ.

Trees or shrubs, leaves scale-like.

Tamariscineæ.

Ovary 2-many-celled.

Sepals imbricate in bud.

Ovary with many (more than 4) ovules in each cell.

Flowers irregular.

Geraniaceæ.

(*Impatiens*).

Flowers regular.

Leaves opposite.

Stamens 3-10 free.

Elatineæ.

Stamens many, in 1 or 5-bundles.

Hypericineæ.

Leaves alternate, trees or shrubs.

Ternstrœmiaceæ.

Leaves radical or whorled, herbs.

Ficoideæ.

(*Mollugo*).

Ovary with a few (less than 4) ovules in each cell.

Trees or shrubs.

Leaves alternate, petals connate at the base.

Ilicineæ.

Leaves opposite, flowers usually unisexual. Calyx
of distinct sepals.

Guttiferæ.

Herbs, leaves simple or compound. Geraniaceæ.

Sepals valvate in bud.

Anthers one-celled.

Malvaceæ.

Anthers two-celled.

Filaments free. Tiliaceæ.
 Filaments monadelphous. Sterculiaceæ.

Series II.—Discifloral. Flowers usually bisexual and regular; calyx inferior, petals distinct or connate at the very base, with usually a perigynous or hypogynous disk or row of glands between their insertion and the ovary. Stamens inserted on or at the inner or outer base of the disk, or between the glands, or on the petals.

Flowers regular.

Fruits of separate carpels.
 Leaves gland-dotted. Rutaceæ.
 Leaves not gland-dotted.
 Leaves opposite.
 Leaves pinnate Zygophyllaceæ.
 Leaves simple. Coriarieæ.
 Leaves alternate, exstipulate, compound.
 Stamens inserted chiefly outside the disk. Simarubeæ.
 Stamens inserted chiefly inside the disk. Sapindaceæ.

Fruits syncarpous.

Herbs.

Terrestrial.

Leaves stipulate, stamens many. Tiliaceæ.
 Leaves stipulate. Geraniaceæ.
 Leaves exstipulate. Lineæ (*Linum*).
 Aquatic herbs, disk adnate to the ovary.
 Whole plant floating. Onagrarieæ (*Trapae*).
 Leaves and flowers only floating.

Nymphaeaceæ.

Trees or shrubs.

Stamens 5 or fewer, opposite or on the petals.
 Leaves simple.

Petals valvate.

Undershrubs with tendrils.

Ampelidæ.

(*Vitis*).

Shrubs, no tendrils.

Olacineæ.

Petals minute, imbricate or involute.

Rhamneæ.

Leaves compound, no tendrils.

Ampelidæ (*Lecia*).

Stamens alternate or opposite and alternate with the petals, or many.

Leaves alternate, exstipulate.

Leaves gland-dotted. Rutaceæ.

Leaves not gland-dotted.

Ovary 1-celled, ovules many, on 3-5 parietal placentas. Bixineæ.

Ovary 1 or more celled, placentas basal or axile.

Leaves simple.

Petals valvate.

Olacineæ.

Petals imbricate.

Disk of glands. Styles 3-5.

Lineæ.

Ovary 2-5-celled. Styles 2-3-fid. Celastrineæ.

Ovary 1-celled. Style simple. Anacardiaceæ.

Ovary 2-5-celled. Style simple. Sapindaceæ.

Leaves compound.

Filaments confluent, forming a tube.

Meliaceæ.

Filaments distinct.

Ovules pendulous.

Ovary 1-celled, 1-ovuled.

Anacardiaceæ.

Ovary 2-3-celled, cells

1-2-ovuled.

Burseraceæ.

Ovules erect.

Ovary, cells 1-2-ovuled.

Sapindaceæ.

Leaves alternate, stipulate.

Stamens many. Tiliaceæ.

Stamens 3-5.

Ovary 3-5-celled. Lineæ.

Ovary 2-celled.

Celastrineæ.

Leaves opposite, trees or shrubs.

Leaves gland-dotted, simple.

Rutaceæ.

(Acronychia).

Leaves not gland-dotted.

Leaves stipulate, compound or sometimes

simple. Sapindaceæ.

(Turpinia).

Leaves exstipulate.

Leaves simple.

Celastrineæ.

Leaves compound.

Sapindaceæ.

Flowers irregular, trees or shrubs.

Leaves opposite, simple, exstipulate.

Malpighiaceæ.

Leaves alternate, simple and compound.

Stamens 5–10.

Sapindaceæ.

Stamens (perfect) 2, opposite 2 of 5 petals.

Sabiaceæ

Serves III.—**Calycifloral.** Flowers regular, mostly bisexual; calyx inferior or superior; petals distinct, or connate at the very base only; disk 0 or very obscure; stamens inserted in the limb of the calyx.

(In the genera and orders with inferior ovaries, the limb of the calyx is often undeveloped, which character should refer them technically to the apetalous division. Most of them will be found also in that division.

Flowers bisexual or polygamous.

Ovary superior (or half-superior in *Trapa* and Ficoideæ).

Herbs.

Fruit a solitary follicle, leaves usually compound.

Leguminosæ.

Fruits of small achenes, leaves compound.

Rosaceæ.

Fruits drupaceous coriaceous.

Halorageæ.

(*Haloragis*).

Fruits capsular.

Sepals 2, embryo annular. Portulacaceæ.

Sepals 3–5.

Aquatic herbs. Lythrarieæ.

Terrestrial herbs.

Leaves not carnose. Saxifrageæ.

Leaves carnose. Crassulaceæ

Fruits indehiscent, 2- or 3- horned nuts, aquatic.

Onagrarieæ. (*Trapa*).

Trees or shrubs.

Fruits of many small drupes, prickly shrubs,

Rosaceæ. (*Rubus*).

Fruits various.

Ovary 1-celled, (style single; leaves alternate

- usually compound, stipulate, fruits follicular or indehiscent. **Leguminosæ.**
- Ovary 2- or more-celled.
- Styles single.
- Anthers opening by slits.
- Styles long, stigmas capitate,
- Leaves exstipulate.
- Lythrarieæ.**
- Stigmas simple, leaves stipulate.
- Rhizophoreæ.**
- Anthers opening by pores.
- Melastomaceæ.**
- Styles as many as the cells.
- Petals 5. **Saxifrageæ.**
(*Astilbe, Itea*)
- Petals 0. **Hamamelideæ.**
- Ovary one-celled, styles 4 or more.
- Sepals 5, placentas parietal.
- Samydaceæ.**
(*Homalium*).
- Sepals 2, placentas basal. **Portulacaceæ.**
- Ovary inferior.
- Stamens inserted on the calyx-limb.
- Anthers opening by pores.
- Melastomaceæ.**
- Anthers opening by slits.
- Petals very small, scale-like.
- Saxifragaceæ.**
(*Astilbe*).
- Petals imbricate, distinct, large, not scaly.
- Leaves stipulate.
- Ovary 1-celled.
- Rosaceæ** (*Photinia*).

Ovary 2-4-celled.

Rhizophoreæ.

Leaves exstipulate, ovary 1-celled.

Combretaceæ.

Stamens epigynous.

Petals valvate, (scaly in Hamamelideæ).

Leaves compound; ovary 4-10-celled (leaves simple in *Fatsea*, *Helwingia*, *Oreopanax*. *Hedera*). Araliaceæ.

Leaves simple.

Ovary 1-celled, shrubs.

Cornaceæ.

Ovary 2-5-celled.

Herbs. Umbelliferæ.

(*Hydrocotyle*).

Shrubs.

Endocarps not horny.

Saxifrageæ.

Endocarps horny.

Hamamelideæ.

Petals imbricate.

Flowers umbelled, styles 2.

Umbelliferæ.

Flowers not umbelled.

Leaves stipulate. Rhizophoreæ.

Leaves exstipulate.

Beset with stellate hairs.

Saxifrageæ.

(*Deutzia*).

Without stellate hairs.

Myrtaceæ.

Flowers unisexual.

Scandent herbs or shrubs with tendrils;

flowers monœcious, fruits baccate.

Cucurbitaceæ.

Erest herbs, shrubs or arbours.

Shrubs or arbours.

Flowers in racemes. Passifloræ (*Carica*).

Flowers in heads. Hamamelideæ.

(*Liquidambar*).

Herbs.

Terrestrial herbs. Begoniaceæ.

Aquatic herbs.

Stamens more than 2. Halorageæ.

(*Myriophyllum*).

Stamen 1.

Halorageæ.

(*Callitrichæ*).

Dicotyledons.

Polypetalous.

Ranunculaceæ.

HAB. Shintiku, Goshōrin, leg. T. KAWAKAMI, Dec. 1905, (No. 1245).

DISTRIB. Central and southern China.

OBSERV. Rather stout, glabrous climbing plant; leaves fleshy, trifoliate, leaflets elliptical, obtuse or acute, narrowed at the base, nerves very obscure, reddish brown when dried; sepals angustate with white hairs on the margin, 18 mm. long; stamens 1 cm. long, with brownish undulated filaments; anthers oblong, not mucronate, five times shorter than the filaments; achenes long hairy, with hairy tails; remarkable for its undulate filaments.

2. Clematis Leschenaultiana DC. "Syst. I. p. 451; KUNTZE Monog. p. 167, (*C. acuminata* δ); FINET et GAGNEPAIN Contrib. Fl. Asi. Orient. p. 27; HAYATA Materials for a Flora of Formosa p. 43.

Clematis Wightiana ? HAYATA Fl. Mont. Formos. p. 43.

HAB. Kachinro, Taitō, Iriyokukaku, Niki et Suichōrin.

DISTRIB. China and Indo-China.

OBSERV. Covered by yellowish soft hairs; leaves trifoliolate, petioles 5 cm. long, leaflets ovate acute 8 cm. long, $3\frac{1}{2}$ cm. broad, obscurely dentate or nearly entire, lateral leaflets oblique at the base; panicles few-flowered, peduncles 4–5 cm. long; sepals 4, ovate, nearly acute, with yellowish soft hairs on the outside, glabrous inside; stamens many, 12 mm. long, filaments hairy on the margin and outside, quite glabrous on the inside, anthers narrow, glabrous; achenes hairy, fusiform with two distinct ridges, tails with long hairs.

In my Flora Montana Formosæ I doubtfully referred this plant to *C. Wightiana*. After examining more carefully, I have found that the specimen is the same as the Philippine form of *C. Leschenaultiana* DC. The present plant differs from *C. Wightiana* in having fusiformed achenes and thread-like filaments. *C. Leschenaultiana* described in KUNTZE'S "Monog. Clemat. p. 167," has lanceolate leaves, while the Formosan plant has ovate ones.

2.* ***Clematis Leschenaultiana* DC. var. *angustifolia*** HAYATA Materials for a Flora of Formosa p. 16. Stem striate, blackish purple, tomentose, or pubescent. Leaves trifoliolate, scarcely tomentose, terminal leaflet oblanceolate, acuminate at the apex, acute or rounded at the base, 7–8 cm. long, $2\frac{1}{2}$ cm. broad, remotely serrate, but entire towards the apex, petiolules 1 cm. long, lateral leaflets oblong-ovate, acute obliquely rounded at the base, common petioles 6 cm. long. Flowers often solitary or paniculate, panicles 2–3-flowered, peduncles yellowish tomentose. Achenes fusiformed rostrate, tails long bearded, beards transversely spreading somewhat yellowish.

3. ***Clematis lasiandra* MAXIM. var. *Nagasawai*** HAYATA Fl. Mont. Formos. p. 40. Stem scandent, glabrous, sulcate. Leaves pinnate, 3–5-foliolate 10–15 cm. long (including petioles) 5–9 cm. broad, folioles long petiolulate, simple or sometimes tri-lobate, ovate or ovately lanceolate, acuminate, unequally sharply serrate. Panicles axillary, few-flowered, or nearly termi-

nal, shorter or longer than the leaves, bracteate at the base, bracts trilobed or not lobed, linear, smaller, pedicels slender, 2-3-times longer than the flowers. Flowers nodding, 2 cm. in diameter and so long. Sepals 4, connivent, revolute at the apex, oblong or ovate-oblong, obtuse, or emarginate, 23 mm. long, 8 mm. broad, subglabrous on both sides, slightly purple, margin velutinous tomentose. Stamens 4-seriate, the outermost the longest, filaments flattened linear, 17 mm. long, long and densely sericeo-pilose on the back, anthers 2 mm. long, not appendiculate on the apex, the innermost the shortest, filaments 9 mm. long, anthers longer 3 mm. long. Pistils 8 mm. long sericeo-plumoso-caudate. Receptacles (fruiting) erect, globose, 4 mm. in diameter, pilose; carpels (when matured) numerous ovately-lanceolate, acuminate, compressed, 3 mm. long, marginate, rubescens, pilose, long plumously caudate, tails $3\frac{1}{2}$ cm. long.

HAB. Shūkoran.

DISTRIB. Type: Kiūshīū. Southern parts of Japan.

The present variety differs from the type in having many-flowered peduncles; this never has uni-flowered peduncles as the type.

4. *Clematis Morii* HAYATA (Pl. I.) Flora Montana Formosæ p. 42.

Stem ligneous, scandent, glabrous, striate. Leaves opposite or quaternate, trifoliolate, nearly 15 cm. long (including petioles, petioles voluble), subcoriaceous, glaucescent beneath, exstipulate, terminal foliole petiolulate, long caudately acuminate obscurely lobate, rounded at the base, margin subentire or remotely mucronately serrulate, veins beneath prominent, but impressed above, veinlets somewhat prominent, 5-nerved, 11 cm. long $3\frac{1}{2}$ cm. broad, petiolules 1 cm. long, lateral leaflets much shorter often elobate caudately ovate remotely mucronately-serrulate, petiolulate, petiolules 3 mm. long or sessile. Flowers larger, nodding, half-closed, $1\frac{1}{2}$ cm. in diameter, and in length, axillary solitary pedicellate, 2-bracteate at the base of pedicels, bracts minute pubescent, pedicels 3 cm. long, pubescent. Sepals 4, broader, 1.8 cm. long, 9 mm. broad, ovate mucronately acute, dark-purple inside, velutinous pilose outside, base slightly cordate, veinlets parallel, half-closed, never opened. Stamens 3-4-seriate, the outermost the longest, filaments

linear, flattened, long barbate, 13 mm. long, anthers nearly 2 mm. long, emarginate at the apex, the innermost the shortest, filaments 7 mm. long, anthers 3 mm. long. Carpels nearly 1 cm. long, long plumosely caudate.

HAB. The Central Mountain Ranges.

Comes near to *Clematis larbellata* EDGEW., and still more to *Clematis lasiandra* MAXIM.; but differs from them in having silky pubescent sepals and subentire leaflets.

5. *Clematis uncinata* CHAMP. in 'Kew Journ. Bot.' III. p. 255". BENTH. Fl. Hongk. p. 6; MAXIM. Mél. Biol. IX. p. 597; FORBES et HEMSL. Ind. Fl. Sin. I. p. 7; FINET et GAGNEPAIN Contrib. Fl. Asi. Orient. p. 8 *Cl. leiocarpa* Oliv. in HOOK. Ic. Pl. t. 1533; var. **floribunda** HAYATA Materials for a Flora of Formosa p. 18. Glabrous, somewhat black in a dried specimen, leaves 12 cm. distant. Leaves 5-foliolate, subcoriaceous nearly 20 cm. long, leaflets ovately lanceolate acuminate, rounded at the base, 11 cm. long, 3½ cm. broad, 3-nerved, nerves prominent on both sides. Panicles axillary, 30 cm. long 15 cm. broad, very much branched, bracts subulate. Flowers smaller 1½ cm. in diameter, sepals 4, lanceolate, aristate, 1 cm. long 2½ mm. broad, margin albo-lamellate, glabrous on both sides, stamens 2-3-seriate, the innermost the largest, 6 mm. long, filaments nigricant, anthers narrowed, connectives broadly produced; achenes subglabrous, ovate, style long barbate, beards reddish.

HAB. Taiko, Coll. T. KAWAKAMI, Aug. 1908, (No. 58).

The present variety differs from the type in having much smaller flowers, ovate-lanceolate leaves, and not leafy inflorescence. It resembles the type in stamens, achenes, and especially in glabrous sepals turning black when dried. The type has usually larger flowers with sepals twice as long as those of the variety, longer, looser and less flowered inflorescence, with longer peduncles. The variety is represented at Kew by a specimen from Hongkong, which is labelled *C. uncinata*; but is different from the type of the species mentioned.

6. *Clematis Meyeniana* WALP.; BENTH. Fl. Hongk. p. 6; MAXIM. in Mél. Biol. X. p. 597; FORBES et HEMSL. Ind. Fl. Sin. I. p. 5; HENRY,

7. *Clematis akœnensis* HAYATA (Pl. II) Materials for a Flora of Formosa p. 13. Stem glabrous. Leaves 15 cm. distant, 3-foliolate, somewhat fleshy, petiolate, petioles 5 cm. long, leaflets cordately ovate, 3 cm. long, often folded along the midrib, acute and reflexed at the apex, glabrous, petiolulate, petiolules 1.5 cm. long. Flowers axillary, solitary, or paniculate, panicles few flowered, long pedunculate; peduncles 7 cm. long, incrassate at the apex, 2-bracteate at the base, sometimes not bracteate, bracts minute spathulate obtuse 1 cm. long. Flowers when opened 4.5 cm. in diameter. Sepals 6, velvety outside, duplicitely reflexed on the margin, glabrous inside, somewhat fleshy, oblong, 23 mm. long, 8 mm. broad, obtuse at the apex; stamens numerous as half long as sepals, anthers with a obtusely produced connectives. Achenes barbate, beards white.

HAB. Akō; Miharashi-tōge, coll T. KAWAKAMI et U. MORI, April, 1907.
(Fl.)

The present plant is very like, or perhaps the same as, HENRY's specimen, No. 1320, labelled *C. parviflora*, at Kew. The type of *C. parviflora* is quite different from our plant and also from HENRY's specimen, in having hirsute sepals, much thinner and less glabrous leaves.

8. *Clematis longisepala* HAYATA Fl. Mont. Formos. p. 41, and Materials for a Flora of Formosa p. 17. Stem ligneous, scandent, glabrous striate. Leaves pinnately 5-foliolate, long petiolate, very glabrous, 15–20 cm. long including petioles, petioles pubescent striate, leaflets petiolulate, petiolules 1.5–2 cm. long, leaflets opposite ovately oblong acute at the apex, rounded at the base, entire 3–5-nerved, submembranaceous, pale beneath, 5 cm. long, 2½ cm. broad, stipules connate, forming a peltate shield on the nodes of the stems. Panicles axillary, a little longer than the leaves, 5–8-flowered. Flowers quite large, patent, 6–7 cm. in diameter, 1-bracteate at the base of the

pedicels, bracts pinnately 3-parted, 3–4 cm. long, long stipitate, segments oblongo-lanceolate, pedicels 7–10 cm. long. Sepals 4, linear, lanceolate, 3 cm. long, or longer, obtuse at the apex carinately mucronate, subglabrous atro-purpuraceous inside, eburneous and velutinous outside, multi-nerved. Stamens many-seriate (nearly 5-seriate), the outer the longer 2 cm. long, filaments linear, slightly thickened upwards, constricted at the apex, slender dilated at the base, glabrous; anthers linear, 2 mm. long, apiculate, the inner stamens the shorter, 7 mm. long. Carpels long sericeo-plumoso-caudate, nearly 1 cm. long.

HAB. Mt. Morrison.

Comes very closely to *Clematis crassifolia* BENTH. Fl. Hongk. p. 7; but differs from that in having round based leaves.

9. *Clematis tozanensis* HAYATA (Pl. III.) Fl. Mont. Formos. p. 42. Stem ligneous, scandent, glabrous striate. Leaves larger, pinnately 5–3-foliolate, long petiolate, quite glabrous, nearly (including petioles) 20 cm. long as broad, petioles striate voluble, leaflets oblongo-ovate or cordately ovate, base cordate or truncate, 8 cm. long, 6 cm. broad, palmately 9–7-nerved, apex obtuse quite entire slightly repand, submembranaceous, or somewhat thick, petioles 2–3 cm. long, very voluble, stipules broad connate, forming a peltate shield at the nodes of the stems. Panicles axillary, few-flowered, nearly as long as the leaves. Flowers large, patent, 6 cm. in diameter, 1-bracteate at the base of the pedicels, bracts large foliaceous, simple stalked, elliptical, acute at the base. Sepals 4, narrowed, 3½ cm. long 8 mm. broad, acute or obtuse, inside glabrous dark-purple, outside eburneous velutinous pubescent, patent. Stamens many-seriate, the outermost the longest, filaments 2 cm. long, dilate, linear, slender, anthers linear 2 mm. long apiculate, the innermost the shortest, filaments 2 mm. long, anthers 3 mm. long apiculate. Carpels long sericeo-plumoso-caudate, nearly 9 mm. long.

HAB. Tozan, in Mts. Morrison.

Comes closely to *Clematis smilacifolia* WALL., but differs from it in the shape of the bracts and stipules. In this *Clematis*, the filaments of

the stamens of the outermost series are the longest, while the anthers of the same series are the shortest.

10. *Clematis taiwaniana* HAYATA (Pl. IV.) Materials for a Flora of Formosa p. 17. Pubescent, stem striate. Leaves triparted or bi-trifoliolate, triangular in outline, 20 cm. long as broad, petioles 12 cm. long, leaflets ovately cordate, cuspidate, grossly dentate, pubescent on both sides. Panicles axillary, 15 cm. long 7 cm. broad, pubescent or tomentose. Flowers small nearly 1 cm. in diameter, 8 mm. long; sepals 4, ovate, or spatulate obtuse, pubescent outside, glabrous inside; stamens 2-3-seriate, filaments dilated, anthers oblong; achenes pubescent, styles long barbate, beards whitish.

HAB. Taichūchō: Daibōho, Bioritsu: Taiko. Taihoku: Shizangan.

One of the commonest species of *Clematis* in Formosa; the leaves of the plant are extremely variable. It comes near *C. triloba* HOOK.; but differs from it in having leaves grossly dentate or incised lobes. Also it is very like *C. Vitalba* LINN. var. *javanica* O. Kze., from which it is distinguishable by its more rounded fruits.

11. *Clematis Owatarii* HAYATA Materials for a Flora of Formosa p. 17. Stem slender, striate, glabrous. Leaves 14 cm. distant, pinnate, leaflets 3-5, rotundately ovate, or triangularly ovate, rounded or emarginate at the apex, truncately rounded at the base, but abruptly acute at the extremity of the base, 4 cm. long, 3½ cm. broad, glabrous, entire, petioles 6 cm. long, petiolules 1½ cm. long. Flowers axillary solitary, long pedunculate, peduncles 7 cm. long, incrassate at the apex, 2-4-bracteate at the base, bracts minute, spatulate or ovate. Achenes complanate, barbate, tails 5 cm. long, barbate, beards transversely patent, 4 mm. long, white.

HAB. Formosa.

The present plant differs from *C. recta* and also from *C. paniculata* in having longer tailed fruits and much more rounded leaves. The leaves have generally three or sometimes five leaflets, then the distance from the first pair to the second pair is nearly as long as the petioles.

12. *Clematis paniculata* THUNB.; HAYATA Materials for a Flora of Formosa p. 18.

HAB. Garanbi, Kōshūn, by T. KAWAKAMI, July, 1906, No. (1620).

DISTRIB. Japan, China and Corea.

Exactly the same with Chinese specimens so named at Kew, but a little different from the Japanese specimens preserved in the Tōkyō Herbarium.

Anemone luzoniensis ROLFE; HAYATA in Tōkyō Bot. Mag. XX. p. 73; and Fl. Mont. Formos. p. 39.

HAB. Shintiku: Goshōrin.

DISTRIB. The Himalayas and the Philippine islands.

The present plant was first mentioned as *Anemone luzoniensis* ROLFE in my paper above cited. A little later, I was informed by Mr. E. D. MERRILL of the Bureau of Science, Manila, that when he was in the Kew Herbarium, he and Mr. ROLFE compared the Philippine material with the Himalayan specimen, and came to the conclusion that the Luzon plant is not distinctive from *Anemone vitifolia* HAM. The description of *Anemone luzoniensis* ROLFE has never been published. I think that the Formosan plant above mentioned is exactly the same as the Luzon plant, and Mr. MERRILL has the same opinion. After considering all the above cases, I am much inclined to think that my plant should be referred to *Anemone vitifolia* HAM.

4. *Ranunculus* LINN.

Dichotomous Key to the Formosan Species.

Plants usually small, less than 15 cm. high. (1)

Plants usually larger, 30-40 cm. high. (3)

- (1) Leaves densely hirsute *R. taisanensis*. 1
Leaves nearly glabrous or slightly hirsute. (2)
- (2) Leaves broadly orbicular, slightly lobulate *R. Kawakamii*. 2
Leaves ternately lobed, lobes linear *R. ternatus*. 3
- (3) Syncarps globose *R. acris*. 4
Syncarps elongately globose *R. japonicus*. 5

1. ***Ranunculus taisanensis*** HAYATA (Pl. V.) Materials for a Flora of Formosa p. 20. Perennial, stem ascendent, hirsute, few-branched, 14 cm. long. Radical leaves long petiolate, hirsute, petioles 4 cm. long, dilated at

the base, embracing the stem, blades broadly rounded, 3-lobate, lobes roundly rhomboid slightly lobulate, or irregularly serrate, truncately cordate at the base, nearly rounded at the apex. Cauline leaves like radical ones, petioles dilated at the base, embracing the stem, upper ones trilobed, lobes acute. Panicles few-flowered or nearly reduced to one flower, bracts minute lanceolate 2 mm. long, peduncles $1\frac{1}{2}$ cm. long. Flowers, when opened, 7-8 mm. in diameter. Sepals 5, elongately oblong, obtuse or rounded at the apex, $3\frac{1}{2}$ mm. long 1 mm. broad, hirsute on the back. Petals 5-10, obovate, cuneate rounded at the apex, cuneate at the base, 4 mm. long 2 mm. broad, distinctly glanduliferous at the base. Stamens nearly 20, 2 mm. long, anthers rounded emarginate at the apex, filaments more or less complanate, carpophore oblongo-cylindrical. Carpels numerous. Achenes obliquely rounded, $1\frac{1}{2}$ mm. long, rostrate, minutely punctate at the face, beaks very short.

HAB. Biōritsu : Rokugio.

Near *R. philippinensis* MERR. et ROLFE, but differs from it by the much smaller flowers and more round leaves.

2. **Ranunculus Kawakamii** HAYATA (Pl. VI.) Materials for a Flora of Formosa p. 19. Perennial herb. Stem slender, 7 cm. long hirsute, few-branched. Radical leaves clustered, longe petiolate, petioles 4-5 cm. long, hirsute, or subglabrous, dilated at the base, turning to a stipule-like scale, blades semiorbicular or rhomboid, rounded or obtuse at the apex, shortly 5-lobed, (lobes obtuse), entire downwards, acute or truncate at the base or sometimes reniformed or cordate, hirsute near the margin, 10 mm. long, 12 mm. broad. Cauline leaves smaller, hirsute, petioles dilated at the base, embracing the stem. Flowers solitary on the apex of the branches, or axillary, peduncles 1 cm. long, hirsute; flowers when opened 5 mm. in diameter. Sepals 4-5, rounded, very concave, bi-fid or rounded at the apex, 2 mm. long, pilose outside. Petals 3-5, white, oblong, rounded at the apex, 4 mm. long. Stamens nearly 10, $1\frac{1}{2}$ mm. long, anthers oblong, rounded at the apex, filaments complanate, more or less shortly hirtellous at the base. Carpels nearly 10. Syncarps globose.

HAB. Kagi : Arizan.

The present plant appears very near to *R. Cymbalaria* PARSH and also to *R. flaccidus*; but differs from the former in the shape of the flowers and especially in having very few carpels, and from the latter in the hairy form of the plant.

Berberis Kawakamii HAYATA (Pl. IX.) Materials for a Flora of Formosa p. 24. Shrub erect, many-branched, branches angulate sulcate, spines ternate 2-3 cm. long. Leaves clustered, coriaceous, obovate, oblanceolate or lanceolate, acute, cuneate at the base, nearly sessile, remotely spinulose dentate, 5-3 cm. long, 2-1 cm. broad, veins impressed on the upper side, but prominent on the under side, veinlets prominent on both sides, more pallid beneath. Flowers 10-15-fasciculate, perulate at the base, perules 2-3-seriate, scaly broadly triangular shortly aristate, pedicels inclined, 1 cm. long. Sepals 5-6, unequal, lanceolate, acuminate or subulate, longer than petals, the outermost the smallest. Petals 5-6, roundedly oblong, 4½ mm. long, obtuse or rounded, with 2-glandules at the base inside. Stamens 5-6, 2½ mm. long, filaments 1½ mm. long, incrassate, anthers 1 mm. long, oblong, connectives slightly produced, truncate. Carpels shortly cylindrical 3 mm. long, stigma sessile peltate. Berries 5-10-clustered, nigrigant, oblongly ovoid, 7 mm. long, obtuse at the base, 2-3-seeded; seeds crescent-shaped, curved, 5 mm. long, minutely rugulose fuscous, peduncles 1 cm. long.

HAB. Mt. Morrison.

The present plant comes very near *B. barandana* VIDAL; but differs from it in having much shorter peduncles and especially in the number of ovules contained in ovaries. *B. barandana* has 1-ovule, while our plant has

always 2 or sometimes 3 ovules. It also bears some resemblance to *B. xanthoxylon* HASK. and *B. Wallichiana*, but differs from both in having more sparingly serrated leaves, and especially from the latter by its much more rounded fruits.

Berberis morrisonensis HAYATA (Pl. X.) Materials for a Flora of Formosa p. 25. Shrub, erect, many-branched, branches with ternate spines. Leaves clustered coriaceous, ovately spatulate, rounded at the apex, aristately mucronate or obtuse, spinulose dentate on the margin, cuneate at the base, sessile or shortly petiolate, 15 mm. long, 7 mm. broad. Berries 3-clustered globosely ellipsoid, obtuse on both ends, reddish, 9 mm. long, 3-seeded; stigma small, sessile; seeds crescent-shaped, 4 mm. long, smooth, scarlet, peduncles 1½ cm. long.

HAB. Mt. Morrison.

Near *B. dictyophylla* FRANCH.; but differs from it in having 3-fasciculate fruits which are much more rounded than those of FRANCHET's species.

4. *Epimedium* LINN.

Epimedium sp. MATSUM. et HAYATA Enum. Pl. Formos. p. 18. Perennial herb. Radical leaves long petiolate, petioles 30–40 cm. long, trifoliate, petiolulate, petiolules 5 cm. long, shorter than the blades, nodes of petiolules swollen, blades 8–10 cm. long, 7 cm. broad, ovately elliptical acuminate at the apex, strongly oblique at the base, auriculate, cordate, serrulate, (teeth setaceous) 8–10-nerved, glabrous, glaucous beneath.

Corydalis taitensis HAYATA Materials for a Flora of Formosa p. 27. A small perennial herb, 8 cm. high; roots fibrous more or less fleshy. Radical leaves pinnate 8 cm. long (including petioles) glabrous, ovate in outline, petioles 4 cm. long, gradually dilated at the base, more or less incrassate, pinnæ distant 2 cm. long (including petiolules), 1 cm. broad, pinnules sessile, obovate, 3-lobate or lobulate, lobules obscurely mucronate. Cauline leaves nearly the same as radical ones. Racemes 5-8 cm. long, bracteate, somewhat densely flowered, bracts obovate obtuse 5 mm. long, $2\frac{1}{2}$ mm. broad, pedicels 6 mm. long. Sepals 2, minute, deciduous, obliquely rounded $1\frac{1}{2}$ mm. in diameter, irregularly dentate, rounded at the base, peltately or cordately affixed. Petals 4, one of the exterior ones spurred at the base, 18 mm. long (including spurs) 5 mm. broad, erect or slightly recurved, truncate at the apex, shortly callously mucronate marginate, concave near the apex, the other narrower 13 mm. long, 3 mm. broad, truncate and carnosely mucronate at the apex, gibbose near the apex; interior ones narrowed, long clawed, 13 mm. long including claws, claws 7 mm. long, blades narrowed, oblique, slightly auriculate, 7 mm. long, $2\frac{1}{2}$ mm. broad, truncate and carnosely mucronate at the apex, carinate on the back, keels slightly produced at the apex, $1\frac{1}{2}$ mm. broad. Filaments

12 mm. long, 2 mm. broad, complanate, narrowed towards the apex.

HAB. Taitō: Daironkōsha.

Corydalis kelungensis HAYATA Materials for a Flora of Formosa p.

27. Herb, very slender, 30 cm. high, ascendent, quite glabrous. Radical leaves long petiolate, many times ternate, 30 cm. long (including petioles), petioles very much slender, 15 cm. long, long petiolulate, pinnules obovate 2 cm. long, 1 cm. broad, rounded at the apex, or 2-3-lobate, gradually narrowed reaching the petioles, more pallid beneath. Racemes 10 cm. long, loosely flowered, bracts ovate, 5 mm. long, pedicels 1 cm. long. Flowers nearly 18 mm. long. Sepals 2, deciduous. Petals 4, unequal, connate, one of the exterior larger, boat-shaped, 18 mm. long including spurs, spurred at the base, (spurs 9 min. long, 3 mm. broad, obtuse straight or more or less curved at the apex), the other flat 13 mm. long, long clawed at the base, blades rounded 7 mm. broad, emarginate or sinuate at the apex, gradually narrowed and reaching the claw; interior ones connate together, narrowed, strongly carinate on the back at the apex, 13 mm. long.

HAB. Kelung: Arikō.

The flowers are somewhat like those of *C. decumbens* PERS.; but the leaves are quite different.

Corydalis formosana HAYATA Materials for a Flora of Formosa p.

26. Herb, 40-50 cm. high, many-branched, very glabrous, stem sulcate flexuose. Cauline leaves 15 cm. long (including petioles), 7 cm. broad bipinnate, petioles 4 cm. long, pinnæ remote, ovate, 5 cm. long, 3 cm. broad, petiolules 2 cm. long, pinnules subsessile obovate, trilobate, or irregularly lobulate, rounded at the apex, lobules obscurely mucronate. Racemes 13 cm. long, pedunculate 4 cm. long, bracts ovate, acute, 4 mm. long, pedicels 4 mm. long. Sepals very small, obliquely rounded, obtuse, 1½ mm. long, rounded at the base. Petals, exterior ones unequal, one of them 17 mm. long (including spur) 4 mm. broad, broadly emarginate and slightly mucronate at the apex, winged near the apex on the back (wings 2 mm. long 1½ mm. broad), spurred at the base, spurs 4 mm. long, 2 mm. broad, abruptly recurved near the apex, rounded at the apex; the other narrowed, 12 mm.

long, 2 mm. broad, dilated towards the apex, rounded and slightly emarginate at the apex, winged near the margin on the back, wings triangular 1 mm. broad; interior ones much narrower, 12 mm. long, clawed, claws $5\frac{1}{2}$ mm. long, $\frac{1}{2}$ mm. broad, blades obliquely rectangular, 6 mm. long, $2\frac{1}{2}$ mm. broad, rounded emarginate and mucronate at the apex, winged near the apex on the back, wings shortly produced 1 mm. broad. Stamens 12 mm. long, filaments complanate, $1\frac{1}{2}$ mm. broad, gradually narrowed towards the apex. Capsules linear $2\frac{1}{2}$ cm. long, (including beaks) 4 mm. broad, beaked at the apex, beaks 6 mm. long. Seeds orbicular compressed, minutely and elegantly concentrically punctate, $1\frac{1}{2}$ mm. in diameter, arils suborbicular, $1\frac{1}{2}$ mm. long.

HAB. Taitō: Taruko, Coll. G. NAKAHARA, 1906, June, (No. 710).

Very near *C. Balansæ* PRAIN; but differs from it in having larger flowers and very much smaller bracts.

2. *Arabis* LINN.*Dichotomous Key to the Formosan Species.*

- Leaves lyrate lobed *Arabis morrisonensis*
 Leaves nearly entire or a very sparingly toothed *Arabis alpina*

Arabis morrisonensis HAYATA (Pl. XI.) Materials for a Flora of Formosa p. 29 *Arabis taraxacifolia* HAYATA Fl. Mont. Formos. p. 49, (non ANDERS). Herb slightly lignified at the base, perennial, hirsute, hairs simple or branched $\frac{1}{2}$ mm.-1 mm. long, stoloniferous, decumbent. Stem 20 cm. long, branches leafy. Radical leaves clustered radiately arranged, long petioled 3 cm. long including petioles, 6 mm. broad stellately hirsute, (hairs furcate or simple) spatulate in outline, petioles $1\frac{1}{2}$ cm. long, as long as the blades, blades ovate lyrate, lobes 4-5 on both sides, terminal lobe obovate, obtuse. Cauline leaves simple, oblanceolate, $3\frac{1}{2}$ cm. long, 4 mm. broad, obtuse at the apex, gradually attenuate downwards scarcely serrate on the margin, or nearly entire. Racemes terminal or axillary, 5-6 cm. long, pedicels 1-2 cm. long, bracts 0. Sepals narrower oblong, $2\frac{1}{2}$ mm. long, 1 mm. broad, rounded and mucronate at the apex, sparingly hirsute on the back. Petals oblong-ovate, clawed, 6 mm. long, rounded or truncate at the apex. Stamens 2 mm. long. Siliques straight or slightly curved, linear, 3-4 cm. long, 1 mm broad, obtuse at both ends; styles persistent, pedicels $1\frac{1}{2}$ cm. long. Seeds elongately oblong, $1\frac{1}{2}$ mm. long, $\frac{2}{3}$ mm. broad, rounded at both ends, complanate, somewhat scabrous.

HAB. Mt. Morrison.

In my paper above cited, I mention that the present plant agrees quite well with the description of *Arabis taraxacifolia* ANDERS given in HOOK. f. Fl. Brit. Ind. I. p. 136, and is also very like the European *A. erenosa* SCOP. Although I did not, at that time, see ANDERSON's specimen, I thought that the plant must be identical with *A. taraxacifolia*. While studying here at Kew, I have compared it with the type of the same species, and have found that they are quite different. The Formosan plant is distinguishable from the Indian in having nearly erect and stouter pods,

larger seeds and smaller leaves, and also in bearing very long stolons. The Indian plant appears to be of more tender habit, with curved pods, narrower, smaller seeds, and larger, thinner leaves. Moreover, the present plant differs from *A. arenosa* Scop. in having longer pods, smaller flowers, and leaves with more rounded lobes.

Chin, in ENGL. Pot. Jahrb. XXIX. p. 359; LEDEB. Fl. Ross. I. p. 117; HOOK. et ARN. Bot. Beech. Voy. p. 112; HAYATA Fl. Mont. Formos. p. 49.

Arabis albida STEV.; DC. Prodr. I. p. 142.

Aralis pterosperma EDGEW. in Trans. Linn. Soc. XX. p. 33.

HAB. Mt. Morrison.

DISTRIB. Asia, from Altai westward to Europe; east Himalaya, central China northward to eastern Siberia.

My specimen does not quite agree with the description of *A. alpina* LINN. It seems to me that the plant differs a little from the type in its individual character only. The leaves of the present form are subentire, while those of the type are more or less dentate.

3. *Cardamine* LINN.

Dichotomous Key to the Formosan Species.

Leaves not lobed. *Cardamine reniformis*.

Leaves pinnately lobed. (1)

(1) Plant very much slender, leaves small, less than 4 cm. in length. *C. parviflora*.

Plant much larger, leaves more than 8 cm. in length. *C. hirsuta*.

α. lobes rounded *C. hirsuta* var *rotundiloba*.

β. lobes mostly obovate. *C. hirsuta* var *formosana*.

Cardamine reniformis HAYATA Fl. Mont. Formos. p. 50, and Materials for a Flora of Formos. p. 31. Stem slender, 8-9 cm. long, erect,

glabrous. Radical leaves long petiolate, petioles nearly 5 cm. long, base slightly dilated, blades roundly reniformed, apex obtuse, base reniformed, repandately palmately 6-7-nerved, 4 cm. long as broad, subglabrous, sparingly ciliolate. Cauline leaves shortly petiolate, nearly like the radical ones. Scapes few-flowered, flowers small, 3 mm. long, pedicellate. Sepals 4, oblong-elliptical, obtuse at both ends, $2\frac{1}{2}$ mm. long. Petals spatulate, 2 mm. long. Stamens 6, $2\frac{1}{2}$ mm. long. Ovary cylindrical, 2 mm. long, style short, stigma globose. Siliques linear, 2 cm. long, $1\frac{1}{2}$ mm. broad; seeds oblong, compressed $\frac{1}{2}$ mm. long.

HAB. Mt. Morrison.

The present species differs from other species of this genus in having reniformed leaves. The leaves are somewhat like *C. asarifolia* LINN., in which species they are never cordate or reniformed. The plant is also near *C. violafolia* O. S. SCHUTZ. from which is separable in having rather angulate leaves and very much smaller flowers. Flowers of my plant are 3 mm. long, while those of the Chinese *C. violafolia* are 8 mm. long, or even more. Those of *C. asarifolia* LINN. are also much larger.

Cardamine parviflora LINN. Sp. Pl. ed-2, p. 914; DC. Prodr. I. p. 152; S. MOORE in Journ. Bot. (1875) p. 230; MAXIM. in Mél. Biol. IX. p. 10; FRANCHET Fl. David. p. 34; FORBES et HEMSL. Ind. Fl. Sin. I. p. 44; HENRY List Fl. Formos. p. 17; MATSUM. et HAYATA Enum. Pl. Formos. p. 23.

HAB. Hikaku.

DISTRIB. Europe, northern Africa, and temperate Asia; Japan to Manchuria.

As is suggested by Mr. T. NAKAI, the Formosan plant is very like or perhaps the same as, var. *manchurica* KOMAR. I have examined with Mr. T. NAKAI the co-type of the variety, and found that it is very similar to the Formosan plant.

Cardamine hirsuta LINN. Sp. Pl. ed-2, p. 915; BENTH. Fl. Hongk. p. 16; MAXIM. in Mél. Biol. IX. p. 6; FRANCHET Fl. David. p. 34; FORBES et HEMSL. Ind. Fl. Sin. I. p. 43; DIELS Fl. Centr. Chin. in ENGL.

Bot. Jahrb. XXIX. p. 358; Itō et MATSUM. Tent. Fl. Lutch. in Journ. Sci. Coll. Imp. Univ. Tōkyō XII. p. 297.

The Formosan plant which was mentioned as *C. hirsuta* in MATSUM. et HAYATA Enum. Pl. Formos. p. 23 should be divided into two, each representing a variety of the type.

var. rotundiloba HAYATA Materials for a Flora of Formosa p. 31. Herb glabrous, stem simple 15 cm. long, few-leaved. Radical leaves pinnate spathulate in outline, 6 cm. long (including petals) 1 cm. broad, pinnae 4–5 on both sides, distant, subsessile rounded often oblique obscurely lobate or entire, 5–10 mm. long, petioles 3 cm. long, complanate slightly dilate at the base. Racemes 10 cm. long remotely flowered. Siliques linear straight, 22 mm. long, 1 mm. broad, obtusely truncate at the apex. Seeds minute scabrous, oblong, rounded at both ends, 1 mm. long.

HAB. Formosa : Shintiku, Goshizan.

The present variety is easily distinguishable from the type in having much more rounded lobes of leaflets. There is a specimen very much like this variety at Kew which is labelled *Cardamine hirsuta* LINN. with a question mark.

var. formosana HAYATA Materials for a Flora of Formosa p. 30. Stems glabrous, branched, ascendent, 15 cm. high, with some leaves. Leaves pinnately-cleft, obovate in outline, 5 cm. long (including petioles), $2\frac{1}{2}$ cm. broad, petioles 2 cm. long, complanate or winged, lateral segments obovate rounded at the apex, 3–5 lobulate, abruptly attenuate at the base, $2\frac{1}{2}$ cm. long. Racemes 4 cm. long, pedicels 1 mm. long, bracts obtuse $\frac{2}{3}$ mm. long. Sepals 4, oblong, $1\frac{1}{2}$ mm. long, $\frac{2}{3}$ mm. broad. Petals 4, obovate, spathulate, $1\frac{1}{2}$ mm. long, rounded or emarginate at the apex, narrowed at the base. Stamens $1\frac{1}{2}$ mm. long, filaments complanate. Ovary cylindrical $1\frac{1}{2}$ mm. long. Siliques linear, straight, 17 mm. long, 1 mm. broad, obtuse on both ends. Seeds oblong, $\frac{2}{3}$ mm. long, minutely scabrous.

HAB. Taitō : Hakuhakusha.

There is a specimen very much like this in the Kew herbarium. It is labelled *C. hirsuta* LINN., but quite different from the type. As the present

plant is quite easily distinguishable from the type of *C. hirsuta* LINN., it is advisable, in my opinion, to regard it as representing a variety of the type, rather than to regard it as a form of it.

4. *Cochlearia* LINN.

Cochlearia formosana HAYATA (Pl. XII.) Materials for a Flora of Formosa p. 32. Herb slender glabrous, 8–10 cm. high, few-branched, radicant. Leaves simple or trifoliate, petiolate, folioles cordate, $2\frac{1}{2}$ cm. long, rounded, emarginate or mucronate at the apex, reniformed at the base, margin entire or remotely crenulate, mucronate at the sinus between crenas, membranaceous. Racemes nearly axillary, long pedunculate, few-flowered. Flowers white, small, 2 mm. long, sepals $1\frac{1}{2}$ mm. long, spatulate, petals $2\frac{1}{2}$ mm. long, obovate long clawed, claws $\frac{1}{2}$ mm. long, stamens $1\frac{1}{2}$ mm. long, with indistinct glandules at the base. Ovary 2-costate. Siliques when matured horizontally divaricate from the axis, oblong or elongate, 5 mm. long, subterete, valves pubescent, concave, obscurely reticulate. Seeds 2-seriate, many, oblong, 1 mm. long or longer, costa red, elegantly punctate.

HAB. Shinkō: Remogansha.

A very pretty herb; the only species belonging to this genus in Formosa. The flowers and fruits of the plant resemble those of *Draba*. But, on account of its being quite glabrous, it should be referred to the present genus.

5. *Brassica* LINN.

Capparis Henryi MATSUM. in MATSUM. et HAYATA Enum. Pl. Formos. p. 26, t. 3; HAYATA Materials for a Flora of Formosa, p. 33. Scandent shrub, branches terete greenish, glabrous. Leaves coriaceous, petiolate, elliptical or oblong, obtuse, shortly callosso-cuspidate at the apex, rounded or attenuate at the base, glabrous on both sides, quite entire, reticulate, nerves 7-9 on both sides of the costa, prominent below, very much curved; petioles

8 mm. long, glabrous; blades of the leaves 10 cm. long, 5.2 cm. broad; stipules spiny, straight, very much shorter than the petioles, but sometimes nearly equally long. Flowers 4-6-clustered, clusters superaxillary; pedicels nearly glabrous, 6 mm. long. Sepals 4, distinct, imbricate, ovately elliptical, acute, glabrescent on both sides, tomentose inside and also on the margin. Petals 4, white, imbricate, linear-oblong, obtuse, tomentose on the margin towards the apex, or glabrescent, 8-13 mm. long, 4 mm. broad. Stamens 12-16, thread like, white, 26-30 mm. long, anthers oblong, yellowish glabrous. Ovary subglobose, glabrous, long stalked (stalks 19 mm. long), 1-celled, placentas 4, ovules numerous; stigma sessile.

This is very near *C. micrantha* from which it is distinguishable only in the venation of the leaves.

Violaceæ.

Viola LINN.*Dichotomous Key to the Formosan Species.*

Leaves more or less purpurascent beneath. (1)

Leaves not at all purpurascent beneath. (3)

- (1) Leaves cordate more or less acute at the apex *Viola Kawakamii.*
Leaves roundly cordate, rounded at the apex. (2)
- (2) Leaves dotted beneath, dots black *V. tozanensis*
Leaves not at all dotted *V. formosana*
- (3) Leaves more or less hirsute. (4)
Leaves nearly glabrous or very shortly hairy. (5)
- (4) Sepals ciliolate *V. diffusa*
Sepals not ciliolate *V. Nagasawai*
- (5) Leaves lanceolately hastate, or simply lanceolate *V. Patrinii*
Leaves broadly oblong, or auriculately cordate, more or less deltoid. (6)
- (6) Leaves deeply auriculately cordate, broadly deltoid;
flowering stem foliose *V. verecunda*
Leaves more or less elongately deltoid, flowering stem not at
all foliose *V. japonica*

Viola Kawakamii HAYATA Fl. Mont. Formos. p. 52, and Materials for a Flora of Formosa p. 33. Slender herb. Leaves long petiolate, stipulate, petioles slender, 10–15 cm. long, blades hastately cordate, acuminate or obtuse, crenulate, pilose at the sinus between the crenas, other parts glabrous, glaucously violascent, nearly 3 cm. long, 2 cm. broad, stipules laciniate, a little adnate to the petioles. Flowers (opened) 1.5 cm. in diameter, long pedunculate, peduncles nearly as long as petioles, bracts 2 subulate remotely arranged, 5 mm. long. Sepals subequal, obtusely acuminate, 4 mm. long, 1 mm. broad, base produced $\frac{1}{2}$ mm. beyond the insertion, glabrous. Upper petals and lateral ones subequal, ovately cuneate, emarginate at the apex, 12 mm. long, 5 mm. broad, the lowest one larger 15 mm. long, 9 mm. broad,

apex strongly emarginate or slightly 2-lobed, long calcarate, spurs 6 mm. long, slightly curved at the apex. Anthers subsessile, connectives complanate, produced in a membranous appendix which is 1 mm. long; 2-lower stamens calcarate on the back at the base, spurs 3 mm. long. Styles nearly straight, stigma terminal. Capsules not yet known.

HAB. Suizan.

This is near *Viola siamensis* from which it differs in having much longer spurs. Spurs are usually very short in the Siamese plant.

Viola tozanensis HAYATA Fl. Mont. Formos. p. 53. Stemless herb. Leaves long petiolate, stipulate, petioles 4 cm. long, blades broadly cordate, rounded, crenulate, setulose pubescent, beneath glaucous violascent, nearly 2 cm. long as broad, stipules lacinate, a little adnate to the petioles. Flowers patent, reflexed, $1\frac{1}{2}$ cm. in diameter, long pedunculate, peduncles as long as petioles, bracts 2 subulate opposite 5 mm. long. Sepals nearly equally long, obtusely acuminate, 4 mm. long, 1 mm. broad, base beyond insertion 1 mm. produced, glabrous. Petals upper and side ones nearly equal; ovately cuneate, truncate at the apex, 10 mm. long, 5 mm. broad, the lowest larger, 18 mm. long, 8 mm. broad, very emarginate at the apex, base long spurred, spurs 4 mm. long, at the apex slightly curved. Anthers subsessile, connectives complanate, produced at the apex in a membrane which is 1 mm. long; 2-lower stamens spurred at the base on the back, spurs 3 mm. long. Style nearly straight, stigma sub-terminal. Capsules not yet known.

HAB. Tozan.

This is found on the large trunk of a tree. The flower is patent and of a whitish purple colour.

Viola formosana HAYATA in MATSUM. et HAYATA Enum. Pl. Formos. p. 28, and HAYATA Materials for a Flora of Formosa p. 33. Stemless herb. Leaves long petiolate, stipulate, petioles slender 3-4 cm. long, twice as long as blades, blades broadly cordate rounded, crenate, pilose only at the sinus between the crenas other parts quite glabrous, glauco-violascent beneath, 2 cm. long, stipules lacinate, partly adnate to the petioles. Flowers when opened 1.5 cm. in diameter, long pedunculate, peduncles twice as long as petioles,

bracts 2, subulate, remote, 4 mm. long. Sepals nearly equally long, obtusely acuminate, 4 mm. long, 1 mm. broad, 1 mm. produced at the base beyond the insertion, quite glabrous. Petals upper and lateral ones nearly equal, ovately cuneate, emarginate at the apex, 12 mm. long, 5 mm. broad, the lowest one larger, 15 mm. long, 9 mm. broad, very emarginate at the apex, or slightly 2-lobed, long spurred at the base, spurs 5 mm. long, slightly curved. Anthers sessile, connectives complanate, produced at the apex to a membrane which is 1 mm. long; 2-inferior stamens calcarate on the back at the base, spurs 3 mm. long. Style nearly erect, stigma terminal.

HAB. Wantan.

This is near *V. Sieboldii* MAXIM. but differs from it in having rounded leaves. The leaves of *V. Sieboldii* are much more oblong, but not quite, rounded at the apex, as is the case with the Formosan plant.

Viola diffusa GING. in DC. Prodr. I. p. 298; BENTH. Fl. Hongk. p. 20; MAXIM. in Mél. Biol. IX. p. 735; FRANCHET Pl. David. p. 43; FORBES et HEMSL. Ind. Fl. Sin. I. p. 52; HENRY List Pl. 35. Branches slender cinerascent, ternately branched. Leaves approximately alternate at the apex of the branches, or verticillate, shortly petiolate, oblong, or oblong-lanceolate, abruptly acuminate at the apex, gradually attenuate at the base, margin entire or obscurely crenulate, costa impressed above, but elevated below, primary lateral veins nearly 10 on both sides, obscurely elevated, veinlets reticulated, inconspicuous, chartaceous, or

chartaceo-coriaceous, petioles 5–10 mm. long. Capsules solitary at the axil of the upper leaves, long pedunculate, (peduncles slender $2\frac{1}{2}$ cm. long, nearly pendulous), globose, 7–10 mm. long, mucronate at the apex, abruptly attenuate at the base and reaching the stalks which are 1–2 mm. long, 2–3-valved, dehiscent, 4–5-seeded. Seeds irregularly angulate, 4 mm. long, reddish.

HAB. Taitō, Biōritsu, Bunsuikai.

Near *Pittosporum pauciflorum* HOOK. et ARN.; but differs from it in having nearly solitary and axillary fruits.

Pittosporum undulatum VENT.; DC. Prodr. I. p. 346; MUELLER, Pl. Victoria pp. 71 et 224; MATSUM. et HAYATA Enum. Pl. Formos. p. 33.

HAB. Soobonsha. It is very uncertain that the Formosan plant should really be identical with the named species

Pittosporum formosanum HAYATA in MATSUM. et HAYATA Enum. Pl. Formos. p. 32, t. 4; HAYATA Materials for a Flora of Formosa p. 34. Branches terete ferrugineo-pubescent. Leaves attenuate, petiolate, glabrous, coriaceous, obovate, or oblong-elliptical, acute or shortly cuspidate at the apex, attenuate at the base, entire or slightly crenulate, nearly 8 cm. long, 2–5 cm. broad, petioles circ. 1 cm. long. Panicles terminal 5–6 cm. long, ferrugineo-pubescent, densely flowered. Flowers very small, patent, 5 mm. long, 6 mm. in diameter. Sepals 5, distinct, ovate, obtuse, somewhat thick, glabrous 2 mm. long. Petals 5, connivent in a tube to the middle in bud, at last patent and distinct from the base, oblong, linear, 5 mm. long, 1 mm. broad, truncate on both ends. Stamens 5, filaments dilate, anthers basifixd on the back, shortly apiculate. Ovary sessile, perfectly 2-celled; style short. Capsules globose, apiculate, 6–7 mm. in diameter, dehiscent by 2-valves; valves slightly lignified. Seeds thick, exalate, smooth, globose, 4 mm. in diameter. Embryo very small, in a small cavity in the albumen near the hilum; cotyledons indistinct.

Comes near *P. pauciflorum* HOOK. from which it differs in having very much smaller flowers and ascending or spreading, but not pendulous, pe-

duncles. I have seen at Kew a specimen from Hainan labelled *P. pauciflorum*. The specimen is quite in accord with the present plant.

Pittosporum daphniphyloides HAYATA Materials for a Flora of Formosa p. 34. Leaves petiolate, oblong or oblong-oblanceolate, abruptly acute at the apex, abruptly attenuate at the base, 15 cm. long, $4\frac{1}{2}$ cm. broad, subentire on the margin, or obscurely repandate, coriaceous, primary lateral veins 10–15 on both sides, spreading from the costa at an angle of 60° , veinlets reticulate, impressed on the upper surface, but elevated on the lower surface costa impressed above, elevated below, petioles $2\frac{1}{2}$ cm. long. Racemes clustered on the apex of the branches, or paniculate. Capsules globose, 6 mm. in diameter mucronate at the apex, 2-valved, dehiscent, valves thick coriaceous 10–15-seeded. Seeds angulate, compressed, 3 mm. long, $2\frac{1}{2}$ mm. broad, smooth, reddish.

HAB. Taitō, Dakunsha.

This is near *P. floribundum* W. et A.; but differs from it by the fruits and leaves. There is at Kew a specimen exactly like this, labelled *Pittosporum sp.* (China, WILSON, No. 3233).

Polygaleæ.

Polygala LINN.

Dichotomous Key to the Formosan Species.

Leaves much larger, longer than 10 cm. *P. arcuata*.

Leaves rather small, 2–3 cm. long (1).

(1) Plant erect very small, less than 12 cm. high *P. Tatarinowii*.

Plant larger, procumbent at the base or erect, more than 15 cm. high.

Flowers glomerate *P. glomerata*.

Flowers racemose *P. japonica*.

Polygala arcuata HAYATA Fl. Mont. Formos. p. 54. Quite glabrous, except young branches which are slightly pubescent; stem lignified, mostly simple, not branched. Leaves petiolate, blade membranaceous somewhat thick, elliptical lanceolate, acuminate, entire, 10 cm. long, 3 cm. broad, base

attenuate to the petioles which are 1 cm. long, dark above, somewhat glaucous beneath, primary veins 4-5 on both sides, arcuate near the apex, reaching the next upper ones. Racemes axillary near the apex or terminal, 5-6 cm. long, densely many-flowered, scarcely exceeding the leaves. Flowers yellowish pedicellate, pedicels short, 2 mm. long. Sepals 5, outer ones 3, inner ones 2, deciduous, the uppermost one of the outer sepals globose, larger, rounded, saccate, 3 mm. long, 2-lower ones of the same series broadly rounded, oblique at the base, $1\frac{1}{2}$ mm. long; 2-inner ones petaloid, oblique, oblong, $5\frac{1}{2}$ mm. long. Petals connate, lateral ones very imbricate, 7 mm. long, rounded at the apex, keels shortly cucullate, long cristate on the back, incrassate, bi-saccate. Ovary glabrous shortly stipitate, disk broadly annular. Styles dilate at the apex, appendiculate under the stigma. Capsules 5 mm. broad, 4 mm. long, membranaceous, compressedly orbiformed or broadly orbicular, emarginate, loculicidal on the margin. Seeds ovoid, 2 mm. long, pendulous, pilose, strophiolate, strophioles 1.2 mm. long on each side.

HAB. Taichū, Kashigatani.

Somewhat resembles *P. Wattersii* HANCE in Journ. Bot. (1881) p. 209; but differs from it in having ob-reniformed fruits, much smaller flowers, divided crests, and in many other points.

6. *Cerastium*.

Dichotomous Key to the Formosan Species.

Leaves rotundately deltoid *Cerastium arisanense*.

Leaves lanceolate *Cerastium trigynum* var. *morrisonense*.

Cerastium arisanense HAYATA (Pl. XIII.) Materials for a Flora of

Formosa p. 35. Herb prostrate, very small; stems slender sparingly hirsute. Leaves opposite, petiolate, smaller, broadly rhomboid, 5–6 mm. long, 7 mm. broad, obtuse and aristate at the apex broadly truncate and shortly attenuate at the base, margin upwards ciliate, glabrous below (except costa), petioles 6 mm. long, complanate. Flowers nearly 9 mm. long, solitary at the axils of the leaves, long pedunculate, peduncles nearly 5 cm. long, hirsute. Sepals 5, lanceolate, 7 mm. long, 2 mm. broad, scaly, tri-nerved, acuminate at the apex, sparingly hirsute on the back and at the apex. Petals 5, obovately spatulate, 12 mm. long, $4\frac{1}{2}$ mm. broad, 2-lobate at the apex, (lobes apex rounded, $2\frac{1}{2}$ mm. long, 2 mm. broad, sinus obtuse), attenuately cuneate, clawed. Stamens 10. Ovary ovoid, 2 mm. long, apex truncate, slightly elevate. Styles 3, erect or recurved, 3 mm. long.

HAB. Arizan.

Cerastium trigynum VILL. var. **morrisonense** HAYATA Materials for a Flora of Formos. p. 36. Herb diffused or caespitose, glandulously pubescent, at last glabrous. Leaves often remote, sometimes approximate linear-lanceolate or spatulate-acuminate, base sometimes attenuate, dilated, half-embracing the stem, apex callosso-acute or aristately acute, 1–2 cm. long, $2-2\frac{1}{2}$ mm. broad. Cymes terminal, some 1-flowered, some tri-flowered, bracteate, bracts scaly, pedicels $2-1\frac{1}{2}$ cm. long, glandulously pubescent. Sepals 5, lanceolate $7\frac{1}{2}$ mm. long, margin scaly, outside glandulos-pubescent, inside glabrous. Petals 5, oblanceolate, 13 mm. long, 2-lobed at the apex, (lobes oblong, obtuse, 6 mm. long), narrowed at the base. Stamens 10, filaments as half long as petals. 2-glanduliferous at the base of the filaments which are opposite the sepals. Ovary ovoid, 2 mm. long, 1-celled, many-ovuled. Styles 5, opposite the sepals, longer than ovary, 3 mm. long. Capsules cylindraceous 7 mm. long, $2\frac{1}{2}$ mm. broad, erect, dehiscent in 10-teeth at the apex, teeth obtuse, truncate. Seeds sub reniform and globose, 1 mm. long, laterally more or less compressed rugose on the back.

Cerastium morrisonense HAYATA Fl. Mont. Formos. p. 57.

HAB. Mt. Morrison.

This is quite near *C. trigynum* VILL. from which it is distinguishable only in having much narrower petals. It should better be regarded as a variety of the same species.

CERASTIUM PIOSUM LEDEB.; HAYATA Fl. Mont. Formos. p. 58.

The occurrence of the species in the island is rather doubtful.

7. *Stellaria* LINN.

Dichotomous Key to the Formosan Species.

- (1) Leaves oblongo-lanceolate, nearly sessile. (2)
 - Leaves ovate, ovato-oblong or cordate, narrowed at the base to the petioles.
 - (3)
 - (2) Leaves densely villosa-stellato-pilose *Stellaria stellato-pilosa*.
Leaves glabrous *S. uliginosa*.
 - (3) Leaves and flowers very much smaller, flowers 2 mm. long... *S. micrantha*.
Leaves much larger, flowers 7 mm. long *S. aquatica*.

Stellaria stellato-pilosa HAYATA Fl. Mont. Formos. p. 58, and Materials for a Flora of Formosa p. 37. Diffused herb, branched, densely stellately pilose. Leaves sessile, ovately lanceolate, base cordate, aristately acuminate at the apex, 12 mm. long, 3 mm. broad, rarely ovately-cordate, densely beset with stellate hairs above, with longer hairs beneath, costas prominent. Flowers 3-4, in a terminal cyme or rarely axillary, pedicellate, pedicels nearly 1 cm. long, bracteate at the base of the pedicels, bracts 2 opposite ovately lanceolate. Sepals 5, lanceolate, densely stellately pilose outside, at last glabrous, $3\frac{1}{2}$ mm. long, 1 mm. broad. Petals profoundly 2-fid, lobes lanceolate, obtuse, longer than sepals. Stamens 10. Disk between stamens, glandulose. Ovary 1-celled, few-ovuled. Styles 3. Capsules oblong-ovoid, 4 mm. long, dehiscent in 3-valves, valves 2-fid. Seeds globosely reniformed laterally compressed, 1 mm. in diameter, rugosely muricate.

HAB. Mt. Morrison.

This is very near *Stellaria nutans* HEMSL. in Journ. Linn. Soc. XXXIV. p. 434, (Tibet Oriental: Tatsin-Lou); but differs from it by its larger and broader leaves, and also in having rough velvety hairs all over the plant.

It is also near *S. dichasioides* WILLIAMS in the same volume of the same journal p. 436, from which it differs in having more hairy leaves. Besides, it comes very near *S. saxatilis* HAM. from which it is hardly distinguishable. All the plants above mentioned are very similar in every respect, and further study will prove that they are one and the same species, though some of them should be regarded as representing a variety of another.

Near *Hypericum erectum* THUNB.; but differs from it in having elongated, ovate leaves.

Hypericum randaiense HAYATA (Pl. XVII.) Materials for a Flora of Formosa p. 39. Shrubby small, procumbent at the base, but ascendent towards the apex, stems slender tetragonal, prominent at the angles, glabrous, rubescent. Leaves opposite, sessile, linear, or linear-lanceolate truncate at the apex, or shortly mucronate, 13 mm. long, $2\frac{1}{2}$ mm. broad, slightly punctate on the margin, or not punctate, but dotted with pelucid dots. Cymes 3-5-flowered, or reduced to one flower, pedicels 1-2 cm. long. Sepals 5, linear-narrowed, $5\frac{1}{2}$ mm. long, $1\frac{1}{4}$ mm. broad, obtuse, dotted with 2 or 3 black points on the margin, but dotted with a few pelucid dots on the blades or not at all punctate. Petals 5, strongly oblique obovate, rounded at the apex, obliquely cuneately acute at the base, 9 mm. long, 5 mm. broad. Stamens numerous, filaments 6-7 mm. long, anthers broad orbicular, $\frac{1}{2}$ mm. broad, emarginate on both sides, maculate on the back on the apex. Ovary ovoid, 3-sulcate, $2\frac{1}{2}$ mm. long, styles 3, distinct, $5\frac{1}{2}$ mm. long.

HAB. Randaizan, coll. U. MORI and B. HAYATA, Aug. 1908, (No. 7108).

This is very near *H. perforatum* but differs from it in having much obtuse sepals.

Hypericum Nagasawai HAYATA (Pl. XVIII.) Materials for a Flora of

Formosa p. 38. Stems slender, base shrubby, 7 cm. high, $\frac{1}{3}$ - $\frac{1}{2}$ mm. in diameter, glabrous, tetragonal, acute at the angles. Leaves opposite, sessile, oblong, or elongately oblong, rounded at the apex or obtuse, shortly mucronate, shortly attenuate at the base, 1- $\frac{1}{2}$ cm. long, 5-6 mm. broad, 1-seriatel dotted with black points on the margin, and also dotted with pelucid points on the blades. Flowers solitary at the apex of the branches, pedicellate, pedicels 6 mm. long. Sepals 5, elongately oblong, 6 mm. long, 2 mm. broad, rounded at the apex, or slightly emarginate, margin slightly reflexed and dotted with black points, but dotted with pelucid points on the blades. Petals 5, obovately oblong, oblique, 12 mm. long, $4\frac{1}{2}$ mm. broad, truncately rounded at the apex, gradually narrowed downwards, thicker on one side, thinner on the other. Stamens numerous, filaments thread-like, anthers nearly orbicular, $\frac{1}{2}$ mm. long, emarginate on both sides, with a dot on the apex, dots orbicular, blackish purple. Ovary oblong-ovoid, 5 mm. long, $2\frac{1}{2}$ mm. in diameter, 3-sulcate. Styles 3, distinct, 6 mm. long.

HAB. Mt. Morrison, at the height of 13094 ft., 1905, Nov., (No. 754).

In my paper above cited, I mention that the present plant is referable to *Hypericum attenuatum* Chois., although there have been some doubts about its being identical with CHOISY's plant. While studying here at Kew, I have compared the plant with the type of the species and found that they are so very different that it hardly needs pointing out. The Formosan plant comes very near *H. perforatum*; but differs from it in having obtuse or even rounded sepals. *H. perforatum* has usually very acute sepals.

Guttiferæ.

DISTRIB. China : Kwantung.

Adinandra pedunculata HAYATA Materials for a Flora of Formosa p. 43. Arborescent. Leaves alternate, shortly petiolate, obovately elliptical or oblong, abruptly acuminate, obtuse at the extremity, 7–8 cm. long, 3–2½ cm. broad, entire on the margin, serrulate towards the apex, veins slightly prominent on both sides, pallid beneath. Flowers axillary, solitary, long pedunculate, glabrous, peduncles 3–4 cm. long. Sepals 5, strongly imbricate, cuneate at the base, ovate, acute, glabrous, somewhat thick, ciliate on the margin, coriaceous, 8 mm. long, 6 mm. broad. Petals 5, cuneate at the base, ovately narrowed, acuminate, somewhat thick, 10 mm. long, 3–4 mm. broad, glabrous; stamens nearly 30, 8 mm. long, filaments geniculate, slightly pilose, anthers linear, pilose, as long as filaments, connectives produced. Ovary 4-celled, broadly ovoid, somewhat pilose, 2½ mm. long, styles filiformed, somewhat glabrous, 8 mm. long, stigmas obscurely 4-lobed.

HAB. Shintiku : Goshizan.

Near *A. acuminata* but differs from it in having glabrous styles and stigmata which are obscurely 4-lobed; also comes near *A. formosana* HAYATA, but quite distinguishable by the larger flowers, numerous (nearly 30) stamens, and 4-celled ovary.

Adinandra formosana HAYATA in MATSUM. et HAYATA Enum. Pl. Formos. p. 45; and Materials for a Flora of Formosa p. 42.

This comes very near *A. Millettii* which has leaves shining velvety beneath. In the present plant, leaves are quite glabrous on both sides or slightly pubescent, but never velvety beneath.

Adinandra lasiostyla HAYATA Materials for a Flora of Formosa p. 42. Arborescent. Branches terete dark-ashy, branchlets sericeo-tomentose towards the apex. Leaves oblong or lanceolate, 8-10 cm. long, 2½ cm.- 3 cm. broad, shortly petioled, entire or obscurely crenulate, glabrous above, tomentose beneath, subcoriaceous, petioles 5 mm. long. Flowers axillary, solitary, shortly pedunculate, peduncles 8 mm. long. Sepals somewhat pilose, ovate, 5 mm. long. Ovary broadly ovoid, styles pilose.

HAB. Tōzan, Mt. Morrison.

Easily distinguished by the leaves which are tomentose beneath. This differs from *A. Millettii* B. et H. which has lanceolate and sericeously barbate sepals.

HAB. Widely cultivated in the island.

DISTRIB. India, Japan and China.

Thea tenuiflora HAYATA Materials for a Flora of Formosa p. 46. Branches slender, cinereo-rubescence, leafy on the upper portions, young branchlets nigricant, hirsute, perulate at the base, perules rounded, ciliolate, 2–3-seriatel arranged, cataphylls spathulate, entire, 1 cm. long. Leaves petiolate, coriaceous, obovately oblong or oblong, 4 cm. long, 16 mm. broad, acute at the apex, obtuse at the extremity, cuneately acute at the base, distinctly serrulate upwards on the margin, but very obscurely at the middle, nearly entire downwards, glabrous on both sides when dried, (in younger stage somewhat pilose) minutely punctate on both sides, costa, veins and veinlets distinctly elevated, petioles 5 mm. long. Flowers sessile, axillary, solitary. Sepals nearly 5, unequal, deciduous, broadly rounded sparingly pilose, coriaceous, 4 mm. broad, ciliolate on the margin. Petals nearly 5, unequal, obovately oblong, rounded or truncately rounded at the apex, base cuneate, 18 mm. long, 10 mm. broad. Stamens numerous, 8 mm.

long, filaments connate at the base. Ovary minutely rounded, 1 mm. long. Styles 3, entirely connate, 3 mm. long.

HAB. Wautang.

Near *T. Sasanqua*, but differs from it in having rounded petals. The petals of the present plant are usually oblong and rounded at the apex, while there of *T. Sasanqua* are generally, if not always, notched at the apex.

Thea biflora HAYATA Materials for a Flora of Formosa p. 44. Branches fusco-cinerascent, or rubescens towards the apex. Leaves alternate remotely arranged, oblong, 5 cm. long, $2\frac{1}{2}$ cm. broad, acute at the apex, retuse at the extremity, obtusely rounded at the base, margin serrulate from middle to apex, nearly entire downwards, pallido-flavescens on both surfaces when dried, costa, veins and veinlets elevated above, veins and veinlets inconspicuous below. Costas and petioles shortly hirsute above, glabrous beneath, petioles 4 mm. long. Flowers in pairs at the apex of the branches, sessile. Flower-buds oblong, sericeo-tomentose. Sepals 5-8, very unequal, very much imbricate, deciduous, 4-seriate, (flower-axis 5 mm. long,) broadly orbicular, densely long sericeo-tomentose on the back at the centre and apex, coriaceous at the centre, thinner on the margin, glabrous inside, the outermost the smallest, the inner the larger, 15 mm. long, 2 mm. broad. Petals 5, unequal—interior ones larger, obovately rounded, truncately rounded at the apex, 2 cm. long, $1\frac{1}{2}$ cm. broad, hirsute outside at the base, glabrous otherwise, inner ones narrower. Stamens numerous half as long as petals, filaments connate to the midway, anthers ovate, nearly 2 mm. long, $1\frac{1}{2}$ mm. broad, emarginate on both ends, connectives more or less dilated. Ovary ovoid densely long tomentose, hairs 2 mm. long, erect, patent, styles 4, connate to the midway or entirely connate, erect, stigma on the outside at the apex of the style, obliquely truncate.

HAB. Kagi, Kodenshō, by. T. KAWAKAMI and U. MORI. Oct. 1906, (No. 1758).

There is nothing like this at Kew. I think it may be a species not yet described.

Thea shinkœnsis HAYATA Materials for a Flora of Formosa p. 45.

Branches slender fuscent, sometimes ashy coloured. Leaves arranged towards the apex of the branches, alternate, petiolate, oblong, obovate, 10–12 cm. long, $3\frac{1}{2}$ cm. broad, subacute at the apex or acuminate, obtuse at the extremity, margin serrate towards the apex, entire downwards, cuneate at the base, veinlets elevated and reticulated beneath, minutely prominently punctate, coriaceous, petioles short, 6 mm. long. Flowers solitary at the axils of the apical leaves, shortly pedunculate, peduncles 3–4 mm. long, nearly pilose. Flower-buds ovate. Flowers when opened 3– $3\frac{1}{2}$ cm. in diameter. Sepals 5, strong imbricate, deciduous, unequal, margin ciliolate, coriaceous, somewhat thick, sericeo-pubescent, outermost ones smaller, broadly orbicular or broadly crescent-shaped, 4 mm. broad, 3 mm. long, innermost larger, embracing flower-buds, broadest, obtusely acute at the base, thick at the middle, thinner towards the margin, 2 cm. broad. Petals 5–6, unequal, connate at the base, obovately oblong, 3–exterior ones larger, obovately oblong, $1\frac{1}{2}$ cm. long, 12 mm. broad, truncately emarginate at the apex, narrowed at the base, margin curled, 2–interior ones smaller, narrowed. Stamens numerous, connate at the base, shorter than petals, 8 mm. long. Ovary densely shortly sericeo-hirsute, 3-celled (placentas incrassate) 7 mm. long (including style) ovoid, gradually narrowed at the apex to the style. Styles 3, connate to the midway, or entirely connate, stigma on the apex of the branchlets of the style, 2-lamellate.

HAB. Shinkō: Remogansha, coll. T. KAWAKAMI and U. MORI, 1906, June.

This comes very near *T. reticulata*; but differs from it by the leaves and flowers.

Species imperfectly known.

Malva sylvestris LINN. Sp. Pl. ed-2, p. 969; DC. Prodr. I. p. 432; MASTERS in HOOK. f. Fl. Brit. Ind. I. p. 320; FORBES et HEMSL. Ind. Fl. Sin. I. p. 84; DIELS Fl. Centr. Chin. p. 469; MATSUM. et HAYATA Enum. Pl. Formos. p. 50.

Malva mauritiana LINN. Sp. Pl. ed-2, p. 970; MAXIM. Ind. Fl. Pek. in Prim. Fl. Amur. p. 469.

Malva mauritiana β *sinensis* DC. Prodr. I. p. 432.

HAB. Pachina.

DISTRIB. Plant of the Old World; widely diffused in the northern temperate regions.

3. *Malvastrum* A. GRAY.

Malvastrum tricuspidatum A. GRAY; BENTH. Fl. Hongk. p. 32; FORBES et HEMSL. Ind. Fl. Sin. I. p. 84; HENRY List Pl. Formos. p. 20; MATSUM. et HAYATA Fnum. Pl. Formos. p. 51.

HAB. Hōsan, Tamsui.

DISTRIB. Indigene of America; but now widely diffused.

4. *Sida* LINN.

Dichotomous Key to the Formosan Species.

- (1) Leaves densely villose *S. cordifolia*.
Leaves glabrous, slightly hispid. (2)
- (2) Leaves cordate, cuspidate at the base. (3)
Leaves rhomboid, acute or obtuse or lanceolate. (4)
- (3) Leaves small, $2\frac{1}{2}$ cm. long. *S. humilis*.
Leaves large, 8–9 cm. long. *S. mysorensis*.
- (4) Leaves much broader, peduncles longer *S. rhombifolia*.
Leaves much narrower, peduncles shorter. *S. acuta*.

Sida cordifolia LINN. Sp. Pl. ed-2, p. 961; DC. Prodr. I. p. 464; BENTH. Fl. Hongk. p. 33; MAST. in HOOK. f. Fl. Brit. Ind. I. p. 324; FORBES et HEMSL. Ind. Fl. Sin. I. p. 85; HENRY List Pl. Formos. p. 20; MATSUM. et HAYATA Enum. Pl. Formos. p. 51.

HAB. Tamsui, Shintiku, Chūkō, Takow.

DISTRIB. Widely diffused in tropical and subtropical regions.

Sida humilis WILLD. Sp. Pl. III. p. 744; DC. Prodr. I. p. 463; BENTH. Fl. Hongk. p. 32; MAST. in HOOK. f. Fl. Brit. Ind. I. p. 322; FORBES et HEMSL. Ind. Fl. Sin. I. p. 85; HENRY List Pl. Formos. p. 20; MATSUM. et HAYATA Enum. Pl. Formos. p. 52.

HAB. Tainan, Takow, South Cape.

DISTRIB. Tropical Asia, Africa and America.

Sida mysorensis W. et A.; HOOK. f. Fl. Brit. Ind. I. p. 322; HAYATA Materials for a Flora of Formosa p. 47.

HAB. Akō: Chōshūshō.

OBSERV. Leaves soft tomentose, cordate, abruptly acuminate, margin serrulate, 9 cm. long, 7 cm. broad, petioles 5 cm. long; very like *S. humilis* WILLD.

DISTRIB. India and Philippines.

Sida rhombifolia LINN. Sp. Pl. ed-2, p. 961; DC. Prodr. I. p. 452; MAST. in HOOK. f. Fl. Brit. Ind. I. p. 32; BENTH. Fl. Hongk. p. 32, et Fl. Austral. I. p. 196; ROXB. Fl. Ind. III. p. 176; FORBES et HEMSL. Ind. Fl. Sin. I. p. 85; E. BAKER in Journ. Bot. (1892) p. 239; HENRY List Pl. Formos. p. 20; MATSUM. et HAYATA Enum. Pl. Formos. p. 52.

Stereuliaceæ

Conspectus of the Formosan Genera.

- (1) Flowers unisexual or polygamous. Petals 0. (2)
 - Flowers hermaphrodite. Petals exist. (3)
- (2) Anthers numerous. *Sterculia*. 1
 - Anthers 5, whorled. *Heritiera*. 2
- (3) Petals deciduous. Androecium columnar below, dilated above into a cup, on the margin of which are placed the anthers usually alternating with staminodes. (4)
 - Petals marcescent, flat. Androecium tubular at the base only ; stamens 5, staminodes 0. (6.)
- (4) Capsules membranous, inflated. *Kleinhovia*. 3
 - Capsules more or less woody, not inflated. (5)
- (5) Anther-cells divaricate ; seeds not winged. *Helicteres*. 4
 - Anther-cells parallel ; seeds winged. *Pterospermum*. 5
- (6) Ovary 2-celled. *Melochia*. 6
 - Ovary of one carpel *Waltheria*. 7

1. *Sterculia* LINN.

Dichotomous Key to the Formosan Species.

- (1) Leaves oblong, very shortly and obtusely caudate *Sterculia nobilis*.
 - Leaves angular, sinuately three lobed *S. platanifolia*.

Sterculia nobilis R. BROWN ; HAYATA Materials for a Flora of Formosa p. 48.

Nom. indig. Pin-pon.

HAB. Tainan, by. T. KAWAKAMI, Aug. 1906, (No. 1440).

DISTRIB. China and Sumatra.

OBSERV. A small tree ; leaves large, oblong, 30 cm. long, 15 cm. wide,

membranaceous, nerves distinct, petioled, petioles 6 cm. long. Panicles 15 cm. long, loosely flowered; flowers polygamous. Calyx campanulate, 5-lobed, lobes lanceolate, hairy. Fl. ♂: staminal column shorter than the calyx, declining, anthers sessile on the outside of the very short lobes, forming a globular terminal head. Fl. ♀: ovary stalked, 4-lobed, with anthers at its base, style declining, stigma 4-lobed, tomentose. Capsules fleshy, leather-like, thick, ovate, beaked, sessile, 5-6 cm. long, bright scarlet slightly velvety. The plant is not indigenous to Formosa, but comes from the opposite continent and is found only in cultivation.

The present *Sterculia* is near *S. lanceolata* CAV. but differs from it in the calyx with lanceolate lobes.

DISTRIB. Southern and eastern China.

Waltheria Makinoi HAYATA in MATSUM. et HAYATA Enum. Pl. Formos. p. 61, t. 5. Shrub, branches slender, ferrugineo-pubescent. Leaves alternate, petiolate, stipulate, ovate, elliptical, base rounded, subcordate, 2–2.5 cm. long, 1.5–1.8 cm. broad, margin serrate, serras acute, tri-nerved, costas impressed above, prominent beneath, densely villosely pubescent, subbicolored, petioles 5–6 mm. long, stipules very small, subulate. Flowers small, glomerate at the axils, bracteate, bracts lanceolate, villose. Calyx campanulate, 5-lobate,

lobes acute, outside villose, inside pubescent, glanduliferous, marginate. Petals 5, oblong-spathulate, truncate or emarginate at the apex. Stamens 5, opposite the petals, filaments dilate, connate, staminodes 0; anther-cells parallel, connectives slightly produced, emarginate. Ovary sessile, 1-celled, 2-ovuled. Styles excentric, upwards fimbriate, flexuose. Capsules obovoid 2-valved on the back, 1-seeded. Seeds ascendent, glabrous, pentagonal in section, albuminose. Embryo straight, cotyledons flattened, radicule near the hilum.

HAB. Shintiku.

DISTRIB. An endemic plant.

Tiliaceæ.

Conspectus of the Formosan Genera.

- (1) Anthers globose or oblong, opening by slits. (2)
 - Anthers linear, opening by terminal pores. (4)
- (2) Petals glandular at the base. Stamens springing from the apex of a raised torus. (3)
 - Petals not glandular. Stamens springing from a contracted torus.
 - *Corchorus*. 2
- (3) Fruits not at all prickly.
 - Grewia*. 1
- Fruits prickly.
 - Triumfetta*. 3
- (4) Stamens on a depressed torus. Fruits Capsular. (5)
 - Stamens on a raised torus. Fruits drupaceous.
 - Elæocarpus*. 6
- (5) Sepals 4-5, petals 0 v. rarely 1-4, imbricate
 - Sloanea*. 4
- Sepals 4, 2-seriatelv imbricate, petals 4, incised, subimbricate
 - Echinocarpus*. 5

1. *Grewia* LINN.

Dichotomous Key to the Formosan Species.

- (1) Leaves obliquely cordate at the base.
 - Grewia tiliæfolia*.
- Leaves cuneate or slightly cordate at the base. (2)

- (2) Leaves smaller, cuneate at the base. *G. piscatorum*.
 Leaves larger, slightly cordate at the base. *G. parviflora*.

HAB. Pratas, by. T. KAWAKAMI, 1907, July.

DISTRIB. Throughout the warmer regions of both hemispheres.

Geraniaceæ.

Conspectus of the Formosan Genera.

- (1) Flowers regular or nearly so. (2)
 - Flowers irregular. *Impatiens*. 4
- (2) Leaves simple. *Geranium*. 1
 - Leaves compound (3)
- (3) Herbs, fruits capsular. (4)
 - Trees, fruits berried. *Averrhoa*. 5
- (4) Capsules loculicidal, valves cohering with the axis,
 - leaves tri-foliolate. *Oxalis*. 2
 - Capsules loculicidal, valves usually separating from the axis to the base, leaves pinnate. *Biophytum*. 3

1. *Geranium* LINN.

Dichotomous Key to the Formosan Species.

- (1) Leaves ternately cleft, segments pinnatilobed. *Geranium Robertianum*.

Leaves palmately 5-lobed, lobes laciniately many-lobed. . . *G. uniflorum*.

Geranium Robertianum LINN.; DC. Prodr. I. p. 644; MAXIM. Mél. Biol. X. p. 613; FRANCH. et SAVAT. Enum. Pl. Jap. II. p. 307, (var. *glabrum*); HOOK. f. Fl. Brit. Ind. I. p. 432; DIELS Fl. Centr. Chin. p. 419; LEDEB. "Fl. Alt. III. p. 233"; HAYATA Fl. Mont. Formos. p. 64.

HAB. Taitō; Bunshisekisha.

DISTRIB. Southern parts of Japan, China throughout, and westward to Europe.

This exactly agrees with the Japanese form.

Geranium uniflorum HAYATA Fl. Mont. Formos. p. 65; and Materials for a Flora of Formosa p. 50. Stem 1-2 ft. high, erect or patent, glabrous, upwards, pilose, branches articulately nodose. Leaves long petioled, piloso-pubescent, petioles 2-4 cm. long, blades broadly orbicular or pentagonal in outline 5-7 cm. in diameter, deeply 5-parted, segments acuminate, pinnatifid inciso-serrate, stipules oblong, abruptly acuminate, 1 cm. long, somewhat pilose outside. Flowers axillary or subterminal, long pedunculate, 1-flowered, 2-bracteate, peduncles 5-6 cm. long, pubescent, bracts subulate, opposite, nearly 1 cm. long. Sepals 5, elliptical, 12 mm. long, 5 mm. broad, outside distinctly 5-nerved, pilose on the nerves, aristately acute at the apex, glabrous inside. Petals 5, obovate, cuneate, entire, 2 cm. long or longer, rounded at the apex, emarginate, base ciliate above the claw. Glandules 5. Stamens 10, 2-seriate, filaments dilated at the base, shortly ciliate, anthers oblong deciduous. Ovary pilose. Capsule-lobes oblong, pilose, 5 mm. long, 2½ mm. broad, tails 14 mm. long.

HAB. Mt. Morrison.

Near *G. aconitifolium* and also *G. collinum* A. DC. but differs from the former by not branched peduncles, and from the latter in having much broader stipules.

2. *Oxalis* LINN.

Dichotomous Key to the Formosan Species.

Leaflets broadly obtriangular slightly 2-lobed, lobes spreading, acute at the base. *O. Griffithii*.

Leaflets much more rounded than the other, slightly 2-lobed at the apex, lobes very short less spreading, much thinner. *O. corniculata*.

Oxalis Griffithii EDGEW. et HOOK. f. in Hook. f. Fl. Brit. Ind. I. p. 436; S. MOORE in Journ. Bot. (1875) p. 230; FORBES et HEMSL. Ind. Fl. Sin. I. p. 99; DIELS Fl. Centr. Chin. p. 420; HAYATA Fl. Mont. Formos. p. 66.

HAB. Suizan, Mt. Morrison, Arizan.

Biophytum sensitivum DC. Prodr. I. p. 690; HOOK. f. Fl. Brit. Ind. I. p. 436; FORBES et HEMSL. Ind. Fl. Sin. I. p. 100; HENRY List Pl. Formos. p. 24; MATSUM. et HAYATA Enum. Pl. Formos. p. 69; HAYATA Materials for a Fl. Formos. p. 50.

Oxalis sensitiva LINN. Sp. Pl. ed-2, p. 622; LOUR. Fl. Cochinch. ed-WILLD. p. 350.

HAB. Akō: Bongarisha, by G. NAKAHARA, Sept. 1905, (No. 544).

OBSERV. A very graceful herb, about 30 cm. high; leaves gathered on the top of the stem, abruptly pinnate, 6-7 cm. long, pinnules 20-30,

obliquely oblong, 1 cm. long. Flowers many on a long peduncle which is projected from the center of congested leaves.

DISTRIB. Generally in the tropical regions of the World.

4. *Impatiens* LINN.

Impatiens uniflora HAYATA Fl. Mont. Formos. p. 66. Erect herb, nearly 30 cm. high, few branched, flexuous towards the apex, stems stramineous, glabrous (except apex). Leaves approximately arranged towards the apex, shortly petiolate, blades oblong, elliptical or lanceolately elliptical, nearly 8 cm. long, $2\frac{1}{2}$ cm. broad, caudately acuminate at the apex, cuneate at the base, attenuate to the petioles, margin serrulate, serras setose, incurved. Flowers solitary larger, rosy terminal or in upper axils, peduncles slender, nearly 4 cm. long, 1- rarely 2- flowered, naked, bracteolate on the middle, bracteoles minute, incurved. Sepals 3, 2-lateral ones oblique, ovate, acuminate, entire, 6 mm. long, $2\frac{1}{2}$ mm. broad, the back one long saccate, acute at the apex, mouth $1\frac{1}{2}$ cm. in diameter, base abruptly turning to a short spur, (which is incrassate at the apex and slightly 2-lobed), $3\frac{1}{2}$ cm. long from the base up to the apex of spurs. Petals: standard as half long as wings, broadly reniform cristate at the middle and back, and attenuate to a horn-like process which is recurved and maculate; wings in outline elliptical $2\frac{1}{3}$ cm. long, 2-lobate on the upper side, exterior basal lobe broad, apical lobe longer and oblong. Stamens 5, filaments unequal, shorter, nearly 4 mm. long, complanate appen- culate at the middle, anthers ovate, apiculate, coherent with pistils; cells introrsely dehiscent. Ovary oblong, 4 mm. long, stigma sessile, 5-dentate. Capsules elongate, 2 cm. long, 5 valvate, valves elastically split, column persistent. Seeds long elliptical scarcely longer than 2 mm., coats glabrous minutely papillose under microscope.

HAB. Tozan, Arizan, Mt. Morrison.

Ilex bioritsensis HAYATA Materials for a Flora of Formosa p. 53.
Branches strong, straight; bark cinerascent, branchlets straight, divaricate, triquetrous. Leaves alternate, shortly petiolate, thick coriaceous, obovately rhomboid, 3½ cm. long, 2 cm. broad, margin 1-2-spinosely-dentate on both sides, central lobes triangular, acute at the apex or strongly aristate, aristas straight, lateral lobes acute, strongly aristate, rounded at the base or cordate, polished above, pallid below, costas and veins slightly impressed above, slightly elevated beneath, petioles 3 mm. long, nigrlicant. Drupes axillary, solitary, sessile, obovoid, 8 mm. long, obtuse at the apex (sepals persistent, triangular,) irregularly minutely punctate and slightly 2-3 cornute. Stones 2, dorsally compressed, convex on the back, nearly 8-sulcate, face flat, nearly 6-sulcate, 5 mm. long, 4 mm. broad.

HAB. Biōritsu : Taizan, by T. KAWAKAMI and U. MORI, Oct. 1908, (No. 7185).

Very like *Ilex Pernyi* FRANCH. var. *Manipurensis* LÖS.; but differs from it in the shape of the drupes in which there are always two stones.

Ilex formosana MAXIM. Coriar. Ilic. Monochas. in Mém. Acad. Sc. Pétersb. 7^e série. XXIX. (1881) p. 46; FORBES et HEMSL. Ind. Fl. Sin. I. p. 116; HENRY List Pl. Formos. p. 27; MATSUM. et HAYATA Enum. Pl. Formos. p. 81; HAYATA Materials for a Flora of Formosa p. 54.

HAB. Kōketsuzan, Bankinsing, Uraisha.

DISTRIB. An endemic plant.

OBSERV. Branches blackish; leaves elliptical, acute at the base, acuminate or cuspidate at the apex, obtuse at the very tip, 7-8 cm. long, 2-3 cm. broad, margin obscurely crenulate, veins not very distinct on the upper surface, reticulated and dotted on the under surface, somewhat pale beneath, petioles about 1 cm. long. Flowers on a very short raceme, almost contracted to a cluster.

Ilex goshiensis HAYATA Materials for a Flora of Formosa p. 54. Branches strong, cinerascent, branchlets fusco-rubescens, angulate. Leaves alternate, petiolate, coriaceous, obovately oblong or oblong, 26 mm. long, 16 mm. broad, retusely acute at the apex, quite entire, opaque above, veins not visible, very pallid beneath, venose, petioles 4 mm. long. Drupes clustered at the axils of the leaves, peduncles 5 mm. long, pedicels 3 mm. long, globose, 4 mm. in diameter, fusco-rubescens with 4-sepals at the base.

HAB. Shintiku: Goshizan.

Near *Ilex Championi* LÖS.; but differs from it in having shortly cuspidate leaves. The leaves of *I. Championi* are very rounded or even emarginate at the apex. It is also near *Ilex memeyclifolia* CHAMP. from which it differs in having leaves which are retused at the apex. There is in the Herbarium at Tōkyō a specimen from the Loo-choo islands which has been identified with *I. Hanceana* MAXIM. by Dr. T. Irō in his "Tent. Fl. Lutch. p. 367." The specimen is very like, or even the same as, the plant just described, and I have wondered if the Loo-chooan plant be really identical with *I. Hanceana*. As is described by MAXIMOWICZ in his "Coriar. Ilic. Monoch. p. 33," *I. Hanceana* has "Cymulae ♂ breve pedunculatae, 5-6-florae, petiolum bis vel ter superantes, pedicelli calyce aequilongi, flores 4-meri circ. linam longi. Calyx puberulus, lobis ciliatis ovatis." But, in the Loo-

chooan plant, we find "flores umbellati, umbellis cymose 5-6-fasciculatis, pedunculis umbellarum 5-6 mm. longis, petiolum æquantibus, pedicellis florium circ. 3 mm. longis florem 2-plo superantibus."* In comparing the above descriptions, we see clearly that the Loo-chooan plant is not identical with MAXIMOWICZ's species. As to the identification of the Loo-choo plant with the present one, I am not as yet in a position to decide it. I can only add that they are very similar.

HAB. Exact locality is not known.

DISTRIB. Japan, Corea and China.

Ilex Kusanoi HAYATA Materials for a Flora of Formosa p. 55. Branches rugose, atro-purpurascent, branchlets slender, cinerascent, angulate. Leaves petiolate, alternate, chartaceous-membranaceous, oblong or oblongly ovate, or obovate, slightly oblique, 5 cm. long, 3 cm. broad, obtuse at the apex, or shortly acuminate, or slightly cuspidate, or obtusely acute, shortly aristate at the extremity, acute at the base, obscurely crenulate on the margin, aristate at the apex of the teeth, nearly entire near the base. Flowers 2-3-4 clustered at the axils, long pedunculate, peduncles slender, 18 mm. long, perulate at the base, perules minute, subulate. Flowers most likely hermaphrodite. Sepals 5, rounded, 1 mm. long, persistent, margin ciliolate. Corolla 5-lobate or sometimes 6-lobate, 3 mm. long, lobes rounded, 2 mm. long, tubes 1 mm. long. Stamens 5, rarely 6, affixed on the tube of the corolla, 1 mm. long, anthers triangular, cordate, $\frac{1}{2}$ mm. long, acute at the apex, filaments dilated. Ovary globose, 2 mm. long (including style), style short, stigma

* The description above referred to has been drawn up by myself from a specimen from the Loo-choo Archipelago, which is referred to *I. Hanceana* MAXIM. by Dr. T. ITŌ.

subglobose, 5-lobate. Drupes globose, 3 mm. in diameter, shortly acute, stigma 5-lobed.

HAB. Taitō, by S. KUSANO, 1908, July.

The present plant bears some resemblance to the Japanese *Ilex macro-poda* MIQ.; but the leaves of the Japanese plant are more or less hairy, while those of the Formosan are quite glabrous. Besides, the former has deciduous leaves, while the latter persistent ones. Also near *I. macrocarpa* OLIVE, but differs from it in having much smaller fruits; from *I. taiwaniana* HAYATA in having much thinner leaves and much larger flowers.

Ilex nokœnsis HAYATA Materials for a Flora of Formosa p. 56. Branches strong, cinerascent, lenticellate, slightly pilose, hairs nigricant, many-branched, branchlets divaricate, leafy, cinereo-rubescens, shortly hirsute. Leaves alternate, shortly petiolate, greenish, oblong, ovate or obovate, $2\frac{1}{2}$ cm. long, $1\frac{1}{3}$ cm. broad, roundly obtuse at the apex, or obtuse, sometimes callosomucronate, base acute or cuneately acute, margin upwards crenate, crenas somewhat callose at the apex, entire downwards costas, veins and veinlets impressed above, but slightly elevated below, petioles 2 mm. long.

HAB. Nökōsan, at an elevation of 9000 ft., by T. KAWAKAMI and U. MORI, 1908, January, (No. 4582).

This is very like *Ilex crenata* THUNB., but differs from it in having impressed veins on the surface of the leaves, which are quite obtusely crenate on the margin. In *I. crenata*, the leaves are shortly aristate at the apex of the teeth on the margin. Moreover, the lowersurface of the leaves of the same species is minutely dotted, while that of the present plant is quite smooth, but never dotted. It also bears some resemblances to *I. luzonica* ROLFE, and also to *I. Thomsoni*; but differs from the former in having obovate or oblongo-ovate leaves which are crenate towards the apex, and from the latter in having callosobtusely (but not mucronately) crenate leaves. Those of *I. luzonica* ROLFE are usually oblong, more acutely or mucronately crenate from the base to the apex, while these are usually obovate, very obtusely crenate only towards the apex.

Ilex parvifolia HAYATA (Pl. XIX.) Materials for a Flora of Formosa p. 57. Branches slender, branchlets ferrugineo-tomentose. Leaves approximate, shortly petiolate, oblong, 12 mm. long, 6 mm. broad, coriaceous, obtuse at both ends or acute, aristately serrate, tomentose above on the costas, veins obscure on both sides, tomentose above. Flowers axillary, solitary, pedicellate, sepals 4, rounded, 1 mm. long. Drupes reddish, globose, 6 mm. in diameter, with 4 stones.

HAB. Mt. Morrison, Arizan.

Near *Ilex intricata* Hook. f.; but differs from it by the thinner, oblong, leaves, which are more or less aristately toothed on the margin. *I. intricata* has nearly obovate leaves, without aristate teeth.

Ilex rotunda THUNB. Fl. Jap. p. 77; DC. Prodr. II. p. 16; Miq. in Ann. Mus. Bot. Lugd.-Bat. III. p. 106; HANCE in Journ. Bot. (1883) p. 296; SIEB. et ZUCC. Fl. Jap. Fam. Nat. I. p. 149; Miq. Prol. HAB. Hokuto, South Cape.

DISTRIB. Japan and China.

Ilex taisanensis HAYATA Materials for a Flora of Formosa p. 57. Branches cinerascent, rugulose longitudinally, branchlets straight, triquetrous towards the apex, shortly pubescent or subglabrous, reddish. Leaves alternate, long petiolate, chartaceo-coriaceous, oblong, or oblong-ovate, 37 mm. long, 15 mm. broad, acute at the apex, roundly obtuse at the base, margin remotely crenate, veins and veinlets inconspicuous on both sides, or very much slender, pallid beneath, petioles 1 cm. long, slightly pubescent. Drupes solitary on the axils of the leaves, long pedunculate, (peduncles 2 cm. long, 2-bracteolate middway, bracteoles lanceolate 2 mm. long), globose, 5–6 mm. in diameter, albo-punctate, or not punctate, with calyx at the base. Stones 3–5, somewhat compressed dorsally, convex on the back, acute at the apex, smooth, 4 mm. long.

HAB. Biōritsu : Rokujōtaisan.

Near *Ilex embeloides* HOOK. f. which differs from the present plant in the leaves, which are more attenuate or cuspidate towards the apex. The leaves of this plant are acute at the apex, but neither attenuate nor cuspidate.

Ilex taiwaniana HAYATA Materials for a Flora of Formosa p. 58. Branches ashy, glabrous. Leaves alternate, ovate, obtusely acute, obliquely acute at the base, mucronately serrate, distinctly venose on both sides, chartaceo-membranaceous. Flowers 3-5-clustered at the axils, clusters pedunculate, peduncles 5 mm. long. Sepals 5, rounded, 1 mm. long, petals 5, rotundate, 2 mm. long; stamens 5, introrse, rudiment of the ovary convex. Drupes globose, 4 mm. long, long pedunculate, (peduncles 2 cm. long), 10-sulcate with 5 stones.

3. Euonymus Miyakei HAYATA in MATSUM. et HAYATA Enum. Pl. Formos. p. 83, t. VII. Shrub subglabrous, branches tetragonal. Leaves ternate, petioled, obovate or elliptical, slightly acute or obtuse, at the apex attenuate at the base, 6–7 cm. long, 2.5–3 cm. broad, petioles short, 5 mm. long. Flowers patent, 1 cm. in diameter, loosely cymosely paniculate, terminal or axillary, bracteate, bract very short. Sepals 5, incurved, rounded. Petals 5, inserted under the disc, patent, margin fimbriate and recurved, orbicular, base shortly narrowed. Stamens 5, inserted above the disc, filaments complanate, subulate, anthers broadly didymous. Disc carnose, ample, broadly explanate, entire. Ovary immersed in the disc, and confluent with it, 5-celled; style short; ovules 2 in each cell.

HAB. Kōtōshō.

Resembles very much *E. javanicus* BL.; but the leaves of the present plant are always verticillate (ternate in almost all cases), while those of the Javan species are always opposite.

4. Euonymus Tanakæ MAXIM. in Mél. Biol. XII. (1886) p. 428; Irō et MATSUM. Tent. Fl. Lutch. p. 371.

HAB. Taiton.

DISTRIB. Japan, Bonin, Loo-choo.

5. Euonymus Spraguei HAYATA (Pl. XX) Materials for a Flora of Formosa p. 59. Branches terete, minutely papilloso-punctate, striate, fulvo-cinerascent, branchlets subtetragonal, sulcate, fulvo-fuscent, slender, divaricata. Leaves opposite, ovately oblong or oblong, $6\frac{1}{2}$ cm. long, 3 cm. broad, (sometimes $4\frac{1}{2}$ cm. long, 23 mm. broad) chartaceo-coriaceous, obtusely acute or obtusely acuminate at the apex, acute or rounded at the base, margin serrulate, teeth obtuse, pallid above, more pallid below, costas and veins slightly elevated above, but costas elevated below, and veins not conspicuous, petioles 8 mm. long, sulcate inside. Capsules cymosely arranged (cymes axillary, peduncles slender, 3 cm. long) broadly globose, 6 mm. in diameter,

2-4-lobate, 2-4-locular, truncate at the apex, echinate on the face, spines sometimes nearly 30, sometimes 5-6, recurved, 1-2 mm. long, styles persistent. Seeds quadrant-shaped, rubescent, 5 mm. long, smooth, testa coriaceous.

Euonymus echinatus T. ITŌ in ITŌ et MATSUM. Tent. Fl. Lutch. p. 371; HAYATA Fl. Mont. Formos. p. 69.

HAB. Mt. Morrison: Tōzan; Mushazan.

DISTRIB. Loo-choo.

When I mentioned the present plant in my "Fl. Mont. Formos.", I was merely comparing it with a Loo-choo plant which had been determined by Dr. T. ITŌ, and referred to *E. echinata* WALL. in his "Tent. Fl. Lutch. p. 371." As the Formosan plant is exactly identical with Dr. ITŌ's plant, I used the same name for my plant. While working here at Kew, I have compared with Mr. SPRAGUE the present plant with the type of the named species, and have found that they are clearly not identical. The former is easily distinguishable from the latter by many points, but especially by the very much fewer and much more slender spines on the fruit. In WALLICH'S species, the spines are much more numerous and stronger. Our plant is very near *E. subsessilis* SPRAGUE (= *E. echinatus* LOUR.), but differs from it in having much fewer and more slender spines.

6. *Euonymus trichocarpus* HAYATA Fl. Mont. Formos. p. 69; Branchlets trichotomously divaricate, nearly tetragonal, glabrous. Leaves opposite, petiolate, petioles nearly 1 cm. long, semi-terete, blades oblong-elliptical, 6-7 cm. long, 4 cm. broad, apex obtuse or acute, base rounded or obtuse, rarely slightly narrowed, margin serrulate, serrulas obtuse, veins prominent on both sides. Cymes (on lateral branchlets) opposite, few-flowered. Flowers not known. Capsules depressingly globose, 6-7 mm. in diameter, shortly prickled, prickles 1 mm. long.

HAB. Mt. Morrison.

This plant resembles *E. echinatus* WALL.; but differs from it in having very short and dense spines on the fruits.

Species imperfectly known to me.

- Leaflets ovate or lanceolate, acuminate at the apex. (9)
- (9) Leaflets acuminate 2–3-dentate (or leaves simple). *V. inconstans*. 7
Leaflets dentate, teeth many on both sides. (10)
- (10) Leaflets dentate; teeth acute. *V. dentata*. 1
Leaflets very obscurely dentate, or remotely serrate, teeth
or serras very minute. *V. triphylla*. 2

1. *Vitis dentata* HAYATA Materials for a Flora of Formosa p. 62.
 Branches fulvo-tomentose, (hairs patent, short,) or subglabrous, remotely leaved. Leaves trifoliolate, petiolate, stipulate, broadly triangular in outline, membranaceous, 10 cm. long, 13 cm. broad, terminal leaflet oblong, 9 cm. long, $4\frac{1}{2}$ cm. broad, obtusely acuminate at the apex, but roundly acute at the base, remotely dentate, (teeth ascendent shortly aristate), glabrous on both sides, petioles 5 mm. long, lateral leaflets oblique, oblong-ovate, obtusely acute at the apex, obliquely rounded at the base, acute on the upper side, rounded on the lower side, $7\frac{1}{2}$ cm. long, 4 cm. broad, shortly petiolulate. petiolules 5 mm. long; petioles $3\frac{1}{2}$ cm. long; stipules oblong-rounded, obtuse, 6 mm. long, affixed at the center, thick on the middle, maculate, membranaceous on the margin, nearly embracing the stem. Cymes opposite the leaves, 4 cm. long as broad, branchlets divaricate, peduncles and pedicels pubescent, hairs patent, bracts and bracteoles deciduous. Flower ♀: calyx complanate, lobes short triangular pilose, or nearly obsolete; corolla patent, 2 mm. long, lobes 5, valvate, ovately triangular, acute at the apex, abruptly acutely reflexed on the back, shortly connate. Ovary conical with styles 2 mm. long, contracted at the base, 5–4-cornute a little above the base, styles short, stigma 4–5-lobate.

HAB. Exact locality is not yet known.

Near *Vitis corniculata* BENTH., but differs from it in having acutely dentate leaves.

2. *Vitis triphylla* HAYATA Materials for a Flora of Formosa p. 63.
 Branches fuscent, hirsute, remotely foliate. Leaves trifoliolate, triangular in outline, hirsute, terminal leaflets oblong-lanceolate, lateral leaflets longer 7 cm. long, 27 mm. broad, acuminate at the apex, obtusely rounded at the

base, remotely and obscurely serrate, (costas and veins slightly elevated on both surfaces), pallid below, tomentose on the costas, but hirsute on the blades, petiolules 15 mm. long, tomentose, lateral leaflets ovately oblong, oblique, acute at the apex, oblique at the base and rounded, acute on the upper side, rounded or cordate on the lower side, 4½ cm. long, 2 cm. broad, petiolules 3 mm. long; petioles 3 cm. long; stipules ovate-lanceolate 5 mm. long. Cymes opposite the leaves. Berry globose, 8 mm. in diameter, 1-seeded.

HAB. Shifun.

Very near *Vitis angustifolia* WALL., but differs from it in having more hairy, very obscurely and remotely serrulate, or nearly entire, leaves.

Dichotomous Key to the Formosan Species.

(1) Leaves entire not lobed. (2)

Leaves more or less lobed or very slightly lobed, lobes serrate. (4)

(2) Leaves ovate, broadest at the basal portion. . . *A. oblongum* var. *Itoanum*.
(not in Formosa.)

Leaves obovate, broadest at the upper portion or lanceolately oblong. (3)

(3) Leaves obovate, broadest at the upper portion. *A. oblongum*.

Leaves elongately oblong, acuminate at the apex. . . *A. albopurpurascens*.

(4) Leaves very slightly lobed only on the margin; length of lateral lobes never exceeds $\frac{1}{5}$ of that of leaves. (5)

Leaves lobed, length of lateral lobes exceeds $\frac{1}{5}$ of that of leaves. (7)

(5) Leaves slightly lobed on the margin, lateral lobes elongately caudate. *A. rubescens*.

Leaves slightly lobed, lateral lobes very obscure. (6)

(6) Leaves obscurely crenulato-serrate. *A. cavidatifolium*.

- Leaves minutely distinctly serrulate. *A. morrisonense*.
- (7) Lobes of leaves usually 3, if more, less than 5, obtuse at the apex. (8)
Lobes of leaves 5, or more than 5, acute or acuminate at the apex. (9)
- (8) Lobes serrate on the margin. *A. Tutcheri* var. *Shimadai*.
Lobes entire on the margin or nearly so. *A. trifidum* var. *formosanum*.
- (9) Leaves 7-lobed. *A. duplicitoserratum*.
Leaves 5-lobed. (10)
- (10) Lobes lanceolate. *A. serrulatum*.
Lobes ovately triangular. *A. Oliverianum* var. *Nakaharai*.

Acer albo-purpurascens HAYATA Materials for a Flora of Formosa

64. Branches rubro-purpuraceous, terete, glabrous. Leaves elongately oblong or oblong lanceolate, 10 cm. long, 3 cm. broad, acuminate at the apex, (acumen linear, obtuse at the apex, $1\frac{1}{2}$ cm. long), acute at the base, undulately entire, or entire, greenish above, glaucous below, obscurely 3-nerved, central nerve strong, rubescence, lateral nerves very much slender or rarely obsolete, primary lateral veins 7 on both sides, nearly straight, divaricate at an angle of 50° , nerves, veins and veinlets slightly elevated, reticulate above, prominently reticulate below, petioles $1\frac{1}{2}$ cm. long, sulcate inside.

HAB. Giokusan.

Near *Acer lavigatum* WALL. and still more *A. Fargesi* and also some form of *A. oblongum* WALL., but quite easily distinguishable by the leaves, which are acuminate at the apex and acute at the base.

Acer caudatifolium HAYATA Materials for a Flora of Formosa p. 65.
Branches fusco-cinerascent, remotely leafy. Leaves ovately lanceolate, 8 cm. long, $3\frac{1}{2}$ cm. broad, acuminate at the apex, cordate at the base, obscurely 3-lobed crenately serrate, obscurely 5-nerved, central nerve 3-times long as lateral nerves, and 7-times long as basal nerves, primary lateral veins 5 on both sides, divaricate from the costa at an angle of 40° , nerves, veins and veinlets elevated below, rubescence, pallid below, petioles $1\frac{1}{2}$ cm. long, sulcate inside.

HAB. Giokusan.

The present *Acer* is very different from *A. caudatum* WALL., but very near *A. Davidi* FRANCH. This species is distinguishable from *A. Davidi* in leaves which have much larger serration.

Acer duplicato-serratum HAYATA Materials for a Flora of Formosa p. 65. Branchlets glabrous. Leaves orbicular in outline, 7 cm. in diameter, palmately 7-lobed, lobes lanceolate acuminate, duplicato-serrate, terminal lobe 5 cm. long, 1½ cm. broad, the lowest lobes shorter, 2½ cm. long, petioles 2 cm. long.

HAB. Taitō : Botankei.

Acer morrisonense HAYATA Materials for a Flora of Formosa p. 66. KOIDZ. in Journ. Coll. Sci. Imp. Univ. Tōkyō, XXXII-1. p. 16, t. 7. Branchlets glabrous, atro-purpurascent. Leaves ovately cordate, 5-nerved, 8 cm. long, 5 cm. broad, slightly 3-lobed, lobes inconspicuous, obtuse, margin duplicato-serrate, acuminate at the apex or cuspidate, tails serrulate, petioles nearly 3 cm. long.

HAB. Mt. Morrison.

Near *Acer Davidi* FRANCHET, but differs from it in having the leaves with three lobes, two of which are very obscure. The present plant is also very like *A. laxiflorum*. There is at Kew a specimen exactly like this, labelled “*Acer off Hookeri*, China No. 218.” It is very like *A. Hookeri*, but quite separable from it.

Acer oblongum WALL. in DC. Prodr. I. p. 593; BENTH. Fl. Hongk. p. 47; MAXIM. in Mél. Biol. X. p. 599; PAX. in ENGL. Jahrb. VII. (1886) p. 208; FORBES et HEMSL. Ind. Fl. Sin. I. p. 141; HENRY List Pl. Formos. p. 29; MATSUM. et HAYATA Enum. Pl. Formos. p. 96.

A. trifidum var.? HAYATA in MATSUM. et HAYATA Enum. Pl. Formos. p. 97.
HAB. Kelung.

Acer Oliverianum PAX. var. **Nakaharai** HAYATA Materials for a Flora of Formosa p. 68. KOIDZ. in Journ. Coll. Sci. Imp. Univ. Tōkyō XXXII.-1, p. 3. Branches pallid, glabrous. Leaves broadly orbicular in outline, 7 cm. long, 10 cm. broad, palmately 5-lobed, cordate at the base, lobes triangular, cuspidate, 3-3½ cm. long, 2 cm. broad or broader, margin serrulate, teeth acute, veins somewhat pilose below, but at last glabrous. Flowers cymose; cymes terminal on the apex of the two-leaved branchlets, 3-5 cm. long including peduncles, glabrous, 3-times branched, terminal pedicels 6 mm. long. Flowers ♀: sepals 5, roundly oblong, 2 mm. long, upwards hirsute on both sides, margin tomentosely ciliolate. Petals 5, rounded, 1¼ mm. long, margin obscurely denticulate or subentire, acute at the base. Stamens 7, rarely 5, 2 mm. long, filaments 1 mm. long, anthers oblong, 1 mm. long, obtuse at the apex, emarginate at the base. Ovary broadly dilate ¾ mm. long, 2½ mm. broad, hirsute, styles 2, entirely connate 2 mm. long, disc extrastaminal, incrassate, 7-5-lobate, lobes rounded. Carpels elliptico-oblong, cells 4 mm. long, wing dimidiately obovate, divaricate, 2½ cm. long including carpels, divaricate at an angle of 120°.

HAB. Chōsōkei.

The present variety differs from the type by the carpels which make an obtuse angle in their junction. Those of the type are arranged nearly in a line, i.e. in 180°.

Acer Oliverianum PAX. var. **Nakaharai** HAYATA form. **longistamina** HAYATA Materials for a Flora of Formosa p. 69. Flowers monœcious; cymes terminal at the apex of the two leaved branchlets. Fl. ♀. 4 mm. in diameter; sepals 5, rarely 6, oblong, somewhat pilose on both sides, 1½ mm. long. Petals 5, obovately oblong, 2 mm. long, rounded at the apex, margin obscurely denticulate or subentire, cuneate at the base, 2 mm. long. Stamens nearly

7.4 mm. long, filaments filiformed, apex very slender, but incrassate at the middle, 3 mm. long, anthers cordate, ovate, 1 mm. long, apex obtuse, cordate at the base. Rudiment of ovary minute with style 1 mm. long, very pilose, disks extra-staminal 7-8-parted, segments clavate, incrassate. Flowers ♀: calyx 5-6-parted, 2 mm. long, segments oblong, rounded at the apex. Petals the same as those of the male. Staminodes 0. Disks extra-staminal, 7-lobate. Ovary broadly dilate, pilose, styles short.

HAB. Ako, Kelung.

Acer Oliverianum PAX. var. **microcarpum** HAYATA Materials for a Flora of Formosa p. 69. Branches and leaves nearly the same as in the type. Flowers unknown. Carpels glabrous, $2\frac{1}{2}$ cm. long, cells slightly nervose, wings oblong, $2-2\frac{1}{2}$ cm. long, rounded at the apex, narrowed at the base, margin rounded on the exterior side, divaricate at an angle of $110^\circ-120^\circ$.

HAB. Shintiku: Daitōge.

Differs from the type in having extremely small carpels. I have examined the fruits of the variety and ascertained that although they are extremely small, they are quite in mature state, having albumen and embryo. This differs also from the other variety *Nakaharai* in the shape of wings. In this variety, the wings are usually oblong, while in the other, they are always semi-oblong or cultriformed.

Acer rubescens HAYATA Materials for a Flora of Formosa p. 66. KOIDZ. in Journ. Coll. Sci. Imp. Univ. Tōkyō XXXII-1, p. 21. Branchlets pallid, blackish in a dried specimen, leaves cordate in outline, or octagonal, slightly 5-lobed, lobes very short, cuspidate, terminal tail narrowed, linear, lateral ones serrulate, basal ones shortest, base cordate, margin (except tails) duplicitely serrate, 9-10 cm. long, 7 cm. broad, coriaceous, long petioled, petioles 6-7 cm. long.

HAB. Taitō, Bataiankei.

There is at Kew a specimen very much like this. The specimen is labelled "*Acer capillipes* MAXIM. Japonia, Nippon, Prov. Shinano, 1864, leg. TSCHONOSKI." The present plant differs from it in having leaves with larger serration, and longer side lobes which are placed in a little upper portion,

Also very near *A. rufinerve* from which it is distinguishable by the leaves with more rounded or slightly cordate base; from *A. erosum* Pax. by the quite glabrous leaves.

Acer serrulatum HAYATA Materials for a Flora of Formosa p. 70. Branches terete, fusco-rubescens, glabrous, leafy, dilated at the insertion of the leaves. Leaves palmately 5-lobed, roundly cordate in outline, $7\frac{1}{2}$ cm. long, 9 cm. broad, duplicitely serrulate, lobes equal, 5-nerved, nerves divaricate at an angle 60° , central nerve nearly as long as the lateral nerves or a little longer, $2\frac{1}{2}$ times long as the basal ones, terminal lobe lanceolate $7\frac{1}{2}$ cm. long, 2 cm. broad, acuminate at the apex, lateral lobes and basal ones all the same, petioles $2\frac{1}{2}$ cm. long, base slightly dilated.

HAB. Taitō: Bataiankei.

Near *Acer palmatum* THUNB.; but differs from it in the serration of the leaves.

Acer Tutcheri DUTHIE var. **Shimadai** HAYATA Materials for a Flora of Formosa p. 70; *Acer Oliverianum* PAX. subvar. *trilobatum* KOIDZ. in Journ. Coll. Sci. Imp. Univ. Tōkyō XXXII.-1, p. 34, Fig. 2. Branches strong, terete, fusco-nigricant, lenticellate, branchlets divaricate, laterally compressed, a little dilated at the insertion of the leaves. Leaves opposite, petiolate, broadly rhomboid, 5 cm. long, 7 cm. broad, 3-lobate, serrulate, nearly entire near the base, lobes nearly equal, (rarely with smaller basal lobes), terminal lobe broadly triangular, margin straight, $2\frac{1}{2}$ cm. long, 3 cm. broad, lateral lobes divaricate, straight on the upper side, but round at the base on the lower side, distinctly 3-nerved, central nerve 5 cm. long, lateral nerves $4\frac{1}{2}$ cm. long, divaricate, petioles 4 cm. long, incrassate at the base. Cymes with fruits at the apex of 2-4-leaved branches, 7 cm. long (including peduncles) peduncles 2-3 cm. long. Carpels glabrous, cells ovoid, $4\frac{1}{2}$ mm. long, slightly nervose, wings knife-shaped, $1\frac{1}{2}$ cm. long, 6 mm. broad, recurved at the inner side, rounded at the apex, outer side straight, divaricate at an angle 40° .

HAB. Shintiku, ~by. T. KAWAKAMI and Y. SHIMADA, 1907, Sept. (No. 5657).

Very near the type, but differs from it in having much smaller carpels and wings which are much less divaricate.

Species not yet Known to me.

Acer ovatifolium KOIDZ. in Journ. Coll. Sci. Imp. Univ. Tōkyō. XXXII.-1, p. 16. t. 6.

Acer Kawakamii KOIDZ. l.c. p. 15, t. 5.

Although I have not yet seen the specimens, so far as I can ascertain from the descriptions and figures here referred, *A. ovatifolium* and *A. Kawakamii* are very similar. I suspect if they may not be one and the same species.

Arbour, branches cinerascent, more or less lenticellate, glabrous. Leaves simple, long petiolate, coriaceous, oblong-lanceolate, 10-12 cm. long, $3\frac{1}{2}$ - $4\frac{1}{2}$ cm. broad, acuminate or caudate at the apex, attenuate at the base, quite glabrous and polished above, pallid or glaucous beneath, under microscope minutely lepidote and pubescent, primary veins arcuate, anastomosing at the extremities, petioles nearly 7-8 cm. long. Flowers white, racemosely paniculate. Panicles erect, 15 cm. long, 5 cm. broad, branches slender, 5-6 cm. long,

lateral branches divaricate, covered by ferruginous hairs, bracts and bracteoles minute, scaly, pedicels 1–3 mm. long. Sepals broadly rounded, nearly 2 mm. broad, ciliolate on the margin. Petals 5, 3-larger ones broadly rounded, $3\frac{1}{2}$ mm. long as broad, 2-smaller ones 1 mm. long, narrowed, 2-dentate at the apex, opposite the stamens. Stamens 2, filaments dilated, 2 mm. long. Staminodes 3, opposite larger petals, filaments very dilated. Disk small, irregularly dentate. Ovary glabrous, globose, 2 mm. long (including style) 2-celled.

Leaflets entire. *R. succedanea*.

Rhus intermedia HAYATA Fl. Mont. Formos. p. 73. Radicant or voluble. Leaves tri-foliolate, nearly 30 mm. long (including petioles), petioles 9–10 cm. long, slightly hairy, as long as terminal leaflets, lateral

leaflets oblong, acute, rounded at the base, oblique, 13 cm. long, shortly petiolulate, petiolules 3 mm. long, terminal leaflets long petiolulate, petiolules 3 cm. long, blades oblong-ovate, acute or shortly acuminate at the apex, 15 cm. long, $7\frac{1}{2}$ cm. broad, entire, costa and nerves pilose beneath, at last glabrous. Drupes broadly globose, compressed, shortly apiculate, 5 cm. broad as long, greenish or yellowish, covered with short setaceous hairs.

HAB. Morrison.

The present plant is in every respect very like *Rhus Toxicodendron* LINN., but differs from it in having densely bristled fruits. The species appears to be referable to *Trichocarpeæ*, on account of its bristled exocarpium. It is also to be referable to *Venenatæ* by the mesocarpium and general characters of the fruit. The plant may better be placed between the two sections. Bristled fruits are sometimes found in the Japanese *R. Toxicodendron*, though they are not so conspicuous as in the Formosan species.

Leaves trifoliolate, pubescent, petiolate, petioles 3 cm. long, longer than leaflets, leaflets subsessile, terminal one longer than the lateral ones, oblong or obovate, retused or minutely mucronate, 3 cm. long, 2 cm. broad. Spikes axillary on the upper branchlets, 7-8 cm. long, pedunculate. Flowers 6 mm. long, pedicellate, pedicels 3 mm. long. Calyx base minutely 2-bracteate, (bracts subulate), campanulate 3 mm. long, 5-lobate, lobes as long as the tube, triangular, acute, 1½ mm. long, 1 mm. broad, pubescent. Standard orbicular, clawed, (blade 5 mm. long, carinate outside at the middle, claws 1½ mm. long) villose inside, strongly reflexed above the claw, 2-callose; wings obovate, 6 mm. long; keel incurved 7 mm. long, rostrate. Ovary stipitate, (stalk 1½ mm. long), 2-ovulate, villose, style abruptly inflexed at the middle, more or less longitudinally barbate inside on the upper portion. Stamens connate. Legumen pedicellate, nodding, pressingly villose, obovate or globose 6 mm. long, 4 mm. broad, obliquely inflated at the apex, (style rostrate), 2-seeded.

HAB. Akō: Kōtanshō.

Near *C. Trifoliastrum* WILLD.; but differs in having much larger obovate folioles and larger flowers.

Dichotomous Key to the Formosan Species.

Calyx-segments rotundate, long ciliate. *S. Nagasawai*.

Calyx-segments acute, not or slightly ciliate. *S. sensitiva*.

Smithia Nagasawai Materials for a Flora of Formosa p. 76. Shrubby, ascendent, branches straight, slender, remotely branched, glabrous, striate, fusco-rubescens, terete, branchlets slender, remotely foliate. Leaves alternate deciduous, pari-pinnate, broadly ovate in outline, $1\frac{1}{2}$ cm. long, with a seta on the apex, seta 3 mm. long, pinnae subopposite, 5-6-juged, linear-oblong, 1 cm. long, $2\frac{1}{4}$ mm. broad, margin remotely ciliato-setulose, rounded and setulose at the apex, (seta $\frac{2}{3}$ mm. long), strongly oblique at the base, acute on the upper side, roundly cordate on the lower side, glabrous above, remotely setulose on the costa beneath, (seta $1\frac{1}{2}$ mm. long), petiolules short $\frac{1}{4}$ mm. long, upper pinnae smaller than the lower ones, pinnae 2 mm. remote, exstipellate; petioles 2-3 mm. long, petioles and rhaches narrowly winged, beneath beset with long setæ, setæ 2 mm. long, stipules membranaceous acutely ovate, 5 mm. long, multinerved, margin ciliato-serrulate, long auriculate at the base on the lower side, (auricles narrowed 2 mm. long) truncate at the

apex. Racemes short, 3–5 mm. long, recurved, axillary near the apex of the branchlets, pedunculate, peduncles 1–2 cm. long, pedicels $1\frac{1}{2}$ mm. long, 1-bracteate at the base, (bracts hyaline ovately-narrowed, 3 mm. long, margin ciliately setose, very oblique), 2-bracteolate at the apex, bracteoles ovately acute, 5 mm. long, acute on both sides, setose on the margin, (setæ $1\frac{1}{2}$ mm. long), setulose outside, glabrous inside. Calyx 2-parted, upper-segment broadly ovate, plicate, 6 mm. long, 7–8 mm. broad, rotundately emarginate at the apex, carinate at the middle, margin upwards ciliately setulose, entire downwards, multinerved, setulose outside on the carina; lower segment obovate, 6 mm. long, $3\frac{1}{2}$ mm. broad, ciliately setose, entire on the margin. Petals not known. Pods included within the calyx, 2 times spirally recurved, constricted between articles to the lower sutures, articles 7–8, obliquely broadly globose, $1\frac{1}{2}$ mm. broad, minutely irregularly maculately punctate, carinate at the lower suture, upper suture rounded, lower suture straight or slightly incurved. Seeds reniformed, laterally compressed, $1\frac{1}{2}$ mm. broad, $1\frac{1}{4}$ mm. long.

HAB. Kōdenshō.

The present plant bears some resemblance to *Smithia ciliata* ROYLE, from which it is distinguishable by the truncate rather round apex of the bracts. The bracts of *S. ciliata* are rather acute on the apex.

26. *Dumasia* DC.

Dumasia bicolor HAYATA Fl. Mont. Formos. p. 75. Herb volatile entirely pubescent. Leaves bicolour, pubescent, pinnately 3-foliate, 12 cm. broad, 18 cm. long, long petioled, petioles base incrassate, 9 cm. long, lateral leaflets shortly petiolulate, petiolules 3 mm. long, blades roundly ovate, base truncate or acute, rounded at the apex, minutely aristately mucronate, 3-

nerved, terminal leaflet long petiolulate, (petiolules $2\frac{1}{2}$ cm. long), blade ovate, base acute, larger, $6\frac{1}{2}$ cm. long, $4\frac{1}{2}$ cm. broad, stipules setaceous, stipels filiformed, minute, sometimes upper leaves simple. Flowers arranged on a axillary racemes which are 10 cm. long, bracts small, narrowed, bracteoles minute. Calyx-tube cylindraceous, 9 mm. long, base gibbose on the back, mouth strongly oblique, truncate, acute on the front. Standard obovate, emarginate at the apex, 14 mm. long, 7 mm. broad, broadly unguiculate, blade as long as the claw, inflexed backwards above the middle, base auricled and narrowed reaching the claw; wings long unguiculate, 14 mm. long, blades oblong, claws linear, 2-times as long as the blades, adherent to the keel; keel shorter than wings, obtuse. Stamens, one free, others connate; anthers uniformed. Ovary villose, substipitate, stalk 1 mm. long; style filiformed, erect, dilate above the middle, inflexed towards the apex, subulate, beardless, stigma terminal. Pod subsessile, villose, always 1-seeded.

HAB. Suizan, Morrison.

The present plant is, in all respects, like *D. villosa* DC. But in this species, the seed is always one in each pod and the standard has a distinct spurs on both sides of the lamina. Accordingly, I think the plant is specifically separable from *D. villosa* DC. The leaves of the specimen, upon which the above description is based, are of a thinly hairy form. Here is another form with villose leaves which are much smaller than the leaves of the other form. The villose form seems to be a young stage of the other.

Prunus taiwaniana HAYATA (Pl. XXI.) Materials for a Flora of Formosa p. 87. Branches virgate, bark dark-ashy, glabrous, lenticellate. Leaves hysteranthous membranaceous, slightly pubescent or glabrous, oblongly obovate, 6 cm. long, 23 mm. broad, cuneately acuminate at the apex, cuneately acute at the base, serrulate on the margin, glabrous, or slightly pubescent above, but densely pubescent beneath on the costa and veins, petioles 6 mm. long, pubescent, stipules linear-lanceolate, minute. Flowers 5-6-clustered, perulate, perules scaly, rounded, glabrous, pedicels 1 cm.

long, pubescent. Calyx-tube pubescent, urceolately tubuliformed, 4 mm. long, limb 5-lobed, lobes patent, narrowed, 3 mm. long, acuminate, glanduloso-serrulate on the margin. Petals 5, oblong, 8 mm. long, 4 mm. broad, 2-lobed at the apex, (lobes $1\frac{1}{2}$ mm. long, obtuse) or emarginate at the apex. Ovary ovate, 1 mm. long, glabrous, style $7\frac{1}{2}$ mm. long, sparingly barbellate downwards, but glabrous towards the apex, stigma capitellate. Fruits ellipsoid 6 mm. long, 5 mm. broad, apiculate, with calyx-cupule at the base, long pedunculate, peduncles 2 cm. long.

HAB. Nanto : Musha.

Somewhat near *Prunus pendula* MAXIM., but distinguishable by the smaller flowers with narrower and more deeply emarginate petals.

2. *Prinsepia* ROYLE.

Prinsepia utilis ROYLE HAYATA Materials for a Flora of Formosa p. 105. Branches greenish, glabrous, spinous, spines alternate, $1\frac{1}{2}$ cm. long, axillary, solitary. Leaves greenish, alternate, petiolate, oblong, lanceolate, $4\frac{1}{2}$ cm. long, $1\frac{1}{2}$ cm. broad, subentire or obscurely subcrenate, acute shortly aristate at the apex and shortly attenuate at the base, petioles 7 mm. long. Flowers shortly racemose or 3-5-clustered, racemes axillary, 2-3 cm. long, few-flowered, pedicels 1 cm.-2 cm. long. Flowers $1\frac{1}{2}$ cm. in diameter. Sepals 5, very unequal 2-outer ones smallest, rounded, 2 mm. long, incrassate, 3-inner ones larger, rounded 4 mm. long, margin scarious. Petals 5, ovately rounded, 6 mm. long, 5 mm. broad, rounded at the apex, shortly obtuse at the base. Stamens ∞ inserted on the margin of the disc, filaments 2 mm. long, anthers 2-celled, connectives broader, emarginate at the apex. Ovary globose, 1 mm. long, style 2-3 mm. long, lateral, spirally recurved or ascendent, stigma capitato-peltate. Fruits not yet known.

Very interesting genus closely allied to Celastrineæ.

HAB. Ganzan, Mt. Morrison, the central mountain ranges.

DISTRIB. Temperate Himalayas.

3. *Spiraea* LINN.*Dichotomous Key to the Formosan Species.*

- (1) Flowers in terminal cymes (2)
 - Flowers in axillary umbels. *S. prunifolia*.
- (2) Plants more than 30 cm. high. *S. formosana*.
 - Plants small, less than 20 cm. high, leaves very much smaller. *S. morrisonicola*.

Spiraea formosana HAYATA (Pl. XXII.) Materials for a Flora of Formosa p. 88. Branches straight, fulvescent, densely pubescent. Leaves oblong, or oblong-ovate, 4 cm. long, $2\frac{1}{2}$ cm. broad, acute at the apex, roundly acute at the base, duplicitely serrulate on the margin, (serrulas callose at the apex), costas and veins impresse above elevated below, primary veins 5 on both sides, nearly straight, ascendent, reaching the apex of the serrulas, nearly glabrous on both sides, pallid-glaucous beneath, petioles 2 mm. long. Terminal cymes 5 cm. long, 8 cm. broad, branches and pedicels pubescent, bracteoles subulate. Calyx broadly campanulate, $1\frac{1}{2}$ mm. long, 3 mm. broad, 5-lobate, lobes patent, triangular, pubescent outside, glabrous inside. Petals 5, broadly rounded, rounded or slightly emarginate at the apex, obtuse at the base. Stamens 20, exserted, 4 mm. long, inserted on the throat of the calyx. Glands of disc nearly 10, inserted on the throat, broadly narrowed, $\frac{1}{2}$ mm. long. Carpels 5, subfusiformed, $2\frac{1}{2}$ mm. long, hirsute on the innerside, styles persistent, 1 mm. long.

HAB. Randaisan.

Near *Spiraea japonica* LINN., but differs from it in having duplicitely serrated leaves and less hairy smaller calyx; also near *Spiraea bella* from which this differs in having ovate acuminate or acute leaves.

Spiraea formosana HAYATA var. *brevistyla* HAYATA Materials for a Flora of Formosa p. 89. Calyx-lobes nearly obsolete, or very much obtuse. Carpels ovoid when ripened, 2 mm. long, shortly rostrate at the apex, or not rostrate, glabrous, other things the same as the type.

HAB. Mt. Morrison.

This variety differs from the type in having much shorter carpels, nearly obsolete styles, and very much shorter calyx-lobes.

Spiraea morrisonicola HAYATA (Pl. XXIII.) Materials for a Flora of Formosa p. 89. Shrub dwarfish glabrous. Leaves alternate, subsessile, ovate, obtuse at the apex, acute at the base, or cuneate, 1½ cm. long, denticulate from the middle upwards, entire towards the base, veins impressed above, prominent beneath. Fruits on terminal racemose cymes. Carpels 2 mm. long, shortly beaked.

HAB. in Mt. Morrison.

The present plant is distinguished from other species of the genus by its small and glabrous form.

Spiraea prunifolia SIEB. et ZUCC. fl. simplici, MATSUM. et HAYATA Enum. Pl. Formos. p. 119, t. 12, et HAYATA Fl. Mont. Formos. p. 78. Shrub. Leaves alternate, petiolate, elliptical, 13–18 mm. long, 9–12 mm. broad, entire downwards, serrulate upwards, (serrulas acute), subglabrous or sparingly pubescent above, sericeo-tomentose beneath, petioles 2–3 mm. long. Flowers axillary, 5–6-clustered, pedicels 10–15 mm. long, pubescent. Flowers when opened 8 mm. in diameter. Calyx persistent; tube urceolately campanulate 5-lobed at the middle, lobes ovate, acute. Petals 5, inserted on the mouth of the calyx, orbicular, shortly clawed, slightly emarginate at the apex. Stamens ∞ , nearly 20, 2-seriatelv inserted at the throat of the calyx, filaments glabrous, base 2-glanduliferous, anthers 2-celled, introrse. Disc carnose, tomentose, adnate to the calyx-tube. Carpels 5, inserted at the base of the calyx, shortly stipitate, free, styles subterminal subgeniculate, stigmas capitate. Ovary 1-celled, ovules ∞ . Carpels when matured coriaceous dehiscing by the ventral suture. Seeds pendulous, linear.

HAB. Mt. Morrison. Nantō: Hinokiyama. Toroku, Kūreikyaku, Rin-kiho.

DISTRIB. China throughout, Japan and Corea.

The original description in "SIEB. et ZUCC. Fl. Jap. p. 131" is written from a plant with double flowers which is very common in Japan proper. No specimen with simple flowers has ever been represented here at Tōkyō.

I thought this simple flowered plant to be a new species which has a close affinity to *S. prunifolia* SIEB. et ZUCC. But I am quite convinced by Mr. T. MAKINO that the specimen is nothing but a simple flowered form of the common Japanese species. Mr. PALIBIN has also written in his "Conspectus Fl. Koreæ I. p. 73" that the Corean species has all simple flowers, while those of Japan and China are all double flowered form.

Rubus elegans HAYATA in Tōkyō Bot. Mag. XX. p. 74, et Fl. Mont. Formosa p. 79, t. 4. Stem very short, nearly shrubby at the base, simple, suberect 1- rarely 2-flowered. Leaves all radical, oblong or oblong-lanceolate, with petioles 6-7 cm. long, 2 cm. broad, (petioles 1.5 cm. long), pinnate 13-15-foliolate, leaflets obovate, 1-1.5 cm. long, $\frac{1}{2}$ cm. broad, terminal one sometimes 3-lobate, serrate, serras acute, aculeate on the petioles and costas, stipules adnate, subulate, linear, nearly 1 cm. long. Flowers larger, pedunculate, peduncles 5-6 cm. long, 1-bracteate, bracts minute, acute, 2 mm. long. Flowers patent, 22 mm. in diameter. Calyx-lobes ovately triangular, aculeate acuminate, 8 mm. long, outside pubescent. Petals broadly ovate, 9 mm. long, obtuse at the apex, base shortly clawed. Stamens numerous, filaments flattened glabrous. Syncarp ovately globose, 1 cm. long or longer. Receptacle ovately globose.

HAB. Ganzan.

Rubus fasciculatus DUTHIE (Pl. XXV.) in Ann. Bot. Gard. Calc. IX. p. 39; HAYATA Materials for a Flora of Formosa p. 90, et Suppl. 449. Branchlets terete, more or less sulcate, covered by soft long bristles and also with soft pubescent coat, (bristles 3 mm. long, very slender transversely spreading), and remotely beset with prickles, prickles recurved downwards, 2-3 mm. long, laterally compressed, broadened at the base. Leaves trifoliolate, ovate in outline, 15 cm. long including petioles, 8-9 cm. broad, petioles and petiolules as downy prickly and bristly as the

branchlets, common petioles 3 cm. long, as long as the terminal petiolules, terminal leaflet nearly rounded, 9 cm. long, 7 cm. broad, shortly cuspidate at the apex, quite rounded at the base, margin duplicitely serrulate, teeth shortly cuspidate at the apex, more or less recurved; leaflets of lateral pair smaller, rounded, 4 cm. long as broad, very shortly stalked or nearly sessile; veins impressed above, prominent beneath, primary lateral veins 7-8, rather divaricate, secondary ones obliquely transverse; blades thinly coriaceous, glabrous on both surfaces except on the midribs and veins which are more or less downy and prickly, reddish brown above, pale brown beneath in a dried specimen; stipules subulate or linear, 9 mm. long. Flowers axillary or terminal, solitary or clustered; bracts many at the base of pedicels; bracts linear-lanceolate, acuminate, 7 mm. long, 1½ mm. broad, pubescent; pedicels 1 cm. long, downy and bristly; fructiferous calyx half-closed pubescent on both sides, cupule sericeously downy, 8 mm. in diameter; calyx-lobes 5, ovate, 7 mm. long, 4½ mm. broad at the base, mucronate at the apex, sparingly bristly at the base outside, stamens on the margin of the cupule, 1-seriate, filaments dilate, complanate, narrowed at the apex. Carpophore globose more or less elongate, elevated, 5 mm. long, pubescent. Carpels in a dried specimen reticulately rugulose, styles 3 mm. long, persistent base hairy; stigma terminal.

HAB. Taitō : Koshiron.

When I was at Kew, I compared the plant with the type of DUTHIE's plant and found that they are quite identical, although there are some small differences between them. The calyx of our plant is half-closed after flowering, but in the Indian plant, as we see in the figures cited above, it is nearly reflexed. The prickles in the latter are much fewer and the leaves are larger.

Rubus hirsutus HAYATA = *Rubus rosæfolius* SM. var. *hirsuta* HAYATA Fl. Mont. Formosa p. 81. Branchlets aculeate, pilose, hairs strong, prickles smaller, falcate, acuminate. Leaves ovately acuminate, hirsute, with petioles 5-6 cm. long, 5-foliolate, lateral leaflets subsessile or shortly petiolulate, oblong, elliptical, 1 cm. long or longer, dentate, teeth acute, terminal leaflet ovately lanceolate, duplicito-dentate, teeth acuminate, petiolules 5 mm. long, aculeate on petioles and costas; stipules subulate, ciliolate. Flowers terminal or lateral, often solitary, pedunculate. Calyx-lobe ovately triangular, long caudate, tails linear, 6 mm. long, outside pubescent. Petals ovate, 11 mm. long, 8 mm. broad, rounded at the apex, acute at the base. Stamens numerous, filaments flattened. Fruits yet unknown.

HAB. Mt. Morrison.

Rubus Kawakamii HAYATA (Pl. XXVI), Materials for a Flora of Formosa p. 91. Branches fusco-pubescent or fuscent, slender, at first soft tomentose, at last glabrous, somewhat straight, shortly aculeate, prickles 1 mm. long, dilate at the base. Leaves long petiolate, oblong, oblong-ovate or elliptically ovate, 12 cm. long, 5 cm. broad, acuminate at the apex, roundly ovate at the base, margin obscurely remotely serrulate duplicitely serrulate, very variable, obscurely 3-nerved at the base, costas and veins slightly impressed above, elevate beneath, primary veins including basal nerves 7-8 on each side, nearly parallel, divaricate from the casta at an angle of 30°, glabrous above, tomentose beneath, glabrous at last, minutely remotely aculeate on the costa beneath, petioles slender, 2½ cm. long, canaliculate above, aculeate beneath, stipules deciduous, not yet seen. Cymes umbellate, a few-flowered, flowers 5-6, long pedicellate, pedicels 2 cm. long, densely

pubescent, bracteate at the base, bracts ovate, 5 mm. long. Calyx campanulate, densely villosely pubescent outside, aculeate, (bristles $\frac{1}{4}$ mm. long, acute or dilately truncate at the apex), shortly villosely pubescent inside, cupules 9 mm. in diameter, lobes ovate, 9 mm. long, suddenly acuminate at the apex, margin laciniate, but entire from the middle to the base. Petals 5, obovate, shortly villose on both surfaces, $\frac{1}{3}$ as long as the calyx-lobes. Carpophore densely barbate. Carpels premature oblong, 1 mm. long, recurvate, styles 5 mm. long, hirsute at the base. Drupels when mature obovate 3 mm. long, $2\frac{1}{2}$ mm. broad.

Near *R. malifolius* FOCKE; but differs from it in having more acute or even acuminate and usually tri-nerved leaves and cymose or even umbellate flowers. In *R. malifolius*, the leaves are pinninerved and the flowers are in racemes. This is also near *R. Swinhœi* HANCE, which differs from this plant in having quite glabrous leaves, and not prickly pedicels and calyx; also distinguishable from *R. sepalanthus* FOCKE by trinerved leaves and umbellately contracted racemes.

Potentilla grandiflora LINN.; WAGNER Deut. Fl. ed-3, p. 399; THOMÉ Fl. Deut. Ost. u. Schw. III. p. 70.

HAB. Mt. Morrison.

DISTRIB. Extends to Europe, northern India, central China, Japan, eastern Siberia and the Kurile and Aleutian islands.

The species seems to vary over a wide range and especially so in the size of flowers.

Potentilla leuconota DON var. **morrisonicola** HAYATA Fl. Mont. Formos. p. 83. Stem sericeo-pilose, erect, nearly 15 cm. long. Leaves subradical pinnate, oblanceolate in outline, obtuse, 10 cm. long, nearly 19-foliolate, leaflets sessile, obovate, obtuse, 1 cm. long, sharply dentate, pilose above, sericeously pilose, petioles adpressingly pilose, stipules scaly, nearly 3 cm. long, adnate to the petioles at the base, entire. Cauline leaves nearly the same as radical one, much smaller, a very few, often 1-2 on the middle of

the stem. Flowers 9-8-clustered at the apex of the stem, nearly subumbellate, 1-2-bracteate, pedicels 1 cm. long. Flowers patent, 8 mm. in diameter, bracteoles narrowed, entire. Calyx-lobes ovate, acute, sericeous. Petals broadly obovate, base slightly narrowed, rounded at the apex. Stamens 10 or (-20?). Stones nearly 15, glabrous.

HAB. Mt. Morrison.

DISTRIB. The type is rather of the alpine character, being found in high mountains of Asia such as the Himalaya and those of Borneo and western central China.

The present plant differs from the type mainly in the absence of whorled leaves at the base of an umbel.

Rosa morrisonensis HAYATA (Pl. XXX.) Materials for a Flora of Formosa p. 97. Shrubs very spinose, spines whitish, straight, subulate, branched, branches patent, slender. Leaves pinnate, 7-11 foliolate, glabrous elliptical in outline, 5 cm. long including petioles, 2½ cm. broad, petioles slender, minutely aculeate, leaflets subsessile, broadly obovate or nearly rotundate, 13 cm. long, 7 mm. broad, denticulate at the middle, dentate towards the apex, teeth acute, stipules adnate to the petioles, free at the apex, acute, glabrous, glanduloso-serrulate, serrulas sharp. Flowers nearly racemose along the branchlets, shortly pedunculate, peduncles 1½ cm. long, gradually dilate at the apex, reaching the calyx-tube. Calyx-tube (after flowering) pyriformed, 8 mm. long, contracted at the apex, attenuate at the base, lobes entire lanceolate, long acuminate, lanato-pubescent inside, sparingly pubescent outside, margin sparingly glandulose. Petals not yet known. Carpels 4-5, trigonous 5 mm. long, hirsute at the apex, styles persistent.

HAB. in Mt. Morrison.

This *Rosa* is near *R. Willmottiae* HEMSL. and also *R. Webbiana* WALL.; but differs from the both in having larger lobes of calyx and more acutely serrated leaves. Also near *R. xanthiana* LINDL., but quite separable by the narrower sepals and more acutely serrated leaves.

10. *Pyrus* LINN.

Dichotomous Key to the Formosan Species.

- (1) Leaves simple. (2)
 - Leaves compound. (3)
 - (2) Leaves roundly ovate shortly cuspidate, fruits small, 7 mm. in diameter *P. Kawakamii*.
 - Leaves elongately ovate, elliptical acuminate or acute, fruits larger depressingly globose, $3\frac{1}{2}$ cm. in diameter. *P. formosana*.
 - (3) Leaflets sharply serrulate, fruits usually 4-celled. *P. aucuparia* var. *randaiensis*.
 - Leaflets less sharply serrulate, fruits 3-celled. *P. aucuparia* var. *trilocularis*.

Pyrus aucuparia var. **randaiensis** HAYATA Materials for a Flora of Formosa p. 98. Branches strong, ashy or dark-purple-rubescence, cicatrices of leaves transversely ring-like, lenticels globose. Leaves pinnate, narrowly elliptical in outline, 13 cm. long, 4 cm. broad, lateral pinnae 8-9-juged, lower and upper ones shorter, middle ones longer, pinnae sessile, lowest ones oblong, 2 cm. long, 12 mm. broad, middle ones oblong-narrowed $4\frac{1}{2}$ cm. long, 12 mm. broad, acuminate at the apex, obliquely rounded at the base, obtuse on the upper side, longer in the lower side, roundly cordate, costas impressed above, elevated beneath, lateral veins impressed above, elevated beneath, hirsute beneath on the costas and veins, glabrous on both surfaces, pallid beneath, margin sharply serrulate, serrulas ascendent, terminal pinna oblong-obovate, 3 cm. long, 13 mm. broad, interjuges 1 cm. long, shortly stipellate, stipels subulate, rhaches winged, glabrous and sulcate above ferrugineo-hirsute beneath, petioles 4 cm. long, glabrous above, winged,

sulcate, dilate at the base, stipules linear, 9 mm. long, connate at the base, somewhat fleshy. Leaf-buds acutely ovate, perules broadly ovate, roundly apiculate at the apex, glabrous. Cymes terminal 8 cm. long, 9 cm. broad, peduncles and pedicels subglabrous or sparingly hirsute, rubescent, lenticels elongate, pedicels 8 mm. long. Fruits globoso-pyriformed, 5 mm. in diameter, generally 4-celled, rarely 3- or 5-celled, calyx-lobes persistent, lobes triangular, obtuse.

HAB. Randaizan.

There is nothing like this at Kew. It is easily distinguishable by the minutely and very shapely toothed leaves.

Pyrus aucuparia var. **trilocularis** HAYATA Materials for a Flora of Formosa p. 99. Fruits nearly globose, nearly 1 cm. in diameter, 3-celled, cells 1-2-seeded, or reduced to 1-seeded. Seeds compressingly oblong, $3\frac{1}{2}$ mm. long, reddish, otherwise the same as the type.

HAB. Seizan.

Very like the type, but differs in having 3-celled fruits.

Pyrus Kawakamii HAYATA Materials for a Flora of Formosa p. 99. Branchlets dark-purpurascent, glabrous, longitudinally rugulose, noted with annular leaf-traces. Leaf-buds cylindrical, 12 mm. long, perules imbricate, triangular, obtusely acute, margin ciliate. Leaves near the apex of the branchlets approximately 3-4-fascicled, long petiolate, coriaceous, patent, broadly oblong or ovately oblong, 7 cm. long, 5 cm. broad, shortly cuspidately acute at the apex, or acute, acute at the base, or obtuse, crenulately serrulate on the margin, teeth obtuse, glabrous on both sides, veins slightly elevated, pallid beneath, petioles 3 cm. long. Fruits racemose, racemes 1 cm. long, pedicellate, pedicels longer, 2 cm. long. Drupes globose, 9 mm. in diameter, rubescent when dried, sparingly punctate, (points subalbican minute, globose), 2-3-seeded. Seeds quadrantiformed convexed on the back, 4 mm. long, 2 mm. broad, obtuse on both ends, dark-reddish purpurascent.

HAB. Nantō.

Very like *P. sinensis* from which this is distinguishable by the leaves which are acute at both ends. Also near *P. Prattii* HEMSL. and *P.*

baccata from which this differs in having much smaller fruits and oblong leaves acute at both ends.

Pyrus formosana KAWAKAMI et KOIZUMI in HAYATA Materials for a Flora of Formosa p. 100; KAWAKAMI in Tōkyō Bot. Mag. XXV. p. 146. Branches longitudinally rugose, fusco-purpurascent or cinerascent, noted transversely with leaf-traces. Leaf-buds ovate, 5 mm. long, perules triangularly acute, glabrous. Leaves 2-3-clustered at the apex of branches, patent, membranaceo-coriaceous, elongately oblong or ovately oblong, 9-10 cm. long, 4 cm. broad, acute or acuminate at the apex, acute at the base, glabrous on both surfaces, pallid beneath, veinlets transversely elevated primary veins 9-10 on each side, inconspicuous above, elevated beneath, costas sulcate above, prominent beneath, petioles 3 cm. long, sulcate above, glabrous. Fruits apple-like, depressingly globose, 3 cm. long, $3\frac{1}{2}$ cm. broad, yellowish when matured.

HAB. Rinkiho.

This differs from *P. Mallus* in the serration and the shape of the leaves.

11. *Cotoneaster* MEDIK.

Dichotomous Key to the Formosan Species.

- (1) Flowers in cymes, cymes terminal. *C. formosana*.
Cymes on shortened lateral branches. (2)
- (2) Stones completely included. *C. taitensis*.
Stones partly included, the upper half exposed. *C. Koizumii*.

Cotoneaster formosana HAYATA Materials for a Flora of Formosa p. 101. Branches straight, rubescens, cinereo-pubescent, at last glabrate, sometimes with branches turning to the spines. Leaves 3-5 clustered at the apex of the leaves, shortly petioled, oblong-obovate, 23 mm. long, 12 mm. broad, truncately emarginate at the apex, truncate at the base, quite entire canescently pubescent, at last glabrous above, pallid beneath, petioles 4 mm. long. Flowers white? 7 mm. in diameter, corymbose, (corymbs bracteate), at the axils of the upper leaves, or terminal. Calyx $4\frac{1}{2}$ mm. in

diameter, lobes 5, triangular, pilose, tube very pilose inside. Petals 5, orbicular, 3-4 mm. long as broad, emarginate at the apex, slightly contracted at the base. Stamens ∞ . Carpels 5, mostly pilose, styles glabrous.

HAB. Taitō.

Cotoneaster Koizumii HAYATA Materials for a Flora of Formosa p. 101. Branches dark ashy, longitudinally rugose, branchlets divaricate, spinose towards the apex, densely pubescent, (hairs soft), leafy. Leaves alternately 2-3-clustered towards the apex of the branchlets (leafy branches very short $\frac{1}{2}$ mm. long), obovate or spatulately obovate, 18 mm. long, 11 mm. broad, roundly emarginate and shortly apiculate at the apex, cuneately obtuse at the base, quite entire, coriaceous, nearly shining above, pallid beneath, slightly reddish on both surfaces when dried, petioles 3 mm. long. Cymes terminal on the apex of the lateral branchlets, sessile, $2\frac{1}{2}$ cm. long, 3 cm. broad, glabrous. Drupes depressingly globose, 4 mm. long, 5 mm. broad. Calyx (fructiferous) suburceolate-globose, lobes persistent, broadly triangular, nearly including stones. Stones 5, naked at the apex, roundly quadrantiformed $2\frac{1}{2}$ mm. long, $1\frac{3}{4}$ mm. broad, fusco-rubescence.

HAB. Pinan.

The present plant is very distinct from other species of the genus, in having obovate or even spatulate leaves which are emarginate at the apex. From *C. formosana*, it differs in the inflorescence on the shortened branchlets standing nearly alternately on a side-branch.

Cotoneaster taitensis HAYATA Materials for a Flora of Formosa p. 102. Shrub, branches very ashy-dark, nearly shining, longitudinally rugose, branchlets divaricate shortly sparingly pubescent, spines simple 1 cm. long. Leaves alternately approximately disposed on the shortest lateral branchlets, or 3-4-clustered on the apex of the very short branchlets, obliquely spatulate or spatulate, $3\frac{1}{2}$ cm. long, 1 cm. broad, truncately emarginate at the apex, shortly apiculate, entire on the margin, slightly pubescent, at last glabrous, cuneately narrowed at the base, coriaceous, nearly shining above, pale beneath, rubescence when dried, petioles 3 mm. long. Fruits paniculate, panicles terminal on the short branchlets. Drupes globose, $\frac{1}{2}$ cm.

in diameter with 5-stones, stones quadrantiformed, $3\frac{1}{2}$ mm. long, apiculate.

HAB. Taitō.

This species is very near *C. formosana*, but differs from it in the inflorescence.

12. *Photinia* LINDL.

Dichotomous Key to the Formosan Species.

- (1) Leaves entire. *P. niitakayamensis*.
- Leaves more or less toothed. (2)
- (2) Leaves large, over 15 cm., grossly dentate. *P. deflexa*.
- Leaves smaller, minutely or obscurely serrate or serrulate. (3)
- (3) Leaves elongately obovately elliptical, serrulate, shortly acute, coriaceous. *P. serrulata*.
- Leaves lanceolate chartaceous, acuminate, minutely serrulate *P. taiwanensis*.

Photinia deflexa HEMSL. Ann. Bot. IX. p. 153; HENRY List Pl. Formos. p. 41; MATSUM. et HAYATA Enum. Pl. Formos. p. 129.

HAB. Taitōchō, Takow, Bankinsing, South Cape.

Photinia niitakayamensis HAYATA Materials for a Flora of Formosa p. 103. Branches dark-ashy, lenticels globose, minute, longitudinally rugose, branchlets slightly tomentose or pubescent, leafy. Leaves oblong-ob lanceolate or lanceolate, chartaceous, $7\frac{1}{2}$ cm. long, $2\frac{1}{2}$ cm. broad, acutely acuminate at the apex, shortly aristate, or calloso-aristate at the apex, obtuse or acute at the base, entire, slightly hirsute on the costas and veins above, at last glabrous, costas slightly impressed above, prominent beneath, lateral veins very slender on both surfaces, petioles $2\frac{1}{2}$ cm. long, terete, slightly hirsute, abruptly dilate at the base, stipule-formed. Flowers cymose, cymes terminal 5 cm. long as broad, hirsute. Fruits globose, 8 mm. long, 5-celled, carpels hirsute, slightly exserted, calyx-lobes triangular, 1 mm. long as broad, hirsute and persistent.

HAB. Ganzan.

The present plant was first identified with *P. integrifolia* LINDL. by Prof. J. MATSUMURA in "Tōkyō Bot. Mag. XII. p. 55," then followed by myself in

"Enum. Pl. Formos. p. 130," and finally identified with *P. Notoniana* WIGHT et ARN. var. *eugenifolia* HOOK. by Mr. G. KOIZUMI in "Tōkyō Bot. Mag. XXIII. p. 170. While studying at Kew, I examined the types of the species above mentioned, and found that they are not at all in accordance with the present plant. They differs from our plant besides many other points in having much larger and thicker or even coriaceous leaves.

Photinia serrulata HEMSL. Ind. Fl. Sin. I. p. 263; HAYATA Materials for a Flora of Formosa p. 104.

HAB. Taitō, Daishinzan.

So far as the external comparison is concerned, the present plant is quite referable to this species. My plant lacks flowers.

Photinia taiwanensis HAYATA (Pl. XXX.) Materials for a Flora of Formosa p. 104. Branches ashy-dark, or fusco-purpurascent, longitudinally rugulose, lenticels minute, branchlets slender, albo-tomentose. Leaves obovately-oblong or oblanceolate, 8 cm. long, 3 cm. broad, cuspidately acuminate at the apex, acute at the base, minutely serrulate upwards, serrulas minute, remotely serrulate downwards, quite entire near the base, chartaceous, at first covered with soft tomentum, at last nearly glabrous, costas and veins slender, petioles 7 mm. long. Flowers shortly umbellate, cymose, cymes terminal, 2 cm. long, as broad, pedicels 1 cm. long, bracts subulate, 2 mm. long. Calyx campanulate, glabrous, $2\frac{1}{2}$ mm. long, lobes patent, triangular or broadly rounded, mucronate, 1 mm. long, $1\frac{1}{2}$ mm. broad. Petals 5, rounded, $3\frac{1}{2}$ mm. long as broad, roundly truncate or acute subemarginate or not emarginate at the apex, abruptly cuspidately obtuse near the base, stamens nearly 15, filaments slightly dilate at the base. Ovary nearly inferior albo-tomentose at the apex, 2-celled, styles 2, entirely connate or slightly distinct at the apex, hirsute at the base, stigma oblique capitate. Fruits elliptico-pyriformed, 6 mm. long, $4\frac{1}{2}$ mm. broad, long pedunculate, peduncles 4 mm. long.

The Formosan plant is included in *P. variabilis* by W. B. HEMSLEY in Ind. Fl. Sin. I p. 263. While studying at Kew, I examined all specimens

included under the same name by the eminent authority, and found that the Formosan specimens are very distinct from any of the other forms of the species collected in continental China.

This is near *P. arguta*, but differs in having more minutely toothed leaves.

NOTICE.

Owing to the limitation of pages of this fascicle, it has become impossible to treat here all the Polypetalous plants. The author is, therefore, obliged to be content with giving families from Ranunculaceæ to Rosaceæ in this fascicle. As copper-plates had been already finished, illustrations of some families between Saxifrageæ to Cornaceæ are given here. Families from Saxifrageæ upwards will be treated in the next fascicle.

INDEX

Orders, genera and species in roman type; tribes, sections, synonyms and species incidentally mentioned in italic type. The numbers inclosed in parentheses refer to pages where orders and genera are mentioned in keys.

ICONES PLANTARUM FORMOSANARUM.

I

PLATE I.

PLATE I.

Clematis Morii HAYATA.

- Fig. 1. The plant.
2. Longitudinal section of a flower.
3. A sepal, seen from without.
4. The same, seen from within.
5. Stamens, one innermost, the other outermost one.
6. A carpel.

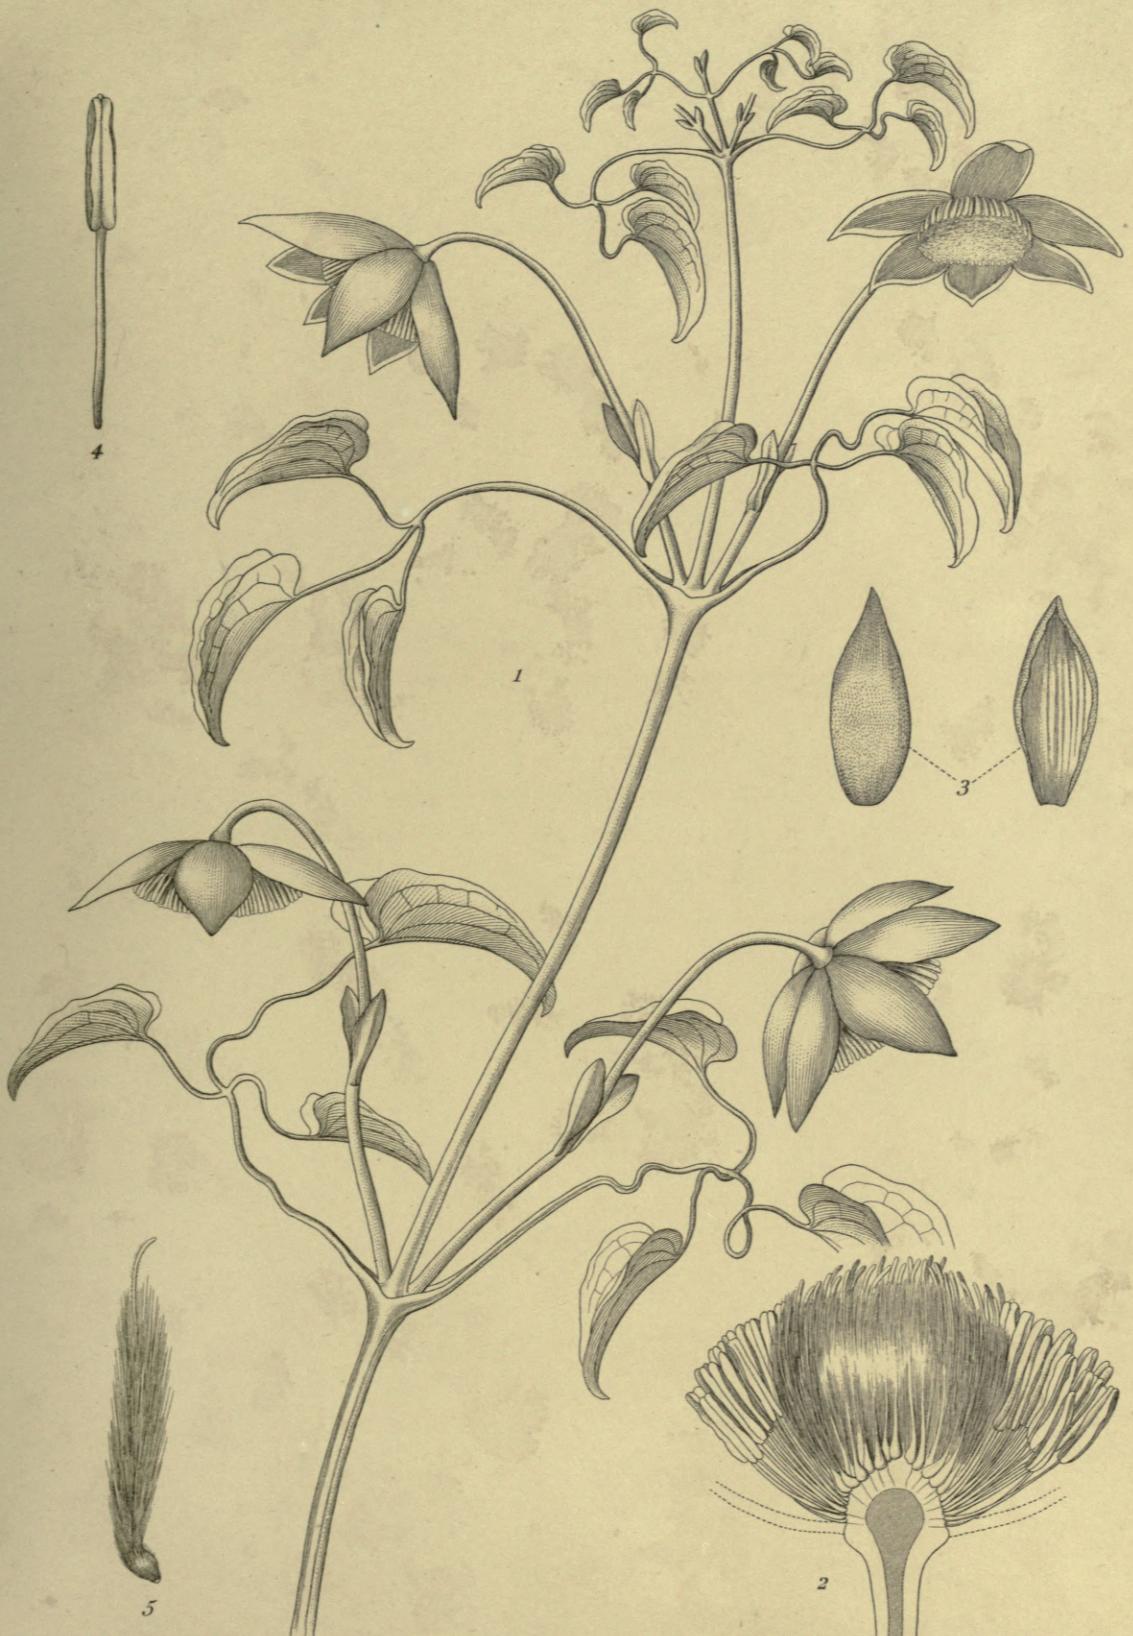

ICONES PLANTARUM FORMOSANARUM.

PLATE II.

PLATE II.

Clematis akensis HAYATA.

- Fig. 1. The plant.
2. A flower, longitudinal section.
3. A sepal, seen from within and without.
4. A stamen.
5. A carpel.

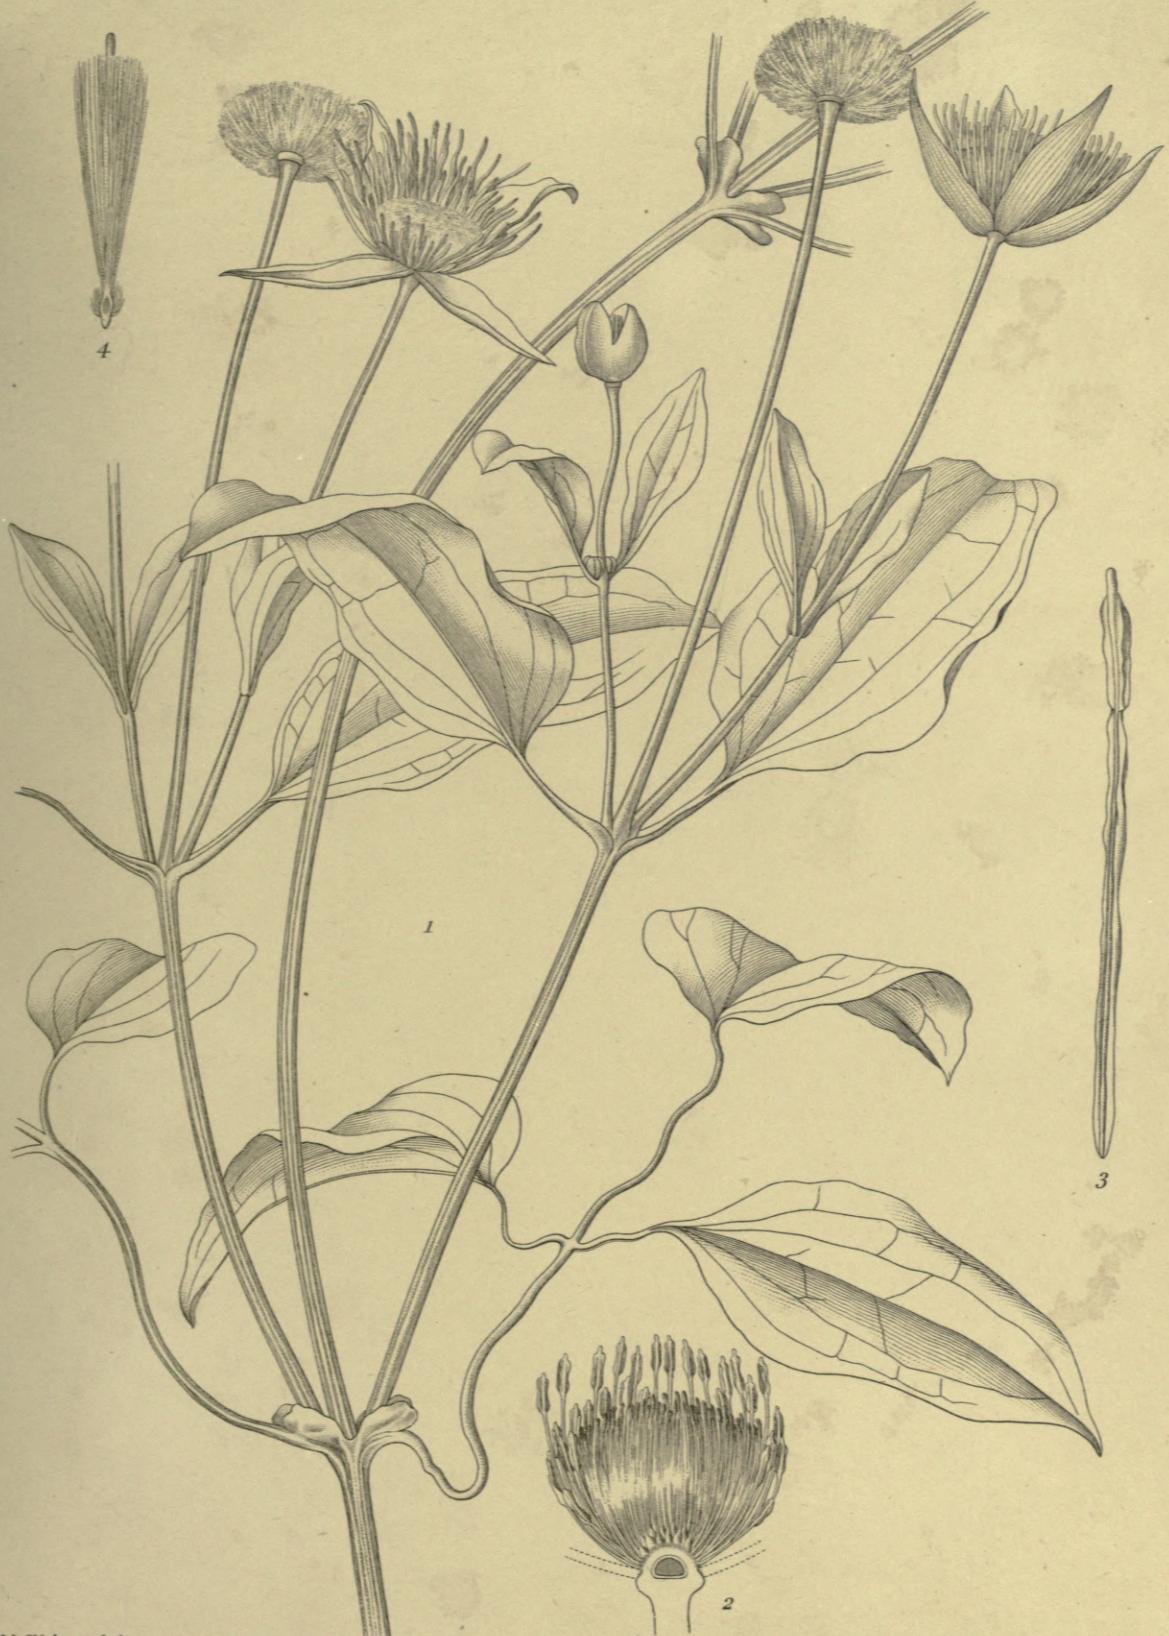

ICONES PLANTARUM FORMOSANARUM.

PLATE III.

PLATE III.

Clematis tozanensis HAYATA.

- Fig. 1. The plant.
2. A flower, longitudinal section.
3. A stamen.
4. A carpel.

ICONES PLANTARUM FORMOSANARUM.

PLATE IV.

PLATE IV.

Clematis taiwaniana HAYATA.

- Fig. 1. The plant.
2. A flower-bud.
3. A flower.
4. A sepal, seen from within and without.
5. A stamen.
6. A carpel.
7. The same, matured.

ICONES PLANTARUM FORMOSANARUM.

PLATE V.

PLATE V.

Ranunculus taisanensis HAYATA.

- Fig. 1. The plant.
2. A flower.
3. A sepal, seen from within.
4. The same, seen from without.
5. A petal, a glandulous body is seen at the base.
6. A stamen.
7. A young carpel.
8. A mature carpel.

ICONES PLANTARUM FORMOSANARUM.

PLATE VI.

PLATE VI.

Ranunculus Kawakamii HAYATA.

- Fig. 1. The plant.
2. A flower.
3. A sepal, seen from without.
4. The same seen from side.
5. The same, seen from another side.
6. A petal, seen from within, a glandular point at the base of the lamina is seen.
7. Another petal.
8. A stamen.
9. Syncarp.
10. A carpel.

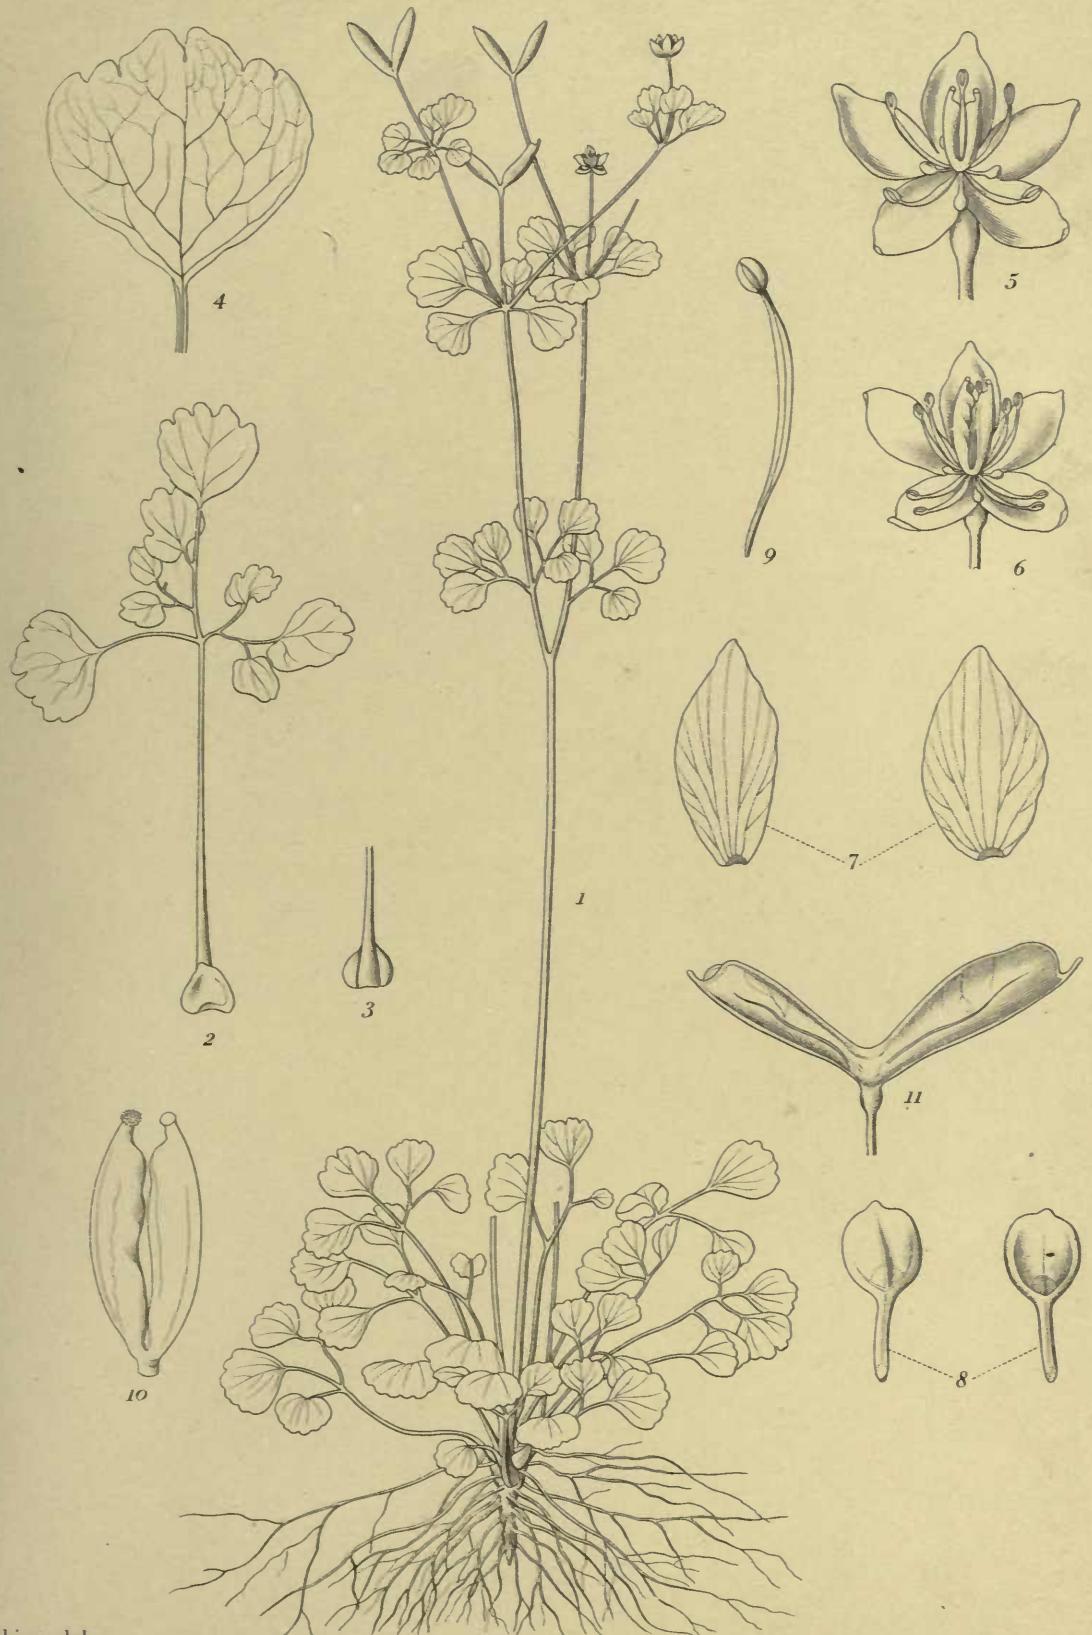

ICONES PLANTARUM FORMOSANARUM.

PLATE VII.

PLATE VII.

Isopyrum adiantifolium HOOK. et THOMS. var. *arisanensis* HAYATA.

- Fig. 1. The plant.
2. A radical leaf.
3. Basal portion of a petiole.
4. A leaflet.
5. An open flower, with five stamens.
6. Another form of flowers, with ten stamens.
7. Sepals of different shape.
8. A petal, seen from within and without.
9. A stamen.
10. An ovary, or two carpels.
11. A fruit.

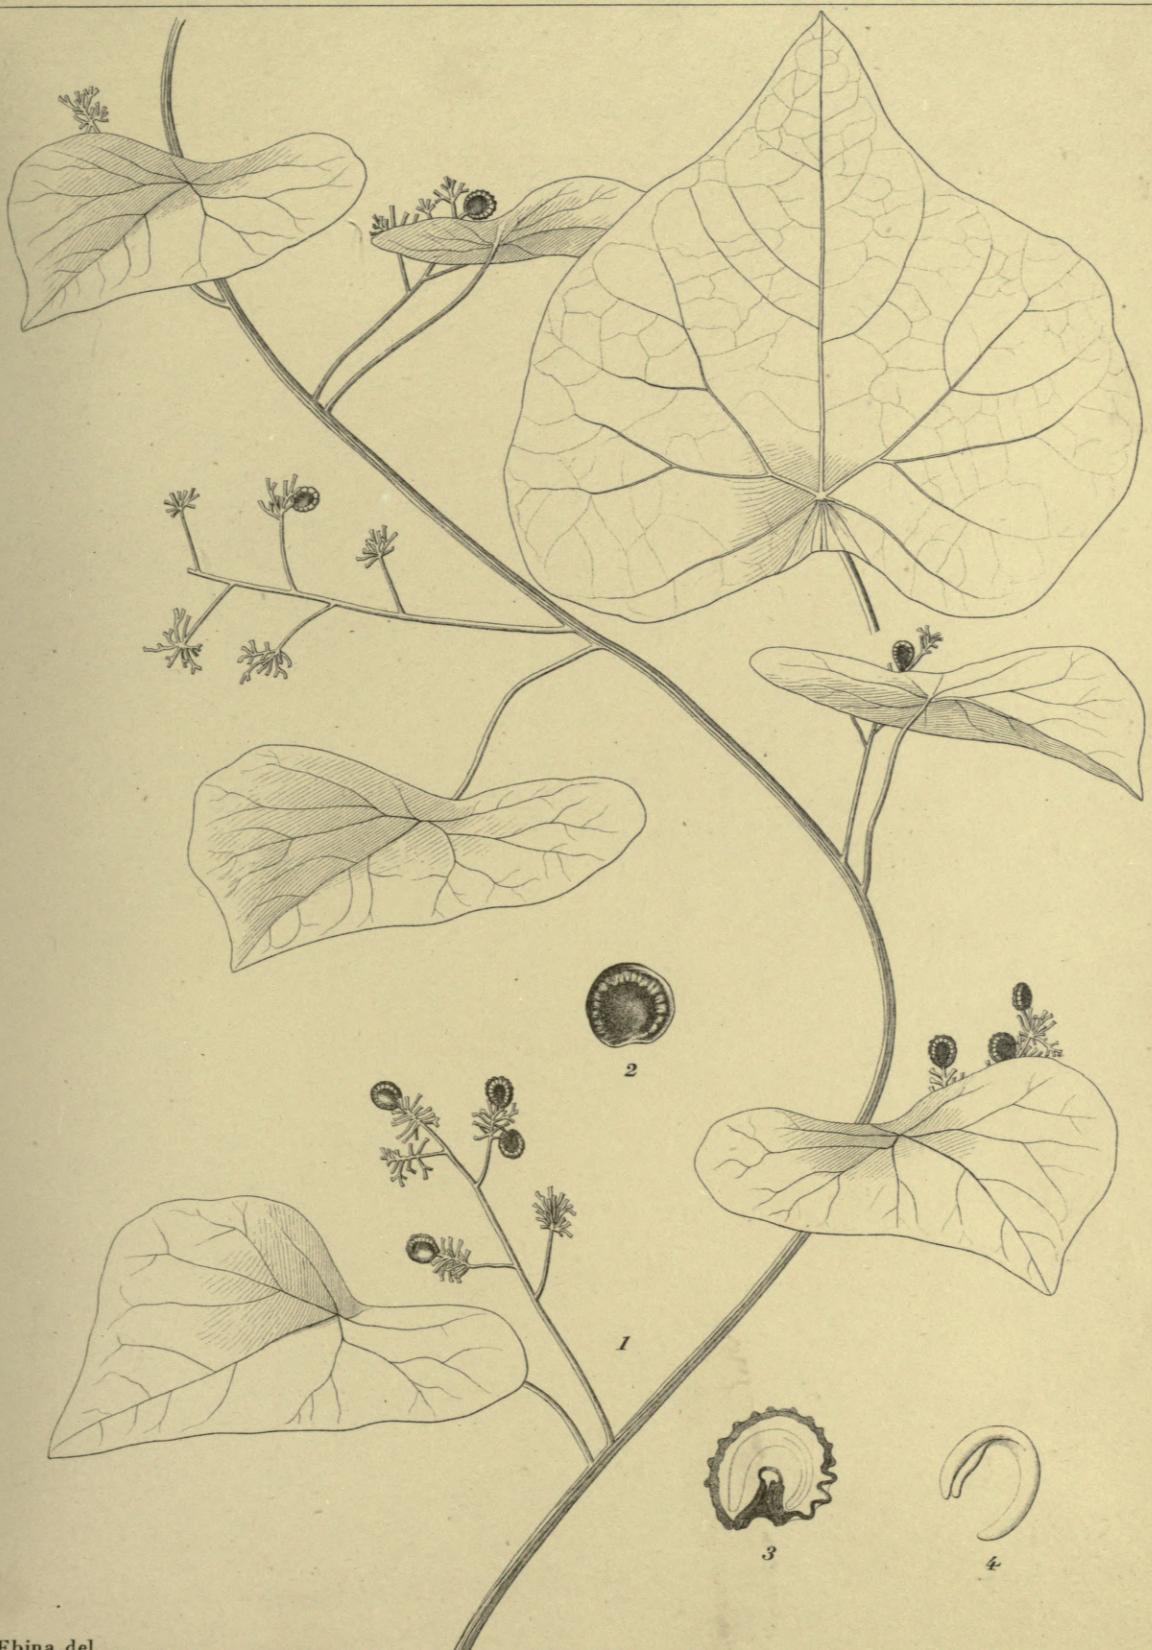

ICONES PLANTARUM FORMOSANARUM.

PLATE VIII.

PLATE VIII.

Stephania tetrandra MOORE.

- Fig. 1. A branch of the plant.
2. A fruit.
3. The same in vertical section.
4. An embryo.

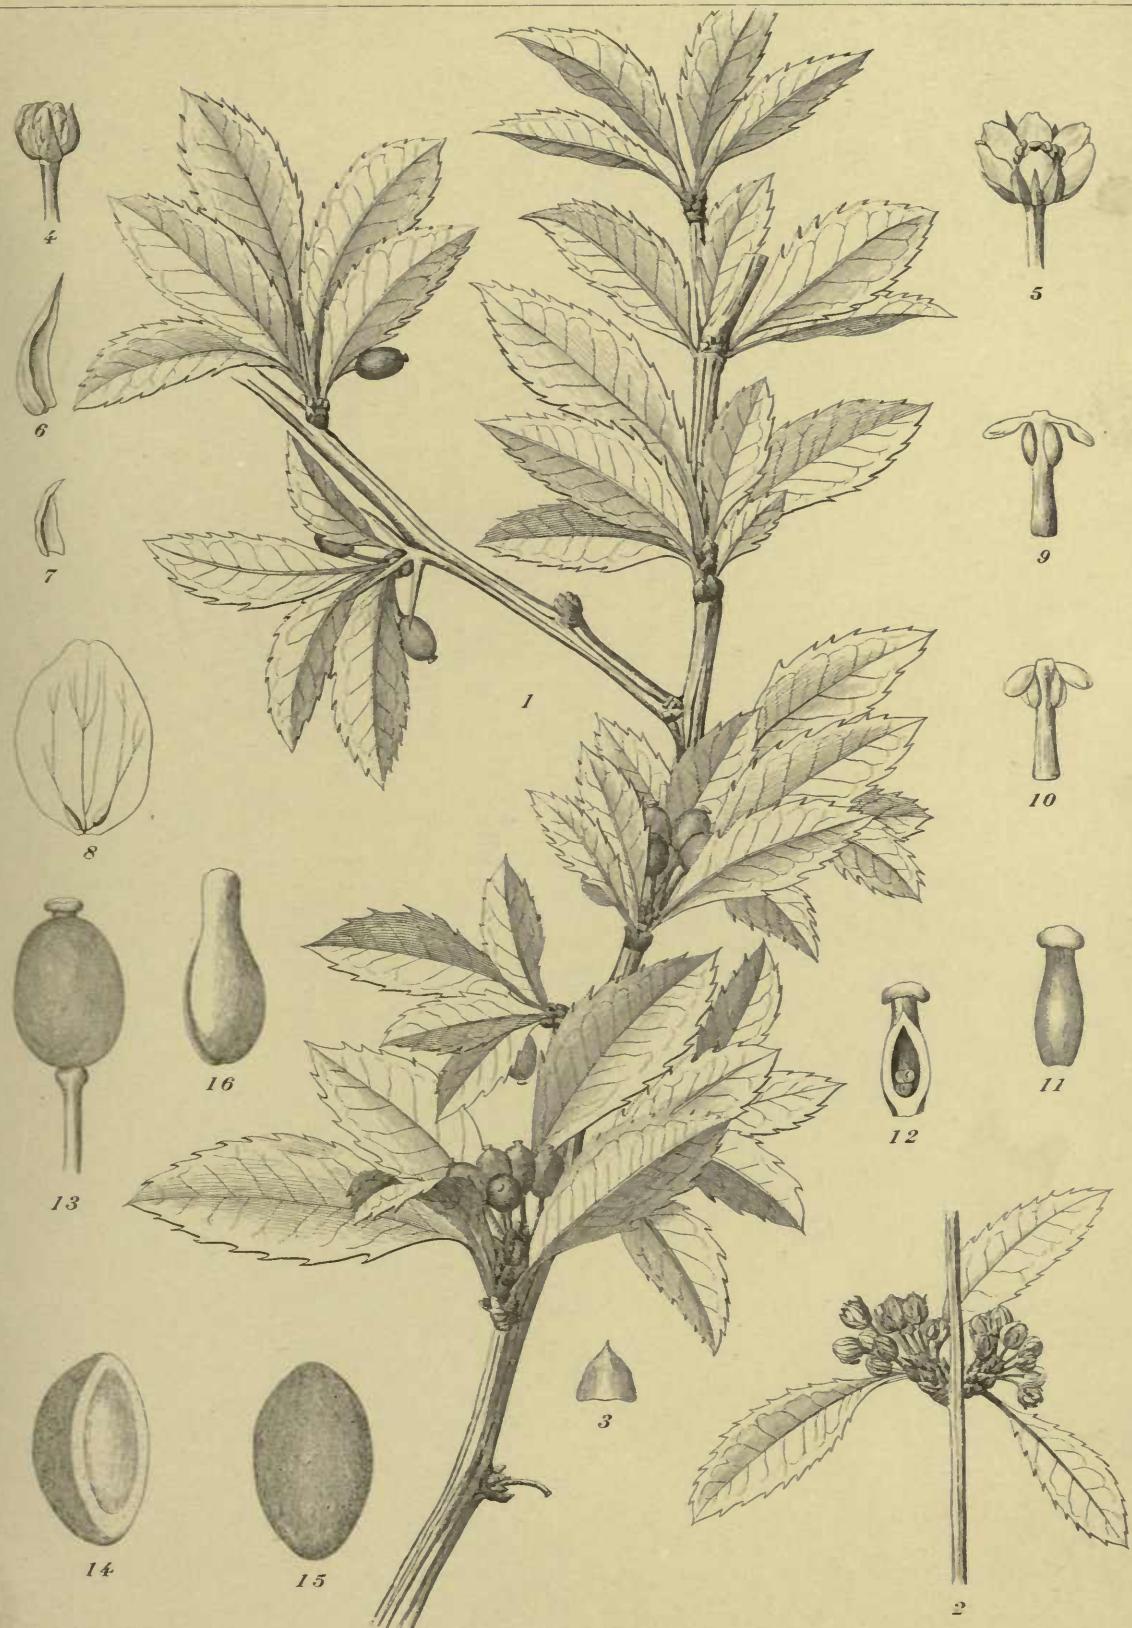

ICONES PLANTARUM FORMOSANARUM.

PLATE IX.

PLATE IX.

Berberis Kawakamii HAYATA.

- Fig. 1. A branch of the plant.
2. A portion of a branch with flower-clusters.
3. A perule.
4. A flower-bud.
5. An open flower.
6. and 7. Sepals of different shapes.
8. A petal, two glandular bodies are seen at the base
of the petal.
9. and 10. A stamen seen from within and without.
11. An ovary.
12. The same, in vertical section.
13. A fruit.
14. and 15. A seed, seen from different sides.
16. An embryo.

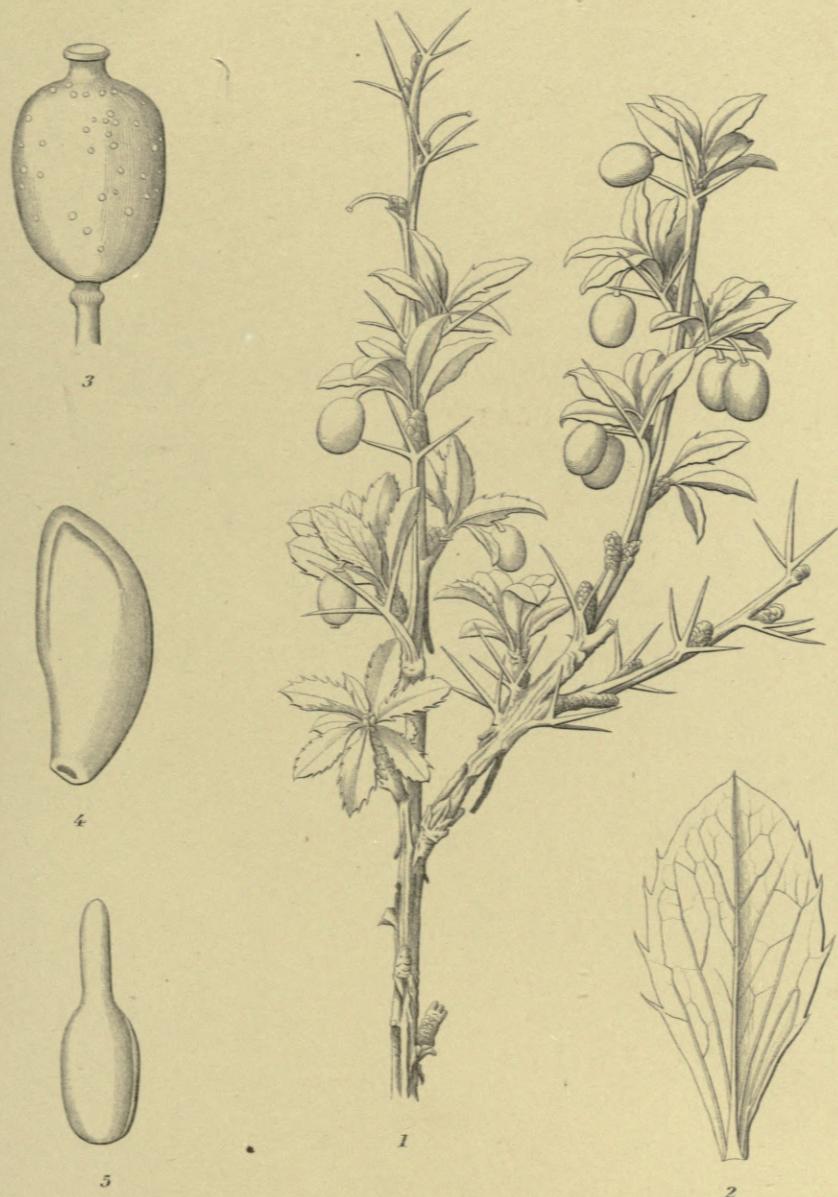

ICONES PLANTARUM FORMOSANARUM.

PLATE X.

PLATE X.

Berberis morrisensis HAYATA.

- Fig. 1. A branch of the plant.
2. A leaf.
3. A fruit.
4. A seed.
5. An embryo.

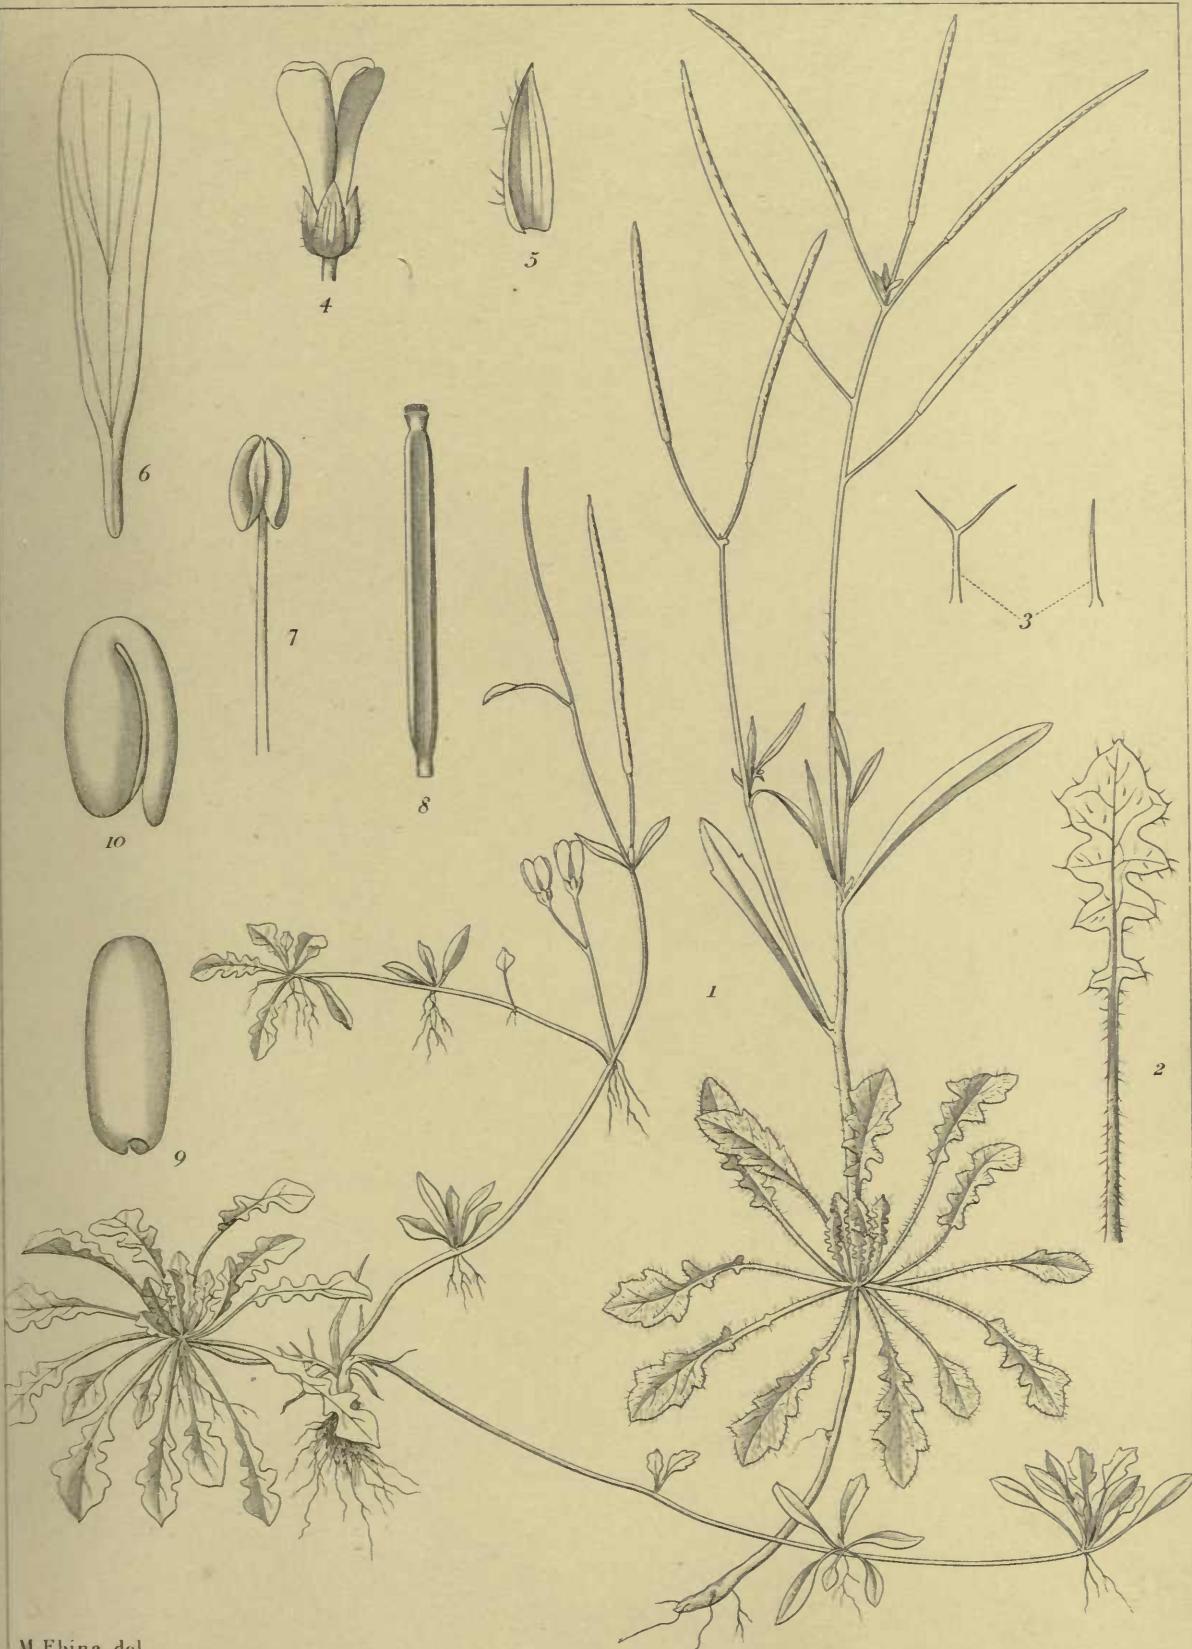

ICONES PLANTARUM FORMOSANARUM.

PLATE XI.

PLATE XI.

Arabis morrisonensis HAYATA.

- Fig. 1. The plant.
2. A radical leaf.
3. Hairs on the leaf, one is simple, the other forked.
4. A flower.
5. A sepal.
6. A petal.
7. A stamen.
8. An ovary.
9. A seed.
10. An embryo.

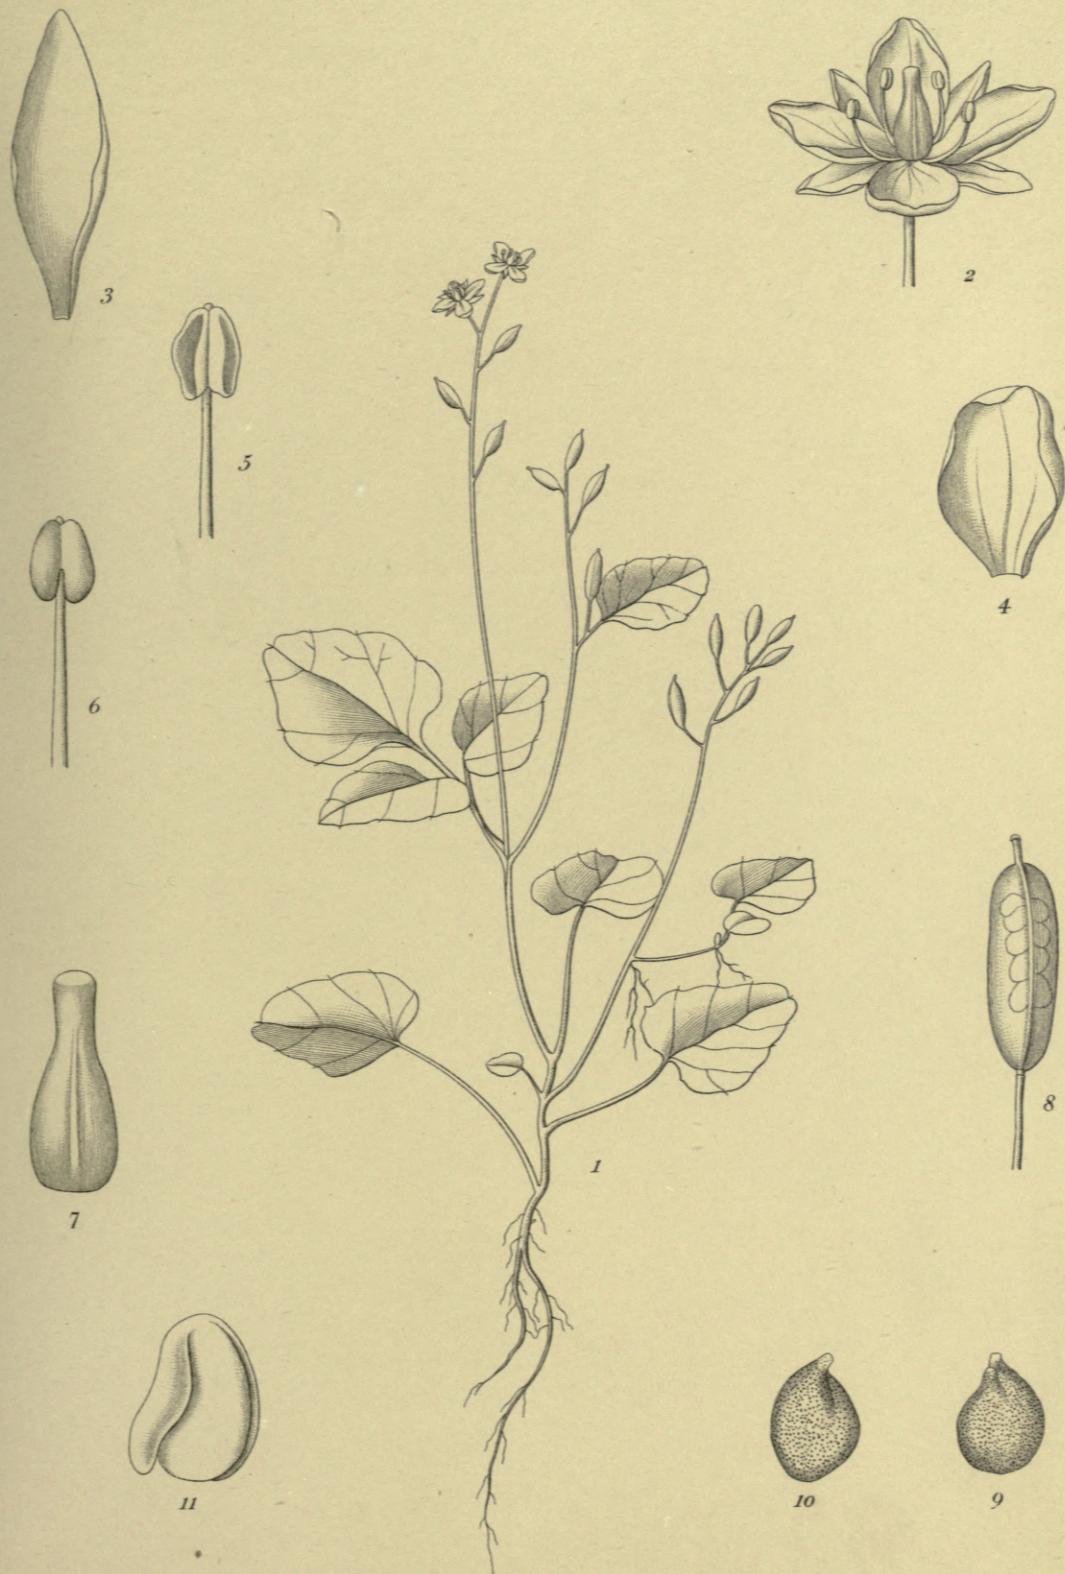

ICONES PLANTARUM FORMOSANARUM.

PLATE XII.

PLATE XII.

Cochlearia formosana HAYATA.

- Fig. 1. The plant.
2. A flower.
3. A sepal.
4. A petal.
5. A stamen.
6. The same, seen from another side.
7. An ovary.
8. A fruit.
9. A seed.
10. The same, seen from another side.
11. An embryo.

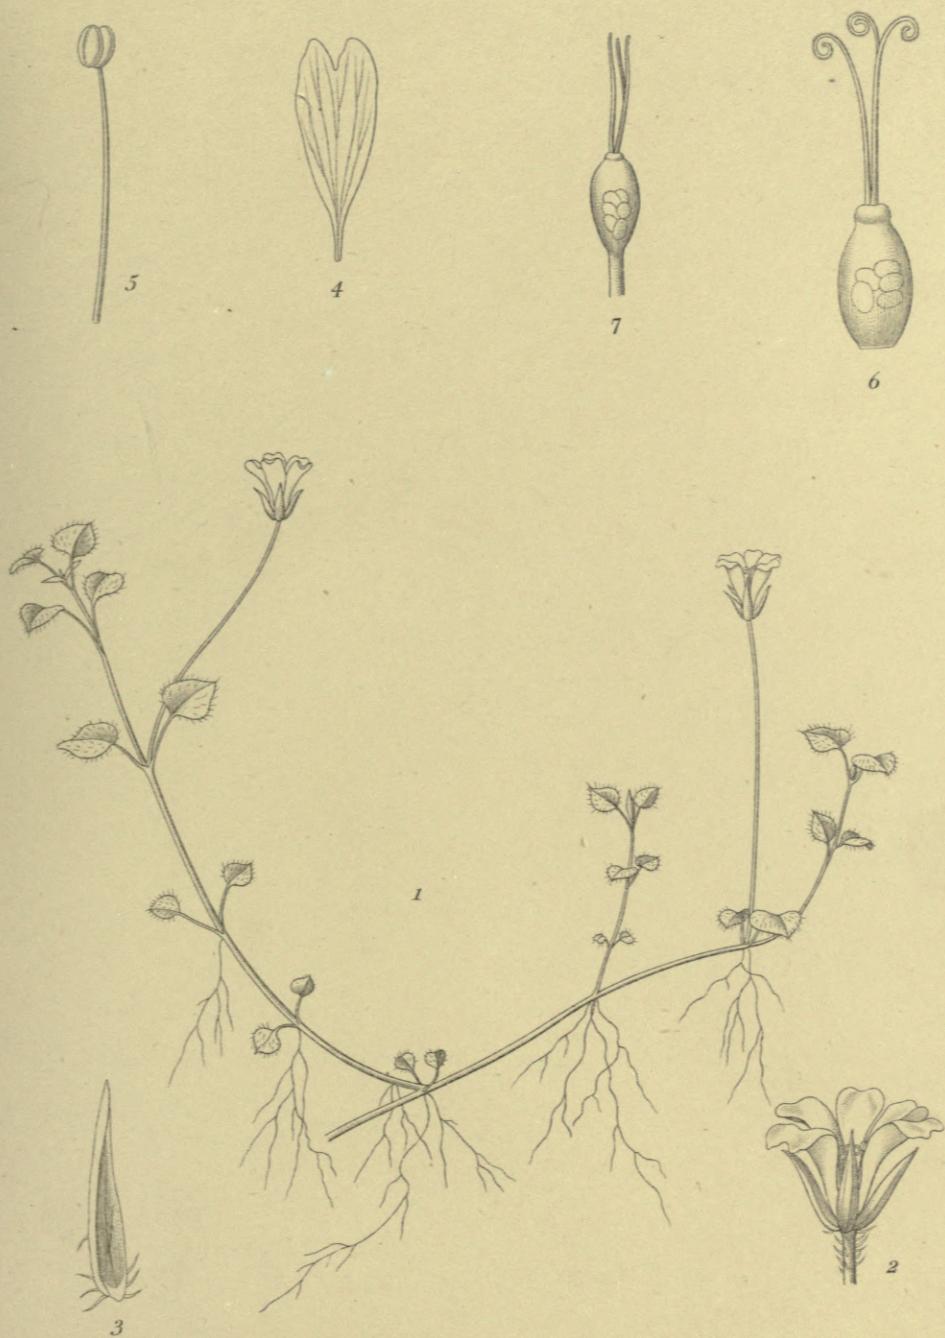

ICONES PLANTARUM FORMOSANARUM.

PLATE XIII.

PLATE XIII.

Cerastium arisanense HAYATA.

- Fig. 1. The plant.
2. A flower.
3. A sepal.
4. A petal.
5. A stamen.
6. An ovary.
7. Another form of an ovary with erect styles.

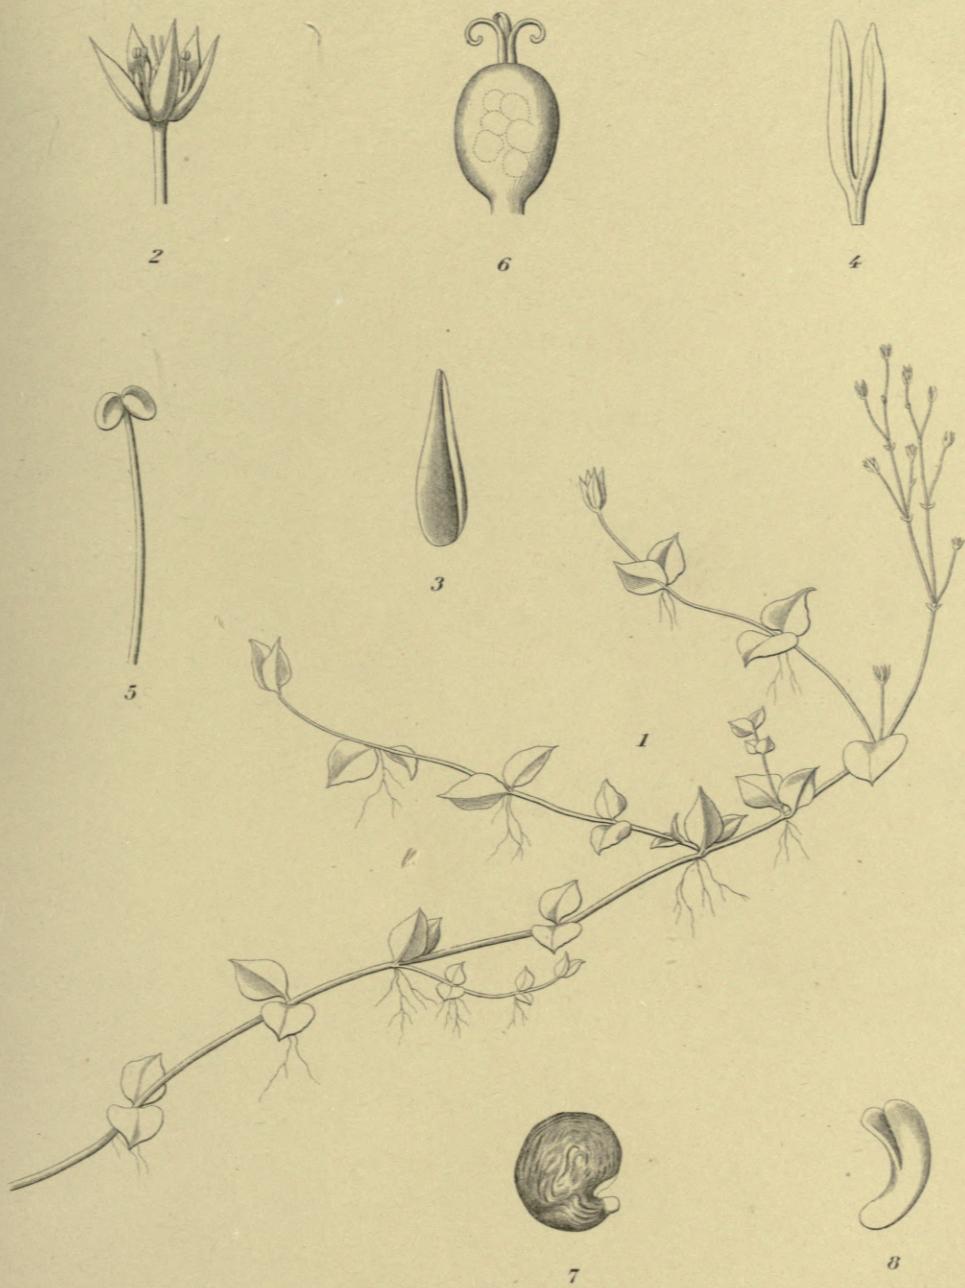

ICONES PLANTARUM FORMOSANARUM.

PLATE XIV.

PLATE XIV.

Stellaria micrantha HAYATA.

- Fig. 1. The plant.
2. A flower.
3. A sepal.
4. A petal.
5. A stamen.
6. An ovary.
7. A seed.
8. An embryo.

ICONES PLANTARUM FORMOSANARUM.

PLATE XV.

PLATE XV.

Hypericum acutisepalum HAYATA.

- Fig. 1. A branch of the plant.
2. A portion of a branch, showing the attachment of
the flowers, perules are shown.
3. An open flower.
4. A sepal.
5. Petals of different shapes.
6. Stamens in bundle.
7. A stamen.
8. The same, seen from another side.
9. An ovary.
10. An apical portion of a style, stigmatic portion is
shown.

ICONES PLANTARUM FORMOSANARUM.

PLATE XVI.

PLATE XVI.

Hypericum simplicistylum HAYATA.

- Fig. 1. A branch of the plant.
2. A leaf.
3. A flower-bud.
4. An open flower.
5. A sepal.
6. A petal.
7. A stamen, seen from within and without.
8. An ovary.
9. Apical portion of a style, stigmatic portion is shown.

ICONES PLANTARUM FORMOSANARUM.

PLATE XVII.

PLATE XVII.

Hypericum randaiense HAYATA.

- Fig. 1. The plant.
2. A leaf.
3. A flower.
4. A sepal.
5. A petal.
6. A stamen, seen from within.
7. The same, seen from without.
8. An ovary.

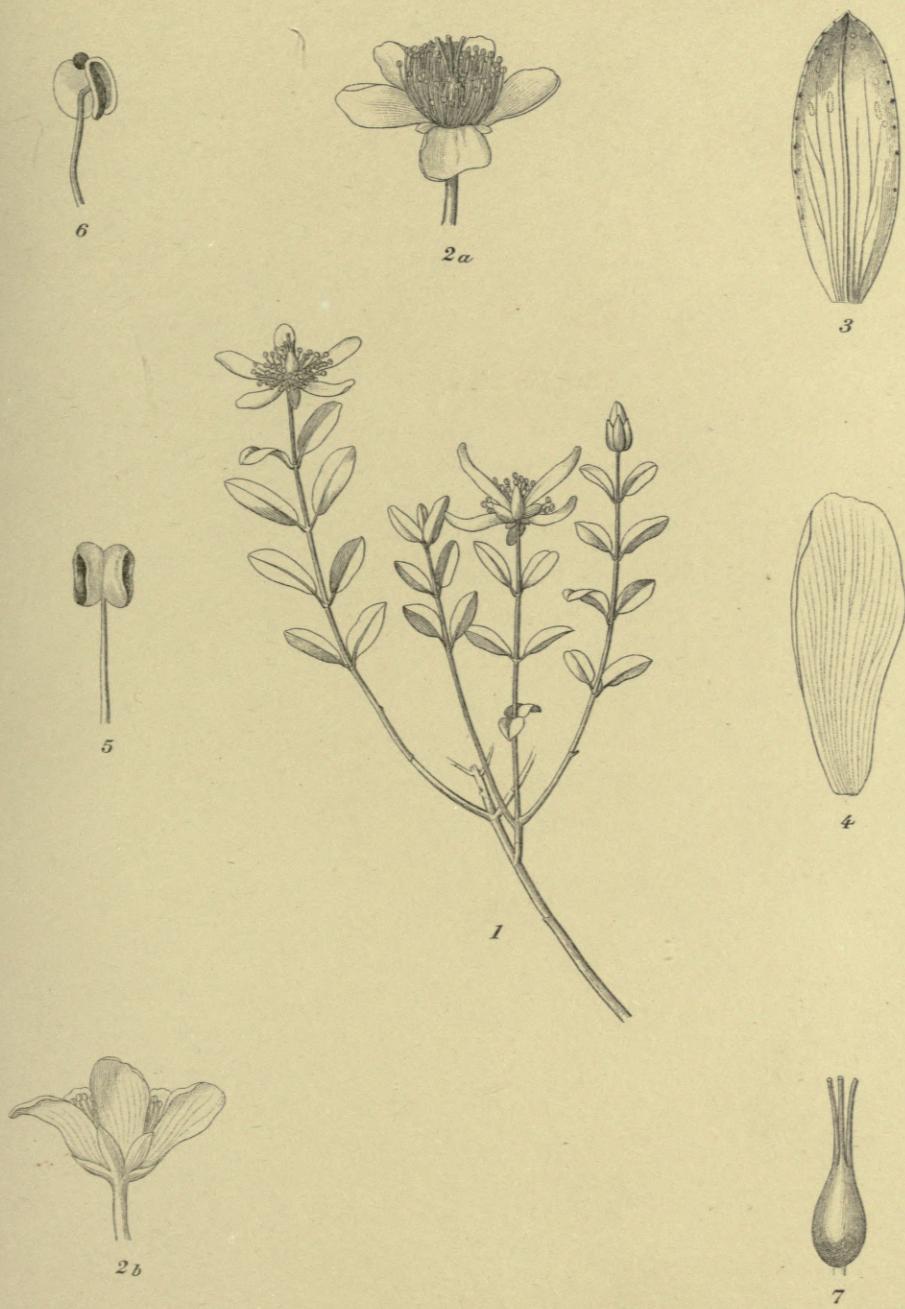

ICONES PLANTARUM FORMOSANARUM.

PLATE XVIII.

PLATE XVIII.

Hypericum Nagasawai HAYATA.

- Fig. 1. A branch of the plant.
2.—*a*. A flower.
2.—*b*. The same, seen from a little below.
3. A sepal.
4. A petal.
5. A stamen.
6. The same, seen from side.
7. An ovary.

ICONES PLANTARUM FORMOSANARUM.

PLATE XIX.

PLATE XIX.

Ilex parvifolia HAYATA.

- Fig. 1. A branch of the plant.
2. A fruit.
3. A sepal.
4. A sepal of another form.
5. A seed.
6. The same, seen from another side.
7. The same, in vertical section.
8. The same, in cross section.

ICONES PLANTARUM FORMOSANARUM.

PLATE XX.

PLATE XX.

Euonymus Spraguei HAYATA.

- Fig. 1. A branch of the plant.
2. A fruit seen from side.
3. The same, seen from a little below.
4. A seed.
5. An anomalous embryo with four cotyledons.

ICONES PLANTARUM FORMOSANARUM.

PLATE XXI.

PLATE XXI.

Prunus taiwaniana HAYATA.

- Fig. 1. A branch of the plant with fruits.
2. Another branch with flowers.
3. A leaf, with stipules.
4. A flower.
4a. A lobe of the calyx.
5. A petal.
6. A stamen seen from within and without.
7. A pistil.
8. A fruit.

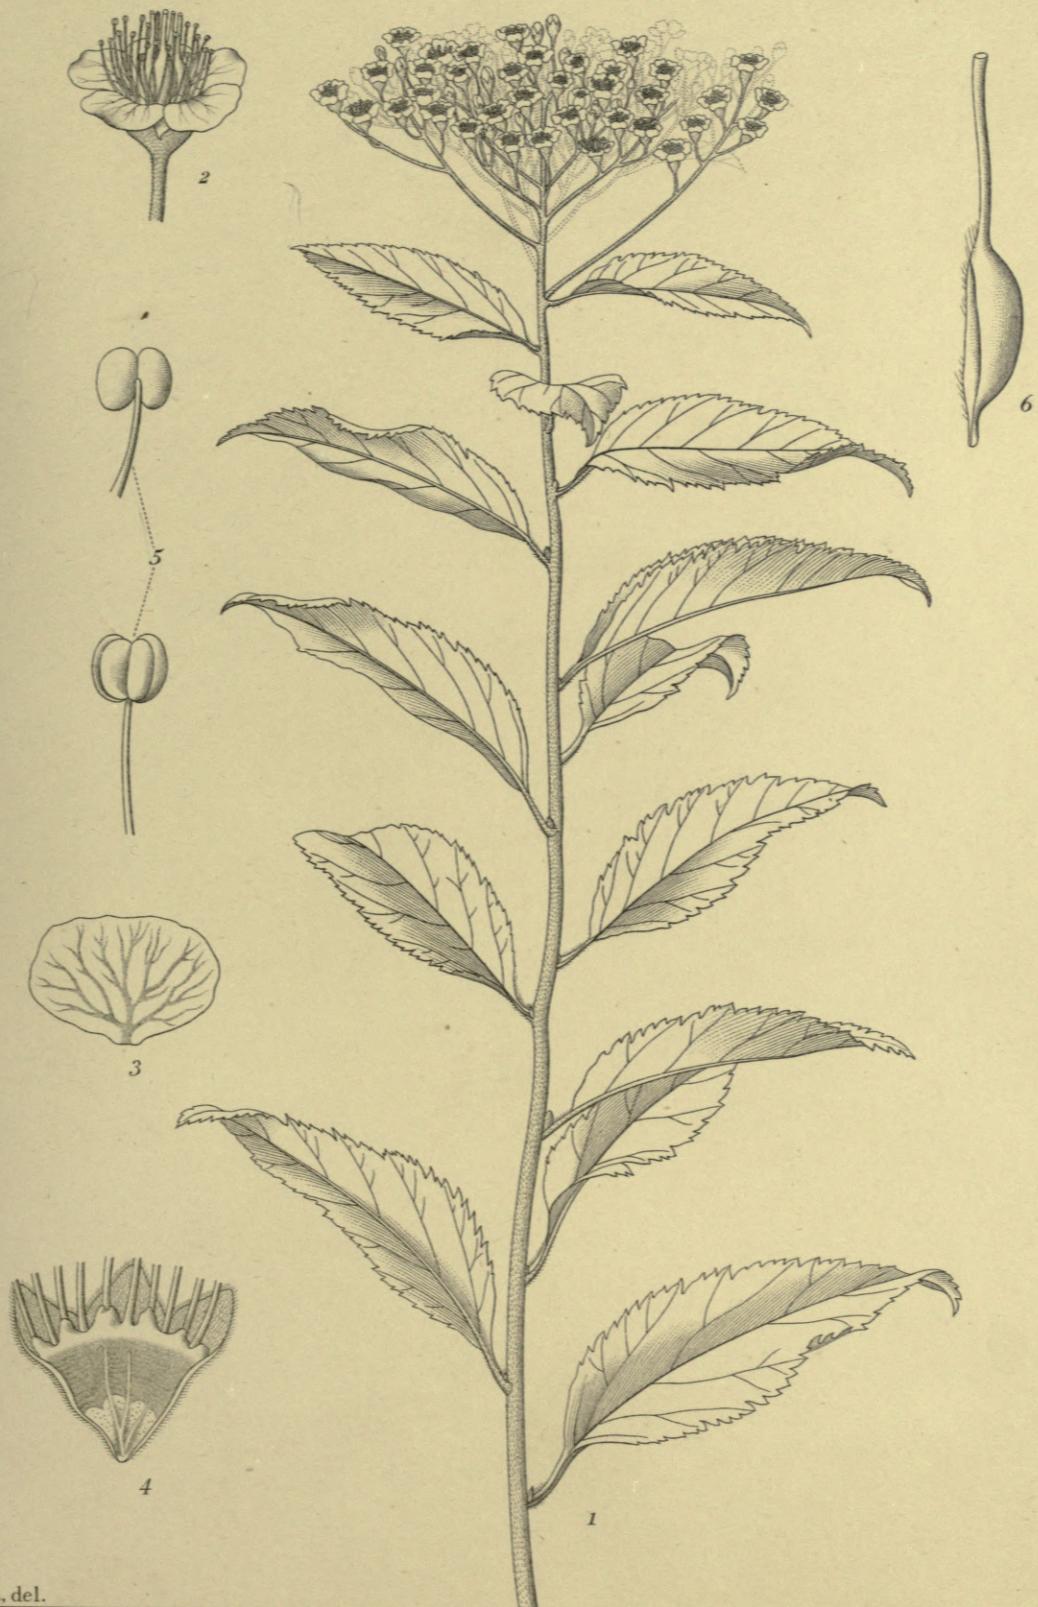

ICONES PLANTARUM FORMOSANARUM.

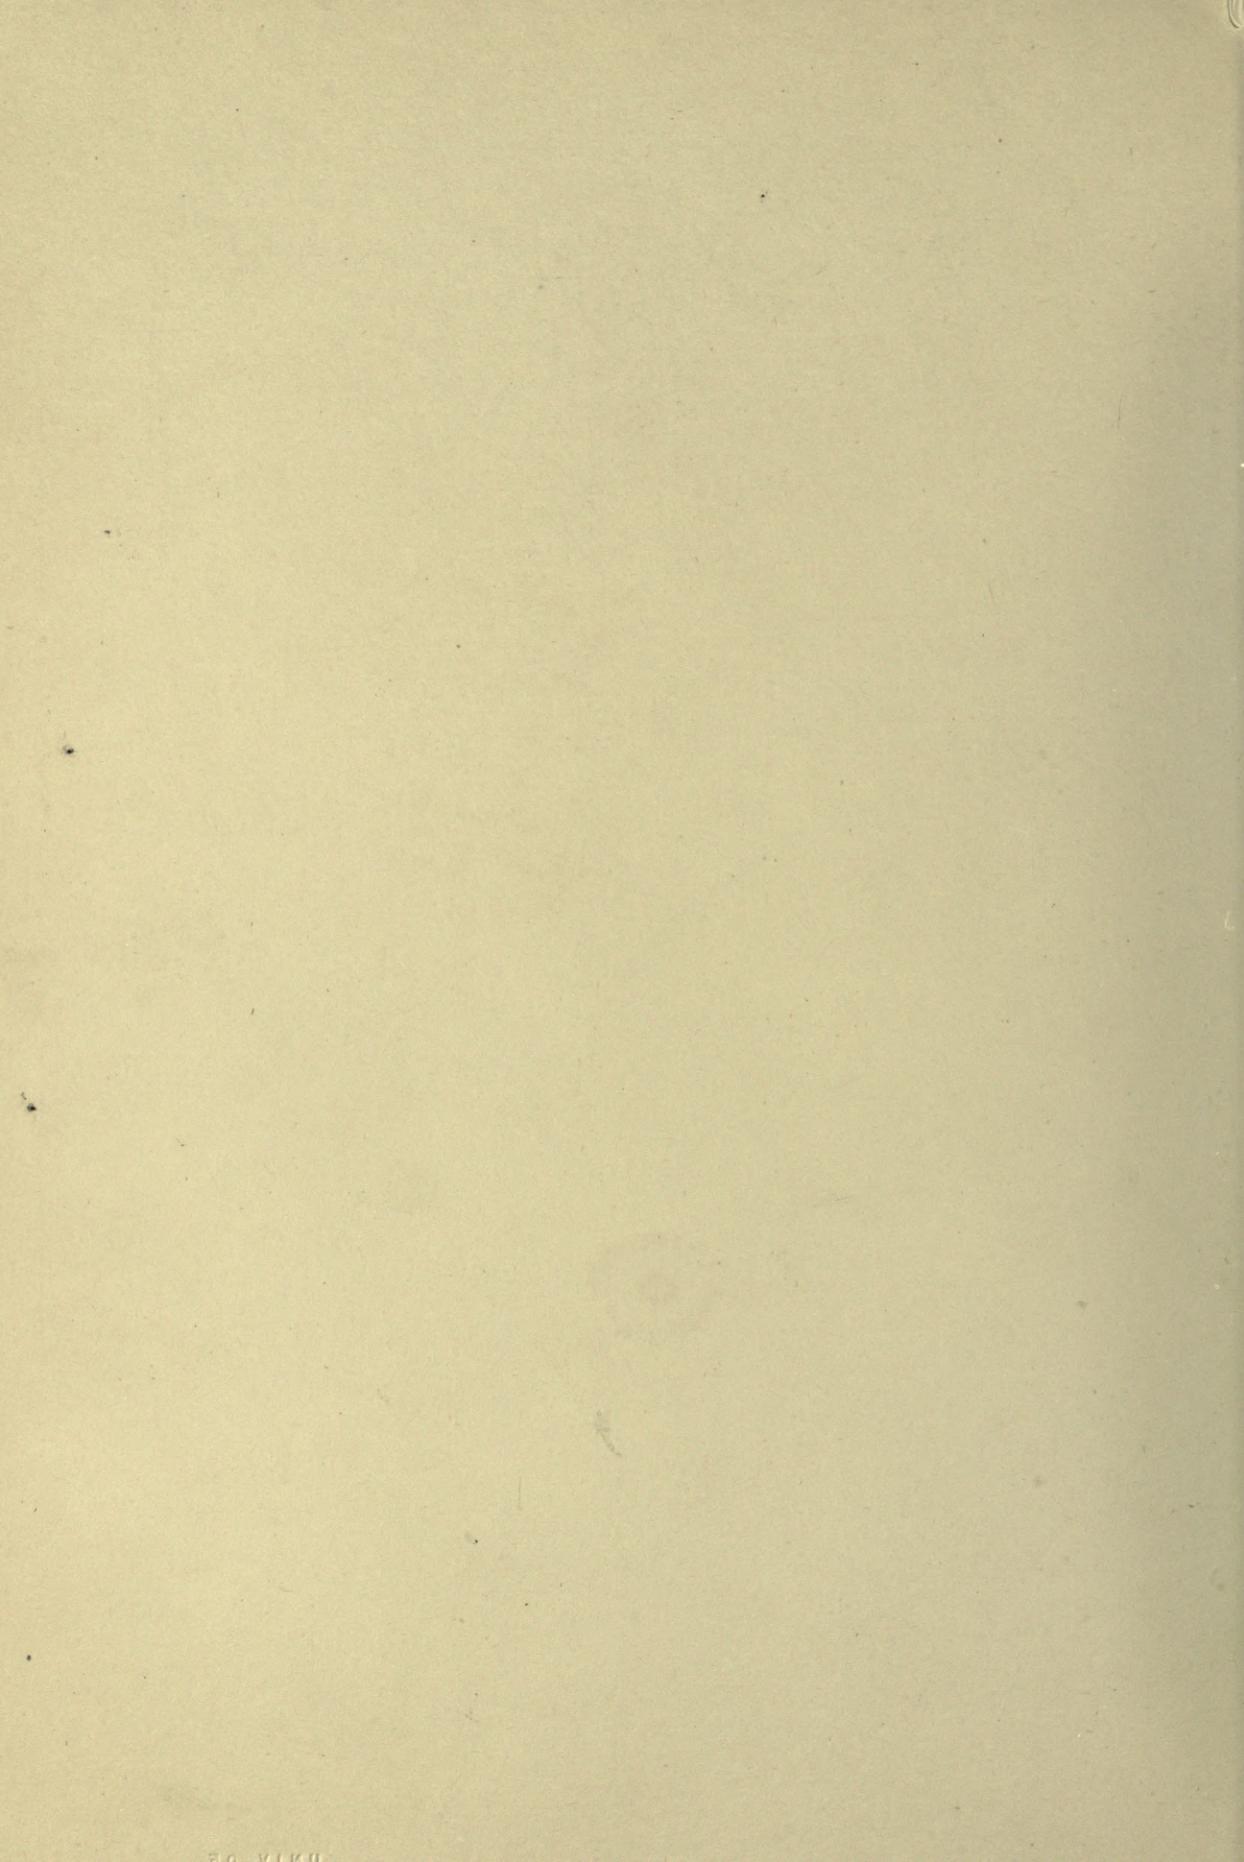

PLATE XXII.

PLATE XXII.

Spiraea formosana HAYATA.

- Fig. 1. The plant.
2. A flower.
3. A petal.
4. Calyx, in longitudinal section.
5. A stamen, seen from within and without.
6. A carpel.

ICONES PLANTARUM FORMOSANARUM.

PLATE XXIII.

PLATE XXIII.

Spiraea morrisonensis HAYATA.

- Fig. 1. The plant.
2. A leaf.
3. A petal.
4. A lobe of a calyx.
5. A flower.
6. A carpel.
7. A seed.
8. An embryo.

ICONES PLANTARUM FORMOSANARUM.

PLATE XXIV.

PLATE XXIV.

Rubus conduplicatus DUTHIE.

- Fig. 1. The plant.
2. A bract.
3. A perule.
4. A flower.
5. The same in vertical section.
6. A fructiferous flower in vertical section.
7. A calyx-lobe.
8. A petal.
9. A stamen, seen from within and without.

ICONES PLANTARUM FORMOSANARUM.

PLATE XXV.

PLATE XXV.

Rubus fasciculatus DUTHIE.

- Fig. 1. The plant.
2. Basal portion of a petiole, showing the stipules.
3. A bract.
4. A flower in vertical section.
5. A calyx-lobe, seen from within and without.
6. A petal, seen from within and without.
7. A stamen, seen from within and without.
8. A carpel.

ICONES PLANTARUM FORMOSANARUM.

PLATE XXVI.

PLATE XXVI.

Rubus Kawakamii HAYATA.

- Fig. 1. A branch of the plant.
2. A flower, seen from a little above.
3. The same, seen from a little below.
4. The same, in vertical section.
5. A petal.
6. A stamen.
7. A carpel.
8. A seed.
9. A prickle with a truncate apex.
10. Another form of a prickle with an acute apex.

ICONES PLANTARUM FORMOSANARUM.

PLATE XXVII.

PLATE XXVII.

Rubus nantensis HAYATA.

- Fig. 1. The plant.
2. A stipule.
3. A bract.
4. Another bract.
5. A flower in vertical section.
6. A calyx-lobe, seen from within and without.
7. A stamen, seen from within and without.
8. A carpel.

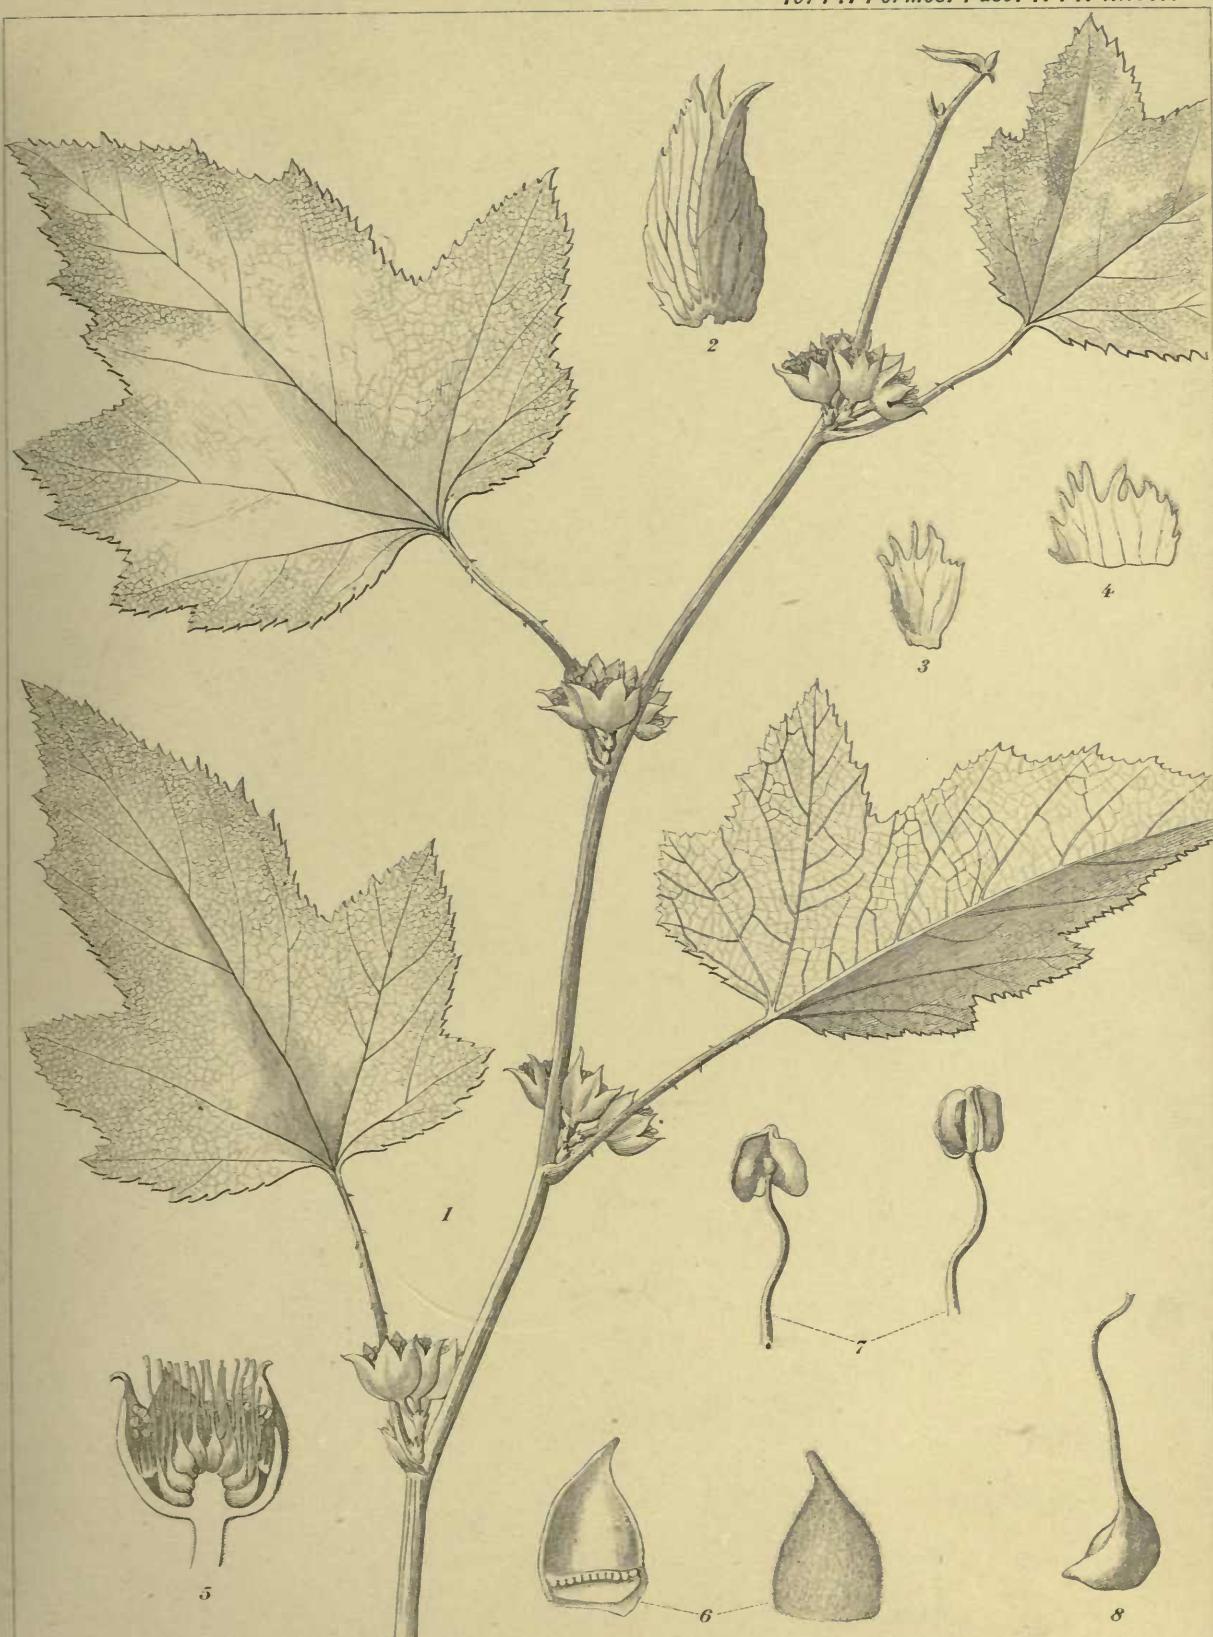

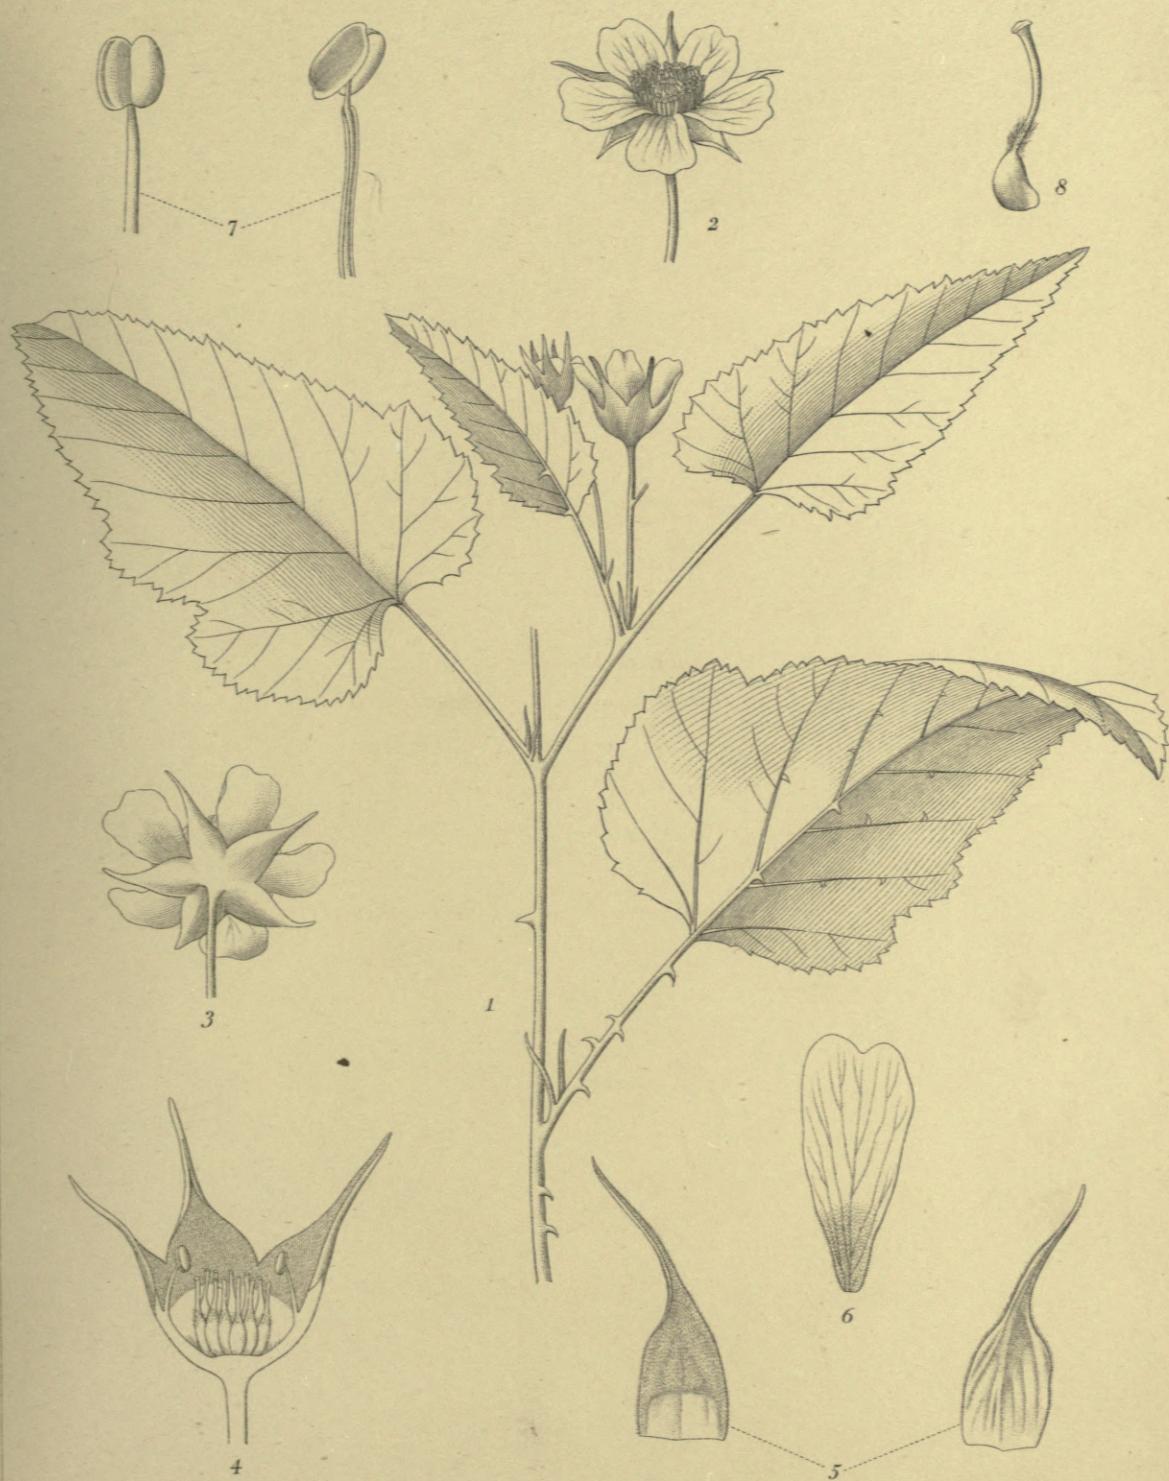

PLATE XXVIII.

Rubus retusipetala HAYATA.

- Fig.** 1. A branch of the plant.
2. A flower, seen from a little above.
3. The same, seen from a little below.
4. The same, in vertical section.
5. A lobe of a calyx, seen from within and without.
6. Petal.
7. Stamen, seen from a different side.
8. A carpel.

ICONES PLANTARUM FORMOSANARUM.

PLATE XXIX.

PLATE XXIX.

Rubus shinkœnsis HAYATA.

- Fig. 1. A branch of the plant.
2. A flower, seen from a little above.
3. The same, seen from a little below.
4. The same, in vertical section.
5. A lobe of a calyx.
6. A petal.
7. A stamen.
8. A carpel.
9. Stigmatic portion of a style.

ICONES PLANTARUM FORMOSANARUM.

PLATE XXX.

PLATE XXX.

Rosa morrisonensis HAYATA.

- Fig. 1. A branch of the plant.
2. A leaf.
3. A leaflet.
4. A flower, petals off.
5. The same, in vertical section.
6. A calyx-lobe.
7. A stamen, seen from within and without.
8. A carpel.

ICONES PLANTARUM FORMOSANARUM.

PLATE XXXI.

PLATE XXXI.

Photinia taiwanensis HAYATA.

- Fig. 1. The plant.
2. A flower in vertical section.
3. A petal.
4. A stamen, seen from within and without.
5. Transversal section of an ovary.
6. A stone.
7. Cross section of a stone.
8. An embryo.

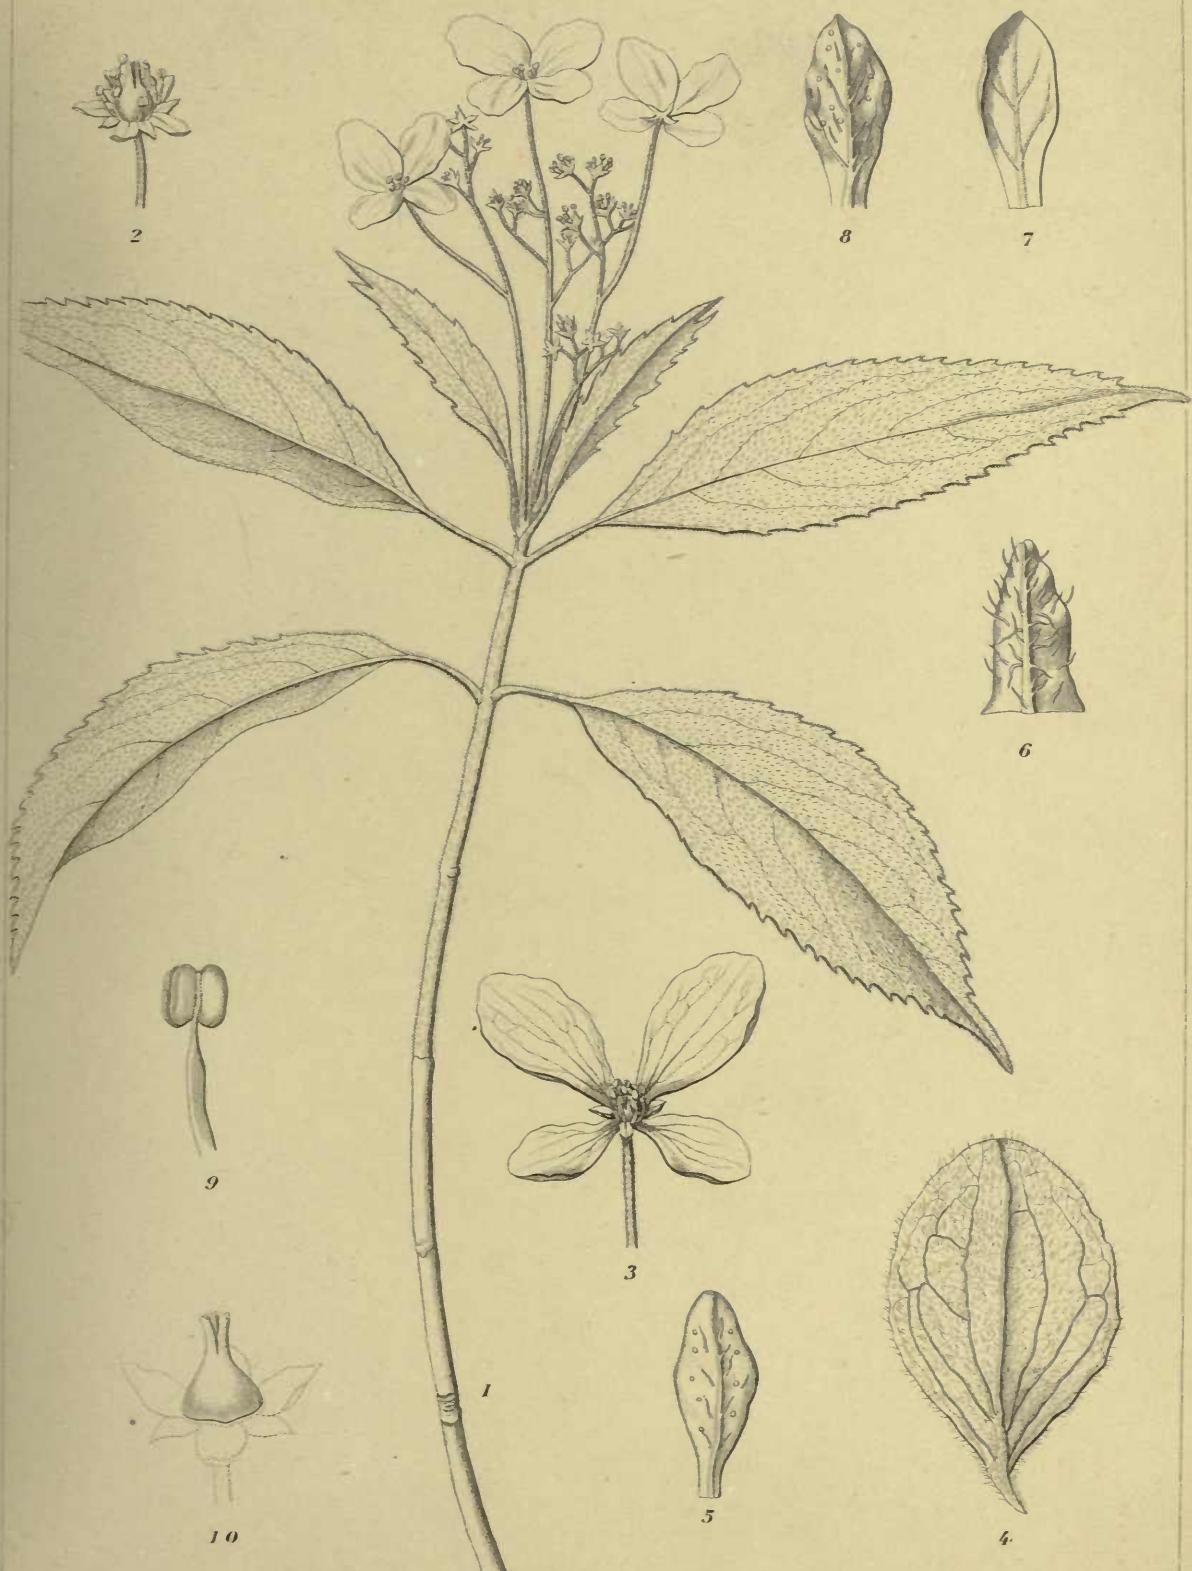

ICONES PLANTARUM FORMOSANARUM.

PLATE XXXII.

PLATE XXXII.

Hydrangea angustifolia HAYATA.

- Fig. 1. The plant.
2. A flower (fertile).
3. A marginal flower.
4. A sepal of the same.
5. A petal of the same.
6. A sepal of the fertile flower.
7. A petal of the same flower.
8. The same, seen from without.
9. A stamen.
10. An ovary.

ICONES PLANTARUM FORMOSANARUM.

PLATE XXXIII.

PLATE XXXIII.

Deutzia taiwanensis HAYATA.

- Fig. 1. A branch of the plant.
2a. A flower-bud.
2b. An open flower.
3. The same in vertical section.
4. A lobe of a calyx.
5. A stellate hair on the calyx.
6. A petal.
7. Hairs beset on the petal.
8. A stamen.
9. A style.

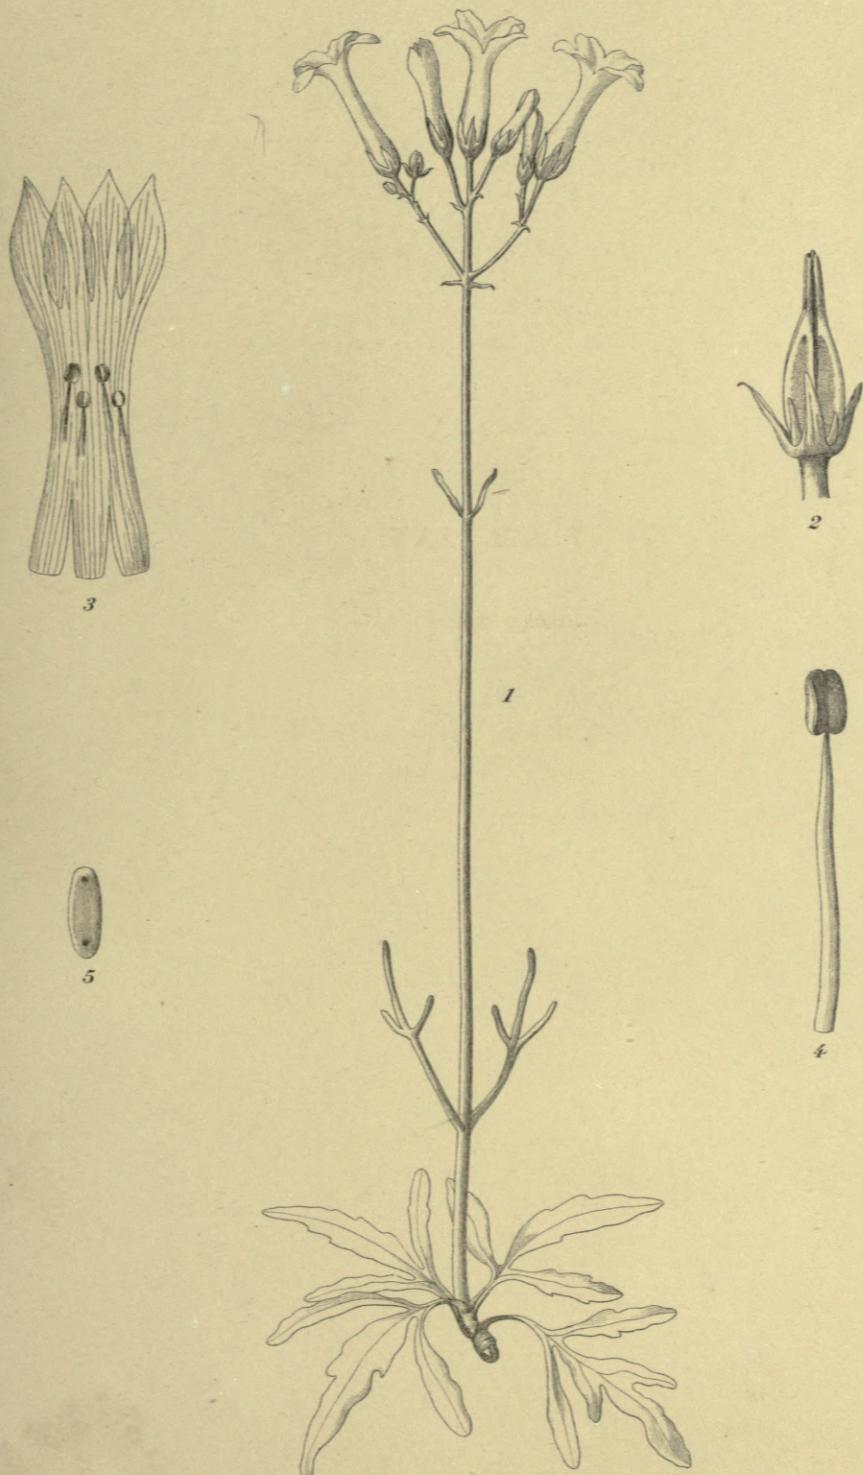

ICONES PLANTARUM FORMOSANARUM.

PLATE XXXIV.

PLATE XXXIV.

Kalanchoë gracilis HEMSL.

- Fig. 1. The plant.
2. A flower, corolla taken off.
3. Corolla, expanded.
4. A stamen.
5. A seed.

ICONES PLANTARUM FORMOSANARUM.

PLATE XXXV.

PLATE XXXV.

Eugenia acutisepala HAYATA.

- Fig. 1. A branch of the plant.
2. A leaf.
3. A flower.
4. A petal.
5. The same in section, petals taken off.
6. A stamen.
7. The same, seen from another side.

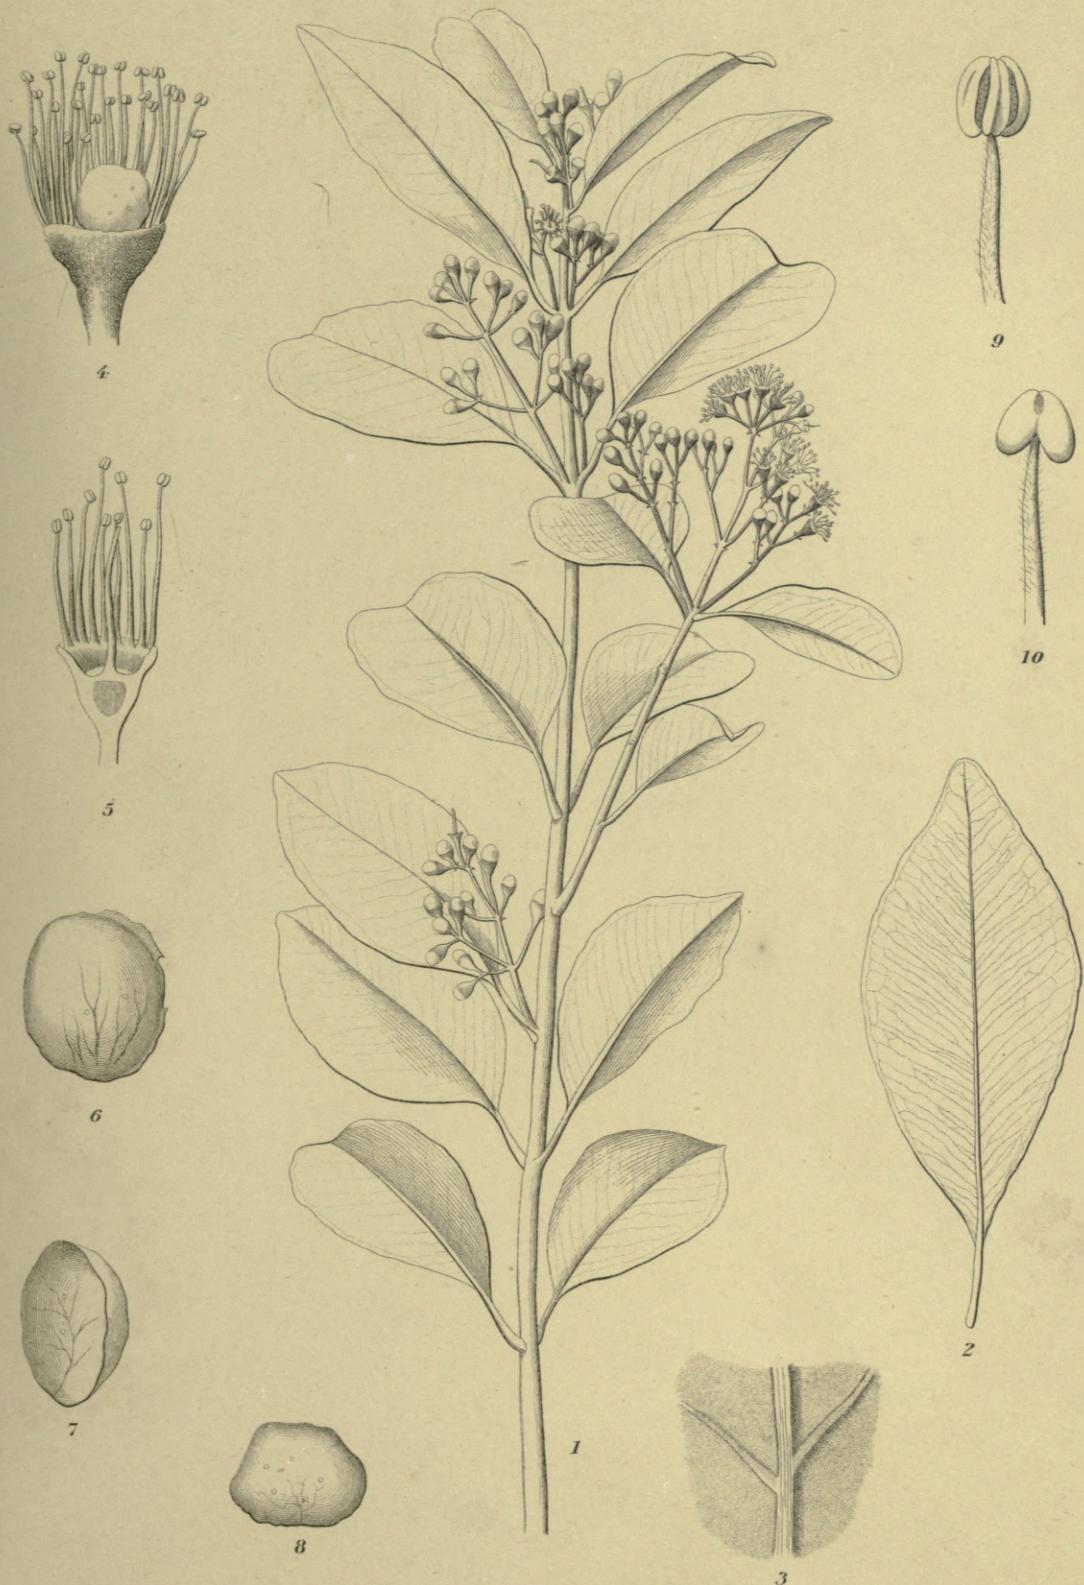

ICONES PLANTARUM FORMOSANARUM.

PLATE XXXVI.

PLATE XXXVI.

Eugenia formosana HAYATA.

- Fig. 1. A branch of the plant.
2. A leaf.
3. A part of the lower surface of a leaf, strongly magnified.
4. A flower.
5. The same in vertical section.
6. A petal.
7. The same seen from side.
8. A stamen, seen from within.
9. The same, seen from without.

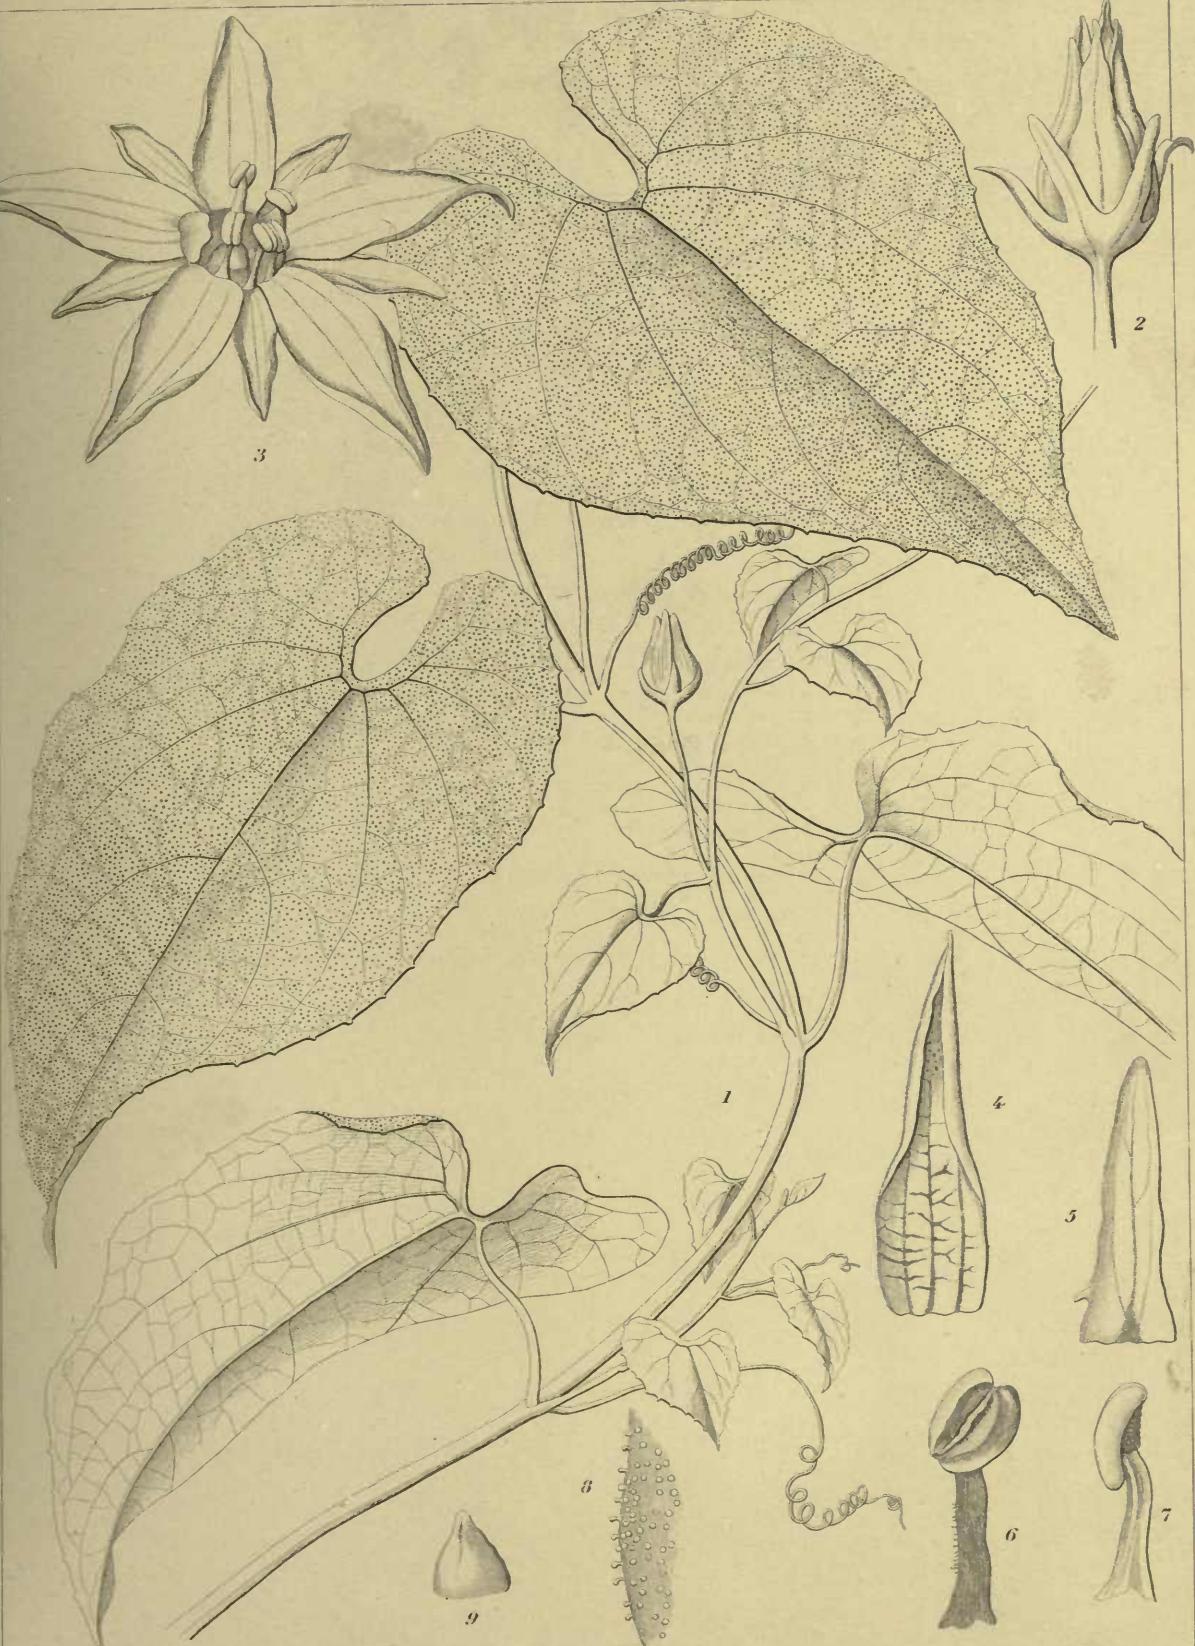

ICONES PLANTARUM FORMOSANARUM.

PLATE XXXVII.

PLATE XXXVII.

Thladiantha punctata HAYATA.

- Fig. 1. A branch of the plant.
2. A flower-bud.
3. An open flower.
4. A petal, seen from within.
5. A sepal.
6. A stamen, seen from within.
7. The same, seen from side.
8. A portion of a petal, showing its glandular surface,
strongly magnified.
9. A rudimentary ovary.

ICONES PLANTARUM FORMOSANARUM.

PLATE XXXVIII.

PLATE XXXVIII.

Alsomitra integrifoliola HAYATA.

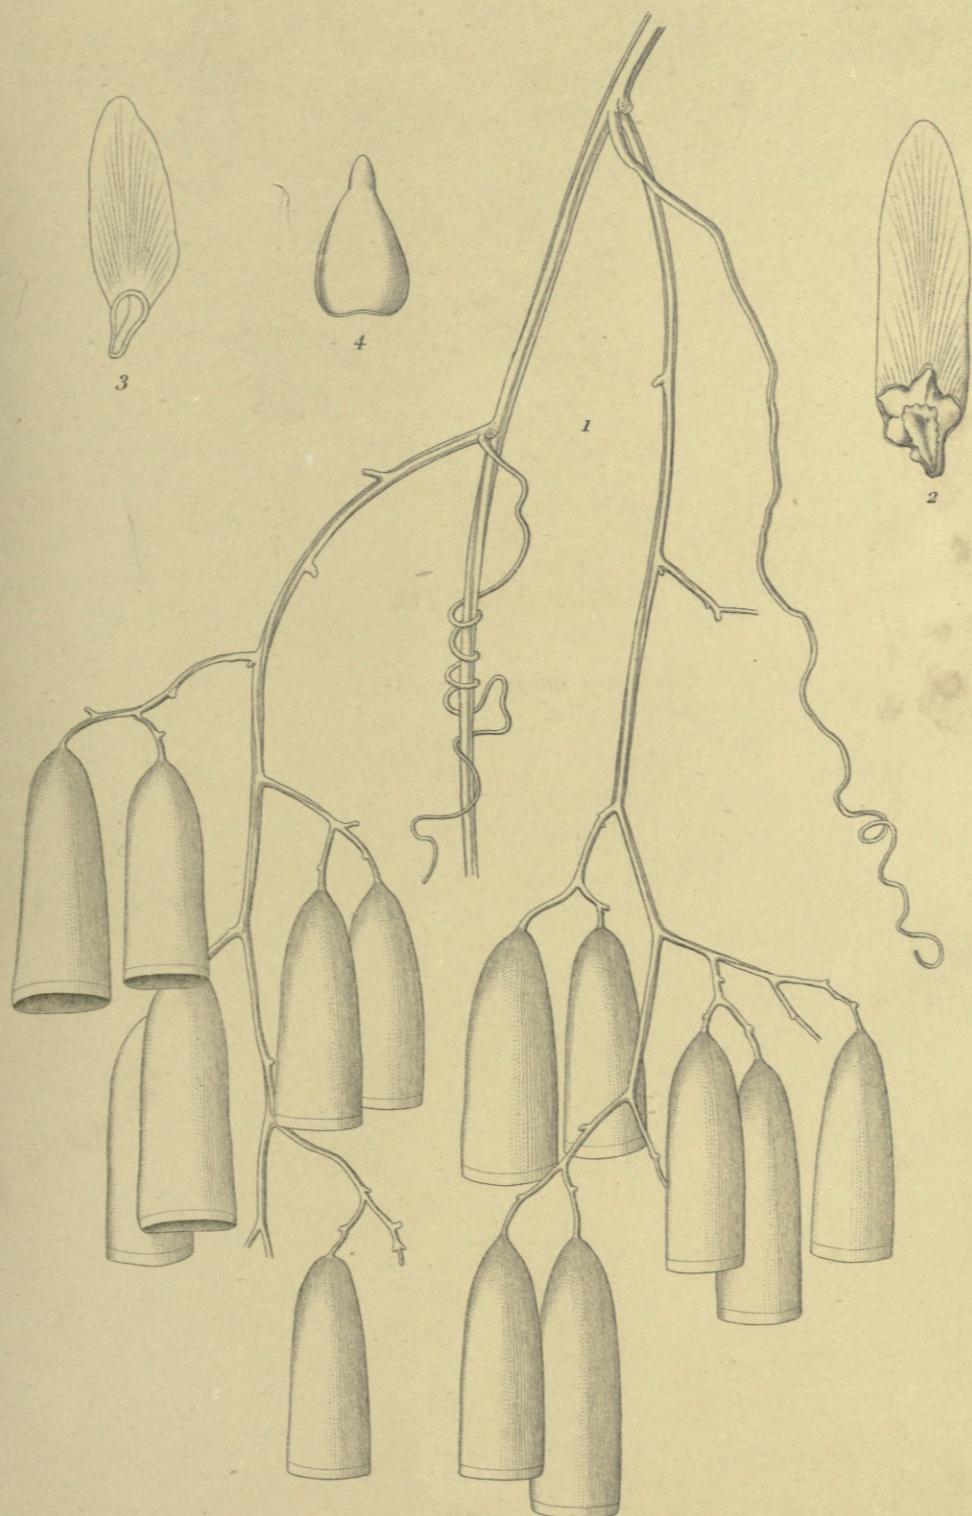

- Fig. 1. The plant.
2. A flower-bud.
3. A flower.
4. The same, seen from back.
5. A calyx-lobe.
6. A petal.
7. A stamen, seen from within and without.

PLATE XXXIX.

Alsomitra integrifoliola HAYATA.

- Fig. 1. A fructiferous panicle.
2. A mature seed.
3. A præmature one.
4. An embryo.

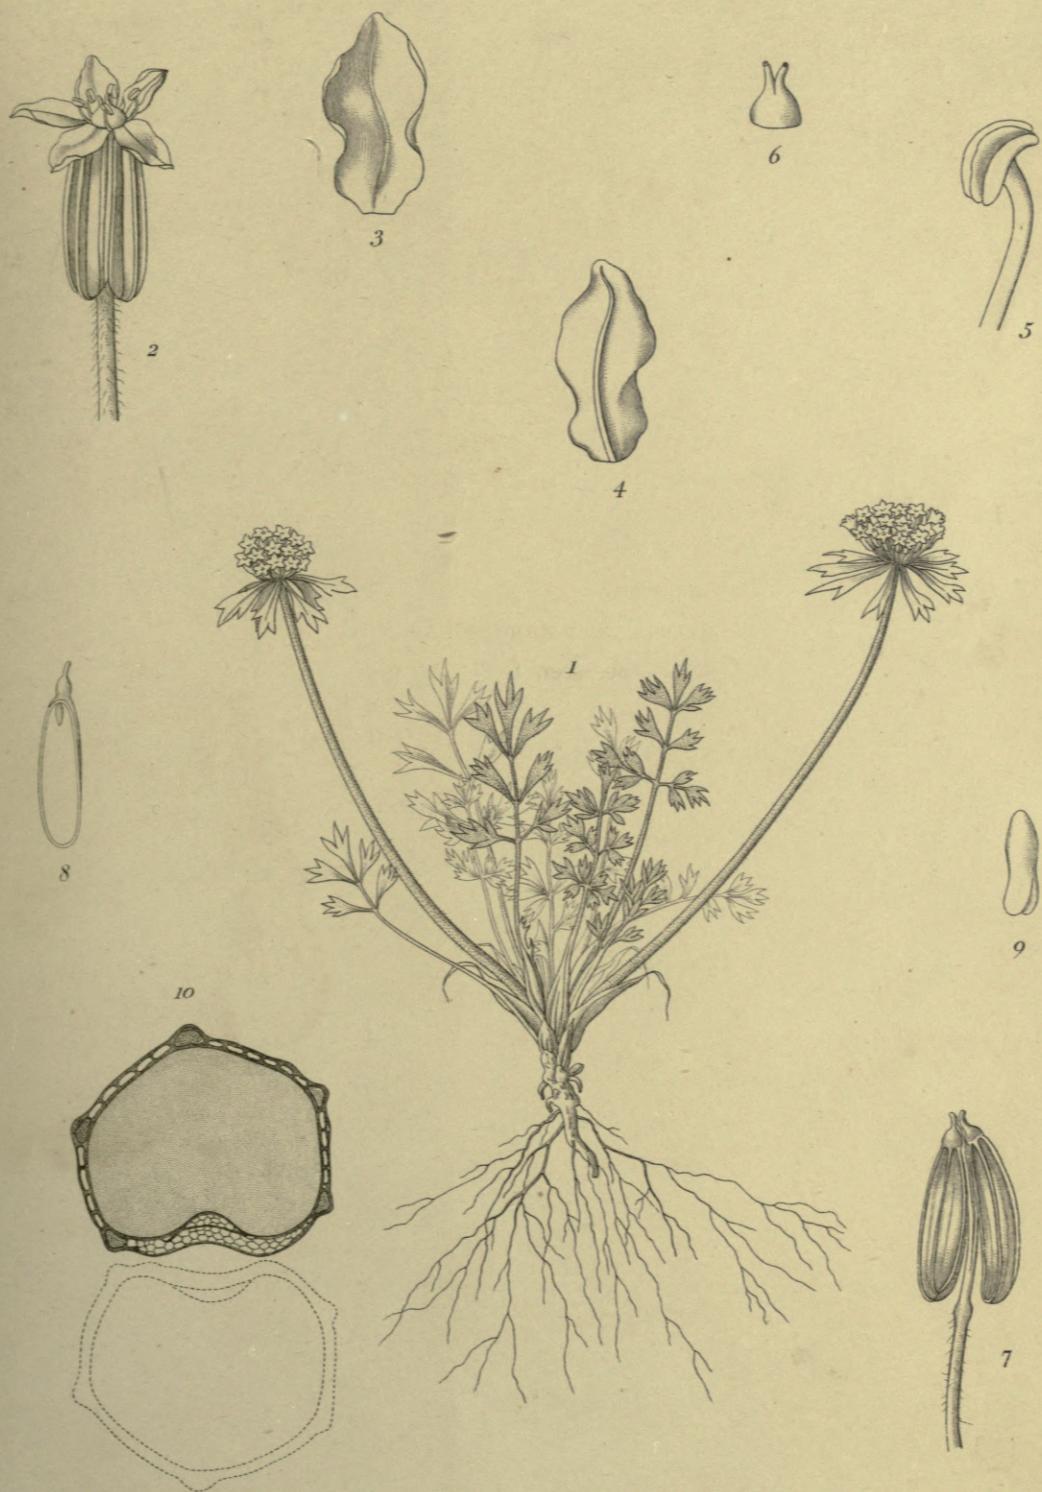

ICONES PLANTARUM FORMOSANARUM.

PLATE XL.

PLATE XL.

Oreomyrrhis involucrata HAYATA.

- Fig. 1. The plant.
2. A flower.
3. A petal, seen from within.
4. The same, seen from without.
5. A stamen.
6. A stylodium.
7. A fruit.
8. A carpel, in vertical section.
9. An embryo.
10. Vertical section of a fruit, showing the vittæ on
the margin.
