The plant mostly employed in this part as a screen is well represented in a big bed close to the river, which one again touches at this point—*Bignonia staua*. It grows with surprising rapidity, last year's cuttings being now 6 to 7 feet high, and proportionally bushy; its flowers are of moderate size, of a good clear yellow colour. A most useful shrub, often employed to hide outbuildings, or as a screen from a public road. *Poinciana pulcherrima*, and its variety *flava*, the roots of which are used for various medicinal purposes, are both common, and pretty, as is *Ixora coccinea*, which flowers freely. The Nim tree, *Melia Azadirachta*, is a common object, and represented in the park; it has handsome, somewhat pendulous *Fraxinus*-like foliage, and possesses the peculiarity of being deciduous for one week in the year. Pink and white *Oleanders* are scattered about in beds, and thrive well, though occasionally a little sticky.

Still wending our way towards the band-stand, a row of dwarf bushy Mangos, not more than 10 feet high, attracted my notice. Mr. Henry told me they

plant, such as *Coleus*, *Salvia farinacea*, *S. coccinea*, *Vincas*, *Gaillardias*, &c. In the centre of one of the *Coleus* beds is a nice dwarf shrub, much variegated with ivory white; its name is *Pedilanthus tithymaloides*, with moderate-sized, fleshy leaves borne on a straight stiff stem, valuable for bedding here, but I am doubtful whether it be worthy of space in an European stove.

A bed of *Zinnias* (a favourite plant in this part), growing rather tall and straggling, is in full flower round the band-stand. It is edged with *Goldfussia isophylla*, a very suitable plant for the purpose. Nearly all the other beds are edged with *Alternanthera*. Beds of *Ageratum* are good, but one of *Chrysanthemum Madame Desgrangee* is only fair. *Borassia flabelliformis*, a noble Palm, common in some parts, is well represented near the band-stand; whilst two large specimens, some 70 feet high, of the "people's tree"—*Ficus religiosa*—strikes one's attention on again turning towards the river; silk-worms will feed on its leaves, and it is an object of peculiar veneration to the worshippers of the powerful god Vishnu, the Destroyer, as some suppose he was born amongst its branches. *Jasminum Sambac*, the flowers of which are sacred to the same god, is also used for bedding.

I was much struck with a large tree of a Mango, against which grew a curled, twisted stem of *Pterospermum brachypterum* near this spot. This creeper had grown in, around, and almost entirely over the head of this huge Mango. When it flowers high up all over the Mango, Mr. Henry tell me it is a fine sight. Its main stem is about 10 inches in diameter.

Various *Jasmines* (about nine species are known in the district of Baroda) are scattered about, whilst *Abutilon coccineum*, a pretty little shrub, with small, highly-coloured scarlet flowers, is not uncommon. *Plumeria acuminata* is also not uncommon; it is one of the most noticeable trees of India. Its long, thick leaves, with their curiously regular venation, strike one at once; it does not grow high, and as it loses its older leaves is somewhat sticky. Its flowers are large, white, with a yellow centre, and most powerfully scented; they are about 1½ inch in diameter, borne in large heads, and last well in water. They are frequently offered to gods in the Temple at Kandy. I saw basket upon basket of it. This tree is in some mysterious way supposed by the natives (who call it the "Pagoda Tree") to be connected with the success of Englishmen in the East.

Cryptostegia grandiflora is grand here. The individual flower is pale lilac, the exterior of the corolla being somewhat darker. It will not last in water.

Two or three small lakes (in reality ponds) are scattered about, one being near the pigeon-house, though the principal, filled with *Nelumbium speciosum*, is close to the main bridge leading to the Superintendent's house. The *Nelumbium* also flourishes in the river, and is usually sown by the seeds being enveloped in balls of clay, and thrown into the water. On the banks of one of these lakes a remarkable shrub, some 3 feet high, and bushy, is to be seen. Its racemes, completely enveloped in large overlapping bracts, are about 4 inches long. These bracts are of a bronzy tinge; from beneath them emerge moderate-sized fleshy yellow tubular flowers—nearly two at a time. A sketch of this in my journal will convey to you a more accurate idea of this peculiar raceme. *J. H. Veitch*.

(To be continued.)

TWO FAMOUS GARDENERS, LONDON AND WISE.

(Concluded from p. 332.)

It is what may be termed their "literary" works, London and Wise were successful so far as regards producing books which sold fairly well. These books were not original, neither were they good translations, but they served a distinct purpose. The more important of the two works in which the names of London and Wise conjointly appear as translators, was an English version, greatly abridged, of *Jean de la Quintinie's*

FIG. 91.—PLANTING OF CHINKS IN ROCKERY. (SEE P. 620.)

were grafted pieces; they grow dwarfer, and flower and fruit earlier than those raised from seed. They looked so different from the huge trees with stems several feet in diameter, of which one sees so many. I fear I shall not see the Mango trees in fruit; it is too early.

Cassia samratana, or *siamea*, a common tree in the province of Guzerat, and most certainly in the district of Baroda, is to be seen in perfection in various parts of the park. It is a pretty tree, of graceful habit, and is recommended for its rapidity of growth and general hardiness. Most kinds of succulents do well, many beds are scattered about. *Kigelia pinnata*, a native of Madagascar, is a curious tree; it is now out of flower, but I saw the remains of last year's racemes, 3 to 4 feet long. Mr. Henry tells me they are usually much longer, and often touch the ground; as the trees are 12 to 15 feet high, it must be a curious sight.

Still going from the direction of the pigeon-house, one soon reaches the band-stand, situated in the centre of a large circular plot of grass, surrounded by beds of various simple shapes, and filled usually with one

Le Parfait Jardinier, which was published in the latter part of the seventeenth century; the earliest edition which we have examined is that of Claude Barbin, Paris, 1635. La Quintinie, who was born at Chabanais (Angoumois) in 1626, and died at Versailles in 1683, occupied a unique position in the horticultural world of France during the seventeenth century. Voltaire declared that his precepts were followed by all Europe; the Prince de Condé took lessons from him in the art of agriculture, and Louis XIV., who loaded him with honours and favours, after having given audience to Turenne or Colbert, delighted to entertain himself with this distinguished horticulturist. La Quintinie was appointed director of all the fruit and vegetable gardens of the king. When in England, he visited Evelyn at Saye's Court, whilst James II.—whose motives, perhaps, were not at all disinterested—treated him with great respect, and offered him a considerable pension if he would remain in London.

Le Parfait Jardinier is a heavy folio of nearly 900 pages, which no amount of enthusiasm would induce one to read through. The author was well versed in the art of making a very few facts go a very long way. If we cannot say with Erasmus, when speaking of Thomas Aquinas' *Secunda Secundæ*, that "no man can carry it about, much less get it into his head," we venture to assert that no one has honestly read it through. The minuteness of its details is appalling. Its preliminary matter has an interest infinitely beyond the subject of the book, for it contains a long poem to the author by no less distinguished a person than Perrault, whose *Les Hommes Illustres* (in which, by the way, is La Quintinie's life "au naturel") was suppressed by the censor, and now realises a high figure in the book-market. There is also another poem in Latin, signed "Santolinus Victorinus." A fine portrait of the author is given as a frontispiece, whilst the diagrams and illustrations are for the most part engraved by Picart, and the book was dedicated to Louis XIV.

A fairly full translation of *Le Parfait Jardinier*, by John Evelyn, under the title of *The Complete Gardener*, was issued by the booksellers, Gillyflower & Partridge, in 1693, and is remarkable, because it reflects greater credit on Evelyn's industry than on his discretion. It was dedicated by the publishers to Lord Capell, who had for many years corresponded regularly with La Quintinie. There are over 500 pages folio, whilst the illustrations, and also the author's portrait, were copied from the original by an English engraver, whose name does not appear. The edition must have gone off very slowly, notwithstanding the distinguished man who translated it, and the even more eminent dedicatee.

Six years later—1699—Matthew Gillyflower—whose cognomen seems so appropriate for a publisher of horticultural books—issued in octavo form a translation by London and Wise, of La Quintinie's work, who described their edition as "compendiously abridged, with very considerable improvements." This, the second English version, can hardly be rightly termed a translation, for it is merely the skeleton of *Le Parfait Jardinier*, but that it had a wide popularity is proved by the fact that it was reprinted in 1704, in 1706, in 1710, in 1717, whilst a seventh edition is dated 1719.

The second book of London and Wise is, like the first, derived from the French, but it is made up from two distinct works by two authors, both coming under the generic heading of *The Retir'd Gardener*. The less important of the two—so far at all events as regards size—is *La Jardinier Solitaire*, ou *Dialogues entre un curieux et un jardinier solitaire, contenant la methode de faire et de cultiver un jardin fruitier et potager et plusieurs experiences nouvelles*, which was first published anonymously in Paris in 1704, in duodecimo form, and consisted of 391 pages of text. The author's name was F. Gentil, of whom very little is known, but whose book had an extensive sale on the continent. At least five editions in French appeared between 1704 and 1723, another being dated 1725, and yet

another 1737. It was translated twice into German, one edition, under the title *Le Jardinier Solitaire, oder nützliche Unterredungen und Gespräche eines Gartenhabers und eines Gärtners, &c.*, appearing at Leipzig in 1715, and another, translated by F. C. Weber, *Gründliche Einleitung zum Garten-Bau . . . aus den Französischen Schriften des . . . Hrn. Quintinie und des Jardinier Solitaire*, dating from Hamburg, 1725, the latter being an exceedingly attenuated and vilely-printed catchpenny affair. The name of the author was evidently unknown to either translator, and was a secret when London and Wise issued their version, which, by the way, was based upon the second French edition.

The bulk of *The Retir'd Gardener* was derived from one of the many "ouvrages médiocres mais utiles," written by Louis Liger, namely, *Le Jardinier Fleuriste et historiographe, ou la culture universelle des fleurs, arbres, arbrustes et arbrisseaux*; it appeared in two octavo volumes at Amsterdam in 1706, and was reprinted in one volume at Paris in 1776, and at Avignon in 1811. Liger was born at Auxerre in 1658, and died at Guerchy, near his birthplace, in November, 1717, but of his career very little is known. *Le Jardinier Fleuriste* had a very circumscribed popularity in this country, which may be accounted for by the fact that it was too literal a rendering, that is to say, its translators greatly nullified its utility by ignoring English requirements. It was published in two octavo volumes in 1711, an advertisement of it appearing in *The Spectator* on May 5, and is in many respects a much superior work to *The Complete Gardener*, adapted from La Quintinie. The portion devoted to floriculture is particularly full, and the translators were justified in considering the book as "perhaps better than anything of this nature that has ever yet appeared in public in one entire treatise." To the second volume is added a description and plan of Count Tallard's garden at Nottingham. The book, which bore the imprint of the famous bookseller, Jacob Tonson, contains a large number of designs.

The second edition of *The Retir'd Gardener* was published in one volume in 1717, and was revised by London and Wise's successor, Joseph Carpenter, who wisely omitted the absurd "mythological histories" of the various flowers. For practical purposes, Carpenter's revision is a great improvement upon the original translation, and is very comprehensive, giving directions even for the making of a bowling-green. The twenty designs are reproduced from the two-volume edition, the frontispiece being a design of Laguerre, and having as its legend a line from Virgil's *Georgics*, "Regum aquas opes animas."

These two books of London and Wise have, of course, no horticultural value at the present day, but as desultory reading, it would not be easy to equal them. The cultural directions and botanical information are of the most quaint description, the effect of the whole being much enhanced by the profusion of capital letters in which our forefathers so delighted. *W. Roberts.*

THE WEEK'S WORK.

THE ORCHID HOUSES.

By H. A. BURBERRY, Orchid Grower, Highbury, Birmingham.
PROPAGATION.—The propagation, as stated by me in the *Gardeners' Chronicle* for April 30, of some kinds of Orchids is slow, and sometimes it is hardly necessary, healthy and vigorous plants that will be sure to flower the first year, being very cheap; yet it is generally desirable to increase the stock of any good thing one may possess. Free-growing Orchids, when doing well, viz., Calanthes, Pleione, Cypripedium, Thunias, and Masdevallias rapidly increase by themselves without artificial aid; but Cattleyas and Laelias are rather slower in this respect, even when of good vigour. I am not an advocate for severing the rhizomes, although this is a means whereby they can be made to break back, but the resulting growths are generally weak, and several years elapse before they will flower. Cattleyas and Laelias often have double breaks, forming two new

pseudobulbs from an old one; but it frequently happens that the following year one of these new growths will again take the lead, and the other remain dormant, and such pseudobulbs may sometimes be observed which are dormant after many years have elapsed. When it is seen that both of the new pseudobulbs are not going to start into growth at the same time, the one which lacks energy should be severed from the parent plant close to the rhizome, when it will be obliged to start on its own account. I have often noticed, especially among the labiate section of Cattleyas, that when a leading growth at about 1 or 2 inches in length is broken off accidentally or otherwise, the plant will freely break from the old eyes. A plant has just come under my notice which had its only lead accidentally broken off last year, when it instantly broke from three old buds, each of which breaks formed strong pseudobulbs, with a flowering sheath on each. I do not mention this case with any desire of advocating the practice as a means of propagation, as it is one which would take a good amount of courage to carry out; yet some gentlemen may feel disposed to experiment on plants of but little value, and communicate the results to this journal, which would doubtless be very interesting to orchidists.

THE INTERMEDIATE-HOUSE.—Most of the inmates of this structure, if they have been surfaced or repotted, will be in good growing order. *Odonoglossum grande* grows much better in this structure than in the cool-house; ours have had a long rest, and have been kept rather dry during the winter, and judging from the vigorous manner in which they are now pushing forth young growths, it is the right treatment to adopt with this species. A liberal supply of water may now be afforded, and weak liquid manure at intervals, and all the necessary re-potting done at once, and the rest left over till next season. *Leptotes bicolor* is a pretty little plant now in bloom, which should be grown in pans or baskets; no special treatment is required for this plant, but like many other species, it enjoys a long period of rest.

Angulosa are easily grown if placed at the cooler end, and where they will get a good amount of air; if the pseudobulbs are strong, the flowers will appear simultaneously with the young growths. In repotting this species, which may be done directly growth recommences, or just after flowering, it is best to use but little sphagnum moss, but good lumpy peat and sharp sand, and well-drained pots, as they like a liberal supply of water while growing, and weak liquid manure occasionally will be of great assistance. The remarks on the last-named Orchid apply equally to *Lycastes*, with an exception, which is, that the latter cannot endure so much cold; indeed, *L. Harrisoni* may be said to grow and flower best if placed in more heat than this house affords. *Miltonia*—another beautiful species of Orchideæ—are well worth growing. *M. spectabilis* and *M. Moreliana* should be grown in shallow pans, or teak wood baskets, placed near the roof-glass, where plenty of light is to be had. The natural colour of the pseudobulbs and foliage of these two species is golden-yellow, and if this colour is not present in them they do not flower well.

THE HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener, Mereworth Castle, Maidstone.

STRAWBERRY PLANTS are, notwithstanding the rough winter, and some damage to their leaves, throwing up numerous flower spikes, the plants having made good strong growths before the end of the season, owing to the timely attention given them. Before the flowers get too forward, all preparations should be made for strawing the beds down to keep the fruit clean. Grass mowings, or anything that sticks to the fruit, or impairs flavour, is best avoided. Before mulching the beds, well trample the soil about the roots, and then over the mulch lay on some long litter, close up to and around the plants; the rain will wash it clean and sweet before the fruit is ripe, and no time should be lost in putting these matters right, for once the fruit gets splashed with rain it is of little value for dessert. The hoe must be kept going in late-planted beds, and if the plants are weak, pull up any spikes that may appear, unless they are varieties grown for testing them. Those plants which were layered early last year, and transplanted, at 1 foot apart, on a warm border for the production of early fruits, should now be well attended to, by thinning out all the weak fruits, leaving from ten to fifteen berries on a plant, more or less, according

to strength, and thoroughly soaking the beds with water at intervals. By this mode of treatment, the crop will be ready several days earlier than that of older plants. Plants which may have been forced and set aside for planting in beds should, if the ground be at liberty, be planted after having been properly hardened off. Give the ball a good watering if very dry; apply water more than once, or dip them overhead in a tub, remove some of the lower leaves, and dip what remain in a mixture of Gishurst Compound Soap, 2 or 3 oz. to the gallon of water, in which a little flowers-of-sulphur is stirred if red-spider or mildew be present on them. Before planting, reduce the size of the ball somewhat, and disentangle the visible roots, and plant very firmly, and afford water to each plant, watering them again if the weather should prove dry till growth re-commences. If any of the early varieties are put out on warm sheltered borders, and attended to in regard to keeping the plants clean and supplied with water when needful, nice fruits may be gathered in some quantity about the end of the month of August and in September. For this purpose the plants may stand at 9 inches apart. For beds to last two or three years, the ground should be in good heart, and the surface should be cleared of weeds before planting. If the ground be not very firm, stand the Strawberry pots somewhat close together on the north side of a wall or building, watering them abundantly at the roots and overhead, removing the flowers and runners as soon as they can be got hold of, and planting out as soon as the ground can be cleared and dug.

RASPBERRIES should have suckers that are not wanted for increase removed, and some of the latter may be transplanted; they will make good canes the present year. To fruit next season, leave from six to nine of the strongest canes on each stool. New plantations of Raspberry should have the canes cut down to within 3 inches of the soil, and the hoe freely used amongst them. In dry soils, mulch the quarters with good rotted manure, and afford water when necessary.

PLANTATIONS OF MIXED FRUIT.—Be careful to keep the weeds in check, for once these become plentiful, they will be very troublesome for the season, so keep the hoe constantly in use till the land is freed of them. Digging deeply amongst bushes and trees is still much practised, but with what object, I am at a loss to know; it certainly damages and destroys the upper roots, and obliges the others to go down into the subsoil; and fruit-growers would do better if they hoed the ground oftener and mulched the roots with manure. The only kind of digging that needs to be done is the slight pricking over the surface to prevent it cracking, and to form a crumb, so that hoeing may be easily performed.

THE FLOWER GARDEN.

By H. W. WARD, *Gardener, Longford Castle, Salisbury.*

THE DAHLIA.—What with the new and improved varieties of the good old double Dahlia, and the many varieties of the Cactus and single-flowered forms, including the miniature "Tom Thumb" race, which have been raised within the last two or three years by Mr. T. W. Girdlestone, and distributed by the Messrs. Cheal and Son, of Crawley, a very good and varied display may be made entirely of Dahlias, the colour having great range, and the forms of all of them are effective and diversified. When Dahlias are planted in rows, it should be at from 5 to 6 feet apart, putting a stake to each plant for support. Large beds might very well be filled with plants of the Cactus and single-flowered varieties producing flowers of the same shade of colour, pegging down the young growths over the beds in due time, and edging the beds with plants of the Tom Thumb varieties, whose flowers agree in colour. Small beds may be filled with "miniature" plants of distinct colours. These last-named range in height from 11 to 22 inches, and the most distinct varieties are Bantam, dark scarlet flowers, height 11 inches; Mignon, bright clear pink flowers, with white ring around disc, height 12 inches; Miniature, clear light yellow flowers, height 15 inches; Miss Grace, light orange, height 14 inches; Pearl, deep mauve flowers, height 15 inches; Tom Tit, clear orange-scarlet, light yellow round disc, and loop-la, rich velvety maroon self, clear yellow ring round disc, height 14 inches. The heights given above include the flower-stems. Of single-flowered varieties (not Tom Thumb), *Alma* simple, pure white; *Defiance*, deep scarlet; *Plavus*, good dwarf yellow; *Hero*, creamy-white, shaded to deep sulphur in the centre;

Paragon, rich dark maroon, with a shade of purple round the edge of each petal; and *Bertha*, purplish-lilac, are six reliable varieties. *Constance*, white; *Juarez*, rich crimson; *Mrs. Douglas*, bright pinkish-salmon; *Mrs. Hawkins*, clear sulphur-yellow, shading to delicate pink; *Panthea*, reddish-salmon, with long graceful petals; and *Robert Mayher*, amber-yellow, are six good representatives of the Cactus species of the Dahlia. Whilst the Pompon section is worthily represented in *Admiration*, *Crimson*, with scarlet band at the edge of each petal; *Archilles*, pale lilac; *Phoebe*, deep golden orange; *Catherine*, yellow; *Dora*, white, shaded with cream; and *Gem*, intense rich scarlet. The above lists of the several kinds of the bedding-out and decorative Dahlia may help those who intend using them in the manner indicated, perhaps for the first time, to make their selection; and, in case the omission from our lists of the show and fancy varieties might be misunderstood by the growers of those flowers, I will give the names of twelve reliable varieties of each. Show: *Alice Emily*, *Clara*, *Crimson King*, *Delight*, *Earl of Radnor*, *H. W. Ward*, *Imperial*, *Miss Barber* (new), *Mrs. Langtry*, *Mrs. Shirley Hibberd*, *Reliance*, and *Walter H. Williams*. Fancy: *A. F. Barron*, *Alderman*, *Comedian*, *Dandy*, *Stanley*, *Duchess of Albany*, *Enchantress*, *Fanny Sturt*, *Flora Wyatt*, *Frank Pearce*, *Frederick Smith*, and *Gaiety*. Dahlias of all sections should be kept well supplied with water at the roots, and have plenty of fresh air admitted to the pits and frames in which they are growing, drawing the sashes off during the heat of the day, and returning them at night. But it will not be safe to plant them out much before the end of the month, as the plants are very susceptible to injury from a degree or two of frost, more so now than in the autumn.

GENERAL WORK.—This will consist of watering recently-planted subjects in the herbaceous border, and annuals, trees and shrubs; cutting out branches of *Yew*, *Laurel*, &c., which have been killed by frosts; transplanting forced plants of *Azalea mollis*, in groups, on either side of walks in certain parts of the grounds; putting peaty soil about the roots, making the same firm about them, and then mulching with a couple of inches thick of leaf-mould, and watering, to settle the soil about them.

PLANTS UNDER GLASS.

By J. MILLNER, *Gardener, Penrice Castle, Swansea.*

SINGLE AND DOUBLE-FLOWERED PETUNIAS.—These make useful pot plants for the conservatory and the greenhouse in summer and autumn, and any young plants which may be in 5 or 6 inch pots may now have a liberal repotting in a good compost, consisting of two parts good loam, one part decayed manure and good leaf soil, with some sharp sand. The pots must be clean and well-drained. As growth proceeds stop the shoots, especially those of the single-flowered varieties, as it is important that a good foundation be formed for the future specimens. If any are to be grown in baskets, they should be of the single-flowered varieties, on account of the larger quantity of flowers produced, and I think that a mixture of colour looks much better than when separate colours are employed, especially when the baskets alternate with others filled with Ferns. After planting in the baskets, place them in a house which is slightly warmer than that previously occupied, but always in a position where they will obtain plenty of direct sunlight.

INDIAN AZALEAS.—As the plants go out of bloom, remove the seed vessels, and if thrips are present on the leaves fumigate the plants two or three times in succession with tobacco or some of its preparations, so as to thoroughly clear them off. Specimens that are out of flower should be placed together in one structure, and kept rather close, syringing them heavily twice a day with tepid water to cause rapid and early growth. Young plants requiring larger pots should have attention in this respect as soon as flowering is over, or even before, if the bloom be not required. If healthy, the plants may be repotted into pots of two sizes larger, and the pots must be clean and well drained—that is, with large crocks at the bottom of the potting, and with gradually diminishing sizes, up to quite fine stuff at the top; this is the more essential, the plants not requiring annual repotting. Only fibrous hard peat of the best quality should be used, and silver sand should form one-twelfth of the whole; before repotting, loosen the fine roots around the ball with a pointed stick, and soak it in water, if it be at all

dry. The ball may be from a quarter to half an inch below the surface of the new soil, which must be placed around it in small quantities, and made firm with the potting-stick. Potting-sticks of two or three sizes, to fit the varying spaces to be filled, should be made use of. When finished, the surface should be level, and enough space left to hold sufficient water to thoroughly moisten the ball. Place the plants in a structure as recommended above, till growth is finished, then remove them to a cooler house. Those which were early forced and have finished their growth, should be placed in a more airy house, syringing them when shutting up in the afternoon to keep down thrips; guard against over-watering any plants that were repotted earlier in the season, as if kept in a too wet state the compost decays, and becomes unwholesome, causing loss of roots and leaves.

FRUITS UNDER GLASS.

By J. RIDDELL, *Gardener, Cattle Howard, York.*

TOMATOS.—Where the planting of Tomatos has yet to be done, there should be no further delay, for the earlier the planting the heavier will be the yield of fruit, if the space in the house suffices for the growth of the plants. To have a house entirely devoted to Tomato culture is the exception rather than the rule in most private gardens, and on this account the structures that are at command, although, perhaps, wanting in some points, have to be utilised for Tomato growing. In looking for a suitable place under glass, where a few plants may be grown, the cultivator should keep in view the conditions that are the likeliest to give satisfactory results; these are, a temperature of 60° to 65°, with a dryish atmosphere, and an unrestricted run in a rough, open soil, enriched with superphosphate of lime. From 15 feet to 2 feet is a convenient distance apart for the plants to stand, and if a trellis be not available, a stout stake should be afforded each plant for support. All side growths, whenever they make their appearance on the stems, should be cut off, and the growing points kept secured to the stakes or trellis. Tomatos in bearing should be liberally supplied with manure-water at the roots, but not that from the farmyard tank, as this produces a too sappy and unfruitful growth. Thomson's Vine Manure is, in my opinion, much better. Shake the flowers daily when expanded. As many gardeners and amateurs suppose that the fertilisation of plants is aided by fiddling among them with a camel's-hair pencil, it may not be out of place to say that such efforts are ineffectual, unless the anthers are given asunder, seeing that they are united wholly or through part of their length into a tube (syngonium), and there is no difficulty in securing a good set, where due attention is paid to maintaining a dry, moving atmosphere among them, and tapping the flowers when open. I may add that the pollen is discharged from within the tube-like formation of the anther encircling the pistil, and as the flowers naturally droop, the pollen grains fall on the stigma, which almost fills the aperture at the end of the stamens.

MELONS.—Remove all superfluous shoots from plants in bearing, by cutting them back to the point from which they spring; support the fruits at an early period when an ample set has been obtained. Plants at this stage should be supplied with liquid manure, and with some fresh materials to the borders. All female blooms may be impregnated as they open on later plants, and a good time for doing this is between 10 and 12 o'clock. Later succession plants should have their shoots trained and stopped as growth proceeds. Plants may now be put out in houses or frames, and seed sown for succession. When Melons are grown in hot-bed frames, fresh linings of fermenting manure must be applied fortnightly to keep up the heat of the bed and the air of the frame, and as at this season leaves are apt to be scarce, if short grass and stable-litter be well mixed together, they will afford fairly lasting materials for linings, but need watching in warm weather, to prevent damage by their getting too hot, or the fumes penetrating the frames. The quantity of grass used should not be so large as that of litter.

PLANT PORTRAITS.

BROWNIA MACROCEPHALA, *Illustration Horticole*, t. 14; *Gardener's Chronicle* (1873), fig. 149.

EPIDENDRUM MANTHANUM, *Illustration Horticole*, t. 150. A plant of the *Nanades* section; flowers star-shaped, 3 by 2½ inches; segments lanceolate greenish, covered with small red spots; lip elliptic acuminate, green with purple spots and lines.

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

PLANTS, &c., TO BE NAMED.—Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.

LOCAL NEWS.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

ILLUSTRATIONS.—Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are particularly solicited.

NEWSPAPERS.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Advertisements should not be sent to the Editor, but to the Publisher.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

TUESDAY, MAY 17 Royal Horticultural Society's Committee, at the Drill Hall, James Street, Westminster.
National Rose Society, Executive Committee, at the Hotel Windsor, Victoria Street, Westminster.
Gardeners' Orphan Fund Bazaar, Whitehall Rooms, Hôtel Métropole.

SHOWS.

WEDNESDAY, MAY 18 Bath Spring Show (two days).
Royal Botanic Society's Show.

SALES.

TUESDAY, MAY 17 Orchids, at Protheroe & Morris' Rooms.
WEDNESDAY, MAY 18 Terrestrial Orchids, Picotee Plants, Palms, &c., at Protheroe & Morris' Rooms.
THURSDAY, MAY 19 A grand importation of Cattleya Seedlings, received direct; Orchids from Brazil, and a Collection of Orchids in Flower, &c., at Stevens' Rooms.
FRIDAY, MAY 20 Orchids from Messrs. F. Sander & Co., St. Albans, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—56°·1.

The first really fine warm day of the season, and the prospect of seeing their Royal Highnesses the Duke and Duchess of CONNAUGHT take part in the first public ceremony at which any member of the Royal family has taken part since the death of Prince VICTOR, were sufficient inducements for a large number of persons to assemble in the main building of the Exhibition at Earl's Court, on May 7. Those assembled however, had to wait some time in expectation; but the Coldstream Guards band, with Lieutenant DAN GODFREY as conductor, helped the time to pass rapidly and pleasantly. When the Duke arrived, the Duchess of CONNAUGHT was not present, having another public engagement in the afternoon. The Duke was met by the principal officials of the exhibition, and conducted by Mr. MILNER, the chairman, to a platform about half-way down the building. We give a portrait of Mr. MILNER, at p. 627. Among those who entered with His Royal Highness were the Bishop of London and Mrs. TEMPLE. Amongst those present then, or later, were a number of well-known horticulturists.

The Duke's speech was spoiled by the crushing round the platform, but the effect of the scene displayed when the curtain was suddenly dropped, disclosing the arrangements of beds of plants in flower, curving paths, and patches of turf, nothing could mar. There were banks and beds of Rhododendrons, Palms, Tree Ferns, Azalea mollis, and Ghent Azaleas, and many others. Doubtless, in a week or two, when the newness has disappeared from the whole, and the turf has begun to grow and get its proper colour, and the beds are still better furnished so as to hide the soil to a greater extent than was perhaps possible on Saturday, this part of the building will be very pretty, especially when seen under the electric light (tempered, we hope, so as not to spoil the colours of the blossoms).

At 1 o'clock some 450 guests were entertained at luncheon by the committee in the Restaurant Français, and the toast of the day, "Prosperity to the Exhibition," was proposed by the Bishop of LONDON, who spoke of the pure delight given by the contemplation of the most beautiful of God's creations, and he added that the object of the exhibition was not merely to give pleasure, but to show and to encourage improvements in horticultural art. Mr. MILNER responded in a speech, calling attention to the great improvements made in horticulture.

To add to the brilliancy of the opening day, many members of the nursery trade had made a beautiful display of flowering plants in the large hall to the left as one enters by the main entrance at Lillie Bridge Road. We noticed tables of plants from Mr. B. S. WILLIAMS, Holloway, consisting of Amaryllis, Cactus, Orchids, Sarraacenas, Dracenas; from Messrs. LAING & SON, Forest Hill, two tables filled with Orchids, Ericas, and fine foliage plants.

Messrs. SHUTTLEWORTH & CO., Peckham Rye, had a large group on the floor of foliage plants, Narcissus, and other flowers in season from out-of-doors, came in large quantities from Messrs. P. BARR & SONS; Messrs. C. LEE & SON, Hammersmith, contributed a welcome mass of rich colour with a group of Azalea mollis and Rhododendrons; and Messrs. J. LANE & SON had a gorgeous lot of Rhododendron bushes in pots.

Mr. R. DEAN had a gay table of Polyanthus and Primrose, which formed a good background to Mr. LIONEL DE ROTHSCHILD's magnificent specimens of pink and white Carnation Souvenir de la Malmaison.

Messrs. J. & J. HAYES, of Edmonton, had a fine lot of Pelargoniums, well-flowered, and showy. Cinerarias came from Messrs. JAMES & SON, Farnham Royal.

Messrs. C. TURNER and J. PEED & SON had well-flowered Azalea indica arranged on tables.

Mr. W. RUMSEY and Messrs. W. PAUL & SON, Waltham Cross, were strong in fine Roses in pots, the latter with two large groups in opposite corners of the hall. Messrs. W. CUTBUSH & SON showed some excellent Narcissus, and Messrs. HUGH LOW had a large table filled with Ericas, Cytisus, Polygala, Pimeleas, Leptospermum, and other hard-wooded plants. The more purely artistic side was seen in a table filled by Mr. G. PHIPPEN of Reading, with handsome bouquets, &c.

The Home of Flowers, Swanley, contributed a table of succulent plants and cut flowers of Begonia and Pelargonium—an interesting exhibit. Of other exhibits of a more permanent character we may speak on another occasion. Granted a continuance of fine weather, this exhibition will form an agreeable lounge for

the Public, and Mr. MILNER may be congratulated not only on the taste he has displayed, but on the skill and energy he has manifested in carrying out so successfully a difficult task.

ALSOPIA CRINITA.—The beautiful Tree Fern figured in our Supplement this week is one of which Mr. J. H. VEITCH writes in one of his letters from Ceylon, and of which he kindly furnished us with a photograph. The plant inhabits the central part of the island, at an elevation of 5000 to 7000 feet, the Negliris, Pulneys, and Anamallays. It is one of the handsomest of Tree Ferns, and has dark stipes, slightly pubescent, as are likewise the pinnales, which are slightly recurving at the tips.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Society in the Drill Hall, James Street, Victoria Street, Westminster, will take place on Tuesday, May 17, when prizes are offered for competition among amateurs who exhibit Indian and hardy Azaleas, and Pelargoniums (zonals excluded). In the afternoon, at 3 P.M., a paper on "Hardy Climbers and Creepers," will be contributed by Mr. W. C. LEACH.

BRUSSELS.—A special exhibition of Orchids will be held at the Horticulture Internationale of Brussels from the 14th to the 20th May.

GREAT FLOWER SHOW IN THE INNER TEMPLE GARDENS.—We have received the following note concerning the Temple Show from Mr. J. WEATHERS, for publication:—On Wednesday and Thursday, May 25 and 26, by the kind permission of the Treasurer and Masters of the Bench, the Royal Horticultural Society will hold its fifth annual Flower Show in the Gardens of the Inner Temple, situate close to the Temple, Blackfriars, and Ludgate Hill Railway Stations. Last year, over 10,000 people, visited the exhibition, and it may be fairly assumed that the forthcoming show, when the interest in plants, flowers, and fruits, which seems to have taken hold of everyone, is considered, will be in every respect as successful and interesting as those which have preceded it, if the weather be favourable. To enable gardeners (that is, *bona fide* employees in a private garden, nursery, market garden, or seed establishment) who are not already Fellows or Associates of the Society, to visit the show, the Council have decided to allow them to purchase 2s. 6d. tickets for 1s., admitting at 10 A.M. on Thursday, provided that applications for same, accompanied with stamped and directed envelope in addition to the price, be made to the Secretary, 117, Victoria Street, S.W., prior to the opening of the show on May 25. Arrangements have been made with Messrs. J. LYONS & Co., of "Olympia," to supply refreshments of all kinds, and music will be performed each day by the band of Her Majesty's Royal Horse Guards (Blue), under the conductorship of Mr. C. GODFREY. A catalogue of the show will also be presented to every person visiting the exhibition. It will contain a brief history of the Society since its establishment in 1804, by the Rev. W. WILKS, M.A., Secretary; the names and addresses of all the exhibitors, with plants, &c., shown; a programme of the music to be performed by the band; and various other particulars, chiefly relating to the Society's work in regard to horticulture in general.

LINNEAN SOCIETY.—On the occasion of the meeting held on May 5, Professor STEWART, President in the chair, Messrs. ERNEST GALEIN and HENRY GROVES were admitted, and the following were elected:—Messrs. C. A. BARBER, F. ENOCK, C. E. COBBEL, C. F. LITKEN, W. G. FARLOW, K. MÖRINS, and HENRY POWER. Mr. CURTIS showed a photograph of sections of the Silver and Douglas Firs, illustrating the relative rate of growth in trees of the same age, growing in the same soil and under similar conditions in all respects, the diameter of the one (A. Douglasii) being nearly double that of the other. Mr. GEORGE MURRAY exhibited spirit specimens of *Ascomathium intricatum*, an organism

ALSOPHILA CRINITA.—THE WOOLLY TREE-FERN.

described as a siphonous Alga, but ascertained to be identical with an animal, namely, *Zoobotryon pellucidum*, Ehrenberg. He also exhibited two specimens of a Palm, *Thrinax Morrisii*, Wright, peculiar to Anguilla in the Leeward Islands, and made some remarks as to the results of the recent Cryptogamic collections made by Mr. W. R. ELLIOTT for the West India Committee. Mr. HOLMES exhibited and made some observations on an abnormal development of the calyx in a *Primrose*. The President exhibited and explained a collection of Lepidoptera, containing several examples of mimicry between protected forms. On behalf of Dr. J. MÜLLER, Mr. TRISSELTON-DYER communicated a paper, entitled "Lichenea Epiphylli Spruceani." Mr. W. F. KIRBY gave an abstract of a paper on the family Saturniidae, with descriptions of new species in the British Museum. In the absence of the author, Mr. W. PERCY SLADEN read a paper by the Rev. HILDERIC FIENDEL, entitled "Observations on British Earthworms." The President announced that the anniversary meeting of the Society would be held on May 24, at 3 P.M.

GARDENERS' ORPHAN FUND.—Even amid the whirl of the exhibition season about beginning, gardeners and their friends are not likely to forget the claims of the hapless orphans. They have not done so in the past, nor will they do so in the future, but many will be glad to be reminded that the annual dinner will take place at the Hôtel Métropole, on Tuesday next, at 6.30, under the presidency of Sir JAMES WHITEHEAD, Bart. We hope to see a goodly muster and a large subscription list.

EATON HALL GARDENS.—It is announced that Mr. NICHOLAS BARNES, recently foreman in the gardens at Floors Castle, and subsequently occupying a similar position in the Prince of Wales' gardens at Sandringham, has been appointed head gardener to the Duke of Westminster at Eaton Hall, Cheshire. During the six years or so that Mr. BARNES was at Floors, he proved himself a skilful gardener and an admirable manager. When Mr. McKELLAR, the head gardener there, was, some eighteen months ago, appointed to the charge of the gardens at Sandringham, he gladly availed himself of Mr. BARNES' services as his assistant. His estimate of Mr. BARNES' abilities has been justified by events. The post at Eaton Hall is one of the prizes of the profession. The establishment is one of the largest in Great Britain, employing about forty gardeners, and is kept in the most perfect order.

FROST IN MAY.—From several parts of the country we have reports of hard frosts last week, the severest occurring in the home counties on Friday night, May 6, when the thermometer fell at Kew to 22°, or 10° of frost; at Harpenden, in Hertfordshire, to 26° = 6° of frost. Plums and Cherries and bush fruits have suffered heavily, but the Apples but little, owing to the lateness of the bloom this year. The full extent of loss from frost will not be ascertainable for some time longer.

NATIONAL PINK SOCIETY: MIDLAND SECTION.—It is intended to hold a show of Pinks at Wolverhampton on the occasion of the floral fête in the public park of that town on Tuesday, July 12, and the two following days. In the interest of all Pink growers, the committee have arranged two additional classes this year, and hope that the liberal classification now offered will induce lovers of this sweet-scented flower to support them, both by subscribing to the society, and exhibiting at the show.

NATIONAL ROSE SOCIETY.—A meeting of the Executive Committee will be held, by kind permission of the Horticultural Club, at their Rooms, Hotel Windsor, Victoria Street, Westminster, on Tuesday, the 17th inst., at 3.30 P.M.

STOCK-TAKING FOR APRIL.—A much more bulky Return than has been issued for months past was issued the other day, representing the imports and exports for the month of April. There is no

doubt that in many cases quantities are represented by less values in both departments—unhappily both show a heavy decline in the exports. As to—

IMPORTS, they this month show a falling-off to the tune of £4,062,265. That is a heavy sum, but then there were only twenty-four working days in the month as against twenty-six in the same month last year, and we have ceased to lend money in certain quarters whence we draw payment in "kind." Cotton, wools, bread-stuffs, did not trouble us so much last month as previously; even tobacco has dropped. Speculators in grain for a rise have had a bad time of it—but let us get to our usual excerpt from the "Summary" of Imports for the past month, as follows:—

IMPORTS.	1891.	1892.	Difference.
Total value for month	£38,982,537	£34,920,272	-4,062,265
§II.—(A.) Articles of food and drink—duty free	13,547,233	11,148,301	-2,398,932
(B.) —do., dutiable	2,033,998	2,415,608	+381,610
§VI.—Raw materials for textile manufactures (including Flax, Hemp, and Jute)	8,970,138	7,401,977	-1,568,161
§VII.—Raw materials for sundry industries and manufactures (including wood and timber, hewn, sawn, split, dressed; vegetable materials; for paper-making, &c.)	3,120,869	2,942,160	-178,709
§IX.—Miscellaneous articles (including Clover, Grass, Flax, Rape, Linseed) ...	1,265,802	1,281,333	—5,269
(B.)—Parcel Post ...	28,951	48,438	+19,487

The "minus" sign is somewhat prominent in the following extracts from the general mass of figures, concerning which, doubtless, both producer and vendor will have enough to say in the current month:—

IMPORTS.	1891.	1892.	Difference.
Fruits:—			
Apples, raw ... bush.	85,656	147,635	+61,979
Plums	5	+5
Pears	1,096	+1,096
Grapes	623	+623
Unenumerated, ..	28,820	19,487	-9,333
Onions ... bush.	409,326	450,738	+41,412
Potatoes ... cwt.	385,054	73,691	-311,363
Vegetables, unenumerated, raw, ... value	£73,357	£69,492	-£3,865

It may be added to these figures that, as they were going through the press there was landed in Liverpool from Florida a large consignment of Strawberries, Tomatoes, and Pine-apples; of all, good accounts have been given in the local press. If it can be made to pay, not much art will be required in forwarding Tomatoes to this country from over the Atlantic—doubtless the demand will increase with the supply. Refrigerator-carried Tomatoes are not always satisfactory, any more than are some Apples, which are apt occasionally to run in the direction of the Turnip—the sweeter the aroma the drier the flesh.

EXPORTS next claim attention. There is a large falling off in the value as well as in the quantity of British and Irish manufactures exported in April as compared with the same period in 1891. Tariffs all round are against us, but not to the advantage of the protectionist countries. There are symptoms, however, of improvement; there will be a less margin of profit, but pluck, cheap freights, cheap raw material, the perpetual stimulus to invention, must force the way—even in Spain, which has set its face recently so determinedly against us. The "finance" world is getting to be more cheerful; the Canadian demand promises to be a good one all round the year. Fruit and meat canners in the United States are

crying out against the prohibition of tin plates; a bill for striking wool out of the McKINLEY Tariff has passed the American House of Representatives, and other producers and vendors are wakening up to the knowledge of having been "sold," the largest iron and steel works in the country has had to close its doors because of the heavy duty on the raw material. Protection in France has contributed something to our "drop" last month of £3,053,190, and in Belgium the iron and steel industry has been so much affected, that it is proposed to shut up some dozen or more ironworks, putting many thousands out of employment, without benefiting the French workman. But in France, merchant, shipper, and workman alike, are loudly asking for information as to where the promised benefits come in. In Bordeaux and its districts, trade and shipping prospects are very bad, and the paralysis is extending. The exports from French ports have sunk most alarmingly during the past few months. In Spain, both exports and imports are tumbling down; the policy pursued there seems to be of a most disastrous character; surely the day cannot be far off when "the greatest good of the greatest number" will be found the best of all policy, and better trade and wages act as a set-off against anarchy. In the meantime, we must perforce curtail the output of many of our manufactures, but there is no reason for despondency—only for more and more thought.

CHICAGO EXHIBITION.—We have received a copy of the "classification and rules," of the Department of Horticulture, from which we extract the following particulars:—"The horticultural hall is the largest ever erected for a horticultural exhibition. It contains about 89,000 square feet, or more floor space than the combined floor areas of the buildings used for a similar purpose at the Centennial, New Orleans and Paris. It is 1000 feet long by an extreme width of 287 feet. The dome is 187 feet in diameter and has an altitude of 113 feet on the inside, thus giving room for the largest Palms, Bamboos, Tree Ferns, giant Cacti, &c. The plan is a central glass dome, connected by front and rear curtains with two end pavilions, forming two interior courts, each 88 by 270 feet. In these courts will be placed bearing Orange trees and other semi-tropical fruits from California and Florida, to illustrate the manner of growing and cultivating the orchards and groves in those States. The front curtains have glass roofs, and are each 270 by 60 feet. They will be used for tender plants. The rear curtains are each 346 by 46 feet, and, while designed to give an abundance of light, are not entirely covered with glass. They will be adapted to fruit and other exhibits that will require a comparatively cool temperature. The first storeys of the pavilions are each 117 by 250 feet, and are intended for the extension of the fruit display, and for installing the viticultural exhibit in one, and horticultural appliances, seeds, &c., in the other. The principal part of the second storey in each will be used for elegant and commodious restaurants; the remainder, in the form of galleries, for garden-seats, vases, preserved fruits, &c. Forming a circle inside the dome, there is a broad promenade gallery from which visitors can look down upon the plant and floral decorations. This gallery is sufficiently extensive to instal many miscellaneous exhibits. In addition to rules applicable to the whole exhibition, there are special rules for the department of horticulture. The exhibits are classed under seven groups and seventy-three classes. The first group is devoted to the Vine and its products; succeeding groups to pomology and preparations of fruit, floriculture (twenty-four classes), culinary vegetables, seeds and seed-testing, arboriculture, and garden constructions and appliances.

BIRMINGHAM ROSE SHOW.—At this exhibition, which will be held in the Moseley Botanical Gardens on July 19 and 20, there are to be several novel and interesting features. No entrance-fees are to be charged, but in order to prevent trouble and disappointment to the committee, a fine of 5s. is to be

deducted from the prize-money of any exhibitor who enters in classes which eventually he does not fill; and no exhibitor will be allowed to take more than one prize in any one class. Exhibitors are requested to give up the flowers they have exhibited (as well as others they may have left after staging) for the purpose of being sold in a tent, the proceeds equally to be divided between the Birmingham Children's Hospital and the Gardeners' Orphan Fund. It is to be hoped that all will unite to make this work of charity a success. The best prizes for cut blooms are offered in the open class for seventy-two dissimilar Roses, viz., 1st, £10; 2nd, £7; 3rd, £5; 4th, £3. For a group of plants, occupying a space of 14 feet, and open to all, prizes of the following amounts are offered: 1st, £10; 2nd, £8; 3rd, £6; 4th, £4.

SPRAYING FRUIT TREES.—We are so slow in this country to adopt any new procedure, that it is specially lamentable when anything arises to render that progress even slower. Nevertheless, it is not wonderful that the free use of powerful arsenical preparations, and of salts-of-copper, should be looked on with suspicious dread. The experiments, however, have now been made on such a gigantic scale both in France and in the United States, as to prove that, when carefully used at the proper season, the danger is practically none. In the United States not a single case of poisoning has been known to occur. As the season for the application of the spray to the Apple is now at hand, we may again invite our readers to test the matter for themselves. The moths lay their eggs in the flower of the Apple, and the caterpillars eat their way into the young fruit. To prevent this, the trees should be sprayed soon after the flowers fall, or when the Apples are of the size of Peas. A second spraying should be given ten days or a fortnight later. In order that our readers may be reassured as to the point of danger, we quote from a Report on Spraying Fruits, with a special consideration of the subject in its relation to public health, published by the authority of the Secretary of Agriculture, and circulated by the United States Department of Agriculture:—

1. It would seem at first glance that the use of an arsenical poison upon a plant like the Cabbage would be very unsafe to recommend, yet Paris Green and London Purple are used upon this crop to kill the several species of leaf-eating worms which are so destructive to it, and an absolute absence of all danger where the application has been properly made has been recently shown by Professor GILLETTE, of the Agricultural Experiment Station of Colorado, by the following *reductio ad absurdum*:—

"Where the green is dusted from a bag in the proportion of 1 oz. of the poison to 100 oz. of flour, and just enough applied to each head to make a slight show of dust on the leaves, say, for twenty-eight heads of Cabbage, 1 oz. of mixture, the worms will all be killed in the course of two or three days, while the average amount of poison on each head will be about one-seventh of a grain. Fully one-half of the powder will fall on the outside leaves and on the ground, and thus an individual will have to eat about twenty-eight heads of Cabbage in order to consume a poisonous dose of arsenic, even if the balance of the poison remained after cooking."

2. In the case of spraying Apple orchards for the codling moth, there is scarcely a possibility of injury to the consumer of the fruit. A mathematical computation will quickly show that where the poison is used in the proportion of 1 lb. to 200 gallons of water (the customary proportion) the arsenic will be so distributed through the water that it will be impossible for a sufficient quantity to collect upon any given Apple to have the slightest injurious effect upon the consumer. In fact, such a computation will indicate beyond all peradventure that it will be necessary for an individual to consume several barrels of Apples at a single meal in order to absorb a fatal dose even should this enormous meal be eaten soon after the spraying, and should the consumer eat the entire fruit.

3. As a matter of fact, careful microscopic examinations have been made of the fruit and foliage of sprayed trees at various intervals after spraying, which indicate that, after the water has evaporated,

the poison soon entirely disappears, either through being blown off by the wind, or washed off by rains, so that after fifteen days hardly the minutest trace can be discovered.

4. In the line of actual experiment, as indicating the very finely divided state of the poison, and the extremely small quantity which is used to each tree, Professor A. J. COOK, of the Michigan Agricultural College, has conducted some striking experiments. A thick paper was placed under an Apple tree, which was thoroughly sprayed on a windy day, so that the dripping was rather excessive. After the dripping had ceased, the paper (covering a space of 72 square feet) was analysed, and four-tenths of a grain of arsenic was found. Another tree was thoroughly sprayed, and subsequently the grass and Clover beneath it was carefully cut, and fed to a horse without the slightest sign of injury.

The whole matter was well summed up by Professor RILEY in a recent lecture before the Lowell Institute, in Boston, in the following words:—

"The latest sensational report of this kind was the rumour, emanating from London, that American Apples were being rejected for fear that their use was unsafe. If we consider for a moment how minute is the quantity of arsenic that can, under the most favourable circumstances, remain in the calyx of an Apple, we shall see at once how absurd this fear is; for, even if the poison that originally killed the worm remained intact, one would have to eat many barrels of Apples at a meal to get a sufficient quantity to poison a human being. Moreover, much of the poison is washed off by rain, and some of it is thrown off by natural growth of the Apple, so that there is, as a rule, nothing left of the poison in the garnered fruit. Add to this the further fact, that few people eat Apples raw without eating away the calyx and stem ends, the only parts where any poison could, under the most favourable circumstances, remain, and that these parts are always cut away in cooking, and we see how utterly groundless are any fears of injury, and how useless any prohibitive measures against American Apples on this score."

Assuming as we do without reserve that the proper application of these poisons in the right proportions and at the right time is practically free from danger, we must, nevertheless, not lose sight of the fact of the carelessness, we may add recklessness, with which these substances are often stored and handled. It is in these directions, not in the careful use of the materials, that danger lurks. As to the risk to the consumer of American Apples, it is clearly infinitesimal. How many scores of thousands of barrels have been consumed without a suspicion even of injury. The consumption is so large and so widespread that some injurious results must have occurred before this.

ROYAL BOTANIC SOCIETY.—The first of a series of six lectures on popular botanical subjects was given in the museum in the Gardens of the Royal Botanic Society, on Friday, May 6, Dr. R. PRIOR in the chair. The lecturer, Professor MARSHALL WARD, took as his subject, "Seeds and Seedlings," and dealt chiefly with the various contrivances by which the seeds of many plants are enabled to distribute themselves over very large areas.

NATIONAL AMATEUR GARDENERS' ASSOCIATION (LIVERPOOL BRANCH).—The monthly meeting of this Association was held on Thursday, May 5, in the Common Hall, Hacking-hey, Professor HARVEY GIBSON, the President, in the chair. Mr. NEALE, head gardener to Major GASKELL, exhibited a collection of show Auriculas, and gave an interesting account of their cultivation. The President read a paper on "A Neglected Aspect of Gardening."

BOURNEMOUTH AND DISTRICT MUTUAL IMPROVEMENT ASSOCIATION.—At a meeting of this association held on April 20, the president (Dr. HITCHCOCK) in the chair, an interesting and exhaustive paper on the "Cultivation of the Melon," by Mr. H. W. WARD, F.R.H.S., Longford Castle Gardens, was read by the secretary, who was instructed to convey the best thanks of the meeting to Mr. WARD for his excellent paper, as well as their regret at his not being present to read the same.

LONGLEAT GARDENS.—We hear that Mr. PRATT, gardener to the Marquis of BATH, at Longleat, is leaving, and will be succeeded by his foreman, Mr.

JOSEPH TROLLOP, who was also with Mr. PRATT's predecessor, TAYLOR, in the same gardens. It is sincerely to be hoped that Mr. PRATT will soon meet with a suitable appointment.

ORIGIN OF THE CULTIVATED BEET.—The following is condensed from *Annales Agronomiques* for April 25:—"Beta maritima, which is indigenous on the borders of the Mediterranean, varies greatly according to its surroundings. It is biennial or perennial, never annual, and in habit also variable, the stems being often flat on the ground, while on the cliffs of Istria, M. FREYEN says that it grows in shrub-like form, with erect stems, bearing hardly any resemblance to our cultivated Beet. But when grown inland, its habit changes, and in a few years annual and biennial plants have been produced quite similar to the cultivated Beet, but readily reverting to their perennial nature. The result is very different when Beta maritima is grown in pots. The plants seed directly, are pyramidal in form, and bear ripe fruit early in September, being altogether much like the Istrian *B. vulgaris* var. *maritima*. Clearly, then, Beta maritima and *B. vulgaris* var. *maritima* are not distinct species, but varieties of the same plant, differing only according to climatic and cultural conditions. When we remember that Chenopods in general, and cultivated Beetroot in particular, are so variable, sometimes seeding in the first year, or, again, not flowering the second, or becoming shrubby and perennial as in California, it seems probable that *B. vulgaris*, our cultivated Beet, is descended as directly from *B. maritima* as from *B. vulgaris* var. *maritima*, two plants which are not specifically distinct. If the influence of the salt be also taken into account, it is evident that *B. maritima* is but a maritime form of *B. vulgaris*.

WIREWORMS.—In *Insect Life* (U. S. Department of Agriculture) for April, the following way of destroying wireworms is recommended:—"Wireworms are the larvae of click-beetles, and by destroying the beetles before they have deposited their eggs, from which the wireworms issue in the spring, the crop of worms will be greatly reduced. . . . A very effectual and practical remedy consists in attracting the beetles to poisoned bait. Some elaborate experiments in this direction have been made by Professor COMSTOCK, and show that the beetles can be easily attracted to baits of Clover which have been poisoned by wetting with one of the arsenicals. These baits consist of small bunches of the freshly-cut plant, about one-fourth pound in weight, distributed throughout the field, and protected and kept moist by being covered with boards. As an indication of the efficiency of this method, it is stated that a series of twelve traps yielded in three days 482 beetles, or an average of more than forty per trap. These traps should be put out during the early summer, and the beetles killed in the majority of cases have not deposited their eggs, and the consequent depredations of their larvae, the wireworms, will be greatly diminished. It frequently happens that the infested areas are rather limited in extent, and do not cover the entire field, and where this is the case, the labour of distributing bait will be greatly lessened. The bait should be renewed once or twice per week during the early part of summer. In place of the Clover, corn-meal dough and sliced Potatoes are used, but Clover has proven itself the most valuable. Where a field has become extensively infested by the worms, there is little which can be done so far as any actual experiment has shown. It has been found that a heavy top-dressing of kainit acts fairly well against the cutworms, and as this is a valuable fertiliser, no harm certainly could be brought about by experimenting with it against wireworms."

OPEN SPACES IN TOWNS.—Some years since we instituted an inquiry as to the provision for open spaces in our great towns. The general result was, that our towns were, for the most part, well-some, very well—provided with large open spaces at a distance from the centre of the town, but that there

was almost everywhere a great lack of open spaces in the very places where, for sanitary reasons, they are most needed—that is, in the more densely-crowded districts. We have been reminded of the circumstance by a report in a Liverpool paper, from which we condense the following particulars:—The area of the public parks and gardens of Liverpool is as nearly as possible 750 acres, or a little less than one-seventh of the entire area of the city, and acquired at a cost of £776,593. The acquisition of the land for Sefton Park in 1867 has provided a place of pleasurable recreation of ever-increasing value. The total cost of this park was

more general approval. On the whole, the cost of these breathing places has been comparatively trifling—a few thousands altogether; and they add very greatly to the embellishment of the city. At the present moment no fewer than eight city churchyards have been secured for public gardens; and as many as seventeen public gardens and recreation grounds have been acquired or laid out, exclusive of the five parks and the botanic gardens. Numerous ornamental beds are laid out in most of the gardens. In winter these are covered with Irish Ivy, but in summer they are filled with Palargoniums, Lobelia, Pyrethrum, Pansies, and other bedding-out

Report gives evidence of steady progress and increase of revenue. It is, however, pointed out that but little has been done in the way of either improving or cheapening the supply of forest produce to the villager, and it is not to be wondered at, therefore, that the department is not popular. What is wanted is not the mere collection of revenue, but the spending of that revenue in the improvement and cheapening of forest produce of all kinds, so that the villager may see that he is getting something in return for the restrictions and inconveniences which are placed upon him. In a recent inspection report, Colonel Walker reported that efforts were being made to sell departmentally-cut fuel and timber to the ryots, at specially low prices on the borders of the forest. This is a practical step in the right direction. The Forest Department, it is stated, cannot be said to be a complete success until the villagers have realised the great value of its operations to themselves.

PERIOD OF FORMATION OF THE FLOWER.—

Several interesting observations on this subject have lately been recorded. W. RUSSELL (*Rev. Gén. de Botanique*, 1892, p. 18) states that the male catkins of the Walnut begin to be formed about the end of April, and are fairly developed by the July preceding their blossoming. The female flowers, on the other hand, make their appearance on twigs which are formed in the spring, and the whole of their development takes place in the same year. They are, therefore, fertilised by the pollen of male flowers formed at a very much earlier period. By July the catkin is about a centimetre in length, and the pollen-sacs are then already formed, although the pollen-grains are not fully differentiated until the moment of flowering. According to Sig. Martelli (*Ebull. Soc. Bot. Ital.*, 1892, p. 52), there are two important periods in the development of the inflorescence of the Vine, viz., the summer (about August), when the axial parts of the inflorescence are first formed, and the early spring (after February), when the differentiation is effected of the principal axis into secondary axes and flower-buds. Winter is a period of rest, when there is no apparent increase in the buds. An examination in the autumn of the degree of development of the third and fourth buds from the apex of the branch, will indicate the prospects of a crop of Grapes for the ensuing summer. The yellow rays of the solar spectrum are those which take the greatest share in the decomposition of carbon dioxide and the process of assimilation; the blue are those which chiefly affect the movements of stimulation and of irritation, while the ultra-violet are most efficacious in the production of the flowers and reproductive organs. For the Vine, salts of potash in the soil are of great importance. Professor Sachs's theory that the substances which go to the formation of the flower are already formed in the green leaves, receives support from a fresh series of experiments carried out by him in the case of the buds formed on the leaves of Begonia (*Flora*, 1892, p. 1). Leaves of a Begonia gathered at the end of May were propagated in the ordinary way on wet sand. Numerous buds were formed in the course of a few weeks; but it was only after they had grown to vigorous plants, about the end of November, that inflorescences were first produced in the axils of later leaves. Another series of leaves, gathered from flowering plants at the end of July, was propagated in the same way, and the buds formed on these already contained inflorescences in the axils of the first leaves, which blossomed in October, and which must have been present in a rudimentary condition in the very youngest condition of the bud. The conclusion drawn from these facts is, that the substances which are used up in the formation of the flower are present in the leaves in the summer, but not in the early spring.

THE TEMPERATURE OF RIVERS AND SOIL.—

Mr. PAUL, of Knaresboro', has forwarded to us a copy of his report, communicated to the British Association, embodying the results of his observations on the temperature of the river Nidd. Mr. PAUL's observations are remarkably regular and consistently

H. E. MILNER, C.E.

£410,266; and no doubt £150,000 seems a big sum to expend on the laying out of any grounds, plus the cost of the land. At the same time, the work has been extremely well and durably done, and the design is generally admired. The formation of Sheil and Newsham Parks was another desirable step in the same direction, some 174 acres being thus reserved for public purposes. Stanley Park, it may be added, was made at the same time as Sefton, and opened in 1870. This park has an area of 100 acres, and cost £161,488. More recently the City Council has undertaken the laying out of open spaces in the centre of the city, and no item of corporate expenditure has met with

plants, which make a splendid show. It may surprise some to know that as many as 100,000 plants are reared and bedded out in this way every year. When to this is added the magnificent collection of Palms and rare plants at the Botanic Gardens, the care of the Corporation for plants must be commended. The great hothouse at the Botanic Gardens is said to contain the largest tropical Palm in England. Planted twenty years ago by the curator from a small pot, it is now 50 feet high—the altitude of the roof, and sooner or later, unless the roof is raised, the tree will inevitably burst through it.

MADRAS FOREST DEPARTMENT.—The annual

careful. He has reinforced them with some interesting observations on the exceptionally severe winter of 1890/91, which contain some apparently new observations on the protective character of a sheet of ice against the cooling of water by radiation. The rapid fall of temperature following a thaw is analogous to the effect observed on earth thermometers not far from the surface in like conditions. Some very interesting effects, says Mr. G. PAUL, were observed during the long period of intense cold. The river was frozen over, but the water under the ice remained at the constant temperature of 34° 0 from December 20 to January 2 inclusive. It fell to 33° on thawing on January 3. On January 6 a second period of ice on the water commenced, and during it the temperature under the ice remained at 33° 0. Not until the next thaw set in and a third frozen period commenced on February 27, did the temperature of the water under the ice fall to 32° 0. Compared with this the record of earth-temperature at the depth of 1 foot acquires a special interest. An ice-cap was formed on the ground on December 21, and remained until January 21. During this entire month the temperature at the depth of 1 foot scarcely varied. On December 20, before the severe cold set in, the temperature at that depth was 37° 4, on the 21st it fell to 36° 5, next day to 36° 4, and until January 4 its range was only between 36° 4 and 36° 3. From January 2 to 17 the temperature at 1 foot was 36° 3 or 36° 2; on the 18th it fell to 36° 0, and on that day the grass thermometer registered only 3° 8, the minimum temperature of the winter. On January 20 the 1-foot earth thermometer registered 33° 4, but on the 21st it fell to 33° 5, coincident with a rise of air-temperature and a general thaw. Next day the temperature at 1 foot had risen to 36° 2, and did not again fall below this value.

PHOTOGRAPHIC REPRESENTATION OF THE MOVEMENTS OF PLANTS.—MM. DEWIVRE and BOBARD describe an ingenious contrivance for photographing the movements of the growing parts of plants, and give the results of a series of observations on climbing plants (*Humulus Lupulus*, *Ipomoea purpurea*, *Convolvulus sepium*), which do not, in all respects, agree with those of Darwin. They state that the nutation of a young stem, whether climbing or not, consists of a succession of more or less irregular circular or elliptical curves, varying every moment, even in their direction, and caused by the unequal lengthening of the zone of growth of the stem. In the case of the *Ipomoea* they were able to determine a distinct heliotropism. They state that while light retards the growth, both of climbing stems and of those which do not climb, and that the violet and ultra-violet rays exercise a distinctly prejudicial influence on the growth of the stem, similar observations on roots made to grow in water demonstrated the existence of a distinct movement of circumnutation, even more regular than that of the stem. A similar movement was observed in a number of aerial roots which are insensible to the effects of radiation, such as those of Orchideæ, Aroidæ, and Bignoniacæ. By the same apparatus, curves were also obtained of the sleep-movements of leaves, both of those in which the movements of the leaves are in an upward, and of those in which they are in a downward direction. In both cases the movement is by no means an uninterrupted one, but consists of a number of alternate movements, upwards and downwards, at first considerable, afterwards much smaller; to the former of these the authors apply the expression movements of oscillation, to the latter movements of trembling. (*Revue Gén. de Botanique*, 1892, 65)

CULTURAL INDUSTRIES AT THE GAMBIA.—In a letter dated Feb. 24 last, says the *Kew Bulletin* for April, p. 103, His Honour R. B. LEWELYN, C.M.G., Administrator of the Settlement, points out the almost insuperable difficulties experienced in endeavouring to establish cultural industries in this part of West Africa:—"Since I came out here in April, between attacks of fever and expeditions

against chiefs, I have had very little time to look after agriculture. What can be done in a country when, practically speaking, there is not a single drop of rain for eight months in the year? The time to collect botanical specimens is during the rainy season, when everything is green; but then that is the time when Europeans cannot tramp about without great risks. The island of St. Mary, on which Bathurst stands, is merely a bank formed by debris from the river, and is barely above high-water mark. In the rainy season it is covered with water, as there are no means of draining it. During the dry season, English vegetables, Cabbages especially, grow well, but they have to be watered. I have prepared and published a comparative rainfall, and a few meteorological statistics, which I enclose. With the natives ground nuts are the staple product. Oil mills in Marseilles receive nearly all that are grown. The difficulty here is getting fresh water to keep the young plants alive during the eight months' drought."

ROSE SHOW FIXTURES IN 1892.—The following fixtures have been supplied to us by Mr. E. MAWLEY, to supplement those published earlier:—June 23 (Thursday), Ryde; June 29 (Wednesday), Farningham, King's Lynn (two days); July 6 (Wednesday), Brockham; July 19 (Tuesday), Moseley (Birmingham) (two days).

HORTICULTURAL CLUB.—We are informed that a special dinner will take place on Wednesday, May 25, the opening day of the Temple Show, when Sir J. D. LEWELYN, chairman of the club, will preside. The dinner will take place at 7 o'clock.

FRUIT FROM AUSTRALIA.—The steamship "Orient" is due to-day (May 14), at Tilbury Dock, bringing 431 cases of Apples from Sydney, 32 cases of Apples and 12 cases of Pears from Melbourne, with 3627 cases of Apples from Hobart, and 2 cases of Grapes from Adelaide; a total of 4449 cases of fruit; 9 cases of Palm seeds, some plants, and 9 cases of unspecified seeds. The "Orizaba" brought from Sydney, 467 cases of Apples, and 5 cases of Plums; from Melbourne, 287 cases of Apples, and 13 cases of Pears; also 7,442 cases of Apples from Hobart, making 8214 cases in all.

CAPE FRUIT.—The steamer "Roslyn Castle" arrived at Tilbury on Monday last, from the Cape, bringing 21 cases of Beurré Bosc Pears, and 12 cases of Apples.

BOOKS RECEIVED.—*Le Potager d'un curieux*, &c., par MM. A. PAILLIEUX et D. POIS. (Paris, Maison Rustique, 20, Rue Jacob.)

NOTICES OF BOOKS.

A MANUAL OF ORCHIDACEOUS PLANTS.

Part VIII.

The last issue of Messrs. James Veitch & Sons' admirable work embraces *Oncidium*, *Miltonia*, *Ada*, *Brassia*, *Gomezia*, *Ionopsis*, and *Ornithocephalus*, and the whole of the subjects enumerated are dealt with in the same careful manner as that which has characterised the previous issues. Of the great genus *Oncidium* the authors say:—"The genus *Oncidium* was formed out of the heterogeneous group of species brought by Linnaeus under *Epidendrum* by his successor, Olof Swartz. Swartz knew but five species when he founded the genus; but so rapid has been the progress of discovery since, that upwards of 300 have now been published, including doubtless several horticultural varieties, and of these nearly three-fifths are said to have been in cultivation at one time or another." These remarks show the extent of the genus, and the difficulties of dealing with it in a satisfactory manner are increased by the fact that many of the species have been renamed on re-introduction, or have received different names in different parts of Europe. In elucidating the doubts which consequently must often exist in the minds of many as to the authentic names of the different species, Messrs. Veitch's work is of the

highest importance, for it bears evidence that no pains have been spared in working out the matter in every case.

The genus *Miltonia* is made to embrace certain species formerly known as *Odontoglossums*, viz., *M. vexillaria*, *M. Roezlii*, *M. Phalenopsis*, *M. Endresii*, &c. It has long been held that there is no botanical feature in any of these species which would warrant the name of *Odontoglossum*; but such is the hold that a first name, be it ever so erroneous, has on the cultivators of plants, that it will be long before the one originally applied be corrected in gardens generally.

The usual copious and interesting notes on the discovery, introduction, and culture of each species run through this as in previous parts, and a map, showing the geographical stations of the principal types of *Oncidium* in Central and South America, is furnished, as well as numerous illustrations of the principal species. By the way, the illustration at p. 105 marked "Miltonia Roezlii alba" seems to be the "Warnham Court variety" mentioned in the letter-press, and not the variety "alba," a mistake having been made in the naming, doubtless.

POULTRY FOR THE TABLE AND MARKET versus FANCY FOWLS. By W. B. Tegetmeier, F.Z.S. Published by Horace Cox, Field Office, Bream's Buildings, E.C.

The keynote of this book is struck in the first page, where the author says that, "as the result of my experience of nearly half a century, I do not hesitate to affirm that no one breed of fowls has been taken in hand by the fancier that has not been seriously depreciated as a useful variety of poultry." The pictures fully bear out this opinion, contrasting, as they do, common and fancy fowls when first introduced, with the deformities bearing the same names now raised by cross-breeding, which latter are generally not only more delicate in constitution, and less productive than the old varieties, but far less suited than those for the table. The monstrosities raised for exhibition are comparatively useless as "producers of meat and eggs." The writer describes many varieties, the histories of which further prove his case; and then proceeds to give practical instructions for feeding, housing, fattening, and killing, all of which businesses he would wish carried out as humanely as possible, since due care and consideration for the comfort and well-being of his birds is ultimately quite as much to the breeder's advantage as to that of his poultry. Much of what Mr. Tegetmeier alleges as to the perpetuation of monstrosities and deformities for the exhibition table would apply equally well to certain garden productions.

SYON HOUSE GARDENS.

A visit to these well-known gardens is always full of interest to all who take a delight in good gardening. It is not our intention to enter into a detailed description of all the vast ranges of glass, or to attempt an enumeration of the many fine trees and shrubs in the grounds. A spring visit is instructive to those who wish to see the early forcing of fruits, flowers, and vegetables in quantity. Little or short supplies of either will not suit the case; provision has to be made to meet a large demand. At the present time and for several weeks past, Strawberries in pots have been yielding heavy crops of fine fruit. Some 5000 or 6000 are forced; two of the most reliable for early work are the "Syon House" form of Keen's seedling, which is very dwarf in growth, making but little foliage in advance of the flower trusses. It is a good setter and a heavy cropper; the fruit is similar to the older type, and another is the well-known Vicomtesse H. de Thury. At the present time the two best are Auguste Nicaise and President, of which nearly 1000 each are grown in pots. There are now nearly 1000 pots of these two kinds with fruits ripe or approaching thereto, all of which will be cleared off in about a week for special festivities at Alnwick Castle. These

fruits are remarkably fine, but heavy crops are the rule in spite of that; this can only be secured by previous good culture. Peaches and Nectarines are bearing excellent crops. Of the former ripe fruits have been already gathered, the variety being Alexander. The earliest lot of pot Vines have been cut, and the next succession are ripe, with others closely following them. Mr. Wythes takes heavy crops from his young Vines, one house just ripening looking remarkably well; an extra early house of Muscats set extremely well with bunches of excellent size. Muscats have to be produced as early as possible, hence a considerable quantity is needed to keep up a succession. The later houses of Vines look well, so also do the Figs, of which some extra fine fruits have been gathered in large quantities, brown Turkey being the standard kind. A considerable space is devoted to French Beans, Tomatoes, and other early vegetables, whilst Asparagus is most successfully forced in covered beds outside.

The outdoor fruit crop upon the walls bids fair to be an excellent one. A long range of wall is covered exclusively with Apricots, which are the picture of health, and a heavier set of fruit could not possibly be desired. These trees afford an instructive lesson to growers of the Apricot. When Mr. Wythes took charge, he found the trees upon a wall of eastern aspect, where they did not bear well, now he has them mainly facing south-west, and obtains the best results. By previous preparations in the way of root-pruning, these trees, many of them large ones, were successfully removed. Morello Cherries are very largely grown, so also are the early and main crop kinds, all bidding fair for a good set of fruit. In the pleasure grounds considerable improvements have been effected throughout its wide range from east to west, bordering upon the Thames for a long distance. Shrubs which had become overgrown, in some instances overhanging the paths too much, have been carefully lopped, whilst the paths themselves have undergone a process of renovation. The splendid specimen of Magnolia conspicua is now nearly out of flower, having been one mass of bloom, some of which were affected by the frosts of the past week or two. Standing in a good position nearly opposite the Palm-house, this tree is a grand sight when in bloom. The large range of glass in the pleasure grounds is almost crowded with large plants, and contains many fine specimens. Behind this range the smaller houses are filled with decorative plants, one full of Hymenocallis macrostaphana, another of Ixoras and Gardenias, others with small ornamental foliage plants. Mr. Wythes has considerably increased the stock of Orchids, aiming chiefly at growing such as will yield good returns for cutting purposes. A large specimen of Cymbidium Lowianum has borne this spring six or more splendid spikes of extra length, and the individual flowers large. Cypripediums are largely cultivated, C. harbatum in its best forms and C. Lawrenceanum are now the chief features, whilst for the winter months there is a large stock of C. insignis in the best of health. Miltonia vexillaria, of which there are several plants, are now freely producing their spikes. Cattleyas and Aroides also occupy considerable space, whilst there is a large stock of Calanthe vestita and C. Veitchii for the winter season. Pleione lagenaria is grown in considerable numbers, a long row of the plants being suspended from the roof. The Dendrobiums are mainly over. Many flowers having to be sent long distances, Orchids when carefully packed are well suited to such cases. Mr. Wythes is to be congratulated upon the all-round good condition of the extensive gardens under his charge. In spite of the encroachments of Greater London, it is to be hoped that Syon House Gardens and Park will be for many years preserved intact. *Vitis*.

House, Brentford, I saw some plants which practically exemplified the opposite state of the case. Mr. Jeffries had put by—forgotten, indeed—a packet of seed for a year or two, at the end of which time he sowed it, with the result that every seed germinated, and he has at the present time as pretty a lot of bloom as any admirer of them could wish for, in all shades of colour. *B.*

CINERARIAS, CALCCEOLARIAS, CYCLAMENS, ETC., AT REDLEES, ISLEWORTH.—It was satisfactory to find, on a recent call, that the grand strains of these flowers, for which Redlees was noted when the late Mr. J. Jamea was gardener here, have not one whit deteriorated under the fostering and skilful care of his successor, Mr. D. White, and not only these flowers but other classes of plants receive due care. In the well-furnished conservatory, we noted some great bushes of the old alba plena Camellia, each about 16 feet round, and clothed with their pure white blossoms, rendering them striking objects; whilst one side of the house was draped with the following varieties, trained as climbers, Mathotiana, Donckelaari, Monarch, a striking variety, flowers very deep red; Lavinia Maggi, and the old Maiden's Blush. As they were all profusely flowered, it rendered the structure very attractive. Here were also to be seen some splendidly-flowered plants of the old *Acacia armata*. Some Gardenias planted out in peat at the end of a hot-water tank in an adjoining house appeared to be in a position exactly suiting their requirements, judging by the extreme floriferousness of the plants. *J. B.*

REMEDY FOR THE ONION-FLY.—In answer to Mr. R. Dean's letter, headed "The Onion-fly," I

FIG. 93.—ANTHONIA CEPARUM—ONION-FLY.

should like to make known a remedy that I have found to be effectual in keeping away the fly from laying her eggs on the Onion plant, or on the ground close by. This must be applied at once, as the fly is now beginning to do her work, or it will be useless. Get some dry wood-ashes or that from a burned refuse-heap, or dry road-sweepings, and well mix half a pint of paraffin to half a bushel of any of the above, and then sow it along the drills early in the morning, whilst the plants are damp with the dew, twice a week through the present month, which will be found effectual. *J. W. Reed*. [This remedy is similar to one which Miss Ormerod gives in her *Manual of Injurious Insects and Methods of Prevention*, 1st edition, p. 126, but there sand is used, and the Onion-bed is watered with a rose-can after the dressing is applied. It is there stated that house-slopes, soap-suds, and trenching Onion ground at least 2 spits deep, burying the "fly-cases," or pupae of the last hatching of grubs of the summer deep in the ground, and making the soil, if light, very firm by trampling, rolling, and beating at seed time, does much to minimise the evil. Onions should never be sown for two years in succession on the same ground. We reproduce in figure the insect magnified, which was first described in our columns on June 19, 1841. En.]

— In replying to R. Dean's inquiry concerning the Onion-fly and maggot, I desire to state that the following treatment will be found effectual for these, and to prevent the ravages of wire-worms and canker on Carrots. The remedy is very simple, viz., procure, say an ordinary petroleum can, put in this about 6 gallons of common gas-tar, fill up with water, stir well, and leave for twenty-four hours. At the end of that period, to

every 4 gallons of water, add 3 quarts of water from the cask, and apply this mixture with a rose water can on alternate evenings. This will not only eradicate the fly and maggot germs, but it acts through the ammonia contained as a stimulus to growth. I may add that I have had crops of Onions which for size of bulb and weight of crop are all that could be desired, whilst my neighbours have failed entirely to grow them; but here the old adage must be borne in mind—prevention is better than cure; and I would advise growers to commence operations early. The same tar will last for two years. *J. S.*

BIRDS' NESTS.—What queer places birds will build in. About two years since the thrushes went to work in the scrub bush of Australia, *Ozothamnus rosemarinifolius*. This year my boys are home from school, and, as boys will be boys, they went bird nesting, and found a thrush's and a finch's nest in an *Abutilon vitifolium* album, and a blackbird's nest in a tub of *Megasea atropurpurea*. The latter abode is quite unique, the bird having taken advantage of the broad leaves of the *Megasea* to carry on a regular "umbrella courtship," and bring up a family, and not a drop of rain can reach the youngsters. *W. B. Hartland, Ard-Cairn, Cork.*

NEW METHOD OF FASTENING WALL TREES.—Instead of cloth or leather clippings, I use sheet lead, and instead of fixing both ends of same by nailing to the wall, I find (from lengthened experience) that one end fixed thereto is thoroughly reliable and efficient, and possesses the great advantage of allowing the branch to be released and refixed quickly, securely, and without risk; so that, for instance, having fastened my lead strips to the wall, I can fasten and release again a large tree in a short time. My method, as you will perceive (amongst other advantages) does away with the risk of giving the branch a dose of hammer, intended for the nail. I find that if the leaden strip comes a little more than half-way round the stem, it is perfectly secure; but of course, where I expect a great increase in the thickness of the stem within a short time, I cut the leaden strip a little longer than at first necessary. I find my method has many advantages too numerous to mention in a hurried letter, but which I should be glad to have an opportunity of detailing and demonstrating. *Alfred Booth*.

FRUIT PROSPECTS.—Bush fruits were very promising a few days ago, but the late frosts have altered the prospect considerably. Red Currants appear to have suffered the most, black Currants but little, most of their flowers being unexpanded. Gooseberries are blackened where the fruits were most exposed, but enough remain for a fair crop. Morello Cherries on walls are safe, only a few flowers being open, so that we shall be fortunate enough to get a good crop, but the Bigarreau cherries on walls are seriously damaged. Early Rivers Cherries on standards are also much cut, whilst the blossoms of later varieties near them are unopened at the present time, and appear to be safe; we always fail, however, to get a crop of these fruits from standard trees owing to the depredations of jackdaws and starlings, which commence as soon as the fruit begins to colour, and every fruit is cleared off before ripening. Plums show few blooms, owing, perhaps, to the heavy crop of last season; at any rate, we did not expect much, and shall not be disappointed, but the greater part of the flowers are killed. Damsons of the Chester variety, on the contrary, have escaped injury, although many of the flowers were open. Pears are grown here on walls only, and many of the expanded blooms are killed, while the unexpanded flower-buds appear to be safe. Strawberries look very promising, and will take no harm while the flowers remain closed. Apples are seriously injured, although the flowers are still very small, and not likely to open for some time. A few trees which only bore light crops last season are showing well, most of the others have very little flower on them this year. Some of the varieties of Apples are not so far advanced as others, and these have escaped damage. Peaches on walls did not flower well this spring, much of the young wood being killed by the winter's frost; moreover, the weather last summer was unfavourable for the ripening of the wood, and then we do not often get cold at and below zero three times in one winter. Most of the flowers of the Peach set well, and they are still safe, protection being afforded them by two thicknesses of fish-nets. The minimum temperature on the grass this morning (May 7) was 20°, and in the

HOME CORRESPONDENCE.

AURICULAS.—It is sometimes said that Auricula seed, if not sown soon, does not come up well. On visiting recently Mr. C. Jeffries, gardener, Boston

screen, 26°; and on the 1st inst. the grass temperature was the same, and that of the screen thermometer 27°. If we get any more such frosts, we shall have in this district a very poor crop of outdoor fruits this season. *W. H. Divers, Kelton Hall Gardens, Stamford.*

STRAWBERRY JOHN RUSKIN.—On Tuesday April 19, last, I met a customer of mine to whom I sent on December 8, 1891, a hundred plants of John Ruskin which I had taken from the field. He said, "I have had some nice Strawberries for breakfast this morning from those John Ruskin plants you sent me. The fruits are of fair size, good colour, and nice shape. Fruit red inside, with a very nice flavour. I think there is a future for this sort." Some of your readers who may have forced John Ruskin this season will be able to substantiate so much of the above as relates to the quality of the variety. *W. Horne, Perry Hill, Cliffe, Rochester.*

WINTERING STRAWBERRIES IN POTS.—Where Strawberries are forced in large quantities, it is often a difficult matter to store them during the winter months. In ridges they are liable to suffer from drought, frame or pit-room is not often at command, and larger structures are so much taken up with other things, that much of the difficulty in forcing is caused by want of proper storage-room for plants in pots. In England, I often made temporary frames, and plunged the pots in ashes, placing shutters of wood or asphalt over them during very severe weather, but have for nine years in the North plunged the pots in the litter placed over the Vine borders, packing them closely together. We have lost no plants, and have had very few pots broken. We have carefully examined the roots always when the plants have been removed for forcing, and nothing could be more satisfactory than we have found them. When the last batch was removed (about the middle of April), the border under the Strawberry pots was comparatively dry and sweet. The plants that have been outside in the plots have suffered somewhat, and mostly during March and April. The good old President appears to be the hardiest of the many varieties grown in Scotland. Duke of Connaught has also stood well, but there seems to be no loss among any of the kinds grown. The report we may have to give from the severity of April frost, and the effect on small fruits, Plums, and Apricots, I fear will be grievous. *M. T.*

OLEA FRAGRANS.—"C. H. B." must surely be poking fun at cultivators, p. 524, when he writes of this favourite old plant, the fragrance of which even he cannot exaggerate, "the foliage being fresh and beautiful, and supposing it had no other favourable qualities, it might be grown as a decorative foliage plant, and would answer very well for this purpose." Well, really, this is adding insult to injury to the hosts of plantsmen who have never been able to grow the Olea fragrans into a fairly passable condition. But, if meant seriously, I would invite "C. H. B." to show a dozen of Olea fragrans, up to his ideal, at the great forthcoming exhibition at Earl's Court, or the Thames Embankment, and so win his easy way to fame and fortune. But "C. H. B." does not even exhaust his praise of the Olea with the climax of converting it into a decorative foliage plant, he adds, "In addition to being very easy of cultivation, it is not troubled to any marked degree by insect pests, thus much labour and anxiety are saved." Does this really mean that it is one of the most difficult plants to cultivate, and that nine out of ten of the Oleas seen in this country are so infested with white scale as to convert their decorative foliage into a curious blend of green and white, leaving considerable uncertainty as to which predominates? I take no exception to "C. H. B.'s" soil, mode of culture, &c., though increase from cuttings is by no means easy, nor the growth of the young plants so rapid as might be supposed. It may be assumed that "C. H. B." is not mistaken in his species of Olive—my criticism is confined to the Olea fragrans—better known now as the Osmanthus fragrans, with which I have never seen the cleverest plantsmen succeed to anything like the degree described by your correspondent. *A. Canny Scot.*

THE FORGET-ME-NOT.—Permit me to thank M. Fr. Benary, of Erfurt, for his charming notes on these in your issue for April 23. I have nothing to take from, with little to add to these, yet, as a devoted admirer of the whole genus, and especially of *Myosotis dissitiflora*, with three varieties, the one just named, the

major, and the white or alba. As to these, neither the white nor the grandiflora, or large-flowered variety of *M. dissitiflora*, are so hardy, and consequently not so good as the normal species, which I have considered for twenty years or more by far and away the finest of all Forget-me-Nots. It can also be had in flower throughout the growing season by keeping up a succession of plants, either through seeds or cuttings, and by growing in any possible aspect from south to north, and all points between the two extremes. One of my rarest pleasures this spring, when lecturing in a distant county on technical education, was to find beautiful examples of *M. dissitiflora*, one in a cottager's, and the other in a parsonage garden. In the latter, group after group and small bed after small bed were composed and filled with this lovely Forget-me-Not in perfect bloom, although I did not see another example in the county but in the solitary cottage garden at least 10 miles from the parsonage. There is no variety equal to this species for pot culture, and by potting up plants before winter, and grown gradually on, and storing free from frost, and laying batches in and on in succession, it is easy to girdle the year round with this lovely Forget-me-Not. For winter and very early spring bloom, nice stubby plants in 3 or 4-inch pots are best. As the season advances 6-inch pots are perhaps more effective, but beyond this size Forget-me-Nots are neither so safe nor effective. Carefully grown in rather poor soil on a dry bottom, and in a sheltered place, *M. dissitiflora* is quite hardy against our ordinary winters, especially if transplanted shortly before winter; but cold, at any season, of much severity either prevents the blooms becoming blue, or changes the blue into a sort of purple, the plant in this way angrily blushing its displeasure at the coldness of its surroundings. But a few genial days restores its lovely colour, and the flowers and plants are themselves again. A sentence or two on M. Benary's last four paragraphs, and I have done. Do not attempt to cure the mildew on these plants. Prevent it by the wise choice of anti-mildew sets, and then should it come, pull up and throw away the first plant on which it appears, and no more may come. I would strongly advise the pot culture of these plants. No plants are easier grown and bloomed in pots, and none sell better. I once saw a fine stock in a street flower-market in Manchester of *M. dissitiflora*, and they were going as fast as they could be handed over—sweet types of beauty and sentiment—to the mill-hands and mechanics, the hard-headed horny-handed sons and daughters of labour. Then as to the decoration of graves, rooms, churches, &c., with cut Forget-me-Not flower-stems and leaves set up in dishes or shallow baskets, nothing can prove more beautiful or durable, unless it be M. Benary's other method of furnishing graves with small pots mossed over so as to hide the pots, this presenting a memento, veiled of the verdure of earth and the azure of the heavens, in remembrance of loved ones. Perhaps one better way of furnishing graves with Forget-me-Nots, that is, by keeping out a good stock of plants in succession, and planting and watering such plants into perpetual health and beauty. *D. T. F.*

SCOTLAND.

METHODS OF EXHIBITING.

It would be well if some of our horticultural societies (Scottish) could bestow a little more careful labour on the arrangement of their schedules, in order that exhibitors may be kept clear of errors which are of much too common occurrence at our exhibitions, to the avoidance of much wrangling and misunderstanding between the show committees and the exhibitors. Judges, too, would have their difficulties greatly reduced, and the public a definite and more complete understanding of the merits of the exhibits, for many persons go to exhibitions to get instruction, as well as to admire the articles which are staged.

Tables of plants are justly popular in the North, and are seen extensively at most exhibitions, and it sometimes happens that the arrangement of the plants—which is a special item of the exhibit—is not mentioned at all in the schedule; and the exhibitor, who may not understand this, takes his finest specimens to the show, and then he finds,

when the judges have given their verdict, that tables of plants, individually of less merit, but vastly superior in the arrangement, have won the first prize easily, while the finer specimens of plant-growing are barely noticed. Bouquets should have their size limited, or, at least, a rule made which would allow the exhibits to be tabled in something like proportionate dimensions. Mere size is a matter of taste, and judges come into conflict with each other, which something more definite in the schedule would prevent. Foliage plants, in the popular sense of the term, are generally well understood; but when it is not stated that Ferns are to be excluded or admitted, opinions again are often at variance, raising difficulties which should be unknown, and putting the inexperienced exhibitor in a dilemma as to the way he should act in the future.

Among fruits and vegetables, the quantities and methods of tabling are often not specified in schedules, and we would like to relate a few examples which have exercised our wits when acting as a censor. The appearance of many fine exhibits is sadly marred when they are huddled together; and if one lot be removed to observe the merits of the others, disarrangement of the whole follows. As examples of last season's experience, a fine dozen of Tomatoes were built up as high on a dish as they could be piled, and to see what was underneath the erection had to be pulled down, and those at the bottom were found to be mostly unripe, and the dish had to give way to one of smaller but quite ripe and sound fruit, arranged flatly in a nest box. A similar dish of Peaches were examined in the same manner, which looked grand, but which were all more or less split to the centre, or otherwise malformed; and when the fruits were replaced in form by the disappointed but good-natured exhibitor, the public could not see how the "blundering" judges should give fruits of smaller size, and with colour not better than the others, the first prize, while the fine-looking pile did not receive a third award. The exhibitor said, "Mom, I thought ye wouldna hae lifted them!" In another class, where four baskets of Strawberries were exhibited, the "toppers" were first-rate, but beneath them was a mass of many sorts, colours, and sizes, of very poor quality, and the exhibitor having been disqualified, he entered a protest; but when I whispered to him that we had gone under the surface and discovered his tactics, he said, "Well, the less I say about this the better." We had numerous cases in point similar to these, with baskets of Apples, Pears, and Potatoes, all with "toppers," which gave us much trouble; and when we went to the bottom of the lots, it was discovered that those which were finest on the top were not the winning lots.

It would save much trouble and annoyance if those who frame and arrange schedules would state how produce is to be exhibited, and all should be flat, as no judge who knew his duties would ever think of being satisfied by merely glancing at the outside of a pile, or the top layer of a basket, when he is expected to give a correct award; and I know many exhibitors who are ready to endorse this, and who would be glad to see schedules made more definite in their language. *M. T.*

VEGETABLES.

SEAKALE LILY WHITE.

The above is really a capital vegetable for April, and in a late spring like the present it is invaluable. If it be buried in a heap of clean coal-ashes or leaf-mould out-of-doors, it is delicate in flavour, and the ivory-whiteness of the stalks makes it a more desirable kind than the other Seakale. I have said that it is most suitable for April, because the roots do not force well. The old method of propagating Seakale from seed is now out of date, most Seakale being raised from sets made of the best pieces, cut off roots dug up for forcing, cut into 4-inch lengths,

and placed in boxes under cover, and buried in soil till April. By that time crowns will have formed, and the sets may then be planted in any open piece of ground 18 inches apart, where they will make good roots for forcing. I shall be excused for mentioning this, because, although the plan is regularly practiced by the market gardener, it is not known in every private place. *J. Rust, Eridge Castle.*

ELLAM'S EARLY AND OTHER CABBAGES.

The first-named is excellent for early cutting, and it is doubtful if we have any better early variety, and whether it is sown at an early or late date it is rare for a plant to bolt. The heads, which turn in quickly, should be cut as soon as they are ready, or they burst. Being small it may be planted 1 foot apart, and a small area will hold a large number of plants, and these coming off the ground early in the summer it can be utilised for growing other crops, two other early varieties of Cabbage growing here for trial which came from France, and which both did well with me last summer, but this spring nearly every plant has bolted. Ellam's Cabbage, I may say, was fit to cut this year on April 21. To follow this one I have Mein's No. 1, a really fine Cabbage, which once grown will always be grown. Hill's Incomparable, Early Battersea, and Carter's Reliance are also excellent, very few plants bolting.

WALCHEREN CAULIFLOWERS.

This old variety, taking all its points, is hard to beat, although there are some that are earlier. I grow it largely for wintering in frames with others, and can trust to it, for it seldom "buttons," which other varieties do, especially the Erfurt. Early London, and Veitch's Pearl and Autumn Giant, are all good. *H. Markham.*

CELERY IN MAY.

In such seasons as those of 1891 and the present year, good samples of Celery in May are most acceptable for salad, and also as a vegetable, owing to the general lack of other vegetables. To have Celery late in the spring is a simple matter, and gives less trouble than Seakale, to which, as a vegetable, it is preferred by some. Of course, something will depend on the nature of the soil, but most gardeners can manage to secure some Celery for late use, and the best late variety is Standard Bearer, which is the longest keeping Celery that I have grown, although there may be others which equal it. Some persons may object to a pink or red Celery for cooking, but, as is well-known, they are the best keepers, and when Standard Bearer is kept till May, it has very little pink colour, and is almost white, and the flavour is good to the last. Seed should be sown in warm districts on a warm border early this month, and covered either with a cold frame or mats till the seeds have germinated. I prefer the frame stood on a hard coal-ash bottom, and place on this a layer 6 inches thick of rotted manure, leaf-mould, and sandy loam. The seed is sown very thinly, and the frame is kept close and moist till the plants appear, when more and more air is afforded. If the plants come up too thickly, thin out and transplant the thinnings to a warm border; they will make useful flavouring for soups. The reason for this early thinning is to allow the plants required for late purposes plenty of space, as sturdiness of growth must be encouraged from the start, weak plants often bolting or decaying in winter. I do not prick out this late lot, hence the value of thin sowing and early thinning; on the other hand abundance of room should be given, and if frame room cannot be spared, it is preferable to sow in the open a fortnight earlier to crowding in frames. Rich manures should not be dug into the trenches, and the latter should not be deep; and on heavy land I would grow this crop on the flat, that is, only removing sufficient soil to make room for the manure, feeding the plants with liquid and other manures whilst growing. For obtaining crisp Celery of good flavour, fish manure is excellent. The time for sowing the seeds depends upon position and locality, in late districts it should be early in May; in earlier over the middle

of the month is not too late; but I do not attach much importance to the time of sowing, as the after management of the crop is of more consequence. I would state that early moulding-up is very injurious, as it checks growth, and sets up decay. The earthing-up should be left to the latest possible date, which allows the tissues of the plants to harden and resist bad weather better than would be the case with the opposite practice. I never protect the plants, and this hardiness is owing to late earthing up. We now have Standard Bearer in good condition. It is perhaps necessary to lift in a very warm spring, and lay in the roots on a south border, but so far this year Celery stocks have not run or started to seed. *G. Wythes.*

NURSERY NOTES.

ORCHIDS AT MESSRS. HUGH LOW AND CO'S.

PHALENOPSIS, Cattleyas, Dendrobiums, and Angre-cums never seem to go out of bloom at the Clapton Nurseries, the stock of each of these great genera being so great, and so varied, that some or other of them are constantly in bloom. Among the Phalenopsis, which in the several houses devoted to them still maintain their wonted vigour, there is a good show of bloom on the Phalenopsis amabilis; some superbly-coloured *P. Ludemanniana*, and numbers of the pretty little *P. rosea*. With them, but not in bloom, are many rare species, including the original plant of the pure white *P. Schilleriana vestalis*, *P. Cynthia*, *P. leucorrhoda*, *P. casta*, &c., and in the same house in bloom is the rare and very singular *Renanthera histerionica*, with its crimson-spotted yellow flowers; and, not in bloom, some grand specimens of *Vanda Lowii*, still in the Bornean vases in which they were imported.

The Cattleya-houses have a fine show of *C. Triane*, coming with some good forms of *C. intermedia*, *amethystina*, *C. amethystoglossa*, &c., and in one of the houses a recent importation of *C. Mendeli* makes a promising start with the first flowers, for among them appears the lovely *C. Mendeli albena*, a finely-formed pure white variety, with a pale pink front to the lip, and a lemon-yellow tinge in the throat.

The ranges of *Cypripedium*-houses have quantities of *C. Volanteum* just expanding. Nearly a houseful of *C. Lawrenceanum* in bloom was to be observed recently, and, in lesser quantity, *C. Druryi*, *C. leucorrhodum*, *C. villosum aureum*, *C. Boxalli*, *C. niveum*, *C. Godefroye*, *C. concolor*, *C. hirsutissimum*, and, in bud, the beautiful *C. Chamberlainianum*.

In the *Angre-cum*-house were a large number of a species of *Angre-cum* of the *A. articulatum* section, but with long spikes of white flowers, differing much in the size, and somewhat in the shape of the flowers. All are beautiful, however, and the importation seemed to be much freer to grow and flower than its neighbour *A. Ellisi*. The pretty, dwarf-growing *A. fastuosum* was in flower in several specimens; the flowers are very large in proportion to the height of the plant. Various other species were showing well for bloom in their season.

In the *Dendrobium*-houses there was a good display of *D. Jamesianum*, every plant of the large quantity grown being well set with flowers or flower buds. Enough of *D. Wardianum Lowii* was observed to show the excellence of the strain; a few of the elegant yellow *D. dixanthum*, a lot of *D. albosanguineum*, *D. Dalhousienum*, *D. Findlayanum*, *D. luteolum*, *D. aggregatum mejus*, and hundreds of fine spikes were coming on the neat specimens of *D. thyrsiflorum*.

The *Odontoglossum*-houses were beginning their show with *O. triumphantis*, *O. Pescatorei*, *O. crispum*, &c.; and other striking things in flower were some good *Trichopilia suavis*, *Miltonia cuneata*, one a very fine form; *Laelia cinnabarina*, *Galeandra dives*, *Oncidium cucullatum*, *Saccolabium bellinum*, and *Lycaste plana*.

The Clapton Orchids thrive well under the care of Mr. L'Anson, an enthusiast in his work.

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

MAY 3.—Present: Dr. M. T. Masters (in the chair), Mr. Morris, Dr. Scott, Mr. Michael, Professor Church, Rev. G. Henslow, Hon. Sec.; and Mr. E. im Thurn, visitor.

Narcissus Basal Rot.—Specimens of the variety *Troilus* were sent by the Rev. W. Dod, with the following communication:—"Of this variety thousands go off every year. With regard to the disease, I observe (1) in places where plants get little or no sun, though they do not flower well, the rot never comes; (2) It attacks particular varieties, e.g., *Ard Righ*, *Spurius coronatus*, and *Golden Spur* worse than others; while *Horsfield*, *Emperor*, and all of the muticus blood, are entirely exempt. The *Incomparabilis* tribe never show a symptom of it, however delicate their growth may be; nor do any poeticus or other delicate *Narcissi*, such as *trianthus*; (3) The best preventive is annual transplanting. *Maximus* need to suffer here, but by this means I now have a large and healthy stock of this form."

Raspberry Canes Diseased.—Mr. G. Massee reported on the plants sent to the last meeting from Holly Lodge, Highgate, as follows:—"The black patches on the stems are caused by a minute parasitic fungus belonging to the genus *Dothidea*, probably *D. rosea*, Fr., but as the specimens are immature, the species is not certain. *Spiraea* and other roseaceous plants suffer from the attacks of species of *Dothidea*. In all known cases the spores germinate at once when mature, and then infest the younger shoots; hence the entire removal of all diseased portions before the spores are mature is imperative."

Conifers, Growth of.—Photographs were received from Mr. Curtis, of Kensington, showing the comparative growth of a Silver Fir (*Abies pectinata*), and of a Douglas Fir (*A. Douglasi*), which grew side by side for twenty-two years. The former was 10½ inches in diameter, the latter 10½ inches. The trees were taken from a plantation in Ireland, in a soil equally adapted to both. The comparative results showed strongly in favour of the cultivation of the Douglas Fir as a timber tree in Great Britain and Ireland.

Odontoglossum citreum, Monstrous.—A blossom was received from Mr. Bull, in which there were three well-developed stamens and three lips, the two extra lips representing two lateral stamens.

Tulip Leaf, Monstrous.—Dr. Masters exhibited, on behalf of Dr. Hogg, a leaf showing a very thick midrib, which was densely clothed with thick and branching cellular processes, which bore stomata and hairs at certain points; a remarkably hypertrophied condition of a not uncommon peculiarity of certain Tulips, which have a row of hairs on the inner surface bulb scale, but not, however, on the developed leaf.

Orchid Leaves Attacked by Beetles (?).—Mr. Ingram, of Elstead, forwarded some leaves of imported *Orchids* attacked apparently by beetles. They were forwarded to Mr. Pascoe for examination.

Azalea Sport.—Mr. G. Paul sent sprays of *Azalea mollis* with yellow flowers, but associated with others which were pure white, the petals being only about three-quarters of an inch in length. The stamens, five in number, were almost included, together with the pistil, within the short tube of the corolla. Mr. Paul reports that, "It was a chance seedling, and possibly the flowers might have been fertilised with some of the other varieties of *Azalea*, such as *pontica alba*; but I think that the reversion to white is through the yellow forms of *mollis*, which have smaller flowers as a rule than the orange-coloured kinds, which also open with a whiter shade."

Pine-apple, Monstrous.—Mr. Morris exhibited a photograph of a tall variety of a Pine-apple from the Straits Settlements, from Sir Hugh Low. It was called the Hen-and-Chickens, as it produced a number of smaller Pines from the base of the stem. They were described as being of a bright red colour, and of excellent quality.

Carnations Diseased.—Mr. McLachlan reports that the name of the fly which attacks Carnations, referred to at the last meeting, is *Hylemyia nigrescens*.

PLANT NOTES.

CYTISUS ARDOINII AND LITHOSPERMUM FRUTICOSUM.

This year the rockeries are deficient in two of their usual May decorations—the abundant yellow flowers of *Cytisus Ardoinii*, and the bright blue of *Lithospermum fruticosum*. This last is often damaged here in severe winters, the young shoots being killed back, so that the plant takes the whole summer to recover itself. But the *Cytisus*, of which all the flower-buds have been frozen when nearly ready to open, has never suffered so before during the fifteen years that I have grown it. *C. Wolley Dod*, *Edge Hall*.

COLONIAL NOTES.

SYDNEY BOTANIC GARDEN.

The third great Australian garden is in New South Wales, about 600 miles from Melbourne, Victoria. For beauty of situation it stands without a rival. It has a commanding position on the shore of the harbour, and possesses remarkable elements for landscape treatment.

The harbour of Sydney (Port Jackson) is one of the most celebrated in the world, usually being associated with that of Rio de Janeiro, as the finest in existence. Like outstretched divergent fingers, promontories extend into this charming sheet of water. On parts of the slopes of two of these the Botanic Gardens, covering about 40 acres, have been established. As was to be expected, the representation of native plants is somewhat different from that in the other gardens, owing to difference in the climate. In certain directions, for instance, in palms from the smaller islands of the Polynesian archipelago, the garden is exceptionally rich. The specimens are numerous and well grown.

Botany Bay, of the early navigators, lies within easy excursion distance of the city of Sydney. There and in the contiguous peninsulas, one can see growing wild the native plants which gave the place its appropriate name.

Before leaving the subject of the Australian gardens, it may not be out of place to call attention again to the deep interest and local pride felt by the people of the respective cities in these establishments. Every intelligent person with whom I conversed upon the subject appreciated the importance of such institutions in a country with undeveloped resources. It was also felt that, since these gardens, and the smaller ones, for that matter, keep in touch with Kew, the botanical interests of the colonies, particularly in their economic aspects, were receiving due attention.

The botanic gardens of the south do not appear to sustain any close connection with the universities. They are, of course, available for purposes of investigation, but they are governmental and not academic institutions.

It is frequently said that, in the southern hemisphere, everything is reversed from what is found in the northern. This is certainly not true of the budgets for botanical gardens. These institutions are everywhere very popular, but I did not find in any case that too much money was provided for the running expenses. In fact, I observed no instance where a somewhat larger income would not have improved the condition of affairs. But the directors and superintendents of the larger gardens, and the curators of the smaller ones, made the best use of the rather scanty funds placed at their disposal. *G. L. Goodale*.

ST. VINCENT.

A considerable portion of a recent number of the *Kew Bulletin* is occupied with an account of the history of the Botanical Establishment of St. Vincent, which has recently been reorganised under the direction of Mr. Henry Powell. Mr. Powell received his training in the gardens at Goodrich Court and in the Royal Gardens, Kew. The great object of the station is to

further the cultivation of plants likely to be commercially useful in the colony, and at the same time to promote botanical knowledge generally. *Xanthosoma sagittifolia* is noted as producing fibre. It is an Aroid, not, so far as we know, used elsewhere for a similar purpose. As showing what is done, we note from Mr. Powell's report the planting of Nutmegs, Cocos, India-rubber (*Manihot Glaziovii*), Para Rubber (*Hevea brasiliensis*), Agave rigida, *Bauhinia acuminata*, *Cassia siamea* (a timber tree), *Cassia fistula*, Figs, Calliandra Saman, *Pachira Spruceana*, *Charlotte Rothschild* and other Pine Apples, *Poinciana regia*, *Sebania grandiflora*, *Sauaveira*, and various Vines.

Obituary.

MR. R. MITCHELL: SAD DEATH OF A GARDENER.—A very promising young gardener was Mr. Richard Mitchell, who was for four years in the employment of Mr. W. Cunard, Orleans House, Twickenham. Apart from the Orleans House gardens, Mr. Mitchell had charge of the market fruit-growing department which Mr. Cunard has in the old kitchen-garden of Lebanon House, nearer to Twickenham town, and to which reference is made elsewhere. He was but twenty-nine years of age, having gone to Twickenham from a garden at Roehampton. On Monday, April 25, he was engaged in tying out the Vine laterals in a viney which has a glass partition, the ladder on which he stood resting at the top against this partition. Suddenly, whilst reaching out, the ladder reversed, throwing Mitchell against the glass partition. He seems to have thrust out his right hand to try and save himself, with the result, that his arm was severely lacerated with the broken glass, and bled profusely; so bad were the cuts, that it was found advisable to remove him to the local hospital. Partial unconsciousness with delirium set in, and although all that was medically possible seems to have been done, the unfortunate man succumbed to his injuries, which seem to have been aggravated by blood-poisoning, and he died at midnight on the following Saturday. An inquest was held on the body on the 4th inst., and it was removed for burial at his early home, Chertsey, which ceremony took place on Saturday last.

MARKETS.

COVENT GARDEN, May 12.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal auctioneers, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day, &c.]

TRADE improving, with prices firmer. *James Webber, Wholesale Apple Market.*

POTATOS.

NEW POTATOS.—The arrivals during the past week have been heavy from Lisbon as well as Malta, which caused prices to give way from 2s. to 4s. per cwt. all round. Market dull.

OLD POTATOS.—Supply not heavy, and market firm. *J. B. Thomas.*

SEEDS.

LONDON: May 11.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, London, S.E., report that the present protracted sowing season is now naturally drawing to a close. With reference to the stocks of seeds left unold, choice Alaska, white, and Trefoll, are apparently about used up, but a moderate quantity of red Clover seed will be carried over. Sanfola is exhausted. Italian Ryegrass is also in very narrow compass. As regards Canary seed, which of late has presented the most interesting feature on the market, last Monday's advance is fully sustained; Liverpool prices, taking freight into account, now considerably overtop London quotations. Spring Tares still feel freely; current rates are temptingly low. Mustard and Rape seed are both firm. Linseed continues to favour holders. The Board of Trade Returns give the imports into the United Kingdom of Clover and Grass seeds for the last four months as 170,339 cwt., value £182,680, as against 138,641 cwt. value £311,733 for the corresponding period of 1891.

FRUITS AND VEGETABLES.

SPITALFIELDS, May 10.—Quotations:—English Apples, 2s. 6d. to 5s. per bushel; American do., 12s. to 22s. 6d. per barrel; New Zealand do., 8s. to 12s. 6d. per bushel; foreign Tomatoes, 1s. to 1s. 6d. per box; forced Rhubarb, 1s. 3d. to 1s. 6d.; natural do., 1s. to 1s. 6d. per dozen bunches; Seakale, 1s. to 1s. 6d. per punnet; Curry Kale, 1s. 6d. to 2s. 6d.; Spinach, 2s. 6d. to 3s. 6d. per bushel; Cabbages, 5s. to 7s. 6d. per tally; Cauliflowers, 3s. 6d. to 7s. per tally; Greens, 5s. to 6s. 6d.; Carrots, 1s. 9d. to 2s. 6d.; Parsley, 3s. to 3s. 6d. per dozen bunches; Parsnips, 1s. 6d. to 2s. 6d.; English Onions, 6s. 6d. to 7s. 6d. per cwt.; Sprouting Broccoli, 4s. to 5s. per sack; Endive, 1s. to 1s. 6d.; Cabbage Lettuce, 1s. to 1s. 3d.; Lettuce, 2s. to 3s.; Brodstouts, 4d. to 6d. per dozen; Celery, 4d. to 1s.; Horseradish, 1s. to 1s. 1d. per bundle.

BONMARK, May 10.—Quotations:—Broccoli, 7s. to 12s. 6d.; Cabbages, 3s. to 5s. per tally; Sprouting Broccoli, 4s. to 4s. per bag; Spinach, 2s. to 3s. per bushel; Greens, 2s. 6d. to 3s.; Carrots, 1s. 3d. to 1s. 6d.; Spring Onions, 4s. per dozen bunches; Egyptian do., 5s. to 6s. per cwt.; English Apples, 5s. to 10s. per bushel; Canadian do., 12s. to 20s.; and Newtown Pippins, 15s. to 25s. per barrel.

CORN.

Averages.—Official statement of the average prices of British Corn, imperial measure, for the week ending May 7, and for the corresponding period last year:—1891: Wheat, 41s. 6d.; Barley, 15s. 10d.; Oats, 20s. 7d. 1892: Wheat, 41s. 6d.; Barley, 25s. 9d.; Oats, 11s. 1d.

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, prime, 80s. to 102s.; inferior, 60s. to 75s.; hay, best, 60s. to 92s.; inferior, do., 25s. to 50s.; and straw, 20s. to 35s. per load.

POTATOS.

SPITALFIELDS: May 10.—Quotations:—Magnums, 60s. to 80s.; Imperators, 60s. to 80s.; Hebrons, 60s. to 80s.; Bruce Magnums, 60s. to 80s.; Snowdrops, 60s. to 80s.; Sutton's Abundance, 65s. to 85s.; Main Crop, 65s. to 105s. per ton.

BOBOROV: May 10.—Quotations:—Bruce Magnums, 60s. to 90s.; Duclair do., 90s. to 100s.; Feenlad do., 50s. to 55s. per ton.

GENERAL MARKET AVERAGES: May 11.—Quotations:—Magnums, 50s. to 90s.; Imperators, 60s. to 80s.; Snowdrops, 60s. to 80s.; Maincrop, 65s. to 105s. per ton; new Jersey, 3d. to 5d. per lb.; foreign Kidneys, 14s. to 20s. per cwt.

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

DISTRICTS.	TEMPERATURE.					RAINFALL.	BRIGHT SUN.
	ACCUMULATED.						
	Mean for the week ending May 7.						
	Above (+) or below (-) the Mean for the week ending May 7.	Above 42°, for the Week.	Below 42° for the Week.	Above 42° difference from Mean since Jan. 3, 1892.	Below 42° difference from Mean since Jan. 3, 1892.	More (+) or less (-) than Mean for the Week.

The districts indicated by number in the first column are the following:—

Principal Wheat-producing Districts:—0, Scotland, N.; 1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, S.

Principal Grazing, &c., Districts:—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending May 7, is furnished from the Meteorological Office:—

"The weather during this period varied considerably; at first it was generally fine and bright, but soon became cloudy and unsettled, with cold rain in nearly all places. Towards the end of the week, however, it gradually improved, and finally became fine and dry in all parts of the Kingdom.

"The temperature was below the mean, the deficit ranging from 1° to 3° in most of the western and northern districts, to 5° in 'England, E. and S.W.,' and to 6° in the 'Midland Counties' and 'England, S.' The highest of the maxima were recorded either on the first or last day of the period, and ranged from 65° in 'Scotland, E.' and 64° in 'England, E.' and the 'Midland Counties,' to 59° in 'Scotland, N.,' 'England, N.W.,' and the 'Channel Islands.' During the middle part of the period the daily maxima were in many cases below 50°. The minima were very low for the time of year. The absolute lowest, which were registered during the early morning of the 7th over England, and on irregular dates in Ire-

land and Scotland, varied from 24° in the 'Midland Counties' (at Cirencester), and 26° in several other districts, to 31° in 'Ireland, N.,' and to 36° in the 'Channel Islands.'

"The rainfall was rather more than the mean in 'England, E.,' and the 'Midland Counties,' but considerably less in all other districts.

"The bright sunshine was less prevalent generally than during the preceding week, but exceeded the normal value in all the western and northern parts of Great Britain, as well as in the Channel Islands. The percentage of possible amount of duration ranged from 70 in the 'Channel Islands,' 52 in 'Scotland, W.,' and 50 in 'Scotland, E.,' to 38 over Southern and Central England, and 37 in 'Ireland, N.'"

NOTICES TO CORRESPONDENTS.

APPLES: Daniels Bros.—We cannot undertake to name any more Apples this season, as nearly all of them have lost their distinguishing characteristics.

BLACK CURRANT: W. G. T. The shoots sent are infested with the Currant bud-mite. Cut off the tips of all shoots having the same appearance, and burn them forthwith. These mites seldom trouble the Currant bushes when good cultivation is the rule. In autumn or early winter scrape all the soil away under the bushes, and bury it deeply or char it, replacing it with fresh soil from another part of the garden, and to this add some rich decayed manure.

BROCCOLI AND CAULIFLOWERS: E. B. R. Both of these plants belong to the species *Brassica oleracea*, or Wild Cabbage, the first named being *B. o. asparagoides*, and the second *B. o. cauliflora*. The authors of the *Vegetable Garden* tell us that Broccoli differs from Cauliflower in having more numerous, broader, and stiffer leaves, and usually bare leaf-stalks; the veins of the leaves are stouter and whiter. The cultivation of the plant dates back to a more remote period than that of the Cauliflower. In Italy, the name Broccoli is applied to the young shoots which are emitted by the various kinds of Cabbages and Turnips preparing to flower, and the Italians have been careful to select and cultivate only those kinds that produce the most tender and succulent sprouts. The sprouting Broccoli represent the first form exhibited by the new vegetable when it ceased to be the earliest Cabbage, and was grown with an especial view to its shoots.

BULBS IN POTS: A. Haslam. Take them out of the pots, and without other disturbance of the roots, lay them in pretty close together on a border in little trenches that are made just deep enough to hold them, afford them a good watering then, and afterwards if they should get dry, and in July, or earlier in the case of Snowdrops and Crocuses, withhold all water as soon as the leaves begin to turn of a yellow colour. Soon after this change take them out of the soil, clear the soil from them, and let them dry in the sun for a week; they may then be stored away till September or October.

COMMERCIAL GARDENING: Jason. You would do best to obtain a situation as a learner in some large nursery, and elect what branch of nursery practice you would give your chief attention to. The instruction and experience gained in the nursery should be supplemented by reading Lindley's *Theory of Horticulture*, the articles in Cassell's *Dictionary of Gardening*, and other standard works of gardening, as well as some elementary one on botany, the physiology of plants, plant-life, &c., by attending lectures on horticultural subjects when possible, and by close observation of the various phenomena exhibited by the plants which are under your charge. None of the schools of horticulture come, at present, up to our idea of what such institutions should be, and we can recommend none.

CORRECTION.—On p. 590, column c, and 16th line from top, for "generally lose the first leaves, which unfold prematurely," read "generally lose prematurely the first leaves to unfold."

FIGS DISEASED: An Anxious One. The fruits are attacked by a fungus *Mucor amethysteus*. We should advise you to gather and burn all affected fruits forthwith, and to employ the usual remedies against these minute fungi, viz.: sulphur in pans of water, mixed with whitewash and smeared on the hot-water pipes, &c.

GREEN FLY: G. M. The ordinary greenfly goes through many stages in the course of its career, and this is one of them. Apply the usual remedies.

INSECTS: I. W. Your Raspberry shootlets are infested by the minute red caterpillars of a small moth, which eat into the hearts of the buds, and then make their way downwards into the canes. They are quite like the little red caterpillars which feed in the hearts of the Apricot buds (*Ditula angustiorana*). Hand-picking is the only remedy which we can at present suggest. We will try and rear them. They are new to us as Raspberry feeders. I. O. W.

JAMAICA: D. D. Grisebach's *Flora of British West Indies* is the only recent work. Luanan's *Hortus Jamaicaensis*, published at the beginning of the century, but still obtainable from second-hand booksellers, gives the commercial uses of Jamaica plants, and for general purposes may be more likely to meet your wants. D. M. [The Report on Jamaica and its products, published in connection with the Colonial Exhibition, and the Government Report just published by Stanford, would also be useful. Ed.]

LATERAL SHOOTS ON THE VINE: Major McEwan. The stopping or removal of sub-lateral shoots are about of equal consequence, the main idea being to confine the growth of the Vine to the first formed and best leaves, and these are found on the shoot which bears the bunch, not letting them be employed in building up useless parts; and the other is the prevention of the crowding of the leaves together in the limited space afforded by a roof. Crowding means the deprivation of much of the leaf surface of the benefits of light and direct sunshine, without which healthy development is not possible, therefore all good cultivators remove the sublateral entirely, or permit them to grow only a joint or so long. The same practice is followed with Vines in vineyards, when these are restricted to three or five canes each, all sublateral shoots are removed, and the canes are topped at about 5 feet in June, and kept to that height by later cuttings.

NAMES OF PLANTS: W. E. G. 1, *Raphiolepis ovata*; 2, *Laurus nobilis*; 3, not recognisable; send better specimen; 4, *Berberis vulgaris*; 5, *Cupressus Lawsoniana*; 6, *Kerria japonica*.—Alexander Kirk. A fairly good *Cattleya labiata* var. Mendell—ordinary type.—J. A. P. 1, *Osmanthus aquifolius*; 2, *O. aquifolius variegatus*; 4, *Ruscus androgynus*; 5, *Weigela rosea variegata*; 6, *Kerria japonica*; 7, *Coronilla glauca*; 8, *Daphne indica rubra*.—K. T. G. 1, *Platycerium alcicorne*; 2, *Lapageria rosea*; 3, *Clerodendron Thompsonianum*; 4, *Anthurium Scherzerianum*; 5, *Euphorbia splendens*. The *Chrysanthemum* have the appearance of having been over-manured.—F. S. 1, *Arnebia echioides*; 2, *Saxifraga sarmentosa*; 3, *Triteileia uniflora*.—Hortus. 1, *Staphylea colchica*; 2, *Acacia*, next week; 3, *Rhododendron fragrantissima*; 4, *R. virgatum*. M. C. 1, *Pasiflora Raddiana* var.; 2, *Jasminum Sambac*; 3, *Mesembryanthemum echinatum*; 4, *Amelanchier vulgaris*; 5 and 6, next week.—A. Nash. *Aspasia epidendroides*.—F. P. We cannot undertake to name florist's flowers. You should send them to some nurseryman who makes a specialty of these plants.—L. J. A. 1, *Ranunculus repens*; 2, *Myosotis arvensis*; 3, *Myosotis* sp.; 4, *Lychnis viscaria*; 5, *Ornithoglossum umbellatum*. 1, 2, 4, are British; 3 and 5 doubtful.—C. S. 3, *Orobuchus vernus*; the Cactus next week.

ODONTOGLOSSUMS: B. C., Allerton. Two remarkably fine varieties of *Odontoglossum Andersonianum*, Reich. f., the No. 1, which is tinged with rose colour, approaching O. Ruckerianum, Reich. f., and showing the inadmissibility of it as a species; indeed, some of the forms of O. Andersonianum itself approach very closely in appearance to O. crispum, but their Hawthorn odour always betrays the O. odoratum, which, crossing both ways with O. crispum, has resulted in this complicated race of hybrids. J. O'E.—W. E. G. 7, *Asplenium viviparum*.

ORCHIDS: *J. B. R.* The appearances of the leaves sent point to high temperature by night, with too little ventilation at all times, and the thinness of the leaves caused by the above, has been aggravated by an attack of Thrips.

PLUMS: *F. C. 1*, we take to be the *Prunus spinosa*, or Sloe, with pubescent branches all spiny, and calyx glabrous within; *2*, we take, in the absence of fruit, to be *P. insititia*, or Bullace, with branches faintly pubescent, some spiny, ultimately glabrous; leaves pubescent beneath when young, and calyx glabrous inside. *P. domestica* is said to differ in the leaves having on the nerves beneath, and calyx velvety inside; but we doubt whether it be possible to draw any fixed line between *insititia* and *domestica*, even in the form of the fruit.

SEEDLING FERN: *J. S.* We are quite unable to name so infantile a specimen.

SHADING FOR OPONTOGLOSSUMS: *W. D.* Your material is much too thick; the colour also should be much lighter.

STRAWBERRY, LA GROSSE SUCRÉE: *J. Barnard.* As fine a sample of this capital fruit as we have ever seen.

STRAWBERRY PLANTS: *J. W.* If the plants are gradually inured to outside air, and planted out of doors in about a fortnight, in good soil without much disturbance of the roots, you will be enabled to have some fair fruits in September. It is scarcely worth the expense and trouble of keeping them in pots for forcing another season because they have not done well in this one, as strong young runners of the present year, potted in August will give much better results. If for early forcing pot the runners into 48's; if for late forcing employ 32's. Use good loam, to which a small quantity of rotted stable manure is added; give good but not excessive drainage to the pots; pot very firmly, and be sure to leave space at the top for a good supply of water. Stand the pots 9 inches apart on coarse gravel coal ashes, or on boards. Keep all runners cut off, and allow only one crown or bud to a plant.

VINES: *D. D.* The roots sent were not exactly in an unhealthy state, although there were few fibrous roots, this alone pointing to their being deep in the border, or to the latter being wet or ill-drained. The leaves are thin, which partly arises from deficient root action, aggravated, probably, by insufficient ventilation, or air not afforded early enough in the morning. The shanking of the whole bunch, for it is a species of shanking, may be due to any of the above conditions, or all of them combined. You will do right to remake the border as proposed; nothing less than that will be any use. You might entice to the surface the roots of any of the Vines, which must perform remain for a time untouched, by strewing some special Vine manure on the surface, and slightly forking it in.

WEED ERADICATOR: *Constant Reader, and Others.* The weed-killer is advertised in this issue. We know nothing of the other preparations you refer to. For conditions of export to Germany, apply to the German Consul at Portsmouth.

WEEDY SANDY SOIL: *A. B.* Could you not crop it with mid-season and late Potatoes? after ploughing or digging it, and in the late autumn manure it heavily and dig it deeply; say one spit, and the top soil to a depth of 3 inches shovelled into the trench, i.e. bastard trench it. The Potato crop could be assisted in the summer with dressings of superphosphate of lime. If you do not care to plant Potatoes, take a crop of Ryegrass and Clover, or white Turnips or white Haricot Beans. It must be either a smothering crop like Clover or Rye, or one that will require the hoe to be in constant use like the others named.

CHEERFUL WINTER EVENINGS.

CAMPBELL'S BROAD REED MELODEONS

(Patent), GRAND NEW MODELS.

NO HOME SHOULD BE WITHOUT ONE. CAMPBELL'S world-famed MELODEONS have Organ and Celestial Tone and Charming Bell Accompaniments, The Solemn Psalm, the Soul-stirring Hymn, the Cheerful Song, and the Merry Dance can all be played on these charming instruments. No knowledge of Music is required by the player.

GOOD NEWS!

CAMPBELL'S GOLD MEDAL MELODEON.

AN UNPARALLELED OFFER. To readers of the *Gardeners' Chronicle*. OUR GRAND PRIZE MEDAL "GEM" MELODEON. 8s. 6d. 6s. 6d. With Two Sets of Broad Reeds, Organ and Celestial Tone, sent carefully packed and carriage paid to any address in Great Britain and Ireland on receipt of P.O.O. for 8s. 6d. Selling in thousands.

CAMPBELL'S GOLD MEDAL MELODEON.

AN UNPARALLELED OFFER. To readers of the *Gardeners' Chronicle*. OUR GRAND PRIZE MEDAL "MINIATURE" MELODEON. 10s. 10s. With Two Sets of Broad Reeds, Organ and Celestial Tone, and the Charming Bell Accompaniments, sent carefully packed and carriage paid to any address in Great Britain and Ireland on receipt of P.O.O. for 10s.

NO DECEPTION HERE. 100,000 TESTIMONIALS. Important Testimonial from Professor Brown, the Champion Melodeon Player of Great Britain, Ireland, and Wales:—"Campbell's Patent Melodeons are the finest instruments that have ever come under my touch, and only require a trial to advertise themselves." Campbell's Patent Melodeons are the only genuine Melodeons in the market. Beware of worthless imitations.

N.B.—All lovers of music should at once send for our New Illustrated Privilege Price List for Season 1891-2, now ready. 100,000 of these valuable lists sent out yearly. Send 1d. stamp to

THE BEDDING PLANT OF THE SEASON—GRAND NEW DWARF TROPÆOLUM, "MRS. CLIBRAN."

Colour, lovely shade of Orange-yellow; habit, compact, and about 6 inches high; free and continuous bloomer, producing a brilliant display.

Gardeners' Chronicle: "The colour is decidedly very good. An excellent bedder."

Journal of Horticulture: "The variety must be regarded as an acquisition."

Gardeners' Magazine: "A distinct bedding variety; will make a gay display in bed or border."

Mr. D. MELVILLE, Dunrobin Castle Gardens: "I think your Tropæolum should be most useful. An excellent substitute where Calceolarias die off."

Mr. W. INGRAM, Belvoir Castle Gardens: "Seems to promise an effect not afforded by any other dwarf bedder."

Mr. W. M. EARLEY, Ilford: "I am charmed with Mrs. Clibran Tropæolum."

Mr. G. DOUGLAS, Great Gearies: "A very distinct novelty."

This Splendid Novelty has been Awarded several Certificates. Plants ready end of May. Price, 1s. 6d. each; 6 for 7s. 6d.; per dozen, 12s.

For full Description of above, also other distinct Novelties and Specialties, including NEW BEDDING PELARGONIUMS, see New CATALOGUE (No. 115), Free on Application.

CLIBRAN & SON, Oldfield Nurseries, Altrincham; 10 & 12, Market Street, Manchester; and Principality Nurseries, Llandudno Junction, N. Wales.

EARL'S COURT, LONDON.

AND SIXPENCE FOR EVERY ADDITIONAL LINE.

If set across two Columns, the lowest charge will be 30s. If set across three Columns the lowest charge will be 30s. Page, 28; Half Page, 24 10s.; Column, 23.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

GARDENERS AND OTHERS WANTING SITUATIONS, 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Births, Deaths and Marriages, 6s. each insertion.

POSITION.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at No. 42, DRURY LANE, to A. G. MARTIN, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week must reach the Office not later than Thursday noon.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements, 41, WELLINGTON ST., STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 6d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months: Post-office Orders to be made payable at the Post-Office, 42, Drury Lane, W.C., to A. G. MARTIN.

Subscribers who experience any difficulty in obtaining their Copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

ESTATE SALES.

The Best County Medium for Advertising Sales of Estates is

THE "WORCESTER HERALD,"

ESTABLISHED 1794.

The Leading County Paper. Extensive circulation among the upper and middle classes in Worcestershire and adjoining counties. Advertisers would do well to forward for reference and distribution plans and particulars of Estates, Catalogues of Machinery, Furniture, Books, and other Property advertised in the Columns of the "HERALD."

Sales of Stock and Agricultural Effects.

The "WORCESTER HERALD" is the most effective organ for giving publicity to announcements of this class. It is the leading Agricultural Paper in the County, and Circulates most extensively among Agriculturists in and around Worcestershire.

Farms to Let.

Land Agents, Estate Managers, and all having Farms to Let would do well to advertise in the "WORCESTER HERALD," the Leading County Paper. Specially adapted for bringing such notices before Tenant Farmers. Large circulation. Moderate charge.

Situations Vacant and Wanted.

For producing results the "WORCESTER HERALD" is recognised as a specially good medium. Cheap Rates. Apply for terms.

SPECIMEN FREE. Price 2d.

Published Friday for Saturday.

HOLLOWAY'S PILLS.—Weakness and Debility.—Unless the blood be kept in a pure state, the constitution must be weakened, and disease supervene. These wonderful Pills possess the power of neutralising and removing all contaminations of the blood and system generally. They quietly but certainly overcome all obstructions tending to produce ill-health, and institute regular actions in organs that are faulty from derangement of Biliary. The dyspeptic, weak, and nervous may rely on these Pills as their best friends and comforters. They improve the appetite, and thoroughly invigorate the digestive apparatus. Holloway's Pills have long been known to be the surest of all remedies for Liver complaint, dreadful Dropsies, Spasms, Colic, Constipation, and many other diseases always hovering round the feeble and infirm.

Thursday, June 2.
THE COLLECTION OF ORCHIDS FORMED BY THE LATE HENRY FORD BARCLAY, Esq.

MR. J. C. STEVENS has been favoured with instructions to SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, June 3, at half-past 12 o'clock precisely, the COLLECTION OF ORCHIDS formed by the late Henry Ford Barclay, Esq., of Monkham, Woodford, which includes fine exhibition specimens of Vanda tricolor, V. suavis, and Angureum sesquipedale; also Cypripedium, Dendrobium, Cattleyas, Calanthes, Anthuriums, &c., &c.

On view morning of Sale, and Catalogues had.

Thursday, June 2.

A FINE COLLECTION OF ESTABLISHED ORCHIDS, chiefly in Flower.

MR. J. C. STEVENS will include in his SALE by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, June 2, a fine COLLECTION OF ESTABLISHED ORCHIDS, chiefly in Flower, comprising many beautiful specimens and varieties. LILIIUM, ANAETHYLLIS, and TUBEROSES, from South Africa, BEGONIAS, &c.

On view morning of Sale, and Catalogues had.

Thursday, June 2.

A small Collection of ESTABLISHED ORCHID.

MR. J. C. STEVENS will include in his SALE by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, June 2, a small private Collection of ESTABLISHED ORCHIDS, consisting of some good specimens and varieties, all well grown.

On view morning of Sale, and Catalogues had.

Tuesday, May 24.

CYPRIPEDIUM SPECIERIANUM MAGNIFICUM, Messrs. CHARLES WORTH, SHIPLEY WORTH, & CO., Heaton, Bradford, and 213, Park Road, Clapham, S.W., have instructed

MESSRS. PROTHEROE AND MORRIS to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on TUESDAY NEXT, May 24, at half-past 12 o'clock, a splendid consignment of CYPRIPEDIUM SPECIERIANUM MAGNIFICUM.

Dried flowers will be on view at time of Sale.

DENDROBIUM CAMBERGIANUM.

A new CYMBIDIUM CATTLEYA L. ELATA, and many

VALUABLE ORCHIDS.

On view morning of Sale, and Catalogues had.

Wednesday Next.

50 lots assorted PALMS, comprising PHOENIX RECLINATA, DRACENA INDIVISA, KENTIAS of sorts, and other choice Palms in various sized pots; also 100 clear-grown plants of SEAFORTHIA ELIENSIS; 150 lots of BULBS and PLANTS, various; 50 lots of HERACLIUM PLANTS; PANCRATIUM CARIBUEUM; 40 lots of GREENHOUSE FERNS; 100 bunches of TIE STICKS; LATTICE WORK, BAMBOO LADDERS and CANES, &c.

MESSRS. PROTHEROE AND MORRIS will SELL the above by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on WEDNESDAY NEXT, May 25, at half-past 11 o'clock.

On view morning of Sale, and Catalogues had.

Cycas revoluta.

An IMPORTATION of 25 SPECIES, received direct from Japan. They are in excellent condition.

MESSRS. PROTHEROE AND MORRIS will include the above in their SALE on WEDNESDAY, June 5.

Friday, May 27.

Being the day following the Great Temple Show.

MESSRS. PROTHEROE AND MORRIS will include on FRIDAY NEXT, a large quantity of ORCHIDS in FLOWER and BUD from various collections.

On view morning of Sale, and Catalogues had.

Friday Next.

A GRAND NEW SOBOLLIA.

An importation direct for sale without the least reserve. It contains a marvelous new Sobollia, described by the Collectors as having large pure white flowers, as large as S. xantholeuca. This is no doubt a wonderful discovery. The case also contained the rare SOBOLLIA LEUCOXANTHA and VIRGINALIS. The three varieties are raised together. The large white-flowered Sobollia was flowered in the forests instead of on the plains, where the other varieties were discovered. There will also be sold a fine lot of CATTLEYA IMPERIALIS, ONIDIUM KERAMET, new DOLERA, described as a grand variety; a very long-bulbed CHYSIS, PERISTERIA ELATA, and a scarlet-flowered EPIDENDRUM. This will give amateurs a fine chance of securing bargains. Most likely the Sobollia will turn out to be the

MOST VALUABLE AND RARE KIENASTIANA.

MESSRS. PROTHEROE AND MORRIS will sell the above by Auction at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, May 27, at half-past 12 o'clock.

On view morning of Sale, and Catalogues had.

Friday Next.

EPIDENDRUM INDIVIDUUM.

A grand new species of Cattleya-like growth, with short spikes, bearing bouquets of large pure white warts like fragrant flowers very freely.

MESSRS. PROTHEROE AND MORRIS will include in their SALE on FRIDAY NEXT, May 27, a small consignment of the above rare and beautiful species in fine condition; also some new and RARE DISA, and other TROPICAL ORCHIDS, from a very high elevation in South Africa hitherto unexplored, including a new species of DISA, with BEAUTIFULLY VARIEGATED LEAVES and handsome flowers.

On view morning of Sale, and Catalogues had.

MESSRS. PROTHEROE AND MORRIS have received instructions from M. SERRA, F. SANDER & CO. to include in their SALE on MAY 27.

A fine lot of unfloored SEEDLING CYPRIPEDIUM, in fine condition and vigour.

DENDROBIUM WARDIANUM, a fine lot of strong established plants.

Established and unfloored ODONTOGLOSSUM CRISPUMS. Also a fine lot of the new and beautiful ONCIDIUM GRAVESIANUM.

EPIDENDRUM GODSEFFIANUM, in fine masses.

DENDROBIUM DALHOUSIANUM, splendid plants, in flower.

LEGIA PURPURATA, grand plants, in flower.

CATTLEYA MOSSIES, fine specimens, in flower.

And other choice ORCHIDS in bloom.

The celebrated "Logs" Collection of

ESTABLISHED ORCHIDS.

MESSRS. PROTHEROE AND MORRIS are favoured with instructions to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on TUESDAY, May 31, at half-past 12 o'clock precisely, the whole of the valuable collection of ESTABLISHED ORCHIDS, by order of E. Gotto, Esq., who is disposing of them in consequence of having to winter abroad. The Plants are in capital condition, and many special choice things that have been sent direct from the Brazil by a consignor on there, notably the Lemia Gottleiana (believed to be unique), First-class Certificate R.H.S.; L. grandis tenebrosa, fine expanse; L. elegans Turani, several magnificent pieces, and fine varieties; L. elegans Turani, specially dark variety; L. purpurata grande and Edwardi, both wonderfully fine forms; Sphoranthus grandiflora (supposed to be a yellow variety). In addition to this will be found fine specimens of Cypripedium bellatulum, villosum, aureum, Spicerianum magnum, calurum, Harrisianum, Dominiana, also marginatum, and others; Cattleya Skinneri alba, C. Harrisoni violacea, Cymbidium Lowii, Cattleya gigas (many fine varieties), C. Dormaniana, C. Mendel grande and C. M. super-bissima (both specially fine varieties), Brassia lanceum longissima, grand pieces of Oncidium Marshallianum, &c.

On view morning of Sale, and Catalogues had.

1,000,000 PALM SEEDS.

Undoubtedly the largest consignment ever submitted to Public Auction. The whole will be offered in one day, and the Consignment includes—

350,000 KENTIA POSTERIANA,

350,000 CECYLIUM BELMONTANA,

85,000 ARECA LUTESCENS,

And large quantities of COCOS, GEONOMAS, MARTINIA DISTICHA, CARYOTAS, &c.

MESSRS. PROTHEROE AND MORRIS will SELL the above by AUCTION at their Rooms on WEDNESDAY, June 5 NEXT.

The Auctioneers will be pleased to execute commissions for Provincial and Foreign Buyers.

The Seeds are being sent by two well-known Firms direct to Messrs. PROTHEROE & MORRIS, and the whole will be sold absolutely without reserve.

Bodicotte Vicarage, 13 miles from Banbury.

THE WHOLE OF THE GREENHOUSE AND BEDDING PLANTS, comprising the Choice and Valuable Collection of Ferns, including First-rate Specimen of Todea Serrata, well-grown Tree Ferns, and many other rare and choice GREENHOUSE PLANTS, consisting of fine Azaleas, Deutzias, Hydrangeas, Geraniums, and other Plants, Roses in pots, 100 Lots of BEDDING PLANTS, consisting of Geraniums, Lobelias, Dahlias, Pansies, Stocks, Anthers, &c. Also, two Alderney Cows, Alderney Stirk, Shorthorn Cow, capital three-cylinder Pony Roll, and other Effects.

Will be SOLD by AUCTION by

MESSRS. SAM C. MILLER AND ABBOTTS,

upon the premises, on WEDNESDAY, June 1st, 1892, by direction of the Rev. A. Short, who is leaving.

The Auctioneers wish to direct special attention to this Sale. The grand Assortment of Ferns have taken many years to collect, and include some very rare specimens, and the Sale offers an opportunity for purchasers seldom to be met with.

The Cattle are in good condition.

On View the morning of Sale until 12 o'clock, when the Auction will commence. Catalogues may be obtained of the Auctioneers, 32, High Street, Banbury.

NATIVE GUANO.—BEST AND CHEAPEST MANURE for GARDEN USE. Price £3 10s. per ton, 10 bags. Lots under 10 cwt., 4s. per cwt.; 1 cwt., Sample bag, sent Carriage Paid to any Station in England, on receipt of P.O. for 5s.

Extracts from 16th Annual Collection of Reports:—**NATIVE GUANO, for POTATOS, VEGETABLES, &c.** H. BRINKWORTH, Potato Grower, Reading, used for Potatos, Onions, and Carrots, results:—"Very good; never had better crops."—J. BUTLER, Sittingbourne:—"Used for Potato, Celery, and other Market Garden Crops, with very good results; Potatos large, clean, and free from disease. Best and Cheapest Manure in the Market."

NATIVE GUANO, for FRUIT, ROSES, TOMATOS, &c. J. PEED & SONS, Streatham, used for Fruit Trees and Roses, results:—"Very satisfactory; we use no other Guano now; consider yours preferable to Peruvian."—J. FINCH, Orford Garden:—"Used for Vegetables, Tomatos, Grapes, Cucumbers, and Flowers, with satisfactory results. Most excellent for Potatos, and many other things. The Cheapest Manure in the Market."

Orders to the **Native Guano Co., Ltd.**, 29, New Bridge Street, Blackfriars, London, where Pamphlet of Testimonials, &c., may be obtained. AGENTS WANTED.

DOHERTY'S CHRYSANTHEMUM

MANURE is the only Manure on the market having a definite scientific basis. It is distinct from all others, and is specially prepared for the cultivation of Chrysanthemums intended for exhibition. It is pronounced by the best judges to be the most perfect fertiliser of the day, not only for Chrysanthemums, but for Pelargoniums, Zonal Geraniums, Fuchsias, Eucharis, Crooms, and Tomatos.

Testimonial.—October 12, 1891. To Mr. A. J. Doherty, "Dear Sir,—I have tried your new fertiliser upon several varieties of Chrysanthemums with great success; in fact, I think it the best fertiliser I have ever used for Chrysanthemums. It produces large Blooms, and quantities of Cuttings, and nourishes the plants during the whole growing season. Kindly send me 1 cwt. more, as I am in want of some immediately, and I prefer this to any other."—(Signed), A. J. MANDA, F.N.C.S., F.R.H.S., United States Nurseries, Hextable."

Sold in sealed tins, with directions for use. Size No. 1— $\frac{1}{2}$ dozen, 4s. 6d.; $\frac{1}{2}$ dozen, 8s.; 1 dozen, 15s. Size No. 2— $\frac{1}{2}$ dozen, 9s.; $\frac{1}{2}$ dozen, 16s.; 1 dozen, 30s. The large tins contain three times the quantity of the small ones.

From the Agents—Messrs. LITTLE & BAILLANTINE, Carlisle; Messrs. FITCH & MANDA, Hextable, Swanley, Kent; Mr. JOHN GREEN, F.R.H.S., Norfolk Nurseries, Dereham; and from the Inventor, A. J. DOHERTY, Analytical and Manufacturing Chemist, Burlington Street, Manchester.

ALBERT'S HIGHLY CONCENTRATED HORTICULTURAL MANURE.

A Chemically Pure Plant Food.

UNPARALLELED FOR ITS RAPID ACTION AND FRUITIFYING PROPERTIES.

BEST AND ONLY RELIABLE COMPLETE FERTILISER for all VEGETABLES, FRUIT TREES, VINES, FLOWERS, LAWNS, &c.

UNPRECEDENTED RESULTS obtained by its use.

For Prices and Descriptive Pamphlet, apply to—

H. & E. ALBERT,
17, GRAVECHURCH STREET, LONDON, E.C.
Responsible Agents wanted.

THE PATENT SILICATE MANURE.

This manure is chemically distinct from all other Manures, and has been proved to supply the place of sunshine, and has the power of hastening the colouring and ripening of Grapes, Tomatos, Peaches, &c., beyond any other Manure.

If you Try it Now
You will Order later on.

Cambridge, September 12, 1891.
"I have formed a very high opinion of the value of the Patent Silicate Manure, especially for Tomatos, Grapes, and Peaches."
(Signed) E. HOBDAY.

Prices in Sacks, at Works, 10s. per cwt.; £2 per $\frac{1}{2}$ ton; £3 15s. per $\frac{1}{2}$ ton; £7 per ton.

GREEN'S PATENT "SILENS MESSOR" AND OTHER LAWN-MOWING, ROLLING AND COLLECTING MACHINES FOR 1892.

The Winners of every Highest Prize in all cases of competition, and they are the only Mowers in constant use at all the Royal Gardens and at the Royal Horticultural Society's Gardens, South Kensington.

Patronised by— They are the first, foremost, and best in the world.
 HER MOST GRACIOUS MAJESTY THE QUEEN on numerous occasions,
 HIS ROYAL HIGHNESS THE PRINCE OF WALES,
 THE KING OF THE BELGIANS,
 The Late EMPEROR OF THE FRENCH, THE EMPEROR OF RUSSIA,
 And most of the Nobility, Clergy, and Gentry of the United Kingdom.

Royal Horticultural Society's Show, South Kensington, London, June 3 to 7, 1881. The "Journal of Horticulture," of June 9, says:—"MOWING MACHINES.—After a critical examination, the Silver Medal was granted to the old firm of world-wide fame, Messrs. T. Green & Son, of Leeds and London. As the Machines are known in all lands where good lawns are cherished, it is quite unnecessary to give any description of them."

Upwards of 170,000 of these Machines have been sold since they were first introduced in the year 1856, and thousands of unsolicited Testimonials have been received, testifying to their superiority over all others.

REDUCED PRICES OF

12 Good Single Mixed ... 3s. 12 Mixed Double ... 6s.
12 Extra Good to Colour 6s. 12 Very Fine, to Colour, 12s.
12 Very Finest, equal to named varieties of 6s. 12s. 12 Extra Fine Double, 18s.

I could give a large number of Testimonials, but the following, I think, will be sufficient to prove the excellence of my Begonias:—Hogg House, Buxted, Uckfield, Aug. 26, 1891.
DEAR SIR.—You will be glad to learn that the Begonias I had from you in the summer have turned out remarkably well. The clinks and terra-cotta are especially fine, some of the blooms measuring near 6 inches across. The flowers are of fine form, and good substance in the petals; plants dwarf in habit, and free-flowering; foliage robust. I shall have much pleasure in recommending them to my friends. Yours truly—
H. C. PRINSEP, Gardener to Viscountess Portman.
To Mr. H. J. Jones.
RYECROFT NURSERY, HITHER GREEN, S.E.

SATURDAY, MAY 21, 1892.

BARRÉ AND THE DISCOVERY OF THE COCO-DE-MER.

VISITORS to Kew Gardens who have lately watched with interest the highly curious—indeed, most remarkable—germination and growth, in the warm Lily-tank house, of the once mysterious Cocco-de-mer, may be pleased to learn the particulars of its original discovery in the Seychelles Islands; whence it is now named the *Lodicea seychellarum*.

This group of small islands, some 5° south of the equator, and 55° east of Greenwich, is supposed to have been first discovered, as far as Europeans were concerned, by the Portuguese, early in the sixteenth century, possibly in 1506 by Fernando Suarez, and named The Seven Brothers. It was not, however, until 1742 that the enterprising Governor of the Isle of France, Labourdonnais, sent Captain Lazare Picault in the *tartane* "Elizabeth" to take possession of these apparently unimportant islands; and they were subsequently visited and settled by M. Moreau de Seychelles, one of the chief officers of the French East India Company, after whom they were named—the French Minister at that time being also his relative, the Viscount Hérault de Seychelles. In 1750, a governor was appointed to Mahé, the principal island, under the control of the Governor of the Isle of France.

It is, however, to that skilful and observant engineer officer, Monsieur Barré, that we owe the first exact and detailed survey of the various islands composing this archipelago of twenty-nine islands and islets in the year 1760, which he undertook by the special desire of that brave navigator, Captain Marion de Fresne, who was massacred with two boats' crews at the Bay of Islands, in New Zealand, during June, 1772.

Second in importance to Mahé, and 21 mi's north-east of it, is the island of Praslin, with an area of some 27 square miles. It was here that Barré landed one fine morning for the purpose of surveying the coast of the island, which, from the number of conspicuous cocoa-nut trees was then named the Ile de Palme. Wandering outside the thickets and scrub, along the coral beach, he saw before him a huge fruit, which he at once conjectured must be a Cocco-de-mer; but as it was just on high-water mark, he thought it had been washed up by the sea, and not being acquainted with the size or shape of the Cocco-de-mer, of which he had only heard by reputation, or only seen when nuts without their enveloping husk, he was not at all sure that it was one. However, knowing the rarity and costly value of a unique specimen (which, up to that date, had been sold in the markets throughout India and

China in small pieces for its weight in silver), he carefully concealed the fruit, which weighed at least 50 lb., out of sight, until he could transport it safely to his ship. But on leaving the shore, rather priding himself on his lucky discovery of a prize, what was his surprise and indeed mortification to find the ground under the tall Palm trees covered with numbers of these nuts in all stages of germination, whilst looking up at the mighty Palms above him he saw that these fine trees bore the same fruit. He had discovered the true habitat of the wonderful tree heretofore unknown to science: a tree so wonderful that General Gordon, more than a hundred years afterwards, declared that it must have sprung from the tree of knowledge which originally grew in Eden in pre-Adamite times.

No wonder that at first sight the poor engineer, who had thought to fill his purse with fifty pounds of silver in exchange for his Coco-dermer, felt some vexation,* foreseeing that as soon as the wonder-working fruit, which was supposed to be the product of the sea, became recognised as a terrestrial natural object, its fictitious value in the oriental markets would speedily become a thing of the past; and rightly he judged, for the Coco-dermer is now only of value as a botanical curiosity.

He found these magnificent double Coco Palms to elevate their crests to a height of at least 50 (French) feet; their summits to be crowned with a tuft, or huge plume, of about a dozen fronds, each 20 feet in length, and somewhat in the form of a fan; and each of these great leaves to be supported on a stipite 6 feet long, which is hollow or indented (*échanuré*) in its contour. From the axilla (*aisselle*) of the leaves issues a panicle, with branches which bear the female blossoms. The pistil of these flowers he found to produce at maturity the huge fruit which, with its husk weighed, as before observed, some fifty pounds.

On reflection, and after careful examination of this large grove (Rochon calls it a forest), Barré was persuaded that this Coco Palm was not the real Coco-dermer of commerce—not the true sea-borne double Coco-nut, whose recuperative qualities were so highly esteemed by the enervated Moguls of India. Nevertheless, out of sheer curiosity, he collected some three dozen of the nuts, and took them with him to the Isle of France, where the celebrated botanist, M. Pierre Poivre, instantly recognised them as the true fruit so much sought after; and as M. Poivre was at this time the Intendant and Commissary of Marine of the French Colony, he and the Governor, the Chevalier Des Roches, instantly accelerated the departure of Captain Grenier,† who, assisted by Rochon, was about to sail for India, with instructions to visit the Isle de Palme, or Praslin, as it was now named, and obtain some germinating nuts and young plants for the Government Botanical Gardens then being formed at Pamplemousses and at Le Reduit.

Accordingly, on May 30, 1769, the "Heure du Berger" and the "Verd-Galand" commanded by Captain Grenier and Lieutenant La Fontaine respectively, left Port Louis; and on June 2, the day of the transit of Venus, these ships were off the Vigie bank, reaching the Seychelles on the 13th of the same month. Rochon speaks feelingly of the dangers he encountered in journeying to and fro from the ship to his

observatory on shore. Crocodiles! sharks and torpedos, we are assured, did great damage, and several of his men were bitten or wounded by these animals. We cannot help thinking that the torpedos were less dangerous than the spikes of the mud-larks! However, Alexis Rochon duly visited the Isle de Palme, and industriously collected a quantity of the young plants and nuts of the great Coco trees, the Cocos-dermer, which he classified as a species of *Latania*. Filled with zeal, he transported several specimens, as well for the Museum of Natural History at Paris, as well as a young growing tree 20 feet in length.

Now comes the curious part of the story, which may be given in Rochon's own terms:—"On my return to Europe, I brought to the Academician, Louis Guillaume Lemonnier (brother of the astronomer), the doctor, a fine Coco-dermer (for so it is called), which had germinated in my trunk by the heat of the hold. The young shoot was doubtless arrested, for it ceased to grow in spite of all the care which this scientific botanist took to restore its life. The form of this fruit and of its germ contributed not a little to the celebrity of this Nut, designated by botanists under the denomination of *Nux medica*; the Indians regard it not only as a powerful antidote and counter-poison, but also as an excellent remedy for venereal diseases."

It is curious that Pickering gives no account of this discovery in his *Chronological History of Plants*; although he mentions the double nuts of the *Lodoicea seychellarum* as having been found by Hieronimo di Santo Stefano on the Maldiv Islands in 1496. He wrongly states that this *Cocos maldivica* was first ascertained by Sonnerat to be a native of the Seychelles Islands. *S. Pasfield Oliver, Captain late Royal Artillery, Moray House, Anglesey, Gosport.* [A figure of the seed in germination was given in our issue for August 7, 1886. Ed.]

NEW OR NOTEWORTHY PLANTS.

ONCIDIUM GRAVESIANUM, Rolfe, n. sp.*

This very elegant species of *Oncidium* (see fig. 94, p. 651), is an ally of the well-known *O. crispum* and *O. pretextum*, but differs in a variety of particulars, among which its much narrower petals, averaging only half an inch in breadth, is perhaps the most striking, for they impart quite a distinctive appearance to the plant. It is a native of Pernambuco, in Brazil, and is one of the things sent home from the district in which *Cattleya labiata* has been re-discovered. It was imported by Messrs. F. Sander & Co., of St. Albans, with whom it has just flowered. It received an Award of Merit from the Royal Horticultural Society of April 19 last. It bears branching panicles of golden-yellow and brown flowers 2 inches in diameter, whose characters are more particularly

* *Oncidium Gravesianum*, n. sp.—Pseudobulbs 3 inches long, 2½ inches broad, broadly elliptical-oblong subcompressed; margin acute. Leaves elliptical-oblong, obtuse, 4 inches long, 1½ to 2½ inches broad. Panicle large and branching. Flowers 2 inches in diameter. Bracts very small. Dorsal sepal spatulate-oblancoate, obtuse, undulate, brown, with a few irregular yellow bars. Lateral sepals united at base into a narrow claw 5 lines long, the free parts suddenly diverging at right angles, lanceolate-oblong in shape. Petals obovate, 5½ to 6½ lines broad, like the sepals in colour. Lip pandurate, 1 line long; side lobes spatulate-obovate, 1 line long; isthmus 2½ lines broad; front lobe broadly suborbicular-ovate, undulate; crest consisting of a triangular acutely-margined elevated basal portion, then extending into a short high central side, and with a few small teeth on the isthmus, directed in a line towards the side lobes; colour yellow, the basal part with many brown spots, the front lobe very broadly margined with brown. Column 5 lines long, purple-brown below, with a prominent yellow swelling in front, yellow above, with light brown anther-case; wings very large and rounded, yellow, with a marginal row and a few other brown spots. Native of Pernambuco, Brazil. *R. A. Rolfe.*

pointed out in the technical description below. This section of the genus contains several very showy garden plants, yet it presents great difficulty to botanists, and the limits of some of the species are not very clearly defined. The present one is a very interesting addition to the group. *R. A. Rolfe.*

CALTHA ALPINA, SCHUR,

Found in 1853, and described in the *Flora Transylvanica*, is one of the most beautiful of the single Marsh Marigolds we have yet seen. In habit and general aspect it differs little from *C. palustris*, but the flowers are larger, and of a rich orange-yellow. The radical leaves are sub-orbicular or reniform, with crenate margins; those on the stem round, cordate, coarsely dentate, and nearly always sessile. It grows from 1 to 2 feet high, with a fine bold habit, and it flowers in great profusion. *C. alpina* is certainly an acquisition to the bog or semi-bog garden, and is well worth possessing, in addition to the best form of the common species. It is a native of Bächen des Arpas, Transylvania, and flowers with us in April and May. Nyman, in the *Conspectus*, places it under *C. palustris*, but for all garden purposes it deserves a separate name.

AQUILEGIA TRANSYLVANICA, Schur. (*C. alpina* Bmg. non L.),

seems to be an extremely rare plant under cultivation, although we are told it is very common in Transylvania, and gives quite a character to some districts. It takes the place of *A. alpina*, and fortunately is a much easier managed plant under cultivation. It flowers more freely, and the individual blooms are quite as large, though not so rich in colour. It grows 1 to 2 feet in height, branches, and is quite glabrous. The lower leaves binate, the segments 2 to 3 fid. The flowers are large, being 2 to 3 inches in diameter, bright rich blue or purplish. The sepals are ovate-oblong, distinctly clawed. It flowers during May and June. If this fine species can only be kept distinct and typical, it will prove a valuable addition to the alpine garden. The difficulty, as every one knows, with *Aquilegias*, is keeping them true if planted or kept together in a collection. It matters little how many are planted in the rock garden or border. Our experience is, that in the matter of a couple of years, *A. chrysantha* and its hybrids, *A. vulgaris* and its varieties, and possibly *A. sibirica* will have taken possession everywhere, to the exclusion of the rarer sorts.

VIOLA DECLINATA

is a species new to us, and recently received from Transylvania, where there still seems to be a large, very important field for the plant hunter. There are two forms found in the neighbourhood of Königstein, *V. gracilis* and *montana*. The latter is the form now in cultivation, and next to *V. calcarata* is one of the most charming Violets we remember having seen. It has a fine compact habit, branching freely from the base with rich green, oval, toothed leaves, and large bright blue flowers, with purple blue blotches on a yellow eye. In the variety *gracilis*, which is the heterophylla var. *gracilis*, Knuch, and *V. gracilis*, *Flora Græca*, vol. i., p. 146, the leaves are much narrower, and the flowers are smaller. They flower from May to July. *V. heterophylla*, a nearly allied species, is now showing abundance of flower-buds and will soon be a picture. It is a true alpine Violet, dwarf in habit, branching near the base, and producing its largish blue flowers in the greatest profusion. The leaves are narrow lanceolate toothed, and of a bright green. *D.*

GENTIANA PYRENAICA,

figured in the *Botanical Magazine*, t. 5742, was, we believe, first introduced to England by Mr. Backhouse, of York, a pioneer of alpine plant cultivation in this country. It is one of the rarest and most beautiful of all the dwarf Gentians, and although widely distributed in the Pyrenees, and among the mountains of Hungary, the Caucasus, and Armenia, ranging from 5000 to 8000 feet above sea level, it is one of the rarest Gentians in cultivation. It flowers in March, April, and May, and often earlier. It has

* "Il vit avec peine," says Rochon, "que la terre étoit couverte de ces fruits et des arbres qui les portoient." (*Voyages aux Indes Orientales*, p. 148).

† It was this Captain Grenier who discovered the short sea route to India for sailing vessels during the North East Monsoon.

a dwarf tufted habit, not unlike *G. verna*, and rarely exceeds 1 or 2 inches high. The leaves are lanceolate, acute, and invariably rough edged. The flowers are solitary. The corolla salver shaped, an inch in diameter, of a deep prussian-blue colour, the edges crenulate. It is really a fine species, and does well in peaty soil, with a little shade. *D.*

INTERNATIONAL HORTICULTURAL EXHIBITION.

HORTICULTURAL SUNDRIES.—Going to this Exhibition by the carriage entrance at Earl's Court, the "sight-seer" passes what, perhaps, the majority of visitors will consider the least entertaining part of all. We refer to the large covered space devoted to the exhibition of implements and sundries of every description that are in any way connected with horticulture. Although this may be the idea of the ordinary sightseer, however, these exhibits cannot fail to attract and interest those who really take interest in the working of a garden, be they amateur or professional. Here may be seen what improvements have taken place in implement-making up to date, and the visitor will doubtless be surprised as his attention is directed to the ingenuity manifested in some of these machines.

The first stand we noticed was that of the Economic Fencing Co., Billiter Street, London, E.C., who have quite a bright display of all kinds of fencing materials, garden rollers, iron seats for lawns, &c.; while immediately opposite is another of the same description, belonging to Messrs. David Rowell & Co., 5, Victoria Street, Westminster. This stand was not yet finished, but we could see stout iron railings, tree-guards, ornamental wire arches, large entrance-gates, &c., that would soon be put in their places.

Close to these is a very interesting exhibit to the gardener, because it refers to the question of fruit culture, which we all seem to be discussing now-a-days. It is an apparatus for drying and preserving surplus fruit, called the "Universal American Evaporator," shown by Messrs. Ph. Mayfarth & Co., Frankfurt-on-Maine, Germany, and also of 16, Mincing Lane, London, E.C. We have not space here to describe perfectly the processes by which this is obtained, but it is by causing heated atmospheric air to play upon the fruit, which has been upon trays with galvanised-wire bottom, and placed in the inclined flue or evaporating-chamber. (For a fuller description, see *Gardeners' Chronicle* for July 11, 1891.) One of these machines is now at the Royal Horticultural Gardens at Chiswick, where its action has attracted much attention of late years. There are also Grape-mills, Apple-slicers, cider and wine-presses, &c.

Messrs. Corry & Co., Ltd., have a stand covered by glass, in which are a quantity of preparations for destroying garden pests. Their specialty, The Lethorion (vapour cone) is the chief amongst these, and is recommended to destroy all forms of parasitic life, without hurt to the most delicate of plants.

Mr. J. Bentley, Chemical Works, Barrow-on-Umber, exhibits many kinds of insecticides and artificial manures, of his own preparation. Messrs. W. Clibran & Son, Altrincham, Manchester, have also a stand containing these kinds of preparations, as well as their "Campbell's Fumigating Insecticide." Messrs. Sheard & Co., 2, Praed Street, Edgware Road, W., have specimens of show cards, stands, signs, metallic labels for hanging or for putting in pots, &c.

Another similar exhibit is that of Mr. Jno. Pinches, Oxenden Street, S.W., who has zinc garden labels in three shapes—for Roses, for fruit trees, and for Orchids; also a new label, made of flax, and patented last week, which is said to be very strong and durable, as it certainly is much lighter than the other ones.

Messrs. Jarman & Co., seed growers, Chard, Somerset, have the only collection of seeds we noticed. This is a very large collection, however, containing seeds for farm and garden, all of which are tastefully shown in small glass globes.

Messrs. B. S. Williams & Son have a stall where the Thanatophore occupies a prominent place. This new patent apparatus for steaming Tobacco juice is now pretty generally known.

Fisher & Sharp, Bamboo importers, 173, Queen Victoria Street, have Bamboo stakes for the garden; also seats and fittings for summer-houses, besides many fancy and attractive articles for use and ornament in the house.

Messrs. Merryweather & Sons, who have greatly developed their system of water supply to mansions, and irrigation generally, have a large number of fire protection apparatuses, from the large and powerful steam engine to the ladies' boudoir hand fire-apparatus. Most of these engines are also adaptable for the purposes of an ordinary "portable." There are also garden engines and hoses of many descriptions, the principal of which is their improved sphincter grip and non-kinkable hose.

Boilers and boiler makers are strongly in evidence, and there is plenty to interest the gardener who is desirous of comparing the different advantages offered by each of them. Foremost amongst these is the Thames Bank Iron Company, who have, as usual, a goodly number of their well-known and attested boilers of divers descriptions, including the

FIG. 94.—*INCIDIUM GRAVESIANUM*. (SEE P. 65.)

horizontal tubular saddle, improved Trentham, automatic independent box boiler, &c. Messrs. Sam Deards & Co., Limited, 21, Eldon Street, Liverpool Street, E.C., show their "Champion" boiler, with which they obtained two first prizes at Liverpool in 1886.

Mr. J. Watson, florist, St. Albans, shows his patent suspension boilers, which, when fixed, are suspended directly in the fire to at least three-quarters their height; and the new double-action boiler ("The Challenge") is suspended in the same way, besides which it is hollow, and the heat has to pass from the back of the boiler through it again before passing out. It is affirmed that this new form presents at least 18-20ths of the whole surface to the fire. The "Victory" patent combination gas stove, fitted with the patent double-action boiler, is specially recommended for amateurs with houses 25 feet in length, or less.

From Mr. F. C. Poidevin, Guernsey, comes a tubular boiler, fitted over by a saddle, the tubes being in direct contact with the fire, as well as the saddle being well exposed to the heat. Each can be worked without the other, in case of an accident. It is called "The Economical Patent Boiler."

There are many examples of horticultural buildings to be seen. Messrs. Crompton & Fawkes,

Chelmsford, have a very pretty specimen; besides which, they have erected and heated the "Insectivorous" house in the grounds.

R. Stevens, Bromley, Kent, exhibits his patent system of glazing for flat or circular roofs. By means of an India-rubber roller and a leaden clip, the glass is firmly fixed in such a manner that it can be removed and refixed in a few seconds.

A little lean-to house, shown by Newton & Co., Hitchin, Herts, is glazed in another style, also without putty, and the rafters are of rolled steel. Mackenzie & Moncur, horticultural builders, Edinburgh and Glasgow, have an ornamental span-roofed greenhouse. An ornamental conservatory is by the well-known firm of Richardson & Co., Darlington.

Mr. W. Duncan Tucker, Tottenham, shows a very useful span-roofed house, of good appearance; and also models of Cucumber-houses.

A very small portable house, described as a tenant's fixture, is shown by Mr. John Bennett, Blenheim House, St. Albans, Herts.

Bone's patent clip for glazing is exhibited by the patentee, Tower House Gardens, Chiswick. Messrs. Ardeshir & Byramji, Mr. J. Falconer, and Mr. A. Mackie have collections of ornamental ware.

The well-known firm of Doulton & Co. have a large stand of ornamental pottery, vases, &c. Mr. Ernest Wayless, of Vienna, and 88, Oxford Street, London, has also a collection of these articles.

A good collection of Messrs. Sankey's Bulwell pottery is to be seen, neatly arranged in a very attractive stand. We noticed many novelties, as well as the ordinary form of pans and pots, for which this firm is so well noted.

Messrs. William Iles & Co., Warner Road, Camberwell Park, have also a varied collection of garden pots and pans, Orchid baskets, &c.

A collection of garden fountains and ornaments is exhibited by Messrs. F. Rother & Co., Ground Street, Blackfriars, made from a prepared stone (Rother's), which is said to withstand the effects of weather and frost. Mr. William Colchester, has a stand of Ichthemio guano, and Mr. J. George, Putney, S.W., has a good collection of garden sundries. Messrs. Stott & Co., Manchester, show their Stott specialties. The Insecticide (Killmright), the Distributor, and the Fertiliser (Feedmright).

Another large collection of sundries, including good samples of peat and loam, come from Messrs. W. Wood & Sons, Wood Green; whilst Mr. G. W. Davis exhibits his Concentrated Fertiliser.

Mowing-machines are shown by Messrs. Ransome Sims & Jeffries, Ipswich, who are mowing the lawns in the Exhibition; and also by Messrs. Alexander Shanks & Son, Arbroath and London.

Messrs. Joseph Davis & Co., Kennington Park Road, London, have a large collection of meteorological and scientific instruments, their specialty being the new American forecast barometer, which we have not space to describe here. Similar exhibits come from Messrs. R. Sprigate & Co., Opticians, Oxford Street; and from Messrs. G. Crawley & Co., 13, Spital Square, E.C.

The Sphincter Grip Armoured Hose Company is represented, and, besides their specialty, have various other articles, such as syringes, small pumps, &c. Messrs. J. H. Heathman & Co., Edzell Street, Long Acre, London, exhibit their patent ladders and steps, garden engines, &c.; and Mr. J. Kelly, Pyrmont House, Winchmore Hill, London, has his patent telescope ladders.

Radiators for heating private and public buildings are shown by Mr. J. Jeffries, 10, Great Queen Street, Westminster. Madame Goffton, though not exhibiting necessities for the gardener has a stand containing very beautiful articles for the house, such as screens, &c., with flowers painted upon them, some of which we noticed were very faithfully represented. Mr. W. Edwards has his easy-levelling rake, and Messrs. B. Hemby & Co., straw blinds. Mr. G. Riley exhibits a rustic house; and Messrs. Needham & Henty self-acting fountains. Refrigerators, useful for preserving fruit and other foods, come from Mr. E. Sydney; and Messrs. Pulham & Son, exhibit stone figures, balustrading, &c. Messrs. Shand, Mason

& Co. have brought some hose hydrants; and fruit from the Australian Irrigation Colonies is shown by Messrs. Chaffey Bros.

We do not pretend to describe the exhibits more fully, but we would advise gardeners and others at all interested in horticulture to spare a little time when visiting this Exhibition, in order to inspect for themselves what we can only give them a few hints upon.

PRUNING DENDROBES.

THOSE desirous of ocular demonstration of the merits or demerits of pruning *Dendrobium nobile*, should make a point of attending the May Show in the Temple Gardens, where they will have an opportunity to draw their own inferences on this question, which has been for several years past pretty well discussed, but which is still, in many quarters, a moot one.

I had the pleasure of inspecting some plants of the above the other day, and was assured that he had had an annual pruning for several years—six, I think; and I can assure your readers that the appearance of these plants showed that they were perfectly satisfied with the treatment adopted, viz., that of cutting out the whole of the flowering-wood with flowers attached, when these had arrived at that stage best adapted for lasting in whatever decorations they might be required for.

Nothing could be finer in the way of *Dendrobis* growth than that exhibited by these plants, some of which were 3 feet 4 inches long, of remarkable solidity and thickness, and covered the entire length with the most perfect foliage, and showing bloom at almost every node; at any rate, some which I counted were showing eighteen and nineteen racemes.

The size of these plants is certainly unique; the first one we measured was 5 feet 8 inches in diameter; second, 6 feet 3 inches; and the third, 6 feet 9 inches; sufficient, I think, to show those holding a contrary opinion that cutting down or pruning is a principle in *Dendrobe* culture safe to follow; besides, the plants are much more slightly when relieved of the old wood, often covered with serial roots. *Pomum*. [Our correspondent furnishes the name and address of the grower of these plants, but for the present he is desired to withhold them from the public. Ed.]

A ROYAL GARDENER.

MR. THOMSON, who, as we learn from a local paper, has just celebrated his 88th birthday, is one of the last remnants of the old school of royal gardeners, and enjoys the distinction of having served under George III. and succeeding sovereigns of this country. Mr. Thomson was born in 1804, in Shropshire. He was educated at the Shrewsbury Grammar School, sitting on the same form with Darwin, the great naturalist. He left Shropshire in 1819, and was placed by Mr. W. T. Aiton, head gardener to George III., in the Royal Lodge Gardens, Windsor, under Mr. Nitchell. Mr. Thomson afterwards went to the Cumberland Lodge Gardens, the Hampton Court Gardens, and, finally, to the Royal Botanic Gardens, Kew.

Mr. Thomson has also every Sunday to prepare and place bouquets of the choicest flowers in season in the pews of the Royal Chapel used by the King, the Marchioness of Conyngham, and members of her family, &c., the favourite flower of the Marchioness—the Neapolitan Violet—being introduced as much as possible. In 1830 Mr. Thomson left the Royal service, and was appointed head gardener to the Duke of Northumberland at Sion House, Isleworth. The Duchess of Northumberland was preceptor to the Queen, then the Princess Victoria, and Mr. Thomson was brought into contact with Her Majesty, thus completing his connection with a line of four monarchs. In his early days in the Royal Gardens, he had charge of the Orange trees presented by Louis XVIII. to George IV., which founded the present orangery at Windsor Castle. He was also deputed to make a selection of American plants

from a sale by the Duke of Buckingham at White-knights, near Reading, and superintending their removal to Windsor Castle, where they were planted when the Castle was restored. He also took a prominent part in forming and planting the ruins on the margin of Virginia Water, so well known to all who have visited that scene of Royal picnics and boating excursions.

While engaged on this work, Mr. Thomson gained the cognomen of "the Royal fool." He was superintending the making of a branch road leading from the main road in the park to the Fishing Temple. The new road was staked out, but the king did not approve of the curve, and wished Mr. Thomson to alter it. The young gardener, nervous in the presence of the king, did not improve matters, and seeing Mr. Nitchell in the distance, suggested to his majesty that he should be called. George IV. said tartly, "Yes, you fool, do." The young man summoned Mr. Nitchell to the king's presence, and disappeared himself among the shrubs.

A horticultural incident, of which Mr. Thomson is very proud, is the fact that while he was head gardener to the Duke of Northumberland, he was the first to flower *Vanda teres* in England in 1833. The Duchess of Northumberland was, as before mentioned, governess to Princess Victoria, then about thirteen years of age. The Duchess took to Kensington Palace every morning some flowers for her illustrious pupil, and Mr. Thomson made up all those baskets and bouquets of flowers. The Princess, with her mother, the Duchess of Kent, would frequently visit Sion House. On those occasions Mr. Thomson had to accompany the Royal ladies, and make up bouquets from any flowers the young Princess might select in the great conservatory and hot-houses of Sion House. On one of these visits the first flower opened of *Vanda teres* was cut and handed to the Princess Victoria by Mr. Thomson. When Her Majesty last year visited Baron Rothschild at Waddesdon Manor, it was curious that a bouquet of *Vanda teres* should again be selected by the Baron as the most beautiful floral offering he could make to his Sovereign.

Mr. Thomson has resided at Hayward's Heath for about sixteen years.

ORCHID NOTES AND GLEANINGS.

CHYSIS BRACTESCENS.

THIS is a deciduous plant, casting its leaves after the growth is completed, requiring at this time to be kept at the cool end of the Cattleya-house, and giving it just sufficient water to keep the bulbs from shrivelling. In the spring of the year, the plants should be re-potted if grown in pots, but we prefer to grow them in baskets, which is more in accordance with their natural conditions, where they grow upon the branches of forest trees, and consequently have some shade during their growing season. After potting or basketing, as the case may be, they should be removed to the East Indian-house. The plants grow low down in Mexico, in the province of Vera Cruz and the province of Tlaxcala, where they are found growing wild, and as these places are said to be very hot, therefore while the growth is forming, we like to place them where they can have the greatest amount of heat. After growth is completed, they like a decided rest; this can be the more easily given them by reducing the temperature and withholding water. The flowers of all the species of *Chysis* are showy, with the exception of one, *C. aurea*, the species upon which Lindley founded the genus, which arises from the fact that the blooms are self-fertilising, and they, consequently, never display their beauties. *Orchid Album*, vol. x., part 112.

DENDROBIUM INFUNDIBULUM

is a very fine variety; the plant here figured flowered in the fine and choice collection of Major-General Berkeley, at Bitterne, Southampton, which is under the able care of Mr. Godfrey, and we ourselves have

scarcely been without blooms of it during the whole season. We grow it in the lightest part of the Olontoglossum-house, at the warmest end, and have found that a moist atmosphere is essential to its welfare during the entire year, but more especially during the summer, its growing season. It may be grown in a pot or hanging-basket, but the soil should be made firm about its roots, taking care not to overload the roots with soil, neither should too great an amount of pot-room be allowed. The pots should be especially well-drained, using as soil good brown fibrous peat, and about an equal part of chopped sphagnum moss, adding a few medium-sized nodules of charcoal. The plants should remain in the house in which they open, taking care to avoid wetting the flowers from the syringe, as we have observed that even the most delicate blooms last in beauty considerably longer when so treated. *Orchid Album*, vol. x., part 112.

FAN PALMS OF AUSTRALIA.

(Continued from p. 619.)

COMING now to R. Brown's two intra-tropic species of *Livistona*, it must be admitted that some of the enigmas concerning them have not yet been solved, even after the lapse of nearly a century. In our young libraries here the great *Palm-wood* of Von Martius is not yet available, hence I cannot follow up the present enquiry from that source; but, during the forty-five years of my uninterrupted researches in Australia, I have become acquainted with only one *Livistona* in Nature, with the characteristic of ovate fruitlets, ascribed to both *L. inermis* and *L. humilis*. It would seem furthermore that the petioles of young plants are far more spinous than those of aged plants, a remark fitting also *L. australis*. The correctness of this observation might be tested even in European conservatories. When in 1836 I saw a tall *Livistona* far in the interior of Arnhem's-land, evidently the same which Leichhardt noticed there in 1845, I gave it the name of that lamented geographer, because it agreed not with the short diagnosis given by R. Brown and by Kunth for the tropic Austral *Livistonas*, and when I subsequently became almost convinced, so far as I here could judge, that *L. humilis* is a youthful *L. inermis*, I kept up the name *L. Leichhardtii* for the united species, their original names having become inapplicable now.

The third genuine species of Australian *Livistona*, namely *L. Marie*, occurs in Central Australia on Gilly's Range, and also on a tributary of the Finke River, in about 24° S., and in West Australia on the Hamersley Range, in about 22° S. It was dedicated at the time of nuptial festivities to H.R.H. the Duchess of Edinburgh. The greatest height known of this extremely local Palm is 70 feet. The petioles are somewhat spiny at the lower part, and attain a length of 5 feet, and that is also the maximum length of the leaves; these in a young state are of a splendid coppery colour, and in age of a remarkable pale green. The panicle had been seen to attain a length of 10 feet, according to notes from the German missionaries in Central Australia. As seemingly germinable seeds were sent by me long ago to European gardens, it is probably now a well-known Palm in culture there, as it is in some parts of Australia. Should this not be the case with you, then living plants might be obtained, for instance, from Mr. J. Edgar, of Rockhampton, Queensland. The fruitlets are globular, and particularly large, from the Western Australia locality in contrast with those of *L. australis* from which species *L. Marie* is also distinguished by the paler leaves, with elongated rachis, which forms a solid axis sometimes nearly 1 foot long beyond the petiole, whereby the leaf gets a somewhat cuneate form; on this account it seems likely that the unnamed *Livistona*, referred to in the *Gardeners' Chronicle*, may be *L. Marie*. A rather full description of that Palm, chiefly from Western Australian material, was given in the *Fragm. Phytographi*, Austral., xi., 54, 55. But the fruitlets there described had lost their exocarp, which is brownish outside, and thus less dark-coloured than in other congeners,

The flowers, as seen on the West Australian plant, are hardly of half the size, compared to those of *L. australis*. *F. von Mueller*.

THE WEEK'S WORK.

FORESTRY.

By J. B. WEBSTER, Forester, Stangmore, Dunganon.

SEASONABLE WORK.—The cold drying winds and hot sunshine in many parts of the country of late have been trying to all recently-planted

moment. Of course, when once the trees attain a large or medium size, artificial fecundation becomes unnecessary. As the seeds of the Scotch, or Wych Elm, *Ulmus montana*, are generally ripe and ready for collecting during the first half of the month of June, a piece of ground should now be prepared for their reception. The most suitable soil is that of an open sandy texture, which should be formed into beds of 4 feet in width. These should be allowed for every 10 or 12 lineal yards of a bed of the width named, according to the quality of the seed. The seed should be covered with about

exhibits it is highly ornamental. Grafted standard ornamental trees of all kinds should now be examined, and all suckers that appear at the base of the stem should be cut or pinched off, and any buds that are appearing here and there along the stem had better be rubbed off by the hand in order to direct the energies of the plant to the formation of a head. Sow the seeds of different species of Barberries as they become ripe; some of the tender sorts may require the protection of a few evergreen branches stuck in the seed-bed during the first winter, but in spring they should be planted out in nursery lines to be prepared as covert plants. When planted

FIG. 95.—PLAN OF PORTION OF INDIAN TERRACE GARDEN. (SEE P. 661.)
(Designed by Mr. W. GOLDRING)

forest stuff. Conifers of recent introduction should claim the early attention of the planter, as some of the species are very apt, during the early stages of their existence, to produce female cones, but very few male catkins, and when the pollen becomes ripe, it should be collected upon a piece of clean paper, and introduced into the cones by brushing it well in between the scales with a camel-hair pencil. By utilising the pollen in this manner, the cones may be rendered fertile, and as the seeds of many of the species of Conifers are valuable, the labour involved in the operations of collecting and distributing is but of small

half an inch of fine soil; and should the weather be dry, the bed should be occasionally watered and shaded. Under favourable circumstances, the plants should make their appearance above-ground in about a week, when the shading should be removed. Sometimes the seed is thoroughly seasoned, and kept in a dry place till early spring, and sown in the above manner. The weeping Elm, *U. pendula*, likewise produces seed, and may be increased in the same way as the former. This is a very ornamental kind, with large, deep green leaves, which makes a fine standard when grafted upon a straight stem, and from the wild rugged head which it

on soft mossy ground in plantations, some species of Barberry reproduce themselves on the spot.

RECENTLY-FORMED ORNAMENTAL PLANTATIONS OF TREES, SHRUBS, AND YOUNG HEDGES.—The ground round about the above should be kept free from weeds, and even if no weeds appear at all, the hard crust had better be broken up with the hoe during the growing season, which will help to accelerate the development of the plants. Ornamental and standard trees that had their branches or limbs torn off during winter should have the wounds pared, and all splinters of wood removed

down to the solid timber, the surface being dressed with a coat of thick paint of the same colour as the bark of the tree; but in cases where fungus growths are making their appearance, tar should be substituted for paint, as it will effectually kill the fungus spores and equally well prevent the lodgment of water. Now that tree growth is making rapid progress, young plantations on heather ground on hill sides should be looked after at this season, as many of the Larch plants are liable to have their leaders bitten off by the hares during the winter; and as such trees will now be showing several leaders, the superfluous ones should be cut off, and the strongest and best-placed left to take the lead. These hares during a snow-storm often nip off the heads of trees fully 3 feet from the ground, which is very tantalising to the forester. Hard-wood trees that have been peeled and otherwise damaged by animals should be puned and sorted in such a way as to direct their forces to the formation of wood in the trunk. I may, however, state that Sycamore, Birch, Chestnut, &c., are apt to bleed when pruned at this season, and had better be left over till the end of July or August, when they can be pruned with impunity.

Scotch Fir, and other species of Pine, often suffer serious damage by winged game picking out the terminal buds of the leaders and branches, and if these are not noticed in due time, and pruned in such a way as to induce a well-placed bud or shoot carry on the stem or branch, otherwise mere bushes, not trees, will be formed, which answer very well for shelter, but are of no value as timber. During dry, warm weather scour and clean out drains and ditches, as the work can be carried out to better perfection and at a cheaper rate during summer than at any other time during the year. This sort of work I always try to do by contract, as it is better for the proprietor, besides affording the workmen an opportunity of making a few extra shillings. This is likewise the best season of the year to form bog roads. The ditches along both sides of the proposed road should be cut first, and the stuff excavated used to form the surface of the road, and bring it into shape, the centre of which should be rather higher than the sides, to allow surface-water to run off. In this way the soil should be allowed to lay and drain itself until it becomes fit to bear hard material.

PLANTS UNDER GLASS.

By R. MILNER, *Gardener, Fowrie Castle, Swainsay.*

PANCRATIUMS.—Plants which are showing for bloom, or making growth, should be assisted frequently with manure-water to which a little soot has been added, and by feeding the plants in this way the flowers will be greatly improved, and the plants strengthened for flowering another year. Bulbs raised from seed last year, which have been kept growing up to the present time, should be put into larger pots, according to the strength of the plants; and large plants which have been growing in the same pots for several years may be repotted at any time when the plants are out of bloom, it not being necessary to disturb the roots, except to remove the old crocks. The proper time to divide the bulbs is just before the plants start into growth.

CRINUMS.—These plants grow to a large size when kept in a suitable temperature, which makes it necessary to afford them considerable root-space, with a view to full development. Any bulbs of flowering age which require larger pots may be treated like the *Pancratium*, not disturbing the roots further than removing the old crocks on repotting them.

TUBEROUS BEGONIAS.—Young plants raised from early-sown seeds which were pricked off into pots or boxes, should be now put into the pots it is intended to bloom them in, for if the roots are confined for too long a period in small pots at this early stage, growth is checked, and the flowering of the plant is likely to be unsatisfactory. Old tubers which started late, should now be put into their flowering pots, and grown on in cold frames until they show for bloom, the frame lights being taken off on fine days.

BOUVARDIAS.—Plants which did good service in the autumn and winter, and were cut back, and have since made fresh growth, should have some of the soil removed, and be potted into pots two or three sizes larger than those they have come out of. The compost may consist of two parts of fibrous loam and one each of rotted manure and leaf soil, with some sand

to keep the soil porous. Cut-back plants, if healthy, generally throw out sufficient shoots to furnish themselves. Young plants propagated in the present spring, and which are still in small pots, when well rooted, should be repotted into large or small 32's, which will generally suffice for this season, as when the pots fill with roots, the frequent application of weak manure water will keep the plants healthy. Strong shoots which may be taking the lead must be stopped, but the stopping should not be carried too far, as I always think that a moderate number of strong growths are preferable to a greater number of weak ones. After repotting, keep them a little closer for two or three weeks than will be necessary after they are established, and grow them in a light house, near the glass, and on a moist bottom, which will be a means to keep them healthy. Shade during bright sunshine, and freely syringe the plants when closing the house for the day, which should be about 4.30 P.M., so as to husband some amount of sun-heat which will be of special advantage to backward plants. Where it is intended to plant out *Bouvardias* in pits, the bed should be made of a rich compost, similar to that recommended for pot culture, plenty of space afforded each plant to grow, as when grown in this way, they attain to double the size they do in pots, and close planting causes them to lose their lower leaves.

THE KITCHEN GARDEN.

By G. WYTHES, *Gardener, Syon House, Brentford.*

CULTIVATION OF THE VEGETABLE MARROW IN FRAMES.—These succeed in the open in most parts of the country, that glass protection is seldom afforded them. Any disused hotbed is sufficiently warm to start Marrows in, and if it be too cool, some additional short stable-dung will suffice to give warmth. To ensure success, free growth should be encouraged from the start, and the plants should be strong, and free from insects. After soiling the bed, and planting it, give little or no ventilation for a time, and when growth begins, stop the plants, when 12 inches long, by taking out the point of the stem. Put two plants under a light on a mound of soil. One of the best Marrows for frames is Pen-y-Byd, a prolific variety, which bears fruit whilst quite small. With due attention to airing, and affording water at the root, it is a variety that will bear fruit at every joint, and if these are cut when of the size of an Orange, they form a delicious vegetable early in the season. Plenty of air should be afforded in fine weather, and when the out-of-doors plants come into bearing, the frame may be removed, and the plants allowed to run outside; and with attention in watering, they will continue to bear till cut down by frost. The Custard Marrow is another kind which does well in a frame, its fruits being used whilst quite young.

GENERAL WORK.—The ground must be stirred between growing crops whenever the hoe can be used, and the later crops must be thinned as soon as the plants can be handled. Turnips soon suffer if left long in a crowded state, and the main crop of Carrots should be thinned early, for if left till very dry weather sets in, the thinning cannot be done so readily or without injury to those that are left for late use. Spinach also, to be good, requires early thinning of the plants, and abundance of water in dry weather. Radishes should now be sown on north borders, and the earlier-sown ones watered. Mustard and Golden Cress may be sown fortnightly. Watercress, if sown in frames, and planted out in a cool and moist position, is always useful. Lettuce may be sown at intervals of three weeks, if a constant supply of these salad plants be needed. At this season sow the seed in drills thinly, and thin out to 1 foot apart any thinning that there may be should be transplanted for succession. When plants are left where the seed was sown, they stand hot weather well, and need less watering. Endive may be sown now in small quantities, but I prefer to sow about a fortnight hence. Turnips should be sown, one of the best varieties for this season being Veitch's Red Globe, an excellent keeper. Potato stems coming up through the soil should have some fine earth drawn around and up to them daily, as a protection against possible frosts. Should any loss have occurred among the Globe Artichokes during the winter, now is the time for dividing large crowns and making good gaps in the rows. A few of these plants should be planted annually, and an equal number of the oldest done away with. Artichokes like richly-manured ground, trenched deeply. The plants are usually divided and planted at the end

of the month of April, but growth is much later than usual this season that it may still be done. From this date onwards Mushrooms will be best obtained from beds in the open, unless the Mushroom-house be a cool one. If not in the open, an outbuilding or some cool cellars under-ground might be utilised.

CELERY.—The seedlings of the earlier sowing will now be ready to prick off, and although an ordinary frame is good for this purpose, various makeshifts have to be resorted to by gardeners to protect the young plants from bright sunshine for a time, and from night-cold. The bed should consist of rotted manure, leaf-mould, sandy loam, and the seedlings should have been somewhat hardened off, and not brought out of strong heat to be transplanted to the frame. Prick them out at 3 inches apart, and make firm by means of the finger, not the dibber; water them gently with a fine rose-can, and sprinkle them morning and evening. The trenches for the earliest crop of Celery, if the ground be vacant, may be thrown out, just deep enough to bury the manure, and leave a shallow depression that will retain the water. For this crop only a moderate amount of rotted dung is necessary, further assistance being given by means of liquid manure and fish manure and guano in showery weather, or before watering the plants. The space between the rows if for inter-cropping should not be less than 5 feet, and the width of the trench if for a double row, 20 inches; if for a single row, a 4 feet interval is enough. The manure may be dug in about 9 inches deep, or if the subsoil is poor, the top spit or some of it may be placed over the dung. It is advisable to fork up the soil at the bottom of the trench before putting in the manure. If the trenches are prepared a short time before the plants are ready the ground gets into a nice condition when planting-time arrives, and there need be no waste of ground between the trenches while the Celery is still in the frames, but it may be cropped with any quick-growing salad plant, &c. If plants were raised in February in heat, no time should be lost in getting these into the trenches. Cow-shed manure is preferable to stable manure.

CAPSIUMS.—The seed pods of Capsicums, both sweet and hot, are not used so much as they deserve to be in salads and cooked. The large kinds, if sown as previously directed, will be now fit for planting out, which may be done on a spent hot-bed, or on a bed of leaves and stable manure, such as is commonly employed for Cucumbers out-of-doors, keeping them close for a few days and moist, the latter point being an important one, for should red-spider obtain a footing on the plants they scarcely ever pay for the space they occupy, and, as everyone knows, a dry atmosphere is very apt to breed red-spider. When established they should be syringed every day when closing the frame for the night, and afforded liquid manure as soon as a good set of fruit is secured.

TOMATOS.—Any plants sufficiently hardened off, and in a condition to plant out at the foot of a south wall, may now be planted, slight protection being given at night for a few weeks. I have given various methods a trial, and have found that the best is to pot the Tomato plant into 10 or 12-inch pots, and to plunge these into the soil of the border, affording Thomson's Vine Manure when the soil is getting exhausted, and supplying water freely in dry weather. By acting in this way the fruits come much earlier, and those which are planted out either then or later form a succession to these. Although the yield of fruit is not so large from those in pots as from planted out plants, the obtaining of early fruit is an advantage. Tomatos are often too well treated at the start by making the soil too rich, but it is safer to restrict their root run, and mix some loam, mortar rubble, and burnt soil with the staple in preference to putting manure with it, which can always be afforded later if it should seem to be needed. Much root moisture should be avoided, as it is conducive to a diseased state of the plant. It will be found that the most fruit can be obtained from plants trained as cordons.

FRUITS UNDER GLASS.

By J. RIDDELL, *Gardener, Castle Howard, York.*

CULTURE OF CUCUMBERS.—A start may now be made with the frame, and much of what has been stated about the frame-culture of Melons is equally applicable to these. Plant when the hills of rich soil have got warmed through. Make it firm, and water thoroughly; stop the plants at the fifth or

sixth leaf, and lay out the shoots regularly all round, but not pegging them down before soil has been put over the whole of the bed. Cut all fruits when they are of a useable size, they will keep fresh for seven days, provided the ends be put in water and they are kept in a cool place. The timely removal of the fruits will relieve the plants considerably. Lay in young shoots wherever there is space for their proper growth, and stop them at every joint if the varieties are free-fruited ones. The beds should be top-dressed with rich compost, and farmyard liquid-manure made free use of when the plants stand in need of a stimulus. Remove exhausted plants and soil, and plant the pit anew.

POT VINES.—Young Vines in 6-inch pots which may have made about 2 feet of growth, may be either stood on the plunging material for a few days, or taken direct to their summer quarters, preparatory to giving them their final shift. If the suggestions with regard to young Vines contained in my last Calendar have been carried out, they will now be in condition for shifting into 10-inch pots, and only those in 6-inch pots which are well rooted dealt with, the others being allowed to stand meanwhile till they have reached the same stage. Employ in potting good fibry loam, dried horse-droppings, lime rubble, wood-ash, finely-crushed bones, and a sprinkling of leaf-soil. It is always desirable to have the compost warm when using it, in order that the Vines may receive no check; and in potting, to make the soil fairly firm, and to give a good watering when the work is finished. It may be necessary to provide longer stakes when a trellis is not available. Those Vines which are intended for planting in borders this year may be transferred to them forthwith, the only disturbance that they are subjected to being the removal of the crocks. When treated in this manner, and strict attention paid to affording the plants abundance of water, that is, treating them like pot plants till such time as they have got a good hold of the new soil, they will grow at a great rate. These Vines, and those intended for planting next year, may be stopped after making 5 or 6 feet of growth, and all sublaterals kept pinched to one leaf, which will cause the buds to become plump. Vines for fruiting in pots should be treated similarly to the above, with this difference, that they are stopped when the length required to suit the structure they will be fruited in is obtained. Give all a minimum temperature of 60° to 65°, with a moist atmosphere, and admit fresh air to the houses on all favourable occasions.

THE HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener, Mereworth Castle, Maidstone.

WITH the advent of warmer weather, wall trees have made rapid growth, and will require constant attention in the matter of disbudding, pinching out the points of shoots that have reached their full limits, and nipping back fore-right and other weaker shoots, to cause them to form fruiting spurs. All young wood required for the filling up of gaps and wall space, or that required to take the place of other branches at a future period, should now be fastened to the walls or to the older wood.

Shoots of the Peach and Nectarine intended for bearing fruits next year should be laid in their places before the base of the shoot gets firm, or they may snap in the operation; put one tie of bast to fasten each to the branch from which it springs, using shreds and twigs to keep it in place afterwards. Disbud generally, but not too severely at present, and train thinly, spreading the shoots as evenly as possible over the space to be covered, so that no overcrowding of the shoots takes place, remembering that superfluous wood is, in its bad effects, next to overcropping the trees. Where trees have set fruit abundantly, remove some of it, but the quantity to be left finally must be decided by the condition of each tree, and the size to which the variety grows. Keep the garden engine in use on the mornings of bright days, making use of tepid water, or of that which has been exposed to the sun—not cold well-water. If black aphid be present, wash with a weak mixture of tobacco-water and clean water, or some other insecticide. Do not wait till the trees are badly attacked before taking steps to destroy the fly. Late-planted trees of all kinds should have the soil at the roots saturated with pond water or that which has the chill taken off it. Nets or other protective materials

may now be safely removed and put aside when dry, numbering each piece to save confusion when again required for use. Nets should be put in order for the protection of small fruits, all repairs to the same being completed without delay.

FIGS.—By this date it will be seen which shoots are likely to produce the most fruit, and if pruning has been deferred till now, it should be finished off. Do not prune too severely, nor restrict the trees too much, extension of branches being conducive to good cropping in the case of this fruit. Lay the bearing shoots in at their full length, but cut away any that are of spongy growth, most of which will be found springing up about the roots. Syringe the foliage of any trees that have been severely root-pruned. In bad weather cut and prepare shreds and nails, and layering pegs for use.

THE FLOWER GARDEN.

By H. W. WARD, Gardener, Longford Castle, Salisbury.

PLANTING BEDS AND BORDERS.—The planting of all kinds of plants, excepting Alternantheras, Coleuses, and Iresines, may now be done, but before doing so, see that all the plants are thoroughly moist at the roots, and make the soil firm about them in planting, afterwards watering the soil to settle it. Verbenas, Calceolarias, Pelargoniums (of various sections), Lobelias, and Ageratums should be planted out first; following these with Heliotropes, Dahlias, Alternantheras, Mesembryanthemums, Golden Pyrethrum, Kleinias, Iresines, and Coleus. Do not set out the plants too close together, but allow them sufficient space for proper development, and at the same time plant them sufficiently closely, that, with proper attention in the matter of watering, they completely cover the space with foliage and flower within one month or thereabouts from the time of planting. The sooner the beds are well furnished with foliage and flowering plants the better, as then the pleasure which the possession and the appearance of such beds undoubtedly afford will be considerably extended. In too many cases the plants only succeed in covering the space allotted them a few short weeks before they get nipped by frost in the autumn. Sometimes a scarcity of the various kinds of plants employed at bedding-out time is responsible for this meagre appearance of the beds during the best part of the season, and not unfrequently it is traceable to a mistaken idea that a good floral display cannot be obtained unless the plants are set widely apart in the beds, so as to make good individual heads of growth. Where old plants of Pelargoniums which were struck in the autumn of 1890 are available for planting, they should be put in the centre of the beds, filling in round them with young plants of the same kind. If the plants are long-legged, they should be planted slanting-wise—that is, with the branches resting on the soil—to ensure that portion of the previously bare stems which are thereby fully exposed to the sun, pushing into fresh growths. Stocks and Asters, as well as Zinnias, Phlox Drummondii, and such-like, should be planted in the places in which they are to flower before they become "drawn." Like other plants, they are best transplanted in showery weather, but in the absence of rain, small flower-pots may be placed over the individual plants during the heat of the day for a few days, removing them in the evening of each day, which will enable the plants to become established quicker than would otherwise be the case.

MIXED BEDS.—Readers who find their stock of plants unequal to the demand, may get over the difficulty by planting mixed beds. Plants of almost every kind agreeing in harmony of colour may be employed, and by judicious arrangement such beds are very effective. Large beds having a groundwork of Phlox Drummondii may be dotted over with light and dark flowered Fuchsias of various heights, Nicotiana affinis or sweet-scented Tobacco, Salvia patens, Sweet Peas, supported by short sticks; variegated Maize, &c., and edged with Pelargonium Mangleri variegatum, are very telling in effect; as also are beds planted with Stocks, Asters, Zinnias, Sweet Scabious, Gaillardias; standard variegated, and pink-flowered Pelargoniums, set in a groundwork of Garaway's White, or other kinds of Mignonette, and edged with some of the Tom Thumb varieties of Nasturtium, such as Crystal Palace Gem, sulphur-coloured flowers; Cloth of Gold, golden-leaved variety; or Ruby King, crimson-rose flowers, so that whether the mixed beds are so planted through necessity or choice, they are equally effective. If a mulch of short dung or leaf-soil be

laid on between the plants as soon as each bed is planted and watered, it will conduce to the speedy filling of the beds by the plants, and will also save labour in watering.

GENERAL WORK.—This will consist in thinning annuals when the ground is moist after rain or a watering; planting out plants of Lily of the Valley which have been forced, the plants being watered some time before turning them out of the pots and after planting. Spring-flowering subjects, as Wall-flowers, Forget-me-Nots, Primroses, Armerias, Arabis, Daisies, and Aubrietias, as they are being removed from the beds to make room for summer bedders, should be planted in patches like the Lily of the Valley alongside the walks in the pleasure-grounds, and in the home woods and in recesses formed by trees and shrubs in close proximity to carriage-drives and other frequented places, thereby creating, as it were, pleasant surprises in every nook and turning, ten or twelve months hence.

THE ORCHID HOUSES.

By H. A. BURBERRY, Orchid Grower, Highbury, Birmingham.

THE SHOW HOUSE.—A show-house is of use for keeping flowers in good condition throughout the year, and at no time more than at this season, for in every house where the plants are cultivated a moist atmosphere is required, or growth will not be satisfactory. This kind of treatment, whilst it suits growing plants, is not conducive to long endurance of the blooms—hence the convenience of a "show-house." Occasionally artificial heat will still be required by day and night, but, as a rule, it may now be dispensed with, its absence tending largely to the welfare of the plants themselves; but with the flowers it is a different matter, the humidity at night, when no artificial heat is used, soon causing them to become spotted and useless. On the other hand, never do those in flower look so nice as when they are arranged by themselves with Ferns, Palms, and climbing Asparagus, where the house is kept cool, and shaded, moisture being afforded in moderation, and there is little warmth maintained in the hot-water pipes, with ventilation at night, if necessary, to stay damping. The various colours should be so placed as to harmonise with one another. The splendid colouring of Cattleyas, Sobralias, Dendrobiums, and Oncidiums, with the more modest tints of Odontoglossums, and the quaint forms and singular colours of Masdevallias, help to make a perfect fairyland. Artificial heat should be discontinued, therefore, in the intermediate, Cattleya, and the Mexican houses during the night, providing the temperature does not fall below 60° and for but a short time only, and in the cool houses also, providing it does not fall below 55° for any length of time. Trichopilis should be grown at the warmest part of the intermediate-house or the Cattleya-house, and in either pots or baskets. This genus is not so largely cultivated as many of the more showy species, yet such species as *T. crispata marginata*, *T. coccinea*, *T. tortilis* and *T. suavis*, and especially a white variety of the latter, are well worth having, their flowers forming a pleasing contrast when the plants are grouped with others in flower. Sphagnum moss and peat are the best materials in which to plant Trichopilis, and the necessary repotting should be performed after the plants have finished their flowering. *Odontoglossum vexillarium*, if tripps are kept from it, and it is treated as advised in my previous Calendar, will amply repay all trouble expended on it by presenting a mass of beautiful flowers about this date. The plant should be well shaded from the sun during its period of flowering, or the flowers will lose much of their brightness, the high-coloured species soon becoming paler. *Odontoglossum citrosum* is flowering well with us this season, and one spike possesses thirty-three flowers. It is an Orchid of easy culture, but to induce good flowering a thorough rest must be afforded it in a cool or intermediate house, from the time the young pseudobulbs are matured until the flower spikes appear at the apex of the new growths in the spring, and during this period just sufficient water to prevent excessive shrivelling of the pseudobulbs is all that is required. Plant it in good fibrous peat and but little sphagnum moss, and what is very essential, in well-drained pans or baskets. It dislikes to be repotted, and the plant should be disturbed at the root as little as possible, and what is done in this direction should immediately follow its flowering.

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

PLANTS, &c., TO BE NAMED.—Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.

ILLUSTRATIONS.—Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are particularly solicited.

Advertisements should not be sent to the Editor, but to the Publisher.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

TUESDAY, MAY 24—Linnean Society; Anniversary Meeting.

WEDNESDAY, MAY 25—Committees of the Royal Horticultural Society in the Temple Gardens at 11 A.M.

SATURDAY, MAY 28—Royal Botanic Society meets.

SHOWS.

WEDNESDAY, MAY 25—Great Show of the Royal Horticultural Society in the Temple Gardens (two days).

FRIDAY, MAY 27—Exhibition, Earl's Court (two days).

SALES.

TUESDAY, MAY 24—Orchids, at Protheroe & Morris' Rooms.

WEDNESDAY, MAY 25—Plants and Palms, at Protheroe & Morris' Rooms.

THURSDAY, MAY 26—Large Collection of New and Rare Orchids, from Messrs. Linden, at Stevens' Rooms.

FRIDAY, MAY 27—Orchids in flower, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCTED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—56° F.

The anniversary dinner of this young and thriving institution took place on Tuesday evening last, at the Hôtel Métropole, Sir JAMES WHITEHEAD being the Chairman. A large gathering of city magnates was present, and, thanks to their liberality and the exertions of the Chairman, nearly £1000 was received for the benefit of the charity. We must refer to another column for a short account of the proceedings on this occasion; here we desire to advert to some points which struck us in connection with it. First and foremost, we must congratulate the managers on the success of their efforts. The orphans are, unfortunately, so numerous, and their wants so pressing, that a substantial addition to the Fund for their relief, whenever obtained, is a circumstance which every gardener will hail with delight. For this result we have largely to thank Sir JAMES WHITEHEAD and his friends. The occasion seems, however, to mark a new departure which will be watched with interest by those concerned. Pre-eminently among similar Institutions, the Gardeners' Orphan Fund is the work of the gardeners themselves. They initiated it, they have reared it, and brought it to its present state, almost exclusively by their own exertions. It appealed to their sympathies from the very first, and it has furnished an illustration of combined effort, such as is not too frequent in the gardening community.

The young Institute, early in its career,

suffered severe losses by death among those who were prominent among its founders and first managers. Happily, others were found to fill their places. We regret that Mr. WILLIAM MARSHALL, the zealous Chairman of the Committee, who was one of those that stepped into the breach, was unable to be present, and share in the gratification experienced by the result of Tuesday's efforts.

As gardeners we are proud of our own Institution, and we should regard any falling off in professional support as a great calamity. We trust no such consequence will follow, but if such results as those on Tuesday are to happen, there is possibly some room for apprehension that the managers may cease their efforts to create a sufficient reserve fund, and live from hand to mouth, trusting to the efforts of a popular chairman to recruit their exhausted coffers. Considering the never-ending responsibilities the fund has to bear, the greater part of such additions as those made on Tuesday last should, in our opinion, go to swell the reserve fund.

Let us also hope that the gardening community will not relax their efforts, and depend more upon the generosity of outsiders than upon their own exertions. That would neither be dignified nor satisfactory, as it might lead to others than gardeners claiming to take the lead in the management of the society. As it was, the gardening community did not take the first place at Tuesday's banquet. Considering the gain to the orphans, we do not wish to make any unfavourable comment upon this, but we would impress upon the management the desirability of supplementing the recent festival by one of more modest pretensions, perhaps, but one in which the rank and file of gardeners will be able to participate more fully than was possible on this occasion. We do not wish to be misunderstood. In the interest of the orphans, we welcome and are grateful for aid from any and all quarters, but we do not want that aid to cause the gardeners to lessen their own efforts or to lose touch with what is emphatically their own institution.

OPHIOGLOSSUM PENDULUM.—"No Ophioglossum," many will say, when they look at fig. 96. Nevertheless, Ophioglossum it is, widely though it differ from our humble British plant, and more like though it be in aspect to *Platycodon*. *Ophioglossum pendulum* is a tropical species, known to LINNÆUS, and was figured in HOOKER and GREVILLE's *Icones Filicum*, t. 19, and in HOOKER's *Garden Ferns*, t. 33. JOHN SMITH, in his *Ferns, British and Foreign*, likens the fronds to ribands or bands hanging loose and waving with the wind, often many feet in length. These plants succeed in a small quantity of soil, firmly fixed in pots, with pieces of soft stone or potsherds, and the pot with a flat back hung against a shady wall or pillar. The photograph, whence our illustration was taken, was executed by Mr. GEORGE ROBSON, of Brisbane, from a plant cultivated by Mr. SOUTER, in the garden of the Acclimatisation Society of Queensland at Brisbane. Mr. SOUTER tells us that he grows it in a shaded house, and the longest fronds are over 7 feet in length. The form that grows in Queensland is known as the variety *furcatum*, and this is probably the variety here figured.

THE TEMPLE FLOWER SHOW.—The fruit, floral, and Orchid committees of the Royal Horticultural Society will assemble at the Inner Temple Gardens on Wednesday, May 25, at 11 o'clock precisely. At 12.30 P.M. the exhibition will be formally opened by the president of the society, Sir TREVOR LAWRENCE, Bart., M.P., and will close on the following day (Thursday) at 8 P.M.

SIR TREVOR LAWRENCE.—We understand that the President of the Royal Horticultural Society does not intend to present himself as a candidate at the next election.

HORTICULTURAL CLUB.—We understand that Sir JOHN LLEWELYN, Bart., has (as Chairman), consented to preside at the special dinner of the Horticultural Club, which will take place on Wednesday, May 25, the first day of the great City Show of the Royal Horticultural Society.

LINNEAN SOCIETY.—The anniversary meeting of the above will take place on Tuesday next, May 24, at 3 P.M. precisely, for the election of Council and officers for the ensuing year. Dr. ALFRED R. WALLACE will this year be the recipient of the Gold Medal of the Linnean Society, which is awarded to him for his contributions to the literature of zoology, and specially for his work on the origin of species.

THE DECIMAL SYSTEM.—The New Decimal Association, says the *Daily Graphic*, whose headquarters are at Btolph House, Eustcheap, has memorialised the Lords of the Committee of Council on Education on the desirability of taking an important step in connection with the introduction of the metric system in this country. The May examinations of the Science and Art Department are known through the length and breadth of the land, and much has been done by means of these examinations to popularise and extend technical study. The memorial which has been presented, recommends that, in certain of the science examinations, alternative questions be given in future, based on the metric system of measurement, which may be taken, at the option of the candidate, in lieu of questions based on feet and inches. The Committee of Council on Education has already ordered that the principles of this system should be taught in the higher standards of all elementary schools; and one of the steps taken by the school boards of London and other towns, in consequence of this order, has been to furnish the pupil teachers and advanced scholars with boxwood rules, having a decimalised inch scale and a metric scale in juxtaposition. In addition to this, coloured wall charts of the metric weights and measures are used, and in this way the rising generation will, to a great extent, be prepared for the introduction of these weights and measures in future, and, we may add, will be spared much useless exertion in learning our present multiple and idiotic systems.

KEW.—An incident, as we learn, occurred at Kew on Sunday last, which scarcely reflects credit on the Commander responsible for the discipline in the British Army. It appears that, no doubt from inadvertence, the Princess of WALES passed into the garden with a dog, and on attempting to enter the Palm-house with it, was very properly prevented from so doing by one of the attendants. The circumstance fell under the notice of H.R.H. the Duke of CAMBRIDGE, who was one of the party, and who, if we are rightly informed, roundly scolded the official for doing what was his plain duty. The man in question did not know the Princess, but even if he had done so, he would have been amply justified in remonstrating. Dogs are not welcome visitors in the Royal Gardens in general, or the Palm-houses in particular, nor does the fact that they belong to a popular Princess make their company any more desirable.

ROYAL BOTANIC SOCIETY OF LONDON.—Professor MARSHALL WARD, F.R.S., yesterday gave his second lecture at these gardens on "Seeds and Seedlings." On this occasion the lecturer described the internal structure and the various changes that take place in the seed during germination and the first stages of growth—changes now found to be due to a fermenting principle which acts upon and breaks up the starch and albumen of the seed into a form capable of being absorbed by the infant plant, operating precisely in the same manner as the digestive secretions upon the food of animals. The next lecture, by Mr. HENRY POWER, F.R.C.S., on the

"Life History of the Fungi," will take place on Friday next at 4 o'clock, free to all visitors to the gardens.

THE ROYAL HORTICULTURAL SOCIETY'S COMMITTEE MEETINGS.—The meetings on Tuesday last might have been in midwinter instead of in

render it more attractive. The resources of Chiswick might have been drawn upon to supply something of an instructive character, even if it were not at this season able to show much that is decorative. Means might also readily have been taken to arrange on one central table what was shown; and even if some exhibitors, contrary to regulations, insisted on

increase in the number of subscribers which we all desire so strongly. The Temple Show next week will, we trust, completely obliterate the unfavourable impressions produced by the meagre fare of Tuesday last.

SPRAYING FRUIT TREES.—In a late bulletin from the United States Department of Agriculture on spraying fruits, it is estimated, says *Garden and Forest*, that no fewer than 50,000 fruit-growers in the United States habitually spray their trees and vines against such diseases as Apple-scab, the black-rot of the Grapes, &c., while five years ago there was practically nothing known of the subject. In order to get a direct answer to the question whether this practice paid, 250 Grape-growers in different parts of the country last year made a series of observations for the purpose of obtaining definite information as to the value in dollars and cents of the spraying treatment for Grape diseases. The facts reported by these men show that the actual profit to them over all expenses resulting from the treatment of black-rot and downy mildew was 37,000 dols.

IS SPRAYING HARMFUL?—In order to discover the amount of copper, says *Garden and Forest*, which remained on fruit from Vines sprayed with the Bordeaux Mixture, ten pounds of Grapes at the State Experiment Station in Amherst were taken, and the bunches selected were those which had the largest amount of copper mixture adhering to them. In one sample not a trace of copper could be found, and in the other two one-thousandths of one per cent of oxide of copper was found, an amount so small that one would need to eat from half a ton to a ton of these Grapes, stems, skin, and all, to obtain any injurious effect.

BRIGHTON AND SUSSEX NEW HORTICULTURAL AND MUTUAL IMPROVEMENT SOCIETY.—At the usual meeting of this Society on May 12, Mr. RICHARD DEAN, delivered a lecture on "The Life History of a Flower," as illustrated by the florists' Tulip, a number of coloured diagrams being employed by way of illustration. Mr. WILLIAM BALCHIN, Jun., presided, and there was a large attendance of members who were much interested in the singular vegetable physiology of this once popular subject. The development of that peculiar growth in the seedling Tulip, known as the "dropper," by which the raiser is unable to flower it under five or seven years; the assumption of the self or breeder form in the first instance of blooming, which is but a transient character; and then its development into the broken or recut form, was traced and fully explained. The characteristics of each section was set forth, as well as those of the feathered and flamed characters. Under the head of culture, the rules of its general management were also laid down.

BURNING OF AN OAK 1100 YEARS OLD.—Early on Saturday an unusual spectacle was witnessed in the Home Park at Hampton Court, when a magnificent Oak, growing about 20 yards from the Long Water, was discovered to be on fire. It is said to be 1100 years old, and one of the eight largest Oaks in England. It is 33 feet in circumference, having an average diameter of 11 feet. The trunk was hollow for about 10 feet, and several of the larger branches above that are also in a decayed condition. The fire was extinguished in a few hours, but not before the tree had been almost consumed. The cause of the fire is unknown.

TREE-PRUNING.—We take from the *Reading Mercury* a brief report of a case which will be of interest to many:—Plaintiff sued the defendant for the sum of £50. Evidence was given that the trees overhanging the defendant's garden 3 feet, and that defendant cut the trees down in mistake thinking that the hedge belonged to his side of the garden. Plaintiff wrote to the defendant complaining that the trees being cut down had thrown the two gardens into one. Defendant called in professional advice, and the damage was assessed

FIG. 96.—OPHIOCLOSSUS PENDULUM. (SEE P. 656).

the height of the London season, judging by the paucity of exhibits and the scanty attendance of members. We know, of course, that there were many valid reasons for this, but none the less it is a matter for great regret that the public should have been allowed to see so poor a display. That the exhibitors would not be numerous might well have been anticipated, and the meeting should either have been cut out of the programme altogether, or some special effort made to

placing their exhibits on the floor, something like grouping might still have been effected. Generally, there is no time to effect any re-arrangement after the work of the committee is over, but that cannot be pleaded on this occasion. To the committee-men conversant with the reason why, the matter was not important, but in the case of the average Fellow, the result was deplorable; a *fiasco* of this kind disgusts visitors, is universally commented on in the press, and will certainly not lead to that

by one gardener at 50s. The plaintiff refused to accept the award. At the conclusion of the case, his Honour gave judgment for the defendant with costs.

WRITING ON FLOWERS.—The *Moniteur des Postes* of Paris is responsible for the following story:—The passage of an electric current through the petals of a Rose causes the discharge of the colour from the part of the petal through which the current passes, and leaves a white mark. This effect was ingeniously turned to account at a banquet, where the place of each guest was indicated by a Rose, on the petals of which were thus inscribed the letters of his name. Our contemporary does not give any details of the way in which this was effected, and we are disposed to think this electrified Rose must take rank with the Blue Rose.

SWEET BRIAR A PEST.—The fragrant *Rosa rubiginosa* has increased and multiplied to so great an extent in some parts of Australia as to have become a serious nuisance, and it is proposed to place it and *Furze* in the list of plants to which the provisions of the Thistle Act apply.

ROSA GIGANTEA.—We learn that this fine single Rose, of which we gave a figure at the time of the Rose Congress at Chiswick, is about to produce flowers in the establishment of Mr. CHARLES TURNER, of Slough.

KELWAY'S MEDALS FOR HERBACEOUS PLANTS.—The following medals are offered this year, through the Royal Horticultural Society, at their meetings:—For *Pyrethrums* (perennial) on June 7: Six single and six double varieties, three blooms of each variety (large silver). For *Herbaceous Paeonies*, June 21: Three single and nine double varieties, three blooms of each variety (large silver gilt). For *Delphiniums*, June 21: Twelve varieties, one spike of each variety (large silver). For *Gaillardias* (perennial), July 12: Six varieties, five blooms of each varieties (large silver). Kelway's *Gladiolus* Medal, September 6: Twelve spikes in twelve varieties.

MAY HORTICULTURAL MEETING AT GHENT.—Certificates of merit for novelty were awarded for the following:—1. Seedling *Anaryllis*, to the Société Louis Van Houtte père; seedling from *A. pardina*, dwarf, with a large bulb, short and thick flower stem, large bloom, 6 inches across; petals, 3½ inches wide, by about ½ long; form perfect, colour dark velvety-red, background tinged with green. 2. *Odontoglossum* amabile, to M. Jules Hye-Leyssen; flower white, with rosy edges, and numerous small deep pink spots evenly distributed; lip most graceful, and whole flower very beautiful. 3. *Cattleya Skinneri*, to the same; large cluster of flowers of an unusually dark colour. 4. Species of *Odontoglossum* (*O. triumphans* × *O. luteo-purpureum*), to the same; flower brown with reddish borders, lip large, white, bordered with pale brown, and dotted with bright yellow. 5. *Tropæolum Lobbi variegata*, to MM. Duriez Frères; a pretty novelty; leaves bordered with white. 6. *Odontoglossum crispum rotundifolium*, to M. J. Hye; a large and beautiful bloom. 7. *Masdevallia Veitchii*, Prince de Galles, also to the same; a fine variety. 8. *Odontoglossum crispum punctatum*, to the same; flower dark coloured, much spotted and marked, well expanded and very fine. 9. *Abutilon Souvenir de Bonn*, to M. Patrick; edges of leaves pure white, suggestive of *Acer negundo*; foliage variegated. 10. *Azalea Madame Jos. Vervaene*, to M. Jos. Vervaene; large salmon-pink flower, bordered with white. Certificate for Culture: for *Vriesia Pastuchoffiana*, from M. Poelman-Maenhout; excellent example, with entire leaves. Honourable Mentions: 1. *Odontoglossum Pescatorei*, to M. J. Hye; flower large, with purple spots. 2. *Cattleya Mendelii Franciscæ*, to the same; lip very pretty. 3. A species of *Odontoglossum*, to the same. 4. *Lælia purpurea rosea*, of a pretty shade, to M. L. Desmet-Duvivier.

ORCHIDS, ETC., AT THE EXPOSITION DE MONT ST. AMAND, GHENT.—M. ALFRED VAN IMSCHOOT showed a group of eighty different Orchids, among

which we may mention:—*Odontoglossum Cervantesii* roseum, very deep pink; *O. Halli*, an excellent variety; *O. polyanthum*, a fine and rare plant; *Dendrobium chrysanthum*, *Oncidium phymatocheilum*, fine bunch of delicate blossoms; *Miltonia vexillaria*, very deep pink; *Cymbidium Lowi*, with very dark lip; *Cattleya intermedia*, magnificent specimen, with about 100 flowers; *C. Schroderi alba*, very rare and beautiful; *Lælia purpurata alba*, with large petals; *Chysis bracteensis*, very curious plant; *Epidendrum Pseudo-Epidendrum*, rare, lip glossy orange; *Anguloa Ruckeri sanguinea*, very deep colour, &c. There were also fine *Odontoglossums* from M. CH. VUYLSTEKE; besides triumphans, gloriosum, sceptrum, crispum, we must notice *Hunewellianum*, pulcherrimum, an excellent variety; *Ruckeri*, picturatum, histrix, ioplocon, rare, with bluish-purple flowers; *crispum*, fastuosum, *Andersonianum*, globata, &c. MM. VERVAET ET CIE, sent fine *Lælia purpurata*; M. L. DESMET-DUVIVIER fine varieties of Orchids, including *Cymbidium Lowi*, *Miltonia vexillaria*, and *Varecewiczii*, *Odontoglossum hastilabium*, *Oncidium scarodes*, *Lælia purpurata Russeliana*. M. JULES DE COCK sent fine *Cypripedium*—*bellatulum*, *Rothschildianum*, *barbatum nigrum*; MM. DESOIS ET CIE, sent *C. ananthum superbum*, *Dayanum superbum*, *Monsi*, &c. Their *Cypripedium insigne* var. *Imeschootiana*, was excellent, the flower generally bright golden yellow; lip large and wide, golden-yellow with large black spots irregularly distributed over the lower half and base; there is a wide white band along the upper edge. MM. DESOIS showed good varieties of *Cypripedium Elliotianum*; and M. L. DESMET-DUVIVIER, a remarkable *Maxillaria Sanderiana*, with unusually dark spots. Among the new varieties of *Azaleas* shown at Mont St. Amand, we noticed *Souverain du Congo*, large flower of uncommon shade of rosy-purple, with a metallic-blue flush; *President Ad. d'Hane*, a fine flower of the flambeau genus; *Perle de Ledeherg*, fine flower, white, streaked and spotted with pink; *Erna*, white lined and dotted with pink; *Robert le Diable*, with large dark spots; *President A. van Imeschoot*, a double dark red flower.

ANTHURIUMS.—A novelty raised by L. DESMET-DUVIVIER, of M. St. Amand, Ghent. There are numerous small bracts of the same colour as the spathe—that is, creamish-white. These bracts rise from the base of the spadix, extend during nearly the entire length, and give the plant a most unusual appearance.

VRIESIA TESSELATA VAR.—M. BERNARD SPEE, of Ghent, found among 100,000 seedlings of *V. tessellata* which he raised, two uncommon varieties, of which one only grew into a fine plant. The leaves are striped longitudinally with rather wide bands, some pure white, others yellowish-white, others, again, greenish-yellow. The plant is dwarfer than the type, more compact, the pretty leaves are more numerous and more dense, and the whole hybrid a decided acquisition. In the same establishment we saw an *Areca Bueri*, about 20 feet high, with nine large and entire leaves.

HORTICULTURAL EXHIBITION AT BRUSSELS.—The Royal Linnean Society and the Royal Floral Society of Brussels have organised for July 21, the date of the national fêtes, a large horticultural exhibition, to be held in the State Botanic Garden.

SPRING FLOWER SHOW AT CHELTENHAM.—On Wednesday, May 11, the spring show of the County of Gloucester and Cheltenham Royal Horticultural Society, was held at the Montpellier Gardens, Cheltenham. The show was in every respect a success. The exhibits were, perhaps, not quite so numerous as in some previous years; but the quality was unsurpassable. The principal features of the exhibition were the grand collections of foliage plants by Mr. Cypher, Messrs. Heath & Sons, and Mr. Mould, whose exhibits were placed in this order by the judges—a splendid lot of Orchids, some very fine collections of *Azaleas*, and excellent specimens of *Gloxinias* and *Calceolarias*. Mr. Cypher was 1st

for ten greenhouse *Azaleas*; Messrs. Heath & Son being 2nd; and Sir Alexander Ramsay, Bart., was 1st, Mr. T. P. W. Butt 2nd, and Mr. J. F. Mould 3rd, in the class for six greenhouse *Azaleas*. Messrs. Heath & Son were 1st, and Mrs. Graves 2nd for *Roses*. In the amateur class for Orchids, Mr. T. P. Butt was the only exhibitor, and was awarded 1st prize. In the nurseryman's class, Mr. J. Cypher took first honours, and Messrs. Heath & Son, 2nd. In the collection of twenty plants, grouped for effect, the prizes went to Mr. J. Cypher, Messrs. Heath & Son, and Mr. J. F. Mould respectively. Sir Alexander Ramsay, Bart., was 1st for a collection of *Calceolarias*, and Mrs. Graves 2nd. Messrs. Heath & Son secured 1st, and Mr. T. P. W. Butt 2nd prize for *Gloxinias*. Messrs. Heath & Son took the 1st prize for collection of herbaceous plants, and Mr. Butt for stand of stove and greenhouse plants. Mrs. Gillilan and Miss Sturt were successful in the classes for ornamental vases of cut flowers. There was a small show of vegetables. The only fruit shown were some fine *Strawberries*, for which the Rev. G. G. Coventry, of Woolstone, was 1st, and Mr. Southwood 2nd.

TUNBRIDGE WELLS GARDENERS' ASSOCIATION.—The first meeting of the third session of the members of the above Society, was held recently. A sub-committee was appointed to consider the best means to be adopted to entertain the secretaries and delegates of various gardeners' associations at a Conference, to discuss the proposed central delegate organisation of gardeners' societies, to be held the first Wednesday in June, at Tunbridge Wells.

BEGONIAS.—An exhibition of Begonias will be held at Heemsde, near Haarlem, from September 16 to 19. Thirty-eight classes are enumerated in the schedule, and medals of gold, silver-gilt, silver, and bronze, will be allotted to the successful competitors in the various classes. The Secretary is M. P. W. Voet.

JAFFA ORANGES.—The British Consul at Jerusalem, reporting on the Trade and Commerce of Palestine for 1890-91, says that the increase in the exportation of Jaffa Oranges was particularly marked in consequence of the increased demand for the fruit in England, on account of their large size and superior flavour, which is especially the case if they are gathered at the right time; and a London firm annually send out an agent to Jaffa, who collects carefully and ships the choicest crops of the season for the London market. In 1891, 270,000 boxes of Oranges of the value of £108,000 were exported, as compared with 200,000 of the value of £83,120 the previous year, and with £51,200 in 1889. It will thus be seen that the trade in this article is steadily on the increase, the Oranges being exported entirely to England.

CHICAGO EXHIBITION.—In the Michigan exhibit will be a representation in wax of 500 specimens of fruit which grow in the State. It will be prepared by a Kalamazoo woman, E. S. DENISON, of Alameda county, Cal., intends to send to the Exposition a Pumpkin weighing 326 lb. Ceylon will have at the Exposition several tea kiosks formed of native timber, including specimens of its exquisitely beautiful cabinet woods—Ebony, Satinwood, Calamander, Tamarind, Nadun, Suriyamara, &c. Descriptions appearing in Ceylon papers indicate that these kiosks will be of most elaborate design and finish, and that the tea industry will spare neither pains nor expense in drawing the attention of visitors to the merits of the fine-flavoured beverage. The scene which the Exposition grounds now afford, with most of the buildings nearing completion, and the construction being pushed forward by more than 6000 workmen, is accounted so interesting and wonderful, that from 1000 to 5000 visitors a day willingly pay the admission fee of 25 cents to witness it. Before the abolition of the free-pass system, the visitors often numbered as high as 15,000 or 20,000. The work of construction was interfered with, so that it was thought best to charge an admission fee, and thus

diminish the size of the crowd of sightseers, and at the same time add to the financial resources of the Exposition. The construction of the Exposition buildings is progressing in the most satisfactory manner, and there is no reason for doubt that all will be completed in time for dedication. The rough carpentry work is practically finished on all of the large structures except Machinery Hall and the manufacturers' building, and on these it is in an advanced stage. Six or seven of the buildings have the exterior appearance almost of finished structures, and look like imposing marble palaces. The erection of a number of the State buildings is now progressing. Landscape gardening and other work of beautifying the grounds is being pushed by a large force of men, and sodding, walk-making, and the planting of thousands of trees, shrubs, &c., is in progress.

PROFIT FROM MARKET GARDENS, PARIS.—We had heard much of the market gardens around Paris, says *The Contemporary Review*, and we give a day to them, driving out to Asnières. We introduce ourselves to M. COLMANT, Rue de Mesnil. His garden is only 2½ acres in extent; ¼ acre is given up to Asparagus. From September 1 to April 30 he sends every day to Paris from 200 to 1000 bunches, getting for them on an average through the eight months, 6d. a bunch. They grow in frames 50 feet long, 5 feet wide, floored with slates; under these hot-air pipes, above them a shallow layer of earth. The roots are crammed in as thickly as possible, covered with 2 inches of good soil, and the glasses drawn over; in eight days they are ready to cut, the stocks lasting for two months. He has also 1000 bell-glasses, costing one franc each, for salads. Every year the whole surface of the garden, to the depth of 6 inches, is taken out, sold to the neighbouring bourgeois for their flower gardens, and replaced by manure from Paris, which we saw standing in large ricks ready to be spread. He employs fifteen men, and pays £35 per acre rent on a fifteen years' lease, with right of pre-emption. We sat down with him to calculate his profits. Here is the balance sheet we made out:

Wages	£1,000	Sale of Asparagus ...	£2,550
Rent and taxes ...	100	Sales from rest of	
Manure	100	garden	178
Firing and repairs ...	200		
Interest and capital ...	150		
Horses and carts ...	100		
Sundries	50		
Balance (profit) ...	1,028		
Total	£2,728	Total	£2,728

Net profit of £1,028 on a little over 2 acres of ground.

GAMBIR.—The Director of Gardens and Forests, Straits Settlements, publishes in the last number of the *Agricultural Bulletin of the Malay Peninsula*, an interesting article on this product. Gambir is an extract made by boiling the leaves of *Uncaria gambir*, a climbing Rubiaceae shrub. It is indispensable in the tanning and silk trades, and is exported from Singapore to the average annual amount of 4,682,333 dollars. Great attention is therefore now being devoted to the cultivation of the plant in tropical countries. Mr. RIDLEY's account here given will, therefore, be read with interest. He describes the plant, its history, the uses of the plant, both for tanning purposes, for chewing, and as an astringent in medicine. The method of planting and cultivation generally are detailed, as well as the mode of preparation of the extract, so that a perfect monograph is given in a small compass.

THE EFFECT OF EXPOSURE ON THE RELATIVE DIMENSIONS OF LEAVES.—A series of observations on the variations in the leaf-ratio, i.e., the relation between the dimensions of length and breadth produced by various conditions of soils and atmosphere, have been carried out by Mr. G. F. SCOTT ELLIOT. The general deduction from these observations is that exposure, that is to say, increase of transpiration, has a tendency to lower the leaf-ratio, that is, to increase the breadth of leaves in proportion to their length. Many of the observa-

tions were made on tropical grasses. In these cases the lowest leaves which are most protected from wind and sun are proportionately the largest. Similar results were obtained by growing the same species in more or less sheltered situations. Mr. SCOTT ELLIOT could obtain no definite results on growing the same species in different soils. These researches are fully described in the *Journal of the Linnean Society*, xviii., pp. 375 to 385.

SOME EXPERIMENTS IN ROOT-GRAFTING.—There is plenty of room for research on the subject of root-grafting—a branch of our art which few understand anything at all about; yet if we only understood the proper way to set about it, it seems not improbable that root-grafting might become a common practice. Mons. LUCIEN DANIEL has been greatly interested in the study of root-grafting during the past year or two, and in a paper which may be consulted in the *Comptes Rendus*, Sept. 12, 1891, he sums up the results of his experiments as follows:—

1. We can often obtain grafts on roots of closely-allied plants.

2. The graft may succeed without bringing the generating layers in contact.

3. Sometimes we can graft a plant on the root of another belonging to an entirely different family; Saponaria on an Onagracea, for example.

4. The lack of success in most cases can be explained by the obstacle which the membranes of the graft present to the passage of nutritive matters.

ACTION OF LIME ON HEAVY SOIL.—The potassium silicate present in heavy loam is liable to be rendered soluble by the action of water and carbonic acid, and to be then taken up by the roots of plants, on which it acts rather injuriously. Hence lime is very frequently added to heavy loam soil, and the result is almost invariably an increase in fertility. The beneficial effect of lime depends according to Herr M. JOHNSTONE on its power of liberating the potash which is of great value to plants; this liberation of potash is accompanied by the formation of calcium silicate. For further details, consult *Biedermann's Centralblatt*, xx., p. 713, or *Naturw. Rundsch.*, vi., p. 322.

BOOK NOTICE.

HORTICULTURAL EXHIBITORS' HANDBOOK. By W. Williamson; revised by Malcolm Dunn. (Crown 8vo.) Publishers, Blackwood & Sons, Edinburgh and London.

This volume deals in a most comprehensive manner with all kinds of products of the garden. It enters into the cultivation of plants, both flowering and foliage, including Orchids and Ferns, with hints upon the arrangement of groups. Cut flowers are treated upon in detail, whilst fruit culture is thoroughly well handled. Vegetables, likewise, receive attention of a practical kind. The vast range of subjects which form the horticultural exhibitions of the present day would bear treating upon in an even more comprehensive manner than the authors have attempted. Had they written two volumes, one for plants and cut flowers, and another for fruit and vegetables, no fault could have been found with the arrangement, for in some instances a more detailed mode of procedure would have been of greater assistance. With the aid of the book, as it now is, those who contemplate further exhibiting, or others who intend to enter the lists but have not yet done so, will derive a deal of useful information. There is an absence throughout of allusions to the somewhat questionable modes of procedure which are at times resorted to, and which bring no credit upon those who practise them. In some particular cases the information given embraces all that is really essential. For instance, the culture of the *Chrysanthemum* is dealt with in a clear and concise manner from the cutting to the full blown flower. In the case of Orchids, some very practical and sensible remarks are made, as at p. 58 upon *Dendrobium*, which some growers

would do well to ponder upon in their spare moments; whilst in the case of other genera, the information is to the point. One piece of advice might have been added in regard to keeping Orchids as a whole cooler and in a dry atmosphere whilst in flower, as, for instance, in a living room, which for the time could be given over to the plants exclusively. Timing the flowering of stove and greenhouse plants is alluded to, so as to have them in flower at certain periods, but more information upon this subject would assist young beginners. For instance, timing by stopping is not mentioned in the case of *Allamandas*, *Ixoras*, *Rondeletias*, *Dracophyllums*, *Pimeleas*, and such like plants, all of these plants when thus treated are more reliable for certain dates. The cultural remarks for both Palms and Ferns are alike good and to the point; the selection of soils, and treatment of each as to watering, as in the case of stove and greenhouse plants in general, is a reliable guide. It has apparently escaped notice, however, when dealing with Palms, that *Stevensonia grandiflora* and *Pheniceophorum seychellarum* are one and the same thing, for both are dealt with separately. Florist's flowers are embraced, and the more popular are fully entered upon, from the seed sowing or the cuttings to the flowering stage. Forced plants are included in the category, so also are bulbs, whilst the somewhat neglected annuals receive necessary attention. Cut flowers are commented upon, with clear instructions for all the best known and most popular kinds. Roses, in particular, receive that attention which their popularity fully entitles them to. The use of paper collars (as accessories (?) in the eyes of the florists) is not advised; this is most commendable. One could wish that even the dressing of *Chrysanthemum* blooms had been not only left out, but condemned into the bargain. Amongst fruits, the notes upon culture may be taken throughout as excellent, and clearly to be understood. Upon Grapes (as a case in point) the amateur grower may aspire to exhibition honours if the instructions are carried out. Good selections of kinds are given, wherein quality, as in other cases, is made essential amongst the sorts to which priority is accorded. This is also the case with Pears, Apples, Peaches, and Nectarines. The culture of the Pineapple is described in a very lucid manner. Remarks are made upon judges and their selections, which many judges might read with profit who perchance fulfil this office in a perfunctory manner, and also the committees who have the selection of the same. It is however, not advisable to follow out the suggestion that each exhibitor should nominate those whom he thinks best suited; this would lead to delay in the choice, and more dissatisfaction than at present exists. A chapter upon manures and their application concludes this interesting book. This is well worth perusing by all cultivators; it might set some thinking who work on hap-hazard lines. The last sentences in this chapter reads:—"These notes on manures are mainly given for the purpose of drawing closer attention to a wide field of useful knowledge which has still to be largely utilised. The scientist has done his part in opening it up; it is the province of the practical horticulturist to make the best use of it for the benefit of all." The printing and general get-up of the book is in the usual good style of the publishers, whose name it bears upon the title page. *An old exhibitor.*

GARDENERS' ORPHAN FUND.

THE friends and supporters of this fund met in the Whitehall Rooms, Hôtel Métropole, on Tuesday evening, May 17, Alderman Sir James Whitehead, Bart., presiding. The room was decorated with Orchids, Anthuriums, Pelargoniums, Tulips, &c. Sir James was supported by many gentlemen well known in city circles, who take a practical interest in gardening pursuits, as well as those who are connected with the horticultural trade. In giving the toast of the evening, "Continued Prosperity to

the Gardeners' Orphan Fund," the chairman, as we learn from the *City Press*, reminded those present that during his mayoralty—in 1888-1889—he was instrumental in starting a fund which had as its main purpose the promotion of fruit culture in this country. He was happy to know that the efforts he made then had been attended with very considerable and successful results, and he attributed his presence there that evening to that fact. He felt highly honoured to think that the horticulturalists of the country had invited him to take the chair on that occasion, and to make an appeal on behalf of the orphans of the gardeners of England. While gardeners were supposed to receive—and in many cases did receive—a fair remuneration for their services, yet it could not be said that they were a highly-paid class. Thus it was that from time to time many of them were taken away prematurely, and their children thrown more or less upon the charitable feelings of the country. He knew that in many instances the services which had been rendered by the father had not been recognised by those who employed him; but in the main they had, of course, to deal with the fact that the children of the man who occupied more or less a labouring position (although in the case of a gardener it was associated with science) could not expect to be supported by those who had employed his father before him. Recognising that fact, the horticulturalists of the country had established the Gardeners' Orphan Fund, which made allowances, not exceeding 5s. per week, in aid of the maintenance of the orphans of gardeners until they were fourteen years of age. In addition to that they gave grants, not exceeding £10, to orphans, to enable them to become apprenticed to any particular trade. The help accorded was no doubt small, yet it was a real boon to those in whose behalf it was given, and he believed that nothing could exceed the gratitude which the widowed mother and other relatives of the poor children showed towards the benefactors who were connected with the Fund. The institution was one of the most useful which had ever been founded, and it was not too much to say that, except for that Fund, a large number of children would be compelled to seek refuge in the workhouse with all its demoralising effects. The Fund was one of the most economically-worked societies he had ever been associated with, or which had ever been brought into being throughout the country. With the exception of £40 or £50 a-year paid in the way of clerical work, all the administration of the fund was purely voluntary. There were no office expenses, because the Royal Horticultural Society at Chiswick had given the Fund a home; and Mr. Barron, the Garden Superintendent, was the Hon. Secretary of the Fund. Mr. Barron performed his duties with great judgment, zeal, and efficiency; and he showed an enthusiasm for the cause which had a great deal to do with its success. During the first year the Fund took eleven pensioners under its charge. The following year the number swelled to nineteen, and subsequently to thirty-nine, the figure for last year having been fifty. If the result of that dinner was a satisfactory one, they would be able to still further increase the number. At the present time there was a very large number of cases with which the committee were entirely unable to deal, not one of which was undeserving of help. Another great feature in connection with the fund was, that it was supported by the class for whose benefit it was instituted. The institution was doing an immense service, and it was building up for itself a position of great usefulness. In conclusion, Sir James Whitehead made a very earnest appeal on behalf of the fund, asking his hearers to generously aid the committee in extending the work which had been so well started. The subscription list was announced during the evening, amounting to nearly £1000, and including, from the chairman, £100; Sir Sir Julian Goldsmid, M.P. (president), £50.

The Rev. M. S. A. Walrond, M.A., in very hearty terms proposed the toast of "The Chairman," endorsing the public-spirited manner in which Sir James had taken up the cause of gardening and

fruit culture throughout the country. The chairman, in expressing his thanks for the kind way in which his name had been received, spoke of the great advantages which were to be derived from fruit culture in London and the country alike. Sir Trevor Lawrence, Bart., M.P., proposed the toast of "Success to Horticulture," to which Mr. H. R. Williams and Mr. J. Laing responded. Other toasts included "Kindred Institutions," proposed by Mr. A. W. G. Weeks, and replied to by Mr. N. Sherwood; and "The Visitors," proposed by Mr. Richard Dean, and replied to by Mr. Alderman Samuel.

NOTES OF A TRAVELLER.

(Continued from p. 621.)

MAKURPURA.—The Makurpura Palace and Park, upon which latter Mr. Goldring is specially engaged, situated about 6½ miles from Baroda, and reached by a straight road kept in splendid condition, is a favourite resort of His Highness the Gaekwar. The vegetation along the road is not particularly striking. The hedges are composed of Prickly Pear and various species of Euphorbia, *E. quadrangularis* predominating. As a hedge it is perfect—quite impassable to cattle.

The entrance to the palace is through a massive archway, built in modern style of red brick, relieved with white stone. On the left of the main drive are the stables, hidden by a thick shrubbery; whilst on the right a "nullah" or dry watercourse has been transformed into a rockery. *Arundo donax*, with its tall plumes, grows well here, and *Ipomoea Leari*, amongst other creepers, helps to hide the barest portions. *Ricinus communis* and *Nim* Trees thrive, and are both bold and effective plants for this purpose.

Handsome lamps, shortly to be used for the electric light, are on either side of the drive, and beds filled with various kinds of plants, with a centre one, such as *Bougainvillea* edged with *Alternanthera*, line each side. A striking tree is planted near the stables; it has large, upright, pea-shaped flowers 4 to 4½ inches long; the upper sepal is a beautiful rosy-pink, the lower being of a somewhat lighter shade. There is also a white variety. It is a pretty tree, of graceful habit, with dark pinnate foliage, and oval pinnæ, by name *Agati grandiflora*. *Bignonia stans*, also in flower, well supports its name as a screen plant in front of the stables.

A "Horse-radish" tree, *Moringa pterygosperma*, covered with its numerous white flowers, a nice specimen, some 30 feet high, is noticeable. The pods of this tree, sometimes eaten by Europeans as *Asparagus*, are said to be very good.

Saccharum Sara—the Penreed grass—is economically a most valuable plant; amongst other things, strong ropes for tow-lines are made from its leaves, which are first beaten to a rough fibre and then twisted, by the hostmen of Allahabad; and the young tops and pith are in some parts also used for food.

Having crossed a bridge, one finds oneself in the wide path encircling the Quadrant, consisting of four large plots of grass with the main drive still leading straight to the palace, and broken only by one large tree some 50 feet high, of *Ailanthus excelsa*, with a noble head. This one tree, with the exception of a moderate-sized *Ficus religiosa*, is the only one anywhere near this side of the palace. The effect is certainly peculiar. The sides of the Quadrant, covered with *Dosh*-grass in good condition, have centre pieces in two instances of large handsome bronze statues on granite pedestals, whilst something of a similar nature is to be obtained for the other two. Beds in a continuous half-circular scroll, have been made near the edges of each quarter, whilst between each, either a lamp-post meant for the electric light, but still unconnected, or a single specimen, usually a *Musa*, has been planted. The beds are filled with the usual type of plants. *Vineas*, *Acalyphas*, *Goldfussia*, *Callipais*, *Gallardias*, *Agaratas*, and *Mule* *Pinks* fill the main portion of these beds, but as they are all raised, and surrounded by a brick edge, about 1 foot high, covered with cement (to protect them from being washed away during the monsoon), quite hidden in some instances by creepers, and in addition to which each has a thick wire arch used for the same class of plant, the effect is pretty. The creepers most usually, in fact almost entirely, used, are the small-flowered *Ipomoeas*, such as *I. semper-virens* and *I. vitifolia*.

The fountains are very peculiar—that in front of

the old palace is in an entirely different style—the figures being but one-quarter the size—to the one in front of the new—the effect to me is one-sided. The exterior is hidden by a closely clipt and dense hedge of double Pomegranate, allowed to grow to within a few inches of the top of the stone-work, but kept close up to it. At regular intervals iron mermaids painted white and relieved with gilt (and manufactured in Manchester), support a pipe for the discharge of water, whilst in the centre a taller piece with two wide shallow basins at the top, the uppermost one being the smaller, has been placed.

This was erected in this style by the Gaekwar's wish, such a fountain having been in front of the palace, where his childhood was spent. The basin of this fountain is very shallow, and covered with dark green tiles.

The best substitute for a Conifer I have yet seen was planted one on each side of the four pairs of steps leading to the terrace surrounding the fountain. *Casuarina glauca*, some 8 feet high, thick and bushy, were cleverly clipped to the almost exact shape of *Cupressus Lawsoni viridis*. Round the fountains are small beds filled with the same plants already mentioned, and edged with *Alternanthera*.

A thick shrubbery hides out the park palings and the country immediately beyond. Here the *Msrana*, the Gaekwar's second wife, can walk without fear of being seen. No man, of course, ever sees her under ordinary circumstances.

In front of the shrubbery some big beds are dotted about on the grass at intervals, one in particular attracting my attention. It is filled with *Casuarina glauca* and *Helianthus cucumerifolia*. The latter is certainly a fine plant as grown here—8 feet high—with greyish-white, hirsute foliage, and numerous moderate-sized sunflowers; in one other portion of the park it is equally showy.

Further on, a bed of double red and white *Oleanders*—slightly sticky—comes into view, whilst *Hibiscus sinensis* and its more handsome ally, *H. mutabilis*, fill another a little to the right. The latter is very fine, and makes handsome bushes. The ends and corners of most of the beds are planted with triangular masses of *Crinum asiaticum*, growing like a weed; *Agave recurva*, *Sansevieria zeylanica*, and other plants of a similar description. The *Sansevieria* yields fibre, but I understand it is too coarse for ordinary use. Still continuing, another rockery made in the same way to resemble sandstone, and which soon narrows into a small tunnel, is reached. It is planted with *Acalyphas*, *Ipomoeas*, *Tamarix indica*, the pretty grey foliage of which forms a pleasing change; whilst tall *Bambusa*, or, perhaps, more correctly, *Dendrocalamus tulda*, with its long graceful shoots, relieve the whole from being too dwarf and even. Much of this rockery is completely hidden by yellow-flowered *Ipomoea semper-virens* and *I. vitifolia*.

Still continuing this walk, one passes the palace behind the band-stand, and soon comes on a charming little roofed rustic bridge, the sides of the steps to which are hidden by the thick foliage of *I. vitifolia*. Beneath is the lake, small, but winding prettily about, bordered on one side by a high rockery plated chiefly with *Bamboos*; whilst on the other, the park stretches up in an unbroken line towards the palace. This rockery is the largest and prettiest in the park, and contains a small grotto, over which water trickles. The grotto has only just been finished, and is planted up the sides with *Nephrolepis tuberosa*, various *Adiantums*, whilst a nice little piece of *Rhipis flabelliformis* is in one corner. A small Chinese pagoda, used as a tea-house, is on the top of this rockery, which is thickly planted with *Bamboos*, *Arundo*, *Gossypium herbaceum*, the native wild cotton, a great favourite herbaceous of its pretty seed; *Ipomoea carnea*, now in flower, and other plants, including a fine mass of *Aloe verrucosa*, with its long stalks and small brilliant scarlet tubular flowers. Not far from here a small plant of *Duranta Eliebi* alba was bearing its white bloom and yellow seeds in profusion, and *Combretum purpureum* was luxuriating with leaves often 1 foot long on the side of the stone steps descending from the rockery. On leaving, one passes through a group of the pretty zebra-like *Sansevieria zeylanica* and *Fourcroya levis*, resembling *Agave americana*, though lighter in colour.

A wooden corridor, prettily domed, built of teak lattice-wood, now comes in view; it is scarcely yet finished, but it is proposed to pave it with marble, and fill it with statuary and creepers. Behind the corridor a fine row of *Cassia sinuata* was in full bloom, whilst a little to the left, connecting it with

the palace, is a small Italian garden, with two handsome bronze vases in the centre.

In the centre of that portion of the park behind the new palace a band-stand has been erected on a terrace. On each side of the road an avenue of Millingtonia has been newly planted, with small beds between the trees.

The band-stand is a pretty structure, with a light pyramidal roof, supported by iron pillars and latticed supports, up which, and over the roof, various creepers, such as *Quisqualis*, *Combretum*, *Ipomoeas*, and *Bougainvillea* have been trained. The terrace is square, and approached from the four sides by stone steps, *Casuarina glauca*, clipped in pyramidal form, heads the top of each flight, whilst the angles

chiefly employed; his attention now is chiefly directed to the park of the grand new palace at Baroda, and a few gardens of ancient Maranas. Makurpura is certainly a pretty place, but small and flat; the extent of the park at present laid out being but 70 acres—it is proposed to include more.

LUXMI VELAS.—The park of the Luxmi Velas Palace was to be 400 acres in extent, but it is now proposed to include 800. Very little work, with the exception of constructing roads, has as yet been done, but here Mr. Goldring has a grand opportunity to distinguish himself. Approaching the Luxmi Velas from the south, and passing one of the main carriage-drives, one comes to the Marana's gardens, immediately in front

vegetation being several great Tamarind trees, which must have been there years before the palace was commenced, one enters a courtyard known as the Throne-room Courtyard. The chief plants were *Caladium macrohiza variegatum* (which, however, grows green here), and *Dracenas*; whilst single specimens of *Caryota urens*, *Rhapis flabelliformis*, and *Oreodoxa regia* have been planted. All the soil was covered with *Pothos aurea*, which, when thus grown, forms small but highly variegated leaves; like this, it is a most pretty plant. Another courtyard, still incomplete, contains some nice specimens of *Crotons*. Continuing round the east side, to the north, with its wonderfully handsome Durbar entrance, one comes

FIG. 97.—ALNWICK CASTLE, AS SEEN FROM ABOVE THE LION BRIDGE. (SEE P. 662.)

of the square on the side of the terrace are planted with masses of *Agave rigida*; the whole is effective and neat. Behind the band-stand is a sunk terraced garden, laid out with *Cannas* and other plants.

To the left of the band-stand is the tennis-court, latticed on one side, against which creepers have been planted, amongst others, *Bignonia Chamberlainiana*; Mr. Goldring thinks it will do well here. Round this is an old plantation of *Zizyphus jozuba*, no doubt marking the site of an ancient village. The tree does not grow high, and is not particularly decorative, its chief value consisting in its edible fruit, much resembling a Cherry; *Guavas*—*Paidium Cattleianum*—are also scattered about. It is on this park, and at Umrut, that Mr. Goldring has been

of that portion of the palace set aside for her use. A high bank with a thick shrubbery at the top, largely composed of *Bignonia stans*, hides this from everything behind. Women are usually employed in this garden. It is sunk several feet below the ground-level, and turfed with good Doab grass, kept constantly watered. Positions have been marked out for two fountains and an aviary, whilst the grass-plot in the centre is cut up into scroll-beds filled with *Gaillardias*, *Vincas*, *Calliopis*, *Ageratum*, *Coleus*, *Mule Pinke*, edged with *Goldfussia* and *Alternanthera*, or purple *Eranthemum* and *Alternanthera*.

Passing from here to the side facing east, where scarcely any work at all has been done, the only

to the front—500 feet long—facing west, in front of which is a sunk terrace $6\frac{1}{2}$ acres in extent, and a grass gallop in course of construction a mile long. In this terrace, which has been excavated some 6 to 7 feet, a band-stand and several fountains are to be erected, surrounded by numerous scroll beds; see fig. 95, p. 653. Passing round the terrace to the right one comes to a nullah, or dried water-course. This Mr. Goldring has transformed into a rockery, always being careful to leave a wide passage in the centre for the monsoon. Near is a huge Tamarind, whilst the rockery is planted chiefly with *Mussa* and *Ipomoeas*. All round this nullah the previously flat ground has been nicely undulated. Labour is cheap, prisoners being largely employed.

They work with chains attached to their feet and waists. Gangs of four men and three women are calculated to move 500 cubic feet of soil per day (of course not far) at a cost of rupees 1.9 = 2s. 2d. The women carry the soil on their heads, whilst the men work with a small pick and a tool formed like a large hoe.

Superintendence is said to cost 10 per cent. of the whole outlay on labour. Another big nullah, close to the entrance, is considered to be the only other portion finished. This has on one side the limit of the park in this direction, a thick shrubbery, whilst on each side of the (now dry) watercourse are rockeries covered with Bamboos, *Bignonia* stans, all the *Ipomoeas*, a species with peculiar *Baninia*-like foliage, from which it obtains the common name of "Goat's-foot," the flower is of moderate size, and purplish in colour.

On the right of this drive is a row of *Millingtonias* in flower, and a few Palms, such as *Lantana rubra* (which grows and colours well), *Washingtonia filifera*, and *Lantana borbonica* have been planted. The main roads of this park are 40 feet wide, the secondary being 20 feet. The electric light will be used on these. Such is at present what will some day be a famous park. *J. H. Veitch.*

(To be continued.)

ALNWICK CASTLE.

The gardens of this unique specimen of a mediæval castle, the residence of the Duke of Northumberland, have frequently been noticed in these pages, and the illustration (fig. 97), which we reproduce, appeared on October 23, 1880. At that time, Ingram, since dead, was gardener at Alnwick, a most successful cultivator of plants, fruits, and vegetables. Mr. Harris, the present, and for some ten years past, gardener at Alnwick, worthily maintains the gardens at their previously high level of keeping, and in some respects has introduced improvements.

The special feature of the gardens at this period of the year is the spring gardening, which in that part of the country is at its best in the present month and during the first half of June. The best effects are produced by simple means, Wallflowers, *Aubrietias*, *Violas*, *Silene pendula*, and the like being the plants mostly employed. The *Rhododendrons* are beautifully in bloom in that part of the grounds which lies to the right hand across the Aln in our illustration.

Tuesday, May 10, saw the coming of age of Lord Warkworth, the Duke of Northumberland's grandson, when a garden party, numbering 3000 persons, assembled, and 1500 of the ducal tenantry, townsfolk, and others sat down to a banquet, held in the guest-hall of the castle and a spacious annexe, which had been fitted up and specially decorated for the occasion. Earl Percy, in the absence of the Duke of Northumberland, was in the chair, with Lord Warkworth on his right, and the Marquis of Stafford on his left. The toast of the evening, "Lord Warkworth," was proposed by Sir Matthew White Ridley, who spoke of Lord Warkworth's "successful scholastic and University career," and said that "above all, he had led a pure and honourable life, a manly life, a straightforward and a pure life, and one which gave every guarantee that his manhood would be brilliant and honourable."

With such grand doings at Alnwick, the resources of the gardens there were severely taxed, and Mr. Wythes, the gardener at Syon, contributed large quantities of forced produce of all kinds out of his abundance.

HOME CORRESPONDENCE.

CLEMATIS INDIVISA LOBATA.—Your note at p. 530 respecting the above-named climber at Roseville Nursery, Harrogate, reminded me of a fine plant that I had under my charge for some considerable time. It occupied a portion of a roof of a large lofty conservatory. It covered some 300 feet of surface, and when the flowering shoots were allowed to hang in graceful festoons, waving with every gentle breeze, and studded with its thousands

of star-shaped flowers, one could not but admire its gracefulness. For cutting purposes during the spring months, there is not another conservatory climber which can come near it for usefulness. We used to cut armfuls of its long sprays for various purposes in the house decoration. Culture is easy, but some care in pruning and training are necessary, otherwise the plant gets into a tangled mass difficult to manage. After flowering, it should be pruned hard back to one or two eyes, that is, if the plant has covered its allotted space, and that was one of the advantages I found in cutting those long sprays, which I cut clean away to the base, leaving only a few buds or eyes, which started immediately into growth, and at the regular pruning would be several inches long, and were left as they were to grow on. Such early growths gave flowers much earlier than those which came after the regular pruning, and the flowering season was thereby considerably lengthened. In the early stages of growth after the pruning, the breaks are numerous, and these require some considerable amount of attention in the matter of disbudding and training. Ripe wood even here is necessary if a profusion of bloom is wanted, therefore the shoots should be trained thinly, and exposed to sun and air. Green-fly is often troublesome when the plant is growing, and for this insect nothing answers better as an insecticide than Lemon-oil, sprayed over the plant with the garden-engine, and the drip of this insecticide never injures anything which stands under the climber. Fumigation is usually out of the question in large conservatories when these adjoin the mansion, but Lemon-oil has no disadvantages. *J. E., Nostell Priory Garden, Yorks.*

AN IMPROVEMENT ON MOWING MACHINES.—We have a 22-inch mowing-machine, Shanks, maker, which we used to work with two men, the ground being very mossy and uneven, but now it may be worked by a donkey, which is much more efficient. The machine would never throw the cuttings far enough into the collecting-box, the machine having to be stopped sometimes twice in going across the lawn, to push the grass into the box. I have invented a simple addition to the mower by which the person guiding it is enabled to push the grass into the box without leaving his post, or stopping. It is of wood, and does not in any way affect the working of the machine, but it makes a great deal of difference in the number of steps taken by the man guiding the mower, and to the amount of his work, the lawn having an area of nearly 2 acres. If these remarks should induce any reader of them to seek further information, I shall be pleased to give further particulars, if their machine is a Shanks; other makes I have no acquaintance with. *A. Corps, Gardener, Hensell, Hawkhurst.*

STACHYS TUBERIFERA.—As a good deal of attention is just now being called to this vegetable, I may state I saw a large plantation of it in Messrs. Sutton & Son's Portland Nursery at Reading, and their method of treatment may prove of service to those who are bent on trying the *Stachys* in their gardens. The soil in which the tubers are planted is light, and deeply trenched in character, and well manured. Just before the tubers begin to grow, a mulching of rotted manure is placed on the surface, and a covering of manure is placed on the plantation in winter to keep them from frost. At the time I saw the plantation, large quantities of fine tubers were being taken from it. At the time the tubers are ready for cooking, it is well not to keep the bed too wet. *R. D.*

THE CARROT GRUB.—I will give my experience in dealing with this matter. Some ten years ago when I was gardener for the late Lord Dacre at the Hoo, Welwyn, I had some trouble with the grub in all our root crops. I found my way out of it in the following manner: having selected sufficient ground for a crop of Peas, it was thrown into ridges during the month of October, no manure being afforded, as the land to grow Peas had been well trenched and manured at the time the Peas were sown. This plot of ground, then, having been thus early thrown up into ridges, it had the whole of the winter's frost and the east wind of the spring to penetrate and pulverise it. About the middle of March it was levelled with forks, and top-dressed with freshly-laked lime to about the depth of an eighth of an inch, and an equal depth of fresh soot, which latter, was procured from the mansion, where wood fires were much used. Having thus dressed the land, it received a good rolling, and the drills were then drawn and the seed sown in the usual manner.

The after-management was of the usual kind, and the root-crops were always satisfactory when the practice of dressing the land with soot and lime was carried out, and I would advise any gardener who is troubled with the grub to give the above method a trial. *G. Merritt, Park View Nursery, Harpenden.*

REVERTED FORMS OF POLYANTHUS AND PRIMULA.—I send what I take (from circumstantial evidence) to be the last stages of reversion by seed from a laced *Polyanthus* to a Cowslip. Formerly I have, in this garden, found them in successive rings of degeneracy round a "garden" *Polyanthus*, the outside ring containing both common wild *Primrose* and common wild Cowslip. Another is a bunch of seedlings of several generations of *Primula elatior* (Jacquin), which was planted here in a corner of my garden, and left to itself. It has changed its form in some instances to the common "hybrid" *Oxlip*, probably, you will say, from *Polyanthus* pollen, which is brought from other parts of the garden, but it is very unwilling to change its colour, and has never got beyond dull red. The others show a curious but not ornamental habit of doubling back the petal which I never before saw in *Primula*. *Primula elatior* (Jacquin) seems to have no share in the garden (laced strain) *Polyanthus*. I should set them down as simple *Primula* veris, judging by the commoner forms of reversion, but no doubt *Primula vulgaris* easily joins in the mixture, but *P. elatior* blood never shows. *C. W. Dod, Edge Hall, Malpas.*

PODOCARPUS PECTINATUS.—I am afraid I must demur to the editorial criticism of the remarks in the *Kew Bulletin* about the nomenclature of this plant. In the *Gardeners' Chronicle* for January 23 last (p. 113) the name is attributed to Brongniart and Gris, on the authority of a specimen in the Kew Herbarium. But I have not been able to ascertain that these writers ever published the name as their own. On the contrary, they described the plant in the *Bulletin de la Société Botanique de France* as *Dacrydium Pancheri*, giving Pancher's name, *Podocarpus pectinatus*, as a synonym. This name being supported by a valid diagnosis of a species to which it is referred as a synonym, is no longer a *nomen nudum*. Its adoption only follows the ordinary Kew rule, that the name of that author is to be adopted who first places a given plant in its right genus. I fail to understand how anyone, even if he could consult the materials and documents at Kew and Paris, could "get on the track" of *Podocarpus pectinatus*, Brongniart and Gris, as such a name is absolutely destitute of any authority; and, in fact, was repudiated by the very authors to whom it is attributed. *W. T. Thiselton-Dyer, Kew.*

HYDRASTIS CANADENSIS, L. YELLOW-ROOT, YELLOW PUCCON.—This very rare plant, not in commerce, and not to be had in Europe, is now flowering in my garden. The plants I received last autumn from the United States. *Hydrastis canadensis* has disappeared from its native country, and is now only to be found very rarely in the United States. The sepals are red on the outside, but fall away as soon as the flower opens. Petals none. The leaves are rounded, heart-shaped at the base, five to seven-lobed, doubly serrate, veiny. I hope to see the crimson fruits. The root of this plant is yellow, bitter, pungent, and tonic; it also yields a dye. *Rheum palmatum*, L. var. *tanguticum*, Regel, the true Turkestan or Thibetan Rhubarb, is also flowering now for the first time, with six flower-stalks from a single root; the leaves are now small. *Rheum officinale*, Baillon, the true Chinese Rhubarb, with its characteristic round and lobed leaves, has a peculiar odour like Pepper, especially the young leaves; I have not remarked this odour in any other species. *Panicum obtusifolium*, Delile, is a very rare grass—a rare even in almost all herbaria of Europe. I received numerous specimens (dried) from Professor Schweinfurth; the specimens are very fine. It is a botanical object of value. *Buysman, Middelburgh.*

INFLUENCE OF LATE FROSTS ON FRUIT PROSPECTS.—The severe frosts experienced during the first week in the present month of May, culminating, on the 9th inst., in nine degrees, did much injury to hardy fruit crops. Though the Apple blooms were yet unexpanded, and had the protection afforded by the floral envelopes, the pistils were frozen to very blackness. As regards Hawthornedens, as many as seventy per cent. seem to be injured. Wellingtons and Blenheim Pippins have also suffered, but to less extent. Codlins and King of the Pippins, though

the blooms were equally advanced, seem to have withstood the trying ideal with immunity. Amongst Cherries, both standards and Morellos, the whole of the blooms which grow upwards, and with their pistils exposed, are destroyed, though, such as hang downwards, having their petals, or floral envelopes, hanging over them in cup-form, seem to have escaped, comprising probably thirty per cent. of the whole. But Cherry trees in this district have unfolded so abundant a display that there is yet hope of a fairly good crop. What a waste of force is annually seen in the over-abundant blossom on varieties of Cherries bear. It is apparent on all named varieties. With improvement of fruit has come less vigour; so much so, that it would be desirable for native fruit improvers to try and get trees with more vigour and less bloom, whereby such extreme exhaustion would be prevented. Turning to bush fruits, the red and white Currant crops were greatly decimated when the bloom racemes first formed in the month of April, many being utterly destroyed. There will be a fair crop, however, of somewhat shortened clusters. The latter frost, owing to the protection the foliage afforded, did not injure them greatly. Gooseberries suffered severely on the 9th inst., quite forty per cent. of the berries most exposed on the upper branches appear now as if they had been steeped in boiling water. Upon Plums the numerous blossoms had set before the more recent severe frost occurred, yet they suffered greatly; a fairly good crop is within the margin of probabilities, however. Williams and other Pears, through stricken severely by the low temperature, are, nevertheless, not wholly destroyed, and Strawberries look well and promising. *William Earley, Iford, May 9.*

COLOUR ON HARDY FRUITS.—To determine what are the real causes that conduce to high colour in Apples, Pears and other fruits, &c., it is important that very early observation should be made, as many fruits last year in spite of the frequent rains, began to lay colour on ere they were half-grown so that it would seem needful to look further afield than to mere sunshine, or to fine dry autumn weather. When I last summer drew the attention of a market grower of hardy fruits to the very early colouring of certain Apples, we remarked that it was to be attributed to the frequent showers and winds, which seemed to be the chief factors in this colour production. We should like to learn whence the colouring matter comes, and of course the causes that tend to create it. Of course, there must be other operating causes to produce colour than are those which appear on the surface. The mere contact of wind, of rain, or sunshine, will not suffice to create colour. This matter must be evolved presumably from the soil, or the roots, or the sap of the trees. Perhaps in certain cases this colouring matter is ever present, and only needs certain conditions to fix it. Perhaps it is but there ordinarily, and only comes when the aerial spirits of warmth, wind, or rain call it. Very pretty indeed is the rich colour usually seen in early winter after the leaves have fallen, on the young growths of deciduous trees. Of course, it is assumed that such coloration comes only late in the autumn, but it may be that it is the product of the whole growing season's work, and only evidenced when maturation has rendered the colour dense and striking. A scientific solution of the fruit coloration problem can only be obtained by careful observation and microscopic examination and analysis. *D.*

CUCUMBERS.—I fear those growers of Cucumbers who would seek for novelties by crossing various varieties, in the hope of getting something specially superior to the sorts now in cultivation, will not find any great encouragement in public opinion, which seems to hold that the general products of cross-fertilising any two good sorts is to spoil them. That, at least, was the verdict pronounced the other day on some Cucumber exhibits at the St. James Street Drill Hall, and the verdict may have been justified. The fact should be recognised, that we have as good, handsome, and as prolific Cucumbers as we may ever hope to possess, and anyone who crosses for the production of new sorts, should realise that it is very difficult to secure in that way anything which is dissimilar from what we already have, and very likely is a long way inferior. It by no means follows in Cucumbers, any more than in Melons, that crossing two of the very best sorts leads to further development of quality; generally, in fact, it leads to deterioration, because Cucumbers seem to have reached their bounds of progression.

Of course, we have in past years obtained many fine kinds through intercrossing, but that advance is now so much less marked, that a real improvement is a novelty indeed. Mr. Lockie would seem to have gathered up all the best qualities of Cucumbers, and concentrated them in the production of his Perfection and other good forms. One thing seems certain, and that is, because the taste now runs so much upon smooth or spineless forms, that the fine old rough spined varieties have become neglected, although these were esteemed to have the best quality and flavour. Perhaps we shall never see a better-coloured, handsomer, or more productive spine Cucumber than is Blue Gown; and it merits being kept not only true, but also well preserved by careful cultivation and selection. In spite of our wealth of handsome varieties, really handsome fruits at exhibitions seem still to be too seldom met with. *A. D.*

NURSERY NOTES.

ORCHID EXHIBITION AT MR. W. BULL'S.

The tenth annual exhibition held at the establishment for new and rare plants, in the King's Road, Chelsea, is perhaps the best which has yet been arranged, the long house in which the display is made being literally crowded with rare and handsome Orchid flowers from end to end. Were it not for the artistic arrangement, we should be inclined to say that as usual there are too many flowers brought together within the space allotted, but the clever use made of such graceful Palms as *Cocos Weddeliana*, and large quantities of *Adiantum cuneatum*, and other suitable foliage plants, together with the graceful hanging of drooping *Panicum*, which borders all the stages, relieves the otherwise too brilliant colour by fresh greenery, and gives harmony to the whole.

Another notable feature in the exhibition, which is seen at a glance, is the great array of gorgeous *Cattleyas*, *Lælias*, *Odontoglossums*, and other showy species, which attracts the eye at a distance, and which are of themselves a picture of much beauty, their tall flower-spikes mingling with the drooping sprays of *Odontoglossum citrosimum* in baskets and rafts; *Cattleya citrina*, *Oncidium concolor*, and other species, with pendent flowers, suspended near the roof, and level with the eye of the beholder. There are also to be witnessed at various points, groups set up as independent effects in floral arrangement, which, although each is perfect in itself, and cannot fail to be admired, combine admirably with their surroundings.

To note two or three of these arrangements—or rather the plants which are used in making them, for the effect cannot be described, let us take that on the stage facing the entrance. Here we have a background of Palms, fronted by a great specimen of *Cymbidium Lowianum*, carrying many spikes, which mingle with the tall branched sprays of *Odontoglossum Pescatorei*; and then the middle and foreground consist of *Cattleyas*, *Miltonia vexillaria*, arranged with brilliant *Masdevallias*, and *Ada aurantiaca*, the whole intermingled with Maidenhair Fern, and fronted by a rockery planted with Ferns. On the right hand, set off by a mirror at the back, we have a group of the sprays of *Oncidium scarceoides*, *O. Marshallianum*, white *Odontoglossums*, and scarlet and purple *Masdevallias*. On the left hand is an equally pretty set of plants, in which the spider-like *Oncidium phymatocellum*, the fragrant and handsome *Cattleya Schroderae*, varieties of *Odontoglossum triumphans*, &c., take part, with, on both sides, suitable *Orchids* suspended overhead. And so on throughout the house are found some striking groups, whose contents are too numerous to particularise here. Let us turn, therefore, to some of the rarer and handsomer species and varieties with which the house is replete, which, in most cases, it needs not the eye of the connoisseur to select, their superiority over the ordinary varieties, being so very evident. First, then, to note the best of the forms of *Lælia purpurata*, which, as with fine varieties of other showy species, are named with

varietal names for the purpose of identification although in many cases the plants are unique. Of these, then, *Lælia purpurata magnifica* is a noble flower of the dark *L. p. Brysiana* section, the lip very large and richly coloured, the petals veined with purple; *L. p. atropurpurea* is another superb form; *L. p. alba*, pure white with maroon-coloured lip with a white tip; *L. p. Victoria*, large pure white with a very large lip of maroon colour, which has a rosy tip; and *L. p. bella* and *L. p. Princess*, two charming things of the "Russelliana" section, the former white with a delicate lilac veining, and the latter nearly white, there being but a slight rose and yellow tinge in the labellum. Next in point of stately beauty come forms of *Cattleya Mendelii*, of which we noted *C. M. grandiflora*, a very large and richly coloured flower; *C. M. insigne* with a lip which has a round flat front lobe of a rich crimson colour, and exquisitely crimped; *C. M. majestica*, white, with light velvety-crimson front to the labellum; and *C. M. princeps*, a very perfect and beautiful flower. Among the many fine specimens of *Cymbidium Lowianum*, two which demanded special attention represent the extremes of beauty in this species, viz., *C. L. concolor*, a wholly light yellow form, with none of the brownish colour seen on the labellum of the ordinary kind; and *C. L. atropurpureum*, whose labellum is adorned with a tint closely approaching blood-red.

Cattleya Mossie enters largely into the display, and among them were some grand named forms; and in point of beauty the varieties of *C. Schroderae* are not a whit behind them, that named *C. S. aurea*, with broad open orange throat and pink sepals and petals, being a noble object, with five flowers. *Odontoglossums* also are in profusion, and a few of the best may be noted. Foremost comes a plant of *O. crispum virginale*, with its white flowers, the labellum having an orange centre edged with white, which at the margin appears like hoar-frost; then we find the original *O. Chestertonii*, a hybrid; and *O. imperator* and *O. Victor*, with pale yellow flowers of waxy texture, with chestnut-brown spotting. Further are some gem-like *O. Scillerianum*, old enough certainly, but still rare; then *O. Wilckeanum* *albens*, *O. triumphans chrysolorum*, *O. t. leopardium*, a small form with spots all over it; the noble *O. polyanthum grandis*, and many others only to be found here.

Around the fountain there is always a rich display and especially of objects of rare botanical interest. Among the showy species there are a fine *Trichopilia crispis*, with wholly crimson lip, and the allied *T. lepidis*, whose petals and labellum are edged with silvery-white; here, too, is the rare *Cymbidium tigrinum*, the fragrant *Epidendrum inosmum*, the stately *Epidendrum Frederici Guilielmi*, the graceful *Oncidium cornigerum*, and the elegant and rare *Pleurothallis scapula*.

Other fine specimens which really command attention are the varied and handsome forms of *Oncidium superbiens*, *O. undulatum*, and *O. macranthum hastiferum*; *Coclogyne cristata alba*, the forms of *Lælia elegans*, of which *L. e. Mastersii* is the most beautiful; the large drooping heads of *Thunia pulchra*, several of the rich rosy-crimson *Vanda Parishii* *Marriottiana*, *Epidendrum Wallisii*, the rare *Oncidium dido*, *Phaius bicolor*, the quaint and rare *Cypripedium Mastersianum*, the elegant *C. caudatum* (some of the specimens with half-a-dozen flowers), and various other *Cypripediums*, *Angraecum Scottianum*, *Miltonia vexillaria erubescens*, a large pan of the dwarf, highland form of *Dendrobium Jamesianum*, *Cattleya Lawrenceana*, *Dendrobium Dearei*, and especially the numerous hanging specimens of *Odontoglossum citrosimum*, varying from pure white to rich rose, spotted and unspotted.

And this show, the invitation card says, will be kept up "from May till August." How will it be done? A glance through the other Orchid-houses, and especially those in the newer nursery, reveals house after house of large plants of *Odontoglossums*, bristling with flower-spikes in every stage; one side of a house of *Miltonia vexillaria*, with hundreds of spikes; a large quantity of *Lælia purpurata*, and

other *Lælias* and *Cattleyas* in sheath, gorgeous *Masdevallias*, *Oncidium macranthum*, &c., and in some sort answers the question, although it must entail much care, thought, and labour in keeping up the high standard at present attained.

SOCIETIES.

ROYAL HORTICULTURAL.

MAY 17.—At the meeting of the Society in the Drill Hall, James Street, Westminster, but a small array of exhibits was brought together, amateurs, gardeners, and nurserymen apparently being intent on the forthcoming great event in the Temple Gardens. There were cut blooms of *Orcids*, some fine flowers of rare *Rhododendrons* from Kew, a group of *Roses*—chiefly novelties, another of *Calceolarias*, which had by some means got placed on the floor, notwithstanding the abundance of tabling; and the rest consisted of miscellaneous cut blooms, *Strawberries*, *Melons*, and other fruits dispersed without order on the thinly filled tables.

Floral Committee.

Present: G. Paul, Esq., in the chair; and Messrs. H. Herbst, R. Dean, H. B. May, N. Davis, C. J. Salter, C. Jeffries, T. W. Girdlestone, E. Mawley, T. Baines, C. Noble, J. Fraser, W. Watson, G. Gordon, G. Phippen, and R. Owen.

Messrs. J. Veitch & Sons, Chelsea, showed a number of plants of a new *Pelargonium Arctæ*, described as a sport from *Volonté Nationale*. The specimens showed good form, and bore large trusses of pink and white blossoms. This variety received an Award of Merit. Another, *Florence Edith*, with white flowers (except for a very little lilac veining on the upper petals) appeared to be a very floriferous variety. The same firm exhibited sprays of *Wistaria sinensis alba*, a pure white form of *W. sinensis*, and was awarded a First-class Certificate. Also sprays of *Cerasus serrulata* and *C. avium multiplex* for comparison; *C. serrulata* has pure white and very large blossoms; also sprays of *Citrus trifoliata*. They showed likewise *Pandanus pacificus*, a green, broad-leaved, good decorative subject from the South Sea Islands. A First-class Certificate was awarded this plant.

Mr. James O'Brien, Harrow-on-the-Hill, exhibited *Cyrtanthus angustifolius aurantiacus*, a flame-coloured tubular flower, borne on a spike about 14 inches long. Also *Cyrtanthus Tuckii*, with bold scarlet flowers.

From T. B. Haywood, Esq., Woodchatch Lodge, Reigate, came a collection of *Streptocarpus* bulbs, raised from seed obtained from Messrs. Veitch & Sons. These were of great merit, and attracted considerable attention. The Hon. P. C. Glynn, Rook's Nest, Godstone, showed a box of cut flowers of the pretty *Mackaya Bella*, and one could not help wishing that this plant was more often to be seen in gardens than it is; also cut flowers of *Cantus dependens*, another good plant very seldom seen doing really well. It is useful for training up a pillar in a cool conservatory.

James Rogers, Esq., Ragsdalewood, Chislehurst, exhibited a seedling *Pelargonium*. Messrs. Lane & Son, Berkhamstead, contributed a basket of pot *Roses* of the *Polyantha* section, *Anne Marie de Montravel*, which were very dwarf, the flowers being white. Also four plants of *The Pet*, also white, but the buds before they unfold are coloured.

A seedling *Carnation* came from Messrs. Laing & Mather, The Nurseries, Kelso, N.B., of a very pale flesh colour, and clove scented. Messrs. William Paul & Son, Waltham Cross Nurseries, Herts, exhibited a group of *Roses*. *Zenobia* is a strong-growing moss variety, and a good colour. Of *Teas* there were *Princess May* and *Medea*, a new and good yellow; *Lady H. Grosvenor*, hybrid *Tea*, a large pale rose-coloured bloom, which received an Award of Merit. *Pink Rover*, a hardy climbing variety, with pale rose-coloured blooms, and *Clio*, a hybrid perpetual.

A group of well-grown herbaceous *Calceolarias* came from T. Nohard, Esq., York House, Lower Sydenham (gr. Mr. H. Slater), and was awarded a vote of thanks. Messrs. J. Peed & Sons, Norwood Road, London, S.E., were accorded a vote of thanks for plants of *Anthurium Jeffersii*, *RouPELLI*, J. Peed, and an unnamed seedling of good merit. Dr. Stewart, Hill Side, Churnside, N.B., sent a few blossoms of a bedding *Pansy*, *Sylvia*, which he de-

scribed as being of dwarf growth, free-flowering, and early; the flowers, which are fragrant, are of a very pale lemon-yellow. Mr. H. Elliott, Stour Vale Nursery, Christchurch, Hants, exhibited a pan with three plants of *Richardia albo-maculata nana*, the spathe of which were about 10 inches high.

A collection of *Rhododendron* blooms came from the Royal Gardens, Kew. *R. arboreum*, *R. a. album*, *R. glaucum*, with small leaves and flowers, the latter a dull red colour; *R. rhombifolium*, a deciduous species from China, bearing small violet blossoms; *R. kewense*, the result of a cross between *R. Griffithianum* and *R. Hookeri*, a very floriferous hybrid, with light pink blossoms, almost white when fully expanded, but quite pink in the bud. The large *R. Griffithianum*, better known as *R. Aucklandii*.

Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair; and Messrs. James O'Brien, Sec., S. Courtauld, T. B. Haywood, R. Brooman White, E. Hill, J. Jacques, Jas. Douglas, Hugh Low, Chas. Pilcher, H. M. Pollett, and H. Ballantine.

In view of the approaching Temple Show, the exhibits were not numerous, but some of them were exceptionally fine, and notably the pure white *Vanda teres alba* from the Right Hon. Lord Rothschild's gardens, and which is the first of this species we have seen worthy to be called white; and the singular and unique *Cattleya icricolor* shown by Baron H. Schroder, The Dell, Egham (gr. Mr. H. Ballantine). Messrs. James Veitch & Sons, Royal Exotic Nursery, King's Road, Chelsea, sent their new *Cypripedium Eboracense* (*Argus* *Phellatium* ♂), which in flower much resembled *C. Marshallianum* ×, but with foliage near to that of *C. argus*. Messrs. Veitch also sent another new hybrid, *C. eurylochus* × (*clivare* ♀, *hirsutissimum* ♂), with curiously elongated and deflected petals, rose at the tips, and at the base greenish, spotted with purple, the upper sepals and pouch also being greenish, shaded and spotted with purple. From the same firm came *Dendrobium lineale*, with five fine spikes, and *Masdevallia candida-Estrade* ×, F. Wigand, Esq., Clare Lane, East Sheen (gr. Mr. W. H. Young), exhibited *Dendrobium Læanum atropurpureum*, which differed from the type in having the labellum wholly rich dark purple. J. W. Temple, Esq., Leywood, Groombridge (gr. Mr. E. Bristow), sent *Cattleya Skinnerii*, Temple's var., with very large and richly-coloured flowers; *C. Schroderi* *Leywoodensis*, a form with a rich glowing orange throat; and *C. Schroderi rosea*, also very handsome. C. J. Lucas, Esq., Warham Court, Horsham, exhibited a very large and singular form of *Sarcopodium Lobbianum*.

R. Brooman White, Esq., Ardarauch, Garelochhead, Dumbartonshire (gr. Mr. Brown), sent fine cut examples of *Cattleya Mendellii*, *C. Lawrenceana*, and a magnificent spike of *Oncotoglossum crissum*. Reginald Young, Esq., Linnet Lane, Ullet Road, Liverpool, sent a flower of a fine *Lælia majalis*, with broad rose-tinted lip; and another form with white lip spotted with crimson, and which has flowered four years in succession. The Right Hon. Joseph Chamberlain, M.P., Birmingham (grower, Mr. H. A. Barbery), sent two very distinct forms of *Dendrobium superbiens*; and the Rev. E. Handley, 19 Royal Crescent, Bath, sent flowers of a dark form of *Lælia præstans*.

List of Awards.

ORCHID COMMITTEE.

First-class Certificates.

To *Vanda teres alba*, from the Right Hon. Lord Rothschild.

To *Cattleya icricolor*, from Baron Schroder.

Awards of Merit.

To *Cypripedium Eboracense* ×, from Messrs. Jas. Veitch & Sons.

To *Masdevallia caudata-Estrade* ×, from Messrs. Jas. Veitch & Sons.

To *Cattleya Skinnerii*, Temple's var., from J. W. Temple.

To *Cattleya Schroderi* *Leywoodensis*, from J. W. Temple.

Butanasi Certificate.

To *Sarcopodium Lobbianum*, from C. J. Lucas.

Cultural Commendation.

For *Cattleyas*, &c., to R. Brooman White (grower, Mr. J. Brown).

Fruit and Vegetable Committee.

Present: P. Crowley, Esq., in the chair; and Messrs. J. Lee, A. Moss, R. D. Blackmore, Harrison Weir, J. Chesel, A. Sutton, G. Taber, T. J. Saltmarsh, G. Bunyard, A. Dean, W. Bates, G. H. Sage, G. W. Cummins, G. Wythes, J. Hudson, F. Q. Lane, H. Balderson, and J. Smith.

The Earl of Dysart, Ham House, Richmond (gr. Mr. G. H. Sage), was awarded a First-class Certificate for ripe fruits of *Pingo* de M-l Fig. The Duke of Northumberland, Syon House, Brentford (gr. Mr. Wythes), was awarded a Cultural Commendation for two dozen large ripe fruits of *Brown Turkey* Fig.

A First-class Certificate was also awarded to a *Melon* (Ganton Orange), exhibited by Lord Suffield, Ganton Park Gardens, Norwich (gr. Mr. W. Allau); a small red-fleshed variety, yellow, and very slightly netted. Lord Suffield also exhibited three seedling *Strawberries*, Ganton Park, Lord Suffield, and Empress of India; the last-named received a First-class Certificate.

A vote of thanks was accorded to Mr. R. Orlebar, Hinwick House, Wellingborough, for a dish of *Strawberries* (John Ruskin). A seedling *Tomato* came from F. Richard, Esq., Bure Homage, Christchurch (gr. Mr. T. Borte).

Mr. Wythes was accorded a vote of thanks for some fruiting shoots of *Ficus elastica*.

R. Burrell, Esq., Westley Hall, Bury St. Edmund's (gr. Mr. E. Bishop), showed a seedling *Melon* (Westley Surprise).

Lecture.

HARDY CLIMBERS AND TRAILING PLANTS.

At the afternoon meeting a paper by Mr. Leach, of Albury Park Gardens, Guildford, was read by the Secretary, the Rev. W. Wilks, on "Hardy Climbing Plants." Mr. Leach complained that these plants had not been made the most of in town or in country gardens, where we might expect to see them, and that although scorned to deprecate the Ivy—which was rightly employed on some old castle or tower, out of reach of the shears, and therefore able to assume its natural habit—it had been, and is, often used in places and under circumstances where other plants would be more suitable. Mr. Leach felt himself all the more unable to account for this, seeing the beautiful foliage and flowers that some of the species present. Even in the midst of a smoky town, the Virginian Creeper and *Ampelopsis Veitchii* would succeed as well as the *Wistaria sinensis*, *Clematises*, and many others that were mentioned. Many people were accustomed to look upon *Aristolochia Sipho* as a plant requiring a warm conservatory, but it would grow and flower well out of doors. The essayist said that *Roses* were and had been for a long time most deservedly popular for covering walls, bowers, and such-like places, but they were usually runed too hard, thus minimising their floriferousness, as well as being cut out of shape and form. Mr. Leach then proceeded to give names of those he would include in a general collection, and added that, with few exceptions, they would be content with almost any soil, and suitable situations could be easily found for them.

The Chairman (Mr. J. Douglas) asked if anyone present would add any particulars to the subject, and in response, the Rev. W. Wilks, who had built a verandah about twelve months ago, and had planted many of these climbers against it, gave interesting particulars as to how they had stood the severity of last winter, when the thermometer had fallen so low as 8° Fahr. Amongst many others, we noticed that *Choisya ternata* was not injured at all, neither *Trachelospermum* (*Rhynchospermum*) *jasminoides*, which is certainly remarkable. *Solanum jasminoides* suffered only at the points, whilst the new *Rose* from Burnham, *Rosa gigantea*, was killed outright. *Passiflora corallæa* had its points injured, but the varieties of *Clematis* were not hurt.

ROYAL BOTANIC.

First Summer Show.

MAY 18.—This was held in the Society's garden, Regent's Park, in good weather. An exceptionally bright display of exhibits was arranged in the artistic manner usual to the summer gatherings in the Society's gardens. Exhibitors for competition, were perhaps fewer than on some former occasions, but the non-competitive groups and miscellaneous exhibits added more than sufficient to the general effect to atone for any falling off in this respect. In the open division for twelve greenhouse Azaleas, the 1st prize was awarded to Mr. C. Turner, the Royal Nurseries, South; Mr. H. Eason, gr. to B. Noakes, Esq., Hove Cottage, Highgate, was 2nd; and Mr. H. James, Castle Nursery, Norwood, 3rd. For six greenhouse Azaleas, open to amateurs only, Mr. A. Offer, gr. to John Warren, Esq., Handcross Park, Crawley, was 1st; and Mr. H. Eason, 2nd.

In the nurserymen's class for six greenhouse Azaleas, Mr. Henry James, Castle Nursery, West Norwood, was 1st.

Mr. A. Offer was 1st for six stove and greenhouse plants (amateurs' division), with good specimens of *Anthurium Scherzerianum*, *Statisia profusa*, *Tetradlea ericoides*, *Hedera fuchsoides*, *Azalea*

Baronne de Vriere, and Erica ventricosa, coccinea minor; Mr. R. Scott, gr. to Miss Foster, The Holme, Regent's Park, was 2nd; and Mr. R. Butler, gr. to H. H. Gibbs, Esq., St. Dunstan, Regent's Park, 3rd. In the nurserymen's division the 1st prize was to Mr. J. F. Mould, Pewsey, Wilts, who had Anthurium Scherzerianum, Erica Cavendishii, Tremandra verticillata, Boria heterophylla, Azalea Fiambeau, and Dracophyllum gracile; Mr. H. James, West Norwood, was 2nd.

In the nurserymen's division for twelve stone and greenhouse plants, Mr. J. F. Mould was again 1st, and Mr. H. James was 2nd.

Mr. A. Offer was 1st for six fine foliage plants (amateurs), and Mr. R. Butler 2nd.

In the nurserymen's division for six fine foliage plants, Mr. Henry James was 1st, and Mr. J. F. Mould, 2nd. Mr. C. Turner, Royal Nurseries, Slough, was 1st for six Pelargoniums (nurserymen) with capital specimens, and Mr. J. Wiggins, manager to Mr. D. Baldwin, Hillingdon Heath, Uxbridge, was a good 2nd. In the open division for six fancy Pelargoniums, Mr. C. Turner was again 1st; Mr. D. Phillips, gr. to R. W. Mann, Esq., Langley Broom, Slough, 2nd, and Mr. J. Wiggins, 3rd. All the Pelargoniums were well shown.

Messrs. Paul & Son, Old Nurseries, Cheshunt, were 1st for a collection of alpine (open), and Mr. T. S. Ware, Hale Farm Nurseries, Tottenham, 2nd. For a collection of hardy herbaceous plants, Mr. Ware was 1st, and Messrs. Paul & Son 2nd. Mr. F. T. Mould, Pewsey, Wilts, was 1st for six Cape Heaths (open), and Mr. Henry James 2nd. Mr. A. Offer was 1st for six large specimen Ferns, open to amateurs, and Mr. R. Butler 2nd.

For six Pelargoniums, open only to amateurs, R. W. Mann, Esq., Langley Broom, Slough, was 1st.

Mr. H. James was the only competitor for twelve exotic Orchids; and Messrs. Paul & Son, Cheshunt, for nine Roses in pots, open to nurserymen.

Messrs. William Paul & Son, Waltham Cross, Herts, were awarded a Small Silver-gilt Medal for a large miscellaneous collection of Roses in pots, and a quantity of cut blooms. This exhibit was really excellent, and attracted much attention.

Messrs. Cutbush & Son, Highgate, for a miscellaneous group of well-grown plants, were awarded a Large Silver Medal. Messrs. B. S. Williams & Son obtained a Small Silver-gilt Medal for a pretty group of miscellaneous plants and Orchids. A Silver Medal was also awarded to Messrs. Hugh Low & Co., Clapton, for a group of Orchids; and a Small Silver Medal to Mr. W. May, gr. to F. C. Jacobine, Esq., Cheam Park, Surrey, also for a group of Orchids, in which we noticed several good varieties of Cattleyas. Messrs. Jno. Laing & Sons, Forest Hill, was awarded a small Silver Medal for a very beautiful and tastefully-arranged group of miscellaneous plants. A Silver Medal to Mr. R. Scott, gr. to Miss Foster, The Holmes, Regent's Park, for a group of plants. For a miscellaneous group of Roses in pots, Mr. C. Turner, Royal Nurseries, Slough, obtained a Silver Medal.

Messrs. Jas. Carter & Co., High Holborn, showed a group of Petunias, well-flowered, single and double, and gained a small Silver Medal. The same firm also obtained a small Silver Medal for an interesting collection of Cactus and succulent plants.

For a group of show Pelargoniums, Mr. D. Phillips, gr. to R. W. Mann, Esq., was awarded a Small Silver Medal. Mr. T. S. Ware, Tottenham, was a collector of Tree-Foamias, Azaleas, &c. Some of the Foenias were very bright and distinctive; a Silver Medal. The same firm also obtained a Small Silver Medal for a collection of late-flowering Tulips. Arcadian floral decoration were shown by Mr. J. R. Chard, Brunswick Nursery, Stoke Newington.

Messrs. Barr & Son, Covent Garden, exhibit a large collection of hardy flowers, and obtained a Silver Medal.

The following plants, exhibited by Messrs. J. Veitch & Son, Chelsea, were awarded Botanical Certificates:—*Pandanus pacificus*, *Adiantum Capillus-veneris* var. *tenuis*, a pretty variety, with fronds very like *A. cuneatum*; but of course much harder; *Cypripedium Evenor*, a hybrid obtained from *C. bellatulum* and *C. Argus*, having the form of *bellatulum*, and the characteristics of both parents in the markings; *Dendrobium lineale*, from New Guinea, a very tall growing species, with long racemes of small white flowers, with violet-lined lip; *Madevallis caudata* Estrade obtained from a cross between *M. candida* and *M. Estradei*; *Cypripedium eurylochum*, from *C. hirsutissimum* × *C. ciliolare*. *Cyrtanthus*

Tuckii, exhibited by Mr. James O'Brien, was also awarded a Botanical Certificate.

Silene virginica, a bright cardinal-red coloured species, about 10 inches or 1 foot high, shown by Mr. T. S. Ware, Tottenham, Botanical Certificate.

Dracena Coulingii, already described in our pages, from Messrs. B. S. Williams & Son, Holloway, Botanical Certificate.

A TESTIMONIAL TO MR. DAVID SYME.—On the occasion of the annual dinner of the London Agricultural Seed Trade, at the Holborn Restaurant, London, on Monday, May 30, at 5.45 P.M., a presentation will be made to Mr. D. SYME, manager to the firm of PETER LAWSON & SON, Limited, Edinburgh, by his friends in the seed and nursery trades, and others. Further particulars will be furnished by the Honorary Secretary, Mr. D. ALLESTREE, 6, Market Buildings, Mark Lane, E.C., on application.

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

DISTRICTS.	TEMPERATURE.				RAINFALL.		BRIGHT SUN.
	Above 42° or below 42° the Mean for the week ending May 14.	Above 42° for the Week.	Below 42° for the Week.	Accumulated. Above 42° difference from Mean since Jan. 1, 1892.	10ths Inch.	No. of Rainy Days since Jan. 1, 1892.

10	2	71	0	28	133	1	61
* 2	1	81	0	27	4	4	68

The districts indicated by number in the first column are the following:—

Principal Wheat-producing Districts—0, Scotland, N.; 1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, S.

Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending May 14, is furnished from the Meteorological Office:—

"The weather during this period was generally fine and dry. Towards the end of the week, however, it became dull and rainy in all the northern and western districts, while some slight showers were experienced at most of our southern and south-eastern stations.

"The temperature just equalled the mean value in 'England, N.E.', but exceeded it in all other districts. In 'England, E.' the excess was only 1°, but in the other parts it amounted to 2° or 3°. The highest of the maxima were recorded generally during the middle part of the week, when they varied from 76° in 'England, S.W.' (at Landover), and 75° in 'England, S.' (at Southampton), to 70° in several other districts, and to 67° in the 'Channel Islands.' The lowest of the minima occurred as a rule during the earlier part of the period, when the thermometer fell to 29° in 'Scotland, N. and E.', to 30° in 'Ireland, N.', to 31° to 32° in several other localities, to 34° or 35° over 'England, N.W., N.E., and E.', and to 36° in the 'Channel Islands.'

"The rainfall was rather more than the mean in 'Ireland,' 'Scotland, N. and W.,' and 'England, N.W.' In nearly all other districts it was less than the normal, the fall over 'eastern, central, and southern England,' being very slight.

"The bright sunshine exceeded the mean considerably in nearly all districts; the percentage of the possible duration ranging from 74 in the 'Channel Islands,' 69 in 'England, S.W.,' and 60 in 'England, S.,' to 43 in 'Ireland, N.,' and 41 in 'Scotland, N.'"

MARKETS.

COVENT GARDEN, May 19.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. Ed.]

MARKET heavily supplied, and with a moderate business doing, prices keep low. *James Webber, Wholesale Apple Market.*

POTATOS.

NEW POTATOS.—Supply comparatively heavy, especially rounds, and prices easier. Kidneys still very firm.

OLD POTATOS.—Weather in favour of this article, and prices gradually rise. Price, 90s. to 110s. J. B. Thomas.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure, for the week ending May 14, and for the corresponding period last year:—1892: Wheat, 31s. 7d.; Barley, 25s. 2d.; Oats, 21s. 4d. 1891: Wheat, 39s. 11d.; Barley, 27s. 11d.; Oats, 20s. 9d.

POTATOS.

SPITALFIELDS: May 17.—Quotations:—Magoums, 65s. to 90s.; Imperators, 65s. to 90s.; Hebrons, 65s. to 90s.; Bruce Magoums, 60s. to 85s.; Snowdrops, 70s. to 90s.; Sutton's Abundance, 70s. to 90s.; Main Crop, 80s. to 100s. per ton.

BOBOUGH: May 17.—Quotations:—Bruce Magoums, 70s. to 85s.; Dunbar do., 85s. to 105s.; Fenland do., 65s. to 70s. per ton.

STRATFORD: May 17.—Quotations:—Light land, 65s. to 85s.; Dark-land, 60s. to 75s.; Scotch, 75s. to 110s. per ton.

NOTICES TO CORRESPONDENTS.

*. PHOTOGRAPHS, DRAWINGS, OR SPECIMENS.—We shall be pleased to receive from our Correspondents notes relating to interesting Gardens, together with Specimens or Illustrations of interesting Plants. Although circumstances prevent us in all cases from reproducing them, we are nevertheless glad to receive them, and as far as possible to utilise them for the benefit of our readers.

ANALYSIS OF FERTILISERS: F. D. Some years ago we published a number of these, but we do not think it would be worth our while to repeat them now that any one can, by paying a fee to a competent analyst, obtain what he wants. The general result of our enquiries was that most of the manures, &c., were fairly good for their purpose, but that the price asked was in some cases, and for small quantities, quite exorbitant.

ARICULAS: G. H. M. Paste is the circular band round the eye of the flower; throat is the mouth of the tube in which are the pistil and stamens; body-colour is the colour of the bloom lying between the paste and the margin, and in a show Auricula is a well-defined band; centre is the orifice or mouth of the tube; edge is the line of colour surrounding the whole bloom. The brown flower sent is what florists call shaded, and has no edge or margin, and scarcely a body-colour. In some cases very fine and distinct alpine are put into stands of show varieties, but to us, it appears to be a straining of the rules and definitions of a show flower to do this.

CORRECTION. In "A Traveller's Notes," *Gardeners' Chronicle*, p. 621, 1st column, for Gaultieria read Guatteria.

EARLY VINERY FROM WHICH THE CROP IS GATHERED: H. B. P. The object now should be to mature the wood, and preserve the foliage as fresh as possible for the longest period. To do this the ventilation should be ample day and night in fine weather; at the same time maintain, even if artificial heat be applied, a dryish atmosphere in dull cool weather, or mildew will attack the leaves. The border must not be allowed, if inside, to lack moisture. In ordinary seasons the border outside will not require to be watered, unless it be a shallow one, or the loam very light. It is well to allow the laterals at the bottom of the canes to extend somewhat, those near the top in a smaller degree. In full summer, if the roof glass be removable it should be taken off.

FIGS: An Anxious One. The Figs sent last week which were stated to be attacked by *Mucor amethysteus*, have since developed another fungus much more likely than the *Mucor* to have caused the disease. This is *Gloeosporium leucolor*, B., which is destructive to Grapes, and was described in *Gardeners' Chronicle*, 1871, p. 1162, and figured in *Gardeners' Chronicle*, 1890, p. 657. Mr. Berkeley seems to have been of the opinion that Grapes would contract the disease from Peach and Nectarines, and vice versa.

FUNGUS ON WALNUT TREE: Jas. Hope. It is not possible to say exactly what the fungus is, but probably the spawn of an *Agaricus*, like *A. melleus*.

INSECTS ON GRAPES. T. We can find no insect. Probably the "ringing" has been done by some small caterpillar.

IXIAS: A. P. We do not know what was the treatment you pursued after the bulbs went out of bloom that has caused them not to flower this season. They should have received water until the leaves turned yellow, when water should have been withheld, gradually keeping the pots in an airy cold frame till the leaves were ripe, when the pots should have been stored away on a shelf in the greenhouse. In September and October shake out the bulbs, select the largest—the flowering ones—and pot them, six or eight, in a 4½-inch pot, in rich sandy loam, with plenty of small crocks for drainage. Stand the pots in a cold pit plunged in

coal ashes or sand, and let them start without the application of heat.

LARGE WHITE-FLOWERED CACTUS: E. P. The species enquired for probably is *Cactus (Cereus) grandiflorus*. The calyx is of a beautiful yellow, the outside brown colour, the petals pure white, which adds to the lustre. The calyx when fully expanded would measure about 1 foot. It opens about 7 o'clock in the evening, is fully open about 11, and begins to fade about 4 A.M. The flowers are strongly fragrant.

NAMES OF PLANTS: W. W. *Amelanchier vulgaris*.—E. D. L. 5 and 6, forms of *Fritillaria pyrenaica*.—*Hortus*. *Acacia pubescens* (*Mimosa pubescens*).—C. S. *Cereus Malesonii*, the angular stemmed sps., *Phyllocactus latifrons*, var.—D. E. 1. *Oxalis* Boweri; 2, *Ornithogalum umbellatum*.—J. W. Jan. 1, *Echites picta* of gardens; 2, *Cardamine* impatiens; 3, *Chrysosplenium oppositifolium*; 4, *Adoxa moschatellina*—all the specimens dried up and scarcely recognisable when we received them.—G. C. 1, *Lonicera Ledebouri*; 2, *Ribes*; next week. 3, *Dacrydium Franklini*, *Cephalotaxus drupacea*. C. *unbraculifera* seems to be a form of C. *pedunculata*, but we are not sure. The others next week.—A. B. C. 1, *Abies grandis*; 2, *Thuja occidentalis* var.; 3, *Retinospora obtusa*; 4, *Abies Pinsapo*; 5, *Retinospora obtusa* var.; 6, *Cryptomeria elegans*.—No name. 7, *Prunus Padus*.—G. W. E. *Arum maculatum*.—G. W. D.A. 1, *Lencioium aestivum*; 2, *Lantana*, garden form of; 3, *Maxillaria tennifolia*; 4, *Viburnum Lantana*; 5, *Leycesteria formosa*; 6, *Weigela hortensis variegata*; 7, *Andromeda floribunda*; 8, *Hippophae rhamnoides*; 9, *Prunus Padus*: all bad specimens, withered.—M. L. N. 1, *Fuchsia Boliviana*; 2, *Escalonia macrantha*; 3, *Kennedyia longercasmosa*; 4, *Bignonia radicans*; 5, *Athyrium Filix femina*.—T. *Euphorbia pilosa*.—J. W. M. *Prunus Padus*.

PELAGONIUM: J. H. R. The death of the plants is due to deep potting. Just as a tree may be killed by piling earth round the stem.

PEACH LEAVES: G. J. The leaves have been caught by the sun when wet, and when there was not enough air on.

PHOTOGRAPH: A. W. Probably because the plant had already been well figured in our columns; or, perhaps, because the photograph was not suited for reproduction. Of course we cannot undertake to reproduce all the photographs and drawings that are sent to us, though we are very pleased to receive them.

ROSES: G. May. The insect which we saw in the bottle was green-fly, in one of its stages. The injury done to the Rose blooms sent by you on the second occasion, point rather to a weevil in the mature beetle stage, or as larvae as having caused the holes in the petals. The injury would appear to have been done whilst the flowers were in bud. As weevils (the perfect insect) feed at night, you should look for them then, using a dark lantern on going into the houses, and suddenly turning the light on the plants. The insects will be startled, and will drop to the ground, on which a calico sheet, or sheets of paper, should have been spread some time previously.

STRAWBERRY PLANTS: Subscriber. The plants put out in February are not likely to produce runners early enough and strong enough for potting for forcing next spring. The bloom trusses should be picked off the plants. Forced plants of *La Grosse Sucrée*, properly hardened off before planting them out, might, under very favourable circumstances, produce runners fit to be forced late, but usually the runners are weak, few, and late.

THORN: J. W. The flowers you send appear to be those of *Crataegus coccinea*, which has probably been grafted on the White Thorn.

COMMUNICATIONS RECEIVED.—G. Fulford.—R. B. (cannot inform you).—H. W.—W. S. (Quercus).—Dr. L. Veronil (Maurice et Loire).—G. W. D. Communication sent to secretary.—G. H. Knareborough.—Ch. de B. THE MYTHE CASTLE GARDENS,
Tewkesbury, Aug. 13th, 1891.

Gentlemen,—I have given your "Climax" Insecticide a good trial on tender foliage, Orchids and Ferns for Bug and Scale. In every instance I found the Bug and Scale dead and the foliage bright and clean. I found it most effectual for Black Fly on Peach trees. The "Climax" Insecticide ought to be better known, it is the only one I have found to kill Bug on tender plants without injury to the foliage.—I am, yours faithfully,

W. MACKIE.

SOLE LICENSEES—

SELIC, SONNENTHAL, & CO.,
85, Queen Victoria St., London, E.C.

For Green and Black Fly, American Blight, Camellia Scale, Red Spider, Mealy Bug, Brown and White Scale Worms, Wood Lice, &c.

"PICRENA," THE UNIVERSAL INSECTICIDE.

SAFE—ECONOMICAL—EFFECTUAL.

15, PRINCES STREET, EDINBURGH, July 15, 1887.—"Dear Sir, I have thoroughly tested a sample of a new Insecticide which you were so good to send me. At the rate of 1 oz. to a gallon of water at a temperature of 95°, I find it kills Green Fly immediately. Double this strength, or 2 oz. to a gallon at 120°, seals the fate of Scale of all sorts in a few seconds; while 3 oz. to gallon at same temperature effectually dissolves Mealy Bug, and so far as I have yet observed, without the slightest injury to leaf or flower, and it is within a most agreeable compound to work with. All our insect remedies are applied through common syringe, or garden engine, a much severer test of efficiency than when applied by hand-washing or spray.—I remain, dear sir, yours truly. (Signed) A. MACKENZIE," of Messrs. Mathew & Sons.

Victoria and Paradise Nurseries, Upper Holloway, London, January 7, 1888. "GENTLEMEN—I have given your Insecticide, 'Picrena,' a good trial in competition with many others. I am pleased to say that I have found it to be more effectual in destroying Mealy Bug and other insects than anything we have ever used. It ought to command a good sale. (Signed) B. S. WILLIAMS."

Sold by Chemists, Nurserymen, and Florists, in Bottles at 1s. 6d., 2s. 6d., and 3s. 6d.; in Tins (1 and 2 gallons), 10s. 6d. and 20s. each; in quantities of 5 gallons and upwards, 9s. per gallon.

Prepared only by DUNCAN, FLOCKHART & CO., Chemists to the Queen Edinburgh.

May be had from B. S. WILLIAMS, Victoria and Paradise Nurseries, Upper Holloway, London; and from WILLIAM EDWARDS and SON, 157, Queen Victoria Street, London.

SAVE HALF THE COST.

GARSDIE'S BEDFORDSHIRE COARSE AND FINE SILVER SAND

Is admitted by the leading Nurserymen to be the Best Quality obtainable in the Trade.

PARTNERSHIP OR MANAGERSHIP
Wanted by a young Man.—Twelve years' thorough experience in all branches. Has a good connection, and could invest £500 or £200.—L. L. Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

PARTNERSHIP.—A Gentleman, about to start a MARKET NURSERY near London, wishes to meet with a PARTNER with a few hundred pounds.—Address H. Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

WANTED, for a Provincial Seed Business, a thoroughly practical MAN, as MANAGER.—Character must bear the strictest investigation.—Apply, with full particulars as to experience and salary required, to R. J. S., Messrs. Hurst & Son, 152, Houndsditch, London, E.

WANTED, a HEAD GARDENER of great experience in Flowers, Fruits, and Shrubs.—Direct to J. MELBURY, Dorchester.

WANTED, a WORKING HEAD GARDENER.—A thoroughly competent man required. Well up in Orchids, Stove, Ferns, and Greenhouse Plants, Early and Late Forcing, Grapes, &c. Three others kept. Wife to attend Lodge Gates, &c. Scotch Gardener preferred.—Reply by letter, stating age, experience, wages, to Mr. EVERED, Otlands, Horley, Surrey.

WANTED.—Can any Gentleman thoroughly recommend a SINGLE-HANDED GARDENER, married (without family preferred). Small Garden and Conservatory at seaside (Hants). Wife to look after House in winter. Full particulars, and wages, to HAMILTON FLETCHER, Brookwood Park, Alresford, Hants.

WANTED, as GARDENER, a young intelligent MAN, who would make himself generally useful. No Glass. Preference given to one who could live Boes.—Apply by letter, stating capabilities, age, and wages required, to O. A., Town Court, Orpington, Kent.

WANTED, GARDENERS, respectable experienced Men. Good references.—Apply, 10 A.M. Tuesday, 24th inst., 210, Earl's Court Road, S.W.

WANTED, AT ONCE, a good SECOND GARDENER, mostly inside.—Willing and obliging. Wages 19s. a week, no botchy.—Apply, H. GARDENER, Kirby Firth Hall, Leicester.

WANTED, a MAN, for a Branch Nursery.—Must be able to Raise and Grow Ferns in quantities. Soft-wooded Plants, &c., for Market. Wages, 25s. per week. A permanent place for a suitable man.—Apply, stating experience, age, &c., with references, to JAMES WINGFIELD, Widmore Hill Nursery, Bromley, Kent.

WANTED, a young MAN, with a good knowledge of Propagating Household Plants for Market. One preferred that is a successful Budder.—Apply in own handwriting to Mr. PROCTOR, Nurseries, Ashgate Road, Chesterfield.

Propagator Wanted.

MESSRS. THOMAS CRIPPS AND SON, Tunbridge Wells Nurseries, Kent, require as above, a MAN thoroughly well up in Clematis, Rhododendrons, Ivies, Roses, Japanese Maples, Conifers, Bedding Plants, &c. Apply, enclosing testimonials and wages, to 49, High Street, Tunbridge Wells.

Nursery Foreman.

WANTED, a WORKING FOREMAN, must be well up in growing general indoor stock, especially Cut Flowers. Preference given to one having a knowledge of General Outdoor Nursery Stock. Wages, 27s. per week, and house on the place.—ROBERT GRAHAM, The Newmarket Nursery, Newmarket.

WANTED, AT ONCE, TEN or TWELVE active young MEN, used to Cucumbers and Tomato growing. Also, a good STOKER, who would also have to attend to a steam boiler and pump.—HENRY WHATELEY, Spring Gardens, Kenilworth.

WANTED, GRAPE THINNERS.—A few respectable MEN can be employed temporarily at Grape Thinning, &c. Only expert hands please apply. Also WANTED, a GOOD HAND at POTTING.—Address, TITE, Hampton-on-Thames.

WANTED, SEVERAL active young MEN, accustomed to Potting Orchids.—Apply, giving references, and stating wages, to the LIVERPOOL HORTICULTURAL CO. (JOHN COWAN), Limited, The Vineyard, Garston, Liverpool.

WANTED, a young man, for general Outdoor Work. Must be accustomed to Scythe and Machine Mowing. Age about 22.—A. BULLEN, The Gardens, Wakehurst, Haywards Heath.

WANTED, TWO young MEN, accustomed to Cucumbers Work. Wages 21s. per week. State age and experience to W. H. & D. WHITE, Heath Park Nursery, Ramford.

WANTED, a good Outdoor Man.—Must be a successful Budder and Grafter of Roses, Fruit Trees, &c. Married man preferred. Wages, with small Cottage and garden, 41 per week, wages, with increase to a thoroughly trustworthy man.—Apply, giving full particulars, to H. ENGLISH, Clapton Nursery, near Clevedon, Somerset.

WANTED, a young MAN, used to Nursery Work, under Glass, to work under Foreman. Preference given to one with some experience of New Holland Plants.—Full particulars as to experience, wages required, &c., to RICHARD SMITH AND CO., Worcester.

WANTED, a respectable YOUTH, about 16, for Florist's Shop. Some knowledge Making-up of Flowers and Book-keeping.—Apply to F. G. MILLER, Florist, Eastbourne.

WANTED, a YOUNG MAN in Seed Shop, one used to making up flowers preferred.—CHARLES WHITING, Florist, Hereford.

WANTED, a MAN, who can make 5 Acres of Light Land profitable.—Mr. H. WILLS, Loughborough.

WANTED, a strong LAD, as IMPROVER, in the Houses in a Market Nursery; one wishing to learn. Wages, 14s.—H. HERBERT, Nurseryman, Wembley, Middlesex.

YOUNG LADIES who want to be INDEPENDENT and make their way in the world, should Write for Prospectus of the Scientific Dress Cutting Association, 272, Regent Street, London, W. Situations found for all pupils at good salaries. No Lady's education is complete without a knowledge of Dressmaking.

WANT PLACES.

TO GARDENERS, AND OTHERS SEEKING SITUATIONS.

The Pressure upon our space at this season of the year is so great, we are compelled to state that advertisements received after 6 P.M. on Wednesday will, in all probability, be held over to the next week.

Advertisers are cautioned against having letters addressed to initials at Post-offices, as all Letters so addressed are opened by the authorities and returned to the sender.

THOMAS BUTCHER can recommend several HEAD and UNDER GARDENERS of first-rate character and proved ability. Gentlemen seeking such may have particulars free.—Apply to THOMAS BUTCHER, Seed Merchant and Nurseryman, Croydon.

Head Gardeners.

JOHN LAING AND SONS can at present recommend with every confidence several energetic and practical Men of tested ability and first-rate character. Ladies and Gentlemen in want of GARDENERS and BALIFFS, and HEAD GARDENERS for first-rate Establishments or Single-handed Situations, can be suited and have full particulars by applying at Stanstead Park Nurseries, Forest Hill, London, S.E.

SANDERS, St. Albans, can thoroughly RECOMMEND several first-class HEAD GARDENERS.

RICHARD SMITH AND CO.

Reg to announce that they are constantly receiving applications from Gentlemen seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

Gardeners, Farm-Baliffs, Foresters, &c.
DICKSON'S (Limited), Royal Nurseries, Chester, are always in a position to RECOMMEND MEN of the highest respectability, and thoroughly practical at their business. All particulars apply to—
Telegraphic and Postal Address—"DICKSONS, CHESTER."

GARDENER (HEAD).—Age 39, married.—J. VERT, Audley End Gardens, Suffolk. Warden, will be pleased to recommend a thoroughly practical man as above. Over years' experience in some of the best establishments in England. Very successful Fruit and Vegetable Grower, and used to the Management and requirements of a large Garden. Eleven years' good recommendation from last situation.

GARDENER (HEAD), to any Lady, Nobleman, or Gentleman requiring the services of a thorough practical and energetic man, where not less than five or six are kept. Experienced in Growing Flowers and Fruits (including Pine-apples), Inside and Out, Flower and Kitchen Garden Work. Laying out Grounds, and their good keeping. Seventeen years' Head Gardener to the late J. Green, Esq. Changing through his death. Character will bear the strictest investigation.—JOSH. SMITH, Gardener, Aakett Hill, Rounday, Leeds.

GARDENER (HEAD), where two or three are kept; age 35, married, two children (youngest 5).—Gentleman wishes to recommend his late Head Gardener as above; thoroughly experienced in all branches. Can have excellent character for honesty and sobriety.—W. T., 3, Bath Place, Albert Road, Bexley, Kent.

GARDENER (HEAD).—Age 30.—Mr. A. HESSACK, Glynnllyn, Carnarvon, can with confidence recommend his late Foreman, where three or four are kept. Full particulars on application.

GARDENER (HEAD).—JAMES BAKER, for four and a half years Orchid Grower with Mr. Sillem, Sydenham—who has been compelled to relinquish his cultivation under doctor's order and previously General Head Gardener, near Great Grimby, Lincolnshire, is seeking an engagement as Head Gardener, in preference where Orchids are grown: he can rely on testimonials in every way satisfactory from Mr. Sillem, who will be pleased to answer any enquiries concerning him, and will also be able himself, to give full particulars as to his work in Lincolnshire, but he cannot refer to his employer there, who has left the locality, and J. B. not knowing his present address is unable to apply for permission to name him as a reference.—JAMES BAKER, Augustus Sillem, Esq., Laurie Park Avenue, Sydenham, S.W.

GARDENER (HEAD).—Age 34, married, three children. A Gentleman recommends his Head Gardener, who has been with him five and a half years, and who has had a thoroughly good training in all branches of his work. Sober and active.—G. BENFIELD, Saltcross Cottages, Swindon.

GARDENER (HEAD WORKING).—Age 35, married one, child; over twenty years' practical experience in all branches of gardening; good character.—G. WHITING, Basin Road, Chichester, Surrey.

GARDENER (HEAD), where two or more are kept, or good SINGLE-HANDED.—Age 32, married; eighteen years' experience in all branches. Two years' character.—M. H., Westbourne, Dorking.

GARDENER (HEAD).—Practically experienced in the requirements of a well-kept establishment, and has been and is well-known as an extensive Grower and successful Exhibitor of Orchids.—GARDENER, Hillingdon Heath, Middlesex.

GARDENER (HEAD); Married.—A Lady wishes to recommend her Head Gardener; leaving owing to death. Thoroughly experienced in every branch, including Orchids. Excellent character.—Mrs. WRIGHTLEY, Horwich, Preston.

GARDENER (HEAD WORKING).—Age 36, married, ten years' testimonials as a Gardener. Thorough practical experience. Estate changing hands. Shortly disengaged.—JAMES RUSE, Trematon Castle, Saltash, Cornwall.

GARDENER (HEAD WORKING), Land and Woods, if required.—Age 42, married; life experience in the profession. Upwards of twenty years as Head in good establishments; excellent references.—GARDENER, Messrs. Williams and Nicholson, Land Agents, Oswestry.

TO FLORISTS and FRUITERS.—Situation wanted by a young lady. Knowledge of the Fruit, Flower, and Seed Trade.—A. WHITING, 23, Eign Street, Hereford.

TO FLORISTS.—Situation wanted by a Youth. Used to First-class Trade.—C. H., The Floral Depot, 1, Broadway, Bromley, Kent.

HOLLOWAY'S PILLS.—Impurities of the Blood.—To ensure health, it is absolutely necessary that the fluids and solids of the human body should be kept free from those impurities which are continually getting admission into the system by erroneous living, unwholesome diet, or disordered stomach. The only safe and certain way to expel all impurities is to take Holloway's Pills, which have the power of cleansing the blood from all noxious matters, and at the same time removing any irregularities which their presence may have already produced in the organs. Holloway's Pills expel all humours which taint or impoverish the blood, which they purify and invigorate, and give general tone. They are applicable to all alike—young or old, robust or delicate.

AWARDED TWENTY PRIZE MEDALS

AT INTERNATIONAL EXHIBITIONS AT HOME AND ABROAD.

KEITH'S PATENT BOILERS, THE "CHALLENGE," "VIADUCT," "PYTHON," &c.,

FOR HOT-WATER HEATING. "STAND FIRST," require no building work round them, are entirely water-jacketing, and heat from 50 feet up to 20,000 feet of 4-inch pipe respectively. Many thousands are in use all over the world, and the Boilers are unrivalled in power and economy.

KEITH'S "PYTHON" BOILER, as illustrated below, has 1000 square feet of effective heating surface, with 17½ square feet of fire-grate area; heats about 20,000 feet of 4-inch pipe, and is the Most Powerful and Complete Sectional "Special" Hot-water Heating Boiler in the World.

This Engraving "illustrates the most powerful form of Boiler that has yet been made for Hot-water Circulation."—Extract from Hoop, on *Warming by Hot-water*, New Edition, 1891.

KEITH'S BOILERS

are almost exclusively used by Her Majesty's Government, at the Home Office, and for the Heating Work of the Prisons throughout the United Kingdom, in preference to all others.

KEITH'S PATENT RAMS & Self-acting, HYDRAULIC RAM-PUMPS, For Raising Water.

The very HIGHEST EFFICIENCY attained in Self-acting Hydraulics, by KEITH'S RAMS.

KEITH'S PATENT "UNIVERSAL" RADIATORS, For Hot-Water Heating. Made in One Piece, and in many Sizes and Modifications. No Joints to Leak. Thousands in use

Manufactured under thirty James Keith's Patents in Great Britain, United States, and Canada.

JAMES KEITH (C.E., Assoc. M.Inst.C.E.), Gas, Hydraulic, Heating, Ventilating, and Consulting Engineer. Established 1823. Contractor to Her Majesty's Government. 57, HOLBORN VIADUCT, LONDON, E.C., ALSO AT EDINBURGH AND ARBROATH.

HARNESS' ELECTROPATHIC BATTERY BELT.

THE MEDICAL BATTERY CO. LTD.

CURES BRUINISM, INDIGESTION, & ALL NERVOUS AFFECTIONS

52, Oxford St. London, W.

This genuine appliance is comfortable in wear, and will speedily invigorate the debilitated constitution, assist digestion, give strength to every nerve and muscle of the body, and effectually prevent chills and rheumatic pains. It is a simple remedy; but, nevertheless, a most reliable one; and the number of unsolicited testimonials we have received amply prove that we do not exaggerate when we say that HARNESS' ELECTROPATHIC BELTS have completely cured thousands of men and women in all parts of the world.

IT STRENGTHENS THE BACK.

NERVOUSNESS, DEBILITY, and RUPTURE—

Mr. M. LILLYSTOWE, 52A, Pollock Road, New Kent Road, S.E., writes:—"I purchased one of your Electropathic Belts on the 26th of May last, and have worn it constantly since. I have great confidence in it. I had been very bad for two years previous, but since wearing your Belt I have enjoyed better health in every way. All my nervousness and bad feelings are gone, and the rupture I have felt nothing of since. I am thankful to say that since the first week of wearing the belt I felt a great improvement in my health. I feel I cannot express the gratitude I owe to you."

CRAMP and CHILLS PREVENTED—Professor

MARCH, Putney Baths, writes:—"Please allow me to add my testimony of the value of using your Electropathic Belt, which has not only kept me from taking any chill, but also prevented all cramp and night sweats this season in my work as a professional swimmer, being constantly, in my profession, in the water. I can thoroughly recommend, and only wish I had used one in previous seasons. I believe also that the use of same greatly strengthens the spinal and cerebral vertebrae; in point of fact, it invigorates the whole frame."

SALES.

TUESDAY, MAY 31 { The Logs collection of Orchids at Protheroe & Morris' Rooms.
 FRIDAY, JUNE 3 { Imported and established Orchids at Protheroe & Morris' Rooms.

SALES BY AUCTION.

Tuesday Next.
 The CELEBRATED "LOGS" COLLECTION OF ESTABLISHED ORCHIDS.

MESSRS. PROTHEROE AND MORRIS are favoured with instructions to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on TUESDAY NEXT, May 31, at 12 o'clock, precisely, the whole of the valuable collection of ESTABLISHED ORCHIDS, by order of E. Gotto, Esq., who is disposing of them in consequence of having to winter abroad. The Plants are in capital condition, and comprise many special things that have been sent direct from the Brazils by a connoisseur out there, notably—

Laelia Guttoliana (believed to be unique), First-class Certificate, R.H.S.
Laelia grandis tenebrosa, fine examples
Laelia elegans Schilleriana, several magnificent pieces and fine varieties
Laelia elegans Turneri, specially dark variety
Laelia purpurata grande and *Edwardsi*, both wonderfully fine forms
Sophronitis grandiflora (supposed to be a yellow variety)
Cymbidium Lowii
Brassia laevis longissima
 Eight volumes bound of the *Orchid Album*, and the remaining ninth volume unbound, complete to date. Two volumes of the *Reichenbachia*, handsomely bound, completing the first series; also nine parts of vol. 1. of the second series, now in course of completion. After the Sale of the above, will be offered, 200 Imported pieces of ODONTOGLOSSUM CRISPUM and O. LUTEO-PURPUREUM, another property.
 On view morning of Sale, and Catalogues had.

Friday Next.

CYPRIPEDIUM SPECIOSUM MAGNIFICUM.
 Messrs. CHARLES WORTH, SHUTTLEWORTH AND CO., Heston, Bradford, and 213, Park Road, Clapham, S.W., have instructed

MESSRS. PROTHEROE AND MORRIS to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on FRIDAY NEXT, June 3, at half-past 12 o'clock, a splendid consignment of

CYPRIPEDIUM SPECIOSUM MAGNIFICUM.
 Dried flowers will be in view at time of Sale.
 DENDROBIUM CAMBRIGEANUM.
 A new CYMBIDIUM, CATTLEYA LABIATA, and many VALUABLE ORCHIDS, ORCHIDS IN FLOWER.
 1000 FINE IMPORTED ODONTOGLOSSUM CRISPUM.
 On view morning of Sale, and Catalogues had.

Wednesday, June 8.

TWO ROYAL CATTLEYAS.

NOTICE of an Important UNRESERVED SALE, by order of Messrs. F. SANDER and Co., of St. Albans.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on WEDNESDAY, June 8, at 12 for half-past 12 o'clock precisely, an exceptionally fine Importation of—

CATTLEYA VICTORIA REGINA,

One of our very finest discoveries. A plant was shown by us on May 3 in flower before the Committee of the Royal Horticultural Society, and it received the highest honours. It is a gorgeous Cattleya, and we warrant that every plant offered is absolutely true. This new Cattleya greatly resembles *Laelia elegans Blenheimensis*, but in place of bearing some five or six blooms on a stem, it frequently produces ten or twelve, and in some instances even as many as twenty; the flowers are individually of a large size.

Also a very great quantity of

CATTLEYA ALEXANDRE,

Comprising many splendid masses. Messrs. SANDER & Co. warrant every plant absolutely true. No reserve whatever will be placed upon a single plant.
 On the same day many other new and splendid ORCHIDS will be offered.

Thursday, June 9.

1,000,000 PALM SEEDS.

Undoubtedly the largest consignment ever submitted to Public Auction. The whole will be offered in one day, and the Consignment includes—

480,000 KENTIA FORTERIANA,
 315,000 ARECA BELTUCENS,
 And large quantities of COCOS, GEONOMAS, MARTINIESIA DISTICHA, CARYOTAS, &c.

MESSRS. PROTHEROE AND MORRIS will SELL the above by AUCTION at their Rooms on THURSDAY, June 9, instead of WEDNESDAY, June 8, as advertised last week.

The Auctioneers will be pleased to execute commissions for Provincial and Foreign Buyers.
 The Seeds are being sent by two well-known Firms direct to Messrs. PROTHEROE & MORRIS, and the whole will be sold absolutely without reserve.

Friday, June 10.

PRELIMINARY NOTICE.
IMPORTANT SALE.

ABSOLUTELY WITHOUT RESERVE.

By Order of Messrs. LINDEN, of BRUSSELS.
 EXTENSIVE IMPORTATIONS, in splendid condition, of CATTLEYA AUREA CHRYSOTOXA, C. ALEXANDRE, C. ACKLANDIA, ANGRÆCUM SRSQUEDALE, PHAIUS HUMBLIOTTI, VANDAS, SACCOLABIDUM, EPIDES, and other FINEST ORCHIDS.
 MESSRS. PROTHEROE AND MORRIS will sell the above by Auction at their Central Sale Rooms, 67 & 68, Cheapside, London, E.C., on FRIDAY, June 10, 1892.

On view morning of Sale, and Catalogues had.

Thursday Next, June 2.

TWO COLLECTIONS OF ESTABLISHED ORCHIDS, one formed by the late Henry Ford Barclay, Esq., of CATTLEYA AUREA CHRYSOTOXA, C. ALEXANDRE, C. ACKLANDIA, ANGRÆCUM SRSQUEDALE, PHAIUS HUMBLIOTTI, VANDAS, SACCOLABIDUM, EPIDES, and other FINEST ORCHIDS.
 MR. J. C. STEVENS has been favoured with instructions to SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY NEXT, June 2, at half-past 12 o'clock precisely, the COLLECTION OF ESTABLISHED ORCHIDS, formed by the late Henry Ford Barclay, Esq., of Monkhams, Woodford, which includes fine EXHIBITION SPECIMENS of Vanda tricolor, V. suavis, and Angræcum sesquipedale, Cypripediums, Dendrobiums, Cattleyas, Phaius, Anthuriums, &c. Also another small Private Collection.
 On view morning of Sale, and Catalogues had.

Thursday Next, June 2.

A very fine COLLECTION OF ORCHIDS IN FLOWER and BUD, and an importation of ODONTOGLOSSUM CRISPUM, from Mr. F. Horsman.

MR. J. C. STEVENS will include in his SALE by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY NEXT, June 2, a very fine COLLECTION OF ORCHIDS IN FLOWER and BUD, comprising ODONTOGLOSSUM Alexandriae, fine varieties; O. strepens, O. maculatum, O. trichophyllum, grand specimens; C. Mendellii, C. labiata Warneri, Oncidium macranthum, O. crispum, choice Dendrobiums, Masdevallias, &c.; also an importation of Odontoglossum crispum, from Mr. F. Horsman, in splendid condition; Trichophyllum species, &c.; 150 Lilium Species (gigantic Bulbs) just to hand. Each plant gives from 15 to 40 Blooms, &c.
 On view morning of Sale, and Catalogues had.

Glasgow.—Public Sale of a Collection of Orchids, at 72, Renfield Street, Glasgow, on WEDNESDAY, June 8, at 12 o'clock, by Messrs. Messrs. Charlesworth, Shuttleworth & Co., Heston, Bradford, including a fine lot of CATTLEYAS (mostly bought in bloom), by a Gentleman who is giving up their cultivation, consisting of such rare species as ODONTOGLOSSUM EXCELSUM, LELIA AUTUMNALIS ALBA, DENDROBIUM NOBILE ALBA, CATTLEYA TRIANE ALBA, LELIA ANCEPS ALBA, DENDROBIUM PHALANOPSIS SCHRODERIANUM, and other choice varieties.

MR. WALTER J. BUCHANAN has received instructions to SELL by PUBLIC AUCTION, the above. Particulars in Catalogues now in course of preparation. 72, Renfield Street, Glasgow, May 28, 1892.

WANTED TO RENT, with option of Purchase, a small Nursery, with about 1500 feet run of Glass, in a thriving country town.—H. HOPPE, Haslemere, Surrey.

London, S.W.

In main thoroughfare close to Station.
 FOR SALE, in consequence of ill-health, the LEASE of a prominent FLORIST'S SHOP and 8-roomed RESIDENCE, together with the GOODWILL. Good Trade attached. Leave sixty years. Low rent £65.
 Full particulars of Messrs. PROTHEROE AND MORRIS, 67 and 68, Cheapside, London, E.C.

FOR SALE, a COMPACT NURSERY, well situated, good Jobbing Connection, 6 Greenhouses and Pits, 8-roomed House, fourteen years old to run of Lease. Shop near Station, doing good Cut Flower Trade. All on main road, and in good repair. In present hands 20 years. A Bargain; reason, ill health.
 Apply to R. HOLLOWAY, Florist, Herne Hill, S.E.

TO BE SOLD, a bargain, the LEASE of a compact MARKET NURSERY, well made, a good branch establishment; 15,000 feet of Glass in good order, well heated with 4-inch Hot-water Flipping, plenty of Water, good Stabling, Van Shed, Loft over; 7-room Dwelling House, with every convenience. Near London, Kent, only 10 miles.
 Apply, J. S., Elm Villa, Town Road, Lower Edmonton.

To Market Gardeners and Others.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

GARDENERS AND OTHERS WANTING SITUATIONS, 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Births, Deaths and Marriages, 5s. each insertion.

POSITION.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at No. 42, DRURY LANE, to A. G. MARTIN, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST reach the Office not later than Thursday noon.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements, 41, WELLINGTON ST., STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months; Post-office Orders to be made payable at the Post-Office, 42, Drury Lane, W.C., to A. G. MARTIN.

Subscribers who experience any difficulty in obtaining their Copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

SPHINCTER GRIP HOSE

"HERCULES" BRAND (Regd.).

DURABILITY & SUPERIORITY Over all Other HOSES GUARANTEED. (See Warranty).

"Are you not afraid these children will injure the Hose or stop the water?"

"Oh, no! This SPHINCTER GRIP ARMoured HOSE will stand anything. It is far superior to any other Hose I have used, seen, or heard of."

Contractors to all Departments of Her Majesty's Government and the Horticultural and Agricultural Societies. Hundreds of Unsolicited Testimonials.

BEWARE OF WORTHLESS IMITATIONS, and send for ILLUSTRATED and DESCRIPTIVE CATALOGUE (post free on application) of HOSE and GARDEN WATERING APPLIANCES and FITTINGS of every kind.

MR. JOHN KNIGHT, Rose of Kent Nurseries, Dartford, writes, April 26, 1892, ordering a supply of our "A Quality" Hose—"I had no end of trouble with another firm's make of Garden Hose last year; it wore clean out in less than three months—went into hundreds of holes in this time—so that I do not want anything of the sort again."

HIGHEST AND ONLY AWARDS:

London, 1887; Paris, Birmingham, & Brighton, 1889; London, Edinburgh, & Birkenhead, 1890; Antwerp, 1891. No Exhibition Medal or Award has ever been secured by any other firm for Armoured Hose.

Drums Charged for, but Allowed when Returned in Good Order.

The "Climax" Insecticide.*The CHEAPEST of all INSECTICIDES. NON-POISONOUS, SAFE, & EFFECTIVE.*

The only Insecticide that Improves and Brightens the Foliage, while at the same time it completely destroys all Insects and Parasites which infest the Foliage and Roots of Plants.

It will not Injure the most Tender Foliage.

PRICES—In Tins, $\frac{1}{2}$ Pints, 1s. 3d.; Pints, 1s. 9d.; Quarts, 3s.; $\frac{1}{2}$ Gallon, 5s.; 1 Gallon, 9s.; 5 and 10-Gallon Drums, 8s. per Gallon, Carriage Paid.

THE MYTHE CASTLE GARDENS, TEWKESBURY, AUGUST 13, 1891.
GENTLEMEN,—I have given your "Climax" Insecticide a good trial on tender foliage—Orchids and Ferns—for Bug and Scale. In every instance I have found the Bug and Scale dead, and the foliage bright and clean. I found it most effectual for Black Fly on Peach Trees.

The "Climax" Insecticide ought to be better known; it is the only one I have found to kill Bug on tender plants without injury to the foliage.

I am, yours faithfully, W. MACKIE.

THE GARDENS, MOYALLON HOUSE, GILFORD, CO. DOWN.

DEAR SIR,—In reply to your inquiry, I found the "Climax" a really good and effective Insecticide, completely destroying Mealy Bug, Thrip, and Green Fly on the most tender plants, without the slightest injury to the Plant; in fact, it brightens and improves the appearance of Foliage Plants very much.

Yours, &c., J. LYNAS.

THE BEDDING PLANT OF THE SEASON—GRAND NEW DWARF TROPÆOLUM, "MRS. CLIBRAN."

Colour, lovely shade of Orange-yellow; habit, compact, and about 6 inches high; free and continuous bloomer, producing a brilliant display.

Gardeners' Chronicle: "The colour is decidedly very good. An excellent bedder."
Journal of Horticulture: "The variety must be regarded as an acquisition."
Gardeners' Magazine: "A distinct bedding variety; will make a gay display in bed or border."
 Mr. D. MELVILLE, Darrobin Castle Gardens: "I think your Tropæolum should be most useful. An excellent substitute where Calceolarias die off."
 Mr. W. INGRAM, Belvoir Castle Gardens: "Seems to promise an effect not afforded by any Mr. W. EARLEY, Hford: "I am charmed with Mrs. Clibran Tropæolum."
 Mr. G. DOUGLAS, Great Geanies: "A very distinct novelty."

Mr. D. T. FISH, Bury St. Edmunds: "Mrs. Clibran Tropæolum is unique in its beauty."
 E. IRWIN LYNCH, Esq., Cambridge Botanical Gardens: A splendid novelty; perfectly charming in colour."
 Sir. H. W. WARD, Logford Castle Gardens: "The colour is quite distinct from any shade of golden I have hitherto seen."
 Mr. E. MOLYNEUX, Swaamore Park Gardens: "The colour, too, is so taking; it is sure to W. E. GUMBLETON, Esq., Queensdown: "The colour is bright and clear; it should be an acquisition."

This Splendid Novelty has been Awarded several Certificates. Plants ready end of May. Price, 1s. 6d. each; 6 for 7s. 6d.; per dozen, 12s.

For full Description of above, also other distinct Novelties and Specialities, including NEW BEDDING PELARGONIUMS, see NEW CATALOGUE (No. 115), Free on Application.

SATURDAY, MAY 28, 1892.

INSTRUCTION IN GARDENING.

NO subject that has been broached of late years in our columns excited so much interest as the question of horticultural education. We infer this, not only from the large mass of correspondence that was published on the subject, but from the still larger amount of communications that we received, and which it became quite impossible to print, or even to deal with satisfactorily in any way. A few—a small proportion—doubted whether any good result could arise from what they called theoretical teaching. The vast majority saw things in a clearer light, and recognised that if good teachers could be found, there could be no question that satisfactory results would be attained. About that time many of the county councils took action in the matter by appointing itinerant lecturers and demonstrators (we designedly emphasise that word to mollify the "once of practice and ton of theory gentlemen"). These lecturers, following a plan long in use in France and Belgium, and one long advocated by us, visited numerous country districts, and gave information on points connected with practical horticulture. We have not space at the moment to go into detail on the matter, but we hope to do so on a future occasion, many of the lecturers having obligingly communicated to us a statement of their methods and of the results that followed. These, we may say in passing, were, as a rule, such as amply to justify the expectations of those who have sympathised with the movement from the first. Doubtless mistakes have been made, and some of the lecturers were not so efficient as others, or failed to hit the right nail on the head. In an experiment of this nature, somewhat suddenly begun and hastily acted on, such variations must have been expected, and they will be valuable for future guidance.

We are indebted to one who has taken a prominent part in this matter of gardening instruction for the following notes with reference to it:—

The publication of books bearing upon the subject is good, and the horticultural press is a powerful agent for the spread of useful knowledge; but we have had both for many years, and the people are still comparatively ignorant. Probably, it is their own fault that they have not laid hold of the knowledge which they might have obtained at a trifling expense, and with but little exertion on their part. Doubtless many have obtained some information through the medium of the gardening press, but their numbers are limited. It is quite evident, from the information before us, that the County Council lecturers have reached individuals who have so far been beyond the influence of the gardening press; but once set people thinking on things horticultural, and the gardening and horticultural papers will become part and parcel of their daily life. The work of the lecturer should be followed up by examinations on the subject-matter

of the lectures, and here the Royal Horticultural Society has been able, as in the case of the Surrey County Council, to do good work by aiding in the preparation of papers, finding examiners to adjudicate upon them, and the Society will, we believe, shortly present medals to the most successful candidates. When people begin to take sufficient interest in gardening matters to obtain a theoretical knowledge of it, they are likely to look around for an opportunity to put it into practice; and when people become interested, it is marvellous what they can accomplish even in the few hours they can spare from the work at which they earn their livelihood, and this not in growing ordinary garden crops, but even in the higher branches of gardening in glasshouses. We knew a surgical instrument maker who cultivated Orchids successfully within a few hundred yards of Shoreditch Church. A carpenter started to grow Grape Vines, and produced Grapes of the highest quality, good enough to win prizes at the leading horticultural exhibitions. Auriculas are supposed to be difficult plants to grow well, and few professional gardeners succeed perfectly in their culture, but there are members of the National Auricula Society who did not know an Auricula from a Cowslip a few years ago, and never had any practical gardening knowledge, who can now win the leading prizes at flower shows.

Those who know what good land is capable of producing, and daily see so much of it lying waste, or producing less than half what might easily be obtained from it in country places, will be pleased to know that there is a good prospect of better things. The Small Holdings and Allotment Act will, as a matter of course, be most beneficial where the knowledge of the cultivation of the ground and the treatment required for the various crops is greatest. Those who say that a theoretical knowledge of gardening is of no use, speak without thought. It is of no practical use until it is applied, but those who have been instructed by lectures, and have applied the knowledge they have gained there to answer questions at an examination, must be more competent to do practical garden-work than those who have not such theoretical knowledge. We have seen allotments in various parts of the country, and judged them for the purpose of awarding prizes, and others who have had similar opportunities of judging will bear us out when we say that in every district there is a sad lack of knowledge as to the practical treatment of the ground. A few get almost as much out of it as it is possible to obtain; but the many do not cultivate the ground, nor do they carry out a good system of alternate cropping. Near a large town in Essex, about 100 plots of land of various sizes were examined, and only about a tenth part of them could be said to be kept as a garden ought to be.

People with little knowledge of the work are generally so anxious to get their seeds sown, their Potatoes planted, or their Cabbage plants set out, that they do not take time to prepare the soil first, but the preparation of the ground should be done first, and is quite as important as laying well the foundation of a house. Trenching is usually recommended, but this is a garden operation that requires some thought. The ordinary labourer sets to work to trench his ground, say 18 inches deep, and, whatever may be the nature of the soil, he places the top spit in the bottom, and throws up perhaps some stiff unfertile clay on to the surface, but such stuff will not grow crops until the ground is retrenched the following season, and the top spit is returned to the top again. A correspondent informs us that he had to deal with an odd corner of a field intended to grow Mangel Wurzel for the cows, and Potatoes for household use, and saw that it was not large enough unless the maximum weight was obtained from it. When our friend took charge of it, it had merely been scratched about 4 or 5 inches deep with a small plough, which had formed a hard pan at the depth of 5 inches the first year. He worked the ground to the depth of a foot, breaking through the pan with the first spit to the depth of 6 inches; this was turned over, and 6 inches of the subsoil was

loosened up. He placed a good layer of manure over this subsoil, and turned the next top spit on to it; and when the work was finished, it came out in this form—6 inches of the subsoil loosened up, over this a dressing of good stable manure, and 6 inches of the good top soil over all. We alternate our crops year after year, but there is no change from Mangel and Potatoes. We weighed our crop last year, and the Mangel (Veitch's Yellow Globe) came out at 42 tons per acre, and the Potatoes about 10 tons. This simple system of working shallow-ploughed land is, probably, the best, when the plots are small. The steam cultivator is excellent when many acres are in question. Of course, for allotments, nothing is better than a good steel digging-fork to bring the subsoil into good working condition. When the ground has been prepared in the winter, or better still, in the autumn, all that is needed is to lightly fork up the surface to a depth of a few inches before putting in the crops, and it is well to take the chance of fine weather for this purpose, or for forking the ground over. Much mischief is done by treading upon the surface of the land when wet, especially on clay soil. It always pays, too, to take time and do the work well. When seeds are sown in drills, such as Peas, Onions, Carrots, &c., the drills should be drawn of an uniform depth and quite straight to a tightly drawn line. It is better to draw shallow drills in which to plant Cabbages, Cauliflowers, and other crops of this kind. The drills give the young plants much support, and protect the stems to a considerable extent from spring frosts and high winds. When they are well established the ground may be hoed, and this will fill in the drills, and answers the same purpose as earthing up. Earthing up a ridge round plants in the form of the letter A inverted is wrong, as it drains the rain water away from the roots. The earth should be drawn up so as to form a ridge on each side, and a depression where the stems of the plants are. It pays to sprinkle nitrate of soda around the roots to force Cabbages, Cauliflowers, &c., in early. The allotment holder can learn much of the application of manure from the farmer, especially those farmers who grow vegetables for market, but he ought to beat the farmers easily in the abundance and quality of the crop. For perfect cultivation the steel fork is far beyond the plough, or even the steel cultivator. The beneficial effects of stirring the surface of the ground with the hoe can scarcely be over-estimated. During the recent dry weather I have had all the ground hoed over twice; and will do it a third time if there is an opportunity. I did not think of the weeds at all, but the first hoeing was done to break the thin crust which is always formed upon the surface after rains, and when the work is being done do it well, not leaving an inch untouched. All recently dug or trenched ground should be stirred with the Dutch hoe, hard ground requires the swan-necked draw hoe. Perennial weeds of the most noxious character can be exterminated by merely keeping them well down with the hoe. Stop their growth and the roots will die out."

NEW OR NOTEWORTHY PLANTS.

CURCUMA (§ MESANTHA) BAKERIANA, Hemsl., n. sp.*

A HANDSOME species, closely allied to *C. australasica*, Hook. (*Botanical Magazine*, plate 5620), differing in having somewhat larger, orange-coloured flowers, and in floral details. The root, too, of *C.*

* *Curcuma* (§ *Mesantha*) *Bakeriana*, Hemsl., n. sp.—Ex affinitate *C. australasica*, differt tuberculis duratis (vel ovatois et stipitatis); foliis longe acuminatis, petiolis longioribus, spica brevi pauciflora; floribus paulo majoribus aurantiis. Planta circiter bipedalis, fere nudique glabra. Radices tubercula 3—2½ polli. longa, et 9 lines crassa. Folia disticha (petiolis arcte vaginantibus) spicam trifloram amplexicinctibus, oblongo-lanceolata, absque petiolo circiter 7 polli. longa. Spica vix triplicariter, bracteis ovatis recurvis superioribus vacuis pilulis roseis. Flores circiter bipedales; calyx pubescens, semi pilicaris, bilobatus; corollae lobis subaequalibus, ovato-oblongis, vix acuti, quam labellum breviores; staminodia lateralia oblonga, labellum sequantia; labellum latum, rotundatum, emarginatum, sinuatum. W.B.H.

australasica is described as consisting of bundles of cylindric white tubers, constricted here and there; whereas, in the present plant they are club-shaped, or egg-shaped and stalked, without any constrictions. In other respects, the two species are much alike. The only flower-spike seen of *C. Bakeriana* is, however, not so long as that depicted in the *Botanical Magazine*, but that may have been due to the conditions under which it grew; and there is little doubt that it will prove a very ornamental stove plant, of easy cultivation.

It was imported by Messrs. Sander & Co., of St. Albans, from "Islands off the coast of New Guinea;" and, at Mr. Sander's request it has been named after my friend and colleague, J. G. Baker, F.R.S., whose numerous works on plants of this and allied natural orders are of the greatest service, alike to botanists and horticulturists. W. Botting Hemsley.

CYRTANTHUS GALPINI.

This is a new species of the sub-genus *Gastro-nema*, with bright red flowers, flushed with yellow. Mr. Baker, who describes the plant in the April number of the *Kew Bulletin*, speaks of it as well worthy of being introduced into cultivation. It is a native of rocky hills in the Transvaal, flowering without the leaves in August.

CARNATION MRS. A. HEMSLEY.

This fine new Tree-Carnation has been blooming all the winter with Mr. H. B. May, Dyson's Lane Nurseries, Upper Edmonton, and there is still no lack of flowers to keep up a succession; indeed it seems equally good either as a winter or summer flowerer. It is in colour like the old Glove, and it has the fragrance of that old favourite flower, and the plant is as free to flower as Miss Jolliffe, and it will probably become equally popular, and be grown largely as a market plant.

BELGIUM.

NEW AND RARE PLANTS AT LIÈGE.

THE firm of Jacob Makoy et Cie. showed at the last exhibition of the Liège Royal Horticultural Society some interesting plants:—*Heliconia Lubberris*, quite new, leaves a peculiar metallic colour, shot, with a central band of rosy-lilac—a capital plant. *Maranta Leopoldi* from Brazil, 1892, a remarkable plant, leaves elongated, under surface lilac-purple, upper surface clear green, shading from olive to deep shining metallic green. *Nidularium rutilans* from Brazil, 1892, leaves large, of good habit, numerous bright pink bracts. *Alocasia memoria Parlouri*, 1892, leaves with metallic gloss on them, very dark and large, habit dwarf. *Echinostachys Pfitzeri*, Brazil, 1891, leaf bordered with white—very fine and ornamental plant. *Vriesia Closini*, 1891, hybrid between *V. Barilleti* and *V. psittacina Morreniana*, inflorescence yellow conspicuously marked with a red band. *Haplophytum Makoyanum*, 1891, leaf edged with white—an interesting novelty. *Vriesia Wiotti*, 1891, a fine hybrid. *V. Kittelliana* x, 1892, hybrid between *V. Barilleti* and *V. (Encholirion) Sanderi*, inflorescence branched, bracts deep ochre-yellow, flowers yellow. *V. conferta* (? species), scales very large, inflorescence rather close, colour, blood-red, merging into brown. *Doryopteris multi-gina*, Brazil, 1890, prolific, much branched, of medium height, with numerous bright but delicate green leaves, petiole black. *Carludovica elegans*, 1889, was effective beside the Palms, which it resembles, petiole long, blade prettily cut—an excellent plant.

Among the fine stove *Arancaria* from the same establishment, we must mention the rare *A. Neipraski*, the not less rare *A. Goldiana*, and a remarkable specimen of *A. elegans*. *Pandanus Legianus* is a fine plant. *Rhaphis flabelliformis* var., is remarkable; so are *Nepenthes picturata* from the Congo, and the splendid specimen of *Lilium Harrisonianum*, with four fine stems of bloom.

The forced *Cannas* were much admired, especially *Madame Crozy*, flower clear vermilion; *Souvenir de Madame Liabaud*, with cluster of bright crimson flowers; *Antonin Crozy*, flowers reddish-carmine;

Souvenir de François Gaulin, beautiful yellow, much spotted and streaked with carmine. Among the Orchids may be noted *Cypripedium Boxalli marginatum*, much yellower generally than the type, the standard evenly edged with white; *C. B. Kienasti*, standard greenish, petals much marked—a very distinct variety; *C. Godseffianum*, flower very pretty; *C. insignis Salieri*, yellow and very glossy flower; we must not omit also a fine *Lycaste Skinneri alba*.

We noticed in the houses of this firm, *Stenosperma vittata* from Kew, the bloom was very curious; a new strain of *Maranta*, sure of great popularity; *Anthurium Andreanum* Princess Clementine, with white spathe; and some *Adiantum cuneatum elegans*, an unusual variety, which is sometimes mistaken for Williams' *A. elegans*. *Ch. de B.*

BATTERSEA PARK IN SUMMER.

THIS public park covers an area of 190 acres, every part of which would appear to be made the most of, indeed it would be difficult to find a park of

or "carpet" bedding that were to be seen there last season, may be mentioned a circular bed (see fig. 98) about 12 feet in diameter, having six raised diamond-shaped pieces, about 5 feet long, and 16 inches high in the middle, and sloping sharply down on both sides and ends to the groundwork, with a like number of smaller ones (about 30 inches long) of the same shape between them, and then twelve similarly-shaped pieces, about 16 inches in length, in the middle, the centre valley being occupied with a good plant of a green *Dracena*, the other "dot" plants used being *Chamaepence diacantha*, in large panels, and *Echeveria metallica* in small ones. The alternate large divisions were covered with *Alternanthera paronychioides major*, with a line of *Echeveria secunda glauca* along the ridge and down the middle on both sides, the others being clothed with *Mesembryanthemum cordifolium variegatum* on the inner side, and the outer half with *Sedum glaucum*. The smaller diamonds were covered with the golden moss-like *Spergula*, which, with the "dot" plants of *Echeveria tabuliformis* interspersed in the slopes, showed to great advantage, the parting lines consisting of *Echeveria secunda glauca*, as in the

apart, and edged with *Sedum lydium*; *Ricinus Gibsoni*, planted thinly on a carpeting of Blue Viola, contrasted well with surrounding objects, and the same may be said of beds carpeted with *Colens Verschaffeltii*, and dotted with plants of *Abutilon Thomsonianum*, Blue Gum trees, Golden Bronze Pelargoniums, encircled by a good band of Swanley Blue Lobelia, with an equally good band of the silvery-foliated *Gnaphalium lanatum* as an outer edging. In conclusion, it is only right to say that the condition of all parts of the park were highly creditable to Mr. Coppin, the Superintendent. *H. W. W.*

VEGETABLES.

CAULIFLOWERS.

THOSE raised in heat which are fit to plant out should be attended to forthwith, and will be but a little later than others which may have been wintered in cold frames, and, moreover, they will not come in altogether like those. Deep drills or shallow trenches should be made on an open piece of ground in good heart, and the ball of earth held intact about the roots, planting being done with a trowel, setting the plants in the bottom of the drills. The plants should be watered when set out, and afterwards when necessary. Those who find a difficulty in keeping up a supply of nice small heads of Cauliflower after July, would do well to plant the Walcheren Broccoli; and if some of the strongest are pricked off, as was advised for early Cauliflowers, and due attention paid to watering, shading them for a day or two until they begin to make fresh roots, and planting them out when sufficiently large, there will be no break in the supply till the autumn crop turns in. The Walcheren Broccoli gives white heads of nice flavour, which do not bolt like the Cauliflower in hot weather, and caterpillars injure them less.

TOMATOS.

THOSE raised in March should now be progressing rapidly, and should be afforded plenty of air, keeping them near the light, so as to induce short sturdy growth, consequently but little heat should be afforded them. The largest plants may be shifted into bigger pots, more loam and less manure being employed in the potting soil. Tomatos should have stations prepared for them by incorporating some loam with the staple, and but little, if any, manure. When a good set of fruits is secured, liquid manure may be afforded with great advantage, and I have found that when some old mortar rubble, road scrapings, or burnt garden refuse is mixed with the soil, the Tomatos are not so liable to disease as when manures are used. *G. Wythes, Syon House, Brentford.*

SUTTON'S FORCING DWARF KIDNEY BEANS.

THIS is a valuable variety for early work, sown on the same day as Osborne's Early Forcing and Syon House, and treated alike. It was fit for table six days sooner than those. Being of short stature, it needs few, if any, supports; and for heavy cropping, and good table qualities, it is everything that could be wished. *R. Milner, Penrice Castle Gardens.*

NOTICES OF BOOKS.

A HANDBOOK OF THE DESTRUCTIVE INSECTS OF VICTORIA.

Under this title, Mr. French, the Government entomologist of Victoria, has published a very handy synopsis of the principal insects affecting fruit crops in general. The insects are described and figured, and the best methods of dealing with them pointed out. As is the case of the United States, the Australian colonies are much in advance of the old country in all such matters. The immobility and prejudice to be overcome here, familiar as they are, yet always excite astonishment when one sees what is done elsewhere.

FIG. 98.—CARPET BED IN BATTERSEA PARK.

like size which contains more charming variety of scenery and subject, and so admirably disposed as to prevent anything approaching crowding or incongruity of parts. Here are glades of tropical Ferns, the pots being buried under the green sod; there groups of Palms, in close proximity to which are a variety of sub-tropical plants occupying warm and sheltered nooks; while on the well-kept lawns, masses of colour and excellent examples of carpet-bedding abound, and every turn in the walks reveals some fresh object of interest; and bold and spacious belts of choice trees and shrubs bordered with foliage, and beds of flowering plants, edged with *Funkia grandiflora* and *F. marginata alba*, contribute not a little to the general effect.

Having given an outline of the bedding, &c., in Battersea Park, as seen the first week in September last, when it looked its best for the year, a few particulars as to the composition of a few of the most noteworthy beds may prove interesting to readers of the *Gardeners' Chronicle*, now, perhaps, exercising their minds as to the advisability of making a departure in the arrangements of their flower beds and borders for the summer and early autumn.

Among the several good examples of geometrical

large section. All the small (No. 3 size) diamonds were filled with *Sedum glaucum*, with lines of the last-mentioned *Echeveria* along the apex and down the sides midway. The scolloping in the space between diamond-shaped pieces and the two outer bands being composed of *Alternanthera amœna*, with "dot" plants of *Echeveria metallica*, &c., set therein at intervals of 20 inches, a 3-inch-wide band of *Pyrethrum* (Golden Feather) encircling the whole, with an outer edging 6 inches wide of *Antennaria tomentosa*. This simple, but nevertheless elegant, design, consisting, as it did, of a series of diamond-shaped hills and valleys, neatly executed, judiciously planted, and admirably kept, was very telling in effect.

In the sub-tropical department, circular beds having an outer edging of blue Lobelia, then a band of Golden *Spergula*, next *Echeveria tabuliformis*, followed by a band each of Creeds's Seedling (pink) Pelargonium, the centre being filled with a dark *Colens*, with "dot" plants of *Eucalyptus globulus*, had a good effect; as also had beds having a groundwork of blue *Ageratum*, and thinly planted with bronzy Castor-oils, *Abutilon Thomsonianum*, Golden Bronze Pelargonium, and *Echeveria glauca*, 8 inches

LES FLEURS À PARIS, CULTURE ET COMMERCE.
Par Philippe L. de Vilmorin. (Paris: Bail-
lière.)

We have already called attention to the publication of this work, but in justice, alike to our readers and to its author, we must now indicate more fully the nature of its contents than we were able to do at the time mentioned. In a short introduction, M. Henri de Vilmorin, the father of the author of the book, alludes to the great development of the trade in flowers, and consequent upon the increased fashion for these unrivalled adornments. Whence do all these flowers come? Who cultivates them? Who harks forward, receives, and distributes them? These and cognate questions are considered by M. Philippe de Vilmorin, acting as the deputy for his father, whose engagements prevented him from fulfilling the task himself.

In Paris, where the trade in flowers has attained such large dimensions, the want of a central flower-market, analogous to the Flower Market in Wellington Street, Covent Garden, is commented on. For lack of such a building, the market is held in a covered passage between the Rue Rambuteau and the Rue Berger. Here, beginning in the evening, and open to the icy winds, come first of all the railway waggons from the Southern Railway; these are followed by the local cultivators, who pay daily 30 to 40 centimes a square metre for their stand, according as it is under cover, or in the open. The accommodation is so inadequate, that in the winter the sellers suffer more than the plants, which are carefully protected by mats. The sales begin at 3 o'clock in the morning in summer, and at 4 a.m. in winter. M. de Vilmorin describes the work done by the several attendants—commission-agents, auctioneers, porters, &c.—at the market, and his account shows that, as with us, the middleman gets a share of the proceeds, which is disproportionately large.

At 9 o'clock in the morning the sales are finished, the "ambulants" ("costermongers") disperse in all directions, the growers sleep the sleep of the blessed under their green-covered carts, leaving their horses to find their way home, just as may be witnessed in any of the roads leading out of London. In addition to the great central wholesale market there are eleven separate flower-markets for retail purposes in different quarters of Paris. Many of our readers know how pictorial, but also how inconvenient, they are. Then there are the flower-shops, where the consummate taste of the artist may be witnessed in the making of bouquets and floral decorations. In the section relating to the sources whence all these come, the author draws a broad distinction between local products and those that come from the south. In the environs of Paris there are between 400 and 500 growers, devoting themselves to a few specialties, thus,—forced Roses are grown at Grenelle, Vauves, and Montrouge; Tulips and bulbous plants are grown at Montrouge; the Avenue de Chatillon has the monopoly for Orchids; Vauves and Grenelle supply Bouvardias; Charonne and the Boulevard d'Italie furnish Oranges; Picpus forced Mignonette and Wallflowers, and various suburban Communes each supply some specialty. This devotion to one or two specialties results in extraordinary perfection of cultivation, combined with the greatest economy of production.

As to the transport by rail from the Southern lines, this is described by M. de Vilmorin, who tells us that flowers gathered in the morning at Cannes or Nice, and sent off about 11 o'clock, arrive in Paris the next day at noon. The first part of M. de Vilmorin's book is full of interest to those who care to know how a great city is provisioned with flowers. The latter part of the book is devoted to the systematic description of the principal flowers, annuals, perennials, or bulbous, as well as stove plants, trees, and shrubs, that are used in gardens, and for decorative purposes. Indications for cultivation are also given. Of all this portion it is enough to say that it is the work of a de Vilmorin. More than 200 woodcuts illustrate the text, and render the book invaluable to the amateur.

PHILOSOPHICAL NOTES ON BOTANICAL SUBJECTS. By E. M. Bonavia, M.D. (Eyre & Spottiswoode.)

The author has not published his reflections for the reason so often assigned—that he has been induced to do so by his friends, but he tells us frankly that he has been so possessed of them, that it became necessary to give freedom to his soul, to take arms against a sea of troubles, and by making his woes public—end them. Let us hope that he has done so; and let us tender our sympathy the more sincerely, that we fear the author's method of presenting his subject, and his discursive rambling on things in general, will injure his book in the eyes of working naturalists, and lead them to grant it less attention than it really merits. The author is of opinion that unless botany be studied in an evolutionary sense, there can be but little interest in learning an infinite number of names as labels to certain forms of plants. Well, most people nowadays are of the same opinion. Dr. Bonavia's leading principle is that existing land plants are the modified descendants of plants lower down the scale, such as seaweeds. This is a speculation by no means peculiar to Dr. Bonavia. His critic, however, who asked him, "What is your authority for all this?" was quite justified. A speculation without a basis of fact to support it is worthless. Dr. Bonavia feels this, for he quotes with approbation Max Müller's dictum, wherein he says, "we must neither turn to the right nor to the left, but look at facts straight in the face to see whether they are facts or not, and if they are facts, to find out what they mean." In spite of this, the only answer he could give to his inquirer was "*l'autorité c'est moi*." We are not greatly surprised that another listener on a similar occasion "jumped off his chair in a fit of incredulity, took up his hat, and said 'Good-morning!'" The average Englishman, indeed, is greedy for facts. If he is not supplied with them, he asks for "authority," or he cuts short the discussion. The interpretation of facts, however, is every bit as important as the facts themselves. Unluckily, the average Englishman does not care so much for the interpretation, and is apt to run away when it is attempted. The mutual relation between fact and theory is, however, so intimate that no progress can be made where this is ignored. Under such circumstances we simply go round and round in the rut our forefathers made for us. Dr. Bonavia is not disposed to remain in the beaten tracks; he sees pastures ready for browsing beyond the limits of convention, and for our parts we sympathise with his wish to reach them. In addition to the supposed ascent of plants from aquatic forms of lower organisation, Dr. Bonavia attributes great importance to cross-fertilisation, to fusion, and to atrophy as factors in the modification of plants. When by fusion the author means in-separation from arrest of development, and when he speaks of atrophy as "modifying factors," it would seem to us that he is dealing with degeneration rather than with progress.

We cannot follow Dr. Bonavia through his book, as it deals with such a variety of matters of detail, the discussion of which would be tedious. Sometimes we sympathise, and then comes what we think a false note, and we mentally part company with the author, only to revert to his pages, for there is so much that interests the lover of plants, that whether the reader agrees or whether he disagrees with the author, he will be sure to obtain much information and some amusement from his pages. It must suffice to say that Dr. Bonavia deals in successive chapters with variation, natural selection, colour, evolution, the morphology of roots, stems, leaves, parts of the flower, hairs, glands, the genesis of the fibro-vascular system, the disc, the peel of the orange, and many other subjects. On these topics, Dr. Bonavia discourses pleasantly, but by no means in all cases convincingly. Critics with less highly-developed imaginative power see only analogies where the author contends for homologies, and some, whose endowments in the way of patience are not great, will repeat the performance of the one who

took up his hat, and said "good morning"—that is, if his impatience does not get the better of their politeness. Here, for instance, is a speculation, which we may express in the author's own words:—"Now bacteriologists have discovered spiral microbes, that is, cells, or strings of cells, which grow into a spiral. These can infiltrate themselves into the minutest tissue, or, at all events, their spores can do so. What wonder would it be, then, if the spiral vessels of plants owed their development to spiral microbes which gained admission into purely cellular plants as parasites, and occupied their intercellular spaces, thus becoming part and parcel of the cladophyll." It is such crude speculation as this that will, we fear, deter botanists from according to Dr. Bonavia such a patient hearing as on many other points he merits.

THE APODIDÆ: A MORPHOLOGICAL STUDY.
By H. M. Bernard. (Macmillan & Co.)

The main objects of this book is to ascertain the relationships between the Annelida and the Crustaceans, and by minute comparative study the author arrived at the conclusions that existing Crustaceans derived their origin from Annelids by successive modifications in the course of time; and, further, that the Trilobites and other archaic forms originated from the same source. The creature called *Apus* is then one of those missing links which were so mockingly called for in the early days of Darwinism, as if such links were not likely to be procurable. We now know that there is no lack of such intermediate forms, and according to Mr. Bernard the *Apus* is one of them. The mechanical causes of the transformation are also apparent. The Apodidæ, says our author, afford as the first complete illustration of the rise of one large animal class out of another by the simple and natural adaptation on the part of one single species of the latter to a new mode of life. It is not a new form, or one previously overlooked, that has been discovered, but a new explanation is afforded of one long known and often described; so far, this is more satisfactory than if the link had really been missing. There must be thousands of such links around us still, only awaiting the attention of our students. We cannot in these columns follow the author in the details he brings forward in support of his argument, but we can and do strongly commend his book to the consideration of philosophic naturalists.

CULTURAL NOTES.

BUSHY BALSAMS IN SMALL POTS.

THE most useful lot of Balsams I ever had were raised and grown as follows. Observing how very ornamental chance seedling Balsams often came in mixed flower borders and beds, and how vigorous and floriferous they came under such conditions, with fine foliage down to the ground, I sowed the plants on a warm border in the open the last week in May. So soon as large enough to handle, they were planted out 6 inches apart. There they made rapid progress, being of abnormal strength and breadth to the ratio of their height, and virtually feathered to the ground. So soon as the plants met, and began to show flower, they were potted up in 4-inch pots. They were potted so low, that the base leaves and branchlets rested on the soil. The pots and compost were taken to the plants, not the plants to the pots; this enabled the plants to be potted with a minimum of check or disturbance.

The compost used to fill in the small spaces, not filled with the small balls of roots and earth transferred from the borders to the pots, consisted of equal parts of one-year old cow-dung and leaf-soil, with a liberal dash of gritty silver-sand. One potsherd was placed over the hole at the bottom of the pot, and about three pieces of rough manure over the potsherd. To add to the food-supplies for the roots, the pots were heaped up with manure

and one inch bones. The plants were then placed for a few days in a close, cold pit, and the leaves sprinkled until the plants were established; they were then gradually inured to the air, and placed in a sunny, airy greenhouse. Occasionally, as the roots ran like thick threads of silver all over the surface, a few crumbs of cow-mauure were applied as a dressing; this was covered over with green moss and the plants were watered, twice, sometimes three times, a day, with a manorial stingo manufactured from cow-dung and soot, and soon the whole surface, moss and all, became a mass of root-fibres, and these latter produced such a profusion of flowers and branchlets, and of clean, healthy foliage, such as is seldom seen on Balsams in 8 or 10-inch pots.

For the many decorative purposes for which Balsams in pots are applicable, nothing can exceed in usefulness and beauty such stubby floriferous examples in 4-inch pots. I have also found plants similarly raised with stubby habits, most useful in Rose-beds and mixed beds and borders, throughout the late summer and autumn months. Where dinner-table decorative designs have to be changed daily, the flowers of fine Balsams placed on the cloth, in saucers, glass dishes, or shallow baskets, form a convenient and welcome change. *D. T. F.*

STREPTOSOLEN (BROWALLIA) JAMESONI.

The list of greenhouse plants that flower very early in the year is not an extensive one, but among them must be included the Streptosolen. I am very much surprised that it is not more frequently met with in collections of greenhouse plants, possessing, as it does, many desirable features. In the first place the pale yellow flowers, changing, as they do, to a deep orange-red, supply a colour but little represented among greenhouse plants at any time. The blooming season lasts for a long time, the flowers usually making their appearance in February, and continuing till the summer is well advanced. Grown in pots, it develops vigorously, and quickly forms neat compact specimens if stopped from time to time during the growing season. Careful attention must be exercised that the plants do not get pot-bound, for if starved in any way, a number of the leaves will fall. It is admirably adapted for training up pillars, &c., each branch bearing at its extremity dense clusters of from thirty to forty flowers, causing a very charming and effective display. A mixture of good fibry loam, leaf-soil, and a fair portion of silver-sand, with a little well-dried cow-mauure, forms a very suitable compost. Propagation may be effected by cuttings inserted in sand under a bell-glass. If propagated in May or June, capital plants for flowering the following spring may be obtained. *Geo. Parrant, Ashby St. Ledgers Lodge, near Rugby.*

TRILLIUM GRANDIFLORUM.

This is one of the choice things that is seldom seen in gardens, and yet in partial shade, and where there is good depth of light, leafy, or peaty soil, and no lack of moisture below, it is very easy to grow. In such a situation, the plant grows freely, and produces its snowy-white flowers numerously; but these should not be cut off, the loss of the foliage which goes with them greatly weakening the plant. The way to increase *Trillium grandiflorum* is by division of the root, just as growth commences, or when the leaves begin to change colour. *J. S.*

DORONICUMS.

Amongst the many good hardy perennials, the *Doronicums* take a high place as early-flowering plants, and clumps of them make a good show in the herbaceous border. The strongest species, *D. plantaginifolium*, is just the plant for the wild garden, and, it being robust and tenacious of life, it is able to hold its own in such a place, and so striking when in bloom as to compel admiration. Where cut flowers are required in large quantities, there is scarcely another plant that is more useful than this one, and of which a row should be planted in every garden for cut blooms, and thus save the clumps in the borders. Sunflowers of the kind referred to are general favourites, being effective when arranged

loosely in vases, where, if supplied with plenty of fresh water, and the ends of their stems are cut once or twice, they will last a long time in perfection. The *Doronicums* seed freely, and plants may be quickly raised in that way either by sowing under handlights in fine soil as soon as the seed is ripe, or by division of the roots, which may be effected at almost any season, but the best is in the early spring, when the plants are about to start into growth, when they may be dug up, and pulled apart; another good season is just as they go out of bloom, if dull or showery weather be chosen for the job. *J. Sheppard.*

THE APIARY.

SWARMING.

The season being so late, few swarms have been heard of as yet, and June will be on us before swarming becomes general. The most profitable way to treat a swarm is to return it to the hive from which it issued, after first taking out five or six of the frames containing brood and adhering bees, which place in a fresh hive. No queen cells must be left in the remaining combs, which should be alternated with frames containing worked-out comb, or whole sheets of foundation, before the

FIG. 99.—A NEW SELF-HIVER FOR BEES.

swarm is put back. Should increase of stocks be desired, the frames taken out of the old hive can be divided and made into two small colonies, or nuclei, as they are termed, taking care that each has a queen cell. These, soon having young queens, will build themselves up into quite good stocks by the end of the summer, especially if care is taken to keep them fed; dry Porto Rican sugar in a dummy feeder being the least trouble, and most stimulating. If increase is not wanted, the nucleus can be stood at the side of the old hive, to which it can be united in the autumn, first killing or otherwise disposing of the old queen.

SUPERING.

The coldness of the season is apparent, so far as honey is concerned. In none but very favoured districts at the time of writing has any surplus been secured from early fruit blossoms, such as Gooseberries. There are now, however, Apple, Pear, Hawthorn, Horse Chestnut, &c., and it is to be hoped that a spell of fine warm weather will come in time for the bees to take advantage of these. In working hives for extracted honey, it is a great advantage to the bees to provide them with worked-out combs in the super in preference to foundation, as they take to it quickly, and it also saves them a lot of time and labour, which might be more profitably employed. It is likewise always

advisable to place two or three sections containing worked-out comb in the centre of the first section crate that is put on, as it is an inducement to commence work therein more quickly.

TWO QUEENS IN ONE HIVE.

As sure as "there is nothing new under the sun," so it is with this idea, for bee-keepers are now coming forward who have previously tried experiments in the same direction. One states that he worked a hive on this principle five years ago, and never before or since had such slabs of comb perfectly filled and sealed. Another says that he tried it sixteen years ago, and abandoned it owing to the swarming difficulty, as when one half of the hive swarmed, the other followed suit.

A NEW SELF-HIVER FOR BEES.

Our illustration (fig. 99) shows a new apparatus for automatically having swarms. It consists of two boards about 18 inches square, in the upper of which is a round hole 12 inches in diameter. The two boards are spaced about an inch apart, so as to make a passage, one end of which is covered with queen-excluding zinc, the other being placed at the entrance to the hive. It is put in position a few days before a swarm is expected to issue, and when that takes place the worker-bees go out and cluster, but when they find that the queen does not join them they go back, and finding her in the straw skep placed over the hole in the upper board, which she ascends in her efforts to get out, remain there, and can be taken away and hived where required. It may be mentioned that the straw skep should have a hole in the top covered with perforated zinc. *Expert.*

FLORISTS' FLOWERS.

POMPON DAHLIAS.

As the season is now approaching when those who have gardens are looking around to see what flowers are worth cultivating, perhaps it would not be out of place to call the attention of those who have the necessary space to try some Pompon Dahlias, which, from the beginning of August until the frost comes, will afford a quantity of very useful and beautiful flowers of varied colours. There is no doubt they have greatly improved in habit and in colour since the National Dahlia and other societies began to offer prizes for them, for but a few years since, it was a matter of some difficulty to find a sufficient number of small-flowering varieties to make up a stand of twenty-four Pompons without the addition of some that would have been more properly classed with the bedding varieties, a class of Dahlias no longer so much required since the Pompons and Cactus section have become so popular. Where a constant supply of cut flowers during the autumn months is required, there is no flower that will furnish a greater abundance than these, and as they require nothing but ordinary care in their cultivation, they are the more likely to give satisfaction. Young plants should be obtained this month; these can either be sent by Parcel Post without pots or soil, or by rail if preferred in the pots they have grown in, or they can be turned out of pots and rolled in paper—a less expensive method. On arrival the sooner they are unpacked the better, when they should be kept shaded for a short time until they are recovered from the effects of the journey, which will be in a day or two, and as it is not safe to plant them out until the first week in June—a shift into a 5 or 6-inch pot will greatly help them. They should be kept close for a few days until they are rooted into the new soil, when they should be gradually hardened off, and, if the weather is favourable, they should stand in the open, day and night, for a few days before being planted out. As Dahlias delight in a rich soil, the ground should be well manured, and they should be planted about 3 or 4 feet from each other, and from 5 to 6 feet between each row, which will afford room to get amongst them during wet weather. During wet or showery weather, a slight

dusting of quicklime will destroy any slugs that are proving troublesome. After they are planted, they should be stacked and securely labelled; and after a rain, a good mulching will help to keep them moist. After the frost has cut them down, they should be taken up and put in a dry place secure from frost, and if plunged in rather dry cocoa-nut fibre or similar material, they will be found to keep all the better. *G. Barnes, The Park, Salisbury.*

[Our correspondent sent a list of varieties, but our readers will find the names of the best of these in any good florist's list. Ed.]

THE WESTERN CAUCASUS AND ITS FLORA.

(Concluded from p. 388.)

HAVING become acquainted with the climate and the character of the wild vegetation of Asia, we may say, *a priori*, that here horticulture ought to flourish. Indeed, Abasia presents to the eye of the traveller a true garden. Rambling about the country, he sees everywhere numberless fruit trees growing singly along plains and hills or in large groups. Everywhere Walnuts lift up their large shadowy crowns, and the Vine twines around trees. But it would be very erroneous to think that rational horticulture could be highly developed in the country. The lazy and careless Abasians are quite satisfied with what they have inherited from their fathers, and do not care a whit about the amelioration of their gardens. The consequence is that the trees grow without any order; wherever, indeed, the stone of a fruit happens to have been thrown, very often in company with common forest trees, as Chestnut, Alder, Hornbeam. This makes an Abasian fruit garden very much like a forest; the resemblance is all the more striking, as the latter sometimes (viz., in lower zones) contains a large proportion of the same fruit trees. The favourite kinds of fruit in Abasia are, various sorts of Apples, Pears, Peaches, Plums, Figs (*Ficus carica*), Khurmah (*Diospyros Lotus*), the two latter being rather forest trees than garden ones. All fruit is gathered in the most barbarous manner, namely, by breaking off the boughs, and is usually eaten in an immature state, the ripe fruit being considered by the natives as good for nothing. The Vine is very largely cultivated in the country, the Abasians being very fond of good wine. Till lately, very many sorts of Vine were in culture which produced excellent wines, having much strength and flavour, and tasting like the best wines of Bordeaux and Malaga; but after the final conquest of the country by the Russians, and consequent emigration of the greater part of the natives to Turkey, Vine culture, as likewise many other branches of horticulture, have been somewhat abandoned. Among the various sorts of Vine must be mentioned a curious early sort, which flowers in February or in the beginning of March, and ripens in the month of May. Everywhere in Abasia common Cotton (*Gossypium herbaceum*) is cultivated; this is a substitute for Flax in Abasian households. Among the kitchen garden plants worthy of remark is a peculiar sort of twining Cucumber, with very long fruit, which is usually allowed to grow along hedges.

Such is a picture of indigenous horticulture. As each will readily conceive, the state of it leaves much to be desired. So much more striking, when compared with it, is the success of horticulture in Sookhoom-kaleh, the principal town of the province. After the conquest of the country, many intelligent Russian people settled here. Under their hands horticulture in a short time made such progress, that the gardens of Sookhoom-kaleh must be considered now as the foremost in Russia, and may be compared with the best gardens of Southern Europe. The horticulturists of Sookhoom, being for the most part very rich men, spare neither efforts nor money in order to collect in their gardens the best specimens of decorative and fruit trees. Some of them particularly attend to the acclimatisation of various exotic plants, whilst others devote themselves to the organisation of excellent orchards. The very mild

climate of the country greatly favours the acclimatisation of many subtropical, and even tropical, plants in the gardens. The numerous representatives of the subtropical zone, viz., *Eucalyptus globulus*, *Albizia julibrissin*, *Catalpa syringifolia*, *Paulownia*, *Melia*, &c., may be seen everywhere along the streets of the town, where they form beautiful walks. Almost every garden of the town is adorned by stately shrubs of *Oleander*, *Hibiscus syriacus*, and *Lagerstromia indica*, richly covered with purple showy flowers, as well as by beautiful specimens of *Yucca*, *Agave*, *Myrtle*, *Tea-plant*, and *Opuntia*. In the magnificent garden of Mr. Voedenky one may admire some excellent *Camellias*, *Magnolias*, *Pittosporums*, *Sterculias*, as well as the richest collection of tropical Conifers (various *Cupressines*, *Araucarias*, *Podocarpus*, &c.).

Mr. Tatarinoff may well be proud of the great number and variety of acclimatised Palms (about fifty species), *Mueas*, *Bromelias*, *Cactus*, and other plants peculiar to tropical climates. (All the plants just mentioned successfully winter in the open ground without any sort of shelter. The best of all grow in the gardens of Sookhoom, the plants of Japan, Northern America, and Australia. Among them, *Eriobotrya japonica* has become the most favourite fruit tree of the country. The growth of *Camellias*, *Tea-plant*, and *Bamboo* leaves nothing to be desired. The American *Magnolias* and *Liriodendrons* are very common trees, occurring in every garden of the town. As for the representatives of Australian flora, they may be said to have found here a native country. Besides many sorts of *Eucalyptus*, in the gardens of Messrs. Voedenky and Tatarinoff, there grow in the greatest luxuriance Australian *Acacias*, *Casuarinas*, *Proteaceae*, *Metrosideros*, New Zealand *Flax* (*Phormium tenax*), the *Grass-tree* (*Xanthorrhoea hastilis*), &c. (All these plants yield ripe fruit each year.) In many gardens there are also little plantations of *Olive*, *Orange*, and *Lemon* trees. As for the two latter, they do not here yield any considerable profit, for they rarely exceed the size of a shrub, which produces only 600 to 800 fruit under the most favourable circumstances. *N. Aboff, University, Odessa.*

OUTDOOR MUSHROOMS.

FULLY half a mile, if the Mushroom-beds were all put end to end, is Mr. Warren's estimate of the length of his beds at Isleworth. It would seem almost as if this was rather an under-estimate, judging by the immense number of them of various lengths, covering fully 2 acres of ground. Although there is much diversity as to length, there is none whatever in regard to shape, or height, or breadth. The average breadth at the base seems to be about $3\frac{1}{2}$ feet, height about the same, and tapering up to a top breadth of about 20 inches. That just represents the average dimensions of market-garden Mushroom-beds outdoors, when they have fairly settled down. A good deal of fuss is often made as to the ability shown in getting a very good crop of Mushrooms in proper sheds, cellars, or houses. There is very much more of ability, as well as practical knowledge, required to grow crops in a profitable way out-of-doors, especially during hard winter weather. The earliest of Mr. Warren's beds were made up last October, and as under such conditions spawn does not move too freely, it is not a matter for surprise that the first week in January was reached before any Mushrooms were gathered. That first picking gave just 91 lb. When I was there to see the beds on February 25, the gathering reached the huge total of 661 lb., and gatherings went on from January twice and thrice a week, so that the entire produce from this half a mile of beds is during the season enormous. As to how many tons of stable-manure are employed in making the beds, how many loads of meadow-loam to surface them, or how many wagon-loads of long litter employed to cover them up some 15 inches thick all over, it is not possible to learn. But it is certain that fully 500

bushels of spawn are used, and this, too, fairly liberally, as the cakes are broken into pieces of six each, and are pressed into the manure at about 6 inches apart all over the surface. Only one firm of spawn makers is patronised, because their manufacture has ever proved to be fully reliable. The loam is obtained from a neighbouring meadow, and its place supplied by other soil as needed. To have plenty of manure for a good start in October, it is needful to begin collecting very early, and have huge heaps from which to draw the necessary supplies but the contiguity to London renders securing an abundance of manure, both for beds and covering, comparatively easy. The earliest beds will soon be done with, whilst the later ones will continue to supply Mushrooms up to the end of June. Later, they are apt to become infested with insects, and it is well to finish cutting in good time. The Mushrooms are all gathered into half-bushel baskets, taken into a big shed, and there trimmed and sorted by women, whilst men weigh and pack them. The cups, or half expanded ones, and the buttons, being all neatly tied up with blue paper in punnets, each of which holds 1 lb., whilst the larger ones are put into half sieves lined with blue paper, and so sent to market. It need hardly be said that the total produce of this half a mile of Mushroom beds is very heavy, and it would be exceedingly interesting to learn how much is the total for the season. Mushrooms so grown are invariably heavier than are those grown in sheds or houses. Mushroom beds do not present very nutritive matter for other crops, the fertility of the materials having been largely exhausted. Mr. Warren has very little of open land, as his ground is nearly all under fruit, especially Plums. Beneath these and old Apple and Pear trees, there are grown extensive breadths of the Grove End Scarlet Strawberry, and the Mushroom beds are largely used to dress these beds or rows of Strawberries after the fruit has been gathered. The course of culture is an odd one. Plants are put out into rows 3 feet apart. The dressing given encourages the free rooting and strong growth of runners. When the original plants have fruited, they are dug in, the runners on either side being saved for fruiting the following year; then the next season these are dug in, and their runners are saved, so that the plants practically are treated as annuals, the liberal dressings of the manure serving admirably to keep the rows in constant growth and fruiting for many years.

Where ordinary varieties of Strawberries will not thrive because of too dense tree growth above, the Grove End Scarlet will do so for many years, and it would seem as if, in these preserving days, there was hardly any limit to the demand for the fruit. The large quantity of litter required for the covering up of the Mushroom-beds naturally becomes half-decayed by the time it is no longer required, and it is then found to be of admirable service in smothering perennial weeds wherever they present themselves, as they will from year to year under the trees Should a patch of under-fruits become foul, they are grubbed out, and the entire piece in the spring smothered fully 9 inches thick with the Mushroom litter. The result is, that top growth is impossible, and the roots in consequence die. This top-dressing is forked in deeply during the winter, and more Strawberries or double white Narcissi or Wall-flowers are planted. It is not to be wondered at, that whilst Apples and Pears seem to have exhausted the soil of their natural requirements, Plums thrive and bloom luxuriantly, the trees this season being literally garlands of snowy whiteness. *A. D.*

SPRING GROVE HOUSE, ISLEWORTH.

This place is of supreme interest to those horticulturally inclined, as it was once the residence of Sir Joseph Banks; indeed, we are at once reminded of this eminent man by a glance at the gardener's cottage, on which is growing the original Banksian Rose introduced to this country by Sir Joseph.

Great alterations and improvements have been

effected in the grounds here since its present owner, Andrew Pears, Esq. (of Pears' soap fame), came into possession, a few years ago, rendering it a pleasant and picturesque rural retreat.

In the plant houses, which are well furnished, containing many examples of cultural skill, we noticed amongst others, fine specimens of *Alocasia metallica*, *Anthurium crystallinum*, and *Maranta zebra*. *Spiraea astilboides* is especially well-flowered here. A noble specimen, in flower, of *Anthurium Scherzerianum* var. *Wardianum* attracts attention by its being stated to be the parent plant of this fine variety. Some fine *Trea* Ferns, which Mr. Pears brought direct from Australia, impart a tropical effect to the structure in which they are located, associated as they are, with grand examples of Palms. A look into the Tomato and Melon-house afforded an interesting note; seed of Hackwood Park, Perfection, and Conference were all sown together in January last. Conference is by far the earliest variety, indeed some of the fruits are now colouring; the two others are not near this stage. This experiment has induced Mr. Debnam, the gardener, in the future to grow Conference largely as an early variety. It should be mentioned that the plants are subjected to the same temperature as Melons, in which house they are growing. Early Melons are made a feature of, and fruit will be ready shortly. A seedling between Hero of Lockinge and Scarlet Premier is grown which will doubtless be heard of later in the season. Bean Ne Plus Ultra is the favourite here for forcing purposes. Forcing Strawberries are represented by Vicomtesse Héricart du Thury and President, the first fruit being cut a month ago. A house of Black Hamburg Grapes is colouring well; some of the bunches, indeed, being of exhibition size. The Vines are thirty years old. A new range of late vineries, 90 feet in length, will shortly be erected. Early Louise Peach sets well, but its cropping capabilities are not good. The favourite Peaches are Dr. Hogg and Royal George, and both have a fine show of fruit. An orchard-house, some 240 feet in length, has Plums and Cherries trained as cordons to hang under the roof. Some trees of Pear Benrê Diel look well, as do the Apple trees in the same structure.

In the outside department the hardy fruit promises well, there being a good set. Cherries on walls also promise good results. Some rockeries have been formed under some grand old Elms, which it is intended to plant with British Ferns. An avenue of the double-flowered Cherry will be an attractive feature when in flower. The roseery, planted eighteen months ago, is now beginning to be established. It is pleasing to find that herbaceous plants are well cared for here, the various borders planted with them occupying about two-thirds of a mile. In what is called the Elizabethan garden a series of beds have been made, which will be filled with suitable plants as the season advances.

Hereabouts is of royal interest, for the story runs that one of the Georges died in "The Temple" which looks out on the Elizabethan garden.

A truly venerable Cedar in front of the mansion is of special interest to lovers of fine trees. A model farm, which is in course of formation, attests to the completeness of the improvements at Spring Grove House; whilst mention must be made of the care that has been taken by Mr. Pears for the comfort of the men employed who are resident on the place, the keep of which reflects great credit on Mr. Debnam. J. B.

THE ROSEERY.

NEW FRENCH ROSES.

THERE cannot be a more striking evidence of the change that has come over English Rose-growers with regard to the new Roses raised annually in France than the fact, that up to the present date (May 11) there has not been a single notice in any of our gardening papers of the novelties (?) announced

by French raisers for the autumn of 1891. I remember well with what feverish anxiety these lists used to be looked for in former years—how every scrap of news relative to them was eagerly welcomed, and he was considered an enviable person who had seen any of them, and could tell the world what he thought of them. But "nous avons changé tout cela," may be retorted of our neighbours, and we wait with the most stoical indifference for all their grand comments and plentiful supply of laudatory assertions which they heap on their new productions. The reasons for this change are not difficult to discover.

There is the old adage, that "A burnt child dreads the fire," which may to a great extent explain the matter. Roses have come from France, and home growers have hoped continually that the high-sounding appellations and grand descriptions given from year to year might in some cases tell the truth. Each year some sixty or seventy Roses have been brought out by the French raisers, and yet of the three or four hundred thus distributed during the last six years, I doubt very much whether there is a dozen which will bear the test of experience, and remain in our catalogue of exhibition Roses. In the year 1884, the National Rose Society published its catalogue of exhibition Roses; and in 1888 a supplement was published for the purpose of adding such Roses as, between those two periods (four years), might be considered worthy of the honour. Now, in that period there were but two hybrid perpetuals of French origin admitted into the catalogue, Madame Hériot Pereira and Madame Joseph Desbois, and I do not consider either of these first-rate Roses; while amongst the H.P.'s, one Rose of 1884 must be added, Victor Hugo. In the same period, two really valuable Tea Roses, Ernest Metz and Madame Hoste, have been added to our list, both from Gailliot; and this is surely a beggarly dish to set before the hungry devourers of novelties. Is it any wonder, then, with such facts as these before them, that English growers for sale should be very shy of the bait thrown to them? Of course, it is very nice to get 25 francs for a new Rose, and the raisers are so far apart that there is some excuse for this, in that they do not see one another's productions, and there are no such Rose shows abroad as are so frequent with us in England.

Then, again, the conviction has forced itself on many lovers of the Rose that we have pretty well reached as far as we are likely to do; it is true we should like to see a yellow hybrid perpetual of the same colour as *Maréchal Niel*, or a white one of the form of *A. K. Williams*; but as far as red and rose-coloured Roses are concerned, late years have not added much to them. Is there, for instance, any Rose of that colour that has been raised of recent years we should like to substitute for *Marie Baumann* or *Alfred Colomb*? What dark crimson would we prefer to *Camille de Rohan*? What Tea of recent years can surpass *Souvenir d'Elise*, or *Anna Olivier*, or *Catherine Mermet*? Yet the first of these has been nearly forty years in cultivation; the second, thirty; and the third, twenty-two years; and as yet they will hold their own against all comers. Then *Niphetos* has a record of nearly half a century, and many of our best Roses have almost similar records. There may be unlooked-for varieties to come, but I very much question whether, as in the case of the *Pelargonium*, the *Dahlia*, and other florists' flowers, we have not reached a point of perfection which it will be difficult to surpass. I know the same has been held with regard to other florists' flowers. Raisers have named their seedlings after their wives or daughters, thinking they were doing them great honour, and yet in a few years they have almost passed out of the lists, and been fairly outstripped by better sorts. It may be so with the Rose, but I do not think it, and it is this feeling which has led most of our rosarians to look with composure on the lists of new sorts.

Then, there is a third reason, and that is, that we are raising in these islands varieties which are quite equal to the French sorts, and which we have the opportunity of examining. During the same years that the French raisers have been pouring in their treasures, the English and Irish raisers have added

of really good flowers quite as many to our lists, and they are willing to bring their flowers to the most exacting tests; and we may safely say that in Earl of Dufferin, Lady Helen Stewart, Her Majesty, and Mrs. John Laing, we have four Roses equal—nay, superior to any that we have received from abroad during the same period; while amongst Teas, I think that Miss Ethel Brownlow is quite as good as either Ernest Metz or Madame Hoste of the same period.

And now, what have the French growers done for us this year? I have received, through the courtesy of Messrs. Ketton Frères, of Luxembourg, their list of forthcoming novelties, and I find, besides certain miscellaneous Roses, including a few English ones, there are thirty-eight Teas, eight hybrid Teas, and twenty hybrid perpetuals, and even then I do not think that the list can be exhausted. I do not see in it the names of either Nabonnaud or Eugène Verdier, but I do not think that they have given up the sending out of new flowers. As I have said, I have not seen their lists, and they are not included in those of either Ketton, or Souperet and Notting. The French have always been noted for their profuse descriptions, describing even the colour of the foliage, and thorns, and wood, and also for the names they have given to their Roses; but they have now surpassed themselves, for they give us a little history of the persons after whom the flowers are named—and as for names, here are a couple taken out of this year's list, "Grande Duchesse L'héritière Hilda de Bade," "Grand Duc L'héritier Guillaume de Luxembourg." "What can English gardeners make of such names? Many of the names of the raisers are comparatively unknown, so that trying to note what may be good is almost like dipping one's hand into a "lucky bag." There are, however, a few which bid fair from the names of their raisers and their descriptions to attract some attention, thus *Germaine de Mareste* (Tea), raised by that most successful raiser of Tea Roses, Gailliot, may be looked upon as promising. This raiser rarely sends out a bad Rose, and many of our very best exhibition Teas have come from him; but I fear it will be only a reproduction of *Madame Berard*, from which it is said to originate. Then there is *Generale Gonzou* (Widow Schwartz), which is said to be a seedling from *Beauté de l'Europe*, and so another of the Dijon race of rampant Tea or Noisette Roses. The Henry M. Stanley (Dingé et Conard), is said to be the issue of *Madame Lambert* and *Comtesse Riza du Parc*, both strong growers, said to be clear rose sometimes shaded with salmon; then we have a pink *Perle des Jardins*, which I should not regard in colour as an improvement on the older flower.

Amongst hybrid perpetuals, we have from *Madame Schwartz*, *De Morand*, which is described as a bright cherry-red shaded with purple, always a doubtful ingredient in a Rose of that colour, as it is apt to shade off to magenta. *Levêque* has *Belle Iryenne*, which he describes as a brilliant rose-red, shaded with white and carmine, a description which puzzles one's conception as to what the Rose really is. But after all it does not much signify, for it is hopeless to think of finding out the real character of the Roses announced. We may see them exhibited, and so be able to judge for ourselves. *Nous verrons. Wild Rose.*

NURSERY GARDENING, NOW AND THEN.

HAVING had occasion to visit the leading London nurseries, after an absence of upwards of a quarter of a century, I felt at the moment a very "Rip Van Winkle." Everything had so changed, not only names and neighbourhoods, but the nurseries themselves.

In many cases the ground had been built over, and the "old established" had not even left a rag of tradition behind. The prosperous neighbours, even "the pubs," knew them not; while those that survived had changed the entire character of their stock, and what were famous for, or had made a *specialité* of, was now simply ignored or neglected.

Others, wiser in their generation, had "gone with the times," but finding their old-fashioned houses not

adapted to grow "market stuff," had submitted with a wry face to patronise "those market fellows," whom in their palmy days they had simply ignored. We thus had in one of the very exclusive establishments in the north of London, a grand show-house, still rich in new, scarce, and well-done plants—a front bench filled with Mignonette, Genistas, early Pelargoniums, and Rhodanthe, flanked by "choice bits" in Palms, Crotons, and Dracaenas, while the beautiful but now neglected New Holland plants were but represented by a few solitary specimens, scattered among the crowd.

Oh, shade of Mrs. Lawrence! what must you think if you visit the scenes of your former triumphs, or the nurseries where you were always a most welcome visitor; where are your perfect yet monster specimen Pimeles, Aphelexis, Chorozeas? where your *Leschenaultias*, especially the lovely blue biloba? where your fragrant *Adenandras*? Where are your grand specimens (now degraded to pieces) of stove plants and Orchids, that used to be the glory of Chiswick and the Botanic, when royalty patronised such things, and Hurlingham was not so much as thought of? A gardener who could do such things well, was then a rare find, but now like the great auk's egg, rare and above price—in fact almost extinct. Alas! we are now content with foliage plants, got up in a season; or worse still, bought as half-specimens of the florists, and pushed on for the shows, the only art being heat and moisture, with judicious—often injudicious shade.

But enough of retrospect, and sighing over the past; for the present I must admit, has its great compensations, in many grand novelties in all classes of plants, many due, as of old, to the painstaking and successful ardour of collectors, and others to the careful and scientific work of the hybridist.

Among the former I place that unique Protead, *Grevillea Manglesii*, with its pretty Fern-like foliage and fringe-like white flowers, admirably adapted for suspended baskets, or to grow *au naturel* in the winter garden. Surpassing the old *Spiraea* (now *Hoteia japonica*), we have the two Japanese *Astilbes*, *A. astilboides* and *A. Thunbergii*, with their curiously erect, and angularly-branched inflorescence; both are easily forced, and will in time take the place of *Spiraea*. How popular and common too are Palms, due in a great measure I think to our gardening intercourse with Belgium and the Continent. When I was a boy, one heard of the Palm-house at Kew, and saw a few of the commoner and hardier kinds about, but now they are as plentiful in the market as Ferns were then, and are highly appreciated by an educated public.

Among new Palms, Phoenix Röbelini runs *Cocos Weddelliana* close in grace and elegance, and is doubtless more hardy, while some of the new *Arecas* and *Dæmonorops* are lovely in a small state.

Journeying south, the unique establishments at Chelsea claim careful attention, but so numerous are the gems there that I must merely give a list:—*Anthurium Rothschildianum*, *A. Scherzerianum* × *Williamsii*, with a large spathe, creamy-white, splashed scarlet; *Asparagus retrofractus* arboreus, a robust-growing form, with very light feathery foliage, which is most gracefully pendulous; a new *Epiphyllum*—*E. Russelianum* Gertneri, demands attention, its intense scarlet flowers glowing like a danger-signal among its leaf-like branches; the flower, too, has the form and appearance of a *Cereus* (Cactus).

Among many new Aroids, a fresh break of dwarf *Caladiums* will find much favour with decorators, the most striking among which must be named *Souvenir de Paro*, which was awarded a First-class Certificate at the Drill Hall on May 3 last.

And now for the hybrid *Streptocarpus*. I only remember uniform and *Rhexis*, which are associated in my memories of the past as being among the first plants I propagated from leaves; but now Messrs. Veitch & Son have a wonderful batch of hybrids, of very free flowering habit, varying in colour from white, through all shades of pale lilac and mauve to dark violet, and one with a decided sug-

gestion of red. These, too, make flowering plants the second season after the seed is sown, some even flowering the first year.

Orchids are above my flight, but I could but note the greatly improved forms of *Odontoglossum crispum* or *Alexandria* among other cool subjects at the Exotic Nursery, while the hybrid *Cypripediums* were legion. How widely some depart from the well-known old species, such as *insigne*, *Lawrenceanum*, and *barbatum*, and how much more interesting in colour and form—one London firm alone growing upwards of 150 species and varieties.

Foliage plants have made great advances in variety and beauty, thanks to Mr. Bause and our Continental friends, but I have only space to name two—*Aglaonema costatum*, a new Aroid from South America; and a very distinct *Bromeliad*, *Tillandsia Massangana* *superba*. And passing through the cool-house before venturing into the cold north-east wind, I can but stay to admire the new *Cytisus scoparius Andreanus* that caused such a sensation at the Paris Exposition, and must be the proverbial new broom that is said to sweep clean; at any rate, a great advance on this useful class of hardy shrubs.

How unique in colour, too, are the Chinese *Pæonies* and *Cherries*, so easily forced, and associated with other subjects, as the *Eulalia japonica*, and such elegant and graceful *Reeds*, give a character to our spring stages that in the past they greatly lacked. *Senec.*

THE WEEK'S WORK.

THE KITCHEN GARDEN.

By H. WYTHES, Gardener, Syon House, Brentford.

GENERAL WORK.—The hoe will require to be kept going on all kinds of soils, to prevent the growth of weeds. The thinning of the Onions, Carrots, Turnips, &c., should obtain attention, and if the hoe is kept going close up to the rows, the thinning will be much easier performed. Crops intended for early consumption will not require so much thinning as others. Asparagus, when grown from seed, is often left too thick; this should receive attention. The older beds should be dressed with agricultural salt or fish-manure in showery weather; the latter manure is excellent for this vegetable. The early-planted *Scakale* will now be pushing above-ground, and no time should be lost in removing all the growths but one, and dressing the ground as advised for Asparagus.

Leeks sown in heat should be transplanted into trenches having plenty of rotted manure at the bottom, and watered freely in dry weather. As a variety for early use, I do not think that the Lyons Leek can be beaten. The early-sown Cabbager, Broccolis, and Cauliflowers will be ready to transplant to their permanent quarters, care being taken to get as much soil to adhere to the roots as possible, and doing the planting with a trowel. Now, is often a critical time with the Onion crop, as often after the thinning the fly attacks the growth. As a remedy, it is best to encourage growth to the full extent, and dress the beds with fish-manure or guano. Soot is also of use, and all or any of these should be applied in a dry state in showery weather, or be followed with a watering. There are some substances equally as effective as sulphate of potassium, but these require more care in the quantities used and the methods of application, whilst manures, such as fish manure, feed the plants as well as prevent an attack.

BRUSSELS SPROUTS.—Those raised in heat will be ready to transplant into their quarters, which should be done after the manner of Cauliflowers. The Aigburth Sprouts should not be planted at less distance apart in the rows than 3 feet, the dwarfier kinds being put closer. Paris Market is an excellent early Sprout, more to be trusted than the imported, and it has a very firm, not too large Sprout.

LETTUCE.—To keep up a supply, seeds must be sown at intervals of three weeks, putting the seed in drills thinly, which saves transplanting them. It is advisable after this date to sow on a north border for a time, so as to prolong the season for Lettuce, and there the plants do better and come succulent. Summer Lettuce should always be sown in highly manured ground.

PARSLEY.—Sow now thinly for autumn use on fresh ground, dressing it with soot before making the sowing; and as a manure for Parsley, wood ashes and manure garden refuse is preferable to any kind of rank manure. The earlier-sown plants should be thinned, and a dressing of soot afforded in showery weather.

VEGETABLE MARROWS.—Plant out Marrows in warm and sheltered quarters, and screen them from the sun and cold for a short time afterwards. Either plant on disused hot-beds, or failing these a place on a south border will do, if a hole be dug to hold two or three barrowloads of warm dung and leaves. The old-fashioned mound is all very well in cold soils, but I find it best to plant on the level, the manure being kept warm for a longer period, and the roots suffer less in dry weather. The shoots of plants in frames should be stopped to induce an early set of fruit.

OPEN-AIR CUCUMBERS.—These, if raised in pots, should now be planted out, and as there are usually some spare frames to be had at this season, these should be utilised. Stockwood Long Ridge is still the best out-of-door variety, being very prolific, and having good long fruits. Sow the seeds in the frames if a suitable amount of heat is still to be found in the bed, or, if the heat is low, mix some fresh material with the old to give the plants a start, and let the soil get warm before sowing. Sow the seeds three in a patch, 3 feet apart, and thin out the weaker ones when they are a few inches high. See that no snails and slugs hide in the soil, as they are very troublesome. When Cucumbers are grown on ridges of warm litter, under hand-lights, the mode of sowing is as described above.

THE HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener, Mere worth Castle, Maidstone.

JUDGING from the marvellous wealth of blossom on Apples, we may surely hope to have a very heavy crop in this part of the country, and from information received, the promise seems to be equally good throughout Kent. What we now stand in need of most, are heavy rains, which would cleanse the foliage, and warm nights to hasten growth, otherwise the maggot will severely injure both flowers and leaves. [It is then that the spraying solution should be employed. En.]

Pears flowered irregularly, some varieties having a fairly good sprinkling of fruit, whilst others set but few, so that the crop will not be a plentiful one, with the exception of some of those which did not fruit last year.

Cherries, notwithstanding the late frosts, present a brighter prospect now than earlier, and those trees whose flowers were not fully expanded at the time of the severe frosts, will yield a fine lot of fruit. Standard Cherries hereabouts are full of promise.

Of bush fruits, Gooseberries show fairly good crops in some gardens; but Currants, both black and red, are very thin.

The Strawberry crop, judging from the strength and quantity of the bloom, will be one of the heaviest that we have had for some years; but rain is now badly needed, and in its absence artificial watering will have to be done ere the plants suffer, and become infested with red-spider and mildew.

ORCHARDS.—Young trees, late planted, and secured temporarily to take to prevent injury from wind-waving, should now be examined, and the fastenings renewed, should the soil have settled much. These trees must be watered forthwith if no rain has fallen recently, or growth will be poor. The watering must be thoroughly done, remembering that one good watering of the soil is of more use than a dozen dribbles. Those trees which were planted last October will be in full leaf, and should have all blooms that may have opened removed, with the exception of a few, which may be allowed to set, the fruits being reduced to two or three at a later date. Keep the grass closely grazed by stock in all orchards under grass, the laying down of orchards for hay being ruinous to the fruit trees. Some means must be adopted to protect the latter from being barked by the animals put into the orchard to feed.

Cuttings of bush fruits should be watered, and the soil trodden firmly afterwards, passing the Dutch-hoe between the rows to destroy weeds and fill up the cracks caused by the drought. Seedling Crab stocks, also the Paradise from cuttings, may be grown for grafting or budding purposes; these will always be found useful. Plum, Cherry, and Quince stocks, should always find a place in a good fruit-garden.

GRAFTS should be examined at short intervals, and the cracked clay coverings filled up by smearing them with thin slip or puddle. Large trees which may have been headed back and grafted last year, should have their stems kept clear of young shoots, but any trees grafted this year should be left alone; see that grafts are made secure against wind.

VINES on open walls may be disbudded, and when fruit shows, the bearing-shoot should be stopped at one or two leaves above the bunch. Attend to keeping the shoots thinly distributed, overcrowding always leading to the ill-ripening of the wood, and do not let them grow into a thicket before taking them in hand. Pinch back the laterals to one leaf.

GOOSEBERRIES.—Where fine dessert fruit is required, the bushes should be mulched with long litter for the purpose of keeping the fruits clean, and these bushes should always be kept apart from those whose fruits will be used in the green state, the bushes with ripe fruit being more readily protected with nets. For the caterpillar, dust with Hellebore powder, but this should be thoroughly washed off the berries before they are used.

FRUITS UNDER GLASS.

By J. RIDDELL, *Gardener, Castle Howard, York.*

PEACHES AND NECTARINES.—Trees in late houses should now have their final thinning, selecting those fruits to remain which grow on the sunny sides of the shoots whenever possible, as fruits in this position colour higher than the less-exposed ones, or those that are merely exposed to the sun from the time they commence to ripen. Stop all useless shoots, and get others into their proper places. Very strong shoots may be stopped; this will equalise the general growth of the trees, and the second breaks may be laid in to fill up vacant spaces. Old trees in partially worn out borders are benefited by a liberal top-dressing with some one of the many manures now obtainable, washing the manure into the soil at any time when the border needs watering. I have found both superphosphate of lime and kainit valuable in Peach and Nectarine houses, the former especially, when the borders contain a large percentage of lime. Peaches and Nectarines whose fruits are stoning should not be subjected to a high temperature until this stage is passed, and due care must be bestowed in the way of regulating the admission of air, so as to prevent sudden changes during this critical period, or some of the fruits will drop off; 55° to 60° should be the degree of warmth aimed at, at night; and air admitted in the daytime whenever the warmth reaches the higher figure named. In houses where the fruits are stoned, from 5° to 10° more warmth may be maintained, and the glass allowed to run up to 95° by shutting up the house early in the afternoon, when the plants should be thoroughly syringed, and the borders and paths damped. Discontinue the syringing of trees when the fruits begin to ripen, but do not let the borders lack water. Trees from which the crop is gathered should be well syringed with force sufficient to dislodge red-spider and other insects. Weakly trees may be assisted with liquid manure when watering has become necessary. Keep doors, front sashes, and ventilators standing open day and night in bright weather, and if the lights can be entirely removed, this should be done.

FIGS that have not been forced into growth, but allowed to start naturally under glass, will now require to have the shoots stopped, and all weak ones, save those required to fill up blank spaces removed. When shoots are laid in from 4 to 6 inches apart, it is quite near enough together for light and air to reach them. Heavily-cropped plants should be freely supplied with manure, and a saturated atmosphere afforded them. Plants propagated this year may be repotted in a similar compost to that recommended for Vines. By growing these plants in a mild bottom-heat, and when the pots are full of roots feeding them liberally, good crops may be gathered from them in the early autumn. Strong shoots must be stopped at the fifth or sixth leaf—this will secure bushiness in the plants. Syringe them twice daily, and keep all available surfaces moist in dry weather. A warmth of 65° to 75° at night, according to external conditions, may be kept up, the higher degree of warmth without hard firing.

THE FLOWER GARDEN.

By H. W. WAID, *Gardener, Longford Castle, Salisbury.*

ARRANGING THE BEDS.—In continuation of my remarks of last week on this subject, I may mention that beds filled with Madame Crousse Ivy-leaf Pelar-

gonium, and edged with Tom Thumb, or some other good dwarf-growing Ageratum, are very pretty, the quiet combination of soft pink and delicate grey being both pleasing and effective; and, by way of change, or convenience as regards the number of plants of the respective kinds at hand, the centre of the bed might be planted with the Ageratum named, and edged with Madame Crousse, keeping the shoots pegged into position, and the points pinched out.

TUBEROUS-ROOTED BEGONIAS.—Tuberous-rooted Begonias are increasing in favour as bedding plants, which is not to be wondered at, seeing that they are profuse flowerers, have great variety of colour, and are capital wet-weather plants, that is to say, the blooms are uninjured by rains which beat those of Pelargoniums to pieces.

Whether the beds be planted with mixed Begonias, or separate colours, the effect when in full flower is very good indeed. Begonia beds should be planted with a groundwork of silvery Sedum, which will save the flowers from being splashed with soil during heavy rains. Small tufts of the Sedum planted about 3 inches apart with a small setting-stick, pressing the soil about them in planting, and then watering to settle the soil, will speedily cover the ground.

SUBTROPICAL PLANTS: WHERE AND HOW TO PLANT THEM.—Subtropical plants should be given sheltered positions from the north and west in recesses formed by trees and shrubs of sufficient height to break the force of the wind, but still it should be open to the south and east. In such places the large foliage of Castor Oils, Cannas, and Nicotianas (tobaccoes), are less likely to get rent by the first rough wind that blows. Cannas and Castor Oils look best when planted thinly in beds by themselves on a groundwork of blue or golden Viola, *Mossbryanthemum cordifolium variegatum*, golden Pyrethrum, or Mignonette, placing the dwarfier varieties of the respective kinds round the outside. Beds look very well planted with Solanums, Nicotianas, Wigandias, Melianthus major, variegated Maize, and Salvia argentea. *Acacia lophantha* and *Grevillea robusta*, intermixed with the striped Japanese Maize and *Abutilon Thompsonianum variegatum*, and edged with *Perilla nankinensis*, also make pretty beds.

GENERAL WORK.—This will consist mainly in the potting out of all kinds of bedding plants, mulching, and watering the same, mowing, trimming grass verges, brushing up the same, and the dividing of old plants of Violets, and the planting them in patches near walks and drives, affording water to settle the soil about them, and repeating the watering to all newly-planted subjects every afternoon, in the absence of rain, and until the plants are well established.

PLANTS UNDER GLASS.

By R. MILNER, *Gardener, Portico Castle, Swansea.*

POINSETTIA.—To have large bracts of this most useful winter-flowering plant, it is necessary to propagate the required number of young plants as early in the season as possible, so as to admit of the plants getting strong and well established before the autumn. Take the cuttings off with a heel when they are from 4 to 5 inches in length; have the required number of 4-inch pots cleaned and well drained, then fill them to half their depth with a mixture of sifted loam and silver-sand, and the other half with clear sand. Insert one cutting in the centre of each pot, and afterwards place them in the propagating-frame or under a hand-glass in the stove; keep them close, and shade them when necessary, to prevent the cuttings from flagging. When the cuttings are well rooted, they should be shifted into 6 or 7-inch pots, keeping them close for a few days, until the roots begin to penetrate the fresh soil. A low house or pit, where the temperature can be kept during the night from 65° to 75°, with a corresponding rise by day, will suit them well, always making it a rule to keep the plants well up to the glass, to encourage a sturdy growth. When the requisite number of cuttings has been obtained, the old stock plants may be turned out, shaking away the greater portion of the old material, when they may be repotted into pots two sizes larger than they had previously.

EUPHORBIA JACQUINIEFLORA.—Cuttings of these which were inserted in 4-inch pots, when well-rooted should be moved into 6 or 7-inch pots, without separating them or disturbing the roots. Grow them in a house or pit where a stove temperature can be maintained, keeping the heads of the plants well up to the glass, using a light shading during the

hotter part of the day if the sun is strong. When the pots get fairly filled with roots, apply light surface dressings of some well-tried fertiliser about once in three weeks, and an occasional application of weak soot-water may be afforded with advantage. By no means should the young plants be stopped, but place a neat stick to each pot, to which the young plants should be supported as growth proceeds. Plants from which the cuttings were obtained, and afterwards shaken out of the soil and placed in the same sized pots, may, when well-rooted, be shifted into pots two sizes larger. They may be allowed from three to four shoots each.

WINTER-FLOWERING CARNATIONS.—Cuttings struck last autumn or early this spring, and at the present time occupying small pots, if they have been stopped, will have formed from three to four shoots each. Those intended to be grown in pots may be shifted into 6 or 7-inch pots, a size which will generally be found large enough for them, as there is nothing to be gained by over-potting them. A good compost is rich loam to which has been added a little decayed manure, and sufficient sand to keep the soil porous. Perfect drainage and firm potting are very essential, and when the young growths have attained about 4 inches in length, the points may be pinched out, which will give the required number of shoots to furnish the plants. When the plants are required to bloom during the early part of the winter, they must not be stopped late in the season.

After the potting is completed, stand them on a bed of coal-ashes, or on boards, in an open, but sheltered position. Keep a sharp look-out for aphides, and on their first appearance, dip the plants in a weak solution of tobacco-water. When the pots get well filled with roots they will require a plentiful supply of water, and occasional applications of weak manure-water.

THE ORCHID HOUSES.

By H. A. BURBERRY, *Orchid Grower, Highbury, Birmingham.*

THE CATTLEYA-HOUSE.—The various species of Sobralia are best suited, and make the healthiest growth, if they can be kept in this house. The plants should be potted in a rich yellow loam, and the watering of the plants, as well as the mode of potting, is similar to that of any ordinary stove-plant. The greatest drawback of a Sobralia are the short time that a flower remains fresh, and the fact of their having no stalks, which prevents their being used as cut flowers; still, in spite of these, the Sobralias hold their own in the show-house, and rival the most beautiful of the Cattleyas of the labiate section. *S. macrantha* is, perhaps, the best known and the most showy species, and whose flowers are at the present time commencing to expand—the colours of the varieties ranging from light pink to deep rich purple. There are other species in cultivation, all of which are beautiful, and amongst them the yellow-flowered *S. xantholeuca*, and the smaller (white) *S. liliustrum* and *S. leucanthra*. *S. Cattleya* seems to be an Orchid exceedingly shy to flower. We have it here planted out in a large box in the warm-greenhouse, where it gets a great deal of sunshine, and we hope under this kind of treatment to flower it well. I may mention that weak liquid-manure is very beneficial to all the Sobralias when their pots have become full of roots.

THE COOL-HOUSE.—Now that cold weather and the east wind have given way to milder breezes and a more genial condition, ventilation at night may be afforded to a greater amount, and it will be found very beneficial if it be afforded with some regard to the prevailing condition of the weather, to remark that applies to the ventilation by day; for example, at times when a high dry wind is blowing, less air will be required, and it will be necessary to constantly damp down the paths, &c., and keep the plants well-shaded, as much will depend on the amount of attention given to these matters, although soil, aspect, locality, and the construction of the floors under the stages, whether of cement or tiles, sand, or coal ashes, must all be considered, the last two being, in my opinion, the most suitable, taking up and giving off moisture freely as they do; besides coal-ashes make good paths. I have often wondered why certain Orchids do better in one part of the country than another, and *vice versa*; but that it is so is certain, and we have much to learn about it. The space allowed for calendarial remarks upon Orchids is small, and I am therefore unable to express my views at greater length, still it is my impression that a discussion on these points, small as the item may appear, would tend to a better knowledge of the needs of the Orchids in this particular.

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

PLANTS, &c., TO BE NAMED.—Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.

ILLUSTRATIONS.—Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are particularly solicited.

NEWSPAPERS.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see. Advertisements should not be sent to the Editor, but to the Publisher.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

WEDNESDAY, JUNE 1—Royal Botanic Society: Promenade.
THURSDAY, JUNE 2—Linnean Society meets.
FRIDAY, JUNE 3—Dundee Horticultural.
Manchester Royal Botanic Society:
Special Exhibition of Orchids.
SATURDAY, JUNE 4—Manchester Royal Botanic Society:
Orchid Conference.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—58°.5.

The Council of
the Royal Horti-
cultural Society.

We avail ourselves of the opportunity afforded us by the Temple Show to publish the portraits of the present rulers of the Royal Horticultural Society. They are, for the most part, such well-known personages in the horticultural world, that, even if our space permitted, it would be unnecessary to enter at length into the details of their career as horticulturists. It will be seen, however, that, as is fitting, all classes of horticulturists are represented. The practical, the scientific, the amateur, the commercial, the general, the special departments—all have their representatives, and prove how comprehensive the society is.

The centre of the group is occupied by the portrait of the President, Sir TREVOR LAWRENCE, an instance of hereditary transmission, for our predecessors had as frequent occasion to chronicle the successes of his mother in the exhibition tent as we have those of the son. Sir TREVOR ascended the throne in troublous times, he stuck to the Society when it was sore oppressed—he guided and directed its struggles with unflinching tact and temper, he never quailed in the presence of adversity or showed the least tendency to desert what at one time was thought to be a sinking ship, and now he has his reward in presiding over a united and flourishing Society, devoted, once again, to horticulture in all its breadth and variety, but still to horticulture only.

Sir TREVOR'S portrait is flanked on the right by that of the Treasurer, Mr. PHILIP CROWLEY. He succeeded to the Chancellorship of the Exchequer at a period when in the re-organisation of the Society the greatest importance attached to the thorough overhauling of the finances by his predecessor, Mr. D. MORRIS. Thanks to Mr. MORRIS' unswerving perseverance, the finances were in a comparatively short time thoroughly set straight, and put on a firm basis. The process was about as agreeable as a surgical operation, but the successful results are apparent on all hands. Mr. CROWLEY, the present trea-

surer, is in the happy position of being able to say "Yes," where his predecessor was obliged to say "No," even when the object sought was in itself most desirable. Mr. CROWLEY is himself an ardent horticulturist; he knows what are the requirements of the Society, and what is expected of it by its constituents, so that he may be trusted to guide the spending department with judgment and experience, and with a due regard to caution. The rehabilitation of Chiswick is only one of the good deeds rendered possible by the work of the Treasurer, and the sympathetic aid of his associates.

On the left of the President is the portrait of the Hon. Secretary, Rev. W. WILKS. It is a standing rule in the editorial department of this journal to dispense as much as possible with the use of superlatives—they are relegated to the advertising columns!—but, if ever there was a case for the use of appreciative epithets, it is in that of the present Hon. Secretary. In a time of great stress and wild turmoil, he suddenly appeared on the scene, was found willing to take office, and by his splendid powers of organisation, indefatigable zeal, untiring labour, keen tact, and gentle courtesy, contributed very specially to the rehabilitation of the Society after the disastrous régime at South Kensington. If we do not speak of some others who were associated with him at the time, but who are no longer members of the council, it is because they are the very people who acknowledge the most heartily the supreme services rendered by the Secretary.

Baron SCHRÖDER is known as a zealous and keenly appreciative horticulturist. The show at the Temple affords proof of what he can do in the way of Orchid culture, and ere long we hope to see him carry out his for the present suspended scheme for the erection of a horticultural institute worthy of the country. Sir HERBERT MAXWELL is well known in natural history and parliamentary circles, as well as in literature and arboriculture, so that we may fairly hope for great things from him at the council table of the Royal Horticultural Society.

Looking now to the top line of our gallery, and going from left to right, we have the commercial element represented by two such excellent representatives as Mr. SHERWOOD, the head of the great seed house of HURST & SONS; and the genial rosarian, and liberal-minded nurseryman, GEORGE PAUL.

In the centre is Mr. D. MORRIS, the Assistant Director of the Royal Gardens, Kew, a man of administrative detail, of whose services to the Society we have already spoken, and who, by his personal exertions, has done excellent work in many of our colonies, and has welded the agricultural and horticultural departments of our Colonial Empire into even closer fusion with Kew than before, to the great profit of the peoples.

Mr. JAMES DOUGLAS, together with Mr. OWEN THOMAS, is a worthy representative of the practical gardener class. A very wide knowledge of all branches of gardening—a special leaning towards florists' flowers, and much natural sagacity render Mr. DOUGLAS an ideal member of Council.

Mr. GEO. BUNYARD is another representative of the commercial element. Those who know how he has built up his nurseries at Maidstone, and pushed his way by steady righteous effort into the foremost rank as a pomologist, will admit how, independently of his personal qualities, Mr. BUNYARD is eminently fitted as a counsellor.

Mr. H. J. PEARSON is another shrewd man of business, whose presence on the Council is a

matter of congratulation. The fact that he lives at Nottingham seems to be no bar to his attendance, and is a proof that the Society is no mere metropolitan association. Mr. SYDNEY COURTAULD, Mr. T. B. HAYWOOD, Mr. C. J. LUCAS, and Mr. O. THOMAS furnish other illustrations of the same circumstances. All of them, like several of those whom we have already spoken, live beyond the metropolitan area. Mr. COURTAULD'S name is well known among Orchid growers, and his personal qualities render him a most useful and efficient member.

Mr. T. B. HAYWOOD is another zealous horticulturist, who may be said to represent the Rosarian element on the Council, but, in truth, his sympathies are not limited to Roses, for Orchids, Chrysanthemums, and we know not what besides engage his attention, and this fact, combined to his business capabilities, amply justify his position on the Council. Mr. C. J. LUCAS is a comparatively new comer on the Council. His garden at Warnham Court, near Horsham, is achieving celebrity for Orchid culture.

Lastly, we have to mention Mr. OWEN THOMAS, the QUEEN'S Gardener, erst of Chatsworth, now of Frogmore. Of him and his work we have spoken not long since in terms of appreciation; suffice it now to say, that since his assumption of office at Frogmore, Mr. THOMAS has been a welcome visitor and a successful exhibitor, so that his presence on the Council must be very serviceable.

Two other portraits demand attention. We have not inserted them on our Supplementary Sheet, because that was reserved exclusively for the existing members of Council. But no collection of portraits of active men connected with the Royal Horticultural Society would be complete without the portraits of Professor FOSTER and of Mr. W. MARSHALL. Professor MICHAEL FOSTER is too famous a man to need any introduction. But it is not everyone who knows that the Cambridge professor, who has brought such good work to bear in the medical and scientific schools of his university, who has achieved such very high repute as a physiologist and a tutor, and rendered such service as one of the secretaries to the Royal Society—it is not everyone, we repeat, who knows that so busy a man is likewise a zealous gardener with a speciality. None contest his supremacy either in the knowledge or the cultivation of Irids. Professor FOSTER was one of those who, with Mr. WILKS, Mr. DYER, and some others, took office in those turbulent times we have spoken of, and who raised the society from a state of despair and despondency to its present condition; but it is hardly to be wondered at that, with his many avocations, he has been compelled to resign the office of Councilor, though still retaining that of President of the Narcissus Committee, in which capacity his portrait is here given.

The President of the Fruit Committee is Mr. PHILIP CROWLEY, of whom we have already spoken.

The Floral Committee has for its President the genial and very competent WILLIAM MARSHALL. For a longer period than we can tell, he has been associated with the Society. His broad sympathies, extensive knowledge of the subject, genial manner, and straightforward character, render him an admirable chairman.

This completes our portrait gallery of the Members of the Council and Chairmen of the Departmental Committees of the Royal Horticultural Society. We have not on this occasion included the paid officers; but no one who

knows Mr. BARRON or Mr. WEATHERS will doubt that the Society is as well served by its paid as by its honorary officers. The horticulturalists of the kingdom will, we feel sure, feel that, whatever changes in detail they might think desirable, no better or more thoroughly representative body of men could be found in any Society.

THE TEMPLE SHOW is being held as these pages are passing through the Press. A full report will be found in another column. Here we can only say that it is quite a first-class Exhibition, well worthy of the traditions of the Society. The Orchids from Sir TREVOR LAWRENCE and Baron SCHROEDER are *hors de ligne*. The new plants sent by Messrs. LINDEN are remarkable; the alpine plants from Messrs. BACKHOUSE delightful; the pruned Dendrobies from Buxted Park very noteworthy; the— but the printer stops us—with "See Report."

KEW GARDENS.—In the House of Commons on May 19, Mr. PLUNKET, in answer to Mr. CHAMBERLAIN, said it was the intention of the Government to continue the publication of the *Kew Bulletin*. Replying to Mr. E. HOLDEN, Mr. PLUNKET said that the reason why Kew Gardens were not open to the public till noon was that the earlier hours were regarded as set apart for botanical students. However, any person who desired to obtain admission for scientific, artistic, or professional purposes, could easily obtain an order from the director. The new edition of the official guide to the Arboretum and Botanical Gardens at Kew was in preparation. It was almost ready, and they hoped to have it out during the summer.

THE LINNEAN SOCIETY.—The annual meeting was held on the 24th inst., when the election for Council and officers took place. The address of the President consisted of a very interesting account of the reciprocal relations between different animals and plants, one living under the protection of another (commensalism), or actually receiving benefit and conferring it in its turn (symbiosis). The examples given strikingly illustrated by black-board diagrams, were very felicitous. The Gold Medal of the Society was presented to ALFRED RUSSET WALLACE in very appropriate terms by the President, who pointed out the analogies between the discoveries and inferences of ADAMS and of LEVEHIER respectively with those of DARWIN and WALLACE. Dr. WALLACE, in replying, alluded to his researches into the phenomena of variation and natural selection as witnessed by him in the Amazons and the Malay Archipelago.

THE PROPOSED FRUIT EXHIBITION.—On Monday last, at a meeting at the Guildhall, at which Alderman Sir JAMES WHITEHEAD presided, of the provisional committee of the proposed International Fruit Show in London, it was resolved, that in view of the concentration of public interest in the coming General Election, and the consequent difficulty of making adequate arrangements for holding the exhibition this year, and also in consideration of the representations made by intending exhibitors that sufficient notice had not been given for preparations, the exhibition should be held in the autumn of 1893, and not this year.

METROPOLITAN PUBLIC GARDENS' ASSOCIATION.—A public recreation ground will be opened at De Beauvoir Square, Kingsland Road, N., at 3.30 this day (Saturday). Mrs. TYSSEN AMHERST will perform the dedication ceremony.

THE BARR MEDAL FOR THE BEST SEEDLING DAFFODIL.—The large Barr Medal, for the best seedling Daffodil shown at the Royal Horticultural Society's spring meetings, has been awarded to the Rev. G. II. ENGLEHEART, for his Trumpet Daffodil Golden Bell, which was exhibited and obtained a First-class Certificate on April 12. Mr. ENGLEHEART also gained the Medal last year.

NATIONAL CHRYSANTHEMUM SOCIETY: HOLMES' MEMORIAL CHALLENGE CUPS.—Mr. W. HERRERT FOWLER, F.N.C.S., Claremont, Tauton;

and Mr. NORMAN DAVIS, F.N.C.S., Lilford Road, Camberwell, London, send us the following letter in reference to the Holmes' Memorial Challenge Cups:—It has long been felt that, in order to stamp the character of the National Chrysanthemum Society as more distinctly National, something beyond mere monetary prizes are desirable, in order to awaken additional interest in the Society's work. The late Secretary, Mr. W. HOLMES, inaugurated a new departure in this sense by organising the Affiliated Societies' National Challenge Trophy, which has answered beyond the most sanguine expectations. In instituting the Holmes' Memorial Fund, it was the desire of the promoters that some portion of the money subscribed should commemorate Mr. HOLMES' work in connection with the Society, in the form, if possible, of special prizes bearing his name. The Trustees of the Fund have devoted a certain portion of the Fund to this purpose, which is inadequate to provide prizes of sufficient value to worthily commemorate Mr. HOLMES' name and labour. A number of gentlemen have volunteered to subscribe with a view of augmenting the amount, and it is intended, with the sanction of the committee of the Society, to provide two National Chrysanthemum Society's Holmes' Memorial Challenge Cups, one for incurred and one for Japanese blooms, full particulars of which will be found in the schedule of prizes for this year. The winners in the present year will be looked upon as the champions for 1892, and will have their names engraved on the Cups accordingly. That these Memorial Cups may be of considerable value and worthy of the Society, is highly desirable, and it is earnestly hoped that members having the future interests of the Society at heart, will not allow this opportunity to pass without making every effort to insure the undertaking being distinctly successful. Promises have already been received to the amount of £15, and it is earnestly hoped the desired sum of £100 may be obtained. A meeting of the subscribers will be called at an early date to make final arrangements for the purchase of the Memorial Cups, so that they may be ready for presentation to the Society previous to the November show, at which the Cups are offered for competition.

NITRIFICATION.—The results of the recent researches on nitrification by Schloßing and Müntz, Frank, Adametz, Warington, Frankland, Winogradsky, and others, are summed up in a paper by Herr J. WORMANN, in the *Landwirthsch. Jahrbuch*, xx., pp. 175–181. He states that in his opinion Winogradsky's observations have had, as one of their results, to overthrow at a blow one of the generally-accepted theories of vegetable physiology, that it is only the chlorophyll-containing cells that are able to assimilate carbonic acid gas.

THE ACQUISITION OF GREEN COLOUR BY LEAVES.—In a recent investigation by W. PALLADIN, which is described at length in *Biedemann's Centralblatt* (vide xx., pp. 756–760), the amount of proteins in green and etiolated leaves was estimated, and an inquiry was made concerning the acquisition of green colour and growth of etiolated leaves. Most of the results are rather wide of our province, but we may notice the following conclusions:—1, Chlorophyll cannot be formed without sugar; 2, The chlorophyll first formed in leaves of germinating plants is formed at the expense of the sugar supplied to them by the acid; 3, Absence of lime is one reason why etiolated leaves do not develop.

TRANSPIRATION FROM THE FLOWER.—In the *Comptes Rendus de l'Académie des Sciences* (April 4), M. G. CURTEL details the results of his experiments on the variations of transpiration in a plant during its growth, and arrives at the following conclusions:— "The transpirational activity of a flower is very vigorous in its early stages, while it still possesses soft tissues only, very rich in water; transpiration diminishes with growth, and is least when the bud is half grown. During this time, indeed, the epidermis is thickening; a more or less impermeable cuticle is developed, both of which conditions tend to a dimi-

nution of transpirational activity. Then, as the bud grows, its surface increases rapidly. The stomata, if the plant should have them, appear, and the amount of water secreted increases. Later on, when the flower opens, increase still continues for the same reasons. This increase is continuous until the death of the flower. This is very easily to be explained. Soon after opening, the bloom reaches the end of the term of its existence. The tissues begin to decay, and the water which is found in the cells in a more or less stable state of combination, owing to the activity of the protoplasm, is set free on the death of the latter, and evaporates; hence the rapidity with which the flower fades. Hence the transpiration of a flower varies with the stage of development of it. Most active in the very young bud, it decreases little by little, then again becomes active, until the bud has reached its greatest size, and is just about to open. From this time, transpiration continues in full activity until the death of the flower."

ENGLISH-GROWN TEA.—We read that during their visit to Exeter Hall, on Tuesday evening, May 17, Princess LOUISE and the Marquess of LORNE were regaled with tea made from leaf grown in this country, and prepared by Mr. JOHN ROGER, who was formerly a tea planter in Ceylon. The plants from which the leaf was obtained were reared in Mr. W. ICBOTON'S Palm Nurseries at Putney. Mr. ROGER had some of the plants on view at the hall, and also a quantity of the prepared tea. He believes that this is the first occasion on which a cup of tea has been made from English-grown leaf.

NURSERYMEN'S EXCURSION.—On Wednesday last, the employés of Messrs. J. BACKHOUSE & SON, York, had their annual excursion; the party, numbering about eighty, going to Scarborough. The trip was somewhat marred by the unsettled weather, some heavy rain falling at times during the day.

SEEDS FROM RUSSIA.—It is stated in *Moller's Deutsche Gärtner Zeitung* that the export of the following articles is permitted by the Russian Government, they not coming under the grain export prohibition, viz., Peas, Turkish Beans, other Beans, Lentils, and Earth-nuts; also the seeds of fodder-grasses, vegetables, and ornamental plants.

SPRING BEDDING AT HAMPTON COURT.—It appears late to talk about spring bedding at the end of May, and yet we have just observed, on a call at Hampton, some good examples of it. A series of bold beds, 27 feet by 15 feet, facing the Palace, were gay with grand clumps of Polyanthes—yellow and white strains of fine quality, which Mr. GRAHAM has carefully selected and interspersed with scarlet-flowered Tulips, the beds being edged with white Daisies.

IN THE AQUATIC-HOUSE AT THE BOTANIC GARDENS, OXFORD, the beautifully-fragrant Nymphaea Daubeniana was recently noted in flower. This plant has the singular characteristic of throwing out young plants from the centre of the leaves. In the same structure stands a fine plant of Arundo donax variegata, growing admirably in a mixture of rough fibry loam.

GARDENERS' ASSOCIATIONS.—We have received a copy of the programme of the Delegate Conference to be held on Wednesday, July 6, at The Friendly Societies Institute, Camden Road, Tunbridge Wells. Cheap tickets will be issued from London, Maidstone, Hastings, Brighton, and all stations on the L. B. & S. C., and S. E. Railways to Tunbridge Wells. A luncheon will be provided at the Institute (which will be decorated for the occasion) at 12 noon, free to Delegates. Visitors' luncheon-tickets, 2s. each. The Conference of Delegates and friends will be held at 1.30 p.m. Amongst those who have promised to attend are:—Mr. George Gordon, Editor *Gardeners' Magazine*; Mr. A. G. Boscawen, Miss Cripps, Messrs. T. Cripps & Sons' Nurseries; Mr. Mark Longhurst, Secretary, Brighton Association; Mr. H. Jupp, Secretary, Tunbridge Association; Mr. W. Webber, The Nurseries, Tonbridge; Mr. J.

Frost, The Borough Nurseries, Maidstone; Mr. W. Chandler, Secretary, Pembury Association; Mr. W. C. Norman, Secretary, Elenbridge Association; Mr. B. S. Wilnot, Representative Agricultural Bureau, Eridge House; Mr. S. Pope, Head Gardener, J. J. Barrow, Esq.; Mr. R. Severson, Sec., Tunbridge Wells Tradesmen's Association; Mr. F. Bridger, Head Gardener, Lord de Lisle and Dudley, Fenshurst; Mr. S. Cooke, Secretary, Sevenoaks Association; Mr. J. Roberts, Head Gardener, Sir David L. Salomons, Broomhill; Messrs. E. & A. Charlton, The Pantiles and Eridge Road Nurseries; Mr. W. Wiseman, P.P.G.M., Oddfellows. After the Conference, visits can be made to some of the most picturesque scenery of the neighbourhood, for which cheap drives will be arranged, all within half-an-hour's walk of the Institute—Messrs. Cripps & Sons' Nurseries, Messrs. Charltons' Nurseries, Eridge Road; the Toad and Rasthall Rocks, the High Rocks, the Pantiles and Mineral Springs, and other places of interest. The dinner will be served at 6.30 p.m. in the large hall of the Institute, free to Delegates. Visitors' tickets, 3s. each. A smoking concert will follow at 8 p.m. We cordially sympathise with this attempt to federalise the scattered Societies, feeling that much loss of power and waste of opportunity occur from the present isolated action of the several Societies.

GARDENERS' ORPHAN FUND.—We have the pleasure to announce the receipt by the Secretary of the following donations to the Gardeners' Orphan Fund—viz., £10 from the Ealing Gardeners' Mutual Improvement Society, the proceeds of a lecture given by the Rev. THOMAS DAVIDSON to that body; and £20, the proceeds of a concert held at Altrincham, under the auspices of the Manchester Local Committee of the Gardeners' Orphan Fund. Such efforts are most praiseworthy.

CORK PAVEMENT.—Our contemporary, *Land and Water*, draws attention to an application of cork which is new to us, though it seems to have been in use in London for more than a year as a durable paving material. This new paving is described as consisting of granulated cork, heated with mineral asphalt, and compressed into bricks of convenient size. The company claims for this substance, that it affords an absolutely secure foothold for horse and man in all weathers; that it is extremely durable and quite noiseless; that it forms a non-absorbent and inodorous roadway. As a proof of the durability of this paving, it is said that Messrs. Pickforn & Co. have the gateway of their premises in Gresham Street laid with cork pavement. This gateway is only 8 feet wide, and upwards of one thousand tons have passed over it daily for eighteen months without producing any appreciable signs of wear. It is used in many streets and railway stations in Australian towns, notably, Sydney, and is uniformly well spoken of. As a flooring for stables and kennels, it is peculiarly suitable. It has been for twelve months laid down in some of the stalls in the Life Guards' stables at Knightsbridge, where, we understand, it has given great satisfaction. It possesses great elasticity, saving wear and tear to feet and legs caused by unyielding asphalt or granite. Altogether moderate cost, combined with striking advantages, make the cork pavement a discovery of genuine value, and we cannot doubt but that it will be the pavement of the future. It does not appear in what proportion cork is used in this manufacture, but if it is used to any extent, the question naturally arises as to the supply.

LAND CLEANING.—It is said that a Mr. BURGESS has invented a new land-cleaning machine, says *Invention*, the principle being to root up all weeds, &c., and pass at once through a double-blast fire by means of a travelling engine. The frame is mounted on four travelling wheels. On the frame a small steam engine is fixed. On the right side of the engine is a blower. On the left side of the engine is a brick hearth, fitted in an iron frame, which forms a fire retainer. In the front of the machine is a screen, and, by a gradual incline leading up to the

fire, the weeds, &c., are elevated to the fire retainer, which is kept up to a great heat by the blast from the blower. The weeds pass through the fire, and are deposited in soil. The engine, which is said to be capable of cleaning 4 to 8 acres a day, is from six to eight horse-power, and with the machine, would require two men when in operation.

NEBRASKA.—We have before us the Annual Report of the State Horticultural Society, which shows how serviceable such a society may be. Prof. BASSER's lecture on "Fertilisation" is well adapted for its purpose, and the same may be said of Mr. BRUNER's paper on "Insects." In judging collections of fruits, the points laid down are: 1, Number of varieties; 2, Quality; 3, Condition; 4, Taste in the display. Special rules are laid down as follows:—

"The judges shall have an ideal standard of perfection in all cases, made up of the following particulars:—

"1st. The condition and general appearance of the fruit, which must be in its natural state, not rubbed or polished, nor specked, bruised, wormy, nor corroded; with all its parts, stem and calyx-segments well preserved, not wilted nor shrivelled, clean.

"2nd. The size, in Apples and Pears particularly, should be average, and neither overgrown nor small. The specimens should be even in size.

"3rd. The form should be regular, or normal to the variety, and the lot even.

"4th. The colour and markings, or the surface, to be in character, not blotched nor scrubby.

"5th. When comparing different varieties, and even the same kind grown on different soils, the texture and flavour are important elements in coming to a decision. Five points.

"In the class for Peaches, Plums, &c., the important are size, form, colour, flavour, and condition. Five points.

"In Grapes, we must consider and compare the form and size of the bunches, the size of the berries, their colour, ripeness, flavour, and condition. Five points.

"In Currants we shall have to examine the perfection and size of the bunches, and of the berries, their flavour and condition. Three points.

"In Gooseberries we shall look at the size, colour, flavour, and condition. Four points.

"In judging Cherries, we have as our guide the size and form, colour, flavour, and condition. Four points.

"In judging Strawberries, we shall compare the size and form, colour, flavour, firmness, and condition. Five points.

"They should be shown with stem and calyx.

"Raspberries may be shown with or without the calyx. In this fruit we shall have to judge of the size, colour, flavour, and condition. Four points.

"Blackberries must have size, colour, flavour, and condition. Four points.

"Blackberries must be tested according as they present size, colour and form, flavour and texture, and condition. Four points.

"In all cases, it is well to have a convenient scale of comparison, for which the number 10 is found to be easily managed. The highest figure denotes perfection for the variety, and five is mediocre; below that is unsatisfactory. The total of the marks should exceed 50 per cent. of the possible number, or the entry must be passed as unworthy of reward.

"Seeding: having once been presented, and failing recognition under the rules of the Society, shall not again be presented."

THE CANARY ISLANDS.—A correspondent of the *Standard*, writing from Tenerife, states that with the practical disappearance of the cochineal industry, killed as it was by the discovery of aniline dyes from coal tar, the commercial prosperity of the Canary Islands received a blow which for many long years it never recovered. The adaptability of the soil and climate to the growing of Tomatoes, many hundreds of tons of which leave the islands every season, must have compensated largely for the loss occasioned by the failure of the cochineal trade. For a considerable time past, however, rumours have been rife concerning a disease which has attacked the plant, rendering its produce in many instances quite unfit for exportation. Every endeavour has been made to localise the mischief, but without success, and it is reported that crops in all parts of the Canary Islands are seriously affected, and that growers view the prospect of the approaching season with considerable apprehension.

BURMESE VANILLA.—Our contemporary, the *Chemist and Druggist*, are told by Mr. J. R. JACKSON, of Kew, says that Vanilla is now being cultivated at Mergui, British Burma, under the superintendence of the Conservator of Forests in the South Tacasserim Division. The first crop, which was cured last autumn, consisted of 253 pods. There

is some trouble with the drying, as the pods ripen in August and September, just at the height of the rainy season.

A NEW USE FOR CAFFEINE.—Caffeine, the active principle of Coffee, has recently been recommended as an excellent local anæsthetic, and is said may, for many purposes, at least advantageously replace Cocaine, the use of which is not altogether liked by many medical men. If Caffeine should, to any extent, become of use in this connection, it will considerably affect the trade that is now established in Coca leaves.

HOW TO EAT STRAWBERRIES.—The very height of Strawberry-eating is with coffee. Nobody ever really tasted coffee who has not drunk it in alternate mouthfuls with Strawberries, and nobody knows the Strawberry flavour excepting immediately after the clearing of the taste which comes from drinking coffee, says the *New York Post*. The clearing property of coffee is familiar enough, but there is strange ignorance of this special application of it. The best of Strawberries with the best of coffee makes the supreme refinement of indulgence in the fruit.

SISAL GRASS.—Sisal Hemp, according to a Mexican authority quoted in the new number of the *Board of Trade Journal*, is likely to prove a very important source of wealth for Mexico. It grows in long, narrow blades, often to the length of 4 or 5 feet, and these, when dry, curl up from side to side, forming a flexible string, stronger than any cotton cord of the same size ever manufactured. It is in great demand among florists and among manufacturers of various kinds of grass goods; and it is said to be capable of being applied to many new uses. Ropes, cords, lines of any description and any size, may be manufactured of it, and a ship's cable of Sisal Grass is one of the possibilities of the future. It is almost impervious to the action of salt water, and is not readily decayed or disintegrated by moisture and heat. It takes its name from the port of Sisal, in Yucatan, through which it was formerly exported. Sisal Grass, so-called, is the produce of Agave 1887, p. 3.

A NEW STRAIN OF IVY-LEAF PELARGONIUM.—We have received from Messrs. H. CANNELL & SONS, Swanley, one of the handsomest double-flowered Ivy-leaf Pelargoniums, so far as we know of, existing. The truss of bloom consisted of six or eight flowers, $2\frac{1}{2}$ to 3 inches in diameter, very double, and of a soft shade of reddish-crimson. Each bloom would make a very pretty button-hole flower, and the entire truss a coachman's nosegay on the occasion of a drawing-room. The bouquetist will rare about it.

DIANTHUS FREYNI.—This is a charming little alpine, which lovers of rock-plants should be on the look-out for. It is of dwarf habit, with linear glaucous leaves. Flower-stalks 2 to 3 inches high. Flowers purple, $\frac{3}{4}$ inch in diameter. It is a native of the mountains of Bosnia. It was originally described by VANDAS, and is now figured in the *Annalen des K. K. Naturhist. Hof-Museum* of Vienna, Band vi. p. 332.

MONKHAMS, WOODFORD GREEN.—The contents of this large mansion and grounds, the residence of the late HENRY FORD BARCLAY, Esq., are to be offered for sale by public auction the first week in July next, and in all probability the entire estate of about 100 acres will be sold at a later date for building purposes. The conservatory is noted for a good specimen of the night-flowering Cereus, which fills a large part of the roof, and for an effective example of Messrs. PULHAM's work in Derbyshire limestone.

VEGETABLE PERFUMES.—BUCHNER has recently described the method of obtaining the fragrant vegetable essential oils in exhausted vessels at the ordinary or at any low temperatures (vide *M. T. Naturm. ver. Steiermark*, pp. 64–71). He has come to the conclusion that most of these oils consist of the greater part of either terpenes or of polyterpenes.

INTERNATIONAL BOTANICAL CONGRESS OF GENOA.—The following is the official programme:—Sunday, September 4, at 8 P.M., reception of foreign botanists (municipal hall). Monday, September 5, at 9.30 A.M., inauguration of the congress (great hall of the university); at 2 P.M., first scientific sitting (great hall). Tuesday, September 6, at 10 A.M., inauguration of the Hanbury Institute (botanical garden); at 2 P.M., second scientific sitting (great hall). Wednesday, September 7, at 9 A.M., third scientific sitting (great hall); at 2 P.M., visit to the exhibition and to the town. Thursday, September 8, at 8 A.M., trip by sea to Portofino, thence by carriage to St. Margherita, Rapallo, Rata, and Recco, returning by steamer. Friday, September 9, at 9 A.M., fourth scientific sitting (great hall); at 2 P.M., fifth (and last) scientific sitting (great hall). Saturday, September 10, at 7 A.M., excursion to Ventimiglia and to Mortola; visit to Mr. TH. HANBURY'S garden. Sunday, September 11, excursion from Ventimiglia to the Col di Tenda. The following are among the principal regulations:—

Anybody occupied in botanical study, or cultivating any special branch of botany, will be entitled to take part in the Congress.

To be inscribed as member of the Congress, it will be necessary to sign and forward to the Secretary of the organizing committee (Prof. O. PENZIG, R. Università, Genoa) the printed form distributed for this purpose by the Committee, or to inscribe oneself during the period of the Congress in a book provided for the purpose.

Every member of the Congress will pay a fee of ten francs on receiving his admission card, which gives the right of entry to museums, libraries, excursions, &c. The members of the Italian Botanical Society will be exempt from this fee.

All the sittings of the Congress will be held in public, but the right to speak and take active part in the discussions and voting will be reserved for members only.

The official language of the Congress will be Italian, but it will be free to anybody when speaking or in discussions to use whatever language he may be most familiar with.

It is not considered advisable to fix any special subjects for discussion, but it is as well to mention from the first that the reform of botanical nomenclature will be treated, in accordance with O. KUNTZE'S recent book, and that lectures are already announced on the theories of F. DELPINO respecting Phyllo-taxis and Pseudanthia.

The subjects to be proposed for discussion during the scientific sittings, must be notified to the secretary of the committee not later than August 15, 1892.

After the Congress the committee will print a brief account of the meetings, and will publish also the original memorials presented at the Congress.

Every member of the Congress will be entitled gratis to a copy of these "Proceedings of the Botanical Congress of 1892."

The seat of the Congress will be in the palace of the Royal University of Genoa (Via Balbi), where all the meetings will be held, and where will be found the receiving office (for the delivery of admission tickets, inscriptions, &c.), the meeting room of the committee, the writing rooms, buffet, post office, telephone, &c., reserved for members of the Congress.

An office, where information concerning lodgings will be obtainable, will be opened at the Municipality of Genoa. Signed, for the Committee, the Secretary, Prof. O. PENZIG.

PROHIBITION OF THE IMPORT OF AMERICAN VINES INTO FRANCE.—In consequence of the appearance of the Phylloxera in California, the Minister of Agriculture of France has decided, in accordance with the terms of the Conference of Berne, May 15, 1882, that under no circumstances whatever shall Vine-cuttings or plants from North America be permitted to enter France.

BIRTHDAY HONOURS.—Among the names or those whom the QUEEN has honoured on this occa-

sion, we note that of Mr. W. T. THISELTON DYER, Director of the Royal Gardens, Kew, who receives the honour of C.I.E., in addition to that of C.M.G., of which he was already in possession. Mr. EVERARD THORN, known to botanists and horticulturists for his explorations in British Guiana, receives the same honour.

LINEAN SOCIETY.—At an evening meeting to be held on Thursday, June 2, 1892, at 8 P.M., the following papers will be read:—I. "On the Disappearance of Desert Plants in Egypt," by E. A. FLOYER, F.L.S. II. "On Insect Colours," by F. H. PERRY COSTE, F.L.S.; III. "Lantern Demonstration."

LADY GOLDSMID.—The death is announced of Lady GOLDSMID, wife of Sir JULIAN GOLDSMID, M.P., which took place at Cannes on Monday, May 23.

PUBLICATIONS RECEIVED.—*The National Boiler and General Insurance Company Limited, Chief Engineer's Report.*

THE SEED TRADE.

ENDIVE.—When we remember that Ovid mentions Endive, Radishes, and Succory as forming part of a garden salad, and Pliny states that Endive was eaten in his time, both as a salad and a pot-herb, we gain some idea that it is an ancient plant. Abundantly cultivated, it is said, in China and Japan, the Endive is supposed to have been introduced to the West about the early part of the sixteenth century; and from that time to this, it has been cultivated more or less extensively, and generally used in the same manner. Possibly the original form has changed but little, but many varieties have been obtained, either as natural sports, by seed, and by selection. As in the case of the Cabbage and Cos Lettuces, there is reason to believe all the varied types of the Endive have sprang from one source, although they differ as widely in character as the broad-leaved Batavian and the Moss Curled. Like the Lettuce, its leaves are used in various ways; but, unless subject to some degree of blanching, they are harsh and bitter. The Endive is a plant of rapid growth, and requiring less

heat than the Lettuce; it is, therefore, a hardy salad-plant, capable of standing a somewhat severe winter. It is mainly used for salads and stews, though we do not appear to consume Endive boiled nearly so much as our neighbours on the other side of the Channel.

About three-quarters of a century ago, our cultivated Endives were the Green Curled, the White Curled, and the Batavian. Thirty years later, the Batavian appeared in two varieties—the green and the white. We may be said at the present time to have some seven or eight distinct types in cultivation, but the French and Germans, who are much larger consumers of Endive than ourselves, make a dozen or more varieties. The Broad Lettuce-leaved Batavian, with its green and white varieties, are well known. They resemble somewhat coarse growing, loose Cabbage Lettuces. The seeds of these are sown in June and July, in most cases on the ground where the plants are to grow; though at times the seeds are sown in beds, and the plants transplanted to the open, as is frequently done with Lettuces. The White Batavian is of a somewhat pale green colour, becoming quite pale when blanched. It differs from the Green Batavian in having more pale colour in the centre, and a rather greyer tint in the leaves. One of the finest types of the Batavian is the Limay, larger than the common Broad-leaved, crisp and solid.

Of the narrow-leaved curled types, there are several handsome forms. One of the smallest is the moss curled, the leaves of which are sharply cut, the growth dense and compact. One of the best of the large-growing curled varieties is the Raffae, large green curled, a variety which grows to a considerable size. A sort which appears to be much esteemed in Germany, is the Pancalère, like the Raffae, but yet distinct enough to be classed as a separate variety. Then there is the Meaux, small fine curled, which is highly esteemed also; but the three last named are only partially cultivated in this country.

In the market gardens where Endive is grown, a sowing is sometimes made in May. One main point with early-sown Endive is to keep the plants growing freely, as a check will cause them to bolt, instead of forming heart-like rosettes of leaves.

There is always a tendency to bolt on the part of early-sown Endive, hence the caution just given. The principal sowings are made in June and July, and it is sometimes the practice to make plantations of Lettuce and Endive alternately, the former being the crop first pulled. Blanching is done by tying up the hearts, as in the case of Lettuce, and they are ready for market in from twelve to fifteen days after. In private gardens, the culture of Endive runs pretty much upon the lines followed in the market gardens. *Pisum.*

SHORT NOTES FROM BLENHEIM PALACE GARDENS.

CARNATIONS.—These are wonderfully well done here, and in great quantities, and have been flowering since last September. For instance, one structure, 118 feet by 24 feet, was crowded with beautiful stuff. Miss Joliffe is one of the favourite kinds, and all the popular varieties are cultivated. A Heliotrope-coloured seedling named Lady Rosamond may be numbered amongst the "good things." Mr. Whillans says it is quite decided in colour, one or two of this colour in commerce "run." He states flowers as big as those of the Malmaison type were grown of this variety last year.

DISA GRANDIFLORA.

The secret of success in flowering this plant here is that it is kept cool and moist summer and winter in frames—a hint that may be useful to some cultivators of the species and of the genus.

ORCHIDS.

It would fill a page to write about these in any adequate manner, suffice it to call attention to one or two genera. About 16,000 *Odontoglossums* are

grown, 8000 *O. Alexandra* being planted out. A grand batch of *Cattleya Mendelii* was noted, plants with twenty-six and twenty-eight sheaths each. *Cymbidium eburneum*, plants, 4 to 5 feet across. The prettiest *Cypripedium* is considered to be *C. Morganæ*. Five hundred *Phalenopsis* in variety were in admirable condition.

CHRYSANTHEMUMS, &c.

About 11,000 of these in all the popular sorts are grown, and the plants are in rude health, giving promise of good results in the flowering season. Mr. Whillans recommends every one to grow Chambers' Victoria Violet. Some beds of it outside are now in flower, whilst all the others are over.

ROSES.

The principal varieties grown for cut work are *Souvenir d'un Ami*, *Perle des Jardins*, and *Niphetos*. Some American Roses are planted out on what is called "Henderson's plan," but they are not approved of. Mr. Whillans thinks if the roof of the structure in which they are grown were removed, and the plants "rested" in summer time, they might give satisfaction. Several houses of large dimensions are devoted to Palms, Ferns, and other foliage plants.

STRAWBERRIES, &c.

Noble is considered here excellent for forcing, some 4000 pots of it being grown for this purpose; *La Grosse Sucrée* and *President* are also favourites. In the Melon-house, Vines struck twelvemonths last January from eyes were carrying from three to four bunches.

Some Melons, planted in turves turned upside down, are doing splendidly. A hole is cut in the centre, and filled with strong manure-water three or four times, the edges being filled in with a little fine soil. The sorts grown are *Blenheim Orange*, *Hero of Lockinge*, and *High Cross Hybrid*. Some 200 fruits have been cut from this house.

A house, 158 feet by 16 feet, is devoted to *Royal George Peach*; the trees have lost a lot of flowers, but still there will be a good crop of fruit.

Tomato Blackwood Park is considered the best *Tomato* here. Canadian Wonder Bean is esteemed by reason of its growing quickly, and good bearing qualities.

Ellam's Cabbage had been in cutting ten days (this was on May 17). It is not a big Cabbage, but very solid and good. *J. H.*

HOME CORRESPONDENCE.

LEGUMINOUS CROPS AS SOURCES OF NITROGEN.—Probably in few parts of the world has the amelioration of sterile soils, by means of leguminous plants, received practical attention for so long a period as in Tuscany and some other provinces of Italy. It is a gently progressive, economical system, adapted to the genius of the people. Moreover, a great many estates consist wholly, or in part, of hill lands, suitable for the cultivation of the Olive and Vine, but very thin for Wheat, for which otherwise the climate is eminently adapted. On rich soils, the exigencies of the *Mezzadra* system demand that Wheat should be grown, and stable-manure being both scarce and dear, efforts have been naturally made in every direction to find substitutes. The system of ploughing-in green crops, such as Beans, termed "Sovescio," is certainly of high antiquity. In 1857, that distinguished agriculturist, Marquis Cosimo Ridolfi, in a series of lectures delivered to the cultivators of the Val d'Arno at Empoli (taken down in shorthand, and published in Florence), fully discussed the subject in its practical and scientific aspect, in so far, that is, as the science of it was then known. He was very desirous of extending the culture of good forages, such as *Lupinella*, *Hedysarum Onobrychia*, identical, I think, with *Sainfoin*, *Medicago sativa* and clovers, and he was very careful to point out that all these, like other leguminous plants, improved the fertility of the soil. *Lupinella*, he said, improved the "initial fertility" of the soil where it was in itself cultivated well, and sufficiently aided by manure, about one-third. "Dimodoché dove il grano potrebbe fare delle 9 farenbe delle 12," that is to say, "Wheat, which previously yielded nine

bushels, would give twelve for one sown." The present writer, like most of his neighbours in the province of Siena, has been engaged for some years in cultivating this, the finest of all fodders for working cattle, to a considerable extent, and his experience, and that of others, confirms that of the distinguished lecturer of thirty-five years ago, with regard to the increased fertility of the soil. It should be pointed out, however, that the land dealt with is of a cretaceous nature ("creta" being the name for that particular marl or clay used by sculptors to model with), and is highly adapted to the growth of leguminous forages, *Lupinella* above others, and naturally poor, or, as the expression is here, frigid, for Wheat. But, as the Marquis Ridolfi cautioned his hearers, *Lupinella* does not appreciably affect the fertility of the soil, unless it has itself been well manured. The practice adopted is to sow the seed among Oats, to cut the forage for three years, and on the fourth to dig or plough it in. The theory of the lecturer was that the plant, when it attained a certain development, was capable of drawing from the air what he called "azoto," and communicating it in increased quantities to the soil; but that it could not do this, at any rate to any appreciable extent, unless it first found that quality itself in the soil, and therefore that the land previous to sowing should, if possible, be liberally manured. Since the date of these lectures, the use of superphosphates has very much extended in Italy, but as a matter of economy, the writer has not found that they can be profitably employed on *Lupinella* crops. A much more initially expensive but speedier way of improving the fertility of the earth, is to sow Beans (the ordinary "fava") liberally treated with superphosphate. It is a remarkable circumstance that Beans when manured even highly with stable manure in these soils, even if they yield well in themselves, do but little good to the following cereals. Whereas in favourable seasons, Beans fertilised with chemical manure not only find their own yield doubled and even trebled, but actually double, and more than double that of the succeeding crop of Wheat. So profitable and secure seems the use of these manures in the way described, that certain small neighbouring proprietors of the writer who would not previously spend one centime as a rule upon "letame" to save their eye-teeth, and regarded the phenomenon of a "forestiére" sowing his Beans with pinches of black powder with amused contempt, now willingly pay good round sums even for the despised compound. *F. C. H., Firenze.*

WHITE AURICULAS.—I am sometimes applied to for white Auriculas, and I occasionally see a white form advertised, only, to my regret, to find that it is *Primula nivea*. Last autumn I saw in a Continental catalogue *Auricula Boule de Neige*, and obtained plants of it, wondering if it was the snowy alpine *Primrose* over again. To my delight it proved to be a plant with decided Auricula foliage, and mealed. The flowers are similar in appearance to those of *P. nivea*, but they open sulphur-coloured, changing to white as they age; it is a form later in blooming, and the flowers possess a certain amount of fragrance. I have tried on several occasions to get a pod of seed from *P. nivea*, but I have never succeeded. Whether I shall be more successful in the case of the *Boule de Neige* remains to be seen. I used to possess a large creamy-coloured Auricula with mealed foliage, which was sent to me from the Continent as a double white, but which proved to be only poorly semi-double, and somewhat disappointing. I tried seeding it for several years, in the hope of securing a double white, but failed. I unfortunately lost it through an accident, but it was only valuable as a curiosity among Auriculas. This season I have bloomed a variety which comes nearer to a true double white Auricula than anything I have before seen; the flowers are of good size, fully double, of good shape, the petals round; it opens of a pale sulphur-yellow, and pales to a very slight creamy-white. I think it must have come from a pale buff semi-double seedling I bloomed two years ago, and from which I managed to get a little seed. The leaves are destitute of meal. It is a good grower, and I shall look forward with much interest to what it will do another season. The double varieties are all late in blooming, and are rarely in flower at the time of the Auricula show. To do them full justice, they should be well grown, and would be helped by a little artificial warmth, to assist them in expanding their blossoms. *R. D.*

YELLOW AND WHITE POLYANTHUS.—Those who have never grown these in a mass should lose no time in setting about preparing a stock of plants for

next year. At the present time we have large beds wholly filled with them in separate colours, and a grand display they make. True, the yellow has two shades, deep and pale; but they harmonise so well that the combination is a gain rather than otherwise. They all have a good constitution, and make large robust foliage which covers the soil, thus tending to prevent the flowers being despatched with the soil from heavy rains. The flowers are borne profusely, twelve to twenty pips on one stork stalk which stands boldly erect, displaying the foliage to the fullest advantage. Although the colours come fairly true from seed, it is necessary to make a selection the first year of flowering, as some are inferior in quality, having very small flowers, and the colour may not be quite so clean as desirable. Seed should be sown in sandy soil in a cold frame at the end of June; if the frame be stood at the back of a north wall, the trouble of shading will be avoided. When the plants are large enough to handle, prick them out into light soil in a frame again, which should be lifted off them when they are thoroughly established in their new quarters. From here the plants will lift with a good ball of earth about the roots for planting in the beds, which is best done as early in October as possible, allowing 6 inches of space each way between the plants. When the plants have done flowering, take them up at once, remove the flower-stems, and divide the roots according to the number of plants required for the next season. A border behind a north wall will be suitable summer quarters for the plants, which we lay in rows 1 foot apart, and each plant 6 inches distance from the other. By dividing the roots at this season instead of the autumn, they will be in a much better condition to make a satisfactory start in their new quarters. *E. M.*

DATURA SUAVEOLENS.—The best specimen of this species that I know of is growing in a bed in the conservatory at Kooksbury Park, Fareham. It is fully 25 feet high, and when in full leaf measures 15 feet across. The branches are cut close in to the main stem in February every year, and a dressing of partly-decomposed farmyard-manure is forked in about the roots. Growth soon commences, and it flowers on continuously until Christmas, and sometimes even longer. I have tried both this and *D. Knightii* out-of-doors in the summer, but in consequence of the cold winds which often prevail after they are put out, the leaves get badly pruned, and the growth receives a check, which they seldom recover during the whole of the summer. It is only in extremely sheltered spots that they will succeed. *S.*

CANTERBURY BELLS.—These are highly esteemed in some gardens; and I find them useful for filling up bare spaces in the herbaceous borders. We have the plant set out in rows in the front of shrubberies, and a capital show they make, the flowers last a long time in a fresh state, and are useful for cutting. From the middle to the end of May is a suitable time to sow the seed, which may be sown on a vest border, first watering the soil if necessary; when the plants are large enough to handle, prick them out in an open piece of ground to become established. They should then be ready for their permanent place by October. *E. M.*

HESPEROCHIRON CALIFORNICUS.—This is the long name of a very short plant, which does not rise an inch from the ground. It makes a small ring of leaves, inside of which come thirty or forty short-stalked white flowers, something in the form of *Gentian* flowers, but the general appearance of the plant is that of a miniature *Primrose*, being about 4 inches across. It entirely disappears in July, reappears in April, flowers in May, and does not seem to get any bigger. This one plant has done this for ten years at least, and it is very pretty. I bought it of Mr. Ware, and two or three years afterwards, when I wanted more, he said he had lost it all. It grows in a sunny spot in a fine peat; once or twice it has ripened seed, which came up, but I lost all the seedlings but one, which is now flowering near its parent, and is about half the size. If I thought anyone else in England had the plant, it would give me less anxiety. My old plant settles the question of its character as regards duration, as *Asa Gray* says it is perhaps only a biennial. *C. Wolley Dod, Edgely Hall.*

PELARGONIUM ROLLISSON'S UNIQUE.—I observed a fine plant of this now seldom seen old favourite in flower recently at Highclere Castle, Newbury, the Earl of Carnarvon's fine seat. It occupies about 30 feet of wall space in one of the plant-houses, and was flowering most profusely—a perfect sheet of bloom, Mr. Pope, the gardener, informing me that it does so annually. *B.*

BASAL ROT IN NARCISSUS.—In a communication on this subject to the Scientific Committee of the Royal Horticultural Society, I appear to say that I lose thousands of the variety called *Troilus* every year by basal rot. This is a mistake, as I do not think I ever had a hundred *Troilus* in my garden. I meant to say, that thousands of Trumpet *Daffodils* of different varieties die in my garden every year, showing the symptoms of which I sent bulbs of *Troilus* as an illustration. *Daffodils* are planted in clumps in the mixed borders, and in three years have become so crowded as to be uncomfortable; it is impossible to find time to transplant them all, so the less choice are left to their fate, which, in the case of some varieties, is to die at once of this mysterious basal rot, and in others to pine away gradually year after year until they die out of starvation. *C. Wolley Dod, Edge Hall, Malpas.*

THE COLONIAL FRUIT TRADE.—A recent issue of the Hobart (Tasmania) *Mercury*, just to hand, contains an article of interest on the home and colonial fruit trade, and notable as having special reference to a well-known gentleman of Aberdeen, Mr. A. R. Gray. The writer discusses the encouraging nature of communications that have taken place on the subject with leading firms in several of the densely-populated centres in Great Britain, and continuing, says:—"But personal interviews with principals make the way much easier, and, quite unexpectedly, an opportunity for consulting a gentleman who is engaged in trade in Aberdeen, and a portion of whose business is devoted to handling fruit, has been afforded us through the courtesy of Mr. Connacher, Manager of the Tasmanian Fruit Growers' Company. Mr. A. R. Gray is the name of the visitor, and he is on a tour round the world in search of health. During his stay in Hobart, his attention has been attracted by the energy displayed over the shipment of fruit to the old country, and he has also remarked the prime quality of the Tasmanian fruit. He has heard of one or two instances in which our fruit has reached Aberdeen, but it is not generally known there, and by the time it has arrived in that city it has passed through many hands. As the city has a population of over 120,000, and forms the central distributing depot for the North of Scotland, it will be readily admitted that Aberdeen should be able to take a fair quantity of our fruit. Mr. Gray tells us that he places about 500 barrels of Canadian fruit per week in the season, and as at this time the home-grown fruit is in the market, Aberdeen must be a good consumer. The Canadian barrels contain about four times the quantity held by our fruit cases; therefore 500 of them would represent about 2000 cases. It may be supposed that Aberdeen could take from 500 to 1000 cases of Tasmanian fruit per week, and Mr. Gray considers that Glasgow could do with a very much larger quantity. Fast steamers trade between Aberdeen and London, and the fruit could be transhipped at the docks at a trifling cost. It would be much better that consignments should be made direct to agents in such centres as those mentioned, rather than let them be supplied by London buyers, who simply look for a profit in passing from one hand to another. We do not go into the details of cost of handling, commission, &c., but Mr. Gray thinks the charge for freight needs reduction in order to secure better returns to the growers. *W. K.*

THE FRUIT CROP.—The general fruit harvest, judging from present appearances, will be, I fear, a very disappointing one, as I find that our Pears are falling off wholesale, and that but few Cherries or Plums are swelling, which shows clearly that the frost of 10° destroyed them in embryo. The Apple blossom looks strong, and we may hope that has escaped injury; but in the forward state it was at the time the frosts came, we can hardly expect it to be so, as the buds must have been frozen hard, the effects of which must be bad. *J. Sheppard.*

THE ORIGIN OF CULTIVATED BEET.—I observe in the *Gardeners' Chronicle*, p. 626, May 14, a note on the "Origin of the Cultivated Beet," condensed from the *Annales Agronomiques*, and tracing it to Beta maritima, which is indigenous on the borders of the Mediterranean. I write to mention that Sea Beet grows wild on one or three places on the East Coast of Scotland—one is somewhere near Aberdeen—but another known to me for two years in a sunny corner of the garden of my coast-house in life. In the old Burgh of Craill, just under the Castle cliff, once inhabited by the Scottish kings. There are at east a dozen wild Beet plants growing there on a

steep rough bank of clayey soil, from 10 to 20 feet above high water mark, and with a south-easterly exposure. The plants remain green over winter, and seed themselves year by year. I have possessed the garden only for two years, and when I was rearranging the slope, a neighbour kindly told me what the plant was, and its extreme rarity. Whereupon I undertook not to disturb it, and to allow any botanist to come in and inspect it. *James Rankin, D.D., Manse of Muthill, Perthshire.* [Beta maritima is a common plant in most localities round the coast of these islands. *Ed.*]

WALLFLOWERS.—Very soon preparation will need to be made to raise a stock of plants for next year's flowering. One of the chief causes of failure with these deliciously-scented biennials is late sowing. In the southern counties, June 1 is a good time to sow the seed, and ten days earlier for the north is not too soon at all. The best plan I find is to well water the soil the day before sowing the seed, which is generally done on a border facing west. This is much better than having to water the beds after sowing the seed. In fact, I prefer to apply some shade for a week or so over the beds to maintain the moisture in the soil. Many make a mistake in allowing them to become drawn up

WILLIAM MARSHALL, Esq.,
Chairman of the Floral Committee, Royal Horticultural Society.
(SEE P. 690.)

weakly in the beds, owing to neglect in pricking them off directly they are large enough to handle. What is wanted is dwarf bushy plants, with numerous side-shoots, which will give spikes of flower, as well as the central one. Those plants which are crowded together in the seed-bed have seldom but one stem or growth. As to variety, this, of course, depends upon personal taste; for a dark colour, I find none to equal Veitch's strain, having tried many others, but all fail so much in colour compared to this. They do not appear to have that deep velvety tinge which is so pleasing in a dark Wallflower. There is no retention of colour, and they are a dingy brown directly the blossoms expand. The best yellow I know is Belvoir Castle, and it is not necessary to grow more sorts than the best one of each colour, except, of course, where double flowers are required. *E. M.*

RHODODENDRON FALCONERI.—We have had this species in our hardy fernery for years, and the plant has grown to be a bush, more than 12 feet high, but this is the first year that it has flowered, and I expected to see big blossoms, but they do not at all correspond with the size of the leaf, being small and bell-shaped. The colour is shaded lilac. This species of *Rhododendron*, however, is worth growing for its foliage alone, which is highly ornamental, the leaves being from 6 to 9 inches long, and half that in width, and coated beneath with a thick ferruginous down, and the upper surface is rugged and of a dull shade of

green, and the bark is smooth and polished, the whole plant having a striking appearance. As the plant has now lived in the open air in these gardens for so many years, there can be no question as to its hardiness, but it is worth mention that the spot where it stands is sheltered and not open to the early morning sun, which often does injury if it follows on a sharp frost, the thawing of the buds being then rapid. *J. Sheppard, Woolverstone Park, Ipswich.*

RHODODENDRON CAMPANULATUM.—Herewith are enclosed three small bits of *Rhododendron campanulatum*—the three are just about the size of one truss, and the blooms only half-size. The recent rain has destroyed the finest head, which I intended to send you, and to draw your attention to the fact that the plant is growing in the flower garden, with no protection, but well sheltered, not a mile from the sea. The plant is about 12 feet high, and nearly as much through, and flowers regularly, and about one month earlier than is the case this season, and, in consequence, it is liable to get its flowers frozen. In all probability, the plant has been in this garden for forty or fifty years. I saw a correspondent in your paper, a year or two ago, writing on this *Rhododendron*, saying that it was hardy in the south of England, and a grand conservatory plant. *J. F. Smith, gardener to the Countess of Seafeld.* [The pure white bell-shaped flowers, and dark green foliage, with light brown tomentum on the underside, make this species a very attractive plant, indoors or out. *Ed.*]

GARDENERS' ORPHAN FUND.—I must first apologise to you for encroaching on your valuable time and space, but as I am most anxious about the welfare of our Orphan Fund, I must ask you to give publicity to a few of my ideas. I was indeed surprised, on reading the account of it in your recent issue, to find the committee, on the strength of a very good dinner subscription, propose at once to place other children on the list of pensioners. It seems to me it would be far better to have a yearly ballot, and if our funds more than a rainy day, when we are not able to get a chairman who brings such good help to our need. I am sure the committee will forgive my airing my opinion, knowing how narrowly I watch the progress of the institution. *Charles Penny, Belle Vue, Salt Hill, Slough.*

STRAY LEA, HARROGATE.

THERE is always something good to be seen in flower at the above place, the residence of E. Beckett Faber, Esq., who is himself an ardent Orchid grower, and possesses some very fine specimens of many of the choicest varieties.

On a recent visit I noticed in flower some grand masses of *Cattleya Mendelii* and *Mossii*; also, in the same house (though not in flower) were nice pieces of *C. aurea*, *C. Gaskelliana*, *C. Dowiana*, *C. Lawrenceana*, and other leading varieties; also a splendid plant of *Vanda suavis*, with two lovely spikes, an excellent variety, this being the second time of flowering in twelve months. Some grand masses of *Lælia purpurata* were noticeable also.

In the *Cypripedium* house was a fine specimen of *C. grande* just passing out of flower, the remains of four spikes still being present, each of which had borne three flowers. The foliage was a perfect picture, being so gross, the whole forming a mass 3 feet across; also in the same house were three plants of *C. venustum*, each with two blooms; *C. hirsutissimum*, a fine plant just going over, but with two flowers remaining, showing it to be a good variety; *C. Lathomianum*, a fine specimen with eight strong leads and four flowers, was also noted. In the same house was a plant of *Anthurium Duvivierianum*, a variety of Continental origin—spathe pure white.

The chief feature among the Orchids was the *Odontoglossums*, of which there is a grand lot, nothing but varieties of sterling merit being retained. There are at present some charming varieties of *O. crispum* in bloom, and specially noteworthy were two, on account of the heavy blotches evenly distributed over the flower. Others, also very pleasing, were of a rosy tinge, all the flowers were of good size,

and of great substance; there were a quantity of others in bloom and spike, so there will undoubtedly be a grand show for some time to come. Others were also noticed, namely, *O. Uro Skinneri*, a good variety; *O. Halli*, with eleven flowers, well marked, a charming variety. In the same house were *Cymbidium Lowianum superbum*, a grand piece with three spikes, fifteen flowers on a spike; and *Oncidium macranthum*, a fine piece, with eleven blooms open, an excellent variety. A splendid basket of *Asparagus deflexus* (new) was hanging from the roof, and was exceedingly graceful-looking.

In another house was a splendid specimen of *Cypripedium villosum splendens* in a 15-inch pan, and carrying twenty-four blooms, and just now at its best. *C. Boxalli stratum*, just passing out of flower, had carried seventeen blooms. Passing on to the next house, I noticed a good collection of stove plants, including specimens of *Anthurium Scherzerianum* var. *grandiflorum*, *A. Andreanum*, *A. Madame E. Pynaert*, *Pandanus Veitchii*, *Bougainvillea glabra*; also nice plants of *Kentia Fostieriana* and *Belmoreana*, also *Geonoma gracilis*. The above were arranged most tastefully.

In the Croton-house were nice plants of *C. Heathii*, *Countess*, *Flambean*, *Queen Victoria*, *Prince of Wales*, *Warrenii*, *Lady Zeland*, and others; also a good collection of useful varieties of stove plants, especially adapted for grouping at exhibitions, in which Mr. Townsend, the head gardener, has for some years taken an active part; and the general healthy and clean appearance of the plants fully testify to the careful attention bestowed on them by Mr. Townsend. *Jno. Clayton, May 20.*

CLUB IN BRUSSELS SPROUTS.

Your correspondent, "R. D.," relates a remedy for this disease which is new to me, viz., a gardener practised the most successful way he knew by putting the plants in trenches 4 or 5 inches deep, and earthing up the stems of them as soon as the slightest sign of the disease manifested itself. A second production of roots, it is said, is thus induced to take the place of the first growth as they become destroyed by disease. But this surely cannot be more than a half remedy, and the crop must be much smaller than it would have been had the disease been entirely prevented.

As preventive agents, "R. D." quotes the favourite one, lime, and also wood-ashes, lime and soot, nitrate of soda, and common salt. In my youthful days, after I had studied Johnstone's *Agricultural Chemistry* and Carpenter's *Animal and Vegetable Physiology*, I pinned my faith to lime, as it was likely to neutralise the excess of vegetable acid of a low order which had been left in the soil by the decomposed roots of a succession of crops of the Cabbage family. But in practice this was found to be only a partial preventive. By placing a given quantity of lime in the soil in juxtaposition with the moisture containing the above-mentioned acid in solution, the strong affinity of the lime for the carbon of it caused the lime to partly return again to carbonate of lime or chalk, whereby a large portion of the acid was made inert or inactive, and, therefore, harmless so far to a future crop of Brussels Sprouts or any other kind of the Cabbage family. But to completely neutralise the amount of acid which accumulates during several crops of these plants in succession would be to commit the error of "over-liming," as Johnstone terms it; or to make the last state of the soil worse than the first, for hardly any crop would then grow vigorously on it.

The other articles mentioned, excepting perhaps the salt, and that cannot be relied on, as to use enough would be worse than over-liming the soil; but excepting the salt as only a partial preventive, the other agents come under the head of stimulants, and merely act by helping the plants to withstand the disease in the same way as the life of a patient suffering from consumption, or other wasting disease, is prolonged by an abundance of palatable and nutritious food, and stimulants.

Now the only expeditions, certain, and complete remedy for this disease, is to grow a cereal crop when it occurs. Wheat is the preferable kind of cereal, as it is a large feeder, and has a great capacity for digesting and converting into starch the carbonaceous acid mentioned. Sometimes, where the soil is low-lying, and naturally damp, even if well-drained, this acid may be so abundant in it that it would be advisable to grow a second cereal crop, as of Rye, after the Wheat. Plots or fields of soil so treated will then produce for several years crops of the Cabbage tribe, if alternated with Beans, Peas, Potatoes, and so on, without the least sign of club being developed on their roots. Cobbett's Maize, or Indian Corn, which I have grown to perfection in Surrey, other southern counties, and in the eastern counties, is an excellent preventive crop for this disease, but it is not so efficient as Wheat. It has a more horticultural appearance in a garden, however.

Apart from my own experience, I have had many opportunities—some made intentionally—for talking with market gardeners, and observing their crops as grown around London after heavy dressings of manure. The more highly crops of the Cabbage family are manured, the fewer crops of them can be grown in succession before clubbing becomes ruinous. This is because, the more a crop is forced into rapid and heavy growth, the more numerous and the larger their roots; and, therefore, the more of the carbonaceous acid in question is deposited in the soil.

As much complaint of this disease as I ever heard made was in a large market garden through which the Southend Railway runs at East Ham, Essex. This farm, too, was mostly light gravelly and sandy soils. The occupier gave deplorable accounts of his losses in past years. I suggested an abundance of lime, as I still had faith in it then. The occupier said, "That is very little use to me now, I have used it so often." I suggested stimulants, among which were some of the above. "They are no use, except to keep the plants just alive, and produce, what I call, a quarter of a crop." "But," I continued, "I saw your large field by the railway crossing, which is producing the cleanest, heaviest, and prettiest crop of Cabbages I ever saw growing." "Ah," he rejoined, "there is the evidence of the only perfect remedy for club. That field had two crops of cereals, Wheat first and Rye next, and this is only the second crop of the kind since. I can go on growing then at frequent intervals heavy crops of Cabbages, Broccoli, Savoy, Collards, and so on, for two or three years, when another crop or two of cereals must be grown." I said, "I suppose you do not care to grow cereals at present prices?" "Care to!" he shouted; "why, you see that field of Wheat and the Rye next to it, when I have cut, harvested, thrashed, and taken them to market, they will make from £10 to £14 perhaps, straw and all, but if I can make sure of crops of clean green stuff they will make £40, £50, or £60 a year."

I had a few more words to say, but I find I have written a long letter. But from what I have said, I trust my readers will be able to draw some definite and useful conclusions. I may add, that I have met with many similar cases to the above, where land has been cultivated as much as possible for producing green crops for the London and other markets.

As to the maggots mentioned, let me add, they are often taken for the cause, but they are only an effect. The slime-fungus mentioned in brackets is the first visible cause; but this, according to my observations, is the result of the acid acid acting on the delicate skin of the roots. When the club-roots begin to decompose, they stink like rotten Turnips, and in bad cases a plot may be smelt roots away. This foul scent attracts flies, which lay their eggs; and hence maggots are always present in advanced stages of this disease. *W. H. G.* [May not the old-fashioned plan of dipping the roots in clay puddle, i.e., fresh unmanured soil, before setting-out the plants have had the effect of preserving them for a time from the acid present in the soil, and in that way have proved an efficient palliative. Ed.]

SOCIETIES.

ROYAL HORTICULTURAL.

Show in the Temple Gardens.

MAY 25, 26.—We are pleased to have to record another well-earned, genuine success for the representative Society of the Empire. The weather was favourable, the company large, and not only numerous, but, what is far better, appreciative. The exhibition was of a very high-class character, and so large, that, in spite of the four large tents, dense packing and overcrowding were unavoidable. There was a lack of fine specimen tree-Ferns, Palms, and Cycas, so that, as usual, the lines were somewhat monotonous. There were, however, some good groups of Palms at the end of the large tent. The Orchids were especially numerous and interesting. The huge bushes of pruned *Dendrobium nobile*, of which we hope to give an illustration in our next, excited lively interest amongst the fraternity. Messrs. Backhouse's rock-garden in miniature was a veritable gem that superlatives would spoil. Roses, Pæonies, and Ferns were well shown; and M. Linden contributed from Brussels a group of twelve new foliage plants, of great beauty and interest.

Bouquets and table decorations were neither numerous nor remarkable. The exhibits were far too numerous for us to notice more than a small proportion of them, but the following columns contain notes as to the more prominent and important of them.

The first tent coming from the Embankment Gate, contained Hardy plants, *Petunias*, *Gloxinias*, *Sprentocarps* and Ferns.

The second tent was filled with Orchids, *Begonias*, *Amaryllis*, *Gloxinias*, *Pelargoniums*, *Ericas* and Ferns.

The third tent contained Orchids, Roses, Palms, Azaleas, and miscellaneous Groups.

The fourth contained Bouquets, Table Decorations, Lilies, Tulips, Violas, Alpine Plants, Fruits, Vegetables, and New Plants.

NEW PLANTS.

The Horticulture Internationale (M. Lucien Linden), Brussels, exhibited a group of new variegated-leaved stove plants of more than ordinary interest. *Labisia smaragdina* is a Boreana plant, closely allied to *Ardisia*, and already represented in gardens by several pretty species introduced by the same firm. This new one is a dwarf plant with oblong obovate leaves, coloured dark olive-green, with the midrib and veins of a darker shade. It is an effective little plant. *Caladium sagittatum* has leaves shaped like those of the common Arrowhead (*Sagittaria*), coloured deep green, with a broad band of dull rose extending along the midrib, and a few grey blotches. *Dichorisandra angustifolia*, from Ecuador, is a pretty addition to this genus. It has leaves coloured like those of *D. muscica*, but narrower and longer. *Heliconia spectabilis* is like *H. metallica*; it has green leaves, with a chocolate-red midrib, and dark brown petioles. *Dieffenbachia melegria* has dark green leaves, with a few blotches of creamy-white, and the petioles thickly mottled with the same colour. The name is particularly apt, the marking of the petioles being very much like that of the Soake-head Frillfairy. *Stenandrium Lindenii*, named by Mr. N. E. Brown, is remarkably like a *Cyrtodeira* in general appearance, though quite distinct from any species of that genus in cultivation. It is dwarf and tufted in habit, with oblong dark green leaves, the midrib and principal veins lined with greenish-yellow. (First-class Certificate.) *Dichorisandra muscica* var. *gigantea* is a great improvement on the type. The specimen exhibited is a magnificent one, with stems 2 feet high, and leaves 9 inches by 5 inches, coloured exactly as in the type. (First-class Certificate.) *Tradescantia Regina*, from Peru, is evidently a free-growing plant, with lanceolate leaves 5 inches long, purple below the upper surface, banded with grey, as in *T. zebrina*. (First-class Certificate.)

Cyrtosperma ferox is exactly like *C. Johnstoni*, sometimes called *Alcaocia*, but the blade is uniformly green; the basal lobes, too, are exceptionally long (Botanical Certificate). *Peperomia metallica*, another new introduction from Peru, is a compact plant, with small oblong-lanceolate leaves, coloured like those of *Pellionia Daveauiana*. It may be *Pellionia*. *Smilax argyrea* from Peru, is an improvement on that pretty little greenhouse climber, *S. maculata*, The former has leaves 6 inches by 2

inches, green, heavily marbled with grey (First-class Certificate). *Tradescantia superba* is like *T. Regina*, but the leaves are not marbled (fig. 102).

Calla Eliottiana. This plant is one of the attractions of the exhibition. It has already been certificated, and Captain Elliott, the lucky owner, has frequently exhibited it. Evidently, the plant behaves well under cultivation. The scapes this year are fully 2 feet high, and the rich yellow spathe as large as those of a good *C. ethiopica*. No doubt, Captain Elliott's plant is a variety of *C. maculata*. By the way, we learn that others have recently become possessed of tubers of this *Calla*, and we may, therefore, shortly hear of its being procurable from the nurseries. So far, Captain Elliott has been the sole possessor of this really beautiful yellow-flowered *Calla*.

THE GROUPS.

The various groups of plants in the central and larger tent formed an important part of the whole, and in them were included a good many new or rare plants, which we shall mention in the places in which they occur. In the smaller tent, where fruits and miscellaneous articles were displayed, a part of the middle tables was filled by Mr. B. S. Williams, Victoria and Paradise Nurseries, Holloway, N., with many plants of the finest varieties of *Clivia* minists, of which we name some of the best, in Meteor, a rich vermilion-orange; *Ambrose Vieschaffelt Marie Reimers*, and *Van Houtte*.

This group contained some pretty double-flowered Ghent Azaleas and *A. mollis*, beautifully flowered, and in much variety of colour.

In the large tent, Messrs. Shuttleworth & Co., Albert Nurseries, Peckham Rye, S.E., occupied a good deal of the space at one end; a group of theirs occupying the space between the doorways, consisted of large and small *Cocos*, *Weddellias* and other species of Palms; some *Dieffenbachias*, *Dracenas*, *Crotons*, *Tillandsia masaiica*, *Acalypha*, *Pandanas*, with a number of *Lilium longiflorum* occupying the middle distance. These were clean, useful, well-grown decorative plants, that would have pleased better had they had a little more space. By the side of this, and separated from it by the path, was a corner group of *Cocos*, *Rhipsis*, and many young plants of *Cycas revoluta*, in very robust health, and ranging in height from 2½ to 4 feet.

Messrs. J. Peed & Son, Ruppell Park Nurseries, Ruppell Park, Norwood, put up a group in which *Anthuriums* in variety formed a large proportion, and amongst them we noticed *Ronpelli*, *Jeffersii*, *anguineum*, and *John Peed*, all of which are improvements, as regards size of spathe, on the type, *A. Scherzerianum*. The group was arranged in a sloping manner from the front to the back, the foreground consisting of *Caladium argyrites*, *Panicum variegatum*, *Crotons*, *Ferns*, &c.

To the right of this group, and apart from it, they had arranged a group of fine-looking *Caladiums*, consisting of some older and some new varieties. We remarked *C. Reine de Danemark*, *Gustave Chandon*, with a greenish-white leaf; *Mons. A. Hardy*, *Madame Groul*, with a very nice bronzy-green and crimson leaf; *Salvator Rosa*, *La Perle de Bresil*, white, with green veins; *John R. Box*, and *Excellent*, a fine bold, stiff leaf, with rich markings of crimson and white.

Messrs. W. Cutbush & Son, The Nurseries, Highgate Hill, staged a large and miscellaneous group, a little too much variety in it to look really satisfactory, albeit the quality of the materials was good. *Azalea indica* in variety, *Spiraea astilboidea*, *Hydrangea paniculata*, *H. Dr. Hogg*, *Rhododendrons*, *Lilies*, *Saxifraga pyramidalis*, the new *Epiphyllum Gaertneri*, *Erica ventricosa*, and others; *Kalsanthus jasmiflora*, pretty freely-flowered examples; and *Mignonette*, *Cutbush's Crimson*, formed the major part.

Messrs. R. Smith & Co., nurserymen, Worcester, came out well with *Clematis* in pots, and showed first-class well-bloomed plants of the following single-flowered varieties, *Blue Gem*, *Marie Lefebvre*, *Ed. Desfosse*, a small flower of light purple; *Purpurea elegans*, *Lady Dorothy Neville*, and *Sensation*, a lovely showy violet flower. The front of this group was filled with Japanese Maples, that helped to mask the big pots of the *Clematis*. Other plants observed in the group were *Boronia heterophylla*, full of its rosy-purple bells; various *Ericas*, *Pteris tremula densa*, with fronds 1 foot high, like the "best curled Parley."

The group exhibited by Messrs. J. Veitch & Son, Chelsea, was composed of new or rare plants mostly. We noted *Azalea "rustica"* flore-pleno Milton, with trusses of white flowers, and very free; it seemed like

a small-flowered Ghent Azalea. Of *Azalea mollis*, *Mons. Arthur Varelles* was good; also several *Moutan Paeonies*. *Hydrangea Hortense rosea* is a fresh-looking and compact growing plant, with its very large trusses of bright pink blooms sitting close down on the foliage. *H. Madame Schwartz* has large corymbs of pink flowers changing to white, and a habit that is very compact. Several species of *Cytisus*, viz., *C. filipes*, *C. scoparius*, *Andreas*, and *C. s. pendulus*; and *Acer palmatum septemlobum purpureum*, and *A. p. sanguineum*, gave a welcome relief in dark purplish-brown to the prevailing brightness. *Ribes pumilum aureum* is a miniature plant with small leaves of a yellowish colour.

Messrs. J. Laing & Sons, Stanstead Park, Nurseries, Forest Hill, S.E., contributed a group of plants that consisted chiefly of variegated-leaved *Crotons*, *Caladiums*, and *Coleus*, associated with *Lælia purpurata* in some variety, *Cattleyas*, *Vanda*, *Odontoglossum crispum*, and *Dendrobis*. *Croton Karreni* was the one distinct and fine variety shown. It has long strap-shaped, pendulous leaves, dark green and marbled with yellow and red. *Coleus Stanstead Beauty* may prove a good plant for the greenhouse. A few excellent *Cliveas*, *Anthuriums*, *Ericas*, and general decorative materials were included in the group.

ORCHIDS.

The exhibition of Orchids on this occasion, must, taken as a whole, certainly be considered the finest yet seen at these annual gatherings; not so much, perhaps, from the point of large specimens, although many were shown, as from the superiority of the varieties of many well-known species shown by various exhibitors. The arrangement also, speaking generally of the Orchids, was superior to any previous attempt, there being more harmony displayed throughout. *Lælias*, *Cattleyas*, *Odontoglossums*, and *Dendrobis* constituted the chief genera exhibited, whilst a few good *Vandas* were included, but, singular to say, few plants of *Saccolabium* or *Aërides* were shown, and these only the minor species.

Baron Schroder's (Mr. Ballantine, gr.) large and choice collection contained many fine grown specimens, being particularly strong in *Lælias*, *Cattleyas*, *Odontoglossums*, *Dendrobis*, and East Indian genera. In the centre of the group was a grand specimen of *Cymbidium Lowianum* with fourteen spikes. *Celogyne Dayana* (the necklace Orchid) was another remarkable specimen with twelve spikes, the longest between three and four feet in length. *Cattleya Skinneri* was a grand specimen with about a dozen spikes, with nearly as many blooms on each variety, one of the best being rich in colour. *Lælia purpurata* was well represented by the pure white forms with the rich purple lip; *Cattleya Mendelii* and *C. Mossie* were present here in the best forms; the *Odontoglossums* were shown in the finest varieties to be found in cultivation, most noteworthy being *O. Wilkeanum* (a superb spike), *O. cirrosum*, *O. Pescatorei* (the yellow variety) a delicately beautiful form; *O. crispum xanthotes* (a pure white flower with pale golden blotches); *O. cuspidatum xanthoglossum*; *O. Hallii xanthobon*, with fine forms; *O. crispum apium*, one of the very finest, with extra large flowers with dark chocolate blotches; *O. Pescatorei leucoxantha* (a pure white var. with golden lip), *O. vexillarium*, and *O. v. Cobbiana* (one of the largest forms). *Dendrobis* are well shown in *D. Jamesianum* and *D. nobile nobilis*; *Madevallias* by *M. ignea*, *M. Veitchii grandiflora* (extra fine); *M. Harryana splendens* and *M. H. armenica*; *Cypripedium grande* and *C. caudatum* with *C. selligerum majus* were all in fine form. Of the *Aërides*, *A. Savageanum* calls for particular notice, being of a deep crimson purple. This collection was too much crowded to do the choice exhibits the justice they deserved. A Silver Cup was awarded to the collection.

From C. J. Lucas, Esq., Warnham Court, Horsham (Mr. Duncan, gr.), came a varied group of choice varieties, the *Cattleyas* and *Lælias* being particularly fine forms. *C. gigas Sanderiana* with the lip of rich colour, *C. Mendelii* delicata, and *C. Mossie* in the best condition, *C. Leopoldi* (seldom seen). *Lælia purpurata* was here shown in several varieties with much variation in colour; *Miltonia vexillaria* was present in highly coloured forms, with several plants of *O. crispum*, *Dendrobium Phalaenopsis* var. *Schroderiana*, *Madevallia chimera* and *Dendrobium Dearii* also call for special notice. A Silver Cup was awarded.

From Sir Trevor Lawrence, Bart. (gr., Mr. W. White), came a most noteworthy and grand display, like that from Baron Schroder, in many points of a unique character. This collection was particularly strong in *Madevallias* (for which Sir Trevor

is famous), and many *Odontoglossums*, in the finest forms. *Cypripediums* were also shown here, in the very best and choicest kinds; *Madevallia Harryana sanguinea* (very bright in colour), *M. Harryana* (several specimens), and many of the smaller species were well represented. *Odontoglossum citrosum* here shown in profuse bloom, the paler forms being remarkably fine and particularly chaste in colour; *O. luteo-purpureum radiatum*, *O. crispum*, in choice variety, and *O. excellens* also call for special notice. Of *Cattleyas*, *C. Mossie* Wagerii, the pure white form with an inner marking of pale golden-yellow in the lip, was here seen in splendid form; *C. Mendelii* and *C. Mossie* being also well represented. Of *Dendrobiums*, the finest were *D. thysiflorum*, and *D. Dearii*, whilst *Cattleya Mendelii* were shown in splendid condition. *C. Lawrenceanum*, *C. Veitchianum*, *C. Curtisii* (extra fine blooms), *C. levigatum*, and *C. Schroderae*, all call for special notice, the cultivation being of the finest possible character. *Phalaenopsis grandiflora* was also staged here as it is now rarely seen, the spike bearing ten extra fine flowers. *Vanda teres* and *V. suavis* were both shown in good flower; also *Acridis falcatum Leonis*, and *A. f. Houtianum* (both fine forms), other good things were *Dendrobium Lowii* (a beautiful yellow species), *Cattleya citrina*, and *Odontoglossum maculatum*. This collection was not so much crowded, and being backed by graceful Palms, presented an imposing display. A Silver Cup was also awarded this collection.

From F. Wigan, Esq., Clare Lawn, East Sheen (gr. Mr. J. H. Young), came a small group of well-grown plants, included amongst which were fine plants of *Lælia purpurata* and *Cattleya Mendelii* (the latter another fine variety with high-coloured lip), with some twenty or more flowers; *Grammotophyllum multiflorum* (2 bore two strong spikes, one fully developed flowers of a pale green colour, spotted with dark brown. *Dendrobium suavisimum*, *Cypripedium* in variety and *Phalaenopsis speciosa*, completed an excellent group. A Silver-gilt Flora Medal was awarded to it.

F. C. Jacob, Esq., Cheam Park, Surrey, showed a capital group of *Cattleyas*, amongst which were very fine varieties of *C. Mossie*, *C. Mendelii*, and *C. gigas*, all bearing blooms of extra size and vigour; *Dendrobium thysiflorum* and *Miltonia vexillaria* being also shown in good form. A Silver Flora Medal was awarded.

From Viscountess Portman, Buxted Park, Sussex (Mr. Prior, sp. gr.), came three of the finest plants of *Dendrobium nobile* probably ever seen at any show; these are specimens some 6 or 7 feet through, in the highest degree of health, with flowers upon the bulbs throughout their entire length, this in many instances being quite 4 feet, bearing one mass of bloom. To these grand plants a Silver Banksian Medal was awarded, the award being hardly commensurate to their merits as a whole. This exhibit is all the more interesting from the fact of the discussion upon the merits and demerits of the pruning system, these being the plants grown upon the pruning principle advocated by Mr. Princeps, which is with him certainly a great success.

Amongst trade exhibits, Messrs. B. S. Williams & Son showed a large group; included in this collection were several extra-fine plants of *Vanda*, *V. suavis* being staged in profusion, and *V. tricolor formosa* (a fine form), very distinct. These were the best *Vandas* in the exhibition. A fine specimen of *Cymbidium Lowianum* formed a central object, being flanked by *Calanthe masuca*, now seldom seen in such fine condition as this one, the spikes being of extra vigour; *Miltonia vexillaria*, and fine varieties of *Odontoglossum crispum*, helped greatly to make a fine display; *Oncidium concolor* stood out distinct by reason of its colour; *Dendrobium thysiflorum* *Walkerianum*, with extra long spikes, was a distinct variety; *Lælia purpurata* was staged here with strong growths and large trusses; this collection also embraced *Cypripedium selligerum majus*, *C. grande*, *C. caudatum roseum*, and *C. Morganiæ*, all in the best of health, with several *Odontoglossums*, *O. luteo-purpureum* and vars. *O. Hallii*, and *Miltonia strelata* (a distinct acquisition). An award of a Silver-gilt Flora Medal was made.

Messrs. Sander & Co.'s exhibit was remarkable for the many unique examples of new and rare kinds, amongst these were *Odontoglossum Pescatorei* *aplatum*, a pale form, with fine blooms, and a strong spike; *O. excellens*, a pale variety; *O. Amesie*, a variety with large and distinct blotches, resembling *O. crispum*, but is more vigorous; *O. crispum Sanderi*, a highly-coloured form, rich in its markings; *O. crispum Wellsianum*, the petals pure

white, the sepals blotched, and both of extra breadth; *O. Bleii* splendidissimum, after the best types of *Miltoia vexillaria*; *O. Pescatorei* Schroderae, pure white; *O. Andersonianum* virginalis, pure white ground, with faint markings; *O. Lowianum*, very distinct. *Miltoia vexillaria* was present in many fine forms. Of *Dendrobiums*, *D. Phalaenopsis* Schroderiana stood out remarkably distinct, both pale and dark varieties being represented. Amongst *Cypripediums*, note should be taken of *C. Chamberlainianum*, of which several plants were shown in good form; also *C. Chamberlainianum* excellens, a variety with a lighter dorsal sepal, otherwise not distinct from the type. *C. bellatulum* with extra fine flowers was also shown. *Cypripedium Wallisii*, of the *Selenipedium* group; *Oncidium Gravesianum*, a promising addition to its class; *Epidendrum Godseffianum* and *E. Randii*, *Phaius Sanderiana*, and several fine forms of *Cattleyas* were also staged. Among the latter were *C. Mendelii* (Cookson's var.), with flowers of remarkable size, the lip equal to the best variety of *C. gigas*. *Vanda Sanderiana* bore a spike of eight fine blooms; whilst *Dendrobium Desei* was in its best character. This collection gained an award of a Silver Cup.

Messrs. Charlesworth, Shuttleworth & Co., Bradford, &c., staged an excellent group of great variety, here were to be seen *Oncidium macranthum* in grand form; *O. Wilckeanum* nobilior, with paler-coloured flowers than the type; *Cymbidium Lowianum*, *Odontoglossum triumphans*, *O. crispum*, extra; *O. Harryanum*, a strong spike; *Oncidium crispum* grandiflorum, a fine specimen of cultural skill; *Laelias* and *Cattleyas* in profusion, with *L. grandis tenebrosa* besides *L. purpurata* and *C. Mendelii*. This group was remarkable for many fine plants of *Oncidium macranthum* which it contained, and if more space had been afforded it would have added to the effect as a whole. It well merited the award of a Silver Cup.

Messrs. H. Low & Co., Clapton, staged a grand group, chiefly consisting of *Cattleyas* and *Laelias*, which in point of numbers and excellence as a collection was second to none in the show, occupying two-thirds of the centre along one side in one marquee. Here were some splendid varieties of *C. Mossie* and *C. Mendelii*, in some instances the colours in both being very rich. One form of *C. Mossie*, called *Venus*, has a well-defined margin of pure white upon the lip. *Cypripedium voluteum*, singularly distinct, and *C. Lawrenceanum* are shown well, likewise *Dendrobium macranthum* in profusion. *Cattleya citrina* and varieties of *Phalaenopsis* were also included with several well-grown *Odontoglossums*. A Silver-gilt Flora Medal was allotted to this group.

Mr. James Cypher, Cheltenham, staged a collection of plants denoting the highest cultural skill. Here were *Cypripedium caudatum* (in grand form, rich in colour), *Dendrobium devonianum*, and *D. Bensoni*. *Laelia purpurata* was represented by many fine varieties, of *C. Mossie grandis*, a good plant, was shown. *Miltoia vexillaria* and *M. v. gigantea* were remarkably fine; *Cymbidium Lowianum*, *Oncidium spheculatum*, with *O. concolor*, made a good show; *Epidendrum radicans* also being shown in the best of health; *Cypripedium caudatum* roseum was here to be seen, with tails some 2 feet in length. Award, a Silver Cup.

Messrs. Lewis & Co., Southgate, staged a small group of choice kinds, including *Oncidium macranthum*, *Cypripediums* in variety, embracing *C. caudatum* in fine form, and *C. Southgatense*, a variety with extremely dark flowers, slightly past its best, but evidently a good variety; also *C. Haynaldianum* virens, a pale form, with *Cymbidium Lowianum* viride, in which the lip is destitute of the dark markings. Award, Silver-gilt Flora Medal.

Messrs. Heath & Co., Cheltenham, showed a good group, amongst which was a grand specimen of *Cypripedium Lawrenceanum* and another of *Cattleya intermedia* with the same of *Cymbidium Lowianum*, and smaller plants of *Cattleyas* and *Laelias*; of the latter, *L. purpurata magnifica* is a noteworthy form. *Cattleya Schroderae* and *C. Mossie Hardyana* are also in fine order. A Silver-gilt Flora Medal was adjudged to this group.

CERTIFICATED ORCHIDS.

Messrs. Sander & Co., received a Certificate for *Odontoglossum crispum Sanderi*, a dark form, the colour chiefly a rich rosey-crimson on a pale ground; for *O. Lowianum*, a natural hybrid, apparently between *O. triumphans* and *O. luteo-purpureum*; the ground colour a pale brown, in form of flower

not unlike *O. grande*, but smaller. For *O. Bleii* splendidissimum, a hybrid between *O. vexillarium* and *O. Roelzii*, being intermediate between the two, having flowers the size of the former parent, with the character of the latter; for *Phaius Sanderiana*, now in much better form than when recently shown, and then given an Award of Merit.

Messrs. Lewis & Co., Southgate, received a Certificate for *Cypripedium southgatense*, a dark-coloured hybrid, and a near neighbour to *C. bellatulum*.

To Captain Vipan, Steppington Hall, Wansford, was awarded a Certificate for *Cypripedium Vipan*, a hybrid between *C. levigatum* and *C. niveum*, in which the character of the flower is after the latter parent, but the size considerably increased; this is one of the lightest-coloured hybrids yet raised, being nearly of a pure white, with rosy purple veining.

Awards of Merit were assigned to Messrs. Sander & Co. for *Cattleya Mendelii* (Cookson's var.); this is quite a major form, with bluish coloured sepals and petals; the lip extra fine, more after *C. gigas* in colour and size, also deeply fringed. *Cypripedium Chamberlainianum* excellens; a lighter coloured variety of this now well-known Orchid, the dorsal sepal being its distinctive feature.

Messrs. Lewis & Co. secured a certificate for *Cymbidium Lowianum* viride, a form with the lip void of the dark pencillings of dark bronzy-crimson as seen in the type.

Messrs. Charlesworth, Shuttleworth, & Co. were adjudged a First-class certificate for *Odontoglossum Wilckeanum* nobilior, a pale form best described as *O. triumphans*, with much lighter colours in its blossoms.

Mr. James Cypher received a similar award for *Laelia purpurata Handleyana*, a variety in which the distinguishing characteristic is the intense colouring of the lip, a deep rich vinous purple.

Botanical certificates were awarded to C. J. Lucas, Esq., for *Zygopetalum graminifolium*, a small growing species with a pale purple lip and darker sepals and petals, and grass-like growth; to Messrs. Sander and Co. for *Epidendrum Godseffianum*, a strong growing species with rather loose spikes, and flowers of a yellowish-brown, and a light lip; and for *Oncidium Rolfeanum*, after *O. crispum*, but with smaller flowers, also lighter in colour.

A Silver Banksian Medal was awarded to the remarkably fine specimen of *Coleogyne Dayana*, to which allusion was made in the collection of Baron Schroder.

ERICAS.

One sees now, nothing more than small plants of *Ericas*, the show specimen being almost universally absent in competitions; and Messrs. Hugh Low & Co.'s group, admirable as it was, in other respects, contained only plants of market size, capably bloomed certainly. The group consisted of *E. ventricosa rosea*, *E. v. grandiflora*, *E. v. globosa alba*, *E. v. superba*, *E. v. coccinea*, *E. v. magnifica*, *E. v. Bothwelliana*, *E. v. tincta*, *E. hybrida*, *E. perspicua*, *E. Cavendishiana*, &c. Associated with the *Ericas* were plants of *Pimelea Hendersoni*, *Cestrum* (*Habrothamnus*) *aurantiacum*, rarely seen in flower of such small size; *Polygala Dalmaisiana*, &c.

AMARYLLIS.

Messrs. B. S. Williams showed a group of *Amaryllis* of their usual good quality, the flowers small, but of good form and colour. Dr. Masters is still one of the best of its kind. Other good varieties were Morning Star, Distinction, Empress of India, Lothair, and Junius, a fine dark-coloured flower with distinct green star.

Messrs. Kelway & Son also showed cut blooms of *Amaryllis*, among various other subjects.

GLOXINIAS.

These were shown to the best advantage by Messrs. Veitch & Sons, Exotic Nursery, Chelsea, who staged a collection in the full flush of their beauty, rich carmine-coloured varieties being very prominent. Of netted and margined varieties, there were a few very fine ones, among them *Cicely*, *Ariadne*, *Clio*, and *Orion*.

Messrs. J. Peed & Sons, Roupell Park Nurseries, Brixton, had a large collection also of good quality, varied in colour, but which had suffered somewhat in journeying to the show. A pure white variety was very good. Messrs. James Carter & Co. also had a large collection, many of them exceedingly rich in colour, and all of fine quality. They were set up in a tasteful manner, intermixed with Ferns and small Palms.

HARDY HERBACEOUS AND ALPINE AND OTHER PLANTS.

These formed a somewhat extensive feature, and greatly helped to fill some of the tents. Plants in pots were furnished by the Hardy Plant Nursery Company, Milford, Guildford, who had a collection largely consisting of alpine arranged in a tasteful manner in baskets, as is their wont; and they were backed by dwarf plants of *Daphne*, *Rhododendron*, *Azalea*, &c. The leading subjects in the collection were *Ramondia pyrenaica* in variety, *Cypripedium pubescens*, *C. acaule*, *Dianthus* in variety, *Viola pictata alba*, *Gem montanum*, &c.

Mr. M. Pritchard, nurseryman, Southborne, Christchurch, had a collection which included *Anthericum*, *Lilium*, *Tulips*, *Aquilegia*, the *Edelweiss*, *Doronicum plantaginaceum* excelsum, *Papaver nudicaule*, in variety; *Iberis gibraltarica*, *Gentiana verna*, &c. The choicest exhibition of this character was that set up by Messrs. Backhouse & Son, nurserymen, York, and arranged as a piece of alpine rockery. It was backed by *Filmy* and other Ferns, *Bamboos*, &c., and the subjects were arranged so that the individuality of each was well displayed. The leading plants were *Dianthus alpinus*, *Gentiana verna*, *Trollius* in variety, *Lychnis virginea*, *Anemone alpina*, *Dodecatheon integrifolia*, *Gentiana picea*, &c.

Messrs. Paul & Son, The Old Nurseries, Chesnut, also set up a large collection in pans and pots, and in addition a group of cut flowers, among them *Trollius*, *Paeonies*, *Lupines*, *Phlox frondosa*, *P. setacea atropurpurea*, *Edraianthus serpyllifolius*, *Tulips*, *Narcissus*, *Doronicum*, &c.

Messrs. Wallace & Co., nurserymen, Colchester, had a fine group of *Lilium eximium giganteum*, finely grown and flowered.

Messrs. W. Cutbush & Sons, The Nurseries, Highbate, had a large collection, mainly of cut flowers, which included handsome bunches of *Centaureas*, *Narcissus*, *Paeonies*, *Doronicums*, *Gladioli*, *Trollius*, *Anemone*, *Poppies*, *Liliums*, *Pyrethrums*, &c., set up with foliaged plants.

Messrs. Kelway & Son, Langport, sent one of their highly-meritorious and well-arranged collections, comprising *Canas*, generally of dwarf character; *Paeonies*, *Pyrethrums*, and *Iris*; among the *Canas* were *C. Marquet*, orange red; and *M. Duterail*, orange scarlet. Among the *Paeonies* (single) were *James Kelway*, deep scarlet; *Rev. W. Wilks*, bluish; *Orme*, crimson-maroon; *Pearl*, white; *Prince George*, purple; the old species *Corallines*, said to have been found on Sheep Holmes, an island in the Bristol Channel; *Will*, delicate pink; *A. J. Balfour*, carmine; and *Mr. Stuckey*, white. Single *Pyrethrums* also made a very pretty feature; *Ayrshire*, bright crimson; *Carnea stylosa*, bluish; *Albert Victor*, brilliant deep crimson; *Mary Anderson*, large bluish, &c. There were also collections of cut *Iris* from the same exhibitor.

TREE-PEONIES.

A large collection of these from Mr. T. S. Ware, Tottenham, found a place in the large tent. They were represented to be importations from Japan, and were generally of good character, *Snowflake* a beautiful and finely formed white variety found many admirers. *Reine Elizabeth*, an old crimson form, is still one of the best.

CALCEOLARIAS.

made a good feature, and some very dwarf but admirably grown and flowered plants of a very fine strain, came from Messrs. J. James & Son, Florists, Farnham Royal, Slough. The strain is famous for its dwarf compact habit, and high quality. From the gardens of Elmstead, Streatham Hill, the residence of Thomas Gabriel, Esq., came a collection of well-grown plants, of taller growth, clean, well-bloomed, and of excellent quality. Messrs. James Carter & Co., Seed Merchants, Holborn, contributed from their Forest Hill Nurseries, a collection of a very good strain, which were seen to the best advantage, nicely arranged with Palms, Ferns, &c.

CARNATIONS.

It was a little too late to have the winter-flowering varieties, and too early for those which bloom in the summer. In the large tent, Mr. Jennings, gr. to Leopold de Rothschild, Esq., Ascot, Leighton Buzzard, had a group of some two dozen plants of that fine yellow ground, *Almira*, the plants admirably grown, and carrying good heads of fine flowers.

From Mr. Ralph Crossing, Penarth, came plants of a flesh-coloured seedling from *Souvenir de la Malmaison*.

TULIPS.

Two collections of these were staged, one by Mr.

James Douglas, gr. to Mrs. Whitbourn, Great Gearies, Ilford, who had of bizarres, Everard, Dr. Hardy, Victor Emanuel, and Sir Joseph Paxton; of Roses, Sarah Heady, Charmer, and Aglaia; of byblomems, Mr. Jackson, Talisman, and Duchess of Sutherland. Dr. Hogg, Stillyans, Sussex, also had a collection, which like Mr. Douglas's flowers, lacked perfect marking; these included, of bizarres, Sir J. Paxton and George Hayward; Byblomems, Duchess of Sutherland, Sarah Heady, and Rose Apollo. Some pretty rose breeders were also found in this collection.

ROSES.

Messrs. William Paul & Son, Waltham Cross Nurseries, Herts, had a large group of pot roses and magnificent cut blossoms, which bore evidences of good culture and selection. Amongst the many striking varieties, we noticed Paul Neyron, an immense pink variety; Merveille de Lyon, almost white; La France; Princess May, a beautiful Tea, which was awarded an Award of Merit; Zenobia, a very excellent hybrid perpetual; Clio, a very light flesh colour; and Spencer, a new hybrid perpetual, flowers very large and pink.

Another good collection of Roses in pots came

Azaleas in white, yellow, and many degrees of pink and red.

Messrs. Paul & Son, Old Nurseries, Cheshunt, had a box of cut bloom of a variety of Rhododendron Fortunei (Mrs. Chas. Butler), a sweet-scented hardy variety with large blooms of very faint pink. Another seedling had much deeper coloured blooms. Some good blooms of seedling Azalea mollis were included with this exhibit.

BEGONIAS.

An immense group of double and single-flowered varieties of Begonia were exhibited by Messrs. Cannell & Sons, Swanley, Kent, and amongst good varieties too numerous to mention, the following each obtained an Award of Merit:—Duchess of Westminster, single and large, of a rich coral colour, rather deeper at centre; Leopold de Rothschild, a large bright rosy-crimson double—this variety had flowers as large as those of a good Camellia.

Messrs. John Laing & Sons had an equally meritorious collection, where the visitor could also see the remarkable perfection to which this flower has now been brought. This exhibit consisted mostly of double varieties, although there were some good single ones also. Laing's Triumph, good large

with a crimson spot; Compactum, a free, fine variety; Volonté alba, Radiant Rose, Bard, Fimbriata alba, Mr. Stanley, and Sir Trevor Lawrence.

Mr. H. J. Jones, Ryecroft Nursery, Hither Lane, Lewisham, contributed a large group of small plants, wonderfully well-bloomed. We mention a few of his most telling novelties and others. Jos Blake, a glowing crimson; Maréchal, a dark flower; Princess of Orange, not new, but nice; Jules Ferry, Marie Malet, a fine white-ground flower; Mrs. Stone, rosy-purple, and very pretty; Duchesa of Bedford, white.

Messrs. H. Low & Co., Clapton, showed a small lot of finely-bloomed stuff, in which Princessa Beatrice, a semi-double white, with a pinkish suffusion; Prince of Pelargoniums, a brilliant flower of the decorative type; and Bush lilil, a semi-double flower, striped with rose; Prince Henry, a bright decorative kind; and St. Blaize, a glowing crimson flower, with a black spot, stood out pre-eminently.

FLORAL DECORATIONS.

Messrs. Perkins & Sons, Coventry, had a very large and beautiful collection of floral decoration, including bouquets, sprays, wreaths, baskets of flowers, glasses arranged specially for table decoration, &c. A floral arrangement representing a harp attracted considerable attention, but such designs are not to be commended on the score of good taste. The framework was composed of Eucharis, Lilies, Roses, Stephanotis, &c., on a ground-work of Ferns, and the strings were represented by small blooms of Bouvardias strung together on slender strings of Asparagus.

Mr. J. R. Chard, Brunswick Nursery, Stoke Newington, had a display of his arcadian floral decoration, which were of a tasteful and light appearance. Some of these were composed of flowers all of one colour, whilst others were of mixed flowers interspersed with the whole were Ferns and grasses,

CUT FLOWERS.

Iris.—These were shown in several collections of hardy flowers, and are mentioned under that heading. It is yet too early, owing to the retarding character of the season, to have them in quantity.

MISCELLANEOUS.

The hybrid Streptocarpus of Messrs. J. Veitch & Sons, Chelsea, of which a large number were shown, excited much attention from the visitors, many of whom at first sight supposed them to be Gloxinias. The plants were nicely-grown, well-bloomed, and in great variety.

Messrs. Veitch also showed a group of the hybrid *Dian Veitchii*, raised between *D. grandiflora* and *D. racemosa*. The flowers are of a beautiful shade of rose.

Messrs. Carter & Co., seed merchants and nurserymen, High Holborn, London, exhibited what is with them a new departure—a collection of Cacti, Mamillaria, Epiphyllum, Cereus, Gasteria, Aloe, Euphorbia, Phyllocactus, &c. The collection consisted of small plants chiefly, but it was of interest to lovers of these plants, from its great variety. This firm also showed a pretty lot of *Petunia*, both double and single-flowered—those named Emperor with double flowers being exceedingly showy, having large, rich-coloured flowers. The double Rosette *Petunia* were likewise admirable. The Mimulus, Queen's Prize, shown by this firm, still holds its own as one of the best obtainable from the trade.

A pretty group of *Viola* blooms, and cut blossoms of Sweet Peas, the whole of good merit, was exhibited by Messrs. Dobbie, Rothesay, Scotland, and was awarded a Silver Medal.

Captain Elliott, of Farnborough Park, showed plants of a (so-called) seedling *Calla*, with leaves of a deep green colour, fully marked with small white spots. The spathe is of a rich yellow. We should be glad to know the history of the plant.

FERNS.

In Messrs. Birkenhead's exhibit were represented all the various classes. Among the *Adiantum* were *A. Veitchii*, *A. fabellatum*, *A. excisum nanum* (a very pretty compact form), and the beautiful North American *A. pedatum*, a deciduous species. On the Continent this is used extensively for decoration, imported clumps being started early in the season in warmth. It has not yet come into use for our London markets.

Platycerium were well represented, and included *Willinkii grande*, *Wallichii*, and *Stemmaria*. *Davallias* included *Veitchii retusa*, *pentaphylla elegans*, *pycnolepis*, &c. *Gymnogrammas* comprised some rare and distinct species, *triangularis rufa*

FIG. 102.—TRADESCANTIA VIRGINICA, L. Lind. and Rod.

from Messrs. Paul & Son, Old Nurseries, Cheshunt, and which were grouped together in a corner in a tasteful manner. These included standard and other trained plants, of excellent quality. Amongst the different varieties, we noticed Céline Forestier, Hon. Ella Gordon, Chas. Lawson, Caroline Kuster, Etoile de Lyon, Beauty of Waltham, &c.

H. V. Collins, Esq., Field Lane, Alvaston, near Derby, exhibited something over 100 cut blooms of Maréchal Niel, all of which had been cut from one plant. A group of Roses in pots came from Mr. Wm. Rumsey, Joyning's Nurseries, Waltham Cross, including Niphetos, Madame Hoste, Madame de Wateville, General Jacqueminot, Dr. Andry, &c.

AZALEAS AND RHODODENDRONS.

Messrs. B. S. Williams & Son, Upper Holloway, had groups of the following:—Azalea mollis, with some very pretty colours; Ghent Azaleas (seedlings), in semi-double forms, such as Byron, white, with a tinge of yellow; Apollo, a very pale bronze; Ribéron, white, with a little pink; and Virgile, the older blooms of which were quite white. Rhododendron Williamsii, a good greenhouse variety with white flowers.

From Mr. Anthony Waterer, Knap Hill Nursery, Woking, Surrey, came a magnificent group of Ghent Azaleas, containing some of the most exquisite shades. Mrs. Anthony Waterer, a new seedling of this group was awarded a 1st class certificate. This exhibit also included a number of double hardy

double bright coral variety, obtained an Award of Merit, as did also another double variety called Picotee, with flowers of a light pink colour, but the tips of the florets, a rosy pink, thus giving the bloom an appearance somewhat like a Picotee, a very distinct variety. A similar award fell to Duchess of Westminster, a single flower, bright carmine with white eye.

Mr. T. S. Ware, Hale Farm Nurseries, also staged a group of Begonias, double and single, including some new seedlings. Bexley Gem is a good close flower, of a bright rose colour, and double.

PELARGONIUMS.

As befits the season of the year, these were largely shown; but few were of large size, and those few came from such a well-known exhibitor as Mr. C. Turner, Slough. Mr. Charles Turner, Royal Nurseries, Slough, had a large group of plants, of show size, and also small. Amongst the former, mention should be made of Cloth of Silver, Mona Desmoulins, Princess of Teck, Alice, Rosetta and Excellent, all of these being beautiful varieties, flowered in Mr. Turner's usually good style. The desirable and pretty varieties, Blue Beard, with a decided shade of blue colour in the flower, Mountain and Ruth were among the small plants.

Messrs. J. & J. Hayes, Lower Edmonton, well maintained their position as market growers by the number and good quality of their exhibits. They showed Pelargonium Princess May, a flower of a warm pink,

being among them. *Pellea ornithopus* a very elegant little Fern, *Nothochloa rufa*, another handsome little species, *Lygodium palmatum*, *Cheilanthes viscosum*, *Nothochloa Newberryi*, *N. cordata*; *Asplenium prolifans* are interesting Ferns of the smaller growing forms, *Polystichum concavum*, a bold and effective Fern; *Lomaria fluviatilis*, some nice examples of the filmy Ferns, and a great number of other choice Ferns, the whole forming a most interesting and attractive exhibit.

The hardy Ferns which were arranged separately, formed a most important exhibit, being remarkably bright and fresh in appearance, and including a great number of beautiful varieties, *Athyrium f. f. plumosum elegans*, *A. f. f. Pritchardi*, *A. f. f. Craigii*, *A. f. f. kalothrix*, *A. f. f. plumosum multifidum*, *A. f. f. Friezelia coronata*, *A. f. f. corymbiferum purpureum*, *Scolopendrium digitatum majus* (a very fine form), *ramo-cristatum*, *grandiceps*, *Lactaria cristata fimbriata*, *Polystichum angulare Pateyi*, *Asplenium lanceolatum*, *microdon*, some very pretty crested and tasselled varieties of *Blechnum* and many others would be worthy of note if space would allow.

Mr. H. B. May, of Edmonton, showed an extensive group, representing all the most useful decorative Ferns. *Adiantum* included about fifty species and varieties of *aculeum* and *elegans*; there were several distinct forms, one named *excellum* was the most distinct; *curvatum*, *Veitchii*, *macrophyllum*, *bipinnatum*, *glacophyllum*, *venustum*, and several forms of *A. capillare* - *venustum* were among the most conspicuous. Crested *Pteris* were represented by some of the most distinct forms, *nobilis* being the most noteworthy, *P. tricolor*, *P. moluccana*, *P. serrulata gracilis*, *P. s. gigas*, *P. f. tremula grandiceps*, *P. f. Smithiana*, and *P. Victoria*, are worthy of note; *Nephrolepis* included some effective varieties, among them being a very pretty seedling called *N. recurvata*, somewhat intermediate between *N. tuberosa* and *N. philippensis*. *Gymnogrammas* included the best gold and silver forms, both normal and crested forms; also the curious *G. trifoliata*, the fronds of which attain to a great length. The group included, besides the decorative forms, many choice species. Among the smaller-growing sorts may be noted *Hemionitis cordata*, *Actinopteris radiata*, *Asplenium formosum*, *Cheilanthes Eckenlonia*, *Pellea ternifolia*, *Pteris geminifolia*, *Anemia collina*, and several pretty *Davallias*. Among the more conspicuous *Acrostichum drynarioides* (a fine specimen), *Platynerium grande*, *Marattia Cooperi*, *Cyathea Hookeri*, and others. The group also included some very pretty *S-laginelias*, *S. elegans* to which a first-class certificate was awarded, is a compact growing form, forming little cup-like growths somewhat like *S. Browni*, but more compact in habit.

Messrs. R. Smith & Co. showed *Pteris tremula densa*, a densely crested form of *P. t. Smithiana*. This Fern could hardly be identified with the type, the ordinary pinnæ being entirely suppressed, the fronds terminating in a dense tuft of finely cut midrib growths; in general appearance it somewhat resembles *Athyrium f. f. acrocladon*.

Fruits and Vegetables.

A very fine exhibit of picked fruits of Strawberries in boxes, also plants of the same sorts in pots very finely fruiting, were staged by Mr. Norman, gr. to the Marquis of Salisbury, Hatfield, and to which a large Silver-gilt medal was awarded. The sorts were *Vicomtesse Hélicart de Thury*, very good; *Auguste Nicaise*, twenty-five wonderful fruits, averaging two ounces each, and specially high coloured and handsome; *Sir C. Napier*, very fine also; *Marguerite*, *President*, and *Noble*. It is doubtful if finer samples of any pot-grown fruits have ever been shown than were some of those from Hatfield. The pot-plants had ripe from eight to ten fruits each. A capital sample of *Sir C. Napier*, rich in colour, came from Mr. Thompson, gr. to Messrs. W. & E. Wells, Hounslow, to which a Cultural Commendation was awarded.

From Mr. E. Peters, gr. to J. L. Mansell, Esq., Guernsey, came six very good bunches of Muscat of Alexandria Grapes, fairly ripe and sweet, but still green, and devoid of flavour. A Cultural Commendation was given, but not unanimously. A superbly-coloured dish of Hale's Early Peach was sent by Mr. W. Armstrong, Toddington Nursery, Winchcomb, Gloucester, which obtained a Cultural Commendation. A dish of Brown Turkey Figs, from Nostell Priory Gardens, obtained a Vote of Thanks. Six Hero of Lockinge Melons were shown by Mr. T. Bowie, Netherlands, Reading, but the tasted fruit lacked flavour. A Vote of Thanks was awarded.

Four fine Melons, of an unnamed variety, shown by Mr. Henderson, gr. to Earl Manvers, Thoresby Gardens, secured a Cultural Commendation, but, because unnamed, were not tasted.

A very fine collection of 40 fruit trees in pots, including 18 plants of a fine new unnamed seedling Nectarine, from Lord Napier, the fruits large, and of rich colour, coming in one month before its parents; also Early Beatrice Peach, with ripe fruit; Alexander Peach, Parrot, Beacon, and other early Peaches; ripe Mayduke Cherries, Oranges in fruit and flower, &c., came from Messrs. Rivers & Son, Sawbridgeforth, and very deservedly secured the award of a Silver-gilt Medal; with these also were four dishes of fine Apples, Belle de Pontoise, very large; Buckingham, Jacquin, and Allen's Everlasting.

A First-class Certificate was awarded to Mr. C. Ross, Welford Park Gardens, for Armored dessert Apples, yellow skin, russety, flattish-round, handsome, and of very pleasing flavour. This variety had previously received an Award of Merit. The same exhibitor also showed two dishes of seedling Apples of inferior merit.

From Mr. G. W. Cummins, gr. to A. H. Smee, Esq., Hackbridge, came a very nice collection of twenty good dishes of Apples and ten of Peaches. The former included Lord Derby, Wellington, Wadhurst Pippin, Hoary Morning, Norfolk Bearer, and Claygate Pearmain; and of Peaches, there were good samples of Catillac, Uredale's St. Germain, Plus the Ninth, Water Rance, and Ballissime d'Hiver. A Silver Banksian Medal was awarded.

Messrs. Jas. Veitch & Sons, Chelsea, staged a fine collection of sixty dishes of Apples, with a few Peaches. Of Apples, there were Northern Pippin, Barnack Beauty, Grand Duke Constantine, Newtown Pippin, Alfriston, Duke of Banfort, extra fine; Seaton House, Lane's Prince Albert, &c.; also fine Catillac Peaches. A Silver Medal was awarded.

Some forty varieties of Apples in single fruits were sent by the Agricultural Department of Victoria, but many were small and had become somewhat disfigured by bruises. The best were Gooseberry, a handsome greenish-cold variety, Munibois Favorite, Fallwater, and Capper's Pearmain. A Vote of Thanks was awarded.

A similar award was made to Mr. Müller, gr. to Lord Foley, Ruxley Lodge, Essex, for two baskets of Apples, Beefing and Yorkshire Greening, and a large quantity of Mushrooms. A remarkably fine exhibit, that attracted special attention was to a grand lot of Cucumbers, some sixty fruits in boxes, and four fine boxes of Tomatoes from Mr. Mortimer, Swiss Nursery, Farnham. The Tomatoes included Perfection, very fine; Large Red, and Conqueror. The Cucumbers comprised Success, a very handsome smooth deep green sample, 20 inches in length—one of the most perfect sorts seen. This unanimously received a First-class Certificate, and, like all Mr. Mortimer's varieties, will be sent out by Messrs. Sutton & Sons, Reading. Also was there very handsome Matchless, Certificated last year; Sutton's A I, Lockie's Perfection, and Improved Telegraph. A Silver Banksian Medal was awarded to the collection.

Mr. Burton, Upper Courts, Slough, showed rather coarse fruits of Lockie's Perfection, to which a vote of thanks was awarded.

A quantity of a strong growing curled Cabbage Lettuce, growing in boxes, came from Mr. Beckett, gr. to H. H. Gibbs, Esq., Aldenham House, Elstree; it was named Harbinger, and was exhibited as suitable for forcing. The sample was not regarded as suitably blanched, and it was hoped that stock would be tried at Chiswick next year.

Official List of Awards.

FIRST-CLASS CERTIFICATE.

To *Pteris tremula densa*, from R. Smith & Co.
To *Dichozandra muscica gigantea*, *Labisia amarantifolia*, *Smilax argentea*, *Stenandrium Lindeni*, *Tridacantha Regine*, *T. superba*, all from M. J. Linden of Brussels.
To *Azalea*, Mrs. Anthony Waterer, from Anthony Waterer.
To *Pteris serrulata gracilis*, from H. B. May.
To *Scolopendrium crispum fimbriatum* and *digitatum majus* from J. F. Rickard.
To *Selaginella elegans*, from H. B. May.

Awards of Merit.

To Begonia, Leopold Rothschild, from H. Canell & Sons.
To Begonia, Duchess of Westminster (Lainé & Son), from J. Lainé & Son.
To Begonia, Picotee, from J. Lainé & Son.
To Begonia, Lainé's Triumph, from J. Lainé & Son.
To Tree Peony, Snowflake, from Thos. S. Ware.
To Tree Peony, Crane, from Messrs. Kelway & Son.
To Tea Rose, Princess May, from W. Paul & Son.
To Gloxinias, Clio, Cicely, and Charibel, from J. Veitch & Sons.
To Carnation, Mrs. H. Canell, from H. Canell & Sons.
To Dracena Bartlettii, from J. Lainé & Son.

To Croton, Reidii, from J. Lainé & Son.
To Seedling Lobelia, Barnard's Perpetual, from H. Barnard.
To Pelargonium, Princess May, from J. & F. Haye.
To Carnation, Mr. G. Devas, from Maria R. Smith.

AWARDS OF THE ORCHID COMMITTEE.

First-class Certificates.

To Messrs. F. Sander & Co., St. Albans, for *Odontoglossum crispum Sanderi Tourjanum*; *Bleu's Splendissimum*, and *Phaius Sanderianus*.
To Messrs. Lewis & Co., Southgate, for *Cypripedium Southgatei*.
To Captain Vipan, Slippington Hall, Wandsford, for *Cypripedium hybridum Vipan*.

Awards of Merit.

To Messrs. F. Sander & Co., St. Albans, for *Cattleya Mendelii*, *Cookson's var.*; and *Cypripedium Chamberlainianum* *excellent*.
To Messrs. Lewis & Co., for *Cymbidium Lowianum viride*.
To Messrs. James Cypher, Cheltenham, for *Laelia purpurata Handleyana*.
To Messrs. Charlesworth, Shuttleworth, & Co., Hinton, Bradford, for *Odontoglossum Wilckeanum nobilior*.

Botanical Certificates.

To Messrs. F. Sander & Co., for *Epiliden from Goleffium*, and *Oncidium Rolfeanum*.
To C. J. Lucas, Esq., Warrham Court, for *Zygopetalum geminiflorum*.

Silver Banksian Medal.

To Baron Schroder, for *Coleogyne Dayana*.

SILVER FLORA MEDALS.

To Messrs. G. Paul & Son, for Alpines and Cut Flowers.
To Messrs. Laing, for Hardy Cut Flowers.
To Messrs. Dobbie, for Sweet Peas, &c.
To Messrs. Shuttleworth, for Ferns and Foliage.
To Messrs. Jas. Veitch, for Gloxinias and Streptocarpus.
To J. C. Jombag, Esq., for Orchids.
To Leopold de Rothschild, Esq., for Carnations.
To Messrs. Rumsey, for Roses.
To Mr. J. Haye, for Pelargoniums.
To Messrs. Low, for Ericas and Pelargoniums.
To Messrs. Peed & Sons, for Cut Flowers.
To Messrs. Wallace, for Lilies.

SILVER GILT FLORA MEDALS.

To Messrs. Carter, for Gloxinias, Calceolarias, Pelargoniums and Mimulus.
To the Earl of Portman, for Orchids.
To F. Wigan, Esq., for Orchids.
To Messrs. B. S. Williams, for Azaleas and Amaryllis.
To Messrs. H. Low, for Orchids.
To Messrs. Hea & Co., for Orchids.
To Messrs. Lewis & Co., for Orchids.
To Mr. H. B. May, for Ferns.
To Messrs. Backhouse, for Alpine Plants.
To the Guildford Hardy Plant Co., for Alpine Plants.
To Messrs. Barr, for Cut Flowers.
To Messrs. Kelway, for Peonies.
To Messrs. Laing, for Begonias.
To Messrs. Canell, for Begonias.
To Mr. Ware, for Peonies and Cut Flowers.
To Messrs. G. Paul, for Roses.
To Messrs. Turner, for Pelargoniums.
To Messrs. James, for Calceolarias and Pelargoniums.
To Messrs. Shuttleworth, for a Mixed Group.
To Mr. Ware, for Begonias.
To Messrs. Perkins, for Bouquets.
To Messrs. B. S. Williams, for Orchids.
To Mr. G. F. Huggins, for a Group of Plants.
To Messrs. J. Peed & Sons, for a Group of Foliage Plants, Caladiums, and Anthuriums.
To Mr. H. Jones, for Pelargoniums.

SILVER BANKSIAN MEDALS.

To H. Mayhew, Esq., for Foliage Plants.
To Messrs. Reid & Borneemann, for Group of Plants.
To Mr. M. Pritchard, for Alpine Plants.
To Messrs. Cutler & Co., for Hardy Cut Flowers.
To Messrs. Chard & Sons, for Table Decoration.
To Miss Hassell, for Table Decoration.
To Messrs. Peed & Son, for Ferns and Foliage.
To Capt. Elliott, for Calceolarias.
To Mr. J. Gabriel, for Calceolarias.
To Mr. S. Mortimer, for Tomatoes and Cucumbers.

SILVER KNIGHTIAN MEDALS.

To Messrs. J. Veitch & Sons, for Apples and Pears.
To A. Smee, Esq., for 23 dishes of Apples and 1 Pears.

SILVER CUPS.

To Baron Schroder (an Williams Memorial Medal), for Orchids.

To Messrs. Sander & Co., for Orchids.
To Sir Trevor Lawrence, Bart., M.P., for Orchids.
To Messrs. Cypher, for Orchids.
To C. J. Lucas, Esq., for Orchids.
To Messrs. Shuttleworth, for Orchids.
To Messrs. Laing, for Mixed Group.
To Messrs. James Veitch & Sons, for Mixed Group.
To Messrs. W. Paul, for Roses.
To Messrs. Rivers, for Fruit Trees.
To Mr. A. Waterer, for Azaleas.
To Messrs. Cutler, for Mixed Group.
To Messrs. Birkenhead, for Ferns.
To Messrs. Smith, for Clematis.
To the Marquis of Salisbury, for Strawberries.

FRUIT AND VEGETABLE COMMITTEE.

To Mr. S. Mortimer, Surrey, for a Collection of Cucumbers and Tomatoes.
To Messrs. J. Veitch & Sons, Chelsea, for a Collection of Apples and Peaches.

Silver-gilt Flora Medal.

To Lord Salisbury, Hert's, for Strawberries.

To Mr. T. F. Rivers, Sawbridgeforth, for Fruit Trees in P.t.s.

First-class Certificates.

To Mr. S. Mortimer, Surrey, for Seedling Cucumber, "Success."
To Colonel Archer, Hounslow, Newbury, for Apple "Amoua."

Cultural Commendations.

To T. L. Mansell, Esq., Guernsey, for Muscat Grapes.
To Mr. A. Henderson, for Melons.
To Messrs. W. & E. Wells, Bournemouth, for Strawberries.
To W. Armstrong, Gloucester, for Peaches.

Scientific Committee.

MAY 17.—Present: Dr. M. T. Masters, in the chair; Mr. Morris, Mr. McLachlan, the Rev. W. Wilks, and the Rev. G. Henslow, Hon. Sec.

Orchids Attacked by Beetles.—With reference to the case brought before the last meeting, Mr. Pascoe reported that the beetles were *Phytophaga*, belonging, he believed, to the genus *Galeruca*. Although they were on imported *O. chidis*, he considered them like an English species.

Basal Rot.—Mr. Michael reported on this subject as follows:—"I have examined the *Narcissus bulb* sent up by Mr. W. Dod, and affected with 'basal rot.' The bulbs looked rather gnawed, and I found one or two *Rhizoglyphus echinopus* on one of them; but, in spite of the destructive character of this mite, it hardly seemed to me that there were enough to have done the damage. The bulbs were decayed just at the base, and nowhere else. There was fungus there, and they looked to me rather as if from some cause water had collected just round the base of the bulb, and had caused a sodden and unhealthy condition. I also examined some 'rusty' *Narcissus bulb*s, sent by Mr. Hlaydon, of Hatfield Vicarage, Doncaster, and received by me from Mr. Morris, of Kew. These bulbs were awarming with the same *Acarus* (*Rhizoglyphus echinopus*), which is quite capable of originating the destruction seen in the bulbs, and of carrying it out, with the assistance of the decay which naturally sets in on the wounded surfaces where the mites have been eating. The bulbs also contained *Anguillula*. I believe some species of these are originators, some followers of decay. The *Rhizoglyphus*, however, is quite sufficient to have done the damage, whether the worms assisted or not." Mr. Morris observed that, in the case of the "rusty" bulbs forwarded to Mr. Michael by him, they were carefully examined by fungologists at Kew, and no fungus was present, as in those sent by Mr. Doi. Mr. Haydon mentions in his letter to Mr. Morris that three were seedlings from Cambricus; the others were a variety called *Miriam Barton*. The rusted *Cernuus* had been all burnt. Mr. W. Dod has written to observe that there was a mistake in the report of the last meeting, in that *Trilium* is not a variety which is subject to basal rot. His words were:—"I enclose specimens belonging, in this case, to the variety *Trilium*, which show how thousands go off with me every year." He now writes:—"I meant to say that thousands of Trumpet *Daffodils* of different varieties die in my garden every year, showing the symptoms, of which I sent bulbs of *Trilium* as an illustration."

China Silk.—Mr. Morris exhibited a specimen of this so-called material having the appearance of fine cat-gut, and read a report from the Foreign Office as follows:—"A very strong 'silk' (t'yn tam), or locally 'paddy insect' (din tang). This grub is found on a sort of Maple, the Fong tree, or *Liquidambar formosana*, Salisb. When the insect is full grown it is thrown into boiling vinegar, on which the 'head' of the gut or 'silk' appears. This is sharply torn out with both hands drawn apart, and is as long as the space between them—say 5 feet. It is so strong that one single thread of it is sufficient to make a line with which to catch the smaller kinds of fish."

Hellebore with Curled Leaves.—Mr. Dod sent leaves of *H. niger* var. *maximus* with the segments of the leaves inrolled, so as to form closed tubes. He writes as follows:—"Can you suggest any reason for the curling up of the leaves? It takes place every year, and in some plants it seems to be spreading. They do not recover from it; the whole growth, including the flowering, is deteriorated. The plants most affected are in a border under glass, but not heated, but it occurs on those out-of-doors as well. I have tried more water, less water, top-dressing, syringing, fungicides, anti-mildew, smoking, &c., but ineffectually. I can never see any insects on the leaves." The only suggestions the committee could offer were, either the possible attempt to protect the upper surfaces from the chill due to radiation, as is the prevailing habit with leaves generally when unfolding from the buds; or, since the undeveloped leaves of some other *Ranunculaceae* plants, as *Pæonia Moutan*, have the edges of the segments partially inverted, it may arise from an arrested condition of growth, the margin becoming more and more inrolled as they grow.

Monstrous Fuchsia.—Mr. Morris exhibited a spray from Kew, one flower being hypertrophied, apparently from synanthry or a fusion with another, while the other was somewhat atrophied in having only

three sepals, as is often the case with the first flowers that expand in the *Fuchsia*.

Tea-plant Diseased.—Mr. McLachlan showed a specimen badly attacked by some mycelium received from Assam. It was forwarded to Kew for examination.

Ficus elastica Fruiting.—Mr. Wythes sent a fine spray of this plant with several fruits upon it. Unlike ordinary *Ficus* this species bears very diminutive fruit. It is not often known to produce them in this country.

Cephalotaxus.—Dr. M. T. Masters exhibited, on behalf of Mr. G. Croucher, a bough, showing the leaves partly spreading around the stem in all directions, and partly pseudo-dictyous; the first form has been called *Taxus* 'Harringtoni,' &c., but it is (like the Irish Yew) merely an accidental occurrence.

Tsuga Mertensiana.—He also showed a bough of this plant bearing male flowers, which are not often to be seen.

Odontoglossum crispum.—A flowering branch was received from Mr. Bull, all the flowers being apparently abnormal. In one examined by the Secretary the two posterior sepals were coherent, the third was wanting; the three petals were present, but all alike except in size. The two posterior of the three stamens of the outer whorl were present; but the anterior, and all three of the inner whorl, were suppressed. The three carpels were present, but the ovary chamber was greatly distorted, the placentae, usually prominent, not being traceable; the stigmatic depression was nearly obsolete. The above details were traceable by means of the distribution of the vascular cords. There appeared, therefore, to have been a tendency to suppression along the median plane.

Cypripedium caudatum Reversed.—Mr. Douglas sent a branch with two blossoms; one was normal, the other completely reversed, showing the correct position of the labellum, which is ordinarily upside down.

Tulip Fasciated.—A specimen of a Tulip was exhibited, having three smaller-flowered peduncles adherent to it. Not having the bulb, it could not be seen whether the smaller Tulips arose from lateral bulbs, or whether the whole was a multiplication of the main stem.

SCOTLAND.

BOTANICAL SOCIETY OF EDINBURGH.

THURSDAY: May 12.—This Society met in the evening at the Royal Botanic Garden, Dr. Christian, President, occupied the chair.

Professor Balfour intimated that Dr. George Watt intended soon to present his very extensive collection of the economic and other plants of India to the herbarium.

Mr. William Sanderson exhibited the following *Orchids*, *Oncidium phymatocaulum*, *Miltonia Warcewiczii*, *Dendrobium Bensoniae*, *D. Dalhousianum*, *Oncoglossum nebulosum*, *Masdevallia Shuttleworthii*, *M. coriacea*, *M. ignea*, *Lælia cinnabarina*, &c.

Mr. Neill Fraser showed fine strains of *Polyanthus* from selected seed.

A large number of plants were shown from the Royal Botanic Garden, including *Daphne rupestris*, *Erpeticon reniforme*, *Gentiana verna*, *Primula alida*, *P. intricata*, *P. longiflora*, *P. reticulata*, *Ranunculus Trautvetterii*, *Saxifraga arctioides*, *S. flagellaris*, *S. virginensis*, *Darlingtonia californica*, *Drosera auriculata*, *D. binata*, *D. dichotoma*, *D. filiformis*, *Masdevallia leontoglossa*, *Rhododendron lepidotum*, *R. Nuttallii*, and *Xanthoxia rotundifolia*.

Dr. Sprague exhibited closely felted balls of *Posidonia*, found by himself near Antibes. They are formed by the motion of the water in which they lie. Similar *Algoid* and *Pine-needle* balls were shown from the class museum.

A number of models of the vascular tissues of flowering plants, and a series illustrating various methods of grafting, were described by Professor Balfour.

Mr. A. N. M'Alpine, B.Sc., described an improved germinating apparatus, and gave the results of his experience of its utility in the case of agricultural seeds sent to him as botanist to the Highland Society. In the discussion which followed, objections were

taken by Mr. A. Mackenzie and Mr. J. Grieve as to the results obtained in such an apparatus being a true indication of the capability of the seed to produce healthy plants if put in the ground, and advocated a return to pot culture. Mr. M'Alpine replied by pointing out that the apparatus was used by him simply to find out what percentage did germinate at all, but that, nevertheless, it was quite easy to tell by observation of seeds so germinated whether they were capable or not of producing healthy plants.

Mr. James Terras, B.Sc., sent a paper on "The Occurrence of Tannin in *Dacrydium Franklinii* and *D. cupressinum*."

Dr. Wilson submitted observations on the structure of the flower, and the method of dissemination of the fruit of *Barnadesia rosea*.

Report on Temperature, &c., for April at the Royal Botanic Garden, by Robert Lindsay, Curator.—The month of April was for the most part excessively cold and dry. Vegetation in consequence is in a very backward condition. Hardy spring flowers are late, and many of them injured by frost. Most forest trees were still in their winter condition at the close of the month. The thermometer was at or below the freezing point on eleven occasions; the total amount of frost registered for the month was 72° as against 56° for April, 1891. The lowest readings were on the mornings of the 14th, 22°, 12th, 21°, 16th, 23°, 17th, 22°, 18th, 23°. The total amount of frost registered this season up to the end of April is 630°, as against 611° for the same period last year. The following is the distribution for each month:—October, 20° of frost; November, 41°; December, 83°; January, 136°; February, 112°; March, 156°; April, 72°. The lowest point reached this season was 7° Fahr., or 25° of frost, which occurred on February 19 last.

On the rock garden, 119 species and varieties came into flower during the month, the same number as for last April. Among the more interesting were *Andromeda fastigiata*, *Arnebia echinoides*, *Draba aizoides*, *Dentaria enneaphylla*, *D. pentaphylla*, *Epigaea repens*, *Erythronium giganteum*, *Pachystigma Canbyi*, *Petrocallis pyrenaica*, *Primula cashemiriana*, *P. rosea*, *Ranunculus montanus*, *Ranunculus chamaecistus*, *Salix Sadlerii*, *Saxifraga Boydii*, *S. retusa*, *Trillium grandiflorum*, *Xanthorrhiza apitifolia*. Of the forty spring-flowering plants whose dates of flowering are annually recorded, the following came into flower:—*Draba aizoides*, on April 3; *Omphalodes verna*, April 4; *Adonis vernalis*, April 9; *Aubrietia grandiflora*, April 9; *Narcissus Pseudo-Narcissus*, April 11; *Corydalis solida*, April 10; *Hyocyamus Scopolia*, *Symphytum caucasicum*, April 25.

On Temperature, &c., at the Botanic Garden, Glasgow, during April. By Robert Bullen, Curator.—Another unusually cold wintry month falls to be recorded. Frost was registered on ten mornings, the total readings for the month being 56°, but frequently the temperature was at or little above the freezing-point, probably owing to the distant hills being heavily clad with snow, which fell frequently on a few days about the middle of the month. Apart from the snow, the rainfall was very light. Vegetation is in a backward state; the hardest kinds of herbaceous plants and the earliest-leaving deciduous trees are equally backward with more tender subjects. An old plant of *Cydonia japonica* which I have had occasion to note in former years as being in bloom in January and February, is only in bloom at the end of this month.

PRESENTATION.

On Friday evening, Mr. Cameron, gardener, Farglen House, N.B., was presented by a few of his friends with a handsome marble clock and silver watch and chain. The clock bore the following inscription:—"Presented to Mr. Robert Cameron, gardener, by a few of his friends, as a mark of their respect, on his leaving the employment of the Abercromby family at Farglen, after a service of thirty years, May, 1892." Mrs. Cameron was also pre-

sented with a beautiful tea service, and Miss Cameron with a silver brooch. Mr. Marr, gardener, Hatton Castle, made the presentations. Mr. Cameron feelingly acknowledged the gifts.

NORTH OF SCOTLAND HORTICULTURAL ASSOCIATION.

A well-attended meeting of this Association was held in the Young Men's Christian Institute, Aberdeen, on Wednesday evening, the 18th inst., Mr. France, President, in the chair. A committee, appointed on a suggestion by the President to consider the advisability of altering the name of the Association, reported that they had resolved unanimously to recommend to the annual meeting that the Association be designated in future, "The North of Scotland Horticultural and Arborescent Association." Further, the committee reported that they had under consideration the question of differential rates of subscription, and considered that the only change necessary was that suggested at the last general meeting, viz., to fix the subscriptions of apprentices at 1s. per annum, and give awards for essays, &c. It was decided to recommend the adoption of the proposals to the annual meeting. The Secretary reported that he had communicated with Sir Arthur Grant, of Monymusk, asking that the members of the Association be permitted to visit Monymusk on June 2. Sir Arthur had replied that he would be glad to see the members on the date mentioned. The next business on the card was a paper on "Daffodils and Narcissi," by Mr. A. Hope, of Exeter, and which was read by the Secretary, Mr. G. C. Minty. The paper was much appreciated, and a hearty vote of thanks passed to Mr. Hope. A fine display of Daffodils and Narcissi and other spring flowers was on view in the room.

THE CLOVE TRADE OF ZANZIBAR.

The importance of Zanzibar as a commercial centre has attracted a good deal of attention of late, and the development of its resources naturally led us to consider the value of its vegetable products; among these gum anime from *Trachylobium vernicosum*, of course, takes a prominent position as being the gum or resin which fetches by far the highest price of any similar gum for varnish making, and considering that at the present time varnish makers are paying as much as 2s. 5d. per lb. for cleaned Sierra Leone copal, and this in quantities of a ton or so at a time, there would seem to be a good chance for developing the anime regions not only of Zanzibar, but of any other locality where fossil or good hard resins can be found.

With Zanzibar, however, there is another product closely associated with its welfare, namely, the Clove, and our contemporary the *Chemist and Druggist*, has some interesting remarks on the subject. As a proof of the rapid growth of the trade of Zanzibar, it is stated that our imports from thence in 1886 were worth only £120,222, but that in 1890, they had grown to £722,893, while the exports in the same period advanced from £251,421 to £521,190. Since the publication of those figures, a new British Political Officer, Mr. Portas, has been sent to Zanzibar, and has assumed practically the government of that island. The city has been declared a free port, and sundry other reforms have been initiated, which will, no doubt, contribute largely to its commercial importance. A big cloud, however, obscures the commercial sky of Zanzibar at this moment, namely, the over-production of Cloves, its staple article of trade. Since the Clove tree was first introduced in the islands, about sixty years ago, it has been an enormous source of wealth to the Arab landowners and to the Sultan. There have been periodical depressions in the price before, but until about three years ago, 6d. to 7d. per lb. was considered a very low quotation, and once, after a hurricane which destroyed the greater part of the plantations, the value of Cloves rose to 1s. 7d. per lb. in the London market. Lately, however, the Clove crops have become larger and

larger, and they are now almost every season greatly in excess of the world's estimated annual consumption, which is about 80,000 bales, of 140 lb. each. As a result, the price (3½d. per lb.) has fallen within measurable distance of the lowest point it has ever touched—namely, 2½d., in 1860—when, however, there was no export duty, or, at any rate, a much smaller one than at present.

The London warehouses are burdened at this moment with a stock of not less than 31,000 bales, and the quantities warehoused in America and on the continent are also known to be exceedingly heavy. The cause of the present depreciation of Cloves lies exclusively in the short-sighted policy of the Arab plantation owners in the islands of Pemba and Zanzibar, who have neglected the culture of all other products which they might have reared with profit upon their fertile soil, and turned every available acre of land into a Clove plantation, without the least thought of the inevitable effect of their action. Telegraphic information received this week states, that the Arab landowners have presented petitions to Mr. Portal, declaring that they are ruined by the low price of Cloves and the scarcity of labour, and asking for a reduction of the Clove tax. There is no doubt that, sooner or later, these demands, so far as the reduction of the export duty is concerned, will have to be granted—the puzzle will be, where to find a source of revenue which will recoup the Sultan, to whom Mr. Portal stands in the relation of a kind of *maître du palais*, for the loss of the mainspring of his income. The reduction of the 25 per cent. export duty the growers probably think would give them a fair margin of profit; but there is no doubt that if it were abolished to-morrow, it is not the Zanzibar Arabs, but the European Spice dealers and oil-distillers who would profit, for quotations here would certainly answer with a corresponding fall. The scarcity of labour of which the Arabs complain is probably traceable to the abolition of slavery by the late Sultan. It must be remembered, that at the time of the budding of the Clove tree there is a sudden demand for labour upon the plantations, for if the buds are not promptly picked, they burst into flower, and become valueless. In the London market, in the early part of the present month, Zanzibar Cloves showed a further decline, being quoted at 3½d. per lb.; while picked Penang Cloves commanded 11½d. to 12½d. per lb.

NEWLY-PLANTED TREES AND SHRUBS.

The spring has been one of the most trying for freshly-moved trees and shrubs that I ever remember, and deciduous things had to be planted later than usual on account of the frost, which necessitated increased care and attention in looking after them, as April was mostly very warm and dry during the day, and the effect was that newly-moved plants got their bark shrivelled. This should be prevented if possible, as contraction of the bark is bad for them, and when it takes place the sap vessels become closed, and it is a long time before a tree or shrub that has suffered in that way recovers. Experienced planters knowing this, take precautions against shrivelling of the bark, as may be seen by the binding up of the stems and branches with moss or other materials, which are kept moist by syringing, the result being that a tree so treated has a good chance of establishing itself. Although this binding up of the stems cannot in all cases be carried out, the damping overhead may, and the latter is essential as regards all large evergreens that have been recently transplanted, as they have an extensive leaf-surface that the dry air is continually acting upon, causing great evaporation of moisture. This action of the leaves cannot be kept up and supported by the roots, be they ever so many, as they are not then sufficiently active, and the plants must therefore be assisted by sprinkling them, which, in weather such as we are now having at the time of writing, should be done at least twice a day, which will contract some of the mischief that would otherwise

result to the trees. If we had experienced the usual kind of spring weather, sunshine and showers, or frequent rain, evergreen and deciduous subjects would be able to start at once.

In addition to the means already referred to, mulching is highly beneficial, by keeping the ground uniformly moist, and when water is afforded it tells, and there is no washing or cracking of the surface, such as always takes place when there is no mulching. The mulch, consisting of half-rotted manure, should be laid round each plant, moderately thick, extending some 2 feet or more, according to their sizes, and each watering or shower of rain will carry some of the properties of the manure down to the roots. *J. Sheppard.*

VARIORUM.

RINGLEADER POTATOS AND WHITE KIDNEY.—For years we have depended upon Myatt's Ash-leaf to give us the first early Potatoes, but we shall not grow it after the present season, for there are varieties which are not only much earlier, but better in quality, and more abundant croppers. For frame use, we find Ringleader fully three weeks earlier than Myatt's, and White Kidney quite a fortnight, all having had the same treatment in every respect. These two varieties, which are introductions of the Messrs. Sutton, are a boon to a gardener on account of the extra early date when they are ready for use. *E. Molynceux.*

Obituary.

EDMUND COLE.—The death of Mr. Cole took place at Cole Park, Northampton, at the age of fifty-two, from disease of the kidneys. This well-known gardener entered the service of F. W. Dolman, Esq., of Alverstoke House, Gosport, in 1871, where he proved himself a successful grower and exhibitor of plants, fruit, and vegetables, in the neighbourhood of Gosport, Portsmouth, and Fareham, his most successful exhibits being stove plants. He was also very successful with Grapes, and was the first to exhibit pot-Vines at the Southsea exhibition; his black and white Grapes in pots on arches being the principal feature of the show on one occasion. In January, 1878, he entered the service of Earl Spencer as gardener at Althorp Park, where he spent much labour in remodelling the extensive pleasure grounds from plans of his own, also the fruit and plant houses. In 1882 he introduced into commerce the fine Potato, Cole's Favourite, which took the prize of ten guineas at the Northampton Seedling Potato Exhibition, and an Award of Merit from the Royal Horticultural Society. Mr. Cole had gained a wide circle of friends in the gardening world, he was much valued and respected by his employer and those employed under him. He leaves a widow and six children to mourn his loss.

MARKETS.

COVENT GARDEN, May 26.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. Ed.]

MARKET heavily supplied, and with a moderate business doing, prices keep low. *James Webber, Wholesale Apple Market.*

POTATOS.

NEW POTATOS.—Arrivals of potatoes during the week before.
Prices rather lower. Kidneys, supply short, prices firm.
OLD POTATOS.—Firm. *J. H. Thomas.*

SEEDS.

LONDON: May 25.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, London, S.E., write that the present remarkably late season is now naturally drawing to a close. A good downpour of rain is greatly needed, and would probably bring to hand, to farmers, what a rotten crop of small sowing oats. For Tares there is a fair request, at the tempting rates current. Mustard and Rape seed meet an improved inquiry. Canary seed is without any striking or novel feature; the recent speculative excitement has fortunately died away; but, holders, in view of the bad reports from Turkey, maintain extreme firmness. There is no change in Hemp-seed. Blue Peas and Haricot Beans meet an improved inquiry.

FRUITS AND VEGETABLES.

SPITALFIELDS, May 24.—Quotations:—English Apples, 2s. 6d. to 5s. per bushel; American do., 10s. to 20s. per barrel; New Zealand do., 6s. 6d. to 10s. 6d. per box; foreign Tomatoes, 1s. to 1s. 6d. doz.; forced Rhubarb, 1s. 3d. to 1s. 6d.; natural do., 1s. 6d. to 2s. 6d. per dozen bunches; Asparagus, 9d. to 2s. per bundle of 100 heads; Seakale, 1s. to 1s. 3d. per punnet; Cabbages, 2s. 9d. to 5s. 6d.; Cauliflowers, 4s. to 7s. per punnet; Radishes, 4s. to 5s. doz.; Greens, 2s. 6d. to 4s.; French Turnips, 2s. 6d. to 3s.; Chervil, 2s. 6d. to 3s.; Spring Onions, 4s. to 5s.; Parsley, 2s. to 3s. per dozen bunches; Spinach, 1s. 9d. to 2s. 6d. per bushel; Endive, 1s. to 1s. 6d.; Cabbage Lettuce, 9d. to 1s.; Leeks, 2s. 6d. to 3s.; France Cucumbers, 2s. to 3s.; natural do., 1s. 3d. to 1s. 9d.; Beet-roots, 4d. to 6d. per dozen; Mustard and Cress, 1s. 6d. to 2s. per dozen baskets; English Onions, 5s. 9d. to 6s. 6d. per cwt. Horseradish, 1s. to 1s. 1d. per bundle.

BOROUGH, May 24.—Quotations:—Broccoli, 5s. to 7s. 6d.; Cabbage, 3s. 6d. to 6s. per tally; Spinach, 2s. to 3s.; per bushel; Greens, 3s. to 4s.; Carrots, 1s. 3d. to 1s. 9d.; Spring Onions, 4s. per dozen bunches; Egyptian do., 5s. to 6s. per cwt.; English Apples, 5s. to 10s. per bushel; Canadian do., 12s. to 20s.; and Newtown Pippins, 15s. to 25s. per barrel.

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, prime, 80s. to 102s.; inferior, do., 46s. to 75s.; hay, best, 60s. to 95s.; inferior, do., 26s. to 50s.; and straw, 20s. to 35s. per load.

POTATOS.

SPITALFIELDS: May 21.—Quotations:—Magnums, 65s. to 90s.; Imperators, 60s. to 90s.; Hebrons, 65s. to 90s.; Bruce Magnums, 65s. to 85s.; Snowdrops, 70s. to 90s.; Sutton's Abundance, 70s. to 85s.; Main Crop, 80s. to 110s. per ton.
BOROUGH: May 24, quotations:—Bruce Magnums, 70s. to 95s.; Dunbar do., 95s. to 105s.; Penfold do., 65s. to 70s. per ton.

GENERAL MARKET AVERAGES: May 25.—Quotations:—Magnums, 65s. to 95s.; Dunbar do., 95s. to 105s.; Hebrons, 65s. to 95s.; Snowdrops, 70s. to 90s.; Imperators, 60s. to 90s. per ton. New—English, 2d. to 5d.; Jersey, do., 3d. to 4d. per lb.; Lisbon, 8s. 6d. to 10s. per cwt.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure, for the week ending May 21, and for the corresponding period last year:—1892: Wheat, 31s. 6d.; Barley, 21s. 10d.; Oats, 21s. 3d. 1891: Wheat, 39s. 6d.; Barley, 27s. 1d.; Oats, 20s. 11d.

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees:—A "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

Principal Wheat-producing Districts:—0, Scotland, N.; 1, Scotland, E.; 2, Scotland, N.E.; 3, England, E.; 4, Midland Counties; 5, England, S.
Principal Grazing, &c., Districts:—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

THE following summary record of the weather for the week ending May 21, is furnished from the Meteorological Office:—

"The weather during this period was unsettled in the extreme north and north-west, with frequent and rather heavy falls of rain. In the more southern and south-eastern districts, however, the conditions remained generally fair, although more cloud prevailed than of late, and some slight showers occurred from time to time.

"The temperature was a little below the mean in 'Scotland,' as well as in 'England, N.W.,' and 'Ireland, N.,' in nearly all other parts of the kingdom it just equalled the normal value. The highest of the maxima, which were recorded on somewhat irregular dates, ranged from 67° in 'England, S.,' to 59° in 'England, N.W.,' and to 58° in 'Scotland, N.' The lowest of the minima were registered on the 15th at most of the English and Irish stations, and on the 18th or 21st in Scotland. They ranged from 30° in 'Scotland, N.,' and 31° in 'Scotland, E.,' to 38° in 'Ireland, S.,' and to 45° in 'the Channel Islands.'"

"The rainfall was again less than the mean over most parts of England, and also in the 'Channel

Islands' and 'Ireland, S.,' in Scotland, 'England, N.W.,' and 'Ireland, N.,' however, there was a considerable excess.

"The bright sunshine was less prevalent than of late, and was below the mean for the time year in all districts, except the 'Channel Islands.' The percentage of the possible duration ranged from 26 in 'Scotland, N.' and 'Ireland, N.,' 27 in 'England, N.W.,' and 29 in 'Ireland, S.,' to 40 in 'England, S.W.,' and to 61 in the 'Channel Islands.'"

HALIMODENDRON ARGENTEUM.—This is a Siberian shrub of great merit, and, as its name implies, is a maritime plant, being found in the salt fields of Siberia. It shows off to much greater advantage when grafted on the Laburnum, and having a pendulous habit of growth, forms a handsome and graceful subject. The leaves are alternate, abruptly pinnate, with two pairs of leaflets covered with a soft white down. The flowering season is from June to August. Its inflorescence is borne in two and three-flowered peduncles, Pea-shaped, fragrant, and of a lively purple colour. The seed-pods are inflated, very hard, colour dull brown. I believe it was introduced in 1777. *W. H. Aggett.*

NOTICES TO CORRESPONDENTS.

* PHOTOGRAPHS, DRAWINGS, OR SPECIMENS.—We shall be pleased to receive from our Correspondents notes relating to interesting Gardens, together with Specimens or Illustrations of interesting Plants. Although circumstances prevent us in all cases from reproducing them, we are nevertheless glad to receive them, and as far as possible to utilise them for the benefit of our readers.

ANTS IN PEACH HOUSE: Subscriber. If a little petroleum be poured into their runs and nests, or some carbolic acid distributed about, the ants will soon desert the house. If chalk be rubbed on the stems and larger branches, say as bands a inch broad, the ants will not pass over them. A thin line of gas tar poured on the soil round the stem, and some distance away from, and against the wall will prevent them ascending the trees.

APPLE-SHOOTS BARKED BY SOME INSECTS: Thomson & Co. The insects sent were fine lively specimens of *Otiorynchus picipes*, the clay-coloured weevil, very destructive to vegetation. They must be caught at night; how, has often been described in these pages. See "Roses" on p. 666 in our last issue.

BEES—FOUL BROOD: R. H. If but little of the comb is affected, cut it out and replace it with pieces of healthy comb. For a bad case there is no cure short of destroying it, and if it be a straw skep, that also. New stocks, or stocks that are not prevented from swarming in a natural manner, seldom have foul brood. Artificial combs may be obtained of any firm dealing in articles for the Apiary.

CUCUMBERS: Hall. Yes, a marked case of eel-worm; they come in the soil. It will be better to turn out the soil, and start with fresh soil.

FRUITS: H. A. Apply to the Secretary of the Royal Horticultural Society for their pamphlet on Apples.

HEATING GREENHOUSE: P. G. The wrought iron pipe will answer for heating the greenhouse, but you must employ twice or thrice as much more of it than would be necessary with any 4½-inch cast-iron pipe, the radiating surface being less. Paint them outside with lamp-black and linseed oil, and always keep them full of water to prevent rusting. Do not use iron filings and sal ammoniac, as these will at last burst the joints.

JARGONELLE PEAR: Ross. The leaves are infested with *Phytoptus Firi*, a gall mite. Collect affected leaves, and burn them. You might try, another year, spraying the foliage quite early in the season with Paris Green.

LAURELS: W. M. Park Harbor. What you take to be fungi are air-roots, such as form on Vines. They occur in Laurels when they grow in thick damp shrubberies where the air is stagnant and moist. They will do no harm, but are an indication that the shrubs need pruning and thinning out.

NAMES OF PLANTS: G. C. Ribes alpinum.—W. Cann. *Gentiana acaulis.—W. H. D.* *Polygala chamaebuxus, var. purpurea.—S. G. H.* *Pyrus Aria, an*

excellent town tree.—*D. J. Amygdalus nana*.—*W. K. Prunus Padus*. Brindle Beauty moth, very destructive.—*G. H. E. Pyrus arsa*, the White Beam.—*M. C. 1. A Birch*, Betula sp.; 2, *Lonicera Ledebouri*; 3, *Ranunculus bulbosus*; 4 and 5, *Begonia*; 6, *Martensia sibirica*.—*G. H. K. A fungus*, *Pholobus*; will do little harm. *W. Elliott*, *Ribes aureum*.—*E. M. C. Maxillaria picta*.—*J. S. & Sons*, *Ranunculus acris* fl.-pen, so far as we can tell.—*F. L. "Grass"*, if wild, *Carex pendula*; 2, *Dendrobium Dahnoussianum*; 3, *Maxillaria picta*.—*J. T. L. 1*, send it when in flower; 2, *Lonicera Ledebouri*; 3, *Gaultheria shallon*; 4, next week.—*W. S. E. Zephyranthes atamasco*.—*H. S.* The leaf is that of *Farfugium grande*. The Pansy leaves show that the plants have been rapidly pushed on with rich soil, &c., and then suddenly checked by cold.

NARCISSES: *J. R. H.* The bulbs are affected with "hasal rot," about which so much has been written of late. See *Gardeners' Chronicle*, May 14, p. 631.

PALM DYING BACK: *W. R.* Too low a temperature, aggravated by a wet soil. The Pine shortly.

PANCRATUM FRAGRANS: *W. G.* West Indies. Introduced in 1759.

PEONIES: *W. C. D.* I can make nothing of these. The injury appears to me to be mechanical, or caused by frost, perhaps, when the leaves were much smaller; but this explanation does not seem to agree with Mr. Dod's description. There are no Nematodes, and no trace whatever of any fungus. I have only a record of one fungus on Peonia, *Cronartium Peoniae*, and there is nothing of the kind here. *W. G. S.* [The plant is probably planted where the early morning sun reaches it suddenly, then, after sharp frosts, this kind of injury to the leaves occurs. Ed.]

PARIS GREEN: *F. B.* Blundell, Spence & Co., Limited, 9, Upper Thames Street, London; and Hull.

SASH-BARS, PUBLICES, &c.: *F. W.* We have no knowledge of the kind of material, strength, &c., of the articles supplied by the persons you mention. Generally, that which is much cheaper than other person's wares will be found wanting in some essential points, and, as you are going to the expense of obtaining good ones from England, you should get the best in the market.

SCALE INSECT ON PEACH: *Robert Bell*. The species infesting your tree is a very large kind—at least the female which came was—but the male which is winged may be very small. The young are very minute, and it would be advisable to wipe them off the shoots and branches with a cloth dipped in some kind of insecticide. If the trees after the leaves are fallen are syringed with clean water at a temperature of 145° Fahrenheit, the insects will perish; still, to make sure that none escape, dress the trees in winter with a thick wash, consisting of water, cal, crowding, flowers-of-sulphur, and a little petroleum, say a wine-glass full to a gallon of the mixture. With this mixture the trees after pruning should be painted in every part, using a moderately stiff brush, which should be in a general way drawn upwards, towards the end of shoots which have buds. A sheet should be spread under the trees when pruning them to receive the prunings, and everything which falls on it should be burnt.

THE TOMATO FUNGUS: *R. S.* Spray the leaves and young green fruits with sulphate of copper, taking care not to use it on the fruit when ripening.

VINES: *J. R. R.* The leaves and berries are affected with the Vine mildew, which has been brought on, probably, by some faults in management, although Vines in some localities are liable to it under any kind of management. Coolness, damp, with air admitted by the front sashes or ventilators, and not warmed by the hot-water pipes before it reaches the Vines. You may check it this time by keeping the Vines somewhat warmer and drier. Keep pans filled with water in which sulphur is mixed. There is a mildew-destroyer sold by nurserymen which you should also make use of.—*G. M.* The leaves have been scorched by the sun while wet. Give more air.

One who is accustomed to the Flower Market preferred. Must have good references.—Apply to Messrs. J. W. SILVER and Co., 95, Victoria Street, Westminster, S.W.

WANTED, at ONCE, a respectable MAN, a good Mower, and understanding large Mowing machine. Wages, 15s. a week.—Apply, HEAD GARDENER, Stanmore Park Gardens, Stanmore.

YOUNG LADIES who want to be INDEPENDENT and make their way in the world, should Write for Prospectus of the Scientific Dress Cutting Association, 272, Regent Street, London, W. Situations found for all pupils at a good salary. No Lady of education is complete without a knowledge of Dressmaking.

WANT PLACES.

To Noblemen and Gentlemen requiring Land Agents, STEWARDS, BALIFFS, or GARDENERS.

JAMES CARTER and CO. have at all times upon their Register reliable and competent MEN, several of whom are personally well known to Messrs. Carter. Enquiries should be made to 257 and 235, High Holborn, W.C.

Head Gardeners.

JOHN LAING and SONS can at present recommend with every confidence several energetic and practical Men of first-class ability and first-rate character. Ladies and Gentlemen in want of GARDENERS and BALIFFS, and HEAD GARDENERS for first-rate Establishments or Single-handed Situations, can be suited and have full particulars by applying at Stanstead Park Nurseries, Forest Hill, London, S.E.

SANDERS, St. Albans, can thoroughly RECOMMEND several first-class HEAD GARDENERS.

RICHARD SMITH and CO. beg to announce that they are constantly receiving applications from Gardeners seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

Gardeners, Farm-Baliffs, Foresters, &c.
DICKSON'S (Limited), Royal Nurseries, Chester, are always in a position to RECOMMEND MEN of the highest respectability, and thoroughly practical at the business. All particulars on application. Telegraphic and Postal Address: "DICKSONS, CHESTER."

GARDENER (HEAD), or GARDENER and FARM STEWARD.—Married; thoroughly experienced in Gardening; Land and Stock. Good References from present employer. Rather than be out of situation, advertiser will give £5 on engagement to introducer of a genuine situation.—BONA FIDE, Head Gardener, Halesworth, Suffolk.

GARDENER (HEAD); Married.—A Lady wishes to recommend her Head Gardener; leaving owing to a death. Thoroughly experienced in every branch, including Orchids. Excellent character.—Mrs. WIGLEY, Howick House, Preston.

GARDENER (HEAD); age 37, married.—Mrs. CROSTON, Copley Dene, Highgate, wishes to recommend her Head Gardener. Thoroughly efficient in all branches. Twelve years' good character.

GARDENER (HEAD).—Middle-aged practical Man; understands Stock. Five years' last situation, left in consequence of death of employer. Good character; terms moderate.—J. MOBBES, 199, Ball's Pond Road, N.

GARDENER (HEAD).—Age 39, married.—J. VERT, Audley End Gardens, Saffron Walden, will be pleased to recommend a thoroughly practical man as above. Over twenty years' experience in some of the best establishments in England. Very successful in Fruit and Vegetable Growing, and used to the Management and requirements of a large Garden. Eleven years' good recommendation from last situation.

GARDENER (HEAD WORKING).—Age 32, married; thoroughly understands Grapes, Peaches, Stove and Greenhouse Plants of all kinds; has taken many prizes. Nearly six years with Mrs. E. L. Hawkins, Esq., Bedford; good references from Mrs. Hawkins. Life experience.—R. DAY, The Gardens, Sunnyside, Bedford.

GARDENER (HEAD WORKING), Land and Woods, if required.—Age 42, married; life experience in the profession. Upwards of twenty years as Head in good establishments; excellent references.—GARDNER, Messrs. Williams and Nicholson, Land Agents, Oswestry.

GARDENER (HEAD WORKING), age 46, [where others are kept.—Married, no family; abstainer; life experience in Early and Late Forcing of all kinds of Fruit, Flowers, Vegetables, and Mushrooms; also Kitchen and Flower Gardens and Pleasure Grounds. Eight years' good character from late employer, and sixteen years' references.—J. D., Myrtle Cottage, Wick Road, Hampton Wick, Middlesex.

GARDENER (HEAD WORKING, or good SINGLE-HANDED).—Age 43, married; twenty years' experience in all branches.—J. H., 12, Devonshire Terrace, Herford Road, Lower Edmonton, N.

GARDENER (HEAD WORKING), where two or three are kept.—Age 38, married; twelve years' practical experience in all branches of the business.—R. WILKINSON, Barwick-in-Elmet, near Leeds.

GARDENER (HEAD WORKING).—Age 40, married, no family; experience in Forcing Vines, Peaches, Stove and Greenhouse Plants, also Kitchen and Flower Garden; good references (two and a half years, and eleven years previous).—J. L., St. Ann's Villa, Holdenhurst Road, Bournemouth.

GARDENER (HEAD WORKING).—Single; trustworthy, intelligent, and thoroughly practical. Abstainer. Eight testimonials. Home Counties preferred.—J. H., 69, Gordon Place, Kensington, W.

GARDENER (HEAD WORKING), others kept.—Age 36, married, no family; Forcing Fruit, Flowers, and Vegetables. Life experience. Suitable for large establishment; five years' character.—A. NEWTON, Tetbury, Glos.

GARDENER (HEAD WORKING).—Age 35, married, one child; over twenty years' practical experience in all branches of gardening; good character.—G. WHITTING, Basin Road, Chichester, Sussex.

SHOPMAN.—Ten years' experience in First-class Houses.—SEEDSMAN, 11, South Street, Stourbridge.

COWMAN.—A Gentleman wishes to recommend a middle-aged Man as practical Cowman. Height, 5 feet, 10 inches; ten years' testimonials. Willing to make himself generally useful in garden or house if required.—E. ELCOCK, French's Nursery, Camberwell Green, S.E.

HOLLOWAYS' PILLS.—Indigestion, Stomach and Liver Complaints.—Persons suffering from any derangements of the liver, stomach, or the organs of digestion, should have recourse to Holloway's Pills, as there is no medicine known that acts on these particular complaints with such certain success. Its peculiar properties strengthen the stomach, increase the appetite, and rouse the sluggish liver. For bowel complaints it is invaluable, as it removes every primary derangement, thereby restoring the patient to the soundest health and strength. These preparations may be used at all times and in all climates by persons affected by biliousness, nausea, or disordered liver; for flatulency and heartburn they are specific. Indeed, no ailment of the digestive organs can long resist their purifying and corrective powers.

SANKEYS' famous GARDEN POTS
* Bulwell Potteries, Nottingham. *

Messrs. Dicksons, Limited, Chester, write:—"The Flower Pots you have so largely supplied us with are light, strong
and well made, and in every respect highly satisfactory."

Messrs. Richard Smith & Co., Worcester, write:—"We beg to say that we are highly satisfied with your 'Garden
Pots,' they are well made, light, yet strong, and we like them better than any other we have ever used."

Mr. William Bull, 536, King's Road, Chelsea, London, writes:—"For nearly thirty years I have been using your
'Garden Pots,' and still find them the best and cheapest."

MESSINGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus,

Just issued, will be found the most complete, practical, and reliable guide to all about to build, alter, or heat Greenhouses.
Illustrations of every description of Glasshouse, from the largest range or Winter Gardens to the simplest forms of Portable
Greenhouses, Plant Protectors, and Garden Frames; also of all the best kind of Boilers, Hot-water Pipes, and all appliances for
heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating,
is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical
hints on the subjects of which it treats, the result of many years' experience. Price, 2s. post-free.

A large number of the illustrations are taken from greenhouses erected by us in various parts of the country; an inspection of
this Catalogue shows, therefore, buildings the efficiency of which has been well tested by actual use. The advantages possessed by
us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys
made, and gentlemen waited on in any part of the country. Plans and Estimates free on application.

and Principality Nurseries, Llandudno Junction.

FRIDAY NEXT, JUNE 10.

GREAT UNRESERVED

ORCHID SALE,

BY ORDER OF

MESSRS. LINDEN, BRUSSELS.

IMPORTATIONS FROM ALL PARTS OF THE GLOBE.

ORCHIDS FROM COLUMBIA—

CATTLEYA SPECIES, collected in the district from which we first imported those magnificent forms, as MASSAIANA, LAVERGINENSIS, HARDYANA, and others. The plants offered are most distinct in appearance; we are confident a number of exquisite New Forms will be found among them.

CATTLEYA AUREA and **CHRYSOTOXA**, just to hand in splendid order.

ORCHIDS FROM THE PHILIPPINE ISLANDS—

VANDA SPECIES, collected in the Mindanar District; not seen in flower; most distinct in appearance.

SACCOLABIUM SPECIES, quite a New Form, producing large trusses of dark rose-purple flowers.

ORCHIDS FROM BRAZIL—

CATTLEYA ALEXANDRÆ, selected plants, including many fine masses, in the best possible condition.

CATTLEYA VICTORIA REGINA, in grand order; all specially selected plants.

SELENIPEDIUM SPECIES, a new form, discovered in a totally unexpected locality; the dried Flowers received are of large size and beautiful colouring.

CATTLEYA ACKLANDIÆ, extra fine selected plants, in capital condition, including many fine masses.

ONCIDIUM CRISTATUM (R. A. Rolfe). A description of this Grand New Species will shortly be published. Flowers will be shown on the day of the Sale.

EPIDENDRUM CAPARTIANUM (synon. E. GODSEFFIANUM), extra fine selected plants, which we introduced and named two years ago.

BY ORDER OF MESSRS. LINDEN, LEOPOLD PARK, BRUSSELS,

MESSRS. PROTHEROE & MORRIS,

WILL SELL THE ABOVE, AT THEIR

GREAT ROOMS, 67 & 68, CHEAPSIDE, LONDON, E.C., on
FRIDAY NEXT, JUNE 10, Without Reserve.

WEDNESDAY NEXT, JUNE 8.

THE NEW and WONDERFUL
UMBEL-FLOWERED

CATTLEYA ALEXANDRÆ,

Just to hand per s.s. "Tarabe," collected by one of our best men.

The plants are in perfect condition, bulbs plump, leaves fresh and green, eyes sound and dormant. Many grand and perfectly-formed specimens being among them.

There has never before been seen anything as unique as this grand novelty in Cattleyas. It is as different from all other Cattleyas as *Cypripedium Chamberlainianum* is from all other *Cypripeds*. It is a perfect gem, and we have never seen a Cattleya so perfect in habit. The bulbs (in themselves graceful) carry two and three well-shaped olive-green leaves, crowned by a spike, $1\frac{1}{2}$ foot long, which bears at the top a cluster of blooms, each spike thus forming a lovely bouquet.

Individual Blooms are 5 inches across.

CATTLEYA FROM PERU.

We had determined to hold this Cattleya until it flowered with us; but, owing to the non-arrival at the time expected of Cattleya Victoria regina (of which over 1000 plants, without reserve, will be sold on July 8), we have decided to sell these plants, to fill up the gap thus occasioned.

PHAJUS SP.

This is the most stately and noble Orchid yet introduced from that little-known land, New Guinea. The dried foliage and old flower spikes remaining on the plants, will convey some idea of its grandeur. Spikes were seen 6 feet high, and the foliage is most luxuriant.

Collected in Dutch East New Guinea.

FOR SALE ON WEDNESDAY NEXT, JUNE 8,

BY

MESSRS. PROTHEROE & MORRIS,

At their Central Sale Rooms, 67 and 68, Cheapside, London, E.C.

F. SANDER & CO., St. Albans.

THE
Gardeners' Chronicle.

SATURDAY, JUNE 4, 1892.

THE MASCARENE ISLANDS.

THE terribly destructive hurricane which lately visited Mauritius has called public attention to the products of this fertile island. Some account of the cultural industries of these, and adjacent islands, may therefore be acceptable, and these we are enabled to supply, as Monsieur M. F. Jadin, Chef des travaux de botanique à la Faculté des sciences, was recently despatched on a mission to the Mascarene Islands, to continue certain investigations of cryptogamic botany, which have for some time past been carried out in France for the public benefit. The *notes de voyage* of M. Jadin were communicated to the Société Languedocienne de Géographie, and published in their late bulletin.

M. Jadin, after visiting Mauritius, was no longer surprised to find Sir G. Bowen, who was Governor of the island from 1879 to 1883, pronouncing this colony to be "the richest in the empire, and, perhaps, the richest country in the world." It is for this reason that the botanist prefers the descriptions of the Isle of France given by Bernardin de St. Pierre in his *Paul and Virginia* to those which are to be found in his former *Voyage à l'île de France*. The first seems to him more just, more true to life, and he suspects, he adds, strongly, that M. Arvède Barine,* the author of a very interesting study on Bernardin de St. Pierre, can never have seen the Mascarene Islands, when he writes, *à propos* of these said descriptions in *Paul and Virginia*, "The landscapes are copied from nature, and completed by a divination of what the tropical vegetation ought to be in a country more fertile than the Isle of France."

After this natural tribute to the comparison of fiction with real life and the literary value of the great Mauritian romance, without alluding to which no French writer could possibly touch on anything to do with Mauritius, M. Jadin proceeds more prosaically to modern facts, which can therefore be given in his own words:—

"The principal cultivation in both colonies (Réunion and Mauritius) is that of the sugar cane (*Saccharum officinale*, L.). The sugar industry includes, naturally, the production of rum and molasses. The two islands, however, do not both export their sugars to the same countries; although Réunion trades only with the French markets, having to compete against the beetroot sugar, and being obliged to make great sacrifices to sustain

* Bernardin de Saint-Pierre, par M. Arvède Barine, (Paris, Hachette, 1891.)

the conflict. Mauritius, on the other hand, sends out her supplies of sugar to the markets of India, the Cape, Australia and England. Moreover, Mauritius as a colony is devoted almost wholly to the sugar production, exporting only besides Aloe fibre and a little Vanilla. Réunion again attempts several small industries, and we shall see that she deserves the greatest encouragement in this line, in which she deserves success.

"Whilst the cane culture in both islands is very nearly the same, Mauritius can boast of a considerable superiority over Réunion as regards the machinery used for manipulating the sacchariferous reed. Some of the sugar-mills of Mauritius are veritable palaces, with powerful steam machines, combining all the latest improvements. On one large property, for instance, where work is carried on till nine or ten o'clock at night, they use the electric light—in fact, there is a very advanced management.

"Has the point of perfection then been reached? you will ask. By no means, we believe that both the cultivation and the manufacture are susceptible of great improvements—thus, the use of the plough is almost unknown; the extraction of the sugar by the system of diffusion does not seem to be readily acceptable to the colonists. In this direction there is a great deal to be done. Just now we only indicate these two points; we hope to be able, later, to treat them in greater detail.

"The two colonies export the fibre of the Aloës—so-called—but these fibres are not extracted from the true Aloë [Aloe vulgaris of Abyssinia, the Aloe of Dioscorides], but from the leaf of several Amaryllideæ allied to the Agave. The principal species is the *Fourcroya gigantea*, Vent., or *Agave fœtida*, L., which locally bears the common name of Aloës vert—Green Aloe. This plant, which blossoms in throwing out a tall flower-bearing stem to a height of six feet, from its basal tuft of stiff leaves, does not bear seed. The flowers, which have the form of a white bell, with a very sweet odour, are never fertile; at the base of each a small bulb is put forth, which develops quickly, and when the flowers are dead these bulbs remain and develop. As soon as each of these little bulbs has one or two small leaves un-sheathed, the stalk bends under the weight of these small plants, and finishes by falling; once on the ground the bulb develops itself into a new plant. Very hardy, thriving in the most arid and rocky soil, the Agave propagates rapidly, and without further care permits the production of fibre at a low price.

"The cultivation of Vanilla is far more delicate; this Orchid requires a light soil, rich in humus, and also a support. The support generally in use throughout the Mascarenes is a Euphorbiaceous plant, the *Jatropha curcas*, L., which vulgarly bears the name of Pignon d'Inde—Indian Nut, or "Physic Nut"; all the same, in Réunion especially, we have seen Vanilla plantations of great importance, having the Orchid supported on one of the trees common to the country, the *Casuarina equisetifolia*, Forst., called Filao. [The translator remembers seeing Vanilla grown on the stems of Palmistes, in Mauritius.] This climber also succeeds on the *Pandanus utilis*, Bory., or *Vacca*, a most useful tree in sugar-producing colonies, for its leaves are largely required to make sacks for the outer covering of the sugar-bags. Besides the particular care which the plantations of Vanilla require, we must not omit to mention the operation of fertilisation. As usual in all the Orchideæ, the fertilisation of the seed rarely takes place without external intervention; in order to insure a good crop, the cultivator must impregnate each blossom which he wishes to produce a pod. It is an easy operation, however, consisting merely of pressing the pollen on the stigma.

"Vanilla, Aloes fibre, sugar, are the industries common to the Mascarene Islands; all the rest of which we now proceed to speak are limited almost exclusively to Réunion.

"Coffee has been for a long time a source of

riches to Réunion; unfortunately a fungus (*Hemileia vastatrix*) allied to mildew, has within the last few years attacked the leaf of the coffee tree. The attack of this parasite first shows in a minute yellow point, enlarging by degrees till the whole leaf is yellow, when it tumbles off and brings about the destruction of the tree. The agriculturists seem little disposed to meet this pest by the scientific means which succeed so well against mildew. Imbued by preconceived ideas, they prefer to give greater vigour to the plant by means of liberal supplies of manure, and they allege that good results are obtained. It is well-known that efforts of the same kind tried in France to resist the disease on the Vines have only retarded the death of the plant. The *Hemileia* is a terrible disease; at Ceylon, for instance, where it is called the 'leaf-disease' (*maladie de la feuille*), all the coffee plantations have been devastated to such an extent that the inhabitants of Ceylon have nearly altogether abandoned the cultivation of coffee for that of tea; so vast a change of cultivation cannot possibly occur without suffering enormous losses.

"The Cassava meal or starch industry (*industrie féculière*), also gives very good results at Réunion. 'The development which the starch industry admits of in this island, is such that we do not hesitate to class it as second in rank in the order of importance,' so writes M. Ed. du Bouisson in his *Agricultural Industry of Réunion*. Starch and tapioca are extracted from the Manioc, *Manihot utilisima*, Pohl. This industry already employs two very important mills in Réunion. They extract the fecula from the root, which contains about 20 per cent. of its weight of this article of commerce. Its cultivation is very easy, and the amount of the yield is calculated at 42,100 kilogrammes of fecula per hectare.

"The *Manihot utilisima*, or Manioc, is one of the Euphorbiaceæ which seems to be a native of oriental and intertropical Brazil. M. Alphonse de Candolle, to whom it is always safe to refer, for the origin of cultivated plants, says:—'If we are unwilling to accept this origin in oriental, intertropical Brazil, we must have recourse to two hypotheses: either the cultivated Maniocs proceed from one of the wild species modified by cultivation, or they are forms which exist solely by the action of man, after the disappearance of their kindred forms of spontaneous vegetation.' (Alph. de Candolle, *L'origine des Plantes Cultivées*, p. 50.)

"However this may be, it was on August 14, 1741, that Mahé de Labourdonnais, the great benefactor of the Mascarene Islands, then Governor of the Isle of France, introduced the Manioc into that French colony. This plant met with a very bad reception. He (Mahé de Labourdonnais) brought from Brazil the plants of Manioc, which he distributed to the inhabitants and it succeeded wonderfully. But some black people who had stolen the roots of this plant, having eaten them without duly cooking them under the ashes, died from their poisonous effect. Labourdonnais, naturally much alarmed, selected M. de Reine to manufacture some flour from the Manioc and Cassava. He sent to him, together with the memoirs of Père Labat, a root of Manioc, a basin, and a plate, and ordered him to make some cakes of Manioc flour. M. de Reine succeeded completely. Labourdonnais then invited to Mon-Plaisir (his residence), a large number of colonists, ate the Manioc cakes in their presence, and made them eat some too. This celebrated repast took place on the day following the Christmas Day, 1741. Labourdonnais, as well as Messieurs Bouloc, Haché, Bernage, De Ponsy, and others, embraced M. de Reine in their transports of delight. Labourdonnais gave orders to have these Cassava cakes distributed gratis every morning at the bazaar, or market, and, by degrees, after a little time the colonists and blacks became accustomed to use them.

"At the present day the Manioc is completely naturalised; its roots serve for nourishment to man and beast, and the féculière (starch) industry at Réunion is on the way to complete prosperity."

NEW OR NOTEWORTHY PLANTS.

Oreopanax Sanderianum, Hemsl., n. sp.*

This is a very striking plant, similar in habit to the familiar *Fatsia papyrifera*, and a member of a genus rather numerous in species of a highly ornamental character. They inhabit the mountains of Central America and western South America, and are mostly remarkable for their graceful habit of growth. Usually, the slender stem is unbranched, and crowned with a tuft of drooping leaves. The present species, *O. Sanderianum*, was imported from Guatemala by Messrs. Sander & Co., of St. Albans, and they inform me that it was obtained from the district in which *Oncidium splendens* is found, but I do not know exactly where that is. In the Kew Herbarium, however, there are excellent flowering specimens, collected by Mr. Osbert Salvin, F.R.S., about twenty years ago. They were collected on the Volcan de Fuego, at an elevation of about 3800 feet, and my description below was mainly drawn up from them.

The leaves on young plants are very uniform in size and shape, but they present a great variety in form on the flowering-branches, a character exhibited by many other Araliaceæ. In the young plant they are nearly equally three-lobed, the lateral lobes being nearly at right angles to the terminal one, and a foot or more from tip to tip. They are tough and leathery in texture, of a bright, glossy, somewhat yellowish-green on the upper surface, paler beneath, and traversed by three principal ribs, radiating from the point at which the long petiole is peltately attached, about half an inch within the basal margin. The leaves on the flowering specimens present every gradation, from the equally three-lobed shape, to perfectly heart-shaped, without any trace of lobing, and the petiole in the latter shape is continuous with the blade, instead of being peltately attached. The leaves, intermediate in shape, have the petiole peltately attached, but nearer the margin than in the equally three-lobed leaves of the young plant.

The flowers are very minute, and collected in little globose heads, arranged in large racemose panicles of a pyramidal outline, borne at the ends of the branches. *W. Bolting Hemsl.*

[The plant was described, but no name given to it, in our columns January 9, 1892, p. 50, and it was shown for the first time at Earl's Court last week among Mr. Sander's new plants. *En.*]

Dendrobium × Nestor, new gard. *hyb.* (PARIKHII ♀, SPERDIUM ANOSMUM (DAYANUM) ♂).†

The parentage of this pretty hybrid is distinctly visible in its flowers, but the colours of both parents

* *Oreopanax Sanderianum*, Hemsl., n. sp.—Species distinctissima, fere omnino glabra; foliis variabilibus æqualiter trilobatis obscure lobatis vel distincte cordiformibus, petiolo prope marginem petiolatis affixo vel foliorum superiorum cum lamina continuis; paniculis terminalibus. Arbuscula ramulis floriferis crassis dense foliatis. Folia glaberrima, maxime coriacea, longissime petiolata, plantæ juvenilis omnia æquiter trilobata (lobis longe acuminiatis lateralibus insigniter divaricatis), circumscriptiōne fere ovalia dimidio inferiore semiobovata, pedem ultra alta, tri-nerviata, supra limbo viridia, nitida, subtus pallidiora, fere glauca, petiolo tereti basi apiculis incrassatis 8–9 poll. longo, semper circiter semipoll. intra lamina marginem petiolatis affixo; foliis ramulorum floriferorum minorum, trilobatis obscure, lobata vel vere cordiformia, varie internerviata, petiolo cum lamina continue vel vis intra marginem inserto. Flores purpurei (vis lineam diametro), difidui vel polygami, capitati (capitula circiter 3 lineas diametro), apiculis breviter pedunculatis racemose paniculatis; paniculis terminalibus, puberulis, 1–1½ ped. longæ, erectæ, rigide, pyramidales, simplicis. Flores masculini tantum visi; petala, ut videtur, calyptratum decidua; stamina 5.—*Oreopanax*, spp. 19 and 20, *Biologia Centrali-Americana*, Botany i., p. 575.

† *Dendrobium Nestor*, new gard. *hyb.* (PARIKHII ♀, *Speridium anosmum* ♂).—Stem terete, slightly thickened at the joints, stoutish, but inclined to be pendulous. Leaves 2 to 3 inches long, oblong-lanceolate, acute, deciduous. Flowers solitary or in fascicles of two or three, each flower 3 inches in diameter. Sepals oblong-lanceolate, acute, ½ inch broad; petals ovate-oblong, ¾ inch broad; lip ovate-acuminate, the basal portion folded over the column, the edge and surface pubescent. Column white, with a crimson anther-cap. Colour rose-lilac, with large dark purple blotches at each side of the middle of the labellum, and purple lines at the base. Raised and flowered by Chas. W. Wain, Esq., The Uplands, Selly Hill, Birmingham. *James O'Brien.*

being similar, the difference from *D. superbum* anostomum is not sufficiently marked to at once catch the eye of the casual observer. Examination, however, discloses the fact that this hybrid has the pseudobulbs shorter and thicker, and with a tendency to project more horizontally than in that drooping species. The flowers, too, have the firm texture of *D. Parishii*, and its glossy surface to the sepals and petals. It is a good companion to the pretty *D. polyphelebium*, Reich. f., illustrated in the *Gardeners' Chronicle*, August 31, 1889, and which I regard as a natural hybrid between *D. Pierardi* and *D. Parishii*. The expanded flowers of *D. x Nestor* are 3 inches in diameter, the sepals and petal white, tinged with rosy-lilac. Lip white at the base, streaked with

spreading, glabrous. Corolla campanulate, about half an inch long, and three-quarters of an inch in expanse, rough outside and inside, from being covered with papillae, which are most dense on the inner surface, otherwise quite glabrous, and destitute of a fringe, or of clavate hairs in the tube; the inside is of a uniform blackish-purple. Outer corona of five short transversely oblong emarginate lobes, not adnate to the base of the corolla, purple-black. Inner corona of five erect lobes, three-quarters of a line long, deltoid-subulate, with a transverse ridge on their shoulder, blackish-purple.

This plant was discovered by Professor O. Penzig, the Director of the Botanic Garden, Genoa, in

BOUVARDIAS.

For general usefulness, freedom of flowering, and value for affording cut bloom during a season when it is invariably scarce, there are no plants that deserve more attention and extensive cultivation than the *Bouvardias*, of which there are now so many varieties. The species are chiefly natives of Mexico, and one or two of these are very beautiful, the most noteworthy being *B. jasminiflora* and *B. Humboldtii corymbiflora*. The first mentioned is a very dwarf-growing species, and produces long tubed flowers, resembling, as its name implies, those of the *Jasmines*. *B. Humboldtii corymbiflora* is not so free blooming, but it is a fine species, and bears pure white long tubular blossoms. Sprays of these are of great value for working up into bouquets. From these two and some few others have originated most of the varieties we now have. It may, perhaps, be as well to give the names of a few of the best and most distinct among them, so as to guide those about to make selections, as this is a good time to purchase and start with the plants, although their propagation would be all the better if carried out earlier; but cuttings put in now will give very useful-sized stuff. The one that has become the most popular with those who cultivate for market is *Alfred Neuner*, which is exceeding free and floriferous, having white double blossoms, with just a faint shade of pink, which disappears, and leaves the white pure. Brilliant, as its name indicates, is a bright crimson, and it is a free-growing kind, with close branching habit. *Dazzler* is another of the bright-flowered varieties, the blossoms being a rich scarlet, and are produced in dense clusters on a close bushy plant. *Elegans* is also a scarlet, and so is *Hogarth*, and both are fine, free, and good. Among those of different shades, *Maiden's Blush*, *Queen of Roses*, and *President Garfield* are the most desirable, the first mentioned being a blush-rose, the two latter rosy-pink. *B. Vreelandii* is a pure white, and the plant flowers with great freedom; the blossoms have long tubes, and are light and elegant in appearance. Excepting the species mentioned, *B. jasminiflora* and *B. Humboldtii corymbiflora*, *Bouvardias* are, unfortunately, scentless; but it is remarkable that the hybrids of these two species should be so, as qualities of whatever kind are generally transmitted in a more or less degree.

Besides being free seed-bearers, and readily increased in that way, *Bouvardias* strike easily from cuttings, but the cuttings must be young, as when they become hard and woody, they are difficult to root. This being so, the freshly-formed shoots should be taken when about 3 inches long, and made in the ordinary way by trimming off the lower leaves, and cutting immediately under a joint, when they should at once be inserted in light sandy soil, around the sides of small pots, as most cuttings strike better when they are so placed. To get them to root, it is necessary to stand them in a close moist heat, such as that afforded by a propagating-box in a stove, or a handlight under the same structure, and in a month or so from the time of making them, they ought to be ready to pot. This should be done in small 60's, the soil most suitable being about equal parts peat and loam or leaf-mould and loam, with just sand enough to keep the whole open. After the potting, the best situation for the plants is a gentle hot-bed frame, where they can be kept close for a time to give them a start. As soon as they begin to grow freely, the points of the shoots should be nipped out, and when they break again, less warmth will be required; and during summer, may be taken off in the daytime. Some plant the plants out, and report them in the autumn. The better way, if this is done, is to plant out in prepared frames, as they can then be covered in bad weather. There can be no question that the more the plants are exposed under favourable conditions, the sturdier they become, as the shoots they make are firmer and fully matured.

If planted out, they should be lifted again and reotted in September, and then stood in a close warm house or pit, where they can be freely syringed.

FIG. 103.—SPECIMEN BOUVARDIA.

purple, which at each side of the median portion of the lip merges into a large bright purple blotch, the margin and front of the lip being pale rosy-lilac, like the petals. The edge and surface of the lip is pubescent, and the flowers have an odour resembling medicinal Rhubarb, a peculiarity which is common to this section of *Dendrobie*. It was raised and flowered by Chas. Winn, Esq., at The Uplands, Selly Hill, Birmingham. *James O'Brien*.

HUERNIA PENZIGII, n. sp.

Stems 2 to 3 inches high, stout, five-angled, the angles very strongly toothed, the teeth being three-eighths of an inch or more long, ending in a fine subulate point, glabrous, green, variegated with purple. Cymes sessile, four or more flowered. Pedicels a quarter of an inch long, glabrous. Calyxlobes subulate, three-eighths to half an inch long,

Gheleb, Abyssinia, in April, 1891, and was introduced by him into cultivation the following month in the well-known garden of T. Hanbury, Esq., at La Mortola, where it flowered in October last, and whence a specimen, accompanied by an excellent drawing, was sent to Kew in December last by Mr. G. Cronmeyer, the head gardener at La Mortola. Specifically, the plant is allied to *H. oculata*, but it is at once distinguished by the colour of the flowers, which are destitute of the smooth white area at the base that renders *H. oculata* so conspicuous, being uniform in colour, and rough inside quite to the base; they perhaps more nearly resemble the flowers of *H. aspera*, but the stems are quite different. I think it probable that *Schweinfurth's* No. 227, collected at Erkauit between Suakim and Berber, in September, 1868, belongs to this species, but the specimens are without flowers. *N. E. Brown*.

Although *Bouvardias* will stand much heat during winter, a temperature ranging from 55° to 60° is the most suitable, as the flowers will then possess more substance, and will last longer when cut. After flowering, the plants should be kept a little dry, to rest them. If large plants are required, then, some of the old ones must be saved, and when they start again, be shaken partly out, and fresh potted, the treatment requisite being the same as that for the young ones. The insects that most affect *Bouvardias* during the summer are green-fly and red-spider, but free syringing will prevent the last-mentioned, and bedewing with tobacco-water will settle the aphid. In the stove the plants are subject to bug, which should be watched for, and got rid of before any flowers open, or they will spoil the whole truss. *J. Sheppard.*

ALOE ARISTATA.

WHAT an interesting little plant this is!—though introduced so long ago as 1801, how seldom met with outside a botanic garden. However, as it is by no means a common plant—in fact, I have never met it in South Africa but hereabouts (Orange Free State) and invariably facing south (our shady side), indeed, it is this peculiarity that I wish to mention as being so different to any other species of *Aloe* known to me. As a rule, they are seen in full sunlight and exposure, whilst this species is never found except in shade, its favourite position being on the very edge of dangerous precipices, with an overgrowth of evergreen shrubs to screen it; nor is this its only peculiarity in these positions, it always receives good drainage, hence, what I will call form No. 1 is found—a half-expanded condition of its leaves. Though the same species, form No. 2 grows in full sun and exposure (as in a box over my head on house-roof whilst writing). This form assumes a spherical outline, the leaves being as regularly incurved as is found in a good bloom of an incurved *Chrysanthemum*. Form No. 3 grows in dense shade, and wet clefts between rocks, in narrow mountain chasms, where water is constantly dripping over it. In this position it assumes a bloated condition, if one likes to think so, yet here the finest rosettes of foliage are to be seen, the leaves being as strictly reflexed as those of form No. 2 are incurved, and present a beautiful imbricated appearance. Not only this, for whilst the raceme in form No. 1 and 2 is always simple in their exposed sites, with from thirty to fifty cylindrical drooping flowers about 1 inch in length, of an orange-red colour, raceme of form No. 3 becomes branched, and produces an inflorescence altogether larger and of richer appearance than the same plant under the two former conditions. The singular beauties of this plant are rather difficult to describe, but being of pygmean proportions—so unlike most of our other *Aloes*—of easy growth, each leaf so singularly awned, and varying so much under different treatment into perpetual beauty and interest to recommend it, constitute a plant that should be better known.

I have often wondered at the hard and fast rules so pointedly laid down by some of our best authorities regarding the correct treatment of plants; for my own part I say cultivate *Aloe aristata* under all these conditions as stated above—all are recommendable, yet so different. This reminds me of a beautiful white-flowered *Sedum* we have in the mountains here, growing in sandstone rocks which have become worn and disintegrated by long years of exposure, so much so, that large basins are formed in them, frequently 2 feet in depth; in these cavities a little drift-sand and dust congregate, and in our rainy seasons these cavities become receptacles for 12 to 24 inches in depth of water, which has no means of escaping except by evaporation, often months, under these conditions—a perfect antithesis to what is supposed to be necessary for their existence. These plants not only exist, but flourish amazingly, and so soon as the water has evaporated, become a perfect sheet of floral beauty. These plants, in both cases, being strictly succulent, I suppose we must

look upon them as exhibiting a perversity of plant nature—however, such are the facts. *W. Nelson, Johannesburg, Transvaal, Feb. 25, 1892.*

ERIDGE.

ERIDGE CASTLE, the Marquis of Abergavenny's Sussex seat, is most pleasantly situated, and surrounded by characteristic English scenery—rolling hills and dale, wood and water—and is about two miles south of Tunbridge Wells. The view from the south front is really magnificent. The open park trends here gently to the lake—a splendid piece of water, with so little of the artificial perceptible in its formation as to be readily accepted for what it was intended to represent—a natural lake.

Looking over the lake, and slightly to the left, the eye has a wide range over the extensive deer park, which rises from the lake in a rather steeper slope. This is fairly well timbered, but in many places—and this, I think, constitutes its chief charm—occur open glades of considerable extent, which are closely studded with Gorse, Heath, Broom, and Bracken, with the long, grey, withered Bent-grass as a ground-work. Still looking beyond the lake, but more in front and to the right, rises a hill of considerable abruptness and altitude, on the top of which stands a land-mark of great historical interest, viz., Saxonbury Tower, marking the scene of a sanguinary conflict waged by the Saxons and Danes at a period long anterior to the Norman conquest. Coming now more directly to the gardens, we here find everywhere and everything in that state described as Apple-pie order, and is only what we should expect where a man of Mr. Rust's well-known abilities has charge.

The kitchen garden, which is surrounded by substantial brick walls, contains over 2 acres. One noticeable feature in this was the entire absence of large trees. Pyramids, espaliers, bush, or cordons, being the only fruit trees, and these skirt the boundaries of the vegetable quarters, the other fruit trees being confined to the garden walls and the orchard.

The soil here is not naturally very fertile, being largely composed of a cold sandy clay, which overlies the sandstone rock; yet, if proof were needed of the possibility to grow first-class fruit on this soil—lying too as it does between 300 and 400 feet above sea-level, Mr. Rust can furnish it in the shape of a beautiful bronze medal he secured at Edinburgh, last autumn, at the fruit show of the Royal Caledonian Society, for his excellent collection of Apples and Pears he there exhibited.

Passing now into the fruit and plant-houses, which are here rather numerous, we find everything in keeping with the general order and neatness elsewhere observable. Early Grapes had had their floral thinning, and were promising a heavy crop of bunches, and the foliage was of ample proportions and substance. The succession vineries, with Vines in various stages of development, looked also very promising. The early Peaches, remarkably healthy and vigorous, had set heavily, and succession houses were, like the earliest house, in capital order. There are several plant-houses, some of which are entirely devoted to supplying cut blooms, and others, amongst them one devoted to tall Palms and other ornamental subjects, the inmates of which are almost in constant use for table and indoor decorations. I could not help observing how fortunately Mr. Rust was situated regarding that most useful adjunct to a garden—a frame ground. This is, in too many establishments of the present day, a thing in name only. Here I found it provided, as it always ought to be, with rows of well-built, well-glazed brick pits, in which stood excellent and promising crops of early vegetables, and the hundred-and-one things so well understood by the really practical man.

Passing on now to a part of the grounds reserved for memorial trees, in which Mr. Rust apparently has especial pride, we are at once struck with the number, variety, and beauty of these young Coni-

feræ, which here show off their various glaucous tints and brilliant sheen of foliage to perfection, as if they had here found their element in the damp, cold clay soil of this district.

I cannot pass from this part of the grounds without mentioning how well adapted this soil is to growth of Portugal Laurels, judging from two enormous specimens on the north lawn. These, I may say here, are allowed to grow in a natural manner, and have never been maltreated with shears or knife. We measured both of them, and found one to be exactly 300 feet in circumference, a diameter of 33 yards = 100 feet; the other was only a few feet—12 feet—short of this diameter. This plainly shows what a beautiful object a Portugal Laurel may become when given room and left alone as they should be, as we were informed these trees set annually enormous crops of berries. I need scarcely say how well the Rhododendrons and hardy Azaleas grow and flower here. They are planted in thousands, and their robust growth and plump flower buds show the suitability of the soil and the climate.

I came away highly pleased with my first visit to Eridge Castle, pondering, as I walked, on the agreeable relations existing between employer and employed, and wished in my heart that such relations were oftener met with. *Pomum.*

SWEET CHESTNUTS.

WE take the following condensed extracts from some reports on the cultivation of the Spanish Chestnut published by the India Office. To these reports Sir George Birdwood prefixes an historical note as interesting as it is erudite. We trust so valuable a document will not be suffered to remain concealed in an official government publication, but that it will be published separately.

The Chestnut tree is a native of Central Asia, or, as this term has now a specialized political significance, it would be better to say, of Middle Asia; its natural habitat extending along the lower slopes of the Tian-Shan and Kuen-lun mountains, and the Hindu-Kush, Elburz, Caucasus, and Taurus ranges. From Anterior Asia it was carried westward into Southern and Central Europe, within the period of the occupation of Greece and Italy by their ancient Aryan populations. The prehistoric forest trees of these countries were the same as those of Central and Northern Europe at the present time.

But with the advance of the Aryan immigrants into Greece and Italy, these now characteristically trans-alpine tree forms were driven out before the new comers into the defiles of the Dalmatian mountains and Mount Hæmus, and the higher recesses of the Apennines, and across the Tyrrhine Sea to their isolated refuges in Corsica and Sardinia; while in the course of the commerce of the Phœnicians, and the conquests of the Persians, Greeks, Romans, and Arabs, the deciduous northern flora of prehistoric southern Europe was gradually supplanted by the subtropical evergreen flora of Syria, Persia, Asia Minor, and India.

I have enumerated but the noblest of the forest and orchard trees, and the loveliest and most odoriferous of the flowers of Anterior and Southern Asia, and only the most striking of the American vegetable forms, the naturalisation of which in Southern Europe has, in the process of the centuries, changed the plant physiognomy of the whole of this classical region from the character indicated by the Pompeian frescoes to that represented in Claude's serene, Salvator Rosa's stormy, and Turner's glowing landscapes: for to cite trees and flowers of less distinction, and inconspicuous pot herbs and sweet herbs, would be to merely enlarge indefinitely a list already long enough to justify the anticipation that beside the Chestnut tree there may be several other timber and fruit trees popularly regarded as aboriginal natives of temperate Europe which would find a congenial home in Northern India; and, conversely, that there are many more plants truly

indigenous to India, and the East Indies generally, awaiting successful acclimatisation in Southern, and even some parts of Western, Europe, as those first introduced by the Phœnicians and the Arabs.

The success of the acclimatisation of exotics from all parts of the subtropical and temperate world in every part of India is truly wonderful, and quite incredible to those unfamiliar with the history of the migrations of plants. It is the simple fact that most of the cultivated cereals and pulses, and oil seed and dyeing plants, and fruit trees of India are of foreign origin, and that very many of them, notably the Custard Apple, Sour-sop, Bullock's Heart, Pommelo, Cachew Nut, Guava, and Pineapple, were introduced by the Portuguese. These fruit trees constitute, in fact, the permanent endowment of the people of India by their Portuguese conquerors. The Pomegranate and Citron, and probably the Vine, with several Egyptian and other African plants, were introduced by the Arabs; while the numerous examples of the flora of farther India, the Indian Archipelago, and China, found in India, were possibly brought into the country by the Buddhists, who were certainly instrumental in gathering together around their monasteries the handsomest wild fruit and flowering trees and shrubs from all parts of the prolonged Indian peninsula itself. The marvellous transformation of the flower gardens in India during the last 200 years has chiefly been the work of the English, supplemented, as regards Chinese flowers, by the Paris. Now Western India is, as well in Parsi and Hindu as in English gardens, "a wilderness of Roses," and it would take up far too much space to name all the other exotic flowers from the West Indies and Mexico, and from South America, from the Mediterranean countries, and Arabia and Persia, from Eastern and South Africa, from the Indian Archipelago, and China, and Japan, and from Australia, that have since the time of Fryer (1698) gradually become perfectly naturalised in Western India. In recent years, Sir Edward Buck has naturalised the Apple tree in several localities of the lower Himalayas, while in other localities in Southern India, the Australian Casuarinas and Eucalyptus trees have, under the care of the forest department, flourished so luxuriantly as to entirely destroy the historical type of the landscape of which they now form the predominating features.

Hazel-nuts or Filberts (Noix de St. Philibert), Walnuts (Wälsche nuss, i.e., "Foreign Nut"), and Sweet Chestnuts (Chesten, Chastaignes, from *Kaeravala* or Castanea in Magnesia), with Almonds (amande, mandola, amygdala), would all appear to have been exported together from Anterior Asia into the islands and mainland of ancient Greece, and thence into Italy and Spain. It may be accepted that the cultivation of the Chestnut tree was introduced into Italy between the time of M. Porcius Cato, n.c. 234-149, and of Virgil, n.c. 70-19. Virgil is the first Latin writer to unequivocally refer to and describe them both under the name they have ever since borne in every European language, i.e., Castanea.

Athenæus, writing *circa* a.n. 230, in his "Deipnosophists" of Nuts, gives a great deal of curious information regarding the earlier synonyms of the Almond, Walnut, and Chestnut, which is the basis of this branch of our knowledge of the archaic history of these trees and their fruits; and there has been, in short, nothing written regarding them since Pliny and Athenæus, but is almost entirely taken from these delightful authors, whose works ought never to be out of the hands of the students of the natural economic productions of the Old World.

The only other classical authority on the subject necessary to mention after them is Palladius R. T. Emiliæus, of the 4th cent. A.D., a mere copyist in all practical matters relating to agriculture of Columella, but who has thrown his information into the always attractive form of a Farmers' Calendar. Under the months of February and November, he gives full directions for the cultivation of the Chestnut.

The celebrated Chestnut tree on Mount Ætoæ, when measured 100 years ago, was 190 feet, while in 1850 it was 204 feet in circumference; a rate of growth which, if it has been at all uniform, would throw back its first germination to the time of Palladius, if not to the Augustan age of Rome.

(To be continued.)

PROFITABLE FRUIT GROWING.

"POMUM" is quite right in saying that this is very largely a matter of selection, cultivation, and management. His opening remarks on these are admirable. Still, there are other points almost equally vital to a vigorous extension of profitable fruit growing in all directions. Among these, the question of rent, security of tenure, and the ownership of the trees or bushes planted, stand out prominently. Perhaps the first is the least of these three difficulties, though a general opinion prevails throughout the rural districts that any general forward movement in fruit growing will be followed by a substantial and general rise in rents. The wild and random statements about possible profits have doubtless strengthened and extended this feeling. So far as it is real, it also rests on this solid basis, that generally the best soils and sites are chosen for fruit culture, and these will naturally in the future as they have always in the past, command the highest rents.

Neither has the future of fruit culture so much to fear in this direction as many suppose. For after all rent is probably the least costly factor in the expenses of the production and distribution of fruit crops. Labour, carriage, skill, manure are far more expensive. Among fruit growers generally, there seems every desire that the parties interested in the rent or value of land should have their due.

But security of tenure for such valuable property as fruit trees and bushes is vital to success. With all our modern methods of hastening and heightening fertility, fruit gardens and orchards need time to develop their full profits. Short tenancies, or tenancies at will, from year to year are wholly unsuitable for such stable and fixed enterprises on the land as profitable fruit growing, and yet it is not uncommon to find occupiers who have invested almost their all on these insecure terms. Others have longer leases and more stable security against disturbance, so as to afford time for them to reap the profits of their planting.

But in urging the labourers to adorn their cottages, and at least partly crop their gardens, allotments, and small holdings with fruit trees, the answer has often been, "Where's the use, we are but weekly or monthly tenants, and then whose shall these things be that we have planted?" This sense of insecurity in regard to rural life and home, which is driving so many of our best young men and women into the towns, is proving a formidable obstacle to the profitable culture of fruit by the labourers, mechanics, and other small occupiers of land. This leads up to the ownership of the fruit trees and bushes. The only solution of this semi-legal question likely to satisfy those most interested may be formulated thus: Those that plant shall own and have the power of removal. It will be noted that the new Small Holdings Bill just through committee contains a clause to this effect. This clause will probably stimulate and encourage small growers to profitable fruit growing to a far wider extent than its framers anticipated.

There are few notions that small occupiers have clung to more tenaciously than their right of property—as they hold it to be—in every flower, bush, or tree they have planted in the land. Hence, peripatetic tenants were constantly found carrying their garden treasures with them, against the law. But when it came to young trees and fruiting bushes, the law not infrequently stopped them, to their astonishment and disgust; and reports of such incidents spread far and ran wide. And now the law is brought up abreast of general rural sentiment, and the trees and bushes are declared to be the property of the planters, labourers will plant with avidity the first opportunity.

The Small Holdings Act also contains compensation clauses for fruit trees, and if these can be readily and cheaply applied through district or county councils, the rights and privileges of ownership to planters would be established beyond civil or dispute—not that, as a rule, many well-established trees would be removed by fruit-growers; but the right to do so being acknowledged by law, would greatly facilitate arrangements for compensation. The existing law provides for this, where written permission to plant is held from the landlord by the occupier. But those most intimately acquainted with the unwritten laws and customs of rural life will be least surprised to learn that such permission in writing is seldom asked, and less seldom granted. On the other hand, many humane and liberal landlords seem disposed to meet their tenants more than halfway in these matters, by either furnishing their smaller tenants with trees gratis, or at specially cheap rates. While yet others have gone further, and sent their skilled gardeners to select and plant the trees most likely to succeed in their district.

Thus by the removal of obstacles, as well as affording special facilities for the planting of fruit trees by small occupiers and owners, as well as by the wider diffusion of knowledge in pamphlet, paper, or book, a powerful stimulus will be given to those who need it most, to grow manifold more fruit for their own use as well as for money profit. Again and again during my lectures in different counties this urgent request has been made to me by clergymen and landowners, "Why don't you publish an epitome at least of each lecture or your lectures singly in full, and supply us with them at a cheap rate for distribution broadcast throughout our parishes and districts?" Only in this way they seemed to think could every householder be enabled to do his best in the new and yet oldest of all industries, of fruit, flower, and vegetable growing for profit. It is gratifying to find "POMUM" virtually advocating the same views in the *Gardeners' Chronicle*, which has already done so much and so well in all these directions. D. T. F.

FORESTRY.

THE HOME TIMBER TRADE AROUND LONDON.

DURING the past year, the prices of home-grown timber were fairly well maintained; indeed, the stagnation in the timber trade that has been so much felt of late years would seem to be gradually giving way, and very fair prices for timber of good quality are now readily enough procured.

Oak of large size, clean, and free from ring-shake, can readily be sold at 2s. per foot, while that of ordinary quality fetches 1s. 8d., and the general run of trees, 1s. 6d. per foot. Elm, unfortunately, like Scotch Fir, is almost a drug in the market, and I have had considerable difficulty in getting even 7d. per foot for large clean trees. The demand for Elm for coffin making, &c., should, one would think, raise the prices of clean timber of this kind, but such is not the case, a fact to be largely attributed to the great numbers of Elm trees that are to be found everywhere throughout the southern English counties. Ash, on the other hand, if clean and well-grown, may be sold at 1s. 8d. to 2s. per foot, but the demand is often very much affected by local circumstances, this being one of the few trees of this country that can be utilised by the home joiner for many farm and estate purposes.

For Larch there is a growing demand, and large straight trees find a ready market at prices ranging from 1s. 3d. to 1s. 6d. per foot. Other Firs, Scotch, Spruce, Silver, the Austrian, and the Corsican, may be got rid of at a low figure, say, 6d. per foot; but the demand for such is not great, though greatly on the increase for the past twelve months.

Sycamore is not very plentiful, and ranges in price with the size and quality of the wood, from 1s. 6d. to 2s. 6d. per foot. Spanish Chestnut does not, if of good quality, remain long on hand, the general prices being 1s. 6d. or 1s. 8d. per foot. Birch, Alder, and

Beech may be said to rank as one, so far as value of wood is concerned, and about 8d. per foot may be given as a fair price.

The system of coppicing used to be wonderfully profitable some five-and-twenty years ago, but now the produce of even first-class plantations is by no means readily disposed of. The Hop trade regulates the value of copse wood largely, as for stakes for training such the demand is good when the crop is extensively cultivated. Unfortunately, of late years, owing to the great decline in Hop growing, coppice wood has fallen in price fully one-fourth, that of the best quality having been sold at as much as £20 per acre, whereas now, it is with difficulty that £6 per acre can be procured.

Faggots, large, bring 12s. per hundred on the plantation, but the demand for them is falling off; the little bundles of split batten ends, as now sold by most grocers, are now slowly but surely ousting the native produce from the market. A large dealer in these, and who supplies the Government houses, told me lately that he does not now sell hundreds where thousands could readily be disposed of some years ago. Small faggots (pimps, as they are called in England) may be bought at from 2s. 6d. to 3s. per hundred, but the demand for these is slowly on the wane. The above prices may be taken as a fair standard, particularly in Kent and the surrounding districts. A. D. W.

THALICTRUM RHYNCHOCARPUM.

WHILST it is generally conceded that all the *Thalictrums* are beautiful and interesting hardy plants, it occurs to me that I have only seen the subject of this note mentioned in the *Gardeners' Chronicle* on one occasion. This seems to me inexplicable, for it is surely to my mind the most elegant of the numerous species of this genus with which I am acquainted. Though its large pinnatifid inflorescence cannot be considered showy, it is nevertheless of exceeding interest, consequent on its fruits being borne on long fragile stalks, which have not only a novel, but exceedingly neat appearance, the plant reaching, as it does, some 3 feet in height, whilst its foliage is of the most charming description, resembling one of the finer forms of Maidenhair Ferns. To be successful in the growth of this plant, a constantly semi-shady moist position is requisite, as much sunshine is simply fatal to its well-being. This is probably the point that has been overlooked by cultivators at home, for, in its native habitat, it is never found but in rather dense and constant shade, and invariably near to water, where it assumes a semi-climbing habit. I imagine it must not be treated as a hardy plant; generally in England a cool fernery, with exactly similar cultural treatment to what the Ferns require, would suit this fine subject exactly, and I am sure, when once seen in good condition, its decorative value—more especially as a table plant—would pronounce it a real acquisition at first sight; but to try and cultivate it under the same conditions as some of the common and more hardy species would end in failure. Given similar conditions to which it revels in here—a cool shady fernery, in or outdoors—it would simply grow like a weed without any trouble whatever. Wm. Nelson, Booyens, Johannesburg, Transvaal, February 25, 1892.

THE WEEK'S WORK.

THE HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener, Moreworth Castle, Maidstone.

STRAWBERRIES.—The heavy rain which fell on the night of the 25th has benefited these plants, and the earlier varieties are rapidly swelling their fruits. If large berries is the aim of the grower, the trusses should be thinned, more or less, according to the strength of the plants. Give the beds where the fruits are set a thorough soaking with liquid manure, and get nets in readiness to put

over them as soon as the fruits begin to change colour. It is best to put up some kind of framework on which to rest the nets, and sufficiently high to clear the leaves. Before putting any net on a bed, pull up all the weeds, and put the litter in order, so that the fruits are kept clean; and when the beds are netted, peg the edge of the nets down to the ground to prevent the ingress of birds. Now that the Strawberry plants are being turned out of forcing-houses, all such as are intended for planting should at once be planted, the plants needing no previous hardening-off, the abundant air that has been afforded them in the houses having been sufficient for that purpose. Let previous directions be fully carried out in preparing these for planting. Those who plant a few rows expressly for early runners should keep them free of weeds, and reduce the number of runners to eight on a plant.

MULCHING AND WATERING.—Late-planted trees, if large, must be well looked after, and if found to be dry at the root, they should be watered abundantly, so that growth be not stunted; and the lateral shoots should be allowed to extend themselves, and thereby force, to some extent, root action; and should much fruit have set, thin it severely. Cherries, especially, need be watched in this respect, watering them at the root, and syringing them overhead till they make fair growth. All trees whose growth is weak, or which may be heavily cropped, should be well mulched as far as the roots extend, with manure, or litter over which Thomson's Vine Manure, bone-meal, Peruvian guano, or other fertiliser is strewn. If the fertilisers are used without litter, prick it in 2 inches deep, and water the soil in the absence of heavy rain. Trees with no fruit, or but a light crop, and with a tendency to make strong wood, will require to have no manure given them.

ORCHARDS.—Apples on the Paradise are sometimes planted with the hope of fruiting them early, but regardless of their roots growing mostly at or near the surface of the soil, annual digging is practised, and the roots destroyed more or less—a kind of treatment that often results in the early death of the trees. Fruit growers would do well to dig but little, and mulch the soil over roots each year. Pears on the Quince should be mulched with manure, or have some kind of fertiliser strewn on the soil and pricked in.

FRUITS UNDER GLASS.

By J. RIDDELL, Gardener, Castle Howard, York.

THE EARLY VINERY.—Vines from which the fruit is cut should be thoroughly syringed to clean the foliage of dust, insects, &c. In case red-spider should have appeared on the leaves, these should be sponged or syringed with water in which flowers-of-sulphur is incorporated, which latter is easily done if a small quantity of water be put to the sulphur at first, and this be reduced to a thick paste, in which condition it can be mixed with the large volume of water. When the borders need to be watered, always make use of some of the manures specially prepared for Vines along with the water, so as to enable the plants the better to recover from hard forcing and fruiting during the summer time. By duly attending to this matter until the wood and foliage are mature, the energies of the Vines can be maintained at a maximum of productiveness for many years in succession. Keep the ventilators opened wide day and night, and only when mildew has to be guarded against should fire-heat be employed, that is, during foggy weather. On sunny days the borders and paths in the vinery should be sprinkled with water, and all superfluous growths kept in check by stopping them.

SUCCESSION VINES.—Where the Grapes are colouring, the Vines should be carefully attended to in the matter of ventilation, and especially to guard against the sweating of the berries, which is best prevented by affording the Vines more or less air continually, according to the state of the weather, and paying great attention to the amount of moisture within the house. Till the fruit is ripe, maintain the vinery at a normal temperature; and if the borders are getting dry, afford them a good watering in the morning of what promises to be a bright day; and then by keeping a fair amount of warmth in the heating apparatus, the surface-moisture will be well dried up before nightfall. Remove the young shoots from any Vines that are swelling their fruit, and afford the borders a liberal supply of diluted liquid-manure when they require watering. When the vines are closed in the afternoons, it is advisable to

moisten the paths, &c., with liquid manure, for although the ammonia from this is not absorbed by the leaves (?) it tends to keep insects in check, and a portion of it will find its way through the soil to the roots; but with such compounds as carbonate of ammonia for this purpose, the gardener should use much caution, or he may do more harm than good, especially if lime be present in quantity. From the present time a small amount of ventilation should be afforded constantly by the upper ventilators or lights, which will act as an invigorator and as a safety-valve.

LATE VINERIES.—Most of the bunches in these houses will be ready for thinning, and as some of the best keeping varieties are the most difficult to thin, they should be early taken in hand, and the operation continued till all are finished. The space to be left between the berries to suit all sorts and conditions of Vines, owing to the great variety of circumstances governing these things cannot be exactly defined. The size of berries, however, varies with the varieties, and from this fact comparisons may be drawn. The Black Hamburg being the most common variety grown, may be used as a standard by which to compare others; thus, for every four berries that are left on a bunch of this variety, only leave three on the bunches of Pearson's Golden Queen, Alicante, and Gros Maroc; and for every three of the Hamburg, leave two of Gros Colmar. Lady Downe's, Muscat Hamburgh, and Alwinck Seedling, have berries of much the same size as those of the Black Hamburg Grape, and may therefore be thinned to the same extent. Those Grapes which it is intended to keep for winter and spring consumption should be more severely dealt with than others, and all the berries which grow in the middle of the bunches must be removed. Should mildew make its appearance on any of the Vines, dust them with flowers-of-sulphur, and keep a gentle warmth in the hot-water pipes, a stagnant atmosphere favouring its development.

THE KITCHEN GARDEN.

By G. WYTHES, Gardener, Syon House, Brentford.

GENERAL WORK.—With the genial rains and warmth the growth of all kinds of vegetation is rapid, and the hoe requires to be in constant use in stirring the surface soil and destroying weeds. Great care is necessary in the use of the implement when hoeing between the lines of vegetables. Advantage should be taken of showery days to plant out Brussels Sprouts, Cauliflower, and to sow all kinds of small seeds whilst the soil is moist. The dressing of Asparagus beds with salt or some kind of artificial manure should receive attention; and such of the beds as are intended for forcing at an early period of the winter, should not have any more heads cut from them after this date; and on light or dry soils a top-dressing of old cow manure will be of assistance to the plants, frequently watering the beds in dry weather. The earthing-up of early Potatoes will now need close attention, so as to get the operation carried out before the stems get long.

Onions, Carrots, and other roots should now get their final thinning. Runner Beans, Scarlet and others, for late supplies, should be sown at this date. Well-mannered land is ordinarily good enough for these vegetables, but in light dry soils it is impossible to get the plants to bear well, unless trenches be thrown out, and manure dug into these as for Celery. A single row of seeds should be dibbled in a line down each trench after it is filled up and trodden firmly. The plants may be topped at 4 feet and made secure with Pea-sticks; or the plants may be topped at 1 foot high, but in that case the ground should be littered down to keep the pods clean. The sticks should be put to the early-sown Runner Beans, previously drawing the soil up to them on each side of the row. Slugs are, in some gardens, apt to be troublesome, and in such, soot or dry wood-ashes should be strewn over the plants when wet with dew or rain. Dwarf Kidney Beans may still be sown.

PEAS.—For late sowings, unless the ground is very retentive, the preparation should be similar to that for Runner Beans. Use plenty of decayed manure, which should be dug into a trench, which should be only filled in, in part, and when the plants are well above-ground, if the weather keeps dry, heavy waterings should be afforded them; indeed on dry land watering is necessary, even should heavy rains occur, or mildew will soon appear on the foliage, and the crop will be a poor one. The manure employed should be rich and succulent, and of such a

nature as will retain moisture for a long time. The new green wrinkled marrow *Succesa*, is a medium grower; *Ne Plus Ultra* and *Sturdy* are all of them good for this late sowing, the first-named was very good with me in 1891.

TURNIPS.—Seed should be sown in a cool part of the garden; choice being made of Veitch's Red Globe, a variety that keeps good for a long period of time, and which has very solid flesh.

SPINACH.—Sow the seeds in small quantities on cool soil or a partially shady border. Sow the seed thinly, or if it be old, sow thickly and thin out. The *Victoria Round-seeded* is a good variety for this sowing. A fortnightly sowing should be made of salad plants, sowing where the plants will remain till fit for use.

THE ORCHID HOUSES.

By H. A. BURNETT, *Orchid Grower, Highbury, Birmingham.*

Bright, warm sunshine, such as the past week has afforded, is a friend in this department, and, consequently, plants have advanced very rapidly; and, advantage must be taken of such weather by supplying warmth and moisture in abundance to the *East Indian* and *Dendrobium-house* Orchids. The inmates of these two houses will require to be free from insects, and to be given liberal supplies of moisture both at the roots and atmospherically; indeed, the floors and other spaces cannot be damped too often, providing the ventilation insures a gentle circulation of fresh air. *Calanthes* may have more water afforded now, but it must be done carefully, and the plants kept near to the light. At this season, when Orchids are in full growth, they derive considerable assistance from the ammonia arising from decaying vegetable matter placed in the houses, such as tan or tree leaves. *Cypripedium* must now have large supplies of water. *Phalopsis* also must have plenty, with an occasional dipping in weak liquid manure. Syringing overhead may be resorted to with good effect amongst the *Dendrobiums*, such as *D. Wardianum*, *D. nobile*, *D. Devonianum*, *D. Phalenopsis*, *D. Ainsworthii*, and others, when there is no danger of the young growths damping off. This is the best time to assist *Dendrobiums* with liquid manure, the growths being well up, and rooting freely. I know of no *Dendro* that is not benefited with a weak mixture during the growing season. The temperature of these two houses now should range from 70° to 75° by night, and from 75° to 85° or 90° by day.

THE CATTLEYA-HOUSE.—Plants in this structure are also moving fast. *Cattleyas* when growing delight in a good amount of sun-heat and light, but the house must at the same time be well ventilated, and much moisture supplied. A good supply of water will now be necessary at the roots, especially to those which are well advanced in growth. *C. Trianae* will have been repotted by this time, if not, they should be done at once, using pots in proportion to size of plant and good fibrous peat and sphagnum moss in equal parts, potting firmly. The most forward of the *C. Warnerii* and *C. gigas* are in flower. No good purpose can be served by keeping *C. gigas* dry, to make it flower after the growths are about 2 or 3 inches high; if the flowering-sheath is not there then, no drying in the world will produce it now; but the plant should be freely watered, to assist it to make a strong pseudobulb. The temperature in this house may range from 60° to 65° by night, to 75° by day, or even higher.

THE MEXICAN-HOUSE.—This house requires now to have much air and moisture; for, having no shading, it soon becomes dry. Plants of the *Epidendrum macrochilum* and *E. nemorale* sections do best here; but the rest are, for the most part, intermediate. Exception must be made to *E. vitellinum majus*, which is a cool house species, and *E. bicornutum*, which should be grown in the lightest and warmest part of the *Dendrobium-house*, and have occasional waterings with salt-water. It does best in small suspended pans. The proper temperature for this house is similar to that of the *Cattleya-house*.

PLANTS UNDER GLASS.

By R. MILNER, *Gardener, Penrice Castle, Swansea.*

CANNAS FOR THE CONSERVATORY.—Plants which were started in gentle heat and afterwards divided and potted, may now have their final shift

into 9 or 10-inch pots, employing as a compost the following:—rich turfy loam, three-quarters; decayed manure, one-quarter; and some sharp sand. Grow the plants in a cool pit, and keep them near to the glass, affording plenty of air in fine weather, so as to prevent the plants becoming weakly and drawn. When the pots are filled with roots, manure-water should be afforded once or twice a week, syringing the plants freely overhead, and on the underside of the leaves. During bright sunshine, if a slight amount of shading be used, the foliage will be preserved in a bright, fresh condition.

SAXIFRAGA PYRAMIDALIS.—When well grown and flowered, this is a pretty plant for the present season, and although it is quite hardy, yet to thoroughly develop its pyramidal spikes of white bloom, it should be grown under glass. This plant is propagated from offsets taken with a small piece of the stem attached, pricked off in light sandy compost, either singly in small well-crooked pots, or several together in shallow pans. A cold frame is a suitable place for striking the cuttings, and till roots are made, little or no water should be applied. When well rooted, the plants should be potted into well-drained 4's, employing as potting-soil rich loam, and sufficient sand to keep it open. In summer time the plants should be grown in the open air, and on the advent of autumn returned to a cold frame, where they should be wintered. About the middle of the month of March, the plants should be placed in a light position in a cool greenhouse, where they may remain till their season of flowering is passed.

NEPENTHES.—Any plants that require more root-space should be taken in hand forthwith, as during the next two or three months these plants will be in active growth. In potting them, the drainage should not be disturbed unless the roots have not become much entangled with the crocks, and the ball should be left intact. A good compost for *Nepenthes* consists of fibrous peat of the best quality which has had all the fine earthy matter shaken out of it, and mixed with sphagnum moss, charcoal broken into small bits, and a small quantity of silver-sand. When potting them, take care to use much force in placing the compost around the ball, the roots being very brittle. After the potting is finished, the plants should be thoroughly watered with tepid water. *Nepenthes* delights in a moist air always, and when this can be supplied, and the warmth is sufficient, there need be no doubt of these plants doing well. Suspend them from the roof, with about 15 or 18 inches of space between the glass and the plants, but avoid hanging them directly opposite to ventilators. Where other stove plants are grown in the same structure, the *Nepenthes* should have shading a little thicker than that spread over the rest of the roof during sunshine. Plants propagated during the autumn of 1891 should now be moved into 4 or 5-inch pots, affording them the same kind of treatment as that described above.

ROCHEA FALCATA.—Leaf cuttings of this very showy and useful plant may now be put in, preference being given to the old leaves, taken from the lower parts of the stems of strong plants. This plant being a succulent, the leaves should be taken off with a clean cut, as, should they be bruised in the least, they are liable to decay. The base of the leaves should be allowed to get dry before inserting them, by leaving them on a board in the potting shed for several hours. Place four or five leaves in a 4-inch pot, which fill with clean sand, which should be kept rather dry at first, afterwards placing them on a shelf near the glass in a stove temperature. Plants which were struck last summer, and are at the present time in small pots, may now be repotted into 5 or 6-inch pots, in rich fibrous loam, with a small quantity of silver sand mixed with it. Grow the plants near the glass, as they, like most other succulents, thrive and bloom best the more light and sun they receive. Old plants may have weak manure water supplied to them once a week, which will help to increase the size of the flower heads.

SHOW AND FANCY PELARGONIUMS.—Those varieties that are showing bloom should have frequent applications of weak manure and soot-water, and have their shoots tied out as growth proceeds, keeping them well up to the glass, and plenty of air at all times. If aphides appear, fumigate the plants before the blooms expand, as if these insects are allowed to infest the young growth, the appearance of the plants is soon spoiled.

ZONAL PELARGONIUMS.—Cuttings of these may now be put into pots of sandy loam. Rooted cuttings may be potted into sandy loam and decayed

manure, the pots being well drained. A cold frame will suit them at this stage, as also the cuttings, if the pots be plunged in coal-ashes.

THE FLOWER GARDEN.

By H. W. WARD, *Gardener, Longford Castle, Salisbury.*

HERBACEOUS PLANTS.—All the plants in the herbaceous borders and beds which stand in need of support should be staked before they are broken down by wind and rain. It may seem unnecessary advice on my part to say that sticks should not be put to plants unless support is absolutely necessary. But be this as it may, I may say that I have seen plants whose appearance was spoiled by needless staking. Plants that require support at all should have it forthwith, the stakes being placed at the side farthest from the walk or point of view, tying the plants thereto in as natural a manner as possible—i.e., putting the support to the plants without altering their natural habit, and keeping the stakes and ties as much out of sight as possible. Never make a plant look like a besom; and another point to be observed is that of allowing sufficient space in the ties for the full development of the shoots or stems, otherwise vigorous-growing plants, like the *Dahlia*, *Hollyhock*, *Faenou*, &c., will be injured by the ties cutting into the rim, causing the shoots to snap off easily. Carnations and the like only require small sticks, but strong-growing species of *Michaelmas* *Daisies*, *Helianthus*, *Delphinium*, *Phloxes*, and plants of like habit of growth, should have fairly stout stakes, standing 4 or 5 feet out of the ground, using from one to three loops of string instead of matting, as occasion may require. Lilies in general require to be fastened to sticks. Sometimes various slugs devour the foliage of Lilies and other plants, especially seedlings, and a close watch should be kept on these plants just after dark, when, with the assistance of a bull's-eye lamp, the depredators will be discovered at feed. As a precaution, a circle of fresh-slaked lime and fresh soot, in about equal parts, should be put around each plant, also a line of it along the sides and ends of the borders containing seedlings, if slugs abound.

ROSES AND THEIR INSECT ENEMIES.—June, the proverbial month of Roses, has arrived, but the blooms, excepting on plants growing on south and west walls, have yet to come. Much may be done to hasten the Rose harvest by affording the plants of all kinds copious supplies of water, the results of which will fully repay the gardener for his labor. Liquid manure, if obtainable, will also be very beneficial. Care and judgment, however, must be exercised in the application of it. If obtained from tanks into which the drainings of manure-heaps empty, it may with perfect safety be used diluted with an equal quantity of clear water; but if obtained from tanks into which the drainage of the stables and cowsheds drain, the dilution should be at the rate of four parts of clear water to one of sewage. Surface-dressings of Thomson's vine and plant manure, or other artificials, to be followed by waterings with clear water, will answer the same purpose, repeating the top dressings and the waterings more or less frequently, according as the soil is light or heavy, and the weather dry or the reverse. Roses, &c., on walls which are provided with copings, require to be watered oftener than plants in beds, or which are planted against plain walls and fences. Keep a sharp watch on the Rose-maggot and Rose-aphis. The former should be looked for daily, and it may readily be found rolled up in the leaves, from which it should be taken and destroyed, otherwise there will be much loss of leaves and flower buds. The aphid is best destroyed by syringing the trees with a mixture of water and tobacco juice, in the proportion of four of the former to one of the latter. This will not only kill the aphides, but in all probability render the leaves distasteful to them for the season. The syringing may be done at sundown. If fine blooms are wanted, the flower buds must be thinned, which is best done at intervals of a few days, so that a good succession of blooms may be secured. Pull up suckers of the Rose stocks, put stakes to standard Roses, and peg down the shoots of such Roses as are on their own roots, so as to get the allotted space covered as soon as possible, and attend to the training of climbers.

GENERAL WORK.—Thus far the weather has been very favourable for hedging out, and much of that kind of work will have been done in the south. This may be followed by the sub-tropical and carpet bedding, which should be pushed on with all despatch.

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

PLANTS, &c., TO BE NAMED.—Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.

LOCAL NEWS.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

ILLUSTRATIONS.—Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are particularly solicited.

NEWSPAPERS.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Advertisements should not be sent to the Editor, but to the Publisher.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

TUESDAY, JUNE 7	Royal Horticultural Society's Committee at the Drill Hall, James Street, Westminster.
WEDNESDAY, JUNE 8	Royal Botanic Society's Musical Promenade.
THURSDAY, JUNE 9	Brighton and Sussex New Horticultural Society.
SATURDAY, JUNE 11	Royal Botanic Society.

SHOWS.

MONDAY, JUNE 6	Market Growers' Show at Earl's Court (three days). Southampton Horticultural Society.
----------------	--

SALES.

WEDNESDAY, JUNE 8	Special Sale of Orchids, from Messrs. Sander & Co., at Protheroe & Morris' Rooms.
THURSDAY, JUNE 9	Importation of 1,000,000 Palm Seeds, Herbaceous Plants, &c., at Protheroe & Morris' Rooms.
FRIDAY, JUNE 10	Great Number of Orchids, from Messrs. Linden, Brussels, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—59° 8.

Those who took part in the Rose Conference at Chiswick on July 2, 1889, will remember that among the many points of interest on that occasion, by no means the least was the exhibition of dried specimens of a Burmese Rose (collected by General COLLETT), *Rosa gigantea*,* made on behalf of Dr. KING, the Director of the Royal Botanic Garden, Calcutta. The flowers were single, with white petals, and measured as much as 6 inches in diameter. A figure was given in the *Gardeners' Chronicle*, July 6, 1889; and subsequently seeds, obligingly sent by Dr. KING, were distributed by the Editor. At Kew and elsewhere, the plant grew under glass with rampant vigour, but up to this time we have not heard of its flowering, till Mr. CHARLES TURNER of Slough, kindly sent us on the 28th inst. two blooms, with a letter in which he said, "Like ourselves, I fear you will be rather disappointed," and so we were in one sense, but perhaps even more surprised than disappointed;

for though the Rose, as sent to us, will have little attraction for the specialist, yet the interest for the botanist is by no means diminished, but rather enhanced, and even the Rosarian proper has "potentialities" opened out which were not surmised. The flowers before us are borne singly on very slender stalks, all but destitute of prickles, with no developed bract, but with a few stalked glands. The leaves are provided with linear adnate stipules, the free portions of which project at right angles from the stalk, and are subsequently curved downwards. The leaves themselves (we have only those on the flowering shoot) are trifoliate, the leaflets glabrous, dark green above, paler beneath, ovate lanceolate crenato-dentate. Flowers $2\frac{1}{2}$ inches across, semi-double, bright crimson, very fragrant; flower-tube dilated in the middle, contracted at both ends, like a soda-water bottle. Sepals linear, some entire, some lacinate on both sides, some on one side only, more *Rosarum*, glabrous externally, pubescent within. Stamens less than half the length of the petals. Styles free, hairy, projecting above the throat of the calyx-tube, free portion nearly as long as the stamens. Carpel densely pubescent, inserted on the sides as well as on the base of the receptacular tube (basilo-parietal insertion of CRÉPIN).

These characters show that the Rose in question belongs to the section Indica, as understood by M. CRÉPIN.* Indeed, there is no other section but the Indica which have free styles projecting beyond the flower-tube. It is interesting in this connection to note, that Mr. HEMSLEY doubts "whether *R. gigantea* is more than a very luxuriant form of *Rosa indica*, for some of the older specimens have flowers no more than 2 to $2\frac{1}{2}$ inches in diameter, and the flowers are sometimes corymbose." Mr. HEMSLEY, however, to whom we submitted Mr. TURNER's specimen, pronounces it to be nothing but *R. indica*.

General COLLETT, in the introduction to a paper in the *Journal of the Linnean Society* (November, 1890), on "Plants from Upper Burma and the Shan States," says, that "The beautiful *Rosa gigantea* is particularly conspicuous, climbing over tall forest trees, from the top of which the long pendent branches, covered with very large white flowers, hang down in rich profusion. This Rose, which has larger flowers probably than any other wild species, is seen from considerable distances in the jungle, reminding one more of a large-flowered Clematis than of a Rose. Though apparently spread over the whole Shan hills, and extending to Munnepore in the north, where it was previously found by Dr. GEORGE WATT, it is only locally abundant, chiefly in dark shady valleys. It is most nearly allied to *R. indica*, which has recently been found wild in China, and is, perhaps, only a fine variety of that species."

General COLLETT then, like Mr. HEMSLEY, thinks *R. gigantea* to be merely a form of *R. indica*. If so, the fact that the seed sent by Dr. KING has produced *R. indica* is specially interesting. There is, however, the fear that the collectors who gathered the seed might not have been quite so careful as they might have been. In any case, we trust we shall not have long to wait ere we see the tree *Rosa gigantea* in its true form and colour.

THE ROYAL HORTICULTURAL SOCIETY.—The next meeting of the above Society will be held in the Drill Hall, James Street, Victoria Street, West-

minster, on Tuesday, June 7, the Fruit, Floral, and Orchid Committees assembling at 12 o'clock. At 3 o'clock a paper on "Summer Pruning and Training of Fruit Trees," will be contributed by Mr. A. YOUNG, gardener, Abberley Hall, Stourport. Amateurs who cultivate hardy species of Rhododendrons and Orchids, will on this occasion have an opportunity of competing for the prizes offered by the Society, and notified in its schedule; and a Silver-gilt Floral Medal will also be awarded to the raiser (amateur or professional) of the best new seedling Orchid. Intending exhibitors should, without delay, apprise the Superintendent, Royal Horticultural Society's Gardens, Chiswick, of the nature of their intended exhibits.

ROYAL NATIONAL TULIP SOCIETY.—The annual Exhibition of this Society is fixed to take place in the Botanical Gardens, Old Trafford, on Wednesday, June 8th. The fine dry weather appears to have favoured the advance of the Tulip, and there is every prospect that this will be one of the best exhibitions held for several years. The interest in this once-popular flower is still active in the midlands and north, but appears to have nearly died out in the south, and especially round London, where, thirty years ago, many fine collections were grown.

HORTICULTURAL CLUB.—A special meeting, on the occasion of the Temple Show of the Royal Horticultural Society, was held on Wednesday, the 25th ult., Sir J. D. T. LLEWELYN, Bart., the Chairman of the Club, presiding. There was a good attendance of the members, including Rev. E. Handley, Rev. F. H. Gall, Messrs. Moss, Sherwood, H. J. Veitch, P. Veitch, Manning, Soper, Leonard, Gordon, C. Pearson, and others. The Chairman subsequently gave some account of his recent visit to Egypt, dealing in an interesting manner with its agricultural and horticultural aspects. In another column we give a *résumé* of the address, which was cordially received, and for which a vote of thanks was moved by Mr. H. Veitch. The next meeting will be held on June 7, when a paper by Mr. F. W. Barbridge, of Trinity College Botanic Gardens, Dublin, on "Nature and Cultivation," will be read.

ROYAL TRADESMEN.—We learn that the firm of Messrs. ALEX. DICKSON & SONS, of Newtownards, in the county of Down, Ireland, nurserymen and Rose raisers, have been appointed by Royal Warrant nurserymen, seedsmen, and florists to the QUEEN, as they had been previously appointed in the same capacity to the Prince and Princess of WALES.

HINTS TO EMIGRANTS.—Considering that while the population at home increases, the area of land cannot be increased correspondingly, even though better use be made of what there is, it follows that emigration has become a necessity. A pamphlet issued by the Self-help Emigration Society, Memorial Hall Buildings, Farringdon Street, gives trustworthy accounts of our various Colonies, the way to get to them, the cost of so doing, and the chances of success when once there. We strongly commend this little tract to the notice of gardeners and other handy-men of good character and sound health who find it difficult to succeed in the struggle for life at home.

COMING ROSE SHOWS.—The latest advices about Rose shows to come are—Richmond, Surrey, on Wednesday, June 29 and following day; Windsor, Thursday, July 7; and Halifax, Thursday, July 28.

HEREDITY.—The Rev. Professor G. HENSLOW has reprinted from *Natural Science* an article on WEISMANN'S theory of heredity as applied to plants. Dr. WEISMANN, it may be stated, is of opinion that the body of all living creatures is made up of two distinct "plasm," one which is specially reproductive, and called consequently the germ-plasm, and one which has nutritive rather than reproductive functions, and which serves to feed the body and

* *Rosa gigantea*, Collett MSS.; CRÉPIN, in *Comptes Rendus Soc. Ent. Belg.*, 1888, p. 150, et 1889, p. 11; MASTERS, in *Gard. Chron.*, July 6, 1889, p. 12, fig. 4; HEMSLEY, in *Journ. Linn. Soc.*, vol. xxviii. (1891), p. 55, tab. ix.

* CRÉPIN, "Sketch of a New Classification of Roses" (Rose Conference Report), *Journal of the Royal Horticultural Society*, vol. xi., 1889, p. 219.

maintain its growth. The germ-plasm is continued from parent to offspring in a certain series of cells only. "Acquired characters," or those modifications of the original form which are produced in course of growth by circumstances, cannot be transmitted at all. Transformation of species is due to direct changes in the germ-plasm due to external influences or to combinations of distinct germ-plasms. These postulates are examined and sifted by Professor HENSLOW, who concludes that there is no necessity for any assumption of a dual plasm. What is known as protoplasm, "however complicated its structure may prove to be, appears to be perfectly capable of acquiring new characters and fixing them

the history of the cultivated species, but notes the date and the person by whom they were introduced. Dr. BUCHENAU admits forty-four species, which he divides into those which do, and those which do not bear tubers. Other characters are afforded by the number and nature of the petals, the spurs, the stipules, the foliage, &c. Dr. BUCHENAU publishes a Latin synopsis of the plants, as arranged according to these characters—a synopsis for which botanists will be the more thankful in that the other parts of his memoir, even the full descriptions of the species, except in the case of newly-described forms, are written in German. The garden forms known as CARTER'S Tom Thumb, CATTLE'S [? CANNELL'S]

COMMERCIAL FLORICULTURE IN THE UNITED STATES.—We take the following details from the American Florist Company's Directory:—"While floriculture has been carried on as a business in the States for upwards of one hundred years, it is only within the past twenty-five years that it has assumed large proportions. Out of a total of 4,650 establishments, 2,795 were started between 1870 and 1890, and of these 1,797 between 1880 and 1890. There are 312 commercial establishments owned and managed by women. These 4,650 establishments had in use in the census year 38,823,247 square feet of glass, covering a space of more than 891 acres of ground. The establishments, including

FIG. 104.—DENDROBIUM NOBILE. (SEE P. 732)

by heredity." Professor HENSLOW finds plenty of instances to support his contention among plants. While accepting the statement that acquired characters are reproduced and even "fixed" for a time by the care of the cultivator, we are still in doubt whether the fixture is permanent, or capable of survival when the protecting and selecting aid of the cultivator is withdrawn.

TROPEOLUMS.—Dr. F. BUCHENAU, a botanist already well-known for his researches into the natural history of the Rushes, Juncaceae, has recently issued a monograph of the genus *Tropeolum* in ENOLER'S *Botanischen Jahrbücher*. Dr. BUCHENAU alludes to the work done by his predecessors, sketches the history of the genus, and details its morphological peculiarities. He does not overlook

dwarf crimson, and DUNNETT'S dwarf-spotted are considered as hybrid productions between *T. majus* and *T. minus*, both of them climbing plants. Dr. BUCHENAU'S memoir is illustrated with woodcuts, showing the conformation of the petals, and with tables showing the geographical distribution of the species. In an appendix, the morphological nature of the tubers and of the methods of germination are discussed. It will be seen that, whether from its botanical and structural interest, or from its importance as furnishing numerous species to the cultivator, Dr. BUCHENAU has had a peculiarly interesting group to deal with. The true test of such work is afforded by daily use, but so far as can be told by the inspection of the Doctor's pages, he has done his part in a methodical and most satisfactory way, as, indeed, was to be expected.

fixtures and heating apparatus, were valued at \$38,355,722.43; tools and implements, \$1,587,693.93, and gave employment to 16,847 men and 1,938 women, who earned in the year \$8,483,657. Fuel for heating cost \$1,160,152.66. The products for the year were 49,056,253 Rose bushes, 38,380,872 hardy plants and shrubs, while all other plants amounted to 152,835,292, reaching a total value of \$12,036,477.76 for plants. Cut flowers brought an additional income of \$14,175,328.01. The largest number of square feet of glass in one establishment in the United States is in the district of Columbia; the oldest establishment was started in New York; the largest number of Roses propagated were, respectively, in Pennsylvania, Illinois, and Ohio; the largest number of hardy plants propagated were, respectively, in Illinois, New York and Kansas;

the largest total value of plant sales were, respectively, in New York, Pennsylvania and California; and the largest total value of cut-flower sales were, respectively, in New York, Illinois and Pennsylvania. 3,425,600 wholesale and 17,630,094 retail catalogues are annually issued, while \$767,438.21 was paid for postage, \$1,161,168.31 for advertising, \$534,221.86 for freight, and \$554,390.55 for express bills, and the estimated freight and express bills on outgoing shipments was \$1,086,904.60.

The Nursery Industry in the United States.—From the tabulations it appears that there are in the United States 4,510 nurseries, valued at \$41,978,835.80, and occupying 172,806 acres of land, with an invested capital of \$52,425,669.51, and giving employment to 45,657 men, 2,279 women, and 14,200 animals, using in the propagation and cultivation of trees and plants \$900,606.04 worth of implements. Of the acreage in nurseries 95,025.42 were found to be used in growing trees, plants, shrubs, and Vines of all ages, and the figures, based upon the best estimate of the nurserymen, make the grand total of plants and trees, 3,386,855,778, of which 518,016,612 are fruit trees, 685,603,396 Grape vines and small fruits, and the balance Nut, deciduous and evergreen trees, hardy shrubs and Roses. The largest acreage is devoted to the production of Apple trees, viz., 20,232.75 acres, numbering 240,570,666 young trees, giving an average of 11,890 per acre, while the Plum, Pear and Peach have, respectively, 7,826.5, 6,854.25, and 3,357 acres, producing 88,494,367, 77,223,402, and 49,887,894 young trees, or an average of 11,307, 11,266, and 14,861 trees to the acre.

Seed Growing in the United States.—There are about 596 seed farms established in the United States, containing in all about 169,851 acres, and representing a total investment in land, buildings, and implements, of \$18,325,935.86. Of these farms, 258, or nearly one-half, are located in the North Atlantic States, with an acreage of 47,813; the North Central Division comes next in number of farms (157), but devotes 87,006 acres, or an average of 555 acres per farm, to this industry. These farms give direct employment to 13,500 men at wages of from \$0.50 to \$1.50 per day, and 1,541 women at from \$0.35 to \$1.00 per day. Of these farms 496 have been established since 1870, this fact alone showing something of the wonderful growth of the business.

WHAT POLLEN IS MADE OF.—The "mechanics" of vegetable reproduction have engaged the attention of all our great botanists, and wonderful are the things which have been discovered concerning the *modus operandi* of the function in various plants; but the chemistry of it, with some well marked exceptions, has been comparatively neglected, and yet, possibly, there is quite as much to learn from the chemistry. A good start has been made with this branch of vegetable science, and some of our readers may remember the researches of DRAEGER and those of VON PLANTA in 1876. All that can be done at present is to accumulate masses of data founded upon actual experiment or observation; some day we may then be able to use them in arriving at important generalisations. Recently, the composition of the pollen of *Pinus sylvestris* has been placed under analytical examination by K. KRESLING (*vide Archiv. Pharm.*, cxcxix., pp. 389 to 425), who has discovered that it contains a wonderful collection of ingredients. Here are the results in an abbreviated form:—Moisture, 8.73 per cent.; ash, 5.51 per cent. (consisting of potash, soda, magnesia, lime, phosphoric acid, sulphuric acid, chlorine, iron oxide, alumina, silica, and manganese); fat, 11.12 per cent. (consisting of glycerol, alcohol, and fatty acids); Lecithin, 0.895 per cent.; cane-sugar, 12.75 per cent.; starch, 7.4 per cent.; glucose, 33.1 per cent.; cellulose, 19.06 per cent.; mucilage, 0.196 per cent.; organic acids (tartaric and malic), and nitrogenous compounds (globulin, peptone, albumin, amines, ammonia, xanthine, guanine, hypoxanthine, and vernine)

make up the rest. This result is almost bewildering in its details, and it will take a good deal of trouble to give a proper interpretation. If our readers are further interested in this curious subject, they will find another recent paper on it in the *Bulletin of the Imperial Academy of Science of St. Petersburg*, xxx., p. 358.

DISEASES OF BEET.—The diseases of the Beet-root observed in Indiana, and described in the *Bulletin of the Purdue University, Lafayette, Indiana*, are three, i.e., a bacterial disease, Beet-scab, and water-core spots, the first being of chief economic importance:—

I.—A Bacterial Parasite.

1. A new disease caused by parasitic bacteria has been detected in 12 per cent. of the Sugar-beets examined.

2. It does not usually cause the death of the plant, any spots upon its surface, or any alteration or discoloration of the tissues.

3. The best external signs of the disease are a crinkled or puffed condition of the leaves, a smaller and paler development, and a more rapid dying off of the outer ones.

4. Upon cutting open the root, it may be detected by the greater prominence of the fibres, a general yellowish tint, and a less firm texture.

5. The gross characters just given are not always sufficient to separate normal and diseased Beets.

6. The microscope shows the presence of great numbers of bacteria in all the tissues.

7. By culture methods, the bacteria are shown to be all of one sort.

8. The disease decreases the content of sugar in variable amount, the loss in some cases reaching 50 per cent.

9. No suggestions are made for treatment or prevention.

II.—Beet Scab.

1. A form of scab is very prevalent, producing rough brown spots on the surface of the roots.

2. It is caused by a fungus identical with that which causes the scab of Potatoes.

3. Its occurrence is best guarded against by using land which has borne no root-crop for a year or two previous.

III.—Water-core Spots.

1. Well-defined, watery spots have been noticed in the Beet-root, whose origin and significance are not known.

THE GREENING OF PLANTS.—PALLADIN observed that without the presence of sugar, chlorophyll could not develop in a plant, and argued that this fact supported his theory of the relation between the starch-grain and the grain of chlorophyll. Further observations have more recently been made by BELSUNG on the formation of starch, and the use that is made of it in plants. From a fact observed by BOKORNY in *Spirogyra*, the conclusion is drawn that the formation of starch is not solely due to the carbon and the elements of water, but to the production of various complex organic substances, and to the intervention of several other elements, such as nitrogen, potassium, etc. [*Journ. de Bot. (Morst.)* v. pp. 350-5.]

FLORAL DECORATIONS.—“The Artistic and Effective Arrangement of Plants and Flowers,” formed the subject of a paper read at the International Horticultural Show at Earl's Court by Mr. G. PHIPPEN, of Reading.

LONDON AGRICULTURAL SEED TRADE ASSOCIATION.—PRESENTATION TO MR. DAVID SYME.—The annual dinner of this Association took place in the Duke's Salon at the Holborn Restaurant, on Monday evening, under the presidency of Mr. N. N. SHERWOOD, Mr. RUDOLPH DAVID occupying the Vice-chair. The usual loyal and patriotic toasts having been duly honoured, the Chairman proposed “Prosperity to the London Agricultural Seed Trade Association.” He regretted that their Association was not in such a flourishing condition as it ought to be;

year by year their numbers were decreasing, as he supposed, because so many of their provincial friends wrongly considered that the benefits of the Association were confined to the London members only. Their rules, however, had been formed so as to be of benefit to all in the trade; their business was a peculiar one, distinct from everything else, and requiring knowledge of a peculiar and special character. They had a just right therefore to conduct their business with due regard to the advantages of all, and if the provincial members of the trade would not abide by the rules of the Association, he for one would be obliged to decline to do business with them. The Association had been most useful for several years past in adjusting differences that arose among them in the course of business; and many disputes had been settled in the most amicable and satisfactory manner without recourse to the law with its attendant delays, vexations, and cost. It was therefore doing a good work, and deserved the support of all engaged in their trade, which was second to none among the commercial industries of the country, for if the farmers and market gardeners could not be properly supplied by them, he might well ask what would become of the agricultural industry. Mr. JAMES WATT then rose to propose the toast of the evening, the health of their old friend Mr. DAVID SYME, and to present him with a handsome testimonial to mark the celebration of his fifty years connection with the seed trade. He offered him their heartiest congratulations on being able to be present on that occasion to receive such a tangible token of their regard and esteem, and concluded by presenting Mr. SYME with a cheque for 300 guineas, together with a very handsome silver tea and coffee service and tray for Mrs. SYME, and an address, signed by 180 members, engrossed on vellum. Mr. SYME, who, on rising to acknowledge the gifts, received a most enthusiastic greeting, said he almost felt incapable of finding appropriate words with which to thank the subscribers for such a handsome token of their good feelings towards Mrs. SYME and himself. He had certainly been connected with the nursery and seed trade for fifty years, for it was in 1841 that Mr. PETER BARR and he found themselves boys together commencing their career in the business, for boys in those days went straight to work from the parish school and at an early age, whereas now they mostly did not commence to learn the business until they were young men. The nursery and the seed shop were great schools, for either branch of the business was a most interesting one, and they had something to learn from the day they entered it until they left it.

THEFT OF CACTUSES AT KEW.—Our readers will share our indignation on reading the following note:—“On Wednesday last, two Cactuses were taken by a visitor from the succulent-house (No. 5). One of the plants was *Echinocactus Haselbergii*, a rare little species, with white silky spines and bright orange-coloured flowers; the specimen was recently figured in the *Botanical Magazine*, t. 7009. The other plant, a *Manillaria*, also in flower, is not so rare. The labels of the plants were not taken. It is possible that the plants may be offered for sale, and as the *Echinocactus* is a well-marked plant, it ought to be easily recognised. W. T. Thistleton Dyer, Director.”

THE TEMPLE SHOW.—We are glad to learn that this great exhibition proved financially successful.

PUBLICATIONS RECEIVED.—*Führer durch die Gartenbau literatur*. List of works on horticulture, published by LEWIG MÖLLER, Erfurt, Prussia.

PLANT PORTRAITS.

DESMODIUM NUDIFLORUM, *Mechan's Monthly*, May, 1892.

RHODORHIZA FLORIDA, better known as *Convolvulus floridus*. It is a native of the Canaries, and

is of shrubby habit, with loose-spreading, wiry branches, and panicles of white funnel-shaped flowers, each about $\frac{3}{4}$ inch in diameter. *Revue Horticole*, April 1.

SAXIFRAGA FORTUNEI, *Revue Horticole*, May 16.

TRILLIUM ERECTUM.—*Meehan's Monthly*, April.

NOTICES OF BOOKS.

TRAITÉ DE CHIMIE AGRICOLE. By P. P. Dehérain.

This large volume of 900 pages will be cordially welcomed. It is nearly twenty years since Dehérain published his course of lectures on agricultural chemistry. During the interval which has elapsed he has continued in his professorship at Grignon, he has published a number of important investigations, and he has conducted during nearly the whole of this time a journal of scientific agriculture, the *Annales Agronomiques*, which is the best of its kind in France. We have thus before us a ripe work, by one well qualified for the task.

Notwithstanding the size of the volume, its scope is rather limited. The animal side of agricultural chemistry is left untouched, with the exception of the subject of farm-yard manure, which is fully treated. Crops and rotation are also only incidentally mentioned; the characteristic effects of manures upon crops are, however, discussed under the headings of the various manures. The first part of the book is on the nutrition and development of plants. The second part deals with soil. The third part treats of manures, including the ploughing-in of green crops, and the amelioration of the soil by burning, by fallow, and by irrigation. A good deal of space is taken up by a description of the chemical properties of the principal substances found in plants; and a probably still larger space is occupied by a description of methods suitable for the chemical analysis of vegetable matters, plant ashes, soils and manures. These methods of analysis might surely have been omitted, especially as there is an excellent work in the French language by L. Grandeaun on this subject.

The book is decidedly French. It has the merit, usual with good French books, of being written in a clear, easy style, very pleasing to the reader. It has also some of the defects usual to French books, of confining the view to work which has been done in France. This common fault of French books is, however, by no means so marked as is frequently the case, the references to Rothamsted work are, for instance, very numerous. It is curious, however, to observe how easily important facts are omitted when they are not French: thus in describing the phosphates used for the manufacture of manures, no mention is made of the American phosphates of Carolina and Florida, although probably half the superphosphate annually made in the world is prepared from these phosphates. The important work of Cross and Bevan on the composition and properties of vegetable fibre, and the equally important investigations of Brown and Morris, and of Green, on the chemical changes occurring during germination, are apparently unknown to the writer; but we must freely admit that it is impossible for any writer to be fully acquainted with so large a subject as agricultural chemistry.

The aim of the book is decidedly practical—it is written for the agricultural student, rather than for the botanist or chemist: this fact is one of the excellencies of the book, and will doubtless greatly increase the number of its readers. A considerable effort has evidently been made to bring the book up to date: thus we find the process of nitrification in the soil correctly described as performed by two organisms, one producing nitrites and the other converting nitrites into nitrates; an appendix is also added to introduce the important fact recently noticed by Schloesing and Laurent, that certain cryptogams have the power of assimilating the free nitrogen of the atmosphere.

The best chapters in the book are naturally those dealing with subjects which the author has himself investigated. Chapter VI., treating of the assimila-

tion of mineral matter by plants, is full of interest. The explanation there given of the apparent selective power of plants, by means of the known laws of diffusion, is the result of one of Dehérain's happiest investigations. The chapter on farmyard manure, the short chapter on Gypsum, and the information afforded as to nitrates in soils and drainage waters, are also specially interesting.

There are a few points which have appeared during our glance through the book which call for less favourable criticism; the mention of one shall suffice. So many important conclusions are drawn from the composition of ordinary field soils, which have been cropped or manured for a series of years in various definite ways, that it is most important that a correct method of taking soil samples should be followed: the method described by Dehérain on p. 360, and adopted by him in his own numerous investigations is, however, deficient in accuracy. For the purpose of the investigations in question, it is essential that the samples of soil taken from the same field at various times, or from fields variously treated, should be exactly similar, and thus admit of comparison. To this end, the sample taken must always be of the same shape (or differ only in area), and of the same depth, and represent as nearly as possible the same weight of dry soil per acre. In this important work French investigators are content to employ a spade: the depth and shape of the sample thus depend solely upon the manipulation of the operator, and the weight of the sample becomes of no value as a basis of calculation. The results obtained by this method of work are frequently extraordinary.

In the introduction to his book Dehérain remarks with pleasure on the great strides which the teaching of agriculture has made in his country since the publication of his first lectures, and on the far more appreciative audience he is now able to address. In France the teaching of agriculture is undertaken by a Department of the State, and much has been done to educate the farmer. In England we are only beginning to realise the importance of this educational work, and the efforts of county councils in this behalf have received, at best, a cold welcome. Such work has, however, become imperative for the welfare of our country, for, in the words of Dehérain, "*L'agriculture cesse d'être purement empirique, elle devient une science.*"

REVISION DER ARTEN VON TROLLIUS. By Dr. Ruth. Berlin, 1891.

This is a much needed revision of the genus *Trollius* now becoming so popular, and one that will be of no small value to all lovers of hardy flowers. The trouble one is exposed to in getting up a collection of the species, and varieties of this useful genus, is at present very great, owing in the first place to a complicated synonymy, and secondly to the still worse evil of receiving plants under obviously wrong names. We are always glad to draw attention to small monographs of this description, that are always useful to the grower, and if followed as we believe they invariably are, save a vast deal of time and bad temper, both important items. The monograph begins with species 1, *T. europæus*, L., of which the following synonymy is given: *T. altissimus*, Crantz., *T. connivens*, Moench., *T. globosus*, Gilib., *T. montanus* and *T. sphaericus*, Salisb.

The varieties are:—1, *T. humilis*, Crantz., syn. *minimus*, Wender. 2, *T. napellifolius*, Reep., syn. *acutifolius*, Miell.; *tauricus* Hort. Berlin. 3, *T. tomentosus*, Rehb., a variety with truncate petals; and 4, *T. viridis*, Mill., with the outside of the sepals green; syn. *chloranthus*, Haussn.

Sp. 2, *T. asiaticus*, L., syn. *sertiflorus*, Salisb., *Bot. Mag.*, vii., t. 235. Var. 1, *T. stenopetalus*, Ruth., 11 to 15 sepals, orange, petals linear; Siberian Alps. 2, *T. parviflorus*, Regel, a dwarf form with small flowers and oblong spatulate petals.

Sp. 3, *T. tschunganicus*, Regel, Turkestan.

Sp. 4, *T. altaicus*, C. A. Mey. Turkestan, Songaria, Altai Mountains; syn. *T. caucasicus*, Ledeb. (non Stev.); styles short, purple, incurved at the apex.

Sp. 5, *T. Ledebourii*, Rehb.; syn. *T. davuricus*, Ledeb. Siberia, Dahuria, &c.; sepals five, yellow. Var. 1 *parviflorus*, flowers very small.

Sp. 6, *T. chinensis*, Burge.; syn. *T. macropetalus*, Fr. Schmidt; *T. asiaticus* var. *affinis* Regel, 1861; *T. japonicus*, Miq., China. Var. 1, *pentasepalus*, Huth.; flowers on long peduncles, sepals 5, orbicular, orange-yellow; Amur.

Sp. 7, *T. patulus*, Salisb., Trans. Linn. Soc. viii., 303; apparently a variable species, including as synonyms or slight forms *T. dahuricus* and *T. americanus*, Turcz.; Europe, Asia, Siberia. Var. 1, *T. caucasicus*, Stev., syn. *T. Somcheticus*, K. Koch. There are two forms of this variety *pedunculatus*, with large flowers and no involucre, and *involucratum* flowers small with involucre. Var. 2, *T. Riederianus*, F. & M., from the Caucasus. Of this there are also two forms, *pedunculatus* and *involucratum*. Var. 3, *T. sibiricus*, Huth.; syn. *T. americanus*, Ledeb.; *T. ochotensis*, Thl.

Sp. 8, *T. pumilus*, Don; Himalayas, 4000 to 6000 feet elevation. Var. 1, *T. yunnanensis*, Franch.; Yunnan.

Sp. 9, *T. americanus*, Muhlen & Gaisn.; *Bot. Mag.*, t. 1938; syn. *T. laxus*, Salisb.; *T. americanus*, Hook.; *Gaissenia verna*, Rafn.; *T. pentapetalus*, Barks.; *T. decapetalus*, Bosc.; and *T. patulus*, Torr. & Gray; North America, Siberia. Var. 1, *T. tenuistylus*, Regel & Thl., of which there are two varieties, *pentasepalus* and *plurisepalus*. Var. 2, *brevistylus*, Rgl. & Thl.

Sp. 10, *T. acutalis*, Lindl., *Bot. Reg.*, 1843, t. 32; a charming dwarf species from the Himalayas, with large orange-yellow flowers; it is near *T. americanus*, but in the latter the ovaries are shorter and truncate.

Sp. 11, *T. lilacinus*, Burge.; syn. *Hegemone lilacina*, Burge.; lilac-tinted; Altai Mountains, Songaria, &c.

Sp. 12, *T. palmatus*, Bailloo; Himalayas; syn. *calathodes palmata*, Hook. and Thoms.

Nos. 1, 2, 3, 4, 5, 7, 9, and 10 are in cultivation with several varieties of the first, second, and seventh species. The name *Fortunei*, known so well in gardens is not mentioned in the monograph, and is probably identical with the variety of *T. asiaticus* named *stenopetalus*, in which the flowers are large, bright orange, with 11 to 15 sepals, which would give the flowers a semi-double appearance. *T. chinensis*, *T. pumilus*, *T. lilacinus*, and *T. palmatus* we have not seen alive, but if one may judge from specimens and descriptions, they are well worth an effort to secure. *D. D.*

FOREIGN CORRESPONDENCE.

BELGIUM.

ORCHIDS AT THE BRUSSELS ORCHIDÉENÉ.

The principal awards were won by MM. Georges Warocqué and MM. Barbier et Cie. M. Warocqué showed a hundred large and fine examples of *Cattleya Mossiae* and *Mendeli*, also some remarkable *C. Lawrenceana* and *Skinneri*, and some excellent *Lælia purpurata*. The 150 *Odontoglossum* from the same orchidist also won a prize, they were chiefly *O. crispum* and *Pescatorei*, but the flowers were well formed and variously spotted and speckled, the *Pescatorei* with purple. *Lindeni* and *maculatum* were most beautiful, and are still rare; we should mention a *crispum* with a very large creamy-white flower, Ruckeri sulphurum with a yellow ground, and a fine *O. triumphans*. The third prize was awarded to MM. Barbier et Cie. for a fine show of *Odontoglossum crispum* and *Pescatorei*. M. van Lansberghe also showed some excellent Orchids, which won him a prize. We noticed a fine variety of *Odontoglossum Halli*, *Cattleya Mossiae* with thirteen blooms, *Epidendrum Wallisi*, *Dendrobium chrysotoxum* with six clusters of bloom, a charming *Sophranitis grandiflora roseum*, a white *Cattleya Mendeli*, *Vanda tricolor*, a good variety of *Oncidium scarodes*, an interesting *Warszewiczii* discolor, and a dark *Oncidium cucullatum*. M. le notaire Moens gained a prize for a mixed lot of Orchids,

among which were *Cypripedium nitens*, two plants of *Dendrobium thyrsiflorum* with fine spikes of bloom, *Dendrobium chrysotoxum*, a good *Cattleya amethystoglossa*, and various *Cypripediums*, such as *canthium*, *villosum*, *albo-marginatum*, with lip daintily bordered with white, *caudatum* with many good flowers, and *Boxalli*. In the collection sent by M. Alfred Van Imechoot were almost the same *Orchids* as those shown at the Exposition of Mont S. Amand; we must specify *Dendrobium thyrsiflorum* giganteum with pink flowers, and *Anguloa* Ruckeri. M. Wincoz sent some good plants, notably a fine *Anguloa* Ruckeri, *Masdevallia* Van Houtteana covered with bloom, and *Cypripedium villosum* barbatum Warneri.

M. Florens Paulus exhibited, among many fine plants, *Cattleya* Warneri, a curious *Oncidium* Laocceanum, a charming *Vanda tricolor* and some good *Cypripediums* *Danthieri*, *barbatum* nigrum and *Druryi*. M. le Dr. van Cauvelaert also sent some excellent plants; M. Vuylsteke, of *Odontoglossum* fame, showed some worthy of him, *O. nobile*, *niveum*, *triumphans* with an effective yellow ground, and also *hyatrix*; with *Cypripedium* *Miteusanum*, very deep in colour and figured in *Lindenia*; *Odontoglossums* *Halli* and *cuspidatum* were sent from M. Miteau. M. Schmitz sent several good *Orchids*, notably *Odontoglossum* *nebulosum*, spotted all over with fine pink dots. M. Stepmann showed specimens of *Cattleyas* *Mossii* and *Mendeli*.

The Society called L'Horticulture Internationale waited until the exhibition of the *Orchidéens* to organise a grand display in their houses. There was quite an avalanche of *Odontoglossums*, *crispum*, *Pescatorei*, *triumphans*, *sceptrum*, *Harryanum*, *Ruckeri*, &c.; in another house *Cattleyas* *Mossii* and *Mendeli*, or again *Masdevallia ignea*, *Lindeni*, *Veitchi*, *Harryana*, &c.; or mixed *Orchids*, *Odontoglossum*, *Oncidium*, *Miltonia*, in choice varieties; other houses were full of *Cattleyas* or *Dendrobium densiflorum* and *thyrsiflorum*, *Angraecum sesquipedale*, *Lælia purpurata*, &c. Never have we seen a finer collection. Among all these fine plants some must be particularised; a grand *Dendrobium bicoloratum* well-bloomed, excellent *Cattleya intermedia*, *Phaius grandifolius*, *Oncidium Cervantesii* roseum, an unusually deep rose; *Odontoglossums* *Pescatorei*, *maculatum*, and *Lindeni* with large purple spots; *Oncidium monachium*, fine *Odontoglossum* *Eldorado*, *O. triumphans* *chrysanthum*, *O. Lucienianum*, *Miltonia* *veixillaria* with large white lips and the other parts deep rose; *Dendrobium Gallicianum*, *Catasetum* *Kodiguanum*, *Dendrobium infundibulum*, *Epidendrum* *Randi*, with distinctive pink flowers and nearly black leaves; *Lælia elegans*, *Schlieriana*, *Stelzeriana* and other remarkable varieties; a new *Phalaenopsis* not yet known, but certain to be liked; *Oncidium Gravesianum*, sure to become general in collections; *O. insculptum*, and *Odontoglossum cirrosum*, a large, well-marked flower. L'Horticulture Internationale has now some important consignments of *Cattleya Alexandra*, *C. Victoria* *Regina*, and *Oncidium Gravesianum*. We would also draw the attention of lovers of the picturesque to the rock garden at the end of the large hall: two large mirrors reflected the ornamental plants around it; the niches were planted with *Cattleyas* *Mossii* and *Mendeli*, *Lælia purpurata*, *Anthurium Scherzerianum*, &c., and a fine *Angraecum sesquipedale* sprang from the rock. The ground at the base of the rocks was carpeted with *Lycopods* and *Selaginellas*, whence rose fine exotics played upon by a fountain which shed a fine spray over both rocks and plants.

M. PEETER'S NURSERY.

We could not hope to enumerate all the species and varieties of *Odontoglossum*, *Oncidium*, *Cattleya*, &c., actually in bloom here, but can only mention a few of the rarer *Orchids*:—*Cypripedium bellatulum*, with seven fine flowers; the rare *Cattleya intermedia alba*; an excellent *Odontoglossum* *Halli*, with large dark blooms spotted with blackish-brown, lip spreading, and much spotted—certainly the finest

variety that there is; *O. Halli leucoglossum*, not less beautiful, with large and fine dark flowers and large white lip; *O. sceptrum*, flower large, lip enormous, compared with the size of the flower; *O. Andersoni*, *O. Ruckeri*, and three pretty varieties of *O. Wilckeanum*, one pale, the second with dark brown blotches, the third spotted with reddish-brown. One *Orchid* which rarely flowers with us, *Cyrtopodium punctatum*, *Lal.* (syn. *spectabilissimum*), from Brazil and the East Indies, is now in full bloom; it is a most effective plant, with long leaves, the panicle large, flowers yellow, spotted with red; sepals much undulating, lip lightly bordered with purple on the two lateral lobes. The special features of this *Orchid* are the large bracts, the colour of the flowers, which come from the base of each pedicel, and are extremely beautiful.

BOTANIC GARDEN.

Among the numerous species and varieties now blooming, we noticed *Epidendrum inervum*, sometimes called *fragrans*, with a fine spike like that of certain *Hyacinths*, and a delicate perfume; *Anguloa* *Ruckeri*, unusually dark in colour; and *Mitotia flavescens*, *Lal.* (*Stellata*, *Lal.*), from Brazil, well-bloomed, with three spikes, each bearing about fifteen blooms. *Ch. de Bosschere*.

SOUTH CALIFORNIA.

From the private correspondence of a young emigrant in Santa Paulo, we are permitted to make the following extracts, which, we think, will interest our readers:—

"April 17, 1892.—I have been busy picking over seed, and 'acme' harrowing, and clod-mashing to get the land in fix; the weeds here are an awful bother to keep down; indeed, the 'Morning Glory,' a *Convolvulus*, is a perfect plague—the land on which it is known to be growing is depreciated to half the value. *Malva* (Marsh Mallow) and *Mustard* are also a great nuisance; the latter grows 9 and 10 feet. A few weeks ago I hoed out the *biranco* (watercourse), the banks of which are 30 feet high in places, and a quarter of a mile long; it took me four days, and was about the stiffest job I ever did. It was to be set out in Blue Gums. Blue Gum is the common name for *Eucalyptus*; it is the quickest-growing tree I ever saw or heard of. Those behind our house are only four years old, and yet some of them are 8 inches through at the bottom, and over 40 feet high.

"Our neighbours have got 6 acres set 4 feet apart, so you can imagine they make quite a dense wood; when they are twelve years old, they will be worth 1200 dols. per acre as they stand, for fire-wood. They are grown in soil which cannot be used for crops, and are also used as windbreaks for orchards; indeed, they are an important factor in California, where there are very few trees except evergreen Oaks and *Sycamores*. . . . All the work up at the ranch is finished; at least, that is, the crops—corn and Barley—are in, but there will be plenty of brush-clearing. When the sap is dried out, it can be burnt as it stands in the summer, though brush-firing is rather dangerous work; only last summer there was a fire on the mountains opposite us. It burnt for several days, and ran for thirty miles; they could read small print at night, and feel its heat on this side of the valley.

"We have been having plenty of Oranges lately; the first crop is just coming on. They are not much cheaper than in England—I dol. per 100, and in my mind, not half so good as Mediterranean Oranges—much thicker-skinned. Other fruits are cheap enough. Grapes, Peaches, and Apricots are a cent ($\frac{3}{4}$), per lb. All the Vines about here are trained like shrubs. I may as well give you a list of the fruits that grow here:—Oranges, Lemons, Citrons, Peaches, Apricots, Pears, Almonds, Walnuts, Grapes, Prunes, Olives, Pomegranates, Figs, Melons, Nectarines, Apples, so there are plenty to suit every taste. . . . There is a great bowl of Roses in front of me; it would be early for them in England, but here we have had them for the last month or more. . . . We are having splendid weather, and the glass has not been more than 90° in the shade. . . . C. W. H."

HOME CORRESPONDENCE.

THE WEATHER AND THE FRUIT CROPS.—It is to be hoped that the cold weather of last April, as well as that of the month of May, may not prove quite so disastrous to fruit crops, more particularly to that of the Apple, as some writers upon the subject would appear to predict. Apple trees, judging from those which came under my observation, were very much later than usual in coming into bloom, which is likely to be an advantage in the securing of a crop of fruit. I have particularly noticed the case of two healthy young Apple trees near to where I now write, which hardly ever fail to furnish an abundant crop of fine fruit, the sorts are what are known as the "New Hawthornden" and "Frogmore Prolific;" both are large-flowering varieties, and when in bloom very ornamental. During the spring of 1891 both trees were in full flower as early as May 1, while during the present season scarcely a bloom expanded before the middle of this month, and they are now (May 18) in full flower and leaf. In 1891 the trees were in full bloom before a leaf had unfolded, while during the present season the reverse is the case, so that the abnormally warm and fine weather which was experienced during the early portion of April appears to have had the effect of hastening the unfolding the foliage without, however, in any degree exciting the flower-buds to move, so that it may be hoped that the safety of the latter is secured, as it is hardly likely the weather we may now have will be such as to cause injury to the blooms or fruits. It appears to be the case that in nearly all parts of the country the weather during the early part of last month was unusually warm and fine, the maximum temperature in the shade being in many instances as high as 80°, although the wind being mostly from north-east, the nights were comparatively cool. Still, the abnormally high day temperature, with bright sunshine, without doubt unduly excited the development of various kinds of fruit trees and bushes, and the severe cold which so suddenly succeeded this spell of warm weather, must have given a check to vegetation in general, which must have been more or less injurious. Snow fell heavily here on the 13th ult., and the temperature during the night fell to 21°, or 11 degrees of frost. It may possibly be interesting to know if other readers of the *Gardeners' Chronicle*, in other parts of the country, have observed a similar development of foliage in advance of bloom in the case of Apple-trees to that I have alluded to. P. G., Bury St. Edmunds.

BERBERIS DARWINII AND B. STENOPHYLLA.—

These have been glorious lately, with their rich, warm, orange-yellow flowers, and excepting *Rhododendrons* [and *Ghent Azaleas*] there are no shrubs that rival them at this season, the first-mentioned being the deeper-coloured of the two, but both equally desirable and beautiful, as they are quite distinct in their habit. *B. Darwinii* forms an erect-growing bush, and is only partially drooping, the leaves very shiny or polished; while *B. stenophylla* is quite pendulous in habit, and the foliage of a dull green colour. Every shoot and twig is crowded with blooms, and for covering banks, mounds, rockwork, or other raised positions, the *Berberis* is well adapted; and when so placed, it is one of the most effective plants that can be chosen for such purposes. *B. Darwinii* is likewise telling in similar situations, or in the foreground of borders of evergreens; but it is not quite hardy, and in severe winters or cold springs it is apt to get injured. Like all species of *Berberis*, these two are not easy to transplant, unless they have been kept moved every year, as they form but few fibres; the best season for transplanting them is early in April, or the latter part of September, the first-mentioned being preferable, as they start off at once, but they must at no time be kept long out of the ground. Propagation may easily be effected by layering, as they root readily in a year if the part of the bark buried in the soil is scraped for an inch or so, or abraded, as that induces callus to form, which is Nature's first effort in healing a wound. J. Sheppard.

PRUNED DENDROBIUM NOBILE.—In reference to the exhibition at the Temple Gardens of specimens of *Dendrobium nobile*, which have undergone a vigorous pruning of the pseudobulbs for several years, it may be of interest to some of your readers to know that, if I judge rightly, finer examples of cultural skill than even those described by "Pomm" (p. 652) are to be met with under what some are

pleased to term "antiquated" methods of culture. Ten years ago there were, in the gardens of Earl Fitzwilliam, at Wentworth Woodhouse, Rotherham, some of the finest potfuls of this Orchid I had ever seen, and although I cannot remember exactly their proportions, which means simply a massing of the plants, yet I have a vivid recollection of the wealth of flowers they produced annually, which numbered on each potful from 300 to 700, and the length of some of the pseudobulbs was quite 4 feet, and some of these produced as many as thirty blooms each. I may also add that no aerial roots manifested themselves upon the growth. This unsightly appearance I have no hesitation in saying is entirely due to badly-ripened growths and too much atmospheric moisture during the earlier stages of the flower-bud's development. If the plants referred to are still at Wentworth, and have continued in the same healthy condition that they were ten years ago, they will now be of huge dimensions, and witnesses of the prudence of leaving the pseudobulbs on the plants till they show signs of decaying. If the present head gardener at Wentworth should see these lines, perhaps he will favour the readers of the *Gardeners' Chronicle* with a description of the present condition and size of these plants, which would enable us to make a comparison with the others, and so see the results obtained from both methods of culture. R. C. H.

CLEMATIS FROM SEED.—Packets of Clematis seed may henceforth become an announcement in seed catalogues, judging from a batch of plants from seed now blooming in Messrs. Pope & Son's nurseries, Middleton, near Birmingham. Some plants were noticed seeding two years or so since, and, when ripe, the seed was gathered and sown, and both double and single-flowered varieties are now in bloom, some of them being of much merit. In one of the houses is a batch of plants. W. D.

STEAM-HEATING IN HORTICULTURE.—Heating by steam-power has, as yet, not been much used in England, but in the United States of America it is more common, and, being desirous of testing its efficacy as a means of heating greenhouses, Messrs. Pope & Sons had a steam boiler and pipes placed in their new nursery at Middleton, near Birmingham, two years' since, so that the system has had a fair trial. Previously, the usual hot-water apparatus had been put in for heating the large block of glass, but the steam boiler was placed as an accessory in very severe weather, and also to see what could be done by steam-heat alone. The boiler for generating steam is an upright cylinder, 8 feet high, and 4 feet in diameter, and equal to generating 6 horse-power. From the top, the steam passes through a 4-inch flow-pipe to some three or four of the houses, where additional pipes are placed purposely for steam, and there is no fear of any explosion in the houses or injury from an escape, as an admirably constructed steam-trap is in use in connection with each house. This boiler for steam purposes is unquestionably a source of very great economy in fuel, as any kinds of waste, slack, cinders, &c., can be used, burning away with rapidity, and steam is very soon got up, and in a few minutes the pipes are hot and throwing out a genial heat. I saw the apparatus in action in the winter of 1890 and 1891, and I had an impression that a dry and somewhat scorching heat would be given off, and not be very suitable to plant life. I was soon undeceived, for the temperature of the houses was all that could be wished, and plants were doing well. Roses in pots are grown very extensively here, and a long house is now filled with Tea Roses, *Maréchal Niel*, and others, and is in charge of one of Messrs. William Paul & Son's old Rose-men, so from such a school he knows something about Rose-growing under glass. He also was prejudiced against steam-heating at first, but he is not now. Every plant is in perfect health, not a speck of mildew or spot to be seen, and he attributes this to the dry atmosphere he is able to command at nights; and, although no heat is wanted now in the daytime, he has a little steam-heat turned on in the evening, the boiler being set going purposely to dry the atmosphere for the night. In a conversation with him, he attributed the success to this fact, and the use of sulphur on the pipes. There is, however, one drawback to the use of steam in small gardens: the boiler requires some one to be in constant attendance, but almost any sort of rubbish can be burned, and, as I before stated, the coal-bill has been reduced from 60 to 70 per cent. But in large establishments it becomes a question whether the cost of keeping a man in attendance at night for five or six months is not

desirable when so great a saving in the cost of fuel is achieved, and heat so speedily generated. A person, who need not be named, but who has a great experience of market-growing, assured me that, so satisfied was he of the benefits of steam-heating, that some day he hoped to employ steam-power extensively. Some of your correspondents may be able to furnish their experiences, and so get the question to the front before next winter. W. D.

ASPARAGUS.—What may be called a hint to decorators was observed on a call at historic Holland House, Kensington, the other day. Mr. C. Dixon, the gardener there, had a lot of the common Asparagus in large 60's; seed had been sown in these sized pots, which presented little pictures of graceful, elegant, grass-like foliage, working in well with other plants in this stage for house decoration, fire-places, and similar purposes. J. B.

WISTARIA SINENSIS, ETC.—A very pretty effect was observed on a recent visit at the residence of Sir John Fowler, Bart., the eminent engineer, Thornwood Lodge, Kensington, the front of the mansion being literally wreathed with this grand deciduous hardy climber, its beautiful racemes of lilac flowers being thrown into bold relief by the golden and silver varieties of Ivy climbing at each side of the house. In the same pretty suburban garden, which is so well managed by Mr. Frogbrook, I noticed a fine tree of the now seldom seen *Magnolia Gordoniana*, introduced from North America in 1750. Last year it bore 1300 flowers, and this year the tree gives promise of even beating that performance. It flowers from now to August. B.

ROCK PLANTS IN FLOWER.—In the *Gardeners' Chronicle* of last Saturday, in the Scottish news, I saw an account of a meeting of the Botanical Societies of Edinburgh and Glasgow, in which is an account of the rock garden during May, and 119 species and varieties of flowers are stated to have been in bloom. We have a rockery here, and during the month of May we have had 124 species and varieties in bloom. The most noticeable were *Gentiana verna*, *G. acaulis* (one clump about the size of two fists had nineteen flowers open at once), *Alyssum saxatile*, *Arnebia echioides*, *Saxifraga muscoides purpurea*, *S. hypnoides*, *S. Andrewii*, *S. Wallacei*, *S. granulata fl.-pl.*, *Iberis superba*, *Trillium grandiflorum*, *Silene virginica*, *Tiarella cordifolia*, *Aubrieta Leichtlini*, *Primula purpurea*, and *Cypripedium calceolatum*. We hope to have many more by next May. R. Hosier, *Swaylands, Penshurst, May 30*.

"NICOTINE FUMIGATOR."—Repeated trials of this material convince me that it is far preferable to tobacco-paper. The tender young leaves of Tea Roses, *Maidenhair Ferns*, &c., are not in the least injured by the smoke or fumes arising from it when burning, although they are fatal to green-fly. No vessel is necessary beyond an old flower-pot or two. Into these should be dropped a few pieces of coke from the furnace, and upon them the nicotine cakes, broken into pieces, have to be placed. Nothing can be more simple or effectual, and I am much indebted to Mr. George, of Putney, for drawing my attention to this excellent fumigating material, and for his practical suggestions as to the best method of using it. The "Nicotine Fumigator" should be used freely, for whatever fumigating material is employed, it is only by repeated fumigations that green-fly, thrips, &c., can be kept under. W. R., *Streatham Hill*.

LARCH FUNGUS.—A very serious case of Larch disease has occurred on the estate of a Mr. Alex. Wilson, of West End, about 2 miles from Hambleton, Hants, and 8 miles from Bishop's Waltham. Mr. Wilson has been a large planter of Larch for many years past. I went over last week, at his particular request, to see the effects of the disease, and to ascertain all about it. When we got to the first plantation of 12 acres, I was perfectly surprised to find the whole absolutely dead. A few had endeavoured to make a sickly growth from the main stem, but out of the 12 acres, there was not one healthy tree left. The plantation was made just thirteen years ago, and made good growth till the year before last, when the disease first appeared. Mr. Wilson immediately had all the trees, apparently diseased, cut down, and again last year, but since then the disease has progressed so rapidly, that not one healthy tree remains. It is quite sad to see the plantation, which presents an extraordinary appearance in walking up and down the open spaces or drives. The trees were planted 4 feet apart, and they average from 15 to 18 feet in height. Many only last season made a growth of 2 and 3 feet.

The ground is on a gentle slope from top to bottom, loamy, with a chalk subsoil. We then visited another plantation within a few yards, of eleven years' growth, which appeared healthy at a little distance; but on closer examination, it appeared very evident they were about to be attacked, although at present it would scarcely be noticed, as they are making a good growth. This plantation also contains 12 acres. We then visited another plantation of the same size which had been planted about seven years. The disease appeared very bad here, and the whole will doubtless be destroyed. Of course, Mr. Wilson is very anxious about the matter, and would like to know, if possible, the nature of the disease, and if there is any remedy for it. A very large quantity of Larch has of late years been planted in that part of Hampshire, and it will be a national calamity if the disease extends in such a rapid and extraordinary manner. I took several small branches and pieces of bark, which I have posted for your examination. You will see a number of brown spots and small white cups which are either the cause or the effect of the disease, as I imagine the disease is of a fungoid character, as it seems impossible to attribute it to any other cause. I could only recommend Mr. Wilson to cut down the dead plantation at once and burn the debris. Most of the trees would make good Hop-poles. Any advice you can offer I am sure will be greatly appreciated. Several Scotch and *Pinus anstracia* in the same plantation were not in the least affected. W. H. Rogers. [The too-well-known Larch disease, due to a fungus, *Peziza Wilkommii*, A paper embodying all that is known on the subject was lately published by Mr. John Carruthers in the *Journal of the Royal Agricultural Society, En.*]

GARDENERS' ORPHAN FUND AND GARDENERS' BENEVOLENT INSTITUTION.—Through the kindness of my employers, Mr. and Mrs. John Fielden, I am permitted to have the use of the gardens and grounds here, in which to hold a sort of *fête*, making a charge of say 1s. each for entrance, the whole proceeds to be divided between the above-named very excellent garden charities. The exact date is not yet fixed, but we propose to have it some time about the middle of August. Most, if not all, of the several Paxton and other gardeners' societies in the various Yorkshire towns have kindly promised to help in the matter, and so make it a representative gathering of Yorkshire horticulturists of all kinds, trade professionals, and amateurs. The well-known Paxton Society at Wakefield, through their secretary, Mr. Garnett, has shown much enthusiasm in the matter. While avoiding the usual paraphernalia of *fêtes*, it is thought that a cricket match between a home team and one representing, say, the rest of the horticulturists of Yorkshire, with a local brass band, would be of interest. We shall require, say, twenty guarantors of 10s. (not to be called on if the day is fine and visitors numerous), so as to ensure payment of preliminary expenses, which, I need scarcely add, will be kept to the lowest possible point. Our agent, E. Harrison, Esq., has kindly promised to act as treasurer, he will also captain the home cricket team, if possible. As honorary secretary, I shall communicate details to secretaries of all the various societies shortly. Meantime, offers of help and assistance in any shape will be gladly received. Henry J. Clayton, *Grimston Park Gardens, Tadcaster*.

TREES AND SHRUBS.

DECIDUOUS DAPHNES.

DAPHNE MEZEREM and its varieties are among the most welcome of early spring-flowering shrubs. In January and February, it may be seen pushing forth its flower-buds, ready to open when the sun's warmth increases. Both *D. Mezereum* and its rarer known variety, *D. M. alba*, make capital border shrubs if planted in clumps of three or four, or better still, in round beds on the grass about 10 feet across, putting the largest plant in the centre, and arranging the others around it according to size. These beds, when in flower, make a pretty picture, and fill the air for some distance around with their perfumes during the first months of the year. To make the best use of the ground, *Ruscus hypoglossum* may be planted between the *Daphnes* as a groundwork, and to set off the *Daphnes* to advantage; moreover, the *Ruscus* looks very pretty in itself when the *Daphnes*

are leafless. Both shrubs delight in a cool moist situation if the water be not stagnant, and the soil in which they thrive best is turfy loam, with a liberal addition of well-decayed leaf-mould. In mild winters, *D. Mezereum* may be found in bloom in the month of December, but its usual flowering time is February and March.

D. Mezereum alba is a pretty white form of the above, and usually a fortnight later than the type in coming into bloom. It flowers as freely as that, and is as delightfully fragrant. If planted together with the *Mezereum*, a fine display of bloom can be kept up for a long period of time, and that, too, when scarcely any other hardy shrub is to be found in flower.

D. M. grandiflora, the freest-flowering kind of the section, has of late come to the front, and it is a grand shrub, which is not peculiar as to position or soil. It flowers more or less from October till March, the colour of the blooms being a soft pink, and it is highly fragrant. It is a very desirable winter-flowering shrub for gardens of a limited extent, and where, if a *Daphne* is going to be planted, it should be *D. M. grandiflora*. In August, the *Daphnes* are covered with berries, which, in *D. alba*, are yellow, in the others red. There is a double form in cultivation, but it is not nearly so attractive as the single-flowered ones; still, in a collection of these shrubs, it should find a place. Very little difficulty is experienced in increasing the stock of these plants, which may be done by sowing seeds as soon as ripe in light soil, covering the seeds with finely-sifted soil, and, after watering the seed-pans, place them in a temperature of 55° to 60°, where they will germinate in a short time; whereas, if they are sown in the open ground, I have known them to be two years in germinating. In transplanting *Daphnes*, it should always be carried out soon after the fall of the leaf, as root-action commences with the approach of the new year. The double kind is grafted on the common *Mezereum*, and placed in close propagating cases early in spring. *H.*

THE SILVER LIME, *TILIA TOMENTOSA*.

The genus *Tilia* embraces some good subjects particularly valuable for the ornamentation of parks and gardens, and of these, *T. argentea* or *T. alba*, as sometimes named, is one of the most beautiful. It is indigenous to Hungary, European Turkey, and Asia Minor, and was introduced in 1767, and although it does not appear to have been employed to any extent by landscape gardeners, it might nevertheless have been used very effectively and advantageously in many positions where other less ornamental deciduous trees have been planted. It thrives well upon strong heavy soil that suits the Oak, and like most of its congeners makes rather rapid growth, withstanding the force of wind better than do many trees; and for this reason apart from its great beauty it is admirably adapted for isolated situations, or for placing prominently in the foreground of groups, or other ornamental plantations of trees. This species, while being symmetrical in habit of growth, unlike the common Lime, deviates from the pyramidal form, and forms a round-headed tree. [In this respect it differs from *T. americana* Alba, Ed.] The pendulous nature of the branches, however, is its most attractive feature, affording it a graceful appearance, especially when clothed with their beautiful foliage, which is somewhat glossy and dark green on the surface, and silvery beneath, and has not the falling so common to that of the generality of Limes of falling early. Its blossoms are larger, and also later in opening than those of *T. europæa*, and are moreover more freely produced, and much more fragrant. The largest specimen that I have seen is at this place, where it is grafted upon the common species, and is 62 feet in height. It stands upon a lawn, and when I first saw it, its bottom branches were cut back to about 5 feet from the turf; it is, however, allowed to grow uncut since then, and when Mr. Milner a short time before his death saw this tree, he was much struck with its beauty, and remarked that the species deserved to be more frequently met with than it is. *Thos. Coomber, The Hendre Gardens, Monmouth.*

CALOPHACA WOLOARICA.

This deciduous shrub has the misfortune of being old, otherwise its merits would not be so often ignored. It forms a very interesting plant when on its own roots, reaching a height of 3 feet, but when grafted on the *Laburnum* as a standard, its beauty is greatly enhanced. It succeeds admirably in any garden soil, and is not at all particular as to situation. The flowers are Pan-shaped, of a bright yellow colour, and borne in axillary pedunculate racemes, the number ranging from six to a dozen flowers. Season of flowering, June and July. The leaves are alternate, pinnate, with a spine-like termination, and a pair of lanceolate stipules at the base. The seed-pods are of a lively red colour, and highly ornamental, oblong in shape, and stalkless. It is a native of Siberia, and was introduced into England more than a century ago. *W. H. Aggett, Oakdene, Guildford.*

GARDENING NOTES.

IN reference to your editorial extracts on *M. Mer's* paper some time ago, on the "rise of growth in trees," I had intended, in my former article on this subject, to add a few words on a question which is constantly cropping up in these pages, but which has also a very direct bearing on the subject-matter of those extracts, and one which is still very imperfectly understood, as no unanimity of opinion is held with regard to it, viz., the cutting back or pruning newly-planted fruit trees.

I have planted a great many fruit trees, and I have never yet neglected to cut them back, and hard back, too, if the planting has been from unavoidable circumstances delayed long beyond the proper time, and I have always had excellent results—results which, of course, I had previously anticipated—a good vigorous growth of young wood, and, consequently, corresponding root-action. Now, by many writers of the present day we are told to leave our trees severely alone for the first year at least, in order, as they say, to encourage a more active and greater root-action, through having a greater number of shoots and buds to maintain.

This is theory, but does this work out in practice? Do we find this greater root-action take place? I think not. What does take place usually with nursery fruit trees, say, two or three years old, when planted and left alone for the first year, is this—it starts, as we naturally expect, much more feebly into growth than if it had never been removed; the buds endeavour to break along the shoots, but at a much later date than usual; the buds at the apex of the branches, e.g., those which have not already formed a flower-bud, make but very poor growth, much of it not exceeding 3 inches, and it is no uncommon thing for these small top shoots to have a small flower bud set on end of each, brought about, it may be, by a dry summer, but chiefly, as might be expected, by the inability of the roots to supply sufficient nourishment for more perfect growth.

The buds breaking along the previous year's wood cannot, through lack of nourishment from roots not yet in action, break, as many would otherwise do, into, at least, small shoots; but are therefore compelled, as it were, merely to exist, and draw their nourishment from the shoots and branches, in the shape of reserve forces stored up in their tissues, which is only sufficient to enable these buds to build up therewith a fruit or flower bud, and in many cases this happens along the entire length of the previous year's wood, so that it is quite common to see such a tree, having been left alone the first year, smothered in flower buds, and bearing a heavy crop the next. But, I ask, at what expense is such a crop borne? By affecting the whole after-life of the tree, I may answer, and I do not think I should be far wrong. The effect of this treatment on a young tree is debilitating in the extreme.

It is doubtless a very gratifying sight to amateurs, to see their trees bearing at so early a stage of their existence, but to those acquainted with its after effects, it is one which they would not care to court.

By planting a fruit tree, and leaving it alone for

twelve months, we miss the opportunity—which really never occurs again—to shape it from the start by cutting back, or rather, pruning it judiciously, more or less, according to the variety and time of planting; but, as before said, the formation of so many flower buds on the branches, drains them of the elaborated juices, and induce thereby a state of debility and emaciation from which it rarely or ever recovers.

We have only to examine such trees to observe the difference in colour of the bark, as well as its texture, and those of the same age and variety which have not been disturbed to find this most marked indeed. In the former, the bark has completely changed colour; instead of the deep, glossy, olive-brown, and showing, in the case of Apples, that peculiar downiness around the buds, and the bright characteristic markings on the young shoots of the several varieties, it becomes of a dull tawny colour, resembling a mixture of Hazel and Saffron. The down and gloss are gone, the texture of the bark is now harder and drier, as well as much thinner, and the whole tree now assumes that appearance known amongst gardeners as "hide" or "barkbound."

When these trees come to be pruned, what do we find? Why, that almost the whole of the wood-buds, through the want of proper root nourishment, have been formed into flower-buds, and the advocates of the system neglect to tell us to which of these we are to cut to in the following autumn.

The natural consequence is, that when these trees are pruned back, having no wood-bud to cut to, the trees stand stock till, so to speak, for years, and rarely make the trees they otherwise would have done. Besides, and owing to this fact, we can never get such trees into proper shape, for it must be admitted that many nursery trees have very far from that ideal form which we wish to have them.

This does not arise so much from lack of attention in their initial stages of pruning and training, as to their having to stand in the nursery rows for two or three years; but pruned at time of planting, they can in a season or two be made into very shapable plants.

Alluding again to *M. Mer's* theory that growth first starts at the extremities of the branches, and then passing downwards through the central portion of the head and stem, and lastly taking place from ten to fifteen days later in the roots, and allowing that this theory is correct, it almost follows that as the roots, even in the case of established trees, do not furnish the resources of this earliest growth, therefore the stored-up forces, or unappropriated food in the branches must be largely drawn upon for its sustenance, and it is; how much more so must this be the case in a tree, the roots of which have undergone the mutilation by tools, &c., inseparable from lifting?

Although not believing in all the theories advanced by *M. Mer*, we are supplied with ocular demonstration that top-growth really takes place first; and the advocates of the "let-alone" system say that the more shoots left, quicker and more vigorous root action supervenes; but if this is so, have we not a right to look for a corresponding top-growth, if not the first year after planting at least the second? But we do not get this, and for the reasons I have already stated.

There can be no vigorous root action unless we get young wood of the current season's growth covered with broad healthy foliage. That very little of this is made by trees planted and left alone for a year goes without saying. I have, therefore, no hesitation in condemning this "let-alone" system, as one altogether wrong in principle, and resulting in much waste of time, injury, and energy.

It will thus be naturally inferred, that as I condemn the above system, I must be a convert to the cutting-back principle, and which I am not ashamed to own to, and for the benefit of those who have not yet adopted it, or who may never have heard the chief reasons advanced against it, I will here briefly state.

As it is wholly impossible to buy nursery trees which have not suffered more or less in the lifting, by mutilation, by tools, and also the drying influence

of winds, &c., it behoves us to do everything in our power that may assist the tree in recuperating in the shortest period of time.

The knowledge, too, that top-growth takes place a fortnight before the roots start, is of the utmost advantage here, for by reducing the branches to one half or more in length, we not only save considerable of the plant's inherent forces from being drawn upon by the buds we cut away, but by thus giving fewer outlets for growth, we get this the first season after planting, of fair average size, and, moreover, have had the satisfaction—and no inconsiderable one, where we want to get our trees, especially dwarfs, into a fair average size before bearing—of shaping our trees from the start.

The principle of cutting back trees at time of planting is based upon the idea that, having cut off the supply by unavoidable breakage and damage to the roots, we must also reduce the outlets—branches.

If it could be proved that the roots first start into growth, those left in the case of a transplanted tree would then have a better chance of supplying the whole of the branches when left intact; but even then, why should we miss a season's pruning at a stage of its existence so amenable to the knife? and especially, seeing that it is next to impossible to get trees to break on the let-alone system.

The advocates of the latter say, that if you cut trees, you simply get a mass of lateral growth which have to be spurred back, and which in turn form more laterals, giving in time a regular broom-top to the trees. But this can be very easily guarded against, by leaving your trees unpruned whenever you have got them to a size suitable for bearing. This will have the effect of throwing the wood-buds on the previous year's growth into fruit-buds, and if the terminal buds break, but short growth will be made, which will nearly always finish up by forming a terminal flower-bud, and thus check to a great extent any further extension of lateral growth.

That the art of pruning is but indifferently understood by amateurs is patent to anyone going about in the country districts; and the advice tendered them, to leave their trees alone for the first year, and then cut them down or prune next autumn, is certainly more likely to complicate matters than mend them—in short, it is wrong, being based upon theories which do not work out in practice. *Pomum.*

SOCIETIES.

INTERNATIONAL HORTICULTURAL EXHIBITION.

MAY 27, 28.—The exhibition of plants, fruits, and vegetables held at Earl's Court had many features of interest to horticulturists and the general public alike. Flowering plants of certain kinds were abundant, Orchids and hardy cut blooms taking the foremost places. Specimen hard-wooded flowering plants were exhibited in considerable numbers, and of more than ordinary merit; and especially good were Roses, Carnation Souvenir de la Malmaison, and Calceolarias; and the show of Palms was one of the best that we have had in London for many years. Foliage plants other than Palms were fairly good specimens of cultivation, but Crotons are better done in the North, as are hardy Ferns, neither of which were present from that part of the country. Fruit, owing to the early date of the show, was necessarily restricted in quantity, and of little variety. Melons, Strawberries, Figs, and imported fruits being amongst the best shown. For the same reasons the exhibits of vegetables were not numerous.

Among the plants of which we had hoped to see many, but were disappointed, are Bromeliads, the Rhododendrons of Sikkim, tender and hardy Conifers, and choice evergreen and deciduous shrubs, the finer leaf Begonias and Nepenthes.

NEW PLANTS.

The most interesting feature of the show to plant-lovers was the display made in the various classes for "new plants" and plants not introduced into commerce. The main competition was between the "Horticulture Internationale (Linden) of Brussels," and Messrs. Sander, of St. Albans. The plants

exhibited by M. Linden were the same as those shown at the Temple, and described in our last issue, p. 696. On this occasion they were not so crowded, and showed to better advantage, though the fact that this was their second and not their first appearance told against them.

The twelve new plants of any description shown by Messrs. Sander included *Dracaena Sanderiana*, *Oreopanax Sanderianum*, *Maranta Mooreana*, *Leopoldina Laucheania*, *Cocos Pynaerti*, *Nidularium Makoyanum*, *Anthurium hybridum albanense*, *Acer Gordoni*, *Alcacia nobilis*, the variegated *Pteris* before mentioned, *Pandanus Dyerianus*, and *Cyclanthus Godseffianus*. For six new plants in addition to some already mentioned in other classes, the St. Albans firm exhibited *Nidularium striatum*, *Phoenix Roebelinii* (see fig. 105), *Anthurium roseiflorum*, and *Alcacia Rex*.

Three distinct Orchids introduced into commerce within the last three years. Here Messrs. Sander showed *Dendrobium Phalaenopsis*, var. *Dellensis*, *Grammatophyllum Measuresianum*, and *Cattleya hybrida Arnoldiana*, a hybrid raised at St. Albans. In the class for a new Orchid in flower (Class 21), Messrs. Sander showed *Miltunia Bleui* splendissima.

In class 54 a first-class certificate was awarded to Messrs. Sander for *Anthurium Lawrenzia*, a hybrid with an Ivory-white spathe, blade of leaf a dark green colour, 1 foot long, 6 inches wide. This plant

FIG. 105.—*PHOENIX ROEBELINII*.
(See New Plants, in this Column.)

also formed part of a group of three plants shown for the first time in or out of flower, the two others being *Dracaena Sanderiana* (hort. Sander) and *Maranta Sanderiana* (hort. Sander). The *Dracaena* has stalked sheathing leaves, with narrow lanceolate blades of a green colour, striped with white, and with a glaucous bloom over the whole surface. It will make a good plant for table decoration.

Maranta Sanderiana (hort. Sander) has broad, oblong, obtuse leaves of a deep bronze varnished colour, marked on the upper surface with oblique parallel cream-coloured or pink lines.

In class 56 one new plant not in flower, Messrs. Sander secured a prize for *Vriesia tessellata Sanderiana*, a dwarf compact-growing Bromeliad with broad oblong leaves of a green colour, with yellow bands of varying width running lengthwise, and numerous minute squarish tessellations marked out by deeper green boundary lines. A very beautiful variety.

Among other new, or comparatively new, plants were also shown blooming plants of *Cypripedium Chamberlainianum*, *Dipladenia Marie Henriette* (hort. Sander) shown in class 55 (one new plant in flower), a form with small leaves like those of a *Trachelospermum* and tubular flowers of a rich purple brown colour. It is a good form of *D. atropurpurea*; *Browallia speciosa major* is chiefly remarkable for the large size of its blue flowers, which are mostly terminal.

Alcacia argyrea, a form with long-stalked, bold, hastate leaves of a dark, bronzy green, flushed with silver.

Oreopanax Sanderianum is the plant mentioned by us some time since without a name, which is now supplied by Mr. Hemaley (see p. 718), where a full description will be found. For winter gardens and cool conservatories this will be found a very striking plant, while the peculiarity and variability of its thick, deep green foliage will always attract attention to it.

Cocos Pynaerti, which received a First-class Certificate, is a graceful little Palm, very much in the way of *Cocos Weddelliana*.

Pteris "phœnicophorum Harriis Victoria," a name meant not for use, but, as the French say, *pour rire*, is the beautiful Fern sent out by Mr. W. Bull. Its pinnately-cut fronds and narrow segments striped with silvery white, are very attractive.

Cyclanthus Godseffianus (hort. Sander) has noble leaves of a rich green colour, oblong, obovate, tapering to a sheathing stalk.

Pandanus Dyeri (hort. Sander) is an Australian (Queensland?) form, remarkable for its narrow bright green leaves, quite devoid of spines.

Calla Eliottiana, shown in class 55, is the yellow-stalked Aroid shown at the Temple.

Anthurium albanense (hort. Sander) is one of the hybrids from A. *Andreanum*, and with a deep red or crimson spathe.

Anthurium "Gloire de Gouville," shown in class 55 by Messrs. B. S. Williams & Son, is another of the same class, with pale pink spathes.

Leopoldina Laucheania, a Palm with arching pinnate foliage, hardly sufficiently developed to show its character.

Dracaena Coulingii has narrow stalked linear lanceolate leaves with alternating bands of white and green.

Neither the *Nepenthes* nor the *Sarracenia*s were adequately represented. *Sarracenia Flambeau*, a hybrid, was shown in bloom, and among the *Nepenthes* N. *Curtisi* (class 23) was remarkable for the thick covering of whitish or cream-coloured meal, by which its pitchers were covered.

ORCHIDS.

These plants were not by any means so numerous as at the Temple Show on the two previous days. Most of the trade collections there shown were present, but the private collections were conspicuous by their absence to a great extent.

In the competing classes Mr. Cypher, Queen's Road Nurseries, Cheltenham, was a good first, showing *Cypripedium caudatum*, with some thirty or more grand flowers, finely coloured; *Cattleya Mendelii*, C. *Mossie grandiflora*, and *Lælia purpurata*, all very good and fresh; *Dendrobium thysaniflorum*, some four feet through, and one mass of flower; D. *Bensonia*, *Miltunia vexillaria*, and *Cymbidium Lowianum*, in all an excellent dozen. Mr. James, Castle Nursery, Norwood, was 2nd, his best plants being a fine *Vanda suavis* and D. *nobile*.

In the class for amateurs for six plants there was no competition, although the prizes were liberal enough.

Messrs. Sander & Co. were the chief competitors in the classes for new Orchids, showing in the class for three distinct species (introduced within the past three years), *Dendrobium Phalaenopsis Dellensis* (one of the best forms), *Grammatophyllum Measuresianum* (with flowers profusely spotted upon a pale green ground), and *Lælia Arnoldiana* (L. *purpurata* × *Cattleya labiata*), having the rich colouring seen in the last-named parent, with some of the purplish lip of the former. Mr. Cypher, who was 2nd, showed *Cypripedium Chamberlainianum*, *Grammatophyllum Seegerianum* and *Dendrobium Phalaenopsis pallida*.

For one new Orchid in flower, Messrs. Sander & Co. were the only exhibitors, showing *Odontoglossum Bleui superbiusculum*, described in our report of the Temple Show. Entered in the same class by the same exhibitor were *Cypripedium nitidissimum*, distinct from (being paler), but not equal to C. *caudatum* at its best, *Oncidium Gravesianum vicians*, a superior form, and *Epidendrum Godseffianum* with buff flowers and a pale violet lip.

In the group classes wherein Orchids and fine-foliated plants were combined, the competition was not encouraging. In the Trade class one large group was disqualified for having flowering plants other than Orchids, but the 1st prize easily fell to Mr. Cypher without regard to this fact. He showed Orchids in profusion, consisting of *Odontoglossums*, *Cattleyas*, *Lælias*, *Dendrobiums*, and *Cymbidium*

Lowianum, all of these being effectively arranged with graceful foliage plants. Mr. James also secured in this instance the 2nd place, making a free use of *Cymbidium Lowianum*, but his foliage plants were characterised by too much heaviness.

In the corresponding class for amateurs, Mr. Currey, West End, Wilton Road, Salisbury, was placed 1st, having no antagonist. His group was well arranged, with a fairly large number of Orchids, *Cattleya Skinneri* being the most prominent species; well-coloured *Crotos* of small size added brightness to the whole.

There were several large groups of Orchids staged by nurserymen, but these were placed apart from the others near the West Brompton Entrance to the buildings, where the opening show was chiefly held. Messrs. Sander and Co. again staged a choice group of new and rare species; so also did Messrs. Hugh Low & Co. and Messrs. Charlesworth, Shuttleworth & Co. (of Bradford). To each of these groups a Gold Medal was awarded.

The immense specimens of *Dendrobium nobile*, shown at the Temple Show by Mr. Prinsep, gr. at Buxted Park, Sussex, were again exhibited here, still being in a very fresh state, received the award of a Silver Medal. (See fig. 104, p. 725.)

STOVE AND GREENHOUSE PLANTS.

These were shown in much better condition than at any previous exhibition this year in or near the metropolis, some of the specimens being quite equal to those that used to be seen in the palmy days of these subjects.

Mr. Cypher was a good 1st for twelve plants in the open class, having as his best some well-grown examples of *Darwinia tulipifera*, with fine flowers, *Erica Cavendishiana*, not over large, but a perfect specimen, and in profuse bloom; *Pimelea Hendersonii* and *P. spectabilis*, both in good order; *Erica ventricosa* Bothwelliana, the white variety, which was an excellent plant, as were two good distinct forms of *Anthurium Scherzerianum*, in very fresh condition.

Mr. Mould, nurseryman, Pewsey, Wilts, came in a good 2nd, having three plants superior to Mr. Cypher's, but the rest were below the average of the winning lot. This trio consisted of *Dracophyllum*, very fresh and fine, and fully 5 feet in diameter; *Phenacoma prolifera* Bainesii, in profuse flower, the specimen a dwarf one; and *Erica aristella*, a finely grown plant, not yet in its best condition; with these were two other good plants of *Tremandra verticillata*, very profusely flowered, and a half specimen plant of *Erica tricolor* Wilson, a variety which it is quite a treat to see nowadays.

Mr. Mould also showed a number of half specimen *Ericas*, chiefly of varieties of *E. ventricosa*, and to these a Silver Medal was awarded.

In the amateur's class, Mr. Chapman, gardener to J. Spode, Esq., Hawkesyard Park, Rugby, was an easy 1st with six plants which would well compare with the specimens of fifteen to twenty years ago, these were *Tremandra ericifolia*, a perfect specimen in every respect, some five feet in diameter and one mass of its rosy lilac flowers; and *Ixora Dixiana*, and *I. Williamsii*, were also fine examples of their class, being loaded with flower; *Statisia profusa* was quite a gem in its way, and exceedingly fresh, with numerous flowers of a deep shade of purplish blue; with these was another worthy companion plant in *Aphelaxis grandiflora*, which was both fresh, in good condition, and freely flowered; a very good example of *Anthurium Scherzerianum* completed this half-dozen, which fully sustained Mr. Chapman's reputation as an excellent plantsman. Mr. Finch, gr. to J. Marriott, Esq., Coventry, was 2nd, but he did not exhibit up to his usual standard; presumably it is yet too soon for him to display his strength. His best plants were *Azalea Mabel* and *Erica Cavendishiana*. The stove and greenhouse plants materially added to the effect produced by the large masses of Palms, *Crotos*, and other foliage plants that came from various exhibitors.

FOLIAGE PLANTS.

In the class for six *Crotos* (distinct), open only to amateurs, the 1st prize was obtained by a very fine collection of well-grown and coloured plants, about 5 feet high, and more than that in breadth. The varieties were *D'Israeli*, *Evansianus*, *Prince of Wales* (Silver Medal), *Warreni*, *Queen Victoria*, and *undulatus*, shown by Mr. A. Offer, gr. to Jno. Warren, Esq., Handcross Park, Crawley.

In the nurserymen's division, for ten *Crotos* (distinct), Messrs. E. D. Shuttleworth & Co., Limited, 250, Peckham Rye, S.E., were awarded the premier position. For eight fine foliage plants (distinct),

Mr. J. Cypher, Cheltenham, exhibited in his usual form, obtained 1st prize, with the following:—*Cycas circinalis*, *Kentia Fosteriana*, *Dasyllirion acrotrichum*, *Latania borbonica* (*Livistona chinensis*), *Kentia Belmoriana*, *Cordylus indivisa*, *Echeopalaros villosus*, and *Croton Sunset*.

Class 35 (amateurs), for six fine foliage plants (distinct).—Mr. A. Offer secured the premier award, for good healthy specimens of the following:—*Cycas circinalis*, *Croton angustifolius*, *Alocasia macrorrhiza variegata*, *Kentia Belmoriana*, and *Croton princeps*.

In the nurserymen's division for nine distinct Palms, Messrs. Wills & Segar, Royal Exotic Nursery, South Kensington, were an easy 1st; this exhibit, which was arranged in a very tasteful manner, was of excellent merit, and consisted of the following:—*Scaevola elegans*, *Kentia Belmoriana*, *K. Wendlandiana*, *Latania borbonica*, *Phoenix canariensis*, *Raphia humilis*, *Areca Baueri*, *Pritchardia pacifica*, and *Kentia Fosteriana*, all large, the latter being about 20 feet high. Mr. Jas. Cypher, Cheltenham, was 2nd, with good specimens, including a monster *Livistona chinensis*.

Twelve *Dracenas*, distinct.—Messrs. John Laing & Sons, Forest Hill, S.E., obtained the 1st prize with good, well-coloured specimens, including *Madame Bergman*, *Thompsoni*, *Massangana*, *Alsace Lorraine*, *Lindeni*, *Barteti*, and *indivisa variegata*, a very pretty and useful variety.

For six *Dracenas* (distinct), amateurs, Mr. Offer was 1st, with well-grown and highly-coloured plants, including a very novel and pretty variety, called *Robinsoniana*. The 2nd prize was secured by Mr. Wm. Horne, gr. to Henry Tait, Esq., Park Hill, Streatham Common, S.W., who had four excellent specimens, but, unfortunately, the other two (*Gouldiana* and *Witzchenii*) were much smaller, but for which the awards might have been reversed.

For six distinct Palms (amateurs), Mr. A. Offer secured 1st with his large fine specimens of *Livistona chinensis*, *Latania Commersonii*, *Phoenix tenuis*, *Kentia Canterburyana*, *K. australis*, and *Pritchardia pacifica*. Messrs. Jno. Peed & Sons were 1st in the competition of the best ten distinct *Caladiums* (nurserymen).

In the amateurs' class for the best six *Caladiums* (distinct), the 1st prize was awarded to W. S. Glover, Esq., Casino House, Herne Hill, S.E.

Messrs. B. S. Williams & Son, Upper Holloway, obtained 1st prize for a pair of specimen *Tree Ferns*, showing two large *Dicksonia antarctica*.

FLORISTS' FLOWERS.

These were generally of much merit, although in some of the classes there was not a great deal of competition.

In the nurserymen's class for twenty herbaceous *Calceolarias*, the 1st prize was secured by Messrs. J. James & Son, Woodside, Farnham Royal, Slough, upon whose plants one could scarcely imagine an improvement possible, their habit being all that could be desired, and the flowers large, and of beautiful colours.

For six herbaceous *Calceolarias*, open to amateurs only, the Hon. H. C. Legge (gr., W. Mowbray), Fulmer, near Slough, was 1st, with very good examples in 8-inch pots, dwarf, and about 3 feet in diameter.

Messrs. J. Laing & Sons, Forest Hill, S.E., were to the fore in the nurserymen's class for twelve double-flowered tuberous *Begonias*, all the specimens being of great merit. The following varieties obtained Certificates:—*Lady Brooke*, *Laing's Rosebud*, a beautiful flesh-coloured variety, which struck us as being the prettiest yet raised; *Mr. Hudson*, a rosy-crimson; *Alfred de Rothschild*, dark crimson; and *Baron Schroder*, a bright red. The same firm was placed 1st in a similar class for twelve single-flowered *Begonias*.

For twenty pots or pans of *Pansies* (open), the successful exhibitor was Mr. F. Hooper, Vine Nurseries, Bath, who was also 1st for twenty pots or pans of *Violas*, both of his exhibits being very fine.

Messrs. Jno. Laing & Sons were to the front in the nurserymen's class for twelve distinct *Gloxinias*, showing examples whose colours baffle description; whilst H. E. Barker, Esq., Leigham Holme, Streatham Hill, S.W., was 1st in the amateur's class, with very fine and well-flowered plants.

Messrs. B. S. Williams & Son, with their fine varieties of *Clivias*, were 1st in the class for twenty distinct. The Upper Holloway firm were 1st also for twelve distinct *Amaryllis* (open).

For six zonal *Pelargoniums*, distinct (amateurs).—1st, R. W. Mann, Esq., Langley Broom, Slough, with good plants, some 4 feet through. The varieties

were Mrs. Gordon, J. Macintosh, Rev. Harris, Mr. H. Cannell, Norah, and Lord Chesterfield.

The same exhibitor was 1st with six fancy *Pelargoniums*, in 8-inch pots, distinct. The plants were good, and dwarf, the varieties being Mrs. Cope, Princess Teck, *Delicatum*, East Lynne, Mrs. Porter, and Lady Carrington.

ROSES.

For twenty Roses, in 10-inch pots, not less than twelve varieties, the 1st prize was awarded to Messrs. Paul & Son, Old Nurseries, Cheshunt, with an excellent group, amongst which were noticed the following varieties:—*Her Majesty*, *Alba rosea*, *Junio*, *Souvenir de S. A. Prince*, *Celine Forestier*, *Madame Victor Verdenier*, and *Madame Lacharme*. Mr. C. Turner, Royal Nurseries, Slough, was 2nd with plants of considerable merit, the best of which were *La France*, *Monchame*, *Madame Lacharme*, *Madame de Montchateau*, and the familiar *Charles Lawson*.

For eight distinct Roses in pots, open to amateurs only, H. E. Barber, Esq., Leigham Holme, Streatham Hill, S.E., was the only exhibitor, and had a meritorious collection.

Messrs. Paul & Son, Old Nurseries, Cheshunt, were the only competitors in the group class for 30 Roses in pots (including standards), but this was a magnificent group, including specimens of (*Teas*), *Alba rosea*, *Celine Forestier*, *Ernest Metz*, *Francis Kruger*, and (*H.P.'s*) *Duchess of Albany*, *Her Majesty*, *Comte de Paris*, besides several varieties of *Rosa Polyantha*.

COMPETING MISCELLANEOUS.

For a collection of hardy, herbaceous, bulbous, and alpine plants (nurserymen), Mr. T. Ware, Hale Farm Nurseries, Tottenham, was 1st with a very extensive group of interesting plants that were in the best of condition.

Mr. G. H. Sage, Ham House, Richmond, was the only competitor for the prize for thirty hardy, herbaceous, bulbous, and alpine plants, distinct (amateurs).

Mr. T. S. Ware was the only exhibitor of hardy deciduous shrubs in flower, not exceeding 200 square feet (open), but this exhibit was of such proportion and merit as to compensate for the absence of other competitors.

For eight *Lycopods* distinct (open) the only competitor was H. W. Segelke, Esq., Effmole Lodge, Herne Hill, S.E. (gr., Jas. Lambert), who was awarded a 2nd prize.

The Covent Garden competition served to bring together one of the brightest displays of flowering plants massed together in a group that one could desire to see. Indeed, they were so massed together that a good deal of their individual beauty was lost. Messrs. W. & F. Brown, Brent Nurseries, Hendon, were awarded a 1st prize for 100 best garden market plants in flower in 48-size pots, and not less than four distinct sorts; and Messrs. J. & J. Hayes, nurserymen, Lower Edmonton, a 1st for a group of market flowering and foliage plants arranged for effect in space not exceeding 150 square feet.

NON-COMPETING MISCELLANEOUS.

The exhibition groups shown by the Trade were both numerous and meritorious, but the demand upon our space will not allow us to give more than a very brief notice of the same. Messrs. H. Low & Co., Clapton Nurseries, London, were awarded a Silver Medal for a similar group of *Ericas* to that exhibited by the same firm at the Temple Show last week. Mr. H. Cannell, Swanley, exhibited a group of *Cactus* plants, also noticed at the Temple Show (a Silver Medal). Messrs. Jno. Peed & Sons, a Silver Medal for a group of *Palms*, *Ferns*, *Anthuriums*, &c. Mr. Adolphe D'Haene, Belgium, was awarded a Silver-gilt Medal for a group of *Palms*, *Ferns*, and such-like plants, thus helping to make the exhibition an international one; as did also M. Linden with new plants before mentioned, and M. Louis van Houtte, Royal Nurseries, Ghent, with a very fine and rare collection of some twenty-five distinct varieties of *Bertolonias*. This exhibit was awarded the highest award—a Gold Medal.

Messrs. J. James & Son, Farnham Royal, Slough, exhibited a group of *Calceolarias* in bloom, and was awarded a Bronze Medal.

A noble and interesting group was that exhibited by Mr. William Ickton, Putney Park Lane, which consisted of large *Palms* and other foliage plants, amongst which were a number of *Tea* plants belonging to the Ceylon Tea Co. This group was also awarded a Gold Medal.

Eighteen *Tea-scented* Roses, distinct, nurserymen.—Some very fine blooms, but owing to the heavy rain of the previous day, not at their best, were

shown by Mr. Mount, Exotic and Rose Nurseries, Canterbury, who received the 1st prize for them. The best were Souvenir d'Elise, Miss E. Brownlow, Jean Ducher, Souvenir d'un Ami, Catherine Mermet, a very fine bloom; and The Bride. Mr. Mount showed twelve Roses other than Teas, also taking the premier award. His Duke of Wellington, General Jacqueminot, Merveille de Lyon, Eugene First, and Ulrich Brunner, were the best, these being free of good substance. In this class Mr. C. Turner, Slough, 2nd, had Madame Victor Verdier, Star of Waltham, and Beauty of Waltham, in fine condition.

An excellent exhibit of Pansies and Violas in great variety, together with a number of Sweet Peas in variety came from Messrs. Dobbie & Co., Rothsay, N.B. The exhibitor received a Silver Medal. Messrs. J. Laing & Sons showed, not in competition, a collection of border flowers and foliage of hardy plants in much variety, together with varieties of Columbine. The same firm had a table filled with mixed stove and greenhouse plants, mixed with small Palms and other decorative plants.

A large group of Souvenir de la Malmaison Carnation in its pink and white varieties came from Mr. Crapp, gr. to Lord Wimborne, Canford Manor, Dorset. The blooms were of an average size, and the plants rather tall (Silver Medal). Mr. Jennings, gr. to Leopold de Rothschild, Esq., Ascot, Leighton Buzzard, an older hand than the previously mentioned exhibitor in the culture of these lovely flowers, showed the same varieties in dwarf compact plants, covered with large blooms. A fine yellow Carnation, named Alnira, came from the same garden.

A mixed floral group was arranged by Messrs. W. Cutbush & Co., Higgate (Silver Medal). Messrs. B. S. Williams & Son contributed a group of plants consisting chiefly of *Amaryllis* in variety, *Orchids*, *Azaleas*, *Clorodendron Thompsons*, *Rhododendrons*, &c.

A fine group of Roses (non-competing), in bushes and standards, including H.P.'s, Teas, and Moss varieties; and besides these a dozen show boxes filled with Roses in triplets. The new Roses Princess May and Her Majesty were among the plants shown.

Ghent Azaleas, both double and single-flowered, and Azalea mollis, both in great variety, came from Mr. A. Waterer, Knap Hill—a very fine showy group (Silver-gilt Medal).

A very extensive collection of Peonies, single and double-flowered; varieties of *Pyrethrum roseum*, *Pyrethrastrum*, of which *Phyllis Broughton*, *Laura*, *W. Pitt*, *Wilkie Collins*, and *Magistrate*, were among the best; and a lot of showy Moutan Peonies, including *M. P. magniflora*, *Ilacina*, a flower of large size, if not of striking colour.

FRUITS AND VEGETABLES.

Although early in the season, yet the considerable prizes offered in the schedule served to attract exhibitors from long distances, even so well-known a grower as Mr. McIndoe, from Hutton Hall, Darlington; but then he came for some purpose. As, for instance, in the class for fruit collections, eight varieties, he was an easy 1st, having admirable Black Hamburg and Foster's Seedling Grapes, good Belle Grosse Peaches, Lord Napier Nectarines, Queen Pine, Best-of-All Melon, very golden in colour and handsome; Strawberries Noble, and Cherries Frogmore Bigarreau, a highly meritorious lot for the time of year, especially from a place so far north as Darlington. Mr. McIndoe's only and far from strong competitor was Mr. John Crawford, gr. to Colonel Thorpe, Newark-on-Trent.

Black Grapes, three bunches, brought seven competitors, with in all cases pretty good fruit. The best, however, came from one of the best southern growers, Mr. Osman, gr. to L. T. Baker, Esq., Otter-shaw Park, Chertsey, who had very fine and admirably finished Black Hamburgs; Mr. McIndoe coming 2nd with the same variety, perhaps larger but less handsome bunches. There were but five lots of three bunches of white Grapes, Mr. McIndoe coming a good 1st with excellent well-ripened clusters of Foster's Seedling; Mr. Peters, gr. to J. J. Mansell, Esq., Guernsey, being next with fairly ripened but still greenish Muscat of Alexandria.

Because of the presence of some of the wonderful pot-Strawberries from Hatfield, the class for twelve plants in pots in fruit attracted much attention. Mr. Norman, gr. to the Marquis of Salisbury, had Marguerite in grand fruit, each plant carrying eight, and all large and fully ripened. They had travelled remarkably well. Very good, each plant carrying

twelve fruits, were the pots of Sir Charles Napier, staged by Mr. Thompson, gr. to Messrs. W. & E. Wells, Hounslow; and from Mr. Chuck, gr. to P. Thelluson, Esq., Brodesworth Hall, Doncaster, came very fair British Queen, the fruits tied up erect above the foliage; these were placed 3rd. With a single dish, Mr. Norman was invincible with wonderful fruits of Anguste Nicaise, the twenty-five weighing 3 lb. 3 oz., a trifle over 2 oz. each. These were the talk of the show, and excited the liveliest interest. It was very curious that, although several others showed single dishes, the three exhibitors of plants in pots also took the single-dish prizes.

Mr. Robins, gr. to Colonel Lee, Hartwell House, Aylesbury, had the best six Peaches in Hales' Early; and Mr. McIndoe 2nd with Grosse Mignonne. He was 1st with six Nectarines, having fine Lord Napier; Mr. Jas. Hudson of Gunnersbury House Gardens (the Messrs. Rothschild), being 2nd with the same variety. Mr. McIndoe was again to the fore with a dish of fine Black Tartarian Cherries.

Melons.—The best Scarlet-flesh, of which a dozen were shown, came from Mr. Crawford in Scarlet Premier. The very best Melon in the show, a beautiful white-flesh, The Countess, came from Mr. Bowerman, gr. to T. Hoare, Esq., Hackwood Park, Basingstoke, very luscious and of fine flavour.

Miscellaneous fruits included a big lot of some seventy Melons from Mr. Churchman, not named, to which a Silver Medal was awarded, the same award being made to a very fine lot of Melons, Peaches, Nectarines, Oranges, &c., from Mr. McIndoe; and a Bronze Medal was awarded to Mr. Blick, The Warren, Hayes Common, for a collection of eighteen Melons, very few of which were ripe.

A grand group of market produce to which a Gold Medal was awarded, is referred to in another column. Mr. Le Poidevin, of Guernsey, also staged excellent market fruits and vegetables. Mr. Henderson, gr. to Thoresby Park Gardens, showed four Melons; Mr. Miller, Baxley Lodge, Esher, Apples and Mushrooms; and Mr. J. C. Talloch, gr. to E. Dresden, Esq., Livermore Park, Bury St. Edmunds, had a fine dish of Brown Turkey Figs.

Vegetables.—A veteran exhibitor, Mr. Lockie, worthily took the 1st prize, with a collection of forced vegetables, having handsome examples of Perfection and Royal Windsor Cucumbers, good Mushrooms, Early Gem Carrots, Long Negro Beans, Snowdrop Potatoes, American Wonder Peas, Perfection Tomatoes, and long white Marrows; this was an excellent lot, that it would have been very difficult to beat. Mr. Crawford was 2nd, having Puritan and Sutton's Seedling Potatoes, Milan Turnips, Osborne and Ne Plus Ultra Dwarf Beans, Nantes Carrots, Chelsea Gem Peas, and Perfection Tomatoes.

Mr. Crawford was the only exhibitor of eight varieties of outdoor vegetables—Asparagus, Beet, Model Broccoli, Cabbages, &c.

A capital basket of salad, in eight varieties, came from Mr. Newell, gr. to Sir E. Saunders, Wimbledon, including excellent Radishes, Beet, Mustard, Cress, Endive, Lettuce, Chervil, and winter Onions; it obtained a 1st prize.

Only one bundle of Asparagus was staged—a fair sample.

Cucumbers produced a better competition, and Mr. Lockie was an easy 1st, with a beautiful brace of his Perfection; Mr. Morland, Swiss Nursery, Farnham, 2nd, with Express or A. 1, 2 feet long; and Mr. Crawford was 3rd, with long fruits of Webb's Perpetual Bearer.

The best dish of twelve Tomatoes, consisting of Perfection, came from Mr. Mount, Exotic Nursery, Canterbury; Mr. Le Poidevin and Mr. Lockie being 2nd and 3rd, with the same variety.

Mr. Mortimer made a fine show with his superb Cucumbers, Success, A. 1, and Matchless, and boxes of fine Tomatoes, obtaining an award of a Silver Medal. The collection was fronted by twelve fine Hero of Lockinge Melons from Mr. T. Bowie, Sutherland, Reading, and were included in the award.

Imported Market Products.—Of the numerous and interesting exhibits seen at the show, few, perhaps, exhibited the economical aspect of fruit growing than the collection of fruits and vegetables staged by Messrs. W. N. White & Co., the well-known salesmen of Covent Garden. Here was an object-lesson at once for would-be Protectionists, for home-growers of similar products, and specially for consumers. Great Britain may be a nation of producers, but eminently she is a nation of consumers, and under the benign aspects of Free Trade, we literally lay the whole world under contribution. Messrs. White, in their remarkable collection, did something more than show us how the whole world

contributes to our food supplies; they showed to us just how foreigners take pains—even the greatest of pains—to send everything to our markets in the most perfect condition. Everything shown was just as received, in boxes, baskets, or whatever utensil is employed for transit. There were beautiful Apples from Australasia, which have travelled some 15,000 miles, and yet have suffered less in the journey than too often do our market fruits that have travelled only 15 miles. What beautiful Reinettes du Canada, Pomme de Neige, Scarlet Pearmain, New York Pippins, French Crab, and other sorts all perfect in appearance, and equal in size. What wonder that fruits so carefully selected and packed obtain such high prices. Here, too, were grand Pines from St. Michaela, as cheap as good, grown where Oranges formerly were cultivated; but now Florida is taking the lead in Oranges, and therefore those St. Michael growers have taken to Pine-apple culture instead. How much wiser is it to thus bend to circumstances than to wail over what cannot be helped. France was represented by Strawberries, a very good sample, not in a flat box, but in a basket; also splendid Cherries in boxes. Portugal sent Oranges, Sicily fine Lemons, the West Indies Bananas, Belgium and Jersey Grapes. The only *bona fide* British-grown, open-air products were some capital green Gooseberries from Cornwall.

As to vegetables, these, too, seemed to come from almost everywhere. France sent Asparagus—too much of it—big, ugly, and uneatable; Holland sent Cucumbers; Egypt, Onions in bags; Canary Islands Tomatoes; New Potatoes from Malta, Portugal, and elsewhere. The finest of these were evidently International Kidney, from Malta and Guernsey; from whence also came dwarf Beans, as also from France. Almost the sole British vegetables were good bundles of Asparagus from Cambridge, Worcester, and Middlesex.

Mr. A. Johnson, fruiterer, Centre Row, Covent Garden, had a good exhibit of excellent Australian Apples, of which the sorts Blue Pearmain, a fine-looking fruit; French Crab, Starmer Pippin, New York Pippin, Cox's Orange Pippin, were the most remarkable for size, colour, and general good saleable condition. In this exhibit, some good samples of Cherries, Messina Lemon, Pine-apples from St. Michaela.

Of course there were numerous other products, and all meritorious as well as representative. The exhibit not only clearly indicated what is the nature of the competition to which home growers are subject, but it also showed how inadequate, after all, would be the present considerable home produce for the nation's requirements. The chief lessons to be derived from the exhibit seemed to be found in the direction of care in selection, of best and even samples, and in packing. Even Oranges and Lemons come to us wrapped in tissue paper, whilst here at home we disdain to show so much of consideration for our best Apples and Pears. The excellent taste shown by the French packers also humiliates us, who in our packing show no taste whatever. If we will compete with the growers of the world, we must not scruple to copy all their best efforts to attract customers.

RURAL INDUSTRIES OF EGYPT.

Subsequently to the special dinner of the Horticultural Club, on the 25th ult., Sir John T. D. Llewellyn, Bart, who presided, gave an able and remarkably interesting address on the horticultural and agricultural resources of Egypt, whence he has recently returned after a prolonged visit.

In his opening remarks, Sir John Llewellyn said that Egypt was a land of agriculture rather than of horticulture, for good gardens were few and far between, and these were taken but little advantage of for teaching the people the cultivation of the several classes of useful and ornamental plants that have a place in them. Agriculture, on the other hand, was most successfully carried out, but it was pretty much a question of water, especially from the Nile, and *Nea os* (new mud) tells the story of the fertility of the vast tract of land watered by this remarkable river. This, at the time of its flood is, as is so well-known, heavily charged with earthy matter which, when the water overflows the banks, is deposited on the land, and so greatly does this deposit contribute to its productiveness, that the point to which the water reaches is so clearly shown when the crops are in full growth that it is hardly a figure of speech to say that it is possible to stand with one foot in the desert and the other on fertile land. Of the cultivated area, about

one half is devoted to Wheat and other cereals, and the other half to Date Palms, Cotton, Castor Oil, Sugar, Lentils, Peas, Beans, and Poppies. Of the several crops other than those of cereals, that of Dates is perhaps of the most importance to the people, and it would perhaps be of the greatest interest to a body of horticulturists. Phoenix dactylifera, of which twenty-seven varieties were commonly offered for sale, is abundant in Egypt, but rare in Palestine. Its rarity in the last-named country is all the more remarkable from the fact that the name by which the land was known to the Greeks and Romans was Phenicia, or the land of Palms. Again, when Vespasian wished to commemorate on his coins the capture of Jerusalem by Titus, he represents Judaea as a woman sitting weeping under a Palm. Probably in olden times the valley of the Jordan was full of Palms, and the shores of the Dead Sea are fringed with trunks that have been preserved from decay by the salt water, and tell of a time when Palms must have been much more common than now. In Egypt the Date Palm grows as a common tree, and under ordinary cultivation is very productive. It also grows freely in some parts of Europe—Italy, for example; but in Granada alone does it ripen fruit on the European continent. To the Moors belong the credit of introducing this Palm to Europe, and they say "He must have his foot in water, and his head in the sun." It undoubtedly marks the presence of water, and in proof of this, Sir John stated that Major Lloyd told him that when he was engaged in a survey of the desert, he saw a decaying Palm trunk, and in consequence sunk for water, and found a spring. In Egypt, each Palm is taxed at 20 piastres, which is equivalent to about 24d., and as illustrating the usefulness of the Date to the people, it was pointed out that, besides its employment for building, wine is made from the sap, and a spirit is distilled from the wine. The crown of barren trees is cooked as a vegetable; sugar is made from the syrup; mats, baskets, and various utensils manufactured from the leaves; horses are fed on the stalks, and camels on the pounded stones. The trees bloom in March and April, and the fruit ripens in August and September. When first ripe the Dates are harsh and astringent, but, like Medlars, are more palatable after fermentation, and are very nice also when dried in the sun.

The other field crops were passed under review, and the enormous increase in the cultivation of Cotton pointed out. This increase was attributed chiefly to the cultivation of a superior form of the Cotton plant, and the consequent improvement in the quality of the produce. In the case of the Water Melons, which form a very important crop, it is the practice to select the sections before the water from the Nile has receded to its bed, and to mark them with bushes. Poppies for opium are largely grown, and Hemp is extensively cultivated, although, like Tobacco, its growth is nominally prohibited.

In gardens, Oranges are the best of the fruits grown, but Bananas, Figs, and Pomegranates are very satisfactory. Tea and Bankian Roses thrive and bloom profusely, but hybrid perennials are very poor. The Damask Rose is also rather extensively cultivated in some districts, for the production of attar of roses. Other flowers to which special reference was made included Bougainvilleas, Poinsettias, Oleanders, and Jasmine, and the effect produced by the great masses of Poinsettia and the sheets of Bougainvillea spreading over the houses was described as indescribably beautiful. Potatoes are not, as a rule, grown well in Egypt, but they are now receiving considerable attention in the vicinity of Alexandria, where they are being grown rather largely for the London markets, as it is found that they can be placed upon the metropolitan markets in advance of Algerian produce.

There was a very interesting discussion, in which Mr. H. J. Veitch, Mr. G. Bunyard, Mr. Sofon, and others took part, and the proceedings closed with a hearty vote of thanks to Sir John Llewellyn for his address.

PLANT NOTES.

BEGONIA PRINCESS BEATRICE.

One of the prettiest and most useful of summer bedding plants is this charming Begonia—one of Messrs. Sutton & Son's hybrids. As it appears to be a mule, and does not therefore seed, the question arises, How is it to be increased? The method recommended is to take up the plants from the beds

before they are injured too much by frost, and the tops cut down; then to put some rubble at the bottom of egg or orange-boxes, over this some spent litter, then place the plants upon it, with sand or fine soil between them. Place the boxes in a temperature of from 40° to 50°, and on no account allow them to become dust-dry. When the tops have decayed, they should be removed, and the plants placed in 48-sized pots; and as soon as established, they put forth numerous growths from the bottom. The plants should then be pulled to pieces, and potted, when they soon grow into size. The aim of the cultivator should be to keep the young plants as dwarf as possible in early spring, and harden them off before planting out. R. D.

THE ALPINE GARDEN.

SAXIFRAGA MUSCICOIDES RUBRA.

This is a gem for the rockery if the soil is but shallow, where it will creep over the stones in a dense manner, and grow not more than 3 inches high. The flowers are freely produced at the end of April and during May. E. M.

S. GRANULATA FL.-PL.

This close-growing Saxifraga is one of the best for borders, but it does not succeed really well on a sunny spot, or on the rockery if the soil is shallow, as it quickly feels the effect of drought. Its pure white double flowers are produced in abundance, and are useful for cutting. E. M.

TRADE NOTICE.

MESSRS. MORRIS AND GRIFFIN, LD.

We understand that the conversion of the well-known firm of Messrs. Morris & Griffin into a limited liability company is likely to take effect shortly. This firm has been long associated with the agricultural interests of the country, having been established so far back as 1821. The business of the firm has consisted chiefly in the manufacture of artificial manures, and was one of the earliest in that field, and has for many years been carried on in Wolverhampton. The growing exigencies of the trade requiring a seaboard, large works were some years ago erected at Newport (Mon.), which have proved a great success, and the managing partner being desirous of still further extending the Newport business has purchased his partners' interests therein, and now proposes to offer a portion of the capital to the public. It is expected that the shares will be well taken up.

MARKETS.

COVENT GARDEN, June 2.

[We cannot accept any editorial responsibility for the unjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate not only from day to day, but often several times in one day, &c.]

A BRISK business has been going all the week, with prices improved. Hothouse Strawberries coming shorter against an increased demand. James Webber, Wholesale Apple Market.

POTATOS.

NEW POTATOS.—Arrivals of rounds during the week heavy. Prices rather lower. Kidneys, supply short, prices firm. OLD POTATOS.—Firm. J. B. Thomas.

SEEDS.

LONDON: June 1.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, London, S.E., write that today's market, as might be expected, presented quite a holiday appearance. Sowing orders for Clover and other seeds, now naturally get fewer and smaller. Spring Tares are rather dearer; stocks in London are nearly exhausted. Mustard and Rape seeds are both firmer. Advice from entomologists speaks of great havoc caused there by the mustard beetle. Blue Peas keep steady, a considerable acreage in Essex, owing to damage done by the pea weevil, has had to be ploughed in. For bird seeds the demand is just now slow.

FRUITS AND VEGETABLES.

SPITALFIELDS, May 31.—Quotations.—English Apples, 2s. 6d. to 5s. per bushel; do., American 12s. to 16s. 6d. per barrel; New Zealand do., 8s. to 12s. 6d. per case; foreign Tomatoes, 1s. to 2s. per box; Asparagus, 9d. to 1s. 9d. per bundle of 100 heads; Sea-kale, 9d. to 1s. 3d. per punnet; Cabbages, 2s. to 6s.; Cauliflowers, 2s. to 6s. per tally; Greens, 2s. 3d. to 3s. 3d.; French Turnips, 3s. to 4s.; new Carrots, 6s. to 8s.; Spring Onions, 4s. to 4s. 6d.; Parsley, 1s. to 2s. per dozen bunches; French Peas, 3s. 3d. to 4s. 6d. per flat; Endive, 6d. to 1s.; Cabbage Lettuce, 6d. to 1s.; Leeks, 2s. to 2s. 6d.; frame Cucumbers, 1s. 6d. to 2s. 3d.; Dutch natural do., 1s. 3d. to 1s. 9d.; Beetroot, 3s. 3d. to 6d. per dozen; French Cos Lettuce, 3s. to 4s. per score; Mustard and Cress, 1s. 6d. to 2s. per dozen baskets; Horseradish, 1s. to 1s. 12d. per bundle.

BOROUGH, May 31.—Broccoli, 5s. to 9s.; Cabbages, 3s. 6d. to 6s. per tally; Spinach, 1s. 6d. to 2s. 6d. per bushel; Greens, 2s. 6d. to 4s.; Carrots, 1s. 3d. to 1s. 9d.; Spring Onions, 4s. per dozen bunches; Egyptian do., 5s. to 6s. per cwt.; English Apples, 5s. to 10s. per bushel; Canadian do., 12s. to 20s.; and Newtown Pippins, 15s. to 28s. per barrel.

STRAFTORD: May 31.—There has been an excellent supply of all kinds of produce at this market during the past week, and a brisk trade was done as under:—Cabbages, 3s. to 4s. per tally; Greens, 3s. to 4s. per dozen bunches; Cauliflowers, 1s. 6d. to 2s. per dozen; ditto, 7s. to 8s. per tally; Carrots, household, 30s. to 40s. per ton; ditto, cattle-feeding, 20s. to 22s. ditto; Mangels, 18s. to 23s. ditto; Onions, Egyptian, 6s. to 6s. 6d. per bag; Rhubarb, 2s. to 2s. 6d. per dozen bunches; Radishes, 2s. 8d. to 3s. per tally.

POTATOS.

SPITALFIELDS, May 31.—New—Jersey Kidneys, 20s. to 22s.; Lisbon Rounds, 9s. to 9s. 3d.; Malta do., 10s. to 11s.; Malta Kidneys, 16s. to 18s. per cwt. Old:—Magna-mo, 60s. to 90s.; Imperator, 60s. to 80s.; Hebrons, 60s. to 90s.; Main Crop, 80s. to 110s.; Sutton's Abundance, 80s. to 90s.; Snowdrops, 70s. to 85s.; Bruce Magnums, 70s. to 90s. per ton.

BOROUGH: May 31.—Bruce Magnums, 95s. to 110s.; Dunbar do., 110s. to 120s.; Fenland do., 75s. per ton.

STRATFORD: May 31.—Quotations:—Light-land, 70s. to 85s.; Dark-land, 70s. to 75s.; Scotch, 85s. to 100s. New:—Lisbon, 9s. to 9s. 6d. per cwt.; Malta, 11s. to 12s. 6d. do.; Kidney, 15s. to 20s. per cwt.

GENERAL MARKET AVERAGES: June 1.—Magnums, 60s. to 100s.; Dunbar, 110s. to 120s.; Imperators, 70s. to 100s.; Snowdrops, 70s. to 90s.; Hammers, 60s. to 90s. per ton. New:—English, 2d. to 5d. per pound; do., Jersey, 10s. to 22s. per cwt.

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, prime, 80s. to 102s. 6d.; inferior, do., 40s. to 75s.; hay, best, 60s. to 95s.; inferior, do., 20s. to 50s.; and straw, 20s. to 38s. per load.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure, for the week ending May 28, and for the corresponding period last year:—1892: Wheat, 31s. 2d.; Barley, 25s. 7d.; Oats, 21s. 8d. 1891: Wheat, 40s. 12d.; Barley, 26s. 9d.; Oats, 20s. 1d.

THE WEATHER.

By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees:—A "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

DISTRICTS.	TEMPERATURE.					RAINFALL.		BRIGHT SUN.	
	ACCUMULATED.					Inches.	Days.	Percentage of possible Duration for the Week.	Percentage of possible Duration since Jan. 3, 1892.

* 3	3	108	0	4	43	9	75	104	50

The districts indicated by number in the first column are the following:—

Principal Wheat-producing Districts:—0, Scotland, N.; 1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, S.

Principal Grazing, &c., Districts:—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

THE following summary record of the weather for the week ending May 28, is furnished from the Meteorological Office:—

"The weather continued unsettled and very rainy in all the western and northern parts of the Kingdom, and the disturbed condition extended at times to the southern and eastern districts also. Thunder and lightning occurred in nearly all places—chiefly towards the end of the week."

"The temperature just equalled the mean in 'Scotland, N.,' but was above it in all other districts; in 'W. and S.W.' the excess varied between 1° and 3°, but in 'England, S.' it was 6°, and in the 'Midland Counties and England, E.,' as much as 8°. The highest of the maxima, which were recorded on the 28th over England, and on irregular dates in Ireland and Scotland, ranged from 66° to 69° in Scotland, and from 67° to 70° in Ireland; over England they were much higher, ranging from 72° to 82°. The lowest of the minima were registered on the first day of the period, and ranged from 32°

in 'Scotland, N.,' to 44° in 'England, E.,' and 46° in the 'Channel Islands.'

"The rainfall was equal to the normal value in 'England, E. and S.,' but exceeded it in all other districts. In Ireland, Scotland, and the northern parts of England, the fall was about three times as much as the mean."

"The bright sunshine shows a still further decrease in all districts, excepting 'England, E. and S.,' and was below the mean very generally. The percentage of the possible duration ranged from 14 in 'England, N.E.,' 15 in 'England, S.W.,' and 16 in 'Scotland, N. and England, N.W.,' to 40 in 'England, E.,' 45 in 'England, S.,' and 50 in the 'Channel Islands.'"

NOTICES TO CORRESPONDENTS.

*. PHOTOGRAPHS, DRAWINGS, OR SPECIMENS.—We shall be pleased to receive from our Correspondents notes relating to interesting Gardens, together with Specimens or Illustrations of interesting Plants. Although circumstances prevent us in all cases from reproducing them, we are nevertheless glad to receive them, and as far as possible to utilise them for the benefit of our readers.

BOOKS: Garcon. Botanical Names for English Readers, by Randal H. Alcock; publishers, Messrs. L. Reeve & Co., Henrietta Street, Covent Garden, W.C.

GRAFTING RHODODENDRONS: J. Grice & W. F. If the Himalayan and finer species of Rhododendron are desirable, crown-graft them on established stocks of the Pontic Rhododendron in summer, so soon as the shoots to be used for scions are nearly ripe. The stocks are cut down to about 6 inches from the soil, and if a leaf or two can be left just at the top, it will be better for the graft. Cut the stocks to a wedge shape for about 1½ inch from the top, and split the scion to the same depth and fit on the former, binding it securely with fine raffia or worsted, over which grafting wax in a warm half-fluid state should be smeared to keep out moisture. Side grafting with a tongue is sometimes followed. The grafts themselves should not be topped, and only as many leaves cut off as will admit of the graft being tied on the stock. Place the grafted stocks in a clove case within a cool house, and shade them from the sun till they have taken. It is sometimes convenient to graft by approach plants standing in the beds, and in that case good stout established stocks in pots should be sunk at convenient intervals round the plant, and shoots selected of about the same diameter as the stocks, and the surface of the opposite sides of branch and stock shaved down nearly to the pith, and placed together with or without tongueing, and make secure as in the other operation described above. Grafting clay or wax should cover the point of union, and each graft made secure to a stout stick firmly stuck into the earth. The stocks must be examined frequently to see if water be necessary. Late summer is the best time for this kind of inarching. Usually, union takes place by the end of September, and the grafted stocks may be cut off from the mother plant, and stood by themselves in a sheltered place. In very hot weather some kind of a sun-screen should be put into use to shade the inarched stocks, and growth should be kept up in the mother plant and the stocks by copious waterings in dry weather, and affording a mulch of mushroom-dung or half-decayed leaves over the roots.

HEAVIEST BUNCH OF GRAPES: H. V. A bunch of White Nice was shown by Mr. Dickson at Edinburgh in 1875 weighing 25 lb. 15 oz. See *Gardeners' Chronicle*, September 18, 1875.

HOUSE DRAINAGE: F. C. The best of liquid manure; it may safely be given to plants out of doors at this season, and to grass land and fruit trees in winter. For gross-growing subjects no dilution is necessary, but for the more delicate plants half water and half sewage will be quite safe. It should not be afforded any plant oftener than once in ten days or a fortnight. Cabbage, Cauliflower, and Asparagus when cutting is finished for the season; Celery, Beans, Tomatoes, bearing heavily in pots or restricted border, or in hungry soils; fruit trees in heavy bearing. Vines, Figs in pots, Dahlias, Hollyhocks, shrubby Phloxes, Roses in pots or beds, and especially plants against sunny walls; Pine-apple plants, Cucumbers, weak-growing hedges of Quick, Laurel, Privet, and Hornbeam, and many other plants are

benefited by liquid manure—the "liquid gold" the British farmer and others too often allow to run into the nearest ditch.

INSECTS: James C. Campbell, Methley Park, Leeds. The caterpillars which have devastated your "trees" (Gooseberry and Currants) are those of the very common magpie moth, one of the Cooper. caterpillars; big enough to be hand-picked. We do not like Paris Green for these fruits. The moth ought to be well known to every gardener. I. O. W.—H. H. Black weevil, *Otiorhynchus sulcatus*, commonly attacks the Vine. Hunt for them at night. They are very destructive, both larvæ and perfect insect.

MUSHROOMS.—A. P. Want of heat in the bed; or exhaustion of the spawn.—J. A. C. We do not suppose that the "mite" has anything to do with the failure of the Mushrooms to come to perfection. It is probably due to errors in management—the soil, too, appeared quite unsuitable.—H. M. S. B. *Cytisus* sp., full name next week.

NAMES OF PLANTS: J. M. 1, *Ada aurantiaca*; 2, not sent; 3, *Reticopsis plumosa*.—St. J. C. *Aërides crassifolium*.—D. B. *Cheimsford*. 1, *Aërides Houletianum*; 2, *Dendrobium Parishii*; 3, *Lycaste speciosa*; 4, send more flowers, with leaf; 5, not found; 6, *Reidia glaucescens*; 7, *Jasminum Sambac*, A. pl.; 8, *Adiantum Facotii*; 9, *Xylophylla latifolia*.—P. W. H. 1, *Oncoclea sensilis*; 2, *Athyrium filix-femina corymbiferum*; 3, *Poly-stichum angulare*; 4, *Cystopteris fragilis*.—A. B. 1, *Lygodium scandens*; 2, *Poa variegata*; 3, *Carix riparia*; 4, *Cattleya labiata* (probably *Mossia*); 5, *Epidendrum ciliare*. It is not right to expect names when only *Orchid pseudobulbs* are sent, and in the case of the other things the flowers are wanting.—H. H. H. 1, *Bifrenaria vitellina*; 2, *Dendrobium Parishii*; 3, *Dendrobium crataecium*.—Linum. *Medicago echinops*; *Pancretium illyricum*.—L. C. *Rugby*. 1, *Thalectrum aculeifolium*; 2, *Ornithogalum umbellatum*.—W. S. We believe your specimen to be a variety of *Papaya nudicaule*.—Stella. *Saxifraga*, withered beyond recognition.—G. 1, *Tradescantia virginica*; 2, not recognisable; 3, *Anomatheca juncea*; 4, *Jasminum revolutum*; 5, not recognisable; 6, *Santolina incana*; 7, a *Cupressus*, impossible to name from such a scrap.—W. C. & Sons. *Gyp-paphia*, perhaps *G. puniculata*.—L. J. A. 1, *Brassica nigra*; 2, *Potentilla anserina*; 3, *Anthyllis vulneraria*; 4, *Geum webanum*; 5, *Orchis morio*; 6, *O. militaris*.—J. T. L. *Vaccinium corymbosum*.

PANSY AND VIOLA: J. K. These are merely popular names of different species of *Viola*. The word Pansy is employed by gardeners and the trade for the varieties of *Viola tricolor*, which are divided now-a-days into show, fancy, spotted, giant, and several others. Pansies bloom in spring and early summer. Violas, probably, spring from *V. cornuta*, crossed in recent years with *V. tricolor*, and crossed in various ways among each other. They increase by creeping roots, throwing up new growth continuously, which flowers the same season, and thus extends the period of bloom till late into the autumn.

PEACHES: A. L. L. The fruits are attacked by mildew. Pick off and burn affected fruits. Dust the whole of the tree with flowers-of-sulphur, or obtain one of the advertised remedies; or wash the trees with a decoction of Elder leaves, boiled in water. Make sure that the border is not dry. If the trees are in a house, be careful about admitting cold air into the house by the lower sashes. Wait till it gets warmer.

SEEDLING SNOW PELARGONIUMS: S. G. Smalbridge. 1, this flower has the right kind of markings of a show variety, is very large, and well worth preservation; 2, is very nice, but there are many others that it resembles—the truss is above the average size; 3, a very good dark flower of the French or spotted type; 4, an excellent flower, spotted form; 5, is like 2, but lighter and seemingly more robust.

SEEDS FROM MEXICO: M. Buysman. We cannot identify them.

VINES: A. B. It is certainly useless to "look to" the border when the leaves are covered with red-spider. You must get some Lethorion cones and fumigate the vine. Keep the viney moiester, and syringe the under sides of the leaves without letting the water strike the bunches too much.

—G. A. M. From a single leaf crushed flat in its passage through the post we are unable to tell you anything definitely. Kindly send a handful of shoots, packed in damp moss, in a box.

WALLFLOWER: *Swaylands*. The Wallflower is a very curious monstrosity, in which the stamens are replaced by carpels. It is known as var. *gynanthus*, and is very interesting, but not attractive.

WEYMOUTH PINE DISEASE: A. F. The shoots you send are affected with Pine blister, a fungus known as *Peridermium pini* (see fig. 106). The spawn of

FIG. 103.—*PERIDERMIIUM PINI*: FUNGUS ATTACKING CONIFERS.

the fungus causes much irritation to the tissues of the shoot, causing them to swell and to secrete much resin, at the same time the fungus appropriates the starch and other food stored up in the bark for the use of the Pine, and so the branch ultimately dies of starvation, and dries up because the water cannot pass through the exuded resin. The only way to combat the disease, which is occasionally very destructive, is to cut off all the affected branches in May and burn them. It is supposed that the fungus in one stage of its life history grows on *Groenouel* and other species of *Senecio*; its appearance then being quite different to that which it presents when growing on the Pine. It is not absolutely certain that the fungus of the *Groenouel* and of the Pine are different forms of one and the same, but in any case you will do no harm by extirpating and burning all the *Groenouel*, and similar composite weeds you can lay your hands on. In France a similar fungus occurs on the leaves of *Vincetoxicum* and on the Pine, but the *Vincetoxicum* is hardly likely to grow with you in any quantity.

COMMUNICATIONS RECEIVED.—G. F. C., Toronto.—G. E.—Northamptonshire Horticultural Society.—W. H. Y. (our list was an official one).—S. P. O.—Hon. Robert S. McCormick.—H. H. W.—W. W.—R. D.—H. E.—J. B.—Dr. Kränzlin.—C. W. D.—A. P.—J. T. L.—J. C.—L. Eckhaute (no flowers came).—C. Sanders.

NOTICE TO ADVERTISERS.—In many instances
Remittances in Payment of Repeat Adver-
tisements are received without name, address,
or anything beyond the postmark on envelope
by which to identify the sender; this in all
cases causes a very great deal of trouble, and
frequently the sender cannot be identified at all.

Advertisers are requested when Remitting
to give their Names and Addresses, and also
a Reference to the Advertisements which they
wish repeated.

GARDENERS AND OTHERS WANTING SITUATIONS
26 words, including name and address, 1s. 6d.,
and 6d. for every additional line (about nine
words) or part of a line. These Advertisements
must be prepaid. This scale does not
apply to announcements of Vacant Situations,
which are charged at the ordinary scale.

Births, Deaths and Marriages, 5s. each
insertion.

POSITION.—Advertisers are specially requested
to note, that under no circumstances what-
ever can any particular position be guaranteed
for advertisements occupying less space than
an entire column.

POSTAL ORDERS.—To Advertisers, Subscribers,
and Others.—It is very important in remit-
ting by Postal Order that it should be filled
in payable at No. 42, DRURY LANE,
to A. G. MARTIN, as, unless the number of a
Postal Order is known, and it has been made
payable at a particular office, and to a particu-
lar person, it is impossible to prevent any
person into whose hands it may fall from
negotiating it.

N.B.—The best and safest means of Remit-
ting is by POST-OFFICE MONEY
ORDER.

Advertisements for the current week MUST reach
the Office not later than Thursday noon.

All Advertisements should be addressed to the
PUBLISHER.

Publishing Office and Office for Advertisements,
41, WELLINGTON ST., STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United
Kingdom, 12 months, 15s.; 6 months, 7s. 6d.;
3 months, 3s. 9d. All Foreign Subscriptions,
including Postage, 17s. 6d. for 12 months;
Post-office Orders to be made payable at
the Post-Office, 42, Drury Lane, W.C., to
A. G. MARTIN.

Subscribers who experience any difficulty in ob-
taining their Copies regularly, are particu-
larly requested to communicate with the
Publisher (in cases of delay in the delivery
by post, the cover should be forwarded with
complaint).

PENDENT and make their way in the world, should
write for Prospectus of the Scientific Dress Cutting Association,
272, Regent Street, London, W. Situations found for all
pupils at good salaries. No Lady's education is complete
without a knowledge of Dressmaking.

WANT PLACES.

TO GARDENERS, AND OTHERS SEEKING SITUATIONS.

The Pressure upon our space at this season of the
year is so great, we are compelled to state
that advertisements received after 6 P.M. on
Wednesday will, in all probability, be held
over to the next week.

Advertisers are cautioned against having letters
addressed to initials at Post-offices, as all
Letters so addressed are opened by the
authorities and returned to the sender.

SCOTCH GARDENERS.—I have at present
several very superior MEN on my Register, whose cha-
racter and ability will bear the strictest investigation.—
JOHN DOWDIE, Seedsman, 144, Princes Street, Edinburgh.

B. S. WILLIAMS and SON beg to intimate
that they have at present in their Nursery and upon their
Register some excellent MEN, competent either to fill
the situation of HEAD GARDENER, BALIFF, FOREMAN,
or JOURNEYMAN. Ladies and Gentlemen requiring any of
the above will please send full particulars, where the best
selections for the different capacities will be made.—Victoria
and Paradise Nurseries, Upper Holloway, N.

Gardeners, Farm-Baliffs, Foresters, &c.
DICKSONS, Royal Nurseries, Chester, are
always in a position to RECOMMEND MEN of the
highest respectability, and thoroughly practical at their busi-
ness. All particulars on application.
Telegraphic and Postal Address—"DICKSONS, CHESTER."

RICHARD SMITH AND CO.
beg to announce that they are constantly receiving
applications from Gardeners seeking situations, and that
they will be able to supply any Lady or Gentleman with
particulars, &c.—St. John's Nurseries, Worcester.

Head Gardeners.
JOHN LAING AND SONS can at present
recommend with every confidence several energetic
and practical MEN of tested ability and first-rate character.
Ladies and Gentlemen in want of GARDENERS and BALIFFS,
and HEAD GARDENERS for first-rate Establishments or
Single-handed Situations, can be suited and have full particu-
lars by applying at Standfast Park Nurseries, Forest Hill,
London, S.E.

GARDENER (HEAD).—Age 33, married.
Can produce in quantities for Market if desired.
Fruits, Flowers, and Vegetables. Thoroughly practical
Nursery experience; excellent references.—S. E., *Gardeners'*
Chronicle Office, 41, Wellington Street, Strand, W.C.

SANDERS, St. Albans, can thoroughly RECOMMEND several first-class HEAD GARDENERS.

GARDENER (HEAD).—Mr. CLARKE, Head Gardener to the Earl of Londesborough, Lutworth Castle, Penrith, can with every confidence recommend his Foreman to any Lady or Gentleman requiring the services of a thorough practical man, experienced in all branches.

GARDENER (HEAD).—Where three or four are kept. Age 31; fifteen years' experience in all branches.—A. B. M. Cheer, Stroud Green Road, Shirley, Croydon.

GARDENER (HEAD).—Age 42; no family. Good all-round practical man seeks re-engagement where several are kept. Life experience.—F. W. 31, Bridge Street, Witney, Oxon.

GARDENER (HEAD); age 30, single.—The Advertiser is open to engage with any Lady or Gentleman requiring the services of a steady industrious practical man in all branches. Six years' excellent character from present situation.—C. E. HUBBARD, Mapledurham, Reading.

GARDENER (HEAD WORKING), age 46, where others are kept.—Married, no family; abstainer; life experience in Early and Late Forcing of all kinds of Fruit, Flowers, Vegetables, and Mushrooms; also Kitchen and Flower Gardens and Pleasure Grounds. Eight years' good character from late employer, and sixteen years' references.—J. D., Myrtle Cottage, Wick Road, Hampton Wick, Middlesex.

GARDENER (HEAD WORKING).—Age 35, married; thoroughly practical in the General routine of Gardening, Flowers, Fruits, and Vegetables.—J. PEARSON, Hungate Lane, Beccles, Suffolk.

GARDENER (HEAD WORKING).—Age 38; a respectable married man. Good practical knowledge of twenty-four years' standing. Good character.—F. ROTHWELL, Hook, near Winchfield, Hants.

GARDENER (HEAD WORKING), others kept.—Age 26, married, no family; Forcing Fruit, Flowers, and Vegetables. Life experience. Suitable for large establishment; five years' character.—JACKSON, 22, Percy Circus, King's Cross, London, W.C.

GARDENER (HEAD WORKING).—Thorough good all-round man, active and energetic. Twelve years' good character and testimonials. Family grown up.—W. PEPPER, Rye Park, Huddersfield, Herts.

GARDENER (HEAD WORKING), where two are kept; age 27.—J. ANDERSON, Charman Dean, Worthing, wishes to recommend his Foreman, J. Skinner, to any Lady or Gentleman requiring a good practical man. Twelve years' experience. Abstainer.

GARDENER (HEAD WORKING).—Age 35, married, two children; twenty years' practical experience in all branches of Gardening. Leaving through breaking up. Excellent character. Please state wages given.—J. S., 13, Church Road, Bromley, Kent.

GARDENER (HEAD WORKING).—Age 43, married; over twenty years' practical experience; thoroughly understanding Grapes, Peaches, Fruit, Flower, and Kitchen Gardens. Seven years' good character from last situation. Abstainer.—B. L., 43, Albany Road, Castle Hill, Ealing Dean.

GARDENER (HEAD WORKING).—Single; Trustworthy, intelligent, and thoroughly practical. Abstainer. High testimonials. Home Counties preferred.—J. H., 69, Gordon Place, Kensington.

GARDENER (HEAD WORKING).—Middle- age, married, no incumbence; is thoroughly experienced in growing all kinds of choice Fruit and Plants under Glass, Kitchen and Flower Gardens, Land and Sto. J. Wife can manage Dairy or Assist in House. Good character. Abstainer.—W. B., 91, Peel Street, Kensington, W.

GARDENER (HEAD WORKING).—Age 32, married; life experience in some of the best places in England and Wales. Well recommended by present employer, whom he has served as Head for over six years. Disengaged beginning of July.—J. STENNETT, Gardener, T. Williams, Esq., Bromfield, Llandudno.

GARDENER (HEAD WORKING); age 30.—Advertiser would be pleased to send particulars to any Lady or Gentleman requiring a practical energetic man. Seventeen years' experience in all branches, including Orchids in first-class Gardens. Can be highly recommended.—MENZIES, South Lechett, Poole.

GARDENER (HEAD WORKING).—Age 40, married (two boys, ages 9 and 7 years); thoroughly practical in all branches. Good character and references.—W. TURNER, 20, Queen Street, May Fair.

GARDENER (HEAD, or good SINGLE-HANDED).—Age 40, married, no family. Good character. Late Gardener to Sir Lewis Cave.—W. BLACKMAN, 6, Avenue, Eltham Road, Lee, Kent.

GARDENER (HEAD, or good SINGLE-HANDED).—Age 30, married, one child; thoroughly experienced in all branches. Good character from present and previous employer. Please state wages.—HIGGS, Wykeham Park, Frimley Green, near Farnborough, Hants.

GARDENER (HEAD, or good SINGLE-HANDED).—Vines, Melons, Cucumbers, Tomatoes, &c. Store and Greenhouse Plants, Flower and Kitchen Garden. Good character.—A. BOOKER, 143, Steel Road, Acton Lane, Willeiden.

GARDENER (SINGLE-HANDED, or UNDER).—Age 26, single; seven years' character.—HOLMES, Jubilee Road, Littlebourne, Dover.

GARDENER (good SINGLE-HANDED, or where help is given).—Age 27, married; thoroughly practical in all branches. Four years in present situation. Abstainer.—A. EMBRY, 2, South Row, Voluntary Place, New Waukesha, Essex.

GARDENER (good SINGLE-HANDED, or where help is given).—Age 26, married when suited; good experience in the general routine of gardening. Well recommended by present and previous employers. Abstainer.—E. P., Belmont, Lee, Kent.

GARDENER (good SINGLE-HANDED).—Age 27; ten years' experience, four and a half years in last place. Steady, willing, and industrious. Excellent references.—UNWIN, 49, Newham, Cambridge.

GARDENER (SINGLE-HANDED), or where help is given.—Age 29, single; thoroughly practical energetic man. Well up in Pruning and Training Fruit Trees and Shrubs, Kitchen and Flower Garden, Lawns. With great interest in his work. Winner of many First Prizes. Good personal characters.—A. W. V., Holmesdale, Kew Gardens, Surrey.

GARDENER (SINGLE-HANDED).—Age 30, married, one child, age 5. Practical experience in all branches. Willing to make himself useful in house if required. Excellent references.—A. PUSEY, Lock's Cottage, Ashford, Middlesex.

GARDENER, where two or more are kept.—Married when suited; thoroughly practical in all branches, including Orchids, Stone and Greenhouse Plants, Fruit, Hardy Herbaceous Plants, &c. Excellent character.—J. PULLEN, The Gardens, Jollywinds, Dorking.

FRUIT, FLOWERS, and VEGETABLES, thoroughly understood and well-grown, either for Market or Private Gentlemen's place. Seventeen years' practical experience in good establishments. Age 32, married; good references.—GARDNER, Mrs. Ireland, Adelaide Place, Castle Street, Canterbury.

GARDENER (SECOND), Inside and Out, where four are kept.—Age 23, single; seven years' experience. Honest and willing. Good character.—G. CORNWELL, Hadlow Down, Buxted, Sussex.

GARDENER (SECOND), Inside and Out.—Age 23; nearly three years in last situation. Other good references.—E. LETHBRIDGE, 40, Princes Rd., Norbiton.

GARDENER, Inside, or Inside and Out, where two or three are kept.—Age 21; good references from previous places.—F. PIKE, The Cottage, Iping, Midhurst, Sussex.

GARDENER (UNDER).—Age 18; three and a half years in Nursery.—C. B., Park Cottage Lodge, East Sheen.

GARDENER (UNDER).—Age 20; good experience in Glass and Kitchen Garden. Good character. Disengaged now.—E. HOAD, Spring Cottage, Limsfield, Surrey.

GARDENER (UNDER).—Age 20; three years' experience in Houses and Kitchen Garden.—W. SKINNER, 1, Fern Hill, Upton Road, Tonquin.

GARDENER (UNDER), Inside and Out.—Age 21; fifteen months' experience. Willing to make himself generally useful. Good character.—G. FOSTER, The Gardens, Barrow Point, Finner, Middlesex.

TO GENTLEMEN and GARDENERS.—A Youth (age 18), seeks a situation in a good establishment. Two years in last situation. Good reference.—W. W., Rhwygddyford, Llandudno, Llanrwst.

TO SEEDSMEN, NURSERYMEN, and FLORISTS.—Situation required by a young man, age 24; experienced in all branches; excellent references.—C. Hyde House, Acton, W.

TO NURSERYMEN.—Permanent situation required in a good Market Nursery (age 23).—W. B., 4, Gabriel Terrace, Heston, Kent.

TO NURSERYMEN and FLORISTS.—Long established BUSINESS to be DISPOSED OF. Owner retiring after successful career of 15 years in the Nursery and 18 Acre of Land. Lease will be granted. Incoming about £250. Within 20 miles of London. Excellent situation. Pretty cottage residence.—Mr. DAVISON, 3, Circus Place, London, E.C.

TO FLORISTS.—Situation wanted, by a Youth, used to first-class trade.—C. H., 95, Shinkspere Road, Acton.

TO FLORISTS and FRUITERS.—Situa- tion wanted by a young lady. Knowledge of the Fruit, Flower, and Seed Trade.—A. WHITING, 23, Eign Street, Hereford.

HOLLOWAY'S PILLS.—Weary of Life. Derangement of the liver is one of the most efficient causes of dangerous diseases, and the most prolific of those melancholy forebodings which are worse than death itself. A few doses of these noted Pills act magically in dispelling gloom and dispelling the nervous attacks made on the nerves by excessive heat, impure atmospheres, over-indulgence, or exhausting excitement. The most shattered constitution may derive benefit from Holloway's Pills, which will regulate disordered action, brace the nerves, increase the energy of the intellectual faculties, and revive the failing memory. By attentively studying the instructions for taking these Pills, and obediently putting them in practice, the most despondent will soon feel confident of a perfect recovery.

GREEN'S PATENT "SILENS MESSOR" AND OTHER LAWN-MOWING, ROLLING AND COLLECTING MACHINES FOR 1892.

The Winners of every Highest Prize in all cases of competition, and they are the only Mowers in constant use at all the Royal Gardens and at the Royal Horticultural Society's Gardens, South Kensington.

Patronised by—
HER MOST GRACIOUS MAJESTY THE QUEEN on numerous occasions,
HIS ROYAL HIGHNESS THE PRINCE OF WALES,
THE KING OF THE BELGIANS,
The Late EMPEROR OF THE FRENCH, THE EMPEROR OF RUSSIA,
And most of the Nobility, Clergy, and Gentry of the United Kingdom.

Upwards of 170,000 of these Machines have been sold since they were first introduced in the year 1856, and thousands of unsolicited Testimonials have been received, testifying to their superiority over all others. They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off the Highest Prize that has been given.

The following are their Advantages over all others:—1st. Simplicity of Construction—every part being easily accessible. 2nd. They are worked with much greater ease than any other. 3rd. They are the least liable to get out of order. 4th. They make little or no noise in working. 5th. They will cut either short or long Grass, wet or dry.

SINGLE-HANDED SILENS MESSOR LAWN MOWER, With Improved Steel Chains and Handles.

To cut 6 in., can be worked by	£1 15 0
a Lady	...
To cut 8 in., do.	2 10 0
To cut 10 in., do. by a strong youth	3 10 0
To cut 12 in., do. by a man	4 10 0
To cut 14 in., do. do.	5 10 0

We are the only makers of Lawn Mowers appointed by Royal Warrant to Her Majesty the Queen, and His Royal Highness the Prince of Wales.

DOUBLE-HANDED LAWN MOWER.

To cut 16 inches, can be worked by one man	£6 10 0	To cut 22 inches, can be worked by two men	£8 10 0
on even lawn	...	To cut 24 inches, do.	9 0 0
To cut 18 inches, do. man and boy	7 10 0		
To cut 20 inches, do.	8 0 0		

These Mowers are the "Ne Plus Ultra" and "Acme" of perfection of all Lawn Mowers extant.

Prices of Donkey, Pony, and Horse Machines, including Patent Self-Delivery Box, or Side Delivery, with Cross-stay complete, suitable for attaching to Ordinary Chaise Traces or Gig Harness:—

DONKEY AND PONY MACHINES.

To cut 26 inches	£14 0 0
To cut 28 inches	16 0 0
To cut 30 inches	18 0 0
Leather Boots for Donkey	1 0 0
Leather Boots for Pony	1 4 0

The 26 and 28 inches can easily be worked by a Donkey, the 30 inches by a Pony, and the larger sizes by a Horse; and as the Machine makes little noise in working, the most spirited animal can be employed without fear of it running away, or in any way damaging the machine. Packing Cases as per List, except when for export.

HORSE MACHINES.

To cut 30 inches	£22 0 0
To cut 36 inches	26 0 0
To cut 42 inches	30 0 0
To cut 48 inches	34 0 0

Friday, July 8.

MESSRS. PROTHEROE AND MORRIS are instructed by Messrs. F. Sander & Co. to hold their **GREATEST SALE** of the **SEASON**, comprising some 5000 **ORCHIDS**, mostly **CATTLEYS**, and among them great quantities of **CATTLEYA**, **CELESTINE**, and **C. VICTORIA REGINA**; also 200 lots of **NEW ORCHIDS**.

Further particulars will appear in later advertisements.

CALLA (RICHARD) ELLIOTTIANA, the magnificent Golden Calla.

Exhibited recently at the Grand Exhibition of the Royal Horticultural Society at the Temple, where it was awarded a Silver Banksian Medal. Also at the International Horticultural Exhibition at Earl's Court, where it received the First Prize for the best New Plant in bloom.

MESSRS. PROTHEROE AND MORRIS have the pleasure to announce that they have received instructions to **SELL BY AUCTION**, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on **FRIDAY NEXT**, June 17, at half-past 12 o'clock.

243 PLANTS

(being the entire stock of this splendid novelty, all raised from one plant) in lots to suit the Trade and private Buyers. This is without doubt one of the finest introductions of late years, and will become a plant universally in demand. It is quite as hardy and equally as easily cultivated as *Calla aethiopica*.

On view morning of sale, and Catalogues had.

Friday, June 24.

GREAT SALE OF CYPRIPEDIUM NIVEUM.

MESSRS. PROTHEROE AND MORRIS will **SELL BY AUCTION**, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on **FRIDAY**, June 24, at half-past 12 o'clock, a grand importation of **CYPRIPEDIUM NIVEUM**, just home, in magnificent order. This superb species is now very rare in its native habitat, and it is difficult to get anything like the quantity collected. It is the only white, and probably the most beautiful, of the whole genus. The plants are equal to being established, and the Collector writes that only by the display of great endurance, he could get the number offered in the Sale, as they almost exterminated. Many magnificent clumps will be offered, and, by the look of the plant, endless forms will turn up among them.

Ieworth and Hounslow.—Notice of Postponement. **FRESHOLD, COPYHOLD, AND LEASEHOLD MARKS**, of which some are ripe for Building Development. By order of the Trustees of the late J. Wilmot, Esq.

MESSRS. PROTHEROE AND MORRIS beg to announce that the Sale of the Above Properties, advertised to take place on June 10 next, is postponed. The Properties may, however, be dealt with privately, and Messrs. Protheroe & Morris will be glad to furnish particulars, and receive offers.

Auction and Estate Offices, 67 & 68, Cheapside, London, E.C.

KENT.—TO BE SOLD, at a sacrifice. In the best district, a **FRESHOLD NURSERY**, with 10 modern Greenhouses, all well-heated. Now in excellent working order. Any reasonable offer entertained. No stock to take. Full particulars of Messrs. PROTHEROE AND MORRIS, Auctioneers, 67 and 68, Cheapside, London, E.C.

Important to Market Gardeners.

GARDENS to be LET WITHOUT RENT. The splendid Kitchen Gardens and Glass belonging to a Gentleman's Mansion, 11 miles from London, and one minute from station on the L. & N.W.R. to be let without rent, in return for the Pleasure Grounds being kept in order. Both gardens and houses are well stocked and in good order. Can be seen at any time by appointment. Address, X. M., 31, Wellington Street, Strand, W.C.

FARM to LET, on High Road, 8 miles from London, 20 acres of Fruit Trees and Strawberry Plants, and four large Greenhouses. To be taken at valuation. Also **FRUITERS** and **GREENGROCERS** (old established). They can be let separately. Apply, J. HANCOCK, 66, Greenwood Road, Dalston, N.E.

To Fruit Growers, Nurserymen and Others. **GOOD ARABLE AND MEADOW LAND** to be LET or SOLD. Close to the main road at Fonder's End (9 miles from London). Long leases granted. Rent, 212 per acre per annum, with option to purchase the Freehold any time during the first nine years. Several large Market Nurseries are established on the Estate. Full particulars of A. and G. GUYER, Land Agents, Fonder's End.

GUERNSEY.—FOR SALE, a **FRESHOLD ESTATE**, consisting of a Dwelling House, large Outbuildings, Stable, &c., about 53 acres of good land, on which are erected thirteen very large Vineries, comprising about 100,000 superficial feet of Glass.

Apply to B. care of Mr. F. B. Guerin, Stationer, 25, High Street, Guernsey.

FLORIST and FRUITERS.—Well-established and thoroughly genuine **BUSINESS**, in thickly populated residential suburb North of London, on main road. Takings over £15 weekly. Could be easily doubled by energetic proprietor. Price, including fixtures, £200.—Apply to Mr. ALFRED V. ROBINSON, High-road, Tottenham.

TO NURSERYMEN and FLORISTS.—Snug old-established **BUSINESS** to be DISPOSED OF. Owner retiring after successful occupancy. 14 Greenhouses, and 5 acres of Land, to be let or sold. Income, £500. Within 20 miles of London. Excellent situation. Pretty cottage residence.

Mr. DAVISON, 3, Circus Place, London, E.C.

To Market Gardeners and Others. **TO BE SOLD**, the unexpired term of a valuable **LEASE** of **MARKET GARDEN**, situated within 5 miles of City Garden Market.—For particulars, apply to Mr. FRAS. ROBINSON, Solicitor, 36, Jermyn Street, St. James.

FOR SALE, a COMPACT NURSERY, well situated, good Jobbing Connection, 6 Greenhouses and Pits, 6-roomed House. Fourteen years odd to run of Lease. Situated near Station, doing good Flower Trade. All on main road and in good repair. In present hands 20 years. A Bargain; reason, ill health.

Apply to R. HOLLOWAY, Florist, Herne Hill, S.E.

EXHIBITIONS.

ROYAL BOTANIC SOCIETY, GARDENS, REGENT'S PARK, SPECIAL FLORAL FÊTE, and CHILDREN'S FLORAL PARADE, WEDNESDAY, JUNE 22.

Prices and Full Particulars sent post-free on application.

THE VINEYARD and NURSERIES, GARSTON, NEAR LIVERPOOL.

The Subscription List will open on Wednesday, June 15, 1892, at 10 a.m., and will close on or before Friday, June 17, at 3 p.m.

Subscriptions will be received by the Company's Bankers, viz.:—
The County of Gloucester Bank, Limited, Cheltenham, Newport, Mon., and all Branches.
The Birmingham District and Counties Bank, Limited, Wolverhampton, and all its Branches.

MORRIS & GRIFFIN, Limited.

(Incorporated under the Companies' Acts, 1862 to 1890).

Share Capital	£40,000
5 per Cent. Mortgage Debentures	£25,000
	£65,000

The Share Capital is divided into:—
1,500 6 per Cent. Preference Shares of £10 each (Cumulative and with priority, in respect of Capital as well as Dividend) £15,000
2,500 Ordinary Shares of £10 each £25,000

The Debentures will be issued in Bonds of £100 each, bearing interest at 5 per cent. per annum, and will be secured by a Trust Deed, charging the same upon the whole undertaking and property of the Company. The Debentures will be repayable at par at the option of the Company, upon payment of a premium of 5 per cent., by giving six months' notice.

Interest on the Debentures will be payable half-yearly, on January 1 and July 1 in each year.
Of the 2,500 Ordinary Shares and the 1,500 six per cent. Preference Shares, the Vendor takes 600 of the former as deferred fully-paid Shares £6,000
300 Fully-paid Ordinary Shares £3,000
250 6 per cent. Preference Shares £2,500
And 25 Mortgage Debentures £2,500

In part-payment of the purchase-money £14,000
The remainder of the issues are now offered for public subscription viz.:—

1,250 Six per cent. Preference Shares of £10 each £12,500
1,600 Ordinary Shares of £10 each £16,000
225 Debentures of £100 each £22,500

Total £85,000
And which will be payable as follows:—

	Preference Shares.	Ordinary Shares.	Debentures.
On application	£ 5 0	£ 5 0	£ 5 0
On Allotment	10 0	10 0	10 0
On 30th June, 1892	3 0	3 0	3 0
On 30th November, 1892	5 0	5 0	5 0
On 28th February, 1893	0 0	0 0	0 0

The remaining £25,000 of the Ordinary Shares will not be called within two months after date of the last-named payment, nor upon less than three weeks' notice.

A limited portion of the Debentures and Preference Shares may be paid up in full on Allotment, and Dividends and Interest will rank from payment of each instalment after Allotment. Failure to pay any instalment when due renders previous payments liable to forfeiture.

PROSPECTUS.

This Company is formed to purchase and carry on the extensive Chemical, Manure, Bone Crushing, and Animal Charcoal Businesses of Messrs. MORRIS & GRIFFIN, at Newport, Monmouthshire, and Wolverhampton, Staffordshire. The firm has been established since 1821, and has extensive connections throughout the United Kingdom, the Western Provinces of France, and various other parts of the World.

The Newport portion of the business has of late years steadily increased, and it has become necessary to extend the works which are situated on the east side of the River Usk adjoining the Great Western Wharf and with a branch line to the Great Western Railway; they now stand on about 4 acres of ground, the lease of which is held for an unexpired term of 90 years, at the low rental of £100 per annum. The Works consist of Plant of the most modern description, and are capable of producing upwards of 5,000 tons of Sulphuric Acid per annum, and comprise powerful Grinding and Dissolving Machinery, which are fully

occupied in the manufacture of all kinds of Fertilisers, Leuner's patent Bone "degassing" apparatus, Warehouses containing about 25,000 square feet of storage room for large Stocks of Boulders, powerful Steam Engine, Lifts; Bone and Pulverising Machinery with Smithy and Fitting Shop; Pumping Machinery, Reservoirs for Storage of Water, and a Railway Siding round the Works, with every facility for the import and export of goods by shipment direct from the River Wharf, at a fixed and advantageous rate for the whole term of the Lease.

The Wolverhampton Works cover an area of about 7 acres, and are connected by a siding with the London & North-Western Railway, with access to the Great Western and Midland Lines, having also Canal Wharves on two sides of the Works. The Manure, Bone and Animal Charcoal portion cover about 3 acres, and it has been arranged to lease this portion of the Works, and carry them on in connection with Newport. They consist of large Warehouses, Powerful Steam-engines, Boilers, &c., and Leuner's Patent Apparatus for "degassing" Bones, carrying with it the sole right of usage in the West Midland Counties. Modern Machinery, for grinding Bones, also the most perfect Animal Charcoal Plant, the plans of which were obtained at great cost from the Continent, with exclusive rights for using in this Country and which are maintained. In connection with the Charcoal Plant are Sulphate of Ammonia and Bone Pitch Works. The Bone Meal Branch of the business is also important and lucrative. An undertaking has been entered into with the Vendor, which precludes him from carrying on a similar trade or otherwise appropriating the remaining portion of the Works to the prejudice of the current business.

A valuation of the Land, Buildings, and Railway sidings, and all the property, including the Plant and Machinery, at Newport, has been made by Messrs. Graham, Son, and Hitchcox, the well-known Valuers of that town; and a copy of their certificate is appended hereto. The whole of this important and Valuable Property, with Goodwill, together with all the Trade Marks and use of Patent rights of Leuner's process, also Secret process in connection with the Animal Charcoal business, Contracts and Agencies; Stock in Trade, estimated at £5,000 but subject to valuation, and Bank Debt, estimated at £15,000 (guaranteed by the Vendor and forming part of the Working Capital), as at 30th June next, the Vendor has arranged to sell the Company for the sum of Fifty-five Thousand Five Hundred Pounds, payment to be made as follows:—

£5,000 in fully-paid deferred ordinary Shares.
£5,000 in ordinary Shares.
£2,500 in 6 per cent. Preference Shares.
£2,500 in Debentures.
£15,000 in Cash.

£35,500

The remaining Capital of £9,500 will be used for extensions at Newport, working the Wolverhampton business, and providing for the payment of the preliminary expenses, as specified herein. No liabilities will be taken over by the Company.

In consequence of the cheap production of Sulphuric Acid in England, and a large supply of Raw materials from countries where Sulphuric Acid is too costly to make, Artificial Manures can be made in England to compete with the World. These works have already shipped considerable quantities to France, Italy, the Mauritius, and other parts.

The satisfactory future in the Newport trade is, that it is mainly conducted on a cash basis, and the proposed re-arrangement of the business gives promise of considerably increasing the trade both at home and abroad of this old-established and, the Directors have no hesitation in saying, thoroughly sound commercial undertaking.

Mr. O. B. Cuville, Chartered Accountant, of Gloucester Bank Chambers, Newport, 2, Street Street, Cardiff and 4, Bishopsgate Street Within, London, has examined the statements of profit and loss submitted to him, with the books at Wolverhampton and Newport, and a copy of his certificate is appended hereto. As one part of the Wolverhampton trade is being taken over, it has been necessary to apportion some of the working expenses, but the Manager has done this as carefully as possible so as to bring a fair charge for them against the Newport Works. The figures taken for five years working at Newport ending June 30, 1891, show an average of profits over that period of £3,848 per annum, the minimum being £3,133 1s. 1d., and the maximum £4,785 18s. 10d., and which average the Directors have every confidence will be maintained in the future.

Take the average actual profit per annum over the five years ending June 30, 1891 £3,848 0 0
Add the two years' profit to be taken over by the Vendor, carried on at Wolverhampton, carefully computed to yield a profit of £1,400 per annum 1,400 0 0

Total £5,248 0 0

No estimate has been made for the increased profits that will necessarily accrue by the transfer of a large Super-Phosphate Business from Wolverhampton to Newport, or by the addition of the old-established connection of Gibbons and Wills (which has been acquired by the Vendor).

Taking the above figures as a basis:—
5 per cent. Interest on £25,000 of Debentures will be ... £1,250
6 per cent. Interest on £15,000 of Preference shares will be ... 900

£2,150
Leaving for the Ordinary Shareholders £3,098 which sum (after allowing for the extra expenses of working as a Company) shows say 10 per cent., and includes the Vendor's Deferred Ordinary shares of £5,000, the latter not ranking for dividend until that percentage is earned by the strict trading of the Company on the Full Ordinary Share Capital.

Mr. W. M. Fuller, who has successfully managed the business for thirty-five years (twenty years as Managing Partner), and is a practical Agricultural Chemist, has agreed to act as Managing Director for a period of at least ten years, and has entered into an Agreement with the Company not to carry on or be interested in any competing business.

The Vendor will pay all Charges in connection with the formation of the Company, up to and including allotment, except printing, advertising, stamps, stamp-duties, and legal expenses incurred on account of the Company.

The only Agreement which has been entered into (and all Applicants for Shares and Debentures shall be deemed to have had notice of the terms thereof) is:—

An Agreement bearing date May 10, 1892, made between WILLIAM MOXON FULLER of the one part, and WILLIAM FREDERICK BENTLEY (on behalf of this Company), of the other part.

Copy of the Memorandum and Articles of Association of the Company and of the Agreement above-mentioned, and of the certificates of the Valuers and Accountant mentioned in this Prospectus, can be inspected at the offices of the Solicitors of the Company.

Applications for Shares and Debentures should be made on the accompanying forms and forwarded to the Bankers of the Company, at any of their branches, or to the Secretary of the Company at the Registered Office, Gloucester Bank Chambers, Newport, together with the amount payable on application. If no allotment be made, the deposit will be returned without deduction, and where the number of Shares allotted is less than the number applied for, the surplus will be credited in reduction of the amount payable on allotment.

Prospectuses and Forms of Application may be obtained at the Office of the Company, or at their Bankers or Solicitors.

COPY OF REPORT AND VALUATION.

The works which were erected in 1892-3 have been carefully designed and well constructed.

The arrangements of the Manufacturing Department are convenient, and the storage accommodation large. For facilities of export trade are situated on a free river, close to a wharf capable of receiving vessels of large tonnage, and for distribution in the interior they are connected with the Great Western Railway main line.

The whole area of the site is not covered by the buildings and railway sidings already constructed, but land is still available for a considerable extension of the Works.

The Machinery and Plant laid down is of the most modern character, and especially adapted for economical and rapid production.

The Acid Plant is large; of the most improved design, and capable of supplying what may be required on an extension of the Works.

Gas and Water are laid throughout the entire Works, and supplied from the Companies services. There are also large storage tanks for water.

Having viewed the Buildings, Plant, and Machinery at the above place (which is described above), and considered the value thereof, and the value of the Vendor's beneficial interest in the lease of August 8, 1892, we fix the present value as the good value at Twenty-one hundred and Loss pounds, and for the business of MORRIS & GRIFFIN, with their Books of Account at Wolverhampton and Newport, for a period of five years, ending June 30, 1891. I see therefore that certain expenses, on account of the re-arrangement of the Works, have had to be apportioned, and I consider the apportionment correct. The result of my verification, therefore, gives an average profit over the five years, after allowing for maintenance and bad debts, of £188 9s. 6d. per annum, for the Newport portion of the business (the minimum year showing £133 1s. 1d., and the maximum £178 18s. 10d.). I have also verified the figures on which the further sum of £1400 a year is estimated as profit on the Bone Crushing business at Wolverhampton, this result being arrived at on a satisfactory basis on the past workings, and up to the corresponding date with the above. Interest on Capital has not been passed through the accounts. Yours faithfully, O. B. CUVILLE.

WILLIAM GRAHAM, SON AND HITCHCOX, SURVEYORS AND VALUERS, Messrs. The Directors of MORRIS & GRIFFIN, Ltd., Newport, Mon., March, 1892.

COPY CERTIFICATE OF ACCOUNTANT.

To the Directors of Messrs. Morris & Griffin, Limited.
GENTLEMEN,—According to your instructions, I have compared the statements of Profit and Loss submitted to me by the business of MORRIS & GRIFFIN, with their Books of Account at Wolverhampton and Newport, for a period of five years, ending June 30, 1891. I see therefore that certain expenses, on account of the re-arrangement of the Works, have had to be apportioned, and I consider the apportionment correct. The result of my verification, therefore, gives an average profit over the five years, after allowing for maintenance and bad debts, of £188 9s. 6d. per annum, for the Newport portion of the business (the minimum year showing £133 1s. 1d., and the maximum £178 18s. 10d.). I have also verified the figures on which the further sum of £1400 a year is estimated as profit on the Bone Crushing business at Wolverhampton, this result being arrived at on a satisfactory basis on the past workings, and up to the corresponding date with the above. Interest on Capital has not been passed through the accounts. Yours faithfully, O. B. CUVILLE.
Cardiff, April 25, 1892. Dated Newport, Mon., May 23, 1892.

MR. JOHN KNIGHT, Rose of Kent Nurseries, Dartford, writes, April 26, 1892, ordering a supply of our "A Quality" Hose:—"I had no end of trouble with another firm's make of Garden Hose last year; it wore clean out in less than three months—went into hundreds of holes in this time—so that I do not want anything of the sort again."

HIGHEST AND ONLY AWARDS:

London, 1887; Paris, Birmingham, & Brighton, 1889; London, Edinburgh, & Birkenhead, 1890; Antwerp, 1891.
No Exhibition Medal or Award has ever been secured by any other firm for Armoured Hose.

THE Gardeners' Chronicle.

SATURDAY, JUNE 11, 1892.

DOWNTON CASTLE.

THE fame of the great horticulturist, T. A. Knight, has perhaps overshadowed that of his accomplished brother. One cannot, however, write of Downton Castle without remembering its owner and builder, Richard Payne Knight, one of the most remarkable classical scholars of his day, and a poet who devoted some of his best verses to the subject of landscape-gardening. At the close of the last century, the formal style of laying-out parks and gardens, which had risen to its highest popularity in France during the reign of Louis XIV., had been gradually amended by William Kent, Gilpin, "Capability" Brown, and Repton, the greatest of them all, who acknowledged the talents of "the immortal Brown," as he called his predecessor, while he adopted what may be described as a more English style. Repton laid-out most of the great gardens of the latter part of the last century, but he was not natural enough for Mr. Payne Knight, who said of his system in a poem called *The Landscape*—

"He, therefore, leads you many a tedious round,
To show the extent of his employer's ground;
Climbs o'er the hills, and to the vales descends;
Then mounts again, through lawn that never ends."

Another champion on the same side was Uvedale Price, and the arguments of the two friends undoubtedly helped to improve the public taste. In another poem the same author sings of his own delightful residence,—

"Here on thy shady banks, pellucid Teme,
May Heaven bestow its last poetic dream;
Here may these Oaks in life's last glimmer shed
Their sober shadows o'er his drooping head,
And these fair Dryads whom he sung to save
Reward their poet with a peaceful grave."

It may be hoped that this digression will be pardoned for the sake of these pleasing native verses. The present owner of Downton Castle is a descendant of Thomas Andrew Knight, and of the founder of the family, the ironmaster, Richard Knight, who owned a furnace and forge at Bringewood, near Ludlow, amidst the primeval woods of Shropshire at a time when the smelting of iron was carried on by means of wood charcoal in small furnaces. The bellows of these furnaces were worked by water-wheels, and were generally situated on the banks of streams in the vicinity of large tracts of coppice wood. The Bringewood forge was leased from the second Lord Craven, from whom Mr. Richard Knight purchased it, together with a large

breadth of land, including the hill of Bringe-wood, and the site on which his grandson built the mansion of Downton Castle. In 1745 the ironmaster was buried in the chancel of Burlington Church under a large slab of cast-iron. In 1773-6 the castle was erected in a style defended by its owner and builder, Mr. Payne Knight, in an essay on the *Principles of Taste*, but not, I think, in the best style of English country mansions. The extensive restorations and additions by the present owner have increased its magnificence, and its Gothic towers and battlements are exceedingly picturesque, seated, as they are, in the midst of a varied landscape, but there must always be a touch of the unreal and uncouth in the imitation of a strong castle of the olden time, by the mock towers and weak embattlements of a modern house. Mr. Payne Knight was a literary M.P. indifferent to politics, and devoted to letters and antiquities. He is now chiefly known and honoured for his bequest to the British Museum of a magnificent collection of ancient bronzes and coins, whose value was estimated at £50,000. In 1810, having retired from Parliament, he yielded to his love of solitude and contemplation, and became the occupant of a cottage near the castle, which he relinquished to his brother, Thomas Andrew Knight, the great horticulturist and improver of fruits, flowers, vegetables, and cattle.

In connection with physiological and horticultural subjects, few names appear more frequently than T. A. Knight's in that wonderful work, Darwin's *Animals and Plants under Domestication*. Mr. Darwin has an important chapter headed, "On the Good Effects of Crossing, and on the Evil Effects of Close Interbreeding;" and in the course of a very interesting inquiry, most of the facts of the case, and much of the experience of the ablest breeders of plants and animals, are brought forward and considered. Knight's experiments are frequently noticed, and when we consider that he commenced his work a hundred years ago, and that his associates were the scientific men of the last century, it is a high tribute to his originality that Mr. Darwin should have so frequently appealed to him. As a vegetable physiologist, as President of the Horticultural Society, and as the first gardener of his day, Mr. Knight sustained his reputation by a long course of experimental researches. Among his subjects were the ascent and descent of sap in trees, the phenomena of germination—why, for example, the root runs down and the stem runs up; the influence of light upon leaves, the cross-breeding of many kinds of plants, and kindred topics. On all such subjects he communicated his ideas to the Royal Society and the London Horticultural Society in many papers. He studied animals as well as plants, and was a most close observer of their habits. I am afraid the stove in which the fly-catcher built has been removed, but I may tell the story of Mr. Knight observing that the bird seemed to appreciate the fact that when the temperature stood at 70°, it was not necessary for her to brood upon her eggs, and that she could leave them in safety. When it fell below 70° she would sit hard. It was an original observation that pet dogs do not hide their food, and that other dogs carefully store the surplus in case of a scarcity, an instinctive habit not so necessary now, perhaps, as it was to the ancestral wild dog, but inherited from him. One of Mr. Knight's last communications to the Royal Society was on animal instinct. Mr. Darwin quotes him on crossing horses of different breeds. As a cattle-breeder at Downton he was distinguished, and

that does not often happen to a scientist who had been elected a member of twenty-one scientific societies, and who was the holder of medals from eleven of them. In the *History of Hereford Cattle*, Messrs. Macdonald and Sinclair give Mr. Knight great credit as an improver of cattle, and it is significant, in reference to his theory of the good effects of a good cross, that the superiority of the Hereford breed of cattle seems to be justly attributed to an importation of stock by Lord Scudamore in the seventeenth century, and the infusion of a Flemish strain into the native breed.

In claiming for Mr. Knight a high degree of originality and a career of usefulness not even yet exhausted, one must admit that some of his views on the degeneracy of particular varieties of the Apple have not been sustained. In all old orchards there are old Apple trees in a state of decay, and Mr. Knight, in common with most of the Apple growers of his time and since, held that several of the old sorts, including some of those which appeared on the lists of Parkinson and Evelyn, were no longer to be found. The Moil, the Red-streak, the Golden Pippin, the Styre, and the Fox-whelp were all believed to be in a state of decay, having degenerated, as Mr. Knight thought, through the want of renewal from seed. His theory was, that in grafting there is no renewal of vitality, but only a continuation of declining life. He came to the conclusion that "all Apple plants propagated from the same stock partake in some degree of the same life," and his experiments in cross-fertilisation were made with a view to the production of new and more vigorous sorts. On the contrary, Loudon thought, that although varieties have a tendency to degenerate into the primitive character of the species, any variety may be perpetuated with all its excellencies by proper culture, and more especially varieties of trees. As to the supposed degeneracy of the Golden Pippin, or other sort of Apple, these sorts might be continued, "such as they are, or were, when the scions were taken from the trees, to the end of time." In opposition to the theory that plants propagated by extension were subject to degeneracy, he pointed out that Vines, Olives, Poplars and Willows have been propagated by extension for ages; and are still, as far as can be ascertained, as vigorous as they were in the time of Noah or of Pliny.

So far as the degeneracy of the Fox-whelp Apple is concerned, the Pomona Committee of the Woolhope Club successfully attempted the restoration of that and several other old and valuable sorts, and distributed through the country a number of young and vigorous trees. T. A. Knight certainly had the merit of anticipating Darwin's views on the beneficial effects of cross-fertilisation, but in the matters of detail just referred to, some of his inferences were incorrect. It is remarkable that not one of his seedling Apples is now regarded as of any value in the great cider-growing districts of Herefordshire and Worcestershire. But it must not be supposed that the author of *Pomona Herefordensis* and of a treatise on *The Culture of the Apple and Pear* left no mark on the industry of the orchard.

Dr. Hogg's work on *The Apple and Pear as Vintage Fruits*, edited by the late Dr. Bull, of Hereford, quotes him on the opening page as having been the first to point out that the real value of cider Apples and perry Pears must be sought in the richness of their juices, as shown by their density or specific gravity. He promoted Apple culture at an unfavourable time. Owing to the great wars early in the century, and the high price of cereals, the orchards of the west fell into a state

of neglect which has been perpetuated probably in more recent times by the prevailing fashion in favour of concoctions of so-called wines, imported from abroad. During the decay of cider growing, failing trees had their places supplied by any worthless sorts that came to hand, and little care was given to the management of the fruit or to the making of the liquor, which, in consequence of deterioration, could only be sold at a low price. It is satisfactory to learn from the work just referred to that a market can always be found for superior cider at high prices. On the subject of quality, Mr. T. A. Knight's opinion is quoted that "Herefordshire is not so much indebted for celebrity as a cider county to her soil, as to her valuable varieties of fruit." These varieties must be restored, and it is not too much to say that the improvement of the orchards can only be effected by the propagation and distribution of superior varieties—that is, the work must be conducted on the lines laid down by the subject of this notice.

The most convenient account of Mr. Knight's enquiries will be found in a selection of his works, published in 1841, shortly after his death. It remains to be stated that he left a son and three daughters, and that the former met with his death in 1827, by an accident, when shooting in the woods of Downton with a friend. The present Mr. Boughton-Knight is a son of Sir William R. Boughton, Bart., of Downton Hall, who married one of the daughters. The estate has been greatly improved by him, and the castle enlarged, while many old and indifferent homesteads have been removed, and replaced by new ones in a modern style. The handsome new church, seen from the castle across the pleasure-grounds and park, was built at the sole cost of the present owner thirty years ago. My visit was paid immediately after a heavy rainfall, and the "pellucid Teme" gentle in summer and running low in its stony bed—was raging madly and running rapidly, and on the following day all the rivers of Herefordshire, fed from the highlands of Wales, overflowed their banks. Some delightful walks have been formed on the river banks, and twice a week the public may use them and wander through the hermitage, a cell cut in the solid rock of the cliff on the right bank of the river. On the one hand there is the limestone cliff, on the other the river, with abundant foliage of trees and shrubs, through which, in summer, the sunbeams lit. It was too late for the summer scene, and instead of sunshine came frequent showers.

In addition to a number of exceedingly handsome Oaks, Elms, Chestnuts, and Beech trees in the grounds around the house, which the great horticulturist must have worshipped in his day, the gardener (Mr. Hancock) showed me several memorials of old times in the gardens. Among these is an old viney with the leading branches trained downwards from the top of the back wall to the front of the roof, reversing the usual method. Some old Pear trees—100 years old—also remain on a south wall; and a Mulberry tree, which covers a large space of wall, not very profitably, though its great limbs and peculiar growth render it interesting. *H. E.*

NEW OR NOTEWORTHY PLANTS.

DIPLODI SEROTINA.

VERY few, perhaps, are acquainted with this curious plant. It is not unlike a large example of the common Blue-bell in general habit and appearance, but it differs strikingly in the colour of the flowers,

which are of a very decided brown. It is, indeed, not very far removed from *Scilla*, but has important generic differences, especially in the possession of a perianth-tube. It is figured in the *Botanical Magazine*, t. 850, under *Scilla*, where G. (no doubt Gawler) says, "While *non scripta* (nutans) *cernua* and *campanulata* continue attached to this genus, and we think they certainly should be, no one can be at a loss where to arrange the present plant." This opinion, however, may be due in great measure to the very inaccurate drawing of the figure, which the accompanying description does not appear to correct, but also, no doubt, to the absence of seeds which, unlike those of any *Scilla*, are compressed. The leaves are narrow, somewhat glaucous, and of the present plant about 18 inches long. The scape is 2 feet high, with a loose somewhat secund raceme of twenty-three flowers. The outer lobes of the perianth are reflexed, and are a little longer than the inner, which approximate and spread at the top. This plant, though rarely seen, has been known in gardens from the time of Gerard. Twenty years ago it flowered at Kew as a pot-plant in a frame, and was flowering recently in the Cambridge Botanic Garden, to which a fine example has been presented in flower by Professor Foster. It is a native of the Canaries, Portugal, S. France, Barbary, and L'Agauri, L.

YUCCA HANBURYI, Baker, in *Kew Bulletin*, 1892, p. 8.*

This is a new species of *Yucca*, allied to *Y. angustifolia*, Pursh; Sims in *Bot. Mag.*, t. 2236. I saw it first in Mr. Thomas Hanbury's garden at La Mortola last November, and now Mr. Hanbury has kindly sent a specimen in flower. The seeds were sent several years ago by Mr. Sampson Hanbury from the Rocky Mountains.

Acaulescent leaves, 100 or more in a dense rosette, linear, rigid, $\frac{1}{2}$ to 2 feet long, $\frac{1}{4}$ to $\frac{1}{2}$ inch broad at the middle, a very pale whitish green, with a pungent point and white-brown edge, from which a very few fine threads break away. Raceme simple, second, $\frac{1}{2}$ feet long; pedicels cernuous, $\frac{3}{4}$ inch long; bracts large, white, lanceolate, scarious. Perianth campanulate, 2 inches long, white tinged with green. Pistil 1 inch long, ovary, white, oblong; styles green, pubescent. Filaments pubescent. J. G. Baker.

LISIOCHILUS GREFFI, n. sp.†

This new *Lisiochilus* is a very good addition to the stock of our terrestrial Orchids. It is a tall, vigorous plant, with long lanceolate folded leaves like a *Curculigo*, and a stout flower-stalk of 3 to 4 feet in height. The flowers, 20 or more in a raceme, are very beautiful. The sepals are dark-green, suffused with a dark purplish-brown, the petals pale yellow outside, and bright yellow inside, the lip with violet coloured side-lobes and a very strong folded and compressed middle-lobe of pale yellow colour. The plant flowered in the stoves of Dr. Hago Graf, at Steglitz, near Berlin, and we received fresh materials from this gentleman. The plant was purchased in England, in the bulk, with many other specimens, in 1888, from Messrs. Seeger & Topp, Lordship Lane, East Dulwich. As the other plants of this sending were only epiphytous ones, Dr. Graf

cultivated the specimen like other epiphytes; the plant responded to this treatment, but it was not doing well; at last it was potted in peat and loam, and from this moment it increased in size from year to year.

The plant is in the way of *Lisiochilus speciosus*, L. Krebsii, and especially *L. streptopetalus*, Lindl., published many years before under the name of *Eulophia streptopetalus*, Lindl. At first sight our plant is in a high degree like a luxuriant specimen of the latter, and it is necessary to point out once more the botanical discrepancies given in the Latin description. 1. The petals are not twisted at the base, as in *L. streptopetalus*. 2. The lip has the middle lobe not flat, as in *L. streptopetalus* (and all the other species), but very strong folded, to such a degree that it is impossible to plait it without breaking the whole labellum. 3. The glandula of the pollinium is a broad rhombic hyaloid body, but not a small brownish one, "glandula parva brunea," as it is said to be in Lindley's original description of *Eulophia streptopetalus*. 4. The whole plant, bulbs, leaves, flowers, are twice to three times larger in *L. Grafii* than in *L. streptopetalus*, Dr. Kränzin, Berlin.

MASDEVALLIA × CASSIOPE, Hort.

Captain Hincks, of Brecklenbrongh, Thirsk, Yorkshire, some time ago took in hand the hybridising of *Masdevallias*, and we are now able to chronicle his third success. It is the crossing of *M. triangularis* with the pollen of *M. Harryana*. The first flower has now expanded, and very charming it is. The result of such a cross could scarcely have been foretold. A flower of *M. Harryana* with the colour of *M. triangularis* would have been a poor thing, but almost the reverse has been attained. The shape is that of an enlarged and improved *M. triangularis*, with the reflexed dorsal sepal of *M. Harryana*, but scarcely modified in other respects. The colours are charming, but not easily described in few words. Viewed not too closely, the flower seems to be of a shade between pink and Indian yellow, with the three nerves of each sepal reddish-purple. But when examined closely, and especially through a lens, it is seen to be densely studded everywhere with minute reddish-purple dots on a pale, almost yellowish, ground. This arrangement of the colours is also clearly traceable to the influence of *M. triangularis*. The petals and lip also approach those of this parent in shape, the latter organ being terminated by a prominent crimson tubercle. It is the latest of a remarkable trio raised by Captain Hincks, the others being *M. × Hinckiana*, from *M. tovarensis* crossed with *M. ignea*, and *M. × Stella*, from *M. Estradae* crossed with *M. Harryana*. In each case the parents are very diverse from each other, and the hybrids handsome. *M. triangularis* produces its flowers in perfect masses, which promises well for the present one. J. O'Brien.

ALPINES AT NEWICK PARK, SUSSEX.

BEING in the neighbourhood of Chislehurst, a short time ago, I called at Newick Park, the residence of J. H. Slater, Esq., who has for many years past taken a lively interest in alpine plants.

The alpine garden proper, as well as the whole of its surroundings, at once showed that an amount of time, labour, and expense have been expended to bring out the many varying features here exhibited; besides which great discrimination has been displayed throughout the whole arrangement in laying hold of, and making the most of every natural advantage.

The ground on the north and west side of the mansion slopes down to a dell, from whence it gradually rises to the south boundary wall of the kitchen garden. At the top or east end of this dell a small lake has been formed at a considerable altitude above the general level, and beyond the boundary of the rock garden proper. The overflow from this is made to descend the face of the native sandstone rock in a cascade, and is further utilised as a meandering stream, but here and there throughout

the whole length of the rock garden it is made to form several very pretty pools, and from thence down the dell to the large lake beyond.

Across the middle of the dell a substantial bridge has been thrown, with a roadway broad enough for a carriage.

In the upper portion, in extent about 2 acres, is planted in rock beds one of the most select collections of alpine plants to be found in this country—indeed it is a question whether such another private collection exists in this country. These beds are disposed and planted in the most charming manner imaginable, and what struck one so forcibly is the health and vigour of the subjects grown.

be stone solely used is the sandstone rock of the place, and for this purpose nothing better could be wished; it is at once pleasing to the eye, and its great degree of porosity has doubtless a good deal to do with the well-being of the plants.

Here and there are interspersed in suitable nooks and crannies throughout these two acres a very large collection of hardy Ferns—and even many that in other districts require greenhouse treatment; the whole, I was told, do remarkably well, and some make enormous growth.

Mr. Potter, the energetic and painstaking gardener here, is particularly well versed in the different species and varieties of alpine plants, and by diligent and careful observation of the peculiar needs of some of the species which are usually considered miffy, he has certainly succeeded far beyond the usual degree of success in this class of plant-culture.

Standing on the bridge in the middle of this dell it seemed difficult of belief that within a period of comparatively few years this beautiful place was the site of a pond. This only shows that where the owners are horticulturally inclined, the natural advantages and beauties of many a private residence, now laying dormant, could be gradually brought out, and where these are prominent, the possibilities of this style of gardening are simply unbounded.

There are here to be found *Saxifragas* by the hundred, notably *S. atropurpurea*, *sancta*, *caespitosa*, *arachnoides*, &c.; *Primula rosea* in many vars., *P. viscosa*, *P. amœna rosea*, &c.; *Phlox setacea*, *P. Nelsoni*, &c.; *Anemone pulsatilla*, *A. apennina*, &c.; *Dodecatheon media*, *Sanguinaria canadensis*, *Dianthus glacialis*, *D. integus*, *D. neglectus*, *D. cruentus*; *Gentiana asclepiadea*, *G. verna*, *G. lutea*, *G. gelida*, &c.; *Daphne Blagayana*, *Wulfenia corinthia*, *Arnica montana*, *Podophyllum Emodi*, *P. peltatum*, *Ranunculus pyrenæus*, *Edelweiss*, *Soldanella montana*, *Androsace sarmentosa*, *A. carnea*; *Silene acaulis*, *Dryas octopetala*, *Linnaea borealis*, *Oursia coccinea*, *Trillium grandiflorum*, *T. erectum*; *Heuchera sanguinea*, *Armeria grandiflora*, *Gunnera scabra*; of these, some of the grandest plants I have ever before seen, and from the positions they occupy, half-way up the slope, and backed by masses of native stone, have altogether an unique effect, to heighten which, if that were possible, splendid masses of various Bamboos are in close proximity. The freedom with which these latter grow, and their graceful foliage, add at once a tropical appearance to this part.

By the several pools may be found masses of *Primula japonica*, which here grow like Cabbages; certainly I had never previously seen plants carrying foliage anything comparable with these. The flower-spikes on many of these plants were just appearing over the top of the foliage, and looked as if the flowers would be ample. There are also many plants of the following along the margins of the pools, viz., *Primula farinosa*, *Sarracenia purpurea*, *Cypripedium spectabile*, *C. calceolus*, *C. pubescens*, *Parnassia-grass*, *Bog Asphodels*, &c. The pools are planted with *Nymphæas*, *Arums*, *Bog Beans*, and *Pond weeds*, many of the latter beautifully in flower.

On the lower side of the bridge this part of the dell is planted with a grand variety of *Rhododendrons*, hardy *Azaleas*, *regal* and other hardy Ferns, with here and there a massive Oak, Ash, or other deciduous tree, the whole presenting a most charming imitation of natural planting from whichever side viewed, although to my mind, the best view is that obtained from the kitchen garden, or north side.

* *Yucca Hanburyi*, Baker, in *Kew Bulletin*.—Acaulescent, folia dense rosulata, linearibus rigidis pungentibus, albidiviridibus margine albo-brunneo filis panis tenuissimis brevibus dejectis, pedunculo valido, racemo elongato simplici, secundo, pedicellis cernuis, bracteis magnis scariosis albis persistentibus; perianthio magno campanulato albo viridi-tincto, staminibus puberulis pistillo brevioribus.

† *Lisiochilus Greffi*, n. sp.—Bulbi ovoides, 3–4 poll. longis, $\frac{1}{2}$ – $\frac{3}{4}$ poll. diametro, foliis longe lanceolatis acuminate plicatis, nervo clavo valido $\frac{1}{4}$ pedes alto, racemo laxiusculo; bracteis Casti cuneatis lanceolatis, acuminatis ovario sublongioribus. Sepala cuneato obovata obtuse acutis arctissime reflexis, petalis ter latioribus subaequilongis obliquis ovatis autice rotundatis; labelli lobis lateralibus ligulatis obtusius erectis intermedio arctissime compresso (explanato ovato) linea elevata in disco a basi apicem usque decurrente, calcaribus brevibus curvatis; gynostemio crasso, antheris actis acuminatis, pollinibus profunde sulcatis, caudicula late-linearis glandula transversa rhombica. Sepala viridia extus et praesertim intus fusco-purpureo suffusa, petala extus stramineo intus vitellina, labellum infra albidum supra lobis laterales violacei, intermedius luteus. Totus flos $\frac{1}{2}$ poll. diametro.

Although but few *Rhododendrons* were in flower at the time of my visit, so many of the best-named varieties, some of which are extra large plants, have been planted in masses, that it is easy to imagine what a grand floral picture is presented at this season in that dell.

The hardy *Azaleas* are certainly by far the largest plants that I have ever seen of this genus; one particular variety was in flower of a soft rosy-mauve colour, and the flowers looked, at the distance from which I saw them, as if borne in spikes instead of on the terminal buds of the shoots; but this, I think, can hardly be the case—at any rate, it is a most charming and bright, early-flowering variety, and I am sorry I could not learn its name.

I should strongly advise anyone contemplating the formation of a rock-garden for alpine, to pay a visit to this charming spot—an easy mile and a half from Newick and Chailey station, Lewes and East Grinstead line, London Brighton and South Coast Railway. *Pomum*.

AUBRETIAS.

On the rocky and as border plants at the private garden of Mr. John Pope, King's Norton, Birmingham, *Aubretia Leichtlinii* is very conspicuous just now, and a mass of beauty in its rich pink-tinted flowers—really a gem amongst our spring-blooming plants. *A. purpurea* is also very beautiful, a long broad edging of this plant being most effective. *A. Bonginvillea* is a fine variety, dwarf and compact. *A. compacta*, similar in colour to *A. purpurea*, is a charming plant. The house stands on high ground, and the west winds from over the Bromsgrove Lick Hills are felt here, but several pretty spring-blooming plants grow freely in the rockwork. *Lithospermum purpureum* has been blooming since Christmas, a deep rich blue, prostrate-growing plant flowering profusely. *Primula marginata* and *P. Sieboldii* varieties are quite hardy here, and *Saxifraga granulata flore-pleno* was also in full bloom.

Eulalia zebrina and *E. z. variegata* are quite hardy here, having stood out in the rockery for two winters. I have noticed its hardiness at Umberslade and elsewhere, and it is a welcome addition to our outdoor decorative plants. *W. D.*

THE ROSERY.

ROSE PROSPECTS.

WE are now at the beginning of June, within measurable distance of the period when Rose growers and Rose exhibitors can with some degree of accuracy take stock and conjecture what may be their hopes and fears in the coming season, and I do not think that during the thirty years or so in which I have grown the flower in any considerable quantity (and now I have only a few hundreds), that I have ever known a more sprightly season. Accounts vary much, of course, in a country like ours where there are so many varying climates, it will happen that in seasons like the present very different estimates will be formed. The climate, for instance, in the Isle of Wight is very different to that of Yorkshire, and that of East Anglia to the West Country. There is a saying in this county, Kent, which illustrates this; they say in a wet season, "When England rings, Thanet sings;" that is, that the drier climate and well-enriched soil of the Isle of Thanet enables them to bear a good deal more rain than other parts of England, although, possibly, it shares this with the whole eastern seaboard of our island.

There is this difference observable this season. I hear from two friends in the eastern counties the most deplorable record; one says "I have during the past two months lost three thousand Teas;" another that he has got to dig up all his, they were so severely crippled. On the other hand, from a friend in Herefordshire, who is a large grower, "I cannot complain much, my Teas are breaking very well, although I shall be late." Yes, this is the cry every-

where, and I fancy at the Tea and Noisette Exhibition, on the 21st inst., the Teas actually grown in the open will be few and far between. Walls will give a great advantage to those who possess them, for while they are best grown under glass, there is such an amount of heat and protection given to them that they are some two or three weeks before those grown completely in the open; and so in the amateur classes, I fancy none will be able to do battle successfully with Mr. Alexander's Hill-Graying of Beaulieu, Bath, whose "fortifications" will give him a great advantage in this backward season.

Two causes have been at work to despond the heart of Rose-growers this season; one was the very long and cold winter—not, perhaps, so severe as last, but of longer duration; while in some parts, as with us in Kent, heavy falls of snow late on in March, not only checked growth, but also made the ground cold. This made it necessary to put off pruning to a much later period than usual, and had we had anything like good weather, things might not have been so bad; but a long period of cold easterly and north-easterly winds, accompanied by drought, completed the work which the winter had begun, and complaints have reached me from many quarters of the following effects produced by this unfavourable season:—

1. As I have already stated, its extreme lateness; this may to some extent be remedied, should the present delightful weather continue. After a drought of six weeks' duration, we have had about half an inch of rain, and it is marvellous what a change has been produced, and there is no saying what another three weeks of it may do; but as far as my own garden is concerned, I notice that the shoots are not above half the length they usually are at this season.

2. I fear it will be found that there are a good many blind shoots, and shoots which do not carry a bud. There are some sorts, such as Duke of Edinburgh, which are prone to do this always; but I notice that in others, which are usually very free in flowering, there are many budless shoots. This implies a want of vigour due, not so much to the frosts, as to the long-continued drought and cold.

3. Flowers with green centres, and, therefore, utterly useless; in some favoured districts, the complaint has already been made of the appearance of these "horror," and I fear we shall have many complaints of their frequency. Of course the only remedy is the immediate pinching off the bud, when perhaps a good sound bloom may be obtained.

As usual, there are many complaints of the prevalence of maggot and green-fly. I find as yet I have not suffered much from the former, while of the latter I have not seen any. The only way to get rid of the former is by hand-picking, while syringing is the only effectual way of getting rid of the latter; and if growers possess "Stott's" machine, they have a very powerful aid in their attempts to conquer this pest.

There are two matters which ought to be attended to at once, but which amateurs too often neglect, and then complain that they do not get such good blooms as they see on the exhibition table, forgetting that unless they adopt the same methods, they cannot hope for success. It would be just as reasonable for a gardener to say, "It is too much trouble to thin my Grapes," and yet expect to have such splendid bunches as a Hunter, Taylor, or McIndoe brings forward. The sooner this disabbling takes place, the better. There is no better weapon for this purpose than a quill toothpick. As soon as the buds show, and it can be ascertained that the centre bud is not malformed, the side buds may be taken away, and all the vigour of the shoots be thrown into the one left. Now, too, will be the time to apply liquid manure, it is of very little use applying this when the buds are fully formed; it is now when the buds are in progress that the effect is most quickly produced. Some time is necessary for the plant to absorb the fertilising material applied, and it is evident that if this is left until the buds are fully formed, the application will be too late, so "his dat qui cito dat," holds good here; staking will not be such a security as in some seasons, still when the

shoots lengthen it will be necessary to do it, so as to prevent the plants from being shaken about by the winds, which are very injurious to their well being. I need hardly say how beneficial it is to the plants that the hoe should be run over the beds especially after heavy rains.

It has always been a pleasant occupation at this season of the year to visit the gardens of friends whom one knows to be keen Rose-growers, whether professional or amateur; there is always something to be learned, and as I am not an exhibitor, there is no possibility of being suspected of spying out the nakedness of the land, although I think Rose-growers are as little open to this suspicion as any people I know. As time rolls on, no doubt the pleasure will be more rarely experienced, and I find it is somewhat more necessary to husband one's resources than it used to be, still I do have the pleasure sometimes of these visits.

I paid to Mr. George Mount, at Canterbury, a visit which, for many reasons, interested me. I saw many things; I saw pot Roses, Teas especially. Mr. Mount, who first made his mark as an amateur, from a small garden at Harbledown, near Canterbury, has been gradually extending his borders; he became possessed of a piece of ground at St. Dunstons, in that city, admirably adapted for growing Roses; here he has erected a large series of houses, in which are grown quantities of such plants as are suitable for supplying flowers for the London market, while Tomatoes are grown in such perfection that he carried off the first prize at the International Horticultural Exhibition at Earl's Court, with a splendid dish of Perfection, which was the admiration of all who saw it. I may say that I have never seen pot Roses, both Teas and H. P. (but especially the former), better grown and rarely so well done as here, each plant, whether large or small, was a model in itself of what a Rose plant ought to be, with healthy and vigorous foliage, plenty of flower-buds, and perfectly clean—not an aphid to be seen anywhere; his out-door Roses are also in excellent condition, although somewhat late, and I feel certain now that he has got his energetic son to work with him, that those who have had it pretty well their own way in the larger classes will find in him a very formidable competitor; his own indifferent health has prevented him a good deal from exhibiting, but now that his son can go about with the flowers, I feel sure he will have to be reckoned with. I was glad also to meet here Mr. King, whom I had known many years ago as the foreman at Mr. Cranston's, at Hereford, and who now fills the same place here. Of course, amongst the pot Roses, *Niphetos* holds the chief place, while *Catherine Mermet*, *The Bride*, *Souvenir d'un Ami*, and other well-known sorts, were in full vigour.

Mr. Mount has, however, not been content with starting a new place, he has completely remodelled an old one. Those who know Canterbury, as I have done for upwards of sixty years, will remember the quaint little house which fronted St. Peter's, and behind which lays the Exotic Nursery. There are a few, and but very few, of us who can recollect its owner, Alderman Masters, who combined what is rare at all times, and even, I fear, almost as extinct as the dodo, or great auk—the keen man of business and the accomplished scientific botanist. After his death, the nursery sadly degenerated; the ill health and deaths of successive occupiers left it in a deplorable condition, so that one could only feel sad over the past. Well, this place Mr. Mount purchased, together with a fine piece of ground at Vauxhall, some mile and a half off, where there is the grandest possible soil for fruit trees and Roses. Mr. Mount has completely remodelled the Exotic Nursery, and here, too, Roses are to be seen in all directions, flourishing as they rarely do in a city. One landmark remains, the old circular greenhouse, which in the alderman's days was a treasure-house of new and rare plants of all kinds, but it is now considerably the worse for wear, and will probably last but few years longer; peace be to its ashes—it has welcomed many a stranger from far-off lands, and may safely die with a good conscience.

Another of the Rose prospects is, I think, the coming to the fore-front of an energetic rosarian, who will leave no stone unturned to secure success. While I am writing, I have just received a letter from the West of England, usually so aqueous a region, in which the writer says, "We are still sadly in want of water, and from the present appearance of my trees, shall be able to show respectably about August." This only confirms what, I fear, is the general notion, that we shall have a late and indifferent season. *Wild Rose.*

THE WATER-LILY HOUSE AT KEW.

Our illustration (fig. 107) represents this house at its best, which is any time between the middle of July and the end of September. The *Nymphaeas*

in the corners of the house are *Nelumbiums*, *Cyperus papyrus*, *Amorphophallus campanulatus*, and other large and remarkable moisture-loving plants. The collection of *Nymphaeas* is a rich one, and we have counted over a hundred expanded flowers in this tank on a July morning at about eleven o'clock, when the whole of the kinds are in "blow." Blue, purple, red, rose, white, and yellow colours are amongst them. The Gourds comprise *Luffas*, including the *Sooly Qua*, *L. egyptiaca*, which has fruits five feet long, and which are shown in the picture; *Lagenarias*, such as *L. gigantea* and *L. vulgaris*; *Cucurbita maxima*, *Cucumis sikkimensis*, snake and adder Gourds (*Trichosanthes*), the wax Gourd, and numerous other kinds.

The house was built in 1853 for the Victoria regia, which was grown there until the present Victoria-house was erected some twenty years afterwards. Since then the "Old" Lily-house has been

the day. These are, roughly, the essential conditions which produce the really delightful display of moisture-loving tropical vegetation represented in the woodcut. *W.*

SMALL HOLDINGS, ALLOT- MENTS, AND FRUIT GROWING.

Without going into political matters, I do think that the Small Holdings Bill and Allotments Acts are the best and most important measures that have been brought forward for many years, as when the first-mentioned becomes law, they conjointly will be the means of bringing back labourers to the soil, and keeping others on it who would have left the country to crowd our already over-peopled centres and towns. This ought not to be, nor will it be after a few years; and what will help to bring this desirable state of things about are

FIG. 107.—WATER-LILY HOUSE, KEW.

occupy the whole of the large circular tank, with specimen plants of *Hedychiums*, Sugar-cane, *Sagittaria*, and *Clusia* round the margin. The iron rail which encircles the tank is partly covered with the stems, leaves, and flowers of *Batatas paniculata*, and the narrow shelves against the sides of the house are covered with soil 1 foot in depth, in which a collection of tropical Gourds is planted. The bine of the Gourds is trained to wires running below the roof, and the effect of their large and sometimes bright-coloured fruits as they hang over the Water Lilies is particularly good. Along with the Gourds grow such handsome flowering creepers as *Solanum Wendlandii*, the best of all tropical *Solanums*, *Passifloras*, *Ipomoeas*, *Aristolochia elegans*, *A. ridicula*, *Clitoria ternata*, *Bignonia Tweediana*, *Beaumontia grandiflora*, *Allamandas*, &c. In tanks

devoted to the *Nymphaeas*, which do extremely well in it. Its dimensions are 44 feet square, with a porch on the south side. The roof is span, about 20 feet high in the middle, and the whole of the framework is of iron, resting on a thick stone base. It is an extremely light, and at the same time a strong and elegant structure. The tank is circular, 36 feet in diameter, 2 feet deep, with a leaden bottom. Two rows of hot-water pipes run through the water, and there are six rows of 4-inch pipes all round the sides of the house. The *Nymphaeas* are grown in large pots, except *N. zanzibarensis*, which is planted in a circular brick bed in the centre of the tank. The water is kept at a temperature of about 70° Fahr. throughout the summer. The house is shaded with thin canvas blinds only in very bright weather in the middle of

the lectures and instruction that are being given throughout the country on horticulture and agriculture, by means of which much interest has been excited in these branches of industry amongst the adult population; and now that country schoolmasters are about to take up these subjects, and teach them in the schools, we may look for a great increase of knowledge, or thirst for the same. This will, I feel sure, come out in a marked manner in the next generation; but what is needed to create and foster a desire among our juveniles and grown-up people in the sister arts referred to are practical demonstrations of the work, or the operations connected therewith, so that the teaching may be through the eye more than the ear, and in that way instruction is easier learned and understood. Of this I am convinced, and I think it will be found to be the general

opinion of others who, like myself, have held classes under the technical education scheme, that the members attending always showed keen interest in the arts of pruning, budding, grafting, and propagation, of seed-sowing, and other modes of rearing of plants, and especially when they were invited to take part in the work.

That the little which has been done in the parishes in this district is already bearing fruit, I have the most gratifying proofs from what I have seen going on in the cottage gardens, and the inquiries made by the cottagers when they see me; and I look forward to quite a new era in gardening among them. Village and country life will, I venture to predict, be in the future much more pleasant and profitable than in the past, as people's tastes improve, and children grow up observant, industrious, and well trained.

One branch of horticulture most likely to be taken up on a large scale is fruit growing; but to induce small farmers and cottagers to plant trees, it will be necessary to give freedom to remove any trees, or pay a fair and fixed compensation, if landlords wish to have them remain in the ground; and when once trees are well established, it will clearly be to their interest to take them, or, better still, to buy or find them, and plant them for their tenants, and so improve their own estates by having more value on the land. *J. Sheppard, Woolverstone Park, Ipswich.*

SEASONABLE NOTES ON HARDY FLORISTS' FLOWERS.

WHEN I wrote these lines, the double-flowered Anemones were beautifully in flower on a Vine border facing nearly due south. They had not received any water, although we were about to give them a soaking when rain fell abundantly. Those who would like to raise seedlings of these double-flowered species should mark some of the best of the flowers, tie them to a neat stick, and the ripening of the seed-pods should be watched, so that the seed be not scattered on the ground and lost. The rich red or scarlet, and the various shades of rose, blush, and purplish-blue of these flowers have a pleasing effect. Some persons advise leaving the tubers of Anemones in the ground all the winter, but I find this does not answer in my district. I planted out a hundred tubers on purpose to ascertain if they would really pass safely through a winter. Probably, they might have been all right had they not started to grow in the late autumn, and flowered for the second time when the frosts came. The best way is to dig up the tubers as soon as the leaves decay, and store them in a dry room till it is time to plant them again. It does not matter greatly when they are planted out, either in the late autumn or early spring. They do not seem to be quite so fastidious in regard to soil as the Ranunculus. Any good well-drained soil answers for them.

Ranunculuses seem to require much the same treatment as Anemones, except that the tubers should not be planted till the spring. Planting some of them early, and others later, gives a long succession. They soon show signs of distress if allowed to suffer for want of water. Whenever the leaves decay lift the tubers; if they are left a week or ten days after, they are almost sure to start into growth, and this injures the tubers for flowering next year.

Tulips now in most parts are out of flower; they are very fleeting if drying winds prevail. The leaves soon show traces of decay in hot, dry weather, and the bulbs should then be dug up as soon as the flower-stems are pliable enough to bend round the finger without breaking. Most of the capsules would ripen seeds if they were allowed so to do, but it is best to break them off as soon as the petals drop, for if they are not removed, the stems will remain stiff and unelastic until the seeds ripen. Care must be taken in lifting the bulbs that the labels are kept right; it is so easy to get them mixed, which is very disappointing the next season, when it is discovered, I provide flower-pots of different sizes when I lift

the bulbs, and each variety is put into its own flower-pot. These are placed on the shelves in the fruit room for three weeks, that is, till they are become dry, when the decayed fibrous roots are removed, and the bulbs are kept in the pots, or put into paper bags.

Pinks will soon be in flower, and about the third week in June the "pipings" may be taken off, and planted in hand-lights, in a rather shady situation; and, if the lights are kept close for some time, roots will soon form. I have found, if the opportunity is taken to put in the pipings in wet weather, they will do very well out-of-doors, if they are put into the ground with the fingers, in a shady border of fine soil.

[An old-fashioned and very successful method of striking *Pinks* was to pull out the piping at the fourth or fifth joint, using no knife to smooth the base, and to just top the longest "grass." Having got ready a kind of puddle-bed, an inch below the surrounding level, in a shady place, the pipings were stuck into it up to the base of the leaves. No glass is necessary. The secret is to seal the soil round the piping with the puddle, which should be so full of moisture that no artificial watering would be required till the pipings are rooted. Ed.]

The *Pink* does not seem to do well when confined under glass, and if pipings can be induced to form roots without it, all the better. I have also propagated them over a gentle hot-bed. A few inches of soil was placed over the manure when the temperature of the bed would be about 90°, and in this soil the pipings formed roots rather more quickly, but as soon as they were rooted, the lights were removed. The laced garden *Pink* is not a plant for pot culture, or to be coddled under glass. The flowers are never well and truly laced unless the plants are set out in good soil in the open border as early as the first week in October. The flowers likely to burst their calyx should have a slit made in the calyx on the opposite side to that at which it is inclined to burst, and it should also be tied round with a strip of raffia.

The forcing *Pinks* should have been planted out in the open ere this. The beds for these plants should have been made rich by digging into it decayed manure, and if the soil is heavy a little leaf-mould and sand should be added. Plant them about one foot apart, the rows being the same distance asunder. Cuttings, or "pipings," as the small grass-like growths are termed, put in during March should now be nice plants, and, if well-planted, they grow into large tufts or clumps by the end of September.

Seedling Carnations.—The seeds were sown on a hot bed about April 1; they were pricked into boxes, and are now nice plants, ready to be put out in the open garden. I like to get them out before the end of June, and if they are planted in well-worked rich soil, they make fine flowering specimens by the end of the season. *J. Douglas.*

FRUIT NOTES.

THE APPLE CROP IN EAST HANTS.—It is now possible to make an estimate of the Apple crop for this season. In these parts there is an abundant promise, the bulk of the fruits having passed the first, or "dropping" stage; or, in other words, their first swelling has been passed safely. In many instances the crop is too heavy, and calls for much thinning, which in the case of large trees is not very practicable; but on small bushes, cordons, &c., if fine large fruits are preferred, it will pay the grower to take off many of them, and no better time for this operation can be chosen than the present. If the fruit is not thinned, the trees require so much more attention in the way of feeding, or the crop, though heavy, will be of moderate quality only, which militates against much profit if the fruit is grown with a view to sale. We have many young trees of Irish Peach growing together in an open field, and although a frost of 7° was experienced at the time these trees were in bloom, no loss of crop has occurred. Irish Peach is the first to open its

bloom here out of nearly one hundred varieties. I was in great doubt as to the kind of crop these trees would carry after so much frost, the more so, seeing that it is not so well furnished with foliage as some others, and it has a tendency to bloom at the points of the shoots, which still more exposes its blossoms. To me it seems strange that some early-ripening Apples should be so late in opening their flowers, but so it is; take, for instance, Worcester Pearmain, which is about the last to open its flowers, although this variety is in season during September; or take Bramley's Seedling, which is undoubtedly a late variety—this opens its blossoms comparatively early. Many other instances might be cited to show peculiarities in this respect. It is not in all cases the varieties which have the most bloom that set the best crops of fruit, very often these have the thinnest crop in the end; still, a fairly abundant bloom augurs well for a good yield. The trees hereabouts are, on the whole, clean, and free from caterpillars or other insect pests. The rains, which came towards the end of May, were just in the nick of time to give the first swelling to the Apple crop; or, as is spoken of in some districts, was a good christening shower for the Apples. *E. M.*

STRAWBERRY LAXTON'S SCARLET QUEEN.

While walking round Burghley Gardens on June 3 with Mr. Gilbert, I was very much surprised to see a ripe fruit of the above Strawberry, for the season is by no means an early one in this part, and King of the Earlies Strawberry, which I find to be the first to ripen as a rule, shows no signs of colouring for some time. The runners of Scarlet Queen were also more advanced than those of other varieties, many of them being large enough for layering. Scarlet Queen will be very valuable as a first early variety; the fruit is of moderate size, and the flavour very good. *W. H. Divers.*

A TRAVELLER'S NOTES.

(Continued from p. 652.)

BARODA TO JEYPORE.—Not far from Baroda, on the way to Jeypore, a handsome tree is well represented on either side of the line. It is very particular as to soil, and only grows in patches. Unfortunately, I am too early to see it flower, but M. Henry tells me it is a wonderful sight, each tree being literally a sheet of orange-scarlet pea-shaped flowers in the way of *Cianthus Dampieri*. Its name is *Butea frondosa*. From its flowers the red dye is made with which the followers of the gods Siva and Vishnu paint their foreheads with the distinctive marks peculiar to each sect. Its leaves are used as cigarettees, and for manufacturing plates. Babools, *Acacia arabica*, are to be seen in quantity, and a pretty little shrub, *Cassia auriculata*, attracts notice by its numerous heads of yellow flowers. In the centre of the great tank at Ahmedabad is a pretty little garden with Bougainvilleas clipped in tiers, as we clip yews, and a fine specimen, thoroughly characteristic of the branching palm—*Hyphene thebaica*. It is some 15 feet high, and has two distinct heads breaking away from the main stem. A few nice trees of the brick-red flowering tree, with its large handsome ovate leaves—*Cardia sebastena* (?)—as well as a neat little specimen of *Agati grandiflora*, with its brown seed-pods, often 1 foot long, were to be seen. A white variety of *Ipomoea rubro-cerulea* trails prettily over a parapet, whilst the arches at the ends of the walks are hidden by *Petræa volubilis*—producing its sky-blue flowers freely, and *Combretum purpureum*, the latter one mass of buds. *Acalyphas*, *Eranthemum*, a bed of single *Hollyhocks* (doing well), *Abutilon coccineum* in flower, a few nice heads of *Cycas revoluta*, and some handsome dark-leaved *Graptochylum hortense* (grown in tubs), as well as *Croton* and *Dracaenas*, were to be seen. Alligators and flamingoes surround this charming spot, which is named Kankaria Lake. Beyond and round the tank Babools (*Acacia arabica*), form the chief vegetation, though *Nim* trees (*Millettia*), and Mangoes are also to be seen, as is *Ficus Trimeni*, easily recognisable by its distinct and peculiar white stem.

There is a small public garden at Ajmeer, little better than a wilderness, evidently quite neglected, though, on account of its situation and natural advantages, were it taken in hand quite a pretty place could be developed.

JEYPORE is a wonderful city—probably next to Hyderabad, the most interesting in India. Picture to yourself a city, with its principal streets 2 miles long and 60 yards broad, straight as an arrow (as are all the cross streets), quite flat, with a view as uninterrupted as that of the Champs Elysées, lined on each side with rows of houses with bazars beneath, all two stories, never more and never less, each fluted rose-pink, the huge streets and still larger squares thronged with people, evidently more or less well-to-do; cows wandering in every direction, strings of camels continually passing to and fro; nobles riding Arabian horses, all armed with curved swords, and richly dressed. The whole is surrounded by a high crenelated wall, above which, in the far distance, are the peaks of the Aravalia.

Jeyapore has been described as "a pink city on a blue lake"—a most terse and true description. It has a railway station with a corrugated iron roof, a school of arts, a water-supply, a huge cotton press with engines of 50 horse-power, and is lighted by gas.

I suppose such things indicate progress, but I agree with Kipling, it is a pity.

The public garden of Jeyapore is considered one of the finest in India, and by many, the finest. It is about 70 acres in extent, most of which is under grass, in first-rate condition; or under shrubberies, with beds in front. The roads are chiefly 30 feet wide. The menagerie is really an interesting one. The museum in the centre is one of the finest buildings I have seen out of Europe. The ground is cleverly and not too abruptly undulated; its fernery, or greenhouse of reeds, is the largest and best I have seen since leaving England. The whole is in first-rate order, and as clean as a new pin, doubtless the result of European management, with a maharajah's money behind it. To a lover of plants it is, perhaps, not so interesting as Baroda public park, as it is not planted with such a variety of trees and shrubs, but for the people I think it preferable. Exactly opposite the double iron gates, just outside which is a fine specimen of the Nim tree, whilst on the inside two Poinciana regia overhang the handsome iron railings supporting them, is a suken grass terrace, reached by a short flight of steps, a stone parapet running along the top. It is perhaps a quarter of an acre in extent, and surrounded by a shrubbery broken up by taller trees, such as *Calocanthus indicus* and *Cassia speciosa*. Small beds planted with a variety of plants, such as *Ruellia juncea* and *Salvia coccinea*, both in flower in one bed; *Justicia*, *Vincas*, and *Canna indica*. At the top of the grass plot in the centre, surrounded by a narrow path, is a small patch laid out in beds chiefly planted with *Ferns* and *Roses*, the latter looking sturdier and generally in better condition than I have as yet seen any. These beds surround some specimens of the tall *Cupressus torulosa* of the Himalayas. On the left a portion of the shrubbery is composed of dwarf plants of *Plumbago capensis*, whilst on the right the yellow berries of *Duraeto Ellisi*, as well as the ivory-white racemes of its variety also, are noticeable. A large piece of *Antigonon leptopus* is entwined in a graceful manner with the long grey shoots of *Buddleia diversifolia*. Further south the *Antigonon* was in flower. Here it is only in bud, but I can well imagine the pink blooms of this handsome creeper against the grey stems and dull green leaves of the *Buddleia* must be most effective. The whole forms a mass trailing over several square yards. A large Nim tree, the earth round the roots having been bucked up for several feet, forms a pleasing change, whilst opposite to it a small arbour leads to a path connected with the winding road between the gate and museum. On this arbour *Petrea volubilis* was just beginning to show its sky-blue flowers, and the delicate, palmate foliage of *Ipomoea semperflorens* covers one side. Round this terrace *Tithonia tagetifolia* is planted; it is the same Sunflower-like plant fast becoming a weed in Ceylon. Here it is straggling, and evidently not at home or in danger of multiplying itself to an alarming extent. Some parts of the shrubbery surrounding this terrace having become a little bare, a row of *Crinum asiaticum* has been planted—very useful for this object—the light green foliage showing up well against the darker back-ground. A *Grevillea robusta*, a good specimen, is in one corner, whilst close by a row of *Goldfussia colorata* is producing its blood-red coloured flowers freely.

Not far off is a circular garden, surrounded by a low stone wall, and laid out with beds of various designs each surrounded by a stone curbing. In the centre a high arbour over a small well is one mass of a creeper with white *Hydrangea*-like flowers

and exceptionally thick foliage; it is *Vallis dicrotoma*. The beds are planted with (*Eriotheca Drummondii*, Chinese *Asters* doing remarkably well, *Cannas*, *Ageratum*, *Roses*, and two of *Amaryllis*; one of prettily-tinted *Verbenas* is perhaps the most noticeable. A fine specimen of a leguminaceous tree, *Dalbergia Sissoo*, stands in front; whilst on one side of this garden the handsome ovate, dark foliage of *Sterculia alata* attracts one's attention as being so different to the foliage of all the surrounding trees. Another tree also worth mentioning is *Theretia nerifolia*; it is rather shrubby in growth, and unfortunately, apt to be bare at the base. It has long, thin, closely-set, narrow foliage, not unlike a *Nerium*, but much denser; its flowers are bright yellow, and moderate in size.

On each side of the road leading to the band-stand, in the centre are oblong beds edged with *Alternanthera*, and planted with *Vincas*, *Ageratum*, *Tagetes*, *Balsams* in flower, which though just passing look remarkably well; whilst behind these beds a shrubbery in which *Tabernaemontana* and the red flowers of *Hamelia patens* are noticeable, hides the bare stems of the bigger trees behind.

The fernery is a sweetly pretty spot; it is high, with a broad lantern, covered with small dried Reeds, just letting a little sun through; pretty cork-covered baskets, with small *Tradescantia discolor*, *Mother-of-Thousands*, and various kinds of *Ferns* hang from the roof; whilst pedestals, often quite hidden by *Maidenhair* of *A. capillus-veneris*, are dotted about. A path encircles the whole house, the body of which is filled with a low undulating rockery, and a round tank in the centre. *Cycas*, small *Palms*, foliage *Begonias*, numerous *Ferns*, *Cyperus*, *Caladiums*, and such like plants abound, whilst *Dracaenas*, often placed as single specimens on the top of the pedestals, form a nice variety in colour. The whole is most tastefully arranged.

Small groups of *Agaves*, *Sansevieria*, *Cannas*, Chinese *Asters*, all in pots, but cleverly hidden by cork, have been placed on the low terrace on which the band-stand has been erected; between each group is a comfortable seat.

If one rests for a moment at the band-stand, one can admire the splendid Albert Hall, approached by a broad road; large grass-plots, a few feet below the ground-level, are on either side in fine condition, and evidently carefully looked after.

On the road, a fine hedge of *Hibiscus sinensis* skirts one side, and a large "Pippal tree," with various kinds of monkeys chained to its branches, is not far off. Further on, and nearing the Hall, a good hedge of *Bignonia Stans*, and another of *Poinciana pulcherrima* is on the left; whilst on the right a large "nullah," crossed by a small suspension-bridge, is as rough a place as one could desire to see. Pretty peacocks abound just here, and they brighten it up a little.

The Albert Hall or Museum is most interesting, containing Indian products of every description, models of flowers and fruits, and photographs of all parts. All is in perfect order, in glass cases, carefully labelled. James H. Veitch.

(To be continued.)

DEW, AND ITS ACTION ON PLANTS.

It is generally believed that dew exercises a great beneficial and refreshing influence on plants, and this supposition has provided poets with many beautiful comparisons. When a scientist, however, declares that it is not a fact that dew is so important a means, and that its beneficial effects have been greatly overrated, it may be safely presumed that the scientist has good grounds for his assertion.

The reasons given by Professor G. Wollny, of Munich, for combatting the generally-received opinion upon the formation and value of dew, are, as might be expected, weighty, and are based upon the researches of several years. These researches prove that dew is not, as is generally supposed, formed by condensation taking place in the atmosphere immediately over the plant, and according to which theory the dew falls on the plants; but that the dew-drops are caused principally by the moisture arising from the earth—a theory first proposed by Gersten in 1833.

It will be seen that the co-working of the earth-moisture is necessary for the formation of dew,

and it will be easily understood that this has a great effect upon the question as to the value of dew as a refresher of plants.

That the generally-accepted theory of the formation of dew is incorrect, is proved conclusively by Wollny, who states that in the field where he made observations the dew was sometimes much heavier in one place than in another; and that while the difference could not be accounted for by the supposition that there was so much difference in the moisture of the atmosphere immediately over the plants in question, the difference of moisture in different parts of the field accounted easily for heavy or light deposition of dew. Wollny's researches prove conclusively that the quantity of dew deposited depends upon the moisture of the earth.

A certain amount of moisture is attracted by the roots, and sent up into that part of the plant which is out of the soil. The quantity of moisture thus abstracted by the plant depends not only upon the moisture of the soil at that particular spot, but also on the temperature. The higher the earth-temperature the greater is the amount of moisture abstracted by the plant.

In winter, when the temperature of the ground is so reduced, the plants can extract little or no moisture, but at the same time they continue to give out from their upper portions to the air. It is because of this that they often die; not because they are frozen, but because they are parched to death. In summer nights, however, the earth cools very slowly, and loses very little of its heat, and, from this reason, the plants abstract a great quantity of moisture; so much, in fact, that the water sometimes oozes from the leaves; or in case the surface of the leaves is suddenly cooled, is condensed, and given off in drops.

Wollny concludes, therefore, that the presence of dew on plants is owing to the action of the moisture drawn up by means of the roots into the upper part of the plants, combined with the action of the moisture rising directly from the earth itself.

It may be remarked here that the leaves of certain plants are so formed as to permit secretion and accumulation in case the evaporation is weaker than the power of suction, or rather when more moisture is absorbed from the earth than is given off into the air. When a hot day is followed by a cold night, the edges of the leaves of such plants (such, for instance, as the *Alchemilla vulgaris*) are found covered by big drops, which cannot be considered as dewdrops, whichever theory of dew formation be accepted. The great use of dew as a means of supplying plants with moisture is, therefore, as shown by Wollny, an error, for the plants can only be adequately refreshed by earth moisture absorbed by the roots.

Dew was said to refresh the thirsty plant. The plant thirsts if it does not receive a sufficient amount of moisture from the ground to supply that which is abstracted from them by the atmosphere. In times of drought, when the earth is more or less parched, and moisture is of the greatest necessity for plant life, there is no dew; besides which the amount of moisture which a plant can absorb by means of its leaves (save only in exceptional cases) is very trifling.

If the leaves and buds, which during the heat of the day are parched, regain their freshness during the night, it is not owing to the refreshing influences of dew, but simply because the air having ceased to extract so much moisture from the plant, and the suction from the earth always continuing, a fresh supply of moisture has been laid up. The dew is only of use in providing the leaves of plants, as it were, with a covering which is some defence against the continual suction of the atmosphere; but even this is not necessary, for the parched parts of the plant can become fresh without a dewy covering. After all, concludes Wollny, there is no doubt that the value of the work of dew has been greatly overestimated, and has not been in accordance with facts. J. Matthewman, Worsbro' Dale, Barnsley.

THE WEEK'S WORK.

THE FLOWER GARDEN.

By H. W. WARD, *Gardener, Longford Castle, Salisbury.*

MANAGEMENT OF BEDDING PLANTS.—Every-thing that is calculated to promote growth and symmetry in the different kinds of bedding plants should be adopted forthwith, so as to get the beds well filled in as short a time as possible, and in that way ensuring early effectiveness. With this object in view, all the flowers should be picked off for a few weeks to come, any unduly strong shoots being likewise stopped by pinching out the points. Afford liberal waterings in dry weather, and if a mulching of leaf soil or short dung has been laid on the soil, as was advised in a previous Calendar, it will accelerate growth, and lessen the amount of watering required. Pinch out the points, and peg out the shoots of all plants that require these operations, viz., *Heliotrope*, *Petunia*, *Calceolaria amplexicaulis*, *Verbena*, and *Phlox Drummondii*. The various species of *Sedum*, *Golden Chickweed* (*Stellaria graminea aurea*), *Cerastiums*, and other plants employed for the groundwork and dividing lines in carpet bedding should have all their flowers cut off, and the tufts pressed down so as to enable them to cover the allotted space in the shortest period of time, afterwards using a pair of sheep-shears to keep the various plants in due bounds. *Sedum lydium* shows a disposition to flower freely with me, and the easiest way to remove the flowers is to pull the flowering-shoots up. The same remark applies to *Antennarias*, afterwards affording the plants water to settle the disturbed soil. The flowers of *Cerastiums* and *Stellarias* should be clipped off.

VIOLAS.—*Viola Blae Perfection*, if set out among plants of *Golden Bronze Pelargonium*, look very well, as does *Viola Golden Queen*, interspersed among plants of *Pelargonium Mangleri variegatum*, the silvery foliage and pink flowers of the latter and the golden-yellow flowers and green leaves of the former making a pleasing combination of colours. At the present time these two *Violas* are in fine flower, and I am loath to disturb them to make room for the summer occupants; indeed, these *Violas* flower so profusely during eight or nine months of the year, that I have this year substituted *Golden Queen* for *Calceolaria floribunda*, a plant that has, during the last few years, been uncertain in its behaviour, the plants sometimes going off in a mysterious manner in the month of August, and thus leaving gaps in the beds. Old plants taken up, and divided into small bunches and planted at once, about 6 inches apart (in beds to themselves), pressing the soil about the roots in planting, and then giving water to settle the soil, experience very little check, and soon fill up the spaces between other plants. They should be planted thinly, except where used as a groundwork to be kept in due order amongst tall-growing plants. In our beds the *Violas* planted are allowed to extend their growth in September, so that by the time frost renders the housing of the *Pelargoniums* necessary, the beds are pretty well furnished with the *Violas*, which remain in bloom some weeks later.

THE KITCHEN GARDEN.

By G. WYTHES, *Gardener, Spon House, Brentford.*

COLEWORKS.—The present is a good time to sow seeds of Colework for autumn use. Coleworks or Collards should be grown in quantity, as the plants occupy but little space, and the crop not being long on the ground, is not very exhausting. To have them in continued succession several sowings should be made. Sow the seed broadcast or in drills in rich soil, and sow thinly and draw for planting direct from the bed, or prick the seedlings out into other beds. London or Rosette Collard is one of the best, soon turning in, and it is of mild flavour; this may be succeeded by St. John's Day dwarf Drumhead Cabbage, an excellent winter variety, and one of the best for early spring use. It is a distinct-looking variety with a very short stem, and a hard compact head, rather broader than long, and rather convex on the upper part. The heads which come in the spring from summer sowing, are not so flat as those from spring sowings.

CARROTS.—A bed of these should be sown on rich land to promote fast growth. These successional sowings of small varieties are useful in helping out the supply, and in preventing much use being made of the main crop roots in the young state. The ground where these Carrots are to be sown should be dusted over with fresh soot or wood ashes. The

varieties to sow may consist of the Early Nantes, Early Carenton, English Horn, and Early Scarlet Dutch Horn. The St. Valarie is one of the half-long varieties, very suitable for light land, if it be rich and deeply dug.

CELERY may be planted out in the rows as soon as large enough to lift, choosing showery weather for carrying out the job. Water well when planted, and at short intervals afterwards. No time should now be lost in getting the late sowings pricked off, or weakening will result from the crowding of the plants together in the seed bed; and the main thing is a sturdy plant. Seedlings, if sown under protection for late planting, may be lifted direct into the trenches. The plants should have sufficient space to grow, and full exposure, and be afforded plenty of root moisture, and a damping over with a fine rose water-pot in the evening.

VEGETABLE MARROWS in frames must be stopped twice a week to induce a good show of fruits, and liquid manure may be afforded occasionally, and the plants damped in the afternoon. Successions plant out on a warm border, and well supply them with water when they have got hold of the soil, and the weather is warm and dry. If small fruits are called for, it may be advisable to sow a few more seeds, and plant out towards the end of the present month. These plants give a nice lot of fruit if planted on a west border. Pen-y-Byd is good for this last sowing.

BROCCOLIS AND CAULIFLOWERS.—The last named are sometimes not much cared for when Peas, Beans, and other vegetables are in season, but the early autumn supply must be taken into consideration, so that no time should be lost in planting out Veitch's Autumn Giant and Walcheren and the Protecting Broccoli, the last being sometimes liked better than Giant Cauliflower, and by occasional sowings, it may be had on the table until Snow's Winter White Broccoli turns in. For the late summer the Walcheren Broccoli or Cauliflower, one and the same plant, is to be preferred to other Cauliflowers as being less likely to run, and it grows compactly, and is milder flavoured, and it may be planted out at about this time, following the early Cauliflowers in close succession. See that the seed-beds do not lack water, and if land is not yet vacant, prick off all plants likely to spoil by crowding.

FRUITS UNDER GLASS.

By J. RIDDELL, *Gardener, Castle Howard, York.*

MELONS.—Another planting of Melons may be made in a house, pit, hotbed, or frame, and more seeds sown for succession. Varieties of Melons differ in the length of time they require to grow to maturity, and it is by making a selection of those varieties which are early ripeners; those that require a little longer time to finish their fruits; and those which may be termed slow-growers, that an unbroken supply may be kept up. This I am enabled to accomplish with Malvern Hall; some seedlings obtained by several crosses with Spanish Melons; and a kind secured by crossing Green Queen with Ly Exoniensis. The last-named variety is from a fortnight to three weeks later than the earliest variety, and will keep in good condition for a fortnight after cutting. Although a second crop can be got from clean Melon plants by cutting them back and liberally top-dressing the bed, still the results secured from fresh plants and soil are much better. In both cases, however, the structure they are to grow in must be well cleansed. Give a surfacing of a rich compost to the beds of those plants on which a sufficient set is secured; water the soil with weak liquid manure, keep down all unnecessary growth, maintaining a dryer atmosphere at night, and ventilating freely during the day where the fruits are ripening. By carrying out these directions, the tendency of some varieties to burst will be lessened, and good flavour brought out. Melons growing in hotbed frames should be aired early in the morning to prevent the scalding of the leaves, and either slates, tiles, or something which absorbs heat should be placed under each fruit. I have seen pieces of glass used for this purpose, but it is the worst substance which can be employed, as it does not absorb heat, and condenses moisture. Stop the shoots of late successional plants at the first leaf beyond the fruit, and attend to the fertilisation of the flowers daily in the forenoon.

TOMATOS.—Cut out superfluous shoots, and reduce a portion of each leaf, where crowding is apparent, and in performing this operation deal most

severely with those leaves which shade the fruit. Plants bearing a heavy crop require manual assistance, especially if the beds or borders are shallow and narrow. At this season the ventilators should be partly opened at all times of day and night, and a gentle warmth during wet and foggy weather maintained in the hot-water pipes, if these are available.

STRAWBERRY PLANTS.—In order that good plants may be obtained for forcing next year, the first runners should be early secured. Some adopt the method of placing a small ridge of rich, porous, loamy soil along between the rows of old plants, and pegging the runners down to it; but I have always employed 3-inch pots filled with the same kind of compost, and in a rather loose state, in which to root my plants. In dry weather, watering has to be done whatever plan is adopted, and the pot plants have the advantage when they come to be shifted into their fruiting pots. I have always found, if runners filled 3-inch pots with roots, and the plants were repotted into 6-inch pots before the end of July, very good plants for forcing were obtained, provided their after-treatment was good.

THE HARDY FRUIT GARDEN.

By H. MARKHAM, *Gardener, Moreworth Castle, Maidstone.*

PEACHES AND NECTARINES.—Trees with fruit thickly set, which is now swelling rapidly, should be relieved forthwith of a large proportion of their over-abundant crop, pulling off the smallest and ill-placed fruits first. If the trees were recently lifted and root-pruned, and the shoots rather weak, the crop should be rather lighter than that of an undisturbed tree, so that the wood may be sufficiently strong to produce good fruit next year. Do not (as is frequently done), allow any tree to bear too heavy a crop, or the flavour of the fruit will be poor. The number of fruits to leave on a tree will depend greatly on the size and strength of the trees, and the variety. If at the final thinning these are left evenly distributed all over the trees in the proportion of one fruit to each square of 9 inches, it will be found when they are fully grown that the crop is a very heavy one. Trees not growing evenly, that is, where one side is stronger than the other, should be regulated in this manner, by leaving a lighter crop on the weaker half than on the other. See that the fruits hang clear of nails and snags, these being removed as the tying and nailing-in of the summer wood gets done. Keep well ahead with disabbing and training, securing a good number of the shoots with small bits of hard Fern stems or Privet twigs, &c.; do not attempt to pull or pinch out the shoots, but use the knife. If the trees have been disabbed, &c., twice previously, it will be advisable to leave only those shoots that are required for next year's fruiting. Keep the leaves perfectly free from aphid and red spider by constantly using the garden engine mornings and evenings, more or less freely according as the weather is bright or dull. Young trees should have their shoots put into their proper position, so that a good framework of the future may be built up. In some instances, where there are more shoots than are required for filling up the wall space, the young shoots may be stopped at 6 inches in length if strong, and the subsequent breaks laid in, which will be sufficiently matured by the end of the season. All blistered leaves should be removed and burned.

SWEET CHERRIES.—The foliage of these trees should be cleared with water from the engine before the fruits get too far advanced, and as the fruit ripens early no insecticide should be made use of after stoning, or a bad flavour will be imparted to the fruit. Should black-fly be present, dip the infested ends of the shoots in a vessel containing tobacco-juice water or quassia water, and syringe the trees occasionally with clean water. Keep the leading shoots secured to the walls, and remove some of the breast wood, but do not shorten it back too hard, but leave 4 inches or more of the wood, for if pinched too hard back at this early part of the summer all the basal buds will burst, and the trees become a forest of shoots.

PLANTS UNDER GLASS.

By R. MILNER, *Gardener, Penrice Castle, Swansea.*

LYORAS are just commencing to bloom, and plants which are, at the present time, growing in stove temperatures, will have their period of flowering prolonged by being placed in an intermediate house, guarding against admitting too much air for some

days afterwards, especially if the plants have been grown in a very high temperature, placing them in such positions that a direct current of air does not reach them. During the time the plants are thus kept in a cooler house, less water will be required at the root.

GARDENIAS.—Plants which have been flowering since the winter, and are getting straggly, may have their leading shoots cut back, so as to get them into a bushy form again, when they will take up less space, without there being any lessening of the quantity of bloom. When the plants have begun to grow again, those that may require repotting should be afforded a liberal shift, employing as a potting soil fibrous peat, or, if this be not attainable, some rich loam instead, with a small quantity of decayed manure and sharp sand, will be found to suit them. Give good drainage to the pots, and make the soil moderately firm about the old ball; and in rearranging the plants keep them well apart, and well up to the roof, which will induce sturdy growth, which always flowers better than that which is weak and drawn. Cuttings struck in spring will be ready for repotting. These should be grown in brisk heat, so as to get strong and well-established plants before the autumn. If there is a deficiency in the number of these plants, cuttings may still be struck. The matured wood of Gardenias strikes freely, and that being so, small branches having three or four shoots each, may be inserted singly in 6-inch pots, filling these three-parts full of sifted peat and sand, and the remainder with clean sand, afterwards placing them in the propagating-frame, when they will strike root in about three weeks. These plants being greatly subject to be infested by scale and mealy-bug, will require constant attention in the matter of cleaning them, or foliage and shoots will quickly get unsightly.

GREENHOUSE ERICAS.—To have the flowers of these plants in the best condition the plants must be put outside, or abundantly aired when these are about to open, as anyone who has seen the bright flowers of those which have opened outside, and compared them with the pale colours of those grown under glass, will have remarked the great difference between them. Take, for instance, the yellow-flowered *E. Cavendishiana*, and which is so liable to become greenish when grown under glass, but which, grown in the open, comes of the finest yellow; and so it is with all those species and varieties which have red in their flowers, the hue becoming much richer when the plants are fully exposed; the substance of the flowers is also much improved, and, consequently, their durability. As *Ericas* go out of bloom, pick off all decayed flowers before the seed vessels form, an important matter in view of next season's flowering. By erecting a light wooden framework over the plants, on which some stout canvas can be placed, or spare lights, heavy rains can be kept off them. As soon as the rain is over, the coverings should be removed.

MISCELLANEOUS.—Prick off early-sown *Cinerarias* into pans when large enough, using a compost consisting of one half sifted loam and one quarter each of leaf-mould and sand, placing the pans in a cold frame, and keeping them close shaded till the plants become established, when air should be afforded them, and light shading made use of on bright days. Sow more seed for succession. Primulas should be pricked off before they become crowded in the seed-pans, making use of a compost similar to that used for the *Cinerarias*. Keep them close like those, till established, and when large enough, pot them off singly into 48's. Young stock of the following plants, which may at the present time be growing in small pots, may be moved into 5-inch as soon as they are well-rooted, viz., *Plumbago rosea*, *Justicia speciosa*, winter-flowering *Begonias*, *Thyracanthus rutillans*, &c. A low, heated pit is the best place for them from this time, where they must be kept close to the glass. Young plants of *Eupatoriums*, *Grevilleas*, *Salvias*, *Marguerites*, *Libonia floribunda*, &c., should now be making free growth, and the leading shoots should be stopped occasionally. Shift them into larger pots as required, syringe the plants freely at closing time, and keep them free from aphids.

THE ORCHID HOUSES.

By H. A. BURBERRY, Orchid Grower, Highbury, Birmingham.

THE INSECT PESTS OF ORCHIDS.—Unfortunately for the cultivator of Orchids, the insects which work mischief in a greater or lesser degree are many, and occasion him much labour in their destruction;

and it always happens that at this busy season the time can be ill afforded, yet if they are not kept in check the harm they do at this season is often very serious. The green and yellow-fly, which are sometimes grievous pests, are really unknown to us here, even

FIG. 108.—ORCHID INSECT, (*Isoptoma chloridrum*. See *Gardeners' Chronicle*, 1889, p. 1231.)

in the *Odontoglossum*-house; and I am acquainted with a gardener near Birmingham who has never seen thrips in his houses, but who has green-fly in abundance. Instructions for the extirpation of these pests will be found in the Calendar for February 20 last. A sharp look-out should be kept if red spider is

FIG. 109.—WEEVIL OF BULB OF *OEOLAGYNE*.

troublesome, especially in the *Dendrobium* house, for it causes the foliage to become spotted, and cripples the growth if left unchecked. The ants are now getting active, showing how quickly they can carry scale insects and other matter, and deposit these on plants that hitherto were clean; they also

show an undoubted preference for pots full of seedling Orchids wherein they make their nests, the result of which proceeding on their part is soon manifested. I think the best method of destroying ants is to place a piece of meat well saturated with a deadly poison in their tracks, but out of the reach of all animals. Again, the Cattleya fly (fig. 108) should be sharply looked after just now, the growths getting forward enough to make their detection easy. Infested growths must be cut off, or the fly will escape and do fourfold damage another year. A full account of it is given in the Calendar for January 9 this year. There is another species of fly which attacks the roots of Cattleyas, causing them to become clubbed; these roots must be cut away and burned. Then there are the various slugs, cockroaches, woodlice, and others that are partial to Orchids, which occasionally do damage, and should, therefore, be hunted for.

GENERAL WORK.—The weather continues bright and warm, and very favourable to the plants making the strong healthy growth so necessary for good flowering next year. Cases of over-watering will now be rare if the plants have been properly potted, and the materials as well the plants themselves are in good condition. The rule should now be to water just as the moss is beginning to get white, and not letting it become any drier than this colour in it shows. The Mexican Orchids will be best if watered in the afternoon. *Laelia anceps* and the other inmates of the Mexican House may also be syringed both night and morning, but never when the sun shines upon them. Proceed with the necessary repotting of Cattleyas as they go out of flower. These plants generally look a little out of sorts after flowering, especially if they are at all weak, but they soon regain plumpness and vigour if placed in growing quarters and treated liberally. In the case of *Lycaste aromatica* and *L. cruenta*, and others of similar growth, it is best to repot these plants now, before they come into flower, or by the time flowering is past the new growths will be too far advanced.

THE APIARY.

By EXPERT.

TAKING SWARMS.—Swarms sometimes settle in such peculiar places that it is often very difficult to give them. In the case of a swarm settling high upon a tree, which often happens if an after-swarm takes flight with a young unfertilised queen, a skep or light box should be securely fastened to the end of a clothes-prop or long pole, by which means it can be held underneath the swarm, whilst a helper, armed with another pole, is able to shake the branch the bees alighted on, so that they may fall into it. Swarms are difficult to dislodge when they get into the middle of a hedgerow, and this is not by any means an uncommon place in which to find them. If a skep is placed on the top of the hedge, or as close above the bees as possible, they can generally be induced to take possession of it by having a cloth saturated with carbolie solution placed underneath them. Another favourite place for swarms to settle is round the stems or trunks of trees, and they are then rather awkward to have, by reason of their covering a large space, and branches sometimes being in the way. Under these circumstances, the best plan is to brush as many bees as possible into the skep with a large, strong feather, moistened with carbolie acid, and then sprinkle the place where they were with the latter. The remainder will beat a hasty retreat, and join their sisters in the skep, which must be propped up near by. There is nothing more likely to be of use in the apiary at swarming time than the carbolie solution, made in the proportion of 1½ oz. of Calvert's No. 5 acid to 1 quart of warm water. When a swarm is observed to be settling in an awkward place, it can be prevented, and the bees induced to go to another, by sprinkling a few drops of carbolie acid on the spot selected as soon as they first begin to cluster; and if it cannot be reached so as to be done with a feather, a syringe can be employed.

HONEY has been coming in freely lately, and as *Sainfoin* blossoms are almost out in many places, to be followed by white Clover—our two best honey plants—supers should already have been placed on all stocks.

TWO QUEENS IN ONE HIVE.—It speaks well for the new system of bee-keeping that manufacturers are now making and advertising hives suitable for the purpose.

EDITORIAL NOTICES.

LOCAL NEWS.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

ILLUSTRATIONS.—Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are particularly solicited.

NEWSPAPERS.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Advertisements should not be sent to the Editor, but to the Publisher.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

WEDNESDAY, JUNE 15 { Royal Botanic Society's Musical Promenade.

THURSDAY, JUNE 16—Linnæan Society.

SHOWS.

TUESDAY, JUNE 14 { Essex Agricultural and Horticultural Show (two days).

WEDNESDAY, JUNE 15—York Show and Gals (three days).

SALES.

TUESDAY, JUNE 14 { Various Orchids, at Protheroe & Morris' Rooms.

WEDNESDAY, JUNE 15 { 1,000,000 Palm Seeds, and Her-
baceous Plants, at Protheroe & Morris' Rooms.

THURSDAY, JUNE 16 { Clearance Sale of Stove and Green-
house Plants, on the Premises,
Ryeotote, Dulwich Common, at
1 P.M., by Protheroe & Morris.

FRIDAY, JUNE 17 { Established and Imported Orchids,
also the entire stock of the new
Cala Rhetotiana, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—60°·8.

So generally have Ferns come to the front as decorative plants of the greatest merit of late years, and so enormously have their cultivators increased in numbers, that we feel certain most of our readers will be instructed, and likewise interested, by the following facts and speculations as to the future developments of the Ferns of these islands from the pen of so enthusiastic a cultivator and hybridiser of this order as Mr. C. T. DRYVER, F.L.S.:—

"To those who make a special study of the development of our native Fern varieties, under that selective culture to which of late years they have been subjected, their wonderful capacity for further variation in the direction of greater delicacy of cutting, and refinement of detail, is a source of ever-increasing astonishment.

"Contrasted with the most delicate exotics, such as the *Todea superba* and *pellucida*, some of the finely-cut species of *Asplenium*, *Davallia*, *Gymnogramma* and others, our normal forms, pretty as they undoubtedly are, certainly stand far in the background as decorative plants; but it has been found that, starting from some of these species, the spores possess a power of divergent variation which enables the cultivator, in a few generations, or it may be in only one, not only to bring them into equal rank with the best of their foreign confrères, but in some cases altogether to surpass them.

"As a most salient and patent instance of this, we may point to the beautiful strain of Plumose Shield Ferns, *Polystichum angulare*, which were exhibited at the Fern Conference and Exhibition of 1890 and 1891 at Chiswick and Westminster under the auspices of the Royal Horticultural Society. These charming plants, which excited universal admiration,

originated some years ago under the skilful hands of the late Colonel A. M. JONES, of Clifton, and his friend and neighbour, Mr. E. F. FOX, of Brislington, near Bristol (who, alas! has also joined the majority), both of whom, though ardent Fern lovers in general, had drifted finally into the position of *Polystichum* fanciers in particular, this family possessing, in addition to unlimited powers of variation, the great virtue of being thoroughly evergreen, which naturally adds materially to their decorative value.

"These gentlemen sowed the spores of a decomposite wild variety of *P. angulare*, which though much more divided than the normal form, could by no means be regarded as plumose; yet, nevertheless, among the young plants resulting, there were several seedlings of such dense and delicate frondage, that although Mr. FOX, relying on his record, was firm in his belief in their origin, Colonel JONES scouted the idea of their having sprung from such inferior parentage, and it was only when Mr. FOX repeated the experiments, and raised a second batch with like results, that he carried conviction to the Colonel's mind.

"The outcome in this case, at one stride, be it observed, was a set of Shield Ferns which absolutely defy any exotic to rival or even approach them in fineness of cutting, density of growth, or general beauty.

"Naturally, among the batch a select few took foremost rank, three especially, which were named respectively *P. a. divisilobum plumosum densum*, *laxum*, and *robustum*. These are reputedly barren of spores, and hence have, so far, only been propagated sparingly by bulbils, which are produced occasionally at the bases of the fronds. From this, one would imagine that the possibilities of development were concluded, since bulbils notoriously yield plants quite true to the type, being, in fact, offsets; but, according to Mr. E. J. LOWE, twin bulbils—i.e., two bulbils at the base of one frond of '*densum*'—have yielded two remarkably distinct forms differing widely not only from the parent, but also from each other. One of these, named *Baldwinii*, would seem to be the *ne plus ultra* of fine division, the frond being built up of long silky filaments, in which not a trace remains of the mitten-shaped divisions peculiar to the Shield Fern family. The other form is much coarser in make, and considerably denser in growth than even *P. densum* itself, the pinnae overlapping each other to such an extent that the frond is like a thick mat of mossy verdure. Cases of bulbil variation are so extremely rare that we cannot look in this direction with any confidence for further development; it is fortunate, therefore, that though these Ferns are, as we have said, 'reputedly' barren of spores, *densum*, at least, is not absolutely so, since one plant two seasons in succession has yielded a crop, microscopic indeed, consisting of one or two solitary capsules, which could only be detected by a powerful lens. Three little plants, however, resulted from the first batch of spores, very small as yet, but showing their parentage unmistakably, and a score of prothalli exists from the second crop, so we have reasonable hope of making progress through the ordinary channel of the spores, and getting even finer types than the parental ones, the progeny being almost certain to vary both ways, i.e., to be better and worse.

"Through the spores, too, thanks to the demonstrated capacity of Ferns for crossing, we may look in the near future for the alliance of these splendid plumose forms with some of the symmetrically tasselled or cristate ones, though it is

really a moot point whether the result would be an improvement. Since, however, it has been repeatedly found that Nature's combinations of this sort are very apt to transcend altogether our preconceived ideas, or to strike out into a new and unimagined line altogether, we may reasonably expect that we should not merely gain variety by crossing, but that the variety would also be charming.

"As an example of the unexpected, we may instance Mr. CHOPPER's beautiful new type of the crested Male Fern (*Lastrea pseudo-mas fimbriata cristata*) raised from the old and well-known crested form, which has been well-named the King of the Male Ferns. Here we have from a comparatively coarse and heavy-tasselled Fern, a charming silky-surfaced plant with delicately-fringed flat tassels of the most refined character, and of altogether new type. Fortunately, though of a plummy nature, which often means sterility, it is by no means barren, and its spores yield remarkably true progeny, careful search through a large batch failing to show a trace of reversion. Strange to say, in this species and, in fact, in the whole genus, numerous as the varieties are, only two true plumose forms have been found, *L. f. in Bollandia* which is far from perfect, and *L. montana plumosa* which we have not seen, but which is described as a splendid form. As *Bollandia* was found in Kent, which is comparatively poor in Ferns, we may reasonably hope that somewhere in our 'ferny' western counties some lucky hunter will be able to add some truly plumose *Lastreas* to the Ferns of the future.

"Among the Lady Ferns, undreamt of possibilities have quite recently been realised by the advent of the 'superbum' strain of plumose forms raised from the Axminster source. Some of these plants were exhibited at the Royal Horticultural Society's show last year, and formed worthy compeers of the remarkable Shield Fern aforesaid. The development of some of these is really marvellous, the best being actually quinque-pinnate, or five times divided. As this strain improves in type, it loses rapidly in fertility, which points to a line being drawn by Nature before very long. Some of the plants, however, have inherited the faculty of yielding dorsal bulbils; but these, of course, are useless for crossing purposes.

"The curious part of this subject is, however, the fact that a wide range of forms, embracing all types of creting, and a number of types of plumation, sprang into existence in two generations from one uncrested variety without any crossing whatever; while a recent sowing from one of these has yielded a crop which, so far as the young plants have declared themselves, is true throughout to the parental form. We have thus constancy and inconstancy mixed up in the one strain in a very perplexing but interesting way, as follows:—First, spores of a perfectly uncrested Fern, yield over 90 per cent. of heavily-crested plants. From one of the best of these a sowing is made which yields a veritable host of diverse forms, crested of all grades, and uncrested of all degrees of delicate cutting; and then the spores from one of these uncrested ones are found to have resumed the constancy of its great-great-grand-parents.

"From the instances given, it is obvious that with careful selection our British Ferns of the future are destined to something better than the popular neglect to which they have been long subjected; but it is equally obvious that the word—careful—wants to be strongly impressed upon the cultivator. Nature is so generous with her varietal gifts to the Fern tribe, that it is simply

FIG. 110.—PALACE OF PARLIAMENT, LONDON. (SEE P. 700.)

ridiculous for those who raise from spores, to grow on the inferior types, which frequently have a knack of asserting their presence obtrusively among their choice companions. These intruders are frequently curious examples of freakishness and eccentricity, but he who aims to do good work and leave behind him something better than he started with, must form a good ideal, and stick to it; and if he takes our advice, that ideal will involve perfect symmetry, perfect constancy, and as much refinement as his imagination permits of.

"Finer and finer types will then reward his labours, and add their quota to the Ferns of the Future."

As the Potato season will once again soon be upon us, the following result of experiments in the Horticultural Division of the Rhode Island State Agricultural Experiment Station, conducted by Mr. L. F. KINNEY, B.Sc., may be of interest and value.

Convinced by experiments tried at this station and elsewhere in previous years, as to the merits of the Bordeaux Mixture as a means of checking the "blight" and "rot" of Potatoes, in 1891 the mixture was prepared in bulk and applied to the entire Potato crop of this station, excepting sections of fields left untreated for trial purposes.

While the blight of the haulm, and particularly the rot of the tubers, were much less prevalent in this locality in 1891 than in 1890, few fields, if any, of late Potatoes, were entirely exempt from it, and many suffered more or less serious injury from the premature dying-off of the haulms, due to the ravages of the disease. Its presence was first noticed on these grounds soon after the middle of July. An application of the Bordeaux Mixture was immediately made, July 20 and 21. This was repeated July 29, and again a third application was made August 8. This treatment of the haulms checked the spreading of the disease to such an extent that all of the varieties formed good-sized and well-matured tubers, which were practically free from the Potato rot.

As is frequently the case, the disease seemed to spread rather slowly at first, in the untreated plots; but by the end of July nearly every Potato plant began to manifest its presence, and by August 10 all growth of the haulms had ceased, and many of the haulms of the late varieties were already dead and dry, while those of the same varieties immediately adjoining them which had grown under exactly the same conditions excepting the treatment that the haulms had received, were yet growing in a comparatively healthy and vigorous condition.

The yields of merchantable tubers of four varieties of these Potatoes were calculated, per acre, both where the haulms were sprayed with the Bordeaux Mixture, and where the haulms were not sprayed, and are given in the following table:—

Variety.	Haulms Sprayed.	Haulms not Sprayed.
	Bushels per Acre.	Bushels per Acre.
Alexander's Prolific	197½	153½
Champion	168½	125½
Climax	135	96½
Green Mountain	208	121
Total, 4 Acres	709½	496½
Average	177½	124½

The average increase in the yield of the merchantable Potatoes due to the application of

the Bordeaux Mixture is shown in the foregoing table to be 53½ bushels per acre; an amount, the value of which considerably exceeds the cost of the Bordeaux Mixture used, and the expense of applying it. This increase in the yield where the haulms were sprayed was mainly due to the large size of the tubers, although there was a slight falling off in the yield of the untreated plots caused by the Potato rot. These results fully sustained the results of previous experiments.

It may also be mentioned that at this same station last year it was found that spraying the seed Potatoes and the soil about them with Bordeaux Mixture, after the seed had been dropped in the furrows, considerably checked the development of "Potato scab" upon the product—at least, in fields not previously contaminated with the disease.

THE TEMPLE SHOW, 1892.—Notwithstanding certain adverse circumstances, the show of the Royal Horticultural Society, held in the Temple Gardens this year was in every respect as great a success as in previous years. The action of the Council in raising the price of admission for the first few hours was evidently keenly appreciated by the Fellows of the Society, who were enabled to obtain a good view of the exhibits without undergoing the discomfort of doing so in a crowd. On the second day gardeners also availed themselves of the privilege to see the show as early as possible, and were able to make their notes before the inrush of the general public at 1 o'clock. It may be added that, from a financial point of view, the show was a greater success than any which have preceded it.

THE GARDENERS' ORPHAN FUND.—At the monthly meeting of the committee, held at the Hotel Windsor, on the 3rd inst., WILLIAM MARSHALL, Esq., presiding, the following special subscriptions and donations were announced:—Ealing District Gardeners' Mutual Improvement Society, proceeds of lecture, £10; The Manchester Local Committee, proceeds of concert at Altrincham, per Mr. W. PLANT, £20; Mr. JOHN WILLS, annual birthday gift, £10 10s.; Miss GIBBONS, per Mr. J. HUGHES, local secretary, Birmingham, £5; Tadcaster Paxton Society, per Mr. H. J. CLAYTON, £1. The Hon. Secretary brought up a report of the recent annual dinner on behalf of the fund, which was considered highly satisfactory. The death of Lady GORNSMID having been announced, the following resolution was unanimously passed:—"The committee of the Gardeners' Orphan Fund, having learned with deep regret of the death of Lady GORNSMID, desires to express their sense of the kind interest taken in the fund by her ladyship, as was particularly shown by her attendance at the floral *fetes* in aid of the fund, held in the wholesale Flower Market, Covent Garden. The committee tender to Sir JULIAN GORNSMID, then President, and the members of his family, their sincere condolence and respectful sympathy under the great bereavement they have sustained." The two following resolutions were also unanimously passed:—"That this committee express to Sir JAMES WHITEHEAD, Bt., their high appreciation of the great services he rendered to the Fund by taking the chair at the recent annual dinner, and for his exertions in securing such a highly satisfactory subscription list. The committee also desire to tender their hearty thanks to Sir JAMES for his eminent services thus rendered to the Fund; and they have the gratification of placing on record their sense of the unprecedented success which marked the new departure in the matter of the annual dinner." "This committee, in recording their sense of the marked success which attended the celebration of the recent annual dinner of the Fund, desire to express their hearty thanks to the Chairman, Mr. WILLIAM MARSHALL; their Hon. Secretary, Mr. A. F. BARRON; and to Mr. BRIAN WYNN, for arranging the details of the dinner, and in carrying out the same in so highly satisfactory a manner; also to

those friends who supplied flowers, and who so kindly assisted in decorating the dinner-tables." The proceedings closed with the usual vote of thanks to the chairman.

LINNEAN SOCIETY.—At an evening meeting to be held on Thursday, June 16, at 8 p.m., the following papers will be read:—1, "Contributions to Indian Carcinology," by Professor J. R. Henderson, F.L.S.; 2, "The Thames as an Agent in Plant Dispersal," by H. B. Guppy; 3, "On some Abnormal Development of the Flowers of *Cypripedium*," by Miss M. F. Ewart; 4, "Supplementary Notes on the Fauna of the Mergui Archipelago," by R. J. Pocock; and 5, "Lantern Demonstration."

MANCHESTER BOTANICAL GARDENS.—Friday, June 3, was a special *fête*-day in connection with the Old America Exhibition at the gardens at Old Trafford. The horticultural show was held in the glass-covered avenue, where Messrs. WATERER & SONS, nurserymen, Bagshot, Surrey, afforded visitors a treat of beauty in their large display of hardy Rhododendrons. The plants were covered with expanded and expanding trusses of brilliant flowers. The dazzling display made by these plants was toned down by masses of Japanese Maples and groups of Palms. The annual dinner of the Council of the Royal Botanical and Horticultural Society of Manchester, was held in the gardens on Friday, the 3rd inst., under the presidency of Mr. S. BARLOW. "Prosperity to the Society" was proposed by Mr. E. J. BROADFIELD, who expressed the belief that before many years had passed some new developments would take place. The county council had large funds at its disposal for the purposes of technical education, and he ventured to hope that part of those funds might be devoted to the special sort of technical education which the society had at heart. Apart from educational purposes they owed much to the gardens. The Society had solved the problem of finding healthy summer recreation for the people in Manchester. He believed the chairman of the county council would be favourable to a proposal for giving a grant to classes in botany to be held at the gardens. Mr. BARLOW, in responding, said he was not without hope that the county council would awaken to a sense of its responsibilities, and he believed that ultimately the suggestion which Mr. BROADFIELD had made would be adopted by the council.

NATIONAL ROSE SHOW, CHESTER.—We understand that owing to local circumstances, it has become necessary to alter the National Rose Society Show at Chester from July 14, to Saturday, July 16.

DINNER OF THE HORTICULTURAL CLUB.—The usual monthly dinner of the Horticultural Club was held at their rooms on Tuesday evening. Owing to the Whitsuntide holidays there was not a numerous attendance. The discussion was on "Nature versus Cultivation," opened by a paper by Mr. F. W. BURRIDGE, Trinity College Botanic Gardens, Dublin, read by Mr. GEO. BUNYARD. It was followed by an interesting discussion, in which all the members present took part.

THE NEILL PRIZE.—At a meeting of the Council of the Royal Caledonian Horticultural Society held on Wednesday, June 1, the Neill Prize for the biennial period, 1890 to 1892, value £37 10s., was awarded to Mr. JOHN PATERSON, formerly gardener at Millbank, Edinburgh, as a distinguished and successful horticulturist.

BERLIN PUBLIC PARK.—The public park at Berlin, "Humboldtshain," says the *Daily News* of June 3, is just now glorious in its spring dress. It is divided into so many zones for native and foreign plants. Each is provided with a tablet, giving its scientific and German name, its country, &c. In the Asiatic zone, many examples of *Pirus koribunda* are now in full and beautiful flower. The views from the different paths, says the *Vossische Zeitung*, become each year prettier. In the south border of the park is the school garden, provided with plants

for the instruction of scholars; there are a nursery of nearly three million young plants; a vivarium, an Alpine garden, and a "geological profile," as studies for both teachers and pupils. Then there are hot-houses, and glass pits, where the plants for the decoration of the public gardens in the city are cultivated. There is plenty of vegetable material for instruction in drawing in the industrial and other schools, and a botanical museum is located in the house of the director of this park. This interesting place is easily reached from the centre of Berlin by means of the trams.

THE TOMATO IN GREAT BRITAIN.—The following report by the United States Commercial Agent SAVIN, has been kindly placed in our hands by the Director of Kew for publication:—"Although known in this country as far back as the sixteenth century, very little effort has been made to cultivate the Tomato as an article of food until late years; and as a well-informed writer in one of the magazines for the current month remarks, it was only within the last ten years that its value in this respect has been properly appreciated. Half a century ago it made its appearance in the London market alongside its democratic congener in the Solanum family, the Potato, but made very poor progress in public favour until a comparatively few years since. Both came from the western hemisphere about the same time. To-day there are over one million square feet of glass surface in Great Britain exclusively devoted to the cultivation and production of Tomatoes for market purposes; and these Tomatoes are sold at prices from 8 cents to 16 cents per pound in the season. Just now, as the crop is about gathered, the price has advanced to 20 and 25 cents, and up it will go until it reaches the high-water mark of 50 cents per pound in the middle of winter. Tomatoes at 50 cents per pound are somewhat of a luxury. The principal source of supply for the Tomato out of season lies in the Channel Islands, Guernsey, Jersey, &c. The climate there suits the plant, where it can be grown in the open air. In the year 1890 these islands supplied the London market with over a thousand tons, valued at 250,000 dols. The Azores and the Canary Islands also sent their quota; and so did France and Spain. Notwithstanding the fact that the inhabitants of these countries enjoy special advantages in the matter of climate for the growth and development of the Tomato, and are able to conduct a large traffic in its sale for most of the year, the facilities for transportation are not such as to enable them to maintain absolute control of the London market. The epicurean taste prefers the hot-house article, from a singular notion that it is superior to the natural growth. This gives it a value that does not properly belong to it, and accounts for the large amount of money invested in hot-houses in the London suburban districts, and particularly in Sussex and the midland counties. The cultivation on both sides is on the increase, for the consumption is becoming greater every year. In ten years from now the trade will be five times what it is to-day. Such a prospect should not fail to act as a strong incentive to our horticulturists to consider the question of its export and its practicability, as well as the commercial possibilities which it possesses. The revolution in steamship service in the past two years should encourage them. Rapid transit at sea as on land has removed a great many obstacles which have hitherto interfered with the transportation of fruit, and confined the products of the American gardener to the local market. It would appear ridiculous to assert that a shipment of Tomatoes in the splendidly equipped and well-ventilated steamers of the Inman and White Star lines could not be delivered at the docks in Liverpool in tip-top condition ready for sale in the market at a substantial profit. The objection to those shipped from the Azores and the Canary Islands is not, properly speaking, based so much on the effects of delay in transit as from those which are directly attributable to irregularities in the methods of packing. Latterly, improvements in

this respect have been introduced. Instead of coarse, solid packages, light, strong wicker baskets, holding about 25 lb. each, are used. These baskets are lined with paper, then filled, when another sheet of paper is placed on top, the necessary cording done, and the package is ready for shipment. The French use similar baskets, and with their characteristic fancy for the picturesque, employ paper of different colours for packing purposes. The idea is to encourage the sale by making them look as attractive as possible. I have no doubt in my mind but that American Tomatoes can be placed on the London market in first-rate condition, and that eventually they could be made an important article of export. I am confirmed in my opinions on this point by my experience on board English steamers on homeward-bound trips, when American Tomatoes could be obtained up to the docks in Liverpool on the seventh and eighth day as sound and fresh as on the first day out. For these reasons I believe there is an opportunity here for the American horticulturist. The trade is becoming so extensive that the capacity of the home production is overtaxed, and the consequence is the price is high and the consumption not near what it would be were the Tomato reduced to the level of the popularity it occupies in the United States. To accomplish this we must look to that country from which England is now drawing seventy or eighty million dollars worth of breadstuffs and provisions each year. We ship fruit in abundance—Pears, Apples, &c., and why not the Tomato? Once established in these markets, it would soon be within the reach of all, the poor as well as the rich. Commercial intercourse between England and the United States has been instrumental in influencing the Englishman's taste in more respects than one. In a hygienic sense he is indebted to it for a great deal. Having become acquainted with the porterhouse steak, it was in concord with the eternal fitness of things that the same instrumentality should fashion his taste for the Tomato. What was once the Love-Apple of his forefathers, a mere object of romance and curiosity mixed up with all sorts of mythological traditions, is now served on his table and eaten "blood-raw"—no longer "Like to the Apples on the dead sea's shore, all ashes to the taste." *William P. Smyth, United States Commercial Agency, Huddersfield, November 6, 1891.*

THE CULTIVATION OF PERFUME PLANTS IN SOUTH AUSTRALIA.—It is of course well-known that the principal seat of the cultivation of perfume-yielding plants is at Cannes, Grasse, and Nice, and that some few kinds are grown more sparingly in this country at Mitcham, Ilitchin, and in Lincolnshire. Besides these centres of cultivation the attention of our principal perfume-makers was, many years since, specially directed to Australia as a country most suitable for the cultivation of this class of plant, where it was thought that the oils distilled from the leaves of the several species of Eucalyptus might well be developed. Since then, however, as has been recently seen, Eucalyptus oils have been distilled in other countries besides Australia in consequence of the widely extended cultivation of the plants themselves. We now learn that the South Australian Government have a perfume farm at Dunolly, which is progressing most favourably. Quite recently, it seems, that they have erected stills of 50 and 300 gallons capacity, respectively, and made several improvements in the machinery. The Director of the farm reports very successful experiments with the leaves of the Iron Bark, which has not hitherto been considered of any value in the production of oil, several other species of Eucalyptus had also been tried, all of which had yielded very fragrant oils; besides these, oil of Peppermint and oil of Wild Thyme, both of excellent quality, had been distilled, as well as oils of Laurel, Tansy, Anise, Lavender, Verbena, &c., and an extract of Vanilla, which had attracted considerable attention. It is stated that the operations on this South Australian flower farm are attracting much interest, not only in the colony itself, but also in other colonies, so that

the cultivation of these plants promises to become a very important branch of industry.

THEOPHRASTA JUSSIEU.—A tall plant of this rare-flowering species was in flower recently in the Palm-house, Kew. The pale buff-coloured flowers, arranged in a lax raceme, are finer, and more numerous than they are shown in our illustration, published in the *Gardeners' Chronicle* on October 8, 1887.

LECTURES ON HORTICULTURE IN LINCOLNSHIRE.—Mr. H. HUNTLEY, formerly gardener at Fowls Castle, Welshpool, has just commenced his second lecturing tour on horticulture in Lincolnshire, under the Lincoln County Council. For the next three months the lectures, weather permitting, will be given in the open air.

CYCLONE IN MAURITIUS.—The following letter has been forwarded to us for publication:—

"Royal Gardens, Pamplemousses, May 12, 1892.
"Since I wrote to you last we have had a sad disaster here. A cyclone of terrific force swept over the island on April 23, and almost laid it in complete ruin. Hundreds of people have been killed and wounded, and thousands are homeless. One-third of the town of Port Louis is a heap of ruins. The Canes have been levelled, and their leaves thrashed into fibre. The gardens at Pamplemousses are a complete wreck, the oldest and finest trees have been uprooted, and the trees that are still standing are reduced to bare poles. The fruit trees have been so smashed up, that I can hardly recognise them. I have sent you a photograph of my house, showing a little of the wreck. I shall send you some more when I can get them. In some parts the wreckage is piled up 9 feet high. It will be months before we get it cleared away. I have sent you an overlaid paper, with a complete account of the disaster.

"WILLIAM SCOTT,
"Assistant-Director, Forest Department, Mauritius."

ANCIENT SOCIETY OF YORK FLORISTS.—Mr. MCINTOSH presided at the usual monthly meeting of the York Florists' Society, held at the White Swan Hotel, Goodramgate, recently, when a paper on the subject of soils, their formation, composition, &c., was read by Mr. J. RIDDELL. The essayist first dealt with the conversion of rocks into fine earthy particles by the elements, passed on to treat of alluvial deposits, and the formation of peat. The many compositions of soil, with hints and advice on their cultivation, were also referred to at length. A vote of thanks was passed to Mr. RIDDELL at the close of the paper.

OPENING OF PUBLIC PARKS IN LONDON.—A public recreation ground, called Avondale Park, after the late Duke of CLARENCE and AVONDALE, was formally opened on June 2, at Pottery-lane, Notting-dale, by Mrs. F. C. FAY, wife of Mr. FAY, the Liberal candidate for North Kensington. The park is situated in a very crowded district. The ground covers an area of a little over four acres, and was purchased for £9,200, towards which the London County Council have contributed £4,250, and the Metropolitan Public Gardens and Open Spaces Association £2,000. Subscriptions were raised towards the payment of the rest through the Rev. C. E. T. ROBERTS, M.A., vicar of the parish, amounting to £667 ls. The work of laying it out was undertaken by the Kensington Vestry, of which Mr. FAY is a member. The land, which used to be a brickfield, has been laid out at an expense of £8,000. The greater portion of the ground has been arranged as a playground for children.—Lord ROSEBURY, on June 6, in the morning, formally opened Brockwell Park, Herne Hill. Although the park was not formally opened until this date, it has really been open to the public for the past twelve months. The park comprises about 75 acres of well-wooded, undulating land, with a frontage to the Norwood Road, and commanding admirable views of Denmark Hill, Knight's Hill, Sydenham Hill, and the surrounding district. The main object of the council in dealing with the space has been to preserve as far as possible its natural beauties. Well-gravelled paths have been laid down in convenient directions, and at the Trinity Road extremity of the park an ornamental lake, in which it is intended to permit bathing, has been constructed. The old mansion has been converted partly into a residence for the

park superintendent, and partly into a refreshment-bar, whilst the stable has been converted into a gymnasium. The work necessary to be done in the park has nearly been completed, but the council hoped to enlarge the entrance at Ilerne Hill, and possibly to provide another entrance at Tulse Hill, and a third on the west side. In concluding his speech, Mr. FLETCHER presented Lord ROSBERRY, as Chairman of the Council, with a key, as an emblem that the park would be from that day dedicated to the service of the public for ever. *Times*, June 3 and 7.

BOOK NOTICE.

THE BOOK OF CHOICE FERNS FOR THE GARDEN, CONSERVATORY, AND GREENHOUSE. By George Schneider. Parts XII., XIII., and XIV. (L. Upcott Gill & Co., London.)

In our issue for February 27, 1892, p. 275, we gave favourable notice of the first eleven numbers of this excellent work, which is to be completed in twenty-one parts, the succeeding three of which are now before us. In the former issues, the general subject of Ferns and all things pertaining to them having been cleverly and intelligently got through, and the enumeration of the species begun, suffice it to say that the succeeding parts will sustain the character of the preceding ones.

Part 12, with a coloured plate of *Gymnogramma calomelanos* var. *chrysophylla*, deals mainly with the genera *Gleichenia* and *Gymnogramma*; and the exhaustive character of the work may be imagined when it is said that about a hundred species and varieties of *Gymnogramma* are enumerated and described, and many of them illustrated.

Part 13, with a coloured plate of *Woodwardia arcolata*, a beautiful plate of *Cyathea medullaris*, and numerous engravings, treats largely of *Hymenophyllum*, *Hemetelia*, *Lindsaya*, and other of the smaller genera; and Part 14, with fine plates of *Sellaginella grandis* and *Lomaria Boryana* Dalgaisnii, takes up *Lomaria*, *Lygodium*, *Marattia*, &c. In *Lomaria* the descriptions and illustrations of the British *Lomaria* spicant and its many quaint varieties are specially interesting; and, indeed, throughout the whole work there runs a vein of interest which prevents it from becoming what is called "dry," even to those but little conversant with the subject.

WARNHAM COURT, HORSHAM.

ABOUT two miles from Horsham station we come to the Lodge which gives entrance to Warnham Court, the fine estate of C. T. Lucas, Esq., and which extends over some 320 acres of as pleasantly-situated land as any in Sussex. A journey up the carriage-drive and beneath the wide-spreading Oaks, with which the property is chiefly wooded, brings us to the mansion and terrace, which form the subject of our illustration (see p. 757). The mansion itself, which contains a grand collection of pictures and rare art treasures, was built in 1828, and its exterior in many parts is now clad with climbing plants, of which a fine *Wistaria sinensis*, heavily laden with its sprays of blue, and a noble Banksian Rose, which reaches to the top of the house, and is now covered with its rich yellow trusses, may be specially noted.

But ascend to the fine expanse of gravel on the highest terrace, look across the grounds, and a fine series of views meet the eye. Immediately below is the first terrace with its closely-trimmed greensward, its few but artistically arranged flower-beds, its broad steps, and vases well filled with flowers; next is the fine lawn-tennis ground, which gives space enough for six sets, and is so arranged as not to spoil the effect of the garden. Beyond, the eye ranges over the undulating ground of the park, and notes the fine herd of red deer some hundred or so in number, besides the lesser fallow and Japanese deer, with an occasional emu. In the bottom glistens the water of the lake; around on

every hand are the flower-laden Hawthorns, and not the least striking feature in the beautiful scene is the Chestnut Avenue, which is one mile in length.

Looking beyond the grounds some fine views taking in the range of Southdowns are obtained, the highest point being Chaucerbury Ring, planted by George III. as a landmark for shipping; and indeed on every hand from Warnham Court beautiful views, both in its own grounds and over the country beyond, are to be seen many of the objects which one beholds being of great historical interest.

Of the gardens generally it should be said that they were laid out principally by Milner in 1864, and have been since improved as occasion required by his scarcely less clever son; but beyond this, Mrs. C. J. Lucas in the garden, and Mr. C. J. Lucas in the Orchid-houses and glass garden, are continually devising improvements, in the carrying out of which and in the general management of this important and extensive garden their gardener, Mr. Duncan, gives ample evidence of his skill.

Turning on one side of the house, and entering a cool wooded walk, we come to the pinetum, which is said to contain every obtainable Conifer likely to succeed on the soil. It was very cleverly planted in 1880 under the personal supervision of Mr. Harry J. Veitch, who has shown that knowledge of the subjects used, the want of which when planting, so generally spoils a pinetum when the specimens grow up, viz., a knowledge of the relative proportions to which the specimens may be expected to attain. If this matter is neglected, either through ignorance or inattention, as it too often is, in a few years there are some of the specimens growing into each other, while the lesser ones do not cover the space allotted to them. The specimens in the pinetum are, of course, not yet large; and when it is said that all likely to succeed are included, we need not particularise—but two very handsome specimens should be noted, viz., *Abies Veitchii*, of which there are but few specimens in cultivation, and *A. bracteata*, a very handsome species.

At the bottom of the pinetum is the bog garden, in which Iris Kemptii, &c., thrive well; and passing round the shady walks at the back of the house, and in which the nightingales are said to abound, we come to a very artistically arranged rockery garden, planned and carried out by Mrs. C. J. Lucas with the assistance of Mr. Leonard, of Guildford, who selected the plants. At present, it is beautiful with the flowers of *Aubrietia*, *Saponaria*, *Saxifrage*, *Veronica*, *Iris*, &c., and among other things, a nice tuft of *Edelweiss*. When the newness wears off, this will be a still more beautiful feature in the garden, as while providing the necessary accommodation for the plants, it has none of the square-crib, all-over-alike appearance of many rockeries, neither is space wasted by ponderous large stones.

On the other side of the house we come to the American garden and the roseery, the former with clumps of large *Rhododendrons*, &c., and the latter with the background of them, both literally covered with the richly-tinted flowers, which have opened unusually well this year. On the lower level extends the long terrace-walk, which runs down one side of the great quadrangular garden under glass; one side of this is backed by a broad Yew hedge, closely clipped, and on the other is a border; while on the smooth grass beside the walk are numerous circular beds planted with summer bedding. And here we must conclude our feeble description of the few things we noted out of the many noteworthy in this extensive and well-kept garden. Suffice it to say, that the aspect of all the flowering things has changed since our earlier notice of the place appeared in these pages. The Orchid-houses now have the main show made up of fine *Cattleya Warscewiczii* (gigas), *C. Mendelii*, *C. labiata* Warnerii, and *Lælia*, among which is a most wonderful variety of *L. grandis tenebrosa*, a fine new *Sobralia*, *Promenaea xanthina*, with over eighty flowers on a single plant, *Epidendrum vitellinum*, *Odontoglossums*, &c. The collection of

Sarracenia, *Droseras*, &c., are in fine condition, the greenhouses glowing with flowers; the *Vinerias* and other fruit houses are looking first rate, and everything about the place, to use a common expression, as neat as a new pin.

HOME CORRESPONDENCE.

CUCUMBER BLUE GOWN.—My experience of this variety of Cucumber does not agree with that of "A. D.," in *Gardeners' Chronicle*, p. 663. I grow it at the present time in a house alongside of Telegraph, and the difference noted in the relative freedom of cropping of the two varieties is very remarkable, for to a certainty we cut five fruits of Telegraph to one of Blue Gown. This also is the experience of a grower for market in this neighbourhood, who had a fancy to try the variety, Blue Gown this year. The fruit may be larger than that of Telegraph, but if larger fruit be desired, Tender-True is, in my opinion, much to be preferred as a variety to grow. *E. M.*

CYPRIPEDIUM CALCEOLUS.—The flowers of this plant have had a short season this year, as the heavy thunder showers filled the slippers with water, and this accompanied with great heat and sunshine, has made them wither soon. Last year they came out earlier, and were much damaged by sharp frosts in the last week of April. This Orchid thrives better, and is more easily pleased in the climate of Cheshire than the North American kinds. It likes best to be planted in the projecting battlement near the top of a rockery, where a pocket of soil is surrounded by vertical stones, so as to secure rapid and perfect drainage. It wants but little soil, but that little should be very stiff loam and full of lime. I have several clumps in such situations which have not been moved for ten years or more. It is surprising from how small a base these produce a large number of stalks. One, of which I measured the area occupied by the plant, and found it less than 3 inches square, has sent up eighteen flower-stalks, with twenty-four fine flowers in all. Another of which I took the dimensions, has made stalks 20 inches high, with flowers 6 inches across, measured to the end of the extended wings. The plants are better for watering in summer, and a dressing of stiff loam mixed with rough lime in winter. *C. Wolley Dod*, Edge Hall, Malpas.

THE GARDENERS' ORPHAN FUND.—Mr. Penny's alarm note in last week's issue of the *Gardeners' Chronicle*, in regard to the funds placed at the disposal of the Committee, as the result of the recent successful dinner, seems to require some notice, especially as Mr. Penny states that his information has been derived from the columns of the *Gardeners' Chronicle*. How easy it is to assume that the committee is bent on some ruinous policy; and having no responsibility, how very easy to advise. Mr. Penny's anxiety and eagerness may readily be forgiven, but a little inquiry would have saved him all this trouble, because it so happens that the subject has not been brought under the notice of the committee in any shape or form up to the present time. The responsibility in this matter rests with the committee, who may surely be trusted to do what is best in the interest of the charity. The holding of the dinner, which was so worthily presided over by Sir James Whitehead, is intended, as you rightly infer, to mark a new departure, the dinners hitherto not having been looked upon as sources of revenue. We put the late dinner forward as typical of what we wish to have annually, and from which we expect to receive at least £500 every year. *A. F. Barron*, Hon. Secretary.

ANEMONE HORTENSE, 'ST. BRIDGID'S' VARIETY.—This variety of Anemone does remarkably well in the red sandloam at Bursley, Stamford, and is a useful plant for cutting; the flowers—especially the double kinds—lasting a long time when placed in water. Many of them are upwards of 4 inches in diameter when expanded, and there is a great variety of colours, some of them being selfs, but they are all very pretty, and look best when arranged loosely in vases with some of their own foliage, or with the wild "Fool's Parakey." By sowing the seed of this plant in shallow drills outside as soon as it ripens, and attending to it carefully with water till it germinates, Mr. Gilbert is able to flower the plants within twelve months from the time of sowing the

seed. Owing to its woolly covering, the seed should be rubbed in dry sand, or some similar material, before sowing, to separate the seeds, and in order to prevent it being sown too thickly. The *Anemone hortense* likes a rich, warm soil, and a sheltered position, as in such case the flowers appear early in the spring, a matter of some moment when cut flowers are in request always. *W. H. Divers, Kettton Hall Gardens, Stamford.*

LARCH FUNGUS.—In the issue of the *Gardeners' Chronicle* for June 4, p. 729, there is an interesting article under the above heading, in which it appears a Mr. Alex. Wilson, of West End, about two miles from Hambleton, Hants, has been a large planter of Larch for many years past. One of his plantations, we are told, which comprises an area of 12 acres, and was planted thirteen years ago, made good growth till the year before last, when disease first appeared; but so rapidly has the disease progressed, that not one healthy tree now remains. "The trees were planted 4 feet apart, and they average from 15 to 18 feet high" (a small size for Larch planted thirteen years ago). "Many only last season made a growth of 2 and 3 feet." Surely there must be some mistake here, as that is very good growth for trees in a healthy progressive condition. "The ground is on a gentle slope from top to bottom, loamy, with a chalk subsoil." The cause of the failure is not far to seek, and Mr. Wilson has made a great mistake in planting his Larch on this class of ground. The trees appear to have been in a healthy progressive state until such time as their roots came in contact with the chalky subsoil, then their doom was sealed, and is just what any experienced planter could have told before a single plant was put into the ground at all. The Larch should never be planted on the chalk formation, nor on the mountain limestone rocks; and in my writings I have repeatedly warned planters against this mistake, for it cannot be too widely known that the Larch never attains a profitable size on this class of ground. I have, however, cut very good Larch on marly soil that contains from five to ten per cent. of lime, but when the soil contains about twenty per cent. of lime, it is then understood to be a calcareous soil, and as such unsuitable for the Larch. Much has been said and written about the Larch fungus, but the fungus is only a secondary stage of the disease, and this example shows a fine illustration of this. When the trees contract a stunted growth, and gradually lose their vitality for want of food suitable for their requirements, they then form a suitable pabulum for the fungus spores, which are always floating about in the air, and although the fungus may be found in this Larch, which I think is questionable at this stage, yet Mr. Wilson may rest assured the soil was the first and principal cause of the failure. *J. B. Webster, Planter and Wood Surveyor, Fairview, Stangmore, Dungenannon.*

NICOTINE FUMIGATOR.—I can fully endorse all that "W. R." says, p. 729, about Nicotine. As a fumigating material it is far before any tobacco-paper that I have ever used. We have used it here in the Peach-houses and vineries, in the Rose-house, for Melons and Cucumbers, in the fernery, and for miscellaneous plants, and have never been able to detect the slightest harm to the most tender plants. The Ferns were fumigated several times early in the spring, when there were little else but young fronds, and with no bad effects. If paper had been used, the whole would have been blackened and browned the first time. If the fronds escape in fumigating with paper, most certainly the aphides will. Not so with Nicotine; it kills the fly, without hurting the youngest fronds. This alone is a great deal in its favor, but when one comes to consider the small amount of trouble and time it takes to fumigate a house or pit with it compared with that needed for tobacco-paper, and the comfort attached to the manipulation of it, there is no real comparison between them. It is only necessary to put the requisite amount into some old flower-pots, as "W. R." says, and place them about the house, and leave the substance to burn out, for there is no need for the operator to fumigate himself along with the green-fly. The fact is, it is a boon to gardeners. *W. M. A., Poles, Ware.*

STEAM HEATING IN HORTICULTURE.—The question raised by "W. D." in his letter in your issue of the 4th inst., is one of considerable interest and importance to all growers of glasshouse plants. The objection to the use of steam, on the ground that it necessarily involves a dry and scorching heat un-

suitable to plant-life is, as "W. D." shows, unfounded; for the temperature of the radiating pipes can be regulated to a nicety by the amount of steam allowed to enter them. Indeed, the ability to command a "dry" heat on occasion is an obvious argument in favour of steam. But to the majority of growers the question must always be, "which is the more economical—by means of which can I obtain the greatest possible result for a given expenditure?" With the view of answering this question, some very thorough experiments were conducted a short time since in one of the admirable agricultural experiment stations in the United States, the report of which was published about eighteen months or two years ago. I regret that I have not this report by me, and that I cannot, therefore, quote figures. The experiments, however, were substantially as follows:—Two forcing-houses of precisely similar size and construction were heated by hot water and steam apparatus respectively—both of the latest and most approved pattern. In the first series of experiments, which were continued for a considerable period of time, a careful record was kept of the temperature of the external air, and of the air in each of the houses. Exactly the same weight of fuel was supplied to the two systems, with the result that the temperatures registered in the water-heated house considerably exceeded those of that for which steam was used. In the second series of experiments, as far as I can recollect, equal temperatures were maintained in the two houses, with the result that a larger consumption of fuel was needed in the case of the steam apparatus. The objection to the use of steam mentioned by your correspondent, namely, that steam apparatus requires constant attendance is, in small places at all events, a very real one; while the advantage that almost any kind of rubbish can be burnt may, I think, fairly be claimed for any furnace—steam or water—which has a strong draught. *Apologies of this subject, may I be allowed to suggest that if some of the readers of the Gardeners' Chronicle—whose collective experience must be enormous—would state their views as to what is the most economical form of boiler among the very many at present in the market, they would be conferring a very real benefit upon the gardening fraternity in general.* *C. W. Herbert Gravels, Bournemouth.* [It would lead to no result. Ed.]

ANEMONE FANNINI.—For seed of this plant—a native of Natal—I am indebted to the editor of the *Gardeners' Chronicle*. I raised a crop of seedlings about six years ago, and two or three plants placed under a south-west wall have proved quite hardy, but have not flowered till this year, when one flower-scape has come which produced three flowers at the beginning of May. The flowers last a long time, and are still fresh, after being out for three weeks. They have about ten white petals of irregular length, the whole flower being nearly 4 inches across. The habit of the plant is not unlike that of a giant *A. narcissiflora*. The flowers form an umbel, each being on a pedicel 4 or 5 inches long, growing out of a node formed by three clasping and overlapping involucral bracts, the stem below being naked and about 20 inches long. *C. Wolley Dod, Edge Hall.*

SOUVENIR DE LA MALMAISON CARNATIONS AT CANFORD MANOR, WIMBORNE.—Before these notes appear in print, many of your readers will have seen staged at Earl's Court, on May 26 a fair sample of the magnificent lot of plants of the above-named flower, which I had the pleasure of observing in the houses at Canford on May 19; and Mr. Crasp, Lord Wimborne's gardener, should be congratulated on being so successful in working up such a fine lot of plants of Malmaisons (about 3000) within the last few years. The plants are the picture of health. A span-roofed house, 90 feet long, and in three divisions, well ventilated at the top and in the front, is filled with successions of flowering plants. Arranged on the floors in two forcing-houses, two rows of specimen plants were noticed, which were being gently pushed into flower for conservatory decoration at Lord Wimborne's London house. Several pits were also seen, which were filled with plants that will flower the next and following years. The specimen plants are grown in 16-size pots, in good loam, and a sprinkling of fertilising moss, with which latter material the soil in all the pots is mulched, and into which the roots freely push. *H. W. W.*

TABERNEMONTANA CORONARIA, FL.-PL.—At the beautiful seat of Colonel G. H. Morrell, Headington Hill Hall, Oxford, so rich in fine trees and

shrubs, I noticed on a recent call some truly magnificent and well-flowered plants of this growing in tubs. The two largest plants were fully 8 feet across and 6 feet high. How very useful its pure white double flowers are for button-holes and bouquets. A brief note as to Mr. W. Hovell's (the gardener) system of treatment which has produced such satisfactory results may not be out of place, and be of practical service to cultivators of this plant. A healthy cutting struck in the ordinary way, with *Gardenias*, *Crotons*, &c., grown on with them in the stove, and given every encouragement to make free growth, will be a nice plant in two years, and begin to flower. If they show before this time, it is Mr. Hovell's practice to pick the buds off as soon as possible, not only when the pots are very full of roots, after this they will take liberal supplies of manure-water and surface-feeding. Pot the plants in good loam with just a little peat, finely broken charcoal, and coarse sand added. *J. L.*

NURSERY NOTES.

MESSRS. H. CANNELL & SONS, SWANLEY.

Most nurserymen have their *spécialité*, and everyone knows that florists' flowers are the specialties of Messrs. H. Cannell & Sons. It was to see these that we went into the Hlop county on a recent occasion. The visitor soon notices that all Mr. Cannell's houses are alike in construction. Not many Nurseries are famous for diversity in their houses, or for great architectural beauty, if we except such a firm as Messrs. Sander & Co., St. Albans, but in the establishment of which we are speaking there appears scarce a solitary exception to the uniform type of construction. This, of course, is accounted for by the fact that Messrs. Cannell grow comparatively few indoor plants that require much head room. Consequently, these houses are span-roofed, about 8 feet high, and with a steep slope. All of them are 100 feet long, some more, and over thirty in number.

For Pelargoniums, *Cinerarias*, *Begonias*, *Gloxinias*, *Fuchsias*, &c., of course such houses are excellently suited, but all gardeners are not so fortunately placed as to be able to afford house accommodation for these plants, and they are relegated to the frames. The first house we entered contained a large collection of Ivy-leaved Pelargonium, some of the newer varieties serving to show the great advance recently made with this most useful plant. Ernest Bergman is an exceptionally large double variety, of a very good crimson colour, the largest yet produced. Beauty of Castle Hill is a pretty salmon-coloured semi-single variety, then there is the distinct puce-coloured Jeanne Gillot, and Victoria, a large single bright red flower, the two upper petals of which are very prettily marked with light maroon. These are all comparatively new ones, having flowered last year for the first time, and are improvements in some particular or another; but even now, for general usefulness and colour, it is difficult to beat *Souvenir de la Chas. Turner*.

Zonal Pelargoniums are strongly in evidence at Swanley, and some seedlings have just now commenced to bloom. One of these, *White Lady*, Mr. Cannell considers the best white yet seen. It is a large single flower, of pure white, except the bright orange stamens. Madame Rozain is a double white, Miller's Gem is a double variety, of a purple shade, with transparent stems, like West Brighton Gem, and some others. *Colossus* is a good crimson-scarlet, semi-double. In another house were about 1000 plants in 6 and 7-inch pots, all best varieties, including new ones, that are to furnish both sides of one of these houses during the summer.

The display of fancy, decorative, and show Pelargoniums is practically over. We noticed a good decorative variety, sent out in 1891, called *W. C. Boye*, a large flower of a salmon shade, with dark chocolate blotch. Mrs. Stanley is a lilac flower with maroon blotch, sent out this year.

Of *Begonias*, there is a splendid show just now, and in one house we saw many hundreds of double and single seedlings of all the shades, and some possessing exquisite markings. As regards size of bloom, it would almost appear that we had nearly

reached the highest perfection possible with this plant, and that the next "advance" that florists must try to obtain is a strain possessing stronger stems. However, Mr. Cannell says that the crimson section is still capable of much improvement.

A bright, almost dazzling array of colour is afforded by upwards of 1000 herbaceous Calceolarias, just passing their meridian; all are one uniform height and habit, but not quite so dwarf as Mr. James exhibited them at Earl's Court.

Amongst a large number of Carnations was Mrs. Cannell, which was certificated at the recent Temple show; and another variety called Engerdine, a deep salmon, somewhat like the pink form of *Souvenir de la Malmaison*, but much darker, quite as large, but seems to be a little disposed to splitting. Amongst other general stuff inside were a nice batch of *Caladiums*, some *Clivellas*, a very large batch of *Cyclamens*, hundreds of *Cinerarias* and *Primulas*, which are being kept for seed purposes; some thousands of young *Fuchsias*, in good condition, but not yet in bloom; and a good number of *Gloxinias*, just commencing to bloom. *Chrysanthemums* are now being put into their flowering pots, some 3000 to 4000 being reserved for the firm's own use, whilst there are many thousands in 3-inch pots plunged outside for distribution. In another house is a large collection of *Cactus* and other succulent plants that Messrs. Cannell seem to have taken quite a liking to lately, and they are trying to create a demand for these undoubtedly interesting plants by exhibiting collections of them at exhibitions, &c.

Many thousands of small *Begonias* are now being planted into three large brakas outside, and preparations are being made to plant out an equally large number of seedling *Dahlias*. Amongst the herbaceous plants in flower were several species of *Phlox*, and the dwarf blue-flowered *Veronica prostrata*. Mr. Cannell says he shall have a real floral display about the middle of July, which is really the best time for visitors to see the "Home of Flowers."

SWEET CHESTNUTS.

(Concluded from p. 721.)

THE Chestnut tree was undoubtedly one of those introduced into Great Britain by the Romans. This may seem an amazing assertion to those unversed in the history of the greater part of the forest and orchard trees, and other familiar plants of this country. But only the following are truly indigenous, viz., the Oak, Birch, Willow, Alder, Ash, Wych-elm, Maple, Aspen, Service, Hawthorn, Apple, Elder, Hazel, Bullace, Slow, Holly, Spurge Laurel, Butchers' Broom, Furze, Dog-Rose, Raspberry, Blackberry, Ivy, Mistletoe, Yew, Scotch Pine, and Juniper; and all the following were brought over by the Romans, viz., the Vine, Peach, Cherry, Pear, Damson, Medlar, Mulberry, Walnut tree, Chestnut tree, Sycamore, Poet's Laurel, Box, Beech, Elm, Lime, Spindle tree, Privet, and Silver Fir. Yet the old Chestnut tree at Totworth Court, the seat of the Earl of Ducie in Gloucestershire, was already remarkable for its size in the reign of King Stephen, A.D. 1135. In 1820 it measured, at 5 feet above the ground, 52 feet in circumference, and 12 feet in diameter. (See fig. 111, p. 763.)

The correct English name of the Chestnut tree and sweet Chestnuts is abbreviated from the Middle English form of *Chesten-nut*, which was derived, through the old French *Châtaigne* (now *Châtaigne*), from the Latin *Castanea* and Greek *Kastanea*, so called from the Magnesian town of Casthanæa, one of the first places on the mainland of Europe into which the nuts were imported, and where the tree was planted. In the fifteenth century the name took the form of *Chesten-nut*, and from that the change to Chestnut was rapidly made, and became permanent. The manor of Northwood Chasteners and the town of Cheston, also spelt Chesthunte and Shesterhunte, in Hertfordshire, and Norwood Chesney and Chestnut Hill, in Kent, are all believed to derive their names from the Chestnut trees that are

said to have formerly flourished in their neighbourhood.*

At one time it was supposed that the woodwork of Westminster Abbey, and other old buildings in England, and of the Louvre in Paris, was of Chestnut, but it is now known that in all these cases it is of Chestnut Oak (*Quercus Robur var. sessiliflora*). The grain of the two woods is similar in appearance, but in all the qualities required for timber construction the wood of the Chestnut tree is comparatively worthless. They can readily be distinguished by working them for a little with a moistened chisel, which the Oak wood, owing to the presence of tannic acid, soon stains, but the Chestnut wood leaves clean. The fact is, that the Chestnut tree was never held in much esteem in England, except to provide hop-poles in Kent, and pig-mast generally. For long its naturalisation seems to have been left to chance, of which the great grove of Chestnuts at Ashted Park, in Surrey, is an interesting illustration. Mr. William Forsyth, gardener to George III., in his *Treatise on the Culture and Management of Fruit Trees*, published in 1806, tells us it was first sown about 1744 by Thomas Davie, gardener to Mr. Richard Howard, who at the time Forsyth wrote owned Ashted Park. Davie had bought three shillings' worth of Sweet Chestnuts in London on purpose to treat his fellow servants, but finding they would have none of them, he put them into a forcing bed in the nursery garden at Ashted, then in the possession of the Earl of Suffolk, and a year or two later planted out the young trees where they now stand, or stood until lately. On Forsyth measuring them in 1806, when they were 62 years old, they had an average circumference of 7 feet at 3 feet from the ground, and the trunks upwards of 50 feet high. The systematic cultivation of the tree, and its present wide-spread growth in the United Kingdom, is entirely due to the action of the Society of Arts at the end of the last and the beginning of the present century in offering prizes to those landowners who showed themselves most zealous in forming plantations of the tree. The idea was to increase the production of building timber in England. But this was soon found to be quite an illusory hope as regards the Chestnut tree; and it is now chiefly planted out for coppice and for fruit in England, particularly in Kent, and for ornamental effect in Scotland and Ireland. The best English Sweet Chestnuts are produced in Gloucestershire and Devonshire.

The late Dr. J. Forbes Royle was the first, so far as I have discovered, to propose the introduction of the Chestnut tree into India. "The common Spanish Chestnut, which," he adds, "seems well suited to Northern India, and the Himalayas, and would yield an additional article of food to the inhabitants of the mountains, who are sometimes forced to subsist upon acorns and bitter Horse Chestnuts." Subsequently, small plantations were successfully formed by the late Dr. Jameson at Dehra, and by Sir John Strachey at Kumaoon; while the seeds of the plantations laid out, and now reported on by Sir Edward Buck, were supplied by my distinguished predecessor in this office, Dr. J. Forbes Watson.

In connection with the prospect of the ultimate success of these tentative experiments, of which the history of the world-wide migrations of the Chestnut tree should leave us in little doubt, I would here again, as I have already done in my *Report on the Old Records of the India Office*, draw attention to the fact that Nicolo Conti, the Venetian merchant,

* The Chestnut tree has certainly given its name to the villages of Castagna and Châtaignets in Tuscany. The number of places in England named after trees is very large. Thus from the Alder—Alderhot, Allerlade, Allerton, Ellerton, Olney; from the Apple—Appley, Appleton, Arvalou, i.e., "Apple Island"; from the Ash—Ashley, Ashton; from the Beech—Buckhurst, Buckland; from the Birch—Bircholt, Birkeley, Birbeck; from the Broom—Bromley and Brompton; from the Cherry—Cherry Hinton; from the Elm—Elmton, Elmsted, Elmwell; from the Hazel—Hazelmore (and Nottingham-hill from its nuts); from the Linden or Lime—Lyndhurst, Linfield; from the Oak—Oakley, Okeley, Auckland, Acton; and from the Thorn—Thorne. Again, Farnham and Farnborough derive their names from Ferns; Rodney and Redford from Reeds; Rushmore from Rushes; Edgemoor and Edgely from Sedges; and Shrewsbury from shrubs.

who travelled in India and the East for twenty-five years, between 1414 and 1444 A.D., writes:—"Leaving Ava, I arrived at the mouth of a moderately-sized river, where there is a port called Keythons, and having entered the river, at the end of ten days arrived at a very prosperous city called Panconia. . . . Here they have the Pine,* Oranges, Chestnuts, Melons, white Sandalwood, Camphor, &c."

The trees producing these Chestnuts are the *Castanea indica* of Roxburgh, and the *C. tribuloides* of Kurz, both now included in the genus *Castanopsis*. But both produce edible Chestnuts; and, probably, wherever they are found growing spontaneously, the true Chestnut tree would grow; and it would prove a boundless blessing to the wild tribes of Upper Burmah and Assam if it could be acclimatised to those countries.†

Yet with all the enlarged knowledge placed at our disposal by modern botanical science, and with the whole equipments of an empire, untostled over every quarter of the globe, at our command, how little shall we ever be able to accomplish in promoting an interchange of economic plants between the east and the west, and adding in this way to the happiness of mankind, compared with the unstudied, casual, and almost unconscious transformation effected in the vegetation of the countries of the Mediterranean Sea, with such incalculable results in the increase of their material wealth, and the impulse thus given, and still operative, to human civilisation, by the propagation throughout them of the worship of the gods of Phœnicia and Greece.

It is impossible to stigmatise as superstitious, beliefs and rites that conferred such enduring benefits on the world. But for them the civilisation of Europe might possibly never have advanced beyond that of the Newer Stone Age, preceding the Age of Bronze, ushered in with the westward advance of the commerce and religion of the Phœnicians; and it is evident, in view of the facts here adduced, that they were the divinely-appointed means for working out, in the long-suffering patience of Providence, the eternal purposes of God toward man.

SOCIETIES.

ROYAL HORTICULTURAL.

JUNE 7.—The meeting at the Drill Hall, Jamaica Street, Westminster, was the occasion for a pretty display of brilliant hardy flowers from Messrs. Kelway & Son's nursery, at Langport, an extensive array of cut blooms of hardy *Rhododendrons* from Messrs. Paul & Son, and some fine things in *Orchids* and *Pansies*.

Floral Committee.

Present: W. Marshall, Esq., in the chair, and Messrs. R. Dean, H. Herbst, E. T. Bause, H. B. May, C. T. Drury, R. B. Lowe, B. Wynne, J. Fraser, H. H. D'Ombraim, G. Paul, C. E. Pearson, H. Turner, G. Phippen, and E. Mawley.

The exhibitors were more numerous than we expected to find them on Whit Tuesday, and several of the nurserymen's collections were bright and attractive.

Messrs. Paul & Son, The Old Nurseries, Cheshunt, showed a miscellaneous group of *Alpines*, &c., in most cases cut specimens, including *Peonia rubens*, *Rosa rugosa alba*, the pretty little *Thalictrum rubellum*, and *T. aquilegifolium*; *Geum minimum*, *Dictamnus dahuricus*, *Vancouveria hexandra*, *Aquilegia chrysantha*, *Silene maritima rosea*, &c., as well as some very fine cut specimens of different species, and varieties of *Iris*. (A Silver Banksian Medal.)

Lord Wimborne (gr., Mr. Crasp) obtained 1st prize—the Kelway Silver Medal—for twelve varieties of cut blooms of double and single-flowered *Pyrethrum roseum*, which were fine and bright-looking. Leonard Kelway is a very large double pink variety; *Aphrodite*, a double white; *Melton*, a double crimson; *Mary Anderson*, very large, single,

* That is "Pinus," not the Pine-apple, a native of America, not yet discovered when Nicolo Conti wrote.

† *Castanea americana* also produces a small sweet Chestnut, occasionally imported into Liverpool from the United States.

pale pink; and Gazelle, a good single, of a shade of crimson.

J. Donaldson, Esq., Tower House, Chiswick (gr., Mr. T. Bones), showed three exceptionally fine plants of *Gloxinias*—The Beacon, a very rich velvety-carmine (Award of Merit); and Ensign, a charming variety, most beautifully marked with puce and white, and having a silver band around the margin (Award of Merit); Silver-edged, another fine variety shown, was of a deep puce colour, with a white throat. The same exhibitor had a seedling Carnation from Pride of Penshurst, called Yellow Queen, of capital form and habit, and possessing a good number of blooms of a desirable lemon-yellow

Mrs. Miles, Ham Green, Bristol (gr., E. F. Crocker), exhibited a *Dracena* called Ham Green Seedling, a cross from *D. hybrida* × *D. suberba*, a pretty, well-coloured variety, but was not considered to be an advance upon existing varieties.

For twelve hardy *Rhododendrons*, the Duke of Northumberland (gr., Mr. Wythes), Syon House, Brentford, obtained 1st prize with large trusses of the following:—*Rhododendrons* James Bateman, *Delicatisimum*, *Curriennum*, *Kate Waterer*, *Concessum*, *Masculatum*, *Lady Dorothy Neville*, *Fastuosum* fl.-pl., *Mrs. R. S. Holford*, and *Lady Eleanor Cathcart*. The Earl of Dysart, Ham House, Richmond (gr., Mr. G. Sage), was 2nd.

and was awarded a Silver-gilt Flora Medal; and an Award of Merit was given to a new single white *Pyrethrum*, *Princess Marie*. The collection also included a good number of *Amaryllis* blooms, possessing great merit.

Mr. Robert Erisly, Worden Hall, Preston, had six plants of *Tagetes pumila* Little Gem.

Messrs. Sander & Co., St. Albans, were awarded a First-class Certificate for *Dipladenia atropurpurea* var. *Clarkei*. Flowers are of a beautiful dark crimson-purple, with exquisitely-lined throat of a lighter colour; leaves small, and habit apparently slow; exhibited in a 9-inch pot, and bearing two dozen or more buds and blossoms.

FIG. 111.—GIANT CHESTNUT AT TORTWORTH COURT. (SEE P. 762.)

colour. This plant also obtained an Award of Merit.

Messrs. Dobbie & Co., Rothesay, had a collection of *Viola* blossoms, also of *Pansies* and *Sweet Peas*. Some of the shades of colour in the *Violas* and *Pansies* were certainly exquisite; but so numerous were the plants that it would serve no good purpose to specify only a few of them. A Silver Banksian Medal was awarded for the collection.

A very large collection of cut specimens of hardy *Rhododendrons* came from Messrs. Wm. Paul & Son, Waltham Cross, including about 60 varieties, most of which were of very fine quality (Silver Floral Medal). Also a few plants of their *Rose* (H. P.) *Clio*, were shown in very good condition.

The Rev. W. Wilks had blooms of *Gladiolus Byzantinus albus*, which he described as a white variety of the common garden *Summer Gladiolus*, and as having been grown in the open border at Shirley, Surrey. It is a perfectly hardy variety.

Messrs. De Rothschild (gr., James Hudson), Gunnersbury House, showed trusses of bloom from *Ixora Westii* and *I. Fraserii*; the trusses of the former were exceptionally large, and this variety was awarded a First-class Certificate. The whole were fine and clean specimens.

Messrs. Kelway & Son, Langport, Somerset, had a very large miscellaneous collection of cut blooms of *Pyrethrums*, double and single, and of *Paonias* in both forms, and in almost endless variety. This exhibit brightened up the entire length of the hall,

Fruit Committee.

Present: Philip Crowley, Esq., in the chair, and Messrs. William Warren, Geo. Taber, J. Cheal, Geo. Bunyard, H. Balderson, A. H. Pearson, A. Dean, G. H. Sage, Geo. Wythes, Rev. W. Wilks, Harrison Weir, and D. Morris.

The exhibits under the Committee included a good number of seedling Melons, as well as some good Peaches and excellent Nectarines. A. Pears, Esq., Spring Grove, Isleworth (gr., F. J. Debnam), sent a dish of Peaches, Dr. Hogg, of fair size, and well-coloured. Also a seedling Melon, Spring Grove hybrid, a large fruit, netted, with white or pinky flesh. A cultural commendation. Dr. Frankland, F.R.S., F.R.H.S., Reigate Hill, Surrey, showed a new Melon called *Ritchins' Perfection*, obtained from a cross between Wm.

Tillery and Read's Scarlet. Fruit yellow and netted, rather small, green flesh (Award of Merit). Another seedling Melon, Worden Hall Favorite, came from Mr. Robt. Frisby, Worden Hall, Preston; this is a large and rather coarse-looking fruit, yellow, with green flesh. T. W. T. Drake, Esq., The Gardens, Shardlow, Amersham, Bucks (gr. Mr. J. Thomas), showed three new seedling Melons.

The Duke of Northumberland, Syon House (gr. Mr. G. Wythes), exhibited a dish of Peaches, "Amaden June," which have ripened in fifteen weeks after being started, and carry a heavy crop.

Messrs. De Rothschild, Gunnersbury House (gr. Mr. J. A. Hudson), showed twelve large well-coloured fruits of Lord Napier Nectarine, and he was awarded a Silver Banksian Medal.

From Mr. J. B. Bowerman, Hackwood Park, Basingstoke, came another seedling Melon, with white flesh, obtained from Blenheim Orange \times The Countess. From the Royal Horticultural Society's garden at Chiswick came four samples of well-grown Spinach, and some very fine sticks of Rhubarb, Victoria and Ryder's Perfection.

Mr. Wythes received a Vote of Thanks for a bunch of extra early Milan Turnip, evenly sized, and clear looking.

Mr. W. H. Castle, The Gardens, Castlemeans, Twyford, sent new seedling Cucumbers from Sutton's Prize-winner \times Lockie's Perfection, some of which appeared to possess considerable merit.

Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair; and Messrs. James O'Brien (Sec.), H. M. Pollett, H. Ballantine, J. W. B. Bond, El. Moon, J. A. Douglas, W. H. White, T. B. Hayward, and A. H. Smea.

Sir Trevor Lawrence, Bart., M.P., Burford Lodge (grower, Mr. W. H. White), sent a small group of rare and interesting Orchids, comprising the fine orange-tipped *Oncidium Loxense*, the new hybrid *Masdevallia Shatruxana* \times (*Shuttleworthii* \times *Harayana*), the beautiful *Odontoglossum Pescatorei*, Prince of Orange, *Dendrobium Parishii* albens, and the curious *Bulbophyllum elegans*, with singularly inflated flowers.

C. J. Lucas, Esq., Warnham Court, Horsham (gr. Mr. Duncan), also exhibited a small but select group, in which the fine *Lælia grandis*, Warnham Court variety, which was admitted to be the best form of *L. g.* tenebrosa which had yet appeared; *Promexia xanthina*, with over eighty golden-yellow flowers; five well-grown and flowered plants of *Dendrobium McCarthiae*, and a curious *Epidendrum* and *Eria*.

C. Ingram, Esq., Elstead House, Godalming (gr. Mr. J. W. Bond), staged a good specimen of the plant which is known in gardens as *Cymbidium Loise-Chauvierii*, but which is more like a *Grammatophyllum*. It had a strong branched spike of greenish and black flowers, closely resembling those of *Celeogyne pandurata*; also *Lælio-Cattleya Canhamiae*, under the name *C. Elsteadiana*.

Baron H. Schroder, The Dell, Egham (gr. Mr. H. Ballantine), sent grand cut examples of *Odontoglossum Dellenae*, a yellow hybrid *Pescatorei*, certificated last year, and the grandly spotted *Odontoglossum crispum Wolstenholmiae*, and O. C. R-x. The Rev. E. Handley, Royal Crescent, Bath, also sent a spike of a very large form of O. crispum, curiously tinged with lilac.

H. Shaw, Esq., Stamford House, Ashton-under-Lyne (gr. Mr. J. Cliffe), exhibited *Cattleya Mendeli Shawiana*, a fine white variety with a slight tinge of pink and a yellow central patch on this labellum.

Drewett O. Drewett, Esq., Riding Mill-on-Tyne (gr. Mr. A. J. Keeling), sent cut flowers of his fine *Masdevallia falcata* \times , and of the parents M. Lindenii and M. Veitchiana; also a flowering spike of his fine hybrid *Cypripedium Alice* \times .

F. Wigan, Esq., Clare Lawn, East Sheen (gr. Mr. W. H. Young), sent a fine plant of *Cypripedium Rothschildianum*, a very distinct and beautiful *Odontoglossum citrosomum* var. *roseum*, *Dendrobium Falconeri*, *Lycaste aromatica*, *Cypripedium Veitchii*, and the Clare Lawn variety of *Cattleya Mendeli*.

W. Furze, Esq., Roselands, Teddington (gr. Mr. Coombe), arranged a varied and effective group of Orchids with *Adiantums*, *Caladiums*, &c. Conspicuous were the numerous fine varieties of *Cattleya Mossiae*, and especially the very pretty C. M. \times Mrs. W. Furze; there were also many fine C. Mendeli, *Lælia purpurata*, *Cypripediums*, *Masdevallias*, *Vanda Denisiana*, *Epidendrum vitellinum*, &c.

His Grace the Duke of Northumberland, Syon House (gr. Mr. G. Wythes), staged a group consist-

ing chiefly of *Cypripedium barbatum*, in variety, and *Miltonia vexillaria*.

J. W. Temple, Esq., Leyswood, Groombridge (grower, Mr. E. Bristow), staged some very fine specimens of the large-flowered *Cattleyas*.

Mr. Bridger, The Gardens, Penshurst Place, showed *Dendrobium latifolium* (*Phytoclinis*).

Messrs. Linden (*Phorticulture Internationale*), Parc Leopold, Brussels, sent their handsome *Warszewiczella Lindenii*, with large pure white flowers, with a few purple lines in the centre of the lip; *Cycnoches peruviana*; a grand specimen of the yellow *Oncidium auriferum*; the curious *Coryanthes leucocorys* and *Odontoglossum Lucianum*, with the lip of O. Hallii, but with sepals and petals of a rich brown colour, tipped with yellow.

Messrs. F. Sander & Co., St. Albans, exhibited their superb hybrid, *Lælio-Cattleya Arnoldiana*, for which they took the medal for the best hybrid last year, and they were again successful in accomplishing the same feat this season. Messrs. Sander also sent *Cattleya Forbesii* Sander's variety, &c.

The Right Hon. J. Chamberlain, M.P. (gr. Mr. H. A. Burberry), sent fine cut examples of *Cattleyas*. Cut spikes of *Lælia purpurata* superbiens also came from Messrs. De Rothschild, Gunnersbury (gr. Mr. Hudson); *Cattleyas* from R. B. Cater, Esq., Bath; and Sir Chas. Strickland, Bart., Hildenley, Malton, Yorks, submitted a fine colored photograph of a bank of *Cattleya citrina* in bloom, as cultivated at Hildenley.

COMPETITION IN ORCHIDS.

The competition in the specially-arranged classes was reduced to a very fine point, the only exhibitor in Class 2 (two fine Orchids, cut trusses) being Mr. Wythes, gr. to His Grace the Duke of Northumberland, who produced a meritorious exhibit, and was, of course, adjudged 1st prize.

In Class 4, for the best Seedling Orchid, Messrs. F. Sander & Co. took the Silver-gilt Flora Medal with *Lælio-Cattleya Arnoldiana*, same as last year; and Chas. Ingram, Esq., Elstead House, Godalming (gr. Mr. T. W. Bond), was 2nd, with the form of *Lælio-Cattleya Canhamiae*, raised at Elstead House.

List of Awards.

ORCHID COMMITTEE.

Silver Flora Medal.

For group of Orchids, to W. Furze, Esq., Teddington.

Bronze Flora Medal.

For group of Orchids, to His Grace the Duke of Northumberland.

First-class Certificate.

To *Warszewiczella Lindenii*, to Messrs. Linden.

Award of Merit.

To *Lælia grandis*, Warnham Court variety, from C. J. Lucas.

To *Cypripedium Alice* \times , from Drewett O. Drewett.

To *Odontoglossum crispum* Rex, from Bron Schroder.

To *Odontoglossum Wolstenholmiae*, from Baron Schroder.

Botanical Certificate.

To *Cymbidium Loise-Chauvierii*, from C. Ingram.

To *Cycnoches peruviana*, from Messrs. Linden.

To *Oncidium auriferum*, from Messrs. Linden.

To *Coryanthes leucocorys*, from Messrs. Linden.

To *Bulbophyllum elegans*, from Sir Trevor Lawrence.

Cultural Commendation.

To C. J. Lucas, for *Promexia xanthina*.

To C. J. Lucas, for *Dendrobium McCarthiae*.

PAPER ON THE SUMMER PRUNING AND TRAINING OF FRUIT TREES.

By Mr. A. Yoona, Appleby Gardens.

In the absence of the author, a paper bearing the above title was read by the Secretary, Rev. W. Wilks. After some preliminary remarks upon the subject, setting forth the different methods of pruning which had existed, and also some of which are still in use, the essayist said that Apricots, Plums, and Cherries with the exception of Morellos, were amenable to the same treatment as each other. They could be trained on the fan system, and they are all subject to gumming. They all bore fruit upon natural spurs, and upon spurs the result of stopping or pruning, and it was necessary to aim for as many natural spurs as could be produced. It was desirable to aim at a well-balanced tree, equally divided, and a well-lush wall. A few leading shoots near the centre of a young tree would try to get away, but these must be stopped. The lower branches may require but little stopping, but should any of them be exceptionally strong they should be checked.

If a young tree had six shoots, then Mr. Young would lay three upon each side. He did not advise to let one leading branch ascend from the centre

upwards, unless the tree had an unequal number, when the centre one should be cut back. Each shoot should be given a straight course, and never stopped unless any individual branch requires it. The same principle applied to secondary shoots also. All crossing of shoots should be prevented. Sometimes there are too many shoots arising from the ends of the branches, and these require to be stopped. Pears on walls are usually trained in the fan system, the horizontal system, or the cordon system. The pruning and management varied somewhat according to the stock; the Pear being very much stronger on the Pear stock than on the Quince. In anxiety to ensure great neatness, many people commenced pinching very early, and continued to do so at intervals during the summer. It is necessary that it should be done, that light can get to the wall and to the fruit buds, but it should not be done until the wood is somewhat ripened. Old unfruitful trees must be root-pruned, if they are to become fruitful again. It is a mistake to pinch the leading shoots of young trees, and it has a tendency to create a bunch of shoots, and also to give to the tree a gross habit. If left alone they will extend cross and form natural spurs. Mr. Young said that as regards the fruit trees in the open, the old system of close pruning must be abandoned. Those grown on the semi-extension system (Apples and Pears), do not require stopping before the end of August, when they may be stopped to three leaves. Any leading shoots can also be stopped and checked. When fruit has been gathered, the bush fruits should be thoroughly well overhauled, and any branches not required cut out. Cherries and Plums merely required that the branches should be thinned out. The more pruning fruit trees are subjected to, the more would the cultivator have to prune. Mr. Young admitted that closely-pruned trees could be made fruitful if they are continually subjected to that treatment.

The Chairman (Mr. G. Bunyard) invited any comment or question, and a gentleman asked for information respecting "ringing," and said that he had seen a Pear tree that had been practically barren for some years bear some good fruit upon a branch that had been subjected to this process, and asked if it was thought that the system was a good one, and whether it would not be dangerous to the tree in the long run.

The Chairman said that many good results had followed ringing, and that an instance was seen in that hall last year in the case of a Jefferson Plum tree that had been practically barren, but a branch that had been cut or "ringed" with the label wire was covered with large fine fruit.

Mr. Hooper said that "ringing" was principally practised in France upon Vines after the berries were set, and by so doing the sap is retained in the branch, and the fruits are larger.

Another gentleman, who owned that "ringing" had temporary results of a beneficial nature, believed that it was dangerous, and had a tendency to kill the branch. He had also noticed that branches so treated were especially subject to disease. The Rev. W. Wilks had seen a golden Gage Plum three years ago growing wonderfully strong and rank, but after an application of the centre-bit, which took out almost one half of its circumference, it did not grow or fruit much the next year, but the following year it was covered with fruit.

Mr. A. H. Pearson said that he knew from experience that breaking the shoots was a better method than cutting them, as they were not so eager to start again directly. With wall trees, he recommended the system of laying-in the shoots the entire length, equally Apricots, and he thought that the absence of cawes to the boxes was the reason that Apricots were often so unsatisfactory.

The chairman could not agree with the essayist in leaving all the summer pruning until August, and said that in Kent, Pears are always ready for pinching in July, and Apples in August, but no doubt, much would depend upon the district. Mr. Wythes thought that Apricot trees lost their branches through lack of moisture.

ROYAL WESTERN HORTICULTURAL.

MAY 31 AND JUNE 1.—A very successful exhibition was held by the above at the Guildhall, Plymouth, and in a large marquee erected in the Guildhall Square, which formed the approach to that part of the show which was held in the building.

The grouping of tall subjects, as Palms, &c., was effectively done, but on this occasion the entries were fewer by 100 than last year, and the show differed from

its predecessors owing to the absence of fruit, which was hardly represented, and the fewness of vegetables. The paucity of these exhibits was due to the early date fixed for the show, it usually occurring in July.

The horticultural part was the best represented, and here the good prizes offered by the Society for twenty stove and greenhouse plants excited a lively competition. The highest prize, £20, was taken by Mr. J. Cypher, Queen's Road Nursery, Cheltenham; and the 2nd prize, £10, was gained by Mr. John Curry, West End, Salisbury.

Good prizes were offered for the best groups of *Azalea indica*, but no entries were received. Groups of stove and greenhouse plants effectively arranged were a distinct feature of the show, and the 1st prize fell to Mr. Cleave, and the 2nd to Mr. J. Curry. Mr. W. G. Hodge had a well-arranged group of Ferns, Selaginellas, *Dracenas*, *Begonias*, &c.

E. Coppen, Esq. (gr. Mr. A. Cornish), was 1st for a group of twenty *Orchids*.

Table decorations and specimens of the floral artists' work in bouquets, &c., were numerous, and non-competitive exhibits of stove and greenhouse plants were staged by Mr. J. T. R. Chalice; flower and foliage plants, by Mr. R. Meers, Colling's Park Nursery; Messrs. H. Veitch & Sons, Royal Nursery, Exeter; had a special feature in alpinas; Mr. J. R. Williams, Compton Nurseries, Plymouth, had *Hydrangeas*, Ferns, *Petunias*, &c.; and Mr. W. B. Smale, Torquay, showed a large quantity of plants of a miscellaneous description.

TRADE NOTICE.

MORRIS AND GRIFFIN, LIMITED.

OUR advertising columns to-day contain the prospectus of Morris and Griffin, Limited, a well-known firm of artificial manure manufacturers, who have registered their business as a limited liability company. The concern was started so far back as 1821, and during this long period it has had a steady and continuous accession of business, not only throughout the United Kingdom, but also in the western provinces of France and other parts of the world. The chief object of the conversion is to secure new capital for a large extension of the works at the sea-board. Recent experience shows that a very considerable saving can be effected, and that the highly remunerative character of the industry can be still further increased by a larger outlay of capital. The board of directors will consist of five gentlemen of well known business capacity, and their names will carry considerable weight with the investing public. The Board includes Mr. W. Moxon Fuller, the managing partner of the late firm, who has successfully conducted the business for thirty-five years, and who has agreed to act as managing director for a period of at least ten years. The share list will remain open for three days from the 15th to the 17th of June.

LAW NOTES.

CHARD v. CORRY & CO., LIMITED.

THIS case occupied the attention of Mr. Justice Hawkins and a special jury at the Royal Courts of Justice for two days last week, June 2 and 3. Mr. Walter appeared for the plaintiff (who was a florist and floral art designer, carrying on business at the Brunswick Nurseries, Stoke Newington), and Mr. Moyes for the defendant company. It appeared that the plaintiff was the registered proprietor of a design for a floral arch for table decoration, No. 174,349, pursuant to section 58 of the 46 & 47 Vict. c. 57, as amended by section 7 of 51 & 52 Vict. c. 50, and the plaintiff claimed damages against the defendant company, and also sought for an injunction to restrain them from continuing to infringe his registered design. Many beautiful specimens of arches decorated with flowers occupied the tables in the court, giving it a most unusual appearance. It was alleged that the defendants in November, 1891, at Coventry, in the county of York, offered for sale, and sold openly, floral

arches, which were fraudulent and obvious imitations of the plaintiff's floral arch. It was also alleged that the defendants had applied the plaintiff's design in a fraudulent way to floral arches, for the purpose of their being sold by them to the public. It was also stated that the defendants had sold large quantities of floral arches which were an imitation of the plaintiff's design. The case of the defendants was that the design was not a fit subject for registration under the Act, and that it was not in fact the design of the plaintiff at all, but of a Mr. Henry Walker, a wire-basket manufacturer of Shackwell Lane, and who was called as a witness on behalf of the defendants, the suggestion being that the design was invented by Mr. Walker before the plaintiff's design was brought out, and that consequently there had been no infringement of the plaintiff's design. After a very patient hearing and elaborate summing up on the part of the presiding judge, the jury found a verdict for the plaintiff, with damages £20, and his lordship granted the injunction which was asked for against the defendant company, ordering the same to deliver up to the plaintiff all arches in their possession, and awarded costs on the High Court scale.

ENQUIRIES.

"He that questioneth much shall learn much."—BACON.

FRENCH ASPARAGOS.—Would any of the readers of the *Gardeners' Chronicle* kindly furnish A. S. H. with particulars of the method of cultivation adopted by French gardeners in raising and forcing giant Asparagus.

DENDROBIUM PHALENOPSIS SCHRODERIANUM.—J. E. Nostell Priory, would be glad if some of our readers who grow the above-named Orchid, would kindly say what is the greatest number of perfect flowers they have had on a single spike; the pseudobulbs carrying them having been grown in this country. He has a plant which made a fine growth this past winter, and is now carrying fourteen perfect flowers of fine shape and colour. At the Temple Show he did not observe a spike with more than eight flowers.

PUBLICATIONS RECEIVED.—*Annual Report of the Agricultural Research Association*, Mr. JAMIESON.—*Annales des Sciences Naturelles, Septième Series*, M. PH. VAN TIEGHEM.—*Bulletin de la Société Royale de Botanique de Belgique*,—*Bulletin of the Agricultural Experiment Station of the Louisiana State University*, and A. and M. FRANK.

APPLES, ETC., FROM TASMANIA, ETC.—The Orient Company's steamer "Orutava" is to-day (June 8) unloading at Tilbury Dock 6,671 cases of Apples from Hobart. A few days previously the steamers "Elderslie" and "Ormuz" discharged—the former 31,051 cases, and the latter 497 cases from Melbourne; 2735 from Hobart and six from Adelaide; a total of 40,960 cases of Apples. The "Ormuz" also brought eleven cases of seeds and one of plants from Sydney.

PÆONIA LUTEA.—We learn that this new and interesting Chinese species is in flower in the Jardin des Plantes, at Paris, where also the Poison-tree of Madagascar, *Tanghinia veneniflua*.

THE WEATHER.

By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

Principal Wheat-producing Districts—0, Scotland, N. 1, Scotland, E.; 2, England, N.E.; 3, England, E. 4, Midland Counties; 5, England, S.

Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

THE following summary record of the weather for the week ending June 4, is furnished from the Meteorological Office:—

"The weather was again unsettled and rainy in the western and northern districts, but over the eastern and southern parts of the Kingdom it was generally fine, although somewhat heavy showers occurred at times. Thunderstorms were experienced in nearly all places, generally on the 30th or 31st of May.

"The temperature just equalled the normal value over Ireland and Scotland, W.," but exceeded it in all other districts; the excess over Scotland was slight, but over England it varied between 3° and 5°. The highest of the maxima were recorded at most stations on May 31, when the thermometer rose to between 80° and 84° over central, southern, and eastern England, and to 74° or 75° in the other parts of England; in Ireland and the north and west of Scotland, however, the readings were below 70°. The lowest of the minima, which were registered on June 3, in the west and north, and on the following day over England, ranged from 34° in 'England, S.W., to 45° in the 'Channel Islands.'

"The rainfall exceeded the mean in all districts, excepting 'England, E.,' over Ireland and in 'Scotland, N.,' the excess was large.

"The bright sunshine was very prevalent, and considerably exceeded the mean in eastern, central, and southern England, but in Ireland, the west of England, and the north and west of Scotland it was rather less than the normal. The percentage of the possible duration ranged from 15 in 'Scotland, N.,' and 28 in 'Scotland, W.,' to 58 in 'England, S.,' and the 'Channel Islands,' and to 65 in 'England, E.'"

MARKETS.

COVENT GARDEN, June 9.

A brisk business has been doing all the week, with prices improved. Hothouse Strawberries coming shorter against an increased demand. James Webber, Wholesale Apple Market.

POTATOS.

NEW POTATOS.—Supplies from Jersey and Cornwall have commenced, and are the best in the trade. Prices from 18s. to 20s. Tendency downward.

OLD POTATOS.—Dull, with lower prices. J. H. Thomas.

SEEDS.

LONDON: June 8.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, London, S.E., write that today's market presented quite a holiday appearance, with but little business doing. Consumptive sowings requirements are now at the lowest ebb, and no speculative activity has sprung up. Tares are still wanted; stocks appear nearly exhausted, and prices have advanced about 1s. For Peas there is an improving enquiry. Birdsseed kept steady.

FRUITS AND VEGETABLES.

SPITALFIELDS, June 7.—Quotations:—Asparagus, 3d. to 1s. 6d. per bunch of 12; head of Asak, 1s. to 1s. 1p. per punnet; Cabbages, 2s. to 5s.; Cauliflowers, 5s. to 6s. 6d.; Radishes, 3s. to 4s. 6d. per tally; Greens, 1s. 6d. to 2s. 6d.; Dutch Turnips, 3s. to 3s. 6d.; old Carrots, 2s. 6d. to 3s.; new do., 5s. to 6s.; Parsley, 1s. 6d. to 2s.; Spring Onions, 4s. to 5s. 6d. per dozen bunches; Endive, 9d. to 1s.; Cabbage Lettuce, 6d. to 1d.; Leeks, 2s. to 2s. 6d.; frame Cucumbers, 2s. to 2s. 6d.; natural do., 1s. to 1s. 6d.; Beetroot, 4s. to 5d. per dozen; Cress, 1s. 6d. to 2s. 6d. per score; Mustard and Cress, 1s. 6d. to 2s. per dozen baskets; Egyptian Onions, 5s. to 5s. 6d. per cwt.; Mint, 2s. 6d. to 3s. per dozen bundles; New Zealand Apples, 8s. 6d. to 9s. 6d. per case; foreign Tomatoes, 1s. to 2s. per box; Rhubarb, 1s. to 1s. 6d. per dozen bundles.

BOROUGH, June 7.—Quotations:—Broccoli, 12s. 6d. to 15s.; Cabbages, 3s. 6d. to 6s. per tally; Peas, 6s. to 7s.; Spinach, 1s. to 3s. per bushel; Greens, 2s. to 3s.; Carrots, 1s. 3d. to 1s. 6d.; Spring Onions, 4s. to 4s. 6d. per dozen bunches; Egyptian do., 5s. to 6s. per cwt.; English Apples, 6s. to 10s. per bushel; Canadian do., 12s. to 20s. per barrel.

STRATFORD, June 8.—There has been an excellent supply of all kinds of produce at this market during the past week, and a brisk trade was done at the ordinary and quotations:—Spring Cabbages, 3s. to 4s. 6d. per tally; Greens, 2s. to 3s. per bag; ditto, 2s. 6d. to 3s. 6d. per dozen bunches; Cauliflowers, 1s. 6d. to 2s. 6d. per dozen, 6s. to 7s. 6d. per

tally; Spinach, 1s. to 1s. 6d. per sieve; Turnips, 4s. to 6s. per dozen bunches; Carrots, household, 2s. to 3s. ditto; Rhubarb, 1s. 6d. to 2s. 6d. per dozen bundle; Asparagus, 3d. to 1s. 6d. per bundle; Cucumbers, 2s. to 4s. per dozen; Horseradish, 1s. to 1s. 6d. per bundle; Radishes, 3s. to 4s. per tally; Mangels, 17s. to 21s. per ton; Onions, Egyptian, 110s. to 120s. per ton; ditto, Lisbon, 5s. to 5s. 6d. per case; Apples, American, 15s. to 25s. per barrel.

POTATOS.

SPITALFIELDS: June 7.—Quotations:—New: Jersey Kidneys, 18s. to 18s.; Malta Rounds, 8s. 6d. to 10s. 6d.; Lisbon do., 8s. to 9s.; Malta Kidneys, 15s. to 16s. 6d. per cwt. Old:—Magnaums, 80s. to 75s.; Imperators, 60s. to 75s.; Hebrons, 60s. to 80s.; Bruce Magnaums, 80s. to 100s.; Snowdrops, 60s. to 70s.; Main Crop, 75s. to 100s.; Sutton's Abundance, 70s. to 80s. per ton.

BOROUGH: June 7.—Quotations:—New: Lisbon, 8s. 6d. to 9s. 6d.; Malta, 14s. to 15s. per cwt. Old:—Bruce Magnaums, 80s. to 100s.; Dunbar do., 110s. to 120s.; Fenland do., 60s. to 70s. per ton.

STRATFORD: June 8.—Quotations:—Light-land, 70s. to 90s.; Dark-land, 65s. to 75s.; Scotch, 80s. to 100s. per ton.

GENERAL MARKET AVERAGES: June 8.—Magnaums, 70s. to 100s.; Dunbar do., 110s. to 120s.; Hebrons, 60s. to 80s.; Snowdrops, 60s. to 80s.; Imperators, 80s. to 100s. per ton. New:—English, 2d. to 4d. per pound; Jersey, 14s. to 18s.; and Lisbon, 8s. to 9s. 6d. per cwt.

NOTICES TO CORRESPONDENTS.

. PHOTOGRAPHS, DRAWINGS, OR SPECIMENS.—We shall be pleased to receive from our Correspondents notes relating to interesting Gardens, together with Specimens or Illustrations of interesting Plants. Although circumstances prevent us in all cases from reproducing them, we are nevertheless glad to receive them, and as far as possible to utilize them for the benefit of our readers.

BOWLING GREEN: F. C. E. The turf sent consisted of moss, with scarcely any plants of grasses. If you require a turf for the bowling-green which shall consist of the finer grasses, and the green is now covered with Moss of the nature of that sent, nothing short of digging it up, draining it with under-ground drains, made with stones, tiles, or pipes, and working some good rich manure into the upper crust before laying new clean turf, or sowing it with the finer grasses and Clover will be of any use. Turf-laying may be performed in October or during late winter and early spring. Sowing may be done in September or March. If the moss be present in patches only, rake off as much as possible with a long-toothed iron rake, scatter good loam over the whole, and give the lawn in the early spring a dressing of burnt earth and wood-ashes, finely sifted; or cover it with a layer of rich manure in December, and let it lay the whole winter, occasionally raking it about, or bush-harrowing it, and raking the whole of it clean off before the grass grows.

CUTTING FURZE: G. T. At the end of winter after the danger from hard frost is past—that is if the Furze is old and thick. Young Furze may be cut at almost any season, if it be not cut hard back.

EUCHARIS: F. D. S. To enable you to form some idea of the requirements of Eucharis amazonica—imagine a plant with thick fleshy roots, and broad evergreen leaves, located on the banks of a tropical stream, just above the usual level of the water, but at flood time buried in water many feet deep; at others, exposed to great heat and little or no moisture in the soil, owing to the falling of the stream in the dry season, and at that time dependent on what its deep striking roots can obtain from the sub-soil. From this, it would be natural treatment to employ stiffish soil, deep rather than shallow wide pots; and, as the plant dislikes disturbance at the root and does not readily take to new soil, the potting materials should be such as will last for two or three years without much deterioration, therefore no manure should be mixed with the stiffish fibry loam used, and only sufficient sand to prevent water-logging. Some gardeners seldom if ever water their plants with a watering-can, but keep them moist by syringing twice and thrice daily; after flowering, reducing the syringing in amount, so as to afford the plants a kind of rest, when no leaf growth is apparent. In winter the warmth to be applied to growing plants is by day 70°, and by night 60° to 65°, according to the state of the weather—the lower degree in very cold weather. In spring, these figures may be increased by 2° or 3°, and in summer the night warmth maintained should not be less than 70°, whilst by day at closing time 90° to 95° will do no harm. In autumn there should be a gradual fall towards the winter temperatures. Sometimes

Eucharis are planted in narrow beds or borders, whose surface is about 2½ to 3 feet from the glass, and if these are made of lasting materials, the plants give good returns in bloom for a number of years. Whether in pots or beds the upper layer of soil should be renewed annually in early spring, if repotting or replanting is not going to be performed. Pot plants should be examined once a year to see that the drainage is in good order; manorial aid may be afforded by means of some of the fertilisers (artificial) in common use, guano or much diluted farm-yard sewage; and these are best applied when the plants are in growth, not when they are at rest. Sometimes Eucharis are rested in a house with a temperature a few degrees lower than that in which growth and flower were made, water being in a great degree withheld, but the plant dislikes low temperatures or rest enforced by the entire withholding of root moisture, and the warm treatment is best.

EUCHARIS MITE: J. L. This should be called properly the bulb mite, as its attacks are not confined to Eucharis. For a full account of the insect, see *Gardeners' Chronicle*, April 4, 1885, p. 440.

INSECT, W. F. Bee-like saw-fly.

JOURNAL: Ch. Havenich Van Put. *Garden and Forest*, weekly, by the Garden and Forest Publishing Company, Tribune Buildings, New York.

LILY OF THE VALLEY: G. C. The result of using fresh animal manures, probably.

NAMES OF PLANTS: W. W. Potentilla fruticosa.—Z. M. L. B. Genista praecox.—Captain F. Croker, Lilium gigantum.—J. C. I. Vaccinium corymbosum.—2. Staphylea trifoliata; 3. Zenobia speciosa.—D. D. Castanea Awa.—G. M. 1. Cupressus Lawsoniana aurea; 2. seedling form of Cupressus Lawsoniana; 3. Cryptomeria japonica; 4. Abies Pinsapo; 5. Cryptomeria elegans; 6. Lep-tospermum fruticosum. S. W. F. Cattleya labiate.—W. D. 1. Asperula odorata (Woodruff); 2. Veronica variegata; 3. next week; 4. Colutea cruenta; 5. Geranium pratense; 6. Tradescantia virginica.—W. C. Begonia corallina, a good variety of it.—Lea. Daphne Cneorum; 2. Lilium martagon, yellow; 3. Veronica gentianoides; 4. Iris foetidissima; 5. Polemonium ceruleum album.—Constant Reader. Crataegus Crus-galli. T. S. Anemone sylvestris. J. W. Trifolium minus.

ONION MAGGOT: G. N. The insect attacks the plant in various ways, sometimes through the leaf descending into the bulb, and sometimes the maggot eats into the stem just about the ground level. The infested bulbs, which may be easily recognised by their flagging, should be carefully raised, base and all, and carried to the stovehole fire. If the bulbs or young plants are left near the bed after being pulled up, the entire crop may be lost. To make the plants and soil distasteful to the fly, use a weak solution of petroleum and water. We should advise you to relinquish Onion growing for a few seasons, then the insects might die out from lack of their accustomed food, or at any rate their numbers would become very much fewer.

ORCHID BLOOMS: A. B. The *Laelia purpurata* blooms are good, coming from a plant so heavily laden. The spike of *Epidendrum pictum* is very beautiful. It should be more commonly grown; and the plant you possess with twenty-six spikes must be highly ornamental.

PALM: Perplexed. The effects, probably, of gas fumes and want of water at the root.

PANSY: J. K. An ordinary case of the blending of two stems.

WOODLICK IN CUCUMBER AND MELON FRAMES: W. M. Place small pots on their sides in the frame stuffed with hay. These will form hiding places during the day, and may be emptied daily into scalding water. Pour boiling water into the chink between the sides of the frame and the soil.

COMMUNICATIONS RECEIVED.—P. Barr & Son.—J. Benbow.—T. M. C. (we were obliged to make use of an earlier report of the case).—Enquirer, Bolton (we will examine carefully, and report in our next).—C. G. MODERATE CHARGES. FIRST-CLASS WORK. THE BEST MATERIALS.

THE BEDDING PLANT OF THE SEASON—GRAND NEW DWARF TROPÆOLUM, "MRS. CLIBRAN."

Colour, lovely shade of Orange-yellow; habit, compact, and about 6 inches high; free and continuous bloomer, producing a brilliant display.

Gardeners' Chronicle: "The colour is decidedly very good. An excellent bedder."

Journal of Horticulture: "The variety must be regarded as an acquisition."

Gardeners' Magazine: "A distinct bedding variety; will make a gay display in bed or border."

Mr. D. MELVILLE, Durbin Castle Gardens: "I think your Tropæolums should be most useful. An excellent substitute where Calceolarias die off."

Mr. W. INGRAM, Belvoir Castle Gardens: "Seems to promise an effect not afforded by any other dwarf bedder."

Mr. W. M. EARLEY, Hford: "I am charmed with Mrs. Clibran Tropæolum."

Mr. G. DOUGLAS, Great Gortree: "A very distinct novelty."

This Splendid Novelty has been Awarded several Certificates. Plants ready end of May. Price, 1s. 6d. each; 6 for 7s. 6d.; per dozen, 12s.

For full Description of above, also other distinct Novelties and Specialties, including NEW BEDDING PELARGONIUMS, see NEW CATALOGUE (No. 115), Free on Application.

CLIBRAN & SON, Oldfield Nurseries, Altrincham; 10 & 12, Market Street, Manchester; and Principality Nurseries, Llandudno Junction, N. Wales.

Mr. D. T. FISH, Bury St. Edmunds: "Mrs. Clibran Tropæolum is unique in its beauty."

R. IRWIN LYNCH, Esq., Cambridge Botanical Gardens: "A splendid novelty; perfectly charming in colour."

Mr. H. W. WARD, Longford Castle Gardens: "The colour is quite distinct from any shade of golden I have hitherto seen."

Mr. E. MOLYNEUX, Swanmore Park Gardens: "The colour, too, is so taking; it is sure to be welcome."

W. E. GUMBLETON, Esq., Queenstown: "The colour is bright and clear; it should be an acquisition."

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

GARDENERS AND OTHERS WANTING SITUATIONS, 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Births, Deaths and Marriages, 5s. each insertion.

POSITION.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at No. 42, DRURY LANE, to A. G. MARTIN, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST reach the Office not later than Thursday noon.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements, 41, WELLINGTON ST., STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months; Post-office Orders to be made payable at the Post-Office, 42, Drury Lane, W.C., to A. G. MARTIN.

Subscribers who experience any difficulty in obtaining their Copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

TO FLORISTS.—Situation wanted by a Young Lady. Knowledge of the Flower, Fruit, and Seed Trade.—**A. WHITING**, 23, Eign Street, Hereford.

HOLLOWAY'S PILLS.—Hale Constitutions. When the human frame has become debilitated from the effects of exposure, excess, or neglect, these Pills will repair the mischief. If they be taken according to the laid directions wrapped round each box, Holloway's Pills exert the most exemplary tonic qualities in all cases of nervous depression, whereby the vital powers are weakened, and the circulation is rendered languid and unsteady. They improve the appetite, strengthen the digestion, regulate the liver, and act as gentle aperients. The Pills are suited to all ages and all habits. A patient writes: "Your Pills to be valued require only to be known. During many years I sought a remedy in vain, was daily becoming weaker, when your Pills soon restored me."

PATENT "MANCHESTER" LAWN MOWER.

Awarded numerous
National and Inter-
national Prize
Medals, including—

VIENNA,

BEATEN in OPEN
COMPETITION.

Awarded numerous
National and Inter-
national Prize
Medals, including—

PARIS,

1873.

ROYAL BOTANI-
CAL SOCIETY,
MANCHESTER,
1873.

ADELAIDE, 1887,
FIRST ORDER
OF MERIT.

NEVER BEEN
BEATEN in OPEN
COMPETITION.

THE PATENT "MANCHESTER" LAWN MOWER continues to command a large sale, notwithstanding many inferior imitations which do not contain the vital points so essential in a Perfect Mower. It still remains the cheapest and most grass on level or uneven ground, and making most excellent work, quite equal and not inferior to that done by the more costly machines. It is put together well, and is too simple with ordinary care to get out of order, and in point of durability superior to anything of the kind in the market at the same price.

THE gearing is boxed in; the wearing parts are interchangeable. The handle adapts itself to the height of the operator, and the patentees recommend it with confidence both to Amateurs and Gardeners.

GRASS COLLECTING BOXES are usually supplied with these machines for use in WET or HUMID WEATHER, but in DRY and HOT WEATHER they may be dispensed with, and the cuttings may be scattered on the lawn with advantage.

THE "TENNIS" LAWN MOWER.

THE New "TENNIS" LAWN MOWER is a strongly made and durable geared machine, very light in draught, of excellent design, superior finish, and fitted throughout with modern adjustments. The cylinder is driven by machine-cut wheels running with the greatest accuracy, and at such a speed as to ensure a beautiful smooth and velvet-like appearance on the lawn.

FROM 25/- EACH.

PRICE LISTS ON
APPLICATION.

FOR THE TENNIS GROUND,
SMALL GRASS PLOTS,
AND FOR GARDENERS.

THE gearing is neatly covered in on both sides of the machine, as illustrated.

The New "TENNIS" LAWN MOWER in the small sizes is eminently suited for verges, ornamental gardening, or for young ladies to use on the Tennis Ground, whilst the larger sizes will be found all that can be desired for more extensive work. A considerable number have been sold, and are giving the greatest satisfaction.

FROM 25/- EACH.

PRICE LISTS ON
APPLICATION.

To be obtained from all respectable Ironmongers and Seedsman throughout the Kingdom, or, if any difficulty is experienced, direct from the Manufactory,

FOLLOWS & BATE, Lim.,

GORTON, MANCHESTER.

PATENTEES AND MANUFACTURERS OF THE
"Climax," "Manchester," "Tennis," and Royal
Prize Medal "Anglo-American" Lawn Mowers.
Upwards of 80,000 sold since 1860.

13, 15, and 16, FINSBURY STREET,
LONDON, E.C.

EDWARD LEIGH, Cranleigh, Surrey, will supply the next few weeks, plants at the following low rates, carriage paid, for cash with order:—Double CARNATIONS, PICOTEES, FANIES, splendid show varieties (simple blooms, 6d.), 1s. per doz., 5s. per 100, 40s. per 1000. Longellow Double DAISY, PURPLE ARABIS, DIANTHUS HEDEWIGII, VIOLAS (Black, White, Sky-blue, Yellow), also Mixed, 1s. per dozen, 4s. per 100, 20s. per 1000. ALYSSUM SAKATILE, SWEET WILLIAM (choicest varieties), 9d. per dozen, 3s. per 100, 20s. per 1000. WALLFLOWERS (many best varieties), 9d. per dozen, 2s. per 100, 15s. per 1000. HERB PLANTS: Sage, Winter Thyme, Winter Savory, 1s. 6d. per dozen, 3s. per 50, 5s. per 100. Above are good year-old plants, from open ground. Send for LIST of Flower, Vegetable, and Herb Plants.
EDWARD LEIGH, Cranleigh, Surrey.

PAUL & SON'S NEW CHESHUNT ROSES, 1892

Ready in Pots, May 20.

H.P. VIOLET QUEEN, 7s. 6d. each.

HYBRID, FRANCES BLOXAM, 5s. each.

And ready during summer.

SWEET BRIAR, JANET'S PRIDE, with semi-double, shaded with lake, flowers. First-class Certificate R.H.S., 5s. each.

"OUR" NEW ROSES of 1891.

BOURBON MRS. PAUL, 3s. 6d. each, 30s. per dozen.

H.P. BRUCE FINDLAY, 3s. 6d. each, 30s. per dozen.

The New Giant Indian Single Rose, ROSA GUANTEA, with flowers 5½ inches across, and making in India and the Temperate House at knee shoots of 50 feet, 3s. 6d. each.

New French and English Roses of three previous years, 18s. to 40s. per dozen.

CACTUS DAHLIA, Claxton's Harlequin.

Three First-class Certificates. "Yellow striped with crimson." A first-class novelty. 3s. 6d. each.

NEW ROSE and SPRING LISTS Post-free, on application.

THE "OLD" NURSERIES, CHESHUNT, N.

SPECIAL TRADE OFFER OF PALMS.

ARECA LUTESCENS, in 4½, 18s. and 24s. per dozen.

" " in 40's, 3 feet, 30s. per dozen.

" " in 32's, 30s. and 42s. per dozen.

CORYPHA AUSTRALIS, in 32's, 30s. dozen.

" " in 45's, 15s. dozen.

KENTIA, in 48's, 24s. per dozen.

LANTANA BORNEO, in 48's, 18s. and 24s. per dozen.

" " in 40's, 30s. per dozen.

" " in 32's, 30s. and 42s. per dozen.

SEAFORTHIA ELEGANS, in 48's, 18s. and 24s. per dozen.

" " in 32's, 30s. per dozen.

" " in 24's, 7s. 6d. each.

FICUS ELASTICA, 3 feet, in 32's, 24s. dozen.

" " 4 feet, 36s. dozen.

All the above are exceedingly strong, and well-grown. Packing free for cash with order.

J. ROCHFORD, Page Green Nursery, South Tottenham.

DAFFODIL BULBS,

FOR FORCING PURPOSES.

Hartland, of Cork, is now raising his Crop of Ard-Righ and Countess of Annesley, Golden Plover, &c., for the Trade, and shall be glad of immediate Orders. The Bulbs are simply magnificent. Please write for Prices and Samples.

Daffodil Grounds at Ard-Cairn.

WM. BAYLOR HARTLAND, F.R.E.S., Seedsman, Cork.

MICHIGAN ORCHIDS, FERNS, SHRUBS and TREES, BOG PLANTS, and AQUATICS, for Parks, Flower Gardens, Bookeries, Bogs, Ornamental Waters, and Carp Ponds. The World's Columbian Exposition buys them.

Retail, Wholesale, and Carp Pond CATALOGUES, each free.

WILFRED A. BROTHERTON,

ROCHESTER, MICH.

NEW ROSES.

WM. PAUL & SON

Respectfully Solicit Orders for the following First-class NEW ROSES, their introductions of 1892 & 1891, Plants of which are Now Ready:—

SPENSER (H.P.), Three First-class Certificates; Award of Merit Royal Horticultural Society; fine Satin-Pink, magnificent and effective. 10s. 6d. each.

LADY HENRY GROSVENOR (H.P.), Award of Merit Royal Horticultural Society; Flesh-colour; exceedingly free. 7s. 6d. each.

ZENOBYA (Hybrid Moss), Soft Rose, large and handsome; a fine addition to the Moss Roses. 5s. each.

CLIMBING QUEEN OF QUEENS (H.P.), a Climbing Sport of the elegant Pink-Rose Queen of Queens. 3s. 6d. each.

SALAMANDER (H.P.), Gold Medal National Rose Society; Bright Scarlet Crimson; very brilliant and attractive. 3s. 6d. each.

MEDEA (Tea-Scented), First-class Certificate; Lemon-Yellow, with Canary-Yellow centre. 3s. 6d. each.

WABAN (Tea-Scented), Award of Merit, Royal Horticultural Society; a Carmine Sport from CATHERINE MERMET; excellent. 3s. 6d. each.

The New CONTINENTAL ROSES of 1892. 2s. each, 30s. per dozen.

The New CONTINENTAL ROSES of 1891. 2s. each, 21s. per dozen.

For full descriptions of the above, and particulars of other New Roses, see DESCRIPTIVE CATALOGUE, which will be forwarded Post-free on Application.
N.B.—All other New Roses can be supplied at advertised prices.

A Large General Collection of ROSES IN POTS, for Planting-out, Climbing, and Pot Culture, 9s. to 18s. per doz.; Extra Strong, 24s. to 42s. per dozen.

PAUL'S NURSERIES, WALTHAM CROSS, HERTS.

TRADE OFFER OF PALMS.

COCOS Weddelliana, in thumbs... .. at 20s. per 100.

" " in 60's, at 55s. per 100.

KENTIA Fosteriana & Belmoreana, in thumbs, at 20s. per 100.

" " in 60's, at 60s. per 100.

" " in 48's, at 24s. per doz.

" " in 32's, at 48s. per doz.

SEAFORTHIA Elegans, in 60's, at 32s. per 100.

" " in 48's, at 48s. per 100.

W. Jeceton has a fine Stock of Asparagus plumosus aureus, in 48's and 60's; Pandanus Veitchii, Draecena Lindenii, and Ficus elastica.—W. JECETON, Putney, S.W.

ORCHID EXHIBITION, at Mr. WILLIAM BULL'S Establishment, 536, King's Road, Chelsea, London, S.W.

ORCHID EXHIBITION.—Now OPEN.

ORCHID EXHIBITION.—Admission Free.

ORCHID EXHIBITION.—One of the most beautiful sights in London.

ORCHID EXHIBITION.—A vision of loveliness unparalleled in Europe.

ORCHIDS.—Must be seen to be realised.

ORCHID EXHIBITION, at Mr. WILLIAM BULL'S Establishment, 536, King's Road, Chelsea, London, S.W.

SPLENDID

NEW DWARF BEDDING TROPÆOLUM,

"**MRS. CLIBRAN,**"

The finest new, soft-wooded plant sent out for years.

See last or next week's advertisement;

Or, send for CATALOGUE No. 115, containing full description and price.

CLIBRAN'S OLD-FIELD NURSERIES, ALTRINCHAM;

10 & 12, MARKET STREET, MANCHESTER;

and Principality Nurseries, Llandudno Junction.

THE

Gardeners' Chronicle.

SATURDAY, JUNE 18, 1892.

FLOWER DISTILLATION AT GRASSE.

(Specially Contributed.)

RECENTLY, a visit was paid by the writer to Grasse, the celebrated flower-producing land of the Riviera. Twice previously the neighbourhood had been visited, but not the town itself, nor its blossoming uplands. The train is taken from Cannes, and in about forty-five minutes the district of perfumery-makers is reached. The railroad is a climb nearly all the way, so that the dozen or so miles to be covered takes time for the train to rumble over.

Grasse gained, an inspection was made of some of the principal flower-distilleries. Among the more important is the concern of Roure-Bertrand et fils, noted as a house for the pureness of its extracts of flowers and essences. Mona. Roure, junior, acted as guide over the extensive establishment, explaining the multiplicated mechanism used in the factory, and revealing part of the vast stores of products already made. In the production of Rose essence, he said 10,000 to 12,000 kilos. of Roses were needed to make 1 kilo. (2½ lb.) of extract. This was sold at the high price of 2,000 francs (£80, or \$400) per kilo. It is the dearest of all the "first matters," or *matières premières*, used by manufacturers of perfumery. In fact, it is such a costly article to handle, that but a few firms can afford to manipulate it. Generally, it is only made on order given a long time in advance of the month of manufacture, which is May. The attar of Roses made in Turkey is the *cicecone* went on, stronger than that made in Grasse, but not so fine. Probably because in the dwindling Ottoman State they have not the perfected machinery which prevails in the Alps—Maritimes department—machinery which, to their further credit, be it noted, is locally made.

In the Grasse country, acres of certain regions are laid out for the growing of the hosts of different flowers which go to make the numerous perfumes for which the town is noted. Violets and Narcissus are especially cultivated and brought in by tons; as a rule, only the unequalled "Parma" Violets are sent into the still; all others are considered too weak, odoriferously, to merit the steaming process. These pale-blue fragrant "Parma" Violets do not come from Italy, but are grown in the immediate neighbourhood. According to the supply and demand, or according to whether it is a good or bad

season for their growth, these choicest of modest flowers are bought wholesale at from 2½ to 10 francs the kilogramme. Sometimes even 16 francs is paid (so the retailers, who are not particular as to fact, will say). But at, say, 3 francs the kilogramme of 2½ lb., a private person on the spot might, if so favoured by the grower (who may hesitate to sell to particular individuals), have enough Violets to form forty or fifty of the small bunches, for which he would have to pay from 30 to 75 centimes per *bouquette* to the street vendor. These retailers—big and little—make money while the flowers last. Of course, when they buy them of the producers at 3, 4, or 5 francs per kilogramme, the Violets are in a confused, entangled mass. They have to make them into neat and pretty bunches to make them saleable, and manage to dispose of them for at least an advance, in all, of 25 to 30 francs. If they sell all, they have a profit of from 20 to 23 or 26 francs. Their risk in having any over, which may wither and become unsaleable as fresh flowers, is now reduced to a minimum, for all the old and stale Violets are disposed of cheaply to the sweetstuff-manufacturer, who steams them in and coats them pretty thickly with flavoured sugar, and then sells such at a high price as “confitures of Violets.”

Neither in Britain nor in the United States has the writer ever seen a battle of flowers, nor does he believe such a *fête* is an institution to be found in those countries. In the Latin-American Republics, yes—the *batalla de flores* is becoming common enough there. But it is in these Riviera visitors' resorts that the *batalla des fleurs* is to be seen at its best. All the towns and townlets have two or three per year. Prizes are awarded for the best shows made, the money prizes or banners (as the case may be) being paid for by the municipality of the town. It is expensive fun, this peltling of each other with loose and small bouquets of flowers. Thousands of francs are thus pitilessly wasted. Though sad is the waste, it is of great benefit to one class of citizens—the florists; they do the roaring trade on these occasions. Then, it is private rich people who spend the money, not the commune; so the expense does not fall on the people.

Carriages and horses present a very pretty sight during these flower-battles. Every sort and condition of equipage will be seen, from the wagonette to the go-cart—most artistically bedecked with flowers. The vehicle is almost hidden by garlands of Roses, Violets, Narcissi, Lilies, &c. In most cases, the harness of the horses is also covered with floral tributes. Wealthy and plebeian take part in the diversion; the costermonger will be there with his vegetable “brougham,” the opulent foreign resident with his mail-coach, and both conveyances so weighted down with the offerings of Nature as to appear quite as good as each other. Further, types of vehicles are temporarily made for the day, which one would never dream of seeing on other occasions; they are veritable curiosities of carriage construction. The best flower corsos are to be seen at Nice, Cannes, Monte-Carlo, and Mentone. Fine souvenir views of these are obtainable in Cannes of the photographer, at Boulevard de la Croisette, 8 (F. Carbasse); and of I. Colombi, Promenade des Anglais, 15, Nice; also W. Bray, Rue Centrale, 57, Cannes.

The principal houses in and about Grasse interested in the raising of flowers of every kind from which suitable essences are extracted, are the following (all in the Avenue des Capucins):—Robertet Concern, A. Pilar, Lautier Fils, Hugues-Guizet, J. Hugues, A. Chiris,

Veuve Cavalier, and B. Roure. There are nearly a score of other firms, of more or less extent; but in the foregoing list, it will be found that the leading trading firms have been fairly summarised.

The best time to visit Grasse is, of course, in advanced spring. Then all is an undulating forest of flowers. The air is filled with a thousand fragrant odours. A three weeks' sojourn spent during the spring-time in this country will never be forgotten. While there, one should get out and about as much as possible; take evening walks along the well-kept lanes, crossing the flower-reserves, when the sweet perfumes are the most powerful and best appreciated. The visitor should never make the ignorant mistake of sleeping with closed windows. Leave them in fine weather wide open all night, and half-open during wet or damp nights. Take no notice of those silly know-nothings who say the nocturnal air is dangerous.

Being situate on a gentle slope of an offshoot of the Maritime Alps, the view of Grasse and vicinity is highly picturesque. It offers ever-changing and charming prospects with every hundred metres the tourist ascends. Up on the hills above the town a magnificent view is had of the town, with its numerous important and busy perfumery manufactories, surrounded on all sides by flower-clad lands, a smiling valley at the foot, and a range of hills closing the view to the sea.

It is a very pretty sight, that of seeing the harvesting of the flowers for the distiller. The flowers are brought into sheds, heaped on long tables, and every grade of poor woman-kind set to work sorting them (see fig. 112). They are so scantily paid, that they can barely exist. Their employers verily exploit and sweat them. Old and young women, little boys and girls—all are at it earning a miserable pittance. On following the carloads of flowers into the distilleries, one will be first pleased with the sense of the all-pervading perfume. But getting right inside, and into the depositing sheds, it becomes too much of a good thing: the odour is so strong and rank as to lose its fineness to the sensitive nasal organs, and becomes nothing more than a strong, almost nauseous smell, permeating everything damp—even your handkerchief, although you may not have taken it from your pocket.

Many beautiful private gardens are found in the Grasse district. The natives, being naturally skilful horticulturists, they make their garden models of good culture and work.

For the verification of a few forgotten names of Grasse flower-people and makers of perfumery, the writer acknowledges his indebtedness to the yearly publication of the Rue Clotilde, 1, Nice, known as *l'Annuaire des Alpes Maritimes*, L. A.

EURYBIA GUNNIANA.

If this subject can be afforded a position near to a wall, it repays one with a profusion of bloom at this season of the year; or if need be, it may be grown in pots, and gently forced into bloom quite early in the year. It may easily be grown from cuttings taken in the month of August and dibbled into 6-inch pots, in prepared sandy soil, and placing them in a frame, from which frost can be excluded. In the spring these may then be potted and grown on. Where white flowers are in demand, this is a most useful plant, although too tender for full exposure. *H. May, Markree Gardens, Collooney, Ireland.*

NEW OR NOTEWORTHY PLANTS.

ALOE AURANTIACA, n. sp.*

THIS is a fine new species of Aloe from the Cape, intermediate in habit between A. arborescens on the one hand, and on the other, A. ciliaris and tenuis. I first saw it growing in the celebrated garden of Mr. Thomas Hanbury, at La Mortola, last November, and mentioned it in my paper in the *Kew Bulletin*, 1892, p. 10. Now Mr. Hanbury has kindly sent me a plant in flower, from which the present diagnosis and description have been drawn up. Stem suberect, several feet long, ¾ inch diameter. Leaves approximate on the upper part of the stem; internodes about ½ inch long, white, with faint shades of green; blade lanceolate, erecto-patent, 8 to 9 inches long, 1½ inch broad low down, narrowed gradually to the point, apple-green, not at all glaucous, not spotted nor striped, flat near the base only, ¼ inch thick, margined with minute pale green deltoid teeth. Peduncles as long as the leaves. Racemes very dense, 5 to 6 inches long, 2 inches diameter; flowers bright yellow, just tinged with red in a young state; pedicels very short; bracts minute. Perianth cylindrical, 1½ inch long; tube short, campanulate; inner segments flat, linguulate, outer narrower and complicate. Stamens exerted half an inch; filaments and anthers yellow. Style finally protruded beyond the stamens. *J. G. Baker.*

PLANTS IN FLOWER AT KEW.

Rhododendrons.—The collection in the Dell has lately been most attractive with flowers. Besides the popular garden kinds, there are also several of exceptional interest, the best of them perhaps being one of those shown recently at the Drill Hall, and which is a hybrid between R. Fortunei and R. Thomsoni. This beautiful plant was raised by Mr. Luscombe some twelve years ago, and was shown at a meeting of the Royal Horticultural Society by the late Mr. Mangles several years since. It has not yet received a name, so far as I can ascertain, so we propose to call it R. Luscombei X. Another hybrid, which has flowered well this spring, is R. kewensis X, raised at Kew from R. Aucklandii and R. Hookeri. It is not quite hardy at Kew, the late frosts nipping the young shoots, but in milder localities it would, no doubt, thrive out-of-doors; it has all the charm of R. Aucklandii plus a tinge of deep rose, which it derives from its other parent. R. Aucklandii has been beautiful in the temperate-house; it has, in my opinion, no equal among Rhododendrons. R. glaucum, a dwarf small-leaved shrub, with raspberry-coloured flowers, is perfectly hardy. R. ferrugineum, the Alpine Rose, and R. cinnabarinum (Blandfordiaeflorum) are also flowering. We can go a good deal further in the matter of the hybridisation of Rhododendrons than we have got up to the present.

The American species of Azaleas have been better than ever this year. A. rhombifolia, a deciduous-leaved Chinese species, with bright mauve flowers, has been a mass of bloom for the past fortnight.

Solanum Wendlandii.—This is grand in the Water Lily-house, and also in No. 5, where it has been a feature for the last three summers. For those who do not know it, it may be described as a robust, somewhat succulent stove climber, with large lacinated leaves of a green colour, and enormous corymbs of purple-blue flowers, which are borne freely during the whole of the summer.

Sreptocarpus Dunnii.—The large-leaved species, with crowded masses of brick-red flowers, is now flowering freely in the succulent-house. It is certainly the most remarkable plant in the genus,

* *Aloe aurantiaca*, n. sp.—Caulis erecto elongato valido, foliis segregatis ascendebus lanceolatis viridibus concoloribus; aequalis marginalibus parvis deltoidis viridibus vagiis albis striis viridibus; pedunculo foliis aequilongio racemo densissimo floribus aurantiacis deflexis; pedicellis brevissimis; bracteis minutis; perianthio cylindrico tubo brevi campanulato, genitalibus longe exsertis.

if not exactly the most ornamental, for the habit is sprawling.

Tricuspidaria Hookeriana is flowering well in the conservatory (No. 4), where there is a large bush of it, 4 feet in diameter, now bearing scores of drooping, fleshy, urceolate, crimson flowers. A smaller plant of it is flowering in the temperate-house.

Cineraria aurita, in the conservatory, and *C. lanata*, in the temperate-house, are special attractions. The former is a noble-looking greenhouse annual, and valuable as a source of cut flowers. As much may be said for the second named species, which has the additional charm of fragrance, besides being perennial.

Primula imperialis, the true Java plant, is again flowering in the T range. This Primrose, it may be remembered, has leaves 16 inches long, and a stout erect scape 3 or 4 feet high, bearing whorls of yellow flowers.

stove are as good plants as *Eucharis*, the former especially, which has a head of ten flowers, each as large as those of *Eucharis candida*, and of sparkling white. Both species come from tropical Australia, and will thrive in the stove. They must be kept dry for a few weeks after the leaves wither.

Amorphophallus campanulatus.—About a dozen flowers of this plant have lately been open in the Water Lily-house. They are singular-looking objects, like inverted bells, but they have not an agreeable odour; a heathenish friend the other day remarking that they were, no doubt, the "pigs" of the vegetable kingdom.

Aristolochia Goldiana, &c., another big-flowered evil-smelling plant, has just produced a fine flower; *A. longifolia*, *A. brasiliensis*, *A. hians*, and several other species, are still in bloom in the Palm-house. *Nelumbium speciosum* and several of the *Nymphaeas* are already in flower. Talauma Candollei, with its

ORCHID NOTES AND GLEANINGS.

CYPRIPEDIUMS IN HANGING BASKETS.

AN effective feature in the well-arranged conservatory at Benham Park, Newbury, is made by baskets of *Cyripediums*, which are arranged around the structure. Mr. Howard, the gardener, informed me that they had been in their present position for some years. They are evidently at home thus treated, for the plants are in robust health, and bloom freely, some of the individual flowers measuring from 5 to 6 inches across. The species are *C. insignis*, *C. barbatum*, and *C. villosum*. *J. B.*

CYPRIPEDIUM × CHRYSOCOMES, Hort.

In the collection of R. H. Measures, Esq., of The Woodlands, Streatham, may be seen at the present time a fine series of the species and hybrids of the

FIG. 112.—DISTILLATION OF PERFUMES AT GRASSE: SORTING ROSE BLOOMS. (SEE P. 779)

Protea nana.—This plant is found in the Cape-house, and almost every one of its many shoots is terminated by a drooping scaly cup of a deep blood-red colour. It is a good plant for the cool greenhouse.

Pentapterygium serpens is equally fine, and is in the same house as the *Protea*. It has long, arching shoots, clothed with small Box-like leaves, and bearing numerous axillary pendent crimson, urn-shaped flowers, not unlike those of some of the Cape Heaths. It was introduced to Kew by Captain Elwes twelve years ago.

Hemantus Katherinea superba is a better stove plant than most persons imagine. It likes heat, moisture, and plenty of sunshine, and then it will grow freely, and produce its large globular heads of bright scarlet flowers every year. It is now finely in bloom in the Begonia-house.

Eurycles sylvestris and *E. Cunninghamii* in the

creamy *Magnolia*-like, deliciously fragrant blooms, is in the Palm-house, where also is the remarkable *Erythrochiton hypophyllanthos*, with its white, waxy flowers springing directly from the underside of the long leaf about half-way from the base, a most extraordinary looking thing.

Orchids.—There is a good display of interesting plants in bloom at present, including *Dendrobium clavatum*, *Cirrhopetalum Collettii*, *Bulbophyllum Lobbianum*, *Miltonia flavaescens*, *Disa tripetaloides*, *D. racemosa*, *Masdevallia Chestertonii*, *M. muscosa*, *M. cucullata*, *M. rosea*, *M. demissa*, *M. Svertiaefolia*, *Vanda Roxburghii*, *Epidendrum bicornutum*, *Aganisia incoptera*, *Oncidium lanceanum*, *O. macranthum*, *Sobralia* and *Herschellia coerulescens*, the blue *Disa*. There has also been a good show of North American *Cyripediums* in the cool Orchid-house until a few days ago. *W. W.*

Selenipedium group, and among them is a very handsome form bearing the above name. It is said to have been obtained from a cross between *C. caudatum roseum* and *C. × conchiferum*, which cross is also said to have produced *C. × nitidissimum*. The two, however, as compared side by side, are markedly different, which perhaps illustrates once more the sportive character of these secondary hybrids. The dorsal sepal of the present one is over 4½ inches long, and arches over, as in *C. caudatum*, which it also resembles in colour; while in *C. × nitidissimum* the same organ is erect, greener, and with much less undulate margins. This latter has also very flat, dark-coloured petals; while the lip has nearly parallel sides; the infolded side-lobes are richly spotted with brown, and the pouch is strongly suffused with the same colour. In *C. × chrysocomes* the petals are more slender, more twisted, and lighter

in colour; while the lip bulges more at the sides, and the colour is light yellowish-green, with fewer spots on the side lobes. The leaves, however, of the present one are much broader, which is clearly due to the Roetzli influence, and is not easily accounted for if the parentage is correctly understood. Mr. Measures is not the raiser of the plant, but the pedigree given is that received with it. Whatever its parentage, however, it is very distinct and handsome. *R. A. R.*

ORCHIDS AT BURFORD LODGE, DORKING.

In the pretty gardens of Sir Trevor Lawrence, Bart., M.P., the President of the Royal Horticultural Society, and in their commodious and well-kept houses, perhaps the most varied and interesting collection of Orchids in cultivation is to be found; for not only is it replete with the best varieties procurable of all the showy genera, such as *Cattleya*, *Lælia*, *Odontoglossum*, &c., but it embraces a large number of rare species which are generally said to be of only botanical interest, but which, when well grown and flowered, as here, never fail to command the admiration of florist and botanist alike. Take, for example, the genus *Epidendrum*. Some of the species are always making a good show; *Epidendrum Wallisii* and some others seem never to go out of bloom, and at present the genus is represented at Burford by these perpetual-flowering species, together with fine plants of *Epidendrum prismatocarpum*; the fine purple *E. evectum*, the scarlet *E. radicans* and their product the fine *E. O'Brienianum* ×, which grows to a great size, and produces its large heads of deep red flowers in profusion. Also in bloom were *E. elongatum*, *E. stenopetalum*, *E. tampense*, *E. aciculare*, the fine white *E. bicoloratum*, *E. variegatum*, *E. raniferum*, *E. arachnoglossum*, &c.

Cirrhopetalum, *Bulbophyllum*, and *Megacelium*, too, are continually producing some quaint and pretty flowers, which never fail to attract attention, and even at the present time there are among them in flower the singular *Megacelium falcatum*, the pretty little *Cirrhopetalum elegantulum*; a probably new yellow *Bulbophyllum* and other species. Taking the houses in rotation, in the first we come to a fine batch of *Vanda* teres in bloom, many being very dark-coloured varieties, while one is nearly white. In the same house, in flower, is a plant of the singular *Luisia volucris*, with its long erected petals; the pretty *Dendrobium tridenum*, and in a shady corner a grand batch of the fine vermilion *Habenaria militaris*, propagated at Burford—a triumph of cultural skill reflecting great credit on Mr. W. H. White, the grower, as indeed all the Orchids here do.

In the first cool-house, among many things of ordinary interest, we found the fine golden yellow *Odontoglossum Pescatorei* "Prince of Orange"; a noble specimen of the large yellow-lipped *Ocoidium Loxense*; a beautiful and distinct *Odontoglossum crispum*, with dead-white flowers, the petals bearing many little purple dots, and the sepals fewer of them. Here the noble *Maxillaria Sanderiana* has borne three flowers, and other *Maxillarias* are in bloom; while in a cool corner *Sobralia macrantha* is finely flowered, and in this cool situation its flowers are said to last considerably longer than in heat.

In the next cool house, in which the large boat-like rafts containing the fine specimens of the chimæra section of *Masdevallia* are suspended, we noted a large plant of *Oncidium bifolium* with many spikes, an equally good golden-yellow *O. auriferum*; some very large-flowered *Dendrobium Jamesianum*, *D. Falconeri*, the showy scarlet *Cochlidia Nozliana*, the fragrant yellow *Epiphora pubescens*, various *Miltonia vexillaria*, &c.

Prominent in the next house was a grand plant of *Calanthe Dominiana*, with twenty large heads of its pale blue flowers; here also many *Epidendrums* were in bloom, and on one side a fine lot of *Celogyne cristata*, among which some of the specimens, apparently from excessive vigour, are again pushing up numerous flower-spikes from the centres of the young growths.

In the next house a batch of *Miltonias* are thriving remarkably well, their large pseudobulbs plump, and not of that sickly yellow hue which these plants have when grown too warm. The main feature here was the fine pure white *Cattleya intermedia Parthenia*, which is one of the best white Orchids we have, but, unfortunately, extremely rare. A fine variety of *Celogyne speciosa*, too, is here, and also the bright yellow and brown *Oncidium Foerstermanni*.

In the *Dendrobium*-house there is a good show, in which the varieties of *Thunia Bensoniæ* are prominent, and one of them is probably the largest and richest-coloured known. *Thunia Marshalliæ*, *T. Veitchiana*, and others, too, are in bloom, with fine plants of *Dendrobium suavisimum*, *D. aduncum*, *D. Lowianum*, *D. secundum*, the curious *D. lamellatum*, *D. binoculare*, *D. transparens*, *D. Parishii albens*, *Oncidium Lanceanum*, *Celogyne pandurata*, &c. At the end is a group of *Cypripedium bellatulum*, *C. Godefroyæ*, and *C. niveum*; and on one side a fine lot of *Phalaenopsis*, among which in flower are a large variety of *P. Sanderiana*, *P. samatrana*, *P. Micholitzii*, and *P. Luddemanniana*. The large specimens of *Cypripedium* have exceptionally well bloomed. *C. Swainianum* ×, with many flowers; *C. marmorophyllum* ×; *C. Curtisii*, *C. Lawrenceanum*, *C. Stonei*, and beside it a vigorous plant of the rare *C. S. platytanum*; *C. selligerum majus*, &c.

Passing through other houses in which *Vandas*, *Aërides*, *Cycnoches*, *Catasetums*, *Lælias*, *Cattleyas*, &c., are in flower, we come to the lobby filled with fine forms of *Cattleya gigas*, making a great show; then through the little new house in which it is thought the rather troublesome *Lissochili* and *Eulophias* will thrive, we come to the house of seedling Orchids raised at Burford, all of which are in remarkably fine health. In this house the beautiful *Zygopetalum Lindenii* is in bloom, and the plants of *Phajus tuberculatus* thriving well. The *Masdevallia*-house also is literally glowing with colour. A glance through the rest of the glass-houses, under the able management of Mr. W. Bain, the gardener at Burford, showed the Burford Anthuriums in fine condition. In one of the stores a large lot of *Tydeas* and other gesneraceous plants are magnificent, the *Begonias* very fine, *Schubertia grandiflora* and other specimen flowering plants profusely bloomed, and the whole place in fine condition, the hardy herbaceous plants, which are extensively cultivated outdoors, giving a very bright display of flowers.

CANADA.

ORCHIDS AT THE HON. J. J. C. ABBOTT'S, MONTREAL.

Horticulture in Canada has steadily increased of late years, and with the rich collection of Orchids and other choice and valuable plants in the possession of the Hon. J. J. C. Abbott [since this notice was penned, Mr. Abbott has received the honour of knighthood, Esq.] now Premier of the Dominion of Canada, as an example of the highest order, I venture to think that the many readers of the *Gardeners' Chronicle* would like to hear of the numerous good things your correspondent saw when he last visited this (in Canada) well-known collection. On the fashionable Sherbrook Street, Montreal, the beautiful town residence of this enthusiastic patron of horticulture, is situated, and here are the conservatory and greenhouses which are managed by Mr. W. Wilshire. Mr. Abbott's hobbies are white-flowered Orchids, winter-flowering species of *Cattleya*, and all such fine foliage plants as *Heliconia aurea striata*, &c.

At the time I saw the gardens (May), the large conservatory was at its best, filled as it was with many handsome Palms and foliage plants, in the centre of which stood a noble specimen of *Latania borbonica*. Artistically arranged amongst these, with due allowance for contrast of colour, was a

remarkably fine lot of well-flowered Orchids, the most prominent being *Cattleyas*, some remarkably fine varieties of *C. Trianae* predominating, and yet it was somewhat late for the species. *Cattleya Skinneri* was well-flowered (fifty-two flowers), and a specially dark form of it, with a dark lip, and *C. Skinneri* alba, very delicately tinted, attracted the eye on entering the house. The favourite *Cattleya citrina* is grown in baskets, and, as seen here, the idea that this plant deteriorates under cultivation would be at once dispelled. One plant, with six fine flowers, reminded one of that fine *Tulip*, *chrysocolora* suspended by the stem, than aught else. *C. Mendeli*, *C. Mossii*, and the rare variety, *Wagneri*, the grandest of all white *Cattleyas*; also *C. Warneri*, and *C. chocoensis* seemed to be perfectly at home.

From the crossbars and trellises hung many well-flowered *Dendrobiums*, the old favourite, *D. Wardianum*, with the variety, *Lowii*, specially grand; *D. crassinode*, *D. thyrsiflorum*, and its variety, *Walkerianum*, far superior to the type, with its long closely-flowered racemes; *Dendrobium chrysotoxum*, a grand piece with twenty-one spikes; *D. superbum*, with forty-seven flowers, showed high cultural skill. I may also mention the neat and pretty *D. draconis*, not often seen; *D. crepidatum*, and the recent introduction, *Dendrobium Phalaenopsis*, of which Mr. Abbott has quite a number—the flowers come on the old wood, and they are a soft pink colour.

Epidendrum bicoloratum, so rarely observed in collections, is to my thinking, the best of the genus, a somewhat despised one. Its *Phalaenopsis*-like flowers contrast well with those of *E. vitellinum majus*. Near by, the fine arching spikes of *Odontoglossum Pescatorei* bowed to their more fortunate brethren, *O. citrosimum* and *O. c. var. album*, a specially good piece of which courted notice.

I must tell you also of a remarkable piece of *Trichopelia snavis alba* (true) carrying thirteen well-flowered buds of waxy whiteness. It is the best that I have hitherto observed.

Half a house is devoted to *Cypripediums*, and all the more popular species and varieties were well represented, some of them carrying many flowers. There were *C. grandæ* ×, *C. Boxalli*, *C. Sedeni candidulum* ×, *C. bellatulum*, a very fine dark-spotted variety; *C. Dayanum*, *C. Lawrenceanum*, and a variety named in honour of Mr. Abbott, *C. Lawrenceanum* var. *Abbottianum*, an immense flower, with deep vinous red markings; and last, but not least, the fine *C. Morganianum* and *C. Schroderi*.

Cymbidium Mastersonianum was well represented, and one plant carried eleven flowers; *C. eburneum* and *C. Lowianum* also held their own.

Among other too numerous to mention, all well flowered, were:—in the cold-house, *Ada aarantias*, and numerous varieties of *O. Alexandræ*. In the *Vanda*-house, the pretty *Vanda caroleusensis* was conspicuous, and vied with the gorgeous-coloured racemes of *Aërides Fieldingii*, and the more modest-coloured *Saccolabium giganteum*. The quaint *Epidendrum Stamfordianum*, and the bold spikes of *Phajus Wallichii* and *grandifolius*, which had lately borne 680 flowers, are only a few which assisted to make up this really good collection. Some pieces of *Celogyne Massangeana* and *C. cristata alba* are worthy of notice.

Among the foliage plants, the best were *Anthurium Veitchii*, *Maranta nitens*, *M. Veitchii*, and *M. Macoyana*, a grand *Bromeliad Nidularium striatum*, *Paritra borbonica*, and the lovely *Heliconia aurea striata*. Of Palms, there were specimens of *Thrinax elegans*, *Geonoma gracilis*, *Verschoffia splendida*, and the compact-growing *Livistona rotundifolia*.

Adiantum Williamsii and *A. Farleyense* were good among the Ferns, and foliaged *Begonias* were very conspicuous, *Arthur Mallet*, *Lucy Glosson*, and the pretty *Otto Foster* catching the eye at once.

An American or Canadian garden invariably has a Rose-house, and this place is not an exception to the rule; and at the time of my visit it was resplendent with *The Bride*, *Catherine Mermet*, *Perle des Jardins*, and *Sunset*, the latter reminding me of the close of the day and my visit. *New York Correspondent*.

MARTIN R. SMITH, ESQ.'S GARDEN AT HAYES, KENT.

MR. SMITH is the President of the Southern Section of the National Carnation and Picotee Society, and not President in name only, but an energetic worker, and a leader whom it is a pleasure to follow. The Carnation is his favourite flower, and he takes infinite pains not only to know their floral properties, but to thoroughly master cultural details. Mr. Smith, if I may be allowed to say so, is ably seconded by his head gardener, Mr. Chas. Blick, who is a good all-round gardener, but is wise enough to give his personal attention to the Carnation, and is a most successful cultivator. Mr. Smith kindly invited me the other day to see a batch of seedling Carnations which he has in flower, and of which I was able to take the following notes. Carnations are found everywhere in the gardens, but hardy plants of all kinds are also carefully grown, and in large numbers, and yet it is easily seen that the resources of the garden in this direction are not exhausted, for, hidden out of sight from the mansion by a belt of trees and shrubs is a stretch of uncovered ground, purposely left in its wild state, and covered with heather, gorse, and bracken, which will be some day utilised as a wild garden.

The beds of Carnations and other beautiful flowers are in their right place on the well-kept lawn, backed up by the aforesaid belt of choice trees and shrubs, and on the other side is Nature free and unrestrained. When walking round I pictured to myself what would be the effect of large masses of single-flowered Roses, as *Rosa rugosa*, and even the Briar Rose growing as they liked amongst the bracken, purple heather, and yellow gorse.

Allan Ramsay, the Scottish lyrical poet of 150 years ago, has the following picturesque sketch of the wild garden:—

"I love the garden wild and wide,
Where Oaks have Plum trees by their side;
Where wood-vines and the twisting Vine
Clip round the Pear tree and the Pine.
Where mixed Jonquils and Gowans grow,
And Roses mid rank Clover blow
Upon a bank of a clear strand,
In wimplings led by Nature's hand;
Though Docks and Brambles here and there
May sometimes cheat the gardener's care,
Yet this to me's a paradise
Compared with prim cut plots and nice,
Where Nature has to art resigned,
Till all looks mean, stiff, and confined."

The worthy author of the *Gentle Shepherd* gives us a hint for a wild garden; but I do not contemplate Docks, Thistles (except the Scottish Thistle) or Nettles in it. Coarse-growing weeds must be rigorously excluded.

But a careful look round this interesting garden reveals the fact that the gardener is great in cultural skill. Carnations demand our attention first, and as we enter the garden we find seedlings of the current year in preparation to flower next year, every plant carefully labelled with the names of both seed and pollen parent; all fine thrifty plants, planted in soil well prepared for them, and to be again transplanted into other beds where they are to flower, the soil being specially prepared with good fibrous loam. Last year's seedlings here, there, and everywhere give promise of an immense display of blossoms when we remember that a hundred or more blooms may be produced by one plant.

But here we are at the greenhouse, where the flowering seedlings are. The entire stock of plants have been produced from seeds obtained by crossing Madame Warocque, a crimson Carnation of the *Souvenir de la Malmaison* type; and Mrs. Reynolds Hole, a buff or apricot-coloured Carnation. There are perhaps 150 seedlings in flower, and one cannot repress a certain feeling of pleasurable excitement on beholding such an array of perfectly distinct well-grown Carnations. I am also a seedling Carnation raiser, and know something of the feeling of disappointment when promising crosses

which have been tended with great care prove to be failures; but I also know something of the elation that comes of a "good hit," and I can realise how much pleasure the possession of such plants affords their owner. As some evidence of the way in which seedlings put on the characteristics of, not only their parents, but their grand-parents, I noted one seedling which has been named Mrs. Stuart MacRae: it has flowers of a pink shade, deeper than that of *Malmaison*, and with larger and better flowers. Lord Rosebery is a fine reddish-crimson variety, with *Malmaison* foliage and flowers. Sir Evelyn Wood is of the type of the flaked *Malmaison* named Lady Middleton, the flowers streaked and flaked rose on a pale pink ground.

There are numerous other deep-coloured large-flowered Carnations of the *Malmaison* type. Many there are, too, which resemble neither parent, and yet have perfect flowers as border Carnations. Of these, *Hayes' Crimson* is of a handsome deep ruby-crimson colour, with large and full flowers, and petals of good substance. *Adonis* is of ruby-crimson, and is a well-formed flower. President Washington has large deep rose-coloured flowers, of good form. Dick Swiveller, likewise rose-coloured, has broad petals, of good substance, and the form is nice. *Bride of Abydos* has a pink-coloured ground, densely streaked and flaked with rosy-red.

The five varieties named above have little in common with either parent; but, as might readily be supposed, there are some with a suffusion of the apricot-colour of Mrs. Hole. Mrs. George Devas is a beautiful variety, with much refinement of petal and form of the flowers, which are of a yellowish-buff colour, flaked with rosy-red. Mrs. Seymour Bouverie has the same ground-colour, with broad, well-formed petals, and handsome flowers; it is flaked much like the other. The Golden Dustman is of yellowish-buff, broadly flaked with rosy-scarlet, and it is a very fine bloom. *Hercules* has a buff-coloured ground, but the flowers are lacking in the refinement of the above-named three; they are of immense size, and full of promise, flaked and streaked rose of two shades.

THE ORCHARD-HOUSE.

In this I found trees of Peaches, Nectarines, Plums, Cherries, Apricots, and Pears, all of which are in pots, and well grown. I have for twenty-five years advocated the culture of trees in this manner, well knowing that, with good management, the best results may be obtained; and the fruitful condition of the trees here, with the fine quality of the ripe and ripening fruits, show very clearly how much of very real enjoyment can be obtained from pot fruit trees. Cherries were ripe and ripening; the trees being laden with fine large fruit. The best black Cherry in the house was *Early Rivers*, a fruit of good quality, rich colour, and large size. *Bigarreau de Schreken* is also a fine early black Cherry, and very free-bearing, but it is not so early as *Early Rivers*, or so good. Of white Cherries for the orchard-house, Governor Wood is supposed to be the best; it is followed by *Bigarreau Napoleon*, or late Mottled *Bigarreau*.

Plums are of superb quality from these pot trees; but the fruits were not ripe at the time of my visit, but Mr. Blick says that *Monarch* is one of the best purple Plums, the fruit very large and of excellent quality; *Curlew* is recommended, the fruit is of a deep blue or purple colour. *Reine Claude de Comte Athens*, a late red Gage is also recommended.

Of Nectarines, *Humboldt*, a large-fruited variety, the fruit yellow-fleshed, is much prized. *Pine-apple* also holds a high position, and Lord Napier is the largest and best early variety. [Mr. Rivers has one that is much earlier than this. *En*] *Sea Eagle* was said to be one of the best mid-season Peaches, and *Crimson Galande* is an excellent Peach for forcing.

Pears are extensively grown as pot trees; some of them are turned out-of-doors to ripen, others are always kept under glass. *Doyenné du Comice* was named as one of the very best for pot culture. Mr. Rivers says of this variety that the fruit will ripen on the tree into November in the orchard-house, and

may then be gathered and eaten from it. *Beurré Superfin* is also highly commended. *Magnate* is a fine variety for the orchard-house, ripening in September and October; *Fondante d'Automne* is one that can be depended upon to bear a good crop of fine quality; *Beacon* is said to be the best early Pear. *Souvenir du Congrès* also bears fruit freely, is early, and of large size; fruits have been gathered from the pot-trees, weighing 24 oz. Fruit culture is evidently the next special feature in these gardens after the Carnations; Peaches and Nectarines being particularly well grown, both planted out and in pots.

The Melon-house contained vigorous plants, bearing heavily; and substantial vineries were well furnished with Vines, bearing well; and I noted that although the Grapes were colouring, no traces of red-spider were to be seen anywhere. This Mr. Blick fancied was owing to soot being placed in the evaporating troughs; I fancy a good deal also depends upon the general management of the Vines, careful and regular ventilation, damping down the house at the right time, and also seeing that the roots are well supplied with water. Something, too, depends upon the way in which gardeners are backed up by their employers, and whether or not they are promptly supplied with materials for carrying out their work effectually. There is such a thing as being "penny wise and pound foolish," and too many hard-working gardeners know something of its application. *J. Douglas.*

THE ROSERY.

STOCKS AND SOIL FOR ROSES.

ALTHOUGH the question of stocks is most important, I venture to say that due regard is not given to another feature in the cultivation of Roses, and one to which the stock question is far more closely related than many would apparently consider, seeing how very vigorously they uphold one stock against another. I allude to the nature of the soil your Roses are to be grown in. Rose stocks, like all other plants, are very much influenced by the soil, and due regard is not paid to this fact by the majority of writers when recommending their particular favourite as being the best stock for Roses.

I may say at once that there is no stock for Roses that will do equally well in all soils. In proof of this, let us remember that our largest and most successful growers do not all use the same stock, and yet each wins in his turn, so to speak.

It is only natural that a grower should uphold the stock that thrives best with him, and did he but describe his soil and remain content with advocating the merits of his stock for similar ground, his observations would be of considerable value; but, unfortunately too many writers are stumbling-blocks to amateurs, through upholding one stock against all others, without the slightest consideration as regards soil. Even in the confines of one garden, the action of this may often be noticed. How much more so, then, when totally distinct soils and localities are being considered.

For some time past, much abuse has been directed against the *Manetti* stock. This is unfair, and although the maligners of this most useful stock may have found some other to be more suitable for their soil and the particular varieties of Roses that they cultivate, it is hardly just to run it down for no other reason, as in many gardens the *Manetti* is the most useful of all stocks.

No Rose grower of much experience would advise all varieties of Roses to be grown upon one stock in all classes of soil, but several amateur friends of my acquaintance have drawn this impression from some of the articles upon this subject which have appeared in the gardening press during the last four or five years. In many cases the discussion upon stocks for Roses has scarcely been carried out in an impartial manner, too many being led away by their partiality for some particular stock, and seeming to entirely forget that the fact of any stock doing well

with them does not guarantee its doing equally well in a totally or even slightly different soil.

Due consideration must be given to the variety of Rose, and also to the class of soil they are to grow in, before any definite answer can be given as to the best stock to cultivate them on. In some few instances it may be better to grow some kinds upon their own roots, and so eschew stocks altogether. I will endeavour to give my impressions upon this matter after considerable experience and careful observation extending over the past twenty years.

There are three distinct stocks for Roses that are in general use, viz., the Briar, the Manetti, and De la Grifferaie. All of these have their good qualities, and although, generally speaking, the Briar will be found the most useful, this is no reason why it should be grown to the exclusion of the two others.

The Briar is grown in three forms: as a seedling, as cuttings, and as standards. As a general rule, seedling Briars are the best stock to use upon a deep loamy soil, the struck cuttings being preferable for the same class of soil when shallow. The hedge Briar, used as standards or half-standards, is an excellent stock for the strong-growing Roses of all classes, and also for the weaker-growing Teas; these last, however, should be grown as dwarf standards, as they have not sufficient vigour to derive enough nourishment from the Briar, when under the necessity of drawing it up through a long stem. Standard Briars will do well upon a stiff loamy soil, whether deep or shallow.

The Manetti stock is well suited for the majority of Hybrid Perpetual and Bourbon Roses, more especially upon a light loamy soil, or one of a warm and sandy nature. This is really an excellent stock, but is no more suited for all classes of Roses and soil than is the Briar. For pot-culture, the Manetti and cutting Briar are by far the best. As a pot-plant, the majority of the Tea-scented and Noisette varieties do very well upon the Manetti; this I attribute to the confinement the roots are subjected to, and which restricts this stock from making the coarse and vigorous roots it is apt to do when planted out. It is also a singular fact that grafted Tea-scented Roses do much better on this stock than when the same varieties are worked by budding. The chief complaint of amateurs against this stock is its tendency to throw suckers; these it is certain to produce when the plants are badly worked; but when the bud is inserted in the proper position—i.e., close upon the crown of the roots, there will not be any greater proportion of suckers accruing from a Manetti stock than there are from a cutting or seedling Briar. The Manetti has many staunch supporters among experienced growers, and many of our finest Roses are very successfully grown upon this stock. I have plants of such sterling varieties as Marie Baumann, La France, A. K. Williams, Alfred Colomb, &c., upon both the Manetti, the cutting, and seedling Briar; and provided the soil is suitable to the stock, I do not recognise the slightest superiority in one over the other.

The De la Grifferaie stock is not so extensively used as the two I have previously noticed. It is, however, a very useful stock for strong growers like Gloire de Dijon, Wm. A. Richardson, and Maréchal Niel, more especially when they are grown upon light sandy soils, in which case the Briar would not obtain nearly so much nourishment as the De la Grifferaie. I would never advise its being used for any of the medium or weak-growing kinds, but for the climbing Teas and Noisettes it is particularly serviceable in light soils.

So much, therefore, for the stock and soil in relation to one another. We will now give a little attention to the question of which stocks are best for certain classes or varieties of Roses. This is a wide question, and can only be approached in a general manner in the limits of my paper. It has often been said that the Manetti is altogether unsuitable for Tea Roses. I grant that it is generally so—but there are exceptions; and as I have previously pointed out, this is a very suitable stock for pot

plants. A few of the stronger-growing Teas will do fairly well upon the Manetti when growing in a light soil. This stock is also an excellent one for almost all of the Hybrid Perpetuals; but here again exceptions occur. For example, Captain Christy, Marie Verdier, and a few others, do not take kindly to this stock, and seldom effect a strong and complete union.

Such varieties are better grown upon the cutting Briar or the seedling Briar stock, according to the nature of the soil they are to occupy. Briefly speaking, the Manetti is suitable for H.P.'s, the Briar for H.P.'s or Teas, and the De la Grifferaie for a few of the strongest growers when cultivated upon light soils.

There is one more point that I think is worthy of consideration, and that is the relative earliness and lateness of these different stocks. I would arrange them in the following order:—Manetti, cutting Briar, De la Grifferaie, and seedling Briar. For late autumn flowers, no stock can surpass the last-named upon suitable soil, and I am fully convinced that we obtain a greater intensity of colour in the dark red and scarlet kinds when grown upon the seedling or cutting Briar stocks. *A. Piper.*

THE WEEK'S WORK.

PLANTS UNDER GLASS.

By R. MILNER, *Gardener, Penrice Castle, Swansea.*

GESNERAS.—No time should now be lost in starting the roots of the winter-blooming species of Gesneras. The best method I have found is to place two or three tubers in a 4-inch pot, or should they be very large, one in a 3-inch pot is better. The pots should be well-drained, and the potting compost of fibrous loam and peat in equal parts, with a liberal addition of sharp clean sand. Place the pots on a shelf near the glass in a house, whose night temperature does not fall below 60°, and after they have started into growth they should have a light shading put over them when the sun shines.

SUMMER-FLOWERING SPECIES OF GESNERAS.—Those tubers which were early started will now be showing bloom, and may be assisted with a clear weak manure water once a week, and the plants should be frequently looked over in case mealy-bug should have established itself. Where the roots are strong, and the foliage has been kept in good condition, the plants can remain in the stove after blooming, keeping the soil after that period moderately moist. They will throw up a succession of shoots, which will come into bloom during the autumn.

CELOSIA PYRAMIDALIS.—Seedlings raised this spring will now be ready for placing in their flowering-pots, employing a compost of three-parts rich loam, one of rotted dung, and sand in quantity sufficient to keep the soil porous. When the pots get well filled with roots, frequent applications of weak manure water are needed. Grow the plants in a light position, in a pit or low house, keeping them well up to the glass, using a light shade during the hottest part of the day, as if the foliage is exposed to the fierce rays of the sun, it soon loses its green colour. Syringe the foliage freely every day to keep down red spider, which is very partial to the Celosia. Another sowing may still be made, the plants from which will be found very useful during the autumn.

ACHIMENES.—The latest batch of tubers which was started to form a succession, should now be placed in baskets to be suspended, or into the pots in which they are intended to bloom. Few plants are more suitable for basket-culture than the Achimenes, and these baskets should be of a good size, as they look better when hanging in the conservatory than small ones. Until the plants show for bloom, they may be grown in an airy intermediate-house well up to the glass. Pay careful attention to watering, and when closing the ventilators in the afternoon; the plants should be thoroughly syringed with tepid water, which will be a means of keeping the foliage clean and healthy until the plants have finished blooming.

THE FINAL POTTING OF CHRYSANTHEMUMS.—The time is now at hand in which to give these plants their final shift. Have the required number of 8 and 9-inch pots thoroughly cleaned. Pots larger than this are not necessary, as manual

stimulus can always be afforded. Good crocking is an essential. A compost for their final shift may consist of three parts rich loam, in a rough state, one part each of leaf-soil and spent Mushroom-bed dung, with some sharp sand. In case the loam is not of the best kind, a little soot and a sprinkling of some one of the well-tried fertilisers may be added with advantage. When potting, it is necessary to make the compost in the pots firm with a potting-stick, leaving the top of the ball 2 inches below the rim, so that good waterings may be afforded, and if needed at a later date, top-dressings of manure. If the potting soil is in a moist condition, no water will be required at the roots for two or three days after potting the plants, but a dewing over with the syringe every evening if the weather is bright will be sufficient. Stand the plants in an open but sheltered position till established, and afterwards put them where it is intended they shall be grown, but do not crowd them together, or weak growth will result.

THE HARDY FRUIT GARDEN.

By H. MARKHAM, *Gardener, Moreworth Castle, Madingley.*

PYRAMID AND BUSH PEARS.—A great many of these, owing to the lightness of their crops, are making exuberant growth, and will soon stand in need of having the shoots thinned and stopped so as to admit light and air to the interior of the heads, or the incipient blossom-buds will not develop properly. At this early date I would advise that there be no wholesale cutting out of shoots, as this will but lead to a denser growth of soft shoots. But where for appearance sake the trees must be trimmed, the shoots should be left from 8 to 10 inches long, and be again shortened at a later date, when the wood has become more matured. Stunted trees usually fruit more freely, but make less wood than free-growing ones, and such should be relieved of much of their fruit, leaving only those which are the most exposed and the best shaped, so that these may swell to a fair size. Freely feed the roots of these stunted trees at short intervals, and mulch the ground with manure, particularly if it is light and dry. The leaders of young pyramids should have some support to prevent them being broken off; a bit of lath will do very well fastened to the firmer part of the stem, and broad soft bass used for tying. The bushes should have the central shoots taken out, and the side shoots regulated and fastened out at regular intervals, so as to form the main branches of the future bush.

Cordons, whether upright or horizontally trained, should have all the leaders made secure to the walls or wires before they get damaged by wind. If trained to wires, the ties should not be tightly fastened, strips of wood or thin sticks may be used to keep the shoots straight. Pear cordons are usually trained obliquely, and should stand not more than 18 inches apart, the first one being planted close to the end, and the stem trained upright; the others should be arranged at equal distances apart, so as to fill the space devoted to them; while at the other end of the row a shoot should be trained horizontally along the bottom of the wall about 12 inches from the soil, and from this others should be trained, so that the wall be covered from end to end.

Trees that are well furnished with fruitful wood, and are bearing heavy crops, should be thinned early, and should the border in which the trees are growing be narrow or shallow, or stand in need of nourishment from some cause, mulch it well with manure, and water it abundantly in dry weather with pond or river-water. Lightly-cropped trees making strong wood will need no manual stimulus. Remove clay from grafts that have made a perfect union, and secure the young growths.

THE ORCHID HOUSES.

By H.A. HURBERT, *Orchid Grower, Highbury, Birmingham.*

If alterations are needed in the heating apparatus, these are better if left till we are well into the month of July, or even in August, if the alterations are not extensive ones, for any inability to make use of the apparatus at this part of the season when needed is an evil, the weather being very capricious. During the last few nights the thermometer outside has fallen to 33°, and this following almost tropical warmth, compelled me to have recourse to artificial heat, even in the Odontoglossum-house, as any check from cold while the plants are in active growth should be carefully avoided, it being possible that a malady which shows itself in the form of black spots on the foliage and pseudobulbs is caused thereby; and the loss of new and immature growth, and in some instances the

sudden stoppage of the new growth of Dendrobiums, which afterwards ripens up without ever gaining its proper dimensions, may be attributable to this cause.

Angracum Scottianum is now in flower; in fact, it is nearly always so. A large specimen of this species would be invaluable, and it is an easy plant to grow, if afforded plenty of heat and moisture. Like most others of the genus, it is both pretty and curious, and the flowers, which are white, are large in comparison to the size of the plant that carries them. The species of Angracum seem to like heat and moisture in abundance whilst growing; but I think that *A. sequepedale* does best if grown in the cooler part of the East India-house. All species must now receive liberal supplies of water, and be kept very clear of insects by occasionally sponging them.

FRUITS UNDER GLASS.

By J. RIDDELL, Gardener, Castle Howard, York.

THE ORCHARD-HOUSE.—Apples, Pear, Plum, Apricot, and Cherry trees (in pots) which may be carrying heavy crops will require to be supplied with artificial manures at every alternate watering, the recent warm weather having caused a very rapid growth, and manurial aids are very necessary as well as abundance of water at the roots. When the trees are planted out on the borders of the orchard-house, a good deal of discretion should be exercised in affording manure, as it is only those trees which are making weak wood and bearing heavily that require any of this kind of assistance; for to feed plants already vigorous enough, and perhaps not carrying heavy crops, will only tend to make matters worse, by causing the production of gross growth, which may not ripen satisfactorily. Superphosphate of lime, kainite, and nitrate of soda are good fertilisers, but must be used sparingly, especially the nitrate. Ferrous sulphate applied once during the season of growth, at the rate of a teaspoonful to a 12-inch pot, will aid the swelling of the fruit, and the solidifying of the wood of the current season. Attend closely to the stopping of shoots, but do not follow any hard and fast lines, as the more vigorous plants will benefit from an extension of their shoots, whilst less vigorous, or less healthy trees, would be weakened by the practice. Thin the fruits of the Apricot where too numerous, the thinnings being used in cooking. Make free use of the syringe amongst the trees on sunny afternoons, and keep down insect life by either fumigating or applying some of the washes recommended for the purpose, the best of which, I believe, is Fir Tree Oil. Afford plenty of air by keeping the ventilators open. Cherries, whose crop is gathered, may be turned out-of-doors, but they should not be neglected, or the chances of a good crop next season will not be promising. Stand the pots on a hard bottom, supply them with water when it is needed, and give them an occasional syringing with clean water; a mulch would also not be amiss.

POT-VINES which were placed early into 10 or 12-inch pots will now be in a condition to take liquid manure, which should be frequently afforded in a well-diluted state at first, but gradually increased in strength. When pot-Vines are not so robust as they should be, any of the artificial manures mentioned above will be found useful, and may be employed alternately, and an occasional watering with soot-water will also be found beneficial. Keep laterals stopped to one leaf, but allow one leaf or joint to grow each time the leader is stopped.

ORANGES.—Trees which have set their fruit may be syringed twice daily in bright weather, and occasionally watered with liquid manure. Afford the trees abundance of air and a minimum temperature of 65°.

THE KITCHEN GARDEN.

By G. WYTTES, Gardener, Syon House, Brentford.

ASPARAGUS.—When midsummer day has come, the cutting of Asparagus should cease, and more especially, if heads are required early next year. For late supplies, a bed or two should be set apart, and means taken to preserve the plants in good growth, by means of copious waterings and various kinds of top-dressing. The beds should be laid down in a cooler part of the garden than the other beds. The plants in the latter should be encouraged to make good growth, as in the case of the late ones, and by the same means. Fish manure raked in lightly, and followed by a good watering, does much good, as does a drenching with cowyard drainage, and top-dressing of dung from the same source, which is better if it be in a partly-decayed state. Beds which may have been forced, will need to have similar treatment. The strong shoots should be tied to sticks, or a few bushy

Pea-sticks may be stuck into the soil among the stems. Seedling Asparagus should have a final thinning.

SEAKALE.—The crowns should be reduced on each plant to one, and that the strongest. Apply a dressing of agricultural salt to the soil between the rows, doing it in rainy weather; fish manure is equally good as a manure, if raked in lightly. The growth of Seakale is finer if this kind of assistance be given at the present season.

GLOBE ARTICHOKEs.—Heads will now be turning in freely, and to give added succulence to these, the plants should not lack moisture at the root, and a mulch of decayed manure if the land be light. Fly the hoe between the rows of Jerusalem Artichokes, destroying all stragglers.

BETROOTS.—The rows of the main crop should be thinned, and if any have to be transplanted, choose wet weather for the job, and take care to get the roots entire. If small Turnip-rooted Beets are required, sowings may still be made, watering the bed in hot weather to promote germination of the seed.

TOMATOS.—Stopping and training should now be closely followed up, but manure need not be applied before a good set of fruit is secured, and then it should be in the form of a mulch. For Tomatos out of doors a restricted root-run is quite as desirable as for the indoor plants. Strong plants from 2 to 3 feet high planted out, or in large pots sunk in the earth, will give more fruit than if planted out in rich soil, as they run much less to leaf.

CUCUMBERS should have the bine stopped occasionally, and be top-dressed with decayed manure; water will be required in fine weather.

CAPSICUMs, if in robust health, should have liquid manure, and be frequently syringed after their fruits are set. If large fruits are desired, thinning must to some extent be practised.

MUSHROOMS.—In making beds in the open at this season, the manure requires to receive heavier waterings, so as to have it in good condition for making up; and after the beds are made and spawned, and covered with a good thickness of loam, cover them with dry litter. Those who possess cool cellars will not need out-of-door beds, but a moist air at 60° should be the aim of the grower.

ENOIVE.—A small sowing may now be made of the curled variety on a cool border. Frequently water the beds, covering them with mats till germination takes place, when they must be removed.

TURNIP-ROOTED RADISHES, ETC.—Sow on a cool border. The present is a good season to make a sowing on a cool border of Corn-salad, a useful salad plant in autumn, when others are not plentiful.

THE FLOWER GARDEN.

By H. W. WARD, Gardener, Longford Castle, Salisbury.

CARPET BEDDING.—The planting of the panels of geometrically-designed beds with *Alternantheras*, *Mesembryanthemum cordifolium variegatum*, *Pyrethrum partheniifolium aurea* (Golden Feather), *Leucophyton Brownii*, and similar plants, should be pushed on to completion. The plants of *Alternantheras* and *Mesembryanthemums* propagated late should have been gradually hardened off, and fully exposed for a few days before being planted out. The plants should be well watered before planting, and not much disturbed at the roots. Set the plants rather closely together, and make the soil firm about them. In the absence of rain, afford water to settle the soil, and repeat the watering every afternoon in bright weather. The colours of the foliage plants employed in carpet beds should be well contrasted, and they should be in harmony with the other foliage plants, and also with the flowering plants in the vicinity. The dividing lines, if of Sedums, should be kept to their proper limits, pulling out the flowers and seed pods, pressing the plants down, and trimming the sides with a pair of sheep-shears, so that the several parts forming the whole pattern may be well defined.

WATERING SHRUBS.—Beds of American plants should have a thorough watering two or three times during the next six weeks, if dry weather prevail. Even during summers that are moderately wet, these plants are all the better for thorough waterings, as it is seldom that the rain reaches the roots of *Rhododendrons* and *Kalmias* in close-planted beds in sufficient quantity to be of much service. It is only in places where a good supply of water is at hand that this kind of work can be properly done.

Clumps of *Azalea mollis*, *Lily of the Valley*, and other forced plants, which were planted out in the grounds, should also receive due attention in affording them water.

WALLFLOWERS.—Seedling Wallflowers resulting from sowings made last month should be pricked out in a fully-exposed situation. The beds should be formed of a layer of short dung 2 inches thick, placed on a hard bottom, and over the dung there should be a like thickness of fine loamy soil. Prick them out 6 inches apart, and afford a little shade during the heat of the day for a few days.

GENERAL WORK.—This consists in bedding out and picking off the flowers of some to induce a rapid growth; and mowing which has got in arrears during the last few weeks. There being a pretty good growth on the grass, the scythes will have first to be used, and then after the removal of the mown grass, the mowing machine should be run over the lawn, raising the knives a little at the first cutting. Trim all edgings, and make paths, &c., neat and clean.

FORESTRY.

By J. B. WEBSTER, Furrier, Stangmore, Dugganion.

The preparation of the ground for autumn and winter planting now claims the attention of the planter, as the crust of impervious soils on the mountains and elsewhere requires to be broken up, in order to convert it into a condition fit to sustain tree life, while bog and marsh land requires to be drained to rid it of water. The erection of fences round plantations for shelter and defence against animals, should engage the forester's attention whilst there is plenty of daylight for the workmen to travel to and from long distances, as they needs must in mountain planting, &c. Dry hilly ground resting upon a hard subsoil should be broken up, and loosened with a "tramp-pick" at the spots where the trees are to be planted, and in performing the work, any rough scrub should be removed, in order to admit air, rain, and heat. Heather, however, when it is but 6 or 8 inches high, need not be removed to any great extent, as I have found it beneficial in promoting the growth of the plants in cold wind-swept situations, through the shelter it affords them at starting; and when the trees become established, they gradually smother the Heath out of life. In all cases where a mixture of hardwood trees are to be planted, pits had better be dug for them of such a size as to allow the roots of the plants being spread out in a regular manner to their full length, and straight from the base of the stem. The size of the pits will vary a little according to the size of the plants to be used, but I have had them dug by contract about 15 inches wide and one spade deep, at an average rate of 1s. per 100. The stuff excavated should be left in a rough state at the edge of the pit, to become pulverised by the weather. The distance at which permanent hardwood trees should be planted apart will depend a good deal on the character of the site and the capabilities of the soil, but from 15 to 20 feet asunder may be considered a fair average on ordinary soil, where the exposure is not so very great. In places where the ground is stocked with furze, bramble, and tall surface scrub, these had better be grubbed up, and burned on the spot, or utilised for the erection of wind screens on the more exposed parts. This work of grubbing can be done by contract, at an average rate of about 40s. per acre. In all cases, however, where the plantations are for ornament and utility combined, and where a large size of plant will be used, the ground had better be trenched 16 or 18 inches deep forthwith, and although this will add considerably to the expenses, yet the more rapid growth, and healthy development of the trees in early life, will, in a great measure, compensate for the outlay. This work of trenching may also be done by contract, the cost of which will vary according to the texture of the soil, and the rate of pay common in the district; but, under ordinary circumstances, I have had it done at an average cost of £5 per acre.

ROADS.—Before planting is commenced, roads had better be laid off and there for the removal of timber, and to afford facilities to sportsmen, and as this can be done to the best advantage when the ground is bare, and the configuration of the surface seen at a glance, it also claims the attention of the planter as a preliminary step. The size of these roads may vary considerably according to the wish of the proprietor, but when they are formed, say, from 12 to 24 feet broad, according to circumstances, they generally give satisfaction.

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

PLANTS, &c., TO BE NAMED.—Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.

LOCAL NEWS.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturalists.

ILLUSTRATIONS.—Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are particularly solicited.

NEWSPAPERS.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see. Advertisements should not be sent to the Editor but to the Publisher.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

TUESDAY, JUNE 21. Royal Horticultural Society's committees at the Drill Hall, James Street, Westminster. Lecture by Mr. W. Thibiston-Dyer C.M.G., director of the Royal Gardens, Kew, on "The Management of Trees in Parks and Gardens."

SATURDAY, JUNE 25—Royal Botanic Society.

SHOWS.

TUESDAY, JUNE 21. National Rose Society show at the Drill Hall, James Street, Westminster.

WEDNESDAY, JUNE 22. Royal Botanic Society: special floral fete.

SALES.

FRIDAY, JUNE 24. Orchids from Messrs. F. Sander & Co., at Protheroe & Morris' Rooms at 12.30.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—61°·8.

OUR readers will remember the brisk discussion which took place some time since in our columns, on the relative advantages of intelligence as compared with empiricism in the cultivation of plants. The subject has come to the front again in the shape of a paper prepared by Mr. BURBRIDGE, and read on his behalf at a recent meeting of the Horticultural Club. Mr. BURBRIDGE's opinions are specially important, inasmuch as he is a gardener bred and born. He studied what corresponded to his humanities at Chiswick and at Kew. He is a gardener, too, who profited by the lectures he heard at Kew, and by the examinations he underwent, and what he has gained by the study of DARWIN and other writers on the philosophy of horticulture, is shown in his admirable little book on the *Propagation and Cultivation of Flowers*. Moreover, he has had the opportunity of seeing tropical plants in their native luxuriance, and of observing the conditions most favourable to their growth. Mr. BURBRIDGE's opportunities have thus been exceptional, and give him a special right to speak on this particular subject. The expression "Culture versus Nature," does not quite commend itself to our notions, seeing that it is by aiding Nature and by profiting by her indications, not by opposing her, that our triumphs are won; but we are generally in such thorough accord with Mr. BURBRIDGE's sentiments that we shall not carp at a phrase. Taking for his text a dictum of Professor MICHAEL FOSTEN's in our columns—

"All knowledge is of use if applied aright; no knowledge is of use if applied awry,"—Mr. BURBRIDGE proceeds as follows:—

"The cultivation of vegetables, fruits, and flowers for domestic use, or for profit in other ways, is now one of our most important national industries, and it is a pleasure to see the interest now being taken in the matter by the different county councils, for we cannot have too much light and learning thrown upon such an interesting and profitable theme.

Your secretary asked me for a paper on the "adaptability of plants to cultivation," so I have glanced at the subject, and headed it, "Culture versus Nature." The fact really is, we do not know much of the adaptability of plants until we actually cultivate them, each for ourselves; for one of the charms of gardening is the ever-varying development of the same plant under different cultural conditions. Now, let us simply ask ourselves, What is the meaning of the word "culture," as applied to plants? Culture to us means improvement; and as FORB has it—

"If vain our toil,
We ought to blame the culture, not the soil."

Then culture or improvement consists of many things. Firstly, for example, the plant selected is isolated; thus competition with other plants for food and light and air and space is removed. Not only does the gardener thus enable a plant to naturally gain the greatest advantage from any one selected plot of soil, but he often augments the food supply by irrigating the soil, and by adding special plant food or manures for special crops; while pruning and training often increase the resultant crop by enabling growth force to develop freely along definite lines, and just where and when it is most wanted, or when the greatest strain of fertility bears upon the plant as an individual.

Now, Culture versus Nature is a big question; and, secondly, let us ask ourselves point-blank whether culture of the best ever surpasses Nature at her best?

In asking this question, I do not wish to limit your views of culture to the glass-house or market-garden point of view; but I do ask it from the cultivator's or human standpoint, and not from Nature's point of view, which is often, if not always, very different. As thus limited, there can be no doubt but that culture "is an art that doth mend Nature, change it rather, but the Art itself is Nature." That is a very suggestive history in the Bible, of CAIN with his flocks and herds, and of his brother ABEL, who cultivated the fruits of the earth, and it shows to us how early the practice of cultivating wild plants and the taming of wild animals began.

As an example of what I mean by improvement, let us take the common Violet (*Viola odorata*), as existing on a soil where it grows and flowers very luxuriantly, and on the same soil the gardener will easily surpass Nature, as I said before, from the human point of view. It is so in tropical lands where Pineapples or Bananas exist in what I may call a state of Nature, much finer crops of fruit being gained by culture; and the same is true in Asia Minor with the Fig and the Vine. Of all fruits, perhaps the Vine is the one most amenable to changed conditions, i.e., culture, and even allowing that Grape growing in Great Britain is the best in the world, yet, I believe, still finer cultural results could be obtained at Alicante and elsewhere in S. E. Europe or Asia Minor where the Vine is more thoroughly at home.

Cultivation really means the conservation and enhancing of growth, force, or energy for particular ends or aims.

One of the earliest and hardest lessons for a gardener to learn, is to rid his mind of prejudice in plant culture. As a rule, we want plants to grow where we like rather than where the plant likes, and sometimes the man and the plant are not agreed on the point, for the question of position, of moisture, and of shelter, is one the plant naturally knows and feels more of than the man, and though the plant cannot speak, its evidence to knowing eyes is unmistakable.

I must now define what I mean by the human

point of view, as before alluded to. Well, it very often means succulent leaves, or large pulpy fruits, or large many-petalled or shapely flowers, rather than the perfectly ripened seeds, actual life, and not mere beauty, after which Nature more generally strives.

Flowers, fruits, or vegetables, constitute the gardener's object, but Nature is lost unless she goes to the end of her cycle of growth, and finishes up by ripening her seeds. With us the gardener and the seed-grower find it more economical to complete the cycle by co-operation, the one growing produce, and the other ensuring the seed.

I have sketched out culture as embracing isolation of the crop, tillage and irrigation of the soil, pruning and training, and manuring or special feeding, all factors in good culture, but factors of widely different value in various localities and soils. In a word, it is a gardener's duty to adapt his methods of cultivation to suit his crops, rather than for him to expect plants to adapt themselves to his system of culture. The best cultivators are facile and elastic in their methods, and so succeed where the "rule-of-thumb" practitioner often fails.

It has been said "many men, many minds," and so of plant culture one may say, "many gardens, many methods." We must not be dictatorial on this question, but preserve a broad and catholic frame of mind; for a course of practice perfectly successful in one place may happen to be the very worst to adopt in another, where geology and climate may be different.

If we study the cultural practice of, say, the best Peach or Grape growers in England, in France, and in America, we shall perceive at once how necessary it is that cultural methods must vary, in order to be successful under different climatic conditions. But we need not go so wide in our geography to note the truth of this statement, for gardeners will tell us that Apples and Pears, or Strawberries or Plums, or any other garden plants, vary enormously as grown in different gardens adjacent to each other, or even as grown in different parts of the same garden. That Orchids will thrive in one part of a hothouse, and not in another, is a fact well known to all cultivators of these plants. Moisture and shade may have something to do with this; but all stiff-leaved Orchids, such as Cattleyas, *Lælias*, &c., in growing, erect or deflect their leaves at a certain angle, so as to receive a certain amount of light, and when once the leaves harden or stiffen, they cannot alter their position, and so, if shifted, or turned round so as to expose the backs of their leaves to sunlight, great harm is often unconsciously done. A Fuchsia, or a Pelargonium, readily readjusts its leaves to altered conditions of light, but to many Orchids this is impossible.

The main facts that influence vegetation may be set down as light, heat, moisture, and the nitrogen-absorbing and nitrogen-yielding qualities of the soil. Elevation, shelter, and aspect influence these in a marked degree.

I have elsewhere said that the gardener, like the poet, is born, rather than made, but, other things being equal, of course, in all arts, the most logical practitioner is sure to succeed best. In a word, cultural success is a matter of accurate observation, careful experiment, and just reasoning powers.

The greatest difficulty in gardening is making quite sure of our facts before we deduce any conclusions from them, or build up a course of practice upon them. When we are not quite sure of our facts, we do what DARWIN advised—i.e., we try "fool's experiments," or index trials, so as to get "guesses at truth."

The difficulty not only consists in the intricate complexity of Nature, but in the circumstance that her facts and figures often form a shifting index from year to year, or from one year to another. Thus gardening becomes an intellectual game, far ahead of the Sirdak's chessboard or the German krieg-spiel, since both her squares and her counters are different every time, and so not only every garden but every season becomes a special study of itself.

We have been told that the gardener's art is an empirical one; but this is a statement only half

FIG. 113.—EUCALYPTUS GUNNII: 50 FEET IN HEIGHT.

(IN THE GARDENS OF J. RASHLEIGH ESQ., MENABILLY, PAR., CORNWALL.)

true. All arts are empirical up to a certain point, but become more and more exact and scientific as accurate knowledge is gained.

Again, we are told that gardeners must be taught by actual work in a garden, just as carpentry is best taught at the bench, smith's-work at the anvil, or surgeon's in a hospital. This again is a half-truth, dangerous in its subtlety. Up to a certain point, actual practice is truly the best way; but work in a garden, if well directed, and supplemented by good reading and good lectures in addition to the work, must in the long run be better than either alone.

I should be one of the first to admit that books and lectures are merely the reflex of actual things, but by them we gain concrete knowledge, and life is, as we all know, too short to allow of our testing or experimenting on all things for ourselves. As HUXLEY says, "Science not only teaches us how to act rightly, but is especially valuable as often preventing our making useless experiments." Any one man's practice is necessarily limited, and books are as valuable to the gardener, if well used, as they are to the lawyer, the architect, or the engineer. If it be thought that they are not so, I must ask the objector for his reason why books are considered a help or aid to one artist or craftsman and not to another?

Speaking of the natural limitation of any one man's power, I am reminded of once speaking to the late Mr. JOHN DOMINY on this very subject. Everyone knows how much DOMINY really did in opening the way of hybridisation amongst Orchids and Nepenthes, and he always felt that "Art is long and Time is fleeting." "Ah!" said he to me, "the fact is, a gardener should have nine lives like a cat, and three or four pairs of hands like a Hindoo idol, and then something might be done in a lifetime."

We must use books as aids to knowledge, just as all wise men use them, and young gardeners may well treasure up Sir JOHN LEBNOCK'S words, that books wisely bought and rightly used are a good investment, and not an expenditure." [The remainder of Mr. BURRIDGE'S paper will be given in our next issue. ED.]

EUCALYPTUS GUNNII.—Our illustration shows a fine specimen of *Eucalyptus Gunnii* in the grounds of J. RASHLEIGH, Esq., of Menabilly, Cornwall. Together with the photograph, Mr. RASHLEIGH sent us ripe fruit and seeds, so that the hardihood of the tree, at least in that locality, may be assumed. At Kew, it will be remembered, this tree, though usually somewhat injured every winter, has now braved the rigours of our climate for many years, being partially sheltered by surrounding trees. The height of Mr. RASHLEIGH'S tree may be estimated by the height of the gardener, Mr. W. H. BENNETT, standing at its base. *Eucalyptus Gunnii*, the Swamp Gum tree, or Cider Eucalypt, occurs abundantly in Tasmania and in Victoria, where it sometimes attains a height of 250 feet, but much less on the islands. Judging from the account in Baron Sir FRED. V. MUELLER'S excellent *Eucalyptographia*, the species is subject to considerable variation, according to the altitude at which it grows. Doubtless, different plants would differ in their power of resisting cold, and those who plant this tree should by preference obtain seeds from plants growing at high elevations. The photograph from which our illustration was taken was executed by Mr. R. V. SHERRING.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Royal Horticultural Society in the Drill Hall, James Street, Victoria Street, Westminster, will be held on Tuesday, June 21, and promises to be of more than ordinary interest. In addition to the usual display of plants and flowers, there will be competitions among amateur growers of Peonies, Delphiniums, and Pinks. The National Rose Society will also hold its first show of the season in connection with the Royal Horticultural Society. At 3 o'clock, Mr. W. T. THISELTON DYER, C.M.G., Director of the Royal Gardens, Kew, has kindly consented to deliver a lecture on "The Management of Trees in Parks and Gardens."

PRACTICAL TEACHING OF HORTICULTURE.—

We have received the subjoined note for publication. For the moment we are precluded from making any further comment than that of congratulating the Society on taking its rightful position. In an early issue we shall revert to the subject.

“To the Editor of the *Gardeners' Chronicle*:—As you may be aware, the Technical Education Committee of the Surrey County Council, instituted (amongst other things) during last autumn and winter, lectures on gardening in various centres in Surrey, and, in compliance with the request of the County Council, our Society undertook to examine all who had attended the lectures regularly, and were desirous of sitting for such examination. Special interest attaches to this examination, as it is the first of the kind that has been made after any county council's technical lectures on gardening; and I, therefore, hope you may be able to find space for the publication of the following Class Lists.—W. WILKS, Vicar of Shirley, Surrey, Secretary, Royal Horticultural Society.”

Class List.—Examination in Gardening, conducted by the Royal Horticultural Society, after Lectures given under the direction of the Technical Education Committee of the Surrey County Council. (Maximum number of Marks obtainable 300.) Higher Grade—28 Candidates. First Class:—1. Stephen Morril, Carshalton (Winner of the Royal Horticultural Society's Medal), 225 marks. Second Class:—2. William Thorpe, Betchworth, 170 marks; 3. Joseph Parry, Reigate, 160 marks; 4. Francis Bradbeer, Bletchingham, 155 marks; 5. W. Green, Horley, and J. P. Owen, Brockham, Betchworth, 150 marks. Third Class:—7. John Harrison, Capel, 135 marks; 8. T. Painter, Redhill, and W. White, Sutton, 130 marks; 10. Felix Crawford, Horley, and Walter Waller, Reigate, 125 marks; 12. R. A. Stone, Horley, J. A. Smith, Wallington, and Rose Jarman, Sutton, 115 marks; 15. John Langdon, Sutton, and W. A. Strong, Sutton, 105 marks; 17. C. F. F. Hutchings, Carshalton, 100 marks. (Candidates obtaining less than 100 out of the 300 marks, not classed.) Lower Grade—44 candidates.—First Class:—1. Walter Smith, Kenley (winner of the Royal Horticultural Society's Medal), 205 marks; 2. Eli Cessar, Farnham, 200 marks. Second Class:—3. G. Miller, Ashstead, 160 marks; 4. W. H. Galsworthy, Farnham, W. H. Woodgate, Kenley, and Geo. King, Egham Hill, 150 marks. Third Class:—7. F. Fernor, Englefield Green, 125 marks; 8. Jesse Morris, Ashstead, 120 marks; 9. W. Goody, Kenley, 107 marks; 10. A. Everard, Kenley, 105 marks; 11. Eleanor Partridge, Ashstead, and J. Auchet, Aldershot, 100 marks. (Candidates obtaining less than 100 out of the 300 marks, not classed.) Generally speaking, and taking into consideration the novelty of the scheme, the candidates showed as good an average acquaintance with the subjects upon which they were examined as could have been expected. We cannot doubt but that such practical teaching as has been given in the county of Surrey, and such testing of results, will be of great service by calling attention to the points of greatest practical importance in cultural matters, and by showing how and why these points are important. Information of the highest practical value has thus been conveyed to a class of persons whom daily experience teaches us are not likely to be reached by the medium of the horticultural press. MAXWELL T. MASTERS, M.D., F.R.S., F.R.H.S., JAMES DOUGLAS, F.R.H.S., Examiners; W. WILKS, Secretary, R.H.S.

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—The committee of the Gardeners' Royal Benevolent Institution regret to announce that, in consequence of the lamented death of Lady Goldsmid, the 53rd Anniversary Festival Dinner, at which Sir JULIAN GOLDSMID had kindly consented to preside on the 29th inst., is unavoidably postponed to a date which will be duly notified. Meanwhile the committee earnestly trust that the many friends who have supported the institution in the past will not relax their efforts, but rather increase them on behalf of its funds. A sum of nearly £700 is required on

July 1, to meet the quarterly payments then due for pensions alone, and the committee therefore sincerely hope that the institution will not be allowed to suffer from any diminution in the amounts collected on account of the unforeseen and regrettable circumstances which have led to the postponement of the Festival for a short time. All moneys should be remitted to the Secretary, GEORGE J. INGRAM, 50, Parliament Street, London, S.W., who will be pleased to send collecting cards to any who may desire them, and also to reply to any communications that may be addressed to him.

LINNEAN SOCIETY.—On Thursday, June 2, the above Society met, Professor STUART, President, in the chair. The Vice-Presidents for the year having been nominated by the President, and a vote of thanks to the officers of the Society having been proposed by Mr. THOMAS CHRISTY, seconded by Mr. C. J. BREESE, and carried, a ballot took place, when the following were declared to be elected:—Messrs. H. A. JAMES, J. R. LEESON, W. B. SCOTT, R. H. WALLACE, and E. H. ALLEN. Mr. D. MORRIS exhibited and made some very instructive remarks on plants yielding Sissal Hemp in the Bahamas and Yucatan, and pointed out their distribution and mode of growth. He also exhibited and described the preparation of a gut silk from Formosa and Kiuichow. Mr. SCOTT ELLIOTT gave a brief account of a journey he had recently made to the west coast of Africa, and described the character of the vegetation of the particular region explored, and the plants collected by him. On behalf of Mr. ERNEST FLAYER, a paper was read by the Secretary on “The Disappearance of Certain Desert Plants in Egypt through the Agency of the Camel.” The President announced that the last meeting of the session would take place on Thursday, June 16.

HORTICULTURE AT THE COLUMBIAN EXHIBITION.—The most enterprising firms of the United Kingdom appreciate the advantages to be derived from a creditable display at the Columbian Exposition, as they will there reach not only their patrons in this country, but from all parts of the world. Applications have been made for liberal amounts of space. Other firms, desiring to more widely cultivate a taste for horticulture, and let the world receive the benefit of their experiments in producing new and choice varieties of trees and other plants, have made large donations to the Exposition, and the department of horticulture is in almost daily receipt of fine collections. There are some large and rare species of plants which can only be procured at the world-famous Kew Gardens, and I am very anxious to secure the donation or loan of some of them. Any exhibits from Kew will be a great source of pride to Englishmen from all parts of the world. The following is a list of plants that will be very desirable, and which will attract general attention:—*Aristolochia hians*, *A. longifolia*, *A. Goldieana*, *A. ringens*; *Dracontium* albo-stipes, *D. annulatum*, *D. asperum*, *D. Carderi*, *D. phyllanthum*; *Amorpha phyllanthus campanulatus*, *A. grandis*, *A. Lacourii*, *A. nivosus*, *A. Titanum*, *A. Leopoldianus*, *A. Teuszi*, *A. virosus*, *A. gigas*, *A. fecundum*; *Pancratium guianensis*. There may be other curious specimens which could be supplied, and the Curator of the Gardens will know the many unique and curious species and varieties that will be of interest to the millions of visitors. The handling and care of the exhibits will be under the control of the most skilled help obtainable, which fact will insure against loss, and when desired, the safe return of all loans will be guaranteed. *J. M. Samuel, Chief Department of Horticulture, to Hon. Robert McCormick, Official Representative in London of World's Columbian Exposition.*

THE COMING PINK SHOWS.—What is known as the Midland Section of the National Pinks Society, will hold an annual exhibition in connection with the Wolverhampton Floral Fête on Tuesday, July 12, and the Northern Section at the Botanical Gardens, Old Trafford, on July 16. So far, there is a promise of a large head of bloom, and a good display may be anticipated on both occasions. The

border Pinks are well cared for, and every encouragement given to this useful class.

DWARF TROP OLUM, MRS. CLIBRAN.—We have received from Messrs. CLIBRAN, nurserymen, Altrincham, Cheshire, a nice form of bedding *Tropæolum*, of dwarf habit, very floriferous, and of a pleasing shade of orange colour. It is likely to be much sought after for window-boxes, bedding, front lines of greenhouse benches, &c.

ROYAL BOTANIC SOCIETY OF LONDON.—A children's floral fête will be held on Wednesday, June 22, from 2 to 7 P.M. The idea of the floral fêtes at the gardens has been to encourage the use of floral decorations as in the south of Europe, in public and family rejoicings, such as public festivals, weddings, majorities, and garden and children's parties. It is to be distinctly understood that all decorations, dresses, &c., are for out-of-door use. The awards will be presented at the royal days. Prizes will be offered for children's flower-dressed carriages, &c.; designs and groups of plants and flowers, &c.

KINGSTON GARDENERS AT CLAREMONT.—The body of gardeners of Kingston and Surbiton which recently promoted a concert in aid of the Gardeners' Orphan Fund, in company with several lady friends, enjoyed a very delightful outing to the Royal Gardens at Claremont, on Friday, June 10, on the invitation of Mr. E. BURRELL, with the sanction of H.R.H. the Duchess of ALBANY. The pleasure-grounds were found in singularly beautiful form, the immense masses of *Rhododendrons* blooming profusely. The grounds are of a very undulating character, some portions forming lofty mounds, upon which stand respectively a huge quadrangular tower, erected in 1714; a fine Camellia-house, and a pretty Gothic chapel, erected to the memory of Princess CHARLOTTE. From these eminences the grounds beneath presented most beautiful pictures, and elicited enthusiastic admiration. The numerous vineries, Peach-houses, plant-houses, &c., with pits and frames, were all found in full use, and having within abundant produce; every part of the place was in splendid order. The party took tea under a giant *Pterocarya caucasica*, and were otherwise most hospitably entertained, enjoying a singularly delightful afternoon.

RHODODENDRON SHOW.—Messrs. ANTHONY WATERER & SONS, of Bagshot Nurseries, opened an exhibition of their world-famed *Rhododendrons* on Monday last on the Victoria Embankment. It is held in a spacious tent, some 165 feet by 45 feet, and the plants occupy groups along the centre and around the sides, with a few specimen-plants in various positions. There is an abundant wealth of bloom, and, as the proceeds are to be given to the London General Hospital, we shall be pleased to hear that it has been well patronised.

BUDDLEIA COLVILLE.—Mr. GUMBLETON writes:—“This beautiful and most distinct hardy shrub from the Himalayas, figured on Plate XVIII. of CATCHEAT & HOOKER's illustrations of Himalayan plants, is flowering with me this summer (I believe for the first time in Europe), but on this point I shall be glad of correction from any of your readers who may be better informed. I had the plant many years ago from a leading shrub nursery in the immediate neighbourhood of London, and up to its coming into flower, had strong doubts as to its being really true to name; indeed, shortly after I bought it, one of the most intelligent foremen of the firm in question, now, I believe dead, said to me, ‘I hope it may prove to be true to name, but I almost fear that it will not be so.’ In the descriptive letter-press accompanying the plate, Sir J. D. HOOKER writes:—‘This is very unlike any other Asiatic species of *Buddleia* in its size, form of flower, colour, and the locality it inhabits, its congeners being almost without exception tropical or sub-tropical plants. In several respects it more closely resembles some of the species of the Andes, but it has no rival anywhere for beauty or graceful habit. It is abundant towards the summit of Tonglo, from an altitude of about 9000 feet to the top 10,000, and it is

also frequent in the Lachen and Lachong Valleys, at similar elevations, even ascending to 12,000 feet.' The beautiful deep rose-coloured bell-shaped flowers are produced as shown on the plate, in large loose open bunches at the extremities of the young growth of the branches, and though the first bunch of flowers produced by my bush is very far from being as fine as represented in the plate, it is to be hoped that now that it has begun to bloom, especially if we are favoured with a good warm ripening summer and autumn (as seems now probable), the bunches produced next year will be much larger and finer than those now opening. Another rare and very beautiful shrub, *Lonicera Maackii*, introduced by the late Dr. REEGL, of St. Petersburg, with bunches of pure white Honeysuckle flowers, has bloomed most abundantly and beautifully in my shrubbery during my absence from home."

DISEASE OF THE POTATO: REPORT OF THE BOARD OF AGRICULTURE.—A report just issued by the Board of Agriculture on recent experiments made both at home and abroad in checking Potato disease, is one, says the *Daily Graphic*, Monday, June 13, that will well pay perusal by all who are interested in the Potato crops. The volume, of some 200 pages, is to be purchased for ninepence from Messrs. EYRE & SPOTTISWOODE, East Harding Street, Fleet Street, E.C.; Messrs. J. MENZIES & Co., 12, Hanover Street, Edinburgh, and 90, West Nile Street, Glasgow; and of Messrs. HODGES, FROGIS & Co., 104, Grafton Street, Dublin, and contains a wealth of information down to a recent date concerning the history and cause of the Potato disease, and full descriptions of experiments made both in Great Britain and Ireland, and in foreign countries, as well as in the Colonies, for checking the disease; and, in addition, papers on Potato culture in these several groupings of countries. The Director of the Intelligence Department of the Board of Agriculture prefaces the volume with a succinct statement as to the causes which have led to the several series of experiments made in this country, and as to the results obtained. Copper dressings have been the materials employed, with generally satisfactory results as regards checking the progress of the fungus to which the disease is due (*Phytophthora infestans*), but the advent of the disease was not anywhere prevented. The results, however, appear to justify the conclusion that the outlay on the dressing and its application is more than repaid by the extra crop yielded; but since no confident opinion can be formed on the experiments of a single year, they are to be repeated this year, and in view of the experience already gained, ought to be even more successful than those of 1891, and to lead to definite recommendations for the future guidance of all Potato growers. The boon to be derived from a satisfactory termination of the extended experiments would be enormous, and nowhere, perhaps, more than in Ireland.

PROFESSOR MEEHAN may well feel some honest pride in remembering that the modest gardener who left the Isle of Wight in his 18th year to seek his fortune in the States is now an honoured citizen of Philadelphia, a vice-president of the Academy of Sciences of that city, and respected throughout the world of horticulture for his many contributions to the literature of his science and his craft. We cite the following from a Philadelphia paper:—"As a sequel to the resolutions of numerous bodies commending Common Councilman MEEHAN, of Germantown, for his unwearied and successful efforts to secure public parks having historical associations, it is proposed to present him with a substantial and appropriate testimonial. It is a plaque on which is engraved a copy of the original city charter with some notable historical structures—The Wister house, Germantown, the residence of James Logan, the Stenton mansion, and the Bartram House. The presentation will take place in September. This is a matter, says our contemporary, in which the entire community is interested. That the public services of Mr. MEEHAN in every capacity are fully

appreciated in his home ward is amply shown by the telling majorities by which he is returned to councils. The word "popular" scarcely describes his relation to his constituency, and a new word must be added to the lexicon to meet the case.

NEW FRUIT AND VEGETABLE MARKET FOR LONDON.—The new Central Fruit, Vegetable and Flower Market, was opened in state, by the Right Hon. DAVID EVANS, Lord Mayor, on Monday, June 13, 1892. This section of the London Central Markets completes the series of markets erected under the Act of Parliament of 1875 by the Corporation of the City of London, at an expenditure of about £1,794,000. Of this sum the new market has cost, beyond the value of the site, about £70,000. The new market is at the junction of Charterhouse Street and Farringdon Road, two leading thoroughfares, having a frontage to Charterhouse Street of about 370 feet, and to Farringdon Road of about 184 feet. Of this area, representing about 54,000 feet, the building now erected occupies 30,000 feet super., having frontages of 165 feet to Charterhouse Street, and 184 feet to Farringdon Road, and therefore leaving ample room for extension when required. The building is designed of iron and glass, and special regard has been paid to the matter of light and ventilation, so necessary a point in a building of this description, while the general requirements of the fruit and vegetable trade have been fully considered. The height of the building to the plate-level is 28 feet, and to the ridge 46 feet. The basements under this and the adjoining markets will be occupied by the Great Northern Railway Company, whose lines of rails and platforms will traverse the entire length from Charles Street to Snow Hill. The area of these basements is about 100,000 feet. Large hydraulic lifts are designed to raise the market produce brought by the railway companies to the markets above, and inclined roadways for horse traffic are provided as means of access from the basement to the street level. The rent of standings, as provided by the bye-laws approved by the Board of Trade, is 1½d. per foot super. per week; but, by a special order of the Corporation, a rebate will be allowed for the first year of one-half, viz., three farthings; and for the second year, one-third, viz., one halfpenny, the full rental of 1½d. coming into operation at the commencement of the third year. Charges for temporary accommodation are:—

Wagon stand, per day	s. d.
Ditto, for Holly or evergreens, per day	0 1
Cart stand, per day	0 2
Ditto, for Holly or evergreens, per day	0 9
Fitching stands, not exceeding 10 feet square, per day...	0 1

The size of the standings varies from 150 to 300 feet, and apart from pitching and wagon stands, the number available is forty-two, and most of these have already been applied for. The tolls to be charged under the bye-laws approved by the Board of Trade are:—

For every wagon containing vegetables or fruit (except Potatoes)	s. d.
Ditto, containing Holly or evergreens	0 1
For every cart containing vegetables or fruit (except Potatoes)	0 6
Ditto, containing Holly or evergreens	0 9
Potatoes, per cwt.	0 1
Vegetables or fruits in sacks, sieves, hampers, or other packages, per bushel	0 0½
Ditto, ditto, less than a bushel	0 0½
For any number of packages of fruit or vegetables not exceeding 5, and containing not more than 12 lb. weight in each	0 0½
Oranges, per box, containing not more than 500	0 2
Watercresses, per hamper	0 2
Ditto, per ½-hamper	0 1½
Ditto, per pad	0 1
Use of scales, per draught	0 0½

Under section 24 of the London Central Markets Act, 1875, Farringdon Market, the site of which was recently sold by public auction, ceases to be used as a market from the opening of the present market. The market, which is built from the designs of the late ALEXANDER PEBBLES, Esq., City Architect, has been constructed under two contracts, that for the substructure and basement having been carried out by Messrs. RUDD & SON, of

Grantham; and the superstructure by Messrs. PERRY & Co., of Bow. The foundation-stone was laid in October, 1890, by the then Lord Mayor.

CHICAGO EXHIBITION.—The State of Pennsylvania intends to make a horticultural exhibit which will surpass anything of the sort ever made. Apart from fruits and viticulture, in which the State will not attempt to outdo other portions of the country, all branches of horticulture will be splendidly represented. Messrs. GEORGE W. CHILDS, A. J. DREXEL, and several others, who have large and valuable collections, will give or lend to the exhibition their finest and rarest plants, some of which cannot be duplicated. The California Bee Keepers' Association is preparing a notable exhibit for the Fair. Besides honey and bees, the exhibit will include pressed flowers of all the different honey flora, specimens of the birds and insects which are the enemies of bees, models and photographs of apiaries, and novelties in the shape of production distinctive to California, especially in the line of beeswax and foundation.

THE NATIONAL UNITED ORDER OF FREE GARDENERS, says the *Standard*, of June 7, commenced their annual meeting at Wednesday yesterday, under the Presidency of Grand Master Wilson, who, in the course of an address, said, during the year there had been 6533 members initiated, but 656 had died, and 4592 had seceded from various causes, including the juveniles and honorary members. There were now 57,076 members in the Order, and the funds were £147,000, an increase of £5000. He expressed the opinion that compulsory insurance was not yet sufficiently understood to be satisfactorily dealt with, but the Friendly Societies would not tolerate any State system which did not desire their co-operation and help. There was a generally expressed hope that during the year convalescent homes would be established for members of the Order.

PANSY SHOW IN BIRMINGHAM.—The Birmingham and Midland Horticultural Society held its second annual show of Pansies and Violas on Thursday, June 9, at the Central Hall, Corporation Street. During the past week or two the district in Scotland from which all the best Pansies come has been visited by severe hailstorms, and the heat of the last day or two has destroyed many of the blooms sent to Birmingham for exhibition. The show, however, was larger than last year's, over 2000 blooms having been exhibited. The Scotch growers, on the whole, made a very fine display; while the good influence of this and other societies is testified by the fact that there is a decided improvement in the exhibits of local amateurs and gardeners. Among the seedlings, the most important novelties are John Kreo, by Mr. IRVINE, of the Kyles of Bute; and Andrew Fraser, by Mr. FRASER, of Ochiltree. Some charming examples of the Viola were shown, including one by Mr. SYDENHAM, a local grower, remarkable for the depth and richness of the central colouring.

RHODODENDRONS, ETC., IN THE PARK.—The display of Rhododendrons and Ghent Azaleas in Hyde Park by Mr. WATERER is exceedingly gorgeous, and has seldom been finer than this season. The greater part of the collection is to be found at the east end of the Serpentine and along the sides of Rotten Row from Park Lane to Albert Gate. The great heat of last week was very trying to the plants, but the cooler weather that has prevailed since Sunday, the 12th inst., will prolong the season of bloom. Mr. WATERER's collection of these plants in the Botanic Gardens, Regent's Park, is still very fine, and contains many very superb varieties, both new and old.

FARNHAM ROSE SHOW.—The managers of that excellent society, the Farnham Amateur Rose and Horticultural, are making a bid for further support by increasing the value of the prizes offered for twenty-four Roses diverse. The secretary is Mr. C. C. Knight, Monk's Hill, Farnham.

PUBLICATIONS RECEIVED.—*Report on Phenological Observations for 1891*, by EDWARD MANLEY, F.R.Met.Soc., F.R.H.S.—*Supplement to the Botanical Jarrook*, 1892.—*Further Observations on the Spiral Torsion of Plants*, by HUGO DE VRIES.—*Report on Recent Experiments in Checking Potato Disease in the United Kingdom and Abroad*, 1892: Board of Agriculture.

HOME CORRESPONDENCE.

CUCUMBERS FOR EXHIBITION.—That Mr. T. Lockie, gardener at Oakley Court, Windsor, has brought the culture of Cucumbers for exhibition to the level of a fine art there can be no doubt, for in any competition with a brace of Cucumbers he nearly always takes the first prize, with fruit so perfect in shape and even in size, as to command general admiration. One fruit is in every respect so closely a *fac simile* of the other in appearance and length, that the question is often put, How is it accomplished? Mr. Lockie's experience as a cultivator of Cucumbers for exhibition dates back as far as 1890. At that time the leading varieties grown for exhibition were Sutton's Berkshire Champion, Webb's Imperial, Crawshaw's Prize-taker, Lynche's Star of the West, Manchester Prize, &c.—all being more or less rough-spined, long in the neck, and more or less coarse in appearance. It was at a time when spined Cucumbers, and especially the black-spined types, were leading favourites with growers. New varieties were then, as now, constantly being introduced, and after testing most of them, Mr. Lockie selected as the most desirable, Turner's Favorite, Godfrey's White Spine, and Hamilton's Market Favorite; and these he grew and selected from them the handsomest and most finished fruit for seed purposes. The seedlings from these were cross-fertilised, and each succeeding year produced some improvements. With some of these I proved successful at exhibitions, and this induced me to try for further improvements. At length he selected a very promising seedling, which he named Blue Gown, after the celebrated racehorse of that year, and which was subsequently sent out by the late Mr. Charles Turner, of Slough. It was much grown and exhibited the first year or two, and awarded fifteen 1st prizes and five First-class Certificates of Merit. While the stock remained in Mr. Lockie's hands it was never once beaten; it was, however, a very shy seeder, and he eventually quite lost it. Then Tender and True took the lead as an exhibition variety, and it would appear to have originated as a sport from Blue Gown with Mr. Douglas, then of Loxford Hall Gardens. Being somewhat deficient of fertile blooms, Mr. Lockie endeavoured to overcome this by crossing it with Kirkless Hall Defiance, a variety raised in the neighbourhood of Leeds, and regarded as a great improvement upon the old Sin House. From this cross Mr. Lockie obtained a very handsome seedling, quite distinct from either of its parents, and exhibited it successfully for several years, and it was ultimately sent out by Messrs. Sutton & Sons, of Reading, under the name of Royal Windsor. Mr. Lockie still considers it to be one of the finest varieties in cultivation for summer crops and show purposes. Finding that smaller but handsomest and well-finished fruit were finding favour on the exhibition table, as well as being grown for general purposes, and especially for market, Mr. Lockie turned his attention to the production of such, and effected a cross between Verdant Green and Purley Park Hero, making the latter the seed parent, and was rewarded by producing a very handsome dark green variety, growing about 16 inches long, perfectly even, with scarcely any heel, and carrying a beautiful bloom; this I named Lockie's Perfection; it has been awarded seven First-class Certificates, and numerous 1st prizes, through being extensively exhibited both in London and the provinces, and when well shown, has scarcely been beaten. In growing Cucumbers for exhibition, Mr. Lockie states the principal points to observe are, to allow the plants plenty of room; to avoid crowding with lateral growths; to crop rather slightly, but at the same time to grow sufficient fruit as a natural balance to a vigorous and healthy habit; to shade lightly in bright weather; to employ plenty of moisture, but to avoid hot pipes and scalding steam. But how does Mr. Lockie secure two fruits so beautifully symmetrical and even in every respect, and such a perfect pair? Much—I may state, also—depends

upon cutting at the right time. It may be necessary to cut one fruit a few hours before the other; it is, therefore, a question of knowing how long it takes a fruit to become perfectly developed, and then cutting it at the nick of time. R. D.

MOONWORT FERN.—There is now a very unusual abundance of this Fern (*Botrychium lunaria*) in several old pastures near here, and it would be interesting to know whether the same has been observed in other parts of the kingdom. In one field I crossed to-day, it would have been easy to gather a hundred specimens, and yet, though I am often in the field and observe plants, I have never seen it there before. In the same field *Habenaria viridis* is found sparingly, and I have several times looked for specimens of this Orchis. I could not have helped noticing the Moonwort, which flowers at the same time, if it had been there in any quantity. In another place about 3 miles away, some young botanists, who have lately come to live there, told me that the old pasture adjacent to their house was reputed to contain Moonwort, but that they have searched for it in vain for three years in succession, but this year they find plenty. The intermittent appearance of such plants as this, and the Bee Orchis and the broad-leaved *Helleborine* is perhaps due to different causes in each case, but I read in *Sowerby's Botany*, 3rd Ed., Vol. 12, p. 26, that the buds of the Moonwort are developing under ground for four years before they produce leaves; therefore, it seems possible that we must look back to the hot summer of 1887 as the cause of the plentiful crop of the present season. C. Wolley Dod, Edge Hall, Malpas.

TROPÆOLUMS.—Referring to the paragraph under this heading on p. 725, middle column, the name "Cattle" should have been spelt "Cattell." The late John Cattell of Westerham sent out some years ago two dwarf varieties of *Tropæolum*, viz., Cattell's dwarf scarlet, and Cattell's dwarf crimson, and as far as my recollection serves me they were raised between T. majus, and a selected form of T. minus, known in those days under the name of Coccineus. I have always regarded these two dwarf *Tropæolums* of Cattell's raising as the progenitors of the compactum varieties grown in the present day. Mr. J. George, of Putney, when a gardener at Stamford Hill, took in hand these dwarf *Tropæolums*, and with the aid of Cattell's varieties and a good form of T. minus, led them on still further in the march of improvement, and it was from Mr. George's productions the compactum forms of Bedford Rival, Lustrous, and the new dwarf spotted, were obtained at Bedford, all of which received certificates of merit from the Royal Horticultural Society. The compactum varieties exceed the ordinary Tom Thumb types in the form of the flowers, and in their being sparing seed producers, which causes them to bloom much more continuously. R. Dean.

LARCH FUNGUS.—As I actually saw Mr. Wilson's plantations of Larch a fortnight since, I can speak confidently as to all the facts, and their present appearance, as affected by a most virulent and subtle disease, which Mr. J. B. Webster attributes wholly to the Larch having been planted on a chalky subsoil. This may, perhaps, be true in a measure, but it certainly does not account for such a sudden visitation in the present instance, as there are several depths of loamy soil throughout the plantations, which are situated on a gentle slope, and consequently the roots would not be likely to come in contact with the chalk all at once, but there is no doubt as to their simultaneous destruction from whatever cause it may be. Mr. Wilson pointed out that many had made a 2 and 3 feet growth only last year, which they would scarcely have done were Mr. Webster's theory the correct one. The average height of the larger plantation, 15 to 18 feet, is a very fair average for twelve years' growth, but many very fine trees were above that average. All, however, are totally destroyed, and not one healthy tree remains alive in the whole plantation. In my opinion it is not the soil alone that is accountable for such a disastrous result, but a most virulent attack of some particular fungus which may have been assisted by the last two seasons' drought. It is without doubt a very serious matter, as there appears no remedy beyond Mr. Webster's suggestion that it is very injudicious to plant Larch on a chalky subsoil instead of Scotch or Pinus laricio or P. austriaca, over which the disease appears to have no power. W. H. Rogers, Southampton, June 13, 1892.

RECENT EXTRAORDINARY WEATHER.—On Thursday, June 9, the temperature at this place reached 100° in the sun, and on Monday morning, the 13th inst., we had a sharp frost, which has blackened the Potatoes and Runner Beans growing in the open. T. H. Slade, Mongevell, Walsingham, Berkshire.

After the great heat of last week, when for several days the thermometer registered 86° in the shade, there was a sudden change on Sunday, when, at midday, the temperature was at 45° in the shade; and on the night of Monday, the 13th inst., the temperature was 5° below freezing point. The Vegetable Marrows and French Beans are blackened, and damage was done to several other tender plants. H. Turner, Fineshade, Stamford.

QUELDRES ROSE, ETC.—I should feel obliged for some information about the Guelldres Rose, which is in unusual beauty this year. It is a form of the wild Guelldres Rose (*Viburnum opulus*), and I want to know if that form is now ever found wild. It is a very old garden favourite, and was grown by Gerard three hundred years ago under the name of the Rose Elder. It was described by other writers before him, to whom, the eldest, according to Caspar Bantini, was Cordus who, in 1525, described it as *Sambucus aquatica flore globoso pleno*. As far as I can make out from Pritzell, it has never been figured. [The plant is British, and in the ordinary wild form the outer flowers have neither stamens nor styles, whilst the cultivated garden form, secured probably by selection, possesses no fertile flowers. There exists in gardens a dwarf form of the sterile plant. We have no means of knowing if Gerard's plant was the ordinary wild or the improved form now existing in gardens. En.] I should also be much obliged if anyone could tell me where I can meet with *Saxifraga virginica pleno* and the white *Melittis Melissophyllum*. They are old favourites which I have lost for some years, and are liable to get again. Henry T. Ellacombe, Bilton Vioarage.

PAPAYER RUPIFRAGUM.—This rare Poppy from Mount Atlas is becoming common in gardens. It is very like a miniature *P. orientale*, with brick-coloured flowers like those of *P. pilosum*. I call attention to it, because I have raised forms from seed of *P. rupifragum* which show no line of demarcation between this species and *P. orientale*, and hybrids in *Papaver* are so exceptional that I ask the question whether *P. orientale* and *P. rupifragum* are not forms of one species? The line of distinction between *P. orientale* and *P. bracteatum*, which E. Boissier made two species, has disappeared in garden seedlings, though I still retain the grand upright *P. bracteatum*, with a very stout straight stem 5 feet high, and blood-red flowers 10 inches across, as introduced fifty years ago, but seedlings from it no longer come true. C. Wolley Dod, Edge Hall, Malpas.

BOUVARDIAS.—In the note on Bouvardias, which appeared in the *Gardener's Chronicle*, 719, a selection of varieties is given, but no mention is made of President Cleveland, which is by far the best of the bright-coloured forms, being greatly superior to those named in the article, and which has now, to a great extent, superseded them. It is an introduction from America, and was first seen here in the autumn of 1887, at which time it attracted a good deal of attention, and soon became popular. Since then a pink sport (Mrs. R. Green) has been obtained from it, and it is one of the best of that tint. Again, the statement that Alfred Neuner is the most popular market kind, is at least open to doubt, while anyone expecting the blooms of Dazzler to be of a rich scarlet colour will certainly be greatly disappointed. T. C.

RHOODENDRON FALCONERI.—I was surprised to read of your correspondent in the *Gardener's Chronicle* of May 28 describing this handsome Himalayan *Rhododendron* as having shaded lilac blossom; ours here, on the contrary, are of a rich creamy-yellow, and large, the black stamens contrasting well against the bell-shaped corolla, and very delicately scented. [The flowers are white, with a tinge of lilac at the base. En.] Here we have two specimens growing outside, one of which is quite a tree. It is surrounded by many plants of other fine species, and, like them, is afforded no sort of protection. Our largest specimen is 12 feet high, and the same in diameter, and produced this year sixty-two well-developed trusses of blossom, each truss having twenty-five and more flowers. The other plant is the more remarkable, being but a small standard of 6 feet high and wide,

consisting of twenty-two branches, each, with but one exception, producing trusses of bloom equal to those of the larger plant. This plant stands in a shrubbery in peat soil, and is surrounded by specimen Figs, Myrtles, and white Azaleas. I hope to be able to send a photograph of this small tree later on. [Do so, please, En.] *J. Benbow, gardener to the Earl of Ilchester, Abbotsbury Castle, Dorchester.*

FRENCH ASPARAGUS.—If "A. S. II." is a Fellow of the Royal Horticultural Society, and will turn to the issue of the *Journal* for March, 1890, which contains the report of the Vegetable Congress of the previous autumn, held at Chiswick, there will be found some interesting remarks with respect to the production of French Giant Asparagus by that eminent authority Mr. Henri Vilmorin. In the course of a very able paper read just previously by the late Mr. Shirley Hibberd, that gentleman referring to the Giant Asparagus of Argenteuil, said that the soil of that district was specially fertile in calcareous salts. Mr. Vilmorin said that he had carefully

LÆLIO-CATTLEYA × PHEBE. *New Gard. Hybrid.* CATTLEYA MOS- SIE & LÆLIA PURPURATA.

Thus, the reverse cross to that from which Messrs. J. Veitch & Son obtained their pretty L. C. Hippolyta, is one of the products in which the hybridiser is afforded a good excuse for his work, which, unfortunately, is not the case in all hybrid Orchids. It was raised in the gardens of Norman C. Cookson, Esq., Oakwood, Wylam-on-Tyne, by his diligent gardener, Mr. Murray, and was exhibited and gained a First-class Certificate at the Royal Horticultural Society on May 3. L. C. Phoebe brings a much-wanted colour into our Orchids, the sepals and petals being of a rich Indian-yellow, while the middle lobe of the neatly-arranged labellum is of the richest purplish-crimson. It may be that Mr. Cookson keeps his poorer hybrids at home; but, certain it is, that he seldom exhibits even an indifferent one *J. O'Brien.*

FIG. 114.—LÆLIO-CATTLEYA × PHEBE.

studied Asparagus growth, and could state that the production of these fine heads was as much the product of selection as of cultivation. It was assumed that the selection of seed from centre plant growths was of importance, but he held that it was of more importance to select seed from plants which produced the finest stems, and as the strength of each plant was necessarily limited, the roots which produced the strongest growths naturally produced the fewest, and seeds saved from these gave the best seed-strain. Then the French growers gave greater width between the plants than we did, the usual distance being 4 feet one way, and 3 feet the other. Thus it is seen that as compared with our British methods of culture, if our heads are not so large, they are far more numerous on a given area. Still it was found in France that only Giant heads paid to grow. The soil was deeply worked and heavily manured. Of course, the soil must be naturally good, otherwise the plants would not produce stout grass. It was the French practice to remove some of the surface soil in the autumn to expose the crowns to the influence of the atmosphere, but these were again covered deeply with soil in the spring, as the heads are blanched almost their entire length of from 9 to 10 inches; in that respect also differing materially from home-grown heads. *A. D.*

SCOTLAND.

SCOTTISH HORTICULTURAL ASSOCIATION.

A LARGELY attended meeting of the above Association was held at 5, St. Andrew Square, Edinburgh, on June 7, 1892, Mr. W. M. Welsh, President, in the chair. Professor McAlpine, Edinburgh, gave a most interesting lecture on "The Germination of Seeds," in which he minutely explained the process of germination, stating that the three principal agents were—water, air, and heat, and giving also the different modes of germinating, exhibiting a model illustrating his own particular mode as adopted at Murto House. After an animated discussion, taken part in by Messrs. Grieve, McHattie, Smile, Dr. Wilson, and the Treasurer, Mr. A. McKenzie, the lecturer was accorded a very hearty Vote of Thanks. The exhibits were a fine stand of Calceolarias and Broccoli Methven's June, from Mr. Henderson, of Clermiston; several fine specimens of Hydrangeas, from Mr. Petrie, of Westerlee; a fine seedling Pelargonium,

from Mr. McMillan, of Trinity Cottage; a fine new Pelargonium, a sport of Queen Victoria, from Mr. McHattie, of New Battle; and a collection of tufted Pansy blooms, from Messrs. Dickson & Co., Pirbright Park Nurseries.

INTERNATIONAL FRUIT EXHIBITION.

Without doubt many of our northern friends will now be suffering disappointment by the postponement of the proposed great fruit show till 1893. Many cannot see a reason, from a horticultural point of view, why exhibitors require such long warning prior to the period when they wish to table their exhibits. Good cultivators are "Aye, ready," and we remember well the short notice given to exhibitors who competed so successfully in 1882 at the great International Fruit Show, held at South Kensington, during October of that year, but there was not then the excitement of "a parliamentary election," in the near future. If the more impulsive exhibitors are contented with the arrangements of the executive (and I think they should be), those who are precluded from joining in the legitimate warfare of a horticultural exhibition, ought to be amicable also. Reverting to cultivators' readiness, I would like to make a few remarks on the condition in which some of my friends stand as to their adequateness at the present time, and who have been for a number of years past able to take largely fine produce to the exhibition tables, without making much difference in the appearance of what remained at home. Where everything is good and plentiful, exhibiting is rendered a very simple matter. For example, at Park Hall, Stirlingshire, Mr. Murray, gardener to Mr. Learmouth, could take scores of perfect bunches of Grapes and many hundreds of stone fruits, Tomatos, &c., from his huge glass structures, and almost without their being missed by his own keen eyes, the crops are always so heavy, and of such uniform size, and the quality of high order. September to January is when the crops are most abundant and best. One range, for stone fruits, Grapes, Plums, and Pears, is between 400 feet and 500 feet in length, forming three sides of a square; besides, there are two large span-roofed houses, each about 100 feet long and 24 feet wide for late Grapes alone, and numerous other structures for fruits and plants, and the general forcing of Cucumbers, &c.

Mr. Murray has been well encouraged to throw his energies into the work which has raised Park Hall to be one of the most extensive private fruit-growing establishments in Britain. Mr. Learmouth is one of those extensive employers of labour on his estates which renders that gentleman a real benefactor of his race. Farming in a wide and varied form is also a specialty at Park Hall. There is another Murray of Culzean Castle, who is a *giant de batailles* among exhibitors, and often high up on the list of successful exhibitors, and always ready to come to the front, and by no means afraid of long journeys when exhibitions are strong enough to tempt him to leave the beautiful land of Burns in battle array. While strong in fruit growing at Culzean, his talents are by no means buried in that alone, other departments in the esteemed Marquis of Ailsen's fine gardens have consummate cultural attention, and those great Onion growers know something of this when they bring their choicest bulbs to face those from Culzean.

Another well-known exhibitor not far from Park Hall (and a felicitous "crony" of the "Culzean Murray") is the well-known Mr. Tom Boyd at Callendar, near Falkirk, whose name is well established in connection with Grape-growing for exhibition. The prizes which he has taken at Manchester, Carlisle, Dundee, Edinburgh, and Glasgow (winning, among other valuable prizes, three Veitch Memorial Medals), has made him widely known among fruit-growers. His strong points are in the finishing off, in high order, of Muscat, Ham-burgh, and Lady Downe's Grapes. His crops, of all fruits under glass, are at present equal to former years. Peaches and Nectarines are extra-abundant, many thousands having been thinned off. Though

his exhibits are always well tabled, he tells us sometimes of his earliest attempts with carrying Grapes to a leading exhibition, having a pair of extra-fine bunches of Foster's Seedling, and, wishing to transmit them in prime order, Mr. Boyd prepared a coat with capacious pockets; into each a bunch was carefully dropped, and he thus conveyed them to the exhibition-table triumphantly, where (by their excellence) they easily won the 1st prize in their class. His fine bloom on Grapes of recent years shows our friend is now far beyond the "big pouch" method of transmitting them to shows.

While leaving out the names of many of the strongest northern exhibitors—so well known for their prowess at fruit tournaments—we would take note of one more who achieved great victories at Edinburgh last autumn, and may now be termed a veteran at his work of fruit exhibiting. He is often a marked man at provincial shows, carrying off cups and other tangible valuables, with plants as well as fruits. I refer to Mr. Kirk (Norwood Gardens, Alloa), who is believed to be much stronger this season than he was last year. I know that appearances, when I last saw his Vines, were favourable to this opinion, and friend Kirk's enthusiasm has no bounds, although he may not (like his compere) have an opportunity of displaying his cultural skill at Earl's Court, or other place in London next autumn. It is to be hoped that he will be ready to march to the south next year and have a friendly "tug of war" with our southern friends, many of whom I know will give the northerners a hearty welcome. If the latter get their "ricks" it would only be like a "Flodden" to console those who came north and lost a "Bannockburn" at Edinburgh in 1891. *W. Temple.*

FRUIT PROSPECTS.

Notwithstanding the loads of blossoms on Apples, Cherries, and Plums, I fear that in many cases disappointment will have to be met, as many trees were not able to set their fruits by reason of their vigour being impaired from the cold, damp, and sunless autumn of last season, followed by the weakening influences of the superabundant crop of flowers which have adorned them (at least throughout this district) in the season just passed. Some rejoice to see their fruit trees in perfect sheets of flower, but I have noticed that moderate flowering is more likely to be succeeded by an abundant set of fruit. I also notice this season that trees which have fruited abundantly for many years in succession are casting their newly-formed fruit in great quantity, and Seaton House Apple, which is the freest cropper we have among culinary sorts, is relieving itself of a good part of the newly-formed fruit. Plums are generally doing the same. The Victoria as a standard and on walls, is as usual, in the most hopeful condition at present. This is about the most productive variety to be met with in Scotland, and standard trees may often be observed in the Stirling district heavily laden with fruit of fair size and quality. On walls I have seen this favourite sort attain great size, and be of deep purple colour next the sun, while the crop has been immense. The May Duke class of Cherries are likely to thin themselves severely, while Morellos are promising superabundance. Unfavourable prospects of small fruits are coming to hand. Gooseberries and Currants, which were in flower during the severe frosts at the end of April, have been most disappointing. *M. T., Stirlingshire.*

LATE BROCCOLI.

While carefully noting the value of our latest Broccoli, two varieties I had little knowledge of turned out to be the most serviceable both as to hardness and lateness, and are, of course, valued accordingly. Veitch's Model and Ireland's Late were the last which remained on the ground (June 13), and a fortnight longer than any of the others. The first-named do justice to their name, for they are very handsome, and well protected—we have seen no Broccoli so perfect in form as this—and hope to

make it in future a standard sort for late main crop. The other referred to is very hardy, and the heart compact, but the foliage is lanky and coarse, and were it not for the good service which it has done, it would have been discarded.

It is not necessary to advert to the value of late Broccoli, which give supplies till early Caniflowers are coming into use, as ours are doing now, which are from plants sown under glass in gentle warmth during February, and grown on till strong, and well hardened before planting out, and coming in earlier than those sown during early autumn. *M. T.*

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

JUNE 7.—Present: Mr. Morris, in the chair; Mr. McLachlan, the Rev. W. Wilks, and the Rev. G. Henslow, Hon. Sec.

Cattleya Mendeli, Monstrous.—Mr. Wilks exhibited a spray bearing two flowers, both of which were dimorphic, in that there were only two lateral sepals, the anterior one being wanting. One of the pair of anterior petals was present, and situated nearly normally, but the lip was peculiar in having one half of the form and colour of a labellum, while the other half had that of an ordinary petal. This suggested the idea of a fusion having taken place between a petal and the lip, only half of each organ, however, being present. Without negating the possibility of this being the case, an examination of the origin, form, and distribution of the fibro-vascular cords entering this complex organ, suggested rather that it was not two, but really only one organ which had developed one half as a lip, the other half as a petal, just as in semi-double flowers a stamen will often develop one anther-cell, the other being petaloid. With regard to the position of the parts, while the two sepals were strictly "right and left," the common (transverse) axis of both the petals and of the column was shifted, and so became unsymmetrically situated with regard to the sepals. The ovary-cell was replaced by an irregular cavity, with no trace of placentas or ovules.

Iris florentina.—Mr. McLachlan brought a normal flower taken from the same plant from which he exhibited three petals at the meeting held on June 23, 1891. They were half white and half purple. The question was then raised whether it was an indication of reversion to *Iris germanica*, supposing the plant to be a pale variety of that species, or the result of a cross between *I. germanica* and *I. florentina*. A comparison made at Kew with the present flower proved it to be the typical *I. florentina*, which differs particularly in the form of its "falls," these being markedly different from those of *I. germanica*, in that they are more contracted towards the base than is the case with the latter species. The pale variety is known as *albicans*, and is quite distinct from *I. florentina*; consequently, the appearance of the purple colour on the petals of this species is the more unaccountable.

THE ROYAL NATIONAL TULIP SOCIETY.

JUNE 8.—The annual exhibition of this society was held in the annexe of the Botanical Gardens, Old Trafford, on the above date, and brought together a larger show of flowers, and a greater number of exhibitors than might have been anticipated, regard being had to the hot Whitsun weather, which proved very trying to the flowers. Had the show been a few days earlier, the flowers would no doubt have been seen to better advantage. It is only in an unusually late season, as this at one time promised to be, that the date of the show is fixed during the first week in June, but the setting in of warm weather upset many calculations, and the great heat in the building on the show day caused a number of the flowers to droop almost before the judges could examine them. June is too late for Tulips, even in the north, and it would perhaps be best all round to make the fixture the last Saturday in May, trusting to the kindness of the season to have the flowers fit at the time.

The annexe was singularly gay: the remarkably extensive collection of *Rhododendrons* shown by Messrs. John Waterer & Sons, of the Bagshot

nurseries, are just now at their best, and they made a splendid display. Some two thousand plants of varied colours formed an exhibition that atoned in large measure for the absence of the usual Whitsun floral display. One of the features of the Tulip exhibition was the remarkable success of Sir J. W. Bentley, of Stakehill, the secretary of the society. He is a young grower who has steadily worked his way into the front rank of successful growers, and the chief prizes of the day fell to his share. It is cheering to see that some young men are coming forward to take the place of the veterans in Tulip culture who have passed away during the past few years.

BROKEN TULIPS.

Despite the fact that the competition on this occasion was confined mainly to the growers of Lancashire and Cheshire, one or two coming from Wakefield, as many as five stands of twelve blooms were forthcoming. Mr. J. W. Bentley won the cup with *bizarres*, feathered, John Mills and Sir Joseph Paxton; *flamed*, Dr. Hardy and Sir Joseph Paxton; *byblomems*, feathered, King of the Universe, a very fine bloom indeed, handsomely marked, and very pure; and *Violet Aimable*; *flamed*, Talisman and Perfection; *roses*, feathered, Alice and Mabel; *flamed*, Annie McGregor and Aglaia. 2nd, Mr. J. Knowles, Stratbridge, who had, *bizarres*, feathered, Robert Guey, a flower remarkable for the purity and the deep gold of its ground colour, in the way of Sir J. Paxton in regard to its markings, but quite distinct, and Sir J. Paxton; *flamed*, Prince of Wales and Sir J. Paxton; *roses*, feathered, Modesty and Julia Farnese, the former very pretty indeed; *flamed*, Queen of England and Lady Catherine Gordon; *byblomems*, feathered, Mrs. Hepworth and Adonis; *flamed*, Talisman and Adonis. 3rd, Mr. Samuel Barlow, Stakehill, Castleton, having a few good flowers, but somewhat spent. Two other prizes were awarded.

In the class for six varieties, Mr. J. W. Bentley was again 1st, having *bizarres*, feathered, William Wilson; *flamed*, Prince of Wales; *roses*, feathered, Rachel, *flamed*, Annie McGregor, *byblomems*, feathered, Violet Aimable, and *flamed*, Adonis. To this stand was also awarded the special *Gardeners' Magazine* Medal for excellence of culture. 2nd, Mr. J. Knowles, with *bizarre*, feathered, Lord Fred. Cavendish, and *flamed*, Dr. Hardy; *rose*, feathered, Modesty; *flamed*, Triomphe Royale; *byblomems*, feathered, Mrs. Hepworth, *flamed*, Adonis. 3rd, Mr. J. Jones, Denton. There were nine competitors, and eight prizes were awarded.

A similar class followed for half-guinea subscribers, and here Mr. W. Mellor, Stockport, was 1st, with *bizarre*, feathered, Lord Lilford; *flamed*, Sir J. Paxton; *rose*, feathered, Lizzie, and *flamed*, Queen of England; *byblomems*, feathered, Connersby Castle, and *flamed*, Lord Denman. 2nd, Mr. S. Johnson, Stafford, with *bizarre*, feathered, Lord Lilford; and *flamed*, Dr. Hardy; *roses*, feathered, Mrs. Collier, and *flamed*, Maggie; *byblomems*, feathered, Angelina; and *flamed*, Lord Denman. 3rd, Mr. H. Keeling, Stoke.

In the class for three feathered Tulips, always an attractive one, there were eleven competitors. Mr. Knowles was placed 1st, with *bizarre* Sir J. Paxton; *rose*, Lizzie, and *byblomems*, King of the Universe. 2nd, Mr. J. W. Bentley, with *bizarre*, Garibaldi; *rose*, Mrs. Collier, and *byblomems*, Agnes. 3rd, Mr. J. Jones.

Mr. Bentley also had the best three *flamed* Tulips, staging *bizarre*, Sir J. Paxton; *rose*, Mabel; and *byblomems*, Talisman. 2nd, Mr. C. W. Needham, with *bizarre*, Sir J. Paxton; *rose*, Aglaia, and *byblomems*, Duchess of Sutherland. 3rd, Mr. W. Kitchen, Marple, with *bizarre*, Sir J. Paxton; *rose*, Clio, and *byblomems*, Bienfait.

A class for maiden growers came next, requiring one feathered and one *flamed* bloom—a maiden grower being one who has not yet won the amount of his subscription at a show. Out of five competitors, Mr. W. Mellor was 1st, with *bizarre* *flamed*, Sir J. Paxton; and *byblomems* feathered Mrs. Hepworth. 2nd, Mr. H. Keeling, with *bizarre*, *flamed*, Sir J. Paxton; and *bizarre*, feathered, Magnum Bonum. 3rd, Mr. J. Jones. A similar open class followed, the flowers staged in the preceding class being allowed to compete in this one also. Mr. Mellor was placed 1st here also with the flowers above-named; Mr. J. Bentley was 2nd, with *bizarre*, feathered, John Mills; and *bizarre*, *flamed*, Sir J. Paxton. 3rd, Mr. J. Knowles, with *rose*, feathered, Heroine; and *rose*, *flamed*, Lady Catherine Gordon.

SINGLE FLOWERS.

As is usual, a large number of flowers were staged

in the classes for single blooms. The best feathered bizzarres in the order of merit were William Wilson, shown by Mr. S. Barlow; Masterpiece, Royal Sovereign, General Grant, and Richard Yates. Feathered roses: Modesty, shown by Mr. Knowles; followed by Julia Farnese, Modesty, Annie, McGregor, and Industry. Feathered byblomms:—Mrs. Hepworth, shown by Mr. Knowles; and then came in order of merit King of the Universe, Adonis, Bacchus, and William Parkinson. Bizzarres, flamed, Sir J. Paxton, in very fine character, shown by Mr. Wood, followed by Dr. Hardy, Prince of Wales, and Dr. Hutcheon; roses, flamed, Aglaia, from Mr. S. Barlow, next Chio, Annie McGregor, Madame St. Arnaud, and Mabel. Byblomms: Lord Denman from Mr. Geo. Needham; then Talisman, Dymock's seedling Queen of the Universe, Adonis and May Queen.

The Premier feathered Tulip was byblom King of the Universe and the premier flamed bizzarre, Dr. Hardy, both shown by Mr. J. W. Bentley, in his first prize twelve blooms in Class 1.

BREEDER TULIPS.

As is usual, these were wonderfully attractive. The best six out of five collections, came from Mr. J. W. Bentley, who had, of bizzarres, Sir J. Paxton and Sulphur; roses, Annie McGregor, in beautiful colour, and Miss B. Coutts; byblomms, Glory of Stakehill and Talisman. 2nd, Mr. Samuel Barlow, also with bizzarres, Sir J. Paxton and Sulphur; roses, Annie McGregor and Miss B. Coutts; byblomms, David Jackson, very fine purple, and Hepworth Seedling. 3rd, Mr. Moorhouse.

Mr. J. W. Bentley also had the best three varieties, having bizzarre, Sir J. Paxton; rose, Annie McGregor; and byblomms, Mr. Parkinson, of a silvery soft mauve colour. 2nd, Mr. Mellor, with bizzarre, Sir J. Paxton; rose, Thomas Parker; and byblomms, Queen of May.

The best bizzarre breeder was Richard Yates, shown by Mr. J. W. Bentley, followed by Sir J. Paxton, Hepworth's Seedling, William Wilson, and Goldfinder.

The best rose breeder was Olivia, also from Mr. Bentley; followed by Mrs. Barlow, Annie McGregor, Mabel, Queen of England, and Thomas Parker.

Byblomms breeders.—1st, Mr. Jones, with Lord Denman, followed by Bridesmaid and Seedlings.

The premier breeder was Richard Yates, also shown by Mr. J. W. Bentley.

THE BUTLEY TULIP SHOW.

For sixty-seven years past a Tulip show has been held at the "Orange Tree" Inn, Butley, a small village near Macclesfield, and so popular is it with the Tulip fraternity that many admirers of the flower are attracted to it from Manchester, Macclesfield, Stockport, &c. The show is conducted according to all the old traditions: the flowers are staged in ginger-beer bottles in one room; in another sit the Secretary and the exhibitors, and as the flowers are judged, stewards bring to the Secretary the blooms awarded prizes; the names of the varieties and the exhibitors are entered by him in a book, and the proper cards affixed to them; they are then returned to the show-room and arranged on a sloping stage—like an old-fashioned plant-stage—placed at one end of the room, where they are on view for a few days, non-subscribers being "admitted on payment of silver at the doors." If anyone would witness something of the old enthusiasm which stirs the Tulip-growing fraternity, they should pay a visit to the Butley Tulip show. One curious proviso in the schedule of prizes is, that growers may be required to prove on oath the flowers they bring to the show were grown and bloomed by them.

On the occasion of the annual show on the 10th inst., additional interest attached to it from the fact that Mr. Samuel Barlow, J.P., of Stakehill House, Manchester, the President of the Society for the year, offered a valuable Silver Cup for the best "pan" of six rectified flowers, one feathered and one flamed in each class. There were four competitors, and the Cup was awarded to Mr. J. W. Bentley, the Hon. Secretary of the National Tulip Society, a young grower who has proved most successful during the present season. His flowers were—bizzarres, feathered, Lord Frederick Cavendish; flamed, Sir J. Paxton; rose, feathered, Alice; flamed, Annie McGregor; byblomms, feathered, King of the Universe; and flamed, May Queen.

There being but one prize, the non-successful stands were broken up, and the blooms placed in the

several classes for single flowers, where they again competed.

Mr. Bentley's stand of six blooms occupied the place of honour upon the Tulip stage. The premier feathered flower in the show was byblomms, Violet Amiable, shown by Mr. W. Kitchen, of Marple. The premier flamed bizzarre, Sir Joseph Paxton, one of Mr. Bentley's prize blooms.

A large company sat down to dinner during the afternoon, under the presidency of Mr. Samuel Barlow, when the Cup was handed over to Mr. Bentley with due ceremony.

THE GRAND YORKSHIRE GALA.

JUNE 15, 16, AND 17.—We had had cold weather for some days past, and it was all the more cheering to see such a splendid display of flowers and fruit brought together as was seen at this most popular provincial show. Not only is the gala popular with the Yorkshire people, but is looked forward to by multitudes in the neighbouring counties of Durham and Lancashire. The gala opened at noon on Wednesday last amid fine, if not actually bright weather, and continued for three days. There was a fine display of specimen stove and greenhouse plants, the Earl of Zetland, gr. Mr. E. Letts, taking the 1st prize for ten, with Erica depressa (Silver Medal), Dipladenia amabilis, D. boliviensis. Orchids were also a fine feature. Mr. J. Cypher was 1st with ten, having splendid specimens of Dendrobium thysiflorum, Cattleya Sanderiana, and Dendrobium infundibulum; E. B. Faber, Esq. (Mr. Townsend, gr.), was 2nd. Mr. Wright, gr. to D. Wilson, Esq., was 1st for four Calanthe veratrifolia—a special exhibit.

Another fine feature at the York Gala were the groups, to which a tent is devoted, and the groups are two sizes, occupying 250 and 150 square feet respectively. Mr. McIntyre, gr. to Mrs. G. Pease, was 1st in both classes with choice and well-selected groups of greenhouse, stove plants, Orchids, Palms, and Ferns, their arrangement being very good.

Considering the late character of the season, and the earliness of the show this year, there was a very creditable display of fruit. Lord Hotham (Mr. Alsop, gr.) was 1st, with three fine bunches of Black Hamburg; Mr. Andrews, gr. to A. Milnthorpe, Esq., 2nd. Lord Hotham was again 1st for three bunches of white Grapes. The Duke of St. Albans (gr., Mr. Edmonds) was 1st for Melons; Mr. McIndoe, gr. to Sir J. W. Pease, Bart., Hutton Hall, Guisborough, 2nd; while for Peaches, Mr. McIndoe was 1st.

For ten varieties of fruits and vegetables, Sir W. Pease, Bart., M.P. (gr. J. Corbett), was 2nd.

Cut flowers were a special feature; in fact, we have never seen a finer display at the gala, both of cut Roses, herbaceous flowers, Pyrethrum roseum, single and double Pansies and Violas, Messrs. Harkness & Sons, Bedale, carrying off several prizes both for Roses and other flowers.

Bouquets were so abundant as to be quite a feature of the show. For bridal bouquets, 1st, Messrs. Perkins, of Coventry. H. Stanton, Esq., 1st for hand-basket of flowers; and 2nd, Mr. A. Booty, Harrogate.

By far the most gorgeous display was in the Pelargonium tent, the plants being marvellously fine, and beautifully flowered. The prize-takers were Mrs. Tetley, of Leeds (gr., Mr. Eastwood), Miss Steward, of York, Dr. Wilson, and J. T. Kingston, Esq. The cut Roses were fine, although, perhaps, less numerous than in some previous years. Pot-Roses were fairly represented. Alpine and herbaceous plants were shown, but not well.

Of miscellaneous exhibits, Mr. Jennings, gr. to Leopold of Rothschild, Esq., M.P., Ascot, was there, with a fine display of Souvenir de la Malmaison Carnations (white and pink), as well grown and flowered as we need wish to see them, and which were the admiration of all. Messrs. Cutbush & Son, Nurseries, Highbury, London, had a display of Peonies and other flowers and foliage—altogether an attractive display. Messrs. Birkenhead staged a large collection of greenhouse and hardy Ferns in their excellent way; while Messrs. Dobbie, Rothsay, N.B., had a wonderful display of Pansies and Violas in great variety, as had Mr. Forbes, Hawick, N.B. Mr. Yeld, Clifton, York, had one or two of his seedling Iris germanica, one of which named Sincerely (a hybrid from I. pallida × Queen of May) was attractive; he also exhibited a hybrid Hemerocallis named Apricot, raised from H. flava × H. fulva. Messrs. Charlesworth, Shuttleworth & Co., Heaton, Bradford, staged a group of miscellaneous Orchids, interspersed with Ferns and other plants,

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

Principal Wheat-producing Districts.—0, Scotland, N.; 1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, S. Principal Grazing Districts.—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending June 11, is furnished from the Meteorological Office:—

"The weather was fine and warm during the greater part of the week, but changeable and unsettled at the beginning, and also at the close of the period. Thunderstorms occurred in many parts of England on the 5th, and in a few isolated places on the 10th. On the latter date severe thunderstorms accompanied by very heavy falls of rain were experienced in the north of Ireland.

"The temperature was above the mean in all districts, the excess ranging in most instances between 2° and 4°. The highest readings were recorded mostly on the 9th or 10th, when the thermometer exceeded 80° in all but the extreme northern parts of Great Britain; in 'England, E.' (at Cambridge) it rose to 85°. A very sudden fall occurred in the north at the close of the week, the maximum readings at some of the Scotch stations being more than 30° lower on the 10th than on the 9th. The lowest readings occurred on various dates in the different districts, but in the northern parts of the Kingdom they were observed mostly on the 11th; over the country generally the absolute minima ranged between 40° and 45°, but in 'Scotland, E.' the thermometer fell to 36°.

"The rainfall was a little less than the mean in most districts, but more in 'England, N.E.', 'Scotland, W.', and 'Ireland, N.', and the 'Channel Islands' the amount agreed with the average.

"The bright sunshine was above the average in all districts, excepting 'Scotland, N.', the excess being large over the greater part of England; where the percentage of possible duration exceeded 60. In 'England, S.' the percentage was as high as 67, and in the 'Midland Counties' and the 'Channel Islands' it reached 65, but in 'Scotland, N.' it did not exceed 36°."

MARKETS.

COVENT GARDEN, June 16.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal elements, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate not only from day to day, but often several times in one day, Ed.]

FIRST arrivals of outdoor Strawberries this week, but, owing to the cold nights, are not finished. Business steady, with prices unaltered. *James Webber, Wholesale Apple Market.*

POTATOS.

NEW POTATOS.—Heavy supply from Jersey and France. Prices, 12s. to 14s.

OLD POTATOS.—Short supply. Market firmer. *J. B. Thomas.*

SEEDS.

LONDON: June 15.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., report that the market is thickly attended, with but little business doing. Valuable seed is consequently without important variation. Orders for the seed still drop in. Canary seed is strong: stocks are without doubt very light. Mustard and Rape seed are both firmly held. Other articles at this quiet season offer no subject for remark.

FRUITS AND VEGETABLES.

SPITALFIELDS, June 14.—Quotations:—American Apples, 12s. to 16s. per barrel; New Zealand do., 6s. to 12s. per case; foreign Tomatoes, 1s. to 2s. per box; forced Rhubarb, 1s. to 1s. 6d.; natural do., 1s. to 2s. per dozen bunches; Asparagus, 9d. to 1s. 6d. per bundle of 100 heads; Sea-kale, 9d. to 1s. per punnet; Cabbages, 2s. to 4s. 6d.; Radishes, 2s. to 3s. per tally; Greens, 1s. 6d. to 2s.; Turnips, 2s. to 3s.; new Carrots, 2s. 6d. to 4s. 6d.; Spring Onions, 3s.; Parsley, 1s. 6d. to 2s. per dozen bunches; Spinach, 6d. to 1s.; Peas, 5s. to 6s. per bushel; Endive, 1s. to 1s. 6d.; Cabbage Lettuce, 6d. to 8d.; Lettuce, 2s. to 3s. 6d.; Trams Cucumbers, 2s. to 3s. 6d.; natural do., 1s. to 1s. 6d.; Beet roots, 4d. to 6d. per dozen; Cos Lettuce, 6d. to 1s. per score;

Mustard and Cress, 1s. 6d. to 2s. per dozen baskets; Egyptian Onions, 5s. to 5s. 6d. per cwt.; Horseradish, 1s. to 1s. 1d. per bundle; Mint, 1s. 6d. to 2s. 6d. per bundle.

BOROUGH, June 14.—Broccoli, 12s. 6d. to 15s.; Cabbages, 3s. 6d. to 6s. per tally; Peas, 4s. to 5s.; Spinach, 1s. 3d. to 2s. per bushel; Greens, 2s.; Carrots, new, 6s. to 7s.; Spring Onions, 4s. per dozen bunches; Egyptian do., 5s. to 6s. per cwt.; English Apples, 5s. to 10s. per bushel; Canadian do., 12s. to 20s. per barrel.

STATIONS, June 15.—There has been an excellent supply of all kinds of produce at this market during the past week, and a brisk trade was done at the undermentioned quotations—Cabbages, 3s. to 5s. per tally; Greens, 2s. 6d. to 3s. per cwt.; Cauliflowers, 2s. to 3s. 6d.; Carrots, household, 3s. to 4s. per ton; cattle-feeding, 2s. to 3s. 6d.; Mangels, 14s. to 18s. do.; Swedes, 18s. to 20s. do.; Onions, Egyptian, 4s. 6d. to 5s. 6d. per bag; English, 5s. to 6s. per bushel; American, 10s. to 20s. per barrel.

POTATOS.

SPITALFIELDS: June 14.—Quotations:—New: Jersey Kidney, 16s. to 18s.; do. Flukes, 17s. to 18s.; St. Malo Rounds, 12s. to 12s. 6d.; do. Kidneys, 10s. to 11s.; Libbon Rounds, 8s. to 9s.; Malta Kidneys, 12s. to 14s.; do. Rounds, 9s. to 10s. per cwt. Old: Maguams, 65s. to 75s.; Imperators, 60s. to 75s.; Hebrons, 60s. to 75s.; Bruce Maguams, 60s. to 80s.; Main Crop, 55s. to 100s.; Snowdrops, 70s. to 85s.; Sutton's Abundance, 70s. to 85s. per ton.

BOROUGH, June 14.—Quotations:—New: Lisbon, 9s. 6d. to 10s. 6d.; Malta, 11s. 6d. to 15s. per cwt. Old: Bruce Maguams, 50s. to 100s.; Dunbar do., 110s. to 120s.; Fenland do., 60s. to 70s. per ton.

FABRINGDON: June 15.—Quotations: New:—Jersey Flukes, 12s. 6d. to 14s.; do. Kidneys, 12s.; do. Rounds, 11s. per cwt. Old: Scotch Maguams, 100s. to 110s.; Bedford, 80s. to 90s. per ton.

WATFORD: June 15.—Quotations:—Light-land, 65s. to 75s.; Dark-land, 60s. to 65s.; Bruce Maguams, 12s. to 90s.; Scotch Maguams, 65s. to 90s.; Main Crop, 70s. to 100s. per ton.

GENERAL MARKET AVERAGES: June 15.—Old: Maguams, 70s. to 100s.; Dunbar do., 100s. to 110s.; Snowdrops, 70s. to 85s.; Hebrons, 60s. to 75s. per ton. New:—Lisbon, 8s. 6d. to 9s. 6d.; Malta, 12s. to 15s.; Jersey, 14s. to 15s. per cwt.; English, 2d. to 4d. per pound.

NOTICES TO CORRESPONDENTS.

* PHOTOGRAPHS, DRAWINGS, OR SPECIMENS.—We shall be pleased to receive from our Correspondents notes relating to interesting Gardens, together with Specimens or Illustrations of interesting Plants. Although circumstances prevent us in all cases from reproducing them, we are nevertheless glad to receive them, and as far as possible to utilize them for the benefit of our readers.

AGRICULTURAL CHEMISTRY: *Con-jungo*. 1. The Colleges at Downton, near Salisbury, or at Cirencester. We believe that some section of agriculture is taught at or near Lewes, in your county. 2. In French, we will get the publisher's name and address for you.

BOOKS: MANUAL ON BEE-KEEPING: *D. Bee-keeping*, by Alfred Rusbridge, London; E. W. Allen, 4, Ave Maria Lane, E.C.

CONFER CONFERENCE PAPERS: *Charles Palmer*. These have not as yet appeared in the Society's Journal. Enquire of the Secretary, 117, Victoria Street, Westminster, S.W.

FUMIGATION OF VINES IN BEARING: *Novice*. The repeated experiments made with "Nicotine," show that no injury to the tenderest foliage or fruit follows its use. See our issue for last week, p. 761.

GOOSEBERRIES: *G. T. and W. M.* I find no fungus disease, but insect remains in all the fissures of the bark. The lichens and small phora on the bark have nothing to do with the disease. The same insect-traces and red bodies are on both sets of specimens sent. *Dr. C. M. Cooke*.

GRAPES: *T. M., Kingsmead*. The berries you sent are affected with a very common disfigurement known as "rust," and is the effect of injury to the cuticle or skin of the berry. There is no cure for berries already affected: cut all such out. It is produced by many and different causes, such as touching them with the hand, or the hair of the head whilst thinning, by cold draughts, or by over-heated and dry atmosphere, as well as by using sulphur applied to hot pipes when the berries are very young.

NAMES OF PLANTS: *R. W.* The broad leaf is *Sanguisorba*. The Canadian (Blood Wort), *Mertensia virginica*.—*C. J. C.* Diplacis glutinosa.—*E. V. B.* Olearia Haasti, a hybrid New Zealand shrub.—*A. P., S. Shields*. The rose sent is not *Sou-*

venir d'un Ami, but *Annie Olivier*.—*Cuthbush & Sons*. No. 1, *Juniperus recurva*; 2, *Pinus macrocarpa*.—*W. D.* No. 3 from last week. *Rheum palmatum* var. *taugathicum*.—*Azalea packed in Walnut Leaves*. Glory of Sunning Hill.—*A. G. H.* *Epidendrum coelestium*.—*C. W. D.* *Senecio crassifolius*, *Erigeron glabellus* var. *asper*.—*E. H. P.* 1, *Vincetoxicum officinale*; 2, *Cynanchum Molesum*.—*W. L. & Co.* A deformed flower of *Cattleya Mossia*.—*R. W. H.* 1, *Habenaria foliosa*; 2, *Lycynis viscaria* fl.-pl.; 3, *Lomaria spicata*; 4, *Mentha pulegium*.—*Lea*. 1, *Erigeron philadelphicus*; 2, *Hesperis matronalis*; 3, *Iris variegata*; 4, *Oncidium lamelligerum*; 5, *Campanula glomerata*.—*J. McM.* 1, *Anthericum liliastrium*; 2, not recognised; 3, *Keria japonica*; 4, *Campanula glomerata*; 5, *Veronica gentianoides*.—*F. A., Cheddar*. *Dendrobium moschatum*.—*J. A. P.* 1, *Cassia corymbosa*; 2, *Lycetaria formosa*; 4, *Olearia Haasti*; 5, *Deutzia gracilis*; 6, *Crenata flore-pleno*.—*G. Southcott*. 1, *Cirrhopetalum* species; 2, *Saxifraga Tridactylites*.—*E. J.* Two *Epidendrum* and a *Cypripedium*, which species we cannot tell until we see the flowers. Of little value.—*H. J. R.* *Warsceviczella velata* and *Pescatorea cerina*, so far as we can judge by the dry flowers sent.—*Simon*. *Broughtonia sanguinea*.—*F. C. E.* *Melaleuca hypericifolia*. It is not very ornamental, but the foliage is of use in setting off cut flowers, in bouquets, vases, &c.—*E. D. L.* 1, *Pyrus americana*; 2, *Rubus nutkanus*; 3, *Spirea trilobata*; 4, *Viburnum Lentago*; 5, *Polygonum molle*; 6, *Lilium pyrenaicum*.—*A. A.* 1, Send when in flower; 2, *Acacia dealbata*; 3, Send when in flower; 4, *Deutzia crenata flore-pleno*; 5, *Spirea Thunbergii*; 6, *Grossularia fuchsoides*; 7, *Ribes grossularioides*.—*A. E. R.* *Osmonda regalis cristata*.

NECTARINES DEFORMED AND UNSOUND: *W. S.* The trees bring weak and old, and in that condition falling a prey to the root mildew, *Dematophora nectatrix*, or *Agaricus melleus*, are unable to bring perfect fruit. There is small chance of a cure.

PEACHES: *J. S. H.* The splitting of the fruits is due to a large access of water to the roots after a period of dryness, and often occurs when the gardener affords water to the borders very abundantly just at the time the fruit is swelling.

SOIL FOR MUSHROOM BEDS: *J. A. C.* Stiffish loamy soil, containing but little decayed vegetable matter. Ordinary kitchen garden soil is seldom suitable; but pasture loam that has been stacked for a year is very suitable for soiling the beds, or this may be mixed with light garden soil as much as possible free from humus, in the proportion of half loam to half garden mould.

THE LONGEST BAMBOO LADDERS: *A Forty Years' Subscriber*. Apply to some of the larger horticultural sundriesmen. You will find their names in the *Garden Directory* or *Garden Annual*.

TOMATOES: *E. K.* The black spot of Tomatoes, a disease for which no remedy is known. (See *Gardeners' Chronicle*, vol. ii., 1889, p. 409). Destroy by burning all affected fruits, and try some of the fungicide remedies so often advocated of late in these pages, and keep the plants less moist, root and top.—*W. R.* Obtain a copy of our issue for March 26, 1892; see p. 403. The remedy is too long to be repeated here.

TWIN CUCUMBERS: *A. C.* A very common occurrence.

VINES: *J. J.* The leaves appear to have been punctured by some kind of insect, causing wounds or galls. Could you not send a good handful of shoots and leaves, packed in damp moss, and describe your treatment of the Vines?—*J. F.* The tips are affected with mildew. There are probably some faults in management. Cut off affected parts, and burn them. Read "Spraying to Destroy Insects and Fungi," in our issue for March 26 last.

COMMUNICATIONS RECEIVED.—*M. C. W.* Sowerby.—*Eady, Chertsey*.—*E. C. D.* Mawley.—*Messrs. J. Carter & Co.*—*F. W. B.*—*J. A. P.*—*D. E. C.*—*J. MacMillan* (next week).—*J. V. T.*—*Bruce Findlay*.—*W. A. C.*—*T. Faxon*.—*S. P. O.*—*C. Cundy*.—*M. T. M.*—*G. F.*—*W. H. C.*—*L. J.*—*R. P.*—*E. M.*—*T. S.*, Timaru, N.Z.—*Dr. K.*—*T. B.*—*J. D.*—*J. L.* & *Sons*.—*H. A.*

Page, 4s; Half Page, 24 10s.; Column, 4s.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; in this all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

GARDENERS AND OTHERS WANTING SITUATIONS, 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Births, Deaths and Marriages, 5s. each insertion.

POSITION.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at No. 42, DRURY LANE, to A. G. MARTIN, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST reach the Office not later than Thursday noon.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements, 41, WELLINGTON ST., STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months: Post-office Orders to be made payable at the Post-Office, 42, Drury Lane, W.C., to A. G. MARTIN.

Subscribers who experience any difficulty in obtaining their Copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

FARMS, ESTATES, RESIDENCES.

Any one desirous of Renting a Farm or Residence, or Purchasing an Estate, can have copies of the

MIDLAND COUNTIES HERALD

SUPPLIED FREE FOR SIX WEEKS,

on stating the purpose for which the paper is required, forwarding Name and Address, and six halfpenny stamps for postage, addressed, "Midland Counties Herald Office, Birmingham." The Midland Counties Herald always contains large numbers of advertisements relating to Farms, Estates, and Residences for Sale and to be Let.

ESTATE SALES.

The Best County Medium for Advertising Sales of Estates is

THE "WORCESTER HERALD,"

ESTABLISHED 1794.

The Leading County Paper. Extensive circulation among the upper and middle classes in Worcestershire and adjoining counties. Advertisers would do well to forward for reference and distribution plans and particulars of Estates, Catalogues of Machinery, Furniture, Books, and other Property advertised in the Columns of the "HERALD."

Sales of Stock and Agricultural Effects.

The "WORCESTER HERALD" is the most effective organ for giving publicity to announcements of this class. It is the leading Agricultural Paper in the County, and Circulates most extensively among Agriculturists in and around Worcestershire.

Farms to Let.

Lead Agents, Estate Managers, and all having Farms to Let would do well to advertise in the "WORCESTER HERALD," the Leading County Paper. Specially adapted for bringing such notices before Tenant Farmers. Large circulation. Moderate charge.

Situations Vacant and Wanted.

For producing results the "WORCESTER HERALD" is recognised as a specially good medium. Cheap Rates. Apply for terms.

SPECIMEN FREE. Price 2d.
Published Friday for Saturday.

OFFICES:—72, HIGH STREET, WORCESTER.

WANT PLACES.

TO GARDENERS, AND OTHERS SEEKING SITUATIONS.

The Pressure upon our space at this season of the year is so great, we are compelled to state that advertisements received after 6 P.M. on Wednesday will, in all probability, be held over to the next week.

Advertisers are cautioned against having letters addressed to initials at Post-offices, as all Letters so addressed are opened by the authorities and returned to the sender.

Gardeners, Farm-Bailiffs, Foresters, &c.

DICKSONS, Royal Nurseries, Chester, are always in a position to RECOMMEND MEN of the highest respectability, and thoroughly practical at their business. All particulars on application to—
Telegraphic and Postal Address—"DICKSONS, CHESTER."

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

Head Gardeners.

JOHN LAING AND SONS can at present recommend with every confidence several energetic and practical Men of tested ability and first-rate character. Ladies and Gentlemen in want of GARDENERS and BAILIFFS, and HEAD GARDENERS for first-rate Establishments or Single-handed Situations, can be suited and have full particulars by applying at Stanstead Park Nurseries, Forest Hill, London, S.E.

SANDERS, St. Albans, can thoroughly RECOMMEND several first-class HEAD GARDENERS.

STEPHEN CASTLE, F.R.H.S., CONSULTING HORTICULTURIST, &c., Ashford Vineyard, Fordbridge, Salisbury, has now OPENING FOR PLACES—HEAD WORKING GARDENERS, also FOREMAN with SPECIAL recommendation; also several UNDER GARDENERS. All can be personally recommended. Particulars on application.

GARDENER (HEAD), where services of conscientious, reliable, and thoroughly competent practical man are required.—Age 39; twelve years Head in present situation, only cause of leaving being death of employer. Over twenty-three years' testimonials.—J. MADDOX, Gardener, Pontpool.

GARDENER (HEAD); age 27.—WM. STAUR-708 requires a situation as above; six years' reference from last, and two from present situation.—For references, apply to Mr. ABBY, Head Gardener, Avery Hill, Eltham, Kent.

GARDENER (HEAD).—Age 32; married; one boy, aged 12. Thoroughly understanding management of Gentleman's place. Good practical experience in all branches. Good testimonials.—SUNNOKS, 2, Bowen Villas, Wembley, Harrow.

GARDENER (HEAD).—Age 25, married when suited.—Advertiser has had ten years' good experience in the cultivation of Grapes, Peaches, Melons, &c., Stave and Greenhouse Plants, Flowers, and Vegetables. First class references.—A. COLE, Hextable, Swanley, Kent.

GARDENER (HEAD WORKING).—Age 27, married; thoroughly experienced in growing all kinds of Fruit and Plants under Glass, Flower and Kitchen Garden; four years in present situation.—A. BARKER, Head Gardener, Stanmore Park, Stanmore, Middlesex.

GARDENER (HEAD WORKING), where about three are kept; age 27.—Mr. HARVEY, Head Gardener to R. B. Martin, Esq., Chislehurst, can highly recommend his Foreman to any Lady or Gentleman requiring a thorough Practical Gardener in all branches, sober and trustworthy man in every way.

GARDENER (HEAD WORKING).—A Lady wishes to recommend a thoroughly practical all-round Gardener who lived fifteen years in the family; only left owing to establishment broken up through a death.—W. BROWN, 1, Stockwell Street, Cambridge.

GARDENER (HEAD WORKING).—Age 30, single; Vines, Melons, Peaches, Tomatoes, and Stove and Greenhouse Plants; Flower and Kitchen Garden. Good character and reference.—BOURNE, JAS. HOLDER & SON, Crown Nurseries, Reading.

GARDENER (HEAD WORKING).—Age 32, married. Thoroughly understands Grapes, Peaches, Melons, Cucumbers, Flower and Kitchen Gardens. Highly recommended.—D. FOSTER, Head Gardener, New Place, Upminster, Essex.

GARDENER (HEAD WORKING).—Age 38, married; thoroughly practical all-round man. Highly recommended.—G. JORDAN, 40, Southfields Road, Wundsworth, S.W.

GARDENER (HEAD WORKING), where more are kept.—Age 34, married, one child 9 years old; thoroughly understands all the routine of Gardening. Six years' excellent character. Left through a death.—REEVES, 12, Grover Road, Watford.

GARDENER (HEAD WORKING), where others are kept.—Age 46, married, no family; abstainer. Life experience in Early and Late Forcing of all kinds of Fruit, Flowers, Vegetables, and Mushrooms; also Kitchen and Flower Gardens and Pleasure Grounds. Eight years' good character from late employer, and sixteen years' references.—J. D. MYRTLE Cottage, Wick Road, Hampton Wick, Middlesex.

GARDENER (HEAD WORKING); age 39, married.—A GENTLEMAN, giving up his Garden, strongly recommends his Gardener, who has been with him for the past four years. Well experienced in Forcing all kinds of Fruits and Flowers, also well versed in the routine of Kitchen and Flower Gardening, and the general requirements of a good establishment.—A. BARKER, The Gardens, Marton Hall, Marton, R.S.O., Yorks.

GARDENER (HEAD WORKING), Land and Woods if required.—Age 42, married; life experience in the profession. Upwards of twenty years as Head in good establishments. Excellent references.—GARDENER, Dolbit, Dinas Maudry, Merionethshire.

GARDENER (HEAD WORKING).—Age 47, married; thoroughly experienced in Flower, Fruit, and Kitchen Gardening. Nearly fourteen years' good character.—J. S. ANCOE, Weybridge, Surrey.

GARDENER (HEAD WORKING), where three or four are kept.—Reference as to character and ability from late employer, who will be pleased to answer any enquiries.—R. W. COSIER, Esq., 28, Chester Street, S.W.

GARDENER (HEAD WORKING).—F. CORNISH, The Gardens, Jollywads, Reigate, wishes to recommend his Foreman; J. Pullen, thoroughly practical in all branches, including Orchids, Stove and Greenhouse Plants, Flower and Kitchen Garden. Excellent character.

GARDENER (HEAD WORKING).—Age 30, single; sixteen years good practical experience in all branches. Good references.—W. HARDING, Poyning's Street, Beeding, Sussex.

GARDENER (HEAD WORKING).—Age 32, married, no family; life experience. Thoroughly practical in all branches. Excellent testimonials and references. Left through a death.—H. T., 164, Wellfield Road, Streatham.

GARDENER (HEAD WORKING).—Age 30, married; fifteen years' practical experience in Fruit, Flowers, and Vegetables, in large and small places. Last three years with R. C. Miller, Esq., Oakfield, near Dartford Kent, as Head Gardener; left through place being let on lease. Good references.—W. BATTERS, Mr. Batters, The Gardens, Gillingham Hall, near Beccles, Norfolk.

GARDENER (HEAD, or good SINGLE-HANDED).—Vines, Melons, Cucumbers, Tomatoes, &c. Stove and Greenhouse Plants, Flower and Kitchen Garden. Good character.—A. BARKER, 145, Steel Road, Acton Lane, Willeston.

GARDENER (HEAD, or good SINGLE-HANDED).—Married, one child; fifteen years' experience. Good character.—HORTUS, 77, Danbrook Road, South Streatham, S.W.

GARDENER (HEAD, or SECOND).—Age 25, single; thoroughly experienced in Vines, Melons, &c. also Early and Late Forcing. Nine months and three and a half years' previous good character.—D. P., Hoe Place Gardens, Woking.

GARDENER (SINGLE-HANDED, or good STEADY).—Age 24; ten years' experience Inside and Out. Understands Tomatoes, Cucumbers, Chrysanthemums, &c. Steady, willing and industrious. Good character.—A. E. GEORGE, Station Road, Great Shelford, Cambridgeshire.

GARDENER (SINGLE-HANDED), or where help is given.—Age 30, married, no family; sixteen years' experience in Vines, Melons, Cucumbers, Stove and Greenhouse Plants, Flower and Kitchen Gardens; also Land and Stock. Good character from previous employers.—A. W. MEECH, Reddington Lane, Mitcham.

GARDENER (SINGLE-HANDED).—Age 24; abstainer. Eight years' experience. Inside and Out. Can have good references.—F. GILBERT, 330, High Road, Lee, Kent.

GARDENER (SINGLE-HANDED, or SECOND), seeks re-engagement.—Age 23; well up in Stove and Greenhouse Plants, Flower and Kitchen Garden. Eight years' experience; good character.—H. PACEY, 8, Clarendon Terrace, Maida Vale.

GARDENER (SINGLE-HANDED), or where one or more is kept.—Age 26, single; thirteen years' experience in Vines, Peaches, Tomatoes, Cucumbers, Flower and Kitchen Garden. B. 1, Godfrey's Cottages, North Street, Redhill, Surrey.

GARDENER (SINGLE-HANDED or SECOND), in or near Kensington.—Age 30. Nine years' good character.—A. B., 41, Camden Street, Kensington, W.

GARDENER (SINGLE-HANDED).—Age 25, married, no family; understands Vines, Plants, Kitchen and Flower Gardens. Good references. Satisfactory reason for leaving.—W. SAUNDERS, Broxbourne Nurseries, Herts.

GARDENER (SINGLE-HANDED).—Age 29, married; thoroughly experienced in all branches. Eleven years' good character. Disengaged now.—W. FLEET, 2, Sherwood Road, Harrow.

GARDENER (good SINGLE-HANDED, or where help is given).—Age 32, single; eight years' good character.—A. MOORE, Ruscombe, near Reading, Berks.

GARDENER (SECOND), Inside, or Inside and Out, where four or more are kept.—Age 22; five years' experience in all branches, Orchids included. Good references.—W. VEALE, Horrington, Wells, Somerset.

GARDENER (SECOND), Inside, or Inside and Out, where three or four are kept.—Age 22. Seven years' experience. Excellent references.—F. C. CROSLY, Bishopstoke, Hants.

GARDENER (SECOND), where three, or THIRD where four are kept.—Age 20; four years' experience. Good character.—G. WICKENS, Hadlow Down, Uckfield, Sussex.

GARDENER (SECOND).—Age 24; ten years' practical experience in well-kept private places, both Inside and Out. Can be well recommended. Bothy preferred.—FOREMAN, 20, King Street, Chelsea, S.W.

GARDENER (SECOND, or in small SINGLE-HANDED place, or Market Garden).—Age 20; twelve years' experience. Good references.—H. HOWARD, Daisy Bank, Knap Hill, Woking, Surrey.

GARDENER.—Middle-aged, married, no children; understands all branches; Stock; eleven years' character; leaving through lease expiring.—GARDENER, Bethnal House Asylum, Cambridge Heath Road, E.

GARDENER, age 30, with upwards of fourteen years' practical experience in all establishments, is desirous of an appointment where one or more are kept, or would take charge of a collection of Orchids.—GARDENER, Blackwood Hall, Luddendenfoot, via Manchester.

GARDENER.—Middle-aged; thoroughly good all round man, and very active. Twelve years' good character as testimonials. Death of employer cause of leaving.—W. PEPPER, Rye Park, Hoddeston, Herts.

GARDENER (UNDER), Inside and Out, in a Gentleman's Garden.—Age 18. Five years' experience.—G. SIMMONDS, Gore, Upchurch, near Sittingbourne, Kent.

GARDENER (UNDER), in the Houses.—Age 19; two years' good character; bothy preferred.—H. SMITH, The Gardens, Compton's Lea, Horsham, Sussex.

GARDENER (UNDER).—Age 20. Four years' excellent character. Good experience.—B. SUMPTON, Heaton, Middlesex.

GARDENER (UNDER), in a Gentleman's private residence.—Age 23, single; five and a half years' Single-handed, and one and a half years' previous Under. Abstainer.—F. B., 22, Upper Road, Plaistow.

GARDENER (UNDER).—Mr. ENTWISLE, Calder Grove House, Wakefield, recommends Arthur Dunkley, a young man, 19, living in the house, and for nearly three years employed in the Garden, &c., and previously in the Garden of the Rector of Blithewick, from whom he received very good character. He now desires situation under Head Gardener in Gentleman's Garden, where he could increase his knowledge. He is steady and industrious, neat and tidy.

GARDENER (UNDER).—Age 25. Well up to Lawns and Kitchen Garden. Live on the place or off. Good character from present situation.—H. B., 2, Westfield Cottages, Fitcham, Middlesex.

GARDENER, Inside, or Inside and Out, where two or three are kept.—Age 21; good references from previous places.—F. FIKK, The Cottage, Iping, Mithurst, Sussex.

To the Trade.

MANAGER, or SHOPMAN (FIRST).—Thorough knowledge of the Retail Trade. First-class references.—SEEDSMAN, *Gardeners' Chronicle*, Office, 41, Wellington Street, Strand, W.C.

MANAGER or TRAVELLER.—Twenty years' experience in first-class houses, wholesale and retail. Thorough knowledge of Seed and Bulb Trade.—J. G., 4, Ingram Terrace, Bradford.

TO THE TRADE.—GENERAL MANAGER of the Glass Department, or TRAVELLER. Extensive experience in both capacities, with influential connection throughout the Northern and Midland Counties.—Address C., 40, York Road, Battersea, London, S.W.

FOREMAN, PROPAGATOR, GROWER.—Age 33; life experience in the leading Market Nurseries. C. J., 10, Light Street, Mapley, Nottingham.

FOREMAN.—THOMAS H. MAWSON, Garden Architect, Widenmore, would be pleased to recommend a reliable young man of exceptional experience to any Gardener requiring same.—For particulars apply as above.

FOREMAN, in the Nursery, or would Grow on Commission. Well up in Vines, Cucumbers, and Tomatoes.—J. O., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

JOURNEYMAN, Inside.—Age 21. Six years' experience. Excellent character. Bothy preferred.—J. FAIRCLOUGH, The Lodge, Myntburn, Leigh, Reigate, Surrey.

JOURNEYMAN (FIRST), in the Houses; age 24.—Mr. C. FOWELL, Head Gardener, Blatherwycke Park, near Wansford, Northants, will be pleased to recommend Geo. Digby as above.

JOURNEYMAN (FIRST), in the Houses, in a good establishment.—Age 23; six years' good character from last situation. Can be highly recommended. Bothy preferred.—F. ELLIS, 10, Kent Terrace, Swanley Junction.

JOURNEYMAN, in the Houses, or Inside and Out.—Age 23, Catholic; ten years' good character.—A. CHURCH, The Gardens, Mapledurham, Reading.

JOURNEYMAN or GARDENER (SECOND), in the Houses. Seven years' experience. Fifteen months' present situation.—W. DUDNEY, The Gardens, Stradey Castle, Llanelli.

JOURNEYMAN, by a young man (age 22). Good knowledge of Plants, &c. Good references.—FRANK H. SEXTONE, George Lane, Lewisham, S.E.

TO GARDENERS, &c.—Young Man (20), in a good private Garden or Nursery. Used to Glass. Five years' experience in all branches. Excellent character.—F. DUFEU, Sturcad Nursery, Christchurch, Hants.

TO GARDENERS.—A Youth seeks situation under a good Gardener as INFEROVER.—E. DANIELS, Roud, near Bath.

TO GARDENERS.—A Young Man (age 20) wishes to Learn Practical Gardening in all its branches. Bothy preferred, in neighbourhood of Kent.—C. K., Weald, Sevenoaks, Kent.

TO NURSEYMEN, &c.—Situations wanted in Market Nursery; used to Ferns, Roses, Bouvardias, Carnations, and the general routine of the trade.—L. H., 1, Brougham Road, Worthing.

TO NURSEYMEN and FLORISTS.—Wanted to APPRENTICE a YOUTH (age 16), indoors. Apply, stating terms, &c.—W. D. BALLINOKE, 13, Caldwell Street, Bedford.

SEED TRADE.—Situation wanted, by young man. Five years' experience. Good references. Good knowledge of trade. Can assist in Book-keeping.—Apply to W. B. C., 86, Wellington Street, Leeds.

SHOPMAN, or ASSISTANT.—Ten years' sound experience in the various branches with leading firms; thorough knowledge of Bulbs.—SEEDSMAN, 11, South Street, Stourbridge.

TO FLORISTS.—Situation wanted, by young Lady. Knowledge of the Fl. wer, Fruit, and Seed Trade.—E. R., Jalyan, Florist, Rusden.

HOLLOWAY'S PILLS.—In general debility, nervous tremor, and mental depression, these unrivalled Pills have a marvellous effect. They have won the confidence of millions in all parts of the civilized world. Constitutions shaken by sensual excesses, or by long residence in unwholesome climates, or by sedentary habits, are wonderfully renovated by a course of this extraordinary medicine, which, powerful as is its action on the whole system, is perfectly harmless to the tenderest frame. The Pills are composed of rare balsams, without the admixture of a grain of any mineral whatever, or of any other deleterious matter. They operate directly, powerfully, and beneficially upon the whole mass of blood, nor can we question the fact when we see indigestion cured, liver complaints arrested, the oppressed lungs brought into healthy play, and every physical function renewed and strengthened by their agency.

PATENT "MANCHESTER" LAWN MOWER.

*Awarded numerous
National and Inter-
national Prize
Medals, including—*

VIENNA,

1873.

**ROYAL HORTI-
CULTURAL
SOCIETY OF
ENGLAND, 1872.**

**ADELAIDE, 1887,
FIRST ORDER
OF MERIT.**

**NEVER BEEN
BEATEN in OPEN
COMPETITION.**

*Awarded numerous
National and Inter-
national Prize
Medals, including—*

PARIS,

1878.

**ROYAL BOTANI-
CAL SOCIETY,
MANCHESTER,
1873.**

**ADELAIDE, 1887,
FIRST ORDER
OF MERIT.**

**NEVER BEEN
BEATEN in OPEN
COMPETITION.**

THE PATENT "MANCHESTER" LAWN MOWER continues to command a large sale, notwithstanding many inferior imitations which do not contain the vital points so essential in a Perfect Mower. It still remains the cheapest and most effective machine of its class, cutting with the least expenditure of power either long or short grass on level or uneven ground, and making most excellent work, quite equal and not inferior to that done by the more costly machines. It is put together well, and is too simple with ordinary care to get out of order, and in point of durability superior to anything of the kind in the market at the same price.

THE gearing is boxed in; the wearing parts are interchangeable. The handle adapts itself to the height of the operator, and the patentees recommend it with confidence both to Amateurs and Gardeners.

GRASS COLLECTING BOXES are usually supplied with these machines for use in WET or HUMID WEATHER, but in DRY and HOT WEATHER they may be dispensed with, and the cuttings may be scattered on the lawn with advantage.

THE "TENNIS" LAWN MOWER.

THE New "TENNIS" LAWN MOWER is a strongly made and durable geared machine, very light in draught, of excellent design, superior finish, and fitted throughout with modern adjustments. The cylinder is driven by machine-cut wheels running with the greatest accuracy, and at such a speed as to ensure a beautiful smooth and velvet-like appearance on the lawn.

FROM 25/- EACH.

PRICE LISTS ON
APPLICATION.

FOR THE TENNIS GROUND,
SMALL GRASS PLOTS,
AND FOR GARDENERS.

THE gearing is neatly covered in on both sides of the machine, as illustrated.

The New "TENNIS" LAWN MOWER in the small sizes is eminently suited for verges, ornamental gardening, or for young ladies to use on the Tennis Ground, whilst the larger sizes will be found all that can be desired for more extensive work. A considerable number have been sold, and are giving the greatest satisfaction.

FROM 25/- EACH.

PRICE LISTS ON
APPLICATION.

To be obtained from all respectable Ironmongers and Seedsman throughout the Kingdom, or, if any difficulty is experienced, direct from the Manufactory,

FOLLOWS & BATE, Lim.,

GORTON, MANCHESTER.

PATENTEES AND MANUFACTURERS OF THE
"Climax," "Manchester," "Tennis," and Royal
Prize Medal "Anglo-American" Lawn Mowers.

Upwards of 80,000 sold since 1869.

THE "CLIMAX" (CONCENTRATED) WEED KILLER

Is Stronger and Superior to all rivals for permanently destroying all vegetation on Carriage Drives, Garden Walks, Stable Yards, Railway Stations, Ash Tennis Courts, Stonework, &c., &c. Saves many times its cost in labour, and will eradicate the weeds far more thoroughly than the most careful hand-weeding, keeping them away for a whole season.

Has no Smell.—Improves and Brightens the Gravel. Can be applied with an ordinary Watering-Can. Will not Injure the Skin or Clothing.

NOTE.—One Gallon makes 51 Gallons for Use.

PRICES.—In ½-Gallon Tins, 1s. 9d.; 1 Gallon, 3s. (tins included); 5-Gallon Drums, 2s. 9d. per Gallon; 10 Gallons, 2s. 6d. per Gallon; 20 Gallons, 2s. 3d. per Gallon; 40-Gallon Casks, 2s. per Gallon. 5 Gallons and upwards sent Carriage Paid.

Drums Charged for, but Allowed when Returned in Good Order.

The "Climax" Insecticide.

The CHEAPEST of all INSECTICIDES. NON-POISONOUS, SAFE, & EFFECTIVE.

The only Insecticide that Improves and Brightens the Foliage, while at the same time it completely destroys all Insects and Parasites which infest the Foliage and Roots of the Plants.

It will not Injure the most Tender Foliage.

PRICES.—In Tins, ½ Pints, 1s. 3d.; Pints, 1s. 9d.; Quarts, 3s.; ½ Gallon, 5s.; 1 Gallon, 9s.; 5 and 10-Gallon Drums, 8s. per Gallon, Carriage Paid.

THE MYTHE CASTLE GARDENS, TEWKESBURY, AUGUST 13, 1891.

GENTLEMEN,—I have given your "Climax" Insecticide a good trial on tender foliage—Orchids and Ferns—for Bug and Scale. In every instance I have found the Bug and Scale dead, and the foliage bright and clean. I found it most effectual for Black Fly on Peach Trees.

The "Climax" Insecticide ought to be better known; it is the only one I have found to kill Bug on tender plants without injury to the foliage.

I am, yours faithfully, W. MACKIE.

THE GARDENS, MOYALLON HOUSE, GILFORD, CO. DOWN.

DEAR SIR,—In reply to your inquiry, I found the "Climax" a really good and effective Insecticide, completely destroying Mealy Bug, Thrip, and Green Fly on the most tender plants, without the slightest injury to the Plant; in fact, it brightens and improves the appearance of Foliage Plants very much.

Yours, &c., J. LYNAS.

MESSENGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus.

Just issued, will be found the most complete, practical, and reliable guide to all about to build, alter, or heat Greenhouses. Illustrations of every description of Glasshouse, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kind of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. **Price, 2s. post-free.**

A large number of the illustrations are taken from greenhouses erected by us in various parts of the country; an inspection of this Catalogue shows, therefore, buildings the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made, and gentlemen waited on in any part of the country. **Plans and Estimates free on application.**

CALLA (RICHARDIA) ÆTHIOPICA,

"LITTLE GEM."

This is a perfect miniature gem of an Arum, from 10 to 15 inches high, with dark, bluish-green sagittate leaves, and pure white spathes; hardy and free-flowering, and requiring the same soil and treatment as the ordinary kind. The illustration was engraved from a photograph, and shows the "Little Gem" by the side of one of the ordinary Arums (Richardia æthiopica), and explains more perfectly than description could do, its comparative size. We greatly regret to find that many firms are offering spurious varieties as "Little Gem," and as we purchased the whole of the stock from the raiser, Mr. Elliott, of Jersey, we strongly advise all to obtain their supply direct from ourselves, to ensure having the true variety.

Price, 42/- per dozen.

CALLA (RICHARDIA) ELLIOTTIANA

THE MAGNIFICENT GOLDEN CALLA.

Exhibited recently at the Grand Exhibition of the Royal Horticultural Society at the Temple, where it was awarded a Silver Banksian Medal; also, at the International Horticultural Exhibition, Earl's Court, where it received the First Prize for the best New Plant in bloom. We have pleasure in stating that we have obtained a stock of this Grand Novelty.

Full particulars as to price, &c., upon application.

THE Gardeners' Chronicle.

SATURDAY, JUNE 25, 1892.

DULWICH PARK.

THIS pretty park is always worth a visit, and invariably has something interesting to show, from the season of Auriculas and the early bulbs to that of the Dahlias and Chrysanthemums, and the richly-tinted leaves of the autumn. Mr. Morman and his men are not yet at the height of the season, when the greatest display may be expected, and which they are preparing for by a daily setting-out of thousands of plants. But in these days the alpine, which were formerly confined to the Alps and other Highlands, are grown in all good gardens in great variety, and they are charming party because they are brilliant, and in some measure because they are so various. In Dulwich Park there is a particularly good collection of these useful, recent, and, so far as the million are concerned, comparatively little-known additions to the wealth of our flower gardens.

On this 1st of June the rockwork, which embanks half a mile or more of border, has its thousand clefts and crannies filled and overflowing with alpine, now bright with blossom, and which have been brightly blossoming during the past three weeks. That gay and golden Alyssum, for example, A. saxatile compactum, abounds, growing and spreading over the rocks in masses 3 feet in diameter, and laying just claim by its golden petals to the popular name of Gold-dust. The golden dust is, however, now fast disappearing through the scattering of the petals, which are pushed off, and begin to fade as the seed-vessels swell. Some blossoms fade in a day, but these have been gay, and greatly admired during the past three weeks.

There is a good collection of Saxifrages. Among them the mossy sorts, S. cespitosa, S. Wallacei, S. zealandica, and others, clothe the rocks, and nestle deliciously green in the crevices, each in blossom, and in plenty. Abundance is a characteristic here, except in the case of such gems among the alpine, that one looks at them with reverence, almost wishing them under lock and key for greater safety—all others are in great abundance. Saxifraga hypnoides is a common but notable species, its foliage presenting the appearance of having been compactly intertwined in the same fashion as finches build their nests; and this Saxifraga is found here in scores running and twisting up the rocks. One must not omit to mention London Pride. It may be a common thing, but it has its place and its uses, and forms here a very good edging to some large beds of Rhododendrons now in full blossom, being itself in full blossom, too. Possibly a mere gorgeous edging might

snuff out the *Rhododendrons*, but *London Pride* does not disconcert them, so to speak, in the least, while its free growth and feathery appearance form a pleasing contrast to the rather rigid habit of named *Rhododendrons*. How infinite is the variety in many tribes of plants! The *Saxifrages* differ

of throwing up a blossoming stem several feet high in the second week of May, and three weeks before the appearance of the leaves. *S. Burseriana* is a small plant, a mere tuft, early, and now out of blossom. *S. oppositifolia* is a very early *Saxifrage*, a bright little mountaineer, of purplish-rose colour, here a specimen plant

diameter; and *S. muscoides purpurea*, one of the most engaging of them all, with purplish rose-coloured blossoms.

Among the other gems of the rocks, *Epimedium niveum* must not be passed over. It blossoms early, and the frost destroyed its flowers this year, and injured the foliage, which has

FIG. 115.—*CATTELEYA VICTORIA REGINA*: COLOURS OF THE FLOWER, ROSY-CRIMSON. (SEE P. 809.)

widely in habit and in shape, size, and colour of leaf and flower. *S. dentata cristata* has blossoms resembling those of the last-named, but its leaves are much smaller, more compact, of a deeper green, and toothed. Then, we may recall the sorts with rigid leaves, such as *S. pyramidalis*, which lifts upwards a lofty flower-stem; and a more dwarf species, *S. Aizoon minor*, with hard foliage, crowding some of the crevices as with a carpet of crystal. *S. peltata* has the peculiarity

only, a treasured cushion; but elsewhere, when the snow melts, a sheet of blossom spread over the ground. It is inevitable that many of the *Saxifrages* in the park will be overlooked on this account, as only those can be named which caught the eye. Among them were *S. serrata elegans*, *S. decipiens*, in its prime; *S. capillaris*, with flower-stems of hair-like delicacy, true to its name; *S. Haworthi*, *S. leptophylla*, in full blossom in hundreds of large patches, 3 feet in

now, however, recovered its beauty. Among the *Sedums*, all who cultivate alpenes should secure *grandiflorum* as well as *S. glaucum*. The former is now just expanding its flowers. The graceful *Polemonium coeruleum* (Jacob's Ladder) is a good old favourite, excellent alike for its blue flower and tender green leaf, and the variegated variety of the same plant is as graceful as a variegated Fern, and might easily be mistaken for one. It makes an excellent edging plant,

and is propagated as easily as a Russian Violet by dividing an old plant in autumn and replanting. The blue *Veronica rupestris* is one of the brightest flowers that can cheer this division of a garden at the present season, but one of the *Aubrietias* is handsomer still. In fact, *A. Leichtlini* is as pre-eminent for beauty among flowers of its class as *Venus* was among the goddesses—a fitting reminder of the great German gardener of Baden Baden. No one blessed with sight could pass its lovely mass of rose blossoms, pure and sparkling as rubies, without that feeling of adoration which perfect beauty inspires; and it is quite a shock

in the last-named position, and bears a profusion of feathery white blossoms, which, in the distance, might be mistaken for foam. Few plants are better suited to rockwork and more pleasing than *Thymus lanuginosus*, and, in the face of an approaching thunderstorm, we walked some distance to the Court Lane entrance to see that not uncommon plant, which was planted freely there when the park was formed, and has spread quickly over the rocks, clinging close to them, according to its habit. Its appearance gave it the name of Downy Thyme. Less common, slow in growth as the last-named plant is fast, we discovered, lurking in a crevice, *Dianthus*

mitted that the visitors to this delightful park find therein a great diversity of subjects, young and old, native and imported. There are lanes here, too, wherein you shall meet as many happy couples as in any country lanes, and as much beauty; and as for *Primroses*, a few weeks back there were more *Primroses* in Snake's Lane, Dulwich Park, than in any Sussex lane. And in the margins of the same lane the *Tulip*, *Hyacinth*, *Crocus*, *Polyanthus*, and *Auricula* were as plentiful as the *Primrose*.

The propagating-house till recently held hundreds of thousands of *Pelargoniums* and other bedders, which were first turned out into frames for protection, and are now being daily planted out in the grounds as fast as work and weather permit. The house is now filled with *Begonias*, *Iresines*, *Heliotropes*, *Fuchsias*, *Maize*, *Cupheas*, *Amaranthus*, foliage *Tobacco*, and other sub-tropical plants of the class which were much admired in the park last year. The immense number of these plants which Mr. Morman manages, with competent assistance, to produce with a comparatively small extent of glass, is astonishing. The London County Council and the people of London, to whom this park and its contents, with all its blossom and its beauty belong, are well served. *H. E.*

CATTLEYA VICTORIA REGINA.

In our number for May 7, of the present year p. 586, Mr. O'Brien described the very remarkable species introduced by Messrs. Sander & Co., and exhibited by them at the Royal Horticultural Society on May 3. We now give an outline showing the "habit" of the plant, and a full-sized drawing of a single flower (pp. 808, 809). As many as twenty-three flowers have been counted on a spike. For further details we must refer to Mr. O'Brien's description taken from the living plant.

NEW OR NOTEWORTHY PLANTS.

ERIA LAUCHEANA, n. sp., Kränzlin.*

This new and very striking species of *Eria* shows the character of *E. Dillwyniana*, Hook., combined with those of *E. hemimelaena*, Rchb. f., but there are several important discrepancies between those species. Imagine a drooping raceme of *E. Dillwyniana* reduced to about half the size, and coloured nearly almost like *E. hemimelaena*, Rchb. f., then you have an idea of this plant. The peculiarities consist in the perfectly different form of the lip and its keel; and in the colour of the petals, which are pale yellow in *E. hemimelaena*, Rchb., and deep black-purple in *E. Lauchea*. The contrast between the chlorotic colour of the larger part of the flower and the deeply-coloured petals and side-lobes of the labellum is the only beauty of this otherwise merely botanical Orchid. The author is indebted for fresh materials to Mr. Lauche, chief gardener of His Grace the Prince Liechtenstein at Eisgrub, Moravia. *Ka.*

* *Eria Lauchea*, n. sp., Kränzlin. — Sepalo dorsali oblongo obtuso, lateralibus triangularibus acutis in mentum subacutum, coalitis extus basi sparsissime fusco-cruentis ceterum omnino calvis; petalis paullo angustioribus ligulatis obtusis calvis, labelli lobis fere æquilongis (intermedio paululum longiore), lateralibus erectis sensuopatis, intermedio reflexo subquadrate antice retuso apiculato dense piloso, callis 2a basi labelli lobi intermedii basin usque decurrentibus medio divergentibus dense pilosis antice in pulvinar pilosum confluentibus; gynostemio generis. Racemus utraque, 15–20 cm. longus. Rhachis sparse fusco pilosa; bractee magnae ovate obtuse acutae, ovaria non omnia requantes glabre. Tota inflorescentia, rhachis, bractee, ovaria, sepala lateralibus et parvis labelli pallide straminea (eodem colore quo gaudet *Monotropa hypopitys*), petala et labelli lobi laterales atropurpurei. Totus flos vix 8 mm. diametro, bractee infimae (1a) 2 cm. longae, superiores decrescentes. *Dr. Kränzlin.*

FIG. 116.—CATTLEYA VICTORIA REGINA—REDUCED SKETCH: SHOWING HABIT.

to learn that it bears a name which few English tongues can pronounce accurately and with ease. The next best *Aubrietia* here is *Andersoni*, which has the merit of bearing a good English proper name, together with purple flowers—beautiful, but much less enchanting than the above. *Iberis coraeifolia*, the finest by far of the evergreen Candytufts, is not to be confounded with *I. corifolia*, since it has larger leaves and heads of milk-white flowers, each of larger size, and is comparatively a giant. It is a hybrid readily increased by cuttings or seeds, and as well disposed towards rocks as the common Thrift to our hills and tops of mountains.

Tiarella cordifolia (Foam Flower), at home alike in borders or among rocks, flourishes here

alpinus, looking much like a tuft of moss; and hard by is *Silene maritima plena*, with a blossom as large as a fair-sized Pink.

Crossing the Park, we noticed Wallflowers just going out, and *Pyrethrums* just coming in; Stocks, the ever-beautiful, when in bloom; *Die-litra spectabilis*, *Rosa rugosa*, in bloom; Brooms, with white, yellow, and cream-coloured blossoms; *Weigela rosea*, in the prime of its blossom; *Guedres Roses*, *Rhododendrons*, and *Azaleas*, and many shrubs, for the mention of which there is no space. Remembering the excellent collection of Maples here, and the old Oaks, which were here 500 years ago, and the Horse Chestnuts, and a larger list of things omitted than of those which have been named, it will be ad-

NOTES FROM WISLEY.

MR. WILSON, writing of some species of plants which are considered as being not very easy to grow successfully, states that *Primula Reidi*, in a cool damp situation; *Lewisia rediviva*, in good loam; *Cypripedium acaule* (large form), in moist vegetable soil; *Oenothera taurica*, on dry banks, have been very fine this season at Oakwood. *Ranunculus parnassifolius* has smaller flowers than usual, probably owing to the drought; *Arnebia chioides*, in exposed situations, stood the last two winters well. When lately showing some plants of this to an old Indian general, and telling him the usual story about Mahomet having passed his hand over the flower, and making the five dark spots vanish, he gave me a new version. Thinking it to be an improvement on the old one, I asked to have it in writing; I give it as he kindly sent it to me, in his own words:—

"In the trans-Indus country of our Indian possessions, a flower grows wild in great profusion, both in the Peshawar and Euxofazai districts, which reminds one to a certain extent of our English Cowslip. The natives of these districts, almost exclusively Mussulmans, call it the 'Mahommied Phul,' which we have anglicised into the 'Prophet Flower.' When in the Peshawar district many years ago, I made friends with a man of the local police, who told me many interesting stories and legends which had come down *visâ voce* from ancient times. My good friend Giel Khan, amongst other things, told me of the origin of the name given to the above flower; it was to the following effect:—Before their great Prophet Mohammed had fairly established himself in power and importance, in one of the ups-and-downs of his earlier fortunes he had been compelled to fly for safety into the desert, accompanied only by a few disheartened but faithful followers. There, as they rested on the dry barren and scorching sand, discontented murmurs arose amongst his companions at the hardness of their lot, at their being compelled to take refuge in such a forsaken spot, not a blade of grass to be seen, nor a drop of water to be had—a spot accursed of God and avoided by man. The Prophet, hearing these words of despair and faithlessness, roused himself from his apparent sleep of abstraction, and striking his open palm on the parched and burning sand, up sprang at once a green and fresh-looking plant, bearing pleasant-scented flowers, each yellow blossom having a dark spot on every one of its five petals. Mohammed then rebuked his murmuring followers. 'See,' said he, 'the power of Allah, even in this barren spot, can produce this flower, and cannot He again restore our fortunes, and rescue us from our present state of misery?' The flower is therefore called the 'Mohammedi Phul,' and the five brown spots, they say, are the marks of the thumb and four fingers of the Prophet's hand.

"This flower grows amongst the hard and stony tracts of the Peshawar Valley, as well as upon the richer soil of Euxofazai; marching at night, I have perceived its pleasant scent when crushed under foot by the troops. The seed-pods are harsh and bristly, making one's fingers quite sore in collecting them."

TREES AND SHRUBS.

RHODODENDRONS AT CRICHEL.

Is looking through Lord Alington's beautiful gardens and grounds at Cricheil, Wimborne, a short time ago, we found Mr. J. Beck, his lordship's head gardener, busily engaged in planting some of the finest varieties of Rhododendrons in some large beds near the mansion. Mr. Beck's rule during his thirty years' service at Cricheil has been, either to do a thing well, or not to do it at all, and there can be no doubt that it is a very good rule to work by; therefore his Rhododendron beds are made $2\frac{1}{2}$ feet deep, and the soil consists of three parts of good peat to one of strong loam, all being well chopped up and mixed together before being wheeled into the holes, every load of

peat costing 24s. delivered from Ringwood. In this excellent mixture of soils the plants received from the nursery, and having nice balls of roots, are planted, and the soil trodden about them, and then a good watering is afforded them; and this is repeated at short intervals, until the roots have pushed well into the new soil. Thus treated, it need hardly be wondered at that Rhododendrons do so well at Cricheil, the display there at the present time being a very fine one. Among the varieties grown may be mentioned R. Broughtoni, rosy-crimson; R. Lady Eleanor Cathcart, pale rose, spotted with chocolate; and R. Nobleanum, scarlet, the latter being a capital variety for forcing, as it may be had in flower from November onward. Hardy Azaleas and Kalmias are also extensively and well grown at Cricheil. H. W. W.

THE WEEK'S WORK.

THE FLOWER GARDEN.

By H. W. WARD, Gardener, Longford Castle, Salisbury.

ROSES.—The present is a busy and anxious month with rosarians. To obtain fine, solid blooms, none but the crown bud on each shoot should be retained, the others being removed as soon as fairly formed; and all the shoots and suckers which may have sprung from the stems and roots of worked standards and dwarfs should be rubbed off and pulled up as soon as they can be seen. In limited collections, the flowering period, as pointed out in a recent Calendar, may be much prolonged by leaving buds of two or three sizes in thinning, which should be performed at intervals of a few days. Climbing Roses should have all weak or superfluous shoots cut out, and securing those that are left. Should mildew be present on any Roses, dust them while the foliage is damp with flowers-of-sulphur; or syringe them in the evening with a solution of the "Climax" mildew destroyer and tepid water, at the rate of 2 oz. of the former (about two wineglassfuls) to 1 gallon of the latter.

RHODODENDRONS AND AZALEAS.—As fast as these shrubs go out of flower, the seed-pods should be cut off, and in that way growth of shoots is assisted. Any straggling or overgrown plants may at this season be cut into shape, and if this be done with care, the appearance of the plants will not be spoiled, the new growth soon oblitterating all traces of the pruning-knife. The same remark applies to Laburnum, Weigela, Broom, Syringa, Gueldres Rose, Berberry, and Laurustinus.

THE RESERVE GARDEN.—Put in a good stock of cuttings of the different varieties of Paeonies used in the spring bedding. These cuttings should be taken with two or three pairs of leaves, and the stems cut clean across just below the lowest joint, the lowest leaves being removed at the same time. Dibble them into a bed having a surface of sand, and which consists of fine soil a few inches thick, overlying a hard bottom. The cuttings may stand 4 inches asunder, and should have the soil made firm about them by pressure, and by means of a good watering. Damp the cuttings overhead every fine afternoon until rooted, as much with a view to freshening up the plants as moistening the soil. Daisies and other spring-flowering subjects which may have been laid in by the heels, should have all the flowers cut off, and be divided, shortening the roots a little, and be planted out like the Pansies.

THE KITCHEN GARDEN.

By G. WYTHES, Gardener, Syon House, Brentford.

BROCCOLI IN THE SEED-BED.—If the plants stand very close together, it is worth while to draw some of them, and prick them off into beds, there to await planting-out when space is at command. Broccoli may sometimes be planted between the rows of other vegetables, no further preparation of the ground being necessary, as the firmer the soil, the more sturdy is the growth for planting. Late-sown Model Broccoli, if planted out in July, will afford a supply in case the earlier and stronger plants get cut off by hard frosts. At Syon we scarcely lost a plant of all those put out on a north border, whilst those grown in other parts of the garden were destroyed.

KALES are more hardy than Broccoli, still it is best to plant them in succession, planting one lot

the latest, on a cool border, so as to afford a late supply of heads that will not readily run to seed. The dwarf sorts of Kales are best for late use; and a good breadth of the Asparagus and cottager's Kales usually are very useful in the scarce time in spring. Sprouting Broccoli require much the same treatment as the Kales, and like them to be planted in firm ground.

SAVOYS are ready for planting out, the ground, which has carried a crop of early Potatoes or Winter Spinach, being utilised for them. The large-growing Drumhead Savoy is a profitable variety, if size only be studied, but the smaller Savoy is of more general usefulness, and not so strong in flavour. The planting-out of other winter crops should receive due attention, and the quarters, &c., be cleared of any crops of early Peas, Beans, and Cauliflowers, not leaving them to impoverish the soil, and become unsightly.

PEAS.—These, if tall-growing, should have the bine topped at 4 feet, to induce early podding; and if these crops are the least dry at the root, water should be applied heavily, and should the soil be light, a good mulching with litter put alongside the rows will retain the moisture in the soil for a long time. The same remarks will apply to the crops of Kidney and Broad Beans and Scarlet Runners, which soon exhaust the soil of its moisture.

LEEKs.—Trenches should be prepared for these in the same way as for Celery, but closer together, and the plants carefully put out in them with all their roots intact, previously watering the beds, and also the trenches after planting. For an early supply, the Lyons Leek is excellent, and the Musselburgh Leek for late use.

PARSLEY.—The present is a good time to make a sowing for winter supply, sowing the seed in such a manner that common frames may be placed over it in severe weather. Sow the seeds thinly. If root be dusted in showery weather over the earlier sown plants, it will assist growth and check the ravages of insects.

CELERY.—The planting of this crop must be proceeded with as fast as the ground is cleared. Sometimes at this date the ground occupied by the early spring Cabbages may be planted with Celery, there being nothing gained by leaving the Cabbages to sprout.

FRUITS UNDER GLASS.

By J. RIDDELL, Gardener, Castle Howard, York.

PEACHES AND NECTARINES.—The late succession trees will require some amount of vigilance to prevent the temperature getting too high now that the fruits are showing, air being admitted freely by day, and some small amount of it by night. If thinning has not been sufficiently severe, no time should be lost in removing the too numerous fruits, not letting the trees carry fruit which must eventually be sacrificed. Look over the trees at short intervals of time, and keep the shoots tied to the trellis, and expose the fruit as much as possible when doing this. Borders that are well drained, if inside the houses, should be well supplied with water at this season, remembering that soils that are light and porous stand in need of heavy watering at intervals of three weeks or a fortnight when the weather is dry. If the trees are weak or the crops heavy, make use of weak manure water, but not to the extent of causing grossness of growth. Syringe the trees twice daily in sunny weather, and frequently sprinkle the borders and paths.

SUCCESION-HOUSES.—When the fruits have commenced their second swelling, the temperature of the house may be raised a few degrees by day, and fewer by night. If the surface of the border be caked, loosen it with a steel digging fork, to admit air and water more readily. The appearance and the flavour of the fruits depend a good deal on the amount of direct sunshine that they receive during the later stages of growth. Therefore, any leaves which may be obstructing the light from the fruits should be brought to the under side of it or quite removed. Should thrips appear on the leaves, fumigate the house on three nights in succession with medicated tobacco paper, and make sure that no red-spider remains before syringing ceases for the season.

THE HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener, Merecroft Castle, Maidstone.

GOOSEBERRIES AND CURRANTS.—Plants trained on walls and fences should now have their leading

shoots nailed in, and the laterals cut back to within 4 or 6 inches of the base. These plants produce good clean fruit for the desert, and they are easily protected from birds and retarded, by covering them with mats or thick netting.

RED AND WHITE CURRANTS on walls, &c., should be treated somewhat similarly to the Gooseberry with regard to pruning and training, as they readily fruit on the spurs and shoots of two years' old. If the plants are trained on a sunny wall, do not thin the young shoots too severely, or the fruits will get damaged by the sun. Mulch the soil over the roots with farmyard manure, and heavily water them, and occasionally use manure water. Green-fly should be dislodged by means of the garden engine and clean water.

SWEET CHERRIES.—In most cases, and especially on trees whose flowers were not fully expanded at the period of the spring frosts, there are very heavy crops, and the foliage is healthy and tolerably free from aphides. Choice varieties should be at once netted. After the leaves, and especially the tips of the shoots, are cleared of all insects, by means of clean soft water only, the fruits should not be exposed too much, or rain will be apt to spoil them. If the nets are large enough, fasten them 4 or 5 feet away from the foot of the wall, thus enabling a person to walk along the front of the trees in gathering fruit, &c., without any disturbance of the net, except at the ends. All leaders should be secured to the walls, care being taken that the bark is not in contact with nails, or gumming will result, with loss of the shoots. If the crop is a very heavy one, slight thinning of the fruit may be practised, and the roots supplied with a soaking of tepid manure-water. Attend to the training of shoots of young fan-shaped trees, laying in the wood required for the framework of the future tree at about 10 inches apart, and pinching out the points of any shoots that may be growing too strongly.

PLANTS UNDER GLASS.

By R. MILNER, Gardener, Penrice Castle, Swansea.

FERNS FOR CUTTING.—To have the fronds of Ferns in such a condition that they will remain fresh-looking for a number of days, the plants should be subjected to no more heat than is necessary, and to as much light as is safe, no more shading being made use of than will preserve the younger fronds from injury by bright light; and the plants from the first should have air freely afforded whenever it is prudent to do so. Treated in this manner, the cut fronds keep fresh for from five to six days. If they are immersed in water for several hours, their freshness may be still further increased.

TODEA SUPERBA.—A very suitable place for this species, which is undoubtedly one of the finest of the Filmy Ferns, is in a glazed case, if the plant be large, or a bell-glass if small, placed in the cool greenhouse, and little or no air afforded them, and on no account to syringe the plants. By keeping *Todeas* in this manner, the fronds will generally be found with drops of water hanging to their margins, a sure indication that the plants are in a healthy condition. Filmy Ferns like subdued light, which makes it necessary to place them in a position where the sun's rays do not reach them.

TREE FERNS.—Large specimens of Tree Ferns which have occupied the same tubs or pots for several years, should be supplied with weak manure-water twice a week during the growing season; a light shade during the hottest part of the day, being afforded, but the matter of shading must not be carried too far. More air, and less moisture overhead and in the atmosphere, are the secrets of having these plants in a healthy condition, for should the plants be afforded too much shade, and the temperature kept too high, there is usually an increase of trips and other insect enemies, and under such kind of treatment, the fronds are too tender to stand much washing with tobacco-water or fumigation, in case the plants become infested with this pest.

FERNS GROWING IN BASKETS.—Specimens which are growing in hanging baskets must have close daily attention in the matter of watering.

POINSETTIAS PLANTED OUT.—Where space can be spared in which to put out a few of these plants

in beds at the back of the stove, so that they will not become crowded by the other inmates, they will grow to a larger size than in pots, and the show is more effective in its season. The plants afford fine material for cutting from. Another lot of cuttings may now be put in to form a succession to those early struck. Choose the young growths which have firm wood at their connection with the main stem. Put the cuttings singly into small pots in a mixture of sifted loam and sand, filling them to half their depth with this compost, and the remaining part with clean sand; place them in the propagating frame, giving them the necessary shading when the weather is bright, and when the cuttings are rooted admit air gradually for a few days before finally removing them. Cuttings which were put in early should, when well rooted and started into growth, be shifted into pots two sizes larger. Rich fibrous loam three parts, with one of decayed manure, and sand in proportion, will suit them well. Grow them in a structure, well up to the glass, where a moderate stove temperature can be maintained, using a light shade during the hottest part of the day.

THE ORCHID HOUSES.

By H. A. BURBERRY, Orchid Grower, Highbury, Birmingham.

THE CATTLEYA-HOUSE.—There is still a good show of bloom on Cattleys of the labiata section, which are invaluable where cut flowers are largely required. The first of these to open was *C. Percivaliana*, which was closely followed by *C. Trianae*, both of which should now be freely growing—the former being so placed as to receive a good deal of sunlight. Next in order of flowering was *C. Mendeli* and *C. Mossii*; and although the flowering of most of the plants of these species is over, there remain a considerable number of blooms to open; and these, together with *C. Warneri* and *C. gigas*, will supply flowers for a month longer—that is, till *C. Gaskelliana* will be plentifully in bloom. The latest Cattleyas to expand their blossoms are *C. Eldorado splendens*, *C. labiata verawarocqueana*, *C. speciosissima-Lundemanniana*, and *C. aurea*, the late-flowering variety of *C. Dowiana*. These species make a grand show during the later autumn months, and they should now be induced to make free growth. *C. aurea* grows best if placed at the warmest part of the house, near the glass. The great beauty of the labiata Cattleys should not, however, lead us to underrate other varieties of Cattleys, which are showy and useful, and flower at different seasons. *C. Schilleriana* has just passed out of bloom; one of the smaller growers, it usually starts to grow in January, and must have a place in the warmest house, although, now that the growth is complete, and rest is necessary, it is best to remove the plant to the Cattleya-house, and afford it only a moderate supply of water. *C. Acklandiae*, now in flower, takes very closely after *C. Schilleriana* in habit and requirements, and we treat them alike, growing them in small baskets or pans up near the glass. *C. Walkeriana* is also in flower, and very pretty it is. The manner of its flowering is curious, the plants making alternately a pseudobulb, and then (if strong enough) a flowering growth, which is simply a short stem from the base of the pseudobulb which has produced a flower spike from its apex. This species grows well in the Cattleya-house. Cattleya *Lawrenceana* and *C. Skinneri* are spring-flowering species, and although they do well in the Cattleya-house proper, they do perhaps better in a house with a trifle more warmth whilst growing. *C. superba* should be in company with *C. Eldorado*, near the roof in the Dendrobium-house. For autumn flowering *C. Harrisonia*, which is valuable at that season, grows well in the Cattleya-house, as do *C. amethystoglossa*, which flowers in spring, and *C. granulosa* in autumn.

Another beautiful Cattleya is *C. maxima*, which I find to grow best in an intermediate-house that is somewhat cool and shady. *C. Bowringiana* is useful, coming in during November; and it should be grown near the glass in the Cattleya-house, its flower trusses coming larger in such places than when the plants stand far away from it. Cattleya *Rex* is apparently a plant of robust constitution, and our established pieces of it are breaking very strongly, but the semi-established ones tell a tale of having been imported at the wrong season. Cattleys imported in the autumn are a considerable time before they regain their strength, which is not to be wondered at when we consider the time of the year

at which they are collected, and the long period of time that elapses before growth recommences in the following spring.

THE APIARY.

By EXPERT.

YOUNG QUEENS.—The swarming season is the time when young queens can be most easily secured and used for superseding old ones, or kept for future requirements. After a stock has swarmed, the queen cells should be searched for, and those that are within a few days of maturity, which may be observed by the dark colour they assume at the ends, should be cut out and placed in a queen nursery or singly in empty match-boxes. They should then be put over the top of the bottom quilt in a hive containing a stock, and well covered up where they will remain warm and snug until the young queens bite their way out. As soon as this happens, they should be disposed of by making nuclei to contain them, comprising two or three frames of brood, each with adhering bees, or by giving them to stocks from which the old queens have been removed. It is a very easy matter to introduce young queens at this early stage of their existence, as they are seldom if ever molested by the workers, and may with impunity be run in at the entrance, or allowed to go down between the frames, a corner of the quilt having been turned back for the purpose. The present is the time when the method as practised by Dr. Tinker, of inducing bees to rear a new queen whilst the existing one is present, and laying in the hive, can be tried. The plan is, to remove and place the old queen in an upper storey, furnished with frames of comb or foundation, and keep her there by placing between them a sheet of queen-excluding zinc. The bees will then start queen-cells below, and raise a new queen, and when hatched, she will be able to leave by the ordinary entrance, and get fertilised. Provision must be made to allow the drones to escape from the upper chamber, if there are any, by boring a hole through the side.

FORESTRY.

By J. B. WEBSTER, Fairview, Stangroom, Devonshire.

DRAINING.—In all cases where the ground contains excess of water, draining becomes necessary, and in most cases the practised eye of the planter can tell by the appearance of the surface herbage, the spots that require drainage; but the best test is to dig narrow holes here and there, some 20 or 30 inches deep, and if these should attract and retain any considerable quantity of water, it shows that the subsoil is wet, and requires to be drained. Sometimes the surface may appear to be fairly dry and firm, while the subsoil is cold and wet; trees planted on such a soil, without drainage, make but slow progress, and in many cases they never attain a profitable size at all, and in some cases, some of the species are apt to die out altogether, or, at best only attain the size of stunted scrub. Open ditches are best for plantations, as they are not apt to be closed up by roots, and can be scoured out occasionally to give egress to the water. On the other hand, when drains are formed and filled-in with stones, or a tile pipe laid in the bottom and filled up with earth, they are sure to get choked with tree-roots in course of time, and then cause a great deal of trouble and expense. Sometimes large areas of ground are kept in a cold, wet, boggy state by a single spring pouring its water on to a hill-side, and when that is the case, the spring should be tapped by cutting a ditch of sufficient size to meet the requirements of the case. A well-directed ditch of this kind may be laid off in such a way as to tap a series of springs at their fountain-heads along its course when it becomes necessary, and this should always be kept in view by the planter at the time of preparation. When it becomes necessary, small branch ditches may be cut here and there from the main drain, and at such an angle from it as the lie of the ground may suggest. All the stuff excavated from these ditches should be spread out in a regular and uniform manner over the surface of the ground, and not left lying in a ridge at the sides, which gives the land a slovenly appearance, and prevents the surface-water in some cases from finding its way into the ditches. The cost of cutting these ditches varies considerably in different parts of the country, according to the rate of wages common in the locality, the size of ditches, and the character of the soil; but if possible the work should be done by contract, more especially when the land forms an outlying part of an estate.

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

WEDNESDAY, JUNE 29 { Royal Botanic Society: Musical Promenade.

FRIDAY, JULY 1—Dundee Horticultural Association.

SHOWS.

TUESDAY, JUNE 28—Maidstone Horticultural and Rose.

WEDNESDAY, JUNE 29 { Ipswich, Widsor, Farnham, and Richmond (Surrey), Rose Shows.

THURSDAY, JUNE 30 { Canterbury, Eltham, and Winchester Rose.

FRIDAY, JULY 1—Brockham Rose.

SATURDAY, JULY 2—Crystal Palace (National Rose).

SALES.

MONDAY, JUNE 27 { Clearance sale of glass erections, stock, and utensils at the Nursery, Northwold Road, Clapton, by Frotheroe and Morris.

TUESDAY, JUNE 28 { Sale of a private collection of established Orchids, at Frotheroe and Morris' Rooms.

FRIDAY, JULY 1 { Sale of imported and established Orchids, at Frotheroe and Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—62°·5.

THE Veitch Memorial Trustees in their discretion have, as we believe, acted wisely in their determination not to confine the awards they make to meritorious exhibits, but have extended their recognition also to gardeners who, by their labours, have substantially promoted the advance of horticulture. There are many ways in which gardeners may thus contribute alike to the advancement of their craft, and to their own honour and repute. Assuredly there are no more powerful means of doing this than by actually calling into existence valuable races of plants which previously were non-existent. In this way, the raisers of new plants take rank with great artists and great men of letters, who, by their genius and skill, are actually originators of new objects of value, interest, and beauty. To make two blades of grass grow where one only grew before, is a task that even an average cultivator performs every day of his life. But the intelligent and skilful hybridiser does more than this—he may, in a sense, be said to create that which before had no existence. The two gentlemen selected by the Veitch Trustees this year belong to this category. They are members of a class which JAMES VEITCH, to whose memory the Medals were instituted, and who was pre-eminently a judge of character, so greatly encouraged in his lifetime.

Mr. WATSON, the Assistant-Curator of the Royal Gardens, Kew, in association with Mr. NICHOLSON, occupies a distinguished but an extremely difficult position. While ordinary gardeners have to care for their Grapes, their kitchen gardens, and to a supply of decorative plants and cut flowers, and comparatively little besides, the Curator at Kew has under his charge a vastly more varied and important collection of plants. He has to consider not only the general decorative effect of the gardens, but the interests of science, which at Kew should always predominate,

and the development of the economic resources of the several colonies. The standard of cultivation in that establishment should be, and indeed is, high in all departments, and the collections should be thoroughly representative, and not limited to a few classes of plants only, such as may be in vogue at any particular time. Those who have watched the condition of the Royal Gardens for some years past will recognise how greatly the cultural details throughout have been improved without any lowering of efficiency in those special features which renders Kew unique among the gardens of the world. Moreover, Mr. WATSON may proudly claim to have originated a new race of hybrid Streptocarpus, which bids fair to rival, if not to surpass, the Gloxinias in the estimation of the horticultural public.

Mr. HEAL is one of a famous band of hybridists at the Chelsea nurseries, and a worthy associate of DOMINY, of COURT, of SEDEN—need we say more? Those who know what the Amaryllis has become in his hands, and specially those cognisant with his feat in originating the greenhouse Rhododendrons, in all their wonderful variety and beauty, will feel that he has well won the honour which Sir TREVOR LAWRENCE, the President of the Royal Horticultural Society, at the instance of the VEITCH Memorial Trustees, conferred upon him on Tuesday last.

Our readers will feel an interest in the following particulars relating to the career of these two representative gardeners, and with which, at our request, we have been favoured by them:—

"W. WATSON left school twenty-three years ago to be apprenticed to the propagator in the nursery of Messrs. S. P. KER & SON, of Liverpool. From here he went to the Rock Ferry nursery of Mr. G. SMITH, and from thence to the Wavertree nursery of Messrs. T. DAVIES & SON. He also worked in the famous Vineyard nursery of Mr. J. MEREDITH in Garston. Thence he went as propagator to Messrs. R. PENNELL & SON, Lincoln, and from there he came to London, where for two years he was employed in the Clapton nurseries of Messrs. H. LOW & CO. In 1879 he obtained the appointment of foreman and propagator in the Royal Gardens, Kew. On the retirement of the late Mr. J. SMITH from the Curatorship, six years ago, the post of Assistant-Curator was made for Mr. WATSON, who now shares with Mr. NICHOLSON, the Curator, responsibility for the living collections of plants. Mr. WATSON's special charge being the indoor department. He has prepared a popular work on Cactaceous plants and another on Orchids, both published by L. UPcott GILL, of the Strand. He has been a contributor of papers on practical subjects to the *Gardeners' Chronicle* and other journals from his first appearance at Kew. He also is London correspondent to the American journal known as *Garden and Forest*."

Mr. HEAL writes:—"I was apprenticed to the nursery and seed business at the Westcott nurseries, near Barnstaple, North Devon, where I learned the usual work of a country nursery, such as budding, grafting, propagating, &c. At the end of my apprenticeship in March, 1863, through the kindness of Mr. JAMES VEITCH, sen., of Exeter, just a few months before his death, I was recommended to the late Mr. JAMES VEITCH, of Chelsea, as an improver for the Coombe Wood nurseries. I remained there for two years, and then came to Chelsea under Mr. TAYLOR, who, with Mr. VEITCH, sen., of Exeter, was the first to hybridise the beautiful Malayan Rhododendrons which are now so popular. My first foreman charge at Chelsea was the ferneries.

"In 1873 I was appointed to my present department, where I have devoted much time to the hybridisation of different flowers, with the view of improving them either in colour, size, form, or habit of growth, especially the Amaryllis and Java Rhododendrons, obtaining amongst the latter the new section of double varieties, known as the Balsamineflorum section. The autumn and winter-flowering Begonias also originated in my department, and, amongst other things, the improvement of the Streptocarpus, which was so ably commenced by Mr. WATSON at Kew, has been followed up."

NATIONAL ROSE SOCIETY.—The Chester exhibition will be held in the Folly Field, Flookersbrook, Chester, on Saturday, July 16, instead of on Thursday, July 14, as previously arranged.

ROSE SHOWS.—I wish to draw attention, writes Mr. BRUCE FINDLAY, to a nuisance in connection with the above, and trust that stringent measures will be adopted to put a stop to it. I refer to the practice of exhibitors selling flowers before the exhibition is closed. At most Rose shows, visitors are seen carrying flowers about the grounds an hour or two after the exhibition is open, and the result is (I speak from unpleasant experience), that the manager of the show is inundated with applications from all sorts and conditions of people to procure blooms for them, and if he expresses his inability to comply with the request, he is at once accused of favouritism, and asked how it is that Mrs. Jones, and a host of others, can walk about with flowers, and others are refused? The remedy is to insert a clause in the schedule, to the effect that any exhibitor selling flowers before the close of the exhibition (either surplus stock, or from the competing stands) shall forfeit the amount awarded in prizes.

JUNE HORTICULTURAL MEETING AT GHENT.

—A brilliant meeting, at which the following awards were made. Certificates of Merit were allotted for: —1, *Odontoglossum cavallianum*, white ground, with border of canary yellow and black spots. 2, *Cattleya Gaskelliana alba* Van Imeschotiana, large, white, well-formed flower. 3, *Odontoglossum nobile*, white, much spotted with chestnut-brown, unusually rounded in shape, all three to M. J. Hye-Leyssen; 4, *Miltonia vexillaria leucoglossa* superba, to M. R. Lemoine; a rare variety, with large white lip, the plant bore ten flower stems, each with from five to eight flowers. 5, *Vanda insignis* to M. A. Van Imeschot, remarkable for the beautiful form of the flower. 6, *Disa Veitchii*, to the Société Louis Van Houtte, père, hybrid of *D. racemosa* × *D. grandiflora*, bloom delicate pink. 7, *Cattleya labiata*, var., to the same, petals very large and dark. 8, *Disa Veitchii*, to M. Aug. Van Geert. 9, *Lælia elegans alba*, to MM. Ed. Vervaeet et Cie. 10, *Cypripedium albo-purpureum*, to the same, a fine plant of a rare hybrid, which is difficult to bloom satisfactorily. 11, *Odontoglossum excelens*, white, bordered and tinged with yellow, spots dark. 12, *O. majesticum*, very beautiful, and somewhat resembling *O. nobile*, but background more clear. 13, *O. crispum* Wrigleyanum, evenly spotted with claret on a white ground. 14, *Lælia elegans alba* var. 15, *Cattleya Warcewiczii*, flower unusually large, all to M. Jules Hye-Leyssen. 16, *Asparagus plumosus cristata*, to MM. Duriez Frères; a curious variety, the edges of the fronds waved as in *Pteris cristata*. 17, *Anthurium Scherzerianum*, Marie-Thérèse, to M. Aug. Van Geert. 18, *Croton Keidi*; and 19, *Croton Golden Ring*, to the same. Certificates of Merit for cultivation and blooming, for:—1, *Miltonia vexillaria leucoglossa*, to M. R. Lemoine; fine specimen with sixteen flower-stems, bearing about a hundred blooms. 2, *M. v. l. superba*, to the same. 3, *Cypripedium Schröderi*, to MM. Vervaeet et Cie. 4, *Odontoglossum hestilabium*, to M. Jules Hye-Leyssen; fine plant, with two stems bearing at least fifty

blooms. Honourable Mentions, for:—1, *Celogyne Dayana*, to M. le Marquis de Waverin. 2, *Oncidium Kramerianum*, to M. J. Ilye-Laysen; and, 3, *Odonoglossum tripudians superbum*, to the same.

RARE AND NEW FERNS.—M. ARTHUR VANDER HEED has, among his many seedling *Adiantum*, one remarkable strain raised from *fragantissimum*; the fronds are reddish as in decorum, but the pinnales much larger, the plant more robust, dwarf and compact than the type. We may mention *Cheilanthes scita*, the peculiar *Doryopteris sagittifolia*, a *Pteris* apparently from Bausei \times Leyi reverting to Bausei, but the pinnales higher and erect.

OPEN SPACES IN LONDON.—At the monthly meeting of the Metropolitan Public Gardens Association, 83, Lancaster Gate, Mr. Deputy BEDFORD, Vice-Chairman, presiding, in the absence of the Earl of MEATH, a legacy of £75 was reported under the will of the late Mr. GEORGE MACKENZIE, De Beauvoir Square, N., and St. Botolph's Churchyard, Aldgate, had been opened to the public by Mrs. TYSSEN-AMHERST and the Hon. CHARLES FREEMANTLE, K.C.B., respectively. It was reported that the laying-out of the burial-grounds, Hackney Road,

STOCK-TAKING: MAY.—Owing to the advent of Whit Monday, the issue of the monthly Trade and Navigation Returns was delayed a little. The task of compilation is a gigantic one, and, this considered, the general correctness of the returns is a subject of congratulation for the issuing department. The—

IMPORTS, for the past month showed an increase of £558,040, as compared with the month of May in 1891, the difference between this and the figures for March need not be more than noted. The following is our usual extract from the monthly "Summary" table:—

IMPORTS.	1891.	1892.	Difference.
	£.	£.	£.
Total value for month	£34,377,898	£34,935,738	+558,040
II.—(A.) Articles of food and drink — duty free	11,249,544	12,111,860	+862,316
(B.) — do., dutiable	1,643,490	1,565,872	—77,618
VI.—Raw materials for textile manufactures (including Flax, Hemp, and Jute)	8,545,364	6,378,593	—2,166,771
VII.—Raw materials for sundry industries and manufactures (including wood and timber, hewn, sawn, split, dressed; vegetable materials, for paper-making, &c.)	2,899,859	3,351,827	+451,968
IX.—Miscellaneous articles (including Clover, Grass, Flax, Rape, Linseed) ...	1,000,599	1,381,901	+381,302
(B.)—Parcel Post ...	44,262	49,849	+5,587

Respecting the items, jute, silk, and flax, it may be remarked that prices vary in an upward direction. Deficiency in quantity or quality of Mulberry foliage affects the prices of silk, and, quite alive to this fact, the Indian Government are doing their utmost to educate native producers in all concerning the industry—an official handbook being spread broadcast where most required. In its pages information is given on all essentials to success, in every stage illustrated with "practical" engravings. Flax and jute also vary in price, the tendency being upward—our colonial friends should make a note of this; in the very far north-west of Manitoba, a large increase in the acreage devoted to Flax has to be noted for the coming season; and as many British farmers have located themselves in that region, we may rest assured they have reckoned with their host. From the general figures we take the following excerpts respecting the importations of fruits and vegetables during the month of May:—

IMPORTS.	1891.	1892.	Difference.
Fruits:—			
Apples, raw ... bush.	71,181	91,608	+20,427
Cherries	8,613	+8,613
Plums	125	+125
Pears	143	+143
Grapes	1,720	+1,720
Unenumerated, ..	43,910	39,710	—4,200
Onions	269,082	417,299	+148,217
Potatoes ... cwt.	313,006	160,787	—152,219
Vegetables, unenumerated, raw, ... value	£76,111	£59,270	+£16,841

There cannot be any doubt as to the value of these figures given month by month—there is a rapid response in the market prices. The imports from the Cape have ended for the season, and already the English syndicate engaged in the venture of the past few months are preparing for the campaign of 1893, forwarding instructions to the producers as to what to grow and how to pack and forward. Some things sent this year will not appear in the next venture, and with advantage the modes of packing and stowing will be altered. We next turn our attention to the

EXPORTS, which showed a decrease for the month of £1,960,504 in British and Irish manufactures, and an increase in the exportation of foreign and Colonial products

amounting to £1,144,116, a more favourable condition of affairs than last reported in this column. It may be placed on record that the decrease in the exports during the first five months of the year foot-up at £881,169, but the exports of produce other than British and Irish amounted to £391,134 during the same period. Our consular agents abroad persevere in calling attention to business backslidings on our part—the most recent coming from France in relation to garden and farm implements and appliances. Our American friends find it pays to cultivate French patrons—high and almost prohibitive as the present tariff may seem. Consular reports are profitable reading, especially at the present juncture. It is noteworthy that the principle of free trade is coming rapidly to the front in Italy and the United States—it will be a powerful factor in the Presidential election now "under way," and in those for the Italian Parliament later on in the year. It would be idle here to anticipate or even guess at the result; but nothing save benefit can result from letting in light on this most important subject. We may be permitted to draw attention here to the fact that India now manufactures 38 per cent. of the cotton goods "consumed"

JOHN HEAL.
(Victory Medalist.)

Spitalfields Churchyard, and St. Anne's Churchyard, Soho, would be completed by the end of June. As regards the last-named, Lord and Lady HOBHOUSE had kindly consented to perform the opening ceremony on the 27th inst. It was stated that the Duncan Terrace enclosure, Islington, had been transferred to the vestry by Lord CALTHORPE, and, on the application of the vestry, it was agreed to lay out the same, and contribute one-half of the cost. The Secretary announced that seats had been accepted for the Horsemen Lane playground; that twelve Bay trees had been placed in front of the National Gallery; and that Bishopsgate Churchyard was to be opened to the public during the summer months, under the care of the Association. It was decided to offer seats for Brompton Road, Acton, and Wandsworth; to apply for an extension of the hours during which the Tower Gardens are opened, and to take steps to secure the running ground, Bromley, and St. James's Churchyard, Pentonville, as public open spaces. It was heard with regret that the Bill of the London County Council for the acquisition of Lincoln's Inn Fields had been defeated in the committee of the House of Commons.

WILLIAM WATSON.
(Victory Medalist.)

by its inhabitants. This is a striking testimony to the beneficence of the British rule in the East.

DUTCH HORTICULTURAL AND BOTANICAL SOCIETY.—On the occasion of the meetings of the Society, on April 27, May 11, and May 25, 1892, the Floral Committee awarded the following certificates: First-class Certificates.—To Messrs. KUNZLAGE & SON, Haarlem, for *Fritillaria latifolia* seedling (new plant); F. I. Alma Tadema (new plant); F. I. Ronner Knip (new plant); *Arum species* (imported new plant); Camassia Cusickii (imported new plant); the following varieties of the Darwin Tulip: André Doria, Bayeriock, Charles Darwin, Edmée, Faust, Hitchcock, Hoala van Nooten, La Candeur, Laurentia, Mrs. Stanley, Nauticus, Parthenope, Pauline, Peter Barr, Prof. Michael Foster, Prof. Sargent, Reine Wilhelmina, Reverend D'Ombraire, Reville, Schoubert, Sieraad van Flora, Stanley, Theodor Jorissen, Van 't Hoff, and Whistler; the following varieties of the Flemish Tulip: Coligny, Colette, La Coquette, La Czarine, Madame de Lamballe, Marco Spada, Marguette de Valois, Meyerbeer, Quasimodo, Thetis, Valentine de Milan, and Victor Hugo. To Messrs. J. H. REELING & Co.,

Nieuwer Amstel, for *Rhododendron Edgeworthii*. To Messrs. DE GRAAF BROTHERS, Leiden, for *Narcissus* hybrid *Croai Plomp* (new plant); *N. hybrid* Mrs. Alfred Pearson (new plant); *N. hybrid* Mrs. Pape (new plant); *N. bicolor* Princess Colibri (new plant). To Messrs. V. SCHEUTZ & SONS, Haarlem, for *Narcissus* *Tazetta Maestro* (new plant); and *N. T. Masterpiece* (new plant). Second-class Certificates were awarded to Messrs. E. H. KRELAGE & SON, Haarlem, for *Anemone fulgens carinata* (imported new plant); the following varieties of the Darwin Tulip, Anton Roozen, Cabanel, César Borgia, Harry Veitch, Mr. J. Douglas, Ouida, Pensée Amère, Prof. Marshall Ward, Reverend Harpur Crewe, Sibylla, The Shah, Virginie, and Von Jehring; the following varieties of the Flemish Tulip, Bulon, Eros, Fleur de Marie, Le Brabant, Le Premier Debut, Le Troubadour, Lola Montez, Tombeau de Lincoln, Violette agate exstriae, Vasco de Gama. To Mr. C. G. VAN TUBERGEN, junior, Haarlem, for *Myosodium nobile* (insufficiently-known plant). To Mr. H. J. VAN HEIJST, Wijk bij Duurstede, for *Gladiolus vinulus* (imported new plant); *Ramondia pyrenaica*. To Messrs. ANT. ROOZEN & SON, Overveen, for *Gladiolus Kotschyana* (imported new plant); *Cyrtanthus Huttoni* (insufficiently-known plant); *C. Thunii* (insufficiently-known plant). To Messrs. V. SCHEUTZ & SONS, Haarlem, for *Narcissus Tazetta Atlas* (new plant); *N. T. Leonard da Vinci* (new plant); *N. T. Leonore* (new plant). Botanical Certificates: To Messrs. E. A. KRELAGE & SON, Haarlem, for *Tulipa species nova* (imported new plant). To Messrs. ANT. ROOZEN & SON, Overveen, for *Onosma alba rosea* (new plant); *Lewisia rediviva*. To Mr. H. J. VAN HEIJST, Wijk bij Duurstede, for *Ourisia coccinea* (insufficiently-known plant); *Thomasia solanacea* (insufficiently-known plant). Awards of Merit: To Mr. H. J. VAN HEIJST, Wijk bij Duurstede, for a collection of *Primula Sieboldii*, in seven varieties; *Boronia elatior* (good culture). To Mr. J. H. SCHONER, Putten, for a collection of cut flowers of *Primula Auricula*. To Messrs. ANT. ROOZEN & SON, Overveen, for a collection of *Primula cortusoides*, in eleven varieties.

EFFECTS OF THE LATE FROST.—The late frost appears to have caused much injury in some parts, as will be apparent from the following note from a correspondent:—*Iresine*, *Colens*, and other tender bedding plants are cut to the ground, and *Cannas* and tuberous *Begonias* are very much injured, whilst *Pelargoniums* have not suffered greatly. Trees of *Catalpa* and *Walnut*, and bushes of *Portugal* and the common *Laurel*, present a scorched appearance; while *Nordmann's Fir* and the common *Spruce*, that were late in starting into growth, have been cut. The garden is near the river Thames, and the frost was from 5° to 7°. A few miles distant on the hills there was little or no damage done.

OLD ENGLISH TULIPS.—It will be observed from an announcement in another column that Messrs. STUART & MEIN'S extensive collection of Old English Tulips is now in bloom, and we would strongly recommend our readers to go and see them, as we believe there is not such another sight to be seen in Scotland. At present, as a class, they are practically unknown to the great body of amateur gardeners, which is unfortunate, as some of these old Tulips are marvellously beautiful.

EARLY NECTARINES.—The proprietors of the nurseries at Sawbridgeworth, past and present, have by their new fruits, added considerably to the fruit season by reason of the early and late varieties which they have from time to time raised and brought into commerce. We remember to have observed some Nectarine trees in pots—as yet unnamed—that were shown by Mr. T. F. RIVINS, at the last Temple Show, whose fine fruits were quite ripe, whilst those of Nectarine Lord Napier, also shown under the same kind of treatment, would require three weeks or a month longer to ripen them. We have lately received some fruits from Mr.

RIVERS of the Early Rivers Nectarine, from trees in 11-inch pots, large, luscious, well-flavoured, and of rich dark colour—excellent in every respect.

FLOWERS IN SEASON.—We have received some beautiful flowers of named varieties of Pansies from Mr. J. FORBES, of Hawick, N.B., of a size and substance that southern growers can scarcely hope to rival.

FOREIGN CORRESPONDENCE.

SPAIN.

Monsenal, Spain, June 16, 1892.—Will the introducer of the *Zaragoza* Daffodil say, if, in 1884, he may have made a mistake when he gave *Zaragoza* as its station? I have spent a week in *Zaragoza*, and have satisfied myself there is no trumpet Daffodil within a wide radius of this town, the country is too dry, and mostly cultivated land artificially irrigated. I also consulted with persons likely to know, and have searched the herbarium and the library all to no purpose. In *Plantas Aragonesas Espontáneas*, 1866 and 1867, p. 405, *Pseudo-narcissus* is given as on Moncayo, so I made a pilgrimage to this little-frequented mountain, its upper half "treeless, wet, and windy." Armed with an introduction to a collector of medicinal herbs and roots, I started for Taragona, and contracted with the landlord of the inn to convey me, feed, and mount me, and bring me home in safety—all of which he duly succeeded in doing, but by the skin of his teeth, as the rain, thunder, and lightning dogged us during our return. Moncayo was enveloped in a grand storm, and black as night. On a Friday afternoon we started in a rickety gig, drawn by an excellent spirited horse, calling at the suppressed monastery of the Cistercians, now occupied by the Jesuits as a college for educating priests, and one of the sights in Spain to those who appreciate church architecture. Thence we proceeded to Añon, a small village or town, with its high walls and old castle. Now came the question where we could sleep. As the landlord declared they all lived like pigs in the place, sundry places were tried, but without success; then José Maria Lobeg fell back on my suggestion to try the priest, and shelter was at once offered with profuse hospitality; the big, handsome priest soon had the bottle on the table, and filled glasses all round, Lobeg meantime looking to the supper, and a sumptuous one it was—salads and Asparagus in abundance. On Saturday morning, at 4.30, two donkeys and their attendant, with his best velvet breeches and blue-striped continuations, and curious devices to protect the feet; my friend, Domingo Viqueza, rigged out in a similar fashion. We started, and by 9 o'clock reached Nuestra Señora de los Remedios del Moncayo. Here, under an arch, we rested and refreshed ourselves, but were soon joined by peasants, who had come from Taragona with offerings of unsalted lime to the Virgin, the place being about to be put in repair for a summer resort for priests and pilgrims; and as Lobeg had sent up a great leathern bottle full of wine, our two guides, Nature's gentlemen in manners and carriage, every inch of them, walking with head erect and a firm foot-hold of the soil, indicating we are Aragonese, and know no superior, dispensed hospitality to their countrymen so freely that Aragonese songs were sung, and one old man favoured us with an Aragonese dance, adding, "I often come up here to see the Virgin, and to enjoy myself." Domingo Viqueza placing himself in position an artist would have delighted to sketch, extemporised a song of welcome to the London botanist. Things went on so merrily that there was danger *Narcissus* might be forgotten, when I made a move, shook hands with our new friends, and just above where we rested found the trumpet *Narcissus* growing on a piece of ground as level as a bowling-green; above in a direct line for 3000 to 4000 feet were loose stones, down which the water would roll after a shower. Below the buildings where we rested, the soil seldom more than 1 inch vegetable loam, the other rich powdered slate, and below this broken

slate. So shallow was the soil that it lifted like turf for laying a lawn, and the bulbs were broke off beneath, leaving the sods as lifted, the roots of the bulbs spread out as if grown on rocks, evidently confining themselves to the 1 inch of vegetable soil; along with them grew *Colchicum montanum*, and amongst the rocks, a pretty pink Thrift. As we collected the *Narcissus*, thunder began to roll and the clouds to gather, so we took the hint, put the bulbs in a sack, mounted the donkeys, and made for shelter to refresh ourselves with some of Lobeg's abundant provisions, returned to Añon, got into the rickety gig, and had our supper in Taragona, and the following morning by an early train returned to Taragona with our prize, but cannot say what it may be till 1893, but it will not be the *Zaragoza* Daffodil. P. Barr.

TABLET TEA AND TEA-DUST IN CHINA.

It appears from the British Consul's report on the trade of Hankow for 1891, that the export of tea tablets was small, a fact due, it is said, to the famine in Russia. The tablets being exported after the leaf tea season is over, and being consumed by the Russian commercial classes as a luxury, the export of them is particularly liable to be affected by the prosperity or otherwise of Russia's commerce. The decrease in the export of tea-dust of over 60 per cent. is serious; all the tea-dust exported from Hankow went to Great Britain to flavour Indian teas. The decrease is due to two facts—first, the consuming classes are getting accustomed to the flavour of Indian tea, and consequently the dust is not so much in demand with our grocers for giving it the flavour of Chinese tea; and, secondly, the tea growers of Ceylon have been successful in producing a flavouring tea, which blended with the Indian tea, suits the palates of the British consumer.

In connection with the tea plant it may be stated, that the oil expressed from the seeds is used both for food and as an illuminant. John R. Jackson, Kew.

CŒLOGYNE MASSANGIANA.

A SHORT time since we noticed among Lord Pembroke's collection of Orchids, under the care of Mr. Challis, at Wilton House, near Salisbury, a young plant of the above handsome *Cœlogyne* in fine condition, bearing three fine spikes of bloom. The sepals and petals of this variety are of a light ochre-yellow, and the lip of a shade of crimson-brown, with lines of yellow colour; the front lobe is white at the edge, with a blotch of brown in the centre, through which run three yellow keels. The plant does well in a Cattleya or intermediate-house.

HOME CORRESPONDENCE.

THE RECENT FROSTS.—A sharp frost last night (the 14th inst.) has done much damage in this district to Runner and French Beans, Potatoes, especially varieties of the early American strain; Vegetable Marrows, Cucumbers when not sheltered by Rye, Tomatoes, &c., and even Longpod Beans in flower, and late Peas hung down their heads. I cannot send you the correct data in degrees of frost, as the thermometer in a town at this time of year is no criterion as to what is going on outside. The chief injury has occurred in lands lying at a somewhat lower level than the rest of the district, and the effects of the frost have been extraordinarily partial, plants and rows being selected here and there without apparent difference of site, soil, or shelter. One piece of early Potatoes I saw under a fence sheltered from the N.E. were, however, injured, whereas, the same variety grown in the open only a few yards off was uninjured. I never recollect so much destruction so late as June 14 or 15. Thomas Laxton, Bedford.

—Great loss has been caused in gardens in our district by the frosts of the 14th inst., which were severe enough to destroy Kidney Beans and Scarlet Runners, and to injure Vegetable Marrows, Ridge Cucumbers, and Potatoes. G. Fulford, Trafalgar Park, Salisbury.

—A sharp frost occurred on the morning of the 15th inst., when 3° or 4° were noted in some places. We registered 32°, and the mean temperature for the 24 hours preceding the frost was only 44° against 63° last week for the corresponding day of the week. *Heliotrope*, *Ageratum*, *Alternanthera*,

Mesembryanthemum, Coleas, and the like tender plants are cut down to the ground. Amongst vegetables, the Vegetable Marrows are blackened; fortunately, we have a few still under protection. French Beans, Potatoes, Strawberry blossoms, and Beetroots are cut down. What with the frost and the dry weather hereabouts, matters horticultural look anything but encouraging. Our deficiency of rain amounts up to date to $3\frac{1}{2}$ inches, reckoning last year's fall, which was under average for the first six months, *W. A. Cook, Compton Bassett.*

LARCH DISEASE.—The letter from Mr. Webster in your paper of June 11, attributing the Larch disease on Mr. Wilson's plantations in Hampshire to the fact of their being on chalk soil, is certainly not a complete explanation, even if it is partially correct. Some of the largest, finest, and healthiest Larches in England, about 100 years old, are now growing on a very thin calcareous soil, not chalk but oolitic limestone soil, on my land in Gloucestershire; whilst on the same soil, aspect, and elevation, Larch planted from five to thirty years ago, are badly diseased. I have long been trying to discover the cause of the great deterioration which appears to have recently taken place in the constitutional vigour of the Larch, which has caused great loss to planters in many parts of England. Many practical, and some scientific, authorities have written on the subject, but none seem to have studied it thoroughly over a large area, and no practical remedy has been discovered. My own opinion is, that there has been a loss of vigour in the tree, owing to the series of more or less bad seasons which have prevailed of late years, especially since 1878, and that trees raised from native seed are not so likely to remain healthy as trees raised from Tyrolse or Swiss seed, which, however, is for some reason I cannot discover, considered inferior by nurserymen. Of course, the more suitable the soil and climate the better the tree will grow, but nearly all that I have planted since 1870 are more or less diseased, and in some cases are now very badly attacked by *Coccus laticus*, which is the effect, as I think, rather than the cause of an unhealthy condition, whilst older plantations are healthy. I planted 28 acres in 1890 with Tyrolse Larch, procured from Messrs. Little & Ballantine, and they withstood the severe frost of May 15, 1891, and the two very dry and cold springs we have had successively, as well as, or better than any others. Mr. Michie, forester to Her Majesty at Balmoral, has attended to this question, and will I hope give his opinion on the subject. *H. J. Elwes, Coleborne, Andoversford, R.S.O., Gloucestershire.*

THE COMPARATIVE EARLINESS OF CERTAIN VARIETIES OF PEAS.—The sample of Peas which I send for inspection were grown from seed sown in the fourth week of January in gentle heat, and when they were hardened off, transferred to the foot of a south wall in the first week of the month of March, all being treated similarly. The varieties were Ringleader, of which pods were gathered on May 30; William I., ready on June 4; and Sutton's Dwarf Marrow on June 8. *T. Lockie, Oakley Court Gardens, Windsor, June 8.* [The Peas were fine for the season, and past their best, especially the first two, when our correspondent sent them. En.]

DEW, AND ITS ACTION ON PLANTS.—In an article with the above title in the *Gardeners' Chronicle* for June 11 (vol. xi., p. 753), Mr. Matthewman gives some account of Professor G. Wollny's researches upon this subject. I have not seen the original paper, but the conclusion that "the great use of dew as a means of supplying plants with moisture is an error, for plants can only be adequately refreshed by earth moisture absorbed by the roots," is one which I think is very misleading, for it is not in accordance with either my own experiments, or those of Boussingault, or of Dr. G. Volken. The controversy as to whether plants can absorb water by their leaves is at least 160 years old, and when M. Duchartre revived it in 1857, and thought that he had proved (negatively) that absorption did not take place, M. Boussingault, on the other hand, proved (positively) that they can, and recorded his observations and experiments in the *Annales de Chimie*, Mars, 1878; while his observations were in progress, I had been experimenting for a long time, and the conclusion I arrived at agreed with his. I would express it thus:—As long as plants can derive their supply by their roots, which are the normal instruments of absorption, and so keep their tissues in a sufficient state of turgidity, they do not absorb any appreciable amount of water, either from rain or dew; but when the

transpiration has exceeded the supply, and the tissues tend to become flaccid, then they will absorb it with avidity, as the following examples show. I will quote from my paper "On the Absorption of Rain and Dew by the Green Parts of Plants" (*Journ. Lin. Soc.*, vol. xvii., 1878, p. 313):—"In the following experiments, the leaves were gathered between 4 and 5 o'clock in the afternoon of September 10, 1878. They were then exposed at an open window to the full light of the sun until it set. After two hours and a half, the herbaceous ones showed obvious signs of loss of water, having become more or less flaccid. The loss was not visible in the case of the coriaceous leaves. They were all weighed at 7 P.M. A bright moonlight night followed, and an exceedingly heavy dew began to form at 7 P.M. The specimens were all spread out upon a grass-plot. At 7 A.M. on the 11th, before the sun was visible, in consequence of a heavy mist, the specimens were carefully dried with a soft cloth, so as to remove all trace of dew, with which they had been entirely covered. They were then weighed. In every case there was an actual gain, as seen in the following table [abbreviated]. But besides the proof afforded by the balance, the stems and leaves had perfectly recovered all the freshness and rigidity which they had lost on the previous evening by exposure to the sun and air:—

	Gn. per cent.		Gn. per cent.
Lime	16.40	Blackberry ...	14.75
Oak	6.40	Thistle	10.71
Geranium ...	11.32	Chiaro	31.16
Nettle	27.31	Yew	1.94
Grass	25.50	Rubbery	0.67

Dr. G. Volken has studied the phenomena of desert plants of North Africa, and he has come to the conclusion that dew plays a very important part in sustaining the life of many plants which only secure rain during two months in the year. The commonest method is by means of a clothing of hair, which acts as an absorbent; but in some cases the dew is retained by means of hygroscopic salts, as in *Tamarix* and *Reaumuria*. In the case of the last-named plant, after the rain has ceased in March, the plant is covered with powdery salts, including chlorides of calcium and magnesium. During the succeeding hot months these salts absorb so much dew, which they transmit to the plant, that it looks like an evergreen. As a curious experience of my own, when drying this plant (which is not uncommon in the desert near Cairo), I had left it under pressure for three days; and on proceeding to change the drying papers, I found them completely saturated, and the "drying" specimens covered with drops of water, which the salts on the surface had thus drawn out of the plant itself. I hope the above brief remarks will be sufficient to refute once more the idea that plants cannot absorb water by other organs than their roots; and, conversely, prove that when in an emergency they can imbibe rain and dew with the greatest facility by aid of their leaves. *George Henslow.*

GOOSEBERRY DISEASE.—From your notices to correspondents last week I learn that some of your readers have the misfortune to become acquainted with a peculiar disease that is attacking Gooseberries. Other plantations of that fruit in this locality as well as mine are affected in the same way. The bushes in these plantations had every appearance of health, and cropped heavily for a period of ten years, when the leaves of only a single bush assumed a rusty appearance; the following year the affected bush was fruitless, with only a poor development of leaves and wood, another season rendered it leafless, except a few on the tips of the branches. In the space of three years from its first appearance I have 200 bushes more or less affected. Gooseberries have been grown here many years, and disease was unknown. Your examination of the samples submitted to you last week, detected no fungus disease, but insect remains, and red bodies in all the fissures of the bark. I believe bringing this matter before your readers, whose varied knowledge and experience might be able to account for its appearance, and prescribe a remedy, would confer a boon on the Gooseberry-growing industry. *W. M., Ponside.*

CULTURE VERSUS NATURE.*

"All knowledge is of use if applied aright; no knowledge is of use if applied awry."—*Frost, M. Foster.*

(Continued from p. 787.)

Good culture hinges on many things, but especially on a good start from seed or other kinds of increase, or propagation. As a rule, all hardy

seeds, i.e., the seeds of hardy ornamental plants, should be sown as soon as they ripen, but where artificial food, crops, &c., are required at particular times and seasons, it follows that seeds must be sown at different times, spring, summer, or autumn, as the case may be. A particular strain of vegetable or flower-seeds can only be kept true by isolation, so as to preclude inter-crossing, but novelties, on the other hand, are often gained by selection after hybridism or cross-fertilisation. As a rule, both special selections or strains, and hybrids alike, die out unless they are specially cultivated and protected, and in this way garden hybrids are far less stable than are Nature's hybrids, many of which are comparatively permanent, and in some cases are dignified and disguised by specific names.

The Oxlip, or *Polyanthus Primrose*, is an instance of this fact. It is the result of inter-crossing between the Cowslip (*Primula veris*) and the *Primrose* (*P. acaulis*), and is itself called *P. elatior*. So again *Narcissus incomparabilis* got a specific name from Miller, which it still retains, although well known to be a hybrid between *N. poeticus* and the *Daffodil* (*N. pseudo-Narcissus*).

All so-called species of plants are now known to be mutable. In a state of Nature plants rest unchanged only when their surroundings are the same. On the other hand, in the forest or jungle "change or die" is often Nature's fiat, and conditions are rare in which some slow series of changes are not in progress before our eyes. In the garden, sudden changes of external or internal conditions take place far more quickly, but are, as we have said garden variations are, far less well fitted for a casual existence; hence, if we ever come across a desolate garden that was once well stocked, we find that most hybrids and selected seedling plants will either have gone back or reverted to their parental stage, or they will have died away entirely.

Chemistry has helped us much as to the due knowledge of, and the true economy of, nitrogenous plant-foods or manures; but there is yet much to be done in the profitable application of chemical principles. Especially should the cultivator take note of the modern observations as to the storage or fixation of atmospheric nitrogen by bacteria that inhabit the root-nodules of many Leguminous plants, such as Peas, Lupins, Clover, &c., for we may some day grow our own nitrogen far cheaper than we can buy it from Col. North, or the vendor of manures.

The chemist tells us that his manures are better than farm-yard manure, of which 80 per cent. consists of water, but he neglects to note the physical action of fresh farm-yard manure on the soil, and the real truth here, as often elsewhere, no doubt lies between the two extremes, farmyard manure being the best bulky basis to be enriched with pure chemical manures for special crops. Thus for Grape-vines, or Potatoes, or leguminous plants, the dominant fertiliser added should be potash; for Wheat, Beet, &c., nitrates are best, and super-phosphates for Turnips and most of the Cabbage family.

The manures especially to be used for any one crop depend in a great measure on the chemical elements in the soil on which it is grown. This is readily known by a fair analysis, our object being to supply the nitrates, or super-phosphates, or lime, or potash salts lacking, or not, in sufficient quantities in the natural soil.

The chemist can tell us the food elements that gain access to the plant, and after the crop is harvested his resultant analysis shows what has been stored up or developed; but that which actually takes place inside the living plants—the vital chemistry, I may call it—is for the most part a mystery still. Hence, one of the mysteries of Nature is this, and it is one no chemist has as yet explained, viz., why and how the vegetable products of the earth vary so enormously in character. From the same earth and the same atmospheric elements, and the same water, we obtain the most delicious of food or flavouring stuffs, the most potent of medicines, or the most fatal of poisons, and the magical laboratories are the living plants themselves, Peach or Pear, grass or Grape-vine, Atropa, or Aconite, or

* A paper prepared by F. W. Burdick, M.A., Curator, Botanic Garden, Trinity College, Dublin, and read, in his absence, at the meeting of the Horticultural Club, Tuesday, June 7.

Digitalis, Eucalyptus or Cinchona, as the case may be.

In a word, land-culture, or rather, plant-culture, actually creates wealth, whereas all other industries merely modify and make it more conveniently useful to our requirements. England is not quite sure of her practical monopoly in coal and iron, but she is sure of her soil, the plant wealth or produce of which may be almost indefinitely increased for all time.

Plants are really self-acting chemical laboratories, and may be economically considered as producing machines. The plant produces food and clothing for us unceasingly, and all we have to do is to start it going, and it works while we are sleeping.

One of the most remarkable of all physiological facts observable in a garden is, the variable power possessed by different plants in the absorption and assimilation of nitrogenous manures. This power varies immensely in different individuals of the same species. Thus, if you sow all the grains in the same ear of Wheat, or all the Peas out of the same pod, it by no means follows that their behaviour in this respect will be identical or even nearly the same. The old simile, "as like as two Peas in a pod," is not true. For some reason, at present not explainable, one or more of the Wheat grains, or of the Peas, will be more or less luxuriant than its neighbours, it will grow faster, and it will prove more fertile, and as a rule this is owing to its enhanced powers of feeding and assimilation, that is to say, in some occult manner it makes a better use of its environment than its relations, and so becomes what the gardener calls a better variety both as a grower and producer. It is the observation of this variability that has led to "selection" as one of the most potent phases of improvement by cultivation. F. W. Burbidge.

(To be continued.)

SOCIETIES.

ROYAL HORTICULTURAL.

JUNE 21.—Fine weather, and the hope of seeing the first fine Roses of the season, brought many visitors to the Drill Hall on this occasion, many of whom lingered round the Tables set out with Roses, Orchids, Peonies, and Delphiniums, the groups of Carnations, and other attractive objects.

A lecture by Mr. W. T. Thistleton-Dyer, Director of Kew, to which many persons wished to listen, and the presentation of two Veitch medals, likewise exercised a certain "drawing" power.

Floral Committee.

Present: W. Marshall, Esq., in the chair; and Messrs. J. Laing, B. Wynne, H. Herbst, C. F. Banse, H. B. May, G. Philpen, C. Jeffries, W. Young, J. Walker, W. B. Fox, C. E. Pearson, N. Davis, C. J. Salter, T. Baines, H. Turner, J. Fraser, G. Gordon, G. Paul, and E. Maxwell.

Conspicuous amongst these exhibits was a group of very fine *Carnation Souvenir de la Malmaison*, exhibited by Lord Wimborne, Canford Manor (gr., Mr. T. H. Crisp). A Silver-gilt Flora Medal was awarded.

Mr. C. F. Banse, Morland Nursery, West Norwood, S.E., obtained an Award of Merit for each of three *Caladiums*, called respectively John Laing, a large leaf, with coloured centre and greenish-yellow margin; Madame Edouard Pynaert, bearing curiously-tinted leaves, and having no variation; and Marguerite Gelinier, a small-growing variety, with very delicately-coloured leaves. Mr. H. B. May, Edmonton, received an Award of Merit for *Carnation Mrs. Hemsley*, a dark crimson variety, of good form.

Mr. T. Bones, gr. to T. Donaldson, Esq., Tower House, Chiswick, had three pretty *Gloxinias*. Messrs. T. & J. Rogers, Fernbank Nursery, Lodswood, Petworth, exhibited a variety of *Adiantum macrophyllum* albo striatum, whose name sufficiently expresses the characteristic of the variety, which obtained an Award of Merit.

Messrs. J. Veitch & Sons, Royal Exotic Nursery, Chelsea, showed sprays of the white *Syringa japonica*, and also some sprays of a new *Cornus C. Kosa*, with white flowers; this latter was awarded a First-class Certificate. The same firm showed a small

collection of choice herbaceous plants, of which we may specify the following:—*Heuchera sanguinea*, *Delphinium cashmerianum*, very dark purplish-blue; the creamy-white-flowered *Cephalaria alpina*; a handsome semi-double crimson-flowered *Potentilla*, named *Phobus*; the purple-flowered *Betonica hirsuta*, and the seldom-seen *Tritoma caulescens*, with handsome yellow and scarlet spikes—this last got a First-class Certificate. A good lot of herbaceous Peonies in variety was shown, of which the following seemed meritorious:—*Gloire de Douai*, purple-crimson; Madame Vilmorin, creamy-white, pink centre flowers; Madame Henri, white, with pink flush; Lady Leonora Bramwell, deep rose; *Fulgida*, deep crimson; Rubens, rich crimson, rather loose in the petal.

R. White, Esq., Pentland House, Lee, Kent, was awarded a First-class Certificate for a yellow *Calla*, called *Calla Pentlandii*. This is entirely different from the variety known as *Calla Elliottiana*, in having a better-formed spathe, which has a dark patch at the bottom, and more substance in the wavy leaf. The stock of *Calla Elliottiana* was sold at the auction rooms recently.

Mr. H. J. Jones, Ryecroft Nursery, Lewisham, had a group of Ivy-leaved *Parlagonium*, Ryecroft's Surprise, a bright pink variety, dwarf-growing and remarkably short-jointed (an Award of Merit). The same exhibitor had two seedling *Chrysanthemums*, raised from seed sown on February 15, 1892, which flowered on June 15, 1892. One of them was a single mauve, and the other somewhat resembled *Chinaman*. Some excellent bushy, well-furnished decorative *Parlagoniums* came from this exhibitor.

Mr. J. Whillans, gr. to the Duke of Marlborough, Blenheim Palace, Woodstock, sent a Tree *Carnation*, Lady Rosamond, the flowers of which were a very dull mauve colour, curious certainly, but not attractive.

Mr. J. Smith, gr. to Lord Rosebery, Mentmore, sent cut blooms of *Crinum brachynema*—pure white, eight to nine flowers on a stalk. It received a First-class Certificate.

Mr. Smith, Market Drayton, Salop, showed half-a-dozen plants of a *Coleus*, Shavington Seedling.

Mr. Reynolds, gr. to Lord Rothschild, received a vote of thanks for a boxful of seedling *Streptocarpus* in some variety; and Messrs. F. Ross & Co., Bletchingly, Surrey, a Vote of Thanks for *Ismene Amancaes* in bloom—the Peruvian Daffodil, which, by the way, is no Daffodil at all.

The Rev. W. Wilks brought some blooms of *Carpenteria californica*, a delightfully pretty white flower, produced in clusters, and the plant, though rare, is a beautiful subject for growing against a wall, or in the open, if sheltered. Mr. Wilks said that the thermometer on the wall fell as low as 7° during the last winter, yet the leaves were not even browned. In some places it is a very shy bloomer.

Messrs. Barr & Son, Covent Garden, had, as usual, a very gay and interesting collection of hardy cut flowers, including a number of their double Peonies, of good quality—*Snowball*, a large, handsome flower, and Madame Brion, were granted an Award of Merit.

Messrs. J. Laing & Sons, Stanstead Park, Forest Hill, had a miscellaneous group of stove and greenhouse plants, including some Orchids, amongst which was a good rosy-crimson *Carnation* named *George Fry*, which received an Award of Merit. Messrs. Paul & Son, the Old Nurseries, Cheshunt, showed a good number of large and beautiful varieties of double Peonies (*Silver Flora Medal*). The four following obtained Awards of Merit, viz., Van Dyck, Mlle. Roseau, Madame Loise, and Felix Crousse.

Mr. Charles Turner, Royal Nurseries, Slough, had a collection of hardy herbaceous flowers, and also plants of several varieties of *Parlagoniums*. The following obtained an Award of Merit, viz., *Souvenir*, a fine, rosy pink variety; *Fireball*, bright and very attractive; and *Rosy Gem*.

Mr. B. Ladham, The Shirley Nurseries, near Southampton, showed several varieties of white and coloured *Pinks*; *Ernest Ladham* being a very fine variety, with large pink blooms, that possess a chocolate-coloured ring near centre; Charles is another *Pink* of considerable merit.

Messrs. Kelway & Son, Langport, Somerset, showed some handsome *Delphiniums* in new varieties, considered to be improvements in some respects to existing varieties. One of the most distinct was *Salamanca*, in which the metallic red-purple sepals are narrowly edged with bright blue, whilst the small depressed petals, that are usually so inconspicuous in cultivated garden *Delphiniums*, are white, and of considerable size. The following have

white petals or "centres":—Lord Brassey, Finale, Gilbert, and Nuphar.

There was a large collection of very fine, large, varied Peonies, from Langport, out of which P. Lottie Collins, a purplish-crimson, and Grizzle Muir, pure white, were selected for Awards of Merit.

Messrs. Paul & Son, Old Nurseries, Cheshunt, showed plants and bloom of a new Bourbon Rose, named "Mrs. Paul." It is a fairly large flower of a dark pink colour, and possessing the blancher appearance so common to the Bourbon section. The same firm obtained an award of merit for a hybrid Tea called *Gustave Regis*. It is delicate bluish-pink, and an exceedingly pretty variety. Lord Penzance, Eashing Park (gr., Mr. G. Baskett), exhibited a very charming collection of hybrid Sweet Briars, comprising many and varied degrees of colour. Alice Bridgenorth, a large single pink flower, received an Award of Merit, as also did Lucy Bertram, another very pretty variety.

Orchid Committee.

Members present: Harry J. Veitch, Esq., in the chair, James O'Brien, and Messrs. S. Courtauld, T. B. Haywood, The Rev. E. Handley, E. Hill, Chas. Pilcher, H. M. Pollett, H. Ballantiae, Jas. Douglas, H. Williams, and A. H. Smea.

Baron Schroder, The Dell, Egham (gr., Mr. H. Ballantiae), exhibited noble cut spikes of the Veitchian hybrids, *Cattleya* x *Empress Frederick* (*Mossie* x *Doviana*); *Laelio-Cattleya* *eximia* (*Warnerii* x *purpurata*); and *Laelio-Cattleya* x *Canhamie* (*Mossie* x *purpurata*), and also a spike of *Cattleya Gaskelliana* alba, and of a very peculiar form of *Laelia purpurata*, with a slight bronzy hue over the whole flower. Messrs. F. Sander & Co., St. Albans, staged a neat group of rare Orchids, including the beautiful pure white *Cattleya Amesiae*; *C. princeps*, which somewhat resembled a fine *C. Schofieldiana*, but with almost the entire surface of the sepals and petals of a port wine hue; *Thunia Campbellii*, a pretty species from the Salween River; *T. Brymeriana*, white with a delicate tracery of rose on the lip; *Oncidium Schlegelianum*, of the *O. Lanceanum* section, but generally white-lipped; *Epidendrum Thayerianum* and *Angracum O'Brienianum*, a thick-leaved species of the *Chaillouanum* class. Messrs. Sander also had fine plants of *Cynochos chlorochilum*, *Cattleya Arnoldiana* x *Dendrobium filiforme*, with over thirty spikes, and *Vanda Hookera*.

Messrs. Collins & Collins, of Willesden Park Nursery, also effectively arranged a group of well-known showy Orchids, such as *Dendrobium suavisimum*, *D. moschatum*, many *Odontoglossum citrinum*, *Acridis*, *Cattleyas*, *Cypripediums*, &c., all very well grown.

C. J. Lucas, Esq., Warnham Court (gr., Mr. Duncan), sent a large plant of the new *Sobralia Lucasiana*, which was, until it flowered, thought to be *S. xantholeuca*. Its flowers were large, like those of *S. xantholeuca*, but the segments were white, tinged with lilac, the front of the lip being rosy-lilac and the centre yellow. Mr. Lucas also sent a fine plant of *Grammatophyllum Senecioides*. From the gardens of J. T. Gabriel, Esq., Palace Road, Streatham, came a handsome mottled form of *Cattleya Warneri* named *marmorata*.

G. R. le Doux, Esq., Langton House, East Moulsey (gr., Mr. Bowyer), sent an eight-flowered plant of the light-coloured *Cattleya Mossie* Mrs. le Doux, and a plant of a *Cattleya* which appeared to be between *C. Percivaliana* and *C. Mossie*.

Hamar Bass, Esq., Burton-on-Trent, exhibited a very elegant pure white *Dendrobium* with many flowers—*Dendrobium Souvenir d'Alce*.

Messrs. J. Veitch & Son, Chelsea, staged their new *Cypripedium* x *Telemachus* (*Lawrenceanum* 3 niveum ?), which, although the same cross as *C. Aphrodite* x, differs in having the greater part of the surface of the flowers suffused with rosy-crimson. The leaves are handsome—ivory-white, chequered with green.

H. F. Tiarks, Esq., Foxbury, Chislehurst (gr., Mr. J. Lyne), sent *Laelia grandis* Foxbury var., very large, but not so richly coloured as some others.

Reginald Young, Esq., Linnet Lane, Sefton Park, Liverpool (gr., Mr. Poyntz), showed *Odontoglossum Poyntzianum*, a distinct variety, with the size of *O. Andersonianum*, but the cinnamon-coloured spotting of *O. Schillerianum* over a great part of its surface.

J. Gurney Fowler, Esq., Glebelands, Woodford (gr., Mr. J. Davis), exhibited a pretty white *Cattleya Mossie*, near to *C. M. Reinckiana*.

E. H. Woodall, Esq., St. Nicholas House, Scar-

borough (gr., Mr. Hughes), sent a fine spike of *Oncidium Lanceanum* Woodall's var., which is fine in size, and has a rich rose labellum.

The Right Hon. Joseph Chamberlain, M.P., sent cut spikes of white and coloured *Cattleya Mossie* and *C. Walkeriana*. R. Brooman-White, Esq., also sent cut Orchids, in which there was a fine *Laelia grandis tenebrosa* and some pretty light *Cattleya Mendeli*; and Sir William Marriott, fine cut spikes of *Cattleya gigas*.

List of Awards.

ORCHID COMMITTEE.

First-class Certificate.

To *Cattleya* × *Empress Frederick*, from Baron Schroder. To *Sobralia Lucasiana*, from C. J. Lucas.

Award of Merit.

To *Cattleya Amesii*, from F. Sander & Co.
To *Cattleya princeps*, from F. Sander & Co.
To *Dendrobium Souvenir d'Alice*, from Hamar Bass.
To *Cattleya labiata marmorata*, from J. T. Gabriel.
To *Oncidium Lanceanum*, Woodall's var., from E. H. Woodall.
To *Cryptanthophyllum Seegerianum*, from C. J. Lucas.
To *Gymnadium* × *Telemachus*, from Jas. Veitch & Son.
To *Liparis purpurata* The Bell var., from Baron Schroder.

Silver Flora Medal.

To Messrs. F. Sander & Co., for group of rare Orchids.

Silver Banksian Medal.

To Messrs. Collios & Collios, for group of Orchids.

Fruit Committee.

Present: T. F. Crowley, Esq., in the chair; and Messrs. T. E. Rivers, R. D. Blackmore, W. Wilks, J. Cheal, T. J. Saltmarsh, G. J. Miles, W. Warren, J. Wright, A. Dean, G. H. Sage, J. Hudson, F. Q. Lane, H. Balderson, J. Smith, Harrison Weir, and G. W. Cummins.

Amongst a fair number of exhibits was an exceptionally fine collection of the Strawberry variety, *Marguerite*, from Mr. T. Sharpe, the Strawberry gardens, Virginia Water, Surrey, shown in fifty punnets, and a Silver Banksian Medal was awarded them.

Mr. T. Laxton showed boxes of Laxton's Sensation, a large, very deep coloured fruit, and Laxton's Royal Sovereign, in appearance very like President. This latter received a First-class Certificate. Plants and sprays of fruit of each variety accompanied the exhibit.

Mr. C. Turner, Royal Nurseries, Slough, had five varieties of Strawberries, viz., John Ruskin, Laxton's Noble, the Captain, Bothwell Park, and Crescent Seeding.

Lord Foley, Ruxley Lodge, Esher (gr., Mr. Miller), exhibited a dish of a Strawberry named Eleanor that was sent out as a late variety, but which ripened considerably earlier than Noble at Esher, grown in the same soil. A dish of large Mushrooms came from the same exhibitor, and a Vote of Thanks was accorded.

As usual, there was a good number of seedling Melons shown. From Mr. W. Allen, The Gardens, Swallowfield Park, Reading, came twelve fruits of a hybrid obtained from Meredith Hybrid × William Tillery. These were large, good-looking fruits, but were not perfectly ripe.

Mr. S. Ely, Joyce Grove Gardens, Nettledred, Henley-on-Thames, had a pretty seedling Melon, Oxonian, rather small, and deeply netted.

Lord Rothschild, Gunnersbury House (gr., G. Reynolds), brought five fruits of another seedling, the five fruits weighing 29 lb.

A collection of Peaches and Nectarines came from Mr. T. H. Crisp, Canford Manor Gardens, Wimborne. The Peaches (three dozen) were a good size, but not well-coloured; the Nectarines, however, were much better in this respect. The committee presented a Vote of Thanks.

The Duke of Northumberland, Syon House, Brentford (gr., Mr. G. Wythes), sent a collection of Cherries, River's Early, Governor Wood, Belle d'Orleans, Elton Heart, Frogmore's Bigarreau, Bigarreau Napoleon, Black Eagle, and Black Tartarian. The fruits were very fine, and received a Cultural Commendation.

Fruits of a seedling Cucumber (Lewes' Advancer), from Luckie's Perfection × Telegraph, came from Mr. J. Lowe, The Nurseries, Uxbridge. The examples sent were well-shaped, and very good in colour.

Messrs. R. Veitch & Son, Exeter, sent a dish of Exonian Peas. Another dish of Peas, Duke of Albany, was exhibited by Mr. Wythes, and received a Vote of Thanks.

National Rose Society.

WHEN we remember the lateness of the season, and the very adverse weather that Rose growers have had to contend with, the show, although somewhat below the average, must be considered very satisfac-

tory, and in most of the classes there was considerable competition.

For three trusses of twelve distinct varieties, Mr. F. Cant, Braisfield, Colchester, was 1st, whose best examples were *Maréchal Niel*, The Bride, Catherine Mermet, and Souvenir de Paul Neyron; the others being *Caroline Kuster*, Madame de Watteville, Rubens, Francisca Krüger, Souvenir d'un Ami, Madame Cusin, and Hon. Edith Gifford. Messrs. D. Prior & Son, Myland Nurseries, Colchester, were a good 2nd, and included fine specimens of Catherine Mermet, Madame Bravy, Marie van Houtte, and Anna Olivier. The 3rd prize was obtained by Mr. George Mount, Rose Nurseries, Canterbury, whose best were Marie van Houtte, Souvenir de Paul Neyron, and Caroline Kuster.

Mr. Cant was again 1st for twenty-four distinct single trusses, showing a very fine collection, consisting of the following varieties:—Catherine Mermet, Niphotos, *Maréchal Niel*, Marie van Houtte, Madame de Watteville, Souvenir de Paul Neyron, Comtesse de Nadailac, The Bride, Caroline Kuster, Jules Finger, Hon. Edith Gifford, Madame Lambert, Souvenir de S. A. Prince, Souvenir d'un Ami, Madame Houtte, Souvenir d'Elise, Princess Beatrice, Madame Margottin, Francisca Krüger, Jean Ducher, Rubens, Cleopatra, Innocente Pirola, and Madame Welcome. Alexander Hill Gray, Esq., Beaulieu, Newbridge Hill, Bath, was 2nd, with a very fair collection, the best of which were *Maréchal Niel*, Catherine Mermet, Climbing Devonensis, &c. The 3rd position was awarded to Messrs. D. Prior & Son, Myland Nurseries, Colchester, who had good examples of Madame Lambert, Etoile de Lyon, and Madame Bravy.

For twenty-four single trusses, including not less than twelve varieties, the 1st prize was awarded to Mr. Alfred Tate, Downside, Leatherhead, for an exceptionally fine collection, including the finest blooms that were to be seen in the hall. He had The Bride, Catherine Mermet, Souvenir d'un Ami, Marie van Houtte, Madame Cusin, Souvenir de la S. A. Prince, Comtesse de Nadailac, Alba rosea, Madame Willermoz, Souvenir d'Elise Vardon, Madame de Watteville, Niphotos, Etoile de Lyon, and Innocente Pirola. Alexander Hill Gray, Esq., was 2nd, including, amongst others, Edith Gifford, Comtesse de Nadailac, Comtesse Panisse, Souvenir de Madame Pernet, &c.

In the competition for twelve trusses, including not less than nine varieties, the premier position was attained by the Rev. F. R. Burnside, Birch Vicarage, Hereford, with Niphotos, Princess of Wales, Madame Cusin, Madame Bravy, Cleopatra, Souvenir d'Elise Vardon, Comtesse Panisse, Caroline Kuster, Rubens, and Souvenir d'un Ami. The Rev. H. Berners, Harkstead Rectory, Ipswich, who was 2nd, had good representatives of Devonensis, Anna Olivier, Souvenir de la S. A. Prince, Madame Bravy, and Niphotos. The 3rd position fell to W. H. Fowler, Esq., Clarendon, Taunton, with a collection including excellent specimens of Princess of Wales and Marie van Houtte.

For twelve single trusses, Tea or Noisette, other than *Maréchal Niel*, the competition for 1st prize was extremely keen, and the judges awarded the two first equal. The exhibitors were Mr. Frank Cant and Messrs. D. Prior & Son, and the varieties in both cases were Marie van Houtte. Mr. Frank Cant's specimens were a little more expanded than the others; Alex. Hill Gray, Esq., was 3rd, with a stand of Anna Olivier.

The Rev. J. Pemberton, Havering-atte-Bower, was 1st for six single trusses, including not less than four varieties, showing *Maréchal Niel*, Jules Finger, The Bride (very fine and full), Souvenir d'un Ami, and Caroline Kuster; 2nd, the Rev. Henry B. Biron, Lynpne Vicarage, with Etoile de Lyon, Souvenir d'un Ami, Marie van Houtte, and Caroline Kuster; R. Tucker, Esq., Swanley Junction, was 3rd, whose finest specimen was Hon. Edith Gifford. For six single trusses of any one variety, the Rev. F. T. Taylor, Littleton Vicarage, Evesham, was 1st with *Maréchal Niel*. 2nd, The Rev. F. R. Burnside, Birch Vicarage, Hereford, for Anna Olivier; and 3rd, R. L. Knight, Esq., Botting, Sittingbourne, with *Maréchal Niel*. Although in the 3rd position in the above classes, Mr. Knight was 1st in the competition for twelve single trusses of *Maréchal Niel*, and had a very fine stand of this beautiful variety. Alex. Hill Gray, Esq., was 2nd, and Mr. Frank Cant, 3rd. Mr. Frank Cant was 1st for twelve bunches distinct, including three trusses to each bunch, with Madame Capucine, Hon. Edith Gifford, Rêve d'Or, Jules Finger, Chas. Legrand, Catherine

Mermet, Madame Falcot, The Bride, Madame Lambert, &c.

Alexander Hill Gray, Esq., obtained 1st for six distinct bunches of three trusses each, and had fine bunches of The Bride, Catherine Mermet, *Maréchal Niel*, Comtesse Nadailac, Alba rosea, and Marie van Houtte.

For a decorative arrangement of Tea or Noisettes, Mrs. Henry B. Biron was 1st, with a very prettily-arranged basket, which attracted a good deal of attention; Miss A. Bloxam, Eltham Court, Eltham, Kent, was 2nd, with another basket, which was also very commendable, but hardly so light and graceful as the other. Mrs. O. G. Orpen, West Bergholt, Colchester, who secured the 3rd award, exhibited an arrangement for the table; in the centre was a glass stand with several tiers furnished with flowers, and at the feet were two horse-shoe shaped tins, filled with damp sand, one on either side. The spaces enclosed by the tins were covered with yellow silk, and yellow and pink were the only colour in the flowers used. There were several other arrangements in baskets, and the decorative arrangements commanded a fair share of attention, especially from the ladies.

LECTURE BY W. T. THRELSTON-DYER, ESQ., DIRECTOR OF KEW.

In the afternoon a lecture was delivered by Mr. Threlston-Dyer on the "Management of Trees, in Parks and Gardens," and in commencing, the lecturer observed that he might venture to say the subject he was about to speak upon did not receive so much attention in this country as it used to do, but he believed that if more attention be not given to it, we shall fail to hand down to our successors such fine specimens of ornamental and other timber as our ancestors left for us. Mr. Dyer said that it was a mistaken notion that the best trees are obtained by isolated planting, and said that the finest examples of timber trees in the country had been secured rather from judicious thinning than from the system just referred to, and instanced some of the woods at Kew, where they had evidence to prove had been planted thickly, and then successively thinned out, as being far superior to some planted at a later date, when our Royal family had less time to cultivate their timber, on account of the ill health of the sovereign. The finest trees could only be obtained by thick planting, and the consequent extensive sacrifice of less desirable timber. Mr. Dyer thought that height was the first point to be obtained in an ideal tree. The axis should be kept entire, a well-balanced bole should be secured, and the branches should not be too long, for if such be the case it is probable that damage will be sustained through the effect of wind or snow. The worst possible form is that which he might describe as the Cabbage-headed tree. It is nothing but a gigantic bush, and the vast majority of trees are prone to this habit; but there are several influences that tend to create the Cabbage-headed growth, and the principal one was the loss of the leader. When a tree is planted in the open, it is exposed to all the cold winds, &c., and the result of a really hard winter or spring is that the leader is killed, after which it can only be restored by artificial treatment.

Pollards, the lecturer said, bore evidence that they had been tended until they had developed an unusually large bole before cutting for fire-wood. Felling was not quite so bad a form as the Cabbage-head, but still, a forked tree was extremely liable to be split by the force of wind playing upon one-half of the tree, and after that had taken place, and an opening had been made for disease and decay, they will not last any great length of time.

In pruning young trees (and all trees need looking to in this respect), steps must be taken to prevent excessive growth of the lateral branches. If the laterals are shortened, the leaders are strengthened to the same extent, and the lateral branches never appear to assume the habit they had of unduly extending themselves. Staking had its drawbacks as well as its advantages, and Mr. Dyer said that he had lately found that Mr. Waterer, by pruning the lateral growths has been able to dispense with any kind of staking. His own experience, however, did not quite justify such a step. But even after a tree has been staked, the necessity will still exist for pruning, and if the head is allowed to become unduly large, it is liable to be broken off. In fact, it will require more pruning than if it were not staked at all. Mr. Dyer then referred to the attacks of animals and cattle that trees were subjected to, and said that the French, who make their trees an especial study, recommended that the trees be painted with coal-tar. The lecturer had seen road metal

placed around the trees to prevent cattle injuring them; they dislike to stand upon it or walk across it.

In regard to the preservation of old trees, the lecturer gave a detailed description of the bark with which the trunk of a tree is covered, and of the vital importance it was to the tree that the bark should be not injured or abraded, and declared that even in this matter timber trees were almost universally neglected. Mr. Dyer then gave directions as to the covering of any place that had become denuded of bark, recommending that the place should be scraped, and the whole then painted with coal-tar. This, the lecturer said, was better than anything that becomes hard, and it never gets quite set, thus allowing the gradual closing up of the healthy tissues, and the closure of the wound to go on. It also acts as an antiseptic. Mr. Dyer then said that branches, when cut off, should be cut close to the trunk, for that if a piece of the shoulder was left, it would decay, and disease would enter the tree, and its end sooner or later would be assured. If the branch is cut off in the manner advised, the bark will gradually close over and cover the cut. The lecturer then spoke of several species of fungi that attack trees, and gave directions for preventing the mischief arising from them.

Sir Trevor Lawrence, who occupied the chair, spoke of the Beech trees in some parts of Surrey that were dying off in hundreds, and, as they were planted upon the chalk, he presumed that they had exhausted the humus contained in the small quantity of soil they had got; but some of the cases could not be accounted for in that way, and he would like to show them the lecturer, that he might give his opinion what was the cause of their death.

SCOTLAND.

EDINBURGH BOTANICAL SOCIETY.

JUNE 9.—This Society met in the evening at the Royal Botanic Garden, Dr. Wm. Craig in the chair.

Among the exhibits from the Royal Botanic Garden were the following:—*Olearia insignis*, *Amorpha phallus campanulatus*, *Sandersonia aurantiaca*, *Fritillaria kamschatcensis*, *Ranunculus pyrenaica alba*.

Wellwood H. Maxwell, Esq., Munches, Dalbeattie, sent branches of *Pseudotsuga Douglasii* var. *Stairii*.

Mr. Neill Fraser exhibited *Asplenium adulterinum*, a hybrid between *A. Trichomanes* and *A. viride*.

Professor Balfour called attention to a portion of *Ash-stem* showing extremely well the burrows of *Hylesinus fraxini*, presented by Dr. Wm. Somerville, of Durham University. Professor Balfour also exhibited seedlings of Plantains to show curling of the cotyledons, enabling the seedlings to gain support from neighbouring plants and other objects.

Dr. Julius Wood showed a series of plants which he had collected in India, and also paintings from nature of *Gloriosa superba* and *Poinciana regia*.

Mr. Ivison Macadam sent an example of *Fritillaria*, which has two flowers instead of one, year after year.

Col. Bailey read a paper on the growth of Oaks in the forest of Dean. In the experiments mentioned, Oaks were transplanted at an early age, others at a more advanced period, and others left in the seed-bed. Measurements of the girth of these had been taken from 1809 up to the present time, and the records showed that the transplanted trees were much ahead of those not transplanted; in fact, it was not too much to expect that transplanted Oak trees come to maturity fifty years sooner than those not transplanted. A second set of experiments were made, whereby it was shown that merely lifting and transplanting into the same holes, without change of soil or increase of space, was advantageous.

REPORT ON TEMPERATURE, &c., AT THE ROYAL BOTANIC GARDEN DURING MAY. BY ROBERT LINDSAY, CURATOR.

The past month of May has been, on the whole, very favourable. During the latter portion of the month an abundant supply of rain fell; this being

succeeded by warm, genial weather, vegetation advanced at a rapid rate. The foliage of deciduous trees came rapidly forward, and towards the end of the month was remarkably fine and luxuriant. The flowering of the ordinary ornamental trees and shrubs is far above the average this season in wealth of blossom. Horse Chestnut, various species of *Pyrus* and *Prunus*, *Lilac*, *Rhododendron*, and *Azalea* presented a very rich appearance. Hawthorn and *Laburnum* are well covered with flower-buds, and promise to be very fine. Hollies also show abundance of flower this season.

During the month the thermometer was at or below the freezing-point on two occasions, indicating 4° of frost. The lowest readings were on the 1st, 32°; 2nd, 28°; 10th, 33°; 12th, 33°; 21st, 33°. The lowest day temperature was 51°, on the 4th; and the highest 78° on the 31st. Rain fell on fourteen days during the month.

On the rock garden 282 species and varieties came into flower during May, as against 260 for the corresponding month last year. Among the most interesting were:—*Aciphylla squarrosa*, *Adonis pyrenaica*, *Anemone Baikalensis*, *A. polyanthes*, *Androsace lactea*, *Aubrietia Leichtlinii*, *Cytisus decumbens*, *Dianthus glacialis*, *Dryas Drummondii*, *Enkianthus himalayensis*, *Patrinia nudicaulis*, *Primula Warei*, &c.

TEMPERATURE, &c., AT THE BOTANIC GARDEN, GLASGOW, DURING MAY. BY ROBERT BULLEN, CURATOR.

No frost was registered here during the month, but on several nights the temperature was near the freezing-point. The first twelve days of the month were very dry; the sun-thermometer on most days registered from 70° to 83°. On and after the 13th, very variable weather was experienced, with frequent and often heavy rain, which was much needed, vegetation at the time being in a starved and backward state. From this time, what is commonly known as good growing weather, prevailed to the end of the month, and all hardy plants made rapid growth, but still, the season is a late one. As these lines are being written (June 6) the common *Ash* is only developing its leaf-buds. Late-sown seeds of Californian and other annuals have had the advantage of those sown three weeks earlier, owing to the dry days and cold nights of early May.

NORTH OF SCOTLAND APIARIAN SOCIETY.

The prize schedule for the annual exhibition of bees, honey, and hive appliances, to be held in connection with the Royal Horticultural Society of Aberdeen's summer show at Central Park, Kittybrewster, Aberdeen, on August 18, 19, and 20, has just been issued. There are twenty-one classes, and the competition embraces honey in sections, collections of bee furniture, samples of wax, varieties of living wild bees and wasps, with their nests and honey, flavoured cake, &c. A source of attraction will be a grand driving competition for the transference of bees and combs from a straw to a bar-frame hive. There will also be a honey market. The schedule includes instructions for candidates who wish to apply for the efficiency certificates granted by the Society for proficiency in apiculture.

ROYAL HORTICULTURAL SOCIETY OF ABERDEEN.

The secretary (Mr. A. M. Byres) has received an intimation that the Duke and Duchess of Fife will give a prize for a bouquet of wild flowers, the competition being open to boys and girls under 16 years of age, at the society's annual floral gala to be held in Aberdeen on August 18, 19, and 20.

TIMOTHY GRASS.

In the new volume of the *Transactions of the Highland Agricultural Society*, unqualified praise is meted out to this grass, and it is strongly recommended therein that permanent Timothy-grass meadows be formed in different parts of the country, experience of it by farmers, especially in Scotland, being most favourable. Timothy-grass is the Meadow

Cat's-tail (*Phleum pratense*). The name Timothy is of American origin, having received it from being extensively cultivated by Mr. Timothy Hanson, and recommended by him for cultivation in British artificial pastures. It is known in America under the name of Herd's-grass or Herd-grass. It receives the common name of Cat's-tail from the form of its contracted panicle, and is the Highland badge of the clan Sutherland, whose crest is a cat.

Agricultural authorities in this country have differed widely as to the value of this grass. It appears to thrive best on moist soils, and on low fertile lands adjacent to rivers, and also on newly-reclaimed soils from moors. When grown on dry light soils, its roots become bulbous or tuberous; hence, in all probability, the remark that it is not a grass suited naturally to the climate of Great Britain. No doubt, on soils that suit it, and under certain conditions, Timothy-grass is one of the most profitable which can be grown, because where it does well, it produces larger crops of hay than almost any other kind of grass; especially has this been the case on clay lands.

It has been said that the Meadow Cat's-tail is not generally found in the best natural pastures, but able authorities differ from this statement; indeed, Mr. Johnson, in his *Grasses of Great Britain*, states that his own observation substantiates the fact that there are few such pastures in which it does not exist, though in exceedingly varied conditions, and probably equally varied as to nutritious quality. Large quantities of seed of this grass are annually imported to this country, which is proof that it is somewhat extensively cultivated.

It is recommended that on the moist soils of the north it be sown with Italian Rye-grass, to form permanent grass meadows; but it should be stated that Timothy is decidedly inferior to other grasses for spring produce—and that is a most important point. This is the testimony which comes from the north, and yet we have it on the authority of Mr. Johnson, that when experiments were made with it at Woburn, its comparative merits were very great, "owing to its producing abundance of fine foliage early in spring, which, as the grass flowers late, may be cropped until an advanced period of the season without injury to the crop of hay." Probably some reconciliation of authorities may be secured by stating that in the southern districts of Great Britain the spring crop of this grass is more plentiful than when grown further north. One writer states that "the value of the grass, when the seed is ripe, is to that when it is in flower as 10 to 23; another, that when the seed is ripe the stem contains more nutritive matter than that of any other grass which is cut for hay," and to these Mr. Johnson adds this statement: "On a moderately rich and tenacious soil, the *Phleum pratense* is a durable and nutritive grass, though too coarse to be generally liked by cattle, unless in the spring, when the early and abundant foliage is often remarkable; in those pastures in which it is plentifully distributed, among the scanty verdure of the later grasses, where quantity rather than quality is an object in making hay, the Timothy-grass is fully equal, if not, indeed, superior, in yield to the Meadow Foxtail; but the hay is harsh and wiry. All of its better qualities are dependent on the depth and retentive character of the soil; where that is light and shallow, as over chalk and gravel, it either becomes useless or soon disappears." *Pisum*.

Obituary.

GEORGE BRUNT.—On May 13, at Brandon, Coventry, the death of this well-known gardener took place at the comparatively early age of forty-nine. He was head gardener to the novelist, Charles Dickens, being with him at the writer's death, and remaining there a few years afterwards. Afterwards he was head gardener to General Fytche, at Pyrgo Park, Essex; and to the Earl of Carnarvon, Bretby Park, Burton-on-Trent, being at the latter place nine years, retiring through ill-health. He

ECCHARIS: E. F. The mite abounded in the bulbs sent, and we would strongly advise you to keep the diseased wide apart from the healthy bulbs or destroy them. We know of no certain remedy, the insects being in the tissues—inner as well as outer—of the bulbs.

FOXGLOVE: C. A. H. C. Very common this season, it is due to the running together of several flowers into one.

GARDENIAS: J. V. T. The parts of the flower have assumed a leafy condition. We cannot tell the reason, but suspect you have been too free with the water-pot or liquid-manure.

INSECT: M. M. H. *Otiorynchus sulcatus*, clay-coloured weevil.

NAMES OF PLANTS: J. A. P. *Corydalis palæstina*.—*MacMillan*. *Heuchera americana*.—*C. H. 1.* *Potentilla fruticosa*; 5, *Berberis vulgaris* purple var.; 3, *Cornus sanguinea*; 4, *Pyrus Aria*; 5, *Lonicera Ledebourii*; 6, *Weigela rosea*.—*J. S. L. 1.* *Carex cæspitosa*; 2, *Eriophorum polystachyum*; 3, *Alchemilla vulgaris*; 4, *Poterium sanguisorba*; 5, *Pedicularis palustris*; 5a, *Barbarea vulgaris*; 6, *Salix*, perhaps *S. repens*.—*W. S. L.* *Syringa Jossikea*.—*W. M.* *Ulmus Rosselsii aurea*.—*W. P. B.* *Heliconia aurea striata*.—*A. D.* *Tradescantia virginica*.—*W. W. 1.* *Cypripedium barbatum*, a bad variety of it; 2, *Cypripedium barbatum*; 3, *Cattleya Mossie*.—*W. M.* *Sussex*. 1, *Cattleya Mossie*; 2, *Oncidium spheaculatum*; 3, *Oncidium hexuosum*; 4, *Maxillaria tenuifolia*; 5, *Adiantum cuneatum grandiceps*; 6, *Poa trivialis variegata*.—*Auchenault*. *Odontoglossum citrosum*.—*H. 1.* *Asphodelus luteus*; 2, *Hemerocallis flava*; 3, *Cerastium*; 4, *Clematis integrifolia*; 5, *Tradescantia virginica*; 6, *Thalictrum aquilegifolium*; 7, send flower. *R. W. 1.* *Lupinus polyphyllus*; 2, *Hemerocallis flava*; 3, *Thalictrum aquilegifolium*; 4, *Trollius europæus*; 5, *Agrostema coronaria*; 6, *Centranthus ruber*; 7, *Adiantum Waltoni*; 8, *Lupinus polyphyllus*. *E. M. Hull*. 1, *Pyrus terminalis*, the Wild Service Tree, England; 2, *Ginkgo biloba*, the Maidenhair Tree, Japan. *J. S. W. 1.* *Anthericum liliistrum*; 2, *Convallaria multiflora*; 3, *Rose*, apparently *Maréchal Niel*; 4, *Rose*, apparently *Catherine Mermet*.—*T. S. Ware*. 1, *Crataegus punctata*, probably; send when in fruit; 2, *Pyrus Aria* variety.

ON-CLOTH FOR SHEETS FOR FASTENING TREES TO THE WALL: W. H. Y. You should apply to some maker of oiled goods. Put in a small advertisement.

PEACHES: H. W. G. The fruits are affected with mildew. See our reply to J. F. Vines, in our last week's issue; the cause and remedy are the same. If mildew commonly attacks Vines, Peaches, &c., and prevention being better than cure, it would be preferable to use, early in the season, one or other of the recommended fungicides, than to wait till mildew is actually present.

PINE-APPLE WITHOUT CROWN: W. H. Y. It is a malformation, certainly, but it does not affect the growth of the fruit. We do not know what it is due to. Pine-apples would be better without crowns. Doubtless, in the wild-state crowns serve as one of the means of increase.

PINK SPORT: J. B. It is, probably, a case of reversion; but, that surmise notwithstanding, it may be useful as a border flower.

VINES: J. J. The Vines have been kept too warm until they bloomed, and then they have received a check from the admission of cold air, which has been followed by mildew at the tips.

WATER PLANT IN JAMAICA: Rev. A. Johnson. By means of your lucid description, we recognise the plant to be *Pontederia azurea*.

ESTATE SALES.

The Best County Medium for Advertising Sales of Estates is

THE "WORCESTER HERALD,"

ESTABLISHED 1794.

The Leading County Paper. Extensive circulation among the
upper and middle classes in Worcestershire and adjoining
counties. Advertisers would do well to forward for reference
and distribution plans and particulars of Estates, Catalogues
of Machinery, Furniture, Books, and other Property advertised
in the Columns of the "HERALD."

Sales of Stock and Agricultural Effects.

The "WORCESTER HERALD" is the most effective organ
for giving publicity to announcements of this class. It is the
leading Agricultural Paper in the County, and Circulates
most extensively among Agriculturists in and around
Worcestershire.

Farms to Let.

Land Agents, Estate Managers, and all having Farms to Let
would do well to advertise in the "WORCESTER HERALD,"
the Leading County Paper. Specially adapted for bringing
such notices before Tenant Farmers. Large circulation.
Moderate charge.

Situations Vacant and Wanted.

For producing results the "WORCESTER HERALD" is
recognised as a specially good medium. Cheap Rates.

NOTICE TO ADVERTISERS.—*In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.*

GARDENERS AND OTHERS WANTING SITUATIONS, 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Births, Deaths and Marriages, 5s. each insertion.

POSITION.—*Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.*

POSTAL ORDERS.—*To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at No. 42, DRURY LANE, to A. G. MARTIN, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.*

N.B.—*The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.*

Advertisements for the current week must reach the Office not later than Thursday noon.

All Advertisements must be addressed to the PUBLISHER.

Publishing office and Office for Advertisements, 41, WELLINGTON ST., STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. *The United Kingdom*, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. *All Foreign Subscriptions*, including Postage, 17s. 6d. for 12 months: Post-office Orders to be made payable to the G. Post-Office, 42, Drury Lane, W.C., to A. G. MARTIN.

Subscribers who experience any difficulty in obtaining their Copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

TO FLORISTS and FRUITERERS.—A young Lady desires re-engagement. Experienced in Flowers, Fruit, Seeds, &c. Willing to help with Books, or Market.—EMILY, The Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

HOLLOWAY'S PILLS.—Impurities of the Blood.—To ensure health it is absolutely necessary that the fluids and solids of the human body should be kept free from those impurities which are continually getting admission into the system by erroneous living, unwholesome atmosphere, or stordered stomach. The only safe and certain way to expel all impurities is to take Holloway's Pills, which have the power of cleansing the blood from all noxious matters, and at the same time removing any irregularities which their presence may have already produced in any organ. Holloway's Pills expel all humours which taint or impoverish the blood, which they purify and invigorate, and give general tone. They are applicable to all alike—young or old, robust or delicate.

AWARDED TWENTY PRIZE MEDALS

AT INTERNATIONAL EXHIBITIONS AT HOME AND ABROAD.

KEITH'S PATENT BOILERS, THE "CHALLENGE," "VIADUCT," "PYTHON," &c.,

FOR HOT-WATER HEATING, "STAND FIRST,"

require no building work around them, are entirely water-jacketed, and heat from 50 feet up to 20,000 feet of 4-inch pipe respectively. Many thousands are in use all over the world, and the Boilers are unrivalled in power and economy.

Manufactured under 30 James Keith's Patents in Great Britain, United States, and Canada.

This Engraving "illustrates the most powerful form of Boiler that has yet been made for Hot-water Circulation."—Extract from Hood, on *Warming by Hot-water*, New Edition, 1891.

KEITH'S "PYTHON" BOILER, as illustrated, has 1,000 square feet of effective heating-surface, with $17\frac{1}{2}$ square feet of fire-grate area, heats about 20,000 feet of 4-inch pipe, and is the Most Powerful and Complete Sectional "Special" Hot-water Heating Boiler in the World.

JAMES KEITH (C.E., Assoc. M.Inst.C.E.), Gas, Hydraulic, Heating, Ventilating, and Consulting Engineer. Established 1823. Contractor to Her Majesty's Government. 57, HOLBORN VIADUCT, LONDON, E.C., ALSO AT EDINBURGH AND ARBROATH.

THE BEDDING PLANT OF THE SEASON—GRAND NEW DWARF TROPÆOLUM, "MRS. CLIBRAN."

Colour, lovely shade of Orange-yellow; habit, compact, and about 6 inches high; free and continuous bloomer, producing a brilliant display.

Gardeners' Chronicle: "The colour is decidedly very good. An excellent bedder."

Journal of Horticulture: "The variety must be regarded as an acquisition."

Gardeners' Magazine: "A distinct bedding variety; will make a gay display in bed or border."

Mr. D. MELVILLE, Dunrobin Castle Gardens: "I think your *Tropæolums* should be most useful. An excellent substitute where *Calceolarias* die off."

Mr. W. INGRAM, Belvoir Castle Gardens: "Seems to promise an effect not afforded by any other dwarf bedder."

Mr. Wm. EARLEY, Ilford: "I am charmed with Mrs. Clibran *Tropæolum*."

Mr. G. DOUGLAS, Great Gearys: "A very distinct novelty."

This Splendid Novelty has been Awarded several Certificates. Plants ready end of May. Price, 1s. 6d. each; 6 for 7s. 6d.; per dozen, 12s.

For full Description of above, also other distinct Novelties and Specialties, including NEW BEDDING PELARGONIUMS, see New CATALOGUE (No. 115), Free on Application.
